Check if the given path is an alternative for a name.
```

New in version 2015.8.4.

CLI Example:
```
salt '*' alternatives.check_exists name path
```

```
salt.modules.alternatives.check_installed(name, path)
Check if the current highest-priority match for a given alternatives link is set to the desired path
```

CLI Example:
```
salt '*' alternatives.check_installed name path
```

```
salt.modules.alternatives.display(name)
Display alternatives settings for defined command name
```

CLI Example:
```
salt '*' alternatives.display editor
```
salt.modules.alternatives.install(name, link, path, priority)
Install symbolic links determining default commands

CLI Example:

```
salt '*' alternatives.install editor /usr/bin/editor /usr/bin/emacs23 50
```

salt.modules.alternatives.remove(name, path)
Remove symbolic links determining the default commands.

CLI Example:

```
salt '*' alternatives.remove name path
```

salt.modules.alternatives.set_(name, path)
Manually set the alternative <path> for <name>.

CLI Example:

```
salt '*' alternatives.set name path
```

salt.modules.alternatives.show_current(name)
Display the current highest-priority alternative for a given alternatives link

CLI Example:

```
salt '*' alternatives.show_current editor
```

salt.modules.alternatives.show_link(name)
Display master link for the alternative

New in version 2015.8.13, 2016.3.4, 2016.11.0.

CLI Example:

```
salt '*' alternatives.show_link editor
```

### 19.9.10 salt.modules.apache

Support for Apache

**Note:** The functions in here are generic functions designed to work with all implementations of Apache. Debian-specific functions have been moved into deb_apache.py, but will still load under the apache namespace when a Debian-based system is detected.

salt.modules.apache.config(name, config, edit=True)
Create VirtualHost configuration files

```
name  File for the virtual host
cfg   VirtualHost configurations
```

**Note:** This function is not meant to be used from the command line. Config is meant to be an ordered dict of all of the apache configs.

CLI Example:
salt 'salt*1' apache.config /etc/httpd/conf.d/ports.conf  
```
config="[{'Listen': '22'}]
```

salt.modules.apache.directives()
Return list of directives together with expected arguments and places where the directive is valid (apachectl -L)

CLI Example:
```
salt 'salt*1' apache.directives
```

salt.modules.apache.fullversion()
Return server version (apachectl -V)

CLI Example:
```
salt 'salt*1' apache.fullversion
```

salt.modules.apache.modules()
Return list of static and shared modules (apachectl -M)

CLI Example:
```
salt 'salt*1' apache.modules
```

salt.modules.apache.server_status(profile='default')
Get Information from the Apache server-status handler

**Note:** The server-status handler is disabled by default. In order for this function to work it needs to be enabled. See [http://httpd.apache.org/docs/2.2/mod/mod_status.html](http://httpd.apache.org/docs/2.2/mod/mod_status.html)

The following configuration needs to exists in pillar/grains. Each entry nested in apache.server-status is a profile of a vhost/server. This would give support for multiple apache servers/vhosts.

```python
apache.server-status:
  default:
    url: http://localhost/server-status
    user: someuser
    pass: password
    realm: 'authentication realm for digest passwords'
    timeout: 5
```

CLI Examples:
```
salt 'salt*1' apache.server_status
salt 'salt*1' apache.server_status other-profile
```

salt.modules.apache.servermods()
Return list of modules compiled into the server (apachectl -l)

CLI Example:
```
salt 'salt*1' apache.servermods
```

salt.modules.apache.signal(signal=None)
Signals httpd to start, restart, or stop.

CLI Example:
salt '*' apache.signal restart

salt.modules.apache.useradd(pwfile, user, password, opts='')
Add HTTP user using the htpasswd command. If the htpasswd file does not exist, it will be created. Valid options that can be passed are:

- n: Don't update file; display results on stdout.
- m: Force MD5 hashing of the password (default).
- d: Force CRYPT(3) hashing of the password.
- p: Do not hash the password (plaintext).
- s: Force SHA1 hashing of the password.

CLI Examples:

```bash
salt '*' apache.useradd /etc/httpd/htpasswd larry badpassword
salt '*' apache.useradd /etc/httpd/htpasswd larry badpass opts=ns
```

salt.modules.apache.userdel(pwfile, user)
Delete HTTP user from the specified htpasswd file.

CLI Example:

```bash
salt '*' apache.userdel /etc/httpd/htpasswd larry
```

salt.modules.apache.version()
Return server version (apachectl -v)

CLI Example:

```bash
salt '*' apache.version
```

salt.modules.apache.vhosts()
Show the settings as parsed from the config file (currently only shows the virtualhost settings) (apachectl -S). Because each additional virtual host adds to the execution time, this command may require a long timeout be specified by using -t 10.

CLI Example:

```bash
salt -t 10 '*' apache.vhosts
```

### 19.9.11 salt.modules.apcups

Module for apcupsd

salt.modules.apcups.status()
Return apcaccess output

CLI Example:

```bash
salt '*' apcups.status
```

salt.modules.apcups.status_battery()
Return true if running on battery power

CLI Example:
salt '*' apcups.status_battery

salt.modules.apcups.status_charge()
  Return battery charge
  CLI Example:
  
  salt '*' apcups.status_charge

salt.modules.apcups.status_load()
  Return load
  CLI Example:
  
  salt '*' apcups.status_load

19.9.12  salt.modules.apf

Support for Advanced Policy Firewall (APF)

  maintainer  Mostafa Hussein <mostafa.hussein91@gmail.com>
  maturity  new
  depends  python-iptables
  platform  Linux

salt.modules.apf.allow(ip, port=None)
  Add host (IP/FQDN) to allow_hosts.rules and immediately load new rule into firewall CLI Example:
  
  salt '*' apf.allow 127.0.0.1

salt.modules.apf.deny(ip)
  Add host (IP/FQDN) to deny_hosts.rules and immediately load new rule into firewall CLI Example:
  
  salt '*' apf.deny 1.2.3.4

salt.modules.apf.disable()
  Stop (flush) all firewall rules CLI Example:
  
  salt '*' apf.disable

salt.modules.apf.enable()
  Load all firewall rules CLI Example:
  
  salt '*' apf.enable

salt.modules.apf.refresh()
  Refresh & resolve dns names in trust rules CLI Example:
  
  salt '*' apf.refresh

salt.modules.apf.reload()
  Stop (flush) & reload firewall rules CLI Example:
salt '∗' apf.reload

salt.modules.apf.remove(ip)
Remove host from [glob]_hosts.rules and immediately remove rule from firewall CLI Example:
salt '∗' apf.remove 1.2.3.4

salt.modules.apf.running()
Check apf status CLI Example:
salt '∗' apf.running

19.9.13 salt.modules.apk module

Support for apk

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `pkg.install` is not available), see here.

salt.modules.apk.file_dict('packages')
List the files that belong to a package, grouped by package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:
salt '∗' pkg.file_list httpd
salt '∗' pkg.file_list httpd postfix
salt '∗' pkg.file_list

salt.modules.apk.file_list('packages')
List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:
salt '∗' pkg.file_list httpd
salt '∗' pkg.file_list httpd postfix
salt '∗' pkg.file_list

salt.modules.apk.install(name=None, refresh=False, pkgs=None, sources=None, **kwargs)
Install the passed package, add refresh=True to update the apk database.

**name** The name of the package to be installed. Note that this parameter is ignored if either `"pkgs"` or `"sources"` is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the `"sources"` option.

CLI Example:
salt '∗' pkg.install <package name>

**refresh** Whether or not to refresh the package database before installing.

Multiple Package Installation Options:

**pkgs** A list of packages to install from a software repository. Must be passed as a python list.

**kwarg**
**salt Documentation, Release 2017.7.8**

```python
salt '* pkg.install pkgs=['"foo", "bar"]'
```

**sources**  A list of IPK packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package. Dependencies are automatically resolved and marked as auto-installed.

CLI Example:

```python
salt '*' pkg.install sources=['{"foo": "salt://foo.deb"}, {"bar": "salt://bar.deb"}]'
```

**install_recommends**  Whether to install the packages marked as recommended. Default is True.

Returns a dict containing the new package names and versions:

```python
{"<package>": {"old": '<old-version>', 'new': '<new-version>'}}
```

**salt.modules.apk.latest_version(**names**, **kwargs**) Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```python
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

**salt.modules.apk.list_pkgs**(versions_as_list=False, **kwargs**) List the packages currently installed in a dict:

```python
{"<package_name>": "<version>"}
```

CLI Example:

```python
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

**salt.modules.apk.list_upgrades**(refresh=True) List all available package upgrades.

CLI Example:

```python
salt '*' pkg.list_upgrades
```

**salt.modules.apk.owner(**paths**)** Return the name of the package that owns the file. Multiple file paths can be passed. Like pkg.version <salt.modules.apk.version>, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Example:

```python
salt '*' pkg.owns /usr/bin/apachectl salt '*' pkg.owns /usr/bin/apachectl /usr/bin/basename
```

**salt.modules.apk.purge**(name=None, pkgs=None, **kwargs**) **Alias to remove**
salt.modules.apk.refresh_db()

Updates the package list
- True: Database updated successfully
- False: Problem updating database

CLI Example:

```
salt '*' pkg.refresh_db
```

salt.modules.apk.remove(name=None, pkgs=None, purge=False, **kwargs)

Remove packages using `apk del`
name The name of the package to be deleted.

Multiple Package Options:
pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

salt.modules.apk.upgrade(name=None, pkgs=None, refresh=True)

Upgrades all packages via `apk upgrade` or a specific package if name or pkgs is specified. Name is ignored if pkgs is specified

Returns a dict containing the changes.

```
{`<package>`: `{`old`: `<old-version>`, `new`: `<new-version>`}`}
```

CLI Example:

```
salt '*' pkg.upgrade
```

salt.modules.apk.version(*names, **kwargs)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

## 19.9.14 salt.modules.aptpkg

Support for APT (Advanced Packaging Tool)

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `pkg.install is not available`), see [here](#).

**Note:** For virtual package support, either the python-apt or dctrl-tools package must be installed. For repository management, the python-apt package must be installed.
salt.modules.aptpkg.add_repo_key(path=None, text=None, keyserver=None, keyid=None, saltenv='base')

New in version 2017.7.0.

Add a repo key using `apt-key add`.

**Parameters**

- **path** *(str)* -- The path of the key file to import.
- **text** *(str)* -- The key data to import, in string form.
- **keyserver** *(str)* -- The server to download the repo key specified by the keyid.
- **keyid** *(str)* -- The key id of the repo key to add.
- **saltenv** *(str)* -- The environment the key file resides in.

**Returns** A boolean representing whether the repo key was added.

**Return type** bool

**CLI Examples:**

```bash
salt '*' pkg.add_repo_key 'salt://apt/sources/test.key'
salt '*' pkg.add_repo_key text="$KEY1"
salt '*' pkg.add_repo_key keyserver='keyserver.example' keyid='0000AAAA'
```

salt.modules.aptpkg.autoremove(list_only=False, purge=False)

New in version 2015.5.0.

Remove packages not required by another package using `apt-get autoremove`.

- **list_only** [False] Only retrieve the list of packages to be auto-removed, do not actually perform the auto-removal.
- **purge** [False] Also remove package config data when autoremoving packages.

New in version 2015.8.0.

**CLI Example:**

```bash
salt '*' pkg.autoremove
salt '*' pkg.autoremove list_only=True
salt '*' pkg.autoremove purge=True
```

salt.modules.aptpkg.del_repo(repo, **kwargs)

Delete a repo from the sources.list / sources.list.d

If the .list file is in the sources.list.d directory and the file that the repo exists in does not contain any other repo configuration, the file itself will be deleted.

The repo passed in must be a fully formed repository definition string.

**CLI Examples:**

```bash
salt '*' pkg.del_repo "myrepo definition"
```

salt.modules.aptpkg.del_repo_key(name=None, **kwargs)

New in version 2015.8.0.

Remove a repo key using `apt-key del`

- **name** Repo from which to remove the key. Unnecessary if keyid is passed.
- **keyid** The KeyID of the GPG key to remove
keyid_ppa [False] If set to True, the repo's GPG key ID will be looked up from ppa.launchpad.net and removed.

**Note**: Setting this option to True requires that the name param also be passed.

CLI Examples:
```
salt '*' pkg.del_repo_key keyid=0123ABCD
salt '*' pkg.del_repo_key name='ppa:foo/bar' keyid_ppa=True
```

**salt.modules.aptpkg.expand_repo_def(**kwargs)**

- **Description**: Take a repository definition and expand it to the full pkg repository dict that can be used for comparison. This is a helper function to make the Debian/Ubuntu apt sources sane for comparison in the pkgrepo states.
- **Usage**: This is designed to be called from pkgrepo states and will have little use being called on the CLI.

**salt.modules.aptpkg.file_dict(**packages)**

- **Description**: List the files that belong to a package, grouped by package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).
- **Usage**: CLI Examples:
```
salt '*' pkg.file_dict httpd
salt '*' pkg.file_dict httpd postfix
salt '*' pkg.file_dict
```

**salt.modules.aptpkg.file_list(**packages)**

- **Description**: List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).
- **Usage**: CLI Examples:
```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

**salt.modules.aptpkg.get_repo(repo,**kwargs)**

- **Description**: Display a repo from the sources.list / sources.list.d
- **Usage**: The repo passed in needs to be a complete repo entry.
- **CLI Examples**: `salt '*' pkg.get_repo "myrepo definition"`

**salt.modules.aptpkg.get_repo_keys()**

- **New in version 2017.7.0**
- **Description**: List known repo key details.
- **Returns**: A dictionary containing the repo keys.
- **Return type**: dict
- **CLI Examples**: `salt '*' pkg.get_repo_keys`

**salt.modules.aptpkg.get_selections(pattern=None, state=None)**

- **Description**: View package state from the dpkg database.
- **Usage**: Returns a dict of dicts containing the state, and package names:
{'<host>':
  {'<state>': ['pkg1',
      ...
  ],
  },
  ...
}

CLI Example:

```plaintext
salt '*' pkg.getSelections
salt '*' pkg.get_selections 'python-*'
salt '*' pkg.get_selections state=hold
salt '*' pkg.get_selections 'openssh*' state=hold
```

salt.modules.aptpkg.**hold**(name=None, pkgs=None, sources=None, **kwargs)

New in version 2014.7.0.

Set package in `hold` state, meaning it will not be upgraded.

**name** The name of the package, e.g., `tmux`

CLI Example:

```plaintext
salt '*' pkg.hold <package name>
```

**pkgs** A list of packages to hold. Must be passed as a python list.

CLI Example:

```plaintext
salt '*' pkg.hold pkgs=['"foo", "bar"]'
```

salt.modules.aptpkg.**info_installed**(names=None, **kwargs)

Return the information of the named package(s) installed on the system.

**names** The names of the packages for which to return information.

**failhard** Whether to throw an exception if none of the packages are installed. Defaults to True.

New in version 2016.11.3.

CLI example:

```plaintext
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
salt '*' pkg.info_installed <package1> failhard=false
```

salt.modules.aptpkg.**install**(name=None, refresh=False, fromrepo=None, skip_verify=False, deb-conf=None, pkgs=None, sources=None, reinstall=False, **kwargs)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any apt-get/dpkg commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Install the passed package, add refresh=True to update the dpkg database.

**name** The name of the package to be installed. Note that this parameter is ignored if either ``pkgs`` or ``sources`` is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the ``sources`` option.
32-bit packages can be installed on 64-bit systems by appending the architecture designation (:i386, etc.) to the end of the package name.

CLI Example:

```
salt '*' pkg.install <package name>
```

**refresh** Whether or not to refresh the package database before installing.

**cache_valid_time**
New in version 2016.11.0.

Skip refreshing the package database if refresh has already occurred within <value> seconds.

**fromrepo** Specify a package repository to install from (e.g., apt-get -t unstable install somepackage)

**skip_verify** Skip the GPG verification check (e.g., --allow-unauthenticated, or --force-bad-verify for install from package file).

**debconf** Provide the path to a debconf answers file, processed before installation.

**version** Install a specific version of the package, e.g. 1.2.3-0ubuntu0. Ignored if ``pkgs'' or ``sources'' is passed.

**reinstall** [False] Specifying reinstall=True will use `apt-get install --reinstall` rather than simply `apt-get install` for requested packages that are already installed.

If a version is specified with the requested package, then apt-get install --reinstall will only be used if the installed version matches the requested version.

New in version 2015.8.0.

**Multiple Package Installation Options:**

**pkgs** A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo", "bar"]'
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3-0ubuntu0"}]'
```

**sources** A list of DEB packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package. Dependencies are automatically resolved and marked as auto-installed.

32-bit packages can be installed on 64-bit systems by appending the architecture designation (:i386, etc.) to the end of the package name.

Changed in version 2014.7.0.

CLI Example:

```
salt '*' pkg.install sources='["foo": "salt://foo.deb"],"bar": "salt://bar.deb"]'
```

**force_yes** Passes --force-yes to the apt-get command. Don't use this unless you know what you're doing.

New in version 0.17.4.

**install_recommends** Whether to install the packages marked as recommended. Default is True.

New in version 2015.5.0.

**only_upgrade** Only upgrade the packages, if they are already installed. Default is False.

New in version 2015.5.0.

**force_conf_new** Always install the new version of any configuration files.

New in version 2015.8.0.
Returns a dict containing the new package names and versions:

```python
{'<package>': {'old': '<old-version>', 'new': '<new-version>'}}
```

salt.modules.aptpkg.latest_version(names, **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

A specific repo can be requested using the fromrepo keyword argument.

cache_valid_time

New in version 2016.11.0.

Skip refreshing the package database if refresh has already occurred within <value> seconds

CLI Example:

```bash
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> fromrepo=unstable
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.aptpkg.list_pkgs(versions_as_list=False, removed=False, purge_desired=False, **kwargs)

List the packages currently installed in a dict:

```python
{'<package_name>': '<version>'
```

removed If True, then only packages which have been removed (but not purged) will be returned.

purge_desired If True, then only packages which have been marked to be purged, but can't be purged due to their status as dependencies for other installed packages, will be returned. Note that these packages will appear in installed

Changed in version 2014.1.1: Packages in this state now correctly show up in the output of this function.

Note: External dependencies

Virtual package resolution requires the dctrl-tools package to be installed. Virtual packages will show a version of 1.

CLI Example:

```bash
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

salt.modules.aptpkg.list_repo_pkgs(*args, **kwargs)

New in version 2017.7.0.

Returns all available packages. Optionally, package names (and name globs) can be passed and the results will be filtered to packages matching those names.

This function can be helpful in discovering the version or repo to specify in a pkg.installed state.

The return data will be a dictionary mapping package names to a list of version numbers, ordered from newest to oldest. For example:

```python
{
    'bash': ['4.3-14ubuntul1.1',
```
CLI Examples:

```
salt '*' pkg.list_repo_pkgs
salt '*' pkg.list_repo_pkgs foo bar baz
```

```
salt.modules.aptpkg.list_repos()
Lists all repos in the sources.list (and sources.lists.d) files

CLI Example:
```
salt '*' pkg.list_repos
salt '*' pkg.list_repos disabled=True
```

```
salt.modules.aptpkg.list_upgrades(refresh=True, dist_upgrade=True, **kwargs)
List all available package upgrades.
refresh Whether to refresh the package database before listing upgrades. Default: True.
cache_valid_time
    New in version 2016.11.0.
    Skip refreshing the package database if refresh has already occurred within <value> seconds
dist_upgrade Whether to list the upgrades using dist-upgrade vs upgrade. Default is to use dist-upgrade.

CLI Example:
```
salt '*' pkg.list_upgrades
```

```
salt.modules.aptpkg.mod_repo(repo, saltenv='base', **kwargs)
Modify one or more values for a repo. If the repo does not exist, it will be created, so long as the definition is well formed. For Ubuntu the ppa:<project>/repo format is acceptable. ppa: format can only be used to create a new repository.

The following options are available to modify a repo definition:

- **architectures** a comma separated list of supported architectures, e.g. amd64 If this option is not set, all architectures (configured in the system) will be used.
- **comps** a comma separated list of components for the repo, e.g. main
- **file** a file name to be used
- **keyserver** keyserver to get gpg key from
- **keyid** key id to load with the keyserver argument
- **key_url** URL to a GPG key to add to the APT GPG keyring
- **key_text** GPG key in string form to add to the APT GPG keyring
- **consolidate** if True, will attempt to de-dup and consolidate sources
- **comments** Sometimes you want to supply additional information, but not as enabled configuration. All comments provided here will be joined into a single string and appended to the repo configuration with a comment marker (#) before it.

    New in version 2015.8.9.
Note: Due to the way keys are stored for APT, there is a known issue where the key won’t be updated unless another change is made at the same time. Keys should be properly added on initial configuration.

CLI Examples:

```bash
salt '*' pkg.mod_repo 'myrepo definition' uri=http://new/uri
salt '*' pkg.mod_repo 'myrepo definition' comps=main,universe
```

`salt.modules.aptpkg.owner(*paths)`

New in version 2014.7.0.

Return the name of the package that owns the file. Multiple file paths can be passed. Like `pkg.version`, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Example:

```bash
salt '*' pkg.owner /usr/bin/apachectl
salt '*' pkg.owner /usr/bin/apachectl /usr/bin/basename
```

`salt.modules.aptpkg.purge(name=None, pkgs=None, **kwargs)`

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any apt-get/dpkg commands spawned by Salt when the salt-minion service is restarted. (See `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a `config option` called `systemd.scope`, with a value of `False` (no quotes).

Remove packages via `apt-get purge` along with all configuration files.

`name` The name of the package to be deleted.

Multiple Package Options:

`pkgs` A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```bash
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

`salt.modules.aptpkg.refresh_db(cache_valid_time=0, failhard=False)`

Updates the APT database to latest packages based upon repositories

Returns a dict, with the keys being package databases and the values being the result of the update attempt.

Values can be one of the following:

- `True`: Database updated successfully
- `False`: Problem updating database
- `None`: Database already up-to-date

`cache_valid_time`

New in version 2016.11.0.
Skip refreshing the package database if refresh has already occurred within <value> seconds
failhard
   If False, return results of Err lines as False for the package database that encountered the error.
   If True, raise an error with a list of the package databases that encountered errors.

CLI Example:
```
salt '*' pkg.refresh_db
```

```
salt.modules.aptpkg.remove(name=None, pkgs=None, **kwargs)
```
Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon’s control group. This is done to keep systemd from killing any apt-get/dpkg commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Remove packages using apt-get remove.

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:
```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

```
salt.modules.aptpkg.set_selections(path=None, selection=None, clear=False, saltenv='base')
```
Change package state in the dpkg database.

The state can be any one of, documented in dpkg(1):

- install
- hold
- deinstall
- purge

This command is commonly used to mark specific packages to be held from being upgraded, that is, to be kept at a certain version. When a state is changed to anything but being held, then it is typically followed by apt-get -u dselect-upgrade.

Note: Be careful with the clear argument, since it will start with setting all packages to deinstall state.

Returns a dict of dicts containing the package names, and the new and old versions:

```
{"<host>":
   {"<package>": {"new": '<new-state>',
                 "old": '<old-state>'}
     },
   ...
}
```

CLI Example:
```
salt '*' pkg.set_selections selection='{"install": ["netcat"]}'
salt '*' pkg.set_selections selection='{"hold": ["openssh-server", "openssh-client"]}''
salt 'salt://path/to/file' pkg.set_selections
salt 'salt://path/to/file' pkg.set_selections clear=True

salt.modules.aptpkg.unhold(name=None, pkgs=None, sources=None, **kwargs)
New in version 2014.7.0.
Set package current in `hold` state to install state, meaning it will be upgraded.
name The name of the package, e.g., `tmux`

CLI Example:
salt '*' pkg.unhold <package name>
pkgs A list of packages to hold. Must be passed as a python list.

CLI Example:
salt '*' pkg.unhold pkgs=['"foo", "bar"]

salt.modules.aptpkg.upgrade(refresh=True, dist_upgrade=False, **kwargs)
Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any apt-get/dpkg commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).
Upgrades all packages via apt-get upgrade or apt-get dist-upgrade if dist_upgrade is True.

Returns a dictionary containing the changes:

```python
{"<package>": {"old": '<old-version>', "new": '<new-version>'}}
```

dist_upgrade Whether to perform the upgrade using dist-upgrade vs upgrade. Default is to use upgrade.

New in version 2014.7.0.
cache_valid_time
New in version 2016.11.0.
Skip refreshing the package database if refresh has already occurred within <value> seconds
force_conf_new Always install the new version of any configuration files.

New in version 2015.8.0.

CLI Example:
salt '*' pkg.upgrade

salt.modules.aptpkg.upgrade_available(name)
Check whether or not an upgrade is available for a given package

CLI Example:
salt '*' pkg.upgrade_available <package name>

salt.modules.aptpkg.version(*names, **kwargs)
Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.
CLI Example:

```bash
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

salt.modules.aptpkg.version_cmp(pkg1, pkg2, ignore_epoch=False)
Do a cmp-style comparison on two packages. Return -1 if pkg1 < pkg2, 0 if pkg1 == pkg2, and 1 if pkg1 > pkg2. Return None if there was a problem making the comparison.

ignore_epoch [False] Set to True to ignore the epoch when comparing versions

New in version 2015.8.10, 2016.3.2.
CLI Example:

```bash
salt '*' pkg.version_cmp '0.2.4-0ubuntu1' '0.2.4.1-0ubuntu1'
```

### 19.9.15 salt.modules.archive

A module to wrap (non-Windows) archive calls

New in version 2014.1.0.

salt.modules.archive.cmd_unzip(zip_file, dest, excludes=None, options=None, template=None, runsas=None, trim_output=False, password=None)

New in version 2015.5.0: In versions 2014.7.x and earlier, this function was known as archive.unzip.

Uses the unzip command to unpack zip files. This command is part of the Info-ZIP suite of tools, and is typically packaged as simply unzip.

**zip_file** Path of zip file to be unpacked

**dest** The destination directory into which the file should be unpacked

**excludes** [None] Comma-separated list of files not to unpack. Can also be passed in a Python list.

**template** [None] Can be set to 'jinja' or another supported template engine to render the command arguments before execution:

```bash
salt '*' archive.cmd_unzip template=jinja /tmp/zipfile.zip '/tmp/{{grains.id}}',!excludes=file_1,file_2
```

**options** Optional when using zip archives, ignored when using other archive files. This is mostly used to overwrite existing files with o. This options are only used when unzip binary is used.

New in version 2016.3.1.

**runas** [None] Unpack the zip file as the specified user. Defaults to the user under which the minion is running.

New in version 2015.5.0.

**trim_output** [False] The number of files we should output on success before the rest are trimmed, if this is set to True then it will default to 100

**password** Password to use with password protected zip files

**Note:** This is not considered secure. It is recommended to instead use archive.unzip for password-protected ZIP files. If a password is used here, then the unzip command run to extract the ZIP file will not show up in the minion log like most shell commands Salt runs do. However, the password will still be present in the events logged to the minion log at the debug log level. If the minion is logging at debug (or more verbose), then be advised that the password will appear in the log.

New in version 2016.11.0.

CLI Example:
salt.modules.archive.cmd_zip(zip_file, sources, template=None, cwd=None, runas=None)

New in version 2015.5.0: In versions 2014.7.x and earlier, this function was known as archive.zip.

Uses the zip command to create zip files. This command is part of the Info-ZIP suite of tools, and is typically packaged as simply zip.

- **zip_file**: Path of zip file to be created
- **sources**: Comma-separated list of sources to include in the zip file. Sources can also be passed in a Python list.

Changed in version 2017.7.0: Globbing is now supported for this argument

- **template**: [None] Can be set to 'jinja' or another supported template engine to render the command arguments before execution:

```
salt '*' archive.cmd_zip template=jinja /tmp/zipfile.zip /tmp/sourcefile1,/tmp/sourcefile2
```

- **cwd**: [None] Use this argument along with relative paths in sources to create zip files which do not contain the leading directories. If not specified, the zip file will be created as if the cwd was /, and creating a zip file of /foo/bar/baz.txt will contain the parent directories foo and bar. To create a zip file containing just baz.txt, the following command would be used:

```
salt '*' archive.cmd_zip /tmp/baz.zip baz.txt cwd=/foo/bar
```

New in version 2014.7.1.

- **runas**: [None] Create the zip file as the specified user. Defaults to the user under which the minion is running.

New in version 2015.5.0.

**CLI Example:**

```
salt '*' archive.cmd_zip /tmp/zipfile.zip /tmp/sourcefile1,/tmp/sourcefile2
```

salt.modules.archive.gunzip(gzipfile, template=None, runas=None, options=None)

Uses the gunzip command to unpack gzip files

- **template**: [None] Can be set to 'jinja' or another supported template engine to render the command arguments before execution:

```
salt '*' archive.gunzip template=jinja /tmp/{{grains.id}}.txt.gz
```

- **runas**: [None] The user with which to run the gzip command line

- **options**: [None] Pass any additional arguments to gzip

New in version 2016.3.4.

**CLI Example:**

```
# Create /tmp/sourcefile.txt
salt '*' archive.gunzip /tmp/sourcefile.txt.gz
salt '*' archive.gunzip /tmp/sourcefile.txt options='--verbose'
```

salt.modules.archive.gzip(sourcefile, template=None, runas=None, options=None)

Uses the gzip command to create gzip files

- **template**: [None] Can be set to 'jinja' or another supported template engine to render the command arguments before execution:
Salt Documentation, Release 2017.7.8

```
salt '...' archive.gzip template=jinja /tmp/[(grains.id)].txt
```

**runas** [None] The user with which to run the gzip command line

**options** [None] Pass any additional arguments to gzip

New in version 2016.3.4.

CLI Example:

```
# Create /tmp/sourcefile.txt.gz
salt '...' archive.gzip /tmp/sourcefile.txt
salt '...' archive.gzip /tmp/sourcefile.txt options='-9 --verbose'
```

salt.modules.archive.is_encrypted(name, clean=False, saltenv='base')

New in version 2016.11.0.

Returns True if the zip archive is password-protected, False if not. If the specified file is not a ZIP archive, an error will be raised.

**name** The path / URL of the archive to check.

**clean** [False] Set this value to True to delete the path referred to by name once the contents have been listed. This option should be used with care.

**Note:** If there is an error listing the archive's contents, the cached file will not be removed, to allow for troubleshooting.

CLI Examples:

```
salt '...' archive.is_encrypted /path/to/myfile.zip
salt '...' archive.is_encrypted salt://foo.zip
salt '...' archive.is_encrypted salt://foo.zip saltenv=dev
salt '...' archive.is_encrypted https://domain.tld/myfile.zip clean=True
salt '...' archive.is_encrypted ftp://10.1.2.3/foo.zip
```

salt.modules.archive.list_(name, archive_format=None, options=None, strip_components=None, clean=False, verbose=False, saltenv='base')

New in version 2016.11.0.

Changed in version 2016.11.2: The rarfile Python module is now supported for listing the contents of rar archives. This is necessary on minions with older releases of the rar CLI tool, which do not support listing the contents in a parsable format.

List the files and directories in an tar, zip, or rar archive.

**Note:** This function will only provide results for XZ-compressed archives if the xz CLI command is available, as Python does not at this time natively support XZ compression in its tarfile module. Keep in mind however that most Linux distros ship with xz already installed.

To check if a given minion has xz, the following Salt command can be run:

```
salt minion_id cmd.which xz
```

If None is returned, then xz is not present and must be installed. It is widely available and should be packaged as either xz or xz-utils.

**name** Path/URL of archive

**archive_format** Specify the format of the archive (tar, zip, or rar). If this argument is omitted, the archive format will be guessed based on the value of the name parameter.
options **For tar archives only.** This function will, by default, try to use the *tarfile* module from the Python standard library to get a list of files/directories. If this method fails, then it will fall back to using the shell to decompress the archive to stdout and pipe the results to `tar -tf` to produce a list of filenames. XZ-compressed archives are already supported automatically, but in the event that the tar archive uses a different sort of compression not supported natively by *tarfile*, this option can be used to specify a command that will decompress the archive to stdout. For example:

```
salt minion_id archive.list /path/to/foo.tar.gz options='gzip --decompress -- --stdout'
```

**Note:** It is not necessary to manually specify options for gzip'ed archives, as gzip compression is natively supported by *tarfile*.

**strip_components** This argument specifies a number of top-level directories to strip from the results. This is similar to the paths that would be extracted if `--strip-components` (or `--strip`) were used when extracting tar archives.

New in version 2016.11.2.

**clean** [**False**] Set this value to **True** to delete the path referred to by `name` once the contents have been listed. This option should be used with care.

**Note:** If there is an error listing the archive's contents, the cached file will not be removed, to allow for troubleshooting.

**verbose** [**False**] If **False**, this function will return a list of files/dirs in the archive. If **True**, it will return a dictionary categorizing the paths into separate keys containing the directory names, file names, and also directories/files present in the top level of the archive.

Changed in version 2016.11.2: This option now includes symlinks in their own list. Before, they were included with files.

**saltenv** [**base**] Specifies the fileserver environment from which to retrieve `archive`. This is only applicable when `archive` is a file from the `salt://` fileserver.

CLI Examples:

```
salt '*' archive.list /path/to/myfile.tar.gz
salt '*' archive.list /path/to/myfile.tar.gz strip_components=1
salt '*' archive.list salt://foo.tar.gz
salt '*' archive.list https://domain.tld/myfile.zip
salt '*' archive.list ftp://10.1.2.3/foo.rar
```

**salt.modules.archive.rar** *(rarfile, sources, template=None, cwd=None, runas=None)*

Uses `rar` for Linux to create rar files

**rarfile** Path of rar file to be created

**sources** Comma-separated list of sources to include in the rar file. Sources can also be passed in a Python list.

Changed in version 2017.7.0: Globbing is now supported for this argument

**cwd** [**None**] Run the rar command from the specified directory. Use this argument along with relative file paths to create rar files which do not contain the leading directories. If not specified, this will default to the home directory of the user under which the salt minion process is running.

New in version 2014.7.1.

**template** [**None**] Can be set to ‘jinja’ or another supported template engine to render the command arguments before execution:
salt '*/' archive:rar template=jinja /tmp/rarfile.rar '/tmp/sourcefile1,/tmp/\{\{grains.id\}\}.txt'

CLI Example:
salt '*/' archive:rar /tmp/rarfile.rar /tmp/sourcefile1,/tmp/sourcefile2
# Globbing for sources (2017.7.0 and later)
salt '*/' archive:rar /tmp/rarfile.rar '/tmp/sourcefile*/'

salt.modules.archive.tar(options, tarfile, sources=None, dest=None, cwd=None, template=None, runas=None)

**Note:** This function has changed for version 0.17.0. In prior versions, the `cwd` and `template` arguments must be specified, with the source directories/files coming as a space-separated list at the end of the command. Beginning with 0.17.0, `sources` must be a comma-separated list, and the `cwd` and `template` arguments are optional.

Uses the tar command to pack, unpack, etc. tar files

**options** Options to pass to the tar command

- Changed in version 2015.8.0: The mandatory `-` prefixing has been removed. An options string beginning with a --long-option, would have uncharacteristically needed its first - removed under the former scheme.

- Also, tar will parse its options differently if short options are used with or without a preceding -, so it is better to not confuse the user into thinking they're using the non-- format, when really they are using the with-- format.

**tarfile** The filename of the tar archive to pack/unpack

**sources** Comma delimited list of files to pack into the tarfile. Can also be passed as a Python list.

- Changed in version 2017.7.0: Globbing is now supported for this argument

**dest** The destination directory into which to unpack the tarfile

**cwd** [None] The directory in which the tar command should be executed. If not specified, will default to the home directory of the user under which the salt minion process is running.

**template** [None] Can be set to `jinja` or another supported template engine to render the command arguments before execution:

salt '*/' archive.tar cjvf /tmp/salt.tar.bz2 {{grains.saltpath}} template=jinja

CLI Examples:

```bash
# Create a tarfile
salt '*/' archive:tar cjvf /tmp/tarfile.tar.bz2 /tmp/file_1,/tmp/file_2
# Create a tarfile using globbing (2017.7.0 and later)
salt '*/' archive.tar cjvf /tmp/tarfile.tar.bz2 '/tmp/file_*'
# Unpack a tarfile
salt '*/' archive.tar xf foo.tar dest=/target/directory
```

salt.modules.archive.unrar(rarfile, dest, excludes=None, template=None, runas=None, trim_output=False)

Uses `rar` for Linux to unpack rar files

**rarfile** Name of rar file to be unpacked

**dest** The destination directory into which to unpack the rar file

**template** [None] Can be set to `jinja` or another supported template engine to render the command arguments before execution:
```python
salt '*' archive.unrar template=jinja /tmp/rarfile.rar /tmp/{{grains.id}}/{{}
~excludes=file_1,file_2
```

**trim_output**  [False] The number of files we should output on success before the rest are trimmed, if this is set to True then it will default to 100

CLI Example:

```bash
salt '*' archive.unrar /tmp/rarfile.rar /home/strongbad/ excludes=file_1,file_2
```

salt.modules.archive.unzip(zip_file, dest, excludes=None, options=None, template=None,
                         runas=None, trim_output=False, password=None, extract_perms=True)

Uses the zipfile Python module to unpack zip files

Changed in version 2015.5.0: This function was rewritten to use Python’s native zip file support. The old functionality has been preserved in the new function `archive.cmd_unzip`. For versions 2014.7.x and earlier, see the `archive.cmd_zip` documentation.

**zip_file** Path of zip file to be unpacked

**dest** The destination directory into which the file should be unpacked

**excludes**  [None] Comma-separated list of files not to unpack. Can also be passed in a Python list.

**options** This options are only used when `unzip` binary is used. In this function is ignored.

New in version 2016.3.1.

**template**  [None] Can be set to ‘jinja’ or another supported template engine to render the command arguments before execution:

```bash
salt '*' archive.unzip template=jinja /tmp/zipfile.zip /tmp/{{grains.id}}/{{}
~excludes=file_1,file_2
```

**runas**  [None] Unpack the zip file as the specified user. Defaults to the user under which the minion is running.

**trim_output**  [False] The number of files we should output on success before the rest are trimmed, if this is set to True then it will default to 100

CLI Example:

```bash
salt '*' archive.unzip /tmp/zipfile.zip /home/strongbad/ excludes=file_1,file_2
```

**password** Password to use with password protected zip files

**Note:** The password will be present in the events logged to the minion log file at the debug log level. If the minion is logging at debug (or more verbose), then be advised that the password will appear in the log.

New in version 2016.3.0.

**extract_perms**  [True] The Python zipfile module does not extract file/directory attributes by default. When this argument is set to True, Salt will attempt to apply the file permission attributes to the extracted files/folders.

On Windows, only the read-only flag will be extracted as set within the zip file, other attributes (i.e. user/group permissions) are ignored.

Set this argument to False to disable this behavior.

New in version 2016.11.0.

CLI Example:

```bash
salt '*' archive.unzip /tmp/zipfile.zip /home/strongbad/ password='BadPassword'
```
salt.modules.archive.zip_(zip_file, sources, template=None, cwd=None, runas=None)

Uses the zipfile Python module to create zip files

Changed in version 2015.5.0: This function was rewritten to use Python's native zip file support. The old functionality has been preserved in the new function archive.cmd_zip. For versions 2014.7.x and earlier, see the archive.cmd_zip documentation.

zip_file Path of zip file to be created

sources Comma-separated list of sources to include in the zip file. Sources can also be passed in a Python list.

Changed in version 2017.7.0: Globbing is now supported for this argument

template [None] Can be set to 'jinja' or another supported template engine to render the command arguments before execution:

```
salt '*' archive.zip template=jinja /tmp/zipfile.zip /tmp/sourcefile1,/tmp/{~{grains.id}}.txt
```

cwd [None] Use this argument along with relative paths in sources to create zip files which do not contain the leading directories. If not specified, the zip file will be created as if the cwd was /, and creating a zip file of /foo/bar/baz.txt will contain the parent directories foo and bar. To create a zip file containing just baz.txt, the following command would be used:

```
salt '*' archive.zip /tmp/baz.zip baz.txt cwd=/foo/bar
```

runas [None] Create the zip file as the specified user. Defaults to the user under which the minion is running.

CLI Example:

```
salt '*' archive.zip /tmp/zipfile.zip /tmp/sourcefile1,/tmp/sourcefile2
salt '*' archive.zip /tmp/zipfile.zip '/tmp/sourcefile*'
```

19.9.16 salt.modules.artifactory

Module for fetching artifacts from Artifactory

exception salt.modules.artifactory.ArtifactError(value)

salt.modules.artifactory.get_latest_release(artifactory_url, repository, group_id, artifact_id, packaging, target_dir='/tmp', target_file=None, classifier=None, username=None, password=None)

Gets the latest release of the artifact

artifactory_url URL of artifactory instance

repository Release repository in artifactory to retrieve artifact from, for example: libs-releases

group_id Group Id of the artifact

artifact_id Artifact Id of the artifact

packaging Packaging type (jar,war,ear,etc)

target_dir Target directory to download artifact to (default: /tmp)

target_file Target file to download artifact to (by default it is target_dir/artifact_id-version.packaging)

classifier Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.

username Artifactory username. Optional parameter.

password Artifactory password. Optional parameter.

salt.modules.artifactory.get_latest_snapshot(artifactory_url, repository, group_id, artifact_id, packaging, target_dir='/tmp', target_file=None, classifier=None, username=None, password=None)

Gets latest snapshot of the given artifact
artifactory_url URL of artifactory instance
repository Snapshot repository in artifactory to retrieve artifact from, for example: libs-snapshots
group_id Group Id of the artifact
artifact_id Artifact Id of the artifact
packaging Packaging type (jar, war, ear, etc)
target_dir Target directory to download artifact to (default: /tmp)
target_file Target file to download artifact to (by default it is target_dir/artifact_id-
   snapshot_version.packaging)
classifier Artifact classifier name (ex: sources, javadoc, etc). Optional parameter.
username Artifactory username. Optional parameter.
password Artifactory password. Optional parameter.

salt.modules.artifactory.get_release(artifactory_url, repository, group_id, artifact_id, packaging, version, target_dir='/tmp', target_file=None, classifier=None, username=None, password=None)

Gets the specified release of the artifact
artifactory_url URL of artifactory instance
repository Release repository in artifactory to retrieve artifact from, for example: libs-releases
group_id Group Id of the artifact
artifact_id Artifact Id of the artifact
packaging Packaging type (jar, war, ear, etc)
version Version of the artifact
target_dir Target directory to download artifact to (default: /tmp)
target_file Target file to download artifact to (by default it is target_dir/artifact_id-version.packaging)
classifier Artifact classifier name (ex: sources, javadoc, etc). Optional parameter.
username Artifactory username. Optional parameter.
password Artifactory password. Optional parameter.

salt.modules.artifactory.get_snapshot(artifactory_url, repository, group_id, artifact_id, packaging, version, snapshot_version=None, target_dir='/tmp', target_file=None, classifier=None, username=None, password=None)

Gets snapshot of the desired version of the artifact
artifactory_url URL of artifactory instance
repository Snapshot repository in artifactory to retrieve artifact from, for example: libs-snapshots
group_id Group Id of the artifact
artifact_id Artifact Id of the artifact
packaging Packaging type (jar, war, ear, etc)
version Version of the artifact
target_dir Target directory to download artifact to (default: /tmp)
target_file Target file to download artifact to (by default it is target_dir/artifact_id-
   snapshot_version.packaging)
classifier Artifact classifier name (ex: sources, javadoc, etc). Optional parameter.
username Artifactory username. Optional parameter.
password Artifactory password. Optional parameter.

19.9.17 salt.modules.at

Wrapper module for at(1)
Also, a `tag' feature has been added to more easily tag jobs.

   platform linux, openbsd, freebsd

Changed in version 2017.7.0.
salt.modules.at.at(*args, **kwargs)
    Add a job to the queue.
    The `timespec' follows the format documented in the at(1) manpage.
    CLI Example:
    
```
    salt '*' at.at <timespec> <cmd> [tag=<tag>] [runas=<user>]
salt '*' at.at 12:05am '/sbin/reboot' tag=reboot
    ```

salt.modules.at.atc(jobid)
    Print the at(1) script that will run for the passed job id. This is mostly for debugging so the output will just
    be text.
    CLI Example:
    
```
    salt '*' at.atc <jobid>
    ```

salt.modules.at.atq(tag=None)
    List all queued and running jobs or only those with an optional `tag'.
    CLI Example:
    
```
    salt '*' at.atq
    salt '*' at.atq [tag]
salt '*' at.atq [job number]
    ```

salt.modules.at.atrm(*args)
    Remove jobs from the queue.
    CLI Example:
    
```
    salt '*' at.atrm <jobid> <jobid> .. <jobid>
salt '*' at.atrm all
    ```

salt.modules.at.jobcheck(**kwargs)
    Check the job from queue. The kwargs dict include `hour minute day month year tag runas' Other parameters
    will be ignored.
    CLI Example:
    
```
    salt '*' at.jobcheck runas=jam day=13
    ```

19.9.18 salt.modules.at_solaris
    Wrapper for at(1) on Solaris-like systems

    **Note:** we try to mirror the generic at module where possible

    maintainer  jorge schrauwen <sjorge@blackdot.be>
    maturity    new
    platform    solaris,illumos,smartso
New in version 2017.7.0.

```
salt.modules.at_solaris.at(*args, **kwargs)
    Add a job to the queue.
    The `timespec' follows the format documented in the at(1) manpage.
    CLI Example:
    salt '*' at.at <timespec> <cmd> [tag=<tag>] [runas=<user>]
salt '*' at.at 12:05am '/sbin/reboot' tag=reboot
salt '*' at.at '3:05am +3 days' 'bin/myscript' tag=nightly runas=jim
```

```
salt.modules.at_solaris.atc(jobid)
    Print the at(1) script that will run for the passed job id. This is mostly for debugging so the output will just
    be text.
    CLI Example:
    salt '*' at.atc <jobid>
```

```
salt.modules.at_solaris.atq(tag=None)
    List all queued and running jobs or only those with an optional `tag'.
    CLI Example:
    salt '*' at.atq
    salt '*' at.atq [tag]
    salt '*' at.atq [job number]
```

```
salt.modules.at_solaris.atrm(*args)
    Remove jobs from the queue.
    CLI Example:
    salt '*' at.atrm <jobid> <jobid> .. <jobid>
salt '*' at.atrm all
    salt '*' at.atrm all [tag]
```

```
salt.modules.at_solaris.jobcheck(**kwargs)
    Check the job from queue. The kwargs dict include `hour minute day month year tag runas' Other parameters
    will be ignored.
    CLI Example:
    salt '*' at.jobcheck runas=jam day=13
c  19.9.19 salt.modules.augeas_cfg

Manages configuration files via augeas

This module requires the augeas Python module.

**Warning:** Minimal installations of Debian and Ubuntu have been seen to have packaging bugs with python-
augeas, causing the augeas module to fail to import. If the minion has the augeas module installed, but the
functions in this execution module fail to run due to being unavailable, first restart the salt-minion service. If
the problem persists past that, the following command can be run from the master to determine what is causing the import to fail:

```
salt minion-id cmd.run 'python -c "from augeas import Augeas"'
```

For affected Debian/Ubuntu hosts, installing `libpython2.7` has been known to resolve the issue.

---

**salt.modules.augeas_cfg.execute**

`execute` lets you execute Augeas commands.

- New in version 2014.7.0.

**CLI Example:**

```
salt '*' augeas.execute /files/etc/redis/redis.conf \commands=["set bind 0.0.0.0", "set maxmemory 1G"]'
```

- `context`: The Augeas context
- `lens`: The Augeas lens to use
- `commands`: The Augeas commands to execute

---

**salt.modules.augeas_cfg.get**

`get` lets you get a value for a specific Augeas path.

- New in version 2016.3.0.

**CLI Example:**

```
salt '*' augeas.get /files/etc/hosts/1/ ipaddr
```

- `path`: The path to get the value of
- `value`: The optional value to get

---

**salt.modules.augeas_cfg.ls**

`ls` lets you list the direct children of a node.

- New in version 2016.3.0.

**CLI Example:**

```
salt '*' augeas.ls /files/etc/passwd
```

- `path`: The path to list

---

**salt.modules.augeas_cfg.match**

`match` lets you get matches for a path expression.

- New in version 2016.3.0.

**CLI Example:**

```
salt '*' augeas.match /files/etc/services/service-name ssh
```

- `path`: The path to match
value  The value to match on

New in version 2016.3.0.
load_path  A colon-seperated list of directories that modules should be searched in. This is in addition to the standard load path and the directories in AUGEAS_LENS_LIB.

salt.modules.augeas_cfg.remove(path, load_path=None)
Get matches for path expression

CLI Example:

```
salt '*' augeas.remove \
/files/etc/sysctl.conf/net.ipv4.conf.all.log_martians
```

path  The path to remove

New in version 2016.3.0.
load_path  A colon-seperated list of directories that modules should be searched in. This is in addition to the standard load path and the directories in AUGEAS_LENS_LIB.

salt.modules.augeas_cfg.setvalue('args)
Set a value for a specific augeas path

CLI Example:

```
salt '*' augeas.setvalue /files/etc/hosts/1/canonical localhost
```

This will set the first entry in /etc/hosts to localhost

CLI Example:

```
salt '*' augeas.setvalue /files/etc/hosts/01/ipaddr 192.168.1.1 \
/files/etc/hosts/01/canonical test
```

Adds a new host to /etc/hosts the ip address 192.168.1.1 and hostname test

CLI Example:

```
salt '*' augeas.setvalue prefix=/files/etc/sudoers/ \ 
  "spec[user = '%wheel']/user" "%wheel" \ 
  "spec[user = '%wheel']/host_group/host" 'ALL' \ 
  "spec[user = '%wheel']/host_group/command[1]" 'ALL' \ 
  "spec[user = '%wheel']/host_group/command[1]/tag" 'PASSWD' \ 
  "spec[user = '%wheel']/host_group/command[2]" '/usr/bin/apt-get' \ 
  "spec[user = '%wheel']/host_group/command[2]/tag" NOPASSWD
```

Ensures that the following line is present in /etc/sudoers:

```
%wheel ALL = PASSWD : ALL , NOPASSWD : /usr/bin/apt-get , /usr/bin/aptitude
```

salt.modules.augeas_cfg.tree(path, load_path=None)
Returns recursively the complete tree of a node

CLI Example:

```
salt '*' augeas.tree /files/etc/
```

path  The base of the recursive listing

New in version 2016.3.0.
**load_path** A colon-separated list of directories that modules should be searched in. This is in addition to the standard load path and the directories in `AUGEAS_LENS_LIB`.

### 19.9.20 `salt.modules.aws_sqs`

Support for the Amazon Simple Queue Service.

**`salt.modules.aws_sqs.create_queue`** *(name, region, opts=None, user=None)*  
Creates a queue with the correct name.  
- **name** Name of the SQS queue to create  
- **region** Region to create the SQS queue in  
- **opts** [None] Any additional options to add to the command line  
- **user** [None] Run hg as a user other than what the minion runs as  

**CLI Example:**  
```bash  
salt '*' aws_sqs.create_queue <sqs queue> <region>  
```

**`salt.modules.aws_sqs.delete_message`** *(queue, region, receipthandle, opts=None, user=None)*  
Delete one or more messages from a queue in a region  
- **queue** The name of the queue to delete messages from  
- **region** Region where SQS queues exists  
- **receipthandle** The ReceiptHandle of the message to delete. The ReceiptHandle is obtained in the return from `receive_message`  
- **opts** [None] Any additional options to add to the command line  
- **user** [None] Run as a user other than what the minion runs as  

**CLI Example:**  
```bash  
salt '*' aws_sqs.delete_message <sqs queue> <region> receipthandle='<sqs queue>!ReceipHandle>'  
```

New in version 2014.7.0.

**`salt.modules.aws_sqs.delete_queue`** *(name, region, opts=None, user=None)*  
Deletes a queue in the region.  
- **name** Name of the SQS queue to deletes  
- **region** Name of the region to delete the queue from  
- **opts** [None] Any additional options to add to the command line  
- **user** [None] Run hg as a user other than what the minion runs as  

**CLI Example:**  
```bash  
salt '*' aws_sqs.delete_queue <sqs queue> <region>  
```

**`salt.modules.aws_sqs.list_queues`** *(region, opts=None, user=None)*  
List the queues in the selected region.  
- **region** Region to list SQS queues for  
- **opts** [None] Any additional options to add to the command line  
- **user** [None] Run hg as a user other than what the minion runs as  

**CLI Example:**  
```bash  
salt '*' aws_sqs.list_queues <region>  
```

**`salt.modules.aws_sqs.queue_exists`** *(name, region, opts=None, user=None)*  
Returns True or False on whether the queue exists in the region.  
- **name** Name of the SQS queue to search for  
- **region** Name of the region to search for the queue in  
- **opts** [None] Any additional options to add to the command line  
- **user** [None] Run hg as a user other than what the minion runs as  

**CLI Example:**  
```bash  
salt '*' aws_sqs.queue_exists <sqs queue> <region>  
```
**salt.modules.aws_sqs.receive_message**(*queue*, *region*, *num=1*, *opts=None*, *user=None*)

Receive one or more messages from a queue in a region

**queue** The name of the queue to receive messages from

**region** Region where SQS queues exists

**num** [1] The max number of messages to receive

**opts** [None] Any additional options to add to the command line

**user** [None] Run as a user other than what the minion runs as

CLI Example:

```
salt '*' aws_sqs.receive_message <sqs queue> <region>
salt '*' aws_sqs.receive_message <sqs queue> <region> num=10
```

New in version 2014.7.0.

### 19.9.21 salt.modules.bamboohr

Support for BambooHR

New in version 2015.8.0.

Requires a subdomain and an apikey in /etc/salt/minion:

**salt.modules.bamboohr.list_employees**(*order_by='id'*)

Show all employees for this company.

CLI Example:

```
salt myminion bamboohr.list_employees
```

By default, the return data will be keyed by ID. However, it can be ordered by any other field. Keep in mind that if the field that is chosen contains duplicate values (i.e., location is used, for a company which only has one location), then each duplicate value will be overwritten by the previous. Therefore, it is advisable to only sort by fields that are guaranteed to be unique.

CLI Examples:

```
salt myminion bamboohr.list_employees order_by=id salt myminion bamboohr.list_employees order_by=displayName salt myminion bamboohr.list_employees order_by=workEmail
```

**salt.modules.bamboohr.list_meta_fields**()

Show all meta data fields for this company.

CLI Example:

```
salt myminion bamboohr.list_meta_fields
```

**salt.modules.bamboohr.list_users**(*order_by='id'*)

Show all users for this company.

CLI Example:

```
salt myminion bamboohr.list_users
```

By default, the return data will be keyed by ID. However, it can be ordered by any other field. Keep in mind that if the field that is chosen contains duplicate values (i.e., location is used, for a company which only has one location), then each duplicate value will be overwritten by the previous. Therefore, it is advisable to only sort by fields that are guaranteed to be unique.

CLI Examples:

```
salt myminion bamboohr.list_users order_by=id salt myminion bamboohr.list_users order_by=email
```

**salt.modules.bamboohr.show_employee**(*emp_id*, *fields=None*)

Show all employees for this company.
CLI Example:
  salt myminion bamboohr.show_employee 1138
By default, the fields normally returned from bamboohr.list_employees are returned. These fields are:
  • canUploadPhoto
  • department
  • displayName
  • firstName
  • id
  • jobTitle
  • lastName
  • location
  • mobilePhone
  • nickname
  • photoUploaded
  • photoUrl
  • workEmail
  • workPhone
  • workPhoneExtension

If needed, a different set of fields may be specified, separated by commas:

CLI Example:
  salt myminion bamboohr.show_employee 1138 displayName,dateOfBirth
A list of available fields can be found at http://www.bamboohr.com/api/documentation/employees.php

salt.modules.bamboohr.update_employee(emp_id, key=None, value=None, items=None)
Update one or more items for this employee. Specifying an empty value will clear it for that employee.

CLI Examples:
  salt myminion bamboohr.update_employee 1138 nickname Curly
  salt myminion bamboohr.update_employee 1138 nickname ''
  salt myminion bamboohr.update_employee 1138 items="{"nickname": "Curly"}"
  salt myminion bamboohr.update_employee 1138 items="{"nickname": ""}"

**19.9.22 salt.modules.bcache module**

Module for managing BCache sets

BCache is a block-level caching mechanism similar to ZFS L2ARC/ZIL, dm-cache and fscache. It works by formatting one block device as a cache set, then adding backend devices (which need to be formatted as such) to the set and activating them.

It's available in Linux mainline kernel since 3.10

https://www.kernel.org/doc/Documentation/bcache.txt

This module needs the bcache userspace tools to function.

salt.modules.bcache.attach_(dev=None)
Attach a backing devices to a cache set If no dev is given, all backing devices will be attached.

CLI example:

```
salt '*' bcache.attach sdc
salt '*' bcache.attach /dev/bcache1
```

**Returns** bool or None if nuttin' happened
salt.modules.bcache.back_make(dev, cache_mode='writeback', force=False, attach=True, bucket_size=None)

Create a backing device for attachment to a set. Because the block size must be the same, a cache set already needs to exist.

CLI example:
```
salt '*' bcache.back_make sdc cache_mode=writeback attach=True
```

Parameters

- **cache_mode** -- writethrough, writeback, writearound or none.
- **force** -- Overwrite existing bcaches
- **attach** -- Immediately attach the backing device to the set
- **bucket_size** -- Size of a bucket (see kernel doc)

salt.modules.bcache.cache_make(dev, reserved=None, force=False, block_size=None, bucket_size=None, attach=True)

Create BCache cache on a block device. If blkdiscard is available the entire device will be properly cleared in advance.

CLI example:
```
salt '*' bcache.cache_make sdb reserved=10% block_size=4096
```

Parameters

- **reserved** -- if dev is a full device, create a partition table with this size empty.

  Note: this increases the amount of reserved space available to SSD garbage collectors, potentially (vastly) increasing performance

- **block_size** -- Block size of the cache; defaults to devices' logical block size
- **force** -- Overwrite existing BCache sets
- **attach** -- Attach all existing backend devices immediately

salt.modules.bcache.config_(dev=None, **kwargs)

Show or update config of a bcache device.

If no device is given, operate on the cache set itself.

CLI example:
```
salt '*' bcache.config
salt '*' bcache.config bcach1
salt '*' bcache.config errors=panic journal_delay_ms=150
salt '*' bcache.config bcach1 cache_mode=writeback writeback_percent=15
```

Returns config or True/False

salt.modules.bcache.detach(dev=None)

Detach a backing device(s) from a cache set. If no dev is given, all backing devices will be attached.

Detaching a backing device will flush its write cache. This should leave the underlying device in a consistent state, but might take a while.

CLI example:
salt '∗' bcache.detach sdc
salt '∗' bcache.detach bcache1

cache.device (dev, stats=False, config=False, internals=False, superblock=False)
Check the state of a single bcache device

CLI example:
salt '∗' bcache.device bcache0
salt '∗' bcache.device /dev/sdc stats=True

Parameters

• **stats** -- include statistics
• **settings** -- include all settings
• **internals** -- include all internals
• **superblock** -- include superblock info

salt.modules.bcache.start()
Trigger a start of the full bcache system through udev.

CLI example:
salt '∗' bcache.start

salt.modules.bcache.status (stats=False, config=False, internals=False, superblock=False, alldevs=False)
Show the full status of the BCache system and optionally all it’s involved devices

CLI example:
salt '∗' bcache.status
salt '∗' bcache.status stats=True
salt '∗' bcache.status internals=True alldevs=True

Parameters

• **stats** -- include statistics
• **config** -- include settings
• **internals** -- include internals
• **superblock** -- include superblock

salt.modules.bcache.stop (dev=None)
Stop a bcache device If no device is given, all backing devices will be detached from the cache, which will subsequently be stopped.

**Warning:**  `Stop` on an individual backing device means hard-stop; no attempt at flushing will be done and the bcache device will seemingly `disappear` from the device lists

CLI example:
salt '∗' bcache.stop
salt.modules.bcache.<strong>super_(dev)</strong>
Read out BCache SuperBlock

CLI example:
```
salt '*' bcache.device bcache0
salt '*' bcache.device /dev/sdc
```

salt.modules.bcache.<strong>uuid(dev=None)</strong>
Return the bcache UUID of a block device. If no device is given, the Cache UUID is returned.

CLI example:
```
salt '*' bcache.uuid
salt '*' bcache.uuid /dev/sda
salt '*' bcache.uuid bcache0
```

### 19.9.23 salt.modules.beacons

Module for managing the Salt beacons on a minion

New in version 2015.8.0.

salt.modules.beacons.<strong>add(name, beacon_data, **kwargs)</strong>
Add a beacon on the minion

**Parameters**
- **name** -- Name of the beacon to configure
- **beacon_data** -- Dictionary or list containing configuration for beacon.

**Returns** Boolean and status message on success or failure of add.

CLI Example:
```
salt '*' beacons.add ps "{'salt-master': 'stopped', 'apache2': 'stopped'}"
```

salt.modules.beacons.<strong>delete(name, **kwargs)</strong>
Delete a beacon item

**Parameters** **name** -- Name of the beacon to delete

**Returns** Boolean and status message on success or failure of delete.

CLI Example:
```
salt '*' beacons.delete ps
salt '*' beacons.delete load
```

salt.modules.beacons.<strong>disable(**kwargs)</strong>
Disable all beaconsd jobs on the minion

**Returns** Boolean and status message on success or failure of disable.

CLI Example:
```
salt '*' beacons.disable
```

salt.modules.beacons.<strong>disable_beacon(name, **kwargs)</strong>
Disable beacon on the minion

**Name** Name of the beacon to disable.

**Returns** Boolean and status message on success or failure of disable.
CLI Example:
```
salt '*' beacons.disable_beacon ps
```

```python
salt.modules.beacons.enable(**kwargs)
    Enable all beacons on the minion
    Returns Boolean and status message on success or failure of enable.
```

CLI Example:
```
salt '*' beacons.disable
```

```python
salt.modules.beacons.enable_beacon(name, **kwargs)
    Enable beacon on the minion
    Name Name of the beacon to enable.
    Returns Boolean and status message on success or failure of enable.
```

CLI Example:
```
salt '*' beacons.enable_beacon ps
```

```python
salt.modules.beacons.list_(return_yaml=True, include_pillar=True, include_opts=True)
    List the beacons currently configured on the minion
    Parameters
    • return_yaml -- Whether to return YAML formatted output, default True
    • include_pillar -- Whether to include beacons that are configured in pillar, default is True.
    • include_opts -- Whether to include beacons that are configured in opts, default is True.
    Returns List of currently configured Beacons.
```

CLI Example:
```
salt '*' beacons.list
```

```python
salt.modules.beacons.list_available(return_yaml=True)
    List the beacons currently available on the minion
    Parameters return_yaml -- Whether to return YAML formatted output, default True
    Returns List of currently configured Beacons.
```

CLI Example:
```
salt '*' beacons.list_available
```

```python
salt.modules.beacons.modify(name, beacon_data, **kwargs)
    Modify an existing beacon
    Parameters
    • name -- Name of the beacon to configure
    • beacon_data -- Dictionary or list containing updated configuration for beacon.
    Returns Boolean and status message on success or failure of modify.
```

CLI Example:
```
salt '*' beacons.modify ps "{'salt-master': 'stopped', 'apache2': 'stopped'}"
```

19.9. execution modules
salt.modules.beacons.save()
    Save all beacons on the minion
    Returns Boolean and status message on success or failure of save.
    CLI Example:
    
    salt '*' beacons.save

19.9.24 salt.modules.bigip

An execution module which can manipulate an f5 bigip via iControl REST

    maturity develop
    platform f5_bigip_11.6

salt.modules.bigip.add_pool_member(hostname, username, password, name, member)
    A function to connect to a bigip device and add a new member to an existing pool.
    hostname The host/address of the bigip device
    username The iControl REST username
    password The iControl REST password
    name The name of the pool to modify
    member The name of the member to add i.e. 10.1.1.2:80
    CLI Example:
    
    salt '*' bigip.add_pool_members bigip admin admin my-pool 10.2.2.1:80

salt.modules.bigip.commit_transaction(hostname, username, password, label)
    A function to connect to a bigip device and commit an existing transaction.
    hostname The host/address of the bigip device
    username The iControl REST username
    password The iControl REST password
    label the label of this transaction stored within the grain: bigip_f5_trans:<label>
    CLI Example:
    
    salt '*' bigip.commit_transaction bigip admin admin my_transaction

salt.modules.bigip.create_monitor(hostname, username, password, monitor_type, name, **kwargs)
    A function to connect to a bigip device and create a monitor.
    hostname The host/address of the bigip device
    username The iControl REST username
    password The iControl REST password
    monitor_type The type of monitor to create
    name The name of the monitor to create
    kwargs Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names
    are used.
    CLI Example:
    
    salt '*' bigip.create_monitor bigip admin admin http my-http-monitor timeout=10 interval=5

salt.modules.bigip.create_node(hostname, username, password, name, address, trans_label=None)
    A function to connect to a bigip device and create a node.
    hostname The host/address of the bigip device
    username The iControl REST username
**password**  The iControl REST password

**name**  The name of the node

**address**  The address of the node

**trans_label**  The label of the transaction stored within the grain: bigip_f5_trans:<label>

**CLI Example:**

```
salt '*' bigip.create_node bigip admin admin 10.1.1.2
```

**salt.modules.bigip.create_pool()**

- **hostname**  The host/address of the bigip device
- **username**  The iControl REST username
- **password**  The iControl REST password
- **name**  The name of the pool to create.
- **members**  List of comma delimited pool members to add to the pool. i.e. 10.1.1.1:80,10.1.1.2:80,10.1.1.3:80
- **allow_nat** [yes | no]
- **allow_snat** [yes | no]
- **description** [string]
- **gateway_failsafe_device** [string]
- **ignore_persisted_weight** [enabled | disabled]
- **ip_tos_to_client** [pass-through | [integer]]
- **ip_tos_to_server** [pass-through | [integer]]
- **link_qos_to_client** [pass-through | [integer]]
- **link_qos_to_server** [pass-through | [integer]]
- **load_balancing_mode** [dynamic-ratio-member | dynamic-ratio-node | fastest-app-response | fastest-node | least-connections-members | least-connections-node | least-sessions | observed-member | observed-node | predictive-member | predictive-node | ratio-least-connections-member | ratio-least-connections-node | ratio-member | ratio-node | ratio-session | round-robin | weighted-least-connections-member | weighted-least-connections-node]
- **min_active_members** [integer]
- **min_up_members** [integer]
- **min_up_members_action** [failover | reboot | restart-all]
- **min_up_members_checking** [enabled | disabled]
- **monitor** [name]
- **profiles** [none | profile_name]
- **queue_depth_limit** [integer]
- **queue_on_connection_limit** [enabled | disabled]
- **queue_time_limit** [integer]
- **reselect_tries** [integer]
- **service_down_action** [drop | none | reselect | reset]
- **slow_ramp_time** [integer]

**CLI Example:**

```
19.9. execution modules

1127
```
salt 'bigip' create_pool bigip admin admin my-pool 10.1.1.1:80,10.1.1.2:80,10.1.1.3:80 monitor=http

salt.modules.bigip.create_profile(hostname, username, password, profile_type, name, **kwargs)

A function to connect to a bigip device and create a profile.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
profile_type The type of profile to create
name The name of the profile to create
kwargs [ arg=val ] ... [arg=key1:val1,key2:val2] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

Creating Complex Args Profiles can get pretty complicated in terms of the amount of possible config options. Use the following shorthand to create complex arguments such as lists, dictionaries, and lists of dictionaries. An option is also provided to pass raw json as well.

lists [i,i,i]: param='item1,item2,item3'
Dictionary [k:v,k:v,k,v]: param='key-1:val-1,key-2:val2,key-3:va-3'
List of Dictionaries [k:v,k:v|k:v,k:v|k:v,k:v]: param='key-1:val-1,key-2:val-2|key-1:val-1,key-2:val-1,key-2:val-2'
JSON: 'j{ ... }j': cert-key-chain='j{ "default": { "cert": "default.crt","chain": "default.crt","key": "default.key" } }j'

Escaping Delimiters: Use \, or \| to escape characters which shouldn't be treated as delimiters i.e. ciphers='DEFAULT\:!SSLv3'

CLI Examples:
salt 'bigip' create_profile bigip admin admin http my-http-profile defaultsFrom=/Common/http
salt 'bigip' create_profile bigip admin admin http my-http-profile defaultsFrom=/Common/http \ enforcement=maxHeaderCount:3200,maxRequests:10

salt.modules.bigip.create_virtual(hostname, username, password, name, destination, pool=None, address_status=None, auto_lasthop=None, bwc_policy=None, cmp_enabled=None, connection_limit=None, dhcp_relay=None, description=None, fallback_persistence=None, flow_eviction_policy=None, gtm_score=None, ip_forward=None, ip_protocol=None, internal=None, twelve_forward=None, last_hop_pool=None, mask=None, mirror=None, nat64=None, persist=None, profiles=None, policies=None, rate_class=None, rate_limit=None, rate_limit_mode=None, rate_limit_dst=None, rate_limit_src=None, rules=None, related_rules=None, reject=None, source=None, source_address_translation=None, source_port=None, state=None, traffic_classes=None, translate_address=None, translate_port=None, vlans=None)

A function to connect to a bigip device and create a virtual server.

hostname The host/address of the bigip device
username The iControl REST username
password  The iControl REST password
name     The name of the virtual to create
destination [ [virtual_address_name:port] | [ipv4:port] | [ipv6:port] ]
pool     [ [pool_name] | none]
destination     address_status [yes | no]
auto_lasthop   [default | enabled | disabled ]
bwc_policy    [none] | [string]
cmp_enabled   [yes | no]
dhcp Relay    [yes | no]
connection_limit [integer]
description   [string]
state        [disabled | enabled]

CLI Examples:

```
salt '*' bigip.create_virtual bigip admin admin my-virtual-3 26.2.2.5:80 pool=my-http-pool-http profiles=http,tcp

salt '*' bigip.create_virtual bigip admin admin my-virtual-3 43.2.2.5:80 pool=test-http-pool-http profiles=http,websecurity persist=cookie,hash policies=asm_auto_l7_policy__http-virtual rules=,sys_APM_ExchangeSupport_helper,_sys_https_redirect related_rules=,sys_APM_activesync,_sys_APM_ExchangeSupport_helper source_address_translation=snat:my-snat-pool translate_address=enabled translate_port=enabled
```
traffic_classes=my-class,other-class
vlans=enabled:external,internal

salt.modules.bigip.delete_monitor

```
salt.modules.bigip.delete_monitor(hostname, username, password, monitor_type, name)
```
A function to connect to a bigip device and delete an existing monitor.

- **hostname**: The host/address of the bigip device
- **username**: The iControl REST username
- **password**: The iControl REST password
- **monitor_type**: The type of monitor to delete
- **name**: The name of the monitor to delete

CLI Example:

```
salt '*' bigip.delete_monitor bigip admin admin http my-http-monitor
```

salt.modules.bigip.delete_node

```
salt.modules.bigip.delete_node(hostname, username, password, name, trans_label=None)
```
A function to connect to a bigip device and delete a specific node.

- **hostname**: The host/address of the bigip device
- **username**: The iControl REST username
- **password**: The iControl REST password
- **name**: The name of the node which will be deleted.
- **trans_label**: The label of the transaction stored within the grain: bigip_f5_trans:<label>

CLI Example:

```
salt '*' bigip.delete_node bigip admin admin my-node
```

salt.modules.bigip.delete_pool

```
salt.modules.bigip.delete_pool(hostname, username, password, name)
```
A function to connect to a bigip device and delete a specific pool.

- **hostname**: The host/address of the bigip device
- **username**: The iControl REST username
- **password**: The iControl REST password
- **name**: The name of the pool which will be deleted

CLI Example:

```
salt '*' bigip.delete_pool bigip admin admin my-pool
```

salt.modules.bigip.delete_pool_member

```
salt.modules.bigip.delete_pool_member(hostname, username, password, name, member)
```
A function to connect to a bigip device and delete a specific pool.

- **hostname**: The host/address of the bigip device
- **username**: The iControl REST username
- **password**: The iControl REST password
- **name**: The name of the pool to modify
- **member**: The name of the pool member to delete

CLI Example:

```
salt '*' bigip.delete_pool_member bigip admin admin my-pool 10.2.2.2:80
```

salt.modules.bigip.delete_profile

```
salt.modules.bigip.delete_profile(hostname, username, password, profile_type, name)
```
A function to connect to a bigip device and delete an existing profile.

- **hostname**: The host/address of the bigip device
- **username**: The iControl REST username
- **password**: The iControl REST password
- **profile_type**: The type of profile to delete
- **name**: The name of the profile to delete

CLI Example:
salt '*' bigip.delete_profile bigip admin admin http my-http-profile

salt.modules.bigip.delete_transaction(hostname, username, password, label)
A function to connect to a bigip device and delete an existing transaction.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
label The label of this transaction stored within the grain: bigip_f5_trans:<label>
CLI Example:
salt '*' bigip.delete_transaction bigip admin admin my_transaction

salt.modules.bigip.delete_virtual(hostname, username, password, name)
A function to connect to a bigip device and delete a specific virtual.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the virtual to delete
CLI Example:
salt '*' bigip.delete_virtual bigip admin admin my-virtual

salt.modules.bigip.list_monitor(hostname, username, password, monitor_type, name=None)
A function to connect to a bigip device and list an existing monitor. If no name is provided than all monitors of the specified type will be listed.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
monitor_type The type of monitor(s) to list
name The name of the monitor to list
CLI Example:
salt '*' bigip.list_monitor bigip admin admin http my-http-monitor

salt.modules.bigip.list_node(hostname, username, password, name=None, trans_label=None)
A function to connect to a bigip device and list all nodes or a specific node.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the node to list. If no name is specified than all nodes will be listed.
trans_label The label of the transaction stored within the grain: bigip_f5_trans:<label>
CLI Example:
salt '*' bigip.list_node bigip admin admin my-node

salt.modules.bigip.list_pool(hostname, username, password, name=None)
A function to connect to a bigip device and list all pools or a specific pool.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the pool to list. If no name is specified then all pools will be listed.
CLI Example:
salt '*' bigip.list_pool bigip admin admin my-pool
salt.modules.bigip.list_profile(hostname, username, password, profile_type, name=None)

A function to connect to a bigip device and list an existing profile. If no name is provided then all profiles of
the specified type will be listed.

hostname  The host/address of the bigip device
username  The iControl REST username
password  The iControl REST password
profile_type  The type of profile(s) to list
name  The name of the profile to list

CLI Example:

```
salt '*' bigip.list_profile bigip admin admin http my-http-profile
```

salt.modules.bigip.list_transaction(hostname, username, password, label)

A function to connect to a bigip device and list an existing transaction.

hostname  The host/address of the bigip device
username  The iControl REST username
password  The iControl REST password
label  the label of this transaction stored within the grain: bigip_f5_trans:<label>

CLI Example:

```
salt '*' bigip.list_transaction bigip admin admin my_transaction
```

salt.modules.bigip.list_virtual(hostname, username, password, name=None)

A function to connect to a bigip device and list all virtuals or a specific virtual.

hostname  The host/address of the bigip device
username  The iControl REST username
password  The iControl REST password
name  The name of the virtual to list. If no name is specified then all virtuals will be listed.

CLI Example:

```
salt '*' bigip.list_virtual bigip admin admin my-virtual
```

salt.modules.bigip.modify_monitor(hostname, username, password, monitor_type, name, **kwargs)

A function to connect to a bigip device and modify an existing monitor.

hostname  The host/address of the bigip device
username  The iControl REST username
password  The iControl REST password
monitor_type  The type of monitor to modify
name  The name of the monitor to modify
kwargs  Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names
are used.

CLI Example:

```
salt '*' bigip.modify_monitor bigip admin admin http my-http-monitor timeout=16
interval=6
```

salt.modules.bigip.modify_node(hostname, username, password, name, connection_limit=None, description=None, dynamic_ratio=None, logging=None, monitor=None, rate_limit=None, ratio=None, session=None, state=None, trans_label=None)

A function to connect to a bigip device and modify an existing node.

hostname  The host/address of the bigip device
username  The iControl REST username
password  The iControl REST password
name  The name of the node to modify
connection_limit [integer]
description [string]
dynamic_ratio [integer]
logging [enabled | disabled]
monitor [[name] | none | default]
rate_limit [integer]
ratio [integer]
session [user-enabled | user-disabled]
state [user-down | user-up ]
trans_label The label of the transaction stored within the grain: bigip_f5_trans:<label>

CLI Example:
salt '*' bigip.modify_node bigip admin admin 10.1.1.2 ratio=2 logging=enabled

salt.modules.bigip.modify_pool(hostname, username, password, name, allow_nat=None, allow_snat=None, gateway_failsafe_device=None, ignore_persisted_weight=None, ip_tos_to_client=None, ip_tos_to_server=None, link_qos_to_client=None, link_qos_to_server=None, load_balancing_mode=None, min_active_members=None, min_up_members=None, min_up_members_action=None, min_up_members_checking=None, monitoring=None, profiles=None, queue_depth_limit=None, queue_on_connection_limit=None, queue_time_limit=None, reselect_tries=None, service_down_action=None, slow_ramp_time=None)

A function to connect to a bigip device and modify an existing pool.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the pool to modify.
allow_nat [yes | no]
allow_snat [yes | no]
description [string]
gateway_failsafe_device [string]
ignore_persisted_weight [yes | no]
ip_tos_to_client [pass-through | [integer]]
ip_tos_to_server [pass-through | [integer]]
link_qos_to_client [pass-through | [integer]]
link_qos_to_server [pass-through | [integer]]
load_balancing_mode [dynamic-ratio-member | dynamic-ratio-node | fastest-app-response | fastest-node
| least-connections-members | least-connections-node | least-sessions | observed-member | observed-node
| predictive-member | predictive-node | ratio-least-connections-member | ratio-least-connections-node | ratio-member | ratio-node | ratio-session | round-robin | weighted-least-connections-member
| weighted-least-connections-node]
min_active_members [integer]
min_up_members [integer]
min_up_members_action [failover | reboot | restart-all]
min_up_members_checking [enabled | disabled]
monitor [name]
profiles [none | profile_name]
queue_on_connection_limit [enabled | disabled]
queue_depth_limit [integer]
queue_time_limit [integer]
reselect_tries [integer]

service_down_action [drop | none | reselect | reset]

slow_ramp_time [integer]

CLI Example:

```
salt '*' bigip.modify_pool bigip admin admin my-pool 10.1.1.80,10.1.1.2:80,10.1.1.3:80 min_active_members=1
```

salt.modules.bigip.modify_pool_member( hostname, username, password, name, member, connection_limit=None, description=None, dynamic_ratio=None, inherit_profile=None, logging=None, monitor=None, priority_group=None, profiles=None, rate_limit=None, ratio=None, session=None, state=None )

A function to connect to a bigip device and modify an existing member of a pool.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the pool to modify
member The name of the member to modify i.e. 10.1.1.2:80
connection_limit [integer]
description [string]
dynamic_ratio [integer]
inherit_profile [enabled | disabled]
logging [enabled | disabled]
monitor [name]
priority_group [integer]
profiles [none | profile_name]
rate_limit [integer]
ratio [integer]
session [user-enabled | user-disabled]
state [ user-up | user-down ]

CLI Example:

```
salt '*' bigip.modify_pool_member bigip admin admin my-pool 10.2.2.1:80 state=use-down session=user-disabled
```

salt.modules.bigip.modify_profile( hostname, username, password, profile_type, name, **kwargs )

A function to connect to a bigip device and create a profile.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
profile_type The type of profile to create
name The name of the profile to create

kwargs [ arg=val ] ... [arg=key1:val1,key2:val2] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

Creating Complex Args

Profiles can get pretty complicated in terms of the amount of possible config options. Use the following shorthand to create complex arguments such as lists, dictionaries, and lists of dictionaries. An option is also provided to pass raw json as well.

```
lists [i,i,i]: param='item1,item2,item3'
```

1134 Chapter 19. Salt Module Reference
**Dictionary [k:v,k:v,k:v]:**

```
param='key-1:val-1,key-2:val2,key-3:va-3'
```

**List of Dictionaries [k:v,k:v|k:v,k:v|k:v,k:v]:**

```
param='key-1:val-1,key-2:val-2|key-1:val-1,key-2:val-2|key-1:val-1,key-2:val-2'
```

**JSON: 'j{ ... }j':**

```
cert-key-chain='j{ "default": { "cert": "default.crt","chain": "default.crt","key": "default.key" } }j'
```

**Escaping Delimiters:** Use `,` or `:` or `|` to escape characters which shouldn't be treated as delimiters i.e. `ciphers='DEFAULT\:!SSLv3'`

**CLI Examples:**

```bash
salt '*' bigip.modify_profile bigip admin admin http my-http-profile defaultsFrom=->'/Common/http'

salt '*' bigip.modify_profile bigip admin admin http my-http-profile defaultsFrom=->'/Common/http' 
  enforcement=maxHeaderCount:3200,maxRequests:10

salt '*' bigip.modify_profile bigip admin admin client-ssl my-client-ssl-1
  retainCertificate=false 
  ciphers='DEFAULT\:!SSLv3'
  cert_key_chain='j{ "default": { "cert": "default.crt", "chain": "default.crt", "key": "default.key" } }j'
```

**salt.modules.bigip.modify_virtual:**

```
(hostname, username, password, name, destination=None, pool=None, address_status=None, auto_lasthop=None, bwc_policy=None, cmp_enabled=None, connection_limit=None, dhcp_relay=None, description=None, fallback_persistence=None, flow_eviction_policy=None, gtm_score=None, ip_forward=None, ip_protocol=None, internal=None, twelve_forward=None, last_hop_pool=None, mask=None, mirror=None, nat64=None, persist=None, profiles=None, policies=None, rate_class=None, rate_limit=None, rate_limit_mode=None, rate_limit_dst=None, rate_limit_src=None, rules=None, related_rules=None, reject=None, source=None, source_address_translation=None, source_port=None, state=None, traffic_classes=None, translate_address=None, translate_port=None, vlans=None)
```

A function to connect to a bigip device and modify an existing virtual server.

- `hostname`: The host/address of the bigip device
- `username`: The iControl REST username
- `password`: The iControl REST password
- `name`: The name of the virtual to modify
- `destination`: The virtual address
- `pool`: The pool name
- `address_status`: The address status
- `auto_lasthop`: Auto last hop
- `bwc_policy`: Bandwidth Consistency
- `cmp_enabled`: CMP Enabled
- `connection_limit`: Connection Limit
- `dhcp_relay`: DHCP Relay
- `description`: Description
- `fallback_persistence`: Fallback Persistence
- `flow_eviction_policy`: Flow Eviction Policy
- `gtm_score`: GTM Score
- `ip_forward`: IP Forward
- `ip_protocol`: IP Protocol
- `internal`: Internal
- `twelve_forward`: Twelve Forward
- `last_hop_pool`: Last Hop Pool
- `mask`: Mask
- `mirror`: Mirror
- `nat64`: Nat64
- `persist`: Persist
- `profiles`: Profiles
- `policies`: Policies
- `rate_class`: Rate Class
- `rate_limit`: Rate Limit
- `rate_limit_mode`: Rate Limit Mode
- `rate_limit_dst`: Rate Limit Destination
- `rate_limit_src`: Rate Limit Source
- `rules`: Rules
- `related_rules`: Related Rules
- `reject`: Reject
- `source`: Source
- `source_address_translation`: Source Address Translation
- `source_port`: Source Port
- `state`: State
- `traffic_classes`: Traffic Classes
- `translate_address`: Translate Address
- `translate_port`: Translate Port
- `vlans`: VLANS
Salt Documentation, Release 2017.7.8

gtm_score [integer]
ip_forward [yes | no]
ip_protocol [any | protocol]
internal [yes | no]
twelve_forward (12-forward) [yes | no]
last_hop_pool [pool_name] | none
mask [[ipv4] | [ipv6]]
mirror {{disabled | enabled | none}}
nat64 [enabled | disabled]
persist [none | profile1,profile2,profile3 ... ]
profiles [none | default | profile1,profile2,profile3 ... ]
policies [none | default | policy1,policy2,policy3 ... ]
rate_class [name]
rate_limit [integer]
rate_limit_mode [destination | object | object-destination | object-source | object-source-destination | source | source-destination]
rate_limit_dst [integer]
rate_limit_src [integer]
rules [none | [rule_one,rule_two ... ]]
related_rules [none | [rule_one,rule_two ... ]]
reject [yes | no]
source [[ipv4[/prefixlen]] | [ipv6[/prefixlen]]]
source_address_translation [none | snat-pool_name | lsn | automap]
source_port [change | preserve | preserve-strict]
state [enabled | disable]
traffic_classes [none | default | class_one,class_two ... ]
translate_address [enabled | disabled]
translate_port [enabled | disabled]
vlans [none | default | [enabled|disabled]:vlan1,vlan2,vlan3 ... ]

CLI Example:

```bash
salt '*' bigip.modify_virtual bigip admin admin my-virtual source_address_translation=none
salt '*' bigip.modify_virtual bigip admin admin my-virtual rules=my-rule,my-other-rule
```

salt.modules.bigip.replace_pool_members

A function to connect to a bigip device and replace members of an existing pool with new members.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**name** The name of the pool to modify

**members** List of comma delimited pool members to replace existing members with. i.e. 10.1.1.1:80,10.1.1.2:80,10.1.1.3:80

CLI Example:

```bash
salt '*' bigip.replace_pool_members bigip admin admin my-pool 10.2.2.1:80,10.2.2.2:80,10.2.2.3:80
```

salt.modules.bigip.start_transaction

A function to connect to a bigip device and start a new transaction.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**label** The name / alias for this transaction. The actual transaction id will be stored within a grain called
bigip_f5_trans:<label>

CLI Example:

```
salt '*' bigip.start_transaction bigip admin admin my_transaction
```

19.9.25 salt.modules.blockdev

Module for managing block devices

New in version 2014.7.0.

Deprecated since version 2016.11.0: Merged to `disk` module

```
salt.modules.blockdev.format(device, fs_type='ext4', inode_size=None, lazy_itable_init=None, force=False)
```

Format a filesystem onto a block device

New in version 2015.8.2.

Deprecated since version 2016.11.0.

device The block device in which to create the new filesystem

fs_type The type of filesystem to create

inode_size Size of the inodes

This option is only enabled for ext and xfs filesystems

lazy_itable_init If enabled and the uninit_bg feature is enabled, the inode table will not be fully initialized by mke2fs. This speeds up filesystem initialization noticeably, but it requires the kernel to finish initializing the filesystem in the background when the filesystem is first mounted. If the option value is omitted, it defaults to 1 to enable lazy inode table zeroing.

This option is only enabled for ext filesystems

force Force mke2fs to create a filesystem, even if the specified device is not a partition on a block special device. This option is only enabled for ext and xfs filesystems

This option is dangerous, use it with caution.

New in version 2016.11.0.

CLI Example:

```
salt '*' blockdev.format /dev/sdX1
```

```
salt.modules.blockdev.fstype(device)
```

Return the filesystem name of a block device

New in version 2015.8.2.

Deprecated since version 2016.11.0.

device The name of the block device

CLI Example:

```
salt '*' blockdev.fstype /dev/sdX1
```

19.9.26 salt.modules.bluez

Support for Bluetooth (using BlueZ in Linux).

The following packages are required packages for this module:

```
bluez >= 5.7 bluez-libs >= 5.7 bluez-utils >= 5.7 pybluez >= 0.18
```
salt.modules.bluez.address()  
Get the many addresses of the Bluetooth adapter  
CLI Example:  
salt '*' bluetooth.address

salt.modules.bluez.block(bdaddr)  
Block a specific bluetooth device by BD Address  
CLI Example:  

salt.modules.bluez.discoverable(dev)  
Enable this bluetooth device to be discoverable.  
CLI Example:  
salt '*' bluetooth.discoverable hci0

salt.modules.bluez.noscan(dev)  
Turn off scanning modes on this device.  
CLI Example:  
salt '*' bluetooth.noscan hci0

salt.modules.bluez.pair(address, key)  
Pair the bluetooth adapter with a device  
CLI Example:  
salt '*' bluetooth.pair DE:AD:BE:EF:CA:FE 1234

Where DE:AD:BE:EF:CA:FE is the address of the device to pair with, and 1234 is the passphrase.  
TODO: This function is currently broken, as the bluez-simple-agent program no longer ships with BlueZ >= 5.0. It needs to be refactored.

salt.modules.bluez.power(dev, mode)  
Power a bluetooth device on or off  
CLI Examples:  
salt '*' bluetooth.power hci0 on  
salt '*' bluetooth.power hci0 off

salt.modules.bluez.scan()  
Scan for bluetooth devices in the area  
CLI Example:  
salt '*' bluetooth.scan

salt.modules.bluez.start()  
Start the bluetooth service.  
CLI Example:
salt '*' bluetooth.start

salt.modules.bluez.stop()
Stop the bluetooth service.

CLI Example:
salt '*' bluetooth.stop

salt.modules.bluez.unblock(bdaddr)
Unblock a specific bluetooth device by BD Address

CLI Example:

salt.modules.bluez.unpair(address)
Unpair the bluetooth adapter from a device

CLI Example:

Where DE:AD:BE:EF:CA:FE is the address of the device to unpair.

TODO: This function is currently broken, as the bluez-simple-agent program no longer ships with BlueZ >= 5.0. It needs to be refactored.

salt.modules.bluez.version()
Return Bluez version from bluetoothd -v

CLI Example:
salt '*' bluetoothd.version

19.9.27 salt.modules.boto3_elasticache module

Execution module for Amazon Elasticache using boto3

New in version 2017.7.0.

configuration This module accepts explicit elasticache credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

elasticache.keyid: GKTADJGHEIQSXMKKRBJ08H
elasticache.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

A region may also be specified in the configuration:
elasticache.region: us-east-1

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjdkgWupUjasdfklfklgjsdfajkgf
  region: us-east-1

depends boto3

salt.modules.boto3_elasticache.add_tags_to_resource(name, region=None, key=None, keyid=None, profile=None, **args)

Add tags to an Elasticache resource.

Note that this function is essentially useless as it requires a full AWS ARN for the resource being operated on, but there is no provided API or programmatic way to find the ARN for a given object from its name or ID alone. It requires specific knowledge about the account number, AWS partition, and other magic details to generate.

If you happen to have those at hand though, feel free to utilize this function...

Example:

```
salt myminion boto3_elasticache.add_tags_to_resource name='arn:aws:
  elasticache:us-west-2:0123456789:snapshot:mySnapshot'
  Tags='[{
    'Key': 'TeamOwner', 'Value': 'infrastructure'}]
```

salt.modules.boto3_elasticache.authorize_cache_security_group_ingress(name, region=None, key=None, keyid=None, profile=None, **args)

Authorize network ingress from an ec2 security group to a cache security group.

Example:

```
salt myminion boto3_elasticache.authorize_cache_security_group_ingress
  mycachesecgrp
  EC2SecurityGroupName=someEC2sg
  EC2SecurityGroupOwnerId=SOMEOWNERID
```

salt.modules.boto3_elasticache.cache_cluster_exists(name, conn=None, region=None, key=None, keyid=None, profile=None)

Check to see if a cache cluster exists.

Example:

```
salt myminion boto3_elasticache.cache_cluster_exists myelasticache
```
salt.modules.boto3_elasticache.cache_security_group_exists(name, region=None, key=None, keyid=None, profile=None)

Check to see if an ElastiCache security group exists.
Example:

```bash
salt myminion boto3_elasticache.cache_security_group_exists mysecuritygroup
```

salt.modules.boto3_elasticache.cache_subnet_group_exists(name, region=None, key=None, keyid=None, profile=None)

Check to see if an ElastiCache subnet group exists.
Example:

```bash
salt myminion boto3_elasticache.cache_subnet_group_exists my-subnet-group
```

salt.modules.boto3_elasticache.copy_snapshot(name, region=None, key=None, keyid=None, profile=None, **args)

Make a copy of an existing snapshot.
Example:

```bash
salt myminion boto3_elasticache.copy_snapshot name=mySnapshot
   TargetSnapshotName=copyOfMySnapshot
```

salt.modules.boto3_elasticache.create_cache_cluster(name, wait=600, security_groups=None, region=None, key=None, keyid=None, profile=None, **args)

Create a cache cluster.
Example:

```bash
salt myminion boto3_elasticache.create_cache_cluster name=myCacheCluster
   Engine=redis
   CacheNodeType=cache.t2.micro
   NumCacheNodes=1
   SecurityGroupIds='[sg-11223344]'
   CacheSubnetGroupName=myCacheSubnetGroup
```

salt.modules.boto3_elasticache.create_cache_parameter_group(name, region=None, key=None, keyid=None, profile=None, **args)

Create a cache parameter group.
Example:

```bash
salt myminion boto3_elasticache.create_cache_parameter_group name=myParamGroup
   CacheParameterGroupFamily=redis2.8
   Description="My Parameter Group"
```

salt.modules.boto3_elasticache.create_cache_security_group(name, region=None, key=None, keyid=None, profile=None, **args)

Create a cache security group.
Create a cache security group.

Example:

```python
salt myminion boto3_elasticache.create_cache_security_group mycachesecgrp
  # Description='My Cache Security Group'
```

```python
salt.modules.boto3_elasticache.create_cache_subnet_group(name, subnets=None, region=None, key=None, keyid=None, profile=None, **args)
```

Create an ElastiCache subnet group

Example:

```python
salt myminion boto3_elasticache.create_cache_subnet_group
  # name=my-subnet-group
  CacheSubnetGroupDescription="description"
  subnets=['[myVPCSubnet1,myVPCSubnet2]'
```

```python
salt.modules.boto3_elasticache.create_replication_group(name, wait=600, security_groups=None, region=None, key=None, keyid=None, profile=None, **args)
```

Example:

```python
salt myminion boto3_elasticache.create_replication_group
  name=myelasticache
  ReplicationGroupDescription=description
```

```python
salt.modules.boto3_elasticache.delete_cache_cluster(name, wait=600, region=None, key=None, keyid=None, profile=None, **args)
```

Delete a cache cluster.

Example:

```python
salt myminion boto3_elasticache.delete myelasticache
```

```python
salt.modules.boto3_elasticache.delete_cache_parameter_group(name, region=None, key=None, keyid=None, profile=None, **args)
```

Delete a cache parameter group.

Example:

```python
salt myminion boto3_elasticache.delete_cache_parameter_group myParamGroup
```

```python
salt.modules.boto3_elasticache.delete_cache_security_group(name, region=None, key=None, keyid=None, profile=None, **args)
```

Delete a cache security group.
Example:

```
salt myminion boto3_elasticache.delete_cache_security_group myelasticachesg
```

```
salt.modules.boto3_elasticache.delete_cache_subnet_group(name, region=None, key=None, keyid=None, profile=None, **args)
```

Delete an ElastiCache subnet group.

Example:

```
salt myminion boto3_elasticache.delete_subnet_group my-subnet-group region=us-east-1
```

```
salt.modules.boto3_elasticache.delete_replication_group(name, wait=600, region=None, key=None, keyid=None, profile=None, **args)
```

Delete an ElastiCache replication group, optionally taking a snapshot first.

Example:

```
salt myminion boto3_elasticache.delete_replication_group my-replication-group
```

```
salt.modules.boto3_elasticache.describe_cache_clusters(name=None, conn=None, region=None, key=None, keyid=None, profile=None, **args)
```

Return details about all (or just one) Elasticache cache clusters.

Example:

```
salt myminion boto3_elasticache.describe_cache_clusters
salt myminion boto3_elasticache.describe_cache_clusters myelasticache
```

```
salt.modules.boto3_elasticache.describe_cache_parameter_groups(name=None, conn=None, region=None, key=None, keyid=None, profile=None)
```

Return details about all (or just one) Elasticache cache clusters.

Example:

```
salt myminion boto3_elasticache.describe_cache_parameter_groups
salt myminion boto3_elasticache.describe_cache_parameter_groups myParameterGroup
```

```
salt.modules.boto3_elasticache.describe_cache_security_groups(name=None, conn=None, region=None, key=None, keyid=None, profile=None)
```

Return details about all (or just one) Elasticache cache clusters.

Example:
salt myminion boto3_elasticache.describe_cache_security_groups
salt myminion boto3_elasticache.describe_cache_security_groups mycachesecgrp

salt.modules.boto3_elasticache.describe_cache_subnet_groups(name=None, conn=None, region=None, key=None, keyid=None, profile=None)

Return details about all (or just one) Elasticache replication groups.
Example:
salt myminion boto3_elasticache.describe_cache_subnet_groups region=us-east-1

salt.modules.boto3_elasticache.describe_replication_groups(name=None, conn=None, region=None, key=None, keyid=None, profile=None)

Return details about all (or just one) Elasticache replication groups.
Example:
salt myminion boto3_elasticache.describe_replication_groups
salt myminion boto3_elasticache.describe_replication_groups myelasticache

salt.modules.boto3_elasticache.list_cache_subnet_groups(region=None, key=None, keyid=None, profile=None)

Return a list of all cache subnet group names
Example:
salt myminion boto3_elasticache.list_cache_subnet_groups region=us-east-1

salt.modules.boto3_elasticache.list_tags_for_resource(name, region=None, key=None, keyid=None, profile=None, **args)

List tags on an Elasticache resource.
Note that this function is essentially useless as it requires a full AWS ARN for the resource being operated on, but there is no provided API or programmatic way to find the ARN for a given object from its name or ID alone. It requires specific knowledge about the account number, AWS partition, and other magic details to generate.

If you happen to have those handy, feel free to utilize this however...
Example:

salt.modules.boto3_elasticache.modify_cache_cluster(name, wait=600, security_groups=None, region=None, key=None, keyid=None, profile=None, **args)

Update a cache cluster in place.
Notes: [ApplyImmediately: False] is pretty danged silly in the context of salt. You can pass it, but for fairly obvious reasons the results over multiple runs will be undefined and probably contrary to your desired state. Reducing the number of nodes requires an EXPLICIT CacheNodeIdsToRemove be passed, which until a reasonable heuristic for programmatically deciding which nodes to remove has been established, MUST be decided and populated intentionally before a state call, and removed again before the next. In practice this is not particularly useful and should probably be avoided.

Example:

```python
Salt Documentation, Release 2017.7.8

salt myminion boto3_elasticache.create_cache_cluster name=myCacheCluster NotificationTopicStatus=inactive

salt.modules.boto3_elasticache.modify_cache_subnet_group(name, subnets=None, region=None, key=None, keyid=None, profile=None, **args)

Modify an ElastiCache subnet group

Example:

```python
salt myminion boto3_elasticache.modify_cache_subnet_group
  name=my-subnet-group
  subnets='[myVPCSubnet3]'
```  

salt.modules.boto3_elasticache.modify_replication_group(name, wait=600, security_groups=None, region=None, key=None, keyid=None, profile=None, **args)

Modify a replication group.

Example:

```python
salt myminion boto3_elasticache.modify_replication_group
  name=myelasticache
  ReplicationGroupDescription=newDescription
```  

salt.modules.boto3_elasticache.remove_tags_from_resource(name, region=None, key=None, keyid=None, profile=None, **args)

Remove tags from an Elasticache resource.

Note that this function is essentially useless as it requires a full AWS ARN for the resource being operated on, but there is no provided API or programmatic way to find the ARN for a given object from its name or ID alone. It requires specific knowledge about the account number, AWS partition, and other magic details to generate.

If you happen to have those at hand though, feel free to utilize this function...

Example:

```python
salt myminion boto3_elasticache.remove_tags_from_resource
  TagKeys=['TeamOwner']
```  

salt.modules.boto3_elasticache.replication_group_exists(name, region=None, key=None, keyid=None, profile=None)

Check to see if a replication group exists.
Example:

```bash
salt myminion boto3_elasticache.replication_group_exists myelasticache
```

```
salt.modules.boto3_elasticache.revoke_cache_security_group_ingress(name, region=None, key=None, keyid=None, profile=None, **args)
```

Revoke network ingress from an ec2 security group to a cache security group.

Example:

```bash
css
salt myminion boto3_elasticache.revoke_cache_security_group_ingress

- mycachesecgrp
- EC2SecurityGroupName=someEC2sg
- EC2SecurityGroupOwnerId=SOMEOWNERID
```

19.9.28 salt.modules.boto3_route53 module

Execution module for Amazon Route53 written against Boto 3

New in version 2017.7.0.

**configuration** This module accepts explicit route53 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```yaml
route53.keyid: GKTADJGHEIQSXMKKRBJ08H
route53.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```yaml
route53.region: us-east-1
```

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```yaml
myprofile:
  keyid: GKTADJGHEIQXSXMKRRB3J08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

Note that Route53 essentially ignores all (valid) settings for `region`, since there is only one Endpoint (in us-east-1 if you care) and any (valid) region setting will just send you there. It is entirely safe to set it to None as well.

**depends** boto3
salt.modules.boto3_route53.associate_vpc_with_hosted_zone(HostedZoneId=None, Name=None, VPCId=None, VPCName=None, VPCRegion=None, Comment=None, region=None, key=None, keyid=None, profile=None)

Associates an Amazon VPC with a private hosted zone.

To perform the association, the VPC and the private hosted zone must already exist. You can’t convert a public hosted zone into a private hosted zone. If you want to associate a VPC from one AWS account with a zone from another, the AWS account owning the hosted zone must first submit a CreateVPCAssociationAuthorization (using create_vpc_association_authorization() or by other means, such as the AWS console). With that done, the account owning the VPC can then call associate_vpc_with_hosted_zone() to create the association.

Note that if both sides happen to be within the same account, associate_vpc_with_hosted_zone() is enough on its own, and there is no need for the CreateVPCAssociationAuthorization step.

Also note that looking up hosted zones by name (e.g. using the Name parameter) only works within a single account - if you’re associating a VPC to a zone in a different account, as outlined above, you unfortunately MUST use the HostedZoneId parameter exclusively.

HostedZoneId The unique Zone Identifier for the Hosted Zone.
Name The domain name associated with the Hosted Zone(s).
VPCId When working with a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCName.
VPCName When working with a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCId.
VPCRegion When working with a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from VPCId or VPCName, if possible. If this fails, you’ll need to provide an explicit value for VPCRegion.
Comment Any comments you want to include about the change being made.

CLI Example:
```
salt myminion boto3_route53.associate_vpc_with_hosted_zone
  Name@example.org. VPCName=myVPC VPCRegion=us-east-1 Comment="Whoo-hoo! I added another VPC."
```

salt.modules.boto3_route53.change_resource_record_sets(HostedZoneId=None, Name=None, PrivateZone=None, ChangeBatch=None, region=None, key=None, keyid=None, profile=None)

See the AWS Route53 API docs as well as the Boto3 documentation for all the details...

The syntax for a ChangeBatch parameter is as follows, but note that the permutations of allowed parameters and combinations thereof are quite varied, so perusal of the above linked docs is highly recommended for any non-trivial configurations.

```
{
  "Comment": "string",
  "Changes": [
    {
      "Action": "CREATE"|"DELETE"|"UPSERT",
      "ResourceRecordSet": {
```
"Name": "string",
"Type": "SOA"|"A"|"TXT"|"NS"|"CNAME"|"MX"|"NAPTR"|"PTR"|"SRV"|"SPF"
|"AAAA",
"SetIdentifier": "string",
"Weight": 123,
"Region": "us-east-1"|"us-east-2"|"us-west-1"|"us-west-2"|"ca-central-1"|"eu-west-1"|"eu-west-2"|"eu-central-1"|"ap-southeast-1"|"ap-southeast-2"|"ap-northeast-1"|"ap-northeast-2"|"sa-east-1"|"cn-north-1"|"ap-south-1",
"GeoLocation": {
  "ContinentCode": "string",
  "CountryCode": "string",
  "SubdivisionCode": "string"
},
"Failover": "PRIMARY"|"SECONDARY",
"TTL": 123,
"ResourceRecords": [
  {
    "Value": "string"
  }
],
"AliasTarget": {
  "HostedZoneId": "string",
  "DNSName": "string",
  "EvaluateTargetHealth": True|False
},
"HealthCheckId": "string",
"TrafficPolicyInstanceId": "string"
}
]
]

CLI Example:

```
foo='{
  "Name": "my-cname.example.org.",
  "TTL": 600,
  "Type": "CNAME",
  "ResourceRecords": [
    {
      "Value": "my-host.example.org"
    }
  ]
}

foo=`echo $foo`  # Remove newlines
salt myminion boto3_route53.change_resource_record_sets DomainName=example.org. keyid=A1234567890ABCDEF123 key=xblahblahblah
->ChangeBatch="{'Changes': [{'Action': 'UPSERT', 'ResourceRecordSet': $foo}]}
```

salt.modules.boto3_route53.create_hosted_zone(Name, VPCId=None, VPCName=None, VPCRegion=None, CallerReference=None, Comment=' ', PrivateZone=False, DelegationSetId=None, region=None, key=None, keyid=None, profile=None)

Create a new Route53 Hosted Zone. Returns a Python data structure with information about the newly created Hosted Zone.

Name The name of the domain. This should be a fully-specified domain, and should terminate with a period.
This is the name you have registered with your DNS registrar. It is also the name you will delegate from your registrar to the Amazon Route 53 delegation servers returned in response to this request.

VPCId When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCName. Ignored if passed for a non-private zone.

VPCName When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCId. Ignored if passed for a non-private zone.

VPCRegion When creating a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from VPCId or VPCName, if possible. If this fails, you’ll need to provide an explicit value for this option. Ignored if passed for a non-private zone.

CallerReference A unique string that identifies the request and that allows create_hosted_zone() calls to be retried without the risk of executing the operation twice. This is a required parameter when creating new Hosted Zones. Maximum length of 128.

Comment Any comments you want to include about the hosted zone.

PrivateZone Boolean - Set to True if creating a private hosted zone.

DelegationSetId If you want to associate a reusable delegation set with this hosted zone, the ID that Amazon Route 53 assigned to the reusable delegation set when you created it. Note that XXX TODO create_delegation_set() is not yet implemented, so you’d need to manually create any delegation sets before utilizing this.

region Region endpoint to connect to.
key AWS key to bind with.
keyid AWS keyid to bind with.
profile Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

CLI Example:
salt myminion boto3_route53.create_hosted_zone example.org.

salt.modules.boto3_route53.delete_hosted_zone(Id, region=None, key=None, keyid=None, profile=None)

Delete a Route53 hosted zone.

CLI Example:
salt myminion boto3_route53.delete_hosted_zone Z1234567890

salt.modules.boto3_route53.delete_hosted_zone_by_domain(Name, PrivateZone=None, region=None, key=None, keyid=None, profile=None)

Delete a Route53 hosted zone by domain name, and PrivateZone status if provided.

CLI Example:
salt myminion boto3_route53.delete_hosted_zone_by_domain example.org.

salt.modules.boto3_route53.disassociate_vpc_from_hosted_zone(HostedZoneId=None, Name=None, VPCId=None, VPCName=None, VPCRegion=None, Comment=None, region=None, key=None, keyid=None, profile=None)

Disassociates an Amazon VPC from a private hosted zone.

You can’t disassociate the last VPC from a private hosted zone. You also can’t convert a private hosted zone.
into a public hosted zone.

Note that looking up hosted zones by name (e.g., using the Name parameter) only works within a single AWS account - if you're disassociating a VPC in one account from a hosted zone in a different account you unfortunately MUST use the HostedZoneId parameter exclusively. XXX FIXME

HostedZoneId The unique Zone Identifier for the Hosted Zone.
Name The domain name associated with the Hosted Zone(s).
VPCId When working with a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCName.
VPCName When working with a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCId.
VPCRegion When working with a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from VPCId or VPCName, if possible. If this fails, you'll need to provide an explicit value for VPCRegion.
Comment Any comments you want to include about the change being made.

CLI Example:

```python
salt myminion boto3_route53.disassociate_vpc_from_hosted_zone
  Name=example.org. VPCName=myVPC VPCRegion=us-east-1 Comment=
  "Whoops! Don't wanna talk to this-here zone no more."
```

Find a hosted zone with the given characteristics.
Id The unique Zone Identifier for the Hosted Zone. Exclusive with Name.
Name The domain name associated with the Hosted Zone. Exclusive with Id. Note this has the potential to match more than one hosted zone (e.g., a public and a private if both exist) which will raise an error unless PrivateZone has been passed in order to split the different.
PrivateZone Boolean - Set to True if searching for a private hosted zone.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

CLI Example:

```python
salt myminion boto3_route53.find_hosted_zone
  Name=salt.org. region=us-east-1
  keyid="A12345678AB", key="xblahblahblah"
```

Return detailed info about the given zone.
Id The unique Zone Identifier for the Hosted Zone.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

CLI Example:

```python
salt myminion boto3_route53.get_hosted_zone
  Id=Z1234567690
  region=us-east-1
  keyid="A12345678AB", key="xblahblahblah"
```

Find any zones with the given domain name and return detailed info about them. Note that this can return

```python
salt myminion boto3_route53.get_hosted_zones_by_domain
  Name=salt.org.
  region=us-east-1
  keyid="A12345678AB", key="xblahblahblah"
```
multiple Route53 zones, since a domain name can be used in both public and private zones.

Name  The domain name associated with the Hosted Zone(s).
region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

CLI Example:

```
salt myminion boto3_route53.get_hosted_zones_by_domain salt.org.
```

```
    -profile='{"region": "us-east-1", "keyid": "A12345678AB", "key": "xblahblahblah"}'}
```

salt.modules.boto3_route53.get_resource_records(HostedZoneId=None, Name=None, StartRecordName=None, StartRecordType=None, PrivateZone=None, region=None, key=None, keyid=None, profile=None)

Get all resource records from a given zone matching the provided StartRecordName (if given) or all records in the zone (if not), optionally filtered by a specific StartRecordType. This will return any and all RRs matching, regardless of their special AWS flavors (weighted, geolocation, alias, etc.) so your code should be prepared for potentially large numbers of records back from this function - for example, if you've created a complex geolocation mapping with lots of entries all over the world providing the same server name to many different regional clients.

If you want EXACTLY ONE record to operate on, you'll need to implement any logic required to pick the specific RR you care about from those returned.

Note that if you pass in Name without providing a value for PrivateZone (either True or False), CommandExecutionError can be raised in the case of both public and private zones matching the domain. XXX FIXME DOCU

CLI example:

```
salt myminion boto3_route53.get_records test.example.org example.org A
```

salt.modules.boto3_route53.list_hosted_zones(DelegationSetId=None, Name=None, region=None, key=None, keyid=None, profile=None)

Return detailed info about all zones in the bound account.

DelegationSetId  If you're using reusable delegation sets and you want to list all of the hosted zones that are associated with a reusable delegation set, specify the ID of that delegation set.

region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

CLI Example:

```
salt myminion boto3_route53.describe_hosted_zones profile='{"region": "us-east-1", "keyid": "A12345678AB", "key": "xblahblahblah"}'}
```

salt.modules.boto3_route53.update_hosted_zone_comment(Id=None, Name=None, Comment=None, PrivateZone=None, region=None, key=None, keyid=None, profile=None)

Update the comment on an existing Route 53 hosted zone.

Id  The unique Zone Identifier for the Hosted Zone.
Name  The domain name associated with the Hosted Zone(s).
**Comment** Any comments you want to include about the hosted zone.

**PrivateZone** Boolean - Set to True if changing a private hosted zone.

CLI Example:

```
salt myminion boto3_route53.update_hosted_zone_comment Name=example.org. Comment="This is an example comment for an example zone"
```

### 19.9.29 salt.modules.boto_apigateway module

Connection module for Amazon APIGateway

New in version 2016.11.0.

**configuration** This module accepts explicit Lambda credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available at:

```
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
apigateway.keyid: GKTADJGHEIQSXMKKRBJ08H
apigateway.key: askdjghsdfjkghWuPujasdhflkdfklgjsdfajkghs
```

A region may also be specified in the configuration:

```
apigateway.region: us-west-2
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWuPujasdhflkdfklgjsdfajkghs
  region: us-west-2
```

Changed in version 2015.8.0: All methods now return a dictionary. Create and delete methods return:

```
created: true
```

or

```
created: false
error:
  message: error message
```

Request methods (e.g., `describe_apigateway`) return:

```
apigateway:
- {...}
- {...}
```

or
error:
  message: error message

depends boto3

salt.modules.boto_apigateway.activate_api_deployment(restApiId, stageName, deploymentId, region=None, key=None, keyid=None, profile=None)

Activates previously deployed deployment for a given stage

CLI Example:
salt myminion boto_apigateway.activate_api_deployent restApiId stagename deploymentId

salt.modules.boto_apigateway.api_exists(name, description=None, region=None, key=None, keyid=None, profile=None)

Check to see if the given Rest API Name and optionally description exists.

CLI Example:
salt myminion boto_apigateway.exists myapi_name

salt.modules.boto_apigateway.api_model_exists(restApiId, modelName, region=None, key=None, keyid=None, profile=None)

Check to see if the given modelName exists in the given restApiId

CLI Example:
salt myminion boto_apigateway.api_model_exists restApiId modelName

salt.modules.boto_apigateway.associate_api_key_stagekeys(apiKey, stagekeyslist, region=None, key=None, keyid=None, profile=None)

associate the given stagekeyslist to the given apiKey.

CLI Example:
salt myminion boto_apigateway.associate_stagekeys_api_key \
  api_key '"["restapi id/stage name", ...]'

salt.modules.boto_apigateway.attach_usage_plan_to_apis(plan_id, apis, region=None, key=None, keyid=None, profile=None)

Attaches given usage plan to each of the apis provided in a list of apid and stage values

New in version 2017.7.0.

apis a list of dictionaries, where each dictionary contains the following:

  apiId a string, which is the id of the created API in AWS ApiGateway

  stage a string, which is the stage that the created API is deployed to.

CLI Example:
salt myminion boto_apigateway.attach_usage_plan_to_apis plan_id='usage plan id'\ 
  apis='["apiId": "some id 1", "stage": "some stage 1"]'
salt.modules.boto_apigateway.create_api(name, description, cloneFrom=None, region=None, key=None, keyid=None, profile=None)

Create a new REST API Service with the given name
Returns [created: True] if the rest api was created and returns [created: False] if the rest api was not created.

CLI Example:

```bash
salt myminion boto_apigateway.create_api myapi_name api_description
```

salt.modules.boto_apigateway.create_api_deployment(restApiId, stageName, stageDescription='', description='', cacheClusterEnabled=False, cacheClusterSize='0.5', variables=None, region=None, key=None, keyid=None, profile=None)

Creates a new API deployment.

