         'new': {'attr1': ['val1', 'val2']}}}
```

Example 'changes' dict where a new attribute was added to an existing entry:

```
{'dn1': {'old': {},  
         'new': {'attr2': ['val3']}}}
```

- 'result' One of the following values:

  - True if no changes were necessary or if all changes were applied successfully.
  - False if at least one change was unable to be applied.
  - None if changes would be applied but it is in test mode.

13.16.99 salt.states.linux_acl

Linux File Access Control Lists

Ensure a Linux ACL is present

```
root:
  acl.present:
    - name: /root
    - acl_type: user
    - acl_name: damian
    - perms: rwx
```
Ensure a Linux ACL does not exist

```python
code
root:
    acl.absent:
        - name: /root
        - acl_type: user
        - acl_name: damian
        - perms: rwx

salt.states.linux_acl.absent(name, acl_type, acl_name='`', perms='`, recurse=False)
Ensure a Linux ACL does not exist

salt.states.linux_acl.present(name, acl_type, acl_name='`', perms='`, recurse=False)
Ensure a Linux ACL is present
```

### 13.16.100 salt.states.locale

**Management of languages/locales**

Manage the available locales and the system default:

```python
code
us_locale:
    locale.present:
        - name: en_US.UTF-8

default_locale:
    locale.system:
        - name: en_US.UTF-8
        - require:
            - locale: us_locale

salt.states.locale.present(name)
Generate a locale if it is not present

    New in version 2014.7.0.
    name  The name of the locale to be present. Some distributions require the charmap to be specified as part of
           the locale at this point.

salt.states.locale.system(name)
Set the locale for the system
    name  The name of the locale to use
```

### 13.16.101 salt.states.lvm

**Management of Linux logical volumes**

A state module to manage LVMs

```python
code
/dev/sda:
    lvm.pv_present

my_vg:
    lvm.vg_present:
        - devices: /dev/sda

lvroot:
```

13.16.  state modules  

2095
salt.states.lvm.lv_present:
  - vgname: my_vg
  - size: 10G
  - stripes: 5
  - striperssize: 8K

salt.states.lvm.lv_absent(name, vgname=None)
  Remove a given existing logical volume from a named existing volume group
  name The logical volume to remove
  vgname The volume group name

salt.states.lvm.lv_present(name, vgname=None, size=None, extents=None, snapshot=None, pv=None, **kwargs)
  Create a new logical volume
  name The name of the logical volume
  vgname The volume group name for this logical volume
  size The initial size of the logical volume
  extents The number of logical extents to allocate
  snapshot The name of the snapshot
  pv The physical volume to use
  kwargs Any supported options to lvcreate. See linux_lvm for more details.

salt.states.lvm.pv_absent(name)
  Ensure that a Physical Device is not being used by lvm
  name The device name to initialize.

salt.states.lvm.pv_present(name, **kwargs)
  Set a physical device to be used as an LVM physical volume
  name The device name to initialize.
  kwargs Any supported options to pvcreate. See linux_lvm for more details.

salt.states.lvm.vg_absent(name)
  Remove an LVM volume group
  name The volume group to remove

salt.states.lvm.vg_present(name, devices=None, **kwargs)
  Create an LVM volume group
  name The volume group name to create
  devices A list of devices that will be added to the volume group
  kwargs Any supported options to vgcreate. See linux_lvm for more details.

13.16.102 salt.states.lvs_server

Management of LVS (Linux Virtual Server) Real Server

salt.states.lvs_server.absent(name, protocol=None, service_address=None, server_address=None)
  Ensure the LVS Real Server in specified service is absent.
  name The name of the LVS server.
  protocol The service protocol(only support tcp, udp and fwmark service).
  service_address The LVS service address.
  server_address The LVS real server address.

salt.states.lvs_server.present(name, protocol=None, service_address=None, server_address=None, packet_forward_method='dr', weight=1)
  Ensure that the named service is present.
name  The LVS server name
protocol  The service protocol
service_address  The LVS service address
server_address  The real server address.
packet_forward_method  The LVS packet forwarding method (dr for direct routing, tunnel for tunneling, nat for network access translation).
weight  The capacity of a server relative to the others in the pool.

```
lvrs:
lvs_server.present:
  - protocol: tcp
  - service_address: 1.1.1.1:80
  - server_address: 192.168.0.11:8080
  - packet_forward_method: dr
  - weight: 10
```

13.16.103  salt.states.lvs_service

Management of LVS (Linux Virtual Server) Service

salt.states.lvs_service.absent(name, protocol=None, service_address=None)
Ensure the LVS service is absent.
name  The name of the LVS service
protocol  The service protocol
service_address  The LVS service address

salt.states.lvs_service.present(name, protocol=None, service_address=None, scheduler='wlc')
Ensure that the named service is present.
name  The LVS service name
protocol  The service protocol
service_address  The LVS service address
scheduler  Algorithm for allocating TCP connections and UDP datagrams to real servers.

```
lvstest:
lvs_service.present:
  - service_address: 1.1.1.1:80
  - protocol: tcp
  - scheduler: rr
```

13.16.104  salt.states.lxc

Manage Linux Containers

salt.states.lxc.absent(name, stop=False, path=None)
Ensure a container is not present, destroying it if present
name  Name of the container to destroy
stop  stop before destroying default: false

New in version 2015.5.2.
path  path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.
salt.states.lxc.absent

```python
web01:
  lxc.absent
```

salt.states.lxc.cloned

```python
salt.states.lxc.cloned(name, orig, snapshot=True, size=None, vgname=None, path=None, profile=None)
```

Deprecated since version 2015.5.0: Use `lxc.present`

salt.states.lxc.created

```python
salt.states.lxc.created(name, **kwargs)
```

Deprecated since version 2015.5.0: Use `lxc.present`

salt.states.lxc.edited_conf

```python
salt.states.lxc.edited_conf(name, lxc_conf=None, lxc_conf_unset=None)
```

Warning: This state is unsuitable for setting parameters that appear more than once in an LXC config file, or parameters which must appear in a certain order (such as when configuring more than one network interface). It is slated to be replaced, and as of version 2015.5.0 it is deprecated.

Edit LXC configuration options

- **path** path to the container parent default: /var/lib/lxc (system default)

  New in version 2015.8.0.

```python
setconf:
  lxc.edited_conf:
    - name: ubuntu
    - lxc_conf:
        - network.ipv4.ip: 10.0.3.6
    - lxc_conf_unset:
        - lxc.utsname
```

salt.states.lxc.frozen

```python
salt.states.lxc.frozen(name, start=True, path=None)
```

New in version 2015.5.0.

Ensure that a container is frozen

- **name** The name of the container
- **path** path to the container parent default: /var/lib/lxc (system default)

  New in version 2015.8.0.

  - **start**: [True] Start container first, if necessary. If **False**, then this state will fail if the container is not running.

```python
web01:
  lxc.frozen

web02:
  lxc.frozen:
    - start: False
```

salt.states.lxc.present

```python
salt.states.lxc.present(name, running=None, clone_from=None, snapshot=False, profile=None, network_profile=None, template=None, options=None, image=None, config=None, fstype=None, size=None, backing=None, vgname=None, lvname=None, path=None)
```
Changed in version 2015.8.0: The `lxc.created` state has been renamed to `lxc.present`, and the `lxc.cloned` state has been merged into this state.

Create the named container if it does not exist
name The name of the container to be created
path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.
running [False]
  • If True, ensure that the container is running
  • If False, ensure that the container is stopped
  • If None, do nothing with regards to the running state of the container
New in version 2015.8.0.

clone_from Create named container as a clone of the specified container
snapshot [False] Use Copy On Write snapshots (LVM). Only supported with `clone_from`.
profile Profile to use in container creation (see the LXC Tutorial for more information). Values in a profile will be overridden by the parameters listed below.
network_profile Network Profile to use in container creation (see the LXC Tutorial for more information). Values in a profile will be overridden by the parameters listed below.

New in version 2015.5.2.

Container Creation Arguments

template The template to use. E.g., 'ubuntu' or 'fedora'. Conflicts with the `image` argument.

New in version 2015.5.0.

template-specific options to pass to the lxc-create command. These correspond to the long options (ones beginning with two dashes) that the template script accepts. For example:

```
web01:
  lxc.present:
    - template: download
    - options:
      dist: centos
      release: 6
      arch: amd64
```

Remember to double-indent the options, due to `how PyYAML works.`

image A tar archive to use as the rootfs for the container. Conflicts with the `template` argument.
backing The type of storage to use. Set to `lvm` to use an LVM group. Defaults to filesystem within /var/lib/lxc.
fstype Filesystem type to use on LVM logical volume
size Size of the volume to create. Only applicable if `backing` is set to `lvm`.
vname [lxc] Name of the LVM volume group in which to create the volume for this container. Only applicable if `backing` is set to `lvm`.
lvname Name of the LVM logical volume in which to create the volume for this container. Only applicable if `backing` is set to `lvm`.

salt.states.lxc.running(name, restart=False, path=None)

Changed in version 2015.5.0: The `lxc.started` state has been renamed to `lxc.running`
Ensure that a container is running

**Note:** This state does not enforce the existence of the named container, it just starts the container if it is not running. To ensure that the named container exists, use `lxc.present`.

<table>
<thead>
<tr>
<th><code>name</code></th>
<th>The name of the container</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>path</code></td>
<td>path to the container parent default: /var/lib/lxc (system default)</td>
</tr>
</tbody>
</table>

New in version 2015.8.0.

**restart** [False] Restart container if it is already running

```yaml
web01:
  lxc.running
web02:
  lxc.running:
    - restart: True
```

salt.states.lxc.set_pass(name, **kwargs)

Deprecated since version 2015.5.0.

This state function has been disabled, as it did not conform to design guidelines. Specifically, due to the fact that `lxc.set_password` uses `chpasswd(8)` to set the password, there was no method to make this action idempotent (in other words, the password would be changed every time). This makes this state redundant, since the following state will do the same thing:

```yaml
setpass:
  module.run:
    - name: set_pass
    - m_name: root
    - password: secret
```

salt.states.lxc.started(name, path=None, restart=False)

Deprecated since version 2015.5.0: Use `lxc.running`

salt.states.lxc.stopped(name, kill=False, path=None)

Ensure that a container is stopped

**Note:** This state does not enforce the existence of the named container, it just stops the container if it running or frozen. To ensure that the named container exists, use `lxc.present`, or use the `lxc.absent` state to ensure that the container does not exist.

<table>
<thead>
<tr>
<th><code>name</code></th>
<th>The name of the container</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>path</code></td>
<td>path to the container parent default: /var/lib/lxc (system default)</td>
</tr>
</tbody>
</table>

New in version 2015.8.0.

**kill** [False] Do not wait for the container to stop, kill all tasks in the container. Older LXC versions will stop containers like this irrespective of this argument.

New in version 2015.5.0.

```yaml
web01:
  lxc.stopped
```
13.16.105 salt.states.mac_assistive module

Allows you to manage assistive access on OS X minions with 10.9+

Install, enable and disable assistive access on OS X minions

```
/usr/bin/osascript:
    assistive.installed:
        - enabled: True
```

```python
salt.states.mac_assistive.installed(name, enabled=True)
```
Make sure that we have the given bundle ID or path to command installed in the assistive access panel.

- **name**: The bundle ID or path to command
- **enabled**: Should assistive access be enabled on this application?

13.16.106 salt.states.mac_defaults module

Writing/reading defaults from an OS X minion

```python
salt.states.mac_defaults.write(name, domain, value, vtype='string', user=None)
```
Write a default to the system

- **name**: The key of the given domain to write to
- **domain**: The name of the domain to write to
- **value**: The value to write to the given key
- **vtype**: The type of value to be written, valid types are string, data, int[eger], float, bool[ean], date, array, array-add, dict, dict-add
- **user**: The user to write the defaults to

13.16.107 salt.states.mac_keychain module

Installing of certificates to the keychain

Install certificates to the OS X keychain

```
/mnt/test.p12:
    keychain.installed:
        - password: test123
```

```python
salt.states.mac_keychain.default_keychain(name, domain='user', user=None)
```
Set the default keychain to use

- **name**: The chain in which to use as the default
- **domain**: The domain to use valid values are user|system|common|dynamic, the default is user
- **user**: The user to run as

```python
salt.states.mac_keychain.installed(name, password, keychain='/Library/Keychains/System.keychain', **kwargs)
```
Install a p12 certificate file into the OS X keychain

- **name**: The certificate to install
- **password**: The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section
- **keychain**: The keychain to install the certificate to, this defaults to /Library/Keychains/System.keychain
- **allow_any**: Allow any application to access the imported certificate without warning
keychain_password  If your keychain is likely to be locked pass the password and it will be unlocked before running the import

salt.states.mac_keychain.uninstalled(name, password, keychain='Library/Keychains/System.keychain', keychain_password=None)

Uninstall a p12 certificate file from the OS X keychain
name  The certificate to uninstall, this can be a path for a .p12 or the friendly name
password  The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section
cert_name  The friendly name of the certificate, this can be used instead of giving a certificate
keychain  The keychain to remove the certificate from, this defaults to /Library/Keychains/System.keychain
keychain_password  If your keychain is likely to be locked pass the password and it will be unlocked before running the import

13.16.108 salt.states.mac_xattr module

Allows you to manage extended attributes on files or directories

Install, enable and disable assitive access on OS X minions

```
/path/to/file:
   xattr.exists:
      - attributes:
         - com.file.attr=test
         - com.apple.quarantine=0x00001111
```

salt.states.mac_xattr.delete(name, attributes)
Make sure the given attributes are deleted from the file/directory
name  The path to the file/directory
attributes  The attributes that should be removed from the file/directory, this is accepted as an array.

salt.states.mac_xattr.exists(name, attributes)
Make sure the given attributes exist on the file/directory
name  The path to the file/directory
attributes  The attributes that should exist on the file/directory, this is accepted as an array, with key and value split with an equals sign, if you want to specify a hex value then add 0x to the beginning of the value.

13.16.109 salt.states.makeconf

Management of Gentoo make.conf

A state module to manage Gentoo's make.conf file

```
makeopts:
   makeconf.present:
      - value: '-j3'
```

salt.states.makeconf.absent(name)
Verify that the variable is not in the make.conf.
name  The variable name. This will automatically be converted to upper case since variables in make.conf are in upper case
salt.states.makeconf.present(name, value=None, contains=None, excludes=None)

Verify that the variable is in the make.conf and has the provided settings. If value is set, contains and excludes will be ignored.

- **name** The variable name. This will automatically be converted to upper case since variables in make.conf are in upper case
- **value** Enforce that the value of the variable is set to the provided value
- **contains** Enforce that the value of the variable contains the provided value
- **excludes** Enforce that the value of the variable does not contain the provided value.

### 13.16.110 salt.states.marathon_app module

Configure Marathon apps via a salt proxy.

```python
my_app:
  marathon_app.config:
    - config:
        cmd: "while [ true ] ; do echo 'Hello Marathon' ; sleep 5 ; done"
        cpus: 0.1
        mem: 10
        instances: 3
```

New in version 2015.8.2.

salt.states.marathon_app.absent(name)

Verify that the marathon app with the given id is not present.

- **name** -- The app name/id

Returns A standard Salt changes dictionary

salt.states.marathon_app.config(name, config)

Ensure that the marathon app with the given id is present and is configured to match the given config values.

- **name** -- The app name/id
- **config** -- The configuration to apply (dict)

Returns A standard Salt changes dictionary

### 13.16.111 salt.states.mdadm

Managing software RAID with mdadm

A state module for creating or destroying software RAID devices.

```python
/dev/md0:
  raid.present:
    - level: 5
    - devices:
      - /dev/xvdd
      - /dev/xvde
      - /dev/xvdf
    - chunk: 256
    - run: True
```

salt.states.mdadm.absent(name)

Verify that the raid is absent

- **name** The name of raid device to be destroyed
Salt Documentation, Release 2016.3.6

```
/dev/md0:
  raid:
    - absent
```

**salt.states.mdadm.present** *(name, level, devices, **kwargs)*

Verify that the raid is present

Changed in version 2014.7.0.

- **name** The name of raid device to be created
- **level** The RAID level to use when creating the raid.
- **devices** A list of devices used to build the array.
- **kwargs** Optional arguments to be passed to mdadm.

Example:

```
/dev/md0:
  raid.present:
    - level: 5
    - devices: 
      - /dev/xvdd
      - /dev/xvde
      - /dev/xvdf
    - chunk: 256
    - run: True
```

13.16.112  **salt.states.memcached**

**States for Management of Memcached Keys**

New in version 2014.1.0.

**salt.states.memcached.absent** *(name, value=None, host=`127.0.0.1`, port=11211, time=0)*

Ensure that a memcached key is not present.

- **name** The key
- **value** [None] If specified, only ensure that the key is absent if it matches the specified value.
- **host** The memcached server IP address
- **port** The memcached server port

```
foo:
  memcached.absent

bar:
  memcached.absent:
    - host: 10.0.0.1
```

**salt.states.memcached.managed** *(name, value=None, host=`127.0.0.1`, port=11211, time=0, min_compress_len=0)*

Manage a memcached key.

- **name** The key to manage
- **value** The value to set for that key
- **host** The memcached server IP address
- **port** The memcached server port

```
foo:
  memcached.managed:
    - value: bar
```
13.16.113 salt.states.modjk

State to control Apache modjk

salt.states.modjk.worker_activated(name, workers=None, profile='default')

Activate all the workers in the modjk load balancer

Example:

```yaml
loadbalancer:
  modjk.worker_activated:
    - workers:
      - app1
      - app2
```

salt.states.modjk.worker_disabled(name, workers=None, profile='default')

Disable all the workers in the modjk load balancer

Example:

```yaml
loadbalancer:
  modjk.worker_disabled:
    - workers:
      - app1
      - app2
```

salt.states.modjk.worker_recover(name, workers=None, profile='default')

Recover all the workers in the modjk load balancer

Example:

```yaml
loadbalancer:
  modjk.worker_recover:
    - workers:
      - app1
      - app2
```

salt.states.modjk.worker_stopped(name, workers=None, profile='default')

Stop all the workers in the modjk load balancer

Example:

```yaml
loadbalancer:
  modjk.worker_stopped:
    - workers:
      - app1
      - app2
```

13.16.114 salt.states.modjk_worker

Manage modjk workers

Send commands to a modjk load balancer via the peer system.

This module can be used with the prereq requisite to remove/add the worker from the load balancer before deploying/restarting service.

Mandatory Settings:
• The minion needs to have permission to publish the modjk.* functions (see here for information on configuring peer publishing permissions)

• The modjk load balancer must be configured as stated in the modjk execution module documentation

salt.states.modjk_worker.activate(name, lbn, target, profile='default', expr_form='glob')

Activate the named worker from the lbn load balancers at the targeted minions

Example:

```
disable-before-deploy:
    modjk_worker.activate:
        - name: {{ grains['id'] }}
        - lbn: application
        - target: 'roles:balancer'
        - expr_form: grain
```

salt.states.modjk_worker.disable(name, lbn, target, profile='default', expr_form='glob')

Disable the named worker from the lbn load balancers at the targeted minions. The worker will get traffic only for current sessions and won't get new ones.

Example:

```
disable-before-deploy:
    modjk_worker.disable:
        - name: {{ grains['id'] }}
        - lbn: application
        - target: 'roles:balancer'
        - expr_form: grain
```

salt.states.modjk_worker.stop(name, lbn, target, profile='default', expr_form='glob')

Stop the named worker from the lbn load balancers at the targeted minions. The worker won't get any traffic from the lbn

Example:

```
disable-before-deploy:
    modjk_worker.stop:
        - name: {{ grains['id'] }}
        - lbn: application
        - target: 'roles:balancer'
        - expr_form: grain
```

13.16.115 salt.states.module

Execution of Salt modules from within states

These states allow individual execution module calls to be made via states. To call a single module function use a module.run state:

```
mine.send:
    module.run:
        - name: network.interfaces
```

Note that this example is probably unnecessary to use in practice, since the mine_functions and mine_interval config parameters can be used to schedule updates for the mine (see here for more info).
It is sometimes desirable to trigger a function call after a state is executed, for this the `module.wait` state can be used:

```yaml
mine.send:
  module.wait:
    - name: network.interfaces
    - watch:
      - file: /etc/network/interfaces
```

All arguments that the `module` state does not consume are passed through to the execution module function being executed:

```yaml
fetch_out_of_band:
  module.run:
    - name: git.fetch
    - cwd: /path/to/my/repo
    - user: myuser
    - opts: '--all'
```

Due to how the state system works, if a module function accepts an argument called, `name`, then `m_name` must be used to specify that argument, to avoid a collision with the `name` argument.

Here is a list of keywords hidden by the state system, which must be prefixed with `m_`:

- `fun`
- `name`
- `names`
- `state`
- `saltenv`

For example:

```yaml
disable_nfs:
  module.run:
    - name: service.disable
    - m_name: nfs
```

Note that some modules read all or some of the arguments from a list of keyword arguments. For example:

```yaml
mine.send:
  module.run:
    - func: network.ip_addrs
    - kwargs:
        interface: eth0
```

```yaml
cloud.create:
  module.run:
    - func: cloud.create
    - provider: test-provider
    - m_names:
      - test-vlad
    - kwargs: {
          ssh_username: 'ubuntu',
          image: 'ami-8d6d9daa',
          securitygroup: 'default',
          size: 'c3.large',
    }
```
location: 'ap-northeast-1',
delvol_on_destroy: 'True'
}
salt.states.module.mod_watch(name, **kwargs)
    This function is an alias of run.
    Run a single module function
    name The module function to execute
    returner Specify the returner to send the return of the module execution to
    **kwargs Pass any arguments needed to execute the function

salt.states.module.run(name, **kwargs)
    Run a single module function
    name The module function to execute
    returner Specify the returner to send the return of the module execution to
    **kwargs Pass any arguments needed to execute the function

salt.states.module.wait(name, **kwargs)
    Run a single module function only if the watch statement calls it
    name The module function to execute
    **kwargs Pass any arguments needed to execute the function

Note: Like the cmd.run state, this state will return True but not actually execute, unless one of the following two things happens:
1. The state has a watch requisite, and the state which it is watching changes.
2. Another state has a watch_in requisite which references this state, and the state with the watch_in changes.

13.16.116 salt.states.mongodb_database

Management of Mongodb databases

Only deletion is supported, creation doesn’t make sense and can be done using mongodb_user.present

salt.states.mongodb_database.absent(name, user=None, password=None, host=None, port=None)
    Ensure that the named database is absent
    name The name of the database to remove
    user The user to connect as (must be able to create the user)
    password The password of the user
    host The host to connect to
    port The port to connect to

13.16.117 salt.states.mongodb_user

Management of Mongodb users

Note: This module requires PyMongo to be installed.

salt.states.mongodb_user.absent(name, user=None, password=None, host=None, port=None, database='admin')
    Ensure that the named user is absent
name  The name of the user to remove
user  MongoDB user with sufficient privilege to create the user
password  Password for the admin user specified by the user parameter
host  The hostname/IP address of the MongoDB server
port  The port on which MongoDB is listening
database  The database from which to remove the user specified by the name parameter

```
salt.states.mongodb_user.presents( name, passwd, database='admin', user=None, password=None, host='localhost', port=27017)
```

Ensure that the user is present with the specified properties

name  The name of the user to manage
passwd  The password of the user to manage
user  MongoDB user with sufficient privilege to create the user
password  Password for the admin user specified with the user parameter
host  The hostname/IP address of the MongoDB server
port  The port on which MongoDB is listening
database  The database in which to create the user

**Note:** If the database doesn't exist, it will be created.

```
mongouser-myapp:
  mongodb_user.present:
    - name: myapp
    - passwd: password-of-myapp
# Connect as admin:sekrit
    - user: admin
    - password: sekrit
```

### 13.16.118  salt.states.monit

**Monit state**

Manage monit states

```
monit_enable_service_monitoring:
  monit.monitor:
    - name: service

monit_disable_service_monitoring:
  monit.unmonitor:
    - name: service
```

**Note:** Use of these states require that the monit execution module is available.

```
salt.states.monit.monitor(name)
```

Get the summary from module monit and try to see if service is being monitored. If not then monitor the service.

13.16.  state modules
salt.states.monit.unmonitor(name)

Get the summary from module monit and try to see if service is being monitored. If it is then stop monitoring the service.

13.16.119 salt.states.mount

Mounting of filesystems

Mount any type of mountable filesystem with the mounted function:

```
/mnt/sdb:
  mount.mounted:
    - device: /dev/sdb1
    - fstype: ext4
    - mkmnt: True
    - opts:
      - defaults

/srv/bigdata:
  mount.mounted:
    - device: UUID=066e0200-2867-4ebe-b9e6-f30026ca2314
    - fstype: xfs
    - opts: nobootwait,noatime,nodiratime,nobarrier,logbufs=8
    - dump: 0
    - pass_num: 2
    - persist: True
    - mkmnt: True
```

**mount.mod_watch(name, user=None, **kwargs)**

The mounted watcher, called to invoke the watch command.

- **name**: The name of the mount point

**mount.mounted(name, device, fstype, mkmnt=False, opts=‘defaults’, dump=0, pass_num=0, config=’/etc/fstab’, persist=True, mount=True, user=None, match_on=’auto’, extra_mount_invisible_options=None, extra_mount_invisible_keys=None, extra_mount_translate_options=None, hidden_opts=None)**

Verify that a device is mounted

- **name**: The path to the location where the device is to be mounted
- **device**: The device name, typically the device node, such as /dev/sdb1 or UUID=066e0200-2867-4ebe-b9e6-f30026ca2314 or LABEL=DATA
- **fstype**: The filesystem type, this will be xfs, ext2/3/4 in the case of classic filesystems, and fuse in the case of fuse mounts
- **mkmnt**: If the mount point is not present then the state will fail, set mkmnt: True to create the mount point if it is otherwise not present
- **opts**: A list object of options or a comma delimited list
- **dump**: The dump value to be passed into the fstab, Default is 0
- **pass_num**: The pass value to be passed into the fstab, Default is 0
- **config**: Set an alternative location for the fstab, Default is /etc/fstab
- **persist**: Set if the mount should be saved in the fstab, Default is True
- **mount**: Set if the mount should be mounted immediately, Default is True
- **user**: The user to own the mount; this defaults to the user salt is running as on the minion
- **match_on**: A name or list of fstab properties on which this state should be applied. Default is auto, a special value indicating to guess based on fstype. In general, auto matches on name for recognized special devices and device otherwise.
extra_mount_invisible_options  A list of extra options that are not visible through the /proc/self/mountinfo interface.

If a option is not visible through this interface it will always remount the device. This option extends the builtin mount_invisible_options list.

extra_mount_invisible_keys  A list of extra key options that are not visible through the /proc/self/mountinfo interface.

If a key option is not visible through this interface it will always remount the device. This option extends the builtin mount_invisible_keys list.

A good example for a key option is the password option:

password=badsecret

extra_ignore_fs_keys  A dict of filesystem options which should not force a remount. This will update the internal dictionary. The dict should look like this:

```
{  'ramfs': ['size']}
```

extra_mount_translate_options  A dict of mount options that gets translated when mounted. To prevent a remount add additional options to the default dictionary. This will update the internal dictionary. The dictionary should look like this:

```
{
  'tcp': 'proto=tcp',
  'udp': 'proto=udp'
}
```

hidden_opts  A list of mount options that will be ignored when considering a remount as part of the state application

New in version 2015.8.2.

salt.states.mount.swap(name, persist=True, config='/etc/fstab')

Activates a swap device

/root/swapfile:
mount.swap

Note:  swap does not currently support LABEL

salt.states.mount.unmounted(name, device=None, config='/etc/fstab', persist=False, user=None)

New in version 0.17.0.

Verify that a device is not mounted

name  The path to the location where the device is to be unmounted from

device  The device to be unmounted. This is optional because the device could be mounted in multiple places.

New in version 2015.5.0.

config  Set an alternative location for the fstab, Default is /etc/fstab

persist  Set if the mount should be purged from the fstab, Default is False

user  The user to own the mount; this defaults to the user salt is running as on the minion
13.16.120  salt.states.mysql_database

Management of MySQL databases (schemas)

depends
• MySQLdb Python module

configuration See salt.modules.mysql for setup instructions.

The mysql_database module is used to create and manage MySQL databases. Databases can be set as either absent or present.

frank:
  mysql_database.present

salt.states.mysql_database.absent(name, **connection_args)
  Ensure that the named database is absent
name  The name of the database to remove

salt.states.mysql_database.present(name, character_set=None, collate=None, **connection_args)
  Ensure that the named database is present with the specified properties
name  The name of the database to manage

13.16.121  salt.states.mysql_grants

Management of MySQL grants (user permissions)

depends
• MySQLdb Python module

configuration See salt.modules.mysql for setup instructions.

The mysql_grants module is used to grant and revoke MySQL permissions.
The name you pass in purely symbolic and does not have anything to do with the grant itself.
The database parameter needs to specify a ‘priv_level’ in the same specification as defined in the MySQL documentation:

• *
  • **
  • db_name.*
  • db_name.tbl_name
  • etc...

This state is not able to set password for the permission from the specified host. See salt.states.mysql_user for further instructions.

frank_exampledb:
  mysql_grants.present:
    - grant: select,insert,update
    - database: exampledb.*
    - user: frank
    - host: localhost
frank_otherdb:
  mysql_grants.present:
    - grant: all privileges
    - database: otherdb.*
    - user: frank

restricted_singletable:
  mysql_grants.present:
    - grant: select
    - database: somedb.sometable
    - user: joe

salt.states.mysql_grants.absent(name, grant=None, database=None, user=None, host='localhost',
        grant_option=False, escape=True, **connection_args)

Ensure that the grant is absent
name The name (key) of the grant to add
grant The grant priv_type (i.e. select,insert,update OR all privileges)
database The database priv_level (i.e. db.tbl OR db.*)
user The user to apply the grant to
host The network/host that the grant should apply to

salt.states.mysql_grants.present(name, grant=None, database=None, user=None, host='localhost',
        grant_option=False, escape=True, revoke_first=False, ssl_option=False, **connection_args)

Ensure that the grant is present with the specified properties
name The name (key) of the grant to add
grant The grant priv_type (i.e. select,insert,update OR all privileges)
database The database priv_level (i.e. db.tbl OR db.*)
user The user to apply the grant to
host The network/host that the grant should apply to
grant_option Adds the WITH GRANT OPTION to the defined grant. Default is False
escape Defines if the database value gets escaped or not. Default is True
revoke_first By default, MySQL will not do anything if you issue a command to grant privileges that are more restrictive than what’s already in place. This effectively means that you cannot downgrade permissions without first revoking permissions applied to a db.table/user pair first.

To have Salt forcibly revoke perms before applying a new grant, enable the `revoke_first` option.

WARNING: This will remove permissions for a database before attempting to apply new permissions. There is no guarantee that new permissions will be applied correctly which can leave your database security in an unknown and potentially dangerous state. Use with caution!

Default is False
ssl_option Adds the specified ssl options for the connecting user as requirements for this grant. Value is a list of single-element dicts corresponding to the list of ssl options to use.

Possible key/value pairings for the dicts in the value:

- SSL: True
- X509: True
- SUBJECT: <subject>
- ISSUER: <issuer>
- CIPHER: <cipher>

The non-boolean ssl options take a string as their values, which should be an appropriate value as specified by the MySQL documentation for these options.
Default is `False` (no ssl options will be used)

## 13.16.122 `salt.states.mysql_query` Execution of MySQL queries

New in version 2014.7.0.

**depends**
- MySQLdb Python module

**configuration** See `salt.modules.mysql` for setup instructions.

The `mysql_query` module is used to execute queries on MySQL databases. Its output may be stored in a file or in a grain.

```python
query_id:
    mysql_query.run
    - database: my_database
    - query:  "SELECT * FROM table;"
    - output: "/tmp/query_id.txt"
```

### `salt.states.mysql_query.run`

* `name` Used only as an ID
* `database` The name of the database to execute the query on
* `query` The query to execute
* `output` grain: output in a grain other: the file to store results None: output to the result comment (default)
* `grain` grain to store the output (need output=grain)
* `key` the specified grain will be treated as a dictionary, the result of this state will be stored under the specified key.
* `overwrite` The file or grain will be overwritten if it already exists (default)

## 13.16.123 `salt.states.mysql_user` Management of MySQL users

**depends**
- MySQLdb Python module

**configuration** See `salt.modules.mysql` for setup instructions.

```python
frank:
    mysql_user.present:
        - host: localhost
        - password: bobcat
```

New in version 0.16.2: Authentication overrides have been added.

The MySQL authentication information specified in the minion config file can be overridden in states using the following arguments: `connection_host`, `connection_port`, `connection_user`, `connection_pass`, `connection_db`, `connection_unix_socket`, `connection_default_file` and `connection_charset`. 
**frank:**
- mysql_user.present:
  - host: localhost
  - password: "bob@cat"
  - connection_user: someuser
  - connection_pass: somepass
  - connection_charset: utf8
  - saltenv:
  - LC_ALL: "en_US.utf8"

This state is not able to grant permissions for the user. See `salt.states.mysql_grants` for further instructions.

**salt.states.mysql_user.absent**(name, host='localhost', **connection_args)

Ensure that the named user is absent

name The name of the user to remove

**salt.states.mysql_user.present**(name, host='localhost', password=None, password_hash=None, allow_passwordless=False, unix_socket=False, password_column=None, **connection_args)

Ensure that the named user is present with the specified properties. A passwordless user can be configured by omitting password and password_hash, and setting allow_passwordless to True.

name The name of the user to manage

host Host for which this user/password combo applies

password The password to use for this user. Will take precedence over the password_hash option if both are specified.

password_hash The password in hashed form. Be sure to quote the password because YAML doesn't like the *.

A password hash can be obtained from the mysql command-line client like so:

```sql
mysql> SELECT PASSWORD('mypass');
+-------------------------------------+
| PASSWORD('mypass')                   |
| +6C8989366EAF75BB678AD8EA7A7FC1176A95CEF4 |
+-------------------------------------+
1 row in set (0.00 sec)
```

allow_passwordless If True, then password and password_hash can be omitted to permit a passwordless login.

New in version 0.16.2.

unix_socket If True and allow_passwordless is True, the unix_socket auth plugin will be used.

**13.16.124 salt.states.network**

**Configuration of network interfaces**

The network module is used to create and manage network settings, interfaces can be set as either managed or ignored. By default all interfaces are ignored unless specified.

**Note:** Prior to version 2014.1.0, only RedHat-based systems (RHEL, CentOS, Scientific Linux, etc.) are supported. Support for Debian/Ubuntu is new in 2014.1.0 and should be considered experimental.

Other platforms are not yet supported.
system:
  network.system:
    - enabled: True
    - hostname: server1.example.com
    - gateway: 192.168.0.1
    - gatewaydev: eth0
    - nozeroconf: True
    - nisdomain: example.com
    - require_reboot: True

eth0:
  network.managed:

    - 10.1.0.12/32
  - ipv6addrs:
    - fc00::1/128
    - fc00::100/128

.. note::
   Apply changes to hostname immediately.

.. versionadded:: 2015.5.0

Note: When managing bridged interfaces on a Debian or Ubuntu based system, the ports argument is required. Red Hat systems will ignore the argument.

salt.states.network.managed(name, type, enabled=True, **kwargs)
Ensure that the named interface is configured properly.
  name  The name of the interface to manage
  type  Type of interface and configuration.
  enabled  Designates the state of this interface.
  kwargs  The IP parameters for this interface.

salt.states.network.routes(name, **kwargs)
Manage network interface static routes.
  name  Interface name to apply the route to.
**kwargs**  Named routes

```python
salt.states.network.system(name, **kwargs)
```

- **name**  Custom name to represent this configuration change.
- **kwargs**  The global parameters for the system.

### 13.16.125 salt.states.nftables

**Management of nftables**

This is an nftables-specific module designed to manage Linux firewalls. It is expected that this state module, and other system-specific firewall states, may at some point be deprecated in favor of a more generic firewall state.

```python
httpd:
    nftables.append:
        - table: filter
        - chain: input
        - jump: accept
        - match: state
        - connstate: new
        - dport: 80
        - proto: tcp
        - sport: 1025:65535
        - save: True

httpd:
    nftables.append:
        - table: filter
        - family: ipv6
        - chain: INPUT
        - jump: ACCEPT
        - match: state
        - connstate: NEW
        - dport: 80
        - proto: tcp
        - sport: 1025:65535
        - save: True

httpd:
    nftables.insert:
        - position: 1
        - table: filter
        - chain: INPUT
        - jump: ACCEPT
        - match: state
        - connstate: NEW
        - dport: 80
        - proto: tcp
        - sport: 1025:65535
        - save: True

httpd:
    nftables.insert:
        - position: 1
        - table: filter
        - family: ipv6
```
- chain: INPUT
- jump: ACCEPT
- match: state
- connstate: NEW
- dport: 80
- proto: tcp
- sport: 1025:65535
- save: True

httpd:
nftables.delete:
  - table: filter
  - chain: INPUT
  - jump: ACCEPT
  - match: state
  - connstate: NEW
  - dport: 80
  - proto: tcp
  - sport: 1025:65535
  - save: True

httpd:
nftables.delete:
  - position: 1
  - table: filter
  - chain: INPUT
  - jump: ACCEPT
  - match: state
  - connstate: NEW
  - dport: 80
  - proto: tcp
  - sport: 1025:65535
  - save: True

httpd:
nftables.delete:
  - table: filter
  - family: ipv6
  - chain: INPUT
  - jump: ACCEPT
  - match: state
  - connstate: NEW
  - dport: 80
  - proto: tcp
  - sport: 1025:65535
  - save: True

salt.states.nftables.append(name, family='ipv4', **kwargs)
New in version 0.17.0.
    Append a rule to a chain
name A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.
family Network family, ipv4 or ipv6.
All other arguments are passed in with the same name as the long option that would normally be used for nftables, with one exception: --state is specified as connstate instead of state (not to be confused with ctstate).
salt.states.nftables.chain_absent(name, table='filter', family='ipv4')
New in version 2014.7.0.

Verify the chain is absent.

family  Networking family, either ipv4 or ipv6

salt.states.nftables.chain_present(name, table='filter', table_type=None, hook=None, priority=None, family='ipv4')

New in version 2014.7.0.

Verify the chain is exist.

name  A user-defined chain name.

name  The table to own the chain.

family  Networking family, either ipv4 or ipv6

salt.states.nftables.delete(name, family='ipv4', **kwargs)

New in version 2014.7.0.

Delete a rule to a chain

name  A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

family  Networking family, either ipv4 or ipv6

All other arguments are passed in with the same name as the long option that would normally be used for nftables, with one exception: --state is specified as connstate instead of state (not to be confused with ctstate).

salt.states.nftables.flush(name, family='ipv4', **kwargs)

New in version 2014.7.0.

Flush current nftables state

family  Networking family, either ipv4 or ipv6

salt.states.nftables.insert(name, family='ipv4', **kwargs)

New in version 2014.7.0.

Insert a rule into a chain

name  A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

family  Networking family, either ipv4 or ipv6

All other arguments are passed in with the same name as the long option that would normally be used for nftables, with one exception: --state is specified as connstate instead of state (not to be confused with ctstate).

13.16.126 salt.states.npm

Installation of NPM Packages

These states manage the installed packages for node.js using the Node Package Manager (npm). Note that npm must be installed for these states to be available, so npm states should include a requisite to a pkg.installed state for the package which provides npm (simply npm in most cases). Example:

```
npm:
  pkg.installed

yaml:
  npm.installed:
    - require:
      - pkg: npm

salt.states.npm.bootstrap(name, user=None, silent=True)
  Bootstraps a node.js application.
```
Will execute `npm install --json` on the specified directory.

**user**  The user to run NPM with

New in version 0.17.0.

```python
salt.states.npm.installed(name, pkgs=None, dir=None, user=None, force_reinstall=False, registry=None, env=None)
```

Verify that the given package is installed and is at the correct version (if specified).

```python
coffee-script:
  npm.installed:
    - user: someuser
coffee-script@1.0.1:
  npm.installed: []
```

**name**  The package to install

   Changed in version 2014.7.2: This parameter is no longer lowercased by salt so that case-sensitive NPM package names will work.

**pkgs**  A list of packages to install with a single npm invocation; specifying this argument will ignore the name argument

   New in version 2014.7.0.

**dir**  The target directory in which to install the package, or None for global installation

**user**  The user to run NPM with

New in version 0.17.0.

**registry**  The NPM registry from which to install the package

New in version 2014.7.0.

**env**  A list of environment variables to be set prior to execution. The format is the same as the `cmd.run` state function.

New in version 2014.7.0.

**force_reinstall**  Install the package even if it is already installed

```python
salt.states.npm.removed(name, dir=None, user=None)
```

Verify that the given package is not installed.

**dir**  The target directory in which to install the package, or None for global installation

**user**  The user to run NPM with

New in version 0.17.0.

### 13.16.127  salt.states.ntp

**Management of NTP servers**

New in version 2014.1.0.

This state is used to manage NTP servers. Currently only Windows is supported.

```python
win_ntp:
  ntp.managed:
    - servers:
      - pool.ntp.org
      - us.pool.ntp.org
```
salt.states.ntp.managed(name, servers=None)
    Manage NTP servers
    servers A list of NTP servers

13.16.128 salt.states.openstack_config
Manage OpenStack configuration file settings.

    maintainer Jeffrey C. Ollie <jeff@ocjtech.us>
    maturity new
    depends
    platform linux
salt.states.openstack_config.absent(name, filename, section, parameter=None)
    Ensure a value is not set in an OpenStack configuration file.
    filename The full path to the configuration file
    section The section in which the parameter will be set
    parameter (optional) The parameter to change. If the parameter is not supplied, the name will be used as the
                       parameter.
salt.states.openstack_config.present(name, filename, section, value, parameter=None)
    Ensure a value is set in an OpenStack configuration file.
    filename The full path to the configuration file
    section The section in which the parameter will be set
    parameter (optional) The parameter to change. If the parameter is not supplied, the name will be used as the
                       parameter.
    value The value to set

13.16.129 salt.states.openvswitch_bridge module
Management of Open vSwitch bridges.
salt.states.openvswitch_bridge.absent(name)
    Ensures that the named bridge does not exist, eventually deletes it.
    Args: name: The name of the bridge.
salt.states.openvswitch_bridge.present(name)
    Ensures that the named bridge exists, eventually creates it.
    Args: name: The name of the bridge.

13.16.130 salt.states.openvswitch_port module
Management of Open vSwitch ports.
salt.states.openvswitch_port.absent(name, bridge=None)
    Ensures that the named port exists on bridge, eventually deletes it. If bridge is not set, port is removed from
    whatever bridge contains it.
    Args: name: The name of the port. bridge: The name of the bridge.
salt.states.openvswitch_port.present(name, bridge, type=None, id=None, remote=None,
                       dst_port=None)
    Ensures that the named port exists on bridge, eventually creates it.
**Args:**
- name: The name of the port.
- bridge: The name of the bridge.
- type: Optional type of interface to create, currently supports: vlan, vxlan and gre.
- id: Optional tunnel’s key.
- remote: Remote endpoint’s IP address.
- dst_port: Port to use when creating tunnelport in the switch.

### 13.16.131 salt.states.pagerduty

**Create an Event in PagerDuty**

New in version 2014.1.0.

This state is useful for creating events on the PagerDuty service during state runs.

```yaml
server-warning-message:
pagerduty.create_event:
  - name: 'This is a server warning message'
  - details: 'This is a much more detailed message'
  - service_key: 9abcd123456789efabcede362783cdbaf
  - profile: my-pagerduty-account
```

```python
class create_event:
    name: str
    details: str
    service_key: str
    profile: str

    def __init__(self, name, details, service_key, profile):
        self.name = name
        self.details = details
        self.service_key = service_key
        self.profile = profile
```

The following parameters are required:
- **name**  This is a short description of the event.
- **details** This can be a more detailed description of the event.
- **service_key**  This key can be found by using pagerduty.list_services.
- **profile**  This refers to the configuration profile to use to connect to the PagerDuty service.

### 13.16.132 salt.states.pagerduty_escalation_policy

**Manage PagerDuty escalation policies.**

Schedules and users can be referenced by pagerduty ID, or by name, or by email address.

For example:

```yaml
ensure test escalation policy:
pagerduty_escalation_policy.present:
  - name: bruce test escalation policy
    escalation_rules:
      - targets:
        type: schedule
        id: 'bruce test schedule level1'
      - type: user
        id: 'Bruce Sherrod'
        escalation_delay_in_minutes: 15
        targets:
          - type: schedule
            id: 'bruce test schedule level2'
```

13.16. state modules
```yaml
escalation_delay_in_minutes: 15
- targets:
  - type: user
    id: 'Bruce TestUser1'
  - type: user
    id: 'Bruce TestUser2'
  - type: user
    id: 'Bruce TestUser3'
  - type: user
    id: 'bruce+test4@lyft.com'
escalation_delay_in_minutes: 15
```

salt.states.pagerduty_escalation_policy.absent(profile='pagerduty', subdomain=None, api_key=None, **kwargs)

Ensure that a PagerDuty escalation policy does not exist. Accepts all the arguments that pager-
duty_escalation_policy.present accepts; but ignores all arguments except the name.

Name can be the escalation policy id or the escalation policy name.

salt.states.pagerduty_escalation_policy.present(profile='pagerduty', subdomain=None, api_key=None, **kwargs)

Ensure that a pagerduty escalation policy exists. Will create or update as needed.

This method accepts as args everything defined in https://developer.pagerduty.com/documentation/rest/escalation_policies/create. In addition, user and schedule id's will be translated from name (or email address) into PagerDuty unique ids. For example:

```yaml
pagerduty_escalation_policy.present:
  • name: bruce test escalation policy
  • escalation_rules:
    - targets:
      * type: schedule id: `bruce test schedule level1'
      * type: user id: `Bruce Sherrod'
```

In this example, 'Bruce Sherrod' will be looked up and replaced with the PagerDuty id (usually a 7 digit all-caps string, e.g. PX6GQL7)

13.16.133 salt.states.pagerduty_schedule

Manage PagerDuty schedules.

Example:

```yaml
ensure test schedule:
  pagerduty_schedule.present:
    • name: `bruce test schedule level1'
    • schedule: name: `bruce test schedule level1' time_zone: `Pacific Time (US & Canada)'
schedule_layers:
  - name: `Schedule Layer 1' start: `2015-01-01T00:00:00' users:
```
* user: `id': 'Bruce TestUser1'
  member_order: 1
* user: `id': 'Bruce TestUser2'
  member_order: 2
* user: `id': 'bruce+test3@lyft.com'
  member_order: 3
* user: `id': 'bruce+test4@lyft.com'
  member_order: 4
rotation_virtual_start: '2015-01-01T00:00:00' priority: 1 rotation_turn_length_seconds: 604800

salt.states.pagerduty_schedule.absent(profile='pagerduty', subdomain=None, api_key=None, **kwargs)

Ensure that a pagerduty schedule does not exist. Name can be pagerduty schedule id or pagerduty schedule name.

salt.states.pagerduty_schedule.present(profile='pagerduty', subdomain=None, api_key=None, **kwargs)

Ensure that a pagerduty schedule exists. This method accepts as args everything defined in https://developer.pagerduty.com/documentation/rest/schedules/create. This means that most arguments are in a dict called ``schedule.''

User id's can be pagerduty id, or name, or email address.

### 13.16.134 salt.states.pagerduty_service

Manage PagerDuty services

Escalation policies can be referenced by pagerduty ID or by namea.

For example:

```

ensure test service

  pagerduty_service.present:
  • name: 'my service'
  • escalation_policy_id: 'my escalation policy'
  • type: nagios

[etc]
```

salt.states.pagerduty_service.absent(profile='pagerduty', subdomain=None, api_key=None, **kwargs)

Ensure a pagerduty service does not exist. Name can be the service name or pagerduty service id.

salt.states.pagerduty_service.present(profile='pagerduty', subdomain=None, api_key=None, **kwargs)

Ensure pagerduty service exists. This method accepts as arguments everything defined in https://developer.pagerduty.com/documentation/rest/services/create

  Note that many arguments are mutually exclusive, depending on the ``type'' argument.
Examples:

```yaml
# create a PagerDuty email service at test-email@DOMAIN.pagerduty.com ensure generic email service exists:
pagerduty_service.present:
  - name: my email service
  - service:
    description: "email service controlled by salt"
    escalation_policy_id: "my escalation policy"
    type: "generic_email"
    service_key: "test-email"

# create a pagerduty service using cloudwatch integration ensure my cloudwatch service exists:
pagerduty_service.present:
  - name: my cloudwatch service
  - service:
    escalation_policy_id: "my escalation policy"
    type: aws_cloudwatch
    description: "my cloudwatch service controlled by salt"

TODO: aws_cloudwatch type should be integrated with boto_sns
```

13.16.135 salt.states.pagerduty_user

Manage PagerDuty users.

Example:

```yaml
ensure bruce test user 1:
  pagerduty.user_present:
    - name: 'Bruce TestUser1'
    - email: bruce@test1@lyft.com
    - requester_id: P1GV5NT

salt.states.pagerduty_user.absent(**kwargs)

Ensure pagerduty user does not exist. Name can be pagerduty id, email address, or user name.

salt.states.pagerduty_user.present(**kwargs)

```

13.16.136 salt.states.pecl

Installation of PHP Extensions Using pecl

These states manage the installed pecl extensions. Note that php-pear must be installed for these states to be available, so pecl states should include a requisite to a pkg.installed state for the package which provides pecl (php-pear in most cases). Example:

```yaml
php-pear:
  pkg.installed

mongo:
```

2128 Chapter 13. Salt Module Reference
pecl.installed:
  - require:
    - pkg: php-pear

salt.states.pecl.installed(name, version=None, defaults=False, force=False, preferred_state='stable')

New in version 0.17.0.

Make sure that a pecl extension is installed.

name The pecl extension name to install
version The pecl extension version to install. This option may be ignored to install the latest stable version.
defaults Use default answers for extensions such as pecl_http which ask questions before installation. Without this option, the pecl.installed state will hang indefinitely when trying to install these extensions.
force Whether to force the installed version or not
preferred_state The pecl extension state to install

salt.states.pecl.removed(name)

Make sure that a pecl extension is not installed.

name The pecl extension name to uninstall

13.16.137  salt.states.pip_state

Installation of Python Packages Using pip

These states manage system installed python packages. Note that pip must be installed for these states to be available, so pip states should include a requisite to a pkg.installed state for the package which provides pip (python-pip in most cases). Example:

cpython-pip:
  pkg.installed

virtualenvwrapper:
  pip.installed:
    - require:
      - pkg: python-pip

salt.states.pip_state.installed(name, pkgs=None, pip_bin=None, requirements=None, env=None, bin_env=None, use_wheel=False, no_use_wheel=False, log=None, proxy=None, timeout=None, repo=None, editable=False, find_links=None, index_url=None, extra_index_url=None, no_index=False, mirrors=None, build=None, target=None, download=None, download_cache=None, source=None, upgrade=False, force_reinstall=False, ignore_installed=False, exists_action=None, no_deps=False, no_install=False, no_download=False, install_options=None, global_options=None, user=None, no_chown=False, cwd=None, activate=False, pre_releases=False, cert=None, allow_all_external=False, allow_external=None, allow_unverified=False, process_dependency_links=False, env_vars=None, use_vt=False, trusted_host=None)

Make sure the package is installed

name The name of the python package to install. You can also specify version numbers here using the standard operators ==, >=, <=. If requirements is given, this parameter will be ignored.
Example:

```yaml
django:
  pip.installed:
    - name: django >= 1.6, <= 1.7
    - require:
      - pkg: python-pip
```

This will install the latest Django version greater than 1.6 but less than 1.7.

- **requirements** Path to a pip requirements file. If the path begins with salt:// the file will be transferred from the master file server.
- **user** The user under which to run pip
- **use_wheel** [False] Prefer wheel archives (requires pip>=1.4)
- **no_use_wheel** [False] Force to not use wheel archives (requires pip>=1.4)
- **log** Log file where a complete (maximum verbosity) record will be kept
- **proxy** Specify a proxy in the form user:passwd@proxy.server:port. Note that the user:password@ is optional and required only if you are behind an authenticated proxy. If you provide user@proxy.server:port then you will be prompted for a password.
- **timeout** Set the socket timeout (default 15 seconds)
- **editable** install something editable (i.e. git+https://github.com/worldcompany/djangoembed.git#egg=djangoembed)
- **find_links** URL to look for packages at
- **index_url** Base URL of Python Package Index
- **extra_index_url** Extra URLs of package indexes to use in addition to `index_url`
- **no_index** Ignore package index
- **mirrors** Specific mirror URL(s) to query (automatically adds --use-mirrors)
- **build** Unpack packages into `build` dir
- **target** Install packages into `target` dir
- **download** Download packages into `download` instead of installing them
- **download_cache** Cache downloaded packages in `download_cache` dir
- **source** Check out editable packages into `source` dir
- **upgrade** Upgrade all packages to the newest available version
- **force_reinstall** When upgrading, reinstall all packages even if they are already up-to-date.
- **ignore_installed** Ignore the installed packages (reinstalling instead)
- **exists_action** Default action when a path already exists: (s)witch, (i)gnore, (w)ipe, (b)ackup
- **no_deps** Ignore package dependencies
- **no_install** Download and unpack all packages, but don't actually install them
- **no_chown** When user is given, do not attempt to copy and chown a requirements file
- **cwd** Current working directory to run pip from
- **activate** Activates the virtual environment, if given via bin_env, before running install.

Deprecated since version 2014.7.2: If `bin_env` is given, pip will already be sourced from that virtualenv, making `activate` effectively a noop.

- **pre_releases** Include pre-releases in the available versions
- **cert** Provide a path to an alternate CA bundle
- **allow_all_external** Allow the installation of all externally hosted files
- **allow_external** Allow the installation of externally hosted files (comma separated list)
- **allow_unverified** Allow the installation of insecure and unverifiable files (comma separated list)
- **process_dependency_links** Enable the processing of dependency links
- **bin_env** [None] Absolute path to a virtual environment directory or absolute path to a pip executable. The example below assumes a virtual environment has been created at `/foo/.virtualenvs/bar`.
- **env_vars** Add or modify environment variables. Useful for tweaking build steps, such as specifying INCLUDE or LIBRARY paths in Makefiles, build scripts or compiler calls. This must be in the form of a dictionary or a mapping.

Example:
use_vt Use VT terminal emulation (see output while installing)

trusted_host Mark this host as trusted, even though it does not have valid or any HTTPS.

Example:

django:
pip.installed:
  - name: django >= 1.6, <= 1.7
  - bin_env: /foo/.virtualenvs/bar/bin/pip
    require:
      - pkg: python-pip

Or

Example:

django:
pip.installed:
  - name: django >= 1.6, <= 1.7
  - bin_env: /foo/.virtualenvs/bar/bin/pip
    require:
      - pkg: python-pip

Attention

The following arguments are deprecated, do not use.

pip_bin [None] Deprecated, use bin_env
env [None] Deprecated, use bin_env

Changed in version 0.17.0: use_wheel option added.

install_options
Extra arguments to be supplied to the setup.py install command. If you are using an option with a directory path, be sure to use absolute path.

Example:

django:
pip.installed:
  - name: django
  - install_options:
    - --prefix=/blah
    - require:
      - pkg: python-pip

global_options Extra global options to be supplied to the setup.py call before the install command.

New in version 2014.1.3.

Attention
As of Salt 0.17.0 the pip state needs an importable pip module. This usually means having the system's pip package installed or running Salt from an active virtualenv.

The reason for this requirement is because pip already does a pretty good job parsing its own requirements. It makes no sense for Salt to do pip requirements parsing and validation before passing them to the pip library. It's functionality duplication and it's more error prone.

---

**Attention**

Please set `reload_modules: True` to have the salt minion import this module after installation.

Example:

```python
pyopenssl:
    pip.installed:
    - name: pyOpenSSL
    - reload_modules: True
    - exists_action: i
```

`salt.states.pip_state.removed` *(name, requirements=None, bin_env=None, log=None, proxy=None, timeout=None, user=None, cwd=None, use_vt=False)*

Make sure that a package is not installed.

- **name** The name of the package to uninstall
- **user** The user under which to run pip
- **bin_env** [None] the pip executable or virtualenv to use
- **use_vt** Use VT terminal emulation (see output while installing)

`salt.states.pip_state.uptodate` *(name, bin_env=None, user=None, cwd=None, use_vt=False)*

New in version 2015.5.0.

Verify that the system is completely up to date.

- **name** The name has no functional value and is only used as a tracking reference
- **user** The user under which to run pip
- **bin_env** the pip executable or virtualenv to use
- **use_vt** Use VT terminal emulation (see output while installing)

---

### 13.16.138 salt.states.pkg

Installation of packages using OS package managers such as `yum` or `apt-get`

**Note:** On minions running systemd>=205, as of version 2015.8.12, 2016.3.3, and Carbon, `systemd-run(1)` is now used to isolate commands which modify installed packages from the *salt-minion* daemon's control group. This is done to keep systemd from killing the package manager commands spawned by Salt, when Salt updates itself (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a `config option` called `systemd.use_scope`, with a value of `False` (no quotes).

Salt can manage software packages via the pkg state module, packages can be set up to be installed, latest, removed and purged. Package management declarations are typically rather simple:

```python
vim:
    pkg.installed
```
A more involved example involves pulling from a custom repository.

```yaml
base:
  pkgrepo.managed:
    - humanname: Logstash PPA
    - name: ppa:wolfnet/logstash
    - dist: precise
    - file: /etc/apt/sources.list.d/logstash.list
    - keyid: 28B04E4A
    - keyserver: keyserver.ubuntu.com

logstash:
  pkg.installed
    - fromrepo: ppa:wolfnet/logstash

Multiple packages can also be installed with the use of the pkgs state module.

dotdeb.repo:
  pkgrepo.managed:
    - humanname: Dotdeb
    - name: deb http://packages.dotdeb.org wheezy-php55 all
    - dist: wheezy-php55
    - file: /etc/apt/sources.list.d/dotbeb.list
    - keyid: 89DF5277
    - keyserver: keys.gnupg.net
    - refresh_db: true

php.packages:
  pkg.installed:
    - fromrepo: wheezy-php55
    - pkgs:
      - php5-fpm
      - php5-cli
      - php5-curl

---

**Warning:** Package names are currently case-sensitive. If the minion is using a package manager which is not case-sensitive (such as `pkgng`), then this state will fail if the proper case is not used. This will be addressed in a future release of Salt.

**salt.states.pkg.group_installed**

New in version 2015.8.0.

Ensure that an entire package group is installed. This state is currently only supported for the `yum` package manager.

- **skip** Packages that would normally be installed by the package group (```default``` packages), which should not be installed.

- **include** Packages which are included in a group, which would not normally be installed by a `yum groupinstall` (`optional` packages). Note that this will not enforce group membership; if you include packages which are not members of the specified groups, they will still be installed.

Load Balancer:

pkg.group_installed:
- include:
  - haproxy

Changed in version 2016.3.0: This option can no longer be passed as a comma-separated list, it must now be passed as a list (as shown in the above example).

Note: Because this is essentially a wrapper around `pkg.install`, any argument which can be passed to `pkg.install` may also be included here, and it will be passed on to the call to `pkg.install`.

`salt.states.pkg.installed(name, version=None, refresh=None, fromrepo=None, skip_verify=False, skip_suggestions=False, pkgs=None, sources=None, allow_updates=False, pkg_verify=False, normalize=True, ignore_epoch=False, reinstall=False, **kwargs)`

Ensure that the package is installed, and that it is the correct version (if specified).

Parameters

- **name (str)** -- The name of the package to be installed. This parameter is ignored if either `"pkgs"` or `"sources"` is used. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the `"sources"` option detailed below.

- **version (str)** -- Install a specific version of a package. This option is ignored if `"sources"` is used. Currently, this option is supported for the following pkg providers: `apt`, `ebuild`, `pacman`, `win_pkg`, `yumpkg`, and `zypper`. The version number includes the release designation where applicable, to allow Salt to target a specific release of a given version. When in doubt, using the `pkg.latest_version` function for an uninstalled package will tell you the version available.

```python
# salt myminion pkg.latest_version vim-enhanced
myminion:
    2:7.4.160-1.el7
```

Important: As of version 2015.8.7, for distros which use yum/dnf, packages which have a version with a nonzero epoch (that is, versions which start with a number followed by a colon like in the `pkg.latest_version` output above) must have the epoch included when specifying the version number. For example:

```python
vim-enhanced:
    pkg.installed:
        - version: 2:7.4.160-1.el7
```

In version 2015.8.9, an `ignore_epoch` argument has been added to `pkg.installed`, `pkg.removed`, and `pkg.purged` states, which causes the epoch to be disregarded when the state checks to see if the desired version was installed.

Also, while this function is not yet implemented for all pkg frontends, `pkg.list_repo_pkgs` will show all versions available in the various repositories for a given package, irrespective of whether or not it is installed.

```python
# salt myminion pkg.list_repo_pkgs httpd
myminion:
    ----------
```
The version strings returned by either of these functions can be used as version specifiers in pkg states.

You can install a specific version when using the `pkgs` argument by including the version after the package:

```yaml
common_packages:
  pkg.installed:
    - pkgs:
      - unzip
      - dos2unix
      - salt-minion: 2015.8.5-1.el6
```

If the version given is the string `latest`, the latest available package version will be installed à la `pkg.latest`.

- `refresh (bool)` -- This parameter controls whether or not the package repo database is updated prior to installing the requested package(s).

  If `True`, the package database will be refreshed (`apt-get update` or equivalent, depending on platform) before installing.

  If `False`, the package database will not be refreshed before installing.

  If unset, then Salt treats package database refreshes differently depending on whether or not a `pkg` state has been executed already during the current Salt run. Once a refresh has been performed in a `pkg` state, for the remainder of that Salt run no other refreshes will be performed for `pkg` states which do not explicitly set `refresh` to `True`. This prevents needless additional refreshes from slowing down the Salt run.

- `fromrepo (str)` -- Specify a repository from which to install

  **Note:** Distros which use APT (Debian, Ubuntu, etc.) do not have a concept of repositories, in the same way as YUM-based distros do. When a source is added, it is assigned to a given release. Consider the following source configuration:

  ```
  deb http://ppa.launchpad.net/saltstack/salt/ubuntu precise main
  ```

  The packages provided by this source would be made available via the `precise` release, therefore `fromrepo` would need to be set to `precise` for Salt to install the package from this source.

  Having multiple sources in the same release may result in the default install candidate being newer than what is desired. If this is the case, the desired version must be specified using the `version` parameter.

  If the `pkgs` parameter is being used to install multiple packages in the same state, then instead of using `version`, use the method of version specification described in

```
the Multiple Package Installation Options section below.

Running the shell command `apt-cache policy pkgname` on a minion can help elucidate the APT configuration and aid in properly configuring states:

```
root@saltmaster:~# salt ubuntu01 cmd.run 'apt-cache policy ffmpeg'
ubuntu01:
  ffmpeg:
    Installed: (none)
    Candidate: 7:0.10.11-1~precise1
    Version table:
    7:0.10.11-1~precise1 0
      500 http://ppa.launchpad.net/jon-severinsson/ffmpeg/
      ubuntu/ precise/main amd64 Packages
      4:0.8.10-0ubuntu0.12.04.1 0
      500 http://us.archive.ubuntu.com/ubuntu/ precise-updates/main amd64 Packages
      500 http://security.ubuntu.com/ubuntu/ precise-security/main amd64 Packages
      4:0.8.1-0ubuntu1 0
      500 http://us.archive.ubuntu.com/ubuntu/ precise/main amd64 Packages
```

The release is located directly after the source's URL. The actual release name is the part before the slash, so to install version 4:0.8.10-0ubuntu0.12.04.1 either precise-updates or precise-security could be used for the fromrepo value.

- **skip_verify** (bool) -- Skip the GPG verification check for the package to be installed

- **skip_suggestions** (bool) -- Force strict package naming. Disables lookup of package alternatives.

  New in version 2014.1.1.

- **allow_updates** (bool) -- Allow the package to be updated outside Salt's control (e.g. auto updates on Windows). This means a package on the Minion can have a newer version than the latest available in the repository without enforcing a reinstallation of the package.

  New in version 2014.7.0.

Example:

```
httpd:
  pkg.installed:
    - fromrepo: mycustomrepo
    - skip_verify: True
    - skip_suggestions: True
    - version: 2.0.6~ubuntu3
    - refresh: True
    - allow_updates: True
    - hold: False
```

- **pkg_verify** (bool) -- New in version 2014.7.0.

  For requested packages that are already installed and would not be targeted for upgrade or downgrade, use pkg.verify to determine if any of the files installed by the package have been altered. If files have been altered, the reinstall option of pkg.install
is used to force a reinstall. Types to ignore can be passed to pkg.verify (see example below). Currently, this option is supported for the following pkg providers: yumpkg.

Examples:

```yaml
httpd:
  pkg.installed:
  - version: 2.2.15-30.el6.centos
  - pkg_verify: True

mypkgs:
  pkg.installed:
  - pkgs:
    - foo
    - bar: 1.2.3-4
    - baz
  - pkg_verify:
    - ignore_types: [config, doc]
```

- **normalize (bool)** -- Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

  New in version 2014.7.0.

  Example:

```yaml
gpfs.gplbin-2.6.32-279.31.1.el6.x86_64:
  pkg.installed:
  - normalize: False
```

- **ignore_epoch (bool)** -- When a package version contains a non-zero epoch (e.g. 1:3.14.159-2.el7, and a specific version of a package is desired, set this option to True to ignore the epoch when comparing versions. This allows for the following SLS to be used:

```yaml
# Actual vim-enhanced version: 2:7.4.160-1.el7
vim-enhanced:
  pkg.installed:
  - version: 7.4.160-1.el7
  - ignore_epoch: True
```

Without this option set to True in the above example, the package would be installed, but the state would report as failed because the actual installed version would be 2:7.4.160-1.el7. Alternatively, this option can be left as False and the full version string (with epoch) can be specified in the SLS file:

```yaml
vim-enhanced:
  pkg.installed:
  - version: 2:7.4.160-1.el7
```

New in version 2015.8.9.
MULTIPLE PACKAGE INSTALLATION OPTIONS: (not supported in pkgng)

Parameters

- **pkgs** *(list)* -- A list of packages to install from a software repository. All packages listed under pkgs will be installed via a single command.

```yaml
mypkgs:
  pkg.installed:
    - pkgs:
        - foo
        - bar
        - baz
        - hold: True
```

**NOTE:** For **apt**, **ebuild**, **pacman**, **yumpkg**, and **zypper**, version numbers can be specified in the pkgs argument. For example:

```yaml
mypkgs:
  pkg.installed:
    - pkgs:
        - foo
        - bar: 1.2.3-4
        - baz
```

Additionally, **ebuild**, **pacman** and **zypper** support the `<`, `<=`, `>`, and `>` operators for more control over what versions will be installed. For example:

```yaml
mypkgs:
  pkg.installed:
    - pkgs:
        - foo
        - bar: '>=1.2.3-4'
        - baz
```

**NOTE:** When using comparison operators, the expression must be enclosed in quotes to avoid a YAML render error.

With **ebuild** is also possible to specify a use flag list and/or if the given packages should be in package.accept_keywords file and/or the overlay from which you want the package to be installed. For example:

```yaml
mypkgs:
  pkg.installed:
    - pkgs:
        - foo:
            - ~
        - bar: '>=1.2:slot::overlay[use,-otheruse]'
        - baz
```

- **sources** *(list)* -- A list of packages to install, along with the source URI or local path from which to install each package. In the example below, foo, bar, baz, etc. refer to the name of the package, as it would appear in the output of the pkg.version or pkg.list_pkgs salt CLI commands.

```yaml
mypkgs:
  pkg.installed:
    - sources:
        - foo: salt://rpms/foo.rpm
        - bar: http://somewebsite.org/bar.rpm
```
 PLATFORM-SPECIFIC ARGUMENTS

These are specific to each OS. If it does not apply to the execution module for your OS, it is ignored.

Parameters

- **hold** *(bool)* -- Force the package to be held at the current installed version. Currently works with YUM & APT based systems.
  
  New in version 2014.7.0.

- **names** *(list)* -- A list of packages to install from a software repository. Each package will be installed individually by the package manager.

  **Warning:** Unlike `pkgs`, the `names` parameter cannot specify a version. In addition, it makes a separate call to the package management frontend to install each package, whereas `pkgs` makes just a single call. It is therefore recommended to use `pkgs` instead of `names` to install multiple packages, both for the additional features and the performance improvement that it brings.

- **install_recommends** *(bool)* -- Whether to install the packages marked as recommended. Default is `True`. Currently only works with APT-based systems.

  New in version 2015.5.0.

  ```
  httpd:
  pkg.installed:
  - install_recommends: False
  ```

- **only_upgrade** *(bool)* -- Only upgrade the packages, if they are already installed. Default is `False`. Currently only works with APT-based systems.

  New in version 2015.5.0.

  ```
  httpd:
  pkg.installed:
  - only_upgrade: True
  ```

  **Note:** If this parameter is set to `True` and the package is not already installed, the state will fail.

**Returns**

A dictionary containing the state of the software installation

**Rtype** dict

**Note:** The `pkg.installed` state supports the usage of `reload_modules`. This functionality allows you to force Salt to reload all modules. In many cases, Salt is clever enough to transparently reload the modules. For example, if you install a package, Salt reloads modules because some other module or state might require the package which was installed. However, there are some edge cases where this may not be the case, which is what `reload_modules` is meant to resolve.

You should only use `reload_modules` if your `pkg.installed` does some sort of installation where if you do not reload the modules future items in your state which rely on the software being installed will fail. Please see the `Reloading Modules` documentation for more information.
salt.states.pkg.latest(name, refresh=None, fromrepo=None, skip_verify=False, pkgs=None, watch_flags=True, **kwargs)

Ensure that the named package is installed and the latest available package. If the package can be updated, this state function will update the package. Generally it is better for the installed function to be used, as latest will update the package whenever a new package is available.

name The name of the package to maintain at the latest available version. This parameter is ignored if `pkgs` is used.

fromrepo Specify a repository from which to install

skip_verify Skip the GPG verification check for the package to be installed

refresh This parameter controls whether or not the package repo database is updated prior to checking for the latest available version of the requested packages.

If True, the package database will be refreshed (apt-get update or equivalent, depending on platform) before checking for the latest available version of the requested packages.

If False, the package database will not be refreshed before checking.

If unset, then Salt treats package database refreshes differently depending on whether or not a pkg state has been executed already during the current Salt run. Once a refresh has been performed in a pkg state, for the remainder of that Salt run no other refreshes will be performed for pkg states which do not explicitly set refresh to True. This prevents needless additional refreshes from slowing down the Salt run.

Multiple Package Installation Options:

(Not yet supported for: FreeBSD, OpenBSD, MacOS, and Solaris pkgutil)

pkgs A list of packages to maintain at the latest available version.

mypkgs:
  pkg.latest:
    - pkgs:
      - foo
      - bar
      - baz

install_recommend Whether to install the packages marked as recommended. Default is True. Currently only works with APT-based systems.

New in version 2015.5.0.

httpd:
  pkg.latest:
    - install_recommend: False

only_upgrade Only upgrade the packages, if they are already installed. Default is False. Currently only works with APT-based systems.

New in version 2015.5.0.

httpd:
  pkg.latest:
    - only_upgrade: True

Note: If this parameter is set to True and the package is not already installed, the state will fail.

salt.states.pkg.mod_aggregate(low, chunks, running)

The mod_aggregate function which looks up all packages in the available low chunks and merges them into a single pkgs ref in the present low data
salt.states.pkg.mod_watch(name, **kwargs)
Install/reinstall a package based on a watch requisite

salt.states.pkg.purged(name, version=None, pkgs=None, normalize=True, ignore_epoch=False, **kwargs)
Verify that a package is not installed, calling pkg.purge if necessary to purge the package. All configuration files are also removed.

- **name** The name of the package to be purged.
- **version** The version of the package that should be removed. Don’t do anything if the package is installed with an unmatching version.

**Important:** As of version 2015.8.7, for distros which use yum/dnf, packages which have a version with a nonzero epoch (that is, versions which start with a number followed by a colon like in the example above) must have the epoch included when specifying the version number. For example:

```
vim-enhanced:
  pkg.installed:
    - version: 2:7.4.160-1.el7
```

In version 2015.8.9, an `ignore_epoch` argument has been added to `pkg.installed`, `pkg.removed`, and `pkg.purged` states, which causes the epoch to be disregarded when the state checks to see if the desired version was installed. If `ignore_epoch` was not set to `True`, and instead of `2:7.4.160-1.el7` a version of `7.4.160-1.el7` were used, this state would report success since the actual installed version includes the epoch, and the specified version would not match.

**normalize** [True] Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2015.8.0.

**ignore_epoch** [False] When a package version contains an non-zero epoch (e.g. `1:3.14.159-2.el7`, and a specific version of a package is desired, set this option to `True` to ignore the epoch when comparing versions. This allows for the following SLS to be used:

```
# Actual vim-enhanced version: 2:7.4.160-1.el7
vim-enhanced:
  pkg.purged:
    - version: 7.4.160-1.el7
    - ignore_epoch: True
```

Without this option set to `True` in the above example, the state would falsely report success since the actual installed version is `2:7.4.160-1.el7`. Alternatively, this option can be left as `False` and the full version string (with epoch) can be specified in the SLS file:

```
vim-enhanced:
  pkg.purged:
    - version: 2:7.4.160-1.el7
```

New in version 2015.8.9.

Multiple Package Options:
- **pkgs** A list of packages to purge. Must be passed as a python list. The `name` parameter will be ignored if this option is passed. It accepts version numbers as well.

New in version 0.16.0.

salt.states.pkg.removed(name, version=None, pkgs=None, normalize=True, ignore_epoch=False, **kwargs)

13.16. state modules
Verify that a package is not installed, calling \texttt{pkg.remove} if necessary to remove the package.

\textbf{name} The name of the package to be removed.

\textbf{version} The version of the package that should be removed. Don't do anything if the package is installed with an unmatching version.

**Important:** As of version 2015.8.7, for distros which use yum/dnf, packages which have a version with a nonzero epoch (that is, versions which start with a number followed by a colon like in the example above) must have the epoch included when specifying the version number. For example:

```
vim-enhanced:
 pkg.installed:
  - version: 2:7.4.160-1.el7
```

In version 2015.8.9, an \texttt{ignore_epoch} argument has been added to \texttt{pkg.installed}, \texttt{pkg.removed}, and \texttt{pkg.purged} states, which causes the epoch to be disregarded when the state checks to see if the desired version was installed. If \texttt{ignore_epoch} was not set to \texttt{True}, and instead of \texttt{2:7.4.160-1.el7} a version of \texttt{7.4.160-1.el7} were used, this state would report success since the actual installed version includes the epoch, and the specified version would not match.

\textbf{normalize} [True] Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2015.8.0.

\textbf{ignore_epoch} [False] When a package version contains an non-zero epoch (e.g. \texttt{1:3.14.159-2.el7}, and a specific version of a package is desired, set this option to \texttt{True} to ignore the epoch when comparing versions. This allows for the following SLS to be used:

```
# Actual vim-enhanced version: 2:7.4.160-1.el7
vim-enhanced:
 pkg.removed:
  - version: 7.4.160-1.el7
  - ignore_epoch: True
```

Without this option set to \texttt{True} in the above example, the state would falsely report success since the actual installed version is \texttt{2:7.4.160-1.el7}. Alternatively, this option can be left as \texttt{False} and the full version string (with epoch) can be specified in the SLS file:

```
vim-enhanced:
 pkg.removed:
  - version: 2:7.4.160-1.el7
```

New in version 2015.8.9.

Multiple Package Options:

\textbf{pkgs} A list of packages to remove. Must be passed as a python list. The \texttt{name} parameter will be ignored if this option is passed. It accepts version numbers as well.

New in version 0.16.0.

\texttt{salt.states.pkg.uptodate(name, refresh=False, **kwargs)}

New in version 2014.7.0.

Verify that the system is completely up to date.

\textbf{name} The name has no functional value and is only used as a tracking reference

\textbf{refresh} refresh the package database before checking for new upgrades

\textbf{kwargs} Any keyword arguments to pass through to \texttt{pkg.upgrade}.
New in version 2015.5.0.

13.16.139 salt.states.pkgbuild

The pkgbuild state is the front of Salt package building backend. It automatically builds DEB and RPM packages from specified sources

New in version 2015.8.0.

```python
salt_2015.5.2:
  pkgbuild.built:
    - runas: thatch
    - results:
      - salt-2015.5.2-2.el7.centos.noarch.rpm
      - salt-api-2015.5.2-2.el7.centos.noarch.rpm
      - salt-cloud-2015.5.2-2.el7.centos.noarch.rpm
      - salt-master-2015.5.2-2.el7.centos.noarch.rpm
      - salt-minion-2015.5.2-2.el7.centos.noarch.rpm
      - salt-ssh-2015.5.2-2.el7.centos.noarch.rpm
      - salt-syndic-2015.5.2-2.el7.centos.noarch.rpm
    - dest_dir: /tmp/pkg
    - spec: salt://pkg/salt/spec/salt.spec
    - template: jinja
    - deps:
      - salt://pkg/salt/sources/required_dependency.rpm
    - tgt: epel-7-x86_64
    - sources:
      - salt://pkg/salt/sources/logrotate.salt
      - salt://pkg/salt/sources/README.fedora
      - salt://pkg/salt/sources/salt-2015.5.2.tar.gz
      - salt://pkg/salt/sources/salt-2015.5.2-tests.patch
      - salt://pkg/salt/sources/salt-api
      - salt://pkg/salt/sources/salt-api.service
      - salt://pkg/salt/sources/salt-master
      - salt://pkg/salt/sources/salt-master.service
      - salt://pkg/salt/sources/salt-minion
      - salt://pkg/salt/sources/salt-minion.service
      - salt://pkg/salt/sources/salt/pkg.sls
      - salt://pkg/salt/sources/salt-syndic
      - salt://pkg/salt/sources/salt-syndic.service
      - salt://pkg/salt/sources/SaltTesting-2015.5.8.tar.gz
    /tmp/pkg:
      pkgbuild.repo
```

salt.states.pkgbuild.built(name, runas, dest_dir, spec, sources, tgt, template=None, deps=None, env=None, results=None, force=False, always=None, saltenv='base',
  log_dir='/var/log/salt/pkgbuild')

Ensure that the named package is built and exists in the named directory

name  The name to track the build, the name value is otherwise unused
runas  The user to run the build process as
dest_dir  The directory on the minion to place the built package(s)
spec  The location of the spec file (used for rpms)
sources  The list of package sources
tgt  The target platform to run the build on
template  Run the spec file through a templating engine

Changed in version 2015.8.2: This argument is now optional, allowing for no templating engine to be
used if none is desired.

deps Packages required to ensure that the named package is built can be hosted on either the salt master server or on an HTTP or FTP server. Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials

eenv A dictionary of environment variables to be set prior to execution. Example:

```
- env:
  DEB_BUILD_OPTIONS: 'nocheck'
```

**Warning:** The above illustrates a common PyYAML pitfall, that yes, no, on, off, true, and false are all loaded as boolean True and False values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

results The names of the expected rpms that will be built

force [False] If True, packages will be built even if they already exist in the dest_dir. This is useful when building a package for continuous or nightly package builds.

New in version 2015.8.2.

always If True, packages will be built even if they already exist in the dest_dir. This is useful when building a package for continuous or nightly package builds.

Deprecated since version 2015.8.2: Use `force` instead.

saltenv The saltenv to use for files downloaded from the salt filesever

log_dir [/var/log/salt/rpmbuild] Root directory for log files created from the build. Logs will be organized by package name, version, OS release, and CPU architecture under this directory.

New in version 2015.8.2.

salt.states.pkgbuild.repo(name, keyid=None, env=None, use_passphrase=False, gnupghome='/etc/salt/gpgkeys', runas='builder', timeout=15.0)

Make a package repository and optionally sign it and packages present

The name is directory to turn into a repo. This state is best used with onchanges linked to your package building states.

name The directory to find packages that will be in the repository

keyid Changed in version 2016.3.0.

Optional Key ID to use in signing packages and repository. Utilizes Public and Private keys associated with keyid which have been loaded into the minion's Pillar data.

For example, contents from a Pillar data file with named Public and Private keys as follows:

```
gpg_pkg_priv_key: |
  -----BEGIN PGP PRIVATE KEY BLOCK-----
  Version: GnuPG v1

  lQ0+BFciIfQBCADAPCtzx715Rl32escCMZsPzaEKWe7bIX1em4KCKkBoX47IG54b
  w82PCE8Y1jJ/9uK2m3RKVmp3YcLlc7Ap3gj6V04ysvVz28UbnhPxsIk0lf2cqc8qc
  .
  .
Ebe+8JQCTqw5XPRTzXmy/b5WXDeM79CkLWvuGpXFor76D+ECMRp/vawukEcNpnt
  R5OmgHqyvdEn04pWbn8JzQ09YX/Us0SMHBVzLC8ei5ZIopzalvX
=JvW8
  -----END PGP PRIVATE KEY BLOCK-----

gpg_pkg_priv_keyname: gpg_pkg_key.pem

```
env  Changed in version 2016.3.0.
    A dictionary of environment variables to be utilized in creating the repository. Example:

    - env:
      OPTIONS: 'ask-passphrase'

    Warning: The above illustrates a common PyYAML pitfall, that yes, no, on, off, true, and false are all loaded as boolean True and False values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found here.

    Use of OPTIONS on some platforms, for example: ask-passphrase, will require gpg-agent or similar to cache passphrases.

Note: This parameter is not used for making yum repositories.

use_passphrase  [False] New in version 2016.3.0.

    Use a passphrase with the signing key presented in keyid. Passphrase is received from Pillar data which could be passed on the command line with pillar parameter. For example:

    pillar='{ "gpg_passphrase" : "my_passphrase" }'

gnupghome  [/etc/salt/gpgkeys] New in version 2016.3.0.

    Location where GPG related files are stored, used with `keyid'

runas  [builder] New in version 2016.3.0.

    User to create the repository as, and optionally sign packages.

Note: Ensure the user has correct permissions to any files and directories which are to be utilized.

timeout  [15.0] New in version 2016.3.4.

    Timeout in seconds to wait for the prompt for inputting the passphrase.
13.16.140 salt.states.pkgng

Manage package remote repo using FreeBSD pkgng

Salt can manage the URL pkgng pulls packages from. ATM the state and module are small so use cases are typically rather simple:

```
pkgng_clients:
    pkgng.update_packaging_site:
        - name: "http://192.168.0.2"

salt.states.pkgng.update_packaging_site(name)
```

13.16.141 salt.states.pkgrepo

Management of APT/YUM package repos

Package repositories for APT-based and YUM-based distros can be managed with these states. Here is some example SLS:

```
base:
    pkgrepo.managed:
        - humanname: CentOS-$releasever - Base
        - mirrorlist: http://mirrorlist.centos.org/?release=$releasever&arch=$basearch&repo=os
        - comments: 'http://mirror.centos.org/centos/$releasever/os/$basearch/'
        - gpgcheck: 1

  - name: logstash
  - refresh: True

Note: On Ubuntu systems, the `python-software-properties` package should be installed for better support of PPA repositories. To check if this package is installed, run `dpkg -l python-software-properties`.

Also, some Ubuntu releases have a bug in their `python-software-properties` package, a missing dependency on pycurl, so `python-pycurl` will need to be manually installed if it is not present once `python-software-properties` is installed.

On Ubuntu & Debian systems, the `python-apt` package is required to be installed. To check if this package is installed, run `dpkg -l python-software-properties`. `python-apt` will need to be manually installed if it is not present.

```
salt.states.pkgrepo.absent(name, **kwargs)
```
This function deletes the specified repo on the system, if it exists. It is essentially a wrapper around `pkg.del_repo`.

**name** The name of the package repo, as it would be referred to when running the regular package manager commands.

**UBUNTU-SPECIFIC OPTIONS**

**ppa** On Ubuntu, you can take advantage of Personal Package Archives on Launchpad simply by specifying the user and archive name.

```
logstash-ppa:
pkgrepo.absent:
  - ppa: wolfnet/logstash
```

**ppa_auth** For Ubuntu PPAs there can be private PPAs that require authentication to access. For these PPAs the username/password can be specified. This is required for matching if the name format uses the `ppa:` specifier and is private (requires username/password to access, which is encoded in the URI).

```
logstash-ppa:
pkgrepo.absent:
  - ppa: wolfnet/logstash
  - ppa_auth: username:password
```

**keyid** If passed, then the GPG key corresponding to the passed KeyID will also be removed.

**keyid_ppa** [False] If set to True, the GPG key's ID will be looked up from ppa.launchpad.net and removed, and the `keyid` argument will be ignored.

**Note:** This option will be disregarded unless the `ppa` argument is present.

```
salt.states.pkgrepo.managed(name, ppa=none, **kwargs)
```

### 13.16 state modules
This state manages software package repositories. Currently, `yum`, `apt`, and `zypper` repositories are supported.

**YUM/DNF/ZYPPER-BASED SYSTEMS**

**Note**: One of `baseurl` or `mirrorlist` below is required. Additionally, note that this state is not presently capable of managing more than one repo in a single repo file, so each instance of this state will manage a single repo file containing the configuration for a single repo.

- **name** This value will be used in two ways: Firstly, it will be the repo ID, as seen in the entry in square brackets (e.g. `[foo]`) for a given repo. Secondly, it will be the name of the file as stored in `/etc/yum.repos.d` (e.g. `/etc/yum.repos.d/foo.conf`).
- **enabled** [True] Whether or not the repo is enabled. Can be specified as True/False or 1/0.
- **disabled** [False] Included to reduce confusion due to APT’s use of the `disabled` argument. If this is passed for a yum/dnf/zypper-based distro, then the reverse will be passed as `enabled`. For example passing `disabled=True` will assume `enabled=False`.
- **humanname** This is used as the `name` value in the repo file in `/etc/yum.repos.d/` (or `/etc/zypp/repos.d` for Suse distros).
- **baseurl** The URL to a yum repository
- **mirrorlist** A URL which points to a file containing a collection of baseurls
- **comments** Sometimes you want to supply additional information, but not as enabled configuration. Anything supplied for this list will be saved in the repo configuration with a comment marker (`#`) in front.

Additional configuration values seen in yum repo files, such as `gpgkey` or `gpgcheck`, will be used directly as key-value pairs. For example:

```
foo:
  pkgrepo.managed:
    - humanname: Personal repo for foo
    - baseurl: https://mydomain.tld/repo/foo/$releasever/$basearch
    - gpgkey: file:///etc/pki/rpm-gpg/foo-signing-key
    - gpgcheck: 1
```

**APT-BASED SYSTEMS**

- **ppa** On Ubuntu, you can take advantage of Personal Package Archives on Launchpad simply by specifying the user and archive name. The keyid will be queried from launchpad and everything else is set automatically. You can override any of the below settings by simply setting them as you would normally. For example:

```
logstash-ppa:
  pkgrepo.managed:
    - ppa: wolfnet/logstash
```

- **ppa_auth** For Ubuntu PPAs there can be private PPAs that require authentication to access. For these PPAs the username/password can be passed as an HTTP Basic style username/password combination.

```
logstash-ppa:
  pkgrepo.managed:
    - ppa: wolfnet/logstash
    - ppa_auth: username:password
```

- **name** On apt-based systems this must be the complete entry as it would be seen in the sources.list file. This can have a limited subset of components (i.e. `main`) which can be added/modified with the `comps` option.

```
precise-repo:
  pkgrepo.managed:
```
name: deb http://us.archive.ubuntu.com/ubuntu precise main

Note: The above example is intended as a more readable way of configuring the SLS, it is equivalent to the following:

```
'deb http://us.archive.ubuntu.com/ubuntu precise main':
```

pkgrepo.managed

disabled [False] Toggles whether or not the repo is used for resolving dependencies and/or installing packages.

enabled [True] Included to reduce confusion due to yum/dnf/zypper's use of the enabled argument. If this is passed for an APT-based distro, then the reverse will be passed as disabled. For example, passing enabled=False will assume disabled=True.

comps On apt-based systems, comps dictate the types of packages to be installed from the repository (e.g. main, nonfree, ...). For purposes of this, comps should be a comma-separated list.

dist This dictates the release of the distro the packages should be built for. (e.g. unstable). This option is rarely needed.

keyid The KeyID of the GPG key to install. This option also requires the keyserver option to be set.

keyserver This is the name of the keyserver to retrieve gpg keys from. The keyid option must also be set for this option to work.

key_url URL to retrieve a GPG key from. Allows the usage of http://, https:// as well as salt://.

Note: Use either keyid/keyserver or key_url, but not both.

consolidate If set to true, this will consolidate all sources definitions to the sources.list file, cleanup the now unused files, consolidate components (e.g. main) for the same URI, type, and architecture to a single line, and finally remove comments from the sources.list file. The consolidate will run every time the state is processed. The option only needs to be set on one repo managed by salt to take effect.

clean_file If set to true, empty file before config repo, dangerous if use multiple sources in one file.

New in version 2015.8.0.

refresh_db If set to false this will skip refreshing the apt package database on debian based systems.

require_in Set this to a list of pkg.installed or pkg.latest to trigger the running of apt-get update prior to attempting to install these packages. Setting a require in the pkg will not work for this.

13.16.142 salt.states.portage_config

Management of Portage package configuration on Gentoo

A state module to manage Portage configuration on Gentoo

```
salt:
    portage_config.flags:
        - use: openssl
```

salt.states.portage_config.flags(name, use=None, accept_keywords=None, env=None, license=None, properties=None, unmask=False, mask=False)

Enforce the given flags on the given package or DEPEND atom.
Warning: In most cases, the affected package(s) need to be rebuilt in order to apply the changes.

name The name of the package or its DEPEND atom
use A list of USE flags
accept_keywords A list of keywords to accept. ~ARCH means current host arch, and will be translated into a line without keywords
env A list of environment files
license A list of accepted licenses
properties A list of additional properties
unmask A boolean to unmask the package
mask A boolean to mask the package

13.16.143 salt.states.ports

Manage software from FreeBSD ports

New in version 2014.1.0.

Note: It may be helpful to use a higher timeout when running a ports.installed state, since compiling the port may exceed Salt's timeout.

```
salt -t 1200 '*' state.highstate
```

salt.states.ports.installed(name, options=None)
Verify that the desired port is installed, and that it was compiled with the desired options.

options Make sure that the desired non-default options are set

Warning: Any build options not passed here assume the default values for the port, and are not just differences from the existing cached options from a previous make config.

Example usage:

```
security/nmap:
ports.installed:
  - options:
    - IPV6: off
```

13.16.144 salt.states.postgres_cluster module

Management of PostgreSQL clusters

The postgres_cluster state module is used to manage PostgreSQL clusters. Clusters can be set as either absent or present

```
create cluster 9.3 main:
postgres_cluster.present:
  - name: 'main'
  - version: '9.3'
```
salt.states.postgres_cluster.absent(version, name)
  Ensure that the named cluster is absent
  version  Version of the postgresql server of the cluster to remove
  name The name of the cluster to remove

  New in version 2015.XX.

salt.states.postgres_cluster.present(version, name, port=None, encoding=None, locale=None, datadir=None)
  Ensure that the named cluster is present with the specified properties. For more information about all of these
  options see man pg_createcluster(1)
  version  Version of the postgresql cluster
  name The name of the cluster
  port Cluster port
  encoding The character encoding scheme to be used in this database
  locale Locale with which to create cluster
  datadir Where the cluster is stored

  New in version 2015.XX.

13.16.145 salt.states.postgres_database

Management of PostgreSQL databases

The postgres_database module is used to create and manage Postgres databases. Databases can be set as either absent
or present

 frank:
   postgres_database.present

salt.states.postgres_database.absent(name, user=None, maintenance_db=None, db_password=None, db_host=None, db_port=None, db_user=None)
  Ensure that the named database is absent
  name The name of the database to remove
  db_user database username if different from config or default
  db_password user password if any password for a specified user
  db_host Database host if different from config or default
  db_port Database port if different from config or default
  user System user all operations should be performed on behalf of

  New in version 0.17.0.

salt.states.postgres_database.present(name, tablespace=None, encoding=None, lc_collate=None, lc_ctype=None, owner=None, owner_recurse=False, template=None, user=None, maintenance_db=None, db_password=None, db_host=None, db_port=None, db_user=None)
  Ensure that the named database is present with the specified properties. For more information about all of
  these options see man createdb(1)
  name The name of the database to manage
  tablespace Default tablespace for the database
  encoding The character encoding scheme to be used in this database
  lc_collate The LC_COLLATE setting to be used in this database
  lc_ctype The LC_CTYPE setting to be used in this database
  owner The username of the database owner
owner_recurse  Recurse owner change to all relations in the database
template  The template database from which to build this database
user  System user all operations should be performed on behalf of
db_user  database username if different from config or default
db_password  user password if any password for a specified user
db_host  Database host if different from config or default
db_port  Database port if different from config or default

New in version 0.17.0.

13.16.146  salt.states.postgres_extension

Management of PostgreSQL extensions

A module used to install and manage PostgreSQL extensions.

adminpack:
  postgres_extension.present

New in version 2014.7.0.

salt.states.postgres_extension.absent(name, if_exists=None, restrict=None, cascade=None,
  user=None, maintenance_db=None, db_user=None,
  db_password=None, db_host=None, db_port=None)

Ensure that the named extension is absent.
name  Extension name of the extension to remove
if_exists  Add if exist slug
restrict  Add restrict slug
cascade  Drop on cascade
user  System user all operations should be performed on behalf of
maintenance_db  Database to act on
db_user  Database username if different from config or default
db_password  User password if any password for a specified user
db_host  Database host if different from config or default
db_port  Database port if different from config or default

salt.states.postgres_extension.present(name, if_not_exists=None, schema=None,
  ext_version=None, from_version=None,
  user=None, maintenance_db=None, db_user=None,
  db_password=None, db_host=None, db_port=None)

Ensure that the named extension is present.

Note:  Before you can use the state to load an extension into a database, the extension’s supporting files must be already installed.

For more information about all of these options see CREATE  EXTENSION SQL command reference in the PostgreSQL documentation.
name  The name of the extension to be installed
if_not_exists  Add an IF NOT EXISTS parameter to the DDL statement
schema  Schema to install the extension into
ext_version  Version to install
from_version  Old extension version if already installed
user  System user all operations should be performed on behalf of
maintenance_db  Database to act on
**db_user**  Database username if different from config or default
**db_password**  User password if any password for a specified user
**db_host**  Database host if different from config or default
**db_port**  Database port if different from config or default

### 13.16.147 salt.states.postgres_group

Management of PostgreSQL groups (roles)

The postgres_group module is used to create and manage Postgres groups.

```python
frank:
  postgres_group.present
```

```python
salt.states.postgres_group.absent(name, user=None, maintenance_db=None, db_password=None, db_host=None, db_port=None, db_user=None)
```

Ensure that the named group is absent
**name**  The groupname of the group to remove
**user**  System user all operations should be performed on behalf of

New in version 0.17.0.

```python
salt.states.postgres_group.present(name, createdb=None, createroles=None, createuser=None, encrypted=None, superuser=None, inherit=None, login=None, replication=None, password=None, refresh_password=None, groups=None, user=None, maintenance_db=None, db_password=None, db_host=None, db_port=None, db_user=None)
```

Ensure that the named group is present with the specified privileges Please note that the user/group notion in postgresql is just abstract, we have roles, where users can be seen as roles with the LOGIN privilege and groups the others.

**name**  The name of the group to manage
**createdb**  Is the group allowed to create databases?
**createroles**  Is the group allowed to create other roles/users
**createuser**  Alias to create roles, and history problem, in pgsql normally createuser == superuser
**encrypted**  Should the password be encrypted in the system catalog?
**login**  Should the group have login perm
**inherit**  Should the group inherit permissions
**superuser**  Should the new group be a `superuser`

**replication**  Should the new group be allowed to initiate streaming replication
**password**  The group's password It can be either a plain string or a md5 postgresql hashed password:

```
‘md5(MD5OF{{password}{role}})’
```

If encrypted is None or True, the password will be automatically encrypted to the previous format if it is not already done.

**refresh_password**  Password refresh flag

Boolean attribute to specify whether to password comparison check should be performed.
If `refresh_password` is `True`, the password will be automatically updated without extra password change check.

This behavior makes it possible to execute in environments without superuser access available, e.g. Amazon RDS for PostgreSQL.

`groups` A string of comma separated groups the group should be in

`user` System user all operations should be performed on behalf of

New in version 0.17.0.

`db_user` database username if different from config or default

`db_password` user password if any password for a specified user

`db_host` Database host if different from config or default

`db_port` Database port if different from config or default

13.16.148 salt.states.postgres_initdb

Initialization of PostgreSQL data directory

The `postgres_initdb` module is used to initialize the `postgresql` data directory.

New in version 2016.3.0.

```yaml
pgsql-data-dir:
  postgres_initdb.present:
    - name: /var/lib/pgsql/data
    - auth: password
    - user: postgres
    - password: strong_password
    - encoding: UTF8
    - locale: C
    - runas: postgres
```

salt.states.postgres_initdb.present(name, user=None, password=None, auth='password', encoding='UTF8', locale=None, runas=None)

Initialize the PostgreSQL data directory

`name` The name of the directory to initialize

`user` The database superuser name

`password` The password to set for the postgres user

`auth` The default authentication method for local connections

`encoding` The default encoding for new databases

`locale` The default locale for new databases

`runas` The system user the operation should be performed on behalf of

13.16.149 salt.states.postgres_language

Management of PostgreSQL languages

The `postgres_language` module is used to create and manage Postgres languages. Languages can be set as either absent or present

New in version 2016.3.0.

```yaml
plpgsql:
  postgres_language.present:
    - maintenance_db: testdb
```
salt.states.postgres_language.absent(name, maintenance_db, user=None, db_password=None, db_host=None, db_port=None, db_user=None)

Ensure that a named language is absent in the specified database.

- name: The name of the language to remove
- maintenance_db: The name of the database in which the language is to be installed
- user: System user all operations should be performed on behalf of
- db_user: database username if different from config or default
- db_password: user password if any password for a specified user
- db_host: Database host if different from config or default
- db_port: Database port if different from config or default

salt.states.postgres_language.present(name, maintenance_db, user=None, db_password=None, db_host=None, db_port=None, db_user=None)

Ensure that a named language is present in the specified database.

- name: The name of the language to install
- maintenance_db: The name of the database in which the language is to be installed
- user: System user all operations should be performed on behalf of
- db_user: database username if different from config or default
- db_password: user password if any password for a specified user
- db_host: Database host if different from config or default
- db_port: Database port if different from config or default

13.16.150 salt.states.postgres_privileges

Management of PostgreSQL Privileges

The postgres_privileges module is used to manage Postgres privileges. Privileges can be set as either absent or present.

Privileges can be set on the following database object types:

- database
- schema
- tablespace
- table
- sequence
- language
- group

Setting the grant option is supported as well.

New in version 2016.3.0.

baruwa:
    postgres_privileges.present:
      - object_name: awl
      - object_type: table
      - privileges:
- SELECT
- INSERT
- DELETE
- grant_option: False
- prepend: public
- maintenance_db: testdb

andrew:
  postgres_privileges.present:
    - object_name: admins
    - object_type: group
    - grant_option: False
    - maintenance_db: testdb

baruwa:
  postgres_privileges.absent:
    - object_name: awl
    - object_type: table
    - privileges:
      - SELECT
      - INSERT
      - DELETE
    - prepend: public
    - maintenance_db: testdb

andrew:
  postgres_privileges.absent:
    - object_name: admins
    - object_type: group
    - maintenance_db: testdb

salt.states.postgres_privileges.absent(name, object_name, object_type, privileges=None, prepend='public', maintenance_db=None, user=None, db_password=None, db_host=None, db_port=None, db_user=None)

Revoke the requested privilege(s) on the specified object(s)

name  Name of the role whose privileges should be revoked
object_name  Name of the object on which the revoke is to be performed
object_type  The object type, which can be one of the following:
  • table
  • sequence
  • schema
  • tablespace
  • language
  • database
  • group
privileges  Comma separated list of privileges to revoke, from the list below:
  • INSERT
  • CREATE
  • TRUNCATE
  • CONNECT
  • TRIGGER
  • SELECT
  • USAGE
  • TEMPORARY
Grant the requested privilege(s) on the specified object to a role

- **name**: Name of the role to which privileges should be granted
- **object_name**: Name of the object on which the grant is to be performed. `ALL` may be used for objects of type `table` or `sequence`.
- **object_type**: The object type, which can be one of the following:
  - table
  - sequence
  - schema
  - tablespace
  - language
  - database
  - group
- **privileges**: List of privileges to grant, from the list below:
  - INSERT
  - CREATE
  - TRUNCATE
  - CONNECT
  - TRIGGER
  - SELECT
  - USAGE
  - TEMPORARY
  - UPDATE
  - EXECUTE
  - REFERENCES
  - DELETE
  - ALL

  **note**: privileges should not be set when granting group membership

- **grant_option**: If grant_option is set to True, the recipient of the privilege can in turn grant it to others
- **prepend**: Table and Sequence object types live under a schema so this should be provided if the object is not under the default `public` schema
- **maintenance_db**: The name of the database in which the language is to be installed
- **user**: System user all operations should be performed on behalf of
- **db_user**: Database username if different from config or default
- **db_password**: User password if any password for a specified user
- **db_host**: Database host if different from config or default
- **db_port**: Database port if different from config or default

The function call is:

```bash
salt.states.postgres_privileges.present(name, object_name, object_type, privileges=None, grant_option=None, prepend='public', maintenance_db=None, user=None, db_password=None, db_host=None, db_port=None, db_user=None)
```
db_host  Database host if different from config or default
db_port  Database port if different from config or default

13.16.151  salt.states.postgres_schema

Management of PostgreSQL schemas

The postgres_schemas module is used to create and manage Postgres schemas.

```python
public:
    postgres_schema.present 'dbname' 'name'
```

```python
salt.states.postgres_schema.absent(dbname, name, db_user=None, db_password=None, db_host=None, db_port=None)
```

Ensure that the named schema is absent.

dbname  The database's name will work on
name  The name of the schema to remove

```python
db_user  database username if different from config or default
db_password  user password if any password for a specified user
db_host  Database host if different from config or default
db_port  Database port if different from config or default
```

```python
salt.states.postgres_schema.present(dbname, name, owner=None, db_user=None, db_password=None, db_host=None, db_port=None)
```

Ensure that the named schema is present in the database.

dbname  The database's name will work on
name  The name of the schema to manage
owner  The database user that will be the owner of the schema
db_user  database username if different from config or default
db_password  user password if any password for a specified user
db_host  Database host if different from config or default
db_port  Database port if different from config or default

13.16.152  salt.states.postgres_tablespace

Management of PostgreSQL tablespace

A module used to create and manage PostgreSQL tablespaces.

```python
ssd-tablespace:
    postgres_tablespace.present:
        - name: indexes
        - directory: /mnt/ssd-data
```

New in version 2015.8.0.

```python
salt.states.postgres_tablespace.absent(name, user=None, maintenance_db=None, db_user=None, db_password=None, db_host=None, db_port=None)
```

Ensure that the named tablespace is absent.

name  The name of the tablespace to remove
user  System user all operations should be performed on behalf of
maintenance_db  Database to act on
db_user  Database username if different from config or default
**db_password** User password if any password for a specified user
**db_host** Database host if different from config or default
**db_port** Database port if different from config or default

```python
salt.states.postgres_tablespace.present(name, directory, options=None, owner=None,
user=None, maintenance_db=None,
db_password=None, db_host=None, db_port=None,
db_user=None)
```

Ensure that the named tablespace is present with the specified properties. For more information about all of these options see man `create_tablespace`(7).

**name** The name of the tablespace to create/manage.

**directory** The directory where the tablespace will be located, must already exist

**options** A dictionary of options to specify for the tablespace. Currently, the only tablespace options supported are `seq_page_cost` and `random_page_cost`. Default values are shown in the example below:

```yaml
my_space:
  postgres_tablespace.present:
    - directory: /srv/my_tablespace
    - options:
      seq_page_cost: 1.0
      random_page_cost: 4.0
```

**owner** The database user that will be the owner of the tablespace. Defaults to the user executing the command (i.e. the `user` option)

**user** System user all operations should be performed on behalf of

**maintenance_db** Database to act on

**db_user** Database username if different from config or default

**db_password** User password if any password for a specified user

**db_host** Database host if different from config or default

**db_port** Database port if different from config or default

---

### 13.16.153 salt.states.postgres_user

**Management of PostgreSQL users (roles)**

The postgres_user module is used to create and manage Postgres users.

```python
frank:
  postgres_user.present
```

```python
salt.states.postgres_user.absent(name, user=None, maintenance_db=None, db_password=None,
db_host=None, db_port=None, db_user=None)
```

Ensure that the named user is absent

**name** The username of the user to remove

**user** System user all operations should be performed on behalf of

New in version 0.17.0.

**db_user** database username if different from config or default

**db_password** user password if any password for a specified user

**db_host** Database host if different from config or default

**db_port** Database port if different from config or default
**salt.states.postgres_user.present**(name, createdb=None, createroles=None, createuser=None, encrypted=None, login=None, password=None, replication=None, inherit=None, superuser=None, default_password=None, refresh_password=None, groups=None, user=None, maintenance_db=None, db_password=None, db_host=None, db_port=None, db_user=None)

Ensure that the named user is present with the specified privileges. Please note that the user/group notion in postgresql is just abstract, we have roles, where users can be seen as roles with the LOGIN privilege and groups the others.

- **name**: The name of the system user to manage.
- **createdb**: Is the user allowed to create databases?
- **createroles**: Is the user allowed to create other users?
- **createuser**: Alias to create roles
- **encrypted**: Should the password be encrypted in the system catalog?
- **login**: Should the group have login perm
- **inherit**: Should the group inherit permissions
- **superuser**: Should the new user be a `superuser`
- **replication**: Should the new user be allowed to initiate streaming replication
- **password**: The system user's password. It can be either a plain string or a md5 postgresql hashed password:

  ```python
  'md5{{MD5OF({password}{role})}}'
  ```

  If encrypted is None or True, the password will be automatically encrypted to the previous format if it is not already done.

- **default_password**: The password used only when creating the user, unless password is set.

  New in version 2016.3.0.

- **refresh_password**: Password refresh flag

  Boolean attribute to specify whether to password comparison check should be performed.

  If refresh_password is True, the password will be automatically updated without extra password change check.

  This behaviour makes it possible to execute in environments without superuser access available, e.g. Amazon RDS for PostgreSQL

- **groups**: A string of comma separated groups the user should be in

- **user**: System user all operations should be performed on behalf of

  New in version 0.17.0.

- **db_user**: Postres database username, if different from config or default.

- **db_password**: Postgres user's password, if any password, for a specified db_user.

- **db_host**: Postgres database host, if different from config or default.

- **db_port**: Postgres database port, if different from config or default.

### 13.16.154 salt.states.powerpath

**Powerpath configuration support**

Allows configuration of EMC Powerpath. Currently only addition/deletion of licenses is supported.

```
key:
  powerpath.license_present: []
```
salt.states.powerpath.license_absent(name)
Ensures that the specified PowerPath license key is absent on the host.
    name  The license key to ensure is absent

salt.states.powerpath.license_present(name)
Ensures that the specified PowerPath license key is present on the host.
    name  The license key to ensure is present

13.16.155  salt.states.process

Process Management

Ensure a process matching a given pattern is absent.

```
httpd-absent:
    process.absent:
        - name: apache2
```

salt.states.process.absent(name, user=None, signal=None)
Ensures that the named command is not running.
    name  The pattern to match.
    user  The user process belongs
    signal  Signal to send to the process(es).

13.16.156  salt.states.pushover

Send a message to PushOver

This state is useful for sending messages to PushOver during state runs.
New in version 2015.5.0.

```
pusher-message:
    pushover.post_message:
        - user: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
        - token: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
        - title: Salt Returner
        - device: phone
        - priority: -1
        - expire: 3600
        - retry: 5
        - message: 'This state was executed successfully.'
```

The api key can be specified in the master or minion configuration like below: .. code-block:: yaml

```
pusher: token: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

salt.states.pushover.post_message(name, user=None, device=None, message=None, title=None, priority=None, expire=None, retry=None, sound=None, api_version=1, token=None)

Send a message to a PushOver channel.

```
pusher-message:
    pushover.post_message:
        - user: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
        - token: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
```
The following parameters are required:

- **name**  The unique name for this event.
- **user**  The user or group of users to send the message to. Must be ID of user, not name or email address.
- **message**  The message that is to be sent to the PushOver channel.

The following parameters are optional:

- **title**  The title to use for the message.
- **device**  The device for the user to send the message to.
- **priority**  The priority for the message.
- **expire**  The message should expire after specified amount of seconds.
- **retry**  The message should be resent this many times.
- **token**  The token for PushOver to use for authentication, if not specified in the configuration options of master or minion.

### 13.16.157 salt.states.pyenv

#### Managing python installations with pyenv

This module is used to install and manage python installations with pyenv. Different versions of python can be installed, and uninstalled. pyenv will be installed automatically the first time it is needed and can be updated later. This module will not automatically install packages which pyenv will need to compile the versions of python.

If pyenv is run as the root user then it will be installed to /usr/local/pyenv, otherwise it will be installed to the users ~/.pyenv directory. To make pyenv available in the shell you may need to add the pyenv/shims and pyenv/bin directories to the users PATH. If you are installing as root and want other users to be able to access pyenv then you will need to add pyenv_ROOT to their environment.

This is how a state configuration could look like:

```yaml
pyenv-deps:
  pkg.installed:
    - pkgs:
      - make
      - build-essential
      - libssl-dev
      - zlib1g-dev
      - libbz2-dev
      - libreadline-dev
      - libsqlite3-dev
      - wget
      - curl
      - llvm

python-2.6:
  pyenv.absent:
    - require:
      - pkg: pyenv-deps

python-2.7.6:
  pyenv.installed:
    - default: True
```
salt.states.pyenv.absent(name, user=None)
Verify that the specified python is not installed with pyenv. pyenv is installed if necessary.
name The version of python to uninstall
user: None The user to run pyenv as.

New in version 0.17.0.
New in version 0.16.0.
salt.states.pyenv.install_pyenv(name, user=None)
Install pyenv if not installed. Allows you to require pyenv be installed prior to installing the plugins. Useful
if you want to install pyenv plugins via the git or file modules and need them installed before installing any
rubies.
Use the pyenv.root configuration option to set the path for pyenv if you want a system wide install that is not
in a user home dir.
user: None The user to run pyenv as.
salt.states.pyenv.installed(name, default=False, user=None)
Verify that the specified python is installed with pyenv. pyenv is installed if necessary.
name The version of python to install
default [False] Whether to make this python the default.
user: None The user to run pyenv as.

New in version 0.17.0.
New in version 0.16.0.

13.16.158 salt.states.pyrax_queues
Manage Rackspace Queues
New in version 2015.5.0.
Create and destroy Rackspace queues. Be aware that this interacts with Rackspace's services, and so may incur
charges.
This module uses pyrax, which can be installed via package, or pip. This module is greatly inspired by boto_*
modules from SaltStack code source.

myqueue:
  pyrax_queues.present:
    - provider: my-pyrax

myqueue:
  pyrax_queues.absent:
    - provider: my-pyrax

salt.states.pyrax_queues.absent(name, provider)
Ensure the named Rackspace queue is deleted.
name Name of the Rackspace queue.
provider Salt Cloud provider
salt.states.pyrax_queues.present(name, provider)
Ensure the RackSpace queue exists.
name Name of the Rackspace queue.
provider Salt Cloud Provider

13.16.159 salt.states.quota

Management of POSIX Quotas

The quota can be managed for the system:

```yaml
/: 
  quota.mode:
    mode: off
    quotatype: user
```

salt.states.quota.mode(name, mode, quotatype)

Set the quota for the system

- **name**: The filesystem to set the quota mode on
- **mode**: Whether the quota system is on or off
- **quotatype**: Must be user or group

13.16.160 salt.states.rabbitmq_cluster

Manage RabbitMQ Clusters

Example:

```yaml
rabbit@rabbit.example.com:
  rabbitmq_cluster.join:
    - user: rabbit
    - host: rabbit.example.com
```

salt.states.rabbitmq_cluster.join(name, host, user='rabbit', ram_node=None, runas='root')

This function is an alias of **joined**.

- **name**: Irrelevant, not used (recommended: user@host)
- **user**: The user of node to join to (default: rabbit)
- **host**: The host of node to join to
- **ram_node**: Join node as a RAM node
- **runas**: The user to run the rabbitmq command as

salt.states.rabbitmq_cluster.joined(name, host, user='rabbit', ram_node=None, runas='root')

Ensure the current node joined to a cluster with node user@host

- **name**: Irrelevant, not used (recommended: user@host)
- **user**: The user of node to join to (default: rabbit)
- **host**: The host of node to join to
- **ram_node**: Join node as a RAM node
- **runas**: The user to run the rabbitmq command as

13.16.161 salt.states.rabbitmq_plugin

Manage RabbitMQ Plugins

New in version 2014.1.0.
Example:

```yaml
some_plugin:
    rabbitmq_plugin.enabled: []
```

```python
salt.states.rabbitmq_plugin.disabled(name, runas=None)
Ensure the RabbitMQ plugin is disabled.
name  The name of the plugin
runas  The user to run the rabbitmq-plugin command as
```

```python
salt.states.rabbitmq_plugin.enabled(name, runas=None)
Ensure the RabbitMQ plugin is enabled.
name  The name of the plugin
runas  The user to run the rabbitmq-plugin command as
```

### 13.16.162 salt.states.rabbitmq_policy

**Manage RabbitMQ Policies**

**maintainer** Benn Eichhorn <benn@getlocalmeasure.com>

**maturity** new

**platform** all

Example:

```yaml
rabbit_policy:
    rabbitmq_policy.present:
        - name: HA
        - pattern: '.*'
        - definition: '{"ha-mode": "all"}'
```

```python
salt.states.rabbitmq_policy.absent(name, vhost='/', runas=None)
Ensure the named policy is absent
name  The name of the policy to remove
runas  Name of the user to run the command as
```

```python
salt.states.rabbitmq_policy.present(name, pattern, definition, priority=0, vhost='/', runas=None)
Ensure the RabbitMQ policy exists.
name  Policy name
pattern  A regex of queues to apply the policy to
definition  A json dict describing the policy
priority  Priority (defaults to 0)
vhost  Virtual host to apply to (defaults to '/')
runas  Name of the user to run the command as
```

### 13.16.163 salt.states.rabbitmq_user

**Manage RabbitMQ Users**

Example:
rabbit_user:
  rabbitmq_user.present:
    - password: password
    - force: True
    - tags:
      - monitoring
      - user
    - perms:
      - '/':
        - '.*'
      - '.*'
      - '.*'
    - runas: rabbitmq

salt.states.rabbitmq_user.absent(name, runas=None)
Ensure the named user is absent
  name    The name of the user to remove
  runas   User to run the command

salt.states.rabbitmq_user.present(name, password=None, force=False, tags=None, perms=(), runas=None)
Ensure the RabbitMQ user exists.
  name    User name
  password User's password, if one needs to be set
  force   If user exists, forcibly change the password
  tags    Optional list of tags for the user
  perms   A list of dicts with vhost keys and 3-tuple values
  runas   Name of the user to run the command

13.16.164 salt.states.rabbitmq_vhost

Manage RabbitMQ Virtual Hosts

Example:

virtual_host:
  rabbitmq_vhost.present:
    - user: rabbit_user
    - conf: .*
    - write: .*
    - read: .*

salt.states.rabbitmq_vhost.absent(name)
Ensure the RabbitMQ Virtual Host is absent
  name    Name of the Virtual Host to remove
  runas   User to run the command

  Deprecated since version 2015.8.0.

salt.states.rabbitmq_vhost.present(name)
Ensure the RabbitMQ VHost exists.
  name    VHost name
  user    Initial user permission to set on the VHost, if present

  Deprecated since version 2015.8.0.
  owner   Initial owner permission to set on the VHost, if present
Conf Deprecated since version 2015.8.0. Initial conf string to apply to the VHost and user. Defaults to .*

Write Deprecated since version 2015.8.0. Initial write permissions to apply to the VHost and user. Defaults to .*

Read Deprecated since version 2015.8.0. Initial read permissions to apply to the VHost and user. Defaults to .*

Runas Name of the user to run the command

Deprecated since version 2015.8.0.

13.16.165 salt.states.rbenv

Managing Ruby installations with rbenv

This module is used to install and manage ruby installations with rbenv and the ruby-build plugin. Different versions of ruby can be installed, and uninstalled. Rbenv will be installed automatically the first time it is needed and can be updated later. This module will not automatically install packages which rbenv will need to compile the versions of ruby. If your version of ruby fails to install, refer to the ruby-build documentation to verify you are not missing any dependencies: https://github.com/sstephenson/ruby-build/wiki

If rbenv is run as the root user then it will be installed to /usr/local/rbenv, otherwise it will be installed to the users ~/.rbenv directory. To make rbenv available in the shell you may need to add the rbenv/shims and rbenv/bin directories to the users PATH. If you are installing as root and want other users to be able to access rbenv then you will need to add RBENV_ROOT to their environment.

The following state configuration demonstrates how to install Ruby 1.9.x and 2.x using rbenv on Ubuntu/Debian:

```
rbenv-deps:
  pkg.installed:
    - names:
      - bash
      - git
      - openssl
      - libssl-dev
      - make
      - curl
      - autoconf
      - bison
      - build-essential
      - libffi-dev
      - libyaml-dev
      - libreadline6-dev
      - zlib1g-dev
      - libncurses5-dev

ruby-1.9.3-p429:
  rbenv.absent:
    - require:
      - pkg: rbenv-deps

ruby-2.0.0-p598:
  rbenv.installed:
    - default: True
```
- require:
  - pkg: rbenv-deps

salt.states.rbenv.absent(name, user=None)
Verify that the specified ruby is not installed with rbenv. Rbenv is installed if necessary.
  name  The version of ruby to uninstall
  user: None  The user to run rbenv as.

    New in version 0.17.0.
    New in version 0.16.0.

salt.states.rbenv.install_rbenv(name, user=None)
Install rbenv if not installed. Allows you to require rbenv be installed prior to installing the plugins. Useful
if you want to install rbenv plugins via the git or file modules and need them installed before installing any
rubies.
Use the rbenv.root configuration option to set the path for rbenv if you want a system wide install that is not
in a user home dir.
  user: None  The user to run rbenv as.

salt.states.rbenv.installed(name, default=False, user=None)
Verify that the specified ruby is installed with rbenv. Rbenv is installed if necessary.
  name  The version of ruby to install
  default  [False]  Whether to make this ruby the default.
  user: None  The user to run rbenv as.

    New in version 0.17.0.
    New in version 0.16.0.

13.16.166  salt.states.rdp
Manage RDP Service on Windows servers

salt.states.rdp.disabled(name)
Disable the RDP service

salt.states.rdp.enabled(name)
Enable the RDP service and make sure access to the RDP port is allowed in the firewall configuration

13.16.167  salt.states.redismod
Management of Redis server

New in version 2014.7.0.
  depends
    •  redis Python module
  configuration  See salt.modules.redis for setup instructions.

    key_in_redis:
      redis.string:
        -  value: string data

The redis server information specified in the minion config file can be overridden in states using the following
arguments: host, post, db, password.
key_in_redis:
  redis.string:
    - value: string data
    - host: localhost
    - port: 6379
    - db: 0
    - password: somuchkittycat

salt.states.redismod.absent(name, keys=None, **connection_args)
  Ensure key absent from redis
  name
    Key to ensure absent from redis
  keys
    list of keys to ensure absent, name will be ignored if this is used

salt.states.redismod.slaveof(name, sentinel_host=None, sentinel_port=None, sentinel_password=None, **connection_args)
  Set this redis instance as a slave.
  name
    Master to make this a slave of
  sentinel_host
    Ip of the sentinel to check for the master
  sentinel_port
    Port of the sentinel to check for the master

salt.states.redismod.string(name, value, expire=None, expireat=None, **connection_args)
  Ensure that the key exists in redis with the value specified
  name
    Redis key to manage
  value
    Data to persist in key
  expire
    Sets time to live for key in seconds
  expireat
    Sets expiration time for key via UNIX timestamp, overrides expire

13.16.168 salt.states.reg

Manage the Windows registry

Many python developers think of registry keys as if they were python keys in a dictionary which is not the case.
The windows registry is broken down into the following components:

Hives

This is the top level of the registry. They all begin with HKEY. - HKEY_CLASSES_ROOT (HKCR) - HKEY_CURRENT_USER(HKCU) - HKEY_LOCAL_MACHINE (HKLM) - HKEY_USER (HKU) - HKEY_CURRENT_CONFIG

Keys

Hives contain keys. These are basically the folders beneath the hives. They can contain any number of subkeys.

Values or Entries

Values or Entries are the name/data pairs beneath the keys and subkeys. All keys have a default name/data pair. It is usually ``(Default)""=""(value not set)"". The actual value for the name and the date is Null. The registry editor will display ``(Default)"" and ``(value not set)"".
Example

The following example is taken from the windows startup portion of the registry:
```
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Run]  "RTHDVCPL"=""C:\Program Files\Realtek\Audio\HDA\RtkNGUI64.exe" -s"  "NvBackend"=""C:\Program Files (x86)\NVIDIA Corporation\Update Core\NvBackend.exe""  "BTMTrayAgent"="rundll32.exe "C:\Program Files (x86)\Intel\Bluetooth\btmshellex.dll",TrayApp" `  In this example these are the values for each:

Hive: HKEY_LOCAL_MACHINE

Key and subkeys: SOFTWARE\Microsoft\Windows\CurrentVersion\Run

Value:
- There are 3 value names: RTHDVCPL, NvBackend, and BTMTrayAgent
- Each value name has a corresponding value

salt.states.reg.absent(name, vname=None, use_32bit_registry=False)
Ensure a registry value is removed. To remove a key use key_absent.

Parameters name (str) -- A string value representing the full path of the key to include the HIVE, Key, and all Subkeys. For example:

HKEY_LOCAL_MACHINE\SOFTWARE\Salt

Valid hive values include:
- HKEY_CURRENT_USER or HKCU
- HKEY_LOCAL_MACHINE or HKLM
- HKEY_USERS or HKU

Parameters vname (str) -- The name of the value you'd like to create beneath the Key. If this parameter is not passed it will assume you want to set the (Default) value

Parameters use_32bit_registry (bool) -- Use the 32bit portion of the registry.
Applies only to 64bit windows. 32bit Windows will ignore this parameter. Default if False.

Returns Returns a dictionary showing the results of the registry operation.

Return type dict

CLI Example:
```
HKEY_CURRENT_USER\SOFTWARE\Salt\version`
reg.absent
```

In the above example the path is interpreted as follows:
- HKEY_CURRENT_USER is the hive
- SOFTWARE\Salt is the key
- version is the value name

So the value version will be deleted from the SOFTWARE\Salt key in the HKEY_CURRENT_USER hive.

salt.states.reg.key_absent(name, force=False, use_32bit_registry=False)
New in version 2015.5.4.

Ensure a registry key is removed. This will remove a key and all value entries it contains. It will fail if the key contains subkeys.

Parameters name (str) -- A string representing the full path to the key to be removed to include the hive and the keypath. The hive can be any of the following:
- HKEY_LOCAL_MACHINE or HKLM
- HKEY_CURRENT_USER or HKCU
- HKEY_USER or HKU
### Parameters

**force (bool)** -- A boolean value indicating that all subkeys should be deleted with the key. If force=False and subkeys exists beneath the key you want to delete, key_absent will fail. Use with caution. The default is False.

**Returns**

Returns a dictionary showing the results of the registry operation.

**Return type**

dict

The following example will delete the SOFTWARE\Salt key and all subkeys under the HKEY_CURRENT_USER hive.

```python
'HKEY_CURRENT_USER\SOFTWARE\Salt':
    reg.key_absent:
    - force: True
```

In the above example the path is interpreted as follows:

- HKEY_CURRENT_USER is the hive
- SOFTWARE\Salt is the key

#### salt.states.reg.present

Ensure a registry key or value is present.

**Parameters**

- **name (str)** -- A string value representing the full path of the key to include the HIVE, Key, and all Subkeys. For example:
- HKEY_LOCAL_MACHINE\SOFTWARE\Salt

Valid hive values include: - HKEY_CURRENT_USER or HKCU - HKEY_LOCAL_MACHINE or HKLM - HKEY_USERS or HKU

- **value (str)** -- Deprecated. Use vname and vdata instead. Included here for backwards compatibility.

- **vname (str)** -- The name of the value you'd like to create beneath the Key. If this parameter is not passed it will assume you want to set the (Default) value

- **vdata (str)** -- The value you'd like to set for the Key. If a value name (vname) is passed, this will be the data for that value name. If not, this will be the (Default) value for the key.

The type for the (Default) value is always REG_SZ and cannot be changed. This parameter is optional. If not passed, the Key will be created with no associated item/value pairs.

- **vtype (str)** -- The value type for the data you wish to store in the registry. Valid values are:
  - REG_BINARY
  - REG_DWORD
  - REG_EXPAND_SZ
  - REG_MULTI_SZ
  - REG_SZ (Default)

- **reflection (bool)** -- On 64 bit machines a duplicate value will be created in the Wow6432Node for 32bit programs. This only applies to the SOFTWARE key. This option is ignored on 32bit operating systems. This value defaults to True. Set it to False to disable reflection.

Deprecation Note:

Deprecation since version 2015.8.2: Use use_32bit_registry instead. The parameter seems to have no effect since Windows 7 / Windows 2008R2 removed support for reflection. The parameter will be removed in Carbon.

- **use_32bit_registry (bool)** -- Use the 32bit portion of the registry.

Applies only to 64bit windows. 32bit Windows will ignore this parameter. Default if False.

**Returns**

Returns a dictionary showing the results of the registry operation.

**Return type**

dict

The following example will set the (Default) value for the SOFTWARE\Salt key in the HKEY_CURRENT_USER hive to 0.15.3. The value will not be reflected in Wow6432Node:
Example:

```plaintext
HKEY_CURRENT_USER\SOFTWARE\Salt:
  reg.present:
    - vdata: 0.15.3
    - reflection: False
```

The following example will set the value for the `version` entry under the SOFTWARE\Salt key in the HKEY_CURRENT_USER hive to 0.15.3. The value will be reflected in Wow6432Node:

Example:

```plaintext
HKEY_CURRENT_USER\SOFTWARE\Salt:
  reg.present:
    - vname: version
    - vdata: 0.15.3
```

In the above example the path is interpreted as follows: - HKEY_CURRENT_USER is the hive - SOFTWARE\Salt is the key - vname is the value name (`version') that will be created under the key - vdata is the data that will be assigned to `version'

13.16.169 salt.states.rsync

State to synchronize files and directories with rsync.

New in version 2016.3.0.

```
/opt/user-backups:
  rsync.synchronized:
    - source: /home
    - force: True
```

`salt.states.rsync.synchronized(name, source, delete=False, force=False, update=False, passwordfile=None, exclude=None, excludefrom=None, prepare=False, dryrun=False)`

Guarantees that the source directory is always copied to the target.

- **name** Name of the target directory.
- **source** Source directory.
- **prepare** Create destination directory if it does not exists.
- **delete** Delete extraneous files from the destination dirs (True or False)
- **force** Force deletion of dirs even if not empty
- **update** Skip files that are newer on the receiver (True or False)
- **passwordfile** Read daemon-access password from the file (path)
- **exclude** Exclude files, that matches pattern.
- **excludefrom** Read exclude patterns from the file (path)
- **dryrun** Perform a trial run with no changes made. Is the same as doing test=True

New in version 2016.3.1.

13.16.170 salt.states.rvm

Managing Ruby installations and gemsets with Ruby Version Manager (RVM)

This module is used to install and manage ruby installations and gemsets with RVM, the Ruby Version Manager. Different versions of ruby can be installed and gemsets created. RVM itself will be installed automatically if it's not
present. This module will not automatically install packages that RVM depends on or ones that are needed to build
ruby. If you want to run RVM as an unprivileged user (recommended) you will have to create this user yourself.
This is how a state configuration could look like:

```yaml
rvm:
  group.present: []
  user.present:
    - gid: rvm

salt.states.rvm.gemset_present(name, ruby='default', user=None)
    Verify that the gemset is present.
    name The name of the gemset.
    ruby: default The ruby version this gemset belongs to.
    user: None The user to run rvm as.

    New in version 0.17.0.

salt.states.rvm.installed(name, default=False, user=None)
    Verify that the specified ruby is installed with RVM. RVM is installed when necessary.
    name The version of ruby to install
    default [False] Whether to make this ruby the default.
    user: None The user to run rvm as.

    New in version 0.17.0.

13.16.171 salt.states.salt_proxy module

Salt proxy state

New in version 2015.8.2.

State to deploy and run salt-proxy processes on a minion.

Set up pillar data for your proxies per the documentation.

Run the state as below
.. code-block:: yaml

    salt-proxy-configure:
      salt_proxy.configure_proxy:
        • proxynamer: p8000
        • start: True

This state will configure the salt proxy settings within /etc/salt/proxy (if /etc/salt/proxy doesn't exists) and start the salt-proxy process (default true), if it isn't already running.

```yaml
salt.states.salt_proxy.configure_proxy(name, proxynamer='p8000', start=True)
```

Create the salt proxy file and start the proxy process if required

**Parameters:**

- **name**: The name of this state
- **proxynamer**: Name to be used for this proxy (should match entries in pillar)
- **start**: Boolean indicating if the process should be started

**Example:**

```yaml
salt-proxy-configure:
  salt_proxy.configure_proxy:
    • proxynamer: p8000
    • start: True
```

## 13.16.172 salt.states.saltmod

### Control the Salt command interface

This state is intended for use from the Salt Master. It provides access to sending commands down to minions as well as access to executing master-side modules. These state functions wrap Salt’s Python API.

**See also:**

- More Orchestrate documentation
  - Full Orchestrate Tutorial
  - The Orchestrate runner

```python
salt.states.saltmod.function(name, tgt, ssh=False, tgt_type=None, expr_form=None, ret='`, expect_minions=False, fail_minions=None, fail_function=None, arg=None, kwarg=None, timeout=None, batch=None)
```

Execute a single module function on a remote minion via salt or salt-ssh

- **name**: The name of the function to run, aka cmd.run or pkg.install
- **tgt**: The target specification, aka `*` for all minions
- **tgt_type** | **expr_form**: The target type, defaults to glob
- **arg**: The list of arguments to pass into the function
- **kwarg**: The dict (not a list) of keyword arguments to pass into the function
- **ret**: Optionally set a single or a list of returners to use
- **expect_minions**: An optional boolean for failing if some minions do not respond
- **fail_minions**: An optional list of targeted minions where failure is an option
- **fail_function**: An optional string that points to a salt module that returns True or False based on the returned data dict for individual minions
- **ssh**: Set to True to use the ssh client instead of the standard salt client

## 13.16. state modules

2175
salt.states.saltmod.runner(name, **kwargs)

Execute a runner module on the master

New in version 2014.7.0.

name The name of the function to run

kwargs Any keyword arguments to pass to the runner function

```
run-manage-up:
salt.runner:
  - name: manage.up
```

salt.states.saltmod.state(name, tgt, ssh=False, tgt_type=None, expr_form=None, ret='`, highstate=None, sls=None, top=None, env=None, test=False, pillar=None, expect_minions=False, fail_minions=None, allow_fail=0, concurrent=False, timeout=None, batch=None, queue=False)

Invoke a state run on a given target

name An arbitrary name used to track the state execution
tgt The target specification for the state run.
tgt_type | expr_form The target type to resolve, defaults to glob
ret Optionally set a single or a list of returners to use
highstate Defaults to None, if set to True the target systems will ignore any sls references specified in the sls option and call state.highstate on the targeted minions
top Should be the name of a top file. If set state.top is called with this top file instead of state.sls.
sls A group of sls files to execute. This can be defined as a single string containing a single sls file, or a list of sls files
test Pass test=true through to the state function
pillar Pass the pillar kwarg through to the state function
saltenv The default salt environment to pull sls files from
ssh Set to True to use the ssh client instead of the standard salt client
roster In the event of using salt-ssh, a roster system can be set
expect_minions An optional boolean for failing if some minions do not respond
fail_minions An optional list of targeted minions where failure is an option
allow_fail Pass in the number of minions to allow for failure before setting the result of the execution to False
concurrent Allow multiple state runs to occur at once.

WARNING: This flag is potentially dangerous. It is designed for use when multiple state runs can safely be run at the same time. Do not use this flag for performance optimization.

queue Pass queue=true through to the state function
batch Execute the command in batches. E.g., 10%

New in version 2016.3.0.

Examples:

Run a list of sls files via state.sls on target minions:

```
webservers:
salt.state:
  - tgt: 'web*'
  - sls:
    - apache
    - django
    - core
  - saltenv: prod
```

Run a full state.highstate on target minions.

```
databases:
salt.state:
```
**salt.states.saltmod.wait_for_event** *(name, id_list, event_id='id', timeout=300, node='master')*

Watch Salt’s event bus and block until a condition is met

New in version 2014.7.0.

**name** An event tag to watch for; supports Reactor-style globbing.

**id_list** A list of event identifiers to watch for -- usually the minion ID. Each time an event tag is matched the event data is inspected for **event_id**, if found it is removed from **id_list**. When **id_list** is empty this function returns success.

**event_id** [id] The name of a key in the event data. Default is **id** for the minion ID, another common value is **name** for use with orchestrating salt-cloud events.

**timeout** [300] The maximum time in seconds to wait before failing.

The following example blocks until all the listed minions complete a restart and reconnect to the Salt master:

```yaml
reboot_all_minions:
  salt.function:
    - name: system.reboot
      - tgt: '*'

wait_for_reboots:
  salt.wait_for_event:
    - name: salt/minion/*/start
    - id_list:
      - jerry
      - stuart
      - dave
      - phil
      - kevin
      - mike
    - require:
      - salt: reboot_all_minions
```

**salt.states.saltmod.wheel**(name, **kwargs)

Execute a wheel module on the master

New in version 2014.7.0.

**name** The name of the function to run

**kwargs** Any keyword arguments to pass to the wheel function

```yaml
accept_minion_key:
  salt.wheel:
    - name: key.accept
    - match: frank
```

### 13.16.173 salt.states.schedule

**Management of the Salt scheduler**

```yaml
job3:
  schedule.present:
    - function: test.ping
    - seconds: 3600
```

### 13.16. state modules
- splay: 10

This will schedule the command: test.ping every 3600 seconds (every hour) splaying the time between 0 and 10 seconds

job2:
schedule.present:
- function: test.ping
- seconds: 15
- splay:
  start: 10
  end: 20

This will schedule the command: test.ping every 15 seconds splaying the time between 10 and 20 seconds

job1:
schedule.present:
- function: state.sls
- job_args:
  - httpd
- job_kwargs:
  test: True
- when:
  - Monday 5:00pm
  - Tuesday 3:00pm
  - Wednesday 5:00pm
  - Thursday 3:00pm
  - Friday 5:00pm

This will schedule the command: state.sls httpd test=True at 5pm on Monday, Wednesday and Friday, and 3pm on Tuesday and Thursday. Requires that python-dateutil is installed on the minion.

job1:
schedule.present:
- function: state.sls
- job_args:
  - httpd
- job_kwargs:
  test: True
- cron: '*/5 * * * *

Scheduled jobs can also be specified using the format used by cron. This will schedule the command: state.sls httpd test=True to run every 5 minutes. Requires that python-croniter is installed on the minion.
- Thursday 3:00pm
- Friday 5:00pm
- returner: xmpp
- return_config: xmpp_state_run
- return_kwargs:
  recipient: user@domain.com

This will schedule the command: state.sls httpd test=True at 5pm on Monday, Wednesday and Friday, and 3pm on Tuesday and Thursday. Using the xmpp returner to return the results of the scheduled job, with the alternative configuration options found in the xmpp_state_run section.

salt.states.schedule.absent(name, **kwargs)
Ensure a job is absent from the schedule
name The unique name that is given to the scheduled job.
persist Whether the job should persist between minion restarts, defaults to True.

salt.states.schedule.disabled(name, **kwargs)
Ensure a job is disabled in the schedule
name The unique name that is given to the scheduled job.
persist Whether the job should persist between minion restarts, defaults to True.

salt.states.schedule.enabled(name, **kwargs)
Ensure a job is enabled in the schedule
name The unique name that is given to the scheduled job.
persist Whether the job should persist between minion restarts, defaults to True.

salt.states.schedule.present(name, **kwargs)
Ensure a job is present in the schedule
name The unique name that is given to the scheduled job.
seconds The scheduled job will be executed after the specified number of seconds have passed.
minutes The scheduled job will be executed after the specified number of minutes have passed.
hours The scheduled job will be executed after the specified number of hours have passed.
days The scheduled job will be executed after the specified number of days have passed.
when This will schedule the job at the specified time(s). The when parameter must be a single value or a dictionary with the date string(s) using the dateutil format. Requires python-dateutil.
cron This will schedule the job at the specified time(s) using the crontab format. Requires python-croniter.
run_on_start Whether the job will run when Salt minion start. Value should be a boolean.
function The function that should be executed by the scheduled job.
job_args The arguments that will be used by the scheduled job.
job_kwargs The keyword arguments that will be used by the scheduled job.
maxrunning Ensure that there are no more than N copies of a particular job running.
jid_include Include the job into the job cache.
splay The amount of time in seconds to splay a scheduled job. Can be specified as a single value in seconds or as a dictionary range with `start' and `end' values.
rangep This will schedule the command within the range specified. The range parameter must be a dictionary with the date strings using the dateutil format. Requires python-dateutil.
once This will schedule a job to run once on the specified date.
once_fmt The default date format is ISO 8601 but can be overridden by also specifying the once_fmt option.
enabled Whether the job should be enabled or disabled. Value should be a boolean.
return_job Whether to return information to the Salt master upon job completion.
metadata Using the metadata parameter special values can be associated with a scheduled job. These values are not used in the execution of the job, but can be used to search for specific jobs later if combined with the return_job parameter. The metadata parameter must be specified as a dictionary, otherwise it will be ignored.
returner The returner to use to return the results of the scheduled job.
**return_config**  The alternative configuration to use for returner configuration options.

**return_kwargs**  Any individual returner configuration items to override. Should be passed as a dictionary.

**persist**  Whether the job should persist between minion restarts, defaults to True.

### 13.16.174  salt.states.selinux

**Management of SELinux rules**

If SELinux is available for the running system, the mode can be managed and booleans can be set.

```python
enforcing:
    selinux.mode

samba_create_home_dirs:
    selinux.boolean:
        - value: True
        - persist: True

nginx:
    selinux.module:
        - enabled: False
```

**Note:** Use of these states require that the selinux execution module is available.

**salt.states.selinux.boolean**(name, value, persist=False)

Set up an SELinux boolean

- **name**  The name of the boolean to set
- **value**  The value to set on the boolean
- **persist**  Defaults to False, set persist to true to make the boolean apply on a reboot

**salt.states.selinux.mode**(name)

Verifies the mode SELinux is running in, can be set to enforcing or permissive

- **name**  The mode to run SELinux in, permissive or enforcing

**salt.states.selinux.module**(name, module_state='Enabled', version='any')

Enable/Disable and optionally force a specific version for an SELinux module

- **name**  The name of the module to control
- **module_state**  Should the module be enabled or disabled?
- **version**  Defaults to no preference, set to a specified value if required. Currently can only alert if the version is incorrect.

New in version 2016.3.0.

### 13.16.175  salt.states.serverdensity_device

**Monitor Server with Server Density**

New in version 2014.7.0.

**Server Density**  Is a hosted monitoring service.

**Warning:**  This state module is beta. It might be changed later to include more or less automation.
Note: This state module requires a pillar for authentication with Server Density. To install a v1 agent:

```yaml
serverdensity:
  api_token: "b97da80a41c4f61b059f75ee51eb1aa"
  account_url: "https://your-account.serverdensity.io"
```

To install a v2 agent:

```yaml
serverdensity:
  api_token: "b97da80a41c4f61b059f75ee51eb1aa"
  account_name: "your-account"
```

Note: Although Server Density allows duplicate device names in its database, this module will raise an exception if you try monitoring devices with the same name.

Example:

```yaml
'server_name':
  serverdensity_device.monitored
```

```python
class.serverdensity_device.monitored(name, group=None, salt_name=True, salt_params=True, agent_version=1, **params)
```

Device is monitored with Server Density.

- **name**: Device name in Server Density.
- **salt_name**: If True (default), takes the name from the id grain. If False, the provided name is used.
- **group**: Group name under which device will appear in Server Density dashboard. Default - None.
- **agent_version**: The agent version you want to use. Valid values are 1 or 2. Default - 1.
- **salt_params**: If True (default), needed config parameters will be sourced from grains and from `status.all_status`.
- **params**: Add parameters that you want to appear in the Server Density dashboard. Will overwrite the `salt_params` parameters. For more info, see the API docs.

Usage example:

```yaml
'server_name':
  serverdensity_device.monitored

'server_name':
  serverdensity_device.monitored:
    - group: web-servers

'my_special_server':
  serverdensity_device.monitored:
    - salt_name: False
    - group: web-servers
    - cpuCores: 2
    - os: '{"code": "linux", "name": "Linux"}'
```
Starting or restarting of services and daemons

Services are defined as system daemons typically started with system init or rc scripts. The service state uses whichever service module that is loaded on the minion with the virtualname of service. Services can be defined as running or dead.

If you need to know if your init system is supported, see the list of supported service modules for your desired init system (systemd, sysvinit, launchctl, etc.).

Note that Salt’s service execution module, and therefore this service state, uses OS grains to ascertain which service module should be loaded and used to execute service functions. As existing distributions change init systems or new distributions are created, OS detection can sometimes be incomplete. If your service states are running into trouble with init system detection, please see the Overriding Virtual Module Providers section of Salt’s module documentation to work around possible errors.

**Note:** The current status of a service is determined by the return code of the init/rc script status command. A status return code of 0 it is considered running. Any other return code is considered dead.

```python
httpd:
    service.running: []
```

The service can also be set to be started at runtime via the enable option:

```python
openvpn:
    service.running:
      - enable: True
```

By default if a service is triggered to refresh due to a watch statement the service is by default restarted. If the desired behavior is to reload the service, then set the reload value to True:

```python
redis:
    service.running:
      - enable: True
      - reload: True
      - watch:
        - pkg: redis
```

**Note:** More details regarding watch can be found in the Requisites documentation.

```python
salt.states.service.dead(name, enable=None, sig=None, **kwargs)

Ensure that the named service is dead by stopping the service if it is running.

name The name of the init or rc script used to manage the service
enable Set the service to be enabled at boot time, True sets the service to be enabled, False sets the named service to be disabled. The default is None, which does not enable or disable anything.
sig The string to search for when looking for the service process with ps
```

```python
class salt.states.service.disabled(name, **kwargs)

Ensure that the service is disabled on boot, only use this state if you don’t want to manage the running process, remember that if you want to disable a service to use the enable: False option for the running or dead function.

name The name of the init or rc script used to manage the service
```
salt.states.service.enabled(name, **kwargs)

Ensure that the service is enabled on boot, only use this state if you don't want to manage the running process, remember that if you want to enable a running service to use the enable: True option for the running or dead function.

**Arguments**

- **name**: The name of the init or rc script used to manage the service

salt.states.service.mod_watch(name, sfun=None, sig=None, reload=False, full_restart=False, init_delay=None, force=False, **kwargs)

The service watcher, called to invoke the watch command.

**Arguments**

- **name**: The name of the init or rc script used to manage the service
- **sfun**: The original function which triggered the mod_watch call (service.running, for example).
- **sig**: The string to search for when looking for the service process with ps
- **reload**: Use reload instead of the default restart (exclusive option with full_restart, defaults to reload if both are used)
- **full_restart**: Use service.full_restart instead of restart (exclusive option with reload)
- **force**: Use service.force_reload instead of reload (needs reload to be set to True)
- **init_delay**: Add a sleep command (in seconds) before the service is restarted/reloaded

salt.states.service.running(name, enable=None, sig=None, init_delay=None, **kwargs)

Ensure that the service is running

**Arguments**

- **name**: The name of the init or rc script used to manage the service
- **enable**: Set the service to be enabled at boot time, True sets the service to be enabled, False sets the named service to be disabled. The default is None, which does not enable or disable anything.
- **sig**: The string to search for when looking for the service process with ps
- **init_delay**: Some services may not be truly available for a short period after their startup script indicates to the system that they are. Provide an 'init_delay' to specify that this state should wait an additional given number of seconds after a service has started before returning. Useful for requisite states wherein a dependent state might assume a service has started but is not yet fully initialized.

Note:

**watch** can be used with service.running to restart a service when another state changes (example: a file.managed state that creates the service's config file). More details regarding **watch** can be found in the **Requisites** documentation.

13.16.177 salt.states.slack

Send a message to Slack

This state is useful for sending messages to Slack during state runs.

New in version 2015.5.0.

```
salt:
    slack_message:
        slack.post_message:
            - channel: '#general'
            - from_name: SuperAdmin
            - message: 'This state was executed successfully.'
            - api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

The api key can be specified in the master or minion configuration like below:

```
salt:
    api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```
salt.states.slack.post_message(name, channel, from_name, message, api_key=None, icon=None)

Send a message to a Slack channel.

| slack-message: |
| slack.post_message: |
|   - channel: '#general' |
|   - from_name: SuperAdmin |
|   - message: 'This state was executed successfully.' |
|   - api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15 |

The following parameters are required:
- name  The unique name for this event.
- channel  The channel to send the message to. Can either be the ID or the name.
- from_name  The name of that is to be shown in the `from` field.
- message  The message that is to be sent to the Slack channel.

The following parameters are optional:
- api_key  The api key for Slack to use for authentication, if not specified in the configuration options of master or minion.
- icon  URL to an image to use as the icon for this message.

13.16.178 salt.states.smartos

Management of SmartOS Standalone Compute Nodes

- maintainer Jorge Schrauwen <sjorge@blackdot.be>
- maturity new
- depends vmadm, imgadm
- platform smartos

New in version 2016.3.0.

vmtest.example.org:
smartos.vm_present:
  - config:
    reprovision: true
  - vmconfig:

        compression: lz4
        boot: true
      nics:
        "82:1b:8e:49:e9:15"
        nic_tag: trunk
        mtu: 1500
        ips:
          - dhcp
        vlan_id: 30

cleanup_images:
  smartos.image_vacuum

Note: Keep in mind that when removing properties from vmconfig they will not get removed from the vm's current configuration, except for nics, disk, tags, ... they get removed via add_*, set_*, update_*, and remove_. Properties must be manually reset to their default value. The same behavior as when using `vmadm update'.

salt.states.smartos.config_absent(name)
   Ensure configuration property is absent in /usbkey/config
   name [string] name of property

salt.states.smartos.config_present(name, value)
   Ensure configuration property is set to value in /usbkey/config
   name [string] name of property
   value [string] value of property

salt.states.smartos.image_absent(name)
   Ensure image is absent on the computenode
   name [string] uuid of image

13.16. state modules
Note: computenode.image_absent will only remove the image if it is not used by a vm.

salt.states.smartos.image_present(name)
   Ensure image is present on the computenode
   name [string] uuid of image

salt.states.smartos.image_vacuum(name)
   Delete images not in use or installed via image_present

salt.states.smartos.vm_absent(name, archive=False)
   Ensure vm is absent on the computenode
   name [string] hostname of vm
   archive [boolean] toggle archiving of vm on removal

   Note: State ID is used as hostname. Hostnames must be unique.

salt.states.smartos.vm_present(name, vmconfig, config=None)
   Ensure vm is present on the computenode
   name [string] hostname of vm
   vmconfig [dict] options to set for the vm
   config [dict] fine grain control over vm_present

   Note:
   The following configuration properties can be toggled in the config parameter.
   • kvm_reboot (true) - reboots of kvm zones if needed for a config update
   • auto_import (false) - automatic importing of missing images
   • reprovision (false) - reprovision on image_uuid changes

   Note: State ID is used as hostname. Hostnames must be unique.

   Note: If hostname is provided in vmconfig this will take president over the State ID. This allows multiple states to be applied to the same vm.

   Note:
   The following instances should have a unique ID.
   • nic : mac
   • filesystem: target
   • disk : path or diskN for zvols
   e.g. disk0 will be the first disk added, disk1 the 2nd,...

salt.states.smartos.vm_running(name)
   Ensure vm is in the running state on the computenode
   name [string] hostname of vm

   Note: State ID is used as hostname. Hostnames must be unique.

salt.states.smartos.vm_stopped(name)
Ensure vm is in the stopped state on the computenode

name  [string] hostname of vm

Note: State ID is used as hostname. Hostnames must be unique.

### 13.16.179  salt.states.smtp

**Sending Messages via SMTP**

New in version 2014.7.0.

This state is useful for firing messages during state runs, using the SMTP protocol

```python
server-warning-message:
smtp.send_msg:
    - name: 'This is a server warning message'
    - profile: my-smtp-account
    - recipient: admins@example.com

salt.states.smtp.send_msg(name, recipient, subject, sender, profile, use_ssl='True')
```

* name  The message to send via SMTP

### 13.16.180  salt.states.splunk

**Splunk User State Module**

New in version 2016.3.0..

This state is used to ensure presence of users in splunk.

```python
ensure example test user 1:
splunk.present:
    - name: 'Example TestUser1'
    - email: example@domain.com

salt.states.splunk.absent(email, profile='splunk'; **kwargs)
```

* Ensure a splunk user is absent

The following parameters are required:
**salt.states.splunk**

### present

Ensure a user is present

```python
salt.states.splunk.present(email, profile='splunk', **kwargs)
```

**Example**

```python
ensure example test user 1:
    splunk.user_present:
        - realname: 'Example TestUser1'
        - name: 'exampleuser'
        - email: 'example@domain.com'
        - roles: ['user']
```

The following parameters are required:

- **email** This is the email of the user in splunk

### splunk_search

**Salt States**

Splunk Search State Module

New in version 2015.5.0.

This state is used to ensure presence of splunk searches.

```python
salt.states.splunk_search
```

**Present**

Ensure a search is present

```python
salt.states.splunk_search.present(name, profile='splunk', **kwargs)
```

**Example**

```python
API Error Search:
    splunk_search.present:
        search: index=main sourcetype=blah
template: alert_5min
```

The following parameters are required:

- **name** This is the name of the search in splunk

**Absent**

Ensure a search is absent

```python
salt.states.splunk_search.absent(name, profile='splunk')
```

**Example**

```python
API Error Search:
    splunk_search.absent
```

The following parameters are required:

- **name** This is the name of the search in splunk

### sqlite3

**Salt States**

Management of SQLite3 databases

- **depends**
  - SQLite3 Python Module
**configuration** See `salt.modules.sqlite3` for setup instructions

New in version 2016.3.0.

The sqlite3 module is used to create and manage sqlite3 databases and execute queries

Here is an example of creating a table using sql statements:

```yaml
users:
sqlite3.table_present:
  - db: /var/www/data/app.sqlite
  - schema: CREATE TABLE `users` (`username` TEXT COLLATE NOCASE UNIQUE NOT NULL, `password` BLOB NOT NULL, `salt` BLOB NOT NULL, `last_login` INT)
```

Here is an example of creating a table using yaml/jinja instead of sql:

```yaml
users:
sqlite3.table_present:
  - db: /var/www/app.sqlite
  - schema:
    - email TEXT COLLATE NOCASE UNIQUE NOT NULL
    - firstname TEXT NOT NULL
    - lastname TEXT NOT NULL
    - company TEXT NOT NULL
    - password BLOB NOT NULL
    - salt BLOB NOT NULL
```

Here is an example of making sure a table is absent:

```yaml
badservers:
sqlite3.table_absent:
  - db: /var/www/data/users.sqlite
```

Sometimes you would to have specific data in tables to be used by other services Here is an example of making sure rows with specific data exist:

```yaml
user_john_doe_xyz:
sqlite3.row_present:
  - db: /var/www/app.sqlite
  - table: users
  - where_sql: email='john.doe@companyxyz.com'
  - data:
    email: john.doe@companyxyz.com
    lastname: doe
    firstname: john
    company: companyxyz.com
    password: abcdef012934125
    salt: abcdef012934125
  - require:
    - sqlite3: users
```

Here is an example of removing a row from a table:

```yaml
user_john_doe_abc:
sqlite3.row_absent:
  - db: /var/www/app.sqlite
  - table: users
  - where_sql: email="john.doe@companyabc.com"
  - require:
    - sqlite3: users
```
**salt.states.sqlite3.row_absent**(name, db, table, where_sql, where_args=None)

- **name**: Only used as the unique ID
- **db**: The database file name
- **table**: The table name to check
- **where_sql**: The SQL to select the row to check
- **where_args**: The list parameters to substitute in where_sql

This state makes sure the specified row is absent in db. If multiple rows match where_sql, then the state will fail.

**salt.states.sqlite3.row_present**(name, db, table, data, where_sql, where_args=None, update=False)

- **name**: Only used as the unique ID
- **db**: The database file name
- **table**: The table name to check the data
- **data**: The dictionary of key/value pairs to check against if row exists, insert into the table if it doesn’t match
- **where_sql**: The SQL to select the row to check
- **where_args**: The list parameters to substitute in where_sql
- **update**: True will replace the existing row with data When False and the row exists and data does not equal the row data then the state will fail

**salt.states.sqlite3.table_absent**(name, db)

- **name**: The name of the table
- **db**: The name of the database file

This state makes sure the specified table does not exist

**salt.states.sqlite3.table_present**(name, db, schema, force=False)

- **name**: The name of the table
- **db**: The name of the database file
- **schema**: The dictionary containing the schema information
- **force**: If the name of the table exists and force is set to False, the state will fail. If force is set to True, the existing table will be replaced with the new table

### 13.16.183 salt.states.ssh_auth

Control of entries in SSH authorized_key files

The information stored in a user’s SSH authorized key file can be easily controlled via the ssh_auth state. Defaults can be set by the enc, options, and comment keys. These defaults can be overridden by including them in the name.

Since the YAML specification limits the length of simple keys to 1024 characters, and since SSH keys are often longer than that, you may have to use a YAML ‘explicit key’, as demonstrated in the second example below.