CLI Example:

```bash
salt myminion boto_apigateway.create_api_deployent restApiId stagename description=''
```

salt.modules.boto_apigateway.create_api_integration(restApiId, resourcePath, httpMethod, integrationType, integrationHttpMethod, uri, credentials, requestParameters=None, requestTemplates=None, region=None, key=None, keyid=None, profile=None)

Creates an integration for a given method in a given API. If integrationType is MOCK, uri and credential parameters will be ignored.

uri is in the form of (substitute APIGATEWAY_REGION and LAMBDA_FUNC_ARNT)
```

credentials is in the form of an iam role name or role arn.

CLI Example:

```bash
salt myminion boto_apigateway.create_api_integration restApiId resourcePath httpMethod integrationType integrationHttpMethod uri credentials ['{}']
```
salt.modules.boto_apigateway.create_api_integration_response

```
salt myminion boto_apigateway.create_api_integration_response restApiId=restApiId,
resourcePath=httpMethod, resourcePath=httpMethod, 
httpMethod=httpMethod, httpMethod=httpMethod, 
statusCode=statusCode, statusCode=statusCode, 
selectionPattern=selectionPattern, selectionPattern=selectionPattern, 
responseParameters=responseParameters, responseTemplates=responseTemplates, 
responseParameters=responseParameters, responseTemplates=responseTemplates, 
region=region, region=region, key=key, key=key, 
keyid=keyid, keyid=keyid, profile=profile, profile=profile)
```

Creates an integration response for a given method in a given API

CLI Example:

```
salt myminion boto_apigateway.create_api_integration_response restApiId=restApiId,
resourcePath=httpMethod, resourcePath=httpMethod, 
httpMethod=httpMethod, httpMethod=httpMethod, 
statusCode=statusCode, statusCode=statusCode, 
selectionPattern=selectionPattern, selectionPattern=selectionPattern, 
responseParameters=responseParameters, responseTemplates=responseTemplates, 
responseParameters=responseParameters, responseTemplates=responseTemplates, 
region=region, region=region, key=key, key=key, 
keyid=keyid, keyid=keyid, profile=profile, profile=profile)
```

salt.modules.boto_apigateway.create_api_key

```
salt myminion boto_apigateway.create_api_key name=description, description=description, 
enabled=True, enabled=True, 
stageKeys=stageKeys, region=region, key=key, key=key, 
keyid=keyid, profile=profile
```

Create an API key given name and description.

An optional enabled argument can be provided. If provided, the valid values are True|False. This argument
defaults to True.

An optional stageKeys argument can be provided in the form of list of dictionary with `restApiId' and `stageName' as keys.

CLI Example:

```
salt myminion boto_apigateway.create_api_key name=description, description=description, 
enabled=True, enabled=True, 
stageKeys=stageKeys, region=region, key=key, key=key, 
keyid=keyid, profile=profile
```

salt.modules.boto_apigateway.create_api_method

```
salt myminion boto_apigateway.create_api_method restApiId=restApiId, resourcePath=resourcePath, 
httpMethod=httpMethod, httpMethod=httpMethod, 
authorizationType=authorizationType, apiKeyRequired=False, apiKeyRequired=False, 
requestParameters=None, requestModels=None, region=region, region=region, 
key=key, key=key, keyid=keyid, keyid=keyid, profile=profile, profile=profile)
```

Creates API method for a resource in the given API

CLI Example:

```
salt myminion boto_apigateway.create_api_method restApiId=restApiId, resourcePath=resourcePath, 
httpMethod=httpMethod, httpMethod=httpMethod, 
authorizationType=authorizationType, apiKeyRequired=False, apiKeyRequired=False, 
requestParameters=None, requestModels=None, region=region, region=region, 
key=key, key=key, keyid=keyid, keyid=keyid, profile=profile, profile=profile)
```
salt.modules.boto_apigateway.create_api_method_response(restApiId, resourcePath, httpMethod, statusCode, responseParameters=None, responseModels=None, region=None, key=None, keyid=None, profile=None)

Create API method response for a method on a given resource in the given API

CLI Example:
```
salt myminion boto_apigateway.create_api_method_response restApiId resourcePath httpMethod \
  statusCode responseParameters='"name", "True|False"' responseModels='{"\n  \"content-type\", "model\"'}
```

salt.modules.boto_apigateway.create_api_model(restApiId, modelName, modelDescription, schema, contentType='application/json', region=None, key=None, keyid=None, profile=None)

Create a new model in a given API with a given schema, currently only contentType supported is `application/json`

CLI Example:
```
salt myminion boto_apigateway.create_api_model restApiId modelName modelDescription '"<schema>" \n  "content-type"'
```

salt.modules.boto_apigateway.create_api_resources(restApiId, path, region=None, key=None, keyid=None, profile=None)

Given rest api id, and an absolute resource path, create all the resources and return all resources in the resourcepath, returns False on failure.

CLI Example:
```
salt myminion boto_apigateway.create_api_resources myapi_id resource_path
```

salt.modules.boto_apigateway.create_api_stage(restApiId, stageName, deploymentId, description='', cacheClusterEnabled=False, cacheClusterSize='0.5', variables=None, region=None, key=None, keyid=None, profile=None)

Creates a new API stage for a given restApilId and deploymentId.

CLI Example:
```
salt myminion boto_apigateway.create_api_stage restApiId stagename deploymentId description='' \n  cacheClusterEnabled=True|False cacheClusterSize='0.5' \n  variables='{"name": "value"'}
```

salt.modules.boto_apigateway.create_usage_plan(name, description=None, throttle=None, quota=None, region=None, key=None, keyid=None, profile=None)

Creates a new usage plan with throttling and quotas optionally applied

New in version 2017.7.0.

name  Name of the usage plan

throttle  A dictionary consisting of the following keys:
rateLimit  requests per second at steady rate, float
burstLimit  maximum number of requests per second, integer
quota  A dictionary consisting of the following keys:
  limit  number of allowed requests per specified quota period [required if quota parameter is present]
  offset  number of requests to be subtracted from limit at the beginning of the period [optional]
  period  quota period, must be one of DAY, WEEK, or MONTH. [required if quota parameter is present]

CLI Example:

```python
salt myminion boto_apigateway.create_usage_plan name='usage plan name' throttle='{"rateLimit": 10.0, "burstLimit": 10}';
```

salt.modules.boto_apigateway.delete_api(name, description=None, region=None, key=None, keyid=None, profile=None)
Delete all REST API Service with the given name and an optional API description
Returns {deleted: True, count: deleted_count} if apis were deleted, and returns {deleted: False} if error or not found.

CLI Example:

```python
salt myminion boto_apigateway.delete_api myapi_name
salt myminion boto_apigateway.delete_api myapi_name description='api description'
```

salt.modules.boto_apigateway.delete_api_deployment(restApiId, deploymentId, region=None, key=None, keyid=None, profile=None)
Deletes API deployment for a given restApiId and deploymentID

CLI Example:

```python
salt myminion boto_apigateway.delete_api_deployent restApiId deploymentId
```

salt.modules.boto_apigateway.delete_api_integration(restApiId, resourcePath, httpMethod, region=None, key=None, keyid=None, profile=None)
Deletes an integration for a given method in a given API

CLI Example:

```python
salt myminion boto_apigateway.delete_api_integration restApiId resourcePath httpMethod
```

salt.modules.boto_apigateway.delete_api_integration_response(restApiId, resourcePath, httpMethod, status_code, region=None, key=None, keyid=None, profile=None)
Deletes an integration response for a given method in a given API

CLI Example:

```python
salt myminion boto_apigateway.delete_api_integration_response restApiId resourcePath httpMethod statusCode
```
salt.modules.boto_apigateway.delete_api_key(apiKey, region=None, key=None, keyid=None, profile=None)

Deletes a given apiKey

CLI Example:

```
salt myminion boto_apigateway.delete_api_key apikeystring
```

salt.modules.boto_apigateway.delete_api_method(restApiId, resourcePath, httpMethod, region=None, key=None, keyid=None, profile=None)

Delete API method for a resource in the given API

CLI Example:

```
salt myminion boto_apigateway.delete_api_method restApiId resourcePath httpMethod
```

salt.modules.boto_apigateway.delete_api_method_response(restApiId, resourcePath, httpMethod, statusCode, region=None, key=None, keyid=None, profile=None)

Delete API method response for a resource in the given API

CLI Example:

```
salt myminion boto_apigateway.delete_api_method_response restApiId resourcePath httpMethod statusCode
```

salt.modules.boto_apigateway.delete_api_model(restApiId, modelName, region=None, key=None, keyid=None, profile=None)

Delete a model identified by name in a given API

CLI Example:

```
salt myminion boto_apigateway.delete_api_model restApiId modelName
```

salt.modules.boto_apigateway.delete_api_resources(restApiId, path, region=None, key=None, keyid=None, profile=None)

Given restApiId and an absolute resource path, delete the resources starting from the absolute resource path. If resourcepath is the root resource `'/`, the function will return False. Returns False on failure.

CLI Example:

```
salt myminion boto_apigateway.delete_api_resources myapi_id, resource_path
```

salt.modules.boto_apigateway.delete_api_stage(restApiId, stageName, region=None, key=None, keyid=None, profile=None)

Deletes stage identified by stageName from API identified by restApId

CLI Example:

```
salt myminion boto_apigateway.delete_api_stage restApiId stageName
```

salt.modules.boto_apigateway.delete_usage_plan(plan_id, region=None, key=None, keyid=None, profile=None)

Deletes usage plan identified by plan_id

New in version 2017.7.0.
CLI Example:

```
salt myminion boto_apigateway.delete_usage_plan plan_id='usage plan id'
```

```
salt.modules.boto_apigateway.describe_api_deployment(restApiId, deploymentId, region=None, key=None, keyid=None, profile=None)
```

Get API deployment for a given restApidl and deploymentId.

CLI Example:

```
salt myminion boto_apigateway.describe_api_deployment restApiId deploymentId
```

```
salt.modules.boto_apigateway.describe_api_deployments(restApiId, region=None, key=None, keyid=None, profile=None)
```

Gets information about the defined API Deployments. Return list of api deployments.

CLI Example:

```
salt myminion boto_apigateway.describe_api_deployments restApiId
```

```
salt.modules.boto_apigateway.describe_api_integration(restApiId, resourcePath, httpMethod, region=None, key=None, keyid=None, profile=None)
```

Get an integration for a given method in a given API

CLI Example:

```
salt myminion boto_apigateway.describe_api_integration restApiId resourcePath httpMethod
```

```
salt.modules.boto_apigateway.describe_api_integration_response(restApiId, resourcePath, httpMethod, statusCode, region=None, key=None, keyid=None, profile=None)
```

Get an integration response for a given method in a given API

CLI Example:

```
salt myminion boto_apigateway.describe_api_integration_response restApiId resourcePath httpMethod statusCode
```

```
salt.modules.boto_apigateway.describe_api_key(apiKey, region=None, key=None, keyid=None, profile=None)
```

Gets info about the given api key

CLI Example:

```
salt myminion boto_apigateway.describe_api_key apigw_api_key
```

```
salt.modules.boto_apigateway.describe_api_keys(region=None, key=None, keyid=None, profile=None)
```

Gets information about the defined API Keys. Return list of apiKey.
CLI Example:

```
salt myminion boto_apigateway.describe_api_keys
```

```
salt.modules.boto_apigateway.describe_api_method(restApId, resourcePath, httpMethod, region=None, key=None, keyid=None, profile=None)
```

Get API method for a resource in the given API

CLI Example:

```
salt myminion boto_apigateway.describe_api_method restApiId resourcePath httpMethod
```

```
salt.modules.boto_apigateway.describe_api_method_response(restApId, resourcePath, httpMethod, status=Code, region=None, key=None, keyid=None, profile=None)
```

Get API method response for a resource in the given API

CLI Example:

```
salt myminion boto_apigateway.describe_api_method_response restApiId resourcePath httpMethod status=Code
```

```
salt.modules.boto_apigateway.describe_api_model(restApId, modelName, flatten=True, region=None, key=None, keyid=None, profile=None)
```

Get a model by name for a given API

CLI Example:

```
salt myminion boto_apigateway.describe_api_model restApiId modelName flatten=True
```

```
salt.modules.boto_apigateway.describe_api_models(restApId, region=None, key=None, keyid=None, profile=None)
```

Get all models for a given API

CLI Example:

```
salt myminion boto_apigateway.describe_api_models restApiId
```

```
salt.modules.boto_apigateway.describe_api_resource(restApId, path, region=None, key=None, keyid=None, profile=None)
```

Given rest api id, and an absolute resource path, returns the resource id for the given path.

CLI Example:

```
salt myminion boto_apigateway.describe_api_resource myapi_id resource_path
```

```
salt.modules.boto_apigateway.describe_api_resource_method(restApId, resourcePath, httpMethod, region=None, key=None, keyid=None, profile=None)
```

Given rest api id, resource path, and http method (must be one of DELETE, GET, HEAD, OPTIONS, PATCH, POST, PUT), return the method for the api/resource path if defined. Return False if method is not defined.
CLI Example:
```
salt myminion boto_apigateway.describe_api_resource_method myapi_id resource_path\n  \nhttpmethod
```

```
salt.modules.boto_apigateway.describe_api_resources(restApiId, region=None, key=None, keyid=None, profile=None)
```

Given rest api id, return all resources for this api.

CLI Example:
```
salt myminion boto_apigateway.describe_api_resources myapi_id
```

```
salt.modules.boto_apigateway.describe_api_stage(restApiId, stageName, region=None, key=None, keyid=None, profile=None)
```

Get API stage for a given apiID and stage name

CLI Example:
```
salt myminion boto_apigateway.describe_api_stage restApiId stageName
```

```
salt.modules.boto_apigateway.describe_api_stages(restApiId, deploymentId, region=None, key=None, keyid=None, profile=None)
```

Get all API stages for a given apiID and deploymentID

CLI Example:
```
salt myminion boto_apigateway.describe_api_stages restApiId deploymentId
```

```
salt.modules.boto_apigateway.describe_apis(name=None, description=None, region=None, key=None, keyid=None, profile=None)
```

Returns all rest apis in the defined region. If optional parameter name is included, returns all rest apis matching the name in the defined region.

CLI Example:
```
salt myminion boto_apigateway.describe_apis
salt myminion boto_apigateway.describe_apis name='api name'
salt myminion boto_apigateway.describe_apis name='api name' description='desc str'
```

```
salt.modules.boto_apigateway.describe_usage_plans(name=None, plan_id=None, region=None, key=None, keyid=None, profile=None)
```

Returns a list of existing usage plans, optionally filtered to match a given plan name

New in version 2017.7.0.

CLI Example:
```
salt myminion boto_apigateway.describe_usage_plans
salt myminion boto_apigateway.describe_usage_plans name='usage plan name'
salt myminion boto_apigateway.describe_usage_plans plan_id='usage plan id'
```
salt.modules.boto_apigateway.detach_usage_plan_from_apis(plan_id, apis, region=None, key=None, keyid=None, profile=None)

Detaches given usage plan from each of the apis provided in a list of apid and stage value

New in version 2017.7.0.

apis a list of dictionaries, where each dictionary contains the following:

    apid  a string, which is the id of the created API in AWS ApiGateway
    stage a string, which is the stage that the created API is deployed to.

CLI Example:

    salt myminion boto_apigateway.detach_usage_plan_to_apis plan_id='usage plan id' api-apis='[["apid": "some id 1", "stage": "some stage 1"]]

salt.modules.boto_apigateway.disable_api_key(apiKey, region=None, key=None, keyid=None, profile=None)

disable the given apiKey.

CLI Example:

    salt myminion boto_apigateway.enable_api_key api_key

salt.modules.boto_apigateway.disassociate_api_key_stagekeys(apiKey, stagekeyslist, region=None, key=None, keyid=None, profile=None)

disassociate the given stagekeyslist to the given apiKey.

CLI Example:

    salt myminion boto_apigateway.disassociate_stagekeys_api_key \
    api_key '["restapi id/stage name", ...]

salt.modules.boto_apigateway.enable_api_key(apiKey, region=None, key=None, keyid=None, profile=None)

enable the given apiKey.

CLI Example:

    salt myminion boto_apigateway.enable_api_key api_key

salt.modules.boto_apigateway.flush_api_stage_cache(restApiId, stageName, region=None, key=None, keyid=None, profile=None)

Flushes cache for the stage identified by stageName from API identified by restApiId

CLI Example:

    salt myminion boto_apigateway.flush_api_stage_cache restApiId stageName

salt.modules.boto_apigatewayoverwrite_api_stage_variables(restApilId, stageName, variables, region=None, key=None, keyid=None, profile=None)

Overwrite the stage variables for the given restApilId and stage name with the given variables, variables must

1162 Chapter 19. Salt Module Reference
be in the form of a dictionary. Overwrite will always remove all the existing stage variables associated with the
given restApiId and stage name, follow by the adding of all the variables specified in the variables dictionary

CLI Example:

```
salt myminion boto_apigateway.overwrite_api_stage_variables restApiId stageName
    --variables='{"name": "value"}'
```

salt.modules.boto_apigateway.update_api_key_description(apiKey, description, region=None, key=None, keyid=None, profile=None)

update the given apiKey with the given description.

CLI Example:

```
salt myminion boto_apigateway.update_api_key_description apiKey description
```

salt.modules.boto_apigateway.update_api_model_schema(restApiId, modelName, schema, region=None, key=None, keyid=None, profile=None)

update the schema (in python dictionary format) for the given model in the given restApild

CLI Example:

```
salt myminion boto_apigateway.update_api_model_schema restApiId modelName schema
```

salt.modules.boto_apigateway.update_usage_plan(plan_id, throttle=None, quota=None, region=None, key=None, keyid=None, profile=None)

Updates an existing usage plan with throttling and quotas

New in version 2017.7.0.

- **plan_id** Id of the created usage plan
- **throttle** A dictionary consisting of the following keys:
  - **rateLimit** requests per second at steady rate, float
  - **burstLimit** maximum number of requests per second, integer
- **quota** A dictionary consisting of the following keys:
  - **limit** number of allowed requests per specified quota period [required if quota parameter is present]
  - **offset** number of requests to be subtracted from limit at the beginning of the period [optional]
  - **period** quota period, must be one of DAY, WEEK, or MONTH. [required if quota parameter is present]

CLI Example:

```
salt myminion boto_apigateway.update_usage_plan plan_id='usage plan id' throttle=
    --{"rateLimit": 10.0, "burstLimit": 10}'
```

**19.9.30 salt.modules.boto_asg**

Connection module for Amazon Autoscale Groups

New in version 2014.7.0.

- **configuration** This module accepts explicit autoscale credentials but can also utilize IAM roles assigned
to the instance through Instance Profiles. Dynamic credentials are then automatically obtained
from AWS API and no further configuration is necessary. More Information available at:
If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```python
asg.keyid: GKTADJGHEIQSXMKKRBJ08H
asg.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```python
asg.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```python
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

```python
depends boto
depends boto3
```

```python
salt.modules.boto_asg.create(name, launch_config_name, availability_zones, min_size, max_size, desired_capacity=None, load_balancers=None, default_cooldown=None, health_check_type=None, health_check_period=None, placement_group=None, vpc_zone_identifier=None, tags=None, termination_policies=None, suspended_processes=None, scaling_policies=None, scheduled_actions=None, region=None, notification_arn=None, notification_types=None, key=None, keyid=None, profile=None)
```

Create an autoscale group.

CLI example:

```bash
salt myminion boto_asg.create myasg mylc ['"us-east-1a", "us-east-1e"]' 1 10 load_balancers='["myelb", "myelb2"]' tags='["key": "Name", value="myasg", 
"propagate_at_launch": True]'
```
salt.modules.boto_asg.create_launch_configuration(name, image_id, key_name=None, vpc_id=None, vpc_name=None, security_groups=None, user_data=None, instance_type='m1.small', key_name=None, ramdisk_id=None, block_device_mappings=None, instance_monitoring=False, spot_price=None, instance_profile_name=None, ebs_optimized=False, associate_public_ip_address=None, volume_type=None, delete_on_termination=True, iops=None, use_block_device_types=False, region=None, key=None, keyid=None, profile=None)

Create a launch configuration.

CLI example:

```
salt myminion boto_asg.create_launch_configuration mylc image_id=ami-0b9c9f62 key_--name='mykey' security_groups='["mygroup"]' instance_type='c3.2xlarge'
```

salt.modules.boto_asg.delete(name, force=False, region=None, key=None, keyid=None, profile=None)

Delete an autoscale group.

CLI example:

```
salt myminion boto_asg.delete myasg region=us-east-1
```

salt.modules.boto_asg.delete_launch_configuration(name, region=None, key=None, keyid=None, profile=None)

Delete a launch configuration.

CLI example:

```
salt myminion boto_asg.delete_launch_configuration mylc
```

salt.modules.boto_asg.describe_launch_configuration(name, region=None, key=None, keyid=None, profile=None)

Dump details of a given launch configuration.

CLI example:

```
salt myminion boto_asg.describe_launch_configuration mylc
```

salt.modules.boto_asg.enter_standby(name, instance_ids, should_decrement_desired_capacity=False, region=None, key=None, keyid=None, profile=None)

Switch desired instances to StandBy mode

New in version 2016.11.0.

CLI example:

```
salt-call boto_asg.enter_standby my_autoscale_group_name 'i-xxxxxx'
```
salt.modules.boto_asg.exists(name, region=None, key=None, keyid=None, profile=None)
Check to see if an autoscale group exists.

CLI example:
```
salt myminion boto_asg.exists myasg region=us-east-1
```

salt.modules.boto_asg.exit_standby(name, instance_ids, should_decrement_desired_capacity=False, region=None, key=None, keyid=None, profile=None)

Exit desired instances from StandBy mode

New in version 2016.11.0.

CLI example:
```
salt-call boto_asg.exit_standby my_autoscale_group_name '[["i-xxxxxx"]]' region=us-east-1
```

salt.modules.boto_asg.get_all_groups(region=None, key=None, keyid=None, profile=None)

Return all AutoScale Groups visible in the account (as a list of boto.ec2.autoscale.group.AutoScalingGroup).

New in version 2016.11.0.

CLI example:
```
salt-call boto_asg.get_all_groups region=us-east-1 --output yaml
```

salt.modules.boto_asg.get_all_launch_configurations(region=None, key=None, keyid=None, profile=None)

Fetch and return all Launch Configuration with details.

CLI example:
```
salt myminion boto_asg.get_all_launch_configurations
```

salt.modules.boto_asg.get_cloud_init_mime(cloud_init)
Get a mime multipart encoded string from a cloud-init dict. Currently supports scripts and cloud-config.

CLI Example:
```
salt myminion boto.get_cloud_init_mime <cloud init>
```

salt.modules.boto_asg.get_config(name, region=None, key=None, keyid=None, profile=None)
Get the configuration for an autoscale group.

CLI example:
```
salt myminion boto_asg.get_config myasg region=us-east-1
```

salt.modules.boto_asg.get_instances(name, lifecycle_state='InService', health_status='Healthy', attribute='private_ip_address', attributes=None, region=None, key=None, keyid=None, profile=None)

return attribute of all instances in the named autoscale group.

CLI example:
```
salt-call boto_asg.get_instances my_autoscale_group_name
```

salt.modules.boto_asg.get_scaling_policy_arn(as_group, scaling_policy_name, region=None, key=None, keyid=None, profile=None)

Return the arn for a scaling policy in a specific autoscale group or None if not found. Mainly used as a helper
method for boto_cloudwatch_alarm, for linking alarms to scaling policies.

CLI Example:

```bash
salt '*' boto_asg.get_scaling_policy_arn mygroup mypolicy
```

salt.modules.boto_asg.launch_configuration_exists(name,  
region=None,  
key=None,  
keyid=None,  
profile=None)

Check for a launch configuration's existence.

CLI example:

```bash
salt myminion boto_asg.launch_configuration_exists mylc
```

salt.modules.boto_asg.list_groups(region=None,  
key=None,  
keyid=None,  
profile=None)

Return all AutoScale Groups visible in the account (as a list of names).

New in version 2016.11.0.

CLI example:

```bash
salt-call boto_asg.list_groups region=us-east-1
```

salt.modules.boto_asg.list_launch_configurations(region=None,  
key=None,  
keyid=None,  
profile=None)

List all Launch Configurations.

CLI example:

```bash
salt myminion boto_asg.list_launch_configurations
```

salt.modules.boto_asg.update(name,  
launch_config_name,  
availability_zones,  
min_size,  
max_size,  
desired_capacity=None,  
load_balancers=None,  
default_cooldown=None,  
health_check_type=None,  
health_check_period=None,  
placement_group=None,  
vpc_zone_identifier=None,  
tags=None,  
termination_policies=None,  
suspended_processes=None,  
scaling_policies=None,  
scheduled_actions=None,  
notification_arn=None,  
notification_types=None,  
region=None,  
key=None,  
keyid=None,  
profile=None)

Update an autoscale group.

CLI example:

```bash
salt myminion boto_asg.update myasg mylc 
["us-east-1a",  
"us-east-1e"]  
1 10  
load_ 
balancers=['"myelb",  
"myelb2"]  
tags={'"key":"Name",  
value="myasg",  
"propagate_at_launch": True}]
```

19.9.31 salt.modules.boto_cfn

Connection module for Amazon Cloud Formation

New in version 2015.5.0.

configuration  This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:
If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:

```python
cfn.keyid: GKTADJGHEIQSXMKKRBJ08H
cfn.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```python
cfn.region: us-east-1
```

depends boto

```
salt.modules.boto_cfn.create(name, template_body=None, template_url=None, parameters=None, notification_arns=None, disable_rollback=None, timeout_in_minutes=None, capabilities=None, tags=None, on_failure=None, stack_policy_body=None, stack_policy_url=None, region=None, key=None, keyid=None, profile=None)
```

Create a CFN stack.

CLI example to create a stack:

```
salt myminion boto_cfn.create mystack template_url='https://s3.amazonaws.com/bucket/template.cft' region=us-east-1
```

```
salt.modules.boto_cfn.delete(name, region=None, key=None, keyid=None, profile=None)
```

Delete a CFN stack.

CLI example to delete a stack:

```
salt myminion boto_cfn.delete mystack region=us-east-1
```

```
salt.modules.boto_cfn.describe(name, region=None, key=None, keyid=None, profile=None)
```

Describe a stack.

New in version 2015.8.0.

CLI example:

```
salt myminion boto_cfn.describe mystack region=us-east-1
```

```
salt.modules.boto_cfn.exists(name, region=None, key=None, keyid=None, profile=None)
```

Check to see if a stack exists.

CLI example:

```
salt myminion boto_cfn.exists mystack region=us-east-1
```

```
salt.modules.boto_cfn.get_template(name, region=None, key=None, keyid=None, profile=None)
```

Check to see if attributes are set on a CFN stack.

CLI example:

```
salt myminion boto_cfn.get_template mystack
```
salt.modules.boto_cfn.update_stack(
    name, template_body=None, template_url=None,
    parameters=None, notification_arns=None, disable_rollback=False,
    timeout_in_minutes=None, capabilities=None, tags=None, use_previous_template=None,
    stack_policy_during_update_body=None,
    stack_policy_during_update_url=None,
    stack_policy_body=None, stack_policy_url=None, region=None, key=None, keyid=None, profile=None)

Update a CFN stack.
New in version 2015.8.0.

CLI example to update a stack:

salt myminion boto_cfn.update_stack mystack template_url='https://s3.amazonaws.com/bucket/template.cft' region=us-east-1

salt.modules.boto_cfn.validate_template(
    template_body=None, template_url=None,
    region=None, key=None, keyid=None, profile=None)

Validate cloudformation template
New in version 2015.8.0.

CLI example:

salt myminion boto_cfn.validate_template mystack-template

19.9.32 salt.modules.boto_cloudtrail module

Connection module for Amazon CloudTrail
New in version 2016.3.0.

depends

• boto

• boto3

The dependencies listed above can be installed via package or pip.

configuration This module accepts explicit Lambda credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

cloudtrail.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudtrail.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

A region may also be specified in the configuration:

cloudtrail.region: us-east-1

If a region is not specified, the default is us-east-1.
It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```python
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: asdjkghsdjfhgjklgjsdfjajgks
    region: us-east-1
```

```python
salt.modules.boto_cloudtrail.add_tags(Name, region=None, key=None, keyid=None, profile=None, **kwargs)
```

Add tags to a trail

Returns {tagged: true} if the trail was tagged and returns {tagged: False} if the trail was not tagged.

CLI Example:

```
salt myminion boto_cloudtrail.add_tags my_trail tag_a=tag_value tag_b=tag_value
```

```python
salt.modules.boto_cloudtrail.create(Name, S3BucketName, S3KeyPrefix=None, SnsTopicName=None, IncludeGlobalServiceEvents=None, IsMultiRegionTrail=None, EnableLogFileValidation=None, CloudWatchLogsLogGroupArn=None, CloudWatchLogsRoleArn=None, KmsKeyId=None, region=None, key=None, keyid=None, profile=None)
```

Given a valid config, create a trail.

Returns {created: true} if the trail was created and returns {created: False} if the trail was not created.

CLI Example:

```
salt myminion boto_cloudtrail.create my_trail my_bucket
```

```python
salt.modules.boto_cloudtrail.delete(Name, region=None, key=None, keyid=None, profile=None)
```

Given a trail name, delete it.

Returns {deleted: true} if the trail was deleted and returns {deleted: false} if the trail was not deleted.

CLI Example:

```
salt myminion boto_cloudtrail.delete mytrail
```

```python
salt.modules.boto_cloudtrail.describe(Name, region=None, key=None, keyid=None, profile=None)
```

Given a trail name describe its properties.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_cloudtrail.describe mytrail
```

```python
salt.modules.boto_cloudtrail.exists(Name, region=None, key=None, keyid=None, profile=None)
```

Given a trail name, check to see if the given trail exists.

Returns True if the given trail exists and returns False if the given trail does not exist.

CLI Example:
salt myminion boto_cloudtrail.exists mytrail

salt.modules.boto_cloudtrail.list(region=None, key=None, keyid=None, profile=None)
List all trails
Returns list of trails
CLI Example:

policies:
- {...}
- {...}

salt.modules.boto_cloudtrail.list_tags(Name, region=None, key=None, keyid=None, profile=None)
List tags of a trail
Returns

- {...}
- {...}

Return type tags
CLI Example:
salt myminion boto_cloudtrail.list_tags my_trail

salt.modules.boto_cloudtrail.remove_tags(Name, region=None, key=None, keyid=None, profile=None, **kwargs)
Remove tags from a trail
Returns {tagged: true} if the trail was tagged and returns {tagged: False} if the trail was not tagged.
CLI Example:
salt myminion boto_cloudtrail.remove_tags my_trail tag_a=tag_value tag_b=tag_value

salt.modules.boto_cloudtrail.start_logging(Name, region=None, key=None, keyid=None, profile=None)
Start logging for a trail
Returns {started: true} if the trail was started and returns {started: False} if the trail was not started.
CLI Example:
salt myminion boto_cloudtrail.start_logging my_trail

salt.modules.boto_cloudtrail.status(Name, region=None, key=None, keyid=None, profile=None)
Given a trail name describe its properties.
Returns a dictionary of interesting properties.
CLI Example:
salt myminion boto_cloudtrail.describe mytrail

salt.modules.boto_cloudtrail.stop_logging(Name, region=None, key=None, keyid=None, profile=None)
Stop logging for a trail
Returns {stopped: true} if the trail was stopped and returns {stopped: False} if the trail was not stopped.
Salt Documentation, Release 2017.7.8

CLI Example:
```
salt myminion boto_cloudtrail.stop_logging my_trail
```

```
salt.modules.boto_cloudtrail.update(Name, S3BucketName, S3KeyPrefix=None, SnsTopicName=None, IncludeGlobalServiceEvents=None, IsMultiRegionTrail=None, EnableLogFileValidation=None, CloudWatchLogsLogGroupArn=None, CloudWatchLogsRoleArn=None, KmsKeyId=None, region=None, key=None, keyid=None, profile=None)
```

Given a valid config, update a trail. It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:
```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdklglgjsdfjajkghs
  region: us-east-1
```

Returns {created: true} if the trail was created and returns {created: False} if the trail was not created.

CLI Example:
```
salt myminion boto_cloudtrail.update my_trail my_bucket
```

19.9.33 salt.modules.boto_cloudwatch

Connection module for Amazon CloudWatch

New in version 2014.7.0.

**configuration**

This module accepts explicit credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:
```
cloudwatch.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudwatch.key: askdjghsdfjkghWupUjasdflkdklglgjsdfjajkghs
```

A region may also be specified in the configuration:
```
cloudwatch.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:
```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdklglgjsdfjajkghs
  region: us-east-1
```

**depends**

```
salt.modules.boto_cloudwatch.convert_to_arn(arns, region=None, key=None, keyid=None, profile=None)
```

Convert a list of strings into actual arns. Converts convenience names such as `scaling_policy:...`

CLI Example:
Create or update a cloudwatch alarm.

Dimensions must be a dict. If the value of Dimensions is a string, it will be json decoded to produce a dict. `alarm_actions`, `insufficient_data_actions`, and `ok_actions` must be lists of string. If the passed-in value is a string, it will be split on ',' to produce a list. The strings themselves for `alarm_actions`, `insufficient_data_actions`, and `ok_actions` must be Amazon resource names (ARN’s); however, this method also supports an arn lookup notation, as follows:

```
arn:aws:.... ARN as per http://docs.aws.amazon.com/general/latest/gr/aws-arns-and-namespaces.html
```

This is convenient for setting up autoscaling as follows. First specify a boto_asg.present state for an ASG with `scaling_policies`, and then set up boto_cloudwatch_alarm.present states which have `alarm_actions` that reference the `scaling_policy`.

**CLI example:**

```
salt myminion boto_cloudwatch.create_alarm name=myalarm ... region=us-east-1
```

Delete a cloudwatch alarm

**CLI example to delete a queue:**

```
salt myminion boto_cloudwatch.delete_alarm myalarm region=us-east-1
```

Get alarm details. Also can be used to check to see if an alarm exists.

**CLI example:**

```
salt myminion boto_cloudwatch.get_alarm myalarm region=us-east-1
```

Get all alarm details. Produces results that can be used to create an sls file.

If prefix parameter is given, alarm names in the output will be prepended with the prefix; alarms that have the prefix will be skipped. This can be used to convert existing alarms to be managed by salt, as follows:

1. Make a `backup` of all existing alarms

   ```bash
   $ salt-call boto_cloudwatch.get_all_alarms --out-txt | sed "s/local: //" > legacy_alarms.sls
   ```
2. Get all alarms with new prefixed names
   $ salt-call boto_cloudwatch.get_all_alarms 'prefix="MANAGED BY SALT"' --out=txt | sed "s/local: //" | > managed_alarms.sls

3. Insert the managed alarms into cloudwatch
   $ salt-call state.template managed_alarms.sls

4. Manually verify that the new alarms look right

5. Delete the original alarms
   $ sed s/present/absent/ legacy_alarms.sls | > remove_legacy_alarms.sls
   $ salt-call state.template remove_legacy_alarms.sls

6. Get all alarms again, verify no changes
   $ salt-call boto_cloudwatch.get_all_alarms --out=txt | sed "s/local: //" | > final_alarms.sls
   $ diff final_alarms.sls managed_alarms.sls

   CLI example:
   
   ```
   salt myminion boto_cloudwatch.get_all_alarms region=us-east-1 --out-txt
   ```

19.9.34 salt.modules.boto_cloudwatch_event module

Connection module for Amazon CloudWatch Events

New in version 2016.11.0.

configuration

This module accepts explicit credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
```

If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:

```
cloudwatch_event.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudwatch_event.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
cloudwatch_event.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQXSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

depends boto3

salt.modules.boto_cloudwatch_event.create_or_update

Given a valid config, create an event rule.

Returns {created: true} if the rule was created and returns {created: False} if the rule was not created.

CLI Example:
salt myminion boto_cloudwatch_event.create_or_update my_rule

salt.modules.boto_cloudwatch_event.delete(Name, region=None, key=None, keyid=None, profile=None)

Given a rule name, delete it.
Returns [deleted: true] if the rule was deleted and returns [deleted: false] if the rule was not deleted.
CLI Example:
salt myminion boto_cloudwatch_event.delete myrule

salt.modules.boto_cloudwatch_event.describe(Name, region=None, key=None, keyid=None, profile=None)

Given a rule name describe its properties.
Returns a dictionary of interesting properties.
CLI Example:
salt myminion boto_cloudwatch_event.describe myrule

salt.modules.boto_cloudwatch_event.exists(Name, region=None, key=None, keyid=None, profile=None)

Given a rule name, check to see if the given rule exists.
Returns True if the given rule exists and returns False if the given rule does not exist.
CLI example:
salt myminion boto_cloudwatch_event.exists myevent region=us-east-1

salt.modules.boto_cloudwatch_event.list_rules(region=None, key=None, keyid=None, profile=None)

List, with details, all Cloudwatch Event rules visible in the current scope.
CLI example:
salt myminion boto_cloudwatch_event.list_rules region=us-east-1

salt.modules.boto_cloudwatch_event.list_targets(Rule, region=None, key=None, keyid=None, profile=None)

Given a rule name list the targets of that rule.
Returns a dictionary of interesting properties.
CLI Example:
salt myminion boto_cloudwatch_event.list_targets myrule

salt.modules.boto_cloudwatch_event.put_targets(Rule, Targets, region=None, key=None, keyid=None, profile=None)

Add the given targets to the given rule
Returns a dictionary describing any failures.
CLI Example:
salt myminion boto_cloudwatch_event.put_targets myrule [{'Id': 'target1', 'Arn': 'arn:***'}]
salt.modules.boto_cloudwatch_event.remove_targets(Rule, Ids, region=None, key=None, keyid=None, profile=None)

Given a rule name remove the named targets from the target list
Returns a dictionary describing any failures.

CLI Example:
```
salt myminion boto_cloudwatch_event.remove_targets myrule ['Target1']
```

19.9.35 salt.modules.boto_cognitoidentity module

Connection module for Amazon CognitoIdentity
New in version 2016.11.0.

**configuration** This module accepts explicit CognitoIdentity credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
cognitoidentity.keyid: GKTADJGHEIQSXMKKRBJ08H
cognitoidentity.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
cognitoidentity.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

Changed in version 2015.8.0: All methods now return a dictionary. Create, delete, set, and update methods return:

```
created: true
```

or

```
created: false
error:
  message: error message
```

Request methods (e.g., `describe_identity_pools`) return:

```
identity_pools:
- {...}
- {...}
```
error:
message: error message

depends boto3

salt.modules.boto_cognitoidentity.create_identity_pool(IdentityPoolName, AllowUnauthenticatedIdentities=False, SupportedLoginProviders=None, DeveloperProviderName=None, OpenIdConnectProviderARNs=None, region=None, key=None, keyid=None, profile=None)

Creates a new identity pool. All parameters except for IdentityPoolName is optional. SupportedLoginProviders should be a dictionary mapping provider names to provider app IDs. OpenIdConnectProviderARNs should be a list of OpenID Connect provider ARNs.

Returns the created identity pool if successful

CLI Example:
salt myminion boto_cognitoidentity.create_identity_pool my_id_pool_name

  DeveloperProviderName=custom_developer_provider

salt.modules.boto_cognitoidentity.delete_identity_pools(IdentityPoolName, IdentityPoolId=None, region=None, key=None, keyid=None, profile=None)

Given an identity pool name, (optionally if an identity pool id is given, the given name will be ignored)

Deletes all identity pools matching the given name, or the specific identity pool with the given identity pool id.

CLI Example:
salt myminion boto_cognitoidentity.delete_identity_pools my_id_pool_name

salt.myminion boto_cognitoidentity.delete_identity_pools '' IdentityPoolId=my_id_pool_id

salt.modules.boto_cognitoidentity.describe_identity_pools(IdentityPoolName, IdentityPoolId=None, region=None, key=None, keyid=None, profile=None)

Given an identity pool name, (optionally if an identity pool id is given, the given name will be ignored)

Returns a list of matched identity pool name's pool properties

CLI Example:
salt myminion boto_cognitoidentity.describe_identity_pools my_id_pool_name

salt.myminion boto_cognitoidentity.describe_identity_pools '' IdentityPoolId=my_id_pool_id
Salt Documentation, Release 2017.7.8

salt.modules.boto_cognitoidentity.get_identity_pool_roles(IdentityPoolName, IdentityPoolId=None, region=None, key=None, keyid=None, profile=None)

Given an identity pool name, (optionally if an identity pool id if given, the given name will be ignored)

Returns a list of matched identity pool name's associated roles

CLI Example:

```
salt myminion boto_cognitoidentity.get_identity_pool_roles my_id_pool_name
salt myminion boto_cognitoidentity.get_identity_pool_roles ''IdentityPoolId=my_id_pool_id
```

salt.modules.boto_cognitoidentity.set_identity_pool_roles(IdentityPoolId, AuthenticatedRole=None, UnauthenticatedRole=None, region=None, key=None, keyid=None, profile=None)

Given an identity pool id, set the given AuthenticatedRole and UnauthenticatedRole (the Role can be an iam arn, or a role name) If AuthenticatedRole or UnauthenticatedRole is not given, the authenticated and/or the unauthenticated role associated previously with the pool will be cleared.

Returns set True if successful, set False if unsuccessful with the associated errors.

CLI Example:

```
salt myminion boto_cognitoidentity.set_identity_pool_roles my_id_pool_roles # this clears the roles
salt myminion boto_cognitoidentity.set_identity_pool_roles my_id_pool_id # AuthenticatedRole=my_auth_role UnauthenticatedRole=my_unauth_role # this set both roles
salt myminion boto_cognitoidentity.set_identity_pool_roles my_id_pool_id # AuthenticatedRole=my_auth_role # this will set the auth role and clear the unauth role
salt myminion boto_cognitoidentity.set_identity_pool_roles my_id_pool_id # UnauthenticatedRole=my_unauth_role # this will set the unauth role and clear the auth role
```

salt.modules.boto_cognitoidentity.update_identity_pool(IdentityPoolId, IdentityPoolName=None, AllowUnauthenticatedIds=False, SupportedLoginProviders=None, DeveloperProviderName=None, OpenIdConnectProviderARNs=None, region=None, key=None, keyid=None, profile=None)

Updates the given IdentityPoolId's properties. All parameters except for IdentityPoolId, is optional. SupportedLoginProviders should be a dictionary mapping provider names to provider app IDs. OpenIdConnectProviderARNs should be a list of OpenID Connect provider ARNs.

To clear SupportedLoginProviders pass `[]`
To clear OpenIdConnectProviderARNs pass `[]`
boto3 api prevents DeveloperProviderName to be updated after it has been set for the first time.
Returns the updated identity pool if successful
CLI Example:

```
salt myminion boto_cognitoidentity.update_identity_pool my_id_pool_id my_id_pool_name
    DeveloperProviderName=custom_developer_provider
```

19.9.36 salt.modules.boto_datapipeline module

Connection module for Amazon Data Pipeline
New in version 2016.3.0.

```
depends boto3
```

salt.modules.boto_datapipeline.activate_pipeline(pipeline_id, region=None, key=None,
    keyid=None, profile=None)

Start processing pipeline tasks. This function is idempotent.
CLI example:

```
salt myminion boto_datapipeline.activate_pipeline my_pipeline_id
```

salt.modules.boto_datapipeline.create_pipeline(name, unique_id, description='`
    region=None, key=None, keyid=None, profile=None)

Create a new, empty pipeline. This function is idempotent.
CLI example:

```
salt myminion boto_datapipeline.create_pipeline my_name my_unique_id
```

salt.modules.boto_datapipeline.delete_pipeline(pipeline_id, region=None, key=None,
    keyid=None, profile=None)

Delete a pipeline, its pipeline definition, and its run history. This function is idempotent.
CLI example:

```
salt myminion boto_datapipeline.delete_pipeline my_pipeline_id
```

salt.modules.boto_datapipeline.describe_pipelines(pipeline_ids, region=None,
    key=None, keyid=None, profile=None)

Retrieve metadata about one or more pipelines.
CLI example:

```
salt myminion boto_datapipeline.describe_pipelines ['my_pipeline_id']
```

salt.modules.boto_datapipeline.get_pipeline_definition(pipeline_id, version='latest',
    region=None, key=None, keyid=None, profile=None)

Get the definition of the specified pipeline.
CLI example:

```
salt myminion boto_datapipeline.get_pipeline_definition my_pipeline_id
```
salt.modules.boto_datapipeline.list_pipelines(region=None, key=None, keyid=None, profile=None)

Get a list of pipeline ids and names for all pipelines.

CLI Example:
```
salt myminion boto_datapipeline.list_pipelines profile=myprofile
```

salt.modules.boto_datapipeline.pipeline_id_from_name(name, region=None, key=None, keyid=None, profile=None)

Get the pipeline id, if it exists, for the given name.

CLI example:
```
salt myminion boto_datapipeline.pipeline_id_from_name my_pipeline_name
```

salt.modules.boto_datapipeline.put_pipeline_definition(pipeline_id, pipeline_objects, parameter_objects=None, parameter_values=None, region=None, key=None, keyid=None, profile=None)

Add tasks, schedules, and preconditions to the specified pipeline. This function is idempotent and will replace an existing definition.

CLI example:
```
salt myminion boto_datapipeline.put_pipeline_definition my_pipeline_id my_pipeline_objects
```

19.9.37 salt.modules.boto_dynamodb

Connection module for Amazon DynamoDB

New in version 2015.5.0.

configuration  
This module accepts explicit DynamoDB credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
```

If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:

```
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
region: us-east-1
```

If a region is not specified, the default is us-east-1.

It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:
depends boto

```
myprofile:
  keyid: GKTADJGHEIQXSXMRSKRBDI
  key: askdjghsdfjksghWupUjasdfsdfklgjsdfajkghs
  region: us-east-1
```

class create_global_secondary_index (table_name, global_index, region=None, key=None, keyid=None, profile=None)

Creates a single global secondary index on a DynamoDB table.

CLI Example: .. code-block:: bash

```
salt myminion boto_dynamodb.create_global_secondary_index table_name / index_name
```

class create_table (table_name, region=None, key=None, keyid=None, profile=None, read_capacity_units=None, write_capacity_units=None, hash_key=None, hash_key_data_type=None, range_key=None, range_key_data_type=None, local_indexes=None, global_indexes=None)

Creates a DynamoDB table.

CLI Example:

```
salt myminion boto_dynamodb.create_table table_name / region=us-east-1 / hash_key=id / hash_key_data_type=N / range_key=created_at / range_key_data_type=N / read_capacity_units=1 / write_capacity_units=1
```

class delete (table_name, region=None, key=None, keyid=None, profile=None)

Delete a DynamoDB table.

CLI Example:

```
salt myminion boto_dynamodb.delete table_name region=us-east-1
```

class describe (table_name, region=None, key=None, keyid=None, profile=None)

Describe a DynamoDB table.

CLI example:

```
salt myminion boto_dynamodb.describe table_name region=us-east-1
```

class exists (table_name, region=None, key=None, keyid=None, profile=None)

Check to see if a table exists.

CLI Example:
salt myminion boto_dynamodb.exists table_name region=us-east-1

salt.modules.boto_dynamodb.**extract_index**(index_data, global_index=False)

  Instantiates and returns an AllIndex object given a valid index configuration

  CLI Example: salt myminion boto_dynamodb.extract_index

salt.modules.boto_dynamodb.**update**(table_name, throughput=None, global_indexes=None, region=None, key=None, keyid=None, profile=None)

  Update a DynamoDB table.

  CLI example:

  salt myminion boto_dynamodb.update table_name region=us-east-1

salt.modules.boto_dynamodb.**update_global_secondary_index**(table_name, global_indexes, region=None, key=None, keyid=None, profile=None)

  Updates the throughput of the given global secondary indexes.

  CLI Example: .. code-block:: bash

  salt myminion boto_dynamodb.update_global_secondary_index table_name / indexes

**19.9.38 salt.modules.boto_ec2**

Connection module for Amazon EC2

New in version 2015.8.0.

  **configuration** This module accepts explicit EC2 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available [here](#).

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
ec2.keyid: GKTADJGHEIQSXMKKRBJ08H
ec2.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
ec2.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid, and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

  **depends** boto

salt.modules.boto_ec2.**allocate_eip_address**(domain=None, region=None, key=None, keyid=None, profile=None)

  Allocate a new Elastic IP address and associate it with your account.
domain (string) Optional param - if set to exactly `vpc', the address will be allocated to the VPC. The default simply maps the EIP to your account container.
returns (dict) dict of ‘interesting’ information about the newly allocated EIP, with probably the most interesting keys being ‘public_ip’ and ‘allocation_id’ iff ‘domain=vpc’ was passed.

CLI Example:
salt-call boto_ec2.allocate_eip_address domain=vpc

New in version 2016.3.0.
salt.modules.boto_ec2.assign_private_ip_addresses(network_interface_id=None, private_ip_addresses=None, secondary_private_ip_address_count=None, allow_reassignment=False, region=None, key=None, keyid=None, profile=None)

Assigns one or more secondary private IP addresses to a network interface.

network_interface_id (string) - ID of the network interface to associate the IP with (exclusive with `network_interface_name')
network_interface_name (string) - Name of the network interface to associate the IP with (exclusive with `network_interface_id')
private_ip_addresses (list) - Assigns the specified IP addresses as secondary IP addresses to the network interface (exclusive with `secondary_private_ip_address_count')
secondary_private_ip_address_count (int) - The number of secondary IP addresses to assign to the network interface (exclusive with `private_ip_addresses')
allow_reassociation (bool) – Allow a currently associated EIP to be re-associated with the new instance or interface.
returns (bool) - True on success, False on failure.

CLI Example:
salt myminion boto_ec2.assign_private_ip_addresses network_interface_name=my_eni
  private_ip_addresses=private_ip
salt myminion boto_ec2.assign_private_ip_addresses network_interface_name=my_eni
  secondary_private_ip_address_count=2

New in version 2017.7.0.
salt.modules.boto_ec2.associate_eip_address(instance_id=None, instance_name=None, public_ip=None, allocation_id=None, network_interface_id=None, network_interface_name=None, private_ip_address=None, allow_reassociation=False, region=None, key=None, keyid=None, profile=None)

Associate an Elastic IP address with a currently running instance or a network interface. This requires exactly one of either `public_ip' or `allocation_id', depending on whether you’re associating a VPC address or a plain EC2 address.

instance_id (string) – ID of the instance to associate with (exclusive with `instance_name')
instance_name (string) – Name tag of the instance to associate with (exclusive with `instance_id')
public_ip (string) – Public IP address, for standard EC2 based allocations.
allocation_id (string) – Allocation ID for a VPC-based EIP.
network_interface_id (string) - ID of the network interface to associate the EIP with
network_interface_name (string) - Name of the network interface to associate the EIP with
private_ip_address (string) – The primary or secondary private IP address to associate with the Elastic IP address.
allow_reassociation (bool) – Allow a currently associated EIP to be re-associated with the new instance or interface.

returns (bool) - True on success, False on failure.

CLI Example:

```bash
salt myminion boto_ec2.associate_eip_address instance_name=bubba.ho.tep
    allocation_id=eipalloc-ef382c8a
```

New in version 2016.3.0.

salt.modules.boto_ec2.attach_network_interface(
    device_index, name=None, network_interface_id=None, instance_name=None, instance_id=None, region=None, key=None, keyid=None, profile=None)

Attach an Elastic Network Interface.

New in version 2016.3.0.

CLI Example:

```bash
salt myminion boto_ec2.attach_network_interface my_eni instance_name=salt-master
    device_index=0
```

salt.modules.boto_ec2.create_image(
    ami_name, instance_id=None, instance_name=None, tags=None, region=None, key=None, keyid=None, profile=None, description=None, no_reboot=False, dry_run=False, filters=None)

Given instance properties that define exactly one instance, create AMI and return AMI-id.

CLI Examples:

```bash
salt myminion boto_ec2.create_image ami_name=myinstance
salt myminion boto_ec2.create_image another_ami_name tags='"mytag": "value"'
    description='this is my ami'
```

salt.modules.boto_ec2.create_key(
    key_name, save_path, region=None, key=None, keyid=None, profile=None)

Creates a key and saves it to a given path. Returns the private key.

CLI Example:

```bash
salt myminion boto_ec2.create_key mykey /root/
```

salt.modules.boto_ec2.create_network_interface(
    name, subnet_id=None, subnet_name=None, private_ip_address=None, description=None, groups=None, region=None, key=None, keyid=None, profile=None)

Create an Elastic Network Interface.

New in version 2016.3.0.

CLI Example:

```bash
salt myminion boto_ec2.create_network_interface my_eni subnet-12345
    description=my_eni groups=['my_group']
```
Create new metadata tags for the specified resource ids.

New in version 2016.11.0.

resource_ids (string) or (list) – List of resource IDs. A plain string will be converted to a list of one element.
tags (dict) – Dictionary of name/value pairs. To create only a tag name, pass `'' as the value.

returns (bool) - True on success, False on failure.

CLI Example:

```bash
salt-call boto_ec2.create_tags vol-12345678 '"Name": "myVolume01"'
```

Deletes a key. Always returns True

CLI Example:

```bash
salt myminion boto_ec2.delete_key mykey
```

Create an Elastic Network Interface.

New in version 2016.3.0.

CLI Example:

```bash
salt myminion boto_ec2.create_network_interface my_eni subnet-123458
    description=my_eni groups=['my_group']
```

Delete metadata tags for the specified resource ids.

New in version 2016.11.0.

resource_ids (string) or (list) – List of resource IDs. A plain string will be converted to a list of one element.
tags (dict) or (list) – Either a dictionary containing name/value pairs or a list containing just tag names.
    If you pass in a dictionary, the values must match the actual tag values or the tag will not be deleted. If you pass in a value of None for the tag value, all tags with that name will be deleted.

returns (bool) - True on success, False on failure.

CLI Example:

```bash
salt-call boto_ec2.delete_tags vol-12345678 '"Name": "myVolume01"
salt-call boto_ec2.delete_tags vol-12345678 '"Name","MountPoint"
```

Detach an EBS volume from an EC2 instance.

New in version 2016.11.0.

volume_id (string) – The ID of the EBS volume to be deleted.
force (bool) – Forces deletion even if the device has not yet been detached from its instance.

returns (bool) - True on success, False on failure.

CLI Example:
Detach an Elastic Network Interface.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_ec2.detach_network_interface my_eni
```

**salt.modules.boto_ec2.detach_volume**(volume_id, instance_id=None, force=False, region=None, key=None, keyid=None, profile=None)

Detach an EBS volume from an EC2 instance.

New in version 2016.11.0.

- **volume_id** (string) – The ID of the EBS volume to be detached.
- **instance_id** (string) – The ID of the EC2 instance from which it will be detached.
- **device** (string) – The device on the instance through which the volume is exposed (e.g. /dev/sdh)
- **force** (bool) – Forces detachment if the previous detachment attempt did not occur cleanly. This option can lead to data loss or a corrupted file system. Use this option only as a last resort to detach a volume from a failed instance. The instance will not have an opportunity to flush file system caches nor file system meta data. If you use this option, you must perform file system check and repair procedures.

**returns** (bool) - True on success, False on failure.

CLI Example:

```
salt-call boto_ec2.detach_volume vol-12345678 i-87654321
```

**salt.modules.boto_ec2.disassociate_eip_address**(public_ip=None, association_id=None, region=None, key=None, keyid=None, profile=None)

Disassociate an Elastic IP address from a currently running instance. This requires exactly one of either `association_id` or `public_ip`, depending on whether you’re dealing with a VPC or EC2 Classic address.

- **public_ip** (string) – Public IP address, for EC2 Classic allocations.
- **association_id** (string) – Association ID for a VPC-bound EIP.

**returns** (bool) - True on success, False on failure.

CLI Example:

```
salt myminion boto_ec2.disassociate_eip_address association_id=eipassoc-e3ba2d16
```

New in version 2016.3.0.

**salt.modules.boto_ec2.exists**(instance_id=None, name=None, tags=None, region=None, key=None, keyid=None, profile=None, in_states=None, filters=None)

Given an instance id, check to see if the given instance id exists.

Returns True if the given an instance with the given id, name, or tags exists; otherwise, False is returned.

CLI Example:
salt myminion boto_ec2.exists myinstance

salt.modules.boto_ec2.find_images(ami_name=None, executable_by=None, owners=None, image_ids=None, tags=None, region=None, key=None, keyid=None, profile=None, return_objs=False)

Given image properties, find and return matching AMI ids

CLI Examples:
salt myminion boto_ec2.find_images tags='{"mytag": "value"}''

salt.modules.boto_ec2.find_instances(instance_id=None, name=None, tags=None, region=None, key=None, keyid=None, profile=None, return_objs=False, in_states=None, filters=None)

Given instance properties, find and return matching instance ids

CLI Examples:
salt myminion boto_ec2.find_instances # Lists all instances
salt myminion boto_ec2.find_instances name=myinstance
salt myminion boto_ec2.find_instances tags='{"mytag": "value"}''
salt myminion boto_ec2.find_instances filters='{"vpc-id": "vpc-12345678"}''

salt.modules.boto_ec2.get_all_eip_addresses(addresses=None, allocation_ids=None, region=None, key=None, keyid=None, profile=None)

Get public addresses of some, or all EIPs associated with the current account.
addresses (list) - Optional list of addresses. If provided, only the addresses associated with those in the list will be returned.
allocation_ids (list) - Optional list of allocation IDs. If provided, only the addresses associated with the given allocation IDs will be returned.
returns (list) - A list of the requested EIP addresses

CLI Example:
salt-call boto_ec2.get_all_eip_addresses

New in version 2016.3.0.

salt.modules.boto_ec2.get_all_volumes(volume_ids=None, filters=None, return_objs=False, region=None, key=None, keyid=None, profile=None)

Get a list of all EBS volumes, optionally filtered by provided 'filters' param
volume_ids (list) - Optional list of volume_ids. If provided, only the volumes associated with those in the list will be returned.
filters (dict) - Additional constraints on which volumes to return. Valid filters are:
- attachment.attach-time - The time stamp when the attachment initiated.
- attachment.delete-on-termination - Whether the volume is deleted on instance termination.
- attachment.device - The device name that is exposed to the instance (for example, /dev/sda1).
- attachment.instance-id - The ID of the instance the volume is attached to.
- attachment.status - The attachment state (attaching | attached | detaching | detached).
- availability-zone - The Availability Zone in which the volume was created.
- create-time - The time stamp when the volume was created.
- encrypted - The encryption status of the volume.
- size - The size of the volume, in GiB.
- snapshot-id - The snapshot from which the volume was created.
- status - The status of the volume (creating | available | in-use | deleting | deleted | error).
Salt Documentation, Release 2017.7.8

•tag:key=value - The key/value combination of a tag assigned to the resource.
•volume-id - The volume ID.
•volume-type - The Amazon EBS volume type. This can be gp2 for General Purpose SSD, io1 for
Provisioned IOPS SSD, st1 for Throughput Optimized HDD, sc1 for Cold HDD, or standard for
Magnetic volumes.
return_objs (bool) - Changes the return type from list of volume IDs to list of boto.ec2.volume.Volume objects
returns (list) - A list of the requested values: Either the volume IDs or, if return_objs is True,
boto.ec2.volume.Volume objects.
CLI Example:
salt-call boto_ec2.get_all_volumes filters='{"tag:Name": "myVolume01"}'

salt.modules.boto_ec2.get_attribute(aribute, instance_name=None, instance_id=None, region=None, key=None, keyid=None, profile=None, filters=None)
Get an EC2 instance aribute.
CLI Example:
salt myminion boto_ec2.get_attribute sourceDestCheck instance_name=my_instance

Available attributes:
• instanceType
• kernel
• ramdisk
• userData
• disableApiTermination
• instanceInitiatedShutdownBehavior
• rootDeviceName
• blockDeviceMapping
• productCodes
• sourceDestCheck
• groupSet
• ebsOptimized
• sriovNetSupport
salt.modules.boto_ec2.get_eip_address_info(addresses=None, allocation_ids=None, region=None, key=None, keyid=None, profile=None)
Get `interesting' info about some, or all EIPs associated with the current account.
addresses (list) - Optional list of addresses. If provided, only the addresses associated with those in the list
will be returned.
allocation_ids (list) - Optional list of allocation IDs. If provided, only the addresses associated with the given
allocation IDs will be returned.
returns (list of dicts) - A list of dicts, each containing the info for one of the requested EIPs.
CLI Example:

1188

Chapter 19. Salt Module Reference


salt-call boto_ec2.get_eip_address_info addresses=52.4.2.15

New in version 2016.3.0.

salt.modules.boto_ec2.get_id(name=None, tags=None, region=None, key=None, keyid=None, profile=None, in_states=None, filters=None)

Given instance properties, return the instance id if it exists.

CLI Example:
salt myminion boto_ec2.get_id myinstance

salt.modules.boto_ec2.get_key(key_name, region=None, key=None, keyid=None, profile=None)

Check to see if a key exists. Returns fingerprint and name if it does and False if it doesn’t

CLI Example:
salt myminion boto_ec2.get_key mykey

salt.modules.boto_ec2.get_keys(keynames=None, filters=None, region=None, key=None, keyid=None, profile=None)

Gets all keys or filters them by name and returns a list. keynames (list):: A list of the names of keypairs to retrieve. If not provided, all key pairs will be returned. filters (dict) :: Optional filters that can be used to limit the results returned. Filters are provided in the form of a dictionary consisting of filter names as the key and filter values as the value. The set of allowable filter names/values is dependent on the request being performed. Check the EC2 API guide for details.

CLI Example:
salt myminion boto_ec2.get_keys

salt.modules.boto_ec2.get_network_interface(name=None, network_interface_id=None, region=None, key=None, keyid=None, profile=None)

Get an Elastic Network Interface.

New in version 2016.3.0.

CLI Example:
salt myminion boto_ec2.get_network_interface name=myeni

salt.modules.boto_ec2.get_network_interface_id(name, region=None, key=None, keyid=None, profile=None)

Get an Elastic Network Interface id from its name tag.

New in version 2016.3.0.

CLI Example:
salt myminion boto_ec2.get_network_interface_id name=myeni

salt.modules.boto_ec2.get_unassociated_eip_address(domain='standard', region=None, key=None, keyid=None, profile=None)

Return the first unassociated EIP

CLI Example:
salt-call boto_ec2.get_unassociated_eip_address
New in version 2016.3.0.
salt.modules.boto_ec2.get_zones(region=None, key=None, keyid=None, profile=None)
Get a list of AZs for the configured region.

CLI Example:
```
salt myminion boto_ec2.get_zones
```

salt.modules.boto_ec2.import_key(key_name, public_key_material, region=None, key=None, keyid=None, profile=None)
Imports the public key from an RSA key pair that you created with a third-party tool. Supported formats: - OpenSSH public key format (e.g., the format in ~/.ssh/authorized_keys) - Base64 encoded DER format - SSH public key file format as specified in RFC4716 - DSA keys are not supported. Make sure your key generator is set up to create RSA keys. Supported lengths: 1024, 2048, and 4096.

CLI Example:
```
salt myminion boto_ec2.import mykey publickey
```

salt.modules.boto_ec2.modify_network_interface_attribute(name=None, network_interface_id=None, attr=None, value=None, region=None, key=None, keyid=None, profile=None)
Modify an attribute of an Elastic Network Interface.

New in version 2016.3.0.

CLI Example:
```
salt myminion boto_ec2.modify_network_interface_attribute my_eni attr=description value='example description'
```

salt.modules.boto_ec2.release_eip_address(public_ip=None, allocation_id=None, region=None, key=None, keyid=None, profile=None)
Free an Elastic IP address. Pass either a public IP address to release an EC2 Classic EIP, or an AllocationId to release a VPC EIP.

```
public_ip (string) - The public IP address - for EC2 elastic IPs.
allocation_id (string) - The Allocation ID - for VPC elastic IPs.
```

returns (bool) - True on success, False on failure

CLI Example:
```
salt myminion boto_ec2.release_eip_address allocation_id=eipalloc-ef382c8a
```

New in version 2016.3.0.
salt.modules.boto_ec2.run(image_id, name=None, tags=None, key_name=None, security_groups=None, user_data=None, instance_type='m1.small', placement=None, kernel_id=None, ramdisk_id=None, monitoring_enabled=None, vpc_id=None, vpc_name=None, subnet_id=None, subnet_name=None, private_ip_address=None, block_device_map=None, disable_api_termination=None, instance_initiated_shutdown_behavior=None, placement_group=None, client_token=None, security_group_ids=None, security_group_names=None, additional_info=None, tenancy=None, instance_profile_arn=None, instance_profile_name=None, ebs_optimized=None, network_interface_id=None, network_interface_name=None, region=None, key=None, keyid=None, profile=None, network_interfaces=None)

Create and start an EC2 instance.

Returns True if the instance was created; otherwise False.

CLI Example:

```
salt myminion boto_ec2.run ami-b80c2b87 name=myinstance
```

image_id (string) – The ID of the image to run.

name (string) - The name of the instance.

tags (dict of key: value pairs) - tags to apply to the instance.

key_name (string) – The name of the key pair with which to launch instances.

security_groups (list of strings) – The names of the EC2 classic security groups with which to associate instances

user_data (string) – The Base64-encoded MIME user data to be made available to the instance(s) in this reservation.

instance_type (string) – The type of instance to run. Note that some image types (e.g. hvm) only run on some instance types.

placement (string) – The Availability Zone to launch the instance into.

kernel_id (string) – The ID of the kernel with which to launch the instances.

ramdisk_id (string) – The ID of the RAM disk with which to launch the instances.

monitoring_enabled (bool) – Enable detailed CloudWatch monitoring on the instance.

vpc_id (string) - ID of a VPC to bind the instance to. Exclusive with vpc_name.

vpc_name (string) - Name of a VPC to bind the instance to. Exclusive with vpc_id.

subnet_id (string) – The subnet ID within which to launch the instances for VPC.

subnet_name (string) – The name of a subnet within which to launch the instances for VPC.

private_ip_address (string) – If you’re using VPC, you can optionally use this parameter to assign the instance a specific available IP address from the subnet (e.g. 10.0.0.25).

block_device_map (boto.ec2.blockdevicemapping.BlockDeviceMapping) – A BlockDeviceMapping data structure describing the EBS volumes associated with the Image. (string) - A string representation of a BlockDeviceMapping structure (dict) - A dict describing a BlockDeviceMapping structure

YAML example:

```
device-maps:
  /dev/sdb:
    ephemeral_name: ephemeral0
  /dev/sdc:
    ephemeral_name: ephemeral1
  /dev/sdd:
    ephemeral_name: ephemeral2
  /dev/sde:
    ephemeral_name: ephemeral3
  /dev/sdf:
```

19.9. execution modules
**disable_api_termination** (bool) – If True, the instances will be locked and will not be able to be terminated via the API.

**instance_initiated_shutdown_behavior** (string) – Specifies whether the instance stops or terminates on instance-initiated shutdown. Valid values are: stop, terminate

**placement_group** (string) – If specified, this is the name of the placement group in which the instance(s) will be launched.

**client_token** (string) – Unique, case-sensitive identifier you provide to ensure idempotency of the request. Maximum 64 ASCII characters.

**security_group_ids** (list of strings) – The ID(s) of the VPC security groups with which to associate instances.

**security_group_names** (list of strings) – The name(s) of the VPC security groups with which to associate instances.

**additional_info** (string) – Specifies additional information to make available to the instance(s).

**tenancy** (string) – The tenancy of the instance you want to launch. An instance with a tenancy of ‘dedicated’ runs on single-tenant hardware and can only be launched into a VPC. Valid values are: “default” or “dedicated”. NOTE: To use dedicated tenancy you MUST specify a VPC subnet-ID as well.

**instance_profile_arn** (string) – The Amazon resource name (ARN) of the IAM Instance Profile (IIP) to associate with the instances.

**instance_profile_name** (string) – The name of the IAM Instance Profile (IIP) to associate with the instances.

**ebs_optimized** (bool) – Whether the instance is optimized for EBS I/O. This optimization provides dedicated throughput to Amazon EBS and an optimized configuration stack to provide optimal EBS I/O performance. This optimization isn’t available with all instance types.

**network_interfaces** (boto.ec2.networkinterface.NetworkInterfaceCollection) – A NetworkInterfaceCollection data structure containing the ENI specifications for the instance.

**network_interface_id** (string) - ID of the network interface to attach to the instance

**network_interface_name** (string) - Name of the network interface to attach to the instance

salt.modules.boto_ec2.set_attribute(attribute, attribute_value, instance_name=None, instance_id=None, region=None, key=None, keyid=None, profile=None, filters=None)

Set an EC2 instance attribute. Returns whether the operation succeeded or not.

CLI Example:

```bash
salt myminion boto_ec2.set_attribute sourceDestCheck False instance_name=my_instance
```

Available attributes:

- instanceType
- kernel
- ramdisk
- userData
- disableApiTermination
- instanceInitiatedShutdownBehavior
- rootDeviceName
- blockDeviceMapping
- productCodes
- sourceDestCheck
salt.modules.boto_ec2.set_volumes_tags(tag_maps, authoritative=False, dry_run=False, region=None, key=None, keyid=None, profile=None)

New in version 2016.11.0.

- filters (list) List of dicts of filters and tags, where `filters` is a dict suitable for passing to the `filters` argument of get_all_volumes() above, and `tags` is a dict of tags to be set on volumes (via create_tags/delete_tags) as matched by the given filters. The filter syntax is extended to permit passing either a list of volume_ids or an instance_name (with instance_name being the Name tag of the instance to which the desired volumes are mapped). Each mapping in the list is applied separately, so multiple sets of volumes can be all tagged differently with one call to this function. If filtering by instance_name, You may additionally limit the instances matched by passing in a list of desired instance states. The default set of states is (‘pending’, ‘rebooting’, ‘running’, ‘stopping’, ‘stopped’).

YAML example fragment:

```yaml
- filters:
  attachment.instance_id: i-abcdef12
  tags:
    Name: dev-int-abcdef12.aws-foo.com
- filters:
  attachment.device: /dev/sdf
  tags:
    ManagedSnapshots: true
    BillingGroup: bubba.hotep@aws-foo.com
- filters:
  name: prd-foo-01.aws-foo.com
  tags:
    Name: prd-foo-01.aws-foo.com

- filters:
  volume_ids: [ vol-12345689, vol-abcdef12 ]
  tags:
    BillingGroup: infra-team@aws-foo.com
```

authoritative (bool) If true, any existing tags on the matched volumes, and not explicitly requested here, will be removed.
dry_run (bool) If true, don’t change anything, just return a dictionary describing any changes which would have been applied.
returns (dict) A dict describing status and any changes.

salt.modules.boto_ec2.terminate(instance_id=None, name=None, region=None, key=None, keyid=None, profile=None, filters=None)

Terminate the instance described by instance_id or name.

CLI Example:

salt myminion boto_ec2.terminate name=myinstance
salt myminion boto_ec2.terminate instance_id=i-a46b9f
salt.modules.boto_ec2.unassign_private_ip_addresses(network_interface_name=None,
network_interface_id=None,
private_ip_addresses=None,
region=None, key=None,
keyid=None, profile=None)

Unassigns one or more secondary private IP addresses from a network interface

- **network_interface_id** (string) - ID of the network interface to associate the IP with (exclusive with `network_interface_name`)
- **network_interface_name** (string) - Name of the network interface to associate the IP with (exclusive with `network_interface_id`)
- **private_ip_addresses** (list) - Assigns the specified IP addresses as secondary IP addresses to the network interface.

**returns** (bool) - True on success, False on failure.

CLI Example:

```
salt myminion boto_ec2.unassign_private_ip_addresses network_interface_name=my_eni private_ip_addresses=private_ip
```

New in version 2017.7.0.

### 19.9.39 salt.modules.boto_efs module

Connection module for Amazon EFS

New in version 2017.7.0.

**configuration** This module accepts explicit EFS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles or it can read them from the `~/.aws/credentials` file or from these environment variables: AWS_ACCESS_KEY_ID, AWS_SECRET_ACCESS_KEY. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file

```
efs.keyid: GKTADJGHEIQSXMKKRBJ08H
nenfs.key: askd+ghsdfjkgghWupU/asdflkdfkllgjsdfjajkghs
```

A region may also be specified in the configuration

```
enfs.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid, and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askd+ghsdfjkgghWupU/asdflkdfkllgjsdfjajkghs
  region: us-east-1
```

New in version 2017.7.0.
depends boto3

salt.modules.boto_efs.create_file_system(name, performance_mode='generalPurpose',
keyid=None, key=None, profile=None, region=None, **kwargs)

Creates a new, empty file system.

name (string) - The name for the new file system
performance_mode (string) - The PerformanceMode of the file system. Can be either generalPurpose or
maxIO
returns (dict) - A dict of the data for the elastic file system

CLI Example:

```
salt 'my-minion' boto_efs.create_file_system efs-name generalPurpose
```

salt.modules.boto_efs.create_mount_target(filesystemid, subnetid, ipaddress=None, securitygroups=None, keyid=None, key=None, profile=None, region=None, **kwargs)

Creates a mount target for a file system. You can then mount the file system on EC2 instances via the mount target.

You can create one mount target in each Availability Zone in your VPC. All EC2 instances in a VPC within a
given Availability Zone share a single mount target for a given file system.

If you have multiple subnets in an Availability Zone, you create a mount target in one of the subnets. EC2
instances do not need to be in the same subnet as the mount target in order to access their file system.

filesystemid (string) - ID of the file system for which to create the mount target.
subnetid (string) - ID of the subnet to add the mount target in.
ipaddress (string) - Valid IPv4 address within the address range of the specified subnet.
securitygroups (list[string]) - Up to five VPC security group IDs, of the form sg-xxxxxxxx. These must be for the
same VPC as subnet specified.
returns (dict) - A dict of the response data

CLI Example:

```
salt 'my-minion' boto_efs.create_mount_target filesystemid subnetid
```

salt.modules.boto_efs.create_tags(filesystemid, tags, keyid=None, key=None, profile=None, region=None, **kwargs)

Creates or overwrites tags associated with a file system. Each tag is a key-value pair. If a tag key specified
in the request already exists on the file system, this operation overwrites its value with the value provided in
the request.

filesystemid (string) - ID of the file system for whose tags will be modified.
tags (dict) - The tags to add to the file system

CLI Example:

```
salt 'my-minion' boto_efs.create_tags
```

salt.modules.boto_efs.delete_file_system(filesystemid, keyid=None, key=None, profile=None, region=None, **kwargs)

Deletes a file system, permanently severing access to its contents. Upon return, the file system no longer
exists and you can't access any contents of the deleted file system. You can't delete a file system that is in
use. That is, if the file system has any mount targets, you must first delete them.

filesystemid (string) - ID of the file system to delete.

CLI Example:
salt 'my-minion' boto_efs.delete_file_system filesystemid

salt.modules.boto_efs.delete_mount_target(mounttargetid, keyid=None, key=None, profile=None, region=None, **kwargs)

Deletes the specified mount target.

This operation forcibly breaks any mounts of the file system via the mount target that is being deleted, which might disrupt instances or applications using those mounts. To avoid applications getting cut off abruptly, you might consider unmounting any mounts of the mount target, if feasible. The operation also deletes the associated network interface. Uncommitted writes may be lost, but breaking a mount target using this operation does not corrupt the file system itself. The file system you created remains. You can mount an EC2 instance in your VPC via another mount target.

mounttargetid (string) - ID of the mount target to delete

CLI Example:
salt 'my-minion' boto_efs.delete_mount_target mounttargetid

salt.modules.boto_efs.delete_tags(filesystemid, tags, keyid=None, key=None, profile=None, region=None, **kwargs)

Deletes the specified tags from a file system.

filesystemid (string) - ID of the file system for whose tags will be removed.
tags (list[string]) - The tag keys to delete to the file system

CLI Example:
salt 'my-minion' boto_efs.delete_tags

salt.modules.boto_efs.get_file_systems(filesystemid=None, keyid=None, key=None, profile=None, region=None, **kwargs)

Get all EFS properties or a specific instance property if filesystemid is specified

filesystemid (string) - ID of the file system to retrieve properties

returns (list[dict]) - list of all elastic file system properties

CLI Example:
salt 'my-minion' boto_efs.get_file_systems efs-id

salt.modules.boto_efs.get_mount_targets(filesystemid=None, mounttargetid=None, keyid=None, key=None, profile=None, region=None, **kwargs)

Get all the EFS mount point properties for a specific filesystemid or the properties for a specific mounttargetid. One or the other must be specified

filesystemid (string) - ID of the file system whose mount targets to list  Must be specified if mounttargetid is not

mounttargetid (string) - ID of the mount target to have its properties returned  Must be specified if filesystemid is not

returns (list[dict]) - list of all mount point properties

CLI Example:
salt 'my-minion' boto_efs.get_mount_targets

salt.modules.boto_efs.get_tags(filesystemid, keyid=None, key=None, profile=None, region=None, **kwargs)

Return the tags associated with an EFS instance.

filesystemid (string) - ID of the file system whose tags to list

returns (list) - list of tags as key/value pairs
CLI Example:

```bash
salt 'my-minion' boto_efs.get_tags efs-id
```

```python
salt.modules.boto_efs.set_security_groups(mounttargetid, securitygroups, **kwargs)
```

Modifies the set of security groups in effect for a mount target

- `mounttargetid` (string) - ID of the mount target whose security groups will be modified
- `securitygroups` (list[string]) - list of no more than 5 VPC security group IDs.

CLI Example:

```bash
salt 'my-minion' boto_efs.set_security_groups my-mount-target-id my-sec-group
```

### 19.9.40 salt.modules.boto_elasticache

Connection module for Amazon Elasticache

New in version 2014.7.0.

**configuration** This module accepts explicit elasticache credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```text
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

- `elasticache.keyid: GKTADJGHEIQSXMKKRBJ08H`
- `elasticache.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs`

A region may also be specified in the configuration:

- `elasticache.region: us-east-1`

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```yaml
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

**depends** boto
**Authorize network ingress from an ec2 security group to a cache security group.**

CLI example:

```bash
salt myminion boto_elasticache.authorize_cache_security_group_ingress
- myelasticsearch myec2sg 879879
```

**Create a cache cluster.**

CLI example:

```bash
salt myminion boto_elasticache.create myelasticsearch 1 redis cache.t1.micro
```

**Create a cache security group.**

CLI example:

```bash
salt myminion boto_elasticache.create_cache_security_group myelasticsearch 'My
```

**Create replication group.**

CLI example:

```bash
salt myminion boto_elasticache.create_replication_group myelasticsearch
```

---

**salt.modules.boto_elasticache.authorize_cache_security_group_ingress**

```python
(name, ec2_security_group_name, ec2_security_group_owner_id, region=None, key=None, keyid=None, profile=None)
```

Authorize network ingress from an ec2 security group to a cache security group.

**salt.modules.boto_elasticache.create**

```python
(name, num_cache_nodes=None, engine=None, cache_node_type=None, replication_group_id=None, engine_version=None, cache_parameter_group_name=None, cache_subnet_group_name=None, cache_security_group_names=None, security_group_ids=None, snapshot_arns=None, preferred_availability_zone=None, preferred_maintenance_window=None, port=None, notification_topic_arn=None, auto_minor_version_upgrade=None, wait=None, region=None, key=None, keyid=None, profile=None)
```

Create a cache cluster.

**salt.modules.boto_elasticache.create_cache_security_group**

```python
(name, description, region=None, key=None, keyid=None, profile=None)
```

Create a cache security group.

**salt.modules.boto_elasticache.create_replication_group**

```python
(name, primary_cluster_id, replication_group_description, wait=None, region=None, key=None, keyid=None, profile=None)
```

Create replication group.
salt.modules.boto_elasticache.create_subnet_group(name, description, subnet_ids=None, subnet_names=None, tags=None, region=None, key=None, keyid=None, profile=None)

Create an ElastiCache subnet group

CLI example to create an ElastiCache subnet group:

```bash
salt myminion boto_elasticache.create_subnet_group my-subnet-group
  
  "group description" subnet_ids='[subnet-12345678, subnet-87654321]'
  
  region=us-east-1
```

salt.modules.boto_elasticache.delete(name, wait=False, region=None, key=None, keyid=None, profile=None)

Delete a cache cluster.

CLI example:

```bash
salt myminion boto_elasticache.delete myelasticache
```

salt.modules.boto_elasticache.delete_cache_security_group(name, region=None, key=None, keyid=None, profile=None)

Delete a cache security group.

CLI example:

```bash
salt myminion boto_elasticache.delete_cache_security_group myelasticachesg "My Cache Security Group"
```

salt.modules.boto_elasticache.delete_replication_group(name, region=None, key=None, keyid=None, profile=None)

Delete an ElastiCache replication group.

CLI example:

```bash
salt myminion boto_elasticache.delete_replication_group my-replication-group
  
  region=us-east-1
```

salt.modules.boto_elasticache.delete_subnet_group(name, region=None, key=None, keyid=None, profile=None)

Delete an ElastiCache subnet group.

CLI example:

```bash
salt myminion boto_elasticache.delete_subnet_group my-subnet-group
  
  region=us-east-1
```

salt.modules.boto_elasticache.describe_replication_group(name, region=None, key=None, keyid=None, profile=None, parameter=None)

Get replication group information.

CLI example:

```bash
salt myminion boto_elasticache.describe_replication_group mygroup
```
salt.modules.boto_elasticache.exists(name, region=None, key=None, keyid=None, profile=None)

Check to see if a cache cluster exists.

CLI example:
```
salt myminion boto_elasticache.exists myelasticache
```

salt.modules.boto_elasticache.get_all_cache_subnet_groups(name=None, region=None, key=None, keyid=None, profile=None)

Return a list of all cache subnet groups with details

CLI example:
```
salt myminion boto_elasticache.get_all_subnet_groups region=us-east-1
```

salt.modules.boto_elasticache.get_cache_subnet_group(name=None, region=None, key=None, keyid=None, profile=None)

Get information about a cache subnet group.

CLI example:
```
salt myminion boto_elasticache.get_cache_subnet_group mycache_subnet_group
```

salt.modules.boto_elasticache.get_config(name=None, region=None, key=None, keyid=None, profile=None)

Get the configuration for a cache cluster.

CLI example:
```
salt myminion boto_elasticache.get_config myelasticache
```

salt.modules.boto_elasticache.get_group_host(name=None, region=None, key=None, keyid=None, profile=None)

Get hostname from replication cache group

CLI example:
```
salt myminion boto_elasticache.get_group_host myelasticachegroup
```

salt.modules.boto_elasticache.get_node_host(name=None, region=None, key=None, keyid=None, profile=None)

Get hostname from cache node

CLI example:
```
salt myminion boto_elasticache.get_node_host myelasticache
```

salt.modules.boto_elasticache.group_exists(name=None, region=None, key=None, keyid=None, profile=None)

Check to see if a replication group exists.

CLI example:
```
salt myminion boto_elasticache.group_exists myelasticache
```
salt.modules.boto_elasticache.list_cache_subnet_groups( name=None, region=None, key=None, keyid=None, profile=None)

Return a list of all cache subnet group names

CLI example:
salt myminion boto_elasticache.list_subnet_groups region=us-east-1

salt.modules.boto_elasticache.revoke_cache_security_group_ingress( name, ec2_security_group_name, ec2_security_group_owner_id, region=None, key=None, keyid=None, profile=None)

Revoke network ingress from an ec2 security group to a cache security group.

CLI example:
salt myminion boto_elasticache.revoke_cache_security_group_ingress
--myelasticachesg myec2sg 879879

salt.modules.boto_elasticache.subnet_group_exists( name, tags=None, region=None, key=None, keyid=None, profile=None)

Check to see if an ElastiCache subnet group exists.

CLI example:
salt myminion boto_elasticache.subnet_group_exists my-param-group
--region=us-east-1

19.9.41 salt.modules.boto_elasticsearch_domain module

Connection module for Amazon Elasticsearch Service

New in version 2016.11.0.

configuration This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance trough Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

lambda.keyid: GKTADJGHEIQXSXMKRRBQ8H
lambda.key: askdjghsdfjkgwupUjasdfklkdfklgjsdfjajkgks

A region may also be specified in the configuration:

lambda.region: us-east-1
If a region is not specified, the default is us-east-1.

It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkgwupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

Create and delete methods return:

```
created: true
```

or

```
created: false
error:
    message: error message
```

Request methods (e.g., describe_function) return:

```
domain:
    - {...}
    - {...}
```

or

```
error:
    message: error message
```

depends boto3

```
salt.modules.boto_elasticsearch_domain.add_tags(DomainName=None, ARN=None, region=None, key=None, keyid=None, profile=None, **kwargs)
```

Add tags to a domain

Returns {tagged: true} if the domain was tagged and returns {tagged: False} if the domain was not tagged.

CLI Example:

```
salt myminion boto_elasticsearch_domain.add_tags mydomain tag_a=tag_value tag_b=tag_value
```

```
salt.modules.boto_elasticsearch_domain.create(DomainName, ElasticsearchClusterConfig=None, EBSOptions=None, AccessPolicies=None, SnapshotOptions=None, AdvancedOptions=None, region=None, key=None, keyid=None, profile=None, ElasticsearchVersion=None)
```

Given a valid config, create a domain.

Returns {created: true} if the domain was created and returns {created: False} if the domain was not created.

CLI Example:

```
salt myminion boto_elasticsearch_domain.create mydomain \
    {'InstanceType': 't2.micro.elasticsearch', 'InstanceCount': 1, \
    'DedicatedMasterEnabled': false, 'ZoneAwarenessEnabled': false} \
```
salt.modules.boto_elasticsearch_domain.delete(DomainName, region=None, key=None, keyid=None, profile=None)

Given a domain name, delete it.

Returns {deleted: true} if the domain was deleted and returns {deleted: false} if the domain was not deleted.

CLI Example:
salt myminion boto_elasticsearch_domain.delete mydomain

salt.modules.boto_elasticsearch_domain.describe(DomainName, region=None, key=None, keyid=None, profile=None)

Given a domain name describe its properties.

Returns a dictionary of interesting properties.

CLI Example:
salt myminion boto_elasticsearch_domain.describe mydomain

salt.modules.boto_elasticsearch_domain.exists(DomainName, region=None, key=None, keyid=None, profile=None)

Given a domain name, check to see if the given domain exists.

Returns True if the given domain exists and returns False if the given function does not exist.

CLI Example:
salt myminion boto_elasticsearch_domain.exists mydomain

salt.modules.boto_elasticsearch_domain.list_tags(DomainName=None, ARN=None, region=None, key=None, keyid=None, profile=None)

List tags of a trail

Returns

• {...}
• {...}

Return type tags

CLI Example:
salt myminion boto_cloudtrail.list_tags my_trail

salt.modules.boto_elasticsearch_domain.remove_tags(TagKeys, DomainName=None, ARN=None, region=None, key=None, keyid=None, profile=None)

Remove tags from a trail

Returns {tagged: true} if the trail was tagged and returns {tagged: False} if the trail was not tagged.
CLI Example:

```bash
salt myminion boto_cloudtrail.remove_tags my_trail tag_a=tag_value tag_b=tag_value
```

salt.modules.boto_elasticsearch_domain.status(DomainName, region=None, key=None, keyid=None, profile=None)

Given a domain name describe its status.

Returns a dictionary of interesting properties.

CLI Example:

```bash
salt myminion boto_elasticsearch_domain.status mydomain
```

salt.modules.boto_elasticsearch_domain.update(DomainName, ElasticsearchClusterConfig=None, EBSOptions=None, AccessPolicies=None, SnapshotOptions=None, AdvancedOptions=None, region=None, key=None, keyid=None, profile=None)

Update the named domain to the configuration.

Returns {updated: true} if the domain was updated and returns {updated: False} if the domain was not updated.

CLI Example:

```bash
salt myminion boto_elasticsearch_domain.update mydomain
{
    'InstanceType': 't2.micro.elasticsearch', 'InstanceCount': 1, \
    'DedicatedMasterEnabled': false, 'ZoneAwarenessEnabled': false}
{
    'EBSEnabled': true, 'VolumeType': 'gp2', 'VolumeSize': 10, \
    'Iops': 0}
{
    'Version': "2012-10-17", "Statement": [{"Effect": "Allow", "Principal": {
    "AWS": "*"}, "Action": "es:*", \
    "Resource": "arn:aws:es:us-east-1:111111111111:domain/mydomain/*", \
    "Condition": {"IpAddress": {"aws:SourceIp": ["172.0.0.1"]}}}], \
    "AutomatedSnapshotStartHour": 0}
{
    "rest.action.multi.allow_explicit_index": "true"
}
```

19.9.42 salt.modules.boto_elb

Connection module for Amazon ELB

New in version 2014.7.0.

configuration This module accepts explicit elb credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```bash
elb.keyid: GKTADJGHEIQSXMKKRBJ08H
elb.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:
Salt Documentation, Release 2017.7.8

elb.region: us-east-1

If a region is not specified, the default is us-east-1.
It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a
string to pull from pillars or minion config:
myprofile:
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
region: us-east-1

depends boto >= 2.33.0
salt.modules.boto_elb.apply_security_groups(name,
security_groups,
region=None,
key=None, keyid=None, profile=None)
Apply security groups to ELB.
CLI example:
salt myminion boto_elb.apply_security_groups myelb '["mysecgroup1"]'

salt.modules.boto_elb.attach_subnets(name, subnets, region=None, key=None, keyid=None,
profile=None)
Aach ELB to subnets.
CLI example:
salt myminion boto_elb.attach_subnets myelb '["mysubnet"]'

salt.modules.boto_elb.create(name,
availability_zones,
listeners,
subnets=None,
security_groups=None,
scheme='internet-facing',
region=None,
key=None, keyid=None, profile=None)
Create an ELB
CLI example to create an ELB:
salt myminion boto_elb.create myelb '["us-east-1a", "us-east-1e"]' '{"elb_port":
,→443, "elb_protocol": "HTTPS", ...}' region=us-east-1

salt.modules.boto_elb.create_listeners(name, listeners, region=None, key=None, keyid=None,
profile=None)
Create listeners on an ELB.
CLI example:
salt myminion boto_elb.create_listeners myelb '[["HTTPS", "HTTP", 443, 80, "arn:
,→aws:iam::11
11111:server-certificate/mycert"]]'

salt.modules.boto_elb.create_policy(name, policy_name, policy_type, policy, region=None,
key=None, keyid=None, profile=None)
Create an ELB policy.
New in version 2016.3.0.
CLI example:
salt myminion boto_elb.create_policy myelb mypolicy LBCookieStickinessPolicyType '
,→{"CookieExpirationPeriod": 3600}'

19.9. execution modules

1205


salt.modules.boto_elb.delete(name, region=None, key=None, keyid=None, profile=None)
Delete an ELB.

CLI example to delete an ELB:

```
salt myminion boto_elb.delete myelb region=us-east-1
```

salt.modules.boto_elb.delete_listeners(name, ports, region=None, key=None, keyid=None, profile=None)
Delete listeners on an ELB.

CLI example:

```
salt myminion boto_elb.delete_listeners myelb '[80,443]'  # 'ports' must be a list
```

salt.modules.boto_elb.delete_policy(name, policy_name, region=None, key=None, keyid=None, profile=None)
Delete an ELB policy.

New in version 2016.3.0.

CLI example:

```
salt myminion boto_elb.delete_policy myelb mypolicy
```

salt.modules.boto_elb.delete_tags(name, tags, region=None, key=None, keyid=None, profile=None)
Add the tags on an ELB

name name of the ELB
tags list of tags to remove

CLI Example:

```
salt myminion boto_elb.delete_tags my-elb-name ['TagToRemove1', 'TagToRemove2']
```

salt.modules.boto_elb.deregister_instances(name, instances, region=None, key=None, keyid=None, profile=None)
Deregister instances with an ELB. Instances is either a string instance id or a list of string instance id's.

Returns:
- True: instance(s) deregistered successfully
- False: instance(s) failed to be deregistered
- None: instance(s) not valid or not registered, no action taken

CLI example:

```
salt myminion boto_elb.deregister_instances myelb instance_id
salt myminion boto_elb.deregister_instances myelb "[instance_id, instance_id]"
```

salt.modules.boto_elb.detach_subnets(name, subnets, region=None, key=None, keyid=None, profile=None)
Detach ELB from subnets.

CLI example:

```
salt myminion boto_elb.detach_subnets myelb '"mysubnet"'
```

salt.modules.boto_elb.disable_availability_zones(name, availability_zones, region=None, key=None, keyid=None, profile=None)
Disable availability zones for ELB.
CLI example:
```
salt myminion boto_elb.disable_availability_zones myelb ['"us-east-1a"']
```

**salt.modules.boto_elb.enable_availability_zones**(name, availability_zones, region=None, key=None, keyid=None, profile=None)
Enable availability zones for ELB.

CLI example:
```
salt myminion boto_elb.enable_availability_zones myelb ['"us-east-1a"']
```

**salt.modules.boto_elb.exists**(name, region=None, key=None, keyid=None, profile=None)
Check to see if an ELB exists.

CLI example:
```
salt myminion boto_elb.exists myelb region=us-east-1
```

**salt.modules.boto_elb.get_all_elbs**(region=None, key=None, keyid=None, profile=None)
Return all load balancers associated with an account

CLI example:
```
salt myminion boto_elb.get_all_elbs region=us-east-1
```

**salt.modules.boto_elb.get_attributes**(name, region=None, key=None, keyid=None, profile=None)
Check to see if attributes are set on an ELB.

CLI example:
```
salt myminion boto_elb.get_attributes myelb
```

**salt.modules.boto_elb.get_elb_config**(name, region=None, key=None, keyid=None, profile=None)
Get an ELB configuration.

CLI example:
```
salt myminion boto_elb.exists myelb region=us-east-1
```

**salt.modules.boto_elb.get_health_check**(name, region=None, key=None, keyid=None, profile=None)
Get the health check configured for this ELB.

CLI example:
```
salt myminion boto_elb.get_health_check myelb
```

**salt.modules.boto_elb.get_instance_health**(name, region=None, key=None, keyid=None, profile=None, instances=None)
Get a list of instances and their health state

CLI example:
```
salt myminion boto_elb.get_instance_health myelb
salt myminion boto_elb.get_instance_health myelb region=us-east-1 instances="[instance_id,instance_id]"
```
salt.modules.boto_elb.list_elbs(region=None, key=None, keyid=None, profile=None)

Return names of all load balancers associated with an account

CLI example:
```
salt myminion boto_elb.list_elbs region=us-east-1
```

salt.modules.boto_elb.listener_dict_to_tuple(listener)

Convert an ELB listener dict into a listener tuple used by certain parts of the AWS ELB API.

CLI example:
```
salt myminion boto_elb.listener_dict_to_tuple '{"elb_port":80,"instance_port":80,"elb_protocol":"HTTP"}''
```

salt.modules.boto_elb.register_instances(name, instances, region=None, key=None, keyid=None, profile=None)

Register instances with an ELB. Instances is either a string instance id or a list of string instance id's.

Returns:
• True: instance(s) registered successfully
• False: instance(s) failed to be registered

CLI example:
```
salt myminion boto_elb.register_instances myelb instance_id
salt myminion boto_elb.register_instances myelb "[instance_id,instance_id]"
```

salt.modules.boto_elb.set_attributes(name, attributes, region=None, key=None, keyid=None, profile=None)

Set attributes on an ELB.

name (string) Name of the ELB instance to set attributes for
attributes A dict of attributes to set.

Valid attributes are:

access_log (dict)

 enabled (bool) Enable storage of access logs.

 s3_bucket_name (string) The name of the S3 bucket to place logs.

 s3_bucket_prefix (string) Prefix for the log file name.

 emit_interval (int) Interval for storing logs in S3 in minutes. Valid values are 5 and 60.

connection_draining (dict)

 enabled (bool) Enable connection draining.

 timeout (int) Maximum allowed time in seconds for sending existing connections to an instance that is deregistering or unhealthy. Default is 300.

cross_zone_load_balancing (dict)

 enabled (bool) Enable cross-zone load balancing.

CLI example to set attributes on an ELB:
```
salt myminion boto_elb.set_attributes myelb '{"access_log": {"enabled": "true","s3_bucket_name": "mybucket", "s3_bucket_prefix": "mylogs/"}, "emit_interval": 5}'' region=us-east-1
```
salt.modules.boto_elb.set_backend_policy(name, port, policies=None, region=None, key=None, keyid=None, profile=None)

Set the policies of an ELB backend server.

CLI example:
```
salt myminion boto_elb.set_backend_policy myelb 443 ```[policy1,policy2]"
```

salt.modules.boto_elb.set_health_check(name, health_check, region=None, key=None, keyid=None, profile=None)

Set attributes on an ELB.

CLI example to set attributes on an ELB:
```
salt myminion boto_elb.set_health_check myelb '{"target": "HTTP:80/"}'
```

salt.modules.boto_elb.set_instances(name, instances, test=False, region=None, key=None, keyid=None, profile=None)

Set the instances assigned to an ELB to exactly the list given

CLI example:
```
salt myminion boto_elb.set_instances myelb region=us-east-1 instances="[instance_id,instance_id]"
```

salt.modules.boto_elb.set_listener_policy(name, port, policies=None, region=None, key=None, keyid=None, profile=None)

Set the policies of an ELB listener.

New in version 2016.3.0.

CLI example:
```
salt myminion boto_elb.set_listener_policy myelb 443 "[policy1,policy2]"
```

salt.modules.boto_elb.set_tags(name, tags, region=None, key=None, keyid=None, profile=None)

Add the tags on an ELB

New in version 2016.3.0.

name  name of the ELB
tags  dict of name/value pair tags

CLI Example:
```
salt myminion boto_elb.set_tags my-elb-name "{'Tag1': 'Value', 'Tag2': 'Another Value'}"
```

19.9.43 salt.modules.boto_elbv2 module

Connection module for Amazon ALB

New in version 2017.7.0.

configuration  This module accepts explicit elb credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:
elbv2.keyid: GKTADJGHEIQSXMKKRBJ08H
elbv2.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
elbv2.region: us-west-2

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```yaml
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

salt.modules.boto_elbv2.deregister_targets(name, targets, region=None, key=None, keyid=None, profile=None)

Deregister targets to a target group of an ALB. targets is either a instance id string or a list of instance id's.

Returns:
- True: instance(s) deregistered successfully
- False: instance(s) failed to be deregistered

CLI example:

```
salt myminion boto_elbv2.deregister_targets myelb instance_id
salt myminion boto_elbv2.deregister_targets myelb "[instance_id,instance_id]"
```

salt.modules.boto_elbv2.describe_target_health(name, targets=None, region=None, key=None, keyid=None, profile=None)

Get the current health check status for targets in a target group.

CLI example:

```
salt myminion boto_elbv2.describe_target_health arn:aws:elasticloadbalancing:us-west-2:644138682826:targetgroup/learn1give1-api/414788a16b5cf163 targets="[i-1isdf23ifjf]"
```

salt.modules.boto_elbv2.register_targets(name, targets, region=None, key=None, keyid=None, profile=None)

Register targets to a target group of an ALB. targets is either a instance id string or a list of instance id's.

Returns:
- True: instance(s) registered successfully
- False: instance(s) failed to be registered

CLI example:

```
salt myminion boto_elbv2.register_targets myelb instance_id
salt myminion boto_elbv2.register_targets myelb "[instance_id,instance_id]"
```

salt.modules.boto_elbv2.target_group_exists(name, region=None, key=None, keyid=None, profile=None)

Check to see if an target group exists.

CLI example:

```
salt myminion boto_elbv2.exists arn:aws:elasticloadbalancing:us-west-2:644138682826:targetgroup/learn1give1-api/414788a16b5cf163
```
19.9.44 salt.modules.boto_iam

Connection module for Amazon IAM

New in version 2014.7.0.

configuration This module accepts explicit iam credentials but can also utilize IAM roles assigned to
the instance through Instance Profiles. Dynamic credentials are then automatically obtained
from AWS API and no further configuration is necessary. More Information available at:

http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
ec2.html

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

iam.keyid: GKTADJGHEIQSXMKKRBJ08H
iam.key: askdjghsdfjkghWupUjasdflkdkfklgjsdfjajkghs
iam.region: us-east-1

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a
string to pull from pillars or minion config:

myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdkfklgjsdfjajkghs
    region: us-east-1

depends boto

salt.modules.boto_iam.add_user_to_group (user_name, group_name, region=None, key=None,
keyid=None, profile=None)

Add user to group.
New in version 2015.8.0.
CLI Example:
salt myminion boto_iam.add_user_to_group myuser mygroup

salt.modules.boto_iam.associate_profile_to_role (profile_name, role_name, region=None,
key=None, keyid=None, profile=None)

Associate an instance profile with an IAM role.
CLI Example:
salt myminion boto_iam.associate_profile_to_role myirole myiprofile

salt.modules.boto_iam.attach_group_policy (policy_name, group_name, region=None,
key=None, keyid=None, profile=None)

Attach a managed policy to a group.
CLI Example:
salt myminion boto_iam.attach_group_policy mypolicy mygroup

salt.modules.boto_iam.attach_role_policy (policy_name, role_name, region=None, key=None,
keyid=None, profile=None)

Attach a managed policy to a role.
CLI Example:
```
salt myminion boto_iam.attach_role_policy mypolicy myrole

salt.modules.boto_iam.attach_user_policy(policy_name, user_name, region=None, key=None, keyid=None, profile=None)

Attach a managed policy to a user.
CLI Example:
salt myminion boto_iam.attach_user_policy mypolicy myuser

salt.modules.boto_iam.build_policy(region=None, key=None, keyid=None, profile=None)

Build a default assume role policy.
New in version 2015.8.0.
CLI Example:
salt myminion boto_iam.build_policy

salt.modules.boto_iam.create_access_key(user_name, region=None, key=None, keyid=None, profile=None)

Create access key id for a user.
New in version 2015.8.0.
CLI Example:
salt myminion boto_iam.create_access_key myuser

salt.modules.boto_iam.create_group(group_name, path=None, region=None, key=None, keyid=None, profile=None)

Create a group.
New in version 2015.8.0.
CLI Example:
salt myminion boto_iam.create_group group

salt.modules.boto_iam.create_instance_profile(name, region=None, key=None, keyid=None, profile=None)

Create an instance profile.
CLI Example:
salt myminion boto_iam.create_instance_profile myiprofile

salt.modules.boto_iam.create_login_profile(user_name, password, region=None, key=None, keyid=None, profile=None)

Creates a login profile for the specified user, give the user the ability to access AWS services and the AWS Management Console.
New in version 2015.8.0.
CLI Example:
salt myminion boto_iam.create_login_profile user_name password
```
salt.modules.boto_iam.create_policy(policy_name, policy_document, path=None, description=None, region=None, key=None, keyid=None, profile=None)

Create a policy.

CLI Example:

```
```

salt.modules.boto_iam.create_policy_version(policy_name, policy_document, set_as_default=None, region=None, key=None, keyid=None, profile=None)

Create a policy version.

CLI Example:

```
```

salt.modules.boto_iam.create_role(name, policy_document=None, path=None, region=None, key=None, keyid=None, profile=None)

Create an instance role.

CLI Example:

```
salt myminion boto_iam.create_role myrole
```

salt.modules.boto_iam.create_role_policy(role_name, policy_name, policy, region=None, key=None, keyid=None, profile=None)

Create or modify a role policy.

CLI Example:

```
salt myminion boto_iam.create_role_policy myrole mypolicy '{"MyPolicy": 
```

salt.modules.boto_iam.create_saml_provider(name, saml_metadata_document, region=None, key=None, keyid=None, profile=None)

Create SAML provider

CLI Example:

```
salt myminion boto_iam.create_saml_provider my_saml_provider_name saml_metadata_ document
```

salt.modules.boto_iam.create_user(user_name, path=None, region=None, key=None, keyid=None, profile=None)

Create a user.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.create_user myuser
```
salt.modules.boto_iam.deactivate_mfa_device(user_name, serial, region=None, key=None, keyid=None, profile=None)

Deactivates the specified MFA device and removes it from association with the user.
New in version 2016.3.0.
CLI Example:

```
salt myminion boto_iam.deactivate_mfa_device user_name serial_num
```

salt.modules.boto_iam.delete_access_key(access_key_id, user_name=None, region=None, key=None, keyid=None, profile=None)

Delete access key id from a user.
New in version 2015.8.0.
CLI Example:

```
salt myminion boto_iam.delete_access_key myuser
```

salt.modules.boto_iam.delete_group(group_name, region=None, key=None, keyid=None, profile=None)

Delete a group policy.
CLI Example:

```
.. code-block:: bash

    salt myminion boto_iam.delete_group mygroup
```

salt.modules.boto_iam.delete_group_policy(group_name, policy_name, region=None, key=None, keyid=None, profile=None)

Delete a group policy.
CLI Example:

```
.. code-block:: bash

    salt myminion boto_iam.delete_group_policy mygroup mypolicy
```

salt.modules.boto_iam.delete_instance_profile(name, region=None, key=None, keyid=None, profile=None)

Delete an instance profile.
CLI Example:

```
salt myminion boto_iam.delete_instance_profile myiprofile
```

salt.modules.boto_iam.delete_login_profile(user_name, region=None, key=None, keyid=None, profile=None)

Deletes a login profile for the specified user.
New in version 2016.3.0.
CLI Example:

```
salt myminion boto_iam.delete_login_profile user_name
```

salt.modules.boto_iam.delete_policy(policy_name, region=None, key=None, keyid=None, profile=None)

Delete a policy.
CLI Example:
salt myminion boto_iam.delete_policy mypolicy

salt.modules.boto_iam.delete_policy_version(policy_name, version_id, region=None, key=None, keyid=None, profile=None)
    Delete a policy version.
    CLI Example:
    salt myminion boto_iam.delete_policy_version mypolicy v1

salt.modules.boto_iam.delete_role(name, region=None, key=None, keyid=None, profile=None)
    Delete an IAM role.
    CLI Example:
    salt myminion boto_iam.delete_role myirole

salt.modules.boto_iam.delete_role_policy(role_name, policy_name, region=None, key=None, keyid=None, profile=None)
    Delete a role policy.
    CLI Example:
    salt myminion boto_iam.delete_role_policy myirole mypolicy

salt.modules.boto_iam.delete_saml_provider(name, region=None, key=None, keyid=None, profile=None)
    Delete SAML provider
    CLI Example:
    salt myminion boto_iam.delete_saml_provider my_saml_provider_name

salt.modules.boto_iam.delete_server_cert(cert_name, region=None, key=None, keyid=None, profile=None)
    Deletes a certificate from Amazon.
    New in version 2015.8.0.
    CLI Example:
    salt myminion boto_iam.delete_server_cert mycert_name

salt.modules.boto_iam.delete_user(user_name, region=None, key=None, keyid=None, profile=None)
    Delete a user.
    New in version 2015.8.0.
    CLI Example:
    salt myminion boto_iam.delete_user myuser

salt.modules.boto_iam.delete_user_policy(user_name, policy_name, region=None, key=None, keyid=None, profile=None)
    Delete a user policy.
    CLI Example:
    salt myminion boto_iam.delete_user_policy myuser mypolicy
salt.modules.boto_iam.describe_role(name, region=None, key=None, keyid=None, profile=None)

Get information for a role.

CLI Example:

```bash
salt myminion boto_iam.describe_role myirole
```

salt.modules.boto_iam.detach_group_policy(policy_name, group_name, region=None, key=None, keyid=None, profile=None)

Detach a managed policy to a group.

CLI Example:

```bash
salt myminion boto_iam.detach_group_policy mypolicy mygroup
```

salt.modules.boto_iam.detach_role_policy(policy_name, role_name, region=None, key=None, keyid=None, profile=None)

Detach a managed policy to a role.

CLI Example:

```bash
salt myminion boto_iam.detach_role_policy mypolicy myrole
```

salt.modules.boto_iam.detach_user_policy(policy_name, user_name, region=None, key=None, keyid=None, profile=None)

Detach a managed policy to a user.

CLI Example:

```bash
salt myminion boto_iam.detach_user_policy mypolicy myuser
```

salt.modules.boto_iam.disassociate_profile_from_role(profile_name, role_name, region=None, key=None, keyid=None, profile=None)

Disassociate an instance profile from an IAM role.

CLI Example:

```bash
salt myminion boto_iam.disassociate_profile_from_role myirole myiprofile
```

salt.modules.boto_iam.export_roles(path_prefix='/', region=None, key=None, keyid=None, profile=None)

Get all IAM role details. Produces results that can be used to create an sls file.

CLI Example:

```bash
salt-call boto_iam.export_roles --out-txt | sed `s/local: //'' > iam_roles.sls
```

salt.modules.boto_iam.export_users(path_prefix='/', region=None, key=None, keyid=None, profile=None)

Get all IAM user details. Produces results that can be used to create an sls file.

New in version 2016.3.0.

CLI Example:

```bash
salt-call boto_iam.export_users --out-txt | sed `s/local: //'' > iam_users.sls
```

salt.modules.boto_iam.get_account_id(region=None, key=None, keyid=None, profile=None)

Get a the AWS account id associated with the used credentials.

CLI Example:
**salt myminion boto_iam.get_account_id**

`salt.modules.boto_iam.get_account_policy(region=None, key=None, keyid=None, profile=None)`

Get account policy for the AWS account.

New in version 2015.8.0.

CLI Example:
```
salt myminion boto_iam.get_account_policy
```

**salt.modules.boto_iam.get_all_access_keys(user_name, marker=None, max_items=None, region=None, key=None, keyid=None, profile=None)**

Get all access keys from a user.

New in version 2015.8.0.

CLI Example:
```
salt myminion boto_iam.get_all_access_keys myuser
```

**salt.modules.boto_iam.get_all_group_policies(group_name, region=None, key=None, keyid=None, profile=None)**

Get a list of policy names from a group.

CLI Example:
```
salt myminion boto_iam.get_all_group_policies mygroup
```

**salt.modules.boto_iam.get_all_groups(path_prefix='/', region=None, key=None, keyid=None, profile=None)**

Get and return all IAM group details, starting at the optional path.

New in version 2016.3.0.

CLI Example:
```
salt-call boto_iam.get_all_groups
```

**salt.modules.boto_iam.get_all_instance_profiles(path_prefix='/', region=None, key=None, keyid=None, profile=None)**

Get and return all IAM instance profiles, starting at the optional path.

New in version 2016.11.0.

CLI Example:
```
salt-call boto_iam.get_all_instance_profiles
```

**salt.modules.boto_iam.get_all_mfa_devices(user_name, region=None, key=None, keyid=None, profile=None)**

Get all MFA devices associated with an IAM user.

New in version 2016.3.0.

CLI Example:
```
salt myminion boto_iam.get_all_mfa_devices user_name
```

**salt.modules.boto_iam.get_all_roles(path_prefix=None, region=None, key=None, keyid=None, profile=None)**

Get and return all IAM role details, starting at the optional path.
New in version 2016.3.0.

CLI Example:
salt-call boto_iam.get_all_roles

salt.modules.boto_iam.get_all_user_policies(user_name, marker=None, max_items=None, region=None, key=None, keyid=None, profile=None)

Get all user policies.

New in version 2015.8.0.

CLI Example:
salt myminion boto_iam.get_group mygroup

salt.modules.boto_iam.get_all_users(path_prefix='/', region=None, key=None, keyid=None, profile=None)

Get and return all IAM user details, starting at the optional path.

New in version 2016.3.0.

CLI Example:
salt-call boto_iam.get_all_users

salt.modules.boto_iam.get_group(group_name, region=None, key=None, keyid=None, profile=None)

Get group information.

New in version 2015.8.0.

CLI Example:
salt myminion boto_iam.get_group mygroup

salt.modules.boto_iam.get_group_members(group_name, region=None, key=None, keyid=None, profile=None)

Get group information.

New in version 2016.3.0.

CLI Example:
salt myminion boto_iam.get_group mygroup

salt.modules.boto_iam.get_group_policy(group_name, policy_name, region=None, key=None, keyid=None, profile=None)

Retrieves the specified policy document for the specified group.

New in version 2015.8.0.

CLI Example:
salt myminion boto_iam.get_group_policy mygroup mypolicyname

salt.modules.boto_iam.get_policy(policy_name, region=None, key=None, keyid=None, profile=None)

Check to see if policy exists.

CLI Example:
salt myminion boto_iam.instance_profile_exists myiprofile
salt.modules.boto_iam.get_policy_version(policy_name, version_id, region=None, key=None, keyid=None, profile=None)

Check to see if policy exists.

CLI Example:
```
salt myminion boto_iam.instance_profile_exists myiprofile
```

salt.modules.boto_iam.get_role_policy(role_name, policy_name, region=None, key=None, keyid=None, profile=None)

Get a role policy.

CLI Example:
```
salt myminion boto_iam.get_role_policy myirole mypolicy
```

salt.modules.boto_iam.get_saml_provider(name, region=None, key=None, keyid=None, profile=None)

Get SAML provider document.

CLI Example:
```
salt myminion boto_iam.get_saml_provider arn
```

salt.modules.boto_iam.get_saml_provider_arn(name, region=None, key=None, keyid=None, profile=None)

Get SAML provider

CLI Example:
```
salt myminion boto_iam.get_saml_provider_arn my_saml_provider_name
```

salt.modules.boto_iam.get_server_certificate(cert_name, region=None, key=None, keyid=None, profile=None)

Returns certificate information from Amazon

New in version 2015.8.0.

CLI Example:
```
salt myminion boto_iam.get_server_certificate mycert_name
```

salt.modules.boto_iam.get_user(user_name=None, region=None, key=None, keyid=None, profile=None)

Get user information.

New in version 2015.8.0.

CLI Example:
```
salt myminion boto_iam.get_user myuser
```

salt.modules.boto_iam.get_user_policy(user_name, policy_name, region=None, key=None, keyid=None, profile=None)

Retrieves the specified policy document for the specified user.

New in version 2015.8.0.

CLI Example:
```
salt myminion boto_iam.get_user_policy myuser mypolicyname
```
salt.modules.boto_iam.instance_profile_exists(name, region=None, key=None, keyid=None, profile=None)

Check to see if an instance profile exists.

CLI Example:

```
salt myminion boto_iam.instance_profile_exists myiprofile
```

salt.modules.boto_iam.list_attached_group_policies(group_name, path_prefix=None, entity_filter=None, region=None, key=None, keyid=None, profile=None)

List entities attached to the given group.

CLI Example:

```
salt myminion boto_iam.list_entities_for_policy mypolicy
```

salt.modules.boto_iam.list_attached_role_policies(role_name, path_prefix=None, entity_filter=None, region=None, key=None, keyid=None, profile=None)

List entities attached to the given role.

CLI Example:

```
salt myminion boto_iam.list_entities_for_policy mypolicy
```

salt.modules.boto_iam.list_attached_user_policies(user_name, path_prefix=None, entity_filter=None, region=None, key=None, keyid=None, profile=None)

List entities attached to the given user.

CLI Example:

```
salt myminion boto_iam.list_entities_for_policy mypolicy
```

salt.modules.boto_iam.list_entities_for_policy(policy_name, path_prefix=None, entity_filter=None, region=None, key=None, keyid=None, profile=None)

List entities that a policy is attached to.

CLI Example:

```
salt myminion boto_iam.list_entities_for_policy mypolicy
```

salt.modules.boto_iam.list_instance_profiles(path_prefix='/', region=None, key=None, keyid=None, profile=None)

List all IAM instance profiles, starting at the optional path.

New in version 2016.11.0.

CLI Example:

```
salt-call boto_iam.list_instance_profiles
```

salt.modules.boto_iam.list_policies(region=None, key=None, keyid=None, profile=None)

List policies.

CLI Example:
salt.myminion.boto_iam.list_policies

```python
salt.modules.boto_iam.list_policy_versions(policy_name, region=None, key=None, keyid=None, profile=None)
```
List versions of a policy.
CLI Example:
salt myminion boto_iam.list_policy_versions mypolicy

salt.myminion.boto_iam.list_role_policies

```python
salt.modules.boto_iam.list_role_policies(role_name, region=None, key=None, keyid=None, profile=None)
```
Get a list of policy names from a role.
CLI Example:
salt myminion boto_iam.list_role_policies myirole

salt.myminion.boto_iam.list_saml_providers

```python
salt.modules.boto_iam.list_saml_providers(region=None, key=None, keyid=None, profile=None)
```
List SAML providers.
CLI Example:
salt myminion boto_iam.list_saml_providers

salt.myminion.boto_iam.policy_exists

```python
salt.modules.boto_iam.policy_exists(policy_name, region=None, key=None, keyid=None, profile=None)
```
Check to see if policy exists.
CLI Example:
salt myminion boto_iam.instance_profile_exists myiprofile

salt.myminion.boto_iam.policy_version_exists

```python
salt.modules.boto_iam.policy_version_exists(policy_name, version_id, region=None, key=None, keyid=None, profile=None)
```
Check to see if policy exists.
CLI Example:
salt myminion boto_iam.instance_profile_exists myiprofile

salt.myminion.boto_iam.profile_associated

```python
salt.modules.boto_iam.profile_associated(role_name, profile_name, region, key, keyid, profile)
```
Check to see if an instance profile is associated with an IAM role.
CLI Example:
salt myminion boto_iam.profile_associated myirole myiprofile

salt.myminion.boto_iam.put_group_policy

```python
salt.modules.boto_iam.put_group_policy(group_name, policy_name, policy_json, region=None, key=None, keyid=None, profile=None)
```
Adds or updates the specified policy document for the specified group.
New in version 2015.8.0.
CLI Example:
salt myminion boto_iam.put_group_policy mygroup policyname policyrules
salt.modules.boto_iam.put_user_policy(user_name, policy_name, policy_json, region=None, key=None, keyid=None, profile=None)

Adds or updates the specified policy document for the specified user.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.put_user_policy myuser policyname policyrules
```

salt.modules.boto_iam.remove_user_from_group(group_name, user_name, region=None, key=None, keyid=None, profile=None)

Remove user from group.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.remove_user_from_group mygroup myuser
```

salt.modules.boto_iam.role_exists(name, region=None, key=None, keyid=None, profile=None)

Check to see if an IAM role exists.

CLI Example:

```
salt myminion boto_iam.role_exists myirole
```

salt.modules.boto_iam.set_default_policy_version(policy_name, version_id, region=None, key=None, keyid=None, profile=None)

Set the default version of a policy.

CLI Example:

```
salt myminion boto_iam.set_default_policy_version mypolicy v1
```

salt.modules.boto_iam.update_account_password_policy(allow_users_to_change_password=None, hard_expiry=None, max_password_age=None, minimum_password_length=None, passwordReusePrevention=None, requireLowercaseCharacters=None, requireNumbers=None, requireSymbols=None, requireUppercaseCharacters=None, region=None, key=None, keyid=None, profile=None)

Update the password policy for the AWS account.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.update_account_password_policy True
```

salt.modules.boto_iam.update_assume_role_policy(role_name, policy_document, region=None, key=None, keyid=None, profile=None)
Update an assume role policy for a role.

New in version 2015.8.0.

CLI Example:

```python
salt myminion boto_iam.update_assume_role_policy myrole '{"Statement":"..."}'
```

```python
salt.modules.boto_iam.update_saml_provider(name, saml_metadata_document, region=None, key=None, keyid=None, profile=None)
```

Update SAML provider.

CLI Example:

```python
salt myminion boto_iam.update_saml_provider my_saml_provider_name saml_metadata_document
```

```python
salt.modules.boto_iam.upload_server_cert(cert_name, cert_body, private_key, cert_chain=None, path=None, region=None, key=None, keyid=None, profile=None)
```

Upload a certificate to Amazon.

New in version 2015.8.0.

CLI Example:

```python
salt myminion boto_iam.upload_server_cert mycert_name crt priv_key
```

Parameters

- **cert_name** -- The name for the server certificate. Do not include the path in this value.
- **cert_body** -- The contents of the public key certificate in PEM-encoded format.
- **private_key** -- The contents of the private key in PEM-encoded format.
- **cert_chain** -- The contents of the certificate chain. This is typically a concatenation of the PEM-encoded public key certificates of the chain.
- **path** -- The path for the server certificate.
- **region** -- The name of the region to connect to.
- **key** -- The key to be used in order to connect
- **keyid** -- The keyid to be used in order to connect
- **profile** -- The profile that contains a dict of region, key, keyid

Returns True / False

```python
salt.modules.boto_iam.user_exists_in_group(user_name, group_name, region=None, key=None, keyid=None, profile=None)
```

Check if user exists in group.

New in version 2015.8.0.

CLI Example:

```python
salt myminion boto_iam.user_exists_in_group myuser mygroup
```
19.9.45 salt.modules.boto_iot module

Connection module for Amazon IoT

New in version 2016.3.0.

depends

• boto
• boto3

The dependencies listed above can be installed via package or pip.

configuration

This module accepts explicit Lambda credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:

iot.keyid: GKTADJGHEIQSXMKKRBJ08H
iot.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

A region may also be specified in the configuration:

iot.region: us-east-1

If a region is not specified, the default is us-east-1.

It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1

salt.modules.boto_iot.attach_principal_policy(policyName, principal, region=None, key=None, keyid=None, profile=None)

Attach the specified policy to the specified principal (certificate or other credential.)

Returns {attached: true} if the policy was attached {attached: False} if the policy was not attached.

CLI Example:

salt myminion boto_iot.attach_principal_policy mypolicy mycognitoID

salt.modules.boto_iot.create_policy(policyName, policyDocument, region=None, key=None, keyid=None, profile=None)

Given a valid config, create a policy.

Returns {created: true} if the policy was created and returns {created: False} if the policy was not created.

CLI Example:

salt myminion boto_iot.create_policy my_policy

'{"Version":"2015-12-12","Statement":[]}
salt.modules.boto_iot.create_policy_version(policyName, policyDocument, setAsDefault=False, region=None, key=None, keyid=None, profile=None)

Given a valid config, create a new version of a policy.

Returns {created: true} if the policy version was created and returns {created: False} if the policy version was not created.

CLI Example:

```
salt myminion boto_iot.create_policy_version my_policy
```

salt.modules.boto_iot.create_thing_type(thingTypeName, thingTypeDescription, searchableAttributesList, region=None, key=None, keyid=None, profile=None)

Given a valid config, create a thing type.

Returns {created: true} if the thing type was created and returns {created: False} if the thing type was not created.

New in version 2016.11.0.

CLI Example:

```
salt myminion boto_iot.create_thing_type mythingtype
    thingtype_description_string = ["searchable_attr_1", "searchable_attr_2"]
```

salt.modules.boto_iot.create_topic_rule(ruleName, sql, actions, description, ruleDisabled=False, region=None, key=None, keyid=None, profile=None)

Given a valid config, create a topic rule.

Returns {created: true} if the rule was created and returns {created: False} if the rule was not created.

CLI Example:

```
salt myminion boto_iot.create_topic_rule my_rule
    SELECT * FROM 'some/thing'
    ["lambda":{"functionArn":"arn:::something"},"sns":{
        "targetArn":"arn:::something","roleArn":"arn:::something"}]
```

salt.modules.boto_iot.delete_policy(policyName, region=None, key=None, keyid=None, profile=None)

Given a policy name, delete it.

Returns {deleted: true} if the policy was deleted and returns {deleted: false} if the policy was not deleted.

CLI Example:

```
salt myminion boto_iot.delete_policy mypolicy
```

salt.modules.boto_iot.delete_policy_version(policyName, policyVersionId, region=None, key=None, keyid=None, profile=None)

Given a policy name and version, delete it.

Returns {deleted: true} if the policy version was deleted and returns {deleted: false} if the policy version was not deleted.
CLI Example:
```
salt myminion boto_iot.delete_policy_version mypolicy version
```

```python
salt.modules.boto_iot.delete_thing_type(thingTypeName, region=None, key=None, keyid=None, profile=None)
```

Given a thing type name, delete it.

Returns {deleted: true} if the thing type was deleted and returns {deleted: false} if the thing type was not deleted.

New in version 2016.11.0.

CLI Example:
```
salt myminion boto_iot.delete_thing_type mythingtype
```

```python
salt.modules.boto_iot.delete_topic_rule(ruleName, region=None, key=None, keyid=None, profile=None)
```

Given a rule name, delete it.

Returns {deleted: true} if the rule was deleted and returns {deleted: false} if the rule was not deleted.

CLI Example:
```
salt myminion boto_iot.delete_rule myrule
```

```python
salt.modules.boto_iot.deprecate_thing_type(thingTypeName, undoDeprecate=False, region=None, key=None, keyid=None, profile=None)
```

Given a thing type name, deprecate it when undoDeprecate is False and undeprecate it when undoDeprecate is True.

Returns {deprecated: true} if the thing type was deprecated and returns {deprecated: false} if the thing type was not deprecated.

New in version 2016.11.0.

CLI Example:
```
salt myminion boto_iot.deprecate_thing_type mythingtype
```

```python
salt.modules.boto_iot.describe_policy(policyName, region=None, key=None, keyid=None, profile=None)
```

Given a policy name describe its properties.

Returns a dictionary of interesting properties.

CLI Example:
```
salt myminion boto_iot.describe_policy mypolicy
```

```python
salt.modules.boto_iot.describe_policy_version(policyName, policyVersionId, region=None, key=None, keyid=None, profile=None)
```

Given a policy name and version describe its properties.

Returns a dictionary of interesting properties.

CLI Example:
salt.myminion.boto_iot.describe_policy_version.mypolicy.version

```python
salt.modules.boto_iot.describe_thing_type(thingTypeName, region=None, key=None, keyid=None, profile=None)
```

Given a thing type name describe its properties.
Returns a dictionary of interesting properties.
New in version 2016.11.0.
CLI Example:
```
salt myminion boto_iot.describe_thing_type mythingtype
```

```python
salt.modules.boto_iot.describe_topic_rule(ruleName, region=None, key=None, keyid=None, profile=None)
```

Given a topic rule name describe its properties.
Returns a dictionary of interesting properties.
CLI Example:
```
salt myminion boto_iot.describe_topic_rule myrule
```

```python
salt.modules.boto_iot.detach_principal_policy(policyName, principal, region=None, key=None, keyid=None, profile=None)
```

Detach the specified policy from the specified principal (certificate or other credential.)
Returns {detached: true} if the policy was detached {detached: False} if the policy was not detached.
CLI Example:
```
salt myminion boto_iot.detach_principal_policy mypolicy mycognitoID
```

```python
salt.modules.boto_iot.list_policies(region=None, key=None, keyid=None, profile=None)
```

List all policies
Returns list of policies
CLI Example:
```
salt myminion boto_iot.list_policies
```

Example Return:
```
policies:
- {...}
- {...}
```

```python
salt.modules.boto_iot.list_policy_versions(policyName, region=None, key=None, keyid=None, profile=None)
```

List the versions available for the given policy.
CLI Example:
```
salt myminion boto_iot.list_policy_versions mypolicy
```

Example Return:
policyVersions:
  - {...}
  - {...}

salt.modules.boto_iot.list_principal_policies(principal, region=None, key=None, keyid=None, profile=None)

List the policies attached to the given principal.

CLI Example:
salt myminion boto_iot.list_principal_policies myprincipal

Example Return:
policies:
  - {...}
  - {...}

salt.modules.boto_iot.list_topic_rules(topic=None, ruleDisabled=None, region=None, key=None, keyid=None, profile=None)

List all rules (for a given topic, if specified)

Returns list of rules

CLI Example:
salt myminion boto_iot.list_topic_rules

Example Return:
rules:
  - {...}
  - {...}

salt.modules.boto_iot.policy_exists(policyName, region=None, key=None, keyid=None, profile=None)

Given a policy name, check to see if the given policy exists.

Returns True if the given policy exists and returns False if the given policy does not exist.

CLI Example:
salt myminion boto_iot.policy_exists mypolicy

salt.modules.boto_iot.policy_version_exists(policyName, policyVersionId, region=None, key=None, keyid=None, profile=None)

Given a policy name and version ID, check to see if the given policy version exists.

Returns True if the given policy version exists and returns False if the given policy version does not exist.

CLI Example:
salt myminion boto_iot.policy_version_exists mypolicy versionid

salt.modules.boto_iot.replace_topic_rule(ruleName, sql, actions, description, ruleDisabled=False, region=None, key=None, keyid=None, profile=None)

Given a valid config, replace a topic rule with the new values.

Returns {created: true} if the rule was created and returns {created: False} if the rule was not created.
CLI Example:
```
salt myminion boto_iot.replace_topic_rule my_rule 'SELECT * FROM some.thing' \
'[{"lambda":{"FunctionArn":"arn:::::something"}},{"sns":{\n "targetArn":"arn:::::something","roleArn":"arn:::::something"}}]'
```

salt.modules.boto_iot.set_default_policy_version(policyName, policyVersionId, region=None, key=None, keyid=None, profile=None)

Sets the specified version of the specified policy as the policy's default (operative) version. This action affects all certificates that the policy is attached to.

Returns {changed: true} if the policy version was set {changed: False} if the policy version was not set.

CLI Example:
```
salt myminion boto_iot.set_default_policy_version mypolicy versionid
```

salt.modules.boto_iot.thing_type_exists(thingTypeName, region=None, key=None, keyid=None, profile=None)

Given a thing type name, check to see if the given thing type exists

Returns True if the given thing type exists and returns False if the given thing type does not exist.

New in version 2016.11.0.

CLI Example:
```
salt myminion boto_iot.thing_type_exists mythingtype
```

salt.modules.boto_iot.topic_rule_exists(ruleName, region=None, key=None, keyid=None, profile=None)

Given a rule name, check to see if the given rule exists.

Returns True if the given rule exists and returns False if the given rule does not exist.

CLI Example:
```
salt myminion boto_iot.topic_rule_exists myrule
```

19.9.46 salt.modules.boto_kinesis module

Connection module for Amazon Kinesis

New in version 2017.7.0.

configuration This module accepts explicit Kinesis credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
kinesis.keyid: GKTADJGHEIQSXMKKRBJ08H
kinesis.key: askdjghsdfjkghWupUjasdflkdkfjlgjsdfjajkghs
```

A region may also be specified in the configuration:
If a region is not specified, the default is `us-east-1`.

It’s also possible to specify `key`, `keyid` and `region` via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQXSXMCKKRBJ08H
  key: askdjghsdfjghWupUjasdfklkdfklgjsdfjajkghs
  region: us-east-1
```

depends boto3

```
salt.modules.boto_kinesis.create_stream(stream_name, num_shards, region=None, key=None, keyid=None, profile=None)
```

Create a stream with name `stream_name` and initial number of shards `num_shards`.

CLI example:
```
salt myminion boto_kinesis.create_stream my_stream N region=us-east-1
```

```
salt.modules.boto_kinesis.decrease_stream_retention_period(stream_name, retention_hours, region=None, key=None, keyid=None, profile=None)
```

Decrease stream retention period to `retention_hours`

CLI example:
```
salt myminion boto_kinesis.decrease_stream_retention_period my_stream N region=us-east-1
```

```
salt.modules.boto_kinesis.delete_stream(stream_name, region=None, key=None, keyid=None, profile=None)
```

Delete the stream with name `stream_name`. This cannot be undone! All data will be lost!!

CLI example:
```
salt myminion boto_kinesis.delete_stream my_stream region=us-east-1
```

```
salt.modules.boto_kinesis.disable_enhanced_monitoring(stream_name, metrics, region=None, key=None, keyid=None, profile=None)
```

Disable enhanced monitoring for the specified shard-level metrics on stream `stream_name`

CLI example:
```
salt myminion boto_kinesis.disable_enhanced_monitoring my_stream ["metrics", "to disable"] region=us-east-1
```

```
salt.modules.boto_kinesis.enable_enhanced_monitoring(stream_name, metrics, region=None, key=None, keyid=None, profile=None)
```

Enable enhanced monitoring for the specified shard-level metrics on stream `stream_name`

CLI example:
Salt Documentation, Release 2017.7.8

```
salt myminion boto_kinesis.enable_enhanced_monitoring my_stream ["metrics", "to", 
  "enable"] region=us-east-1
```

`salt.modules.boto_kinesis.exists(stream_name, region=None, key=None, keyid=None, profile=None)`

Check if the stream exists. Returns False and the error if it does not.

CLI example:
```
salt myminion boto_kinesis.exists my_stream region=us-east-1
```

`salt.modules.boto_kinesis.get_info_for_reshard(stream_details)`

Collect some data: number of open shards, key range, etc. Modifies stream_details to add a sorted list of
OpenShards. Returns (min_hash_key, max_hash_key, stream_details)

CLI example:
```
salt myminion boto_kinesis.get_info_for_reshard existing_stream_details
```

`salt.modules.boto_kinesis.get_stream_when_active(stream_name, region=None, key=None, keyid=None, profile=None)`

Get complete stream info from AWS, returning only when the stream is in the ACTIVE state. Continues to
retry when stream is updating or creating. If the stream is deleted during retries, the loop will catch the error
and break.

CLI example:
```
salt myminion boto_kinesis.get_stream_when_active my_stream region=us-east-1
```

`salt.modules.boto_kinesis.increase_stream_retention_period(stream_name, retention_hours, region=None, key=None, keyid=None, profile=None)`

Increase stream retention period to retention_hours

CLI example:
```
salt myminion boto_kinesis.increase_stream_retention_period my_stream N region=us-east-1
```

`salt.modules.boto_kinesis.long_int(hash_key)`

The hash key is a 128-bit int, sent as a string. It's necessary to convert to int/long for comparison operations.
This helper method handles python 2/3 incompatibility

CLI example:
```
salt myminion boto_kinesis.long_int some_MD5_hash_as_string
```

**Returns** long object if python 2.X, int object if python 3.X

`salt.modules.boto_kinesis.reshard(stream_name, desired_size, force=False, region=None, key=None, keyid=None, profile=None)`

Reshard a kinesis stream. Each call to this function will wait until the stream is ACTIVE, then make a single
split or merge operation. This function decides where to split or merge with the assumption that the ultimate
goal is a balanced partition space.

For safety, user must past in force=True; otherwise, the function will dry run.

19.9. execution modules
CLI example:

```bash
salt myminion boto_kinesis.reshard my_stream N True region=us-east-1
```

Returns  True if a split or merge was found/performer, False if nothing is needed.

**19.9.47 salt.modules.boto_kms**

Connection module for Amazon KMS

New in version 2015.8.0.

**configuration**  This module accepts explicit kms credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```yaml
kms.keyid: GKTADJGHEIQSXMKKRBJ08H
kms.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```yaml
kms.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```yaml
myprofile: keyid: GKTADJGHEIQSXMKKRBJ08H key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs region: us-east-1
```

**depends**  boto

salt.modules.boto_kms.**create_alias**(alias_name, target_key_id, region=None, key=None, keyid=None, profile=None)

Create a display name for a key.

CLI example:

```bash
salt myminion boto_kms.create_alias 'alias/mykey' key_id
```

salt.modules.boto_kms.**create_grant**(key_id, grantee_principal, retiring_principal=None, operations=None, constraints=None, grant_tokens=None, region=None, key=None, keyid=None, profile=None)

Adds a grant to a key to specify who can access the key and under what conditions.

CLI example:

```bash
salt myminion boto_kms.create_grant 'alias/mykey' 'arn:aws:iam::11111111:role/myrole' operations=['"Encrypt","Decrypt"]
```

salt.modules.boto_kms.**create_key**(policy=None, description=None, key_usage=None, region=None, key=None, keyid=None, profile=None)

Creates a master key.
CLI example:
```
salt myminion boto_kms.create_key '{"Statement":...}' "My master key"
```

```
salt.modules.boto_kms.decrypt(ciphertext_blob, encryption_context=None, grant_tokens=None, region=None, key=None, keyid=None, profile=None)
```

Decrypt ciphertext.

CLI example:
```
salt myminion boto_kms.decrypt encrypted_ciphertext
```

```
salt.modules.boto_kms.describe_key(key_id, region=None, key=None, keyid=None, profile=None)
```

Get detailed information about a key.

CLI example:
```
salt myminion boto_kms.describe_key 'alias/mykey'
```

```
salt.modules.boto_kms.disable_key(key_id, region=None, key=None, keyid=None, profile=None)
```

Mark key as disabled.

CLI example:
```
salt myminion boto_kms.disable_key 'alias/mykey'
```

```
salt.modules.boto_kms.disable_key_rotation(key_id, region=None, key=None, keyid=None, profile=None)
```

Disable key rotation for specified key.

CLI example:
```
salt myminion boto_kms.disable_key_rotation 'alias/mykey'
```

```
salt.modules.boto_kms.enable_key(key_id, region=None, key=None, keyid=None, profile=None)
```

Mark key as enabled.

CLI example:
```
salt myminion boto_kms.enable_key 'alias/mykey'
```

```
salt.modules.boto_kms.enable_key_rotation(key_id, region=None, key=None, keyid=None, profile=None)
```

Disable key rotation for specified key.

CLI example:
```
salt myminion boto_kms.enable_key_rotation 'alias/mykey'
```

```
salt.modules.boto_kms.encrypt(key_id, plaintext, encryption_context=None, grant_tokens=None, region=None, key=None, keyid=None, profile=None)
```

Encrypt plaintext into cipher text using specified key.

CLI example:
```
salt myminion boto_kms.encrypt 'alias/mykey' 'myplaindata' '{"aws:username": "myuser"}'
```
salt.modules.boto_kms.generate_data_key(key_id, encryption_context=None, number_of_bytes=None, key_spec=None, grant_tokens=None, region=None, key=None, keyid=None, profile=None)

Generate a secure data key.

CLI example:
```
salt myminion boto_kms.generate_data_key 'alias/mykey' number_of_bytes=1024 key_spec=AES_128
```

salt.modules.boto_kms.generate_data_key_without_plaintext(key_id, encryption_context=None, number_of_bytes=None, key_spec=None, grant_tokens=None, region=None, key=None, keyid=None, profile=None)

Generate a secure data key without a plaintext copy of the key.

CLI example:
```
salt myminion boto_kms.generate_data_key_without_plaintext 'alias/mykey' number_of_bytes=1024 key_spec=AES_128
```

salt.modules.boto_kms.generate_random(number_of_bytes=None, region=None, key=None, keyid=None, profile=None)

Generate a random string.

CLI example:
```
salt myminion boto_kms.generate_random number_of_bytes=1024
```

salt.modules.boto_kms.get_key_policy(key_id, policy_name, region=None, key=None, keyid=None, profile=None)

Get the policy for the specified key.

CLI example:
```
salt myminion boto_kms.get_key_policy 'alias/mykey' mypolicy
```

salt.modules.boto_kms.get_key_rotation_status(key_id, region=None, key=None, keyid=None, profile=None)

Get status of whether or not key rotation is enabled for a key.

CLI example:
```
salt myminion boto_kms.get_key_rotation_status 'alias/mykey'
```

salt.modules.boto_kms.key_exists(key_id, region=None, key=None, keyid=None, profile=None)

Check for the existence of a key.

CLI example:
```
salt myminion boto_kms.key_exists 'alias/mykey'
```
salt.modules.boto_kms.list_grants(key_id, limit=None, marker=None, region=None, key=None, keyid=None, profile=None)

List grants for the specified key.

CLI example:

```
salt myminion boto_kms.list_grants 'alias/mykey'
```

salt.modules.boto_kms.list_key_policies(key_id, limit=None, marker=None, region=None, key=None, keyid=None, profile=None)

List key_policies for the specified key.

CLI example:

```
salt myminion boto_kms.list_key_policies 'alias/mykey'
```

salt.modules.boto_kms.put_key_policy(key_id, policy_name, policy, region=None, key=None, keyid=None, profile=None)

Attach a key policy to the specified key.

CLI example:

```
salt myminion boto_kms.put_key_policy 'alias/mykey' default '{"Statement":...}'
```

salt.modules.boto_kms.re_encrypt(ciphertext_blob, destination_key_id, source_encryption_context=None, destination_encryption_context=None, grant_tokens=None, region=None, key=None, keyid=None, profile=None)

Reencrypt encrypted data with a new master key.

CLI example:

```
salt myminion boto_kms.re_encrypt 'encrypted_data' 'alias/mynewkey' default '{"Statement":...}'
```

salt.modules.boto_kms.revoke_grant(key_id, grant_id, region=None, key=None, keyid=None, profile=None)

Revoke a grant from a key.

CLI example:

```
salt myminion boto_kms.revoke_grant 'alias/mykey' 8u89hf-j09j...
```

salt.modules.boto_kms.update_key_description(key_id, description, region=None, key=None, keyid=None, profile=None)

Update a key's description.

CLI example:

```
salt myminion boto_kms.update_key_description 'alias/mykey' 'My key'
```

19.9.48 salt.modules.boto_lambda module

Connection module for Amazon Lambda

New in version 2016.3.0.

depends

- boto

19.9. execution modules
The dependencies listed above can be installed via package or pip.

**configuration** This module accepts explicit Lambda credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available [here](#).

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```yaml
lambda.keyid: GKTADJGHEIQSXMKKRBJ08H
lambda.key: askdjghsdfjkgHwupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```yaml
lambda.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```yaml
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkgHwupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

Changed in version 2015.8.0: All methods now return a dictionary. Create and delete methods return:

```yaml
created: true
```

or

```yaml
created: false
error:
  message: error message
```

Request methods (e.g., `describe_function`) return:

```yaml
function:
  - {...}
  - {...}
```

or

```yaml
error:
  message: error message
```

salt.modules.boto_lambda.add_permission(FunctionName, StatementId, Action, Principal, SourceArn=None, SourceAccount=None, Qualifier=None, region=None, key=None, keyid=None, profile=None)

Add a permission to a lambda function.

Returns [added: true] if the permission was added and returns [added: False] if the permission was not added.

CLI Example:
salt myminion boto_lambdas.add_permission my_function my_id "lambda:*" \ 
  s3.amazonaws.com aws:arn:::bucket-name \ 
  aws-account-id

salt.modules.boto_lambda.alias_exists(FunctionName, Name, region=None, key=None, 
  keyid=None, profile=None)
Given a function name and alias name, check to see if the given alias exists.
Returns True if the given alias exists and returns False if the given alias does not exist.
CLI Example:
  salt myminion boto_lambda.alias_exists myfunction myalias

salt.modules.boto_lambda.create_alias(FunctionName, Name, FunctionVersion, Description="`, 
  region=None, key=None, keyid=None, profile=None)
Given a valid config, create an alias to a function.
Returns [created: true] if the alias was created and returns [created: False] if the alias was not created.
CLI Example:
  salt myminion boto_lamba.create_alias my_function my_alias $LATEST "An alias"

salt.modules.boto_lambda.create_event_source_mapping(EventSourceArn, FunctionName, 
  StartingPosition, Enabled=True, 
  BatchSize=100, region=None, key=None, keyid=None, profile=None)
Identifies a stream as an event source for a Lambda function. It can be either an Amazon Kinesis stream or 
an Amazon DynamoDB stream. AWS Lambda invokes the specified function when records are posted to the 
stream.
Returns [created: true] if the event source mapping was created and returns [created: False] if the event source 
mapping was not created.
CLI Example:
  salt myminion boto_lambda.create_event_source_mapping arn:::eventsource
  ->myfunction LATEST

class modules.boto_lambda.create_function(FunctionName, Runtime, Role, Handler, Zip
  File=None, S3Bucket=None, S3Key=None, S3ObjectVersion=None, Description="`, Timeout=3, 
  MemorySize=128, Publish=False, Wait
  ForRole=False, RoleRetries=5, region=None, key=None, keyid=None, profile=None, Vpc
  Config=None, Environment=None)
New in version 2017.7.0.
Given a valid config, create a function.
Environment The parent object that contains your environment’s configuration settings. This is a dictionary 
of the form:
```json
{ 
  'Variables': { 
    'VariableName': 'VariableValue' 
  }
}
```
Salt Documentation, Release 2017.7.8

Returns {'created': True} if the function was created and {'created': False} if the function was not created.

CLI Example:
```
salt myminion boto_lamba.create_function my_function python2.7 my_role my_file.my_function.zip
```

salt.modules.boto_lambda.delete_alias(FunctionName, Name, region=None, key=None, keyid=None, profile=None)
Given a function name and alias name, delete the alias.
Returns {deleted: true} if the alias was deleted and returns {deleted: false} if the alias was not deleted.

CLI Example:
```
salt myminion boto_lamba.delete_alias myfunction myalias
```

salt.modules.boto_lambda.delete_event_source_mapping(UUID=None, EventSourceArn=None, FunctionName=None, region=None, key=None, keyid=None, profile=None)
Given an event source mapping ID or an event source ARN and FunctionName, delete the event source mapping.
Returns {deleted: true} if the mapping was deleted and returns {deleted: false} if the mapping was not deleted.

CLI Example:
```
salt myminion boto_lamba.delete_event_source_mapping 260c423d-e8b5-4443-8d6a-5e91b9ecd0fa
```

salt.modules.boto_lambda.delete_function(FunctionName, Qualifier=None, region=None, key=None, keyid=None, profile=None)
Given a function name and optional version qualifier, delete it.
Returns {deleted: true} if the function was deleted and returns {deleted: false} if the function was not deleted.

CLI Example:
```
salt myminion boto_lamba.delete_function myfunction
```

salt.modules.boto_lambda.describe_alias(FunctionName, Name, region=None, key=None, keyid=None, profile=None)
Given a function name and alias name describe the properties of the alias.
Returns a dictionary of interesting properties.

CLI Example:
```
salt myminion boto_lamba.describe_alias myalias
```

salt.modules.boto_lambda.describe_event_source_mapping(UUID=None, EventSourceArn=None, FunctionName=None, region=None, key=None, keyid=None, profile=None)
Given an event source mapping ID or an event source ARN and FunctionName, obtain the current settings of that mapping.
Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_lambda.describe_event_source_mapping uuid
```

**salt.modules.boto_lambda.describe_function** (*FunctionName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a function name describe its properties.
Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_lambda.describe_function myfunction
```

**salt.modules.boto_lambda.event_source_mapping_exists** (*UUID=None*, *EventSourceArn=None*, *FunctionName=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given an event source mapping ID or an event source ARN and FunctionName, check whether the mapping exists.
Returns True if the given alias exists and returns False if the given alias does not exist.

CLI Example:

```
salt myminion boto_lambda.alias_exists myfunction myalias
```

**salt.modules.boto_lambda.function_exists** (*FunctionName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a function name, check to see if the given function name exists.
Returns True if the given function exists and returns False if the given function does not exist.

CLI Example:

```
salt myminion boto_lambda.function_exists myfunction
```

**salt.modules.boto_lambda.get_event_source_mapping_ids** (*EventSourceArn*, *FunctionName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given an event source and function name, return a list of mapping IDs

CLI Example:

```
salt myminion boto_lambda.get_event_source_mapping_ids arn:::: myfunction
```

**salt.modules.boto_lambda.get_permissions** (*FunctionName*, *Qualifier=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get resource permissions for the given lambda function
Returns dictionary of permissions, by statement ID

CLI Example:

```
salt myminion boto_lambda.get_permissions my_function
```

permissions: {...}
salt.modules.boto_lambda.list_function_versions(FunctionName, region=None, key=None, keyid=None, profile=None)

List the versions available for the given function.
Returns list of function versions

CLI Example:

```
versions:
- {...}
- {...}
```

salt.modules.boto_lambda.list_functions(region=None, key=None, keyid=None, profile=None)

List all Lambda functions visible in the current scope.

CLI Example:

```
salt myminion boto_lambda.list_functions
```

salt.modules.boto_lambda.remove_permission(FunctionName, StatementId, Qualifier=None, region=None, key=None, keyid=None, profile=None)

Remove a permission from a lambda function.
Returns {removed: true} if the permission was removed and returns {removed: False} if the permission was not removed.

CLI Example:

```
salt myminion boto_lamba.remove_permission my_function my_id
```

salt.modules.boto_lambda.update_alias(FunctionName, Name, FunctionVersion=None, Description=None, region=None, key=None, keyid=None, profile=None)

Update the named alias to the configuration.
Returns {updated: true} if the alias was updated and returns {updated: False} if the alias was not updated.

CLI Example:

```
salt myminion boto_lamba.update_alias my_lambda my_alias $LATEST
```

salt.modules.boto_lambda.update_event_source_mapping(UUID, FunctionName=None, Enabled=None, BatchSize=None, region=None, key=None, keyid=None, profile=None)

Update the event source mapping identified by the UUID.
Returns {updated: true} if the alias was updated and returns {updated: False} if the alias was not updated.

CLI Example:

```
salt myminion boto_lamba.update_event_source_mapping uuid FunctionName=new_function
```
salt.modules.boto_lambda.update_function_code(FunctionName, ZipFile=None, S3Bucket=None, S3Key=None, S3ObjectVersion=None, Publish=False, region=None, key=None, keyid=None, profile=None)

Upload the given code to the named lambda function.

Returns {updated: true} if the function was updated and returns {updated: False} if the function was not updated.

CLI Example:

```
salt myminion boto_lambda.update_function_code my_function ZipFile=function.zip
```

salt.modules.boto_lambda.update_function_config(FunctionName, Role=None, Handler=None, Description=None, Timeout=None, MemorySize=None, region=None, key=None, keyid=None, profile=None, VpcConfig=None, WaitForRole=False, RoleRetries=5, Environment=None)

New in version 2017.7.0.

Update the named lambda function to the configuration.

Environment The parent object that contains your environment’s configuration settings. This is a dictionary of the form:

```{ 'Variables': {'VariableName': 'VariableValue'} }
```

Returns {'updated': True} if the function was updated, and {'updated': False} if the function was not updated.

CLI Example:

```
salt myminion boto_lambda.update_function_config my_function my_role my_file.my_
```

19.9.49 salt.modules.boto_rds

Connection module for Amazon RDS

New in version 2015.8.0.

configuration This module accepts explicit rds credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-

If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:

```
rds.keyid: GKTADJGHEIQSXMKKRBJ08H
rds.key: askdjghsdfjkgHwupUjasdfsdkldfklgjsdfjakghs
```
A region may also be specified in the configuration:

```
rds.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfkldgjsdfajkghs
  region: us-east-1
```

**depends** boto3

salt.modules.boto_rds.create(name, allocated_storage, db_instance_class, engine, master_username, master_user_password, db_name=None, db_security_groups=None, vpc_security_group_ids=None, availability_zone=None, db_subnet_group_name=None, preferred_maintenance_window=None, db_parameter_group_name=None, backup_retention_period=None, preferred_backup_window=None, port=None, multi_az=None, engine_version=None, auto_minor_version_upgrade=None, license_model=None, iops=None, option_group_name=None, character_set_name=None, publicly_accessible=None, wait_status=None, tags=None, db_cluster_identifier=None, storage_type=None, tde_credential_arn=None, tde_credential_password=None, storage_encrypted=None, kms_key_id=None, domain=None, copy_tags_to_snapshot=None, monitoring_interval=None, monitoring_role_arn=None, domain_iam_role_name=None, region=None, promotion_tier=None, key=None, keyid=None, profile=None)

Create an RDS

CLI example to create an RDS:

```
salt myminion boto_rds.create myrds 10 db.t2.micro MySQL sqlusr sqlpassw
```

salt.modules.boto_rds.create_option_group(name, engine_name, major_engine_version, option_group_description, tags=None, region=None, key=None, keyid=None, profile=None)

Create an RDS option group

CLI example to create an RDS option group:

```
salt myminion boto_rds.create_option_group my-opt-group mysql 5.6
  → "group description"
```

salt.modules.boto_rds.create_parameter_group(name, db_parameter_group_family, description, tags=None, region=None, key=None, keyid=None, profile=None)

Create an RDS parameter group

CLI example to create an RDS parameter group:

```
salt myminion boto_rds.create_parameter_group my-param-group mysql5.6
  → "group description"
```
salt.modules.boto_rds.create_read_replica(name, source_name, db_instance_class=None, availability_zone=None, port=None, auto_minor_version_upgrade=None, iops=None, option_group_name=None, publiclyAccessible=None, tags=None, db_subnet_group_name=None, storage_type=None, copy_tags_to_snapshot=None, monitoring_interval=None, monitoring_role_arn=None, region=None, key=None, keyid=None, profile=None)

Create an RDS read replica
CLI example to create an RDS read replica:

```bash
salt myminion boto_rds.create_read_replica replicaname source_name
```

salt.modules.boto_rds.create_subnet_group(name, description, subnet_ids, tags=None, region=None, key=None, keyid=None, profile=None)

Create an RDS subnet group
CLI example to create an RDS subnet group:

```bash
salt myminion boto_rds.create_subnet_group my-subnet-group "group description" '[subnet-12345678, subnet-87654321]' region=us-east-1
```

salt.modules.boto_rds.delete(name, skip_final_snapshot=None, final_db_snapshot_identifier=None, region=None, key=None, keyid=None, profile=None, timeout=180)

Delete an RDS instance.
CLI example:

```bash
salt myminion boto_rds.delete myrds skip_final_snapshot=True region=us-east-1
```

salt.modules.boto_rds.delete_option_group(name, region=None, key=None, keyid=None, profile=None)

Delete an RDS option group.
CLI example:

```bash
salt myminion boto_rds.delete_option_group my-opt-group region=us-east-1
```

salt.modules.boto_rds.delete_parameter_group(name, region=None, key=None, keyid=None, profile=None)

Delete an RDS parameter group.
CLI example:

```bash
salt myminion boto_rds.delete_parameter_group my-param-group region=us-east-1
```

salt.modules.boto_rds.delete_subnet_group(name, region=None, key=None, keyid=None, profile=None)

Delete an RDS subnet group.
CLI example:
salt.myminion boto_rds.delete_subnet_group my-subnet-group
    region=us-east-1

salt.modules.boto_rds.describe(name, tags=None, region=None, key=None, keyid=None, profile=None)
    Return RDS instance details.
    CLI example:
    salt myminion boto_rds.describe myrds

salt.modules.boto_rds.describe_parameter_group(name, Filters=None, MaxRecords=None, Marker=None, region=None, key=None, keyid=None, profile=None)
    Returns a list of DBParameterGroup descriptions. CLI example to description of parameter group:
    salt myminion boto_rds.describe_parameter_group parametergroupname
    region=us-east-1

salt.modules.boto_rds.describe_parameters(name, Source=None, MaxRecords=None, Marker=None, region=None, key=None, keyid=None, profile=None)
    Returns a list of DBParameterGroup parameters. CLI example to description of parameters
    salt myminion boto_rds.describe_parameters parametergroupname region=us-east-1

salt.modules.boto_rds.exists(name, tags=None, region=None, key=None, keyid=None, profile=None)
    Check to see if an RDS exists.
    CLI example:
    salt myminion boto_rds.exists myrds region=us-east-1

salt.modules.boto_rds.get_endpoint(name, tags=None, region=None, key=None, keyid=None, profile=None)
    Return the endpoint of an RDS instance.
    CLI example:
    salt myminion boto_rds.get_endpoint myrds
salt.modules.boto_rds.modify_db_instance(name, allocated_storage=None, allow_major_version_upgrade=None, apply_immediately=None, auto_minor_version_upgrade=None, backup_retention_period=None, ca_certificate_identifier=None, character_set_name=None, copy_tags_to_snapshot=None, db_cluster_identifier=None, db_instance_class=None, db_name=None, db_parameter_group_name=None, db_port_number=None, db_security_groups=None, db_subnet_group_name=None, domain=None, domain_iam_role_name=None, engine_version=None, iops=None, kms_key_id=None, license_model=None, master_user_password=None, monitoring_interval=None, monitoring_role_arn=None, multi_az=None, new_db_instance_identifier=None, option_group_name=None, preferred_backup_window=None, preferred_maintenance_window=None, promotion_tier=None, publicly_accessible=None, storage_encrypted=None, storage_type=None, tde_credential_arn=None, tde_credential_password=None, vpc_security_group_ids=None, region=None, key=None, keyid=None, profile=None)

Modify settings for a DB instance. CLI example to description of parameters

```salt myminion boto_rds.modify_db_instance db_instance_identifier region=us-east-1```

salt.modules.boto_rds.option_group_exists(name, tags=None, region=None, key=None, keyid=None, profile=None)

Check to see if an RDS option group exists.

CLI example:

```salt myminion boto_rds.option_group_exists myoptiongr region=us-east-1```

salt.modules.boto_rds.parameter_group_exists(name, tags=None, region=None, key=None, keyid=None, profile=None)

Check to see if an RDS parameter group exists.

CLI example:

```salt myminion boto_rds.parameter_group_exists myparametergroup region=us-east-1```

salt.modules.boto_rds.subnet_group_exists(name, tags=None, region=None, key=None, keyid=None, profile=None)

Check to see if an RDS subnet group exists.

CLI example:
salt myminion boto_rds.subnet_group_exists my-param-group
--region=us-east-1

salt.modules.boto_rds.update_parameter_group(name, parameters, apply_method='pending-reboot', tags=None, region=None, key=None, keyid=None, profile=None)

Update an RDS parameter group.
CLI example:
salt myminion boto_rds.update_parameter_group my-param-group
--parameters="\"back_log\":1, \"binlog_cache_size\":4096\" region=us-east-1

19.9.50 salt.modules.boto_route53

Connection module for Amazon Route53
New in version 2014.7.0.

configuration This module accepts explicit route53 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

route53.keyid: GKTADJGHEIQSXMKKRBJ08H
route53.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

A region may also be specified in the configuration:

route53.region: us-east-1

If a region is not specified, the default is `universal`, which is what the boto_route53 library expects, rather than None.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1

depends boto

salt.modules.boto_route53.add_record(name, value, zone, record_type, identifier=None, ttl=None, region=None, key=None, keyid=None, profile=None, wait_for_sync=True, split_dns=False, private_zone=False, retry_on_rate_limit=True, rate_limit_retries=5)

Add a record to a zone.
CLI example:
salt myminion boto_route53.add_record test.example.org 1.1.1.1 example.org A

salt.modules.boto_route53.create_hosted_zone(domain_name, caller_ref=None, comment='', private_zone=False, vpc_id=None, vpc_name=None, vpc_region=None, region=None, key=None, keyid=None, profile=None)

Create a new Route53 Hosted Zone. Returns a Python data structure with information about the newly created Hosted Zone.

domain_name The name of the domain. This should be a fully-specified domain, and should terminate with a period. This is the name you have registered with your DNS registrar. It is also the name you will delegate from your registrar to the Amazon Route 53 delegation servers returned in response to this request.

caller_ref A unique string that identifies the request and that allows create_hosted_zone() calls to be retried without the risk of executing the operation twice. You want to provide this where possible, since additional calls while the first is in PENDING status will be accepted and can lead to multiple copies of the zone being created in Route53.

comment Any comments you want to include about the hosted zone.

private_zone Set True if creating a private hosted zone.

vpc_id When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with vpc_name. Ignored if passed for a non-private zone.

vpc_name When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with vpc_id. Ignored if passed for a non-private zone.

vpc_region When creating a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from vpc_id or vpc_name, if possible. If this fails, you'll need to provide an explicit value for this option. Ignored if passed for a non-private zone.

region Region endpoint to connect to

key AWS key to bind with

keyid AWS keyid to bind with

profile Dict, or pillar key pointing to a dict, containing AWS region/key/keyid

CLI Example:

salt myminion boto_route53.create_hosted_zone example.org

salt.modules.boto_route53.create_zone(zone, private=False, vpc_id=None, vpc_region=None, region=None, key=None, keyid=None, profile=None)

Create a Route53 hosted zone.

New in version 2015.8.0.

zone DNS zone to create

private True/False if the zone will be a private zone

vpc_id VPC ID to associate the zone to (required if private is True)

vpc_region VPC Region (required if private is True)

region region endpoint to connect to

key AWS key

keyid AWS keyid

profile AWS pillar profile

CLI Example:

salt myminion boto_route53.create_zone example.org
salt.modules.boto_route53.delete_record(name, zone, record_type, identifier=None, all_records=False, region=None, key=None, keyid=None, profile=None, wait_for_sync=True, split_dns=False, private_zone=False, retry_on_rate_limit=True, rate_limit_retries=5)

Modify a record in a zone.

CLI example:

```
salt myminion boto_route53.delete_record test.example.org example.org A
```

salt.modules.boto_route53.delete_zone(zone, region=None, key=None, keyid=None, profile=None)

Delete a Route53 hosted zone.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_route53.delete_zone example.org
```

salt.modules.boto_route53.describe_hosted_zones(zone_id=None, domain_name=None, region=None, key=None, keyid=None, profile=None)

Return detailed info about one, or all, zones in the bound account. If neither zone_id nor domain_name is provided, return all zones. Note that the return format is slightly different between the `all` and `single` description types.

- **zone_id** The unique identifier for the Hosted Zone
- **domain_name** The FQDN of the Hosted Zone (including final period)
- **region** Region to connect to.
- **key** Secret key to be used.
- **keyid** Access key to be used.
- **profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

CLI Example:

```
salt myminion boto_route53.describe_hosted_zones domain_name=foo.bar.com.
```

salt.modules.boto_route53.get_record(name, zone, record_type, fetch_all=False, region=None, key=None, keyid=None, profile=None, split_dns=False, private_zone=False, identifier=None, retry_on_rate_limit=True, rate_limit_retries=5)

Get a record from a zone.

CLI example:

```
salt myminion boto_route53.get_record test.example.org example.org A
```

salt.modules.boto_route53.list_all_zones_by_id(region=None, key=None, keyid=None, profile=None)

List, by their IDs, all hosted zones in the bound account.

- **region** Region to connect to.
- **key** Secret key to be used.
- **keyid** Access key to be used.
- **profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
CLI Example:

```
salt myminion boto_route53.list_all_zones_by_id
```

```
salt.modules.boto_route53.list_all_zones_by_name(region=None, key=None, keyid=None, profile=None)
```

List, by their FQDNs, all hosted zones in the bound account.

- **region**: Region to connect to.
- **key**: Secret key to be used.
- **keyid**: Access key to be used.
- **profile**: A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

CLI Example:

```
salt myminion boto_route53.list_all_zones_by_name
```

```
salt.modules.boto_route53.update_record(name, value, zone, record_type, identifier=None, ttl=None, region=None, key=None, keyid=None, profile=None, wait_for_sync=True, split_dns=False, private_zone=False, retry_on_rate_limit=True, rate_limit_retries=5)
```

Modify a record in a zone.

CLI example:

```
salt myminion boto_route53.modify_record test.example.org 1.1.1.1 example.org A
```

```
salt.modules.boto_route53.zone_exists(zone, region=None, key=None, keyid=None, profile=None, retry_on_rate_limit=True, rate_limit_retries=5)
```

Check for the existence of a Route53 hosted zone.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_route53.zone_exists example.org
```

### 19.9.51 salt.modules.boto_s3_bucket module

Connection module for Amazon S3 Buckets

New in version 2016.3.0.

- **depends**
  - boto
  - boto3

The dependencies listed above can be installed via package or pip.

- **configuration**
  - This module accepts explicit Lambda credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:

```yaml
s3.keyid: GKTADJGHEIQXSXMKKRBJ08H
s3.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```yaml
s3.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```yaml
myprofile:
  keyid: GKTADJGHEIQXSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

```python
salt.modules.boto_s3_bucket.create(Bucket, ACL=None, LocationConstraint=None, GrantFullControl=None, GrantRead=None, GrantReadACP=None, GrantWrite=None, GrantWriteACP=None, region=None, key=None, keyid=None, profile=None)
```

Given a valid config, create an S3 Bucket.

Returns {created: true} if the bucket was created and returns {created: False} if the bucket was not created.

CLI Example:

```
salt myminion boto_s3_bucket.create my_bucket
  GrantFullControl='emailaddress@example@example.com' \  
  GrantRead='uri="http://acs.amazonaws.com/groups/global/AllUsers"' \  
  GrantReadACP='emailaddress="exampl@example.com",id="2345678909876432"' \  
  LocationConstraint=us-west-1
```

```python
salt.modules.boto_s3_bucket.delete(Bucket, MFA=None, RequestPayer=None, Force=False, region=None, key=None, keyid=None, profile=None)
```

Given a bucket name, delete it, optionally emptying it first.

Returns {deleted: true} if the bucket was deleted and returns {deleted: false} if the bucket was not deleted.

CLI Example:

```
salt myminion boto_s3_bucket.delete mybucket
```

```python
salt.modules.boto_s3_bucket.delete_cors(Bucket, region=None, key=None, keyid=None, profile=None)
```

Delete the CORS configuration for the given bucket

Returns {deleted: true} if CORS was deleted and returns {deleted: False} if CORS was not deleted.

CLI Example:

```
salt myminion boto_s3_bucket.delete_cors my_bucket
```

```python
salt.modules.boto_s3_bucket.delete_lifecycle_configuration(Bucket, region=None, key=None, keyid=None, profile=None)
```

Delete the lifecycle configuration for the given bucket

Returns {deleted: true} if lifecycle configuration was deleted and returns {deleted: False} if lifecycle configuration was not deleted.

CLI Example:

```
salt myminion boto_s3_bucket.delete_lifecycle_configuration my_bucket
```
Returns {deleted: true} if Lifecycle was deleted and returns {deleted: False} if Lifecycle was not deleted.

CLI Example:
```
salt myminion boto_s3_bucket.delete_lifecycle_configuration my_bucket
```

salt.modules.boto_s3_bucket.delete_objects(Bucket, Delete, MFA=None, Request-Payer=None, region=None, key=None, keyid=None, profile=None)

Delete objects in a given S3 bucket.

Returns {deleted: true} if all objects were deleted and {deleted: false, failed: [key, ...]} otherwise

CLI Example:
```
salt myminion boto_s3_bucket.delete_objects mybucket '{Objects: [Key: myobject]}'
```

salt.modules.boto_s3_bucket.delete_policy(Bucket, region=None, key=None, keyid=None, profile=None)

Delete the policy from the given bucket

Returns {deleted: true} if policy was deleted and returns {deleted: False} if policy was not deleted.

CLI Example:
```
salt myminion boto_s3_bucket.delete_policy my_bucket
```

salt.modules.boto_s3_bucket.delete_replication(Bucket, region=None, key=None, keyid=None, profile=None)

Delete the replication config from the given bucket

Returns {deleted: true} if replication configuration was deleted and returns {deleted: False} if replication configuration was not deleted.

CLI Example:
```
salt myminion boto_s3_bucket.delete_replication my_bucket
```

salt.modules.boto_s3_bucket.delete_tagging(Bucket, region=None, key=None, keyid=None, profile=None)

Delete the tags from the given bucket

Returns {deleted: true} if tags were deleted and returns {deleted: False} if tags were not deleted.

CLI Example:
```
salt myminion boto_s3_bucket.delete_tagging my_bucket
```

salt.modules.boto_s3_bucket.delete_website(Bucket, region=None, key=None, keyid=None, profile=None)

Remove the website configuration from the given bucket

Returns {deleted: true} if website configuration was deleted and returns {deleted: False} if website configuration was not deleted.

CLI Example:
```
salt myminion boto_s3_bucket.delete_website my_bucket
```

salt.modules.boto_s3_bucket.describe(Bucket, region=None, key=None, keyid=None, profile=None)

Given a bucket name describe its properties.
Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_s3_bucket.describe mybucket
```

salt.modules.boto_s3_bucket.empty(Bucket, MFA=None, RequestPayer=None, region=None, key=None, keyid=None, profile=None)
Delete all objects in a given S3 bucket.
Returns {deleted: true} if all objects were deleted and {deleted: false, failed: [key, ...]} otherwise

CLI Example:

```
salt myminion boto_s3_bucket.empty mybucket
```

salt.modules.boto_s3_bucket.exists(Bucket, region=None, key=None, keyid=None, profile=None)
Given a bucket name, check to see if the given bucket exists.
Returns True if the given bucket exists and returns False if the given bucket does not exist.

CLI Example:

```
salt myminion boto_s3_bucket.exists mybucket
```

salt.modules.boto_s3_bucket.list(region=None, key=None, keyid=None, profile=None)
List all buckets owned by the authenticated sender of the request.
Returns list of buckets

CLI Example:

```
Owner: {...}
Buckets:
 - {...}
 - {...}
```

salt.modules.boto_s3_bucket.list_object_versions(Bucket, Delimiter=None, EncodingType=None, Prefix=None, region=None, key=None, keyid=None, profile=None)
List objects in a given S3 bucket.
Returns a list of objects.

CLI Example:

```
salt myminion boto_s3_bucket.list_object_versions mybucket
```

salt.modules.boto_s3_bucket.list_objects(Bucket, Delimiter=None, EncodingType=None, Prefix=None, FetchOwner=False, StartAfter=None, region=None, key=None, keyid=None, profile=None)
List objects in a given S3 bucket.
Returns a list of objects.

CLI Example:

```
salt myminion boto_s3_bucket.list_objects mybucket
```
salt.modules.boto_s3_bucket.put_acl(Bucket, ACL=None, AccessControlPolicy=None, GrantFullControl=None, GrantRead=None, GrantReadACP=None, GrantWrite=None, GrantWriteACP=None, region=None, key=None, keyid=None, profile=None)

Given a valid config, update the ACL for a bucket.
Returns {updated: true} if the ACL was updated and returns {updated: False} if the ACL was not updated.

CLI Example:
```
salt myminion boto_s3_bucket.put_acl my_bucket 'public'  
    GrantFullControl='emailaddress@example@example.com'  
    GrantRead='uri=http://acs.amazonaws.com/groups/global/AllUsers'  
    GrantReadACP='emailaddress=example@example.com',id= 
    "2345678909876432''
```

salt.modules.boto_s3_bucket.put_cors(Bucket, CORSRules, region=None, key=None, keyid=None, profile=None)

Given a valid config, update the CORS rules for a bucket.
Returns {updated: true} if CORS was updated and returns {updated: False} if CORS was not updated.

CLI Example:
```
salt myminion boto_s3_bucket.put_cors my_bucket '[[
    "AllowedHeaders": [],
    "AllowedMethods": ["GET"],
    "AllowedOrigins": ["*"],
    "ExposeHeaders": [],
    "MaxAgeSeconds": 123,
]]'
```

salt.modules.boto_s3_bucket.put_lifecycle_configuration(Bucket, Rules, region=None, key=None, keyid=None, profile=None)

Given a valid config, update the Lifecycle rules for a bucket.
Returns {updated: true} if Lifecycle was updated and returns {updated: False} if Lifecycle was not updated.

CLI Example:
```
salt myminion boto_s3_bucket.put_lifecycle_configuration my_bucket '[[
    "Expiration": {...},
    "ID": "idstring",
    "Prefix": "prefixstring",
    "Status": "enabled",
    "Transitions": [{...}],
    "NoncurrentVersionTransitions": [{...}],
    "NoncurrentVersionExpiration": {...},
]]'
```

salt.modules.boto_s3_bucket.put_logging(Bucket, TargetBucket=None, TargetPrefix=None, TargetGrants=None, region=None, key=None, keyid=None, profile=None)

Given a valid config, update the logging parameters for a bucket.
Returns {updated: true} if parameters were updated and returns {updated: False} if parameters were not updated.
CLI Example:
```
salt myminion boto_s3_bucket.put_logging my_bucket log_bucket '[[...]]' prefix
```

```
salt.modules.boto_s3_bucket.put_notification_configuration(Bucket, TopicConfigurations=None, QueueConfigurations=None, LambdaFunctionConfigurations=None, region=None, key=None, keyid=None, profile=None)
```

Given a valid config, update the notification parameters for a bucket.

Returns {updated: True} if parameters were updated and returns {updated: False} if parameters were not updated.

CLI Example:
```
salt myminion boto_s3_bucket.put_notification_configuration my_bucket
    
    
    
```

```
salt.modules.boto_s3_bucket.put_policy(Bucket, Policy, region=None, key=None, keyid=None, profile=None)
```

Given a valid config, update the policy for a bucket.

Returns {updated: True} if policy was updated and returns {updated: False} if policy was not updated.

CLI Example:
```
salt myminion boto_s3_bucket.put_policy my_bucket {...}
```

```
salt.modules.boto_s3_bucket.put_replication(Bucket, Role, Rules, region=None, key=None, keyid=None, profile=None)
```

Given a valid config, update the replication configuration for a bucket.

Returns {updated: True} if replication configuration was updated and returns {updated: False} if replication configuration was not updated.

CLI Example:
```
salt myminion boto_s3_bucket.put_replication my_bucket my_role [...]
```

```
salt.modules.boto_s3_bucket.put_request_payment(Bucket, Payer, region=None, key=None, keyid=None, profile=None)
```

Given a valid config, update the request payment configuration for a bucket.

Returns {updated: True} if request payment configuration was updated and returns {updated: False} if request payment configuration was not updated.

CLI Example:
```
salt myminion boto_s3_bucket.put_request_payment my_bucket Requester
```

```
salt.modules.boto_s3_bucket.put_tagging(Bucket, region=None, key=None, keyid=None, profile=None, **kwargs)
```

Given a valid config, update the tags for a bucket.

Returns {updated: True} if tags were updated and returns {updated: False} if tags were not updated.
CLI Example:

```
salt myminion boto_s3_bucket.put_tagging my_bucket my_role [...]```

```
salt.modules.boto_s3_bucket.put_versioning(Bucket, Status, MFADelete=None, MFA=None,
region=None, key=None, keyid=None, profile=None)
```

Given a valid config, update the versioning configuration for a bucket.

Returns {updated: true} if versioning configuration was updated and returns {updated: False} if versioning configuration was not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_versioning my_bucket Enabled```

```
salt.modules.boto_s3_bucket.put_website(Bucket, ErrorDocument=None, IndexDocument=None,
RedirectAllRequestsTo=None, RoutingRules=None, region=None, key=None, keyid=None, profile=None)
```

Given a valid config, update the website configuration for a bucket.

Returns {updated: true} if website configuration was updated and returns {updated: False} if website configuration was not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_website my_bucket IndexDocument='{"Suffix":
"index.html"}';```

## 19.9.52 salt.modules.boto_secgroup

Connection module for Amazon Security Groups

New in version 2014.7.0.

### configuration

This module accepts explicit ec2 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
secgroup.keyid: GKTADJGHEIQSXMKKRBJ08H
secgroup.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
secgroup.region: us-east-1```

If a region is not specified, the default is us-east-1.

It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjghWupUjasdflkdfklgjsdfajkghs
  region: us-east-1

depends boto

salt.modules.boto_secgroup.authorize(name=None, source_group_name=None, source_group_owner_id=None, ip_protocol=None, from_port=None, to_port=None, cidr_ip=None, group_id=None, source_group_group_id=None, region=None, key=None, keyid=None, profile=None, vpc_id=None, vpc_name=None, egress=False)

Add a new rule to an existing security group.

CLI example:
salt myminion boto_secgroup.authorize mysecgroup ip_protocol=tcp from_port=80 to_port=80 cidr_ip=['10.0.0.0/8', '192.168.0.0/24']

salt.modules.boto_secgroup.convert_to_group_ids(groups, vpc_id=None, vpc_name=None, region=None, key=None, keyid=None, profile=None)

Given a list of security groups and a vpc_id, convert_to_group_ids will convert all list items in the given list to security group ids.

CLI example:
salt myminion boto_secgroup.convert_to_group_ids mysecgroup vpc=89yhh7h

salt.modules.boto_secgroup.create(name, description, vpc_id=None, vpc_name=None, region=None, key=None, keyid=None, profile=None)

Create a security group.

CLI example:
salt myminion boto_secgroup.create mysecgroup 'My Security Group'

salt.modules.boto_secgroup.delete(name=None, group_id=None, region=None, key=None, keyid=None, profile=None, vpc_id=None, vpc_name=None)

Delete a security group.

CLI example:
salt myminion boto_secgroup.delete mysecgroup

salt.modules.boto_secgroup.delete_tags(tags, name=None, group_id=None, vpc_name=None, vpc_id=None, region=None, key=None, keyid=None, profile=None)

deletes tags from a security group

New in version 2016.3.0.
tags a list of tags to remove
name the name of the security group
group_id the group id of the security group (in lie of a name/vpc combo)
vpc_name the name of the vpc to search the named group for
vpc_id the id of the vpc, in lieu of the vpc_name
region the amazon region
key amazon key
keyid  amazon keyid
profile  amazon profile

CLI example:

```
salt myminion boto_secgroup.delete_tags ['TAG_TO_DELETE1','TAG_TO_DELETE2']
```

salt.modules.boto_secgroup.exists(name=None, region=None, key=None, keyid=None, profile=None, vpc_id=None, vpc_name=None, group_id=None)

Check to see if a security group exists.

CLI example:

```
salt myminion boto_secgroup.exists mysecgroup
```

salt.modules.boto_secgroup.get_all_security_groups(groupnames=None, group_ids=None, filters=None, region=None, key=None, keyid=None, profile=None)

Return a list of all Security Groups matching the given criteria and filters.

Note that the `groupnames' argument only functions correctly for EC2 Classic and default VPC Security Groups. To find groups by name in other VPCs you'll want to use the `group-name' filter instead.

Valid keys for the filters argument are: description - The description of the security group. egress.ip-permission.prefix-list-id - The ID (prefix) of the AWS service to which the security group allows access. group-id - The ID of the security group. group-name - The name of the security group. ip-permission.cidr - A CIDR range that has been granted permission. ip-permission.from-port - The start of port range for the TCP and UDP protocols, or an ICMP type number. ip-permission.group-id - The ID of a security group that has been granted permission. ip-permission.group-name - The name of a security group that has been granted permission. ip-permission.protocol - The IP protocol for the permission (tcp | udp | icmp or a protocol number). ip-permission.to-port - The end of port range for the TCP and UDP protocols, or an ICMP code. ip-permission.user-id - The ID of an AWS account that has been granted permission. owner-id - The AWS account ID of the owner of the security group. tag-key - The key of a tag assigned to the security group. tag-value - The value of a tag assigned to the security group. vpc-id - The ID of the VPC specified when the security group was created.

CLI example:

```
salt myminion boto_secgroup.get_all_security_groups filters='{{group-name: mygroup}}'
```

salt.modules.boto_secgroup.get_config(name=None, group_id=None, region=None, key=None, keyid=None, profile=None, vpc_id=None, vpc_name=None)

Get the configuration for a security group.

CLI example:

```
salt myminion boto_secgroup.get_config mysecgroup
```

salt.modules.boto_secgroup.get_group_id(name, vpc_id=None, vpc_name=None, region=None, key=None, keyid=None, profile=None)

Get a Group ID given a Group Name or Group Name and VPC ID

CLI example:

```
salt myminion boto_secgroup.get_group_id mysecgroup
```
salt.modules.boto_secgroup.revoke(name=None, source_group_name=None, source_group_owner_id=None, ip_protocol=None, from_port=None, to_port=None, cidr_ip=None, group_id=None, source_group_group_id=None, region=None, key=None, keyid=None, profile=None, vpc_id=None, vpc_name=None, egress=False)

Remove a rule from an existing security group.

CLI example:

```bash
salt myminion boto_secgroup.revoke mysecgroup ip_protocol=tcp from_port=80 to_port=80 cidr_ip='10.0.0.0/8'
```

salt.modules.boto_secgroup.set_tags(tags, name=None, group_id=None, vpc_name=None, vpc_id=None, region=None, key=None, keyid=None, profile=None)

sets tags on a security group

New in version 2016.3.0.

tags a dict of key:value pair of tags to set on the security group
name the name of the security group

group_id the group id of the security group (in lie of a name/vpc combo)
vpc_id the id of the vpc, in lieu of the vpc_name
region the amazon region
key amazon key
keyid amazon keyid
profile amazon profile

CLI example:

```
salt myminion boto_secgroup.set_tags "{'TAG1': 'Value1', 'TAG2': 'Value2'}", security_group_name vpc_id=vpc-13435 profile=my_aws_profile
```

19.9.53 salt.modules.boto_sns

Connection module for Amazon SNS

configuration This module accepts explicit sns credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```python
sns.keyid: GKTADJGHEIQSXMKKRBJ08H
sns.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```python
sns.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjghWupUjasdfklkflgjsdfajkghs
  region: us-east-1

depends boto

salt.modules.boto_sns.create(name, region=None, key=None, keyid=None, profile=None)
Create an SNS topic.

CLI example to create a topic:
```
salt myminion boto_sns.create mytopic region=us-east-1
```

salt.modules.boto_sns.delete(name, region=None, key=None, keyid=None, profile=None)
Delete an SNS topic.

CLI example to delete a topic:
```
salt myminion boto_sns.delete mytopic region=us-east-1
```

salt.modules.boto_sns.exists(name, region=None, key=None, keyid=None, profile=None)
Check to see if an SNS topic exists.

CLI example:
```
salt myminion boto_sns.exists mytopic region=us-east-1
```

salt.modules.boto_sns.get_all_subscriptions_by_topic(name, region=None, key=None, keyid=None, profile=None)
Get list of all subscriptions to a specific topic.

CLI example to delete a topic:
```
salt myminion boto_sns.get_all_subscriptions_by_topic mytopic region=us-east-1
```

salt.modules.boto_sns.get_all_topics(region=None, key=None, keyid=None, profile=None)
Returns a list of the all topics.

CLI example:
```
salt myminion boto_sns.get_all_topics
```

salt.modules.boto_sns.get_arn(name, region=None, key=None, keyid=None, profile=None)
Returns the full ARN for a given topic name.

CLI example:
```
salt myminion boto_sns.get_arn mytopic
```

salt.modules.boto_sns.subscribe(topic, protocol, endpoint, region=None, key=None, keyid=None, profile=None)
Subscribe to a Topic.

CLI example to delete a topic:
```
salt myminion boto_sns.subscribe mytopic https https://www.example.com/sns- endpoint region=us-east-1
```
salt.modules.boto_sns.unsubscribe(topic, subscription_arn, region=None, key=None, keyid=None, profile=None)

Unsubscribe a specific SubscriptionArn of a topic.

CLI Example:

```
salt myminion boto_sns.unsubscribe my_topic my_subscription_arn region=us-east-1
```

New in version 2016.11.0.

19.9.54 salt.modules.boto_sqs

Connection module for Amazon SQS

New in version 2014.7.0.

**configuration** This module accepts explicit sqs credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
sqs.keyid: GKTADJGHEIQSXMKKRBJ08H
sqs.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
sqs.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

depends boto

salt.modules.boto_sqs.create(name, region=None, key=None, keyid=None, profile=None)

Create an SQS queue.

CLI Example:

```
salt myminion boto_sqs.create myqueue region=us-east-1
```

salt.modules.boto_sqs.delete(name, region=None, key=None, keyid=None, profile=None)

Delete an SQS queue.

CLI Example:

```
salt myminion boto_sqs.delete myqueue region=us-east-1
```
salt.modules.boto_sqs.exists(name, region=None, key=None, keyid=None, profile=None)
Check to see if a queue exists.

CLI Example:
```
salt myminion boto_sqs.exists myqueue region=us-east-1
```

salt.modules.boto_sqs.get_all_queues(prefix=None, region=None, key=None, keyid=None, profile=None)
Return a list of Queue() objects describing all visible queues.
New in version 2016.11.0.

CLI Example:
```
salt myminion boto_sqs.get_all_queues region=us-east-1 --output yaml
```

salt.modules.boto_sqs.get_attributes(name, region=None, key=None, keyid=None, profile=None)
Return attributes currently set on an SQS queue.

CLI Example:
```
salt myminion boto_sqs.get_attributes myqueue
```

salt.modules.boto_sqs.list(prefix=None, region=None, key=None, keyid=None, profile=None)
Return a list of the names of all visible queues.
New in version 2016.11.0.

CLI Example:
```
salt myminion boto_sqs.list region=us-east-1
```

salt.modules.boto_sqs.set_attributes(name, attributes, region=None, key=None, keyid=None, profile=None)
Set attributes on an SQS queue.

CLI Example:
```
salt myminion boto_sqs.set_attributes myqueue '{ReceiveMessageWaitTimeSeconds: 20}' region=us-east-1
```

19.9.55 salt.modules.boto_vpc

Connection module for Amazon VPC

New in version 2014.7.0.

depends
- boto >= 2.8.0
- boto3 >= 1.2.6

configuration This module accepts explicit VPC credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available here.

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:
vpc.keyid: GKTADJGHEIQXSXM kidneys
vpc.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

A region may also be specified in the configuration:

vpc.region: us-east-1

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

myprofile:
  keyid: GKTADJGHEIQXSXM kidneys
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1

Changed in version 2015.8.0: All methods now return a dictionary. Create and delete methods return:

created: true

or

created: false
error:
  message: error message

Request methods (e.g., `describe_vpc`) return:

vpcs:
- {...}
- {...}

or

error:
  message: error message

New in version 2016.11.0.

Functions to request, accept, delete and describe VPC peering connections. Named VPC peering connections can be requested using these modules. VPC owner accounts can accept VPC peering connections (named or otherwise).

Examples showing creation of VPC peering connection

```bash
# Create a named VPC peering connection
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-be82e9da
  → name=my_vpc_connection
# Without a name
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-be82e9da
# Specify a region
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-be82e9da
  → region=us-west-2
```

Check to see if VPC peering connection is pending

```bash
salt myminion boto_vpc.is_peering_connection_pending name=salt-vpc
# Specify a region
```

1262 Chapter 19. Salt Module Reference
## Accept VPC peering connection

```python
salt myminion boto_vpc.is_peering_connection_pending name=salt-vpc region=us-west-2
# specify an id
salt myminion boto_vpc.is_peering_connection_pending conn_id=pcx-8a8939e3
```

Request a VPC peering connection between two VPCs.

New in version 2016.11.0.

#### Parameters

- **conn_id** -- The ID to use. String type.
- **name** -- The name of this VPC peering connection. String type.
- **region** -- The AWS region to use. Type string.
- **key** -- The key to use for this connection. Type string.
- **keyid** -- The key id to use.
- **profile** -- The profile to use.
- **dry_run** -- The dry_run flag to set.

#### Returns

dict

Warning: Please specify either the `vpc_peering_connection_id` or `name` but not both. Specifying both will result in an error!

#### CLI Example:

```bash
salt myminion boto_vpc.accept_vpc_peering_connection name=salt-vpc
# Specify a region
salt myminion boto_vpc.accept_vpc_peering_connection name=salt-vpc region=us-west-2
# specify an id
salt myminion boto_vpc.accept_vpc_peering_connection conn_id=pcx-8a8939e3
```

## Deleting VPC peering connection via this module

```python
salt myminion boto_vpc.is_peering_connection_pending name=salt-vpc region=us-west-2
# Specify an id
salt myminion boto_vpc.is_peering_connection_pending conn_id=pcx-8a8939e3
```

#### salt.modules.boto_vpc.accept_vpc_peering_connection(conn_id='', name='', region=None, key=None, keyid=None, profile=None, dry_run=False)

19.9. execution modules
Given valid DHCP options id and a valid VPC id, associate the DHCP options record with the VPC. Returns True if the DHCP options record were associated and returns False if the DHCP options record was not associated.

CLI Example:
```
salt myminion boto_vpc.associate_dhcp_options_to_vpc 'dhcp-a0bl34pp' 'vpc-6b1fe402'
```

salt.modules.boto_vpc.associate_network_acl_to_subnet(network_acl_id=None,
subnet_id=None, network_acl_name=None,
subnet_name=None, region=None, key=None,
keyid=None, profile=None)

Given a network acl and subnet ids or names, associate a network acl to a subnet.

CLI Example:
```
salt myminion boto_vpc.associate_network_acl_to_subnet
  network_acl_id='acl-5fb85d36' subnet_id='subnet-6a1fe403'
```
```
salt myminion boto_vpc.associate_network_acl_to_subnet
  network_acl_id='myacl' subnet_id='mysubnet'
```

salt.modules.boto_vpc.associate_route_table(route_table_id=None,
subnet_id=None, route_table_name=None,
subnet_name=None, region=None, key=None,
keyid=None, profile=None)

Given a route table and subnet name or id, associates the route table with the subnet.

CLI Example:
```
salt myminion boto_vpc.associate_route_table 'rtb-1f382e7d' 'subnet-6a1fe403'
```
```
salt myminion boto_vpc.associate_route_table subnet_name='mysubnet' route_table_name='myrtb'
```

salt.modules.boto_vpc.check_vpc(vpc_id=None, vpc_name=None, region=None, key=None,
keyid=None, profile=None)

Check whether a VPC with the given name or id exists. Returns the vpc_id or None. Raises SaltInvocationError if both vpc_id and vpc_name are None. Optionally raise a CommandExecutionError if the VPC does not exist.

New in version 2016.3.0.

CLI Example:
```
salt myminion boto_vpc.check_vpc vpc_name=myvpc profile=awsprofile
```

salt.modules.boto_vpc.create(cidr_block, instance_tenancy=None, vpc_name=None, enable_dns_support=None, enable_dns_hostnames=None, tags=None,
region=None, key=None, keyid=None, profile=None)

Given a valid CIDR block, create a VPC.

An optional instance_tenancy argument can be provided. If provided, the valid values are `default` or `dedicated`

An optional vpc_name argument can be provided.
Returns {created: true} if the VPC was created and returns {created: False} if the VPC was not created.

CLI Example:

```
salt myminion boto_vpc.create '10.0.0.0/24'
```

salt.modules.boto_vpc.create_customer_gateway(vpn_connection_type, ip_address, bgp_asn, customer_gateway_name=None, tags=None, region=None, key=None, keyid=None, profile=None)

Given a valid VPN connection type, a static IP address and a customer gateway’s Border Gateway Protocol (BGP) Autonomous System Number, create a customer gateway.

Returns the customer gateway id if the customer gateway was created and returns False if the customer gateway was not created.

CLI Example:

```
salt myminion boto_vpc.create_customer_gateway 'ipsec.1', '12.1.2.3', 65534
```

salt.modules.boto_vpc.create_dhcp_options(domain_name=None, domain_name_servers=None, ntp_servers=None, netbios_name_servers=None, netbios_node_type=None, dhcp_options_name=None, tags=None, vpc_id=None, vpc_name=None, region=None, key=None, keyid=None, profile=None)

Given valid DHCP options, create a DHCP options record, optionally associating it with an existing VPC.

Returns True if the DHCP options record was created and returns False if the DHCP options record was not deleted.

Changed in version 2015.8.0: Added vpc_name and vpc_id arguments

CLI Example:

```
salt myminion boto_vpc.create_dhcp_options domain_name='example.com' \ domain_name_servers='[1.2.3.4]' ntp_servers='[5.6.7.8]'
 netbios_name_servers='[10.0.0.1]' netbios_node_type=1 \ vpc_name='myvpc'
```

salt.modules.boto_vpc.create_internet_gateway(internet_gateway_name=None, vpc_id=None, vpc_name=None, tags=None, region=None, key=None, keyid=None, profile=None)

Create an Internet Gateway, optionally attaching it to an existing VPC.

Returns the internet gateway id if the internet gateway was created and returns False if the internet gateways was not created.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_vpc.create_internet_gateway \ internet_gateway_name=myigw vpc_name=myvpc
```

salt.modules.boto_vpc.create_nat_gateway(subnet_id=None, subnet_name=None, allocation_id=None, region=None, key=None, keyid=None, profile=None)

19.9. execution modules
Create a NAT Gateway within an existing subnet. If allocation_id is specified, the elastic IP address it references is associated with the gateway. Otherwise, a new allocation_id is created and used.

This function requires boto3 to be installed.

Returns the nat gateway id if the nat gateway was created and returns False if the nat gateway was not created.

New in version 2016.11.0.

CLI Example:

```
salt myminion boto_vpc.create_nat_gateway subnet_name=mysubnet
```

```
salt.modules.boto_vpc.create_network_acl(vpc_id=None, vpc_name=None, network_acl_name=None, subnet_id=None, subnet_name=None, tags=None, region=None, key=None, keyid=None, profile=None)
```

Given a vpc_id, creates a network acl.

Returns the network acl id if successful, otherwise returns False.

Changed in version 2015.8.0: Added vpc_name, subnet_id, and subnet_name arguments

CLI Example:

```
salt myminion boto_vpc.create_network_acl 'vpc-6b1fe402'
```

```
salt.modules.boto_vpc.create_network_acl_entry(network_acl_id=None, rule_number=None, protocol=None, rule_action=None, cidr_block=None, egress=None, network_acl_name=None, icmp_code=None, icmp_type=None, port_range_from=None, port_range_to=None, region=None, key=None, keyid=None, profile=None)
```

Creates a network acl entry.

CLI Example:

```
salt myminion boto_vpc.create_network_acl_entry 'acl-5fb85d36' '32767' 'all' 'deny' '0.0.0.0/0' egress=true
```

```
salt.modules.boto_vpc.create_route(route_table_id=None, destination_cdr_block=None, route_table_name=None, gateway_id=None, internet_gateway_name=None, instance_id=None, interface_id=None, vpc_peering_connection_id=None, region=None, key=None, keyid=None, profile=None, nat_gateway_id=None, nat_gateway_subnet_name=None, nat_gateway_subnet_id=None)
```

Creates a route.

If a nat gateway is specified, boto3 must be installed

CLI Example:

```
salt myminion boto_vpc.create_route 'rtb-1f382e7d' '10.0.0.0/16' gateway_id='vgw-!a1b2c3'
```
salt.modules.boto_vpc.create_route_table(vpc_id=None, vpc_name=None, route_table_name=None, tags=None, region=None, key=None, keyid=None, profile=None)

Creates a route table.
Changed in version 2015.8.0: Added vpc_name argument

CLI Examples:

```
salt myminion boto_vpc.create_route_table vpc_id='vpc-6b1fe402' \ route_table_name='myroutetable'
salt myminion boto_vpc.create_route_table vpc_name='myvpc' \ route_table_name='myroutetable'
```

salt.modules.boto_vpc.create_subnet(vpc_id=None, cidr_block=None, vpc_name=None, availability_zone=None, subnet_name=None, tags=None, region=None, key=None, keyid=None, profile=None)

Given a valid VPC ID or Name and a CIDR block, create a subnet for the VPC.
An optional availability zone argument can be provided.
Returns True if the VPC subnet was created and returns False if the VPC subnet was not created.
Changed in version 2015.8.0: Added vpc_name argument

CLI Examples:

```
salt myminion boto_vpc.create_subnet vpc_id='vpc-6b1fe402' \ subnet_name='mysubnet' cidr_block='10.0.0.0/25'
salt myminion boto_vpc.create_subnet vpc_name='myvpc' \ subnet_name='mysubnet', cidr_block='10.0.0.0/25'
```

salt.modules.boto_vpc.customer_gateway_exists(customer_gateway_id=None, customer_gateway_name=None, region=None, key=None, keyid=None, profile=None)

Given a customer gateway ID, check if the customer gateway ID exists.
Returns True if the customer gateway ID exists; Returns False otherwise.

CLI Example:

```
salt myminion boto_vpc.customer_gateway_exists cgw-b6a247df
salt myminion boto_vpc.customer_gateway_exists customer_gateway_name=mycgw
```

salt.modules.boto_vpc.delete(vpc_id=None, name=None, vpc_name=None, tags=None, region=None, key=None, keyid=None, profile=None)

Given a VPC ID or VPC name, delete the VPC.
Returns {deleted: true} if the VPC was deleted and returns {deleted: false} if the VPC was not deleted.

CLI Example:

```
salt myminion boto_vpc.delete vpc_id='vpc-6b1fe402'
salt myminion boto_vpc.delete name='myvpc'
```

salt.modules.boto_vpc.delete_customer_gateway(customer_gateway_id=None, customer_gateway_name=None, region=None, key=None, keyid=None, profile=None)

Given a customer gateway ID or name, delete the customer gateway.
Returns True if the customer gateway was deleted and returns False if the customer gateway was not deleted.

Changed in version 2015.8.0: Added customer_gateway_name argument

CLI Example:
```
salt myminion boto_vpc.delete_customer_gateway 'cgw-b6a247df'
```

```
salt.modules.boto_vpc.delete_dhcp_options(dhcp_options_id=None, dhcp_options_name=None, region=None, key=None, keyid=None, profile=None)
```

Delete dhcp options by id or name.

New in version 2015.8.0.

CLI Example:
```
salt myminion boto_vpc.delete_dhcp_options 'dopt-b6a247df'
```

```
salt.modules.boto_vpc.delete_internet_gateway(internet_gateway_id=None, internet_gateway_name=None, detach=False, region=None, key=None, keyid=None, profile=None)
```

Delete an internet gateway (by name or id).

Returns True if the internet gateway was deleted and otherwise False.

New in version 2015.8.0.

CLI Examples:
```
salt myminion boto_vpc.delete_internet_gateway internet_gateway_id=igw-1a2b3c
salt myminion boto_vpc.delete_internet_gateway internet_gateway_name=myigw
```

```
salt.modules.boto_vpc.delete_nat_gateway(nat_gateway_id, release_eips=False, region=None, key=None, keyid=None, profile=None, wait_for_delete=False, wait_for_delete_retries=5)
```

Delete a nat gateway (by id).

Returns True if the internet gateway was deleted and otherwise False.

This function requires boto3 to be installed.

New in version 2016.11.0.

```
nat_gateway_id  Id of the NAT Gateway
release_eips  whether to release the elastic IPs associated with the given NAT Gateway Id
region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
wait_for_delete  whether to wait for delete of the NAT gateway to be in failed or deleted state after issuing the delete call.
wait_for_delete_retries  NAT gateway may take some time to be go into deleted or failed state. During the deletion process, subsequent release of elastic IPs may fail; this state will automatically retry this number of times to ensure the NAT gateway is in deleted or failed state before proceeding.
```

CLI Examples:
```
salt myminion boto_vpc.delete_nat_gateway nat_gateway_id=igw-1a2b3c
```
salt.modules.boto_vpc.delete_network_acl(network_acl_id=None, network_acl_name=None, disassociate=False, region=None, key=None, keyid=None, profile=None)

Delete a network acl based on the network_acl_id or network_acl_name provided.

CLI Examples:

```
salt myminion boto_vpc.delete_network_acl network_acl_id='acl-5fb85d36' \ disassociate=false
```

```
salt myminion boto_vpc.delete_network_acl network_acl_name='myacl' \ disassociate=true
```

salt.modules.boto_vpc.delete_network_acl_entry(network_acl_id=None, rule_number=None, egress=None, network_acl_name=None, region=None, key=None, keyid=None, profile=None)

Deletes a network acl entry.

CLI Example:

```
salt myminion boto_vpc.delete_network_acl_entry 'acl-5fb85d36' '32767'
```

salt.modules.boto_vpc.delete_route(route_table_id=None, destination_cidr_block=None, route_table_name=None, region=None, key=None, keyid=None, profile=None)

Deletes a route.

CLI Example:

```
salt myminion boto_vpc.delete_route 'rtb-1f382e7d' '10.0.0.0/16'
```

salt.modules.boto_vpc.delete_route_table(route_table_id=None, route_table_name=None, region=None, key=None, keyid=None, profile=None)

Deletes a route table.

CLI Examples:

```
salt myminion boto_vpc.delete_route_table route_table_id='rtb-1f382e7d'
salt myminion boto_vpc.delete_route_table route_table_name='myroutetable'
```

salt.modules.boto_vpc.delete_subnet(subnet_id=None, subnet_name=None, region=None, key=None, keyid=None, profile=None)

Given a subnet ID or name, delete the subnet.

Returns True if the subnet was deleted and returns False if the subnet was not deleted.

Changed in version 2015.8.0: Added subnet_name argument

CLI Example:

```
salt myminion boto_vpc.delete_subnet 'subnet-6a1fe403'
```

salt.modules.boto_vpc.delete_vpc_peering_connection(conn_id=None, conn_name=None, region=None, key=None, keyid=None, profile=None, dry_run=False)

Delete a VPC peering connection.
New in version 2016.11.0.

conn_id  The connection ID to check. Exclusive with conn_name.
conn_name  The connection name to check. Exclusive with conn_id.
region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and
         keyid.
dry_run  If True, skip application and simply return projected status.

CLI Example:

```
# Create a named VPC peering connection
salt myminion boto_vpc.delete_vpc_peering_connection conn_name=salt-vpc
# Specify a region
salt myminion boto_vpc.delete_vpc_peering_connection conn_name=salt-vpc region=us-west-2
# specify an id
salt myminion boto_vpc.delete_vpc_peering_connection conn_id=pcx-8a8939e3
```

salt.modules.boto_vpc.describe(vpc_id=None, vpc_name=None, region=None, key=None, keyid=None, profile=None)

Given a VPC ID describe its properties.

Returns a dictionary of interesting properties.

Changed in version 2015.8.0: Added vpc_name argument

CLI Example:

```
salt myminion boto_vpc.describe vpc_id=vpc-123456
salt myminion boto_vpc.describe vpc_name=myvpc
```

salt.modules.boto_vpc.describe_nat_gateways(nat_gateway_id=None, subnet_id=None, subnet_name=None, vpc_id=None, vpc_name=None, states=('pending', 'available'), region=None, key=None, keyid=None, profile=None)

Return a description of nat gateways matching the selection criteria

This function requires boto3 to be installed.

CLI Example:

```
salt myminion boto_vpc.describe_nat_gateways nat_gateway_id='nat-03b02643b43216fe7'
salt myminion boto_vpc.describe_nat_gateways subnet_id='subnet-5b05942d'
```

salt.modules.boto_vpc.describe_route_table(route_table_id=None, route_table_name=None, tags=None, region=None, key=None, keyid=None, profile=None)

Given route table properties, return route table details if matching table(s) exist.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_vpc.describe_route_table route_table_id='rtb-1f382e7d'
```
salt.modules.boto_vpc.describe_route_tables(
    route_table_id=None,
    route_table_name=None,
    vpc_id=None,
    tags=None,
    region=None,
    key=None,
    keyid=None,
    profile=None
)

Given route table properties, return details of all matching route tables.
This function requires boto3 to be installed.
New in version 2016.11.0.
CLI Example:
salt myminion boto_vpc.describe_route_tables vpc_id='vpc-a6a9efc3'

salt.modules.boto_vpc.describe_subnet(
    subnet_id=None, subnet_name=None, region=None,
    key=None, keyid=None, profile=None
)

Given a subnet id or name, describe its properties.
Returns a dictionary of interesting properties.
New in version 2015.8.0.
CLI Examples:
salt myminion boto_vpc.describe_subnet subnet_id=subnet-123456
salt myminion boto_vpc.describe_subnet subnet_name=mysubnet

salt.modules.boto_vpc.describe_subnets(
    subnet_ids=None, subnet_names=None,
    vpc_id=None, cidr=None, region=None, key=None,
    keyid=None, profile=None
)

Given a VPC ID or subnet CIDR, returns a list of associated subnets and their details. Return all subnets if VPC ID or CIDR are not provided. If a subnet id or CIDR is provided, only its associated subnet details will be returned.
New in version 2015.8.0.
CLI Examples:
salt myminion boto_vpc.describe_subnets
salt myminion boto_vpc.describe_subnets subnet_ids=["subnet-ba1987ab", "subnet-ba1987cd"]
salt myminion boto_vpc.describe_subnets vpc_id=vpc-123456
salt myminion boto_vpc.describe_subnets cidr=10.0.0.0/21

salt.modules.boto_vpc.describe_vpc_peering_connection(
    name, region=None,
    key=None, keyid=None,
    profile=None
)

Returns any VPC peering connection id(s) for the given VPC peering connection name.
VPC peering connection ids are only returned for connections that are in the active, pending-acceptance or provisioning state.
New in version 2016.11.0.
Parameters
- **name** -- The string name for this VPC peering connection
- **region** -- The aws region to use
- `key` -- Your aws key
- `keyid` -- The key id associated with this aws account
- `profile` -- The profile to use

Returns: dict

CLI Example:

```bash
salt myminion boto_vpc.describe_vpc_peering_connection salt-vpc
salt myminion boto_vpc.describe_vpc_peering_connection salt-vpc region=us-west-2
```

```python
salt.modules.boto_vpc.describe_vpcs(vpc_id=None, name=None, cidr=None, tags=None, region=None, key=None, keyid=None, profile=None)
```

Describe all VPCs, matching the filter criteria if provided.

Returns a list of dictionaries with interesting properties.

New in version 2015.8.0.

CLI Example:

```bash
salt myminion boto_vpc.describe_vpcs
```

```python
salt.modules.boto_vpc.dhcp_options_exists(dhcp_options_id=None, name=None, dhcp_options_name=None, tags=None, region=None, key=None, keyid=None, profile=None)
```

Check if a dhcp option exists.

Returns True if the dhcp option exists; Returns False otherwise.

CLI Example:

```bash
salt myminion boto_vpc.dhcp_options_exists dhcp_options_id='dhcp-a0bl34pp'
```

```python
salt.modules.boto_vpc.disassociate_network_acl(subnet_id=None, vpc_id=None, subnet_name=None, vpc_name=None, region=None, key=None, keyid=None, profile=None)
```

Given a subnet ID, disassociates a network acl.

CLI Example:

```bash
salt myminion boto_vpc.disassociate_network_acl 'subnet-6a1fe403'
```

```python
salt.modules.boto_vpc.disassociate_route_table(association_id, region=None, key=None, keyid=None, profile=None)
```

Disassociates a route table.

`association_id` The Route Table Association ID to disassociate

CLI Example:

```bash
salt myminion boto_vpc.disassociate_route_table 'rtbassoc-d8ccddba'
```

```python
salt.modules.boto_vpc.exists(vpc_id=None, name=None, cidr=None, tags=None, region=None, key=None, keyid=None, profile=None)
```

Given a VPC ID, check to see if the given VPC ID exists.

Returns True if the given VPC ID exists and returns False if the given VPC ID does not exist.

CLI Example:
Salt Documentation, Release 2017.7.8

```
salt myminion boto_vpc.exists myvpc
```

```
salt.modules.boto_vpc.get_dhcp_options(dhcp_options_name=None, dhcp_options_id=None, region=None, key=None, keyid=None, profile=None)
```

Return a dict with the current values of the requested DHCP options set

CLI Example:

```
salt myminion boto_vpc.get_dhcp_options 'myfunnydhcpoptionsname'
```

New in version 2016.3.0.

```
salt.modules.boto_vpc.get_id(name=None, cidr=None, tags=None, region=None, key=None, keyid=None, profile=None)
```

Given VPC properties, return the VPC id if a match is found.

CLI Example:

```
salt myminion boto_vpc.get_id myvpc
```

```
salt.modules.boto_vpc.get_resource_id(resource, name=None, resource_id=None, region=None, key=None, keyid=None, profile=None)
```

Get an AWS id for a VPC resource by type and name.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_vpc.get_resource_id internet_gateway myigw
```

```
salt.modules.boto_vpc.get_subnet_association(subnets, region=None, key=None, keyid=None, profile=None)
```

Given a subnet (aka: a vpc zone identifier) or list of subnets, returns vpc association.

Returns a VPC ID if the given subnets are associated with the same VPC ID. Returns False on an error or if the given subnets are associated with different VPC IDs.

CLI Examples:

```
salt myminion boto_vpc.get_subnet_association subnet-61b47516
```

```
salt myminion boto_vpc.get_subnet_association ['subnet-61b47516', 'subnet-2cb9785b']
```

```
salt.modules.boto_vpc.is_peering_connection_pending(conn_id=None, conn_name=None, region=None, key=None, keyid=None, profile=None)
```

Check if a VPC peering connection is in the pending state.

New in version 2016.11.0.

conn_id The connection ID to check. Exclusive with conn_name.

conn_name The connection name to check. Exclusive with conn_id.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

CLI Example:
salt myminion boto_vpc.is_peering_connection_pending conn_name=salt-vpc
# Specify a region
salt myminion boto_vpc.is_peering_connection_pending conn_name=salt-vpc region=us-west-2
# specify an id
salt myminion boto_vpc.is_peering_connection_pending conn_id=pcx-8a8939e3

salt.modules.boto_vpc.nat_gateway_exists(nat_gateway_id=None, subnet_id=None, subnet_name=None, vpc_id=None, vpc_name=None, states=('pending', 'available'), region=None, key=None, keyid=None, profile=None)

Checks if a nat gateway exists.

This function requires boto3 to be installed.

New in version 2016.11.0.

CLI Example:

salt myminion boto_vpc.nat_gateway_exists nat_gateway_id='nat-03b02643b43216fe7'
salt myminion boto_vpc.nat_gateway_exists subnet_id='subnet-5b05942d'

salt.modules.boto_vpc.network_acl_exists(network_acl_id=None, name=None, network_acl_name=None, tags=None, region=None, key=None, keyid=None, profile=None)

Checks if a network acl exists.

Returns True if the network acl exists or returns False if it doesn’t exist.

CLI Example:

salt myminion boto_vpc.network_acl_exists network_acl_id='acl-5fb85d36'

salt.modules.boto_vpc.peering_connection_pending_from_vpc(conn_id=None, conn_name=None, vpc_id=None, vpc_name=None, region=None, key=None, keyid=None, profile=None)

Check if a VPC peering connection is in the pending state, and requested from the given VPC.

New in version 2016.11.0.

conn_id The connection ID to check. Exclusive with conn_name.
conn_name The connection name to check. Exclusive with conn_id.
vpc_id Is this the ID of the requesting VPC for this peering connection. Exclusive with vpc_name.
vpc_name Is this the Name of the requesting VPC for this peering connection. Exclusive with vpc_id.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

CLI Example:

salt myminion boto_vpc.is_peering_connection_pending name=salt-vpc
salt.modules.boto_vpc.replace_network_acl_entry(network_acl_id=None, rule_number=None, protocol=None, rule_action=None, cidr_block=None, egress=None, network_acl_name=None, icmp_code=None, icmp_type=None, port_range_from=None, port_range_to=None, region=None, key=None, keyid=None, profile=None)

Replaces a network acl entry.

CLI Example:

```bash
salt myminion boto_vpc.replace_network_acl_entry 'acl-5fb85d36' '32767' 'all' 'deny' '0.0.0.0/0' egress=true
```

salt.modules.boto_vpc.replace_route(route_table_id=None, destination_cidr_block=None, route_table_name=None, gateway_id=None, instance_id=None, interface_id=None, region=None, key=None, keyid=None, profile=None, vpc_peering_connection_id=None)

Replaces a route.

CLI Example:

```bash
salt myminion boto_vpc.replace_route 'rtb-1f382e7d' '10.0.0.0/16' gateway_id='vgw--a1b2c3'
```

salt.modules.boto_vpc.replace_route_table_association(association_id, route_table_id, region=None, key=None, keyid=None, profile=None)

Replaces a route table association.

CLI Example:

```bash
salt myminion boto_vpc.replace_route_table_association 'rtbassoc-d8ccddba' 'rtb-1f382e7d'
```

salt.modules.boto_vpc.request_vpc_peering_connection(requester_vpc_id=None, requester_vpc_name=None, peer_vpc_id=None, peer_vpc_name=None, name=None, peer_owner_id=None, region=None, key=None, keyid=None, profile=None, dry_run=False)

Request a VPC peering connection between two VPCs.

New in version 2016.11.0.

requester_vpc_id ID of the requesting VPC. Exclusive with requester_vpc_name.
requester_vpc_name Name tag of the requesting VPC. Exclusive with requester_vpc_id.
peer_vpc_id ID of the VPC to create VPC peering connection with. This can be a VPC in another account. Exclusive with peer_vpc_name.
peer_vpc_name Name tag of the VPC to create VPC peering connection with. This can only be a VPC in the same account, else resolving it into a vpc id will almost certainly fail. Exclusive with peer_vpc_id.
name The name to use for this VPC peering connection.
peer_owner_id ID of the owner of the peer VPC. Defaults to your account ID, so a value is required if peering with a VPC in a different account.
**region** Region to connect to.
**key** Secret key to be used.
**keyid** Access key to be used.
**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
**dry_run** If True, skip application and return status.

**CLI Example:**
```
# Create a named VPC peering connection
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-be82e9da
    # name=my_vpc_connection
# Without a name
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-be82e9da
# Specify a region
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-be82e9da
    # region=us-west-2
```

```
salt.modules.boto_vpc.resource_exists(resource, name=None, resource_id=None, tags=None, region=None, key=None, keyid=None, profile=None)
```

Given a resource type and name, return {exists: true} if it exists, {exists: false} if it does not exist, or {error: {message: error text}} on error.

New in version 2015.8.0.

**CLI Example:**
```
salt myminion boto_vpc.resource_exists internet_gateway myigw
```

```
salt.modules.boto_vpc.route_exists(destination_cidr_block, route_table_name=None, route_table_id=None, gateway_id=None, instance_id=None, interface_id=None, tags=None, region=None, key=None, keyid=None, profile=None, vpc_peering_connection_id=None)
```

Checks if a route exists.

New in version 2015.8.0.

**CLI Example:**
```
salt myminion boto_vpc.route_exists destination_cidr_block='10.0.0.0/20' gateway_id='local' route_table_name='test'
```

```
salt.modules.boto_vpc.route_table_exists(route_table_id=None, name=None, route_table_name=None, tags=None, region=None, key=None, keyid=None, profile=None)
```

Checks if a route table exists.

**CLI Example:**
```
salt myminion boto_vpc.route_table_exists route_table_id='rtb-1f382e7d'
```

```
salt.modules.boto_vpc.subnet_exists(subnet_id=None, name=None, subnet_name=None, cidr=None, tags=None, zones=None, region=None, key=None, keyid=None, profile=None)
```

Check if a subnet exists.

Returns True if the subnet exists, otherwise returns False.

Changed in version 2015.8.0: Added subnet_name argument Deprecated name argument
CLI Example:

```
salt myminion boto_vpc.subnet_exists subnet_id='subnet-6a1fe403'
```

### 19.9.56 `salt.modules.bower`

**Manage and query Bower packages**

This module manages the installed packages using Bower. Note that npm, git and bower must be installed for this module to be available.

#### `salt.modules.bower.install(pkg, dir, pkgs=None, runas=None, env=None)`

Install a Bower package.

- **pkg** A package name in any format accepted by Bower, including a version identifier
- **dir** The target directory in which to install the package
- **pkgs** A list of package names in the same format as the `pkg` parameter
- **runas** The user to run Bower with
- **env** Environment variables to set when invoking Bower. Uses the same `env` format as the `cmd.run` execution function.

CLI Example:

```
salt '*' bower.install underscore /path/to/project

salt '*' bower.install jquery#2.0 /path/to/project
```

#### `salt.modules.bower.list_(dir, runas=None, env=None)`

List installed Bower packages.

- **dir** The directory whose packages will be listed
- **runas** The user to run Bower with
- **env** Environment variables to set when invoking Bower. Uses the same `env` format as the `cmd.run` execution function.

CLI Example:

```
salt '*' bower.list /path/to/project
```

#### `salt.modules.bower.prune(dir, runas=None, env=None)`

New in version 2017.7.0.

Remove extraneous local Bower packages, i.e. those not referenced in bower.json

- **dir** The directory whose packages will be pruned
- **runas** The user to run Bower with
- **env** Environment variables to set when invoking Bower. Uses the same `env` format as the `cmd.run` execution function.

CLI Example:

```
salt '*' bower.prune /path/to/project
```

#### `salt.modules.bower.uninstall(pkg, dir, runas=None, env=None)`

Uninstall a Bower package.

- **pkg** A package name in any format accepted by Bower
- **dir** The target directory from which to uninstall the package
- **runas** The user to run Bower with
env  Environment variables to set when invoking Bower. Uses the same env format as the `cmd.run` execution function.

CLI Example:
```
salt '*' bower.uninstall underscore /path/to/project
```

19.9.57 salt.modules.bridge

Module for gathering and managing bridging information

`salt.modules.bridge.add(br=None)`

Creates a bridge

CLI Example:
```
salt '*' bridge.add br0
```

`salt.modules.bridge.addif(br=None, iface=None)`

Adds an interface to a bridge

CLI Example:
```
salt '*' bridge.addif br0 eth0
```

`salt.modules.bridge.delete(br=None)`

Deletes a bridge

CLI Example:
```
salt '*' bridge.delete br0
```

`salt.modules.bridge.delif(br=None, iface=None)`

Removes an interface from a bridge

CLI Example:
```
salt '*' bridge.delif br0 eth0
```

`salt.modules.bridge.find_interfaces(*args)`

Returns the bridge to which the interfaces are bond to

CLI Example:
```
salt '*' bridge.find_interfaces eth0 [eth1...]
```

`salt.modules.bridge.interfaces(br=None)`

Returns interfaces attached to a bridge

CLI Example:
```
salt '*' bridge.interfaces br0
```

`salt.modules.bridge.list()`

Returns the machine's bridges list

CLI Example:
```
salt '*' bridge.list
```
salt.modules.bridge.show(br=None)
Returns bridges interfaces along with enslaved physical interfaces. If no interface is given, all bridges are shown, else only the specified bridge values are returned.

CLI Example:
```
salt '*' bridge.show
salt '*' bridge.show br0
```

salt.modules.bridge.stp(br=None, state='disable', iface=None)
Sets Spanning Tree Protocol state for a bridge

CLI Example:
```
salt '*' bridge.stp br0 enable
salt '*' bridge.stp br0 disable
```

For BSD-like operating systems, it is required to add the interface on which to enable the STP.

CLI Example:
```
salt '*' bridge.stp bridge0 enable fxp0
salt '*' bridge.stp bridge0 disable fxp0
```

19.9.58 salt.modules.bsd_shadow

Manage the password database on BSD systems

Important: If you feel that Salt should be using this module to manage passwords on a minion, and it is using a different module (or gives an error similar to `shadow.info' is not available), see here.

salt.modules.bsd_shadow.default_hash()
Returns the default hash used for unset passwords

CLI Example:
```
salt '*' shadow.default_hash
```

salt.modules.bsd_shadow.del_password(name)
New in version 2015.8.2.
Delete the password from name user

CLI Example:
```
salt '*' shadow.del_password username
```

salt.modules.bsd_shadow.info(name)
Return information for the specified user

CLI Example:
```
salt '*' shadow.info someuser
```

salt.modules.bsd_shadow.set_change(name, change)
Sets the time at which the password expires (in seconds since the UNIX epoch). See man 8 usermod on NetBSD and OpenBSD or man 8 pw on FreeBSD.
A value of 0 sets the password to never expire.

CLI Example:
```
salt '*' shadow.set_change username 1419980400
```

**salt.modules.bsd_shadow.set_expire**(name, expire)

Sets the time at which the account expires (in seconds since the UNIX epoch). See man 8 usermod on NetBSD and OpenBSD or man 8 pw on FreeBSD.

A value of 0 sets the account to never expire.

CLI Example:
```
salt '*' shadow.set_expire username 1419980400
```

**salt.modules.bsd_shadow.set_password**(name, password)

Set the password for a named user. The password must be a properly defined hash. The password hash can be generated with this command:
```
python -c "import crypt; print crypt.crypt('password',ciphersalt)"
```

**Note:** When constructing the ciphersalt string, you must escape any dollar signs, to avoid them being interpolated by the shell.

'password' is, of course, the password for which you want to generate a hash.

ciphersalt is a combination of a cipher identifier, an optional number of rounds, and the cryptographic salt. The arrangement and format of these fields depends on the cipher and which flavor of BSD you are using. For more information on this, see the manpage for crypt(3). On NetBSD, additional information is available in passwd.conf(5).

It is important to make sure that a supported cipher is used.

CLI Example:
```
salt '*' shadow.set_password someuser '$1$UYCIxa628.9qXjpQCjM4a..'
```

### 19.9.59 salt.modules.btrfs

Module for managing BTRFS file systems.

**salt.modules.btrfs.add**(mountpoint, *devices, **kwargs)

Add a devices to a BTRFS filesystem.

General options:
- **nodiscard**: Do not perform whole device TRIM
- **force**: Force overwrite existing filesystem on the disk

CLI Example:
```
salt '*' btrfs.add /mountpoint /dev/sda1 /dev/sda2
```

**salt.modules.btrfs.convert**(device, permanent=False, keeplf=False)

Convert ext2/3/4 to BTRFS. Device should be mounted.

Filesystem can be converted temporarily so the further processing and rollback is possible, or permanently, where previous extended filesystem image gets deleted. Please note, permanent conversion takes a while as BTRFS filesystem needs to be properly rebalanced afterwards.
General options:
- `permanent`: Specify if the migration should be permanent (false by default)
- `keeplf`: Keep `lost+found` of the partition (removed by default, but still in the image, if not permanent migration)

CLI Example:

```shell
salt '*' btrfs.convert /dev/sda1
salt '*' btrfs.convert /dev/sda1 permanent=True
```

**salt.modules.btrfs.defragment(path)**

Defragment mounted BTRFS filesystem. In order to defragment a filesystem, device should be properly mounted and writable.

If passed a device name, then defragmented whole filesystem, mounted on in. If passed a mount point of the filesystem, then only this mount point is defragmented.

CLI Example:

```shell
salt '*' btrfs.defragment /dev/sda1
salt '*' btrfs.defragment /path/on/filesystem
```

**salt.modules.btrfs.delete(mountpoint, *devices, **kwargs)**

Remove devices from a BTRFS filesystem.

CLI Example:

```shell
salt '*' btrfs.delete /mountpoint /dev/sda1 /dev/sda2
```

**salt.modules.btrfs.devices()**

Get known BTRFS formatted devices on the system.

CLI Example:

```shell
salt '*' btrfs.devices
```

**salt.modules.btrfs.features()**

List currently available BTRFS features.

CLI Example:

```shell
salt '*' btrfs.mkfs_features
```

**salt.modules.btrfs.info(device)**

Get BTRFS filesystem information.

CLI Example:

```shell
salt '*' btrfs.info /dev/sda1
```

**salt.modules.btrfs.mkfs(*devices, **kwargs)**

Create a file system on the specified device. By default wipes out with force.

General options:
- `allocsize`: Specify the BTRFS offset from the start of the device.
- `bytecount`: Specify the size of the resultant filesystem.
- `nodesize`: Node size.
- `leafsize`: Specify the nodesize, the tree block size in which btrfs stores data.
- `noforce`: Prevent force overwrite when an existing filesystem is detected on the device.
- `sectorsize`: Specify the sectorsize, the minimum data block allocation unit.
- **nodiscard**: Do not perform whole device TRIM operation by default.
- **uuid**: Pass UUID or pass True to generate one.

Options:
- **dto**: *(raid0|raid1|raid5|raid6|raid10|single|dup)* Specify how the data must be spanned across the devices specified.
- **mto**: *(raid0|raid1|raid5|raid6|raid10|single|dup)* Specify how metadata must be spanned across the devices specified.
- **fts**: Features (call `salt <host> btrfs.features` for full list of available features)

See the `mkfs.btrfs(8)` manpage for a more complete description of corresponding options description.

CLI Example:

```
salt '*' btrfs.mkfs /dev/sda1
salt '*' btrfs.mkfs /dev/sda1 noforce=True
```

**salt.modules.btrfs.properties**(obj, type=None, set=None)
List properties for given btrfs object. The object can be path of BTRFS device, mount point, or any directories/files inside the BTRFS filesystem.

General options:
- **type**: Possible types are s[ubvol], f[ilesystem], i[node] and d[evice].
- **force**: Force overwrite existing filesystem on the disk
- **set**: <key=value,key1=value1…> Options for a filesystem properties.

CLI Example:

```
salt '*' btrfs.properties /mountpoint
salt '*' btrfs.properties /dev/sda1 type=subvol set='ro=false,label="My Storage"'
```

**salt.modules.btrfs.resize**(mountpoint, size)
Resize filesystem.

General options:
- **mountpoint**: Specify the BTRFS mountpoint to resize.
- **size**: ([+/-]<newsize>[kKmMgGtTpPeE]|max) Specify the new size of the target.

CLI Example:

```
salt '*' btrfs.resize /mountpoint size=+1g
salt '*' btrfs.resize /dev/sda1 size=max
```

**salt.modules.btrfs.usage**(path)
Show in which disk the chunks are allocated.

CLI Example:

```
salt '*' btrfs.usage /your/mountpoint
```

**salt.modules.btrfs.version**()
Return BTRFS version.

CLI Example:

```
salt '*' btrfs.version
```
19.9.60 salt.modules.cabal

Manage and query Cabal packages

New in version 2015.8.0.

salt.modules.cabal.install(pkg=None, pkgs=None, user=None, install_global=False, env=None)
  Install a cabal package.
  pkg  A package name in format accepted by cabal-install. See: https://wiki.haskell.org/Cabal-Install
  pkgs A list of packages names in same format as pkg
  user The user to run cabal install with
  install_global Install package globally instead of locally
  env  Environment variables to set when invoking cabal. Uses the same env format as the cmd.run execution function

CLI Example:

```
salt '*' cabal.install shellcheck
salt '*' cabal.install shellcheck-0.3.5
```

salt.modules.cabal.list_(pkg=None, user=None, installed=False, env=None)
  List packages matching a search string.
  pkg  Search string for matching package names
  user The user to run cabal list with
  installed If True, only return installed packages.
  env  Environment variables to set when invoking cabal. Uses the same env format as the cmd.run execution function

CLI example:

```
salt '*' cabal.list
salt '*' cabal.list ShellCheck
```

salt.modules.cabal.uninstall(pkg, user=None, env=None)
  Uninstall a cabal package.
  pkg  The package to uninstall
  user The user to run ghc-pkg unregister with
  env  Environment variables to set when invoking cabal. Uses the same env format as the cmd.run execution function

CLI Example:

```
salt '*' cabal.uninstall ShellCheck
```

salt.modules.cabal.update(user=None, env=None)
  Updates list of known packages.
  user The user to run cabal update with
  env  Environment variables to set when invoking cabal. Uses the same env format as the cmd.run execution function.

CLI Example:
19.9.61 salt.modules.capirca_acl module

Capirca ACL

Generate ACL (firewall) configuration for network devices.

New in version 2017.7.0.

```yaml
codeauthor Mircea Ulinic <mircea@cloudflare.com> & Robert Ankeny <robankeny@google.com>
maturity new
depends capirca
platform unix
```

Dependencies

The firewall configuration is generated by Capirca.

To install Capirca, execute: `pip install capirca`.

```python
salt.modules.capirca_acl.get_filter_config(platform, filter_name, filter_options=None, terms=None, prepend=True, pillar_key='acl', pillarenv=None, saltenv=None, merge_pillar=True, only_lower_merge=False, revision_id=None, revision_no=None, revision_date=True, revision_date_format='%Y/%m/%d')
```

Return the configuration of a policy filter.

- `platform`: The name of the Capirca platform.
- `filter_name`: The name of the policy filter.
- `filter_options`: Additional filter options. These options are platform-specific. See the complete list of options.
- `terms`: List of terms for this policy filter. If not specified or empty, will try to load the configuration from the pillar, unless `merge_pillar` is set as False.
- `prepend`: When `merge_pillar` is set as True, the final list of terms generated by merging the terms from `terms` with those defined in the pillar (if any): new terms are prepended at the beginning, while existing ones will preserve the position. To add the new terms at the end of the list, set this argument to False.
- `pillar_key`: acl The key in the pillar containing the default attributes values. Default: acl.
- `pillarenv`: Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.
- `saltenv`: Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.
- `merge_pillar`: True Merge the CLI variables with the pillar. Default: True.
- `only_lower_merge`: False Specify if it should merge only the terms fields. Otherwise it will try to merge also filters fields. Default: False.
- `revision_id`: Add a comment in the filter config having the description for the changes applied.
- `revision_no`: The revision count.
- `revision_date`: True Boolean flag: display the date when the filter configuration was generated. Default: True.
- `revision_date_format`: %Y/%m/%d The date format to be used when generating the perforce data. Default: %Y/%m/%d (<year>/<month>/<day>).
CLI Example:

```
salt '*' capirca.get_filter_config ciscoxr my-filter pillar_key=netacl
```

Output Example:

```
! $Id:$
! $Date:$
! $Revision:的优点
no ipv4 access-list my-filter
ipv4 access-list my-filter
remark $Id:$
remark my-term
deny ipv4 any eq 1234 any
deny ipv4 any eq 1235 any
remark my-other-term
permit tcp any range 5678 5680 any
exit
```

The filter configuration has been loaded from the pillar, having the following structure:

```
netacl:
  - my-filter:
    terms:
      - my-term:
        source_port: [1234, 1235]
        action: reject
      - my-other-term:
        source_port:
          - [5678, 5680]
        protocol: tcp
        action: accept
```

salt.modules.capirca_acl.get_filter_pillar(filter_name, pillar_key='acl', pillarenv=None, saltenv=None)

Helper that can be used inside a state SLS, in order to get the filter configuration given its name.

- **filter_name**: The name of the filter.
- **pillar_key**: The root key of the whole policy config.
- **pillarenv**: Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.
- **saltenv**: Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.

salt.modules.capirca_acl.get_policy_config(platform, filters=None, prepend=True, pillar_key='acl', pillarenv=None, saltenv=None, merge_pillar=True, only_lower_merge=False, revision_id=None, revision_no=None, revision_date=True, revision_date_format='%Y/%m/%d')

Return the configuration of the whole policy.

- **platform**: The name of the Capirca platform.
- **filters**: List of filters for this policy. If not specified or empty, will try to load the configuration from the pillar, unless merge_pillar is set as False.
- **prepend**: True When merge_pillar is set as True, the final list of filters generated by merging the filters from filters with those defined in the pillar (if any): new filters are prepended at the beginning, while existing ones will preserve the position. To add the new filters at the end of the list, set this argument to False.
- **pillar_key**: acl The key in the pillar containing the default attributes values. Default: acl.
pillarenv  Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.
saltenv  Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.
merge_pillar: True  Merge the CLI variables with the pillar. Default: True.
only_lower_merge: False  Specify if it should merge only the filters and terms fields. Otherwise it will try to merge everything at the policy level. Default: False.
revision_id  Add a comment in the policy config having the description for the changes applied.
revision_no  The revision count.
revision_date: True  Boolean flag: display the date when the policy configuration was generated. Default: True.
revision_date_format: %Y/%m/%d  The date format to be used when generating the perforce data. Default: %Y/%m/%d (<year>/<month>/<day>).

CLI Example:

```
salt '*' capirca.get_policy_config juniper pillar_key=netacl
```

Output Example:

```
firewall {
  family inet {
    replace:
    /*
    ** $Id:$
    ** $Date:$
    ** $Revision:$
    ** */
    filter my-filter {
      term my-term {
        from {
          source-port [ 1234 1235 ];
        }
        then {
          reject;
        }
      }
      term my-other-term {
        from {
          protocol tcp;
          source-port 5678-5680;
        }
        then accept;
      }
    }
  }
  firewall {
    family inet {
      replace:
      /*
      ** $Id:$
      ** $Date:$
      ** $Revision:$
      ** */
      filter my-other-filter {
        interface-specific;
        term dummy-term {
```
```plaintext
from {
    protocol [ tcp udp ];
}
then {
    reject;
}
}
}

The policy configuration has been loaded from the pillar, having the following structure:

```
netacl:
    - my-filter:
        options:
            - not-interface-specific
        terms:
            - my-term:
                source_port: [1234, 1235]
                action: reject
            - my-other-term:
                source_port:
                    - [5678, 5680]
                protocol: tcp
                action: accept
    - my-other-filter:
        terms:
            - dummy-term:
                protocol:
                    - tcp
                    - udp
                action: reject
```

salt.modules.capirca_acl.get_term_config(platform, filter_name, term_name, filter_options=None, pillar_key='acl', pillarenv=None, saltenv=None, merge_pillar=True, revision_id=None, revision_no=None, revision_date=True, revision_date_format='%Y/%m/%d', source_service=None, destination_service=None, **term_fields)

Return the configuration of a single policy term.

**platform** The name of the Capirca platform.
**filter_name** The name of the policy filter.
**term_name** The name of the term.
**filter_options** Additional filter options. These options are platform-specific. E.g.: inet6, bridge, object-group. See the complete list of [options](#).

**pillar_key:** acl The key in the pillar containing the default attributes values. Default: acl. If the pillar contains the following structure:

```
firewall:
    - my-filter:
        terms:
            - my-term:
                source_port: 1234
                source_address:
```

19.9. execution modules
The `pillar_key` field would be specified as `firewall`.

- `pillarenv` Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

- `saltenv` Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

- `merge_pillar: True` Merge the CLI variables with the pillar. Default: `True`.

- `revision_id` Add a comment in the term config having the description for the changes applied.

- `revision_no` The revision count.

- `revision_date: True` Boolean flag: display the date when the term configuration was generated. Default: `True`.

- `revision_date_format: %Y/%m/%d` The date format to be used when generating the perforce data. Default: `%Y/%m/%d (<year>/<month>/<day>).

- `source_service` A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a source_port and protocol.

  As this module is available on Unix platforms only, it reads the IANA port assignment from `/etc/services`.

  If the user requires additional shortcuts to be referenced, they can add entries under `/etc/services`, which can be managed using the `file state`.

- `destination_service` A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a destination_port and protocol. Allows the same options as `source_service`.

- `term_fields` Term attributes. To see what fields are supported, please consult the list of supported keywords. Some platforms have few other optional keywords.

  **Note:** The following fields are accepted:

  - `action`
  - `address`
  - `address_exclude`
  - `comment`
  - `counter`
  - `expiration`
  - `destination_address`
  - `destination_address_exclude`
  - `destination_port`
  - `destination_prefix`
  - `forwarding_class`
  - `forwarding_class_except`
  - `logging`
  - `log_name`
  - `loss_priority`
  - `option`
  - `policer`
  - `port`
  - `precedence`
  - `principals`
  - `protocol`
  - `protocol_except`
  - `qos`
  - `pan_application`
  - `routing_instance`
• source_address
• source_address_exclude
• source_port
• source_prefix
• verbatim
• packet_length
• fragment_offset
• hop_limit
• icmp_type
• ether_type
• traffic_class_count
• traffic_type
• translated
• dscp_set
• dscp_match
• dscp_except
• next_ip
• flexible_match_range
• source_prefix_except
• destination_prefix_except
• vpn
• source_tag
• destination_tag
• source_interface
• destination_interface
• flattened
• flattened_addr
• flattened_saddr
• flattened_daddr
• priority

Note: The following fields can be also a single value and a list of values:
• action
• address
• address_exclude
• comment
• destination_address
• destination_address_exclude
• destination_port
• destination_prefix
• forwarding_class
• forwarding_class_except
• logging
• option
• port
• precedence
• principals
• protocol
• protocol_except
• pan_application
• source_address
• source_address_exclude
source_port
source_prefix
verbatim
icmp_type
ether_type
traffic_type
dscp_match
dscp_except
flexible_match_range
source_prefix_except
destination_prefix_except
source_tag
destination_tag
source_service
destination_service

Example: destination_address can be either defined as:

```
destination_address: 172.17.17.1/24
```

or as a list of destination IP addresses:

```
destination_address:
  - 172.17.17.1/24
  - 172.17.19.1/24
```

or a list of services to be matched:

```
source_service:
  - ntp
  - snmp
  - ldap
  - bgpd
```

Note: The port fields `source_port` and `destination_port` can be used as above to select either a single value, either a list of values, but also they can select port ranges. Example:

```
source_port:
  - [1000, 2000]
  - [3000, 4000]
```

With the configuration above, the user is able to select the 1000-2000 and 3000-4000 source port ranges.

CLI Example:

```
salt '*' capirca.get_term_config arista filter-name term-name source_address=1.2.
  !-3.4 destination_address=5.6.7.8 action=accept
```

Output Example:

```
! $Date: 2017/03/22 $
no ip access-list filter-name
ip access-list filter-name
remark term-name
```
salt.modules.capirca_acl.get_term_pillar(filter_name, term_name, pillar_key='acl', pillarenv=None, saltenv=None)
Helper that can be used inside a state SLS, in order to get the term configuration given its name, under a certain filter uniquely identified by its name.

filter_name  The name of the filter.
term_name  The name of the term.
pillar_key: acl  The root key of the whole policy config. Default: acl.
pillarenv  Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.
saltenv  Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.

19.9.62 salt.modules.cassandra
Cassandra NoSQL Database Module

depends
  • pycassa Cassandra Python adapter

cassandra

configuration The location of the `nodetool' command, host, and thrift port needs to be specified via pillar:

        cassandra.nodetool: /usr/local/bin/nodetool
        cassandra.host: localhost
        cassandra.thrift_port: 9160

salt.modules.cassandra.column_families(keyspace=None)
Return existing column families for all keyspaces or just the provided one.

CLI Example:

    salt '*' cassandra.column_families
    salt '*' cassandra.column_families <keyspace>

salt.modules.cassandra.column_family_definition(keyspace, column_family)
Return a dictionary of column family definitions for the given keyspace/column_family

CLI Example:

    salt '*' cassandra.column_family_definition <keyspace> <column_family>

salt.modules.cassandra.compactionstats()
Return compactionstats info

CLI Example:

    salt '*' cassandra.compactionstats

salt.modules.cassandra.info()
Return cassandra node info

CLI Example:

    salt '*' cassandra.info

19.9. execution modules
salt.modules.cassandra.keyspaces()
Return existing keyspaces

CLI Example:
```
salt '*' cassandra.keyspaces
```

salt.modules.cassandra.netstats()
Return netstats info

CLI Example:
```
salt '*' cassandra.netstats
```

salt.modules.cassandra.ring()
Return cassandra ring info

CLI Example:
```
salt '*' cassandra.ring
```

salt.modules.cassandra.tpstats()
Return tpstats info

CLI Example:
```
salt '*' cassandra.tpstats
```

salt.modules.cassandra.version()
Return the cassandra version

CLI Example:
```
salt '*' cassandra.version
```

### 19.9.63 salt.modules.cassandra_cql

Cassandra Database Module

New in version 2015.5.0.

**depends** DataStax Python Driver for Apache Cassandra [https://github.com/datastax/python-driver](https://github.com/datastax/python-driver)
install cassandra-driver

**referenced by** Salt's cassandra_cql returner

**configuration** The Cassandra cluster members and connection port can either be specified in the master or minion config, the minion's pillar or be passed to the module.

Example configuration in the config for a single node:

```
cassandra:
    cluster: 192.168.50.10
    port: 9000
```

Example configuration in the config for a cluster:
cassandra:
  cluster:
    - 192.168.50.10
    - 192.168.50.11
    - 192.168.50.12
  port: 9000
  username: cas_admin

Changed in version 2016.11.0.

Added support for `ssl_options` and `protocol_version`.

Example configuration with `ssl_options`:

If `ssl_options` are present in cassandra config the cassandra_cql returner will use SSL. SSL isn't used if `ssl_options` isn't specified.

cassandra:
  cluster:
    - 192.168.50.10
    - 192.168.50.11
    - 192.168.50.12
  port: 9000
  username: cas_admin

  ssl_options:
    ca_certs: /etc/ssl/certs/ca-bundle.trust.crt

    # SSL version should be one from the ssl module
    # This is an optional parameter
    ssl_version: PROTOCOL_TLSv1

Additionally you can also specify the `protocol_version` to use.

cassandra:
  cluster:
    - 192.168.50.10
    - 192.168.50.11
    - 192.168.50.12
  port: 9000
  username: cas_admin

  # defaults to 4, if not set
  protocol_version: 3

%salt.modules.cassandra_cql.cql_query%(query, contact_points=None, port=None, cql_user=None, cql_pass=None)

Run a query on a Cassandra cluster and return a dictionary.

Parameters

- `query` *(str)* -- The query to execute.
- `contact_points` *(str | list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- `cql_user` *(str)* -- The Cassandra user if authentication is turned on.
- `cql_pass` *(str)* -- The Cassandra user password if authentication is turned on.
- `port` *(int)* -- The Cassandra cluster port, defaults to None.
- **params** *(str)* -- The parameters for the query, optional.

**Returns** A dictionary from the return values of the query

**Return type** `list[dict]`

**CLI Example:**

```bash
salt '*' cql_query "SELECT * FROM users_by_name WHERE first_name = 'jane'"
```

salt.modules.cassandra_cql.cql_query_with_prepare(`query`, `statement_name`, `statement_arguments`, `async=False`, `callback_errors=None`, `contact_points=None`, `port=None`, `cql_user=None`, `cql_pass=None`)  

Run a query on a Cassandra cluster and return a dictionary.

This function should not be used asynchronously for SELECTs -- it will not return anything and we don't currently have a mechanism for handling a future that will return results.

**Parameters**

- **query** *(str)* -- The query to execute.
- **statement_name** *(str)* -- Name to assign the prepared statement in the __context__ dictionary
- **statement_arguments** *(list[str]*) -- Bind parameters for the SQL statement
- **async** *(bool)* -- Run this query in asynchronous mode
- **callback_errors** *(Function callable)* -- Function to call after query runs if there is an error
- **contact_points** *(str | list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user** *(str)* -- The Cassandra user if authentication is turned on.
- **cql_pass** *(str)* -- The Cassandra user password if authentication is turned on.
- **port** *(int)* -- The Cassandra cluster port, defaults to None.
- **params** *(str)* -- The parameters for the query, optional.

**Returns** A dictionary from the return values of the query

**Return type** `list[dict]`

**CLI Example:**

```
# Insert data asynchronously
salt this-node cassandra_cql.cql_query_with_prepare "name_insert" "INSERT INTO USERS (first_name, last_name) VALUES (?, ?)"  
"'John', 'Doe'", async=True

# Select data, should not be asynchronous because there is not currently a facility to return data from a future
salt this-node cassandra_cql.cql_query_with_prepare "name_select" "SELECT * FROM USERS WHERE first_name=?"  
"'John'"
```

salt.modules.cassandra_cql.create_keyspace(`keyspace`, `replication_strategy='SimpleStrategy'`, `replication_factor=1`, `replication_datacenters=None`, `contact_points=None`, `port=None`, `cql_user=None`, `cql_pass=None`)
Create a new keyspace in Cassandra.

Parameters

- **keyspace** *(str)* -- The keyspace name
- **replication_strategy** *(str)* -- either *SimpleStrategy* or *NetworkTopologyStrategy*
- **replication_factor** *(int)* -- number of replicas of data on multiple nodes. not used if using *NetworkTopologyStrategy*
- **replication_datacenters** *(str | dict[str, int])* -- string or dict of datacenter names to replication factors, required if using *NetworkTopologyStrategy* (will be a dict if coming from state file).
- **contact_points** *(str | list[str])* -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user** *(str)* -- The Cassandra user if authentication is turned on.
- **cql_pass** *(str)* -- The Cassandra user password if authentication is turned on.
- **port** *(int)* -- The Cassandra cluster port, defaults to None.

Returns

The info for the keyspace or False if it does not exist.

Return type: dict

CLI Example:

```bash
# CLI Example:
salt 'minion1' cassandra_cql.create_keyspace keyspace=newkeyspace
salt 'minion1' cassandra_cql.create_keyspace keyspace=newkeyspace replication_strategy=NetworkTopologyStrategy replication_datacenters='{"datacenter_1": 3, "datacenter_2": 2}''
```

Create a new cassandra user with credentials and superuser status.

Parameters

- **username** *(str)* -- The name of the new user.
- **password** *(str)* -- The password of the new user.
- **superuser** *(bool)* -- Is the new user going to be a superuser? default: False
- **contact_points** *(str | list[str])* -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user** *(str)* -- The Cassandra user if authentication is turned on.
- **cql_pass** *(str)* -- The Cassandra user password if authentication is turned on.
- **port** *(int)* -- The Cassandra cluster port, defaults to None.

Returns

Return type: dict

CLI Example:

```bash
salt 'minion1' cassandra_cql.create_user username=joe password=secret
```
salt 'minion1' cassandra_cql.create_user username=joe password=secret superuser=True

salt 'minion1' cassandra_cql.create_user username=joe password=secret superuser=True contact_points=minion1

salt.modules.cassandra_cql.drop_keyspace(keyspace, contact_points=None, port=None, cql_user=None, cql_pass=None)

Drop a keyspace if it exists in a Cassandra cluster.

Parameters

- **keyspace** (str) -- The keyspace to drop.
- **contact_points** (str | list[str]) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user** (str) -- The Cassandra user if authentication is turned on.
- **cql_pass** (str) -- The Cassandra user password if authentication is turned on.
- **port** (int) -- The Cassandra cluster port, defaults to None.

Returns

The info for the keyspace or False if it does not exist.

Return type
dict

CLI Example:
salt 'minion1' cassandra_cql.drop_keyspace keyspace=test
salt 'minion1' cassandra_cql.drop_keyspace keyspace=test contact_points=minion1

salt.modules.cassandra_cql.grant_permission(username, resource=None, resource_type='keyspace', permission=None, contact_points=None, port=None, cql_user=None, cql_pass=None)

Grant permissions to a user.

Parameters

- **username** (str) -- The name of the user to grant permissions to.
- **resource** (str) -- The resource (keyspace or table), if None, permissions for all resources are granted.
- **resource_type** (str) -- The resource_type (keyspace or table), defaults to 'keyspace'.
- **permission** (str) -- A permission name (e.g. select), if None, all permissions are granted.
- **contact_points** (str | list[str]) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user** (str) -- The Cassandra user if authentication is turned on.
- **cql_pass** (str) -- The Cassandra user password if authentication is turned on.
- **port** (int) -- The Cassandra cluster port, defaults to None.

Returns

Return type
dict

CLI Example:
salt 'minion1' cassandra_cql.grant_permission
salt 'minion1' cassandra_cql.grant_permission username=joe resource=test_keyspace permission=select
salt 'minion1' cassandra_cql.grant_permission username=joe resource=test_table resource_type=table permission=select contact_points=minion1

salt.modules.cassandra_cql.info(contact_points=None, port=None, cql_user=None, cql_pass=None)

Show the Cassandra information for this cluster.

Parameters

- **contact_points** *(str | list[str])* -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user** *(str)* -- The Cassandra user if authentication is turned on.
- **cql_pass** *(str)* -- The Cassandra user password if authentication is turned on.
- **port** *(int)* -- The Cassandra cluster port, defaults to None.

Returns

The information for this Cassandra cluster.

Return type  dict

CLI Example:

salt 'minion1' cassandra_cql.info
salt 'minion1' cassandra_cql.info contact_points=minion1

salt.modules.cassandra_cql.keyspace_exists(keyspace, contact_points=None, port=None, cql_user=None, cql_pass=None)

Check if a keyspace exists in a Cassandra cluster.

:param keyspace The keyspace name to check for. :type keyspace: str
:param contact_points: The Cassandra cluster addresses, can either be a string or a list of IPs. :type contact_points: str | list[str]
:param cql_user: The Cassandra user if authentication is turned on. :type cql_user: str
:param cql_pass: The Cassandra user password if authentication is turned on. :type cql_pass: str
:param port: The Cassandra cluster port, defaults to None. :type port: int
:returns: The info for the keyspace or False if it does not exist. :rtype: dict

CLI Example:

salt 'minion1' cassandra_cql.keyspace_exists keyspace=system
salt 'minion1' cassandra_cql.list_keyspaces keyspace=system contact_points=minion1

salt.modules.cassandra_cql.list_column_families(keyspace=None, contact_points=None, port=None, cql_user=None, cql_pass=None)

List column families in a Cassandra cluster for all keyspaces or just the provided one.

Parameters

- **keyspace** *(str)* -- The keyspace to provide the column families for, optional.
- **contact_points** *(str | list[str])* -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user** *(str)* -- The Cassandra user if authentication is turned on.
- **cql_pass** *(str)* -- The Cassandra user password if authentication is turned on.
**port (int)** -- The Cassandra cluster port, defaults to None.

*Returns* The column families in this Cassandra cluster.

*Return type* list[dict]

*CLI Example:*

```
salt 'minion1' cassandra_cql.list_column_families
salt 'minion1' cassandra_cql.list_column_families contact_points=minion1
salt 'minion1' cassandra_cql.list_column_families keyspace=system
```

### salt.modules.cassandra_cql.list_keyspaces(

**list_keyspaces** (contact_points=None, cql_user=None, cql_pass=None, port=None)

List keyspaces in a Cassandra cluster.

*Parameters*

- **contact_points (str | list[str])** -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user (str)** -- The Cassandra user if authentication is turned on.
- **cql_pass (str)** -- The Cassandra user password if authentication is turned on.
- **port (int)** -- The Cassandra cluster port, defaults to None.

*Returns* The keyspaces in this Cassandra cluster.

*Return type* list[dict]

*CLI Example:*

```
salt 'minion1' cassandra_cql.list_keyspaces
salt 'minion1' cassandra_cql.list_keyspaces contact_points=minion1 port=9000
```

### salt.modules.cassandra_cql.list_permissions(

**list_permissions** (username=None, resource=None, resource_type='keyspace', permission=None, contact_points=None, cql_user=None, cql_pass=None, port=None)

List permissions.

*Parameters*

- **username (str)** -- The name of the user to list permissions for.
- **resource (str)** -- The resource (keyspace or table), if None, permissions for all resources are listed.
- **resource_type (str)** -- The resource_type (keyspace or table), defaults to 'keyspace'.
- **permission (str)** -- A permission name (e.g. select), if None, all permissions are listed.
- **contact_points (str | list[str])** -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user (str)** -- The Cassandra user if authentication is turned on.
- **cql_pass (str)** -- The Cassandra user password if authentication is turned on.
- **port (int)** -- The Cassandra cluster port, defaults to None.

*Returns* Dictionary of permissions.
Return type  dict

CLI Example:

```
salt 'minion1' cassandra_cql.list_permissions
salt 'minion1' cassandra_cql.list_permissions username=joe resource=test_keyspace
  permission=select
salt 'minion1' cassandra_cql.list_permissions username=joe resource=test_table
  resource_type=table permission=select contact_points=minion1
```

salt.modules.cassandra_cql.list_users(  
    contact_points=None,  
    port=None,  
    cql_user=None,  
    cql_pass=None
)

List existing users in this Cassandra cluster.

Parameters

- **contact_points** *(str | list[str])* -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **port** *(int)* -- The Cassandra cluster port, defaults to None.
- **cql_user** *(str)* -- The Cassandra user if authentication is turned on.
- **cql_pass** *(str)* -- The Cassandra user password if authentication is turned on.

Returns  The list of existing users.

Return type  dict

CLI Example:

```
salt 'minion1' cassandra_cql.list_users
salt 'minion1' cassandra_cql.list_users contact_points=minion1
```

salt.modules.cassandra_cql.version(  
    contact_points=None,  
    port=None,  
    cql_user=None,  
    cql_pass=None
)

Show the Cassandra version.

Parameters

- **contact_points** *(str | list[str])* -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user** *(str)* -- The Cassandra user if authentication is turned on.
- **cql_pass** *(str)* -- The Cassandra user password if authentication is turned on.
- **port** *(int)* -- The Cassandra cluster port, defaults to None.

Returns  The version for this Cassandra cluster.

Return type  str

CLI Example:

```
salt 'minion1' cassandra_cql.version
salt 'minion1' cassandra_cql.version contact_points=minion1
```

19.9.64  salt.modules.celery module

Support for scheduling celery tasks. The worker is independent of salt and thus can run in a different virtualenv or on a different python version, as long as broker, backend and serializer configurations match. Also note that celery
and packages required by the celery broker, e.g. redis must be installed to load the salt celery execution module.

**Note:** A new app (and thus new connections) is created for each task execution

```python
salt.modules.celery.run_task(task_name, args=None, kwars=None, broker=None, backend=None,
wait_for_result=False, timeout=None, propagate=True, interval=0.5,
no_ack=True, raise_timeout=True, config=None)
```

Execute celery tasks. For celery specific parameters see celery documentation.

CLI Example:

```
salt '*' celery.run_task tasks.sleep args=[4] broker=redis://localhost 
backend=redis://localhost wait_for_result=true
```

- **task_name** The task name, e.g. tasks.sleep
- **args** Task arguments as a list
- **kwargs** Task keyword arguments
- **broker** Broker for celeryapp, see celery documentation
- **backend** Result backend for celeryapp, see celery documentation
- **wait_for_result** Wait until task result is read from result backend and return result, Default: False
- **timeout** Timeout waiting for result from celery, see celery AsyncResult.get documentation
- **propagate** Propagate exceptions from celery task, see celery AsyncResult.get documentation, Default: True
- **interval** Interval to check for task result, see celery AsyncResult.get documentation, Default: 0.5
- **no_ack** See celery AsyncResult.get documentation. Default: True
- **raise_timeout** Raise timeout exception if waiting for task result times out. Default: False
- **config** Config dict for celery app, See celery documentation

### 19.9.65 salt.modules.ceph module

Module to provide ceph control with salt.

```
depends
  - ceph_cfg Python module
```

New in version 2016.11.0.

```python
salt.modules.ceph.ceph_version()
```

Get the version of ceph installed

CLI Example:

```
salt '*' ceph.ceph_version
```

```python
salt.modules.ceph.cluster_quorum(**kwargs)
```

Get the cluster's quorum status

CLI Example:

```
salt '*' ceph.cluster_quorum \\
  'cluster_name'='ceph' \\
  'cluster_uuid'='cluster_uuid'
```

- **cluster_uuid** The cluster UUID. Defaults to value found in ceph config file.
- **cluster_name** The cluster name. Defaults to ceph.
salt.modules.ceph.cluster_status(**kwargs)
Get the cluster status, including health if in quorum

CLI Example:

```bash
salt '*' ceph.cluster_status \
    'cluster_name'='ceph' \n    'cluster_uuid'='cluster_uuid'
```

- **cluster_uuid** The cluster UUID. Defaults to value found in ceph config file.
- **cluster_name** The cluster name. Defaults to ceph.

salt.modules.ceph.keyring_auth_add(**kwargs)
Add keyring to authorized list

CLI Example:

```bash
salt '*' ceph.keyring_auth_add \
    'keyring_type'='admin' \n    'cluster_name'='ceph' \n    'cluster_uuid'='cluster_uuid'
```

- **keyring_type** (required) One of admin, mon, osd, rgw, mds
- **cluster_uuid** The cluster UUID. Defaults to value found in ceph config file.
- **cluster_name** The cluster name. Defaults to ceph.

salt.modules.ceph.keyring_auth_del(**kwargs)
Remove keyring from authorised list

CLI Example:

```bash
salt '*' ceph.keyring_osd_auth_del \
    'keyring_type'='admin' \n    'cluster_name'='ceph' \n    'cluster_uuid'='cluster_uuid'
```

- **keyring_type** (required) One of admin, mon, osd, rgw, mds
- **cluster_uuid** The cluster UUID. Defaults to value found in ceph config file.
- **cluster_name** The cluster name. Defaults to ceph.

salt.modules.ceph.keyring_auth_list(**kwargs)
List all cephx authorization keys

CLI Example:

```bash
salt '*' ceph.keyring_auth_list \
    'cluster_name'='ceph' \n    'cluster_uuid'='cluster_uuid'
```

- **cluster_name** The cluster name. Defaults to ceph.
- **cluster_uuid** The cluster UUID. Defaults to value found in ceph config file.

salt.modules.ceph.keyring_create(**kwargs)
Create keyring for cluster

CLI Example:

```bash
salt '*' ceph.keyring_create \
    'keyring_type'='admin' \n    'cluster_name'='ceph' \n    'cluster_uuid'='cluster_uuid'
```
keyring_type (required) One of admin, mon, osd, rgw, mds
cluster_uuid The cluster UUID. Defaults to value found in ceph config file.
cluster_name The cluster name. Defaults to ceph.
salt.modules.ceph.keyring_present(**kwargs)
Returns True if the keyring is present on disk, otherwise False

CLI Example:

salt '*' ceph.keyring_present \
'keyring_type'='admin' \
'cluster_name'='ceph' \
'cluster_uuid'='cluster_uuid'

keyring_type (required) One of admin, mon, osd, rgw, mds
cluster_uuid The cluster UUID. Defaults to value found in ceph config file.
cluster_name The cluster name. Defaults to ceph.
salt.modules.ceph.keyring_purge(**kwargs)
Delete keyring for cluster

CLI Example:

salt '*' ceph.keyring_purge \
'keyring_type'='admin' \
'cluster_name'='ceph' \
'cluster_uuid'='cluster_uuid'

keyring_type (required) One of admin, mon, osd, rgw, mds
cluster_uuid The cluster UUID. Defaults to value found in ceph config file.
cluster_name The cluster name. Defaults to ceph.
If no ceph config file is found, this command will fail.
salt.modules.ceph.keyring_save(**kwargs)
Create save keyring locally

CLI Example:

salt '*' ceph.keyring_save \
'keyring_type'='admin' \
'cluster_name'='ceph' \
'cluster_uuid'='cluster_uuid'

keyring_type (required) One of admin, mon, osd, rgw, mds
cluster_uuid The cluster UUID. Defaults to value found in ceph config file.
cluster_name The cluster name. Defaults to ceph.
salt.modules.ceph.mds_create(**kwargs)
Create a mds

CLI Example:

salt '*' ceph.mds_create \
'name' = 'mds.name' \
'port' = 1000, \
'addr' = 'fqdn.example.org' \
'cluster_name'='ceph' \
'cluster_uuid'='cluster_uuid'

name (required) The MDS name (must start with mds.)
**port (required)** Port to which the MDS will listen
**addr (required)** Address or IP address for the MDS to listen
**cluster_uuid** The cluster UUID. Defaults to value found in ceph config file.
**cluster_name** The cluster name. Defaults to ceph.