```yaml
AAAAB3NzaC1kc3MAAAACBAL0sQ09fJ5bYTeY==:
  - user: root
  - enc: ssh-dss

AAAAB3NzaC1kc3MAAAACBAL0sQ09fJ5bYTeY==...

ssh_auth.present:
```
thatch:
  ssh_auth.present:
    - user: root
    - source: salt://ssh_keys/thatch.id_rsa.pub
    - config: '%h/.ssh/authorized_keys'

sshkeys:
  ssh_auth.present:
    - user: root
    - enc: ssh-rsa
    - options:
      - option1="value1"
      - option2="value2 flag2"
    - comment: myuser
    - names:
      - AAAAB3NzaC1kc3MAAACBAL0sQ9fJ5bYTEyY==
      - ssh-dss AAAAB3NzaCL0sQ9fJ5bYTEyY== user@domain
      - option3="value3" ssh-dss AAAAB3NzaC1kcQ9J5bYTEyY== other@testdomain
      - AAAAB3NzaC1kcQ9JFF435bYTEyY== newcomment

salt.states.ssh_auth.absent(name, user, enc='ssh-rsa', comment='', source='', options=None, config='ssh/authorized_keys')

Verifies that the specified SSH key is absent

name The SSH key to manage
user The user who owns the SSH authorized keys file to modify
enc Defines what type of key is being used; can be ed25519, ecdsa, ssh-rsa or ssh-dss
comment The comment to be placed with the SSH public key
options The options passed to the key, pass a list object
source The source file for the key(s). Can contain any number of public keys, in standard `authorized_keys` format. If this is set, comment, enc and options will be ignored.
config The location of the authorized keys file relative to the user's home directory, defaults to `~/.ssh/authorized_keys`. Token expansion %u and %h for username and home path supported.

salt.states.ssh_auth.present(name, user, enc='ssh-rsa', comment='', source='', options=None, config='ssh/authorized_keys', **kwargs)

Verifies that the specified SSH key is present for the specified user

name The SSH key to manage
user The user who owns the SSH authorized keys file to modify
enc Defines what type of key is being used; can be ed25519, ecdsa, ssh-rsa or ssh-dss
comment The comment to be placed with the SSH public key
source The source file for the key(s). Can contain any number of public keys, in standard `authorized_keys` format. If this is set, comment and enc will be ignored.

Note: The source file must contain keys in the format `<enc> <key> <comment>`. If you have generated a keypair using PuTTYgen, then you will need to do the following to retrieve an OpenSSH-compatible public key.

1. In PuTTYgen, click `Load`, and select the `private` key file (not the public key), and click `Open`.
2. Copy the public key from the box labeled `Public key for pasting into OpenSSH authorized_keys file`.
3. Paste it into a new file.
**options** The options passed to the key, pass a list object

**config** The location of the authorized keys file relative to the user’s home directory, defaults to ".ssh/authorized_keys". Token expansion %u and %h for username and home path supported.

### 13.16.184 salt.states.ssh_known_hosts

**Control of SSH known_hosts entries**

Manage the information stored in the known_hosts files.

<table>
<thead>
<tr>
<th>GitHub.com</th>
<th>Example.com</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>github.com:</strong></td>
<td><strong>example.com:</strong></td>
</tr>
<tr>
<td><em>ssh_known_hosts:</em></td>
<td></td>
</tr>
<tr>
<td>- present</td>
<td>- absent</td>
</tr>
<tr>
<td>- <code>user: root</code></td>
<td>- <code>user: root</code></td>
</tr>
</tbody>
</table>

salt.states.ssh_known_hosts.absent(name, user=None, config=None)

Verifies that the specified host is not known by the given user

**name** The host name

**user** The user who owns the ssh authorized keys file to modify

**config** The location of the authorized keys file relative to the user’s home directory, defaults to ".ssh/known_hosts". If no user is specified, defaults to "/etc/ssh/ssh_known_hosts". If present, must be an absolute path when a user is not specified.

salt.states.ssh_known_hosts.present(name, user=None, fingerprint=None, key=None, port=None, enc=None, config=None, hash_hostname=True, hash_known_hosts=True, timeout=5)

Verifies that the specified host is known by the specified user

On many systems, specifically those running with openssh 4 or older, the enc option must be set, only openssh 5 and above can detect the key type.

**name** The name of the remote host (e.g. "github.com")

**user** The user who owns the ssh authorized keys file to modify

**fingerprint** The fingerprint of the key which must be present in the known_hosts file (optional if key specified)

**key** The public key which must be present in the known_hosts file (optional if fingerprint specified)

**port** optional parameter, port which will be used to when requesting the public key from the remote host, defaults to port 22.

**enc** Defines what type of key is being used, can be ed25519, ecdsa ssh-rsa or ssh-dss

**config** The location of the authorized keys file relative to the user’s home directory, defaults to ".ssh/known_hosts". If no user is specified, defaults to "/etc/ssh/ssh_known_hosts". If present, must be an absolute path when a user is not specified.

**hash_hostname** [True] Hash all hostnames and addresses in the known hosts file.

Deprecated since version Carbon: Please use hash_known_hosts instead.

**hash_known_hosts** [True] Hash all hostnames and addresses in the known hosts file.

**timeout** [int] Set the timeout for connection attempts. If timeout seconds have elapsed since a connection was initiated to a host or since the last time anything was read from that host, then the connection is closed and the host in question considered unavailable. Default is 5 seconds.

New in version 2016.3.0.
13.16.185 salt.states.stateconf

Stateconf System

The stateconf system is intended for use only with the stateconf renderer. This State module presents the set function. This function does not execute any functionality, but is used to interact with the stateconf renderer.

salt.states.stateconf.context(name, **kwargs)
   No-op state to support state config via the stateconf renderer.

salt.states.stateconf.set(name, **kwargs)
   No-op state to support state config via the stateconf renderer.

13.16.186 salt.states.status

Minion status monitoring

Maps to the status execution module.

salt.states.status.loadavg(name, maximum=None, minimum=None)
   Return the current load average for the specified minion. Available values for name are 1-min, 5-min and 15-min. minimum and maximum values should be passed in as strings.

salt.states.status.process(name)
   Return whether the specified signature is found in the process tree. This differs slightly from the services states, in that it may refer to a process that is not managed via the init system.

13.16.187 salt.states.stormpath_account

Support for Stormpath.

New in version 2015.8.0.

salt.states.stormpath_account.absent(name, directory_id=None)
   Ensure that an account associated with the given email address is absent. Will search all directories for the account, unless a directory_id is specified.
   name The email address of the account to delete.
   directory_id Optional. The ID of the directory that the account is expected to belong to. If not specified, then a list of directories will be retrieved, and each will be scanned for the account. Specifying a directory_id will therefore cut down on the number of requests to Stormpath, and increase performance of this state.

salt.states.stormpath_account.present(name, **kwargs)
   Ensure that an account is present and properly configured
   name The email address associated with the Stormpath account
   directory_id The ID of a directory which the account belongs to. Required.
   password Required when creating a new account. If specified, it is advisable to reference the password in another database using an sdb:// URL. Will NOT update the password if an account already exists.
   givenName Required when creating a new account.
   surname Required when creating a new account.
   username Optional. Must be unique across the owning directory. If not specified, the username will default to the email field.
   middleName Optional.
   status enabled accounts are able to login to their assigned applications, disabled accounts may not login to applications, unverified accounts are disabled and have not verified their email address.
   customData Optional. Must be specified as a dict.
13.16.188 salt.states.supervisord

Interaction with the Supervisor daemon

```python
wsgi_server:
supervisord.running:
    - require:
      - pkg: supervisor
    - watch:
      - file: /etc/nginx/sites-enabled/wsgi_server.conf
```

```python
salt.states.supervisord.dead(name, user=None, conf_file=None, bin_env=None, **kwargs)
```

Ensure the named service is dead (not running).

- **name**: Service name as defined in the supervisor configuration file
- **user**: Name of the user to run the supervisorctl command

New in version 0.17.0.

- **conf_file**: path to supervisorctl config file
- **bin_env**: path to supervisorctl bin or path to virtualenv with supervisor installed

```python
salt.states.supervisord.mod_watch(name, restart=True, update=False, user=None, conf_file=None, bin_env=None, **kwargs)
```

```python
salt.states.supervisord.running(name, restart=False, update=False, user=None, conf_file=None, bin_env=None, **kwargs)
```

Ensure the named service is running.

- **name**: Service name as defined in the supervisor configuration file
- **restart**: Whether to force a restart
- **update**: Whether to update the supervisor configuration.
- **user**: Name of the user to run the supervisorctl command

New in version 0.17.0.

- **conf_file**: path to supervisorctl config file
- **bin_env**: path to supervisorctl bin or path to virtualenv with supervisor installed

13.16.189 salt.states.svn

Manage SVN repositories

Manage repository checkouts via the svn vcs system. Note that subversion must be installed for these states to be available, so svn states should include a requisite to a pkg.installed state for the package which provides subversion (subversion in most cases). Example:

```python
subversion:
pkg.installed

http://unladen-swallow.googlecode.com/svn/trunk/:
svn.latest:
    - target: /tmp/swallow
```

```python
salt.states.svn.dirty(name, target, user=None, username=None, password=None, ignore_unversioned=False)
```

Determine if the working directory has been changed.

```python
salt.states.svn.export(name, target=None, rev=None, user=None, username=None, password=None, force=False, overwrite=False, externals=True, trust=False)
```

Export a file or directory from an SVN repository
name Address and path to the file or directory to be exported.
target Name of the target directory where the checkout will put the working directory
rev [None] The name revision number to checkout. Enable `force` if the directory already exists.
user [None] Name of the user performing repository management operations
username [None] The user to access the name repository with. The svn default is the current user
password Connect to the Subversion server with this password

New in version 0.17.0.
force [False] Continue if conflicts are encountered
overwrite [False] Overwrite existing target
externals [True] Change to False to not checkout or update externals
trust [False] Automatically trust the remote server. SVN's --trust-server-cert

salt.states.svn.latest(name, target=None, rev=None, user=None, username=None, password=None,
force=False, externals=True, trust=False)

Checkout or update the working directory to the latest revision from the remote repository.
name Address of the name repository as passed to `svn checkout`
target Name of the target directory where the checkout will put the working directory
rev [None] The name revision number to checkout. Enable `force` if the directory already exists.
user [None] Name of the user performing repository management operations
username [None] The user to access the name repository with. The svn default is the current user
password Connect to the Subversion server with this password

New in version 0.17.0.
force [False] Continue if conflicts are encountered
overwrite [False] Overwrite existing target
externals [True] Change to False to not checkout or update externals
trust [False] Automatically trust the remote server. SVN's --trust-server-cert

13.16.190 salt.states.sysctl

Configuration of the Linux kernel using sysctl

Control the kernel sysctl system.

vm.swappiness:
sysctl.present:
  - value: 20

salt.states.sysctl.present(name, value, config=None)

Ensure that the named sysctl value is set in memory and persisted to the named configuration file. The default sysctl configuration file is /etc/sysctl.conf
name The name of the sysctl value to edit
value The sysctl value to apply
config The location of the sysctl configuration file. If not specified, the proper location will be detected based on platform.

13.16.191 salt.states.syslog_ng

State module for syslog_ng

maintainer Tibor Benke <btibi@sch.bme.hu>
maturity new
depends cmd, ps, syslog_ng
function. For more information see syslog-ng state usage.

Syslog-ng configuration file format

The syntax of a configuration snippet in syslog-ng.conf:

    object_type object_id {<options>};

These constructions are also called statements. There are options inside of them:

    option(parameter1, parameter2); option2(parameter1, parameter2);

salt.states.syslog_ng.config(name, config, write=True)
    Builds syslog-ng configuration.
    name : the id of the Salt document config : the parsed YAML code write : if True, it writes the config into the
configuration file, otherwise just returns it

salt.states.syslog_ng.reloaded(name)
    Reloads syslog-ng.

salt.states.syslog_ng.started(name=None, user=None, group=None, chroot=None, caps=None, no_caps=False, pidfile=None, enable_core=False, fd_limit=None, verbose=False, debug=False, trace=False, yydebug=False, persist_file=None, control=None, worker_threads=None, **kwargs)
    Ensures, that syslog-ng is started via the given parameters.
    Users shouldn’t use this function, if the service module is available on their system.

salt.states.syslog_ng.stopped(name=None)
    Kills syslog-ng.

13.16.192 salt.states.sysrc

salt.states.sysrc.absent(name, **kwargs)
    Ensure a sysrc variable is absent.
    name  The variable name to set
    file (optional) The rc file to add the variable to.
    jail (option) the name or JID of the jail to set the value in.
salt.states.sysrc.managed(name, value, **kwargs)
Ensure a sysrc variable is set to a specific value.
name The variable name to set
value Value to set the variable to
file (optional) The rc file to add the variable to.
jail (option) the name or JID of the jail to set the value in.
Example:

```
syslogd:
sysrc.managed:
  - name: syslogd_flags
  - value: -ss
```

### 13.16.193 salt.states.telemetry_alert

New in version 2016.3.0..

Manage Telemetry alert configurations

Create, Update and destroy Mongo Telemetry alert configurations.
This module uses requests, which can be installed via package, or pip.
This module accepts explicit credential (telemetry api key) or can also read api key credentials from a pillar. Example:

```
ensure telemetry alert X is defined on deployment Y:
telemetry_alert.present:
  - deployment_id: "rs-XXXXXX"
  - metric_name: "testMetric"
  - alert_config:
    max: 1
    filter: SERVER_ROLE_MONGOD_PRIMARY
    escalate_to: "example@pagerduty.com"
    - name: "**MANAGED BY ORCA DO NOT EDIT BY HAND** manages alarm on testMetric"
```

salt.states.telemetry_alert.absent(name, deployment_id, metric_name, api_key=None, profile='telemetry')
Ensure the telemetry alert config is deleted
name An optional description of the alarms (not currently supported by telemetry API)
deployment_id Specifies the ID of the root deployment resource (replica set cluster or sharded cluster) to which this alert definition is attached
metric_name Specifies the unique ID of the metric to whose values these thresholds will be applied
api_key Telemetry api key for the user
profile A dict with telemetry config data. If present, will be used instead of api_key.

salt.states.telemetry_alert.present(name, deployment_id, metric_name, alert_config,
  api_key=None, profile='telemetry')
Ensure the telemetry alert exists.
name An optional description of the alarm (not currently supported by telemetry API)
deployment_id Specifies the ID of the root deployment resource (replica set cluster or sharded cluster) to which this alert definition is attached
metric_name Specifies the unique ID of the metric to whose values these thresholds will be applied
alert_config: Is a list of dictionaries where each dict contains the following fields:
  filter By default the alert will apply to the deployment and all its constituent resources. If the alert only applies to a subset of those resources, a filter may be specified to narrow this scope.
min  the smallest "ok" value the metric may take on; if missing or null, no minimum is enforced.
max  the largest "ok" value the metric may take on; if missing or null, no maximum is enforced.
notify_all Used to indicate if you want to alert both onCallEngineer and apiNotifications
api_key Telemetry api key for the user
profile A dict of telemetry config information. If present, will be used instead of api_key.

13.16.194  salt.states.test

Test States

Provide test case states that enable easy testing of things to do with state calls, e.g. running, calling, logging, output filtering etc.

always-passes-with-any-kwarg:
  test.nop:
    - name: foo
    - something: else
    - foo: bar

always-passes:
  test.succeed_without_changes:
    - name: foo

always-fails:
  test.fail_without_changes:
    - name: foo

always-changes-and-succeeds:
  test.succeed_with_changes:
    - name: foo

always-changes-and-fails:
  test.fail_with_changes:
    - name: foo

my-custom-combo:
  test.configurable_test_state:
    - name: foo
    - changes: True
    - result: False
    - comment: bar.baz

is-pillar-foo-present-and-bar-is-int:
  test.check_pillar:
    - present:
      - foo
    - integer:
      - bar

salt.states.test.check_pillar(name, present=None, boolean=None, integer=None, string=None, listing=None, dictionary=None, verbose=False)

Checks the presence and, optionally, the type of given keys in Pillar. Supported kwargs for types are: - boolean (bool) - integer (int) - string (str) - listing (list) - dictionary (dict)

Checking for None type pillars is not implemented yet.
is-pillar-foo-present-and-bar-is-int:
  test.check_pillar:
    - present:
      - foo
    - integer:
      - bar

salt.states.test.configurable_test_state(name, changes=True, result=True, comment='')
A configurable test state which determines its output based on the inputs.

New in version 2014.7.0.
name: A unique string.
changes: Do we return anything in the changes field? Accepts True, False, and 'Random' Default is True
result: Do we return successfully or not? Accepts True, False, and 'Random' Default is True
If test is True and changes is True, this will be None. If test is True and and changes is False, this will be True.
comment: String to fill the comment field with. Default is ''

salt.states.test.fail_with_changes(name)
Returns failure and changes is not empty.

New in version 2014.7.0.
name: A unique string.

salt.states.test.fail_without_changes(name)
Returns failure.

New in version 2014.7.0.
name: A unique string.

salt.states.test.mod_watch(name, sfun=None, **kwargs)
Call this function via a watch statement

New in version 2014.7.0.

Any parameters in the state return dictionary can be customized by adding the keywords result, comment, and changes.

this_state_will_return_changes:
  test.succeed_with_changes

this_state_will_NOT_return_changes:
  test.succeed_without_changes

this_state_is_watching_another_state:
  test.succeed_without_changes:
    - comment: 'This is a custom comment'
    - watch:
      - test: this_state_will_return_changes
      - test: this_state_will_NOT_return_changes

this_state_is_also_watching_another_state:
  test.succeed_without_changes:
    - watch:
      - test: this_state_will_NOT_return_changes

salt.states.test.nop(name, **kwargs)
A no-op state that does nothing. Useful in conjunction with the use requisite, or in templates which could otherwise be empty due to jinja rendering

salt.states.test.show_notification(name, text=None, **kwargs)

Simple notification using text argument.

    New in version 2015.8.0.
    name  A unique string.
    text  Text to return in the comment.

salt.states.test.succeed_with_changes(name)

Returns successful and changes is not empty

    New in version 2014.7.0.
    name  A unique string.

salt.states.test.succeed_without_changes(name)

Returns successful.

    New in version 2014.7.0.
    name  A unique string.

13.16.195 salt.states.timezone

Management of timezones

The timezone can be managed for the system:

```yaml
America/Denver:
  timezone.system
```

The system and the hardware clock are not necessarily set to the same time. By default, the hardware clock is set to localtime, meaning it is set to the same time as the system clock. If utc is set to True, then the hardware clock will be set to UTC, and the system clock will be an offset of that.

```yaml
America/Denver:
  timezone.system:
    - utc: True
```

The Ubuntu community documentation contains an explanation of this setting, as it applies to systems that dual-boot with Windows. This is explained in greater detail here.

salt.states.timezone.system(name, utc=True)

Set the timezone for the system.

    name  The name of the timezone to use (e.g.: America/Denver)
    utc  Whether or not to set the hardware clock to UTC (default is True)

13.16.196 salt.states.tls

Enforce state for SSL/TLS

salt.states.tls.valid_certificate(name, weeks=0, days=0, hours=0, minutes=0, seconds=0)

Verify that a TLS certificate is valid now and (optionally) will be valid for the time specified through weeks, days, hours, minutes, and seconds.
13.16.197 salt.states.tomcat

This state uses the manager webapp to manage Apache tomcat webapps. This state requires the manager webapp to be enabled.

The following grains/pillar should be set:

```
tomcat-manager:user: admin user name
tomcat-manager:passwd: password
```

and also configure a user in the conf/tomcat-users.xml file:

```
<?xml version='1.0' encoding='utf-8'?>
<tomcat-users>
    <role rolename="manager-script"/>
    <user username="tomcat" password="tomcat" roles="manager-script"/>
</tomcat-users>
```

Notes:

- Not supported multiple version on the same context path
- if you use only this module for deployments you might want to restrict access to the manager so its only accessible via localhost for more info: http://tomcat.apache.org/tomcat-7.0-doc/manager-howto.html#Configuring_Manager_Application_Access

- Tested on:
  JVM Vendor: Sun Microsystems Inc.
  JVM Version: 1.6.0_43-b01
  OS Architecture: amd64
  OS Name: Linux
  OS Version: 2.6.32-358.el6.x86_64
  Tomcat Version: Apache Tomcat/7.0.37

salt.states.tomcat.mod_watch(name, url='http://localhost:8080/manager', timeout=180)
  The tomcat watcher function. When called it will reload the webapp in question

canstates.tomcat.undeployed(name, url='http://localhost:8080/manager', timeout=180)
  Enforce that the WAR will be un-deployed from the server
  name the context path to deploy
  url [http://localhost:8080/manager] the URL of the server manager webapp
  timeout [180] timeout for HTTP request to the tomcat manager
  Example:

  jenkins:
    tomcat.undeployed:
      - name: /ran
      - require:
        - service: application-service

canstates.tomcat.wait(name, url='http://localhost:8080/manager', timeout=180)
  Wait for the tomcat manager to load
Notice that if tomcat is not running we won’t wait for it start and the state will fail. This state can be required in the tomcat.war_deployed state to make sure tomcat is running and that the manager is running as well and ready for deployment

url [http://localhost:8080/manager] the URL of the server manager webapp

timeout [180] timeout for HTTP request to the tomcat manager

Example:

```yaml
tomcat-service:
  service.running:
    - name: tomcat
    - enable: True

wait-for-tomcatmanager:
  tomcat.wait:
    - timeout: 300
    - require:
      - service: tomcat-service

jenkins:
  tomcat.war_deployed:
    - name: /ran
    - war: salt://jenkins-1.2.4.war
    - require:
      - tomcat: wait-for-tomcatmanager
```

salt.states.tomcat.war_deployed(name, war, force=False, url='http://localhost:8080/manager', timeout=180, temp_war_location=None, version='')

Enforce that the WAR will be deployed and started in the context path it will make use of WAR versions

for more info: http://tomcat.apache.org/tomcat-7.0-doc/config/context.html#Naming

name the context path to deploy

war absolute path to WAR file (should be accessible by the user running tomcat) or a path supported by the salt.modules.cp.get_url function

force force deploy even if version strings are the same, False by default.

url [http://localhost:8080/manager] the URL of the server manager webapp

timeout [180] timeout for HTTP request to the tomcat manager

temp_war_location [None] use another location to temporarily copy to war file by default the system’s temp directory is used

version [''] Specify the war version. If this argument is provided, it overrides the version encoded in the war file name, if one is present.

Example:

```yaml
jenkins:
  tomcat.war_deployed:
    - name: /ran
    - war: salt://jenkins-1.2.4.war
    - require:
      - tomcat: application-service
```

13.16.198 salt.states.trafficserver

Control Apache Traffic Server

New in version 2015.8.0.
salt.states.trafficserver.bounce_cluster(name)

```yaml
bounce_ats_cluster:
  trafficserver.bounce_cluster
```

salt.states.trafficserver.bounce_local(name, drain=False)

This option modifies the behavior of traffic_line -b and traffic_line -L such that traffic_server is not shut down until the number of active client connections drops to the number given by the proxy.config.restart.active_client_threshold configuration variable.

```yaml
bounce_ats_local:
  trafficserver.bounce_local

bounce_ats_local:
  trafficserver.bounce_local
  - drain: True
```

salt.states.trafficserver.clear_cluster(name)
Clears accumulated statistics on all nodes in the cluster.

```yaml
clear_ats_cluster:
  trafficserver.clear_cluster
```

salt.states.trafficserver.clear_node(name)
Clears accumulated statistics on the local node.

```yaml
clear_ats_node:
  trafficserver.clear_node
```

salt.states.trafficserver.offline(name, path)
Mark a cache storage device as offline. The storage is identified by a path which must match exactly a path specified in storage.config. This removes the storage from the cache and redirects requests that would have used this storage to other storage. This has exactly the same effect as a disk failure for that storage. This does not persist across restarts of the traffic_server process.

```yaml
offline_ats_path:
  trafficserver.offline:
    - path: /path/to/cache
```

salt.states.trafficserver.refresh(name)
Initiate a Traffic Server configuration file reread. Use this command to update the running configuration after any configuration file modification.

The timestamp of the last reconfiguration event (in seconds since epoch) is published in the proxy.node.config.reconfigure_time metric.

```yaml
refresh_ats:
  trafficserver.refresh
```

salt.states.trafficserver.restart_cluster(name)
Restart the traffic_manager process and the traffic_server process on all the nodes in a cluster.
**restart_ats_cluster:**
```
trafficserver.restart_cluster
```

**salt.states.trafficserver.restart_local**(name, drain=False)
Restart the traffic_manager and traffic_server processes on the local node.

This option modifies the behavior of traffic_line -b and traffic_line -L such that traffic_server is not shut down until the number of active client connections drops to the number given by the proxy.config.restart.active_client_threshold configuration variable.

```
restart_ats_local:
    trafficserver.restart_local
restart_ats_local_drain:
    trafficserver.restart_local
    - drain: True
```

**salt.states.trafficserver.set_var**(name, value)
Set Traffic Server variable values

```
proxy.config.proxy_name:
    trafficserver.set_var:
    - value: cdn.site.domain.tld

OR

traffic_server_setting:
    trafficserver.set_var:
    - name: proxy.config.proxy_name
    - value: cdn.site.domain.tld
```

**salt.states.trafficserver.shutdown**(name)
Shut down Traffic Server on the local node.

```
shutdown_ats:
    trafficserver.shutdown
```

**salt.states.trafficserver.startup**(name)
Start Traffic Server on the local node.

```
startup_ats:
    trafficserver.startup
```

**salt.states.trafficserver.zero_cluster**(name)
Reset performance statistics to zero across the cluster.

```
zero_ats_cluster:
    trafficserver.zero_cluster
```

**salt.states.trafficserver.zero_node**(name)
Reset performance statistics to zero on the local node.

```
zero_ats_node:
    trafficserver.zero_node
```
13.16.199  salt.states.tuned

Interface to Red Hat tuned-adm module

maintainer        Syed Ali <alicsyed@gmail.com>
maturity          new
depends            cmd.run
platform          Linux

salt.states.tuned.off(name=None)
    Turns `tuned' off. Example tuned.sls file for turning tuned off:
    tuned: tuned.off: []
    To see a valid list of states call execution module: tuned.list

salt.states.tuned.profile(name)
    This state module allows you to modify system tuned parameters
    Example tuned.sls file to set profile to virtual-guest
    tuned:
       - profile
       - name: virtual-guest
    name  tuned profile name to set the system to
    To see a valid list of states call execution module: tuned.list

13.16.200  salt.states.uptime

Monitor Web Server with Uptime

Uptime is an open source remote monitoring application using Node.js, MongoDB, and Twitter Bootstrap.

Warning:  This state module is beta. It might be changed later to include more or less automation.

Note:  This state module requires a pillar to specify the location of your uptime install

  uptime:
     application_url: "http://uptime-url.example.org"

Example:

text
"application_url: "http://uptime-url.example.org"

salt.states.uptime.monitored(name, **params)
    Makes sure an URL is monitored by uptime. Checks if URL is already monitored, and if not, adds it.
13.16.201 salt.states.user

Management of user accounts

The user module is used to create and manage user settings, users can be set as either absent or present

Fred:
  user.present:
    - fullname: Fred Jones
    - shell: /bin/zsh
    - home: /home/fred
    - uid: 4000
    - gid: 4000
    - groups:
      - wheel
      - storage
      - games

testuser:
  user.absent

salt.states.user.absent(name, purge=False, force=False)
Ensure that the named user is absent

  name  The name of the user to remove
  purge Set purge to True to delete all of the user's files as well as the user, Default is False.
  force If the user is logged in, the absent state will fail. Set the force option to True to remove the user even if
  they are logged in. Not supported in FreeBSD and Solaris, Default is False.

salt.states.user.present(name, uid=None, gid=None, gid_from_name=False, groups=None, optional_groups=None, remove_groups=True, home=None, createhome=True, password=None, enforce_password=True, empty_password=False, shell=None, unique=True, system=False, fullname=None, roomnumber=None, workphone=None, homophone=None, loginclass=None, date=None, mindays=None, maxdays=None, inactdays=None, warndays=None, expire=None, win_homedrive=None, win_profile=None, win_logonscript=None, win_description=None)
Ensure that the named user is present with the specified properties

  name  The name of the user to manage
  uid  The user id to assign, if left empty then the next available user id will be assigned
  gid  The default group id. Also accepts group name.
  gid_from_name If True, the default group id will be set to the id of the group with the same name as the user,
  Default is False.
  groups A list of groups to assign the user to, pass a list object. If a group specified here does not exist on the
  minion, the state will fail. If set to the empty list, the user will be removed from all groups except the
  default group. If unset, salt will assume current groups are still wanted (see issue #28706).
  optional_groups A list of groups to assign the user to, pass a list object. If a group specified here does not
  exist on the minion, the state will silently ignore it.
  NOTE: If the same group is specified in both `groups` and `optional_groups`, then it will be assumed to be
  required and not optional.
  remove_groups Remove groups that the user is a member of that weren't specified in the state, Default is True.
  home  The custom login directory of user. Uses default value of underlying system if not set. Notice that this
directory does not have to exist. This also the location of the home directory to create if createhome is
set to True.
  createhome [True] If set to False, the home directory will not be created if it doesn't already exist.
Warning: Not supported on Windows or Mac OS.
Additionally, parent directories will not be created. The parent directory for home must already exist.

password A password hash to set for the user. This field is only supported on Linux, FreeBSD, NetBSD, OpenBSD, and Solaris. If the empty_password argument is set to True then password is ignored. For Windows this is the plain text password. For Linux, the hash can be generated with openssl passwd -1.

Changed in version 0.16.0: BSD support added.
enforce_password Set to False to keep the password from being changed if it has already been set and the password hash differs from what is specified in the `password` field. This option will be ignored if `password` is not specified, Default is True.
empty_password Set to True to enable password-less login for user, Default is False.
shell The login shell, defaults to the system default shell
unique Require a unique UID, Default is True.
system Choose UID in the range of FIRST_SYSTEM_UID and LAST_SYSTEM_UID, Default is False.
loginclass The login class, defaults to empty (BSD only)

User comment field (GECOS) support (currently Linux, BSD, and MacOS only):
The below values should be specified as strings to avoid ambiguities when the values are loaded. (Especially the phone and room number fields which are likely to contain numeric data)

fullname The user's full name
roomnumber The user's room number (not supported in MacOS)
workphone The user's work phone number (not supported in MacOS)
homephone The user's home phone number (not supported in MacOS)

Changed in version 2014.7.0: Shadow attribute support added.

Shadow attributes support (currently Linux only):
The below values should be specified as integers.
date Date of last change of password, represented in days since epoch (January 1, 1970).
mindays The minimum number of days between password changes.
maxdays The maximum number of days between password changes.
inactdays The number of days after a password expires before an account is locked.
warndays Number of days prior to maxdays to warn users.
expire Date that account expires, represented in days since epoch (January 1, 1970).

The below parameters apply to windows only:
win_homedrive (Windows Only) The drive letter to use for the home directory. If not specified the home directory will be a unc path. Otherwise the home directory will be mapped to the specified drive. Must be a letter followed by a colon. Because of the colon, the value must be surrounded by single quotes. ie: - win_homedrive: `U:

Changed in version 2015.8.0.
win_profile (Windows Only) The custom profile directory of the user. Uses default value of underlying system if not set.

Changed in version 2015.8.0.
win_logonscript (Windows Only) The full path to the logon script to run when the user logs in.

Changed in version 2015.8.0.
win_description (Windows Only) A brief description of the purpose of the users account.

Changed in version 2015.8.0.
13.16.202 salt.states.vbox_guest

VirtualBox Guest Additions installer state

salt.states.vbox_guest.additions_installed(name, reboot=False, upgrade_os=False)
   Ensure that the VirtualBox Guest Additions are installed. Uses the CD, connected by VirtualBox.
   name The name has no functional value and is only used as a tracking reference.
   reboot [False] Restart OS to complete installation.
   upgrade_os [False] Upgrade OS (to ensure the latests version of kernel and developer tools installed).

salt.states.vbox_guest.additions_removed(name, force=False)
   Ensure that the VirtualBox Guest Additions are removed. Uses the CD, connected by VirtualBox.
   name The name has no functional value and is only used as a tracking reference.
   force Force VirtualBox Guest Additions removing.

salt.states.vbox_guest.grant_access_to_shared_folders_to(name, users=None)
   Grant access to auto-mounted shared folders to the users.
   User is specified by its name. To grant access for several users use argument users.
   name Name of the user to grant access to auto-mounted shared folders to.
   users List of names of users to grant access to auto-mounted shared folders to. If specified, name will not be taken into account.

13.16.203 salt.states.victorops

Create an Event in VictorOps

New in version 2015.8.0.

This state is useful for creating events on the VictorOps service during state runs.

webserver-warning-message:
   victorops.create_event:
      - message_type: 'CRITICAL'
      - entity_id: 'webserver/diskspace'
      - state_message: 'Webserver diskspace is low.'

salt.states.victorops.create_event(name, message_type, routing_key='everyone', **kwargs)
   Create an event on the VictorOps service

   webserver-warning-message:
      victorops.create_event:
         - message_type: 'CRITICAL'
         - entity_id: 'webserver/diskspace'
         - state_message: 'Webserver diskspace is low.'

   database-server-warning-message:
      victorops.create_event:
         - message_type: 'WARNING'
         - entity_id: 'db_server/load'
         - state_message: 'Database Server load is high.'
         - entity_is_host: True
         - entity_display_name: 'dbdserver.example.com'

The following parameters are required:
name  This is a short description of the event.
message_type  One of the following values: INFO, WARNING, ACKNOWLEDGEMENT, CRITICAL, RECOVERY.

The following parameters are optional:
  routing_key  The key for where messages should be routed. By default, sent to `everyone' route.
  entity_id  The name of alerting entity. If not provided, a random name will be assigned.
  timestamp  Timestamp of the alert in seconds since epoch. Defaults to the time the alert is received at VictorOps.
  timestamp_fmt  The date format for the timestamp parameter. Defaults to `%Y-%m-%dT%H:%M:%S'.
  state_start_time  The time this entity entered its current state (seconds since epoch). Defaults to the time alert is received.
  state_start_time_fmt  The date format for the timestamp parameter. Defaults to `%Y-%m-%dT%H:%M:%S'.
  state_message  Any additional status information from the alert item.
  entity_is_host  Used within VictorOps to select the appropriate display format for the incident.
  entity_display_name  Used within VictorOps to display a human-readable name for the entity.
  ack_message  A user entered comment for the acknowledgment.
  ack_author  The user that acknowledged the incident.

13.16.204  salt.states.virt module

Manage virt

For the key certificate this state uses the external pillar in the master to call for the generation and signing of certificates for systems running libvirt:

```python
libvirt_keys:
  virt.keys

salt.states.virt.keys(name, basepath='/etc/pki')
Manage libvirt keys.
  name  The name variable used to track the execution
  basepath  Defaults to /etc/pki, this is the root location used for libvirt keys on the hypervisor

salt.states.virt.powered_off(name)
Stops a VM by power off.
  New in version 2016.3.0.

  domain_name:
    virt.stopped

salt.states.virt.rebooted(name)
Reboots VMs
  New in version 2016.3.0.
    Parameters name --
    Returns

salt.states.virt.reverted(name, snapshot=None, cleanup=False)
Deprecation since version 2016.3.0.
Reverts to the particular snapshot.
  New in version 2016.3.0.
```
salt.states.virt.running(name, **kwargs)
   Starts an existing guest, or defines and starts a new VM with specified arguments.
   New in version 2016.3.0.

salt.states.virt.saved(name, suffix=None)
   Deprecated since version 2016.3.0: Use snapshot() instead.
   Takes a snapshot of a particular VM or by a UNIX-style wildcard.
   New in version 2016.3.0.

salt.states.virt.snapshot(name, suffix=None)
   Takes a snapshot of a particular VM or by a UNIX-style wildcard.
   New in version 2016.3.0.

salt.states.virt.stopped(name)
   Stops a VM by shutting it down nicely.
   New in version 2016.3.0.
salt.states.virt.unpowered(name)
    Deprecated since version 2016.3.0: Use powered_off() instead.
    Stops a VM by power off.
    New in version 2016.3.0.

    domain_name:
        virt.stopped

13.16.205 salt.states.virtualenv

Setup of Python virtualenv sandboxes.
New in version 0.17.0.

salt.states.virtualenv_mod.managed(name, venv_bin=None, requirements=None,
    system_site_packages=False, distribute=False,
    use_wheel=False, clear=False, python=None, extra_search_dir=None,
    never_download=False, prompt=None, user=None, no_chown=False,
    cwd=None, index_url=None, extra_index_url=None,
    pre_releases=False, no_deps=False, pip_download=None,
    pip_download_cache=None, pip_exists_action=None,
    pip_ignore_installed=False, proxy=None, use_vt=False,
    env_vars=None, no_use_wheel=False, pip_upgrade=False,
    pip_pkgs=None)

Create a virtualenv and optionally manage it with pip
name Path to the virtualenv.
requirements: None Path to a pip requirements file. If the path begins with salt:// the file will be transferred from the master file server.
use_wheel: False Prefer wheel archives (requires pip >= 1.4).
python [None] Python executable used to build the virtualenv
user: None The user under which to run virtualenv and pip.
no_chown: False When user is given, do not attempt to copy and chown a requirements file (needed if the requirements file refers to other files via relative paths, as the copy-and-chown procedure does not account for such files)
cwd: None Path to the working directory where pip install is executed.
no_deps: False Pass --no-deps to pip install.
pip_exists_action: None Default action of pip when a path already exists: (s)witch, (i)gnore, (w)ipe, (b)ackup.
proxy: None Proxy address which is passed to pip install.
env_vars: None Set environment variables that some builds will depend on. For example, a Python C-module may have a Makefile that needs INCLUDE_PATH set to pick up a header file while compiling.
no_use_wheel: False Force to not use wheel archives (requires pip>=1.4)
pip_upgrade: False Pass --upgrade to pip install.
pip_pkgs: None As an alternative to requirements, pass a list of pip packages that should be installed.
Also accepts any kwargs that the virtualenv module will. However, some kwargs, such as the pip option, require --distribute: True.

/var/www/myvirtualenv.com:
virtualenv.managed:
    - system_site_packages: False
    - requirements: salt://REQUIREMENTS.txt
13.16.206 salt.states.win_certutil module

Installing of certificates to the Windows Certificate Manager

Install certificates to the Windows Certificate Manager

```python
salt://certs/cert.cer:

  certutil.add_store:
    - store: TrustedPublisher
```

```python
salt.states.win_certutil.add_store(name, store, saltenv='base')
```

Store a certificate to the given store

- **name** The certificate to store, this can use local paths or salt:// paths
- **store** The store to add the certificate to
- **saltenv** The salt environment to use, this is ignored if a local path is specified

```python
salt.states.win_certutil.del_store(name, store, saltenv='base')
```

Remove a certificate in the given store

- **name** The certificate to remove, this can use local paths or salt:// paths
- **store** The store to remove the certificate from
- **saltenv** The salt environment to use, this is ignored if a local path is specified

13.16.207 salt.states.win_dacl

Windows Object Access Control Lists

Ensure an ACL is present

**parameters:**
- **name** - the path of the object
- **objectType** - Registry/File/Directory
- **user** - user account for the ace
- **permission** - permission for the ace (see module win_acl for available permissions for each objectType)
- **acetype** - Allow/Deny
- **propagation** - how the ACL should apply to child objects (see module win_acl for available propagation types)

```python
addAcl:
  win_dacl.present:
    - name: HKEY_LOCAL_MACHINE\SOFTWARE\mykey
    - objectType: Registry
    - user: FakeUser
    - permission: FullControl
    - acetype: ALLOW
    - propagation: KEY&SUBKEYS
```

Ensure an ACL does not exist

**parameters:**
- **name** - the path of the object
- **objectType** - Registry/File/Directory
- **user** - user account for the ace
- **permission** - permission for the ace (see module win_acl for available permissions for each objectType)
- **acetype** - Allow/Deny
- **propagation** - how the ACL should apply to child objects (see module win_acl for available propagation types)

```python
removeAcl:
  win_dacl.absent:
```

- **name** - HKEY_LOCAL_MACHINE\SOFTWARE\mykey
- **objectType** - Registry

Ensure an object is inheriting permissions

parameters: name - the path of the object objectType - Registry/File/Directory clear_existing_acl - True/False
- when inheritance is enabled, should the existing ACL be kept or cleared out

elnInherit:

win_dacl.enableinheritance:
  • name: HKEY_LOCAL_MACHINESOFTWAREmykey
  • objectType: Registry
  • clear_existing_acl: True

Ensure an object is not inheriting permissions

parameters: name - the path of the object objectType - Registry/File/Directory copy_inherited_acl - True/False - if inheritance is enabled, should the inherited permissions be copied to the ACL when inheritance is disabled

dlnInherit:

win_dacl.disableinheritance:
  • name: HKEY_LOCAL_MACHINESOFTWAREmykey
  • objectType: Registry
  • copy_inherited_acl: False

salt.states.win_dacl.absent(name, objectType, user, permission, acetype, propagation)
Ensure a Linux ACL does not exist

salt.states.win_dacl.disinherit(name, objectType, copy_inherited_acl=True)
Ensure an object is not inheriting ACLs from its parent

salt.states.win_dacl.inherit(name, objectType, clear_existing_acl=False)
Ensure an object is inheriting ACLs from its parent

salt.states.win_dacl.present(name, objectType, user, permission, acetype, propagation)
Ensure an ACE is present

13.16.208 salt.states.win_dism module

Installing of Windows features using DISM

Install windows features/capabilities with DISM
salt.states.win_dism.capability_installed(name, source=None, limit_access=False, image=None, restart=False)

Install a DISM capability

_ARGS:
- name (str): The capability to install source (str): The optional source of the capability limit_access (bool): Prevent DISM from contacting Windows Update for online images
- image (Optional[str]): The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
- restart (Optional[bool]): Reboot the machine if required by the install

_Example:_ Run `dism.available_capabilities` to get a list of available capabilities. This will help you get the proper name to use.

```bash
install_dotnet35:
  dism.capability_installed:
    - name: NetFX3
```

salt.states.win_dism.capability_removed(name, image=None, restart=False)

Uninstall a DISM capability

_ARGS:
- name (str): The capability to uninstall
- image (Optional[str]): The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
- restart (Optional[bool]): Reboot the machine if required by the install

_Example:_ Run `dism.installed_capabilities` to get a list of installed capabilities. This will help you get the proper name to use.

```bash
remove_dotnet35:
  dism.capability_removed:
    - name: NetFX3
```

salt.states.win_dism.feature_installed(name, package=None, source=None, limit_access=False, enable_parent=False, image=None, restart=False)

Install a DISM feature

_ARGS:
- name (str): The feature in which to install package (Optional[str]): The parent package for the feature. You do not have to specify the package if it is the Windows Foundation Package. Otherwise, use package to specify the parent package of the feature
- source (str): The optional source of the feature limit_access (bool): Prevent DISM from contacting Windows Update for online images
- enable_parent (Optional[bool]): True will enable all parent features of the specified feature
- image (Optional[str]): The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
- restart (Optional[bool]): Reboot the machine if required by the install

_Example:_ Run `dism.available_features` to get a list of available features. This will help you get the proper name to use.
install_telnet_client:
dism.feature_installed:
  - name: TelnetClient

salt.states.win_dism.feature_removed(name, remove_payload=False, image=None, restart=False)
Disables a feature.
Args: name (str): The feature to disable remove_payload (Optional[bool]): Remove the feature's payload. Must supply source when enabling in the future.
image (Optional[str]): The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
restart (Optional[bool]): Reboot the machine if required by the install
Example: Run dism.installed_features to get a list of installed features. This will help you get the proper name to use.

remove_telnet_client:
dism.feature_removed:
  - name: TelnetClient
  - remove_payload: True

salt.states.win_dism.package_installed(name, ignore_check=False, prevent_pending=False, image=None, restart=False)
Install a package.
Args:
  name (str): The package to install. Can be a .cab file, a .msu file, or a folder
  ignore_check (Optional[bool]): Skip installation of the package if the applicability checks fail
  prevent_pending (Optional[bool]): Skip the installation of the package if there are pending online actions
  image (Optional[str]): The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
  restart (Optional[bool]): Reboot the machine if required by the install
Example:

install_KB123123123:
dism.package_installed:
  - name: C:\Packages\KB123123123.cab

salt.states.win_dism.package_removed(name, image=None, restart=False)
Uninstall a package
Args:
  name (str): The full path to the package. Can be either a .cab file or a folder. Should point to the original source of the package, not to where the file is installed. This can also be the name of a package as listed in dism.installed_packages
  image (Optional[str]): The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
  restart (Optional[bool]): Reboot the machine if required by the install
Example:

# Example using source
remove_KB1231231:
dism.package_installed:
  - name: C:\Packages\KB1231231.cab

# Example using name from `dism.installed_packages`
remove_KB1231231:
13.16.209 `salt.states.win_dns_client`

Module for configuring DNS Client on Windows systems

```python
salt.states.win_dns_client.dns_dhcp(name, interface='Local Area Connection')
```

Configure the DNS server list from DHCP Server

```python
salt.states.win_dns_client.dns_exists(name, servers=None, interface='Local Area Connection', replace=False)
```

Configure the DNS server list in the specified interface

Example:

```
config_dns_servers:
    win_dns_client.dns_exists:
        - replace: True  #remove any servers not in the "servers" list, default is False
        - servers:
            - 8.8.8.8
            - 8.8.8.9
```

```
salt.states.win_dns_client.primary_suffix(name, suffix=None, updates=False)
```

New in version 2014.7.0.

Configure the global primary DNS suffix of a DHCP client.

- `suffix` [None] The suffix which is advertised for this client when acquiring a DHCP lease When none is set, the explicitly configured DNS suffix will be removed.
- `updates` [False] Allow syncing the DNS suffix with the AD domain when the client’s AD domain membership changes

```
primary_dns_suffix:
    win_dns_client.primary_suffix:
        - suffix: sub.domain.tld
        - updates: True
```

13.16.210 `salt.states.win_firewall`

State for configuring Windows Firewall

```
salt.states.win_firewall.add_rule(name, localport, protocol='tcp', action='allow', dir='in')
```

Add a new firewall rule (Windows only)

```
salt.states.win_firewall.disabled(name)
```

Disable all the firewall profiles (Windows only)

13.16.211 `salt.states.win_iis module`

Microsoft IIS site management

This module provides the ability to add/remove websites and application pools from Microsoft IIS.

New in version 2016.3.0.
salt.states.win_iis.create_apppool(name)
    Creates an IIS application pool.
    **name**  The name of the application pool to use

salt.states.win_iis.deployed(name, protocol, sourcepath, port, apppool='__', hostheader='__', ipaddress='__')
    Ensure the website has been deployed. This only validates against the website name and will not update
    information on existing websites with the same name. If the website name doesn't exist it will create with the
    provided parameters.
    **name**  Name of the website in IIS.
    **protocol**  http or https
    **sourcepath**  The directory path on the IIS server to use as a root file store. example: c:websiteswebsite1
    **port**  The network port to listen for traffic. example: 80
    **apppool**  The application pool to configure for the website. Must already exist.
    **hostheader**  The hostheader to route to this website.
    **ipaddress**  The website ipaddress

salt.states.win_iis.remove_apppool(name)
    Removes an existing Application Pool from the server
    **name**  The name of the application pool to remove

salt.states.win_iis.remove_site(name)
    Remove an existing website from the webserver.
    **name**  The website name as shown in IIS.

13.16.212  salt.states.win_license module

Installation and activation of windows licenses

Install and activate windows licenses

```
XXXXX-XXXXX-XXXXX-XXXXX-XXXXX:
    license.activate
```

salt.states.win_license.activate(name)
    Install and activate the given product key
    **name**  The 5x5 product key given to you by Microsoft

13.16.213  salt.states.win_network

Configuration of network interfaces on Windows hosts

New in version 2014.1.0.

This module provides the network state(s) on Windows hosts. DNS servers, IP addresses and default gateways can
currently be managed.

Below is an example of the configuration for an interface that uses DHCP for both DNS servers and IP addresses:

```
Local Area Connection #2:
    network.managed:
    - dns_proto: dhcp
    - ip_proto: dhcp
```
Note: Both the `dns_proto` and `ip_proto` arguments are required.

Static DNS and IP addresses can be configured like so:

```
Local Area Connection #2:
  network.managed:
    - dns_proto: static
    - dns_servers:
      - 8.8.8.8
      - 8.8.4.4
    - ip_proto: static
    - ip_addrs:
      - 10.2.3.4/24
```

Note: IP addresses are specified using the format `<ip-address>/<subnet-length>`. Salt provides a convenience function called `ip.get_subnet_length` to calculate the subnet length from a netmask.

Optionally, if you are setting a static IP address, you can also specify the default gateway using the `gateway` parameter:

```
Local Area Connection #2:
  network.managed:
    - dns_proto: static
    - dns_servers:
      - 8.8.8.8
      - 8.8.4.4
    - ip_proto: static
    - ip_addrs:
      - 10.2.3.4/24
    - gateway: 10.2.3.1
```

```
salt.states.win_network.managed(name, dns_proto=None, dns_servers=None, ip_proto=None, ip_addrs=None, gateway=None, enabled=True, **kwargs)
```

Ensure that the named interface is configured properly.

- `name` The name of the interface to manage
- `dns_proto` [None] Set to `static` and use the `dns_servers` parameter to provide a list of DNS name-servers. set to `dhcp` to use DHCP to get the DNS servers.
- `dns_servers` [None] A list of static DNS servers.
- `ip_proto` [None] Set to `static` and use the `ip_addrs` and (optionally) `gateway` parameters to provide a list of static IP addresses and the default gateway. Set to `dhcp` to use DHCP.
- `ip_addrs` [None] A list of static IP addresses.
- `gateway` [None] A list of static IP addresses.
- `enabled` [True] Set to `False` to ensure that this interface is disabled.

### 13.16.214 salt.states.win_path

Manage the Windows System PATH

```
salt.states.win_path.absent(name)
```

Remove the directory from the SYSTEM path

- `index`: where the directory should be placed in the PATH (default: 0)

Example:
Salt Documentation, Release 2016.3.6

```python
'C:\sysinternals':
    win_path.absent
salt.states.win_path.exists(name, index=None)
    Add the directory to the system PATH at index location
    index: where the directory should be placed in the PATH (default: None) [Note: Providing no index will append directory to PATH and will not enforce its location within the PATH.]
    Example:

'C:\python27':
    win_path.exists
'C:\sysinternals':
    win_path.exists:
        index: 0
```

13.16.215 salt.states.win_powercfg

This module allows you to control the power settings of a windows minion via powercfg.

New in version 2015.8.0.

```python
monitor:
    powercfg.set_timeout:
        - value: 30
        - power: dc
salt.states.win_powercfg.set_timeout(name, value, power='ac')
    Set the sleep timeouts of specific items such as disk, monitor.
    CLI Example:

monitor:
    powercfg.set_timeout:
        - value: 30
        - power: dc
disk:
    powercfg.set_timeout:
        - value: 12
        - power: ac
```

**name** The setting to change, can be one of the following: monitor, disk, standby, hibernate

**timeout** The amount of time in minutes before the item will timeout i.e the monitor

**power** Should we set the value for AC or DC (battery)? Valid options ac,dc.

13.16.216 salt.states.win_servermanager

Manage Windows features via the ServerManager powershell module

```python
salt.states.win_servermanager.installed(name, recurse=False, force=False, source=None, restart=False, exclude=None)
    Install the windows feature
```

13.16. state modules 2219
name (str): Short name of the feature (the right column in win_servermanager.list_available)
recurse (Optional[bool]): install all sub-features as well force (Optional[bool]): if the feature is installed but one of its sub-features are not installed set this to True to force the installation of the sub-features
source (Optional[str]): Path to the source files if missing from the target system. None means that the system will use windows update services to find the required files. Default is None
restart (Optional[bool]): Restarts the computer when installation is complete, if required by the role/feature installed. Default is False
exclude (Optional[str]): The name of the feature to exclude when installing the named feature.

Note: Some features require reboot after un/installation. If so, until the server is restarted other features can not be installed!

Example: Run salt MinionName win_servermanager.list_available to get a list of available roles and features. Use the name in the right column. Do not use the role or feature names mentioned in the PKGMGR documentation. In this example for IIS-WebServerRole the name to be used is Web-Server.

```
ISWebserverRole:
  win_servermanager.installed:
    - force: True
    - recurse: True
    - name: Web-Server
```

salt.states.win_servermanager.removed(name, remove_payload=False, restart=False)
Remove the windows feature

Args:
  name (str): Short name of the feature (the right column in win_servermanager.list_available)
  remove_payload (Optional[bool]): True will case the feature to be removed from the side-by-side store
  restart (Optional[bool]): Restarts the computer when unistall is complete, if required by the role/feature removed. Default is False

Note: Some features require a reboot after unistallation. If so the feature will not be completely uninstalled until the server is restarted.

Example: Run salt MinionName win_servermanager.list_installed to get a list of all features installed. Use the top name listed for each feature, not the indented one. Do not use the role or feature names mentioned in the PKGMGR documentation.

```
ISWebserverRole:
  win_servermanager.removed:
    - name: Web-Server
```

13.16.217 salt.states.win_system

Management of Windows system information

New in version 2014.1.0.

This state is used to manage system information such as the computer name and description.

```
ERIK-WORKSTATION:
  system.computer_name: []
  system.computer_desc: []
```

This is Erik's computer, don't touch!
salt.states.win_system.computer_desc(name)
    Manage the computer's description field
    name  The desired computer description

salt.states.win_system.computer_name(name)
    Manage the computer's name
    name  The desired computer name

salt.states.win_system.hostname(name)
    New in version 2016.3.0.
    Manage the hostname of the computer
    name  The hostname to set

13.16.218  salt.states.win_update

Management of the windows update agent

New in version 2014.7.0.
Set windows updates to run by category. Default behavior is to install all updates that do not require user interaction to complete.
Optionally set category to a category of your choice to only install certain updates. Default is to set to install all available updates.
The following example will install all Security and Critical Updates, and download but not install standard updates.

```
updates:
    win_update.installed:
        - categories:
          - 'Critical Updates'
          - 'Security Updates'
        - skips:
          - downloaded
    win_update.downloaded:
        - categories:
          - 'Updates'
        - skips:
          - downloaded
```

You can also specify a number of features about the update to have a fine grain approach to specific types of updates. These are the following features/states of updates available for configuring:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'UI'</td>
<td>User interaction required, skipped by default</td>
</tr>
<tr>
<td>'downloaded'</td>
<td>Already downloaded, included by default</td>
</tr>
<tr>
<td>'present'</td>
<td>Present on computer, skipped by default</td>
</tr>
<tr>
<td>'installed'</td>
<td>Already installed, skipped by default</td>
</tr>
<tr>
<td>'reboot'</td>
<td>Reboot required, included by default</td>
</tr>
<tr>
<td>'hidden'</td>
<td>Skip updates that have been hidden, skipped by default</td>
</tr>
<tr>
<td>'software'</td>
<td>Software updates, included by default</td>
</tr>
<tr>
<td>'driver'</td>
<td>driver updates, included by default</td>
</tr>
</tbody>
</table>

The following example installs all driver updates that don't require a reboot: .. code-block:: yaml

```
gryffindor:
    win_update.installed:
```

13.16.  state modules
Skips: - driver: True - software: False - reboot: False

To just update your Windows machine, add this to your sls:

```yaml
class salt.states.win_update.PyWinUpdater:
    updates:
        win_update.installed
```

class 

salt.states.win_update.

PyWinUpdater:

categories=None, skipUI=True, skipDownloaded=False, skipInstalled=True, skipReboot=False, skipPresent=False, skipSoftwareUpdates=False, skipDriverUpdates=False, skipHidden=True)

AutoSearch()

Download()

GetAvailableCategories()

GetCategories()

GetDownloadResults()

GetInstallationResults()

Install()

Search(searchString)

SetCategories(categories)

SetSkip(skip, state)

SetSkips(skips)

salt.states.win_update.

downloaded(name, categories=None, skips=None, retries=10)

Cache updates for later install.

name: if categories is left empty, it will be assumed that you are passing the category option through the name. These are separate because you can only have one name, but can have multiple categories.

categories: the list of categories to be downloaded. These are simply strings in the update's information, so there is no enumeration of the categories available. Some known categories:

- Updates
- Windows 7
- Critical Updates
- Security Updates
- Update Rollups

skips: a list of features of the updates to cull by. Available features:

- 'UI' - User interaction required, skipped by default
- 'downloaded' - Already downloaded, skipped by default (downloading)
- 'present' - Present on computer, included by default (installing)
- 'installed' - Already installed, skipped by default
- 'reboot' - Reboot required, included by default
- 'hidden' - skip those updates that have been hidden.
- 'software' - Software updates, included by default
- 'driver' - driver updates, skipped by default

retries Number of retries to make before giving up. This is total, not per step.

salt.states.win_update.

installed(name, categories=None, skips=None, retries=10)

Install specified Windows updates.

name: if categories is left empty, it will be assumed that you are passing the category option through the name. These are separate because you can only have one name, but can have multiple categories.
categories: the list of categories to be downloaded. These are simply strings in the update's information, so there is no enumeration of the categories available. Some known categories:

<table>
<thead>
<tr>
<th>Updates</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows 7</td>
</tr>
<tr>
<td>Critical Updates</td>
</tr>
<tr>
<td>Security Updates</td>
</tr>
<tr>
<td>Update Rollups</td>
</tr>
</tbody>
</table>

skips: a list of features of the updates to cull by. Available features:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'UI'</td>
<td>User interaction required, skipped by default</td>
</tr>
<tr>
<td>'downloaded'</td>
<td>Already downloaded, skipped by default (downloading)</td>
</tr>
<tr>
<td>'present'</td>
<td>Present on computer, included by default (installing)</td>
</tr>
<tr>
<td>'installed'</td>
<td>Already installed, skipped by default</td>
</tr>
<tr>
<td>'reboot'</td>
<td>Reboot required, included by default</td>
</tr>
<tr>
<td>'hidden'</td>
<td>Skip those updates that have been hidden</td>
</tr>
<tr>
<td>'software'</td>
<td>Software updates, included by default</td>
</tr>
<tr>
<td>'driver'</td>
<td>Driver updates, skipped by default</td>
</tr>
</tbody>
</table>

retries: Number of retries to make before giving up. This is total, not per step.

13.16.219 salt.states.winrepo

Manage Windows Package Repository

salt.states.winrepo.genrepo(name, force=False, allow_empty=False)

Refresh the winrepo.p file of the repository (salt-run winrepo.genrepo)

If force is True no checks will be made and the repository will be generated if allow_empty is True then the state will not return an error if there are 0 packages.

Note: This state only loads on minions that have the roles: salt-master grain set.

Example:

```
winrepo:
    winrepo.genrepo
```

13.16.220 salt.states.x509

Manage X509 Certificates

New in version 2015.8.0.

This module can enable managing a complete PKI infrastructure including creating private keys, CAs, certificates and CRLs. It includes the ability to generate a private key on a server, and have the corresponding public key sent to a remote CA to create a CA signed certificate. This can be done in a secure manner, where private keys are always generated locally and never moved across the network.

Here is a simple example scenario. In this example ca is the ca server, and www is a web server that needs a certificate signed by ca.

For remote signing, peers must be permitted to remotely call the sign_remote_certificate function.

/etc/salt/master.d/peer.conf
peer:
  .*:
    - x509.sign_remote_certificate

/srv/salt/top.sls

base:
  'x':
    - cert
  'ca':
    - ca
  'www':
    - www

This state creates the CA key, certificate and signing policy. It also publishes the certificate to the mine where it can be easily retrieved by other minions.

/srv/salt/ca.sls

salt-minion:
  service.running:
    - enable: True
    - listen:
      - file: /etc/salt/minion.d/signing_policies.conf

/etc/salt/minion.d/signing_policies.conf:
  file.managed:
    - source: salt://signing_policies.conf

/etc/pki:
  file.directory: []

/etc/pki/issued_certs:
  file.directory: []

/etc/pki/ca.key:
  x509.private_key_managed:
    - bits: 4096
    - backup: True
    - require:
      - file: /etc/pki

/etc/pki/ca.crt:
  x509.certificate_managed:
    - signing_private_key: /etc/pki/ca.key
    - CN: ca.example.com
    - C: US
    - ST: Utah
    - L: Salt Lake City
    - basicConstraints: "critical CA:true"
    - keyUsage: "critical cRLSign, keyCertSign"
    - subjectKeyIdentifier: hash
    - authorityKeyIdentifier: keyid,issuer:always
    - days_valid: 3650
    - days_remaining: 0
    - backup: True
    - require:
      - x509: /etc/pki/ca.key
The signing policy defines properties that override any property requested or included in a CRL. It also can define a restricted list of minions which are allowed to remotely invoke this signing policy.

```
x509_signing_policies:
  www:
    minions: 'www'
    signing_private_key: /etc/pki/ca.key
    signing_cert: /etc/pki/ca.crt
    C: US
    ST: Utah
    L: Salt Lake City
    basicConstraints: "critical CA:false"
    keyUsage: "critical keyEncipherment"
    subjectKeyIdentifier: hash
    authorityKeyIdentifier: keyid,issuer:always
    days_valid: 90
    copypath: /etc/pki/issued_certs/
```

This state will instruct all minions to trust certificates signed by our new CA. Using jinja to strip newlines from the text avoids dealing with newlines in the rendered yaml, and the `sign_remote_certificate` state will handle properly formatting the text before writing the output.

```
/usr/local/share/ca-certificates:
  file.directory: []
/usr/local/share/ca-certificates/intca.crt:
  x509.pem_managed:
    - text: {{ salt['mine.get']('ca', 'x509.get_pem_entries')['ca']['/etc/pki/ca.crt'] | replace('
', '') }}
```

This state creates a private key then requests a certificate signed by ca according to the www policy.

```
/etc/pki/www.key:
  x509.private_key_managed:
    - bits: 4096

/etc/pki/www.crt:
  x509.certificate_managed:
    - ca_server: ca
    - signing_policy: www
    - public_key: /etc/pki/www.key
    - CN: www.example.com
    - days_remaining: 30
    - backup: True
```
salt.states.x509.certificate_managed(name, days_remaining=90, backup=False, **kwargs)
Manage a Certificate
name: Path to the certificate
days_remaining: The minimum number of days remaining when the certificate should be recreated. Default is 90. A value of 0 disables automatic renewal.
backup: When replacing an existing file, backup the old file on the minion. Default is False.
kwargs: Any arguments supported by x509.create_certificate are supported.
Examples:

```
/etc/pki/ca.crt:
x509.certificate_managed:
    - signing_private_key: /etc/pki/ca.key
    - CN: ca.example.com
    - C: US
    - ST: Utah
    - L: Salt Lake City
    - basicConstraints: "critical CA:true"
    - keyUsage: "critical cRLSign, keyCertSign"
    - subjectKeyIdentifier: hash
    - authorityKeyIdentifier: keyid,issuer:always
    - days_valid: 3650
    - days_remaining: 0
    - backup: True
```

```
/etc/ssl/www.crt:
x509.certificate_managed:
    - ca_server: pki
    - signing_policy: www
    - public_key: /etc/ssl/www.key
    - CN: www.example.com
    - days_valid: 90
    - days_remaining: 30
    - backup: True
```

salt.states.x509.crl_managed(name, signing_private_key, signing_cert=None, revoked=None, days_valid=100, digest='*', days_remaining=30, include_expired=False, backup=False)
Manage a Certificate Revocation List
name: Path to the certificate
signing_private_key: The private key that will be used to sign this crl. This is usually your CA's private key.
signing_cert: The certificate of the authority that will be used to sign this crl. This is usually your CA's certificate.
revoked: A list of certificates to revoke. Must include either a serial number or a the certificate itself. Can optionally include the revocation date and notAfter date from the certificate. See example below for details.
days_valid: The number of days the certificate should be valid for. Default is 100.
digest: The digest to use for signing the CRL. This has no effect on versions of pyOpenSSL less than 0.14
days_remaining: The crl should be automatically recreated if there are less than days_remaining days until the crl expires. Set to 0 to disable automatic renewal. Default is 30.
include_expired: Include expired certificates in the CRL. Default is False.
backup: When replacing an existing file, backup the old file on the minion. Default is False.
Example:
/etc/pki/ca.crl:
  x509.crl_managed:
    - signing_private_key: /etc/pki/myca.key
    - signing_cert: /etc/pki/myca.crt
    - revoked:
      - compromised_web_key:
        - certificate: /etc/pki/certs/badweb.crt
        - revocation_date: 2015-03-01 00:00:00
        - reason: keyCompromise
      - terminated_vpn_user:
        - serial_number: D6:D2:DC:D8:4D:5C:C0:F4
        - not_after: 2016-01-01 00:00:00
        - revocation_date: 2015-02-25 00:00:00
        - reason: cessationOfOperation

salt.states.x509.csr_managed(name, backup=False, **kwargs)
Manage a Certificate Signing Request
name: Path to the CSR
properties: The properties to be added to the certificate request, including items like subject, extensions and public key. See above for valid properties.
Example:

/etc/pki/mycert.csr:
  x509.csr_managed:
    - private_key: /etc/pki/mycert.key
    - CN: www.example.com
    - C: US
    - ST: Utah
    - L: Salt Lake City
    - keyUsage: 'critical dataEncipherment'

salt.states.x509.pem_managed(name, text, backup=False)
Manage the contents of a PEM file directly with the content in text, ensuring correct formatting.
name: The path to the file to manage
text: The PEM formatted text to write.
backup: When replacing an existing file, backup the old file on the minion. Default is False.

salt.states.x509.private_keyManaged(name, bits=2048, new=False, backup=False)
Manage a private key's existence.
name: Path to the private key
bits: Key length in bits. Default 2048.
new: Always create a new key. Defaults to False. Combining new with prereq can allow key rotation whenever a new certificate is generated.
backup: When replacing an existing file, backup the old file on the minion. Default is False.
Example:
The jinja templating in this example ensures a private key is generated if the file doesn't exist and that a new private key is generated whenever the certificate that uses it is to be renewed.

/etc/pki/www.key:
  x509.private_keyManaged:
    - bits: 4096
    - new: True
    {% if salt['file.file_exists']('/etc/pki/ca.key') -%}
    - prereq:
      - x509: /etc/pki/www.crt
    {% endif %}
13.16.221 salt.states.xmpp

Sending Messages over XMPP

New in version 2014.1.0.

This state is useful for firing messages during state runs, using the XMPP protocol

```python
server-warning-message:
    xmpp.send_msg:
        - name: 'This is a server warning message'
        - profile: my-xmpp-account
        - recipient: admins@xmpp.example.com/salt
```

salt.states.xmpp.send_msg(name, recipient, profile)

Send a message to an XMPP user

```python
server-warning-message:
    xmpp.send_msg:
        - name: 'This is a server warning message'
        - profile: my-xmpp-account
        - recipient: admins@xmpp.example.com/salt
```

**name** The message to send to the XMPP user

salt.states.xmpp.send_msg_multi(name, profile, recipients=None, rooms=None)

Send a message to an list of recipients or rooms

```python
server-warning-message:
    xmpp.send_msg:
        - name: 'This is a server warning message'
        - profile: my-xmpp-account
        - recipients:
        - admins@xmpp.example.com/salt
        - rooms:
        - qa@conference.xmpp.example.com
```

**name** The message to send to the XMPP user

13.16.222 salt.states.zabbix_host module

Management of Zabbix hosts.

**codeauthor** Jiri Kotlin <jiri.kotlin@ultimum.io>

salt.states.zabbix_host.absent(name)

Ensures that the host does not exists, eventually deletes host.

**Args:**

- **name:** technical name of the host

salt.states.zabbix_host.present(host, groups, interfaces, **kwargs)

Ensures that the host exists, eventually creates new host.

**NOTE:** please use argument visible_name instead of name to not mess with name from salt sls

**Args:**

- **host:** technical name of the host groups: groupids of host groups to add the host to interfaces: interfaces to be created for the host

**optional kwargs:**

- **_connection_user:** zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password:** zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url:** url of zabbix frontend (can also be set in opts or pillar, see module's docstring)
visible_name: string with visible name of the host, use `visible_name' instead of `name' parameter to not mess with value supplied from Salt sls file.

all standard host properties: keyword argument names differ depending on your zabbix version, see:

https://www.zabbix.com/documentation/2.4/manual/api/reference/host/object#host

13.16.223 salt.states.zabbix_hostgroup module

Management of Zabbix host groups.

codeauthor Jiri Kotlin <jiri.kotlin@ultimum.io>

salt.states.zabbix_hostgroup.absent(name)
Ensures that the host group does not exist, eventually delete host group.

Args:
name: name of the host group

salt.states.zabbix_hostgroup.present(name)
Ensures that the host group exists, eventually creates new host group.

Args:
name: name of the host group

13.16.224 salt.states.zabbix_user module

Management of Zabbix users.

codeauthor Jiri Kotlin <jiri.kotlin@ultimum.io>

salt.states.zabbix_user.absent(name)
Ensures that the user does not exist, eventually delete user.

Args:
name: user alias

salt.states.zabbix_user.present(alias, passwd, usgrps, **kwargs)
Ensures that the user exists, eventually creates new user.

NOTE: use argument firstname instead of name to not mess values with name from salt sls

Args:
alias: user alias passwd: user's password usgrps: user groups to add the user to
optional kwargs:

_connection_user: zabbix user (can also be set in opts or pillar, see execution module's docstring)

_connection_password: zabbix password (can also be set in opts or pillar, see execution module's docstring)

_connection_url: url of zabbix frontend (can also be set in opts or pillar, see execution module's docstring)

firstname: string with firstname of the user, use `firstname' instead of `name' parameter to not mess with value supplied from Salt sls file.

13.16.225 salt.states.zabbix_usergroup module

Management of Zabbix user groups.

codeauthor Jiri Kotlin <jiri.kotlin@ultimum.io>

salt.states.zabbix_usergroup.absent(name)
Ensures that the user group does not exist, eventually delete user group.
Args: name: name of the user group

**salt.states.zabbix_usergroup**.present(name, **kwargs)

Creates new user.

Args: alias: user alias passwd: user's password usrgrps: user groups to add the user to

Optional kwargs:

- _connection_user: zabbix user (can also be set in opts or pillar, see execution module's docstring)
- _connection_password: zabbix password (can also be set in opts or pillar, see execution module's docstring)
- _connection_url: url of zabbix frontend (can also be set in opts or pillar, see execution module's docstring)

All standard user group properties: keyword argument names differ depending on your zabbix version, see:

https://www.zabbix.com/documentation/2.0/manual/appendix/api/usergroup/definitions#user_group

### 13.16.226 salt.states.zcbuildout

**Management of zc.buildout**

This module is inspired from minitage's buildout maker ([https://github.com/minitage/minitage/blob/master/src/minitage/core/makers/buildout.py](https://github.com/minitage/minitage/blob/master/src/minitage/core/makers/buildout.py))

New in version 2016.3.0.

**Note:** This state module is beta; the API is subject to change and no promise as to performance or functionality is yet present

**Available Functions**

- built

```python
installed1
    buildout.installed:
    - name: /path/to/buildout

installed2
    buildout.installed:
    - name: /path/to/buildout
    - parts:
      - a
      - b
    - python: /path/to/pythonpath/bin/python
    - unless: /bin/test_something_installed
    - onlyif: /bin/test_else_installed
```
salt.states.zcbuildout.installed(name, config='buildout.cfg', quiet=False, parts=None, user=None, env=(), buildout_ver=None, distribute=None, offline=False, newest=False, python='/usr/bin/python', debug=False, verbose=False, unless=None, onlyif=None, use_vt=False, loglevel='debug', **kwargs)

Install buildout in a specific directory

It is a thin wrapper to modules.buildout.buildout

name directory to execute in
quiet
do not output console & logs
config buildout config to use (default: buildout.cfg)
parts specific buildout parts to run
user user used to run buildout as

New in version 2014.1.4.

env environment variables to set when running
buildout_ver force a specific buildout version (1 | 2)
test_release buildout accept test release
new_st Forcing use of setuptools >= 0.7
distribute use distribute over setuptools if possible
offline does buildout run offline
python python to use
debug run buildout with -D debug flag
onlyif Only execute cmd if statement on the host return 0
unless Do not execute cmd if statement on the host return 0
newest run buildout in newest mode
verbose run buildout in verbose mode (-vvvvv)
use_vt Use the new salt VT to stream output [experimental]
loglevel loglevel for buildout commands

13.16.227 salt.states.zenoss

State to manage monitoring in Zenoss.

New in version 2016.3.0.

This state module depends on the `zenoss' Salt execution module.

Allows for setting a state of minions in Zenoss using the Zenoss API. Currently Zenoss 4.x is supported.

```yaml
enable_monitoring:
  zenoss.monitored:
    - name: web01.example.com
    - device_class: /Servers/Linux
    - collector: localhost
    - prod_state: 1000
```

salt.states.zenoss.monitored(name, device_class=None, collector='localhost', prod_state=None)

Ensure a device is monitored. The `name' given will be used for Zenoss device name and should be resolvable.

```yaml
enable_monitoring:
  zenoss.monitored:
    - name: web01.example.com
    - device_class: /Servers/Linux
```
13.16.228 salt.states.zk_concurrency

Control concurrency of steps within state execution using zookeeper

This module allows you to "wrap" a state's execution with concurrency control. This is useful to protect against all hosts executing highstate simultaneously if your services don't all HUP restart. The common way of protecting against this is to run in batch mode, but that doesn't protect from another person running the same batch command (and thereby having 2x the number of nodes deploying at once).

This module will block while acquiring a slot, meaning that however the command gets called it will coordinate with zookeeper to ensure that no more than max_concurrency steps are executing with a single path.

```yaml
acquire_lock:
  zk_concurrency.lock:
    - name: /trafficeserver
    - zk_hosts: 'zookeeper:2181'
    - max_concurrency: 4
    - prereq:
      - service: trafficserver

trafficserver:
  service.running:
    - watch:
      - file: /etc/trafficserver/records.config

/etc/trafficserver/records.config:
  file.managed:
    - source: salt://records.config

release_lock:
  zk_concurrency.unlock:
    - name: /trafficeserver
    - require:
      - service: trafficserver
```

This example would allow the file state to change, but would limit the concurrency of the trafficserver service restart to 4.

```python
salt.states.zk_concurrency.lock(name, zk_hosts, identifier=None, max_concurrency=1, timeout=None, ephemeral_lease=False)
```

Block state execution until you are able to get the lock (or hit the timeout)

```python
salt.states.zk_concurrency.min_party(name, zk_hosts, min_nodes)
```

Ensure that there are min_nodes in the party at name.

```python
salt.states.zk_concurrency.unlock(name, zk_hosts=None, identifier=None, max_concurrency=1, ephemeral_lease=False)
```

Remove lease from semaphore.

13.16.229 salt.states.zfs

Management zfs datasets
maintainer  Jorge Schrauwen <sjorge@blackdot.be>
maturity new
depends zfs
platform smartos, illumos, solaris, freebsd, linux

New in version 2016.3.0.

```yaml
# Test shares/yuki:
zfs.filesystem_present:
  - create_parent: true
  - properties:
    quota: 16G

# Test iscsi/haruhi:
zfs.volume_present:
  - create_parent: true
  - volume_size: 16M
  - sparse: true
  - properties:
    readonly: on

# Test shares/yuki@frozen:
zfs.snapshot_present

# Moka Origin:
zfs.hold_present
  - snapshot: test/shares/yuki@frozen

# Test shares/moka:
zfs.filesystem_present:
  - cloned_from: test/shares/yuki@frozen

# Test shares/moka@tsukune:
zfs.snapshot_absent
```

```python
salt.states.zfs.bookmark_absent(name, force=False, recursive=False)
  ensure bookmark is absent on the system
  name [string] name of snapshot
  force [boolean] try harder to destroy the dataset (zfs destroy -f)
  recursive [boolean] also destroy all the child datasets (zfs destroy -r)

salt.states.zfs.bookmark_present(name, snapshot)
  ensure bookmark exists
  name [string] name of bookmark
  snapshot [string] name of snapshot

salt.states.zfs.filesystem_absent(name, force=False, recursive=False)
  ensure filesystem is absent on the system
  name [string] name of filesystem
  force [boolean] try harder to destroy the dataset (zfs destroy -f)
  recursive [boolean] also destroy all the child datasets (zfs destroy -r)
.
  warning:
  If a volume with name exists, this state will succeed without destroying the volume specified by
  name. This module is dataset type sensitive.

salt.states.zfs.filesystem_present(name, create_parent=False, properties=None, cloned_from=None)
```

13.16. state modules
ensure filesystem exists and has properties set
name [string] name of filesystem
create_parent [boolean] creates all the non-existing parent datasets. any property specified on the command
  line using the -o option is ignored.
cloned_from [string] name of snapshot to clone
properties [dict] additional zfs properties (-o)

Note: cloned_from is only use if the filesystem does not exist yet, when cloned_from is set after the
  filesystem exists it will be ignored.

Note: Properties do not get cloned, if you specify the properties in the state file they will be applied on a
  subsequent run.

salt.states.zfs.hold_absent(name, snapshot, recursive=False)
  ensure hold is absent on the system
  name [string] name of hold
  snapshot [string] name of snapshot
  recursive [boolean] recursively releases a hold with the given tag on the snapshots of all descendent file
  systems.

salt.states.zfs.hold_present(name, snapshot, recursive=False)
  ensure hold is present on the system
  name [string] name of hold
  snapshot [string] name of snapshot
  recursive [boolean] recursively add hold with the given tag on the snapshots of all descendent file systems.

salt.states.zfs.promoted(name)
  ensure a dataset is not a clone
  name [string] name of fileset or volume

..warning:: only one dataset can be the origin,
if you promote a clone the original will now point to the promoted dataset

salt.states.zfs.scheduled_snapshot(name, prefix, recursive=True, schedule=None)
  maintain a set of snapshots based on a schedule
  name [string] name of filesystem or volume
  prefix [string] prefix for the snapshots e.g. 'test' will result in snapshots being named 'test-
    YYYYMMDD_HHMM'
  recursive [boolean] create snapshots for all children also
  schedule [dict] dict holding the schedule, the following keys are available (minute, hour, day, month, and
    year) by default all are set to 0 the value indicated the number of snapshots of that type to keep around.
  ..warning::
  snapshots will only be created and pruned every time the state runs.
a schedule must be setup to automatically run the state. this means that if
  you run the state daily the hourly snapshot will only be made once per day!

salt.states.zfs.snapshot_absent(name, force=False, recursive=False)
  ensure snapshot is absent on the system
  name [string] name of snapshot
  force [boolean] try harder to destroy the dataset (zfs destroy -f)
  recursive [boolean] also destroy all the child datasets (zfs destroy -r)
salt.states.zfs.snapshot_present(name, recursive=False, properties=None)
ensure snapshot exists and has properties set
name [string] name of snapshot
recursive [boolean] recursively create snapshots of all descendent datasets
properties [dict] additional zfs properties (-o)

salt.states.zfs.volume_absent(name, force=False, recursive=False)
ensure volume is absent on the system
name [string] name of volume
force [boolean] try harder to destroy the dataset (zfs destroy -f)
recursive [boolean] also destroy all the child datasets (zfs destroy -r)
..warning:
   If a filesystem with name exists, this state will succeed without destroying the filesystem specified by name. This module is dataset type sensitive.

salt.states.zfs.volume_present(name, volume_size, sparse=False, create_parent=False, properties=None, cloned_from=None)
ensure volume exists and has properties set
name [string] name of volume
volume_size [string] size of volume
sparse [boolean] create sparse volume
create_parent [boolean] creates all the non-existing parent datasets. any property specified on the command line using the -o option is ignored.
cloned_from [string] name of snapshot to clone
properties [dict] additional zfs properties (-o)

Note: cloned_from is only use if the volume does not exist yet, when cloned_from is set after the volume exists it will be ignored.

Note: Properties do not get cloned, if you specify the properties in the state file they will be applied on a subsequent run.

volume_size is considered a property, so the volume's size will be corrected when the properties get updated if it differs from the original volume.

The sparse parameter is ignored when using cloned_from.

**13.16.230 salt.states.zpool**

Management zpool

maintainer Jorge Schrauwen <sjorge@blackdot.be>
maturity new
depends zpool
platform smartos, illumos, solaris, freebsd, linux

New in version 2016.3.0.

oldpool:
  zpool.absent:
    - export: true

newpool:
zpool.present:
  - config:
    import: false
    force: true
  - properties:
    comment: salty storage pool
  - layout:
    mirror-0:
      /dev/disk0
      /dev/disk1
    mirror-1:
      /dev/disk2
      /dev/disk3

simplepool:
zpool.present:
  - config:
    import: false
    force: true
  - properties:
    comment: another salty storage pool
  - layout:
    - /dev/disk0
    - /dev/disk1

**Warning:** The layout will never be updated, it will only be used at time of creation. It’s a whole lot of work to figure out if a devices needs to be detached, removed, … this is best done by the sysadmin on a case per case basis.

Filesystem properties are also not updated, this should be managed by the zfs state module.

salt.states.zpool.absent(name, export=False, force=False)

ensure storage pool is absent on the system
name [string] name of storage pool
export [boolean] export instread of destroy the zpool if present
force [boolean] force destroy or export

salt.states.zpool.present(name, properties=None, filesystem_properties=None, layout=None, config=None)

ensure storage pool is present on the system
name [string] name of storage pool
properties [dict] optional set of properties to set for the storage pool
filesystem_properties [dict] optional set of filesystem properties to set for the storage pool (creation only)
layout: dict disk layout to use if the pool does not exist (creation only)
config [dict] fine grain control over this state

**Note:**
The following configuration properties can be toggled in the config parameter.
- import (true) - try to import the pool before creating it if absent
- import_dirs (None) - specify additional locations to scan for devices on import
- device_dir (None, SunOS=/dev/rdsk) - specify device directory to use if not absolute path
- force (false) - try to force the import or creation
**Note:** Because ID’s inside the layout dict must be unique they need to have a suffix.

```yaml
mirror-0:
  /tmp/vdisk3
  /tmp/vdisk2
mirror-1:
  /tmp/vdisk0
  /tmp/vdisk1
```

The above yaml will always result in the following zpool create:

```
zpool create mypool mirror /tmp/vdisk3 /tmp/vdisk2 mirror /tmp/vdisk0 /tmp/vdisk1
```

**Warning:** Pay attention to the order of your dict!

```yaml
mirror-0:
  /tmp/vdisk0
  /tmp/vdisk1
  /tmp/vdisk2:
```

The above will result in the following zpool create:

```
zpool create mypool mirror /tmp/vdisk0 /tmp/vdisk1 /tmp/vdisk2
```

Creating a 3-way mirror! Why you probably expect it to be mirror root vdev with 2 devices + a root vdev of 1 device!

## 13.17 thorium modules

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

### 13.17.1 salt.thorium.check module

The check Thorium state is used to create gateways to commands, the checks make it easy to make states that watch registers for changes and then just succeed or fail based on the state of the register, this creates the pattern of having a command execution get gated by a check state via a requisite.

**salt.thorium.check.contains(name, value)**

Only succeed if the value in the given register location is greater than the given value
salt.thorium.check.gt(name, value)
Only succeed if the value in the given register location is greater than the given value

salt.thorium.check.lt(name, value)
Only succeed if the value in the given register location is greater than the given value

13.17.2 salt.thorium.file module

Writes matches to disk to verify activity, helpful when testing
salt.thorium.file.save(name)
Save the register to <salt cachedir>/thorium/saves/<name>

13.17.3 salt.thorium.local module

Run remote execution commands via the local client
salt.thorium.local.cmd(name, tgt, fun, arg=(), tgt_type='glob', ret='', kwarg=None, **kwargs)
Execute a remote execution command

13.17.4 salt.thorium.reg module

Used to manage the thorium register. The thorium register is where compound values are stored and computed, such as averages etc.
salt.thorium.reg.list(name, add, match)
Add to the named list the specified values
salt.thorium.reg.mean(name, add, match)
Accept a numeric value from the matched events and store a running average of the values in the given register. If the specified value is not numeric it will be skipped
salt.thorium.reg.set(name, add, match)
Add a value to the named set

13.17.5 salt.thorium.timer module

Allow for flow based timers. These timers allow for a sleep to exist across multiple runs of the flow
salt.thorium.timer.hold(name, seconds)
Wait for a given period of time, then fire a result of True, requiring this state allows for an action to be blocked for evaluation based on time

13.18 master tops modules

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>reclass_adapter</td>
<td>Read tops data from a reclass database</td>
</tr>
</tbody>
</table>
13.18.1 salt.tops.cobbler

Cobbler Tops

Cobbler Tops is a master tops subsystem used to look up mapping information from Cobbler via its API. The same cobbler-* parameters are used for both the Cobbler tops and Cobbler pillar modules.

```yaml
master_tops:
  cobbler: {}
cobbler.url: https://example.com/cobbler_api  # default is http://localhost/cobbler_api
cobbler.user: username  # default is no username
cobbler.password: password  # default is no password
```

Module Documentation

```py
salt.tops.cobbler.top(**kwargs)
    Look up top data in Cobbler for a minion.
```

13.18.2 salt.tops.ext_nodes

External Nodes Classifier

The External Nodes Classifier is a master tops subsystem that retrieves mapping information from major configuration management systems. One of the most common external nodes classifiers system is provided by Cobbler and is called cobbler-ext-nodes.

The cobbler-ext-nodes command can be used with this configuration:

```
master_tops:
  ext_nodes: cobbler-ext-nodes
```

It is noteworthy that the Salt system does not directly ingest the data sent from the cobbler-ext-nodes command, but converts the data into information that is used by a Salt top file.

Any command can replace the call to `cobbler-ext-nodes' above, but currently the data must be formatted in the same way that the standard `cobbler-ext-nodes' does.

See (admittedly degenerate and probably not complete) example:

```
classes:
  - basepackages
  - database
```

The above essentially is the same as a top.sls containing the following:

```
base:
  '*':
    - basepackages
    - database
base:
  '*':
    - basepackages
    - database
```
salt.tops.ext_nodes.top(**kwars)
   Run the command configured

13.18.3 salt.tops.mongo

Read tops data from a mongodb collection

This module will load tops data from a mongo collection. It uses the node’s id for lookups.

Salt Master Mongo Configuration

The module shares the same base mongo connection variables as salt.returners.mongo_return. These variables go in your master config file.

- `mongo.db` - The mongo database to connect to. Defaults to 'salt'.
- `mongo.host` - The mongo host to connect to. Supports replica sets by specifying all hosts in the set, comma-delimited. Defaults to 'salt'.
- `mongo.port` - The port that the mongo database is running on. Defaults to 27017.
- `mongo.user` - The username for connecting to mongo. Only required if you are using mongo authentication. Defaults to ''. 
- `mongo.password` - The password for connecting to mongo. Only required if you are using mongo authentication. Defaults to ''. 

Configuring the Mongo Tops Subsystem

```yaml
master_tops:
   mongo:
      collection: tops
      id_field: _id
      re_replace: ""
      re_pattern: \.example\.com
      states_field: states
      environment_field: environment
```

Module Documentation

salt.tops.mongo.top(**kwars)
   Connect to a mongo database and read per-node tops data.
   Parameters:
   - `collection`: The mongodb collection to read data from. Defaults to 'tops'.
   - `id_field`: The field in the collection that represents an individual minion id. Defaults to '_id'.
   - `re_pattern`: If your naming convention in the collection is shorter than the minion id, you can use this to trim the name. `re_pattern` will be used to match the name, and `re_replace` will be used to replace it. Backrefs are supported as they are in the Python standard library. If None, no mangling of the name will be performed - the collection will be searched with the entire minion id. Defaults to None.
   - `re_replace`: Use as the replacement value in node ids matched with `re_pattern`. Defaults to ".". Feel free to use backreferences here.
   - `states_field`: The name of the field providing a list of states.
   - `environment_field`: The name of the field providing the environment. Defaults to `environment`. 

2240 Chapter 13. Salt Module Reference
13.18.4 salt.tops.reclass_adapter

Read tops data from a reclass database

This `master_tops` plugin provides access to the reclass database, such that state information (top data) are retrieved from reclass.

You can find more information about reclass at [http://reclass.pantsfullofunix.net](http://reclass.pantsfullofunix.net).

To use the plugin, add it to the `master_tops` list in the Salt master config and tell reclass by way of a few options how and where to find the inventory:

```python
master_tops:
  reclass:
    storage_type: yaml_fs
    inventory_base_uri: /srv/salt
```

This would cause reclass to read the inventory from YAML files in `/srv/salt/nodes` and `/srv/salt/classes`.

If you are also using reclass as `ext_pillar` plugin, and you want to avoid having to specify the same information for both, use YAML anchors (take note of the differing data types for `ext_pillar` and `master_tops`):

```python
reclass: &reclass
  storage_type: yaml_fs
  inventory_base_uri: /srv/salt
reclass_source_path: ~/code/reclass

ext_pillar:
  - reclass: *reclass
master_tops:
  reclass: *reclass
```

If you want to run reclass from source, rather than installing it, you can either let the master know via the PYTHONPATH environment variable, or by setting the configuration option, like in the example above.

```
salt.tops.reclass_adapter.top(**kwargs)
    Query reclass for the top data (states of the minions).
```

13.19 wheel modules

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>config</code></td>
<td>Manage the master configuration file</td>
</tr>
<tr>
<td><code>error</code></td>
<td>Error generator to enable integration testing of salt wheel error handling</td>
</tr>

</tr>
</tbody>
</table>

13.19.1 salt.wheel.config

Manage the master configuration file
salt.wheel.config.apply(key, value)
Set a single key

Note: This will strip comments from your config file

salt.wheel.config.update_config(file_name, yaml_contents)
Update master config with yaml_contents.
Writes yaml_contents to a file named file_name.conf under the folder specified by default_include. This folder is named master.d by default. Please look at include-configuration for more information.

Example low data:

```python
data = {
    'username': 'salt',
    'password': 'salt',
    'fun': 'config.update_config',
    'file_name': 'gui',
    'yaml_contents': {'id': 1},
    'client': 'wheel',
    'eauth': 'pam',
}
```

salt.wheel.config.values()
Return the raw values of the config file

13.19.2 salt.wheel.error

Error generator to enable integration testing of salt wheel error handling

salt.wheel.error.error(name=None, message='')
If name is None Then return empty dict
Otherwise raise an exception with __name__ from name, message from message

CLI Example:

```bash
salt-wheel error
salt-wheel error.error name="Exception" message="This is an error."
```

13.19.3 salt.wheel.file_roots

Read in files from the file_root and save files to the file root

salt.wheel.file_roots.find(path, saltenv='base', env=None)
Return a dict of the files located with the given path and environment

salt.wheel.file_roots.list_env(saltenv='base', env=None)
Return all of the file paths found in an environment

salt.wheel.file_roots.list_roots()
Return all of the files names in all available environments

salt.wheel.file_roots.read(path, saltenv='base', env=None)
Read the contents of a text file, if the file is binary then
sage.wheel.file_roots.write(data, path, saltenv='base', index=0, env=None)
    Write the named file, by default the first file found is written, but the index of the file can be specified to write to a lower priority file root

13.19.4 salt.wheel.key

Wheel system wrapper for the Salt key system to be used in interactions with the Salt Master programmatically.

The key module for the wheel system is meant to provide an internal interface for other Salt systems to interact with the Salt Master. The following usage examples assume that a WheelClient is available:

```python
import salt.config
import salt.wheel
opts = salt.config.master_config('/etc/salt/master')
wheel = salt.wheel.WheelClient(opts)
```

Note that importing and using the WheelClient must be performed on the same machine as the Salt Master and as the same user that runs the Salt Master, unless external_auth is configured and the user is authorized to execute wheel functions.

The function documentation starts with the wheel reference from the code sample above and use the WheelClient functions to show how they can be called from a Python interpreter.

The wheel key functions can also be called via a salt command at the CLI using the saltutil execution module.

sage.wheel.key.accept(match, include_rejected=False, include_denied=False)
    Accept keys based on a glob match. Returns a dictionary.
    match The glob match of keys to accept.
    include_rejected To include rejected keys in the match along with pending keys, set this to True. Defaults to False.
    include_denied To include denied keys in the match along with pending keys, set this to True. Defaults to False.

```python
>>> wheel.cmd('key.accept', ['minion1'])
{'minions': ['minion1']}
```

sage.wheel.key.accept_dict(match, include_rejected=False, include_denied=False)
    Accept keys based on a dict of keys. Returns a dictionary.
    match The dictionary of keys to accept.
    include_rejected To include rejected keys in the match along with pending keys, set this to True. Defaults to False.
    include_denied To include denied keys in the match along with pending keys, set this to True. Defaults to False.

New in version 2016.3.4.

```python
>>> wheel.cmd('accept_dict',
            {'minions_pre': ['jerry', 'stuart', 'bob'],
             'minions': ['minion1']})
```
salt.wheel.key.delete(match)
Delete keys based on a glob match. Returns a dictionary.
match The glob match of keys to delete.

```python
>>> wheel.cmd_async({'fun': 'key.delete', 'match': 'minion1'})
{'jid': '20160826201244808521', 'tag': 'salt/wheel/20160826201244808521'}
```

salt.wheel.key.delete_dict(match)
Delete keys based on a dict of keys. Returns a dictionary.
match The dictionary of keys to delete.

```python
>>> wheel.cmd_async({'fun': 'key.delete_dict', 'match': {'minions': ['jerry', 'stuart', 'bob']}})
{'jid': '20160826201244808521', 'tag': 'salt/wheel/20160826201244808521'}
```

salt.wheel.key.finger(match)
Return the matching key fingerprints. Returns a dictionary.
match The key for with to retrieve the fingerprint.

```python
>>> wheel.cmd('key.finger', ['minion1'])
```

salt.wheel.key.gen(id_=None, keysize=2048)
Generate a key pair. No keys are stored on the master. A key pair is returned as a dict containing pub and priv keys. Returns a dictionary containing the pub and priv keys with their generated values.

- id_ Set a name to generate a key pair for use with salt. If not specified, a random name will be specified.
- keysize The size of the key pair to generate. The size must be 2048, which is the default, or greater. If set to a value less than 2048, the key size will be rounded up to 2048.

```python
>>> wheel.cmd('key.gen')
{'pub': '-----BEGIN PUBLIC KEY-----', 'priv': '-----BEGIN RSA PRIVATE KEY-----
MIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQEA42Kf+w9XeZWgguuzv ... QH3/W74X1+WTBlx4R2KGLYBiH+bCCFEQ/Zvcu4Xp4bIOPtRKozEQQ==
-----END RSA PRIVATE KEY-----'}
```

salt.wheel.key.gen_accept(id_, keysize=2048, force=False)
Generate a key pair then accept the public key. This function returns the key pair in a dict, only the public key is preserved on the master. Returns a dictionary.

- id_ The name of the minion for which to generate a key pair.
- keysize The size of the key pair to generate. The size must be 2048, which is the default, or greater. If set to a value less than 2048, the key size will be rounded up to 2048.
force  If a public key has already been accepted for the given minion on the master, then the gen_accept function will return an empty dictionary and not create a new key. This is the default behavior. If force is set to True, then the minion’s previously accepted key will be overwritten.

```python
>>> wheel.cmd('key.gen_accept', ['foo'])
{'pub': '-----BEGIN PUBLIC KEY-----
MIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBC
… BBPfamX9gGPQTpN9e8HwcZjXQnmg8OrcUl10WHw09SDWLOInW+
… iQIDAQAB
-----END PUBLIC KEY-----'}
```

MIIBjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBC ... BBPfamX9gGPQTpN9e8HwcZjXQnmg8OrcUl10WHw09SDWLOInW+

```python
>>> wheel.cmd('key.list', ['accepted'])
{'minions': ['foo', 'minion1', 'minion2', 'minion3']}
```

salt.wheel.key.key_str(match)
Return information about the key. Returns a dictionary.
match The key to return information about.

```python
>>> wheel.cmd('key.key_str', ['minion1'])
{'minions': ['minion1': '-----BEGIN PUBLIC KEY-----
```

salt.wheel.key.list(match)
List all the keys under a named status. Returns a dictionary.
match The type of keys to list. The pre, un, and unaccepted options will list unaccepted/unsigned keys. acc or accepted will list accepted/signed keys. rej or rejected will list rejected keys. Finally, all will list all keys.

```python
>>> wheel.cmd('key.list', ['accepted'])
{'minions': ['foo', 'minion1', 'minion2', 'minion3']}
```

salt.wheel.key.list_all()
List all the keys. Returns a dictionary containing lists of the minions in each salt-key category, including minions, minions_rejected, minions_denied, etc. Returns a dictionary.

```python
>>> wheel.cmd('key.list_all')
{'local': ['master.pem', 'master.pub'], 'minions_rejected': [],
'minions_denied': [], 'minions_pre': [],
'minions': ['minion1', 'minion2', 'minion3']}
```

salt.wheel.key.reject(match, include_accepted=False, include_denied=False)
Reject keys based on a glob match. Returns a dictionary.
match The glob match of keys to reject.
include_accepted To include accepted keys in the match along with pending keys, set this to True. Defaults to False.
include_denied To include denied keys in the match along with pending keys, set this to True. Defaults to False.
salt.wheel.key.reject_dict(match, include_accepted=False, include_denied=False)
Reject keys based on a dict of keys. Returns a dictionary.

match The dictionary of keys to reject.
include_accepted To include accepted keys in the match along with pending keys, set this to True. Defaults to False.
New in version 2016.3.4.
include_denied To include denied keys in the match along with pending keys, set this to True. Defaults to False.
New in version 2016.3.4.

>>> wheel.cmd_async({'fun': 'key.reject', 'match': 'minion1'})
{'jid': '20160826201244808521', 'tag': 'salt/wheel/20160826201244808521'}

13.19.5 salt.wheel.minions
Wheel system wrapper for connected minions
	salt.wheel.minions.connected()
List all connected minions on a salt-master

13.19.6 salt.wheel.pillar_roots
The pillar_roots wheel module is used to manage files under the pillar roots directories on the master server.
	salt.wheel.pillar_roots.find(path, saltenv='base', env=None)
Return a dict of the files located with the given path and environment
	salt.wheel.pillar_roots.list_env(saltenv='base', env=None)
Return all of the file paths found in an environment
	salt.wheel.pillar_roots.list_roots()
Return all of the files names in all available environments
	salt.wheel.pillar_roots.read(path, saltenv='base', env=None)
Read the contents of a text file, if the file is binary then
	salt.wheel.pillar_roots.write(data, path, saltenv='base', index=0, env=None)
Write the named file, by default the first file found is written, but the index of the file can be specified to write to a lower priority file root
14.1 Python client API

Salt provides several entry points for interfacing with Python applications. These entry points are often referred to as `*Client()` APIs. Each client accesses different parts of Salt, either from the master or from a minion. Each client is detailed below.

See also:

There are many ways to access Salt programmatically.

Salt can be used from CLI scripts as well as via a REST interface.

See Salt’s `outpurret system` to retrieve structured data from Salt as JSON, or as shell-friendly text, or many other formats.

See the `state.event` runner to utilize Salt’s event bus from shell scripts.

Salt’s `netapi` module provides access to Salt externally via a REST interface. Review the `netapi` module documentation for more information.

14.1.1 Salt’s `opts` dictionary

Some clients require access to Salt’s `opts` dictionary. (The dictionary representation of the `master` or `minion` config files.)

A common pattern for fetching the `opts` dictionary is to defer to environment variables if they exist or otherwise fetch the `config` from the default location.

```
salt.config.client_config(path, env_var='SALT_CLIENT_CONFIG', defaults=None)
```

Load Master configuration data

Usage:

```
import salt.config
master_opts = salt.config.client_config('/etc/salt/master')
```

Returns a dictionary of the Salt Master configuration file with necessary options needed to communicate with a locally-running Salt Master daemon. This function searches for client specific configurations and adds them to the data from the master configuration.

This is useful for master-side operations like `LocalClient`. 
salt.config.minion_config(path, env_var='SALT_MINION_CONFIG', defaults=None, cache_minion_id=False, ignore_config_errors=True, minion_id=None)

Reads in the minion configuration file and sets up special options

This is useful for Minion-side operations, such as the Caller class, and manually running the loader interface.

```
import salt.client
minion_opts = salt.config.minion_config('/etc/salt/minion')
```

### 14.1.2 Salt's Loader Interface

Modules in the Salt ecosystem are loaded into memory using a custom loader system. This allows modules to have conditional requirements (OS, OS version, installed libraries, etc) and allows Salt to inject special variables (``__salt__``, ``__opts__``, etc).

Most modules can be manually loaded. This is often useful in third-party Python apps or when writing tests. However some modules require and expect a full, running Salt system underneath. Notably modules that facilitate master-to-minion communication such as the `mine`, `publish`, and `peer` execution modules. The error `KeyError: 'master_uri'` is a likely indicator for this situation. In those instances use the Caller class to execute those modules instead.

Each module type has a corresponding loader function.

```
salt.loader.minion_mods(opts, context=None, utils=None, whitelist=None, initial_load=False, loaded_base_name=None, notify=False, static_modules=None, proxy=None)
```

Load execution modules

Returns a dictionary of execution modules appropriate for the current system by evaluating the `__virtual__()` function in each module.

**Parameters**

- `opts` (**dict**) -- The Salt options dictionary
- `context` (**dict**) -- A Salt context that should be made present inside generated modules in `__context__`
- `utils` (**dict**) -- Utility functions which should be made available to Salt modules in `__utils__`. See `utils_dir` in `salt.config` for additional information about configuration.
- `whitelist` (**list**) -- A list of modules which should be whitelisted.
- `initial_load` (**bool**) -- Deprecated flag! Unused.
- `loaded_base_name` (**str**) -- A string marker for the loaded base name.
- `notify` (**bool**) -- Flag indicating that an event should be fired upon completion of module loading.

```
import salt.config
import salt.loader
__opts__ = salt.config.minion_config('/etc/salt/minion')
__grains__ = salt.loader.grains(__opts__)
__opts__['grains'] = __grains__
__utils__ = salt.loader.utils(__opts__)
__salt__ = salt.loader.minion_mods(__opts__, utils=__utils__, loaded_base_name='test.ping')

salt.loader.raw_mod(opts, name, functions, mod='modules')
```

Returns a single module loaded raw and bypassing the `__virtual__` function
import salt.config
import salt.loader

__opts__ = salt.config.minion_config('/etc/salt/minion')
testmod = salt.loader.raw_mod(__opts__, 'test', None)
testmod['test.ping']()

salt.loader.states(opts, functions, utils, serializers, whitelist=None, proxy=None)
Returns the state modules
Parameters
  - **opts** (dict) -- The Salt options dictionary
  - **functions** (dict) -- A dictionary of minion modules, with module names as keys and funcs as values.

import salt.config
import salt.loader

__opts__ = salt.config.minion_config('/etc/salt/minion')
statemods = salt.loader.states(__opts__, None, None)

salt.loader.grains(opts, force_refresh=False, proxy=None)
Return the functions for the dynamic grains and the values for the static grains.
Since grains are computed early in the startup process, grains functions do not have __salt__ or __proxy__ available. At proxy-minion startup, this function is called with the proxymodule LazyLoader object so grains functions can communicate with their controlled device.

import salt.config
import salt.loader

__opts__ = salt.config.minion_config('/etc/salt/minion')
__grains__ = salt.loader.grains(__opts__)
print __grains__['id']

salt.loader.grain_funcs(opts, proxy=None)
Returns the grain functions

import salt.config
import salt.loader

__opts__ = salt.config.minion_config('/etc/salt/minion')
grainfuncs = salt.loader.grain_funcs(__opts__)

14.1.3 Salt’s Client Interfaces

LocalClient

class salt.client.LocalClient(c_path='/etc/salt/master', mopts=None, skip_perm_errors=False, io_loop=None, keep_loop=False, auto_reconnect=False)
The interface used by the salt CLI tool on the Salt Master

LocalClient is used to send a command to Salt minions to execute execution modules and return the results to the Salt Master.
Importing and using `LocalClient` must be done on the same machine as the Salt Master and it must be done using the same user that the Salt Master is running as. (Unless `external_auth` is configured and authentication credentials are included in the execution).

```python
import salt.client
local = salt.client.LocalClient()
local.cmd('*', 'test.fib', [10])
```

`cmd(tgt, fun, arg=(), timeout=None, expr_form='glob', ret='*', jid='`) Synchronously execute a command on targeted minions

The cmd method will execute and wait for the timeout period for all minions to reply, then it will return all minion data at once.

```python
>>> import salt.client
>>> local = salt.client.LocalClient()
>>> local.cmd('*', 'cmd.run', ['whoami'])
{'jerry': 'root'}
```

With extra keyword arguments for the command function to be run:

```python
local.cmd('*', 'test.arg', ['arg1', 'arg2'], kwarg={'foo': 'bar'})
```

Compound commands can be used for multiple executions in a single publish. Function names and function arguments are provided in separate lists but the index values must correlate and an empty list must be used if no arguments are required.

```python
>>> local.cmd('*', [  
'grains.items',  
'sys.doc',  
'cmd.run',  
],  
[  
[],  
[],  
['uptime'],  
])
```

### Parameters

- **tgt**(string or list) -- Which minions to target for the execution. Default is shell glob. Modified by the `expr_form` option.

- **fun**(string or list of strings) -- The module and function to call on the specified minions of the form `module.function`. For example `test.ping` or `grains.items`.

  **Compound commands** Multiple functions may be called in a single publish by passing a list of commands. This can dramatically lower overhead and speed up the application communicating with Salt. This requires that the `arg` param is a list of lists. The `fun` list and the `arg` list must correlate by index meaning a function that does not take arguments must still have a corresponding empty list at the expected index.

- **arg**(list or list-of-lists) -- A list of arguments to pass to the remote function. If the function takes no arguments `arg` may be omitted except when executing a compound command.
• **timeout** -- Seconds to wait after the last minion returns but before all minions return.

• **expr_form** -- The type of tgt. Allowed values:
  - `glob` - Bash glob completion - Default
  - `pcre` - Perl style regular expression
  - `list` - Python list of hosts
  - `grain` - Match based on a grain comparison
  - `grain_pcre` - Grain comparison with a regex
  - `pillar` - Pillar data comparison
  - `pillar_pcre` - Pillar data comparison with a regex
  - `nodegroup` - Match on nodegroup
  - `range` - Use a Range server for matching
  - `compound` - Pass a compound match string

• **ret** -- The returner to use. The value passed can be single returner, or a comma delimited list of returners to call in order on the minions

• **kwa** -- A dictionary with keyword arguments for the function.

• **kw** -- Optional keyword arguments. Authentication credentials may be passed when using `external_auth`.

  For example: `local.cmd('*','test.ping',username='saltdev',password='saltdev')`
  Or: `local.cmd('*','test.ping',token='5871821ea51754fdcea8153c1c745433')`

**Returns**

A dictionary with the result of the execution, keyed by minion ID. A compound command will return a sub-dictionary keyed by function name.

```python
local.cmd_async('*', 'test.sleep', [300])

20131219215921857715
```

`cmd_batch(tgt, fun, arg=(), expr_form='glob', ret='*', jid='*', kwarg=None, **kwargs)`

Iteratively execute a command on subsets of minions at a time

**Parameters**

- **batch** -- The batch identifier of systems to execute on

**Returns**

A generator of minion returns

```python
returns = local.cmd_batch('*', 'state.highstate', batch='10%')
for ret in returns:
    print(ret)
    {'jerry': {...}}
    {'dave': {...}}
    {'stewart': {...}}
```
**cmd_iter** *(tgt, fun, arg=(), timeout=None, expr_form='glob', ret='`, kwarg=None, **kwargs)*

Yields the individual minion returns as they come in

The function signature is the same as **cmd()** with the following exceptions.

**Returns** A generator yielding the individual minion returns

```python
>>> ret = local.cmd_iter('*', 'test.ping')
>>> for i in ret:
...    print(i)
{'jerry': {'ret': True}}
{'dave': {'ret': True}}
{'stewart': {'ret': True}}
```

**cmd_iter_no_block** *(tgt, fun, arg=(), timeout=None, expr_form='glob', ret='`, kwarg=None, **kwargs)*

Yields the individual minion returns as they come in, or **None** when no returns are available.

The function signature is the same as **cmd()** with the following exceptions.

**Returns** A generator yielding the individual minion returns, or **None** when no returns are available. This allows for actions to be injected in between minion returns.

```python
>>> ret = local.cmd_iter_no_block('*', 'test.ping')
>>> for i in ret:
...    print(i)
None
{'jerry': {'ret': True}}
None
{'dave': {'ret': True}}
None
{'stewart': {'ret': True}}
```

**cmd_subset** *(tgt, fun, arg=(), expr_form='glob', ret='`, kwarg=None, sub=3, cli=False, progress=False, **kwargs)*

Execute a command on a random subset of the targeted systems

The function signature is the same as **cmd()** with the following exceptions.

**Parameters** sub -- The number of systems to execute on

```python
>>> SLC.cmd_subset('*', 'test.ping', sub=1)
{'jerry': True}
```

**get_cli_returns** *(jid, minions, timeout=None, tgt='*', tgt_type='glob', verbose=False, show_jid=False, **kwargs)*

Starts a watcher looking at the return data for a specified JID

**Returns** all of the information for the JID

**get_event_iter_returns** *(jid, minions, timeout=None)*

Gather the return data from the event system, break hard when timeout is reached.

**run_job** *(tgt, fun, arg=(), expr_form='glob', ret='`, timeout=None, jid='`, kwarg=None, listen=False, **kwargs)*

Asynchronously send a command to connected minions

Prep the job directory and publish a command to any targeted minions.

**Returns** A dictionary of (validated) **pub_data** or an empty dictionary on failure. The **pub_data** contains the job ID and a list of all minions that are expected to return data.

```python
>>> local.run_job('*', 'test.sleep', [300])
{'jid': '20131219215650131543', 'minions': ['jerry']}
```
Salt Caller

class salt.client.Caller(c_path='/etc/salt/minion', mopts=None)

Caller is the same interface used by the `salt-call` command-line tool on the Salt Minion.

Changed in version 2015.8.0: Added the `cmd` method for consistency with the other Salt clients. The existing `function` and `sminion.functions` interfaces still exist but have been removed from the docs.

Importing and using `Caller` must be done on the same machine as a Salt Minion and it must be done using the same user that the Salt Minion is running as.

Usage:

```python
import salt.client
caller = salt.client.Caller()
caller.cmd('test.ping')
```

Note, a running master or minion daemon is not required to use this class. Running `salt-call --local` simply sets `file_client` to `'local'`. The same can be achieved at the Python level by including that setting in a minion config file.

New in version 2014.7.0: Pass the minion config as the `mopts` dictionary.

```python
import salt.client
import salt.config
__opts__ = salt.config.minion_config('/etc/salt/minion')
__opts__['file_client'] = 'local'
caller = salt.client.Caller(mopts=__opts__)
```

caller.cmd('test.arg', 'Foo', 'Bar', baz='Baz')

caller.cmd('event.send', 'myco/myevent/something',
          data={'foo': 'Foo'}, with_env=['GIT_COMMIT'], with_grains=True)

RunnerClient

class salt.runner.RunnerClient(opts)

The interface used by the `salt-run` CLI tool on the Salt Master

It executes `runner modules` which run on the Salt Master.

Importing and using `RunnerClient` must be done on the same machine as the Salt Master and it must be done using the same user that the Salt Master is running as.

Salt’s `external_auth` can be used to authenticate calls. The eauth user must be authorized to execute runner modules: (@runner). Only the `master_call()` below supports eauth.

```python
async (fun, low, user='UNKNOWN')

Execute the function in a multiprocess and return the event tag to use to watch for the return

cmd (fun, arg=None, pub_data=None, kwarg=None, print_event=True)

Execute a function
```
**cmd_async** *(low)*
Execute a runner function asynchronously; eauth is respected

This function requires that `external_auth` is configured and the user is authorized to execute runner functions: (@runner).

```python
runner.eauth_async({
    'fun': 'jobs.list_jobs',
    'username': 'saltdev',
    'password': 'saltdev',
    'eauth': 'pam',
})
```

**cmd_sync** *(low, timeout=None)*
Execute a runner function synchronously; eauth is respected

This function requires that `external_auth` is configured and the user is authorized to execute runner functions: (@runner).

```python
runner.eauth_sync({
    'fun': 'jobs.list_jobs',
    'username': 'saltdev',
    'password': 'saltdev',
    'eauth': 'pam',
})
```

**WheelClient**

class `salt.wheel.WheelClient(opt=opt=)`
An interface to Salt’s wheel modules

Wheel modules interact with various parts of the Salt Master.

Importing and using WheelClient must be done on the same machine as the Salt Master and it must be done using the same user that the Salt Master is running as. Unless `external_auth` is configured and the user is authorized to execute wheel functions: (@wheel).

Usage:

```python
import salt.config
import salt.wheel
opts = salt.config.master_config('/etc/salt/master')
wheel = salt.wheel.WheelClient(opts)
```

**async** *(fun, low, user=’UNKNOWN’)*
Execute the function in a multiprocess and return the event tag to use to watch for the return

**cmd** *(fun, arg=None, pub_data=None, kwarg=None, print_event=True)*
Execute a function

```python
>>> wheel.cmd('key.finger', ['jerry'])
```

**cmd_async** *(low)*
Execute a function asynchronously; eauth is respected

This function requires that `external_auth` is configured and the user is authorized
### cmd_async

```python
cmd_async({
    'fun': 'key.finger',
    'match': 'jerry',
    'eauth': 'auto',
    'username': 'saltdev',
    'password': 'saltdev',
})
{'jid': '20131219224744416681', 'tag': 'salt/wheel/20131219224744416681'}
```

**cmd_sync** *(low, timeout=None)*

Execute a wheel function synchronously; eauth is respected

This function requires that `external_auth` is configured and the user is authorized to execute runner functions: (`@wheel`).

```python
cmd_sync({
    'fun': 'key.finger',
    'match': 'jerry',
    'eauth': 'auto',
    'username': 'saltdev',
    'password': 'saltdev',
})
```

### CloudClient

**class** `salt.cloud.CloudClient(path=None, opts=None, config_dir=None, pillars=None)`

The client class to wrap cloud interactions

**action** *(fun=None, cloudmap=None, names=None, provider=None, instance=None, kwargs=None)*

Execute a single action via the cloud plugin backend

Examples:

```python
client.action(fun='show_instance', names=['myinstance'])
client.action(fun='show_image', provider='my-ec2-config',
             kwargs={'image': 'ami-10314d79'})
```

**create** *(provider, names, **kwargs)*

Create the named VMs, without using a profile

Example:

```python
client.create(names=['myinstance'], provider='my-ec2-config',
              kwargs={'image': 'ami-1624987f', 'size': 't1.micro',
                      'ssh_username': 'ec2-user', 'securitygroup': 'default',
                      'delvol_on_destroy': True})
```

**destroy** *(names)*

Destroy the named VMs

**extra_action** *(names, provider, action, **kwargs)*

Perform actions with block storage devices

Example:
Salt Documentation, Release 2016.3.6

```python
client.extra_action(names=['myblock'], action='volume_create',
    provider='my-nova', kwargs={'voltype': 'SSD', 'size': 1000})
client.extra_action(names=['salt-net'], action='network_create',
    provider='my-nova', kwargs={'cidr': '192.168.100.0/24'})

full_query(query_type='list_nodes_full')
    Query all instance information

list_images(provider=None)
    List all available images in configured cloud systems

list_locations(provider=None)
    List all available locations in configured cloud systems

list_sizes(provider=None)
    List all available sizes in configured cloud systems

low(fun, low)
    Pass the cloud function and low data structure to run

map_run(path, **kwargs)
    Pass in a location for a map to execute

min_query(query_type='list_nodes_min')
    Query select instance information

profile(profile, names, vm_overrides=None, **kwargs)
    Pass in a profile to create, names is a list of vm names to allocate
    vm_overrides is a special dict that will be per node options overrides
Example:

```python
>>> client = salt.cloud.CloudClient(path='/etc/salt/cloud')
>>> client.profile('do_512_git', names=['minion01',])
{'minion01': {u'backups_active': 'False',
    u'created_at': '2014-09-04T18:10:15Z',
    u'droplet': {u'event_id': 31000502,
        u'id': 2530006,
        u'image_id': 5140006,
        u'name': u'minion01',
        u'size_id': 66},
    u'id': '2530006',
    u'image_id': '5140006',
    u'ip_address': '107.XXX.XXX.XXX',
    u'locked': 'True',
    u'name': 'minion01',
    u'private_ip_address': None,
    u'region_id': '4',
    u'size_id': '66',
    u'status': 'new'}}
```

query(query_type='list_nodes')
    Query basic instance information

select_query(query_type='list_nodes_select')
    Query select instance information
**SSHClient**

```python
class salt.client.ssh.client.SSHClient(c_path='/etc/salt/master', mopts=None, disable_custom_roster=False)
```

Create a client object for executing routines via the salt-ssh backend

New in version 2015.5.0.

```python
cmd(tgt, fun, arg=(), timeout=None, expr_form='glob', kwarg=None, **kwargs)
```

Execute a single command via the salt-ssh subsystem and return all routines at once

New in version 2015.5.0.

```python
cmd_iter(tgt, fun, arg=(), timeout=None, expr_form='glob', ret='`, kwarg=None, **kwargs)
```

Execute a single command via the salt-ssh subsystem and return a generator

New in version 2015.5.0.

## 14.2 netapi modules

### 14.2.1 Introduction to netapi modules

netapi modules provide API-centric access to Salt. Usually externally-facing services such as REST or WebSockets, XMPP, XMLRPC, etc.

In general netapi modules bind to a port and start a service. They are purposefully open-ended. A single module can be configured to run as well as multiple modules simultaneously.

netapi modules are enabled by adding configuration to your Salt Master config file and then starting the `salt-api` daemon. Check the docs for each module to see external requirements and configuration settings.

Communication with Salt and Salt satellite projects is done using Salt’s own Python API. A list of available client interfaces is below.

---

**salt-api**

Prior to Salt’s 2014.7.0 release, netapi modules lived in the separate sister project `salt-api`. That project has been merged into the main Salt project.

---

See also:

*The full list of netapi modules*

### 14.2.2 Client interfaces

Salt’s client interfaces expose executing functions by crafting a dictionary of values that are mapped to function arguments. This allows calling functions simply by creating a data structure. (And this is exactly how much of Salt’s own internals work!)

```python
class salt.netapi.NetapiClient(opts)
```

Provide a uniform method of accessing the various client interfaces in Salt in the form of low-data data structures. For example:

```python
>>> client = NetapiClient(__opts__)
```

```python
>>> lowstate = {'client': 'local', 'tgt': '*', 'fun': 'test.ping', 'arg': ''}
```

```python
>>> client.run(lowstate)
```
local (**args, **kwargs)
Run execution modules synchronously

See `salt.client.LocalClient.cmd()` for all available parameters.

Sends a command from the master to the targeted minions. This is the same interface that Salt's own CLI uses. Note the `arg` and `kwargs` parameters are sent down to the minion(s) and the given function, `fun`, is called with those parameters.

Returns Returns the result from the execution module

local_async (**args, **kwargs)
Run execution modules asynchronously

Wraps `salt.client.LocalClient.run_job()`.

Returns job ID

local_subset (**args, **kwargs)
Run execution modules against subsets of minions

New in version 2016.3.0.

Wraps `salt.client.LocalClient.cmd_subset()`

runner (fun, timeout=None, **kwargs)
Run runner modules <all-salt.runners> synchronously

Wraps `salt.runner.RunnerClient.cmd_sync()`.

Note that runner functions must be called using keyword arguments. Positional arguments are not supported.

Returns Returns the result from the runner module

runner_async (fun, **kwargs)
Run runner modules <all-salt.runners> asynchronously

Wraps `salt.runner.RunnerClient.cmd_async()`.

Note that runner functions must be called using keyword arguments. Positional arguments are not supported.

Returns Returns event data and a job ID for the executed function.

ssh (**args, **kwargs)
Run salt-ssh commands synchronously

Wraps `salt.client.ssh.client.SSHClient.cmd_sync()`.

Returns the result from the salt-ssh command

ssh_async (fun, timeout=0, **kwargs)
Run salt-ssh commands asynchronously

Wraps `salt.client.ssh.client.SSHClient.cmd_async()`.

Returns the JID to check for results on

wheel (fun, **kwargs)
Run `wheel modules` synchronously

Wraps `salt.wheel.WheelClient.master_call()`.

Note that wheel functions must be called using keyword arguments. Positional arguments are not supported.

Returns Returns the result from the wheel module

wheel_async (fun, **kwargs)
Run `wheel modules` asynchronously
Wraps `salt.wheel.WheelClient.master_call()`.

Note that wheel functions must be called using keyword arguments. Positional arguments are not supported.

**Returns** Returns the result from the wheel module

**HTTP Modules**

This tutorial demonstrates using the various HTTP modules available in Salt. These modules wrap the Python `tornado`, `urllib2`, and `requests` libraries, extending them in a manner that is more consistent with Salt workflows.

**The `salt.utils.http` Library**

This library forms the core of the HTTP modules. Since it is designed to be used from the minion as an execution module, in addition to the master as a runner, it was abstracted into this multi-use library. This library can also be imported by 3rd-party programs wishing to take advantage of its extended functionality.

Core functionality of the execution, state, and runner modules is derived from this library, so common usages between them are described here. Documentation specific to each module is described below.

This library can be imported with:

```python
import salt.utils.http
```

**Configuring Libraries**

This library can make use of either `tornado`, which is required by Salt, `urllib2`, which ships with Python, or `requests`, which can be installed separately. By default, `tornado` will be used. In order to switch to `urllib2`, set the following variable:

```ini
backend: urllib2
```

In order to switch to `requests`, set the following variable:

```ini
backend: requests
```

This can be set in the master or minion configuration file, or passed as an option directly to any `http.query()` functions.

**`salt.utils.http.query()`**

This function forms a basic query, but with some add-ons not present in the `tornado`, `urllib2`, and `requests` libraries. Not all functionality currently available in these libraries has been added, but can be in future iterations.

**HTTPS Request Methods**

A basic query can be performed by calling this function with no more than a single URL:

```python
salt.utils.http.query('http://example.com')
```
By default the query will be performed with a GET method. The method can be overridden with the method argument:

```
salt.utils.http.query('http://example.com/delete/url', 'DELETE')
```

When using the POST method (and others, such as PUT), extra data is usually sent as well. This data can be sent directly, in whatever format is required by the remote server (XML, JSON, plain text, etc).

```
salt.utils.http.query(
    'http://example.com/delete/url',
    method='POST',
    data=json.loads(mydict)
)
```

**Data Formatting and Templating**

Bear in mind that the data must be sent pre-formatted; this function will not format it for you. However, a templated file stored on the local system may be passed through, along with variables to populate it with. To pass through only the file (untemplated):

```
salt.utils.http.query(
    'http://example.com/post/url',
    method='POST',
    data_file='/srv/salt/somefile.xml'
)
```

To pass through a file that contains jinja + yaml templating (the default):

```
salt.utils.http.query(
    'http://example.com/post/url',
    method='POST',
    data_file='/srv/salt/somefile.jinja',
    data_render=True,
    template_data={'key1': 'value1', 'key2': 'value2'}
)
```

To pass through a file that contains mako templating:

```
salt.utils.http.query(
    'http://example.com/post/url',
    method='POST',
    data_file='/srv/salt/somefile.mako',
    data_render=True,
    data_renderer='mako',
    template_data={'key1': 'value1', 'key2': 'value2'}
)
```

Because this function uses Salt’s own rendering system, any Salt renderer can be used. Because Salt’s renderer requires __opts__ to be set, an opts dictionary should be passed in. If it is not, then the default __opts__ values for the node type (master or minion) will be used. Because this library is intended primarily for use by minions, the default node type is minion. However, this can be changed to master if necessary.
data_render=True,
    template_data={'key1': 'value1', 'key2': 'value2'},
    opts=___opts___
)

salt.utils.http.query(
    'http://example.com/post/url',
    method='POST',
    data_file='/srv/salt/somefile.jinja',
    data_render=True,
    template_data={'key1': 'value1', 'key2': 'value2'},
    node='master'
)

Headers

Headers may also be passed through, either as a header_list, a header_dict, or as a header_file. As with the data_file, the header_file may also be templated. Take note that because HTTP headers are normally syntactically-correct YAML, they will automatically be imported as an a Python dict.

Because much of the data that would be templated between headers and data may be the same, the template_data is the same for both. Correcting possible variable name collisions is up to the user.

Authentication

The query() function supports basic HTTP authentication. A username and password may be passed in as username and password, respectively.

Cookies and Sessions

Cookies are also supported, using Python's built-in cookielib. However, they are turned off by default. To turn cookies on, set cookies to True.
By default cookies are stored in Salt's cache directory, normally /var/cache/salt, as a file called cookies.txt. However, this location may be changed with the cookie_jar argument:

```python
salt.utils.http.query(
    'http://example.com',
    cookies=True,
    cookie_jar='/path/to/cookie_jar.txt'
)
```

By default, the format of the cookie jar is LWP (aka, lib-www-perl). This default was chosen because it is a human-readable text file. If desired, the format of the cookie jar can be set to Mozilla:

```python
salt.utils.http.query(
    'http://example.com',
    cookies=True,
    cookie_jar='/path/to/cookie_jar.txt',
    cookie_format='mozilla'
)
```

Because Salt commands are normally one-off commands that are piped together, this library cannot normally behave as a normal browser, with session cookies that persist across multiple HTTP requests. However, the session can be persisted in a separate cookie jar. The default filename for this file, inside Salt's cache directory, is cookies.session.p. This can also be changed.

```python
salt.utils.http.query(
    'http://example.com',
    persist_session=True,
    session_cookie_jar='/path/to/jar.p'
)
```

The format of this file is msgpack, which is consistent with much of the rest of Salt's internal structure. Historically, the extension for this file is .p. There are no current plans to make this configurable.

**Proxy**

If the tornado backend is used (tornado is the default), proxy information configured in proxy_host, proxy_port, proxy_username, and proxy_password from the __opts__ dictionary will be used. Normally these are set in the minion configuration file.

```python
proxy_host: proxy.my-domain
proxy_port: 31337
proxy_username: charon
proxy_password: obolus
```

```python
salt.utils.http.query(
    'http://example.com',
    opts=__opts__,
    backend='tornado'
)
```

**Return Data**

Note: Return data encoding
If `decode` is set to `True`, `query()` will attempt to decode the return data. `decode_type` defaults to `auto`. Set it to a specific encoding, `xml`, for example, to override autodetection.

Because Salt's http library was designed to be used with REST interfaces, `query()` will attempt to decode the data received from the remote server when `decode` is set to `True`. First it will check the `Content-type` header to try and find references to XML. If it does not find any, it will look for references to JSON. If it does not find any, it will fall back to plain text, which will not be decoded.

JSON data is translated into a dict using Python's built-in `json` library. XML is translated using `salt.utils.xml_util`, which will use Python's built-in XML libraries to attempt to convert the XML into a dict. In order to force either JSON or XML decoding, the `decode_type` may be set:

```python
salt.utils.http.query('http://example.com',
    decode_type='xml',
)
```

Once translated, the return dict from `query()` will include a dict called `dict`.

If the data is not to be translated using one of these methods, decoding may be turned off.

```python
salt.utils.http.query('http://example.com',
    decode=False,
)
```

If decoding is turned on, and references to JSON or XML cannot be found, then this module will default to plain text, and return the undecoded data as `text` (even if `text` is set to `False`; see below).

The `query()` function can return the HTTP status code, headers, and/or text as required. However, each must individually be turned on.

```python
salt.utils.http.query('http://example.com',
    status=True,
    headers=True,
    text=True,
)
```

The return from these will be found in the return dict as `status`, `headers` and `text`, respectively.

### Writing Return Data to Files

It is possible to write either the return data or headers to files, as soon as the response is received from the server, but specifying file locations via the `text_out` or `headers_out` arguments. `text` and `headers` do not need to be returned to the user in order to do this.

```python
salt.utils.http.query('http://example.com',
    text=False,
    headers=False,
    text_out='/path/to/url_download.txt',
    headers_out='/path/to/headers_download.txt',
)
```
SSL Verification

By default, this function will verify SSL certificates. However, for testing or debugging purposes, SSL verification can be turned off.

```python
salt.utils.http.query('https://example.com', verify_ssl=False)
```

CA Bundles

The `requests` library has its own method of detecting which CA (certificate authority) bundle file to use. Usually this is implemented by the packager for the specific operating system distribution that you are using. However, `urllib2` requires a little more work under the hood. By default, Salt will try to auto-detect the location of this file. However, if it is not in an expected location, or a different path needs to be specified, it may be done so using the `ca_bundle` variable.

```python
salt.utils.http.query('https://example.com', ca_bundle='/path/to/ca_bundle.pem')
```

The `update_ca_bundle()` function can be used to update the bundle file at a specified location. If the target location is not specified, then it will attempt to auto-detect the location of the bundle file. If the URL to download the bundle from does not exist, a bundle will be downloaded from the cURL website.

**CAUTION:** The target and the source should always be specified! Failure to specify the target may result in the file being written to the wrong location on the local system. Failure to specify the source may cause the upstream URL to receive excess unnecessary traffic, and may cause a file to be download which is hazardous or does not meet the needs of the user.

```python
salt.utils.http.update_ca_bundle(target='/path/to/ca-bundle.crt',
                                 source='https://example.com/path/to/ca-bundle.crt',
                                 opts=__opts__,
                                 )
```

The `opts` parameter should also always be specified. If it is, then the target and the source may be specified in the relevant configuration file (master or minion) as `ca_bundle` and `ca_bundle_url`, respectively.

```
ca_bundle: /path/to/ca-bundle.crt
ca_bundle_url: https://example.com/path/to/ca-bundle.crt
```

If Salt is unable to auto-detect the location of the CA bundle, it will raise an error.

The `update_ca_bundle()` function can also be passed a string or a list of strings which represent files on the local system, which should be appended (in the specified order) to the end of the CA bundle file. This is useful in environments where private certs need to be made available, and are not otherwise reasonable to add to the bundle file.

```python
salt.utils.http.update_ca_bundle(
    opts=__opts__,
    merge_files=[
        '/etc/ssl/private_cert_1.pem',
        '/etc/ssl/private_cert_2.pem',
    ]
)```
Test Mode

This function may be run in test mode. This mode will perform all work up until the actual HTTP request. By default, instead of performing the request, an empty dict will be returned. Using this function with TRACE logging turned on will reveal the contents of the headers and POST data to be sent.

Rather than returning an empty dict, an alternate test_url may be passed in. If this is detected, then test mode will replace the url with the test_url, set test to True in the return data, and perform the rest of the requested operations as usual. This allows a custom, non-destructive URL to be used for testing when necessary.

Execution Module

The http execution module is a very thin wrapper around the salt.utils.http library. The opts can be passed through as well, but if they are not specified, the minion defaults will be used as necessary.

Because passing complete data structures from the command line can be tricky at best and dangerous (in terms of execution injection attacks) at worse, the data_file, and header_file are likely to see more use here.

All methods for the library are available in the execution module, as kwargs.

Runner Module

Like the execution module, the http runner module is a very thin wrapper around the salt.utils.http library. The only significant difference is that because runners execute on the master instead of a minion, a target is not required, and default opts will be derived from the master config, rather than the minion config.

All methods for the library are available in the runner module, as kwargs.

State Module

The state module is a wrapper around the runner module, which applies stateful logic to a query. All kwargs as listed above are specified as usual in state files, but two more kwargs are available to apply stateful logic. A required parameter is match, which specifies a pattern to look for in the return text. By default, this will perform a string comparison of looking for the value of match in the return text. In Python terms this looks like:
if match in html_text:
    return True

If more complex pattern matching is required, a regular expression can be used by specifying a `match_type`. By default this is set to `string`, but it can be manually set to `pcre` instead. Please note that despite the name, this will use Python's `re.search()` rather than `re.match()`.

Therefore, the following states are valid:

```
http://example.com/restapi:
    http.query:
        - match: 'SUCCESS'
        - username: 'larry'
        - password: '5700g3543v4r'
        - data_render: True
        - header_file: /tmp/headers.txt
        - data_file: /tmp/data.txt
        - header_render: True
        - cookies: True
        - persist_session: True

http://example.com/restapi:
    http.query:
        - match_type: pcre
        - match: '(?i)succes\[ss|ed\]'  # Regular expression pattern
        - username: 'larry'
        - password: '5700g3543v4r'
        - data_render: True
        - header_file: /tmp/headers.txt
        - data_file: /tmp/data.txt
        - header_render: True
        - cookies: True
        - persist_session: True
```

In addition to, or instead of a match pattern, the status code for a URL can be checked. This is done using the `status` argument:

```
http://example.com/:
    http.query:
        - status: '200'
```

If both are specified, both will be checked, but if only one is `True` and the other is `False`, then `False` will be returned. In this case, the comments in the return data will contain information for troubleshooting.

Because this is a monitoring state, it will return extra data to code that expects it. This data will always include `text` and `status`. Optionally, `headers` and `dict` may also be requested by setting the `headers` and `decode` arguments to `True`, respectively.

### Writing netapi modules

Netapi modules, put simply, bind a port and start a service. They are purposefully open-ended and can be used to present a variety of external interfaces to Salt, and even present multiple interfaces at once.

See also:

*The full list of netapi modules*
Configuration

All netapi configuration is done in the Salt master config and takes a form similar to the following:

```python
rest_cherrypy:
    port: 8000
    debug: True
    ssl_crt: /etc/pki/tls/certs/localhost.crt
    ssl_key: /etc/pki/tls/certs/localhost.key
```

The __virtual__ function

Like all module types in Salt, netapi modules go through Salt’s loader interface to determine if they should be loaded into memory and then executed.

The __virtual__ function in the module makes this determination and should return False or a string that will serve as the name of the module. If the module raises an ImportError or any other errors, it will not be loaded.

The start function

The start() function will be called for each netapi module that is loaded. This function should contain the server loop that actually starts the service. This is started in a multiprocess.

Inline documentation

As with the rest of Salt, it is a bestpractice to include liberal inline documentation in the form of a module docstring and docstrings on any classes, methods, and functions in your netapi module.

Loader “magic” methods

The loader makes the __opts__ data structure available to any function in a netapi module.
If you are used to configuration management tools that require you to plan down to the last detail before you install anything, you are probably wondering why this section doesn’t appear before the installation instructions. With Salt, you can switch to a high availability architecture at any time, and add additional components to scale your deployment as you go.

Since a single Salt master can manage thousands of systems, we usually recommend that you start by deploying a single Salt master, and then modifying your deployment as needed for redundancy, geographical distribution, and scale.

### 15.1 High Availability Features in Salt

Salt supports several features for high availability and fault tolerance. Brief documentation for these features is listed alongside their configuration parameters in Configuration file examples.

#### 15.1.1 Multimaster

Salt minions can connect to multiple masters at one time by configuring the `master` configuration parameter as a YAML list of all the available masters. By default, all masters are `hot`, meaning that any master can direct commands to the Salt infrastructure.

In a multimaster configuration, each master must have the same cryptographic keys, and minion keys must be accepted on all masters separately. The contents of file_roots and pillar_roots need to be kept in sync with processes external to Salt as well.

A tutorial on setting up multimaster with `hot` masters is here:

*Multimaster Tutorial*

#### 15.1.2 Multimaster with Failover

Changing the `master_type` parameter from `str` to `failover` will cause minions to connect to the first responding master in the list of masters. Every `master_alive_interval` seconds the minions will check to make sure the current master is still responding. If the master does not respond, the minion will attempt to connect to the next master in the list. If the minion runs out of masters, the list will be recycled in case dead masters have been restored.

Note that `master_alive_interval` must be present in the minion configuration, or else the recurring job to check master status will not get scheduled.

Failover can be combined with PKI-style encrypted keys, but PKI is NOT REQUIRED to use failover.
Multimaster with PKI and Failover is discussed in this tutorial

master_type: failover can be combined with master_shuffle: True to spread minion connections across all masters (one master per minion, not each minion connecting to all masters). Adding Salt Syndics into the mix makes it possible to create a load-balanced Salt infrastructure. If a master fails, minions will notice and select another master from the available list.

15.1.3 Syndic

Salt’s Syndic feature is a way to create differing infrastructure topologies. It is not strictly an HA feature, but can be treated as such.

With the syndic, a Salt infrastructure can be partitioned in such a way that certain masters control certain segments of the infrastructure, and “Master of Masters” nodes can control multiple segments underneath them.

Syndics are covered in depth in Salt Syndic.

15.1.4 Syndic with Multimaster

New in version 2015.5.0.

Syndic with Multimaster lets you connect a syndic to multiple masters to provide an additional layer of redundancy in a syndic configuration.

Syndics are covered in depth in Salt Syndic.

15.2 Salt Syndic

The most basic or typical Salt topology consists of a single Master node controlling a group of Minion nodes. An intermediate node type, called Syndic, when used offers greater structural flexibility and scalability in the construction of Salt topologies than topologies constructed only out of Master and Minion node types.

A Syndic node can be thought of as a special passthrough Minion node. A Syndic node consists of a salt-syndic daemon and a salt-master daemon running on the same system. The salt-master daemon running on the Syndic node controls a group of lower level Minion nodes and the salt-syndic daemon connects higher level Master node, sometimes called a Master of Masters.

The salt-syndic daemon relays publications and events between the Master node and the local salt-master daemon. This gives the Master node control over the Minion nodes attached to the salt-master daemon running on the Syndic node.

15.2.1 Configuring the Syndic

To setup a Salt Syndic you need to tell the Syndic node and its Master node about each other. If your Master node is located at 10.10.0.1, then your configurations would be:

On the Syndic node:

```
# /etc/salt/master
syndic_master: 10.10.0.1  # may be either an IP address or a hostname
```
On the Master node:

```bash
# /etc/salt/master
order_masters: True
```

The `syndic_master` option tells the Syndic node where to find the Master node in the same way that the `master` option tells a Minion node where to find a Master node.

The `id` option is used by the `salt-syndic` daemon to identify with the Master node and if unset will default to the hostname or IP address of the Syndic just as with a Minion.

The `order_masters` option configures the Master node to send extra information with its publications that is needed by Syndic nodes connected directly to it.

**Note:** Each Syndic must provide its own `file_roots` directory. Files will not be automatically transferred from the Master node.

### 15.2.2 Configuring the Syndic with Multimaster

New in version 2015.5.0.

Syndic with Multimaster lets you connect a syndic to multiple masters to provide an additional layer of redundancy in a syndic configuration.

Higher level masters should first be configured in a multimaster configuration. See [Multimaster Tutorial](#).

On the syndic, the `syndic_master` option is populated with a list of the higher level masters.

Since each syndic is connected to each master, jobs sent from any master are forwarded to minions that are connected to each syndic. If the `master_id` value is set in the master config on the higher level masters, job results are returned to the master that originated the request in a best effort fashion. Events/jobs without a `master_id` are returned to any available master.

### 15.2.3 Running the Syndic

The `salt-syndic` daemon is a separate process that needs to be started in addition to the `salt-master` daemon running on the Syndic node. Starting the `salt-syndic` daemon is the same as starting the other Salt daemons.

The Master node in many ways sees the Syndic as an ordinary Minion node. In particular, the Master will need to accept the Syndic’s Minion key as it would for any other Minion.

On the Syndic node:

```bash
# salt-syndic
```

or

```bash
# service salt-syndic start
```

On the Master node:
The Master node will now be able to control the Minion nodes connected to the Syndic. Only the Syndic key will be listed in the Master node’s key registry but this also means that key activity between the Syndic’s Minions and the Syndic does not encumber the Master node. In this way, the Syndic’s key on the Master node can be thought of as a placeholder for the keys of all the Minion and Syndic nodes beneath it, giving the Master node a clear, high level structural view on the Salt cluster.

On the Master node:

```
# salt-key -L
Accepted Keys:
my_syndic
Denied Keys:
Unaccepted Keys:
Rejected Keys:
```

```
# salt '*' test.ping
minion_1:
   True
minion_2:
   True
minion_4:
   True
minion_3:
   True
```

### 15.2.4 Topology

A Master node (a node which is itself not a Syndic to another higher level Master node) must run a `salt-master` daemon and optionally a `salt-minion` daemon.

A Syndic node must run `salt-syndic` and `salt-master` daemons and optionally a `salt-minion` daemon.

A Minion node must run a `salt-minion` daemon.

When a `salt-master` daemon issues a command, it will be received by the Syndic and Minion nodes directly connected to it. A Minion node will process the command in the way it ordinarily would. On a Syndic node, the `salt-syndic` daemon will relay the command to the `salt-master` daemon running on the Syndic node, which then propagates the command to to the Minions and Syndics connected to it.

When events and job return data are generated by `salt-minion` daemons, they are aggregated by the `salt-master` daemon they are connected to, which `salt-master` daemon then relays the data back through its `salt-syndic` daemon until the data reaches the Master or Syndic node that issued the command.

### 15.2.5 Syndic wait

`syndic_wait` is a master configuration file setting that specifies the number of seconds the Salt client should wait for additional syndics to check in with their lists of expected minions before giving up. This value defaults to 5 seconds.

The `syndic_wait` setting is necessary because the higher-level master does not have a way of knowing which minions are below the syndics. The higher-level master has its own list of expected minions and the masters below them have their own lists as well, so the Salt client does not how long to wait for all returns. The `syndic_wait` option allows time for all minions to return to the Salt client.
Note: To reduce the amount of time the CLI waits for Minions to respond, install a Minion on the Syndic or tune the value of the `syndic_wait` configuration.

While it is possible to run a Syndic without a Minion installed on the same system, it is recommended, for a faster CLI response time, to do so. Without a Minion installed on the Syndic node, the timeout value of `syndic_wait` increases significantly - about three-fold. With a Minion installed on the Syndic, the CLI timeout resides at the value defined in `syndic_wait`.

Note: If you have a very large infrastructure or many layers of Syndics, you may find that the CLI doesn’t wait long enough for the Syndics to return their events. If you think this is the case, you can set the `syndic_wait` value in the Master configs on the Master or Syndic nodes from which commands are executed. The default value is 5, and should work for the majority of deployments.

In order for a Master or Syndic node to return information from Minions that are below their Syndics, the CLI requires a short wait time in order to allow the Syndics to gather responses from their Minions. This value is defined in the `syndic_wait` config option and has a default of five seconds.

15.2.6 Syndic config options

These are the options that can be used to configure a Syndic node. Note that other than `id`, Syndic config options are placed in the Master config on the Syndic node.

- `id`: Syndic id (shared by the `salt-syndic` daemon with a potential `salt-minion` daemon on the same system)
- `syndic_master`: Master node IP address or hostname
- `syndic_master_port`: Master node ret_port
- `syndic_log_file`: path to the logfile (absolute or not)
- `syndic_pidfile`: path to the pidfile (absolute or not)
- `syndic_wait`: time in seconds to wait on returns from this syndic

15.3 Using Salt at scale

The focus of this tutorial will be building a Salt infrastructure for handling large numbers of minions. This will include tuning, topology, and best practices.

For how to install the Salt Master please go here: Installing saltstack

Note: This tutorial is intended for large installations, although these same settings won’t hurt, it may not be worth the complexity to smaller installations.

When used with minions, the term ‘many’ refers to at least a thousand and ‘a few’ always means 500.

For simplicity reasons, this tutorial will default to the standard ports used by Salt.
15.3.1 The Master

The most common problems on the Salt Master are:

1. too many minions authing at once
2. too many minions re-authing at once
3. too many minions re-connecting at once
4. too many minions returning at once
5. too few resources (CPU/HDD)

The first three are all "thundering herd" problems. To mitigate these issues we must configure the minions to back-off appropriately when the Master is under heavy load.

The fourth is caused by masters with little hardware resources in combination with a possible bug in ZeroMQ. At least that's what it looks like till today (Issue 118651, Issue 5948, Mail thread)

To fully understand each problem, it is important to understand, how Salt works.

Very briefly, the Salt Master offers two services to the minions.

- a job publisher on port 4505
- an open port 4506 to receive the minions returns

All minions are always connected to the publisher on port 4505 and only connect to the open return port 4506 if necessary. On an idle Master, there will only be connections on port 4505.

Too many minions authing

When the Minion service is first started up, it will connect to its Master's publisher on port 4505. If too many minions are started at once, this can cause a "thundering herd". This can be avoided by not starting too many minions at once.

The connection itself usually isn't the culprit, the more likely cause of master-side issues is the authentication that the Minion must do with the Master. If the Master is too heavily loaded to handle the auth request it will time it out. The Minion will then wait `acceptance_wait_time` to retry. If `acceptance_wait_time_max` is set then the Minion will increase its wait time by the `acceptance_wait_time` each subsequent retry until reaching `acceptance_wait_time_max`.

Too many minions re-authing

This is most likely to happen in the testing phase of a Salt deployment, when all Minion keys have already been accepted, but the framework is being tested and parameters are frequently changed in the Salt Master's configuration file(s).

The Salt Master generates a new AES key to encrypt its publications at certain events such as a Master restart or the removal of a Minion key. If you are encountering this problem of too many minions re-authing against the Master, you will need to recalibrate your setup to reduce the rate of events like a Master restart or Minion key removal (`salt-key -d`).

When the Master generates a new AES key, the minions aren't notified of this but will discover it on the next pub job they receive. When the Minion receives such a job it will then re-auth with the Master. Since Salt does minion-side filtering this means that all the minions will re-auth on the next command published on the master-- causing another "thundering herd". This can be avoided by setting the

```
random_reauth_delay: 60
```
in the minions configuration file to a higher value and stagger the amount of re-auth attempts. Increasing this value will of course increase the time it takes until all minions are reachable via Salt commands.

**Too many minions re-connecting**

By default the zmq socket will re-connect every 100ms which for some larger installations may be too quick. This will control how quickly the TCP session is re-established, but has no bearing on the auth load.

To tune the minions sockets reconnect attempts, there are a few values in the sample configuration file (default values)

```plaintext
recon_default: 1000
recon_max: 5000
recon_randomize: True
```

- recon_default: the default value the socket should use, i.e. 1000. This value is in milliseconds. (1000ms = 1 second)
- recon_max: the max value that the socket should use as a delay before trying to reconnect. This value is in milliseconds. (5000ms = 5 seconds)
- recon_randomize: enables randomization between recon_default and recon_max

To tune these values to an existing environment, a few decision have to be made.

1. How long can one wait, before the minions should be online and reachable via Salt?
2. How many reconnects can the Master handle without a syn flood?

These questions can not be answered generally. Their answers depend on the hardware and the administrators requirements.

Here is an example scenario with the goal, to have all minions reconnect within a 60 second time-frame on a Salt Master service restart.

```plaintext
recon_default: 1000
recon_max: 59000
recon_randomize: True
```

Each Minion will have a randomized reconnect value between `recon_default` and `recon_default + recon_max`, which in this example means between 1000ms and 60000ms (or between 1 and 60 seconds). The generated random-value will be doubled after each attempt to reconnect (ZeroMQ default behavior).

Lets say the generated random value is 11 seconds (or 11000ms).

```
reconnect 1: wait 11 seconds
reconnect 2: wait 22 seconds
reconnect 3: wait 33 seconds
reconnect 4: wait 44 seconds
reconnect 5: wait 55 seconds
reconnect 6: wait time is bigger than 60 seconds (recon_default + recon_max)
reconnect 7: wait 11 seconds
reconnect 8: wait 22 seconds
reconnect 9: wait 33 seconds
reconnect x: etc.
```

With a thousand minions this will mean

```
1000/60 = ~16
```
round about 16 connection attempts a second. These values should be altered to values that match your environment. Keep in mind though, that it may grow over time and that more minions might raise the problem again.

**Too many minions returning at once**

This can also happen during the testing phase, if all minions are addressed at once with

```
$ salt * disk.usage
```

it may cause thousands of minions trying to return their data to the Salt Master open port 4506. Also causing a flood of syn-flood if the Master can't handle that many returns at once.

This can be easily avoided with Salt's batch mode:

```
$ salt * disk.usage -b 50
```

This will only address 50 minions at once while looping through all addressed minions.

### 15.3.2 Too few resources

The masters resources always have to match the environment. There is no way to give good advise without knowing the environment the Master is supposed to run in. But here are some general tuning tips for different situations:

**The Master is CPU bound**

Salt uses RSA-Key-Pairs on the masters and minions end. Both generate 4096 bit key-pairs on first start. While the key-size for the Master is currently not configurable, the minions keysize can be configured with different key-sizes. For example with a 2048 bit key:

```
keysise: 2048
```

With thousands of decryptions, the amount of time that can be saved on the masters end should not be neglected. See here for reference: [Pull Request 9235](https://gitlab.com/saltstack/salt/issues/9235) how much influence the key-size can have.

Downsizing the Salt Master's key is not that important, because the minions do not encrypt as many messages as the Master does.

In installations with large or with complex pillar files, it is possible for the master to exhibit poor performance as a result of having to render many pillar files at once. This exhibit itself in a number of ways, both as high load on the master and on minions which block on waiting for their pillar to be delivered to them.

To reduce pillar rendering times, it is possible to cache pillars on the master. To do this, see the set of master configuration options which are prefixed with `pillar_cache`.

**Note:** Caching pillars on the master may introduce security considerations. Be certain to read caveats outlined in the master configuration file to understand how pillar caching may affect a master's ability to protect sensitive data!

**The Master is disk IO bound**

By default, the Master saves every Minion's return for every job in its job-cache. The cache can then be used later, to lookup results for previous jobs. The default directory for this is:
cachedir: /var/cache/salt

and then in the /proc directory.

Each job return for every Minion is saved in a single file. Over time this directory can grow quite large, depending on the number of published jobs. The amount of files and directories will scale with the number of jobs published and the retention time defined by

keep_jobs: 24

250 jobs/day * 2000 minions returns = 500,000 files a day

If no job history is needed, the job cache can be disabled:

job_cache: False

If the job cache is necessary there are (currently) 2 options:

- ext_job_cache: this will have the minions store their return data directly into a returner (not sent through the Master)
- master_job_cache (New in 2014.7.0): this will make the Master store the job data using a returner (instead of the local job cache on disk).

15.4 Multi Master Tutorial

As of Salt 0.16.0, the ability to connect minions to multiple masters has been made available. The multi-master system allows for redundancy of Salt masters and facilitates multiple points of communication out to minions. When using a multi-master setup, all masters are running hot, and any active master can be used to send commands out to the minions.

Note: If you need failover capabilities with multiple masters, there is also a MultiMaster-PKI setup available, that uses a different topology [MultiMaster-PKI with Failover Tutorial](#)

In 0.16.0, the masters do not share any information, keys need to be accepted on both masters, and shared files need to be shared manually or use tools like the git fileserver backend to ensure that the file_roots are kept consistent.

15.4.1 Summary of Steps

1. Create a redundant master server
2. Copy primary master key to redundant master
3. Start redundant master
4. Configure minions to connect to redundant master
5. Restart minions
6. Accept keys on redundant master
15.4.2 Prepping a Redundant Master

The first task is to prepare the redundant master. If the redundant master is already running, stop it. There is only one requirement when preparing a redundant master, which is that masters share the same private key. When the first master was created, the master's identifying key pair was generated and placed in the master's pki_dir. The default location of the master's key pair is /etc/salt/pki/master/. Take the private key, master.pem, and copy it to the same location on the redundant master. Do the same for the master's public key, master.pub. Assuming that no minions have yet been connected to the new redundant master, it is safe to delete any existing key in this location and replace it.

Note: There is no logical limit to the number of redundant masters that can be used.

Once the new key is in place, the redundant master can be safely started.

15.4.3 Configure Minions

Since minions need to be master-aware, the new master needs to be added to the minion configurations. Simply update the minion configurations to list all connected masters:

```
master:
  - saltmaster1.example.com
  - saltmaster2.example.com
```

Now the minion can be safely restarted.

Note: If the ipc_mode for the minion is set to TCP (default in Windows), then each minion in the multi-minion setup (one per master) needs its own tcp_pub_port and tcp_pull_port.

If these settings are left as the default 4510/4511, each minion object will receive a port 2 higher than the previous. Thus the first minion will get 4510/4511, the second will get 4512/4513, and so on. If these port decisions are unacceptable, you must configure tcp_pub_port and tcp_pull_port with lists of ports for each master. The length of these lists should match the number of masters, and there should not be overlap in the lists.

Now the minions will check into the original master and also check into the new redundant master. Both masters are first-class and have rights to the minions.

Note: Minions can automatically detect failed masters and attempt to reconnect to them quickly. To enable this functionality, set master_alive_interval in the minion config and specify a number of seconds to poll the masters for connection status.

If this option is not set, minions will still reconnect to failed masters but the first command sent after a master comes back up may be lost while the minion authenticates.

15.4.4 Sharing Files Between Masters

Salt does not automatically share files between multiple masters. A number of files should be shared or sharing of these files should be strongly considered.
Minion Keys

Minion keys can be accepted the normal way using salt-key on both masters. Keys accepted, deleted, or rejected on one master will NOT be automatically managed on redundant masters; this needs to be taken care of by running salt-key on both masters or sharing the /etc/salt/pki/master/{minions,minions_pre,minions_rejected} directories between masters.

Note: While sharing the /etc/salt/pki/master directory will work, it is strongly discouraged, since allowing access to the master.pem key outside of Salt creates a SERIOUS security risk.

File_Roots

The file_roots contents should be kept consistent between masters. Otherwise state runs will not always be consistent on minions since instructions managed by one master will not agree with other masters.

The recommended way to sync these is to use a fileserver backend like gitfs or to keep these files on shared storage.

Important: If using gitfs/git_pillar with the cachedir shared between masters using GlusterFS, nfs, or another network filesystem, and the masters are running Salt 2015.5.9 or later, it is strongly recommended not to turn off gitfs_global_lock/git_pillar_global_lock as doing so will cause lock files to be removed if they were created by a different master.

Pillar_Roots

Pillar roots should be given the same considerations as file_roots.

Master Configurations

While reasons may exist to maintain separate master configurations, it is wise to remember that each master maintains independent control over minions. Therefore, access controls should be in sync between masters unless a valid reason otherwise exists to keep them inconsistent.

These access control options include but are not limited to:

- external_auth
- publisher_acl
- peer
- peer_run

15.5 Multi-Master-PKI Tutorial With Failover

This tutorial will explain how to run a salt-environment where a single minion can have multiple masters and fail-over between them if its current master fails.

The individual steps are

- setup the master(s) to sign its auth-replies
• setup minion(s) to verify master-public-keys
• enable multiple masters on minion(s)
• enable master-check on minion(s)

Please note, that it is advised to have good knowledge of the salt- authentication and communication-process to understand this tutorial. All of the settings described here, go on top of the default authentication/communication process.

15.5.1 Motivation

The default behaviour of a salt-minion is to connect to a master and accept the masters public key. With each publication, the master sends his public-key for the minion to check and if this public-key ever changes, the minion complains and exits. Practically this means, that there can only be a single master at any given time.

Would it not be much nicer, if the minion could have any number of masters (1:n) and jump to the next master if its current master died because of a network or hardware failure?

Note: There is also a MultiMaster-Tutorial with a different approach and topology than this one, that might also suite your needs or might even be better suited Multi-Master Tutorial

It is also desirable, to add some sort of authenticity-check to the very first public key a minion receives from a master. Currently a minions takes the first masters public key for granted.

15.5.2 The Goal

Setup the master to sign the public key it sends to the minions and enable the minions to verify this signature for authenticity.

15.5.3 Prepping the master to sign its public key

For signing to work, both master and minion must have the signing and/or verification settings enabled. If the master signs the public key but the minion does not verify it, the minion will complain and exit. The same happens, when the master does not sign but the minion tries to verify.

The easiest way to have the master sign its public key is to set

```
master_sign_pubkey: True
```

After restarting the salt-master service, the master will automatically generate a new key-pair

```
master_sign.pem
master_sign.pub
```

A custom name can be set for the signing key-pair by setting

```
master_sign_key_name: <name_without_suffix>
```

The master will then generate that key-pair upon restart and use it for creating the public keys signature attached to the auth-reply.

The computation is done for every auth-request of a minion. If many minions auth very often, it is advised to use conf_master:master_pubkey_signature and conf_master:master_use_pubkey_signature settings described below.
If multiple masters are in use and should sign their auth-replies, the signing key-pair `master_sign.*` has to be copied to each master. Otherwise a minion will fail to verify the masters public when connecting to a different master than it did initially. That is because the public keys signature was created with a different signing key-pair.

### 15.5.4 Prepping the minion to verify received public keys

The minion must have the public key (and only that one!) available to be able to verify a signature it receives. That public key (defaults to `master_sign.pub`) must be copied from the master to the minions pki-directory.

```
/etc/salt/pki/minion/master_sign.pub
```

**DO NOT COPY THE master_sign.pem FILE. IT MUST STAY ON THE MASTER AND ONLY THERE!**

When that is done, enable the signature checking in the minions configuration

```
verify_master_pubkey_sign: True
```

and restart the minion. For the first try, the minion should be run in manual debug mode.