```python
salt.modules.ceph.mds_destroy(**kwargs)
```
Remove a mds

**CLI Example:**
```
salt '*' ceph.mds_destroy
    'name' = 'mds.name'
    'cluster_name'='ceph'
    'cluster_uuid'='cluster_uuid'
```

**name (required)** The MDS name (must start with mds.)
**cluster_uuid** The cluster UUID. Defaults to value found in ceph config file.
**cluster_name** The cluster name. Defaults to ceph.

```python
salt.modules.ceph.mon_active(**kwargs)
```
Returns True if the mon daemon is running, otherwise False

**CLI Example:**
```
salt '*' ceph.mon_active
    'cluster_name'='ceph'
    'cluster_uuid'='cluster_uuid'
```

**cluster_uuid** The cluster UUID. Defaults to value found in ceph config file.
**cluster_name** The cluster name. Defaults to ceph.

```python
salt.modules.ceph.mon_create(**kwargs)
```
Create a mon node

**CLI Example:**
```
salt '*' ceph.mon_create
    'cluster_name'='ceph'
    'cluster_uuid'='cluster_uuid'
```

**cluster_uuid** The cluster UUID. Defaults to value found in ceph config file.
**cluster_name** The cluster name. Defaults to ceph.

```python
salt.modules.ceph.mon_is(**kwargs)
```
Returns True if the target is a mon node, otherwise False

**CLI Example:**
```
salt '*' ceph.mon_is
    'cluster_name'='ceph'
    'cluster_uuid'='cluster_uuid'
```

**cluster_name** The cluster name. Defaults to ceph.
**cluster_uuid** The cluster UUID. Defaults to value found in ceph config file.

```python
salt.modules.ceph.mon_quorum(**kwargs)
```
Returns True if the mon daemon is in the quorum, otherwise False

**CLI Example:**
```
salt '*' ceph.mon_quorum
    'cluster_name'='ceph'
    'cluster_uuid'='cluster_uuid'
```
cluster_uuidd  The cluster UUID. Defaults to value found in ceph config file.
cluster_name  The cluster name. Defaults to ceph.
salt.modules.ceph.mon_status(**kwargs)
    Get status from mon daemon
    CLI Example:

    salt '*' ceph.mon_status
        'cluster_name'='ceph'
        'cluster_uuid'='cluster_uuid'

cluster_uuidd  The cluster UUID. Defaults to value found in ceph config file.
cluster_name  The cluster name. Defaults to ceph.
salt.modules.ceph.osd_activate(**kwargs)
    Activate an OSD
    CLI Example:

    salt '*' ceph.osd_activate 'osd_dev'='/dev/vdc'

salt.modules.ceph.osd_discover()
    List all OSD by cluster
    CLI Example:

    salt '*' ceph.osd_discover

salt.modules.ceph.osd_prepare(**kwargs)
    Prepare an OSD
    CLI Example:

    salt '*' ceph.osd_prepare 'osd_dev'='/dev/vdc'
        'journal_dev'='device'
        'cluster_name'='ceph'
        'cluster_uuid'='cluster_uuid'
        'osd_fs_type'='xfs'
        'osd_uuid'='2a143b73-6d85-4389-a9e9-b8a78d9e1e07'
        'journal_uuid'='4562a5db-ff6f-4268-811d-12fd4a09ae98'

cluster_uuidd  The device to store the osd data on.
journal_dev  The journal device. defaults to osd_dev.
cluster_name  The cluster name. Defaults to ceph.
cluster_uuidd  The cluster date will be added too. Defaults to the value found in local config.
osd_fs_type  set the file system to store OSD data with. Defaults to "xfs".
osd_uuid  set the OSD data UUID. If set will return if OSD with data UUID already exists.
journal_uuid  set the OSD journal UUID. If set will return if OSD with journal UUID already exists.
salt.modules.ceph.partition_is(dev)
    Check whether a given device path is a partition or a full disk.
    CLI Example:
salt '*' ceph.partition_is /dev/sdc1

salt.modules.ceph.partition_list()  
List partitions by disk  
CLI Example:  
salt '*' ceph.partition_list

salt.modules.ceph.partition_list_journal()  
List all OSD journal partitions by partition  
CLI Example:  
salt '*' ceph.partition_list_journal

salt.modules.ceph.partition_list_osd()  
List all OSD data partitions by partition  
CLI Example:  
salt '*' ceph.partition_list_osd

salt.modules.ceph.pool_add(pool_name, **kwargs)  
Create a pool  
CLI Example:

salt '*' ceph.pool_add pool_name \  
  'cluster_name'='ceph' \  
  'cluster_uuid'='cluster_uuid'

- cluster_name The cluster name. Defaults to ceph.
- cluster_uuid The cluster UUID. Defaults to value found in ceph config file.
- pg_num Default to 8
- pgp_num Default to pg_num
- pool_type can take values ``replicated`` or ``erasure``
- erasure_code_profile The ``erasure_code_profile``
- crush_ruleset The crush map rule set

salt.modules.ceph.pool_del(pool_name, **kwargs)  
Delete a pool  
CLI Example:

salt '*' ceph.pool_del pool_name \  
  'cluster_name'='ceph' \  
  'cluster_uuid'='cluster_uuid'

- cluster_name The cluster name. Defaults to ceph.
- cluster_uuid The cluster UUID. Defaults to value found in ceph config file.

salt.modules.ceph.pool_list(**kwargs)  
List all pools  
CLI Example:

salt '*' ceph.pool_list \  
  'cluster_name'='ceph' \  
  'cluster_uuid'='cluster_uuid'
cluster_name  The cluster name. Defaults to ceph.
cluster_uuid  The cluster UUID. Defaults to value found in ceph config file.

```
salt.modules.ceph.purge(**kwargs)
```

purge ceph configuration on the node

**CLI Example:**

```
salt '*' ceph.purge
   'cluster_name'=ceph'
   'cluster_uuid'=cluster_uuid'
```

cluster_name  The cluster name. Defaults to ceph.
cluster_uuid  The cluster UUID. Defaults to value found in ceph config file.

```
salt.modules.ceph.rgw_create(**kwargs)
```

Create a rgw

**CLI Example:**

```
salt '*' ceph.rgw_create
   'name'=rgw.name'
   'cluster_name'=ceph'
   'cluster_uuid'=cluster_uuid'
```

name (required)  The RGW client name. Must start with rgw.
cluster_uuid  The cluster UUID. Defaults to value found in ceph config file.
cluster_name  The cluster name. Defaults to ceph.

```
salt.modules.ceph.rgw_destroy(**kwargs)
```

Remove a rgw

**CLI Example:**

```
salt '*' ceph.rgw_destroy
   'name'=rgw.name'
   'cluster_name'=ceph'
   'cluster_uuid'=cluster_uuid'
```

name (required)  The RGW client name (must start with rgw.)
cluster_uuid  The cluster UUID. Defaults to value found in ceph config file.
cluster_name  The cluster name. Defaults to ceph.

```
salt.modules.ceph.rgw_pools_create(**kwargs)
```

Create pools for rgw

**CLI Example:**

```
salt '*' ceph.rgw_pools_create
```

cluster_uuid  The cluster UUID. Defaults to value found in ceph config file.
cluster_name  The cluster name. Defaults to ceph.

```
salt.modules.ceph.rgw_pools_missing(**kwargs)
```

Show pools missing for rgw

**CLI Example:**
```
salt '*' ceph.rgw_pools_missing
```

**cluster_uuid**  The cluster UUID. Defaults to value found in ceph config file.
**cluster_name**  The cluster name. Defaults to `ceph`.

**salt.modules.ceph.zap**(*target=None, **kwargs)*

Destroy the partition table and content of a given disk.

```
salt '*' ceph.osd_prepare 'dev='/dev/vdc' \\
'cluster_name'='ceph' \\
'cluster_uuid'='cluster_uuid'
```

**dev**  The block device to format.
**cluster_name**  The cluster name. Defaults to `ceph`.
**cluster_uuid**  The cluster UUID. Defaults to value found in ceph config file.

### 19.9.66 salt.modules.chassis

Glue execution module to link to the `fx2 proxymodule`.

**Depends:** iDRAC Remote execution module (**salt.modules.dracr**)

For documentation on commands that you can direct to a Dell chassis via proxy, look in the documentation for **salt.modules.dracr**.

This execution module calls through to a function in the `fx2` proxy module called `chconfig`. That function looks up the function passed in the `cmd` parameter in **salt.modules.dracr** and calls it.

New in version 2015.8.2.

**salt.modules.chassis.chassis_credentials()**

**salt.modules.chassis.cmd(cmd, *args, **kwargs)**

### 19.9.67 salt.modules.chef

Execute chef in server or solo mode

**salt.modules.chef.client**(whyrun=False, localmode=False, logfile=None, **kwargs)*

Execute a chef client run and return a dict with the stderr, stdout, return code, and pid.

CLI Example:

```
salt '*' chef.client server=https://localhost
```

**server**  The chef server URL
**client_key**  Set the client key file location
**config**  The configuration file to use
**config-file-jail**  Directory under which config files are allowed to be loaded (no client.rb or knife.rb outside this path will be loaded).
**environment**  Set the Chef Environment on the node
**group**  Group to set privilege to
**json-attributes**  Load attributes from a JSON file or URL
**localmode**  Point chef-client at local repository if True
**log_level**  Set the log level (debug, info, warn, error, fatal)
**logfile**  Set the log file location
**node-name**  The node name for this client

19.9.  execution modules
override-runlist  Replace current run list with specified items for a single run
pid  Set the PID file location, defaults to /tmp/chef-client.pid
run-lock-timeout  Set maximum duration to wait for another client run to finish, default is indefinitely.
runlist  Permanently replace current run list with specified items
user  User to set privilege to
validation_key  Set the validation key file location, used for registering new clients
whyrun  Enable whyrun mode when set to True

salt.modules.chef.solo(whyrun=False, logfile=None, **kwargs)
Execute a chef solo run and return a dict with the stderr, stdout, return code, and pid.

CLI Example:
salt '*' chef.solo override-runlist=test

config  The configuration file to use
environment  Set the Chef Environment on the node
group  Group to set privilege to
json-attributes  Load attributes from a JSON file or URL
log_level  Set the log level (debug, info, warn, error, fatal)
logfile  Set the log file location
node-name  The node name for this client
override-runlist  Replace current run list with specified items for a single run
recipe-url  Pull down a remote gzipped tarball of recipes and untar it to the cookbook cache
run-lock-timeout  Set maximum duration to wait for another client run to finish, default is indefinitely.
user  User to set privilege to
whyrun  Enable whyrun mode when set to True

19.9.68  salt.modules.chocolatey

A dead simple module wrapping calls to the Chocolatey package manager (http://chocolatey.org)
New in version 2014.1.0.
salt.modules.chocolatey.add_source(name, source_location, username=None, password=None)
Instructs Chocolatey to add a source.
name  The name of the source to be added as a chocolatey repository.
source  Location of the source you want to work with.
username  Provide username for chocolatey sources that need authentication credentials.
password  Provide password for chocolatey sources that need authentication credentials.

CLI Example:
salt '*' chocolatey.add_source <source name> <source_location>
salt '*' chocolatey.add_source <source name> <source_location> user=<user>,password=<password>
salt.modules.chocolatey.bootstrap(force=False)
Download and install the latest version of the Chocolatey package manager via the official bootstrap.
Chocolatey requires Windows PowerShell and the .NET v4.0 runtime. Depending on the host's version of Windows, chocolatey.bootstrap will attempt to ensure these prerequisites are met by downloading and executing the appropriate installers from Microsoft.
Note that if PowerShell is installed, you may have to restart the host machine for Chocolatey to work.
force  Run the bootstrap process even if Chocolatey is found in the path.

CLI Example:
salt '*' chocolatey.bootstrap
salt '*' chocolatey.bootstrap force=True

salt.modules.chocolatey.chocolatey_version()
Returns the version of Chocolatey installed on the minion.

CLI Example:
salt '*' chocolatey.chocolatey_version

salt.modules.chocolatey.disable_source(name)
Instructs Chocolatey to disable a source.
name Name of the source repository to disable.

CLI Example:
salt '*' chocolatey.disable_source <name>

salt.modules.chocolatey.enable_source(name)
Instructs Chocolatey to enable a source.
name Name of the source repository to enable.

CLI Example:
salt '*' chocolatey.enable_source <name>

salt.modules.chocolatey.install(name, version=None, source=None, force=False,
pre_versions=False, install_args=None, override_args=False,
force_x86=False, package_args=None, allow_multiple=False)
Instructs Chocolatey to install a package.

Parameters

- **name** *(str)* -- The name of the package to be installed. Only accepts a single argument. Required.

- **version** *(str)* -- Install a specific version of the package. Defaults to latest version. Default is None.

- **source** *(str)* -- Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed. Default is None.

Alternate Sources:
- cygwin
- python
- ruby
- webpi
- windowfeatures

- **force** *(bool)* -- Reinstall the current version of an existing package. Do not use with allow_multiple. Default is False.

- **pre_versions** *(bool)* -- Include pre-release packages. Default is False.

- **install_args** *(str)* -- A list of install arguments you want to pass to the installation process i.e product key or feature list. Default is None.

- **override_args** *(bool)* -- Set to true if you want to override the original install arguments (for the native installer) in the package and use your own. When this is
set to False install_args will be appended to the end of the default arguments. Default is None.

- **force_x86** *(bool)* -- Force x86 (32bit) installation on 64 bit systems. Default is False.

- **package_args** *(str)* -- Arguments you want to pass to the package. Default is None.

- **allow_multiple** *(bool)* -- Allow multiple versions of the package to be installed. Do not use with force. Does not work with all packages. Default is False.

New in version 2017.7.0.

**Returns** The output of the chocolatey command

**Return type** `str`

CLI Example:

```bash
salt '*' chocolatey.install <package name>
salt '*' chocolatey.install <package name> version=<package version>
salt '*' chocolatey.install <package name> install_args=<args> override_args=True
```

```
salt.modules.chocolatey.install_cygwin(name, install_args=None, override_args=False)
Instructs Chocolatey to install a package via Cygwin.
name The name of the package to be installed. Only accepts a single argument.
install_args A list of install arguments you want to pass to the installation process i.e product key or feature list
override_args Set to true if you want to override the original install arguments (for the native installer) in
the package and use your own. When this is set to False install_args will be appended to the end of the
default arguments
```

CLI Example:

```bash
salt '*' chocolatey.install_cygwin <package name>
salt '*' chocolatey.install_cygwin <package name> install_args=<args> override_args=True
```

```
salt.modules.chocolatey.install_gem(name, version=None, install_args=None, override_args=False)
Instructs Chocolatey to install a package via Ruby's Gems.
name The name of the package to be installed. Only accepts a single argument.
version Install a specific version of the package. Defaults to latest version available.
install_args A list of install arguments you want to pass to the installation process i.e product key or feature list
override_args Set to true if you want to override the original install arguments (for the native installer) in
the package and use your own. When this is set to False install_args will be appended to the end of the
default arguments
```

CLI Example:

```bash
salt '*' chocolatey.install_gem <package name>
salt '*' chocolatey.install_gem <package name> version=<package version>
salt '*' chocolatey.install_gem <package name> install_args=<args> override_args=True
```

```
salt.modules.chocolatey.install_missing(name, version=None, source=None)
Instructs Chocolatey to install a package if it doesn't already exist.
```

Changed in version 2014.7.0: If the minion has Chocolatey >= 0.9.8.24 installed, this function calls `chocolatey.install` instead, as `install_missing` is deprecated as of that version and will be removed in
Chocolatey 1.0.

**name**  The name of the package to be installed. Only accepts a single argument.

**version**  Install a specific version of the package. Defaults to latest version available.

**source**  Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed.

CLI Example:

```bash
salt '*' chocolatey.install_missing <package name>
salt '*' chocolatey.install_missing <package name> version=<package version>
```

**salt.modules.chocolatey.install_python(name, version=None, install_args=None, override_args=False)**

Instructs Chocolatey to install a package via Python's easy_install.

**name**  The name of the package to be installed. Only accepts a single argument.

**version**  Install a specific version of the package. Defaults to latest version available.

**install_args**  A list of install arguments you want to pass to the installation process i.e product key or feature list

**override_args**  Set to true if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False install_args will be appended to the end of the default arguments

CLI Example:

```bash
salt '*' chocolatey.install_python <package name> version=<package version>
salt '*' chocolatey.install_python <package name> install_args=<args> override_args=True
```

**salt.modules.chocolatey.install_webpi(name, install_args=None, override_args=False)**

Instructs Chocolatey to install a package via the Microsoft Web PI service.

**name**  The name of the package to be installed. Only accepts a single argument.

**install_args**  A list of install arguments you want to pass to the installation process i.e product key or feature list

**override_args**  Set to true if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False install_args will be appended to the end of the default arguments

CLI Example:

```bash
salt '*' chocolatey.install_webpi <package name> install_args=<args> override_args=True
```

**salt.modules.chocolatey.install_windowsfeatures(name)**

Instructs Chocolatey to install a Windows Feature via the Deployment Image Servicing and Management tool.

**name**  The name of the feature to be installed. Only accepts a single argument.

CLI Example:

```bash
salt '*' chocolatey.install_windowsfeatures <package name>
```

**salt.modules.chocolatey.list_(narrow=None, all_versions=False, pre_versions=False, source=None, local_only=False, exact=False)**

Instructs Chocolatey to pull a vague package list from the repository.

**Parameters**

- **narrow (str)**  --  Term used to narrow down results.  Searches against name/description/tag. Default is None.
- **all_versions** *(bool)* -- Display all available package versions in results. Default is False.
- **pre_versions** *(bool)* -- Display pre-release packages in results. Default is False.
- **source** *(str)* -- Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed if None is passed. Default is None.
- **local_only** *(bool)* -- Display packages only installed locally. Default is False.
- **exact** *(bool)* -- Display only packages that match narrow exactly. Default is False.

New in version 2017.7.0.

**Returns**  A dictionary of results.

**Return type**  *dict*

**CLI Example:**

```bash
salt '*' chocolatey.list <narrow>
salt '*' chocolatey.list <narrow> all_versions=True
```

salt.modules.chocolatey.list_webpi()

Instructs Chocolatey to pull a full package list from the Microsoft Web PI repository.

**Returns** List of webpi packages

**Return type** *str*

**CLI Example:**

```bash
salt '*' chocolatey.list_webpi
```

salt.modules.chocolatey.list_windowsfeatures()

Instructs Chocolatey to pull a full package list from the Windows Features list, via the Deployment Image Servicing and Management tool.

**Returns** List of Windows Features

**Return type** *str*

**CLI Example:**

```bash
salt '*' chocolatey.list_windowsfeatures
```

salt.modules.chocolatey.uninstall(*name*, *version=None*, *uninstall_args=None*, *override_args=False*)

Instructs Chocolatey to uninstall a package.

**name**  The name of the package to be uninstalled. Only accepts a single argument.

**version**  Uninstalls a specific version of the package. Defaults to latest version installed.

**uninstall_args**  A list of uninstall arguments you want to pass to the uninstallation process i.e product key or feature list

**override_args**  Set to true if you want to override the original uninstall arguments (for the native uninstaller) in the package and use your own. When this is set to False uninstall_args will be appended to the end of the default arguments

**CLI Example:**

```bash
salt '*' chocolatey.uninstall <package name>
salt '*' chocolatey.uninstall <package name> version=<package version>
salt '*' chocolatey.uninstall <package name> version=<package version> uninstall_args=<args> override_args=True
```
salt.modules.chocolatey.update(name, source=None, pre_versions=False)

Instructs Chocolatey to update packages on the system.

- **name** (str) -- The name of the package to update, or ``all`` to update everything installed on the system.
- **source** (str) -- Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed.
- **pre_versions** (bool) -- Include pre-release packages in comparison. Defaults to False.

CLI Example:

```
salt "+" chocolatey.update all
salt "+" chocolatey.update <package name> pre_versions=True
```

salt.modules.chocolatey.upgrade(name, version=None, source=None, force=False, pre_versions=False, install_args=None, override_args=False, force_x86=False, package_args=None)

New in version 2016.3.4.

Instructs Chocolatey to upgrade packages on the system. (update is being deprecated)

- **name** (str) -- The name of the package to update, or ``all`` to update everything installed on the system.
- **version** (str) -- Install a specific version of the package. Defaults to latest version.
- **source** (str) -- Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed.
- **force** (bool) -- Reinstall the same version already installed
- **pre_versions** (bool) -- Include pre-release packages in comparison. Defaults to False.
- **install_args** (str) -- A list of install arguments you want to pass to the installation process i.e product key or feature list
- **override_args** (str) -- Set to true if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False install_args will be appended to the end of the default arguments
- **force_x86** -- Force x86 (32bit) installation on 64 bit systems. Defaults to false.
- **package_args** -- A list of arguments you want to pass to the package

Returns Results of the chocolatey command

Return type str

CLI Example:

```
salt "*" chocolatey.upgrade all
salt "*" chocolatey.upgrade <package name> pre_versions=True
```

salt.modules.chocolatey.version(name, check_remote=False, source=None, pre_versions=False)

Instructs Chocolatey to check an installed package version, and optionally compare it to one available from a remote feed.

- **name** (str) -- The name of the package to check. Required.
- **check_remote** (bool) -- Get the version number of the latest package from the remote feed. Default is False.
• **source** *(str)* -- Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed. Default is None.

• **pre_versions** *(bool)* -- Include pre-release packages in comparison. Default is False.

**Returns**  A dictionary of currently installed software and versions

**Return type**  *dict*

**CLI Example:**
```
salt "*" chocolatey.version <package name>
salt "*" chocolatey.version <package name> check_remote=True
```

## 19.9.69  salt.modules.chronos module

Module providing a simple management interface to a chronos cluster.

Currently this only works when run through a proxy minion.

New in version 2015.8.2.

`salt.modules.chronos.has_job(name)`

Return whether the given job is currently configured.

**CLI Example:**
```
salt chronos-minion-id chronos.has_job my-job
```

`salt.modules.chronos.job(name)`

Return the current server configuration for the specified job.

**CLI Example:**
```
salt chronos-minion-id chronos.job my-job
```

`salt.modules.chronos.jobs()`

Return a list of the currently installed job names.

**CLI Example:**
```
salt chronos-minion-id chronos.jobs
```

`salt.modules.chronos.rm_job(name)`

Remove the specified job from the server.

**CLI Example:**
```
salt chronos-minion-id chronos.rm_job my-job
```

`salt.modules.chronos.update_job(name, config)`

Update the specified job with the given configuration.

**CLI Example:**
```
salt chronos-minion-id chronos.update_job my-job '<config yaml>'
```
19.9.70 salt.modules.cisconso

Execution module for Cisco Network Services Orchestrator Proxy minions

For documentation on setting up the cisconso proxy minion look in the documentation for salt.proxy.cisconso.

**salt.modules.cisconso.apply_rollback** *(datastore, name)*

Apply a system rollback

**Parameters**

- **datastore** *(DatastoreType (str enum).)* -- The datastore, e.g. running, operational. One of the NETCONF store IETF types
- **name** *(str)* -- an ID of the rollback to restore

```
salt cisco-nso cisconso.apply_rollback 52
```

**salt.modules.cisconso.get_data** *(datastore, path)*

Get the configuration of the device tree at the given path

**Parameters**

- **datastore** *(DatastoreType (str enum).)* -- The datastore, e.g. running, operational. One of the NETCONF store IETF types
- **path** *(list, str OR tuple)* -- The device path to set the value at, a list of element names in order, / separated

**Returns** The network configuration at that tree

**Return type** *dict*

```
salt cisco-nso cisconso.get_data running 'devices/ex0'
```

**salt.modules.cisconso.get_rollback** *(name)*

Get the backup of stored a configuration rollback

**Parameters** **name** *(str)* -- Typically an ID of the backup

**Return type** *str*

**Returns** the contents of the rollback snapshot

```
salt cisco-nso cisconso.get_rollback 52
```

**salt.modules.cisconso.get_rollbacks** *

Get a list of stored configuration rollbacks

```
salt cisco-nso cisconso.get_rollbacks
```

**salt.modules.cisconso.info** *

Return system information for grains of the NSO proxy minion

```
salt '*'* cisconso.info
```

**salt.modules.cisconso.set_data_value** *(datastore, path, data)*

Get a data entry in a datastore

**Parameters**

- **datastore** *(DatastoreType (str enum).)* -- The datastore, e.g. running, operational. One of the NETCONF store IETF types
• **path** (list, str OR tuple) -- The device path to set the value at, a list of element names in order, / separated
• **data** (dict) -- The new value at the given path

Return type  bool
Returns  True if successful, otherwise error.

```
salt cisco-nso cisconso.set_data_value running 'devices/ex0/routes' 10.0.0.20/24
```

### 19.9.71 salt.modules.cloud

Salt-specific interface for calling Salt Cloud directly

**salt.modules.cloud.action** *(fun=None, cloudmap=None, names=None, provider=None, instance=None, **kwargs)*

Execute a single action on the given provider/instance

CLI Example:

```
salt minionname cloud.action start instance=myinstance
salt minionname cloud.action stop instance=myinstance
salt minionname cloud.action show_image provider=my-ec2-config image=ami-1624987f
```

**salt.modules.cloud.create** *(provider, names, opts=None, **kwargs)*

Create an instance using Salt Cloud

CLI Example:

```
salt minionname cloud.create my-ec2-config myinstance image=ami-1624987f size='t1.micro' ssh_username=ec2-user securitygroup=default delvol_on_destroy=True
```

**salt.modules.cloud.destroy** *(names)*

Destroy the named VM(s)

CLI Example:

```
salt minionname cloud.destroy myinstance
```

**salt.modules.cloud.full_query** *(query_type='list_nodes_full')*

List all available cloud provider data

CLI Example:

```
salt minionname cloud.full_query
```

**salt.modules.cloud.get_instance** *(name, provider=None)*

Return details on an instance.

Similar to the cloud action show_instance but returns only the instance details.

CLI Example:

```
salt minionname cloud.get_instance myinstance
```

SLS Example:

```
{{ salt['cloud.get_instance']('myinstance')['mac_address'] }}
```
salt.modules.cloud.has_instance(name, provider=None)
Return true if the instance is found on a provider

CLI Example:
```
salt minionname cloud.has_instance myinstance
```

salt.modules.cloud.list_images(provider='all')
List cloud provider images for the given providers

CLI Example:
```
salt minionname cloud.list_images my-gce-config
```

salt.modules.cloud.list_locations(provider='all')
List cloud provider locations for the given providers

CLI Example:
```
salt minionname cloud.list_locations my-gce-config
```

salt.modules.cloud.list_sizes(provider='all')
List cloud provider sizes for the given providers

CLI Example:
```
salt minionname cloud.list_sizes my-gce-config
```

salt.modules.cloud.map_run(path=None, **kwargs)
Execute a salt cloud map file

CLI Examples:
```
salt minionname cloud.map_run /path/to/cloud.map
salt minionname cloud.map_run map_data='<actual map data>'
```

salt.modules.cloud.network_create(provider, names, **kwargs)
Create private network

CLI Example:
```
salt minionname cloud.network_create my-nova names=['salt'] cidr='192.168.100.0/24'
```

salt.modules.cloud.network_list(provider)
List private networks

CLI Example:
```
salt minionname cloud.network_list my-nova
```

salt.modules.cloud.profile_(profile, names, vm_overrides=None, opts=None, **kwargs)
Spin up an instance using Salt Cloud

CLI Example:
```
salt minionname cloud.profile my-gce-config myinstance
```

salt.modules.cloud.query(query_type='list_nodes')
List cloud provider data for all providers
CLI Examples:

```bash
salt minionname cloud.query
salt minionname cloud.query list_nodes_full
salt minionname cloud.query list_nodes_select
```

```python
salt.modules.cloud.select_query(query_type='list_nodes_select')
```

List selected nodes

CLI Example:

```bash
salt minionname cloud.select_query
```

```python
salt.modules.cloud.virtual_interface_create(provider, names, **kwargs)
```

Attach private interfaces to a server

CLI Example:

```bash
salt minionname cloud.virtual_interface_create my-nova names=['salt-master'] net_listener_name='salt'
```

```python
salt.modules.cloud.virtual_interface_list(provider, names, **kwargs)
```

List virtual interfaces on a server

CLI Example:

```bash
salt minionname cloud.virtual_interface_list my-nova names=['salt-master']
```

```python
salt.modules.cloud.volume_attach(provider, names, **kwargs)
```

Attach volume to a server

CLI Example:

```bash
salt minionname cloud.volume_attach my-nova myblock server_name=myserver device='/dev/xvdf'
```

```python
salt.modules.cloud.volume_create(provider, names, **kwargs)
```

Create volume

CLI Example:

```bash
salt minionname cloud.volume_create my-nova myblock size=100 voltype=SSD
```

```python
salt.modules.cloud.volume_delete(provider, names, **kwargs)
```

Delete volume

CLI Example:

```bash
salt minionname cloud.volume_delete my-nova myblock
```

```python
salt.modules.cloud.volume_detach(provider, names, **kwargs)
```

Detach volume from a server

CLI Example:

```bash
salt minionname cloud.volume_detach my-nova myblock server_name=myserver
```

```python
salt.modules.cloud.volume_list(provider)
```

List block storage volumes

CLI Example:
salt minionname cloud.volume_list my-nova

**19.9.72 salt.modules.cmdmod**

A module for shelling out.

Keep in mind that this module is insecure, in that it can give whomever has access to the master root execution access to all salt minions.

```python
class cmd:
    def exec_code(self, lang, code, cwd=None):
        pass
```

Pass in two strings, the first naming the executable language, aka - python2, python3, ruby, perl, lua, etc. the second string containing the code you wish to execute. The stdout will be returned.

CLI Example:

```bash
salt '*' cmd.exec_code ruby "puts "cheese""
```

```python
class cmd:
    def exec_code_all(self, lang, code, cwd=None):
        pass
```

Pass in two strings, the first naming the executable language, aka - python2, python3, ruby, perl, lua, etc. the second string containing the code you wish to execute. All cmd artifacts (stdout, stderr, retcode, pid) will be returned.

CLI Example:

```bash
salt '*' cmd.exec_code_all ruby "puts "cheese""
```

```python
class cmd:
    def has_exec(self, cmd):
        pass
```

Returns true if the executable is available on the minion, false otherwise

CLI Example:

```bash
salt '*' cmd.has_exec cat
```

```python
class cmd:
    def powershell(self, cmd, cwd=None, stdin=None, runas=None, shell='/bin/sh',
                   env=None, clean_env=False, template=None, rstrip=True,
                   umask=None, output_loglevel='debug', quiet=False,
                   timeout=None, reset_system_locale=True, ignore_retcode=False,
                   saltenv='base', use_vt=False, password=None, depth=None,
                   encode_cmd=False, **kwargs)
```

Execute the passed PowerShell command and return the output as a dictionary.

Other cmd.* functions return the raw text output of the command. This function appends | ConvertTo-JSON to the command and then parses the JSON into a Python dictionary. If you want the raw textual result of your PowerShell command you should use cmd.run with the shell=powershell option.

For example:

```bash
salt '*' cmd.run 'Get-NetTCPConnection' shell=powershell
salt '*' cmd.run 'Get-NetTCPConnection' shell=powershell
```

New in version 2016.3.0.

**Warning:** This passes the cmd argument directly to PowerShell without any further processing! Be absolutely sure that you have properly sanitized the command passed to this function and do not use untrusted inputs.
Note that `env` represents the environment variables for the command, and should be formatted as a dict, or a YAML string which resolves to a dict.

In addition to the normal `cmd.run` parameters, this command offers the `depth` parameter to change the Windows default depth for the `ConvertTo-JSON` powershell command. The Windows default is 2. If you need more depth, set that here.

**Note:** For some commands, setting the depth to a value greater than 4 greatly increases the time it takes for the command to return and in many cases returns useless data.

### Parameters

- **cmd (str)** -- The powershell command to run.
- **cwd (str)** -- The current working directory to execute the command in. Defaults to the home directory of the user specified by `runas`.
- **stdin (str)** -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas (str)** -- User to run command as. If running on a Windows minion you must also pass a password. The target user account must be in the Administrators group.
- **password (str)** -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.
  
  New in version 2016.3.0.
- **shell (str)** -- Shell to execute under. Defaults to the system default shell.
- **python_shell (bool)** -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.
- **env (list)** -- A list of environment variables to be set prior to execution.

  Example:

  ```
  salt://scripts/foo.sh:
  cmd.script:
    env:
    - BATCH: 'yes'
  ```

  **Warning:** The above illustrates a common PyYAML pitfall, that `yes`, `no`, `on`, `off`, `true`, and `false` are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

  Variables as values are not evaluated. So `$PATH` in the following example is a literal `$PATH`:

  ```
  salt://scripts/bar.sh:
  cmd.script:
    env: "PATH=/some/path:$PATH"
  ```

  One can still use the existing `$PATH` by using a bit of Jinja:
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':') }}

- clean_env (bool) -- Attempt to clean out all other shell environment variables and set only those provided in the `env` argument to this function.
- template (str) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.
- rstrip (bool) -- Strip all whitespace off the end of output before it is returned.
- umask (str) -- The umask (in octal) to use when running the command.
- output_loglevel (str) -- Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: DEBUG) regardless, unless quiet is used for this value.
- timeout (int) -- A timeout in seconds for the executed process to return.
- use_vt (bool) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.
- reset_system_locale (bool) -- Resets the system locale.
- ignore_retcode (bool) -- Ignore the return code.
- saltenv (str) -- The salt environment to use. Default is `base`.
- depth (int) -- The number of levels of contained objects to be included. Default is 2. Values greater than 4 seem to greatly increase the time it takes for the command to complete for some commands. eg: `dir`
  New in version 2016.3.4.
- encode_cmd (bool) -- Encode the command before executing. Use in cases where characters may be dropped or incorrectly converted when executed. Default is False.

Returns
dict A dictionary of data returned by the powershell command.

CLI Example:

```
salt '*' cmd.powershell "$PSVersionTable.CLRVersion"
```

salt.modules.cmdmod.retcodestrue (cmd, cwd=None, stdin=None, runas=None, shell='/bin/sh', python_shell=None, env=None, clean_env=False, template=None, umask=None, output_loglevel='debug', log_callback=None, timeout=None, reset_system_locale=True, ignore_retcode=False, saltenv='base', use_vt=False, password=None, **kwargs)

Execute a shell command and return the command's return code.

Parameters
- cmd (str) -- The command to run. ex: `ls -lart /home`
• **cwd (str)** -- The current working directory to execute the command in. Defaults to the home directory of the user specified by `runas`.

• **stdin (str)** -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.:

• **runas (str)** -- User to run command as. If running on a Windows minion you must also pass a password. The target user account must be in the Administrators group.

• **password (str)** -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.0.

• **shell (str)** -- Shell to execute under. Defaults to the system default shell.

• **python_shell (bool)** -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection

• **env (list)** -- A list of environment variables to be set prior to execution.

Example:

```yaml
salt://scripts/foo.sh:
  cmd.script:
    - env:
      - BATCH: 'yes'
```

Warning: The above illustrates a common PyYAML pitfall, that `yes`, `no`, `on`, `off`, `true`, and `false` are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So `$PATH` in the following example is a literal `'$PATH'`:

```yaml
salt://scripts/bar.sh:
  cmd.script:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing `PATH` by using a bit of Jinja:

```yaml
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

• **clean_env (bool)** -- Attempt to clean out all other shell environment variables and set only those provided in the `env` argument to this function.

• **template (str)** -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported
- **rstrip** *(bool)* -- Strip all whitespace off the end of output before it is returned.
- **umask** *(str)* -- The umask (in octal) to use when running the command.
- **output_loglevel** *(str)* -- Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: DEBUG) regardless, unless `quiet` is used for this value.
- **timeout** *(int)* -- A timeout in seconds for the executed process to return.
- **use_vt** *(bool)* -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

**Note:** env represents the environment variables for the command, and should be formatted as a dict, or a YAML string which resolves to a dict.

**Return type** int

**Return type** None

**Returns** Return Code as an int or None if there was an exception.

**CLI Example:**

```bash
salt '*' cmd.retcode "file /bin/bash"
```

The template arg can be set to `jinjaa` or another supported template engine to render the command arguments before execution. For example:

```bash
salt '*' cmd.retcode template=jinja "file {{grains.pythonpath[0]}}/python"
```

A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input:

```bash
salt '*' cmd.retcode "grep f" stdin='one
two
three
four
five
'
```

salt.modules.cmdmod.run(cmd, cwd=None, stdin=None, runas=None, shell="/bin/sh", python_shell=None, env=None, clean_env=False, template=None, rstrip=True, umask=None, output_loglevel='debug', log_callback=None, timeout=None, reset_system_locale=True, ignore_retcode=False, saltenv='base', use_vt=False, bg=False, password=None, encoded_cmd=False, **kwargs)

Execute the passed command and return the output as a string.

Note that env represents the environment variables for the command, and should be formatted as a dict, or a YAML string which resolves to a dict.

**Parameters**

- **cmd** *(str)* -- The command to run. ex: `ls -lart /home`
- **cwd** *(str)* -- The current working directory to execute the command in. Defaults to the home directory of the user specified by `runas`.
- **stdin** *(str)* -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas** *(str)* -- User to run command as. If running on a Windows minion you must also pass a password. The target user account must be in the Administrators group.
• **password** *(str)* -- Windows only. Required when specifying runas. This parameter will be ignored on non-Windows platforms.

   New in version 2016.3.0.

• **shell** *(str)* -- Shell to execute under. Defaults to the system default shell.

• **python_shell** *(bool)* -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.

• **bg** *(bool)* -- If True, run command in background and do not await or deliver it's results

   New in version 2016.3.0.

• **env** *(list)* -- A list of environment variables to be set prior to execution.

   Example:

   ```
   salt://scripts/foo.sh:
   cmd.script:
   - env:
     - BATCH: 'yes'
   ```

   **Warning:** The above illustrates a common PyYAML pitfall, that *yes*, *no*, *on*, *off*, *true*, and *false* are all loaded as boolean *True* and *False* values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

   Variables as values are not evaluated. So `$PATH` in the following example is a literal `'$PATH'`:

   ```
   salt://scripts/bar.sh:
   cmd.script:
   - env: "PATH=/some/path:$PATH"
   ```

   One can still use the existing $PATH by using a bit of Jinja:

   ```
   {% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}
   
   mycommand:
   cmd.run:
   - name: ls -l /
   - env:
     - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
   ```

• **clean_env** *(bool)* -- Attempt to clean out all other shell environment variables and set only those provided in the `env` argument to this function.

• **template** *(str)* -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported

• **rstrip** *(bool)* -- Strip all whitespace off the end of output before it is returned.

• **umask** *(str)* -- The umask (in octal) to use when running the command.
- **output_loglevel** *(str)* -- Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: DEBUG) regardless, unless quiet is used for this value.

- **timeout** *(int)* -- A timeout in seconds for the executed process to return.

- **use_vt** *(bool)* -- Use VT util (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

- **encoded_cmd** *(bool)* -- Specify if the supplied command is encoded. Only applies to shell 'powershell'.

**Warning:** This function does not process commands through a shell unless the python_shell flag is set to True. This means that any shell-specific functionality such as `echo` or the use of pipes, redirection or &&, should either be migrated to cmd.shell or have the python_shell=True flag set here.

The use of python_shell=True means that the shell will accept _any_ input including potentially malicious commands such as `good_command;rm -rf /`. Be absolutely certain that you have sanitized your input prior to using python_shell=True

CLI Example:

```bash
salt '*' cmd.run "ls -l | awk '/foo/{print $2}""
```

The template arg can be set to `jinja` or another supported template engine to render the command arguments before execution. For example:

```bash
salt '*' cmd.run template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/{print $2}\n""
```

Specify an alternate shell with the shell parameter:

```bash
salt '*' cmd.run "Get-ChildItem C:\ " shell='powershell'
```

A string of standard input can be specified for the command to be run using the stdin parameter. This can be useful in cases where sensitive information must be read from standard input:

```bash
salt '*' cmd.run "grep f" stdin='one\ntwo\nthree\nfour\nfive\n'
```

If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format key=val. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```bash
salt '*' cmd.run cmd='sed -e s/=/:/g'
```

salt.modules.cmdmod.run_all(cmd, cwd=None, stdin=None, runas=None, shell='/bin/sh', python_shell=None, env=None, clean_env=False, template=None, rstrip=True, umask=None, output_loglevel='debug', log_callback=None, timeout=None, reset_system_locale=True, ignore_retcode=False, saltenv='base', use_vt=False, redirect_stderr=False, password=None, **kwargs)

Execute the passed command and return a dict of return data:

Parameters

- **cmd** *(str)* -- The command to run. ex: `ls -lart /home`

- **cwd** *(str)* -- The current working directory to execute the command in. Defaults to the home directory of the user specified by runas.
- **stdin** *(str)* -- A string of standard input can be specified for the command to be run using the stdin parameter. This can be useful in cases where sensitive information must be read from standard input.

- **runas** *(str)* -- User to run command as. If running on a Windows minion you must also pass a password. The target user account must be in the Administrators group.

- **password** *(str)* -- Windows only. Required when specifying runas. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.

- **shell** *(str)* -- Shell to execute under. Defaults to the system default shell.

- **python_shell** *(bool)* -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection

- **env** *(list)* -- A list of environment variables to be set prior to execution.

  Example:

  ```
salt://scripts/foo.sh:
  cmd.script:
  - env:
    - BATCH: 'yes'
  ```

  **Warning:** The above illustrates a common PyYAML pitfall, that *yes*, *no*, *on*, *off*, *true*, and *false* are all loaded as boolean *True* and *False* values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

  Variables as values are not evaluated. So **PATH** in the following example is a literal `$PATH`:

  ```
salt://scripts/bar.sh:
  cmd.script:
  - env: "PATH=/some/path:$PATH"
  ```

  One can still use the existing **PATH** by using a bit of Jinja:

  ```
  {% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}
  
  mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
  ```

- **clean_env** *(bool)* -- Attempt to clean out all other shell environment variables and set only those provided in the `env` argument to this function.

- **template** *(str)* -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported

- **rstrip** *(bool)* -- Strip all whitespace off the end of output before it is returned.

- **umask** *(str)* -- The umask (in octal) to use when running the command.
- **output_loglevel** (**str**) -- Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: DEBU) regardless, unless `quiet` is used for this value.

- **timeout** (**int**) -- A timeout in seconds for the executed process to return.

- **use_vt** (**bool**) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

**Note:** env represents the environment variables for the command, and should be formatted as a dict, or a YAML string which resolves to a dict.

### Parameters

- **redirect_stderr** (**bool**) -- If set to True, then stderr will be redirected to stdout. This is helpful for cases where obtaining both the retcode and output is desired, but it is not desired to have the output separated into both stdout and stderr.

  New in version 2015.8.2.

- **password** (**str**) -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.

- **bg** (**bool**) -- If True, run command in background and do not await or deliver it's results.

  New in version 2016.3.6.

**CLI Example:**

```bash
cmd.run_all "ls -l | awk '/foo/{print \$2}"
```

The template arg can be set to `jinja` or another supported template engine to render the command arguments before execution. For example:

```bash
cmd.run_all template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/{print \n!$2}"
```

A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input:

```bash
cmd.run_all "grep f" stdin='one\ntwo\nthree\nfour\nfive'
```

**salt.modules.cmdmod.run_bg**

```python
cmd, cwd=None, runas=None, shell='/bin/sh', python_shell=None, 
env=None, clean_env=False, template=None, umask=None, 
timeout=None, output_loglevel='debug', log_callback=None, 
reset_system_locale=True, saltenv='base', password=None, **kwargs)
```

Execute the passed command in the background and return it's PID.

**Note:** If the init system is systemd and the backgrounded task should run even if the salt-minion process is restarted, prepend `systemd-run` to the command. This will reparent the process in its own scope separate from salt-minion, and will not be affected by restarting the minion service.

### Parameters
• **cmd** *(str)* -- The command to run. ex: `ls -lart /home`

• **cwd** *(str)* -- The current working directory to execute the command in. Defaults to the home directory of the user specified by `runas`.

• **output_loglevel** *(str)* -- Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: DEBUG) regardless, unless `quiet` is used for this value.

• **runas** *(str)* -- User to run command as. If running on a Windows minion you must also pass a password. The target user account must be in the Administrators group.

• **password** *(str)* -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.

• **shell** *(str)* -- Shell to execute under. Defaults to the system default shell.

• **python_shell** *(bool)* -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection

• **env** *(list)* -- A list of environment variables to be set prior to execution.

  Example:

  ```yaml
  salt://scripts/foo.sh:
  cmd.script:
  - env:
    - BATCH: 'yes'
  ```

**Warning:** The above illustrates a common PyYAML pitfall, that `yes`, `no`, `on`, `off`, `true`, and `false` are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So `$PATH` in the following example is a literal `$PATH`:

```yaml
salt://scripts/bar.sh:
cmd.script:
- env: "PATH=/some/path:$PATH"
```

One can still use the existing `$PATH` by using a bit of Jinja:

```yaml
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
  cmd.run:
  - name: ls -l /
  - env:
    - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

• **clean_env** *(bool)* -- Attempt to clean out all other shell environment variables and set only those provided in the `env` argument to this function.
• **template** *(str)* -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported

• **umask** *(str)* -- The umask (in octal) to use when running the command.

• **timeout** *(int)* -- A timeout in seconds for the executed process to return.

---

**Warning:** This function does not process commands through a shell unless the python_shell flag is set to True. This means that any shell-specific functionality such as `echo` or the use of pipes, redirection or `&&`, should either be migrated to cmd.shell or have the python_shell=True flag set here.

The use of python_shell=True means that the shell will accept any input including potentially malicious commands such as `good_command;rm -rf /`. Be absolutely certain that you have sanitized your input prior to using python_shell=True

CLI Example:

```bash
salt '*' cmd.run_bg "fstrim-all"
```

The template arg can be set to `jinja` or another supported template engine to render the command arguments before execution. For example:

```bash
salt '*' cmd.run_bg template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/{print $2}'"
```

Specify an alternate shell with the shell parameter:

```bash
salt '*' cmd.run_bg "Get-ChildItem C:\ " shell='powershell'
```

If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format key=val. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```bash
salt '*' cmd.run_bg cmd='ls -lR / | sed -e s/=/:/g > /tmp/dontwait'
```

---

`salt.modules.cmdmod.run_chroot(root, cmd, cwd=None, stdin=None, runas=None, shell='/bin/sh', python_shell=True, env=None, clean_env=False, template=None, rstrip=True, umask=None, output_loglevel='quiet', log_callback=None, quiet=False, timeout=None, reset_system_locale=True, ignore_retcode=False, saltenv='base', use_vt=False, bg=False, **kwargs)`

New in version 2014.7.0.

This function runs `cmd.run_all` wrapped within a chroot, with dev and proc mounted in the chroot.

- **root** Path to the root of the jail to use.
- **cmd** The command to run. ex: `ls -lart /home`
- **cwd** The current working directory to execute the command in. defaults to /root
- **stdin** A string of standard input can be specified for the command to be run using the stdin parameter. This can be useful in cases where sensitive information must be read from standard input:
- **runas** User to run script as.
- **shell** Shell to execute under. Defaults to the system default shell.
- **python_shell** If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection
- **env** A list of environment variables to be set prior to execution. Example:
Variables as values are not evaluated. So $PATH in the following example is a literal `$PATH':

```
salt://scripts/bar.sh:
  cmd.script:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing $PATH by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}
mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

**clean_env:** Attempt to clean out all other shell environment variables and set only those provided in the `env` argument to this function.

**template** If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wepmy are supported

**rstrip** Strip all whitespace off the end of output before it is returned.

**umask** The umask (in octal) to use when running the command.

**output_loglevel** Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: DEBUG) regardless, unless `quiet` is used for this value.

**timeout** A timeout in seconds for the executed process to return.

**use_vt** Use VT utils (saltstack) to stream the command output more interactively to the console and the logs.

This is experimental.

**CLI Example:**

```
salt '*' cmd.run_chroot /var/lib/lxc/container_name/rootfs 'sh /tmp/bootstrap.sh'
```

salt.modules.cmdmod.run_stderr(cmd, cwd=None, stdin=None, runas=None, shell='/bin/sh',
    python_shell=None, env=None, clean_env=False, template=None, rstrip=True, umask=None, output_loglevel='debug',
    log_callback=None, timeout=None, reset_system_locale=True, ignore_retcode=False, saltenv='base', use_vt=False, password=None, **kwargs)

Execute a command and only return the standard error

**Parameters**

- **cmd**(str) -- The command to run. ex: 'ls -lart /home'
• **cwd** *(str)* -- The current working directory to execute the command in. Defaults to the home directory of the user specified by runas.

• **stdin** *(str)* -- A string of standard input can be specified for the command to be run using the stdin parameter. This can be useful in cases where sensitive information must be read from standard input:

• **runas** *(str)* -- User to run command as. If running on a Windows minion you must also pass a password. The target user account must be in the Administrators group.

• **password** *(str)* -- Windows only. Required when specifying runas. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.0.

• **shell** *(str)* -- Shell to execute under. Defaults to the system default shell.

• **python_shell** *(bool)* -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection

• **env** *(list)* -- A list of environment variables to be set prior to execution.

Example:

```yaml
salt://scripts/foo.sh:
  cmd.script:
    - env:
      - BATCH: 'yes'
```

**Warning**: The above illustrates a common PyYAML pitfall, that yes, no, on, off, true, and false are all loaded as boolean True and False values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found here.

Variables as values are not evaluated. So $PATH in the following example is a literal `$PATH`:

```yaml
salt://scripts/bar.sh:
  cmd.script:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing $PATH by using a bit of Jinja:

```python
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

• **clean_env** *(bool)* -- Attempt to clean out all other shell environment variables and set only those provided in the `env` argument to this function.

• **template** *(str)* -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported
- **rstrip**(bool) -- Strip all whitespace off the end of output before it is returned.
- **umask**(str) -- The umask (in octal) to use when running the command.
- **output_loglevel**(str) -- Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: DEBUG) regardless, unless **quiet** is used for this value.
- **timeout**(int) -- A timeout in seconds for the executed process to return.
- **use_vt**(bool) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

**Note:** *env* represents the environment variables for the command, and should be formatted as a dict, or a YAML string which resolves to a dict.

**CLI Example:**
```
salt '*' cmd.run_stderr "ls -l | awk '/foo/{print $2}"
```

The template arg can be set to `jinja` or another supported template engine to render the command arguments before execution. For example:
```
salt '*' cmd.run_stderr template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/ \
{{print $2}}"
```

A string of standard input can be specified for the command to be run using the **stdin** parameter. This can be useful in cases where sensitive information must be read from standard input:
```
salt '*' cmd.run_stderr "grep f" stdin='one
two
three
four
five
'
```

**salt.modules.cmdmod.run_stdout**(cmd, cwd=None, stdin=None, runas=None, shell='/bin/sh', python_shell=None, env=None, clean_env=False, template=None, rstrip=True, umask=None, output_loglevel='debug', log_callback=None, timeout=None, reset_system_locale=True, ignore_retcode=False, saltenv='base', use_vt=False, password=None, **kwargs)

Execute a command, and only return the standard out

**Parameters**
- **cmd**(str) -- The command to run. ex: `ls -lart /home`
- **cwd**(str) -- The current working directory to execute the command in. Defaults to the home directory of the user specified by runas.
- **stdin**(str) -- A string of standard input can be specified for the command to be run using the **stdin** parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas**(str) -- User to run command as. If running on a Windows minion you must also pass a password. The target user account must be in the Administrators group.
- **password**(str) -- Windows only. Required when specifying runas. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.0.
- **shell**(str) -- Shell to execute under. Defaults to the system default shell.
- **python_shell**(bool) -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.
- **env (list)** -- A list of environment variables to be set prior to execution.

  Example:

  ```
salt://scripts/foo.sh:
  cmd.script:
    - env:
      - BATCH: 'yes'
  ```

  **Warning:** The above illustrates a common PyYAML pitfall, that `yes`, `no`, `on`, `off`, `true`, and `false` are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

  Variables as values are not evaluated. So `$PATH` in the following example is a literal `$PATH`:

  ```
salt://scripts/bar.sh:
  cmd.script:
    - env: "PATH=/some/path:$PATH"
  ```

  One can still use the existing `$PATH` by using a bit of Jinja:

  ```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}
mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ current_path, '/my/special/bin' }}|join(':')
  ```

- **clean_env (bool)** -- Attempt to clean out all other shell environment variables and set only those provided in the `env` argument to this function.

- **template (str)** -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported

- **rstrip (bool)** -- Strip all whitespace off the end of output before it is returned.

- **umask (str)** -- The umask (in octal) to use when running the command.

- **output_loglevel (str)** -- Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: DEBUG) regardless, unless `quiet` is used for this value.

- **timeout (int)** -- A timeout in seconds for the executed process to return.

- **use_vt (bool)** -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

**Note:** `env` represents the environment variables for the command, and should be formatted as a dict, or a YAML string which resolves to a dict.

CLI Example:
salt '*/' cmd.run_stdout "ls -l | awk '/foo/{print \$2}'"

The template arg can be set to `jinja` or another supported template engine to render the command arguments before execution. For example:

salt '*/' cmd.run_stdout template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/\n
A string of standard input can be specified for the command to be run using the stdin parameter. This can be useful in cases where sensitive information must be read from standard input:

salt '*/' cmd.run_stdout "grep f stdin='one\ntwo\nthree\nfour\nfive\n"

salt.modules.cmdmod.script(source, args=None, cwd=None, stdin=None, runas=None, shell='/bin/sh', python_shell=None, env=None, template=None, umask=None, output_loglevel='debug', log_callback=None, quiet=False, timeout=None, reset_system_locale=True, saltenv='base', use_vt=False, bg=False, password=None, **kwargs)

Download a script from a remote location and execute the script locally. The script can be located on the salt master file server or on an HTTP/FTP server.

The script will be executed directly, so it can be written in any available programming language.

Parameters

- **source (str)** -- The location of the script to download. If the file is located on the master in the directory named spam, and is called eggs, the source string is `salt://spam/eggs`
- **args (str)** -- String of command line args to pass to the script. Only used if no args are specified as part of the name argument. To pass a string containing spaces in YAML, you will need to doubly-quote it: `arg1 'arg two' arg3`
- **cwd (str)** -- The current working directory to execute the command in. Defaults to the home directory of the user specified by runas.
- **stdin (str)** -- A string of standard input can be specified for the command to be run using the stdin parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas (str)** -- User to run script as. If running on a Windows minion you must also pass a password. The target user account must be in the Administrators group.
- **password (str)** -- Windows only. Required when specifying runas. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.0.
- **shell (str)** -- Shell to execute under. Defaults to the system default shell.
- **python_shell (bool)** -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection
- **bg (bool)** -- If True, run script in background and do not await or deliver it’s results
- **env (list)** -- A list of environment variables to be set prior to execution.

Example:

salt://scripts/foo.sh:

    cmd.script:
- env:
  - BATCH: 'yes'

**Warning:** The above illustrates a common PyYAML pitfall, that yes, no, on, off, true, and false are all loaded as boolean True and False values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So $PATH in the following example is a literal `$PATH':

```
salt://scripts/bar.sh:
  cmd.script:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing $PATH by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin'] | join(':') }}
```

- **template**(str) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported
- **umask**(str) -- The umask (in octal) to use when running the command.
- **output_loglevel**(str) -- Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: DEBUG) regardless, unless quiet is used for this value.
- **quiet**(bool) -- The command will be executed quietly, meaning no log entries of the actual command or its return data. This is deprecated as of the 2014.1.0 release, and is being replaced with output_loglevel: quiet.
- **timeout**(int) -- If the command has not terminated after timeout seconds, send the subprocess sigterm, and if sigterm is ignored, follow up with sigkill
- **use_vt**(bool) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

CLI Example:

```
salt '*' cmd.script salt://scripts/runme.sh
salt '*' cmd.script salt://scripts/runme.sh 'arg1 arg2 "arg 3"'
salt '*' cmd.script salt://scripts/windows_task.ps1 args=' -Input c:\tmp\infile.'
shell='powershell'
```

```
salt '*' cmd.script salt://scripts/runme.sh stdin='one\ntwo\nthree\nfour\nfive\n'
```
Download a script from a remote location and execute the script locally. The script can be located on the salt master file server or on an HTTP/FTP server.

The script will be executed directly, so it can be written in any available programming language.

The script can also be formatted as a template, the default is jinja.

Only evaluate the script return code and do not block for terminal output

**Parameters**

- **source** *(str)* -- The location of the script to download. If the file is located on the master in the directory named spam, and is called eggs, the source string is `salt://spam/eggs`

- **args** *(str)* -- String of command line args to pass to the script. Only used if no args are specified as part of the `name` argument. To pass a string containing spaces in YAML, you will need to doubly-quote it: ```arg1 `arg two' arg3```

- **cwd** *(str)* -- The current working directory to execute the command in. Defaults to the home directory of the user specified by `runas`.

- **stdin** *(str)* -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input:

- **runas** *(str)* -- User to run script as. If running on a Windows minion you must also pass a password. The target user account must be in the Administrators group.

- **password** *(str)* -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.

- **shell** *(str)* -- Shell to execute under. Defaults to the system default shell.

- **python_shell** *(bool)* -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection

- **env** *(list)* -- A list of environment variables to be set prior to execution.

Example:

```yaml
salt://scripts/foo.sh:
  cmd.script:
    - env:
      - BATCH: 'yes'
```

**Warning:** The above illustrates a common PyYAML pitfall, that `yes`, `no`, `on`, `off`, `true`, and `false` are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So `$PATH` in the following example is a literal `'$PATH'`:
salt://scripts/bar.sh:
  cmd.script:
    - env: "PATH=/some/path:$PATH"

One can still use the existing $PATH by using a bit of Jinja:

```jinja
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}
```

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':') }}

- **template**(str) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported

- **umask**(str) -- The umask (in octal) to use when running the command.

- **output_loglevel**(str) -- Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: DEBUG) regardless, unless quiet is used for this value.

- **quiet**(bool) -- The command will be executed quietly, meaning no log entries of the actual command or its return data. This is deprecated as of the 2014.1.0 release, and is being replaced with output_loglevel: quiet.

- **timeout**(int) -- If the command has not terminated after timeout seconds, send the subprocess sigterm, and if sigterm is ignored, follow up with sigkill

- **use_vt**(bool) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

CLI Example:

```bash
salt '*' cmd.script_retcode salt://scripts/runme.sh
salt '*' cmd.script_retcode salt://scripts/runme.sh 'arg1 arg2 "arg 3"'
salt '*' cmd.script_retcode salt://scripts/windows_task.ps1 args='-Input c:
  \tmp\infile.txt' shell='powershell'
```

A string of standard input can be specified for the command to be run using the stdin parameter. This can be useful in cases where sensitive information must be read from standard input:

```bash
salt '*' cmd.script_retcode salt://scripts/runme.sh stdin=
  'one\ntwo\nthree\nfour\nfive\n'
```

salt.modules.cmdmod.shell(cmd, cwd=None, stdin=None, runas=None, shell='/bin/sh', env=None, clean_env=False, template=None, rstrip=True, umask=None, output_loglevel='debug', log_callback=None, quiet=False, timeout=None, reset_system_locale=True, ignore_retcode=False, saltenv='base', use_vt=False, bg=False, password=None, **kwargs)

Execute the passed command and return the output as a string.

New in version 2015.5.0.

Parameters

- **cmd**(str) -- The command to run. ex: 'ls -lart /home'
• `cwd` (`str`) -- The current working directory to execute the command in. Defaults to the home directory of the user specified by `runas`.

• `stdin` (`str`) -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.

• `runas` (`str`) -- User to run command as. If running on a Windows minion you must also pass a password. The target user account must be in the Administrators group.

• `password` (`str`) -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.0.

• `shell` (`int`) -- Shell to execute under. Defaults to the system default shell.

• `bg` (`bool`) -- If True, run command in background and do not await or deliver its results.

• `env` (`list`) -- A list of environment variables to be set prior to execution.

Example:

```
salt://scripts/foo.sh:
  cmd.script:
    - env:
      - BATCH: 'yes'
```

**Warning:** The above illustrates a common PyYAML pitfall, that `yes`, `no`, `on`, `off`, `true`, and `false` are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So `$PATH` in the following example is a literal `$PATH`:

```
salt://scripts/bar.sh:
  cmd.script:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing `$PATH` by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

• `clean_env` (`bool`) -- Attempt to clean out all other shell environment variables and set only those provided in the `env` argument to this function.

• `template` (`str`) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.
• **rstrip** (*bool*) -- Strip all whitespace off the end of output before it is returned.

• **umask** (*str*) -- The umask (in octal) to use when running the command.

• **output_loglevel** (*str*) -- Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: DEBUG) regardless, unless **quiet** is used for this value.

• **timeout** (*int*) -- A timeout in seconds for the executed process to return.

• **use_vt** (*bool*) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

**Warning:** This passes the cmd argument directly to the shell without any further processing! Be absolutely sure that you have properly sanitized the command passed to this function and do not use untrusted inputs.

**Note:** env represents the environment variables for the command, and should be formatted as a dict, or a YAML string which resolves to a dict.

CLI Example:
```bash
salt '*' cmd.shell "ls -l | awk '/foo/{print $2}"
```

The template arg can be set to 'jinja' or another supported template engine to render the command arguments before execution. For example:
```bash
salt '*' cmd.shell template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/{print \n $2}"
```

Specify an alternate shell with the shell parameter:
```bash
salt '*' cmd.shell "Get-ChildItem C:\" shell='powershell'
```

A string of standard input can be specified for the command to be run using the stdin parameter. This can be useful in cases where sensitive information must be read from standard input:
```bash
salt '*' cmd.shell "grep f" stdin='one\ntwo\nthree\nfour\nfive\n'
```

If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format **key=val**. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:
```bash
salt '*' cmd.shell cmd='sed -e s/=/:/g'
```

**salt.modules.cmdmod.shell_info**(*shell, list_modules=False*)

New in version 2016.11.0.

Provides information about a shell or script languages which often use #!. The values returned are dependent on the shell or scripting languages all return the installed, path, version, version_raw

Parameters

• **shell** (*str*) -- Name of the shell. Support shells/script languages include

• **cmd, perl, php, powershell, python, ruby and zsh** (*bash,*)--

• **list_modules** (*bool*) -- True to list modules available to the shell.
only lists powershell modules. (Currently) --

Returns  A dictionary of information about the shell

Return type  dict

```python
{'version': '<2 or 3 numeric components dot-separated>',
'version_raw': '<full version string>',
'path': '<full path to binary>',
'installed': '<True, False or None>',
'<attribute>': '<attribute value>'}
```

Note:
- installed is always returned, if None or False also returns error and may also return stdout for diagnostics.
- version is for use in determine if a shell/script language has a particular feature set, not for package management.
- The shell must be within the executable search path.

CLI Example:
```bash
salt '*' cmd.shell_info bash
salt '*' cmd.shell_info powershell
```

Codeauthor  Damon Atkins <https://github.com/damon-atkins>

`salt.modules.cmdmod.shells()

Lists the valid shells on this system via the /etc/shells file

New in version 2015.5.0.

CLI Example:
```bash
salt '*' cmd.shells
```

`salt.modules.cmdmod.tty(device, echo='')

Echo a string to a specific tty

CLI Example:
```bash
salt '*' cmd.tty tty0 'This is a test'
salt '*' cmd.tty pts3 'This is a test'
```

`salt.modules.cmdmod.which(cmd)

Returns the path of an executable available on the minion, None otherwise

CLI Example:
```bash
salt '*' cmd.which cat
```

`salt.modules.cmdmod.which_bin(cmds)

Returns the first command found in a list of commands

CLI Example:
```bash
salt '*' cmd.which_bin ['[pip2, pip, pip-python]'
```
19.9.73 `salt.modules.composer`

Use composer to install PHP dependencies for a directory

```python
salt.modules.composer.did_composer_install(dir)
```

Test to see if the vendor directory exists in this directory

- **dir**: Directory location of the composer.json file

CLI Example:

```bash
salt '*' composer.did_composer_install /var/www/application
```

```python
salt.modules.composer.install(directory, composer=None, php=None, runas=None, prefer_source=None, prefer_dist=None, no_scripts=None, no_plugins=None, optimize=None, no_dev=No, quiet=False, composer_home='/root')
```

Install composer dependencies for a directory.

If composer has not been installed globally making it available in the system PATH & making it executable, the `composer` and `php` parameters will need to be set to the location of the executables.

- **directory**: Directory location of the composer.json file.
- **composer**: Location of the composer.phar file. If not set composer will just execute ``composer`` as if it is installed globally. (i.e. /path/to/composer.phar)
- **php**: Location of the php executable to use with composer. (i.e. /usr/bin/php)
- **runas**: Which system user to run composer as.
- **prefer_source**: --prefer-source option of composer.
- **prefer_dist**: --prefer-dist option of composer.
- **no_scripts**: --no-scripts option of composer.
- **no_plugins**: --no-plugins option of composer.
- **optimize**: --optimize-autoloader option of composer. Recommended for production.
- **no_dev**: --no-dev option for composer. Recommended for production.
- **quiet**: --quiet option for composer. Whether or not to return output from composer.
- **composer_home**: $COMPOSER_HOME environment variable

CLI Example:

```bash
salt '*' composer.install /var/www/application
salt '*' composer.install /var/www/application no_dev=True optimize=True
```

```python
salt.modules.composer.selfupdate(composer=None, php=None, runas=None, quiet=False, composer_home='/root')
```

Update composer itself.

If composer has not been installed globally making it available in the system PATH & making it executable, the `composer` and `php` parameters will need to be set to the location of the executables.

- **composer**: Location of the composer.phar file. If not set composer will just execute ``composer`` as if it is installed globally. (i.e. /path/to/composer.phar)
- **php**: Location of the php executable to use with composer. (i.e. /usr/bin/php)
- **runas**: Which system user to run composer as.
- **quiet**: --quiet option for composer. Whether or not to return output from composer.
- **composer_home**: $COMPOSER_HOME environment variable

CLI Example:

```bash
salt '*' composer.selfupdate
```
salt.modules.composer.update(directory, composer=None, php=None, runas=None, prefer_source=None, prefer_dist=None, no_scripts=None, no_plugins=None, optimize=None, no_dev=None, quiet=False, composer_home='/root')

Update composer dependencies for a directory.

If composer install has not yet been run, this runs composer install instead.

If composer has not been installed globally making it available in the system PATH & making it executable, the composer and php parameters will need to be set to the location of the executables.

directory Directory location of the composer.json file.
composer Location of the composer.phar file. If not set composer will just execute `composer` as if it is installed globally. (i.e. /path/to/composer.phar)
php Location of the php executable to use with composer. (i.e. /usr/bin/php)
runas Which system user to run composer as.
prefer_source --prefer-source option of composer.
prefer_dist --prefer-dist option of composer.
no_scripts --no-scripts option of composer.
no_plugins --no-plugins option of composer.
optimize --optimize-autoloader option of composer. Recommended for production.
no_dev --no-dev option for composer. Recommended for production.
quiet --quiet option for composer. Whether or not to return output from composer.
composer_home $COMPOSER_HOME environment variable

CLI Example:

```
salt '*' composer.update /var/www/application
salt '*' composer.update /var/www/application no_dev=True optimize=True
```

19.9.74 salt.modules.config

Return config information

salt.modules.config.backup_mode(backup='')

Return the backup mode

CLI Example:

```
salt '*' config.backup_mode
```

salt.modules.config.dot_vals(value)

Pass in a configuration value that should be preceded by the module name and a dot, this will return a list of all read key/value pairs

CLI Example:

```
salt '*' config.dot_vals host
```

salt.modules.config.gather_bootstrap_script(bootstrap=None)

Download the salt-bootstrap script, and return its location

bootstrap URL of alternate bootstrap script

CLI Example:

```
salt '*' config.gather_bootstrap_script
```

salt.modules.config.get(key, default='', delimiter=';', merge=None)

Attempt to retrieve the named value from the minion config file, pillar, grains or the master config. If the
named value is not available, return the value specified by default. If not specified, the default is an empty string.

Values can also be retrieved from nested dictionaries. Assume the below data structure:

```
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the apache key, in the sub-dictionary corresponding to the pkg key, the following command can be used:

```
salt myminion config.get pkg:apache
```

The : (colon) is used to represent a nested dictionary level.

Changed in version 2015.5.0: The delimiter argument was added, to allow delimiters other than : to be used.

This function traverses these data stores in this order, returning the first match found:

- Minion configuration
- Minion's grains
- Minion's pillar data
- Master configuration (requires pillar_opts to be set to True in Minion config file in order to work)

This means that if there is a value that is going to be the same for the majority of minions, it can be configured in the Master config file, and then overridden using the grains, pillar, or Minion config file.

Adding config options to the Master or Minion configuration file is easy:

```
my-config-option: value
cafe-menu:
  - egg and bacon
  - egg sausage and bacon
  - egg and spam
  - egg bacon and spam
  - egg bacon sausage and spam
  - spam bacon sausage and spam
  - spam egg spam spam bacon and spam
  - spam sausage spam spam tomato and spam
```

**Note:** Minion configuration options built into Salt (like those defined here) will always be defined in the Minion configuration and thus cannot be overridden by grains or pillar data. However, additional (user-defined) configuration options (as in the above example) will not be in the Minion configuration by default and thus can be overridden using grains/pillar data by leaving the option out of the minion config file.

**Arguments**

- **delimiter**  New in version 2015.5.0.
  
  Override the delimiter used to separate nested levels of a data structure.

- **merge**  New in version 2015.5.0.
  
  If passed, this parameter will change the behavior of the function so that, instead of traversing each data store above in order and returning the first match, the data stores are first merged together and then searched. The pillar data is merged into the master config data, then the grains are merged, followed by the Minion config data. The resulting data structure is then searched for a match. This allows for configurations to be more flexible.

  **Note:** The merging described above does not mean that grain data will end up in the Minion's pillar data, or pillar data will end up in the master config data, etc. The data is just combined for the purposes...
of searching an amalgam of the different data stores.

The supported merge strategies are as follows:

- **recurse** - If a key exists in both dictionaries, and the new value is not a dictionary, it is replaced. Otherwise, the sub-dictionaries are merged together into a single dictionary, recursively on down, following the same criteria. For example:

```python
>>> dict1 = {'foo': {'bar': 1, 'qux': True}, 'hosts': ['a', 'b', 'c'], 'only_x': None}
>>> dict2 = {'foo': {'baz': 2, 'qux': False}, 'hosts': ['d', 'e', 'f'], 'only_y': None}
>>> merged = {'foo': {'bar': 1, 'baz': 2, 'qux': False}, 'hosts': ['d', 'e', 'f'], 'only_dict1': None, 'only_dict2': None}
```

- **overwrite** - If a key exists in the top level of both dictionaries, the new value completely overwrites the old. For example:

```python
>>> dict1 = {'foo': {'bar': 1, 'qux': True}, 'hosts': ['a', 'b', 'c'], 'only_x': None}
>>> dict2 = {'foo': {'baz': 2, 'qux': False}, 'hosts': ['d', 'e', 'f'], 'only_y': None}
>>> merged = {'foo': {'baz': 2, 'qux': False}, 'hosts': ['d', 'e', 'f'], 'only_dict1': None, 'only_dict2': None}
```

CLI Example:

```bash
salt '*' config.get pkg:apache
salt '*' config.get lxc.container_profile:centos merge=recurse
```

**salt.modules.config.manage_mode(mode)**

Return a mode value, normalized to a string

CLI Example:

```bash
salt '*' config.manage_mode
```

**salt.modules.config.merge(value, default='', omit_opts=False, omit_master=False, omit_pillar=False)**

Retrieves an option based on key, merging all matches. Same as `option()` except that it merges all matches, rather than taking the first match.

CLI Example:

```bash
salt '*' config.merge schedule
```

**salt.modules.config.option(value, default='', omit_opts=False, omit_master=False, omit_pillar=False)**

Pass in a generic option and receive the value that will be assigned
CLI Example:
```
salt '*' config.option redis.host
```

salt.modules.config.valid_fileproto(uri)
Returns a boolean value based on whether or not the URI passed has a valid remote file protocol designation

CLI Example:
```
salt '*' config.valid_fileproto salt://path/to/file
```

19.9.75 salt.modules.consul

Interact with Consul
https://www.consul.io

salt.modules.consul.acl_clone(consul_url=None, **kwargs)
Information about an ACL token.

Parameters
- consul_url -- The Consul server URL.
- id -- Unique identifier for the ACL to update.

Returns Boolean, message of success or failure, and new ID of cloned ACL.

CLI Example:
```
salt '*' consul.acl_info id='c1c4d223-91cb-3d1f-1ee8-f2af9e7b6716'
```

salt.modules.consul.acl_create(consul_url=None, **kwargs)
Create a new ACL token.

Parameters
- consul_url -- The Consul server URL.
- id -- Unique identifier for the ACL to create leave it blank to let consul server generate one
- name -- Meaningful indicator of the ACL’s purpose.
- type -- Type is either client or management. A management token is comparable to a root user and has the ability to perform any action including creating, modifying, and deleting ACLs.
- rules -- The Consul server URL.

Returns Boolean & message of success or failure.

CLI Example:
```
salt '*' consul.acl_create
```

salt.modules.consul.acl_delete(consul_url=None, **kwargs)
Delete an ACL token.

Parameters
- consul_url -- The Consul server URL.
- id -- Unique identifier for the ACL to update.

Returns Boolean & message of success or failure.
CLI Example:

```bash
salt '*' consul.acl_delete id='c1c4d223-91cb-3d1f-1ee8-f2af9e7b6716'
```

salt.modules.consul.acl_info(consul_url=None, **kwargs)

Information about an ACL token.

**Parameters**

- `consul_url` -- The Consul server URL.
- `id` -- Unique identifier for the ACL to update.

**Returns** Information about the ACL requested.

CLI Example:

```bash
salt '*' consul.acl_info id='c1c4d223-91cb-3d1f-1ee8-f2af9e7b6716'
```

salt.modules.consul.acl_list(consul_url=None, **kwargs)

List the ACL tokens.

**Parameters**

- `consul_url` -- The Consul server URL.

**Returns** List of ACLs

CLI Example:

```bash
salt '*' consul.acl_list
```

salt.modules.consul.acl_update(consul_url=None, **kwargs)

Update an ACL token.

**Parameters**

- `consul_url` -- The Consul server URL.
- `name` -- Meaningful indicator of the ACL's purpose.
- `id` -- Unique identifier for the ACL to update.
- `type` -- Type is either client or management. A management token is comparable to a root user and has the ability to perform any action including creating, modifying, and deleting ACLs.
- `rules` -- The Consul server URL.

**Returns** Boolean & message of success or failure.

CLI Example:

```bash
salt '*' consul.acl_update
```

salt.modules.consul.agent_check_deregister(consul_url=None, checkid=None)

The agent will take care of deregistering the check from the Catalog.

**Parameters**

- `consul_url` -- The Consul server URL.
- `checkid` -- The ID of the check to deregister from Consul.

**Returns** Boolean and message indicating success or failure.

CLI Example:

```bash
salt '*' consul.agent_check_deregister checkid='Memory Utilization'
```
salt.modules.consul.agent_check_fail(consul_url=None, checkid=None, **kwargs)

This endpoint is used with a check that is of the TTL type. When this is called, the status of the check is set to critical and the TTL clock is reset.

Parameters

- consul_url -- The Consul server URL.
- checkid -- The ID of the check to deregister from Consul.
- note -- A human-readable message with the status of the check.

Returns Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_check_fail checkid='redis_check1' note='Forcing check into critical state.'
```

salt.modules.consul.agent_check_pass(consul_url=None, checkid=None, **kwargs)

This endpoint is used with a check that is of the TTL type. When this is called, the status of the check is set to passing and the TTL clock is reset.

Parameters

- consul_url -- The Consul server URL.
- checkid -- The ID of the check to mark as passing.
- note -- A human-readable message with the status of the check.

Returns Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_check_pass checkid='redis_check1' note='Forcing check into passing state.'
```

salt.modules.consul.agent_check_register(consul_url=None, **kwargs)

The register endpoint is used to add a new check to the local agent.

Parameters

- consul_url -- The Consul server URL.
- name -- The description of what the check is for.
- id -- The unique name to use for the check, if not provided `name' is used.
- notes -- Human readable description of the check.
- script -- If script is provided, the check type is a script, and Consul will evaluate that script based on the interval parameter.
- http -- Check will perform an HTTP GET request against the value of HTTP (expected to be a URL) based on the interval parameter.
- ttl -- If a TTL type is used, then the TTL update endpoint must be used periodically to update the state of the check.
- interval -- Interval at which the check should run.

Returns Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_check_register name='Memory Utilization' script='/usr/local/bin/check_mem.py' interval='15s'
```
salt.modules.consul.agent_check_warn(consul_url=None, checkid=None, **kwargs)

This endpoint is used with a check that is of the TTL type. When this is called, the status of the check is set to warning and the TTL clock is reset.

Parameters

- **consul_url** -- The Consul server URL.
- **checkid** -- The ID of the check to deregister from Consul.
- **note** -- A human-readable message with the status of the check.

Returns

Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_check_warn checkid='redis_check1' note='Forcing check into warning state.'
```

salt.modules.consul.agent_checks(consul_url=None)

Returns the checks the local agent is managing.

Parameters

- **consul_url** -- The Consul server URL.

Returns

Returns the checks the local agent is managing.

CLI Example:

```
salt '*' consul.agent_checks
```

salt.modules.consul.agent_join(consul_url=None, address=None, **kwargs)

Triggers the local agent to join a node.

Parameters

- **consul_url** -- The Consul server URL.
- **address** -- The address for the agent to connect to.
- **wan** -- Causes the agent to attempt to join using the WAN pool.

Returns

Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_join address='192.168.1.1'
```

salt.modules.consul.agent_leave(consul_url=None, node=None)

Used to instruct the agent to force a node into the left state.

Parameters

- **consul_url** -- The Consul server URL.
- **node** -- The node the agent will force into left state.

Returns

Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_leave node='web1.example.com'
```

salt.modules.consul.agent_maintenance(consul_url=None, **kwargs)

Manages node maintenance mode.

Parameters

- **consul_url** -- The Consul server URL.
- **enable** -- The enable flag is required. Acceptable values are either true (to enter maintenance mode) or false (to resume normal operation).
• **reason** -- If provided, its value should be a text string explaining the reason for placing the node into maintenance mode.

**Returns**

Boolean and message indicating success or failure.

**CLI Example:**

```
salt '*' consul.agent_maintenance enable='False' reason='Upgrade in progress'
```

`salt.modules.consul.agent_members(consul_url=None, **kwargs)`

Returns the members as seen by the local serf agent.

**Parameters**

- **consul_url** -- The Consul server URL.

**Returns**

Returns the members as seen by the local serf agent.

**CLI Example:**

```
salt '*' consul.agent_members
```

`salt.modules.consul.agent_self(consul_url=None)`

Returns the local node configuration.

**Parameters**

- **consul_url** -- The Consul server URL.

**Returns**

Returns the local node configuration.

**CLI Example:**

```
salt '*' consul.agent_self
```

`salt.modules.consul.agent_service_deregister(consul_url=None, serviceid=None)`

Used to remove a service.

**Parameters**

- **consul_url** -- The Consul server URL.
- **serviceid** -- A serviceid describing the service.

**Returns**

Boolean and message indicating success or failure.

**CLI Example:**

```
salt '*' consul.agent_service_deregister serviceid='redis'
```

`salt.modules.consul.agent_service_maintenance(consul_url=None, serviceid=None, **kwargs)`

Used to place a service into maintenance mode.

**Parameters**

- **consul_url** -- The Consul server URL.
- **serviceid** -- A name of the service.
- **enable** -- Whether the service should be enabled or disabled.
- **reason** -- A human readable message of why the service was enabled or disabled.

**Returns**

Boolean and message indicating success or failure.

**CLI Example:**

```
salt '*' consul.agent_service_maintenance serviceid='redis' enable='True' reason='Down for upgrade'
```

`salt.modules.consul.agent_service_register(consul_url=None, **kwargs)`

The used to add a new service, with an optional health check, to the local agent.

**Parameters**
- `consul_url` -- The Consul server URL.
- `name` -- A name describing the service.
- `address` -- The address used by the service, defaults to the address of the agent.
- `port` -- The port used by the service.
- `id` -- Unique ID to identify the service, if not provided the value of the name parameter is used.
- `tags` -- Identifying tags for service, string or list.
- `script` -- If script is provided, the check type is a script, and Consul will evaluate that script based on the interval parameter.
- `http` -- Check will perform an HTTP GET request against the value of HTTP (expected to be a URL) based on the interval parameter.
- `check_ttl` -- If a TTL type is used, then the TTL update endpoint must be used periodically to update the state of the check.
- `check_interval` -- Interval at which the check should run.

Returns
Boolean and message indicating success or failure.

CLI Example:
```
salt '*' consul.agent_service_register name='redis' tags='["master", "v1"]' address="127.0.0.1" port="8080" check_script="/usr/local/bin/check_redis.py" interval="10s"
```

```
salt.modules.consul.agent_services(consul_url=None)
```
Returns the services the local agent is managing

Parameters
- `consul_url` -- The Consul server URL.

Returns
Returns the services the local agent is managing

CLI Example:
```
salt '*' consul.agent_services
```

```
salt.modules.consul.catalog_datacenters(consul_url=None)
```
Return list of available datacenters from catalog.

Parameters
- `consul_url` -- The Consul server URL.

Returns
The list of available datacenters.

CLI Example:
```
salt '*' consul.catalog_datacenters
```

```
salt.modules.consul.catalog_deregister(consul_url=None, **kwargs)
```
Deregisters a node, service, or check

Parameters
- `consul_url` -- The Consul server URL.
- `node` -- The node to deregister.
- `datacenter` -- By default, the datacenter of the agent is queried; however, the dc can be provided using the `dc` parameter.
- `checkid` -- The ID of the health check to deregister.
- `serviceid` -- The ID of the service to deregister.
Returns  Boolean & message of success or failure.

CLI Example:
```
salt '*' consul.catalog_register node='node1' serviceid='redis_server1' checkid='redis_check1'
```

salt.modules.consul.catalog_node(consul_url=None, node=None, **kwargs)

Information about the registered node.

Parameters

- **consul_url** -- The Consul server URL.
- **node** -- The node to request information about.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the `dc` parameter.

Returns  Information about the requested node.

CLI Example:
```
salt '*' consul.catalog_service service='redis'
```

salt.modules.consul.catalog_nodes(consul_url=None, **kwargs)

Return list of available nodes from catalog.

Parameters

- **consul_url** -- The Consul server URL.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the `dc` parameter.

Returns  The list of available nodes.

CLI Example:
```
salt '*' consul.catalog_nodes
```

salt.modules.consul.catalog_register(consul_url=None, **kwargs)

Registers a new node, service, or check

Parameters

- **consul_url** -- The Consul server URL.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the `dc` parameter.
- **node** -- The node to register.
- **address** -- The address of the node.
- **service** -- The service that will be registered.
- **service_address** -- The address that the service listens on.
- **service_port** -- The port for the service.
- **service_id** -- A unique identifier for the service, if this is not provided `name` will be used.
- **service_tags** -- Any tags associated with the service.
- **check** -- The name of the health check to register
- **check_status** -- The initial status of the check, must be one of unknown, passing, warning, or critical.
• **check_service** -- The service that the check is performed against.

• **check_id** -- Unique identifier for the service.

• **check_notes** -- An opaque field that is meant to hold human-readable text.

Returns: Boolean & message of success or failure.

CLI Example:

```bash
salt '*' consul.catalog_register node='node1' address='192.168.1.1' service='redis' service_address='127.0.0.1' service_port='8080' service_id='redis_server1'
```

**salt.modules.consul.catalog_service(consul_url=None, service=None, **kwargs)**

Information about the registered service.

Parameters

• **consul_url** -- The Consul server URL.

• **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the ``dc`` parameter.

• **tag** -- Filter returned services with tag parameter.

Returns: Information about the requested service.

CLI Example:

```bash
salt '*' consul.catalog_service service='redis'
```

**salt.modules.consul.catalog_services(consul_url=None, **kwargs)**

Return list of available services rom catalog.

Parameters

• **consul_url** -- The Consul server URL.

• **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the ``dc`` parameter.

Returns: The list of available services.

CLI Example:

```bash
salt '*' consul.catalog_services
```

**salt.modules.consul.delete(consul_url=None, key=None, **kwargs)**

Delete values from Consul

Parameters

• **consul_url** -- The Consul server URL.

• **key** -- The key to use as the starting point for the list.

• **recurse** -- Delete values recursively beginning at the value of key.

• **cas** -- This flag is used to turn the DELETE into a Check-And-Set operation.

Returns: Boolean & message of success or failure.

CLI Example:

```bash
salt '*' consul.delete key='web'
salt '*' consul.delete key='web' recurse='True'
```

**salt.modules.consul.event_fire(consul_url=None, name=None, **kwargs)**

List the ACL tokens.

Parameters
• **consul_url** -- The Consul server URL.

• **name** -- The name of the event to fire.

• **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the ``dc`` parameter.

• **node** -- Filter by node name.

• **service** -- Filter by service name.

• **tag** -- Filter by tag name.

**Returns** List of ACLs

**CLI Example:**

```
salt '*' consul.event_fire name='deploy'
```

salt.modules.consul.event_list(consul_url=None, **kwargs)

List the recent events.

**Parameters**

• **consul_url** -- The Consul server URL.

• **name** -- The name of the event to fire.

**Returns** List of ACLs

**CLI Example:**

```
salt '*' consul.event_list
```

salt.modules.consul.get(consul_url=None, key=None, recurse=False, decode=False, raw=False)

Get key from Consul

**Parameters**

• **consul_url** -- The Consul server URL.

• **key** -- The key to use as the starting point for the list.

• **recurse** -- Return values recursively beginning at the value of key.

• **decode** -- By default values are stored as Base64 encoded values, decode will return the whole key with the value decoded.

• **raw** -- Simply return the decoded value of the key.

**Returns** The keys in Consul.

**CLI Example:**

```
salt '*' consul.get key='web/key1'
salt '*' consul.get key='web' recurse=True
salt '*' consul.get key='web' recurse=True decode=True
```

By default values stored in Consul are base64 encoded, passing the decode option will show them as the decoded values.

```
salt '*' consul.get key='web' recurse=True decode=True raw=True
```

By default Consul will return other information about the key, the raw option will return only the raw value.

salt.modules.consul.health_checks(consul_url=None, service=None, **kwargs)

Health information about the registered service.

**Parameters**
- **consul_url** -- The Consul server URL.
- **service** -- The service to request health information about.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the ``dc`` parameter.

**Returns** Health information about the requested node.

CLI Example:
```
salt '*' consul.health_checks service='redis1'
```

salt.modules.consul.health_node(**consul_url=None, node=None, **kwargs)**
Health information about the registered node.

**Parameters**
- **consul_url** -- The Consul server URL.
- **node** -- The node to request health information about.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the ``dc`` parameter.

**Returns** Health information about the requested node.

CLI Example:
```
salt '*' consul.health_node node='node1'
```

salt.modules.consul.health_service(**consul_url=None, service=None, **kwargs)**
Health information about the registered service.

**Parameters**
- **consul_url** -- The Consul server URL.
- **service** -- The service to request health information about.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the ``dc`` parameter.
- **tag** -- Filter returned services with tag parameter.
- **passing** -- Filter results to only nodes with all checks in the passing state.

**Returns** Health information about the requested node.

CLI Example:
```
salt '*' consul.health_service service='redis1'
salt '*' consul.health_service service='redis1' passing='True'
```

salt.modules.consul.health_state(**consul_url=None, state=None, **kwargs)**
Returns the checks in the state provided on the path.

**Parameters**
- **consul_url** -- The Consul server URL.
- **state** -- The state to show checks for. The supported states are any, unknown, passing, warning, or critical. The any state is a wildcard that can be used to return all checks.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the ``dc`` parameter.
Returns  The checks in the provided state.

CLI Example:

```bash
salt '*' consul.health_state state='redis1'
salt '*' consul.health_state service='redis1' passing='True'
```

```python
salt.modules.consul.list_
```
List keys in Consul

Parameters

- **consul_url** -- The Consul server URL.
- **key** -- The key to use as the starting point for the list.

Returns  The list of keys.

CLI Example:

```bash
salt '*' consul.list
salt '*' consul.list key='web'
```

```python
salt.modules.consul.put
```
Put values into Consul

Parameters

- **consul_url** -- The Consul server URL.
- **key** -- The key to use as the starting point for the list.
- **value** -- The value to set the key to.
- **flags** -- This can be used to specify an unsigned value between 0 and 2^64-1. Clients can choose to use this however makes sense for their application.
- **cas** -- This flag is used to turn the PUT into a Check-And-Set operation.
- **acquire** -- This flag is used to turn the PUT into a lock acquisition operation.
- **release** -- This flag is used to turn the PUT into a lock release operation.

Returns  Boolean & message of success or failure.

CLI Example:

```bash
salt '*' consul.put key='web/key1' value='Hello there'
salt '*' consul.put key='web/key1' value='Hello there' acquire='d5d371f4-c380-5280-12fd-8810be175592'
salt '*' consul.put key='web/key1' value='Hello there' release='d5d371f4-c380-5280-12fd-8810be175592'
```

```python
salt.modules.consul.session_create
```
Used to create a session.

Parameters

- **consul_url** -- The Consul server URL.
- **lockdelay** -- Duration string using a ``s`` suffix for seconds. The default is 15s.
- **node** -- Must refer to a node that is already registered, if specified. By default, the agent’s own node name is used.
- **name** -- A human-readable name for the session
- **checks** -- A list of associated health checks. It is highly recommended that, if you override this list, you include the default ``serfHealth``.

- **behavior** -- Can be set to either release or delete. This controls the behavior when a session is invalidated. By default, this is release, causing any locks that are held to be released. Changing this to delete causes any locks that are held to be deleted. **delete** is useful for creating ephemeral key/value entries.

- **ttl** -- Session is invalidated if it is not renewed before the TTL expires

**Returns**

Boolean and message indicating success or failure.

**CLI Example:**

```
salt '*' consul.session_create node='node1' name='my-session' behavior='delete' --ttl='3600s'
```

salt.modules.consul.session_destroy(consul_url=None, session=None, **kwargs)

Destroy session

**Parameters**

- **consul_url** -- The Consul server URL.
- **session** -- The ID of the session to destroy.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the ``dc`` parameter.

**Returns**

Boolean & message of success or failure.

**CLI Example:**

```
salt '*' consul.session_destroy session='c1c4d223-91cb-3d1f-1ee8-f2af9e7b6716'
```

salt.modules.consul.session_info(consul_url=None, session=None, **kwargs)

Information about a session

**Parameters**

- **consul_url** -- The Consul server URL.
- **session** -- The ID of the session to return information about.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the ``dc`` parameter.

**Returns**

Boolean & message of success or failure.

**CLI Example:**

```
salt '*' consul.session_info session='c1c4d223-91cb-3d1f-1ee8-f2af9e7b6716'
```

salt.modules.consul.session_list(consul_url=None, return_list=False, **kwargs)

Used to list sessions.

**Parameters**

- **consul_url** -- The Consul server URL.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the ``dc`` parameter.
- **return_list** -- By default, all information about the sessions is returned, using the return_list parameter will return a list of session IDs.

**Returns**

A list of all available sessions.

**CLI Example:**

```
salt 'localhost' consul.session_list

salt.modules.consul.status_leader(consul_url=None)
Returns the current Raft leader
    Parameters consul_url -- The Consul server URL.
    Returns The address of the Raft leader.
CLI Example:
salt 'localhost' consul.status_leader

salt.modules.consul.status_peers(consul_url)
Returns the current Raft peer set
    Parameters consul_url -- The Consul server URL.
    Returns Retrieves the Raft peers for the datacenter in which the agent is running.
CLI Example:
salt 'localhost' consul.status_peers

19.9.76 salt.modules.container_resource

Common resources for LXC and systemd-nspawn containers
New in version 2015.8.0.
These functions are not designed to be called directly, but instead from the lxc, nspawn, and docker execution modules. They provide for common logic to be re-used for common actions.

salt.modules.container_resource.cache_file(source)
Wrapper for cp.cache_file which raises an error if the file was unable to be cached.
CLI Example:
salt myminion container_resource.cache_file salt://foo/bar/baz.txt

salt.modules.container_resource.copy_to(*args, **kwargs)
Common logic for copying files to containers
    path path to the container parent (for LXC only) default: /var/lib/lxc (system default)
CLI Example:
salt myminion container_resource.copy_to mycontainer /local/file/path /container/

salt.modules.container_resource.run(*args, **kwargs)
Common logic for running shell commands in containers
    path path to the container parent (for LXC only) default: /var/lib/lxc (system default)
CLI Example:
salt myminion container_resource.run mycontainer 'ps aux' container_type=docker exec_driver=nsenter output=stdout

19.9.77 salt.modules.cp

Minion side functions for salt-cp
salt.modules.cp.cache_dir(path, saltenv='base', include_empty=False, include_pat=None, exclude_pat=None)

Download and cache everything under a directory from the master

**include_pat** [None] Glob or regex to narrow down the files cached from the given path. If matching with a regex, the regex must be prefixed with E@, otherwise the expression will be interpreted as a glob.

New in version 2014.7.0.

**exclude_pat** [None] Glob or regex to exclude certain files from being cached from the given path. If matching with a regex, the regex must be prefixed with E@, otherwise the expression will be interpreted as a glob.

Note: If used with include_pat, files matching this pattern will be excluded from the subset of files defined by include_pat.

New in version 2014.7.0.

**CLI Examples:**

```bash
salt '*' cp.cache_dir salt://path/to/dir
salt '*' cp.cache_dir salt://path/to/dir include_pat='E@*.py$'
```

salt.modules.cp.cache_file(path, saltenv='base')

Used to cache a single file on the Minion

Returns the location of the new cached file on the Minion.

**CLI Example:**

```bash
salt '*' cp.cache_file salt://path/to/file
```

There are two ways of defining the fileserver environment (a.k.a. saltenv) from which to cache the file. One is to use the saltenv parameter, and the other is to use a querystring syntax in the salt:// URL. The below two examples are equivalent:

```bash
salt '*' cp.cache_file salt://foo/bar.conf saltenv=config
salt '*' cp.cache_file salt://foo/bar.conf?saltenv=config
```

If the path being cached is a salt:// URI, and the path does not exist, then False will be returned.

Note: It may be necessary to quote the URL when using the querystring method, depending on the shell being used to run the command.

salt.modules.cp.cache_files(paths, saltenv='base')

Used to gather many files from the Master, the gathered files will be saved in the minion cachedir reflective to the paths retrieved from the Master

**CLI Example:**

```bash
salt '*' cp.cache_files salt://path/to/file1,salt://path/to/file1
```

There are two ways of defining the fileserver environment (a.k.a. saltenv) from which to cache the files. One is to use the saltenv parameter, and the other is to use a querystring syntax in the salt:// URL. The below two examples are equivalent:

```bash
salt '*' cp.cache_files salt://foo/bar.conf,salt://foo/baz.conf saltenv=config
salt '*' cp.cache_files salt://foo/bar.conf?saltenv=config,salt://foo/baz.conf?
```
The querystring method is less useful when all files are being cached from the same environment, but is a good way of caching files from multiple different environments in the same command. For example, the below command will cache the first file from the config1 environment, and the second one from the config2 environment.

```
salt '*' cp.cache_files salt://foo/bar.conf?saltenv=config1,salt://foo/bar.conf?saltenv=config2
```

**Note:** It may be necessary to quote the URL when using the querystring method, depending on the shell being used to run the command.

salt.modules.cp.cache_local_file(path)

Cache a local file on the minion in the localfiles cache

CLI Example:

```
salt '*' cp.cache_local_file /etc/hosts
```

salt.modules.cp.cache_master(saltenv='base')

Retrieve all of the files on the master and cache them locally

CLI Example:

```
salt '*' cp.cache_master
```

salt.modules.cp.envs()

List available environments for fileserver

CLI Example

```
salt '*' cp.envs
```

salt.modules.cp.get_dir(path, dest, saltenv='base', makedirs=False, template=None, gzip=None, **kwargs)

Used to recursively copy a directory from the salt master

CLI Example:

```
salt '*' cp.get_dir salt://path/to/dir/ /minion/dest
```

get_dir supports the same template and gzip arguments as get_file.

salt.modules.cp.get_file(path, dest, saltenv='base', makedirs=False, template=None, gzip=None, **kwargs)

Used to get a single file from the salt master

CLI Example:

```
salt '*' cp.get_file salt://path/to/file /minion/dest
```

Template rendering can be enabled on both the source and destination file names like so:

```
salt '*' cp.get_file "salt://{{grains.os}}/vimrc" /etc/vimrc template=jinja
```

This example would instruct all Salt minions to download the vimrc from a directory with the same name as their os grain and copy it to /etc/vimrc.

For larger files, the cp.get_file module also supports gzip compression. Because gzip is CPU-intensive, this should only be used in scenarios where the compression ratio is very high (e.g. pretty-printed JSON or YAML files).
Use the `gzip` named argument to enable it. Valid values are 1..9, where 1 is the lightest compression and 9 the heaviest. 1 uses the least CPU on the master (and minion), 9 uses the most.

There are two ways of defining the fileserver environment (a.k.a. `saltenv`) from which to retrieve the file. One is to use the `saltenv` parameter, and the other is to use a querystring syntax in the `salt://` URL. The below two examples are equivalent:

```python
salt '*' cp.get_file salt://foo/bar.conf /etc/foo/bar.conf saltenv=config
salt '*' cp.get_file salt://foo/bar.conf?saltenv=config /etc/foo/bar.conf
```

**Note:** It may be necessary to quote the URL when using the querystring method, depending on the shell being used to run the command.

### `salt.modules.cp.get_file_str(path, saltenv='base')`

Download a file from a URL to the Minion cache directory and return the contents of that file

Returns False if Salt was unable to cache a file from a URL.

**CLI Example:**

```
salt '*' cp.get_file_str salt://my/file
```

### `salt.modules.cp.get_template(path, dest, template='jinja', saltenv='base', makedirs=False, **kwargs)`

Render a file as a template before setting it down. Warning, order is not the same as in fileclient.cp for non breaking old API.

**CLI Example:**

```
salt '*' cp.get_template salt://path/to/template /minion/dest
```

### `salt.modules.cp.get_url(path, dest='`, saltenv='base', makedirs=False)`

Used to get a single file from a URL.

**Path** A URL to download a file from. Supported URL schemes are: salt://, http://, https://, ftp://, s3://, swift:// and file:// (local filesystem). If no scheme was specified, this is equivalent of using file://. If a file:// URL is given, the function just returns absolute path to that file on a local filesystem. The function returns False if Salt was unable to fetch a file from a salt:// URL.

**Dest** The default behaviour is to write the fetched file to the given destination path. If this parameter is omitted or set as empty string (''), the function places the remote file on the local filesystem inside the Minion cache directory and returns the path to that file.

**Note:** To simply return the file contents instead, set destination to None. This works with salt://, http://, https:// and file:// URLs. The files fetched by http:// and https:// will not be cached.

**Saltenv** [base] Salt fileserver environment from which to retrieve the file. Ignored if path is not a salt:// URL.

**CLI Example:**

```
salt '*' cp.get_url salt://my/file /tmp/this_file_is_mine
salt '*' cp.get_url http://www.slashdot.org /tmp/index.html
```

### `salt.modules.cp.hash_file(path, saltenv='base')`

Return the hash of a file, to get the hash of a file on the salt master file server prepend the path with salt://<file on server> otherwise, prepend the path with / for a local file.
CLI Example:

```bash
salt '*' cp.hash_file salt://path/to/file
```

**salt.modules.cp.is_cached**(path, saltenv='base')

Return a boolean if the given path on the master has been cached on the minion

CLI Example:

```bash
salt '*' cp.is_cached salt://path/to/file
```

**salt.modules.cp.list_master**(saltenv='base', prefix='')

List all of the files stored on the master

CLI Example:

```bash
salt '*' cp.list_master
```

**salt.modules.cp.list_master_dirs**(saltenv='base', prefix='')

List all of the directories stored on the master

CLI Example:

```bash
salt '*' cp.list_master_dirs
```

**salt.modules.cp.list_master_symlinks**(saltenv='base', prefix='')

List all of the symlinks stored on the master

CLI Example:

```bash
salt '*' cp.list_master_symlinks
```

**salt.modules.cp.list_minion**(saltenv='base')

List all of the files cached on the minion

CLI Example:

```bash
salt '*' cp.list_minion
```

**salt.modules.cp.list_states**(saltenv='base')

List all of the available state modules in an environment

CLI Example:

```bash
salt '*' cp.list_states
```

**salt.modules.cp.push**(path, keep_symlinks=False, upload_path=None, remove_source=False)

WARNING Files pushed to the master will have global read permissions.

Push a file from the minion up to the master, the file will be saved to the salt master in the master's minion files cachedir (defaults to /var/cache/salt/master/minions/minion-id/files)

Since this feature allows a minion to push a file up to the master server it is disabled by default for security purposes. To enable, set file_recv to True in the master configuration file, and restart the master.

- **keep_symlinks** Keep the path value without resolving its canonical form
- **upload_path** Provide a different path inside the master's minion files cachedir
- **remove_source** Remove the source file on the minion

New in version 2016.3.0.

CLI Example:
salt.modules.cp.push_dir(path, glob=None, upload_path=None)

Push a directory from the minion up to the master, the files will be saved to the salt master in the master's
minion files cachedir (defaults to /var/cache/salt/master/minions/minion-id/files). It also
has a glob for matching specific files using globbing.

New in version 2014.7.0.

Since this feature allows a minion to push files up to the master server it is disabled by default for security
purposes. To enable, set file_recv to True in the master configuration file, and restart the master.

upload_path Provide a different path and directory name inside the master's minion files cachedir

CLI Example:
salt '*' cp.push /usr/lib/mysql
salt '*' cp.push /usr/lib/mysql upload_path='/newmysql/path'
salt '*' cp.push_dir /etc/modprobe.d/ glob='*.conf'

salt.modules.cp.recv(files, dest)

Used with salt-cp, pass the files dict, and the destination.

This function receives small fast copy files from the master via salt-cp. It does not work via the CLI.

salt.modules.cp.recv_chunked(dest, chunk, append=False, compressed=True, mode=None)

This function receives files copied to the minion using salt-cp and is not intended to be used directly on
the CLI.

salt.modules.cp.stat_file(path, saltenv='base', octal=True)

Return the permissions of a file, to get the permissions of a file on the salt master file server prepend the path
with salt://<file on server> otherwise, prepend the file with / for a local file.

CLI Example:
salt '*' cp.stat_file salt://path/to/file

19.9.78 salt.modules.cpan

Manage Perl modules using CPAN

New in version 2015.5.0.

salt.modules.cpan.install(module)

Install a Perl module from CPAN

CLI Example:
salt '*' cpan.install Template::Alloy

salt.modules.cpan.list()

List installed Perl modules, and the version installed

CLI Example:
salt '*' cpan.list
salt.modules.cpan.remove(module, details=False)

Attempt to remove a Perl module that was installed from CPAN. Because the cpan command doesn't actually support `uninstall`-like functionality, this function will attempt to do what it can, with what it has from CPAN.

Until this function is declared stable, USE AT YOUR OWN RISK!

CLI Example:
```
salt '*' cpan.remove Old::Package
```

salt.modules.cpan.show(module)

Show information about a specific Perl module

CLI Example:
```
salt '*' cpan.show Template::Alloy
```

salt.modules.cpan.show_config()

Return a dict of CPAN configuration values

CLI Example:
```
salt '*' cpan.show_config
```

19.9.79 salt.modules.cron

Work with cron

**Note:** Salt does not escape cron metacharacters automatically. You should backslash-escape percent characters and any other metacharacters that might be interpreted incorrectly by the shell.

salt.modules.cron.list_tab(user)

Return the contents of the specified user's crontab

CLI Example:
```
salt '*' cron.list_tab root
```

salt.modules.cron.ls(user)

This function is an alias of list_tab.

Return the contents of the specified user's crontab

CLI Example:
```
salt '*' cron.list_tab root
```

salt.modules.cron.raw_cron(user)

Return the contents of the user's crontab

CLI Example:
```
salt '*' cron.raw_cron root
```

salt.modules.cron.rm(user, cmd, minute=None, hour=None, daymonth=None, month=None, dayweek=None, identifier=None)

This function is an alias of rm_job.

19.9. execution modules
Remove a cron job for a specified user. If any of the day/time params are specified, the job will only be removed if the specified params match.

CLI Example:

```
salt '*' cron.rm_job root /usr/local/weekly
salt '*' cron.rm_job root /usr/bin/foo dayweek=1
```

`salt.modules.cron.rm_env(user, name)`
Remove cron environment variable for a specified user.

CLI Example:

```
salt '*' cron.rm_env root MAILTO
```

`salt.modules.cron.rm_job(user, cmd, minute=None, hour=None, daymonth=None, month=None, dayweek=None, identifier=None)`
Remove a cron job for a specified user. If any of the day/time params are specified, the job will only be removed if the specified params match.

CLI Example:

```
salt '*' cron.rm_job root /usr/local/weekly
salt '*' cron.rm_job root /usr/bin/foo dayweek=1
```

`salt.modules.cron.rm_special(user, cmd, special=None, identifier=None)`
Remove a special cron job for a specified user.

CLI Example:

```
salt '*' cron.rm_special root /usr/bin/foo
```

`salt.modules.cron.set_env(user, name, value=None)`
Set up an environment variable in the crontab.

CLI Example:

```
salt '*' cron.set_env root MAILTO user@example.com
```

`salt.modules.cron.set_job(user, minute, hour, daymonth, month, dayweek, cmd, commented=False, comment=None, identifier=None)`
Sets a cron job up for a specified user.

CLI Example:

```
salt '*' cron.set_job root '*' '*' '*' '*' '*' 1 /usr/local/weekly
```

`salt.modules.cron.set_special(user, special, cmd, commented=False, comment=None, identifier=None)`
Set up a special command in the crontab.

CLI Example:

```
salt '*' cron.set_special root @hourly 'echo foobar'
```

`salt.modules.cron.write_cron_file(user, path)`
Writes the contents of a file to a user’s crontab

CLI Example:
salt.modules.cron.write_cron_file_verbose(user, path)

Writes the contents of a file to a user's crontab and return error message on error

CLI Example:
```
salt '*' cron.write_cron_file_verbose root /tmp/new_cron
```

Changed in version 2015.8.9.

**Note:** Some OS' do not support specifying user via the `crontab` command i.e. (Solaris, AIX)

---

19.9.80 salt.modules.csf

Support for Config Server Firewall (CSF)

**maintainer** Mostafa Hussein <mostafa.hussein91@gmail.com>

**maturity** new

**platform** Linux

salt.modules.csf.allow(ip, port=None, proto='tcp', direction='in', port_origin='d', ip_origin='s', ttl=None, comment='')

Add an rule to csf allowed hosts See _access_rule(). 1- Add an IP: CLI Example:
```
salt '*' csf.allow 127.0.0.1
salt '*' csf.allow 127.0.0.1 comment="Allow localhost"
```

salt.modules.csf.allow_port(port, proto='tcp', direction='both')

Like allow_ports, but it will append to the existing entry instead of replacing it. Takes a single port instead of a list of ports.

CLI Example:
```
salt '*' csf.allow_port 22 proto='tcp' direction='in'
```

salt.modules.csf.allow_ports(ports, proto='tcp', direction='in')

Fully replace the incoming or outgoing ports line in the csf.conf file - e.g. TCP_IN, TCP_OUT, UDP_IN, UDP_OUT, etc.

CLI Example:
```
salt '*' csf.allow_ports ports=["22,80,443,4505,4506"] proto='tcp' direction='in'
```

salt.modules.csf.build_directions(direction)

salt.modules.csf.deny(ip, port=None, proto='tcp', direction='in', port_origin='d', ip_origin='d', ttl=None, comment='')

Add an rule to csf denied hosts See _access_rule(). 1- Deny an IP: CLI Example:
salt modules.csf.disable()
    Disable csf permanently CLI Example:
    
    salt '*' csf.disable

salt.modules.csf.disable_testing_mode()

salt.modules.csf.enable()
    Activate csf if not running CLI Example:
    
    salt '*' csf.enable

salt.modules.csf.enable_testing_mode()

salt.modules.csf.exists(method, ip, port=None, proto='tcp', direction='in', port_origin='d', ip_origin='d', ttl=None, comment=''))
    Returns true a rule for the ip already exists based on the method supplied. Returns false if not found. CLI Example:
    
    salt '*' csf.exists allow 1.2.3.4
    salt '*' csf.exists tempdeny 1.2.3.4

salt.modules.csf.get_option(option)

salt.modules.csf.get_ports(proto='tcp', direction='in')
    Lists ports from csf.conf based on direction and protocol. e.g. - TCP_IN, TCP_OUT, UDP_IN, UDP_OUT, etc..
    CLI Example:
    
    salt '*' csf.allow_port 22 proto='tcp' direction='in'

salt.modules.csf.get_skipped_nics(ipv6=False)

salt.modules.csf.get_testing_status()

salt.modules.csf.reload()
    Restart csf CLI Example:
    
    salt '*' csf.reload

salt.modules.csf.remove_rule(method, ip, port=None, proto='tcp', direction='in', port_origin='d', ip_origin='s', ttl=None, comment=''))

salt.modules.csf.remove_temp_rule(ip)

salt.modules.csf.running()
    Check csf status CLI Example:
    
    salt '*' csf.running

salt.modules.csf.set_option(option, value)

salt.modules.csf.skip_nic(nic, ipv6=False)

salt.modules.csf.skip_nics(nics, ipv6=False)

salt.modules.csf.split_option(option)
salt.modules.csf.tempallow(ip=None, ttl=None, port=None, direction=None, comment='')
Add an rule to the temporary ip allow list. See _access_rule(). 1- Add an IP: CLI Example:

```
salt '*' csf.tempallow 127.0.0.1 3600 port=22 direction='in' comment='# Temp dev ssh access'
```

salt.modules.csf.tempdeny(ip=None, ttl=None, port=None, direction=None, comment='')
Add a rule to the temporary ip deny list. See _access_rule(). 1- Add an IP: CLI Example:

```
salt '*' csf.tempdeny 127.0.0.1 300 port=22 direction='in' comment='# Brute force attempt'
```

salt.modules.csf.unallow(ip)
Remove a rule from the csf denied hosts See _access_rule(). 1- Deny an IP: CLI Example:

```
salt '*' csf.unallow 127.0.0.1
```

salt.modules.csf.undeny(ip)
Remove a rule from the csf denied hosts See _access_rule(). 1- Deny an IP: CLI Example:

```
salt '*' csf.undeny 127.0.0.1
```

19.9.81 salt.modules.cyg

Manage cygwin packages.
Module file to accompany the cyg state.
salt.modules.cyg.check_valid_package(package, cyg_arch='x86_64', mirrors=None)
Check if the package is valid on the given mirrors.

Parameters

- **package** -- The name of the package
- **cyg_arch** -- The cygwin architecture
- **mirrors** -- any mirrors to check

Returns (bool): True if Valid, otherwise False

CLI Example:

```
salt '*' cyg.check_valid_package <package name>
```

salt.modules.cyg.install(packages=None, cyg_arch='x86_64', mirrors=None)
Install one or several packages.

- **packages** [None] The packages to install
- **cyg_arch** [x86_64] Specify the architecture to install the package under Current options are x86 and x86_64

CLI Example:

```
salt '*' cyg.install dos2unix
salt '*' cyg.install dos2unix mirrors="[{{http://mirror': 'http://url/to/public/ key}}]
```

salt.modules.cyg.list_(package=None, cyg_arch='x86_64')
List locally installed packages.

- **package** [''] package name to check. else all
- **cyg_arch** : Cygwin architecture to use Options are x86 and x86_64
CLI Example:

```bash
salt '*' cyg.list
```

```python
salt.modules.cyg.uninstall(packages, cyg_arch='x86_64', mirrors=None)  
Uninstall one or several packages.
packages  The packages to uninstall.
cyg_arch  [x86_64] Specify the architecture to remove the package from Current options are x86 and x86_64
CLI Example:

```bash
salt '*' cyg.uninstall dos2unix  
salt '*' cyg.uninstall dos2unix mirrors="[ HTTP://mirror': 'http://url/to/public/ "key]]"
```

```python
salt.modules.cyg.update(cyg_arch='x86_64', mirrors=None)  
Update all packages.
cyg_arch  [x86_64] Specify the cygwin architecture update Current options are x86 and x86_64
CLI Example:

```bash
salt '*' cyg.update  
salt '*' cyg.update dos2unix mirrors="[ HTTP://mirror': 'http://url/to/public/ "key]]"
```

### 19.9.82 salt.modules.daemontools

daemontools service module. This module will create daemontools type service watcher.
This module is compatible with the `service` states, so it can be used to maintain services using the `provider` argument:

```python
myservice:
    service.running:
        - provider: daemontools
```

```python
salt.modules.daemontools.available(name)
Returns True if the specified service is available, otherwise returns False.
CLI Example:

```bash
salt '*' daemontools.available foo
```

```python
salt.modules.daemontools.disabled(name)
Return True if the named service is enabled, false otherwise
New in version 2015.5.6.
CLI Example:

```bash
salt '*' daemontools.disabled <service name>
```

```python
salt.modules.daemontools.enabled(name, **kwargs)
Return True if the named service is enabled, false otherwise A service is considered enabled if in your service directory: - an executable ./run file exist - a file named `"down` does not exist
New in version 2015.5.7.
name  Service name
CLI Example:
```
salt '*' daemontools.enabled <service name>

salt.modules.daemontools.full_restart(name)
    Calls daemontools.restart() function
    CLI Example:
    salt '*' daemontools.full_restart <service name>

salt.modules.daemontools.get_all()
    Return a list of all available services
    CLI Example:
    salt '*' daemontools.get_all

salt.modules.daemontools.missing(name)
    The inverse of daemontools.available. Returns True if the specified service is not available, otherwise returns False.
    CLI Example:
    salt '*' daemontools.missing foo

salt.modules.daemontools.reload_(name)
    Wrapper for term()
    CLI Example:
    salt '*' daemontools.reload <service name>

salt.modules.daemontools.restart(name)
    Restart service via daemontools. This will stop/start service
    CLI Example:
    salt '*' daemontools.restart <service name>

salt.modules.daemontools.start(name)
    Starts service via daemontools
    CLI Example:
    salt '*' daemontools.start <service name>

salt.modules.daemontools.status(name, sig=None)
    Return the status for a service via daemontools, return pid if running
    CLI Example:
    salt '*' daemontools.status <service name>

salt.modules.daemontools.stop(name)
    Stops service via daemontools
    CLI Example:
    salt '*' daemontools.stop <service name>
**salt.modules.daemontools**.term(name)
Send a TERM to service via daemontools

CLI Example:
```
salt '*' daemontools.term <service name>
```

### 19.9.83 salt.modules.data

Manage a local persistent data structure that can hold any arbitrary data specific to the minion

**salt.modules.data.cas(key, value, old_value)**
Check and set a value in the minion datastore

CLI Example:
```
salt '*' data.cas <key> <value> <old_value>
```

**salt.modules.data.clear()**
Clear out all of the data in the minion datastore, this function is destructive!

CLI Example:
```
salt '*' data.clear
```

**salt.modules.data.dump(new_data)**
Replace the entire datastore with a passed data structure

CLI Example:
```
salt '*' data.dump '{'eggs': 'spam'}'
```

**salt.modules.data.get(key, default=None)**
Get a (list of) value(s) from the minion datastore

New in version 2015.8.0.

CLI Example:
```
salt '*' data.get key
salt '*' data.get ['"key1", "key2"]'
```

**salt.modules.data.has_key(key)**
Check if key is in the minion datastore

New in version 2015.8.0.

CLI Example:
```
salt '*' data.has_key <mykey>
```

**salt.modules.data.items()**
Get items from the minion datastore

New in version 2015.8.0.

CLI Example:
```
salt '*' data.items
```
salt.modules.data.keys()
Get all keys from the minion datastore
New in version 2015.8.0.
CLI Example:

```bash
salt '*' data.keys
```

salt.modules.data.load()
Return all of the data in the minion datastore

CLI Example:

```bash
salt '*' data.load
```

salt.modules.data.pop(key, default=None)
Pop (return & delete) a value from the minion datastore
New in version 2015.5.2.
CLI Example:

```bash
salt '*' data.pop <key> "there was no val"
```

salt.modules.data.update(key, value)
Update a key with a value in the minion datastore
CLI Example:

```bash
salt '*' data.update <key> <value>
```

salt.modules.data.values()
Get values from the minion datastore
New in version 2015.8.0.
CLI Example:

```bash
salt '*' data.values
```

19.9.84 salt.modules.ddns
Support for RFC 2136 dynamic DNS updates.

depends

- dnspython Python module

configuration If you want to use TSIG authentication for the server, there are a couple of optional configuration parameters made available to support this (the keyname is only needed if the keyring contains more than one key):

```bash
keyfile: keyring file (default=None)
keyname: key name in file (default=None)
keyalgorithm: algorithm used to create the key (default='HMAC-MD5.SIG-ALG.REG.INT'). Other possible values: hmac-sha1, hmac-sha224, hmac-sha256, hmac-sha384, hmac-sha512
```
The keyring file needs to be in json format and the key name needs to end with an extra period in the file, similar to this:

```
{"keyname.": "keycontent"}
```

salt.modules.ddns.add_host(zone, name, ttl, ip, nameserver=’127.0.0.1’, replace=True, timeout=5, port=53, **kwargs)
Add, replace, or update the A and PTR (reverse) records for a host.

CLI Example:
```
salt ns1 ddns.add_host example.com host1 60 10.1.1.1
```

salt.modules.ddns.delete(zone, name, rdtype=None, data=None, nameserver=’127.0.0.1’, timeout=5, port=53, **kwargs)
Delete a DNS record.

CLI Example:
```
salt ns1 ddns.delete example.com host1 A
```

class salt.modules.ddns.delete_host(zone, name, nameserver=’127.0.0.1’, timeout=5, port=53, **kwargs)
Delete the forward and reverse records for a host.
Returns true if any records are deleted.

CLI Example:
```
salt ns1 ddns.delete_host example.com host1
```

class salt.modules.ddns.update(zone, name, ttl, rdtype, data, nameserver=’127.0.0.1’, timeout=5, replace=False, port=53, **kwargs)
Add, replace, or update a DNS record. nameserver must be an IP address and the minion running this module must have update privileges on that server. If replace is true, first deletes all records for this name and type.