```
salt-minion -l debug
```

Upon connecting to the master, the following lines should appear on the output:

```
[DEBUG ] Attempting to authenticate with the Salt Master at 172.16.0.10
[DEBUG ] Loaded minion key: /etc/salt/pki/minion/minion.pem
[DEBUG ] salt.crypt.verify_signature: Loading public key
[DEBUG ] salt.crypt.verify_signature: Verifying signature
[DEBUG ] Successfully verified signature of master public key with verification
        --public key master_sign.pub
[INFO  ] Received signed and verified master pubkey from master 172.16.0.10
[DEBUG ] Decrypting the current master AES key
```

If the signature verification fails, something went wrong and it will look like this

```
[DEBUG ] Attempting to authenticate with the Salt Master at 172.16.0.10
[DEBUG ] Loaded minion key: /etc/salt/pki/minion/minion.pem
[DEBUG ] salt.crypt.verify_signature: Loading public key
[DEBUG ] salt.crypt.verify_signature: Verifying signature
[DEBUG ] Failed to verify signature of public key
[CRITICAL] The Salt Master server's public key did not authenticate!
```

In a case like this, it should be checked, that the verification pubkey (master_sign.pub) on the minion is the same as the one on the master.

Once the verification is successful, the minion can be started in daemon mode again.

For the paranoid among us, its also possible to verify the publication whenever it is received from the master. That is, for every single auth-attempt which can be quite frequent. For example just the start of the minion will force the signature to be checked 6 times for various things like auth, mine, highstate, etc.

If that is desired, enable the setting

```
always_verify_signature: True
```
15.5.5 Multiple Masters For A Minion

Configuring multiple masters on a minion is done by specifying two settings:

- a list of masters addresses
- what type of master is defined

<table>
<thead>
<tr>
<th>master:</th>
</tr>
</thead>
<tbody>
<tr>
<td>- 172.16.0.10</td>
</tr>
<tr>
<td>- 172.16.0.11</td>
</tr>
<tr>
<td>- 172.16.0.12</td>
</tr>
</tbody>
</table>

| master_type: failover |

This tells the minion that all the master above are available for it to connect to. When started with this configuration, it will try the master in the order they are defined. To randomize that order, set

| master_shuffle: True |

The master-list will then be shuffled before the first connection attempt.

The first master that accepts the minion, is used by the minion. If the master does not yet know the minion, that counts as accepted and the minion stays on that master.

For the minion to be able to detect if its still connected to its current master enable the check for it

| master_alive_interval: <seconds> |

If the loss of the connection is detected, the minion will temporarily remove the failed master from the list and try one of the other masters defined (again shuffled if that is enabled).

15.5.6 Testing the setup

At least two running masters are needed to test the failover setup.

Both masters should be running and the minion should be running on the command line in debug mode

```
salt-minion -l debug
```

The minion will connect to the first master from its master list

```
[DEBUG ] Attempting to authenticate with the Salt Master at 172.16.0.10
[DEBUG ] Loaded minion key: /etc/salt/pki/minion/minion.pem
[DEBUG ] salt.crypt.verify_signature: Loading public key
[DEBUG ] salt.crypt.verify_signature: Verifying signature
[DEBUG ] Successfully verified signature of master public key with verification password key master_sign.pub
[INFO ] Received signed and verified master pubkey from master 172.16.0.10
[DEBUG ] Decrypting the current master AES key
```

A test.ping on the master the minion is currently connected to should be run to test connectivity.

If successful, that master should be turned off. A firewall-rule denying the minions packets will also do the trick.

Depending on the configured conf_minion:master_alive_interval, the minion will notice the loss of the connection and log it to its logfile.
The minion will then remove the current master from the list and try connecting to the next master

If everything is configured correctly, the new masters public key will be verified successfully

and the minion can be pinged again from its new master.

15.5.7 Performance Tuning

With the setup described above, the master computes a signature for every auth-request of a minion. With many minions and many auth-requests, that can chew up quite a bit of CPU-Power.

To avoid that, the master can use a pre-created signature of its public-key. The signature is saved as a base64 encoded string which the master reads once when starting and attaches only that string to auth-replies.

Enabling this also gives paranoid users the possibility, to have the signing key-pair on a different system than the actual salt-master and create the public keys signature there. Probably on a system with more restrictive firewall rules, without internet access, less users, etc.

That signature can be created with

```
salt-key --gen-signature
```

This will create a default signature file in the master pki-directory

```
/etc/salt/pki/master/master_pubkey_signature
```

It is a simple text-file with the binary-signature converted to base64.

If no signing-pair is present yet, this will auto-create the signing pair and the signature file in one call

```
salt-key --gen-signature --auto-create
```

Telling the master to use the pre-created signature is done with

```
master_use_pubkey_signature: True
```
That requires the file `master_pubkey_signature` to be present in the masters pki-directory with the correct signature. If the signature file is named differently, its name can be set with

```
master_pubkey_signature: <filename>
```

With many masters and many public-keys (default and signing), it is advised to use the salt-masters hostname for the signature-files name. Signatures can be easily confused because they do not provide any information about the key the signature was created from.

Verifying that everything works is done the same way as above.

### 15.5.8 How the signing and verification works

The default key-pair of the salt-master is

```
/etc/salt/pki/master/master.pem
/etc/salt/pki/master/master.pub
```

To be able to create a signature of a message (in this case a public-key), another key-pair has to be added to the setup. Its default name is:

```
master_sign.pem
master_sign.pub
```

The combination of the master.* and master_sign.* key-pairs give the possibility of generating signatures. The signature of a given message is unique and can be verified, if the public-key of the signing-key-pair is available to the recipient (the minion).

The signature of the masters public-key in master.pub is computed with

```
master_sign.pem
master.pub
M2Crypto.EVP.sign_update()
```

This results in a binary signature which is converted to base64 and attached to the auth-reply send to the minion.

With the signing-pair's public-key available to the minion, the attached signature can be verified with

```
master_sign.pub
master.pub
M2Cryptos EVP.verify_update().
```

When running multiple masters, either the signing key-pair has to be present on all of them, or the master_pubkey_signature has to be pre-computed for each master individually (because they all have different public-keys).

**DO NOT PUT THE SAME master.pub ON ALL MASTERS FOR EASE OF USE.**
This section contains details on the Windows Package Manager, and specific information you need to use Salt on Windows.

16.1 Windows Software Repository

**Note:** In 2015.8.0 and later, the Windows Software Repository cache is compiled on the Salt Minion, which enables pillar, grains and other things to be available during compilation time. To support this new functionality, a next-generation (ng) package repository was created. See the *Changes in Version 2015.8.0* for details.

The SaltStack Windows Software Repository provides a package manager and software repository similar to what is provided by yum and apt on Linux. This repository enables the installation of software using the installers on remote Windows systems.

In many senses, the operation is similar to that of the other package managers salt is aware of:

- the `pkg.installed` and similar states work on Windows.
- the `pkg.install` and similar module functions work on Windows.

High level differences to yum and apt are:

- The repository metadata (SLS files) is hosted through either salt or git.
- Packages can be downloaded from within the salt repository, a git repository or from http(s) or ftp urls.
- No dependencies are managed. Dependencies between packages needs to be managed manually.

**Requirements**:

- GitPython 0.3 or later, or pygit2 0.20.3 with libgit 0.20.0 or later installed on your Salt master. The Windows package definitions are downloaded and updated using Git.

16.1.1 Configuration

**Populate the Repository**

The SLS files used to install Windows packages are not distributed by default with Salt. Run the following command to initialize the repository on your Salt master:
Sync Repo to Windows Minions

Run `pkg.refresh_db` on each of your Windows minions to synchronize the package repository.

```
salt -G 'os:windows' pkg.refresh_db
```

### 16.1.2 Install Windows Software

After completing the configuration steps, you are ready to manage software on your Windows minions.

#### Show Installed Packages

```
salt -G 'os:windows' pkg.list_pkgs
```

#### Install a Package

You can query the available version of a package using the Salt `pkg` module.

```
salt winminion pkg.available_version firefox

{'firefox': {'15.0.1': 'Mozilla Firefox 15.0.1 (x86 en-US)',
             '16.0.2': 'Mozilla Firefox 16.0.2 (x86 en-US)',
             '17.0.1': 'Mozilla Firefox 17.0.1 (x86 en-US)'}
```

As you can see, there are three versions of Firefox available for installation. You can refer a software package by its name or its `full_name` surrounded by single quotes.

```
salt winminion pkg.install 'firefox'

The above line will install the latest version of Firefox.
```

```
salt winminion pkg.install 'firefox' version=16.0.2

The above line will install version 16.0.2 of Firefox.
```

If a different version of the package is already installed it will be replaced with the version in the winrepo (only if the package itself supports live updating).

You can also specify the full name:

```
salt winminion pkg.install 'Mozilla Firefox 17.0.1 (x86 en-US)'
```

### 16.1.3 Uninstall Windows Software

Uninstall software using the `pkg` module:

```
salt winminion pkg.remove firefox
salt winminion pkg.purge firefox
```
16.1.4 Repository Location

Salt maintains a repository of SLS files to install a large number of Windows packages:

- 2015.8.0 and later minions: https://github.com/saltstack/salt-winrepo-ng
- Earlier releases: https://github.com/saltstack/salt-winrepo

By default, these repositories are mirrored to /srv/salt/win/repo_ng and /srv/salt/win/win/repo.

This location can be changed in the master config file by setting the `winrepo_dir_ng` and `winrepo_dir` options.

16.1.5 Maintaining Windows Repo Definitions in Git Repositories

Windows software package definitions can be hosted in one or more Git repositories. The default repositories are hosted on GitHub by SaltStack. These include software definition files for various open source software projects. These software definition files are .sls files. There are two default repositories: salt-winrepo and salt-winrepo-ng. salt-winrepo contains software definition files for older minions (older than 2015.8.0). salt-winrepo-ng is for newer minions (2015.8.0 and newer).

Each software definition file contains all the information salt needs to install that software on a minion including the HTTP or FTP locations of the installer files, required command-line switches for silent install, etc. Anyone is welcome to send a pull request to this repo to add new package definitions. The repos can be browsed here: salt-winrepo salt-winrepo-ng

Note: The newer software definition files are run through the salt's parser which allows for the use of Jinja.

Configure which git repositories the master can search for package definitions by modifying or extending the `winrepo_remotes` and `winrepo_remotes_ng` options.

**Important:** `winrepo_remotes` was called `win_gitrepos` in Salt versions earlier than 2015.8.0

Package definitions are pulled down from the online repository by running the `winrepo.update_git_repos` runner. This command is run on the master:

```
salt-run winrepo.update_git_repos
```

This will pull down the software definition files for older minions (salt-winrepo) and new minions (salt-winrepo-ng). They are stored in the `file_roots` under `win/repo/salt-winrepo` and `win/repo-ng/salt-winrepo-ng` respectively.

**Important:** If you have customized software definition files that aren't maintained in a repository, those should be stored under `win/repo` for older minions and `win/repo-ng` for newer minions. The reason for this is that the contents of `win/repo/salt-winrepo` and `win/repo-ng/salt-winrepo-ng` are wiped out every time you run a `winrepo.update_git_repos`.

Note: pkg.purge just executes pkg.remove on Windows. At some point in the future pkg.purge may direct the installer to remove all configs and settings for software packages that support that option.
Additionally, when you run `winrepo.genrepo` and `pkg.refresh_db` the entire contents under `win/repo` and `win/repo-ng`, to include all subdirectories, are used to create the msgpack file.

The next step (if you have older minions) is to create the msgpack file for the repo (`winrepo.p`). This is done by running the `winrepo.genrepo` runner. This is also run on the master:

```
salt-run winrepo.genrepo
```

**Note:** If you have only 2015.8.0 and newer minions, you no longer need to run `salt-run winrepo.genrepo` on the master.

Finally, you need to refresh the minion database by running the `pkg.refresh_db` command. This is run on the master as well:

```
salt '*' pkg.refresh_db
```

On older minions (older than 2015.8.0) this will copy the winrepo.p file down to the minion. On newer minions (2015.8.0 and newer) this will copy all the software definition files (.sls) down to the minion and then create the msgpack file (`winrepo.p`) locally. The reason this is done locally is because the jinja needs to be parsed using the minion's grains.

**Important:** Every time you modify the software definition files on the master, either by running `salt-run winrepo.update_git_repos`, modifying existing files, or by creating your own, you need to refresh the database on your minions. For older minions, that means running `salt-run winrepo.genrepo` and then `salt '*' pkg.refresh_db`. For newer minions (2015.8.0 and newer) it is just `salt '*' pkg.refresh_db`.

**Note:** If the `winrepo.genrepo` or the `pkg.refresh_db` fails, it is likely a problem with the jinja in one of the software definition files. This will cause the operations to stop. You'll need to fix the syntax in order for the msgpack file to be created successfully.

To disable one of the repos, set it to an empty list `[]` in the master config. For example, to disable `winrepo_remotes` set the following in the master config file:

```
winrepo_remotes: []
```

### 16.1.6 Creating a Package Definition SLS File

The package definition file is a yaml file that contains all the information needed to install a piece of software using salt. It defines information about the package to include version, full name, flags required for the installer and uninstaller, whether or not to use the windows task scheduler to install the package, where to find the installation package, etc.

Take a look at this example for Firefox:

```
firefox:
  '17.0.1':
    installer: 'salt://win/repo/firefox/English/Firefox Setup 17.0.1.exe'
    full_name: Mozilla Firefox 17.0.1 (x86 en-US)
    locale: en_US
    reboot: False
```
Each software definition file begins with a package name for the software. As in the example above firefox. The next line is indented two spaces and contains the version to be defined. As in the example above, a software definition file can define multiple versions for the same piece of software. The lines following the version are indented two more spaces and contain all the information needed to install that package.

**Warning:** The package name and the `full_name` must be unique to all other packages in the software repository.

The version line is the version for the package to be installed. It is used when you need to install a specific version of a piece of software.

**Warning:** The version must be enclosed in quotes, otherwise the yaml parser will remove trailing zeros.

**Note:** There are unique situations where previous versions are unavailable. Take Google Chrome for example. There is only one url provided for a standalone installation of Google Chrome. ([https://dl.google.com/edgedl/chrome/install/GoogleChromeStandaloneEnterprise.msi](https://dl.google.com/edgedl/chrome/install/GoogleChromeStandaloneEnterprise.msi)) When a new version is released, the url just points to the new version. To handle situations such as these, set the version to `latest`. Salt will install the version of Chrome at the URL and report that version. Here’s an example:

```yaml
chrome:
  latest:
    full_name: 'Google Chrome'
    installer: 'https://dl.google.com/edgedl/chrome/install/GoogleChromeStandaloneEnterprise.msi'
    install_flags: '/qn /norestart'
    uninstaller: 'https://dl.google.com/edgedl/chrome/install/GoogleChromeStandaloneEnterprise.msi'
    uninstall_flags: '/qn /norestart'
    msiexec: True
    locale: en_US
    reboot: False
```
Available parameters are as follows:

**param str full_name**  The Full Name for the software as shown in "Programs and Features" in the control panel. You can also get this information by installing the package manually and then running `pkg.list_pkgs`. Here's an example of the output from `pkg.list_pkgs`:

```
salt 'test-2008' pkg.list_pkgs
test-2008
--------
7-Zip 9.20 (x64 edition):
  9.20.00.0
Microsoft .NET Framework 4 Client Profile:
  4.0.30319,4.0.30319
Microsoft .NET Framework 4 Extended:
  4.0.30319,4.0.30319
Microsoft Visual C++ 2008 Redistributable - x64 9.0.21022:
  9.0.21022
Mozilla Firefox 17.0.1 (x86 en-US):
  17.0.1
Mozilla Maintenance Service:
  17.0.1
NSClient++ (x64):
  0.3.9.328
Notepad++:
  6.4.2
Salt Minion 0.16.0:
  0.16.0
```

Notice the Full Name for Firefox: Mozilla Firefox 17.0.0 (x86 en-US). That's exactly what's in the `full_name` parameter in the software definition file.

If any of the software installed on the machine matches one of the software definition files in the repository the `full_name` will be automatically renamed to the package name. The example below shows the `pkg.list_pkgs` for a machine that already has Mozilla Firefox 17.0.1 installed.

```
test-2008:
--------
  7zip:
  9.20.00.0
Microsoft .NET Framework 4 Client Profile:
  4.0.30319,4.0.30319
Microsoft .NET Framework 4 Extended:
  4.0.30319,4.0.30319
Microsoft Visual C++ 2008 Redistributable - x64 9.0.21022:
  9.0.21022
Mozilla Maintenance Service:
  17.0.1
NSClient++ (x64):
  0.3.9.328
Notepad++:
  6.4.2
Salt Minion 0.16.0:
  0.16.0
firefox:
  17.0.1
nsclient:
  0.3.9.328
```

**Important:** The version number and `full_name` need to match the output from `pkg.list_pkgs` so that the
status can be verified when running highstate.

Note: It is still possible to successfully install packages using `pkg.install` even if they don't match. This can make troubleshooting difficult so be careful.

```
param str installer The path to the .exe or .msi to use to install the package. This can be a path or a URL. If it is a URL or a salt path (salt://), the package will be cached locally and then executed. If it is a path to a file on disk or a file share, it will be executed directly.

param str install_flags Any flags that need to be passed to the installer to make it perform a silent install. These can often be found by adding `/?` or `/h` when running the installer from the command-line. A great resource for finding these silent install flags can be found on the WPKG project's wiki:
```
Salt will not return if the installer is waiting for user input so these are important.

```
param str uninstaller The path to the program used to uninstall this software. This can be the path to the same exe or msi used to install the software. It can also be a GUID. You can find this value in the registry under the following keys:
- Software\Microsoft\Windows\CurrentVersion\Uninstall
- Software\Wow6432Node\Microsoft\Windows\CurrentVersion\Uninstall

param str uninstall_flags Any flags that need to be passed to the uninstaller to make it perform a silent uninstall. These can often be found by adding `/?` or `/h` when running the uninstaller from the command-line. A great resource for finding these silent install flags can be found on the WPKG project's wiki:
```
Salt will not return if the installer is waiting for user input so these are important.

Here are some examples of installer and uninstaller settings:

```
7zip:
'9.20.00.00':
  installer: salt://win/repo/7zip/7z920-x64.msi
  full_name: 7-Zip 9.20 (x64 edition)
  reboot: False
  install_flags: '/qn /norestart'
  msiexec: True
  uninstaller: '{23170F69-40C1-2702-0920-000001000000}'
  uninstall_flags: '/qn /norestart'

Alternatively the uninstaller can also simply repeat the URL of the msi file.

```
7zip:
'9.20.00.00':
  installer: salt://win/repo/7zip/7z920-x64.msi
  full_name: 7-Zip 9.20 (x64 edition)
  reboot: False
  install_flags: '/qn /norestart'
  msiexec: True
  uninstaller: salt://win/repo/7zip/7z920-x64.msi
  uninstall_flags: '/qn /norestart'

param bool msiexec This tells salt to use `msiexec /i` to install the package and `msiexec /x` to uninstall. This is for .msi installations.
```
**param bool allusers** This parameter is specific to `.msi` installations. It tells `msiexec` to install the software for all users. The default is True.

**param bool cache_dir** If true, the entire directory where the installer resides will be recursively cached. This is useful for installers that depend on other files in the same directory for installation.

Note: Only applies to `salt: installer URLs`.

Here's an example for a software package that has dependent files:

```plaintext
sqlexpress:
  12.0.2000.8:
    installer: 'salt://win/repo/sqlexpress/setup.exe'
    full_name: Microsoft SQL Server 2014 Setup (English)
    reboot: False
    install_flags: '/ACTION=install /IACCEPTSQLSERVERLICENSETERMS /Q'
    cache_dir: True
```

**param bool use_scheduler** If true, windows will use the task scheduler to run the installation. This is useful for running the salt installation itself as the installation process kills any currently running instances of salt.

**param bool reboot** Not implemented

**param str local** Not implemented

Examples can be found at [https://github.com/saltstack/salt-winrepo-ng](https://github.com/saltstack/salt-winrepo-ng)

### 16.1.7 Managing Windows Software on a Standalone Windows Minion

The Windows Package Repository functions similar in a standalone environment, with a few differences in the configuration.

To replace the winrepo runner that is used on the Salt master, an `execution module` exists to provide the same functionality to standalone minions. The functions are named the same as the ones in the runner, and are used in the same way; the only difference is that `salt-call` is used instead of `salt-run`:

```plaintext
salt-call winrepo.update_git_repos
salt-call winrepo.genrepo
salt-call pkg.refresh_db
```

After executing the previous commands the repository on the standalone system is ready to use.

**Custom Location for Repository SLS Files**

If `file_roots` has not been modified in the minion configuration, then no additional configuration needs to be added to the minion configuration. The `winrepo.genrepo` function from the `winrepo` execution module will by default look for the filename specified by `winrepo_cachefile` within `C:\salt\srv\salt\win\repo`.

If the `file_roots` parameter has been modified, then `winrepo_dir` must be modified to fall within that path, at the proper relative path. For example, if the base environment in `file_roots` points to `D:\foo`, and `winrepo_source_dir` is `salt://win/repo`, then `winrepo_dir` must be set to `D:\foo\win\repo` to ensure that `winrepo.genrepo` puts the cachefile into right location.
16.1.8 Config Options for Minions 2015.8.0 and Later

The `winrepo_source_dir` config parameter (default: `salt://win/repo`) controls where `pkg.refresh_db` looks for the cachefile (default: `winrepo.p`). This means that the default location for the winrepo cachefile would be `salt://win/repo/winrepo.p`. Both `winrepo_source_dir` and `winrepo_cachefile` can be adjusted to match the actual location of this file on the Salt fileserver.

16.1.9 Config Options for Minions Before 2015.8.0

If connected to a master, the minion will by default look for the winrepo cachefile (the file generated by the `winrepo.genrepo` runner) at `salt://win/repo/winrepo.p`. If the cachefile is in a different path on the salt fileserver, then `win_repo_cachefile` will need to be updated to reflect the proper location.

16.1.10 Changes in Version 2015.8.0

Git repository management for the Windows Software Repository has changed in version 2015.8.0, and several master/minion config parameters have been renamed to make their naming more consistent with each other.

For a list of the winrepo config options, see here for master config options, and here for configuration options for masterless Windows minions.

On the master, the `winrepo.update_git_repos` runner has been updated to use either `pygit2` or `GitPython` to checkout the git repositories containing repo data. If `pygit2` or `GitPython` is installed, existing winrepo git checkouts should be removed after upgrading to 2015.8.0, to allow them to be checked out again by running `winrepo.update_git_repos`.

If neither `GitPython` nor `pygit2` are installed, then Salt will fall back to the pre-existing behavior for `winrepo.update_git_repos`, and a warning will be logged in the master log.

---

**Note:** Standalone Windows minions do not support the new `GitPython/pygit2` functionality, and will instead use the `git.latest` state to keep repositories up-to-date. More information on how to use the Windows Software Repo on a standalone minion can be found here.

---

**Config Parameters Renamed**

Many of the legacy winrepo configuration parameters have changed in version 2015.8.0 to make the naming more consistent. The old parameter names will still work, but a warning will be logged indicating that the old name is deprecated.

Below are the parameters which have changed for version 2015.8.0:

**Master Config**

<table>
<thead>
<tr>
<th>Old Name</th>
<th>New Name</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>win_repo</code></td>
<td><code>winrepo_dir</code></td>
</tr>
<tr>
<td><code>win_repo_mastercachefile</code></td>
<td><code>winrepo_cachefile</code></td>
</tr>
<tr>
<td><code>win_gitrepos</code></td>
<td><code>winrepo_remotes</code></td>
</tr>
</tbody>
</table>

**Note:** `winrepo_cachefile` is no longer used by 2015.8.0 and later minions, and the `winrepo_dir` setting is replaced by `winrepo_dir_ng` for 2015.8.0 and later minions.
See [here](#) for detailed information on all master config options for the Windows Repo.

### Minion Config

<table>
<thead>
<tr>
<th>Old Name</th>
<th>New Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>win_repo</td>
<td>winrepo_dir</td>
</tr>
<tr>
<td>win_repo_cachefile</td>
<td>winrepo_cachefile</td>
</tr>
<tr>
<td>win_gitrepos</td>
<td>winrepo_remotes</td>
</tr>
</tbody>
</table>

See [here](#) for detailed information on all minion config options for the Windows Repo.

#### pygit2/GitPython Support for Maintaining Git Repos

The `winrepo.update_git_repos` runner (and the corresponding remote execution function for standalone minions) now makes use of the same underlying code used by the Git Fileserver Backend and Git External Pillar to maintain and update its local clones of git repositories. If a compatible version of either pygit2 (0.20.3 and later) or GitPython (0.3.0 or later) is installed, then Salt will use it instead of the old method (which invokes the `git.latest` state).

**Note:** If compatible versions of both pygit2 and GitPython are installed, then Salt will prefer pygit2, to override this behavior use the `winrepo_provider` configuration parameter:

```yaml
winrepo_provider: gitpython
```

The `winrepo execution module` (discussed above in the Managing Windows Software on a Standalone Windows Minion section) does not yet officially support the new pygit2/GitPython functionality, but if either pygit2 or GitPython is installed into Salt’s bundled Python then it should work. However, it should be considered experimental at this time.

To minimize potential issues, it is a good idea to remove any winrepo git repositories that were checked out by the old (pre-2015.8.0) winrepo code when upgrading the master to 2015.8.0 or later, and run `winrepo.update_git_repos` to clone them anew after the master is started.

Additional added features include the ability to access authenticated git repositories (**Note**: pygit2 only), and to set per-remote config settings. An example of this would be the following:

```yaml
winrepo_remotes:
  - https://github.com/saltstack/salt-winrepo.git
  - git@github.com:myuser/myrepo.git:
    - pubkey: /path/to/key.pub
    - privkey: /path/to/key
    - passphrase: myaw3s0m3pa$$phr4$$3
  - https://github.com/myuser/privaterepo.git:
    - user: mygithubuser
    - password: CorrectHorseBatteryStaple
```

**Note:** Per-remote configuration settings work in the same fashion as they do in gitfs, with global parameters being overridden by their per-remote counterparts (for instance, setting `winrepo_passphrase` would set a global passphrase for winrepo that would apply to all SSH-based remotes, unless overridden by a `passphrase` per-remote parameter).
See [here](#) for more a more in-depth explanation of how per-remote configuration works in gitfs, the same principles apply to winrepo.

There are a couple other changes in how Salt manages git repos using pygit2/GitPython. First of all, a `clean` argument has been added to the `winrepo.update_git_repos` runner, which (if set to `True`) will tell the runner to dispose of directories under the `winrepo_dir` which are not explicitly configured. This prevents the need to manually remove these directories when a repo is removed from the config file. To clean these old directories, just pass `clean=True`, like so:

```
salt-run winrepo.update_git_repos clean=True
```

However, if a mix of git and non-git Windows Repo definition files are being used, then this should not be used, as it will remove the directories containing non-git definitions.

The other major change is that collisions between repo names are now detected, and the `winrepo.update_git_repos` runner will not proceed if any are detected. Consider the following configuration:

```
winrepo_remotes:
  - https://foo.com/bar/baz.git
  - https://mydomain.tld/baz.git
  - https://github.com/foobar/baz
```

The `winrepo.update_git_repos` runner will refuse to update repos here, as all three of these repos would be checked out to the same directory. To work around this, a per-remote parameter called `name` can be used to resolve these conflicts:

```
winrepo_remotes:
  - https://foo.com/bar/baz.git
  - https://mydomain.tld/baz.git:
    - name: baz_junior
  - https://github.com/foobar/baz:
    - name: baz_the_third
```

## Troubleshooting

### Incorrect name/version

If the package seems to install properly, but salt reports a failure then it is likely you have a version or `full_name` mismatch.

Check the exact `full_name` and version used by the package. Use `pkg.list_pkgs` to check that the names and version exactly match what is installed.

### Changes to sls files not being picked up

Ensure you have (re)generated the repository cache file (for older minions) and then updated the repository cache on the relevant minions:

```
salt-run winrepo.genrepo
salt winminion pkg.refresh_db
```
Packages management under Windows 2003

On Windows server 2003, you need to install optional Windows component "wmi windows installer provider" to have full list of installed packages. If you don't have this, salt-minion can't report some installed software.

How Success and Failure are Reported

The install state/module function of the Windows package manager works roughly as follows:

1. Execute `pkg.list_pkgs` and store the result

2. Check if any action needs to be taken. (i.e. compare required package and version against `pkg.list_pkgs` results)

3. If so, run the installer command.

4. Execute `pkg.list_pkgs` and compare to the result stored from before installation.

5. Success/Failure/Changes will be reported based on the differences between the original and final `pkg.list_pkgs` results.

If there are any problems in using the package manager it is likely due to the data in your sls files not matching the difference between the pre and post `pkg.list_pkgs` results.

16.2 Windows-specific Behaviour

Salt is capable of managing Windows systems, however due to various differences between the operating systems, there are some things you need to keep in mind.

This document will contain any quirks that apply across Salt or generally across multiple module functions. Any Windows-specific behavior for particular module functions will be documented in the module function documentation. Therefore this document should be read in conjunction with the module function documentation.

16.2.1 Group parameter for files

Salt was originally written for managing Unix-based systems, and therefore the file module functions were designed around that security model. Rather than trying to shoehorn that model on to Windows, Salt ignores these parameters and makes non-applicable module functions unavailable instead.

One of the commonly ignored parameters is the `group` parameter for managing files. Under Windows, while files do have a 'primary group' property, this is rarely used. It generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Because of this, any file module functions that typically require a group, do not under Windows. Attempts to directly use file module functions that operate on the group (e.g. `file.chgrp`) will return a pseudo-value and cause a log message to appear. No group parameters will be acted on.

If you do want to access and change the 'primary group' property and understand the implications, use the `file.get_pgid` or `file.get_pgroup` functions or the `pgroup` parameter on the `file.chown` module function.
16.2.2 Dealing with case-insensitive but case-preserving names

Windows is case-insensitive, but however preserves the case of names and it is this preserved form that is returned from system functions. This causes some issues with Salt because it assumes case-sensitive names. These issues generally occur in the state functions and can cause bizarre looking errors.

To avoid such issues, always pretend Windows is case-sensitive and use the right case for names, e.g. specify `user=Administrator` instead of `user=administrator`.

Follow issue 11801 for any changes to this behavior.

16.2.3 Dealing with various username forms

Salt does not understand the various forms that Windows usernames can come in, e.g. username, mydomain\username, username@mydomain.tld can all refer to the same user. In fact, Salt generally only considers the raw username value, i.e. the username without the domain or host information.

Using these alternative forms will likely confuse Salt and cause odd errors to happen. Use only the raw username value in the correct case to avoid problems.

Follow issue 11801 for any changes to this behavior.

16.2.4 Specifying the None group

Each Windows system has built-in _None_ group. This is the default `primary group` for files for users not on a domain environment.

Unfortunately, the word _None_ has special meaning in Python - it is a special value indicating `nothing`, similar to `null` or `nil` in other languages.

To specify the None group, it must be specified in quotes, e.g. `salt '*' file.chgrp C:\path\to\file "'None'"`.

16.2.5 Symbolic link loops

Under Windows, if any symbolic link loops are detected or if there are too many levels of symlinks (defaults to 64), an error is always raised.

For some functions, this behavior is different to the behavior on Unix platforms. In general, avoid symlink loops on either platform.

16.2.6 Modifying security properties (ACLs) on files

There is no support in Salt for modifying ACLs, and therefore no support for changing file permissions, besides modifying the owner/user.
17.1 Overview

In its most typical use, Salt is a software application in which clients, called "minions" can be commanded and controlled from a central command server called a "master".

Commands are normally issued to the minions (via the master) by calling a client script simply called, 'salt'.

Salt features a pluggable transport system to issue commands from a master to minions. The default transport is ZeroMQ.

17.2 Salt Client

17.2.1 Overview

The salt client is run on the same machine as the Salt Master and communicates with the salt-master to issue commands and to receive the results and display them to the user.

The primary abstraction for the salt client is called 'LocalClient'.

When LocalClient wants to publish a command to minions, it connects to the master by issuing a request to the master's ReqServer (TCP: 4506)

The LocalClient system listens to responses for its requests by listening to the master event bus publisher (master_event_pub.ipc).

17.3 Salt Master

17.3.1 Overview

The salt-master daemon runs on the designated Salt master and performs functions such as authenticating minions, sending, and receiving requests from connected minions and sending and receiving requests and replies to the 'salt' CLI.
17.3.2 Moving Pieces

When a Salt master starts up, a number of processes are started, all of which are called `salt-master` in a process-list but have various role categories.

Among those categories are:

- Publisher
- EventPublisher
- MWorker

17.3.3 Publisher

The Publisher process is responsible for sending commands over the designated transport to connected minions. The Publisher is bound to the following:

- TCP: port 4505
- IPC: publish_pull.ipc

Each salt minion establishes a connection to the master Publisher.

17.3.4 EventPublisher

The EventPublisher publishes events onto the event bus. It is bound to the following:

- IPC: master_event_pull.ipc
- IPC: master_event_pub.ipc

17.3.5 MWorker

Worker processes manage the back-end operations for the Salt Master.

The number of workers is equivalent to the number of `worker_threads` specified in the master configuration and is always at least one.

Workers are bound to the following:

- IPC: workers.ipc

17.3.6 ReqServer

The Salt request server takes requests and distributes them to available MWorker processes for processing. It also receives replies back from minions.

The ReqServer is bound to the following:

- TCP: 4506
- IPC: workers.ipc

Each salt minion establishes a connection to the master ReqServer.
17.3.7 Job Flow

The Salt master works by always publishing commands to all connected minions and the minions decide if the command is meant for them by checking themselves against the command target.

The typical lifecycle of a salt job from the perspective of the master might be as follows:

1. A command is issued on the CLI. For example, `salt my_minion test.ping`.
2) The `salt` command uses LocalClient to generate a request to the salt master by connecting to the ReqServer on TCP:4506 and issuing the job.
3) The salt-master ReqServer sees the request and passes it to an available MWorker over workers.ipc.
4) A worker picks up the request and handles it. First, it checks to ensure that the requested user has permissions to issue the command. Then, it sends the publish command to all connected minions. For the curious, this happens in ClearFuncs.publish().
5) The worker announces on the master event bus that it is about to publish a job to connected minions. This happens by placing the event on the master event bus (master_event_pull.ipc) where the EventPublisher picks it up and distributes it to all connected event listeners on master_event_pub.ipc.
6) The message to the minions is encrypted and sent to the Publisher via IPC on publish_pull.ipc.
7) Connected minions have a TCP session established with the Publisher on TCP port 4505 where they await commands. When the Publisher receives the job over publish_pull, it sends the jobs across the wire to the minions for processing.
8) After the minions receive the request, they decrypt it and perform any requested work, if they determine that they are targeted to do so.
9) When the minion is ready to respond, it publishes the result of its job back to the master by sending the encrypted result back to the master on TCP 4506 where it is again picked up by the ReqServer and forwarded to an available MWorker for processing. (Again, this happens by passing this message across workers.ipc to an available worker.)
10) When the MWorker receives the job it decrypts it and fires an event onto the master event bus (master_event_pull.ipc). (Again for the curious, this happens in AESFuncs._return().
11) The EventPublisher sees this event and re-publishes it on the bus to all connected listeners of the master event bus (on master_event_pub.ipc). This is where the LocalClient has been waiting, listening to the event bus for minion replies. It gathers the job and stores the result.
12) When all targeted minions have replied or the timeout has been exceeded, the salt client displays the results of the job to the user on the CLI.

17.4 Salt Minion

17.4.1 Overview

The salt-minion is a single process that sits on machines to be managed by Salt. It can either operate as a stand-alone daemon which accepts commands locally via `salt-call` or it can connect back to a master and receive commands remotely.

When starting up, salt minions connect _back_ to a master defined in the minion config file. The connect to two ports on the master:

- **TCP: 4505** This is the connection to the master Publisher. It is on this port that the minion receives jobs from the master.
• TCP: 4506 This is the connection to the master ReqServer. It is on this port that the minion sends job results back to the master.

17.4.2 Event System

Similar to the master, a salt-minion has its own event system that operates over IPC by default. The minion event system operates on a push/pull system with IPC files at minion_event_<unique_id>_pub.ipc and minion_event_<unique_id>_pull.ipc.

The astute reader might ask why have an event bus at all with a single-process daemon. The answer is that the salt-minion may fork other processes as required to do the work without blocking the main salt-minion process and this necessitates a mechanism by which those processes can communicate with each other. Secondarily, this provides a bus by which any user with sufficient permissions can read or write to the bus as a common interface with the salt minion.

17.4.3 Job Flow

When a salt minion starts up, it attempts to connect to the Publisher and the ReqServer on the salt master. It then attempts to authenticate and once the minion has successfully authenticated, it simply listens for jobs.

Jobs normally come either come from the `salt-call' script run by a local user on the salt minion or they can come directly from a master.

17.4.4 Master Job Flow

1) A master publishes a job that is received by a minion as outlined by the master’s job flow above.

2) The minion is polling its receive socket that’s connected to the master Publisher (TCP 4505 on master). When it detects an incoming message, it picks it up from the socket and decrypts it.

3) A new minion process or thread is created and provided with the contents of the decrypted message. The _thread_return() method is provided with the contents of the received message.

4) The new minion thread is created. The _thread_return() function starts up and actually calls out to the requested function contained in the job.

   5. The requested function runs and returns a result. [Still in thread.]

6) The result of the function that’s run is encrypted and returned to the master’s ReqServer (TCP 4506 on master). [Still in thread.]

7) Thread exits. Because the main thread was only blocked for the time that it took to initialize the worker thread, many other requests could have been received and processed during this time.

17.5 A Note on ClearFuncs vs. AESFuncs

A common source of confusion is determining when messages are passed in the clear and when they are passed using encryption. There are two rules governing this behaviour:

1) ClearFuncs is used for intra-master communication and during the initial authentication handshake between a minion and master during the key exchange.

2. AESFuncs is used everywhere else.
17.6 Contributing

There is a great need for contributions to Salt and patches are welcome! The goal here is to make contributions clear, make sure there is a trail for where the code has come from, and most importantly, to give credit where credit is due!

There are a number of ways to contribute to Salt development.

For details on how to contribute documentation improvements please review Writing Salt Documentation.

17.6.1 Salt Coding Style

SaltStack has its own coding style guide that informs contributors on various coding approaches. Please review the Salt Coding Style documentation for information about Salt's particular coding patterns.

Within the Salt Coding Style documentation, there is a section about running Salt's .pylintrc file. SaltStack recommends running the .pylintrc file on any files you are changing with your code contribution before submitting a pull request to Salt's repository. Please see the Linting documentation for more information.

Sending a GitHub pull request

Sending pull requests on GitHub is the preferred method for receiving contributions. The workflow advice below mirrors GitHub's own guide and is well worth reading.

1. Fork saltstack/salt on GitHub.
2. Make a local clone of your fork.

   ```shell
   git clone git@github.com:my-account/salt.git
   cd salt
   ```

3. Add saltstack/salt as a git remote.

   ```shell
   git remote add upstream https://github.com/saltstack/salt.git
   ```

4. Create a new branch in your clone.

   ```shell
   git fetch upstream
   git checkout -b fix-broken-thing upstream/2016.3
   ```

   If you're working on a bug or documentation fix, create your branch from the oldest release branch that contains the bug or requires the documentation update. See Which Salt Branch?.

   ```shell
   git fetch upstream
   git checkout -b add-cool-feature upstream/develop
   ```

   If you're working on a feature, create your branch from the develop branch.

5. Edit and commit changes to your branch.
Write a short, descriptive commit title and a longer commit message if necessary.

**Note:** If your change fixes a bug or implements a feature already filed in the issue tracker, be sure to reference the issue number in the commit message body.

```bash
vim path/to/file1 path/to/file2
git diff
git add path/to/file1 path/to/file2
git commit
```

Fix things in `file1` and `file2`

Fixes #31337

```bash
# Please enter the commit message for your changes. Lines starting
# with '#' will be ignored, and an empty message aborts the commit.
# On branch fix-broken-thing
# Changes to be committed:
#   modified: path/to/file1
#   modified: path/to/file2
```

If you get stuck, there are many introductory Git resources on [http://help.github.com](http://help.github.com).

6. Push your locally-committed changes to your GitHub fork.

```bash
git push -u origin fix-broken-thing
```

or

```bash
git push -u origin add-cool-feature
```

**Note:** You may want to rebase before pushing to work out any potential conflicts:

```bash
git fetch upstream
git rebase upstream/2016.3 fix-broken-thing
git push -u origin fix-broken-thing
```

or

```bash
git fetch upstream
git rebase upstream/develop add-cool-feature
git push -u origin add-cool-feature
```

If you do rebase, and the push is rejected with a (non-fast-forward) comment, then run `git status`. You will likely see a message about the branches diverging:

```bash
On branch fix-broken-thing
Your branch and 'origin/fix-broken-thing' have diverged,
and have 1 and 2 different commits each, respectively.
  (use "git pull" to merge the remote branch into yours)
nothing to commit, working tree clean
```

Do **NOT** perform a `git pull` or `git merge` here. Instead, add `--force` to the end of the `git push` command to get the changes pushed to your fork. Pulling or merging, while they will resolve the non-fast-
forward issue, will likely add extra commits to the pull request which were not part of your changes.

7. Find the branch on your GitHub salt fork.
   https://github.com/my-account/salt/branches/fix-broken-thing

8. Open a new pull request.
   Click on Pull Request on the right near the top of the page,
   https://github.com/my-account/salt/pull/new/fix-broken-thing
   (a) If your branch is a fix for a release branch, choose that as the base branch (e.g. 2016.3),
       https://github.com/my-account/salt/compare/saltstack:2016.3...fix-broken-thing
   (b) If your branch is a feature, choose develop as the base branch,
       https://github.com/my-account/salt/compare/saltstack:develop...add-cool-feature
   (c) Review that the proposed changes are what you expect.
   (d) Write a descriptive comment. Include links to related issues (e.g. `Fixes #31337.`) in the comment field.
   (d) Click Create pull request.

9. Salt project members will review your pull request and automated tests will run on it.
   If you recognize any test failures as being related to your proposed changes or if a reviewer asks for modifications:
      (a) Make the new changes in your local clone on the same local branch.
      (b) Push the branch to GitHub again using the same commands as before.
      (c) New and updated commits will be added to the pull request automatically.
      (d) Feel free to add a comment to the discussion.

Note: Jenkins

Pull request against saltstack/salt are automatically tested on a variety of operating systems and configurations. On average these tests take 30 minutes. Depending on your GitHub notification settings you may also receive an email message about the test results.

Test progress and results can be found at http://jenkins.saltstack.com/.

Which Salt branch?

GitHub will open pull requests against Salt's main branch, develop, by default. Ideally, features should go into develop and bug fixes and documentation changes should go into the oldest supported release branch affected by the bug or documentation update. See Sending a GitHub pull request.

If you have a bug fix or doc change and have already forked your working branch from develop and do not know how to rebase your commits against another branch, then submit it to develop anyway and we'll be sure to backport it to the correct place.
17.6.2 The current release branch

The current release branch is the most recent stable release. Pull requests containing bug fixes should be made against the release branch.

The branch name will be a date-based name such as 2016.3.

Bug fixes are made on this branch so that minor releases can be cut from this branch without introducing surprises and new features. This approach maximizes stability.

The Salt development team will "merge-forward" any fixes made on the release branch to the develop branch once the pull request has been accepted. This keeps the fix in isolation on the release branch and also keeps the develop branch up-to-date.

Note: Closing GitHub issues from commits

This "merge-forward" strategy requires that the magic keywords to close a GitHub issue appear in the commit message text directly. Only including the text in a pull request will not close the issue.

GitHub will close the referenced issue once the commit containing the magic text is merged into the default branch (develop). Any magic text input only into the pull request description will not be seen at the Git-level when those commits are merged-forward. In other words, only the commits are merged-forward and not the pull request.

17.6.3 The develop branch

The develop branch is unstable and bleeding-edge. Pull requests containing feature additions or non-bug-fix changes should be made against the develop branch.

The Salt development team will back-port bug fixes made to develop to the current release branch if the contributor cannot create the pull request against that branch.

Keeping Salt Forks in Sync

Salt is advancing quickly. It is therefore critical to pull upstream changes from upstream into your fork on a regular basis. Nothing is worse than putting hard work into a pull request only to see bunches of merge conflicts because it has diverged too far from upstream.

See also:

GitHub Fork a Repo Guide

The following assumes origin is the name of your fork and upstream is the name of the main saltstack/salt repository.

1. View existing remotes.

   ```
   git remote -v
   ```

2. Add the upstream remote.

   ```
   # For ssh github
   git remote add upstream git@github.com:saltstack/salt.git
   
   # For https github
   git remote add upstream https://github.com/saltstack/salt.git
   ```
3. Pull upstream changes into your clone.
   ```
   git fetch upstream
   ```

4. Update your copy of the develop branch.
   ```
   git checkout develop
   git merge --ff-only upstream/develop
   ```
   If Git complains that a fast-forward merge is not possible, you have local commits.
   
   • Run `git pull --rebase origin develop` to rebase your changes on top of the upstream changes.
   
   • Or, run `git branch <branch-name>` to create a new branch with your commits. You will then need to reset your develop branch before updating it with the changes from upstream.

   If Git complains that local files will be overwritten, you have changes to files in your working directory. Run `git status` to see the files in question.

5. Update your fork.
   ```
   git push origin develop
   ```

6. Repeat the previous two steps for any other branches you work with, such as the current release branch.

**Posting patches to the mailing list**

Patches will also be accepted by email. Format patches using `git format-patch` and send them to the `salt-users` mailing list. The contributor will then get credit for the patch, and the Salt community will have an archive of the patch and a place for discussion.

**Backporting Pull Requests**

If a bug is fixed on develop and the bug is also present on a currently-supported release branch it will need to be back-ported to all applicable branches.

**Note:** Most Salt contributors can skip these instructions

These instructions do not need to be read in order to contribute to the Salt project! The SaltStack team will back-port fixes on behalf of contributors in order to keep the contribution process easy.

These instructions are intended for frequent Salt contributors, advanced Git users, SaltStack employees, or independent souls who wish to back-port changes themselves.

It is often easiest to fix a bug on the oldest supported release branch and then merge that branch forward into develop (as described earlier in this document). When that is not possible the fix must be back-ported, or copied, into any other affected branches.

These steps assume a pull request #1234 has been merged into develop. And upstream is the name of the remote pointing to the main Salt repo.

1. Identify the oldest supported release branch that is affected by the bug.
2. Create a new branch for the back-port by reusing the same branch from the original pull request.
   
   Name the branch `bp-<NNNN>` and use the number of the original pull request.
3. Find the parent commit of the original pull request.

   The parent commit of the original pull request must be known in order to rebase onto a release branch. The easiest way to find this is on GitHub.

   Open the original pull request on GitHub and find the first commit in the list of commits. Select and copy the SHA for that commit. The parent of that commit can be specified by appending ~1 to the end.

4. Rebase the new branch on top of the release branch.

   - `<release-branch>` is the branch identified in step #1.
   - `<orig-base>` is the SHA identified in step #3 -- don't forget to add ~1 to the end!

   ```
   git rebase --onto <release-branch> <orig-base> bp-1234
   ```

   Note, release branches prior to 2016.3 will not be able to make use of rebase and must use cherry-picking instead.

5. Push the back-port branch to GitHub and open a new pull request.

   Opening a pull request for the back-port allows for the test suite and normal code-review process.

   ```
   git push -u origin bp-1234
   ```

**Issue and Pull Request Labeling System**

SaltStack uses several labeling schemes to help facilitate code contributions and bug resolution. See the *Labels and Milestones* documentation for more information.

**Mentionbot**

SaltStack runs a mention-bot which notifies contributors who might be able to help review incoming pull-requests based on their past contribution to files which are being changed.

If you do not wish to receive these notifications, please add your GitHub handle to the blacklist line in the `.mention-bot` file located in the root of the Salt repository.

**17.7 Deprecating Code**

Salt should remain backwards compatible, though sometimes, this backwards compatibility needs to be broken because a specific feature and/or solution is no longer necessary or required. At first one might think, let me change this code, it seems that it's not used anywhere else so it should be safe to remove. Then, once there's a new release, users complain about functionality which was removed and they where using it, etc. This should, at all costs, be avoided, and, in these cases, *that* specific code should be deprecated.

In order to give users enough time to migrate from the old code behavior to the new behavior, the deprecation time frame should be carefully determined based on the significance and complexity of the changes required by the user.

Salt feature releases are based on the Periodic Table. Any new features going into the develop branch will be named after the next element in the Periodic Table. For example, Beryllium was the feature release name of the develop branch before the 2015.8 branch was tagged. At that point in time, any new features going into the develop branch after 2015.8 was branched were part of the Boron feature release.
A deprecation warning should be in place for at least two major releases before the deprecated code and its accompanying deprecation warning are removed. More time should be given for more complex changes. For example, if the current release under development is Sodium, the deprecated code and associated warnings should remain in place and warn for at least Aluminum.

To help in this deprecation task, salt provides salt.utils.warn_until. The idea behind this helper function is to show the deprecation warning to the user until salt reaches the provided version. Once that provided version is equalled salt.utils.warn_until will raise a RuntimeError making salt stop its execution. This stoppage is unpleasant and will remind the developer that the deprecation limit has been reached and that the code can then be safely removed.

Consider the following example:

```python
def some_function(bar=False, foo=None):
    if foo is not None:
        salt.utils.warn_until(  
            'Aluminum',  
            'The \'foo\' argument has been deprecated and its \'functionality removed, as such, its usage is no longer \'required.'
        )
```

Development begins on the Aluminum release when the Magnesium branch is forked from the develop branch. Once this occurs, all uses of the warn_until function targeting Aluminum, along with the code they are warning about should be removed from the code.

## 17.8 Dunder Dictionaries

Salt provides several special "dunder" dictionaries as a convenience for Salt development. These include __opts__, __context__, __salt__, and others. This document will describe each dictionary and detail where they exist and what information and/or functionality they provide.

### 17.8.1 __opts__

**Available in**

- All loader modules

The __opts__ dictionary contains all of the options passed in the configuration file for the master or minion.

**Note:** In many places in salt, instead of pulling raw data from the __opts__ dict, configuration data should be pulled from the salt get functions such as config.get, aka __salt__['config.get']('foo:bar') The get functions also allow for dict traversal via the : delimiter. Consider using get functions whenever using __opts__ or __pillar__ and __grains__ (when using grains for configuration data)

The configuration file data made available in the __opts__ dictionary is the configuration data relative to the running daemon. If the modules are loaded and executed by the master, then the master configuration data is available, if the modules are executed by the minion, then the minion configuration is available. Any additional information passed into the respective configuration files is made available.
17.8.2 __salt__

Available in

- Execution Modules
- State Modules
- Returners
- Runners

__salt__ contains the execution module functions. This allows for all functions to be called as they have been set up by the salt loader.

```
__salt__["cmd.run"]("fdisk -l")
__salt__["network.ip_addrs"]()
```

Note: When used in runners, __salt__ references other runner modules, and not execution modules.

17.8.3 __grains__

Available in

- Execution Modules
- State Modules
- Returners
- External Pillar

The __grains__ dictionary contains the grains data generated by the minion that is currently being worked with. In execution modules, state modules and returners this is the grains of the minion running the calls, when generating the external pillar the __grains__ is the grains data from the minion that the pillar is being generated for.

17.8.4 __pillar__

Available in

- Execution Modules
- State Modules
- Returners

The __pillar__ dictionary contains the pillar for the respective minion.

17.8.5 __context__

__context__ exists in state modules and execution modules.

During a state run the __context__ dictionary persists across all states that are run and then is destroyed when the state ends.
When running an execution module `__context__` persists across all module executions until the modules are refreshed; such as when `saltutil.sync_all` or `state.apply` are executed.

A great place to see how to use `__context__` is in the `cp.py` module in `salt/modules/cp.py`. The fileclient authenticates with the master when it is instantiated and then is used to copy files to the minion. Rather than create a new fileclient for each file that is to be copied down, one instance of the fileclient is instantiated in the `__context__` dictionary and is reused for each file. Here is an example from `salt/modules/cp.py`:

```python
if not 'cp.fileclient' in __context__:
    __context__['cp.fileclient'] = salt.fileclient.get_file_client(__opts__)
```

**Note:** Because `__context__` may or may not have been destroyed, always be sure to check for the existence of the key in `__context__` and generate the key before using it.

## 17.9 External Pillars

Salt provides a mechanism for generating pillar data by calling external pillar interfaces. This document will describe an outline of an `ext_pillar` module.

### 17.9.1 Location

Salt expects to find your `ext_pillar` module in the same location where it looks for other python modules. If the `extension_modules` option in your Salt master configuration is set, Salt will look for a `pillar` directory under there and load all the modules it finds. Otherwise, it will look in your Python site-packages `salt/pillar` directory.

### 17.9.2 Configuration

The external pillars that are called when a minion refreshes its pillars is controlled by the `ext_pillar` option in the Salt master configuration. You can pass a single argument, a list of arguments or a dictionary of arguments to your pillar:

```yaml
ext_pillar:
    - example_a: some argument
    - example_b:
        - argumentA
        - argumentB
    - example_c:
        keyA: valueA
        keyB: valueB
```

### 17.9.3 The Module

### 17.9.4 Imports and Logging

Import modules your external pillar module needs. You should first include generic modules that come with stock Python:
import logging

And then start logging. This is an idiomatic way of setting up logging in Salt:

```python
log = logging.getLogger(__name__)
```

Finally, load modules that are specific to what you are doing. You should catch import errors and set a flag that the `__virtual__` function can use later.

```python
try:
    import weird_thing
    EXAMPLE_A_LOADED = True
except ImportError:
    EXAMPLE_A_LOADED = False
```

### 17.9.5 Options

If you define an `__opts__` dictionary, it will be merged into the `__opts__` dictionary handed to the `ext_pillar` function later. This is a good place to put default configuration items. The convention is to name things `module-name.option`.

```python
__opts__ = { 'example_a.someconfig': 137 }
```

### 17.9.6 Initialization

If you define an `__init__` function, it will be called with the following signature:

```python
def __init__( __opts__ ):
    # Do init work here
```

**Note:** The `__init__` function is run every time a particular minion causes the external pillar to be called, so don't put heavy initialization code here. The `__init__` functionality is a side-effect of the Salt loader, so it may not be as useful in pillars as it is in other Salt items.

### 17.9.7 `__virtual__`

If you define a `__virtual__` function, you can control whether or not this module is visible. If it returns `False` then Salt ignores this module. If it returns a string, then that string will be how Salt identifies this external pillar in its `ext_pillar` configuration. If you're not renaming the module, simply return `True` in the `__virtual__` function, which is the same as if this function did not exist, then, the name Salt's `ext_pillar` will use to identify this module is its conventional name in Python.

This is useful to write modules that can be installed on all Salt masters, but will only be visible if a particular piece of software your module requires is installed.

```python
# This external pillar will be known as 'example_a'
def __virtual__():
    if EXAMPLE_A_LOADED:
        return True
    return False
```
# This external pillar will be known as `something_else`

```python
__virtualname__ = 'something_else'
```

```python
def __virtual__():
    if EXAMPLE_A_LOADED:
        return __virtualname__
    return False
```

## 17.9.8 ext_pillar

This is where the real work of an external pillar is done. If this module is active and has a function called `ext_pillar`, whenever a minion updates its pillar this function is called.

How it is called depends on how it is configured in the Salt master configuration. The first argument is always the current pillar dictionary, this contains pillar items that have already been added, starting with the data from `pillar_roots`, and then from any already-ran external pillars.

Using our example above:

```python
ext_pillar(id, pillar, 'some argument') # example_a
ext_pillar(id, pillar, 'argumentA', 'argumentB') # example_b
ext_pillar(id, pillar, keyA='valueA', keyB='valueB') # example_c
```

In the example_a case, pillar will contain the items from the `pillar_roots`, in example_b pillar will contain that plus the items added by example_a, and in example_c pillar will contain that plus the items added by example_b. In all three cases, id will contain the ID of the minion making the pillar request.

This function should return a dictionary, the contents of which are merged in with all of the other pillars and returned to the minion. **Note**: this function is called once for each minion that fetches its pillar data.

```python
def ext_pillar( minion_id, pillar, *args, **kwargs ) :
    my_pillar = { 'external_pillar': {} }
    my_pillar['external_pillar'] = get_external_pillar_dictionary()
    return my_pillar
```

You can call pillar with the dictionary's top name to retrieve its data. From above example, `external_pillar` is the top dictionary name. Therefore:

```bash
salt-call '*' pillar.get external_pillar
```

You shouldn't just add items to pillar and return that, since that will cause Salt to merge data that already exists. Rather, just return the items you are adding or changing. You could, however, use `pillar` in your module to make some decision based on pillar data that already exists.

This function has access to some useful globals:

- __opts__ A dictionary of mostly Salt configuration options. If you had an __opts__ dictionary defined in your module, those values will be included.
- __salt__ A dictionary of Salt module functions, useful so you don’t have to duplicate functions that already exist. E.g. __salt__['cmd.run']('ls -l') **Note**: runs on the `master`
- __grains__ A dictionary of the grains of the minion making this pillar call.

---

### 17.9. External Pillars

2313
17.9.9 Example configuration

As an example, if you wanted to add external pillar via the cmd_json external pillar, add something like this to your master config:

```yaml
ext_pillar:
  - cmd_json: 'echo \"arg\":\"value\"'}
```

17.9.10 Reminder

Just as with traditional pillars, external pillars must be refreshed in order for minions to see any fresh data:

```
salt '*' saltutil.refresh_pillar
```

17.10 Installing Salt for development

Clone the repository using:

```
git clone https://github.com/saltstack/salt
```

**Note:** tags

Just cloning the repository is enough to work with Salt and make contributions. However, fetching additional tags from git is required to have Salt report the correct version for itself. To do this, first add the git repository as an upstream source:

```
git remote add upstream https://github.com/saltstack/salt
```

Fetching tags is done with the git `fetch` utility:

```
git fetch --tags upstream
```

Create a new virtualenv:

```
virtualenv /path/to/your/virtualenv
```

Avoid making your `virtualenv path too long.`

On Arch Linux, where Python 3 is the default installation of Python, use the `virtualenv2` command instead of `virtualenv`.

On Gentoo you must use `--system-site-packages` to enable pkg and portage_config functionality

**Note:** Using system Python modules in the virtualenv

To use already-installed python modules in virtualenv (instead of having pip download and compile new ones), run `virtualenv --system-site-packages` Using this method eliminates the requirement to install the salt dependencies again, although it does assume that the listed modules are all installed in the system PYTHONPATH at the time of virtualenv creation.
Note: Python development package

Be sure to install python devel package in order to install required Python modules. In Debian/Ubuntu run sudo apt-get install -y python-dev. In RedHat based system install python-devel

Activate the virtualenv:

```
source /path/to/your/virtualenv/bin/activate
```

Install Salt (and dependencies) into the virtualenv:

```
pip install M2Crypto  # Don't install on Debian/Ubuntu (see below)
pip install pyzmq PyYAML pycrypto msgpack-python jinja2 psutil futures tornado
pip install -e ./salt  # the path to the salt git clone from above
```

Note: Installing M2Crypto

swig and libssl-dev are required to build M2Crypto. To fix the error command 'swig' failed with exit status 1 while installing M2Crypto, try installing it with the following command:

```
env SWIG_FEATURES="-cpperraswarn -includeall -D__`uname -m`__ -I/usr/include/openssl"
--pip install M2Crypto
```

Debian and Ubuntu systems have modified openssl libraries and mandate that a patched version of M2Crypto be installed. This means that M2Crypto needs to be installed via apt:

```
apt-get install python-m2crypto
```

This also means that pulling in the M2Crypto installed using apt requires using `--system-site-packages` when creating the virtualenv.

If you're using a platform other than Debian or Ubuntu, and you are installing M2Crypto via pip instead of a system package, then you will also need the gcc compiler.

Note: Installing psutil

Python header files are required to build this module, otherwise the pip install will fail. If your distribution separates binaries and headers into separate packages, make sure that you have the headers installed. In most Linux distributions which split the headers into their own package, this can be done by installing the python-dev or python-devel package. For other platforms, the package will likely be similarly named.

Note: Installing dependencies on OS X.

You can install needed dependencies on OS X using homebrew or macports. See OS X Installation

Warning: Installing on RedHat-based Distros

If installing from pip (or from source using setup.py install), be advised that the yum-utils package is needed for Salt to manage packages on RedHat-based systems.
17.10.1 Running a self-contained development version

During development it is easiest to be able to run the Salt master and minion that are installed in the virtualenv you created above, and also to have all the configuration, log, and cache files contained in the virtualenv as well.

Copy the master and minion config files into your virtualenv:

```bash
mkdir -p /path/to/your/virtualenv/etc/salt
cp ./salt/conf/master ./salt/conf/minion /path/to/your/virtualenv/etc/salt/
```

Edit the master config file:

1. Uncomment and change the `user: root` value to your own user.
2. Uncomment and change the `root_dir: /` value to point to `/path/to/your/virtualenv`.
3. If you are running version 0.11.1 or older, uncomment, and change the `pidfile: /var/run/salt-master.pid` value to point to `/path/to/your/virtualenv/salt-master.pid`.
4. If you are also running a non-development version of Salt you will have to change the `publish_port` and `ret_port` values as well.

Edit the minion config file:

1. Repeat the edits you made in the master config for the `user` and `root_dir` values as well as any port changes.
2. If you are running version 0.11.1 or older, uncomment, and change the `pidfile: /var/run/salt-minion.pid` value to point to `/path/to/your/virtualenv/salt-minion.pid`.
3. Uncomment and change the `master: salt` value to point at `localhost`.
4. Uncomment and change the `id:` value to something descriptive like `saltdev`. This isn't strictly necessary but it will serve as a reminder of which Salt installation you are working with.
5. If you changed the `ret_port` value in the master config because you are also running a non-development version of Salt, then you will have to change the `master_port` value in the minion config to match.

**Note:** Using `salt-call` with a Standalone Minion

If you plan to run `salt-call` with this self-contained development environment in a masterless setup, you should invoke `salt-call` with `-c /path/to/your/virtualenv/etc/salt` so that salt can find the minion config file. Without the `-c` option, Salt finds its config files in `/etc/salt`.

Start the master and minion, accept the minion's key, and verify your local Salt installation is working:

```bash
cd /path/to/your/virtualenv
salt-master -c ./etc/salt -d
salt-minion -c ./etc/salt -d
salt-key -c ./etc/salt -L
salt-key -c ./etc/salt -A
salt -c ./etc/salt '*' test.ping
```

Running the master and minion in debug mode can be helpful when developing. To do this, add `-l debug` to the calls to `salt-master` and `salt-minion`. If you would like to log to the console instead of to the log file, remove the `-d`.

**Note:** Too long socket path?

Once the minion starts, you may see an error like the following:
zmq.core.error.ZMQError: ipc path "/path/to/your/virtualenv/var/run/salt/minion/minion_event_7824dc92f7aef6575939af78b96249f_pub.ipc" is longer than 107 characters (sizeof(sockaddr_un.sun_path)).

This means that the path to the socket the minion is using is too long. This is a system limitation, so the only workaround is to reduce the length of this path. This can be done in a couple different ways:

1. Create your virtualenv in a path that is short enough.

2. Edit the sock_dir minion config variable and reduce its length. Remember that this path is relative to the value you set in root_dir.

**NOTE:** The socket path is limited to 107 characters on Solaris and Linux, and 103 characters on BSD-based systems.

---

**Note:** File descriptor limits

Ensure that the system open file limit is raised to at least 2047:

```bash
# check your current limit
ulimit -n

# raise the limit. persists only until reboot
# use 'limit descriptors 2047' for c-shell
ulimit -n 2047
```

To set file descriptors on OSX, refer to the [OS X Installation instructions](#).

---

### Changing Default Paths

Instead of updating your configuration files to point to the new root directory and having to pass the new configuration directory path to all of Salt's CLI tools, you can explicitly tweak the default system paths that Salt expects:

```bash
GENERATE_SALT_SYSPATHS=1 pip install --global-option='--salt-root-dir=/path/to/your/virtualenv/' \
-e ./salt  # the path to the salt git clone from above
```

You can now call all of Salt's CLI tools without explicitly passing the configuration directory.

### Additional Options

If you want to distribute your virtualenv, you probably don’t want to include Salt's .git/ directory, and, without it, Salt won’t report the accurate version. You can tell `setup.py` to generate the hardcoded version information which is distributable:

```bash
GENERATE_SALT_SYSPATHS=1 WRITE_SALT_VERSION=1 pip install --global-option='--salt-root-dir=/path/to/your/virtualenv/' \
-e ./salt  # the path to the salt git clone from above
```

Instead of passing those two environmental variables, you can just pass a single one which will trigger the other two:
This last one will grant you an editable salt installation with hardcoded system paths and version information.

17.10.2 Installing Salt from the Python Package Index

If you are installing using easy_install, you will need to define a USE_SETUPTOOLS environment variable, otherwise dependencies will not be installed:

```
USE_SETUPTOOLS=1 easy_install salt
```

17.10.3 Editing and previewing the documentation

You need sphinx-build command to build the docs. In Debian/Ubuntu this is provided in the python-sphinx package. Sphinx can also be installed to a virtualenv using pip:

```
pip install Sphinx==1.3.1
```

Change to salt documentation directory, then:

```
cd doc; make html
```

- This will build the HTML docs. Run make without any arguments to see the available make targets, which include html, man, and text.
- The docs then are built within the docs/_build/ folder. To update the docs after making changes, run make again.
- The docs use reStructuredText for markup. See a live demo at http://rst.ninjs.org/.
- The help information on each module or state is culled from the python code that runs for that piece. Find them in salt/modules/ or salt/states/.
- To build the docs on Arch Linux, the python2-sphinx package is required. Additionally, it is necessary to tell make where to find the proper sphinx-build binary, like so:

```
make SPHINXBUILD=sphinx-build2 html
```

- To build the docs on RHEL/CentOS 6, the python-sphinx10 package must be installed from EPEL, and the following make command must be used:

```
make SPHINXBUILD=sphinx-build html
```

Once you've updated the documentation, you can run the following command to launch a simple Python HTTP server to see your changes:

```
cd _build/html; python -m SimpleHTTPServer
```

17.10.4 Running unit and integration tests

Run the test suite with following command:
See [here](#) for more information regarding the test suite.

### 17.10.5 Issue and Pull Request Labeling System

SaltStack uses several labeling schemes to help facilitate code contributions and bug resolution. See the [Labels and Milestones](#) documentation for more information.

### 17.11 GitHub Labels and Milestones

SaltStack uses several label categories, as well as milestones, to triage incoming issues and pull requests in the GitHub issue tracker. Labels are used to sort issues by type, priority, severity, status, functional area, functional group, and targeted release and pull requests by status, functional area, functional group, type of change, and test status. Milestones are used to indicate whether an issue is fully triaged or is scheduled to be fixed by SaltStack in an upcoming sprint.

#### 17.11.1 Milestones

All issues are assigned to a milestone, whereas pull requests are almost never assigned to a milestone as the mean lifetime of pull requests is short enough that there is no need to track them temporally.

SaltStack uses milestones to indicate which issues are blocked on submitter or upstream actions, are approved, or are scheduled to be fixed or implemented in an upcoming sprint. If an issue is not attached to a sprint milestone, you are welcome to work on it at your own desire and convenience. If it is attached to a sprint milestone and you have already begun working on it or have a solution in mind or have other ideas related to the issue, you are encouraged to coordinate with the assignee via the GitHub issue tracker to create the best possible solution or implementation.

- **Approved** The issue has been validated and has all necessary information.
- **Blocked** The issue is waiting on actions by parties outside of SaltStack, such as receiving more information from the submitter or resolution of an upstream issue. This milestone is usually applied in conjunction with the labels `Info Needed`, `Question`, `Expected Behavior`, `Won't Fix For Now`, or `Upstream Bug`.
- **Under Review** The issue is having further validation done by a SaltStack engineer.
- `<Sprint>` The issue is being actively worked on by a SaltStack engineer. Sprint milestones names are constructed from the chemical symbol of the next release’s codename and the number of sprints until that release is made. For example, if the next release codename is `Neon` and there are five sprints until that release, the corresponding sprint milestone will be called `Ne 5`. See `<version-numbers>` for a discussion of Salt’s release codenames.

#### 17.11.2 Labels

Labels are used to sort and describe issues and pull requests. Some labels are usually reserved for one or the other, though most labels may be applied to both.

New issues will receive at least one label and a milestone, and new pull requests will receive at least one label. Except for the `functional area` and `functional group` label categories, issues will generally receive only up to one label per category.
Type

Issues are categorized into one of several types. Type labels are almost never used for pull requests. GitHub treats pull requests like issues in many ways, so a pull request could be considered an issue with an implicit Pull Request type label applied.

**Feature**  The issue is a request for new functionality including changes, enhancements, refactors, etc.

**Bug**  The issue documents broken, incorrect, or confusing behavior. This label is always accompanied by a severity label.

**Duplicate**  The issue is a duplicate of another feature request or bug report.

**Upstream Bug**  The issue is a result of an upstream issue.

**Question**  The issue is more of a question than a request for new features or a report of broken features, but can sometimes lead to further discussion or changes of confusing or incongruous behavior or documentation.

**Expected Behavior**  The issue is a bug report of intended functionality.

Priority

An issue’s priority is relative to its functional area. If a bug report, for example, about gitfs indicates that all users of gitfs will encounter this bug, then a P1 label will be applied, even though users who are not using gitfs will not encounter the bug. If a feature is requested by many users, it may be given a high priority.

**P1**  The issue will be seen by all users.

**P2**  The issue will be seen by most users.

**P3**  The issue will be seen by about half of users.

**P4**  The issue will not be seen by most users. Usually the issue is a very specific use case or corner case.

Severity

Severity labels are almost always only applied to issues labeled Bug.

**Blocker**  The issue is blocking an impending release.

**Critical**  The issue causes data loss, crashes or hangs salt processes, makes the system unresponsive, etc.

**High Severity**  The issue reports incorrect functionality, bad functionality, a confusing user experience, etc.

**Medium Severity**  The issue reports cosmetic items, formatting, spelling, colors, etc.

Functional Area

Many major components of Salt have corresponding GitHub labels. These labels are applied to all issues and pull requests as is reasonably appropriate. They are useful in organizing issues and pull requests according to the source code relevant to issues or the source code changed by pull requests.

- Execution Module
- File Servers
- Grains
- Multi-Master
- Packaging  Related to packaging of Salt, not Salt’s support for package management.
Functional Group

These labels sort issues and pull requests according to the internal SaltStack engineering teams.

**Core** The issue or pull request relates to code that is central or existential to Salt itself.

**Platform** The issue or pull request relates to support and integration with various platforms like traditional operating systems as well as containers, platform-based utilities like filesystems, command schedulers, etc., and system-based applications like web servers, databases, etc.

**RIoT** The issue or pull request relates to support and integration with various abstract systems like cloud providers, hypervisors, API-based services, etc.

**Console** The issue or pull request relates to the SaltStack enterprise console.

**Documentation** The issue or pull request relates to documentation.

Status

Status labels are used to define and track the state of issues and pull requests. Not all potential statuses correspond to a label, but some statuses are common enough that labels have been created for them. If an issue has not been moved beyond the **Blocked** milestone, it is very likely that it will only have a status label.

**Bugfix -back-port** The pull request needs to be back-ported to an older release branch. This is done by recreating the pull request against that branch. Once the back-port is completed, this label is replaced with a **Bugfix -[Done] back-ported** label. Normally, new features should go into the develop and bug fixes into the oldest supported release branch, see `<which-salt-branch>`.

**Bugfix -[Done] back-ported** The pull request has been back-ported to an older branch.

**Cannot Reproduce** The issue is a bug and has been reviewed by a SaltStack engineer, but it cannot be replicated with the provided information and context. Those involved with the bug will need to work through additional ideas until the bug can be isolated and verified.

**Confirmed** The issue is a bug and has been confirmed by a SaltStack engineer, who often documents a minimal working example that reproduces the bug.
Fixed Pending Verification The issue is a bug and has been fixed by one or more pull requests, which should link to the issue. Closure of the issue is contingent upon confirmation of resolution from the submitter. If the submitter reports a negative confirmation, this label is removed. If no response is given after a few weeks, then the issue will be assumed fixed and closed.

Info Needed The issue needs more information before it can be verified and resolved. For a feature request this may include a description of the use cases. Almost all bug reports need to include at least the versions of salt and its dependencies, the system type and version, commands used, debug logs, error messages, and relevant configs.

Pending Changes The pull request needs additional changes before it can be merged.

Pending Discussion The issue or pull request needs more discussion before it can be closed or merged. The status of the issue or pull request is not clear or apparent enough for definite action to be taken, or additional input from SaltStack, the submitter, or another party has been requested.

If the issue is not a pull request, once the discussion has arrived at a cogent conclusion, this label will be removed and the issue will be accepted. If it is a pull request, the results of the discussion may require additional changes and thus, a Pending Changes label.

Won't Fix for Now The issue is legitimate, but it is not something the SaltStack team is currently able or willing to fix or implement. Issues having this label may be revisited in the future.

Type of Change

Every pull request should receive a change label. These labels measure the quantity of change as well as the significance of the change. The amount of change and the importance of the code area changed are considered, but often the depth of secondary code review required and the potential repercussions of the change may also advise the label choice.

Core code areas include: state compiler, crypto engine, master and minion and syndic daemons, transport, pillar rendering, loader, transport layer, event system, salt.utils, client, cli, logging, netapi, runner engine, templating engine, top file compilation, file client, file server, mine, salt-ssh, test runner, etc.

Non-core code usually constitutes the specific set of plugins for each of the several plugin layers of Salt: execution modules, states, runners, returners, clouds, etc.

Minor Change
- Less than 64 lines changed, or
- Less than 8 core lines changed

Medium Change
- Less than 256 lines changed, or
- Less than 64 core lines changed

Master Change
- More than 256 lines changed, or
- More than 64 core lines changed

Expert Change
- Needs specialized, in-depth review
Test Status

These labels relate to the status of the automated tests that run on pull requests. If the tests on a pull request fail and are not overridden by one of these labels, the pull request submitter needs to update the code and/or tests so that the tests pass and the pull request can be merged.

**Lint** The pull request has passed all tests except for the code lint checker.

**Tests Passed** The pull request has passed all tests even though some test results are negative. Sometimes the automated testing infrastructure will encounter internal errors unrelated to the code change in the pull request that cause test runs to fail. These errors can be caused by cloud host and network issues and also Jenkins issues like erroneously accumulating workspace artifacts, resource exhaustion, and bugs that arise from long running Jenkins processes.

Other

These labels indicate miscellaneous issue types or statuses that are common or important enough to be tracked and sorted with labels.

**Awesome** The pull request implements an especially well crafted solution, or a very difficult but necessary change.

**Help Wanted** The issue appears to have a simple solution. Issues having this label should be a good starting place for new contributors to Salt.

**Needs Testcase** The issue or pull request relates to a feature that needs test coverage. The pull request containing the tests should reference the issue or pull request having this label, whereupon the label should be removed.

**Regression** The issue is a bug that breaks functionality known to work in previous releases.

**Story** The issue is used by a SaltStack engineer to track progress on multiple related issues in a single place.

**Stretch** The issue is an optional goal for the current sprint but may not be delivered.

**ZD** The issue is related to a Zendesk customer support ticket.

**<Release>** The issue is scheduled to be implemented by <Release>. See <version-numbers> for a discussion of Salt’s release codenames.

## 17.12 Logging Internals

TODO

## 17.13 Modular Systems

When first working with Salt, it is not always clear where all of the modular components are and what they do. Salt comes loaded with more modular systems than many users are aware of, making Salt very easy to extend in many places.

The most commonly used modular systems are execution modules and states. But the modular systems extend well beyond the more easily exposed components and are often added to Salt to make the complete system more flexible.
### 17.13.1 Execution Modules

Execution modules make up the core of the functionality used by Salt to interact with client systems. The execution modules create the core system management library used by all Salt systems, including states, which interact with minion systems.

Execution modules are completely open ended in their execution. They can be used to do anything required on a minion, from installing packages to detecting information about the system. The only restraint in execution modules is that the defined functions always return a JSON serializable object.

For a list of all built in execution modules, click [here](#).

For information on writing execution modules, see [this page](#).

### 17.13.2 Interactive Debugging

Sometimes debugging with `print()` and extra logs sprinkled everywhere is not the best strategy.

IPython is a helpful debug tool that has an interactive python environment which can be embedded in python programs.

First the system will require IPython to be installed.

```
# Debian
apt-get install ipython

# Arch Linux
pacman -Syu ipython2

# RHEL/CentOS (via EPEL)
yum install python-ipython
```

Now, in the troubling python module, add the following line at a location where the debugger should be started:

```
test = 'test123'
import IPython; IPython.embed_kernel()
```

After running a Salt command that hits that line, the following will show up in the log file:

```
[CRITICAL] To connect another client to this kernel, use:
[IPKernelApp] --existing kernel-31271.json
```

Now on the system that invoked `embed_kernel`, run the following command from a shell:

```
# NOTE: use ipython2 instead of ipython for Arch Linux
ipython console --existing
```

This provides a console that has access to all the vars and functions, and even supports tab-completion.

```
print(test)
test123
```

To exit IPython and continue running Salt, press Ctrl-d to logout.
17.13.3 State Modules

State modules are used to define the state interfaces used by Salt States. These modules are restrictive in that they must follow a number of rules to function properly.

Note: State modules define the available routines in sls files. If calling an execution module directly is desired, take a look at the module state.

17.13.4 Auth

The auth module system allows for external authentication routines to be easily added into Salt. The auth function needs to be implemented to satisfy the requirements of an auth module. Use the pam module as an example.

17.13.5 Fileserver

The fileserver module system is used to create fileserver backends used by the Salt Master. These modules need to implement the functions used in the fileserver subsystem. Use the gitfs module as an example.

17.13.6 Grains

Grain modules define extra routines to populate grains data. All defined public functions will be executed and MUST return a Python dict object. The dict keys will be added to the grains made available to the minion.

17.13.7 Output

The output modules supply the outputter system with routines to display data in the terminal. These modules are very simple and only require the output function to execute. The default system outputter is the nested module.

17.13.8 Pillar

Used to define optional external pillar systems. The pillar generated via the filesystem pillar is passed into external pillars. This is commonly used as a bridge to database data for pillar, but is also the backend to the libvirt state used to generate and sign libvirt certificates on the fly.

17.13.9 Renderers

Renderers are the system used to render sls files into salt highdata for the state compiler. They can be as simple as the py renderer and as complex as stateconf and pydsl.

17.13.10 Returners

Returners are used to send data from minions to external sources, commonly databases. A full returner will implement all routines to be supported as an external job cache. Use the redis returner as an example.
17.13.11 Runners

Runners are purely master-side execution sequences.

17.13.12 Tops

Tops modules are used to convert external data sources into top file data for the state system.

17.13.13 Wheel

The wheel system is used to manage master side management routines. These routines are primarily intended for the API to enable master configuration.

17.14 Package Providers

This page contains guidelines for writing package providers.

17.14.1 Package Functions

One of the most important features of Salt is package management. There is no shortage of package managers, so in the interest of providing a consistent experience in `pkg` states, there are certain functions that should be present in a package provider. Note that these are subject to change as new features are added or existing features are enhanced.

**list_pkgs**

This function should declare an empty dict, and then add packages to it by calling `pkg_resource.add_pkg`, like so:

```
__salt__['pkg_resource.add_pkg'](ret, name, version)
```

The last thing that should be done before returning is to execute `pkg_resource.sort_pkglist`. This function does not presently do anything to the return dict, but will be used in future versions of Salt.

```
__salt__['pkg_resource.sort_pkglist'](ret)
```

`list_pkgs` returns a dictionary of installed packages, with the keys being the package names and the values being the version installed. Example return data:

```
{'foo': '1.2.3-4',
 'bar': '5.6.7-8'}
```

**latest_version**

Accepts an arbitrary number of arguments. Each argument is a package name. The return value for a package will be an empty string if the package is not found or if the package is up-to-date. The only case in which a non-empty string is returned is if the package is available for new installation (i.e. not already installed) or if there is an upgrade available.

If only one argument was passed, this function return a string, otherwise a dict of name/version pairs is returned.
This function must also accept \*\*kwargs, in order to receive the fromrepo and repo keyword arguments from pkg states. Where supported, these arguments should be used to find the install/upgrade candidate in the specified repository. The fromrepo kwarg takes precedence over repo, so if both of those kwargs are present, the repository specified in fromrepo should be used. However, if repo is used instead of fromrepo, it should still work, to preserve backwards compatibility with older versions of Salt.

**version**

Like latest_version, accepts an arbitrary number of arguments and returns a string if a single package name was passed, or a dict of name/value pairs if more than one was passed. The only difference is that the return values are the currently-installed versions of whatever packages are passed. If the package is not installed, an empty string is returned for that package.

**upgrade_available**

Deprecated and destined to be removed. For now, should just do the following:

```python
return __salt__['pkg.latest_version'](name) != ''
```

**install**

The following arguments are required and should default to None:

1. name (for single-package pkg states)
2. pkgs (for multiple-package pkg states)
3. sources (for binary package file installation)

The first thing that this function should do is call pkg_resource.parse_targets (see below). This function will convert the SLS input into a more easily parsed data structure. pkg_resource.parse_targets may need to be modified to support your new package provider, as it does things like parsing package metadata which cannot be done for every package management system.

```python
pkg_params, pkg_type = __salt__['pkg_resource.parse_targets'](name, pkgs, sources)
```

Two values will be returned to the install function. The first of them will be a dictionary. The keys of this dictionary will be package names, though the values will differ depending on what kind of installation is being done:

- If name was provided (and pkgs was not), then there will be a single key in the dictionary, and its value will be None. Once the data has been returned, if the version keyword argument was provided, then it should replace the None value in the dictionary.

- If pkgs was provided, then name is ignored, and the dictionary will contain one entry for each package in the pkgs list. The values in the dictionary will be None if a version was not specified for the package, and the desired version if specified. See the Multiple Package Installation Options section of the pkg.installed state for more info.

- If sources was provided, then name is ignored, and the dictionary values will be the path/URI for the package.

The second return value will be a string with two possible values: repository or file. The install function can use this value (if necessary) to build the proper command to install the targeted package(s).

Both before and after the installing the target(s), you should run list_pkgs to obtain a list of the installed packages. You should then return the output of salt.utils.compare_dicts()
return salt.utils.compare_dicts(old, new)

remove

Removes the passed package and return a list of the packages removed.

## 17.14.2 Package Repo Functions

There are some functions provided by `pkg` which are specific to package repositories, and not to packages themselves. When writing modules for new package managers, these functions should be made available as stated below, in order to provide compatibility with the `pkgrepo` state.

All repo functions should accept a `basedir` option, which defines which directory repository configuration should be found in. The default for this is dictated by the repo manager that is being used, and rarely needs to be changed.

```python
basedir = '/etc/yum.repos.d'
__salt__['pkg.list_repos'](basedir)
```

### list_repos

Lists the repositories that are currently configured on this system.

```python
__salt__['pkg.list_repos']()
```

Returns a dictionary, in the following format:

```json
{ 'reponame': 'config_key_1': 'config value 1',
  'config_key_2': 'config value 2',
  'config_key_3': ['list item 1 (when appropriate)',
                  'list item 2 (when appropriate)']}
```

### get_repo

Displays all local configuration for a specific repository.

```python
__salt__['pkg.get_repo'](repo='myrepo')
```

The information is formatted in much the same way as list_repos, but is specific to only one repo.

```json
{ 'config_key_1': 'config value 1',
  'config_key_2': 'config value 2',
  'config_key_3': ['list item 1 (when appropriate)',
                  'list item 2 (when appropriate)']}
```

### del_repo

Removes the local configuration for a specific repository. Requires a `repo` argument, which must match the locally configured name. This function returns a string, which informs the user as to whether or not the operation was a success.
mod_repo

Modify the local configuration for one or more option for a configured repo. This is also the way to create new repository configuration on the local system; if a repo is specified which does not yet exist, it will be created.

The options specified for this function are specific to the system; please refer to the documentation for your specific repo manager for specifics.

17.14.3 Low-Package Functions

In general, the standard package functions as describes above will meet your needs. These functions use the system's native repomanager (for instance, yum or the apt tools). In most cases, the repo manager is actually separate from the package manager. For instance, yum is usually a front-end for rpm, and apt is usually a front-end for dpkg. When possible, the package functions that use those package managers directly should do so through the low package functions.

It is normal and sane for pkg to make calls to lowpkgs, but lowpkg must never make calls to pkg. This is affects functions which are required by both pkg and lowpkg, but the technique in pkg is more performant than what is available to lowpkg. When this is the case, the lowpkg function that requires that technique must still use the lowpkg version.

list_pkgs

Returns a dict of packages installed, including the package name and version. Can accept a list of packages; if none are specified, then all installed packages will be listed.

Example output:

```python
{'foo': '1.2.3-4',
 'bar': '5.6.7-8'}
```

verify

Many (but not all) package management systems provide a way to verify that the files installed by the package manager have or have not changed. This function accepts a list of packages; if none are specified, all packages will be included.

Example output:

```python
{'/etc/httpd/conf/httpd.conf': {'mismatch': ['size', 'md5sum', 'mtime'],
 'type': 'config'}}
```
file_list

Lists all of the files installed by all packages specified. If not packages are specified, then all files for all known packages are returned.

```python
installed = __salt__['lowpkg.file_list']('httpd', 'apache')
```

This function does not return which files belong to which packages; all files are returned as one giant list (hence the file_list function name. However, this information is still returned inside of a dict, so that it can provide any errors to the user in a sane manner.

```python
dict = {'errors': ['package apache is not installed'],
        'files': ['/etc/httpd',
                 '/etc/httpd/conf',
                 '/etc/httpd/conf.d',
                 '...SNIP...']}
```

file_dict

Lists all of the files installed by all packages specified. If not packages are specified, then all files for all known packages are returned.

```python
installed = __salt__['lowpkg.file_dict']('httpd', 'apache', 'kernel')
```

Unlike file_list, this function will break down which files belong to which packages. It will also return errors in the same manner as file_list.

```python
dict = {'errors': ['package apache is not installed'],
        'packages': {'httpd': ['/etc/httpd',
                             '/etc/httpd/conf',
                             '...SNIP...'],
                     'kernel': ['/boot/.vmlinuz-2.6.32-279.el6.x86_64.hmac',
                                '/boot/System.map-2.6.32-279.el6.x86_64',
                                '...SNIP...']}
```

17.15 Reporting Bugs

Salt uses GitHub to track open issues and feature requests.

To file a bug, please navigate to the new issue page for the Salt project.

In an issue report, please include the following information:

- The output of `salt --versions-report` from the relevant machines. This can also be gathered remotely by using `salt <my_tgt> test.versions_report`.
- A description of the problem including steps taken to cause the issue to occur and the expected behaviour.
- Any steps taken to attempt to remediate the problem.
- Any configuration options set in a configuration file that may be relevant.
- A reproduceable test case. This may be as simple as an SLS file that illustrates a problem or it may be a link to a repository that contains a number of SLS files that can be used together to re-produce
a problem. If the problem is transitory, any information that can be used to try and reproduce the
problem is helpful.

• [Optional] The output of each salt component (master/minion/CLI) running with the \\-ldebug
flag set.

Note: Please be certain to scrub any logs or SLS files for sensitive data!

17.16 Salt Topology

Salt is based on a powerful, asynchronous, network topology using ZeroMQ. Many ZeroMQ systems are in place to
enable communication. The central idea is to have the fastest communication possible.

17.16.1 Servers

The Salt Master runs 2 network services. First is the ZeroMQ PUB system. This service by default runs on port 4505
and can be configured via the publish_port option in the master configuration.

Second is the ZeroMQ REP system. This is a separate interface used for all bi-directional communication with
minions. By default this system binds to port 4506 and can be configured via the ret_port option in the master.

17.16.2 PUB/SUB

The commands sent out via the salt client are broadcast out to the minions via ZeroMQ PUB/SUB. This is done by
allowing the minions to maintain a connection back to the Salt Master and then all connections are informed to
download the command data at once. The command data is kept extremely small (usually less than 1K) so it is not a
burden on the network.

17.16.3 Return

The PUB/SUB system is a one way communication, so once a publish is sent out the PUB interface on the master
has no further communication with the minion. The minion, after running the command, then sends the command's
return data back to the master via the ret_port.

17.17 Translating Documentation

If you wish to help translate the Salt documentation to your language, please head over to the Transifex website and
signup for an account.

Once registered, head over to the Salt Translation Project, and either click on Request Language if you can’t find
yours, or, select the language for which you wish to contribute and click Join Team.

Transifex provides some useful reading resources on their support domain, namely, some useful articles directed to
translators.

17.17.1 Building A Localized Version of the Documentation

While you’re working on your translation on Transifex, you might want to have a look at how it’s rendering.
Install The Transifex Client

To interact with the Transifex web service you will need to install the transifex-client:

```
pip install transifex-client
```

Configure The Transifex Client

Once installed, you will need to set it up on your computer. We created a script to help you with that:

```
.scripts/setup-transifex-config
```

Download Remote Translations

There’s a little script which simplifies the download process of the translations (which isn’t that complicated in the first place). So, let’s assume you’re translating pt_PT, Portuguese (Portugal). To download the translations, execute from the `doc/` directory of your Salt checkout:

```
make download-translations SPHINXLANG=pt_PT
```

To download pt_PT, Portuguese (Portugal), and nl, Dutch, you can use the helper script directly:

```
.scripts/download-translation-catalog pt_PT nl
```

Build Localized Documentation

After the download process finishes, which might take a while, the next step is to build a localized version of the documentation. Following the pt_PT example above:

```
make html SPHINXLANG=pt_PT
```

View Localized Documentation

Open your browser, point it to the local documentation path and check the localized output you’ve just build.

17.18 Developing Salt Tutorial

This tutorial assumes you have:

- a web browser
- a GitHub account (<my_account>)
- a command line (CLI)
- git
- a text editor
17.18.1 Fork

In your browser, navigate to the saltstack/salt GitHub repository. Click on Fork (https://github.com/saltstack/salt/#fork-destination-box).

Note: If you have more than one GitHub presence, for example if you are a member of a team, GitHub will ask you into which area to clone Salt. If you don't know where, then select your personal GitHub account.

17.18.2 Clone

In your CLI, navigate to the directory into which you want clone the Salt codebase and submit the following command:

```
$ git clone https://github.com/<my_account>/salt.git
```

where `<my_account>` is the name of your GitHub account. After the clone has completed, add SaltStack as a second remote and fetch any changes from upstream.

```
$ cd salt
$ git remote add upstream https://github.com/saltstack/salt.git
$ git fetch upstream
```

For this tutorial, we will be working off from the develop branch, which is the default branch for the SaltStack GitHub project. This branch needs to track upstream/develop so that we will get all upstream changes when they happen.

```
$ git checkout develop
$ git branch --set-upstream-to upstream/develop
```

17.18.3 Fetch

Fetch any upstream changes on the develop branch and sync them to your local copy of the branch with a single command:

```
$ git pull --rebase
```

Note: For an explanation on `pull vs pull --rebase` and other excellent points, see this article by Mislav Marohnić.

17.18.4 Branch

Now we are ready to get to work. Consult the sprint beginner bug list and select an execution module whose __virtual__ function needs to be updated. I'll select the alternatives module.

Create a new branch off from develop. Be sure to name it something short and descriptive.

```
$ git checkout -b virt_ret
```
17.18.5 Edit

Edit the file you have selected, and verify that the changes are correct.

```
$ vim salt/modules/alternatives.py
$ git diff
diff --git a/salt/modules/alternatives.py b/salt/modules/alternatives.py
index 1653e5f..30c0a59 100644
--- a/salt/modules/alternatives.py
+++ b/salt/modules/alternatives.py
@@ -30,7 +30,7 @@ def __virtual__():
     if os.path.isdir('/etc/alternatives'):
         return True
-    return False
+    return (False, 'Cannot load alternatives module: /etc/alternatives dir not
    -found')

def _get_cmd():
```

17.18.6 Commit

Stage and commit the changes. Write a descriptive commit summary, but try to keep it less than 50 characters. Review your commit.

```
$ git add salt/modules/alternatives.py
$ git commit -m 'modules.alternatives: __virtual__ return err msg'
$ git show
```

Note: If you need more room to describe the changes in your commit, run `git commit` (without the `-m`, message, option) and you will be presented with an editor. The first line is the commit summary and should still be 50 characters or less. The following paragraphs you create are free form and will be preserved as part of the commit.

17.18.7 Push

Push your branch to your GitHub account. You will likely need to enter your GitHub username and password.

```
$ git push origin virt_ret
Username for 'https://github.com': <my_account>
Password for 'https://<my_account>@github.com':
```

Note: If authentication over https does not work, you can alternatively setup ssh keys. Once you have done this, you may need add the keys to your git repository configuration

```
$ git config ssh.key ~/.ssh/<key_name>
```

where `<key_name>` is the file name of the private key you created.
17.18.8 Merge

In your browser, navigate to the new pull request page on the saltstack/salt GitHub repository and click on compare across forks. Select <my_account> from the list of head forks and the branch you are wanting to merge into develop (virt_ret in this case).

When you have finished reviewing the changes, click Create pull request.

If your pull request contains only a single commit, the title and comment will be taken from that commit’s summary and message, otherwise the branch name is used for the title. Edit these fields as necessary and click Create pull request.

Note: Although these instructions seem to be the official pull request procedure on github’s website, here are two alternative methods that are simpler.

- If you navigate to your clone of salt, https://github.com/<my_account>/salt, depending on how old your branch is or how recently you pushed updates on it, you may be presented with a button to create a pull request with your branch.
- I find it easiest to edit the following URL:
  https://github.com/saltstack/salt/compare/develop...<my_account>:virt_ret

17.18.9 Resources

GitHub offers many great tutorials on various aspects of the git- and GitHub-centric development workflow:
https://help.github.com/

There are many topics covered by the Salt Developer documentation:
https://docs.saltstack.com/en/latest/topics/development/index.html

The contributing documentation presents more details on specific contributing topics:
https://docs.saltstack.com/en/latest/topics/development/contributing.html

17.19 Salt’s Test Suite

Salt comes with a powerful integration and unit test suite allowing for the fully automated run of integration and/or unit tests from a single interface.

To learn the basics of how Salt’s test suite works, be sure to check out the Salt’s Test Suite: An Introduction tutorial.

17.19.1 Test Directory Structure

Salt’s test suite is located in the tests directory in the root of Salt’s codebase. The test suite is divided into two main groups:

- Integration Tests
- Unit Tests
Within each of these groups, the directory structure roughly mirrors the structure of Salt's own codebase. Notice that there are directories for states, modules, runners, output, and more in each testing group.

The files that are housed in the modules directory of either the unit or the integration testing factions contain respective integration or unit test files for Salt execution modules.

### Integration Tests

The Integration section of Salt's test suite start up a number of Salt daemons to test functionality in a live environment. These daemons include two Salt Masters, one Syndic, and two Minions. This allows the Syndic interface to be tested and Master/Minion communication to be verified. All of the integration tests are executed as live Salt commands sent through the started daemons.

Integration tests are particularly good at testing modules, states, and shell commands, among other segments of Salt's ecosystem. By utilizing the integration test daemons, integration tests are easy to write. They are also SaltStack's generally preferred method of adding new tests.

The discussion in the Integration vs. Unit section of the testing tutorial is beneficial in learning why you might want to write integration tests vs. unit tests. Both testing arenas add value to Salt's test suite and you should consider adding both types of tests if possible and appropriate when contributing to Salt.

- Integration Test Documentation

### Unit Tests

Unit tests do not spin up any Salt daemons, but instead find their value in testing singular implementations of individual functions. Instead of testing against specific interactions, unit tests should be used to test a function's logic as well as any return or raises statements. Unit tests also rely heavily on mocking external resources.

The discussion in the Integration vs. Unit section of the testing tutorial is useful in determining when you should consider writing unit tests instead of, or in addition to, integration tests when contributing to Salt.

- Unit Test Documentation

### 17.19.2 Running The Tests

There are requirements, in addition to Salt's requirements, which need to be installed in order to run the test suite. Install one of the lines below, depending on the relevant Python version:

```
pip install -r requirements/dev_python26.txt
pip install -r requirements/dev_python27.txt
```

To be able to run integration tests which utilizes ZeroMQ transport, you also need to install additional requirements for it. Make sure you have installed the C/C++ compiler and development libraries and header files needed for your Python version.

This is an example for RedHat-based operating systems:

```
yum install gcc gcc-c++ python-devel
pip install -r requirements/zeromq.txt
```

On Debian, Ubuntu or their derivatives run the following commands:

```
apt-get install build-essential python-dev
pip install -r requirements/zeromq.txt
```
This will install the latest `pycrypto` and `pyzmq` (with bundled `libzmq`) Python modules required for running integration tests suite.

Once all requirements are installed, use `runtests.py` script to run all of the tests included in Salt's test suite:

```
python tests/runtests.py
```

For more information about options you can pass the test runner, see the `--help` option:

```
python tests/runtests.py --help
```

An alternative way of invoking the test suite is available in `setup.py`:

```
./setup.py test
```

### Running Test Subsections

Instead of running the entire test suite all at once, which can take a long time, there are several ways to run only specific groups of tests or individual tests:

- Run **unit tests only**: `python tests/runtests.py --unit-tests`
- Run unit and integration tests for states: `python tests/runtests.py --state`
- Run integration tests for an individual module: `python tests/runtests.py --n integration.modules.virt`
- Run unit tests for an individual module: `python tests/runtests.py --n unit.modules.virt_test`
- Run an individual test by using the class and test name (this example is for the `test_default_kvm_profile` test in the `integration.module.virt`): `python tests/runtests.py --n integration.module.virt.VirtTest.test_default_kvm_profile`

For more specific examples of how to run various test subsections or individual tests, please see the `Test Selection Options` documentation or the `Running Specific Tests` section of the `Salt's Test Suite: An Introduction` tutorial.

### Running Unit Tests Without Integration Test Daemons

Since the unit tests do not require a master or minion to execute, it is often useful to be able to run unit tests individually, or as a whole group, without having to start up the integration testing daemons. Starting up the master, minion, and syndic daemons takes a lot of time before the tests can even start running and is unnecessary to run unit tests. To run unit tests without invoking the integration test daemons, simply run the `runtests.py` script with `--unit` argument:

```
python tests/runtests.py --unit
```

All of the other options to run individual tests, entire classes of tests, or entire test modules still apply.

### Running Destructive Integration Tests

Salt is used to change the settings and behavior of systems. In order to effectively test Salt's functionality, some integration tests are written to make actual changes to the underlying system. These tests are referred to as `destructive tests`. Some examples of destructive tests are changes may be testing the addition of a user or installing packages. By default, destructive tests are disabled and will be skipped.
Generally, destructive tests should clean up after themselves by attempting to restore the system to its original state. For instance, if a new user is created during a test, the user should be deleted after the related test(s) have completed. However, no guarantees are made that test clean-up will complete successfully. Therefore, running destructive tests should be done with caution.

**Note:** Running destructive tests will change the underlying system. Use caution when running destructive tests.

To run tests marked as destructive, set the `--run-destructive` flag:

```
python tests/runtests.py --run-destructive
```

**Running Cloud Provider Tests**

Salt’s testing suite also includes integration tests to assess the successful creation and deletion of cloud instances using *Salt-Cloud* for providers supported by *Salt-Cloud*.

The cloud provider tests are off by default and run on sample configuration files provided in `tests/integration/files/conf/cloud.providers.d/`. In order to run the cloud provider tests, valid credentials, which differ per provider, must be supplied. Each credential item that must be supplied is indicated by an empty string value and should be edited by the user before running the tests. For example, DigitalOcean requires a client key and an api key to operate. Therefore, the default cloud provider configuration file for DigitalOcean looks like this:

```
digitalocean-config:
  driver: digital_ocean
  client_key: ''
  api_key: ''
  location: New York 1
```

As indicated by the empty string values, the `client_key` and the `api_key` must be provided:

```
digitalocean-config:
  driver: digital_ocean
  client_key: wFGEwgregeqw3435gDger
  api_key: GDE43t43REGTrkilg43934t34qT43t4dgegerGEGg
  location: New York 1
```

**Note:** When providing credential information in cloud provider configuration files, do not include the single quotes.

Once all of the valid credentials for the cloud provider have been supplied, the cloud provider tests can be run by setting the `--cloud-provider-tests` flag:

```
./tests/runtests.py --cloud-provider-tests
```

**Running The Tests In A Docker Container**

The test suite can be executed under a *docker* container using the `--docked` option flag. The *docker* container must be properly configured on the system invoking the tests and the container must have access to the internet. Here’s a simple usage example:
The full `docker` container repository can also be provided:

```
python tests/runtests.py --docked=salttest/ubuntu-12.04 -v
```

The SaltStack team is creating some containers which will have the necessary dependencies pre-installed. Running the test suite on a container allows destructive tests to run without making changes to the main system. It also enables the test suite to run under a different distribution than the one the main system is currently using.

The current list of test suite images is on Salt’s `docker` repository.

Custom `docker` containers can be provided by submitting a pull request against Salt’s `docker Salt test containers` repository.

### 17.19.3 Automated Test Runs

SaltStack maintains a Jenkins server to allow for the execution of tests across supported platforms. The tests executed from Salt's Jenkins server create fresh virtual machines for each test run, then execute destructive tests on the new, clean virtual machine.

SaltStack's Jenkins server continuously runs the entire test suite, including destructive tests, on an array of various supported operating systems throughout the day. Each actively supported branch of Salt's repository runs the tests located in the respective branch's code. Each set of branch tests also includes a pylint run. These branch tests help ensure the viability of Salt code at any given point in time as pull requests are merged into branches throughout the day.

In addition to branch tests, SaltStack’s Jenkins server also runs tests on pull requests. These pull request tests include a smaller set of virtual machines that run on the branch tests. The pull request tests, like the branch tests, include a pylint test as well.

When a pull request is submitted to Salt’s repository on GitHub, the suite of pull request tests are started by Jenkins. These tests are used to gauge the pull request’s viability to merge into Salt’s codebase. If these initial tests pass, the pull request can then merged into the Salt branch by one of Salt’s core developers, pending their discretion. If the initial tests fail, core developers may request changes to the pull request. If the failure is unrelated to the changes in question, core developers may merge the pull request despite the initial failure.

As soon as the pull request is merged, the changes will be added to the next branch test run on Jenkins.

For a full list of currently running test environments, go to [http://jenkins.saltstack.com](http://jenkins.saltstack.com).

### Using Salt-Cloud on Jenkins

For testing Salt on Jenkins, SaltStack uses `Salt-Cloud` to spin up virtual machines. The script using Salt-Cloud to accomplish this is open source and can be found here: [https://github.com/saltstack/salt/blob/develop/tests/jenkins.py](https://github.com/saltstack/salt/blob/develop/tests/jenkins.py)

### 17.19.4 Writing Tests

The salt testing infrastructure is divided into two classes of tests, integration tests and unit tests. These terms may be defined differently in other contexts, but for Salt they are defined this way:

- **Unit Test**: Tests which validate isolated code blocks and do not require external interfaces such as `salt-call` or any of the salt daemons.
- **Integration Test**: Tests which validate externally accessible features.
Salt testing uses unittest2 from the python standard library and MagicMock.

- Writing integration tests
- Writing unit tests

**Naming Conventions**

Any function in either integration test files or unit test files that is doing the actual testing, such as functions containing assertions, must start with `test_`:

```python
def test_user_present(self):
```

When functions in test files are not prepended with `test_`, the function acts as a normal, helper function and is not run as a test by the test suite.

**Submitting New Tests**

Which branch of the Salt codebase should new tests be written against? The location of where new tests should be submitted depends largely on the reason you're writing the tests.

**Tests for New Features**

If you are adding new functionality to Salt, please write the tests for this new feature in the same pull request as the new feature. New features should always be submitted to the `develop` branch.

If you have already submitted the new feature, but did not write tests in the original pull request that has already been merged, please feel free to submit a new pull request containing tests. If the feature was recently added to Salt's `develop` branch, then the tests should be added there as well. However, if the feature was added to `develop` some time ago and is already present in one or more release branches, please refer to the Tests for Entire Files or Functions section below for more details about where to submit tests for functions or files that do not already have tests.

**Tests to Accompany a Bugfix**

If you are writing tests for code that fixes a bug in Salt, please write the test in the same pull request as the bugfix. If you're unsure of where to submit your bugfix and accompanying test, please review the Which Salt Branch? documentation in Salt's Contributing guide.

**Tests for Entire Files or Functions**

Sometimes entire files in Salt are completely untested. If you are writing tests for a file that doesn't have any tests written for it, write your test against the earliest supported release branch that contains the file or function you're testing.

Once your tests are submitted in a pull request and is merged into the branch in question, the tests you wrote will be merged-forward by SaltStack core engineers and the new tests will propagate to the newer release branches. That way the tests you wrote will apply to all current and relevant release branches, and not just the `develop` branch, for example. This methodology will help protect against regressions on older files in Salt's codebase.

There may be times when the tests you write against an older branch fail in the merge-forward process because functionality has changed in newer release branches. In these cases, a Salt core developer may reach out to you for advice on the tests in question if the path forward is unclear.
Note: If tests are written against a file in an older release branch and then merged forward, there may be new functionality in the file that is present in the new release branch that is untested. It would be wise to see if new functionality could use additional testing once the test file has propagated to newer release branches.

17.20 raet

# RAET # Reliable Asynchronous Event Transport Protocol

See also:

RAET Overview

17.20.1 Protocol

Layering:

OSI Layers

7: Application: Format: Data (Stack to Application interface buffering etc) 
6: Presentation: Format: Data (Encrypt-Decrypt convert to machine independent format)
5: Session: Format: Data (Interhost communications. Authentication. Groups)
4: Transport: Format: Segments (Reliable delivery of Message, Transactions, Segmentation, Error checking)
2: Link: Format: Frames (Reliable per frame communications connection, Media access controller)
1: Physical: Bits (Transceiver communication connection not reliable)

Link is hidden from Raet Network is IP host address and Udp Port Transport is Raet transactions, service kind, tail error checking. Could include header signing as part of transport reliable delivery serialization of header Session is session id key exchange for signing. Grouping is Road (like 852 channel) Presentation is Encrypt Decrypt body Serialize Deserialize Body Application is body data dictionary

Header signing spans both the Transport and Session layers.

17.20.2 Header

JSON Header (Tradeoff some processing speed for extensibility, ease of use, readability)

Body initially JSON but support for "packed" binary body

17.20.3 Packet

Header ASCII Safe JSON Header termination: Empty line given by double pair of carriage return linefeed /r/n/r/n 10 13 10 13 ADAD 1010 1010 1101

In json carriage return and newline characters cannot appear in a json encoded string unless they are escaped with backslash, so the 4 byte combination is illegal in valid json that does not have multi-byte unicode characters.

These means the header must be ascii safe so no multibyte utf-8 strings allowed in header.

Following Header Terminator is variable length signature block. This is binary and the length is provided in the header.

Following the signature block is the packet body or data. This may either be JSON or packed binary. The format is given in the json header
Finally is an optional tail block for error checking or encryption details

### 17.20.4 Header Fields

In UDP header

- **sh**: source host
- **sp**: source port
- **dh**: destination host
- **dp**: destination port

In RAET Header

- **hk**: header kind
- **hl**: header length
- **vn**: version number
- **sd**: Source Device ID
- **dd**: Destination Device ID
- **cf**: Corresponder Flag
- **mf**: Multicast Flag
- **si**: Session ID
- **ti**: Transaction ID
- **sk**: Service Kind
- **pk**: Packet Kind
- **bf**: Burst Flag
- **oi**: Order Index
- **dt**: DateTime Stamp
- **sn**: Segment Number
- **sc**: Segment Count
- **pf**: Pending Segment Flag
- **af**: All Flag
- **nk**: Auth header kind
- **nl**: Auth header length
- **bk**: body kind
- **bl**: body length
- **tk**: tail kind
- **tl**: tail length
- **fg = flags packed (Flags)** Default `00' hex string

2 byte Hex string with bits (0, 0, af, pf, 0, bf, mf, cf) Zeros are TBD

### 17.20.5 Session Bootstrap

Minion sends packet with SID of Zero with public key of minions Public Private Key pair
Master acks packet with SID of Zero to let minion know it received the request

Some time later Master sends packet with SID of zero that accepts the Minion

Minion

### 17.20.6 Session

Session is important for security. Want one session opened and then multiple transactions within session.

Session ID SID sid

GUID hash to guarantee uniqueness since no guarantee of nonvolatile storage or require file storage to keep last session ID used.

### 17.20.7 Service Types or Modular Services

Four Service Types

1. One or more maybe (unacknowledged repeat) maybe means no guarantee
2. Exactly one at most (ack with retries) (duplicate detection idempotent) at most means fixed number of retries has finite probability of failing B1) finite retries B2) infinite retries with exponential back-off up to a maximum delay

3. Exactly one of sequence at most (sequence numbered) Receiver requests retry of missing packet with same B1 or B2 retry type

4. End to End (Application layer Request Response) This is two B sub transactions

Initially unicast messaging Eventually support for Multicast

The use case for C) is to fragment large packets as once a UDP packet exceeds the frame size its reliability goes way down So its more reliable to fragment large packets.

Better approach might be to have more modularity. Services Levels

1. Maybe one or more
   (a) Fire and forget no transaction either side
   (b) Repeat, no ack, no dupdet repeat counter send side, no transaction on receive side
   (c) Repeat, no Ack, dupdet repeat counter send side, dup detection transaction receive side

2. More or Less Once
   (a) retry finite, ack no dupdet retry timer send side, finite number of retires ack receive side no dupdet

3. At most Once
   (a) retry finite, ack, dupdet retry timer send side, finite number of retires ack receive side dupdet

4. Exactly once
   (a) ack retry retry timer send side, ack and duplicate detection receive side Infinite retries with exponential backoff

5. Sequential sequence number
   (a) reorder escrow
   (b) Segmented packets

6. request response to application layer

Service Features

1. repeats
2. ack retry transaction id
3. sequence number duplicate detection out of order detection sequencing
4. rep-req

Always include transaction id since multiple transactions on same port So get duplicate detection for free if keep transaction alive but if use

A) Maybe one or more B1) At Least One B2) Exactly One C) One of sequence D) End to End

A) Sender creates transaction id for number of repeats but receiver does not keep transaction alive

B1) Sender creates transaction id keeps it for retries. Receiver keeps it to send ack then kills so retry could be duplicate not detected

B2) Sender creates transaction id keeps for retries Receiver keeps tid for acks on any retires so no duplicates.

C) Sender creates TID and Sequence Number. Receiver checks for out of order sequence and can request retry.
D) Application layer sends response. So question is do we keep transaction open or have response be new transaction. No because then we need a rep-req ID so might as well use the same transaction id. Just keep alive until get response.

Little advantage to B1 vs B2 not having duplicates.

So 4 service types

1. Maybe one or more (unacknowledged repeat)
2. Exactly One (At most one) (ack with retry) (duplicate detection idempotent)
3. One of Sequence (sequence numbered)
4. End to End

Also multicast or unicast

Modular Transaction Table

**Sender Side:** Transaction ID plus transaction source sender or receiver generated transaction id Repeat Counter Retry Timer Retry Counter (finite retries) Redo Timer (infinite redos with exponential backoff) Sequence number without acks (look for resend requests) Sequence with ack (wait for ack before sending next in sequence) Segmentation

**Receiver Side:** Nothing just accept packet Acknowledge (can delete transaction after acknowledge) No duplicate detection Transaction timeout (keep transaction until timeout) Duplicate detection save transaction id duplicate detection timeout Request resend of missing packet in sequence Sequence reordering with escrow timeout wait escrow before requesting resend Unsegmentation (request resends of missing segment)

### 17.21 SaltStack Git Policy

The SaltStack team follows a git policy to maintain stability and consistency with the repository.

The git policy has been developed to encourage contributions and make contributing to Salt as easy as possible. Code contributors to SaltStack projects DO NOT NEED TO READ THIS DOCUMENT, because all contributions come into SaltStack via a single gateway to make it as easy as possible for contributors to give us code.

The primary rule of git management in SaltStack is to make life easy on contributors and developers to send in code. Simplicity is always a goal!

#### 17.21.1 New Code Entry

All new SaltStack code should be submitted against either the develop branch or a point release branch, depending on the nature of the submission. Please see the Which Salt Branch? section of Salt’s Contributing documentation or the Release Branching section below for more information.

#### 17.21.2 Release Branching

SaltStack maintains two types of releases, **Feature Releases** and **Point Releases** (also commonly referred to as **Bugfix Releases**). A feature release is managed by incrementing the first or second release point number, so 2015.5.5 -> 2015.8.0 signifies a feature release and 2015.8.0 -> 2015.8.1 signifies a point release.
Feature Release Branching

Each feature release is maintained in a dedicated git branch derived from the last applicable release commit on develop. All file changes relevant to the feature release will be completed in the develop branch prior to the creation of the feature release branch. The feature release branch will be named after the relevant numbers to the feature release, which constitute the first two numbers. This means that the release branch for the 2015.8.0 series is named 2015.8.

A feature release branch is created with the following command:

```
# git checkout -b 2015.8 # From the develop branch
# git push origin 2015.8
```

Point Releases

Each point release is derived from its parent release branch. Constructing point releases is a critical aspect of Salt development and is managed by members of the core development team. Point releases comprise bug and security fixes. Bug fixes can be made against a point release branch in one of two ways: the bug fix can be submitted directly against the point release branch, or an attempt can be made to back-port the fix to the point release branch.

Bug fixes should be made against the earliest supported release branch on which the bug is present. The Salt development team regularly merges older point release branches forward into newer point release branches. That way, the bug fixes that are submitted to older release branches can cascade up through all related release branches.

For more information, please see the *Which Salt Branch?* section of Salt's *Contributing* documentation.

Determining when a point release is going to be made is up to the project leader (Thomas Hatch). Generally point releases are made every 2-4 weeks or if there is a security fix they can be made sooner.

The point release is only designated by tagging the commit on the release branch with a release number using the existing convention (version 2015.8.1 is tagged with v2015.8.1). From the tag point a new source tarball is generated and published to PyPI, and a release announcement is made.

17.22 Salt Conventions

17.22.1 Writing Salt Documentation

Salt's documentation is built using the *Sphinx* documentation system. It can be built in a large variety of output formats including HTML, PDF, ePub, and manpage.

All the documentation is contained in the main Salt repository. Speaking broadly, most of the narrative documentation is contained within the `https://github.com/saltstack/salt/blob/develop/doc` subdirectory and most of the reference and API documentation is written inline with Salt's Python code and extracted using a Sphinx extension.

Style

The Salt project recommends the *IEEE style guide* as a general reference for writing guidelines. Those guidelines are not strictly enforced but rather serve as an excellent resource for technical writing questions. The *NCBI style guide* is another very approachable resource.
Point-of-view

Use third-person perspective and avoid ‘I’, ‘we’, ‘you’ forms of address. Identify the addressee specifically e.g., ‘users should’, ‘the compiler does’, etc.

Active voice

Use active voice and present-tense. Avoid filler words.

Title capitalization

Document titles and section titles within a page should follow normal sentence capitalization rules. Words that are capitalized as part of a regular sentence should be capitalized in a title and otherwise left as lowercase. Punctuation can be omitted unless it aids the intent of the title (e.g., exclamation points or question marks).

For example:

**This is a main heading**

======================

Paragraph.

**This is an exciting sub-heading!**

--------------------------------

Paragraph.

Serial Commas

According to Wikipedia: In English punctuation, a serial comma or series comma (also called Oxford comma and Harvard comma) is a comma placed immediately before the coordinating conjunction (usually ‘and’, ‘or’, or ‘nor’) in a series of three or more terms. For example, a list of three countries might be punctuated either as ‘France, Italy, and Spain’ (with the serial comma), or as ‘France, Italy and Spain’ (without the serial comma).”

When writing a list that includes three or more items, the serial comma should always be used.

Documenting modules

Documentation for Salt’s various module types is inline in the code. During the documentation build process it is extracted and formatted into the final HTML, PDF, etc format.

Inline documentation

Python has special multi-line strings called doctstrings as the first element in a function or class. These strings allow documentation to live alongside the code and can contain special formatting. For example:

```python
def my_function(value):
    '''
    Upper-case the given value
    
    Usage:
```
Specify a release for additions or changes

New functions or changes to existing functions should include a marker that denotes what Salt release will be affected. For example:

```python
def my_function(value):
    
    Upper-case the given value
    .. versionadded:: 2014.7.0
    
    return value.upper()
```

For changes to a function:

```python
def my_function(value, strip=False):
    
    Upper-case the given value
    .. versionchanged:: 2016.3.0
        Added a flag to also strip whitespace from the string.
    
    if strip:
        return value.upper().strip()
    return value.upper()
```

Adding module documentation to the index

Each module type has an index listing all modules of that type. For example: all-salt.modules, state modules, renderer modules. New modules must be added to the index manually.

1. Edit the file for the module type: execution modules, state modules, renderer modules, etc.

2. Add the new module to the alphabetized list.

3. Build the documentation which will generate an `.rst` file for the new module in the same directory as the `index.rst`.

4. Commit the changes to `index.rst` and the new `.rst` file and send a pull request.
Cross-references

The Sphinx documentation system contains a wide variety of cross-referencing capabilities.

Glossary entries

Link to glossary entries using the term role. A cross-reference should be added the first time a Salt-specific term is used in a document.

A common way to encapsulate master-side functionality is by writing a custom :term:`Runner Function`. Custom Runner Functions are easy to write.

Index entries

Sphinx automatically generates many kinds of index entries, but it is occasionally useful to manually add items to the index.

One method is to use the index directive above the document or section that should appear in the index.

```
.. index:: ! Event, event bus, event system
   see: Reactor; Event
```

Another method is to use the index role inline with the text that should appear in the index. The index entry is created and the target text is left otherwise intact.

```
Information about the :index:`Salt Reactor`
```

Documents and sections

Each document should contain a unique top-level label of the form:

```
.. _my-page:

My page
======

Paragraph.
```

Unique labels can be linked using the ref role. This allows cross-references to survive document renames or movement.

```
For more information see :ref:`my-page`.
```

Note, the :doc: role should not be used to link documents together.

Modules

Cross-references to Salt modules can be added using Sphinx's Python domain roles. For example, to create a link to the test.ping function:
A useful execution module to test active communication with a minion is the `test.ping` function.

Salt modules can be referenced as well:

The `test module` contains many useful functions for inspecting an active Salt connection.

The same syntax works for all modules types:

One of the workhorse state module functions in Salt is the `file.managed` function.

**Settings**

Individual settings in the Salt Master or Salt Minion configuration files are cross-referenced using two custom roles, `conf_master` and `conf_minion`.

The `minion ID` setting is a unique identifier for a single minion.

**Documentation Changes and Fixes**

Documentation changes and fixes should be made against the earliest supported release branch that the update applies to. The practice of updating a release branch instead of making all documentation changes against Salt’s main, default branch, develop, is necessary in order for the docs to be as up-to-date as possible when the docs are built.

The workflow mentioned above is also in line with the recommendations outlined in Salt’s Contributing page. You can read more about how to choose where to submit documentation fixes by reading the Which Salt branch? section.

For an explanation of how to submit changes against various branches, see the Sending a GitHub pull request section. Specifically, see the section describing how to Create a new branch and the steps that follow.

**Building the documentation**

1. Install Sphinx using a system package manager or pip. The package name is often of the form `python-sphinx`. There are no other dependencies.

2. Build the documentation using the provided Makefile or .bat file on Windows.

   ```
   cd /path/to/salt/doc
   make html
   ```

3. The generated documentation will be written to the `doc/_build/<format>` directory.

4. A useful method of viewing the HTML documentation locally is to start Python’s built-in HTTP server:

   ```
   cd /path/to/salt/doc/_build/html
   python -m SimpleHTTPServer
   ```

   Then pull up the documentation in a web browser at http://localhost:8000/.
17.22.2 Salt Formulas

Formulas are pre-written Salt States. They are as open-ended as Salt States themselves and can be used for tasks such as installing a package, configuring, and starting a service, setting up users or permissions, and many other common tasks.

All official Salt Formulas are found as separate Git repositories in the `saltstack-formulas` organization on GitHub: https://github.com/saltstack-formulas

As a simple example, to install the popular Apache web server (using the normal defaults for the underlying distro) simply include the `apache-formula` from a top file:

```yaml
base:
  'web*':
    - apache
```

Installation

Each Salt Formula is an individual Git repository designed as a drop-in addition to an existing Salt State tree. Formulas can be installed in the following ways.

Adding a Formula as a GitFS remote

One design goal of Salt's GitFS fileserver backend was to facilitate reusable States. GitFS is a quick and natural way to use Formulas.

1. Install and configure GitFS.

2. Add one or more Formula repository URLs as remotes in the `gitfs_remotes` list in the Salt Master configuration file:

```yaml
gitfs_remotes:
  - https://github.com/saltstack-formulas/apache-formula
  - https://github.com/saltstack-formulas/memcached-formula
```

We strongly recommend forking a formula repository into your own GitHub account to avoid unexpected changes to your infrastructure.

Many Salt Formulas are highly active repositories so pull new changes with care. Plus any additions you make to your fork can be easily sent back upstream with a quick pull request!

3. Restart the Salt master.

Adding a Formula directory manually

Formulas are simply directories that can be copied onto the local file system by using Git to clone the repository or by downloading and expanding a tarball or zip file of the repository. The directory structure is designed to work with `file_roots` in the Salt master configuration.

1. Clone or download the repository into a directory:

```bash
mkdir -p /srv/formulas
cd /srv/formulas
git clone https://github.com/saltstack-formulas/apache-formula.git
```
# or

```shell
mkdir -p /srv/formulas
cd /srv/formulas
wget https://github.com/saltstack-formulas/apache-formula/archive/master.tar.gz
tar xf apache-formula-master.tar.gz
```

2. Add the new directory to **file_roots**:

```yaml
file_roots:
  base:
    - /srv/salt
    - /srv/formulas/apache-formula
```

3. Restart the Salt Master.

**Usage**

Each Formula is intended to be immediately usable with sane defaults without any additional configuration. Many formulas are also configurable by including data in Pillar; see the `pillar.example` file in each Formula repository for available options.

**Including a Formula in an existing State tree**

Formula may be included in an existing `sls` file. This is often useful when a state you are writing needs to require or extend a state defined in the formula.

Here is an example of a state that uses the `epel-formula` in a `require` declaration which directs Salt to not install the `python26` package until after the EPEL repository has also been installed:

```yaml
include:
  - epel

python26:
  pkg.installed:
    - require:
      - pkg: epel
```

**Including a Formula from a Top File**

Some Formula perform completely standalone installations that are not referenced from other state files. It is usually cleanest to include these Formula directly from a Top File.

For example the easiest way to set up an OpenStack deployment on a single machine is to include the `openstack-standalone-formula` directly from a `top.sls` file:

```yaml
base:
  'myopenstackmaster':
    - openstack
```

Quickly deploying OpenStack across several dedicated machines could also be done directly from a Top File and may look something like this:
Configuring Formula using Pillar

Salt Formulas are designed to work out of the box with no additional configuration. However, many Formula support additional configuration and customization through Pillar. Examples of available options can be found in a file named pillar.example in the root directory of each Formula repository.

Using Formula with your own states

Remember that Formula are regular Salt States and can be used with all Salt’s normal state mechanisms. Formula can be required from other States with require declarations, they can be modified using extend, they can made to watch other states with The _in versions of requisites.

The following example uses the stock apache-formula alongside a custom state to create a vhost on a Debian/Ubuntu system and to reload the Apache service whenever the vhost is changed.

```yaml
# Include the stock, upstream apache formula.
include:
  - apache

# Use the watch_in requisite to cause the apache service state to reload
# apache whenever the my-example-com-vhost state changes.
my-example-com-vhost:
  file:
    - managed
    - name: /etc/apache2/sites-available/my-example-com
      watch_in:
        - service: apache
```

Don’t be shy to read through the source for each Formula!

Reporting problems & making additions

Each Formula is a separate repository on GitHub. If you encounter a bug with a Formula please file an issue in the respective repository! Send fixes and additions as a pull request. Add tips and tricks to the repository wiki.

Writing Formulas

Each Formula is a separate repository in the saltstack-formulas organization on GitHub.

Note: Get involved creating new Formulas
The best way to create new Formula repositories for now is to create a repository in your own account on GitHub and notify a SaltStack employee when it is ready. We will add you to the contributors team on the saltstack-formulas organization and help you transfer the repository over. Ping a SaltStack employee on IRC (#salt on Freenode) or send an email to the salt-users mailing list.

There are a lot of repositories in that organization! Team members can manage which repositories they are subscribed to on GitHub's watching page: https://github.com/watching.

### Style

Maintainability, readability, and reusability are all marks of a good Salt sls file. This section contains several suggestions and examples.

```yaml
# Deploy the stable master branch unless version overridden by passing
# Pillar at the CLI or via the Reactor.

deploy_myapp:
  git.latest:
    - name: git@github.com/myco/myapp.git
    - version: {{ salt.pillar.get('myapp:version', 'master') }}
```

#### Use a descriptive State ID

The ID of a state is used as a unique identifier that may be referenced via other states in requisites. It must be unique across the whole state tree (it is a key in a dictionary, after all).

In addition a state ID should be descriptive and serve as a high-level hint of what it will do, or manage, or change. For example, deploy_webapp, or apache, or reload_firewall.

#### Use module.function notation

So-called ``short-declaration`` notation is preferred for referencing state modules and state functions. It provides a consistent pattern of module.function shared between Salt States, the Reactor, Salt Mine, the Scheduler, as well as with the CLI.

```yaml
# Do
apache:
  pkg.installed:
    - name: httpd

# Don't
apache:
  pkg:
    - installed
    - name: httpd
```

Salt's state compiler will transform ``short-decs`` into the longer format when compiling the human-friendly highstate structure into the machine-friendly lowstate structure.

#### Specify the name parameter

Use a unique and permanent identifier for the state ID and reserve name for data with variability.
The *name declaration* is a required parameter for all state functions. The state ID will implicitly be used as `name` if it is not explicitly set in the state.

In many state functions the `name` parameter is used for data that varies such as OS-specific package names, OS-specific file system paths, repository addresses, etc. Any time the ID of a state changes all references to that ID must also be changed. Use a permanent ID when writing a state the first time to future-proof that state and allow for easier refactors down the road.

**Comment state files**

YAML allows comments at varying indentation levels. It is a good practice to comment state files. Use vertical whitespace to visually separate different concepts or actions.

```yaml
# Start with a high-level description of the current sls file.
# Explain the scope of what it will do or manage.

# Comment individual states as necessary.
update_a_config_file:
  # Provide details on why an unusual choice was made. For example:
  #
  # This template is fetched from a third-party and does not fit our
  # company norm of using Jinja. This must be processed using Mako.
  file.managed:
    - name: /path/to/file.cfg
    - source: salt://path/to/file.cfg.template
    - template: mako

  # Provide a description or explanation that did not fit within the state
  # ID. For example:
  #
  # Update the application's last-deployed timestamp.
  # This is a workaround until Bob configures Jenkins to automate RPM
  # builds of the app.
  cmd.run:
    # FIXME: Joe needs this to run on Windows by next quarter. Switch these
    # from shell commands to Salt's file.managed and file.replace state
    # modules.
    - name: |
      touch /path/to/file_last_updated
      sed -e 's/foo/bar/g' /path/to/file_environment
    - onchanges:
      - file: a_config_file
```

Be careful to use Jinja comments for commenting Jinja code and YAML comments for commenting YAML code.

```yaml
# BAD EXAMPLE
# The Jinja in this YAML comment is still executed!
# {% set apache_is_installed = 'apache' in salt.pkg.list_pkgs() %}

# GOOD EXAMPLE
# The Jinja in this Jinja comment will not be executed.
{% # % set apache_is_installed = 'apache' in salt.pkg.list_pkgs() %} #}
```
Easy on the Jinja!

Jinja templating provides vast flexibility and power when building Salt sls files. It can also create an unmaintainable tangle of logic and data. Speaking broadly, Jinja is best used when kept apart from the states (as much as is possible). Below are guidelines and examples of how Jinja can be used effectively.

Know the evaluation and execution order

High-level knowledge of how Salt states are compiled and run is useful when writing states. The default renderer setting in Salt is Jinja piped to YAML. Each is a separate step. Each step is not aware of the previous or following step. Jinja is not YAML aware, YAML is not Jinja aware; they cannot share variables or interact.

- Whatever the Jinja step produces must be valid YAML.
- Whatever the YAML step produces must be a valid highstate data structure. (This is also true of the final step for any of the alternate renderers in Salt.)
- Highstate can be thought of as a human-friendly data structure; easy to write and easy to read.
- Salt’s state compiler validates the highstate and compiles it to low state.
- Low state can be thought of as a machine-friendly data structure. It is a list of dictionaries that each map directly to a function call.
- Salt’s state system finally starts and executes on each “chunk” in the low state. Remember that requisites are evaluated at runtime.
- The return for each function call is added to the “running” dictionary which is the final output at the end of the state run.

The full evaluation and execution order:

Jinja -> YAML -> Highstate -> low state -> execution

Avoid changing the underlying system with Jinja

Avoid calling commands from Jinja that change the underlying system. Commands run via Jinja do not respect Salt’s dry-run mode (test=True)! This is usually in conflict with the idempotent nature of Salt states unless the command being run is also idempotent.

Inspect the local system

A common use for Jinja in Salt states is to gather information about the underlying system. The grains dictionary available in the Jinja context is a great example of common data points that Salt itself has already gathered. Less common values are often found by running commands. For example:

{% set is_selinux_enabled = salt.cmd.run('sestatus') == '1' %}

This is usually best done with a variable assignment in order to separate the data from the state that will make use of the data.
Gather external data

One of the most common uses for Jinja is to pull external data into the state file. External data can come from anywhere like API calls or database queries, but it most commonly comes from flat files on the file system or Pillar data from the Salt Master. For example:

```jinja
{% set some_data = salt.pillar.get('some_data', {'sane default': True}) %}

# or #
{% import_yaml 'path/to/file.yaml' as some_data %}

# or #
{% import_json 'path/to/file.json' as some_data %}

# or #
{% import_text 'path/to/ssh_key.pub' as ssh_pub_key %}

# or #
{% from 'path/to/other_file.jinja' import some_data with context %}
```

This is usually best done with a variable assignment in order to separate the data from the state that will make use of the data.

Light conditionals and looping

Jinja is extremely powerful for programmatically generating Salt states. It is also easy to overuse. As a rule of thumb, if it is hard to read it will be hard to maintain!

Separate Jinja control-flow statements from the states as much as is possible to create readable states. Limit Jinja within states to simple variable lookups.

Below is a simple example of a readable loop:

```jinja
{% for user in salt.pillar.get('list_of_users', []) %}

# Ensure unique state IDs when looping. #
{{ user.name }}-{{ loop.index }}:
    user.present:
        - name: {{ user.name }}
        - shell: {{ user.shell }}

{% endfor %}
```

Avoid putting a Jinja conditionals within Salt states where possible. Readability suffers and the correct YAML indentation is difficult to see in the surrounding visual noise. Parametrization (discussed below) and variables are both useful techniques to avoid this. For example:

```jinja
# ---- Bad example ---- #
apache:
    pkg.installed:
        {% if grains.os_family == 'RedHat' %}
            - name: httpd
        {% endif %}
```

2356 Chapter 17. Developing Salt
Dictionaries are useful to effectively "namespace" a collection of variables. This is useful with parametrization (discussed below). Dictionaries are also easily combined and merged. And they can be directly serialized into YAML which is often easier than trying to create valid YAML through templating. For example:

```
{% if grains.os_family == 'RedHat' %}
  % set name = 'httpd'
{% elif grains.os_family == 'Debian' %}
  % set name = 'apache2'
{% endif %}

apache:
  pkg.installed:
    - name: {{ name }}

{% set name = {
    'RedHat': 'httpd',
    'Debian': 'apache2',
}.get(grains.os_family) %}

apache:
  pkg.installed:
    - name: {{ name }}
```

```
{% load_yaml as haproxy_defaults %}

common_settings:
  bind_port: 80

internal_loadbalancer:
  source: salt://haproxy/internal_haproxy.cfg
  settings:
```

Dictionaries are useful to effectively "namespace" a collection of variables. This is useful with parametrization (discussed below). Dictionaries are also easily combined and merged. And they can be directly serialized into YAML which is often easier than trying to create valid YAML through templating. For example:

```
 haproxy_conf:
  file.managed:
    - name: /etc/haproxy/haproxy.cfg
    - template: jinja
      {% if 'external_loadbalancer' in grains.roles %}
        source: salt://haproxy/external_haproxy.cfg
      {% elif 'internal_loadbalancer' in grains.roles %}
        source: salt://haproxy/internal_haproxy.cfg
      {% endif %}
      - context:
        {% if 'external_loadbalancer' in grains.roles %}
          ssl_termination: True
        {% elif 'internal_loadbalancer' in grains.roles %}
          ssl_termination: False
        {% endif %}

{% # Better example ---- #}

{% load_yaml as haproxy_defaults %}

common_settings:
  bind_port: 80

internal_loadbalancer:
  source: salt://haproxy/internal_haproxy.cfg
  settings:
```
There is still room for improvement in the above example. For example, extracting into an external file or replacing the if-elif conditional with a function call to filter the correct data more succinctly. However, the state itself is simple and legible, the data is separate and also simple and legible. And those suggested improvements can be made at some future date without altering the state at all!

**Avoid heavy logic and programming**

Jinja is not Python. It was made by Python programmers and shares many semantics and some syntax but it does not allow for arbitrary Python function calls or Python imports. Jinja is a fast and efficient templating language but the syntax can be verbose and visually noisy.

Once Jinja use within an sls file becomes slightly complicated -- long chains of if-elif-elif-else statements, nested conditionals, complicated dictionary merges, wanting to use sets -- instead consider using a different Salt renderer, such as the Python renderer. As a rule of thumb, if it is hard to read it will be hard to maintain -- switch to a format that is easier to read.

Using alternate renderers is very simple to do using Salt’s ``she-bang” syntax at the top of the file. The Python renderer must simply return the correct highstate data structure. The following example is a state tree of two sls files, one simple and one complicated.

```
/srv/salt/top.sls:
base:
  '*':
    - common_configuration
    - roles_configuration

/srv/salt/common_configuration.sls:
common_users:
  user.present:
    - names: [larry, curly, moe]
```
/srv/salt/roles_configuration:

```python
#py
def run()
    list_of_roles = set()

    # This example has the minion id in the form 'web-03-dev'.
    # Easily access the grains dictionary:
    try:
        app, instance_number, environment = __grains__['id'].split('-')
        instance_number = int(instance_number)
    except ValueError:
        app, instance_number, environment = ['Unknown', 0, 'dev']
    list_of_roles.add(app)

    if app == 'web' and environment == 'dev':
        list_of_roles.add('primary')
        list_of_roles.add('secondary')
    elif app == 'web' and environment == 'staging':
        if instance_number == 0:
            list_of_roles.add('primary')
        else:
            list_of_roles.add('secondary')

    # Easily cross-call Salt execution modules:
    if __salt__['myutils.query_valid_ec2_instance']():
        list_of_roles.add('is_ec2_instance')
    return {
        'set_roles_grains': {
            'grains.present': [
                {'name': 'roles'},
                {'value': list(list_of_roles)},
            ],
        },
    }
```

**Jinja Macros**

In Salt sls files Jinja macros are useful for one thing and one thing only: creating mini templates that can be reused and rendered on demand. Do not fall into the trap of thinking of macros as functions; Jinja is not Python (see above).

Macros are useful for creating reusable, parameterized states. For example:

```jinja
{% macro user_state(state_id, user_name, shell='/bin/bash', groups=[]) %}
{{ state_id }}:
    user.present:
        - name: {{ user_name }}
        - shell: {{ shell }}
        - groups: {{ groups | json() }}
{% endmacro %}

{% for user_info in salt.pillar.get('my_users', []) %}
{{ user_state('user_number_' ~ loop.index, **user_info) }}
{% endfor %}
```
Macros are also useful for creating one-off "serializers" that can accept a data structure and write that out as a domain-specific configuration file. For example, the following macro could be used to write a php.ini config file:

```
/srv/salt/php.sls:

php_ini:
  file.managed:
    - name: /etc/php.ini
    - source: salt://php.ini.tmpl
    - template: jinja
    - context:
      php_ini_settings: {{ salt.pillar.get('php_ini', {}) | json() }}
```

```
/srv/pillar/php.sls:

php_ini:
  PHP:
    engine: 'On'
    short_open_tag: 'Off'
    error_reporting: 'E_ALL & ~E_DEPRECATED & ~E_STRICT'
```

```
/srv/salt/php.ini.tmpl:

{% macro php_ini_serializer(data) %}
{% for section_name, name_val_pairs in data.items() %}
  [{{ section_name }}]
  {% for name, val in name_val_pairs.items() %}
    {{ name }} = "{{ val }}"
  {% endfor %}
{% endfor %}
{% endmacro %}

; File managed by Salt at {{ source }}.
; Your changes will be overwritten.

{{ php_ini_serializer/php_ini_settings }}
```

### Abstracting static defaults into a lookup table

Separate data that a state uses from the state itself to increases the flexibility and reusability of a state.

An obvious and common example of this is platform-specific package names and file system paths. Another example is sane defaults for an application, or common settings within a company or organization. Organizing such data as a dictionary (aka hash map, lookup table, associative array) often provides a lightweight namespace and allows for quick and easy lookups. In addition, using a dictionary allows for easily merging and overriding static values within a lookup table with dynamic values fetched from Pillar.

A strong convention in Salt Formulas is to place platform-specific data, such as package names and file system paths, into a file named `map.jinja` that is placed alongside the state files.

The following is an example from the MySQL Formula. The `grains.filter_by` function performs a lookup on that table using the `os_family` grain (by default).

The result is that the `mysql` variable is assigned to a subset of the lookup table for the current platform. This allows states to reference, for example, the name of a package without worrying about the underlying OS. The syntax for referencing a value is a normal dictionary lookup in Jinja, such as `{{ mysql['service'] }}` or the shorthand `{{ mysql.service }}`.  

2360 Chapter 17. Developing Salt
map.jinja:

```jinja
{% set mysql = salt['grains.filter_by']({
   'Debian': {
      'server': 'mysql-server',
      'client': 'mysql-client',
      'service': 'mysql',
      'config': '/etc/mysql/my.cnf',
      'python': 'python-mysqldb',
   },
   'RedHat': {
      'server': 'mysql-server',
      'client': 'mysql',
      'service': 'mysqld',
      'config': '/etc/my.cnf',
      'python': 'MySQL-python',
   },
   'Gentoo': {
      'server': 'dev-db/mysql',
      'client': 'dev-db/mysql',
      'service': 'mysql',
      'config': '/etc/mysql/my.cnf',
      'python': 'dev-python/mysql-python',
   },
}), merge=salt['pillar.get']('mysql:lookup')) %}
```

Values defined in the map file can be fetched for the current platform in any state file using the following syntax:

```jinja
{% from "mysql/map.jinja" import mysql with context %}

mysql-server:
   pkg.installed:
      - name: {{ mysql.server }}
   service.running:
      - name: {{ mysql.service }}
```

---

Organizing Pillar data

It is considered a best practice to make formulas expect all formula-related parameters to be placed under second-level `lookup` key, within a main namespace designated for holding data for particular service/software/etc, managed by the formula:

```python
mysql:
   lookup: version: 5.7.11 ...
```

Collecting common values

Common values can be collected into a `base` dictionary. This minimizes repetition of identical values in each of the `lookup_dict` sub-dictionaries. Now only the values that are different from the base must be specified of the alternates:

map.jinja:
Overriding values in the lookup table

Allow static values within lookup tables to be overridden. This is a simple pattern which once again increases flexibility and reusability for state files.

The `merge` argument in `filter_by` specifies the location of a dictionary in Pillar that can be used to override values returned from the lookup table. If the value exists in Pillar it will take precedence.

This is useful when software or configuration files are installed to non-standard locations or on unsupported platforms. For example, the following Pillar would replace the `config` value from the call above.

```yaml
mysql:
  lookup:
    config: /usr/local/etc/mysql/my.cnf
```

Note: Protecting Expansion of Content with Special Characters

When templating keep in mind that YAML does have special characters for quoting, flows, and other special structure and content. When a Jinja substitution may have special characters that will be incorrectly parsed by YAML care must be taken. It is a good policy to use the `yaml_encode` or the `yaml_dquote` Jinja filters:

```jinja
{% set foo = 7.7 %}
{% set bar = none %}
{% set baz = true %}
{% set zap = 'The word of the day is "salty".' %}
{% set zip = "The quick brown fox . . ." %}

foo: {{ foo|yaml_encode }}
bar: {{ bar|yaml_encode }}
baz: {{ baz|yaml_encode }}
zap: {{ zap|yaml_encode }}
zip: {{ zip|yaml_dquote }}
```
The above will be rendered as below:

```yaml
foo: 7.7
bar: null
baz: true
zap: "The word of the day is "salty"."
zip: ""The quick brown fox . . .""
```

The `filter_by` function performs a simple dictionary lookup but also allows for fetching data from Pillar and overriding data stored in the lookup table. That same workflow can be easily performed without using `filter_by`; other dictionaries besides data from Pillar can also be used.

```jinja
{% set lookup_table = {} %}
{% do lookup_table.update(salt.pillar.get('my:custom:data')) %}
```

### When to use lookup tables

The `map.jinja` file is only a convention within Salt Formulas. This greater pattern is useful for a wide variety of data in a wide variety of workflows. This pattern is not limited to pulling data from a single file or data source. This pattern is useful in States, Pillar and the Reactor, for example.

Working with a data structure instead of, say, a config file allows the data to be cobbled together from multiple sources (local files, remote Pillar, database queries, etc), combined, overridden, and searched.

Below are a few examples of what lookup tables may be useful for and how they may be used and represented.

#### Platform-specific information

An obvious pattern and one used heavily in Salt Formulas is extracting platform-specific information such as package names and file system paths in a file named `map.jinja`. The pattern is explained in detail above.

#### Sane defaults

Application settings can be a good fit for this pattern. Store default settings along with the states themselves and keep overrides and sensitive settings in Pillar. Combine both into a single dictionary and then write the application config or settings file.

The example below stores most of the Apache Tomcat `server.xml` file alongside the Tomcat states and then allows values to be updated or augmented via Pillar. (This example uses the BadgerFish format for transforming JSON to XML.)

```
/srv/salt/tomcat/defaults.yaml:

Server:
  '@port': '8005'
  '@shutdown': SHUTDOWN
GlobalNamingResources:
  Resource:
    '@auth': Container
    '@description': User database that can be updated and saved
    '@factory': org.apache.catalina.users.MemoryUserDatabaseFactory
    '@name': UserDatabase
```
'@pathname': conf/tomcat-users.xml
'@type': org.apache.catalina.UserDatabase
# <...snip...>

/srv/pillar/tomcat.sls:

appX:
  server_xml_overrides:
    Server:
      Service:
        '@name': Catalina
      Connector:
        '@port': '8009'
        '@protocol': AJP/1.3
        '@redirectPort': '8443'
# <...snip...>

/srv/salt/tomcat/server_xml.sls:

{% import_yaml 'tomcat/defaults.yaml' as server_xml_defaults %}
{% set server_xml_final_values = salt.pillar.get(
    'appX:server_xml_overrides',
    default=server_xml_defaults,
    merge=True
)%}

appX_server_xml:
  file.serialize:
    - name: /etc/tomcat/server.xml
    - dataset: {{ server_xml_final_values | json() }}
    - formatter: xml_badgerfish

The file.serialize state can provide a shorthand for creating some files from data structures. There are also many examples within Salt Formulas of creating one-off `serializers` (often as Jinja macros) that reformat a data structure to a specific config file format. For example, `Nginx vhosts` or the `php.ini`:

https://github.com/saltstack-formulas/nginx-formula/blob/5cad4512/nginx/ng/vhosts_config.sls
https://github.com/saltstack-formulas/php-formula/blob/82e2cd3a/php/ng/files/php.ini

Environment specific information

A single state can be reused when it is parameterized as described in the section below, by separating the data the state will use from the state that performs the work. This can be the difference between deploying Application X and Application Y, or the difference between production and development. For example:

/srv/salt/app/deploy.sls:

{% import_yaml 'app/defaults.yaml' as app_defaults %}

{% do app_defaults.update(salt.pillar.get('myapp', {})) %}
deploy_application:
  git.latest:
    - name: {{ app.repo_url }}
    - version: {{ app.version }}
    - target: {{ app.deploy_dir }}

myco/myapp/deployed:
  event.send:
    - data:
      version: {{ app.version }}
    - onchanges:
      - git: deploy_application

/srv/salt/app/LICENSE:

Single-purpose SLS files

Each sls file in a Formula should strive to do a single thing. This increases the reusability of this file by keeping unrelated tasks from getting coupled together.

As an example, the base Apache formula should only install the Apache httpd server and start the httpd service. This is the basic, expected behavior when installing Apache. It should not perform additional changes such as set the Apache configuration file or create vhosts.

If a formula is single-purpose as in the example above, other formulas, and also other states can include and use that formula with Requisites and Other Global State Arguments without also including undesirable or unintended side-effects.

The following is a best-practice example for a reusable Apache formula. (This skips platform-specific options for brevity. See the full apache-formula for more.)

```
# apache/init.sls
apache:
  pkg.installed:
    [...]  
  service.running: 
    [...]  

# apache/mod_wsgi.sls
include:
  - apache  
mod_wsgi:
  pkg.installed:
    [...]  
  - require:             
    - pkg: apache 
```
To illustrate a bad example, say the above Apache formula installed Apache and also created a default vhost. The mod_wsgi state would not be able to include the Apache formula to create that dependency tree without also installing the unneeded default vhost.

*Formulas should be reusable.* Avoid coupling unrelated actions together.

**Parameterization**

*Parameterization is a key feature of Salt Formulas* and also for Salt States. Parameterization allows a single Formula to be reused across many operating systems; to be reused across production, development, or staging environments; and to be reused by many people all with varying goals.

Writing states, specifying ordering and dependencies is the part that takes the longest to write and to test. Filling those states out with data such as users or package names or file locations is the easy part. How many users, what those users are named, or where the files live are all implementation details that should be parameterized. This separation between a state and the data that populates a state creates a reusable formula.

In the example below the data that populates the state can come from anywhere -- it can be hard-coded at the top of the state, it can come from an external file, it can come from Pillar, it can come from an execution function call, or it can come from a database query. The state itself doesn’t change regardless of where the data comes from. Production data will vary from development data will vary from data from one company to another, however the state itself stays the same.

```yaml
# apache/conf.sls
include:
  - apache

apache_conf:
  file.managed:
    [...]
    - watch_in:
      - service: apache
```

```yaml
{% set user_list = [  
  {'name': 'larry', 'shell': 'bash'},  
  {'name': 'curly', 'shell': 'bash'},  
  {'name': 'moe', 'shell': 'zsh'},  
] %}

{% set user_list = salt['pillar.get']('user_list') %}

{% load_json "default_users.json" as user_list %}

{% set user_list = salt['acme_utils.get_user_list']() %}

{% for user in list_list %}
  {{ user.name }}:
  user.present:
    - name: {{ user.name }}
```
### Configuration

Formulas should strive to use the defaults of the underlying platform, followed by defaults from the upstream project, followed by sane defaults for the formula itself.

As an example, a formula to install Apache should not change the default Apache configuration file installed by the OS package. However, the Apache formula should include a state to change or override the default configuration file.

### Pillar overrides

Pillar lookups must use the safe `get()` and must provide a default value. Create local variables using the Jinja `set` construct to increase readability and to avoid potentially hundreds or thousands of function calls across a large state tree.

```
{% from "apache/map.jinja" import apache with context %}
{% set settings = salt['pillar.get']('apache', {}) %}

mod_status:
  file.managed:
    - name: {{ apache.conf_dir }}
    - source: {{ settings.get('mod_status_conf', 'salt://apache/mod_status.conf') }}
    - template: {{ settings.get('template_engine', 'jinja') }}
```

Any default values used in the Formula must also be documented in the `pillar.example` file in the root of the repository. Comments should be used liberally to explain the intent of each configuration value. In addition, users should be able copy-and-paste the contents of this file into their own Pillar to make any desired changes.

### Scripting

Remember that both State files and Pillar files can easily call out to Salt execution modules and have access to all the system grains as well.

```
{% if '/storage' in salt['mount.active']() %}
/usr/local/etc/myfile.conf:
  file:
    - symlink
    - target: /storage/myfile.conf
{% endif %}
```

Jinja macros to encapsulate logic or conditionals are discouraged in favor of *writing custom execution modules* in Python.

### Repository structure

A basic Formula repository should have the following layout:
See also:

template-formula

The template-formula repository has a pre-built layout that serves as the basic structure for a new formula repository. Just copy the files from there and edit them.

**README.rst**

The README should detail each available `.sls` file by explaining what it does, whether it has any dependencies on other formulas, whether it has a target platform, and any other installation or usage instructions or tips.

A sample skeleton for the README.rst file:

```rst
===
foo
===

Install and configure the FOO service.

.. note::
   See the full `Salt Formulas installation and usage instructions`_.

Available states

.. contents::
   :local:

`foo`

---

Install the `foo` package and enable the service.

`foo.bar`

---

Install the `bar` package.
```
**CHANGELOG.rst**

The CHANGELOG.rst file should detail the individual versions, their release date and a set of bullet points for each version highlighting the overall changes in a given version of the formula.

A sample skeleton for the CHANGELOG.rst file:

```
foo formula
==========
0.0.2 (2013-01-01)
- Re-organized formula file layout
- Fixed filename used for upstart logger template
- Allow for pillar message to have default if none specified
```

**Versioning**

Formula are versioned according to Semantic Versioning, [http://semver.org/](http://semver.org/).

**Note:** Given a version number MAJOR.MINOR.PATCH, increment the:

1. **MAJOR** version when you make incompatible API changes,
2. **MINOR** version when you add functionality in a backwards-compatible manner, and
3. **PATCH** version when you make backwards-compatible bug fixes.

Additional labels for pre-release and build metadata are available as extensions to the MAJOR.MINOR.PATCH format.

Formula versions are tracked using Git tags as well as the VERSION file in the formula repository. The VERSION file should contain the currently released version of the particular formula.

**Testing Formulas**

A smoke-test for invalid Jinja, invalid YAML, or an invalid Salt state structure can be performed by with the `state.show_sls` function:

```
salt '*' state.show_sls apache
```

Salt Formulas can then be tested by running each `.sls` file via `state.apply` and checking the output for the success or failure of each state in the Formula. This should be done for each supported platform.

**17.22.3 SaltStack Packaging Guide**

Since Salt provides a powerful toolkit for system management and automation, the package can be split into a number of sub-tools. While packaging Salt as a single package containing all components is perfectly acceptable, the split packages should follow this convention.
Patching Salt For Distributions

The occasion may arise where Salt source and default configurations may need to be patched. It is preferable if Salt is only patched to include platform specific additions or to fix release time bugs. It is preferable that configuration settings and operations remain in the default state, as changes here lowers the user experience for users moving across distributions.

In the event where a packager finds a need to change the default configuration it is advised to add the files to the master.d or minion.d directories.

Source Files

Release packages should always be built from the source tarball distributed via pypi. Release packages should NEVER use a git checkout as the source for distribution.

Single Package

Shipping Salt as a single package, where the minion, master, and all tools are together is perfectly acceptable and practiced by distributions such as FreeBSD.

Split Package

Salt Should always be split in a standard way, with standard dependencies, this lowers cross distribution confusion about what components are going to be shipped with specific packages. These packages can be defined from the Salt Source as of Salt 2014.1.0:

Salt Common

The salt-common or salt package should contain the files provided by the salt python package, or all files distributed from the salt/ directory in the source distribution packages. The documentation contained under the doc/ directory can be a part of this package but splitting out a doc package is preferred. Since salt-call is the entry point to utilize the libs and is useful for all salt packages it is included in the salt-common package.

Name

- salt OR salt-common

Files

- salt/*
- man/salt.7
- scripts/salt-call
- tests/*
- man/salt-call.1
Depends

- Python 2.6-2.7
- PyYAML
- Jinja2

Salt Master

The *salt-master* package contains the applicable scripts, related man pages and init information for the given platform.

Name

- salt-master

Files

- scripts/salt-master
- scripts/salt
- scripts/salt-run
- scripts/salt-key
- scripts/salt-cp
- pkg/<master init data>
- man/salt.1
- man/salt-master.1
- man/salt-run.1
- man/salt-key.1
- man/salt-cp.1
- conf/master

Depends

- Salt Common
- ZeroMQ >= 3.2
- PyZMQ >= 2.10
- PyCrypto
- M2Crypto
- Python MessagePack (Messagepack C lib, or msgpack-pure)
Salt Syndic

The Salt Syndic package can be rolled completely into the Salt Master package. Platforms which start services as part of the package deployment need to maintain a separate salt-syndic package (primarily Debian based platforms). The Syndic may optionally not depend on the anything more than the Salt Master since the master will bring in all needed dependencies, but fall back to the platform specific packaging guidelines.

Name

- salt-syndic

Files

- scripts/salt-syndic
- pkg/<syndic init data>
- man/salt-syndic.1

Depends

- Salt Common
- Salt Master
- ZeroMQ >= 3.2
- PyZMQ >= 2.10
- PyCrypto
- M2Crypto
- Python MessagePack (Messagepack C lib, or msgpack-pure)

Salt Minion

The Minion is a standalone package and should not be split beyond the salt-minion and salt-common packages.

Name

- salt-minion

Files

- scripts/salt-minion
- pkg/<minion init data>
- man/salt-minion.1
- conf/minion
Depends

- Salt Common
- ZeroMQ >= 3.2
- PyZMQ >= 2.10
- PyCrypto
- M2Crypto
- Python MessagePack (Messagepack C lib, or msgpack-pure)

Salt SSH

Since Salt SSH does not require the same dependencies as the minion and master, it should be split out.

Name

- salt-ssh

Files

- scripts/salt-ssh
- man/salt-ssh.1
- conf/cloud*

Depends

- Salt Common
- Python MessagePack (Messagepack C lib, or msgpack-pure)

Salt Cloud

As of Salt 2014.1.0 Salt Cloud is included in the same repo as Salt. This can be split out into a separate package or it can be included in the salt-master package.

Name

- salt-cloud

Files

- scripts/salt-cloud
- man/salt-cloud.1
Depends

- Salt Common
- apache libcloud \(\geq 0.14.0\)

Salt Doc

The documentation package is very distribution optional. A completely split package will split out the documentation, but some platform conventions do not prefer this. If the documentation is not split out, it should be included with the Salt Common package.

Name

- salt-doc

Files

- doc/*

Optional Depends

- Salt Common
- Python Sphinx
- Make

17.22.4 Salt Release Process

The goal for Salt projects is to cut a new feature release every four to six months. This document outlines the process for these releases, and the subsequent bug fix releases which follow.

Feature Release Process

When a new release is ready to be cut, the person responsible for cutting the release will follow the following steps (written using the 0.16 release as an example):

1. All open issues on the release milestone should be moved to the next release milestone. (e.g. from the 0.16 milestone to the 0.17 milestone)
2. Release notes should be created documenting the major new features and bugfixes in the release.
3. Create an annotated tag with only the major and minor version numbers, preceded by the letter \(v\). (e.g. \(v0.16\)) This tag will reside on the develop branch.
4. Create a branch for the new release, using only the major and minor version numbers. (e.g. 0.16)
5. On this new branch, create an annotated tag for the first revision release, which is generally a release candidate. It should be preceded by the letter \(v\). (e.g. \(v0.16.0rc1\))
6. The release should be packaged from this annotated tag and uploaded to PyPI as well as the GitHub releases page for this tag.
7. The packagers should be notified on the `salt-packagers` mailing list so they can create packages for all the major operating systems. (note that release candidates should go in the testing repositories)

8. After the packagers have been given a few days to compile the packages, the release is announced on the `salt-users` mailing list.

9. Log into RTD and add the new release there. (Have to do it manually)

**Maintenance and Bugfix Releases**

Once a feature release branch has been cut from `develop`, the branch moves into a `feature freeze` state. The new release branch enters the `merge-forward` chain and only bugfixes should be applied against the new branch. Once major bugs have been fixed, a bugfix release can be cut:

1. On the release branch (i.e. 0.16), create an annotated tag for the revision release. It should be preceded by the letter `v`. (e.g. `v0.16.2`) Release candidates are unnecessary for bugfix releases.

2. The release should be packaged from this annotated tag and uploaded to PyPI.

3. The packagers should be notified on the `salt-packagers` mailing list so they can create packages for all the major operating systems.

4. After the packagers have been given a few days to compile the packages, the release is announced on the `salt-users` mailing list.

For more information about the difference between the `develop` branch and bugfix release branches, please refer to the `Which Salt Branch?` section of Salt’s `Contributing` documentation.

**17.22.5 Salt Coding Style**

Salt is developed with a certain coding style, while the style is dominantly PEP 8 it is not completely PEP 8. It is also noteworthy that a few development techniques are also employed which should be adhered to. In the end, the code is made to be “Salty”.

Most importantly though, we will accept code that violates the coding style and KINDLY ask the contributor to fix it, or go ahead and fix the code on behalf of the contributor. Coding style is NEVER grounds to reject code contributions, and is never grounds to talk down to another member of the community (There are no grounds to treat others without respect, especially people working to improve Salt)!!

**Linting**

Most Salt style conventions are codified in Salt’s `.pylintrc` file. Salt’s pylint file has two dependencies: `pylint` and `saltpylint`. You can install these dependencies with `pip`:

```
pip install pylint
pip install saltpylint
```

The `.pylintrc` file is found in the root of the Salt project and can be passed as an argument to the `pylint` program as follows:

```
pylint --rcfile=/path/to/salt/.pylintrc salt/dir/to/lint
```
Variables

Variables should be a minimum of three characters and should provide an easy-to-understand name of the object being represented.

When keys and values are iterated over, descriptive names should be used to represent the temporary variables.

Multi-word variables should be separated by an underscore.

Variables which are two-letter words should have an underscore appended to them to pad them to three characters.

Strings

Salt follows a few rules when formatting strings:

Single Quotes

In Salt, all strings use single quotes unless there is a good reason not to. This means that docstrings use single quotes, standard strings use single quotes etc.:

```python
def foo():
    '''
    A function that does things
    '''
    name = 'A name'
    return name
```

Formatting Strings

All strings which require formatting should use the `.format` string method:

```python
data = 'some text'
more = '{0} and then some'.format(data)
```

Make sure to use indices or identifiers in the format brackets, since empty brackets are not supported by python 2.6.

Please do NOT use printf formatting.

Docstring Conventions

Docstrings should always add a newline, docutils takes care of the new line and it makes the code cleaner and more vertical:

GOOD:

```python
def bar():
    '''
    Here lies a docstring with a newline after the quotes and is the salty way to handle it! Vertical code is the way to go!
    '''
    return
```

BAD:
When adding a new function or state, where possible try to use a `versionadded` directive to denote when the function or state was added.

```python
def new_func(msg=' '):
    '''
    .. versionadded:: 0.16.0
    Prints what was passed to the function.
    msg : None
    The string to be printed.
    '''
    print msg
```

If you are uncertain what version should be used, either consult a core developer in IRC or bring this up when opening your pull request and a core developer will add the proper version once your pull request has been merged. Bugfixes will be available in a bugfix release (i.e. 0.17.1, the first bugfix release for 0.17.0), while new features are held for feature releases, and this will affect what version number should be used in the `versionadded` directive.

Similar to the above, when an existing function or state is modified (for example, when an argument is added), then under the explanation of that new argument a `versionadded` directive should be used to note the version in which the new argument was added. If an argument's function changes significantly, the `versionchanged` directive can be used to clarify this:

```python
def new_func(msg=' ', signature=' '):
    '''
    .. versionadded:: 0.16.0
    Prints what was passed to the function.
    msg : None
    The string to be printed. Will be prepended with 'Greetings! '
    .. versionchanged:: 0.17.1
    signature : None
    An optional signature.
    .. versionadded 0.17.0
    '''
    print 'Greetings! {0}\n{1}'.format(msg, signature)
```

Dictionaries

Dictionaries should be initialized using `f` instead of `dict()`.

See here for an in-depth discussion of this topic.

Imports

Salt code prefers importing modules and not explicit functions. This is both a style and functional preference. The functional preference originates around the fact that the module import system used by pluggable modules will
include callable objects (functions) that exist in the direct module namespace. This is not only messy, but may unintentionally expose code python libs to the Salt interface and pose a security problem.

To say this more directly with an example, this is GOOD:

```python
import os

def minion_path():
    path = os.path.join(self.opts['cachedir'], 'minions')
    return path
```

This on the other hand is DISCOURAGED:

```python
from os.path import join

def minion_path():
    path = join(self.opts['cachedir'], 'minions')
    return path
```

The time when this is changed is for importing exceptions, generally directly importing exceptions is preferred:

This is a good way to import exceptions:

```python
from salt.exceptions import CommandExecutionError
```

## Absolute Imports

Although absolute imports seems like an awesome idea, please do not use it. Extra care would be necessary all over salt's code in order for absolute imports to work as supposed. Believe it, it has been tried before and, as a tried example, by renaming `salt.modules.sysmod` to `salt.modules.sys`, all other salt modules which needed to import `sys` would have to also import `absolute_import`, which should be avoided.

Note: An exception to this rule is the `absolute_import` from `__future__` at the top of each file within the Salt project. This import is necessary for Py3 compatibility. This particular import looks like this:

```python
from __future__ import absolute_import
```

This import is required for all new Salt files and is a good idea to add to any custom states or modules. However, the practice of avoiding absolute imports still applies to all other cases as to avoid a name conflict.

## Vertical is Better

When writing Salt code, vertical code is generally preferred. This is not a hard rule but more of a guideline. As PEP 8 specifies, Salt code should not exceed 79 characters on a line, but it is preferred to separate code out into more newlines in some cases for better readability:

```python
import os

os.chmod(
    os.path.join(self.opts['sock_dir'],
                 'minion_event_pub.ipc'),
    448
)
```
Where there are more line breaks, this is also apparent when constructing a function with many arguments, something very common in state functions for instance:

```python
def managed(name, 
    source=None, 
    source_hash='', 
    user=None, 
    group=None, 
    mode=None, 
    template=None, 
    makedirs=False, 
    context=None, 
    replace=True, 
    defaults=None, 
    env=None, 
    backup='', 
    **kwargs):
```

**Note**: Making function and class definitions vertical is only required if the arguments are longer than 80 characters. Otherwise, the formatting is optional and both are acceptable.

### Line Length

For function definitions and function calls, Salt adheres to the PEP-8 specification of at most 80 characters per line.

Non function definitions or function calls, please adopt a soft limit of 120 characters per line. If breaking the line reduces the code readability, don’t break it. Still, try to avoid passing that 120 characters limit and remember, *vertical is better... unless it isn’t*

### Indenting

Some confusion exists in the python world about indenting things like function calls, the above examples use 8 spaces when indenting comma-delimited constructs.

The confusion arises because the pep8 program INCORRECTLY flags this as wrong, where PEP 8, the document, cites only using 4 spaces here as wrong, as it doesn’t differentiate from a new indent level.

Right:

```python
def managed(name, 
    source=None, 
    source_hash='', 
    user=None)
```

WRONG:

```python
def managed(name, 
    source=None, 
    source_hash='', 
    user=None)
```

Lining up the indent is also correct:
```python
def managed(name,
            source=None,
            source_hash=''
            user=None)
```

This also applies to function calls and other hanging indents.

pep8 and Flake8 (and, by extension, the vim plugin Syntastic) will complain about the double indent for hanging indents. This is a known conflict between pep8 (the script) and the actual PEP 8 standard. It is recommended that this particular warning be ignored with the following lines in ~/.config/flake8:

```ini
[flake8]
ignore = E226,E241,E242,E126
```

Make sure your Flake8/pep8 are up to date. The first three errors are ignored by default and are present here to keep the behavior the same. This will also work for pep8 without the Flake8 wrapper -- just replace all instances of `flake8` with `pep8`, including the filename.

**Code Churn**

Many pull requests have been submitted that only churn code in the name of PEP 8. Code churn is a leading source of bugs and is strongly discouraged. While style fixes are encouraged they should be isolated to a single file per commit, and the changes should be legitimate, if there are any questions about whether a style change is legitimate please reference this document and the official PEP 8 ([http://legacy.python.org/dev/peps/pep-0008/](http://legacy.python.org/dev/peps/pep-0008/)) document before changing code. Many claims that a change is PEP 8 have been invalid, please double check before committing fixes.

## 17.23 Salt code and internals

Reference documentation on Salt’s internal code.

### 17.23.1 Contents

- `salt.aggregation`
- `salt.utils.aggregation`

This library makes it possible to introspect dataset and aggregate nodes when it is instructed.

**Note:** The following examples with be expressed in YAML for convenience's sake:

- `!aggr-scalar` will refer to Scalar python function
- `!aggr-map` will refer to Map python object
- `!aggr-seq` will refer for Sequence python object

**How to instructs merging**

This yaml document has duplicate keys:
foo: !aggr-scalar first
foo: !aggr-scalar second
bar: !aggr-map {first: foo}
bar: !aggr-map {second: bar}
baz: !aggr-scalar 42

but tagged values instruct Salt that overlapping values they can be merged together:

foo: !aggr-seq [first, second]
bar: !aggr-map {first: foo, second: bar}
baz: !aggr-seq [42]

Default merge strategy is keep untouched

For example, this yaml document still has duplicate keys, but does not instruct aggregation:

foo: first
foo: second
bar: {first: foo}
bar: {second: bar}
baz: 42

So the late found values prevail:

foo: second
bar: {second: bar}
baz: 42

Limitations

Aggregation is permitted between tagged objects that share the same type. If not, the default merge strategy prevails.

For example, these examples:

foo: {first: value}
foo: !aggr-map {second: value}
bar: !aggr-map {first: value}
bar: 42
baz: !aggr-seq [42]
baz: [fail]
qux: 42
qux: !aggr-scalar fail

are interpreted like this:

foo: !aggr-map {second: value}
bar: 42
baz: [fail]
qux: !aggr-seq [fail]
Introspection

TODO: write this part

```
salt.utils.aggregation.aggregate(obj_a, obj_b, level=False, map_class=<class 'salt.utils.aggregation.Map'>, sequence_class=<class 'salt.utils.aggregation.Sequence'>)
```

Merge obj_b into obj_a.

```
>>> aggregate('first', 'second', True) == ['first', 'second']
True
```

class salt.utils.aggregation.Aggregate
    Aggregation base.

class salt.utils.aggregation.Map(*args, **kwds)
    Map aggregation.

class salt.utils.aggregation.Scalar(obj)
    Shortcut for Sequence creation

```
>>> Scalar('foo') == Sequence(['foo'])
True
```

class salt.utils.aggregation.Sequence
    Sequence aggregation.

Exceptions

Salt-specific exceptions should be thrown as often as possible so the various interfaces to Salt (CLI, API, etc) can handle those errors appropriately and display error messages appropriately.

```
salt.exceptions
    This module is a central location for all salt exceptions
```

class salt.exceptions
    This module is a central location for all salt exceptions

exception salt.exceptions.AuthenticationError(message='')
    If sha256 signature fails during decryption

exception salt.exceptions.AuthorizationError(message='')
    Thrown when runner or wheel execution fails due to permissions

exception salt.exceptions.CommandExecutionError(message='', info=None)
    Used when a module runs a command which returns an error and wants to show the user the output gracefully instead of dying

exception salt.exceptions.CommandNotFoundError(message='')
    Used in modules or grains when a required binary is not available

exception salt.exceptions.EauthAuthenticationError(message='')
    Thrown when eauth authentication fails

exception salt.exceptions.FileLockError(msg, time_start=None, *args, **kwargs)
    Used when an error occurs obtaining a file lock
exception salt.exceptions.FileserverConfigError(message='"
Used when invalid fileserver settings are detected

exception salt.exceptions.GitLockError(errno, strerror, *args, **kwargs)
Raised when an uncaught error occurs in the midst of obtaining an update/checkout lock in salt.utils.gitfs.

   NOTE: While this uses the errno param similar to an OSError, this exception class is not a subclass of OSError.
   This is done intentionally, so that this exception class can be caught in a try/except without being caught as an OSError.

exception salt.exceptions.LoaderError(message='"
Problems loading the right renderers

exception salt.exceptions.MasterExit
Rise when the master exits

exception salt.exceptions.MinionError(message='"
Minion problems reading uris such as salt:// or http://

exception salt.exceptions.NotImplemented(message='"
Used when a module runs a command which returns an error and wants to show the user the output gracefully
   instead of dying

exception salt.exceptions.PkgParseError(message='"
Used when of the pkg modules cannot correctly parse the output from the CLI tool (pacman, yum, apt, aptitude,
   etc)

exception salt.exceptions.PublishError(message='"
Problems encountered when trying to publish a command

exception salt.exceptions.SaltCacheError(message='"
Thrown when a problem was encountered trying to read or write from the salt cache

exception salt.exceptions.SaltClientError(message='"
Problem reading the master root key

exception salt.exceptions.SaltClientTimeout(msg, jid=None, *args, **kwargs)
Thrown when a job sent through one of the Client interfaces times out
   Takes the jid as a parameter

exception salt.exceptions.SaltCloudConfigError(message='"
Raised when a configuration setting is not found and should exist.

exception salt.exceptions.SaltCloudException(message='"
Generic Salt Cloud Exception

exception salt.exceptions.SaltCloudExecutionFailure(message='"
Raised when too much failures have occurred while querying/waiting for data.

exception salt.exceptions.SaltCloudExecutionTimeout(message='"
Raised when too much time has passed while querying/waiting for data.

exception salt.exceptions.SaltCloudNotFound(message='"
Raised when some cloud provider function cannot find what's being searched.

exception salt.exceptions.SaltCloudPasswordError(message='"
Raise when virtual terminal password input failed

exception salt.exceptions.SaltCloudSystemExit(message, exit_code=1)
   This exception is raised when the execution should be stopped.

exception salt.exceptions.SaltConfigurationError(message='"
   Configuration error
exception salt.exceptions.SaltDaemonNotRunning
    Throw when a running master/minion/syndic is not running but is needed to perform the requested operation
    (e.g., eauth).

exception salt.exceptions.SaltException
    Base exception class; all Salt-specific exceptions should subclass this

def pack()
    Pack this exception into a serializable dictionary that is safe for transport via msgpack

exception salt.exceptions.SaltInvocationError
    Used when the wrong number of arguments are sent to modules or invalid arguments are specified on the
    command line

exception salt.exceptions.SaltMasterError
    Problem reading the master root key

exception salt.exceptions.SaltNoMinionsFound
    An attempt to retrieve a list of minions failed

exception salt.exceptions.SaltRenderError
    Used when a renderer needs to raise an explicit error. If a line number and buffer string are passed, get_context
    will be invoked to get the location of the error.

exception salt.exceptions.SaltReqTimeoutError
    Thrown when a salt master request call fails to return within the timeout

exception salt.exceptions.SaltRunnerError
    Problem in runner

exception salt.exceptions.SaltSyndicMasterError
    Problem while proxying a request in the syndication master

exception salt.exceptions.SaltSystemExit
    This exception is raised when an unsolvable problem is found. There's nothing else to do, salt should just exit.

exception salt.exceptions.SaltWheelError
    Problem in wheel

exception salt.exceptions.TimedProcTimeoutError
    Thrown when a timed subprocess does not terminate within the timeout, or if the specified timeout is not an
    int or a float

exception salt.exceptions.TokenAuthenticationError
    Thrown when token authentication fails

salt.exceptions.get_error_message(error)
    Get human readable message from Python Exception

Salt opts dictionary

It is very common in the Salt codebase to see opts referred to in a number of contexts.

For example, it can be seen as __opts__ in certain cases, or simply as opts as an argument to a function in others.

Simply put, this data structure is a dictionary of Salt's runtime configuration information that's passed around in
order for functions to know how Salt is configured.

When writing Python code to use specific parts of Salt, it may become necessary to initialize a copy of opts from
scratch in order to have it available for a given function.
To do so, use the utility functions available in `salt.config`.

As an example, here is how one might generate and print an options dictionary for a minion instance:

```python
import salt.config
opts = salt.config.minion_config('/etc/salt/minion')
print(opts)
```

To generate and display `opts` for a master, the process is similar:

```python
import salt.config
opts = salt.config.master_config('/etc/salt/master')
print(opts)
```

### 17.24 Salt Community Projects

This page contains links to Salt-related projects created by community members. If you come across a useful project please add it to the list!

#### 17.24.1 Hubblestack

Hubble is a modular, open-source security compliance framework built on top of SaltStack. The project provides on-demand profile-based auditing, real-time security event notifications, automated remediation, alerting and reporting.  

http://hubblestack.io/

#### 17.24.2 alkali

alkali is a collections of SaltStack states and pillar data that provide just the basics for provisioning Linux instances that may be built upon. alkali is a starter kit of sorts, to help new users to SaltStack get up-and-running quickly with the most commonly used, core packages.  

https://github.com/zulily/alkali

#### 17.24.3 buoyant

buoyant leverages docker to provide an alternative to VM-centric SaltStack development environments. buoyant containers may be spun up nearly instantly, once an initial docker image has been built.  

https://github.com/zulily/buoyant

#### 17.24.4 Salt Sandbox

SaltSandbox is a multi-VM Vagrant-based Salt development environment used for creating and testing new Salt state modules outside of your production environment. It’s also a great way to learn firsthand about Salt and its remote execution capabilities.  

https://github.com/elasticdog/salt-sandbox
17.24.5 Salt Vagrant Demo

A Salt Demo using Vagrant.

https://github.com/UtahDave/salt-vagrant-demo

17.25 Salt's Test Suite: An Introduction

Note: This tutorial makes a couple of assumptions. The first assumption is that you have a basic knowledge of Salt. To get up to speed, check out the Salt Walkthrough.

The second assumption is that your Salt development environment is already configured and that you have a basic understanding of contributing to the Salt codebase. If you’re unfamiliar with either of these topics, please refer to the Installing Salt for Development and the Contributing pages, respectively.

Salt comes with a powerful integration and unit test suite. The test suite allows for the fully automated run of integration and/or unit tests from a single interface.

Salt’s test suite is located under the tests directory in the root of Salt’s code base and is divided into two main types of tests: unit tests and integration tests. The unit and integration sub-test-suites are located in the tests directory, which is where the majority of Salt’s test cases are housed.

17.25.1 Getting Set Up For Tests

There are a couple of requirements, in addition to Salt’s requirements, that need to be installed in order to run Salt’s test suite. You can install these additional requirements using the files located in the salt/requirements directory, depending on your relevant version of Python:

```
pip install -r requirements/dev_python26.txt
pip install -r requirements/dev_python27.txt
```

To be able to run integration tests which utilizes ZeroMQ transport, you also need to install additional requirements for it. Make sure you have installed the C/C++ compiler and development libraries and header files needed for your Python version.

This is an example for RedHat-based operating systems:

```
yum install gcc gcc-c++ python-devel
pip install -r requirements/zeromq.txt
```

On Debian, Ubuntu or their derivatives run the following commands:

```
apt-get install build-essential python-dev
pip install -r requirements/zeromq.txt
```

This will install the latest pycrypto and pyzmq (with bundled libzmq) Python modules required for running integration tests suite.

17.25.2 Test Directory Structure

As noted in the introduction to this tutorial, Salt’s test suite is located in the tests directory in the root of Salt’s code base. From there, the tests are divided into two groups integration and unit. Within each of these directories,
the directory structure roughly mirrors the directory structure of Salt's own codebase. For example, the files inside tests/integration/modules contains tests for the files located within salt/modules.

Note: tests/integration and tests/unit are the only directories discussed in this tutorial. With the exception of the tests/runtests.py file, which is used below in the Running the Test Suite section, the other directories and files located in tests are outside the scope of this tutorial.

Integration vs. Unit

Given that Salt’s test suite contains two powerful, though very different, testing approaches, when should you write integration tests and when should you write unit tests?

Integration tests use Salt masters, minions, and a syndic to test salt functionality directly and focus on testing the interaction of these components. Salt's integration test runner includes functionality to run Salt execution modules, runners, states, shell commands, salt-ssh commands, salt-api commands, and more. This provides a tremendous ability to use Salt to test itself and makes writing such tests a breeze. Integration tests are the preferred method of testing Salt functionality when possible.

Unit tests do not spin up any Salt daemons, but instead find their value in testing singular implementations of individual functions. Instead of testing against specific interactions, unit tests should be used to test a function's logic. Unit tests should be used to test a function's exit point(s) such as any return or raises statements.

Unit tests are also useful in cases where writing an integration test might not be possible. While the integration test suite is extremely powerful, unfortunately at this time, it does not cover all functional areas of Salt's ecosystem. For example, at the time of this writing, there is not a way to write integration tests for Proxy Minions. Since the test runner will need to be adjusted to account for Proxy Minion processes, unit tests can still provide some testing support in the interim by testing the logic contained inside Proxy Minion functions.

17.25.3 Running the Test Suite

Once all of the requirements are installed, the runtests.py file in the salt/tests directory is used to instantiate Salt’s test suite:

```
python tests/runtests.py [OPTIONS]
```

The command above, if executed without any options, will run the entire suite of integration and unit tests. Some tests require certain flags to run, such as destructive tests. If these flags are not included, then the test suite will only perform the tests that don't require special attention.

At the end of the test run, you will see a summary output of the tests that passed, failed, or were skipped.

The test runner also includes a --help option that lists all of the various command line options:

```
python tests/runtests.py --help
```

You can also call the test runner as an executable:

```
./tests/runtests.py --help
```

Running Integration Tests

Salt’s set of integration tests use Salt to test itself. The integration portion of the test suite includes some built-in Salt daemons that will spin up in preparation of the test run. This list of Salt daemon processes includes:
These various daemons are used to execute Salt commands and functionality within the test suite, allowing you to write tests to assert against expected or unexpected behaviors.

A simple example of a test utilizing a typical master/minion execution module command is the test for the `test.ping` function in the `tests/integration/modules/test.py` file:

```python
def test_ping(self):
    '''
    test.ping
    '''
    self.assertTrue(self.run_function('test.ping'))
```

The test above is a very simple example where the `test.ping` function is executed by Salt's test suite runner and is asserting that the minion returned with a `True` response.

**Test Selection Options**

If you look in the output of the `--help` command of the test runner, you will see a section called **Tests Selection Options**. The options under this section contain various subsections of the integration test suite such as `--modules`, `--ssh`, or `--states`. By selecting any one of these options, the test daemons will spin up and the integration tests in the named subsection will run.

```bash
./tests/runtests.py --modules
```

**Note:** The testing subsections listed in the Tests Selection Options of the `--help` output only apply to the integration tests. They do not run unit tests.

**Running Unit Tests**

While `./tests/runtests.py` executes the *entire* test suite (barring any tests requiring special flags), the `--unit` flag can be used to run only Salt's unit tests. Salt's unit tests include the tests located in the `tests/unit` directory.

The unit tests do not spin up any Salt testing daemons as the integration tests do and execute very quickly compared to the integration tests.

```bash
./tests/runtests.py --unit
```

**Running Specific Tests**

There are times when a specific test file, test class, or even a single, individual test need to be executed, such as when writing new tests. In these situations, the `--name` option should be used.

For running a single test file, such as the pillar module test file in the integration test directory, you must provide the file path using . instead of / as separators and no file extension:
Some test files contain only one test class while other test files contain multiple test classes. To run a specific test class within the file, append the name of the test class to the end of the file path:

```bash
./tests/runtests.py --name=integration.modules.pillar
./tests/runtests.py -n integration.modules.pillar
```

To run a single test within a file, append both the name of the test class the individual test belongs to, as well as the name of the test itself:

```bash
./tests/runtests.py --name=integration.modules.pillar.PillarModuleTest
./tests/runtests.py -n integration.modules.pillar.PillarModuleTest
```

The `--name` and `-n` options can be used for unit tests as well as integration tests. The following command is an example of how to execute a single test found in the `tests/unit/modules/cp_test.py` file:

```bash
./tests/runtests.py -n unit.modules.cp_test.CpTestCase.test_get_template_success
```

### 17.25.4 Writing Tests for Salt

Once you're comfortable running tests, you can now start writing them! Be sure to review the Integration vs. Unit section of this tutorial to determine what type of test makes the most sense for the code you're testing.

---

**Note:** There are many decorators, naming conventions, and code specifications required for Salt test files. We will not be covering all of these specifics in this tutorial. Please refer to the testing documentation links listed below in the Additional Testing Documentation section to learn more about these requirements.

In the following sections, the test examples assume the ``new'' test is added to a test file that is already present and regularly running in the test suite and is written with the correct requirements.

---

**Writing Integration Tests**

Since integration tests validate against a running environment, as explained in the Running Integration Tests section of this tutorial, integration tests are very easy to write and are generally the preferred method of writing Salt tests.

The following integration test is an example taken from the `test.py` file in the `tests/integration/modules` directory. This test uses the `run_function` method to test the functionality of a traditional execution module command.

The `run_function` method uses the integration test daemons to execute a `module.function` command as you would with Salt. The minion runs the function and returns. The test also uses Python's Assert Functions to test that the minion's return is expected.

```python
def test_ping(self):
    '''
    test.ping
    '''
    self.assertTrue(self.run_function('test.ping'))
```

Args can be passed in to the `run_function` method as well:
def test_echo(self):
    '''
    test.echo
    '''
    selfcassertEqual(self.run_function('test.echo', ['text']), 'text')

The next example is taken from the tests/integration/modules/aliases.py file and demonstrates how to pass kwargs to the run_function call. Also note that this test uses another salt function to ensure the correct data is present (via the aliases.set_target call) before attempting to assert what the aliases.get_target call should return.

def test_set_target(self):
    '''
    aliases.set_target and aliases.get_target
    '''
    set_ret = self.run_function('aliases.set_target',
                                  alias='fred',
                                  target='bob')
    selfcassertTrue(set_ret)
    tgt_ret = self.run_function('aliases.get_target',
                                 alias='fred')
    selfcassertEqual(tgt_ret, 'bob')

Using multiple Salt commands in this manner provides two useful benefits. The first is that it provides some additional coverage for the aliases.set_target function. The second benefit is the call to aliases.get_target is not dependent on the presence of any aliases set outside of this test. Tests should not be dependent on the previous execution, success, or failure of other tests. They should be isolated from other tests as much as possible.

While it might be tempting to build out a test file where tests depend on one another before running, this should be avoided. SaltStack recommends that each test should test a single functionality and not rely on other tests. Therefore, when possible, individual tests should also be broken up into singular pieces. These are not hard-and-fast rules, but serve more as recommendations to keep the test suite simple. This helps with debugging code and related tests when failures occur and problems are exposed. There may be instances where large tests use many asserts to set up a use case that protects against potential regressions.

Note: The examples above all use the run_function option to test execution module functions in a traditional master/minion environment. To see examples of how to test other common Salt components such as runners, salt-api, and more, please refer to the Integration Test Class Examples documentation.

Destructive vs Non-destructive Tests

Since Salt is used to change the settings and behavior of systems, often, the best approach to run tests is to make actual changes to an underlying system. This is where the concept of destructive integration tests comes into play. Tests can be written to alter the system they are running on. This capability is what fills in the gap needed to properly test aspects of system management like package installation.

To write a destructive test, import and use the destructiveTest decorator for the test method:

import integration
from salttesting.helpers import destructiveTest
Writing Unit Tests

As explained in the Integration vs. Unit section above, unit tests should be written to test the logic of a function. This includes focusing on testing return and raises statements. Substantial effort should be made to mock external resources that are used in the code being tested.

External resources that should be mocked include, but are not limited to, APIs, function calls, external data either globally available or passed in through function arguments, file data, etc. This practice helps to isolate unit tests to test Salt logic. One handy way to think about writing unit tests is to "block all of the exits". More information about how to properly mock external resources can be found in Salt's Unit Test documentation.

Salt's unit tests utilize Python's mock class as well as MagicMock. The @patch decorator is also heavily used when "blocking all the exits".

A simple example of a unit test currently in use in Salt is the test_get_file_not_found test in the tests/unit/modules/cp_test.py file. This test uses the @patch decorator and MagicMock to mock the return of the call to Salt's cp.hash_file execution module function. This ensures that we're testing the cp.get_file function directly, instead of inadvertently testing the call to cp.hash_file, which is used in cp.get_file.

```python
@patch('salt.modules.cp.hash_file', MagicMock(return_value=False))
def test_get_file_not_found(self):
    '''
    Test if get_file can't find the file.
    '''
    path = 'salt://saltines'
    dest = '/srv/salt/cheese'
    ret = ''
    self.assertEqual(cp.get_file(path, dest), ret)
```

Note that Salt's cp module is imported at the top of the file, along with all of the other necessary testing imports. The get_file function is then called directed in the testing function, instead of using the run_function method as the integration test examples do above.

The call to cp.get_file returns an empty string when a hash_file isn't found. Therefore, the example above is a good illustration of a unit test "blocking the exits" via the @patch decorator, as well as testing logic via asserting against the return statement in the if clause.

There are more examples of writing unit tests of varying complexities available in the following docs:

- Simple Unit Test Example
- Complete Unit Test Example
- Complex Unit Test Example

Note: Considerable care should be made to ensure that you're testing something useful in your test functions. It is very easy to fall into a situation where you have mocked so much of the original function that the test results in
only asserting against the data you have provided. This results in a poor and fragile unit test.

17.25.5 Automated Test Runs

SaltStack maintains a Jenkins server which can be viewed at https://jenkins.saltstack.com. The tests executed from this Jenkins server create fresh virtual machines for each test run, then execute the destructive tests on the new, clean virtual machine. This allows for the execution of tests across supported platforms.

17.25.6 Additional Testing Documentation

In addition to this tutorial, there are some other helpful resources and documentation that go into more depth on Salt’s test runner, writing tests for Salt code, and general Python testing documentation. Please see the follow references for more information:

- Salt’s Test Suite Documentation
- Integration Tests
- Unit Tests
- MagicMock
- Python Unittest
- Python’s Assert Functions
Release Notes

See the version numbers page for more information about the version numbering scheme.

18.1 Latest Branch Release

Salt 2016.3.6 Release Notes

18.2 Previous Releases

18.2.1 Salt 2016.3.0 Release Notes - Codename Boron

Known Issues

Warning: Some Salt Masters may need to apply a patch for Default Job Cache to prevent a possible crash

An issue exists that prevents the Salt master from cleaning the default job cache. This issue can cause an over-consumption of resources resulting in a crash. 2016.3.0 Salt masters should apply the patch in PR:`33555`. This issue will be addressed in 2016.3.1.

- issue 33516: When upgrading from 2015.8.10 to 2016.3.0 on centos7/redhat7 salt-minion must be restarted twice.
- issue 33517: SPM does not work on amazon linux 2015 in 2016.3.0.

Backwards-incompatible Changes

- The default path for the extension_modules master config option has been changed. Prior to this release, the location was a directory named extmods in the Salt cachedir. On most platforms, this would put the extension_modules directory in /var/cache/salt/extmods. It has been moved one directory down, into the master cachedir. On most platforms, this is /var/cache/salt/master/extmods. Most users won’t have to worry about this, but those who have been manually placing custom runners into /var/cache/salt/extmods/runners, or outputers into /var/cache/salt/extmods/output, etc. will be affected by this. To transition, it is recommended not to simply move the extmods directory into /var/cache/salt/master, but to copy the custom modules into the salt fileserver under
salt://_runners, salt://_output, etc. and sync them using the functions in the new `saltutil runner`.

- The `pkg.check_db` function has been removed for yum/dnf.

### Core Changes

- The `onchanges` requisite now fires if any watched state changes. (issue 19592)
- The `ext_pillar` functions must now accept a minion ID as the first argument. This stops the deprecation path started in Salt 0.17.x. Before this minion ID first argument was introduced, the minion ID could be retrieved accessing `__opts__['id']` losing the reference to the master ID initially set in opts. This is no longer the case, `__opts__['id']` will be kept as the master ID.
- Custom types can now be synced to the master using the new `saltutil runner`. Before, these needed to manually be placed under the `extension_modules` directory. This allows custom modules to easily be synced to the master to make them available when compiling Pillar data. Just place custom runners into `salt://_runners`, custom outputters into `salt://_output`, etc. and use the functions from the `saltutil runner` to sync them.
- The `client_acl` configuration options were renamed to `publisher_acl`.
- Added a new `--config-dump` option. (issue 26639)
- TCP Transport presence events were updated to work with a NAT. (PR 30629)
- A `minion_pillar_cache` setting was added to save rendered pillar data to cachedir for later use when `file_client` is set to local. (PR 30428)
- Added the ability for binary data (such as a license key) to be distributed via pillar using the `file.managed` (issue 9569).
- Scheduled jobs now include `success` and `retcode`. (issue 24237)
- The `saltversioninfo` grain was changed from a string to a list to enable reading values by index. (PR 30082)
- A `pillar_merge_lists` option was added to enable recursively merging pillar lists by aggregating them instead of replacing them. (PR 30062)
- Grain values reported by Debian 8 (jessie) when `lsb-release` is installed were updated for consistency. (PR 28649)
- A new option for minions called `master_tries` has been added. This specifies the number of times a minion should attempt to contact a master to attempt a connection. This allows better handling of occasional master downtime in a multi-master topology.
- The default directory for deploying the salt-thin tarball has changed for salt-ssh. It is now `/var/tmp` instead of `/tmp`. Users may also wish to delete any directories in `/tmp` ending with `_salt/`. (issue 32771)

### External Module Packaging

Modules may now be packaged via entry-points in setuptools. See external module packaging tutorial for more information.
Cloud Changes

- Refactored the OpenNebula driver and added numerous --function and --action commands to enhance Salt support for image, template, security group, virtual network and virtual machine management in OpenNebula.
- Added execution/state modules to support the deployment of AWS cognito identity pools (PR 31094).
- Added ability to set tags and listener policies on a AWS ELB (PR 27552).

Platform Changes

- Renamed modules related to OS X. The following module filenames were changed. The virtual name remained unchanged.
  - PR #30558: renamed osxdesktop.py to mac_desktop.py
  - PR #30557: renamed macports.py to mac_ports.py
  - PR #30556: renamed darwin_sysctl.py to mac_sysctl.py
  - PR #30555: renamed brew.py to mac_brew.py
  - PR #30552: renamed darwin_pkgutil.py to mac_pkgutil.py

Package Support

- Ubuntu Xenial: Packages for Ubuntu Xenial (16.04) are available for 2016.3.0 and onwards. See repo.saltstack.com for more information. Note that Xenial comes with Debian’s packaged version of Salt 2015.8.8 and official repo.saltstack.com packages are available for 2015.8 releases beginning with Salt 2015.8.11.

Proxy Minion Changes

The deprecated config option enumerate_proxy_minions has been removed.

As mentioned in earlier documentation, the add_proxymodule_to_opts configuration variable defaults to False in this release. This means if you have proxymodules or other code looking in __opts__['proxymodule'] you will need to set this variable in your /etc/salt/proxy file, or modify your code to use the __proxy__ injected variable.

The __proxyenabled__ directive now only applies to grains and proxy modules themselves. Standard execution modules and state modules are not prevented from loading for proxy minions.

Support has been added to Salt’s loader allowing custom proxymodules to be placed in salt://_proxy. Proxy minions that need these modules will need to be restarted to pick up any changes. A corresponding utility function, saltutil.sync_proxymodules, has been added to sync these modules to minions.

Enhancements in grains processing have made the __proxyenabled__ directive somewhat redundant in dynamic grains code. It is still required, but best practices for the __virtual__ function in grains files have changed. It is now recommended that the __virtual__ functions check to make sure they are being loaded for the correct proxytype, example below:

```python
def __virtual__():
    # Only work on proxy
    try:
        if salt.utils.is_proxy() and 
```
__opts__['proxy']['proxytype'] == 'ssh_sample':
    return __virtualname__
    except KeyError:
        pass
    return False

The try/except block above exists because grains are processed very early in the proxy minion startup process, sometimes earlier than the proxy key in the __opts__ dictionary is populated.

Grains are loaded so early in startup that no dunder dictionaries are present, so __proxy__, __salt__, etc. are not available. Custom grains located in /srv/salt/_grains and in the salt install grains directory can now take a single argument, proxy, that is identical to __proxy__. This enables patterns like

```python
def get_ip(proxy):
    '''Ask the remote device what IP it has'''
    return {'ip':proxy['proxymodulename.get_ip']()}
```

Then the grain ip will contain the result of calling the get_ip() function in the proxymodule called proxymodulename.

Proxy modules now benefit from including a function called initialized(). This function should return True if the proxy's init() function has been successfully called. This is needed to make grains processing easier.

Finally, if there is a function called grains in the proxymodule, it will be executed on proxy-minion startup and its contents will be merged with the rest of the proxy's grains. Since older proxy-minions might have used other methods to call such a function and add its results to grains, this is config-gated by a new proxy configuration option called proxy_merge_grains_in_module. This defaults to False in this release. It will default to True in the release after next. The next release is codenamed Carbon, the following is Nitrogen.

The example proxy minions rest_sample and ssh_sample have been updated to reflect these changes.

**Syndic Updates**

A major performance and management issue was found and fixed in the syndic. This makes the Salt Syndic substantially more reliable and performant. Please make sure that the syndic and the master of masters which syndics attach to are updated, otherwise the syndic fixes alone can cause minor performance issues with older master of masters. Please update masters first, then syndics. Minions do not need to be updated for this fix to work.

**Module Changes**

- **file execution module**: show_diff is deprecated in favor of show_changes. (PR 30988)
- **reg execution module**:  
  - Removed the following deprecated functions from the reg module (PR 30956):  
    * read_key  
    * set_key  
    * create_key  
    * delete_key  
  - Removed force parameter from reg state module
- Fixed virtual function in state
- Improved error information for `reg.delete_value` function

- `jboss7` execution module: deployed function was decoupled from Artifactory by removing Artifactory-specific functionality. Note that the changes in some of the function arguments break existing state files, see issue 30515 and PR 3080 for details.

- `pkg state module`: The `wait` function was removed, the functionality was replaced with the `onchanges` requisite (PR 30297).

- `firewalld state module`: A permanent argument was added `add_port`. Note that `permanent` defaults to `True`, which changes previous behavior (PR 30275). A `bind` function was also added that allows binding zones to interfaces and sources (PR 29497).

- `journald beacon module`: The event string was updated to include a tag. Note this this might impact existing reactors based on this beacon. (PR 30116).

- `postgres_privileges state module`: The default value of the `prepend` argument was changed from `None` to `public`.

- `zenoss execution module`: The `add_device` function was updated with a default value of `1000` for `prod_state` to match the documentation (PR 28924).

- The etcd execution module, state module, returner module, and util module were refactor (PR 28599). This refactor changes error returns for several functions (primarily edge cases):
  - `get`: Used to return `'` on key-not-found. Now returns `None`.
  - `set`: Used to return `'` on issues setting keys. Now returns `None`.
  - `ls`: Used to return `{path: {}}` on key-not-found. Now returns `None`.
  - `Tree`: Used to return `{}` on key-not-found. Now returns `None`.

- `smartos_virt execution module`: Updated to use most of the new `smartos_vmadm` (PR 28284).

- `apache_conf state module`, `apache_module state module`, and `apache_site state module`: the `enable` and `disable` functions were renamed to `enabled` and `disabled`, respectively. In PR 33562, these functions were readded and properly deprecated and will be removed in Salt Nitrogen. This fix will be available in 2016.3.1. As a workaround, try

  ```python
  apache_module.enable({'
  'd' if grains.saltversioninfo == [2016, 3, 0] else '' })
  ```

New Features

Thorium - Provisional New Reactor

The 2016.3 release introduces the new Thorium Reactor. This reactor is an experimental new feature that implements a flow programming interface using the salt state system as the engine. This means that the Thorium reactor uses a classic state tree approach to create a reactor that can aggregate event data from multiple sources and make aggregate decisions about executing reactions.

This feature is both experimental and provisional, it may be removed and APIs may be changed. This system should be considered as ambitious as the Salt State System in that the scope of adding a programmable logic engine of this scale into the event systems is non trivial.

See Thorium Complex Reactor.
Improved Mac OS Support

Improved Solaris Support

A lot of work was done to improve support for SmartOS. This work also resulted in improvements for Solaris and illumos as SmartOS.

- rewrite of vmadm module (SmartOS)
- rewrite of imgadm module (SmartOS)
- deprecation of virt module in favor of vmadm (SmartOS)
- implemented smartos state (SmartOS)
- improved zpool module add SmartOS, illumos and Solaris support
- improved zfs module add SmartOS, illumos and Solaris support
- implemented zpool state
- implemented zfs state implemented solaris_system system module to provide better Solaris support (PR 30519)
- other minor fixes to grains, localmod, ...

Tornado Transport

**Important:** The Tornado Transport wire protocol was changed in 2016.3, making it incompatible with 2015.8 (PR 29339).

Windows DSC Integration (Experimental)

Dimension Data Cloud Support

A SaltStack Cloud driver for Dimension Data Public Cloud, provides the driver functionality to service automation for any of the Dimension Data Public Cloud locations:

- Deploy new virtual machines
- List and query virtual machine images
- Destroy and query virtual machines

Documentation of the Dimension Data SaltStack integration is found on developer.dimensiondata.com

Minion Blackout

During a blackout, minions will not execute any remote execution commands, except for saltutil.refresh_pillar. Blackouts are enabled using a special pillar key, minion_blackout set to True.

See Minion Blackout.
Splunk Returner

A Splunk Returner that uses HTTP Event Collector is now available (PR 30718).

SQLCipher Pillar Module

Support was added for retrieving pillar data via queries to SQLCipher databases (PR 29782).

New Modules

The following list contains a link to the new modules added in this release.

Beacons

- beacons.adb
- beacons.glxinfo
- beacons.memusage
- beacons.network_settings
- beacons.proxy_example
- beacons.salt_proxy

Engines

- engines.docker_events
- engines.redis_sentinel
- engines.slack
- engines.sqs_events
- engines.thorium

Execution Modules

- modules.bcache
- modules.beacons
- modules.boto_cloudtrail

18.2.2 Salt 2016.3.1 Release Notes

Version 2016.3.1 is a bugfix release for 2016.3.0.

Final Release of Debian 7 Packages

Regular security support for Debian 7 ended on April 25th 2016. As a result, 2016.3.1 and 2015.8.10 will be the last Salt releases for which Debian 7 packages are created.

Changes for v2016.3.0..v2016.3.1

Extended changelog courtesy of Todd Stansell (https://github.com/tjstansell/salt-changelogs):

Generated at: 2016-06-08T22:43:50Z

Total Merges: 87

Changes:

• PR #33866: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #33860: `(cachedout)` Allow socket closes when the socket is disconnected

- PR #33806: `(cachedout)` Work around upstream cherrypy bug
- PR #33776: `(danslimmon)` Fixed ACL user comparison. Resolves `#33754`.
- PR #33763: `(abednarik)` Insert `--no-refresh` before install in Zyper.
- PR #33764: `(terminalmage)` Merge instead of update pillar overrides
- PR #33772: `(danslimmon)` Fixed spelling of `'' through''`
- PR #33651: `(cachedout)` Restore grains context to renderers
- PR #33757: `(cachedout)` Reminder not to return non-serializable data from states
- PR #33670: `(rallytime)` Handle non-ascii package names in state.format_log
- PR #33723: `(rallytime)` Back-port #33641 to 2016.3
- PR #33748: `(ticosax)` HostConfig has been introduced by docker api version 1.15
- PR #33745: `(eliasp)` Typo `(privileges → privileges)`
- PR #33562: `(jfindlay)` states.apache_*: readd and deprecate enable and disable
- PR #33659: `(danslimmon)` Added test mode to states.dockerng. Resolves `#33632`.
- PR #33696: `(clburlison)` Update mac native package for upcoming release
- PR #33710: `(rallytime)` [2016.3] Merge forward from 2015.8 to 2016.3
- e87c310 backport #33599 to 2016.3 (#33682)
- 377556a Undo `__repr__() and __str__() parts of d5a7dcc (#33688)
- 778b290 Remove explicit PW column default from mysql_user (#33690)
- PR #33680: `(rallytime)` Back-port #32942 to 2016.3
- PR #33677: `(twangboy)` Pass kwargs to cmd.run
- PR #33648: `(terminalmage)` salt.modules.pkgng: Fix incorrect usage of _pkg()
- PR #33646: `(jfindlay)` Fix more tmp paths on MacOS
- PR #33656: `(cachedout)` Fix indentation error in minion.py
- PR #33637: `(rallytime)` [2016.3] Merge forward from 2015.8 to 2016.3
- b7230bd Back-port #33613 to 2016.3 (#33638)
- PR #33606: `(danslimmon)` Fixed ini.options_absent. Resolves `#33590`.
- PR #33604: `(kev009)` Fix `#33578` disks grain
- 259529e Use correct state name in libvirt formula doc (#33631)
- PR #33603: `(sjorge)` allow esky packages to be build on base64 2015Q4
PR #33576: (tomlaredo) Fix `#33565`_ (typo causes invalid syntax)
PR #33549: (thatch45) Fix for `#33530`_
PR #33538: (anlutro) Fix a KeyError if group is provided but not user in cmd states
PR #33550: (jacobhammons) Fixes display of thorium docs
PR #33509: (twangboy) Detect System Architecture for Mac Build
PR #33522: (jfindlay) rework modules.mac_brew.latest_version to work around brew version inconsistency
PR #33519: (jacobhammons) New doc site layout, 2016.3.0 release note known issue additions
PR #33508: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
PR #33505: (twangboy) Fix build script where pip didn’t work
PR #33076: (cachedout) Avoid second grains load on windows multiprocessing

18.2.3 Salt 2016.3.2 Release Notes

Version 2016.3.2 is a bugfix release for 2016.3.0.

Returner Changes

- Any returner which implements a save_load function is now required to accept a minions keyword argument. All returners which ship with Salt have been modified to do so.

Changes for v2016.3.1..2016.3.2

Extended changelog courtesy of Todd Stansell (https://github.com/tjstansell/salt-changelogs):

Generated at: 2016-07-27T15:47:45Z

Statistics:
- Total Merges: 198

Changes:
- PR #34946: (anlutro) Fix virtualenv behavior when requirements files are in subdirectories
- PR #34957: (sjmh) Don’t fall through to checking auth entries
- PR #34971: (cachedout) Increase timeout for grains test
- PR #34951: (vutny) Fix #34873
- PR #34935: (rallytime) Avoid UnboundLocalError in beacons module
- PR #34956: (cachedout) Increase all run_script timeouts to 30s
- PR #34933: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34916: (cachedout) Master performance improvement
- PR #34911: (cachedout) Backport #34906
- PR #34906: (cachedout) Set timeout for run_salt in test suite
- PR #34898: (hrumph) Stop multiple refreshes during call to pkg.list_upgrades
- PR #34915: (abednarik) Update service_rh provider to exclude XenServer >= 7.
• PR #34926: (rallytime) Lint #34923
• PR #34923: (eliasp) Handle exception when no Slack API key was provided
• PR #34910: (cachedout) Fix grains error on proxy minions
• PR #34864: (jmasfar) Check for version in list of installed versions
• PR #34902: (rallytime) Back-port #34878 to 2016.3
• PR #34878: (abednarik) Add VirtuozzoLinux is yumpkg enable list.
• PR #34901: (rallytime) Add VirtuozzoLinux to the list of enabled distros for rpm.py
• PR #34900: (rallytime) Add VirtuozzoLinux to enabled platforms list in rh_service.py
• PR #34887: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
• PR #34869: (terminalmage) Fail git.latest states with uncommitted changes when force_reset=False
• PR #34862: (thatch45) Fix salt-ssh cacheing issue
• PR #34859: (cachedout) Fix wheel test
• PR #34632: (eliasp) Try to create the log directory when not present yet
• PR #34854: (rallytime) Remove string_types import from state compiler
• PR #34865: (thatch45) This needs discussion, since this breaks SUSE
• PR #34858: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
• PR #34847: (cachedout) Add an option to skip the verification of client_acl users
• PR #34833: (rallytime) Back-port #28521 to 2015.8
• PR #34828: (thatch45) Fix #34648
• PR #34827: (thatch45) fix beacon list to include all beacons being processed
• PR #34823: (rallytime) Back-port #25276 to 2015.8
• PR #34822: (thatch45) Fix salt-ssh state.high and state.low
• PR #28521: (gongled) SPM: packaging doesn’t work in Python 2.6. Fixed.
• PR #25276: (jacobhammons) copy spm.1 man page during setup
• PR #34852: (rallytime) Skip GCE unit tests - causes test suite to hang
• PR #34844: (vutny) Fix getting total available memory without psutil installed
• PR #34837: (thatch45) Fix #34344
• PR #34838: (thatch45) Check if a valid value is passed to unlyif/unless
• PR #34840: (thatch45) update the state wrapper to include show_low_sls
• PR #34842: (sjorge) 2016.3 zpool cleanup and fixes
• PR #34770: (aphor) zpool state module needs support for disk vdev #34762
• PR #34825: (thatch45) keep this beacon from stack tracing at the loader
• PR #34824: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
• PR #34818: (jtand) Skip mysql state test if mysqladmin is not available
• PR #34803: (junovitch) salt/state.py: set ‘chunk’[‘order’] = 0’ with ‘order: first’; fixes `#24744`
• PR #34642: (jtand) Check that mysqladmin exists before running mysql integration tests

18.2. Previous Releases 2405
- PR #34670: (isbm) Add `osmajorrelease` grain (2016.3)
- PR #34683: (cachedout) Fix publisher leak
- PR #34791: (sjorge) salt.state.zpool tweaks
- PR #34784: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34773: (randomed) Bugfix: Startup states on minions are not being written to mysql returner
- PR #34754: (cachedout) Disable test
- PR #34751: (cachedout) Remove unneded config test
- PR #34741: (rallytime) Back-port #34726 to 2015.8
- PR #34726: (martinhoefling) Always loop over updated keys in non recursive update
- PR #34606: (isbm) Bugfix: Exit on configuration read (backport)
- PR #34756: (jacobhammons) Rebuild man pages
- PR #34746: (rallytime) Update azure lib dep to match the one in cloud.clouds.msazure
- PR #34744: (jtand) Test valid docs fix
- PR #34740: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34721: (rallytime) Add output_file option to master config docs
- PR #34607: (isbm) Bugfix: Exit on configuration read (backport)
- PR #34739: (cachedout) Remove unneded config test
- PR #34679: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34651: (rallytime) Lint 34644
- PR #34618: (jtand) Network state integration test test=True
- PR #34601: (lorensgordon) Clarifies the proper way to reference states
- PR #34605: (gtmanfred) catch error if no dns domains exist
- PR #34557: (jacobweinstock) handle jboss cli expression type in the parsing of output
- PR #34652: (rallytime) Spelling fixes found in sqlite3 pillar docs
- PR #34565: (Ch3LL) add num_cpus grain to freebsd
- PR #34621: (jtand) Suse Leap doesn't have `man`
- PR #34619: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34617: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #34593: (rallytime) Back-port #33851 to 2015.8
- PR #34592: (jtand) Update github IP for ssh state integration tests
- PR #34591: (jtand) Gate docker unit test to check for docker
- PR #34590: (oeufete) [2015.8] dockerng: When sorting list actual_data, make it a list
- PR #34584: (rallytime) [2015.5] Avoid circular imports when calling salt.utils functions
- PR #34560: (terminalmage) Add a bunch of documentation on getting files from other environments
- PR #34545: (terminalmage) Handle cases where Docker Remote API returns an empty ExecutionDriver
- PR #34531: (terminalmage) Support ignore_epoch argument in version comparisons
- PR #33851: (ticosax) [dockerng] Add support for edge case when Cmd and Entrypoint can't be blanked
- PR #34585: (rallytime) [2016.3] Avoid salt.utils circular imports when using `from`
- PR #34616: (jacobhammons) Adds a mock required for the network settings beacon
- PR #34553: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34546: (rallytime) Rename unit.states.boto_secgroup to unit.states.boto_secgroup_test
- PR #34537: (rallytime) Rename tests.unit.simple to tests.unit.simple_test
- PR #34527: (rallytime) [2015.8] Update bootstrap script to latest stable
- PR #34521: (cachedout) Prevent many errors in the test suite in loader tests
- PR #34518: (terminalmage) Fix pkg.latest integration test for non-LTS ubuntu
- PR #34507: (AbouZaid) Fix wrong order of retention_policy_exists.
- PR #34569: (eliasp) Minor doc fixes for PostgreSQL states
- PR #34524: (terminalmage) yumpkg: Avoid spurious logging in pkg.upgrade
- PR #34490: (cachedout) Fix master crash on ct1-c for long-running job
- PR #34520: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34513: (cachedout) Lower the log level for modules which cannot be loaded to trace
- PR #34505: (terminalmage) Improve top file merging documentation
- PR #34503: (rallytime) Rename some unit test files by adding _test
- PR #34498: (rallytime) Use -O in the wget example in the bootstrap tutorial for the develop branch
- PR #34492: (zer0def) Gracefully handle non-XML output in GlusterFS execution module.
- PR #34489: (jtand) Use skipTest for network state integration test

18.2. Previous Releases
• PR #34488: (rallytime) Update dnsmasq.get_config docs to use correct config_file param.
• PR #34499: (gtmanfred) remove unnecessary block parsing ip addrs for nova
• PR #34468: (twangboy) Use Python 2.7.12 for Windows Build
• PR #34493: (twangboy) Use Python 2.7.12 for Mac Build
• PR #34486: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
• PR #34467: (rallytime) Back-port #34457 to 2015.8
• PR #34462: (terminalmage) Use --always when available to git describe
• PR #34457: (ryan-lane) Only access key metadata if we found key metadata
• PR #34455: (cro) Forgot reference to inotify
• PR #34432: (twangboy) Fix file.append
• PR #34429: (terminalmage) Skip version checking for targeted packages in pkg.latest state
• PR #34459: (terminalmage) Ignore retcode when formatting highstate output
• PR #34463: (terminalmage) states/git: pass required cwd parameter to git.describe.
• PR #34466: (rallytime) Back-port #34436 to 2016.3
• PR #34436: (artxki) Fix #34395 Nonfunctional default_password in states.postgres_user.present
• PR #34453: (jtand) Arch linux does not have osrelease or osmajorrelease grains
• PR #34456: (thatch45) Be more careful when making the SMinion
• PR #34452: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
• PR #34451: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #34435: (cachedout) Backport change to integraiton test suite
• PR #34426: (cro) Document that inotify is Linux only
• PR #34401: (terminalmage) Use rpmdev-vercmp as a fallback for version comparison on RHEL5
• PR #34366: (steverweber) Update service.py
• PR #34427: (twangboy) Automated signing fixes for Ubuntu 16.04, 14.04, 12.04 (for dmurphy)
• PR #34400: (cachedout) Fix uninitialized value
• PR #34404: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
• PR #34392: (cro) Clarify that salt-cloud doesn't get installed by bootstrap
• PR #34377: (terminalmage) Optimize pkg integration tests and add a couple new tests
• PR #34373: (jtand) Network state integration test
• PR #34292: (twangboy) Fix runas function for System Account
• PR #34388: (rallytime) Back-port #34378 to 2016.3
• PR #34378: (adelcast) network_settings.py: fix documentation
• PR #34352: (cro) Esxi dvs
• PR #34386: (rallytime) Beacon network docs
• PR #34376: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
• PR #34368: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #34344: (rallytime) Back-port #34324 to 2015.8
- PR #34342: (rallytime) Back-port #34316 to 2015.8
- PR #34324: (cachedout) Test custom grains matcher
- PR #34316: (edgan) Making salt-ssh pass proper return codes for jinja rendering errors
- PR #34252: (gtmanfred) return list of nodes for lxc driver when called directly
- PR #34365: (sjorge) fixes computenode_* grains on SmartOS compute nodes
- PR #34353: (cro) Remove proxy check and additional GetConnection--this makes the proxy...
- PR #34348: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34339: (terminalmage) Revert py3modernize lint changes
- PR #34335: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #34325: (terminalmage) Remove unnecessarily-disabled sanity check
- PR #34323: (jacobhammons) Doc clarifications to file modules, addition of new profile log lev...
- PR #34319: (rallytime) Back-port #34244 to 2015.8
- PR #34313: (rallytime) [2015.5] Update to latest bootstrap script v2016.06.27
- PR #34312: (rallytime) [2015.8] Update to latest bootstrap script v2016.06.27
- PR #34307: (rallytime) Fix test example in integration testing docs
- PR #34306: (ghedo) Fix iptables.flush state: Do not force `filter' table when flushing
- PR #34244: (the-glu) Typo in dockerio doc
- PR #34343: (rallytime) Back-port #34256 to 2016.3
- PR #34256: (tmehlinger) detect running from master in State.event method
- PR #34338: (themalkolm) Add listen/listen_in support to stateconf.py
- PR #34308: (sjorge) 2016.3 mount vfstab support
- PR #34322: (Ch3LL) add osmajorrelease grain for raspbian
- PR #34337: (clinta) Change merge-if-exists logic to properly report changes
- PR #34300: (vutny) Make apache.configfile state handle the Options list correctly
- PR #34333: (rallytime) Back-port #33734 to 2016.3
- PR #34304: (rallytime) Back-port #33734 to 2016.3
- PR #33734: (glomium) modules/rabbitmq.py version checking had a logical error
- PR #34330: (clinta) fix #34329
- PR #34318: (rallytime) Back-port #32182 to 2016.3
- PR #32182: (dongweiming) Fix psutil.cpu_times unpack error
- PR #34311: (rallytime) [2016.3] Update to latest bootstrap script v2016.06.27
- PR #34284: (rallytime) Don't require `domain' to be present before checking fqdn_ip* grains
- PR #34296: (sjorge) 2016.3 status module now works on Solaris like platforms
- PR #34281: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #34274: (clinta) Don't escape source before calling managed
• PR #34258: *(rallytime)* [2015.8] Merge forward from 2015.5 to 2015.8
• PR #34257: *(rallytime)* Use `config_dir` setting instead of CONFIG_DIR in gpg renderer
• PR #34233: *(thegoodduke)* ipset: fix the comment containing blank
• PR #34232: *(thegoodduke)* ipset: fix comment containing blank
• PR #34225: *(richardscollin)* Fix win_system.set_system_date_time
• PR #34271: *(opdude)* Fixed symlinks on windows where the slashes don’t match
• PR #34254: *(sjorge)* Fix for #14915
• PR #34259: *(rallytime)* [2016.3] Merge forward from 2015.8 to 2016.3
• PR #34136: *(meaksh)* Fixed behavior for SUSE OS grains in 2015.8
• PR #34134: *(meaksh)* Fixed behavior for SUSE OS grains in 2016.3
• PR #34093: *(terminalmage)* Catch CommandExecutionError in pkg states
• PR #33903: *(meaksh)* Fetching grains['os'] from /etc/os-release on SUSE systems if it is possible
• PR #34134: *(meaksh)* Fixed behavior for SUSE OS grains in 2016.3
• PR #33903: *(meaksh)* Fetching grains['os'] from /etc/os-release on SUSE systems if it is possible
• PR #34159: *(christoe)* Fixes to the win_task module
• PR #34223: *(peterdemin)* Fixed typo in filtering LDAP’s potential_ous
• PR #34239: *(vutny)* file.find module: fix handling of broken symlinks
• PR #34229: *(rallytime)* [2016.3] Merge forward from 2015.8 to 2016.3
• PR #34218: *(terminalmage)* Fix a pair of gitfs bugs
• PR #34208: *(lomeroe)* fix regression from #33681 which causes pulling a list of s3 objects ...
• PR #34206: *(terminalmage)* Change target for dockerng assuming default status to Nitrogen release
• PR #34188: *(terminalmage)* Clarify pkg.list_repo_pkgs docstring for held packages
• PR #34182: *(rallytime)* Handle child PIDs differently depending on the availability of psutils
• PR #33942: *(cachedout)* ZD 762
• PR #33681: *(rallytime)* Back-port #33599 to 2015.8
• PR #33599: *(lomeroe)* Fix s3 large file download
• PR #34214: *(rallytime)* Update saltutil.wheel docs to specify remote vs local minion behavior
• PR #34209: *(lomeroe)* fix regression in s3.query from #33682
• PR #33682: *(lomeroe)* backport #33599 to 2016.3
• PR #33599: *(lomeroe)* Fix s3 large file download
• PR #34222: *(cachedout)* Lint 34200
• PR #34200: *(secumod)* Fix parted module set CLI example
• PR #34197: *(eliasp)* Make module.ssh.recv_known_host() more resilient against hosts not returning a key
• PR #34201: *(DarkKnightCZ)* Suffix temp file with .sr1 and add mandatory argument when executing Power-Shell script
• PR #34198: *(DarkKnightCZ)* Don’t use binary mode for cmdmod.exec_code
• PR #34198: (DarkKnightCZ) Don’t use binary mode for cmdmod.exec_code
• PR #34172: (dmurphy18) Support for building with local packages on Debian and Ubuntu
• PR #34194: (vutny) Correct the docstrings formatting in pkgbuild modules and state
• PR #34056: (vutny) Make rpmbuild module work on non-RPM based GNU/Linux systems
• PR #34186: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
• PR #34184: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #34179: (terminalmage) Raise the correct exception when gitfs lockfile is empty
• PR #34178: (terminalmage) Remove unnecessary comment
• PR #34176: (rallytime) Back-port #34103 to 2015.8
• PR #34175: (rallytime) Back-port #34128 to 2015.8
• PR #34174: (rallytime) Back-port #34066 to 2015.8
• PR #34165: (mcalmer) fix salt --summary to count not responding minions correctly
• PR #34141: (jtand) Fixed boto_vpc_test failure
• PR #34128: (bebehei) doc: add missing dot
• PR #34103: (morganwillcock) Fix diskusage beacon
• PR #34077: (rallytime) Add some grains targeting tests
• PR #34066: (complexsplit) Typo fix
• PR #33474: (cachedout) Fix diskusage beacon
• PR #34173: (rallytime) Update docs to match log_level default
• PR #34095: (rallytime) Back-port #32396 to 2016.3
• PR #32396: (eradman) Unbreak cron.file
• PR #34108: (l2ol33rt) Make dockerng.absent state honor test=true
• PR #34133: (rallytime) Back-port #34057 to 2016.3
• PR #34057: (ajacoutot) _active_mounts_openbsd: unbreak output for special filesystems
• PR #34156: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
• PR #34142: (isbm) Move log message from INFO to DEBUG.
• PR #34100: (terminalmage) Update documentation on `''refresh'' behavior in pkg states
• PR #34072: (jfindlay) modules.pkg int tests: skip refresh_db upon error
• PR #34110: (garethgreenaway) Fixes to git module & state module related to identity file
• PR #34138: (rallytime) Update package dep note to systemd-python for RHEL7 install
• PR #34166: (vutny) Fix YAML indentation in Apache state docstrings
• PR #34098: (terminalmage) Restore old refresh logic
• PR #34087: (bbinet) Encourage to report issues to upstream PillarStack project
• PR #34075: (jfindlay) modules.inspectlib.kiwiproc: import gate lxml
• PR #34056: (vutny) Make rpmbuild module work on non-RPM based GNU/Linux systems
• PR #34073: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3

• PR #33814: (terminalmage) Support extraction of XZ archives in archive.extracted state
• PR #33778: (sodium-chloride) Fix minor docstring issues
• PR #33765: (cachedout) Correct issue with ping on rotate with minion cache
• PR #33726: (jtand) glance.warn_until shouldn't be checked for a doc string
• PR #33611: (rolffokkens) 2015.5
• PR #33960: (mecarus) Fix mongo get_load to return full mongo record instead of non-existant 'load' key
• PR #33961: (jacobhammons) 2016.3.0 known issues update
• PR #33908: (ticosax) [boto_lambda] handle omitted Permissions parameter
• PR #33896: (DmitryKuzmenko) Don't deep copy context dict values.
• PR #33905: (rallytime) Back-port #33847 to 2016.3
• PR #33910: (cachedout) Ensure tht pillar have freshest grains
• PR #33870: (rallytime) Add note about Xenial packages to 2016.3.0 release notes
• PR #33847: (whiteinge) Add docs for arg/kwarg eauth matching
• PR #33076: (cachedout) Avoid second grains load on windows multiprocesing
• PR #29153: (DmitryKuzmenko) ACL limit args
18.2.4 Salt 2016.3.3 Release Notes

Version 2016.3.3 is a bugfix release for 2016.3.0.

Known Issues

issue 36055: Salt Cloud events (salt/cloud) are not generated on the master event bus when provisioning cloud systems.

Bootstrap Issue #973: python-futures is not installed when installing from a git tag on RedHat-based distributions. Python futures is needed when running Salt with the TCP transport. This is fixed on the develop branch of the salt-bootstrap repo and the fix will be included in the upcoming release of salt-bootstrap, but is a bug in the bootstrap release that ships with this version of Salt. Please see the salt-bootstrap repo for more information on how to update your bootstrap version.

Changes for v2016.3.2..2016.3.3

Extended changelog courtesy of Todd Stansell (https://github.com/tjstansell/salt-changelogs):

Generated at: 2016-08-19T16:17:34Z

Total Merges: 134

Changes:

- PR #35580: (twangboy) Fix mac_service attempts to parse non-plist files
- PR #35586: (hu-dabao) Fix 35420, add run_on_start in build_schedule_item
- PR #35583: (terminalmage) Fix locademod tests
- PR #35579: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35577: (terminalmage) Unit file changes for 2015.8.12, 2016.3.3
- PR #35571: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35566: (rallytime) Back-port #35545 to 2015.8
- PR #35546: (whiteinge) Salt api eauth fail gracefully
- PR #35545: (hu-dabao) fix-35384, fix cmd.run unless
- PR #35540: (rallytime) Whitespace fix for 2015.8
- PR #35525: (UtahDave) add missing glob import
- PR #35510: (terminalmage) Better systemd integration
- PR #35492: (terminalmage) Clarify config.get docstring
- PR #35483: (gtmanfred) use __utils__ in salt.cloud
- PR #35573: (rallytime) Back-port #33337 to 2016.3
- PR #33337: (mzupan) adding the () to make changes work
- PR #35572: (terminalmage) Fix poor formatting in pkg state docs
- PR #35545: (hu-dabao) fix-35384, fix cmd.run unless
- PR #35489: (rallytime) Back-port #35463 to 2016.3
- PR #35463: (skizunov) Make auth_timeout user configurable again
- PR #35538: (thatch45) Treat python XML as an optdep
- PR #35526: (thatch45) Always deploy the thin to /var/tmp
- PR #35522: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35513: (cachedout) Might be a good idea to be able to download the software we make
- PR #35512: (cachedout) Fixup 35419
- PR #35508: (terminalmage) Add Carbon to versionadded for git.diff
- PR #35497: (deepakhj) Fixes spacing in requirements files
- PR #35302: (Ch3LL) Add job cache test
- PR #35516: (rallytime) Back-port #34441 to 2016.3
- PR #34441: (markuskramerlgitt) Copy and delete silently, do not list each file
- PR #35517: (rallytime) Back-port #34502 to 2016.3
- PR #34502: (markuskramerlgitt) Windows installer build scripts will exit on error
- PR #35429: (tankywoo) Fix iptables target options with no arguments
- PR #35495: (rallytime) Use correct deprecated notation instead of a warning for apache_module.enable state function.
- PR #35498: (rallytime) Add supported templates list to all template doc references in file state
- PR #35406: (rallytime) Provide links to the renderers in the template docs
- PR #35360: (rallytime) Add all template registry templates to file.managed docs
- PR #35487: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35486: (rallytime) Update bootstrap script to latest stable (2016.08.16)
- PR #35476: (cachedout) Fixup SSH bug where sudo without sudo user would break
- PR #35471: (terminalmage) win_pkg: Fix traceback when package is not installed
- PR #35460: (rallytime) [2015.8] Update bootstrap script to latest stable (2016.08.15)
- PR #35459: (thatch45) Ensure that output for salt-ssh gets back
- PR #35453: (theothergraham) fixes #34279 - disk cache ttl expiry
- PR #35451: (isbm) Bugfix: zypper mod repo unchanged
- PR #35448: (isbm) Add ignore_repo_failure option to suppress zypper’s exit code 106 on ...
- PR #35413: (cachedout) Resolve path issues with cp.push
- PR #35446: (cachedout) Make salt-client aware of edge-case where saltutil might be broken
- PR #35449: (dkruger) aptpkg will specify --install-recommends if enabled by the SLS
- PR #35467: (rallytime) Back-port #33518 to 2016.3
- PR #35235: (rallytime) Back-port #33518 to 2016.3
- PR #33518: (tonybaloney) Fix libcloud bug #33367
- PR #35461: (rallytime) [2016.3] Update bootstrap script to latest stable (2016.08.15)
- PR #35456: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35442: (cachedout) Fix cp.push_dir pushing empty dirs
Salt Documentation, Release 2016.3.6

- PR #35436: (cachedout) Minor doc fixup
- PR #35132: (sjorge) fixes, causing lots of mayhem (onchange) with 2016.3.2 for me
- PR #35447: (ticosax) [dockerng] RepoTags can be also be None with docker 1.12
- PR #35308: (farcaller) Actually fixed dockerng.list_tags
- PR #35470: (farcaller) Fixed dockerng.list_tags
- PR #35427: (cachedout) Correct errant call to argspec from master. Fix ext_job_cache.
- PR #35428: (cachedout) Resolve stacktrace logged by highstate outputter if sls cannot be found
- PR #35412: (s0undt3ch) Only allow one sync read to happen at a time.
- PR #35406: (rallytime) Provide links to the renderers in the template docs
- PR #35360: (rallytime) Add all template registry templates to file.managed docs
- PR #35393: (deniszh) No need to run ddns update every time
- PR #35407: (hu-dabao) [Fix-35094] None will not be added to grains which generate [none]
- PR #35411: (eliasp) modules.event.send(): Prevent backtrace for masterless Minions
- PR #35395: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35394: (rallytime) Back-port #34573 to 2015.8
- PR #35359: (terminalmage) Clean up open filehandles
- PR #35357: (twangboy) Fix file.recurse with clean: True on Windows (2015.8)
- PR #35339: (isbm) Bugfix: Prevent continuous restart, if a dependency wasn't installed
- PR #35473: (cedwards) Update freebsd.rst
- PR #35373: (cachedout) Raise SaltRenderError on bad requisite
- PR #35352: (twangboy) Fix file.recurse with clean: True on Windows (2016.3)
- PR #35356: (jfindlay) document log levels and warn on all logging below info
- PR #35358: (twangboy) Update libsodium deps
- PR #35360: (rallytime) Add all template registry templates to file.managed docs
- PR #35362: (rallytime) Correct deprecation version tags
- PR #35361: (rallytime) Blockdev deprecations
- PR #25267: (jfindlay) Disk module improvements
- PR #24893: (The-Loeki) Contribution: Disk module improvements
- PR #35347: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35325: (kev009) Fix freebsd netstat route on bsd 10+
- PR #35323: (thatch45) Fix issue with bad error check in salt-vt
- PR #35309: (terminalmage) file.recurse: Do not convert octal mode string to int
- PR #35301: (bobrik) Pass port to ssh.check_known_host, closes #35264
- PR #35334: (cachedout) Restore random_master functionality
- PR #35331: (hu-dabao) fix 35165, salt-run jobs.exit_success jid is broken
- PR #35318: (rallytime) Remove legacy compat docs in mysql pillar since the code was removed already
• PR #30913: (jtand) Deprecated code removed.
• PR #35329: (hu-dabao) sys.doc will skip all not connected minions
• PR #35306: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
• PR #35290: (terminalmage) Resolve a couple bugs in orchestration output
• PR #35229: (lubyou) Ignore import error for pwd module in mac_shadow
• PR #35227: (ismb) Isbm osfinger ubuntu fix
• PR #35286: (hu-dabao) fix 34425, a bug that sys.doc cannot output format
• PR #35275: (rallytime) Back-port #35213 to 2016.3
• PR #35213: (gtmanfred) add identity v3 support to openstack driver
• PR #35278: (dmurphy18) Increase timeout for siging to 10 seconds when signing rpm packages
• PR #35276: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
• PR #35271: (bobrik) Default state_output_profile to True everywhere, closes #35166
• PR #35249: (terminalmage) Fix regression in git.latest
• PR #35245: (rallytime) Back-port #35039 to 2015.8
• PR #35241: (terminalmage) Ensure max recursion in gitfs results in no blob object being returned.
• PR #35240: (derekmaciel) Backport #35225 to 2015.8
• PR #35236: (rallytime) Backport #35119 to 2015.8
• PR #35233: (terminalmage) Do not attempt to get fqdn_ip[4,6] grains when ipv[4,6] grains are empty
• PR #35225: (derekmaciel) Add missing documentation for pkg.installed
• PR #35211: (cachedout) Alternative sudo users for salt-ssh
• PR #35202: (multani) doc: fix broken links in the test documentation page
• PR #35119: (derekmaciel) Assume two EVRs are equal if E and V are equal but one R is missing.
• PR #35039: (whiteinge) Add saltenv support to module.run
• PR #35274: (rallytime) Lint fixes for 2016.3 branch
• PR #35232: (theredcat) fix rabbitmq version detection using a package-agnostic version
• PR #35269: (meaksh) Checksum validation for zypper pkg.download in 2016.3 and develop
• PR #35197: (vutny) Make pkgbuild.repo state recognize createrepo command return code
• PR #35178: (cro) Add append_minionid_config_dirs option
• PR #35259: (cachedout) Fixup 35253
• PR #35253: (abednarik) Fix disk.wipe missing option.
• PR #35253: (abednarik) Fix disk.wipe missing option.
• PR #35206: (hu-dabao) Make the log level back to warning for unclassified exc
• PR #35196: (ismb) Deprecate status.uptime one version later
• PR #35207: (eliasp) Handle exceptions in _get_virtual() and in _get_virtual() consumers
• PR #35232: (theredcat) fix rabbitmq version detection using a package-agnostic version
• PR #35244: (rallytime) Back-port #31677 to 2016.3
- PR #31677: (mihael) Return correct value for services that must be enabled in Systemd
- PR #35182: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35174: (rallytime) Back-port #35146 to 2015.8
- PR #35173: (rallytime) Back-port #35135 to 2015.8
- PR #35146: (cachedout) Don't discard running beacons config when listing beacons
- PR #35145: (jacobhammons) doc version update to 2015.8.11, updates to release notes
- PR #35173: (rallytime) Back-port #35146 to 2015.8
- PR #35150: (rallytime) Start release notes for 2016.3.3
- PR #35157: (hu-dabao) master returned from func should be a string as designed so far
- PR #35147: (jacobhammons) doc version updated to 2016.3.2
- PR #35136: (stundt3ch) Don't restart processes if the manager is not set to restart them
- PR #35133: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35114: (terminalmage) Add clarification docs on a common git_pillar misconfiguration
- PR #35043: (rallytime) Start release notes file for 2015.8.12
- PR #34768: (hbrum) Fixes #34767
- PR #35120: (kstreee) The `_handle_event_socket_recv` function in Salt Api is missing first data of stream.
- PR #35131: (rallytime) Back-port #35011 to 2016.3
- PR #35011: (nishigorii) Fix docstring for code-block of rst
- PR #35110: (hu-dabao) Do not return job status back to master for master_alive and master_failback schedules
- PR #35104: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #35066: (jfindlay) returners.postgres_local_cache: do not log in __virtual__
- PR #35050: (terminalmage) [orchestration] Properly handle runner/wheel func which accept a `saltdev` argument
- PR #35026: (cachedout) Expressly deny a minion if a key cannot be found
- PR #35024: (bobrik) Cache systemd unit update check per unit, closes #34927
- PR #35105: (rallytime) Update 2016.3.0 release notes with repo.saltstack.com Xenial pkg availability
- PR #33870: (rallytime) Add note about Xenial packages to 2016.3.0 release notes
- PR #35059: (vutny) Add fun_args field to events generated by execution of Master modules
- PR #34955: (lubyou) force dism to always output english text
- PR #35078: (jacobweinstock) added missing non-keyword argument skip_verify to __get_artifact func...
- PR #35008: (hu-dabao) Fix multimaster failover on more than two masters and failback behaviour
- PR #35055: (galet) #35356 pkgrepo.managed does not disable a yum repo with `disabled: True`
- PR #35039: (whiteinge) Add saltenv support to module.run
- PR #35046: (eliasp) Prevent backtrace in salt.states.network
- PR #35054: (lubyou) Only fail user lookup is the user parameter is required
• PR #35029: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
• PR #35000: (rallytime) Back-port #33875 and #34999 to 2015.8
• PR #34949: (rallytime) Back-port #34835 to 2015.8
• PR #34835: (thatch45) Make the mine and publish combine minion and master opts in salt-ssh
• PR #33875: (jmesquita) Fix naive fileserver map diff algorithm
• PR #35021: (terminalmage) Don’t add ‘.’ to strerror when passed string ends in ? or !
• PR #34983: (eliasp) modules.slack.post_message: Allow sending messages to direct-message ...
• PR #34996: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
• PR #34991: (cachedout) SSH timeout
• PR #34976: (cachedout) Refine errors in client
• PR #34831: (thatch45) If the thin does not match, then redeploy, don’t error
• PR #34987: (eliasp) salt.states.slack: check correct result attribute
• PR #34835: (thatch45) Make the mine and publish combine minion and master opts in salt-ssh
• PR #34988: (rallytime) Update release notes with new changes
• PR #34946: (anlutro) Fix virtualenv behavior when requirements files are in subdirectories
• PR #34957: (sjmh) Don’t fall through to checking auth entries
• PR #34971: (cachedout) Increase timeout for grains test
• PR #34951: (vutny) Fix #34873
• PR #34935: (rallytime) Avoid UnboundLocalError in beacons module
• PR #34894: (rallytime) [develop] Merge forward from 2016.3 to develop
• PR #34956: (cachedout) Increase all run_script timeouts to 30s
• PR #34933: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
• PR #34916: (cachedout) Master performance improvement
• PR #34911: (cachedout) Backport #34906
• PR #34906: (cachedout) Set timeout for run_salt in test suite
• PR #34898: (hrumph) Stop multiple refreshes during call to pkg.list_upgrades
• PR #34606: (isbm) Bugfix: Exit on configuration read (backport)
• PR #34915: (abednarik) Update service_rh provider to exclude XenServer >= 7.
• PR #34926: (rallytime) Lint #34923
• PR #34923: (eliasp) Handle exception when no Slack API key was provided
• PR #34910: (cachedout) Fix grains error on proxy minions
• PR #34864: (jmacfar) Check for version in list of installed versions

• PR #34900: (rallytime) Add VirtuozzoLinux to enabled platforms list in rh_service.py
18.2.5 Salt 2016.3.4 Release Notes

Version 2016.3.4 is a bugfix release for 2016.3.0.

Known Issues

The Salt Minion does not clean up files in /tmp when rendering templates. This potentially results in either running out of disk space or running out of inodes. Please see Issue #37541 for more information. This bug was fixed with Pull Request #37540, which will be available in the 2016.3.5 release of Salt.

The release of the bootstrap-salt.sh script that is included with 2016.3.4 release has a bug in it that fails to install salt correctly for git installs using tags in the 2015.5 branch. This bug has not been fixed in the salt-bootstrap repository yet, but the previous bootstrap release (v2016.08.16) does not contain this bug.

Changes

- The disk.wipe execution module function has been modified so that it correctly wipes a disk.
- Add ability to clone from a snapshot to the VMWare salt-cloud driver.
- Add ability to specify disk backing mode in the VMWare salt cloud profile.
Changes for v2016.3.3..v2016.3.4

Changes:

- PR #37282: (thatch45) add cpub to raet event for compat
- PR #37278: (jfindlay) update 2016.3.4 release notes
- PR #37252: (vutny) Set logging level to `info' for message about init system detection
- 4729d88 Update man pages for the 2016.3 branch (#37259)
- PR #37257: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #37254: (DmitryKuzmenko) Bugs/37191 minion hangs
- PR #37218: (darkalia) Issue `#37187' Do not parse first /proc/1/cmdline binary if it’s not ...
- PR #37239: (Ch3LL) Fix cloud tests timeout
- PR #37244: (rallytime) Update bootstrap release to 2016.10.25
- PR #37245: (rallytime) Back-port #36334 to 2016.3
- PR #37233: (rallytime) Back-port #37154 to 2016.3
- PR #37232: (rallytime) Back-port #37153 to 2016.3
- PR #37228: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
- PR #37213: (cachedout) More salttesting fixes
- PR #37207: (cachedout) Correct documentation for mine_functions
- PR #37208: (cachedout) Give multiminion a process manager and its own destroy method
- PR #37206: (cachedout) Address transport test hang
- PR #37179: (isbm) Fix Salt-API ssh crash (2016.3)
- PR #37183: (gtmanfred) load tags should reference the actual load tags
- PR #37188: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
- d7e28d2 Pylint fix for 2016.3 (#37186)
- PR #37175: (cachedout) Fix test hang
- PR #37144: (DmitryKuzmenko) Bugs/36866 salt minion communication broken 2016.3
- PR #37158: (jfindlay) add mock for status.uptime unit test
- PR #37161: (rallytime) Back-port #37098 to 2016.3
- PR #37159: (rallytime) Back-port #37107 to 2016.3
- PR #37163: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
- 2bc5ded Allow the minion test daemons a couple of tries to connect to the master (#37150)
- ec7ad9e Add note about salt-bootstrap known issue for 2016.3.4 (#37152)
- PR #37135: (AaronM-Cloudtek) Fix example signing policy in salt.states.x509 docs
- PR #37140: (vutny) pkgbuild.repo: fix GPG signing with use_passphrase=False
• PR #37071: (vutny) pkgbuild.repo: add timeout parameter for waiting passphrase prompt
• PR #37115: (DmitryKuzmenko) Backport/36720 fix race condition
• PR #37119: (jfindlay) log.setup: only assign user if defined
• f22c686 fix digital ocean image name in profile (#37126)
• 4263849 add 2016.3.4 release notes (#37125)
• PR #37120: (rallytime) Back-port #36246 to 2016.3
• PR #37103: (cachedout) Remove unnecessary sleep from unit.utils.process_test.TestProcessMana...
• PR #36823: (terminalmage) Update debian systemd unit files to use default KillMode, Type=notify
• PR #37030: (isbm) Fix status.uptime for Solaris 9, 10 and 11.
• PR #37101: (rallytime) [2016.3] Merge forward from 2016.3 to carbon
• PR #36958: (twangboy) Fix bug where cmd.powershell fails to return
• PR #37086: (cachedout) Make salt-call a first-class citizen for multi-master
• PR #36988: (clinta) X509 fixes
• PR #37025: (cro) Make salt.utils.minion._check_cmdline work on OSes without /proc.
• PR #37050: (twangboy) Fix service state for Windows (DO NOT MERGE FORWARD)
• PR #37076: (jfindlay) Document proxy settings
• PR #37081: (terminalmage) Fix archive.extracted remote source_hash verification
• PR #37064: (cachedout) Unify job check in scheduler
• PR #37072: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
• PR #37049: (terminalmage) Further clarification on new grains docs from #37028
• PR #37057: (rallytime) [2016.3] Update salt.utils.cloud references to __utils__ for cache funcs
• PR #36977: (twangboy) Remove whitespace from string commands
• PR #37048: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
• PR #37028: (damon-atkins) Update topics/grains doco, about considerations before adding a Grain
• PR #37012: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
• 519e1dc opkg: Support ignore_epoch argument in version comparisons (#37007)
• PR #36808: (gtmanfred) allow for closing stuff in beacons
• a02868b Make helper funcs private (#36993)
• PR #36986: (jfindlay) modules.archive.unzip: zipfile is stdlib
• PR #36981: (rallytime) Skip pkg.upgrades test on distros other that Suse in 2016.3
• PR #36755: (terminalmage) systemd.py: check retcode for service availability in systemd >= 231
• PR #36750: (terminalmage) Add the CLI client and pub_data as class attributes
• PR #36241: (hrumph) Fixes `#36240`
• PR #36950: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
• PR #36948: (rallytime) Back-port #36943 to 2016.3
• PR #36946: (rallytime) Back-port #36892 to 2016.3
• PR #36945: (rallytime) Back-port #35199 to 2016.3
• 7565ed6 Fix versionadded (#36949)
• 4d8f03 return opennebula errors to user (#36930)
• PR #36929: (rallytime) [yumpkg] Skip test_pkg_upgrade_has_pending_upgrades if there are no upgrades
• 288f437 [2016.3] Remove ``Targeting with Executions” section from docs (#36926)
• PR #36915: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
• 0ebf7a4 modules: debian_ip: override params early to fix diff (#36820)
• a23ce84 states.schedule: splay is not ordereddict (#36894)
• PR #36885: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
• 1c0ba80 salt-ssh: Try ``command -v'' before falling back to ``which'' (#36889)
• 85eea4d fileclient: Change queryarg comparison from None to simple boolean check (#36830)
• PR #36853: (rallytime) Back-port #33939 to 2016.3
• PR #36852: (rallytime) Back-port #36743 to 2016.3
• PR #36844: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
• PR #36835: (jfindlay) unify and expand beacon documentation
• PR #36789: (maximeguillet) Fix behavior of psql -c option with postgresql 9.6
• PR #36797: (cachedout) Error on reaction with missing SLS file
• PR #36803: (gtmanfred) do not load libvirt pillar if certool is unavailable
• PR #36815: (BenoitKnecht) Fix glance.image_present state
• PR #36754: (terminalmage) Base rpmdev-vercmp comparison result on retcode
• PR #36785: (cachedout) Fixup merge forward #36728
• PR #36768: (gtmanfred) add __utils__ to vultr cloud provider
• PR #36764: (cachedout) Another bit of detection for failed pip tests
• PR #36747: (jfindlay) modules.archive integration tests: check for gzip, rar
• PR #36744: (cachedout) Fix issue where test suite could hang on shutdown
• PR #36696: (cro) pass __proxy__ in state.sls_id
• PR #36716: (vutny) salt.modules.ini_manage: fix creating options in empty file
• PR #36724: (rallytime) Back-port #36628 to 2016.3
• PR #36725: (rallytime) Back-port #36643 to 2016.3
• PR #36726: (rallytime) Back-port #36722 to 2016.3
• 48d2b01 fix python26 archive zip module (#36719)
• PR #36699: (cachedout) Fix error in test
• PR #36670: (jackyw) fix bug for including loopback addr
• PR #36694: (loremgordon) Expose ignore_if_missing to file.replace state module
• PR #36686: (jfindlay) log levels doc: try long form table
• PR #36690: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
• PR #36680: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
• PR #36659: (terminalmage) Support dynamic env in new-style git_pillar
• PR #36538: (clinta) daemon-reload on call to service.available
• PR #36616: (cro) Zypper fix test
• PR #36621: (terminalmage) Fix shadowed builtins
• PR #36636: (rallytime) Back-port #36618 to 2016.3
• PR #36648: (jfindlay) Integration tests for archive execution module
• PR #36650: (rallytime) Revert ``Pr 36386``
• PR #36646: (rallytime) Provide an error message when invalid transport is set
• PR #36635: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
• PR #36620: (rallytime) Don't allow mercurial states to return True with errors
• PR #36622: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
• PR #36520: (twangboy) Fix cmd.script runs for Windows
• PR #36564: (DmitryKuzmenko) Improve and fix _check_cache_minions
• PR #36606: (danlsgiga) Add support for ACL Tokens in consul_pillar with the option consul.token
• PR #36613: (slinn0) Remove file.check_managed_changes when not needed (backport of PR #36589 to 2016.3)
• PR #36609: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
• PR #36595: (cachedout) Remove tests which no longer apply
• PR #36594: (cachedout) Update bootstrap docs to recent versions of Ubuntu
• PR #36585: (twangboy) Add pyOpenSSL to req file for Windows
• f205d5f Fix salt.utils.rm_rf to delete files too (#36572)
• PR #36495: (cro) Fix pkg.upgrade for zypper
• PR #36539: (jfindlay) Prefer archive.cmd_unzip
• PR #36546: (rallytime) Mercurial Module: Pass the identity_path portion as own arg
• PR #36555: (DmitryKuzmenko) Bugs/35480 master shutdown
• PR #36542: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
• 5548ed7 Back-port #36435 to 2016.3 (#36532)
• fe377b3 Be explicit about the salt.utils.templates import (#36535)
• fcc50c9 Wrap the entire GrainsAppendTestCase class with destructiveTest (#36537)
• PR #36529: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
• PR #36483: (dmurphy18) Isolate sun IPv6 fix to Sun OS only
• PR #36280: (alertedsnake) Feature/2016.3 better postgresql grants
• PR #36508: (twangboy) Fix chocolatey
• PR #36519: (terminalmage) Rewrite minionfs walkthrough
• PR #36505: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3

• PR #36474: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
• PR #36478: (rallytime) Add the `bash` option to the `code-block` directive.
• PR #36484: (terminalmage) Fix for temp files being left over by salt-cloud execution
• PR #36486: (terminalmage) Improve the rebase docs in contributing guidelines
• PR #36455: (twangboy) Update docs for Windows
• PR #36459: (cachedout) Pr 36426
• PR #36442: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
• PR #36310: (thatch45) Fix bug where the client will destroy the loop
• PR #36394: (oba11) fix accound_id in boto_iam and get_region in boto_sns
• PR #36424: (jfindlay) skip some mac_timezone tests
• PR #36428: (terminalmage) A couple fixes for Antergos Linux
• PR #36425: (whiteinge) Check for dictionary explicitly since we're accessing it as one
• PR #36199: (thatch45) skip all failhards if test=True
• PR #36418: (rallytime) Back-port #36246 to 2016.3
• PR #36419: (rallytime) Back-port #36329 to 2016.3
• PR #36420: (rallytime) Back-port #36365 to 2016.3
• PR #36413: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
• PR #36305: (gtmanfred) cache query args with url as well
• PR #36389: (cachedout) Pr 36386
• 5737b1c Update versionadded and release notes (#36352)
• PR #36369: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
• fbbe9ec Quote postgres privilege target names (#36249)
• 9451141 set __virtualname__ to `service` (#36330)
• fee3be4 Use infoblox_* values if present in arguments (#36339)
• 19eb848 remove help message from glance module (#36345)
• a4bd5e Add resize2fs unit test from blockdev_test to disk_test (#36346)
• PR #36350: (terminalmage) Add note about yumpkg.check_db removal in Boron
• PR #36344: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
• 3a37fe5 merge error overwrites correct ssh_host with stale data in ip_address (#36312)
• PR #36299: (rallytime) Gate the pkg.group_installed state test: not all pkg modules have group_install
• b3aa0e Back-port #36273 to 2016.3 (#36295)
• 7296179 Back-port #36124 to 2016.3 (#36296)
• PR #36297: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
• 768aebd Filter out pub kwargs from cloud runner (#36178)
• PR #36238: (pass-by-value) Add ability to clone from a snapshot to salt-cloud vmware driver
• a0bb0f Integration tests fixes for 2016.3 (#36263)
• PR #36264: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
• PR #35688: (cachedout) Splat serializer default configs into the serializer kwargs
• PR #36025: (mirceaulinic) Potential fix for '#36021'
• 449c298 Fix timezones states on OS X (#36183)
• PR #36235: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
• PR #36137: (cachedout) Allow highstate outputter to show all results
• 1b12940 Docs clarification for module sync and state.apply (#36217)
• PR #36184: (DmitryKuzmenko) Disable signal handling while handling signal
• PR #36203: (xiaoanyunfei) fix owner of MultiprocessingLoggingQueue
• b586ed7 if the backend stack traces when it should return an empty string (#36193)
• PR #36188: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
• PR #35907: (rallytime) Catch CommandExecutionError when the group in group_installed doesn’t exist
• PR #36068: (rallytime) Remove grains type deprecation warning from 2016.3
• PR #36152: (cachedout) Remove unnecessary unpack
• PR #36158: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
• 3445a33 Remove unclosed backticks in walkthrough doc (#36170)
• PR #36161: (jacobhammons) Adds '#36055' to release notes
• PR #36139: (meaksh) Fixing unit tests for 2016.3
• PR #36143: (multani) doc: fix doc formatting for salt.states.mount
• PR #36070: (rallytime) Use __utils__ instead of salt.utils.cloud in opennebula driver
• PR #36089: (terminalmage) Support running git states / remote exec funcs as a different user in Windows
• PR #35923: (kstreee) Fixes a bug that Ctrl-c not working on Salt CLI.
• PR #36078: (thatch45) Failhard test=True fix
• PR #34529: (Ch3LL) Add skip_verify for archive.extracted
• PR #36073: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3
• a86e36c Add docs for new kwargs added to the wheel key module (#36040)
• 2934fc1 Doc cherrypy deemphasize urllencoded (#36047)

18.2.6 Salt 2016.3.5 Release Notes

Version 2016.3.5 is a bugfix release for 2016.3.0.

Security Fixes

CVE-2017-5192: local_batch client external authentication not respected
The LocalClient.cmd_batch() method client does not accept external_auth credentials and so access to it from salt-api has been removed for now. This vulnerability allows code execution for already-authenticated users and is only in effect when running salt-api as the root user.

CVE-2017-5200: Salt-api allows arbitrary command execution on a salt-master via Salt’s ssh_client
Users of Salt-API and salt-ssh could execute a command on the salt master via a hole when both systems were enabled.

We recommend everyone on the 2016.3 branch upgrade to a patched release as soon as possible.

Improved Checksum Handling in file.managed, archive.extracted States

When the source_hash argument for these states refers to a file containing checksums, Salt now looks for checksums matching the name of the source URI, as well as the file being managed. Prior releases only looked for checksums matching the filename being managed. Additionally, a new argument (source_hash_name) has been added, which allows the user to disambiguate ambiguous matches when more than one matching checksum is found in the source_hash file.

A more detailed explanation of this functionality can be found in the file.managed documentation, in the section for the new source_hash_name argument.
Changes for v2016.3.4..v2016.3.5

Changes:

• PR #38812: (rallytime) Update pyobjects test to be a list @ 2017-01-18T21:06:01Z
  - d14f0c6 Merge pull request #38812 from rallytime/pyobjects-test
  - f3e84c1 Update pyobjects test to be a list

• PR #38813: (gtmanfred) catch SIGPIPE in vmware connection @ 2017-01-18T21:05:42Z
  - ISSUE #36598: (ikkaro) CloudClient vmware driver reusing SI bug | refs: #38813
  - 50f03f8 Merge pull request #38813 from gtmanfred/2016.3
  - ce3472c catch SIGPIPE in vmware connection

• PR #38809: (twangboy) Fix get_hostname to handle longer computer names @ 2017-01-18T19:32:00Z
  - 23b8b47 Merge pull request #38809 from twangboy/fix_hostname_2016.3
  - d57a51f Fix tests for get_hostname
  - 7ca3fd7 Fix get_hostname to handle longer computer names

• PR #38808: (vutny) Fix #38388 @ 2017-01-18T18:32:00Z
  - ISSUE #38388: (johje349) No INFO logs in minion log file | refs: #38808
  - 1033bbd Merge pull request #38808 from vutny/fix-38388
  - 9bd203f Fix #38388

• PR #38668: (terminalmage) Fix proposal for #38604 @ 2017-01-18T17:53:09Z
  - ISSUE #10: (thatch45) list jobs option
  - f3ae3cd Merge pull request #38668 from terminalmage/issue38604
  - 0e907cd Merge pull request #10 from cachedout/pr-38668
    * db81afc Munge retcode into return data for batching
    - a642a99 Return the ret data from batch execution instead of raw data

• PR #38789: (rallytime) Update some saltenv refs to environment in salt.modules.state docs @ 2017-01-18T15:39:22Z
  - ISSUE #38622: (mikefford) Incorrect saltenv argument documentation in salt.modules.state | refs: #38789
  - c6a19a9 Merge pull request #38789 from rallytime/fix-38622
  - af41e0 Merge pull request #38789 from rallytime/fix-38622
  - af41f0 Update some saltenv refs to environment in salt.modules.state docs

• PR #38790: (cachedout) Fix typo in pyobjects test @ 2017-01-18T15:38:57Z
  - e0bf700 Merge pull request #38790 from cachedout/fix_pyobjects_test_typo
- a66a5 Fix typo in pyobjects test

- **PR #38792**: *(rallytime)* Update pillar tutorial lanuage regarding pillar_opts settings @ 2017-01-18T15:38:19Z
  - **ISSUE #38629**: *(Arabus)* Conflicting documentation about default value of pillar_opts | refs: #38792
  - 6e9785e Merge pull request #38792 from rallytime/fix-38629
  - 1e125e2 Update pillar tutorial lanuage regarding pillar_opts settings

- **PR #38796**: *(cachedout)* Revert ``Fixed prepending of root_dir override to the other paths” @ 2017-01-17T23:18:18Z
  - **PR #38707**: *(alexbletou)* Fixed prepending of root_dir override to the other paths | refs: #38796
  - 3417ad Merge pull request #38796 from saltstack/revert-38707-root_dir_fix-gh
  - cb08f3 Revert ‘‘Fixed prepending of root_dir override to the other paths”

- **PR #38585**: *(rallytime)* Follow up to PR #38527 @ 2017-01-17T18:40:01Z
  - **ISSUE #38524**: *(rbjorklin)* salt-api seems to ignore rest_timeout since 2016.11.0 | refs: #38585 #38527
  - **ISSUE #38479**: *(tyeapple)* api_logfile setting takes no effect | refs: #38585
  - **PR #38570**: *(rallytime)* [2016.11] Merge forward from 2016.3 to 2016.11 | refs: #38585
  - **PR #38560**: *(Ch3LL)* fix api logfile | refs: #38585
  - **PR #38527**: *(rbjorklin)* salt-api no longer forces the default timeout | refs: #38585 #38585 #38585
  - bab3479 Merge pull request #38585 from rallytime/follow-up-38527
  - 055878 Pylint fix: add line at end of file
  - fa01367 Keep a copy of the DEFAULT_API_OPTS and restore them after the test run
  - 2ad0763 Test clean up
  - fd2ee7d Add some simple unit tests for salt.config.api_config function
  - 3d2f6e4 Make sure the pidfile and log_file values are overriden by api opts
  - 1f6b540 Make sure the pidfile and log_file values are overriden by api opts
  - 04d307f salt-api no longer forces the default timeout

- **PR #38707**: *(alexbletou)* Fixed prepending of root_dir override to the other paths | refs: #38796 @ 2017-01-17T15:40:13Z
  - 0fb6bb7 Merge pull request #38707 from alexbleotu/root_dir_fix-gh
  - 0b6a988 Fixed prepending of root_dir override to the other paths

- **PR #38774**: *(vutny)* DOCS: add C++ compiler installation on RHEL required for bundled 0mq @ 2017-01-17T15:21:00Z
  - 96c9dc1 Merge pull request #38774 from vutny/dev-test-docs
  - 4620dc4 DOCS: add C++ compiler installation on RHEL required for bundled 0mq

- **PR #38749**: *(vutny)* pkg build modules throw better exception message if keyid wasn't found @ 2017-01-17T02:13:08Z
  - aedfbbf Merge pull request #38749 from vutny/pkg-build-better-exception-msg
  - 3f52be5 pkg build modules throw better exception message if keyid wasn't found

- **PR #38743**: *(rallytime)* [2016.3] Merge forward from 2015.8 to 2016.3 @ 2017-01-17T01:46:01Z
- ISSUE #20: (thatch45) Sort sys.doc output
- ISSUE #19: (thatch45) Sending a faulty command kills all the minions!
- PR #38731: (rallytime) Various follow up fixes
- PR #38602: (terminalmage) Fix failing `unit.states.boto_vpc_test.BotoVpcRouteTableTestCase.test_present_with_routes`.
- 8466b34 Merge pull request #3843 from rallytime/merge-2016.3
- d24776f Merge branch `2015.8` into `2016.3`
- 6869621 Merge pull request #38731 from rallytime/merge-2015.8
  * 9eb191b Pylint fix
  * b910499 Various follow up fixes
  * e8309a6 Add release notes for 2015.8.13
  * f881f36 Merge pull request #20 from rallytime/2015.8.12_follow_up-batch-tests
    - 3428232 Clean up tests and docs for batch execution
  * c80b20b Merge pull request #19 from whiteinge/batchclient
    - 3d8f3d1 Remove batch execution from NetapiClient and SaltNado
  * 97b0f64 Lintfix
  * d151666 Add explanation comment
  * 62f2c87 Add docstring
  * 9b0a786 Explain what it is about and how to configure that
  * 5ea3579 Pick up a specified roster file from the configured locations
  * 3a8614c Disable custom rosters in API
  * c0e5a11 Add roster disable flag
- e9c59e9 Merge pull request #38602 from terminalmage/fix-boto-test
  * 3424a10 Fix failing `unit.states.boto_vpc_test.BotoVpcRouteTableTestCase.test_present_with_routes`
- PR #38723: (rallytime) Remove ```event_publisher_pub_hwm''` and ```salt_event_pub_hwm''` from config/`__init__.py` @ 2017-01-15T18:36:14Z
  - ISSUE #38674: (jackywu) There is no code to use parameter ```event_publisher_pub_hwm''` in saltstack-2016.3 | refs: #38723
  - PR #29294: (skizunov) ZeroMQ no longer required when transport is TCP | refs: #38723 #38723
  - a642cde Merge pull request #38723 from rallytime/fix-38674
  - 706c885 Remove ```event_publisher_pub_hwm''` and ```salt_event_pub_hwm''` from config/`__init__.py`
- PR #38669: (rallytime) Update bootstrap script version to latest release @ 2017-01-15T18:03:27Z
  - fc54af Merge pull request #38669 from rallytime/update-bootstrap-script
  - 78ba76e Update bootstrap script version to latest release
- PR #38693: (twangboy) Update jinja2 to 2.9.4 @ 2017-01-15T14:40:46Z
  - 50d417f Merge pull request #38693 from twangboy/update_jinja
  - e0c7e55 Update jinja2 to 2.9.4
- PR #38739: (vutny) DOCS: correct examples of running test suite @ 2017-01-15T14:35:47Z
- f423bb Merge pull request #38739 from vutny/fix-runtests-doc
- b872bb6 DOCS: correct examples of running test suite

- 51d4707 DOCS: add links to File State Backups page where necessary (#38735)
  - PR #38735: (vutny) DOCS: add links to File State Backups page where necessary

- 6d3717b Proofread jinja_to_execution_module tutorial (#38720)
  - PR #38720: (dereckson) Proofread jinja_to_execution_module tutorial

- PR #38647: (gtmanfred) Allow novaclient to use keystoneauth1 sessions for authentication @ 2017-01-10T17:48:26Z
  - ISSUE #36548: (abonillasuse) openstack auth with nova driver | refs: #38647
  - 7b850d4 Merge pull request #38647 from gtmanfred/nova
  - 5be9b60 add documentation about using keystoneauth for v3
  - 7b657ca add the ability to use keystone v2 and v3
  - 5646ae1 add ability to use keystoneauth to authenticate in nova driver

- PR #38650: (rallytime) Remove the installation instructions for out-of-date community ppa @ 2017-01-10T17:47:45Z
  - ISSUE #36458: (ericul dall) No release file error from PPA on Ubuntu | refs: #38650
  - ISSUE #38572: (COLABORATI) ppa: saltstack/salt failure | refs: #38650
  - ISSUE #34504: (Avi nashDeluxeVR) Installation documentation for Ubuntu server and Windows minion leads the user to use different salt versions. | refs: #38650
  - 383768d Merge pull request #38650 from rallytime/remove-ubuntu-ppa-docs
  - 30429b2 Remove the installation instructions for out-of-date community ppa

- PR #38657: (DmitryKuzmenko) Publish the `data` field content for Syndic evets @ 2017-01-10T16:59:33Z
  - ISSUE #38087: (UtahDave) The `data` field in the return from a minion below a syndic is wrapped in an extra `data` field. | refs: #38657
  - 7df956e Merge pull request #38657 from DSRCorporation/bugs/38087_syndic_event_format_fix
  - 594c33f Publish the `data` field content for Syndic evets

- PR #38649: (Ch3LL) fix unit.modules.file_test @ 2017-01-10T16:44:45Z
  - 8398751 Merge pull request #38649 from Ch3LL/test_apply_template
  - 47f8bb8 fix unit.modules.file_test

  - e6f0aa0 Merge pull request #38491 from gtmanfred/timing
  - 79368c7 Use UTC for timing in case timezone changes

• PR #38503: (jinn) Hash type fallback for file management @ 2017-01-01T17:36:51Z
  - ISSUE #38472: (jinn) file.managed Unable to manage file: `hash_type` (2016.3.4) | refs: #38503
  - 86f0aa0 Merge pull request #38503 from jinn/issue_38472_jinn
  - 0cd9df2 Hash type fallback for file management

• PR #38457: (bshelton229) Stops git.latest checking for local changes in a bare repo @ 2016-12-30T14:28:47Z
  - ed2ba4b Merge pull request #38457 from bshelton229/git-latest-head-bug
  - 558e7a7 Stops git.latest checking for local changes in a bare repo

• PR #38385: (dragon788) Use unambiguous long names with double dashes @ 2016-12-29T17:10:48Z
  - 36ec21b2 Merge pull request #38385 from dragon788/2016.3-double-dash
  - 86c4b56 Newline for lint compat
  - 9d9b686 Address review comments, consistency of quotes
  - df9bd5e Use unambiguous long names with double dashes

• PR #38474: (cachedout) Allow an existing ioloop to be passed to salt-key @ 2016-12-29T16:28:51Z
  - ISSUE #38209: (limited) Accepting a minion causes tornado to exit | refs: #38474
  - 59f2560 Merge pull request #38474 from cachedout/key_loop
  - de50453 Allow an existing ioloop to be passed to salt-key

• PR #38467: (gtmanfred) file.line fail with mode=delete @ 2016-12-28T20:00:33Z
  - ISSUE #38438: (jf) file.line with mode=delete breaks on empty file | refs: #38467
  - 3d0c752 Merge pull request #38467 from gtmanfred/2016.3
  - 7b7c6b3 file.line fail with mode=delete

• PR #38434: (slinn0) Make sysctl.persist fail when failing to set a value into the running kernel @ 2016-12-27T15:37:53Z
  - 940025d Merge pull request #38434 from slinn0/issue_38433_fixes
  - 22af87a Fixes for https://github.com/saltstack/salt/issues/38433

• e5eb512 Update deprecation notices to the correct version (#38421)
  - PR #38421: (rallytime) Update deprecation notices to the correct version
- PR #38420: (rallytime) Removed various deprecation notices from salt/modules/* files | refs: #38421
  - 9ce5331 file.managed: Fix failure when filename contains unicode chars (#38415)
    - ISSUE #38282: (sash-kan) file.managed fails when file (which contains utf-characters in the name) exists | refs: #38415
    - PR #38415: (terminalmage) file.managed: Fix failure when filename contains unicode chars
- PR #38419: (Ch3LL) fix scsci docs example @ 2016-12-22T18:57:51Z
  - 2cd59d Merge pull request #38419 from Ch3LL/fix_doc_scsi
  - 234043b fix scsci docs example
- 2725352 Improve pillar documentation (#38407)
  - PR #38407: (terminalmage) Improve pillar documentation
- PR #38398: (terminalmage) Fix call to file.get_manager in cron.file state @ 2016-12-22T16:46:14Z
  - ISSUE #38372: (fanirama) Issue with cron.file. Source: salt://path/to/crontab_file not found | refs: #38398
  - 423b1fd Merge pull request #38398 from terminalmage/issue38372
  - e80dbaa Fix call to file.get_manager in cron.file state
- 5a33d1e Fix http.query when result has no text (#38382)
  - PR #38382: (heewa) Fix http.query when result has no text
- PR #38390: (meaksh) Add ```try-restart``` to fix auto-restarting on SUSE systems @ 2016-12-21T16:06:24Z
  - b74b5c7 Merge pull request #38390 from meaksh/2016.3-fix-try-restart-for-auto-restarting-on-SUSE-systems
  - de6ec05 add try-restart to fix auto-restarting on SUSE systems
- PR #38221: (UtahDave) Fix default returner @ 2016-12-20T20:34:36Z
  - 2c3a397 Merge pull request #38221 from UtahDave/fix_default_returner
  - 3856d407 remove a blank line to satisfy linter
  - 9c248aa validate return opt, remove default.
  - 8bb37f9 specify allowed types and default for ```return```
  - 118634a add examples of default minion returners
  - e7c6012 add support for default returners using return
- PR #38288: (terminalmage) archive.extracted: don't try to cache local sources (2016.3 branch) @ 2016-12-18T13:07:11Z
  - 09d9c57 Merge pull request #38288 from terminalmage/archive-extracted-local-source-2016.3
  - 8453d0 Update tests to reflect change in cache behavior
  - 5a08d7c archive.extracted: don't try to cache local sources (2016.3 branch)
- PR #38312: (cro) Backport feature allowing proxy config to live in pillar OR /etc/salt/proxy @ 2016-12-18T12:39:01Z
  - bf37667 Merge pull request #38312 from cro/proxy_config_in_cfg
  - 2006c40 Typo
  - 689d95b Backport feature allowing proxy config to live in pillar OR /etc/salt/proxy.
• PR #38320: (rallytime) Cleanup doc internal markup references @ 2016-12-18T12:31:28Z
  - ISSUE #12788: (whiteinge) Comb through docs to replace :doc: roles with :ref: | refs: #38320
  - c83db5a Merge pull request #38320 from rallytime/cleanup-doc-refs
  - 62978cb Don't check the doc/conf.py file for doc markup refs
  - 770e732 Add a unit test to search for new doc markup refs
  - 5c42a36 Remove ":doc:" references from all doc/topics/installation/* files
  - 23bce1c Remove ":doc:" references from all doc/topics/releases/* files
  - 4aafa41 Remove ":doc:" references from a bunch of doc/* files
  - 02bfe79 Remove more ":doc:" references from doc/* files
  - 6e32267 Remove ":doc:" references in salt/* files
  - 4676ca7 Add nick to args for create_multi (#38281)
    - PR #38281: (mikejford) Add nick to args for create_multi
  • PR #38313: (dragon778) 2016.3 chocolatey fix @ 2016-12-16T17:20:39Z
    - ISSUE #38290: (dragon778) Need to use machine automation friendly output | refs: #38313
    - 235682b Merge pull request #38313 from dragon778/2016.3-chocolatey-fix
    - 6f9fc7c Remove machine readable output for list
    - cdbd2b Added limit-output to eliminate false packages
  • PR #38279: (rallytime) Add docs for syndic_wait setting @ 2016-12-15T18:30:31Z
    - ISSUE #38174: (NickDubelman) [syndic] Why can’t a syndic node signal when all of it’s minions have returned? | refs: #38279
    - ISSUE #32400: (rallytime) Document Default Config Values | refs: #38279
    - 9e78dcd Merge pull request #38279 from rallytime/fix-38174
    - 4a62d01 Add docs for syndic_wait setting
  • PR #38248: (meaksh) Successfully exit of salt-api child processes when SIGTERM is received @ 2016-12-15T09:16:27Z
    - fc9e1df Merge pull request #38248 from meaksh/salt-api-successfully-close-child-processes
    - ee6eae9 Successfully exit of salt-api child processes when SIGTERM.
  • PR #38254: (terminalmage) Also check if pillarenv is in opts @ 2016-12-15T09:10:24Z
    - 3c718ed Merge pull request #38254 from terminalmage/check-pillarenv
    - fa9ad31 Also check if pillarenv is in opts
  • PR #38198: (vutny) Add missing requirements for running unit tests: libcloud and boto3 @ 2016-12-13T14:12:20Z
    - 004e46a Merge pull request #38198 from vutny/unit-tests-require-libcloud-boto3
    - a6099ba Remove note about SaltTesting installation, now it is in the requirements
    - 004bfff1 Add missing requirements for running unit tests: libcloud and boto3
Salt Documentation, Release 2016.3.6

- **PR #38213**: (rallytime) Skip test_cert_info tls unit test on pyOpenSSL upstream errors @ 2016-12-13T12:05:01Z
  - 9d497bc Merge pull request #38213 from rallytime/skip-tls-test
  - bdb807f Skip test_cert_info tls unit test on pyOpenSSL upstream errors
- **PR #38224**: (whiteinge) Allow CORS OPTIONS requests to be unauthenticated @ 2016-12-13T12:02:30Z
  - 203109d Merge pull request #38224 from whiteinge/cors-options-unauthed
  - de4d322 Allow CORS OPTIONS requests to be unauthenticated
- **PR #38223**: (whiteinge) Add root_dir to salt-api file paths @ 2016-12-13T07:44:19Z
  - PR #37272: (vutny) Get default logging level and log file from default opts dict | refs: #38223
  - 721a5fe Merge pull request #38223 from whiteinge/salt-api-root_dirs
  - bbf390 Add root_dir to salt-api file paths
- **PR #38191**: (terminalmage) Clarify the fact that git_pillar.update does not fast-forward @ 2016-12-12T09:45:48Z
  - ISSUE #38162: (747project) git_pillar does not detect changes to remote repository when told to update | refs: #38191
  - 70f7d22 Merge pull request #38191 from terminalmage/issue38162
  - 1ae543a Clarify the fact that git_pillar.update does not fast-forward
- **PR #38194**: (vutny) Document the requirements for running ZeroMQ-based integration tests @ 2016-12-12T07:42:11Z
  - 28171cb Merge pull request #38194 from vutny/integration-test-requirements-doc
  - e9f419f Document the requirements for running ZeroMQ-based integration tests
- **PR #38185**: (rallytime) Back-port #38181 to 2016.3 @ 2016-12-09T22:27:44Z
  - PR #38181: (rallytime) Reset socket default timeout to None (fixes daemons_tests failures) | refs: #38185
  - a4f037 Merge pull request #38185 from rallytime/bp-38181
  - 609f814 Reset socket default timeout to None (fixes daemons_tests failures)
- **PR #38163**: (Ch3LL) enabled ec2 cloud tests @ 2016-12-09T18:01:57Z
  - 65b2ad7 Merge pull request #38163 from Ch3LL/enabled_ec2_cloud
  - be74c45 enabled ec2 cloud tests
- **PR #38177**: (vutny) Correct cp.get_file_str docstring and add integration tests @ 2016-12-09T16:55:35Z
  - b6374e Merge pull request #38177 from vutny/fix-cp-get-file-str
  - a449980 Correct cp.get_file_str docstring and add integration tests
- **PR #38153**: (vutny) Master config includes may contain errors and be safely skipped @ 2016-12-08T17:43:34Z
  - 7596313 Merge pull request #38153 from vutny/master-includes-error-tolerance
  - cd0154e Master config includes may contain errors and be safely skipped
- **PR #38102**: (rallytime) Add False + msg tuple return if requests is missing for zenoss module @ 2016-12-07T13:24:37Z
- 86091db Skip daemon unit tests when running on Python 2.6 (#38134)
  - PR #38134: (rallytime) Skip daemon unit tests when running on Python 2.6
- **PR #38112**: (rallytime) Add False + msg tuple return if requests is missing for zenoss module @ 2016-12-07T13:24:37Z
- ISSUE #38091: (tjyang) [WARNING ] salt.loaded.int.module.zenoss.__virtual__() is wrongly returning None. | refs: #38102
- d3d98fd4 Merge pull request #38102 from rallytime/fix-38091
- 4f79d5a Add False + msg tuple return if requests is missing for zenoss module

• PR #38104: (rallytime) Back-port #36794 to 2016.3 @ 2016-12-07T13:23:48Z
  - ISSUE #36707: (do3meli) slow FreeBSD sysctl module with test=true | refs: #36794
  - PR #36794: (do3meli) FreeBSD sysctl module now handels config_file parameter in show method | refs: #38104
  - 8c8bc2 Merge pull request #38104 from rallytime/bp-36794
  - c906ca8a Pylint fixes
  - da3ebf8 FreeBSD sysctl module now handels config_file parameter in show method

• PR #38083: (twangboy) Only delete .sls files from winrepo-ng [DO NOT MERGE FORWARD] @ 2016-12-06T14:13:35Z
  - ISSUE #35342: (morganwillcock) win_pkg: refresh_db doesn't remove cached items which have been renamed or removed | refs: #38083
  - fbc8776 Merge pull request #38083 from twangboy/fix_refresh_db
  - 978af0d Remove only .sls files from the cached winrepo-ng

• PR #38059: (rallytime) Call exec_test for the Syndic daemon in tests.unit.daemons_test.py @ 2016-12-04T04:18:41Z
  - PR #38057: (rallytime) [2016.11] Merge forward from 2016.3 to 2016.11 | refs: #38059
  - PR #38034: (cachedout) Modify daemons test to use multiprocessing | refs: #38059
  - 9dcddee Merge pull request #38059 from rallytime/daemons-test-fix
  - eb372b2 Add missing `not` statement: The last syndic test should assertFalse()
  - 4e10f8e Call exec_test for the Syndic daemon in tests.unit.daemons_test.py

• PR #38039: (rallytime) Check to see if a line is already commented before moving on @ 2016-12-02T20:08:35Z
  - ISSUE #37939: (Talkless) file.comment always report changes in test=True mode | refs: #38039
  - 9cd42b9 Merge pull request #38039 from rallytime/fix-37939
  - 1da7aa0 Update unit tests to account for additional file.search call
  - 8a685b1 Check to see if a line is already commented before moving on
  - f2e0455 Write an integration test demonstrating the issue

• PR #38045: (terminalmage) yumpkg.py: don't include non-upgrade versions found by `yum list available` @ 2016-12-02T20:07:38Z
  - ISSUE #38037: (dmurphy18) pkg.latest and yumpkg.latest_version return incorrect package versions 2016.3 and 2016.11 | refs: #38045
  - a34a763 Merge pull request #38045 from terminalmage/issue38037
  - 6528950 Simplify logic for matching desired pkg arch with actual pkg arch
  - 3babbcd yumpkg.py: don't include non-upgrade versions found by `yum list available`

• 6724fe4 Modify daemons test to use multiprocessing (#38034)
- **PR #38034**: (cachedout) Modify daemons test to use multiprocessing | refs: #38059

- **PR #37995**: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3 @ 2016-11-30T20:12:55Z
  - **PR #37978**: (terminalmage) Add clarifying language to ext_pillar_first docs
  - 6942d5d Merge pull request #37995 from rallytime/merge-2016.3
  - b44e179 Merge branch `2015.8` into `2016.3`
    * 7a7e367 Merge pull request #37978 from terminalmage/ext_pillar_first-docs
      - 61ed9a8 Add clarifying language to ext_pillar_first_docs

- PR #37995: (cachedout) Modify daemons test to use multiprocessing | refs: #38059

- **PR #37995**: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3 @ 2016-11-30T20:12:55Z
  - **PR #37978**: (terminalmage) Add clarifying language to ext_pillar_first docs
  - 6942d5d Merge pull request #37995 from rallytime/merge-2016.3
  - b44e179 Merge branch `2015.8` into `2016.3`
    * 7a7e367 Merge pull request #37978 from terminalmage/ext_pillar_first-docs
      - 61ed9a8 Add clarifying language to ext_pillar_first_docs

- cd66c17 fix broken yaml code block (#38002)
  - **PR #38002**: (laleocen) fix broken yaml code block

- **PR #37912**: (attiasr) fix encoding problem aws responses @ 2016-11-30T18:10:30Z
  - **ISSUE #35088**: (Modulus) salt/cloud/ec2.py encoding problems. | refs: #37912
  - 3dd45fb Merge pull request #37912 from attiasr/fix_aws_response_encoding
  - ba4ec4e use Requests result encoding to encode the text
  - abe4eb3 fix encoding problem aws responses

- **PR #37950**: (vutny) Set default Salt Master address for a Syndic (like for a Minion) @ 2016-11-30T18:09:04Z
  - 69a74a4 Merge pull request #37950 from vutny/fix-starting-up-syndic
  - 7d9bc9a syndic_master: correct default value, documentation and example config
  - 92a7c7e Set default Salt Master address for a Syndic (like for a Minion)

- **PR #37964**: (terminalmage) Add clarification on expr_form usage and future deprecation (#37964)
  - 7f269bc Add clarification on expr_form usage and future deprecation

- **ISSUE #37867**: (tobiasBora) Bug into lsb_release that crash salt | refs: #37962
  - **PR #37962**: (cachedout) Catch possible exception from lsb_release

- **ISSUE #37945**: (gstachowiak) Missing exception handling in salt.master.Maintenance. Process never completes. | refs: #37961
  - **PR #37961**: (cachedout) Handle empty tokens safely

- **PR #37272**: (vutny) Get default logging level and log file from default opts dict | refs: #38223 @ 2016-11-28T23:04:20Z
  - ea46639 Merge pull request #37272 from vutny/fix-getting-default-logging-opts
  - e5ce523 Fix description in the Salt Syndic usage info
  - 518a3dd Add unit tests for Salt parsers processing logging options
  - 83d6a44 Add ssh_log_file option to master config and documentation
  - c8a0915 Fix configuration example and documentation for syndic_log_file option
  - e4d6d3c Correct default attributes for various parser classes
  - 8a2e21 Fix default usage string for Salt command line programs
  - 45df7a2 Fix readding and updating logfile and pidfile config options for Salt API
- f47253c Fix reading and applying Salt Cloud default configuration
- fad5bec Work with a copy of default opts dictionaries
- b7c2481 Fix log_level_logfile config value type
- 1bd76a1 Fix setting temporary log level if CLI option omitted
- 121848c Fix obtaining log_granular_levels config setting
- 44cf07f Make CLI options take precedence for setting up logfile_logger
- 61afaf1 Fix setting option attributes when processing log_level and log_file
- 3c60e23 Fix processing of log_level_logfile config setting
- 55a0af5 Use attribute functions for getting/setting options and config values
- c25f2d0 Fix getting Salt API default logfile option
- f242237 Remove processing of unused and undocumented cli_*_log_* config options
- 2065e83 Get default logging level and file from default opts dict

- PR #37925: (kontrolld) Fix missing ipv6 options centos network @ 2016-11-28T22:38:43Z
  - f2f957d Merge pull request #37925 from kontrolld/add-ipv6-centos-network
  - ac2b477 Adding IPv6 functionality for CentOS /etc/sysconfig/network

- PR #37899: (DmitryKuzmenko) Clear functions context in schedule tasks for ZeroMQ. @ 2016-11-28T22:23:45Z
  - ISSUE #37059: (basepi) Beacon fileserver operations cause scheduled jobs with fileserver operations to hang | refs: #37899
  - c07ad11 Merge pull request #37899 from DSRCorporation/bugs/37059_schedule_task_hang
  - 9497748 Clear functions context in schedule tasks for ZeroMQ.

- PR #37928: (techhat) Don’t modify self.opts directly @ 2016-11-28T21:07:40Z
  - ISSUE #37737: (b-harper) python client api CloudClient multiple calls needed | refs: #37928
  - a5553d4 Merge pull request #37928 from techhat/issue37737
  - a09a60e Don’t modify self.opts directly

- PR #37929: (gtmanfred) add list_nodes_min to nova driver @ 2016-11-28T21:05:40Z
  - 9d17f1c Merge pull request #37929 from gtmanfred/2016.3
  - c7d2c73 add list_nodes_min to nova driver

- PR #37926: (kontrolld) Fixes no IPv6 functionality in /etc/sysconfig/network @ 2016-11-28T20:40:00Z
  - 3bb743b Merge pull request #37926 from kontrolld/fix-ipv6-centos-network
  - 3ed42e5 updated
  - 3b3bc4f Fixes no IPv6 functionality in /etc/sysconfig/network

- PR #37921: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3 @ 2016-11-28T19:54:40Z
  - PR #37918: (rallytime) [2015.8] Update version numbers in doc config for 2016.11.0 release
  - PR #37914: (terminalmage) Update earlier release channels’ docs with Carbon release notes
  - 271170a Merge pull request #37921 from rallytime/merge-2016.3
  - 523a67c Merge branch `2015.8' into `2016.3'
• PR #37924: (cachedout) Update test for new gem ver @ 2016-11-28T18:17:53Z
  – 6cd6429 Merge pull request #37924 from cachedout/fix_gem_states
  – 894cca3 Update test for new gem ver

• PR #37916: (rallytime) [2016.3] Update version numbers in doc config for 2016.11.0 release @ 2016-11-28T17:09:08Z
  – c35ba1f Merge pull request #37916 from rallytime/doc-update-2016.3
  – bd40592 [2016.3] Update version numbers in doc config for 2016.11.0 release

• PR #37785: (AaronM-Cloudtek) respect trailing dot in ddns name parameter @ 2016-11-28T14:02:10Z
  – ISSUE #37287: (AaronM-Cloudtek) salt.states.ddns.present: `NS' record type always returns as changed
    | refs: #37785
  – e13a248 Merge pull request #37785 from Cloudtek/ddns-respect-trailing-dot
  – 262e3b3 respect trailing dot in ddns name parameter

• PR #37895: (fj40crawler) Change return value for salt/states/augeas.py to be True instead of None... @ 2016-11-28T13:49:27Z
  – ISSUE #37870: (fj40crawler) salt.states.augeas.change returns None when test=True | refs: #37895
  – c03b389 Merge pull request #37895 from fj40crawler/fix-augeas-return-for-test
  – ddc238d Fixed augeas_test.py to match True v.s. None for test_change_in_test_mode
  – ef75c45 Merge branch `2016.3' of github.com:saltstack/salt into fix-augeas-return-for-test
  – b0fe0cd Change return value for salt/states/augeas.py to be True instead of None for cases where salt is run with test=True. Fixes #37870

• PR #37907: (Talkless) Fix server trust in test run of svn.latest @ 2016-11-28T13:47:39Z
  – fdbc31e Merge pull request #37907 from Talkless/patch-2
  – 072a319 Fix server trust in test run of svn.latest

• PR #37896: (toanju) rh networking: add missing values @ 2016-11-27T10:30:35Z
  – f39df4 Merge pull request #37896 from toanju/2016.3
  – c953041 rh networking: add missing values

• PR #37886: (bdrung) Fix various spelling mistakes @ 2016-11-25T02:59:36Z
  – ea935c5 Merge pull request #37886 from bdrung/fix-typos
  – 9a51ba5 Fix various spelling mistakes

• PR #37736: (dhaines) handle semodule version >=2.4 (#37732) and fix typo @ 2016-11-24T01:59:20Z
  – ISSUE #37732: (dhaines) list_semod() (from modules/selinux.py) incompatible with policycoreutils-2.5 (RHEL 7.3) | refs: #37736
  – 371b0a8 Merge pull request #37736 from dhaines/issue-37732
  – 7ef590a Update selinux.py
  – 516a67e fix indexing error
  – 4e49c1e fix typo
- b16f2d8 handle semodule version >=2.4 (#37732) and fix typo

- **PR #37797**: (clan) check count of columns after split @ 2016-11-24T01:28:59Z
  - 87aeb66 Merge pull request #37797 from clan/extfs
  - acf096 check count of columns after split

- **PR #37762**: (twangboy) Add pre_versions to chocolatey.installed @ 2016-11-24T01:27:29Z
  - f7c7109 Merge pull request #37762 from twangboy/fix_chocolatey_state
  - 969b6d Use keyword args instead of relying on ordering
  - 398ea0 Add pre_versions to the available arguments

- **PR #37866**: (meaksh) Backport #37149 #36938 #36784 to 2016.3 @ 2016-11-23T21:54:17Z
  - PR #37857: (meaksh) Backport #37149 and #36938 to 2015.8 | refs: #37866
  - PR #37856: (meaksh) Backport #36784 to 2015.8 | refs: #37866
  - PR #37149: (dincamihai) Fix pkg.latest_version when latest already installed | refs: #37866 #37857
  - PR #36938: (wanparo) acl.delfacl: fix position of -X option to setfacl | refs: #37866 #37857
  - PR #36784: (moio) OS grains for SLES Expanded Support | refs: #37866 #37856
  - 56baa92 Merge pull request #37866 from meaksh/2016.3-bp-37149-36938-36784
  - 9d8d578 Fix pkg.latest_version when latest already installed
  - ffca0d4 - acl.delfacl: fix position of -X option to setfacl
  - 3dfed6b Adjust linux_acl unit test argument ordering
  - f185ecd core.py: quote style fixed
  - 8404d13 Setting up OS grains for SLES Expanded Support (SUSE’s Red Hat compatible platform)

- **PR #37863**: (rallytime) Back-port #36893 to 2016.3 @ 2016-11-23T17:09:09Z
  - ISSUE #32829: (tyhunt99) Dockerng appears to not be using docker registries pillar data | refs: #36893 #36893
  - PR #36893: (tyhunt99) add option to force a reauth for a docker registry | refs: #37863
  - d0cc7f0 Merge pull request #37863 from rallytime/bp-36893
  - 4c70534 Add versionadded to reauth option in dockerng module
  - 5ca2e38 added documentation for the new reuth option in docker registry configuration
  - 5b0c11a add option to force a reauth for a docker registry

  - 96b8b9a Merge pull request #37457 from rallytime/fix-31081
  - 25821bb Clarify which modes use `before`, `after`, and `indent` options
  - 8b2d2b9 Clarify file.line state docs as well
  - b261589 Move note about using mode=insert with location options to mode section
  - db0b0ce Fixup file.line docs to be more clear and consistent

- PR #37526: (twangboy) Remove loop from dsc.apply_config @ 2016-11-08T00:23:11Z
  - ISSUE #35799: (davegiles) dsc.apply_config hangs (no error) on empty directory on target | refs: #37526
  - 7de790f Merge pull request #37526 from twangboy/fixed_35799
  - fc42609 Remove unnecessary format
- c934a2b Remove the loop from apply_config

- **PR #37534**: `(rallytime)` Back-port fix needed from #37515 @ 2016-11-08T00:14:46Z
  - **PR #37515**: `(rallytime) [carbon]` Merge forward from 2016.3 to carbon | refs: #37534 #37534
  - 9481df Merge pull request #37534 from rallytime/bp-merge-forward-fix
  - d1b2af1 Add missing source_hash_name args to a couple funcs

- **PR #37533**: `(whiteinge)` Return a 504 response instead of 500 for Salt timeouts @ 2016-11-08T00:14:15Z
  - 17adb90 Merge pull request #37533 from whiteinge/salt-api-504-timeouts
  - 63226ae Return a 504 response instead of 500 for Salt timeouts

- **PR #37529**: `(lorengeordon)` Backport: PR 36736 to 2016.3 @ 2016-11-08T00:04:10Z
  - **ISSUE #36679**: `(lorengeordon)` Command `Import-ModuleServerManager` failed with return code: 1 | refs: #37529
  - **PR #36736**: `(m03)` Fix issue 36679 win_servermanager error | refs: #37529
  - a9f03ee Merge pull request #37529 from lorengeordon/bp-36736
  - 21c2664 Fix issue 36679 win_servermanager failure

- **PR #37519**: `(rallytime)` Update returner __virtual__() return messages for loader @ 2016-11-07T23:06:23Z
  - **ISSUE #37444**: `(Tanoti)` Returning False from __virtual__ in a returner does not return expected error | refs: #37519
  - **PR #37502**: `(cachedout)` Log proper message on returners that cannot be loaded | refs: #37519
  - 19475aa Merge pull request #37502 from rallytime/returner-load-errors
  - fb261a3 Update returner __virtual__() return messages for loader

- **PR #37527**: `(rallytime)` Add syndic_id=None kwarg to save_minions funcs in returners @ 2016-11-07T23:04:03Z
  - **ISSUE #35016**: `(pingangit)` TypeError: save_minions() got an unexpected keyword argument `syndic_id` | refs: #37527
  - ff6fab Merge pull request #37527 from rallytime/fix-35016
  - 2944b24 Add syndic_id=None kwarg to save_minions funcs in returners

- b77b6ba fix Lithium to 2015.5.0 (#37530)
  - **PR #37530**: `(gtmanfred)` fix Lithium to 2015.5.0

- **PR #37514**: `(rallytime)` [2016.3] Merge forward from 2015.8 to 2016.3 @ 2016-11-07T16:51:06Z
  - **PR #37482**: `(rallytime)` [2015.8] Doc version updated to 2016.3.4
  - 7431648 Merge pull request #37514 from rallytime/merge-2016.3
  - 41166ae Merge branch `2015.8` into `2016.3`
  - c505a05 [2015.8] Doc version updated to 2016-3.4 (#37482)

- **PR #37503**: `(cachedout)` Catch loader error on returners without save_load @ 2016-11-07T09:33:57Z
  - **ISSUE #36713**: `(Tanoti)` ExtraData: unpack(b) received extra data after upgrading to 2016.3.3 | refs: #37503
  - 2d924d0 Merge pull request #37503 from cachedout/issue_36713
  - 5f7f971 Catch loader error on returners without save_load

- **PR #37499**: `(cachedout)` Clarify docs on salt-key events @ 2016-11-07T09:33:20Z
– ISSUE #37448: (alisson276) In `salt/key' events there are acts that never happen | refs: #37499
– d95bf59 Merge pull request #37499 from cachedout/key_docs_clarify
– 2758e74 Clarify docs on salt-key events

• PR #37500: (cachedout) Remove unused flag @ 2016-11-07T09:33:04Z
  – 1dd1408 Merge pull request #37500 from cachedout/remove_include_errors
  – 6c705b1 Remove unused flag

• PR #37502: (cachedout) Log proper message on returners that cannot be loaded | refs: #37519 @ 2016-11-07T09:32:45Z
  – ISSUE #37444: (Tanoti) Returning False from __virtual__ in a returner does not return expected error | refs: #37502 #37519
  – 4b6f1ab Merge pull request #37502 from cachedout/issue_37444
  – 4c5ab05 Remove debugging
  – 17d01e4 Log proper message on returners that cannot be loaded

• PR #37494: (sjorge) Forgot to update os_family map in #37472 @ 2016-11-06T22:18:54Z
  – ISSUE #37389: (d101nelson) Some core grains are inaccurate or incomplete for Solaris | refs: #37472
  – PR #37472: (sjorge) 2016.3 solaris grains improvements | refs: #37494 #37494
  – 2422daf Merge pull request #37494 from sjorge/2016.3-osfam_map
  – 96ba545 Forgot to update os_family map in #37472

• PR #37496: (mcalmer) fix status handling in sysv init scripts @ 2016-11-06T22:18:00Z
  – 41bd8e3 Merge pull request #37496 from mcalmer/fix-status-handling-in-sysv-init-scripts
  – 1fb2c4d fix status handling in sysv init scripts

• PR #37497: (terminalmage) Update 2016.3.5 release notes with source_hash_name explanation @ 2016-11-06T22:17:40Z
  – e741a77 Merge pull request #37497 from terminalmage/release_notes
  – c08038d Update 2016.3.5 release notes with source_hash_name explanation

• PR #37486: (twangboy) Add requirement for PowerShell 3 on Windows @ 2016-11-06T06:01:07Z
  – f4426c2 Merge pull request #37486 from twangboy/fix_win_docs
  – 9e063b1 Add docs denoting the requirement for at least PowerShell 3

• PR #37493: (cachedout) Add sdb support to minion and master configs @ 2016-11-06T06:00:18Z
  – a1f355a Merge pull request #37493 from cachedout/minion_master_sdb
  – 9761a46 Add sdb support to minion and master configs

• PR #37452: (rallytime) file.line with mode=replace on an empty file should return False, not stacktrace @ 2016-11-06T01:55:11Z
  – ISSUE #31135: (jeffreyctang) file.line mode=replace breaks on empty file. | refs: #37452
  – be93710 Merge pull request #37452 from rallytime/fix-31135
  – c792f76 Bump log level from debug to warning on empty file
  – 5f181cf file.line with mode=replace on an empty file should return False
- 94a00c6 Write a unit test demonstrating stack trace in #31135

- **PR #37469**: *(terminalmage)* Rewrite file.extract_hash to improve its matching ability @ 2016-11-06T01:50:01Z
  - **ISSUE #37001**: *(phil123456)* URGENT: archive.extracted does not work anymore | refs: #37081
  - **ISSUE #29010**: *(The-loeki)* file.managed download failing checksum testing for Ubuntu initrd w/source_hash | refs: #37469
  - **PR #37081**: *(terminalmage)* Fix archive.extracted remote source_hash verification | refs: #37469 #37469
  - 129b038 Merge pull request #37469 from terminalmage/issue29010
  - a3f38e5 Update file.extract_hash unit tests
  - b26b528 Add the source_hash_name param to file.managed states
  - 52fe72d Rewrite file.extract_hash

- **PR #37472**: *(sjorge)* 2016.3 solaris grains improvements | refs: #37494 #37494 @ 2016-11-06T01:46:10Z
  - **ISSUE #37389**: *(d101nelly)* Some core grains are inaccurate or incomplete for Solaris | refs: #37472
  - 9426b9d Merge pull request #37472 from sjorge/2016.3-solaris-grains
  - 2958f5c detect and properly handle OmniOS
  - 37c3a7f handle Oracle Solaris better
  - 69706d3 parse minorrelease if it has a / in it
  - d1cf4a0 improve regex for parsing /etc/release using files from Solaris 8 SPARC and Solaris 10
  - 88eddef some more cleanup for smartos
  - d3ff39f improve smartos os version grains

- **PR #37478**: *(rallytime)* [2016.3] Merge forward from 2015.8 to 2016.3 @ 2016-11-04T20:30:08Z
  - **ISSUE #37388**: *(tyhunt99)* [2016.3.4] Refreshing of an s3 file server results in an exception. | refs: #37428
  - **ISSUE #37286**: *(terminalmage)* GitFS: mountpoints with trailing slashes cause all file paths in that repo to fail to be matched | refs: #37408
  - **ISSUE #36849**: *(skulikov)* file.managed and archive.extracted don't properly work for tgz remote files | refs: #37418
  - **PR #37441**: *(rallytime)* Back-port #37428 to 2015.8
  - **PR #37428**: *(cachedout)* Fix incorrect reference of __utils__ in salt.utils | refs: #37441
  - **PR #37418**: *(terminalmage)* Do not use compression in tornado httpclient requests
  - **PR #37408**: *(terminalmage)* Strip slashes from gitfs mountpoints
  - 4ba63ab Merge pull request #37478 from rallytime/merge-2016.3
  - 3483a44 Merge branch `2015.8` into `2016.3`
    - 35888c2 Merge pull request #37408 from terminalmage/issue37286
      - 4e4a057 Strip slashes from gitfs mountpoints
    - b6c57c6 Merge pull request #37418 from terminalmage/issue36849
      - 740bc54 Do not use compression in tornado httpclient requests
    - 7fba8aa Merge pull request #37441 from rallytime/bp-37428
      - 6fe3ef4 Fix incorrect reference of __utils__ in salt.utils

- **PR #37340**: (cachedout) SIGILL -> SIGKILL in process test @ 2016-10-31T08:50:10Z
  - 25c987e Merge pull request #37340 from cachedout/ill_kill_3
  - a6b7417 SIGILL -> SIGKILL in process test

- **PR #37306**: (DmitryKuzmenko) Don't use os.wait() on subprocesses managed by multiprocessing. @ 2016-10-31T06:55:30Z
  - ISSUE #35480: (jelenak) 200 processes of salt-master (2016.3.2) | refs: #37306
  - 7f16548 Merge pull request #37306 from DSRCorporation/bugs/35480_master_shutdown_no_process_error
  - b6937eb Don't use os.wait() on subprocesses managed by multiprocessing.

- **PR #37314**: (rallytime) Document the existence of placementgroup option in ec2 driver @ 2016-10-31T06:42:33Z
  - ISSUE #34998: (exowaucka) placementgroup parameter for salt-cloud is undocumented | refs: #37314
  - bf8b97 Merge pull request #37314 from rallytime/fix-34998
  - 39459ed Document the existence of placementgroup option in ec2 driver

- **PR #37219**: (alex-zel) Fix freeipa ldap groups @ 2016-10-28T04:33:37Z
  - ISSUE #36148: (alex-zel) Eauth error with openLDAP groups | refs: #37219
  - e0baf4db Merge pull request #37219 from alex-zel/fix-freeipa-ldap-groups
  - b5b2e7e Remove trailing whitespaces
  - 32f906b Add support for FreeIPA

### 18.2.7 Salt 2016.3.6 Release Notes

Version 2016.3.6 is a bugfix release for 2016.3.0.

---

**Changes for v2016.3.5..v2016.3.6**

Extended changelog courtesy of Todd Stansell (https://github.com/tjstansell/salt-changelogs):

*Generated at: 2017-03-22T20:18:54Z*

**Statistics:**

- Total Merges: 118
- Total Issue references: 53
- Total PR references: 168

**Changes:**

- **PR #39855**: (Foxlik) Use regular expression instead of split when replacing authorized_keys @ 2017-03-22T18:28:32Z
  - ISSUE #39854: (Foxlik) quoted space in authorized_keys confuses ssh.py | refs: #39855
  - c59ae9a Merge pull request #39855 from Foxlik/use_regex_to_compare_authorized_keys
  - d46845a Add newline at end of file
  - d4a3c8a Use regular expression instead of split when replacing authorized_keys
• PR #40221: (rallytime) Back-port #39179 to 2016.3 @ 2017-03-22T17:40:34Z
  - PR #39179: (mcalmer) fix error parsing | refs: #40221
  - fd10430 Merge pull request #40221 from rallytime/bp-39179
  - 07dc2de fix error parsing
• PR #40206: (cro) Leave sign_pub_messages off by default. @ 2017-03-22T16:43:03Z
  - ISSUE #40203: (frogunder) 2016.3.6. Minion don't connect to older master. | refs: #40206
  - a27a2cc Merge pull request #40206 from cro/sign_pub_take2
  - 01048de leave sign_pub_messages off on minion by default.
  - a82b005 Leave sign_pub_messages off by default.
• PR #40193: (rallytime) Back-port #40117 to 2016.3 @ 2017-03-22T16:42:21Z
  - PR #40117: (narendraingale2) Fix force remove | refs: #40193
  - d1abb4c Merge pull request #40193 from rallytime/bp-40117
  - cf18579 More optimization.
  - 5a08266 Removed debug statemnt
  - f557f7c Added fix for issue 39393
  - bb62278 Reverting changes.
  - a9107cd Added if condition for broken link.
• PR #40196: (twangboy) Update dependencies for PyOpenSSL @ 2017-03-22T16:40:46Z
  - 0f1ff4d Merge pull request #40196 from twangboy/win_fix_deps
  - 6761527 Update dependencies for PyOpenSSL
• PR #40184: (terminalmage) Link to minion start reactor example from FAQ. @ 2017-03-21T17:33:09Z
  - b050151 Merge pull request #40184 from terminalmage/link-reactor-example
  - a42be82 Link to minion start reactor example from FAQ
• PR #40182: (terminalmage) Add support for ``stopped” state to dockerng's mod_watch @ 2017-03-21T15:40:29Z
  - d4e6c58 Merge pull request #40182 from terminalmage/dockerng-mod_watch-stopped
  - 4629a26 Add support for `’stopped” state to dockerng’s mod_watch
• PR #40171: (Ch3LL) additional PRs/issues for 2016.3.6 release notes @ 2017-03-20T22:14:17Z
  - a0b4082 Merge pull request #40171 from Ch3LL/2016.3.6_release
  - 9c6d8d8 additional PRs/issues for 2016.3.6 release notes
• PR #40120: (sergeizv) gce: Exclude GCENodeDriver objects from _expand_node result @ 2017-03-20T21:44:42Z
  - 33ba782 Merge pull request #40120 from sergeizv/gce-expand-node-fix
  - 9d06be7 gce: Exclude GCENodeDriver objects from _expand_node result
• PR #40122: (meaksh) Adding `’pkg.install downloadonly=True” support to yum/dnf execution module @ 2017-03-20T21:44:15Z
  - 4884397 Merge pull request #40122 from meaksh/2016.3-yum-downloadonly-support
  - 067f3f7 Adding downloadonly support to yum/dnf module
- **PR #40159**: (cro) Turn on sign_pub_messages by default. @ 2017-03-20T21:00:49Z
  - 60e1d4 Merge pull request #40159 from cro/sign_pub
  - e663b7 Fix small syntax error
  - 0a0f46f Turn on sign_pub_messages by default. Make sure messages with no `sig` are dropped with error when sign_pub_messages is True.

- **PR #40123**: (twangboy) Adds support for inet_pton in Windows to network util @ 2017-03-20T16:25:47Z
  - 28e4fc1 Merge pull request #40123 from twangboy/win_fix_network
  - 06d6d55 Adds support for inet_pton in Windows to network util

- **PR #40141**: (bobrik) Use the first address if cannot connect to any @ 2017-03-20T15:06:57Z
  - ISSUE #39995: (frogunder) Head of Develop - Multimaster error | refs: #40141
  - ISSUE #39118: (bobrik) Minion ipv6 option is not documented | refs: #39289
  - PR #39289: (bobrik) Autodetect IPv6 connectivity from minion to master | refs: #39766 #40141
  - 35dbb79 Merge pull request #40141 from bobrik/fallback-resolve
  - af1545d Use the first address if cannot connect to any

- **PR #40059**: (terminalmage) Fix traceback when virtualenv.managed is invoked with nonexistant user @ 2017-03-16T46:43Z
  - 116201f Merge pull request #40059 from terminalmage/fix-virtualenv-traceback
  - e3cfd29 Fix traceback when virtualenv.managed is invoked with nonexistant user

- **PR #40069**: (rallytime) Back-port #40056 to 2016.3 @ 2017-03-16T19:42:58Z
  - PR #40056: (thatch45) update mention bot blacklist | refs: #40069
  - a01b52b Merge pull request #40056 from rallytime/bp-40056
  - ae012db update mention bot blacklist

- **PR #40057**: (cachedout) More mentionbot blacklists @ 2017-03-16T18:10:11Z
  - d1570bb Merge pull request #40057 from cachedout/ollie_blacklist
  - 0ac2e83 Merge branch `2016.3' into ollie_blacklist

- **PR #40070**: (Ch3LL) update 2016.3.6 release notes with additional PR's @ 2017-03-16T15:43:22Z
  - d36bd1 Merge pull request #40070 from Ch3LL/2016.3.6_release
  - a1f8b49 update 2016.3.6 release notes with additional PR's

- **PR #40018**: (meaksh) Allows overriding `timeout` and `gather_job_timeout` to `manage.up` runner call @ 2017-03-15T19:43:01Z
  - 8dcccc Merge pull request #40018 from meaksh/2016.3-handling-timeouts-for-manage.up-runner
  - 9f5c977 Allows to set custom timeouts for `manage.up` and `manage.status`
  - 2102d9c Allows to set `timeout` and `gather_job_timeout` via kwargs

- **PR #40038**: (velom) correctly parse ```pkg_name===version``` from pip freeze @ 2017-03-15T19:30:03Z
  - 22fc529 Merge pull request #40038 from velom/fix-pip-freeze-parsing
  - 3fae91d correctly parse ```pkg_name==version``` from pip freeze

- **PR #40053**: (gtmanfred) Update rh_ip.py @ 2017-03-15T18:57:32Z
– ISSUE #40036: (oogali) UnboundLocalError: local variable `ifcfg` referenced before assignment | refs: #40053
– 3584f93 Merge pull request #40053 from saltstack/rh_ip_patch
– 219947a Update rh_ip.py

- PR #40041: (terminalmage) Fix transposed lines in salt.utils.process @ 2017-03-15T17:58:24Z
  - ISSUE #40011: (tsaridas) salt-minion does not shutdown properly 2016.11.3 rh6 | refs: #40041
  - 837432d Merge pull request #40041 from terminalmage/issue40011
  - 5b5d1b3 Fix transposed lines in salt.utils.process

- PR #40021: (Ch3LL) 2016.3.6 release notes with change log @ 2017-03-14T21:06:18Z
  - ee7f3b1 Merge pull request #40021 from Ch3LL/2016.3.6_release

- PR #40016: (terminalmage) Attempt to fix failing grains tests in 2016.3 @ 2017-03-14T18:34:32Z
  - 26895b7 Merge pull request #40016 from terminalmage/fix-grains-test
  - 0e81a4 Fixup a syntax error
  - 5d84b40 Attempt to fix failing grains tests in 2016.3

- PR #39980: (vutny) [2016.3] Allow to use bg kwarg for cmd.run state function @ 2017-03-14T17:16:14Z
  - 061d06 Merge pull request #39980 from vutny/cmd-run-state-bg
  - a81de9d [2016.3] Allow to use bg kwarg for cmd.run state function

- PR #39994: (rallytime) Add a versionadded tag for dockerng ulimits addition @ 2017-03-13T20:58:02Z
  - ISSUE #39942: (Foxlik) Web Documentation not in sync with release 2016.11.3 | refs: #39994
  - b042844 Merge pull request #39994 from rallytime/ulimits-dockerng-version
  - 37bd800 Add a versionadded tag for dockerng ulimits addition

- PR #39988: (terminalmage) Add comment explaining change from #39973 @ 2017-03-13T18:37:29Z
  - PR #39973: (terminalmage) Don’t use docker.Client instance from context if missing attributes
  - 6e12c94 Merge pull request #39988 from terminalmage/dockerng-timeout
  - bd2519e Add comment explaining change from #39973

- PR #39973: (terminalmage) Don’t use docker.Client instance from context if missing attributes @ 2017-03-11T14:57:50Z
  - cd0336e Merge pull request #39973 from terminalmage/dockerng-timeout
  - 869416e Don’t use docker.Client instance from context if missing attributes

- PR #39962: (cachedout) Disable mention bot delay on 2016.3 @ 2017-03-10T20:24:08Z
  - 282ce07 Merge pull request #39962 from cachedout/disable_mentionbot_delay_3
  - 7a638f2 Disable mention bot delay on 2016.3

- PR #39937: (cachedout) Fix --non-gpg-checks in zypper module @ 2017-03-10T18:02:51Z
  - 1e0c88a Merge pull request #39937 from cachedout/gpg_zypper
  - 13ed0d1 Fix --non-gpg-checks in zypper module
• PR #39929: *(terminalmage)* Scrap event-based approach for refreshing grains (2016.3 branch) @ 2017-03-09T22:03:16Z
  - 4526fc6 Merge pull request #39929 from terminalmage/pr-39770-2016.3
  - cf0100d Scrap event-based approach for refreshing grains

• PR #39919: *(The-Loeki)* CIDR matching supports IPv6, update docs @ 2017-03-09T16:03:00Z
  - ISSUE #22080: *(The-Loeki)* CIDR matching for IPv6 / improve IPv6 support in utils.network | refs: #39919
  - 111110c Merge pull request #39919 from The-Loeki/patch-1
  - 170cbad CIDR matching supports IPv6, update docs

• PR #39899: *(techhat)* Update cleanup function for azure @ 2017-03-08T23:28:33Z
  - caf10e9 Merge pull request #39899 from techhat/cleanupdisks
  - ba4579e Update cleanup function for azure

• PR #39871: *(terminalmage)* Squelch warning for pygit2 import @ 2017-03-07T20:40:18Z
  - fc9f5f3 Merge pull request #39871 from terminalmage/squelch-import-warning
  - 2b2ec69 Squelch warning for pygit2 import

• PR #39794: *(cachedout)* Clean up errors which might be thrown when the monitor socket shuts down @ 2017-03-04T16:12:37Z
  - f223fa8 Merge pull request #39794 from cachedout/clean_monitor_socket_shutdown
  - 2e683ce Clean up errors which might be thrown when the monitor socket shuts down

• PR #39624: *(drawsmcgraw)* Address issue 39622 @ 2017-03-03T15:59:04Z
  - ISSUE #39622: *(drawsmcgraw)* boto_vpc.create_subnet does not properly assign tags | refs: #39624
  - f575ef4 Merge pull request #39624 from drawsmcgraw/39622
  - 13da50b Fix indentation lint errors
  - 5450263 Address issue 39622

• PR #39820: *(ni3mm4nd)* Add missing apostrophe in Beacons topic documentation @ 2017-03-04T16:05:29Z
  - c08aaeb Merge pull request #39820 from ni3mm4nd/beacons_topic_doc_typo
  - 804b120 Add missing apostrophe

• PR #39826: *(cachedout)* Add group func to yubikey auth @ 2017-03-04T16:02:14Z
  - cbd2a4e Merge pull request #39826 from cachedout/yubikey_fix
  - 6125eff Add group func to yubikey auth

• PR #39624: *(drawsmcgraw)* Address issue 39622 @ 2017-03-03T15:59:04Z
  - ISSUE #39622: *(drawsmcgraw)* boto_vpc.create_subnet does not properly assign tags | refs: #39624
  - f575ef4 Merge pull request #39624 from drawsmcgraw/39622
  - 13da50b Fix indentation lint errors
  - 5450263 Address issue 39622

• PR #39796: *(cachedout)* Stop the process manager when it no longer has processes to manage @ 2017-03-02T23:03:13Z
  - ISSUE #39119: *(frogunder)* Head of 2016.3 - Salt-Master uses 90 seconds to restart | refs: #39796
  - 1f3619c Merge pull request #39796 from cachedout/master_shutdown
  - e31d46c Stop the process manager when it no longer has processes to manage
• PR #39791: (gtmanfred) load runners if role is master @ 2017-03-02T19:43:41Z
  - ISSUE #39333: (jagguli) Not Available error - Scheduling custom runner functions | refs: #39791

  - PR #25021: (GideonRed) Introduce ip:port minion config | refs: #39766
  - 4ee59be Merge pull request #39766 from rallytime/fix-ipv6-connection
  - 65b2396 Restore ipv6 connectivity and `\`master: <ip>:<port>`` support
• PR #39761: (cachedout) Properly display error in jboss7 state @ 2017-03-01T18:43:23Z
  - ISSUE #33187: (usbportnoy) Deploy to jboss TypeError at boss7.py:469 | refs: #39170 #39761
  - a24da31 Merge pull request #39761 from cachedout/issue_33187
  - c2df29e Properly display error in jboss7 state
• PR #39728: (rallytime) [2016.3] Bump latest release version to 2016.11.3 @ 2017-02-28T18:07:44Z
  - 0888bc3 Merge pull request #39728 from rallytime/update-release-ver-2016.3
  - c9bc8af [2016.3] Bump latest release version to 2016.11.3
• PR #39619: (terminalmage) Add a function to simply refresh the grains @ 2017-02-28T00:20:27Z
  - b52dbee Merge pull request #39619 from terminalmage/zd1207
  - c7db49 Fix mocking for grains refresh
  - 7e0ced3 Properly hand proxy minions
  - 692c456 Add a function to simply refresh the grains
• PR #39487: (bobrik) Document default permission modes for file module @ 2017-02-24T23:49:00Z
  - ISSUE #39482: (bobrik) file.managed and file mode don’t mention default mode | refs: #39487
  - 3fb5e6 Merge pull request #39487 from bobrik/mode-docs
  - 41ef69b Document default permission modes for file module
• PR #39641: (smarsching) Return runner return code in a way compatible with check_state_result @ 2017-02-24T23:07:11Z
- ISSUE #39169: (blueyed) Using batch-mode with salt.state in orchestration runner considers all minions to have failed | refs: #39641 #39641
- f7389bf Merge pull request #39641 from smarsching/issue-39169-2016.3
- 88c2d9a Fix return data structure for runner (issue #39169).