CLI Example:
```
salt ns1 ddns.update example.com host1 60 A 10.0.0.1
```

**19.9.85 salt.modules.deb_apache**

Support for Apache

Please note: The functions in here are Debian-specific. Placing them in this separate file will allow them to load only on Debian-based systems, while still loading under the apache namespace.

salt.modules.deb_apache.a2disconf(conf)
New in version 2016.3.0.
Runs a2disconf for the given conf.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:
```
salt '*' apache.a2disconf security
```

class salt.modules.deb_apache.a2dismod(mod)
Runs a2dismod for the given mod.
This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.a2dismod vhost_alias
```

```
salt.modules.deb_apache.a2dissite(site)
Runs a2dissite for the given site.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.a2dissite example.com
```

```
salt.modules.deb_apache.a2enconf(conf)
New in version 2016.3.0.
Runs a2enconf for the given conf.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.a2enconf security
```

```
salt.modules.deb_apache.a2enmod(mod)
Runs a2enmod for the given mod.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.a2enmod vhost_alias
```

```
salt.modules.deb_apache.a2ensite(site)
Runs a2ensite for the given site.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.a2ensite example.com
```

```
salt.modules.deb_apache.check_conf_enabled(conf)
New in version 2016.3.0.
Checks to see if the specific conf symlink is in /etc/apache2/conf-enabled.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.check_conf_enabled security
salt '*' apache.check_conf_enabled security.conf
```

```
salt.modules.deb_apache.check_mod_enabled(mod)
Checks to see if the specific mod symlink is in /etc/apache2/mods-enabled.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:
salt '*' apache.check_mod_enabled status
salt '*' apache.check_mod_enabled status.load
salt '*' apache.check_mod_enabled status.conf

salt.modules.deb_apache.check_site_enabled(site)
Checks to see if the specific site symlink is in /etc/apache2/sites-enabled.
This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.check_site_enabled example.com
salt '*' apache.check_site_enabled example.com.conf
```

19.9.86 salt.modules.deb_postgres
Module to provide Postgres compatibility to salt for debian family specific tools.

salt.modules.deb_postgres.cluster_create(version, name='main', port=None, locale=None, encoding=None, datadir=None)
Adds a cluster to the Postgres server.

CLI Example:

```
salt '*' postgres.cluster_create '9.3'
salt '*' postgres.cluster_create '9.3' 'main'
salt '*' postgres.cluster_create '9.3' locale='fr_FR'
```

salt.modules.deb_postgres.cluster_exists(version, name='main')
Checks if a given version and name of a cluster exists.

CLI Example:

```
salt '*' postgres.cluster_exists '9.3'
salt '*' postgres.cluster_exists '9.3' 'main'
```

salt.modules.deb_postgres.cluster_list(verbos=False)
Return a list of cluster of Postgres server (tuples of version and name).

CLI Example:

```
salt '*' postgres.cluster_list
salt '*' postgres.cluster_list verbose=True
```

salt.modules.deb_postgres.cluster_remove(version, name='main', stop=False)
Remove a cluster on a Postgres server. By default it doesn't try to stop the cluster.

CLI Example:

```
salt '*' postgres.cluster_remove '9.3'
salt '*' postgres.cluster_remove '9.3' 'main'
salt '*' postgres.cluster_remove '9.3' 'main' stop=True
```
19.9.87 salt.modules.debbuild

Debian Package builder system

New in version 2015.8.0.

This system allows for all of the components to build debs safely in chrooted environments. This also provides a function to generate debian repositories

This module implements the pkgbuild interface

salt.modules.debbuild.build(runas, tgt, dest_dir, spec, sources, deps, env, template, saltenv='base',
    log_dir='/var/log/salt/pkgbuild')

Given the package destination directory, the tarball containing debian files (e.g. control) and package sources, use pbuilder to safely build the platform package

CLI Example:

```
Debian

salt '*' pkgbuild.make_src_pkg deb-8-x86_64 /var/www/html https://raw.githubusercontent.com/saltstack/libnacl/master/pkg/deb/python-libnacl.control

https://pypi.python.org/packages/source/l/libnacl/libnacl-1.3.5.tar.gz
```

This example command should build the libnacl package for Debian using pbuilder and place it in /var/www/html/ on the minion

salt.modules.debbuild.make_repo(repodir, keyid=None, env=None, use_passphrase=False,
    gnuphomen='/etc/salt/gpgkeys', runas='root', timeout=15.0)

Make a package repository and optionally sign it and packages present

Given the repodir (directory to create repository in), create a Debian repository and optionally sign it and packages present. This state is best used with onchanges linked to your package building states.

repodir The directory to find packages that will be in the repository.

keyid Changed in version 2016.3.0.

Optional Key ID to use in signing packages and repository. Utilizes Public and Private keys associated with keyid which have been loaded into the minion’s Pillar data. Leverages gpg-agent and gpg-passphrase for caching keys, etc.

For example, contents from a Pillar data file with named Public and Private keys as follows:

```
gpg_pkg_priv_key: |
-----BEGIN PGP PRIVATE KEY BLOCK-----
Version: GnuPG v1

lQOnk+nFQiFQBCADAPCtzw7I5RL32escCMZsPzaEKWesbIXIem4KCKkBoX47IG54b
w82PCE8Y1jf/9uk2m3RkWp3yCllc7Ap3gJ6v04ysVz28ubnhPxsIk0lf2cq8qc
.
.
Ebe+8jQTwqSXPRtZxmy/b5WXDep79CkLWvuGpXFor76D+ECMRPv/rawukEcNptn
RS0mgHqvydEn04pWbn8JzQ09YX/Us0SMHBVzL8eIisZIopzalvX=JvW8
-----END PGP PRIVATE KEY BLOCK-----

gpg_pkg_priv_keyname: gpg_pkg_key.pem

gpg_pkg_pub_key: |
-----BEGIN PGP PUBLIC KEY BLOCK-----
Version: GnuPG v1
```

19.9. execution modules
env  Changed in version 2016.3.0.

A dictionary of environment variables to be utilized in creating the repository.

use_passphrase  [False] New in version 2016.3.0.

Use a passphrase with the signing key presented in keyid. Passphrase is received from Pillar data which could be passed on the command line with pillar parameter. For example:

```
pillar={'gue_passphrase' : 'my_passphrase'}
```

gnuphomed  [/etc/salt/gpgkeys] New in version 2016.3.0.

Location where GPG related files are stored, used with keyid.

User to create the repository as, and optionally sign packages.

**Note:** Ensure the user has correct permissions to any files and directories which are to be utilized.

timeout  [15.0] New in version 2016.3.4.

Timeout in seconds to wait for the prompt for inputting the passphrase.

CLI Example:

```
salt '*' pkgbuild.make_repo /var/www/html
```

salt.modules.debbuild.make src pkg  

Create a platform specific source package from the given platform spec/control file and sources

CLI Example:

```
-https://raw.githubusercontent.com/ 
https://raw.githubusercontent.com/ 
https://raw.githubusercontent.com/ 
https://raw.githubusercontent.com/ 
https://raw.githubusercontent.com/ 
https://raw.githubusercontent.com/ 
https://pypi.org/packages/source/l/libnacl/libnacl-1.3.5.tar.gz
```

This example command should build the libnacl SOURCE package and place it in /var/www/html/ on the minion

**19.9.88 salt.modules.debconfmod**

Support for Debconf

salt.modules.debconfmod.get selections  

Answers to debconf questions for all packages in the following format:
['package': [['question', 'type', 'value'], ...]]

CLI Example:
```
salt '*' debconf.get_selections
```

salt.modules.debconfmod.set_(*package, question, type, value, 'extra*)
Set answers to debconf questions for a package.

CLI Example:
```
salt '*' debconf.set <package> <question> <type> <value> [<value> ...]
```

salt.modules.debconfmod.set_file(*path, saltenv='base', **kwargs*)
Set answers to debconf questions from a file.

CLI Example:
```
salt '*' debconf.set_file salt://path/to/pkg.selections
```

salt.modules.debconfmod.set_template(*path, template, context, defaults, saltenv='base', **kwargs*)
Set answers to debconf questions from a template.

path location of the file containing the package selections

*template* template format

context variables to add to the template environment

default default values for the template environment

CLI Example:
```
salt '*' debconf.set_template salt://path/to/pkg.selections.jinja jinja None None
```

salt.modules.debconfmod.show(*name*)
Answers to debconf questions for a package in the following format:

[['question', 'type', 'value'], ...]

If debconf doesn't know about a package, we return None.

CLI Example:
```
salt '*' debconf.show <package name>
```

19.9.89 salt.modules.debian_ip

The networking module for Debian based distros

References:

salt.modules.debian_ip.apply_network_settings(*settings*)
Apply global network configuration.

CLI Example:
```
salt '*' ip.apply_network_settings
```

19.9. execution modules 1377
salt.modules.debian_ip.build_bond(iface, **settings)
Create a bond script in /etc/modprobe.d with the passed settings and load the bonding kernel module.

CLI Example:
```
salt '*' ip.build_bond bond0 mode=balance-alb
```

salt.modules.debian_ip.build_interface(iface, iface_type, enabled, **settings)
Build an interface script for a network interface.

CLI Example:
```
salt '*' ip.build_interface eth0 eth <settings>
```

salt.modules.debian_ip.build_network_settings(**settings)
Build the global network script.

CLI Example:
```
salt '*' ip.build_network_settings <settings>
```

salt.modules.debian_ip.build_routes(iface, **settings)
Add route scripts for a network interface using up commands.

CLI Example:
```
salt '*' ip.build_routes eth0 <settings>
```

salt.modules.debian_ip.down(iface, iface_type)
Shutdown a network interface

CLI Example:
```
salt '*' ip.down eth0 eth
```

salt.modules.debian_ip.get_bond(iface)
Return the content of a bond script

CLI Example:
```
salt '*' ip.get_bond bond0
```

salt.modules.debian_ip.get_interface(iface)
Return the contents of an interface script

CLI Example:
```
salt '*' ip.get_interface eth0
```

salt.modules.debian_ip.get_network_settings()
Return the contents of the global network script.

CLI Example:
```
salt '*' ip.get_network_settings
```

salt.modules.debian_ip.get_routes(iface)
Return the routes for the interface

CLI Example:
salt '*' ip.get_routes eth0

salt.modules.debian_ip.up(iface, iface_type)
Start up a network interface

CLI Example:
salt '*' ip.up eth0 eth

19.9.90 salt.modules.debian_service

Service support for Debian systems (uses update-rc.d and /sbin/service)

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `service.start is not available`), see [here](#).

salt.modules.debian_service.available(name)
Returns True if the specified service is available, otherwise returns False.

CLI Example:
salt '*' service.available sshd

salt.modules.debian_service.disable(name, **kwargs)
Disable the named service to start at boot

CLI Example:
salt '*' service.disable <service name>

salt.modules.debian_service.disabled(name)
Return True if the named service is enabled, false otherwise

CLI Example:
salt '*' service.disabled <service name>

salt.modules.debian_service.enable(name, **kwargs)
Enable the named service to start at boot

CLI Example:
salt '*' service.enable <service name>

salt.modules.debian_service.enabled(name, **kwargs)
Return True if the named service is enabled, false otherwise

CLI Example:
salt '*' service.enabled <service name>

salt.modules.debian_service.force_reload(name)
Force-reload the named service

CLI Example:
salt '*' service.force_reload <service name>

salt.modules.debian_service.get_all()
Return all available boot services
CLI Example:
```
salt '*' service.get_all
```

salt.modules.debian_service.get_disabled()
Return a set of services that are installed but disabled
CLI Example:
```
salt '*' service.get_disabled
```

salt.modules.debian_service.get_enabled()
Return a list of service that are enabled on boot
CLI Example:
```
salt '*' service.get_enabled
```

salt.modules.debian_service.missing(name)
The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.
CLI Example:
```
salt '*' service.missing sshd
```

salt.modules.debian_service.reload_(name)
Reload the named service
CLI Example:
```
salt '*' service.reload <service name>
```

salt.modules.debian_service.restart(name)
Restart the named service
CLI Example:
```
salt '*' service.restart <service name>
```

salt.modules.debian_service.start(name)
Start the specified service
CLI Example:
```
salt '*' service.start <service name>
```

salt.modules.debian_service.status(name, sig=None)
Return the status for a service, pass a signature to use to find the service via ps
CLI Example:
```
salt '*' service.status <service name>
```
salt.modules.debian_service.stop(name)
Stop the specified service

CLI Example:
```
salt '*' service.stop <service name>
```

19.9.91 salt.modules.defaults

salt.modules.defaults.get(key, default=``
defaults.get is used much like pillar.get except that it will read a default value for a pillar from defaults.json or defaults.yaml files that are stored in the root of a salt formula.

CLI Example:
```
salt '*' defaults.get core:users:root
```

The defaults is computed from pillar key. The first entry is considered as the formula namespace. For example, querying core:users:root will try to load salt://core/defaults.yaml and salt://core/defaults.json.

salt.modules.defaults.merge(dest, upd)
Allows deep merging of dicts in formulas.

CLI Example: .. code-block:: bash
```
salt '*' default.merge a=b d=e
```

It is more typical to use this in a templating language in formulas, instead of directly on the command-line.

19.9.92 salt.modules.devmap

Device-Mapper module

salt.modules.devmap.multipath_flush(device)
Device-Mapper Multipath flush

CLI Example:
```
salt '*' devmap.multipath_flush mpath1
```

salt.modules.devmap.multipath_list()
Device-Mapper Multipath list

CLI Example:
```
salt '*' devmap.multipath_list
```

19.9.93 salt.modules.dig

Compendium of generic DNS utilities. The `dig' command line tool must be installed in order to use this module.

salt.modules.dig.A(host, nameserver=None)
Return the A record for host.

Always returns a list.

CLI Example:
salt ns1 dig.A www.google.com

salt.modules.dig.AAAA(host, nameserver=None)
Return the AAAA record for host.
Always returns a list.
CLI Example:
salt ns1 dig.AAAA www.google.com

salt.modules.dig.MX(domain, resolve=False, nameserver=None)
Return a list of lists for the MX of domain.
If the resolve argument is True, resolve IPs for the servers.
It's limited to one IP, because although in practice it's very rarely a round robin, it is an acceptable configuration and pulling just one IP lets the data be similar to the non-resolved version. If you think an MX has multiple IPs, don't use the resolver here, resolve them in a separate step.
CLI Example:
salt ns1 dig.MX google.com

salt.modules.dig.NS(domain, resolve=True, nameserver=None)
Return a list of IPs of the nameservers for domain
If resolve is False, don't resolve names.
CLI Example:
salt ns1 dig.NS google.com

salt.modules.dig.SPF(domain, record='SPF', nameserver=None)
Return the allowed IPv4 ranges in the SPF record for domain.
If record is SPF and the SPF record is empty, the TXT record will be searched automatically. If you know the domain uses TXT and not SPF, specifying that will save a lookup.
CLI Example:
salt ns1 dig.SPF google.com

salt.modules.dig.TXT(host, nameserver=None)
Return the TXT record for host.
Always returns a list.
CLI Example:
salt ns1 dig.TXT google.com
salt.modules.dig.check_ip(addr)
Check if address is a valid IP. returns True if valid, otherwise False.
CLI Example:
salt ns1 dig.check_ip 127.0.0.1
19.9.94 salt.modules.disk

Module for managing disks and blockdevices

salt.modules.disk.blkid(device=None)

Return block device attributes: UUID, LABEL, etc. This function only works on systems where blkid is available.

CLI Example:

```
salt '*' disk.blkid
salt '*' disk.blkid /dev/sda
```

salt.modules.disk.dump(device, args=None)

Return all contents of dumpe2fs for a specified device

CLI Example: .. code-block:: bash

```
salt '*' disk.dump /dev/sda1
```

salt.modules.disk.format_(device, fs_type='ext4', inode_size=None, lazy_itable_init=None, force=False)

Format a filesystem onto a device

New in version 2016.11.0.

device The device in which to create the new filesystem
fs_type The type of filesystem to create
inode_size Size of the inodes

This option is only enabled for ext and xfs filesystems

lazy_itable_init If enabled and the uninit_bg feature is enabled, the inode table will not be fully initialized by mke2fs. This speeds up filesystem initialization noticeably, but it requires the kernel to finish initializing the filesystem in the background when the filesystem is first mounted. If the option value is omitted, it defaults to 1 to enable lazy inode table zeroing.

This option is only enabled for ext filesystems

force Force mke2fs to create a filesystem, even if the specified device is not a partition on a block special device. This option is only enabled for ext and xfs filesystems

This option is dangerous, use it with caution.

CLI Example:

```
salt '*' disk.format /dev/sdX1
```

salt.modules.disk.fstype(device)

Return the filesystem name of the specified device

New in version 2016.11.0.

device The name of the device

CLI Example:

```
salt '*' disk.fstype /dev/sdX1
```

salt.modules.disk.hdparmss(disks, args=None)

Retrieve all info's for all disks parse 'em into a nice dict (which, considering hdparm output, is quite a hassle)

New in version 2016.3.0.

CLI Example: .. code-block:: bash

```
salt '*' disk.hdparmss /dev/sda
```
salt.modules.disk.hpa(disks, size=None)

Get/set Host Protected Area settings

T13 INCITS 346-2001 (1367D) defines the BEER (Boot Engineering Extension Record) and PARTIES (Protected Area Run Time Interface Extension Services), allowing for a Host Protected Area on a disk.

It’s often used by OEMS to hide parts of a disk, and for overprovisioning SSD’s

**Warning:** Setting the HPA might clobber your data, be very careful with this on active disks!

New in version 2016.3.0.

CLI Example:

```bash
salt '*' disk.hpa /dev/sda
salt '*' disk.hpa /dev/sda 5%
salt '*' disk.hpa /dev/sda 10543256
```

salt.modules.disk_inodeusage(args=None)

Return inode usage information for volumes mounted on this minion

CLI Example:

```bash
salt '*' disk.inodeusage
```

salt.modules.disk.iostat(interval=1, count=5, disks=None)

Gather and return (averaged) IO stats.

New in version 2016.3.0.

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```bash
salt '*' disk.iostat 1 5 disks=sda
```

salt.modules.disk.percent(args=None)

Return partition information for volumes mounted on this minion

CLI Example:

```bash
salt '*' disk.percent /var
```

salt.modules.disk.resize2fs(device)

Resizes the filesystem.

CLI Example: .. code-block:: bash

```bash
salt '*' disk.resize2fs /dev/sda1
```

salt.modules.disk.smart_attributes(dev, attributes=None, values=None)

Fetch SMART attributes Providing attributes will deliver only requested attributes Providing values will deliver only requested values for attributes

Default is the Backblaze recommended set (https://www.backblaze.com/blog/hard-drive-smart-stats/): (5,187,188,197,198)

New in version 2016.3.0.

CLI Example:
salt.modules.disk.tune(device, **kwargs)
Set attributes for the specified device

CLI Example:
salt '*' disk.tune /dev/sda1 read-ahead=1024 read-write=True

Valid options are: read-ahead, filesystem-read-ahead, read-only, read-write.
See the blockdev(8) manpage for a more complete description of these options.

salt.modules.disk.usage(args=None)
Return usage information for volumes mounted on this minion

CLI Example:
salt '*' disk.usage

salt.modules.disk.wipe(device)
Remove the filesystem information

CLI Example:
salt '*' disk.wipe /dev/sda1

19.9.95 salt.modules.djangomod
Manage Django sites

salt.modules.djangomod.collectstatic(settings_module, bin_env=None, no_post_process=False, ignore=None, dry_run=False, clear=False, link=False, no_default_ignore=False, pythonpath=None, env=None)
Collect static files from each of your applications into a single location that can easily be served in production.

CLI Example:
salt '*' django.collectstatic <settings_module>

salt.modules.djangomod.command(settings_module, command, bin_env=None, pythonpath=None, env=None, *args, **kwargs)
Run arbitrary django management command

CLI Example:
salt '*' django.command <settings_module> <command>

salt.modules.djangomod.createsuperuser(settings_module, username, email, bin_env=None, database=None, pythonpath=None, env=None)
Create a super user for the database. This function defaults to use the --noinput flag which prevents the creation of a password for the superuser.

CLI Example:
salt '*' django.createsuperuser <settings_module> user user@example.com
salt.modules.djangomod.loaddata(settings_module, fixtures, bin_env=None, database=None, pythonpath=None, env=None)

Load fixture data
Fixtures: comma separated list of fixtures to load
CLI Example:

```
salt '*' django.loaddata <settings_module> <comma delimited list of fixtures>
```

salt.modules.djangomod.syncdb(settings_module, bin_env=None, migrate=False, database=None, pythonpath=None, env=None, noinput=True)

Run syncdb
Execute the Django-Admin syncdb command, if South is available on the minion the migrate option can be passed as True calling the migrations to run after the syncdb completes
CLI Example:

```
salt '*' django.syncdb <settings_module>
```

19.9.96 salt.modules.dnsmasq

Module for managing dnsmasq
salt.modules.dnsmasq.fullversion()

Shows installed version of dnsmasq and compile options.
CLI Example:

```
salt '*' dnsmasq.fullversion
```

salt.modules.dnsmasq.get_config(config_file='/etc/dnsmasq.conf')

Dumps all options from the config file.
cfg_file The location of the config file from which to obtain contents. Defaults to /etc/dnsmasq.conf.
CLI Examples:

```
salt '*' dnsmasq.get_config
salt '*' dnsmasq.get_config config_file=/etc/dnsmasq.conf
```

salt.modules.dnsmasq.set_config(config_file='~/etc/dnsmasq.conf', follow=True, **kwargs)

Sets a value or a set of values in the specified file. By default, if conf-dir is configured in this file, salt will attempt to set the option in any file inside the conf-dir where it has already been enabled. If it does not find it inside any files, it will append it to the main config file. Setting follow to False will turn off this behavior.

If a config option currently appears multiple times (such as dhcp-host, which is specified at least once per host), the new option will be added to the end of the main config file (and not to any includes). If you need an option added to a specific include file, specify it as the config_file.

Parameters

- **config_file (string)** -- config file where settings should be updated / added.
- **follow (bool)** -- attempt to set the config option inside any file within the conf-dir where it has already been enabled.
- **kwargs** -- key value pairs that contain the configuration settings that you want set.

CLI Examples:
salt modules.dnsmasq.version()
Shows installed version of dnsmasq.
CLI Example:
salt '*' dnsmasq.version

19.9.97 salt.modules.dnsmasq
Compendium of generic DNS utilities.

Note: Some functions in the dnsutil execution module depend on dig.

salt.modules.dnsmasq.A(host, nameserver=None)
Return the A record(s) for host.
Always returns a list.
CLI Example:
salt ns1 dnsutil.A www.google.com
	salt.modules.dnsmasq.AAAA(host, nameserver=None)
Return the AAAA record(s) for host.
Always returns a list.
New in version 2014.7.5.
CLI Example:
salt ns1 dnsutil.AAAA www.google.com
	salt.modules.dnsmasq.MX(domain, resolve=False, nameserver=None)
Return a list of lists for the MX of domain.
If the 'resolve' argument is True, resolve IPs for the servers.
It's limited to one IP, because although in practice it's very rarely a round robin, it is an acceptable configuration and pulling just one IP lets the data be similar to the non-resolved version. If you think an MX has multiple IPs, don't use the resolver here, resolve them in a separate step.
CLI Example:
salt ns1 dnsutil.MX google.com
	salt.modules.dnsmasq.NS(domain, resolve=True, nameserver=None)
Return a list of IPs of the nameservers for domain
If 'resolve' is False, don't resolve names.
CLI Example:
salt ns1 dnsutil.NS google.com

salt.modules.dnsutil.SPF(domain, record='SPF', nameserver=None)
Return the allowed IPv4 ranges in the SPF record for domain.

If record is SPF and the SPF record is empty, the TXT record will be searched automatically. If you know the
domain uses TXT and not SPF, specifying that will save a lookup.

CLI Example:
salt ns1 dnsutil.SPF google.com

salt.modules.dnsutil.check_ip(ip_addr)
Check that string ip_addr is a valid IP

CLI Example:
salt ns1 dnsutil.check_ip 127.0.0.1

salt.modules.dnsutil.hosts_append(hostsfile='/etc/hosts', ip_addr=None, entries=None)
Append a single line to the /etc/hosts file.

CLI Example:
salt '*' dnsutil.hosts_append /etc/hosts 127.0.0.1 ad1.yuk.co,ad2.yuk.co

salt.modules.dnsutil.hosts_remove(hostsfile='/etc/hosts', entries=None)
Remove a host from the /etc/hosts file. If doing so will leave a line containing only an IP address, then the
line will be deleted. This function will leave comments and blank lines intact.

CLI Examples:
salt '*' dnsutil.hosts_remove /etc/hosts ad1.yuk.co
salt '*' dnsutil.hosts_remove /etc/hosts ad2.yuk.co,ad1.yuk.co

salt.modules.dnsutil.parse_hosts(hostsfile='/etc/hosts', hosts=None)
Parse /etc/hosts file.

CLI Example:
salt '*' dnsutil.parse_hosts

salt.modules.dnsutil.parse_zone(zonefile=None, zone=None)
Parses a zone file. Can be passed raw zone data on the API level.

CLI Example:
salt ns1 dnsutil.parse_zone /var/lib/named/example.com.zone

salt.modules.dnsutil.serial(zone='', update=False)
Return, store and update a dns serial for your zone files.

zone: a keyword for a specific zone
update: store an updated version of the serial in a grain

If update is False, the function will retrieve an existing serial or return the current date if no serial is stored.
Nothing will be stored
If `update` is True, the function will set the serial to the current date if none exist or if the existing serial is for a previous date. If a serial for greater than the current date is already stored, the function will increment it.

This module stores the serial in a grain, you can explicitly set the stored value as a grain named `dnsserial_<zone_name>`.

CLI Example:

```
salt ns1 dnsutil.serial example.com
```

### 19.9.98 `salt.modules.dockercompose` module

Module to import docker-compose via saltstack

New in version 2016.3.0.

- **Maintainer**: Jean Praloran <jeanpralo@gmail.com>
- **Maturity**: New
- **Depends**: docker-compose>=1.5
- **Platform**: All

#### Introduction

This module allows one to deal with docker-compose file in a directory.

This is a first version only, the following commands are missing at the moment but will be built later on if the community is interested in this module:

- run
- logs
- port
- scale

#### Installation Prerequisites

This execution module requires at least version 1.4.0 of both docker-compose and Docker. docker-compose can easily be installed using `pip.install`:

```
salt myminion pip.install docker-compose>=1.5.0
```

#### How to use this module?

In order to use the module if you have no docker-compose file on the server you can issue the command create, it takes two arguments the path where the docker-compose.yml will be stored and the content of this latter:

```
# salt-call -l debug dockercompose.create /tmp/toto 'database:
  image: mongo:3.0
  command: mongod --smallfiles --quiet --logpath=/dev/null`
```
Then you can execute a list of method defined at the bottom with at least one argument (the path where the docker-compose.yml will be read) and an optional python list which corresponds to the services names:

```
# salt-call -l debug dockercompose.up /tmp/toto
# salt-call -l debug dockercompose.restart /tmp/toto '[database]'
# salt-call -l debug dockercompose.stop /tmp/toto
# salt-call -l debug dockercompose.rm /tmp/toto
```

**Docker-compose method supported**

- `up`
- `restart`
- `stop`
- `start`
- `pause`
- `unpause`
- `kill`
- `rm`
- `ps`
- `pull`
- `build`

**Functions**

- `docker-compose.yml management`
  - `dockercompose.create`
  - `dockercompose.get`

- **Manage containers**
  - `dockercompose.restart`
  - `dockercompose.stop`
  - `dockercompose.pause`
  - `dockercompose.unpause`
  - `dockercompose.start`
  - `dockercompose.kill`
  - `dockercompose.rm`
  - `dockercompose.up`

- **Manage containers image**:
  - `dockercompose.pull`
  - `dockercompose.build`

- **Gather information about containers**:
Detailed Function Documentation

**salt.modules.dockercompose.build**(path, service_names=None)

Build image for containers in the docker-compose file. service_names is a python list, if omitted build images for all containers. Please note that at the moment the module does not allow you to upload your Dockerfile, nor any other file you could need with your docker-compose.yml, you will have to make sure the files you need are actually in the directory specified in the `build` keyword.

* `path` Path where the docker-compose file is stored on the server
* `service_names` If specified will pull only the image for the specified services

CLI Example:

```
salt myminion dockercompose.build /path/where/docker-compose/stored
salt myminion dockercompose.build /path/where/docker-compose/stored '[janus]' 
```

**salt.modules.dockercompose.create**(path, docker_compose)

Create and validate a docker-compose file into a directory.

* `path` Path where the docker-compose file will be stored on the server
* `docker_compose` docker_compose file

CLI Example:

```
salt myminion dockercompose.create /path/where/docker-compose/stored content
```

**salt.modules.dockercompose.get**(path)

Get the content of the docker-compose file into a directory.

* `path` Path where the docker-compose file is stored on the server

CLI Example:

```
salt myminion dockercompose.get /path/where/docker-compose/stored
```

**salt.modules.dockercompose.kill**(path, service_names=None)

Kill containers in the docker-compose file. service_names is a python list, if omitted kill all containers.

* `path` Path where the docker-compose file is stored on the server
* `service_names` If specified will kill only the specified services

CLI Example:

```
salt myminion dockercompose.kill /path/where/docker-compose/stored
salt myminion dockercompose.kill /path/where/docker-compose/stored '[janus]' 
```

**salt.modules.dockercompose.pause**(path, service_names=None)

Pause running containers in the docker-compose file. service_names is a python list, if omitted pause all containers.

* `path` Path where the docker-compose file is stored on the server
* `service_names` If specified will pause only the specified services

CLI Example:

```
salt myminion dockercompose.pause /path/where/docker-compose/stored
salt myminion dockercompose.pause /path/where/docker-compose/stored '[janus]' 
```

**salt.modules.dockercompose.ps**(path)

List all running containers and report some information about them.

* `path` Path where the docker-compose file is stored on the server

CLI Example:
salt.myminion.dockercompose.ps /path/where/docker-compose/stored

salt.modules.dockercompose.pull(path, service_names=None)
    Pull image for containers in the docker-compose file, service_names is a python list, if omitted pull all images
    path  Path where the docker-compose file is stored on the server
    service_names  If specified will pull only the image for the specified services
    CLI Example:

    salt myminion dockercompose.pull /path/where/docker-compose/stored
    salt myminion dockercompose.pull /path/where/docker-compose/stored '[janus]'

salt.modules.dockercompose.restart(path, service_names=None)
    Restart container(s) in the docker-compose file, service_names is a python list, if omitted restart all containers
    path  Path where the docker-compose file is stored on the server
    service_names  If specified will restart only the specified services
    CLI Example:

    salt myminion dockercompose.restart /path/where/docker-compose/stored
    salt myminion dockercompose.restart /path/where/docker-compose/stored '[janus]'

salt.modules.dockercompose.rm(path, service_names=None)
    Remove stopped containers in the docker-compose file, service_names is a python list, if omitted remove all stopped containers
    path  Path where the docker-compose file is stored on the server
    service_names  If specified will remove only the specified stopped services
    CLI Example:

    salt myminion dockercompose.rm /path/where/docker-compose/stored
    salt myminion dockercompose.rm /path/where/docker-compose/stored '[janus]'

salt.modules.dockercompose.start(path, service_names=None)
    Start containers in the docker-compose file, service_names is a python list, if omitted start all containers
    path  Path where the docker-compose file is stored on the server
    service_names  If specified will start only the specified services
    CLI Example:

    salt myminion dockercompose.start /path/where/docker-compose/stored
    salt myminion dockercompose.start /path/where/docker-compose/stored '[janus]'

salt.modules.dockercompose.stop(path, service_names=None)
    Stop running containers in the docker-compose file, service_names is a python list, if omitted stop all containers
    path  Path where the docker-compose file is stored on the server
    service_names  If specified will stop only the specified services
    CLI Example:

    salt myminion dockercompose.stop /path/where/docker-compose/stored
    salt myminion dockercompose.stop /path/where/docker-compose/stored '[janus]'

salt.modules.dockercompose.unpause(path, service_names=None)
    Un-Pause containers in the docker-compose file, service_names is a python list, if omitted un-pause all containers
    path  Path where the docker-compose file is stored on the server
    service_names  If specified will un-pause only the specified services
    CLI Example:
salt.myminion dockercompose.pause /path/where/docker-compose/stored
salt.myminion dockercompose.pause /path/where/docker-compose/stored '[janus]'
salt.modules.dockercompose.up(path, service_names=None)
    Create and start containers defined in the docker-compose.yml file located in path, service_names is a python list, if omitted create and start all containers
    path Path where the docker-compose file is stored on the server
    service_names If specified will create and start only the specified services
    CLI Example:
salt myminion dockercompose.up /path/where/docker-compose/stored
salt.myminion dockercompose.up /path/where/docker-compose/stored '[janus]'

19.9.99 salt.modules.dockermod

Management of Docker Containers
New in version 2015.8.0.
Changed in version 2017.7.0: This module has replaced the legacy docker execution module.
    depends docker Python module

Note: Older releases of the Python bindings for Docker were called docker-py in PyPI. All releases of docker, and releases of docker-py >= 1.6.0 are supported. These python bindings can easily be installed using pip.install:
salt myminion pip.install docker

To upgrade from docker-py to docker, you must first uninstall docker-py, and then install docker:
salt myminion pip.uninstall docker-py
salt.myminion pip.install docker

Authentication

If you have previously performed a docker login from the minion, then the credentials saved in ~/.docker/config.json will be used for any actions which require authentication. If not, then credentials can be configured in Pillar data. The configuration schema is as follows:
docker-registries:
    <registry_url>:
        username: <username>
        password: <password>

For example:
docker-registries:
    hub:
        username: foo
        password: s3cr3t
Note: As of the 2016.3.7, 2016.11.4, and 2017.7.0 releases of Salt, credentials for the Docker Hub can be configured simply by specifying hub in place of the registry URL. In earlier releases, it is necessary to specify the actual registry URL for the Docker Hub (i.e. https://index.docker.io/v1/).

More than one registry can be configured. Salt will look for Docker credentials in the docker-registries Pillar key, as well as any key ending in -docker-registries. For example:

```yaml
docker-registries:
  'https://mydomain.tld/registry:5000':
    username: foo
    password: s3cr3t

foo-docker-registries:
  https://index.foo.io/v1/:
    username: foo
    password: s3cr3t

bar-docker-registries:
  https://index.bar.io/v1/:
    username: foo
    password: s3cr3t
```

To login to the configured registries, use the `docker.login` function. This only needs to be done once for a given registry, and it will store/update the credentials in `~/.docker/config.json`.

Note: For Salt releases before 2016.3.7 and 2016.11.4, `docker.login` is not available. Instead, Salt will try to authenticate using each of your configured registries for each push/pull, behavior which is not correct and has been resolved in newer releases.

### Configuration Options

The following configuration options can be set to fine-tune how Salt uses Docker:

- `docker.url`: URL to the docker service (default: local socket).
- `docker.version`: API version to use (should not need to be set manually in the vast majority of cases)
- `docker.exec_driver`: Execution driver to use, one of nsenter, lxc-attach, or docker-exec. See the Executing Commands Within a Running Container section for more details on how this config parameter is used.

These configuration options are retrieved using `config.get` (click the link for further information).

### Executing Commands Within a Running Container

Note: With the release of Docker 1.13.1, the Execution Driver has been removed. Starting in versions 2016.3.6, 2016.11.4, and 2017.7.0, Salt defaults to using `docker exec` to run commands in containers, however for older Salt releases it will be necessary to set the `docker.exec_driver` config option to either `docker-exec` or `nsenter` for Docker versions 1.13.1 and newer.

Multiple methods exist for executing commands within Docker containers:
- lxc-attach: Default for older versions of docker
- nsenter: Enters container namespace to run command
- docker-exec: Native support for executing commands in Docker containers (added in Docker 1.3)

Adding a configuration option (see config.get) called docker.exec_driver will tell Salt which execution driver to use:

```
docker.exec_driver: docker-exec
```

If this configuration option is not found, Salt will use the appropriate interface (either nsenter or lxc-attach) based on the Execution Driver value returned from docker info. docker-exec will not be used by default, as it is presently (as of version 1.6.2) only able to execute commands as the effective user of the container. Thus, if a USER directive was used to run as a non-privileged user, docker-exec would be unable to perform the action as root. Salt can still use docker-exec as an execution driver, but must be explicitly configured (as in the example above) to do so at this time.

If possible, try to manually specify the execution driver, as it will save Salt a little work.

This execution module provides functions that shadow those from the cmd module. They are as follows:

- docker.retcode
- docker.run
- docker.run_all
- docker.run_stderr
- docker.run_stdout
- docker.script
- docker.script_retcode

Detailed Function Documentation

salt.modules.dockermod.build(path=None, image=None, cache=True, rm=True, api_response=False, fileobj=None, dockerfile=None, buildargs=None)

Builds a docker image from a Dockerfile or a URL

- **path** Path to directory on the Minion containing a Dockerfile
- **image** Image to be built, in repo:tag notation. If just the repository name is passed, a tag name of latest will be assumed. If building from a URL, this parameted can be omitted.
- **cache** [True] Set to False to force the build process not to use the Docker image cache, and pull all required intermediate image layers
- **rm** [True] Remove intermediate containers created during build
- **api_response** [False] If True: an API_Response key will be present in the return data, containing the raw output from the Docker API.
- **fileobj** Allows for a file-like object containing the contents of the Dockerfile to be passed in place of a file path argument. This argument should not be used from the CLI, only from other Salt code.
- **dockerfile** Allows for an alternative Dockerfile to be specified. Path to alternative Dockerfile is relative to the build path for the Docker container.

New in version develop.

**buildargs** A dictionary of build arguments provided to the docker build process.

**RETURN DATA**

A dictionary containing one or more of the following keys:

- **Id** - ID of the newly-built image
- **Time_Elapsed** - Time in seconds taken to perform the build
• Intermediate Containers - IDs of containers created during the course of the build process
  *(Only present if rm=False)*

• Images - A dictionary containing one or more of the following keys:
  - Already_Pulled - Layers that that were already present on the Minion
  - Pulled - Layers that that were pulled
  *(Only present if the image specified by the `image` argument was not present on the Minion, or if cache=False)*

• Status - A string containing a summary of the pull action (usually a message saying that an image was downloaded, or that it was up to date).
  *(Only present if the image specified by the `image` argument was not present on the Minion, or if cache=False)*

CLI Example:
```
salt myminion docker.build /path/to/docker/build/dir image=myimage:dev
salt myminion docker.build https://github.com/myuser/myrepo.git image=myimage:latest
```

.. versionadded:: develop

```
salt myminion docker.build /path/to/docker/build/dir dockerfile=Dockefile. different image=myimage:dev
```

```
salt.modules.dockermod.call(name, function, *args, **kwargs)
Executes a Salt function inside a running container
New in version 2016.11.0.
The container does not need to have Salt installed, but Python is required.

*name* Container name or ID
*function* Salt execution module function
```

CLI Example:
```
salt myminion docker.call test.ping
salt myminion test.arg arg1 arg2 key1=val1
salt myminion dockerng.call compassionate_mirzakhani test.arg arg1 arg2 key1=val1
```

```
salt.modules.dockermod.commit(name, image, message=None, author=None)
Commits a container, thereby promoting it to an image. Equivalent to running the docker commit Docker CLI command.

*name* Container name or ID to commit
*image* Image to be committed, in repo:tag notation. If just the repository name is passed, a tag name of latest will be assumed.
*message* Commit message (Optional)
*author* Author name (Optional)
```

**RETURN DATA**
A dictionary containing the following keys:
  • Id - ID of the newly-created image
  • Image - Name of the newly-created image
  • Time_Elapsed - Time in seconds taken to perform the commit

CLI Example:
```
salt myminion docker.commit mycontainer myuser/myimage
salt myminion docker.commit mycontainer myuser/myimage:mytag
```
salt.modules.dockermod.compare_container(first, second, ignore=None)

New in version 2017.7.0.

Compare two containers' Config and HostConfig and return any differences between the two.

- **first**: Name or ID of first container
- **second**: Name or ID of second container
- **ignore**: A comma-separated list (or Python list) of keys to ignore when comparing. This is useful when comparing two otherwise identical containers which have different hostnames.

salt.modules.dockermod.connect_container_to_network(container, network_id, ipv4_address=None)

Connect container to network.

- **container**: Container name or ID
- **network_id**: ID of network
- **ipv4_address**: The IPv4 address to connect to the container

New in version 2017.7.0.

CLI Example:

```shell
salt myminion docker.connect_container_from_network web-1
```

salt.modules.dockermod.copy_from(name, *args, **kwargs)

Copy a file from inside a container to the Minion.

- **name**: Container name
- **source**: Path of the file on the container's filesystem
- **dest**: Destination on the Minion. Must be an absolute path. If the destination is a directory, the file will be copied into that directory.
- **overwrite**: [False] Unless this option is set to True, then if a file exists at the location specified by the dest argument, an error will be raised.
- **makedirs**: [False] Create the parent directory on the container if it does not already exist.

RETURN DATA

A boolean (True if successful, otherwise False)

CLI Example:

```shell
salt myminion docker.copy_from mycontainer /var/log/nginx/access.log /home/myuser
```

salt.modules.dockermod.copy_to(name, *args, **kwargs)

Copy a file from the host into a container.

- **name**: Container name
- **source**: File to be copied to the container. Can be a local path on the Minion or a remote file from the Salt fileserver.
- **dest**: Destination on the container. Must be an absolute path. If the destination is a directory, the file will be copied into that directory.
- **exec_driver**: [None] If not passed, the execution driver will be detected as described above.
- **overwrite**: [False] Unless this option is set to True, then if a file exists at the location specified by the dest argument, an error will be raised.
- **makedirs**: [False] Create the parent directory on the container if it does not already exist.

RETURN DATA

A boolean (True if successful, otherwise False)

CLI Example:

```shell
salt myminion docker.copy_to mycontainer /tmp/foo /root/foo
```
salt.modules.dockermod.create(*args, **kwargs)

Create a new container

- **image**: Image from which to create the container
- **name**: Name for the new container. If not provided, Docker will randomly generate one for you (it will be included in the return data).
- **skip_translate**: This function translates Salt CLI or SLS input into the format which docker-py expects. However, in the event that Salt’s translation logic fails (due to potential changes in the Docker Remote API, or to bugs in the translation code), this argument can be used to exert granular control over which arguments are translated and which are not.

Pass this argument as a comma-separated list (or Python list) of arguments, and translation for each passed argument name will be skipped. Alternatively, pass `True` and all translation will be skipped.

Skipping translation allows for arguments to be formatted directly in the format which docker-py expects. This allows for API changes and other issues to be more easily worked around. An example of using this option to skip translation would be:

```bash
salt myminion docker.create image=centos:7.3.1611 skip_translate=environment --environment='{"FOO': 'bar'}'
```

See the following links for more information:

- docker-py Low-level API
- Docker Engine API

- **ignore_collisions**: [False] Since many of docker-py’s arguments differ in name from their CLI counterparts (with which most Docker users are more familiar), Salt detects usage of these and aliases them to the docker-py version of that argument. However, if both the alias and the docker-py version of the same argument (e.g. `env` and `environment`) are used, an error will be raised. Set this argument to `True` to suppress these errors and keep the docker-py version of the argument.

- **validate_ip_addrs**: [True] For parameters which accept IP addresses as input, IP address validation will be performed. To disable, set this to `False`

- **client_timeout**: [60] Timeout in seconds for the Docker client. This is not a timeout for this function, but for receiving a response from the API.

**Note**: This is only used if Salt needs to pull the requested image.

### CONTAINER CONFIGURATION ARGUMENTS

- **auto_remove** (or **rm**): [False] Enable auto-removal of the container on daemon side when the container’s process exits (analogous to running a docker container with `--rm` on the CLI).

Examples:

- `auto_remove=True`
- `rm=True`

- **binds**: Files/directories to bind mount. Each bind mount should be passed in one of the following formats:

  - `<host_path>:<container_path>` - `host_path` is mounted within the container as `container_path` with read-write access.
  - `<host_path>:<container_path>:<se linux_context>` - `host_path` is mounted within the container as `container_path` with read-write access. Additionally, the specified se linux context will be set within the container.
  - `<host_path>:<container_path>:<read_only>` - `host_path` is mounted within the container as `container_path`, with the read-only or read-write setting explicitly defined.
- `<host_path>:<container_path>:<read_only>,<selinux_context>`
  host_path is mounted within the container as container_path, with the read-only or read-write setting explicitly defined. Additionally, the specified selinux context will be set within the container.

<read_only> can be either `ro` for read-write access, or `ro` for read-only access. When omitted, it is assumed to be read-write.

<selinux_context> can be `z` if the volume is shared between multiple containers, or `Z` if the volume should be private.

**Note:** When both <read_only> and <selinux_context> are specified, there must be a comma before <selinux_context>.

Binds can be expressed as a comma-separated list or a Python list, however in cases where both ro/rw and an selinux context are specified, the binds must be specified as a Python list.

Examples:
- `binds=/srv/www:/var/www:ro`
- `binds=/srv/www:/var/www:rw`
- `binds=/srv/www:/var/www`
- `binds="[/srv/www:/var/www:ro,Z]"
- `binds="[/srv/www:/var/www:rw,Z]"
- `binds=/srv/www:/var/www:Z`

**Note:** The second and third examples above are equivalent to each other, as are the last two examples.

`blkio_weight` Block IO weight (relative weight), accepts a weight value between 10 and 1000.

Example: `blkio_weight=100`

`blkio_weight_device` Block IO weight (relative device weight), specified as a list of expressions in the format PATH:WEIGHT

Example: `blkio_weight_device=/dev/sda:100`

`cap_add` List of capabilities to add within the container. Can be passed as a comma-separated list or a Python list. Requires Docker 1.2.0 or newer.

Examples:
- `cap_add=SYS_ADMIN,MKNOD`
- `cap_add="[SYS_ADMIN,MKNOD]"

`cap_drop` List of capabilities to drop within the container. Can be passed as a comma-separated string or a Python list. Requires Docker 1.2.0 or newer.

Examples:
- `cap_drop=SYS_ADMIN,MKNOD`
- `cap_drop="[SYS_ADMIN,MKNOD]"

`command (or cmd)` Command to run in the container

Example: `command=bash` or `cmd=bash`

Changed in version 2015.8.1: cmd is now also accepted
**cpuset_cpus** (or **cpuset**) CPUs on which to allow execution, specified as a string containing a range (e.g. `0-3`) or a comma-separated list of CPUs (e.g. `0,1`).

Examples:

- cpuset_cpus="0-3"
- cpuset="0,1"

**cpuset_mems** Memory nodes on which to allow execution, specified as a string containing a range (e.g. `0-3`) or a comma-separated list of MEMs (e.g. `0,1`). Only effective on NUMA systems.

Examples:

- cpuset_mems="0-3"
- cpuset_mems="0,1"

**cpu_group** The length of a CPU period in microseconds

Example: cpu_group=100000

**cpu_period** Microseconds of CPU time that the container can get in a CPU period

Example: cpu_period=50000

**cpu_shares** CPU shares (relative weight), specified as an integer between 2 and 1024.

Example: cpu_shares=512

**detach** [False] If True, run the container's command in the background (daemon mode)

Example: detach=True

**devices** List of host devices to expose within the container

Examples:

- devices="/dev/net/tun, /dev/xvda1, /dev/xvdb1, /dev/xvdb1:r"
- devices="['/dev/net/tun', '/dev/xvda1', '/dev/xvdb1', '/dev/xvdb1:r']"

**device_read_bps** Limit read rate (bytes per second) from a device, specified as a list of expressions in the format `PATH:RATE`, where RATE is either an integer number of bytes, or a string ending in `kb`, `mb`, or `gb`.

Examples:

- device_read_bps="/dev/sda:1mb, /dev/sdb:5mb"
- device_read_bps="['/dev/sda:100mb', '/dev/sdb:5mb']"

**device_read_iops** Limit read rate (I/O per second) from a device, specified as a list of expressions in the format `PATH:RATE`, where RATE is a number of I/O operations.

Examples:

- device_read_iops="/dev/sda:1000, /dev/sdb:500"
- device_read_iops="['/dev/sda:1000', '/dev/sdb:500']"

**device_write_bps** Limit write rate (bytes per second) from a device, specified as a list of expressions in the format `PATH:RATE`, where RATE is either an integer number of bytes, or a string ending in `kb`, `mb` or `gb`.

Examples:

- device_write_bps="/dev/sda:100mb, /dev/sdb:50mb"
- device_write_bps="['/dev/sda:100mb', '/dev/sdb:50mb']"

**device_read_iops** Limit write rate (I/O per second) from a device, specified as a list of expressions in the format `PATH:RATE`, where RATE is a number of I/O operations.

Examples:
• device_read_iops="/dev/sda:1000,/dev/sdb:500"
• device_read_iops="["/dev/sda:1000","/dev/sdb:500"]"

dns List of DNS nameservers. Can be passed as a comma-separated list or a Python list.
Examples:
• dns=8.8.8.8,8.8.4.4
• dns="[8.8.8.8,'8.8.4.4']"

Note: To skip IP address validation, use validate_ip_addrs=False

dns_opt Additional options to be added to the container’s resolv.conf file
Example: dns_opt=ndots:9
dns_search List of DNS search domains. Can be passed as a comma-separated list or a Python list.
Examples:
• dns_search=foo1.domain.tld,foo2.domain.tld
• dns_search="[foo1.domain.tld,foo2.domain.tld]"
domainname The domain name to use for the container
Example: domainname=domain.tld
entrypoint Entrypoint for the container. Either a string (e.g. "mycmd --arg1 --arg2") or a Python list (e.g. "["mycmd'(),'--arg1','--arg2'"])"
Examples:
• entrypoint="cat access.log"
• entrypoint="["cat'(),'access.log'"]"
environment (or env) Either a dictionary of environment variable names and their values, or a Python list of strings in the format VARNAME=value.
Examples:
• environment='VAR1=value,VAR2=value'
• environment="['VAR1'=value','VAR2'=value']"
• environment="{"VAR1": 'value','VAR2': 'value'}"
extra_hosts Additional hosts to add to the container’s /etc/hosts file. Can be passed as a comma-separated list or a Python list. Requires Docker 1.3.0 or newer.
Examples:
• extra_hosts=web1:10.9.8.7,web2:10.9.8.8
• extra_hosts="['web1:10.9.8.7','web2:10.9.8.8']"
• extra_hosts="['web1': '10.9.8.7','web2': '10.9.8.8']"

Note: To skip IP address validation, use validate_ip_addrs=False
group_add List of additional group names and/or IDs that the container process will run as
Examples:
• group_add=web,network
• group_add="["web'(),'network'"]"
hostname  Hostname of the container. If not provided, and if a name has been provided, the hostname will default to the name that was passed.

Example: hostname=web1

**Warning:** If the container is started with `network_mode=host`, the hostname will be overridden by the hostname of the Minion.

**interactive (or stdin_open):** False  Leave stdin open, even if not attached

Examples:

- interactive=True
- stdin_open=True

**ipc_mode (or ipc):** Set the IPC mode for the container. The default behavior is to create a private IPC namespace for the container, but this option can be used to change that behavior:

- container: <container_name_or_id> reuses another container shared memory, semaphores and message queues
- host: use the host's shared memory, semaphores and message queues

Examples:

- ipc_mode=container:foo
- ipc=host

**Warning:** Using host gives the container full access to local shared memory and is therefore considered insecure.

**isolation:** Specifies the type of isolation technology used by containers

Example: isolation=hyperv

**Note:** The default value on Windows server is process, while the default value on Windows client is hyperv. On Linux, only default is supported.

**labels (or label):** Add metadata to the container. Labels can be set both with and without values:

Examples *(with values):*

- labels="label1=value1,label2=value2"
- labels="["label1=value1","label2=value2"]"
- labels="{"label1": "value1","label2": "value2"}"

Examples *(without values):*

- labels=label1,label2
- labels="["label1","label2"]"

**links:** Link this container to another. Links should be specified in the format `<container_name_or_id>:<link_alias>`. Multiple links can be passed, either as a comma separated list or a Python list.

Examples:

- links=web1:link1,web2:link2,
- links="['web1:link1','web2:link2']"
- links="{"web1': 'link1','web2': 'link2'}"

**log_driver** Set container's logging driver. Requires Docker 1.6 or newer.

Example:

- log_driver=syslog

---

**Note:** The logging driver feature was improved in Docker 1.13 introducing option name changes. Please see Docker's Configure logging drivers documentation for more information.

**log_opt** Config options for the log_driver config option. Requires Docker 1.6 or newer.

Example:

- log_opt="syslog-address=tcp://192.168.0.42,syslog-facility=daemon"
- log_opt="['syslog-address=tcp://192.168.0.42','syslog-facility=daemon']"
- log_opt="{"syslog-address": 'tcp://192.168.0.42','syslog-facility': 'daemon'}"

**lxc_conf** Additional LXC configuration parameters to set before starting the container.

Examples:

- lxc_conf="lxc.utsname=docker,lxc.arch=x86_64"
- lxc_conf="['lxc.utsname=docker','lxc.arch=x86_64']"
- lxc_conf="{"lxc.utsname': 'docker','lxc.arch': 'x86_64'}"

---

**Note:** These LXC configuration parameters will only have the desired effect if the container is using the LXC execution driver, which has been deprecated for some time.

**mac_address** MAC address to use for the container. If not specified, a random MAC address will be used.

Example: mac_address=01:23:45:67:89:0a

**mem_limit (or memory)** [0] Memory limit. Can be specified in bytes or using single-letter units (i.e. 512M, 2G, etc.). A value of 0 (the default) means no memory limit.

Examples:

- mem_limit=512M
- memory=1073741824

**mem_swapness** Tune a container's memory swappiness behavior. Accepts an integer between 0 and 100.

Example: mem_swapness=60

**memswap_limit (or memory_swap)** [-1] Total memory limit (memory plus swap). Set to -1 to disable swap. A value of 0 (the default) means no swap limit.

Examples:

- memswap_limit=1G
- memory_swap=2147483648

**network_disabled** [False] If True, networking will be disabled within the container

Example: network_disabled=True

**network_mode** [bridge] One of the following:
• **bridge** - Creates a new network stack for the container on the docker bridge
• **none** - No networking (equivalent of the Docker CLI argument `--net=none`). Not to be confused with Python's `None`.
• **container:<name_or_id>** - Reuses another container's network stack
• **host** - Use the host's network stack inside the container

**Warning:** Using `host` mode gives the container full access to the host's system's services (such as D-Bus), and is therefore considered insecure.

Examples:
- `network_mode=null`
- `network_mode=container:web1`

**oom_kill_disable** Whether to disable OOM killer
Example: `oom_kill_disable=False`

**oom_score_adj** An integer value containing the score given to the container in order to tune OOM killer preferences
Example: `oom_score_adj=500`

**pid_mode** Set to `host` to use the host container's PID namespace within the container. Requires Docker 1.5.0 or newer.
Example: `pid_mode=host`

**pids_limit** Set the container's PID limit. Set to `-1` for unlimited.
Example: `pids_limit=2000`

**port_bindings (or publish)** Bind exposed ports which were exposed using the `ports` argument to `docker.create`. These should be passed in the same way as the `--publish` argument to the `docker run` CLI command:
- `ip:hostPort:containerPort` - Bind a specific IP and port on the host to a specific port within the container.
- `ip:containerPort` - Bind a specific IP and an ephemeral port to a specific port within the container.
- `hostPort:containerPort` - Bind a specific port on all of the host's interfaces to a specific port within the container.
- `containerPort` - Bind an ephemeral port on all of the host's interfaces to a specific port within the container.

Multiple bindings can be separated by commas, or passed as a Python list. The below two examples are equivalent:
- `port_bindings="5000:5000,2123:2123/udp,8080"
- `port_bindings="['5000:5000','2123:2123/udp',8080]"

Port bindings can also include ranges:
- `port_bindings="14505-14506:4505-4506"

**Note:** When specifying a protocol, it must be passed in the `containerPort` value, as seen in the examples above.
ports  A list of ports to expose on the container. Can be passed as comma-separated list or a Python list. If the protocol is omitted, the port will be assumed to be a TCP port.

Examples:

- ports=1111,2222/udp
- ports="[1111,'2222/udp']"

privileged  [False] If True, runs the exec process with extended privileges

Example: privileged=True

publish_all_ports (or publish_all): False  Publish all ports to the host

Example: publish_all_ports=True

read_only  [False] If True, mount the container’s root filesystem as read only

Example: read_only=True

restart_policy (or restart)  Set a restart policy for the container. Must be passed as a string in the format policy[:retry_count] where policy is one of always, unless-stopped, or on-failure, and retry_count is an optional limit to the number of retries. The retry count is ignored when using the always or unless-stopped restart policy.

Examples:

- restart_policy=on-failure:5
- restart_policy=always

security_opt  Security configuration for MLS systems such as SELinux and AppArmor. Can be passed as a comma-separated list or a Python list.

Examples:

- security_opt=apparmor:unconfined,param2:value2
- security_opt='["apparmor:unconfined","param2:value2"]'

**Important:** Some security options can contain commas. In these cases, this argument must be passed as a Python list, as splitting by comma will result in an invalid configuration.

**Note:** See the documentation for security_opt at https://docs.docker.com/engine/reference/run/#security-configuration

shm_size  Size of /dev/shm

Example: shm_size=128M

stop_signal  The signal used to stop the container. The default is SIGTERM.

Example: stop_signal=SIGRTMIN+3

stop_timeout  Timeout to stop the container, in seconds

Example: stop_timeout=5

storage_opt  Storage driver options for the container

Examples:

- storage_opt='dm.basesize=40G'
- storage_opt="'dm.basesize=40G'"
- storage_opt="{'dm.basesize': '40G'}"
sysctls (or sysctl) Set sysctl options for the container

Examples:
  • sysctl='fs.nr_open=1048576,kernel.pid_max=32768'
  • sysctls="[fs.nr_open=1048576,\'kernel.pid_max\'=32768']"
  • sysctls="\'fs.nr_open\'=1048576,\'kernel.pid_max\'=32768\'"

tmpfs A map of container directories which should be replaced by tmpfs mounts, and their corresponding mount options. Can be passed as Python list of PATH:VALUE mappings, or a Python dictionary. However, since commas usually appear in the values, this option cannot be passed as a comma-separated list.

Examples:
  • tmpfs="[\'/run:rw,noexec,nosuid,size=65536k\',\'/var/lib/mysql:rw,noexec,nosuid,size=600m\']"
  • tmpfs="\'\'/run\':\'rw,noexec,nosuid,size=65536k\',\'/var/lib/mysql\':\'rw,noexec,nosuid,size=600m\'\'"

tty [False] Attach TTYs

Example: tty=True

ulimits (or ulimit) List of ulimits. These limits should be passed in the format <ulimit_name>:<soft_limit>:<hard_limit>, with the hard limit being optional. Can be passed as a comma-separated list or a Python list.

Examples:
  • ulimits="nofile=1024:1024,nproc=60"
  • ulimits="[\'nofile\'=1024,\'nproc\'=60\']"

user User under which to run exec process

Example: user=foo

userns_mode (or user_ns_mode) Sets the user namespace mode, when the user namespace remapping option is enabled.

Example: usersns_mode=host

volumes (or volume) List of directories to expose as volumes. Can be passed as a comma-separated list or a Python list.

Examples:
  • volumes=/mnt/vol1,/mnt/vol2
  • volume="/mnt/vol1","/mnt/vol2"

volumes_from Container names or IDs from which the container will get volumes. Can be passed as a comma-separated list or a Python list.

Example: volumes_from=foo,volumes_from=foo,bar,volumes_from="[foo,bar]"

volume_driver Sets the container's volume driver

Example: volume_driver=foobar

working_dir (or workdir) Working directory inside the container

Examples:
  • working_dir=/var/log/nginx
  • workdir=/var/www/myapp

RETURN DATA
A dictionary containing the following keys:
  • Id - ID of the newly-created container
• Name - Name of the newly-created container

CLI Example:

```bash
# Create a data-only container
salt myminion docker.create myuser/mycontainer volumes="/mnt/vol1,/mnt/vol2"
```

```bash
# Create a CentOS 7 container that will stay running once started
salt myminion docker.create centos:7 name=mycent7 interactive=True tty=True! command=bash
```

```bash
salt.modules.dockermod.create_network(name, driver=None)
Create a new network
network_id  ID of network
driver  Driver of the network
CLI Example:

```bash
salt myminion docker.create_network web_network driver=bridge
```

```bash
salt.modules.dockermod.create_volume(name, driver=None, driver_opts=None)
Create a new volume
New in version 2015.8.4.
network_id  ID of network
driver  Driver of the network
driver_opts  Options for the driver volume
CLI Example:

```bash
salt myminion docker.create_volume my_volume driver=local
```

```bash
salt.modules.dockermod.dangling(prune=False, force=False)
Return top-level images (those on which no other images depend) which do not have a tag assigned to them. These include:
  • Images which were once tagged but were later untagged, such as those which were superseded by committing a new copy of an existing tagged image.
  • Images which were loaded using `docker.load` (or the `docker load` Docker CLI command), but not tagged.

prune  [False] Remove these images
force  [False] If True, and if prune=True, then forcibly remove these images.

RETURN DATA
If prune=False, the return data will be a list of dangling image IDs.
If prune=True, the return data will be a dictionary with each key being the ID of the dangling image, and
the following information for each image:
  • Comment - Any error encountered when trying to prune a dangling image
    (Only present if prune failed)
  • Removed - A boolean (True if prune was successful, False if not)

CLI Example:

```bash
salt myminion docker.dangling
salt myminion docker.dangling prune=True
```

```bash
salt.modules.dockermod.depends(name)
Returns the containers and images, if any, which depend on the given image
name  Name or ID of image

RETURN DATA
```

19.9. execution modules
A dictionary containing the following keys:
  - `Containers` - A list of containers which depend on the specified image
  - `Images` - A list of IDs of images which depend on the specified image

CLI Example:
```
salt myminion docker.depends myimage
salt myminion docker.depends 0123456789ab
```

salt.modules.dockermod.diff(name, *args, **kwargs)
Get information on changes made to container’s filesystem since it was created. Equivalent to running the `docker diff` Docker CLI command.

name Container name or ID

RETURN DATA
A dictionary containing any of the following keys:
  - `Added` - A list of paths that were added.
  - `Changed` - A list of paths that were changed.
  - `Deleted` - A list of paths that were deleted.
These keys will only be present if there were changes, so if the container has no differences the return dict will be empty.

CLI Example:
```
salt myminion docker.diff mycontainer
```

salt.modules.dockermod.disconnect_container_from_network(container, network_id)
Disconnect container from network.

container Container name or ID
network_id ID of network

CLI Example:
```
salt myminion docker.disconnect_container_from_network web-1
```

salt.modules.dockermod.exists(name)
Check if a given container exists

name Container name or ID

RETURN DATA
A boolean (True if the container exists, otherwise False)

CLI Example:
```
salt myminion docker.exists mycontainer
```

salt.modules.dockermod.export(name, *args, **kwargs)
Exports a container to a tar archive. It can also optionally compress that tar archive, and push it up to the Master.

name Container name or ID
path Absolute path on the Minion where the container will be exported
overwrite [False] Unless this option is set to True, then if a file exists at the location specified by the path argument, an error will be raised.
makedirs [False] If True, then if the parent directory of the file specified by the path argument does not exist, Salt will attempt to create it.
compression [None] Can be set to any of the following:
  - gzip or gz for gzip compression
- `bzip2` or `bz2` for bzip2 compression
- `xz` or `lzma` for XZ compression (requires `xz-utils`, as well as the `lzma` module from Python 3.3, available in Python 2 and Python 3.0-3.2 as `backports.lzma`)

This parameter can be omitted and Salt will attempt to determine the compression type by examining the filename passed in the `path` parameter.

**push** [False] If True, the container will be pushed to the master using `cp.push`.

---

**Note:** This requires `file_recv` to be set to True on the Master.

### RETURN DATA

A dictionary will containing the following keys:
- **Path** - Path of the file that was exported
- **Push** - Reports whether or not the file was successfully pushed to the Master

(Only present if `push=True`)
- **Size** - Size of the file, in bytes
- **Size_Human** - Size of the file, in human-readable units
- **Time_Elapsed** - Time in seconds taken to perform the export

**CLI Examples:**

```
salt myminion docker.export mycontainer /tmp/mycontainer.tar
salt myminion docker.export mycontainer /tmp/mycontainer.tar.xz push=True
```

### salt.modules.dockermod.get_client_args()

New in version 2016.3.6,2016.11.4,2017.7.0.

Changed in version 2017.7.0: Replaced the container config args with the ones from the API's `create_container` function.

Returns the args for docker-py's low-level API, organized by args for container creation, host config, and networking config.

**CLI Example:**

```
salt myminion docker.get_client_args
```

### salt.modules.dockermod.history(name, quiet=False)

Return the history for an image. Equivalent to running the docker `history` Docker CLI command.

**name** Container name or ID

**quiet** [False] If True, the return data will simply be a list of the commands run to build the container.

```
$ salt myminion docker.history nginx:latest quiet=True
myminion:
  - FROM scratch
  - ADD file: ef063ed3f0e9579362871b9f23d2bc0781ef7cd4de6ac822052cf6c9c5a12b1e2 in /
  - CMD [/bin/bash]
  - MAINTAINER NGINX Docker Maintainers "docker-maint@nginx.com"
  - apt-key adv --keyserver pgp.mit.edu --recv-keys
    573BFD6B3BD8FCB641079A6ABABF5B0827BD9BF62
  - echo "deb http://nginx.org/packages/mainline/debian/ wheezy nginx" >> /
  - etc/apt/sources.list
  - ENV NGINX_VERSION=1.7.10-1-wheezy
  - apt-get update && apt-get install -y ca-certificates nginx=${NGINX_
    VERSION} &&
    rm -rf /var/lib/apt/lists/*
  - ln -sf /dev/stdout /var/log/nginx/access.log
```
If quiet=False, the return value will be a list of dictionaries containing information about each step taken to build the image. The keys in each step include the following:

- Command - The command executed in this build step
- Id - Layer ID
- Size - Cumulative image size, in bytes
- Size_Human - Cumulative image size, in human-readable units
- Tags - Tag(s) assigned to this layer
- Time_Created_Epoch - Time this build step was completed (Epoch time)
- Time_Created_Local - Time this build step was completed (Minion's local timezone)

CLI Example:

```
salt myminion docker.exists mycontainer
```

**salt.modules.dockermod.images(verbos=False, **kwargs)**

Returns information about the Docker images on the Minion. Equivalent to running the `docker images` Docker CLI command.

- all [False] If True, untagged images will also be returned
- verbose [False] If True, a `docker inspect` will be run on each image returned.

**RETURN DATA**

A dictionary with each key being an image ID, and each value some general info about that image (time created, size, tags associated with the image, etc.)

CLI Example:

```
salt myminion docker.images
salt myminion docker.images all=True
```

**salt.modules.dockermod.import_(source, image, api_response=False)**

Imports content from a local tarball or a URL as a new docker image

- source Content to import (URL or absolute path to a tarball). URL can be a file on the Salt fileserver (i.e. `salt://path/to/rootfs/tarball.tar.xz`). To import a file from a saltenv other than base (e.g. dev), pass it at the end of the URL (ex. `salt://path/to/rootfs/tarball.tar.xz?saltenv=dev`).
- image Image to be created by the import, in repo:tag notation. If just the repository name is passed, a tag name of latest will be assumed.
- api_response [False] If True an api_response key will be present in the return data, containing the raw output from the Docker API.

**RETURN DATA**

A dictionary containing the following keys:

- Id - ID of the newly-created image
- Image - Name of the newly-created image
- Time_Elapsed - Time in seconds taken to perform the commit

CLI Example:

```
salt myminion docker.import /tmp/cent7-minimal.tar.xz myuser/centos
salt myminion docker.import /tmp/cent7-minimal.tar.xz myuser/centos:7
salt myminion docker.import salt://dockerimages/cent7-minimal.tar.xz myuser/
   __centos:7
```
salt.modules.dockermod.info()

Returns a dictionary of system-wide information. Equivalent to running the docker info Docker CLI command.

CLI Example:

```
salt myminion docker.info
```

salt.modules.dockermod.inspect(name)

Changed in version 2017.7.0: Volumes and networks are now checked, in addition to containers and images.

This is a generic container/image/volume/network inspection function. It will run the following functions in order:

- `docker.inspect_container`
- `docker.inspect_image`
- `docker.inspect_volume`
- `docker.inspect_network`

The first of these to find a match will be returned.

Name  Container/image/volume/network name or ID

**RETURN DATA**

A dictionary of container/image/volume/network information

CLI Examples:

```
salt myminion docker.inspect mycontainer
salt myminion docker.inspect busybox
```

class dockermod.inspect_container(name, *args, **kwargs)

Retrieves container information. Equivalent to running the docker inspect Docker CLI command, but will only look for container information.

Name  Container name or ID

**RETURN DATA**

A dictionary of container information

CLI Example:

```
salt myminion docker.inspect_container mycontainer
salt myminion docker.inspect_container 0123456789ab
```

class dockermod.inspect_image(name)

Retrieves image information. Equivalent to running the docker inspect Docker CLI command, but will only look for image information.

**Note:** To inspect an image, it must have been pulled from a registry or built locally. Images on a Docker registry which have not been pulled cannot be inspected.

Name  Image name or ID

**RETURN DATA**

A dictionary of image information

CLI Examples:
salt myminion docker.inspect_image busybox
salt myminion docker.inspect_image centos:6
salt myminion docker.inspect_image 0123456789ab

salt.modules.dockermod.inspect_network(network_id)
Inspect Network
network_id ID of network

CLI Example:
salt myminion docker.inspect_network 1f9d2454d0872b68dd9e8744c6e7a4c66b86f10abaccc21e14f7f014f729b2bc

salt.modules.dockermod.inspect_volume(name)
Inspect Volume
name Name of volume

CLI Example:
salt myminion docker.inspect_volume my_volume

salt.modules.dockermod.kill(*args, **kwargs)
Kill all processes in a running container instead of performing a graceful shutdown
name Container name or ID

RETURN DATA
A dictionary will be returned, containing the following keys:
  • status - A dictionary showing the prior state of the container as well as the new state
  • result - A boolean noting whether or not the action was successful
  • comment - Only present if the container cannot be killed

CLI Example:
salt myminion docker.kill mycontainer

salt.modules.dockermod.layers(name)
Returns a list of the IDs of layers belonging to the specified image, with the top-most layer (the one corresponding to the passed name) appearing last.
name Image name or ID

CLI Example:
salt myminion docker.layers centos:7

salt.modules.dockermod.list_containers(**kwargs)
Returns a list of containers by name. This is different from docker.ps in that docker.ps returns its results organized by container ID.
all [False] If True, stopped containers will be included in return data

CLI Example:
salt myminion docker.inspect_image <image>

salt.modules.dockermod.list_tags()
Returns a list of tagged images

CLI Example:
salt myminion docker.list_tags
**salt.modules.dockermod.load**(path, image=\`None\`)  
Load a tar archive that was created using `docker.save` (or via the Docker CLI using `docker save`).  
*path*  Path to docker tar archive. Path can be a file on the Minion, or the URL of a file on the Salt fileserver (i.e. `salt://path/to/docker/saved/image.tar`). To load a file from a saltenv other than `base` (e.g. `dev`), pass it at the end of the URL (ex. `salt://path/to/rootfs/tarball.tar.xz?saltenv=dev`).  
*image*  [\`None\`] If specified, the topmost layer of the newly-loaded image will be tagged with the specified repo and tag using `docker.tag`. The image name should be specified in `repo:tag` notation. If just the repository name is passed, a tag name of `latest` will be assumed.  

**RETURN DATA**  
A dictionary will be returned, containing the following keys:  
• **Path**  - Path of the file that was saved  
• **Layers**  - A list containing the IDs of the layers which were loaded. Any layers in the file that was loaded, which were already present on the Minion, will not be included.  
• **Image**  - Name of tag applied to topmost layer  

*(Only present if tag was specified and tagging was successful)*  
• **Time_Elapsed**  - Time in seconds taken to load the file  
• **Warning**  - Message describing any problems encountered in attempt to tag the topmost layer  

*(Only present if tag was specified and tagging failed)*  

**CLI Example:**
```
salt myminion docker.load /path/to/image.tar  
salt myminion docker.load salt://path/to/docker/saved/image.tar image=myuser/myimage:mytag
```  

**salt.modules.dockermod.login**(\`*registries\`)  
New in version 2016.3.7,2016.11.4,2017.7.0.  
Performs a `docker login` to authenticate to one or more configured repositories. See the documentation at the top of this page to configure authentication credentials.  
Multiple registry URLs (matching those configured in Pillar) can be passed, and Salt will attempt to login to just those registries. If no registry URLs are provided, Salt will attempt to login to all configured registries.  

**RETURN DATA**  
A dictionary containing the following keys:  
• **Results**  - A dictionary mapping registry URLs to the authentication result. True means a successful login, False means a failed login.  
• **Errors**  - A list of errors encountered during the course of this function.  

**CLI Example:**
```
salt myminion docker.login  
salt myminion docker.login hub  
salt myminion docker.login hub https://mydomain.tld/registry/
```  

**salt.modules.dockermod.logs**(name)  
Returns the logs for the container. Equivalent to running the `docker logs` Docker CLI command.  
*name*  Container name or ID  

**CLI Example:**
```
salt myminion docker.logs mycontainer
```  

**salt.modules.dockermod.networks**(names=\`None\`, ids=\`None\`)  
Changed in version 2017.7.0: The names and ids can be passed as a comma-separated list now, as well as a Python list.
List existing networks
names Filter by name
ids Filter by id
CLI Example:

```
salt myminion docker.networks names=network-web
salt myminion docker.networks
  ids=1f9d2454d0872b68dd9e8744c6e7a4c66b86f10abaccc21e14f7f014f729b2bc
```

```
salt myminion docker.networks names
```

```
salt myminion docker.networks
```

```
salt myminion docker.networks
```

salt.modules.dockermod.pause(*args, **kwargs)
Pauses a container
name Container name or ID

**RETURN DATA**

A dictionary will be returned, containing the following keys:

- **status** - A dictionary showing the prior state of the container as well as the new state
- **result** - A boolean noting whether or not the action was successful
- **comment** - Only present if the container cannot be paused

CLI Example:

```
salt myminion docker.pause mycontainer
```

salt.modules.dockermod.pid(name, *args, **kwargs)
Returns the PID of a container
name Container name or ID

CLI Example:

```
salt myminion docker.pid mycontainer

salt myminion docker.pid 0123456789ab
```

salt.modules.dockermod.port(name, *args, **kwargs)
Returns port mapping information for a given container. Equivalent to running the docker port Docker CLI command.

name Container name or ID
private_port [None] If specified, get information for that specific port. Can be specified either as a port number (i.e. 5000), or as a port number plus the protocol (i.e. 5000/udp).

If this argument is omitted, all port mappings will be returned.

**RETURN DATA**

A dictionary of port mappings, with the keys being the port and the values being the mapping(s) for that port.

CLI Examples:

```
salt myminion docker.port mycontainer

salt myminion docker.port mycontainer 5000

salt myminion docker.port mycontainer 5000/udp
```

salt.modules.dockermod.ps_(filters=None, **kwargs)
Returns information about the Docker containers on the Minion. Equivalent to running the docker ps Docker CLI command.

all [False] If True, stopped containers will also be returned
host: False If True, local host's network topology will be included
verbose [False] If True, a docker inspect will be run on each container returned.
filters: None A dictionary of filters to be processed on the container list. Available filters:

- **exited (int)**: Only containers with specified exit code
- **status (str)**: One of restarting, running, paused, exited
- label (str): format either `'key'` or `'key=value'`

**RETURN DATA**

A dictionary with each key being an container ID, and each value some general info about that container (time created, name, command, etc.)

CLI Example:

```bash
salt myminion docker.ps
salt myminion docker.ps all=True
salt myminion docker.ps filters="{'label': 'role=web'}"
```

```python
salt.modules.dockermod.pull(image, insecure_registry=False, api_response=False, client_timeout=60)
```

Pulls an image from a Docker registry

- **image** Image to be pulled, in *repo:tag* notation. If just the repository name is passed, a tag name of `latest` will be assumed.
- **insecure_registry** [False] If True, the Docker client will permit the use of insecure (non-HTTPS) registries.
- **api_response** [False] If True, an API_Response key will be present in the return data, containing the raw output from the Docker API.

**Note:** This may result in a lot of additional return data, especially for larger images.

**client_timeout** Timeout in seconds for the Docker client. This is not a timeout for this function, but for receiving a response from the API.

**RETURN DATA**

A dictionary will be returned, containing the following keys:

- **Layers** - A dictionary containing one or more of the following keys:
  - **Already_Pulled** - Layers that were already present on the Minion
  - **Pulled** - Layers that were pulled
- **Status** - A string containing a summary of the pull action (usually a message saying that an image was downloaded, or that it was up to date).
- **Time_Elapsed** - Time in seconds taken to perform the pull

CLI Example:

```bash
salt myminion docker.pull centos
salt myminion docker.pull centos:6
```

```python
salt.modules.dockermod.push(image, insecure_registry=False, api_response=False, client_timeout=60)
```

Changed in version 2015.8.4: The `Id` and `Image` keys are no longer present in the return data. This is due to changes in the Docker Remote API.

Pushes an image to a Docker registry. See the documentation at top of this page to configure authentication credentials.

- **image** Image to be pushed, in *repo:tag* notation.

  Changed in version 2015.8.4: If just the repository name is passed, then all tagged images for the specified repo will be pushed. In prior releases, a tag of `latest` was assumed if the tag was omitted.

- **insecure_registry** [False] If True, the Docker client will permit the use of insecure (non-HTTPS) registries.
- **api_response** [False] If True, an API_Response key will be present in the return data, containing the raw output from the Docker API.

**client_timeout** Timeout in seconds for the Docker client. This is not a timeout for this function, but for receiving a response from the API.

**RETURN DATA**

19.9. execution modules
A dictionary will be returned, containing the following keys:

- **Layers** - A dictionary containing one or more of the following keys:
  - **Already_Pushed** - Layers that were already present on the Minion
  - **Pushed** - Layers that were pushed
- **Time_Elapsed** - Time in seconds taken to perform the push

CLI Example:

```
salt myminion docker.push myuser/mycontainer
salt myminion docker.push myuser/mycontainer:mytag
```

salt.modules.dockermod.remove_network(network_id)

Remove a network

- **network_id** ID of network

CLI Example:

```
salt myminion docker.remove_network 1f9d2454d872b68dd9e8744c6e7a4c66b86f10abaccc21e14f7f014f729b2bc
```

salt.modules.dockermod.remove_volume(name)

Remove a volume

- **name** Name of volume

New in version 2015.8.4.

CLI Example:

```
salt myminion docker.remove_volume my_volume
```

salt.modules.dockermod.rename(name, new_name)

Renames a container. Returns True if successful, and raises an error if the API returns one. If unsuccessful and the API returns no error (should not happen), then False will be returned.

- **name** Name or ID of existing container
- **new_name** New name to assign to container

New in version 2017.7.0.

CLI Example:

```
salt myminion docker.rename foo bar
```

salt.modules.dockermod.resolve_tag(name, tags=None)

New in version 2017.7.2.Oxygen.

Given an image tag, check the locally-pulled tags (using docker.list_tags) and return the matching tag. This helps disambiguate differences on some platforms where images from the Docker Hub are prefixed with docker.io/. If an image name with no tag is passed, a tag of latest is assumed.

If the specified image is not pulled locally, this function will return False.

- **name** An optional Python list of tags to check against. If passed, then docker.list_tags will not be run to get a list of tags. This is useful when resolving a number of tags at the same time.

CLI Examples:

```
salt myminion docker.resolve_tag busybox
salt myminion docker.resolve_tag busybox:latest
```

salt.modules.dockermod.restart(name, *args, **kwargs)

Restarts a container

- **name** Container name or ID
**timeout** [10] Timeout in seconds after which the container will be killed (if it has not yet gracefully shut down)

**RETURN DATA**

A dictionary will be returned, containing the following keys:

- **status** - A dictionary showing the prior state of the container as well as the new state
- **result** - A boolean noting whether or not the action was successful
- **restarted** - If restart was successful, this key will be present and will be set to True.

CLI Examples:

```
salt myminion docker.restart mycontainer
salt myminion docker.restart mycontainer timeout=20
```

salt.modules.dockermod.

**retcode**(*name, cmd, exec_driver=None, stdin=None, python_shell=True,
                 output_loglevel='debug', use_vt=False, ignore_retcode=False,
                 keep_env=None)*

Run `cmd.retcode` within a container

**name** Container name or ID in which to run the command
**cmd** Command to run
**exec_driver** [None] If not passed, the execution driver will be detected as described above.
**stdin** [None] Standard input to be used for the command
**output_loglevel** [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.
**use_vt** [False] Use SaltStack’s `util.vt` to stream output to console.
**keep_env** [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container’s host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion docker.retcode mycontainer 'ls -l /etc'
```

salt.modules.dockermod.

**rm_**(*args, **kwargs)*

Removes a container

**name** Container name or ID
**force** [False] If True, the container will be killed first before removal, as the Docker API will not permit a running container to be removed. This option is set to False by default to prevent accidental removal of a running container.
**stop** [False] If True, the container will be stopped first before removal, as the Docker API will not permit a running container to be removed. This option is set to False by default to prevent accidental removal of a running container.

New in version 2017.7.0.

**volumes** [False] Also remove volumes associated with container

**RETURN DATA**

A list of the IDs of containers which were removed

CLI Example:

```
salt myminion docker.rm mycontainer
salt myminion docker.rm mycontainer force=True
```

salt.modules.dockermod.

**rmi**(*names, **kwargs)*

Removes an image

**name** Name (in `repo:tag` notation) or ID of image.
**force** [False] If True, the image will be removed even if the Minion has containers created from that image
**prune** [True] If True, untagged parent image layers will be removed as well, set this to False to keep them.
RETURN DATA

A dictionary will be returned, containing the following two keys:

- **Layers** - A list of the IDs of image layers that were removed
- **Tags** - A list of the tags that were removed
- **Errors** - A list of any errors that were encountered

CLI Examples:

```
salt myminion docker.rmi busybox
salt myminion docker.rmi busybox force=True
salt myminion docker.rmi foo bar baz
```

```
salt.modules.dockermod.run(name, cmd, exec_driver=None, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)
```

Run `cmd.run` within a container

- **name** Container name or ID in which to run the command
- **cmd** Command to run
- **exec_driver** [None] If not passed, the execution driver will be detected as described above.
- **stdin** [None] Standard input to be used for the command
- **output_loglevel** [debug] Level at which to log the output from the command. Set to quiet to suppress logging.
- **use_vt** [False] Use SaltStack's utils.vt to stream output to console.
- **keep_env** [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion docker.run mycontainer 'ls -l /etc'
```

```
salt.modules.dockermod.run_all(name, cmd, exec_driver=None, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)
```

Run `cmd.run_all` within a container

- **name** Container name or ID in which to run the command
- **cmd** Command to run
- **exec_driver** [None] If not passed, the execution driver will be detected as described above.
- **stdin** [None] Standard input to be used for the command
- **output_loglevel** [debug] Level at which to log the output from the command. Set to quiet to suppress logging.
- **use_vt** [False] Use SaltStack's utils.vt to stream output to console.
- **keep_env** [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion docker.run_all mycontainer 'ls -l /etc'
```

```
salt.modules.dockermod.run_stderr(name, cmd, exec_driver=None, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)
```

Note: While the command is run within the container, it is initiated from the host. Therefore, the PID in the return dict is from the host, not from the container.
Run `cmd.run_stderr` within a container

- **name**: Container name or ID in which to run the command
- **cmd**: Command to run
- **exec_driver** ([None](#)): If not passed, the execution driver will be detected as described above.
- **stdin** ([None](#)): Standard input to be used for the command
- **output_loglevel** ([debug](#)): Level at which to log the output from the command. Set to quiet to suppress logging.
- **use_vt** ([False](#)): Use SaltStack's `utils.vt` to stream output to console.
- **keep_env** ([None](#)): If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

**CLI Example:**
```
salt myminion docker.run_stderr mycontainer 'ls -l /etc'
```

```python
salt.modules.dockermod.run_stdout(name, cmd, exec_driver=None, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)
```

Run `cmd.run_stdout` within a container

- **name**: Container name or ID in which to run the command
- **cmd**: Command to run
- **exec_driver** ([None](#)): If not passed, the execution driver will be detected as described above.
- **stdin** ([None](#)): Standard input to be used for the command
- **output_loglevel** ([debug](#)): Level at which to log the output from the command. Set to quiet to suppress logging.
- **use_vt** ([False](#)): Use SaltStack's `utils.vt` to stream output to console.
- **keep_env** ([None](#)): If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

**CLI Example:**
```
salt myminion docker.run_stdout mycontainer 'ls -l /etc'
```

```python
salt.modules.dockermod.save(name, path, overwrite=False, makedirs=False, compression=None, **kwargs)
```

Saves an image and to a file on the minion. Equivalent to running the `docker save` Docker CLI command, but unlike `docker save` this will also work on named images instead of just images IDs.

- **name**: Name or ID of image. Specify a specific tag by using the repo:tag notation.
- **path**: Absolute path on the Minion where the image will be exported
- **overwrite** ([False](#)): Unless this option is set to True, then if the destination file exists an error will be raised.
- **makedirs** ([False](#)): If True, then if the parent directory of the file specified by the path argument does not exist, Salt will attempt to create it.
- **compression** ([None](#)): Can be set to any of the following:
  - gzip or gz for gzip compression
  - bzip2 or bz2 for bzip2 compression
  - xz or LZMA for XZ compression (requires `xz-utils`, as well as the `lzma` module from Python 3.3, available in Python 2 and Python 3.0-3.2 as `backports.lzma`)

This parameter can be omitted and Salt will attempt to determine the compression type by examining the filename passed in the path parameter.

**Note:** Since the Docker API does not support `docker save`, compression will be a bit slower with this function than with `docker.export` since the image(s) will first be saved and then the compression
done afterwards.

push [False] If True, the container will be pushed to the master using cp.push.

**Note:** This requires file_recv to be set to True on the Master.

### RETURN DATA

A dictionary will be returned, containing the following keys:

- Path - Path of the file that was saved
- Push - Reports whether or not the file was successfully pushed to the Master

(*Only present if push=True*)

- Size - Size of the file, in bytes
- Size_Human - Size of the file, in human-readable units
- Time_Elapsed - Time in seconds taken to perform the save

**CLI Examples:**

```
salt myminion docker.save centos:7 /tmp/cent7.tar
salt myminion docker.save 0123456789ab cdef01234567 /tmp/saved.tar
```

**salt.modules.dockermod.script**

```
(name, source, saltenv='base', args=None, template=None, exec_driver=None, stdin=None, python_shell=True, output_loglevel='debug', ignore_retcode=False, use_vt=False, keep_env=None)
```

Run cmd.script within a container

**Note:** While the command is run within the container, it is initiated from the host. Therefore, the PID in the return dict is from the host, not from the container.

- name Container name or ID
- source Path to the script. Can be a local path on the Minion or a remote file from the Salt fileserver.
- args A string containing additional command-line options to pass to the script.
- template [None] Templating engine to use on the script before running.
- exec_driver [None] If not passed, the execution driver will be detected as described above.
- stdin [None] Standard input to be used for the script
- output_loglevel [debug] Level at which to log the output from the script. Set to quiet to suppress logging.
- use_vt [False] Use SaltStack's utils.vt to stream output to console.
- keep_env [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

**CLI Example:**

```
salt myminion docker.script mycontainer salt://docker_script.py
salt myminion docker.script mycontainer salt://scripts/runme.sh 'arg1 arg2 "arg 3"'
salt myminion docker.script mycontainer salt://scripts/runme.sh stdin=
  \-"one\ntwo\nthree\nfour\nfive\n' output_loglevel=quiet
```

**salt.modules.dockermod.script_retcode**

```
(name, source, saltenv='base', args=None, template=None, exec_driver=None, stdin=None, python_shell=True, output_loglevel='debug', ignore_retcode=False, use_vt=False, keep_env=None)
```

Run cmd.script_retcode within a container

- name Container name or ID
source  Path to the script. Can be a local path on the Minion or a remote file from the Salt fileserver.
args   A string containing additional command-line options to pass to the script.
template [None] Templating engine to use on the script before running.
exec_driver [None] If not passed, the execution driver will be detected as described above.
stdin  [None] Standard input to be used for the script
output_loglevel [debug] Level at which to log the output from the script. Set to quiet to suppress logging.
use_vt  [False] Use SaltStack's utils.vt to stream output to console.
keep_env [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container’s host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:
```
salt myminion docker.script_retcode mycontainer salt://docker_script.py
salt myminion docker.script_retcode mycontainer salt://scripts/runme.sh 'arg1
  \"arg2 \"arg 3\"\n'
salt myminion docker.script_retcode mycontainer salt://scripts/runme.sh stdin=
  \"one\ntwo\nthree\nfour\nfive\n\n\noutput_loglevel=quiet
```

salt.modules.dockermod.search(name, official=False, trusted=False)

Searches the registry for an image
name  Search keyword
official [False] Limit results to official builds
trusted [False] Limit results to trusted builds

RETURN DATA
A dictionary with each key being the name of an image, and the following information for each image:
- Description - Image description
- Official - A boolean (True if an official build, False if not)
- Stars - Number of stars the image has on the registry
- Trusted - A boolean (True if a trusted build, False if not)

CLI Example:
```
salt myminion docker.search centos
salt myminion docker.search centos official=True
```

salt.modules.dockermod.signal_("args", **kwargs)

Send a signal to a container. Signals can be either strings or numbers, and are defined in the Standard Signals section of the signal(7) manpage. Run man 7 signal on a Linux host to browse this manpage.
name Container name or ID
signal Signal to send to container

RETURN DATA
If the signal was successfully sent, True will be returned. Otherwise, an error will be raised.

CLI Example:
```
salt myminion docker.signal mycontainer SIGHUP
```

salt.modules.dockermod.sls(name, mods=None, saltenv='base', **kwargs)

Apply the states defined by the specified SLS modules to the running container

New in version 2016.11.0.

The container does not need to have Salt installed, but Python is required.
name Container name or ID
mods  [None] A string containing comma-separated list of SLS with defined states to apply to the container.
saltenv [base] Specify the environment from which to retrieve the SLS indicated by the mods parameter.
CLI Example:

```
salt myminion docker.sls compassionate_mirzakhani mods=rails,web
```

```
salt.modules.dockermod.sls_build(name, base='opensuse/python', mods=None, saltenv='base', dryrun=False, **kwargs)
```

Build a Docker image using the specified SLS modules on top of base image

New in version 2016.11.0.

The base image does not need to have Salt installed, but Python is required.

- **name**: Image name to be built and committed
- **base**: Name or ID of the base image
- **mods**: A string containing comma-separated list of SLS with defined states to apply to the base image.
- **saltenv**: [base] Specify the environment from which to retrieve the SLS indicated by the `mods` parameter.
- **base**: the base image
- **mods**: the state modules to execute during build
- **saltenv**: the salt environment to use
- **dryrun**: False when set to True the container will not be committed at the end of the build. The dryrun succeed also when the state contains errors.

**RETURN DATA**

A dictionary with the ID of the new container. In case of a dryrun, the state result is returned and the container gets removed.

CLI Example:

```
salt myminion docker.sls_build imname base=mybase mods=rails,web
```

```
salt.modules.dockermod.start(*args, **kwargs)
```

Start a container

- **name**: Container name or ID

**RETURN DATA**

A dictionary will be returned, containing the following keys:

- **status**: A dictionary showing the prior state of the container as well as the new state
- **result**: A boolean noting whether or not the action was successful
- **comment**: Only present if the container cannot be started

CLI Example:

```
salt myminion docker.start mycontainer
```

```
salt.modules.dockermod.state(name, *args, **kwargs)
```

Returns the state of the container

- **name**: Container name or ID

**RETURN DATA**

A string representing the current state of the container (either running, paused, or stopped)

CLI Example:

```
salt myminion docker.state mycontainer
```

```
salt.modules.dockermod.stop(*args, **kwargs)
```

Stops a running container

- **name**: Container name or ID
- **unpause**: [False] If True and the container is paused, it will be unpaused before attempting to stop the container.
timeout  Timeout in seconds after which the container will be killed (if it has not yet gracefully shut down)

Changed in version 2017.7.0: If this argument is not passed, then the container's configuration will be checked. If the container was created using the stop_timeout argument, then the configured timeout will be used, otherwise the timeout will be 10 seconds.

RETURN DATA

A dictionary will be returned, containing the following keys:

- **status** - A dictionary showing the prior state of the container as well as the new state
- **result** - A boolean noting whether or not the action was successful
- **comment** - Only present if the container can not be stopped

CLI Examples:

```
salt myminion docker.stop mycontainer
salt myminion docker.stop mycontainer unpause=True
salt myminion docker.stop mycontainer timeout=20
```

`salt.modules.dockermod.tag(name, image, force=False)`

Tag an image into a repository and return True. If the tag was unsuccessful, an error will be raised.

- **name**  ID of image
- **image**  Tag to apply to the image, in repo:tag notation. If just the repository name is passed, a tag name of latest will be assumed.
- **force**  [False] Force apply tag

CLI Example:

```
salt myminion docker.tag 0123456789ab myrepo/mycontainer
salt myminion docker.tag 0123456789ab myrepo/mycontainer:mytag
```

`salt.modules.dockermod.top(name, *args, **kwargs)`

Runs the docker top command on a specific container

- **name**  Container name or ID

CLI Example:

```
salt myminion docker.top mycontainer
salt myminion docker.top 0123456789ab
```

`salt.modules.dockermod.unpause(*args, **kwargs)`

Unpauses a container

- **name**  Container name or ID

RETURN DATA

A dictionary will be returned, containing the following keys:

- **status** - A dictionary showing the prior state of the container as well as the new state
- **result** - A boolean noting whether or not the action was successful
- **comment** - Only present if the container can not be unpaused

CLI Example:

```
salt myminion docker.unpause mycontainer
```

`salt.modules.dockermod.version()`

Returns a dictionary of Docker version information. Equivalent to running the docker version Docker CLI command.

CLI Example:
**salt myminion docker.version**

salt.modules.dockermod.volumes(filters=None)
List existing volumes

New in version 2015.8.4.
 filters There is one available filter: dangling=true

CLI Example:

```
salt myminion docker.volumes filters="{'dangling': True}"  
```

salt.modules.dockermod.wait(name, ignore_already_stopped=False, fail_on_exit_status=False)
Wait for the container to exit gracefully, and return its exit code

**Note:** This function will block until the container is stopped.

name Container name or ID
ignore_already_stopped Boolean flag that prevent execution to fail, if a container is already stopped.
fail_on_exit_status Boolean flag to report execution as failure if exit_status is different than 0.

**RETURN DATA**

A dictionary will be returned, containing the following keys:
- status - A dictionary showing the prior state of the container as well as the new state
- result - A boolean noting whether or not the action was successful
- exit_status - Exit status for the container
- comment - Only present if the container is already stopped

CLI Example:

```
salt myminion docker.wait mycontainer  
```

### 19.9.100 salt.modules.dpkg

Support for DEB packages

salt.modules.dpkg.bin_pkg_info(path, saltenv='base')
New in version 2015.8.0.

Parses RPM metadata and returns a dictionary of information about the package (name, version, etc.).
path Path to the file. Can either be an absolute path to a file on the minion, or a salt fileserver URL (e.g. salt://path/to/file.rpm). If a salt fileserver URL is passed, the file will be cached to the minion so that it can be examined.
saltenv [base] Salt fileserver environment from which to retrieve the package. Ignored if path is a local file path on the minion.

CLI Example:

```
salt '*' lowpkg.bin_pkg_info /root/foo-1.2.3-1ubuntu1_all.deb  
salt '*' lowpkg.bin_pkg_info salt://foo-1.2.3-1ubuntu1_all.deb  
```

salt.modules.dpkg.file_dict('packages')
List the files that belong to a package, grouped by package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:
salt.modules.dpkg.file_list(*packages)
List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' lowpkg.file_list httpd
salt '*' lowpkg.file_list httpd postfix
salt '*' lowpkg.file_list
```

salt.modules.dpkg.info(*packages, **kwargs)
Returns a detailed summary of package information for provided package names. If no packages are specified, all packages will be returned.

- **packages** The names of the packages for which to return information.
- **failhard** Whether to throw an exception if none of the packages are installed. Defaults to True.

New in version 2016.11.3.

CLI example:

```
salt '*' lowpkg.info
salt '*' lowpkg.info apache2 bash
salt '*' lowpkg.info 'php5*' failhard=false
```

salt.modules.dpkg.list_pkgs(*packages)
List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

External dependencies:

Virtual package resolution requires aptitude. Because this function uses dpkg, virtual packages will be reported as not installed.

CLI Example:

```
salt '*' lowpkg.list_pkgs
salt '*' lowpkg.list_pkgs httpd
```

salt.modules.dpkg.unpurge(*packages)
Change package selection for each package specified to `install`

CLI Example:

```
salt '*' lowpkg.unpurge curl
```

19.9.101 salt.modules.drac

Manage Dell DRAC

salt.modules.drac.change_password(username, password, uid=None)
Change users password

19.9. execution modules
CLI Example:
```
salt dell drac.change_password [USERNAME] [PASSWORD] [UID - optional]
salt dell drac.change_password diana secret
```

**salt.modules.drac.create_user(username, password, permissions, users=None)**
Create user accounts

CLI Example:
```
salt dell drac.create_user [USERNAME] [PASSWORD] [PRIVILEGES]
salt dell drac.create_user diana secret login,test_alerts,clear_logs
```

**DRAC Privileges**
- login: Login to iDRAC
- drac: Configure iDRAC
- user_management: Configure Users
- clear_logs: Clear Logs
- server_control_commands: Execute Server Control Commands
- console_redirection: Access Console Redirection
- virtual_media: Access Virtual Media
- test_alerts: Test Alerts
- debug_commands: Execute Debug Commands

**salt.modules.drac.delete_user(username, uid=None)**
Delete a user

CLI Example:
```
salt dell drac.delete_user [USERNAME] [UID - optional]
salt dell drac.delete_user diana 4
```

**salt.modules.drac.email_alerts(action)**
Enable/Disable email alerts

CLI Example:
```
salt dell drac.email_alerts True
salt dell drac.email_alerts False
```

**salt.modules.drac.list_users()**
List all DRAC users

CLI Example:
```
salt dell drac.list_users
```

**salt.modules.drac.nameservers("ns")**
Configure the nameservers on the DRAC

CLI Example:
```
salt dell drac.nameservers [NAMESERVERS]
salt dell drac.nameservers ns1.example.com ns2.example.com
```
salt.modules.drac.network_info()
Return Network Configuration

CLI Example:
salt dell drac.network_info

salt.modules.drac.server_hardreset()
Performs a reset (reboot) operation on the managed server.

CLI Example:
salt dell drac.server_hardreset

salt.modules.drac.server_poweroff()
Powers down the managed server.

CLI Example:
salt dell drac.server_poweroff

salt.modules.drac.server_poweron()
Powers up the managed server.

CLI Example:
salt dell drac.server_poweron

salt.modules.drac.server_pxe()
Configure server to PXE perform a one off PXE boot

CLI Example:
salt dell drac.server_pxe

salt.modules.drac.server_reboot()
Issues a power-cycle operation on the managed server. This action is similar to pressing the power button on the system's front panel to power down and then power up the system.

CLI Example:
salt dell drac.server_reboot

salt.modules.drac.set_network(ip, netmask, gateway)
Configure Network

CLI Example:
salt dell drac.set_network [DRAC IP] [NETMASK] [GATEWAY]
salt dell drac.set_network 192.168.0.2 255.255.255.0 192.168.0.1

salt.modules.drac.set_permissions(username, permissions, uid=None)
Configure users permissions

CLI Example:
salt dell drac.set_permissions [USERNAME] [PRIVILEGES] [USER INDEX - optional]
salt dell drac.set_permissions diana login,test_alerts,clean_logs 4

DRAC Privileges
- login: Login to iDRAC
- drac: Configure iDRAC
- user_management: Configure Users
- clear_logs: Clear Logs
- server_control_commands: Execute Server Control Commands
- console_redirection: Access Console Redirection
- virtual_media: Access Virtual Media
- test_alerts: Test Alerts
- debug_commands: Execute Debug Commands

```
salt.modules.drac.set_snmp(community)
```
Configure SNMP community string

CLI Example:
```
salt dell drac.set_snmp [COMMUNITY]
salt dell drac.set_snmp public
```

```
salt.modules.drac.syslog(server, enable=True)
```
Configure syslog remote logging, by default syslog will automatically be enabled if a server is specified. However, if you want to disable syslog you will need to specify a server followed by False

CLI Example:
```
salt dell drac.syslog [SYSLOG IP] [ENABLE/DISABLE]
salt dell drac.syslog 0.0.0.0 False
```

```
salt.modules.drac.system_info()
```
Return System information

CLI Example:
```
salt dell drac.system_info
```

19.9.102 salt.modules.dracr

Manage Dell DRAC.

New in version 2015.8.2.

```
salt.modules.dracr.bare_rac_cmd(cmd, host=None, admin_username=None, admin_password=None)
```

```
salt.modules.dracr.change_password(username, password, uid=None, host=None, admin_username=None, admin_password=None, module=None)
```
Change user's password

CLI Example:
```
salt dell dracr.change_password [USERNAME] [PASSWORD] uid=[OPTIONAL]
host=<remote DRAC> admin_username=<DRAC user>
admin_password=<DRAC PW>
salt dell dracr.change_password diana secret
```
Note that if only a username is specified then this module will look up details for all 16 possible DRAC users. This is time consuming, but might be necessary if one is not sure which user slot contains the one you want. Many late-model Dell chassis have ‘root’ as UID 1, so if you can depend on that then setting the password is much quicker. Raises an error if the supplied password is greater than 20 chars.

```
salt.modules.dracr.create_user(username, password, permissions, users=None, host=None, admin_username=None, admin_password=None)
```

Create user accounts

CLI Example:

```
salt dell dracr.create_user [USERNAME] [PASSWORD] [PRIVILEGES]
salt dell dracr.create_user diana secret login,test_alerts,clear_logs
```

**DRAC Privileges**

- login: Login to iDRAC
- drac: Configure iDRAC
- user_management: Configure Users
- clear_logs: Clear Logs
- server_control_commands: Execute Server Control Commands
- console_redirection: Access Console Redirection
- virtual_media: Access Virtual Media
- test_alerts: Test Alerts
- debug_commands: Execute Debug Commands

```
salt.modules.dracr.delete_user(username, uid=None, host=None, admin_username=None, admin_password=None)
```

Delete a user

CLI Example:

```
salt dell dracr.delete_user [USERNAME] [UID - optional]
salt dell dracr.delete_user diana 4
```

```
salt.modules.dracr.deploy_password(username, password, host=None, admin_username=None, admin_password=None, module=None)
```

Change the Quick Deploy password, used for switches as well

CLI Example:

```
salt dell dracr.deploy_password [USERNAME] [PASSWORD]
    host=<remote DRAC> admin_username=<DRAC user>
    admin_password=<DRAC PW>
salt dell dracr.change_password diana secret
```

Note that if only a username is specified then this module will look up details for all 16 possible DRAC users. This is time consuming, but might be necessary if one is not sure which user slot contains the one you want. Many late-model Dell chassis have ‘root’ as UID 1, so if you can depend on that then setting the password is much quicker.

```
salt.modules.dracr.deploy_snmp(snmp, host=None, admin_username=None, admin_password=None, module=None)
```

Change the Quick Deploy SNMP community string, used for switches as well

CLI Example:
salt modules.dracr.deploy_snmp

```python
salt dell dracr.deploy_snmp SNMP_STRING
    host=<remote DRAC or CMC> admin_username=<DRAC user>
    admin_password=<DRAC PW>
salt dell dracr.deploy_password diana secret
```

salt.modules.dracr.email_alerts

```python
salt.modules.dracr.email_alerts(action, host=None, admin_username=None, admin_password=None)
```

Enable/Disable email alerts

CLI Example:

```bash
salt dell dracr.email_alerts True
salt dell dracr.email_alerts False
```

salt.modules.dracr.get_chassis_datacenter

```python
salt.modules.dracr.get_chassis_datacenter(host=None, admin_username=None, admin_password=None)
```

Get the datacenter of the chassis.

- `host` The chassis host.
- `admin_username` The username used to access the chassis.
- `admin_password` The password used to access the chassis.

CLI Example:

```bash
salt 'host' dracr.set_chassis_location host=111.222.333.444
    admin_username=root admin_password=secret
```

salt.modules.dracr.get_chassis_location

```python
salt.modules.dracr.get_chassis_location(host=None, admin_username=None, admin_password=None)
```

Get the location of the chassis.

- `host` The chassis host.
- `admin_username` The username used to access the chassis.
- `admin_password` The password used to access the chassis.

CLI Example:

```bash
salt 'host' dracr.set_chassis_location host=111.222.333.444
    admin_username=root admin_password=secret
```

salt.modules.dracr.get_chassis_name

```python
salt.modules.dracr.get_chassis_name(host=None, admin_username=None, admin_password=None)
```

Get the name of a chassis.

- `host` The chassis host.
- `admin_username` The username used to access the chassis.
- `admin_password` The password used to access the chassis.

CLI Example:

```bash
salt 'host' dracr.get_chassis_name host=111.222.333.444
    admin_username=root admin_password=secret
```

salt.modules.dracr.get_dns_dracname

```python
salt.modules.dracr.get_dns_dracname(host=None, admin_username=None, admin_password=None)
```

salt.modules.dracr.get_general

```python
salt.modules.dracr.get_general(cfg_sec, cfg_var, host=None, admin_username=None, admin_password=None)
```

salt.modules.dracr.get_slotname

```python
salt.modules.dracr.get_slotname(slot, host=None, admin_username=None, admin_password=None)
```

Get the name of a slot number in the chassis.

- `slot` The number of the slot for which to obtain the name.
- `host` The chassis host.
admin_username The username used to access the chassis.
admin_password The password used to access the chassis.

CLI Example:

```
salt-call --local dracr.get_slotname 0 host=111.222.333.444
admin_username=root admin_password=secret
```

`salt.modules.dracr.idrac_general(blade_name, command, idrac_password=None, host=None, admin_username=None, admin_password=None)`

Run a generic racadm command against a particular blade in a chassis. Blades are usually named things like `server-1`, `server-2`, etc. If the iDRAC has a different password than the CMC, then you can pass it with the idrac_password kwarg.

Parameters

- **blade_name** -- Name of the blade to run the command on
- **command** -- Command like to pass to racadm
- **idrac_password** -- Password for the iDRAC if different from the CMC
- **host** -- Chassis hostname
- **admin_username** -- CMC username
- **admin_password** -- CMC password

Returns stdout if the retcode is 0, otherwise a standard cmd.run_all dictionary

CLI Example:

```
salt fx2 chassis.cmd idrac_general server-1 'get BIOS.SysProfileSettings'
```

`salt.modules.dracr.inventory(host=None, admin_username=None, admin_password=None)`

`salt.modules.dracr.list_slotnames(host=None, admin_username=None, admin_password=None)`

List the names of all slots in the chassis.

- **host** The chassis host.
- **admin_username** The username used to access the chassis.
- **admin_password** The password used to access the chassis.

CLI Example:

```
salt-call --local dracr.list_slotnames host=111.222.333.444
admin_username=root admin_password=secret
```

`salt.modules.dracr.list_users(host=None, admin_username=None, admin_password=None, module=None)`

List all DRAC users

CLI Example:

```
salt dell dracr.list_users
```

`salt.modules.dracr.nameservers(ns, host=None, admin_username=None, admin_password=None, module=None)`

Configure the nameservers on the DRAC

CLI Example:

```
salt dell dracr.nameservers [NAMESERVERS]
salt dell dracr.nameservers ns1.example.com ns2.example.com
```
```python
admin_username=root admin_password=calvin module=server-1
host=192.168.1.1
```

```
salt.modules.dracr.network_info(host=None, admin_username=None, admin_password=None, module=None)
Return Network Configuration
CLI Example:
salt dell dracr.network_info
```

```
salt.modules.dracr.server_hardreset(host=None, admin_username=None, admin_password=None, module=None)
Performs a reset (reboot) operation on the managed server.
host The chassis host.
admin_username The username used to access the chassis.
admin_password The password used to access the chassis.
module The element to hard reset on the chassis such as a blade. If not provided, the chassis will be reset.
CLI Example:
salt dell dracr.server_hardreset
salt dell dracr.server_hardreset module=server-1
```

```
salt.modules.dracr.server_power(status, host=None, admin_username=None, admin_password=None, module=None)
status One of `powerup', `powerdown', `powercycle', `hardreset', `graceshutdown'
host The chassis host.
admin_username The username used to access the chassis.
admin_password The password used to access the chassis.
module The element to reboot on the chassis such as a blade. If not provided, the chassis will be rebooted.
CLI Example:
salt dell dracr.server_reboot
salt dell dracr.server_reboot module=server-1
```

```
salt.modules.dracr.server_poweroff(host=None, admin_username=None, admin_password=None, module=None)
Powers down the managed server.
host The chassis host.
admin_username The username used to access the chassis.
admin_password The password used to access the chassis.
module The element to power off on the chassis such as a blade. If not provided, the chassis will be powered off.
CLI Example:
salt dell dracr.server_poweroff
salt dell dracr.server_poweroff module=server-1
```

```
salt.modules.dracr.server_poweron(host=None, admin_username=None, admin_password=None, module=None)
Powers up the managed server.
host The chassis host.
admin_username The username used to access the chassis.
admin_password The password used to access the chassis.
module The element to power on located on the chassis such as a blade. If not provided, the chassis will be powered on.
```

1432 Chapter 19. Salt Module Reference
CLI Example:

```
salt dell dracr.server_poweron
salt dell dracr.server_poweron module=server-1
```

```
salt.modules.dracr.server_powerstatus(host=None, admin_username=None, admin_password=None, module=None)
```
return the power status for the passed module

CLI Example:

```
salt dell dracr.server_powerstatus
```

```
salt.modules.dracr.server_pxe(host=None, admin_username=None, admin_password=None)
```
Configure server to PXE perform a one off PXE boot

CLI Example:

```
salt dell dracr.server_pxe
```

```
salt.modules.dracr.server_reboot(host=None, admin_username=None, admin_password=None, module=None)
```
Issues a power-cycle operation on the managed server. This action is similar to pressing the power button on the system’s front panel to power down and then power up the system.

host The chassis host.
admin_username The username used to access the chassis.
admin_password The password used to access the chassis.
module The element to reboot on the chassis such as a blade. If not provided, the chassis will be rebooted.

CLI Example:

```
salt dell dracr.server_reboot
salt dell dracr.server_reboot module=server-1
```

```
salt.modules.dracr.set_chassis_datacenter(location=, host=None, admin_username=None, admin_password=None)
```
Set the location of the chassis.

location The name of the datacenter to be set on the chassis.
host The chassis host.
admin_username The username used to access the chassis.
admin_password The password used to access the chassis.

CLI Example:

```
salt '*' dracr.set_chassis_datacenter datacenter-name host=111.222.333.444
admin_username=root admin_password=secret
```

```
salt.modules.dracr.set_chassis_location(location=, host=None, admin_username=None, admin_password=None)
```
Set the location of the chassis.

location The name of the location to be set on the chassis.
host The chassis host.
admin_username The username used to access the chassis.
admin_password The password used to access the chassis.

CLI Example:

```
salt '*' dracr.set_chassis_location location-name host=111.222.333.444
admin_username=root admin_password=secret
```

19.9. execution modules
salt.modules.dracr.set_chassis_name(name, host=None, admin_username=None, admin_password=None)

Set the name of the chassis.
name The name to be set on the chassis.
host The chassis host.
admin_username The username used to access the chassis.
admin_password The password used to access the chassis.

CLI Example:
```
salt '*' dracr.set_chassis_name my-chassis host=111.222.333.444
    admin_username=root admin_password=secret
```

salt.modules.dracr.set_dns_dracname(name, host=None, admin_username=None, admin_password=None)

salt.modules.dracr.set_general(cfg_sec, cfg_var, val, host=None, admin_username=None, admin_password=None)

salt.modules.dracr.set_network(ip, netmask, gateway, host=None, admin_username=None, admin_password=None)

Configure Network on the CMC or individual iDRAC. Use set_niccfg for blade and switch addresses.

CLI Example:
```
salt dell dracr.set_network [DRAC IP] [NETMASK] [GATEWAY]
salt dell dracr.set_network 192.168.0.2 255.255.255.0 192.168.0.1
    admin_username=root admin_password=calvin host=192.168.1.1
```

salt.modules.dracr.set_niccfg(ip=None, netmask=None, gateway=None, dhcp=False, host=None, admin_username=None, admin_password=None, module=None)

salt.modules.dracr.set_nicvlan(vlan=None, host=None, admin_username=None, admin_password=None, module=None)

sal.t.modules.dracr.set_permissions(username, permissions, uid=None, host=None, admin_username=None, admin_password=None)

Configure users permissions

CLI Example:
```
salt dell dracr.set_permissions [USERNAME] [PRIVILEGES]
    [USER_INDEX - optional]
salt dell dracr.set_permissions diana login,test_alerts,clear_logs 4
```

DRAC Privileges

- login: Login to iDRAC
- drac: Configure iDRAC
- user_management: Configure Users
- clear_logs: Clear Logs
- server_control_commands: Execute Server Control Commands
- console_redirection: Access Console Redirection
- virtual_media: Access Virtual Media
- test_alerts: Test Alerts
- debug_commands: Execute Debug Commands
salt.modules.dracr.set_slotname(slot, name, host=None, admin_username=None, admin_password=None)

Set the name of a slot in a chassis.
slot The slot number to change.
name The name to set. Can only be 15 characters long.
host The chassis host.
admin_username The username used to access the chassis.
admin_password The password used to access the chassis.

CLI Example:
```
salt '*' dracr.set_slotname 2 my-slotname host=111.222.333.444
        admin_username=root admin_password=secret
```

salt.modules.dracr.set_snmp(community, host=None, admin_username=None, admin_password=None)

Configure CMC or individual iDRAC SNMP community string. Use deploy_snmp for configuring chassis switch SNMP.

CLI Example:
```
salt dell dracr.set_snmp [COMMUNITY]
salt dell dracr.set_snmp public
```

salt.modules.dracr.syslog(server, enable=True, host=None, admin_username=None, admin_password=None, module=None)

Configure syslog remote logging, by default syslog will automatically be enabled if a server is specified. However, if you want to disable syslog you will need to specify a server followed by False

CLI Example:
```
salt dell dracr.syslog [SYSLOG IP] [ENABLE/DISABLE]
salt dell dracr.syslog 0.0.0.0 False
```

salt.modules.dracr.system_info(host=None, admin_username=None, admin_password=None, module=None)

Return System information

CLI Example:
```
salt dell dracr.system_info
```

salt.modules.dracr.update_firmware(filename, host=None, admin_username=None, admin_password=None)

Updates firmware using local firmware file
```
salt dell dracr.update_firmware firmware.exe
```

This executes the following command on your FX2 (using username and password stored in the pillar data)
```
racadm update –f firmware.exe -u user –p pass
```

salt.modules.dracr.update_firmware_nfs_or_cifs(filename, share, host=None, admin_username=None, admin_password=None)

Executes the following for CIFS (using username and password stored in the pillar data)
```
racadm update -f <updatefile> -u user -p pass -l //IP-Address/share
```
Or for NFS (using username and password stored in the pillar data)

```
racadm update -f <updatefile> -u user -p pass -l IP-address:/share
```

Salt command for CIFS:

```
salt dell dracr.update_firmware_nfs_or_cifs firmware.exe //IP-Address/share
```

Salt command for NFS:

```
salt dell dracr.update_firmware_nfs_or_cifs firmware.exe IP-address:/share
```

### 19.9.103 salt.modules.drbd

DRBD administration module

salt.modules.drbd.**overview()**

Show status of the DRBD devices

CLI Example:

```
salt '*' drbd.overview
```

### 19.9.104 salt.modules.dummyproxy_package module

Package support for the dummy proxy used by the test suite

salt.modules.dummyproxy_package.**install**(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs)

salt.modules.dummyproxy_package.**installed**(name, version=None, refresh=False, fromrepo=None, skip_verify=False, pkgs=None, sources=None, **kwargs)

salt.modules.dummyproxy_package.**list_pkgs**(versions_as_list=False, **kwargs)

salt.modules.dummyproxy_package.**remove**(name=None, pkgs=None, **kwargs)

salt.modules.dummyproxy_package.**upgrade**(name=None, pkgs=None, refresh=True, skip_verify=True, normalize=True, **kwargs)

salt.modules.dummyproxy_package.**version**(‘names’, **kwargs)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

### 19.9.105 salt.modules.dummyproxy_service module

Provide the service module for the dummy proxy used in integration tests
salt.modules.dummyproxy_service.enabled(name, sig=None)
    Only the 'redbull' service is 'enabled' in the test
    New in version 2016.11.3.

salt.modules.dummyproxy_service.get_all()
    Return a list of all available services
    New in version 2016.11.3.
    CLI Example:
    salt '*' service.get_all

salt.modules.dummyproxy_service.list()
    Return a list of all available services.
    New in version 2016.11.3.
    CLI Example:
    salt '*' service.list

salt.modules.dummyproxy_service.restart(name, sig=None)
    Restart the specified service with dummy.
    New in version 2016.11.3.
    CLI Example:
    salt '*' service.restart <service name>

salt.modules.dummyproxy_service.running(name, sig=None)
    Return whether this service is running.
    New in version 2016.11.3.

salt.modules.dummyproxy_service.start(name, sig=None)
    Start the specified service on the dummy
    New in version 2016.11.3.
    CLI Example:
    salt '*' service.start <service name>

salt.modules.dummyproxy_service.status(name, sig=None)
    Return the status for a service via dummy, returns a bool whether the service is running.
    New in version 2016.11.3.
    CLI Example:
    salt '*' service.status <service name>

salt.modules.dummyproxy_service.stop(name, sig=None)
    Stop the specified service on the dummy
    New in version 2016.11.3.
    CLI Example:
salt 'x' service.stop <service name>

19.9.106 salt.modules.ebuild

Support for Portage

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `pkg.install' is not available), see here.

    optdepends
        • portage Python adapter

For now all package names **MUST** include the package category, i.e. `vim' will not work, `app-editors/vim' will.

salt.modules.ebuild.check_db(*names, **kwargs)

New in version 0.17.0.

Returns a dict containing the following information for each specified package:

1. A key `found` which will be a boolean value denoting if a match was found in the package database.
2. If `found` is False, then a second key called `suggestions` will be present, which will contain a list of possible matches. This list will be empty if the package name was specified in category/pkgname format, since the suggestions are only intended to disambiguate ambiguous package names (ones submitted without a category).

CLI Examples:

    salt '*' pkg.check_db <package1> <package2> <package3>

salt.modules.ebuild.check_extra_requirements(pkgname, pkgver)

Check if the installed package already has the given requirements.

CLI Example:

    salt '*' pkg.check_extra_requirements 'sys-devel/gcc' ' ~>4.1.2:4.1::
    --gentoo[nls,fortran]'

salt.modules.ebuild.depclean(name=None, slot=None, fromrepo=None, pkgs=None)

Portage has a function to remove unused dependencies. If a package is provided, it will only removed the package if no other package depends on it.

- **name** The name of the package to be cleaned.
- **slot** Restrict the remove to a specific slot. Ignored if `name` is None.
- **fromrepo** Restrict the remove to a specific slot. Ignored if `name` is None.
- **pkgs** Clean multiple packages. `slot` and `fromrepo` arguments are ignored if this argument is present.

Must be passed as a python list.

Return a list containing the removed packages:

CLI Example:

    salt '*' pkg.depclean <package name>

salt.modules.ebuild.ex_mod_init(low)

If the config option `ebuild.enforce_nice_config` is set to True, this module will enforce a nice tree structure for `/etc/portage/package.*` configuration files.

New in version 0.17.0: Initial automatic enforcement added when pkg is used on a Gentoo system.
Changed in version 2014.1.0-Hydrogen: Configure option added to make this behaviour optional, defaulting to off.

**See also:**

ebuild.ex_mod_init is called automatically when a state invokes a pkg state on a Gentoo system.
salt.states.pkg.mod_init()

ebuild.ex_mod_init uses portage_config.enforce_days_config to do the lifting.
salt.modules.portage_config.enforce_days_config()

CLI Example:
```
salt '*' pkg.ex_mod_init
```

salt.modules.ebuild.install(name=None, refresh=False, pkgs=None, sources=None, slot=None, fromrepo=None, uses=None, binhost=None, **kwargs)

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any emerge commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Install the passed package(s), add refresh=True to sync the portage tree before package is installed.

- **name** The name of the package to be installed. Note that this parameter is ignored if either ``pkgs`` or ``sources`` is passed. Additionally, please note that this option can only be used to emerge a package from the portage tree. To install a tbz2 package manually, use the ``sources`` option described below.

**CLI Example:**
```
salt '*' pkg.install <package name>
```

- **refresh** Whether or not to sync the portage tree before installing.

- **version** Install a specific version of the package, e.g. 1.0.9-r1. Ignored if ``pkgs`` or ``sources`` is passed.

- **slot** Similar to version, but specifies a valid slot to be installed. It will install the latest available version in the specified slot. Ignored if ``pkgs`` or ``sources`` or ``version`` is passed.

**CLI Example:**
```
salt '*' pkg.install sys-devel/gcc slot='4.4'
```

- **fromrepo** Similar to slot, but specifies the repository from the package will be installed. It will install the latest available version in the specified repository. Ignored if ``pkgs`` or ``sources`` or ``version`` is passed.

**CLI Example:**
```
salt '*' pkg.install salt fromrepo='gentoo'
```

- **uses** Similar to slot, but specifies a list of use flag. Ignored if ``pkgs`` or ``sources`` or ``version`` is passed.

**CLI Example:**
```
salt '*' pkg.install sys-devel/gcc uses=['nptl','nossp']
```

**Multiple Package Installation Options:**

- **pkgs** A list of packages to install from the portage tree. Must be passed as a python list.

**CLI Example:**
```
salt '*' pkg.install pkgs=['foo','bar','~category/package:slot::repository[use]']
```
sources  A list of tbz2 packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```bash
salt '* pkg.install sources=[{"foo": "salt://foo.tbz2"},{"bar": "salt://bar...}]
```

binhost  has two options try and force. try - tells emerge to try and install the package from a configured binhost. force - forces emerge to install the package from a binhost otherwise it fails out.

Returns a dict containing the new package names and versions:

```json
{"<package>":{"old": "<old-version>"},
 "new": "<new-version>"}
```

```
salt.modules.ebuild.latest_version("names", **kwargs)
```

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```bash
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

```
salt.modules.ebuild.list_pkgs(versions_as_list=False, **kwargs)
```

List the packages currently installed in a dict:

```json
{"<package_name>": '<version>'}
```

CLI Example:

```bash
salt '*' pkg.list_pkgs
```

```
salt.modules.ebuild.list_upgrades(refresh=True, backtrack=3, **kwargs)
```

List all available package upgrades.

- **refresh**  Whether or not to sync the portage tree before checking for upgrades.
- **backtrack**  Specifies an integer number of times to backtrack if dependency calculation fails due to a conflict or an unsatisfied dependency (default: `3`).

CLI Example:

```bash
salt '*' pkg.list_upgrades
```

```
salt.modules.ebuild.porttree_matches(name)
```

Returns a list containing the matches for a given package name from the portage tree. Note that the specific version of the package will not be provided for packages that have several versions in the portage tree, but rather the name of the package (i.e. `"dev-python/paramiko"`).

```
salt.modules.ebuild.purge(name=None, slot=None, fromrepo=None, pkgs=None, **kwargs)
```

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any emerge commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Portage does not have a purge, this function calls remove followed by depclean to emulate a purge process

- **name**  The name of the package to be deleted.
- **slot**  Restrict the remove to a specific slot. Ignored if name is None.
fromrepo  Restrict the remove to a specific slot. Ignored if name is None.

Multiple Package Options:

pkgs  Uninstall multiple packages. slot and fromrepo arguments are ignored if this argument is present.

   Must be passed as a python list.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package name> slot=4.4
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

**salt.modules.ebuild.refresh_db()**

Updates the portage tree (emerge --sync). Uses eix-sync if available.

CLI Example:

```
salt '*' pkg.refresh_db
```

**salt.modules.ebuild.remove(name=None, slot=None, fromrepo=None, pkgs=None, **kwargs)**

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any emerge commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Remove packages via emerge --unmerge.

name  The name of the package to be deleted.

slot  Restrict the remove to a specific slot. Ignored if name is None.

fromrepo  Restrict the remove to a specific slot. Ignored if name is None.

Multiple Package Options:

pkgs  Uninstall multiple packages. slot and fromrepo arguments are ignored if this argument is present.

   Must be passed as a python list.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package name> slot=4.4 fromrepo=gentoo
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

**salt.modules.ebuild.update(pkg, slot=None, fromrepo=None, refresh=False, binhost=None)**

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any emerge commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Updates the passed package (emerge --update package)

slot  Restrict the update to a particular slot. It will update to the latest version within the slot.
fromrepo  Restrict the update to a particular repository. It will update to the latest version within the repository.

binhost  has two options try and force.  try - tells emerge to try and install the package from a configured binhost.  force - forces emerge to install the package from a binhost otherwise it fails out.