**PR #39633: (terminalmage) Fix misspelled argument in salt.modules.systemd.disable() @ 2017-02-24T18:21:36Z**
- fc970b6 Merge pull request #39633 from terminalmage/fix-systemd-typo
- ca54541 Add missing unit test for disable func
- 17109e1 Fix misspelled argument in salt.modules.systemd.disable()

**PR #39613: (terminalmage) Fix inaccurate documentation @ 2017-02-24T07:35Z**
- 53e78d6 Merge pull request #39613 from terminalmage/fix-docs
- 9342eda Fix inaccurate documentation

**PR #39600: (vutny) state.file: drop non-relevant examples for source_hash parameter @ 2017-02-23T16:55:27Z**
- 4e2b852 Merge pull request #39600 from vutny/state-file-docs
- 9b0427c state.file: drop non-relevant examples for source_hash parameter

**PR #39584: (cachedout) A note in the docs about mentionbot @ 2017-02-23T15:12:13Z**
- ed83420 Merge pull request #39584 from cachedout/mentionbot_docs
- 652044b A note in the docs about mentionbot

**PR #39583: (cachedout) Add empty blacklist to mention bot @ 2017-02-23T14:22:57Z**
- d3e50b4 Merge pull request #39583 from cachedout/mentionbot_blacklist
- 62491c9 Add empty blacklist to mention bot

**PR #39579: (rallytime) [2016.3] Pylint: Remove unused import @ 2017-02-22T23:46:33Z**
- 83520eb Merge pull request #39579 from rallytime/fixed-lint
- 6589ae1 [2016.3] Pylint: Remove unused import

**PR #39578: (cachedout) Add mention-bot configuration @ 2017-02-22T23:39:24Z**
- 43da32 Merge pull request #39578 from cachedout/2016.3
- 34499e Add mention-bot configuration

**PR #39542: (twangboy) Gate ssh_known_hosts state against Windows @ 2017-02-22T20:16:41Z**
- 8f7a0f9 Merge pull request #39542 from twangboy/gate_ssh_known_hosts
- c90a52e Remove expensive check
- 6d645ea Add __virtual__ function

**PR #39289: (bobrik) Autodetect IPv6 connectivity from minion to master | refs: #39766 #40141 @ 2017-02-22T19:05:32Z**
- ISSUE #39118: (bobrik) Minion ipv6 option is not documented | refs: #39289
- c10965 Merge pull request #39289 from bobrik/autodetect-ipv6
- 2761a1b Move new kwargs to the end of argument list
- 0df692 Narrow down connection exception to socket.error
- e8a2cc0 Do no try to connect to salt master in syndic config test
- af95786 Properly log address that failed to resolve or pass connection check
- 9a34fbe Actually connect to master instead of checking route availability
- c494839 Avoid bare exceptions in dns_check
- 29f3766 Rewrite dns_check to try to connect to address
- 55965ce Autodetect IPv6 connectivity from minion to master
- PR #39569: (s0undt3ch) Don't use our own six dictionary fixes in this branch @ 2017-02-22T18:59:49Z
  - 3fb928b Merge pull request #39569 from s0undt3ch/2016.3
  - 49da135 Don't use our own six dictionary fixes in this branch
- PR #39508: (dincamihai) Openscap @ 2017-02-22T18:36:36Z
  - 91e3319 Merge pull request #39508 from dincamihai/openscap
  - 9fde8b4 Always return oscap's stderr
  - 0ece2c Include oscap returncode in response
- PR #39562: (terminalmage) Add ulimits to dockerng state/exec module @ 2017-02-22T16:31:49Z
  - ISSUE #30802: (kjelle) Missing ulimits on docker.running / dockerng.running | refs: #39562
  - fbe2194 Merge pull request #39562 from terminalmage/issue30802
  - c503740 Add ulimits to dockerng state/exec module
  - da42040 Try the docker-py 2.0 client name first
- PR #39562: (terminalmage) Add ulimits to dockerng state/exec module @ 2017-02-22T16:31:49Z
  - ISSUE #30802: (kjelle) Missing ulimits on docker.running / dockerng.running | refs: #39562
  - fbe2194 Merge pull request #39562 from terminalmage/issue30802
  - c503740 Add ulimits to dockerng state/exec module
  - da42040 Try the docker-py 2.0 client name first
- PR #39498: (terminalmage) dockerng.get_client_args: Fix path for endpoint config for some versions of docker-py (#39544)
  - dff35b5 Merge pull request #39498 from terminalmage/pr-39483
  - 20b097a dockerng: compare sets instead of lists of security_opt
- PR #39497: (terminalmage) Two dockerng compatibility fixes @ 2017-02-19T17:43:36Z
  - 6418e72 Merge pull request #39497 from terminalmage/docker-compat-fixes
  - cbd0270 docker: make docker-exec the default execution driver
  - a6a17d5 Handle docker-py 2.0's new host_config path
- PR #39423: (dincamihai) Openscap module @ 2017-02-17T18:31:04Z
  - 9c4292f Merge pull request #39423 from dincamihai/openscap
  - 9d13422 OpenSCAP module
- PR #39464: (gtmanfred) skip false values from preferred_ip @ 2017-02-16T22:48:32Z
  - ISSUE #39444: (elem-compilatio) salt-cloud - IPv6 and IPv4 private_ips - preferred_ip sends False to is_public_ip | refs: #39464
  - 7dd2502 Merge pull request #39464 from gtmanfred/2016.3
  - f829d6f skip false values from preferred_ip
- PR #39460: (cachedout) Fix mocks in win_dism tests @ 2017-02-16T19:27:48Z
  - db359ff Merge pull request #39460 from cachedout/win_dism_test_fix
- e652a45 Fix mocks in win_disim tests

- **PR #39426**: (morganwillcock) win_dism: Return failure when package path does not exist @ 2017-02-16T00:22Z
  - 9dbba9 Merge pull request #39426 from morganwillcock/dism
  - a7d5118 Return failure when package path does not exist

- **PR #39431**: (UtahDave) Fix grains.setval performance @ 2017-02-15T23:56:30Z
  - 5616270 Merge pull request #39431 from UtahDave/fx_grains.setval_performance
  - 391bbec add docs
  - 709c197 allow sync_grains to be disabled on grains.setval

- **PR #39405**: (rallytime) Update :depends: docs for boto states and modules @ 2017-02-15T17:32:08Z
  - ISSUE #39304: (Auha) boto_s3_bucket documentation dependency clarification | refs: #39405
  - 239e16e Merge pull request #39405 from rallytime/fx-39304
  - bd1fe03 Update :depends: docs for boto states and modules

- **PR #39411**: (rallytime) Update external_cache docs with other configuration options @ 2017-02-15T17:30:40Z
  - ISSUE #38762: (oz123) Configuration information for custom returners | refs: #39411
  - 415102f Merge pull request #39411 from rallytime/fx-38762
  - e13febe Update external_cache docs with other configuration options

- 7e1803b Update docs on upstream EPEL7 pygit2/libgit2 issues (#39421)
  - **PR #39421**: (terminalmage) Update docs on upstream EPEL7 pygit2/libgit2 issues

- 4ff13ac salt.filesserver.roots: Fix regression in symlink_list (#39409)
  - **PR #39409**: (terminalmage) salt.filesserver.roots: Fix regression in symlink_list
  - **PR #39337**: (terminalmage) Don't re-walk the roots fileserver in symlink_list() | refs: #39409

- **PR #39362**: (dincamihai) Add cp.push test @ 2017-02-14T18:42:11Z
  - 8b8ab8e Merge pull request #39362 from dincamihai/cp-push-test-2016.3
  - 91383c5 Add cp.push test

- **PR #39380**: (joe-niland) Quote numeric user names so pwd.getpwnam handles them properly @ 2017-02-14T18:33:33Z
  - 4b726f9 Merge pull request #39380 from joe-niland/quote-numeric-usernames
  - c2edff3 Quote numeric user names so pwd.getpwnam handles them properly

- **PR #39400**: (meaksh) Prevents `OSError` exception in case certain job cache path doesn't exist @ 2017-02-14T18:27:04Z
  - 1116d32 Merge pull request #39400 from meaksh/2016.3-fix-local-cache-issue
  - e7e559e Prevents `OSError` exception in case path doesn't exist

- **PR #39300**: (terminalmage) Replace more usage of str.format in the loader @ 2017-02-13T19:01:19Z
  - **PR #39227**: (terminalmage) Loader optimization | refs: #39300
  - 6c854da Merge pull request #39300 from terminalmage/loader-optimization
  - d3e5d15 Replace more usage of str.format in the loader

---

  - PR #10792: (cachedout) Documentation overhaul | refs: #39173
  - a40cb46 Merge pull request #39173 from rallytime/restore-community-docs
  - 5aedd4 Restore `Salt Community” doc section
- 9de08af Apply fix from #38705 to 2016.3 branch (#39077)
  - ISSUE #38704: (nassenbaer13) Archive extracted fails when another state run is queued | refs: #38705
  - PR #39077: (terminalmage) Apply fix from #38705 to 2016.3 branch
  - PR #38705: (nassenbaer13) Fix for #38704 archive extracted and dockerio states
- **da3053e** update vmware getting started doc (#39146)
  - PR #39146: (gtmanfred) update vmware getting started doc
- **e78ca0f** Fixing a weird edge case when using salt syndics and targeting via pillar. Without this fix the master of masters ends up in an infinite loop since the data returned from the minions is differently structured than if a sync was not in use. (#39145)
  - PR #39145: (garethgreenaway) [2016.3] Fix when targeting via pillar with Salt syndic
- **PR #38804**: (alexbleotu) Second attempt to fix prepending of root_dir to paths @ 2017-02-02T16:10:37Z
  - ISSUE #2016: (seanchannel) status.custom failing on any arguments
  - ISSUE #3: (thatch45) libvirt module
  - ISSUE #1: (thatch45) Enable regex on the salt cli
  - cd8077a Merge pull request #38804 from alexbleotu/root_dir_`fix-2016`_.3-gh
  - b3bddd3 Add missing whiteline
  - c7715ac Merge pull request #3 from cro/ab_rootsdirfix
  - * e8cbafa When running testsuite, salt.syspaths.ROOT_DIR is often empty.
  - b12dd44 Merge pull request #1 from cro/ab_rootsdirfix
  - * bffc537 Remove extra if statements (rstrip will check for the presence anyway).
  - 97521b3 Second attempt to fix prepending of root_dir to paths
- **6ffeda3** Clarify ipv6 option for minion and interface for master, closes #39118 (#39131)
  - ISSUE #39118: (bobrik) Minion ipv6 option is not documented | refs: #39289
  - PR #39131: (bobrik) Clarify ipv6 option for minion and interface for master, closes #39118
- **646b9ea** Don’t abort pillar.get with merge=True if default is None (#39116)
  - PR #39116: (terminalmage) Don’t abort pillar.get with merge=True if default is None
- **PR #39091**: (terminalmage) Run test_valid_docs in batches @ 2017-02-01T19:09:05Z
  - cc9b69b Merge pull request #39091 from terminalmage/update-test-valid-docs
  - d76f038 add debug logging for batch vars
  - b4afea2 Don’t fail test if data is empty
  - b3a5d54 Account for trimmed value in `salt -d` output
  - 909916c Run test_valid_docs in batches
- **bcee3d1** Move fileclient tests to tests/integration/fileserver/fileclient_test.py (#39081)
  - PR #39081: (terminalmage) Move fileclient tests to tests/integration/fileserver/fileclient_test.py
- **122422b** Bump openstack deprecation notice to Oxygen (#39067)
  - PR #39067: (rallytime) Bump openstack deprecation notice to Oxygen
- **PR #39047**: (rallytime) [2016.3] Merge forward from 2015.8 to 2016.3 @ 2017-01-30T23:48:14Z
  - PR #39046: (rallytime) Add 2015.8.14 release notes file
  - PR #39037: (rallytime) Update 2015.8.13 release notes
  - a24af5a Merge pull request #39047 from rallytime/merge-2016.3
  - b732a1f Merge branch `2015.8` into `2016.3`
Chapter 18. Release Notes

- 56cca6 Add 2015.8.14 release notes file (#39046)
- 5943fe6 Update 2015.8.13 release notes (#39037)

- PR #39045: (rallytime) Add 2016.3.6 release notes file

- PR #39042: (rallytime) [2016.3] Update release numbers for doc build

- PR #39045: (rallytime) Add 2016.3.6 release notes file

- PR #39038: (rallytime) Update 2016.3.5 release notes

- PR #39028: (terminalmage) Clarify delimiter argument @ 2017-01-30T18:20:26Z

- 1f3b9e Enable __proxy__ availability in states, highstate, and utils. Enable __utils__ availability in proxies. (#38899)

- ISSUE #38753: (alexbleotu) __proxy__ dunder is not injected when invoking the salt variable in sls files | refs: #38899 #38829

- ISSUE #38557: (alexbleotu) Proxy not working on develop | refs: #38829

- ISSUE #38265: (mirceaulinic) __utils__ object not available in proxy module | refs: #38899 #38829 #38829

- ISSUE #32918: (mirceaulinic) Proxy minions reconnection | refs: #38829

- PR #38899: (cro) Enable __proxy__ availability in states, highstate, and utils. Enable __utils__ availability in proxies.

- PR #38829: (cro) MANY dunder variable fixes for proxies + proxy keepalive from @mirceaulinic | refs: #38899

- PR #38951: (DmitryKuzmenko) Keep the only one record per module-function in depends decorator. @ 2017-01-27T17:05:42Z

- ISSUE #37938: (johje349) Memory leak in Reactor | refs: #38951

- ISSUE #33890: (hvnswetting) salt memleak when running state.sls | refs: #38951

- da96221 Merge pull request #38951 from DSRCorporation/bugs/37938_fix_depends_decorator_memleak

- 0b18f34 Keep the only one record per module-function in depends decorator.

- PR #38982: (rallytime) Set response when using `\``GET``\` method in s3 utils @ 2017-01-27T17:04:48Z

- ISSUE #34780: (joehoyle) S3fs broken in 2016.3.1 | refs: #38982

- 8516ed Merge pull request #38982 from rallytime/fixed-34780

- 1583c55 Set response when using `\``GET``\` method in s3 utils

- PR #38989: (anlutro) Documentation: fix SLS in environment variable examples @ 2017-01-27T17:00:08Z

- cfdbe99 Merge pull request #38989 from alprs/docfix-state_pt3_environ
- 52a9ad1 fix SLS in environment variable examples

**PR #39000:** *(rallytime)* Skip the test_badload test until Jenkins move is complete @ 2017-01-27T16:58:21Z
- 55e4d25 Merge pull request #39000 from rallytime/skip-badload-test
- 4b3f0f Skip the test_badload test until Jenkins move is complete

**PR #38995:** *(terminalmage)* Fix pillar.item docstring @ 2017-01-27T16:58:00Z
- fe054eb Merge pull request #38995 from terminalmage/fix-pillar.item-docstring
- 06d094d Fix pillar.item docstring

**PR #38950:** *(mbom2004)* Fixed Logstash Engine in file logstash.py @ 2017-01-26T19:10:07Z
- ISSUE #34551: *(mbom2004)* salt.engines.logstash not loading | refs: #38950
- b66b6f6 Merge pull request #38950 from mbom2004/2016.3
- c09f39d Remove unused json import
- 249efa3 Fixed Logstash Engine in file logstash.py

- a6c6e47 Handle changing ``is_default`` value in moto package for boto test mock (#38973)
  - PR #38973: *(rallytime)* Handle changing ``is_default`` value in moto package for boto test mock

**PR #38952:** *(terminalmage)* Make the ext_pillars available to pillar.ext tunable @ 2017-01-26T19:01:56Z
- b965b5d Merge pull request #38952 from terminalmage/zh1168
- 6b014e5 Rename on_demand_pillar to on_demand_ext_pillar
- d216f90 Document new on_demand_pillar option and add to config template
- 426b20f Add documentation for on-demand pillar to pillar.ext docstring
- 7b10274 Make on-demand ext_pillars tunable
- d54723c Add on_demand_pillar config option

**PR #38948:** *(rallytime)* Bump the template context deprecation version to Oxygen @ 2017-01-25T19:45:59Z
- ISSUE #35777: *(rallytime)* Properly deprecate template context data in Oxygen | refs: #38948
- 2c4a485 Merge pull request #38948 from rallytime/bump-template-context-deprecation
- 749e003 Bump the template context deprecation version to Oxygen

**PR #38946:** *(rallytime)* Back-port #37632 to 2016.3 @ 2017-01-25T19:40:40Z
- PR #37632: *(twangboy)* Fix versions report for Windows Server platforms | refs: #38946
- e4514ca Merge pull request #38946 from rallytime/bp-37632
- ee37ca Fix some lint
- c08071e Fix versions report for server OSs

**PR #38913:** *(Adaephon-GH)* Ignore plist files without Label key @ 2017-01-25T19:07:27Z
- 953a203 Merge pull request #38913 from Adaephon-GH/patch-1
- e2fa16 Removing trailing whitespace
- 616292c Ignore plist files without Label key

**PR #38917:** *(twangboy)* Update Jinja2 to 2.9.4 @ 2017-01-25T19:05:38Z
- 826dce1 Merge pull request #38917 from twangboy/update_jinja_mac
- 62e608b Update Jinja2 to 2.9.4

- **PR #38925:** *(terminalmage)* Fix two wheel issues in netapi @ 2017-01-25T18:28:52Z
  - **ISSUE #38540:** *(amendlik)* API wheel client throws exception and success=true | refs: #38925
  - **ISSUE #38537:** *(amendlik)* API client wheel_async always returns status 500 | refs: #38925
  - b27733c Merge pull request #38925 from terminalmage/issue38540
  - 76392fc Fix traceback when a netapi module uses wheel_async
  - bd4474f Fix `success` value for wheel commands

- **PR #38926:** *(gtmanfred)* add note about pysss for pam eauth @ 2017-01-25T18:12:20Z
  - 618596f Merge pull request #38926 from gtmanfred/2016.3
  - 9cae953 add note about pysss for pam eauth

- **PR #38847:** *(terminalmage)* Catch MinionError in file.source_list @ 2017-01-24T16:03:10Z
  - **ISSUE #38825:** *(IshMalik)* file.managed multiple sources for redundancy failure | refs: #38847
  - 405d86a Merge pull request #38847 from terminalmage/issue38825
  - 11a4780 Use log.exception() instead
  - e40fac5 Catch MinionError in file.source_list

- **PR #38875:** *(terminalmage)* Reactor: fix traceback when salt:// path is nonexistent @ 2017-01-24T15:23:39Z
  - **ISSUE #36121:** *(Ashald)* TemplateNotFound/Unable to cache file | refs: #38875
  - b5df104 Merge pull request #38875 from terminalmage/issue36121
  - fbc4d2a reactor: ensure glob_ref is a string
  - 2e443d7 cp.cache_file: add note re: return for nonexistent salt:// path

- **PR #38890:** *(cro)* Backport #38887 to 2016.3: Enable resetting a VM via salt-cloud & VMware driver @ 2017-01-24T15:15:35Z
  - **ISSUE #37413:** *(Snarfingcode666)* Salt-cloud vmware missing reboot command | refs: #38890
  - e9ebc4c Merge pull request #38890 from cro/vmware_reset_vm_20163
  - 0146562 Call correct function for resetting a VM

- **PR #38883:** *(techhat)* Don’t require text_out path to exist @ 2017-01-23T18:20:42Z
  - **PR #38867:** *(mchugh19)* Touch deploy.sh before use | refs: #38883
  - **PR #32026:** *(techhat)* Don’t require the decode_out file to already exist | refs: #38883
  - c3bf6d0 Merge pull request #38883 from techhat/dontrequire
  - 67bc4d6 Don’t require text_out path to exist

- **PR #38851:** *(terminalmage)* Support docker-py 2.0 in dockerng @ 2017-01-23T15:48:12Z
  - 6430a45 Merge pull request #38851 from terminalmage/docker-py-2.0
  - 3c061b2 Support docker-py 2.0 in dockerng

- **PR #38844:** *(cachedout)* Fix memory leak in HTTP client @ 2017-01-20T20:59:14Z
  - ac8008d Merge pull request #38844 from cachedout/http_memory_leak
  - c46bf85 Fix memory leak in HTTP client
18.2.8 Salt 2016.3.7 Release Notes

Version 2016.3.7 is a bugfix release for 2016.3.0.

New master configuration option allow_minion_key_revoke, defaults to True. This option controls whether a minion can request that the master revoke its key. When True, a minion can request a key revocation and the master will comply. If it is False, the key will not be revoked by the master.

New master configuration option require_minion_sign_messages This requires that minions cryptographically sign the messages they publish to the master. If minions are not signing, then log this information at loglevel `INFO' and drop the message without acting on it.

New master configuration option drop_messages_signature_fail Drop messages from minions when their signatures do not validate. Note that when this option is False but require_minion_sign_messages is True minions MUST sign their messages but the validity of their signatures is ignored.

New minion configuration option minion_sign_messages Causes the minion to cryptographically sign the payload of messages it places on the event bus for the master. The payloads are signed with the minion's private key so the master can verify the signature with its public key.

18.2.9 Salt 2015.8.0 Release Notes - Codename Beryllium

2015.8.0 Detailed Change List

Extended changelog courtesy of Todd Stansell (https://github.com/tjstansell/salt-changelogs)

Generated at: 2015-09-09T18:15:43Z

This list includes all pull requests merged into the 2015.8 branch between the forking of the branch from develop and the release of 2015.8.0.

Statistics:

- Total Merges: 682
- Total Issue references: 342
- Total PR references: 866

Pull Requests:

- #26993: (whiteinge) Backport #26975
- #26970: (cachedout) Revert ´better path query parsing in fileserver´
- #26980: (terminalmage) Use human-readable cachedirs for gitsfs-backed winrepo
- #26969: (TheBigBear) URL of salt windows downloads has changed
- #26968: (TheBigBear) URL of salt windows downloads has changed
- #26958: (s0undt3ch) Bradthurber bootstrap command line help doc update
- #26949: (rallytime) Back-port #25148 to 2015.8
• #26914: (cro) Add salt-proxy script and manpage to setup.py so they will get installed.
• #26909: (terminalmage) Don't try to git clone from /tmp on Windows
• #26910: (s0undt3ch) Sometimes the event system is just too fast
• #26905: (s0undt3ch) Exit the loop if run_once is true
• #26897: (msteed) spm file hash part deux
• #26900: (s0undt3ch) If no tag is passed, don't actually subscribe to anything.
• #26880: (s0undt3ch) Restore backwards compatibility to salt.utils.event
• #26896: (msteed) spm remove: use pkgfiles to calculate file hashes
• #26891: (jtand) Fixed an unboundlocalerror
• #26892: (cachedout) Make the testing iloop the current one
• #26886: (jtand) Gets the azure version correctly on python-azure 1.0.0
• #26870: (rallytime) Back-port #26834 to 2015.8
• #26865: (dmurphy18) Fix apt preferences for apts, repos for pbuilder building for Debian
• #26873: (terminalmage) Properly handle getting local config values in older git versions
• #26869: (rallytime) Fix provider --> driver change for salt-cloud lxc
• #26858: (terminalmage) Fix a couple version checks for git state and execution module
• #26853: (UtahDave) Fix salt-cloud on windows
• #26852: (basepi) [2015.8] Only reference msgpack if it imported successfully
• #26835: (terminalmage) Backport #26572 to 2015.8
• #26836: (jacobhammons) Added rst source for salt-proxy man page, added build and copy lines ...
• #26818: (terminalmage) Support empty repositories in git.latest
• #26819: (rallytime) Make sure we're calling _validate_name in the correct place in 2015.8 Linode driver
• #26841: (l2ol33rt) Fix reference before assignment in sqs engine
• #26822: (terminalmage) Add some missing imports for masterless winrepo
• #26831: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
• #26826: (techhat) Pass a package name to unregister_file()
• #26757: (cachedout) Fix various filehandle leaks
• #26816: (gtmanfred) rev defaults to HEAD
• #26801: (jacobhammons) Added doc for dockerng minion configuration options
• #26808: (anlutro) Fix git init argument formatting
• #26807: (terminalmage) Move salt.utils.iteresplit() to salt.utils.iterertools.split()
• #26796: (jacobhammons) Add doc for __states__
• #26764: (sjorge) salt.utils.is_proxy() is no longer always true on SunOS/Illumos/SmartOS
• #26772: (sjorge) pull in smartsos `virt` module from develop
• #26726: (terminalmage) Redact HTTPS Basic Auth in states/funcs which deal with git remotes
• #26769: (terminalmage) Use --track to set tracking branch on older git versions
• #26765: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
• #26761: (sjorge) fix SPM paths on smartos/illum os esky
• #26751: (terminalmage) Fixes for masterless winrepo
• #26745: (rallytime) Make sure pyrax configs are in place before checking for deps
• #26746: (rallytime) Make sure nova configs are set before checking for dependencies
• #26750: (basepi) [2015.8] Add __utils__ to state modules
• #26752: (cro) Fix typo in some diagram labels
• #26747: (basepi) [2015.8] Add __states__ to state modules, for cross-calling states
• #26744: (basepi) [2015.8] Fix issue from #26717
• #26737: (dmurphy18) Fix to allow for package naming other than just salt
• #26742: (rallytime) Only warn about vsphere deprecation if vsphere is configured
• #26733: (sjorge) Refactor of smartos_vmadm module
• #26735: (s0undt3ch) Add .hg and .cvs to spm_build_exclude
• #26720: (UtahDave) Updates for winrepo in 2015.8 to support jinja, while maintaining backwards compat
• #26719: (jodv) Backport 26532 to 2015.8
• #26721: (rallytime) Linode Driver Cleanup
• #26707: (techhat) Add top_level_dir to FORMULAs
• #26723: (s0undt3ch) Handle SPM paths in the setup script
• #26717: (basepi) [2015.8] Revert loader changes from #26645
• #26712: (techhat) Move SPM paths around
• #26680: (TheBigBear) add more python libs info in `--versions-report`
• #26716: (terminalmage) Allow git identity to be a list
• #26691: (garethgreenaway) Fixes to ipset module for 2015.8
• #26701: (kev009) Ignore the first element of kern.disks split, which is the sysctl name (new disks grain)
• #26678: (terminalmage) Restructure git.latest rewrite to work better when following HEAD
• #26679: (rallytime) Back-port #26661 to 2015.8
• #26684: (techhat) Add reactor formulas tospm
• #26682: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
• #26671: (rallytime) Warn users if cloud driver dependencies are missing.
• #26674: (rallytime) Back-port #26583 to 2015.8
• #26670: (techhat) Set up SPM to install -conf packages
• #26657: (jfindlay) top file compilation fixes
• #26659: (TheBigBear) minor doc edits - spelling
• #26654: (jfindlay) merge `#26650`_
• #26657: (jtand) Added git version check to git module
• #26649: (twangboy) Fixed Lint for real in win_repo.py
#26608: (jacobhammons) 2015.8.0 release notes and doc/conf.py updates

#26646: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8

#26645: (rallytime) Back-port #26390 to 2015.8

#26642: (twangboy) Added function to render winrepo Jinja

#26625: (twangboy) Correctly detect packages with no version, docs

#26575: (msteed) Update spm for integration into raas

#26635: (cro) Don't report windows as a proxy.

#26622: (rallytime) [2015.8] Also add -Z to script args for cloud tests

#26619: (rallytime) Apply cloud test fixes from 2015.5 to 2015.8

#26603: (terminalmage) Fixes for git.latest, git module integration tests, etc.

#26577: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8

#26534: (cachedout) Bump required Tornado version to 4.2.1

#26566: (cachedout) Don't stacktrace trying to publish without a master

#26541: (terminalmage) Make winrepo execution module use the same code as the runner

#26530: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8

#26570: (cachedout) Fix haproxy docs to be valid

#26562: (cachedout) Fix suprious error message with systemd-detect

#26557: (jfindlay) add docs to #26550

#26544: (nmadhok) Do not raise KeyError when calling avail_images if VM/template is in disconnected state

#26501: (terminalmage) Update git_pillar docs, add git.list_worktrees function

#26521: (terminalmage) Work around upstream git bug when cloning repo as root

#26518: (krak3n) Fix for "#25492"_

#26514: (evverx) Unmask a runtime masked services too

#26529: (mnalt) bugfix: fix service.enable for missing rc.conf

#26516: (techhat) Move more path operations into SPM loader

#26533: (cachedout) Fix too aggressive even init check

#26522: (cro) Do not load package provider if its not a proxy

#26531: (cachedout) Fix failing event tests and modify event init

#26433: (cro) Add support for default proxy config options, change default location of proxy config and log to /etc/salt/proxy and /var/log/proxy

#26504: (nmadhok) [Backport] Adding ability to specify the virtual hardware version when creating VM

#26517: (cachedout) Better fix for opensuse tornado httpclient

#26479: (rallytime) Don't allow VMs with duplicate names to be created in EC2/AWS

#26488: (cachedout) Don't pass unsupported kwarg to tornado

#26451: (terminalmage) Use 'rpm -qa' instead of repoquery to list installed packages

#26491: (jacobhammons) doc site css fix for tiny fonts that appeared in code or pre tags in ...
• #26442: (rallytime) Hide API Key from debug logs for Linode Driver
• #26441: (rallytime) Refactor a few linode functions to be useful with salt-cloud command
• #26485: (s0undt3ch) One more missed typo
• #26495: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
• #26492: (cachedout) Fix schedule test error on py26
• #26489: (cachedout) Fixing more tarfile tests on py2.6
• #26475: (cachedout) Better object checking on asyncreq cleanup
• #26477: (cachedout) Fix integration.modules.git.GitModuleTest.test_archive on py26
• #26469: (jtand) --annotate and --message aren't valid options in older versions of git.
• #26439: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
• #26464: (rallytime) Back-port #26456 to 2015.8
• #26463: (rallytime) Back-port #26455 to 2015.8
• #26449: (s0undt3ch) The CLI options are not meant to include underscores.
• #26270: (sjorge) salt.modules.network now supports SmartOS and SunOS < Solaris 11
• #26436: (TheBigBear) minor edits
• #26410: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
• #26427: (anlutro) git.latest with no rev: fix concatenation error (NoneType and str)
• #26307: (cachedout) Fix bug in top file ordering
• #26428: (cro) Update docs to reflect new pillar structure
• #26429: (cachedout) Add release note regarding tcp transport on freebsd
• #26418: (driskell) Fix forward-merged caching from 2015.5 into 2015.8 to be compatible with the new match_func
• #26252: (DmitryKuzmenko) Issues/24048 http client 2015.8
• #26413: (evverx) Fix service.[start,restart,reload,force-reload] for masked services
• #26393: (dmurphy18) Added option parameters to make_repo to allow for configuration settings
• #26422: (TheBigBear) no dots in SLS filename __AND__ any directories (incl git repos)
• #26323: (0xf10e) Fix Credentials used in glance Exec Module
• #26341: (terminalmage) Rewrite git state and execution modules
• #26419: (terminalmage) Only use pygit2.errors if it exists
• #26423: (ellasp) doc - Correct function name for peer configuration
• #26401: (cachedout) Adapt proxy minion to tornado (w/lint)
• #26400: (rallytime) Back-port #26318 to 2015.8
• #26397: (s0undt3ch) A single isinstance() check for all types is enough
• #26385: (gtmanfred) don't require volume endpoint in nova driver
• #26287: (techhat) Break out SPM components into loaders
• #26384: (TheBigBear) Fix shell quoting for cmd.run
• #26391: (rallytime) Back-port #26367 to 2015.8
• #26383: (rallytime) Allow the creation of a VM without a profile
• #26375: (s0undt3ch) [2015.8] Schema DictItem required attribute fixes
• #26363: (garethgreenaway) Fixes to mount state 2015.8
• #26347: (0xf10e) Load `pkgng' as `pkg' on FreeBSD 9 when providers:pkg == `pkgng'
• #26361: (TronPaul) sign security token
• #26346: (TronPaul) Fix s3 using IAM credentials
• #26331: (mnalt) fix bug in sysrc to allow for empty rc variables
• #26334: (rallytime) Call salt.utils.cloud.bootstrap in GCE Driver provisioning
• #26308: (dmurphy18) Support for environment overrides building packages
• #26279: (TheScriptSage) Merge changes for pull`#26083` and pull`#25632` into 2015.8
• #26224: (cachedout) Cleanup of a few cases to move to salt.utils.fopen
• #26260: (nmadhok) Correct spelling of integration in docs
• #26226: (rallytime) Fix `#25463`
• #26248: (nmadhok) Initial commit of unit tests for vmware cloud driver
• #26228: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
• #26244: (nmadhok) Backport additions to VMware cloud driver from develop to 2015.8 branch
• #26235: (sjorge) salt.utils.is_smartos_zone, inverse of is_smartos_globalzone
• #26221: (sjorge) SmartOS grain fixes
• #26218: (terminalmage) Add warning about file.recurse unicode errors with vim swap files.
• #26214: (rallytime) Back-port #24878 to 2015.8
• #26211: (techhat) Move SPM to its own directory
• #26197: (TronPaul) Fix GitFS when whitelisting base
• #26200: (anlutro) Make it possible to run salt-cloud as current user
• #26201: (kev009) Avoid VBOX storage emulation bugs in FreeBSD disks grain
• #26188: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
• #26194: (basepi) Allow virtual grains to be generated even if virt-what is not available
• #26176: (rallytime) Back-port #26165 to 2015.8
• #26169: (terminalmage) Fix attribute error in gits' find_file functions
• #26170: (nmadhok) [Backport] Make sure variable is a dictionary before popping something from it.
• #26143: (nmadhok) VMware cloud driver fixes [forward port from 2015.5 into 2015.8]
• #26173: (jacobhammons) Updates to cloud docs for the provider > driver change
• #26125: (evverx) Use timedatectl set-timezone to tzsetting if available
• #26145: (sjorge) smartos_imgadm cleanup
• #26148: (terminalmage) Refactor winrepo support
• #26128: (sjorge) imgadm.avail should return multiple results
- #26109: (jfindlay) fix quote indent
- #26089: (anlutro) User state/module: fix coercing of None into string `"None" in GECOS
- #26081: (cachedout) Move invocation routine up
- #26086: (rallytime) Back-port #26019 to 2015.8
- #26087: (rallytime) Back-port #26059 to 2015.8
- #26052: (jtand) Rh_ip fix
- #26078: (cachedout) Fix missing key in error return
- #26074: (basepi) [2015.8] Re-apply #25358 in 2015.8
- #26069: (jfindlay) fix win_firewall.delete_rule
- #26066: (s0undt3ch) [2015.8] Update to latest bootstrap stable release v2015.06.08
- #26049: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
- #26026: (anlutro) Fix htpasswd result false positive in test mode
- #26037: (rallytime) Back-port #25489 to 2015.8
- #26004: (techhat) Allow updating a single SPM repo at a time
- #26012: (cachedout) Merge kwargs into opts for tcp client
- #26007: (anlutro) file.managed: wrap os.remove in if isfile, don't remove on success
- #26009: (terminalmage) Add winrepo and dockerNG information to 2015.8.0 release notes
- #26006: (basepi) Revert #25727 in favor of #25645
- #26001: (cachedout) Fix failing tests
- #25978: (anlutro) Correct service state changes in test mode
- #25982: (sjorge) salt.modules.smartos_* limit to global zone only
- #25989: (rallytime) Back-port #25832 to 2015.8
- #25988: (cachedout) Move #25642 to 2015.8
- #25999: (s0undt3ch) Include subschema defaults
- #25997: (s0undt3ch) Allow getting a defaults dictionary from schema defaults
- #25979: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
- #25902: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
- #25956: (anlutro) Fix user argument to cron functions
- #25946: (sjorge) Fix for salt.utils.decorators under esky
- #25957: (anlutro) Remove temporary file after file.managed with checkcmd
- #25874: (rallytime) Back-port #25668 to 2015.8
- #25929: (sjorge) salt.module.pkgin's __virtual__() should not return None if pkg_info is not present
- #25952: (garethgreenaway) Log when event.fire and event.fire_master fail 2015.8
- #25944: (sjorge) Smartos libcrypto nonesky fix
- #25906: (dmurphy18) Cherry-pick of pkgbuild changes from develop branch
- #25925: (sjorge) Create default log location in smartos esky buildscript
- #25928: *(cachedout)* Fix stacktrace for non-existant states
- #25922: *(jacksontj)* Correct max_wait -> max_auth_wait in MultiMinion
- #25907: *(rallytime)* Back-port #25892 to 2015.8
- #25910: *(terminalmage)* Pass osarch to check_32()
- #25849: *(basepi)* Repress template error for GPG renderer (can't seek an OrderedDict)
- #25868: *(rallytime)* Back-port #25404 to 2015.8
- #25896: *(cachedout)* Lint
- #25876: *(jacksontj)* Fixes for 2015.8
- #25867: *(rallytime)* Back-port #25370 to 2015.8
- #25845: *(jacobhammons)* updated versionadded
- #25836: *(jacksontj)* Keep track of SyncWrapper's IOLoop usage
- #25859: *(0xf10e)* warn_until(Carbon,...) instead of Boron
- #25505: *(0xf10e)* Glance state module for 2015.8 `"Beryllium"
- #25843: *(jtand)* Fixed a lint error in parsers.py
- #25835: *(techhat)* spm update_repo doesn't always require arguments
- #25837: *(jacobhammons)* regenerated man pages
- #25830: *(sjorge)* Loading of libcrypto on smartos esky fixed
- #25808: *(jfindlay)* add highstate opts to config/___init__.py, update docs
- #25820: *(sjorge)* Prerequisite to fix the smartos libcrypto loading
- #25781: *(anlutro)* Fix iptables.build_rule
- #25764: *(gtmanfred)* allow use of cloudnetworks in ssh_interface
- #25736: *(jfindlay)* insert explicit formatter number
- #25742: *(rallytime)* Back-port #25731 to 2015.8
- #25741: *(rallytime)* Back-port #25727 to 2015.8
- #25712: *(cachedout)* Fix outputter for state.apply
- #25698: *(rallytime)* Back-port #25659 to 2015.8
- #25690: *(anlutro)* Fix highstate duration alignment (again)
- #25684: *(davidjb)* Fix doc around Include/Exclude for states
- #25549: *(techhat)* Switch Scaleway to salt.utils.cloud.bootstrap()
- #25667: *(jfindlay)* add 2015.8.0rc2 autogenerated changelog
- #25653: *(anlutro)* Properly align highstate duration sum
- #25663: *(rallytime)* Back-port #25638 to 2015.8
- #25639: *(terminalmage)* Don't do pre-flight check on git_pillar if it is not configured
- #25587: *(cachedout)* Fix prereq in salt.state
- #25628: *(anlutro)* Highstate output: show duration in seconds instead of milliseconds when appropriate
- #25631: *(basepi)* Remove trailing whitespace
- #25627: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
- #25626: (basepi) Fix the highstate outputter if `duration` is not present
- #25601: (terminalmage) Fix error message when local bin pkg path is not absolute
- #25595: (terminalmage) Bring git_pillar up to feature parity with gitfs
- #25619: (cachedout) Lint stateconf changes
- #25578: (davidjb) Allow parent relative includes in state files
- #25610: (s0undt3ch) [2015.8] Update the bootstrap script to latest release v2015.07.22
- #25599: (jfindlay) fix transport settings in #25596
- #25596: (jfindlay) Tcp test
- #25591: (garethgreenaway) Return data for scheduled jobs in 2015.8 default to True.
- #25588: (basepi) Fix some of the retcode work from #23105
- #25583: (jtand) Fixed lint error where pprint wasn't imported.
- #25572: (rallytime) Back-port #25570 to 2015.8
- #25575: (rallytime) Make Sure Scaleway driver works with deprecation paths
- #25564: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
- #25566: (techhat) Fix download process for SPM repo updates
- #25553: (techhat) Switch SoftLayer to salt.utils.cloud.bootstrap()
- #25552: (techhat) Update pricing for SoftLayerHW
- #25547: (techhat) Switch Parallels to salt.utils.cloud.bootstrap()
- #25548: (techhat) Switch Proxmox to salt.utils.cloud.bootstrap()
- #25543: (techhat) Switch GCE to salt.utils.cloud.bootstrap()
- #25546: (techhat) Switch CloudStack to salt.utils.cloud.bootstrap()
- #25558: (cachedout) Lint config_test
- #25515: (s0undt3ch) salt.utils.schema fixes
- #25514: (garethgreenaway) fixes to schedule.add documentation in 2015.8
- #25508: (s0undt3ch) [2015.8] Update bootstrap script to latest stable release, v2015.07.17
- #25501: (basepi) Add optional job end time to the local_cache returner
- #25491: (s0undt3ch) Let’s call it for what it is!
- #25462: (rallytime) Wrap is_profile_configured calls in try/except block
- #25439: (rallytime) Reduce digital_ocean API call frequency
- #25451: (s0undt3ch) Salt-SSH Scan roster bugfixes (And Py3 support)
- #25449: (ruzarowski) Exclude dotfiles and directories from minion key lists (Fixes `#25448`_)
- #25421: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
- #25412: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
- #25415: (bechtoldt) [docs] declare YAML as code block
- #25407: (rallytime) Back-port #23236 to 2015.8

18.2. Previous Releases 2481
• #25409: (rallytime) Back-port #24422 to 2015.8
• #25394: (rallytime) Back-port #25355 to 2015.8
• #25393: (rallytime) Back-port #25289 to 2015.8
• #25387: (cachedout) Lint #25319
• #25319: (ruzarowski) [cloud:EC2] Move SourceDest logic to _update_enis and add alias for delete_interface_on_terminate
• #25310: (anlutro) Add an ``is list`` test to the jinja environment
• #25264: (ruzarowski) Fix AttributeError in fileserver update_opts
• #25372: (rallytime) Don't stacktrace when provisioning instances with softlayer* drivers
• #25315: (ruzarowski) [cloud:EC2] Move handling of AssociatePublicIpAddress to associate_eip/allocate_new_eip logic depending on value type
• #25312: (ruzarowski) [cloud:EC2] Introduce eni Name property to set name tag value after its creation
• #25311: (ruzarowski) [cloud:EC2] Add ability to attach an existing eni
• #25280: (rallytime) Remove deprecation warnings for Beryllium
• #25283: (jfindlay) ensure ret is always defined
• #25254: (jfindlay) Change versionadded/changed references from Beryllium to 2015.8.0
• #25285: (thusoy) Remove error logging of missing victorops keys
• #25266: (ruzarowski) cloud: EC2 eni property SourceDestCheck is a AttributeBooleanValue
• #25216: (jfindlay) replace shell code with native python code
• #25278: (rallytime) Don't require size for all cloud drivers when checking profile configs
• #25271: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
• #25263: (techhat) Allow non-standard HTTP requests on tornado
• #25253: (s0undt3ch) Remove the deprecation warning. The driver has been renamed.
• #25248: (techhat) Do not resize while iterating
• #25244: (rallytime) Remove parted deprecations and fix failing tests
• #25242: (ruzarowski) Make SourceDestCheck flag available to network interface definition
• #25226: (nmadhok) Backporting fix for issue `#25223`_ on 2015.8 branch
• #25234: (krak3n) Fix: Bug in boto_asg state argument passing to boto_asg module
• #25222: (rallytime) Back-port #25219 to 2015.8
• #25188: (rallytime) Use linode status descriptions instead of ints when logging status to CLI
• #25203: (s0undt3ch) Added DictConfig with tests & More tests
The 2015.8.0 feature release of Salt contains several major new features. As usual the release notes are not exhaustive and primarily include the most notable additions and improvements. Hundreds of bugs have been fixed and many modules have been substantially updated and added.

New SaltStack Installation Repositories

SaltStack now provides installation repositories for several platforms, with more to come. See the following links for instructions:

- Red Hat / CentOS 5, 6, 7
- Debian 8
- Windows
- FreeBSD

Send Event on State Completion

A `fire_event` global state keyword argument was added that allows any state to send an event upon completion. Useful for custom progress bars and checking in on long state runs. See `fire_event`.

ZeroMQ socket monitoring

If `zmq_monitor` is enabled, log all ZMQ events for socket monitoring purposes. Verbose, but useful.

SPM (Salt Package Manager)

Allows Salt formulas to be packaged for ease of deployment. See `spm`.

**Note:** The `spm` executable was not included in the Debian or Ubuntu packages for the 2015.8.0 or the 2015.8.1 releases. This executable will be included in an upcoming release. As a workaround, copy the SPM script from the salt library installation into `/usr/local/bin` or your local equivalent.

Specify a Single Environment for Top Files

A new `default_top` option was added to load the state top file from a single, specific environment, rather than merging top data across all environments. Additionally, new `top_file_merge_strategy` and `env_order` options were added for more control over top file merging. See *The Top File*.  

18.2. Previous Releases
Tornado TCP Transport

Implemented a pure-TCP transport, in addition to ZeroMQ and RAET. The new transport uses Tornado, which allows Salt to use a standardized set of libraries for asynchronous behavior, which should greatly improve reliability and performance.

Note: Tornado is considered experimental in this release. The following known issues were being investigated at the time of release:

- TCP tests show performance degradation over time (issue 26051)
- TCP transport stacktrace on windows minion: Future exception was never retrieved (issue 25718)
- [freebsd] TCP transport not working in 2015.8.0rc3 (issue 26364)

Proxy Minion Enhancements

Proxy Minions have undergone a significant overhaul in 2015.8, see Proxy Minion Enhancements.

Engines

Salt engines are long-running, external processes that leverage Salt. See Salt Engines.

Core Changes

- Add system version info to versions_report, which appears in both salt --versions-report and salt '*' test.versions_report. Also added is an alias test.versions to test.versions_report. (issue 21906)
- Add colorized console logging support. This is activated by using %(colorlevel)s, %(colormsg)s, %(colorprocess)s, %(colormsg)s in log_fmt_console in the config file for any of salt-master, salt-minion, and salt-cloud.

Git Pillar

The git external pillar has been rewritten to bring it up to feature parity with gitfs. Support for pygit2 has been added, bringing with it the ability to access authenticated repositories.

Using the new features will require updates to the git ext_pillar configuration, further details can be found in the pillar.git_pillar docs.

Salt Cloud Improvements

- Pricing data from several cloud providers (GCE, DigitalOcean, SoftLayer_HW, EC2)
- All cloud providers now use standardized bootstrapping code.
- Modified the Linode Salt Cloud driver to use Linode's native API instead of depending on apache-libcloud or linode-python.
Salt Cloud Changes

- Changed the default behavior of `rename_on_destroy` to be set to `True` in the EC2 and AWS drivers.
- Changed the default behavior of the EC2 and AWS drivers to always check for duplicate names of VMs before trying to create a new VM. Will now throw an error similarly to other salt-cloud drivers when trying to create a VM of the same name, even if the VM is in the `terminated` state.
- When querying for VMs in `digital_ocean.py`, the number of VMs to include in a page was changed from 20 (default) to 200 to reduce the number of API calls to Digital Ocean.Ocean.

State and Execution Module Improvements

- New and improved Docker state and execution modules (`state` and `execution module`).

Git State and Execution Modules Rewritten

The git state and execution modules have gone through an extensive overhaul.

Changes in the `git.latest` State

- The `branch` argument has been added, allowing for a custom branch name to be used in the local checkout maintained by the `git.latest` state. This can be helpful in avoiding ambiguous refs in the local checkout when a tag is used as the `rev` argument. If no `branch` is specified, then the state uses the value of `rev` as the branch name.
- The `always_fetch` argument no longer has any effect, and will be removed in a future release. The state now detects whether or not a fetch is needed based on comparisons made between the local and remote repositories.
- The `force_fetch` argument has been added to force a fetch if the fetch is not a fast-forward (for instance, if someone has done a reset and force-pushed to the remote repository).
- The `remote_name` argument has been deprecated and renamed to `remote`.
- The `force` argument has been deprecated and renamed to `force_clone` to reduce ambiguity with the other ``force`` arguments.
- Using SHA1 hashes (full or shortened) in the `rev` argument is now properly supported.
- Non-fast-forward merges are now detected before the repository is updated, and the state will not update the repository if the change is not a fast-forward. Non-fast-forward updates must be overridden with the `force_reset` argument. If `force_reset` is set to `True`, the state will only reset the repository if it cannot be fast-forwarded. This is in contrast to the earlier behavior, in which a hard-reset would be performed every time the state was run if `force_reset` was set to `True`.
- A `git pull` is no longer performed by this state, dropped in favor of a fetch-and-merge (or fetch-and-reset) workflow.

`git.config_unset` state added

This state allows for configuration values (or entire keys) to be unset. See `here` for more information and example SLS.
git.config State Renamed to **git.config_set**

To reduce confusion after the addition of `git.config_unset`, the `git.config` state has been renamed to `git.config_set`. The old `config.get` name will still work for a couple releases, allowing time for SLS files to be updated.

In addition, this state now supports managing multivar git configuration values. See [here](#) for more information and example SLS.

**Initial Support for Git Worktrees in Execution Module**

Several functions have been added to the execution module to manage worktrees (a feature new to Git 2.5.0). State support does not exist yet, but will follow soon.

**New Functions in Git Execution Module**

- `git.config_get_regexp`
- `git.config_unset`
- `git.is_worktree`
- `git.list_branches`
- `git.list_tags`
- `git.list_worktrees`
- `git.merge_base`
- `git.merge_tree`
- `git.rev_parse`
- `git.version`
- `git.worktree_rm`
- `git.worktree_add`
- `git.worktree_prune`

**Changes to Functions in Git Execution Module**

**git.add**

- `--verbose` is now implied when running the `git add` command, to provide a list of the files added in the return data.

**git.archive**

- Now returns `True` when the `git archive` command was successful, and otherwise raises an error.
- The `overwrite` argument has been added to prevent an existing archive from being overwritten by this function.
- The `fmt` argument has been deprecated and renamed to `format`.  

---

2486 Chapter 18. Release Notes
• Trailing slash no longer implied in prefix argument, must be included if this argument is passed.

**git.checkout**

• The rev argument is now optional when using -b or -B in opts, allowing for a branch to be created (or reset) using HEAD as the starting point.

**git.clone**

• The name argument has been added to specify the name of the directory in which to clone the repository. If this option is specified, then the clone will be made within the directory specified by the cwd, instead of at that location.
• The repository argument has been deprecated and renamed to url.

**git.config_get**

• The setting_name argument has been deprecated and renamed to key.
• The global argument has been added, to query the global git configuration
• The all argument has been added to return a list of all values for the specified key, allowing for all values in a multivar to be returned.
• The cwd argument is now optional if global is set to True

**git.config_set**

• The value(s) of the key being set are now returned
• The setting_name argument has been deprecated and renamed to key.
• The setting_value argument has been deprecated and renamed to value.
• The is_global argument has been deprecated and renamed to global.
• The multivar argument has been added to specify a list of values to set for the specified key. The value argument is not compatible with multivar.
• The add argument has been added to add a value to a key (this essentially just adds an --add to the git config command that is run to set the value).

**git.fetch**

• The force argument has been added to force the fetch when it is not a fast-forward. This could have been achieved in previous Salt versions by including --force in the opts argument, this argument is just for convenience and to match the usage of other functions with force arguments.
• The refspects argument has been added to allow for one or more refspects to be provided which override the one(s) specified by the remote.remote_name.fetch git configuration option.
git.ls_remote

- The repository argument has been deprecated and renamed to remote.
- The branch argument has been deprecated and renamed to ref.
- The opts argument has been added to allow for additional CLI options to be passed to the `git ls-remote` command.

git.merge

- The branch argument has been deprecated and renamed to rev.

git.status

- Return data has been changed from a list of lists to a dictionary containing lists of files in the modified, added, deleted, and untracked states.

git.submodule

- Added the command argument to allow for operations other than update to be run on submodules, and deprecated the init argument. To do a submodule update with init=True moving forward, use command=update opts='--init'.
- OpenStack Glance API V2 execution module
- Amazon VPC state module
- RallyDev execution module
- BambooHR execution module
- Stormpath execution, state modules
- Remove unused argument timeout in jboss7.status.
- Deprecate enabled argument in pkgrepo.managed in favor of disabled.
- Archive module changes: In the archive.tar and archive.cmd_unzip module functions, remove the arbitrary prefixing of the options string with -. An options string beginning with a --long-option, would have uncharacteristically needed its first - removed under the former scheme. Also, tar will parse its options differently if short options are used with or without a preceding -, so it is better to not confuse the user into thinking they're using the non- - format, when really they are using the with- - format.
- Added __states__ to state modules, for cross-calling states. This enables using existing states when writing custom states. See cross calling states.

Windows Improvements

- Enhanced the windows minion silent installation with command line parameters to configure the salt master and minion name. See Silent Installer Options.
- Improved user management with additional capabilities in the user module for Windows.
- Improved patch management with a new module for managing windows updates (win_wua).
- Turned on multi-processing by default for windows in minion configuration.
Windows Software Repo Changes

A next-generation (ng) windows software repo is available for 2015.8.0 and later minions. When using this new repository, the repo cache is compiled on the Salt Minion, which enables pillar, grains and other things to be available during compilation time.

See the Windows Software Repository documentation for more information.

Changes to legacy Windows repository

If you have pre 2015.8 Windows minions connecting to your 2015.8 Salt master, you can continue to use the legacy Windows repository for these Salt minions.

If you were previously using this repository and have customized settings, be aware that several config options have been renamed to make their naming more consistent.

See the Windows Software Repository documentation for more information.

Win System Module

The unit of the timeout parameter in the system.halt, system.poweroff, system.reboot, and system.shutdown functions has been changed from seconds to minutes in order to be consistent with the linux timeout setting. (issue 24411) Optionally, the unit can be reverted to seconds by specifying in_seconds=True.

Other Improvements

- Sanitize sensitive fields in http.query
- Allow authorization to be read from Django and eauth
- Add templating to SMTP returner
- New REST module for SDB
- Added rest_timeout config option and timeout argument to jobs api call
- Provide config options for Raet lane and road buffer count. (Useful for BSD kernels)
- Implemented ZeroMQ socket monitor for master and minion
- Add end time to master job cache for jobs (optional, off by default)
- Tornado is now the default backend for http.request
- Support pillarenv selection as it's done for saltenv
- salt was updated to use python-crypto version 2.6.1, which removes the dependency on python-m2crypto.

Deprecations

- The digital_ocean.py Salt Cloud driver was removed in favor of the digital_ocean_v2.py driver as DigitalOcean has removed support for APIv1. The digital_ocean_v2.py was renamed to digital_ocean.py and supports DigitalOcean's APIv2.
- The vsphere.py Salt Cloud driver has been deprecated in favor of the vmware.py driver.
- The openstack.py Salt Cloud driver has been deprecated in favor of the nova.py driver.
• The use of `provider` in Salt Cloud provider files to define cloud drivers has been deprecated in favor of using `driver`. Both terms will work until the Nitrogen release of Salt. Example provider file:

```yaml
my-ec2-cloud-config:
id: 'HJGRYCILJLKJYG'
key: 'kdjgsgm;woormgl/aserigjksjdhasdfgn'
private_key: /etc/salt/my_test_key.pem
keyname: my_test_key
securitygroup: default
driver: ec2
```

• The use of `lock` has been deprecated and from `salt.utils.fopen`, `salt.utils.flopen` should be used instead.

• The following args have been deprecated from the `rabbitmq_vhost.present` state: `user`, `owner`, `conf`, `write`, `read`, and `runas`.

• The use of `runas` has been deprecated from the `rabbitmq_vhost.absent` state.

• Support for output in `mine.get` was removed. `--out` should be used instead.

• The use of `delim` was removed from the following functions in the match execution module: `pillar_pcre`, `pillar`, `grain_pcre`.

### Security Fixes

CVE-2015-6918 - Git modules leaking HTTPS auth credentials to debug log

Updated the Git state and execution modules to no longer display HTTPS basic authentication credentials in loglevel debug output on the Salt master. These credentials are now replaced with REDACTED in the debug output. Thanks to Andreas Stieger <asteiger@suse.com> for bringing this to our attention.

### Major Bug Fixes

• Fixed minion failover to next master on DNS errors (issue 21082)

• Fixed memory consumption in SaltEvents (issue 25557)

• Don’t lookup outside system path in which() util (issue 24085)

• Fixed broken jobs rest api call (issue 23408)

• Fixed stale grains data using in modules (issue 24073)

• Added `ssh_identities_only` config flag for ssh-agent configured environments (issue 24096)

• Fixed ```object has no attribute``` errors for Raet transport (issue 21640)

• Flush event returners before master exit (issue 22814)

• Fix CommandExecutionError in grains generation with lspci missing (issue 23342)

• Fix salt-ssh against CentOS 7 when python-zmq not installed (issue 23503)

• Fix salt-ssh issues related to out-of-date six module (issue 20949)

• Fix salt-ssh thin generation after previous run was interrupted (issue 24376)

• Use proper line endings on Windows with ```file.managed``` w/contents (issue 25675)

• Fixed broken comment/uncomment functions in file.py (issue 24620)

• Fixed problem with unicode when changing computer description (issue 12255)
• Fixed problem with chocolatey module not loading (issue 25717)
• Fixed problem adding users to groups with spaces in the name (issue 25144)
• Fixed problem adding full name to user account (issue 25206)
• Fixed gem module stack trace (issue 21041)
• Fixed problem with file.managed when test=True (issue 20441)
• Fixed problem with powershell hanging while waiting for user input (issue 13943)
• Fixed problem where the salt-minion service would not consistently start (issue 25272)
• Fixed problem where pkg.refresh_db would return True even when winrepo.p was not found (issue 18919)
• Could someone please provide end to end example for Proxy Minion with REST (issue 25500)
• Proxy minions stopped working between 2014.7 and 2015.5 (issue 25053)
• Proxy minion documentation includes outdated code sample (issue 24018)
• Proxy Minion documentation missing grains example (issue 18273)
• Improve process management in proxy minion (issue 12024)
• Proxy minion never comes up with message `I am XXX and I am not supposed to start any proxies.' (issue 25908)
• Fixed an issue that caused an exception when using Salt mine from pillar. (issue 11509)

18.2.10 Salt 2015.8.1 Release Notes

Version 2015.8.1 is a bugfix release for 2015.8.0.

Security Fixes

CVE-2015-6941 - win_useradd module and salt-cloud display passwords in debug log
Updated the win_useradd module return data to no longer include the password of the newly created user. The password is now replaced with the string XXX-REDACTED-XXX. Updated the Salt Cloud debug output to no longer display win_password and sudo_password authentication credentials. Also updated the Linode driver to no longer display authentication credentials in debug logs. These credentials are now replaced with REDACTED in the debug output.

CVE-2015-6918 - Git modules leaking HTTPS auth credentials to debug log
Updated the Git state and execution modules to no longer display HTTPS basic authentication credentials in loglevel debug output on the Salt master. These credentials are now replaced with REDACTED in the debug output. Thanks to Andreas Steiger <asteiger@suse.com> for bringing this to our attention.

Major Bug Fixes

• Add support for spm.d/*conf configuration of SPM (issue 27010)
• Fix proxy grains breakage for non-proxy minions (issue 27039)
• Fix global key management for git state
• Fix passing http auth to util.http from state.file (issue 21917)
• Fix multiprocessing: True in windows (on by default)
• Add `pkg.info` to pkg modules
• Fix name of `serial` grain (this was accidentally renamed in 2015.8.0')
• Merge config values from `master.d/minion.d` conf files (rather than flat update')
• Clean grains cache on grains sync (issue 19853)
• Remove streamed response for fileclient to avoid HTTP redirection problems (issue 27093)
• Fixed incorrect warning about `osrelease` grain (issue 27065)
• Fix authentication via Salt-API with tokens (issue 27270)
• Fix winrepo downloads from https locations (issue 27081)
• Fix potential error with salt-call as non-root user (issue 26889)
• Fix global minion provider overrides (issue 27209)
• Fix backward compatibility issues for pecl modules
• Fix Windows uninstaller to only remove `/bin, salt*, nssm.exe, uninst.exe` (issue 27383)
• Fix misc issues with mongo returner.
• Add sudo option to cloud config files (issue 27398)
• Fix regression in RunnerClient argument handling (issue 25107)
• Fix `dockerng.running` replacing creation hostconfig with runtime hostconfig (issue 27265)
• Fix `dockerng.running` replacing creation hostconfig with runtime hostconfig (issue 27265)
• Increased performance on boto asg/elb states due to `__states__` integration
• Windows minion no longer requires powershell to restart (issue 26629)
• Fix x509 module to support recent versions of OpenSSL (issue 27326)
• Some issues with proxy minions were corrected.

Known Issues:

• Proxy minions currently cannot execute a highstate because of the way the proxymodule is being loaded internally. This will be fixed in a future release.

Changes for v2015.8.0..v2015.8.1

Extended changelog courtesy of Todd Stansell (https://github.com/tjstansell/salt-changelogs):

Generated at: 2015-10-01T04:45:02Z
Total Merges: 200

Changes:

• PR #27584: (jacobhammons) added changes list to 2015.8.1 release notes
• PR #27575: (rallytime) Don't report existing instances as running only if they're actually terminated in EC2
• PR #27573: (basepi) [2015.8] Use the custom yaml serializer for minion_opts for salt-ssh
• PR #27514: (clinta) Recent Versions of OpenSSL don't allow importing incomplete PEMs
• PR #27564: (jacobhammons) Man pages
• PR #27522: (twangboy) Removed dependency on powershell to restart salt-minion
• PR #27550: (rallytime) [2015.8] Clean up salt-cloud logging and make it more useful
• PR #27517: (jacobhammons) Updated install docs
• PR #27526: (eliasp) Add missing newlines before param listing to fix doc rendering
• PR #27525: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #27513: (terminalmage) Fix integration tests for worktree addition in git >= 2.6
• PR #27510: (rallytime) Merge #27475 with test fixes
• PR #27451: (ticosax) [dockerng] Enforce usage of host_config and require docker-py>=1.4.0
• PR #27461: (cachedout) Only clean context if it exists
• PR #27473: (terminalmage) salt.utils.gitfs: Don't use close_fds=True on Windows
• PR #27496: (blueyed) Fix version reporting of gitpython
• PR #27502: (ticosax) Add test to check we don't call inspect_image on absent images.
• PR #27497: (blueyed) dockerng: fix image_present for forced, non-existent image
• PR #27411: (terminalmage) Fix invocation of git.config_get and git.config_set
• PR #27477: (terminalmage) Don't append role to hash_cachedir
• PR #27474: (whiteinge) Add fake pymongo version attribute for the docs
• PR #27466: (blueyed) Fix version reporting of python-gnupg and mysql-python
• PR #27465: (ticosax) Fix usage of dockerng `cmd` was #27459
• PR #27417: (whiteinge) Backport #25243 into 2015.8
• PR #27423: (dmurphy18) Changes to support configurable repository for Debian / Ubuntu
• PR #27428: (rallytime) Back-port #27398 to 2015.8
• PR #27429: (rallytime) Back-port #27344 to 2015.8
• PR #27450: (ticosax) [dockerng] Fix typo in docstring
• PR #27430: (jacksontj) Fix bug introduced in eee0291ff8b65ff1e22f4dc2447a74aa28a3ce7f
• PR #27418: (terminalmage) Don't always remove dest path in salt.utils.files.rename()
• PR #27383: (twangboy) Uninstaller only removes specific files and dirs
• PR #27416: (rallytime) Back-port #27399 to 2015.8
• PR #27394: (jacksontj) Remove streamed response for fileclient to avoid HTTP redirection problems
• PR #27415: (ryan-lane) Backwards compat fixes for pecl module
• PR #27407: (meggiebot) Adding stretch label definition
• PR #27388: (basepi) [2015.8] Fix global provider overrides
• PR #27386: (rallytime) Document tty: True usage in salt-ssh roster file
• PR #27380: (jand) Skipping Async tests

• PR #26923: (rallytime) Code clean up of cloud drivers and files
• PR #27010: (rallytime) Back-port #26988 to 2015.8
• PR #26985: (rallytime) Fix versionadded tag

18.2.11 Salt 2015.8.10 Release Notes

Version 2015.8.10 is a bugfix release for 2015.8.0.

Final Release of Debian 7 Packages

Regular security support for Debian 7 ended on April 25th 2016. As a result, 2016.3.1 and 2015.8.10 will be the last Salt releases for which Debian 7 packages are created.
Mint Linux: Important Post-Upgrade Instructions

As a result of some upstream changes, the os grain on Mint Linux is now being detected as LinuxMint (issue 33295). Run the following command after you upgrade to 2015.8.10 to reset the os grain to Mint and the os_family grain to Debian:

```bash
salt -G 'os:LinuxMint' grains.setvals "{'os': 'Mint', 'os_family': 'Debian'}"
```

Changes for v2015.8.9..v2015.8.10

Salt 2015.8.10 includes fixes for the following known issues in 2015.8.9:

- issue 33376: pip state broken in 2015.8.9 with pip <6.0
- PR 33386: Fix traceback in logging for config validation

Since 2015.8.10 includes only two fixes, the 2015.8.9 changes list is included below for convenience:

Extended changelog courtesy of Todd Stansell (https://github.com/tjstansell/salt-changelogs):

Generated at: 2016-05-17T17:09:39Z

Total Merges: 145

Changes:

- PR #33293: (twangboy) Fix minion start retry on Windows (2015.8)
- 22c4331 linux_acl: Allow `-` as a separation character in ACL permissions. Fixes `#31270` (#33172) (#33305)
- 7a181f2 Handle more ipv6 error as an exception `#33299` (#33300)
- eb47a15 Ignore retcode when checking service's status (#33294)
- PR #33274: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
- 4f3596a Add comment for test=true w/o changes ret and add changes dict example (#33254)
- 2a30c48 Update Git Policy docs to match Contribution guide (#33252)
- 056c273 Fix `#33238` (#33239)
- 1cd34ab Properly report on invalid giffs/git_pillar/winrepo repos (#33245)
- PR #33253: (rallytime) Update the release process docs
- 8c2c5b1 update 2015.8.9 release notes (#33251)
- 8ee8ee3 Handle ipv6 error as an exception (#33246)
- 855bed3 Check rendered YAML for invalid keys (#33213)
- 6b825a8 Make note of files that begin with `_' in master.d or minion.d dirs (#33224)
- a6dc0d2 Gate jnpr imports in salt.proxy.junos.py (#33150)
- 64a89c4 Add docs for the http state (#33222)
- 0a32163 Don't stacktrace when using --out=highstate at CLI during staterun. (#33215)
- 04d714d propagate opts to salt.util.http call (#33219)
- c8236c0 update 2015.8.9 release notes (#33237)
- PR #33217: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
- 730bec1 [2015.8] Merge forward from 2015.5 to 2015.8 (#33207)
- 379b151 Add a fetch when compiling git_pillar for masterless minions (#33204)
- b3805d8 cloud.clouds.ec2: cache each named node (#33164)
- 86db5df Properly handle failed git commands when redirect_stderr=True (#33203)
- 8a0950d Don't force use of global ssh_config when git identity file is specified (#33152)
- ce07133 update 2015.8.9 release notes (#33198)
- PR #33188: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
- e9108e0 add 2015.8.9 release notes (#33161)
- 2d9919e [2015.8] Update to latest bootstrap script v2016.05.10 (#33156)
- 033bef2 Hash fileclients by opts (#33142)
- f520fa3 Back-port #31769 to 2015.8 (#33139)
- PR #33144: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #33140: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
- ad607ef If cache_jobs: True is set, populate the local job cache when running salt-call (#33100)
- 64689a6 Fix broken parsing of usermgmt.conf on OpenBSD (#33135)
- 06a382e Add a check that the cmdline of the found proc matches (#33129)
- 10018e9 salt.utils.gitfs: fix formatting for warning messages (#33064)
- d45b599 Fix 33058 (#33099)
- PR #33106: (abednarik) Moved _finger_fail method to parent class.
- 20c7e10 clarify docs that map is designed to be run once. is not stateful (#33102)
- 55851d cloud.query needs to define mapper.opts (#33098)
- PR #33096: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
- 22a327b salt-cloud: fix ipv6-only virtual machines (#32865)
- e788f7e modules.npm: do not log npm --version at info level (#33084)
- PR #33081: (jfindlay) ssh docs: install py-2.6 for RHEL 5
- PR #33088: (ismb) Bugfix: Restore boolean values from the repo configuration
- 2c6326f fix tests for file.blockplace to remove newline (#33082)
- PR #32892: (ismb) Resolve Zypper locks on asynchronous calls
- 3e0bf23 Add fun_args to scheduled return data (part of `#24237`) (#33039)
- 264cd04 Don't append a newline when creating new content with blockreplace (#33049)
- 54b783a Pass all data to batch.run() call when using --failhard (#33048)
- 2dbfa55 Display command output when command fails with batch + failhard options (#33050)
- add9199 Allow security_groups kwarg for boto_elb.present to be string or list (#33053)
- 111701c [2015.8] Merge forward from 2015.5 to 2015.8 (#33054)
- 1066063 File and User test fixes for 2015.8 on Fedora23 (#33056)
• f97b5d5 Back-port #33030 to 2015.8 (#33040)
• e90a501 Update the docs for saltutil.find_job to be more clear/accurate (#33017)
• d3d77ce Add saltenv to the cmd.script state function (#33031)
• 3434f44 Fix syndic regression (#33021)
• 4bb3ca5 Compare uid and gid instead of name and group (#32674)
• 9ca5b02 Allow batch mode to use verbose option, as well as show_jid. (#32996)
• 81c0fa4 Fixed glusterfs.peered output (#32955)
• 8c70d7a Clarify some arg docs (#32994)
• 00beab Fix boto_secgroup_test (#32986)
• 3362367 fix user cron on solarish operating systems (#32970)
• 07e38bc salt.log.setup: process user args before format (#32796)
• b2d7c81 doc.ref.states.ordering: clarify requisite change (#32934)
• df14d5d mode should default to `text' (#32928)
• f581a82 Remove FileClient class references from docs - it doesn't exist. (#32925)
• 31b96de Update contents_grains option with relevant docs (#32922)
• PR #32926: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
• 1cd6a45 specify volume tags in profile configuration (#32908)
• 85ca86d Update docs to warn users that -1 isn't valid for iptables insert state (#32906)
• cb68706 Allow profile options to be specified in provider file when using maps (#32900)
• 1a55fcb Clarify service state opening docs - uses `service' virtualname (#32880)
• PR #32884: (terminalmage) Fix incorrect deprecation notice
• PR #32878: (jacobhammons) added note about updating the bootstrap script in salt-cloud using th...
• PR #32869: (rallytime) Use correct config setting in cloud syndic docs
• PR #32844: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
• eb8f6e6 Back-port #31139 to 2015.8 (#32868)
• 4dbb5545 backport PR #32732 for issue `#23714` (#32847)
• Sea003b Add pyvmomi version warning to Getting Started with VMware docs (#32845)
• 44f08d0 Pass None as memory limit. (#32841)
• feebe69 Back-port #32813 to 2015.8 (#32839)
• 3b81031 various improvements on cloud deploy script docs (#32659)
• b8f5987 update bootstrap to 2016.04.18 release (#32668)
• 83dee63 Back-port #29322 to 2015.8 (#32785)
• PR #32787: (rallytime) Back-port #32722 to 2015.8
• PR #32786: (rallytime) Back-port #32703 to 2015.8
• a6a42740 Merge branch `pr-32775' into 2015.8
• cda00f4 Improve documentation on pygit2 versions (#32779)
• 1d6d234 Properly handle minion failback failure. (#32749)
• 3751a27 Document pillar cache options (#32643)
• 35c8af3 modules.win_dacl: consistent case of dacl constants (#32720)
• 2cd0817 Update external auth documentation to list supported matcher. (#32733)
• bba089d Check dependencies type before applying str operations (#32693)
• 3aa0605 Handle when beacon not configured and we try to enable/disable them (#32692)

PR #32718: (garethgreenaway) Fixes to schedule.list in 2015.8

PR #32684: (captaininspiration) Fix routes for redhat < 6

7cdd512 Handle a couple of arguments better (Azure) (#32683)

aaa03bc Fix for issue 32523 (#32672)

21081b1 Don't access deprecated Exception.message attribute. (#32556)

5d1e9a4 Lower log level for pillar cache (#32655)

PR #32588: (anlutro) Fix salt-ssh module function call argument type juggling by JSON encoding them

5e7edfc yumpkg: Ignore epoch in version comparison for explicit versions without an epoch (#32563)

fea6056 Fixing critical bug to remove only the specified Host instead of the entire Host cluster (#32540)

077f66 align OS grains from older SLES with current one (#32499)

8d46244 Prevent crash if pygit2 package is requesting re-compilation of the executor (#32495)

PR #32614: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8

PR #32616: (rallytime) Back-port #32547 to 2015.8

3047471 Fix comments value in salt.states.pkgrepo example (#32604)

ab9da90 Revert PR #32480 and apply #32314 with fixes / documentation (#32558)

c84c921 Better log message on minion restart if master couldn't be reached. (#32576)

3c81798 Don't return None from eval_master (#32555)

PR #32536: (rallytime) Back-port #31898 to 2015.8

d12a1c2 Fix binary search and replace (#32542)

PR #32539: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8

PR #32531: (ticosax) [dockerng] Fix support of dockerng.volume_present when no volume is on present.

5d73d54 Enhance dockerng.wait() to control success on exit_code and on already stopped containers (#32475)

214f01e Bugfix: salt-key crashes if tries to generate keys to the directory w/o write access (#32436)

288839f Turn on exc_info when logging failed minion startup (#32515)

08a8020 Add ignore_epoch option to pkg.installed/removed/purged states (#32520)

492ebfc Isbm zypper list products sles11 crash (#32505)

ae89882 Clear VCS fsbackend and git_pillar locks on master start (#32480)

a6482a3 Use win32api to get Total System Memory (#32491)

PR #32487: (terminalmage) Add explanation of nonzero epoch requirement to pkg.installed state documentation
• PR #32482: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
• f5bd6bd Backport 31164 and 31364 (#32474)
• PR #32450: (cachedout) Pass parser options into batch mode
• b299835 Issue `#28706`_: Fix state user.present behavior. (#32448)
• cef33d5 Argument name in docs should match actual arg name (#32445)
• PR #32432: (ticosax) [dockerng] Fix Domainname introspection
• PR #32427: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #32423: (jtandi) Update glusterfs_test to be inline with #32312
• PR #32425: (cachedout) Fix salt-cloud parallel provisioning
• 51fb2ac FreeBSD supports packages in format java/openjdk7 so the prior commit broke that functionality. Check freebsd/pkg`#1409`_ for more info.
• 709410a Improve git_pillar documentation/logging
• c53efc3 Update master config docs
• PR #32333: (mcalmer) fix sorting by latest version when called with an attribute
• PR #32376: (amontalban) Fixes saltstack/salt`#28262`_
• 0d9a06b Cleaner deprecation process with decorators
• 6979fda Correcty index glusterfs bricks
• PR #32393: (jffindlay) modules.win_timezone: don't list all zones in debug log
• PR #32372: (rallytime) Back-port #32358 to 2015.8
• PR #32392: (multani) Fix documentation on boto_asg and boto_elb modules and states
• PR #32373: (cachedout) Resolve memory leak in authentication
• PR #32126: (cro) Add a couple CLI examples for the highstate outputter.
• PR #32353: (mcalmer) Prevent metadata download when listing installed products
• PR #32321: (abednarik) Better message when minion fail to start
• PR #32345: (nmadhok) [2015.8] Check if profile key exists in vm_dict
• PR #32343: (Ferbla) Fixed win_wua example documentation
• PR #32360: (rallytime) Make sure hash_type is lowercase in master/minion config files
• PR #32361: (cro) SDB is no longer experimental
• PR #32336: (rallytime) Back-port #28639 to 2015.8
• PR #32332: (rallytime) Don’t unsubscribe from open events on the CLI too early on long-running commands
• PR #32333: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #32289: (rallytime) New salt-cloud instances should not use old hash_type default.
• PR #32291: (twangboy) Fix bad output for chocolatey.version (fixes `#14277`_)
• PR #32295: (rallytime) Test the contents of `deploy_scripts_search_path` in salt.config.cloud_config
• PR #32315: (ahust) fixing file.managed with requests lib
• PR #32316: (vutny) Update Salt Bootstrap tutorial
• PR #32325: (bdrung) Re-add shebang to ssh-id-wrapper shell script
• PR #32326: (bdrung) Fix typos
• PR #32300: (twangboy) Add documentation to disable winrepo/winrepo_ng
• PR #32288: (terminalmage) use dictupdate.merge instead of dict.update to merge CLI pillar overrides
• PR #32243: (isbm) Ensure latest pkg.info_installed ensure latest
• PR #32268: (ticosax) [dockerng] Improve detection for older versions of docker-py
• PR #32258: (jacobhammons) Replaces incorrect reference to master_alive_check
• PR #32254: (twangboy) Fix Display Name with spaces in win_servermanager
• PR #32248: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #32230: (terminalmage) systemd.py: Support both update-rc.d and chkconfig as managers of sysv services
• PR #32249: (jacobhammons) Fixes windows download paths to account for patch
• PR #32221: (dmurphy18) Fix version check, fix extracting Major and Minor versions from __ver...
• PR #32227: (twangboy) Remove list2cmdline usage from win_service.py
• PR #32239: (anlutro) Add state file name to warning log line
• PR #32215: (DmitryKuzmenko) rhel oscodename
• PR #32217: (jacobhammons) 2015.8.8.2 release notes
• PR #32212: (rallytime) Back-port #32197 to 2015.8
• PR #32211: (rallytime) Back-port #32210 to 2015.8
• PR #32209: (rallytime) Back-port #32208 to 2015.8
• PR #32204: (ticosax) [dockerng] Consider labels carried by the image when comparing user defined labels.
• PR #32186: (rallytime) Add some ```best practices``` information to test documentation
• PR #32176: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #32163: (rallytime) Update nacl.config docs to use key value instead of `None`
• PR #32166: (vutny) salt.states.file: correct examples with multiline YAML string
• PR #32168: (rallytime) Lint 2015.8
• PR #32165: (terminalmage) Make __virtual__ for rhservice.py more robust
• PR #32160: (cachedout) Fix beacon tutorial docs
• PR #32145: (paclat) fixes 29817
• PR #32133: (basepi) Pass eauth user/groups through salt-api to destination functions
• PR #32127: (rallytime) Add runners to __salt__ docs
• PR #32143: (DmitryKuzmenko) Set auth retry count to 0 if multimaster mode is failover.
• PR #32134: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #32091: (clarkperkins) Fixed the regression in 410da78
• PR #32135: (rallytime) [2015.8] Support multiple valid option types when performing type checks
• PR #31760: (sakateka) SMinion need wait future from eval_master
• PR #32106: (jfindlay) update suse master service patch
18.2.12 Salt 2015.8.11 Release Notes

Version 2015.8.11 is a bugfix release for 2015.8.0.

Retuner Changes

- Any returner which implements a save_load function is now required to accept a minions keyword argument. All returners which ship with Salt have been modified to do so.

New Configuration Parameter: **rotate_aes_key**

- Rotate_aes_key causes Salt to generate a new AES key whenever a minion key is deleted. This eliminates the chance that a deleted minion could continue to eavesdrop on communications with the master if it continues to run after its key is deleted. See the entry in the documentation for `rotate_aes_key`.
Ubuntu 16.04 Packages

SaltStack is now providing official Salt 2015.8 packages for Ubuntu 16.04.

Changes for v2015.8.10..v2015.8.11

Generated at: 2016-07-14T21:16:18Z

Total Merges: 122

Changes:

- PR #34676: (cachedout) Revert `Modify lodaer global test to use populated dunders`
- PR #34601: (lorendordon) Clarifies the proper way to reference states
- bc63f25 Lint 34644 (#34651)
- 5036026 Adjust the mine test a little bit to give it a better chance of success (#34647)
- PR #34642: (jtand) Check that mysqladmin exists before running mysql integration tests
- PR #34618: (jtand) Network state integration test test=True
- PR #34617: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
- b90ae40 Add support for edge case when Cmd and Entrypoint can't be blanked (#34593)
- 12b579c When sorting list actual_data, make it a list (#34590)
- 7dd8035 Gate docker unit test to check for docker (#34591)
- ae38c87 Add a bunch of documentation on getting files from other environments (#34560)
- PR #34531: (terminalmage) Support ignore_epoch argument in version comparisons
- PR #34545: (terminalmage) Handle cases where Docker Remote API returns an empty ExecutionDriver
- PR #34546: (rallytime) Rename unit.states.boto_secgroup to unit.states.boto_secgroup_test
- PR #34537: (rallytime) Rename tests.unit.simple to tests.unit.simple_test
- fbab2f8 [2015.8] Update bootstrap script to latest stable (#34527)
- 6b8c76a Prevent many errors in the test suite in loader tests (#34521)
- c2f296c Fix wrong order of retention_policy_exists (#34507)
- PR #34518: (terminalmage) Fix pkg.latest integration test for non-LTS ubuntu
- PR #34513: (cachedout) Lower the log level for modules which cannot be loaded to trace
- PR #34498: (rallytime) Use -O in the wget example in the bootstrap tutorial for the develop branch
- 3ebba02 Rename some unit test files by adding _test (#34503)
- 8722257 Improve top file merging documentation (#34505)
- 6ece7cb9 Gracefully handle non-XML output in GlusterFS execution module. (#34492)
- 7529945 Use skipTest for network state integration test (#34489)
- 0f387f Update dnsmasq.get_config docs to use correct config_file param. (#34488)
- PR #34462: (terminalmage) Use --always when available to git describe
• PR #34467: (rallytime) Back-port #34457 to 2015.8
• PR #34432: (twangboy) Fix file.append
• PR #34429: (terminalmage) Skip version checking for targeted packages in pkg.latest state
• 0a26459 Forgot reference to inotify (#34455)
• PR #34451: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #34401: (terminalmage) Use rpmdev-vercmp as a fallback for version comparison on RHEL5
• PR #34366: (steverweber) Update service.py
• PR #34426: (cro) Document that inotify is Linux only
• PR #34392: (cro) Clarify that salt-cloud doesn't get installed by bootstrap
• PR #34373: (jtand) Network state integration test
• d6af1de Optimize pkg integration tests and add a couple new tests (#34377)
• PR #34368: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
• 94e0946 Back-port #34324 to 2015.8 (#34344)
• 11dc020 Making salt-ssh pass proper return codes for jinja rendering errors (#34342)
• fbdb1ad Revert py3modernize lint changes (#34339)
• PR #34306: (ghedo) Fix iptables.flush state: Do not force 'filter' table when flushing
• 0c60fea Doc clarifications to file modules, addition of new profile log level to docs, fixed example in dnsmasq (#34323)
• b793426 Remove unnecessarily-disabled sanity check (#34325)
• PR #34335: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
• a6d3cc6 Typo in dockerio doc (#34319)
• PR #34312: (rallytime) [2015.8] Update to latest bootstrap script v2016.06.27
• PR #34307: (rallytime) Fix test example in integration testing docs
• PR #34233: (thegoodduke) ipset: fix the comment containing blank
• PR #34257: (rallytime) Use `config_dir' setting instead of CONFIG_DIR in gpg renderer
• PR #34274: (clinta) Don't escape source before calling managed
• PR #34258: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #34093: (terminalmage) Catch CommandExecutionError in pkg states
• PR #34136: (meksh) Fixed behavior for SUSE OS grains in 2015.8
• 56c7267 fix regression from #33681 which causes pulling a list of s3 objects via s3.query to fail (#34208)
• 02eb331 Fix a pair of gitfs bugs (#34218)
• PR #34182: (rallytime) Handle child PIDs differently depending on the availability of psutils
• 5d3ec31 Clarify pkg.list_repo_pkgs docstring for held packages (#34188)
• 5bca5c4 Change target for dockerng assuming default status to Nitrogen release (#34206)
• PR #34184: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #34176: (rallytime) Back-port #34103 to 2015.8
• PR #34179: (terminalmage) Raise the correct exception when gitfs lockfile is empty
• PR #34178: (terminalmage) Remove unnecessary comment
• 6387d16 fix salt --summary to count not responding minions correctly (#34165)
• e594ea doc: add missing dot (#34175)
• 47595d6 Typo fix (#34174)
• PR #34077: (rallytime) Add some grains targeting tests
• PR #34142: (isbm) Move log message from INFO to DEBUG.
• 79a719b Update documentation on ``refresh`` behavior in pkg states (#34100)
• 6d0d52f modules.pkg int tests: skip refresh_db upon error (#34072)
• PR #34069: (rallytime) Add a test to check for disconnected minion messaging
• PR #34048: (terminalmage) RFC: proposed fix for multiple fileserver updates in masterless runs
• PR #34011: (rallytime) Back-port #33948 and #34009 to 2015.8
• bca4371 Fixed a bug in the consul.py module that was preventing services (#34051)
• PR #34045: (jacobhammons) Updated latest release version
• f9bcfde Always make changes to minion config if set (#34020)
• e25da4 More YAML indentation fixes in state module examples (#34030)
• PR #34018: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
• 7d940ae states.file: fix indentation in YAML examples (#34003)
• 4c7fac0 Remove loader test for pam module (#34002)
• PR #33990: (jacobhammons) Adds links to several current Salt-related projects
• PR #33983: (twangboy) Clarify the account_exists parameter
• PR #33951: (jfindlay) modules.gem int tests: more fixes
• PR #33984: (jfindlay) Add docs and tests to disk state
• PR #33985: (rallytime) Write some more simple batch command tests
• 6080846 acl.ClientACL: add unit tests (#33684)
• a74f1b8 ZD 762 (#33942)
• PR #33946: (rallytime) Back-port #33698 to 2015.8
• PR #33952: (rallytime) Add base argument to salt-ssh grains wrapper for filter_by func
• 4a80649 Adds a ``Generated on <timestamp>`` line to the footer of each doc html page in the doc (#33962)
• b3ec39d Correct issue with ping on rotate with minion cache (#33765)
• PR #33888: (jfindlay) random.org checks
• 2dc1914 Add connecting_settings to boto_elb state attributes list (#33936)
• 91a2184 Wait for up to a minute for sync_after_install (#33917)
• PR #33877: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #33827: (cachedout) Fix broken locate.locate function
• PR #33839: (cachedout) Fix another unit test stacktrace in pkg_resource
• PR #33840: (cachedout) Remove matcher tests
• PR #33836: (cachedout) Fixing more stupid unit tests
• PR #33805: (jfindlay) states.pkg int tests: skip if pkg mgr unavailable
• PR #33808: (jfindlay) fix some problems with the gem module integration tests
• PR #33770: (jfindlay) service state integration tests
• PR #33691: (jtand) Gem integration test
• PR #33777: (sodium-chloride) Fix minor docstring issue of arg being missing
• PR #33759: (cachedout) Catch no minions exception in batch mode
• PR #33719: (cachedout) Catch oserror for race condition
• PR #33712: (meaksh) Fix for groupadd execution module failures in SLES11 systems
• PR #33718: (rallytime) Back-port #33700 to 2015.8
• PR #33727: (terminalmage) Fix git_pillar edge case for remote repos without a master branch
• PR #33728: (jfindlay) Make configurable_test_state configurable in test mode
• PR #33729: (twangboy) Add exclude option to win_servermanager
• PR #33743: (vutny) Debian installation docs: drop section about community-maintained repo
• 56c0a42 Create missing jid dir if it doesn’t exist (#33653)
• PR #33654: (twangboy) Fix win servermanager
• PR #33679: (terminalmage) Only compile the template contents if they evaluate to True
• PR #33685: (jfindlay) modules.cp.get_url: add test for https://
• PR #33581: (dincamihai) Call zypper refresh after adding/modifying a repository
• PR #33681: (rallytime) Back-port #33599 to 2015.8
• PR #33396: (babilen) Issue 33393
• PR #33652: (terminalmage) Lower the log level for failed auths
• PR #33615: (danslimmon) Fix crash on unconnectable MySQL server (resolves ‘#33582’)
• PR #33558: (twangboy) Fix win servermanager
• PR #33555: (cachedout) Fix crashing Maintenence process
• PR #33501: (meaksh) unit tests for rpm.checksum() and zypper.download()
• PR #33513: (rallytime) Add a section to the jinja docs about escaping jinja
• PR #33520: (jacobhammons) Updated version numbers in the docs for the 2016.3.0 release
• PR #33507: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #33503: (rallytime) Add docs about minion config file in standalone minion docs
• PR #33474: (cachedout) Fix diskusage beacon
• PR #33465: (meaksh) jobs.exit_success allow one to check if a job has executed and exit successfully
• PR #33487: (jtand) Add docstring examples to glance.py and nova.py [2015.8]
• PR #33481: (rallytime) Fix docs about etcd config options and add pillar_opts doc
• PR #33490: (rallytime) Document the postgres.psql_query function
- PR #33480: (jfindlay) states.service: minor doc updates
- 4f96cc1 Return full pending computer name (#33483)
- a89be5e Use six.string_types in jobs runner (#33499)
- PR #33491: (BlaineAtAffirm) fix jobs.list_jobs failing with search_target
- PR #33478: (rallytime) Back-port #32484 to 2015.8
- PR #33457: (rallytime) Make doc formatting consistent and use correct versionadded
- 1dfa956 Don't allow a `repo` kwarg for pkgrepo.managed (#33477)
- b4071b0 Allow for config entry to be a list in a dict for beacons (#33476)
- PR #33469: (meaksh) check the RPM signature of zypper pkg.download packages and report errors
- 00f9090 Add docs about PyYAML’s 1024 character limitations for simple keys (#33459)
- 3b12f39 Prevent several minion processes on the same machine (#33464)
- c8bf33 Make --gpg-auto-import-keys a global param when calling zypper (#33432)
- 0c4e38c Fix the saltutil.wheel function and add integration tests (#33414)
- e4f0f9 Make sure the path we’re removing is present first - avoid an OSError (#33440)
- 93fd00b Avoid a syntax error by using ” instead of escaped ” (#33443)
- ec609c Fix virtual function (#33436)
- PR #33438: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
- c9d0de4 Documentation update in file.serialize. (#33421)
- f8a90eb Fix LVM parameter devices as a pure list. Comma separated lists are cstå#33398)
- 3989e5b Spelling correction. (#33406)
- 9accb53 Update windows pkg.[install|remove] error logic (#33321)
- 04ac89d Add note about reload_modules functionality for pkg.installed (#33374)
- 635b81d Document how to set the alias file location for alias state (#33380)
- PR #33403: (jacobhammons) 2015.8.10 release notes
- PR #33381: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
- 946d27e Fix traceback in logging for config validation (#33386)
- 38fbcf8 Add note about name parameter in git_pillar docs (#33369)
- 4925199 Add win_pkg to list of modules that support ”version” in pkg.installed (#33362)
- 7a400a9 Add note to docs about api settings for Hipchat API v2 (#33365)
- 37e1930 Add initscripts, SystemD service units and environment files for Debian (#32857)
- PR #33370: (jacobhammons) Update docs version to 2015.8.9
- PR #33366: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
- f248003 Remove mentions of windows not supporting pkgs param (#33361)
- 4f8d097 Update job_cache and keep_jobs docs to be more specific to their behavior (#33328)
- 2f06918 Properly detect newer Linux Mint distros (#33359)

18.2. Previous Releases
• d85096c Fix UnboundLocalError in git.latest (#33340)
• e602446 Describes parameters in register_instances function (#33339)
• 5c29c65 Fix some link errors in the test writing tutorial (#33347)
• e532e58 Fix network.managed for windows (#33312)
• 11a2525 Bp 28467 calm mine (#33327)
• b897f2c import ps from psutil_compat in beacons (#33334)
• 089c1a2 remove redundant, incorrect sudo_runas config documentation (#33318)
• 1f7fda2 Disambiguate non-exact matches when checking if sysv service is enabled (#33324)
• 8c1f19a Allow concurrency mode in state runs if using sudo (#33325)
• ed14ef2 Fix master hanging after a request from minion with removed key. (#33333)
• daafa27 Cleanup comments in smbios.get output (fixes `#33266`_) (#33306)
• bfe12d9 Fix iptables --match-set (`#23643`_) (#33314)

**18.2.13 Salt 2015.8.12 Release Notes**

Version 2015.8.12 is a bugfix release for 2015.8.0.

Changes for v2015.8.11..v2015.8.12

Extended changelog courtesy of Todd Stansell (https://github.com/tjstansell/salt-changelogs):

*Generated at: 2016-08-19T16:06:27Z*

Total Merges: 57

Changes:

- **PR #35611**: (rallytime*) Everything in the sample master config file should be commented out
- **PR #35569**: (*rallytime) Write test for multiple unless commands where 1st cmd passes and 2nd fails
- **PR #35600**: (*rallytime) Update release notes for 2015.8.12
- **PR #35599**: (rallytime) Update release notes for 2015.8.12
- **PR #35584**: (terminalmage) Update linux_sysctl tests to reflect new context key
- **PR #35575**: (terminalmage) Add warning about AWS flagging of nmap usage
- **PR #35577**: (terminalmage) Unit file changes for 2015.8.12, 2016.3.3
- **PR #35566**: (rallytime) Back-port #35545 to 2015.8
- **PR #35545**: (hu-dabao) fix-35384, fix cmd.run unless
- **PR #35492**: (terminalmage) Clarify config.get docstring
- **PR #35483**: (gtmanfred) use __utils__ in salt.cloud
- **PR #35546**: (whiteinge) Salt api eauth fail gracefully
- **PR #35525**: (UtahDave) add missing glob import
- **PR #35540**: (rallytime) Whitespace fix for 2015.8
• PR #35510: (terminalmage) Better systemd integration
• PR #35513: (cachedout) Might be a good idea to be able to download the software we make
• PR #35302: (Ch3LL) Add job cache test
• PR #35512: (cachedout) Fixup 35419
• PR #35497: (deepakji) Fixes spacing in requirements files
• PR #35508: (terminalmage) Add Carbon to versionadded for git.diff
• PR #35486: (rallytime) Update bootstrap script to latest stable (2016.08.16)
• PR #35413: (cachedout) Resolve path issues with cp.push
• PR #35476: (cachedout) Fixup SSH bug where sudo without sudo user would break
• PR #35471: (terminalmage) win_pkg: Fix traceback when package is not installed
• PR #35448: (ismb) Add ignore_repo_failure option to suppress zypper’s exit code 106 on ...
• PR #35451: (ismb) Bugfix: zypper mod repo unchanged
• PR #35453: (theothergraham) fixes #34279 - disk cache ttl expiry
• PR #35459: (thatch45) Ensure that output for salt-ssh gets back
• PR #35460: (rallytime) [2015.8] Update bootstrap script to latest stable (2016.08.15)
• PR #35442: (cachedout) Fix cp.push_dir pushing empty dirs
• PR #35436: (cachedout) Minor doc fixup
• PR #35132: (sjorge) fixes, causing lots of mayham (onchange) with 2016.3.2 for me
• PR #35394: (rallytime) Back-port #34573 to 2015.8
• PR #34573: (cedwards) Update freebsd.rst
• PR #35359: (terminalmage) Clean up open filehandles
• PR #35339: (ismb) Bugfix: Prevent continuous restart, if a dependency wasn’t installed
• PR #35357: (twangboy) Fix file.recurse with clean: True on Windows (2015.8)
• PR #35323: (thatch45) Fix issue with bad error check in salt-vt
• PR #35325: (kv009) Fix freebsd netstat route on fbsd 10+
• PR #35301: (bobrik) Pass port to ssh.check_known_host, closes #35264
• PR #35309: (terminalmage) file.recurse: Do not convert octal mode string to int
• PR #35290: (terminalmage) Resolve a couple bugs in orchestration output
• PR #35211: (cachedout) Alternative sudo users for salt-ssh
• PR #35271: (bobrik) Default state_output_profile to True everywhere, closes #35166
• PR #35233: (terminalmage) Do not attempt to get fqdn_ip[4,6] grains when ipv[4,6] grains are empty
• PR #35202: (multani) doc: fix broken links in the test documentation page
• PR #35236: (rallytime) Back-port #35119 to 2015.8
• PR #35119: (derekmaciel) Assume two EVRs are equal if E and V are equal but one R is missing.
• PR #35240: (derekmaciel) Backport #35225 to 2015.8
• PR #35225: (derekmaciel) Add missing documentation for pkg.installed
PR #35241: (*terminalmage*) Ensure max recursion in gitfs results in no blob object being returned.

PR #35245: (*rallytime*) Back-port #35039 to 2015.8

PR #35039: (*whiteinge*) Add saltenv support to module.run

PR #35249: (*terminalmage*) Fix regression in git.latest

PR #35174: (*rallytime*) Back-port #35146 to 2015.8

PR #35146: (*cachedout*) Don't discard running beacons config when listing beacons

PR #34827: (*thatch45*) fix beacon list to include all beacons being processed

PR #35173: (*rallytime*) Back-port #35135 to 2015.8

PR #35135: (*rallytime*) Add missing CLI Examples to aws_sqs module funcs

PR #35145: (*jacobhammons*) doc version update to 2015.8.11, updates to release notes

PR #35114: (*terminalmage*) Add clarification docs on a common git_pillar misconfiguration

PR #34768: (*hrumph*) Fixes #34767

PR #35043: (*rallytime*) Start release notes file for 2015.8.12

PR #35050: (*terminalmage*) [orchestration] Properly handle runner/wheel funcs which accept a `saltdev` argument

PR #35066: (*jfindlay*) returners.postgres_local_cache: do not log in __virtual__

PR #35024: (*bobrik*) Cache systemd unit update check per unit, closes #34927

PR #35026: (*cachedout*) Expressly deny a minion if a key cannot be found

PR #35000: (*rallytime*) Back-port #33875 and #34999 to 2015.8

PR #33875: (*jmesquita*) Fix naive fileserver map diff algorithm

PR #34994: (*rallytime*) Back-port #34835 to 2015.8

PR #34835: (*thatch45*) Make the mine and publish combine minion and master opts in salt-ssh

PR #34991: (*cachedout*) SSH timeout

PR #34976: (*cachedout*) Refine errors in client

PR #34831: (*thatch45*) If the thin does not match, then redeploy, don’t error

PR #34916: (*cachedout*) Master performance improvement

PR #34911: (*cachedout*) Backport #34906

PR #34906: (*cachedout*) Set timeout for run_salt in test suite

PR #34898: (*hrumph*) Stop multiple refreshes during call to pkg.list_upgrades

PR #34606: (*isbm*) Bugfix: Exit on configuration read (backport)

PR #34862: (*thatch45*) Fix salt-ssh caching issue

PR #34869: (*terminalmage*) Fail git.latest states with uncommitted changes when force_reset=False

PR #34859: (*cachedout*) Fix wheel test

PR #34822: (*thatch45*) Fix salt-ssh state.high and state.low

PR #34847: (*cachedout*) Add an option to skip the verification of client_acl users

PR #34827: (*thatch45*) fix beacon list to include all beacons being processed
\cdot PR #34833: (rallytime) Back-port #28521 to 2015.8
\cdot PR #28521: (gongled) SPM: packaging doesn’t work in Python 2.6. Fixed.
\cdot PR #34823: (rallytime) Back-port #25276 to 2015.8
\cdot PR #25276: (jacobhammons) copy spm.1 man page during setup
\cdot PR #34828: (thatch45) Fix #34648
\cdot PR #34818: (jtand) Skip mysql state test if mysqladmin is not available
\cdot PR #34642: (jtand) Check that mysqladmin exists before running mysql integration tests
\cdot PR #34803: (junovitch) salt/state.py: set `chunk[‘order’] = 0’ with `order: first’; fixes `#24744`_
\cdot PR #34773: (randomed) Bugfix: Startup states on minions are not being written to mysql returner
\cdot PR #34751: (cachedout) Remove unneeded config test
\cdot PR #34606: (isbm) Bugfix: Exit on configuration read (backport)
\cdot PR #34754: (cachedout) Disable test
\cdot PR #34741: (rallytime) Back-port #34726 to 2015.8
\cdot PR #34726: (martinhoefling) Always loop over updated keys in non recursive update
\cdot PR #34721: (rallytime) Add output_file option to master config docs
\cdot PR #34689: (Azidburn) fix second run problems with pkg.installed using sources
\cdot PR #34695: (isbm) Bugfix: Zypper pkg.list_products returns False on some empty values (2015.8)

18.2.14 Salt 2015.8.13 Release Notes

Version 2015.8.13 is a bugfix release for 2015.8.0.

Security Fixes

CVE-2017-5192: local_batch client external authentication not respected

The LocalClient.cmd_batch() method client does not accept external_auth credentials and so access to it from salt-api has been removed for now. This vulnerability allows code execution for already-authorized users and is only in effect when running salt-api as the root user.

CVE-2017-5200: Salt-api allows arbitrary command execution on a salt-master via Salt’s ssh_client

Users of Salt-API and salt-ssh could execute a command on the salt master via a hole when both systems were enabled.

We recommend everyone on the 2015.8 branch upgrade to a patched release as soon as possible.

Changes for v2015.8.12..v2015.8.13

Statistics:
\cdot Total Merges: 3
Changes:

- 3428232 Clean up tests and docs for batch execution
- 3d8f3d1 Remove batch execution from NetapiClient and Saltnado
- 97b0f64 Lintfix
- d151666 Add explanation comment
- 62f2c87 Add docstring
- 9b0a786 Explain what it is about and how to configure that
- 5ea3579 Pick up a specified roster file from the configured locations
- 3a8614c Disable custom rosters in API
- c0e5a11 Add roster disable flag

18.2.15 Salt 2015.8.14 Release Notes

Version 2015.8.14 is a bugfix release for 2015.8.0.

18.2.16 Salt 2015.8.2 Release Notes

Note: A significant orchestrate issue #29110 was discovered during the release process of 2015.8.2, so it has not been officially released. Please use 2015.8.3 instead.

Changes:

- PR #28730: (garethgreenaway) Fixes to how return_job is handled in the scheduler for the salt master.
- PR #28848: (cro) Lint
- PR #28842: (cachedout) Add transport setting to shell test
- PR #28837: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #28827: (jacksontj) Cleanup virtual_timer in loader
- PR #28836: (cachedout) Cast to dict to fix wheel tests in tcp
- PR #28834: (cachedout) Fix breakage in tcp server
- PR #28804: (cachedout) TCP test fixes
- PR #28826: (basepi) [2015.8] Add new tornado deps to salt-ssh thin
- PR #28759: (jfindlay) simplify stdin use of stdin in at.present state
- PR #28824: (rallytime) Back-port #28778 and #28820 to 2015.8
- PR #28803: (jfindlay) decode strings to utf-8
• PR #28782: (rallytime) Fixes to rabbitmq user state
• PR #28789: (nmadhok) Provide ability to enable/disable customization for newly create VMs using VMware salt-cloud driver
• PR #28768: (mrosedale) 2015.8
• PR #28772: (rallytime) rabbitmq.list_user_permissions returns a dict, not a list. Don't expect a list.
• PR #28774: (rallytime) Back-port #28725 to 2015.8
• PR #28775: (rallytime) Back-port #28740 to 2015.8
• PR #28755: (rallytime) Move most vmware driver list_* functions to use salt.utils.vmware functions
• PR #28744: (jfindlay) import gates elementtree
• PR #28758: (jfindlay) remove redundant logic in useradd execution module
• PR #28757: (mbarrien) Bug fix: pip command to not quote spaces in cmd line args
• PR #28764: (multani) Various documentation fixes
• PR #28752: (above76) Update openSUSE grain for tumbleweed
• PR #28713: (hexedpackets) Rename consul.list to consul.list_keys.
• PR #28719: (jacobhammons) removed dependencies info from docs
• PR #28709: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #28710: (rallytime) Pass kwargs correctly to _get_group from get_group_id
• PR #28698: (rallytime) Back-port #28725 to 2015.8
• PR #28700: (rallytime) Back-port #28679 to 2015.8
• PR #28695: (stundtisch) [2015.8] Update to latest bootstrap script v2015.11.09
• PR #28656: (clarkperkins) '28526' fixed yumpkg module issue with pkg.installed
• PR #28672: (jfindlay) add OS grain support for SuSE Leap
• PR #28673: (jfindlay) add hidden_opts to mount.mounted
• PR #28667: (cro) saltutil.sync_all should sync proxymodules as well as the rest.
• PR #28665: (jfindlay) fixes to windows execution and state modules
• PR #28660: (techhat) Don't sign empty regions
• PR #28632: (terminalmage) Fixes/improvements to pkgbuild state/modules
• PR #28658: (techhat) Remove _pkgdb_fun() references
• PR #28653: (rallytime) Provide possible parameters for boto_rds.present engine values
• PR #28649: (bdrng) Fix OS related grains on Debian
• PR #28646: (rallytime) Back-port #28614 to 2015.8
• PR #28647: (rallytime) Back-port #28624 to 2015.8
• PR #28648: (rallytime) Merge branch `2015.5` into `2015.8`
• PR #28638: (anlutro) Salt-SSH: Return more concise error when SSH command fails
• PR #28644: (pass-by-value) Make sure versionchanged is correct
• PR #28615: (The-Loeki) Fixes to FreeBSD pkg
• PR #28613: (cachedout) Add facility to deepcopy bound methods in Py2.6 and apply to grains
• PR #28612: (rallytime) Remove unsupported storage_type argument for parity with boto_rds module
• PR #28611: (rallytime) [2015.8] Be explicit about salt.utils.vmware function calls
• PR #28610: (pass-by-value) Lxc config additions
• PR #28602: (nasenbaer13) Allow setting of custom dimensions in asg alarm specification
• PR #28596: (rallytime) Merge branch `2015.5' into `2015.8'
• PR #28593: (blueyed) doc: fix typo with salt.states.file: s/preseve/preserve/
• PR #28584: (rallytime) If AssociatePublicIpAddress is set to True, don't auto-assign eip.
• PR #28586: (jacksontj) Only encode the zmq message once
• PR #28587: (cachedout) Reset yaml rendering hooks to avoid leaks
• PR #28581: (basepi) Revert b4875e585a165482c41dca8898776b0a71ef1b0
• PR #28573: (jacksontj) Add body to salt.utils.http.query returns
• PR #28564: (stundt3ch) [2015.8] Update to latest bootstrap script v2015.11.04
• PR #28561: (Oro) Issue `#28527`_ boto_rds.create does not work
• PR #28560: (bdrung) Fix various typos
• PR #28550: (jacksontj) check timedatectl errno and return stdout on failure
• PR #28545: (jacksontj) pass on concurrent create of jid_dir in local_cache
• PR #28544: (rallytime) Start moving some vmware.py cloud funcs to utils/vmware.py
• PR #28543: (gtmanfred) clean up changes for pkg.uptodate and supervisord.dead
• PR #28538: (jacksontj) decode path and url to utf-8 in url.create
• PR #28533: (jacksontj) decode highstate error messages to utf-8
• PR #28547: (nmadhok) [Backport] [2015.8] Tasks can be in queued state instead of running
• PR #28535: (techhat) Fail gracefully if 169.254* isn't available
• PR #28536: (cro) Default configuration file for proxy minions.
• PR #28534: (rallytime) Add versionadded directive for vpc_name arg in boto_secgroup.present
• PR #28516: (rallytime) Back-port #28489 to 2015.8
• PR #28506: (basepi) [2015.8] Log minion list for all rosters, at debug level
• PR #28514: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #28502: (cachedout) Lint #28427
• PR #28464: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #28486: (rallytime) Back-port #26945 to 2015.8
• PR #28472: (gtmanfred) overwrite more than one value with names
• PR #28493: (rallytime) Back-port #28492 to 2015.8
• PR #28494: (whiteinge) Fix filter_by passing incorrect parameters to match functions
• PR #28491: (rallytime) Back-port #28388 to 2015.8
• PR #28465: (twangboy) Fix `#12363`_: Password Expiration in Windows
• PR #28485: (nasenbaer13) Fix invalid usage of _get_conn causing `#28484`_
• PR #28454: (sdm24) Fixed nodegroup doc formatting to correctly link to pillar_opts in the master config
• PR #28487: (cachedout) Lint 28456
• PR #28457: (sdm24) Clarified comments for grains/core.py for ip_interfaces, ip4_interface...
• PR #28473: (anlutro) Show check_cmd output on failure
• PR #28460: (jtand) Skipped wipefs test if wipefs does not exist on OS
• PR #28426: (terminalmage) pkgbuild.built: make template engine optional
• PR #28422: (cachedout) Handle windows logging on thread_multi [WIP]
• PR #28425: (twangboy) Fix `#13513`_ - Reflection
• PR #28417: (rallytime) Add note about azure sdk version to getting started docs
• PR #28410: (jacksontj) Add retries to the zeromq.AsyncReqMessageClient
• PR #28404: (rallytime) Back-port #28395 to 2015.8
• PR #28405: (opdude) Detect legacy versions of chocolatey correctly
• PR #28187: (sjansen) fix at.present
• PR #28375: (merll) Merge pillar includes correctly
• PR #28376: (rylan-lane) Support update of route53 records with multiple values
• PR #28377: (terminalmage) Deprecate `always` in favor of `force` in pkgbuild.built
• PR #28380: (cro) Add missing call for service provider
• PR #28348: (jfindlay) salt.utils.alias informs user they are using a renamed function
• PR #28361: (jtand) In CentOS 5 the .split() causes a stacktrace.
• PR #28360: (multani) Various documentation fixes
• PR #28370: (rallytime) Back-port #28276 to 2015.8
• PR #28353: (merll) Consider each pillar match only once.
• PR #28334: (anlutro) iptables needs -m comment for --comment to work
• PR #28340: (jfindlay) sdecode file and dir lists in fileclient
• PR #28344: (rylan-lane) Fix iptables state for non-filter tables
• PR #28343: (rallytime) Back-port #28342 to 2015.8
• PR #28330: (rallytime) Back-port #28305 to 2015.8
• PR #28270: (rallytime) Refactor RabbitMQ Plugin State to correctly use test=true and format errors
• PR #28269: (rallytime) Refactor rabbitmq_user state to use test=True correctly
• PR #28299: (rallytime) Add test for availability_zone check to boto_vpc_tests
• PR #28306: (sdm24) Updated the Nodegroup docs to include how to target nodegroups in SLS Jinja
• PR #28308: (rallytime) Firewalld state services should use --add-service, not --new-service
• PR #28302: (DmitryKuzmenko) Always close socket even if there is no stream.
• PR #28282: (keesbos) Fix for __env__ in legacy git_pillar
• PR #28258: (pass-by-value) Add service module for ssh proxy example
• PR #28294: (bechtoldt) correct a bad default value in http utility
• PR #28185: (jtand) Added single package return for latest_version, fixed other bug.
• PR #28297: (cachedout) Lint fix proxy junos
• PR #28210: (terminalmage) Fix for ext_pillar being compiled twice in legacy git_pillar code
• PR #28265: (jfindlay) fix blockdev execution and state modules
• PR #28266: (rallytime) Back-port #28260 to 2015.8
• PR #28253: (rallytime) Back-port #28063 to 2015.8
• PR #28231: (rallytime) Make sure we’re compairing strings when getting images in the DO driver
• PR #28224: (techhat) Optimize create_repo for large packages
• PR #28214: (rallytime) Don’t stacktrace if invalid credentials are passed to boto_route53 state
• PR #28228: (rallytime) Back-port #27562 to 2015.8
• PR #28232: (rallytime) Add documentation to supply the ssh_username: freebsd config to DO docs
• PR #28198: (jacobhammons) Added note regarding missing spm exe on Debian/Ubuntu
• PR #28182: (erchn) Some fixes for nova driver for Rackspace
• PR #28181: (rallytime) Revamp firewalld state to be more stateful.
• PR #28176: (cro) Add ping function
• PR #28167: (The-Loeki) file.serialize needs to add a final newline to serialized files
• PR #28168: (rallytime) Make sure availability zone gets passed in boto_vpc module when creating subnet
• PR #28148: (basepi) [2015.8] Only expand nodegroups to lists if there is a nested nodegroup
• PR #28155: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #28149: (pass-by-value) Add clarification to cloud profile doc about host
• PR #28146: (cachedout) Lint dracr.py
• PR #28141: (rallytime) Don’t use RAM for root disk size in linode.py
• PR #28143: (jtand) Removed blank line at end of chassis.py
• PR #28021: (blueeyed) Handle includes in include_config recursively
• PR #28095: (rallytime) Back-port #28001 to 2015.8
• PR #28096: (rallytime) Back-port #28061 to 2015.8
• PR #28139: (rallytime) Back-port #28103 to 2015.8
• PR #28098: (jacksontj) For all multi-part messages, check the headers. If the header is not ...
• PR #28134: (bernieke) fix unicode pillar values `#3436`
• PR #28076: (redmcg) Replace option `i` with an explicit queryformat
• PR #28119: (jacksontj) Check if the remote exists before casting to a string.
• PR #28105: (jfindlay) add reason for not loading localemod
- PR #28108: (cachedout) Set logfile permissions correctly
- PR #27922: (cro) WIP States/Modules for managing Dell FX2 chassis via salt-proxy
- PR #28104: (pass-by-value) Add documentation for proxy minion ssh
- PR #28200: (DmitryKuzmenko) LazyLoader deepcopy fix.
- PR #27933: (eliasp) Provide all git pillar dirs in opts[pillar_roots]
- PR #28013: (rallytime) Back-port #27891 to 2015.8
- PR #28018: (rallytime) Add example to Writing Grains of how grains can be loaded twice
- PR #28084: (cachedout) #28069 with lint
- PR #28079: (The-Loeki) Fix for trace dump on failing imports for win32com & pythoncom 4 win_task
- PR #28081: (The-Loeki) fix for glance state trace error on import failure
- PR #28066: (jacksontj) Use the generic text attribute, not .body of the handler
- PR #28019: (rallytime) Clean up version added and deprecated msgs to be accurate
- PR #28058: (rallytime) Back-port #28041 to 2015.8
- PR #28055: (rallytime) Back-port #28043 to 2015.8
- PR #28046: (pass-by-value) Add pkg install and remove functions
- PR #28050: (ryan-lane) Use a better method for checking dynamodb table existence
- PR #28042: (jfindlay) fix repo path in ubuntu installation documentation
- PR #28033: (twangboy) Fixed win_useradd.py
- PR #28027: (cro) Make ssh conn persistent.
- PR #28029: (jacobhammons) Updated release notes with additional CVE information
- PR #28022: (jacobhammons) Updated Debian and Ubuntu repo paths with new structure for 2015.8.1
- PR #27983: (rallytime) Pip state run result should be False, not None, if installation error occurs.
- PR #27991: (twangboy) Fix for `#20678`
- PR #27997: (rallytime) Remove note about pip bug with pip v1 vs pip v2 return codes
- PR #27994: (jfindlay) Fix schedule_test failure
- PR #27992: (cachedout) Make load beacon config into list
- PR #28003: (twangboy) Fix `#26336`
- PR #27984: (rallytime) Version added for clean_file option for pkgrepo
- PR #27989: (ryan-lane) Do not try to remove the main route table association
- PR #27982: (pass-by-value) Add example for salt-proxy over SSH
- PR #27985: (jacobhammons) Changed current release to 8.1 and added CVEs to release notes
- PR #27979: (cachedout) Fix regression with key whitespace
- PR #27977: (cachedout) Decode unicode names in fileclient/server
- PR #27981: (jfindlay) Fixed trailing whitespace lint
- PR #27969: (jeffreyctang) fix parse of ` on next line
- PR #27978: (terminalmage) Add note about dockerng.inspect_image usage

18.2. Previous Releases 2517
- PR #27955: (pass-by-value) Bp 27868
- PR #27953: (The-Loeki) Fix CloudStack cloud for new 'driver' syntax
- PR #27965: (ryan-lane) Fail in boto_asg.present if alarms fail
- PR #27958: (twangboy) Added new functionality to win_task.py
- PR #27959: (techhat) Change __opts__ to self.opts
- PR #27943: (rallytime) Back-port #27910 to 2015.8
- PR #27944: (rallytime) Back-port #27909 to 2015.8
- PR #27946: (jtand) Changed grain to look at osmajorrelease instead of osrelease
- PR #27914: (rallytime) Use eipalloc instead of eni in EC2 interface properties example
- PR #27926: (rallytime) Back-port #27905 to 2015.8
- PR #27927: (ryan-lane) Do not manage ingress or egress rules if set to None
- PR #27928: (rallytime) Back-port #27908 to 2015.8
- PR #27676: (ticosax) [dockerng] WIP No more runtime args passed to docker.start()
- PR #27885: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #27882: (twangboy) Created win_task.py module
- PR #27802: (terminalmage) Correct warning logging when update lock is present for git_pillar/winrepo, add runner function for clearing git_pillar/winrepo locks
- PR #27867: (rallytime) Handle group lists as well as comma-separated group strings.
- PR #27746: (anlutro) timezone module: handle timedatectl errors
- PR #27816: (anlutro) Make system.reboot use shutdown -r when available
- PR #27874: (rallytime) Add mention of Periodic Table naming scheme to deprecation docs
- PR #27883: (terminalmage) Work around --is-ancestor not being present in git-merge-base before git 1.8.0
- PR #27877: (rallytime) Back-port #27774 to 2015.8
- PR #27878: (rallytime) Use apache2ctl binary on SUSE in apache module
- PR #27879: (cro) Add docs for 2015.8.2+ changes to proxies
- PR #27731: (cro) Add __proxy__ to replace opts['proxymodule']
- PR #27745: (anlutro) Add pip_upgrade arg to virtualenv.managed state
- PR #27859: (ticosax) [dockerng] Remove dockerng.ps caching
- PR #27850: (rallytime) Back-port #27722 to 2015.8
- PR #27851: (rallytime) Back-port #27771 to 2015.8
- PR #27833: (jfindlay) decode path before string ops in fileclient
- PR #27837: (jfindlay) reverse truth in python_shell documentation
- PR #27860: (flavio) Fix OS related grains on openSUSE and SUSE Linux Enterprise
- PR #27768: (rallytime) Clean up bootstrap function to be slightly cleaner
• PR #27797: (isbm) Zyper module clusterfix
• PR #27849: (rallytime) Don't require a size parameter for proxmox profiles
• PR #27827: (techhat) Add additional error checking to SPM
• PR #27826: (martinhoefling) Fixes `#27825`
• PR #27795: (eguven) better change reporting for postgres_user groups
• PR #27799: (terminalmage) Fix usage of identity file in git.latest
• PR #27717: (pass-by-value) Proxy beacon example
• PR #27793: (anlutro) update code that changes log level of salt-ssh shim command
• PR #27761: (terminalmage) Merge git pillar data instead of using dict.update()
• PR #27741: (ticosax) [dockerng] pass filters argument to dockerng.ps
• PR #27760: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #27757: (jfindlay) fix virtual fcn return doc indentation
• PR #27754: (rallytime) Change test.nop version directive to 2015.8.1
• PR #27734: (jacobhammons) Updated saltstack2 theme to add SaltConf16 banner
• PR #27727: (rallytime) Merge #27719 w/pylint fix
• PR #27724: (jfindlay) update __virtual__ return documentation
• PR #27725: (basepi) Fix global injection for state cross calls
• PR #27628: (ticosax) [dockerng] Add support of labels parameter for dockerng
• PR #27704: (jacobhammons) Update compound matcher docs to clarify the usage of alternate delimi...
• PR #27705: (rallytime) Merge #27602 with final pylint fix
• PR #27691: (notpeter) Faster timeout (3s vs 2min) for instance metadata lookups. `#13850`
• PR #27696: (blueyed) loader.proxy: call _modules_dirs only once
• PR #27630: (ticosax) Expose container_id in mine.get_docker
• PR #27600: (blueyed) dockerng: use docker.version=auto by default
• PR #27689: (rallytime) Merge #27448 with test fixes
• PR #27693: (jacobhammons) initial engines topic, updates to windows repo docs
• PR #27601: (blueyed) dockerng: handle None in container.Names
• PR #27596: (blueyed) gitfs: fix UnboundLocalError for `msg`
• PR #27651: (eliasp) Check for existence of `subnetId` key in subnet dict
• PR #27639: (rallytime) Docement version added for new artifactory options
• PR #27677: (rallytime) Back-port #27675 to 2015.8
• PR #27637: (rallytime) Back-port #27604 to 2015.8
• PR #27657: (garethgreenaway) Fix to pkg state module
• PR #27632: (rallytime) Back-port #27539 to 2015.8
• PR #27633: (rallytime) Back-port #27559 to 2015.8

18.2. Previous Releases
• PR #27579: (rallytime) Change boto_route53 region default to `universal' to avoid problems with boto library
• PR #27581: (tkwilliams) Add support for `vpc_name' tag in boto_secggroup module and state
• PR #27624: (nasenbaer13) Wait for sync is not passed to boto_route53 state
• PR #27614: (blueyed) doc: minor fixes to doc and comments
• PR #27627: (eyj) Fix crash in boto_asg.get_instances if the requested attribute is None
• PR #27616: (jacobhammons) Updated windows software repository docs
• PR #27569: (lomeroe) boto_vpc.get_subnet_association now returns a dict w/key of vpc_id, a...
• PR #27567: (whiteinge) Use getattr to fetch psutil.version_info
• PR #27583: (tkwilliams) Fixup zypper module
• PR #27597: (blueyed) gifs: remove unused variable `"bad_per_remote_conf"
• PR #27585: (ryan-lane) Fix undefined variable in cron state module

18.2.17 Salt 2015.8.3 Release Notes

Security Fix

CVE-2015-8034: Saving state.sls cache data to disk with insecure permissions

This affects users of the state.sls function. The state run cache on the minion was being created with incorrect permissions. This file could potentially contain sensitive data that was inserted via jinja into the state SLS files. The permissions for this file are now being set correctly. Thanks to @zmalone for bringing this issue to our attention.

Changes

Extended changelog courtesy of Todd Stansell (https://github.com/tjstansell/salt-changelogs):

Generated at: 2015-11-25T00:34:50Z
Merges: 452

Changes:

• PR #29172: (basepi) [2015.8] Backport new philips_hue proxy features from develop
• PR #29167: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #29141: (optix2000) Add test case for require: sls with only import statements
• PR #29072: (terminalmage) Several gifs/git_pillar fixes
• PR #29118: (ticosax) [dockerng] Add networking capabilities
• PR #29145: (anlutro) Remove duplicate import of salt.utils.s3
• PR #29148: (lomeroe) correcting parameter calls to boto get_zone/create_zone functions in ...
• PR #29108: (lorentgordon) Enforce length as an int, fixes `#29107'`
• PR #29125: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #29126: (fcrozat) Fix deployment when umask is non-standard
• PR #29124: (rallytime) Back-port #28130 to 2015.8
• PR #29076: (RealKelsar) We can't query installed use flags for a non installed pkg
- PR #29097: (rallytime) Back-port #29070 to 2015.8
- PR #29090: (gtmanfred) clean up novaclient module
- PR #29095: (terminalmage) Add warning about pygit2 API instability
- PR #28919: (cro) Update Philips Hue proxy minion to support __proxy__ instead of proxymodule stored in __opts__
- PR #29065: (cachedout) Handle failures inside python’s inspect if a module is reloaded
- PR #29057: (paulhvin) Add local file support for file.managed source list
- PR #29017: (jfindlay) pagerduty runner: add missing salt.utils import
- PR #29039: (anlutro) Allow passing list of pip packages to virtualenv.managed
- PR #29047: (schwing) Fix salt.modules.gpg.import_key exception: `GPG_1_3_1 referenced before assignment`
- PR #29050: (terminalmage) Make git_pillar global config option docs more prominent
- PR #29048: (nmadhow) Fix incorrect debug log statement
- PR #29024: (jfindlay) cache runner test: add new unit tests
- PR #28967: (cro) Fix some issues with password changes
- PR #29020: (basepi) [2015.8] Add special list-only nodegroup support to salt-ssh
- PR #28970: (terminalmage) Properly handle non-string saltenvs
- PR #28959: (rallytime) Add blade password example and make note of timeout
- PR #29000: (kiorky) [Mergeable] Fix up LXC
- PR #29014: (jfindlay) systemd module: remove unneeded col command
- PR #28983: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #28969: (rallytime) Back-port #28825 to 2015.8
- PR #28787: (chrigl) closes `#28784`_
- PR #28944: (rallytime) The ret result must contain `name`, not `chassis_name` for the state compiler.
- PR #28957: (terminalmage) Fix version number for new state option
- PR #28950: (DmitryKuzmenko) PR 28812 which test fix
- PR #28812: (isbm) Enhance `which` decorator reliability
- PR #28934: (terminalmage) git.latest: Add update_head option to prevent local HEAD from being updated
- PR #28937: (rallytime) Update delchassis state example to use correct jinja syntax
- PR #28889: (jfindlay) state compiler: relax aggregate conditional check
- PR #28921: (rallytime) Back-port #25470 to 2015.8
- PR #28922: (rallytime) Change 2015.8.2 release note title to reflect proper version
- PR #28891: (jfindlay) rh_service module: fix logic in _chkconfig_is_enabled
- PR #28892: (jfindlay) grains.core: correctly identify SLES 11 distrib_id
- PR #28910: (lorengordon) Fix winrepo command in windows pkg mgmt doc
- PR #28896: (rallytime) Back-port #28855 to 2015.8
- PR #28895: (rallytime) Back-port #28823 to 2015.8

18.2. Previous Releases

2521
- PR #28885: (kt97679) fix for: service.enabled fails on xen server `#28754`
- PR #28880: (terminalmage) Add `"profile"` loglevel
- PR #28882: (basepi) [2015.8] salt-ssh: Check return type to make sure it's an error
- PR #28867: (rallytime) [fx2 grains] Grains functions should return dictionaries
- PR #28863: (mhoogendoorn) Fix ebuild.install causing extra refresh_db calls.
- PR #28865: (jfindlay) add 2015.8.2 release notes
- PR #28730: (garethgreenaway) Fixes to how return_job is handled in the scheduler for the salt master.
- PR #28848: (cro) Lint
- PR #28842: (cachedout) Add transport setting to shell test
- PR #28837: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #28827: (jacksontj) Cleanup virtual_timer in loader
- PR #28836: (cachedout) Cast to dict to fix wheel tests in tcp
- PR #28834: (cachedout) Fix breakage in tcp server
- PR #28804: (cachedout) TCP test fixes
- PR #28826: (basepi) [2015.8] Add new tornado deps to salt-ssh thin
- PR #28759: (jfindlay) simplify stdin use of stdin in at.present state
- PR #28824: (rallytime) Back-port #28778 and #28820 to 2015.8
- PR #28803: (jfindlay) decode strings to utf-8
- PR #28782: (rallytime) Fixes to rabbitmq user state
- PR #28789: (nmadhok) Provide ability to enable/disable customization for newly create VMs using VMware salt-cloud driver
- PR #28768: (mrosedale) 2015.8
- PR #28772: (rallytime) rabbitmq.list_user_permissions returns a dict, not a list. Don't expect a list.
- PR #28774: (rallytime) Back-port #28725 to 2015.8
- PR #28775: (rallytime) Back-port #28740 to 2015.8
- PR #28755: (rallytime) Move most vmware driver list_* functions to use salt.utils.vmware functions
- PR #28744: (jfindlay) import gate elementtree
- PR #28758: (jfindlay) remove redundant logic in useradd execution module
- PR #28757: (mbarrien) Bug fix: pip command to not quote spaces in cmd line args
- PR #28764: (multani) Various documentation fixes
- PR #28752: (aboe76) Update openSUSE grain for tumbleweed
- PR #28713: (hexedpackets) Rename consul.list to consul.list_keys.
- PR #28719: (jacobhammons) removed dependencies info from docs
- PR #28709: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #28710: (rallytime) Pass kwargs correctly to _get_group from get_group_id
- PR #28698: (rallytime) Back-port #28530 to 2015.8
• PR #28700: (`rallytime`) Back-port #28679 to 2015.8
• PR #28695: (s0undt3ch) [2015.8] Update to latest bootstrap script v2015.11.09
• PR #28656: (clarkperkins) `#28526` fixed yumpkg module issue with pkg.installed
• PR #28672: (jfindlay) add OS grain support for SuSE Leap
• PR #28673: (jfindlay) add hidden_opts to mount.mounted
• PR #28667: (cro) saltutil.sync_all should sync proxymodules as well as the rest.
• PR #28665: (jfindlay) fixes to windows execution and state modules
• PR #28660: (techhat) Don’t sign empty regions
• PR #28632: (terminalmage) Fixes/improvements to pkgbuild state/modules
• PR #28658: (techhat) Remove __pkgdb_fun() references
• PR #28653: (`rallytime`) Provide possible parameters for boto_rds.present engine values
• PR #28649: (bdrun) Fix OS related grains on Debian
• PR #28646: (`rallytime`) Back-port #28614 to 2015.8
• PR #28647: (`rallytime`) Back-port #28624 to 2015.8
• PR #28648: (`rallytime`) Merge branch `2015.5` into `2015.8`
• PR #28638: (anlutro) Salt-SSH: Return more concise error when SSH command fails
• PR #28644: (pass-by-value) Make sure versionchanged is correct
• PR #28615: (The-Loeki) Fixes to FreeBSD pkg
• PR #28613: (cachedout) Add facility to deepcopy bound methods in Py2.6 and apply to grains
• PR #28612: (`rallytime`) Remove unsupported storage_type argument for parity with boto_rds module
• PR #28611: (`rallytime`) [2015.8] Be explicit about salt.utils.vmware function calls
• PR #28610: (pass-by-value) Lxc config additions
• PR #28602: (nasenbaer13) Allow setting of custom dimensions in asg alarm specification
• PR #28596: (`rallytime`) Merge branch `2015.5` into `2015.8`
• PR #28593: (blueyed) doc: fix typo with salt.states.file: s/preseve/preserve/
• PR #28578: (twangboy) Fixed the script... something got broke...
• PR #28579: (jfindlay) fix __virtual__ returns: tls,uptime mods
• PR #28584: (`rallytime`) If AssociatePublicIpAddress is set to True, don’t auto-assign eip.
• PR #28576: (jacksontj) Only encode the zmq message once
• PR #28587: (cachedout) Reset yaml rendering hooks to avoid leaks
• PR #28581: (basepi) Revert b4875e588a165482c41dc8987d76b0a71ef1b0
• PR #28573: (jacksontj) Add body to salt.utils.http.query returns
• PR #28564: (s0undt3ch) [2015.8] Update to latest bootstrap script v2015.11.04
• PR #28561: (Oro) Issue `#28527`_ _boto_rds.create does not work
• PR #28560: (bdrun) Fix various typos
• PR #28550: (jfindlay) check timedatectl errno and return stdout on failure
• PR #28545: (jfindlay) pass on concurrent create of jid_dir in local_cache
• PR #28544: (rallytime) Start moving some vmware.py cloud funcs to utils/vmware.py
• PR #28543: (gtmanfred) clean up changes for pkg.uptodate and supervisord.dead
• PR #28538: (jfindlay) decode path and url to utf-8 in url.create
• PR #28533: (jfindlay) decode highstate error messages to utf-8
• PR #28547: (nmadhok) [Backport] [2015.8] Tasks can be in queued state instead of running
• PR #28535: (techhat) Fail gracefully if 169.254* isn’t available
• PR #28536: (cro) Default configuration file for proxy minions.
• PR #28534: (rallytime) Add versionadded directive for vpc_name arg in boto_secgroup.present
• PR #28516: (rallytime) Back-port #28489 to 2015.8
• PR #28506: (basepi) [2015.8] Log minion list for all rosters, at debug level
• PR #28514: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #28502: (cachedout) Lint #28427
• PR #28464: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #28486: (rallytime) Back-port #26945 to 2015.8
• PR #28472: (gtmanfred) overwrite more than one value with names
• PR #28493: (rallytime) Back-port #28492 to 2015.8
• PR #28494: (whiteinge) Fix filter_by passing incorrect parameters to match functions
• PR #28491: (rallytime) Back-port #28388 to 2015.8
• PR #28465: (twangboy) Fix `#12363`_: Password Expiration in Windows
• PR #28485: (nasenbaer13) Fix invalid usage of _get_conn causing `#28484`_
• PR #28454: (sdm24) Fixed nodegroup doc formatting to correctly link to pillar_opts in the master config
• PR #28487: (cachedout) Lint 28456
• PR #28457: (sdm24) Clarified comments for grains/core.py for ip_interfaces, ip4_interfac...
• PR #28473: (anlutro) Show check_cmd output on failure
• PR #28460: (jtand) Skipped wipefs test if wipefs does not exist on OS
• PR #28426: (terminalmage) pkgbuild.built: make template engine optional
• PR #28422: (cachedout) Handle windows logging on thread_multi [WIP]
• PR #28425: (twangboy) Fix `#13513`_ - Reflection
• PR #28417: (rallytime) Add note about azure sdk version to getting started docs
• PR #28410: (jacksontj) Add retries to the zeromq.AsyncReqMessageClient
• PR #28404: (rallytime) Back-port #28395 to 2015.8
• PR #28405: (opdude) Detect legacy versions of chocolatey correctly
• PR #28187: (sjansen) fix at.present
• PR #28375: (merll) Merge pillar includes correctly
• PR #28376: (ryan-lane) Support update of route53 records with multiple values
• PR #28377: (terminalmage) Deprecate `always` in favor of `force` in pkgbuild.built
• PR #28380: (cro) Add missing call for service provider
• PR #28348: (jfindlay) salt.utils.alias informs user they are using a renamed function
• PR #28364: (jtand) In CentOS 5 the .split() causes a stacktrace.
• PR #28361: (rallytime) Back-port #28087 to 2015.8
• PR #28360: (multani) Various documentation fixes
• PR #28370: (rallytime) Back-port #28276 to 2015.8
• PR #28353: (merll) Consider each pillar match only once.
• PR #28348: (anlutro) iptables needs -m comment for --comment to work
• PR #28344: (jjfindlay) sdecode file and dir lists in fileclient
• PR #28343: (rallytime) Back-port #28342 to 2015.8
• PR #28330: (rallytime) Back-port #28305 to 2015.8
• PR #28270: (rallytime) Refactor RabbitMQ Plugin State to correctly use test=True and format errors
• PR #28269: (rallytime) Refactor rabbitmq_user state to use test=True correctly
• PR #28299: (rallytime) Add test for availability_zone check to boto_vpc_tests
• PR #28306: (sdm24) Updated the Nodegroup docs to include how to target nodegroups in SLS Jinja
• PR #28308: (rallytime) Firewalld state services should use --add-service, not --new-service
• PR #28302: (DmitryKuzmenko) Always close socket even if there is no stream.
• PR #28282: (keesbos) Fix for __env__ in legacy git_pillar
• PR #28258: (pass-by-value) Add service module for ssh proxy example
• PR #28294: (bechtoldt) correct a bad default value in http utility
• PR #28185: (jtand) Added single package return for latest_version, fixed other bug.
• PR #28297: (cachedout) Lint fix proxy junos
• PR #28210: (terminalmage) Fix for ext_pillar being compiled twice in legacy git_pillar code
• PR #28265: (jjfindlay) fix blockdev execution and state modules
• PR #28266: (rallytime) Back-port #28260 to 2015.8
• PR #28253: (rallytime) Back-port #28063 to 2015.8
• PR #28231: (rallytime) Make sure we're compairing strings when getting images in the DO driver
• PR #28224: (techhat) Optimize create_repo for large packages
• PR #28214: (rallytime) Don't stacktrace if invalid credentials are passed to boto_route53 state
• PR #28228: (rallytime) Back-port #27562 to 2015.8
• PR #28232: (rallytime) Add documentation to supply the ssh_username: freebsd config to DO docs
• PR #28198: (jacobhammons) Added note regarding missing spm exe on Debian/Ubuntu
• PR #28182: (erchn) Some fixes for nova driver for Rackspace
• PR #28181: (rallytime) Revamp firewalld state to be more stateful.
- PR #28176: (cro) Add ping function
- PR #28167: (The-Loeki) file.serialize needs to add a final newline to serialized files
- PR #28168: (rallytime) Make sure availability zone gets passed in boto_vpc module when creating subnet
- PR #28148: (basepi) [2015.8] Only expand nodegroups to lists if there is a nested nodegroup
- PR #28155: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #28149: (pass-by-value) Add clarification to cloud profile doc about host
- PR #28146: (cachedout) Lint dracr.py
- PR #28141: (rallytime) Don’t use RAM for root disk size in linode.py
- PR #28143: (jtand) Removed blank line at end of chassis.py
- PR #28095: (blueyed) Handle includes in include_config recursively
- PR #28096: (rallytime) Back-port #28001 to 2015.8
- PR #28096: (rallytime) Back-port #28061 to 2015.8
- PR #28139: (rallytime) Back-port #28103 to 2015.8
- PR #28098: (jacksontj) For all multi-part messages, check the headers. If the header is not ...
- PR #28134: (bernieke) fix unicode pillar values `#3436`_
- PR #28076: (redmcg) Replace option `i` with an explicit queryformat
- PR #28119: (jacksontj) Check if the remote exists before casting to a string.
- PR #28105: (jfindlay) add reason for not loading localemod
- PR #28108: (cachedout) Set logfile permissions correctly
- PR #27922: (cro) WIP States/Modules for managing Dell FX2 chassis via salt-proxy
- PR #28104: (pass-by-value) Add documentation for proxy minion ssh
- PR #28020: (DmitryKuzmenko) LazyLoader deepcopy fix.
- PR #27933: (eliasp) Provide all git pillar dirs in opts[pillar_roots]
- PR #28013: (rallytime) Back-port #27891 to 2015.8
- PR #28018: (rallytime) Add example to Writing Grains of how grains can be loaded twice
- PR #28084: (cachedout) #28069 with lint
- PR #28079: (The-Loeki) Fix for trace dump on failing imports for win32com & pythoncom 4 win_task
- PR #28081: (The-Loeki) fix for glance state trace error on import failure
- PR #28066: (jacksontj) Use the generic text attribute, not .body of the handler
- PR #28019: (rallytime) Clean up version added and deprecated msgs to be accurate
- PR #28058: (rallytime) Back-port #28041 to 2015.8
- PR #28055: (rallytime) Back-port #28043 to 2015.8
- PR #28046: (pass-by-value) Add pkg install and remove functions
- PR #28050: (ryan-lane) Use a better method for checking dynamodb table existence
- PR #28042: (jfindlay) fix repo path in ubuntu installation documentation
- PR #28033: (twangboy) Fixed win_useradd.py
- PR #28027: (cro) Make ssh conn persistent.
- PR #28029: (jacobhammons) Updated release notes with additional CVE information
- PR #28022: (jacobhammons) Updated Debian and Ubuntu repo paths with new structure for 2015.8.1
- PR #27983: (rallytime) Pip state run result should be False, not None, if installation error occurs.
- PR #27991: (twangboy) Fix for `#20678`_
- PR #27997: (rallytime) Remove note about pip bug with pip v1 vs pip v2 return codes
- PR #27994: (jtand) Fix schedule_test failure
- PR #27992: (cachedout) Make load beacon config into list
- PR #28003: (twangboy) Fix `#26336`_
- PR #27984: (rallytime) Version added for clean_file option for pkgrepo
- PR #27989: (ryan-lane) Do not try to remove the main route table association
- PR #27982: (pass-by-value) Add example for salt-proxy over SSH
- PR #27985: (jacobhammons) Changed current release to 8.1 and added CVEs to release notes
- PR #27979: (cachedout) Fix regression with key whitespace
- PR #27977: (cachedout) Decode unicode names in fileclient/server
- PR #27981: (jtand) Fixed trailing whitespace lint
- PR #27969: (jeffreyctang) fix parse of { on next line
- PR #27978: (terminalmage) Add note about dockerng.inspect_image usage
- PR #27955: (pass-by-value) Bp 27868
- PR #27953: (The-Loekë) Fix CloudStack cloud for new `driver` syntax
- PR #27965: (ryan-lane) Fail in boto_asg.present if alarms fail
- PR #27958: (twangboy) Added new functionality to win_task.py
- PR #27959: (techhat) Change __opts__ to self.opts
- PR #27943: (rallytime) Back-port #27910 to 2015.8
- PR #27944: (rallytime) Back-port #27909 to 2015.8
- PR #27946: (jtand) Changed grain to look at osmajorrelease instead of osrelease
- PR #27914: (rallytime) Use eipalloc instead of eni in EC2 interface properties example
- PR #27926: (rallytime) Back-port #27905 to 2015.8
- PR #27927: (ryan-lane) Do not manage ingress or egress rules if set to None
- PR #27928: (rallytime) Back-port #27908 to 2015.8
- PR #27676: (ticosax) [dockerng] WIP No more runtime args passed to docker.start()
- PR #27885: (basepå) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #27882: (twangboy) Created win_task.py module
- PR #27802: (terminalmage) Correct warning logging when update lock is present for git_pillar/winrepo, add runner function for clearing git_pillar/winrepo locks
- PR #27886: (rallytime) Handle group lists as well as comma-separated group strings.
• PR #27746: (anlutro) timezone module: handle timedatectl errors
• PR #27816: (anlutro) Make system.reboot use shutdown -r when available
• PR #27874: (rallytime) Add mention of Periodic Table naming scheme to deprecation docs
• PR #27883: (anlutro) Work around --is-ancestor not being present in git-merge-base before git 1.8.0
• PR #27877: (rallytime) Back-port #27774 to 2015.8
• PR #27878: (rallytime) Use apache2ctl binary on SUSE in apache module
• PR #27879: (cro) Add docs for 2015.8.2+ changes to proxies
• PR #27731: (cro) Add __proxy__ to replace opts['proxymodule']
• PR #27745: (anlutro) Add pip_upgrade arg to virtualenv.managed state
• PR #27809: (ticosax) [dockerng] Remove dockerng.ps caching
• PR #27859: (ticosax) [dockerng] Clarify doc port bindings
• PR #27748: (multani) Fix `#8646`_
• PR #27850: (rallytime) Back-port #27722 to 2015.8
• PR #27851: (rallytime) Back-port #27771 to 2015.8
• PR #27833: (jfindlay) decode path before string ops in fileclient
• PR #27837: (jfindlay) reverse truth in python_shell documentation
• PR #27860: (flavio) Fix OS related grains on openSUSE and SUSE Linux Enterprise
• PR #27768: (rallytime) Clean up bootstrap function to be slightly cleaner
• PR #27797: (ismb) Zypper module clusterfix
• PR #27849: (rallytime) Don't require a size parameter for proxmox profiles
• PR #27827: (techhat) Add additional error checking to SPM
• PR #27826: (martinhoefling) Fixes `#27825`_
• PR #27824: (techhat) Update Azure errors
• PR #27795: (eguven) better change reporting for postgres_user groups
• PR #27799: (terminalmage) Fix usage of identity file in git.latest
• PR #27717: (pass-by-value) Proxy beacon example
• PR #27793: (anlutro) update code that changes log level of salt-ssh shim command

• PR #27585: (ryan-lane) Fix undefined variable in cron state module

18.2.18 Salt 2015.8.4 Release Notes

Known Issues

in_ requisites (issue 30820)
This issue affects all users targeting an explicit -name: <name> with a _in requisite (such as watch_in or require_in). If you are not using explicit -name: <name> arguments, are targeting with the state ID instead of the name, or are not using _in requisites, then you should be safe to upgrade to 2015.8.4.
This issue is resolved in the 2015.8.5 release.

Security Fix

CVE-2016-1866: Improper handling of clear messages on the minion, which could result in executing commands not sent by the master.

This issue affects only the 2015.8.x releases of Salt. In order for an attacker to use this attack vector, they would have to execute a successful attack on an existing TCP connection between minion and master on the pub port. It does not allow an external attacker to obtain the shared secret or decrypt any encrypted traffic between minion and master. Thank you to Sebastian Krahmer <krahmer@suse.com> for bringing this issue to our attention.

We recommend everyone upgrade to 2015.8.4 as soon as possible.

Core Changes

- PR #28994: timcharper Salt S3 module has learned how to assume IAM roles
- Added option mock=True for state.sls and state.highstate. This allows the salt state compiler to process sls data in a state run without actually calling the state functions, thus providing feedback on the validity of the arguments used for the functions beyond the preprocessing validation provided by state.show_sls (issue 30118 and issue 30189).

```bash
salt '*' state.sls core,edit.vim mock=True
salt '*' state.highstate mock=True
salt '*' state.apply edit.vim mock=True
```

Changes for v2015.8.3..v2015.8.4

Extended changelog courtesy of Todd Stansell (https://github.com/tjstansell/salt-changelogs):

Generated at: 2016-01-25T17:48:35Z

Total Merges: 320

Changes:

- PR #30613: (basepi) Fix minion/syndic clearfuncs
- PR #30609: (seanjnks) Fix documentation for pillar_merge_lists which default is False, not ...
- PR #30584: (julianbrost) file.line state: add missing colon in docstring
- PR #30589: (terminalmage) Merge 2015.5 into 2015.8
- PR #30599: (multani) Documentation formatting fixes
- PR #30554: (rallytime) Make the salt-cloud actions output more verbose and helpful
- PR #30549: (techhat) Salt Virt cleanup
- PR #30553: (techhat) AWS: Support 17-character IDs
- PR #30532: (whiteinge) Add execution module for working in sls files
- PR #30529: (terminalmage) Merge 2015.5 into 2015.8
- PR #30526: (twangboy) Added FlushKey to make sure it's changes are saved to disk
- PR #30521: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #30485: (jtand) Updated pip_state to work with pip 8.0 on 2015.8
• PR #30494: (isbm) Zypper: info_installed — `errors' flag change to type `boolean'
• PR #30506: (jacksontj) Properly remove newlines after reading the file
• PR #30508: (rallytime) Fix Linode driver cloning functionality
• PR #30522: (terminalmage) Update git.list_worktree tests to reflect new return data
• PR #30483: (borgstrom) Pyobjects recursive import support (for 2015.8)
• PR #30491: (jacksontj) Add multi-IP support to network state
• PR #30496: (anlutro) Fix KeyError when adding ignored pillars
• PR #30506: (jacksontj) Properly remove newlines after reading the file
• PR #30508: (rallytime) Fix Linode driver cloning functionality
• PR #30522: (terminalmage) Update git.list_worktree tests to reflect new return data
• PR #30483: (borgstrom) Pyobjects recursive import support (for 2015.8)
• PR #30491: (jacksontj) Add multi-IP support to network state
• PR #30496: (anlutro) Fix KeyError when adding ignored pillars
• PR #30359: (kingsquirrel152) Removes suspected copy/paste error for zmq_filtering functionality
• PR #30448: (cournape) Fix osx scripts location
• PR #30457: (rallytime) Remove fsutils references from modules list
• PR #30453: (rallytime) Make sure private AND public IPs are listed for Linode driver
• PR #30458: (rallytime) Back-port #30062 to 2015.8
• PR #30468: (timcharper) make note of s3 role assumption in upcoming changelog
• PR #30470: (whiteinge) Add example of the match_dict format to accept_dict wheel function
• PR #30450: (gtmanfred) fix extension loading in novaclient
• PR #30212: (abednarik) Fix incorrect file permissions in file.line
• PR #29947: (jfindlay) fileclient: decode file list from master
• PR #30363: (terminalmage) Use native ``list” subcommand to list git worktrees
• PR #30445: (jtand) Boto uses False for is_default instead of None
• PR #30406: (frioux) Add an example of how to use file.managed/check_cmd
• PR #30424: (isbm) Check if byte strings are properly encoded in UTF-8
• PR #30405: (jtand) Updated glusterfs.py for python2.6 compatibility.
• PR #30396: (pass-by-value) Remove hardcoded val
• PR #30391: (jtand) Added else statements
• PR #30375: (rallytime) Wrap formatted log statements with six.u() in cloud/__init__.py
• PR #30384: (isbm) Bugfix: info_available does not work correctly on SLE 11 series
• PR #30376: (pritambaral) Fix FLO_DIR path in 2015.8
• PR #30389: (jtand) Older versions of ipset don't support comments
• PR #30373: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #30372: (jacobhammons) Updated man pages for 2015.8.4, updated copyright to 2016
• PR #30370: (rallytime) Remove incomplete function
• PR #30366: (rallytime) Back-port #28702 to 2015.8
• PR #30361: (cro) Flip the sense of the test for proxymodule imports, add more fns for esxi proxy
• PR #30267: (isbm) Fix RPM issues with the date/time and add package attributes filtering
• PR #30360: (jfindlay) file.remove, file.absent: mention recursive dir removal
• PR #30221: (mbarrien) No rolcatupdate for user_exist in Postgres>=9.5 `#26845`_
• PR #30358: (terminalmage) Add libgit2 version to versions-report
• PR #30346: (pass-by-value) Prevent orphaned volumes
• PR #30349: (rallytime) Back-port #30347 to 2015.8
• PR #30354: (anlutro) Make sure all ignore_missing SLSes are caught
• PR #30356: (nmadhok) Adding code author
• PR #30340: (jfindlay) Updated seed_test.py for changes made to seed module
• PR #30339: (jfindlay) Backport #30257 to 2015.8
• PR #30343: (rallytime) Fix 2015.8 from incomplete back-port
• PR #30342: (eliasp) Correct whitespace placement in error message
• PR #30308: (rallytime) Back-port #30257 to 2015.8
• PR #30187: (rallytime) Back-port #27606 to 2015.8
• PR #30223: (serge-p) adding support for DragonFly BSD
• PR #30238: (rallytime) Reinit crypto before calling RSA.generate when generating keys.
• PR #30246: (dmacvicar) Add missing return data to scheduled jobs (`#24237`_)
• PR #30292: (thegoodduke) ipset: fix test=true & add comment for every entry
• PR #30275: (abednarik) Add permanent argument in firewalld.
• PR #30328: (cachedout) Fix file test
• PR #30310: (pass-by-value) Empty bucket fix
• PR #30211: (techhat) Execute choot on the correct path
• PR #30309: (rallytime) Back-port #30304 to 2015.8
• PR #30278: (nmadhok) If datacenter is specified in the config, then look for managed objects under it
• PR #30305: (jacobhammons) Changed examples to use the ``example.com`` domain instead of ``mycompany...``
• PR #30249: (mprezioso) Fixes performance and timeout issues on win_pkg.install
• PR #30217: (pass-by-value) Make sure cloud actions can be called via salt-run
• PR #30268: (terminalmage) Optimize file_tree ext_pillar and update file.managed to allow for binary contents
• PR #30245: (rallytime) Boto secgroup/iam_role: Add note stating us-east-1 is default region
• PR #30299: (rallytime) ESXi Proxy minions states are located at salt.states.esxi, not vsphere.
• PR #30202: (opdude) Fixed the periodic call to beacons
• PR #30303: (jacobhammons) Changed notes to indicate that functions are matched using regular ex...
• PR #30284: (terminalmage) salt.utils.gitfs: Fix Dulwich env detection and submodule handling
• PR #30280: (jfindlay) add state mocking to release notes
• PR #30273: (rallytime) Back-port #30121 to 2015.8
• PR #30301: (cachedout) Accept whatever comes into highstate mock for state tests
• PR #30282: (cachedout) Fix file.append logic
• PR #30289: (cro) Fix problems with targeting proxies by grains
• PR #30293: (cro) Ensure we don’t log stuff we shouldn’t
• PR #30279: (cachedout) Allow modules to be packed into boto utils
• PR #30186: (rallytime) Update CLI Examples in boto_ec2 module to reflect correct arg/kwarg positioning
• PR #30156: (abednarik) Add option in file.append to ignore_whitespace.
• PR #30189: (rallytime) Back-port #30185 to 2015.8
• PR #30215: (jacobhammons) Assorted doc bug fixes
• PR #30206: (cachedout) Revert ‘`Fix incorrect file permissions in file.line’”
• PR #30190: (jacobhammons) Updated doc site banners
• PR #30188: (jfindlay) modules.x509._dec2hex: add fmt index for 2.6 compat
• PR #30179: (terminalmage) Backport #29589 to 2015.8 branch
• PR #29693: (rallytime) Update boto_secgroup and boto_iam_role docs to only use region OR profile
• PR #29705: (rallytime) Move _option(value) calls to __salt__['config.option'] in boto utils
• PR #30160: (dmurphy18) Fix parsing disk usage for line with no number and AIX values in Kilos
• PR #30162: (rallytime) Update list_present and append grains state docs to be more clear.
• PR #30163: (rallytime) Add warning about using ‘`=`” in file.line function
• PR #30164: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #30168: (abednarik) Fix incorrect file permissions in file.line
• PR #30154: (Oro) Fix file serialize on windows
• PR #30144: (rallytime) Added generic ESXCLI command ability to ESXi Proxy Minion
• PR #30142: (terminalmage) Fix dockerng.push, and allow for multiple images
• PR #30075: (joejulian) Convert glusterfs module to use xml
• PR #30129: (optix2000) Clean up _uptodate() in git state
• PR #30139: (rallytime) Back-port #29589 to 2015.8
• PR #30124: (abednarik) Update regex to detect ip alias in OpenBSD.
• PR #30133: (stanislavb) Fix typo in gpgkey URL
• PR #30126: (stanislavb) Log S3 API error message
• PR #30128: (oeufete) Log retryable transport errors as warnings
• PR #30096: (cachedout) Add rm_special to crontab module
• PR #30106: (techhat) Ensure last dir
• PR #30101: (gtmanfred) fix bug where nova driver exits with no adminPass
• PR #30090: (techhat) Add argument to isdir()
• PR #30094: (rallytime) Fix doc formatting for cloud.create example in module.py state
• PR #30095: (rallytime) Add the list_nodes_select function to linode driver
• PR #30082: (abednarik) Fixed saltversioninfo grain return
• PR #30084: (rallytime) Back-port #29987 to 2015.8
• PR #30071: (rallytime) Merge branch `2015.5' into `2015.8'
• PR #30067: (ryan-lane) Pass in kwargs to boto_secgroup.convert_to_group_ids explicitly
• PR #30069: (techhat) Ensure that pki_dir exists
• PR #30064: (rallytime) Add Syndic documentation to miscellaneous Salt Cloud config options
• PR #30049: (rallytime) Add some more unit tests for the vsphere execution module
• PR #30060: (rallytime) Back-port #27104 to 2015.8
• PR #30048: (jacobhammons) Remove internal APIs from rest_cherrypy docs.
• PR #30043: (rallytime) Be explicit about importing from salt.utils.jinja to avoid circular imports
• PR #30038: (rallytime) Back-port #30017 to 2015.8
• PR #30036: (rallytime) Back-port #29995 to 2015.8
• PR #30035: (rallytime) Back-port #29895 to 2015.8
• PR #30034: (rallytime) Back-port #29893 to 2015.8
• PR #30033: (rallytime) Back-port #29876 to 2015.8
• PR #30029: (terminalmage) git.latest: Fix handling of nonexistent branches
• PR #30016: (anlutro) Properly normalize locales in locale.gen_locale
• PR #30015: (anlutro) locale module: don't escape the slash in \n
• PR #30022: (gggunhed) Two minor typos fixed
• PR #30026: (anlutro) states.at: fix wrong variable being used
• PR #29966: (multani) Fix bigip state/module documentation + serializers documentation
• PR #29904: (twangboy) Improvements to osx packaging scripts
• PR #29950: (multani) boto_iam: fix deletion of IAM users when using delete_keys=true
• PR #29937: (multani) Fix states.boto_iam group users
• PR #29934: (multani) Fix state.boto_iam virtual name
• PR #29943: (cachedout) Check args correctly in boto_rds
• PR #29924: (gggunhed) fixed: uptime now working on non-US Windows
• PR #29883: (serge-p) fix for nfs mounts in _active_mounts_openbsd()
• PR #29894: (techhat) Support Saltfile in SPM
• PR #29856: (rallytime) Added some initial unit tests for the salt.modules.vsphere.py file
• PR #29855: (rallytime) Back-port #29740 to 2015.8
• PR #29890: (multani) Various documentation fixes
• PR #29850: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #29811: (anlutro) influxdb: add retention policy module functions
• PR #29814: (basepi) [2015.8][Windows] Fix multi-master on windows
• PR #29819: (rallytime) Add esxi module and state to docs build
• PR #29832: (jeleimbach) Fixed typo in order to use the keyboard module for RHEL without systemd
• PR #29803: (rallytime) Add vSphere module to doc ref module tree
- PR #29767: (abednarik) Hosts file update in mod_hostname.
- PR #29772: (terminalmage) pygit2: skip submodules when traversing tree
- PR #29765: (gtmanfred) allow nova driver to be boot from volume
- PR #29773: (l2ol33rt) Append missing wget in debian installation guide
- PR #29800: (rallytime) Back-port #29769 to 2015.8
- PR #29775: (paulnivin) Change listen requisite resolution from name to ID declaration
- PR #29754: (rallytime) Back-port #29719 to 2015.8
- PR #29713: (The-Loeki) Pillar-based cloud providers still forcing use of deprecated `provider`
- PR #29729: (rallytime) Further clarifications on `unless` and `onlyif` requisites.
- PR #29737: (akissa) fix pillar sqlite3 documentation examples
- PR #29743: (akissa) fix pillar sqlite not honouring config options
- PR #29723: (rallytime) Clarify db_user and db_password kwargs for postgres_user.present state function
- PR #29722: (rallytime) Link `stateful` kwargs to definition of what `stateful` means for cmd state.
- PR #29724: (rallytime) Add examples of using multiple matching levels to Pillar docs
- PR #29726: (cachedout) Disable some boto tests per resolution of moto issue
- PR #29708: (lagesag) Fix test=True for file.directory with recurse ignore_files/ignore_dirs.
- PR #29642: (cachedout) Correctly restart daemonized minions on failure
- PR #29599: (cachedout) Clean up minion shutdown
- PR #29675: (clinta) allow returning all refs
- PR #29683: (rallytime) Catch more specific error to pass the error message through elegantly.
- PR #29687: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #29681: (clinta) fix bare/mirror in git.latest
- PR #29644: (rallytime) Fixed a couple more ESXi proxy minion bugs
- PR #29645: (rallytime) Back-port #29558 to 2015.8
- PR #29632: (jfindlay) reduce severity of tls module __virtual__ logging
- PR #29606: (abednarik) Fixed duplicate mtu entry in RedHat 7 network configuration.
- PR #29613: (rallytime) Various ESXi Proxy Minion Bug Fixes
- PR #29628: (DmitryKuzmenko) Don’t create io_loop before fork
- PR #29609: (basepi) [2015.8][salt-ssh] Add ability to set salt-ssh command umask in roster
- PR #29603: (basepi) Fix orchestration failure-checking
- PR #29597: (terminalmage) dockerng: Prevent exception when API response contains empty dictionary
- PR #29596: (rallytime) Back-port #29587 to 2015.8
- PR #29588: (rallytime) Added ESXi Proxy Minion Tutorial
- PR #29572: (gtmanfred) [nova] use old discover_extensions if available
- PR #29545: (terminalmage) git.latest: init submodules if not yet initialized
- PR #29548: (rallytime) Back-port #29449 to 2015.8

18.2. Previous Releases
• PR #29547: (rallytime) Refactored ESXCLI-based functions to accept a list of esxi_hosts
• PR #29563: (anlutro) Fix a call to deprecated method in python-influxdb
• PR #29565: (bdrung) Fix typos and missing release note
• PR #29540: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #29499: (rallytime) Initial commit of ESXi Proxy Minion
• PR #29526: (jfindlay) 2015.8.2 notes: add note about not being released
• PR #29531: (jfindlay) grains.core: handle undefined variable
• PR #29538: (basepi) [2015.8] [salt-ssh] Remove umask around actual execution for salt-ssh
• PR #29505: (rallytime) Update boto_rds state docs to include funky yaml syntax for `tags` option.
• PR #29513: (bdrung) Drop obsolete syslog.target from systemd services
• PR #29500: (rallytime) Back-port #29467 to 2015.8
• PR #29463: (abednarik) Add **kwargs to debconf.set.
• PR #29399: (jfindlay) modules.status: add human_readable option to uptime
• PR #29433: (cro) Files for building .pkg files for MacOS X
• PR #29455: (jfindlay) modules.nova.__init__: do not return None
• PR #29454: (jfindlay) rh_service module __virtual__ return error messages
• PR #29476: (tbaker57) Doc fix - route_table_present needs subnet_names (not subnets) as a key
• PR #29487: (rallytime) Back-port #29450 to 2015.8
• PR #29441: (rallytime) Make sure docs line up with blade_idrac function specs
• PR #29440: (rallytime) Back-port #28925 to 2015.8
• PR #29435: (galet) Grains return wrong OS version and other OS related values for Oracle Linux
• PR #29430: (rall0r) Fix host.present state limitation
• PR #29417: (jacobhammons) Repo install updates
• PR #29402: (techhat) Add rate limiting to linode
• PR #29400: (twangboy) Fix #19332
• PR #29398: (cachedout) Lint 29288
• PR #29331: (DmitryKuzmenko) Bugfix - #29116 raet dns error
• PR #29390: (jacobhammons) updated version numbers in documentation
• PR #29381: (nmadhok) No need to deepcopy since six.iterkeys() creates a copy
• PR #29349: (cro) Fix mis-setting chassis names
• PR #29334: (rallytime) Back-port #29237 to 2015.8
• PR #29300: (ticsax) [dockerng] Add support for volume management in dockerng
• PR #29218: (clan) check service enable state in test mode
• PR #29315: (jfindlay) dev tutorial doc: fix markup errors
• PR #29317: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #29240: (clan) handle acl_type [[default:][user|group|mask|other]
• PR #29305: (lorendordon) Add 'file' as a source_hash proto
• PR #29272: (jfindlay) win_status module: handle 12 hour time in uptime
• PR #29289: (terminalmage) file.managed: Allow local file sources to use source_hash
• PR #29264: (anlutro) Prevent ssh_auth.absent from running when test=True
• PR #29277: (terminalmage) Update git_pillar runner to support new git_ext_pillar config schema
• PR #29283: (cachedout) Single-quotes and use format
• PR #29139: (thomason-mirodin) [salt-ssh] Add a range roster and range targeting options for the flat roster
• PR #29282: (cachedout) dev docs: add development tutorial
• PR #28994: (timcharper) add support to s3 for aws role assumption
• PR #29278: (techhat) Add verify_log to SPM

18.2.19 Salt 2015.8.5 Release Notes

About this Release

Salt 2015.8.5 is identical to the 2015.8.4 release with the addition of a fix for issue 30820, fixed by PR #30833. For convenience, the content from the 2015.8.4 release notes is included below.
Known Issue in boto_* execution modules

This release contains an issue that causes the boto_* execution modules to display a __salt__ not defined error (issue 30300). This issue will be fixed in an upcoming release, but can be manually resolved by completing the following:

1. Download the boto_* execution modules that you would like to update from the 2015.8 branch of Salt. A complete list of affected modules with the specific changes is available in PR #30867.
   A simple way to get the updated modules is to download a zip file of the 2015.8 branch from GitHub. The updated modules are in the salt\modules directory.
2. Copy the boto_* modules to the \srv\salt\_modules directory on your Salt master.
3. Run the following command to sync these modules to all Salt minions:
   ```shell
   salt '*' saltutil.sync_modules
   ```

2015.8.4 Release Notes

Security Fix

CVE-2016-1866: Improper handling of clear messages on the minion, which could result in executing commands not sent by the master.

This issue affects only the 2015.8.x releases of Salt. In order for an attacker to use this attack vector, they would have to execute a successful attack on an existing TCP connection between minion and master on the pub port. It does not allow an external attacker to obtain the shared secret or decrypt any encrypted traffic between minion and master. Thank you to Sebastian Krahmer <krahmer@suse.com> for bringing this issue to our attention.

We recommend everyone upgrade to 2015.8.4 as soon as possible.

Core Changes

- PR #28994: timcharper Salt S3 module has learned how to assume IAM roles
- Added option mock=True for state.sls and state.highstate. This allows the salt state compiler to process sls data in a state run without actually calling the state functions, thus providing feedback on the validity of the arguments used for the functions beyond the preprocessing validation provided by state.show_sls (issue 30118 and issue 30189).

```
salt '*' state.sls core,edit.vim mock=True
salt '*' state.highstate mock=True
salt '*' state.apply edit.vim mock=True
```

Changes for v2015.8.3..v2015.8.4

Generated at: 2016-01-25T17:48:35Z

Total Merges: 320

Changes:

- PR #30613: (basepi) Fix minion/syndic clearfuncs
• PR #30609: (seanjnkns) Fix documentation for pillar_merge_lists which default is False, not ...
• PR #30584: (julianbrost) file.line state: add missing colon in docstring
• PR #30589: (terminalmage) Merge 2015.5 into 2015.8
• PR #30599: (multani) Documentation formatting fixes
• PR #30554: (rallytime) Make the salt-cloud actions output more verbose and helpful
• PR #30549: (techhat) Salt Virt cleanup
• PR #30553: (techhat) AWS: Support 17-character IDs
• PR #30532: (whiteinge) Add execution module for working in sls files
• PR #30529: (terminalmage) Merge 2015.5 into 2015.8
• PR #30526: (twangboy) Added FlushKey to make sure it’s changes are saved to disk
• PR #30521: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #30485: (jitand) Updated pip_state to work with pip 8.0 on 2015.8
• PR #30494: (isbm) Zypper: info_installed — `errors` flag change to type `boolean`
• PR #30506: (jackson) Properly remove newlines after reading the file
• PR #30508: (rallytime) Fix Linode driver cloning functionality
• PR #30522: (terminalmage) Update git.list_worktree tests to reflect new return data
• PR #30483: (borgstrom) Pyobjects recursive import support (for 2015.8)
• PR #30491: (jackson) Add multi-IP support to network state
• PR #30496: (anlutro) Fix KeyError when adding ignored pillars
• PR #30539: (kingsquirrel152) Removes suspected copy/paste error for zmq_filtering functionalty
• PR #30448: (cournaple) Fix osx scripts location
• PR #30457: (rallytime) Remove fsutils references from modules list
• PR #30453: (rallytime) Make sure private AND public IPs are listed for Linode driver
• PR #30458: (rallytime) Back-port #30062 to 2015.8
• PR #30468: (timcharper) make note of s3 role assumption in upcoming changelog
• PR #30470: (whiteinge) Add example of the match_dict format to accept_dict wheel function
• PR #30450: (gtmanfred) fix extension loading in novaclient
• PR #30212: (abednarik) Fix incorrect file permissions in file.line
• PR #29947: (jfindlay) fileclient: decode file list from master
• PR #30363: (terminalmage) Use native ```list`` subcommand to list git worktrees
• PR #30445: (jitand) Boto uses False for is_default instead of None
• PR #30406: (frioux) Add an example of how to use file.managed/check_cmd
• PR #30424: (isbm) Check if byte strings are properly encoded in UTF-8
• PR #30405: (jitand) Updated glusterfs.py for python2.6 compatibility.
• PR #30396: (pass-by-value) Remove hardcoded val
• PR #30391: (jitand) Added else statements
- PR #30375: (rallytime) Wrap formatted log statements with six.u() in cloud/__init__.py
- PR #30384: (isbm) Bugfix: info_available does not work correctly on SLE 11 series
- PR #30376: (pritambaral) Fix FLO_DIR path in 2015.8
- PR #30389: (jtand) Older versions of ipset don’t support comments
- PR #30372: (jacobhammons) Updated man pages for 2015.8.4, updated copyright to 2016
- PR #30370: (rallytime) Remove incomplete function
- PR #30366: (rallytime) Back-port #28702 to 2015.8
- PR #30361: (cro) Flip the sense of the test for proxymodule imports, add more fns for esxi proxy
- PR #30267: (isbm) Fix RPM issues with the date/time and add package attributes filtering
- PR #30360: (jfindlay) file.remove, file.absent: mention recursive dir removal
- PR #30221: (mbarrien) No rolcatupdate for user_exist in Postgres>=9.5 `#26845`
- PR #30358: (terminalmage) Add libgit2 version to versions-report
- PR #30346: (pass-by-value) Prevent orphaned volumes
- PR #30349: (rallytime) Back-port #30347 to 2015.8
- PR #30354: (anlutro) Make sure all ignore_missing SLses are caught
- PR #30356: (nmadhok) Adding code author
- PR #30340: (jtand) Updated seed_test.py for changes made to seed module
- PR #30339: (jfindlay) Backport #26511
- PR #30343: (rallytime) Fix 2015.8 from incomplete back-port
- PR #30342: (eliasp) Correct whitespace placement in error message
- PR #30308: (rallytime) Back-port #30257 to 2015.8
- PR #30187: (rallytime) Back-port #27606 to 2015.8
- PR #30223: (serge-p) adding support for DragonFly BSD
- PR #30238: (rallytime) Reinit crypto before calling RSA.generate when generating keys.
- PR #30246: (dmacvicar) Add missing return data to scheduled jobs (`#24237`)
- PR #30292: (thegoodduke) ipset: fix test=true & add comment for every entry
- PR #30275: (abednarik) Add permanent argument in firewalld.
- PR #30328: (cachedout) Fix file test
- PR #30310: (pass-by-value) Empty bucket fix
- PR #30211: (techhat) Execute choot on the correct path
- PR #30309: (rallytime) Back-port #30304 to 2015.8
- PR #30278: (nmadhok) If datacenter is specified in the config, then look for managed objects under it
- PR #30305: (jacobhammons) Changed examples to use the ```example.com” domain instead of ```mycompan...
- PR #30249: (mprezioso) Fixes performance and timeout issues on win_pkg.install
- PR #30217: (pass-by-value) Make sure cloud actions can be called via salt run
- PR #30268: (terminalmage) Optimize file_tree ext_pillar and update file.managed to allow for binary contents
- PR #30245: (rallytime) Boto secgroup/iam_role: Add note stating us-east-1 is default region
- PR #30299: (rallytime) ESXi Proxy minions states are located at salt.states.esxi, not vsphere.
- PR #30202: (opdude) Fixed the periodic call to beacons
- PR #30303: (jacobhammons) Changed notes to indicate that functions are matched using regular ex...
- PR #30284: (terminalmage) salt.utils.gitfs: Fix Dulwich env detection and submodule handling
- PR #30280: (jfindlay) add state mocking to release notes
- PR #30273: (rallytime) Back-port #30121 to 2015.8
- PR #30301: (cachedout) Accept whatever comes into highstate mock for state tests
- PR #30282: (cachedout) Fix file.append logic
- PR #30289: (cro) Fix problems with targeting proxies by grains
- PR #30293: (cro) Ensure we don’t log stuff we shouldn’t
- PR #30279: (cachedout) Allow modules to be packed into boto utils
- PR #30186: (rallytime) Update CLI Examples in boto_ec2 module to reflect correct arg/kwarg positioning
- PR #30156: (abednarik) Add option in file.append to ignore_whitespace.
- PR #30189: (rallytime) Back-port #30185 to 2015.8
- PR #30215: (jacobhammons) Assorted doc bug fixes
- PR #30206: (cachedout) Revert `Fix incorrect file permissions in file.line`'
- PR #30190: (jacobhammons) Updated doc site banners
- PR #30180: (jfindlay) modules.x509._dec2hex: add fmt index for 2.6 compat
- PR #30179: (terminalmage) Backport #26962 to 2015.8 branch
- PR #29693: (abednarik) Handle missing source file in ssh_auth.
- PR #30155: (rallytime) Update boto_secgroup and boto_iam_role docs to only use region OR profile
- PR #30158: (rallytime) Move _option(value) calls to __salt__['config.option'] in boto utils
- PR #30160: (dmurphy18) Fix parsing disk usage for line with no number and AIX values in Kilos
- PR #30162: (rallytime) Update list_present and append grains state function docs to be more clear.
- PR #30163: (rallytime) Add warning about using ```='' in file.line function
- PR #30164: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #30168: (abednarik) Fix incorrect file permissions in file.line
- PR #30154: (Oro) Fix file serialize on windows
- PR #30144: (rallytime) Added generic ESXCLI command ability to ESXi Proxy Minion
- PR #30142: (terminalmage) Fix dockerng.push, and allow for multiple images
- PR #30075: (joejulian) Convert glusterfs module to use xml
- PR #30129: (optix2000) Clean up _uptodate() in git state
- PR #30139: (rallytime) Back-port #29589 to 2015.8
- PR #30124: (abednarik) Update regex to detect ip alias in OpenBSD.
• PR #30133: (stanislavb) Fix typo in gpgkey URL
• PR #30126: (stanislavb) Log S3 API error message
• PR #30128: (oeufete) Log retryable transport errors as warnings
• PR #30096: (cachedout) Add rm_special to crontab module
• PR #30106: (techhat) Ensure last dir
• PR #30101: (gtmanfred) fix bug where nova driver exits with no adminPass
• PR #30090: (techhat) Add argument to isdir()
• PR #30094: (rallytime) Fix doc formatting for cloud.create example in module.py state
• PR #30095: (rallytime) Add the list_nodes_select function to linode driver
• PR #30082: (abednarik) Fixed saltversioninfo grain return
• PR #30084: (rallytime) Back-port #29987 to 2015.8
• PR #30071: (rallytime) Merge branch `2015.5` into `2015.8`
• PR #30067: (ryan-lane) Pass in kwargs to boto_secgroup.convert_to_group_ids explicitly
• PR #30069: (techhat) Ensure that pki_dir exists
• PR #30064: (rallytime) Add Syndic documentation to miscellaneous Salt Cloud config options
• PR #30049: (rallytime) Add some more unit tests for the vSphere execution module
• PR #30060: (rallytime) Back-port #27104 to 2015.8
• PR #30048: (jacobhammons) Remove internal APIs from rest_cherrypy docs.
• PR #30043: (rallytime) Be explicit about importing from salt.utils.jinja to avoid circular imports
• PR #30038: (rallytime) Back-port #30017 to 2015.8
• PR #30036: (rallytime) Back-port #29995 to 2015.8
• PR #30035: (rallytime) Back-port #29895 to 2015.8
• PR #30034: (rallytime) Back-port #29893 to 2015.8
• PR #30033: (rallytime) Back-port #29876 to 2015.8
• PR #30029: (terminalmage) git.latest: Fix handling of nonexistent branches
• PR #30016: (anlutro) Properly normalize locales in locale.gen_locale
• PR #30015: (anlutro) locale module: don’t escape the slash in \n
• PR #30023: (gqgunhed) Two minor typos fixed
• PR #30026: (anlutro) states.at: fix wrong variable being used
• PR #29966: (multani) Fix bigip state/module documentation + serializers documentation
• PR #29904: (twangboy) Improvements to osx packaging scripts
• PR #29950: (multani) boto_iam: fix deletion of IAM users when using delete_keys=true
• PR #29937: (multani) Fix states.boto_iam group users
• PR #29934: (multani) Fix state.boto_iam virtual name
• PR #29943: (cachedout) Check args correctly in boto_rds
• PR #29924: (gqgunhed) fixed: uptime now working on non-US Windows
- PR #29883: (serge-p) fix for nfs mounts in _active_mounts_openbsd()
- PR #29894: (techhat) Support Saltfile in SPM
- PR #29856: (rallytime) Added some initial unit tests for the salt.modules.vsphere.py file
- PR #29855: (rallytime) Back-port #29740 to 2015.8
- PR #29890: (multani) Various documentation fixes
- PR #29850: (basepi) Back-port #29740 to 2015.8
- PR #29811: (anlutro) influxdb: add retention policy module functions
- PR #29814: (basepi) [2015.8][Windows] Fix multi-master on windows
- PR #29819: (rallytime) Add esxi module and state to docs build
- PR #29832: (jleimbach) Fixed typo in order to use the keyboard module for RHEL without systemd
- PR #29767: (abednarik) Hosts file update in mod_hostname.
- PR #29772: (terminalmage) pygit2: skip submodules when traversing tree
- PR #29765: (gtmanfred) allow nova driver to be boot from volume
- PR #29773: (l2ol33rt) Append missing wget in debian installation guide
- PR #29800: (rallytime) Back-port #29769 to 2015.8
- PR #29775: (paulnivin) Change listen requisite resolution from name to ID declaration
- PR #29754: (rallytime) Back-port #29719 to 2015.8
- PR #29713: (The-Loeki) Pillar-based cloud providers still forcing use of deprecated `provider`
- PR #29729: (rallytime) Further clarifications on `unless` and `onlyif` requisites.
- PR #29737: (akissa) fix pillar sqlite3 documentation examples
- PR #29743: (akissa) fix pillar sqlite not honouring config options
- PR #29723: (rallytime) Clarify db_user and db_password kwargs for postgres_user.present state function
- PR #29722: (rallytime) Link `stateful` kwargs to definition of what `stateful` means for cmd state.
- PR #29724: (rallytime) Add examples of using multiple matching levels to Pillar docs
- PR #29726: (cachedout) Disable some boto tests per resolution of moto issue
- PR #29708: (lagesag) Fix test=True for file.directory with recurse ignore_files/ignore_dirs.
- PR #29642: (cachedout) Correctly restart deamonized minions on failure
- PR #29599: (cachedout) Clean up minion shutdown
- PR #29675: (clinta) allow returning all refs
- PR #29683: (rallytime) Catch more specific error to pass the error message through elegantly.
- PR #29687: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #29681: (clinta) fix bare/mirror in git.latest
- PR #29644: (rallytime) Fixed a couple more ESXi proxy minion bugs
- PR #29645: (rallytime) Back-port #29558 to 2015.8
- PR #29632: (jfindlay) reduce severity of tls module __virtual__ logging
• PR #29606: (abednarik) Fixed duplicate mtu entry in RedHat 7 network configuration.
• PR #29613: (rallytime) Various ESXi Proxy Minion Bug Fixes
• PR #29628: (DmitryKuzmenko) Don’t create io_loop before fork
• PR #29609: (basepi) [2015.8][salt-ssh] Add ability to set salt-ssh command umask in roster
• PR #29603: (basepi) Fix orchestration failure-checking
• PR #29597: (terminalmage) dockerng: Prevent exception when API response contains empty dictionary
• PR #29588: (rallytime) Added ESXi Proxy Minion Tutorial
• PR #29572: (gtmanfred) [nova] use old discover_extensions if available
• PR #29545: (terminalmage) git.latest: init submodules if not yet initialized
• PR #29548: (rallytime) Back-port #29449 to 2015.8
• PR #29547: (rallytime) Refactored ESXCLI-based functions to accept a list of esxi_hosts
• PR #29563: (anlutro) Fix a call to deprecated method in python-influxdb
• PR #29565: (bdrung) Fix typos and missing release note
• PR #29540: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #29499: (rallytime) Initial commit of ESXi Proxy Minion
• PR #29526: (jfindlay) 2015.8.2 notes: add note about not being released
• PR #29531: (jfindlay) grains.core: handle undefined variable
• PR #29538: (basepi) [2015.8] [salt-ssh] Remove umask around actual execution for salt-ssh
• PR #29505: (rallytime) Update boto_rds state docs to include funky yaml syntax for `tags` option.
• PR #29513: (bdrung) Drop obsolete syslog.target from systemd services
• PR #29500: (rallytime) Back-port #29467 to 2015.8
• PR #29463: (abednarik) Add `**kwargs to debconf.set.
• PR #29399: (jfindlay) modules.status: add human_readable option to uptime
• PR #29433: (cro) Files for building .pkg files for MacOS X
• PR #29455: (jfindlay) modules.nova.__init__: do not return None
• PR #29454: (jfindlay) rh_service module __virtual__ return error messages
• PR #29476: (tbaker57) Doc fix - route_table_present needs subnet_names (not subnets) as a key
• PR #29487: (rallytime) Back-port #29450 to 2015.8
• PR #29441: (rallytime) Make sure docs line up with blade_idrac function specs
• PR #29440: (rallytime) Back-port #28925 to 2015.8
• PR #29435: (galet) Grains return wrong OS version and other OS related values for Oracle Linux
• PR #29430: (rall0r) Fix host.present state limitation
• PR #29417: (jacobhammons) Repo install updates
• PR #29402: (techhat) Add rate limiting to linode
• PR #29400: (twangboy) Fix #19332
- PR #29398: (cachedout) Lint 29288
- PR #29331: (DmitryKuzmenko) Bugfix - #29116 rae_t dns error
- PR #29390: (jacobhammons) updated version numbers in documentation
- PR #29381: (nmadhok) No need to deepcopy since six.iterkeys() creates a copy
- PR #29349: (cro) Fix mis-setting chassis names
- PR #29334: (rallytime) Back-port #29237 to 2015.8
- PR #29300: (ticsax) [dockerng] Add support for volume management in dockerng
- PR #29218: (clan) check service enable state in test mode
- PR #29315: (jfindlay) dev tutorial doc: fix markup errors
- PR #29317: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #29240: (clan) handle acl_type [[d]efault|[u]ser|[g]roup|[m]ask|[o]ther]
- PR #29305: (lorenngordon) Add `file` as a source_hash proto
- PR #29272: (jfindlay) win_status module: handle 12 hour time in uptime
- PR #29289: (terminalmage) file.managed: Allow local file sources to use source_hash
- PR #29264: (anlutro) Prevent ssh_auth.absent from running when test=True
- PR #29277: (terminalmage) Update git_pillar runner to support new git ext_pillar config schema
- PR #29283: (cachedout) Single-quotes and use format
- PR #29139: (thomaso-mirodin) [salt-ssh] Add a range roster and range targeting options for the flat roster
- PR #29282: (cachedout) dev docs: add development tutorial
- PR #28994: (timcharper) add support to s3 for aws role assumption
- PR #29278: (techhat) Add verify_log to SPM
- PR #29067: (jacksoni) Fix infinite recursion in state compiler for prereq of SLSs
- PR #29207: (jfindlay) do not shadow ret function argument
- PR #29215: (rallytime) Back-port #29192 to 2015.8
- PR #29217: (clan) show duration only if state_output_profile is False
- PR #29221: (ticsax) [dokcerng] Docu network mode
- PR #29269: (jfindlay) win_status module: fix function names in docs
- PR #29213: (rallytime) Move _wait_for_task func from vmware cloud to vmware utils
- PR #29271: (techhat) Pass full path for digest (SPM)
- PR #29244: (isbm) List products consistently across all SLES systems
- PR #29255: (garethgreenaway) fixes to consul module
- PR #29208: (whytewolf) Glance more profile errors
- PR #29207: (jfindlay) mount state: unmount by device is optional
- PR #29205: (trevor-h) Fixes #29187 - using winrm on EC2
- PR #29170: (cachedout) Migrate pydsl tests to integration test suite
- PR #29198: (jfindlay) rh_ip module: only set the mtu once

• PR #29196: (s0undt3ch) We need novaclient imported to compare versions
• PR #29059: (terminalmage) Work around upstream pygit2 bug
• PR #29112: (eliasp) Prevent backtrace (KeyError) in ssh_known_hosts.present state
• PR #29178: (whytwolf) Profile not being passed to keystone.endpoint_get in _auth. so if a p...

18.2.20 Salt 2015.8.7 Release Notes

Note: Salt 2015.8.4, 2015.8.5, and 2015.8.7 were all released within a short period due to regressions found soon after the releases of 2015.8.4 and 2015.8.5. These release notes contain all of the changes since 2015.8.3 to make it easier to see everything that has changed recently.

Changes for v2015.8.4..v2015.8.7

For pkg.installed states, on Linux distributions which use yum/dnf, packages which have a non-zero epoch in the version number now require this epoch to be included when specifying an exact version for a package. For example:

```bash
vim-enhanced:
  pkg.installed:
    - version: 2:7.4.160-1.el7
```

The pkg.latest_version and pkg.list_repo_pkgs functions can be used to get the correct version string to use, as they will now contain the epoch when it is non-zero.

Changes:

• PR #31111: (jtand) Fixes failing npm test on arch. @ 2016-02-10T21:51:47Z
  - 8d84c63 Merge pull request #31111 from jtand/8_4_npm_fix
  - b0a48e5 Fixes failing npm test on arch.
  - 733c6ab Some 3rd-party modules (e.g. gnupg) define custom log levels that emit at INFO level and above. This patch sets the color data lookups to default to TextFormat('reset') rather than producing a stack trace every time a log message is generated from an affected module.
  - 3f71fd0 Revert #30217

• PR #30217: (pass-by-value) Make sure cloud actions can be called via salt run

• PR #31092: (terminalmage) Apply PR #31031 to 2015.8.4.follow_up @ 2016-02-10T20:54:37Z
- 5a6a93e Merge pull request #31092 from terminalmage/issue31014-2015.8.4.follow_up
  - e5dfc0 More efficient way to add the epoch before version number
  - ed74627 include possible epoch in version for rpm
- 6c6b66a Comment multiprocessing line in minion config
- 1f7dfef Set multiprocessing to true in config.py
- 433c645 Fix remove placeholder files
- 7103756 Remove placeholder files
- 20b381f Set overwrite to off
- ca50f56 Fix boto_secgroup
- fd571d2 Fix boto test failures
- cb6588 Fix regression when contents_pillar/contents_grains is a list.
- 881d866 utils.aws: use time lib to covert to epoch seconds
- 3141292 The call to cp.get_url needs the saltenv, if you’re using environments other than base, it will fail.
- a869401 Fix regression in git_pillar when multiple remotes are configured
- 2243f25 Properly set the default value for pillar_merge_lists
- c7472ff Lint
- d868711 Fix failing boto_vpc module unit tests
- ed09516 Fix failing state module tests
- fdoe940 Pylint fix
- bc780a7 Don’t use pack=pack. Just pass in pack=__salt__ always.
- 1ae022d Pass in `pack` variable to utils.boto.assign_funcs function from ALL boto modules.
- 1efaff1 Remove bad symlinks in osx pkg dirs
- c7db435 Fix regression in scanning for state with `name` param

---

**Security Fix**

CVE-2016-1866: Improper handling of clear messages on the minion, which could result in executing commands not sent by the master.

This issue affects only the 2015.8.x releases of Salt. In order for an attacker to use this attack vector, they would have to execute a successful attack on an existing TCP connection between minion and master on the pub port. It does not allow an external attacker to obtain the shared secret or decrypt any encrypted traffic between minion and master. Thank you to Sebastian Krahmer <krahmer@suse.com> for bringing this issue to our attention.

We recommend everyone upgrade to 2015.8.4 as soon as possible.
Core Changes

- PR #28994: timcharper Salt S3 module has learned how to assume IAM roles
- Added option mock=True for state.sls and state.highstate. This allows the salt state compiler to process sls data in a state run without actually calling the state functions, thus providing feedback on the validity of the arguments used for the functions beyond the preprocessing validation provided by state.show_sls (issue 30118 and issue 30189).

```
salt '*' state.sls core,edit.vim mock=True
salt '*' state.highstate mock=True
salt '*' state.apply edit.vim mock=True
```

Changes for v2015.8.3..v2015.8.4

Generated at: 2016-01-25T17:48:35Z

Total Merges: 320

Changes:

- PR #30613: (basepi) Fix minion/syndic clearfuncs
- PR #30609: (seanjnkns) Fix documentation for pillar_merge_lists which default is False, not ...
- PR #30584: (julianbrost) file.line state: add missing colon in docstring
- PR #30589: (terminalmage) Merge 2015.5 into 2015.8
- PR #30599: (multani) Documentation formatting fixes
- PR #30554: (rallytime) Make the salt-cloud actions output more verbose and helpful
- PR #30549: (techhat) Salt Virt cleanup
- PR #30553: (techhat) AWS: Support 17-character IDs
- PR #30532: (whiteinge) Add execution module for working in sls files
- PR #30529: (terminalmage) Merge 2015.5 into 2015.8
- PR #30526: (twangboy) Added FlushKey to make sure it's changes are saved to disk
- PR #30521: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #30485: (jitand) Updated pip_state to work with pip 8.0 on 2015.8
- PR #30494: (isbm) Zypper: info_installed — 'errors' flag change to type 'boolean'
- PR #30506: (jacksontj) Properly remove newlines after reading the file
- PR #30508: (rallytime) Fix Linode driver cloning functionality
- PR #30522: (terminalmage) Update git.list_worktree tests to reflect new return data
- PR #30483: (borgstrom) Pyobjects recursive import support (for 2015.8)
- PR #30491: (jacksontj) Add multi-IP support to network state
- PR #30496: (anlutro) Fix KeyError when adding ignored pillars
- PR #30359: (kingsquirrel152) Removes suspected copy/paste error for zmq_filtering functionality
- PR #30448: (cournape) Fix osx scripts location
• PR #30457: (rallytime) Remove fsutils references from modules list
• PR #30453: (rallytime) Make sure private AND public IPs are listed for Linode driver
• PR #30458: (rallytime) Back-port #30062 to 2015.8
• PR #30468: (timcharper) make note of s3 role assumption in upcoming changelog
• PR #30470: (whiteinge) Add example of the match_dict format to accept_dict wheel function
• PR #30450: (gtmanfred) fix extension loading in novaclient
• PR #30212: (abednarik) Fix incorrect file permissions in file.line
• PR #29947: (jfindlay) fileclient: decode file list from master
• PR #30363: (terminalmage) Use native `list` subcommand to list git worktrees
• PR #30445: (jtand) Boto uses False for is_default instead of None
• PR #30406: (frioux) Add an example of how to use file.managed/check_cmd
• PR #30424: (isbm) Check if byte strings are properly encoded in UTF-8
• PR #30405: (jtand) Updated glusterfs.py for python2.6 compatibility.
• PR #30396: (pass-by-value) Remove hardcoded val
• PR #30391: (jtand) Added else statements
• PR #30375: (rallytime) Wrap formatted log statements with six.u() in cloud/__init__.py
• PR #30384: (isbm) Bugfix: info_available does not work correctly on SLE 11 series
• PR #30376: (pritambaral) Fix FLO_DIR path in 2015.8
• PR #30389: (jtand) Older versions of ipset don't support comments
• PR #30373: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #30372: (jacobhammons) Updated man pages for 2015.8.4, updated copyright to 2016
• PR #30370: (rallytime) Remove incomplete function
• PR #30366: (rallytime) Back-port #28702 to 2015.8
• PR #30361: (cro) Flip the sense of the test for proxymodule imports, add more fns for esxi proxy
• PR #30267: (isbm) Fix RPM issues with the date/time and add package attributes filtering
• PR #30360: (jfindlay) file.remove, file.absent: mention recursive dir removal
• PR #30221: (mbarrien) No rolcatupdate for user_exist in Postgres>=9.5 `#26845`_
• PR #30358: (terminalmage) Add libgit2 version to versions-report
• PR #30346: (pass-by-value) Prevent orphaned volumes
• PR #30349: (rallytime) Back-port #30347 to 2015.8
• PR #30354: (anlutro) Make sure all ignore_missing SLSes are caught
• PR #30356: (nmadhok) Adding code author
• PR #30340: (jtand) Updated seed_test.py for changes made to seed module
• PR #30339: (jfindlay) Backport #26511
• PR #30343: (rallytime) Fix 2015.8 from incomplete back-port
• PR #30342: (eliasp) Correct whitespace placement in error message
• PR #30308: (rallytime) Back-port #30257 to 2015.8
• PR #30187: (rallytime) Back-port #27606 to 2015.8
• PR #30223: (serge-p) adding support for DragonFly BSD
• PR #30238: (rallytime) Reinit crypto before calling RSA.generate when generating keys.
• PR #30246: (dmacvicar) Add missing return data to scheduled jobs (¨#24237¨)
• PR #30292: (thegoodduke) ipset: fix test=true & add comment for every entry
• PR #30275: (abednarik) Add permanent argument in firewalld.
• PR #30328: (cachedout) Fix file test
• PR #30310: (pass-by-value) Empty bucket fix
• PR #30211: (techhat) Execute choot on the correct path
• PR #30309: (rallytime) Back-port #30304 to 2015.8
• PR #30278: (nmadhok) If datacenter is specified in the config, then look for managed objects under it
• PR #30305: (jacobhammons) Changed examples to use the¨example.com¨ domain instead of¨mycompan...
• PR #30249: (mpreziuso) Fixes performance and timeout issues on win_pkg.install
• PR #30217: (pass-by-value) Make sure cloud actions can be called via salt run
• PR #30268: (terminalmage) Optimize file_tree.ext_pillar and update file.managed to allow for binary contents
• PR #30245: (rallytime) Boto secgroup/iam_role: Add note stating us-east-1 is default region
• PR #30299: (rallytime) ESXi Proxy minions states are located at salt.states.esxi, not vsphere.
• PR #30202: (opdude) Fixed the periodic call to beacons
• PR #30303: (jacobhammons) Changed notes to indicate that functions are matched using regular ex...
• PR #30284: (terminalmage) salt.utils.gitfs: Fix Dulwich env detection and submodule handling
• PR #30280: (jfindlay) add state mocking to release notes
• PR #30273: (rallytime) Back-port #30121 to 2015.8
• PR #30301: (cachedout) Accept whatever comes into hightstate mock for state tests
• PR #30282: (cachedout) Fix file.append logic
• PR #30289: (cro) Fix problems with targeting proxies by grains
• PR #30293: (cro) Ensure we don’t log stuff we shouldn’t
• PR #30279: (cachedout) Allow modules to be packed into boto utils
• PR #30186: (rallytime) Update CLI Examples in boto_ec2 module to reflect correct arg/kwarg positioning
• PR #30156: (abednarik) Add option in file.append to ignore_whitespace.
• PR #30189: (rallytime) Back-port #30185 to 2015.8
• PR #30215: (jacobhammons) Assorted doc bug fixes
• PR #30206: (cachedout) Revert¨`Fix incorrect file permissions in file.line¨
• PR #30190: (jacobhammons) Updated doc site banners
• PR #30180: (jfindlay) modules.x509._dec2hex: add fmt index for 2.6 compat
• PR #30179: (terminalmage) Backport #26962 to 2015.8 branch
• PR #29693: (abadnarik) Handle missing source file in ssh_auth.
• PR #30155: (rallytime) Update boto_secgroup and boto_iam_role docs to only use region OR profile
• PR #30158: (rallytime) Move _option(value) calls to __salt__['config.option'] in boto utils
• PR #30160: (dmurphy18) Fix parsing disk usage for line with no number and AIX values in Kilos
• PR #30162: (rallytime) Update list_present and append grains state function docs to be more clear.
• PR #30163: (rallytime) Add warning about using `=` in file.line function
• PR #30164: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #30168: (abadnarik) Fix incorrect file permissions in file.line
• PR #30154: (Oro) Fix file serialize on windows
• PR #30144: (rallytime) Added generic ESXCLI command ability to ESXi Proxy Minion
• PR #30142: (terminalmage) Fix dockerng.push, and allow for multiple images
• PR #30075: (joejulian) Convert glusterfs module to use xml
• PR #30129: (optix2000) Clean up _uptodate() in git state
• PR #30129: (rallytime) Back-port #29589 to 2015.8
• PR #30124: (abadnarik) Update regex to detect ip alias in OpenBSD.
• PR #30133: (stanislavb) Fix typo in gpgkey URL
• PR #30126: (stanislavb) Log S3 API error message
• PR #30128: (oeufete) Log retryable transport errors as warnings
• PR #30096: (cachedout) Add rm_special to crontab module
• PR #30106: (techhat) Ensure last dir
• PR #30101: (gtmanfred) fix bug where nova driver exits with no adminPass
• PR #30090: (techhat) Add argument to isdir()
• PR #30094: (rallytime) Fix doc formatting for cloud.create example in module.py state
• PR #30095: (rallytime) Add the list_nodes_select function to linode driver
• PR #30082: (abadnarik) Fixed saltversioninfo grain return
• PR #30084: (rallytime) Back-port #29987 to 2015.8
• PR #30071: (rallytime) Merge branch `2015.5` into `2015.8`
• PR #30067: (ryan-lane) Pass in kwargs to boto_secgroup.convert_to_group_ids explicitly
• PR #30069: (techhat) Ensure that pki_dir exists
• PR #30064: (rallytime) Add Syndic documentation to miscellaneous Salt Cloud config options
• PR #30049: (rallytime) Add some more unit tests for the vsphere execution module
• PR #30060: (rallytime) Back-port #27104 to 2015.8
• PR #30048: (jacobhammons) Remove internal APIs from rest_cherrypy docs.
• PR #30043: (rallytime) Be explicit about importing from salt.utils.jinja to avoid circular imports
• PR #30038: (rallytime) Back-port #30017 to 2015.8
• PR #30036: (rallytime) Back-port #29995 to 2015.8
• PR #30035: (rallytime) Back-port #29895 to 2015.8
• PR #30034: (rallytime) Back-port #29893 to 2015.8
• PR #30033: (rallytime) Back-port #29876 to 2015.8
• PR #30029: (terminalmage) git.latest: Fix handling of nonexistent branches
• PR #30034: (anlutro) Properly normalize locales in locale.gen_locale
• PR #30015: (anlutro) locale module: don’t escape the slash in \n
• PR #30022: (ggunhned) Two minor typos fixed
• PR #30026: (anlutro) states.at: fix wrong variable being used
• PR #29966: (multani) Fix bigip state/module documentation + serializers documentation
• PR #29904: (twangboy) Improvements to osx packaging scripts
• PR #29950: (multani) boto_iam: fix deletion of IAM users when using delete_keys=true
• PR #29937: (multani) Fix states.boto_iam group users
• PR #29934: (multani) Fix state.boto_iam virtual name
• PR #29943: (cachedout) Check args correctly in boto_rds
• PR #29924: (ggunhned) fixed: uptime now working on non-US Windows
• PR #29883: (serge-p) fix for nfs mounts in _active_mounts_openbsd()
• PR #29894: (techhat) Support Saltfile in SPM
• PR #29856: (rallytime) Added some initial unit tests for the salt.modules.vsphere.py file
• PR #29855: (rallytime) Back-port #29740 to 2015.8
• PR #29890: (multani) Various documentation fixes
• PR #29850: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #29811: (anlutro) influxdb: add retention policy module functions
• PR #29814: (basepi) [2015.8][Windows] Fix multi-master on windows
• PR #29819: (rallytime) Add esxi module and state to docs build
• PR #29832: (jleimbach) Fixed typo in order to use the keyboard module for RHEL without systemd
• PR #29803: (rallytime) Add vSphere module to doc ref module tree
• PR #29767: (abednarik) Hosts file update in mod_hostname.
• PR #29772: (terminalmage) pygit2: skip submodules when traversing tree
• PR #29765: (gtmanfred) allow nova driver to be boot from volume
• PR #29773: (l2ol33rt) Append missing wget in debian installation guide
• PR #29800: (rallytime) Back-port #29769 to 2015.8
• PR #29775: (paulninvin) Change listen requisite resolution from name to ID declaration
• PR #29754: (rallytime) Back-port #29719 to 2015.8
• PR #29713: (The-Loek) Pillar-based cloud providers still forcing use of deprecated `provider`
• PR #29729: (rallytime) Further clarifications on `unless` and `onlyif` requisites.
• PR #29737: (akissa) fix pillar sqlite3 documentation examples
• PR #29743: (akissa) fix pillar sqlite not honouring config options
• PR #29723: (rallytime) Clarify db_user and db_password kwargs for postgres_user.present state function
• PR #29722: (rallytime) Link `stateful` kwargs to definition of what `stateful` means for cmd state.
• PR #29724: (rallytime) Add examples of using multiple matching levels to Pillar docs
• PR #29726: (cachedout) Disable some boto tests per resolution of moto issue
• PR #29708: (lagesag) Fix test=True for file.directory with recurse ignore_files/ignore_dirs.
• PR #29642: (cachedout) Correctly restart deamonized minions on failure
• PR #29599: (cachedout) Clean up minion shutdown
• PR #29675: (clinta) allow returning all refs
• PR #29683: (rallytime) Catch more specific error to pass the error message through elegantly.
• PR #29687: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #29681: (clinta) fix bare/mirror in git.latest
• PR #29644: (rallytime) Fixed a couple more ESXi proxy minion bugs
• PR #29645: (rallytime) Back-port #29558 to 2015.8
• PR #29632: (jfindlay) reduce severity of tls module __virtual__ logging
• PR #29606: (abednarik) Fixed duplicate mtu entry in RedHat 7 network configuration.
• PR #29613: (rallytime) Various ESXi Proxy Minion Bug Fixes
• PR #29628: (DmitryKuzmenko) Don't create io_loop before fork
• PR #29609: (basepi) [2015.8][salt-ssh] Add ability to set salt-ssh command umask in roster
• PR #29603: (basepi) Fix orchestration failure-checking
• PR #29597: (terminalmage) dockerng: Prevent exception when API response contains empty dictionary
• PR #29596: (rallytime) Back-port #29587 to 2015.8
• PR #29588: (rallytime) Added ESXi Proxy Minion Tutorial
• PR #29572: (gtmanfred) [nova] use old discover_extensions if available
• PR #29545: (terminalmage) git.latest: init submodules if not yet initialized
• PR #29548: (rallytime) Back-port #29449 to 2015.8
• PR #29547: (rallytime) Refactored ESXCLI-based functions to accept a list of esxi_hosts
• PR #29563: (anlutro) Fix a call to deprecated method in python-influxdb
• PR #29565: (bdrung) Fix typos and missing release note
• PR #29540: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #29499: (rallytime) Initial commit of ESXi Proxy Minion
• PR #29526: (jfindlay) 2015.8.2 notes: add note about not being released
• PR #29531: (jfindlay) grains.core: handle undefined variable
• PR #29538: (basepi) [2015.8] [salt-ssh] Remove umask around actual execution for salt-ssh
• PR #29505: (rallytime) Update boto_rds state docs to include funky yaml syntax for `tags` option.
• PR #29513: (bdrung) Drop obsolete syslog.target from systemd services
Salt Documentation, Release 2016.3.6

- PR #29500: (rallytime) Back-port #29467 to 2015.8
- PR #29463: (abednarik) Add **kwargs to debconf.set.
- PR #29399: (jfindlay) modules.status: add human_readable option to uptime
- PR #29433: (cro) Files for building .pkg files for MacOS X
- PR #29455: (jfindlay) modules.nova.__init__: do not return None
- PR #29454: (jfindlay) rh_service module __virtual__ return error messages
- PR #29476: (tbaker57) Doc fix - route_table_present needs subnet_names (not subnets) as a key
- PR #29487: (rallytime) Back-port #29450 to 2015.8
- PR #29441: (rallytime) Make sure docs line up with blade_idrac function specs
- PR #29440: (rallytime) Back-port #28925 to 2015.8
- PR #29435: (galet) Grains return wrong OS version and other OS related values for Oracle Linux
- PR #29430: (rall0r) Fix host.present state limitation
- PR #29417: (jacobhammons) Repo install updates
- PR #29402: (techhat) Add rate limiting to linode
- PR #29400: (twangboy) Fix #19332
- PR #29398: (cachedout) Lint 29288
- PR #29331: (DmitryKuzmenko) Bugfix - #29116 rae dns error
- PR #29390: (jacobhammons) updated version numbers in documentation
- PR #29381: (nmadhok) No need to deepcopy since six.iterkeys() creates a copy
- PR #29349: (cro) Fix mis-setting chassis names
- PR #29334: (rallytime) Back-port #29237 to 2015.8
- PR #29300: (ticosax) [dockerng] Add support for volume management in dockerng
- PR #29218: (clan) check service enable state in test mode
- PR #29315: (jfindlay) dev tutorial doc: fix markup errors
- PR #29317: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #29240: (clan) handle acl_type [[d]efault][[user|group|mask|other]
- PR #29305: (lorenmgordon) Add `file' as a source_hash proto
- PR #29272: (jfindlay) win_status module: handle 12 hour time in uptime
- PR #29289: (terminalmage) file.managed: Allow local file sources to use source_hash
- PR #29264: (anlutro) Prevent ssh_auth.absent from running when test=True
- PR #29277: (terminalmage) Update git_pillar runner to support new git ext_pillar config schema

18.2.21 Salt 2015.8.8 Release Notes

Important: 2015.8.8.2 was released shortly after 2015.8.8 to fix several known issues. If you installed 2015.8.8 before 03/30/2016, you likely have installed 2015.8.8 and can optionally upgrade (find out which version you have installed using salt --version. The latest version is 2015.8.8.2).

Salt 2015.8.8.2

Salt 2015.8.8.2 includes fixes for the following known issues in 2015.8.8:

• issue 32044: Key master with value [...] has an invalid type of list Error
• issue 32004: Failed to import module win_dacl Error
• issue 32114: Wrong validation type for file_ignore_glob key
• issue 31969: Fix file.managed for windows

Important: issue 32183 prevents Salt Cloud from installing the Salt minion on new systems. To workaround this issue, call salt-cloud -u to update the bootstrap script to the latest version.
Salt 2015.8.8

Security Fix

CVE-2016-3176: Insecure configuration of PAM external authentication service

This issue affects all Salt versions prior to 2015.8.8/2015.5.10 when PAM external authentication is enabled. This issue involves passing an alternative PAM authentication service with a command that is sent to `LocalClient`, enabling the attacker to bypass the configured authentication service. Thank you to Dylan Frese <dmfrese@gmail.com> for bringing this issue to our attention.

This update defines the PAM eAuth service that users authenticate against in the Salt Master configuration.

Read Before Upgrading Debian 7 (Wheezy) from 2015.8.7 to 2015.8.8

Before you upgrade from 2015.8.7 on Debian 7, you must run the following commands to remove previous packages:

```
sudo apt-get remove python-pycrypto
sudo apt-get remove python-apache-libcloud
```

Note that `python-pycrypto` will likely remove `python-apache-libcloud`, so the second command might not be necessary. These have been replaced by `python-crypto` and `python-libcloud` with `-bpo70+1` moniker.

Read Before Upgrading Debian 8 (Jessie) from Salt Versions Earlier than 2015.8.4

Salt systemd service files are missing the following statement in these versions:

```
[Service]
KillMode=process
```

This statement must be added to successfully upgrade on these earlier versions of Salt.

Changes for v2015.8.7..v2015.8.8

Extended changelog courtesy of Todd Stansell (https://github.com/tjstansell/salt-changelogs):

Generated at: 2016-03-17T21:03:44Z

Total Merges: 312

Changes:

- **PR #31947**: (cro) Move proxymodule assignment earlier in proxy minion init
- **PR #31948**: (rallytime) Revert `not not` deletion and add comment as to why that is there
- **PR #31952**: (rallytime) Fix lint for 2015.8 branch
- **PR #31933**: (rallytime) Fix linking syntax in testing docs
- **PR #31930**: (cro) Backport changes from 2016.3
- **PR #31924**: (jfindlay) update 2015.8.8 release notes
- **PR #31922**: (cachedout) For 2015.8 head
- **PR #31904**: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #31906: (sbreidba) Win_dacl module: fix FULLCONTROL / FILE_ALL_ACCESS definition
• PR #31745: (isbm) Fix the always-false behavior on checking state
• PR #31911: (rallytime) Merge #31903 with pylint fix
• PR #31883: (paion) Fix scaleway cloud provider and manage x86 servers
• PR #31903: (terminalmage) Use remote_ref instead of local_ref to see if checkout is necessary
• PR #31845: (sakateka) Now a check_file_meta deletes temporary files when test=True
• PR #31901: (rallytime) Back-port #31846 to 2015.8
• PR #31905: (terminalmage) Update versionadded directive
• PR #31902: (rallytime) Update versionadded tag for new funcs
• PR #31888: (terminalmage) Fix salt.utils.decorators.Depends
• PR #31857: (sjorge) gen_password and del_password missing from solaris_shadow
• PR #31879: (cro) Clarify some comments
• PR #31815: (dr4Ke) Fix template on contents 2015.8
• PR #31818: (anlutro) Prevent event logs from writing huge amounts of data
• PR #31836: (terminalmage) Fix git_pillar race condition
• PR #31824: (rallytime) Back-port #31819 to 2015.8
• PR #31856: (szeestraten) Adds missing docs for Virtual Network and Subnet options in salt-cloud Azure cloud profile
• PR #31839: (jfindlay) add 2015.8.8 release notes
• PR #31828: (gtmanfred) Remove ability of authenticating user to specify pam service
• PR #31787: (anlutro) Fix user_create and db_create for new versions of influxdb
• PR #31800: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #31797: (Ch3LL) Change pkg name to less for suse pkg.info_installed test
• PR #31793: (xopher-mc) fixing init system detection on sles 11, refs #31617
• PR #31786: (isbm) Bugfix: zypper doesn’t detect base product on SLE11 series
• PR #31780: (gtmanfred) use already created vsphere connection
• PR #31779: (sbreidba) win_dacl state & module: return comment field as strings, not lists.
• PR #31723: (sjorge) file_ignore_regex is a list, not bool
• PR #31747: (techhat) Use get_local_client with MASTER opts, not MINION
• PR #31688: (whiteinge) Various SMTP returner fixes
• PR #31752: (rallytime) Back-port #31686 to 2015.8
• PR #31733: (jacobhammons) docs to clarify cloud configuration
• PR #31775: (techhat) Show correct provider/driver name
• PR #31754: (techhat) Check all providers, not just the current one
• PR #31735: (rallytime) Add reboot, start, and stop actions to digital ocean driver
• PR #31770: (anlutro) Fix influxdb user functionality for version 0.9+
• PR #31743: (Talkless) Fix parentheses mismatch in documentation
• PR #31162: (isbm) Remove MD5 digest from everywhere and default to SHA256
• PR #31670: (terminalmage) Write lists of minions targeted by syndic masters to job cache
• PR #31711: (ticosax) [dockerng] Port and Volume comparison should consider Dockerfile
• PR #31719: (techhat) Don’t worry about KeyErrors if the node is already removed
• PR #31713: (ticosax) [dockerng] Fix dockerng.network_present when container is given by name
• PR #31705: (peripatetic-sojourner) Foreman pillar
• PR #31702: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #31700: (s0undt3ch) It's a function!
• PR #31679: (cro) Fix bad link to the sample REST endpoint in salt-contrib.
• PR #31668: (rallytime) Some more testing documentation improvements
• PR #31653: (DmitryKuzmenko) Don’t attempt to verify token if it wasn’t sent to master.
• PR #31629: (darix) Fix services on sles
• PR #31641: (rallytime) Improve Salt Testing tutorial to be a more comprehensive intro
• PR #31651: (dr4Ke) test case: test_list_present_nested_already
• PR #31643: (opdude) Make sure we are really updating the mercurial repository
• PR #31598: (terminalmage) Remove limitations on validation types for eauth targets
• PR #31627: (jakehilton) Handling error from using gevent 1.1.
• PR #31630: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #31594: (rallytime) Back-port #31589 to 2015.8
• PR #31604: (joejulian) Workaround for non-xml output from gluster cli when not tty
• PR #31583: (vutny) Remove trailing white spaces
• PR #31592: (rallytime) Back-port #31546 to 2015.8
• PR #31593: (rallytime) Back-port #31570 to 2015.8
• PR #31567: (cachedout) Restore FIPS compliance when using master_finger
• PR #31568: (twangboy) Grant permissions using SID instead of name
• PR #31561: (jitand) Skipped test
• PR #31550: (rallytime) Correct versionadded tag for win_service.config
• PR #31549: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #31544: (DmitryKuzmenko) Protect getattr from recursion
• PR #31525: (DmitryKuzmenko) Issues/30643 merge forward fixes
• PR #31536: (virtualguy) Remove debian repo from raspbian installation
• PR #31528: (vutny) Correct Salt Cloud documentation about updating Salt Bootstrap script
• PR #31539: (DmitryKuzmenko) Added temporary workaround for CentOS 7 os-release id bug.
• PR #31508: (mcalmer) Zypper correct exit code checking
• PR #31510: (vutny) Add installation guide for Raspbian (Debian on Raspberry Pi)
• PR #31498: (Ch3LL) rename methods in pkg states test
• PR #31471: (cachedout) Correct issue where duplicate items in grains list during state run will result in duplicate grains
• PR #31455: (ticosax) [dockerng] Disable notset check
• PR #31488: (isbm) Unit Test for Zypper’s ``remove’’ and ``purge’’
• PR #31485: (jacobhammons) Fixed transport description in minion / master config
• PR #31411: (jiland) Added some beacons execution module integration tests
• PR #31475: (jacobhammons) Assorted doc issues
• PR #31477: (vutny) Correct installation documentation for Ubuntu
• PR #31479: (isbm) Zypper unit tests & fixes
• PR #31445: (rallytime) Only use LONGSIZE in rpm.info if available. Otherwise, use SIZE.
• PR #31464: (Ch3LL) integration test: ensure decorator only runs on one method and not class
• PR #31458: (vutny) Correct installation documentation for Debian
• PR #31457: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #31439: (rallytime) Fix lowpkg.info function for Ubuntu 12 - make sure we have a pkg name
• PR #31456: (RabidCicada) Clarified the form of requisite targets/requisite-references
• PR #31453: (DmitryKuzmenko) Backport cp_geturl fix for large files into 2015.8
• PR #31444: (jacobhammons) Documentation updates - ddns state, file.line state/execute function, installation dependencies
• PR #31341: (twangboy) Clarification on Windows Package Manager docs
• PR #31380: (kiorky) Bring up ext_pillar rendering errors as well
• PR #31418: (terminalmage) Fix core grains when Debian OS detected as `Debian GNU/Linux’
• PR #31429: (mcalmer) fix argument handling for pkg.download
• PR #31432: (ticosax) [dockerng] Hotfix docker 1.10.2
• PR #31420: (twangboy) Handle Unversioned Packages
• PR #31417: (jacobhammons) ddns state docs updated with notes regarding the name, zone, and keyfile.
• PR #31391: (redmcg) Added sanity check: is `pillar’ in self.opts
• PR #31376: (cro) Some distros don’t have a /lib/systemd
• PR #31352: (ticosax) [dockerng] Pull missing images when calling dockerng.running
• PR #31378: (mcalmer) Zypper refresh handling
• PR #31373: (terminalmage) Use --set-upstream instead of --track to set upstream on older git
• PR #31390: (abednarik) Fix Logrotate module.
• PR #31354: (ticosax) [dockerng] Don’t require auth for all registries
• PR #31368: (whiteinge) Update list of netapi clients for autoclass
• PR #31367: (techhat) Add docs on how to actually use SDB
• PR #31357: (ticosax) [dockerng] Support docker inconsistencies
• PR #31353: (ticosax) [dockerng] Fix when ports are integers
• PR #31346: (ticosax) Backport #31130 to 2015.8
• PR #31332: (terminalmage) Clarify documentation for gitfs/hgfs/svnfs mountpoint and root options
• PR #31305: (mcalmer) call zypper with option --non-interactive everywhere
• PR #31337: (jacobhammons) Release notes and versioning for 2015.8.7
• PR #31326: (ticosax) [dockerng ] Detect settings removal
• PR #31292: (twangboy) Fix dunder virtual to check for Remote Administration Tools
• PR #31287: (joiejulian) Rework tests and fix reverse peering with gluster 3.7
• PR #31196: (sakateka) Here are a few fixes utils.network
• PR #31299: (rallytime) Allow state-output and state-verbose default settings to be set from CLI
• PR #31317: (terminalmage) Fix versionadded directive
• PR #31301: (terminalmage) Corrected fix for `#30999`
• PR #31302: (terminalmage) Audit CLI opts used in git states
• PR #31312: (terminalmage) Merge 2015.5 into 2015.8
• PR #31225: (pprince) Fix in file_tree pillar (Fixes `#31223`)
• PR #31233: (mcalmer) implement version_cmp for zypper
• PR #31273: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #31253: (gtmanfred) allow for nova servers to be built with premade volumes
• PR #31271: (rallytime) Back-port #30689 to 2015.8
• PR #31255: (jacobhammons) Fixes `#30461`
• PR #31189: (dmacvicar) Fix crash with scheduler and runners (`#31106`
• PR #31201: (The-Loekt) Utilize prepared grains var in master-side ipcidr matching
• PR #31239: (terminalmage) Improve logging when master cannot decode a payload
• PR #31190: (twangboy) Clear minion cache before caching from master
• PR #31226: (pprince) Minor docs fix: file_tree pillar (Fixes #31124)
• PR #31234: (mcalmer) improve doc for list_pkgs
• PR #31237: (mcalmer) add handling for OEM products
• PR #31182: (rallytime) Back-port #31172 to 2015.8
• PR #31191: (rallytime) Make sure doc example matches kwarg
• PR #31171: (Ch3LL) added logic to check for installed package
• PR #31177: (Ch3LL) add integration test for issue `#30934`
• PR #31181: (cachedout) Lint 2015.8 branch
• PR #31169: (rallytime) Back-port #29718 to 2015.8
• PR #31170: (rallytime) Back-port #31157 to 2015.8
• PR #31147: (cro) Documentation clarifications.
• PR #31153: (edencrane) Fixed invalid host causing `reference to variable before assignment`
• PR #31152: (garethgreenaway) fixes to beacon module, state module and friends
• PR #31149: (jfindlay) add 2015.8.7 release notes
• PR #31134: (isbm) Fix types in the output data and return just a list of products
• PR #31120: (gtmanfred) Clean up some bugs in the nova driver
• PR #31132: (rallytime) Make sure required profile configurations passed in a map file work
• PR #31131: (Ch3LL) integration test for issue `#31014`
• PR #31133: (cachedout) Fixup 31121
• PR #31125: (isbm) Force-kill websocket’s child processes faster than default two minutes.
• PR #31119: (sakateka) fixes for ipv6-only multi-master failover
• PR #31107: (techhat) Don’t try to add a non-existent IP address
• PR #31108: (jtand) Changed npm integration test to install request.
• PR #31105: (cachedout) Lint 30975
• PR #31100: (jfindlay) states.x509: docs: peer.sls -> peer.conf
• PR #31103: (twangboy) Point to reg.delete_key_recursive
• PR #31093: (techhat) Ensure double directories don’t get created
• PR #31095: (jfindlay) modules.file, states.file: explain symbolic links
• PR #31061: (rallytime) Revert #30217 - was causing salt-cloud -a breakage
• PR #31090: (rallytime) Back-port #30542 to 2015.8
• PR #31085: (jacksont) Correctly remove path we added after loader is completed
• PR #31037: (vutny) Update RHEL installation guide to reflect latest repo changes
• PR #31050: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #31053: (cachedout) Fix boto test failures
• PR #31029: (twangboy) Windows defaults to multiprocessing true
• PR #30998: (dmacvicar) add_key/reject_key: do not crash w/Permission denied: `/var/cache/salt/master/.dfn` (`#27796`)
• PR #31049: (twangboy) Fix versionadded in win_service.config
• PR #30987: (yougnick) Changed glusterfs.peer() module so state can handle localhost peering attempts.
• PR #31042: (moltob) Allow using Windows path in archive.extracted name attribute
• PR #31012: (terminalmage) Fix gitifs/git_pillar/winrepo provider to allow lowercase values
• PR #31024: (jfindlay) modules.aptpkg.upgrade: clarify dist-upgrade usage
• PR #31028: (twangboy) Fix config overwrite by windows installer
• PR #31031: (terminalmage) More complete fix for `#31014`
• PR #31026: (terminalmage) Fix regression when contents_pillar/contents_grains is a list.
• PR #30978: (garethgreenaway) fixes to state.py in 2015.8
• PR #30893: (bdrung) Make build reproducible
• PR #30945: (cachedout) Note that pillar cli args are sent via pub
• PR #31002: (rmtmckenzie) Fix lxc cloud provided minion reporting present
- PR #31007: (jtand) Fixed rabbitmq_vhost test failure.
- PR #31004: (rallytime) Remove overstate docs and a few references.
- PR #30965: (anlutro) Fix rabbitmq_vhost.present result when test=True
- PR #30955: (Ch3LL) docs: add clarification when source is not defined
- PR #30941: (rallytime) Back-port #30879 to 2015.8
- PR #30940: (twangboy) Fix Build Process for OSX
- PR #30944: (jacobhammons) 2015.8.5 release notes linking and clean up
- PR #30905: (joejulian) Add realpath to lvm.pvdisplay and use it in vg_present
- PR #30924: (youngnick) Fix small bug with starting volumes after creation.
- PR #30910: (cro) fix iDRAC state
- PR #30919: (garethgreenaway) Fixes to ssh_auth state module
- PR #30920: (jacobhammons) Versioned to 2015.8.5, added known issue `#30300` to release notes
- PR #30894: (terminalmage) git module/state: Handle identity files more gracefully
- PR #30750: (jfindlay) extract whole war version
- PR #30884: (rallytime) Move checks for private_key file existence and permissions to create function
- PR #30888: (ticosax) Backport #30797 to 2015.8
- PR #30895: (bdrung) Fix various typos
- PR #30889: (anlutro) Make msgpack an optional dependency in salt.utils.cache
- PR #30896: (vutny) Update nodegroups parameter examples in master config example and docs
- PR #30898: (abednarik) Fix pkg install with version.
- PR #30860: (rallytime) Pass in `pack` variable to utils.boto.assign_funcs function from ALL boto modules
- PR #30849: (jfindlay) utils.aws: use time lib to convert to epoch seconds
- PR #30874: (terminalmage) Fix regression in git_pillar when multiple remotes are configured
- PR #30850: (jfindlay) modules.dpkg._get_pkg_info: allow for ubuntu 12.04
- PR #30852: (replicant0wnz) Added more descriptive error message
- PR #30847: (terminalmage) Backport #30844 to 2015.8 branch
- PR #30860: (vutny) Correct installation documentation for RHEL-based distributions
- PR #30841: (jacobhammons) Release notes for 2015.8.5
- PR #30835: (terminalmage) Integration test for `#30820`
- PR #30837: (jacobhammons) Added known issue `#30820` to release notes
- PR #30832: (rallytime) Add grains modules to salt modindex
- PR #30822: (rallytime) Make sure setting list_user_permissions to ["", ","] doesn't stacktrace
- PR #30833: (terminalmage) Fix regression in scanning for state with `name` param
- PR #30823: (yannis666) Fix for mine to merge configuration on update.
- PR #30827: (jacobhammons) Version to 2015.8.4, added CVE 2016-1866 to release notes
- PR #30813: (anlutro) Properly set the default value for pillar_merge_lists
• PR #30826: (cachedout) Fix 30682
• PR #30818: (rallytime) Back-port #30790 to 2015.8
• PR #30815: (vutny) Pick right user argument for updating reactor function’s low data
• PR #30747: (jfindlay) modules.lxc.running_systemd: use command -v not which
• PR #30800: (twangboy) Ability to handle special case installations
• PR #30794: (rallytime) A spelling fix and some spacing fixes for the boto_ec2 module docs
• PR #30756: (basepi) [2015.8] Fix two error conditions in the highstate outputter
• PR #30788: (rallytime) Fix incorrect doc example for dellchassis blade_idrac state
• PR #30791: (Ch3LL) do not shadow ret function argument for salt.function
• PR #30726: (sjmh) Fix improper use of yield in generator
• PR #30752: (terminalmage) Backport systemd and yum/dnf optimizations from develop into 2015.8
• PR #30759: (thusoy) Allow managing empty files
• PR #30758: (thusoy) Support mounting labelled volumes with multiple drives
• PR #30686: (cachedout) Master-side pillar caching
• PR #30675: (jfindlay) handle non-ascii minion IDs
• PR #30691: (rallytime) Make sure we use the "instance" kwarg in cloud.action.
• PR #30713: (rallytime) Fix-up autodoc proxy modules for consistency
• PR #30741: (jfindlay) states.locale.__virtual__: return exec mod load err
• PR #30751: (basepi) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #30720: (clinta) x509.pem_managed does not return changes dict
• PR #30687: (clarkperkins) Setting `del_root_vol_on_destroy' changes the root volume type to `standard'
• PR #30673: (terminalmage) Properly derive the git_pillar cachedir from the id instead of the URL
• PR #30666: (cachedout) Fix grains cache
• PR #30623: (twangboy) Added service.config function
• PR #30678: (rallytime) Back-port #30668 to 2015.8
• PR #30677: (clarkperkins) Fix EC2 volume creation logic
• PR #30680: (cro) Merge forward from 2015.5, primarily for #30671
• PR #30663: (isbm) Zypper: latest version bugfix and epoch support feature
• PR #30652: (mew1033) Fix sh beacon
• PR #30657: (jfindlay) [2015.8] Backport #30378 and #29650
• PR #30656: (rallytime) [2015.8] Merge 2015.5 into 2015.8
• PR #30644: (tbaker57) Another go at fixing 30573
• PR #30641: (isbm) Bugfix: Zypper pkg.latest crash fix
• PR #30631: (rallytime) Refactor rabbitmq_cluster states to use test=true functionality correctly
• PR #30628: (rallytime) Refactor rabbitmq_policy states to use test=true functionality correctly
• PR #30624: (cro) Remove bad symlinks from osx pkg dir
• PR #30622: (rallytime) Add glance state to list of state modules
• PR #30618: (rallytime) Back-port #30591 to 2015.8
• PR #30625: (jfindlay) doc.topics.eauth: clarify client_acl vs eauth

18.2.22 Salt 2015.8.9 Release Notes

Version 2015.8.9 is a bugfix release for 2015.8.0.

Mint Linux: Important Post-Upgrade Instructions

As a result of some upstream changes, the os grain on Mint Linux is now being detected as LinuxMint (issue 33295). Run the following command after you upgrade to 2015.8.9 to reset the os grain to Mint and the os_family grain to Debian:

```
salt -G 'os:LinuxMint' grains.setvals "{'os': 'Mint', 'os_family': 'Debian'}"
```

Changes for v2015.8.8..v2015.8.9

Extended changelog courtesy of Todd Stansell (https://github.com/tjstansell/salt-changelogs):

Generated at: 2016-05-17T17:09:39Z

Total Merges: 145

Changes:

• PR #33293: (twangboy) Fix minion start retry on Windows (2015.8)
• 22c4331 linux_acl: Allow `-' as a separation character in ACL permissions. Fixes `#31270` (#33172) (#33305)
• 7a181f2 Handle more ipv6 error as an exception `#33299` (#33300)
• eb47a15 Ignore retcode when checking service's status (#33294)
• PR #33274: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
• 4f3596a Add comment for test=true w/o changes ret and add changes dict example (#33254)
• 2a30c48 Update Git Policy docs to match Contribution guide (#33252)
• 056c273 Fix `#33238` (#33239)
• 1cd34ab Properly report on invalid gitfs/git_pillar/winrepo repos (#33245)
• PR #33253: (rallytime) Update the release process docs
• 8c2c5b1 update 2015.8.9 release notes (#33251)
• 8ee8ee3 Handle ipv6 error as an exception (#33246)
• 855bed3 Check rendered YAML for invalid keys (#33213)
• 6fb25a8 Make note of files that begin with `_' in master.d or minion.d dirs (#33224)
• a6dc0d2 Gate jnpr imports in salt.proxy.junos.py (#33150)
• 64a89c4 Add docs for the http state (#33222)
• 0a32163 Don't stacktrace when using --out=highstate at CLI during staterun. (#33215)
• 04d714d propagate opts to salt.util.http call (#33219)
• c8236c0 update 2015.8.9 release notes (#33237)
• PR #33217: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
• 730bec1 [2015.8] Merge forward from 2015.5 to 2015.8 (#33207)
• 379b151 Add a fetch when compiling git_pillar for masterless minions (#33204)
• b3805d8 cloud.clouds.ec2: cache each named node (#33164)
• 86db5df Properly handle failed git commands when redirect_stderr=True (#33203)
• a3a950d Don't force use of global ssh_config when git identity file is specified (#33152)
• ce07133 update 2015.8.9 release notes (#33198)
• PR #33188: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
• e9108e0 add 2015.8.9 release notes (#33161)
• 2d9919e [2015.8] Update to latest bootstrap script v2016.05.10 (#33156)
• 033bef2 Hash fileclients by opts (#33142)
• f520fa3 Back-port #31769 to 2015.8 (#33139)
• PR #33144: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #33140: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
• ad607ef If cache_jobs: True is set, populate the local job cache when running salt-call (#33100)
• 64689a6 Fix broken parsing of usermgmt.conf on OpenBSD (#33135)
• 06a382e Add a check that the cmdline of the found proc matches (#33129)
• 10018e9 salt.utils.gitfs: fix formatting for warning messages (#33064)
• d45b599 Fix 33058 (#33099)
• PR #33106: (abednarik) Moved _finger_fail method to parent class.
• 20c7e10 clarify docs that map is designed to be run once. is not stateful (#33102)
• 558561d cloud.query needs to define mapper.opts (#33098)
• PR #33096: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
• 22a327b salt-cloud: fix ipv6-only virtual machines (#32865)
• e788f7e modules.npm: do not log npm --version at info level (#33084)
• PR #33081: (jfindlay) ssh docs: install py-2.6 for RHEL 5
• PR #33088: (isbm) Bugfix: Restore boolean values from the repo configuration
• 2c6326f fix tests for file.blockplace to remove newline (#33082)
• PR #32892: (isbm) Resolve Zypper locks on asynchronous calls
• 3e06b23 Add fun_args to scheduled return data (part of `#24237`_) (#33039)
• 264c0d4 Don't append a newline when creating new content with blockreplace (#33049)
• 54b783a Pass all data to batch.run() call when using --failhard (#33048)
• 2dbf35 Display command output when command fails with batch + failhard options (#33050)
• add9199 Allow security_groups kwarg for boto_elb.present to be string or list (#33053)
• 111701c [2015.8] Merge forward from 2015.5 to 2015.8 (#33054)
• 1066063 File and User test fixes for 2015.8 on Fedora23 (#33056)
• f97b5d5 Back-port #33030 to 2015.8 (#33040)
• e90a501 Update the docs for saltutil.find_job to be more clear/accurate (#33017)
• d3d77ce Add saltenv to the cmd.script state function (#33031)
• 343f44 Fix syndic regression (#33021)
• 4bb3ca5 Compare uid and gid instead of name and group (#32674)
• 9ca5b02 Allow batch mode to use verbose option, as well as show_jid. (#32996)
• 81c0fa4 Fixed glusterfs.peered output (#32955)
• 8c70d7a Clarify some arg docs (#32994)
• 00ebab Fix boto_secgroup_test (#32986)
• 3362367 fix user cron on solarish operating systems (#32970)
• 07e38bc salt.log.setup: process user args before format (#32976)
• b2d7c81 doc.ref.states.ordering: clarify requisite change (#32934)
• df41d5d mode should default to `text' (#32928)
• f581a82 Remove FileClient class references from docs - it doesn't exist. (#32925)
• 31b96de Update contents_grains option with relevant docs (#32922)
• PR #32926: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
• 1cd6a45 specify volume tags in profile configuration (#32908)
• 85ca86d Update docs to warn users that -1 isn't valid for iptables insert state (#32906)
• cb68706 Allow profile options to be specified in provider file when using maps (#32900)
• 1a55fcb Clarify service state opening docs - uses `service' virtualname (#32880)
• PR #32884: (terminalmage) Fix incorrect deprecation notice
• PR #32878: (jacobhammons) added note about updating the bootstrap script in salt-cloud using th...
• PR #32869: (rallytime) Use correct config setting in cloud syndic docs
• PR #32844: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
• eb8fb6b Back-port #31139 to 2015.8 (#32868)
• 4bb5545 backport PR #32732 for issue `#23714`_ (#32847)
• 5ea003b Add pyvmomi version warning to Getting Started with VMware docs (#32845)
• 44f08d0 Pass None as memory limit. (#32841)
• feebe69 Back-port #32813 to 2015.8 (#32839)
• 3b81031 various improvements on cloud deploy script docs (#32659)
• bf85987 update bootstrap to 2016.04.18 release (#32668)
• 83dee63 Back-port #29322 to 2015.8 (#32785)
• PR #32787: (rallytime) Back-port #32722 to 2015.8
• PR #32786: (rallytime) Back-port #32703 to 2015.8
• a6a42740 Merge branch `pr-32775` into 2015.8
• cda00f4 Improve documentation on pygit2 versions (#32779)
• 1d6d234 Properly handle minion failback failure. (#32749)
• 3751a27 Document pillar cache options (#32643)
• 35e8af3 modules.win_dacl: consistent case of dacl constants (#32720)
• 2cd0817 Update external auth documentation to list supported matcher. (#32733)
• bba089d Check dependencies type before applying str operations (#32693)
• 3aa0605 Handle when beacon not configured and we try to enable/disable them (#32692)
• PR #32718: (garethgreenaway) Fixes to schedule.list in 2015.8
• PR #32684: (captaininspiration) Fix routes for redhat < 6
• 7cdd512 Handle a couple of arguments better (Azure) (#32683)
• aaaa03bc Fix for issue 32523 (#32672)
• 21081b1 Don't access deprecated Exception.message attribute. (#32556)
• 5d1e9a4 Lower log level for pillar cache (#32655)
• PR #32588: (anlutro) Fix salt-ssh module function call argument type juggling by JSON encoding them
• 8d46244 Prevent crash if pygit2 package is requesting re-compilation of the exdb (#32652)
• PR #32614: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #32616: (rallytime) Back-port #32547 to 2015.8
• 3047471 Fix comments value in salt.states.pkgrepo example (#32604)
• ab9da90 Revert PR #32480 and apply #32314 with fixes / documentation (#32558)
• c84c921 Better log message on minion restart if master couldn't be reached. (#32576)
• 3e81798 Don't return None from eval_master (#32555)
• PR #32536: (rallytime) Back-port #31898 to 2015.8
• d12a1c2 Fix binary search and replace (#32542)
• PR #32539: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #32531: (ticosax) [dockerng] Fix support of dockerng.volume_present when no volume is on present.
• 5d73d54 Enhance dockerng.wait() to control success on exit_code and on already stopped containers (#32475)
• 214f01e Bugfix: salt-key crashes if tries to generate keys to the directory w/o write access (#32436)
• 28883af Turn on exc_info when logging failed minion startup (#32515)
• 08a8020 Add ignore_epoch option to pkg.installed/removed/purged states (#32520)
• 492ebfc Isbm zypper list products sles11 crash (#32505)
• ae89882 Clear VCS fsbackend and git_pillar locks on master start (#32480)
• a6482a3 Use win32api to get Total System Memory (#32491)
• PR #32477: (terminalmage) Add explanation of nonzero epoch requirement to pkg.installed state documenta-
tion
• PR #32482: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
• f5bd6bd Backport 31164 and 31364 (#32474)
• PR #32450: (cachedout) Pass parser options into batch mode
• b299835 Issue `#28706`: Fix state user.present behavior. (#32448)
• cef33d5 Argument name in docs should match actual arg name (#32445)
• PR #32432: (ticosax) [dockerng] Fix Domainname introspection
• PR #32427: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #32423: (jtand) Update glusterfs_test to be inline with #32312
• PR #32425: (cachedout) Fix salt-cloud parallel provisioning
• 51fb2ac FreeBSD supports packages in format java/openjdk7 so the prior commit broke that functionality. Check freebsd/pkg`#1409` for more info.
• 709410a Improve git_pillar documentation/logging
• c53efc3 Update master config docs
• PR #32323: (mcalmer) fix sorting by latest version when called with an attribute
• PR #32376: (amontalban) Fixes saltstack/salt`#28262`
• 0d9a06b Cleaner deprecation process with decorators
• 6979fda Correctly index glusterfs bricks
• PR #32393: (jfindlay) modules.win_timezone: don’t list all zones in debug log
• PR #32372: (rallytime) Back-port #32358 to 2015.8
• PR #32392: (multani) Fix documentation on boto_asg and boto_elb modules and states
• PR #32373: (cachedout) Resolve memory leak in authentication
• PR #32126: (cro) Add a couple CLI examples for the highstate outputter.
• PR #32353: (mcalmer) Prevent metadata download when listing installed products
• PR #32321: (abednarik) Better message when minion fail to start
• PR #32345: (nmadhok) [2015.8] Check if profile key exists in vm_dict
• PR #32343: (Ferbla) Fixed win_wua example documentation
• PR #32360: (rallytime) Make sure hash_type is lowercase in master/minion config files
• PR #32361: (cro) SDB is no longer experimental
• PR #32336: (rallytime) Back-port #28639 to 2015.8
• PR #32332: (rallytime) Don’t unsubscribe from open events on the CLI too early on long-running commands
• PR #32333: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #32289: (rallytime) New salt-cloud instances should not use old hash_type default.
• PR #32291: (twangboy) Fix bad output for chocolatey.version (fixes `#14277`)
• PR #32295: (rallytime) Test the contents of `deploy_scripts_search_path` in salt.config.cloud_config
• PR #32315: (ahusl) fixing file.managed with requests lib
• PR #32316: (vutny) Update Salt Bootstrap tutorial
• PR #32325: (bdrung) Re-add shebang to ssh-id-wrapper shell script
• PR #32326: (bdrung) Fix typos
• PR #32300: (twangboy) Add documentation to disable winrepo/winrepo_ng
• PR #32288: (terminalmage) use dictupdate.merge instead of dict.update to merge CLI pillar overrides
• PR #32243: (ismb) Ensure latest pkg.info_installed ensure latest
• PR #32268: (ticosax) [dockerng] Improve detection for older versions of docker-py
• PR #32258: (jacobhammons) Replaces incorrect reference to master_alive_check
• PR #32254: (twangboy) Fix Display Name with spaces in win_servermanager
• PR #32248: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #32230: (terminalmage) systemd.py: Support both update-rc.d and chkconfig as managers of sysv services
• PR #32249: (jacobhammons) Fixes windows download paths to account for patch
• PR #32221: (dmurphy18) Fix version check, fix extracting Major and Minor versions from __version__
• PR #32227: (twangboy) Remove list2cmdline usage from win_service.py
• PR #32239: (anlutro) Add state file name to warning log line
• PR #32215: (DmitryKuzmenko) rhel oscodename
• PR #32217: (jacobhammons) 2015.8.8.2 release notes
• PR #32212: (rallytime) Back-port #32197 to 2015.8
• PR #32211: (rallytime) Back-port #32210 to 2015.8
• PR #32209: (rallytime) Back-port #32208 to 2015.8
• PR #32204: (ticosax) [dockerng] Consider labels carried by the image when comparing user defined labels.
• PR #32186: (rallytime) Add some "best practices" information to test documentation
• PR #32176: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #32163: (rallytime) Update nacl.config docs to use key value instead of `None`
• PR #32166: (vutny) salt.states.file: correct examples with multiline YAML string
• PR #32168: (rallytime) Lint 2015.8
• PR #32165: (terminalmage) Make __virtual__ for rhservice.py more robust
• PR #32160: (cachedout) Fix beacon tutorial docs
• PR #32145: (paclat) fixes 29817
• PR #32133: (basepi) Pass eauth user/groups through salt-api to destination functions
• PR #32127: (rallytime) Add runners to __salt__ docs
• PR #32143: (DmitryKuzmenko) Set auth retry count to 0 if multimaster mode is failover.
• PR #32134: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
• PR #32091: (clarkperkins) Fixed the regression in 410da78
• PR #32135: (rallytime) [2015.8] Support multiple valid option types when performing type checks
• PR #31760: (sakateka) SMinion need wait future from eval_master

18.2. Previous Releases
Salt Documentation, Release 2016.3.6

- PR #32106: (jfindlay) update suse master service patch
- PR #32130: (jacobhammons) Added known issues 32004 and 32044 to 2015.8.8 release notes
- PR #32105: (clarkperkins) Fixed invalid deploy_scripts_search_path
- PR #32117: (tomlaredo) Fixed validation type for file_ignore_glob
- PR #32113: (sakateka) Fix log message for AsyncAuth initialization
- PR #32116: (ticosax) Obtain default value of memory_swap from the container.
- PR #32098: (rallytime) Back-port #32083 to 2015.8
- PR #32099: (jacobhammons) 2015.8.8 release docs

- PR #32026: (techhat) Don't require the decode_out file to already exist
- PR #32019: (rallytime) Back-port #32012 to 2015.8
- PR #32015: (ticosax) [dockerng] Fix ports exposition when protocol is passed.
- PR #31999: (jacobhammons) Fixes a doc build exception caused by missing mocks for modules.win_dacl
- PR #31992: (notpeter) salt-cloud: add D2 and G2 EC2 instance types
- PR #31981: (lloydoliver) include rotational disks in grains under linux
- PR #31970: (twangboy) Add apply_template_on_contents for windows
- PR #31960: (aletourneau) fixed ec2 get_console_output
- PR #31958: (rallytime) [2015.8] Merge forward from 2015.5 to 2015.8
- 3934c66 Merge branch `2015.5` into `2015.8`
- PR #31935: (twangboy) Back port nullsoft build script from 2015.8
- PR #31912: (jfindlay) log.mixins: remove extermporaneous .record

### 18.2.23 Salt 2015.5.0 Release Notes - Codename Lithium

The 2015.5.0 feature release of Salt is focused on hardening Salt and mostly on improving existing systems. A few major additions are present, primarily the new Beacon system. Most enhancements have been focused around improving existing features and interfaces.

As usual the release notes are not exhaustive and primarily include the most notable additions and improvements. Hundreds of bugs have been fixed and many modules have been substantially updated and added.

**Warning:** In order to fix potential shell injection vulnerabilities in salt modules, a change has been made to the various cmd module functions. These functions now default to python_shell=False, which means that the commands will not be sent to an actual shell.

The largest side effect of this change is that "shellisms", such as pipes, will not work by default. The modules shipped with salt have been audited to fix any issues that might have arisen from this change. Additionally, the
**cmd** state module has been unaffected, and use of **cmd.run** in Jinja is also unaffected. **cmd.run** calls on the CLI will also allow shellisms.

However, custom execution modules which use shellisms in **cmd** calls will break, unless you pass `python_shell=True` to these calls.

As a temporary workaround, you can set `cmd_safe=False` in your minion and master configs. This will revert the default, but is also less secure, as it will allow shell injection vulnerabilities to be written in custom code. We recommend you only set this setting for as long as it takes to resolve these issues in your custom code, then remove the override.

---

**Note:** Starting in this version of Salt, `pillar_opts` defaults to False instead of True. This means that master opts will not be present in minion pillar, and as a result, `config.get` calls will not include master opts.

We recommend pillar is used for configuration options which need to make it to the minion.

---

**Beacons**

The beacon system allows the minion to hook into system processes and continually translate external events into the salt event bus. The primary example of this is the `inotify` beacon. This beacon uses inotify to watch configured files or directories on the minion for changes, creation, deletion etc.

This allows for the changes to be sent up to the master where the reactor can respond to changes.

---

**Sudo Minion Settings**

It is now possible to run the minion as a non-root user and for the minion to execute commands via sudo. Simply add `sudo_user: root` to the minion config, run the minion as a non-root user and grant that user sudo rights to execute `salt-call`.

---

**Lazy Loader**

The Lazy Loader is a significant overhaul of Salt’s module loader system. The Lazy Loader will lazily load modules on access instead of all on start. In addition to a major performance improvement, this `\`sandboxes\` modules so a bad/broken import of a single module will only affect jobs that require accessing the broken module. ([issue: 20274](#))

---

**Enhanced Active Directory Support**

The eauth system for LDAP has been extended to support Microsoft Active Directory out of the box. This includes Active Directory and LDAP group support for eauth.

---

**Salt LXC Enhancements**

The LXC systems have been overhauled to be more consistent and to fix many bugs.

This overhaul makes using LXC with Salt much easier and substantially improves the underlying capabilities of Salt’s LXC integration.
Salt SSH

- Additional configuration options and command line flags have been added to configure the scan roster on the fly
- Added support for state.single in salt-ssh
- Added support for publish.publish, publish.full_data, and publish.runner in salt-ssh
- Added support for mine.get in salt-ssh

New Windows Installer

The new Windows installer changes how Salt is installed on Windows. The old installer used bbfreeze to create an isolated python environment to execute in. This made adding modules and python libraries difficult. The new installer sets up a more flexible python environment making it easy to manage the python install and add python modules.

Instead of frozen packages, a full python implementation resides in the bin directory (C:\salt\bin). By executing pip or easy_install from within the Scripts directory (C:\salt\bin\Scripts) you can install any additional python modules you may need for your custom environment.

The .exe's that once resided at the root of the salt directory (C:\salt) have been replaced by .bat files and should function the same way as the .exe's in previous versions.

The new Windows Installer will not replace the minion config file and key if they already exist on the target system. Only the salt program files will be replaced. C:\salt\conf and C:\salt\var will remain unchanged.

Removed Requests Dependency

The hard dependency on the requests library has been removed. Requests is still required by a number of cloud modules but is no longer required for normal Salt operations.

This removal fixes issues that were introduced with requests and salt-ssh, as well as issues users experienced from the many different packaging methods used by requests package maintainers.

Python 3 Updates

While Salt does not YET run on Python 3 it has been updated to INSTALL on Python 3, taking us one step closer. What remains is getting the test suite to the point where it can run on Python 3 so that we can verify compatibility.

RAET Additions

The RAET support continues to improve. RAET now supports multi-master and many bugs and performance issues have been fixed. RAET is much closer to being a first class citizen.

Modified File Detection

A number of functions have been added to the RPM-based package managers to detect and diff files that are modified from the original package installs. This can be found in the new pkg.modified functions.
Reactor Update

Fix an infinite recursion problem for runner/wheel reactor jobs by passing a `user` (Reactor) to all jobs that the reactor starts. The reactor skips all events created by that username -- thereby only reacting to events not caused by itself. Because of this, runner and wheel executions from the runner will have user `"Reactor"` in the job cache.

Misc Fixes/Additions

- SDB driver for etcd. (:issue: 22043)
- Add `only_upgrade` argument to apt-based `pkg.install` to only install a package version if the package is already installed. (Great for security updates!)
- Joyent now requires a `keyname` to be specified in the provider configuration. This change was necessitated upstream by the 7.0+ API.
- Add `args` argument to `cmd.script_retcode` to match `cmd.script` in the `cmd` module. (:issue: 21122)
- Fixed bug where TCP keepalive was not being sent on the defined interval on the return port (4506) from minion to master. (:issue: 21465)
- LocalClient may now optionally raise SaltClientError exceptions. If using this class directly, checking for and handling this exception is recommended. (:issue: 21501)
- The SAuth object is now a singleton, meaning authentication state is global (per master) on each minion. This reduces sign-Ins of minions from 3->1 per startup.
- Nested outputer has been optimized, it is now much faster.
- Extensive fileserver backend updates.

Deprecations

- Removed `parameter` keyword argument from `eselect.exec_action` execution module.
- Removed `runas` parameter from the following pip` execution module functions: `install`, `uninstall`, `freeze`, `list`, `list_upgrades`, `upgrade_available`, `upgrade`. Please migrate to `user`.
- Removed `runas` parameter from the following pip state module functions: `installed`, `removed`, `up-to-date`. Please migrate to `user`.
- Removed `quiet` option from all functions in `cmdmod` execution module. Please use `output_loglevel=quiet` instead.
- Removed `parameter` argument from `eselect.set_.state`. Please migrate to `module_parameter` or `action_parameter`.
- The `salt_events` table schema has changed to include an additional field called `master_id` to distinguish between events flowing into a database from multiple masters. If `event_return` is enabled in the master config, the database schema must first be updated to add the `master_id` field. This alteration can be accomplished as follows:

  ALTER TABLE salt_events ADD master_id VARCHAR(255) NOT NULL;
Known Issues

- In multi-master mode, a minion may become temporarily unresponsive if modules or pillars are refreshed at the same time that one or more masters are down. This can be worked around by setting `auth_timeout' and `auth_tries' down to shorter periods.

18.2.24 Salt 2015.5.1 Release Notes

release 2015-05-20

Version 2015.5.1 is a bugfix release for 2015.5.0.

Changes:

- salt.runners.cloud.action() has changed the fun keyword argument to func. Please update any calls to this function in the cloud runner.

Extended Changelog Courtesy of Todd Stansell (https://github.com/tjstansell/salt-changelogs):

PR #23989: (rallytime) Backport #23980 to 2015.5 @ 2015-05-20T19:33:41Z

- PR #23980: (iggy) template: jinja2 -> jinja | refs: #23989
- 117ecb1 Merge pull request #23989 from rallytime/bp-23980
- 8f8557c template: jinja2 -> jinja

**PR #23922:** (garethgreenaway) Fixes to debian_ip.py @ 2015-05-19T18:50:53Z

- ISSUE #23900: (hashi825) salt ubuntu network building issue 2015.5.0 | refs: #23922
- b818f72 Merge pull request #23922 from garethgreenaway/23900_2015_5_bonding_interface_fixes
- 0bca536 Fixing issue reported when using bonded interfaces on Ubuntu. Attributes should be bond-, but the code was attempting to split just on bond_. Fix accounts for both, but the debian_ip.py module will write out bond attributes with bond-

**PR #23925:** (jpic) Fixed wrong path in LXC cloud documentation @ 2015-05-19T18:23:56Z

- PR #23924: (jpic) Fixed wrong path in LXC cloud documentation | refs: #23925
- b1c98a3 Merge pull request #23925 from jpic/fix/wrong_lxc_path
- a4bcd75 Fixed wrong path in LXC cloud documentation

**PR #23894:** (whiteinge) Add __all__ attribute to Mock class for docs @ 2015-05-19T17:17:35Z
Chapter 18. Release Notes

- 7f6a716 Merge pull request #23894 from whiteinge/doc-mock__all__
- 6eeeca46 Add __all__ attribute to Mock class for docs

- **PR #23884**: (jfindlay) Fix locale.set_locale on debian @ 2015-05-19T15:51:22Z
  - ISSUE #23767: (chrini) Salt system.locale fails on non existent default locale | refs: #23884
  - 8108a9b Merge pull request #23884 from jfindlay/fix_locale
  - 91c2d51 use append_if_not_found in locale.set_locale
  - e632603 (re)generate /etc/default/locale

- **PR #23866**: (jfindlay) backport #23834, change portage.dep.strip_empty to list comprehension @ 2015-05-19T15:50:43Z
  - PR #23834: (Arabus) Avoid deprecation warning from portage.dep.strip_empty() | refs: #23866
  - 6bae12f Merge pull request #23866 from jfindlay/flag_strip
  - aa032cc replace portage.dep.strip_empty() with list comprehension
  - 7576872 Proper replacement for portage.dep.strip_empty() with list comprehension, pep8fix
  - 2851a5c Switch portage.dep.strip_empty(...) to filter(None,...) to avoid deprecation warning and do essentially the same

- **PR #23917**: (corywright) Split debian bonding options on dash instead of underscore @ 2015-05-19T15:44:35Z
  - ISSUE #23904: (mbrgm) Network config bonding section cannot be parsed when attribute names use dashes | refs: #23917
  - a67a008 Merge pull request #23917 from corywright/issue23904
  - c06f8cf Split debian bonding options on dash instead of underscore

- **PR #23909**: (jayeshka) `str` object has no attribute `capitalized` @ 2015-05-19T15:41:53Z
  - e8fcd09 Merge pull request #23909 from jayeshka/file-exe-module
  - e422d9d `str` object has no attribute `capitalized`

- **PR #23903**: (garethgreenaway) Adding docs for missing schedule state module parameters. @ 2015-05-19T06:29:34Z
  - c73bf38 Merge pull request #23903 from garethgreenaway/missing_docs_schedule_state
  - acd8ab9 Adding docs for missing schedule state module parameters.

- f7eb70c changed previous release to 2014.7.6

    - 1f4c868 Adding states/test.py unit tests
  
  • PR #23859: (rahulhan) Adding states/sysrc.py unit tests @ 2015-05-18T17:01:46Z
    - 3c9bb813 Merge pull request #23859 from rahulhan/states_sysrc_unit_test
    - 6a903b0 Adding states/sysrc.py unit tests
  
  • PR #23812: (rallytime) Backport #23790 to 2015.5 @ 2015-05-18T15:30:34Z
    - PR #23790: (aboe76) updated suse spec file to version 2015.5.0 | refs: #23812
    - 4cf30a7 Merge pull request #23812 from rallytime/bp-23790
- 3f65631 updated suse spec file to version 2015.5.0

- **PR #23811**: (rallytime) Backport #23786 to 2015.5 @ 2015-05-18T15:30:27Z
  - **PR #23786**: (kaithar) Log the error generated that causes returns.mysql.returner to except. | refs: #23811
  - 56f939a Merge pull request #23811 from rallytime/bp-23786
  - 346f30b Log the error generated that causes returns.mysql.returner to except.

- **PR #23850**: (jayeshka) adding sysbench unit test case @ 2015-05-18T15:28:04Z
  - ce60582 Merge pull request #23850 from jayeshka/sysbench-unit-test
  - 280abde adding sysbench unit test case

- **PR #23843**: (The-Loeki) Fix erroneous virtual:physical core grain detection @ 2015-05-18T15:24:22Z
  - 069092f Merge pull request #23843 from The-Loeki/patch-1
  - 9e2cf60 Fix erroneous virtual:physical core grain detection

- **PR #23816**: (Snergster) Doc for #23685 Added prereq, caution, and additional mask information @ 2015-05-18T15:18:03Z
  - ISSUE #23815: (Snergster) [beacons] inotify errors on subdir creation | refs: #23816
  - 3257a9b Merge pull request #23816 from Snergster/23685-doc-fix
  - 0fca49d Added prereq, caution, and additional mask information

- **PR #23832**: (ahus1) make saltify provider use standard bootstrap procedure @ 2015-05-18T02:18:29Z
  - **PR #23829**: (ahus1) make saltify provider use standard bootstrap procedure | refs: #23832
  - 3df3b85 Merge pull request #23832 from ahus1/ahus1_saltify_bootstrap_2015.5
  - f5b1734 fixing problem in unit test
  - cba47f6 make saltify to use standard bootstrap procedure, therefore providing all options like master_sign_pub_file

- **PR #23791**: (optix2000) Psutil compat @ 2015-05-16T04:05:54Z
  - 8e4fb2 Merge pull request #23791 from optix2000/psutil_compat
  - 5470cf5 Fix pylint errors and sloppy inline comments
  - 64634b6 Update psutil.pid_list to use psutil.pids
  - 5dd6d69 Fix imports that aren't in __all__
  - 8a1da33 Fix test cases by mocking psutil_compat
  - 558798d Fix net_io_counters deprecation issue
  - 8140f92 Override unnecessary pylint errors
  - 7d02ad4 Fix some of the mock names for the new API
  - 9b3023e Fix overloaded getters/setters. Fix line lengths
  - 180eb87 Fix whitespace
  - f8edf72 Use new psutil API in ps module
  - e48982f Fix version checking in psutil_compat
  - 93ee411 Create compatibility psutil. psutil 3.0 drops 1.0 API, but we still support old psutil versions.
• PR #23782: (terminalmage) Replace `'command -v'' with `'which'' and get rid of spurious log messages @ 2015-05-16T04:03:10Z
  - 405517b Merge pull request #23782 from terminalmage/issue23772
  - 0f6f239 More ignore_retcode to suppress spurious log msgs
  - b4c48e6 Ignore return code in lxc.attachable
  - 08658c0 Replace `'command -v'' with `'which''

• PR #23783: (basepi) [2015.5] Merge forward from 2014.7 to 2015.5 @ 2015-05-15T21:38:51Z
  - ISSUE #22959: (highlyunavailable) Windows Salt hangs if file.directory is trying to write to a drive that doesn't exist
  - ISSUE #22332: (rallytime) [salt-ssh] Add a check for host in /etc/salt/roster | refs: #23748
  - ISSUE #16424: (stanvit) salt-run cloud.create fails with saltify
  - PR #23748: (basepi) [2014.7] Log salt-ssh roster render errors more assertively and verbosely
  - PR #23731: (twangboy) Fixes #22959: Trying to add a directory to an unmapped drive in windows
  - PR #23730: (rallytime) Backport #23729 to 2014.7
  - PR #23729: (rallytime) Partially merge #23437 (grains fix) | refs: #23730
  - PR #23688: (twangboy) Added inet_pton to utils/validate/net.py for ip.set_static_ip in windows
  - PR #23488: (cellscape) LXC cloud fixes
  - PR #23437: (cedwards) Grains item patch | refs: #23729
  - cb2eb40 Merge pull request #23783 from basepi/merge-forward-2015.5
  - 9df51ca __opts__get
  - 51d23ed Merge remote-tracking branch `upstream/2014.7' into merge-forward-2015.5
    * d9af0c3 Merge pull request #23488 from cellscape/lxc-cloud-fixes
      - 64250a6 Remove profile from opts after creating LXC container
      - c4047d2 Set destroy=True in opts when destroying cloud instance
      - 9e1311a Store instance names in opts when performing cloud action
      - 934bc57 Correctly pass custom env to lxc-attach
      - 7fb85f7 Preserve test=True option in cloud states
      - 9771b5a Fix detection of absent LXC container in cloud state
      - fb24f0c Report failure when failed to create/clone LXC container
      - 2d9aa2b Avoid shadowing variables in lxc module
      - 792e102 Allow overriding profile options in lxc.cloud_init_interface
      - 42bd64b Return changes on successful lxc.create from salt-cloud
      - 4409eab Return correct result when creating cloud LXC container
      - 377015c Issue #16424: List all providers when creating salt-cloud instance without profile
    * 808be1 Merge pull request #23748 from basepi/salt-ssh.roster.host.check
      - bc53e04 Log entire exception for render errors in roster
      - 753de6a Log render errors in roster to error level
Always let the real YAML error through

* 72cf360 Merge pull request #23731 from twangboy/fix_22959
  - 88e5495 Fixes #22959: Trying to add a directory to an unmapped drive in windows

* 2610195 Merge pull request #23730 from rallytime/bp-23729
  - 1877cae adding support for nested grains to grains.item

* 3e9df88 Merge pull request #23688 from twangboy/fix_23415
  - 6a91169 Fixed unused-import pylint error
  - 5e25b3f fixed pylint errors
  - 1a96766 Added inet_pton to utils/validate/net.py for ip.set_static_ip in windows

- PR #23781: (jfindlay) fix unit test mock errors on arch @ 2015-05-15T19:40:07Z
  - 982f873 Merge pull request #23781 from jfindlay/fix_locale_tests
  - 14c711e fix unit test mock errors on arch

- PR #23740: (jfindlay) Binary write @ 2015-05-15T18:10:44Z
  - ISSUE #23566: (rks2286) Salt-cp corrupting the file after transfer to minion | refs: #23740
  - 916b1c4 Merge pull request #23740 from jfindlay/binary_write
  - 626930a update incorrect comment wording
  - a978f5c always use binary file write mode on windows

- PR #23736: (jfindlay) always load pip execution module @ 2015-05-15T18:10:16Z
  - ISSUE #23682: (chrish42) Pip module requires system pip, even when not used (with env_bin) | refs: #23736
  - 348645e Merge pull request #23736 from jfindlay/fix_pip
  - b8867a8 update pip tests
  - 040bbc4 only check pip version in one place
  - 6c453a5 check for executable status of bin_env
  - 3337257 always load the pip module as pip could be anywhere

- PR #23770: (cellscape) Fix cloud LXC container destruction @ 2015-05-15T17:38:59Z
  - 10cedfb Merge pull request #23770 from cellscape/fix-cloud-lxc-destruction
  - 4f6021c Fix cloud LXC container destruction

- PR #23759: (lisa2lisa) fixed the problem for not beable to revoke ., for more detail https... @ 2015-05-15T17:38:38Z
  - ddea822 Merge pull request #23759 from lisa2lisa/iss23664
  - a29f161 fixed the problem for not beable to revoke ., for more detail https://github.com/saltstack/salt/issues/23201, fixed mysql cannot create user with pure digit password, for more info https://github.com/saltstack/salt/issues/23664

  - 10615ff Merge pull request #23769 from cellscape/utils-http-ca-file-roots
  - 8e90f32 Fix file_roots CA lookup in salt.utils.http.get_ca_bundle

18.2. Previous Releases 2583
• PR #23765: (jayeshka) adding states/makeconf unit test case @ 2015-05-15T14:29:43Z
  – fd8a1b7 Merge pull request #23765 from jayeshka/makeconf_states-unit-test
  – 26e31af adding states/makeconf unit test case
• PR #23760: (ticosax) [doc] document refresh argument @ 2015-05-15T14:23:47Z
  – ee13b08 Merge pull request #23760 from ticosax/2015.5
  – e3ca859 document refresh argument
• PR #23766: (jayeshka) adding svn unit test case @ 2015-05-15T14:23:18Z
  – a017f72 Merge pull request #23766 from jayeshka/svn-unit-test
  – 19939cf adding svn unit test case
• PR #23751: (rallytime) Backport #23737 to 2015.5 @ 2015-05-15T03:58:37Z
  – ISSUE #23734: (bradthurberr) 2015.5.0 modules/archive.py ZipFile instance has no attribute `__exit__' - only python 2.6? | refs: #23737
  – PR #23737: (bradthurberr) fix for 2015.5.0 modules/archive.py ZipFile instance has no attribute... | refs: #23751
  – 0ed9d45 Merge pull request #23751 from rallytime/bp-23737
  – 8d1eb32 fix for 2015.5.0 modules/archive.py ZipFile instance has no attribute `__exit__' - only python 2.6? #23734
• PR #23710: (kiorky) Get more useful output from stateful commands @ 2015-05-14T21:58:10Z
  – ISSUE #23709: (kiorky) cmdmod: enhancement is really needed for stateful commands | refs: #23710
  – d73984e Merge pull request #23710 from makinacorpus/i23709
  – c706909 Get more useful output from stateful commands
• PR #23724: (rallytime) Backport #23609 to 2015.5 @ 2015-05-14T19:34:22Z
  – PR #23609: (kaidakert) file_map: chown created directories if not root #23608 | refs: #23724
  – cdf421b Merge pull request #23724 from rallytime/bp-23609
  – fe3a762 file_map: chmod created directories if not root
• PR #23723: (rallytime) Backport #23568 to 2015.5 @ 2015-05-14T19:34:11Z
  – PR #23568: (techhat) Allow Salt Cloud to use either SCP or SFTP, as configured | refs: #23723
  – 94f9099 Merge pull request #23723 from rallytime/bp-23568
  – bbc34aa Allow Salt Cloud to use either SCP or SFTP, as configured
• PR #23725: (rallytime) Backport #23691 to 2015.5 @ 2015-05-14T19:32:30Z
  – PR #23691: (dennisjac) add initial configuration documentation for varstack pillar | refs: #23725
  – 137e5ee Merge pull request #23725 from rallytime/bp-23691
  – 28a846e add initial configuration documentation for varstack pillar
• PR #23722: (rallytime) Backport #23472 to 2015.5 @ 2015-05-14T19:31:52Z
  – PR #23472: (techhat) Allow neutron network list to be used as pillar data | refs: #23722
  – 0c00995 Merge pull request #23722 from rallytime/bp-23472
  – c3d0f39 Change versionadded tag for backport
- 023e88f Allow neutron network list to be used as pillar data

- **PR #23727**: (jfindlay) fix npm execution module stacktrace @ 2015-05-14T18:14:12Z
  - ISSUE #23657: (arthurlogilab) [salt-cloud lxc] NameError: global name `_salt_` is not defined | refs: #23727 #23898 #23897
  - cbf4ca8 Merge pull request #23727 from jfindlay/npm_salt
  - 05392f2 fix npm execution module stacktrace

- **PR #23718**: (rahulhan) Adding states/user.py unit tests @ 2015-05-14T17:15:38Z
  - ef536d5 Merge pull request #23718 from rahulhan/states_user_unit_tests
  - aad27db Adding states/user.py unit tests

- **PR #23720**: (basepi) [2015.5] Merge forward from 2014.7 to 2015.5 @ 2015-05-14T17:13:02Z
  - ISSUE #23604: (Azidburn) service.dead on systemd Minion create an Error Message | refs: #23607
  - ISSUE #23548: (kkaig) grains.list_present produces incorrect (?) output | refs: #23674
  - ISSUE #23403: (iamfil) salt.runners.cloud.action fun parameter is replaced | refs: #23680
  - PR #23680: (cachedout) Rename kwarg in cloud runner
  - PR #23674: (cachedout) Handle lists correctly in grains.list_presents
  - PR #23672: (twangboy) Fix user present
  - PR #23670: (rallytime) Backport #23607 to 2014.7
  - PR #23607: (Azidburn) Fix for #23604. No error reporting. Exitcode !=0 are ok | refs: #23670
  - a529d74 Merge pull request #23720 from basepi/merge-forward-2015.5
  - 06a3ebd Merge remote-tracking branch `upstream/2014.7` into merge-forward-2015.5
  - 1b86460 Merge pull request #23680 from cachedout/issue_23403
    - d5986c2 Rename kwarg in cloud runner
  - cd64af0 Merge pull request #23674 from cachedout/issue_23548
    - da8a2f5 Handle lists correctly in grains.list_presents
  - d322a19 Merge pull request #23672 from twangboy/fixed_user_present
    - 731e7af Merge branch `2014.7` of https://github.com/saltstack/salt into fixed_user_present
    - d6f70a4 Fixed user.present to create password in windows
  - 43f7025 Merge pull request #23670 from rallytime/bp-23607
    - ed30dc4 Fix for #23604. No error reporting. Exitcode !=0 are ok

- **PR #23704**: (jayeshka) adding states/lvs_server unit test case @ 2015-05-14T14:22:10Z
  - 13facbf Merge pull request #23704 from jayeshka/lvs_server_states-unit-test
  - da323da adding states/lvs_server unit test case

- **PR #23703**: (jayeshka) adding states/lvs_service unit test case @ 2015-05-14T14:21:23Z
  - f95ca31 Merge pull request #23703 from jayeshka/lvs_service_states-unit-test
  - 66717c8 adding states/lvs_service unit test case

- **PR #23702**: (jayeshka) Remove superfluous return statement. @ 2015-05-14T14:20:42Z
Chapter 18. Release Notes

- 07e987e Merge pull request #23702 from jayeshka/fix_lvs_service
- ecf218 fix lvs_service
- PR #23686: (jfindlay) remove superfluous return statement @ 2015-05-14T14:20:18Z
  - 39973d4 Merge pull request #23686 from jfindlay/fix_lvs_server
  - 5aae73 remove superfluous return statement
- PR #23690: (rallytime) Backport #23424 to 2015.5 @ 2015-05-13T23:04:36Z
  - PR #23424: (jtand) Added python_shell=True for refresh_db in pacman.py | refs: #23690
  - be7c7ef Merge pull request #23690 from rallytime/bp-23424
  - 94574b7 Added python_shell=True for refresh_db in pacman.py
- PR #23681: (cachedout) Start on 2015.5.1 release notes @ 2015-05-13T19:44:22Z
  - 1a0db43 Merge pull request #23681 from cachedout/2015_5_1_release_notes
  - bdbbfa6 Start on 2015.5.1 release notes
- PR #23679: (jfindlay) Merge #23616 @ 2015-05-13T19:03:53Z
  - PR #23616: (Sn ergster) virtual returning none warning fixed in dev but missed in 2015.5 | refs: #23679
  - b54075a Merge pull request #23616 from jfindlay/merge_23616
  - 6e15e19 appease pylint's blank line strictures
  - 8750680 virtual returning none warning fixed in dev but missed in 2015.5
- PR #23675: (basepi) [2015.5] Merge forward from 2014.7 to 2015.5 @ 2015-05-13T18:35:54Z
  - ISSUE #23611: (hubez) master_type set to `failover' but `master' is not of type list but of type `<type 'str'>` | refs: #23637
  - ISSUE #23479: (danielmorlock) Typo in pkg.removed for Gentoo? | refs: #23558
  - ISSUE #23452: (michaelforge) minion crashed with empty grain | refs: #23639
  - ISSUE #23411: (dr4Ke) grains.append should work at any level of a grain | refs: #23440
  - ISSUE #23355: (dr4Ke) salt-ssh: `sources: salt://' files from `pkg' state are not included in salt_state.tgz | refs: #23530
  - ISSUE #23110: (martinhoefling) Copying files from gitfs in file.recurse state fails
  - ISSUE #23004: (b18) 2014.7.5 - Windows - pkg.list_pkgs - `\nxlog" never shows up in output. | refs: #23433
  - ISSUE #22908: (karanjad) Add failhard option to salt orchestration | refs: #23389
  - ISSUE #22141: (Deshke) grains.get_or_set_hash render error if hash begins with `\''%'' | refs: #23640
  - PR #23661: (rallytime) Merge #23640 with whitespace fix
  - PR #23640: (cachedout) Add warning to get_or_set_hash about reserved chars | refs: #23661
  - PR #23639: (cachedout) Handle exceptions raised by __virtual__
  - PR #23637: (cachedout) Convert str master to list
  - PR #23606: (twangboy) Fixed checkbox for starting service and actually starting it
  - PR #23595: (rallytime) Backport #23549 to 2014.7
  - PR #23594: (rallytime) Backport #23496 to 2014.7
- PR #23593: (rallytime) Backport #23442 to 2014.7
- PR #23592: (rallytime) Backport #23389 to 2014.7
- PR #23573: (techhat) Scan all available networks for public and private IPs | refs: #23802
- PR #23558: (jfindlay) reorder emerge command line
- PR #23554: (jleroy) Debian: Hostname always updated
- PR #23551: (dr4Ke) grains.append unit tests, related to #23474
- PR #23549: (vr-jack) Update __init__.py | refs: #23595
- PR #23537: (t0rrant) Update changelog
- PR #23530: (dr4Ke) salt-ssh state: fix including all salt:// references
- PR #23496: (martinhoefling) Fix for issue #23110 | refs: #23594
- PR #23474: (dr4Ke) Fix grains.append in nested dictionary grains #23411
- PR #23442: (clan) add directory itself to keep list | refs: #23593
- PR #23440: (dr4Ke) fix grains.append in nested dictionary grains #23411 | refs: #23474
- PR #23433: (twangboy) Obtain all software from the registry
- PR #23389: (cachedout) Correct fail_hard typo | refs: #23592
- e480f13 Merge pull request #23675 from basepi/merge-forward-2015.5
- bd63548 Merge remote-tracking branch `upstream/2014.7' into merge-forward-2015.5
  * 0f006ac Merge pull request #23661 from rallytime/merge-23640
    - 4427f42 Whitespace fix
    - dd91154 Add warning to get_or_set_hash about reserved chars
  * 84e2ef8 Merge pull request #23639 from cachedout/issue_23452
    - d418b49 Syntax error!
    - 45b4015 Handle exceptions raised by __virtual__
  * bd9b94b Merge pull request #23637 from cachedout/issue_23611
    - 56cb1f5 Fix typo
    - f6fcf19 Convert str master to list
  * f20c0e4 Merge pull request #23595 from rallytime/bp-23549
    - 6efcac0 Update __init__.py
  * 1aca86 Merge pull request #23594 from rallytime/bp-23496
    - d5ae1d2 Fix for issue #23110 This resolves issues when the freshly created directory is removed by fileserver.update.
  * 2c221c7 Merge pull request #23593 from rallytime/bp-23442
    - 39869a1 check w/ low['name'] only
    - 304cc49 another fix for file defined w/ id, but require name
    - 8814d41 add directory itself to keep list
  * fadd1ef Merge pull request #23606 from twangboy/fix_installer

18.2. Previous Releases 2587
038331e Fixed checkbox for starting service and actually starting it
  - acdd3fc Fix lint
  - 680e88f Merge remote-tracking branch `upstream/2014.7' into merge-forward-2015.5
    * 10b3f0f Merge pull request #23592 from rallytime/bp-23389
      - 734cc43 Correct fail_hard typo
    * cd34b9b Merge pull request #23573 from techhat/novaquery
      - f92db5e Linting
      - 26e00d3 Scan all available networks for public and private IPs
    * 2a72cd7 Merge pull request #23558 from jfindlay/fix_ebuild
      - 45404fb reorder emerge command line
    * a664a3c Merge pull request #23530 from dr4Ke/fix_salt-ssh_to_include_pkg_sources
      - 5df6a80 fix pylint warning
      - d054e5 salt-ssh state: fix including all salt:// references
    * 55c3869 Merge pull request #23433 from twangboy/list_pkgs_fix
      - 8ab5b1b Fix pylint error
      - 2d11d65 Obtain all software from the registry
    * 755bed0 Merge pull request #23554 from jleroy/debian-hostname-fix
      - 5ff749e Debian: Hostname always updated
    * 6ec87ce Merge pull request #23551 from dr4Ke/grains.append_unit_tests
      - ebf9df fix pylint errors
      - c495404 unit tests for grains.append module function
      - 0c9a323 use MagickMock
      - c838a22 unit tests for grains.append module function
    * e96c5c5 Merge pull request #23474 from dr4Ke/fix_grains.append_nested
      - a01a5bb grains.get, parameter delimititer, versionadded: 2014.7.6
      - b39f504 remove debugging output
      - b6e15c2 fix grains.append in nested dictionary grains #23411
    * ab7e1ae Merge pull request #23537 from t0rrant/patch-1
      - 8e03cc9 Update changelog

  - PR #23669: (rallytime) Backport #23586 to 2015.5 @ 2015-05-13T18:27:11Z
    - PR #23586: (Lothiraldan) Fix salt.state.file._unify_sources_and_hashes when sources is used without sources_hashes | refs: #23669
    - 0dad6be Merge pull request #23669 from rallytime/bp-23586
    - ef4e6ad Remove another unused import
    - 73c5da7 Remove unused import
    - 52b68d6 Use the zip_longest from six module for python 3 compatibility
- 18d5ff9 Fix salt.state.file._unify_sources_and_hashes when sources is used without sources_hashes

- **PR #23662**: (rallytime) Merge #23642 with pylint fix @ 2015-05-13T15:46:51Z
  - **PR #23642**: (cachedout) Let saltmod handle lower-level exceptions gracefully | refs: #23662
  - fabef75 Merge pull request #23662 from rallytime/merge-23642
  - aa7bbd8 Remove unused import
  - 9e6664c Let saltmod handle lower-level exceptions gracefully

- **PR #23622**: (jfindlay) merge #23508 @ 2015-05-13T15:36:49Z
  - **PR #23508**: (cro) Port mysql returner to postgres using jsonb datatype | refs: #23622
  - 072b927 Merge pull request #23622 from jfindlay/pgjsonb
  - 454322c appease pylint's proscription on blank line excess
  - 57c6171 Get time with timezone correct also in job return.
  - e109d0f Get time with timezone correct.
  - 21e06b9 Fix SQL, remove unneeded imports.
  - 653f360 Stop making changes in 2 places.
  - d6daa0 Typo.
  - 7d47bf SSL is handled differently by Pg, so don't set it here.
  - cc7c377 Fill alter_time field in salt_events with current time with timezone.
  - 43defe9 Port mysql module to Postgres using jsonb datatypes

- **PR #23651**: (jayeshka) adding solr unit test case @ 2015-05-13T15:26:15Z
  - c1bdd4d Merge pull request #23651 from jayeshka/solr-unit-test
  - 6e05148 adding solr unit test case

- **PR #23649**: (jayeshka) adding states/libvirt unit test case @ 2015-05-13T15:24:48Z
  - ee43411 Merge pull request #23649 from jayeshka/libvirt_states-unit-test
  - 0fb923a adding states/libvirt unit test case

- **PR #23648**: (jayeshka) adding states/linux_acl unit test case @ 2015-05-13T15:24:11Z
  - c7fc466 Merge pull request #23648 from jayeshka/linux_acl_states-unit-test
  - 3f0ab29 removed error.
  - 11081c1 adding states/linux_acl unit test case

- **PR #23650**: (jayeshka) adding states/kmod unit test case @ 2015-05-13T15:09:18Z
  - 4cba7ba Merge pull request #23650 from jayeshka/kmod_states-unit-test
  - 1987015 adding states/kmod unit test case

- **PR #23633**: (jayeshka) made changes to test_interfaces function. @ 2015-05-13T06:51:07Z
  - bc8fa1 Merge pull request #23633 from jayeshka/win_network-2015.5-unit-test
  - 09361d made changes to test_interfaces function.

- **PR #23619**: (jfindlay) fix kmod.present processing of module loading @ 2015-05-13T01:16:56Z
  - 7df3579 Merge pull request #23619 from jfindlay/fix_kmod_state
- 73facbf fix kmod.present processing of module loading

- **PR #23598**: (rahulhan) Adding states/win_dns_client.py unit tests @ 2015-05-12T21:47:36Z
  - d4f3095 Merge pull request #23598 from rahulhan/states_win_dns_client_unit_test
  - d08d885 Adding states/win_dns_client.py unit tests

- **PR #23597**: (rahulhan) Adding states/vbox_guest.py unit tests @ 2015-05-12T21:46:30Z
  - 811c6a1 Merge pull request #23597 from rahulhan/states_vbox_guest_unit_test
  - 6a2909e Removed errors
  - 4cde78a Adding states/vbox_guest.py unit tests

- **PR #23615**: (rallytime) Backport #23577 to 2015.5 @ 2015-05-12T21:19:11Z
  - **PR #23577**: (msciciel) Fix find and remove functions to pass database param | refs: #23615
  - 029f11 Merge pull request #23615 from rallytime/bp-23577
  - 6f74477 Fix find and remove functions to pass database param

- **PR #23603**: (rahulhan) Adding states/winrepo.py unit tests @ 2015-05-12T18:40:12Z
  - b858953 Merge pull request #23603 from rahulhan/states_winrepo_unit_test
  - a66e7e7 Adding states/winrepo.py unit tests

- **PR #23602**: (rahulhan) Adding states/win_path.py unit tests @ 2015-05-12T18:39:37Z
  - 3cbbd6d Merge pull request #23602 from rahulhan/states_win_path_unit_test
  - 122c29f Adding states/win_path.py unit tests

- **PR #23600**: (rahulhan) Adding states/win_network.py unit tests @ 2015-05-12T18:39:01Z
  - 3c904e8 Merge pull request #23600 from rahulhan/states_win_network_unit_test
  - b418404 removed lint error
  - 1be8023 Adding states/win_network.py unit tests

- **PR #23599**: (rahulhan) Adding win_firewall.py unit tests @ 2015-05-12T18:37:49Z
  - 10243a7 Merge pull request #23599 from rahulhan/states_win_firewall_unit_test
  - 6cda890 Adding win_firewall.py unit tests

- **PR #23601**: (basepi) Add versionadded for jboss module/state @ 2015-05-12T17:22:59Z
  - e73071d Merge pull request #23601 from basepi/jboss.version.added
  - 017e9cf Add versionadded for jboss module/state

- **PR #23469**: (s0undt3ch) Call the windows specific function not the general one @ 2015-05-12T16:47:22Z
  - 9beb7bc Merge pull request #23469 from s0undt3ch/hotfix/call-the-win-func
  - 83e88a3 Call the windows specific function not the general one

- **PR #23583**: (jayeshka) adding states/ipset unit test case @ 2015-05-12T16:31:55Z
  - d2f0975 Merge pull request #23583 from jayeshka/ipset_states-unit-test
  - 4330cf4 adding states/ipset unit test case

- **PR #23582**: (jayeshka) adding states/keyboard unit test case @ 2015-05-12T16:31:17Z
  - 82a47e8 Merge pull request #23582 from jayeshka/keyboard_states-unit-test
- fa94d7a adding states/keyboard unit test case
- **PR #23581**: *(jayeshka)* adding states/layman unit test case @ 2015-05-12T16:30:36Z
  - 77e5b28 Merge pull request #23581 from jayeshka/layman_states-unit-test
  - 297b055 adding states/layman unit test case
- **PR #23580**: *(jayeshka)* adding smf unit test case @ 2015-05-12T16:29:58Z
  - cbe3282 Merge pull request #23580 from jayeshka/smf-unit-test
  - 497191 adding smf unit test case
- **PR #23572**: *(The-Loeki)* Fix regression of #21355 introduced by #21603 @ 2015-05-12T16:28:05Z
  - **ISSUE #21603**: *(ipmb)* ssh_auth.present fails on key without comment | refs: #23572 #23572
  - **PR #21355**: *(The-Loeki)* Fix for comments containing whitespaces
  - 16a3338 Merge pull request #23572 from The-Loeki/ssh_auth_fix
  - d8248dd Fix regression of #21355 introduced by #21603
- **PR #23565**: *(garethgreenaway)* fix to aptpkg module @ 2015-05-12T16:25:46Z
  - **ISSUE #23490**: *(lichtamberg)* salt.modules.aptpkg.upgrade should have default `dist_upgrade=False` | refs: #23565
  - f843f89 Merge pull request #23565 from garethgreenaway/2015_2_aptpkg_upgrade_default_to_upgrade
  - 97ae514 aptpkg.upgrade should default to upgrade instead of dist_upgrade.
- **PR #23550**: *(jfindlay)* additional mock for rh_ip_test test_build_bond @ 2015-05-12T15:17:16Z
  - **ISSUE #23473**: *(terminalmage)* unit.modules.rh_ip_test.RhipTestCase.test_build_bond is not properly mocked | refs: #23550
  - c1157cd Merge pull request #23550 from jfindlay/fix_rh_ip_test
  - e9b9d3f additional mock for rh_ip_test test_build_bond
- **PR #23552**: *(garethgreenaway)* Fix for an issue caused by a previous pull request @ 2015-05-11T21:54:59Z
  - b593328 Merge pull request #23552 from garethgreenaway/2015_5_returner_fix_broken_previous_pr
  - 7d70e2b Passed argumentes in the call _fetch_profile_opts to were in the wrong order
- **PR #23547**: *(slinu3d)* Added AWS v4 signature support for 2015.5 @ 2015-05-11T21:52:24Z
  - d0f9682 Merge pull request #23547 from slinu3d/2015.5
  - f3bdf5b Fixed urlparse and urlencode calls
  - 802dbdb Added AWS v4 signature support for 2015.5
- **PR #23544**: *(basepi)* [2015.5] Merge forward from 2014.7 to 2015.5 @ 2015-05-11T18:02:06Z
  - **ISSUE #23159**: *(aneeshusa)* Unused validator
  - **ISSUE #20518**: *(ekle)* module s3.get does not support eu-central-1 | refs: #23467
  - **ISSUE #563**: *(chutz)* pidfile support for minion and master daemons | refs: #23460 #23461
  - **PR #23538**: *(cro)* Update date in LICENSE file
  - **PR #23505**: *(aneeshusa)* Remove unused ssh config validator. Fixes #23159.
  - **PR #23467**: *(slinu3d)* Added AWS v4 signature support
  - **PR #23460**: *(s0undt3ch)* [2014.7] Update to latest stable bootstrap script v2015.05.07
- **PR #23444**: (techhat) Add create_attach_volume to nova driver
- **PR #23439**: (techhat) Add wait_for_passwd_maxtries variable
- 06c6a1f Merge pull request #23544 from basepi/merge-forward-2015.5
- f8a36bc Merge remote-tracking branch `upstream/2014.7` into merge-forward-2015.5
  * b79fed3 Merge pull request #23538 from cro/licupdate
    · 345efe2 Update date in LICENSE file
  * a123a36 Merge pull request #23505 from aneeshusa/remove-unused-ssh-config-validator
    · 90af167 Remove unused ssh config validator. Fixes #23159.
  * ca2c21a Merge pull request #23467 from slinu3d/2014.7
    · 0b4081d Fixed pylint error at line 363
    · 5be5eb5 Fixed pylink errors
    · e64f374 Fixed lint errors
    · b9d1ac4 Added AWS v4 signature support
  * e6f9eec Merge pull request #23444 from techhat/novacreateattach
    · ebdb7ea Add create_attach_volume to nova driver
  * e331463 Merge pull request #23460 from s0undt3ch/bootstrap-script-2014.7
    · edcd0c4 Update to latest stable bootstrap script v2015.05.07
  * 7a8ce1a Merge pull request #23439 from techhat/maxtries
    · 0ad3ff2 Add wait_for_passwd_maxtries variable

- **PR #23470**: (twangboy) Fixed service.restart for salt-minion @ 2015-05-11T17:54:47Z
  - ISSUE #23426: (twangboy) Can’t restart salt-minion on 64 bit windows (2015.5.0) | refs: #23470
  - aa5b896 Merge pull request #23470 from twangboy/fix_svc_restart
  - b3f284c Fixed tests
  - ad44d79 Fixed service.restart for salt-minion

- **PR #23539**: (rahulhan) Adding states/virtualenv_mod.py unit tests @ 2015-05-11T17:02:31Z
  - 67988b2 Merge pull request #23539 from rahulhan/states_virtualenv_mod_unit_test
  - 750bb07 Adding states/virtualenv_mod.py unit tests

- 6f0cf2e Merge remote-tracking branch `upstream/2015.2` into 2015.5
  - ISSUE #23244: (freimer) Caller not available in reactors | refs: #23245
  - **PR #23509**: (keesbos) Catch the unset (empty/None) environment case
  - **PR #23423**: (cachedout) Remove jid_event from state.orch
  - **PR #23245**: (freimer) Add Caller functionality to reactors.
  - c966196 Merge pull request #23423 from cachedout/remove_jid_event_from_orch
    * f81aab7 Remove jid_event from state.orch
  - 2bb09b7 Merge pull request #23509 from keesbos/Catch_empty_environment
    * 6dedeac Catch the unset (empty/None) environment case

  - f9da6db adding riak unit test case

18.2.25 Salt 2015.5.10 Release Notes

Security Fix

CVE-2016-3176: Insecure configuration of PAM external authentication service

This issue affects all Salt versions prior to 2015.8.8/2015.5.10 when PAM external authentication is enabled. This issue involves passing an alternative PAM authentication service with a command that is sent to LocalClient, enabling the attacker to bypass the configured authentication service. Thank you to Dylan Frese <dmfrese@gmail.com> for bringing this issue to our attention.

This update defines the PAM eAuth service that users authenticate against in the Salt Master configuration. (No additional fixes are contained in this release).

Read Before Upgrading Debian 8 (Jessie) from Salt Versions Earlier than 2015.5.9

Salt systemd service files are missing the following statement in these versions:

```
[Service]
KillMode=process
```

This statement must be added to successfully upgrade on these earlier versions of Salt.

18.2.26 Salt 2015.5.11 Release Notes

Version 2015.5.11 is a bugfix release for 2015.5.0.

Changes for v2015.5.10..v2015.5.11

Extended changelog courtesy of Todd Stansell (https://github.com/tjstansell/salt-changelogs):

Generated at: 2016-05-20T21:02:38Z

Total Merges: 101

Changes:
  - dc8ce2d Fix traceback in logging for config validation (#33386) (#33405)
  - PR #33383: (thatch45) maintain the fallabck because I am totally sick of this crap
  - 755acfb Improve doc clarity for disable_modules documentation (#33379)
  - 2b5ad12 Better YAML syntax error handling (#33375)
  - PR #33372: (jacobhammons) revved 2015.8 branch to .9 in version selector
**55be0ab** Expanded documentation for boto_elb state and module (#33341)

**9b42a05** Added some more docs for master and minion config settings (#33292)

**8acee5e** Fix iptables --match-set (`#23643`_) (#33301)

**75ef2f0** fix `loose` typo (#33290)

**b7d98da** Add auth_tries config option to minion.rst docs (#33287)

**8acee5e** Fix iptables --match-set (`#23643`_) (#33301)

**061851b** Document minion_id_caching config value (#33282)

**8fa72f6** Clarify file.replace MULTILINE flag interaction with regex anchors (#33137)

**4b1f460** update 2015.5.11 release notes (#33236)

**PR #33211**: (cachedout) Don't try to kill a parent proc if we can't

**f868329** Resolve issue with pkg module on Mint Linux (#33205)

**a09e1b6** Add pip installed and removed test (#33178)

**96e3586** update 2015.5.11 release notes (#33197)

**09b072a** Fix file.managed for Windows (#33181)

**30868ab** [2015.5] Update to latest bootstrap script v2016.05.11 (#33185)

**264ad34** Pip fix (#33180)

**43288b2** add 2015.5.11 release notes (#33160)

**e0da8fd** [2015.5] Update to latest bootstrap script v2016.05.10 (#33155)

**PR #33141**: (jtand) Skipping salt-call --local test

**878d34a** Doc mock decorators (#33132)

**30edead** Lower display of msgpack failure msg to debug (#33078)

**d4928c5** Use saltstack repo in buildpackage.py on CentOS 5 (#33080)

**61d126c** add test for installing package while using salt-call --local (#33025)

**6d3e4e8** File and User test fixes for 2015.5 on Fedora23 (#33055)

**d48b2b8** test pillar.items output (#33060)

**398793b** Fix minor document error of test.assertion (#33067)

**f875763** Saltfile with pillar tests (#33045)

**1d78924** Backport #33021 manually to 2015.5 (#33044)

**f00b5f9** Add run_on_start docs to schedule.rst (#32958)

**edce22a** backport PR #32732 to 2015.5 fixes `#23714`_ (#32848)

**9b5c14c** salt-cloud -u downloads stable version from bootstrap.saltstack.com by default (#32837)

**9725804** update bootstrap to 2016.04.18 release (#32667)

**PR #32776**: (rallytime) [2015.5] Merge forward from 2014.7 to 2015.5

**67d0c81** Support remote sources in a source list (#32691)

**PR #32686**: (cachedout) Fix stacktrace in batch with dup minion ids

**3ec9502** Update ``Low Hanging Fruit`` to ``Help Wanted`` (#32675)

**77bea56** Additional documentation on calling exec modules from templates (#32657)
• c910b8d Fixing critical bug to remove only the specified Host instead of the entire Host cluster (#32639)
• 4568565 Add _syspaths.py to .gitignore (#32638)
• PR #32561: (gtmanfred) redact passwords and hashes from user.present updates
• PR #32538: (rallytime) Back-port #32528 to 2015.5
• 29333e5 Add documentation for some master/minion configs (#32454)
• PR #32458: (terminalmage) Improve and clarify docs on provider overrides.
• 0809126 Merge #32293 with test fixes (#32418)
• bbd8260 Ignore Raspbian in service.py __virtual__ (#32421)
• 690addf FreeBSD supports packages in format java/openjdk7 so the prior commit broke that functionality. Check freebsd/pkg`#1409`_ for more info.
• PR #32399: (amontalban) Backport to fix `#28262`_ for 2015.5 as requested in PR #32376
• PR #32374: (cachedout) Update proxmox documentation
• PR #32339: (Ch3LL) remove reference to master_alive_check in 2015.5
• PR #32284: (rallytime) Audit config.py default types and values
• PR #32302: (terminalmage) Properly support packages with blank `Release` param in pkg.latest_version
• PR #32162: (terminalmage) Properly handle yum/zypper repositories in pkgrepo.managed
• PR #32223: (twangboy) Create minion.d directory on install for Windows
• PR #3218: (cachedout) Only display error when tty is True in salt-ssh
• PR #32196: (jtand) Fixed pylint error in app_pam_test.py
• PR #32154: (Ch3LL) Add integration tests for salt-api using pam eauth
• PR #32170: (gtmanfred) add name for lxc for use with cloud cache
• PR #32164: (terminalmage) Make __virtual__ for rhservice.py more robust (2015.5 branch)
• PR #32141: (paclat) fixes 32108
• PR #32129: (terminalmage) Support multiple valid option types when performing type checks
• PR #32056: (bstevenson) Fix list absent
• PR #32096: (rallytime) Back-port #32065 to 2015.5
• PR #32104: (jacobhammons) One additional known issue for 2015.5.10 release notes
• PR #32100: (jacobhammons) 2015.5.10 release docs
• PR #32038: (terminalmage) Improve state module docs, replace references to state.highstate/state.sls with state.apply
• PR #32051: (terminalmage) Fix outputter for state.apply
• PR #32002: (abednarik) Added Manajro Linux to virtual.
• PR #31957: (rallytime) [2015.5] Merge forward from 2014.7 to 2015.5
• PR #31972: (terminalmage) Make lack of python-ldap module more explicit when LDAP eauth is enabled
• PR #31935: (twangboy) Back port nullsoft build script from 2015.8
• PR #31912: (jfindlay) log.mixins: remove extermporaneous .record
• PR #31825: (jtand) Updated .testing.pylintrc to match newer versions of pylintrc
• PR #31900: (rallytime) Add `python module` clarification to ps__virtual__ warning.
• PR #31878: (rallytime) Make sure __virtual__ error message is helpful when psutil is missing
• PR #31852: (rallytime) [2015.5] Merge forward from 2014.7 to 2015.5
• PR #31827: (gtmanfred) Remove ability of authenticating user to specify pam service
• PR #31810: (whiteinge) Fix outdated Jinja `env' variable reference
• PR #31744: (brejoc) Fix for AttributeError with libcloud <0.15
• PR #31740: (terminalmage) Assume pillar_opts is False when not specified in masterless mode
• PR #31750: (rallytime) Back-port #26170 to 2015.5
• PR #31689: (rallytime) Back-port #29467 to 2015.5
• PR #31687: (cachedout) Removed useless GPG tests
• PR #31660: (terminalmage) Remove epoch from version string if present when installing with yum
• PR #31683: (rallytime) Back-port #31578 to 2015.5
• PR #31658: (cachedout) Add definition of job cache to glossary
• PR #31658: (rallytime) Add mentioned of Salt's Coding Style docs to the Contributing docs
• PR #31655: (rallytime) Make note of pylint dependencies in docs
• PR #31440: (cachedout) Set correct type for master_tops config value
• PR #31622: (jfindlay) doc/topics/tutorials/http: update query decoding docs
• PR #31558: (cachedout) Don't stacktrace if ssh binary is not installed with salt-ssh
• PR #31521: (terminalmage) salt-ssh: Fix race condition when caching files to build the thin tarball
• PR #31497: (rallytime) Remove duplicate `timeout` definition in Roster docs
• PR #31472: (rallytime) Update contributing docs
• PR #31461: (DmitryKuzmenko) Set auth retry count to 0 if multimaster mode is failover.
• PR #31442: (sastorsl) Add os.path.exists(src) to file.py, def copy
• PR #31441: (cachedout) Include localhost minions in presence detection for runner
• PR #31416: (carlwgeorge) selinux module documentation fix
• PR #31336: (terminalmage) Improve config validation logging
• PR #31374: (sjorge) fix for `#31369`
• PR #31339: (jacobhammons) changed latest release to 2015.8.7
• PR #31288: (notpeter) Improve salt.states.ssh_known_hosts documentation.
• PR #31183: (heyfife) Fixed named external_ip reservation/re-use code in gce driver.
• PR #31032: (terminalmage) (2015.5 branch) yumpkg: ensure that dnf-plugins-core >= 0.1.15 is installed
• PR #31264: (sjorge) fix if_missing gets appended to dirs list, take III
• PR #31110: (cachedout) Fixup 30730
• PR #30974: (rallytime) Back-port #30949 to 2015.5
• PR #30942: (rallytime) Back-port #30897 to 2015.5
• PR #30922: (jacobhammons) Rev latest version to 2015.8.5
• PR #30865: (abednarik) Better boto elb error message.
• PR #30831: (jacobhammons) Updated readme
• PR #30829: (jacobhammons) Updated latest version to 2015.8.4
• PR #30784: (rallytime) Back-port #24952 to 2015.5
• PR #30764: (terminalmage) Work around yum versionlock's inability to remove holds by package name alone
• PR #30760: (toanja) Changed output format of arp_ip_target from list to comma delimited...
• PR #30757: (yannis666) Fix to mine update to merge configuration
• PR #30749: (abednarik) Fix Network hostname Module in Debian systems.
• PR #30699: (abednarik) Add Retry to save_load.
• PR #30659: (sjmh) Fix lsscsi issues for certain platforms
• PR #30671: (techhat) Add file locking to cloud index
• PR #30586: (abednarik) Fix comment_line permissions.
• PR #30582: (terminalmage) yumpkg.check_db: run separate repoquery commands when multiple names passed
• PR #30548: (jacobhammons) Added placeholder release notes for 2015.5.10
• PR #30530: (terminalmage) 2015.5 tweaks from #30529
• PR #30484: (terminalmage) Backport DNF support to 2015.5 branch
• PR #30512: (jfindlay) disable pkgrepo test for ubuntu 15.10+
• PR #30478: (jtand) Updated pip_state to work with pip 8.0
• PR #30482: (borgstrom) Pyobjects recursive import support (for 2015.5)
• PR #30459: (jfindlay) modules.pkg: disable repo int test for ubuntu 15.10
• PR #30443: (jtand) Boto uses False for is_default instead of None
• PR #30420: (attiasr) Backport #26853
• PR #30364: (rallytime) Add TLS version imports and add linode driver documentation notices
• PR #30184: (rallytime) Back-port #30166 to 2015.5
• PR #30291: (thegoodduke) ipset: fix test=true & add comment for every entry

18.2.27 Salt 2015.5.2 Release Notes

release 2015-06-10

Version 2015.5.2 is a bugfix release for 2015.5.0.

Extended Changelog Courtesy of Todd Stansell (https://github.com/tjstansell/salt-changelogs):

PR #24346: (rallytime) Backport #24271 to 2015.5 @ 2015-06-03T18:44:31Z

PR #24271: (randybias) Fixed the setup instructions

refs: #24346
- 76927c9 Merge pull request #24346 from rallytime/bp-24271
- 04067b6 Fixed the setup instructions
PR #24345: (rallytime) Backport #24013 to 2015.5 @ 2015-06-03T18:39:41Z

ISSUE #24012: (jbq) Enabling a service does not create the appropriate rc.d symlinks on Ubuntu
refs: #24013

PR #24013: (jbq) Fix enabling a service on Ubuntu #24012
refs: #24345

- 4afa03d Merge pull request #24345 from rallytime/bp-24013
- 16e0732 Fix enabling a service on Ubuntu #24012

PR #24365: (jacobhammons) Fixes for PDF build errors @ 2015-06-03T17:50:02Z

- c3392c2 Merge pull request #24365 from jacobhammons/DocFixes
- 0fc1902 Fixes for PDF build errors

PR #24313: (nicholascapo) Fix #22991 Correctly set result when test=True @ 2015-06-03T14:49:18Z

ISSUE #22991: (nicholascapo) npm.installed ignores test=True * ae681a4 Merge pull request #24313 from nicholascapo/fix-22991-npm.installed-test-true * ac9644c Fix #22991 npm.installed correctly set result on test=True

PR #24312: (nicholascapo) Fix #18966: file.serialize supports test=True @ 2015-06-03T14:49:06Z

ISSUE #18966: (bechtold) file.serialize ignores test=True * d57a9a2 Merge pull request #24312 from nicholascapo/fix-18966-file.serialize-test-true * e7328e7 Fix #18966 file.serialize correctly set result on test=True

PR #24302: (jfindlay) fix pkg hold/unhold integration test @ 2015-06-03T03:27:43Z

- 6b694e3 Merge pull request #24302 from jfindlay/pkg_tests
- c2db0b1 fix pkg hold/unhold integration test

PR #24349: (rallytime) Remove references to mount_points in ec2 docs @ 2015-06-03T01:54:09Z

ISSUE #14021: (mathrawka) EC2 doc mentions mount_points, but unable to use properly
refs: #24349

- aca8447 Merge pull request #24349 from rallytime/fix-14021
- a23b511 Remove references to mount_points in ec2 docs

PR #24328: (dr4Ke) Fix state grains silently fails 2015.5 @ 2015-06-02T15:18:46Z

ISSUE #24319: (dr4Ke) grains state shouldn’t fail silently * 88a997e Merge pull request #24328 from dr4Ke/fix_state_grains_silently_fails_2015.5 * 8a63d1e fix state grains silently fails #24319

- ca1af20 grains state: add some tests

PR #24310: (techhat) Add warning about destroying maps @ 2015-06-02T03:01:28Z

ISSUE #24036: (arthurlogilab) [salt-cloud] Protect against passing command line arguments as names for the --destroy command
refs: #24310

ISSUE #9772: (s0undt3ch) Delete VM’s in a map does not delete them all
refs: #24310

- 7dcd9bb Merge pull request #24310 from techhat/mapwarning
- ca535a6 Add warning about destroying maps

PR #24281: (steverweber) Ipmi docfix @ 2015-06-01T17:45:36Z
- 02bb25 Merge pull request #24281 from steverweber/ipmi_docfix
- dd36f2c yaml formatting
- f6deef3 include api_kg kwarg in ipmi state
- a7d4e97 doc cleanup
- 0ded2fd save more cleanup to doc
- 08872f2 fix name api_key to api_kg
- 165a387 doc fix add api_kg kwargs
- 1ec7888 cleanup docs

PR #24287: (jfindlay) fix pkg test on ubuntu 12.04 for realz @ 2015-06-01T14:16:37Z
- 73cd2cb Merge pull request #24287 from jfindlay/pkg_test
- 98944d8 fix pkg test on ubuntu 12.04 for realz

PR #24279: (rallytime) Backport #24263 to 2015.5 @ 2015-06-01T04:29:34Z

PR #24263: (cdarwin) Correct usage of import_yaml in formula documentation
refs: #24279
- 02017a0 Merge pull request #24279 from rallytime/bp-24263
- beff7c7 Correct usage of import_yaml in formula documentation

PR #24277: (rallytime) Put a space between after_jump commands @ 2015-06-01T04:28:26Z

ISSUE #24226: (c4urself) iptables state needs to keep ordering of flags
refs: #24277
- 2ba696d Merge pull request #24277 from rallytime/fix_iptables_jump
- e2d1606 Move after_jump split out of loop
- d14f130 Remove extra loop
- 42ed532 Put a space between after_jump commands

PR #24262: (basepi) More dictupdate after #24142 @ 2015-05-31T04:09:37Z

PR #24142: (basepi) Optimize dictupdate.update and add #24097 functionality
refs: #24262

PR #24097: (kiorky) Optimize dictupdate
refs: #24142 #24142
- 113eba3 Merge pull request #24262 from basepi/dictupdatefix
- 0c4832c Raise a typeerror if non-dict types
- be21aaa Pylint
- bb8a6c6 More optimization
- c933249 py3 compat
- ff6b2a7 Further optimize dictupdate.update()
- c73f5ba Remove unused valtype

PR #24269: (kiorky) zfs: Fix spurious retcode hijacking in virtual @ 2015-05-30T17:47:49Z
• 785d5a1 Merge pull request #24269 from makinacorpus/zfs
• 0bf23ce zfs: Fix spurious retcode hijacking in virtual

PR #24257: (jfindlay) fix pkg mod integration test on ubuntu 12.04  @ 2015-05-29T23:09:00Z
• 3d885c0 Merge pull request #24257 from jfindlay/pkg_tests
• 9508924 fix pkg mod integration test on ubuntu 12.04

PR #24260: (basepi) Fix some typos from #24080  @ 2015-05-29T22:54:58Z

ISSUE #23657: (arthurlogilab) [salt-cloud lxc] NameError: global name '__salt__' is not defined
refs: #24080 #23982

PR #24080: (kiorky) Lxc consistency2
refs: #24260 #23982 #24066

PR #24066: (kiorky) Merge forward 2015.5 -> develop
refs: #23982

PR #24065: (kiorky) continue to fix #23883
refs: #24080 #24066

PR #23982: (kiorky) lxc: path support
refs: #24080
• 08a1075 Merge pull request #24260 from basepi/lxctypos24080
• 0fa1ad3 Fix another lxc typo
• 669938f s/you ll/you'll/

PR #24080: (kiorky) Lxc consistency2
refs: #24260 #23982 #24066
@ 2015-05-29T22:51:54Z

ISSUE #23657: (arthurlogilab) [salt-cloud lxc] NameError: global name '__salt__' is not defined
refs: #24080 #23982

PR #24066: (kiorky) Merge forward 2015.5 -> develop
refs: #23982

PR #24065: (kiorky) continue to fix #23883
refs: #24080 #24066

PR #23982: (kiorky) lxc: path support
refs: #24080
• 75590cf Merge pull request #24080 from makinacorpus/lxc_consistency2
• 81f8067 lxc: fix old lxc test
• 458f506 seed: lint
• 96b8d55 Fix seed.mkconfig yamldump
• 76db6e6 lxc/applynet: conservative
• ce7096f variable collision
• 8a8b28d lxc: lint
• 458b18b more lxc docs
• ef1f952 lxc docs: typos
• d67a43d more lxc docs
• 608da5e modules/lxc: merge resolution
• 27c4689 modules/lxc: more consistent comparison
• 07c365a lxc: merge conflict spotted
• 9993915 modules/lxc: rework settings for consistency
• ce11d83 lxc: Global doc refresh
• 61ed2f5 clouds/lxc: profile key is conflicting

PR #24247: (rallytime) Backport #24220 to 2015.5 @ 2015-05-29T21:40:01Z

ISSUE #24210: (damonnk) salt-cloud vsphere.py should allow key_filename param
refs: #24220

PR #24220: (djcrabhat) adding key_filename param to vsphere provider
refs: #24247
• da14f3b Merge pull request #24247 from rallytime/bp-24220
• 0b1041d adding key_filename param to vsphere provider

PR #24254: (rallytime) Add deprecation warning to Digital Ocean v1 Driver @ 2015-05-29T21:39:25Z

PR #22731: (dmyerscough) Decommission DigitalOcean APIv1 and have users use the new DigitalOcean APIv2

refs: #24254
• 21d6126 Merge pull request #24254 from rallytime/add_deprecation_warning_digitalocean
• 0ad617d Updated suse spec to 2015.5.1

PR #24252: (aboe76) Updated suse spec to 2015.5.1 @ 2015-05-29T21:38:45Z
• dac055d Merge pull request #24252 from aboe76/opensuse_package
• 0ad617d Updated suse spec to 2015.5.1

PR #24251: (garethgreenaway) Returners broken in 2015.5 @ 2015-05-29T21:37:52Z
• 49e7fe8 Merge pull request #24251 from garethgreenaway/2015_5_returner_brokenness
• 5df6b52 The code calling cfg as a function vs treating it as a dictionary and using get is currently back-
wards causing returners to fail when used from the CLI and in scheduled jobs.

PR #24255: (rallytime) Clarify digital ocean documentation and mention v1 driver deprecation @ 2015-05-
29T21:37:07Z

ISSUE #21498: (rallytime) Clarify Digital Ocean Documentation
refs: #24255
• bf99461 Merge pull request #24255 from rallytime/clarify_digital_ocean_driver_docs
• 8d51f75 Clarify digital ocean documentation and mention v1 driver deprecation

18.2. Previous Releases
PR #24232: ([rallytime](#)) Backport #23308 to 2015.5 @ 2015-05-29T21:36:46Z

PR #23308: ([thusoy](#)) Don't merge: Add missing jump arguments to iptables module
refs: #24232
- 41f5756 Merge pull request #24232 from rallytime/bp-23308
- 2733f66 Import string
- 9097ca Add missing jump arguments to iptables module

PR #24245: ([Sacro](#)) Unset PYTHONHOME when starting the service @ 2015-05-29T20:00:31Z

- a95982c Merge pull request #24245 from Sacro/patch-2
- 6632d06 Unset PYTHONHOME when starting the service

PR #24121: ([hvnsweeting](#)) deprecate setting user permission in rabbitmq_vhost.present @ 2015-05-29T15:55:40Z

- 1504c76 Merge pull request #24121 from hvnsweeting/rabbitmq-host-deprecate-set-permission
- 2223158 deprecate setting user permission in rabbitmq_host.present

PR #24179: ([merll](#)) Changing user and group only possible for existing ids. @ 2015-05-29T15:52:43Z

PR #24169: ([merll](#)) Changing user and group only possible for existing ids.
refs: #24179
- ba02f65 Merge pull request #24179 from Precis/fix-file-uid-gid-2015.0
- ee4c9d5 Use ids if user or group is not present.

PR #24229: ([msteed](#)) Fix auth failure on syndic with external_auth @ 2015-05-29T15:04:06Z

ISSUE #24147: ([paclat](#)) Syndication issues when using authentication on master of masters.
refs: #24229
- 9bf0066 Merge pull request #24229 from msteed/issue-24147
- 482d1cf Fix auth failure on syndic with external_auth

PR #24234: ([jayeshka](#)) adding states/quota unit test case. @ 2015-05-29T14:14:27Z

- 19fa43c Merge pull request #24234 from jayeshka/quota-states-unit-test
- c233565 adding states/quota unit test case.

PR #24217: ([jfindlay](#)) disable intermittently failing tests @ 2015-05-29T03:08:39Z

ISSUE #40: ([thatch45](#)) Clean up timeouts
refs: #22857

PR #23623: ([jfindlay](#)) Fix /jobs endpoint’s return
refs: #24217

PR #22857: ([jacksontj](#)) Fix /jobs endpoint’s return
refs: #23623
- e15142c Merge pull request #24217 from jfindlay/disable_bad_tests
- 6b62804 disable intermittently failing tests

PR #24199: ([ryan-lane](#)) Various fixes for boto_route53 and boto_elb @ 2015-05-29T03:02:41Z
• ce8e43b Merge pull request #24199 from lyft/route53-fix-elb
• d8dc9a7 Better unit tests for boto_elb state
• 62f214b Remove cnames_present test
• 7b9ae82 Lint fix
• b74b0d1 Various fixes for boto_route53 and boto_elb

PR #24142: (basepi) Optimize dictupdate.update and add #24097 functionality
refs: #24262
@ 2015-05-29T03:00:56Z

PR #24097: (kiorky) Optimize dictupdate
refs: #24142 #24142

PR #21968: (ryanwohara) Verifying the key has a value before using it. * a43465d Merge pull request #24142 from basepi/dictupdate24097 * 5c6e210 Deepcopy on merge_recurse
• a13c84a Fix None check from #21968
• 9ef2c64 Add docstring
• 8579429 Add in recursive_update from #24097
• 8599143 if key not in dest, don’t recurse
• d8a8b3 Rename klass to valtype

PR #24208: (jayeshka) adding states/port test case. @ 2015-05-28T23:06:33Z
• 526698b Merge pull request #24208 from jayeshka/ports-states-unit-test
• 657b709 adding states/port test case.

PR #24219: (jfindlay) find zfs without modinfo @ 2015-05-28T21:07:26Z

ISSUE #20635: (dennisjac) 2015.2.0rc1: zfs errors in log after update
refs: #24219
• d00945f Merge pull request #24219 from jfindlay/zfs_check
• 15d4019 use the salt loader in the zfs mod
• 5599b67 try to search for zfs if modinfo is unavailable

PR #24190: (msteed) Fix issue 23815 @ 2015-05-28T20:10:34Z

ISSUE #23815: (Snergster) [beacons] inotify errors on subdir creation * 3dc4b85 Merge pull request #24190 from msteed/issue-23815 * 086a1a9 lint
• 65de62f fix #23815
• d04e916 spelling
• db9f682 add inotify beacon unit tests

PR #24211: (rallytime) Backport #24205 to 2015.5 @ 2015-05-28T18:28:15Z

PR #24205: (hazelesque) Docstring fix in salt.modules.yumpkg.hold
refs: #24211
• 436634b Merge pull request #24211 from rallytime/bp-24205
• 23284b5 Docstring fix in salt.modules.yumpkg.hold
PR #24212: (terminalmage) Clarify error in rendering template for top file @ 2015-05-28T18:26:20Z
   • cc58624 Merge pull request #24212 from terminalmage/clarify-error-msg
   • ca807fb Clarify error in rendering template for top file
PR #24213: (The-Loeki) ShouldFix _- troubles in debian_ip @ 2015-05-28T18:24:39Z
   ISSUE #23904: (mbrgm) Network config bonding section cannot be parsed when attribute names use dashes

   refs: #23917

   ISSUE #23900: (hashi825) salt ubuntu network building issue 2015.5.0
   refs: #23922

PR #23922: (garethgreenaway) Fixes to debian_ip.py

   refs: #24213

PR #23917: (corywright) Split debian bonding options on dash instead of underscore

   refs: #24213
   • 9825160 Merge pull request #24213 from The-Loeki/patch-3
   • a68d515 ShouldFix _- troubles in debian_ip

PR #24214: (basepi) 2015.5.1release @ 2015-05-28T16:23:57Z
   • 071751d Merge pull request #24214 from basepi/2015.5.1release
   • e5ba31b 2015.5.1 release date
   • 768494c Update latest release in docs

PR #24202: (rallytime) Backport #24186 to 2015.5 @ 2015-05-28T05:16:48Z

PR #24186: (thcipriani) Update salt vagrant provisioner info

   refs: #24202
   • c2f1fb9 Merge pull request #24202 from rallytime/bp-24186
   • db793dd Update salt vagrant provisioner info

PR #24192: (rallytime) Backport #20474 to 2015.5 @ 2015-05-28T05:16:18Z

PR #20474: (djcrabhat) add sudo, sudo_password params to vsphere deploy to allow for non-root deploys

   refs: #24192
   • 8a085a2 Merge pull request #24192 from rallytime/bp-20474
   • fd3c783 add sudo, sudo_password params to deploy to allow for non-root deploys

PR #24184: (rallytime) Backport #24129 to 2015.5 @ 2015-05-28T05:15:08Z

PR #24129: (pengyao) Wheel client doc

   refs: #24184
   • 7cc535b Merge pull request #24184 from rallytime/bp-24129
   • 722a662 fixed a typo
   • 565eb46 Add cmd doc for WheelClient

PR #24183: (rallytime) Backport #19320 to 2015.5 @ 2015-05-28T05:14:36Z
PR #19320: (clan) add `state_output_profile' option for profile output
refs: #24183
• eb0af70 Merge pull request #24183 from rallytime/bp-19320
• 55db1bf state_output_profile default to True
• 9919227 fix type: statei -&gt; state
• 0549ca6 add `state_output_profile' option for profile output

PR #24201: (whiteinge) Add list of client libraries for the rest_cherrypy module to the top-level documentation
@ 2015-05-28T02:12:09Z
• 1b5bf23 Merge pull request #24201 from whiteinge/rest_cherrypy-client-libs
• 5f71802 Add list of client libraries for the rest_cherrypy module
• 28fc77f Fix rest_cherrypy config example indentation

PR #24195: (rallytime) Merge #24185 with a couple of fixes  @ 2015-05-27T22:18:37Z
PR #24185: (jacobhammons) Fixes for doc build errors
refs: #24195
• 3307ec2 Merge pull request #24195 from rallytime/merge-24185
• d8daa9d Merge #24185 with a couple of fixes
• 634d56b Fixed pylon error
• 0689815 Fixes for doc build errors

PR #24166: (jayeshka) adding states/pkgng unit test case.  @ 2015-05-27T20:27:49Z
• 7e400bc Merge pull request #24166 from jayeshka/pkgng-states-unit-test
• 2234bb0 adding states/pkgng unit test case.

PR #24189: (basepi) [2015.5] Merge forward from 2014.7 to 2015.5 @ 2015-05-27T20:26:31Z
PR #24178: (rallytime) Backport #24118 to 2014.7, too.  PR #24159: (rallytime) Fill out modules/keystone.py CLI Examples PR #24158: (rallytime) Fix test_valid_docs test for tls module PR #24118: (trevor-h) removed deprecated pymongo usage
refs: #24139 #24178
• 9fcda79 Merge pull request #24189 from basepi/merge-forward-2015.5
• 8839e9c Merge remote-tracking branch `upstream/2014.7' into merge-forward-2015.5
• 9d7331c Merge pull request #24178 from rallytime/bp-24118
  – e2217a0 removed deprecated pymongo usage as no longer functional with pymongo &gt; 3.x
• 4e8c503 Merge pull request #24159 from rallytime/keystone_doc_examples
  – dadac8d Fill out modules/keystone.py CLI Examples
• fc10ee8 Merge pull request #24158 from rallytime/fixed_doc_error
  – 49a517e Fix test_valid_docs test for tls module

PR #24181: (jtand) Fixed error where file was evaluated as a symlink in test_absent @ 2015-05-27T18:26:28Z
• 2303dec Merge pull request #24181 from jtand/file_test
• 5f0e601 Fixed error where file was evaluated as a symlink in test_absent
PR #24180: (terminalmage) Skip libvirt tests if not running as root  @ 2015-05-27T18:18:47Z
- a162768 Merge pull request #24180 from terminalmage/fix-libvirt-test
- 72e7416 Skip libvirt tests if not running as root

PR #24165: (jayeshka) adding states/portage_config unit test case.  @ 2015-05-27T17:15:08Z
- 1fbce5b2 Merge pull request #24165 from jayeshka/portage_config-states-unit-test
- 8c1f1505 adding states/portage_config unit test case.

PR #24164: (jayeshka) adding states/pecl unit test case.  @ 2015-05-27T14:26Z
- 4747856 Merge pull request #24164 from jayeshka/pecl-states-unit-test
- 563a5b3 adding states/pecl unit test case.

PR #24160: (The-Loeki) small enhancement to data module; pop()  @ 2015-05-27T13:10Z
- cdaaa19 Merge pull request #24160 from The-Loeki/patch-1
- 2175ff3 doc & merge fix
- eba382c small enhancement to data module; pop()

PR #24153: (techhat) Batch mode sometimes improperly builds lists of minions to process  @ 2015-05-27T12:53Z
- 4a8d7c7 Merge pull request #24153 from techhat/batchlist
- 467ba64 Make sure that minion IDs are strings

PR #24167: (jayeshka) adding states/pagerduty unit test case.  @ 2015-05-27T11:01Z
- ed8ccf5 Merge pull request #24167 from jayeshka/pagerduty-states-unit-test
- 1af8c83 adding states/pagerduty unit test case.

PR #24156: (basepi) [2015.5] Merge forward from 2014.7 to 2015.5  @ 2015-05-27T10:05Z

ISSUE #23464: (tibold) cmd_iter_no_block() blocks
refs: #24093

PR #24125: (hvnsweeting) Fix rabbitmq test mode PR #24093: (msteed) Make LocalClient.cmd_iter_no_block() not block PR #24008: (davidjb) Correct reST formatting for states.cmd documentation PR #23933: (jacobham-mons) sphinx saltstack2 doc theme * b9507d1 Merge pull request #24156 from basepi/merge-forward-2015.5 * e52b5ab Remove stray >>>>>>;
- 7dfb92 Merge remote-tracking branch `upstream/2014.7` into merge-forward-2015.5
  - c0d32e0 Merge pull request #24125 from hvnsweeting/fix-rabbitmq-test-mode
    * 71862c6 enhance log
    * 28e2594 change according to new output of rabbitmq module functions
    * cd0212e processes and returns better output for rabbitmq module
  - 39a8f30 Merge pull request #24093 from msteed/issue-23464
    * fd3590d Fix failing test
    * 41b344c Make LocalClient.cmd_iter_no_block() not block
  - 5b8d30 Merge pull request #24008 from davidjb/2014.7
    * 8b8d029 Correct reST formatting for documentation
PR #24145: (jfindlay) attempt to decode win update package  @ 2015-05-26T23:20:20Z

ISSUE #24102: (bormotov) win_update encondig problems
 refs: #24145
 • 05745fa Merge pull request #24145 from jfindlay/win_update_encoding
 • cc5e17e attempt to decode win update package

PR #24123: (kiorky) fix service enable/disable change  @ 2015-05-26T24:19Z

ISSUE #24122: (kiorky) service.dead is no more stateful: services does not handle correctly enable/disable change state
 refs: #24123
 • 7024789 Merge pull request #24123 from makinacorpus/ss
 • 2e2e1d2 fix service enable/disable change

PR #24146: (rallytime) Fixes the boto_vpc_test failure on CentOS 5 tests  @ 2015-05-26T20:15:19Z

 • 51c3ec Merge pull request #24146 from rallytime/fix_centos_boto_failure
 • ac0f97d Fixes the boto_vpc_test failure on CentOS 5 tests

PR #24144: (twangboy) Compare Keys ignores all newlines and carriage returns  @ 2015-05-26T19:25:48Z

ISSUE #24052: (twangboy) v2015.5.1 Changes the way it interprets the minion_master.pub file
 refs: #24089 #24144

ISSUE #23566: (rks2286) Salt-cp corrupting the file after transfer to minion
 refs: #24144 #23740

PR #23740: (jfindlay) Binary write
 refs: #24144
 • 1c91a21 Merge pull request #24144 from twangboy/fix_24052
 • c197b41 Compare Keys removing all newlines and carriage returns

PR #24139: (rallytime) Backport #24118 to 2015.5  @ 2015-05-26T18:24:27Z

PR #24118: (trevor-h) removed deprecated pymongo usage
 refs: #24139 #24178
 • 0841667 Merge pull request #24139 from rallytime/bp-24118
 • 45bb519b removed deprecated pymongo usage as no longer functional with pymongo > 3.x

PR #24138: (rallytime) Backport #24116 to 2015.5  @ 2015-05-26T18:23:51Z

PR #24116: (awdrius) Fixed typo in chown username (ending dot) that fails the command.
 refs: #24138
742eca2 Merge pull request #24138 from rallytime/bp-24116
7f08641 Fixed typo in chown username (ending dot) that fails the command.