Return a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.update <package name>
```

```
salt.modules.ebuild.upgrade(refresh=True, binhost=None, backtrack=3)
```

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any emerge commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Run a full system upgrade (emerge -uDN @world)

binhost has two options try and force.  try - tells emerge to try and install the package from a configured binhost.  force - forces emerge to install the package from a binhost otherwise it fails out.

backtrack  Specifies an integer number of times to backtrack if dependency calculation fails due to a conflict or an unsatisfied dependency (default: 3').

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

```
salt.modules.ebuild.upgrade_available(name)
```

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

```
salt.modules.ebuild.version(names, **kwargs)
```

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

```
salt.modules.ebuild.version_clean(version)
```

Clean the version string removing extra data.

CLI Example:

```
salt '*' pkg.version_clean <version_string>
```
**salt.modules.ebuild.version_cmp(pkg1, pkg2, **kwargs)**

Do a cmp-style comparison on two packages. Return -1 if pkg1 < pkg2, 0 if pkg1 == pkg2, and 1 if pkg1 > pkg2. Return None if there was a problem making the comparison.

CLI Example:

```
salt '*' pkg.version_cmp '0.2.4-0' '0.2.4.1-0'
```

---

**19.9.107 salt.modules.eix**

Support for Eix

salt.modules.eix.sync()

Sync portage/overlay trees and update the eix database

CLI Example:

```
salt '*' eix.sync
```

salt.modules.eix.update()

Update the eix database

CLI Example:

```
salt '*' eix.update
```

---

**19.9.108 salt.modules.elasticsearch**

Elasticsearch - A distributed RESTful search and analytics server

Module to provide Elasticsearch compatibility to Salt (compatible with Elasticsearch version 1.5.2+)

New in version 2015.8.0.

**depends elasticsearch-py**

**configuration** This module accepts connection configuration details either as parameters or as configuration settings in /etc/salt/minion on the relevant minions:

```
elasticsearch:
  host: '10.10.10.100:9200'
elasticsearch-cluster:
  hosts:
    - '10.10.10.100:9200'
    - '10.10.10.101:9200'
    - '10.10.10.102:9200'
elasticsearch-extra:
  hosts:
    - '10.10.10.100:9200'
  use_ssl: True
  verify_certs: True
  ca_certs: /path/to/custom_ca_bundle.pem
  number_of_shards: 1
  number_of_replicas: 0
  functions_blacklist:
    - 'saltutil.find_job'
```

---
When specifying proxies the requests backend will be used and the `proxies` data structure is passed as-is to that module.

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

Some functionality might be limited by elasticsearch-py and Elasticsearch server versions.

```python
salt.modules.elasticsearch.alias_create(indices, alias, hosts=None, body=None, profile=None)
```

Create an alias for a specific index/indices

- **indices** Single or multiple indices separated by comma, use _all to perform the operation on all indices.
- **alias** Alias name
- **body** Optional definition such as routing or filter as defined in https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-aliases.html

CLI example:

```
salt myminion elasticsearch.alias_create testindex_v1 testindex
```

```python
salt.modules.elasticsearch.alias_delete(indices, aliases, hosts=None, body=None, profile=None)
```

Delete an alias of an index

- **indices** Single or multiple indices separated by comma, use _all to perform the operation on all indices.
- **aliases** Alias names separated by comma

CLI example:

```
salt myminion elasticsearch.alias_delete testindex_v1 testindex
```

```python
salt.modules.elasticsearch.alias_exists(aliases, indices=None, hosts=None, profile=None)
```

Return a boolean indicating whether given alias exists

- **indices** Single or multiple indices separated by comma, use _all to perform the operation on all indices.
- **aliases** Alias names separated by comma

CLI example:

```
salt myminion elasticsearch.alias_exists None testindex
```

```python
salt.modules.elasticsearch.alias_get(indices=None, aliases=None, hosts=None, profile=None)
```

Check for the existence of an alias and if it exists, return it

- **indices** Single or multiple indices separated by comma, use _all to perform the operation on all indices.
- **aliases** Alias names separated by comma

CLI example:

```
salt myminion elasticsearch.alias_get testindex
```

```python
salt.modules.elasticsearch.cluster_health(index=None, level='cluster', local=False, hosts=None, profile=None)
```

New in version 2017.7.0.

Return Elasticsearch cluster health.

- **index** Limit the information returned to a specific index
- **level** Specify the level of detail for returned information, default `cluster`, valid choices are: `cluster`, `indices`, `shards`
local  Return local information, do not retrieve the state from master node
CLI example:

```
salt myminion elasticsearch.health
```

```
salt.modules.elasticsearch.cluster_stats(nodes=None, hosts=None, profile=None)
```
New in version 2017.7.0.
Return Elasticsearch cluster stats.

```
nodes List of cluster nodes (id or name) to display stats for. Use _local for connected node, empty for all
```

CLI example:

```
salt myminion elasticsearch.stats
```

```
salt.modules.elasticsearch.document_create(index, doc_type, body=None, id=None, hosts=None, profile=None)
```
Create a document in a specified index

index  Index name where the document should reside
doc_type  Type of the document
body  Document to store
id  Optional unique document identifier for specified doc_type (empty for random)

CLI example:

```
salt myminion elasticsearch.document_create testindex doctype1 '{}'
```

```
salt.modules.elasticsearch.document_delete(index, doc_type, id, hosts=None, profile=None)
```
Delete a document from an index

index  Index name where the document resides
doc_type  Type of the document
id  Document identifier

CLI example:

```
salt myminion elasticsearch.document_delete testindex doctype1 AUx-384m0Bug_-\8U80wQZ
```

```
salt.modules.elasticsearch.document_exists(index, id, doc_type='_'all', hosts=None, profile=None)
```
Return a boolean indicating whether given document exists

index  Index name where the document resides
id  Document identifier
doc_type  Type of the document, use _all to fetch the first document matching the ID across all types

CLI example:

```
salt myminion elasticsearch.document_exists testindex AUx-384m0Bug_8U80wQZ
```

```
salt.modules.elasticsearch.document_get(index, id, doc_type='_'all', hosts=None, profile=None)
```
Check for the existence of a document and if it exists, return it

index  Index name where the document resides
id  Document identifier
doc_type  Type of the document, use _all to fetch the first document matching the ID across all types

CLI example:

```
salt myminion elasticsearch.document_get testindex AUx-384m0Bug_8U80wQZ
```

19.9. execution modules 1445
salt.modules.elasticsearch.index_close(index, allow_no_indices=True, expand_wildcards='open', ignore_unavailable=True, hosts=None, profile=None)

New in version 2017.7.0.

Close specified index.

- **index**: Index to be closed
  - **allow_no_indices**: Whether to ignore if a wildcard indices expression resolves into no concrete indices. (This includes _all string or when no indices have been specified)
  - **expand_wildcards**: Whether to expand wildcard expression to concrete indices that are open, closed or both., default 'open', valid choices are: 'open', 'closed', 'none', 'all'
  - **ignore_unavailable**: Whether specified concrete indices should be ignored when unavailable (missing or closed)

CLI example:
```python
salt myminion elasticsearch.index_close testindex
```

salt.modules.elasticsearch.index_create(index, body=None, hosts=None, profile=None)

Create an index

- **index**: Index name
  - **body**: Index definition, such as settings and mappings as defined in https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-create-index.html

CLI example:
```python
salt myminion elasticsearch.index_create testindex
salt myminion elasticsearch.index_create testindex2 
  
  
  
  
  
  
  
  ```

salt.modules.elasticsearch.index_delete(index, hosts=None, profile=None)

Delete an index

- **index**: Index name

CLI example:
```python
salt myminion elasticsearch.index_delete testindex
```

salt.modules.elasticsearch.index_exists(index, hosts=None, profile=None)

Return a boolean indicating whether given index exists

- **index**: Index name

CLI example:
```python
salt myminion elasticsearch.index_exists testindex
```

salt.modules.elasticsearch.index_get(index, hosts=None, profile=None)

Check for the existence of an index and if it exists, return it

- **index**: Index name

CLI example:
```python
salt myminion elasticsearch.index_get testindex
```

salt.modules.elasticsearch.index_open(index, allow_no_indices=True, expand_wildcards='closed', ignore_unavailable=True, hosts=None, profile=None)

New in version 2017.7.0.

Open specified index.

- **index**: Index to be opened
allow_no_indices  Whether to ignore if a wildcard indices expression resolves into no concrete indices. (This includes _all string or when no indices have been specified)
expand_wildcards  Whether to expand wildcard expression to concrete indices that are open, closed or both., default 'closed', valid choices are: 'open', 'closed', 'none', 'all'
ignore_unavailable  Whether specified concrete indices should be ignored when unavailable (missing or closed)

CLI example:

```
salt myminion elasticsearch.index_open testindex
```

salt.modules.elasticsearch.index_template_create(name, body, hosts=None, profile=None)
Create an index template

name  Index template name

CLI example:

```
salt myminion elasticsearch.index_template_create testindex_templ '{ "template": "logstash-*", "order": 1, "settings": { "number_of_shards": 1 } }'
```

salt.modules.elasticsearch.index_template_delete(name, hosts=None, profile=None)
Delete an index template (type) along with its data

name  Index template name

CLI example:

```
salt myminion elasticsearch.index_template_delete testindex_templ user
```

salt.modules.elasticsearch.index_template_exists(name, hosts=None, profile=None)
Return a boolean indicating whether given index template exists

name  Index template name

CLI example:

```
salt myminion elasticsearch.index_template_exists testindex_templ
```

salt.modules.elasticsearch.index_template_get(name, hosts=None, profile=None)
Retrieve template definition of index or index/type

name  Index template name

CLI example:

```
salt myminion elasticsearch.index_template_get testindex_templ
```

salt.modules.elasticsearch.info(hosts=None, profile=None)
New in version 2017.7.0.
Return Elasticsearch information.

CLI example:

```
salt myminion elasticsearch.info
salt myminion elasticsearch.info profile=elasticsearch-extra
```

salt.modules.elasticsearch.mapping_create(index, doc_type, body, hosts=None, profile=None)
Create a mapping in a given index

index  Index for the mapping
doc_type  Name of the document type

CLI example:
```
salt myminion elasticsearch.mapping_create testindex user '{ "user": {
    "properties": { "message": { "type": "string", "store": true } } }
}
```

salt.modules.elasticsearch.mapping_delete(index, doc_type, hosts=None, profile=None)
Delete a mapping (type) along with its data. As of Elasticsearch 5.0 this is no longer available.
- index Index for the mapping
- doc_type Name of the document type

CLI example:
```
salt myminion elasticsearch.mapping_delete testindex user
```

salt.modules.elasticsearch.mapping_get(index, doc_type, hosts=None, profile=None)
Retrieve mapping definition of index or index/type
- index Index for the mapping
- doc_type Name of the document type

CLI example:
```
salt myminion elasticsearch.mapping_get testindex user
```

salt.modules.elasticsearch.node_info(nodes=None, flat_settings=False, hosts=None, profile=None)
New in version 2017.7.0.
- nodes List of cluster nodes (id or name) to display stats for. Use _local for connected node, empty for all
- flat_settings Flatten settings keys

CLI example:
```
salt myminion elasticsearch.node_info flat_settings=True
```

salt.modules.elasticsearch.ping(allow_failure=False, hosts=None, profile=None)
New in version 2017.7.0.
- allow_failure Throw exception if ping fails

CLI example:
```
salt myminion elasticsearch.ping allow_failure=True
```

salt.modules.elasticsearch.pipeline_create(id, body, hosts=None, profile=None)
New in version 2017.7.0.
- id Pipeline id

CLI example:
```
salt myminion elasticsearch.pipeline_create mypipeline '{"description": "my custom pipeline", "processors": [{"set": {"field": "collector_timestamp_millis", "value": "{{_ingest.timestamp}}"}}]}
```

1448 Chapter 19. Salt Module Reference
salt.modules.elasticsearch.pipeline_delete(id, hosts=None, profile=None)
New in version 2017.7.0.
Delete Ingest pipeline. Available since Elasticsearch 5.0.
id Pipeline id
CLI example:
salt myminion elasticsearch.pipeline_delete mypipeline

salt.modules.elasticsearch.pipeline_get(id, hosts=None, profile=None)
New in version 2017.7.0.
Retrieve Ingest pipeline definition. Available since Elasticsearch 5.0.
id Pipeline id
CLI example:
salt myminion elasticsearch.pipeline_get mypipeline

salt.modules.elasticsearch.pipeline_simulate(id, body, verbose=False, hosts=None, profile=None)
New in version 2017.7.0.
Simulate existing Ingest pipeline on provided data. Available since Elasticsearch 5.0.
id Pipeline id
verbose Specify if the output should be more verbose
CLI example:
salt myminion elasticsearch.pipeline_simulate mypipeline '{"docs": [{"_index": "-_index", "_type": "type", "_id": "id", "_source": {"foo": "bar"}}, {"_index": "index", "_type": "type", "_id": "id", "_source": {"foo": "rab"}}], "verbose": true'}

salt.modules.elasticsearch.repository_create(name, body, hosts=None, profile=None)
New in version 2017.7.0.
Create repository for storing snapshots. Note that shared repository paths have to be specified in path.repo Elasticsearch configuration option.
name Repository name
CLI example:
salt myminion elasticsearch.repository_create testrepo '{"type": "fs", "settings": {"location": "/tmp/test", "compress": true}}'

salt.modules.elasticsearch.repository_delete(name, hosts=None, profile=None)
New in version 2017.7.0.
Delete existing repository.
name Repository name
CLI example:
salt myminion elasticsearch.repository_delete testrepo

salt.modules.elasticsearch.repository_get(name, local=False, hosts=None, profile=None)
New in version 2017.7.0.
Get existing repository details.
name  Repository name
local  Retrieve only local information, default is false
CLI example:
salt myminion elasticseach.repository_get testrepo

salt.modules.elasticsearch.repository_verify(name, hosts=None, profile=None)
New in version 2017.7.0.
Obtain list of cluster nodes which successfully verified this repository.
name  Repository name
CLI example:
salt myminion elasticseach.repository_verify testrepo

salt.modules.elasticsearch.search_template_create(id, body=None, hosts=None, profile=None)
New in version 2017.7.0.
Create search template by supplied definition
id  Template ID
body  Search template definition
CLI example:
salt myminion elasticseach.search_template_create mytemplate '{"template":{"match":{"title":{{query_string}}}}}'

salt.modules.elasticsearch.search_template_delete(id, hosts=None, profile=None)
New in version 2017.7.0.
Delete existing search template definition.
id  Template ID
CLI example:
salt myminion elasticseach.search_template_delete mytemplate

salt.modules.elasticsearch.search_template_get(id, hosts=None, profile=None)
New in version 2017.7.0.
Obtain existing search template definition.
id  Template ID
CLI example:
salt myminion elasticseach.search_template_get mytemplate

salt.modules.elasticsearch.snapshot_create(repository, snapshot, body=None, hosts=None, profile=None)
New in version 2017.7.0.
Create snapshot in specified repository by supplied definition.
repository  Repository name
snapshot  Snapshot name
CLI example:
salt myminion elasticseach.snapshot_create testrepo testsnapshot '{"indices":{"index_1,index_2","ignore_unavailable":true,"include_global_state":false}'}
salt.modules.elasticsearch.snapshot_delete(repository, snapshot, host=None, profile=None)

New in version 2017.7.0.
Delete snapshot from specified repository.
repository Repository name
snapshot Snapshot name
CLI example:
salt myminion elasticsearch.snapshot_delete testrepo testsnapshot

salt.modules.elasticsearch.snapshot_get(repository, snapshot, ignore_unavailable=False, host=None, profile=None)

New in version 2017.7.0.
Obtain snapshot residing in specified repository.
repository Repository name
snapshot Snapshot name, use _all to obtain all snapshots in specified repository
ignore_unavailable Ignore unavailable snapshots
CLI example:
salt myminion elasticsearch.snapshot_get testrepo testsnapshot

salt.modules.elasticsearch.snapshot_restore(repository, snapshot, body=None, host=None, profile=None)

New in version 2017.7.0.
Restore existing snapshot in specified repository by supplied definition.
repository Repository name
snapshot Snapshot name
CLI example:
salt myminion elasticsearch.snapshot_restore testrepo testsnapshot '{"indices": "index_1,index_2","ignore_unavailable":true,"include_global_state":true}"

salt.modules.elasticsearch.snapshot_status(repository=None, snapshot=None, ignore_unavailable=False, host=None, profile=None)

New in version 2017.7.0.
Obtain status of all currently running snapshots.
repository Particular repository to look for snapshots
snapshot Snapshot name
ignore_unavailable Ignore unavailable snapshots
CLI example:
salt myminion elasticsearch.snapshot_status ignore_unavailable=True

19.9.109 salt.modules.environ

Support for getting and setting the environment variables of the current salt process.
salt.modules.environ.get(key, default='')
Get a single salt process environment variable.
key String used as the key for environment lookup.
default  If the key is not found in the environment, return this value. Default: `''

CLI Example:

```
salt '*' environ.get foo
salt '*' environ.get baz default=False
```

salt.modules.environ.has_value(key, value=None)
Determine whether the key exists in the current salt process environment dictionary. Optionally compare the current value of the environment against the supplied value string.

key  Must be a string. Used as key for environment lookup.
value: Optional. If key exists in the environment, compare the current value with this value. Return True if they are equal.

CLI Example:

```
salt '*' environ.has_value foo
```

salt.modules.environ.item(keys, default='``
Get one or more salt process environment variables. Returns a dict.

keys Either a string or a list of strings that will be used as the keys for environment lookup.
default If the key is not found in the environment, return this value. Default: `''

CLI Example:

```
salt '*' environ.item foo
salt '*' environ.item ['foo, baz'] default=None
```

salt.modules.environ.items()
Return a dict of the entire environment set for the salt process

CLI Example:

```
salt '*' environ.items
```

salt.modules.environ.setenv(environ, false_unsets=False, clear_all=False, update_minion=False, permanent=False)
Set multiple salt process environment variables from a dict. Returns a dict.
environ Must be a dict. The top-level keys of the dict are the names of the environment variables to set.
Each key's value must be a string or False. Refer to the `false_unsets' parameter for behavior when a value set to False.
false_unsets If a key's value is False and false_unsets is True, then the key will be removed from the salt processes environment dict entirely. If a key's value is False and false_unsets is not True, then the key's value will be set to an empty string. Default: False
clear_all USE WITH CAUTION! This option can unset environment variables needed for salt to function properly. If clear_all is True, then any environment variables not defined in the environ dict will be deleted. Default: False
update_minion If True, apply these environ changes to the main salt-minion process. If False, the environ changes will only affect the current salt subprocess. Default: False
permanent On Windows minions this will set the environment variable in the registry so that it is always added as an environment variable when applications open. If you want to set the variable to HKLM instead of HKCU just pass in "HKLM" for this parameter. On all other minion types this will be ignored. Note: This will only take affect on applications opened after this has been set.

CLI Example:

```
salt '*' environ.setenv '{"foo": "bar", "baz": "quux"}'
salt '*' environ.setenv '{"a": "b", "c": False}' false_unsets=True
```

salt.modules.environ.setval(key, val, false_unsets=False, permanent=False)
Set a single salt process environment variable. Returns True on success.
key  The environment key to set. Must be a string.
val  The value to set. Must be a string or False. Refer to the `false_unsets` parameter for behavior when set
to False.
false_unsets  If val is False and false_unsets is True, then the key will be removed from the salt processes
environment dict entirely. If val is False and false_unsets is not True, then the key's value will be set to
an empty string. Default: False.
permanent  On Windows minions this will set the environment variable in the registry so that it is always
added as a environment variable when applications open. If you want to set the variable to HKLM
instead of HKCU just pass in "HKLM" for this parameter. On all other minion types this will be
ignored. Note: This will only take affect on applications opened after this has been set.

CLI Example:

```bash
salt '*' environ.setval foo bar
salt '*' environ.setval baz val=False false_unsets=True
salt '*' environ.setval baz bar permanent=True
salt '*' environ.setval baz bar permanent=HKLM
```

### 19.9.110  `salt.modules.eselect`

Support for eselect, Gentoo's configuration and management tool.

```bash
class `exec_action`:
    `exec_action`(module, action, module_parameter=None, action_parameter=None, state_only=False)

    Execute an arbitrary action on a module.

    module  name of the module to be executed
    action  name of the module's action to be run
    module_parameter  additional params passed to the defined module
    action_parameter  additional params passed to the defined action
    state_only  don't return any output but only the success/failure of the operation
```

CLI Example (updating the php implementation used for apache2):

```bash
salt '*' eselect.exec_action php update action_parameter='apache2'
```

```bash
class `get_current_target`:
    `get_current_target`(module, module_parameter=None, action_parameter=None)

    Get the currently selected target for the given module.

    module  name of the module to be queried for its current target
    module_parameter  additional params passed to the defined module
    action_parameter  additional params passed to the `show` action
```

CLI Example (current target of system-wide java-vm):

```bash
salt '*' eselect.get_current_target java-vm action_parameter='system'
```

CLI Example (current target of kernel symlink):

```bash
salt '*' eselect.get_current_target kernel
```

```bash
class `get_modules`:
    `get_modules`()

    List available eselect modules.
```

CLI Example:

```bash
salt '*' eselect.get_modules
```

```bash
class `get_target_list`:
    `get_target_list`(module, action_parameter=None)

    List available targets for the given module.
```

```bash
salt '*' eselect.get_target_list
```
module  name of the module to be queried for its targets
action_parameter  additional params passed to the defined action

New in version 2016.11.0.

CLI Example:

salt '*' eselect.get_target_list kernel

salt.modules.eselect.set_target(module, target, module_parameter=None, action_parameter=None)

Set the target for the given module. Target can be specified by index or name.
module  name of the module for which a target should be set
target  name of the target to be set for this module
module_parameter  additional params passed to the defined module
action_parameter  additional params passed to the defined action

CLI Example (setting target of system-wide java-vm):

salt '*' eselect.set_target java-vm icedtea-bin-7 action_parameter='system'

CLI Example (setting target of kernel symlink):

salt '*' eselect.set_target kernel linux-3.17.5-gentoo

19.9.111  salt.modules.esxi

Glues the VMware vSphere Execution Module to the VMware ESXi Proxy Minions to the esxi proxymodule.
New in version 2015.8.4.
Depends: vSphere Remote Execution Module (salt.modules.vsphere)

For documentation on commands that you can direct to an ESXi host via proxy, look in the documentation for salt.modules.vsphere.

This execution module calls through to a function in the ESXi proxy module called ch_config, which looks up the function passed in the command parameter in salt.modules.vsphere and calls it.

To execute commands with an ESXi Proxy Minion using the vSphere Execution Module, use the esxi.cmd <vsphere-function-name> syntax. Both args and kwargs needed for various vsphere execution module functions must be passed through in a kwarg-type manner.

salt 'esxi-proxy' esxi.cmd system_info
salt 'esxi-proxy' esxi.cmd get_service_policy service_name='ssh'

salt.modules.esxi.cmd(command, *args, **kwargs)

19.9.112  salt.modules.etcd_mod

Execution module to work with etcd

depends
  • python-etcd
**Configuration**

To work with an etcd server you must configure an etcd profile. The etcd config can be set in either the Salt Minion configuration file or in pillar:

```
my_etcd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

It is technically possible to configure etcd without using a profile, but this is not considered to be a best practice, especially when multiple etcd servers or clusters are available.

```
etcd.host: 127.0.0.1
etcd.port: 4001
```

**Note:** The etcd configuration can also be set in the Salt Master config file, but in order to use any etcd configurations defined in the Salt Master config, the `pillar_opts` must be set to True.

Be aware that setting `pillar_opts` to True has security implications as this makes all master configuration settings available in all minion’s pillars.

```python
salt.modules.etcd_mod.get_(key, recurse=False, profile=None)
New in version 2014.7.0.
Get a value from etcd, by direct path. Returns None on failure.
CLI Examples:
salt myminion etcd.get /path/to/key
salt myminion etcd.get /path/to/key profile=my_etcd_config
salt myminion etcd.get /path/to/key recurse=True profile=my_etcd_config
```

```python
salt.modules.etcd_mod.ls_(path='/', profile=None)
New in version 2014.7.0.
Return all keys and dirs inside a specific path. Returns an empty dict on failure.
CLI Example:
salt myminion etcd.ls /path/to/dir/
salt myminion etcd.ls /path/to/dir/ profile=my_etcd_config
```

```python
salt.modules.etcd_mod.rm_(key, recurse=False, profile=None)
New in version 2014.7.0.
Delete a key from etcd. Returns True if the key was deleted, False if it was not and None if there was a failure.
CLI Example:
salt myminion etcd.rm /path/to/key
salt myminion etcd.rm /path/to/key profile=my_etcd_config
salt myminion etcd.rm /path/to/dir recurse=True profile=my_etcd_config
```

```python
salt.modules.etcd_mod.set_(key, value, profile=None, ttl=None, directory=False)
New in version 2014.7.0.
Set a key in etcd by direct path. Optionally, create a directory or set a TTL on the key. Returns None on failure.
```
CLI Example:

```
salt myminion etcd.set /path/to/key value
salt myminion etcd.set /path/to/key value profile=my_etcd_config
salt myminion etcd.set /path/to/dir '' directory=True
salt myminion etcd.set /path/to/key value ttl=5
```

salt.modules.etcd_mod.tree(path='/', profile=None)
New in version 2014.7.0.
Recurse through etcd and return all values. Returns None on failure.

CLI Example:

```
salt myminion etcd.tree
salt myminion etcd.tree profile=my_etcd_config
salt myminion etcd.tree /path/to/keys profile=my_etcd_config
```

salt.modules.etcd_mod.update(fields, path='/', profile=None)
New in version 2016.3.0.
Sets a dictionary of values in one call. Useful for large updates in syndic environments. The dictionary can contain a mix of formats such as:

```
{
    '/some/example/key': 'bar',
    '/another/example/key': 'baz'
}
```

Or it may be a straight dictionary, which will be flattened to look like the above format:

```
{
    'some': {
        'example': {
            'key': 'bar'
        }
    },
    'another': {
        'example': {
            'key': 'baz'
        }
    }
}
```

You can even mix the two formats and it will be flattened to the first format. Leading and trailing '//' will be removed.

Empty directories can be created by setting the value of the key to an empty dictionary.

The `path` parameter will optionally set the root of the path to use.

CLI Example:

```
salt myminion etcd.update "{"/path/to/key": 'baz', '/another/key': 'bar'}" -p "my_etcd_config"
salt myminion etcd.update "{"/path/to/key": 'baz', '/another/key': 'bar'}" -p "my_etcd_config"
salt myminion etcd.update "{"/path/to/key": 'baz', '/another/key': 'bar'}" -p "/some/root"
```
salt.modules.etcd_mod.watch(key, recurse=False, profile=None, timeout=0, index=None)
New in version 2016.3.0.

Makes a best effort to watch for a key or tree change in etcd. Returns a dict containing the new key value (or None if the key was deleted), the modifiedIndex of the key, whether the key changed or not, the path to the key that changed and whether it is a directory or not.

If something catastrophic happens, returns {}.

CLI Example:

```
salt myminion etcd.watch /path/to/key
salt myminion etcd.watch /path/to/key timeout=10
salt myminion etcd.watch /patch/to/key profile=my_etcd_config index=10
```

19.9.113 salt.modules.ethtool module

Module for running ethtool command
New in version 2016.3.0.

codeauthor Krzysztof Pawlowski <msciciel@msciciel.eu>
maturity new
depends python-ethtool
platform linux

salt.modules.ethtool.set_coalesce(devname, **kwargs)
Changes the coalescing settings of the specified network device

CLI Example:

```
salt '*' ethtool.set_coalesce <devname> [adaptive_rx=on|off] [adaptive_tx=on|off] [rx_usecs=N] [rx_frames=N] [rx_usecs_irq=N] [rx_frames_irq=N] [stats_block_usecs=N] [pkt_rate_low=N] [rx_usecs_low=N] [rx_frames_low=N] [tx_usecs=N] [tx_frames=N] [tx_usecs_irq=N] [tx_frames_irq=N] [sample_interval=N]
```

salt.modules.ethtool.set_offload(devname, **kwargs)
Changes the offload parameters and other features of the specified network device

CLI Example:

```
salt '*' ethtool.set_offload <devname> tcp_segmentation_offload=on
```

salt.modules.ethtool.set_ring(devname, **kwargs)
Changes the rx/tx ring parameters of the specified network device

CLI Example:

```
salt '*' ethtool.set_ring <devname> [rx=N] [rx_mini=N] [rx_jumbo=N] [tx=N]
```

salt.modules.ethtool.show_coalesce(devname)
Queries the specified network device for coalescing information
CLI Example:

```
salt '*' ethtool.show_coalesce <devname>
```

salt.modules.ethtool.show_driver(devname)
Queries the specified network device for associated driver information

CLI Example:

```
salt '*' ethtool.show_driver <devname>
```

salt.modules.ethtool.show_offload(devname)
Queries the specified network device for the state of protocol offload and other features

CLI Example:

```
salt '*' ethtool.show_offload <devname>
```

salt.modules.ethtool.show_ring(devname)
Queries the specified network device for rx/tx ring parameter information

CLI Example:

```
salt '*' ethtool.show_ring <devname>
```

19.9.114 salt.modules.event

Use the Salt Event System to fire events from the master to the minion and vice-versa.

salt.modules.event.fire(data, tag)
Fire an event on the local minion event bus. Data must be formed as a dict.

CLI Example:

```
salt '*' event.fire '{{"data":"my event data"}}' 'tag'
```

salt.modules.event.fire_master(data, tag, preload=None)
Fire an event off up to the master server

CLI Example:

```
salt '*' event.fire_master '{{"data":"my event data"}}' 'tag'
```

salt.modules.event.send(tag, data=None, preload=None, with_env=False, with_grains=False, with_pillar=False, with_env_opts=False, **kwargs)
Send an event to the Salt Master

New in version 2014.7.0.

Parameters

- **tag** -- A tag to give the event. Use slashes to create a namespace for related events. E.g., myco/build/buildserver1/start, myco/build/buildserver1/success, myco/build/buildserver1/failure.

- **data** -- A dictionary of data to send in the event. This is free-form. Send any data points that are needed for whoever is consuming the event. Arguments on the CLI are interpreted as YAML so complex data structures are possible.
with_env (Specify True to include all environment variables, or specify a list of strings of variable names to include.) -- Include environment variables from the current shell environment in the event data as environ. This is a short-hand for working with systems that seed the environment with relevant data such as Jenkins.

with_grains (Specify True to include all grains, or specify a list of strings of grain names to include.) -- Include grains from the current minion in the event data as grains.

with_pillar (Specify True to include all Pillar values, or specify a list of strings of Pillar keys to include. It is a best-practice to only specify a relevant subset of Pillar data.) -- Include Pillar values from the current minion in the event data as pillar. Remember Pillar data is often sensitive data so be careful. This is useful for passing ephemeral Pillar values through an event. Such as passing the pillar={} kwarg in state.sls from the Master, through an event on the Minion, then back to the Master.

with_env_opts (Specify True to include saltenv and pillarenv values or False to omit them.) -- Include saltenv and pillarenv set on minion at the moment when event is send into event data.

kwargs -- Any additional keyword arguments passed to this function will be interpreted as key-value pairs and included in the event data. This provides a convenient alternative to YAML for simple values.

CLI Example:

```
salt-call event.send myco/mytag foo=Foo bar=Bar
salt-call event.send 'myco/mytag' '{foo: Foo, bar: Bar}'
```

A convenient way to allow Jenkins to execute salt-call is via sudo. The following rule in sudoers will allow the jenkins user to run only the following command.

/etc/sudoers (allow preserving the environment):

```
jenkins ALL=(ALL) NOPASSWD:SETENV: /usr/bin/salt-call event.send*
```

Call Jenkins via sudo (preserve the environment):

```
sudo -E salt-call event.send myco/jenkins/build/success with_env=[BUILD_ID, BUILD_, --URL, GIT_BRANCH, GIT_COMMIT]
```

19.9.115 salt.modules.extfs

Module for managing ext2/3/4 file systems

salt.modules.extfs.attributes (device, args=None)

Return attributes from dumpe2fs for a specified device

CLI Example:

```
salt '*' extfs.attributes /dev/sda1
```

salt.modules.extfs.blocks (device, args=None)

Return block and inode info from dumpe2fs for a specified device

CLI Example:
salt '*' extfs.blocks /dev/sda1

salt.modules.extfs.dump(device, args=None)
    Return all contents of dumpe2fs for a specified device
    CLI Example:
    
    salt '*' extfs.dump /dev/sda1

salt.modules.extfs.mkfs(device, fs_type, **kwargs)
    Create a file system on the specified device
    CLI Example:
    
    salt '*' extfs.mkfs /dev/sda1
    fs_type=ext4
    opts=acl,noexec

Valid options are:
    • block_size: 1024, 2048 or 4096
    • check: check for bad blocks
    • direct: use direct IO
    • ext_opts: extended file system options (comma-separated)
    • fragment_size: size of fragments
    • force: setting force to True will cause mke2fs to specify the -F option twice (it is already set once); this
      is truly dangerous
    • blocks_per_group: number of blocks in a block group
    • number_of_groups: ext4 option for a virtual block group
    • bytes_per_inode: set the bytes/inode ratio
    • inode_size: size of the inode
    • journal: set to True to create a journal (default on ext3/4)
    • journal_opts: options for the fs journal (comma separated)
    • blocks_file: read bad blocks from file
    • label: label to apply to the file system
    • reserved: percentage of blocks reserved for super-user
    • last_dir: last mounted directory
    • test: set to True to not actually create the file system (mke2fs -n)
    • number_of_inodes: override default number of inodes
    • creator_os: override `creator operating system` field
    • opts: mount options (comma separated)
    • revision: set the filesystem revision (default 1)
    • super: write superblock and group descriptors only
    • fs_type: set the filesystem type (REQUIRED)
    • usage_type: how the filesystem is going to be used
    • uuid: set the UUID for the file system
    See the mke2fs(8) manpage for a more complete description of these options.

salt.modules.extfs.tune(device, **kwargs)
    Set attributes for the specified device (using tune2fs)
    CLI Example:
    
    salt '*' extfs.tune /dev/sda1
    force=True
    label=wildstallyns
    opts=acl,noexec

Valid options are:
    • max: max mount count
    • count: mount count
    • error: error behavior
- **extended_opts**: extended options (comma separated)
- **force**: force, even if there are errors (set to True)
- **group**: group name or gid that can use the reserved blocks
- **interval**: interval between checks
- **journal**: set to True to create a journal (default on ext3/4)
- **journal_opts**: options for the fs journal (comma separated)
- **label**: label to apply to the file system
- **reserved**: percentage of blocks reserved for super-user
- **last_dir**: last mounted directory
- **opts**: mount options (comma separated)
- **feature**: set or clear a feature (comma separated)
- **mmp_check**: mmp check interval
- **reserved**: reserved blocks count
- **quota_opts**: quota options (comma separated)
- **time**: time last checked
- **user**: user or uid who can use the reserved blocks
- **uuid**: set the UUID for the file system

See the `mke2fs(8)` manpage for a more complete description of these options.

### 19.9.116 salt.modules.file

Manage information about regular files, directories, and special files on the minion, set/read user, group, mode, and data

salt.modules.file.**access**(path, mode)

New in version 2014.1.0.

Test whether the Salt process has the specified access to the file. One of the following modes must be specified:

**CLI Example:**

```
salt '*' file.access /path/to/file f
salt '*' file.access /path/to/file x
```

salt.modules.file.**append**(path, *args, **kwargs)

New in version 0.9.5.

Append text to the end of a file

**path** path to file

*args* strings to append to file

**CLI Example:**

```
salt '*' file.append /etc/motd \
    "With all thine offerings thou shalt offer salt." \n    "Salt is what makes things taste bad when it isn't in them."
```

**Attention**

If you need to pass a string to append and that string contains an equal sign, you must include the argument name, args. For example:

```
salt '*' file.append /etc/motd args='cheese=spam'
salt '*' file.append /etc/motd args=['cheese=spam','spam=cheese']
```
salt.modules.file.apply_template_on_contents(contents, template, context, defaults, saltenv)

Return the contents after applying the templating engine

- contents: template string
- template: template format
- context: Overrides default context variables passed to the template.
- defaults: Default context passed to the template.

CLI Example:

```
salt '*' file.apply_template_on_contents \
    contents='This is a {{ template }} string.' \
    template=jinja \
    "context={}" "defaults={'template': 'cool'}" \
    saltenv=base
```

salt.modules.file.basename(path)

Returns the final component of a pathname

New in version 2015.5.0.

This can be useful at the CLI but is frequently useful when scripting.

```
{% set filename = salt['file.basename'](source_file) %}
```

CLI Example:

```
salt '*' file.basename 'test/test.config'
```

salt.modules.file.blockreplace(path, marker_start='#-- start managed zone --', marker_end='#-- end managed zone --', content='''', append_if_not_found=False, prepend_if_not_found=False, backup='.bak', dry_run=False, show_changes=True, append_newline=False)

New in version 2014.1.0.

Replace content of a text block in a file, delimited by line markers

A block of content delimited by comments can help you manage several lines entries without worrying about old entries removal.

**Note:** This function will store two copies of the file in-memory (the original version and the edited version) in order to detect changes and only edit the targeted file if necessary.

- path: Filesystem path to the file to be edited
- marker_start: The line content identifying a line as the start of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output
- marker_end: The line content identifying a line as the end of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output
- content: The content to be used between the two lines identified by marker_start and marker_stop.
- append_if_not_found: [False] If markers are not found and set to True then, the markers and content will be appended to the file.
- prepend_if_not_found: [False] If markers are not found and set to True then, the markers and content will be prepended to the file.
- backup: The file extension to use for a backup of the file if any edit is made. Set to False to skip making a backup.
**`dry_run`** [False] If True, do not make any edits to the file and simply return the changes that *would* be made.

**`show_changes`** [True] Controls how changes are presented. If True, this function will return a unified diff of the changes made. If False, then it will return a boolean (True if any changes were made, otherwise False).

**`append_newline`** [False] Controls whether or not a newline is appended to the content block. If the value of this argument is True then a newline will be added to the content block. If it is False, then a newline will not be added to the content block. If it is None then a newline will only be added to the content block if it does not already end in a newline.

New in version 2016.3.4.

Changed in version 2017.7.5, 2018.3.1: New behavior added when value is None.

Changed in version Fluorine: The default value of this argument will change to None to match the behavior of the *file.blockreplace state*

CLI Example:

```
salt '*' file.blockreplace /etc/hosts '#-- start managed zone foobar : DO NOT EDIT --'
    '##-- end managed zone foobar --' $'10.0.1.1 foo.foobar
10.0.1.2 bar.foobar' True
```

**`salt.modules.file.check_file_meta(name, sfn, source, source_sum, user, group, mode, saltenv, contents=None)`**

Check for the changes in the file metadata.

CLI Example:

```
salt '*' file.check_file_meta /etc/httpd/conf.d/httpd.conf salt://http/httpd.conf
    ->'{hash_type: 'md5', 'hsum': <md5sum>}' root, root, '755' base
```

**Note:** Supported hash types include sha512, sha384, sha256, sha224, sha1, and md5.

**name** Path to file destination

**sfn** Template-processed source file contents

**source** URL to file source

**source_sum** File checksum information as a dictionary

```python
{hash_type: md5, hsum: <md5sum>}
```

**user** Destination file user owner

**group** Destination file group owner

**mode** Destination file permissions mode

**saltenv** Salt environment used to resolve source files

**contents** File contents

**`salt.modules.file.check_hash(path, file_hash)`**

Check if a file matches the given hash string

Returns True if the hash matches, otherwise False.

**path** Path to a file local to the minion.

**hash** The hash to check against the file specified in the *path* argument.

Changed in version 2016.11.4.

For this and newer versions the hash can be specified without an accompanying hash type (e.g. `e138491e9d5b97023cea823fe17bac22`), but for earlier releases it is nec-
necessary to also specify the hash type in the format `<hash_type>=<hash_value>` (e.g. `md5=e138491e9d5b97023cea823fe17bac22`).

CLI Example:

```bash
salt '*' file.check_hash /etc/fstab e138491e9d5b97023cea823fe17bac22
salt '*' file.check_hash /etc/fstab md5=e138491e9d5b97023cea823fe17bac22
```

**salt.modules.file.check_managed**

```python
salt.modules.file.check_managed(name, source, source_hash, source_hash_name, user, group, mode, template, context, defaults, saltenv, contents=None, skip_verify=False, **kwargs)
```

Check to see what changes need to be made for a file

CLI Example:

```bash
salt '*' file.check_managed /etc/httpd/conf.d/httpd.conf salt://http/httpd.conf '{hash_type: 'md5', 'hsum': <md5sum>}' root, root, '755' jinja True None None base
```

**salt.modules.file.check_managed_changes**

```python
salt.modules.file.check_managed_changes(name, source, source_hash, source_hash_name, user, group, mode, template, context, defaults, saltenv, contents=None, skip_verify=False, keep_mode=False, **kwargs)
```

Return a dictionary of what changes need to be made for a file

CLI Example:

```bash
salt '*' file.check_managed_changes /etc/httpd/conf.d/httpd.conf salt://http/httpd.conf '{hash_type: 'md5', 'hsum': <md5sum>}' root, root, '755' jinja True None None base
```

**salt.modules.file.check_perms**

```python
salt.modules.file.check_perms(name, ret, user, group, mode, follow_symlinks=False)
```

Check the permissions on files and chown if needed

CLI Example:

```bash
salt '*' file.check_perms /etc/sudoers '{}' root root 400
```

Changed in version 2014.1.3: follow_symlinks option added

**salt.modules.file.chgrp**

```python
salt.modules.file.chgrp(path, group)
```

Change the group of a file

path path to the file or directory

CLI Example:

```bash
salt '*' file.chgrp /etc/passwd root
```

**salt.modules.file.chown**

```python
salt.modules.file.chown(path, user, group)
```

Chown a file, pass the file the desired user and group

path path to the file or directory

user user owner

group group owner

CLI Example:

```bash
salt '*' file.chown /etc/passwd root root
```

**salt.modules.file.comment**

```python
salt.modules.file.comment(path, regex, char='#', backup='.bak')
```

Deprecated since version 0.17.0: Use `replace()` instead.

Comment out specified lines in a file
**path** The full path to the file to be edited

**regex** A regular expression used to find the lines that are to be commented; this pattern will be wrapped in parenthesis and will move any preceding/trailing ^ or $ characters outside the parenthesis (e.g., the pattern ^foo$ will be rewritten as ^(foo)$)

**char** [ #] The character to be inserted at the beginning of a line in order to comment it out

**backup** [.bak] The file will be backed up before edit with this file extension

**Warning:** This backup will be overwritten each time `sed / comment / uncomment` is called. Meaning the backup will only be useful after the first invocation.

**CLI Example:**

```
salt '*' file.comment /etc/modules pcspkr
```

```python
salt.modules.file.comment_line(path, regex='^', cmnt=True, backup='.bak')
```

Comment or Uncomment a line in a text file.

**Parameters**

- **path** -- string The full path to the text file.
- **regex** -- string A regex expression that begins with ^ that will find the line you wish to comment. Can be as simple as ^color =
- **char** -- string The character used to comment a line in the type of file you're referencing. Default is #
- **cmnt** -- boolean True to comment the line. False to uncomment the line. Default is True.
- **backup** -- string The file extension to give the backup file. Default is .bak Set to False/None to not keep a backup.

**Returns** boolean Returns True if successful, False if not

**CLI Example:**

The following example will comment out the pcspkr line in the /etc/modules file using the default # character and create a backup file named modules.bak

```
salt '*' file.comment_line '/etc/modules' '^pcspkr'
```

**CLI Example:**

The following example will uncomment the log_level setting in minion config file if it is set to either warning, info, or debug using the # character and create a backup file named minion.bk

```
salt '*' file.comment_line 'C:salt\conf\minion' '^log_level: (warning|info|debug) ➔ '#' False '.bk'
```

```python
salt.modules.file.contains(path, text)
```

Deprecated since version 0.17.0: Use `search()` instead.

Return True if the file at path contains text

**CLI Example:**

```
salt '*' file.contains /etc/crontab 'mymaintenance.sh'
```

```python
salt.modules.file.contains_glob(path, glob_expr)
```

Deprecated since version 0.17.0: Use `search()` instead.
Return True if the given glob matches a string in the named file

CLI Example:

```shell
salt '*' file.contains_glob /etc/foobar '*cheese*'
```

**salt.modules.file.contains_regex(path, regex, lchar='')**

Deprecated since version 0.17.0: Use `search()` instead.

Return True if the given regular expression matches on any line in the text of a given file.

If the `lchar` argument (leading char) is specified, it will strip `lchar` from the left side of each line before trying to match

CLI Example:

```shell
salt '*' file.contains_regex /etc/crontab
```

**salt.modules.file.copy(src, dst, recurse=False, remove_existing=False)**

Copy a file or directory from source to dst

In order to copy a directory, the `recurse` flag is required, and will by default overwrite files in the destination with the same path, and retain all other existing files. (similar to `cp -r` on unix)

`remove_existing` will remove all files in the target directory, and then copy files from the source.

**Note:** The copy function accepts paths that are local to the Salt minion. This function does not support `salt://`, `http://`, or the other additional file paths that are supported by `states.file.managed` and `states.file.recurse`.

CLI Example:

```shell
salt '*' file.copy /path/to/src /path/to/dst
salt '*' file.copy /path/to/src_dir /path/to/dst_dir recurse=True
salt '*' file.copy /path/to/src_dir /path/to/dst_dir recurse=True remove_existing=True
```

**salt.modules.file.delete_backup(path, backup_id)**

New in version 0.17.0.

Delete a previous version of a file that was backed up using Salt's `file state backup` system.

- **path** The path on the minion to check for backups
- **backup_id** The numeric id for the backup you wish to delete, as found using `file.list_backups`

CLI Example:

```shell
salt '*' file.delete_backup /var/cache/salt/minion/file_backup/home/foo/bar/baz.txt 0
```

**salt.modules.file.directory_exists(path)**

Tests to see if path is a valid directory. Returns True/False.

CLI Example:

```shell
salt '*' file.directory_exists /etc
```

**salt.modules.file.dirname(path)**

Returns the directory component of a pathname

New in version 2015.5.0.
This can be useful at the CLI but is frequently useful when scripting.

```python
{%- from salt['file.dirname'](tpldir) + '/vars.jinja' import parent_vars %}
```

CLI Example:

```
salt '*' file.dirname 'test/path/filename.config'
```

`salt.modules.file.diskusage(path)`
Recursively calculate disk usage of path and return it in bytes

CLI Example:

```
salt '*' file.diskusage /path/to/check
```

`salt.modules.file.extract_hash(hash_fn, hash_type='sha256', file_name='`, source='`, source_hash_name=None)`

Changed in version 2016.3.5: Prior to this version, only the file_name argument was considered for filename matches in the hash file. This would be problematic for cases in which the user was relying on a remote checksum file that they do not control, and they wished to use a different name for that file on the minion from the filename on the remote server (and in the checksum file). For example, managing /tmp/myfile.tar.gz when the remote file was at https://mydomain.tld/different_name.tar.gz. The file.managed state now also passes this function the source URI as well as the source_hash_name (if specified). In cases where source_hash_name is specified, it takes precedence over both the file_name and source. When it is not specified, file_name takes precedence over source. This allows for better capability for matching hashes.

Changed in version 2016.11.0: File name and source URI matches are no longer disregarded when source_hash_name is specified. They will be used as fallback matches if there is no match to the source_hash_name value.

This routine is called from the file.managed state to pull a hash from a remote file. Regular expressions are used line by line on the source_hash file, to find a potential candidate of the indicated hash type. This avoids many problems of arbitrary file layout rules. It specifically permits pulling hash codes from debian *.dsc files.

If no exact match of a hash and filename are found, then the first hash found (if any) will be returned. If no hashes at all are found, then None will be returned.

For example:

```
openerp_7.0-latest-1.tar.gz:
  file.managed:
    - name: /tmp/openerp_7.0-20121227-075624-1_all.deb
    - source: http://nightly.openerp.com/7.0/nightly/deb/openerp_7.0-20121227-
      -075624-1.tar.gz
    - source_hash: http://nightly.openerp.com/7.0/nightly/deb/openerp_7.0-
      -20121227-075624-1.dsc
```

CLI Example:

```
salt '*' file.extract_hash /path/to/hash/file sha512 /etc/foo
```

`salt.modules.file.file_exists(path)`
Tests to see if path is a valid file. Returns True/False.

CLI Example:
salt 'x' file.file_exists /etc/passwd

salt.modules.file.find(path, *args, **kwargs)
Approximate the Unix find(1) command and return a list of paths that meet the specified criteria.

The options include match criteria:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>path-glob</td>
</tr>
<tr>
<td>iname</td>
<td>path-glob</td>
</tr>
<tr>
<td>regex</td>
<td>path-regex</td>
</tr>
<tr>
<td>iregex</td>
<td>path-regex</td>
</tr>
<tr>
<td>type</td>
<td>file-types</td>
</tr>
<tr>
<td>user</td>
<td>users</td>
</tr>
<tr>
<td>group</td>
<td>groups</td>
</tr>
<tr>
<td>size</td>
<td>number[size-unit]</td>
</tr>
<tr>
<td>mtime</td>
<td>interval</td>
</tr>
<tr>
<td>grep</td>
<td>regex</td>
</tr>
</tbody>
</table>

and/or actions:

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>delete</td>
<td>[= file-types]</td>
</tr>
<tr>
<td>exec</td>
<td>[command [arg ...]]</td>
</tr>
<tr>
<td>print</td>
<td>[= print-opts]</td>
</tr>
</tbody>
</table>

and/or depth criteria:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>maxdepth</td>
<td>maximum depth to transverse in path</td>
</tr>
<tr>
<td>mindepth</td>
<td>minimum depth to transverse before checking files or directories</td>
</tr>
</tbody>
</table>

The default action is print=path

path-glob:

- * = match zero or more chars
- ? = match any char
- [abc] = match a, b, or c
- [!abc] or [^abc] = match anything except a, b, and c
- [x-y] = match chars x through y
- [!x-y] or [^x-y] = match anything except chars x through y
- {a,b,c} = match a or b or c

path-regex: a Python Regex (regular expression) pattern to match pathnames

file-types: a string of one or more of the following:

- a: all file types
- b: block device
- c: character device
- d: directory
- p: FIFO (named pipe)
- f: plain file
- l: symlink
- s: socket

users: a space and/or comma separated list of user names and/or uids

groups: a space and/or comma separated list of group names and/or gids

size-unit:
b: bytes  
k: kilobytes  
m: megabytes  
g: gigabytes  
t: terabytes

interval:

\[[<\text{num}>w] [<\text{num}>d] [<\text{num}>h] [<\text{num}>m] [<\text{num}>s]\]

where:

- w: week
- d: day
- h: hour
- m: minute
- s: second

print-opts: a comma and/or space separated list of one or more of the following:

- group: group name
- md5: MD5 digest of file contents
- mode: file permissions (as integer)
- mtime: last modification time (as time_t)
- name: file basename
- path: file absolute path
- size: file size in bytes
- type: file type
- user: user name

CLI Examples:

```
salt '*' file.find / type=f name='*.bak' size=+10m
salt '*' file.find /var mtime=+30d size=+10m print=path,size,mtime
salt '*' file.find /var/log name='*[0-9]' mtime=+30d size=+10m delete
```

salt.modules.file.get_devmm(name)

Get major/minor info from a device

CLI Example:

```
salt '*' file.get_devmm /dev/chr
```

salt.modules.file.get_diff(minionfile, masterfile, saltenv='base')

Return unified diff of file compared to file on master

CLI Example:

```
salt '*' file.get_diff /home/fred/.vimrc salt://users/fred/.vimrc
```

salt.modules.file.get_gid(path, follow_symlinks=True)

Return the id of the group that owns a given file

path file or directory of which to get the gid

follow_symlinks indicated if symlinks should be followed

CLI Example:

```
salt '*' file.get_gid /etc/passwd
```

Changed in version 0.16.4: follow_symlinks option added

19.9. execution modules
salt.modules.file.get_group(path, follow_symlinks=True)

Return the group that owns a given file

- path: file or directory of which to get the group
- follow_symlinks: indicated if symlinks should be followed

CLI Example:

```
salt '*.' file.get_group /etc/passwd
```

Changed in version 0.16.4: follow_symlinks option added

salt.modules.file.get_hash(path, form='sha256', chunk_size=65536)

Get the hash sum of a file

This is better than get_sum for the following reasons:

- It does not read the entire file into memory.
- It does not return a string on error. The returned value of get_sum cannot really be trusted since it is vulnerable to collisions: get_sum(...,'xyz') == 'Hash xyz not supported'

- path: path to the file or directory
- form: desired sum format
- chunk_size: amount to sum at once

CLI Example:

```
salt '*.' file.get_hash /etc/shadow
```

salt.modules.file.get_managed(name, template, source, source_hash, source_hash_name, user, group, mode, saltenv, context, defaults, skip_verify=False, **kwargs)

Return the managed file data for file.managed

- name: location where the file lives on the server
- template: template format
- source: managed source file
- source_hash: hash of the source file
- source_hash_name: When source_hash refers to a remote file, this specifies the filename to look for in that file.

New in version 2016.3.5.

- user: Owner of file
- group: Group owner of file
- mode: Permissions of file
- context: Variables to add to the template context
- defaults: Default values of for context_dict
- skip_verify: If True, hash verification of remote file sources (http://, https://, ftp://) will be skipped, and the source_hash argument will be ignored.

New in version 2016.3.0.

CLI Example:

```
salt '*.' file.get_managed /etc/httpd/conf.d/httpd.conf jinja salt://http/httpd.conf '{hash_type: 'md5', 'hsum': <md5sum>}' None root root '755' base None None
```

salt.modules.file.get_mode(path, follow_symlinks=True)

Return the mode of a file

- path: file or directory of which to get the mode
- follow_symlinks: indicated if symlinks should be followed

CLI Example:
salt '*' file.get_mode /etc/passwd

Changed in version 2014.1.0: follow_symlinks option added

**salt.modules.file.get_selinux_context**(path)

Get an SELinux context from a given path

CLI Example:

```
salt '*' file.get_selinux_context /etc/hosts
```

**salt.modules.file.get_source_sum**(file_name='`', source='`', source_hash=None, source_hash_name=None, saltenv='base')

New in version 2016.11.0.

Used by **file.get_managed** to obtain the hash and hash type from the parameters specified below.

- **file_name** Optional file name being managed, for matching with **file.extract_hash**.
- **source** Source file, as used in **file** and other states. If **source_hash** refers to a file containing hashes, then this filename will be used to match a filename in that file. If the **source_hash** is a hash expression, then this argument will be ignored.
- **source_hash** Hash file/expression, as used in **file** and other states. If this value refers to a remote URL or absolute path to a local file, it will be cached and **file.extract_hash** will be used to obtain a hash from it.
- **source_hash_name** Specific file name to look for when **source_hash** refers to a remote file, used to disambiguate ambiguous matches.
- **saltenv** [base] Salt fileserver environment from which to retrieve the source_hash. This value will only be used when source_hash refers to a file on the Salt fileserver (i.e. one beginning with salt://).

CLI Example:

```
salt '*' file.get_source_sum /tmp/foo.tar.gz source=http://mydomain.tld/foo.tar.gz source_hash=499ae16dc8ae71ee8b7c3a30c75ea7a1a6
salt '*' file.get_source_sum /tmp/foo.tar.gz source=http://mydomain.tld/foo.tar.gz source_hash=../dir2/foo.tar.gz
```

**salt.modules.file.get_sum**(path, form='sha256')

Return the checksum for the given file. The following checksum algorithms are supported:

- md5
- sha1
- sha224
- sha256 (default)
- sha384
- sha512

- **path** path to the file or directory
- **form** desired sum format

CLI Example:

```
salt '*' file.get_sum /etc/passwd sha512
```

**salt.modules.file.get_uid**(path, follow_symlinks=True)

Return the id of the user that owns a given file

- **path** file or directory of which to get the uid
- **follow_symlinks** indicated if symlinks should be followed
CLI Example:

```
salt ' '* file.get_uid /etc/passwd
```

Changed in version 0.16.4: follow_symlinks option added

```python
salt.modules.file.get_user(path, follow_symlinks=True)
```

Return the user that owns a given file

- **path** file or directory of which to get the user
- **follow_symlinks** indicated if symlinks should be followed

### CLI Example:

```
salt ' '* file.get_user /etc/passwd
```

### Changed in version 0.16.4: follow_symlinks option added

```python
salt.modules.file.gid_to_group(gid)
```

Convert the group id to the group name on this system

- **gid** gid to convert to a group name

### CLI Example:

```
salt ' '* file.gid_to_group 0
```

```python
salt.modules.file.grep(path, pattern, *opts)
```

Grep for a string in the specified file

**Note:** This function's return value is slated for refinement in future versions of Salt

- **path** Path to the file to be searched

**Note:** Globbing is supported (i.e. `/var/log/foo/*.log`) but if globbing is being used then the path should be quoted to keep the shell from attempting to expand the glob expression.

- **pattern** Pattern to match. For example: `test`, or a `[0-5]`
- **opts** Additional command-line flags to pass to the grep command. For example: `-v`, or `-i -B2`

**Note:** The options should come after a double-dash (as shown in the examples below) to keep Salt's own argument parser from interpreting them.

### CLI Example:

```
salt ' '* file.grep /etc/passwd nobody
salt ' '* file.grep /etc/sysconfig/network-scripts/ifcfg-eth0 ipaddr -- -i
salt ' '* file.grep /etc/sysconfig/network-scripts/ifcfg-eth0 ipaddr -- -i -B2
salt ' '* file.grep "/etc/sysconfig/network-scripts/*" ipaddr -- -i -l
```

```python
salt.modules.file.group_to_gid(group)
```

Convert the group to the gid on this system

- **group** group to convert to its gid

### CLI Example:

```
salt ' '* file.group_to_gid root
```
salt.modules.file.is_blkdev(name)
Check if a file exists and is a block device.

CLI Example:
salt '*' file.is_blkdev /dev/blk

salt.modules.file.is_chrdev(name)
Check if a file exists and is a character device.

CLI Example:
salt '*' file.is_chrdev /dev/chr

salt.modules.file.is_fifo(name)
Check if a file exists and is a FIFO.

CLI Example:
salt '*' file.is_fifo /dev/fifo

salt.modules.file.is_link(path)
Check if the path is a symbolic link

CLI Example:
salt '*' file.is_link /path/to/link

salt.modules.file.join(*args)
Return a normalized file system path for the underlying OS

New in version 2014.7.0.
This can be useful at the CLI but is frequently useful when scripting combining path variables:

```yaml
{%- set www_root = '/var' %}
{%- set app_dir = 'myapp' %}

myapp_config:
  file:
    - managed
    - name: {{ salt['file.join'](www_root, app_dir, 'config.yaml') }}
```

CLI Example:
salt '*' file.join '/usr/local/bin'

salt.modules.file.lchown(path, user, group)
Chown a file, pass the file the desired user and group without following symlinks.

path  path to the file or directory
user  user owner
group  group owner

CLI Example:
salt '*' file.chown /etc/passwd root root

salt.modules.file.line(path, content=None, match=None, mode=None, location=None, before=None, after=None, show_changes=True, backup=False, quiet=False, indent=True)

New in version 2015.8.0.
Edit a line in the configuration file. The `path` and `content` arguments are required, as well as passing in one of the `mode` options.

- **path** Filesystem path to the file to be edited.
- **content** Content of the line. Allowed to be empty if `mode=delete`.
- **match** Match the target line for an action by a fragment of a string or regular expression.

  If neither before nor after are provided, and match is also `None`, match becomes the content value.

- **mode** Defines how to edit a line. One of the following options is required:
  - `ensure` If line does not exist, it will be added. This is based on the `content` argument.
  - `replace` If line already exists, it will be replaced.
  - `delete` Delete the line, once found.
  - `insert` Insert a line.

**Note:** If `mode=insert` is used, at least one of the following options must also be defined: location, before, or after. If location is used, it takes precedence over the other two options.

- **location** Defines where to place content in the line. Note this option is only used when `mode=insert` is specified. If a location is passed in, it takes precedence over both the before and after kwargs. Valid locations are:
  - `start` Place the content at the beginning of the file.
  - `end` Place the content at the end of the file.

- **before** Regular expression or an exact case-sensitive fragment of the string. This option is only used when either the ensure or insert mode is defined.

- **after** Regular expression or an exact case-sensitive fragment of the string. This option is only used when either the ensure or insert mode is defined.

- **show_changes** Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made. Default is `True`.

**Note:** Using this option will store two copies of the file in-memory (the original version and the edited version) in order to generate the diff.

- **backup** Create a backup of the original file with the extension: ``Year-Month-Day-Hour-Minutes-Seconds``.
- **quiet** Do not raise any exceptions. E.g. ignore the fact that the file that is tried to be edited does not exist and nothing really happened.
- **indent** Keep indentation with the previous line. This option is not considered when the delete mode is specified.

**CLI Example:**

```sh
salt '*' file.line /etc/nsswitch.conf "networks: files dns" after="hosts:.?\" mode='ensure'
```

**Note:** If an equal sign (=) appears in an argument to a Salt command, it is interpreted as a keyword argument in the format of `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```sh
salt '*' file.line /path/to/file content="CREATEMAIL_SPOOL=no" match="CREATE_MAIL_ SPOOL=yes" mode="replace"
```
salt.modules.file.link(src, path)
New in version 2014.1.0.
Create a hard link to a file
CLI Example:
```
salt '*' file.link /path/to/file /path/to/link
```

salt.modules.file.list_backups(path, limit=None)
New in version 0.17.0.
Lists the previous versions of a file backed up using Salt’s file state backup system.
**path** The path on the minion to check for backups
**limit** Limit the number of results to the most recent N backups
CLI Example:
```
salt '*' file.list_backups /foo/bar/baz.txt
```

salt.modules.file.list_backups_dir(path, limit=None)
Lists the previous versions of a directory backed up using Salt’s file state backup system.
**path** The directory on the minion to check for backups
**limit** Limit the number of results to the most recent N backups
CLI Example:
```
salt '*' file.list_backups_dir /foo/bar/baz/
```

salt.modules.file.lstat(path)
New in version 2014.1.0.
Returns the lstat attributes for the given file or dir. Does not support symbolic links.
CLI Example:
```
salt '*' file.lstat /path/to/file
```

salt.modules.file.makedirs_(path, user=None, group=None, mode=None)
Ensure that the directory containing this path is available.

**Note:** The path must end with a trailing slash otherwise the directory/directories will be created up to the parent directory. For example if path is `/opt/code`, then it would be treated as `/opt/` but if the path ends with a trailing slash like `/opt/code/`, then it would be treated as `/opt/code/`.

CLI Example:
```
salt '*' file.makedirs /opt/code/
```

salt.modules.file.makedirs_perms(name, user=None, group=None, mode=’0755’)
Taken and modified from os.makedirs to set user, group and mode for each directory created.
CLI Example:
```
salt '*' file.makedirs_perms /opt/code
```

19.9. execution modules
salt.modules.file.manage_file(name, sfn, ret, source, source_sum, user, group, mode, saltenv, backup, makedirs=False, template=None, show_changes=True, contents=None, dir_mode=None, follow_symlinks=True, skip_verify=False, keep_mode=False, encoding=None, encoding_errors='strict', **kwargs)

Checks the destination against what was retrieved with get_managed and makes the appropriate modifications (if necessary).

name  location to place the file
sfn  location of cached file on the minion

This is the path to the file stored on the minion. This file is placed on the minion using cp.cache_file. If the hash sum of that file matches the source_sum, we do not transfer the file to the minion again.

This file is then grabbed and if it has template set, it renders the file to be placed into the correct place on the system using salt.files.utils.copyfile()

ret  The initial state return data structure. Pass in None to use the default structure.
source  file reference on the master
source_sum  sum hash for source
user  user owner
group  group owner
backup  backup_mode
makedirs  make directories if they do not exist
template  format of templating
show_changes  Include diff in state return
contents:  contents to be placed in the file
dir_mode  mode for directories created with makedirs
skip_verify  [False] If True, hash verification of remote file sources (http://, https://, ftp://) will be skipped, and the source_hash argument will be ignored.

New in version 2016.3.0.

keep_mode  [False] If True, and the source is a file from the Salt fileserver (or a local file on the minion), the mode of the destination file will be set to the mode of the source file.

Note: keep_mode does not work with salt-ssh.

As a consequence of how the files are transferred to the minion, and the inability to connect back to the master with salt-ssh, salt is unable to stat the file as it exists on the fileserver and thus cannot mirror the mode on the salt-ssh minion

encoding  [None] If None, str() will be applied to contents. If not None, specified encoding will be used. See https://docs.python.org/3/library/codecs.html#standard-encodings for the list of available encodings.

New in version 2017.7.0.

encoding_errors  ['strict'] Default is 'strict'. See https://docs.python.org/2/library/codecs.html#codec-base-classes for the error handling schemes.

New in version 2017.7.0.

CLI Example:

```bash
salt '*' file.manage_file /etc/httpd/conf.d/httpd.conf '' '{hash_type: "md5", hsum: <md5sum>}' root root '755' base ''
```

Changed in version 2014.7.0: follow_symlinks option added

salt.modules.file.mkdir(dir_path, user=None, group=None, mode=None)

Ensure that a directory is available.

CLI Example:
salt '***' file.mkdir /opt/jetty/context

```python
salt.modules.file.mknod(name, ntype, major=0, minor=0, user=None, group=None, mode='0600')
```

New in version 0.17.0.

Create a block device, character device, or fifo pipe. Identical to the gnu mknod.

CLI Examples:

```bash
salt '***' file.mknod /dev/chr c 180 31
salt '***' file.mknod /dev/blk b 8 999
salt '***' file.mknod /dev/fifo p
```

```python
salt.modules.file.mknod_blkdev(name, major, minor, user=None, group=None, mode='0660')
```

New in version 0.17.0.

Create a block device.

CLI Example:

```bash
salt '***' file.mknod_blkdev /dev/blk 8 999
```

```python
salt.modules.file.mknod_chrdev(name, major, minor, user=None, group=None, mode='0660')
```

New in version 0.17.0.

Create a character device.

CLI Example:

```bash
salt '***' file.mknod_chrdev /dev/chr 180 31
```

```python
salt.modules.file.mknod_fifo(name, user=None, group=None, mode='0660')
```

New in version 0.17.0.

Create a FIFO pipe.

CLI Example:

```bash
salt '***' file.mknod_fifo /dev/fifo
```

```python
salt.modules.file.move(src, dst)
```

Move a file or directory

CLI Example:

```bash
salt '***' file.move /path/to/src /path/to/dst
```

```python
salt.modules.file.normpath(path)
```

Returns Normalize path, eliminating double slashes, etc.

New in version 2015.5.0.

This can be useful at the CLI but is frequently useful when scripting.

```bash
[%- from salt['file.normpath'](tpldir + '/../vars.jinja') import parent_vars %]
```

CLI Example:

```bash
salt '***' file.normpath 'a/b/c/..'
```
salt.modules.file.open_files(by_pid=False)

Return a list of all physical open files on the system.

CLI Examples:

```bash
salt '*' file.open_files
salt '*' file.open_files by_pid=True
```

salt.modules.file.pardir()

Return the relative parent directory path symbol for underlying OS

New in version 2014.7.0.

This can be useful when constructing Salt Formulas.

```python
{% set pardir = salt['file.pardir']() %}
{% set final_path = salt['file.join']('subdir', pardir, 'confdir') %}
```

CLI Example:

```bash
salt '*' file.pardir
```

salt.modules.file.patch(originalfile, patchfile, options='', dry_run=False)

New in version 0.10.4.

Apply a patch to a file or directory.

Equivalent to:

```bash
patch <options> -i <patchfile> <originalfile>
```

Or, when a directory is patched:

```bash
patch <options> -i <patchfile> -d <originalfile> -p0
```

originalfile  The full path to the file or directory to be patched
patchfile  A patch file to apply to originalfile
options  Options to pass to patch.

CLI Example:

```bash
salt '*' file.patch /opt/file.txt /tmp/file.txt.patch
```

salt.modules.file.path_exists_glob(path)

Tests to see if path after expansion is a valid path (file or directory). Expansion allows usage of ? * and character ranges []). Tilde expansion is not supported. Returns True/False.

New in version 2014.7.0.

CLI Example:

```bash
salt '*' file.path_exists_glob /etc/pam*/pass*
```

salt.modules.file.prepend(path, *args, **kwargs)

New in version 2014.7.0.

Prepend text to the beginning of a file

path  path to file

*args  strings to prepend to the file

CLI Example:
salt '_salt* file.prepend /etc/motd \  "With all thine offerings thou shalt offer salt." \  "Salt is what makes things taste bad when it isn't in them."

Attention

If you need to pass a string to append and that string contains an equal sign, you must include the argument name, args. For example:

```bash
salt '*' file.prepend /etc/motd args='cheese=spam'
salt '*' file.prepend /etc/motd args="['cheese=spam','spam=cheese']"
```

salt.modules.file.psed(path, before, after, limit='', backup='.bak', flags='gMS', escape_all=False, multi=False)

Deprecated since version 0.17.0: Use replace() instead.

Make a simple edit to a file (pure Python version)

Equivalent to:

```bash
sed <backup> <options> "'/<limit>/ s/<before>/<after>/<flags> <file>"
```

- **path**  The full path to the file to be edited
- **before** A pattern to find in order to replace with after
- **after**  Text that will replace before
- **limit** [''] An initial pattern to search for before searching for before
- **backup** [.bak] The file will be backed up before edit with this file extension; **WARNING:** each time sed/comment/uncomment is called will overwrite this backup
- **flags** [gMS] Flags to modify the search. Valid values are:
  - g: Replace all occurrences of the pattern, not just the first.
  - I: Ignore case.
  - L: Make \w, \W, \b, \B, \s and \S dependent on the locale.
  - M: Treat multiple lines as a single line.
  - S: Make . match all characters, including newlines.
  - U: Make \w, \W, \b, \B, \d, \D, \s and \S dependent on Unicode.
  - X: Verbose (whitespace is ignored).

- **multi:** False If True, treat the entire file as a single line

Forward slashes and single quotes will be escaped automatically in the before and after patterns.

CLI Example:

```bash
salt '*' file.sed /etc/httpd/httpd.conf 'LogLevel warn' 'LogLevel info'
```

salt.modules.file.read(path, binary=False)

New in version 2017.7.0.

Return the content of the file.

CLI Example:
```
salt '*' file.read /path/to/file
```

```
salt.modules.file.readdir(path)
New in version 2014.1.0.
Return a list containing the contents of a directory
CLI Example:

```
salt '*' file.readdir /path/to/dir/
```

```
salt.modules.file.readlink(path, canonicalize=False)
New in version 2014.1.0.
Return the path that a symlink points to. If canonicalize is set to True, then it return the final target
CLI Example:

```
salt '*' file.readlink /path/to/link
```

```
salt.modules.file.remove(path)
Remove the named file. If a directory is supplied, it will be recursively deleted.
CLI Example:

```
salt '*' file.remove /tmp/foo
```

```
salt.modules.file.rename(src, dst)
Rename a file or directory
CLI Example:

```
salt '*' file.rename /path/to/src /path/to/dst
```

```
salt.modules.file.replace(path, pattern, repl, count=0, flags=8, bufsize=1, append_if_not_found=False, prepend_if_not_found=False, not_found_content=None, backup='.bak', dry_run=False, search_only=False, show_changes=True, ignore_if_missing=False, preserve_inode=True, backslash_literal=False)
New in version 0.17.0.
Replace occurrences of a pattern in a file. If show_changes is True, then a diff of what changed will be returned, otherwise a True will be returned when changes are made, and False when no changes are made.
This is a pure Python implementation that wraps Python's sub().
path Filesystem path to the file to be edited. If a symlink is specified, it will be resolved to its target.
pattern A regular expression, to be matched using Python's search().
repl The replacement text
count [0] Maximum number of pattern occurrences to be replaced. If count is a positive integer n, only n occurrences will be replaced, otherwise all occurrences will be replaced.
flags (list or int) A list of flags defined in the re module documentation from the Python standard library. Each list item should be a string that will correlate to the human-friendly flag name. E.g., ['IGNORECASE', 'MULTILINE']. Optionally, flags may be an int, with a value corresponding to the XOR (^) of all the desired flags. Defaults to 8 (which supports `MULTILINE`).
bufsize (int or str) How much of the file to buffer into memory at once. The default value 1 processes one line at a time. The special value file may be specified which will read the entire file into memory before processing.
append_if_not_found [False] New in version 2014.7.0.
If set to `True`, and pattern is not found, then the content will be appended to the file.

prepend_if_not_found  [False] New in version 2014.7.0.

If set to `True` and pattern is not found, then the content will be prepended to the file.

not_found_content  New in version 2014.7.0.

Content to use for append/prepend if not found. If None (default), uses repl. Useful when repl uses references to group in pattern.

backup  [.bak] The file extension to use for a backup of the file before editing. Set to False to skip making a backup.

dry_run  [False] If set to True, no changes will be made to the file, the function will just return the changes that would have been made (or a True/False value if show_changes is set to False).

search_only  [False] If set to true, this no changes will be performed on the file, and this function will simply return True if the pattern was matched, and False if not.

show_changes  [True] If True, return a diff of changes made. Otherwise, return True if changes were made, and False if not.

Note: Using this option will store two copies of the file in memory (the original version and the edited version) in order to generate the diff. This may not normally be a concern, but could impact performance if used with large files.

ignore_if_missing  [False] New in version 2015.8.0.

If set to True, this function will simply return False if the file doesn’t exist. Otherwise, an error will be thrown.

Preserve the inode of the file, so that any hard links continue to share the inode with the original filename. This works by copying the file, reading from the copy, and writing to the file at the original inode. If False, the file will be moved rather than copied, and a new file will be written to a new inode, but using the original filename. Hard links will then share an inode with the backup, instead (if using backup to create a backup copy).

Interpret backslashes as literal backslashes for the repl and not escape characters. This will help when using append/prepend so that the backslashes are not interpreted for the repl on the second run of the state.

If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format key=val. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```bash
salt '*' file.replace /path/to/file pattern='=' repl=':'
salt '*' file.replace /path/to/file pattern="bind-address\sx=" repl='bind-address: '
```

CLI Examples:

```bash
salt '*' file.replace /etc/httpd/httpd.conf pattern='LogLevel warn' repl='LogLevel info'
salt '*' file.replace /some/file pattern='before' repl='after' flags='[MULTILINE,\n\nIGNORECASE]'
```

salt.modules.file.restore_backup(path, backup_id)

New in version 0.17.0.

Restore a previous version of a file that was backed up using Salt’s file state backup system.

path  The path on the minion to check for backups
backup_id  The numeric id for the backup you wish to restore, as found using \texttt{file.list_backups}

CLI Example:

```bash
salt '*' file.restore_backup /foo/bar/baz.txt 0
```

\texttt{salt.modules.file.restorecon(path, recursive=False)}

Reset the SELinux context on a given path

CLI Example:

```bash
salt '*' file.restorecon /home/user/.ssh/authorized_keys
```

\texttt{salt.modules.file.rmdir(path)}

New in version 2014.1.0.

Remove the specified directory. Fails if a directory is not empty.

CLI Example:

```bash
salt '*' file.rmdir /tmp/foo/
```

\texttt{salt.modules.file.search(path, pattern, flags=8, bufsize=1, ignore_if_missing=False, multiline=False)}

New in version 0.17.0.

Search for occurrences of a pattern in a file

Except for multiline, params are identical to \texttt{replace()}.

\texttt{multiline}  If true, inserts `MULTILINE' into flags and sets bufsize to `file'.

New in version 2015.8.0.

CLI Example:

```bash
salt '*' file.search /etc/crontab 'mymaintenance.sh'
```

\texttt{salt.modules.file.sed(path, before, after, limit='', backup='.bak', options='-r -e', flags='g', escape_all=False, negate_match=False)}

Deprecated since version 0.17.0: Use \texttt{replace()} instead.

Make a simple edit to a file

Equivalent to:

```bash
sed <backup> <options> "/<limit>/ s/<before>/<after>/<flags> <file>"
```

\texttt{path}  The full path to the file to be edited

\texttt{before}  A pattern to find in order to replace with \texttt{after}

\texttt{after}  Text that will replace \texttt{before}

\texttt{limit}  [""] An initial pattern to search for before searching for \texttt{before}

\texttt{backup}  [.bak] The file will be backed up before edit with this file extension; \texttt{WARNING}: each time \texttt{sed/comment/uncomment} is called will overwrite this backup

\texttt{options}  [-r -e] Options to pass to sed

\texttt{flags}  [g] Flags to modify the sed search; e.g., \texttt{i} for case-insensitive pattern matching

\texttt{negate_match}  [False] Negate the search command (\texttt{!})

New in version 0.17.0.

Forward slashes and single quotes will be escaped automatically in the \texttt{before} and \texttt{after} patterns.

CLI Example:
salt 'salt '*' file.sed /etc/httpd/httpd.conf 'LogLevel warn' 'LogLevel info'

salt.modules.file.sed_contains(path, text, limit='', flags='g')
  Deprecated since version 0.17.0: Use search() instead.
  Return True if the file at path contains text. Utilizes sed to perform the search (line-wise search).
  Note: the p flag will be added to any flags you pass in.
  CLI Example:
  
salt '*' file.contains /etc/crontab 'mymaintenance.sh'

salt.modules.file.seek_read(path, size, offset)
  New in version 2014.1.0.
  Seek to a position on a file and read it
  path  path to file
  seek  amount to read at once
  offset  offset to start into the file
  CLI Example:
  
salt '*' file.seek_read /path/to/file 4096 0

salt.modules.file.seek_write(path, data, offset)
  New in version 2014.1.0.
  Seek to a position on a file and write to it
  path  path to file
  data  data to write to file
  offset  position in file to start writing
  CLI Example:
  
salt '*' file.seek_write /path/to/file 'some data' 4096

salt.modules.file.set_mode(path, mode)
  Set the mode of a file
  path  file or directory of which to set the mode
  mode  mode to set the path to
  CLI Example:
  
salt '*' file.set_mode /etc/passwd 0644

salt.modules.file.set_selinux_context(path, user=None, role=None, type=None, range=None)
  Set a specific SELinux label on a given path
  CLI Example:
  
salt '*' file.set_selinux_context path <role> <type> <range>

salt.modules.file.source_list(source, source_hash, saltenv)
  Check the source list and return the source to use
  CLI Example:
  
salt '*' file.source_list salt://http/httpd.conf '{hash_type: 'md5', 'hsum': 
  =><md5sum>}' base
### salt.modules.file.stats

Return a dict containing the stats for a given file

**CLI Example:**

```bash
salt '*' file.stats /etc/passwd
```

### salt.modules.file.statvfs

New in version 2014.1.0.

Perform a statvfs call against the filesystem that the file resides on

**CLI Example:**

```bash
salt '*' file.statvfs /path/to/file
```

### salt.modules.file symlink

Create a symbolic link (symlink, soft link) to a file

**CLI Example:**

```bash
salt '*' file.symlink /path/to/file /path/to/link
```

### salt.modules.file.touch

New in version 0.9.5.

Just like the `touch` command, create a file if it doesn't exist or simply update the atime and mtime if it already does.

- **atime:** Access time in Unix epoch time
- **mtime:** Last modification in Unix epoch time

**CLI Example:**

```bash
salt '*' file.touch /var/log/emptyfile
```

### salt.modules.file.truncate

New in version 2014.1.0.

Seek to a position on a file and delete everything after that point

- **path:** path to file
- **length:** offset into file to truncate

**CLI Example:**

```bash
salt '*' file.truncate /path/to/file 512
```

### salt.modules.file.uid_to_user

Convert a uid to a user name

- **uid:** uid to convert to a username

**CLI Example:**

```bash
salt '*' file.uid_to_user 0
```

### salt.modules.file.uncomment

Deprecated since version 0.17.0: Use `replace()` instead.

Uncomment specified commented lines in a file

- **path:** The full path to the file to be edited
- **regex:** A regular expression used to find the lines that are to be uncommented. This regex should not include the comment character. A leading `^` character will be stripped for convenience (for easily switching between `comment()` and `uncomment()`).
char [#] The character to remove in order to uncomment a line
backup [.bak] The file will be backed up before edit with this file extension; WARNING: each time sed/comment/uncomment is called will overwrite this backup

CLI Example:
```
salt '*' file.uncomment /etc/hosts.deny 'ALL: PARANOID'
```

salt.modules.file.user_to_uid(user)
Convert user name to a uid
user user name to convert to its uid

CLI Example:
```
salt '*' file.user_to_uid root
```

salt.modules.file.write(path, *args, **kwargs)
Write text to a file, overwriting any existing contents.
path path to file
*args strings to write to the file

CLI Example:
```
salt '*' file.write /etc/motd "With all thine offerings thou shalt offer salt."
```

**Attention**
If you need to pass a string to append and that string contains an equal sign, you must include the argument name, args. For example:
```
salt '*' file.write /etc/motd args='cheese=spam'
salt '*' file.write /etc/motd args="['cheese=spam','spam=cheese']"
```

### 19.9.117 salt.modules.firewalld

Support for firewalld.
New in version 2015.2.0.

salt.modules.firewalld.add_interface(zone, interface, permanent=True)
Bind an interface to a zone

CLI Example:
```
salt '*' firewalld.add_interface zone eth0
```

salt.modules.firewalld.add_masquerade(zone=None, permanent=True)
Enable masquerade on a zone. If zone is omitted, default zone will be used.

CLI Example:
To enable masquerade on a specific zone:
```
salt '*' firewalld.add_masquerade dmz
```

```
salt '*' firewalld.add_masquerade
```

salt.modules.firewalld.add_port(zone, port, permanent=True)

Allow specific ports in a zone.

New in version 2015.8.0.

CLI Example:
```
salt '*' firewalld.add_port internal 443/tcp
```

salt.modules.firewalld.add_port_fwd(zone, src, dest, proto='tcp', dstaddr='', permanent=True)

Add port forwarding.

New in version 2015.8.0.

CLI Example:
```
salt '*' firewalld.add_port_fwd public 80 443 tcp
```

salt.modules.firewalld.add_rich_rule(zone, rule, permanent=True)

Add a rich rule to a zone

New in version 2016.11.0.

CLI Example:
```
salt '*' firewalld.add_rich_rule zone 'rule'
```

salt.modules.firewalld.add_service(service, zone=None, permanent=True)

Add a service for zone. If zone is omitted, default zone will be used.

CLI Example:
```
salt '*' firewalld.add_service ssh
```

To assign a service to a specific zone:
```
salt '*' firewalld.add_service ssh my_zone
```

salt.modules.firewalld.add_service_port(service, port)

Add a new port to the specified service.

New in version 2016.11.0.

CLI Example:
```
salt '*' firewalld.add_service_port zone 80
```

salt.modules.firewalld.add_service_protocol(service, protocol)

Add a new protocol to the specified service.

New in version 2016.11.0.

CLI Example:
salt '*' firewalld.add_service_protocol zone ssh

salt.modules.firewalld.add_source(zone, source, permanent=True)
    Bind a source to a zone
    New in version 2016.3.0.
    CLI Example:
    salt '*' firewalld.add_source zone 192.168.1.0/24

salt.modules.firewalld.allow_icmp(zone, icmp, permanent=True)
    Allow a specific ICMP type on a zone
    New in version 2015.8.0.
    CLI Example:
    salt '*' firewalld.allow_icmp zone echo-reply

salt.modules.firewalld.block_icmp(zone, icmp, permanent=True)
    Block a specific ICMP type on a zone
    New in version 2015.8.0.
    CLI Example:
    salt '*' firewalld.block_icmp zone echo-reply

salt.modules.firewalld.default_zone()
    Print default zone for connections and interfaces
    CLI Example:
    salt '*' firewalld.default_zone

salt.modules.firewalld.delete_service(name, restart=True)
    Delete an existing service
    CLI Example:
    salt '*' firewalld.delete_service my_service
    By default firewalld will be reloaded. However, to avoid reloading you need to specify the restart as False
    salt '*' firewalld.delete_service my_service False

salt.modules.firewalld.delete_zone(zone, restart=True)
    Delete an existing zone
    CLI Example:
    salt '*' firewalld.delete_zone my_zone
    By default firewalld will be reloaded. However, to avoid reloading you need to specify the restart as False
    salt '*' firewalld.delete_zone my_zone False

salt.modules.firewalld.get_icmp_types(permanent=True)
    Print predefined icmptypes
CLI Example:
```
salt '*' firewalld.get_icmp_types
```

```
salt.modules.firewalld.get_interfaces(zone, permanent=True)
```
List interfaces bound to a zone
New in version 2016.3.0.
CLI Example:
```
salt '*' firewalld.get_interfaces zone
```

```
salt.modules.firewalld.get_masquerade(zone=None, permanent=True)
```
Show if masquerading is enabled on a zone. If zone is omitted, default zone will be used.
CLI Example:
```
salt '*' firewalld.get_masquerade zone
```

```
salt.modules.firewalld.get_rich_rules(zone, permanent=True)
```
List rich rules bound to a zone
New in version 2016.11.0.
CLI Example:
```
salt '*' firewalld.get_rich_rules zone
```

```
salt.modules.firewalld.get_service_ports(service)
```
List ports of a service.
New in version 2016.11.0.
CLI Example:
```
salt '*' firewalld.get_service_ports zone
```

```
salt.modules.firewalld.get_service_protocols(service)
```
List protocols of a service.
New in version 2016.11.0.
CLI Example:
```
salt '*' firewalld.get_service_protocols zone
```

```
salt.modules.firewalld.get_services(permanent=True)
```
Print predefined services
CLI Example:
```
salt '*' firewalld.get_services
```

```
salt.modules.firewalld.get_sources(zone, permanent=True)
```
List sources bound to a zone
New in version 2016.3.0.
CLI Example:
salt '*' firewalld.get_sources zone

salt.modules.firewalld.get_zones(permanent=True)
Print predefined zones
CLI Example:
salt '*' firewalld.get_zones

salt.modules.firewalld.list_all(zone=None, permanent=True)
List everything added for or enabled in a zone
CLI Example:
salt '*' firewalld.list_all

List a specific zone
salt '*' firewalld.list_all my_zone

salt.modules.firewalld.list_icmp_block(zone, permanent=True)
List ICMP blocks on a zone
New in version 2015.8.0.
CLI Example:
salt '*' firewalld.list_icmp_block zone

salt.modules.firewalld.list_port_fwd(zone, permanent=True)
List port forwarding
New in version 2015.8.0.
CLI Example:
salt '*' firewalld.list_port_fwd public

salt.modules.firewalld.list_ports(zone, permanent=True)
List all ports in a zone.
New in version 2015.8.0.
CLI Example:
salt '*' firewalld.list_ports

salt.modules.firewalld.list_services(zone=None, permanent=True)
List services added for zone as a space separated list. If zone is omitted, default zone will be used.
CLI Example:
salt '*' firewalld.list_services

List a specific zone
salt '*' firewalld.list_services my_zone

salt.modules.firewalld.list_zones(permanent=True)
List everything added for or enabled in all zones
CLI Example:

```
salt '*' firewalld.list_zones
```

```
salt.modules.firewalld.make_permanent()
```
Make current runtime configuration permanent.
New in version 2016.3.0.
CLI Example:

```
salt '*' firewalld.make_permanent
```

```
salt.modules.firewalld.new_service(name, restart=True)
```
Add a new service
CLI Example:

```
salt '*' firewalld.new_service my_service
```
By default firewalld will be reloaded. However, to avoid reloading you need to specify the restart as False

```
salt '*' firewalld.new_service my_service False
```

```
salt.modules.firewalld.new_zone(zone, restart=True)
```
Add a new zone
CLI Example:

```
salt '*' firewalld.new_zone my_zone
```
By default firewalld will be reloaded. However, to avoid reloading you need to specify the restart as False

```
salt '*' firewalld.new_zone my_zone False
```

```
salt.modules.firewalld.reload_rules()
```
Reload the firewall rules, which makes the permanent configuration the new runtime configuration without losing state information.
New in version 2016.11.0.
CLI Example:

```
salt '*' firewalld.reload
```

```
salt.modules.firewalld.remove_interface(zone, interface, permanent=True)
```
Remove an interface bound to a zone
New in version 2016.3.0.
CLI Example:

```
salt '*' firewalld.remove_interface zone eth0
```

```
salt.modules.firewalld.remove_masquerade(zone=None, permanent=True)
```
Remove masquerade on a zone. If zone is omitted, default zone will be used.
New in version 2015.8.0.
CLI Example:
salt '*' firewalld.remove_masquerade

To remove masquerade on a specific zone

salt '*' firewalld.remove_masquerade dmz

salt.modules.firewalld.remove_port(zone, port, permanent=True)

Remove a specific port from a zone.

New in version 2015.8.0.

CLI Example:

salt '*' firewalld.remove_port internal 443/tcp

salt.modules.firewalld.remove_port_fwd(zone, src, dest, proto='tcp', dstaddr=';', permanent=True)

Remove Port Forwarding.

New in version 2015.8.0.

CLI Example:

salt '*' firewalld.remove_port_fwd public 80 443 tcp

salt.modules.firewalld.remove_rich_rule(zone, rule, permanent=True)

Add a rich rule to a zone

New in version 2016.11.0.

CLI Example:

salt '*' firewalld.remove_rich_rule zone 'rule'

salt.modules.firewalld.remove_service(service, zone=None, permanent=True)

Remove a service from zone. This option can be specified multiple times. If zone is omitted, default zone will be used.

CLI Example:

salt '*' firewalld.remove_service ssh

To remove a service from a specific zone

salt '*' firewalld.remove_service ssh dmz

salt.modules.firewalld.remove_service_port(service, port)

Remove a port from the specified service.

New in version 2016.11.0.

CLI Example:

salt '*' firewalld.remove_service_port zone 80

salt.modules.firewalld.remove_service_protocol(service, protocol)

Remove a protocol from the specified service.

New in version 2016.11.0.

CLI Example:
salt '*' firewalld.remove_service_protocol zone ssh

salt.modules.firewalld.remove_source(zone, source, permanent=True)
Remove a source bound to a zone
New in version 2016.3.0.
CLI Example:
salt '*' firewalld.remove_source zone 192.168.1.0/24

salt.modules.firewalld.set_default_zone(zone)
Set default zone
CLI Example:
salt '*' firewalld.set_default_zone damian

salt.modules.firewalld.version()
Return version from firewall-cmd
CLI Example:
salt '*' firewalld.version

19.9.118 salt.modules.freebsd_sysctl
Module for viewing and modifying sysctl parameters
salt.modules.freebsd_sysctl.assign(name, value)
Assign a single sysctl parameter for this minion
CLI Example:
salt '*' sysctl.assign net.inet.icmp.icmplim 50

salt.modules.freebsd_sysctl.get(name)
Return a single sysctl parameter for this minion
CLI Example:
salt '*' sysctl.get hw.physmem

salt.modules.freebsd_sysctl.persist(name, value, config='/etc/sysctl.conf')
Assign and persist a simple sysctl parameter for this minion
CLI Example:
salt '*' sysctl.persist net.inet.icmp.icmplim 50
salt '*' sysctl.persist coretemp_load NO config=/boot/loader.conf

salt.modules.freebsd_sysctl.show(config_file=False)
Return a list of sysctl parameters for this minion
CLI Example:
salt '*' sysctl.show
19.9.119 salt.modules.freebsd_update module

Support for freebsd-update utility on FreeBSD.

New in version 2017.7.0.

**maintainer**  George Mamalakis <mamalos@gmail.com>

**maturity**  new

**platform**  FreeBSD

```python
salt.modules.freebsd_update.fetch(**kwargs)
```

New in version 2016.3.4.

freebsd-update fetch wrapper. Based on the currently installed world and the configuration options set, fetch all available binary updates.

**kwargs:** Parameters of freebsd-update command.

```python
salt.modules.freebsd_update.ids(**kwargs)
```

New in version 2016.3.4.

freebsd-update IDS wrapper function. Compares the system against a `known good` index of the installed release.

**kwargs:** Parameters of freebsd-update command.

```python
salt.modules.freebsd_update.install(**kwargs)
```

New in version 2016.3.4.

freebsd-update install wrapper. Install the most recently fetched updates or upgrade.

**kwargs:** Parameters of freebsd-update command.

```python
salt.modules.freebsd_update.rollback(**kwargs)
```

New in version 2016.3.4.

freebsd-update rollback wrapper. Uninstalls the most recently installed updates.

**kwargs:** Parameters of freebsd-update command.

```python
salt.modules.freebsd_update.update(**kwargs)
```

New in version 2016.3.4.

Command that simplifies freebsd-update by running freebsd-update fetch first and then freebsd-update install.

**kwargs:** Parameters of freebsd-update command.

```python
salt.modules.freebsd_update.upgrade(**kwargs)
```

New in version 2016.3.4.

Dummy function used only to print a message that upgrade is not available. The reason is that upgrade needs manual intervention and reboot, so even if used with:

```bash
yes | freebsd-upgrade -r VERSION
```

the additional freebsd-update install that needs to run after the reboot cannot be implemented easily.

**kwargs:** Parameters of freebsd-update command.

---

19.9.120 salt.modules.freebsdjail

The jail module for FreeBSD

```python
salt.modules.freebsdjail.fstab(jail)
```

Display contents of a fstab(5) file defined in specified jail's configuration. If no file is defined, return False.

CLI Example:
salt '*' jail.fstab <jail name>

salt.modules.freebsdjail.get_enabled()
Return which jails are set to be run

CLI Example:
```
salt '*' jail.get_enabled
```

salt.modules.freebsdjail.is_enabled()
See if jail service is actually enabled on boot

CLI Example:
```
salt '*' jail.is_enabled <jail name>
```

salt.modules.freebsdjail.restart(jail='')
Restart the specified jail or all, if none specified

CLI Example:
```
salt '*' jail.restart [jail name]
```

salt.modules.freebsdjail.show_config(jail)
Display specified jail's configuration

CLI Example:
```
salt '*' jail.show_config <jail name>
```

salt.modules.freebsdjail.start(jail='')
Start the specified jail or all, if none specified

CLI Example:
```
salt '*' jail.start [jail name]
```

salt.modules.freebsdjail.status(jail)
See if specified jail is currently running

CLI Example:
```
salt '*' jail.status <jail name>
```

salt.modules.freebsdjail.stop(jail='')
Stop the specified jail or all, if none specified

CLI Example:
```
salt '*' jail.stop [jail name]
```

salt.modules.freebsdjail.sysctl()
Dump all jail related kernel states (sysctl)

CLI Example:
```
salt '*' jail.sysctl
```
19.9.121 salt.modules.freebsdkmod

Module to manage FreeBSD kernel modules

salt.modules.freebsdkmod.available()
  Return a list of all available kernel modules

  CLI Example:
  
  salt '*' kmod.available

salt.modules.freebsdkmod.check_available(mod)
  Check to see if the specified kernel module is available

  CLI Example:
  
  salt '*' kmod.check_available vmm

salt.modules.freebsdkmod.is_loaded(mod)
  Check to see if the specified kernel module is loaded

  CLI Example:
  
  salt '*' kmod.is_loaded vmm

salt.modules.freebsdkmod.load(mod, persist=False)
  Load the specified kernel module

  mod  Name of the module to add
  persist  Write the module to sysrc kld_modules to make it load on system reboot

  CLI Example:
  
  salt '*' kmod.load bhyve

salt.modules.freebsdkmod.lsmod()
  Return a dict containing information about currently loaded modules

  CLI Example:
  
  salt '*' kmod.lsm

salt.modules.freebsdkmod.mod_list(only_persist=False)
  Return a list of the loaded module names

  CLI Example:
  
  salt '*' kmod.mod_list

salt.modules.freebsdkmod.remove(mod, persist=False)
  Remove the specified kernel module

  CLI Example:
  
  salt '*' kmod.remove vmm

19.9.122 salt.modules.freebsdpkg

Remote package support using pkg_add(1)
Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `pkg.install' is not available), see here.

Warning: This module has been completely rewritten. Up to and including version 0.17.0, it supported pkg_add(1), but checked for the existence of a pkgng local database and, if found, would provide some of pkgng's functionality. The rewrite of this module has removed all pkgng support, and moved it to the pkgng execution module. For versions <= 0.17.0, the documentation here should not be considered accurate. If your Minion is running one of these versions, then the documentation for this module can be viewed using the sys.doc function:

```
salt bsdminion sys.doc pkg
```

This module acts as the default package provider for FreeBSD 9 and older. If you need to use pkgng on a FreeBSD 9 system, you will need to override the pkg provider by setting the providers parameter in your Minion config file, in order to use pkgng.

```yaml
providers:
  pkg: pkgng
```

More information on pkgng support can be found in the documentation for the pkgng module.

This module will respect the PACKAGEROOT and PACKAGESITE environment variables, if set, but these values can also be overridden in several ways:

1. **Salt configuration parameters.** The configuration parameters freebsdpkgs.PACKAGEROOT and freebsdpkgs.PACKAGESITE are recognized. These config parameters are looked up using `config.get` and can thus be specified in the Master config file, Grains, Pillar, or in the Minion config file. Example:

```
freebsdpkgs.PACKAGESITE: ftp://ftp.freebsd.org/pub/FreeBSD/ports/ia64/packages-9-
\stable/Latest/
```

2. **CLI arguments.** Both the packageroot (used interchangeably with fromrepo for API compatibility) and packagesite CLI arguments are recognized, and override their config counterparts from section 1 above.

```
salt -G 'os:FreeBSD' pkg.install zsh fromrepo=ftp://ftp2.freebsd.org/
salt -G 'os:FreeBSD' pkg.install zsh packageroot=ftp://ftp2.freebsd.org/
salt -G 'os:FreeBSD' pkg.install zsh packagesite=ftp://ftp2.freebsd.org/pub/
  ~FreeBSD/ports/ia64/packages-9-stable/Latest/
```

.. note::

These arguments can also be passed through in states:

```yaml
.. code-block:: yaml

  zsh:
    pkg.installed:
```

```
salt.modules.freebsdpkg.file_dict('packages')
```

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:
salt.modules.freebsdpkg.file_list(*packages*)

List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

salt.modules.freebsdpkg.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs)

Install package(s) using pkg_add(1)

*name*  The name of the package to be installed.

*refresh*  Whether or not to refresh the package database before installing.

*fromrepo* or *packageroot*  Specify a package repository from which to install. Overrides the system default, as well as the PACKAGEROOT environment variable.

*packagesite*  Specify the exact directory from which to install the remote package. Overrides the PACKAGE_SITE environment variable, if present.

**Multiple Package Installation Options:**

*pkgs*  A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo", "bar"]'
```

*sources*  A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources='[{"foo": "salt://foo.deb"}, {"bar": "salt://bar.deb"}]'
```

Return a dict containing the new package names and versions:

```
{<package>: {"old": <old-version>, "new": <new-version>}}
```

CLI Example:

```
salt '*' pkg.install <package name>
```

salt.modules.freebsdpkg.latest_version(*names, **kwargs*)

pkg_add(1) is not capable of querying for remote packages, so this function will always return results as if there is no package available for install or upgrade.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.freebsdpkg.list_pkgs(versions_as_list=False, with_origin=False, **kwargs)

List the packages currently installed as a dict:
{'<package_name>': '<version>'}

with_origin [False] Return a nested dictionary containing both the origin name and version for each installed package.

   New in version 2014.1.0.

CLI Example:

salt '*' pkg.list_pkgs

salt.modules.freebsdpkg.refresh_db()

pkg_add(1) does not use a local database of available packages, so this function simply returns True. It exists merely for API compatibility.

   CLI Example:

salt '*' pkg.refresh_db

salt.modules.freebsdpkg.remove(name=None, pkgs=None, **kwargs)

Remove packages using pkg_delete(1)
name The name of the package to be deleted.
Multiple Package Options:
pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.
New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'

salt.modules.freebsdpkg.version(*names, **kwargs)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.
with_origin [False] Return a nested dictionary containing both the origin name and version for each specified package.

   New in version 2014.1.0.

CLI Example:

salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...

19.9.123 salt.modules.freebsdports

Install software from the FreeBSD ports(7) system

New in version 2014.1.0.

This module allows you to install ports using BATCH=yes to bypass configuration prompts. It is recommended to use the ports state to install ports, but it is also possible to use this module exclusively from the command line.

salt minion-id ports.config security/nmap IPV6=off
salt minion-id ports.install security/nmap
salt.modules.freebsdports.config(name, reset=False, **kwargs)
Modify configuration options for a given port. Multiple options can be specified. To see the available options
for a port, use ports.showconfig.

name The port name, in category/name format
reset [False] If True, runs a make rmconfig for the port, clearing its configuration before setting the
desired options

CLI Examples:
salt '*' ports.config security/nmap IPV6=off

salt.modules.freebsdports.deinstall(name)
De-install a port.

CLI Example:
salt '*' ports.deinstall security/nmap

salt.modules.freebsdports.install(name, clean=True)
Install a port from the ports tree. Installs using BATCH=yes for non-interactive building. To set config options
for a given port, use ports.config.
clean [True] If True, cleans after installation. Equivalent to running make install clean
BATCH=yes.

Note: It may be helpful to run this function using the -t option to set a higher timeout, since compiling a
port may cause the Salt command to exceed the default timeout.

CLI Example:
salt -t 1200 '*' ports.install security/nmap

salt.modules.freebsdports.list_all()
Lists all ports available.

CLI Example:
salt '*' ports.list_all

Warning: Takes a while to run, and returns a LOT of output

salt.modules.freebsdports.rmconfig(name)
Clear the cached options for the specified port; run a make rmconfig
name The name of the port to clear

CLI Example:
salt '*' ports.rmconfig security/nmap

salt.modules.freebsdports.search(name)
Search for matches in the ports tree. Globs are supported, and the category is optional

CLI Examples:
salt '*' ports.search 'security/*'
salt '*' ports.search 'security/n*'  
salt '*' ports.search nmap
**Warning:** Takes a while to run

```python
def salt.modules.freebsdports.showconfig(name, default=False, dict_return=False):
    # Show the configuration options for a given port.
    # default [False] Show the default options for a port (not necessarily the same as the current configuration)
    # dict_return [False] Instead of returning the output of make showconfig, return the data in an dictionary
    # CLI Example:
    salt '*' ports.showconfig security/nmap
    salt '*' ports.showconfig security/nmap default=True
```

```python
def salt.modules.freebsdports.update(extract=False):
    # Update the ports tree
    # extract [False] If True, runs a portsnap extract after fetching, should be used for first-time installation of the ports tree.
    # CLI Example:
    salt '*' ports.update
```

## 19.9.124 salt.modules.freebsdservice

The service module for FreeBSD

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `service.start' is not available), see here.

```python
def salt.modules.freebsdservice.available(name, jail=None):
    # Check that the given service is available.
    Changed in version 2016.3.4.
    jail: optional jid or jail name
    # CLI Example:
    salt '*' service.available sshd
```

```python
def salt.modules.freebsdservice.disable(name, **kwargs):
    # Disable the named service to start at boot
    Arguments the same as for enable()
    Changed in version 2016.3.4.
    jail (optional keyword argument) the jail's id or name
    chroot (optional keyword argument) the jail's chroot, if the jail's /etc is not mounted read-write
    # CLI Example:
    salt '*' service.disable <service name>
```

```python
def salt.modules.freebsdservice.disabled(name, **kwargs):
    # Return True if the named service is enabled, false otherwise
    # CLI Example:
```

1500 Chapter 19. Salt Module Reference
salt 'x' service.disabled <service name>

salt.modules.freebsdservice.enable(name, **kwargs)
   Enable the named service to start at boot
   name  service name
   config [/etc/rc.conf] Config file for managing service. If config value is empty string, then
         /etc/rc.conf.d/<service> used. See man rc.conf(5) for details.
         Also service.config variable can be used to change default.
   jail (optional keyword argument)  the jail’s id or name
   chroot (optional keyword argument) the jail’s chroot, if the jail’s /etc is not mounted read-write
   CLI Example:
   salt 'x' service.enable <service name>

salt.modules.freebsdservice.enabled(name, **kwargs)
   Return True if the named service is enabled, false otherwise
   name  Service name
   Changed in version 2016.3.4.
   Support for jail (representing jid or jail name) keyword argument in kwargs
   CLI Example:
   salt 'x' service.enabled <service name>

salt.modules.freebsdservice.get_all(jail=None)
   Return a list of all available services
   Changed in version 2016.3.4.
   jail: optional jid or jail name
   CLI Example:
   salt 'x' service.get_all

salt.modules.freebsdservice.get_disabled(jail=None)
   Return what services are available but not enabled to start at boot
   Changed in version 2016.3.4.
   Support for jail (representing jid or jail name) keyword argument in kwargs
   CLI Example:
   salt 'x' service.get_disabled

salt.modules.freebsdservice.get_enabled(jail=None)
   Return what services are set to run on boot
   Changed in version 2016.3.4.
   Support for jail (representing jid or jail name) keyword argument in kwargs
   CLI Example:
   salt 'x' service.get_enabled
salt.modules.freebsdservice.missing(name, jail=None)
    The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.

    Changed in version 2016.3.4.

    jail: optional jid or jail name

    CLI Example:

    salt '*' service.missing sshd

salt.modules.freebsdservice.reload_(name, jail=None)
    Restart the named service

    Changed in version 2016.3.4.

    jail: optional jid or jail name

    CLI Example:

    salt '*' service.reload <service name>

salt.modules.freebsdservice.restart(name, jail=None)
    Restart the named service

    Changed in version 2016.3.4.

    jail: optional jid or jail name

    CLI Example:

    salt '*' service.restart <service name>

salt.modules.freebsdservice.start(name, jail=None)
    Start the specified service

    Changed in version 2016.3.4.

    jail: optional jid or jail name

    CLI Example:

    salt '*' service.start <service name>

salt.modules.freebsdservice.status(name, sig=None, jail=None)
    Return the status for a service (True or False).

    name  Name of service

    Changed in version 2016.3.4.

    jail: optional jid or jail name

    CLI Example:

    salt '*' service.status <service name>

salt.modules.freebsdservice.stop(name, jail=None)
    Stop the specified service

    Changed in version 2016.3.4.

    jail: optional jid or jail name

    CLI Example:
**19.9.125 salt.modules.gem**

Manage ruby gems.

```python
class salt.modules.gem

salt.modules.gem.install(gems, ruby=None, gem_bin=None, runas=None, version=None, rdoc=False, ri=False, pre_releases=False, proxy=None, source=None)
```

Installs one or several gems.

**Parameters**

- **gems** -- string The gems to install
- **gem_bin** -- string : None Full path to gem binary to use.
- **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if gem_bin is specified.
- **runas** -- string : None The user to run gem as.
- **version** -- string : None Specify the version to install for the gem. Doesn’t play nice with multiple gems at once
- **rdoc** -- boolean : False Generate RDoc documentation for the gem(s).
- **ri** -- boolean : False Generate RI documentation for the gem(s).
- **pre_releases** -- boolean : False Include pre-releases in the available versions
- **proxy** -- string : None Use the specified HTTP proxy server for all outgoing traffic.

**source** [None] Use the specified HTTP gem source server to download gem. Format: http://hostname[:port]

**CLI Example:**

```
salt '*' gem.install vagrant
salt '*' gem.install redphone  gem_bin=/opt/sensu/embedded/bin/gem
```

```python
class salt.modules.gem

gem.list(prefix='`, ruby=None, runas=None, gem_bin=None)
```

List locally installed gems.

**Parameters**

- **prefix** -- string : Only list gems when the name matches this prefix.
- **gem_bin** -- string : None Full path to gem binary to use.
- **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if gem_bin is specified.
- **runas** -- string : None The user to run gem as.

**CLI Example:**

```
salt '*' gem.list
```

```python
class salt.modules.gem

list_upgrades(ruby=None, runas=None, gem_bin=None)
```

New in version 2015.8.0.

Check if an upgrade is available for installed gems

**gem_bin** [None] Full path to gem binary to use.
ruby [None] If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if gem_bin is specified.
runas  [None] The user to run gem as.

CLI Example:
```
salt '*' gem.list_upgrades
```

salt.modules.gem.sources_add(source_uri, ruby=None, runas=None, gem_bin=None)

Add a gem source.

Parameters

- **source_uri** -- string The source URI to add.
- **gem_bin** -- string : None Full path to gem binary to use.
- **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if gem_bin is specified.
- **runas** -- string : None The user to run gem as.

CLI Example:
```
salt '*' gem.sources_add http://rubygems.org/
```

salt.modules.gem.sources_list(ruby=None, runas=None, gem_bin=None)

List the configured gem sources.

Parameters

- **gem_bin** -- string : None Full path to gem binary to use.
- **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if gem_bin is specified.
- **runas** -- string : None The user to run gem as.

CLI Example:
```
salt '*' gem.sources_list
```

salt.modules.gem.sources_remove(source_uri, ruby=None, runas=None, gem_bin=None)

Remove a gem source.

Parameters

- **source_uri** -- string The source URI to remove.
- **gem_bin** -- string : None Full path to gem binary to use.
- **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if gem_bin is specified.
- **runas** -- string : None The user to run gem as.

CLI Example:
```
salt '*' gem.sources_remove http://rubygems.org/
```

salt.modules.gem.uninstall(gems, ruby=None, runas=None, gem_bin=None)

Uninstall one or several gems.

Parameters

- **gms** -- string The gems to uninstall.
- **gem_bin** -- string : None Full path to gem binary to use.
• **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.

• **runas** -- string : None The user to run gem as.

CLI Example:

```bash
salt '*' gem.uninstall vagrant
```

**salt.modules.gem.update** (`gems, ruby=None, runas=None, gem_bin=None`)

Update one or several gems.

**Parameters**

• **gems** -- string The gems to update.

• **gem_bin** -- string : None Full path to gem binary to use.

• **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.

• **runas** -- string : None The user to run gem as.

CLI Example:

```bash
salt '*' gem.update vagrant
```

**salt.modules.gem.update_system** (`version='*', ruby=None, runas=None, gem_bin=None`)

Update rubygems.

**Parameters**

• **version** -- string : (newest) The version of rubygems to install.

• **gem_bin** -- string : None Full path to gem binary to use.

• **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.

• **runas** -- string : None The user to run gem as.

CLI Example:

```bash
salt '*' gem.update_system
```

---

**19.9.126 salt.modules.genesis**

Module for managing container and VM images

New in version 2014.7.0.

**salt.modules.genesis.avail_platforms()**

Return which platforms are available

CLI Example:

```bash
salt myminion genesis.avail_platforms
```

**salt.modules.genesis.bootstrap** (`platform, root, img_format='dir', fs_format='ext2', fs_opts=None, arch=None, flavor=None, repo_url=None, static_qemu=None, img_size=None, mount_dir=None, pkg_cache=None, pkgs=None, exclude_pkgs=None, epel_url='http://download.fedoraproject.org/pub/epel/6/i386/epel-release-6-8.noarch.rpm')

Create an image for a specific platform.
Please note that this function **MUST** be run as root, as images that are created make files belonging to root.

platform  Which platform to use to create the image. Currently supported platforms are rpm, deb and pacman.

root  Local path to create the root of the image filesystem.

img_format  Which format to create the image in. By default, just copies files into a directory on the local filesystem (dir). Future support will exist for sparse.

fs_format  When using a non-dir img_format, which filesystem to format the image to. By default, ext2.

fs_opts  When using a non-dir img_format, a dict of opts may be specified.

arch  Architecture to install packages for, if supported by the underlying bootstrap tool. Currently only used for deb.

flavor  Which flavor of operating system to install. This correlates to a specific directory on the distribution repositories. For instance, wheezy on Debian.

repo_url  Mainly important for Debian-based repos. Base URL for the mirror to install from. (e.x.: http://ftp.debian.org/debian/)

static_qemu  Local path to the static qemu binary required for this arch. (e.x.: /usr/bin/qemu-amd64-static)

pkg_confs  The location of the conf files to copy into the image, to point the installer to the right repos and configuration.

img_size  If img_format is not dir, then the size of the image must be specified.

mount_dir  If img_format is not dir, then the image must be mounted somewhere. If the mount_dir is not specified, then it will be created at /opt/salt-genesis.<random_uuid>. This directory will be unmounted and removed when the process is finished.

pkg_cache  This points to a directory containing a cache of package files to be copied to the image. It does not need to be specified.

pkgs  A list of packages to be installed on this image. For RedHat, this will include yum, centos-release and iputils by default.

exclude_pkgs  A list of packages to be excluded. If you do not want to install the defaults, you need to include them in this list.

epel_url  The URL to download the EPEL release package from.

CLI Examples:

```bash
salt myminion genesis.bootstrap pacman /root/arch
salt myminion genesis.bootstrap rpm /root/redhat
salt myminion genesis.bootstrap deb /root/wheezy arch=amd64 flavor=wheezy static_qemu=/usr/bin/qemu-x86_64-static
```

salt.modules.genesis.**ldd_deps** (*filename*, *rel=None*)

Recurse through a set of dependencies reported by ldd, to find associated dependencies.

Please note that this does not necessarily resolve all (non-package) dependencies for a file; but it does help.

CLI Example:

```bash
salt myminion genesis.ldd_deps bash salt myminion genesis.ldd_deps /bin/bash
```

salt.modules.genesis.**mksls**( *fmt*, *src*, *dst=None*)

Convert an installation file/script to an SLS file. Currently supports kickstart, preseed, and autoyast.

CLI Examples:

```bash
salt <minion> genesis.mksls kickstart /path/to/kickstart.cfg salt <minion> genesis.mksls kickstart /path/to/kickstart.cfg /path/to/dest.sls
```

New in version Beryllium.

salt.modules.genesis.**pack**( *name*, *root*, *path=None*, *pack_format='tar'*, *compress='bzip2'*)

Pack up a directory structure, into a specific format.

CLI Examples:

```bash
salt myminion genesis.pack centos /root/centos
salt myminion genesis.pack centos /root/centos pack_format='tar'
```
salt.modules.genesis.unpack(name, dest=None, path=None, pack_format='tar', compress='bz2')

Unpack an image into a directory structure

CLI Example:
```
salt myminion genesis.unpack centos /root/centos
```

19.9.127 salt.modules.gentoo_service

Top level package command wrapper, used to translate the os detected by grains to the correct service manager

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `service.start` is not available), see here.

salt.modules.gentoo_service.available(name)

Returns True if the specified service is available, otherwise returns False.

CLI Example:
```
salt '*' service.available sshd
```

salt.modules.gentoo_service.disable(name, **kwargs)

Disable the named service to start at boot

CLI Example:
```
salt '*' service.disable <service name> <runlevels=single-runlevel>
salt '*' service.disable <service name> <runlevels=[runlevel1,runlevel2]>
```

salt.modules.gentoo_service.disabled(name)

Return True if the named service is enabled, false otherwise

CLI Example:
```
salt '*' service.disabled <service name> <runlevels=[runlevel]>
```

salt.modules.gentoo_service.enable(name, **kwargs)

Enable the named service to start at boot

CLI Example:
```
salt '*' service.enable <service name> <runlevels=single-runlevel>
salt '*' service.enable <service name> <runlevels=[runlevel1,runlevel2]>
```

salt.modules.gentoo_service.enabled(name, **kwargs)

Return True if the named service is enabled, false otherwise

CLI Example:
```
salt '*' service.enabled <service name> <runlevels=single-runlevel>
salt '*' service.enabled <service name> <runlevels=[runlevel1,runlevel2]>
```

salt.modules.gentoo_service.get_all()

Return all available boot services
CLI Example:

```
salt '*' service.get_all
```

```python
salt.modules.gentoo_service.get_disabled()
Return a set of services that are installed but disabled
```

CLI Example:

```
salt '*' service.get_disabled
```

```python
salt.modules.gentoo_service.get_enabled()
Return a list of service that are enabled on boot
```

CLI Example:

```
salt '*' service.get_enabled
```

```python
salt.modules.gentoo_service.missing(name)
The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.
```

CLI Example:

```
salt '*' service.missing sshd
```

```python
salt.modules.gentoo_service.reload_(name)
Reload the named service
```

CLI Example:

```
salt '*' service.reload <service name>
```

```python
salt.modules.gentoo_service.restart(name)
Restart the named service
```

CLI Example:

```
salt '*' service.restart <service name>
```

```python
salt.modules.gentoo_service.start(name)
Start the specified service
```

CLI Example:

```
salt '*' service.start <service name>
```

```python
salt.modules.gentoo_service.status(name, sig=None)
Return the status for a service, returns the PID or an empty string if the service is running or not, pass a signature to use to find the service via ps
```

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

```python
salt.modules.gentoo_service.stop(name)
Stop the specified service
```

CLI Example:
salt 'salt '*' service.stop <service name>

salt.modules.gentoo_service.zap(name)
    Resets service state
    CLI Example:
    salt 'salt '*' service.zap <service name>

19.9.128 salt.modules.gentoolkitmod
Support for Gentoolkit

salt.modules.gentoolkitmod.eclean_dist(destructive=False, package_names=False, size_limit=0, time_limit=0, fetch_restricted=False, exclude_file='/etc/eclean/distfiles.exclude')
    Clean obsolete portage sources
    destructive Only keep minimum for reinstallaion
    package_names Protect all versions of installed packages. Only meaningful if used with destructive=True
    size_limit <size> Don't delete distfiles bigger than <size>. <size> is a size specification: ``10M'' is ``ten megabytes'', ``200K'' is ``two hundreds kilobytes'', etc. Units are: G, M, K and B.
    time_limit <time> Don't delete distfiles files modified since <time> <time> is an amount of time: ``1y'' is ``one year'', ``2w'' is ``two weeks'', etc. Units are: y (years), m (months), w (weeks), d (days) and h (hours).
    fetch_restricted Protect fetch-restricted files. Only meaningful if used with destructive=True
    exclude_file Path to exclusion file. Default is /etc/eclean/distfiles.exclude This is the same default eclean-dist uses. Use None if this file exists and you want to ignore.

    Returns a dict containing the cleaned, saved, and deprecated dists:

    ```
    {'cleaned': {<dist file>: <size>},
    'deprecated': {<package>: <dist file>},
    'saved': {<package>: <dist file>},
    'total_cleaned': <size>}
    ```

    CLI Example:
    salt 'salt '*' gentoolkit.eclean_dist destructive=True

salt.modules.gentoolkitmod.eclean_pkg(destructive=False, package_names=False, time_limit=0, exclude_file='/etc/eclean/packages.exclude')
    Clean obsolete binary packages
    destructive Only keep minimum for reinstallaion
    package_names Protect all versions of installed packages. Only meaningful if used with destructive=True
    time_limit <time> Don't delete distfiles files modified since <time> <time> is an amount of time: ``1y'' is ``one year'', ``2w'' is ``two weeks'', etc. Units are: y (years), m (months), w (weeks), d (days) and h (hours).
    exclude_file Path to exclusion file. Default is /etc/eclean/packages.exclude This is the same default eclean-pkg uses. Use None if this file exists and you want to ignore.

    Returns a dict containing the cleaned binary packages:

    ```
    {'cleaned': {<dist file>: <size>},
    'total_cleaned': <size>}
    ```

    CLI Example:
salt '*' gentoolkit.eclean_pkg destructive=True

gentoolkitmod.glSA_check_list(glSA_list)

List the status of Gentoo Linux Security Advisories
glSA_list can contain an arbitrary number of GLSA ids, filenames containing GLSAs or the special identifiers 'all' and 'affected'
Returns a dict containing glsa ids with a description, status, and CVEs:

```
{<glsa_id>: {'description': <glsa_description>,
            'status': <glsa status>,
            'CVEs': [<list of CVEs]>}}
```

CLI Example:

```
salt '*' gentoolkit.glSA_check_list 'affected'
```

gentoolkitmod.revdep_rebuild(lib=None)

Fix up broken reverse dependencies
lib Search for reverse dependencies for a particular library rather than every library on the system. It can be a full path to a library or basic regular expression.
CLI Example:

```
salt '*' gentoolkit.revdep_rebuild
```

19.9.129 salt.modules.git

Support for the Git SCM

git.add(cwd, filename, opts='`, git_opts='`, user=None, password=None, ignore_retcode=False)

Changed in version 2015.8.0: The --verbose command line argument is now implied

Interface to git-add(1)
cwd The path to the git checkout
filename The location of the file/directory to add, relative to cwd
opts Any additional options to add to the command line, in a single string

**Note:** On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with opts= (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

**git_opts** Any additional options to add to git command itself (not the add subcommand), in a single string. This is useful for passing -c to run git with temporary changes to the git configuration.

New in version 2017.7.0.

**Note:** This is only supported in git 1.7.2 and newer.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.
password

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.
ignore_retcode [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```sh
salt myminion git.add /path/to/repo foo/bar.py
salt myminion git.add /path/to/repo foo/bar.py opts='--dry-run'
```

salt.modules.git.archive(cwd, output, rev='HEAD', prefix=None, git_opts='', user=None, password=None, ignore_retcode=False, **kwargs)

Changed in version 2015.8.0: Returns True if successful, raises an error if not.

Interface to git-archive(1), exports a tarball/zip file of the repository

cwd The path to be archived

**Note:** git archive permits a partial archive to be created. Thus, this path does not need to be the root of the git repository. Only the files within the directory specified by cwd (and its subdirectories) will be in the resulting archive. For example, if there is a git checkout at /tmp/foo, then passing /tmp/foo/bar as the cwd will result in just the files underneath /tmp/foo/bar to be exported as an archive.

output The path of the archive to be created

overwrite [False] Unless set to True, Salt will over overwrite an existing archive at the path specified by the output argument.

New in version 2015.8.0.

rev [HEAD] The revision from which to create the archive

format Manually specify the file format of the resulting archive. This argument can be omitted, and git archive will attempt to guess the archive type (and compression) from the filename. zip, tar, tar.gz, and tgz are extensions that are recognized automatically, and git can be configured to support other archive types with the addition of git configuration keys.

See the git-archive(1) manpage explanation of the --format argument (as well as the CONFIGURATION section of the manpage) for further information.

New in version 2015.8.0.

prefix Prepend <prefix> to every filename in the archive. If unspecified, the name of the directory at the top level of the repository will be used as the prefix (e.g. if cwd is set to /foo/bar/baz, the prefix will be baz, and the resulting archive will contain a top-level directory by that name).

**Note:** The default behavior if the --prefix option for git archive is not specified is to not prepend a prefix, so Salt's behavior differs slightly from git archive in this respect. Use prefix='' to create an archive with no prefix.

Changed in version 2015.8.0: The behavior of this argument has been changed slightly. As of this version, it is necessary to include the trailing slash when specifying a prefix, if the prefix is intended to create a top-level directory.

git_opts Any additional options to add to git command itself (not the archive subcommand), in a single string. This is useful for passing -c to run git with temporary changes to the git configuration.

New in version 2017.7.0.

**Note:** This is only supported in git 1.7.2 and newer.
user  User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

   Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode  [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Example:

```
salt myminion git.archive /path/to/repo /path/to/archive.tar
```

salt.modules.git.branch(cwd, name=None, opts=' ', git_opts=' ', user=None, password=None, ignore_retcode=False)

Interface to `git-branch(1)`

cwd  The path to the git checkout

name  Name of the branch on which to operate. If not specified, the current branch will be assumed.

opts  Any additional options to add to the command line, in a single string

Note: To create a branch based on something other than HEAD, pass the name of the revision as opts. If the revision is in the format remotename/branch, then this will also set the remote tracking branch.