PR #24137: (rallytime) Backport #24105 to 2015.5 @ 2015-05-26T18:23:40Z
PR #24105: (cedwards) Updated some beacon-specific documentation formatting
  refs: #24137
  • e01536d Merge pull request #24137 from rallytime/bp-24105
  • f0778a0 Updated some beacon-specific documentation formatting

PR #24136: (rallytime) Backport #24104 to 2015.5 @ 2015-05-26T15:58:47Z
  ISSUE #23364: (pruiz) Unable to destroy host using proxmox cloud: There was an error destroying machines: 501 Server Error: Method 'DELETE /nodes/pmx1/openvz/openvz/100' not implemented PR #24104: (pruiz) Only try to stop a VM if it’s not already stopped. (fixes #23364)
  refs: #24136
  • 89cfdf9 Merge pull request #24136 from rallytime/bp-24104
  • c538884 Only try to stop a VM if it’s not already stopped. (fixes #23364)

PR #24135: (rallytime) Backport #24083 to 2015.5 @ 2015-05-26T15:58:27Z
PR #24083: (swdream) fix code block syntax
  refs: #24135
  • 67c4373 Merge pull request #24135 from rallytime/bp-24083
  • e1d06f9 fix code block syntax

PR #24131: (jayeshka) adding states/mysql_user unit test case @ 2015-05-26T15:58:10Z
  • a83371e Merge pull request #24131 from jayeshka/mysql_user-states-unit-test
  • ed1ef69 adding states/mysql_user unit test case

PR #24130: (jayeshka) adding states/ntp unit test case @ 2015-05-26T15:57:29Z
  • 1dc1d2a Merge pull request #24130 from jayeshka/ntp-states-unit-test
  • ede4a9f adding states/ntp unit test case

PR #24128: (jayeshka) adding states/openstack_config unit test case @ 2015-05-26T15:56:08Z
  • 3943417 Merge pull request #24128 from jayeshka/openstack_config-states-unit-test
  • ca09e0f adding states/openstack_config unit test case

PR #24127: (jayeshka) adding states/npm unit test case @ 2015-05-26T15:55:18Z
  • 23f25c4 Merge pull request #24127 from jayeshka/npm-states-unit-test
  • c3ecabb adding states/npm unit test case

PR #24077: (anlutro) Change how state_verbose output is filtered @ 2015-05-26T15:41:11Z
  ISSUE #24009: (hvnsweeting) state_verbose False summary is wrong
  refs: #24077
  • 07488a4 Merge pull request #24077 from alprs/fix-outputter_highstate_nonverbose_count
  • 7790408 Change how state_verbose output is filtered

PR #24119: (jfindlay) Update contrib docs @ 2015-05-26T15:37:01Z
• 224820f Merge pull request #24119 from jfindlay/update_contrib_docs
• fa2d411 update example release branch in contrib docs
• a0b76b5 clarify git rebase instructions
• 3517e00 fix contribution docs link typos
• 651629c backport dev contrib doc updates to 2015.5

PR #23928: *joejulian* Add the ability to replace existing certificates @ 2015-05-25T19:47:26Z
• 5488c4a Merge pull request #23928 from joejulian/2015.5_tls_module_replace_existing
• 4a4cbdd Add the ability to replace existing certificates

PR #24078: *jfindlay* if a charmap is not supplied, set it to the codeset @ 2015-05-25T19:39:19Z

ISSUE #23221: *(Reiner030)* Debian Jessie: locale.present not working again
refs: #24078
• dd90ef0 Merge pull request #24078 from jfindlay/locale_charmap
• 5eb97f0 if a charmap is not supplied, set it to the codeset

PR #24088: *jfindlay* pkg module integration tests @ 2015-05-25T19:39:02Z
• 9ceef63 Merge pull request #24088 from jfindlay/pkg_tests
• f1bd5ec adding pkg module integration tests
• 739b2ef rework yumpkg refresh_db so args are not mandatory

PR #24089: *jfindlay* allow override of binary file mode on windows @ 2015-05-25T19:38:44Z

ISSUE #24052: *(twangboy)* v2015.5.1 Changes the way it interprets the minion_master.pub file
refs: #24089 #24144
• 517552c Merge pull request #24089 from jfindlay/binary_write
• 4a4cbdd Add the ability to replace existing certificates

PR #24092: *jfindlay* collect scattered contents edits, ensure it’s a str @ 2015-05-25T19:37:47Z

ISSUE #23973: *(mschiff)* state file.managed: setting contents_pillar to a pillar which is a list throws exception instead giving
refs: #24092
• 121ab9f Merge pull request #24092 from jfindlay/file_state
• cfa0f13 collect scattered contents edits, ensure it’s a str

PR #24112: *(The-Loeki)* thin_gen breaks when thinner doesn’t exist @ 2015-05-25T19:37:47Z
• 84e65de Merge pull request #24112 from The-Loeki/patch-1
• 34646ea thin_gen breaks when thinner doesn’t exist

PR #24108: *(jayeshka)* adding states/mysql_query unit test case @ 2015-05-25T12:30:48Z
• ec509ed Merge pull request #24108 from jayeshka/mysql_query-states-unit-test
• ec50450 adding states/mysql_query unit test case

PR #24110: *(jayeshka)* adding varnish unit test case @ 2015-05-25T12:30:21Z
• f2e56dc Merge pull request #24110 from jayeshka/varnish-unit-test

18.2. Previous Releases
• e119889 adding varnish unit test case

PR #24109: (jayeshka) adding states/mysql_grants unit test case @ 2015-05-25T12:29:53Z
  • 4fca2b4 Merge pull request #24109 from jayeshka/mysql_grants-states-unit-test
  • 11a93cb adding states/mysql_grants unit test case

PR #24028: (nleib) send a disable message to disable puppet @ 2015-05-25T04:02:11Z
  • 6b43c9a Merge pull request #24028 from nleib/2015.5
  • 15f24b4 update format of string in disabled msg
  • 7690e5b remove trailing whitespaces
  • 56a9720 Update puppet.py
  • 9686391 Update puppet.py
  • 33f3d68 send a disable message to disable puppet

PR #24100: (jfindlay) adding states/file unit test case @ 2015-05-24T05:17:54Z
  PR #23963: (jayeshka) adding states/file unit test case
  refs: #24100
    • 52c9aca Merge pull request #24100 from jfindlay/merge_23963
    • 7d59deb adding states/file unit test case

PR #24098: (galet) Systemd not recognized properly on Oracle Linux 7 @ 2015-05-24T04:07:31Z
  ISSUE #21446: (dpheasant) check for systemd on Oracle Linux
  refs: #24098
    • 0eb9f15 Merge pull request #24098 from galet/2015.5
    • 4d6ab21 Systemd not recognized properly on Oracle Linux 7

PR #24090: (jfindlay) adding states/mount unit test case @ 2015-05-22T23:02:57Z
  PR #24062: (jayeshka) adding states/mount unit test case
  refs: #24090
    • 8e04db7 Merge pull request #24090 from jfindlay/merge_24062
    • a81a922 adding states/mount unit test case

PR #24086: (rallytime) Backport #22806 to 2015.5 @ 2015-05-22T21:18:20Z
  ISSUE #22574: (unicolet) error when which is not available
  refs: #22806

PR #22806: (jfindlay) use cmd.run_all instead of cmd.run_stdout
  refs: #24086
    • c0079f5 Merge pull request #24086 from rallytime/bp-22806
    • f728f55 use cmd.run_all instead of cmd.run_stdout

PR #24024: (jayeshka) adding states/mongodb_user unit test case @ 2015-05-22T20:53:19Z
  • 09de253 Merge pull request #24024 from jayeshka/mongodb_user-states-unit-test
  • f31dc92 resolved errors
• d038b1f adding states/mongodb_user unit test case

PR #24065: (kiorky) continue to fix #23883
refs: #24080 #24066
@ 2015-05-22T18:59:21Z

ISSUE #23883: (kaithar) max_event_size seems broken * bfd812c Merge pull request #24065 from makinacorpus/real23883 * 028282e continue to fix #23883

PR #24029: (kiorky) Fix providers handling  @ 2015-05-22T16:56:06Z

ISSUE #24017: (arthurlogilab) [salt-cloud openstack] TypeError: unhashable type: `dict' on map creation
refs: #24029
• 429adfe Merge pull request #24029 from makinacorpus/fixproviders
• 412b39b Fix providers handling

PR #23936: (jfindlay) remove unreachable returns in file state  @ 2015-05-22T16:26:49Z

• a42cccc Merge pull request #23936 from jfindlay/file_state
• ac29c0c also validate file.recurse source parameter
• 57f7388 remove unreachable returns in file state

PR #24063: (jayeshka) removed tuple index error  @ 2015-05-22T14:58:20Z

• 8b69b41 Merge pull request #24063 from jayeshka/mount-states-module
• b9745d5 removed tuple index error

PR #24057: (rallytime) Backport #22572 to 2015.5  @ 2015-05-22T05:36:25Z

PR #22572: (The-Loeki) Small docfix for GitPillar
refs: #24057
• 02ac4aa Merge pull request #24057 from rallytime/bp-22572
• 49aad84 Small docfix for GitPillar

PR #24040: (rallytime) Backport #24027 to 2015.5  @ 2015-05-21T23:43:54Z

ISSUE #23088: (wfhg) Segfault when adding a Zypper repo on SLES 11.3
refs: #24027

PR #24027: (wfhg) Add baseurl to salt.modules.zypper.mod_repo
refs: #24040

• 82de059 Merge pull request #24040 from rallytime/bp-24027
• 37d25d8 Added baseurl as alias for url and mirrorlist in salt.modules.zypper.mod_repo.

PR #24039: (rallytime) Backport #24015 to 2015.5  @ 2015-05-21T23:43:25Z

PR #24015: (YanChii) minor improvement of solarisips docs & fix typos
refs: #24039

• d909781 Merge pull request #24039 from rallytime/bp-24015
• 6bf8a94 minor improvement of solarisips docs & fix typos

PR #24038: (rallytime) Backport #19599 to 2015.5  @ 2015-05-21T23:43:10Z
ISSUE #19598: (fayetted) ssh_auth.present test=true incorrectly reports changes will be made

refs: #19599

PR #19599: (fayetted) Fix ssh_auth test mode, compare lines not just key

refs: #24038

- 4a0f254 Merge pull request #24038 from rallytime/bp-19599
- ea00d3e Fix ssh_auth test mode, compare lines not just key

PR #24046: (rallytime) Remove key management test from digital ocean cloud tests @ 2015-05-21T22:32:04Z

- 42b87f1 Merge pull request #24046 from rallytime/remove_key_test
- 1d031ca Remove key management test from digital ocean cloud tests

PR #24044: (cro) Remove spurious log message, fix typo in doc @ 2015-05-21T22:31:49Z

- eff54b1 Merge pull request #24044 from cro/pgjsonb
- de06633 Remove spurious log message, fix typo in doc

PR #24001: (msteed) issue #23883 @ 2015-05-21T20:32:30Z

ISSUE #23883: (kaithar) max_event_size seems broken * ac32000 Merge pull request #24001 from msteed/issue-23883 * bea97a8 issue #23883

PR #23995: (kiorky) Lxc path pre @ 2015-05-21T17:26:03Z

- l7fae26 Merge pull request #23995 from makinacorpus/lxc_path_pre
- 319282a lint
- 1dc67e5 lxc: versionadded
- fcad7cb lxc: states improvements
- 644bd72 lxc: more consistence for profiles
- 139372c lxc: remove merge cruft
- 725b046 lxc: Repair merge

PR #24032: (kartiksubbarao) Update augeas_cfg.py @ 2015-05-21T17:03:42Z

ISSUE #16383: (interjection) salt.states.augeas.change example from docs fails with exception

refs: #24032

- 26d6851 Merge pull request #24032 from kartiksubbarao/augeas_insert_16383
- 3686dcd Update augeas_cfg.py

PR #24025: (jayeshka) adding timezone unit test case @ 2015-05-21T16:50:53Z

- 55c9245 Merge pull request #24025 from jayeshka/timezone-unit-test
- 1ec33e2 removed assertion error
- 16ecb28 adding timezone unit test case

PR #24023: (jayeshka) adding states/mongodb_database unit test case @ 2015-05-21T16:49:17Z

- e243617 Merge pull request #24023 from jayeshka/mongodb_database-states-unit-test
- 5a9ac7e adding states/mongodb_database unit test case

PR #24022: (jayeshka) adding states/modjk_worker unit test case @ 2015-05-21T16:48:29Z
- b377bd9 Merge pull request #24022 from jayeshka/modjk_worker-states-unit-test
- 05c0a98 adding states/modjk_worker unit test case

PR #24005: (msteed) issue #23776 @ 2015-05-21T01:55:34Z

ISSUE #23776: (enblde) Presence change events constantly reporting all minions as new in 2015.5 * 701c51b Merge pull request #24005 from msteed/issue-23776 * 62e67d8 issue #23776

PR #23996: (neogenix) iptables state generates a 0 position which is invalid in iptables cli #23950 @ 2015-05-20T24:44:27Z

ISSUE #23950: (neogenix) iptables state generates a 0 position which is invalid in iptables cli
refs: #23996
- 17b7c0b Merge pull request #23996 from neogenix/2015.5-23950
- ad417a5 fix for #23950

PR #23994: (rallytime) Skip the gpdoder pkgrepo test for Ubuntu 15 - they don't have vivid ppa up yet @ 2015-05-20T21:18:21Z
- 4cb8773 Merge pull request #23994 from rallytime/skip_test_ubuntu_15
- 9e0ec07 Skip the gpdoder pkgrepo test - they don't have vivid ppa up yet

18.2.28 Salt 2015.5.3 Release Notes

Extended Changelog Courtesy of Todd Stansell (https://github.com/tjstansell/salt-changelogs):

Statistics:
- Total Merges: 177
- Total Issue references: 81
- Total PR references: 231

Changes:
- PR #25096: (jfindlay) Postgres group test @ 2015-07-01T18:48:26Z
  - PR #24330: (jayeshka) adding states/postgres_group unit test case. | refs: #25096
  - 21709aa Merge pull request #25096 from jfindlay/postgres_group_test
  - 3c379dc declobber postgres state unit test mocking
  - a162ff6 adding states/postgres_group unit test case.
- PR #25085: (jfindlay) accept all sources in the file state @ 2015-07-01T18:23:45Z
  - ISSUE #25041: (wt) REGRESSION: pillar.get of integer fails to render in sls | refs: #25085
  - 0a84640 Merge pull request #25085 from jfindlay/fix_file
  - 937a252 remove unnecessary file state tests
  - 6f238e9 integration test file.managed sources
  - a5978d3 iterate an iterable source othwerise list+str it
- PR #25095: (jfindlay) Win groupadd unit tests @ 2015-07-01T18:18:53Z
  - PR #24207: (jayeshka) adding win_groupadd unit test case. | refs: #25095

18.2. Previous Releases
a983942 Merge pull request #25095 from jfindlay/win_groupadd_test
564dfdd depend on win libs rather than mocking them
9b9aeb8 resolved all errors.
aaf8935 adding win_groupadd unit test case.

PR #25089: (jfindlay) fix minion sudo @ 2015-07-01T15:53:16Z
- ISSUE #21520: (jfindlay) sudo.salt_call is broken | refs: #25089
- PR #20226: (thatch45) Allow sudo priv escalation | refs: #25089
- 7c8d2a8 Merge pull request #25089 from jfindlay/fix_sudo
d8f91d4 add some apprehension to the sudo exec module
- a9269c0 adding sudo exec module docs
e4a40b7 comment whitespace in minion config
- 44cb167 adding sudo_user minion config docs
d461060 adding sudo_user minion config to default

PR #25099: (driskell) Fix broken batch results @ 2015-07-01T15:51:29Z
- ISSUE #24875: (ahammond) ValueError: list.remove(x): x not in list in File ```/usr/lib/python2.6/site-packages/salt/cli/batch.py'', line 179, in run active.remove(minion) | refs: #25099
- 4d6078e Merge pull request #25099 from driskell/patch-1
- 59b23e5 Fix broken batch results

PR #25083: (steverweber) ipmi: get_sensor_data would always fail @ 2015-06-30T20:57:21Z
- 4635079 Merge pull request #25083 from steverweber/fix_ipmi_stat
- 836f48c include _ in IpmiCommand
- 817e434 get_sensor_data would always fail

PR #25067: (The-Loeki) Fix for maxdepth=0 in find @ 2015-06-30T20:54:06Z
- 15f2a40 Merge pull request #25067 from The-Loeki/patch-1
- 61edad3 Fix for maxdepth=0 in find

PR #25078: (terminalmage) Use smaller number for upper limit of mac_user's _first_avail_uid helper function @ 2015-06-30T20:53:24Z
- 58d933c Merge pull request #25078 from terminalmage/fix-mac-uid
df2ab7e Use smaller number for upper limit of mac_user's _first_avail_uid helper function

PR #25045: (garethgreenaway) Fixes to debian_ip.py in 2015.5 @ 2015-06-30T17:36:43Z
- ISSUE #24521: (multani) State network.managed fails on Debian (Jessie) | refs: #25045
ebd6cde Merge pull request #25045 from garethgreenaway/24521_debian_networking
- 6f2a6c9 having proto default to static since it's needed to build the template

PR #25065: (lorengordon) Add download links for 2015.5.1-3 and 2015.5.2 Windows installers @ 2015-06-30T15:29:31Z
- ISSUE #25057: (TheBigBear) why is there still no newer salt-minion for windows than ver. 2015.5.0-2?
  no 2015.5.1 or 2015.5.2?
18.2. Previous Releases

- ae31b27 Merge pull request #25065 from lorengordon/update-windows-installer-links
- 40a0c13 Add download links for 2015.5.1-3 and 2015.5.2, Fixes #25057

**PR #25052**: (basepi) [2015.5] Merge forward from 2014.7 to 2015.5 @ 2015-06-30T01:05:00Z
  - ISSUE #15209: (hubez) file.manage: source_hash not working with s3:// (2014.7.0rc1) | refs: #25011
  - PR #25011: (notpeter) Add s3 to protocols for remote source_hash (2014.7 backport)
  - ddaeb0f Merge pull request #25052 from basepi/merge-forward-2015.5
  - 2c5e664 Merge remote-tracking branch 'upstream/2014.7' into merge-forward-2015.5
  - a7154e7 Merge pull request #25011 from notpeter/s3_2014.7_backport
    * 8b8af64 Add s3 to protocols for remote source_hash

**PR #25038**: (jfindlay) versionadded @ 2015-06-29T19:49:27Z

- PR #24747: (msciciel) add get_route function to network module | refs: #25038
- c7003d4 Merge pull request #25038 from jfindlay/versionadded
- 6d6c6f9 versionadded

**PR #24747**: (msciciel) add get_route function to network module | refs: #25038 @ 2015-06-29T16:51:43Z

- 28c87ca Merge pull request #24747 from msciciel/2015.5
- 79b4ec2 network module lint fix
- 0b6ef78 network module: fix for ipv6
- f3d184c add get_route function to network module

**PR #24975**: (ryan-lane) Fix update of undefined env var in npm module @ 2015-06-29T16:45:05Z

- 46a9677 Merge pull request #24975 from lyft/npm-module-fix
- 6fde581 Try byte literals rather than unicode strings in the env
- c8514de Fix update of undefined env var in npm module

**PR #24986**: (heewa) Don’t modify empty change @ 2015-06-29T16:44:17Z

- 9cf8550 Merge pull request #24986 from heewa/fx-pkg-hold-when-errored
- d47a448 Don’t modify empty change

**PR #24999**: (rallytime) Provide a less confusing error when cloud provider is misconfigured @ 2015-06-29T16:43:31Z

  - ISSUE #24969: (bradhurber) salt-cloud 2015.5.0: missing azure dependency results in misleading error | refs: #24999
  - ece897d Merge pull request #24999 from rallytime/cloud_error_help
  - 1e81a88 Clean up
  - be19a67 Provide a less confusing error when cloud provider is misconfigured

**PR #24987**: (heewa) Don’t try to cache a template when it’s not a file @ 2015-06-29T14:02:59Z

- 4af15cf Merge pull request #24987 from heewa/fx-trying-to-cache-no-file
- 9ae9e78 Don’t try to cache a template when it’s not a file

**PR #25022**: (jfindlay) revise label and milestone documentation @ 2015-06-29T13:51:24Z

- 8eaddb Merge pull request #25022 from jfindlay/label_docs
- 8575192 revise label and milestone documentation

- **PR #25029**: (jayeshka) adding redismod unit test case. @ 2015-06-29T13:50:33Z
  - 89c2e01 Merge pull request #25029 from jayeshka/redismod-unit-test
  - e3045be adding redismod unit test case.

- **PR #24995**: (rallytime) Fix deprecated pymongo usage causing errors in latest pymongo @ 2015-06-27T22:28:56Z
  - **PR #24175**: (trevor-h) fix deprecated pymongo usage causing errors in latest pymongo | refs: #24995
  - 6425252 Merge pull request #24995 from rallytime/tops_mongo
  - a3c1063 fix deprecated pymongo usage causing errors in latest pymongo

- **PR #24994**: (garethgreenaway) Another Fix to gpg.py in 2015.5 @ 2015-06-27T22:28:15Z
  - ISSUE #24862: (dkatsanikakis) gpg.import_key returns error after successfully completed | refs: #24966 #24994
  - e9aaa11 Merge pull request #24994 from garethgreenaway/2015_5_24862_gpg_import_key
  - d2f0d8f variable was referenced before assignment. Just removing the variable and checking the return from distutils.version.LooseVersion directly.

- **PR #24988**: (jayeshka) adding states/supervisord unit test case. @ 2015-06-27T22:24:42Z
  - ebd66ee Merge pull request #24988 from jayeshka/supervisord-states-unit-test
  - bb0a6d5 adding states/supervisord unit test case.

- **PR #25007**: (basepi) [2015.5] Merge forward from 2014.7 to 2015.5 @ 2015-06-26T21:28:57Z
  - ISSUE #24915: (jtand) Salt-cloud not working in 2014.7.6 | refs: #24944
  - **PR #24944**: (techhat) Double-check main_cloud_config
  - **PR #24936**: (jtand) Fixed ps module to not use depreciated psutil commands
  - 0487c3c Merge pull request #25007 from basepi/merge-forward-2015.5
  - 4980fd5 Merge remote-tracking branch `upstream/2014.7` into merge-forward-2015.5
  - a11e4c6 Merge pull request #24944 from techhat/issue24915
    * 59c3081 Double-check main_cloud_config
    * d26a544 Merge pull request #24936 from jtand/psutil
      * bdb7a19 Fixed ps module to not use depreciated psutil commands

- **PR #25003**: (jacobhammons) Updated man pages @ 2015-06-26T19:13:41Z
  - 819a60e1 Merge pull request #25003 from jacobhammons/man-pages
  - cf97a4a Updated man pages

- **PR #25002**: (jacobhammons) sphinx html theme updates @ 2015-06-26T18:39:14Z
  - a60a2e4 Merge pull request #25002 from jacobhammons/doc-announcements
  - f88f344 sphinx html theme updates

- **PR #24977**: (rallytime) Only warn about digital ocean deprecation if digital ocean is configured @ 2015-06-25T23:54:46Z
  - a791b23 Merge pull request #24977 from rallytime/do_move_warning
6b54422 Only warn about digital ocean deprecation if digital ocean is configured

**PR #24966:** (garethgreenaway) Fixes to gpg.py in 2015.5 @ 2015-06-25T19:58:49Z
- ISSUE #24862: (dkatsanikakis) gpg.import_key returns error after successfully completed | refs: #24966 #24994
- a71c1b7 Merge pull request #24966 from garethgreenaway/2015_5_24862_gpg_import_key
- 55eb73b fixing unit tests.
- 80c24be Fixing an issue with the import_key method. Different results depending on which gnupg python module is installed.

**PR #24965:** (jacksontj) Fix memory leak in saltando @ 2015-06-25T18:48:03Z
- ISSUE #24846: (mavenAtHouzz) Memory leak issue in rest_tornado EventListener | refs: #24965 #24994
- 8622184 Merge pull request #24965 from jacksontj/2015.5
- 48b5e16 pylint
- 87adca4 Fix memory leak in saltando

**PR #24948:** (jfindlay) fix some malformed doc links and anchors @ 2015-06-25T15:51:38Z
- 773c4cf Merge pull request #24948 from jfindlay/doc_links
- 152a9b2 fix some malformed doc links and anchors

**PR #24886:** (anlutro) Be more careful about stripping away root_dir from directory options @ 2015-06-25T15:50:11Z
- ISSUE #24885: (anlutro) Master config - Directories starting with a dot have the dot stripped when root_dir is . | refs: #24886
- 4ebc01e Merge pull request #24886 from alprs/fix-root_dir_bug
- 52ccaf0 os.sep is the correct directory separator constant
- 0ebea73 Be more careful about stripping away root_dir from directory options

**PR #24930:** (jacksontj) Don’t refetch file templates 100% of the time-- Performance optimization for templated files @ 2015-06-24T21:22:47Z
- f52fe1e Merge pull request #24930 from jacksontj/2015.5
- 5fb7534 Only parse the source if we have one
- c03a6fa Add support for sources of managed files to be local
- 4cf78a0 pylint
- d70914e Don’t refetch the template 100% of the time-- Performance optimization for templated files

**PR #24935:** (basepi) [2015.5] Merge forward from 2014.7 to 2015.5 @ 2015-06-24T18:22:17.54Z
- PR #24198: (BretFisher) SmartOS SMF minion startup fix
- PR #473: (whiteinge) Added a couple functions to work with the minion file cache | refs: #24918
- 925a4d9 Merge pull request #24935 from basepi/merge-forward-2015.5
- 8db3f34 Merge remote-tracking branch ‘upstream/2014.7’ into merge-forward-2015.5
- eeb05a1 Merge pull request #24918 from BretFisher/minion-start-smartos-smf-fix
  * d7bf0c Smartos smf minion fix

**PR #24873:** (jfindlay) convert osrelease grain to str before str op @ 2015-06-24T16:43:08Z
Salt Documentation, Release 2016.3.6

- ISSUE #24826: (rakai93) rh_service.py: 'int' object has no attribute 'startswith' | refs: #24873
- 4e8ed0d Merge pull request #24873 from jfindlay/rh_service
- febe6ef convert osrelease grain to str before str op

• PR #24923: (jayeshka) adding states/status unit test case. @ 2015-06-24T15:50:07Z
  - 90819f9 Merge pull request #24923 from jayeshka/status-states-unit-test
  - baec650 adding states/status unit test case.

• PR #24902: (cro) Fix minion failover, document same @ 2015-06-24T15:20:43Z
  - 2dd24ec Merge pull request #24902 from cro/fixfo2
  - 90c73ff References to documentation.
  - f0c9204 Add references to failover parameters in conf
  - 9da96a8 Docs
  - e2314f0 Move comment.
  - b9a756f Fix master failover and add documentation for same. Factor in syndics. Syndics will not failover (yet).

• PR #24926: (rallytime) Back-port #22263 to 2015.5 @ 2015-06-24T15:09:40Z
  - PR #22263: (cachedout) Prevent a load from being written if one already exists | refs: #24926
  - 087ee09 Merge pull request #24926 from rallytime/bp-22263
  - 8c92d9c Prevent a load from being written if one already exists

• PR #24900: (rallytime) Back-port #24848 to 2015.5 @ 2015-06-24T15:09:18Z
  - PR #24848: (nmadhok) Correcting bash code blocks | refs: #24900
  - b34a74f Merge pull request #24900 from rallytime/bp-24848
  - d2b5456 Correcting bash code blocks

• PR #24899: (rallytime) Back-port #24847 to 2015.5 @ 2015-06-24T15:09:01Z
  - PR #24847: (borutmrak) unset size parameter for lxc.create when backing=zfs | refs: #24899

  - fd73390 Merge pull request #24782 from jayeshka/slack-states-unit-test
  - e2b6241 adding states/slack unit test case.
- PR #24771: (jacksontj) Always extend requisites, instead of replacing them @ 2015-06-18T14:29:09Z
  - ISSUE #24770: (jacksontj) Requisite and Requisite_in don't play nice together | refs: #24771
  - c9c90af Merge pull request #24771 from jacksontj/2015.5
  - b1211c5 Re-enable tests for complex prereq and prereq_in
  - 378f6bf Only merge when the merge is of requisites
- PR #24766: (msteed) Remove doc references to obsolete minion opt @ 2015-06-17T21:36:55Z
  - 5fe4de8 Merge pull request #24766 from msteed/undoc-dns_check
  - f92a769 Remove doc references to obsolete minion opt
- PR #24329: (jayeshka) adding states/postgres_database unit test case. | refs: #24798 @ 2015-06-17T19:11:02Z
  - a407ab7 Merge pull request #24329 from jayeshka/postgres_database-states-unit-test
  - ee06f1a adding states/postgres_database unit test case.
- PR #24632: (jacobhammons) Doc bug fixes @ 2015-06-17T18:40:02Z
  - ISSUE #24560: (hydroisine) Documentation missing on parameter | refs: #24632
  - ISSUE #24547: (dragonpaw) Artifactory docs say module is `jboss7`. | refs: #24632
  - ISSUE #24375: (companykitchen-dev) Custom grain won't sync under any circumstances | refs: #24632
  - ISSUE #24275: (kartiksubbarao) augeas issue with apache and recognizing changes that have been already made | refs: #24632
  - ISSUE #24163: (tbaker57) enable_gpu_grains default value confusion | refs: #24632
  - 3ff6eff Merge pull request #24632 from jacobhammons/bug-fixes
  - 7c52012 Fixed typos
  - c7ed414 Doc bug fixes Refs #24547 Refs #24275 Refs #24375 Refs #24560 Refs #24163
- PR #24607: (garethgreenaway) fixes to minion.py @ 2015-06-17T18:16:42Z
  - ISSUE #24198: (ahammond) salt-call event.send doesn't send events from minion | refs: #24607
- 9995f64 Merge pull request #24607 from garethgreenaway/2015_5_sending_events_multi_master
- 8abd3f0 A fix if you have multiple masters configured and try to fire events to the minion. Currently they fail silently. Might be the cause of #24198.

**PR #24755: (rallytime) Remove SALT CLOUD_REQS from setup.py @ 2015-06-17T17:42:25Z**
- bf2dd94 Merge pull request #24755 from rallytime/fix_setup_15
- 48769a5 Remove SALT CLOUD_REQS from setup.py

**PR #24740: (rallytime) Backport #24720 to 2015.5 @ 2015-06-17T16:43:37Z**
- PR #24720: (TheScriptSage) Issue 24621 - AD/LDAP Group Auth Issue | refs: #24740
- 3d53d79 Merge pull request #24740 from rallytime/bp-24720
- a9bcdc5b Updating master.py to properly check against groups when user is only authed against group. Tested against unit.auth_test.

**PR #24723: (rallytime) Back-port #20124 to 2015.5 @ 2015-06-17T16:43:20Z**
- PR #20124: (cgtx) add init system to default grains | refs: #24723
- ac2851b Merge pull request #24723 from rallytime/bp-20124
- 4d0061b fix infinite loop introduced by #20124 when the init system is not in the supported_inits list
- a9bcdc5b Updating master.py to properly check against groups when user is only authed against group. Tested against unit.auth_test.

**PR #24754: (anlutro) salt-cloud documentation - Add information about linode location @ 2015-06-17T16:04:48Z**
- 78c00b Merge pull request #24754 from alprs/docs-add_linode_location_option
- d88e071 add information about linode location

**PR #24748: (jayeshka) adding states/serverdensity_device unit test case. @ 2015-06-17T15:39:07Z**
- d5554f7 Merge pull request #24748 from jayeshka/serverdensity_device-states-unit-test
- 1a4c241 adding states/serverdensity_device unit test case.

**PR #24739: (rallytime) Back-port #24735 to 2015.5 @ 2015-06-17T15:16:47Z**
- PR #24735: (notpeter) Add 2015.5 codename to version numbers docs | refs: #24739
- 0b7e7e8 Merge pull request #24739 from rallytime/bp-24735
- 6c565d6 Add .0 to version number
- 5ed801b Add codenames for 2015.5 and future versions. Trailing newline.

**PR #24732: (msteed) Fix stacktrace when --summary is used @ 2015-06-17T03:27:57Z**
- ISSUE #24111: (yermulnik) cli option `--summary' got broken after upgrade to 2015.5.1 | refs: #24732
- c8713f2 Merge pull request #24732 from msteed/issue-24111
- 54b33dd Fix stacktrace when --summary is used

**PR #24721: (rallytime) Back-port #24668 to 2015.5 @ 2015-06-17T03:23:47Z**
- PR #24668: (grischa) enable virtual package names in pyobjects renderer | refs: #24721 #24757
- 70d3781 Merge pull request #24721 from rallytime/bp-24668
- 68fb5af fixing other test
- ba4f262 fixing text for virtual support in pyobjects
- b349d91 enable virtual package names in pyobjects renderer

**PR #24718:** [rallytime] Added some missing config documentation to the vsphere driver @ 2015-06-17T03:19:35Z
  - ISSUE #21923: (Fluro) Salt cloud not running provisioning script as root | refs: #24718
  - ISSUE #17241: (hasues) Salt-Cloud for vSphere needs additional documentation | refs: #24718
  - 1b9d689 Merge pull request #24718 from rallytime/update_vsphere_docs
  - bfdebb6 Added some missing config documentation to the vsphere driver

**PR #24714:** [rallytime] Remove cloud-requirements.txt @ 2015-06-17T03:17:04Z
  - 64857c7 Merge pull request #24714 from rallytime/remove_cloud_reqs_15
  - 67b796d Remove cloud-requirements.txt

**PR #24733:** [msteed] Include Tornado in versions report @ 2015-06-17T03:13:53Z
  - ISSUE #24439: (bechtoldt) Add tornado version to versions report | refs: #24733
  - 906b1d6 Merge pull request #24733 from msteed/issue-24439
  - 76cefe0 Include Tornado in versions report

**PR #24737:** [jacksontj] Move AES command logging to trace @ 2015-06-17T01:48:11Z
  - a861fe0 Merge pull request #24737 from jacksontj/2015.5
  - a4ed41a Move AES command logging to trace

**PR #24724:** [basepi] [2015.5] Merge forward from 2014.7 to 2015.5 @ 2015-06-16T22:46:27Z
  - ISSUE #24196: (johnccfm) Exception when using user.present with Windows | refs: #24646
  - PR #24646: (twangboy) Fixed user.present on existing user
  - 0d2dc46 Merge pull request #24724 from basepi/merge-forward-2015.5
  - 4641028 Merge remote-tracking branch `upstream/2014.7` into merge-forward-2015.5
  - a18dada Merge pull request #24646 from twangboy/fix_24196
    * a208e1d Fixed user.present on existing user

**PR #24701:** [jayeshka] adding states/selinux unit test case. @ 2015-06-16T15:27:29Z
  - 3d33fe7 Merge pull request #24701 from jayeshka/selinux-states-unit-test
  - 0c136fd adding states/selinux unit test case.

**PR #24687:** [cachedout] Note about minimum worker_threads @ 2015-06-15T20:46:23Z
  - 2e287a9 Merge pull request #24687 from cachedout/min_worker_threads
  - b7bb7ea Note about minimum worker_threads

**PR #24688:** [cachedout] Update AUTHORS @ 2015-06-15T20:46:03Z
  - 432478c Merge pull request #24688 from cachedout/update_authors
  - 3f6880e Better email
  - 6c7b773 Update AUTHORS

**PR #24649:** [cachedout] Improved error reporting for failed states @ 2015-06-15T16:04:20Z
• ISSUE #22385: (cachedout) States which require unavailable modules should display the reason | refs: #24649
  9a2b50d Merge pull request #24649 from cachedout/issue_22385
  b9fe792 States will now return the reason behind failure if a module could not be loaded

• PR #24673: (jayeshka) adding states/schedule unit test case. @ 2015-06-15T15:24:52Z
  66e9e16 Merge pull request #24673 from jayeshka/schedule-states-unit-test
  54aaa5 adding states/schedule unit test case.

• PR #24663: (kartiksubbarao) Update augeasCfg.py @ 2015-06-15T15:18:48Z
  ISSUE #24661: (kartiksubbarao) augeas.change doesn’t support setting empty values | refs: #24663
  5eb19c4 Merge pull request #24663 from kartiksubbarao/patch-2
  e18db50 Update augeasCfg.py

• PR #24667: (dkiser) fix for #24583 clouds/openstack.py kerying first time succeeds @ 2015-06-14T21:58:58Z
  ISSUE #24583: (dkiser) salt-cloud keyring password referenced before assignment | refs: #24667
  4450432 Merge pull request #24667 from dkiser/fix-cloud-keyring
  c92c05f fix for #24583 clouds/openstack.py kerying first time succeeds

• PR #24659: (kartiksubbarao) Update aliases.py @ 2015-06-13T17:31:42Z
  ISSUE #24537: (kartiksubbarao) alias.present doesn’t update alias values that are substrings of the exist-
  ing value | refs: #24659
  4c64ee9 Merge pull request #24659 from kartiksubbarao/patch-1
  d683474 Update aliases.py

• PR #24644: (cro) Merge forward 2014.7->2015.5 @ 2015-06-12T21:31:41Z
  PR #24643: (cro) Add reference to salt-announce mailing list
  PR #24620: (twangboy) Fixed comment and uncomment functions in file.py
  89eb616 Merge pull request #24644 from cro/2014.7-2015.5-20150612
  4136dc3 Merge forward from 2014.7 to 2015.5
  b99484f Merge pull request #24643 from cro/saltannounce
    * ecb0623 Add salt-announce mailing list.
  635121e Merge pull request #24620 from twangboy/fixed_24215
    * d7a9999 Fixed comment and uncomment functions in file.py

• PR #24642: (basepi) Revert \"fix target rule, remove unneeded quotation mark\" @ 2015-06-12T20:14:26Z
  PR #24595: (tankywoo) fix target rule, remove unneeded quotation mark | refs: #24642
  b896a0d Merge pull request #24642 from saltstack/revert-24595-fix-iptables-target
  5ff3224 Revert \"fix target rule, remove unneeded quotation mark\"

• PR #24628: (jayeshka) adding states/reg unit test case. @ 2015-06-12T17:29:11Z
  01092c2 Merge pull request #24628 from jayeshka/reg_states-unit-test
  af1bd8f adding states/reg unit test case.

• PR #24631: (rallytime) Back-port #24591 to 2015.5 @ 2015-06-12T16:54:32Z

18.2. Previous Releases

2631
- ISSUE #24494: (arnoutpierre) Computed comments in jinja states | refs: #24591
- ISSUE #24073: (primechuck) State.highstate uses stale grain data. | refs: #24492
- ISSUE #23359: (BalintSzigeti) init.sls parsing issue | refs: #24591
- ISSUE #21217: (Colstuwix) Maybe a bug for jinja render? | refs: #24591
- PR #24591: (tbaker57) Add some documentation surrounding Jinja vs yaml comments - | refs: #24631
- PR #24492: (DmitryKuzmenko) Don’t remove grains from opts
- 5f491f9 Merge pull request #24631 from rallytime/bp-24591
- f13cd41 Add extra clarification why jinja comments are needed.
- 2374971 Fix typo
- 6a91747 Add some documentation surrounding Jinja comments - refs #24492, #21217, #23359

• PR #24616: (garethgreenaway) additional logging in state.py module @ 2015-06-12T16:25:39Z
- f23f99e Merge pull request #24616 from garethgreenaway/2015_5_logging_disabled_states
- 4dfb0ef Adding some logging statement to give feedback when states, including highstate, are disabled. Useful when running from scheduler.

• PR #24595: (tankywoo) fix target rule, remove unneeded quotation mark | refs: #24642 @ 2015-06-12T16:23:22Z
- 6dccbb0 Merge pull request #24595 from tankywoo/fix-iptables-target
- 10a5160 fix target rule, remove unneeded quotation mark

• PR #24604: (jfindlay) fix pkg module integration tests @ 2015-06-12T16:04:26Z
- 8ac3d94 Merge pull request #24604 from jfindlay/pkg_tests
- d88fb22 fix pkg module integration tests on CentOS 5
- fb91b40 fix pkg module integration tests on ubuntu 12

• PR #24600: (basepi) [2015.5] Remove __kwarg__ from salt-ssh keyword args @ 2015-06-12T04:21:29Z
- 0ff545c Merge pull request #24600 from basepi/salt-ssh.orchestrate.20615
- 9b55683 Remove __kwarg__ from salt-ssh keyword args

• PR #24608: (basepi) [2015.5] Normalize salt-ssh flat roster minion IDs to strings @ 2015-06-11T21:35:07Z
- ISSUE #22843: (Xiol) salt-ssh roster doesn’t support integers as host keys | refs: #24608
- 832916f Merge pull request #24608 from basepi/salt-ssh.flat.roster.integers.22843
- 381820f Normalize salt-ssh flat roster minion IDs to strings

• PR #24605: (basepi) [2015.5] Merge forward from 2014.7 to 2015.5 @ 2015-06-11T19:15:21Z
- PR #24589: (BretFisher) Fixed Mine example for jinja code block
- 4eb5bb2 Merge pull request #24605 from basepi/merge-forward-2015.5
- f96c502 Merge remote-tracking branch `upstream/2014.7` into merge-forward-2015.5
- d83916f Merge pull request #24589 from BretFisher/patch-1
- 65a1133 Fixed Mine example for jinja code block

• PR #24598: (jacobhammons) 2015.5.2 release changes @ 2015-06-11T17:24:11Z
- ISSUE #24457: (ryan-lane) When selecting the version of docs on the docs site, it brings you to the homepage | refs: #24598
- **ISSUE #24250**: ([jfindlay](https://github.com/saltstack/salt/tree/2015.5.2)) have version links on docs page link to that version of the current page | refs: #24598
- e0bb177 Merge pull request #24598 from jacobhammons/doc-fixes
- f3f34dd 2015.5.2 release changes Refs #24250 Refs #24457

- **PR #24588**: ([basepi](https://github.com/saltstack/salt/tree/2015.5.2)) Fixes for saltmod.function for salt-ssh @ 2015-06-11T15:51:41Z
  - **ISSUE #20615**: ([aurynn](https://github.com/saltstack/salt/tree/2015.5.2)) 2014.7.1: salt/states/saltmod using incorrect return dict for orchestrate | refs: #24588
  - 26930b4 Merge pull request #24588 from basepi/salt-ssh.orchestrate.20615
  - 826936c Move documentation into docstring instead of comments
  - de052e7 Assign `return` to `ret` if necessary in saltmod.function
  - 34ff989 Convert keyword args to key=value strings in salt-ssh

- **PR #24593**: ([jayeshka](https://github.com/saltstack/salt/tree/2015.5.2)) adding states/redismod unit test case. @ 2015-06-11T15:51:41Z
  - 5a21ad1 Merge pull request #24593 from jayeshka/redismod_states-unit-test
  - 3b95744 adding states/redismod unit test case.

- **PR #24581**: ([rallytime](https://github.com/saltstack/salt/tree/2015.5.2)) Disabled some flaky tests until we can figure out how to make them more reliable @ 2015-06-11T15:51:41Z
  - **ISSUE #40**: ([thatch45](https://github.com/saltstack/salt/tree/2015.5.2)) Clean up timeouts | refs: #22857
  - **PR #24217**: ([jfindlay](https://github.com/saltstack/salt/tree/2015.5.2)) disable intermittently failing tests | refs: #24581
  - **PR #23623**: ([jfindlay](https://github.com/saltstack/salt/tree/2015.5.2)) Fix /jobs endpoint’s return | refs: #24217
  - **PR #22857**: ([jacksontj](https://github.com/saltstack/salt/tree/2015.5.2)) Fix /jobs endpoint’s return | refs: #23623
  - 8ff8b6e Merge pull request #24581 from rallytime/disable_some_flaky_tests
  - c82f135 Disabled some flaky tests until we can figure out how to make them more reliable

- **PR #24566**: ([jayeshka](https://github.com/saltstack/salt/tree/2015.5.2)) adding states/rdp unit test case. @ 2015-06-11T02:13:06Z
  - a570d7f Merge pull request #24566 from jayeshka/rdp_states-unit-test
  - 273b994 adding states/rdp unit test case.

- **PR #24551**: ([joejulian](https://github.com/saltstack/salt/tree/2015.5.2)) 2015.5 don’t pollute environment @ 2015-06-11T02:13:06Z
  - **ISSUE #24480**: ([kiorky](https://github.com/saltstack/salt/tree/2015.5.2)) [CRITICAL] [2015.5] tls breaks tzinfo | refs: #24551
  - 20ada1f Merge pull request #24551 from joejulian/2015.5_dont_pollute_environment
  - cfc3b43 Don’t pollute the TZ environment variable
  - cb53d3f pep8
  - 9cb7015 Mark keyword version adds
  - 76e2583 Merge tls changes from develop

- **PR #24574**: ([jacobhammons](https://github.com/saltstack/salt/tree/2015.5.2)) Refs #19901 @ 2015-06-10T20:09:23Z
  - **ISSUE #19901**: ([clinta](https://github.com/saltstack/salt/tree/2015.5.2)) State cache is not documented | refs: #24468
  - bb2fd6a Merge pull request #24574 from jacobhammons/19901
  - e2a2946 Refs #19901

- **PR #24577**: ([basepi](https://github.com/saltstack/salt/tree/2015.5.2)) [2015.5] Merge forward from 2014.7 to 2015.5 @ 2015-06-10T19:46:22Z
ISSUE #24427: (fayetted) 2015.5.1-3 Windows 64Bit Minion fails to start after install | refs: #24530

PR #24530: (twangboy) Start Minion Service on Silent Install

b03166c Merge pull request #24577 from basepi/merge-forward-2015.5

e1d45cc Merge remote-tracking branch `upstream/2014.7' into merge-forward-2015.5

d376390 Merge pull request #24530 from twangboy/fix_24427

* 673e1d8 Added missing panel.bmp for installer
* cc50218 Start Minion Service on Silent Install

• PR #24571: (jacobhammons) Refs #24235 @ 2015-06-10T17:02:18Z

ISSUE #24235: (tomasfejfar) Difference between running from minion and from master | refs: #24468

3ec457b Merge pull request #24571 from jacobhammons/24235

8df5d53 Merge remote-tracking branch `upstream/2014.7' into merge-forward-2015.5

d376390 Merge pull request #24530 from twangboy/fix_24427

• PR #24565: (pille) fix backtrace, when listing plugins @ 2015-06-10T16:33:11Z

fe07eb5 Merge pull request #24565 from pille/munin-ignore-broken-symlinks

8511a6c fix backtrace, when listing plugins

• PR #24554: (ryan-lane) Fix yes usage for pecl defaults @ 2015-06-09T23:59:49Z

251c8f9 Merge pull request #24554 from lyt/pecl-module-fix

56a9cfc Fix yes usage for pecl defaults

• PR #24535: (rallytime) Back-port #24518 to 2015.5 @ 2015-06-09T20:06:18Z

PR #24518: (rallytime) Merge #24448 with Pylint Fixes | refs: #24535

PR #24448: (codertux) Update modules path for operating systems using systemd | refs: #24518

dbd49b4 Merge pull request #24535 from rallytime/bp-24518

fc75197 Pylint fix

3e08840 Update modules path for operating systems using systemd

• PR #24538: (basepi) [2015.5] Merge forward from 2014.7 to 2015.5 @ 2015-06-09T17:27:20Z

PR #24513: (jquast) bugfix use of `iteritem` in 2014.7 branch

PR #24511: (jquast) bugfix: trailing "...done" in rabbitmq output | refs: #24513

485ed3c Merge pull request #24538 from basepi/merge-forward-2015.5

6a8039d Merge remote-tracking branch `upstream/2014.7' into merge-forward-2015.5

6e6c476 Merge pull request #24513 from jquast/2014.7-bugfix-iteritem

* 2e018b0 bugfix use of `iteritem` in 2014.7 branch

• PR #24495: (jayeshka) adding states/rabbitmq_vhost unit test case. @ 2015-06-09T15:33:23Z

73e6388 Merge pull request #24495 from jayeshka/rabbitmq_vhost_states-unit-test

31889e3 cosmetic change.

cf501cf resolved error.

4bb6087 Merge branch `2015.5' of https://github.com/saltstack/salt into rabbitmq_vhost_states-unit-test

3ad7714 adding states/rabbitmq_vhost unit test case.
• PR #24445: (jayeshka) adding states/pyrax_queues unit test case. @ 2015-06-09T15:28:45Z
  - bf1abcc Merge pull request #24445 from jayeshka/pyrax_queues_states-unit-test
  - ea27cef adding states/pyrax_queues unit test case.
• PR #24490: (aneeshusa) Fix pacman.list_upgrades for new python_shell default. @ 2015-06-09T15:13:16Z

### 18.2.29 Salt 2015.5.4 Release Notes

Version 2015.5.4 is a bugfix release for 2015.5.0.

Changes:

- The `cron.present` state now correctly defaults to state ID as identifier.

- When querying for VMs in `digital_ocean_v2.py`, the number of VMs to include in a page was changed from 20 (default) to 200 to reduce the number of API calls to Digital Ocean.

- The `vmware` Salt-Cloud driver was back-ported from the develop branch in order for installations of Salt that are older than 2015.8.0 to be able to use the `vmware` driver without stack-tracing on various deprecation paths that were implemented in the 2015.8.0 release.

### Changes for v2015.5.3..v2015.5.4

Extended changelog courtesy of Todd Stansell ([https://github.com/tjstansell/salt-changelogs](https://github.com/tjstansell/salt-changelogs)):

18.2. Previous Releases 2655
Salt 2015.5.5 Release Notes

Version 2015.5.5 is a bugfix release for 2015.5.0. Changes:

- The cron.present state now correctly defaults to state ID as identifier.
- When querying for VMs in digital_ocean_v2.py, the number of VMs to include in a page was changed from 20 (default) to 200 to reduce the number of API calls to Digital Ocean.
- The VMware Salt-Cloud driver was back-ported from the develop branch in order for installations of Salt that are older than 2015.8.0 to be able to use the VMware driver without stack-tracing on various deprecation paths that were implemented in the 2015.8.0 release.

Changes for v2015.5.3..v2015.5.5

Changes:

- PR #26292: (jquast) Rabbitmq 3.2.4 on Ubuntu has "...done.", not "...done" @ 2015-08-13T19:53:29Z
- PR #26296: (jquast) bugfix missing 'runas=None' for rabbitmqctl cmds (backport to 2015.5) @ 2015-08-13T19:52:40Z
- PR #26293: (jfindlay) Fix #26268 @ 2015-08-13T19:48:06Z

- ISSUE #25618: (twangboy) Fix reg.py to work with the registry properly | refs: #26268
- PR #26268: (twangboy) Multiple improvements to reg executionmod and state mod | refs: #26293
- PR #26290: (rallytime) Only call convert_to_arn when action name is provided @ 2015-08-13T18:48:58Z

- ISSUE #25192: (deuscapturus) 2015.5.2 boto_cloudwatch_alarm.present not working. | refs: #26290
- PR #26288: (bbinet) allow deleting grains which value is False @ 2015-08-13T24:36Z

- PR #26263: (rallytime) Don’t make changes when test=True for openstack present/absent funcs @ 2015-08-13T16:30:31Z
  - ISSUE #24882: (nmadhok) salt.states.openstack_config.present and salt.states.openstack_config.absent make changes when test=True | refs: #26263

- PR #26257: (silenius) fix issue #26207 | refs: #26257
- PR #26246: (nmadhok) Backport additions to VMware cloud driver from develop to 2015.5 branch @ 2015-08-12T04:48:27Z
- PR #26239: (opdude) Fixed documentation to match function name @ 2015-08-12T14:48:52Z
- PR #26232: (garethgreenaway) Fix to trust_key in gpg module for 2015.5. @ 2015-08-12T16:42:33Z
- PR #26219: (anlutro) cron: make identifier default to state ID @ 2015-08-12T18:42:33Z
  - ISSUE #25958: (anlutro) Cron identifier does not default to state ID as documented | refs: #26219
- PR #26257: (rallytime) Back-port #26237 to 2015.5 @ 2015-08-12T18:40:35Z
  - ISSUE #26207: (fullermd) group members setting fails with obscure error message on FreeBSD | refs: #26237
  - PR #26237: (silenius) fix issue #26207 | refs: #26257
- PR #26258: (nmadhok) Fix permission on tests/runtests.py on 2015.5 branch @ 2015-08-12T18:40:04Z
- PR #26261: (nmadhok) Correct spelling of integration in docs @ 2015-08-12T18:14:48Z
  - PR #2015: (thekuffs) Esky / bbfreeze support
- PR #26247: (nmadhok) Initial commit of unit tests for vmware cloud driver @ 2015-08-12T16:58:24Z
- PR #26246: (nmadhok) Backport additions to VMware cloud driver from develop to 2015.5 branch @ 2015-08-12T15:11:26Z
- PR #26239: (opdude) Fixed documentation to match function name @ 2015-08-12T14:48:52Z
- PR #26232: (garethgreenaway) Fix to trust_key in gpg module for 2015.5. @ 2015-08-12T04:48:27Z
- PR #26084: (twangboy) Added python_shell=True, quoted user input @ 2015-08-10T21:29:35Z
- **ISSUE #25802**: (jefftucker) Running module `npm.list` fails on Windows for masterless minion | refs: #26084

- **PR #26183**: (cro) Fix LDAP configuration issue. @ 2015-08-10T19:09:41Z

- **PR #26186**: (jacobhammons) regenerated man pages @ 2015-08-10T19:07:44Z

- **PR #26182**: (basepi) [2015.5] Merge forward from 2014.7 to 2015.5 @ 2015-08-10T19:00:10Z

- **ISSUE #25961**: (getabc) [2015.5.3-2] salt-winrepo.git/salt-minion.sls fails certificate `*wpengine.com` or `wpengine.com` | refs: #26047

- **PR #26184**: (jefftucker) Document `master_finger` more prominently | refs: #26088

- **PR #26186**: (jacobhammons) Updated windows download links in the docs to https://repo.saltstack.com

- **PR #26000**: (driskell) Implement full event caching for subscribed tags @ 2015-08-10T18:57:17Z

- **PR #26163**: (nmadhok) VMware cloud driver create function failing with traceback on latest develop | refs: #26172

- **PR #26168**: (cachedout) Fix slack docs @ 2015-08-10T14:57:18Z

- **ISSUE #25802**: (jefftucker) Running module `npm.list` fails on Windows for masterless minion | refs: #26084

- **PR #26183**: (cro) Fix LDAP configuration issue. @ 2015-08-10T19:09:41Z

- **PR #26186**: (jacobhammons) regenerated man pages @ 2015-08-10T19:07:44Z

- **PR #26182**: (basepi) [2015.5] Merge forward from 2014.7 to 2015.5 @ 2015-08-10T19:00:10Z

- **ISSUE #25961**: (getabc) [2015.5.3-2] salt-winrepo.git/salt-minion.sls fails certificate `*wpengine.com` or `wpengine.com` | refs: #26047

- **ISSUE #25751**: (basepi) Document `master_finger` more prominently | refs: #26088

- **PR #26116**: (corux) file.replace fails if repl string is an invalid regex and append/prepend is used

- **PR #26088**: (jacobhammons) Master finger

- **PR #26047**: (jacobhammons) Updated windows download links in the docs to https://repo.saltstack.com

- **PR #26000**: (driskell) Implement full event caching for subscribed tags @ 2015-08-10T18:57:17Z

- **ISSUE #26024**: (jpic) lxc_conf_unset in cloud.profile is ignored

- **PR #26177**: (rallytime) Back-port #26147 to 2015.5 @ 2015-08-10T18:22:01Z

- **PR #26179**: (rallytime) Back-port #25404 to 2015.5 @ 2015-08-10T18:21:50Z

- **ISSUE #21082**: (clinta) master_type failover does not failover on DNS errors | refs: #25404

- **PR #26147**: (martinhoefling) Fixes #26024 | refs: #26177

- **PR #26172**: (nmadhok) [Backport] Make sure variable is a dictionary before popping something from it. @ 2015-08-10T16:42:50Z

- **ISSUE #26162**: (nmadhok) VMware cloud driver create function failing with traceback on latest develop | refs: #26163 #26172

- **PR #26163**: (nmadhok) Make sure variable is a dictionary before popping something from it.

- **PR #26168**: (cachedout) Fix slack docs @ 2015-08-10T14:57:18Z

- **ISSUE #26098**: (rdinoff) SALT.STATES.SLACK Doc update | refs: #26168

- **PR #26127**: (garethgreenaway) Fixes to salt.utils.http related to cp.get_file_str bug. @ 2015-08-10T14:38:25Z

- **ISSUE #24106**: (nvx) fileclient.py#get_url ignores HTTP Auth again (2015.5 regression) | refs: #26127

- **PR #26140**: (nmadhok) VMware cloud driver fixes @ 2015-08-10T13:15:58Z

- **ISSUE #26141**: (nmadhok) salt-cloud VMware driver fails with error in parsing configuration file | refs: #26140

- **ISSUE #25809**: (o-sleep) vmware cloud module error message | refs: #26140

2658 Chapter 18. Release Notes
ISSUE #25625: (steverweber) cloud vmware driver does not provide mac_address unless vmware tools is running | refs: #26137 #26140

• PR #26137: (steverweber) use device mac address if vmtools not active @ 2015-08-09T03:53:36Z

• ISSUE #25625: (steverweber) cloud vmware driver does not provide mac_address unless vmware tools is running | refs: #26137 #26140

• PR #26119: (jody) Backport eauth bugfix to 2015.5 @ 2015-08-09T03:53:36Z

• PR #26135: (cro) Fix proxy minions in 2015.5 and significantly update documentation. @ 2015-08-09T03:53:36Z

• PR #26132: (jfindlay) Back-port #25984 in salt/modules/pkgng.py and salt/states/pkg.py @ 2015-08-08T21:05:34Z

• PR #26133: (amontalban) Fixed #25915 in salt/modules/pkgng.py and salt/states/pkg.py @ 2015-08-08T21:05:05Z

• ISSUE #25915: (ari) FreeBSD pkg install fails

• PR #26111: (anlutro) Better error messages when virtualenv creation fails @ 2015-08-07T21:42:09Z

• PR #26110: (jfindlay) check for sources before adding them to cmd str @ 2015-08-07T21:42:09Z

• PR #26093: (freedba) archive.tar bug | refs: #26110

• PR #26106: (vr-jack) Update __init__.py @ 2015-08-07T21:05:34Z

• PR #26101: (techhat) Fix string checking in s3fs @ 2015-08-07T21:05:34Z

• PR #26080: (cachedout) Update docs to remove state.over @ 2015-08-06T23:35:26Z

• PR #26079: (freedba) archive.tar bug | refs: #26110

• PR #26078: (jfindlay) fix autoruns.list looking in wrong directory @ 2015-08-06T23:35:26Z

• PR #26065: (s0undt3ch) [2015.5] Update to latest bootstrap stable release v2015.06.08 @ 2015-08-06T23:35:26Z

• PR #26061: (gmcwhistler) Patch for issue #25994 @ 2015-08-06T23:35:26Z

• PR #26060: (jfindlay) fix autoruns.list looking in wrong directory @ 2015-08-06T23:35:26Z

• PR #26058: (opdude) Fix choco version on chocolatey versions below 0.9.9 @ 2015-08-06T23:35:26Z

• PR #26056: (terminalmage) fix syntax errors introduced in 0f776c13 | refs: #26065

• ISSUE #2594: (gmcwhistler) module.ilo tempfile creation in __execute_cmd results in TypeError: cannot concatenate `str' and `int' objects

• PR #26048: (jacobhammons) Updated windows download links in the docs to https://repo.saltstack.com @ 2015-08-05T22:59:50Z
• **PR #26044**: ([rallytime](#)) Make sure the key we're comparing is also lowercase @ 2015-08-05T19:23:54Z  
  - **ISSUE #25616**: ([rallytime](#)) [2015.5] Provisioning Linodes Stacktraces | refs: #26044

• **PR #26042**: ([jfindlay](#)) fix test mode logic in state docs @ 2015-08-05T19:23:07Z

• **PR #26036**: ([nicholascapo](#)) survey.hash: Remove manually printed text @ 2015-08-05T19:21:59Z  
  - **ISSUE #24460**: ([nicholascapo](#)) Survey runner does not follow --out flag | refs: #26036

• **PR #26030**: ([jfindlay](#)) Fix a bug in choco version that returned odd data @ 2015-08-05T16:30:25Z

• **PR #26032**: ([jfindlay](#)) add test logic to state result doc @ 2015-08-05T16:28:32Z

• **PR #26031**: ([alekti](#)) Revert `Add file as supported protocol for file source_hash. Fixes #23764` @ 2015-08-05T15:32:01Z  
  - **ISSUE #23764**: ([es1o](#)) source_hash from local file is not supported. | refs: #25750

• **PR #26021**: ([anlutro](#)) Documentation: Specify versionadded for git.present shared argument @ 2015-08-05T14:17:38Z

• **PR #26020**: ([alekti](#)) Correctly resolve conflict merging pull 25750 to 2015.5 @ 2015-08-05T14:16:58Z  
  - **ISSUE #22241**: ([masterkorp](#)) Salt master not properly generating the map | refs: #25358
  - **PR #25750**: ([alekti](#)) Add file as supported protocol for file source_hash. Fixes #25701. | refs: #26020

• **PR #26016**: ([basepi](#)) Revert `Deep merge of pillar lists" @ 2015-08-05T04:59:52Z  
  - **ISSUE #22241**: ([masterkorp](#)) Salt master not properly generating the map | refs: #25358
  - **PR #25538**: ([dkiser](#)) Deep merge of pillar lists | refs: #26016

• **PR #25992**: ([twangboy](#)) Refactor win_system.py @ 2015-08-05T04:54:18Z  
  - **ISSUE #12255**: ([eliasp](#)) `system.set_computer_desc’ fails with non-ASCII chars | refs: #25992
  - **ISSUE #3**: ([thatch45](#)) libvirt module

• **PR #25990**: ([twangboy](#)) Fixed regex to account for comment character followed by whitespace @ 2015-08-04T22:28:11Z  
  - **ISSUE #25948**: ([twangboy](#)) Fix uncomment function to handle spaces | refs: #26002

• **PR #25970**: ([jfindlay](#)) accept addition of layman overlay @ 2015-08-04T15:42:28Z

• **PR #25971**: ([basepi](#)) [2015.5] salt.modules.reg Add spaces for strings split across multiple lines @ 2015-08-04T15:39:48Z

• **PR #25996**: ([attiasr](#)) fix msiexec package remove @ 2015-08-04T15:42:28Z

• **PR #25966**: ([rallytime](#)) Back-port #25976 to 2015.5 @ 2015-08-04T14:36:36:53Z  
  - **PR #25976**: ([fleaflicker](#)) Typo in help output | refs: #25990

• **PR #25967**: ([rallytime](#)) Back-port #25864 to 2015.5 @ 2015-08-03T18:48:26Z

• **PR #25895**: ([basepi](#)) [2015.5] Merge forward from 2014.7 to 2015.5 @ 2015-08-03T17:12:37Z
- ISSUE #23764: (es1o) source_hash from local file is not supported. | refs: #25750
- PR #25750: (alekti) Add file as supported protocol for file source_hash. Fixes #25701. | refs: #26020
- PR #25704: (cachedout) Ensure prior alignment with master_type in 2014.7
- PR #25657: (MrCitron) Add the ability to specify a base pattern for carbon returner
- PR #25633: (AkhterAli) Update updater.py

- PR #25941: (jfindlay) add timelib to dependency versions @ 2015-08-03T12:23:42Z
  - ISSUE #25850: (ssgward) Need to add packages to --versions-report | refs: #25941
- PR #25951: (garethgreenaway) Log when event.fire and event.fire_master fail. @ 2015-08-03T00:19:45Z
- PR #25942: (jfindlay) typo in minion doc @ 2015-07-31T23:05:05Z
  - ISSUE #25838: (grep4linux) docs disable_modules documentation typo | refs: #25942
- PR #25938: (jacobhammons) Doc on using syndic with multimaster @ 2015-07-31T23:05:05Z
  - PR #25927: (jacksontj) Multi syndic | refs: #25938
- PR #25848: (twangboy) Added allusers="1" when installing msi @ 2015-07-31T20:33:17Z
  - ISSUE #25839: (twangboy) ALLUSERS="1" should be a default when installing MSI's | refs: #25848
- PR #25938: (jacobhammons) clarify and expand syndic docs @ 2015-07-31T20:01:23Z
- PR #25922: (jacksontj) Pass actual renderers to the Reactor's Compiler @ 2015-07-31T20:00:17Z
  - ISSUE #25852: (UtahDave) Salt loader is not loading Salt vars in reactor python renderer | refs: #25927
- PR #25921: (cachedout) Handle non-ascii in state log @ 2015-07-31T17:41:30Z
  - ISSUE #25810: (nvx) winpkg highstate fails when a new package name contains a unicide character | refs: #25921
- PR #25919: (TheBigBear) Minor update to msi un-installer info @ 2015-07-31T17:39:48Z
- PR #25905: (rallytime) Back-port #25982 to 2015.5 @ 2015-07-30T23:24:19Z
  - PR #25892: (TheBigBear) Update 7-zip msi un-installer instructions | refs: #25905
- PR #25890: (rallytime) Back-port #25698 to 2015.5 @ 2015-07-30T23:12:09Z
  - ISSUE #25577: (yellow1912) Wrong indentation in document | refs: #25696
  - PR #25698: (rallytime) Back-port #25659 to 2015.8 | refs: #25890
  - PR #25696: (AkhterAli) Update schedule.py
  - PR #25659: (isbm) Bugfix: crash at getting non-existing repo | refs: #25698
- PR #25894: (jacobhammons) Minor doc bug fixes @ 2015-07-30T23:02:34Z
  - ISSUE #25650: (jacksontj) state.running documentation is incorrect | refs: #25894
  - ISSUE #24042: (whiteinge) The state_events setting is not documented | refs: #25894
  - ISSUE #23788: (k5jj) functions in drac.py module do not match documentation | refs: #25894
  - ISSUE #21296: (Lothiraldan) Possible minion enumeration using saltutil.find_job and eauth | refs: #25894
- PR #25877: (rallytime) Protect against passing a map file in addition to VM names with --destroy @ 2015-07-30T21:55:45Z
  - ISSUE #24036: (arthurlogilab) [salt-cloud] Protect against passing command line arguments as names for the --destroy command in map files | refs: #25877
PR #25870: (rallytime) Back-port #25824 to 2015.5 @ 2015-07-30T21:54:35Z
- PR #25824: (klyr) Fix get_managed() in file.py module for local files | refs: #25870

PR #25885: (torrant) Update Debian changelog @ 2015-07-30T20:05:59Z

PR #25869: (rallytime) Back-port #25788 to 2015.5 @ 2015-07-30T17:33:33Z
- ISSUE #25447: (spo0nman) SaltMaster is crippled with Minion Re-Authentication | refs: #25869

PR #25868: (rallytime) Fix typo in salt.states.saltmod.function doc string | refs: #25868

PR #25855: (puneetc) Patch 3 | refs: #25855

PR #25846: (jfindlay) rework deprecation documentation for release names @ 2015-07-30T15:33:27Z
- ISSUE #25827: (0xf10e) "Deprecating Code" doesn't mention Usage of warn_until() w/ Release Names | refs: #25827

PR #25840: (jfindlay) add note to winrepo state docs about required grain @ 2015-07-30T14:38:27Z
- ISSUE #25801: (themalkolm) Update docs that salt.states.winrepo requires roles:salt-master in grains. | refs: #25840

PR #25853: (davidjb) Make ssh-id-wrapper accessible to non-root users @ 2015-07-30T16:49:47Z
- ISSUE #19532: (stolendog) salt-ssh running git clone with not root user | refs: #25853

PR #25862: (rallytime) Fix get_managed() in file.py module for local files | refs: #25862

PR #25871: (rallytime) Back-port #25829 to 2015.5 @ 2015-07-30T17:33:43Z
- PR #25829: (peterdemin) Fixed typo in salt.states.saltmod.function doc string | refs: #25871

PR #25866: (jfindlay) expand minion reauth scalability documentation @ 2015-07-30T15:33:17Z
- ISSUE #25447: (spo0nman) SaltMaster is crippled with Minion Re-Authentication | refs: #25866

PR #25807: (rallytime) Provide helpful error when using actions with a mapfile @ 2015-07-29T15:30:15Z
- ISSUE #22699: (arthurlogilab) salt-cloud fails on KeyError when given a nonexistent action | refs: #25807

PR #25818: (jfindlay) fix autoreuns list @ 2015-07-29T15:29:20Z

PR #25826: (anlutro) Check that `onchanges` is a list @ 2015-07-29T15:00:28Z

PR #25798: (twangboy) Fixed stacktrace on package name not found @ 2015-07-28T22:40:14Z
- ISSUE #25288: (UtahDave) cp.push fails to recreate empty files. | refs: #25833

PR #25797: (twangboy) Changed repocache back to cached_repo @ 2015-07-28T22:39:32Z
- ISSUE #25437: (lorengordon) Stacktrace on Windows when running pkg.list_pkgs | refs: #25598 #25763
- PR #25763: (twangboy) Fix 25437 | refs: #25797

- PR #25793: (rallytime) Back-port #25730 to 2015.5 @ 2015-07-28T19:37:34Z
  - PR #25730: (sjorge) patchelf lives in pkgsrc | refs: #25793

- PR #25792: (rallytime) Back-port #25688 to 2015.5 @ 2015-07-28T19:37:17Z
  - PR #25688: (bcclermont) Don't acquire lock if there is no formatter | refs: #25792

- PR #25796: (cachedout) Remove debug from docs @ 2015-07-28T17:35:59Z

- PR #25749: (jahamn) Allow zpool.create on character devices @ 2015-07-28T16:01:40Z
  - ISSUE #24920: (voileux) module.zpool.create on character device is not possible by salt | refs: #25749

- PR #25792: (rallytime) Back-port #25688 to 2015.5 @ 2015-07-28T19:37:27Z
  - PR #25688: (bcclermont) Don't acquire lock if there is no formatter | refs: #25792

- PR #25796: (cachedout) Remove debug from docs @ 2015-07-28T17:35:59Z

- PR #25688: (twangboy) Fixed regex issues with comment and uncomment @ 2015-07-28T15:29:49Z

18.2.31 Salt 2015.5.6 Release Notes

Version 2015.5.6 is a bugfix release for 2015.5.0.

Security Fixes

CVE-2015-6941 - win_useradd module and salt-cloud display passwords in debug log

Updated the win_useradd module return data to no longer include the password of the newly created user. The password is now replaced with the string XXX-REDACTED-XXX. Updated the Salt Cloud debug output to no longer display win_password and sudo_password authentication credentials.

CVE-2015-6918 - Git modules leaking HTTPS auth credentials to debug log

Updated the Git state and execution modules to no longer display HTTPS basic authentication credentials in loglevel debug output on the Salt master. These credentials are now replaced with REDACTED in the debug output. Thanks to Andreas Stieger <asteiger@suse.com> for bringing this to our attention.
Changes for v2015.5.5..v2015.5.6

Total Merges: 144

Changes:

- PR #27557: (jfindlay) add doc motivating mine vs grains
- PR #27515: (jfindlay) save iptables rules on SuSE
- PR #27509: (jfindlay) tell the user why the gluster module does not work
- PR #27379: (jfindlay) document and check dict type for pip env_vars
- PR #27516: (basepi) [2015.5] Merge forward from 2014.7 to 2015.5
- PR #27472: (cachedout) Change recommended schema for data field in mysql event table
- PR #27468: (cachedout) Fix 27351
- PR #27479: (aboe76) fix locale on opensuse and suse `#27438`_
- PR #27483: (rallytime) Outputters should sync to output, not outputters, on the minion.
- PR #27484: (rallytime) Back-port #27434 and #27470 to 2015.5
- PR #27469: (twangboy) Added quotes to version numbers example
- PR #27467: (cachedout) file.managed: check contents_{pillar|grain} result
- PR #27419: (rallytime) Amend error log to include multiple tips for troubleshooting.
- PR #27426: (rallytime) Don't stacktrace if there are conflicting id errors in highstate
- PR #27408: (rallytime) Fix avail_locations function for the softlayer_hw driver in 2015.5
- PR #27410: (jacobhammons) Fix css layout Refs `#27389`_
- PR #27336: (rallytime) [2015.5] Fixup salt-cloud logging
- PR #27358: (lorengordon) Escape search replacement text, fixes `#27356`_
- PR #27345: (rallytime) Allow use of rst header links by separating options out from yaml example
- PR #26903: (bersace) Review defaults.get
- PR #27317: (efficks) State unzip should use unzip command instead of unzip_cmd.
- PR #27309: (rallytime) Change a value list to a comma-separated string in boto_route53.present
- PR #27311: (jfindlay) discuss replacement occurrences in file doc
- PR #27310: (basepi) [2015.5] Merge forward from 2014.7 to 2015.5
- PR #27308: (terminalmage) Fix refresh_db regression in yumpkg.py
- PR #27286: (terminalmage) Add a configurable timer for minion return retries
- PR #27278: (rallytime) Back-port #27256 to 2015.5
- PR #27277: (rallytime) Back-port #27230 to 2015.5
- PR #27253: (jfindlay) 2015.5 -> 2015.5.0
- PR #27244: (garethgreenaway) Exception in cloud.ec2.create_snapshot
- PR #27231: (jfindlay) only write cron file if it is changed
• PR #27233: (basepi) [2015.5] Add stub release notes for 2015.5.6
• PR #27208: (basepi) [2015.5] Add test.nop state
• PR #27201: (jfindlay) rename hash_hostname to hash_known_hosts
• PR #27214: (jacksontj) Correctly support https, port 443 is not a requirement
• PR #27172: (rallytime) Back-port #27150 to 2015.5
• PR #27194: (rallytime) Back-port #27180 to 2015.5
• PR #27176: (basepi) [2015.5] Merge forward from 2014.7 to 2015.5
• PR #27170: (rallytime) UpdateGeingStartedwithGCEdocstousecloud.profilesorcloud.profiles.dexamples
• PR #27167: (rallytime) Back-port #27148 to 2015.5
• PR #27168: (techhat) Add further gating of impacket library
• PR #27166: (rallytime) Allow a full-query for EC2, even if there are no profiles defined
• PR #27162: (rallytime) Be explicit in using `"SoftLayer" for service queries in SoftLayer drivers
• PR #27149: (twangboy) Fixed problem with add/remove path
• PR #27147: (rallytime) Enforce bounds in the GCE Regex
• PR #27128: (eguven) don’t show diff for test run if show_diff=False
• PR #27116: (jacobhammons) Update latest to 2015.8, 2015.5 is now previous
• PR #27033: (jfindlay) Merge #27019
• PR #26942: (Arabus) Fix docker.run
• PR #26977: (abh) Add support for PEERNTTP network interface configuration
• PR #27023: (jfindlay) add test support for htpasswd state mod
• PR #27074: (twangboy) Replaced password with redacted when displayed
• PR #27073: (rallytime) Remove `"use develop branch" warning from LXC tutorial
• PR #27054: (rallytime) Back-port #27029 to 2015.5
• PR #27053: (rallytime) Back-port #26992 to 2015.5
• PR #27052: (rallytime) Back-port #26930 to 2015.5
• PR #27049: (johanek) Run repoquery less
• PR #27070: (stanislavb) Deprecate salt.utils.iam in Carbon
• PR #27030: (jfindlay) Backport #26938
• PR #27025: (cachedout) Better try and error handling for prep_jid
• PR #27035: (terminalmage) useradd.py: Use contextmanager to prevent leaked filehandles
• PR #27034: (rallytime) Update softlayer docs for where to find apikey
• PR #27024: (rallytime) Back-port #27004 to 2015.5
• PR #27027: (rallytime) Back-port #27013 to 2015.5
• PR #27026: (rallytime) Back-port #27011 to 2015.5
• PR #26972: (twangboy) Catch the 404 error from fileclient
• PR #26951: (terminalmage) Fix timezone module for CentOS
- PR #26875: (marccardinal) LXC gateway provisioned only when IP is provided
- PR #26997: (twangboy) Fixed symlinks for windows (don’t use user root)
- PR #27001: (twangboy) Added CLI Example for reg.delete_key_recursive
- PR #26996: (jacobhammons) Beacon doc updates
- PR #26868: (joejulian) Use the actual device name when checking vgdisplay
- PR #26955: (dsumsky) S3 ext_pillar module has broken caching mechanism (backport to 2015.5)
- PR #26987: (rallytime) Back-port #26966 to 2015.5
- PR #26915: (rallytime) Update Joyent Cloud Tests
- PR #26971: (rallytime) Fix a couple of typos in reactor docs
- PR #26976: (thatch45) Revert "file.symlink gets windows account instead of root"
- PR #26975: (whiteinge) Remove mocks from rest_cherrypy integration tests; fix groups check bug
- PR #26899: (twangboy) file.symlink gets windows account instead of root
- PR #2660: (rallytime) Fix bash code block formatting in CherryPy netapi docs
- PR #26940: (rallytime) Fix minor doc typo in client api
- PR #26871: (rallytime) Back-port #26852 to 2015.5
- PR #26851: (jacobhammons) states/pkgrepo examples, suse installation updates
- PR #26817: (jfindlay) modify groupadd for rhel 5
- PR #26824: (pravka) [salt-cloud] Fix creating droplet from snapshot in digital_ocean provider
- PR #26823: (joejulian) use dbus instead of localectl
- PR #26820: (jfindlay) add default param in _parse_localectl in locale mod
- PR #26821: (twangboy) Fixed user.rename function in windows
- PR #26803: (twangboy) Added check for PyMySQL if MySQLdb import fails
- PR #26815: (jfindlay) stringify linode id before performing str actions
- PR #26800: (jacobhammons) Doc bug fixes
- PR #26793: (rallytime) Don’t stacktrace if ‘`name`’ is specified as a minion id in a map file
- PR #26790: (rallytime) Update Saltify docs to be more accurate and helpful
- PR #26787: (jfindlay) merge #26775
- PR #26759: (terminalmage) Backport PR #26726 to 2015.5 branch
- PR #26768: (garethgreenaway) Fixes to ipset in 2015.5 for `#26628`
- PR #26753: (jfindlay) import elementree from _compat in ilo exec mod
- PR #26736: (twangboy) Changed import from smbconnection to smb3
- PR #26714: (jfindlay) add exception placeholder for older msgpacks
- PR #26710: (rallytime) Update GCE driver to return True, False or a new name in __virtual__()
- PR #26709: (rallytime) Ensure VM name is valid before trying to create Linode VM
- PR #26617: (terminalmage) Fix Windows failures in pip module due to raw string formatting
- PR #26700: (kev009) Ignore the first element of kern.disks split, which is the sysctl name
• PR #26695: (terminalmage) Better HTTPS basic auth redaction for 2015.5 branch
• PR #26694: (terminalmage) Backport #26693 to 2015.5
• PR #26681: (basepi) [2015.5] Merge forward from 2014.7 to 2015.5
• PR #26676: (rallytime) Back-port #26648 to 2015.5
• PR #26677: (rallytime) Back-port #26653 to 2015.5
• PR #26675: (rallytime) Back-port #26631 to 2015.5
• PR #26655: (cheng0919) Update win_dns_client.py
• PR #26662: (jacobhammons) update version to 2015.5
• PR #26651: (jfindlay) add 2015.5.4 notes to 2015.5.5 notes
• PR #26525: (jfindlay) document check_file_meta args, remove unused arg
• PR #26561: (stanislavb) Leave salt.utils.s3 location fallback to salt.utils.aws
• PR #26573: (rallytime) Don't stacktrace if using private_ips and delete_sshkeys together
• PR #26563: (rallytime) Fix error detection when salt-cloud config is missing a master's address
• PR #26641: (basepi) [2015.5] Merge forward from 2014.7 to 2015.5
• PR #26620: (rallytime) Also add -Z to script args for cloud tests
• PR #26618: (rallytime) Add script_args: `-P' to Ubuntu 14 profiles for nightly cloud tests
• PR #26612: (rallytime) Use an available image to test against
• PR #26576: (rallytime) Ensure GCE and EC2 configuration checks are correct
• PR #26580: (rallytime) Avoid race condition when assigning floating IPs to new VMs
• PR #26581: (terminalmage) Skip tests that don't work with older mock
• PR #26591: (rallytime) Back-port #26554 to 2015.5
• PR #26565: (cachedout) Fix many errors with __virtual__ in tests
• PR #26553: (rallytime) Back-port #26548 to 2015.5
• PR #26552: (rallytime) Back-port #26542 to 2015.5
• PR #26551: (rallytime) Back-port #26539 to 2015.5
• PR #26549: (rallytime) Back-port #26524 to 2015.5
• PR #26527: (jfindlay) check exists and values in boto_elb listeners
• PR #26446: (stanislavb) Fetch AWS region from EC2 instance metadata
• PR #26546: (nmadhok) Do not raise KeyError when calling avail_images if VM/template is in disconnected state
• PR #26537: (jfindlay) Merge #26481
• PR #26528: (zmalone) Fixing encrypt to instructions in the 2015.5 branch
18.2.32 Salt 2015.5.7 Release Notes

Note: A significant orchestrate issue #29110 was discovered during the release process of 2015.5.7, so it has not been officially released. Please use 2015.5.8 instead.

• PR #28110: (terminalmage) Add explanation of file_client: local setting masterless mode
• PR #28109: (rallytime) Add created reactor event to lxc cloud driver
• PR #27996: (rallytime) Don’t fail if pip package is already present and pip1 is installed
• PR #28056: (rallytime) Back-port #28033 to 2015.5
• PR #28059: (rallytime) Back-port #28040 to 2015.5
• PR #28047: (cachedout) Restore FTP functionality to file client
• PR #28032: (twangboy) Fixed win_path.py
• PR #28037: (rallytime) Back-port #28003 to 2015.5
• PR #28031: (jacobhammons) Updated release notes with additional CVE information
• PR #28008: (jfindlay) platform independent line endings in hosts mod
• PR #28012: (rallytime) Clean up stack trace when something goes wrong with minion output
• PR #27995: (jacobhammons) added link to grains security FAQ to targeting and pillar topics.
• PR #27986: (jacobhammons) Changed current release to 5.6 and added CVE to release notes
• PR #27913: (pass-by-value) Set default
• PR #27876: (terminalmage) 2015.5 branch: Fix traceback when 2015.8 git ext_pillar config schema used
• PR #27726: (jfindlay) deprecate hash_hostname in favor of hash_known_hosts
• PR #27776: (jfindlay) return message when local jobs_cache not found
• PR #27766: (jfindlay) better check for debian userdel error
• PR #27758: (iggy) Remove redundant text from syslog returner
• PR #27841: (terminalmage) Detect Manjaro Linux as Arch derivative
• PR #27852: (rallytime) Back-port #27806 to 2015.5
• PR #27838: (basepi) [2015.5] Fix highstate outputter for jobs.lookup_jid
• PR #27791: (eguven) 2015.5 postgres_user groups backport
• PR #27759: (basepi) [2015.5] Merge forward from 2014.7 to 2015.5
• PR #27732: (jacobhammons) update docs for __virtual__ and __virtualname__
• PR #27747: (Sacro) Chocolatey doesn't have a help command.
• PR #27733: (jacobhammons) hardening topic - updates to docs.saltstack.com theme
• PR #27706: (jacobhammons) Assorted doc bugs
• PR #27695: (rallytime) Back-port #27671 to 2015.5
• PR #27524: (jfindlay) parse pkgng output in quiet mode for >= 1.6.1
• PR #27686: (rallytime) Back-port #27476 to 2015.5
• PR #27684: (rallytime) Back-port #27656 to 2015.5
• PR #27683: (rallytime) Back-port #27659 to 2015.5
• PR #27682: (rallytime) Back-port #27566 to 2015.5
• PR #27681: (rallytime) Back-port #25928 to 2015.5
• PR #27680: (rallytime) Back-port #27535 to 2015.5
• PR #27442: (JaseFace) Ensure we pass on the enable setting if present, or use the default of True if not in build_schedule_item()
• PR #27641: (rallytime) Gate the psutil import and add depends doc for diskusage beacon
• PR #27644: (rallytime) Back-port #27640 to 2015.5
• PR #27612: (rallytime) Fix GCE external_ip stacktraces in 2015.5
• PR #27568: (jacobhammons) regenerated man pages
18.2.33 Salt 2015.5.8 Release Notes

Security Fix

CVE-2015-8034: Saving state.sls cache data to disk with insecure permissions

This affects users of the state.sls function. The state run cache on the minion was being created with incorrect permissions. This file could potentially contain sensitive data that was inserted via jinja into the state SLS files. The permissions for this file are now being set correctly. Thanks to @zmalone for bringing this issue to our attention.

Generated at: 2015-11-23T23:16:23Z

Total Merges: 118

Changes:

- PR #29128: (cachedout) Set a safer default value for ret in saltmod
- PR #29122: (cachedout) Fix broken state orchestration
- PR #29096: (rallytime) Back-port #29093 to 2015.5
- PR #29084: (rallytime) Back-port #29055 to 2015.5
- PR #29083: (rallytime) Back-port #29053 to 2015.5
- PR #28932: (twangboy) Fixed user.present / user.absent in windows
- PR #29011: (rallytime) Back-port #28630 to 2015.5
- PR #28982: (basepi) [2015.5] Merge forward from 2014.7 to 2015.5
- PR #28949: (whiteinge) Add sync_sdb execution function
- PR #28930: (twangboy) Added missing import mmap required by file.py
- PR #28908: (rallytime) A couple of spelling fixes for doc conventions page.
- PR #28902: (whiteinge) Fix missing JSON support for /keys endpoint
- PR #28897: (rallytime) Back-port #28873 to 2015.5
- PR #28871: (basepi) [2015.5] Fix command generation for mdadm.assemble
- PR #28864: (jfindlay) add 2015.5.7 release notes
- PR #28731: (garethgreenaway) Fixes to salt scheduler in 2015.5, ensuring that return_job is only used on minion scheduler
- PR #28857: (rallytime) Back-port #28851 to 2015.5
- PR #28856: (rallytime) Back-port #28853 to 2015.5
- PR #28832: (basepi) [2015.5] Backport #28826
- PR #28833: (basepi) [2015.5] Increase the default gather_job_timeout
- PR #28829: (basepi) [2015.5] Merge forward from 2014.7 to 2015.5
- PR #28756: (MrCitron) Fix `#25775`
- PR #28786: (chrigl) closes `#28783`
• PR #28776: (rallytime) Back-port #28740 to 2015.5
• PR #28760: (dmyerscough) Fixing CherryPy key bug

18.2.34 Salt 2015.5.9 Release Notes

Extended changelog courtesy of Todd Stansell (https://github.com/tjstansell/salt-changelogs):

Generated at: 2016-01-08T23:02:31Z

Total Merges: 44

Changes:

- PR #30237: (jacobhammons) Updated man pages and doc version for 2015.5.9
- PR #30207: (rallytime) Use correct spacing in rabbitmq state examples
- PR #30191: (jacobhammons) Updated doc site banners
- PR #30125: (abednarik) Update user home event when createhome is set to False
- PR #30127: (jsutton) Updating documentation and example minion config for random_master/master_shuffle.
- PR #30110: (markckimball) Fixed flag sent to salt.utils.http in order for verify_ssl to work correctly
- PR #30093: (zmalone) Noting that file_roots and `state tree` should both be avoided
- PR #30097: (cachedout) Note concern about cleartext password in docs for shadow.gen_password
- PR #30089: (mprezioso) Fixes terminology and adds more accurate details about the algorithms
- PR #30086: (cachedout) Document that gitfs needs recent libs
- PR #30070: (cachedout) Add documentation on debugging salt-ssh
- PR #30059: (mprezioso) Fixes wrong function scope
• PR #30025: (jtand) Skipping some Boto tests until resolved moto issue
• PR #29949: (aletourneau) Enhanced netscaler docstring
• PR #29941: (cachedout) Fix spelling error in boto_vpc
• PR #29908: (cachedout) Allow kwargs to be passed to pacman provide for update func
• PR #29909: (abednarik) FreeBSD pkgng fix for non-interactive install.
• PR #29730: (rallytime) Update docker-py version requirement to 0.6.0 for dockerio.py files
• PR #29715: (rallytime) Install correct package version, if provided, for npm state.
• PR #29721: (terminalmage) Fix display of multiline strings when iterating over a list
• PR #29646: (rallytime) Don’t stacktrace on kwargs.get if kwargs=None
• PR #29673: (rallytime) Default value should be False and not `False`
• PR #29527: (jfindlay) 2015.5.7 notes: add note about not being released
• PR #29539: (basepi) [2015.5] Merge forward from 2014.7 to 2015.5
• PR #29504: (rallytime) Document userdata_file option for EC2 driver
• PR #29507: (rallytime) Switch volumes and del_*_on_destroy example ordering
• PR #29469: (abednarik) Added Documentation note in salt cloud.
• PR #29461: (dmyerscough) Fix resource limits, systemd sets the default too small
• PR #29439: (rallytime) Back-port #28656 to 2015.5
• PR #29418: (jacobhammons) Added CVE 2015-8034 to 2015.5.8 release notes
• PR #29389: (jacobhammons) updated version numbers in documentation
• PR #28501: (twangboy) Requested fixes for 26898
• PR #29348: (jtand) Fixes an file.search on python2.6
• PR #29336: (rallytime) Back-port #29276 to 2015.5
• PR #29333: (rallytime) Back-port #29280 to 2015.5
• PR #29316: (basepi) [2015.5] Merge forward from 2014.7 to 2015.5
• PR #29216: (clan) size is 0 doesn’t mean no data, e.g. /proc/version
• PR #29261: (attiasr) fix incorrect reinstallation of windows pkg
• PR #29214: (cro) Doc for salt.utils.http should say verify_ssl not ssl_verify.
• PR #29204: (lorensgordon) Use os.path.join to return full path to ca bundle

18.2.35 Salt 2014.7.0 Release Notes - Codename Helium

This release is the largest Salt release ever, with more features and commits then any previous release of Salt. Everything from the new RAET transport to major updates in Salt Cloud and the merging of Salt API into the main project.

**Important:** The Fedora/RHEL/CentOS salt-master package has been modified for this release. The following components of Salt have been broken out and placed into their own packages:
- salt-syndic
• salt-cloud
• salt-ssh

When the **salt-master** package is upgraded, these components will be removed, and they will need to be manually installed.

---

**Important**: Compound/pillar matching have been temporarily disabled for the **mine** and **publish** modules for this release due to the possibility of inferring pillar data using pillar glob matching. A proper fix is now in the 2014.7 branch and scheduled for the 2014.7.1 release, and compound matching and non-globbing pillar matching will be re-enabled at that point. Compound and pillar matching for normal salt commands are unaffected.

---

**New Transport!**

**RAET Transport Option**

This has been a HUGE amount of work, but the beta release of Salt with RAET is ready to go. RAET is a reliable queuing transport system that has been developed in partnership with a number of large enterprises to give Salt an alternative to ZeroMQ and a way to get Salt to scale well beyond tens of thousands of servers. Unlike ZeroMQ, RAET is completely asynchronous in every aspect of its operation and has been developed using the flow programming paradigm. This allows for many new capabilities to be added to Salt in the upcoming releases.

Please keep in mind that this is a beta release of RAET and we hope for bugs to be worked out, performance to be better realized and more in the 2015.5.0 release.

Simply stated, users running Salt with RAET should expect some hiccups as we hammer out the update. This is a BETA release of Salt RAET.

For information about how to use Salt with RAET please see the *tutorial*.

**Salt SSH Enhancements**

Salt SSH has just entered a new league, with substantial updates and improvements to make salt-ssh more reliable and easier then ever! From new features like the ansible roster and files server backends to the new pypi salt-ssh installer to lowered deps and a swath of bugfixes, salt-ssh is basically reborn!

**Install salt-ssh Using pip**

Salt-ssh is now pip-installable!

[https://pypi.python.org/pypi/salt-ssh/](https://pypi.python.org/pypi/salt-ssh/)

Pip will bring in all of the required deps, and while some deps are compiled, they all include pure python implementations, meaning that any compile errors which may be seen can be safely ignored.

```
pip install salt-ssh
```
Saltfile Support

The new saltfile system makes it easy to have a user specific custom extended configuration.

Ext Pillar

Salt-ssh can now use the external pillar system. Making it easier then ever to use salt-ssh with teams.

No More sshpass

Thanks to the enhancements in the salt vt system, salt-ssh no longer requires sshpass to send passwords to ssh. This also makes the manipulation of ssh calls substantially more flexible, allowing for intercepting ssh calls in a much more fluid way.

Pure Python Shim

The salt-ssh call originally used a shell script to discover what version of python to execute with and determine the state of the ssh code deployment. This shell script has been replaced with a pure python version making it easy to increase the capability of the code deployment without causing platform inconsistency issues with different shell interpreters.

Custom Module Delivery

Custom modules are now seamlessly delivered. This makes the deployment of custom grains, states, execution modules and returners a seamless process.

CP Module Support

Salt-ssh now makes simple file transfers easier then ever! The cp module allows for files to be conveniently sent from the salt fileserver system down to systems.

More Thin Directory Options

Salt ssh functions by copying a subset of the salt code, or salt thin down to the target system. In the past this was always transferred to /tmp/salt and cached there for subsequent commands.

Now, salt thin can be sent to a random directory and removed when the call is complete with the -W option. The new -W option still uses a static location but will clean up that location when finished.

The default salt thin location is now user defined, allowing multiple users to cleanly access the same systems.
State System Enhancements

New Imperative State Keyword ``Listen"

The new listen and listen_in keywords allow for completely imperative states by calling the mod_watch() routine after all states have run instead of re-ordering the states.

Mod Aggregate Runtime Manipulator

The new mod_aggregate system allows for the state system to rewrite the state data during execution. This allows for state definitions to be aggregated dynamically at runtime.

The best example is found in the pkg state. If mod_aggregate is turned on, then when the first pkg state is reached, the state system will scan all of the other running states for pkg states and take all other packages set for install and install them all at once in the first pkg state.

These runtime modifications make it easy to run groups of states together. In future versions, we hope to fill out the mod_aggregate system to build in more and more optimizations.

For more documentation on mod_aggregate, see the documentation.

New Requisites: onchanges and onfail

The new onchanges and onchanges_in requisites make a state apply only if there are changes in the required state. This is useful to execute post hooks after changes occur on a system.

The other new requisites, onfail, and onfail_in, allow for a state to run in reaction to the failure of another state.

For more information about these new requisites, see the requisites documentation.

Global onlyif and unless

The onlyif and unless options can now be used for any state declaration.

Use names to expand and override values

The names declaration in Salt's state system can now override or add values to the expanded data structure. For example:

```
my_users:
  user.present:
    - names:
      - larry
      - curly
      - moe:
        - shell: /bin/zsh
        - groups:
          - wheel
        - shell: /bin/bash
```
Major Features

Scheduler Additions

The Salt scheduler system has received MAJOR enhancements, allowing for cron-like scheduling and much more granular timing routines. See here for more info.

Red Hat 7 Family Support

All the needed additions have been made to run Salt on RHEL 7 and derived OSes like CentOS and Scientific.

Fileserver Backends in salt-call

Fileserver backends like gitfs can now be used without a salt master! Just add the fileserver backend configuration to the minion config and execute salt-call. This has been a much-requested feature and we are happy to finally bring it to our users.

Amazon Execution Modules

An entire family of execution modules further enhancing Salt's Amazon Cloud support. They include the following:

- **Autoscale Groups** (includes state support) -- related: Launch Control states
- **Cloud Watch** (includes state support)
- **Elastic Cache** (includes state support)
- **Elastic Load Balancer** (includes state support)
- **IAM Identity and Access Management** (includes state support)
- **Route53 DNS** (includes state support)
- **Security Groups** (includes state support)
- **Simple Queue Service** (includes state support)

LXC Runner Enhancements

BETA The Salt LXC management system has received a number of enhancements which make running an LXC cloud entirely from Salt an easy proposition.

Next Gen Docker Management

The Docker support in Salt has been increased at least ten fold. The Docker API is now completely exposed and Salt ships with Docker data tracking systems which make automating Docker deployments very easy.

Peer System Performance Improvements

The peer system communication routines have been refined to make the peer system substantially faster.
SDB

Encryption at rest for configs

GPG Renderer

Encrypted pillar at rest

OpenStack Expansion

Lots of new OpenStack stuff

Queues System

Ran change external queue systems into Salt events

Multi Master Failover Additions

Connecting to multiple masters is more dynamic then ever

Chef Execution Module

Managing Chef with Salt just got even easier!

salt-api Project Merge

The salt-api project has been merged into Salt core and is now available as part of the regular salt-master package install. No API changes were made, the salt-api script and init scripts remain intact.
salt-api has always provided Yet Another Pluggable Interface to Salt (TM) in the form of ‘netapi’ modules. These are modules that bind to a port and start a service. Like many of Salt’s other module types, netapi modules often have library and configuration dependencies. See the documentation for each module for instructions.

See also:
The full list of netapi modules.

Synchronous and Asynchronous Execution of Runner and Wheel Modules

salt.runner.RunnerClient and salt.wheel.WheelClient have both gained complimentary cmd_sync and cmd_async methods allowing for synchronous and asynchronous execution of any Runner or Wheel module function, all protected using Salt’s external authentication system. salt-api benefits from this addition as well.

rest_cherrypy Additions

The rest_cherrypy netapi module provides the main REST API for Salt.
Web Hooks

This release of course includes the Web Hook additions from the most recent salt-api release, which allows external services to signal actions within a Salt infrastructure. External services such as Amazon SNS, Travis-CI, or GitHub, as well as internal services that cannot or should not run a Salt minion daemon can be used as first-class components in Salt’s rich orchestration capabilities.

The raw HTTP request body is now available in the event data. This is sometimes required information for checking an HMAC signature in order to verify a HTTP request. As an example, Amazon or GitHub requests are signed this way.

Generating and Accepting Minion Keys

The /key convenience URL generates a public and private key for a minion, automatically pre-accepts the public key on the Salt Master, and returns both keys as a tarball for download.

This allows for easily bootstrapping the key on a new minion with a single HTTP call, such as with a Kickstart script, all using regular shell tools.

```bash
curl -sS http://salt-api.example.com:8000/keys \
    -d mid=jerry \n    -d username=kickstart \n    -d password=kickstart \n    -d eauth=pam \n    -o jerry-salt-keys.tar
```

Fileserver Backend Enhancements

All of the fileserver backends have been overhauled to be faster, lighter, and more reliable. The VCS backends (gitfs, hgfs, and svnfs) have also received a lot of new features.

Additionally, most config parameters for the VCS backends can now be configured on a per-remote basis, allowing for global config parameters to be overridden for a specific gitfs/hgfs/svnfs remote.

New gitfs Features

Pygit2 and Dulwich

In addition to supporting GitPython, support for pygit2 (0.20.3 and newer) and dulwich have been added. Provided a compatible version of pygit2 is installed, it will now be the default provider. The config parameter gitfs_provider has been added to allow one to choose a specific provider for gitfs.

Mountpoints

Prior to this release, to serve a file from gitfs at a salt fileserver URL of salt://foo/bar/baz.txt, it was necessary to ensure that the parent directories existed in the repository. A new config parameter gitfs_mountpoint allows gitfs remotes to be exposed starting at a user-defined salt:// URL.
Environment Whitelisting/Blacklisting

By default, gitfs will expose all branches and tags as Salt fileserver environments. Two new config parameters, `gitfs_env_whitelist` and `gitfs_env_blacklist`, allow more control over which branches and tags are exposed. More detailed information on how these two options work can be found in the *Gitfs Walkthrough*.

Expanded Authentication Support

As of *pygit2* 0.20.3, both http(s) and SSH key authentication are supported, and Salt now also supports both authentication methods when using *pygit2*. Keep in mind that *pygit2* 0.20.3 is not yet available on many platforms, so those who had been using authenticated git repositories with a passphraseless key should stick to GitPython if a new enough *pygit2* is not yet available for the platform on which the master is running.

A full explanation of how to use authentication can be found in the *Gitfs Walkthrough*.

New **hgfs** Features

**Mountpoints**

This feature works exactly like its *gitfs* counterpart. The new config parameter is called `hgfs_mountpoint`.

**Environment Whitelisting/Blacklisting**

This feature works exactly like its *gitfs* counterpart. The new config parameters are called `hgfs_env_whitelist` and `hgfs_env_blacklist`.

New **svnfs** Features

**Mountpoints**

This feature works exactly like its *gitfs* counterpart. The new config parameter is called `svnfs_mountpoint`.

**Environment Whitelisting/Blacklisting**

This feature works exactly like its *gitfs* counterpart. The new config parameters are called `svnfs_env_whitelist` and `svnfs_env_blacklist`.

Configurable Trunk/Branches/Tags Paths

Prior to this release, the paths where trunk, branches, and tags were located could only be in directories named `''trunk'', ''branches'', and ''tags''` directly under the root of the repository. Three new config parameters (`svnfs_trunk`, `svnfs_branches`, and `svnfs_tags`) allow SVN repositories which are laid out differently to be used with svnfs.
New `minionfs` Features

**Mountpoint**

This feature works exactly like its `gitfs` counterpart. The new config parameter is called `minionfs_mountpoint`. The one major difference is that, as `minionfs` doesn’t use multiple remotes (it just serves up files pushed to the master using `cp.push`) there is no such thing as a per-remote configuration for `minionfs_mountpoint`.

**Changing the Saltenv from Which Files are Served**

A new config parameter (`minionfs_env`) allows `minionfs` files to be served from a Salt fileserver environment other than `base`.

**Minion Whitelisting/Blacklisting**

By default, `minionfs` will expose the pushed files from all minions. Two new config parameters, `minionfs_whitelist`, and `minionfs_blacklist`, allow `minionfs` to be restricted to serve files from only the desired minions.

**Pyobjects Renderer**

Salt now ships with with the `Pyobjects Renderer` that allows for construction of States using pure Python with an idiomatic object interface.

**New Modules**

In addition to the Amazon modules mentioned above, there are also several other new execution modules:

- Oracle
- Random
- Redis
- Amazon Simple Queue Service
- Block Device Management
- CoreOS etcd
- Genesis
- InfluxDB
- Server Density
- Twilio Notifications
- Varnish
- ZNC IRC Bouncer
- SMTP
New Runners

- Map/Reduce Style
- Queue

New External Pillars

- CoreOS etcd

New Salt-Cloud Providers

- Aliyun ECS Cloud
- LXC Containers
- Proxmox (OpenVZ containers & KVM)

Salt Call Change

When used with a returner, salt-call now contacts a master if --local is not specified.

Deprecations

salt.modules.virtualenv_mod

- Removed deprecated memoize function from salt/utils/__init__.py (deprecated)
- Removed deprecated no_site_packages argument from create function (deprecated)
- Removed deprecated check_dns argument from minion_config and apply_minion_config functions (deprecated)
- Removed deprecated OutputOptionsWithTextMixIn class from salt/utils/parsers.py (deprecated)
- Removed the following deprecated functions from salt/modules/ps.py: - physical_memory_usage (deprecated) - virtual_memory_usage (deprecated) - cached_physical_memory (deprecated) - physical_memory_buffers (deprecated)
- Removed deprecated cloud arguments from cloud_config function in salt/config.py: -vm_config (deprecated) - vm_config_path (deprecated)
- Removed deprecated libcloud_version function from salt/cloud/libcloudfuncs.py (deprecated)
- Removed deprecated CloudConfigMixIn class from salt/utils/parsers.py (deprecated)

18.2.36 Salt 2014.7.1 Release Notes

release 2015-01-12

Version 2014.7.1 is a bugfix release for 2014.7.0.

The changes include:
• Fixed gitfs serving symlinks in file.recurse states (issue 17700)
• Fixed holding of multiple packages (YUM) when combined with version pinning (issue 18468)
• Fixed use of Jinja templates in masterless mode with non-roots fileserver backend (issue 17963)
• Re-enabled pillar and compound matching for mine and publish calls. Note that pillar globbing is still disabled for those modes, for security reasons. (issue 17194)
• Fix for tty: True in salt-ssh (issue 16847)
• Fix for supervisord states when supervisor not installed to system python (issue 18044)
• Fix for logging when log_level='quiet' for cmd.run (issue 19479)

18.2.37 Salt 2014.7.2 Release Notes

release 2015-02-09

Version 2014.7.2 is a bugfix release for 2014.7.0.

The changes include:

• Fix erroneous warnings for systemd service enabled check (issue 19606)
• Fix FreeBSD kernel module loading, listing, and persistence kmod (issue 197151, issue 19682)
• Allow case-sensitive npm package names in the npm state. This may break behavior for people expecting the state to lowercase their npm package names for them. The npm module was never affected by mandatory lowercasing. (issue 20329)
• Deprecate the activate parameter for pip.install for both the module and the state. If bin_env is given and points to a virtualenv, there is no need to activate that virtualenv in a shell for pip to install to the virtualenv.
• Fix a file-locking bug in gitfs (issue 18839)
• Deprecated archive_user in favor of standardized user parameter in state and added group parameter.

18.2.38 Salt 2014.7.3 Release Notes

release TBA

Version 2014.7.3 is a bugfix release for 2014.7.0.

Changes:

• Multi-master minions mode no longer route fileclient operations asymetrically. This fixes the source of many multi-master bugs where the minion would become unresponsive from one or more masters.
• Fix bug wherein network.iface could produce stack traces.
• net.arp will no longer be made available unless arp is installed on the system.
• Major performance improvements to Saltnado
• Allow KVM module to operate under KVM itself or VMWare Fusion
• Various fixes to the Windows installation scripts
• Fix issue where the syndic would not correctly propagate loads to the master job cache.
• Improve error handling on invalid /etc/network/interfaces file in salt networking modules
• Fix bug where a response status was not checked for in fileclient.get_url
• Enable eauth when running salt in batch mode
• Increase timeout in Boto Route53 module
• Fix bugs with Salt’s ‘tar’ module option parsing
• Fix parsing of NTP servers on Windows
• Fix issue with blockdev tuning not reporting changes correctly
• Update to the latest Salt bootstrap script
• Update Linode salt-cloud driver to use either linode-python or apache-libcloud
• Fix for s3.query function to return correct headers
• Fix for s3.head returning None for files that exist
• Fix the disable function in win_service module so that the service is disabled correctly
• Fix race condition between master and minion when making a directory when both daemons are on the same host
• Fix an issue where file.recurse would fail at the root of an svn repo when the repo has a mountpoint
• Fix an issue where file.recurse would fail at the root of an hgfs repo when the repo has a mountpoint
• Fix an issue where file.recurse would fail at the root of an gitfs repo when the repo has a mountpoint
• Add status.master capability for Windows.
• Various fixes to ssh_known_hosts
• Various fixes to states.network bonding for Debian
• The debian_ip.get_interfaces module no longer removes nameservers.
• Better integration between grains.virtual and systemd-detect-virt and virt-what
• Fix traceback in sysctl.present state output
• Fix for issue where mount.mounted would fail when superopts were not a part of mount.active (extended=True). Also mount.mounted various fixes for Solaris and FreeBSD.
• Fix error where datetimes were not correctly safeguarded before being passed into msgpack.
• Fix file.replace regressions. If the pattern is not found, and if dry run is False, and if backup is False, and if a pre-existing file exists with extension .bak, then that backup file will be overwritten. This backup behavior is a result of how fileinput works. Fixing it requires either passing through the file twice (the first time only to search for content and set a flag), or rewriting file.replace so it doesn’t use fileinput
• VCS filer server fixes/optimizations
• Catch fileserver configuration errors on master start
• Raise errors on invalid gitfs configurations
• set_locale when locale file does not exist (Redhat family)
• Fix to correctly count active devices when created mdadm array with spares
• Fix to correctly target minions in batch mode
• Support ssh:// urls using the gitfs dulwhich backend
• New fileserver runner
• Fix various bugs with argument parsing to the publish module.
• Fix disk.usage for Synology OS
• Fix issue with tags occurring twice with docker.pulled
• Fix incorrect key error in SMTP returner
• Fix condition which would remount loopback filesystems on every state run
• Remove requisites from listens after they are called in the state system
• Make system implementation of service.running aware of legacy service calls
• Fix issue where publish.publish would not handle duplicate responses gracefully.
• Accept Kali Linux for aptpkg salt execution module
• Fix bug where cmd.which could not handle a dirname as an argument
• Fix issue in ps.pgrep where exceptions were thrown on Windows.

Known issues:
• In multimaster mode, a minion may become temporarily unresponsive if modules or pillars are refreshed at the same time that one or more masters are down. This can be worked around by setting `auth_timeout` and `auth_tries` down to shorter periods.

18.2.39 Salt 2014.7.4 Release Notes

release 2015-03-30

Version 2014.7.4 is a bugfix release for 2014.7.0.

This is a security release. The security issues fixed have only been present since 2014.7.0, and only users of the two listed modules are vulnerable. The following CVEs have been resolved:

• CVE-2015-1838 SaltStack: insecure /tmp file handling in salt/modules/serverdensity_device.py
• CVE-2015-1839 SaltStack: insecure /tmp file handling in salt/modules/chef.py

Changes:
• Multi-master minions mode no longer route fileclient operations asymmetrically. This fixes the source of many multi-master bugs where the minion would become unresponsive from one or more masters.
• Fix bug wherein network.iface could produce stack traces.
• net.arp will no longer be made available unless arp is installed on the system.
• Major performance improvements to Saltnado
• Allow KVM module to operate under KVM itself or VMWare Fusion
• Various fixes to the Windows installation scripts
• Fix issue where the syndic would not correctly propagate loads to the master job cache.
• Improve error handling on invalid /etc/network/interfaces file in salt networking modules
• Fix bug where a response status was not checked for in fileclient.get_url
• Enable eauth when running salt in batch mode
• Increase timeout in Boto Route53 module
• Fix bugs with Salt's `tar` module option parsing
• Fix parsing of NTP servers on Windows

18.2. Previous Releases
- Fix issue with blockdev tuning not reporting changes correctly
- Update to the latest Salt bootstrap script
- Update Linode salt-cloud driver to use either linode-python or apache-libcloud
- Fix for s3.query function to return correct headers
- Fix for s3.head returning None for files that exist
- Fix the disable function in win_service module so that the service is disabled correctly
- Fix race condition between master and minion when making a directory when both daemons are on the same host
- Fix an issue where file.recurse would fail at the root of an svn repo when the repo has a mountpoint
- Fix an issue where file.recurse would fail at the root of an hgfs repo when the repo has a mountpoint
- Fix an issue where file.recurse would fail at the root of an gitfs repo when the repo has a mountpoint
- Add status.master capability for Windows.
- Various fixes to ssh_known_hosts
- Various fixes to states.network bonding for Debian
- The debian_ip.get_interfaces module no longer removes nameservers.
- Better integration between grains.virtual and systemd-detect-virt and virt-what
- Fix traceback in sysctl.present state output
- Fix for issue where mount.mounted would fail when superopts were not a part of mount.active (extended=True). Also mount.mounted various fixes for Solaris and FreeBSD.
- Fix error where datetimes were not correctly safeguarded before being passed into msgpack.
- Fix file.replace regressions. If the pattern is not found, and if dry run is False, and if backup is False, and if a pre-existing file exists with extension .bak, then that backup file will be overwritten. This backup behavior is a result of how fileinput works. Fixing it requires either passing through the file twice (the first time only to search for content and set a flag), or rewriting file.replace so it doesn't use fileinput
- VCS filreserver fixes/optimizations
- Catch fileserver configuration errors on master start
- Raise errors on invalid gitfs configurations
- set_locale when locale file does not exist (Redhat family)
- Fix to correctly count active devices when created mdadm array with spares
- Fix to correctly target minions in batch mode
- Support ssh:// urls using the gitfs dulwhich backend
- New fileserver runner
- Fix various bugs with argument parsing to the publish module.
- Fix disk.usage for Synology OS
- Fix issue with tags occurring twice with docker.pulled
- Fix incorrect key error in SMTP returner
- Fix condition which would remount loopback filesystems on every state run
- Remove requisites from listsens after they are called in the state system
• Make system implementation of service.running aware of legacy service calls
• Fix issue where publish.publish would not handle duplicate responses gracefully.
• Accept Kali Linux for aptpkg salt execution module
• Fix bug where cmd.which could not handle a dirname as an argument
• Fix issue in ps.pgrep where exceptions were thrown on Windows.

Known issues:
• In multimaster mode, a minion may become temporarily unresponsive if modules or pillars are refreshed at the same time that one or more masters are down. This can be worked around by setting `auth_timeout’ and `auth_tries’ down to shorter periods.
• There are known issues with batch mode operating on the incorrect number of minions. This bug can be patched with the change in Pull Request #22464.
• The `fun, state, and `unless` keywords are missing from the state internals, which can cause problems running some states. This bug can be patched with the change in Pull Request #22365.

18.2.40 Salt 2014.7.5 Release Notes

release 2015-04-16

Version 2014.7.5 is a bugfix release for 2014.7.0.

Changes:
• Fixed a key error bug in salt-cloud
• Updated man pages to better match documentation
• Fixed bug concerning high CPU usage with salt-ssh
• Fixed bugs with remounting cvfs and fuse filesystems
• Fixed bug with alowing requisite tracking of entire sls files
• Fixed bug with aptpkg.mod_repo returning OK even if apt-add-repository fails
• Increased frequency of ssh terminal output checking
• Fixed malformed locale string in localmod module
• Fixed checking of available version of package when accept_keywords were changed
• Fixed bug to make git.latest work with empty repositories
• Added `**kwargs to service.mod_watch which removes warnings about `enable` and `__reqs__` not being supported by the function
• Improved state comments to not grow so quickly on failed requisites
• Added force argument to service to trigger force_reload
• Fixed bug to andle pkgrepo keyids that have been converted to int
• Fixed module.portage_config bug with appending accept_keywords
• Fixed bug to correctly report disk usage on windows minion
• Added the ability to specify key prefix for S3 ext_pillar
• Fixed issues with batch mode operating on the incorrect number of minions
• Fixed a bug with the proxmox cloud provider stacktracing on disk definition
- Fixed a bug with the changes dictionary in the file state
- Fixed the TCP keep alive settings to work better with SREQ caching
- Fixed many bugs within the iptables state and module
- Fixed bug with states by adding *fun*, *state*, and *unless* to the state runtime internal keywords listing
- Added ability to eAuth against Active Directory
- Fixed some salt-ssh issues when running on Fedora 21
- Fixed grains.get_or_set_hash to work with multiple entries under same key
- Added better explanations and more examples of how the Reactor calls functions to docs
- Fixed bug to not pass *ex_config_drive* to libcloud unless it's explicitly enabled
- Fixed bug with *pip.install* on windows
- Fixed bug where puppet.run always returns a 0 retcode
- Fixed race condition bug with minion scheduling via pillar
- Made efficiency improvements and bug fixes to the windows installer
- Updated environment variables to fix bug with pygit2 when running salt as non-root user
- Fixed cas behavior on data module -- data.cas was not saving changes
- Fixed GPG rendering error
- Fixed strace error in virt.query
- Fixed stacktrace when running chef-solo command
- Fixed possible bug wherein uncaught exceptions seem to make zmq3 tip over when threading is involved
- Fixed argument passing to the reactor
- Fixed glibc caching to prevent bug where salt-minion getaddrinfo in dns_check() never got updated nameservers

Known issues:
- In multimaster mode, a minion may become temporarily unresponsive if modules or pillars are refreshed at the same time that one or more masters are down. This can be worked around by setting `auth_timeout` and `auth_tries` down to shorter periods.

18.2.41 Salt 2014.7.6 Release Notes

**release** 2015-05-18

Version 2014.7.6 is a bugfix release for 2014.7.0.

This release is a security release. A minor issue was found, as cited below:

- CVE-2015-4017 -- Certificates are not verified when connecting to server in the Aliyun and Proxmox modules

Only users of the Aliyun or Proxmox cloud modules are at risk. The vulnerability does not exist in the latest 2015.5.0 release of Salt.

Changes:

- `salt.runners.cloud.action()` has changed the *fun* keyword argument to *func*. Please update any calls to this function in the cloud runner.

Extended Changelog Courtesy of Todd Stansell (https://github.com/tjstansell/salt-changelogs):
• PR #23810: (rallytime) Backport #23757 to 2014.7 @ 2015-05-18T15:30:21Z
  - PR #23757: (clan) use abspath, do not eliminating symlinks | refs: #23810
  - aee0c8 Merge pull request #23810 from rallytime/bp-23757
  - fb32c32 use abspath, do not eliminating symlinks
• PR #23809: (rallytime) Fix virtualport section of virt.get_nics loop @ 2015-05-18T15:30:09Z
  - ISSUE #20198: (jcftang) virt.get_graphics, virt.get_nics are broken, in turn breaking other things | refs: #23809
  - PR #21487: (rallytime) Backport #21469 to 2014.7 | refs: #23809
  - PR #21469: (vdesjardins) fixes #20198: virt.get_graphics and virt.get_nics calls in module virt | refs: #21487
  - 6b3352b Merge pull request #23809 from rallytime/virt_get_nics_fix
  - 0616fb7 Fix virtualport section of virt.get_nics loop
• PR #23823: (gtmanfred) add link local for ipv6 @ 2015-05-17T12:48:25Z
  - 188f03f Merge pull request #23823 from gtmanfred/2014.7
  - 5e0f06d add link local for ipv6
• PR #23802: (gtmanfred) if it is ipv6 ip_to_int will fail @ 2015-05-16T04:06:59Z
  - PR #23573: (techhat) Scan all available networks for public and private IPs | refs: #23802
  - f3ca682 Merge pull request #23802 from gtmanfred/2014.7
  - 2da98b5 if it is ipv6 ip_to_int will fail
• PR #23488: (cellscape) LXC cloud fixes @ 2015-05-15T18:09:35Z
  - ISSUE #16424: (stanvit) salt-run cloud.create fails with saltify
  - d9af0c3 Merge pull request #23488 from cellscape/lxc-cloud-fixes
  - 64250a6 Remove profile from opts after creating LXC container
  - c4047d2 Set destroy=True in opts when destroying cloud instance
  - 9e1311a Store instance names in opts when performing cloud action
  - 934be57 Correctly pass custom env to lxc-attach
  - 7fb85f7 Preserve test=True option in cloud states
  - 9771b5a Fix detection of absent LXC container in cloud state
  - fb24f0c Report failure when failed to create/clone LXC container
  - 2d9aa2b Avoid shadowing variables in lxc module
  - 792e102 Allow overriding profile options in lxc.cloud_init_interface
  - 42bd64b Return changes on successful lxc.create from salt-cloud
  - 4409eab Return correct result when creating cloud LXC container
  - 377015c Issue #16424: List all providers when creating salt-cloud instance without profile
• PR #23748: (basepi) [2014.7] Log salt-ssh roster render errors more assertively and verbosely @ 2015-05-14T22:38:10Z
  - ISSUE #22332: (rallytime) [salt-ssh] Add a check for host in /etc/salt/roster | refs: #23748
- 808bbe1 Merge pull request #23748 from basepi/salt-ssh.roster.host.check
- bc53e04 Log entire exception for render errors in roster
- 753de6a Log render errors in roster to error level
- e01a7a9 Always let the real YAML error through

**PR #23731**: (twangboy) Fixes #22959: Trying to add a directory to an unmapped drive in windows @ 2015-05-14T21:59:14Z
- ISSUE #22959: (highlyunavailable) Windows Salt hangs if file.directory is trying to write to a drive that doesn’t exist
- 72cf360 Merge pull request #23731 from twangboy/fix_22959
- 88e5495 Fixes #22959: Trying to add a directory to an unmapped drive in windows

**PR #23730**: (rallytime) Backport #23729 to 2014.7 @ 2015-05-14T21:58:34Z
- PR #23729: (rallytime) Partially merge #23437 (grains fix) | refs: #23730
- PR #23437: (cedwards) Grains item patch | refs: #23729
- 2610195 Merge pull request #23730 from rallytime/bp-23729
- 1877ca8 adding support for nested grains to grains.item

**PR #23688**: (twangboy) Added inet_pton to utils/validate/net.py for ip.set_static_ip in windows @ 2015-05-14T16:15:56Z
- 3e9df88 Merge pull request #23688 from twangboy/fix_23415
- 6a91169 Fixed unused-import pylint error
- 5e2b3f fixed pylint errors
- 1a96766 Added inet_pton to utils/validate/net.py for ip.set_static_ip in windows

**PR #23680**: (cachedout) Rename kwarg in cloud runner @ 2015-05-13T19:44:02Z
- ISSUE #23403: (iamfil) salt.runners.cloud.action fun parameter is replaced | refs: #23680
- 1b86460 Merge pull request #23680 from cachedout/issue_23403
- d5986c2 Rename kwarg in cloud runner

**PR #23674**: (cachedout) Handle lists correctly in grains.list_present @ 2015-05-13T18:34:58Z
- ISSUE #23548: (kkaig) grains.list_present produces incorrect (?) output | refs: #23674
- cd64af0 Merge pull request #23674 from cachedout/issue_23548
- da8a2f5 Handle lists correctly in grains.list_present

**PR #23672**: (twangboy) Fix user present @ 2015-05-13T18:30:09Z
- d322a19 Merge pull request #23672 from twangboy/fix_user_present
- 731e7af Merge branch ’2014.7’ of https://github.com/saltstack/salt into fix_user_present
- d6b7a44 Fixed user.present to create password in windows

**PR #23670**: (rallytime) Backport #23607 to 2014.7 @ 2015-05-13T18:27:17Z
- ISSUE #23604: (Azidburn) service.dead on systemd Minion create an Error Message | refs: #23607
- PR #23607: (Azidburn) Fix for #23604. No error reporting. Exitcode !=0 are ok | refs: #23670
- 43f7025 Merge pull request #23670 from rallytime/bp-23607
• PR #23661: (rallytime) Merge #23640 with whitespace fix @ 2015-05-13T15:47:30Z
  - ISSUE #22141: (Deshke) grains.get_or_set_hash render error if hash begins with `\%` | refs: #23640
  - PR #23640: (cachedout) Add warning to get_or_set_hash about reserved chars | refs: #23661
  - 0f006ac Merge pull request #23661 from rallytime/merge-23640
  - 4427f42 Whitespace fix
  - dd91154 Add warning to get_or_set_hash about reserved chars

• PR #23639: (cachedout) Handle exceptions raised by __virtual__ @ 2015-05-13T11:12Z
  - ISSUE #23452: (michaelforge) minion crashed with empty grain | refs: #23639
  - 84e2ef8 Merge pull request #23639 from cachedout/issue_23452
  - d418b49 Syntax error!
  - 45b4015 Handle exceptions raised by __virtual__

• PR #23637: (cachedout) Convert str master to list @ 2015-05-13T15:08:19Z
  - ISSUE #23611: (hubez) master_type set to `failover` but `master` is not of type list but of type `<type 'str'>` | refs: #23637
  - bd9994b Merge pull request #23637 from cachedout/issue_23611
  - 56cb1f5 Fix typo
  - f6f6f9 Convert str master to list

• PR #23595: (rallytime) Backport #23549 to 2014.7 @ 2015-05-12T19:40Z
  - PR #23549: (vr-jack) Update __init__.py | refs: #23595
  - f200e4 Merge pull request #23595 from rallytime/bp-23549
  - 2e6c0a Update __init__.py

• PR #23594: (rallytime) Backport #23496 to 2014.7 @ 2015-05-12T21:19:34Z
  - ISSUE #23110: (martinhoefling) Copying files from gitfs in file.recurse state fails
  - PR #23496: (martinhoefling) Fix for issue #23110 | refs: #23594
  - 1acac86 Merge pull request #23594 from rallytime/bp-23496
  - d5a1d2 Fix for issue #23110 This resolves issues when the freshly created directory is removed by file-server.update.

• PR #23593: (rallytime) Backport #23442 to 2014.7 @ 2015-05-12T21:19:26Z
  - PR #23442: (clan) add directory itself to keep list | refs: #23593
  - 2c221c7 Merge pull request #23593 from rallytime/bp-23442
  - 3986a1 check w/ low[\name\] only
  - 304cc49 another fix for file defined w/ id, but require name
  - 8814d44 add directory itself to keep list

• PR #23606: (twangboy) Fixed checkbox for starting service and actually starting it @ 2015-05-12T21:18:50Z
  - fadd1ef Merge pull request #23606 from twangboy/fix_installer
  - 038331e Fixed checkbox for starting service and actually starting it
• **PR #23592**: *(rallytime)* Backport #23389 to 2014.7 @ 2015-05-12T16:44:42Z
  - **ISSUE #22908**: *(karanjaj)* Add failhard option to salt orchestration | refs: #23389
  - **PR #23389**: *(cachedout)* Correct fail_hard typo | refs: #23592
  - 10b30f Merge pull request #23592 from rallytime/bp-23389
  - 734c43 Correct fail_hard typo

• **PR #23573**: *(techhat)* Scan all available networks for public and private IPs | refs: #23802 @ 2015-05-15:22:22Z
  - cd34b9b Merge pull request #23573 from techhat/novaquery
  - f92db5e Linting
  - 26e00d3 Scan all available networks for public and private IPs

• **PR #23558**: *(jfindlay)* reorder emerge command line @ 2015-05-12T17:46Z
  - **ISSUE #23479**: *(danielmorlock)* Typo in pkg.removed for Gentoo? | refs: #23558
  - 2a72cd7 Merge pull request #23558 from jfindlay/fix_ebuild
  - 45404b4 reorder emerge command line

• **PR #23530**: *(dr4Ke)* salt-ssh state: fix including all salt:// references @ 2015-05-12T15:43Z
  - **ISSUE #23555**: *(dr4Ke)* salt-ssh: `sources: salt://` files from `pkg` state are not included in salt_state.tgz | refs: #23530
  - a664a3c Merge pull request #23530 from dr4Ke/fix_salt-ssh_to_include_pkg_sources
  - 5df6a80 fix pylint warning
  - d0549e5 salt-ssh state: fix including all salt:// references

• **PR #23433**: *(twangboy)* Obtain all software from the registry @ 2015-05-11T22:47:52Z
  - **ISSUE #23004**: *(b18)* 2014.7.5 - Windows - pkg.list_pkgs - ```nxlog``` never shows up in output. | refs: #23433
  - 55c3869 Merge pull request #23433 from twangboy/list_pkgs_fix
  - 8ab5b1b Fix pylint error
  - 2d11d65 Obtain all software from the registry

• **PR #23554**: *(jleroy)* Debian: Hostname always updated @ 2015-05-11T21:57:00Z
  - 755bed0 Merge pull request #23554 from jleroy/debian-hostname-fix
  - 5ff749e Debian: Hostname always updated

• **PR #23551**: *(dr4Ke)* grains.append unit tests, related to #23474 @ 2015-05-11T21:54:25Z
  - 6ec87ce Merge pull request #23551 from dr4Ke/grains.append_unit_tests
  - ebf9df fix pylint errors
  - c495404 unit tests for grains.append module function
  - 0c9a323 use MagickMock
  - c838a22 unit tests for grains.append module function

• **PR #23474**: *(dr4Ke)* Fix grains.append in nested dictionary grains #23411 @ 2015-05-11T18:00:21Z
  - **ISSUE #23411**: *(dr4Ke)* grains.append should work at any level of a grain | refs: #23440
- **PR #23440**: (dr4Ke) fix grains.append in nested dictionary grains #23411 | refs: #23474
- e96c5c5 Merge pull request #23474 from dr4Ke/fix_grains.append_nested
- a01a5bb grains.get, parameter delimititer, versionadded: 2014.7.6
- b39f504 remove debugging output
- b6e15e2 fix grains.append in nested dictionary grains #23411

- **PR #23537**: (t0rrant) Update changelog @ 2015-05-11T17:02:16Z
  - ab7e1ae Merge pull request #23537 from t0rrant/patch-1
  - 8e03cc9 Update changelog

- **PR #23538**: (cro) Update date in LICENSE file @ 2015-05-11T15:19:25Z
  - b79fed3 Merge pull request #23538 from cro/licupdate
  - 345efe2 Update date in LICENSE file

- **PR #23505**: (aneeshusa) Remove unused ssh config validator. Fixes #23159. @ 2015-05-09T13:24:15Z
  - ISSUE #23159: (aneeshusa) Unused validator
  - a123a36 Merge pull request #23505 from aneeshusa/remove-unused-ssh-config-validator
  - 90af167 Remove unused ssh config validator. Fixes #23159.

- **PR #23467**: (slinu3d) Added AWS v4 signature support @ 2015-05-08T14:36:19Z
  - ISSUE #20518: (ekle) module s3.get does not support eu-central-1 | refs: #23467
  - ca2c1a Merge pull request #23467 from slinu3d/2014.7
  - 0b4081d Fixed pylint error at line 363
  - 5be5eb5 Fixed pylint errors
  - e6f374 Fixed lint errors
  - b9d1ac4 Added AWS v4 signature support

- **PR #23444**: (techhat) Add create_attach_volume to nova driver @ 2015-05-07T19:51:32Z
  - e6f9ece Merge pull request #23444 from techhat/novacreateattach
  - ebdb7ea Add create_attach_volume to nova driver

- **PR #23460**: (s0undt3ch) [2014.7] Update to latest stable bootstrap script v2015.05.07 @ 2015-05-07T19:10:54Z
  - ISSUE #563: (chutz) pidfile support for minion and master daemons | refs: #23460
  - e331463 Merge pull request #23460 from s0undt3ch/hotfix/bootstrap-script-2014.7
  - edcd0c4 Update to latest stable bootstrap script v2015.05.07

- **PR #23439**: (techhat) Add wait_for_passwd_maxtries variable @ 2015-05-07T07:28:56Z
  - 7a9ce1a Merge pull request #23439 from techhat/maxtries
  - 0ad3ff2 Add wait_for_passwd_maxtries variable

- **PR #23422**: (cro) $HOME should not be used, some shells don't set it. @ 2015-05-06T21:02:36Z
  - 644eb75 Merge pull request #23422 from cro/gce_sh_home
  - 4ef9e6b Don't use $HOME to find user's directory, some shells don't set it

- **PR #23425**: (basepi) [2014.7] Fix typo in FunctionWrapper @ 2015-05-06T20:38:03Z
- ef17ab4 Merge pull request #23425 from basepi/functionwrapper_typo
- c390737 Fix typo in FunctionWrapper

- **PR #23385**: (rallytime) Backport #23346 to 2014.7 @ 2015-05-06T20:12:29Z
  - PR #23346: (ericfode) Allow file_map in salt-cloud to handle folders. | refs: #23385
  - 1b13ec0 Merge pull request #23385 from rallytime/bp-23346
  - 9efc13c more linting fixes
  - cf131c9 cleaned up some pylint errors
  - f981699 added logic to sftp_file and file_map to allow folder uploads using file_map

- **PR #23414**: (jfindlay) 2015.2 -> 2015.5 @ 2015-05-06T20:04:02Z
  - 8074d16 2015.2 -> 2015.5
  - f8c7a62 Merge pull request #23414 from jfindlay/update_branch

- **PR #23404**: (hvnsweeting) saltapi cherrypy: initialize var when POST body is empty @ 2015-05-06T17:35:56Z
  - 54b3bd4 Merge pull request #23404 from hvnsweeting/cherrypy-post-emptybody-fix
  - f85f8f9 initialize var when POST body is empty

- **PR #23409**: (terminalmage) Update Lithium docstrings in 2014.7 branch @ 2015-05-06T16:20:46Z
  - 160f703 Merge pull request #23409 from terminalmage/update-lithium-docstrings-2014.7
  - bc97d01 Fix sphinx typo
  - 2006b0 Update Lithium docstrings in 2014.7 branch

- **PR #23397**: (jfindlay) add more flexible whitespace to locale_gen search @ 2015-05-06T03:44:11Z
  - ISSUE #17245: (tomashavlas) localemmod does not generate locale for Arch | refs: #23307 #23397
  - aa5fb0a Merge pull request #23397 from jfindlay/fix_locale_gen
  - 0941fe1d add more flexible whitespace to locale_gen search

- **PR #23368**: (kaithar) Backport #23367 to 2014.7 @ 2015-05-05T21:42:26Z
  - **PR #23367**: (kaithar) Put the sed insert statement back in to the output. | refs: #23368
  - **PR #18368**: (basepi) Merge forward from 2014.7 to develop | refs: #23367 #23368
  - 0c7edd4 Merge pull request #23368 from kaithar/bp-23367
  - 577f419 Pylint fix
  - 8d9a6d1 Put the sed insert statement back in to the output.

- **PR #23350**: (lorengordon) Append/prepend: search for full line @ 2015-05-05T21:42:11Z
  - ISSUE #23294: (variia) file.replace fails to append if repl string partially available | refs: #23350
  - 3493cc1 Merge pull request #23350 from lorengordon/file.replace_assume_line
  - b60e224 Append/prepend: search for full line

- **PR #23341**: (cachedout) Fix syndic pid and logfile path @ 2015-05-05T21:29:10Z
  - ISSUE #23026: (adelcast) Incorrect salt-syndic logfile and pidfile locations | refs: #23341
  - 7be5c48 Merge pull request #23341 from cachedout/issue_23026
  - e98e65e Fix tests
- 6011b43 Fix syndic pid and logfile path

**PR #23272:** (basepi) [2014.7] Allow salt-ssh minion config overrides via master config and roster | refs: #23347

- ISSUE #19114: (pykler) salt-ssh and gpg pillar renderer | refs: #23188 #23272 #23347
- PR #23188: (basepi) [2014.7] Work around bug in salt-ssh in config.get for gpg renderer | refs: #23272
- ea61abf Merge pull request #23272 from basepi/salt-ssh.minion.config.19114
- c223309 Add versionadded
- be7407f Lint
- c2c375 Missing comma
- 8e3e8e0 Pass the minion_opts through the FunctionWrapper
- cb69cd0 Match the master config template in the master config reference
- 87fc316 Add Salt-SSH section to master config template
- 91dd9dc Add ssh_minion_opts to master config ref
- c273ea1 Add minion config to salt-ssh doc
- a0b6b76 Add minion_opts to roster docs
- 5212c35 Accept minion_opts from the target information
- e2099b6 Process ssh_minion_opts from master config
- 3b64214 Revert "Work around bug in salt-ssh in config.get for gpg renderer"
- 494953a Remove the strip (embracing multi-line YAML dump)
- fe87f0f Dump multi-line yaml into the SHIM
- b751a72 Inject local minion config into shim if available

**PR #23347:** (basepi) [2014.7] Salt-SSH Backport FunctionWrapper.__contains__ @ 2015-05-05T14:13:21Z

- ISSUE #19114: (pykler) salt-ssh and gpg pillar renderer | refs: #23188 #23272 #23347
- PR #23272: (basepi) [2014.7] Allow salt-ssh minion config overrides via master config and roster | refs: #23347
- PR #23188: (basepi) [2014.7] Work around bug in salt-ssh in config.get for gpg renderer | refs: #23272
- 4f760dd Merge pull request #23347 from basepi/salt-ssh.functionwrapper.contains.19114
- 3059e53 Backport FunctionWrapper.__contains__

**PR #23344:** (cachedout) Explicitly set file_client on master @ 2015-05-04T23:21:48Z

- ISSUE #22742: (hvnsweeting) salt-master says: "This master address: `salt' was previously resolvable but now fails to resolve!" | refs: #23344
- 02658b1 Merge pull request #23344 from cachedout/issue_22742
- 5ad9f6c Explicitly set file_client on master

**PR #23318:** (cellscape) Honor seed argument in LXC container initialization @ 2015-05-04T20:58:12Z

- PR #23311: (cellscape) Fix new container initialization in LXC runner | refs: #23318
- ba760d5 Merge pull request #23318 from cellscape/honor-seed-argument
- 228b1be Honor seed argument in LXC container initialization

18.2. Previous Releases
• PR #23307: (jfindlay) check for /etc/locale.gen @ 2015-05-04T20:56:32Z
  - ISSUE #17245: (tomashavlas) localemod does not generate locale for Arch | refs: #23307 #23397
  - 4ac4509 Merge pull request #23307 from jfindlay/fix_locale_gen
  - 101199a check for /etc/locale.gen

• PR #23324: (s0undt3ch) [2014.7] Update to the latest stable release of the bootstrap script v2015.05.04 @ 2015-05-04T16:28:30Z
  - ISSUE #580: (thatch45) recursive watch not being caught | refs: #23324
  - ISSUE #552: (jhutchins) Support require and watch under the same state dec | refs: #23324
  - PR #589: (epoelke) add --quiet and --outfile options to saltkey | refs: #23324
  - PR #567: (bastichealaar) Added upstart module | refs: #23324
  - PR #560: (UtahDave) The runs feature that was added in 93423aa2e5e4b7de645209b0039560d2b13... | refs: #23324
  - PR #504: (SEJeff) File state goodies | refs: #23324
  - f790f42 Merge pull request #23324 from s0undt3ch/hotfix/bootstrap-script-2014.7
  - 6643e47 Update to the latest stable release of the bootstrap script v2015.05.04

• PR #23329: (cro) Require requests to verify cert when talking to aliyun and proxmox cloud providers @ 2015-05-04T16:18:17Z
  - 5487367 Merge pull request #23329 from cro/cloud_verify_cert
  - 860d4b7 Turn on ssl verify for requests.

• PR #23311: (cellscape) Fix new container initialization in LXC runner | refs: #23318 @ 2015-05-04T09:55:29Z
  - ea20176 Merge pull request #23311 from cellscape/fix-salt-cloud-lxc-init
  - 76fbb34 Fix new container initialization in LXC runner

• PR #23298: (chris-prince) Fixed issue #18880 in 2014.7 branch @ 2015-05-03T15:49:41Z
  - ISSUE #18880: (johtso) npm installed breaks when a module is missing
  - c399b8f Merge pull request #23298 from chris-prince/2014.7
  - 0fa25db Fixed issue #18880 in 2014.7 branch

• PR #23292: (rallytime) Merge #23151 with pylint fixes @ 2015-05-02T03:54:12Z
  - ISSUE #23148: (cr1stIp) virt - error handling bogus if machine image location is wrong
  - PR #23151: (cr1stIp) Fixes #23148 | refs: #23292
  - 16ecefd Merge pull request #23292 from rallytime/merge-23151
  - 8ff852a Merge #23151 with pylint fixes
  - 8fa12e Fixes #23148

• PR #23274: (basepi) [2014.7] Reduce salt-ssh debug log verbosity @ 2015-05-01T20:19:23Z
  - ce24315 Merge pull request #23274 from basepi/salt-ssh.debug.verbosity
  - eceee6c Log stdout and stderr to trace
  - 08f54d7 Log stdout and stderr to trace as well
  - 9b9c30f Reduce salt-ssh debug log verbosity
- PR #23261: (rallytime) Fix tornado websocket event handler registration @ 2015-05-01T18:31Z
  - ISSUE #22605: (mavenAtHouzz) Tornado websockets event Handlers registration are incorrect | refs: #23261
  - 7b55e43 Merge pull request #23261 from rallytime/fixed-22605
  - 4950fbf Fix tornado websocket event handler registration

- PR #23258: (teizz) TCP keepalives on the ret side, Revisited. @ 2015-05-01T16:49Z
  - 83ef7cb Merge pull request #23258 from teizz/ret_keepalive_2014_7_5
  - 0b9f8b6f The fixes by `is_cachedout` which were backported into 2015_2 were missing a single parameter thus not setting up the TCP keepalive for the ZeroMQ Channel by default.

- PR #23241: (techhat) Move iptables log options after the jump @ 2015-05-01T15:59Z
  - ISSUE #23224: (twellspring) iptables.append --log parameters must be after --jump LOG | refs: #23241
  - 8de3c83 Merge pull request #23241 from techhat/issue23224
  - 87f7948 Move iptables log options after the jump

- PR #23227: (rallytime) Backport #22808 to 2014.7 @ 2015-04-30T21:09:14Z
  - PR #23171: (skizunov) Bugfix: `clean_proc_dir` is broken | refs: #23228
  - f20210e Merge pull request #23227 from rallytime/bp-23171
  - e670e99 Bugfix: `clean_proc_dir` is broken

- PR #22977: (bersace) Fix fileserver backends __opts__ overwritten by _pillar @ 2015-04-30T15:24:56Z
  - ISSUE #22941: (bersace) _pillar func breaks fileserver globals | refs: #22977 #22942
  - PR #22942: (bersace) Fix fileserver backends global overwritten by _pillar | refs: #22977
  - f6c0728 Merge pull request #22977 from bersace/fixed-fileserver-backends-pillar-side-effect
  - 5f451f6 Fix fileserver backends __opts__ overwritten by _pillar

- PR #23180: (jfindlay) fix typos from 36841bdd in masterapi.py @ 2015-04-30T15:24:12Z

18.2. Previous Releases
– ISSUE #23166: (claudiupopescu) `Error in function _minion_event" resulting in modules not loaded | refs: #23180
– 34206f7 Merge pull request #23180 from jfindlay/remote_event
– 72066e1 fix typos from 36841bdd in masterapi.py

• PR #23176: (jfindlay) copy standard cmd.run* kwargs into cmd.run_chroot @ 2015-04-30T15:22:12Z
– ISSUE #23153: (cr1stip) cmdmod : run_chroot - broken in 2014.7.5 - missing kwargs | refs: #23176
– b6b8216 Merge pull request #23176 from jfindlay/run_chroot
– 7dc3417 copy standard cmd.run* kwargs into cmd.run_chroot

• PR #23193: (joejulian) supervisord.mod_watch should accept sfun @ 2015-04-30T04:34:21Z
– ISSUE #23192: (joejulian) supervisord mod_watch does not accept sfun | refs: #23193
– efb59f9 supervisord.mod_watch should accept sfun

• PR #23188: (basepi) [2014.7] Work around bug in salt-ssh in config.get for gpg renderer | refs: #23272 @ 2015-04-30T04:34:10Z

– 72fe88e Merge pull request #23188 from basepi/salt-ssh.function.wrapper.gpg.19114
– d73979e Work around bug in salt-ssh in config.get for gpg renderer

• PR #23154: (cachedout) Re-establish channel on interruption in fileclient @ 2015-04-29T16:18:59Z
– ISSUE #21480: (msciciel) TypeError: string indices must be integers, not str | refs: #23154
– 168508e Merge pull request #23154 from cachedout/refresh_channel
– 9f8dd80 Re-establish channel on interruption in fileclient

• PR #23146: (rallytime) Backport #20779 to 2014.7 @ 2015-04-28T20:45:06Z
– ISSUE #20647: (ryan-lane) file.serialize fails to serialize due to ordered dicts | refs: #20779
– PR #20779: (cachedout) Use declared yaml options | refs: #23146
– 3b53e04 Merge pull request #23146 from rallytime/bp-20779
– a221706 Just change serialize
– a111798 Use declared yaml options

• PR #23145: (rallytime) Backport #23089 to 2014.7 @ 2015-04-28T20:44:56Z
– PR #23089: (cachedout) Stringify version number before lstrip | refs: #23145
– 8bb4664 Merge pull request #23089 from rallytime/bp-23089
– 93c41af Stringify version number before lstrip

• PR #23144: (rallytime) Backport #23124 to 2014.7 @ 2015-04-28T20:44:46Z
– ISSUE #16188: (drawks) salt.modules.parted has various functions with bogus input validation. | refs: #23124
– PR #23124: (ether42) fix parsing the output of parted in parted.list_() | refs: #23144
– c85d36f Merge pull request #23144 from rallytime/bp-23124-2014-7
- 6b64da7 fix parsing the output of parted
- **PR #23120**: *(terminalmage)* Don't run os.path.relpath() if repo doesn't have a ```root``` param set @ 2015-04-28T15:46:54Z
  - a27b158 Merge pull request #23120 from terminalmage/fix-gitfs-relpath
  - 1860ff Don't run os.path.relpath() if repo doesn't have a ```root``` param set
- **PR #23132**: *(clinta)* Backport b27c176 @ 2015-04-28T15:00:30Z
  - fcba607 Merge pull request #23132 from clinta/patch-2
- **PR #23114**: *(rallytime)* Adjust ZeroMQ 4 docs to reflect changes to Ubuntu 12 packages @ 2015-04-28T15:00:30Z
  - ISSUE #18476: *(Auha)* Upgrading salt on my master caused dependency issues | refs: #23114 #18610
  - PR #18610: *(rallytime)* Make ZMQ 4 installation docs for ubuntu more clear | refs: #23114
  - b0f4b28 Merge pull request #23114 from rallytime/removeUbuntu_zmq4_docs
  - f6ec7c8 Adjust ZeroMQ 4 docs to reflect changes to Ubuntu 12 packages
- **PR #23108**: *(rallytime)* Backport #23097 to 2014.7 @ 2015-04-28T03:58:05Z
  - ISSUE #23085: *(xenophonf)* Use ```s3fs``` (not ```s3```) in fileserver_roots | refs: #23097
  - PR #23097: *(rallytime)* Change s3 to s3fs in fileserver_roots docs example | refs: #23108
  - 399857f Merge pull request #23108 from rallytime/bp-23097
  - fa88984 Change s3 to s3fs in fileserver_roots docs example
- **PR #23112**: *(basepi)* [2014.7] Backport #22199 to fix mysql returner save_load errors @ 2015-04-28T03:55:44Z
  - ISSUE #22171: *(basepi)* We should only call returner.save_load once per jid | refs: #22199
  - PR #22199: *(basepi)* [2015.2] Put a bandaid on the save_load duplicate issue (mysql returner) | refs: #23112
  - 5541537 Merge pull request #23112 from basepi/mysql_returner_save_load
  - 0127012 Put a bandaid on the save_load duplicate issue
- **PR #23113**: *(rallytime)* Revert ``Backport #22895 to 2014.7`` @ 2015-04-28T03:27:29Z
  - PR #22925: *(rallytime)* Backport #22895 to 2014.7 | refs: #23113
  - PR #22895: *(aletourneau)* pam_tally counter was not reset to 0 after a succesfull login | refs: #22925
  - dfe2066 Merge pull request #23113 from saltstack/revert-22925-bp-22895
  - b957ea8 Revert ``Backport #22895 to 2014.7``
- **PR #23094**: *(terminalmage)* pygit2: disable cleaning of stale refs for authenticated remotes @ 2015-04-27T20:51:28Z
  - ISSUE #23013: *(markusr815)* gitfs regression with authenticated repos | refs: #23094
  - 21515f3 Merge pull request #23094 from terminalmage/issue23013
  - aaf7b04 pygit2: disable cleaning of stale refs for authenticated remotes
- **PR #23048**: *(jfindlay)* py-2.6 compat for util/boto.py ElementTree exception @ 2015-04-25T16:56:45Z
  - d45aa21 Merge pull request #23048 from jfindlay/ET_error
  - 64c42cc py-2.6 compat for util/boto.py ElementTree exception
- **PR #23025**: *(jfindlay)* catch exceptions on bad system locales/encodings @ 2015-04-25T16:56:30Z
- ISSUE #22981: (syphernl) Locale state throwing traceback when generating not (yet) existing locale | refs: #23025
  - d25a5c1 Merge pull request #23025 from jfindlay/fix_sys_locale
  - 9c4d62b catch exceptions on bad system locales/encodings

- PR #22932: (hvnsweeting) bugfix: also manipulate dir_mode when source not defined @ 2015-04-25T16:54:58Z
  - 5e44b59 Merge pull request #22932 from hvnsweeting/file-append-bugfix
  - 3f368de do not use assert in execution module
  - 9d4fd4a bugfix: also manipulate dir_mode when source not defined

- PR #23055: (jfindlay) prevent ps module errors on accessing dead procs @ 2015-04-24T23:39:49Z
  - ISSUE #23021: (ether42) ps.pgrep raises NoSuchProcess | refs: #23055
  - c2416a4 Merge pull request #23055 from jfindlay/fix_ps
  - 2dc7ad prevent ps module errors on accessing dead procs

- PR #23031: (jfindlay) convert exception e.message to just e @ 2015-04-24T18:38:13Z
  - bf9158 Merge pull request #23031 from jfindlay/exception
  - 85bad1a convert exception e.message to just e

- PR #23015: (hvnsweeting) if status of service is stop, there is not an error with it @ 2015-04-24T14:35:10Z
  - 774f3 Merge pull request #23015 from hvnsweeting/set-non-error-lvl-for-service-status-log
  - 92ea163 if status of service is stop, there is not an error with it

- PR #23000: (jfindlay) set systemd service killMode to process for minion @ 2015-04-24T03:42:39Z
  - ISSUE #22993: (jetpak) salt-minion restart causes all spawned daemons to die on centos7 (systemd) | refs: #23000
  - 2e09789 Merge pull request #23000 from jfindlay/systemd_kill
  - 3d575e2 set systemd service killMode to process for minion

- PR #22999: (jtand) Added retry_dns to minion doc. @ 2015-04-24T03:30:24Z
  - ISSUE #22707: (arthurgiliab) retry_dns of master configuration is missing from the documentation | refs: #22999
  - b5c059a Merge pull request #22999 from jtand/fix_22707
  - 846e17 Added retry_dns to minion doc.

- PR #22990: (techhat) Use the proper cloud conf variable @ 2015-04-23T17:48:07Z
  - 27dc87 Merge pull request #22990 from techhat/2014.7
  - d3bcb Use the proper cloud conf variable

- PR #22976: (multani) Improve state_output documentation @ 2015-04-23T12:24:22Z
  - 13df65 Merge pull request #22976 from multani/state-output-doc
  - 19ef401 Improve state_output documentation

- PR #22955: (terminalmage) Fix regression introduced yesterday in dockerio module @ 2015-04-22T18:56:39Z
  - 89f1a18 Merge pull request #22955 from terminalmage/dockerio-run-fix
  - b472ad Fix regression introduced yesterday in dockerio module
• PR #22954: (rallytime) Backport #22909 to 2014.7 @ 2015-04-22T18:56:20Z
  - PR #22909: (mguegan) Fix compatibility with pkgin > 0.7 | refs: #22954
  - 46ef227 Merge pull request #22954 from rallytime/bp-22909
  - 70c1cd3 Fix compatibility with pkgin > 0.7

• PR #22856: (jfindlay) increase timeout and decrease tries for route53 records @ 2015-04-22T16:47:01Z
  - ISSUE #18720: (Reiner030) timeouts when setting Route53 records | refs: #22856
  - c9ae593 Merge pull request #22856 from jfindlay/route53_timeout
  - ba4a786 add route53 record sync wait, default=False
  - ea2fd50 increase timeout and tries for route53 records

• PR #22946: (s0undt3ch) Test with a more recent pip version to avoid a traceback @ 2015-04-22T16:25:17Z
  - a178d44 Merge pull request #22946 from s0undt3ch/2014.7
  - bc87749 Test with a more recent pip version to avoid a traceback

• PR #22945: (garethgreenaway) Fixes to scheduler @ 2015-04-22T16:25:00Z
  - ISSUE #22571: (BoomerB) same error message as on issue #18504 | refs: #22945
  - de339be Merge pull request #22945 from garethgreenaway/22571_2014_7_schedule_pillar_refresh_seconds_exceptions
  - bfa6d25 Fixing a reported issue when using a scheduled job from pillar with splay. _seconds element that acted as a backup of the actual seconds was being removed when pillar was refreshed and causing exceptions. This fix moves some splay related code out of the if else condition so it's checked whether the job is in the job queue or not.

• PR #22887: (hvnsweeting) fix #18843 @ 2015-04-22T15:47:05Z
  - ISSUE #18843: (calvinhp) State user.present will fail to create home if user exists and homedir doesn't
  - 12d2b91 Merge pull request #22887 from hvnsweeting/18843-fix-user-present-home
  - 7fe7b08 run user.chhome once to avoid any side-effect when run it twice
  - 19de995 clarify the usage of home arg
  - d6dc09a enhance doc, as usermod on ubuntu 12.04 will not CREATE home
  - 0ce4d7f refactor: force to use boolean
  - 849d19e log debug the creating dir process
  - c4e95b9 fix #18843: usermod won't create a dir if old home does not exist

• PR #22930: (jfindlay) localemod.gen_locale now always returns a boolean @ 2015-04-22T15:37:39Z
  - ISSUE #21140: (holms) locale.present state executed successfully, although originally fails | refs: #22930 #22829
  - ISSUE #2417: (ffa) Module standards | refs: #22829
  - PR #22829: (F30) Always return a boolean in gen_locale() | refs: #22930
  - b7de7bd Merge pull request #22930 from jfindlay/localegen_bool
  - 399399f localemod.gen_locale now always returns a boolean

• PR #22933: (hvnsweeting) add test for #18843 @ 2015-04-22T15:27:18Z
  - ISSUE #18843: (calvinhp) State user.present will fail to create home if user exists and homedir doesn’t
- 11bcf14 Merge pull request #22933 from hvnsweeting/18843-test
- b13db32 add test for #18843

**PR #22925:** (rallytime) Backport #22895 to 2014.7 | refs: #23113 @ 2015-04-22T02:30:26Z
- PR #22895: (aletourneau) pam_tally counter was not reset to 0 after a succesfull login | refs: #22925
- 6890752 Merge pull request #22925 from rallytime/bp-22895
- 3852d96 Pylint fix
- 90f7829 Fixed pylint issues
- 5ebf159 Cleaned up pull request
- a08ac47 pam_tally counter was not reset to 0 after a succesfull login

**PR #22914:** (cachedout) Call proper returner function in jobs.list_jobs @ 2015-04-22T00:49:01Z
- ISSUE #22790: (whiteinge) jobs.list_jobs runner tracebacks on `missing' argument | refs: #22914
- eca37eb Merge pull request #22914 from cachedout/issue_22790
- d828d6f Call proper returner function in jobs.list_jobs

**PR #22918:** (JaseFace) Add a note to the git_pillar docs stating that GitPython is the only currently supported provider @ 2015-04-22T00:48:26Z
- 31c461f Merge pull request #22918 from JaseFace/git-pillar-provider-doc-note
- 3bf4e66 Properly merge cloud configs to create profiles

**PR #22907:** (techhat) Add param documentation for file.replace state @ 2015-04-21T22:02:44Z
- f093975 Merge pull request #22907 from techhat/cloudconfig
- 81771a7 Merge pull request #22907 from techhat/cloudconfig

**PR #22894:** (0xf10e) Fix issue #22782 @ 2015-04-21T18:55:18Z
- 81771a7 Merge pull request #22894 from 0xf10e/2014.7
- f093975 Merge pull request #22894 from 0xf10e/2014.7
- c802ba7 Merge pull request #22902 from rallytime/docker_doc_fix
- 9c51630 Fix pillar and salt fileserver mixed @ 2015-04-21T17:04:33Z

**PR #22897:** (rallytime) Add param documentation for file.replace state @ 2015-04-21T17:31:04Z
- 81771a7 Merge pull request #22897 from terminalmage/issue12003
- c375309 dockerio: better error message for native exec driver @ 2015-04-21T18:50:47Z
- f093975 dockerrun TypeWarning: run() argument after ** must be a mapping, not str | refs: #22902
- 81771a7 Merge pull request #22902 from rallytime/docker_doc_fix
- 81771a7 Merge pull request #22902 from rallytime/docker_doc_fix
- 81771a7 Change state example to use proper kwarg

**PR #22898:** (terminalmage) dockerio: better error message for native exec driver @ 2015-04-21T18:02:58Z
- 81771a7 Merge pull request #22898 from terminalmage/issue12003
- c375309 dockerio: better error message for native exec driver

**PR #22897:** (rallytime) Add param documentation for file.replace state @ 2015-04-21T17:31:04Z
- 81771a7 Merge pull request #22897 from rallytime/fix-22825
- 9c51630 Add param documentation for file.replace state

**PR #22850:** (bersace) Fix pillar and salt fileserver mixed @ 2015-04-21T17:04:33Z
 Salt Documentation, Release 2016.3.6

- ISSUE #22844: (bersace) LocalClient file cache confuse pillar and state files | refs: #22850
- fd53889 Merge pull request #22850 from bersace/fix-pillar-salt-mixed
- 31b98e7 Initialize state file client after pillar loading
- f6ebb7 Use saltenv
- PR #22818: (twangboy) Added documentation regarding pip in windows @ 2015-04-21T03:58:59Z
  - 1380fec Merge pull request #22818 from twangboy/upd_pip_docs
  - cb999c7 Update pip.py
- PR #22827: (rallytime) Prevent stacktrace on os.path.exists in hosts module @ 2015-04-21T02:54:40Z
  - b2bf17f Merge pull request #22827 from rallytime/fix_hosts_stacktrace
  - c88a1ea Prevent stacktrace on os.path.exists in hosts module
- PR #22853: (s0undt3ch) Don’t assume package installation order. @ 2015-04-21T02:42:41Z
  - 03af523 Merge pull request #22853 from s0undt3ch/2014.7
  - b62df62 Don’t assume package installation order.
- PR #22872: (s0undt3ch) Don’t fail on make clean just because the directory does not exist @ 2015-04-21T02:40:47Z
  - 9211e36 Merge pull request #22872 from s0undt3ch/hotfix/clean-docs-fix
  - 95d6887 Don’t fail on make clean just because the directory does not exist
- PR #22873: (thatch45) Type check the version since it will often be numeric @ 2015-04-21T02:38:11Z
  - 5bdbd08 Merge pull request #22873 from thatch45/type_check
  - 53b8376 Type check the version since it will often be numeric
- PR #22870: (twangboy) Added ability to send a version with a space in it @ 2015-04-20T23:18:28Z
  - c965b0a Merge pull request #22870 from twangboy/fix_installer_again
  - 3f180cf Added ability to send a version with a space in it
- PR #22863: (rallytime) Backport #20974 to 2014.7 @ 2015-04-20T19:29:37Z
  - PR #20974: (JohannesEbke) Fix expr_match usage in salt.utils.check_whitelist_blacklist | refs: #22863
    - 2973eb1 Merge pull request #22863 from rallytime/bp-20974
    - 14913a4 Fix expr_match usage in salt.utils.check_whitelist_blacklist
- PR #22578: (hvnsweeting) gracefully handle when salt-minion cannot decrypt key @ 2015-04-20T15:24:45Z
  - c45b92b Merge pull request #22578 from hvnsweeting/2014-7-fix-compile-pillar
  - f75b24a gracefully handle when salt-minion cannot decrypt key
- PR #22800: (terminalmage) Improve error logging for pygit2 SSH-based remotes @ 2015-04-18T17:18:55Z
  - ISSUE #21979: (yrdevops) gitfs: error message not descriptive enough when libgit2 was compiled without libssh2 | refs: #22800
    - 900c7a5 Merge pull request #22800 from terminalmage/issue21979
    - 8f1c008 Clarify that for pygit2, receiving 0 objects means repo is up-to-date
    - 98885f7 Add information about libssh2 requirement for pygit2 ssh auth
- 09468d2 Fix incorrect log message
- 2093b08 Adjust loglevels for gitfs errors
- 9d394df Improve error logging for pygit2 SSH-based remotes

**PR #22813:** (twangboy) Updated instructions for building salt @ 2015-04-18T04:10:07Z
- e99f2fd Merge pull request #22813 from twangboy/win_doc_fix
- ade421a Fixed some formatting issues
- 8901b3b Updated instructions for building salt

**PR #22810:** (basepi) [2014.7] More msgpack gating for salt-ssh @ 2015-04-17T22:28:24Z
- ISSUE #22708: (Bilge) salt-ssh file.accumulated error: NameError: global name `msgpack' is not defined
  | refs: #22810
- fe1de89 Merge pull request #22810 from basepi/salt-ssh.more.msgpack.gating
- d4da8e6 Gate msgpack in salt/modules/saltutil.py
- 02303b2 Gate msgpack in salt/modules/data.py
- d7e8741 Gate salt.states.file.py msgpack

**PR #22803:** (rallytime) Allow map file to work with softlayer @ 2015-04-17T20:34:42Z
- ISSUE #17144: (xpender) salt-cloud -m fails with softlayer | refs: #22803
- 11df71e Merge pull request #22803 from rallytime/fix-17144
- ce88b6a Allow map file to work with softlayer

**PR #22807:** (rallytime) Add 2014.7.5 links to windows installation docs @ 2015-04-17T20:32:13Z
- cd43a95 Merge pull request #22807 from rallytime/windows_docs_update
- 5931a58 Replace all 4s with 5s
- cedaed Add 2014.7.5 links to windows installation docs

**PR #22795:** (rallytime) Added release note for 2014.7.5 release @ 2015-04-17T18:05:36Z
- 0b295e2 Merge pull request #22795 from rallytime/release_notes
- fde1fee Remove extra line
- b19b95d Added release note for 2014.7.5 release

**PR #22759:** (twangboy) Final edits to the batch files for running salt @ 2015-04-17T04:31:15Z
- ISSUE #22740: (loren gord) New Windows installer assumes salt is installed to the current directory | refs: #22759
- PR #22754: (twangboy) Removed redundant \ and “ | refs: #22759
- 3c91459 Merge pull request #22759 from twangboy/fix_bat_one_last_time
- 075f82e Final edits to the batch files for running salt

**PR #22760:** (thatch45) Fix issues with the syndic @ 2015-04-17T04:30:48Z
- 20d3f2b Merge pull request #22760 from thatch45/syndic_fix
- e2db624 Fix issues with the syndic not resolving the master when the interface is set

**PR #22762:** (twangboy) Fixed version not showing in Add/Remove Programs @ 2015-04-17T04:29:46Z
- 54c4584 Merge pull request #22762 from twangboy/fix_installer
- 4d25af8 Fixed version not showing in Add/Remove Programs

### 18.2.42 Salt 2014.7.8 Release Notes

**Changes for v2014.7.7..v2014.7.8**

Extended changelog courtesy of Todd Stansell ([https://github.com/tjstansell/salt-changelogs](https://github.com/tjstansell/salt-changelogs)):

**Statistics:**
- Total Merges: 7
- Total Issue references: 3
- Total PR references: 10

**Changes:**

- **PR #28839**: (cachedout) Revert #28740 @ 2015-11-12T22:54:28Z
  - PR #28740: (MasterNayru) Add missing S3 module import | refs: #28777
  - 4b8bdd0 Merge pull request #28839 from cachedout/revert_28740
  - 215b26c Revert #28740

- **PR #28777**: (rallytime) Back-port #28740 to 2014.7 @ 2015-11-11T18:00:00Z
  - PR #28740: (MasterNayru) Add missing S3 module import | refs: #28777
  - 76e69b4 Merge pull request #28777 from rallytime/bp-28740-2014.7
  - da5fac2 Back-port #28740 to 2014.7

- **PR #28716**: (cachedout) Back-port #28705 to 2014.7 @ 2015-11-10T16:15:03Z
  - PR #28705: (cachedout) Account for new headers class in tornado 4.3 | refs: #28716
  - 45c73eb Merge pull request #28716 from rallytime/bp-28705
  - 32e7bd3 Account for new headers class in tornado 4.3

- **PR #28717**: (cachedout) Add note about recommended umask @ 2015-11-09T23:26:20Z
  - ISSUE #28199: (felskrone) Non-standard umasks might break the master | refs: #28717
  - f4fe921 Merge pull request #28717 from cachedout/umask_note
  - 1874300 Add note about recommended umask

- **PR #28461**: (cachedout) Wrap all cache calls in state.sls in correct umask @ 2015-11-02T17:11:02Z
  - ISSUE #28455: (zmalone) highstate.cache is world readable, and contains secrets | refs: #28461
  - 4bf56ca Merge pull request #28461 from cachedout/issue_28455
  - 097838e Wrap all cache calls in state.sls in correct umask

- **PR #28407**: (DmitryKuzmenko) Don't request creds if auth with key. @ 2015-10-29T16:12:30Z
  - ISSUE #28410: (boeig) `-T, --make-token flag does NOT work- LDAP Groups | refs: #28407
  - f3e61db Merge pull request #28407 from DSRCompany/issues/24910_token_auth_fix_2014
  - b7b5bec Don't request creds if auth with key.
• **PR #27390:** *(JaseFace)* Ensure we pass on the enable setting if present, or use the default of True if not in `build_schedule_item()` @ 2015-10-05T18:09:33Z
  - d284eb1 Merge pull request #27390 from JaseFace/schedule-missing-enabled
  - 563db71 Ensure we pass on the enable setting if present, or use the default of True if not in `build_schedule_item()` Prior to this, when schedule.present compares the existing schedule to the one crafted by this function, enabled will actually be removed at each run. schedule.present sees a modification needs to be made, and invokes schedule.modify, which does so with enabled: True, creating and endless loop of an 'enabled' removal and addition.