Additionally, on the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with opts= (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

git_opts  Any additional options to add to git command itself (not the branch subcommand), in a single string. This is useful for passing --c to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

user  User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

   Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode  [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
# Set remote tracking branch
salt myminion git.branch /path/to/repo mybranch opts='--set-upstream-to origin/→mybranch'

# Create new branch
salt myminion git.branch /path/to/repo mybranch upstream/somebranch

# Delete branch
salt myminion git.branch /path/to/repo mybranch opts='--d'
```
# Rename branch (2015.8.0 and later)
salt myminion git.branch /path/to/repo newbranch opts='--m oldbranch'

salt.modules.git.checkout(cwd, rev=None, force=False, opts='', git_opts='', user=None, password=None, ignore_retcode=False)

Interface to git-checkout(1)

cwd The path to the git checkout

opts Any additional options to add to the command line, in a single string

**Note:** On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt’s own argument parsing.

git_opts Any additional options to add to git command itself (not the checkout subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

**Note:** This is only supported in git 1.7.2 and newer.

rev The remote branch or revision to checkout.

force [False] Force a checkout even if there might be overwritten changes

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

# Checking out local local revisions
salt myminion git.checkout /path/to/repo somebranch user=jeff
salt myminion git.checkout /path/to/repo opts='testbranch -- conf/file1 file2'
salt myminion git.checkout /path/to/repo rev=origin/mybranch opts='--track'

# Checking out remote revision into new branch
salt myminion git.checkout /path/to/repo upstream/master opts='--b newbranch'

# Checking out current revision into new branch (2015.8.0 and later)
salt myminion git.checkout /path/to/repo opts='--b newbranch'

salt.modules.git.clone(cwd, url=None, name=None, opts='', git_opts='', user=None, password=None, identity=None, https_user=None, https_pass=None, ignore_retcode=False, saltenv='base')

Interface to git-clone(1)

cwd Location of git clone

url The URL of the repository to be cloned

Changed in version 2015.8.0: If name is passed, then the clone will be made within this directory.

name Optional alternate name for the top-level directory to be created by the clone
New in version 2015.8.0.

**opts**  Any additional options to add to the command line, in a single string

**git_opts**  Any additional options to add to git command itself (not the clone subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

**Note:**  This is only supported in git 1.7.2 and newer.

**user**  User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**identity**  Path to a private key to use for ssh URLs

**Warning:**  Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`

Changed in version 2016.3.0.

**https_user**  Set HTTP Basic Auth username. Only accepted for HTTPS URLs.

New in version 2015.5.0.

**https_pass**  Set HTTP Basic Auth password. Only accepted for HTTPS URLs.

New in version 2015.5.0.

**ignore_retcode**  `[False]`  If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**saltenv**  The default salt environment to pull sls files from

New in version 2016.3.1.

**CLI Example:**

```
salt myminion git.clone /path/to/parent_dir git://github.com/saltstack/salt.
```

```python
salt.modules.git.commit(cwd, message, opts='', git_opts='', user=None, password=None, file_name=None, ignore_retcode=False)
```

Interface to `git-commit(1)`

**cwd**  The path to the git checkout

**message**  Commit message

**opts**  Any additional options to add to the command line, in a single string. These opts will be added to the end of the git command being run.

**Note:**  On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt’s own argument parsing.
Salt Documentation, Release 2017.7.8

The -m option should not be passed here, as the commit message will be defined by the message argument.

git_opts Any additional options to add to git command itself (not the commit subcommand), in a single string. This is useful for passing -c to run git with temporary changes to the git configuration.

New in version 2017.7.0.

**Note:** This is only supported in git 1.7.2 and newer.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

filename The location of the file/directory to commit, relative to cwd. This argument is optional, and can be used to commit a file without first staging it.

**Note:** This argument only works on files which are already tracked by the git repository.

New in version 2015.8.0.

ignore_retcode [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
salt myminion git.commit /path/to/repo 'The commit message'
salt myminion git.commit /path/to/repo 'The commit message' filename=foo/bar.py
```

salt.modules.git.config_get(key, cwd=None, user=None, password=None, ignore_retcode=False, **kwargs)

Get the value of a key in the git configuration file

key The name of the configuration key to get

cwd The path to the git checkout

Changed in version 2015.8.0: Argument renamed from setting_name to key

global [False] If True, query the global git configuration. Otherwise, only the local git configuration will be queried.

New in version 2015.8.0.

all [False] If True, return a list of all values set for key. If the key does not exist, None will be returned.

New in version 2015.8.0.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.
ignore_retcode [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
salt myminion git.config_get user.name cwd=/path/to/repo
salt myminion git.config_get user.email global=True
salt myminion git.config_get core.gitproxy cwd=/path/to/repo all=True
```

salt.modules.git.config_get_regexp(key, value_regex=None, cwd=None, user=None, password=None, ignore_retcode=False, **kwargs)

New in version 2015.8.0.

Get the value of a key or keys in the git configuration file using regexes for more flexible matching. The return data is a dictionary mapping keys to lists of values matching the value_regex. If no values match, an empty dictionary will be returned.

- **key**: Regex on which key names will be matched
- **value_regex**: If specified, return all values matching this regex. The return data will be a dictionary mapping keys to lists of values matching the regex.

**Important**: Only values matching the value_regex will be part of the return data. So, if key matches a multivar, then it is possible that not all of the values will be returned. To get all values set for a multivar, simply omit the value_regex argument.

- **cwd**: The path to the git checkout
- **global**: [False] If True, query the global git configuration. Otherwise, only the local git configuration will be queried.
- **user**: User under which to run the git command. By default, the command is run by the user under which the minion is running.
- **password**: Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

CLI Examples:

```
# Matches any values for key 'foo.bar'
salt myminion git.config_get_regexp /path/to/repo foo.bar
# Matches any value starting with 'baz' set for key 'foo.bar'
salt myminion git.config_get_regexp /path/to/repo foo.bar 'baz.*'
# Matches any key starting with 'user.'
salt myminion git.config_get_regexp '\^user\.' global=True
```

salt.modules.git.config_set(key, value=None, multivar=None, cwd=None, user=None, password=None, ignore_retcode=False, **kwargs)

Changed in version 2015.8.0: Return the value(s) of the key being set

Set a key in the git configuration file

- **cwd**: The path to the git checkout. Must be an absolute path, or the word global to indicate that a global key should be set.

  Changed in version 2014.7.0: Made cwd argument optional if is_global=True

- **key**: The name of the configuration key to set
Changed in version 2015.8.0: Argument renamed from `setting_name` to `key`.

*value* The value to set for the specified key. Incompatible with the `multivar` argument.

Changed in version 2015.8.0: Argument renamed from `setting_value` to `value`.

*add* [False] Add a value to a key, creating/updating a multivar

New in version 2015.8.0.

*multivar* Set a multivar all at once. Values can be comma-separated or passed as a Python list. Incompatible with the `value` argument.

New in version 2015.8.0.

*user* User under which to run the git command. By default, the command is run by the user under which the minion is running.

*password*

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

*ignore_retcode* [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

*global* [False] If `True`, set a global variable

CLI Example:

```sh
salt myminion git.config_set user.email me@example.com cwd=/path/to/repo
salt myminion git.config_set user.email foo@bar.com global=True
```

**salt.modules.git.config_unset** (*key*, *value_regex=None*, *cwd=None*, *user=None*, *password=None*, *ignore_retcode=False*, **kwargs)

New in version 2015.8.0.

Unset a key in the git configuration file.

*cwd* The path to the git checkout. Must be an absolute path, or the word `global` to indicate that a global key should be unset.

*key* The name of the configuration key to unset

*value_regex* Regular expression that matches exactly one key, used to delete a single value from a multivar. Ignored if `all` is set to `True`.

*all* [False] If `True` unset all values for a multivar. If `False`, and `key` is a multivar, an error will be raised.

*global* [False] If `True`, unset set a global variable. Otherwise, a local variable will be unset.

*user* User under which to run the git command. By default, the command is run by the user under which the minion is running.

*password*

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

*ignore_retcode* [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

CLI Example:

```sh
salt myminion git.config_unset /path/to/repo foo.bar
salt myminion git.config_unset /path/to/repo foo.bar all=True
```

**salt.modules.git.current_branch** (*cwd*, *user=None*, *password=None*, *ignore_retcode=False*)

Returns the current branch name of a local checkout. If HEAD is detached, return the SHA1 of the revision which is currently checked out.
cwd  The path to the git checkout
user  User under which to run the git command. By default, the command is run by the user under which
      the minion is running.
password
      Windows only. Required when specifying user. This parameter will be ignored on non-
      Windows platforms.

      New in version 2016.3.4.
ignore_retcode  [False] If True, do not log an error to the minion log if the git command returns a nonzero
      exit status.

      New in version 2015.8.0.
CLI Example:

    salt myminion git.current_branch /path/to/repo

salt.modules.git.describe(cwd, rev='HEAD', user=None, password=None, ignore_retcode=False)
Returns the git-describe(1) string (or the SHA1 hash if there are no tags) for the given revision.
cwd  The path to the git checkout
rev  [HEAD] The revision to describe
user  User under which to run the git command. By default, the command is run by the user under which
      the minion is running.
password
      Windows only. Required when specifying user. This parameter will be ignored on non-
      Windows platforms.

      New in version 2016.3.4.
ignore_retcode  [False] If True, do not log an error to the minion log if the git command returns a nonzero
      exit status.

      New in version 2015.8.0.
CLI Examples:

    salt myminion git.describe /path/to/repo
    salt myminion git.describe /path/to/repo develop

salt.modules.git.diff(cwd, item1=None, item2=None, opts='`, git_opts='`, user=None, password=None, no_index=False, cached=False, paths=None)
New in version 2015.8.12,2016.3.3,2016.11.0.

    Interface to git-diff(1)
cwd  The path to the git checkout
item1 and item2  Revision(s) to pass to the git diff command. One or both of these arguments may be
      ignored if some of the options below are set to True. When cached is False, and no revisions are
      passed to this function, then the current working tree will be compared against the index (i.e. unstaged
      changes). When two revisions are passed, they will be compared to each other.
opts  Any additional options to add to the command line, in a single string

    Note:  On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with
            opts= (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

    git_opts  Any additional options to add to git command itself (not the diff subcommand), in a single string.
              This is useful for passing -c to run git with temporary changes to the git configuration.

              New in version 2017.7.0.
**Note**: This is only supported in git 1.7.2 and newer.

**user**  User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**  
Windows only. Required when specifying **user**. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**no_index**  [False] When it is necessary to diff two files in the same repo against each other, and not diff two different revisions, set this option to True. If this is left False in these instances, then a normal git diff will be performed against the index (i.e. unstaged changes), and files in the **paths** option will be used to narrow down the diff output.

**Note**: Requires Git 1.5.1 or newer. Additionally, when set to True, *item1* and *item2* will be ignored.

**cached**  [False] If True, compare staged changes to *item1* (if specified), otherwise compare them to the most recent commit.

**Note**: *item2* is ignored if this option is set to True.

**paths**  File paths to pass to the git diff command. Can be passed as a comma-separated list or a Python list.

CLI Example:

```bash
# Perform diff against the index (staging area for next commit)
salt myminion git.diff /path/to/repo
# Compare staged changes to the most recent commit
salt myminion git.diff /path/to/repo cached=True
# Compare staged changes to a specific revision
salt myminion git.diff /path/to/repo mybranch cached=True
# Perform diff against the most recent commit (includes staged changes)
salt myminion git.diff /path/to/repo HEAD
# Diff two commits
salt myminion git.diff /path/to/repo abcdef1 aabbcccd
# Diff two commits, only showing differences in the specified paths
salt myminion git.diff /path/to/repo abcdef1 aabbcccd paths=path/to/file1,path/to/
←file2
# Diff two files with one being outside the working tree
salt myminion git.diff /path/to/repo no_index=True paths=path/to/file1,/absolute/
←path/to/file2
```

salt.modules.git.fetch(cwd, remote=None, force=False, refspecs=None, opts='`, git_opts='`, user=None, password=None, identity=None, ignore_retcode=False, saltenv='base')

Changed in version 2015.8.2: Return data is now a dictionary containing information on branches and tags that were added/updated.

Interface to git-fetch(1)

**cwd**  The path to the git checkout

**remote**  Optional remote name to fetch. If not passed, then git will use its default behavior (as detailed in git-fetch(1)).

New in version 2015.8.0.

**force**  Force the fetch even when it is not a fast-forward.

19.9. execution modules
New in version 2015.8.0.

refspecs

Override the refspec(s) configured for the remote with this argument. Multiple refspecs can be passed, comma-separated.

New in version 2015.8.0.

opts

Any additional options to add to the command line, in a single string.

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with opts= (as in the CLI examples below) to avoid causing errors with Salt’s own argument parsing.

git_opts

Any additional options to add to git command itself (not the fetch subcommand), in a single string. This is useful for passing -c to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

user

User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

identity

Path to a private key to use for ssh URLs

Warning: Unless Salt is invoked from the minion using salt-call, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the sshd manpage for information on securing the keypair from the remote side in the authorized_keys file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using salt-call, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. salt://location/identity_file

Changed in version 2016.3.0.

ignore_retcode

[False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

saltenv

The default salt environment to pull sls files from

New in version 2016.3.1.

CLI Example:

```
salt myminion git.fetch /path/to/repo upstream
salt myminion git.fetch /path/to/repo identity=/root/.ssh/id_rsa
```

salt.modules.git.init(cwd, bare=False, template=None, separate_git_dir=None, shared=None, opts='', git_opts='', user=None, password=None, ignore_retcode=False)

Interface to git-init(1)

cwd

The path to the directory to be initialized

bare

[False] If True, init a bare repository

New in version 2015.8.0.
**template** Set this argument to specify an alternate template directory

New in version 2015.8.0.

**separate_git_dir** Set this argument to specify an alternate $GIT_DIR

New in version 2015.8.0.

**shared** Set sharing permissions on git repo. See `git-init(1)` for more details.

New in version 2015.8.0.

**opts** Any additional options to add to the command line, in a single string

**Note:** On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt’s own argument parsing.

**git_opts** Any additional options to add to `git` command itself (not the `init` subcommand), in a single string. This is useful for passing `-c` to run `git` with temporary changes to the git configuration.

New in version 2017.7.0.

**Note:** This is only supported in `git` 1.7.2 and newer.

**user** User under which to run the `git` command. By default, the command is run by the user under which the minion is running.

**password** Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore_retcode** [False] If True, do not log an error to the minion log if the `git` command returns a nonzero exit status.

New in version 2015.8.0.

**CLI Examples:**

```
salt myminion git.init /path/to/repo
# Init a bare repo (before 2015.8.0)
salt myminion git.init /path/to/bare/repo.git opts='--bare'
# Init a bare repo (2015.8.0 and later)
salt myminion git.init /path/to/bare/repo.git bare=True
```

**salt.modules.git.is_worktree** *(cwd, user=None, password=None)*

New in version 2015.8.0.

This function will attempt to determine if `cwd` is part of a worktree by checking its `.git` to see if it is a file containing a reference to another gitdir.

**cwd** path to the worktree to be removed

**user** User under which to run the `git` command. By default, the command is run by the user under which the minion is running.

**password** Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**CLI Example:**

```
salt myminion git.is_worktree /path/to/repo
```
salt.modules.git.list_branches(cwd, remote=False, user=None, password=None, ignore_retcode=False)

New in version 2015.8.0.
Return a list of branches

- **cwd** The path to the git checkout
- **remote** [False] If True, list remote branches. Otherwise, local branches will be listed.

**Warning:** This option will only return remote branches of which the local checkout is aware, use `git.fetch` to update remotes.

- **user** User under which to run the git command. By default, the command is run by the user under which the minion is running.
- **password**

  Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.4.
- **ignore_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

  New in version 2015.8.0.

**CLI Examples:**

```
salt myminion git.list_branches /path/to/repo
salt myminion git.list_branches /path/to/repo remote=True
```

salt.modules.git.list_tags(cwd, user=None, password=None, ignore_retcode=False)

New in version 2015.8.0.
Return a list of tags

- **cwd** The path to the git checkout
- **user** User under which to run the git command. By default, the command is run by the user under which the minion is running.
- **password**

  Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.4.
- **ignore_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

  New in version 2015.8.0.

**CLI Examples:**

```
salt myminion git.list_tags /path/to/repo
```

salt.modules.git.list_worktrees(cwd, stale=False, user=None, password=None, **kwargs)

New in version 2015.8.0.
Returns information on worktrees

Changed in version 2015.8.4: Version 2.7.0 added the `list` subcommand to `git-worktree(1)` which provides a lot of additional information. The return data has been changed to include this information, even for pre-2.7.0 versions of git. In addition, if a worktree has a detached head, then any tags which point to the worktree's HEAD will be included in the return data.
Note: By default, only worktrees for which the worktree directory is still present are returned, but this can be changed using the all and stale arguments (described below).

cwd The path to the git checkout
user User under which to run the git command. By default, the command is run by the user under which the minion is running.
password

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.
all [False] If True, then return all worktrees tracked under $GIT_DIR/worktrees, including ones for which the gitdir is no longer present.
stale [False] If True, return only worktrees whose gitdir is no longer present.

Note: Only one of all and stale can be set to True.

CLI Examples:
salt myminion git.list_worktrees /path/to/repo
salt myminion git.list_worktrees /path/to/repo all=True
salt myminion git.list_worktrees /path/to/repo stale=True

salt.modules.git.ls_remote(cwd=None, remote='origin', ref=None, opts='`, git_opts='`, user=None, password=None, identity=None, https_user=None, https_pass=None, ignore_retcode=False, saltenv='base')
Interface to git-ls-remote(1). Returns the upstream hash for a remote reference.
cwd The path to the git checkout. Optional (and ignored if present) when remote is set to a URL instead of a remote name.
remote [origin] The name of the remote to query. Can be the name of a git remote (which exists in the git checkout defined by the cwd parameter), or the URL of a remote repository.

Changed in version 2015.8.0: Argument renamed from repository to remote
ref The name of the ref to query. Optional, if not specified, all refs are returned. Can be a branch or tag name, or the full name of the reference (for example, to get the hash for a Github pull request number 1234, ref can be set to refs/pull/1234/head

Changed in version 2015.8.0: Argument renamed from branch to ref
opts Any additional options to add to the command line, in a single string

git_opts Any additional options to add to git command itself (not the ls-remote subcommand), in a single string. This is useful for passing -c to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.
password
Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**identity** Path to a private key to use for ssh URLs

**Warning:** Unless Salt is invoked from the minion using salt-call, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the sshd(8) manpage for information on securing the keypair from the remote side in the authorized_keys file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using salt-call, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. salt://location/identity_file

Changed in version 2016.3.0.

**https_user** Set HTTP Basic Auth username. Only accepted for HTTPS URLs.

New in version 2015.5.0.

**https_pass** Set HTTP Basic Auth password. Only accepted for HTTPS URLs.

New in version 2015.5.0.

**ignore_recode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**saltenv** The default salt environment to pull sls files from

New in version 2016.3.1.

**CLI Example:**

```
salt myminion git.ls_remote /path/to/repo origin master
salt myminion git.ls_remote remote=https://mydomain.tld/repo.git ref=mytag opts='--tags'
```

salt.modules.git.merge(cwd, rev=None, opts='', git_opts='', user=None, password=None, ignore_recode=False, **kwargs)

Interface to git-merge(1)

cwd The path to the git checkout

rev Revision to merge into the current branch. If not specified, the remote tracking branch will be merged.

New in version 2015.8.0.

**opts** Any additional options to add to the command line, in a single string

**Note:** On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with opts= (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

**git_opts** Any additional options to add to git command itself (not the merge subcommand), in a single string. This is useful for passing --c to run git with temporary changes to the git configuration.

New in version 2017.7.0.

**Note:** This is only supported in git 1.7.2 and newer.

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**
Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Example:

```bash
# Fetch first...
salt myminion git.fetch /path/to/repo
# ... then merge the remote tracking branch
salt myminion git.merge /path/to/repo
# ... or merge another rev
salt myminion git.merge /path/to/repo rev=upstream/foo
```

salt.modules.git.merge_base(
        cwd, refs=None, octopus=False, is_ancestor=False, independent=False,
        fork_point=None, opts='`, git_opts='`, user=None, password=None, ignore_retcode=False, **kwargs)

New in version 2015.8.0.

Interface to `git-merge-base(1)`.

**cwd** The path to the git checkout

**refs** Any refs/commits to check for a merge base. Can be passed as a comma-separated list or a Python list.

**all** [False] Return a list of all matching merge bases. Not compatible with any of the below options except for `octopus`.

**octopus** [False] If True, then this function will determine the best common ancestors of all specified commits, in preparation for an n-way merge. See here for a description of how these bases are determined.

Set all to True with this option to return all computed merge bases, otherwise only the ```best``` will be returned.

**is_ancestor** [False] If True, then instead of returning the merge base, return a boolean telling whether or not the first commit is an ancestor of the second commit.

**Note:** This option requires two commits to be passed.

Changed in version 2015.8.2: Works properly in git versions older than 1.8.0, where the ```--is-ancestor``` CLI option is not present.

**independent** [False] If True, this function will return the IDs of the refs/commits passed which cannot be reached by another commit.

**fork_point** If passed, then this function will return the commit where the commit diverged from the ref specified by `fork_point`. If no fork point is found, None is returned.

**Note:** At most one commit is permitted to be passed if a `fork_point` is specified. If no commits are passed, then HEAD is assumed.

**opts** Any additional options to add to the command line, in a single string

**Note:** On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

This option should not be necessary unless new CLI arguments are added to `git-merge-base(1)` and are not yet supported in Salt.
**git_opts**

Any additional options to add to the git command itself (not the merge-base subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

**Note:** This is only supported in git 1.7.2 and newer.

**user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore_retcode**

[Boolean] if `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

CLI Examples:

```bash
salt myminion git.merge_base /path/to/repo HEAD upstream/mybranch
salt myminion git.merge_base /path/to/rep 8f2e542,4ad8cab,c9886
salt myminion git.merge_base /path/to/rep refs=8f2e542,4ad8cab,c9886
salt myminion git.merge_base /path/to/rep refs=8f2e542,4ad8cab is_ancestor=True
salt myminion git.merge_base /path/to/rep fork_point=upstream/master
salt myminion git.merge_base /path/to/rep refs=mybranch fork_point=upstream/master
```

**salt.modules.git.merge_tree(cwd, ref1, ref2, base=None, user=None, password=None, ignore_retcode=False)**

New in version 2015.8.0.

Interface to `git-merge-tree(1)`, shows the merge results and conflicts from a 3-way merge without touching the index.

**cwd**

The path to the git checkout

**ref1**

First ref/commit to compare

**ref2**

Second ref/commit to compare

**base**

The base tree to use for the 3-way-merge. If not provided, then `git.merge_base` will be invoked on `ref1` and `ref2` to determine the merge base to use.

**user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore_retcode**

[Boolean] if `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

CLI Examples:

```bash
salt myminion git.merge_tree /path/to/repo HEAD upstream/dev
salt myminion git.merge_tree /path/to/repo HEAD upstream/dev base=aaf3c3d
```

**salt.modules.git.pull(cwd, opts='`, git_opts='`, user=None, password=None, identity=None, ignore_retcode=False, saltenv='base')**

Interface to `git-pull(1)`

**cwd**

The path to the git checkout
**opts**  Any additional options to add to the command line, in a single string

**Note:** On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

**git_opts**  Any additional options to add to git command itself (not the pull subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

**Note:** This is only supported in git 1.7.2 and newer.

**user**  User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**identity**  Path to a private key to use for ssh URLs

**Warning:** Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`

Changed in version 2016.3.0.

**ignore_retcode**  `[False]` If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**saltenv**  The default salt environment to pull sls files from

New in version 2016.3.1.

CLI Example:

```
salt myminion git.pull /path/to/repo opts='--rebase origin master'
```

**salt.modules.git.push**

`(cwd, remote=None, ref=None, opts='`, git_opts='`, user=None, password=None, identity=None, ignore_retcode=False, saltenv='base'; **kwargs)`

Interface to `git-push(1)`

**cwd**  The path to the git checkout

**remote**  Name of the remote to which the ref should be pushed

New in version 2015.8.0.

**ref**  `[master]` Name of the ref to push

**Note:** Being a refspec, this argument can include a colon to define local and remote ref names.
opts  Any additional options to add to the command line, in a single string

**Note:** On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt’s own argument parsing.

git_opts  Any additional options to add to git command itself (not the `push` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

**Note:** This is only supported in git 1.7.2 and newer.

user  User under which to run the git command. By default, the command is run by the user under which the minion is running.

password  Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

identity  Path to a private key to use for ssh URLs

**Warning:** Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`

Changed in version 2016.3.0.

ignore_retcode  [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

saltenv  The default salt environment to pull sls files from

New in version 2016.3.1.

### CLI Example:

```
# Push master as origin/master
salt myminion git.push /path/to/repo origin master
# Push issue21 as upstream/develop
salt myminion git.push /path/to/repo upstream issue21:develop
# Delete remote branch 'upstream/temp'
salt myminion git.push /path/to/repo upstream :temp
```

`salt.modules.git.rebase(cwd, rev=’master’, opts=’’, git_opts=’’, user=None, password=None, ignore_retcode=False)`

Interface to `git-rebase(1)`

cwd  The path to the git checkout

rev  [master] The revision to rebase onto the current branch

opts  Any additional options to add to the command line, in a single string
**Note:** On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt’s own argument parsing.

**git_opts** Any additional options to add to git command itself (not the `rebase` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

**Note:** This is only supported in git 1.7.2 and newer.

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Example:

```bash
salt myminion git.rebase /path/to/repo master
salt myminion git.rebase /path/to/repo
'stored master'
salt myminion git.rebase /path/to/repo origin/master
 opts='--onto newbranch'
```

salt.modules.git.remote_get(cwd, remote='origin', user=None, password=None, redact_auth=True, ignore_retcode=False)

Get the fetch and push URL for a specific remote

**cwd** The path to the git checkout

**remote** [origin] Name of the remote to query

**user** User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**redact_auth** [True] Set to False to include the username/password if the remote uses HTTPS Basic Auth. Otherwise, this information will be redacted.

**Warning:** Setting this to False will not only reveal any HTTPS Basic Auth that is configured, but the return data will also be written to the job cache. When possible, it is recommended to use SSH for authentication.

New in version 2015.5.6.

**ignore_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:
salt.myminion git.remote_get /path/to/repo
salt.myminion git.remote_get /path/to/repo upstream

```
salt.modules.git.remote_refs(url, heads=False, tags=False, user=None, password=None, identity=None, https_user=None, https_pass=None, ignore_retcode=False, saltenv='base')
```

New in version 2015.8.0.

Return the remote refs for the specified URL

- **url** URL of the remote repository
- **heads** [False] Restrict output to heads. Can be combined with tags.
- **tags** [False] Restrict output to tags. Can be combined with heads.
- **user** User under which to run the git command. By default, the command is run by the user under which the minion is running.
- **password** Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

- **identity** Path to a private key to use for ssh URLs

```
Warning: Unless Salt is invoked from the minion using salt-call, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the sshd(8) manpage for information on securing the keypair from the remote side in the authorized_keys file.
```

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using salt-call, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. salt://location/identity_file

Changed in version 2016.3.0.

- **https_user** Set HTTP Basic Auth username. Only accepted for HTTPS URLs.
- **https_pass** Set HTTP Basic Auth password. Only accepted for HTTPS URLs.
- **ignore_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.
- **saltenv** The default salt environment to pull sls files from

New in version 2016.3.1.

CLI Example:

```
salt myminion git.remote_refs https://github.com/saltstack/salt.git
```

```
salt.modules.git.remote_set(cwd, url, remote='origin', user=None, password=None, https_user=None, https_pass=None, push_url=None, push_https_user=None, push_https_pass=None, ignore_retcode=False)
```

- **cwd** The path to the git checkout
- **url** Remote URL to set
- **remote** [origin] Name of the remote to set
- **push_url** If unset, the push URL will be identical to the fetch URL.

New in version 2015.8.0.

- **user** User under which to run the git command. By default, the command is run by the user under which the minion is running.
- **password**
Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**https_user** Set HTTP Basic Auth username. Only accepted for HTTPS URLs.

New in version 2015.5.0.

**https_pass** Set HTTP Basic Auth password. Only accepted for HTTPS URLs.

New in version 2015.5.0.

**push_https_user** Set HTTP Basic Auth user for push_url. Ignored if push_url is unset. Only accepted for HTTPS URLs.

New in version 2015.8.0.

**push_https_pass** Set HTTP Basic Auth password for push_url. Ignored if push_url is unset. Only accepted for HTTPS URLs.

New in version 2015.8.0.

**ignore_recode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```bash
salt myminion git.remote_set /path/to/repo git@github.com:user/repo.git
salt myminion git.remote_set /path/to/repo git@github.com:user/repo.git
  --remote=upstream
salt myminion git.remote_set /path/to/repo https://github.com/user/repo.git
  --remote=upstream push_url=git@github.com:user/repo.git
```

```
salt.modules.git.remotes(cwd, user=None, password=None, redact_auth=True, ignore_recode=False)
```

Get fetch and push URLs for each remote in a git checkout

cwd The path to the git checkout

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**redact_auth** [True] Set to False to include the username/password for authenticated remotes in the return data. Otherwise, this information will be redacted.

**Warning:** Setting this to False will not only reveal any HTTPS Basic Auth that is configured, but the return data will also be written to the job cache. When possible, it is recommended to use SSH for authentication.

New in version 2015.5.6.

**ignore_recode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Example:

```bash
salt myminion git.remotes /path/to/repo
```
**salt.modules.git.reset** *(cwd, opts=' ', git_opts=' ', user=None, password=None, ignore_retcode=False)*

Interface to `git-reset(1)` returns the stdout from the git command

- **cwd** The path to the git checkout
- **opts** Any additional options to add to the command line, in a single string

**Note:** On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

- **git_opts** Any additional options to add to git command itself (not the `reset` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

  New in version 2017.7.0.

**Note:** This is only supported in git 1.7.2 and newer.

- **user** User under which to run the git command. By default, the command is run by the user under which the minion is running.
- **password** Required when specifying **user**. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.4.

- **ignore_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

  New in version 2015.8.0.

**CLI Examples:**

```
# Soft reset to a specific commit ID
salt myminion git.reset /path/to/repo ac3ee5c

# Hard reset
salt myminion git.reset /path/to/repo opts='--hard origin/master'
```
Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_recode  [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

CLI Examples:

```
# Get the full SHA1 for HEAD
salt myminion git.rev_parse /path/to/repo HEAD

# Get the short SHA1 for HEAD
salt myminion git.rev_parse /path/to/repo HEAD opts='--short'

# Get the develop branch's upstream tracking branch
salt myminion git.rev_parse /path/to/repo 'develop@{upstream}' opts='--abbrev-ref'

# Get the SHA1 for the commit corresponding to tag v1.2.3
salt myminion git.rev_parse /path/to/repo v1.2.3^{commit}

# Get the SHA1 for the commit corresponding to tag v1.2.3
salt myminion git.rev_parse /path/to/repo 'v1.2.3^{commit}'

# Find out whether or not the repo at /path/to/repo is a bare repository
salt myminion git.rev_parse /path/to/repo opts='--is-bare-repository'
```

```

salt.modules.git.revision(cwd, rev='HEAD', short=False, user=None, password=None, ignore_recode=False)

Returns the SHA1 hash of a given identifier (hash, branch, tag, HEAD, etc.)

cwd  The path to the git checkout
rev  [HEAD] The revision
short  [False] If True, return an abbreviated SHA1 git hash
user  User under which to run the git command. By default, the command is run by the user under which the minion is running.
password

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_recode  [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Example:

```
salt myminion git.revision /path/to/repo mybranch
```

salt.modules.git.rm_(cwd, filename, opts=' ', git_opts=' ', user=None, password=None, ignore_recode=False)

Interface to git-rm(1)

cwd  The path to the git checkout
filename  The location of the file/directory to remove, relative to cwd

**Note:** To remove a directory, `-r` must be part of the opts parameter.

**opts** Any additional options to add to the command line, in a single string

**Note:** On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with opts= (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

**git_opts** Any additional options to add to git command itself (not the rm subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.
New in version 2017.7.0.

**Note:** This is only supported in git 1.7.2 and newer.

**user**  User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**  Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore_retcode**  [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
salt myminion git.rm /path/to/repo foo/bar.py
salt myminion git.rm /path/to/repo foo/bar.py opts='--dry-run'
salt myminion git.rm /path/to/repo foo/baz opts='--
```

```
\r
```

salt.modules.git.stash(cwd, action='save', opts='', user=None, password=None, ignore_retcode=False)
Interface to `git-stash(1)`, returns the stdout from the git command

**cwd**  The path to the git checkout

**opts**  Any additional options to add to the command line, in a single string. Use this to complete the git stash command by adding the remaining arguments (i.e. 'save <stash comment>', 'apply stash@{2}', 'show', etc.). Omitting this argument will simply run `git stash`.

**git_opts**  Any additional options to add to git command itself (not the stash subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

**Note:** This is only supported in git 1.7.2 and newer.

**user**  User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**  Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore_retcode**  [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
salt myminion git.stash /path/to/repo save opts='work in progress'
salt myminion git.stash /path/to/repo apply opts='stash@{1}'
salt myminion git.stash /path/to/repo drop opts='stash@{1}'
salt myminion git.stash /path/to/repo list
```

salt.modules.git.status(cwd, user=None, password=None, ignore_retcode=False)
Changed in version 2015.8.0: Return data has changed from a list of lists to a dictionary
Returns the changes to the repository

**cwd**  The path to the git checkout

**user**  User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

- Windows only. Required when specifying **user**. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore_retcode**  [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Example:

```
salt myminion git.status /path/to/repo
```

salt.modules.git.submodule(cwd, command, opts='', git_opts='', user=None, password=None, identity=None, ignore_retcode=False, saltenv='base', **kwargs)

Changed in version 2015.8.0: Added the command argument to allow for operations other than update to be run on submodules, and deprecated the init argument. To do a submodule update with init=True moving forward, use command=update opts='--init'

Interface to `git-submodule(1)`

**cwd**  The path to the submodule

**command**  Submodule command to run, see `git-submodule(1)` <git submodule> for more information. Any additional arguments after the command (such as the URL when adding a submodule) must be passed in the opts parameter.

New in version 2015.8.0.

**opts**  Any additional options to add to the command line, in a single string

**Note:**  On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with opts=(as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

**git_opts**  Any additional options to add to git command itself (not the submodule subcommand), in a single string. This is useful for passing -c to run git with temporary changes to the git configuration.

New in version 2017.7.0.

**Note:**  This is only supported in git 1.7.2 and newer.

**init**  [False] If True, ensures that new submodules are initialized

Deprecation note: Since version 2015.8.0: Pass init as the command parameter, or include --init in the opts param with command set to update.

**user**  User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

- Windows only. Required when specifying **user**. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**identity**  Path to a private key to use for ssh URLs
Warning: Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`

Changed in version 2016.3.0.

`ignore_retcode` [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

`saltenv` The default salt environment to pull sls files from

New in version 2016.3.1.

CLI Example:

```bash
# Update submodule and ensure it is initialized (before 2015.8.0)
salt myminion git.submodule /path/to/repo/sub/repo init=True

# Update submodule and ensure it is initialized (2015.8.0 and later)
salt myminion git.submodule /path/to/repo/sub/repo update opts='--init'

# Rebase submodule (2015.8.0 and later)
salt myminion git.submodule /path/to/repo/sub/repo update opts='--rebase'

# Add submodule (2015.8.0 and later)
salt myminion git.submodule /path/to/repo/sub/repo add opts='https://mydomain.tld/\n--repo.git'

# Unregister submodule (2015.8.0 and later)
salt myminion git.submodule /path/to/repo/sub/repo deinit
```

`salt.modules.git.symbolic_ref`(cwd, ref, value=None, opts='`, git_opts='`, user=None, password=None, ignore_retcode=False)

New in version 2015.8.0.

Interface to `git-symbolic-ref(1)`

`cwd` The path to the git checkout

`ref` Symbolic ref to read/modify

`value` If passed, then the symbolic ref will be set to this value and an empty string will be returned.

If not passed, then the ref to which ref points will be returned, unless --delete is included in opts (in which case the symbolic ref will be deleted).

`opts` Any additional options to add to the command line, in a single string

`git_opts` Any additional options to add to git command itself (not the symbolic-refs subcommand), in a single string. This is useful for passing -c to run git with temporary changes to the git configuration.

New in version 2017.7.0.

**Note:** This is only supported in git 1.7.2 and newer.

`user` User under which to run the git command. By default, the command is run by the user under which the minion is running.

`password`
Windows only. Required when specifying *user*. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
# Get ref to which HEAD is pointing
salt myminion git.symbolic_ref /path/to/repo HEAD
# Set/overwrite symbolic ref 'FOO' to local branch 'foo'
salt myminion git.symbolic_ref /path/to/repo FOO refs/heads/foo
# Delete symbolic ref 'FOO'
salt myminion git.symbolic_ref /path/to/repo FOO
```

salt.modules.git.*version*(versioninfo=False)

New in version 2015.8.0.

Returns the version of Git installed on the minion

**versioninfo** [False] If True, return the version in a versioninfo list (e.g. [2,5,0])

CLI Example:

```
salt myminion git.version
```

salt.modules.git.*worktree_add*(cwd, worktree_path, ref=None, reset_branch=None, force=None, detach=False, opts='`', git_opts='`', user=None, password=None, ignore_retcode=False, **kwargs)

New in version 2015.8.0.

Interface to *git-worktree(1)*, adds a worktree

**cwd** The path to the git checkout

**worktree_path** Path to the new worktree. Can be either absolute, or relative to *cwd*.

**branch** Name of new branch to create. If omitted, will be set to the basename of the *worktree_path*. For example, if the *worktree_path* is /foo/bar/baz, then branch will be baz.

**ref** Name of the ref on which to base the new worktree. If omitted, then HEAD is used, and a new branch will be created, named for the basename of the *worktree_path*. For example, if the *worktree_path* is /foo/bar/baz then a new branch baz will be created, and pointed at HEAD.

**reset_branch** [False] If False, then *git-worktree(1)* will fail to create the worktree if the targeted branch already exists. Set this argument to True to reset the targeted branch to point at *ref*, and checkout the newly-reset branch into the new worktree.

**force** [False] By default, *git-worktree(1)* will not permit the same branch to be checked out in more than one worktree. Set this argument to True to override this.

**opts** Any additional options to add to the command line, in a single string

**Note:** On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with opts= to avoid causing errors with Salt’s own argument parsing.

All CLI options for adding worktrees as of Git 2.5.0 are already supported by this function as of Salt 2015.8.0, so using this argument is unnecessary unless new CLI arguments are added to *git-worktree(1)* and are not yet supported in Salt.

**git_opts** Any additional options to add to git command itself (not the *worktree* subcommand), in a single string. This is useful for passing -c to run git with temporary changes to the git configuration.

New in version 2017.7.0.
user  User under which to run the git command. By default, the command is run by the user under which the minion is running.
password  Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.
ignore_recode  [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.
New in version 2015.8.0.

CLI Examples:

```
salt myminion git.worktree_add /path/to/repo/main .. hotfix ref=origin/master
salt myminion git.worktree_add /path/to/repo/main .. hotfix branch=hotfix21
  \-ref=v2.1.9.3
```

salt.modules.git.worktree_prune(cwd, dry_run=False, verbose=True, expire=None, opts='',
  git_opts='', user=None, password=None, ignore_recode=False)

New in version 2015.8.0.

Interface to git-worktree(1), prunes stale worktree administrative data from the gitdir
cwd  The path to the main git checkout or a linked worktree
dry_run  [False] If True, then this function will report what would have been pruned, but no changes will be made.
verbose  [True] Report all changes made. Set to False to suppress this output.
expire  Only prune unused worktree data older than a specific period of time. The date format for this parameter is described in the documentation for the gc.pruneWorktreesExpire config param in the git-config(1) manpage.
opts  Any additional options to add to the command line, in a single string

Note:  On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with opts= to avoid causing errors with Salt’s own argument parsing.

All CLI options for pruning worktrees as of Git 2.5.0 are already supported by this function as of Salt 2015.8.0, so using this argument is unnecessary unless new CLI arguments are added to git-worktree(1) and are not yet supported in Salt.

git_opts  Any additional options to add to git command itself (not the worktree subcommand), in a single string. This is useful for passing -c to run git with temporary changes to the git configuration.
New in version 2017.7.0.

Note:  This is only supported in git 1.7.2 and newer.

text

user  User under which to run the git command. By default, the command is run by the user under which the minion is running.
password  Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.
New in version 2016.3.4.
**ignore_retcode** [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```shell
salt myminion git.worktree_prune /path/to/repo
salt myminion git.worktree_prune /path/to/repo dry_run=True
salt myminion git.worktree_prune /path/to/repo expire=1.day.ago
```

**salt.modules.git.worktree_prune**(cwd, user=None)

New in version 2015.8.0.

Recursively removes the worktree located at `cwd`, returning `True` if successful. This function will attempt to determine if `cwd` is actually a worktree by invoking `git.is_worktree`. If the path does not correspond to a worktree, then an error will be raised and no action will be taken.

**Warning:** There is no undoing this action. Be VERY careful before running this function.

**cwd** Path to the worktree to be removed

**user** Used for path expansion when `cwd` is not an absolute path. By default, when `cwd` is not absolute, the path will be assumed to be relative to the home directory of the user under which the minion is running. Setting this option will change the home directory from which path expansion is performed.

CLI Examples:

```shell
salt myminion git.worktree_rm /path/to/worktree
```

### 19.9.130 salt.modules.github module

Module for interacting with the GitHub v3 API.

New in version 2016.3.0.

**depends** PyGithub python module

**Configuration**

Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the `github` key by default, if defined.

For example:

```yaml
github:
  token: abc1234
  org_name: my_organization

# optional: some functions require a repo_name, which
# can be set in the config file, or passed in at the CLI.
repo_name: my_repo

# optional: it can be dangerous to change the privacy of a repository
# in an automated way. set this to True to allow privacy modifications
allow_repo_privacy_changes: False
```

---

19.9. execution modules 1539
salt.modules.github.add_repo(name, description=None, homepage=None, private=None, has_issues=None, has_wiki=None, has_downloads=None, auto_init=None, gitignore_template=None, license_template=None, profile='github')

Create a new github repository.

name The name of the team to be created.
description The description of the repository.
homepage The URL with more information about the repository.
private The visibility of the repository. Note that private repositories require a paid GitHub account.
has_issues Whether to enable issues for this repository.
has_wiki Whether to enable the wiki for this repository.
has_downloads Whether to enable downloads for this repository.
auto_init Whether to create an initial commit with an empty README.
gitignore_template The desired language or platform for a .gitignore, e.g. "Haskell".
license_template The desired LICENSE template to apply, e.g. "mit" or "mozilla".
profile The name of the profile configuration to use. Defaults to github.

CLI Example:

```
salt myminion github.add_repo 'repo_name'
```

New in version 2016.11.0.

salt.modules.github.add_team(name, description=None, repo_names=None, privacy=None, permission=None, profile='github')

Create a new Github team within an organization.

name The name of the team to be created.
description The description of the team.
repo_names The names of repositories to add the team to.
privacy The level of privacy for the team, can be `secret' or `closed'.
permission The default permission for new repositories added to the team, can be `pull', `push' or `admin'.
profile The name of the profile configuration to use. Defaults to github.

CLI Example:

```
salt myminion github.add_team 'team_name'
```

New in version 2016.11.0.

salt.modules.github.add_team_member(name, team_name, profile='github')

Adds a team member to a team with team_name.

name The name of the team member to add.
team_name The name of the team of which to add the user.
profile The name of the profile configuration to use. Defaults to github.

CLI Example:

```
salt myminion github.add_team_member 'user_name' 'team_name'
```

New in version 2016.11.0.

salt.modules.github.add_team_repo(repo_name, team_name, profile='github', permission=None)

Adds a repository to a team with team_name.

repo_name The name of the repository to add.
team_name The name of the team of which to add the repository.
profile The name of the profile configuration to use. Defaults to github.
permission The permission for team members within the repository, can be `pull', `push' or `admin'. If not specified, the default permission specified on the team will be used.

New in version 2017.7.0.
CLI Example:

```
salt myminion github.add_team_repo my_repo team_name
```

New in version 2016.11.0.

`salt.modules.github.add_user(name, profile='github')`

Add a GitHub user.

- **name**: The user for which to obtain information.
- **profile**: The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.add_user github-handle
```

`salt.modules.github.edit_repo(name, description=None, homepage=None, private=None, has_issues=None, has_wiki=None, has_downloads=None, profile='github')`

Updates an existing Github repository.

- **name**: The name of the team to be created.
- **description**: The description of the repository.
- **homepage**: The URL with more information about the repository.
- **private**: The visibility of the repository. Note that private repositories require a paid GitHub account.
- **has_issues**: Whether to enable issues for this repository.
- **has_wiki**: Whether to enable the wiki for this repository.
- **has_downloads**: Whether to enable downloads for this repository.
- **profile**: The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.add_repo repo_name
```

New in version 2016.11.0.

`salt.modules.github.edit_team(name, description=None, privacy=None, permission=None, profile='github')`

Updates an existing Github team.

- **name**: The name of the team to be edited.
- **description**: The description of the team.
- **privacy**: The level of privacy for the team, can be `secret` or `closed`.
- **permission**: The default permission for new repositories added to the team, can be `pull`, `push` or `admin`.
- **profile**: The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.edit_team team_name description=Team description
```

New in version 2016.11.0.

`salt.modules.github.get_issue(issue_number, repo_name=None, profile='github', output='min')`

Return information about a single issue in a named repository.

New in version 2016.11.0.

- **issue_number**: The number of the issue to retrieve.
- **repo_name**: The name of the repository from which to get the issue. This argument is required, either passed via the CLI, or defined in the configured profile. A `repo_name` passed as a CLI argument will override the `repo_name` defined in the configured profile, if provided.
- **profile**: The name of the profile configuration to use. Defaults to `github`.
- **output**: The amount of data returned by each issue. Defaults to `min`. Change to `full` to see all issue output.

CLI Example:
salt modules.github.get_issue_comments(issue_number, repo_name=None, profile='github', since=None, output='min')

Return information about the comments for a given issue in a named repository.

New in version 2016.11.0.

issue_number The number of the issue for which to retrieve comments.
repo_name The name of the repository to which the issue belongs. This argument is required, either passed via the CLI, or defined in the configured profile. A repo_name passed as a CLI argument will override the repo_name defined in the configured profile, if provided.
profile The name of the profile configuration to use. Defaults to github.
since Only comments updated at or after this time are returned. This is a timestamp in ISO 8601 format: YYYY-MM-DDTHH:MM:SSZ.
output The amount of data returned by each issue. Defaults to min. Change to full to see all issue output.

CLI Example:
salt myminion github.get_issue_comments 514
salt myminion github.get_issue 514 repo_name=salt

salt modules.github.get_issues(repo_name=None, profile='github', milestone=None, state='open', assignee=None, creator=None, mentioned=None, labels=None, sort='created', direction='desc', since=None, output='min', per_page=None)

Returns information for all issues in a given repository, based on the search options.

New in version 2016.11.0.

repo_name The name of the repository for which to list issues. This argument is required, either passed via the CLI, or defined in the configured profile. A repo_name passed as a CLI argument will override the repo_name defined in the configured profile, if provided.
profile The name of the profile configuration to use. Defaults to github.
milestone The number of a GitHub milestone, or a string of either * or none.

If a number is passed, it should refer to a milestone by its number field. Use the github.get_milestone function to obtain a milestone’s number.

If the string * is passed, issues with any milestone are accepted. If the string none is passed, issues without milestones are returned.
state Indicates the state of the issues to return. Can be either open, closed, or all. Default is open.
assignee Can be the name of a user. Pass in none (as a string) for issues with no assigned user or * for issues assigned to any user.
creator The user that created the issue.
mentioned A user that’s mentioned in the issue.
labels A string of comma separated label names. For example, bug,ui,@high.
sort What to sort results by. Can be either created, updated, or comments. Default is created.
direction The direction of the sort. Can be either asc or desc. Default is desc.
since Only issues updated at or after this time are returned. This is a timestamp in ISO 8601 format: YYYY-MM-DDTHH:MM:SSZ.
output The amount of data returned by each issue. Defaults to min. Change to full to see all issue output.
per_page GitHub paginates data in their API calls. Use this value to increase or decrease the number of issues gathered from GitHub, per page. If not set, GitHub defaults are used. Maximum is 100.

CLI Example:
salt myminion github.get_issues my-github-repo
salt.modules.github.get_milestone(number=None, name=None, repo_name=None, profile='github', output='min')

Return information about a single milestone in a named repository.

New in version 2016.11.0.

- `number` The number of the milestone to retrieve. If provided, this option will be favored over `name`.
- `name` The name of the milestone to retrieve.
- `repo_name` The name of the repository for which to list issues. This argument is required, either passed via the CLI, or defined in the configured profile. A `repo_name` passed as a CLI argument will override the `repo_name` defined in the configured profile, if provided.
- `profile` The name of the profile configuration to use. Defaults to `github`.
- `output` The amount of data returned by each issue. Defaults to `min`. Change to `full` to see all issue output.

CLI Example:

```
salt myminion github.get_milestone 72
salt myminion github.get_milestone name=my_milestone
```

salt.modules.github.get_milestones(repo_name=None, profile='github', state='open', sort='due_on', direction='asc', output='min', per_page=None)

Return information about milestones for a given repository.

New in version 2016.11.0.

- `repo_name` The name of the repository for which to list issues. This argument is required, either passed via the CLI, or defined in the configured profile. A `repo_name` passed as a CLI argument will override the `repo_name` defined in the configured profile, if provided.
- `profile` The name of the profile configuration to use. Defaults to `github`.
- `state` The state of the milestone. Either `open`, `closed`, or `all`. Default is `open`.
- `sort` What to sort results by. Either `due_on` or `completeness`. Default is `due_on`.
- `direction` The direction of the sort. Either `asc` or `desc`. Default is `asc`.
- `output` The amount of data returned by each issue. Defaults to `min`. Change to `full` to see all issue output.
- `per_page` GitHub paginates data in their API calls. Use this value to increase or decrease the number of issues gathered from GitHub, per page. If not set, GitHub defaults are used.

CLI Example:

```
salt myminion github.get_milestones
```

salt.modules.github.get_prs(repo_name=None, profile='github', state='open', head=None, base=None, sort='created', direction='desc', output='min', per_page=None)

Returns information for all pull requests in a given repository, based on the search options provided.

New in version 2017.7.0.

- `repo_name` The name of the repository for which to list pull requests. This argument is required, either passed via the CLI, or defined in the configured profile. A `repo_name` passed as a CLI argument will override the `repo_name` defined in the configured profile, if provided.
- `profile` The name of the profile configuration to use. Defaults to `github`.
- `state` Indicates the state of the pull requests to return. Can be either `open`, `closed`, or `all`. Default is `open`.
- `head` Filter pull requests by head user and branch name in the format of `user:ref-name`. Example: `github:new-script-format`. Default is `None`.
- `base` Filter pulls by base branch name. Example: `gh-pages`. Default is `None`.
- `sort` What to sort results by. Can be either `created`, `updated`, `popularity` (comment count), or `long-running` (age, filtering by pull requests updated within the last month). Default is `created`.
- `direction` The direction of the sort. Can be either `asc` or `desc`. Default is `desc`.
- `output` The amount of data returned by each pull request. Defaults to `min`. Change to `full` to see all pull request output.
per_page  GitHub paginates data in their API calls. Use this value to increase or decrease the number of pull requests gathered from GitHub, per page. If not set, GitHub defaults are used. Maximum is 100.

CLI Example:

```
salt myminion github.get_prs
salt myminion github.get_prs base=2016.11
```

salt.modules.github.get_repo_info(repo_name, profile='github', ignore_cache=False)

Return information for a given repo.

New in version 2016.11.0.

repo_name  The name of the repository.
profile  The name of the profile configuration to use. Defaults to github.

CLI Example:

```
salt myminion github.get_repo_info salt
salt myminion github.get_repo_info salt profile='my-github-profile'
```

salt.modules.github.get_repo_teams(repo_name, profile='github')

Return teams belonging to a repository.

New in version 2017.7.0.

repo_name  The name of the repository from which to retrieve teams.
profile  The name of the profile configuration to use. Defaults to github.

CLI Example:

```
salt myminion github.get_repo_teams salt
salt myminion github.get_repo_teams salt profile='my-github-profile'
```

salt.modules.github.get_team(name, profile='github')

Returns the team details if a team with the given name exists, or None otherwise.

name  The team name for which to obtain information.
profile  The name of the profile configuration to use. Defaults to github.

CLI Example:

```
salt myminion github.get_team 'team_name'
```

salt.modules.github.get_user(name, profile='github', user_details=False)

Get a GitHub user by name.

name  The user for which to obtain information.
profile  The name of the profile configuration to use. Defaults to github.
user_details  Prints user information details. Defaults to False. If the user is already in the organization and user_details is set to False, the get_user function returns True. If the user is not already present in the organization, user details will be printed by default.

CLI Example:

```
salt myminion github.get_user github-handle
salt myminion github.get_user github-handle user_details=true
```

salt.modules.github.is_team_member(name, team_name, profile='github')

Returns True if the github user is in the team with team_name, or False otherwise.

name  The name of the user whose membership to check.
team_name  The name of the team to check membership in.
profile  The name of the profile configuration to use. Defaults to github.

CLI Example:
**salt.myminion**

```python
salt.myminion github.is_team_member 'user_name' 'team_name'
```

New in version 2016.11.0.

**salt.modules.github.list_members_without_mfa**

```python
salt.modules.github.list_members_without_mfa(profile='github', ignore_cache=False)
```

List all members (in lower case) without MFA turned on.

- **profile** The name of the profile configuration to use. Defaults to `github`.
- **ignore_cache** Bypasses the use of cached team repos.

CLI Example:

```bash
salt myminion github.list_members_without_mfa
```

New in version 2016.11.0.

**salt.modules.github.list_private_repos**

```python
salt.modules.github.list_private_repos(profile='github')
```

List private repositories within the organization. Dependent upon the access rights of the profile token.

New in version 2016.11.0.

- **profile** The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```bash
salt myminion github.list_private_repos
salt myminion github.list_private_repos profile='my-github-profile'
```

**salt.modules.github.list_public_repos**

```python
salt.modules.github.list_public_repos(profile='github')
```

List public repositories within the organization.

New in version 2016.11.0.

- **profile** The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```bash
salt myminion github.list_public_repos
salt myminion github.list_public_repos profile='my-github-profile'
```

**salt.modules.github.list_repos**

```python
salt.modules.github.list_repos(profile='github')
```

List all repositories within the organization. Includes public and private repositories within the organization. Dependent upon the access rights of the profile token.

New in version 2016.11.0.

- **profile** The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```bash
salt myminion github.list_repos
salt myminion github.list_repos profile='my-github-profile'
```

**salt.modules.github.list_team_members**

```python
salt.modules.github.list_team_members(team_name, profile='github', ignore_cache=False)
```

Gets the names of team members in lower case.

- **team_name** The name of the team from which to list members.
- **profile** The name of the profile configuration to use. Defaults to `github`.
- **ignore_cache** Bypasses the use of cached team members.

CLI Example:

```bash
salt myminion github.list_team_members 'team_name'
```

New in version 2016.11.0.

**salt.modules.github.list_teamrepos**

```python
salt.modules.github.list_teamrepos(team_name, profile='github', ignore_cache=False)
```

Gets the repo details for a given team as a dict from repo_name to repo details. Note that repo names are...
always in lower case.

```python
team_name The name of the team from which to list repos.
profile The name of the profile configuration to use. Defaults to github.
ignore_cache Bypasses the use of cached team repos.
```

CLI Example:

```bash
salt myminion github.list_team_repos 'team_name'
```

New in version 2016.11.0.

```python
salt.modules.github.list_teams(profile='github', ignore_cache=False)
```

Lists all teams within the organization.

```bash
profile The name of the profile configuration to use. Defaults to github.
ignore_cache Bypasses the use of cached teams.
```

CLI Example:

```bash
salt myminion github.list_teams
```

New in version 2016.11.0.

```python
salt.modules.github.list_users(profile='github', ignore_cache=False)
```

List all users within the organization.

```bash
profile The name of the profile configuration to use. Defaults to github.
ignore_cache Bypasses the use of cached users.
```

CLI Example:

```bash
salt myminion github.list_users
salt myminion github.list_users profile='my-github-profile'
```

New in version 2016.11.0.

```python
salt.modules.github.remove_repo(name, profile='github')
```

Remove a Github repository.

```bash
name The name of the repository to be removed.
profile The name of the profile configuration to use. Defaults to github.
```

CLI Example:

```bash
salt myminion github.remove_repo 'my-repo'
```

New in version 2016.11.0.

```python
salt.modules.github.remove_team(name, profile='github')
```

Remove a github team.

```bash
name The name of the team to be removed.
profile The name of the profile configuration to use. Defaults to github.
```

CLI Example:

```bash
salt myminion github.remove_team 'team_name'
```

New in version 2016.11.0.

```python
salt.modules.github.remove_team_member(name, team_name, profile='github')
```

Removes a team member from a team with team_name.

```bash
name The name of the team member to remove.
team_name The name of the team from which to remove the user.
profile The name of the profile configuration to use. Defaults to github.
```

CLI Example:
```
salt myminion github.remove_team_member 'user_name' 'team_name'
```

New in version 2016.11.0.

salt.modules.github.remove_team_repo(repo_name, team_name, profile='github')

Removes a repository from a team with team_name.

repo_name The name of the repository to remove.
team_name The name of the team of which to remove the repository.
profile The name of the profile configuration to use. Defaults to github.

CLI Example:
```
salt myminion github.remove_team_repo 'my_repo' 'team_name'
```

New in version 2016.11.0.

salt.modules.github.remove_user(name, profile='github')

Remove a Github user by name.

name The user for which to obtain information.
profile The name of the profile configuration to use. Defaults to github.

CLI Example:
```
salt myminion github.remove_user github-handle
```

### 19.9.131 salt.modules.glance

Module for handling openstack glance calls.

- optdepends
  - glanceclient Python adapter

- configuration This module is not usable until the following are specified either in a pillar or in the minion's config file:

```
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.insecure: False  #(optional)
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/
```

If configuration for multiple openstack accounts is required, they can be set up as different configuration profiles: For example:

```
openstack1:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/

openstack2:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.2:5000/v2.0/
```

With this configuration in place, any of the glance functions can make use of a configuration profile by declaring it explicitly. For example:
salt '...' glance.image_list profile=openstack1

```
salt.modules.glance.image_create(name, location=None, profile=None, visibility=None, container_format='bare', disk_format='raw', protected=None)
```

Create an image (glance image-create)

CLI Example, old format:

```
salt '...' glance.image_create name=f16-jeos \\
    disk_format=qcow2 container_format=ovf
```

CLI Example, new format resembling Glance API v2:

```
salt '...' glance.image_create name=f16-jeos visibility=public \\
    disk_format=qcow2 container_format=ovf
```

The parameter 'visibility' defaults to 'public' if not specified.

```
salt.modules.glance.image_delete(id=None, name=None, profile=None)
```

Delete an image (glance image-delete)

CLI Examples:

```
salt '...' glance.image_delete c2eb2eb0-53e1-4a80-b990-8ec887eae7df
salt '...' glance.image_delete id=c2eb2eb0-53e1-4a80-b990-8ec887eae7df
salt '...' glance.image_delete name=f16-jeos
```

```
salt.modules.glance.image_list(id=None, profile=None, name=None)
```

Return a list of available images (glance image-list)

CLI Example:

```
salt '...' glance.image_list
```

```
salt.modules.glance.image_schema(profile=None)
```

Returns names and descriptions of the schema `image`'s properties for this profile's instance of glance

CLI Example:

```
salt '...' glance.image_schema
```

```
salt.modules.glance.image_show(id=None, name=None, profile=None)
```

Return details about a specific image (glance image-show)

CLI Example:

```
salt '...' glance.image_show
```

```
salt.modules.glance.image_update(id=None, name=None, profile=None, **kwargs)
```

Update properties of given image. Known to work for: - min_ram (in MB) - protected (bool) - visibility ('public' or 'private')

CLI Example:

```
salt '...' glance.image_update id=c2eb2eb0-53e1-4a80-b990-8ec887eae7df
salt '...' glance.image_update name=f16-jeos
```

```
salt.modules.glance.schema_get(name, profile=None)
```

Known valid names of schemas are:
• image
• images
• member
• members

**CLI Example:**

```
salt '*' glance.schema_get name=f16-jeos
```

### 19.9.132 `salt.modules.glusterfs`

Manage a glusterfs pool

**salt.modules.glusterfs.add_volume_bricks** *(name, bricks)*

Add brick(s) to an existing volume

- **name**: Volume name
- **bricks**: List of bricks to add to the volume

**CLI Example:**

```
salt '*' glusterfs.add_volume_bricks <volume> <bricks>
```

**salt.modules.glusterfs.create_volume** *(name, bricks, stripe=False, replica=False, device_vg=False, transport='tcp', start=False, force=False)*

Create a glusterfs volume

- **name**: Name of the gluster volume
- **bricks**: Bricks to create volume from, in `<peer>:<brick path>` format. For multiple bricks use list format: `['<peer1>:<brick1>', '<peer2>:<brick2>']`
- **stripe**: Stripe count, the number of bricks should be a multiple of the stripe count for a distributed striped volume
- **replica**: Replica count, the number of bricks should be a multiple of the replica count for a distributed replicated volume
- **device_vg**: If true, specifies volume should use block backend instead of regular posix backend. Block device backend volume does not support multiple bricks
- **transport**: Transport protocol to use, can be `tcp`, `rdma` or `tcp,rdma`
- **start**: Start the volume after creation
- **force**: Force volume creation, this works even if creating in root FS

**CLI Examples:**

```
salt host1 glusterfs.create newvolume host1:/brick
salt gluster1 glusterfs.create vol2 ['gluster1:/export/vol2/brick', 'gluster2:/export/vol2/brick'] replica=2 start=True
```

**salt.modules.glusterfs.delete_volume** *(target, stop=True)*

Deletes a gluster volume

- **target**: Volume to delete
- **stop**: [True] If True, stop volume before delete

**CLI Example:**

```
salt '*' glusterfs.delete_volume <volume>
```

**salt.modules.glusterfs.disable_quota_volume** *(name)*

Disable quota on a glusterfs volume.

- **name**: Name of the gluster volume
CLI Example:

```bash
salt '*' glusterfs.disable_quota_volume <volume>
```

`salt.modules.glusterfs.enable_quota_volume(name)`

Enable quota on a glusterfs volume.

- **name** Name of the gluster volume

CLI Example:

```bash
salt '*' glusterfs.enable_quota_volume <volume>
```

`salt.modules.glusterfs.info(name=None)`

New in version 2015.8.4.

Return gluster volume info.

- **name** Optional name to retrieve only information of one volume

CLI Example:

```bash
salt '*' glusterfs.info
```

`salt.modules.glusterfs.list_quota_volume(name)`

List quotas of glusterfs volume

- **name** Name of the gluster volume

CLI Example:

```bash
salt '*' glusterfs.list_quota_volume <volume>
```

`salt.modules.glusterfs.list_volumes()`

List configured volumes

CLI Example:

```bash
salt '*' glusterfs.list_volumes
```

`salt.modules.glusterfs.peer(name)`

Add another node into the peer list.

- **name** The remote host to probe.

CLI Example:

```bash
salt 'one.gluster.*' glusterfs.peer two
```

GLUSTER direct CLI example (to show what salt is sending to gluster):

```bash
$ gluster peer probe ftp2
```

GLUSTER CLI 3.4.4 return example (so we know what we are parsing):

```bash
# if the `peer` is the local host:
peer probe: success: on localhost not needed

# if the peer was just added: peer probe: success
# if the peer was already part of the cluster: peer probe: success: host ftp2 port 24007 already in peer list
```

`salt.modules.glusterfs.peer_status()`

Return peer status information

The return value is a dictionary with peer UUIDs as keys and dicts of peer information as values. Hostnames are listed in one list. GlusterFS separates one of the hostnames but the only reason for this seems to be which hostname happens to be used first in peering.

CLI Example:
GLUSTER direct CLI example (to show what salt is sending to gluster):

```
gluster peer status
```

GLUSTER CLI 3.4.4 return example (so we know what we are parsing):

```
Number of Peers: 2

Hostname: ftp2 Port: 24007 Uuid: cbcb256b-e66e-4ec7-a718-21082d396c24 State: Peer in Cluster (Connected)

Hostname: ftp3 Uuid: 5ea10457-6cb2-427b-a770-7897509625e9 State: Peer in Cluster (Connected)
```

```
salt.modules.glusterfs.set_quota_volume(name, path, size, enable_quota=False)
```

Set quota to glusterfs volume.

- **name**: Name of the gluster volume
- **path**: Folder path for restriction in volume (`/`)
- **size**: Hard-limit size of the volume (MB/GB)
- **enable_quota**: Enable quota before set up restriction

CLI Example:

```
salt '*' glusterfs.set_quota_volume <volume> <path> <size> enable_quota=True
```

```
salt.modules.glusterfs.start_volume(name, force=False)
```

Start a gluster volume.

- **name**: Volume name
- **force**: Force the volume start even if the volume is started .. versionadded:: 2015.8.4

CLI Example:

```
salt '*' glusterfs.start mycluster
```

```
salt.modules.glusterfs.status(name)
```

Check the status of a gluster volume.

- **name**: Volume name

CLI Example:

```
salt '*' glusterfs.status myvolume
```

```
salt.modules.glusterfs.stop_volume(name, force=False)
```

Stop a gluster volume.

- **name**: Volume name
- **force**: Force stop the volume

New in version 2015.8.4.

CLI Example:

```
salt '*' glusterfs.stop_volume mycluster
```

```
salt.modules.glusterfs.unset_quota_volume(name, path)
```

Unset quota on glusterfs volume.

- **name**: Name of the gluster volume
- **path**: Folder path for restriction in volume

CLI Example:

```
salt '*' glusterfs.unset_quota_volume <volume> <path>
```
19.9.133 salt.modules.gnomedesktop

GNOME implementations

salt.modules.gnomedesktop.get(schema=None, key=None, user=None, **kwargs)
Get key in a particular GNOME schema

CLI Example:
```
salt '*' gnome.get user=<username> schema=org.gnome.desktop.screensaver key=idle-...activation-enabled
```

salt.modules.gnomedesktop.getClockFormat(**kwargs)
Return the current clock format, either 12h or 24h format.

CLI Example:
```
salt '*' gnome.getClockFormat user=<username>
```

salt.modules.gnomedesktop.getClockShowDate(**kwargs)
Return the current setting, if the date is shown in the clock

CLI Example:
```
salt '*' gnome.getClockShowDate user=<username>
```

salt.modules.gnomedesktop.getIdleActivation(**kwargs)
Get whether the idle activation is enabled

CLI Example:
```
salt '*' gnome.getIdleActivation user=<username>
```

salt.modules.gnomedesktop.getIdleDelay(**kwargs)
Return the current idle delay setting in seconds

CLI Example:
```
salt '*' gnome.getIdleDelay user=<username>
```

salt.modules.gnomedesktop.ping(**kwargs)
A test to ensure the GNOME module is loaded

CLI Example:
```
salt '*' gnome.ping user=<username>
```

salt.modules.gnomedesktop.setClockFormat(clockFormat, **kwargs)
Set the clock format, either 12h or 24h format.

CLI Example:
```
salt '*' gnome.setClockFormat <12h|24h> user=<username>
```

salt.modules.gnomedesktop.setClockShowDate(kvalue, **kwargs)
Set whether the date is visible in the clock

CLI Example:
```
salt '*' gnome.setClockShowDate <True|False> user=<username>
```
salt.modules.gnomedesktop.setIdleActivation(*kvalue, **kwargs)
Set whether the idle activation is enabled

CLI Example:

```
salt '*' gnome.setIdleActivation <True|False> user=<username>
```

salt.modules.gnomedesktop.setIdleDelay(*delaySeconds, **kwargs)
Set the current idle delay setting in seconds

CLI Example:

```
salt '*' gnome.setIdleDelay <seconds> user=<username>
```

salt.modules.gnomedesktop.set_(*schema=None, key=None, user=None, value=None, **kwargs)
Set key in a particular GNOME schema

CLI Example:

```
salt '*' gnome.set user=<username> schema=org.gnome.desktop.screensaver key=idle-→activation-enabled value=False
```

### 19.9.134 salt.modules.gpg

Manage a GPG keychains, add keys, create keys, retrieve keys from keyservers. Sign, encrypt and sign plus encrypt text and files.

New in version 2015.5.0.

**Note:** The python-gnupg library and gpg binary are required to be installed.

salt.modules.gpg.create_key(*args, **kwargs)
Create a key in the GPG keychain

**Note:** GPG key generation requires a lot of entropy and randomness. Difficult to do over a remote connection, consider having another process available which is generating randomness for the machine. Also especially difficult on virtual machines, consider the rng-tools package.

The create_key process takes awhile so increasing the timeout may be necessary, e.g. -t 15.

- **key_type** The type of the primary key to generate. It must be capable of signing. `RSA` or `DSA`.
- **key_length** The length of the primary key in bits.
- **name_real** The real name of the user identity which is represented by the key.
- **name_comment** A comment to attach to the user id.
- **name_email** An email address for the user.
- **subkey_type** The type of the secondary key to generate.
- **subkey_length** The length of the secondary key in bits.
- **expire_date** The expiration date for the primary and any secondary key. You can specify an ISO date, A number of days/weeks/months/years, an epoch value, or 0 for a non-expiring key.
- **use_passphrase** Whether to use a passphrase with the signing key. Passphrase is received from Pillar.
- **user** Which user's keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to the /etc/salt/gpgkeys.
- **gnupghome** Specify the location where GPG keyring and related files are stored.
CLI Example:
```
salt -t 15 '*' gpg.create_key
```

salt.modules.gpg.decrypt(
    user=None,  
    text=None,  
    filename=None,  
    output=None,  
    use_passphrase=False,  
    gnupghome=None,  
    bare=False)

Decrypt a message or file

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to the /etc/salt/gpgkeys.

text The encrypted text to decrypt.

filename The encrypted filename to decrypt.

output The filename where the decrypted data will be written, default is standard out.

use_passphrase Whether to use a passphrase with the signing key. Passphrase is received from Pillar.

 gnupghome Specify the location where GPG keyring and related files are stored.

bare If True, return the (armored) decrypted block as a string without the standard comment/res dict.

CLI Example:
```
salt '*' gpg.decrypt filename='/path/to/important.file.gpg'
salt '*' gpg.decrypt filename='/path/to/important.file.gpg' use_passphrase=True
```

salt.modules.gpg.delete_key(
    keyid=None,  
    fingerprint=None,  
    delete_secret=False,  
    user=None,  
    gnupghome=None)

Get a key from the GPG keychain

keyid The keyid of the key to be deleted.

fingerprint The fingerprint of the key to be deleted.

delete_secret Whether to delete a corresponding secret key prior to deleting the public key. Secret keys must be deleted before deleting any corresponding public keys.

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to the /etc/salt/gpgkeys.

 gnupghome Specify the location where GPG keyring and related files are stored.

CLI Example:
```
salt '*' gpg.delete_key keyid=3FAD9F1E
salt '*' gpg.delete_key fingerprint=53C96788253E58416D20B8BD352952C84C3252192
salt '*' gpg.delete_key keyid=3FAD9F1E user=username
salt '*' gpg.delete_key keyid=3FAD9F1E user=username delete_secret=True
```

salt.modules.gpg.encrypt(
    user=None,  
    recipients=None,  
    text=None,  
    filename=None,  
    output=None,  
    sign=None,  
    use_passphrase=False,  
    gnupghome=None,  
    bare=False)

Encrypt a message or file

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to the /etc/salt/gpgkeys.

recipients The fingerprints for those recipient whom the data is being encrypted for.

text The text to encrypt.

filename The filename to encrypt.

output The filename where the signed file will be written, default is standard out.

sign Whether to sign, in addition to encrypt, the data. True to use default key or fingerprint to specify a different key to sign with.

use_passphrase Whether to use a passphrase with the signing key. Passphrase is received from Pillar.

 gnupghome Specify the location where GPG keyring and related files are stored.

bare If True, return the (armored) encrypted block as a string without the standard comment/res dict.

CLI Example:
```python
salt '*' gpg.encrypt text='Hello there. How are you?'
salt '*' gpg.encrypt filename='/path/to/important.file'
salt '*' gpg.encrypt filename='/path/to/important.file' use_passphrase=True
```

### salt.modules.gpg.export_key

**Function:**
Export a key from the GPG keychain

**Signature:**
```
salt.modules.gpg.export_key(keyids=None, secret=False, user=None, gnupghome=None)
```

**Key Arguments:**
- `keyids`: The key ID(s) of the key(s) to be exported. Can be specified as a comma separated string or a list. Anything which GnuPG itself accepts to identify a key - for example, the key ID or the fingerprint could be used.
- `secret`: Export the secret key identified by the `keyids` information passed.
- `user`: Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.
- `gnupghome`: Specify the location where GPG keyring and related files are stored.

**CLI Example:**
```
salt '*' gpg.export_key keyids=3FAD9F1E
salt '*' gpg.export_key keyids=3FAD9F1E secret=True
salt '*' gpg.export_key keyids="[3FAD9F1E,3FBD8F1E]", user=username
```

### salt.modules.gpg.get_key

**Function:**
Get a key from the GPG keychain

**Signature:**
```
salt.modules.gpg.get_key(keyid=None, fingerprint=None, user=None, gnupghome=None)
```

**Key Arguments:**
- `keyid`: The key ID (short or long) of the key to be retrieved.
- `fingerprint`: The fingerprint of the key to be retrieved.
- `user`: Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.
- `gnupghome`: Specify the location where GPG keyring and related files are stored.

**CLI Example:**
```
salt '*' gpg.get_key keyid=3FAD9F1E
salt '*' gpg.get_key fingerprint=53C96788253E58416D20BCD352952C84C3252192
salt '*' gpg.get_key keyid=3FAD9F1E user=username
```

### salt.modules.gpg.get_secret_key

**Function:**
Get a key from the GPG keychain

**Signature:**
```
salt.modules.gpg.get_secret_key(keyid=None, fingerprint=None, user=None, gnupghome=None)
```

**Key Arguments:**
- `keyid`: The key ID (short or long) of the key to be retrieved.
- `fingerprint`: The fingerprint of the key to be retrieved.
- `user`: Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.
- `gnupghome`: Specify the location where GPG keyring and related files are stored.

**CLI Example:**
```
salt '*' gpg.get_secret_key keyid=3FAD9F1E
salt '*' gpg.get_secret_key fingerprint=53C96788253E58416D20BCD352952C84C3252192
salt '*' gpg.get_secret_key keyid=3FAD9F1E user=username
```

### salt.modules.gpg.import_key

**Function:**
Import a key from text or file

**Signature:**
```
salt.modules.gpg.import_key(*args, **kwargs)
```

**Key Arguments:**
- `text`: The text containing to import.
filename  The filename containing the key to import.
user Which user's keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to the /etc/salt/gpgkeys.
gnupghome Specify the location where GPG keyring and related files are stored.

**CLI Example:**

```
salt '*' gpg.import_key text='-----BEGIN PGP PUBLIC KEY BLOCK-----
 ... -----END GPG PUBLIC KEY BLOCK-----'
salt '*' gpg.import_key filename='/path/to/public-key-file'
```

salt.modules.gpg.list_keys(user=None, gnupghome=None)
List keys in GPG keychain
user Which user's keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to the /etc/salt/gpgkeys.
gnupghome Specify the location where GPG keyring and related files are stored.

**CLI Example:**

```
salt '*' gpg.list_keys
```

salt.modules.gpg.list_secret_keys(user=None, gnupghome=None)
List secret keys in GPG keychain
user Which user's keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to the /etc/salt/gpgkeys.
gnupghome Specify the location where GPG keyring and related files are stored.

**CLI Example:**

```
salt '*' gpg.list_secret_keys
```

salt.modules.gpg.receive_keys(*args, **kwargs)
Receive key(s) from keyserver and add them to keychain
keyserver Keyserver to use for searching for GPG keys, defaults to pgp.mit.edu
keys The keyID(s) to retrieve from the keyserver. Can be specified as a comma separated string or a list.
user Which user's keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to the /etc/salt/gpgkeys.
gnupghome Specify the location where GPG keyring and related files are stored.

**CLI Example:**

```
salt '*' gpg.receive_keys keys='3FAD9F1E'
salt '*' gpg.receive_keys keys='[3FAD9F1E, 3FBD9F2E]'
salt '*' gpg.receive_keys keys=3FAD9F1E user=username
```

salt.modules.gpg.search_keys(text, keyserver=None, user=None)
Search keys from keyserver
text Text to search the keyserver for, e.g. email address, keyID or fingerprint.
keyserver Keyserver to use for searching for GPG keys, defaults to pgp.mit.edu.
user Which user's keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to the /etc/salt/gpgkeys.

**CLI Example:**

```
salt '*' gpg.search_keys text=user@example.com
salt '*' gpg.search_keys text=user@example.com keyserver=keyserver.ubuntu.com
salt '*' gpg.search_keys text=user@example.com keyserver=keyserver.ubuntu.com user=username
```
salt.modules.gpg.sign function

Sign message or file

- **user** - Which user's keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to the /etc/salt/gpgkeys.
- **keyid** - The keyid of the key to set the trust level for, defaults to first key in the secret keyring.
- **text** - The text to sign.
- **filename** - The filename to sign.
- **output** - The filename where the signed file will be written, default is standard out.
- **use_passphrase** - Whether to use a passphrase with the signing key. Passphrase is received from Pillar.
- **gnupghome** - Specify the location where GPG keyring and related files are stored.

CLI Example:

```python
salt '*' gpg.sign text='Hello there. How are you?'
salt '*' gpg.sign filename='/path/to/important.file'
salt '*' gpg.sign filename='/path/to/important.file' use_passphrase=True
```

salt.modules.gpg.trust_key function

Set the trust level for a key in GPG keychain

- **keyid** - The keyid of the key to set the trust level for.
- **fingerprint** - The fingerprint of the key to set the trust level for.
- **trust_level** - The trust level to set for the specified key, must be one of the following: expired, unknown, not_trusted, marginally, fully, ultimately
- **user** - Which user's keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to the /etc/salt/gpgkeys.

CLI Example:

```python
salt '*' gpg.trust_key keyid='3FAD9F1E' trust_level='marginally'
salt '*' gpg.trust_key fingerprint='53C96788253E58416D20B0C352952C84C3252192' trust_level='not_trusted'
salt '*' gpg.trust_key keys=['3FAD9F1E'] trust_level='ultimately' user='username'
```

salt.modules.gpg.verify function

Verify a message or file

- **text** - The text to verify.
- **filename** - The filename to verify.
- **user** - Which user's keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to the /etc/salt/gpgkeys.
- **gnupghome** - Specify the location where GPG keyring and related files are stored.

CLI Example:

```python
salt '*' gpg.verify text='Hello there. How are you?'
salt '*' gpg.verify filename='/path/to/important.file'
salt '*' gpg.verify filename='/path/to/important.file' use_passphrase=True
```

19.9.135 salt.modules.grafana4 module

Module for working with the Grafana v4 API

New in version 2017.7.0.
depends  requests

configuration  This module requires a configuration profile to be configured in the minion config, minion pillar, or master config. The module will use the `grafana' key by default, if defined.

For example:

```
grafana:
    grafana_url: http://grafana.localhost
    grafana_user: admin
    grafana_password: admin
    grafana_timeout: 3
```

call

```
salt.modules.grafana4.create_datasource(orgname=None, profile='grafana', **kwargs)
```
Create a new datasource in an organisation.

name  Name of the data source.
type  Type of the datasource (‘graphite’, ‘influxdb’ etc.).
access  Use proxy or direct.
url  The URL to the data source API.
user  Optional - user to authenticate with the data source.
password  Optional - password to authenticate with the data source.
database  Optional - database to use with the data source.
basicAuth  Optional - set to True to use HTTP basic auth to authenticate with the data source.
basicAuthUser  Optional - HTTP basic auth username.
basicAuthPassword  Optional - HTTP basic auth password.
jsonData  Optional - additional json data to post (eg. `timeInterval`).
isDefault  Optional - set data source as default.
withCredentials  Optional - Whether credentials such as cookies or auth headers should be sent with cross-site requests.
typeLogoUrl  Optional - Logo to use for this datasource.
orgname  Name of the organization in which the data source should be created.
profile  Configuration profile used to connect to the Grafana instance. Default is `grafana'.

CLI Example:

```
salt '*' grafana4.create_datasource
```

call

```
salt.modules.grafana4.create_org(profile='grafana', **kwargs)
```
Create a new organization.

name  Name of the organization.
profile  Configuration profile used to connect to the Grafana instance. Default is `grafana'.

CLI Example:

```
salt '*' grafana4.create_org <name>
```

call

```
salt.modules.grafana4.create_org_user(orgname=None, profile='grafana', **kwargs)
```
Add user to the organization.

loginOrEmail  Login or email of the user.
role  Role of the user for this organization. Should be one of:

- Admin
- Editor
- Read Only Editor
- Viewer

orgname  Name of the organization in which users are added.
profile  Configuration profile used to connect to the Grafana instance. Default is `grafana'.

CLI Example:

```
salt '*' grafana4.create_org_user <orgname> loginOrEmail=<loginOrEmail> role=←<role>
```

salt.modules.grafana4.create_update_dashboard

Create or update a dashboard.

dashboard  A dict that defines the dashboard to create/update.

overwrite  Whether the dashboard should be overwritten if already existing.

orgname  Name of the organization.

profile  Configuration profile used to connect to the Grafana instance. Default is `grafana'.

CLI Example:

```
salt '*' grafana4.create_update_dashboard dashboard=<dashboard> overwrite=True
←orgname=<orgname>
```

salt.modules.grafana4.create_user

Create a new user.

login  Login of the new user.

password  Password of the new user.

e-mail  Email of the new user.

name  Optional - Full name of the new user.

profile  Configuration profile used to connect to the Grafana instance. Default is `grafana'.

CLI Example:

```
salt '*' grafana4.create_user login=<login> password=<password> e-mail=<email>
```

salt.modules.grafana4.delete_dashboard

Delete a dashboard.

dasourceid  Id of the datasource.

profile  Configuration profile used to connect to the Grafana instance. Default is `grafana'.

CLI Example:

```
salt '*' grafana4.delete_dashboard <slug>
```

salt.modules.grafana4.delete_datasource

Delete a datasource.

datasourceid  Id of the datasource.

profile  Configuration profile used to connect to the Grafana instance. Default is `grafana'.

CLI Example:

```
salt '*' grafana4.delete_datasource <datasource_id>
```

salt.modules.grafana4.delete_org

Delete an organization.

orgid  Id of the organization.

profile  Configuration profile used to connect to the Grafana instance. Default is `grafana'.

CLI Example:

```
salt '*' grafana4.delete_org <org_id>
```

salt.modules.grafana4.delete_org_user

Remove user from the organization.
userid  Id of the user.
orgname  Name of the organization in which users are updated.
profile  Configuration profile used to connect to the Grafana instance. Default is `grafana'.

CLI Example:

```salt
salt '*' grafana4.delete_org_user <user_id> <orgname>
```

**salt.modules.grafana4.delete_user(userid, profile='grafana')**
Delete a user.
userid  Id of the user.
profile  Configuration profile used to connect to the Grafana instance. Default is `grafana'.

CLI Example:

```salt
salt '*' grafana4.delete_user <user_id>
```

**salt.modules.grafana4.delete_user_org(userid, orgid, profile='grafana')**
Remove a user from an organization.
userid  Id of the user.
orgid  Id of the organization.
profile  Configuration profile used to connect to the Grafana instance. Default is `grafana'.

CLI Example:

```salt
salt '*' grafana4.delete_user_org <user_id> <org_id>
```

**salt.modules.grafana4.get_dashboard(slug, orgname=None, profile='grafana')**
Get a dashboard.
slug  Slug (name) of the dashboard.
orgname  Name of the organization.
profile  Configuration profile used to connect to the Grafana instance. Default is `grafana'.

CLI Example:

```salt
salt '*' grafana4.get_dashboard <slug>
```

**salt.modules.grafana4.get_datasource(name, orgname=None, profile='grafana')**
Show a single datasource in an organisation.
nname  Name of the datasource.
orgname  Name of the organization.
profile  Configuration profile used to connect to the Grafana instance. Default is `grafana'.

CLI Example:

```salt
salt '*' grafana4.get_datasource <name> <orgname>
```

**salt.modules.grafana4.get_datasources(orgname=None, profile='grafana')**
List all datasources in an organisation.
orgname  Name of the organization.
profile  Configuration profile used to connect to the Grafana instance. Default is `grafana'.

CLI Example:

```salt
salt '*' grafana4.get_datasources <orgname>
```

**salt.modules.grafana4.get_org(name, profile='grafana')**
Show a single organization.
nname  Name of the organization.
profile  Configuration profile used to connect to the Grafana instance. Default is `grafana'.

CLI Example:
salt 'salt '*' grafana4.get_org_address <orgname>'

`salt.modules.grafana4.get_org_address`(*orgname=*
None, *profile=*
`grafana`)  
Get the organization address. 

*orgname* Name of the organization in which users are updated. 

*profile* Configuration profile used to connect to the Grafana instance. Default is `grafana`.  

CLI Example:  
```
salt 'salt '*' grafana4.get_org_address <orgname>
```

salt 'salt '*' grafana4.get_org_prefs <orgname>'

`salt.modules.grafana4.get_org_prefs`(*orgname=*
None, *profile=*
`grafana`)  
Get the organization preferences.  

*orgname* Name of the organization in which users are updated. 

*profile* Configuration profile used to connect to the Grafana instance. Default is `grafana`.  

CLI Example:  
```
salt 'salt '*' grafana4.get_org_prefs <orgname>
```

salt 'salt '*' grafana4.get_org_users <orgname>'

`salt.modules.grafana4.get_org_users`(*orgname=*
None, *profile=*
`grafana`)  
Get the list of users that belong to the organization. 

*orgname* Name of the organization.  

*profile* Configuration profile used to connect to the Grafana instance. Default is `grafana`.  

CLI Example:  
```
salt 'salt '*' grafana4.get_org_users <orgname>
```

salt 'salt '*' grafana4.get_orgs'

`salt.modules.grafana4.get_orgs`(*profile=*
`grafana`)  
List all organizations.  

*profile* Configuration profile used to connect to the Grafana instance. Default is `grafana`.  

CLI Example:  
```
salt 'salt '*' grafana4.get_orgs
```

salt 'salt '*' grafana4.get_user <login>'

`salt.modules.grafana4.get_user`(*login, *profile=*
`grafana`)  
Show a single user. 

*login* Login of the user.  

*profile* Configuration profile used to connect to the Grafana instance. Default is `grafana`.  

CLI Example:  
```
salt 'salt '*' grafana4.get_user <login>
```

salt 'salt '*' grafana4.get_user_data <user_id>'

`salt.modules.grafana4.get_user_data`(*userid, *profile=*
`grafana`)  
Get user data. 

*userid* Id of the user.  

*profile* Configuration profile used to connect to the Grafana instance. Default is `grafana`.  

CLI Example:  
```
salt 'salt '*' grafana4.get_user_data <user_id>
```

salt 'salt '*' grafana4.get_user_orgs <user_id>'

`salt.modules.grafana4.get_user_orgs`(*userid, *profile=*
`grafana`)  
Get the list of organisations a user belong to. 

*userid* Id of the user.  

*profile* Configuration profile used to connect to the Grafana instance. Default is `grafana`.  

CLI Example:  
```
salt 'salt '*' grafana4.get_user_orgs <user_id>
```

19.9. execution modules
salt 'ktor' grafana4.get_user_orgs <user_id>

salt.modules.grafana4.get_users(profile='grafana')
List all users.

profile Configuration profile used to connect to the Grafana instance. Default is `grafana'.
CLI Example:
salt 'ktor' grafana4.get_users

salt.modules.grafana4.switch_org(ogname, profile='grafana')
Switch the current organization.

name Name of the organization to switch to.
profile Configuration profile used to connect to the Grafana instance. Default is `grafana'.
CLI Example:
salt 'ktor' grafana4.switch_org <name>

salt.modules.grafana4.update_datasource(datasourceid, orgname=None, profile='grafana'; **kwargs)
Update a datasource.

datasourceid Id of the datasource.
name Name of the data source.
type Type of the datasource (`graphite', `influxdb' etc.).
access Use proxy or direct.
url The URL to the data source API.
user Optional - user to authenticate with the data source.
password Optional - password to authenticate with the data source.
database Optional - database to use with the data source.
basicAuth Optional - set to True to use HTTP basic auth to authenticate with the data source.
basicAuthUser Optional - HTTP basic auth username.
basicAuthPassword Optional - HTTP basic auth password.
jsonData Optional - additional json data to post (eg. `timeInterval').
isDefault Optional - set data source as default.
withCredentials Optional - Whether credentials such as cookies or auth headers should be sent with cross-site requests.
typeLogoUrl Optional - Logo to use for this datasource.
profile Configuration profile used to connect to the Grafana instance. Default is `grafana'.
CLI Example:
salt 'ktor' grafana4.update_datasource <datasourceid>

salt.modules.grafana4.update_org(ogid, profile='grafana'; **kwargs)
Update an existing organization.

orgid Id of the organization.
name New name of the organization.
profile Configuration profile used to connect to the Grafana instance. Default is `grafana'.
CLI Example:
salt 'ktor' grafana4.update_org <org_id> name=<name>

salt.modules.grafana4.update_org_address(ogname=None, profile='grafana'; **kwargs)
Update the organization address.

ogname Name of the organization in which users are updated.
address1 Optional - address1 of the org.
address2 Optional - address2 of the org.
city | Optional - city of the org.
zip_code | Optional - zip_code of the org.
state | Optional - state of the org.
country | Optional - country of the org.
profile | Configuration profile used to connect to the Grafana instance. Default is `grafana`.

CLI Example:
```
salt '*' grafana4.update_org_address <orgname> country=<country>
```

salt.modules.grafana4.update_org_prefs
```
orgname | Name of the organization in which users are updated.
theme | Selected theme for the org.
homeDashboardId | Home dashboard for the org.
timezone | Timezone for the org (one of: ``browser'', ``utc'', or `'').
profile | Configuration profile used to connect to the Grafana instance. Default is `grafana`.

CLI Example:
```
salt '*' grafana4.update_org_prefs <orgname> theme=<theme> timezone=<timezone>
```

salt.modules.grafana4.update_org_user
```
userid | Id of the user.
loginOrEmail | Login or email of the user.
role | Role of the user for this organization. Should be one of:
• Admin
• Editor
• Read Only Editor
• Viewer
orgname | Name of the organization in which users are updated.
profile | Configuration profile used to connect to the Grafana instance. Default is `grafana`.

CLI Example:
```
salt '*' grafana4.update_org_user <user_id> <orgname> loginOrEmail=<loginOrEmail> role=<role>
```

salt.modules.grafana4.update_user
```
userid | Id of the user.
login | Optional - Login of the user.
email | Optional - Email of the user.
name | Optional - Full name of the user.
profile | Configuration profile used to connect to the Grafana instance. Default is `grafana`.

CLI Example:
```
salt '*' grafana4.update_user <user_id> login=<login> email=<email>
```

salt.modules.grafana4.update_user_password
```
userid | Id of the user.
password | New password of the user.
profile | Configuration profile used to connect to the Grafana instance. Default is `grafana`.

19.9. execution modules
CLI Example:

```
salt '*' grafana4.update_user_password <user_id> password=<password>
```

`salt.modules.grafana4.update_user_permissions`(userid, profile='grafana', **kwargs)
Update a user password.

- `userid` Id of the user.
- `isGrafanaAdmin` Whether user is a Grafana admin.
- `profile` Configuration profile used to connect to the Grafana instance. Default is `grafana`.

CLI Example:

```
salt '*' grafana4.update_user_permissions <user_id> isGrafanaAdmin=<true|false>
```

### 19.9.136 salt.modules.grains

Return/control aspects of the grains data

Grains set or altered with this module are stored in the `grains` file on the minions. By default, this file is located at: `/etc/salt/grains`

**Note:** This does NOT override any grains set in the minion config file.

`salt.modules.grains.append`(key, val, convert=False, delimiter=':')
New in version 0.17.0.

Append a value to a list in the grains config file. If the grain doesn't exist, the grain key is added and the value is appended to the new grain as a list item.

- `key` The grain key to be appended to
- `val` The value to append to the grain key
- `convert` If convert is True, convert non-list contents into a list. If convert is False and the grain contains non-list contents, an error is given. Defaults to False.
- `delimiter` The key can be a nested dict key. Use this parameter to specify the delimiter you use, instead of the default `:`. You can now append values to a list in nested dictionary grains. If the list doesn't exist at this level, it will be created.

New in version 2014.7.6.

CLI Example:

```
salt '*' grains.append key val
```

`salt.modules.grains.delkey`(key)
New in version 2017.7.0.

Remove a grain completely from the grain system, this will remove the grain key and value

- `key` The grain key from which to delete the value.

CLI Example:

```
salt '*' grains.delkey key
```

`salt.modules.grains.delval`(key, destructive=False)
New in version 0.17.0.

Delete a grain value from the grains config file. This will just set the grain value to None. To completely remove the grain, run `grains.delkey` or pass `destructive=True` to `grains.delval`.

- `key` The grain key from which to delete the value.
destructive  Delete the key, too. Defaults to False.

CLI Example:

```
salt '*' grains.delval key
```

**salt.modules.grains.equals**(key, value)

Used to make sure the minion's grain key/value matches.

Returns **True** if matches otherwise **False**.

New in version 2017.7.0.

CLI Example:

```
salt '*' grains.equals fqdn <expected_fqdn>
salt '*' grains.equals systemd:version 219
```

**salt.modules.grains.fetch**(key, default='', delimiter=':', ordered=True)

Attempt to retrieve the named value from grains, if the named value is not available return the passed default. The default return is an empty string.

The value can also represent a value in a nested dict using a "::" delimiter for the dict. This means that if a dict in grains looks like this:

```
{ 'pkg': { 'apache': 'httpd' }}
```

To retrieve the value associated with the apache key in the pkg dict this key can be passed:

```
pkg:apache
```

**Parameters**

- **delimiter** -- Specify an alternate delimiter to use when traversing a nested dict. This is useful for when the desired key contains a colon. See CLI example below for usage.
  
  New in version 2014.7.0.

- **ordered** -- Outputs an ordered dict if applicable (default: True)
  
  New in version 2016.11.0.

CLI Example:

```
salt '*' grains.get pkg:apache
salt '*' grains.get abc::def|ghi delimiter='|'
```

**salt.modules.grains.filter_by**(lookup_dict, grain='os_family', merge=None, default='default', base=None)

New in version 0.17.0.

Look up the given grain in a given dictionary for the current OS and return the result

Although this may occasionally be useful at the CLI, the primary intent of this function is for use in Jinja to make short work of creating lookup tables for OS-specific data. For example:

```
{% set apache = salt['grains.filter_by']({
    'Debian': {'pkg': 'apache2', 'srv': 'apache2'},
    'RedHat': {'pkg': 'httpd', 'srv': 'httpd'},
}, default='Debian') %}
```

myapache:
Values in the lookup table may be overridden by values in Pillar. An example Pillar to override values in the example above could be as follows:

```yaml
apache:
  lookup:
    pkg: apache_13
    srv: apache
```

The call to `filter_by()` would be modified as follows to reference those Pillar values:

```python
{% set apache = salt['grains.filter_by']({
  ...,
}, merge=salt['pillar.get']('apache:lookup')) %}
```

**Parameters**

- `lookup_dict` -- A dictionary, keyed by a grain, containing a value or values relevant to systems matching that grain. For example, a key could be the grain for an OS and the value could the name of a package on that particular OS.

  Changed in version 2016.11.0: The dictionary key could be a globbing pattern. The function will return the corresponding `lookup_dict` value where grain value matches the pattern. For example:

  ```
  # this will render 'got some salt' if Minion ID begins from 'salt*
  salt '*' grains.filter_by '{salt*: got some salt, default: salt is not here}' id
  ```

- `grain` -- The name of a grain to match with the current system's grains. For example, the value of the `os_family` grain for the current system could be used to pull values from the `lookup_dict` dictionary.

  Changed in version 2016.11.0: The grain value could be a list. The function will return the `lookup_dict` value for a first found item in the list matching one of the `lookup_dict` keys.

- `merge` -- A dictionary to merge with the results of the grain selection from `lookup_dict`. This allows Pillar to override the values in the `lookup_dict`. This could be useful, for example, to override the values for non-standard package names such as when using a different Python version from the default Python version provided by the OS (e.g., `python26-mysql` instead of `python-mysql`).

- `default` -- default `lookup_dict`'s key used if the grain does not exists or if the grain value has no match on `lookup_dict`. If unspecified the value is `''default''`.

  New in version 2014.1.0.

- `base` -- A `lookup_dict` key to use for a base dictionary. The grain-selected `lookup_dict` is merged over this and then finally the `merge` dictionary is merged. This allows common values for each case to be collected in the base and overridden by the grain selection dictionary and the merge dictionary. Default is unset.

  New in version 2015.5.0.
CLI Example:

```bash
salt '* grains.filter_by '{Debian: Debheads rule, RedHat: I love my hat}'
# this one will render {D: {E: I, G: H}, J: K}
# next one will render {A: {B: G}, D: J}
salt '*' grains.filter_by '{default: {A: {B: C}, D: E}, F: {A: {B: G}}, H: {D: I}}}'xxx' '{D: J}' 'F' 'default'
# next same as above when default='H' instead of 'F' renders {A: {B: C}, D: J}
```

salt.modules.grains.get(key, default='', delimiter=':', ordered=True)

Attempt to retrieve the named value from grains, if the named value is not available return the passed default. The default return is an empty string.

The value can also represent a value in a nested dict using a "::" delimiter for the dict. This means that if a dict in grains looks like this:

```python
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the apache key in the pkg dict this key can be passed:

```bash
grep:apache
```

Parameters

- `delimiter` -- Specify an alternate delimiter to use when traversing a nested dict. This is useful for when the desired key contains a colon. See CLI example below for usage.

  New in version 2014.7.0.

- `ordered` -- Outputs an ordered dict if applicable (default: True)

  New in version 2016.11.0.

CLI Example:

```bash
salt '*' grains.get pkg:apache
salt '*' grains.get abc::def|ghi delimiter='|'
```

salt.modules.grains.get_or_set_hash(name, length=8, chars='abcdefghijklmnopqrstuvwxyz0123456789!@#$%^&*(-_=+)')

Perform a one-time generation of a hash and write it to the local grains. If that grain has already been set return the value instead.

This is useful for generating passwords or keys that are specific to a single minion that don't need to be stored somewhere centrally.

State Example:

```python
some_mysql_user:
  mysql_user:
    - present
    - host: localhost
    - password: {{ salt['grains.get_or_set_hash']('mysql:some_mysql_user') }}
```

CLI Example:

```bash
salt '*' grains.get_or_set_hash 'django:SECRET_KEY' 50
```
**Warning:** This function could return strings which may contain characters which are reserved as directives by the YAML parser, such as strings beginning with `%`. To avoid issues when using the output of this function in an SLS file containing YAML+Jinja, surround the call with single quotes.

```python
salt.modules.grains.has_value(key)
```
Determine whether a key exists in the grains dictionary.

Given a grains dictionary that contains the following structure:

```python
{'pkg': {'apache': 'httpd'}}
```

One would determine if the apache key in the pkg dict exists by:

```python
pkg:apache
```

CLI Example:

```bash
salt '*' grains.has_value pkg:apache
```

```python
salt.modules.grains.item(*args, **kwargs)
```
Return one or more grains

CLI Example:

```bash
salt '*' grains.item os
salt '*' grains.item os osrelease oscodename
```

Sanitized CLI Example:

```bash
salt '*' grains.item host sanitize=True
```

```python
salt.modules.grains.items(sanitize=False)
```
Return all of the minion's grains

CLI Example:

```bash
salt '*' grains.items
```

Sanitized CLI Example:

```bash
salt '*' grains.items sanitize=True
```

```python
salt.modules.grains.ls()
```
Return a list of all available grains

CLI Example:

```bash
salt '*' grains.ls
```

```python
salt.modules.grains.remove(key, val, delimiter=':')
```
New in version 0.17.0.

Remove a value from a list in the grains config file

- **key** The grain key to remove.
- **val** The value to remove.
- **delimiter** The key can be a nested dict key. Use this parameter to specify the delimiter you use, instead of the default `:`. You can now append values to a list in nested dictionary grains. If the list doesn't exist at this level, it will be created.
New in version 2015.8.2.

CLI Example:
```
salt '*' grains.remove key val
```

```
salt.modules.grains.set(key, val, force=False, destructive=False, delimiter=':')</nsalt.modules.grains.set(key, val, force=False, destructive=False, delimiter=':'))
```

**salt.modules.grains.set**(key, val

Set a key to an arbitrary value. It is used like setval but works with nested keys.

This function is conservative. It will only overwrite an entry if its value and the given one are not a list or a dict. The `force` parameter is used to allow overwriting in all cases.

New in version 2015.8.0.

**Parameters**

- `force` -- Force writing over existing entry if given or existing values are list or dict. Defaults to False.
- `destructive` -- If an operation results in a key being removed, delete the key, too. Defaults to False.
- `delimiter` -- Specify an alternate delimiter to use when traversing a nested dict, the default being `:`

CLI Example:
```
salt '*' grains.set 'apps:myApp:port' 2209
salt '*' grains.set 'apps:myApp' '{port: 2209}'
```

```
salt.modules.grains.setval(key, val, destructive=False)
salt.modules.grains.setval(key, val, destructive=False)
```

**salt.modules.grains.setval**(key, val, destructive=False)

Set a grains value in the grains config file

- `key` The grain key to be set.
- `val` The value to set the grain key to.
- `destructive` If an operation results in a key being removed, delete the key, too. Defaults to False.

CLI Example:
```
salt '*' grains.setval key val
salt '*' grains.setval 'sub-key': 'val', 'sub-key2': 'val2'
```

```
salt.modules.grains.setvals(grains, destructive=False)
salt.modules.grains.setvals(grains, destructive=False)
```

**salt.modules.grains.setvals**(grains, destructive=False)

Set new grains values in the grains config file

- `destructive` If an operation results in a key being removed, delete the key, too. Defaults to False.

CLI Example:
```
salt '*' grains.setvals '{key1': 'val1', 'key2': 'val2}'
```

**19.9.137 salt.modules.groupadd**

Manage groups on Linux, OpenBSD and NetBSD

**Important:** If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to `'group.info` is not available), see [here](#).

```
salt.modules.groupadd.add(name, gid=None, system=False, root=None)
salt.modules.groupadd.add(name, gid=None, system=False, root=None)
```

Add the specified group

CLI Example:
salt '...' group.add foo 3456

salt.modules.groupadd.adduser\(name, username, root=None\)
Add a user in the group.

CLI Example:
salt '...' group.adduser foo bar

Verifies if a valid username `bar' as a member of an existing group `foo', if not then adds it.

salt.modules.groupadd.chgid\(name, gid, root=None\)
Change the gid for a named group

CLI Example:
salt '...' group.chgid foo 4376

salt.modules.groupadd.delete\(name, root=None\)
Remove the named group

CLI Example:
salt '...' group.delete foo

salt.modules.groupadd.deluser\(name, username, root=None\)
Remove a user from the group.

CLI Example:
salt '...' group.deluser foo bar

Removes a member user `bar' from a group `foo'. If group is not present then returns True.

salt.modules.groupadd.getent\(refresh=False\)
Return info on all groups

CLI Example:
salt '...' group.getent

salt.modules.groupadd.info\(name\)
Return information about a group

CLI Example:
salt '...' group.info foo

salt.modules.groupadd.members\(name, members_list, root=None\)
Replaces members of the group with a provided list.

CLI Example:
salt '...' group.members foo `user1,user2,user3,...'

Replaces a membership list for a local group `foo'.

19.9.138 salt.modules.grub_legacy
Support for GRUB Legacy
salt.modules.grub_legacy.conf()
Parse GRUB conf file

CLI Example:
```
salt '*' grub.conf
```

salt.modules.grub_legacy.version()
Return server version from grub --version

CLI Example:
```
salt '*' grub.version
```

19.9.139 salt.modules.guestfs
Interact with virtual machine images via libguestfs

depends
• libguestfs

salt.modules.guestfs.mount(location, access='rw', root=None)
Mount an image

CLI Example:
```
salt '*' guest.mount /srv/images/fedora.qcow
```

19.9.140 salt.modules.hadoop
Support for hadoop

maintainer Yann Jouanin <yann.jouanin@intelunix.fr>
maturity new
depends
platform linux

salt.modules.hadoop.dfs(command=None, *args)
Execute a command on DFS

CLI Example:
```
salt '*' hadoop.dfs ls /
```

salt.modules.hadoop.dfs_absent(path)
Check if a file or directory is absent on the distributed FS.

CLI Example:
```
salt '*' hadoop.dfs_absent /some_random_file
```

Returns True if the file is absent
salt.modules.hadoop.dfs_present(path)
Check if a file or directory is present on the distributed FS.

CLI Example:
```
salt '*' hadoop.dfs_present /some_random_file
```
Returns True if the file is present

salt.modules.hadoop.namenode_format(force=None)
Format a name node

```
salt '*' hadoop.namenode_format force=True
```

salt.modules.hadoop.version()
Return version from hadoop version

CLI Example:
```
salt '*' hadoop.version
```

19.9.141 salt.modules.haproxyconn

Support for haproxy

New in version 2014.7.0.

salt.modules.haproxyconn.disable_server(name, backend, socket='/var/run/haproxy.sock')
Disable server in haproxy.

- **name**: Server to disable
- **backend**: haproxy backend, or all backends if `'*'` is supplied
- **socket**: haproxy stats socket

CLI Example:
```
salt '*' haproxy.disable_server db1.example.com mysql
```

salt.modules.haproxyconn.enable_server(name, backend, socket='/var/run/haproxy.sock')
Enable Server in haproxy

- **name**: Server to enable
- **backend**: haproxy backend, or all backends if `'*'` is supplied
- **socket**: haproxy stats socket

CLI Example:
```
salt '*' haproxy.enable_server web1.example.com www
```

salt.modules.haproxyconn.get_sessions(name, backend, socket='/var/run/haproxy.sock')
Get number of current sessions on server in backend (scur)

- **name**: Server name
- **backend**: haproxy backend
- **socket**: haproxy stats socket

CLI Example:
```
salt '*' haproxy.get_sessions web1.example.com www
```

salt.modules.haproxyconn.get_weight(name, backend, socket='/var/run/haproxy.sock')
Get server weight
name  Server name
backend haproxy backend
socket haproxy stats socket

CLI Example:
```
salt '*' haproxy.get_weight web1.example.com www
```

```
salt.modules.haproxyconn.list_servers(backend, socket='/var/run/haproxy.sock', objec-
tify=False)
List servers in haproxy backend.
```

```
backend haproxy backend
socket haproxy stats socket
CLI Example:
```
```
salt '*' haproxy.list_servers mysql
```

```
salt.modules.haproxyconn.set_state(name, backend, state, socket='/var/run/haproxy.sock')
Force a server's administrative state to a new state. This can be useful to disable load balancing and/or any
traffic to a server. Setting the state to `ready` puts the server in normal mode, and the command is the
equivalent of the `enable server` command. Setting the state to `maint` disables any traffic to the server
as well as any health checks. This is the equivalent of the `disable server` command. Setting the mode
to `drain` only removes the server from load balancing but still allows it to be checked and to accept new
persistent connections. Changes are propagated to tracking servers if any.
name  Server name
backend haproxy backend
state A string of the state to set. Must be `ready', `drain', or `maint'
CLI Example:
```
salt '*' haproxy.set_state my_proxy_server my_backend ready
```

```
salt.modules.haproxyconn.set_weight(name, backend, weight=0,
socket='/var/run/haproxy.sock')
Set server weight
name  Server name
backend haproxy backend
weight Server Weight
socket haproxy stats socket
CLI Example:
```
```
salt '*' haproxy.set_weight web1.example.com www 13
```

```
salt.modules.haproxyconn.show_backends(socket='/var/run/haproxy.sock')
Show HaProxy Backends
```

```
salt '*' haproxy.show_backends
```

```
salt.modules.haproxyconn.show_frontends(socket='/var/run/haproxy.sock')
Show HaProxy frontends
```

```
salt '*' haproxy.show_frontends
```

19.9. execution modules 1573
19.9.142  salt.modules.hashutil

A collection of hashing and encoding functions

salt.modules.hashutil.base64_b64decode(instr)
Decode a base64-encoded string using the "modern" Python interface

New in version 2016.3.0.

CLI Example:

```
salt '*' hashutil.base64_b64decode 'Z2V0IHNhbHRlZA=='
```

salt.modules.hashutil.base64_b64encode(instr)
Encode a string as base64 using the "modern" Python interface.

Among other possible differences, the "modern" encoder does not include newline (\'n\') characters in the encoded output.

New in version 2016.3.0.

CLI Example:

```
salt '*' hashutil.base64_b64encode 'get salted'
```

salt.modules.hashutil.base64_decodefile(instr, outfile)
Decode a base64-encoded string and write the result to a file

New in version 2016.3.0.

CLI Example:

```
salt '*' hashutil.base64_decodefile instr='Z2V0IHNhbHRlZAo=' outfile='/path/to/binary_file'
```

salt.modules.hashutil.base64_decodestring(instr)
Decode a base64-encoded string using the "legacy" Python interface

New in version 2014.7.0.

CLI Example:

```
salt '*' hashutil.base64_decodestring instr='Z2V0IHNhbHRlZAo='
```

salt.modules.hashutil.base64_encodefile(fname)
Read a file from the file system and return as a base64 encoded string

New in version 2016.3.0.

Pillar example:

```
path:
  to:
    data: |
    {{ salt.hashutil.base64_encodefile('/path/to/binary_file') | indent(6) }}
```

The file.decode state function can be used to decode this data and write it to disk.

CLI Example:

```
salt '*' hashutil.base64_encodefile /path/to/binary_file
```
salt.modules.hashutil.base64_encodestring(instr)
    Encode a string as base64 using the "legacy" Python interface.
    Among other possible differences, the "legacy" encoder includes a newline ('n') character after every 76 characters and always at the end of the encoded string.
    New in version 2014.7.0.
    CLI Example:
    
    ```
    salt '*' hashutil.base64_encodestring 'get salted'
    ```

salt.modules.hashutil.digest(instr, checksum='md5')
    Return a checksum digest for a string
    instr A string
    CLI Example:
    
    ```
    salt '*' hashutil.digest 'get salted'
    ```

salt.modules.hashutil.digest_file(infile, checksum='md5')
    Return a checksum digest for a file
    infile A file path
    checksum [md5] The hashing algorithm to use to generate checksums. Wraps the hashutil.digest execution function.
    CLI Example:
    
    ```
    salt '*' hashutil.digest_file /path/to/file
    ```

salt.modules.hashutil.github_signature(string, shared_secret, challenge_hmac)
    Verify a challenging hmac signature against a string / shared-secret for github webhooks.
    New in version 2017.7.0.
    Returns a boolean if the verification succeeded or failed.
    CLI Example:
    
    ```
    salt '*' hashutil.github_signature '{"ref":.....} 'shared secret' 
    =>'sha1=bc6550fc29b0acf5b42283fa8deaf55ceaa0f8c206'
    ```

salt.modules.hashutil.hmac_signature(string, shared_secret, challenge_hmac)
    Verify a challenging hmac signature against a string / shared-secret
    New in version 2014.7.0.
    Returns a boolean if the verification succeeded or failed.
    CLI Example:
    
    ```
    salt '*' hashutil.hmac_signature 'get salted' 'shared secret' 
    =>'eBWf9bstXg+NiP5AowpP5HMvZiYMPzEM9W5YMm/4mQ='
    ```

salt.modules.hashutil.md5_digest(instr)
    Generate an md5 hash of a given string
    New in version 2014.7.0.
    CLI Example:
salt '//' hashutil.md5_digest 'get salted'
salt.modules.hashutil.sha256_digest(instr)
Generate an sha256 hash of a given string
New in version 2014.7.0.
CLI Example:
salt '//' hashutil.sha256_digest 'get salted'
salt.modules.hashutil.sha512_digest(instr)
Generate an sha512 hash of a given string
New in version 2014.7.0.
CLI Example:
salt '//' hashutil.sha512_digest 'get salted'

19.9.143 salt.modules.heat module
Module for handling OpenStack Heat calls
New in version 2017.7.0.

depends

- heatclient Python module

configuration This module is not usable until the user, password, tenant, and auth URL are specified either in a pillar or in the minion’s config file. For example:

```python
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.insecure: False  #(optional)
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
  # Optional
keystone.region_name: 'RegionOne'
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles. For example:

```python
openstack1:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'

openstack2:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.2:5000/v2.0/'
```

With this configuration in place, any of the heat functions can make use of a configuration profile by declaring it explicitly. For example:
Create a stack (heat stack-create)

name  Name of the new stack
template_file  File of template
environment  File of environment
parameters  Parameter dict used to create the stack
poll  Poll and report events until stack complete
rollback  Enable rollback on create failure
timeout  Stack creation timeout in minutes
profile  Profile to build on

CLI Example:

```bash
salt '*' heat.create_stack name=mystack \template_file=salt://template.yaml \environment=salt://environment.yaml \parameters="{"image": "Debian 8", "flavor": "m1.small"}" \poll=5 rollback=False timeout=60 profile=openstack1
```

New in version 2017.7.5,2018.3.1: The spelling mistake in parameter environment was corrected to environment. The misspelled version is still supported for backward compatibility, but will be removed in Salt Neon.

Delete a stack (heat stack-delete)

name  Name of the stack
poll  Poll and report events until stack complete
timeout  Stack creation timeout in minutes
profile  Profile to use

CLI Examples:

```bash
salt '*' heat.delete_stack name=mystack poll=5 \profile=openstack1
```

Return a list of available stack (heat stack-list)

profile  Profile to use

CLI Example:

```bash
salt '*' heat.list_stack profile=openstack1
```

Return details about a specific stack (heat stack-show)

name  Name of the stack
profile  Profile to use

CLI Example:

```bash
salt '*' heat.show_stack name=mystack profile=openstack1
```

Return template a specific stack (heat stack-template)

name  Name of the stack
profile  Profile to use
CLI Example:

```
salt '*' heat.template_stack name=mystack profile=openstack1
```

salt.modules.heat.update_stack(name=None, template_file=None, environment=None, parameters=None, poll=0, rollback=False, timeout=60, profile=None, environment=None)

Update a stack (heat stack-template)

- **name** Name of the stack
- **template_file** File of template
- **environment** File of environment
- **parameters** Parameter dict used to update the stack
- **poll** Poll and report events until stack complete
- **rollback** Enable rollback on update failure
- **timeout** Stack creation timeout in minutes
- **profile** Profile to build on

CLI Example:

```
salt '*' heat.update_stack name=mystack 
  template_file=salt://template.yaml 
  environment=salt://environment.yaml 
  parameters="{"image": "Debian 8", "flavor": "m1.small"}"
  poll=5 rollback=False timeout=60 profile=openstack1
```

New in version 2017.7.5,2018.3.1: The spelling mistake in parameter enviroment was corrected to environment. The misspelled version is still supported for backward compatibility, but will be removed in Salt Neon.

### 19.9.144 salt.modules.hg

Support for the Mercurial SCM

salt.modules.hg.archive(cwd, output, rev='tip', fmt=None, prefix=None, user=None)

Export a tarball from the repository

- **cwd** The path to the Mercurial repository
- **output** The path to the archive tarball
- **rev** The revision to create an archive from
- **fmt** Format of the resulting archive. Mercurial supports: tar, tbz2, tgz, zip, uzip, and files formats.
- **prefix** [None] Prepend `<prefix>/` to every filename in the archive
- **user** [None] Run hg as a user other than what the minion runs as

If `prefix` is not specified it defaults to the basename of the repo directory.

CLI Example:

```
salt '*' hg.archive /path/to/repo output=/tmp/archive.tgz fmt=tgz
```

salt.modules.hg.clone(cwd, repository, opts=None, user=None, identity=None)

Clone a new repository

- **cwd** The path to the Mercurial repository
- **repository** The hg URI of the repository
- **opts** [None] Any additional options to add to the command line
- **user** [None] Run hg as a user other than what the minion runs as
- **identity** [None] Private SSH key on the minion server for authentication (ssh://)

New in version 2015.5.0.

CLI Example:
salt 's' hg.clone /path/to/repo https://bitbucket.org/birkenfeld/sphinx

salt.modules.hg.describe(cwd, rev='tip', user=None)
Mimic git describe and return an identifier for the given revision

cwd: The path to the Mercurial repository

rev: tip: The path to the archive tarball

user: [None]: Run hg as a user other than what the minion runs as

CLI Example:

salt 's' hg.describe /path/to/repo

salt.modules.hg.pull(cwd, opts=None, user=None, identity=None, repository=None)
Perform a pull on the given repository

cwd: The path to the Mercurial repository

repository: [None]: Perform pull from the repository different from .hg/hgrc[:paths]:default

opts: [None]: Any additional options to add to the command line

user: [None]: Run hg as a user other than what the minion runs as

identity: [None]: Private SSH key on the minion server for authentication (ssh://)

New in version 2015.5.0.

CLI Example:

salt 's' hg.pull /path/to/repo opts=-u

salt.modules.hg.revision(cwd, rev='tip', short=False, user=None)
Returns the long hash of a given identifier (hash, branch, tag, HEAD, etc)

cwd: The path to the Mercurial repository

rev: tip: The revision

short: False: Return an abbreviated commit hash

user: [None]: Run hg as a user other than what the minion runs as

CLI Example:

salt 's' hg.revision /path/to/repo mybranch

salt.modules.hg.status(cwd, opts=None, user=None)
Show changed files of the given repository

cwd: The path to the Mercurial repository

opts: [None]: Any additional options to add to the command line

user: [None]: Run hg as a user other than what the minion runs as

CLI Example:

salt 's' hg.status /path/to/repo

salt.modules.hg.update(cwd, rev, force=False, user=None)
Update to a given revision

cwd: The path to the Mercurial repository

rev: The revision to update to

force: [False]: Force an update

user: [None]: Run hg as a user other than what the minion runs as

CLI Example:

salt devserver1 hg.update /path/to/repo somebranch
salt.modules.hipchat

Module for sending messages to hipchat.

New in version 2015.5.0.

configuration

This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

It is possible to use a different API than http://api.hipchat.com, by specifying the API URL in config as api_url, or by passing the value directly.

For example:

```yaml
hipchat:
    api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
    api_version: v1
```

Custom API Example:

```yaml
hipchat:
    api_url: http://api.hipchat.myteam.com
    api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
    api_version: v2
```

salt.modules.hipchat.find_room(name, api_url=None, api_key=None, api_version=None)

Find a room by name and return it.

Parameters

- **name** -- The room name.
- **api_url** -- The HipChat API URL, if not specified in the configuration.
- **api_key** -- The HipChat admin api key.
- **api_version** -- The HipChat api version, if not specified in the configuration.

Returns

The room object.

CLI Example:

```bash
salt '*' hipchat.find_room name="Development Room"
```

```bash
salt '*' hipchat.find_room name="Development Room" api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15 api_version=v1
```

salt.modules.hipchat.find_user(name, api_url=None, api_key=None, api_version=None)

Find a user by name and return it.

Parameters

- **name** -- The user name.
- **api_url** -- The HipChat API URL, if not specified in the configuration.
- **api_key** -- The HipChat admin api key.
- **api_version** -- The HipChat api version, if not specified in the configuration.

Returns

The user object.

CLI Example:

```bash
salt '*' hipchat.find_user name="Thomas Hatch"
```

```bash
salt '*' hipchat.find_user name="Thomas Hatch" api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15 api_version=v1
```
salt.modules.hipchat.list_rooms(api_url=None, api_key=None, api_version=None)
List all HipChat rooms.
Parameters

* api_url -- The HipChat API URL, if not specified in the configuration.
* api_key -- The HipChat admin api key.
* api_version -- The HipChat api version, if not specified in the configuration.

Returns The room list.
CLI Example:
salt '*' hipchat.list_rooms
salt '*' hipchat.list_rooms api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15 api_version=v1

salt.modules.hipchat.list_users(api_url=None, api_key=None, api_version=None)
List all HipChat users.
Parameters

* api_url -- The HipChat API URL, if not specified in the configuration.
* api_key -- The HipChat admin api key.
* api_version -- The HipChat api version, if not specified in the configuration.

Returns The user list.
CLI Example:
salt '*' hipchat.list_users
salt '*' hipchat.list_users api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15 api_version=v1

salt.modules.hipchat.send_message(room_id, message, from_name, api_url=None, api_key=None, api_version=None, color='yellow', notify=False)
Send a message to a HipChat room.
Parameters

* room_id -- The room id or room name, either will work.
* message -- The message to send to the HipChat room.
* from_name -- Specify who the message is from.
* api_url -- The HipChat api URL, if not specified in the configuration.
* api_key -- The HipChat api key, if not specified in the configuration.
* api_version -- The HipChat api version, if not specified in the configuration.
* color -- The color for the message, default: yellow.
* notify -- Whether to notify the room, default: False.

Returns Boolean if message was sent successfully.
CLI Example:
salt '*' hipchat.send_message room_id="Development Room" message="Build is done"
  --from_name="Build Server"

salt '*' hipchat.send_message room_id="Development Room" message="Build failed"
  --from_name="Build Server" color="red" notify=True

19.9.146 salt.modules.hosts

Manage the information in the hosts file

salt.modules.hosts.add_host(ip, alias)
   Add a host to an existing entry, if the entry is not in place then create it with the given host
   CLI Example:
   ```
salt '*' hosts.add_host <ip> <alias>
   ```

salt.modules.hosts.get_alias(ip)
   Return the list of aliases associated with an ip
   Aliases (host names) are returned in the order in which they appear in the hosts file. If there are no aliases
   associated with the IP, an empty list is returned.
   CLI Example:
   ```
salt '*' hosts.get_alias <ip addr>
   ```

salt.modules.hosts.get_ip(host)
   Return the ip associated with the named host
   CLI Example:
   ```
salt '*' hosts.get_ip <hostname>
   ```

salt.modules.hosts.has_pair(ip, alias)
   Return true if the alias is set
   CLI Example:
   ```
salt '*' hosts.has_pair <ip> <alias>
   ```

salt.modules.hosts.list_hosts()
   Return the hosts found in the hosts file in this format:
   ```
   {"<ip addr>": ["alias1", "alias2", ...]}
   ```
   CLI Example:
   ```
salt '*' hosts.list_hosts
   ```

salt.modules.hosts.rm_host(ip, alias)
   Remove a host entry from the hosts file
   CLI Example:
   ```
salt '*' hosts.rm_host <ip> <alias>
   ```
salt.modules.hosts.set_host(ip, alias)
Set the host entry in the hosts file for the given ip, this will overwrite any previous entry for the given ip

Changed in version 2016.3.0: If alias does not include any host names (it is the empty string or contains only whitespace), all entries for the given IP address are removed.

CLI Example:
```bash
salt '*' hosts.set_host <ip> <alias>
```

19.9.147 salt.modules.htpasswd

Support for htpasswd command. Requires the apache2-utils package for Debian-based distros.

New in version 2014.1.0.