18.2.43 Salt 2014.7.9 Release Notes

Changes for v2014.7.8..v2014.7.9

Extended changelog courtesy of Todd Stansell (https://github.com/tjstansell/salt-changelogs):

*Generated at: 2016-03-11T20:58:58Z*

Statistics:

- Total Merges: 3
- Total Issue references: 1
- Total PR references: 3

Changes:

- **PR #31826:** *(gtmanfred)* Remove ability of authenticating user to specify pam service @ 2016-03-11T20:41:01Z
  - c5e7c03 Merge pull request #31826 from gtmanfred/2014.7
  - d73f70e Remove ability of authenticating user to specify pam service

- **PR #29392:** *(jacobhammons)* updated version number to not reference a specific build from the latest branch... @ 2015-12-03T15:54:31Z
  - 85aa70a Merge pull request #29392 from jacobhammons/2014.7
  - d7f0d1b updated version number to not reference a specific build from the latest branch

- **PR #29296:** *(douardda)* Use process KillMode on Debian systems also @ 2015-12-01T16:00:16Z
  - ISSUE #29295: *(douardda)* systemd's service file should use the 'process' KillMode option on Debian also | refs: #29296
  - d2f8210 Merge pull request #29296 from douardda/patch-3
  - d288539 Use process KillMode on Debian systems also

18.2.44 Salt 2014.1.0 Release Notes - Codename Hydrogen

*Note:* Due to a change in master to minion communication, 2014.1.0 minions are not compatible with older-version masters. Please upgrade masters first. More info on backwards-compatibility policy here <installation, under the `Upgrading Salt` subheading.

*Note:* A change in the grammar in the state compiler makes `module.run` in requisites illegal syntax. Its use is replaced simply with the word `module`. In other words you will need to change requisites like this:
This is a breaking change. We apologize for the inconvenience, we needed to do this to remove some ambiguity in parsing requisites.

---

**release** 2014-02-24

The 2014.1.0 release of Salt is a major release which not only increases stability but also brings new capabilities in virtualization, cloud integration, and more. This release brings a great focus on the expansion of testing making roughly double the coverage in the Salt tests, and comes with many new features.

2014.1.0 is the first release to follow the new date-based release naming system. See the version numbers page for more details.

**Major Features**

**Salt Cloud Merged into Salt**

Salt Cloud is a tool for provisioning salted minions across various cloud providers. Prior to this release, Salt Cloud was a separate project but this marks its full integration with the Salt distribution. A Getting Started guide and additional documentation for Salt Cloud can be found [here](#).

**Google Compute Engine**

Alongside Salt Cloud comes new support for the Google Compute Engine. Salt Stack can now deploy and control GCE virtual machines and the application stacks that they run.

For more information on Salt Stack and GCE, please see [this blog post](#).

Documentation for Salt and GCE can be found [here](#).

**Salt Virt**

Salt Virt is a cloud controller that supports virtual machine deployment, inspection, migration, and integration with many aspects of Salt.

Salt Virt has undergone a major overhaul with this release and now supports many more features and includes a number of critical improvements.

**Docker Integration**

Salt now ships with [states](#) and an [execution module](#) to manage Docker containers.
Substantial Testing Expansion

Salt continues to increase its unit/regression test coverage. This release includes over 300 new tests.

BSD Package Management

BSD package management has been entirely rewritten. FreeBSD 9 and older now default to using pkg_add, while FreeBSD 10 and newer will use pkgng. FreeBSD 9 can be forced to use pkgng, however, by specifying the following option in the minion config file:

```
providers:
  pkg: pkgng
```

In addition, support for installing software from the ports tree has been added. See the documentation for the ports state and execution module for more information.

Network Management for Debian/Ubuntu

Initial support for management of network interfaces on Debian-based distros has been added. See the documentation for the network state and the debian_ip for more information.

IPv6 Support for iptables State/Module

The iptables state and module now have IPv6 support. A new parameter family has been added to the states and execution functions, to distinguish between IPv4 and IPv6. The default value for this parameter is ipv4, specifying ipv6 will use ip6tables to manage firewall rules.

GitFS Improvements

Several performance improvements have been made to the Git fileserver backend. Additionally, file states can now use any any SHA1 commit hash as a fileserver environment:

```
/etc/httpd/httpd.conf:
  file.managed:
    - source: salt://webserver/files/httpd.conf
    - saltenv: 45af879
```

This applies to the functions in the cp module as well:

```
salt '*' cp.get_file salt://readme.txt /tmp/readme.txt saltenv=45af879
```

MinionFS

This new fileserver backend allows files which have been pushed from the minion to the master (using cp.push) to be served up from the salt fileserver. The path for these files takes the following format:

```
salt://minion-id/path/to/file
```
minion-id is the id of the "source" minion, the one from which the files were pushed to the master. /path/to/file is the full path of the file.

The MinionFS Walkthrough contains a more thorough example of how to use this backend.

**saltenv**

To distinguish between fileserver environments and execution functions which deal with environment variables, fileserver environments are now specified using the saltenv parameter. env will continue to work, but is deprecated and will be removed in a future release.

**Grains Caching**

A caching layer has been added to the Grains system, which can help speed up minion startup. Disabled by default, it can be enabled by setting the minion config option grains_cache:

```
grains_cache: True
# Seconds before grains cache is considered to be stale.
grains_cache_expiration: 300
```

If set to True, the grains loader will read from/write to a msgpack-serialized file containing the grains data.

Additional command-line parameters have been added to salt-call, mainly for testing purposes:

- `--skip-grains` will completely bypass the grains loader when salt-call is invoked.
- `--refresh-grains-cache` will force the grains loader to bypass the grains cache and refresh the grains, writing a new grains cache file.

**Improved Command Logging Control**

When using the `cmd` module, either on the CLI or when developing Salt execution modules, a new keyword argument `output_loglevel` allows for greater control over how (or even if) the command and its output are logged. For example:

```
salt '*' cmd.run 'tail /var/log/messages' output_loglevel=debug
```

The package management modules (apt, yumpkg, etc.) have been updated to log the copious output generated from these commands at loglevel `debug`.

**Note:** To keep a command from being logged, `output_loglevel=quiet` can be used.

Prior to this release, this could be done using `quiet=True`. This argument is still supported, but will be removed in a future Salt release.

**PagerDuty Support**

Initial support for firing events via PagerDuty has been added. See the documentation for the `pagerduty` module.
Virtual Terminal

Sometimes the subprocess module is not good enough, and, in fact, not even askpass is. This virtual terminal is still in it’s infant childhood, needs quite some love, and was originally created to replace askpass, but, while developing it, it immediately proved that it could do so much more. It’s currently used by salt-cloud when bootstrapping salt on clouds which require the use of a password.

Proxy Minions

Initial basic support for Proxy Minions is in this release. Documentation can be found here.

Proxy minions are a developing feature in Salt that enables control of devices that cannot run a minion. Examples include network gear like switches and routers that run a proprietary OS but offer an API, or ”dumb” devices that just don’t have the horsepower or ability to handle a Python VM.

Proxy minions can be difficult to write, so a simple REST-based example proxy is included. A Python bottle-based webserver can be found at https://github.com/cro/salt-proxy-rest as an endpoint for this proxy.

This is an ALPHA-quality feature. There are a number of issues with it currently, mostly centering around process control, logging, and inability to work in a masterless configuration.

Additional Bugfixes (Release Candidate Period)

Below are many of the fixes that were implemented in salt during the release candidate phase.

- Fix mount.mounted leaving conflicting entries in fstab (issue 7079)
- Fix mysql returner serialization to use json (issue 9590)
- Fix ZMQError: Operation cannot be accomplished in current state errors (issue 6306)
- Rbenv and ruby improvements
- Fix quoting issues with mysql port (issue 9568)
- Update mount module/state to support multiple swap partitions (issue 9520)
- Fix archive state to work with bsdtar
- Clarify logs for minion ID caching
- Add numeric revision support to git state (issue 9718)
- Update master_uri with master_ip (issue 9694)
- Add comment to Debian mod_repo (issue 9923)
- Fix potential undefined loop variable in rabbitmq state (issue 8703)
- Fix for salt-virt runner to delete key on VM deletion
- Fix for salt-run -d to limit results to specific runner or function (issue 9975)
- Add tracebacks to jinja renderer when applicable (issue 10010)
- Fix parsing in monit module (issue 10041)
- Fix highstate output from syndic minions (issue 9732)
- Quiet logging when dealing with passwords/hashes (issue 10000)
- Fix for multiple remotes in git_pillar (issue 9932)
• Fix npm installed command (issue 10109)
• Add safeguards for utf8 errors in zcbuildout module
• Fix compound commands (issue 9746)
• Add systemd notification when master is started
• Many doc improvements

18.2.45 Salt 2014.1.1 Release Notes

release 2014-03-18

Version 2014.1.1 is a bugfix release for 2014.1.0. The changes include:

• Various doc fixes, including up-to-date Salt Cloud installation documentation.
• Renamed state.sls runner to state.orchestrate, to reduce confusion with the state.sls execution function
• Fix various bugs in the dig module (issue 10367)
• Add retry for query on certain EC2 status codes (issue 10154)
• Fix various bugs in mongodb_user state module (issue 10430)
• Fix permissions on ~/.salt_token (issue 10422)
• Add PyObjects support
• Fix launchctl module crash with missing files
• Fix saltutil.find_job for Windows (issue 10581)
• Fix OS detection for OpenSolaris (issue 10601)
• Fix broken salt-ssh key_deploy
• Add support for multiline cron comments (issue 10721)
• Fix timezone module for Arch (issue 10789)
• Fix symlink support for file.recurse (issue 10809)
• Fix multi-master bugs (issue 10732 and issue 10969)
• Fix file.patch to error when source file is unavailable (issue 10380)
• Fix pkg to handle packages set as purge in pkg.installed (issue 10719)
• Add zmqversion grain
• Fix highstate summary for masterless minions (issue 10945)
• Fix saltutil.find_job for 2014.1 masters talking to 0.17 minions (issue 11020)
• Fix file.recurse states with trailing slashes in source (issue 11002)
• Fix pkg states to allow pkgname.x86_64 (issue 7306)
• Make iptables states set a default table for flush (issue 10373)
• Added iptables --reject-with after final iptables call in iptables states (issue:10757)
• Fix improper passing of “family” in iptables states (issue 10774)
• Fix traceback in iptables.insert states (issue 10988)
• Fix zombie processes (issue 10867 and others)
• Fix batch mode to obey --return settings (issue 9146)
• Fix localclient issue that was causing batch mode breakage (issue 11094, issue 10470, and others)
• Multiple salt-ssh fixes
• FreeBSD: look in /usr/local/etc/salt for configuration by default, if installed using pip --editable.
• Add a skip_suggestions parameter to pkg.installed states which allows pre-flight check to be skipped (issue 11106)
• Fixed tag-based gitfs fileserver environments regression (issue 10956)
• Yum: fix cache of available pkgs not cleared when repos are changed (issue 11001)
• Yum: fix for plugin-provided repositories (i.e. RHN/Spacewalk) (issue 11145)
• Fix regression in chocolatey.bootstrap (issue 10541)
• Fix fail on unknown target in jobs runner (issue 11151)
• Don’t log errors for commands which are expected to sometimes exit with non-zero exit status (issue 11154, issue 11090)
• Fix test=True CLI override of config option (issue 10877)
• Log sysctl key listing at loglevel TRACE (issue 10931)

18.2.46 Salt 2014.1.10 Release Notes

release 2014-08-01

Note: Version 2014.1.9 contained a regression which caused inaccurate Salt version detection, and thus was never packaged for general release. This version contains the version detection fix, but is otherwise identical to 2014.1.9.

Version 2014.1.10 is another bugfix release for 2014.1.0. Changes include:
  • Ensure salt-ssh will not continue if permissions on a temporary directory are not correct.
  • Use the bootstrap script distributed with Salt instead of relying on an external resource
  • Remove unused testing code
  • Ensure salt states are placed into the .salt directory in salt-ssh
  • Use a randomized path for temporary files in a salt-cloud deployment
  • Clean any stale directories to ensure a fresh copy of salt-ssh during a deployment

18.2.47 Salt 2014.1.11 Release Notes

release 2014-08-29

Version 2014.1.11 is another bugfix release for 2014.1.0. Changes include:
  • Fix for minion_id with byte-order mark (BOM) (issue 12296)
  • Fix runas deprecation in at module
  • Fix trailing slash behavior for file.makedirs_ (issue 14019)
• Fix chocolatey path (issue 13870)
• Fix git_pillar infinite loop issues (issue 14671)
• Fix json outputter null case
• Fix for minion error if one of multiple masters are down (issue 14099)

18.2.48 Salt 2014.1.12 Release Notes

release 2014-10-08
Version 2014.1.12 is another bugfix release for 2014.1.0. Changes include:

• Fix scp_file always failing (which broke salt-cloud) (issue 16437)
• Fix regression in pillar in masterless (issue 16210, issue 16416, issue 16428)

18.2.49 Salt 2014.1.13 Release Notes

release 2014-10-14
Version 2014.1.13 is another bugfix release for 2014.1.0. Changes include:

• Fix sftp_file by checking the exit status code of scp (which broke salt-cloud) (issue 16599)

18.2.50 Salt 2014.1.2 Release Notes

release 2014-04-15
Version 2014.1.2 is another bugfix release for 2014.1.0. The changes include:

• Fix username detection when su’ed to root on FreeBSD (issue 11628)
• Fix minionfs backend for file.recurse states
• Fix 32-bit packages of different arches than the CPU arch, on 32-bit RHEL/CentOS (issue 11822)
• Fix bug with specifying alternate home dir on user creation (FreeBSD) (issue 11790)
• Don’t reload site module on module refresh for MacOS
• Fix regression with running execution functions in Pillar SLS (issue 11453)
• Fix some modules missing from Windows installer
• Don’t log an error for yum commands that return nonzero exit status on non-failure (issue 11645)
• Fix bug in rabbitmq state (issue 8703)
• Fix missing ssh config options (issue 10604)
• Fix top.sls ordering (issue 10810 and issue 11691)
• Fix salt-key --list all (issue 10982)
• Fix win_servermanager install/remove function (issue 11038)
• Fix interaction with tokens when running commands as root (issue 11223)
• Fix overstate bug with find_job and **kwargs (issue 10503)
• Fix saltenv for aptpkg.mod_repo from pkgrepo state
• Fix environment issue causing file caching problems (issue 11189)
• Fix bug in \_\_parse_key in registry state (issue 11408)
• Add minion auth retry on rejection (issue 10763)
• Fix publish\_session updating the encryption key (issue 11493)
• Fix for bad AssertionError raised by GitPython (issue 11473)
• Fix debian\_ip to allow disabling and enabling networking on Ubuntu (issue 11164)
• Fix potential memory leak caused by saved (and unused) events (issue 11582)
• Fix exception handling in the MySQL module (issue 11616)
• Fix environment-related error (issue 11534)
• Include psutil on Windows
• Add file.replace and file.search to Windows (issue 11471)
• Add additional file module helpers to Windows (issue 11235)
• Add pid to netstat output on Windows (issue 10782)
• Fix Windows not caching new versions of installers in winrepo (issue 10597)
• Fix hardcoded md5 hashing
• Fix kwargs in salt-ssh (issue 11609)
• Fix file backup timestamps (issue 11745)
• Fix stacktrace on sys.doc with invalid eauth (issue 11293)
• Fix git.latest with test=True (issue 11595)
• Fix file\_check\_perms hardcoded follow\_symlinks (issue 11387)
• Fix certain pkg states for RHEL5/Cent5 machines (issue 11719)

18.2.51 Salt 2014.1.3 Release Notes

release 2014-04-15

Version 2014.1.3 is another bugfix release for 2014.1.0. It was created as a hotfix for a regression found in 2014.1.2, which was not distributed. The only change made was as follows:

• Fix regression that caused saltutil\_find\_job to fail, causing premature terminations of salt CLI commands.

Changes in the not-distributed 2014.1.2, also included in 2014.1.3:

• Fix username detection when su\'ed to root on FreeBSD (issue 11628)
• Fix minionfs backend for file.recurse states
• Fix 32-bit packages of different arches than the CPU arch, on 32-bit RHEL/CentOS (issue 11822)
• Fix bug with specifying alternate home dir on user creation (FreeBSD) (issue 11790)
• Don’t reload site module on module refresh for MacOS
• Fix regression with running execution functions in Pillar SLS (issue 11453)
• Fix some modules missing from Windows installer
• Don’t log an error for yum commands that return nonzero exit status on non-failure (issue 11645)
• Fix bug in rabbitmq state (issue 8703)
• Fix missing ssh config options (issue 10604)
• Fix top.sls ordering (issue 10810 and issue 11691)
• Fix salt-key --list all (issue 10982)
• Fix win_servermanager install/remove function (issue 11038)
• Fix interaction with tokens when running commands as root (issue 11223)
• Fix overstate bug with find_job and **kwargs (issue 10503)
• Fix saltenv for aptpkg.mod_repo from pkgrepo state
• Fix environment issue causing file caching problems (issue 11189)
• Fix bug in __parse_key in registry state (issue 11408)
• Add minion auth retry on rejection (issue 10763)
• Fix publish_session updating the encryption key (issue 11493)
• Fix for bad AssertionError raised by GitPython (issue 11473)
• Fix debian_ip to allow disabling and enabling networking on Ubuntu (issue 11164)
• Fix potential memory leak caused by saved (and unused) events (issue 11582)
• Fix exception handling in the MySQL module (issue 11616)
• Fix environment-related error (issue 11534)
• Include psutil on Windows
• Add file.replace and file.search to Windows (issue 11471)
• Add additional file module helpers to Windows (issue 11235)
• Add pid to netstat output on Windows (issue 10782)
• Fix Windows not caching new versions of installers in winrepo (issue 10597)
• Fix hardcoded md5 hashing
• Fix kwargs in salt-ssh (issue 11609)
• Fix file backup timestamps (issue 11745)
• Fix stacktrace on sys.doc with invalid eauth (issue 11293)
• Fix git.latest with test=True (issue 11595)
• Fix file.check_perms hardcoded follow_symlinks (issue 11387)
• Fix certain pkg states for RHEL5/Cent5 machines (issue 11719)

18.2.52 Salt 2014.1.4 Release Notes

release 2014-05-05

Version 2014.1.4 is another bugfix release for 2014.1.0. Changes include:
• Fix setup.py dependency issue (issue 12031)
• Fix handling for IOErrors under certain circumstances (issue 11783 and issue 11853)
• Fix fatal exception when /proc/1/cgroup is not readable (issue 11619)
Salt Documentation, Release 2016.3.6

- Fix os grains for OpenSolaris (issue 11907)
- Fix lvs.zero module argument pass-through (issue 9001)
- Fix bug in debian_ip interaction with network.system state (issue 11164)
- Remove bad binary package verification code (issue 12177)
- Fix traceback in solaris package installation (issue 12237)
- Fix file.directory state symlink handling (issue 12209)
- Remove external_ip grain
- Fix file.managed makedirs issues (issue 10446)
- Fix hang on non-existent Windows drive letter for file module (issue 9880)
- Fix salt minion caching all users on the server (issue 9743)
- Add strftime formatting for ps.boot_time (issue 12428)

18.2.53 Salt 2014.1.5 Release Notes

release 2014-06-11

Version 2014.1.5 is another bugfix release for 2014.1.0. Changes include:

- Add function for finding cached job on the minion
- Fix iptables save file location for Debian (issue 11730)
- Fix for minion caching jobs when master is down
- Bump default syndic_wait to 5 to fix syndic-related problems (issue 12262)
- Add OpenBSD, FreeBSD, and NetBSD support for network.netstat (issue 12121)
- Fix false positive error in logs for makeconf state (issue 9762)
- Fix for yum fromrepo package installs when repo is disabled by default (issue 12466)
- Fix for extra blank lines in file.blockreplace (issue 12422)
- Fix grain detection for OpenVZ guests (issue 11877)
- Fix get_dns_servers function for Windows win_dns_client
- Use system locale for ports package installations
- Use correct stop/restart procedure for Debian networking in debian_ip (issue 12614)
- Fix for cmd_iter/cmd_iter_no_block blocking issues (issue 12617)
- Fix traceback when syncing custom types (issue 12883)
- Fix cleaning directory symlinks in file.directory
- Add performance optimizations for saltutil.sync_all and state.highstate
- Fix possible error in saltutil.running
- Fix for kmod modules with dashes (issue 13239)
- Fix possible race condition for Windows minions in state module reloading (issue 12370)
- Fix bug with roster for passwd option that is loaded as a non-string object (issue 13249)
- Keep duplicate version numbers from showing up in pkg.list_pkgs output
- Fixes for Jinja renderer, timezone `module/state` (issue 12724)
- Fix `timedatectl` parsing for systemd>=210 (issue 12728)
- Fix `saltenv` being written to YUM repo config files (issue 12887)
- Removed the deprecated external nodes classifier (originally accessible by setting a value for external_nodes in the master configuration file). Note that this functionality has been marked deprecated for some time and was replaced by the more general `master_tops` system.
- More robust escaping of ldap filter strings.
- Fix trailing slash in `gitfs_root` causing files not to be available (issue 13185)

18.2.54 Salt 2014.1.6 Release Notes

**release** 2014-07-08

Version 2014.1.6 is another bugfix release for 2014.1.0. Changes include:

- Fix extra `iptables --help` output (Sorry!) (issue 13648, issue 13507, issue 13527, issue 13607)
- Fix `mount.active` for Solaris
- Fix support for `allow-hotplug` statement in `debian_ip` network module
- Add `sqlite3` to esky builds
- Fix `jobs.active` output (issue 9526)
- Fix the `virtual` grain for Xen (issue 13534)
- Fix `_ext_nodes` unavailable on master (issue 13535)
- Fix `eauth` for batch mode (issue 9605)
- Fix force-related issues with `tomcat` support (issue 12889)
- Fix `KeyError` when cloud mapping
- Fix `salt-minion` restart loop in Windows (issue 12086)
- Fix detection of `service` virtual module on Fedora minions
- Fix traceback with missing `ipv4` grain (issue 13838)
- Fix `issue in roots backend with invalid data inmtime_map` (issue 13836)
- Fix traceback in `jobs.active` (issue 11151)
- Fix `master_tops` and `_ext_nodes` issue (issue 13535, issue 13673)

18.2.55 Salt 2014.1.7 Release Notes

**release** 2014-07-09

Version 2014.1.7 is another bugfix release for 2014.1.0. Changes include:

- Fix batch mode regression (issue 14046)

This release was a hotfix release for the regression listed above which was present in the 2014.1.6 release. The changes included in 2014.1.6 are listed below:

- Fix extra `iptables --help` output (Sorry!) (issue 13648, issue 13507, issue 13527, issue 13607)
- Fix `mount.active` for Solaris

18.2. Previous Releases
• Fix support for `allow-hotplug` statement in `debian_ip` network module
• Add sqlite3 to esky builds
• Fix `jobs.active` output ([issue 9526](#issue9526))
• Fix the `virtual` grain for Xen ([issue 13534](#issue13534))
• Fix eauth for batch mode ([issue 9605](#issue9605))
• Fix force-related issues with `tomcat` support ([issue 12889](#issue12889))
• Fix KeyErrors when cloud mapping
• Fix salt-minion restart loop in Windows ([issue 12086](#issue12086))
• Fix detection of `service` virtual module on Fedora minions
• Fix traceback with missing `ipv4` grain ([issue 13838](#issue13838))
• Fix issue in roots backend with missing data in `mtime_map` ([issue 13836](#issue13836))
• Fix traceback in `jobs.active` ([issue 11151](#issue11151))
• Fix `master_tops` and `_ext_nodes` issue ([issue 13535](#issue13535), [issue 13673](#issue13673))

### 18.2.56 Salt 2014.1.8 Release Notes

**release** 2014-07-30

**Note:** This release contained a regression which caused inaccurate Salt version detection, and thus was never packaged for general release. Please use version 2014.1.10 instead.

Version 2014.1.8 is another bugfix release for [2014.1.0](#2014.1.0). Changes include:

• Ensure salt-ssh will not continue if permissions on a temporary directory are not correct.
• Use the bootstrap script distributed with Salt instead of relying on an external resource
• Remove unused testing code
• Ensure salt states are placed into the `.salt` directory in salt-ssh
• Use a randomized path for temporary files in a salt-cloud deployment
• Clean any stale directories to ensure a fresh copy of salt-ssh during a deployment

### 18.2.57 Salt 2014.1.9 Release Notes

**release** 2014-07-31

**Note:** This release contained a regression which caused inaccurate Salt version detection, and thus was never packaged for general release. Please use version 2014.1.10 instead.

**Note:** Version 2014.1.8 contained a regression which caused inaccurate Salt version detection, and thus was never packaged for general release. This version contains the version detection fix, but is otherwise identical to 2014.1.8.

Version 2014.1.9 is another bugfix release for [2014.1.0](#2014.1.0). Changes include:
- Ensure salt-ssh will not continue if permissions on a temporary directory are not correct.
- Use the bootstrap script distributed with Salt instead of relying on an external resource
- Remove unused testing code
- Ensure salt states are placed into the .salt directory in salt-ssh
- Use a randomized path for temporary files in a salt-cloud deployment
- Clean any stale directories to ensure a fresh copy of salt-ssh during a deployment

### 18.2.58 Salt 0.10.0 Release Notes

**release** 2012-06-16

0.10.0 has arrived! This release comes with MANY bug fixes, and new capabilities which greatly enhance performance and reliability. This release is primarily a bug fix release with many new tests and many repaired bugs. This release also introduces a few new key features which were brought in primarily to repair bugs and some limitations found in some of the components of the original architecture.

**Major Features**

**Event System**

The Salt Master now comes equipped with a new event system. This event system has replaced some of the back end of the Salt client and offers the beginning of a system which will make plugging external applications into Salt. The event system relies on a local ZeroMQ publish socket and other processes can connect to this socket and listen for events. The new events can be easily managed via Salt’s event library.

**Unprivileged User Updates**

Some enhancements have been added to Salt for running as a user other than root. These new additions should make switching the user that the Salt Master is running as very painless, simply change the user option in the master configuration and restart the master, Salt will take care of all of the particulars for you.

**Peer Runner Execution**

Salt has long had the peer communication system used to allow minions to send commands via the salt master. 0.10.0 adds a new capability here, now the master can be configured to allow for minions to execute Salt runners via the peer_run option in the salt master configuration.

**YAML Parsing Updates**

In the past the YAML parser for sls files would return the incorrect numbers when the file mode was set with a preceding 0. The YAML parser used in Salt has been modified to no longer convert these numbers into octal but to keep them as the correct value so that sls files can be a little cleaner to write.

**State Call Data Files**

It was requested that the minion keep a local cache of the most recent executed state run. This has been added and now with state runs the data is stored in a msgpack file in the minion’s cachedir.

18.2. Previous Releases
Turning Off the Job Cache

A new option has been added to the master configuration file. In previous releases the Salt client would look over the Salt job cache to read in the minion return data. With the addition of the event system the Salt client can now watch for events directly from the master worker processes.

This means that the job cache is no longer a hard requirement. Keep in mind though, that turning off the job cache means that historic job execution data cannot be retrieved.

Test Updates

Minion Swarms Are Faster

To continue our efforts with testing Salt’s ability to scale the minionswarm script has been updated. The minionswarm can now start up minions much faster than it could before and comes with a new feature allowing modules to be disabled, thus lowering the minion’s footprint when making a swarm. These new updates have allows us to test

```
# python minionswarm.py -m 20 --master salt-master
```

Many Fixes

To get a good idea for the number of bugfixes this release offers take a look at the closed tickets for 0.10.0, this is a very substantial update:

https://github.com/saltstack/salt/issues?milestone=12&state=closed

Master and Minion Stability Fixes

As Salt deployments grow new ways to break Salt are discovered. 0.10.0 comes with a number of fixes for the minions and master greatly improving Salt stability.

18.2.59 Salt 0.10.1 Release Notes

release 2012-06-19

18.2.60 Salt 0.10.2 Release Notes

release 2012-07-30

0.10.2 is out! This release comes with enhancements to the pillar interface, cleaner ways to access the salt-call capabilities in the API, minion data caching and the event system has been added to salt minions.

There have also been updates to the ZeroMQ functions, many more tests (thanks to sponsors, the code sprint and many contributors) and a swath of bug fixes.
Major Features

Ext Pillar Modules

The ranks of available Salt modules directories sees a new member in 0.10.2. With the popularity of pillar a higher demand has arisen for ext_pillar interfaces to be more like regular Salt module additions. Now ext_pillar interfaces can be added in the same way as other modules, just drop it into the pillar directory in the salt source.

Minion Events

In 0.10.0 an event system was added to the Salt master. 0.10.2 adds the event system to the minions as well. Now event can be published on a local minion as well.

The minions can also send events back up to the master. This means that Salt is able to communicate individual events from the minions back up to the Master which are not associated with command.

Minion Data Caching

When pillar was introduced the landscape for available data was greatly enhanced. The minion’s began sending grain data back to the master on a regular basis.

The new config option on the master called minion_data_cache instructs the Salt master to maintain a cache of the minion's grains and pillar data in the cachedir. This option is turned off by default to avoid hitting the disk more, but when enabled the cache is used to make grain matching from the salt command more powerful, since the minions that will match can be predetermined.

Backup Files

By default all files replaced by the file.managed and file.recurse states we simply deleted. 0.10.2 adds a new option. By setting the backup option to minion the files are backed up before they are replaced.

The backed up files are located in the cachedir under the file_backup directory. On a default system this will be at: /var/cache/salt/file_backup

Configuration files

salt-master and salt-minion automatically load additional configuration files from master.d/* .conf respective minion.d/* .conf where master.d/minion.d is a directory in the same directory as the main configuration file.

Salt Key Verification

A number of users complained that they had inadvertently deleted the wrong salt authentication keys. 0.10.2 now displays what keys are going to be deleted and verifies that they are the keys that are intended for deletion.

Key auto-signing

If autosign_file is specified in the configuration file incoming keys will be compared to the list of keynames in autosign_file. Regular expressions as well as globbing is supported.
The file must only be writable by the user otherwise the file will be ignored. To relax the permission and allow group write access set the `permissive_pki_access` option.

**Module changes**

**Improved OpenBSD support**

New modules for managing services and packages were provided by Joshua Elsasser to further improve the support for OpenBSD.

Existing modules like the `disk` module were also improved to support OpenBSD.

**SQL Modules**

The MySQL and PostgreSQL modules have both received a number of additions thanks to the work of Avi Marcus and Roman Imankulov.

**ZFS Support on FreeBSD**

A new ZFS module has been added by Kurtis Velarde for FreeBSD supporting various ZFS operations like creating, extending or removing zpools.

**Augeas**

A new Augeas module by Ulrich Dangel for editing and verifying config files.

**Native Debian Service module**

The support for the Debian was further improved with an new service module for Debian by Ahmad Khayyat supporting `disable` and `enable`.

**Cassandra**

Cassandra support has been added by Adam Garside. Currently only status and diagnostic information are supported.

**Networking**

The networking support for RHEL has been improved and supports bonding support as well as zeroconf configuration.

**Monit**

Basic monit support by Kurtis Velarde to control services via monit.
nzbget

Basic support for controlling nzbget by Joseph Hall

Bluetooth

Basic Bluez support for managing and controlling Bluetooth devices. Supports scanning as well as pairing/unpairing by Joseph Hall.

Test Updates

Consistency Testing

Another testing script has been added. A bug was found in pillar when many minions generated pillar data at the same time. The new consist.py script is the tests directory was created to reproduce bugs where data should always be consistent.

Many Fixes

To get a good idea for the number of bugfixes this release offers take a look at the closed tickets for 0.10.2, this is a very substantial update:

https://github.com/saltstack/salt/issues?milestone=24&page=1&state=closed

Master and Minion Stability Fixes

As Salt deployments grow new ways to break Salt are discovered. 0.10.2 comes with a number of fixes for the minions and master greatly improving Salt stability.

18.2.61 Salt 0.10.3 Release Notes

release 2012-09-30

The latest taste of Salt has come, this release has many fixes and feature additions. Modifications have been made to make ZeroMQ connections more reliable, the beginning of the ACL system is in place, a new command line parsing system has been added, dynamic module distribution has become more environment aware, the new master_finger option and many more!

Major Features

ACL System

The new ACL system has been introduced. The ACL system allows for system users other than root to execute salt commands. Users can be allowed to execute specific commands in the same way that minions are opened up to the peer system.

The configuration value to open up the ACL system is called client_acl and is configured like so:
client_acl:
  fred:
    - test.*
    - pkg.list_pkgs

Where fred is allowed access to functions in the test module and to the pkg.list_pkgs function.

Master Finger Option

The master_finger option has been added to improve the security of minion provisioning. The master_finger option allows for the fingerprint of the master public key to be set in the configuration file to double verify that the master is valid. This option was added in response to a motivation to pre-authenticate the master when provisioning new minions to help prevent man in the middle attacks in some situations.

Salt Key Fingerprint Generation

The ability to generate fingerprints of keys used by Salt has been added to salt-key. The new option finger accepts the name of the key to generate and display a fingerprint for.

```
salt-key -F master
```

Will display the fingerprints for the master public and private keys.

Parsing System

Pedro Algavio, aka s0undt3ch, has added a substantial update to the command line parsing system that makes the help message output much cleaner and easier to search through. Salt parsers now have --versions-report besides usual --version info which you can provide when reporting any issues found.

Key Generation

We have reduced the requirements needed for salt-key to generate minion keys. You're no longer required to have salt configured and it's common directories created just to generate keys. This might prove useful if you're batch creating keys to pre-load on minions.

Startup States

A few configuration options have been added which allow for states to be run when the minion daemon starts. This can be a great advantage when deploying with Salt because the minion can apply states right when it first runs. To use startup states set the startup_states configuration option on the minion to highstate.

New Exclude Declaration

Some users have asked about adding the ability to ensure that other sls files or ids are excluded from a state run. The exclude statement will delete all of the data loaded from the specified sls file or will delete the specified id:
Max Open Files

While we're currently unable to properly handle ZeroMQ's abort signals when the max open files is reached, due to the way that's handled on ZeroMQ's, we have minimized the chances of this happening without at least warning the user.

More State Output Options

Some major changes have been made to the state output system. In the past state return data was printed in a very verbose fashion and only states that failed or made changes were printed by default. Now two options can be passed to the master and minion configuration files to change the behavior of the state output. State output can be set to verbose (default) or non-verbose with the `state_verbose` option:

```python
state_verbose: False
```

It is noteworthy that the `state_verbose` option used to be set to `False` by default but has been changed to `True` by default in 0.10.3 due to many requests for the change.

The next option to be aware of new and called `state_output`. This option allows for the state output to be set to `full` (default) or `terse`.

The `full` output is the standard state output, but the new `terse` output will print only one line per state making the output much easier to follow when executing a large state system.

```python
state_output: terse
```

**state.file.append Improvements**

The salt state `file.append()` tries not to append existing text. Previously the matching check was being made line by line. While this kind of check might be enough for most cases, if the text being appended was multi-line, the check would not work properly. This issue is now properly handled, the match is done as a whole ignoring any white space addition or removal except inside commas. For those thinking that, in order to properly match over multiple lines, salt will load the whole file into memory, that's not true. For most cases this is not important but an erroneous order to read a 4GB file, if not properly handled, like salt does, could make salt chew that amount of memory. Salt has a buffered file reader which will keep in memory a maximum of 256KB and iterates over the file in chunks of 32KB to test for the match, more than enough, if not, explain your usage on a ticket. With this change, also `salt.modules.file.contains()`, `salt.modules.file.contains_regex()`, `salt.modules.file.contains_glob()` and `salt.utils.find` now do the searching and/or matching using the buffered chunks approach explained above.

Two new keyword arguments were also added, `makedirs`, and `source`. The first, `makedirs` will create the necessary directories in order to append to the specified file, of course, it only applies if we're trying to append to a non-existing file on a non-existing directory:

```
/tmp/salttest/file-append-makedirs:
    file.append:
        text: foo
        makedirs: True
```
The second, source, allows one to append the contents of a file instead of specifying the text.

```
/tmp/salttest/file-append-source:
file.append:
  - source: salt://testfile
```

Security Fix

A timing vulnerability was uncovered in the code which decrypts the AES messages sent over the network. This has been fixed and upgrading is strongly recommended.

18.2.62 Salt 0.10.4 Release Notes

release 2012-10-23

Salt 0.10.4 is a monumental release for the Salt team, with two new module systems, many additions to allow granular access to Salt, improved platform support and much more.

This release is also exciting because we have been able to shorten the release cycle back to under a month. We are working hard to keep up the aggressive pace and look forward to having releases happen more frequently!

This release also includes a serious security fix and all users are very strongly recommended to upgrade. As usual, upgrade the master first, and then the minion to ensure that the process is smooth.

Major Features

External Authentication System

The new external authentication system allows for Salt to pass through authentication to any authentication system to determine if a user has permission to execute a Salt command. The Unix PAM system is the first supported system with more to come!

The external authentication system allows for specific users to be granted access to execute specific functions on specific minions. Access is configured in the master configuration file, and uses the new access control system:

```
external_auth:
  pam:
    thatch:
    - 'web*':
      - test.*
      - network.*
```

The configuration above allows the user thatch to execute functions in the test and network modules on minions that match the web* target.

Access Control System

All Salt systems can now be configured to grant access to non-administrative users in a granular way. The old configuration continues to work. Specific functions can be opened up to specific minions from specific users in the case of external auth and client ACLs, and for specific minions in the case of the peer system.

Access controls are configured like this:
client_acl:
  fred:
    - web\*:
      - pkg.list_pkgs
      - test.*
      - apache.*

Target by Network

A new matcher has been added to the system which allows for minions to be targeted by network. This new matcher can be called with the `-S` flag on the command line and is available in all places that the matcher system is available. Using it is simple:

$ salt -S '192.168.1.0/24' test.ping
$ salt -S '192.168.1.100' test.ping

Nodegroup Nesting

Previously a nodegroup was limited by not being able to include another nodegroup, this restraint has been lifted and now nodegroups will be expanded within other nodegroups with the `N@` classifier.

Salt Key Delete by Glob

The ability to delete minion keys by glob has been added to `salt-key`. To delete all minion keys whose minion name starts with `web`:

$ salt-key -d 'web*'

Master Tops System

The `external_nodes` system has been upgraded to allow for modular subsystems to be used to generate the top file data for a highstate run.

The `external_nodes` option still works but will be deprecated in the future in favor of the new `master_tops` option.

Example of using `master_tops`:

```
master_tops:
  ext_nodes: cobbler-external-nodes
```

Next Level Solaris Support

A lot of work has been put into improved Solaris support by Romeo Theriault. Packaging modules (pkgadd/pkgrm and pkgutil) and states, cron support and user and group management have all been added and improved upon. These additions along with SMF (Service Management Facility) service support and improved Solaris grain detection in 0.10.3 add up to Salt becoming a great tool to manage Solaris servers with.
Security

A vulnerability in the security handshake was found and has been repaired, old minions should be able to connect to a new master, so as usual, the master should be updated first and then the minions.

Pillar Updates

The pillar communication has been updated to add some extra levels of verification so that the intended minion is the only one allowed to gather the data. Once all minions and the master are updated to salt 0.10.4 please activate pillar 2 by changing the `pillar_version` in the master config to 2. This will be set to 2 by default in a future release.

18.2.63 Salt 0.10.5 Release Notes

release 2012-11-15

Salt 0.10.5 is ready, and comes with some great new features. A few more interfaces have been modularized, like the outputter system. The job cache system has been made more powerful and can now store and retrieve jobs archived in external databases. The returner system has been extended to allow minions to easily retrieve data from a returner interface.

As usual, this is an exciting release, with many noteworthy additions!

Major Features

External Job Cache

The external job cache is a system which allows for a returner interface to also act as a job cache. This system is intended to allow users to store job information in a central location for longer periods of time and to make the act of looking up information from jobs executed on other minions easier.

Currently the external job cache is supported via the mongo and redis returners:

```
ext_job_cache: redis
redis.host: salt
```

Once the external job cache is turned on the new `ret` module can be used on the minions to retrieve return information from the job cache. This can be a great way for minions to respond and react to other minions.

OpenStack Additions

OpenStack integration with Salt has been moving forward at a blistering pace. The new `nova`, `glance`, and `keystone` modules represent the beginning of ongoing OpenStack integration.

The Salt team has had many conversations with core OpenStack developers and is working on linking to OpenStack in powerful new ways.

Wheel System

A new API was added to the Salt Master which allows the master to be managed via an external API. This new system allows Salt API to easily hook into the Salt Master and manage configs, modify the state tree, manage the pillar and
more. The main motivation for the wheel system is to enable features needed in the upcoming web UI so users can manage the master just as easily as they manage minions.

The wheel system has also been hooked into the external auth system. This allows specific users to have granular access to manage components of the Salt Master.

**Render Pipes**

Jack Kuan has added a substantial new feature. The render pipes system allows Salt to treat the render system like unix pipes. This new system enables sls files to be passed through specific render engines. While the default renderer is still recommended, different engines can now be more easily merged. So to pipe the output of Mako used in YAML use this shebang line:

```bash
#!/mako|yaml
```

**Salt Key Overhaul**

The Salt Key system was originally developed as only a CLI interface, but as time went on it was pressed into becoming a clumsy API. This release marks a complete overhaul of Salt Key. Salt Key has been rewritten to function purely from an API and to use the outpuer system. The benefit here is that the outpuer system works much more cleanly with Salt Key now, and the internals of Salt Key can be used much more cleanly.

**Modular Outpuers**

The outpuer system is now loaded in a modular way. This means that output systems can be more easily added by dropping a python file down on the master that contains the function `output`.

**Gzip from Fileserver**

Gzip compression has been added as an option to the cp.get_file and cp.get_dir commands. This will make file transfers more efficient and faster, especially over slower network links.

**Unified Module Configuration**

In past releases of Salt, the minions needed to be configured for certain modules to function. This was difficult because it required pre-configuring the minions. 0.10.5 changes this by making all module configs on minions search the master config file for values.

Now if a single database server is needed, then it can be defined in the master config and all minions will become aware of the configuration value.

**Salt Call Enhancements**

The `salt-call` command has been updated in a few ways. Now, `salt-call` can take the `--return` option to send the data to a returner. Also, `salt-call` now reports executions in the minion proc system, this allows the master to be aware of the operation `salt-call` is running.
Death to pub refresh and sub_timeout

The old configuration values `pub_refresh` and `sub_timeout` have been removed. These options were in place to alleviate problems found in earlier versions of ZeroMQ which have since been fixed. The continued use of these options has proven to cause problems with message passing and have been completely removed.

Git Revision Versions

When running Salt directly from git (for testing or development, of course) it has been difficult to know exactly what code is being executed. The new versioning system will detect the git revision when building and how many commits have been made since the last release. A release from git will look like this:

0.10.4-736-gec74d69

Svn Module Addition

Anthony Cornehl (twinshadow) contributed a module that adds Subversion support to Salt. This great addition helps round out Salt’s VCS support.

Noteworthy Changes

Arch Linux Defaults to Systemd

Arch Linux recently changed to use systemd by default and discontinued support for init scripts. Salt has followed suit and defaults to systemd now for managing services in Arch.

Salt, Salt Cloud and Openstack

With the releases of Salt 0.10.5 and Salt Cloud 0.8.2, OpenStack becomes the first (non-OS) piece of software to include support both on the user level (with Salt Cloud) and the admin level (with Salt). We are excited to continue to extend support of other platforms at this level.

18.2.64 Salt 0.11.0 Release Notes

Salt 0.11.0 is here, with some highly sought after and exciting features. These features include the new overstate system, the reactor system, a new state run scope component called __context__, the beginning of the search system (still needs a great deal of work), multiple package states, the MySQL returner and a better system to arbitrarily reference outpurters.

It is also noteworthy that we are changing how we mark release numbers. For the life of the project we have been pushing every release with features and fixes as point releases. We will now be releasing point releases for only bug fixes on a more regular basis and major feature releases on a slightly less regular basis. This means that the next release will be a bugfix only release with a version number of 0.11.1. The next feature release will be named 0.12.0 and will mark the end of life for the 0.11 series.
Major Features

OverState

The overstate system is a simple way to manage rolling state executions across many minions. The overstate allows for a state to depend on the successful completion of another state.

Reactor System

The new reactor system allows for a reactive logic engine to be created which can respond to events within a salted environment. The reactor system uses sls files to match events fired on the master with actions, enabling Salt to react to problems in an infrastructure.

Your load-balanced group of webservers is under extra load? Spin up a new VM and add it to the group. Your fileserver is filling up? Send a notification to your sysadmin on call. The possibilities are endless!

Module Context

A new component has been added to the module loader system. The module context is a data structure that can hold objects for a given scope within the module.

This allows for components that are initialized to be stored in a persistent context which can greatly speed up ongoing connections. Right now the best example can be found in the cp execution module.

Multiple Package Management

A long desired feature has been added to package management. By definition Salt States have always installed packages one at a time. On most platforms this is not the fastest way to install packages. Erik Johnson, aka terminalmage, has modified the package modules for many providers and added new capabilities to install groups of packages. These package groups can be defined as a list of packages available in repository servers:

```
python_pkgs:
  pkg.installed:
    - pkgs:
      - python-mako
      - whoosh
      - python-git
```

or specify based on the location of specific packages:

```
python_pkgs:
  pkg.installed:
    - sources:
      - python-mako: http://some-rpms.org/python-mako.rpm
      - whoosh: salt://whoosh/whoosh.rpm
      - python-git: ftp://companyserver.net/python-git.rpm
```

Search System

The bones to the search system have been added. This is a very basic interface that allows for search backends to be added as search modules. The first supported search module is the whoosh search backend. Right now only the
basic paths for the search system are in place, making this very experimental. Further development will involve improving the search routines and index routines for whoosh and other search backends.

The search system has been made to allow for searching through all of the state and pillar files, configuration files and all return data from minion executions.

**Notable Changes**

All previous versions of Salt have shared many directories between the master and minion. The default locations for keys, cached data and sockets has been shared by master and minion. This has created serious problems with running a master and a minion on the same systems. 0.11.0 changes the defaults to be separate directories. Salt will also attempt to migrate all of the old key data into the correct new directories, but if it is not successful it may need to be done manually. If your keys exhibit issues after updating make sure that they have been moved from `/etc/salt/pki` to `/etc/salt/pki/{master,minion}`.

The old setup will look like this:

```
/etc/salt/pki
|-- master.pem
|-- master.pub
|-- minions
   `-- ragnarok.saltstack.net
   `-- minions_pre
   `-- minion.pem
   `-- minion.pub
   `-- minion_master.pub
   `-- minions_pre
   `-- minions_rejected
```

With the accepted minion keys in `/etc/salt/pki/minions`, the new setup places the accepted minion keys in `/etc/salt/pki/master/minions`.

```
/etc/salt/pki
|-- master
   |-- master.pem
   |-- master.pub
   `-- minions
      `-- ragnarok.saltstack.net
      `-- minions_pre
      `-- minions_rejected
|-- minion
   |-- minion.pem
   |-- minion.pub
   `-- minion_master.pub
```

**18.2.65 Salt 0.11.1 Release Notes**

*release* 2012-12-19

**18.2.66 Salt 0.12.0 Release Notes**

*release* 2013-01-15
Another feature release of Salt is here! Some exciting additions are included with more ways to make salt modular and even easier management of the salt file server.

**Major Features**

**Modular Fileserver Backend**

The new modular fileserver backend allows for any external system to be used as a salt file server. The main benefit here is that it is now possible to tell the master to directly use a git remote location, or many git remote locations, automatically mapping git branches and tags to salt environments.

**Windows is First Class!**

A new Salt Windows installer is now available! Much work has been put in to improve Windows support. With this much easier method of getting Salt on your Windows machines, we hope even more development and progress will occur. Please file bug reports on the Salt GitHub repo issue tracker so we can continue improving.

One thing that is missing on Windows that Salt uses extensively is a software package manager and a software package repository. The Salt pkg state allows sys admins to install software across their infrastructure and across operating systems. Software on Windows can now be managed in the same way. The SaltStack team built a package manager that interfaces with the standard Salt pkg module to allow for installing and removing software on Windows. In addition, a software package repository has been built on top of the Salt fileserver. A small YAML file provides the information necessary for the package manager to install and remove software.

An interesting feature of the new Salt Windows software package repository is that one or more remote git repositories can supplement the master's local repository. The repository can point to software on the master's fileserver or on an HTTP, HTTPS, or ftp server.

**New Default Outputer**

Salt displays data to the terminal via the outputer system. For a long time the default outputer for Salt has been the python pretty print library. While this has been a generally reasonable outputer, it did have many failings. The new default outputer is called `nested`, it recursively scans return data structures and prints them out cleanly.

If the result of the new nested outputer is not desired any other outpper can be used via the --out option, or the output option can be set in the master and minion configs to change the default outputer.

**Internal Scheduler**

The internal Salt scheduler is a new capability which allows for functions to be executed at given intervals on the minion, and for runners to be executed at given intervals on the master. The scheduler allows for sequences such as executing state runs (locally on the minion or remotely via an overstate) or continually gathering system data to be run at given intervals.

The configuration is simple, add the schedule option to the master or minion config and specify jobs to run, this in the master config will execute the state.over runner every 60 minutes:

```
schedule:
  overstate:
    function: state.over
    minutes: 60
```
This example for the minion configuration will execute a highstate every 30 minutes:

```yaml
schedule:
  highstate:
    function: state.highstate
    minutes: 30
```

Optional DSL for SLS Formulas

Jack Kuan, our renderer expert, has created something that is astonishing. Salt, now comes with an optional Python based DSL, this is a very powerful interface that makes writing SLS files in pure python easier than it was with the raw py renderer. As usual this can be used with the renderer shebang line, so a single sls can be written with the DSL if pure python power is needed while keeping other sls files simple with YAML.

Set Grains Remotely

A new execution function and state module have been added that allows for grains to be set on the minion. Now grains can be set via a remote execution or via states. Use the `grains.present` state or the `grains.setval` execution functions.

Gentoo Additions

Major additions to Gentoo specific components have been made. The encompasses executions modules and states ranging from supporting the make.conf file to tools like layman.

18.2.67 Salt 0.12.1 Release Notes

release 2013-01-21

18.2.68 Salt 0.13.0 Release Notes

release 2013-02-12

The lucky number 13 has turned the corner! From CLI notifications when quitting a salt command, to substantial improvements on Windows, Salt 0.13.0 has arrived!

Major Features

Improved file.recurse Performance

The file.recurse system has been deployed and used in a vast array of situations. Fixes to the file state and module have led towards opening up new ways of running file.recurse to make it faster. Now the file.recurse state will download fewer files and will run substantially faster.
Salt Documentation, Release 2016.3.6

Windows Improvements
Minion stability on Windows has improved. Many ﬁle operations, including ﬁle.recurse, have been ﬁxed and improved. e network module works beer, to include network.interfaces. Both 32bit and 64bit installers are now
available.
Nodegroup Targeting in Peer System
In the past, nodegroups were not available for targeting via the peer system. is has been ﬁxed, allowing the new
nodegroup expr_form argument for the publish.publish function:
salt-call publish.publish group1 test.ping expr_form=nodegroup
Blacklist Additions
Additions allowing more granular blacklisting are available in 0.13.0. e ability to blacklist users and functions in
client_acl have been added, as well as the ability to exclude state formulas from the command line.
Command Line Pillar Embedding
Pillar data can now be embedded on the command line when calling state.sls and state.highstate. is
allows for on the ﬂy changes or seings to pillar and makes parameterizing state formulas even easier. is is done
via the keyword argument:
salt '*' state.highstate pillar='{"cheese": "spam"}'

e above example will extend the existing pillar to hold the cheese key with a value of spam. If the cheese key
is already speciﬁed in the minion's pillar then it will be overwrien.
CLI Notifications
In the past hiing ctrl-C and quiing from the salt command would just drop to a shell prompt, this caused
confusion with users who expected the remote executions to also quit. Now a message is displayed showing what
command can be used to track the execution and what the job id is for the execution.
Version Specification in Multiple-Package States
Versions can now be speciﬁed within multiple-package pkg.installed states. An example can be found below:
mypkgs:
pkg.installed:
- pkgs:
- foo
- bar: 1.2.3-4
- baz

18.2. Previous Releases

2747


Noteworthy Changes

The configuration subsystem in Salt has been overhauled to make the opts dict used by Salt applications more portable, the problem is that this is an incompatible change with salt-cloud, and salt-cloud will need to be updated to the latest git to work with Salt 0.13.0. Salt Cloud 0.8.5 will also require Salt 0.13.0 or later to function.

The SaltStack team is sorry for the inconvenience here, we work hard to make sure these sorts of things do not happen, but sometimes hard changes get in.

18.2.69 Salt 0.13.1 Release Notes

release 2013-02-15

18.2.70 Salt 0.13.2 Release Notes

release 2013-03-13

18.2.71 Salt 0.13.3 Release Notes

release 2013-03-18

18.2.72 Salt 0.14.0 Release Notes

release 2013-03-23

Salt 0.14.0 is here! This release was held up primarily by PyCon, Scale, and illness, but has arrived! 0.14.0 comes with many new features and is breaking ground for Salt in the area of cloud management with the introduction of Salt providing basic cloud controller functionality.

Major Features

Salt - As a Cloud Controller

This is the first primitive inroad to using Salt as a cloud controller is available in 0.14.0. Be advised that this is alpha, only tested in a few very small environments.

The cloud controller is built using kvm and libvirt for the hypervisors. Hypervisors are autodetected as minions and only need to have libvirt running and kvm installed to function. The features of the Salt cloud controller are as follows:

- Basic vm discovery and reporting
- Creation of new virtual machines
- Seeding virtual machines with Salt via qemu-nbd or libguestfs
- Live migration (shared and non shared storage)
- Delete existing VMs

It is noteworthy that this feature is still Alpha, meaning that all rights are reserved to change the interface if needs be in future releases!
Libvirt State

One of the problems with libvirt is management of certificates needed for live migration and cross communication between hypervisors. The new libvirt state makes the Salt Master hold a CA and manage the signing and distribution of keys onto hypervisors, just add a call to the libvirt state in the sls formulas used to set up a hypervisor:

```python
libvirt_keys:
  libvirt.keys
```

New get Functions

An easier way to manage data has been introduced. The pillar, grains, and config execution modules have been extended with the new get function. This function works much in the same way as the get method in a python dict, but with an enhancement, nested dict components can be extracted using a : delimiter.

If a structure like this is in pillar:

```yaml
foo:
  bar:
    baz: quo
```

Extracting it from the raw pillar in an sls formula or file template is done this way:

```python
{{ pillar['foo']['bar']['baz'] }}
```

Now with the new get function the data can be safely gathered and a default can be set allowing the template to fall back if the value is not available:

```python
{{ salt['pillar.get']('foo:bar:baz', 'qux') }}
```

This makes handling nested structures much easier, and defaults can be cleanly set. This new function is being used extensively in the new formulae repository of salt sls formulas.

18.2.73 Salt 0.14.1 Release Notes

    release 2013-04-13

18.2.74 Salt 0.15.0 Release Notes

    release 2013-05-03

The many new features of Salt 0.15.0 have arrived! Salt 0.15.0 comes with many smaller features and a few larger ones.

These features range from better debugging tools to the new Salt Mine system.

Major Features

The Salt Mine

First there was the peer system, allowing for commands to be executed from a minion to other minions to gather data live. Then there was the external job cache for storing and accessing long term data. Now the middle ground is
being filled in with the Salt Mine. The Salt Mine is a system used to execute functions on a regular basis on minions and then store only the most recent data from the functions on the master, then the data is looked up via targets. The mine caches data that is public to all minions, so when a minion posts data to the mine all other minions can see it.

**IPV6 Support**

0.13.0 saw the addition of initial IPV6 support but errors were encountered and it needed to be stripped out. This time the code covers more cases and must be explicitly enabled. But the support is much more extensive than before.

**Copy Files From Minions to the Master**

Minions have long been able to copy files down from the master file server, but until now files could not be easily copied from the minion up to the master.

A new function called `cp.push` can push files from the minions up to the master server. The uploaded files are then cached on the master in the master cachedir for each minion.

**Better Template Debugging**

Template errors have long been a burden when writing states and pillar. 0.15.0 will now send the compiled template data to the debug log, this makes tracking down the intermittent stage templates much easier. So running `state.sls` or `state.highstate` with `-l debug` will now print out the rendered templates in the debug information.

**State Event Firing**

The state system is now more closely tied to the master's event bus. Now when a state fails the failure will be fired on the master event bus so that the reactor can respond to it.

**Major Syndic Updates**

The Syndic system has been basically re-written. Now it runs in a completely asynchronous way and functions primarily as an event broker. This means that the events fired on the syndic are now pushed up to the higher level master instead of the old method used which waited for the client libraries to return.

This makes the syndic much more accurate and powerful, it also means that all events fired on the syndic master make it up the pipe as well making a reactor on the higher level master able to react to minions further downstream.

**Peer System Updates**

The Peer System has been updated to run using the client libraries instead of firing directly over the publish bus. This makes the peer system much more consistent and reliable.

**Minion Key Revocation**

In the past when a minion was decommissioned the key needed to be manually deleted on the master, but now a function on the minion can be used to revoke the calling minion's key:
Function Return Codes

Functions can now be assigned numeric return codes to determine if the function executed successfully. While not all functions have been given return codes, many have and it is an ongoing effort to fill out all functions that might return a non-zero return code.

Functions in Overstate

The overstate system was originally created to just manage the execution of states, but with the addition of return codes to functions, requisite logic can now be used with respect to the overstate. This means that an overstate stage can now run single functions instead of just state executions.

Pillar Error Reporting

Previously if errors surfaced in pillar, then the pillar would consist of only an empty dict. Now all data that was successfully rendered stays in pillar and the render error is also made available. If errors are found in the pillar, states will refuse to run.

Using Cached State Data

Sometimes states are executed purely to maintain a specific state rather than to update states with new configs. This is grounds for the new cached state system. By adding `cache=True` to a state call the state will not be generated fresh from the master but the last state data to be generated will be used. If no previous state data is available then fresh data will be generated.

Monitoring States

The new monitoring states system has been started. This is very young but allows for states to be used to configure monitoring routines. So far only one monitoring state is available, the `disk.status` state. As more capabilities are added to Salt UI the monitoring capabilities of Salt will continue to be expanded.

18.2.75 Salt 0.15.1 Release Notes

`release` 2013-05-08

The 0.15.1 release has been posted, this release includes fixes to a number of bugs in 0.15.1 and a three security patches.

Security Updates

A number of security issues have been resolved via the 0.15.1 release.
Path Injection in Minion IDs

Salt masters did not properly validate the id of a connecting minion. This can lead to an attacker uploading files to the master in arbitrary locations. In particular this can be used to bypass the manual validation of new unknown minions. Exploiting this vulnerability does not require authentication.

This issue affects all known versions of Salt.
This issue was reported by Ronald Volgers.

Patch

The issue is fixed in Salt 0.15.1. Updated packages are available in the usual locations.
Specific commits:
https://github.com/saltstack/salt/commit/5427b9438e452a5a8910d9128c6aaf45d8fd5d3
https://github.com/saltstack/salt/commit/7560908ee62351769c3cd43b03d74c1ca772cc52
https://github.com/saltstack/salt/commit/e200b8a7ff53780124e08d2bdefde7587e52bfca

RSA Key Generation Fault

RSA key generation was done incorrectly, leading to very insecure keys. It is recommended to regenerate all RSA keys.

This issue can be used to impersonate Salt masters or minions, or decrypt any transferred data.
This issue can only be exploited by attackers who are able to observe or modify traffic between Salt minions and the legitimate Salt master.

A tool was included in 0.15.1 to assist in mass key regeneration, the manage.regen_keys runner.

This issue affects all known versions of Salt.
This issue was reported by Ronald Volgers.

Patch

The issue is fixed in Salt 0.15.1. Updated packages are available in the usual locations.
Specific commits:
https://github.com/saltstack/salt/commit/5dd304276ba5745ec21fc1e6686a0b28da29e6fc

Command Injection Via ext_pillar

Arbitrary shell commands could be executed on the master by an authenticated minion through options passed when requesting a pillar.

Ext pillar options have been restricted to only allow safe external pillars to be called when prompted by the minion.
This issue affects Salt versions from 0.14.0 to 0.15.0.
This issue was reported by Ronald Volgers.
Patch

The issue is fixed in Salt 0.15.1. Updated packages are available in the usual locations.
Specific commits:
https://github.com/saltstack/salt/commit/43d8c16bd26159d827d1a945c83ac28159ec5865

18.2.76 Salt 0.15.2 Release Notes
release 2013-05-29

18.2.77 Salt 0.15.3 Release Notes
release 2013-06-01

18.2.78 Salt 0.16.0 Release Notes
release 2013-07-01
The 0.16.0 release is an exciting one, with new features in master redundancy, and a new, powerful requisite.

Major Features

Multi-Master

This new capability allows for a minion to be actively connected to multiple salt masters at the same time. This allows for multiple masters to send out commands to minions and for minions to automatically reconnect to masters that have gone down. A tutorial is available to help get started here:

Multi Master Tutorial

Prereq, the New Requisite

The new prereq requisite is very powerful! It allows for states to execute based on a state that is expected to make changes in the future. This allows for a change on the system to be preempted by another execution. A good example is needing to shut down a service before modifying files associated with it, allowing, for instance, a webserver to be shut down allowing a load balancer to stop sending requests while server side code is updated. In this case, the prereq will only run if changes are expected to happen in the prerequisite state, and the prerequisite state will always run after the prereq state and only if the prereq state succeeds.

Peer System Improvements

The peer system has been revamped to make it more reliable, faster, and like the rest of Salt, async. The peer calls when an updated minion and master are used together will be much faster!
Relative Includes

The ability to include an sls relative to the defined sls has been added, the new syntax id documented here:

Includes

More State Output Options

The state_output option in the past only supported full and terse, 0.16.0 add the mixed and changes modes further refining how states are sent to users' eyes.

Improved Windows Support

Support for Salt on Windows continues to improve. Software management on Windows has become more seamless with Linux/UNIX/BSD software management. Installed software is now recognized by the short names defined in the repository SLS. This makes it possible to run salt '*' pkg.version firefox and get back results from Windows and non-Windows minions alike.

When templating files on Windows, Salt will now correctly use Windows appropriate line endings. This makes it much easier to edit and consume files on Windows.

When using the cmd state the shell option now allows for specifying Windows Powershell as an alternate shell to execute cmd.run and cmd.script. This opens up Salt to all the power of Windows Powershell and its advanced Windows management capabilities.

Several fixes and optimizations were added for the Windows networking modules, especially when working with IPv6.

A system module was added that makes it easy to restart and shutdown Windows minions.

The Salt Minion will now look for its config file in c:salt\conf by default. This means that it's no longer necessary to specify the -c option to specify the location of the config file when starting the Salt Minion on Windows in a terminal.

Multiple Targets for pkg.removed, pkg.purged States

Both pkg.removed and pkg.purged now support the pkgs argument, which allow for multiple packages to be targeted in a single state. This, as in pkg.installed, helps speed up these states by reducing the number of times that the package management tools (apt, yum, etc.) need to be run.

Random Times in Cron States

The temporal parameters in cron.present states (minute, hour, etc.) can now be randomized by using random instead of a specific value. For example, by using the random keyword in the minute parameter of a cron state, the same cron job can be pushed to hundreds or thousands of hosts, and they would each use a randomly-generated minute. This can be helpful when the cron job accesses a network resource, and it is not desirable for all hosts to run the job concurrently.

/path/to/cron/script:
cron.present:
    - user: root
    - minute: random
    - hour: 2
Since Salt assumes a value of * for unspecified temporal parameters, adding a parameter to the state and setting it to random will change that value from * to a randomized numeric value. However, if that field in the cron entry on the minion already contains a numeric value, then using the random keyword will not modify it.

Confirmation Prompt on Key Acceptance

When accepting new keys with salt-key -a minion-id or salt-key -A, there is now a prompt that will show the affected keys and ask for confirmation before proceeding. This prompt can be bypassed using the -y or --yes command line argument, as with other salt-key commands.

Support for Setting Password Hashes on BSD Minions

FreeBSD, NetBSD, and OpenBSD all now support setting passwords in user.present states.

18.2.79 Salt 0.16.1 Release Notes

release 2013-07-29

18.2.80 Salt 0.16.2 Release Notes

release 2013-08-01

Version 0.16.2 is a bugfix release for 0.16.0, and contains a number of fixes.

Windows

• Only allow Administrator's group and SYSTEM user access to C:salt. This eliminates a race condition where a non-admin user could modify a template or managed file before it is executed by the minion (which is running as an elevated user), thus avoiding a potential escalation of privileges. (issue 6361)

Grains

• Fixed detection of virtual grain on OpenVZ hardware nodes
• Gracefully handle lsb_release data when it is enclosed in quotes
• LSB grains are now prefixed with lsb_distrib_ instead of simply lsb_. The old naming is not preserved, so SLS may be affected.
• Improved grains detection on MacOS

Pillar

• Don’t try to load git_pillar if not enabled in master config (issue 6052)
• Functions pillar.item and pillar.items added for parity with grains.item/grains.items. The old function pillar.data is preserved for backwards compatibility.
• Fixed minion traceback when Pillar SLS is malformed (issue 5910)
Peer Publishing

- More gracefully handle improperly quoted publish commands ([issue 5958])
- Fixed traceback when timeout specified via the CLI for `publish.publish, publish.full_data` ([issue 5959])
- Fixed unintended change in output of `publish.publish` ([issue 5928])

Minion

- Fixed salt-key usage in minionswarm script
- Quieted warning about `SALT_MINION_CONFIG` environment variable on minion startup and for CLI commands run via `salt-call` ([issue 5956])
- Added minion config parameter `random_reauth_delay` to stagger re-auth attempts when the minion is waiting for the master to approve its public key. This helps prevent SYN flooding in larger environments.

User/Group Management

- Implement previously-ignored `unique` option for `user.present` states in FreeBSD
- Report in state output when a `group.present` state attempts to use a gid in use by another group
- Fixed regression that prevents a `user.present` state to set the password hash to the system default (i.e. an unset password)
- Fixed multiple `group.present` states with the same group ([issue 6439])

File Management

- Fixed file.mkdir setting incorrect permissions ([issue 6033])
- Fixed cleanup of source files for templates when `/tmp` is in `file_roots` ([issue 6118])
- Fixed caching of zero-byte files when a non-empty file was previously cached at the same path
- Added HTTP authentication support to the cp module ([issue 5641])
- Diffs are now suppressed when binary files are changed

Package/Repository Management

- Fixed traceback when there is only one target for `pkg.latest` states
- Fixed regression in detection of virtual packages (apt)
- Limit number of pkg database refreshes to once per `state.sls/state.highstate`
- YUM: Allow 32-bit packages with arches other than i686 to be managed on 64-bit systems ([issue 6299])
- Fixed incorrect reporting in `pkgrepo.managed` states ([issue 5517])
- Fixed 32-bit binary package installs on 64-bit RHEL-based distros, and added proper support for 32-bit packages on 64-bit Debian-based distros ([issue 6303])
- Fixed issue where requisites were inadvertently being put into YUM repo files ([issue 6471])
Service Management

- Fixed inaccurate reporting of results in `service.running` states when the service fails to start (issue 5894)
- Fixed handling of custom initscripts in RHEL-based distros so that they are immediately available, negating the need for a second state run to manage the service that the initscript controls

Networking

- Function `network.hwaddr` renamed to `network.hw_addr` to match `network.ip_addrs` and `network.ip_addrs6`. All three functions also now work without the underscore in the name, as well.
- Fixed traceback in `bridge.show` when interface is not present (issue 6326)

SSH

- Fixed incorrect result reporting for some `ssh_known_hosts.present` states
- Fixed inaccurate reporting when `ssh_auth.present` states are run with `test=True`, when rsa/dss is used for the `enc` param instead of ssh-rsa/ssh-dss (issue 5374)

pip

- Properly handle `-f` lines in pip freeze output
- Fixed regression in pip.installed states with specifying a requirements file (issue 6003)
- Fixed use of `editable` argument in `pip.installed` states (issue 6025)
- Deprecated `runas` parameter in execution function calls, in favor of `user`

MySQL

- Allow specification of MySQL connection arguments via the CLI, overriding/bypassing minion config params
- Allow `mysql_user.present` states to set a passwordless login (issue 5550)
- Fixed endless loop when `mysql.processlist` is run (issue 6297)

PostgreSQL

- Fixed traceback in `postgres.user_list` (issue 6352)

Miscellaneous

- Don’t allow `npm states` to be used if `npm module` is not available
- Fixed `alternatives.install` states for which the target is a symlink (issue 6162)
- Fixed traceback in `sysbench module` (issue 6175)
- Fixed traceback in job cache
- Fixed tempfile cleanup for windows
- Fixed issue where SLS files using the `pydsl renderer` were not being run
- Fixed issue where returners were being passed incorrect information (issue 5518)
- Fixed traceback when numeric args are passed to `cmd.script` states
- Fixed bug causing `cp.get_dir` to return more directories than expected (issue 6048)
- Fixed traceback when `supervisord.running` states are run with `test=True` (issue 6053)
- Fixed tracebacks when Salt encounters problems running rbenv (issue 5888)
- Only make the `monit module` available if monit binary is present (issue 5871)
- Fixed incorrect behavior of `img.mount_image`
- Fixed traceback in `tomcat.deploy_war` in Windows
- Don't re-write `/etc/fstab` if mount fails
- Fixed tracebacks when Salt encounters problems running gem (issue 5886)
- Fixed incorrect behavior of `selinux.boolean` states (issue 5912)
- RabbitMQ: Quote passwords to avoid symbols being interpolated by the shell (issue 6338)
- Fixed tracebacks in `extfs.mkfs` and `extfs.tune` (issue 6462)
- Fixed a regression with the `module.run` state where the `m_name` and `m_fun` arguments were being ignored (issue 6464)

### 18.2.81 Salt 0.16.3 Release Notes

release 2013-08-09

Version 0.16.3 is another bugfix release for 0.16.0. The changes include:

- Various documentation fixes
- Fix proc directory regression (issue 6502)
- Properly detect Linaro Linux (issue 6496)
- Fix regressions in `mount.mounted` (issue 6522, issue 6545)
- Skip malformed state requisites (issue 6521)
- Fix regression in gitfs from bad import
- Fix for watching prereq states (including recursive requisite error) (issue 6507)
- Fix `mod_watch` not overriding prereq (issue 6520)
- Don't allow functions which compile states to be called within states (issue 5623)
- Return error for malformed top.sls (issue 6544)
- Fix traceback in `mysql.query`
- Fix regression in binary package installation for 64-bit packages on Debian-based Linux distros (issue 6563)
- Fix traceback caused by running `cp.push` without having set `file_recv` in the master config file
- Fix scheduler configuration in pillar (issue 6201)
18.2.82 Salt 0.16.4 Release Notes

release 2013-09-07

Version 0.16.4 is another bugfix release for 0.16.0, likely to be the last before 0.17.0 is released. The changes include:

- Multiple documentation improvements/additions
- Added the osfinger and osarch grains
- Properly handle 32-bit packages for debian32 on x86_64 (issue 6607)
- Fix regression in yum package installation in CentOS 5 (issue 6677)
- Fix bug in hg.latest state that would erroneously delete directories (issue 6661)
- Fix bug related to pid not existing for ps.top (issue 6679)
- Fix regression in MySQL returner (issue 6695)
- Fix IP addresses grains (ipv4 and ipv6) to include all addresses (issue 6656)
- Fix regression preventing authenticated FTP (issue 6733)
- Fix setting password for windows users (issue 6824)
- Fix file.contains on values YAML parses as non-string (issue 6817)
- Fix file.get_gid, file.get_uid, and file.chown for broken symlinks (issue 6826)
- Fix comment for service reloads in service state (issue 6851)

18.2.83 Salt 0.17.0 Release Notes

release 2013-09-26

The 0.17.0 release is a very exciting release of Salt, this brings to Salt some very powerful new features and advances. The advances range from the state system to the test suite, covering new transport capabilities and making states easier and more powerful, to extending Salt Virt and much more!

The 0.17.0 release will also be the last release of Salt to follow the old 0.XX.X numbering system, the next release of Salt will change the numbering to be date based following this format:

<Year>.<Month>.<Minor>

So if the release happens in November of 2013 the number will be 13.11.0, the first bugfix release will be 13.11.1 and so forth.

Major Features

Halite

The new Halite web GUI is now available on PyPI. A great deal of work has been put into Halite to make it fully event driven and amazingly fast. The Halite UI can be started from within the Salt Master (after being installed from PyPI), or standalone, and does not require an external database to run. It is very lightweight!

This initial release of Halite is primarily the framework for the UI and the communication systems, making it easy to extend and build the UI up. It presently supports watching the event bus and firing commands over Salt.

At this time, Halite is not available as a package, but installation documentation is available at: http://docs.saltstack.com/topics/tutorials/halite.html
Halite is, like the rest of Salt, Open Source!
Much more will be coming in the future of Halite!

Salt SSH

The new `salt-ssh` command has been added to Salt. This system allows for remote execution and states to be run over ssh. The benefit here being, that salt can run relying only on the ssh agent, rather than requiring a minion to be deployed.

The `salt-ssh` system runs states in a compatible way as Salt and states created and run with salt-ssh can be moved over to a standard salt deployment without modification.

Since this is the initial release of salt-ssh, there is plenty of room for improvement, but it is fully operational, not just a bootstrap tool.

Rosters

Salt is designed to have the minions be aware of the master and the master does not need to be aware of the location of the minions. The new salt roster system was created and designed to facilitate listing the targets for salt-ssh.

The roster system, like most of Salt, is a plugin system, allowing for the list of systems to target to be derived from any pluggable backend. The rosters shipping with 0.17.0 are flat and scan. Flat is a file which is read in via the salt render system and the scan roster does simple network scanning to discover ssh servers.

State Auto Order

This is a major change in how states are evaluated in Salt. State Auto Order is a new feature that makes states get evaluated and executed in the order in which they are defined in the sls file. This feature makes it very easy to see the finite order in which things will be executed, making Salt now, fully imperative AND fully declarative.

The requisite system still takes precedence over the order in which states are defined, so no existing states should break with this change. But this new feature can be turned off by setting `state_auto_order: False` in the master config, thus reverting to the old lexicographical order.

state.sls Runner

The `state.sls` runner has been created to allow for a more powerful system for orchestrating state runs and function calls across the salt minions. This new system uses the state system for organizing executions.

This allows for states to be defined that are executed on the master to call states on minions via `salt-run state.sls`.

Salt Thin

Salt Thin is an exciting new component of Salt, this is the ability to execute Salt routines without any transport mechanisms installed, it is a pure python subset of Salt.

Salt Thin does not have any networking capability, but can be dropped into any system with Python installed and then `salt-call` can be called directly. The Salt Thin system, is used by the `salt-ssh` command, but can still be used to just drop salt somewhere for easy use.
Event Namespacing

Events have been updated to be much more flexible. The tags in events have all been namespaced allowing easier tracking of event names.

Mercurial Fileserver Backend

The popular git fileserver backend has been joined by the mercurial fileserver backend, allowing the state tree to be managed entirely via mercurial.

External Logging Handlers

The external logging handler system allows for Salt to directly hook into any external logging system. Currently supported are sentry and logstash.

Jenkins Testing

The testing systems in Salt have been greatly enhanced, tests for salt are now executed, via jenkins.saltstack.com, across many supported platforms. Jenkins calls out to salt-cloud to create virtual machines on Rackspace, then the minion on the virtual machine checks into the master running on Jenkins where a state run is executed that sets up the minion to run tests and executes the test suite.

This now automates the sequence of running platform tests and allows for continuous destructive tests to be run.

Salt Testing Project

The testing libraries for salt have been moved out of the main salt code base and into a standalone codebase. This has been done to ease the use of the testing systems being used in salt based projects other than Salt itself.

StormPath External Authentication

The external auth system now supports the fantastic Stormpath cloud based authentication system.

LXC Support

Extensive additions have been added to Salt for LXC support. This included the backend libs for managing LXC containers. Addition into the salt-virt system is still in the works.

Mac OS X User/Group Support

Salt is now able to manage users and groups on Minions running Mac OS X. However, at this time user passwords cannot be managed.

Django ORM External Pillar

Pillar data can now be derived from Django managed databases.
Fixes from RC to release

- Multiple documentation fixes
- Add multiple source files + templating for `file.append` ([issue 6905](#))
- Support sysctl configuration files in systemd>=207 ([issue 7351](#))
- Add `file.search` and `file.replace`
- Fix cross-calling execution functions in provider overrides
- Fix locale override for postgres ([issue 4543](#))
- Fix Raspbian identification for service/pkg support ([issue 7371](#))
- Fix `cp.push` file corruption ([issue 6495](#))
- Fix ALT Linux password hash specification ([issue 3474](#))
- Multiple salt-ssh-related fixes and improvements

### 18.2.84 Salt 0.17.1 Release Notes

**release** 2013-10-17

Note: THIS RELEASE IS NOT COMPATIBLE WITH PREVIOUS VERSIONS. If you update your master to 0.17.1, you must update your minions as well. Sorry for the inconvenience -- this is a result of one of the security fixes listed below.

The 0.17.1 release comes with a number of improvements to salt-ssh, many bugfixes, and a number of security updates.

Salt SSH has been improved to be faster, more featureful and more secure. Since the original release of Salt SSH was primarily a proof of concept, it has been very exciting to see its rapid adoption. We appreciate the willingness of security experts to review Salt SSH and help discover oversights and ensure that security issues only exist for such a tiny window of time.

#### SSH Enhancements

#### Shell Improvements

Improvements to Salt SSH's communication have been added that improve routine execution regardless of the target system's login shell.

#### Performance

Deployment of routines is now faster and takes fewer commands to execute.

#### Security Updates

Be advised that these security issues all apply to a small subset of Salt users and mostly apply to Salt SSH.
**Insufficient Argument Validation**

This issue allowed for a user with limited privileges to embed executions inside of routines to execute routines that should be restricted. This applies to users using external auth or client ACL and opening up specific routines.

Be advised that these patches address the direct issue. Additional commits have been applied to help mitigate this issue from resurfacing.

**CVE**

CVE-2013-4435

**Affected Versions**

0.15.0 - 0.17.0

**MITM SSH attack in salt-ssh**

SSH host keys were being accepted by default and not enforced on future SSH connections. These patches set SSH host key checking by default and can be overridden by passing the -i flag to `salt-ssh`.

**CVE**

CVE-2013-4436

**Affected Versions**

0.17.0
Insecure Usage of /tmp in salt-ssh

The initial release of salt-ssh used the /tmp directory in an insecure way. These patches not only secure usage of files under /tmp in salt-ssh, but also add checksum validation for all packages sent into the now secure locations on target systems.

YAML Calling Unsafe Loading Routine

It has been argued that this is not a valid security issue, as the YAML loading that was happening was only being called after an initial gateway filter in Salt has already safely loaded the YAML and would fail if non-safe routines were embedded. Nonetheless, the CVE was filed and patches applied.

Fix Reference

Version 0.17.1 is the first bugfix release for 0.17.0. The changes include:

- Fix symbolic links in thin.tgz (issue 7482)
- Pass env through to file.patch state (issue 7452)
- Service provider fixes and reporting improvements (issue 7361)
- Add --priv option for specifying salt-ssh private key
- Fix salt-thin’s salt-call on setuptools installations (issue 7516)
- Fix salt-ssh to support passwords with spaces (issue 7480)
- Fix regression in wildcard includes (issue 7455)
- Fix salt-call outputter regression (issue 7456)
- Fix custom returner support for startup states (issue 7540)
- Fix value handling in augeas (issue 7605)
- Fix regression in apt (issue 7624)
- Fix minion ID guessing to use socket.getfqdn() first (issue 7558)
- Add minion ID caching (issue 7558)
- Fix salt-key race condition (issue 7304)
- Add --include-all flag to salt-key (issue 7399)
- Fix custom grains in pillar (part of issue 5716, issue 6083)
- Fix race condition in salt-key (issue 7304)
- Fix regression in minion ID guessing, prioritize socket.getfqdn() (issue 7558)
- Cache minion ID on first guess (issue 7558)
- Allow trailing slash in file.directory state
- Fix reporting of file.roots in pillar return (issue 5449 and issue 5951)
- Remove pillar matching for mine.get (issue 7197)
- Sanitize args for multiple execution modules
- Fix yumpkg mod_repo functions to filter hidden args (issue 7656)
- Fix conflicting IDs in state includes (issue 7526)
- Fix mysql_grants.absent string formatting issue (issue 7827)
- Fix postgres.version so it won’t return None (issue 7695)
- Fix for trailing slashes in mount.mounted state
- Fix rogue AttributeError in the outputter system (issue 7845)
- Fix for incorrect ssh key encodings resulting in incorrect key added (issue 7718)
- Fix for pillar/grains naming regression in python renderer ([issue 7693])
- Fix args/kwarg handling in the scheduler ([issue 7422])
- Fix logfile handling for `file://`, `tcp://`, and `udp://` ([issue 7754])
- Fix error handling in config file parsing ([issue 6714])
- Fix RVM using sudo when running as non-root user ([issue 2193])
- Fix client ACL and underlying logging bugs ([issue 7706])
- Fix scheduler bug with returner ([issue 7367])
- Fix user management bug related to default groups ([issue 7690])
- Fix various salt-ssh bugs ([issue 7528])
- Many various documentation fixes

### 18.2.85 Salt 0.17.2 Release Notes

**release** 2013-11-14

Version 0.17.2 is another bugfix release for 0.17.0. The changes include:

- Add ability to delete key with grains.delval ([issue 7872])
- Fix possible state compiler stack trace ([issue 5767])
- Fix architecture regression in yumpkg ([issue 7813])
- Use correct `ps` on Debian to prevent truncating ([issue 5646])
- Fix grains targeting for new grains ([issue 5737])
- Fix bug with merging in git_pillar ([issue 6992])
- Fix print_jobs duplicate results
- Fix apt version specification for pkg.install
- Fix possible KeyError from ext_job_cache missing option
- Fix auto_order for `~names` states ([issue 7649])
- Fix regression in new gitfs installs (directory not found error)
- Fix escape pipe issue on Windows for file.recurse ([issue 7967])
- Fix fileclient in case of master restart ([issue 7987])
- Try to output warning if CLI command malformed ([issue 6538])
- Fix `--out=quiet` to actually be quiet ([issue 8000])
- Fix for state.sls in salt-ssh ([issue 7991])
- Fix for MySQL grants ordering issue ([issue 5817])
- Fix traceback for certain missing CLI args ([issue 8016])
- Add ability to disable lspci queries on master ([issue 4906])
- Fail if sls defined in topfile does not exist ([issue 5998])
- Add ability to downgrade MySQL grants ([issue 6606])
- Fix ssh_auth.absent traceback ([issue 8043])
- Add upstart detection for Debian/Raspbian ([issue 8039])
- Fix ID-related issues ([issue 8052], [issue 8050], and others)
- Fix for jinja rendering issues ([issue 8066] and [issue 8079])
- Fix argument parsing in salt-ssh ([issue 7928])
- Fix some GPU detection instances ([issue 6945])
- Fix bug preventing includes from other environments in SLS files
- Fix for kwARGS with dashes ([issue 8102])
- Fix salt.utils.which for windows `.exe' ([issue 7904])
- Fix apache.adduser without apachectl ([issue 8123])
- Fix issue with evaluating test kwarg in states ([issue 7788])
- Fix regression in salt.client.Caller() ([issue 8078])
- Fix apt-key silent failure
- Fix bug where cmd.script would try to run even if caching failed ([issue 7601])
- Fix apt pkg.latest regression ([issue 8067])
- Fix for mine data not being updated ([issue 8144])
- Fix for noarch packages in yum
- Fix a Xen detection edge case ([issue 7839])
- Fix windows __opts__ dictionary persistence ([issue 7714])
- Fix version generation for when it's part of another git repo ([issue 8090])
- Fix _handle_iorder stacktrace so that the real syntax error is shown ([issue 8114] and [issue 7905])
- Fix git.latest state when a commit SHA is used ([issue 8163])
- Fix various small bugs in yumpkg.py ([issue 8201])
- Fix for specifying identify file in git.latest ([issue 8094])
- Fix for --output-file CLI arg ([issue 8205])
- Add ability to specify shutdown time for system.shutdown ([issue 7833])
- Fix for salt version using non-salt git repo info ([issue 8266])
- Add additional hints at impact of pkgrepo states when test=True ([issue 8247])
- Fix for salt-ssh files not being owned by root ([issue 8216])
- Fix retry logic and error handling in fileserver (related to [issue 7755])
- Fix file.replace with test=True ([issue 8279])
- Add flag for limiting file traversal in fileserver ([issue 6928])
- Fix for extra mine processes ([issue 5729])
- Fix for unloading custom modules ([issue 7691])
- Fix for salt-ssh opts ([issue 8005] and [issue 8271])
- Fix compound matcher for grains ([issue 7944])
- Improve error reporting in ebuild module (related to [issue 5393])
- Add `dir_mode` to `file.managed` ([issue 7860](#issue7860))
- Improve traceroute support for FreeBSD and OS X ([issue 4927](#issue4927))
- Fix for matching minions under syndics ([issue 7671](#issue7671))
- Improve exception handling for missing ID ([issue 8259](#issue8259))
- Fix grain mismatch for ScientificLinux ([issue 8338](#issue8338))
- Add configuration option for `minion_id_caching`
- Fix open mode auth errors ([issue 8402](#issue8402))

### 18.2.86 Salt 0.17.3 Release Notes

release 2013-12-08

Note: 0.17.3 had some regressions which were promptly fixed in the 0.17.4 release. Please use 0.17.4 instead.

Version 0.17.3 is another bugfix release for 0.17.0. The changes include:

- Fix some jinja render errors ([issue 8418](#issue8418))
- Fix `file.replace` state changing file ownership ([issue 8399](#issue8399))
- Fix state ordering with the PyDSL renderer ([issue 8446](#issue8446))
- Fix for new npm version ([issue 8517](#issue8517))
- Fix for pip state requiring `name` even with requirements file ([issue 8519](#issue8519))
- Fix yum logging to open terminals ([issue 3855](#issue3855))
- Add sane maxrunning defaults for scheduler ([issue 8563](#issue8563))
- Fix states duplicate key detection ([issue 8053](#issue8053))
- Fix SUSE patch level reporting ([issue 8428](#issue8428))
- Fix managed file creation umask ([issue 8590](#issue8590))
- Fix logstash exception ([issue 8635](#issue8635))
- Improve argument exception handling for `salt` command ([issue 8016](#issue8016))
- Fix pecl success reporting ([issue 8750](#issue8750))
- Fix launchctl module exceptions ([issue 8759](#issue8759))
- Fix argument order in `pw_user` module
- Add warnings for failing grains ([issue 8690](#issue8690))
- Fix hgfs problems caused by connections left open ([issue 8811](#issue8811) and [issue 8810](#issue8810))
- Add Debian iptables default for `iptables-persistent` package ([issue 8889](#issue8889))
- Fix installation of packages with dots in pkg name ([issue 8614](#issue8614))
- Fix noarch package installation on CentOS 6 ([issue 8945](#issue8945))
- Fix `portage_config.enforce_nice_config` ([issue 8252](#issue8252))
- Fix `salt.util.copyfile` umask usage ([issue 8590](#issue8590))
- Fix rescheduling of failed jobs ([issue 8941](#issue8941))
- Fix pkg on Amazon Linux (uses yumpkg5 now) (issue 8226)
- Fix conflicting options in postgres module (issue 8717)
- Fix ps modules for psutil >= 0.3.0 (issue 7432)
- Fix postgres module to return False on failure (issue 8778)
- Fix argument passing for args with pound signs (issue 8585)
- Fix pid of salt CLI command showing in status.pid output (issue 8720)
- Fix rvm to run gem as the correct user (issue 8951)
- Fix namespace issue in win_file module (issue 9060)
- Fix masterless state paths on windows (issue 9021)
- Fix timeout option in master config (issue 9040)

18.2.87 Salt 0.17.4 Release Notes

release 2013-12-10

Version 0.17.4 is another bugfix release for 0.17.0. The changes include:
- Fix file.replace bug when replacement str is numeric (issue 9101)
- Fix regression in file.managed (issue 9131)
- Prevent traceback when job is None. (issue 9145)

18.2.88 Salt 0.17.5 Release Notes

release 2014-01-27

Version 0.17.5 is another bugfix release for 0.17.0. The changes include:
- Fix user.present states with non-string fullname (issue 9085)
- Fix virt.init return value on failure (issue 6870)
- Fix reporting of file.blockreplace state when test=True
- Fix network.interfaces when used in cron (issue 7990)
- Fix bug in pkgrepo when switching to/from mirrorlist-based repo def (issue 9121)
- Fix infinite recursion when cache file is corrupted
- Add checking for rev and mirror/bare args in git.latest (issue 9107)
- Add cmd.watch alias (points to cmd.wait) (issue 8612)
- Fix stacktrace when prereq is not formed as a list (issue 8235)
- Fix stdin issue with lvdisplay command (issue 9128)
- Add pre-check function for range matcher (issue 9236)
- Add exception handling for psutil for processes that go missing (issue 9274)
- Allow _in requisites to match both on ID and name (issue 9061)
- Fix multiple client timeout issues (issue 7157 and issue 9302, probably others)
- Fix ZMQError: Operation cannot be accomplished in current state errors (issue 6306)
- Multiple optimization in minion auth routines
- Clarify logs for minion ID caching

### 18.2.89 Salt 0.6.0 release notes

The Salt remote execution manager has reached initial functionality! Salt is a management application which can be used to execute commands on remote sets of servers.

The whole idea behind Salt is to create a system where a group of servers can be remotely controlled from a single master, not only can commands be executed on remote systems, but salt can also be used to gather information about your server environment.

Unlike similar systems, like Func and MCollective, Salt is extremely simple to setup and use, the entire application is contained in a single package, and the master and minion daemons require no running dependencies in the way that Func requires Certmaster and MCollective requires activeMQ.

Salt also manages authentication and encryption. Rather than using SSL for encryption, salt manages encryption on a payload level, so the data sent across the network is encrypted with fast AES encryption, and authentication uses RSA keys. This means that Salt is fast, secure, and very efficient.

Messaging in Salt is executed with ZeroMQ, so the message passing interface is built into salt and does not require an external ZeroMQ server. This also adds speed to Salt since there is no additional bloat on the networking layer, and ZeroMQ has already proven itself as a very fast networking system.

The remote execution in Salt is ``Lazy Execution'', in that once the command is sent the requesting network connection is closed. This makes it easier to detach the execution from the calling process on the master, it also means that replies are cached, so that information gathered from historic commands can be queried in the future.

Salt also allows users to make execution modules in Python. Writers of these modules should also be pleased to know that they have access to the impressive information gathered from PuppetLabs' Facter application, making Salt module more flexible. In the future I hope to also allow Salt to group servers based on Facter information as well.

All in all Salt is fast, efficient, and clean, can be used from a simple command line client or through an API, uses message queue technology to make network execution extremely fast, and encryption is handled in a very fast and efficient manner. Salt is also VERY easy to use and VERY easy to extend.

You can find the source code for Salt on my GitHub page, I have also set up a few wiki pages explaining how to use and set up Salt. If you are using Arch Linux there is a package available in the Arch Linux AUR.

Salt 0.6.0 Source: https://cloud.github.com/downloads/saltstack/salt/salt-0.6.0.tar.gz

GitHub page: https://github.com/saltstack/salt

Wiki: https://github.com/saltstack/salt/wiki

Arch Linux Package: https://aur.archlinux.org/packages/salt-git/

I am very open to contributions, for instance I need packages for more Linux distributions as well as BSD packages and testers.

Give Salt a try, this is the initial release and is not a 1.0 quality release, but it has been working well for me! I am eager to get your feedback!

### 18.2.90 Salt 0.7.0 release notes

I am pleased to announce the release of Salt 0.7.0!

This release marks what is the first stable release of salt, 0.7.0 should be suitable for general use.
0.7.0 Brings the following new features to Salt:

- Integration with Facter data from puppet labs
- Allow for matching minions from the salt client via Facter information
- Minion job threading, many jobs can be executed from the master at once
- Preview of master clustering support - Still experimental
- Introduce new minion modules for stats, virtualization, service management and more
- Add extensive logging to the master and minion daemons
- Add sys.reload_functions for dynamic function reloading
- Greatly improve authentication
- Introduce the saltkey command for managing public keys
- Begin backend development preparatory to introducing butter
- Addition of man pages for the core commands
- Extended and cleaned configuration

0.7.0 Fixes the following major bugs:

- Fix crash in minions when matching failed
- Fix configuration file lookups for the local client
- Repair communication bugs in encryption
- Numerous fixes in the minion modules

The next release of Salt should see the following features:

- Stabilize the cluster support
- Introduce a remote client for salt command tiers
- salt-ftp system for distributed file copies
- Initial support for ”butter”

Coming up next is a higher level management framework for salt called Butter. I want salt to stay as a simple and effective communication framework, and allow for more complicated executions to be managed via Butter.

Right now Butter is being developed to act as a cloud controller using salt as the communication layer, but features like system monitoring and advanced configuration control (a puppet manager) are also in the pipe.

Special thanks to Joseph Hall for the status and network modules, and thanks to Matthias Teege for tracking down some configuration bugs!

Salt can be downloaded from the following locations;

Source Tarball:
https://cloud.github.com/downloads/saltstack/salt/salt-0.7.0.tar.gz

Arch Linux Package:
https://aur.archlinux.org/packages/salt-git/

Please enjoy the latest Salt release!
18.2.91 Salt 0.8.0 release notes

Salt 0.8.0 is ready for general consumption! The source tarball is available on GitHub for download:

https://cloud.github.com/downloads/saltstack/salt/salt-0.8.0.tar.gz

A lot of work has gone into salt since the last release just 2 weeks ago, and salt has improved a great deal. A swath of new features are here along with performance and threading improvements!

The main new features of salt 0.8.0 are:

Salt-cp
Cython minion modules
Dynamic returners
Faster return handling
Lowered required Python version to 2.6
Advanced minion threading
Configurable minion modules

Salt-cp

The salt-cp command introduces the ability to copy simple files via salt to targeted servers. Using salt-cp is very simple, just call salt-cp with a target specification, the source file(s) and where to copy the files on the minions. For instance:

# salt-cp '*' /etc/hosts /etc/hosts

Will copy the local /etc/hosts file to all of the minions.

Salt-cp is very young, in the future more advanced features will be added, and the functionality will much more closely resemble the cp command.

Cython minion modules

Cython is an amazing tool used to compile Python modules down to c. This is arguably the fastest way to run Python code, and since pyzmq requires cython, adding support to salt for cython adds no new dependencies.

Cython minion modules allow minion modules to be written in cython and therefore executed in compiled c. Simply write the salt module in cython and use the file extension “.pyx” and the minion module will be compiled when the minion is started. An example cython module is included in the main distribution called cytest.pyx:

https://github.com/saltstack/salt/blob/develop/salt/modules/cytest.pyx

Dynamic Returners

By default salt returns command data back to the salt master, but now salt can return command data to any system. This is enabled via the new returners modules feature for salt. The returners modules take the return data and sends it to a specific module. The returner modules work like minion modules, so any returner can be added to the minions.

This means that a custom data returner can be added to communicate the return data so anything from MySQL, Redis, MongoDB, and more!

There are 2 simple stock returners in the returners directory:

https://github.com/saltstack/salt/blob/develop/salt/returners

18.2. Previous Releases
The documentation on writing returners will be added to the wiki shortly, and returners can be written in pure Python, or in cython.

**Configurable Minion Modules**

Minion modules may need to be configured, now the options passed to the minion configuration file can be accessed inside of the minion modules via the `__opt__` dict.

Information on how to use this simple addition has been added to the wiki: [Writing modules](https://github.com/saltstack/salt/blob/develop/salt/modules/test.py)

**Advanced Minion Threading**

In 0.7.0 the minion would block after receiving a command from the master, now the minion will spawn a thread or multiprocess. By default Python threads are used because for general use they have proved to be faster, but the minion can now be configured to use the Python multiprocessing module instead. Using multiprocessing will cause executions that are CPU bound or would otherwise exploit the negative aspects of the Python GIL to run faster and more reliably, but simple calls will still be faster with Python threading. The configuration option can be found in the minion configuration file:

https://github.com/saltstack/salt/blob/develop/conf/minion

**Lowered Supported Python to 2.6**

The requirement for Python 2.7 has been removed to support Python 2.6. I have received requests to take the minimum Python version back to 2.4, but unfortunately this will not be possible, since the ZeroMQ Python bindings do not support Python 2.4.

Salt 0.8.0 is a very major update, it also changes the network protocol slightly which makes communication with older salt daemons impossible, your master and minions need to be upgraded together!

I could use some help bringing salt to the people! Right now I only have packages for Arch Linux, Fedora 14 and Gentoo. We need packages for Debian and people willing to help test on more platforms. We also need help writing more minion modules and returner modules. If you want to contribute to salt please hop on the mailing list and send in patches, make a fork on GitHub and send in pull requests! If you want to help but are not sure where you can, please email me directly or post to the mailing list!

I hope you enjoy salt, while it is not yet 1.0 salt is completely viable and usable!

-Thomas S. Hatch

**18.2.92 Salt 0.8.7 release notes**

It has been a month since salt 0.8.0, and it has been a long month! But Salt is still coming along strong. 0.8.7 has a lot of changes and a lot of updates. This update makes Salt’s ZeroMQ back end better, strips Facter from the dependencies, and introduces interfaces to handle more capabilities.

Many of the major updates are in the background, but the changes should shine through to the surface. A number of the new features are still a little thin, but the back end to support expansion is in place.

I also recently gave a presentation to the Utah Python users group in Salt Lake City, the slides from this presentation are available here: https://cloud.github.com/downloads/saltstack/salt/Salt.pdf
The major new features and changes in Salt 0.8.7 are:

- Revamp ZeroMQ topology on the master for better scalability
- State enforcement
- Dynamic state enforcement managers
- Extract the module loader into salt.loader
- Make Job ids more granular
- Replace Facter functionality with the new salt grains interface
- Support for “virtual” salt modules
- Introduce the salt-call command
- Better debugging for minion modules

The new ZeroMQ topology allows for better scalability, this will be required by the need to execute massive file transfers to multiple machines in parallel and state management. The new ZeroMQ topology is available in the aforementioned presentation.

0.8.7 introduces the capability to declare states, this is similar to the capabilities of Puppet. States in salt are declared via state data structures. This system is very young, but the core feature set is available. Salt states work around rendering files which represent Salt high data. More on the Salt state system will be documented in the near future.

The system for loading salt modules has been pulled out of the minion class to be a standalone module, this has enabled more dynamic loading of Salt modules and enables many of the updates in 0.8.7 – https://github.com/saltstack/salt/blob/develop/salt/loader.py

Salt Job ids are now microsecond precise, this was needed to repair a race condition unveiled by the speed improvements in the new ZeroMQ topology.

The new grains interface replaces the functionality of Facter, the idea behind grains differs from Facter in that the grains are only used for static system data, dynamic data needs to be derived from a call to a salt module. This makes grains much faster to use, since the grains data is generated when the minion starts.

Virtual salt modules allows for a salt module to be presented as something other than its module name. The idea here is that based on information from the minion decisions about which module should be presented can be made. The best example is the pacman module. The pacman module will only load on Arch Linux minions, and will be called pkg. Similarly the yum module will be presented as pkg when the minion starts on a Fedora/RedHat system.

The new salt-call command allows for minion modules to be executed from the minion. This means that on the minion a salt module can be executed, this is a great tool for testing Salt modules. The salt-call command can also be used to view the grains data.

In previous releases when a minion module threw an exception very little data was returned to the master. Now the stack trace from the failure is returned making debugging of minion modules MUCH easier.

Salt is nearing the goal of 1.0, where the core feature set and capability is complete!

Salt 0.8.7 can be downloaded from GitHub here: https://cloud.github.com/downloads/saltstack/salt/salt-0.8.7.tar.gz
-Thomas S Hatch

**18.2.93 Salt 0.8.8 release notes**

Salt 0.8.8 is here! This release adds a great deal of code and some serious new features. The latest release can be downloaded here: https://cloud.github.com/downloads/saltstack/salt/salt-0.8.8.tar.gz
Improved Documentation has been set up for salt using sphinx thanks to the efforts of Seth House. This new documentation system will act as the back end to the salt website which is still under heavy development. The new sphinx documentation system has also been used to greatly clean up the salt manpages. The salt 7 manpage in particular now contains extensive information which was previously only in the wiki. The new documentation can be found at: http://docs.saltstack.com/ We still have a lot to add, and when the domain is set up I will post another announcement.

More additions have been made to the ZeroMQ setup, particularly in the realm of file transfers. Salt 0.8.8 introduces a built in, stateless, encrypted file server which allows salt minions to download files from the salt master using the same encryption system used for all other salt communications. The main motivation for the salt file server has been to facilitate the new salt state system.

Much of the salt code has been cleaned up and a new cleaner logging system has been introduced thanks to the efforts of Pedro Algarvio. These additions will allow for much more flexible logging to be executed by salt, and fixed a great deal of my poor spelling in the salt docstrings! Pedro Algarvio has also cleaned up the API, making it easier to embed salt into another application.

The biggest addition to salt found in 0.8.8 is the new state system. The salt module system has received a new front end which allows salt to be used as a configuration management system. The configuration management system allows for system configuration to be defined in data structures. The configuration management system, or as it is called in salt, the “salt state system” supports many of the features found in other configuration managers, but allows for system states to be written in a far simpler format, executes at blazing speeds, and operates via the salt minion matching system. The state system also operates within the normal scope of salt, and requires no additional configuration to use.

The salt state system can enforce the following states with many more to come: Packages Files Services Executing commands Hosts

The system used to define the salt states is based on a data structure, the data structure used to define the salt states has been made to be as easy to use as possible. The data structure is defined by default using a YAML file rendered via a Jinja template. This means that the state definition language supports all of the data structures that YAML supports, and all of the programming constructs and logic that Jinja supports. If the user does not like YAML or Jinja the states can be defined in yaml-mako, json-jinja, or json-mako. The system used to render the states is completely dynamic, and any rendering system can be added to the capabilities of Salt, this means that a rendering system that renders XML data in a cheetah template, or whatever you can imagine, can be easily added to the capabilities of salt.

The salt state system also supports isolated environments, as well as matching code from several environments to a single salt minion.

The feature base for Salt has grown quite a bit since my last serious documentation push. As we approach 0.9.0 the goals are becoming very clear, and the documentation needs a lot of work. The main goals for 0.9.0 are to further refine the state system, fix any bugs we find, get Salt running on as many platforms as we can, and get the documentation filled out. There is a lot more to come as Salt moves forward to encapsulate a much larger scope, while maintaining supreme usability and simplicity.

If you would like a more complete overview of Salt please watch the Salt presentation: Slides: https://cloud.github.com/downloads/saltstack/salt/Salt.pdf

-Thomas S Hatch

18.2.94 Salt 0.8.9 Release Notes

Salt 0.8.9 has finally arrived! Unfortunately this is much later than I had hoped to release 0.8.9, life has been very crazy over the last month. But despite challenges, Salt has moved forward!

This release, as expected, adds few new features and many refinements. One of the most exciting aspect of this release is that the development community for salt has grown a great deal and much of the code is from contributors.
Also, I have filled out the documentation a great deal. So information on States is properly documented, and much of the documentation that was out of date has been filled in.

Download!

The Salt source can be downloaded from the salt GitHub site:
https://cloud.github.com/downloads/saltstack/salt/salt-0.8.9.tar.gz
Or from PyPI:
https://pypi.python.org/packages/source/s/salt/salt-0.8.9.tar.gz
Here’s the md5sum:
7d5aca4633bc22f59045f9e82f43b56
For instructions on how to set up Salt please see the Installation instructions.

New Features

Salt Run

A big feature is the addition of Salt run, the salt-run command allows for master side execution modules to be made that gather specific information or execute custom routines from the master.

Documentation for salt-run can be found here

Refined Outputters

One problem often complained about in salt was the fact that the output was so messy. Thanks to help from Jeff Schroeder a cleaner interface for the command output for the Salt CLI has been made. This new interface makes adding new printout formats easy and additions to the capabilities of minion modules makes it possible to set the printout mode or outputter for functions in minion modules.

Cross Calling Salt Modules

Salt modules can now call each other, the __salt__ dict has been added to the predefined references in minion modules. This new feature is documented in the modules documentation.

Watch Option Added to Salt State System

Now in Salt states you can set the watch option, this will allow watch enabled states to change based on a change in the other defined states. This is similar to subscribe and notify statements in puppet.

Root Dir Option

Travis Cline has added the ability to define the option root_dir which allows the salt minion to operate in a subdir. This is a strong move in supporting the minion running as an unprivileged user
Config Files Defined in Variables

Thanks again to Travis Cline, the master and minion configuration file locations can be defined in environment variables now.

New Modules

Quite a few new modules, states, returners, and runners have been made.

New Minion Modules

apt

Support for apt-get has been added, this adds greatly improved Debian and Ubuntu support to Salt!

useradd and groupadd

Support for manipulating users and groups on Unix-like systems.

moosefs

Initial support for reporting on aspects of the distributed file system, MooseFS. For more information on MooseFS please see: http://www.moosefs.org

Thanks to Joseph Hall for his work on MooseFS support.

mount

Manage mounts and the fstab.

puppet

Execute puppet on remote systems.

shadow

Manipulate and manage the user password file.

ssh

Interact with ssh keys.
New States

user and group

Support for managing users and groups in Salt States.

mount

Enforce mounts and the fstab.

New Returners

mongo_return

Send the return information to a MongoDB server.

New Runners

manage

Display minions that are up or down.

18.2.95 Salt 0.9.0 Release Notes

release 2011-08-27

Salt 0.9.0 is here. This is an exciting release. 0.9.0 includes the new network topology features allowing peer salt commands and masters of masters via the syndic interface.

0.9.0 also introduces many more modules, improvements to the API and improvements to the ZeroMQ systems.

Download!

The Salt source can be downloaded from the salt GitHub site:
https://cloud.github.com/downloads/saltstack/salt/salt-0.9.0.tar.gz

Or from PyPI:
https://pypi.python.org/packages/source/s/salt/salt-0.9.0.tar.gz

Here is the md5sum:
9a925da04981e65a0f237f2e77ddab37

For instructions on how to set up Salt please see the Installation instructions.
New Features

Salt Syndic

The new Syndic interface allows a master to be commanded via another higher level salt master. This is a powerful solution allowing a master control structure to exist, allowing salt to scale to much larger levels then before.

Peer Communication

0.9.0 introduces the capability for a minion to call a publication on the master and receive the return from another set of minions. This allows salt to act as a communication channel between minions and as a general infrastructure message bus.

Peer communication is turned off by default but can be enabled via the peer option in the master configuration file. Documentation on the new Peer interface.

Easily Extensible API

The minion and master classes have been redesigned to allow for specialized minion and master servers to be easily created. An example on how this is done for the master can be found in the master.py salt module:

https://github.com/saltstack/salt/blob/develop/salt/master.py

The Master class extends the SMaster class and set up the main master server.

The minion functions can now also be easily added to another application via the SMinion class, this class can be found in the minion.py module:

https://github.com/saltstack/salt/blob/develop/salt/minion.py

Cleaner Key Management

This release changes some of the key naming to allow for multiple master keys to be held based on the type of minion gathering the master key.

The -d option has also been added to the salt-key command allowing for easy removal of accepted public keys.

The --gen-keys option is now available as well for salt-key, this allows for a salt specific RSA key pair to be easily generated from the command line.

Improved 0MQ Master Workers

The 0MQ worker system has been further refined to be faster and more robust. This new system has been able to handle a much larger load than the previous setup. The new system uses the IPC protocol in 0MQ instead of TCP.

New Modules

Quite a few new modules have been made.
New Minion Modules

apache

Work directly with apache servers, great for managing balanced web servers

cron

Read out the contents of a systems crontabs

mdadm

Module to manage raid devices in Linux, appears as the raid module

mysql

Gather simple data from MySQL databases

ps

Extensive utilities for managing processes

publish

Used by the peer interface to allow minions to make publications

18.2.96 Salt 0.9.1 Release Notes

release 2011-08-29

18.2.97 Salt 0.9.2 Release Notes

release 2011-09-17

Salt 0.9.2 has arrived! 0.9.2 is primarily a bugfix release, the exciting component in 0.9.2 is greatly improved support for salt states. All of the salt states interfaces have been more thoroughly tested and the new salt-states git repo is growing with example of how to use states.

This release introduces salt states for early developers and testers to start helping us clean up the states interface and make it ready for the world!

0.9.2 also fixes a number of bugs found on Python 2.6.
Download!

The Salt source can be downloaded from the salt GitHub site:
https://cloud.github.com/downloads/saltstack/salt/salt-0.9.2.tar.gz

Or from PyPI:
https://pypi.python.org/packages/source/s/salt/salt-0.9.2.tar.gz

For instructions on how to set up Salt please see the Installation instructions.

New Features

Salt-Call Additions

The salt-call command has received an overhaul, it now hooks into the outputter system so command output looks clean, and the logging system has been hooked into salt-call, so the -l option allows the logging output from salt minion functions to be displayed.

The end result is that the salt-call command can execute the state system and return clean output:

```
# salt-call state.highstate
```

State System Fixes

The state system has been tested and better refined. As of this release the state system is ready for early testers to start playing with. If you are interested in working with the state system please check out the (still very small) salt-states GitHub repo:

https://github.com/saltstack/salt-states

This git repo is the active development branch for determining how a clean salt-state database should look and act. Since the salt state system is still very young a lot of help is still needed here. Please fork the salt-states repo and help us develop a truly large and scalable system for configuration management!

Notable Bug Fixes

Python 2.6 String Formatting

Python 2.6 does not support format strings without an index identifier, all of them have been repaired.

Cython Loading Disabled by Default

Cython loading requires a development tool chain to be installed on the minion, requiring this by default can cause problems for most Salt deployments. If Cython auto loading is desired it will need to be turned on in the minion config.

18.2.98 Salt 0.9.3 Release Notes

release 2011-11-05
Salt 0.9.3 is finally arrived. This is another big step forward for Salt, new features range from proper FreeBSD support to fixing issues seen when attaching a minion to a master over the Internet.

The biggest improvements in 0.9.3 though can be found in the state system, it has progressed from something ready for early testers to a system ready to compete with platforms such as Puppet and Chef. The backbone of the state system has been greatly refined and many new features are available.

Download!

The Salt source can be downloaded from the salt GitHub site:
https://cloud.github.com/downloads/saltstack/salt/salt-0.9.3.tar.gz

Or from PyPI:
https://pypi.python.org/packages/source/s/salt/salt-0.9.3.tar.gz

For instructions on how to set up Salt please see the Installation instructions.

New Features

WAN Support

Recently more people have been testing Salt minions connecting to Salt Masters over the Internet. It was found that Minions would commonly loose their connection to the master when working over the internet. The minions can now detect if the connection has been lost and reconnect to the master, making WAN connections much more reliable.

State System Fixes

Substantial testing has gone into the state system and it is ready for real world usage. A great deal has been added to the documentation for states and the modules and functions available to states have been cleanly documented.

A number of State System bugs have also been founds and repaired, the output from the state system has also been refined to be extremely clear and concise.

Error reporting has also been introduced, issues found in sls files will now be clearly reported when executing Salt States.

Extend Declaration

The Salt States have also gained the extend declaration. This declaration allows for states to be cleanly modified in a post environment. Simply said, if there is an apache.sls file that declares the apache service, then another sls can include apache and then extend it:

```
include:
  - apache

extend:
  apache:
    service:
      - require:
        - pkg: mod_python
```
The notable behavior with the extend functionality is that it literally extends or overwrites a declaration set up in another sls module. This means that Salt will behave as though the modifications were made directly to the apache sls. This ensures that the apache service in this example is directly tied to all requirements.

**Highstate Structure Specification**

This release comes with a clear specification of the Highstate data structure that is used to declare Salt States. This specification explains everything that can be declared in the Salt SLS modules.

The specification is extremely simple, and illustrates how Salt has been able to fulfill the requirements of a central configuration manager within a simple and easy to understand format and specification.

**SheBang Renderer Switch**

It came to our attention that having many renderers means that there may be a situation where more than one State Renderer should be available within a single State Tree.

The method chosen to accomplish this was something already familiar to developers and systems administrators, a SheBang. The Python State Renderer displays this new capability.

**Python State Renderer**

Until now Salt States could only be declared in yaml or json using Jinja or Mako. A new, very powerful, renderer has been added, making it possible to write Salt States in pure Python:

```python
#!/py

def run():
    '''
    Install the python-mako package
    '''
    return {'include': ['python'],
            'python-mako': {'pkg': ['installed']}}
```

This renderer is used by making a run function that returns the Highstate data structure. Any capabilities of Python can be used in pure Python sls modules.

This example of a pure Python sls module is the same as this example in yaml:

```yaml
include:
    - python

python-mako:
    pkg:
        - installed
```
FreeBSD Support

Additional support has been added for FreeBSD, this is Salt's first branch out of the Linux world and proves the viability of Salt on non-Linux platforms.

Salt remote execution already worked on FreeBSD, and should work without issue on any Unix-like platform. But this support comes in the form of package management and user support, so Salt States also work on FreeBSD now.

The new freebsdpkgs module provides package management support for FreeBSD and the new pw_user and pw_group provide user and group management.

Module and State Additions

Cron Support

Support for managing the system crontab has been added, declaring a cron state can be done easily:

date > /tmp/datestamp:
cron:
  - present
  - user: fred
  - minute: 5
  - hour: 3

File State Additions

The file state has been given a number of new features, primarily the directory, recurse, symlink, and absent functions.

file.directory Make sure that a directory exists and has the right permissions.

/srv/foo:
  file:
    - directory
    - user: root
    - group: root
    - mode: 1755

file.symlink Make a symlink.

/var/lib/www:
  file:
    - symlink
    - target: /srv/www
    - force: True

file.recurse The recurse state function will recursively download a directory on the master file server and place it on the minion. Any change in the files on the master will be pushed to the minion. The recurse function is very powerful and has been tested by pushing out the full Linux kernel source.

/opt/code:
  file:
    - recurse
    - source: salt://linux

file.absent Make sure that the file is not on the system, recursively deletes directories, files, and symlinks.
Sysctl Module and State

The sysctl module and state allows for sysctl components in the kernel to be managed easily. The sysctl module contains the following functions:

- `sysctl.show` Return a list of sysctl parameters for this minion
- `sysctl.get` Return a single sysctl parameter for this minion
- `sysctl.assign` Assign a single sysctl parameter for this minion
- `sysctl.persist` Assign and persist a simple sysctl parameter for this minion

The sysctl state allows for sysctl parameters to be assigned:

```
vm.swappiness:
    sysctl:
        - present
        - value: 20
```

Kernel Module Management

A module for managing Linux kernel modules has been added. The new functions are as follows:

- `kmod.available` Return a list of all available kernel modules
- `kmod.check_available` Check to see if the specified kernel module is available
- `kmod.lsmod` Return a dict containing information about currently loaded modules
- `kmod.load` Load the specified kernel module
- `kmod.remove` Unload the specified kernel module

The kmod state can enforce modules be either present or absent:

```
kvm_intel:
    kmod:
        - present
```

Ssh Authorized Keys

The ssh_auth state can distribute ssh authorized keys out to minions. Ssh authorized keys can be present or absent.

```
AAAAB3NzaC1kc3MAACBAL0sQ9fJ5bYTEyYvrlRBsJdD0o49CNfhlWHXQRqu6rl6rwL4KIuPrhY7hBw0tV7UNC7j9IiZRN0iGod9C+6fH52ZyTv1PZkXW7P4UOAf9H7ZjQP5B67F0fjM7DwGh2XW0OaCCoo1SxuK+339l2/0d9JKyR9G940zGDPd867bT4O7IA==
  -> xw6NtnQZVMcmZIre5E1rw30KgxcDNomjYFNHuOYaQLBBMosyO+++Te1KTAr3A2zGj2xbWO9JhEzu8xvSdF8jRj0N5SRXPzSyU1f11L8uG8fQAAAIBXUz6ZO0bregF5xtJRuxUN583HlfQkXvxLqHAGY8WSEVlTnuG/
  -> x75wOlBDbV2eTlxWgXwUkieA7j7P6Ncdv25Wz9wvc6ko/puwWo8b3rcLNgQ+kXCNJl5sM/
  -> 7LBQ26iKsRZznSeGwGTyzNIMBekGYQ5MRdICp5dBIP/1M6fQDEsAXQ==:
    ssh_auth:
        - present
        - user: frank
        - enc: dsa
        - comment: 'Frank's key'
```

2786 Chapter 18. Release Notes
18.2.99 Salt 0.9.4 Release Notes

release 2011-11-27

Salt 0.9.4 has arrived. This is a critical update that repairs a number of key bugs found in 0.9.3. But this update is not without feature additions as well! 0.9.4 adds support for Gentoo portage to the pkg module and state system. Also there are 2 major new state additions, the failhard option and the ability to set up finite state ordering with the order option.

This release also sees our largest increase in community contributions. These contributors have and continue to be the life blood of the Salt project, and the team continues to grow. I want to put out a big thanks to our new and existing contributors.

Download!

The Salt source can be downloaded from the salt GitHub site:
https://cloud.github.com/downloads/saltstack/salt/salt-0.9.4.tar.gz

Or from PyPI:
https://pypi.python.org/packages/source/s/salt/salt-0.9.4.tar.gz

For instructions on how to set up Salt please see the Installation instructions.

New Features

Failhard State Option

Normally, when a state fails Salt continues to execute the remainder of the defined states and will only refuse to execute states that require the failed state.

But the situation may exist, where you would want all state execution to stop if a single state execution fails. The capability to do this is called failing hard.

State Level Failhard

A single state can have a failhard set, this means that if this individual state fails that all state execution will immediately stop. This is a great thing to do if there is a state that sets up a critical config file and setting a require for each state that reads the config would be cumbersome. A good example of this would be setting up a package manager early on:

```
/etc/yum.repos.d/company.repo:
  file:
    - managed
    - source: salt://company/yumrepo.conf
    - user: root
    - group: root
    - mode: 644
    - order: 1
    - failhard: True
```
In this situation, the yum repo is going to be configured before other states, and if it fails to lay down the config file, than no other states will be executed.

**Global Failhard**

It may be desired to have failhard be applied to every state that is executed, if this is the case, then failhard can be set in the master configuration file. Setting failhard in the master configuration file will result in failing hard when any minion gathering states from the master have a state fail.

This is NOT the default behavior, normally Salt will only fail states that require a failed state.

Using the global failhard is generally not recommended, since it can result in states not being executed or even checked. It can also be confusing to see states failhard if an admin is not actively aware that the failhard has been set.

To use the global failhard set failhard: True in the master configuration

**Finite Ordering of State Execution**

When creating salt sls files, it is often important to ensure that they run in a specific order. While states will always execute in the same order, that order is not necessarily defined the way you want it.

A few tools exist in Salt to set up the correct state ordering, these tools consist of requisite declarations and order options.

**The Order Option**

Before using the order option, remember that the majority of state ordering should be done with requisite statements, and that a requisite statement will override an order option.

The order option is used by adding an order number to a state declaration with the option `order`:

```yaml
vim:
pkg:
  - installed
  - order: 1
```

By adding the order option to `1` this ensures that the vim package will be installed in tandem with any other state declaration set to the order `1`.

Any state declared without an order option will be executed after all states with order options are executed.

But this construct can only handle ordering states from the beginning. Sometimes you may want to send a state to the end of the line, to do this set the order to `last`:

```yaml
vim:
pkg:
  - installed
  - order: last
```

Substantial testing has gone into the state system and it is ready for real world usage. A great deal has been added to the documentation for states and the modules and functions available to states have been cleanly documented.

A number of State System bugs have also been founds and repaired, the output from the state system has also been refined to be extremely clear and concise.
Error reporting has also been introduced, issues found in sls files will now be clearly reported when executing Salt States.

**Gentoo Support**

Additional experimental support has been added for Gentoo. This is found in the contribution from Doug Renn, aka nestegg.

### 18.2.100 Salt 0.9.5 Release Notes

**release** 2012-01-15

Salt 0.9.5 is one of the largest steps forward in the development of Salt. 0.9.5 comes with many milestones, this release has seen the community of developers grow out to an international team of 46 code contributors and has many feature additions, feature enhancements, bug fixes and speed improvements.

**Warning:** Be sure to *read the upgrade instructions* about the switch to msgpack before upgrading!

**Community**

Nothing has proven to have more value to the development of Salt that the outstanding community that has been growing at such a great pace around Salt. This has proven not only that Salt has great value, but also the expandability of Salt is as exponential as I originally intended.

0.9.5 has received over 600 additional commits since 0.9.4 with a swath of new commiters. The following individuals have contributed to the development of 0.9.5:

- Aaron Bull Schaefer
- Antti Kaihola
- Bas Tichelaar
- Brad Barden
- Brian Wagner
- Byron Clark
- Chris Scheller
- Christer Edwards
- Clint Savage
- Corey Quinn
- David Boucha
- Eivind Uggedal
- Eric Poelke
- Evan Borgstrom
- Jed Glazner
This makes 21 new developers since 0.9.4 was released!

To keep up with the growing community follow Salt on Ohloh (http://www.ohloh.net/p/salt), to join the Salt development community, fork Salt on GitHub, and get coding (https://github.com/saltstack/salt)!

**Major Features**

**SPEED! Pickle to msgpack**

For a few months now we have been talking about moving away from Python pickles for network serialization, but a preferred serialization format had not yet been found. After an extensive performance testing period involving everything from JSON to protocol buffers, a clear winner emerged. Message Pack (http://msgpack.org/) proved to not only be the fastest and most compact, but also the most ``salt like''. Message Pack is simple, and the code involved is very small. The msgpack library for Python has been added directly to Salt.

This move introduces a few changes to Salt. First off, Salt is no longer a ``noarch'' package, since the msgpack lib is written in C. Salt 0.9.5 will also have compatibility issues with 0.9.4 with the default configuration.

We have gone through great lengths to avoid backwards compatibility issues with Salt, but changing the serialization medium was going to create issues regardless. Salt 0.9.5 is somewhat backwards compatible with earlier minions. A 0.9.5 master can command older minions, but only if the `serial` config value in the master is set to `pickle`. This will tell the master to publish messages in pickle format and will allow the master to receive messages in both msgpack and pickle formats.

Therefore **the suggested methods for upgrading** are either to just upgrade everything at once, or:

1. Upgrade the master to 0.9.5
2. Set `serial` to `pickle` in the master config
3. Upgrade the minions
4. Remove the `serial` option from the master config

Since pickles can be used as a security exploit the ability for a master to accept pickles from minions at all will be removed in a future release.
C Bindings for YAML

All of the YAML rendering is now done with the YAML C bindings. This speeds up all of the sls files when running states.

Experimental Windows Support

David Boucha has worked tirelessly to bring initial support to Salt for Microsoft Windows operating systems. Right now the Salt Minion can run as a native Windows service and accept commands.

In the weeks and months to come Windows will receive the full treatment and will have support for Salt States and more robust support for managing Windows systems. This is a big step forward for Salt to move entirely outside of the Unix world, and proves Salt is a viable cross platform solution. Big Thanks to Dave for his contribution here!

Dynamic Module Distribution

Many Salt users have expressed the desire to have Salt distribute in-house modules, states, renderers, returners, and grains. This support has been added in a number of ways:

Modules via States

Now when salt modules are deployed to a minion via the state system as a file, then the modules will be automatically loaded into the active running minion - no restart required - and into the active running state. So custom state modules can be deployed and used in the same state run.

Modules via Module Environment Directories

Under the file_roots each environment can now have directories that are used to deploy large groups of modules. These directories sync modules at the beginning of a state run on the minion, or can be manually synced via the Salt module `salt.modules.saltutil.sync_all`.

The directories are named:
- `_modules`
- `_states`
- `_grains`
- `_renderers`
- `_returners`

The modules are pushed to their respective scopes on the minions.

Module Reloading

Modules can now be reloaded without restarting the minion, this is done by calling the `salt.modules.sys.reload_modules` function.

But wait, there's more! Now when a salt module of any type is added via states the modules will be automatically reloaded, allowing for modules to be laid down with states and then immediately used.

Finally, all modules are reloaded when modules are dynamically distributed from the salt master.
Enable / Disable Added to Service

A great deal of demand has existed for adding the capability to set services to be started at boot in the service module. This feature also comes with an overhaul of the service modules and initial systemd support.

This means that the `service state` can now accept `-enable: True` to make sure a service is enabled at boot, and `-enable: False` to make sure it is disabled.

Compound Target

A new target type has been added to the lineup, the compound target. In previous versions the desired minions could only be targeted via a single specific target type, but now many target specifications can be declared.

These targets can also be separated by and/or operators, so certain properties can be used to omit a node:

```bash
salt -C 'webserv* and G@os:Debian or E@db.*' test.ping
```

will match all minions with ids starting with webserv via a glob and minions matching the `os:Debian` grain. Or minions that match the `db.*` regular expression.

Node Groups

Often the convenience of having a predefined group of minions to execute targets on is desired. This can be accomplished with the new nodegroups feature. Nodegroups allow for predefined compound targets to be declared in the master configuration file:

```yaml
nodegroups:
  group1: 'L@foo.domain.com,bar.domain.com,baz.domain.com and bl*.domain.com'
  group2: 'G@os:Debian and foo.domain.com'
```

And then used via the `-N` option:

```bash
salt -N group1 test.ping
```

Minion Side Data Store

The data module introduces the initial approach into storing persistent data on the minions, specific to the minions. This allows for data to be stored on minions that can be accessed from the master or from the minion.

The Minion datastore is young, and will eventually provide an interface similar to a more mature key/value pair server.

Major Grains Improvement

The Salt grains have been overhauled to include a massive amount of extra data. this includes hardware data, os data and salt specific data.

Salt -Q is Useful Now

In the past the salt query system, which would display the data from recent executions would be displayed in pure Python, and it was unreadable.
0.9.5 has added the outputer system to the `–Q` option, thus enabling the salt query system to return readable output.

**Packaging Updates**

Huge strides have been made in packaging Salt for distributions. These additions are thanks to our wonderful community where the work to set up packages has proceeded tirelessly.

**FreeBSD**

Salt on FreeBSD? There a port for that:
http://svnweb.freebsd.org/ports/head/sysutils/py-salt/

This port was developed and added by Christer Edwards. This also marks the first time Salt has been included in an upstream packaging system!

**Fedora and Red Hat Enterprise**

Salt packages have been prepared for inclusion in the Fedora Project and in EPEL for Red Hat Enterprise 5 and 6. These packages are the result of the efforts made by Clint Savage (herlo).

**Debian/Ubuntu**

A team of many contributors have assisted in developing packages for Debian and Ubuntu. Salt is still actively seeking inclusion in upstream Debian and Ubuntu and the package data that has been prepared is being pushed through the needed channels for inclusion.

These packages have been prepared with the help of:

- Corey
- Aaron Toponce
- and’

**More to Come**

We are actively seeking inclusion in more distributions. Primarily getting Salt into Gentoo, SUSE, OpenBSD, and preparing Solaris support are all turning into higher priorities.

**Refinement**

Salt continues to be refined into a faster, more stable and more usable application. 0.9.5 comes with more debug logging, more bug fixes and more complete support.

**More Testing, More BugFixes**

0.9.5 comes with more bugfixes due to more testing than any previous release. The growing community and the introduction of a dedicated QA environment have unearthed many issues that were hiding under the covers. This has further refined and cleaned the state interface, taking care of things from minor visual issues to repairing misleading data.
Custom Exceptions

A custom exception module has been added to throw salt specific exceptions. This allows Salt to give much more granular error information.

New Modules

data

The new data module manages a persistent datastore on the minion. Big thanks to bastichelaar for his help refining this module

freebsdmod

FreeBSD kernel modules can now be managed in the same way Salt handles Linux kernel modules. This module was contributed thanks to the efforts of Christer Edwards

gentoo_service

Support has been added for managing services in Gentoo. Now Gentoo services can be started, stopped, restarted, enabled, disabled, and viewed.

pip

The pip module introduces management for pip installed applications. Thanks goes to whitinge for the addition of the pip module

rh_service

The rh_service module enables Red Hat and Fedora specific service management. Now Red Hat like systems come with extensive management of the classic init system used by Red Hat

saltutil

The saltutil module has been added as a place to hold functions used in the maintenance and management of salt itself. Saltutil is used to salt the salt minion. The saltutil module is presently used only to sync extension modules from the master server.

systemd

Systemd support has been added to Salt, now systems using this next generation init system are supported on systems running systemd.
virtualenv

The virtualenv module has been added to allow salt to create virtual Python environments. Thanks goes to whitinge for the addition of the virtualenv module

win_disk

Support for gathering disk information on Microsoft Windows minions The windows modules come courtesy of Utah_Dave

win_service

The win_service module adds service support to Salt for Microsoft Windows services

win_useradd

Salt can now manage local users on Microsoft Windows Systems

yumpkg5

The yumpkg module introduces in 0.9.4 uses the yum API to interact with the yum package manager. Unfortunately, on Red Hat 5 systems salt does not have access to the yum API because the yum API is running under Python 2.4 and Salt needs to run under Python 2.6. The yumpkg5 module bypasses this issue by shelling out to yum on systems where the yum API is not available.

New States

mysql_database

The new mysql_database state adds the ability to systems running a mysql server to manage the existence of mysql databases.

The mysql states are thanks to syphernl

mysql_user

The mysql_user state enables mysql user management.

virtualenv

The virtualenv state can manage the state of Python virtual environments. Thanks to Whitinge for the virtualenv state
New Returners

cassandra_returner

A returner allowing Salt to send data to a cassandra server. Thanks to Byron Clark for contributing this returner

18.2.101 Salt 0.9.6 Release Notes

release 2012-01-21

Salt 0.9.6 is a release targeting a few bugs and changes. This is primarily targeting an issue found in the names declaration in the state system. But a few other bugs were also repaired, like missing support for grains in extmods. Due to a conflict in distribution packaging msgpack will no longer be bundled with Salt, and is required as a dependency.

New Features

HTTP and ftp support in files.managed

Now under the source option in the file.managed state a HTTP or ftp address can be used instead of a file located on the salt master.

Allow Multiple Returners

Now the returner interface can define multiple returners, and will also return data back to the master, making the process less ambiguous.

Minion Memory Improvements

A number of modules have been taken out of the minion if the underlying systems required by said modules are not present on the minion system. A number of other modules need to be stripped out in this same way which should continue to make the minion more efficient.

Minions Can Locally Cache Return Data

A new option, cache_jobs, has been added to the minion to allow for all of the historically run jobs to cache on the minion, allowing for looking up historic returns. By default cache_jobs is set to False.

Pure Python Template Support For file.managed

Templates in the file.managed state can now be defined in a Python script. This script needs to have a run function that returns the string that needs to be in the named file.
18.2.102 Salt 0.9.7 Release Notes

release 2012-02-15

Salt 0.9.7 is here! The latest iteration of Salt brings more features and many fixes. This release is a great refinement over 0.9.6, adding many conveniences under the hood, as well as some features that make working with Salt much better.

A few highlights include the new Job system, refinements to the requisite system in states, the mod_init interface for states, external node classification, search path to managed files in the file state, and refinements and additions to dynamic module loading.

0.9.7 also introduces the long developed (and oft changed) unit test framework and the initial unit tests.

Major Features

Salt Jobs Interface

The new jobs interface makes the management of running executions much cleaner and more transparent. Building on the existing execution framework the jobs system allows clear introspection into the active running state of the running Salt interface.

The Jobs interface is centered in the new minion side proc system. The minions now store msgpack serialized files under /var/cache/salt/proc. These files keep track of the active state of processes on the minion.

Functions in the saltutil Module

A number of functions have been added to the saltutil module to manage and view the jobs:
- running - Returns the data of all running jobs that are found in the proc directory.
- find_job - Returns specific data about a certain job based on job id.
- signal_job - Allows for a given jid to be sent a signal.
- term_job - Sends a termination signal (SIGTERM, 15) to the process controlling the specified job.
- kill_job - Sends a kill signal (SIGKILL, 9) to the process controlling the specified job.

The jobs Runner

A convenience runner front end and reporting system has been added as well. The jobs runner contains functions to make viewing data easier and cleaner.

The jobs runner contains a number of functions...

active

The active function runs saltutil.running on all minions and formats the return data about all running jobs in a much more usable and compact format. The active function will also compare jobs that have returned and jobs that are still running, making it easier to see what systems have completed a job and what systems are still being waited on.
**lookup_jid**

When jobs are executed the return data is sent back to the master and cached. By default, it is cached for 24 hours, but this can be configured via the `keep_jobs` option in the master configuration.

Using the `lookup_jid` runner will display the same return data that the initial job invocation with the salt command would display.

**list_jobs**

Before finding a historic job, it may be required to find the job id. `list_jobs` will parse the cached execution data and display all of the job data for jobs that have already, or partially returned.

**External Node Classification**

Salt can now use external node classifiers like Cobbler's `cobbler-ext-nodes`.

Salt uses specific data from the external node classifier. In particular the classes value denotes which sls modules to run, and the environment value sets to another environment.

An external node classification can be set in the master configuration file via the `external_nodes` option: http://salt.readthedocs.org/en/latest/ref/configuration/master.html#external-nodes

External nodes are loaded in addition to the top files. If it is intended to only use external nodes, do not deploy any top files.

**State Mod Init System**

An issue arose with the pkg state. Every time a package was run Salt would need to refresh the package database. This made systems with slower package metadata refresh speeds much slower to work with. To alleviate this issue the `mod_init` interface has been added to salt states.

The `mod_init` interface is a function that can be added to a state file. This function is called with the first state called. In the case of the pkg state, the `mod_init` function sets up a tag which makes the package database only refresh on the first attempt to install a package.

In a nutshell, the `mod_init` interface allows a state to run any command that only needs to be run once, or can be used to set up an environment for working with the state.

**Source File Search Path**

The file state continues to be refined, adding speed and capabilities. This release adds the ability to pass a list to the source option. This list is then iterated over until the source file is found, and the first found file is used.

The new syntax looks like this:

```
/etc/httpd/conf/httpd.conf:
  file:
    - managed
    - source:
      - salt://httpd/httpd.conf
      - http://myserver/httpd.conf: md5=8c1fe119e6f1fd96bc06614473509bf1
```
The source option can take sources in the list from the salt file server as well as an arbitrary web source. If using an arbitrary web source the checksum needs to be passed as well for file verification.

**Refinements to the Requisite System**

A few discrepancies were still lingering in the requisite system, in particular, it was not possible to have a `require` and a `watch` requisite declared in the same state declaration.

This issue has been alleviated, as well as making the requisite system run more quickly.

**Initial Unit Testing Framework**

Because of the module system, and the need to test real scenarios, the development of a viable unit testing system has been difficult, but unit testing has finally arrived. Only a small amount of unit testing coverage has been developed, much more coverage will be in place soon.

A huge thanks goes out to those who have helped with unit testing, and the contributions that have been made to get us where we are. Without these contributions unit tests would still be in the dark.

**Compound Targets Expanded**

Originally only support for `and` and `or` were available in the compound target. 0.9.7 adds the capability to negate compound targets with `not`.

**Nodegroups in the Top File**

Previously the nodegroups defined in the master configuration file could not be used to match nodes for states. The nodegroups support has been expanded and the nodegroups defined in the master configuration can now be used to match minions in the top file.

**18.2.103 Salt 0.9.8 Release Notes**

**release** 2012-03-21

Salt 0.9.8 is a big step forward, with many additions and enhancements, as well as a number of precursors to advanced future developments.

This version of Salt adds much more power to the command line, making the old hard timeout issues a thing of the past and adds keyword argument support. These additions are also available in the salt client API, making the available API tools much more powerful.

The new pillar system allows for data to be stored on the master and assigned to minions in a granular way similar to the state system. It also allows flexibility for users who want to keep data out of their state tree similar to `external lookup` functionality in other tools.

A new way to extend requisites was added, the `requisite in` statement. This makes adding requires or watch statements to external state decs much easier.

Additions to requisites making them much more powerful have been added as well as improved error checking for sls files in the state system. A new provider system has been added to allow for redirecting what modules run in the background for individual states.
Support for OpenSUSE has been added and support for Solaris has begun serious development. Windows support has been significantly enhanced as well.

The matcher and target systems have received a great deal of attention. The default behavior of grain matching has changed slightly to reflect the rest of salt and the compound matcher system has been refined.

A number of impressive features with keyword arguments have been added to both the CLI and to the state system. This makes states much more powerful and flexible while maintaining the simple configuration everyone loves.

The new batch size capability allows for executions to be rolled through a group of targeted minions a percentage or specific number at a time. This was added to prevent the “thundering herd” problem when targeting large numbers of minions for things like service restarts or file downloads.

**Upgrade Considerations**

**Upgrade Issues**

There was a previously missed oversight which could cause a newer minion to crash an older master. That oversight has been resolved so the version incompatibility issue will no longer occur. When upgrading to 0.9.8 make sure to upgrade the master first, followed by the minions.

**Debian/Ubuntu Packages**

The original Debian/Ubuntu packages were called salt and included all salt applications. New packages in the ppa are split by function. If an old salt package is installed then it should be manually removed and the new split packages need to be freshly installed.

On the master:

```
# apt-get purge salt
# apt-get install salt-{master,minion}
```

On the minions:

```
# apt-get purge salt
# apt-get install salt-minion
```

And on any Syndics:

```
# apt-get install salt-syndic
```

The official Salt PPA for Ubuntu is located at: [https://launchpad.net/~saltstack/+archive/salt](https://launchpad.net/~saltstack/+archive/salt)

**Major Features**

**Pillar**

_Pillar_ offers an interface to declare variable data on the master that is then assigned to the minions. The pillar data is made available to all modules, states, sls files etc. It is compiled on the master and is declared using the existing renderer system. This means that learning pillar should be fairly trivial to those already familiar with salt states.
CLI Additions

The `salt` command has received a serious overhaul and is more powerful than ever. Data is returned to the terminal as it is received, and the `salt` command will now wait for all running minions to return data before stopping. This makes adding very large `--timeout` arguments completely unnecessary and gets rid of long running operations returning empty `{}` when the timeout is exceeded.

When calling `salt` via `sudo`, the user originally running `salt` is saved to the log for auditing purposes. This makes it easy to see who ran what by just looking through the minion logs.

The `salt-key` command gained the `-D` and `--delete-all` arguments for removing all keys. Be careful with this one!

Running States Without a Master

The addition of running states without a salt-master has been added to 0.9.8. This feature allows for the unmodified salt state tree to be read locally from a minion. The result is that the UNMODIFIED state tree has just become portable, allowing minions to have a local copy of states or to manage states without a master entirely.

This is accomplished via the new file client interface in Salt that allows for the `salt://` URI to be redirected to custom interfaces. This means that there are now two interfaces for the salt file server, calling the master or looking in a local, minion defined `file_roots`.

This new feature can be used by modifying the minion config to point to a local `file_roots` and setting the `file_client` option to `local`.

Keyword Arguments and States

State modules now accept the `**kwargs` argument. This results in all data in a sls file assigned to a state being made available to the state function.

This passes data in a transparent way back to the modules executing the logic. In particular, this allows adding arguments to the `pkg.install` module that enable more advanced and granular controls with respect to what the state is capable of.

An example of this along with the new `debconf` module for installing ldap client packages on Debian:

```
ldap-client-packages:
  pkg:
    - debconf: salt://debconf/ldap-client.ans
    - installed
    - names:
      - nslcd
      - libpam-ldapd
      - libnss-ldapd
```

Keyword Arguments and the CLI

In the past it was required that all arguments be passed in the proper order to the `salt` and `salt-call` commands. As of 0.9.8, keyword arguments can be passed in the form of `kvarg=argument`.

```
# salt --type:dev git.clone
  repository=https://github.com/saltstack/salt.git cwd=/tmp/salt user=jeff
```
Matcher Refinements and Changes

A number of fixes and changes have been applied to the Matcher system. The most noteworthy is the change in the grain matcher. The grain matcher used to use a regular expression to match the passed data to a grain, but now defaults to a shell glob like the majority of match interfaces in Salt. A new option is available that still uses the old style regex matching to grain data called `grain-pcre`. To use regex matching in compound matches use the letter `P`.

For example, this would match any ArchLinux or Fedora minions:

```
# salt --grain-pcre 'os:(Arch:Fed).*' test.ping
```

And the associated compound matcher suitable for `top.sls` is `P`:

```
P@os:(Arch|Fed).*
```

**NOTE**: Changing the grains matcher from pcre to glob is backwards incompatible.

Support has been added for matching minions with Yahoo's range library. This is handled by passing range syntax with `-R` or `--range` arguments to salt.

More information at: https://github.com/ytoolshed/range/wiki/%22yamlfile%22-module-file-spec

**Requisite "in"**

A new means to updating requisite statements has been added to make adding watchers and requires to external states easier. Before 0.9.8 the only way to extend the states that were watched by a state outside of the sls was to use an extend statement:

```
include:
  - http
extend:
  apache:
    service:
      - watch:
        - pkg: tomcat
tomcat:
  pkg:
    - installed
```

But the new `Requisite in` statement allows for easier extends for requisites:

```
include:
  - http
tomcat:
  pkg:
    - installed
    - watch_in:
      - service: apache
```

Requisite in is part of the extend system, so still remember to always include the sls that is being extended!
Providers

Salt predetermines what modules should be mapped to what uses based on the properties of a system. These determinations are generally made for modules that provide things like package and service management. The apt module maps to pkg on Debian and the yum module maps to pkg on Fedora for instance.

Sometimes in states, it may be necessary for a non-default module to be used for the desired functionality. For instance, an Arch Linux system may have been set up with systemd support. Instead of using the default service module detected for Arch Linux, the systemd module can be used:

```yaml
http:
  service:
    - running
    - enable: True
    - provider: systemd
```

Default providers can also be defined in the minion config file:

```yaml
providers:
  service: systemd
```

When default providers are passed in the minion config, then those providers will be applied to all functionality in Salt, this means that the functions called by the minion will use these modules, as well as states.

Requisite Glob Matching

Requisites can now be defined with glob expansion. This means that if there are many requisites, they can be defined on a single line.

To watch all files in a directory:

```yaml
http:
  service:
    - running
    - enable: True
    - watch:
      - file: /etc/http/conf.d/*
```

This example will watch all defined files that match the glob `/etc/http/conf.d/*`

Batch Size

The new batch size option allows commands to be executed while maintaining that only so many hosts are executing the command at one time. This option can take a percentage or a finite number:

```bash
salt '*' -b 10 test.ping
salt -G 'os:RedHat' --batch-size 25% apache.signal restart
```

This will only run test.ping on 10 of the targeted minions at a time and then restart apache on 25% of the minions matching os:RedHat at a time and work through them all until the task is complete. This makes jobs like rolling web server restarts behind a load balancer or doing maintenance on BSD firewalls using carp much easier with salt.
Module Updates

This is a list of notable, but non-exhaustive updates with new and existing modules.

Windows support has seen a flurry of support this release cycle. We've gained all new file, network, and shadow modules. Please note that these are still a work in progress.

For our ruby users, new rvm and gem modules have been added along with the associated states

The virt module gained basic Xen support.

The yum module gained Scientific Linux support.

The pkg module on Debian, Ubuntu, and derivatives force apt to run in a non-interactive mode. This prevents issues when package installation waits for confirmation.

A pkg module for OpenSUSE's zypper was added.

The service module on Ubuntu natively supports upstart.

A new debconf module was contributed by our community for more advanced control overdeb package deployments on Debian based distributions.

The mysql.user state and mysql module gained a password_hash argument.

The cmd module and state gained a shell keyword argument for specifying a shell other than /bin/sh on Linux / Unix systems.

New git and mercurial modules have been added for fans of distributed version control.

In Progress Development

Master Side State Compiling

While we feel strongly that the advantages gained with minion side state compiling are very critical, it does prevent certain features that may be desired. 0.9.8 has support for initial master side state compiling, but many more components still need to be developed, it is hoped that these can be finished for 0.9.9.

The goal is that states can be compiled on both the master and the minion allowing for compilation to be split between master and minion. Why will this be great? It will allow storing sensitive data on the master and sending it to some minions without all minions having access to it. This will be good for handling ssl certificates on front-end web servers for instance.

Solaris Support

Salt 0.9.8 sees the introduction of basic Solaris support. The daemon runs well, but grains and more of the modules need updating and testing.

Windows Support

Salt states on windows are now much more viable thanks to contributions from our community! States for file, service, local user, and local group management are more fully fleshed out along with network and disk modules. Windows users can also now manage registry entries using the new `reg` module.
18.2.104 Salt 0.9.9 Release Notes

release 2012-04-27

0.9.9 is out and comes with some serious bug fixes and even more serious features. This release is the last major feature release before 1.0.0 and could be considered the 1.0.0 release candidate.

A few updates include more advanced kwargs support, the ability for salt states to more safely configure a running salt minion, better job directory management and the new state test interface.

Many new tests have been added as well, including the new minion swarm test that allows for easier testing of Salt working with large groups of minions. This means that if you have experienced stability issues with Salt before, particularly in larger deployments, that these bugs have been tested for, found, and killed.

Major Features

State Test Interface

Until 0.9.9 the only option when running states to see what was going to be changed was to print out the highstate with state.show_highstate and manually look it over. But now states can be run to discover what is going to be changed.

Passing the option test=True to many of the state functions will now cause the salt state system to only check for what is going to be changed and report on those changes.

```
salt '*' state.highstate test=True
```

Now states that would have made changes report them back in yellow.

State Syntax Update

A shorthand syntax has been added to sls files, and it will be the default syntax in documentation going forward. The old syntax is still fully supported and will not be deprecated, but it is recommended to move to the new syntax in the future. This change moves the state function up into the state name using a dot notation. This is in-line with how state functions are generally referred to as well:

The new way:

```
/etc/sudoers:
  file.present:
    - source: salt://sudo/sudoers
    - user: root
    - mode: 400
```

Use and Use_in Requisites

Two new requisite statements are available in 0.9.9. The use and use_in requisite and requisite-in allow for the transparent duplication of data between states. When a state “uses” another state it copies the other state's arguments as defaults. This was created in direct response to the new network state, and allows for many network interfaces to be configured in the same way easily. A simple example:

```
root_file:
  file.absent:
    - name: /tmp/nothing
```
This makes the 2 lower state decs inherit the options from their respectively `used` state decs.

**Network State**

The new network state allows for the configuration of network devices via salt states and the ip salt module. This addition has been given to the project by Jeff Hutchins and Bret Palsson from Jive Communications.

Currently the only network configuration backend available is for Red Hat based systems, like Red Hat Enterprise, CentOS, and Fedora.

**Exponential Jobs**

Originally the jobs executed were stored on the master in the format: `<cachedir>/jobs/jid/{minion ids}` But this format restricted the number of jobs in the cache to the number of subdirectories allowed on the filesystem. Ext3 for instance limits subdirectories to 32000. To combat this the new format for 0.9.9 is: `<cachedir>/jobs/jid_hash[:2]/jid_hash[2:][/minion ids]` So that now the number of maximum jobs that can be run before the cleanup cycle hits the job directory is substantially higher.

**ssh_auth Additions**

The original ssh_auth state was limited to accepting only arguments to apply to a public key, and the key itself. This was restrictive due to the way the we learned that many people were using the state, so the key section has been expanded to accept options and arguments to the key that over ride arguments passed in the state. This gives substantial power to using ssh_auth with names:

```
sshkeys:
  ssh_auth:
    - present
    - user: backup
```
LocalClient Additions

To follow up the recent additions in 0.9.8 of additional kwargs support, 0.9.9 also adds the capability to send kwargs into commands via a dict. This addition to the LocalClient api can be used like so:

```python
import salt.client

client = salt.client.LocalClient('/etc/salt/master')
ret = client.cmd('*', 'cmd.run', ['ls -l'], kwarg={'cwd': '/etc'})
```

This update has been added to all cmd methods in the LocalClient class.

Better Self Salting

One problem faced with running Salt states, is that it has been difficult to manage the Salt minion via states, this is due to the fact that if the minion is called to restart while a state run is happening then the state run would be killed. 0.9.9 slightly changes the process scope of the state runs, so now when salt is executing states it can safely restart the salt-minion daemon.

In addition to daemonizing the state run, the apt module also daemonizes. This update makes it possible to cleanly update the salt-minion package on Debian/Ubuntu systems without leaving apt in an inconsistent state or killing
the active minion process mid-execution.

### Wildcards for SLS Modules

Now, when including sls modules in include statements or in the top file, shell globs can be used. This can greatly simplify listing matched sls modules in the top file and include statements:

```yaml
base:
  '*':
    - files*
    - core*

include:
  - users.dev.*
  - apache.ser*
```

### External Pillar

Since the pillar data is just data, it does not need to come expressly from the pillar interface. The external pillar system allows for hooks to be added making it possible to extract pillar data from any arbitrary external interface. The external pillar interface is configured via the `ext_pillar` option. Currently interfaces exist to gather external pillar data via hiera or via a shell command that sends yaml data to the terminal:

```yaml
ext_pillar:
  - cmd_yaml: cat /etc/salt/ext.yaml
  - hiera: /etc/hirea.yaml
```

The initial external pillar interfaces and extra interfaces can be added to the file salt/pillar.py, it is planned to add more external pillar interfaces. If the need arises a new module loader interface will be created in the future to manage external pillar interfaces.

### Single State Executions

The new state.single function allows for single states to be cleanly executed. This is a great tool for setting up a small group of states on a system or for testing out the behavior of single states:

```
salt '*' state.single user.present name=wade uid=2000
```

The test interface functions here as well, so changes can also be tested against as:

```
salt '*' state.single user.present name=wade uid=2000 test=True
```

### New Tests

A few exciting new test interfaces have been added, the minion swarm allows not only testing of larger loads, but also allows users to see how Salt behaves with large groups of minions without having to create a large deployment.
Minion Swarm

The minion swarm test system allows for large groups of minions to be tested against easily without requiring large numbers of servers or virtual machines. The minion swarm creates as many minions as a system can handle and roots them in the /tmp directory and connects them to a master.

The benefit here is that we were able to replicate issues that happen only when there are large numbers of minions. A number of elusive bugs which were causing stability issues in masters and minions have since been hunted down. Bugs that used to take careful watch by users over several days can now be reliably replicated in minutes, and fixed in minutes.

Using the swarm is easy, make sure a master is up for the swarm to connect to, and then use the minionswarm.py script in the tests directory to spin up as many minions as you want. Remember, this is a fork bomb, don’t spin up more than your hardware can handle!

```
python minionswarm.py -m 20 --master salt-master
```

Shell Tests

The new Shell testing system allows us to test the behavior of commands executed from a high level. This allows for the high level testing of salt runners and commands like salt-key.

Client Tests

Tests have been added to test the aspects of the client APIs and ensure that the client calls work, and that they manage passed data, in a desirable way.