The functions here will load inside the webutil module. This allows other functions that don’t use htpasswd to use the webutil module name.

salt.modules.htpasswd.useradd(pwfile, user, password, opts=’, runas=None)
Add a user to htpasswd file using the htpasswd command. If the htpasswd file does not exist, it will be created.

pwfile Path to htpasswd file
user User name
password User password
opts Valid options that can be passed are:
• n Don’t update file; display results on stdout.
• m Force MD5 encryption of the password (default).
• d Force CRYPT encryption of the password.
• p Do not encrypt the password (plaintext).
• s Force SHA encryption of the password.
runas The system user to run htpasswd command with

CLI Examples:
```bash
salt '*' webutil.useradd /etc/httpd/htpasswd larry badpassword
salt '*' webutil.useradd /etc/httpd/htpasswd larry badpass opts=ns
```

salt.modules.htpasswd.userdel(pwfile, user, runas=None, all_results=False)
Delete a user from the specified htpasswd file.

pwfile Path to htpasswd file
user User name
runas The system user to run htpasswd command with
all_results Return stdout, stderr, and retcode, not just stdout

CLI Examples:
```bash
salt '*' webutil.userdel /etc/httpd/htpasswd larry
```

salt.modules.htpasswd.verify(pwfile, user, password, opts=’, runas=None)
Return True if the htpasswd file exists, the user has an entry, and their password matches.

pwfile Fully qualified path to htpasswd file
user User name
password User password
opts Valid options that can be passed are:
• m Force MD5 encryption of the password (default).
- `d` Force CRYPT encryption of the password.
- `p` Do not encrypt the password (plaintext).
- `s` Force SHA encryption of the password.

**runas** The system user to run htpasswd command with

CLI Examples:

```
salt '*' webutil.verify /etc/httpd/htpasswd larry maybepassword
salt '*' webutil.verify /etc/httpd/htpasswd larry maybepassword opts=ns
```

### 19.9.148 salt.modules.http

Module for making various web calls. Primarily designed for webhooks and the like, but also useful for basic http testing.

New in version 2015.5.0.

**salt.modules.http.query** *(url, **kwargs)*

Query a resource, and decode the return data

New in version 2015.5.0.

CLI Example:

```
salt '*' http.query http://somelink.com/
salt '*' http.query http://somelink.com/ method=POST params='key1=val1&key2=val2'
salt '*' http.query http://somelink.com/ method=POST data='<xml>
  <somecontent/></xml>'
```

**salt.modules.http.update_ca_bundle** *(target=None, source=None, merge_files=None)*

Update the local CA bundle file from a URL

New in version 2015.5.0.

CLI Example:

```
salt '*' http.update_ca_bundle
salt '*' http.update_ca_bundle target=/path/to/cacerts.pem
salt '*' http.update_ca_bundle source=https://example.com/cacerts.pem
```

If the `target` is not specified, it will be pulled from the `ca_cert` configuration variable available to the minion. If it cannot be found there, it will be placed at `{{FILE_ROOTS}}/cacerts.pem`.

If the `source` is not specified, it will be pulled from the `ca_cert_url` configuration variable available to the minion. If it cannot be found, it will be downloaded from the cURL website, using an http (not https) URL. USING THE DEFAULT URL SHOULD BE AVOIDED!

`merge_files` may also be specified, which includes a string or list of strings representing a file or files to be appended to the end of the CA bundle, once it is downloaded.

CLI Example:

```
salt '*' http.update_ca_bundle merge_files=/path/to/mycert.pem
```

**salt.modules.http.wait_for_successful_query** *(url, wait_for=300, **kwargs)*

Query a resource until a successful response, and decode the return data

CLI Example:
19.9.149 salt.modules.ifttt

Support for IFTTT

New in version 2015.8.0.

Requires an api_key in /etc/salt/minion:

```python
salt.modules.ifttt.trigger_event(event=None, **kwargs)
```

Trigger a configured event in IFTTT.

**Parameters**

- `event` -- The name of the event to trigger.

**Returns**

A dictionary with status, text, and error if result was failure.

19.9.150 salt.modules.ilo

Manage HP ILO

```python
depends hponcfg (SmartStart Scripting Toolkit Linux Edition)
```

**salt.modules.ilo.change_password(username, password)**

Reset a users password

CLI Example:

```bash
salt '*' ilo.change_password damianMyerscough
```

**salt.modules.ilo.change_username(old_username, new_username)**

Change a username

CLI Example:

```bash
salt '*' ilo.change_username damian diana
```

**salt.modules.ilo.configure_network(ip, netmask, gateway)**

Configure Network Interface

CLI Example:

```bash
salt '*' ilo.configure_network [IP ADDRESS] [NETMASK] [GATEWAY]
```

**salt.modules.ilo.configure_snmp(community, snmp_port=161, snmp_trapport=161)**

Configure SNMP

CLI Example:

```bash
salt '*' ilo.configure_snmp [COMMUNITY STRING] [SNMP PORT] [SNMP TRAP PORT]
```

**salt.modules.ilo.create_user(name, password, *privileges)**

Create user

CLI Example:

```bash
salt '*' ilo.create_user damian secretagent VIRTUAL_MEDIA_PRIV
```
If no permissions are specified the user will only have a read-only account.

Supported privileges:
- **ADMIN_PRIV** Enables the user to administer user accounts.
- **REMOTE_CONS_PRIV** Enables the user to access the Remote Console functionality.
- **RESET_SERVER_PRIV** Enables the user to remotely manipulate the server power setting.
- **VIRTUAL_MEDIA_PRIV** Enables the user permission to access the virtual media functionality.
- **CONFIG_ILO_PRIV** Enables the user to configure iLO settings.

```python
salt.modules.ilo.delete_ssh_key(username)
```
Delete a user's SSH key from the ILO

CLI Example:
```
salt '*' ilo.delete_user_sshkey damian
```

```python
salt.modules.ilo.delete_user(username)
```
Delete a user

CLI Example:
```
salt '*' ilo.delete_user damian
```

```python
salt.modules.ilo.disable_dhcp()
```
Disable DHCP

CLI Example:
```
salt '*' ilo.disable_dhcp
```

```python
salt.modules.ilo.disable_ssh()
```
Disable the SSH daemon

CLI Example:
```
salt '*' ilo.disable_ssh
```

```python
salt.modules.ilo.enable_dhcp()
```
Enable DHCP

CLI Example:
```
salt '*' ilo.enable_dhcp
```

```python
salt.modules.ilo.enable_ssh()
```
Enable the SSH daemon

CLI Example:
```
salt '*' ilo.enable_ssh
```

```python
salt.modules.ilo.get_user(username)
```
Returns local user information, excluding the password

CLI Example:
```
salt '*' ilo.get_user damian
```

```python
salt.modules.ilo.global_settings()
```
Show global settings
CLI Example:
```
salt '*' ilo.global_settings
```

salt.modules.ilo.list_users()
List all users

CLI Example:
```
salt '*' ilo.list_users
```

salt.modules.ilo.list_users_info()
List all users in detail

CLI Example:
```
salt '*' ilo.list_users_info
```

salt.modules.ilo.network()
Grab the current network settings

CLI Example:
```
salt '*' ilo.network
```

salt.modules.ilo.set_http_port(port=80)
Configure the port HTTP should listen on

CLI Example:
```
salt '*' ilo.set_http_port 8080
```

salt.modules.ilo.set_https_port(port=443)
Configure the port HTTPS should listen on

CLI Example:
```
salt '*' ilo.set_https_port 4334
```

salt.modules.ilo.set_ssh_key(public_key)
Configure SSH public keys for specific users

CLI Example:
```
salt '*' ilo.set_ssh_key "ssh-dss AAAAB3NzaC1kc3MAAACBA... damian"
```

The SSH public key needs to be DSA and the last argument in the key needs to be the username (case-sensitive) of the ILO username.

salt.modules.ilo.set_ssh_port(port=22)
Enable SSH on a user defined port

CLI Example:
```
salt '*' ilo.set_ssh_port 2222
```

19.9.151 salt.modules.icinga2 module

Module to provide icinga2 compatibility to salt.
New in version 2017.7.0.

depends
  - icinga2 server

salt.modules.icinga2.generate_cert(domain)
  Generate an icinga2 client certificate and key.
  Returns: icinga2 pki new-cert --cn domain.tld --key /etc/icinga2/pki/domain.tld.key --cert /etc/icinga2/pki/domain.tld.crt
  CLI Example:

  ```
  salt '*' icinga2.generate_cert domain.tld
  ```

salt.modules.icinga2.generate_ticket(domain)
  Generate and save an icinga2 ticket.
  Returns: icinga2 pki ticket --cn domain.tld
  CLI Example:

  ```
  salt '*' icinga2.generate_ticket domain.tld
  ```

salt.modules.icinga2.node_setup(domain, master, ticket)
  Setup the icinga2 node.
  Returns: icinga2 node setup --ticket TICKET_ID --endpoint master.domain.tld --zone domain.tld --master_host master.domain.tld --trustedcert /etc/icinga2/pki/trusted-master.crt
  CLI Example:

  ```
  salt '*' icinga2.node_setup domain.tld master.domain.tld TICKET_ID
  ```

salt.modules.icinga2.request_cert(domain, master, ticket, port)
  Request CA cert from master icinga2 node.
  Returns: icinga2 pki request --host master.domain.tld --port 5665 --ticket TICKET_ID --key /etc/icinga2/pki/domain.tld.key --cert /etc/icinga2/pki/domain.tld.crt --trustedcert /etc/icinga2/pki/trusted-master.crt --ca /etc/icinga2/pki/ca.crt
  CLI Example:

  ```
  salt '*' icinga2.request_cert domain.tld master.domain.tld TICKET_ID
  ```

salt.modules.icinga2.save_cert(domain, master)
  Save the certificate for master icinga2 node.
  Returns: icinga2 pki save-cert --key /etc/icinga2/pki/domain.tld.key --cert /etc/icinga2/pki/domain.tld.crt --trustedcert /etc/icinga2/pki/trusted-master.crt --host master.domain.tld
  CLI Example:

  ```
  salt '*' icinga2.save_cert domain.tld master.domain.tld
  ```

19.9.152 salt.modules.incron

Work with incron

salt.modules.incron.list_tab(user)
  Return the contents of the specified user's incrontab
  CLI Example:

  ```
  salt '*' incron.list_tab root
  ```
salt.modules.incron.ls(<user>)
This function is an alias of list_tab.
Return the contents of the specified user's incrontab

CLI Example:
```
salt '*' incron.list_tab root
```

salt.modules.incron.raw_incron(<user>)
Return the contents of the user's incrontab

CLI Example:
```
salt '*' incron.raw_incron root
```

salt.modules.incron.raw_system_incron()
Return the contents of the system wide incrontab

CLI Example:
```
salt '*' incron.raw_system_incron
```

salt.modules.incron.rm(<user>, <path>, <mask>, <cmd>)
This function is an alias of rm_job.
Remove a incron job for a specified user. If any of the day/time params are specified, the job will only be removed if the specified params match.

CLI Example:
```
salt '*' incron.rm_job root /path
```

salt.modules.incron.rm_job(<user>, <path>, <mask>, <cmd>)
Remove a incron job for a specified user. If any of the day/time params are specified, the job will only be removed if the specified params match.

CLI Example:
```
salt '*' incron.rm_job root /path
```

salt.modules.incron.set_job(<user>, <path>, <mask>, <cmd>)
Sets an incron job up for a specified user.

CLI Example:
```
salt '*' incron.set_job root '/root' 'IN_MODIFY' 'echo "$@ $% $&"
```

salt.modules.incron.write_incron_file(<user>, <path>)
Writes the contents of a file to a user's incrontab

CLI Example:
```
salt '*' incron.write_incron_file root /tmp/new_incron
```

salt.modules.incron.write_incron_file_verbose(<user>, <path>)
Writes the contents of a file to a user's incrontab and return error message on error

CLI Example:
```
salt '*' incron.write_incron_file_verbose root /tmp/new_incron
```
19.9.153  salt.modules.influx

InfluxDB - A distributed time series database

Module to provide InfluxDB compatibility to Salt (compatible with InfluxDB version 0.9+)

depends

- influxdb Python module (>= 3.0.0)

configuration

This module accepts connection configuration details either as parameters or as configuration settings in /etc/salt/minion on the relevant minions:

```yaml
influxdb.host: 'localhost'
influxdb.port: 8086
influxdb.user: 'root'
influxdb.password: 'root'
```

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

Most functions in this module allow you to override or provide some or all of these settings via keyword arguments:

```python
salt '*' influxdb.foo_function user='influxadmin' password='s3cr1t'
```

would override user and password while still using the defaults for host and port.

salt.modules.influx.alterRetentionPolicy(database, name, duration, replication, default=False, **client_args)

Modify an existing retention policy.

- name Name of the retention policy to modify.
- database Name of the database for which the retention policy was defined.
- duration New duration of given retention policy.
  
  Durations such as 1h, 90m, 12h, 7d, and 4w, are all supported and mean 1 hour, 90 minutes, 12 hours, 7 day, and 4 weeks, respectively. For infinite retention – meaning the data will never be deleted – use 'INF' for duration. The minimum retention period is 1 hour.

- replication New replication of given retention policy.
  
  This determines how many independent copies of each data point are stored in a cluster.

- default [False] Whether or not to set the modified policy as default.

CLI Example:

```python
salt '*' influxdb.alterRetentionPolicy metrics default 1d 1
```

salt.modules.influx.continuousQueryExists(database, name, **client_args)

Check if continuous query with given name exists on the database.

- database Name of the database for which the continuous query was defined.
- name Name of the continuous query to check.

CLI Example:

```python
salt '*' influxdb.continuousQueryExists metrics default
```

salt.modules.influx.createContinuousQuery(database, name, query, resample_time=None, coverage_period=None, **client_args)

Create a continuous query.

- database Name of the database for which the continuous query will be created on.
- name Name of the continuous query to create.
- query The continuous query string.
resample_time [None] Duration between continuous query resampling.
coverage_period [None] Duration specifying time period per sample.

CLI Example:

```bash
salt '*' influxdb.create_continuous_query mydb cq_month 'SELECT mean(*) INTO mydb.a_month.:MEASUREMENT FROM mydb.a_week./.*/ GROUP BY time(5m), *'
```

salt.modules.influx.create_db(name, **client_args)
Create a database.
name Name of the database to create.

CLI Example:

```bash
salt '*' influxdb.create_db <name>
```

salt.modules.influx.create_retention_policy(database, name, duration, replication, default=False, **client_args)
Create a retention policy.
database Name of the database for which the retention policy will be created.
name Name of the new retention policy.
duration Duration of the new retention policy.
    Durations such as 1h, 90m, 12h, 7d, and 4w, are all supported and mean 1 hour, 90 minutes, 12 hours, 7 day, and 4 weeks, respectively. For infinite retention – meaning the data will never be deleted – use 'INF' for duration. The minimum retention period is 1 hour.
replication Replication factor of the retention policy.
    This determines how many independent copies of each data point are stored in a cluster.
default [False] Whether or not the policy as default will be set as default.

CLI Example:

```bash
salt '*' influxdb.create_retention_policy metrics default 1d 1
```

salt.modules.influx.create_user(name, password, admin=False, **client_args)
Create a user.
name Name of the user to create.
password Password of the new user.
admin [False] Whether the user should have cluster administration privileges or not.

CLI Example:

```bash
salt '*' influxdb.create_user <name> <password>
salt '*' influxdb.create_user <name> <password> admin=True
```

salt.modules.influx.db_exists(name, **client_args)
Checks if a database exists in InfluxDB.
name Name of the database to check.

CLI Example:

```bash
salt '*' influxdb.db_exists <name>
```

salt.modules.influx.drop_continuous_query(database, name, **client_args)
Drop a continuous query.
database Name of the database for which the continuous query will be drop from.
name Name of the continuous query to drop.

CLI Example:

```bash
salt '*' influxdb.drop_continuous_query mydb my_cq
```
salt.modules.influx.drop_db(name, **client_args)
    Drop a database.
    name Name of the database to drop.
    CLI Example:
    salt '*' influxdb.drop_db <name>

salt.modules.influx.drop_retention_policy(database, name, **client_args)
    Drop a retention policy.
    database Name of the database for which the retention policy will be dropped.
    name Name of the retention policy to drop.
    CLI Example:
    salt '*' influxdb.drop_retention_policy mydb mypr

salt.modules.influx.get_continuous_query(database, name, **client_args)
    Get an existing continuous query.
    database Name of the database for which the continuous query was defined.
    name Name of the continuous query to get.
    CLI Example:
    salt '*' influxdb.get_continuous_query mydb cq_month

salt.modules.influx.get_retention_policy(database, name, **client_args)
    Get an existing retention policy.
    database Name of the database for which the retention policy was defined.
    name Name of the retention policy.
    CLI Example:
    salt '*' influxdb.get_retention_policy metrics default

salt.modules.influx.grant_admin_privileges(name, **client_args)
    Grant cluster administration privileges to a user.
    name Name of the user to whom admin privileges will be granted.
    CLI Example:
    salt '*' influxdb.grant_admin_privileges <name>

salt.modules.influx.grant_privilege(database, privilege, username, **client_args)
    Grant a privilege on a database to a user.
    database Name of the database to grant the privilege on.
    privilege Privilege to grant. Can be one of 'read', 'write' or 'all'.
    username Name of the user to grant the privilege to.

salt.modules.influx.list_dbs(**client_args)
    List all InfluxDB databases.
    CLI Example:
    salt '*' influxdb.list_dbs

salt.modules.influx.list_privileges(name, **client_args)
    List privileges from a user.
    name Name of the user from whom privileges will be listed.
    CLI Example:
salt '*

```
salt '*' influxdb.list_privileges <name>
```

```
salt.modules.influx.list_users(**client_args)
List all users.

CLI Example:

```
salt '*' influxdb.list_users
```

```
salt.modules.influx.query(database, query, **client_args)
Execute a query.
database Name of the database to query on.
query InfluxQL query string.
```

```
salt.modules.influx.remove_user(name, **client_args)
Remove a user.
name Name of the user to remove

CLI Example:

```
salt '*' influxdb.remove_user <name>
```

```
salt.modules.influx.retention_policy_exists(database, name, **client_args)
Check if retention policy with given name exists.
database Name of the database for which the retention policy was defined.
name Name of the retention policy to check.

CLI Example:

```
salt '*' influxdb.retention_policy_exists metrics default
```

```
salt.modules.influx.revoke_admin_privileges(name, **client_args)
Revoke cluster administration privileges from a user.
name Name of the user from whom admin privileges will be revoked.

CLI Example:

```
salt '*' influxdb.revoke_admin_privileges <name>
```

```
salt.modules.influx.revoke_privilege(database, privilege, username, **client_args)
Revoke a privilege on a database from a user.
database Name of the database to grant the privilege on.
privilege Privilege to grant. Can be one of `read`, `write' or `all'.
username Name of the user to grant the privilege to.
```

```
salt.modules.influx.set_user_password(name, password, **client_args)
Change password of a user.
name Name of the user for whom to set the password.
password New password of the user.

CLI Example:

```
salt '*' influxdb.set_user_password <name> <password>
```

```
salt.modules.influx.user_exists(name, **client_args)
Check if a user exists.
name Name of the user to check.

CLI Example:

```
```
salt '™ influxdb.user_exists <name>

salt.modules.influx.user_info(name, **client_args)
Get information about given user.
  name Name of the user for which to get information.
CLI Example:
salt '™ influxdb.user_info <name>

19.9.154 salt.modules.influx08 module

InfluxDB - A distributed time series database

Module to provide InfluxDB compatibility to Salt (compatible with InfluxDB version 0.5-0.8)

New in version 2014.7.0.

depends
  • influxdb Python module (>= 1.0.0)

configuration This module accepts connection configuration details either as parameters or as config-
  uration settings in /etc/salt/minion on the relevant minions:

```python
influxdb08.host: 'localhost'
influxdb08.port: 8086
influxdb08.user: 'root'
influxdb08.password: 'root'
```

This data can also be passed into pillar. Options passed into opts will overwrite options passed
into pillar.

salt.modules.influx08.db_create(name, user=None, password=None, host=None, port=None)
Create a database
  name Database name to create
  user The user to connect as
  password The password of the user
  host The host to connect to
  port The port to connect to
CLI Example:
salt '™ influxdb08.db_create <name>
salt '™ influxdb08.db_create <name> <user> <password> <host> <port>

salt.modules.influx08.db_exists(name, user=None, password=None, host=None, port=None)
Checks if a database exists in Influxdb
  name Database name to create
  user The user to connect as
  password The password of the user
  host The host to connect to
  port The port to connect to
CLI Example:
salt '™ influxdb08.db_exists <name>
salt '™ influxdb08.db_exists <name> <user> <password> <host> <port>
salt.modules.influx08.db_list

List all InfluxDB databases

- **user**: The user to connect as
- **password**: The password of the user
- **host**: The host to connect to
- **port**: The port to connect to

CLI Example:

```
salt '*' influxdb08.db_list
salt '*' influxdb08.db_list <user> <password> <host> <port>
```

salt.modules.influx08.db_remove

Remove a database

- **name**: Database name to remove
- **user**: The user to connect as
- **password**: The password of the user
- **host**: The host to connect to
- **port**: The port to connect to

CLI Example:

```
salt '*' influxdb08.db_remove <name>
salt '*' influxdb08.db_remove <name> <user> <password> <host> <port>
```

salt.modules.influx08.login_test

Checks if a credential pair can log in at all.

If a database is specified: it will check for database user existence. If a database is not specified: it will check for cluster admin existence.

- **name**: The user to connect as
- **password**: The password of the user
- **database**: The database to try to log in to
- **host**: The host to connect to
- **port**: The port to connect to

CLI Example:

```
salt '*' influxdb08.login_test <name>
salt '*' influxdb08.login_test <name> <database>
salt '*' influxdb08.login_test <name> <database> <user> <password> <host> <port>
```

salt.modules.influx08.query

Querying data

- **database**: The database to query
- **query**: Query to be executed
- **time_precision**: Time precision to use (`s', `m', or `u')
- **chunked**: Whether is chunked or not
- **user**: The user to connect as
- **password**: The password of the user
- **host**: The host to connect to
- **port**: The port to connect to

CLI Example:

```
salt '*' influxdb08.query <database> <query>
salt '*' influxdb08.query <database> <query> <time_precision> <chunked> <user> <password> <host> <port>
```
salt.modules.influx08.retention_policy_add(database, name, duration, replication, default=False, user=None, password=None, host=None, port=None)

Add a retention policy.

database  The database to operate on.
name      Name of the policy to modify.
duration  How long InfluxDB keeps the data.
replication How many copies of the data are stored in the cluster.
default    Whether this policy should be the default or not. Default is False.

CLI Example:
```
salt '*' influxdb.retention_policy_add metrics default 1d 1
```

salt.modules.influx08.retention_policy_alter(database, name, duration, replication, default=False, user=None, password=None, host=None, port=None)

Modify an existing retention policy.

database  The database to operate on.
name      Name of the policy to modify.
duration  How long InfluxDB keeps the data.
replication How many copies of the data are stored in the cluster.
default    Whether this policy should be the default or not. Default is False.

CLI Example:
```
salt '*' influxdb08.retention_policy_modify metrics default 1d 1
```

salt.modules.influx08.retention_policy_exists(database, name, user=None, password=None, host=None, port=None)

Check if a retention policy exists.

database  The database to operate on.
name      Name of the policy to modify.

CLI Example:
```
salt '*' influxdb08.retention_policy_exists metrics default
```

salt.modules.influx08.retention_policy_get(database, name, user=None, password=None, host=None, port=None)

Get an existing retention policy.

database  The database to operate on.
name      Name of the policy to modify.

CLI Example:
```
salt '*' influxdb08.retention_policy_get metrics default
```

salt.modules.influx08.user_chpass(name, passwd, database=None, user=None, password=None, host=None, port=None)

Change password for a cluster admin or a database user.

If a database is specified: it will update database user password. If a database is not specified: it will update cluster admin password.

name      User name for whom to change the password
passwd    New password
database  The database on which to operate
user      The user to connect as
password  The password of the user
host      The host to connect to
port  The port to connect to
  CLI Example:

```bash
salt '*' influxdb08.user_chpass <name> <passwd>
salt '*' influxdb08.user_chpass <name> <passwd> <database>
salt '*' influxdb08.user_chpass <name> <passwd> <database> <user> <password>
  <-<host> <port>
```

**salt.modules.influx08.user_create**

Create a cluster admin or a database user.

If a database is specified: it will create database user. If a database is not specified: it will create a cluster admin.

- **name**  User name for the new user to create
- **passwd**  Password for the new user to create
- **database**  The database to create the user in
- **user**  The user to connect as
- **password**  The password of the user
- **host**  The host to connect to
- **port**  The port to connect to

  CLI Example:

```bash
salt '*' influxdb08.user_create <name> <passwd>
salt '*' influxdb08.user_create <name> <passwd> <database>
salt '*' influxdb08.user_create <name> <passwd> <database> <user> <password>
  <-<host> <port>
```

**salt.modules.influx08.user_exists**

Checks if a cluster admin or database user exists.

If a database is specified: it will check for database user existence. If a database is not specified: it will check for cluster admin existence.

- **name**  User name
- **database**  The database to check for the user to exist
- **user**  The user to connect as
- **password**  The password of the user
- **host**  The host to connect to
- **port**  The port to connect to

  CLI Example:

```bash
salt '*' influxdb08.user_exists <name>
salt '*' influxdb08.user_exists <name> <database>
salt '*' influxdb08.user_exists <name> <database> <user> <password> <host> <port>
```

**salt.modules.influx08.user_list**

List cluster admins or database users.

If a database is specified: it will return database users list. If a database is not specified: it will return cluster admins list.

- **database**  The database to list the users from
- **user**  The user to connect as
- **password**  The password of the user
- **host**  The host to connect to
- **port**  The port to connect to
CLI Example:

```
salt '*' influxdb08.user_list
salt '*' influxdb08.user_list <database>
salt '*' influxdb08.user_list <database> <user> <password> <host> <port>
```

```python
salt.modules.influx08.user_remove(name, database=None, user=None, password=None, host=None, port=None)
```

Remove a cluster admin or a database user.

If a database is specified: it will remove the database user. If a database is not specified: it will remove the cluster admin.

- **name** User name to remove
- **database** The database to remove the user from
- **user** User name for the new user to delete
- **password** The password of the user
- **host** The host to connect to
- **port** The port to connect to

CLI Example:

```
salt '*' influxdb08.user_remove <name>
salt '*' influxdb08.user_remove <name> <database>
salt '*' influxdb08.user_remove <name> <database> <user> <password> <host> <port>
```

### 19.9.155 salt.modules.infoblox

Module for managing Infoblox

Will look for pillar data infoblox:server, infoblox:user, infoblox:password if not passed to functions

New in version 2016.3.0.

```
depends
  • requests
```

```python
salt.modules.infoblox.add_record(name, value, record_type, dns_view, infoblox_server=None,
infoblox_user=None, infoblox_password=None, infoblox_api_version='v1.4.2', sslVerify=True)
```

add a record to an infoblox dns view

- **name** the record name
- **value** the value for the entry can make use of infoblox functions for next available IP, like `func:nextavailableip:10.1.0.0/24`
- **record_type** the record type (cname, a, host, etc)
- **dns_view** the DNS view to add the record to
- **infoblox_server** the infoblox server hostname (can also use the infoblox:server pillar)
- **infoblox_user** the infoblox user to connect with (can also use the infoblox:user pillar)
- **infoblox_password** the infoblox user's password (can also use the infoblox:password pillar)
- **infoblox_api_version** the infoblox api version to use
- **sslVerify** should ssl verification be done on the connection to the Infoblox REST API

CLI Example:

```
salt 'myminion' infoblox.add_record alias.network.name canonical.network.name
```

---

Chapter 19. Salt Module Reference
salt.modules.infoblox.delete_record(name, dns_view, record_type, infoblox_server=None, infoblox_user=None, infoblox_password=None, infoblox_api_version='v1.4.2', sslVerify=True)

delete a record
name name of the record
dns_view the DNS view to remove the record from
record_type the record type (a, cname, host, etc)
infoblox_server the infoblox server hostname (can also use the infoblox:server pillar)
infoblox_user the infoblox user to connect with (can also use the infoblox:user pillar)
infoblox_password the infoblox user's password (can also use the infoblox:password pillar)
infoblox_api_version the infoblox api version to use
sslVerify should ssl verification be done on the connection to the Infoblox REST API

CLI Example:

```shell
salt my-minion infoblox.delete_record some.dns.record MyInfobloxView A Ø
```

salt.modules.infoblox.get_network(network_name, network_view=None, infoblox_server=None, infoblox_user=None, infoblox_password=None, infoblox_api_version='v1.4.2', sslVerify=True)

get a network from infoblox
network_name The name of the network in IPAM
network_view The name of the network view the network belongs to
infoblox_server the infoblox server hostname (can also use the infoblox:server pillar)
infoblox_user the infoblox user to connect with (can also use the infoblox:user pillar)
infoblox_password the infoblox user's password (can also use the infoblox:password pillar)
infoblox_api_version the infoblox api version to use
sslVerify should ssl verification be done on the connection to the Infoblox REST API

CLI Example:

```shell
salt myminion infoblox.get_network '10.0.0.0/8'
```

salt.modules.infoblox.get_record(record_name, record_type='host', infoblox_server=None, infoblox_user=None, infoblox_password=None, dns_view=None, infoblox_api_version='v1.4.2', sslVerify=True)

get a record from infoblox
record_name name of the record to search for
record_type type of record to search for (host, cname, a, etc...defaults to host)
infoblox_server the infoblox server hostname (can also use the infoblox:server pillar)
infoblox_user the infoblox user to connect with (can also use the infoblox:user pillar)
infoblox_password the infoblox user's password (can also use the infoblox:password pillar)
dns_view the infoblox DNS view to search, if not specified all views are searched
infoblox_api_version the infoblox api version to use
sslVerify should ssl verification be done on the connection to the Infoblox REST API

CLI Example:

```shell
salt myminion infoblox.get_record some.host.com A Ø
sslVerify=False
```

salt.modules.infoblox.update_record(name, value, dns_view, record_type, infoblox_server=None, infoblox_user=None, infoblox_password=None, infoblox_api_version='v1.4.2', sslVerify=True)

update an entry to an infoblox dns view
name the dns name
value the value for the record
record_type the record type (a, cname, etc)
**dns_view** the DNS view to add the record to
**infoblox_server** the infoblox server hostname (can also use the infoblox:server pillar)
**infoblox_user** the infoblox user to connect with (can also use the infoblox:user pillar)
**infoblox_password** the infoblox user's password (can also use the infoblox:password pillar)
**infoblox_api_version** the infoblox api version to use

**sslVerify** should ssl verification be done on the connection to the Infoblox REST API

CLI Example:

```bash
salt '*' infoblox.update_record alias.network.name canonical.network.name
    --MyInfobloxView cnez sslVerify=False
```

### 19.9.156 salt.modules.ini_manage

Edit ini files

- **maintainer** <akilesh1597@gmail.com>
- **maturity** new
- **depends** re
- **platform** all

(for example /etc/sysctl.conf)

salt.modules.ini_manage.get_option(file_name, section, option, separator='=')

Get value of a key from a section in an ini file. Returns None if no matching key was found.

API Example:

```python
import salt
sc = salt.client.get_local_client()
sc.cmd('target', 'ini.get_option',
    [path_to_ini_file, section_name, option])
```

CLI Example:

```bash
salt '*' ini.get_option /path/to/ini section_name option_name
```

salt.modules.ini_manage.get_section(file_name, section, separator='=')

Retrieve a section from an ini file. Returns the section as dictionary. If the section is not found, an empty dictionary is returned.

API Example:

```python
import salt
sc = salt.client.get_local_client()
sc.cmd('target', 'ini.get_section',
    [path_to_ini_file, section_name])
```

CLI Example:

```bash
salt '*' ini.get_section /path/to/ini section_name
```

salt.modules.ini_manage.remove_option(file_name, section, option, separator='=')

Remove a key/value pair from a section in an ini file. Returns the value of the removed key, or None if nothing was removed.

API Example:
import salt
sc = salt.client.get_local_client()
sc.cmd('target', 'ini.remove_option',
       [path_to_ini_file, section_name, option])

CLI Example:
salt '*' ini.remove_option /path/to/ini section_name option_name

salt.modules.ini_manage.remove_section(file_name, section, separator='=')
Remove a section in an ini file. Returns the removed section as dictionary, or None if nothing was removed.

API Example:
import salt
sc = salt.client.get_local_client()
sc.cmd('target', 'ini.remove_section',
       [path_to_ini_file, section_name])

CLI Example:
salt '*' ini.remove_section /path/to/ini section_name

salt.modules.ini_manage.set_option(file_name, sections=None, separator='=')
Edit an ini file, replacing one or more sections. Returns a dictionary containing the changes made.

file_name path of ini file
sections [None] A dictionary representing the sections to be edited ini file The keys are the section names and the values are the dictionary containing the options If the ini file does not contain sections the keys and values represent the options
separator [-] A character used to separate keys and values. Standard ini files use the ``='' character.

New in version 2016.11.0.

API Example:
import salt
sc = salt.client.get_local_client()
sc.cmd('target', 'ini.set_option',
       ['path_to_ini_file', '{"section_to_change": {"key": "value"}}'])

CLI Example:
salt '*' ini.set_option /path/to/ini '{section_foo: {key: value}}'

19.9.157 salt.modules.inspectlib package

Submodules

salt.modules.inspectlib.collector module

class salt.modules.inspectlib.collector.Inspector(cachedir=None, piddir=None, pidfile=
        name=None)

DEFAULT_MINION_CONFIG_PATH = '/etc/salt/minion'

IGNORE_FS_TYPES = ['autofs', 'cifs', 'nfs', 'nfs4']

19.9. execution modules
**IGNORE_MOUNTS** = ['proc', 'sysfs', 'devtmpfs', 'tmpfs', 'fuse.gvfs-fuse-daemon']

**IGNORE_PATHS** = ['/tmp', '/var/tmp', '/lost+found', '/var/run', '/var/lib/rpm', '/.snapshots', '/.zfs', '/etc/ssh', '/root', '/]

**MODE** = ['configuration', 'payload', 'all']

```python
build(format='qcow2', path='/tmp')
```

Build an image using Kiwi.

Parameters

- format
- path

Returns

```python
create_snapshot()
```

Open new snapshot.

Returns

```python
export(description, local=False, path='/tmp', format='qcow2')
```

Export description for Kiwi.

Parameters

- local
- path

Returns

```python
request_snapshot(mode, priority=19, **kwargs)
```

Take a snapshot of the system.

```python
reuse_snapshot()
```

Open an existing, latest snapshot.

Returns

```python
snapshot(mode)
```

Take a snapshot of the system.

```python
salt.modules.inspectlib.collector.is_alive(pidfile)
```

Check if PID is still alive.

```python
salt.modules.inspectlib.collector.main(dbfile, pidfile, mode)
```

Main analyzer routine.

```python
salt.modules.inspectlib.dbhandle module
```

class salt.modules.inspectlib.dbhandle.DBHandle(path)

class salt.modules.inspectlib.dbhandle.DBHandleBase(path)

Handle for the volatile database, which serves the purpose of caching the inspected data. This database can be destroyed or corrupted, so it should be simply re-created from scratch.

```python
close()
```

Close the database connection.

```python
flush(table)
```

Flush the table.
**open**(new=True)
Init the database, if required.

**purge**()
Purge whole database.

### salt.modules.inspectlib.exceptions module

e**xception** salt.modules.inspectlib.exceptions.**InspectorKiwiProcessorException**
Kiwi builder/exporter exception.

e**xception** salt.modules.inspectlib.exceptions.**InspectorQueryException**
Exception that is only for the inspector query.

e**xception** salt.modules.inspectlib.exceptions.**InspectorSnapshotException**
Snapshot exception.

e**xception** salt.modules.inspectlib.exceptions.**SIException**
System information exception.

### salt.modules.inspectlib.query module

c**lass** salt.modules.inspectlib.query.**Query**(scope, cachedir=None)
Query the system. This class is actually puts all Salt features together, so there would be no need to pick it from various places.

**SCOPES** = ['changes', 'configuration', 'identity', 'system', 'software', 'services', 'payload', 'all']

c**lass** salt.modules.inspectlib.query.**SysInfo**(systype)
System information.

### Module contents

c**lass** salt.modules.inspectlib.**EnvLoader**(cachedir=None, piddir=None, pidfilename=None)
Load environment.

- **DB_FILE** = `.minion_collector.db`
- **DEFAULT_CACHE_PATH** = `/var/cache/salt`
- **DEFAULT_PID_PATH** = `/var/run`
- **PID_FILE** = `.minion_collector.pid`

### 19.9.158 salt.modules.inspectlib.entities module

c**lass** salt.modules.inspectlib.entities.**AllowedDir**
Allowed directories

c**lass** salt.modules.inspectlib.entities.**IgnoredDir**
Ignored directories

c**lass** salt.modules.inspectlib.entities.**Package**
Package.

c**lass** salt.modules.inspectlib.entities.**PackageCfgFile**
Config file, belongs to the package
class salt.modules.inspectlib.entities.PayloadFile
    Payload file.

19.9.159 salt.modules.inspectlib.fsdb module

codeauthor Bo Maryniuk <bo@suse.de>

class salt.modules.inspectlib.fsdb.CsvDB(path)
    File-based CSV database. This database is in-memory operating relatively small plain text csv files.

    close()
        Close the database.

    Returns

    create_table_from_object(obj)
        Create a table from the object. NOTE: This method doesn't stores anything.

        Parameters
            obj --

        Returns

    delete(obj, matches=None, mt=None, lt=None, eq=None)
        Delete object from the database.

        Parameters
            obj --
            matches -- Regexp.
            mt -- More than.
            lt -- Less than.
            eq -- Equals.

        Returns

    flush(table)
        Flush table.

        Parameters
            table --

        Returns

    get(obj, matches=None, mt=None, lt=None, eq=None)
        Get objects from the table.

        Parameters
            obj --
            matches -- Regexp.
            mt -- More than.
            lt -- Less than.
            eq -- Equals.

        Returns

    is_closed()
        Return if the database is closed.

        Returns
list()
List all the databases on the given path.

Returns

list_tables()
Load existing tables and their descriptions.

Returns

new()
Create a new database and opens it.

Returns

open(dbname=None)
Open database from the path with the name or latest. If there are no yet databases, create a new implicitly.

Returns

purge(dbid)
Purge the database.

Parameters dbid --

Returns

store(obj, distinct=False)
Store an object in the table.

Parameters

• obj -- An object to store
• distinct -- Store object only if there is none identical of such. If at least one field is different, store it.

Returns

update(obj, matches=None, mt=None, lt=None, eq=None)
Update object(s) in the database.

Parameters

• obj --
• matches --
• mt --
• lt --
• eq --

Returns

class salt.modules.inspectlib.fsdb.CsvDBEntity
Serializable object for the table.

19.9.160 salt.modules.inspectlib.kiwiproc module

class salt.modules.inspectlib.kiwiproc.KiwiExporter(grains, format)
Exports system description as Kiwi configuration.
export(name)
Export to the Kiwi config.xml as text.

Returns

load("*descr")
Load data by keys.

Parameters data --

Returns

19.9.161 salt.modules.inspector module

Module for full system inspection.

salt.modules.inspector.build(format='qcow2', path='/tmp/)
Build an image from a current system description. The image is a system image can be output in bootable ISO or QCOW2 formats.

Node uses the image building library Kiwi to perform the actual build.

Parameters:
- **format**: Specifies output format: ```qcow2``` or ```iso```. Default: qcow2.
- **path**: Specifies output path where to store built image. Default: `/tmp`

CLI Example:

```shell
salt myminion inspector.build
salt myminion inspector.build format=iso path=/opt/builds/
```

salt.modules.inspector.delete(all=False, `databases)
Remove description snapshots from the system.

:parameter: all. Default: False. Remove all snapshots, if set to True.

CLI example:

```shell
salt myminion inspector.delete <ID> <ID1> <ID2>..
salt myminion inspector.delete all=True
```

salt.modules.inspector.export(local=False, path='/tmp', format='qcow2')
Export an image description for Kiwi.

Parameters:
- **local**: Specifies True or False if the export has to be in the local file. Default: False.
- **path**: If local=True, then specifies the path where file with the Kiwi description is written. Default: `/tmp`

CLI Example:

```shell
salt myminion inspector.export
salt myminion inspector.export format=iso path=/opt/builds/
```

salt.modules.inspector.inspect(mode='all', priority=19, **kwargs)
Start node inspection and save the data to the database for further query.

Parameters:
- **mode**: Clarify inspection mode: configuration, payload, all (default)
- payload
  - **filter**: Comma-separated directories to track payload.
•**priority**: (advanced) Set priority of the inspection. Default is low priority.

CLI Example:
```bash
salt '*' inspector.inspect
salt '*' inspector.inspect configuration
salt '*' inspector.inspect payload filter=/opt,/ext/oracle
```

```
salt.modules.inspector.query(*args, **kwargs)
Query the node for specific information.

Parameters:
•**scope**: Specify scope of the query.
  • **System**: Return system data.
  • **Software**: Return software information.
  • **Services**: Return known services.
  • **Identity**: Return user accounts information for this system.
    • **accounts**: Can be either `local', `remote' or `all' (equal to `local,remote`). Remote accounts cannot be resolved on all systems, but only those, which supports `passwd -S -a`.
    • **disabled**: True (or False, default) to return only disabled accounts.

•**payload**: Payload scope parameters:
  • **filter**: Include only results which path starts from the filter string.
  • **time**: Display time in Unix ticks or format according to the configured TZ (default) Values: ticks, tz (default)
  • **size**: Format size. Values: B, KB, MB, GB
  • **type**: Include payload type. Values (comma-separated): directory (or dir), link, file (default) Example (returns everything): type=directory,link,file
  • **owners**: Resolve UID/GID to an actual names or leave them numeric (default). Values: name (default), id
  • **brief**: Return just a list of payload elements, if True. Default: False.

•**all**: Return all information (default).

CLI Example:
```bash
salt '*' inspector.query scope=system
salt '*' inspector.query scope=payload type=file,link filter=/etc size=Kb brief=False
```

```
salt.modules.inspector.snapshots()
List current description snapshots.

CLI Example:
```bash
salt myminion inspector.snapshots
```

**19.9.162 salt.modules.introspect**

Functions to perform introspection on a minion, and return data in a format usable by Salt States
salt.modules.introspect.enabled_service_owners()
Return which packages own each of the services that are currently enabled.

CLI Example:
salt myminion introspect.enabled_service_owners

salt.modules.introspect.running_service_owners(exclude=('/dev', '/home', '/media',
'/proc', '/run', '/sys', '/tmp', '/var'))
Determine which packages own the currently running services. By default, excludes files whose full path
starts with /dev, /home, /media, /proc, /run, /sys, /tmp and /var. This can be overridden by
passing in a new list to exclude.

CLI Example:
salt myminion introspect.running_service_owners

salt.modules.introspect.service_highstate(requires=True)
Return running and enabled services in a highstate structure. By default also returns package dependencies
for those services, which means that package definitions must be created outside this function. To drop the
package dependencies, set requires to False.

CLI Example:
salt myminion introspect.service_highstate salt myminion introspect.service_highstate re-
quires=False

19.9.163 salt.modules.ipmi

Support IPMI commands over LAN. This module does not talk to the local systems hardware through IPMI drivers.
It uses a python module pyghmi.

depends Python module pyghmi. You can install pyghmi using pip:

    pip install pyghmi

configuration The following configuration defaults can be define (pillar or config files):

    ipmi.config:
    api_host: 127.0.0.1
    api_user: admin
    api_pass: apassword
    api_port: 623
    api_kg: None

Usage can override the config defaults:

    salt-call ipmi.get_user api_host=myipmienabled.system
    api_user=admin api_pass=pass
    uid=1

salt.modules.ipmi.create_user(uid, name, password, channel=14, callback=False, link_auth=True,
ipmi_msg=True, privilege_level='administrator', **kwargs)
create/ensure a user is created with provided settings.

Parameters

- **privilege_level** -- User Privilege Limit. (Determines the maximum privilege
  level that the user is allowed to switch to on the specified channel.) * callback * user
  * operator * administrator * proprietary * no_access

- **kwargs** --
- api_host=127.0.0.1
- api_user=admin
- api_pass=example
- api_port=623
- api_kg=None

CLI Examples:

```bash
salt-call ipmi.create_user uid=2 name=steverweber api_host=172.168.0.7 api_user=admin api_pass=nevertell
```

```python
salt.modules.ipmi.fast_connect_test(**kwargs)

Returns True if connection success. This uses an aggressive timeout value!

Parameters **kwargs --

- api_host=127.0.0.1
- api_user=admin
- api_pass=example
- api_port=623
- api_kg=None

CLI Examples:

```bash
salt-call ipmi.fast_connect_test api_host=172.168.0.9
```

```python
salt.modules.ipmi.get_bootdev(**kwargs)

Get current boot device override information.

Provides the current requested boot device. Be aware that not all IPMI devices support this. Even in BMCs that claim to, occasionally the BIOS or UEFI fail to honor it. This is usually only applicable to the next reboot.

Parameters **kwargs --

- api_host=127.0.0.1
- api_user=admin
- api_pass=example
- api_port=623
- api_kg=None

CLI Example:

```bash
salt-call ipmi.get_bootdev api_host=127.0.0.1 api_user=admin api_pass=pass
```

```python
salt.modules.ipmi.get_channel_access(channel=14, read_mode='non_volatile', **kwargs)

:param kwags:api_host='127.0.0.1' api_user='admin' api_pass='example' api_port=623

Parameters

- **channel**: number [1:7]
- **read_mode** --
  - non_volatile = get non-volatile Channel Access
  - volatile = get present volatile (active) setting of Channel Access

- **kwargs** --
- api_host=127.0.0.1
- api_user=admin
- api_pass=example
- api_port=623
- api_kg=None

Return Data
A Python dict with the following keys/values:

```python
{
    alerting:
    per_msg_auth:
    user_level_auth:
    access_mode: { (ONE OF)
        0: 'disabled',
        1: 'pre_boot',
        2: 'always',
        3: 'shared'
    }
    privilege_level: { (ONE OF)
        1: 'callback',
        2: 'user',
        3: 'operator',
        4: 'administrator',
        5: 'proprietary',
    }
}
```

CLI Examples:

```
salt-call ipmi.get_channel_access channel=1
```

```
salt.modules.ipmi.get_channel_info(channel=14, **kwargs)
```

Get channel info

Parameters

- **channel** -- number [1:7]
- **kwargs** --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

Return Data
channel session supports

- no_session: channel is session-less
- single: channel is single-session
- multi: channel is multi-session
- auto: channel is session-based (channel could alternate between
  single- and multi-session operation, as can occur with a
  serial/modem channel that supports connection mode auto-detect)

CLI Examples:
salt.call ipmi.get_channel_info

```
salt.modules.ipmi.get_channel_max_user_count(channel=14, **kwargs)
    Get max users in channel

    Parameters
    • channel -- number [1:7]
    • kwargs --
        - api_host=127.0.0.1
        - api_user=admin
        - api_pass=example
        - api_port=623
        - api_kg=None

    Returns  int -- often 16
```

CLI Examples:
```
salt-call ipmi.get_channel_max_user_count
```

salt.modules.ipmi.get_health(**kwargs)
    Get Summarize health

    This provides a summary of the health of the managed system. It additionally provides an iterable list of
    reasons for warning, critical, or failed assessments.

    good health: {`badreadings': [], `health': 0}

    Parameters  kwargs --
    • api_host=127.0.0.1
    • api_user=admin
    • api_pass=example
    • api_port=623
    • api_kg=None

    CLI Example:
```
salt-call ipmi.get_health api_host=127.0.0.1 api_user=admin api_pass=pass
```

salt.modules.ipmi.get_power(**kwargs)
    Get current power state

    The response, if successful, should contain `powerstate' key and either `on' or `off' to indicate current state.

    Parameters  kwargs --
    • api_host=127.0.0.1
    • api_user=admin
    • api_pass=example
    • api_port=623
    • api_kg=None

    CLI Example:
salt-call ipmi.get_power api_host=127.0.0.1 api_user=admin api_pass=pass

salt.modules.ipmi.get_sensor_data(**kwargs)
Get sensor readings
Iterates sensor reading objects
Parameters **kwargs --
  • api_host=127.0.0.1
  • api_user=admin
  • api_pass=example
  • api_port=623
  • api_kg=None

CLI Example:
salt-call ipmi.get_sensor_data api_host=127.0.0.1 api_user=admin api_pass=pass

salt.modules.ipmi.get_user(uid, channel=14, **kwargs)
Get user from uid and access on channel
Parameters
  • uid -- user number [1:16]
  • channel -- number [1:7]
  • kwargs --
    - api_host=127.0.0.1
    - api_user=admin
    - api_pass=example
    - api_port=623
    - api_kg=None

Return Data:

name: (str)
uid: (int)
channel: (int)
access:
  - callback (bool)
  - link_auth (bool)
  - ipmi_msg (bool)
  - privilege_level: (str)[callback, user, operator, administrator, proprietary, no_access]

CLI Examples:
salt-call ipmi.get_user uid=2

salt.modules.ipmi.get_user_access(uid, channel=14, **kwargs)
Get user access
Parameters
  • uid -- user number [1:16]
  • channel -- number [1:7]
**kwargs --
- api_host=127.0.0.1
- api_user=admin
- api_pass=example
- api_port=623
- api_kg=None

Return Data

channel_info:
- max_user_count = maximum number of user IDs on this channel
- enabled_users = count of User ID slots presently in use
- users_with_fixed_names = count of user IDs with fixed names

access:
- callback
- link_auth
- ipmi_msg
- privilege_level: [reserved, callback, user, operator, administrator, proprietary, no_access]

CLI Examples:
salt-call ipmi.get_user_access uid=2

```
salt.modules.ipmi.get_user_access(uid=2, **kwargs)
```

Get user name

Parameters

- **uid** -- user number [1:16]
- **return_none_on_error** -- return None on error
- **kwargs** --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

CLI Examples:
salt-call ipmi.get_user_name uid=2

```
salt.modules.ipmi.get_user_name(uid=2, return_none_on_error=True, **kwargs)
```

Get list of users and access information

Parameters

- **channel** -- number [1:7]
- **kwargs** --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
Returns

- name: (str)
- uid: (int)
- channel: (int)
- access:
  - callback (bool)
  - link_auth (bool)
  - ipmi_msg (bool)
  - privilege_level: (str) [callback, user, operator, administrator, proprietary, no_access]

CLI Examples:

```
salt-call ipmi.get_users api_host=172.168.0.7
```

salt.modules.ipmi.raw_command(netfn, command, bridge_request=None, data=(), retry=True, delay_xmit=None, **kwargs)

Send raw ipmi command

This allows arbitrary IPMI bytes to be issued. This is commonly used for certain vendor specific commands.

Parameters

- netfn -- Net function number
- command -- Command value
- bridge_request -- The target slave address and channel number for the bridge request.
- data -- Command data as a tuple or list
- kwargs --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

Returns dict -- The response from IPMI device

CLI Examples:

```
salt-call ipmi.raw_command netfn=0x06 command=0x46 data=[0x02]
# this will return the name of the user with id 2 in bytes
```

salt.modules.ipmi.set_bootdev(bootdev='default', persist=False, uefiboow=False, **kwargs)

Set boot device to use on next reboot

Parameters

- bootdev --
  - network: Request network boot
- hd: Boot from hard drive
- safe: Boot from hard drive, requesting 'safe mode'
- optical: boot from CD/DVD/BD drive
- setup: Boot into setup utility
- default: remove any IPMI directed boot device request

• persist -- If true, ask that system firmware use this device beyond next boot. Be aware many systems do not honor this

• uefiboot -- If true, request UEFI boot explicitly. Strictly speaking, the spec suggests that if not set, the system should BIOS boot and offers no `don't care` option. In practice, this flag not being set does not preclude UEFI boot on any system I've encountered.

• kwargs --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kw=None

Returns dict or True -- If callback is not provided, the response

CLI Examples:

```
salt-call ipmi.set_bootdev bootdev=network persist=True
```

salt.modules.ipmi.set_channel_access(channel=14, access_update_mode='non_volatile', alerting=False, per_msg_auth=False, user_level_auth=False, access_mode='always', privilege_update_mode='non_volatile', privilege_level='administrator', **kwargs)

Set channel access

Parameters

• channel -- number [1:7]

• access_update_mode --
  - `don't_change` = don't set or change Channel Access
  - `non_volatile` = set non-volatile Channel Access
  - `volatile` = set volatile (active) setting of Channel Access

• alerting -- PEF Alerting Enable/Disable
  - True = enable PEF Alerting
  - False = disable PEF Alerting on this channel (Alert Immediate command can still be used to generate alerts)

• per_msg_auth -- Per-message Authentication
  - True = enable
- False = disable Per-message Authentication. [Authentication required to activate any session on this channel, but authentication not used on subsequent packets for the session.]

- user_level_auth -- User Level Authentication Enable/Disable
  - True = enable User Level Authentication. All User Level commands are to be authenticated per the Authentication Type that was negotiated when the session was activated.
  - False = disable User Level Authentication. Allow User Level commands to be executed without being authenticated. If the option to disable User Level Command authentication is accepted, the BMC will accept packets with Authentication Type set to None if they contain user level commands. For outgoing packets, the BMC returns responses with the same Authentication Type that was used for the request.

- access_mode -- Access Mode for IPMI messaging (PEF Alerting is enabled/disabled separately from IPMI messaging)
  - disabled = disabled for IPMI messaging
  - pre_boot = pre-boot only channel only available when system is in a powered down state or in BIOS prior to start of boot.
  - always = channel always available regardless of system mode. BIOS typically dedicates the serial connection to the BMC.
  - shared = same as always available, but BIOS typically leaves the serial port available for software use.

- privilege_update_mode -- Channel Privilege Level Limit. This value sets the maximum privilege level that can be accepted on the specified channel.
  - dont_change = don't set or change channel Privilege Level Limit
  - non_volatile = non-volatile Privilege Level Limit according
  - volatile = volatile setting of Privilege Level Limit

- privilege_level -- Channel Privilege Level Limit
  - reserved = unused
  - callback
  - user
  - operator
  - administrator
  - proprietary = used by OEM

- kwargs --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

CLI Examples:
```
salt-call ipmi.set_channel_access privilege_level='administrator'
```

```
salt.modules.ipmi.set_identify(on=True, duration=600, **kwargs)

Request identify light

Request the identify light to turn off, on for a duration, or on indefinitely. Other than error exceptions,

Parameters

- **on** -- Set to True to force on or False to force off
- **duration** -- Set if wanting to request turn on for a duration in seconds, None =
  indefinitely.
- **kwargs** --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

CLI Examples:
```
salt-call ipmi.set_identify
```

```
salt.modules.ipmi.set_power(state='power_on', wait=True, **kwargs)

Request power state change

Parameters

- **name** --
  - power_on -- system turn on
  - power_off -- system turn off (without waiting for OS)
  - shutdown -- request OS proper shutdown
  - reset -- reset (without waiting for OS)
  - boot -- If system is off, then `on', else `reset'
- **ensure** -- If (bool True), do not return until system actually completes requested
  state change for 300 seconds. If a non-zero (int), adjust the wait time to the requested
  number of seconds
- **kwargs** --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

Returns dict -- A dict describing the response retrieved

CLI Examples:
```
salt-call ipmi.set_power state=shutdown wait=True
```
salt.modules.ipmi.set_user_access(uid, channel=14, callback=True, link_auth=True, ipmi_msg=True, privilege_level='administrator', **kwargs)

Set user access

Parameters

- **uid** -- user number [1:16]
- **channel** -- number [1:7]
- **callback** -- User Restricted to Callback
  - False = User Privilege Limit is determined by the User Privilege Limit parameter, below, for both callback and non-callback connections.
  - True = User Privilege Limit is determined by the User Privilege Limit parameter for callback connections, but is restricted to Callback level for non-callback connections. Thus, a user can only initiate a Callback when they ‘call in’ to the BMC, but once the callback connection has been made, the user could potentially establish a session as an Operator.
- **link_auth** -- User Link authentication enable/disable (used to enable whether this user’s name and password information will be used for link authentication, e.g. PPP CHAP) for the given channel. Link authentication itself is a global setting for the channel and is enabled/disabled via the serial/modem configuration parameters.
- **ipmi_msg** -- User IPMI Messaging: (used to enable/disable whether this user’s name and password information will be used for IPMI Messaging. In this case, ‘IPMI Messaging’ refers to the ability to execute generic IPMI commands that are not associated with a particular payload type. For example, if IPMI Messaging is disabled for a user, but that user is enabled for activating the SOL payload type, then IPMI commands associated with SOL and session management, such as Get SOL Configuration Parameters and Close Session are available, but generic IPMI commands such as Get SEL Time are unavailable.)
- **privilege_level** -- User Privilege Limit. (Determines the maximum privilege level that the user is allowed to switch to on the specified channel.)
  - callback
  - user
  - operator
  - administrator
  - proprietary
  - no_access
- **kwargs**
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

CLI Examples:

```
salt-call ipmi.set_user_access uid=2 privilege_level='operator'
```
salt.modules.ipmi.set_user_name

Set user name

Parameters

- **uid** -- user number [1:16]
- **name** -- username (limit of 16 bytes)
- **kwargs**
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

CLI Examples:
salt-call ipmi.set_user_name uid=2 name='steverweber'

salt.modules.ipmi.set_user_password

Set user password and (modes)

Parameters

- **uid** -- id number of user. see: get_names_uid()['name']
- **mode**
  - disable = disable user connections
  - enable = enable user connections
  - set_password = set or ensure password
  - test_password = test password is correct
- **password** -- max 16 char string (optional when mode is [disable or enable])
- **kwargs**
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

Returns True on success when mode = test_password, return False on bad password

CLI Example:
salt-call ipmi.set_user_password api_host=127.0.0.1 api_user=admin api_pass=pass uid=1 password=newPass
salt-call ipmi.set_user_password uid=1 mode=enable

salt.modules.ipmi.user_delete

Delete user (helper)

Parameters

- **uid** -- user number [1:16]
- **channel** -- number [1:7]
• **kwargs --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

CLI Examples:
salt-call ipmi.user_delete uid=2

19.9.164 salt.modules.ipset

Support for ipset

salt.modules.ipset.add(set=None, entry=None, family='ipv4', **kwargs)
  Append an entry to the specified set.

CLI Example:
salt '*' ipset.add setname 192.168.1.26

salt.modules.ipset.check(set=None, entry=None, family='ipv4')
  Check that an entry exists in the specified set.

set The ipset name
entry An entry in the ipset. This parameter can be a single IP address, a range of IP addresses, or a subnet block. Example:

- 192.168.0.1
- 192.168.0.2-192.168.0.19
- 192.168.0.0/25

family IP protocol version: ipv4 or ipv6

CLI Example:
salt '*' ipset.check setname '192.168.0.1 comment "Hello"'

salt.modules.ipset.check_set(set=None, family='ipv4')
  Check that given ipset set exists.

New in version 2014.7.0.

CLI Example:
salt '*' ipset.check_set setname

salt.modules.ipset.delete(set=None, entry=None, family='ipv4', **kwargs)
  Delete an entry from the specified set.

CLI Example:
salt.modules.ipset.delete_set(set=None, family='ipv4')
New in version 2014.7.0.
Delete ipset set.

CLI Example:

salt '*': ipset.delete_set custom_set
IPv6:
  salt '*': ipset.delete_set custom_set family=ipv6

salt.modules.ipset.flush(set=None, family='ipv4')
Flush entries in the specified set, Flush all sets if set is not specified.

CLI Example:

salt '*': ipset.flush
salt '*': ipset.flush set
IPv6:
  salt '*': ipset.flush
  salt '*': ipset.flush set

salt.modules.ipset.list_sets(family='ipv4')
New in version 2014.7.0.
List all ipset sets.

CLI Example:

salt '*': ipset.list_sets

salt.modules.ipset.long_range(start, end)
salt.modules.ipset.new_set(set=None, set_type=None, family='ipv4', comment=False, **kwargs)
New in version 2014.7.0.
Create new custom set

CLI Example:

salt '*': ipset.new_set custom_set list:set
salt '*': ipset.new_set custom_set list:set comment=True
IPv6:
  salt '*': ipset.new_set custom_set list:set family=ipv6

salt.modules.ipset.rename_set(set=None, new_set=None, family='ipv4')
New in version 2014.7.0.
Delete ipset set.

CLI Example:

salt '*': ipset.rename_set custom_set new_set=new_set_name
IPv6:
  salt '*': ipset.rename_set custom_set new_set=new_set_name family=ipv6
salt.modules.ipset.test(set=None, entry=None, family='ipv4', **kwargs)
Test if an entry is in the specified set.

CLI Example:

```
salt '*' ipset.test setname 192.168.0.2
IPv6:
salt '*' ipset.test setname fd81:fc56:9ac7::/48
```

salt.modules.ipset.version()
Return version from ipset --version

CLI Example:

```
salt '*' ipset.version
```

19.9.165 salt.modules.iptables
Support for iptables

Configuration Options

The following options can be set in the minion config, grains, pillar, or master config. The configuration is read using config.get.

- `iptables.save_filters`: List of REGEX strings to FILTER OUT matching lines

  This is useful for filtering out chains, rules, etc that you do not wish to persist, such as ephemeral Docker rules.

The default is to not filter out anything.

```
iptables.save_filters:
  - "-j CATTLE_PREROUTING"
  - "-j DOCKER"
  - "-A POSTROUTING"
  - "-A CATTLE_POSTROUTING"
  - "-A FORWARD"
```

salt.modules.iptables.append(table='filter', chain=None, rule=None, family='ipv4')
Append a rule to the specified table/chain.

This function accepts a rule in a standard iptables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```
salt '*' iptables.append filter INPUT \
      rule='-m state --state RELATED,ESTABLISHED -j ACCEPT'
IPv6:
salt '*' iptables.append filter INPUT \
      rule='-m state --state RELATED,ESTABLISHED -j ACCEPT' \
      family=ipv6
```
salt.modules.iptables.build_rule(table='filter', chain=None, command=None, position='`, full=None, family='ipv4', **kwargs)

Build a well-formed iptables rule based on kwargs. A table and chain are not required, unless full is True.

If full is True, then table, chain and command are required. command may be specified as either a short option ('I') or a long option (--insert). This will return the iptables command, exactly as it would be used from the command line.

If a position is required (as with -I or -D), it may be specified as position. This will only be useful if full is True.

If connstate is passed in, it will automatically be changed to state.

To pass in jump options that doesn’t take arguments, pass in an empty string.

**Note:** Whereas iptables will accept -p, --proto[c[o[l]]] as synonyms of --protocol, if --proto appears in an iptables command after the appearance of --m policy, it is interpreted as the --proto option of the policy extension (see the iptables-extensions(8) man page).

CLI Examples:

```bash
salt '*' iptables.build_rule match=state \  
    connstate=RELATED,ESTABLISHED jump=ACCEPT
salt '*' iptables.build_rule filter INPUT command=I position=3 \ 
    full=True match=state state=RELATED,ESTABLISHED jump=ACCEPT
salt '*' iptables.build_rule filter INPUT command=A \ 
    full=True match=state state=RELATED,ESTABLISHED \ 
    source='127.0.0.1' jump=ACCEPT

.. Invert Rules
salt '*' iptables.build_rule filter INPUT command=A \ 
    full=True match=state state=RELATED,ESTABLISHED \ 
    source='! 127.0.0.1' jump=ACCEPT
salt '*' iptables.build_rule filter INPUT command=A \ 
    full=True match=state state=RELATED,ESTABLISHED \ 
    destination='! 127.0.0.1' jump=ACCEPT

IPv6:
salt '*' iptables.build_rule match=state \ 
    connstate=RELATED,ESTABLISHED jump=ACCEPT \ 
    family=ipv6
salt '*' iptables.build_rule filter INPUT command=I position=3 \ 
    full=True match=state state=RELATED,ESTABLISHED jump=ACCEPT \ 
    family=ipv6
```

salt.modules.iptables.check(table='filter', chain=None, rule=None, family='ipv4')

Check for the existence of a rule in the table and chain

**This function accepts a rule in a standard iptables command format**, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```bash
salt '*' iptables.check filter INPUT \ 
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT'
```

IPv6:
salt '***' iptables.check filter INPUT \
    rules='^-m state --state RELATED,ESTABLISHED -j ACCEPT' \
    family='ipv6'

salt.modules.iptables.check_chain(table='filter', chain=None, family='ipv4')
    New in version 2014.1.0.
    Check for the existence of a chain in the table
    CLI Example:

    salt '***' iptables.check_chain filter INPUT
    IPv6:
    salt '***' iptables.check_chain filter INPUT family=ipv6

salt.modules.iptables.delete(table, chain=None, position=None, rule=None, family='ipv4')
    Delete a rule from the specified table/chain, specifying either the rule in its entirety, or the rule's position in the chain.
    This function accepts a rule in a standard iptables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.
    CLI Examples:

    salt '***' iptables.delete filter INPUT position=3
    salt '***' iptables.delete filter INPUT \
        rule='^-m state --state RELATED,ESTABLISHED -j ACCEPT'
    IPv6:
    salt '***' iptables.delete filter INPUT position=3 family=ipv6
    salt '***' iptables.delete filter INPUT \
        rule='^-m state --state RELATED,ESTABLISHED -j ACCEPT' \
        family=ipv6

salt.modules.iptables.delete_chain(table='filter', chain=None, family='ipv4')
    New in version 2014.1.0.
    Delete custom chain to the specified table.
    CLI Example:

    salt '***' iptables.delete_chain filter CUSTOM_CHAIN
    IPv6:
    salt '***' iptables.delete_chain filter CUSTOM_CHAIN family=ipv6

salt.modules.iptables.flush(table='filter', chain='*', family='ipv4')
    Flush the chain in the specified table, flush all chains in the specified table if not specified chain.
    CLI Example:

    salt '***' iptables.flush filter INPUT
    IPv6:
    salt '***' iptables.flush filter INPUT family=ipv6

salt.modules.iptables.get_policy(table='filter', chain=None, family='ipv4')
    Return the current policy for the specified table/chain
### salt.modules.iptables.get_policy

```
salt '*' iptables.get_policy filter INPUT
```

**IPv6:**
```
salt '*' iptables.get_policy filter INPUT family=ipv6
```

#### Function Description

Return the current policy for the specified table/chain.

**CLI Examples:**
```
salt '*' iptables.get_policy filter INPUT
salt '*' iptables.get_policy filter INPUT family=ipv6
```

### salt.modules.iptables.get_rules

```
salt '*' iptables.get_rules
```

**IPv6:**
```
salt '*' iptables.get_rules family=ipv6
```

#### Function Description

Return a data structure of the current, in-memory rules.

**CLI Example:**
```
salt '*' iptables.get_rules
```

### salt.modules.iptables.get_saved_policy

```
salt.modules.iptables.get_saved_policy(table='filter', chain=None, conf_file=None, family='ipv4')
```

#### Function Description

Return the current policy for the specified table/chain.

**CLI Examples:**
```
salt '*' iptables.get_saved_policy filter INPUT
salt '*' iptables.get_saved_policy filter INPUT conf_file=/etc/iptables.saved
salt '*' iptables.get_saved_policy filter INPUT family=ipv6
```

### salt.modules.iptables.get_saved_rules

```
salt.modules.iptables.get_saved_rules(conf_file=None, family='ipv4')
```

#### Function Description

Return a data structure of the rules in the conf file.

**CLI Example:**
```
salt '*' iptables.get_saved_rules
```

### salt.modules.iptables.insert

```
salt.modules.iptables.insert(table='filter', chain=None, position=None, rule=None, family='ipv4')
```

#### Function Description

Insert a rule into the specified table/chain, at the specified position.

**This function accepts a rule in a standard iptables command format,** starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

**If the position specified is a negative number, then the insert will be performed counting from the end of the list. For instance, a position of -1 will insert the rule as the second to last rule. To insert a rule in the last position, use the append function instead.**

**CLI Examples:**
```
salt '*' iptables.insert filter INPUT position=3 \
   rule='^-m state --state RELATED,ESTABLISHED -j ACCEPT'
```

**IPv6:**
```
salt '*' iptables.insert filter INPUT position=3 \
   rule='^-m state --state RELATED,ESTABLISHED -j ACCEPT' family=ipv6
```
salt.modules.iptables.new_chain(\texttt{table='filter', chain=None, family='ipv4'})
New in version 2014.1.0.
Create new custom chain to the specified table.
CLI Example:

```
salt '*' iptables.new_chain filter CUSTOM_CHAIN
```
IPv6:
```
salt '*' iptables.new_chain filter CUSTOM_CHAIN family=ipv6
```

salt.modules.iptables.save(\texttt{filename=None, family='ipv4'})
Save the current in-memory rules to disk
CLI Example:

```
salt '*' iptables.save /etc/sysconfig/iptables
```
IPv6:
```
salt '*' iptables.save /etc/sysconfig/iptables family=ipv6
```

salt.modules.iptables.set_policy(\texttt{table='filter', chain=None, policy=None, family='ipv4'})
Set the current policy for the specified table/chain
CLI Example:

```
salt '*' iptables.set_policy filter INPUT ACCEPT
```
IPv6:
```
salt '*' iptables.set_policy filter INPUT ACCEPT family=ipv6
```

salt.modules.iptables.version(\texttt{family='ipv4'})
Return version from iptables --version
CLI Example:

```
salt '*' iptables.version
```
IPv6:
```
salt '*' iptables.version family=ipv6
```

**19.9.166 salt.modules.iwtools module**

Support for Wireless Tools for Linux

salt.modules.iwtools.list_interfaces(\texttt{style=None})
List all of the wireless interfaces
CLI Example:
```
salt minion iwtools.list_interfaces
```

salt.modules.iwtools.scan(\texttt{iface, style=None})
List networks on a wireless interface
CLI Examples:
```
salt minion iwtools.scan wlp3s0
salt minion iwtools.scan wlp3s0 list
```
salt.modules.iwtools.set_mode(iface, mode)
List networks on a wireless interface

CLI Example:
salt minion iwtools.set_mode wlp3s0 Managed

19.9.167 salt.modules.jboss7

Module for managing JBoss AS 7 through the CLI interface.
New in version 2015.5.0.

In order to run each function, jboss_config dictionary with the following properties must be passed:

- cli_path: the path to jboss-cli script, for example: `/opt/jboss/jboss-7.0/bin/jboss-cli.sh'
- controller: the IP address and port of controller, for example: 10.11.12.13:9999
- cli_user: username to connect to jboss administration console if necessary
- cli_password: password to connect to jboss administration console if necessary

Example:

```python
jboss_config:
    cli_path: '/opt/jboss/jboss-7.0/bin/jboss-cli.sh'
    controller: 10.11.12.13:9999
    cli_user: 'jbossadm'
    cli_password: 'jbossadm'
```

salt.modules.jboss7.create_datasource(jboss_config, name, datasource_properties, profile=None)

Create datasource in running jboss instance

jboss_config Configuration dictionary with properties specified above.
nname Datasource name
datasource_properties A dictionary of datasource properties to be created:

- driver-name: mysql
- connection-url: `jdbc:mysql://localhost:3306/sampleDatabase`
- jndi-name: `java:jboss/datasources/sampleDS`
- user-name: sampleuser
- password: secret
- min-pool-size: 3
- use-java-context: True

profile The profile name (JBoss domain mode only)

CLI Example:

```python
```
salt.modules.jboss7.create_simple_binding(jboss_config, binding_name, value, profile=None)

Create a simple jndi binding in the running jboss instance

jboss_config Configuration dictionary with properties specified above.
binding_name Binding name to be created
value Binding value
profile The profile name (JBoss domain mode only)

CLI Example:

```bash
salt '*' jboss7.create_simple_binding \ 
  '{"cli_path": "integration.modules.sysmod.SysModuleTest.test_valid_docs", \ 
    "controller": "10.11.12.13:9999", "cli_user": "jbossadm", "cli_password": \ 
     "jbossadm"}, \ 
  my_binding_name my_binding_value
```

salt.modules.jboss7.deploy(jboss_config, source_file)

Deploy the application on the jboss instance from the local file system where minion is running.

jboss_config Configuration dictionary with properties specified above.
source_file Source file to deploy from

CLI Example:

```bash
```

salt.modules.jboss7.list_deployments(jboss_config)

List all deployments on the jboss instance

jboss_config Configuration dictionary with properties specified above.

CLI Example:

```bash
```

salt.modules.jboss7.read_datasource(jboss_config, name, profile=None)

Read datasource properties in the running jboss instance.

jboss_config Configuration dictionary with properties specified above.
name Datasource name
profile Profile name (JBoss domain mode only)

CLI Example:

```bash
```

salt.modules.jboss7.read_simple_binding(jboss_config, binding_name, profile=None)

Read jndi binding in the running jboss instance

jboss_config Configuration dictionary with properties specified above.
binding_name Binding name to be created
profile The profile name (JBoss domain mode only)

CLI Example:

salt.modules.jboss7.reload_({jboss_config, host=host}, {jboss_config, host=host})
Reload running jboss instance

jboss_config Configuration dictionary with properties specified above.

host The name of the host. JBoss domain mode only - and required if running in domain mode. The host name is the `name` attribute of the `host` element in host.xml

CLI Example:

```
```

salt.modules.jboss7.remove_datasource(name, profile=profile)
Remove an existing datasource from the running jboss instance.

jboss_config Configuration dictionary with properties specified above.

name Datasource name

profile The profile (JBoss domain mode only)

CLI Example:

```
salt '*' jboss7.remove_datasource '{"cli_path": "integration.modules.sysmod.SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user": "jbossadm", "cli_password": "jbossadm"}' my_datasource_name
```

salt.modules.jboss7.status({jboss_config, host=host}, {jboss_config, host=host})
Get status of running jboss instance.

jboss_config Configuration dictionary with properties specified above.

host The name of the host. JBoss domain mode only - and required if running in domain mode. The host name is the `name` attribute of the `host` element in host.xml

server_config The name of the `Server Configuration`. JBoss Domain mode only - and required if running in domain mode.

CLI Example:

```
```

salt.modules.jboss7.stop_server({jboss_config, host=host}, {jboss_config, host=host})
Stop running jboss instance

jboss_config Configuration dictionary with properties specified above.

host The name of the host. JBoss domain mode only - and required if running in domain mode. The host name is the `name` attribute of the `host` element in host.xml

CLI Example:

```
```

salt.modules.jboss7.undeploy({jboss_config, deployment}, {jboss_config, deployment})
Undeploy the application from jboss instance

jboss_config Configuration dictionary with properties specified above.

deployment Deployment name to undeploy

CLI Example:
salt.modules.jboss7.update_datasource(jboss_config, name, new_properties, profile=None)

Update an existing datasource in running jboss instance. If the property doesn't exist if will be created, if it does, it will be updated with the new value.

jboss_config  Configuration dictionary with properties specified above.
name  Datasource name
new_properties  

A dictionary of datasource properties to be updated. For example:

- driver-name: mysql
- connection-url: `jdbc:mysql://localhost:3306/sampleDatabase`
- jndi-name: `java:jboss/datasources/sampleDS`
- user-name: sampleuser
- password: secret
- min-pool-size: 3
- use-java-context: True

profile  The profile name (JBoss domain mode only)

CLI Example:

```bash
```

salt.modules.jboss7.update_simple_binding(jboss_config, binding_name, value, profile=None)

Update the simple jndi binding in the running jboss instance

jboss_config  Configuration dictionary with properties specified above.
binding_name  Binding name to be updated
value  New binding value
profile  The profile name (JBoss domain mode only)

CLI Example:

```bash
salt '*' jboss7.update_simple_binding '{"cli_path": "integration.modules.sysmod.SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user": "jbossadm", "cli_password": "jbossadm"}' my_deployment my_binding_name my_binding_value
```

19.9.168  salt.modules.jboss7_cli

Module for low-level interaction with JbossAS7 through CLI.

This module exposes two ways of interaction with the CLI, either through commands or operations.

Note:  Following JBoss documentation (https://developer.jboss.org/wiki/CommandLineInterface): "Operations are considered a low level but comprehensive way to manage the AS controller, i.e. if it can't be done with operations it can't be done in any other way. Commands, on the other hand, are more user-friendly in syntax, although most
of them still translate into operation requests and some of them even into a few composite operation requests, i.e. commands also simplify some management operations from the user’s point of view.”

The difference between calling a command or operation is in handling the result. Commands return a zero return code if operation is successful or return non-zero return code and print an error to standard output in plain text, in case of an error.

Operations return a json-like structure, that contain more information about the result. In case of a failure, they also return a specific return code. This module parses the output from the operations and returns it as a dictionary so that an execution of an operation can then be verified against specific errors.

In order to run each function, jboss_config dictionary with the following properties must be passed:
- cli_path: the path to jboss-cli script, for example: `/opt/jboss/jboss-7.0/bin/jboss-cli.sh`
- controller: the IP address and port of controller, for example: 10.11.12.13:9999
- cli_user: username to connect to jboss administration console if necessary
- cli_password: password to connect to jboss administration console if necessary

Example:

```
jboss_config:
  cli_path: /opt/jboss/jboss-7.0/bin/jboss-cli.sh
  controller: 10.11.12.13:9999
  cli_user: 'jbossadm'
  cli_password: 'jbossadm'
```

**salt.modules.jboss7_cli.run_command** *(jboss_config, command, fail_on_error=True)*

Execute a command against jboss instance through the CLI interface.

**jboss_config** Configuration dictionary with properties specified above.

**command** Command to execute against jboss instance

**fail_on_error (default=True)** Is true, raise CommandExecutionError exception if execution fails. If false, 'success' property of the returned dictionary is set to False

CLI Example:

```
salt '*' jboss7_cli.run_command '{"cli_path": "integration.modules.sysmod.SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user": "jbossadm", "cli_password": "jbossadm"}' my_command
```

**salt.modules.jboss7_cli.run_operation** *(jboss_config, operation, fail_on_error=True, retries=1)*

Execute an operation against jboss instance through the CLI interface.

**jboss_config** Configuration dictionary with properties specified above.

**operation** An operation to execute against jboss instance

**fail_on_error (default=True)** Is true, raise CommandExecutionError exception if execution fails. If false, 'success' property of the returned dictionary is set to False

**retries:** Number of retries in case of ”JBAS012144: Could not connect to remote” error.

CLI Example:

```
salt '*' jboss7_cli.run_operation '{"cli_path": "integration.modules.sysmod.SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user": "jbossadm", "cli_password": "jbossadm"}' my_operation
```

**19.9.169 salt.modules.jenkinsmod module**

Module for controlling Jenkins

**19.9. execution modules** 1631
depends python-jenkins

New in version 2016.3.0.

depends python-jenkins Python module (not to be confused with jenkins)

collection This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

```
jenkins:
  api_key: peWcBiMOS9HzG15peWcBiMOS9HzG15
```

salt.modules.jenkinsmod.build_job(name=None, parameters=None)
Initiate a build for the provided job.

Parameters

- **name** -- The name of the job is check if it exists.
- **parameters** -- Parameters to send to the job.

Returns True is successful, otherwise raise an exception.

CLI Example:

```
salt '*' jenkins.build_job jobname
```

salt.modules.jenkinsmod.create_job(name=None, config_xml=None, saltenv='base')
Return the configuration file.

Parameters

- **name** -- The name of the job is check if it exists.
- **config_xml** -- The configuration file to use to create the job.
- **saltenv** -- The environment to look for the file in.

Returns The configuration file used for the job.

CLI Example:

```
salt '*' jenkins.create_job jobname
```

salt.modules.jenkinsmod.delete_job(name=None)
Return true is job is deleted successfully.

Parameters **name** -- The name of the job to delete.

Returns Return true if job is deleted successfully.

CLI Example:

```
salt '*' jenkins.delete_job jobname
```

salt.modules.jenkinsmod.disable_job(name=None)
Return true is job is disabled successfully.

Parameters **name** -- The name of the job to disable.

Returns Return true if job is disabled successfully.

CLI Example:

```
salt '*' jenkins.disable_job jobname
```
salt.modules.jenkinsmod.enable_job(name=None)
Return true is job is enabled successfully.
Parameters name -- The name of the job to enable.
Returns Return true if job is enabled successfully.
CLI Example:
salt '*' jenkins.enable_job jobname

salt.modules.jenkinsmod.get_job_config(name=None)
Return the current job configuration for the provided job.
Parameters name -- The name of the job to return the configuration for.
Returns The configuration for the job specified.
CLI Example:
salt '*' jenkins.get_job_config jobname

salt.modules.jenkinsmod.get_job_info(name=None)
Return information about the Jenkins job.
Parameters name -- The name of the job is check if it exists.
Returns Information about the Jenkins job.
CLI Example:
salt '*' jenkins.get_job_info jobname

salt.modules.jenkinsmod.get_jobs()
Return the currently configured jobs.
Returns The currently configured jobs.
CLI Example:
salt '*' jenkins.get_jobs

salt.modules.jenkinsmod.get_version()
Return version of Jenkins
Returns The version of Jenkins
CLI Example:
salt '*' jenkins.get_version

salt.modules.jenkinsmod.job_exists(name=None)
Check whether the job exists in configured Jenkins jobs.
Parameters name -- The name of the job is check if it exists.
Returns True if job exists, False if job does not exist.
CLI Example:
salt '*' jenkins.job_exists jobname

salt.modules.jenkinsmod.job_status(name=None)
Return the current status, enabled or disabled, of the job.
Parameters name -- The name of the job to return status for
Returns Return true if enabled or false if disabled.
CLI Example:
salt '*' jenkins.job_status jobname

salt.modules.jenkinsmod.plugin_installed(name)
New in version 2016.11.0.
Return if the plugin is installed for the provided plugin name.
Parameters name -- The name of the parameter to confirm installation.
Returns True if plugin exists, False if plugin does not exist.
CLI Example:
salt '*' jenkins.plugin_installed pluginName

salt.modules.jenkinsmod.run(script)
New in version 2017.7.0.
Execute a script on the jenkins master
Parameters script -- The script
CLI Example:
salt '*' jenkins.run "Jenkins.instance.doSafeRestart()"

salt.modules.jenkinsmod.update_job(name=None, config_xml=None, saltenv='base')
Return the updated configuration file.
Parameters
   • name -- The name of the job is check if it exists.
   • config_xml -- The configuration file to use to create the job.
   • saltenv -- The environment to look for the file in.
Returns The configuration file used for the job.
CLI Example:
salt '*' jenkins.update_job jobname
salt '*' jenkins.update_job jobname config_xml='salt://jenkins/config.xml'

19.9.170 salt.modules.junos

Module to interact with Junos devices.
maturity new
dependencies junos-eznc, jxmlease

Note: Those who wish to use junos-eznc (PyEZ) version >= 2.1.0, must use the latest salt code from github until the next release.

Refer to junos for information on connecting to junos proxy.
salt.modules.junos.cli(command=None, **kwargs)
    Executes the CLI commands and returns the output in specified format. (default is text) The output can also be stored in a file.
    command (required) The command to execute on the Junos CLI
    format [text] Format in which to get the CLI output (either text or xml)
dev_timeout [30] The NETCONF RPC timeout (in seconds)
dest Destination file where the RPC output is stored. Note that the file will be stored on the proxy minion.
   To push the files to the master use cp.push.

CLI Examples:

```bash
salt 'device_name' junos.cli 'show system commit'
salt 'device_name' junos.cli 'show version' dev_timeout=40
salt 'device_name' junos.cli 'show system alarms' format=xml dest=/home/user/cli__output.txt
```

salt.modules.junos.commit(**kwargs)
To commit the changes loaded in the candidate configuration.
dev_timeout [30] The NETCONF RPC timeout (in seconds)
comment Provide a comment for the commit
confirm Provide time in minutes for commit confirmation. If this option is specified, the commit will be
   rolled back in the specified amount of time unless the commit is confirmed.
sync [False] When True, on dual control plane systems, requests that the candidate configuration on one
   control plane be copied to the other control plane, checked for correct syntax, and committed on both
   Routing Engines.
force_sync [False] When True, on dual control plane systems, force the candidate configuration on one
   control plane to be copied to the other control plane.
full When True, requires all the daemons to check and evaluate the new configuration.
detail When True, return commit detail

CLI Examples:

```bash
salt 'device_name' junos.commit comment='Commiting via saltstack' detail=True
salt 'device_name' junos.commit dev_timeout=60 confirm=10
salt 'device_name' junos.commit sync=True dev_timeout=90
```

salt.modules.junos.commit_check()
Perform a commit check on the configuration

CLI Example:

```bash
salt 'device_name' junos.commit_check
```

salt.modules.junos.diff(**kwargs)
Returns the difference between the candidate and the current configuration
id [0] The rollback ID value (0-49)

CLI Example:

```bash
salt 'device_name' junos.diff 3
```

salt.modules.junos.facts()
Displays the facts gathered during the connection. These facts are also stored in Salt grains.

CLI Example:

```bash
salt 'device_name' junos.facts
```

salt.modules.junos.facts_refresh()
Reload the facts dictionary from the device. Usually only needed if, the device configuration is changed by
some other actor. This function will also refresh the facts stored in the salt grains.

CLI Example:
salt 'device_name' junos.facts_refresh

salt.modules.junos.file_copy(src=None, dest=None)
Copies the file from the local device to the junos device
src The source path where the file is kept.
dest The destination path on where the file will be copied
CLI Example:
salt 'device_name' junos.file_copy /home/m2/info.txt info_copy.txt

salt.modules.junos.install_config(path=None, **kwargs)
Installs the given configuration file into the candidate configuration. Commits the changes if the commit checks or throws an error.
path (required) Path where the configuration/template file is present. If the file has a .conf extension, the content is treated as text format. If the file has a .xml extension, the content is treated as XML format. If the file has a .set extension, the content is treated as Junos OS set commands.
mode [exclusive] The mode in which the configuration is locked. Can be one of private, dynamic, batch, exclusive.
dev_timeout [30] Set NETCONF RPC timeout. Can be used for commands which take a while to execute.
overwrite [False] Set to True if you want this file is to completely replace the configuration file.
replace [False] Specify whether the configuration file uses replace: statements. If True, only those statements under the replace tag will be changed.
format Determines the format of the contents
update [False] Compare a complete loaded configuration against the candidate configuration. For each hierarchy level or configuration object that is different in the two configurations, the version in the loaded configuration replaces the version in the candidate configuration. When the configuration is later committed, only system processes that are affected by the changed configuration elements parse the new configuration. This action is supported from PyEZ 2.1.
comment Provide a comment for the commit
confirm Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the specified amount of time unless the commit is confirmed.
diffs_file Path to the file where the diff (difference in old configuration and the committed configuration) will be stored. Note that the file will be stored on the proxy minion. To push the files to the master use cp.push.
template_vars Variables to be passed into the template processing engine in addition to those present in the minion configuration, grains, etc. You may reference these variables in your template like so:

```
{{ template_vars["var_name"] }}
```

CLI Examples:

salt 'device_name' junos.install_config 'salt://production/network/routers/config.
---set'
salt 'device_name' junos.install_config 'salt://templates/replace_config.conf'---replace=True comment='Committed via SaltStack'
salt 'device_name' junos.install_config 'salt://my_new_configuration.conf' dev_---timeout=300 diffs_file='salt/conf/old_config.conf' overwrite=True
salt 'device_name' junos.install_config 'salt://syslog_template.conf' template_---vars='{"syslog_host": "10.180.222.7"}"

salt.modules.junos.install_os(path=None, **kwargs)
Installs the given image on the device. After the installation is complete the device is rebooted, if reboot=True is given as a keyworded argument.
path (required) Path where the image file is present on the proxy minion
dev_timeout [30] The NETCONF RPC timeout (in seconds)
reboot [False] Whether to reboot after installation
no_copy [False] If True the software package will not be SCP’d to the device

CLI Examples:

```plaintext
salt 'device_name' junos.install_os 'salt://images/junos_image.tgz' reboot=True
salt 'device_name' junos.install_os 'salt://junos_16_1.tgz' dev_timeout=300
```

salt.modules.junos.load(path=None, **kwargs)
Loads the configuration from the file provided onto the device.

path (required) Path where the configuration/template file is present. If the file has a .conf extension, the content is treated as text format. If the file has a .xml extension, the content is treated as XML format. If the file has a .set extension, the content is treated as Junos OS set commands.

overwrite [False] Set to True if you want this file is to completely replace the configuration file.
replace [False] Specify whether the configuration file uses replace: statements. If True, only those statements under the replace tag will be changed.
format Determines the format of the contents
update [False] Compare a complete loaded configuration against the candidate configuration. For each hierarchy level or configuration object that is different in the two configurations, the version in the loaded configuration replaces the version in the candidate configuration. When the configuration is later committed, only system processes that are affected by the changed configuration elements parse the new configuration. This action is supported from PyEZ 2.1.

template_vars Variables to be passed into the template processing engine in addition to those present in pillar, the minion configuration, grains, etc. You may reference these variables in your template like so:

```plaintext
{{ template_vars["var_name"] }}
```

CLI Examples:

```plaintext
salt 'device_name' junos.load 'salt://production/network/routers/config.set'
salt 'device_name' junos.load 'salt://templates/replace_config.conf' replace=True
salt 'device_name' junos.load 'salt://my_new_configuration.conf' overwrite=True
```

salt.modules.junos.lock()
Attempts an exclusive lock on the candidate configuration. This is a non-blocking call.

**Note:** When locking, it is important to remember to call junos.unlock once finished. If locking during orchestration, remember to include a step in the orchestration job to unlock.

CLI Example:

```plaintext
salt 'device_name' junos.lock
```

salt.modules.junos.ping(dest_ip=None, **kwargs)
Send a ping RPC to a device

dest_ip The IP of the device to ping
dev_timeout [30] The NETCONF RPC timeout (in seconds)
rapid [False] When True, executes ping at 100pps instead of 1pps
ttl Maximum number of IP routers (IP hops) allowed between source and destination
routing_instance Name of the routing instance to use to send the ping
interface Interface used to send traffic
count [5] Number of packets to send
CLI Examples:

```
salt 'device_name' junos.ping '8.8.8.8' count=5
salt 'device_name' junos.ping '8.8.8.8' ttl=1 rapid=True
```

salt.modules.junos.rollback(**kwargs)
Roll back the last committed configuration changes and commit

* id [0] The rollback ID value (0-49)
* dev_timeout [30] The NETCONF RPC timeout (in seconds)
* comment Provide a comment for the commit
* confirm Provide time in minutes for commit confirmation. If this option is specified, the commit will be
  rolled back in the specified amount of time unless the commit is confirmed.
* diffs_file Path to the file where the diff (difference in old configuration and the committed configuration) will
  be stored. Note that the file will be stored on the proxy minion. To push the files to the master use
  `cp.push`.

CLI Example:

```
salt 'device_name' junos.rollback 10
```

salt.modules.junos.rpc(cmd=None, dest=None, **kwargs)
This function executes the RPC provided as arguments on the junos device. The returned data can be stored
in a file.

* cmd The RPC to be executed
* dest Destination file where the RPC output is stored. Note that the file will be stored on the proxy minion.
  To push the files to the master use `cp.push`.
* format [xml] The format in which the RPC reply is received from the device
* dev_timeout [30] The NETCONF RPC timeout (in seconds)
* filter Used with the `get-config` RPC to get specific configuration
* terse [False] Amount of information you want
* interface_name Name of the interface to query

CLI Example:

```
salt 'device' junos.rpc get_config /var/log/config.txt format=text filter='
  <configuration><system></configuration>'
salt 'device' junos.rpc get-interface-information /home/user/interface.xml filter='
  <interface_name='lo0' terse=True'
salt 'device' junos.rpc get-chassis-inventory
```

salt.modules.junos.set_hostname(hostname=None, **kwargs)
Set the device's hostname

* hostname The name to be set
* dev_timeout [30] The NETCONF RPC timeout (in seconds)
* comment Provide a comment to the commit
* confirm Provide time in minutes for commit confirmation. If this option is specified, the commit will be
  rolled back in the specified amount of time unless the commit is confirmed.

CLI Example:

```
salt 'device_name' junos.set_hostname salt-device
```

salt.modules.junos.shutdown(**kwargs)
Shut down (power off) or reboot a device running Junos OS. This includes all Routing Engines in a Virtual
Chassis or a dual Routing Engine system.

**Note:** One of shutdown or reboot must be set to True or no action will be taken.
shutdown [False] Set this to True if you want to shutdown the machine. This is a safety mechanism so that the user does not accidentally shutdown the junos device.

reboot [False] If True, reboot instead of shutting down

at Used when rebooting, to specify the date and time the reboot should take place. The value of this option must match the JunOS CLI reboot syntax.

in_min Used when shutting down. Specify the delay (in minutes) before the device will be shut down.

CLI Examples:

```
salt 'device_name' junos.shutdown reboot=True
salt 'device_name' junos.shutdown shutdown=True in_min=10
salt 'device_name' junos.shutdown shutdown=True
```

salt.modules.junos.unlock()
Unlocks the candidate configuration.

CLI Example:

```
salt 'device_name' junos.unlock
```

salt.modules.junos.zeroize()
Resets the device to default factory settings

CLI Example:

```
salt 'device_name' junos.zeroize
```

19.9.171 salt.modules.k8s

Salt module to manage Kubernetes cluster

New in version 2016.3.0.

Roadmap:

- Add creation of K8S objects (pod, rc, service, ...)
- Add replace of K8S objects (pod, rc, service, ...)
- Add deletion of K8S objects (pod, rc, service, ...)
- Add rolling update
- Add (auto)scalling

salt.modules.k8s.create_namespace(name, apiserver_url=none)
New in version 2016.3.0.

Create kubernetes namespace from the name, similar to the functionality added to kubectl since v.1.2.0:

```
code-block:: bash

kubectl create namespaces namespace-name
```

CLI Example:

```
salt '*' k8s.create_namespace namespace_name
salt '*' k8s.create_namespace namespace_name http://kube-master.cluster.local
```

salt.modules.k8s.create_secret(namespace, name, sources, apiserver_url=none, force=False, update=False, saltenv='base')
New in version 2016.3.0.
Create k8s secrets in the defined namespace from the list of files

CLI Example:

```
salt '*' k8s.create_secret namespace_name secret_name sources
salt '*' k8s.create_secret namespace_name secret_name sources http://kube-master.cluster.local
```

sources are either dictionary of \{name: path, name1: path\} pairs or array of strings defining paths.

Example of paths array:

```
```

Example of dictionaries:

```
{``name1``: `/full/path/filename`, name2: `salt://secret/storage/file.txt`}
```

optional parameters accepted:

update=[false] default value is false if set to false, and secret is already present on the cluster - warning will be returned and no changes to the secret will be done. In case it is set to ```true``` and secret is present but data is differ - secret will be updated.

force=[true] default value is true if the to False, secret will not be created in case one of the files is not valid kubernetes secret. e.g. capital letters in secret name or _ in case force is set to True, wrong files will be skipped but secret will be created any way.

saltenv=[`base`] default value is base in case `salt://` path is used, this parameter can change the visibility of files

```python
salt.modules.k8s.delete_secret(namespace, name, apiserver_url=None, force=True)
```

New in version 2016.3.0.

Delete kubernetes secret in the defined namespace. Namespace is the mandatory parameter as well as name.

CLI Example:

```
salt '*' k8s.delete_secret namespace_name secret_name
salt '*' k8s.delete_secret namespace_name secret_name http://kube-master.cluster.local
```

```python
salt.modules.k8s.get_labels(node=None, apiserver_url=None)
```

New in version 2016.3.0.

Get labels from the current node

CLI Example:

```
salt '*' k8s.get_labels
salt '*' k8s.get_labels kube-node.cluster.local http://kube-master.cluster.local
```

```python
salt.modules.k8s.get_namespaces(namespace=``, apiserver_url=None)
```

New in version 2016.3.0.
Get one or all kubernetes namespaces.

If namespace parameter is omitted, all namespaces will be returned back to user, similar to following kubectl example:

```bash
kubectl get namespaces -o json
```

In case namespace is set by user, the output will be similar to the one from kubectl:

```bash
kubectl get namespaces namespace_name -o json
```

CLI Example:

```bash
salt '*' k8s.get_namespaces
salt '*' k8s.get_namespaces namespace_name http://kube-master.cluster.local
```

```python
salt.modules.k8s.get_secrets(namespace, name='*', apiserver_url=None, decode=False, brief=False)
```

Get k8s namespaces

CLI Example:

```bash
salt '*' k8s.get_secrets namespace_name
salt '*' k8s.get_secrets namespace_name secret_name http://kube-master.cluster.local
```

```python
salt.modules.k8s.label_absent(name, node=None, apiserver_url=None)
```

New in version 2016.3.0.

Delete label to the current node

CLI Example:

```bash
salt '*' k8s.label_absent hw/disktype
salt '*' k8s.label_absent hw/disktype kube-node.cluster.local http://kube-master.cluster.local
```

```python
salt.modules.k8s.label_folder_absent(name, node=None, apiserver_url=None)
```

New in version 2016.3.0.

Delete label folder to the current node

CLI Example:

```bash
salt '*' k8s.label_folder_absent hw
salt '*' k8s.label_folder_absent hw/ kube-node.cluster.local http://kube-master.cluster.local
```

```python
salt.modules.k8s.label_present(name, value, node=None, apiserver_url=None)
```

New in version 2016.3.0.

Set label to the current node

CLI Example:

```bash
salt '*' k8s.label_present hw/disktype ssd
salt '*' k8s.label_present hw/disktype ssd kube-node.cluster.local http://kube-master.cluster.local
```
salt.modules.k8s.update_secret(namespace, name, sources, apiserver_url=None, force=True, saltenv='base')

New in version 2016.3.0.
alias to k8s.create_secret with update=true

CLI Example:
```
salt '*' k8s.update_secret namespace_name secret_name sources [apiserver_url] \n  ->[force=true] [update=false] [saltenv='base']
```

sources are either dictionary of {name: path, name1: path} pairs or array of strings defining paths.

Example of paths array:
```
```

Example of dictionaries:
```
{`name1`: `/full/path/filename`, name2: `salt://secret/storage/file.txt`}
```

optional parameters accepted:

force=[true] default value is true if the to False, secret will not be created in case one of the files is not valid kubernetes secret. e.g. capital letters in secret name or _ in case force is set to True, wrong files will be skipped but secret will be created any way.

saltenv=['base'] default value is base in case `salt://` path is used, this parameter can change the visibility of files

19.9.172 salt.modules.kapacitor module

Kapacitor execution module.

**configuration** This module accepts connection configuration details either as parameters or as configuration settings in /etc/salt/minion on the relevant minions:

```
kapacitor.host: 'localhost'
kapacitor.port: 9092
```

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

New in version 2016.11.0.

salt.modules.kapacitor.define_task(name, tick_script, task_type='stream', database=None, retention_policy='default')

Define a task. Serves as both create/update.

name Name of the task.
tick_script Path to the TICK script for the task. Can be a salt:// source.
task_type Task type. Defaults to `stream`
database Which database to fetch data from. Defaults to None, which will use the default database in InfluxDB.
retention_policy Which retention policy to fetch data from. Defaults to `default`.
CLI Example:

```
salt '*' kapacitor.define_task cpu salt://kapacitor/cpu.tick database=telegraf
```

salt.modules.kapacitor.delete_task(name)
Delete a kapacitor task.

**name** Name of the task to delete.

CLI Example:

```
salt '*' kapacitor.delete_task cpu
```

salt.modules.kapacitor.disable_task(name)
Disable a kapacitor task.

**name** Name of the task to disable.

CLI Example:

```
salt '*' kapacitor.disable_task cpu
```

salt.modules.kapacitor.enable_task(name)
Enable a kapacitor task.

**name** Name of the task to enable.

CLI Example:

```
salt '*' kapacitor.enable_task cpu
```

salt.modules.kapacitor.get_task(name)
Get a dict of data on a task.

**name** Name of the task to get information about.

CLI Example:

```
salt '*' kapacitor.get_task cpu
```

salt.modules.kapacitor.version(*args, **kwargs)
Get the kapacitor version.

19.9.173 salt.modules.kerberos

Manage Kerberos KDC

**configuration** In order to manage your KDC you will need to generate a keytab that can authenticate without requiring a password.

```
# ktadd -k /root/secure.keytab kadmin/admin kadmin/changepw
```

On the KDC minion you will need to add the following to the minion configuration file so Salt knows what keytab to use and what principal to authenticate as.

```
auth_keytab: /root/auth.keytab
auth_principal: kadmin/admin
```

salt.modules.kerberos.create_keytab(name, keytab, enctypes=None)
Create keytab

CLI Example:
### 19.9.174 Salt Documentation, Release 2017.7.8

```bash
salt 'kdc.example.com' kerberos.create_keytab host/host1.example.com host1.example.com.keytab
```

**salt.modules.kerberos.create_principal**(*name*, *enctypes=None*)
Create Principal

CLI Example:
```bash
salt 'kdc.example.com' kerberos.create_principal host/example.com
```

**salt.modules.kerberos.delete_principal**(*name*)
Delete Principal

CLI Example:
```bash
salt 'kdc.example.com' kerberos.delete_principal host/example.com@
```

**salt.modules.kerberos.get_policy**(*name*)
Get policy details

CLI Example:
```bash
salt 'kdc.example.com' kerberos.get_policy my_policy
```

**salt.modules.kerberos.get_principal**(*name*)
Get principal details

CLI Example:
```bash
salt 'kdc.example.com' kerberos.get_principal root/admin
```

**salt.modules.kerberos.get_privs()**
Current privileges

CLI Example:
```bash
salt 'kdc.example.com' kerberos.get_privs
```

**salt.modules.kerberos.list_policies()**
List policies

CLI Example:
```bash
salt 'kdc.example.com' kerberos.list_policies
```

**salt.modules.kerberos.list_principals()**
Get all principals

CLI Example:
```bash
salt 'kde.example.com' kerberos.list_principals
```

---

### 19.9.174 Salt Documentation, Release 2017.7.8

Functions to view the minion's public key information

**salt.modules.key.finger**(*hash_type=None*)
Return the minion’s public key fingerprint
hash_type  The hash algorithm used to calculate the fingerprint

CLI Example:

```
salt '*' key.finger
```

salt.modules.key.**finger_master**(hash_type=None)
Return the fingerprint of the master's public key on the minion.

hash_type  The hash algorithm used to calculate the fingerprint

CLI Example:

```
salt '*' key.finger_master
```

### 19.9.175 salt.modules.keyboard

Module for managing keyboards on supported POSIX-like systems using systemd, or such as Redhat, Debian and Gentoo.

salt.modules.keyboard.**get_sys**()
Get current system keyboard setting

CLI Example:

```
salt '*' keyboard.get_sys
```

salt.modules.keyboard.**get_x**()
Get current X keyboard setting

CLI Example:

```
salt '*' keyboard.get_x
```

salt.modules.keyboard.**set_sys**(layout)
Set current system keyboard setting

CLI Example:

```
salt '*' keyboard.set_sys dvorak
```

salt.modules.keyboard.**set_x**(layout)
Set current X keyboard setting

CLI Example:

```
salt '*' keyboard.set_x dvorak
```

### 19.9.176 salt.modules.keystone

Module for handling openstack keystone calls.

**optdepends**

- keystoneclient Python adapter

**configuration** This module is not usable until the following are specified either in a pillar or in the minion’s config file:
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.tenant_id: f80919baedab48ec8931f200c65a50df
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/

OR (for token based authentication)

keystone.token: 'ADMIN'
keystone.endpoint: 'http://127.0.0.1:35357/v2.0/

If configuration for multiple openstack accounts is required, they can be set up as different configuration profiles. For example:

openstack1:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.tenant_id: f80919baedab48ec8931f200c65a50df
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/

openstack2:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.tenant_id: f80919baedab48ec8931f200c65a50df
  keystone.auth_url: 'http://127.0.0.2:5000/v2.0/

With this configuration in place, any of the keystone functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' keystone.tenant_list profile=openstack1
```

salt.modules.keystone.api_version(profile=None, **connection_args)
Returns the API version derived from endpoint's response.

CLI Example:
```
salt '*' keystone.api_version
```

salt.modules.keystone.auth(profile=None, **connection_args)
Set up keystone credentials. Only intended to be used within Keystone-enabled modules.

CLI Example:
```
salt '*' keystone.auth
```

salt.modules.keystone.ec2_credentials_create(user_id=None, name=None, tenant_id=None, tenant=None, profile=None, **connection_args)
Create EC2-compatible credentials for user per tenant

CLI Examples:
```
salt '*' keystone.ec2_credentials_create name=admin tenant=admin
salt '*' keystone.ec2_credentials_create user_id=c965f79c4f864eaaa9c3b4190467082 tenant_id=722787eb540849158668370dc627ec5f
```
salt.modules.keystone.ec2_credentials_delete(user_id=None, name=None, access_key=None, profile=None, **connection_args)

Delete EC2-compatible credentials

CLI Examples:

```
salt '*' keystone.ec2_credentials_delete 860f8c2c38ca4fab989f9bc56a061a64
  --access_key=5f66d2f24f604b8bb9cd28886106f442
salt '*' keystone.ec2_credentials_delete name=admin access_
  --key=5f66d2f24f604b8bb9cd28886106f442
```

salt.modules.keystone.ec2_credentials_get(user_id=None, name=None, access=None, profile=None, **connection_args)

Return ec2_credentials for a user (keystone ec2-credentials-get)

CLI Examples:

```
salt '*' keystone.ec2_credentials_get c965f79c4f864eaaa9c3b41904e67082
  --access=722787eb540849158668370
salt '*' keystone.ec2_credentials_get user_id=c965f79c4f864eaaa9c3b41904e67082
  --access=722787eb540849158668370
salt '*' keystone.ec2_credentials_get name=nova
  --access=722787eb540849158668370dc627ec5f
```

salt.modules.keystone.ec2_credentials_list(user_id=None, name=None, profile=None, **connection_args)

Return a list of ec2_credentials for a specific user (keystone ec2-credentials-list)

CLI Examples:

```
salt '*' keystone.ec2_credentials_list 298ce377245c4ec9b70e1c639c89e654
salt '*' keystone.ec2_credentials_list user_id=298ce377245c4ec9b70e1c639c89e654
salt '*' keystone.ec2_credentials_list name=jack
```

salt.modules.keystone.endpoint_create(service, publicurl=None, internalurl=None, adminurl=None, region=None, profile=None, url=None, interface=None, **connection_args)

Create an endpoint for an Openstack service

CLI Examples:

```
salt 'v2' keystone.endpoint_create nova 'http://public/url' 'http://internal/url'
  ->'http://adminurl/url' region
salt 'v3' keystone.endpoint_create nova url='http://public/url' interface='public
  ->' region='RegionOne'
```

salt.modules.keystone.endpoint_delete(service, region=None, profile=None, interface=None, **connection_args)

Delete endpoints of an Openstack service

CLI Examples:

```
salt 'v2' keystone.endpoint_delete nova [region=RegionOne]
salt 'v3' keystone.endpoint_delete nova interface=admin [region=RegionOne]
```
salt.modules.keystone.endpoint_get(
    service, region=None, profile=None, interface=None, **connection_args)

Return a specific endpoint (keystone endpoint-get)

CLI Example:

```bash
salt 'v2' keystone.endpoint_get nova [region=RegionOne]
salt 'v3' keystone.endpoint_get nova interface=admin [region=RegionOne]
```

code

salt.modules.keystone.endpoint_list(
    profile=None, **connection_args)

Return a list of available endpoints (keystone endpoints-list)

CLI Example:

```bash
salt '*' keystone.endpoint_list
```

code

salt.modules.keystone.project_create(
    name, domain, description=None, enabled=True, profile=None, **connection_args)

Create a keystone project. Overrides keystone tenant_create form api V2. For keystone api V3.

New in version 2016.11.0.

- **name**: The project name, which must be unique within the owning domain.
- **domain**: The domain name.
- **description**: The project description.
- **enabled**: Enables or disables the project.
- **profile**: Configuration profile - if configuration for multiple openstack accounts required.

CLI Examples:

```bash
salt '*' keystone.project_create nova default description='Nova Compute Project'
salt '*' keystone.project_create test default enabled=False
```

code

salt.modules.keystone.project_delete(
    project_id=None, name=None, profile=None, **connection_args)

Delete a project (keystone project-delete). Overrides keystone tenant-delete form api V2. For keystone api V3 only.

New in version 2016.11.0.

- **project_id**: The project id.
- **name**: The project name.
- **profile**: Configuration profile - if configuration for multiple openstack accounts required.

CLI Examples:

```bash
salt '*' keystone.project_delete c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.project_delete project_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.project_delete name=demo
```

code

salt.modules.keystone.project_get(
    project_id=None, name=None, profile=None, **connection_args)

Return a specific projects (keystone project-get) Overrides keystone tenant-get form api V2. For keystone api V3 only.

New in version 2016.11.0.

- **project_id**: The project id.
- **name**: The project name.
- **profile**: Configuration profile - if configuration for multiple openstack accounts required.

CLI Examples:
salt '*' keystone.project_get c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.project_get project_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.project_get name=nova

salt.modules.keystone.project_list(profile=None, **connection_args)

Return a list of available projects (keystone projects-list). Overrides keystone tenants-list form api V2. For keystone api V3 only.

New in version 2016.11.0.

profile Configuration profile - if configuration for multiple openstack accounts required.

CLI Example:
salt '*' keystone.project_list

salt.modules.keystone.project_update(project_id=None, name=None, description=None, enabled=None, profile=None, **connection_args)

Update a tenant’s information (keystone project-update) The following fields may be updated: name, description, enabled. Can only update name if targeting by ID

Overrides keystone tenant_update form api V2. For keystone api V3 only.

New in version 2016.11.0.

project_id The project id.
name The project name, which must be unique within the owning domain.
description The project description.
enabled Enables or disables the project.
profile Configuration profile - if configuration for multiple openstack accounts required.

CLI Examples:
salt '*' keystone.project_update name=admin enabled=True
salt '*' keystone.project_update c965f79c4f864eaaa9c3b41904e67082 name=admin
<--email=admin@domain.com

salt.modules.keystone.role_create(name, profile=None, **connection_args)

Create a named role.

CLI Example:
salt '*' keystone.role_create admin

salt.modules.keystone.role_delete(role_id=None, name=None, profile=None, **connection_args)

Delete a role (keystone role-delete)

CLI Examples:
salt '*' keystone.role_delete c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.role_delete role_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.role_delete name=admin

salt.modules.keystone.role_get(role_id=None, name=None, profile=None, **connection_args)

Return a specific roles (keystone role-get)

CLI Examples:
salt '*' keystone.role_get c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.role_get role_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.role_get name=nova
Salt Documentation, Release 2017.7.8

salt.modules.keystone.role_list(profile=None, **connection_args)
Return a list of available roles (keystone role-list)

CLI Example:
salt '*' keystone.role_list

salt.modules.keystone.service_create(name, service_type, description=None, profile=None, **connection_args)
Add service to Keystone service catalog

CLI Examples:
salt '*' keystone.service_create nova compute 'OpenStack Compute Service'

salt.modules.keystone.service_delete(service_id=None, name=None, profile=None, **connection_args)
Delete a service from Keystone service catalog

CLI Examples:
salt '*' keystone.service_delete c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.service_delete name=nova

salt.modules.keystone.service_get(service_id=None, name=None, profile=None, **connection_args)
Return a specific service (keystone service-get)

CLI Examples:
salt '*' keystone.service_get c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.service_get service_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.service_get name=nova

salt.modules.keystone.service_list(profile=None, **connection_args)
Return a list of available services (keystone services-list)

CLI Example:
salt '*' keystone.service_list

salt.modules.keystone.tenant_create(name, description=None, enabled=True, profile=None, **connection_args)
Create a keystone tenant

CLI Examples:
salt '*' keystone.tenant_create nova description='nova tenant'
salt '*' keystone.tenant_create test enabled=False

salt.modules.keystone.tenant_delete(tenant_id=None, name=None, profile=None, **connection_args)
Delete a tenant (keystone tenant-delete)

CLI Examples:
salt '*' keystone.tenant_delete c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.tenant_delete tenant_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.tenant_delete name=demo
salt.modules.keystone.tenant_get(tenant_id=None, name=None, profile=None, **connection_args)
Return a specific tenants (keystone tenant-get)

CLI Examples:
salt '*' keystone.tenant_get c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.tenant_get tenant_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.tenant_get name=nova

salt.modules.keystone.tenant_list(profile=None, **connection_args)
Return a list of available tenants (keystone tenants-list)

CLI Example:
salt '*' keystone.tenant_list

salt.modules.keystone.tenant_update(tenant_id=None, name=None, description=None, enabled=None, profile=None, **connection_args)
Update a tenant's information (keystone tenant-update) The following fields may be updated: name, description, enabled. Can only update name if targeting by ID

CLI Examples:
salt '*' keystone.tenant_update name=admin enabled=True
salt '*' keystone.tenant_update c965f79c4f864eaaa9c3b41904e67082 name=admin email=admin@domain.com

salt.modules.keystone.token_get(profile=None, **connection_args)
Return the configured tokens (keystone token-get)

CLI Example:
salt '*' keystone.token_get c965f79c4f864eaaa9c3b41904e67082

salt.modules.keystone.user_create(name, password, email, tenant_id=None, enabled=True, profile=None, project_id=None, description=None, **connection_args)
Create a user (keystone user-create)

CLI Examples:
salt '*' keystone.user_create name=jack password=zero email=jack@halloweentown.org tenant_id=a28a7b5a999a455f84b1f5210264375e enabled=True

salt.modules.keystone.user_delete(user_id=None, name=None, profile=None, **connection_args)
Delete a user (keystone user-delete)

CLI Examples:
salt '*' keystone.user_delete c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.user_delete user_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.user_delete name=nova

salt.modules.keystone.user_get(user_id=None, name=None, profile=None, **connection_args)
Return a specific users (keystone user-get)

CLI Examples:
salt '***' keystone.user_get c965f79c4f864eaa9c3b41904e67082
salt '***' keystone.user_get user_id=c965f79c4f864eaa9c3b41904e67082
salt '***' keystone.user_get name=nova

salt.modules.keystone.user_list(profile=None, **connection_args)

Return a list of available users (keystone user-list)

CLI Example:

```
salt '***' keystone.user_list
```

salt.modules.keystone.user_password_update(user_id=None, name=None, password=None, profile=None, **connection_args)

Update a user's password (keystone user-password-update)

CLI Examples:

```
salt '***' keystone.user_password_update user_id=c965f79c4f864eaa9c3b41904e67082 password=12345
salt '***' keystone.user_password_update name=nova password=12345
```

salt.modules.keystone.user_role_add(user_id=None, user=None, tenant_id=None, tenant=None, role_id=None, role=None, profile=None, project_id=None, project_name=None, **connection_args)

Add role for user in tenant (keystone user-role-add)

CLI Examples:

```
salt '***' keystone.user_role_add user_id=298ce377245c4ec9b70e1c639c89e654 user_name=admin tenant_id=7167a092ec8e8cad4bf9d15bb3b role_id=ce377245c4ec9b70e1c639c89e68ced4 role_name=admin
```

salt.modules.keystone.user_role_list(user_id=None, tenant_id=None, user_name=None, tenant_name=None, profile=None, project_id=None, project_name=None, **connection_args)

Return a list of available user_roles (keystone user-roles-list)

CLI Examples:

```
salt '***' keystone.user_role_list user_id=298ce377245c4ec9b70e1c639c89e654 tenant_id=7167a092ec8e8cad4bf9d15bb3b tenant_name=admin user_name=admin
```

salt.modules.keystone.user_role_remove(user_id=None, user=None, tenant_id=None, tenant=None, role_id=None, role=None, profile=None, project_id=None, project_name=None, **connection_args)

Remove role for user in tenant (keystone user-role-remove)

CLI Examples:

```
salt '***' keystone.user_role_remove user_id=298ce377245c4ec9b70e1c639c89e654 user_name=admin tenant_id=7167a092ec8e8cad4bf9d15bb3b role_id=ce377245c4ec9b70e1c639c89e68ced4 role_name=admin
```
salt.modules.keystone.user_update(user_id=None, name=None, email=None, enabled=None, tenant=None, profile=None, project=None, description=None, **connection_args)

Update a user's information (keystone user-update) The following fields may be updated: name, email, enabled, tenant. Because the name is one of the fields, a valid user id is required.

CLI Examples:

```
salt '*' keystone.user_update user_id=c965f79c4f864eaaa9c3b41904e67082 name=newname
salt '*' keystone.user_update c965f79c4f864eaaa9c3b41904e67082 name=newname email=newemail@domain.com
```

salt.modules.keystone.user_verify_password(user_id=None, name=None, password=None, profile=None, **connection_args)

Verify a user's password

CLI Examples:

```
salt '*' keystone.user_verify_password name=test password=foobar
salt '*' keystone.user_verify_password user_id=c965f79c4f864eaaa9c3b41904e67082 password=foobar
```

19.9.177 salt.modules.kmod

Module to manage Linux kernel modules

salt.modules.kmod.available()

Return a list of all available kernel modules

CLI Example:

```
salt '*' kmod.available
```

salt.modules.kmod.check_available(mod)

Check to see if the specified kernel module is available

CLI Example:

```
salt '*' kmod.check_available kvm
```

salt.modules.kmod.is_loaded(mod)

Check to see if the specified kernel module is loaded

CLI Example:

```
salt '*' kmod.is_loaded kvm
```

salt.modules.kmod.load(mod, persist=False)

Load the specified kernel module

mod Name of module to add

persist Write module to /etc/modules to make it load on system reboot

CLI Example:

```
salt '*' kmod.load kvm
```

salt.modules.kmod.lsmod()

Return a dict containing information about currently loaded modules
CLI Example:

```
salt '*' kmod.lsmod
```

```
salt.modules.kmod.mod_list(only_persist=False)
```

Return a list of the loaded module names

- `only_persist` Only return the list of loaded persistent modules

CLI Example:

```
salt '*' kmod.mod_list
```

```
salt.modules.kmod.remove(mod, persist=False, comment=True)
```

Remove the specified kernel module

- `mod` Name of module to remove
- `persist` Also remove module from /etc/modules
- `comment` If persist is set don't remove line from /etc/modules but only comment it

CLI Example:

```
salt '*' kmod.remove kvm
```

---

### 19.9.178 `salt.modules.kubernetes`

Module for handling kubernetes calls.

**optdepends**

- kubernetes Python client

**configuration** The k8s API settings are provided either in a pillar, in the minion's config file, or in master's config file:

```
kubernetes.user: admin
kubernetes.password: verybadpass
kubernetes.api_url: 'http://127.0.0.1:8080'
kubernetes.certificate-authority-data: '...
kubernetes.client-certificate-data: '....n'
kubernetes.client-key-data: '...
kubernetes.certificate-authority-file: '/path/to/ca.crt'
kubernetes.client-certificate-file: '/path/to/client.crt'
kubernetes.client-key-file: '/path/to/client.key'
```

These settings can be also overridden by adding `api_url`, `api_user`, `api_password`, `api_certificate_authority_file`, `api_client_certificate_file` or `api_client_key_file` parameters when calling a function:

The data format for `kubernetes.*-data` values is the same as provided in `kubeconfig`. It's base64 encoded certificates/keys in one line.

For an item only one field should be provided. Either a `data` or a `file` entry. In case both are provided the `file` entry is preferred.

```
salt '*' kubernetes.nodes api_url=http://k8s-api-server:port api_user=myuser api_
   password=pass
```

**Warning**: Configuration options will change in Flourine. All options above will be replaced by:

- kubernetes.kubeconfig or kubernetes.kubeconfig-data
salt.modules.kubernetes.configmaps(namespace='default', **kwargs)

Return a list of kubernetes configmaps defined in the namespace

CLI Examples:

```python
salt '*' kubernetes.configmaps
salt '*' kubernetes.configmaps namespace=default
```

salt.modules.kubernetes.create_configmap(name, namespace, data, source, template, saltenv, **kwargs)

Creates the kubernetes configmap as defined by the user.

salt.modules.kubernetes.create_deployment(name, namespace, metadata, spec, source, template, saltenv, **kwargs)

Creates the kubernetes deployment as defined by the user.

salt.modules.kubernetes.create_namespace(name, **kwargs)

Creates a namespace with the specified name.

CLI Example: salt '*' kubernetes.create_namespace salt salt '*' kubernetes.create_namespace name=salt

salt.modules.kubernetes.create_pod(name, namespace, metadata, spec, source, template, saltenv, **kwargs)

Creates the kubernetes deployment as defined by the user.

salt.modules.kubernetes.create_secret(name, namespace, data, source, template, saltenv, **kwargs)

Creates the kubernetes secret as defined by the user.

salt.modules.kubernetes.create_service(name, namespace, metadata, spec, source, template, saltenv, **kwargs)

Creates the kubernetes service as defined by the user.

salt.modules.kubernetes.delete_configmap(name, namespace='default', **kwargs)

Deletes the kubernetes configmap defined by name and namespace

CLI Examples:

```python
salt '*' kubernetes.delete_configmap settings default
salt '*' kubernetes.delete_configmap name=settings namespace=default
```

salt.modules.kubernetes.delete_deployment(name, namespace='default', **kwargs)

Deletes the kubernetes deployment defined by name and namespace

CLI Examples:

```python
salt '*' kubernetes.delete_deployment my-nginx
salt '*' kubernetes.delete_deployment name=my-nginx namespace=default
```

salt.modules.kubernetes.delete_namespace(name, **kwargs)

Deletes the kubernetes namespace defined by name

CLI Examples:

```python
salt '*' kubernetes.delete_namespace salt
salt '*' kubernetes.delete_namespace name=salt
```

salt.modules.kubernetes.delete_pod(name, namespace='default', **kwargs)

Deletes the kubernetes pod defined by name and namespace
Salt Documentation, Release 2017.7.8

CLI Examples:

```python
salt '*' kubernetes.delete_pod guestbook-708336848-5nl8c default
salt '*' kubernetes.delete_pod name=guestbook-708336848-5nl8c namespace=default
```

```python
salt.modules.kubernetes.delete_secret(name, namespace='default', **kwargs)
Deletes the kubernetes secret defined by name and namespace

CLI Examples:

```python
salt '*' kubernetes.delete_secret confidential default
salt '*' kubernetes.delete_secret name=confidential namespace=default
```

```python
salt.modules.kubernetes.delete_service(name, namespace='default', **kwargs)
Deletes the kubernetes service defined by name and namespace

CLI Examples:

```python
salt '*' kubernetes.delete_service my-nginx default
salt '*' kubernetes.delete_service name=my-nginx namespace=default
```

```python
salt.modules.kubernetes.deployments(namespace='default', **kwargs)
Return a list of kubernetes deployments defined in the namespace

CLI Examples:

```python
salt '*' kubernetes.deployments
salt '*' kubernetes.deployments namespace=default
```

```python
salt.modules.kubernetes.namespaces(**kwargs)
Return the names of the available namespaces

CLI Examples:

```python
salt '*' kubernetes.namespaces
salt '*' kubernetes.namespaces api_url=http://myhost:port api_user=my-user
```

```python
salt.modules.kubernetes.node(name, **kwargs)
Return the details of the node identified by the specified name

CLI Examples:

```python
salt '*' kubernetes.node name='minikube'
```

```python
salt.modules.kubernetes.node_add_label(node_name, label_name, label_value, **kwargs)
Set the value of the label identified by label_name to label_value on the node identified by the name node_name. Creates the lable if not present.

CLI Examples:

```python
salt '*' kubernetes.node_add_label node_name="minikube" label_name="foo" label_value="bar"
```

```python
salt.modules.kubernetes.node_labels(name, **kwargs)
Return the labels of the node identified by the specified name

CLI Examples:

```python
salt '*' kubernetes.node_labels name="minikube"
```
salt.modules.kubernetes.node_remove_label(node_name, label_name, **kwargs)
Removes the label identified by label_name from the node identified by the name node_name.

CLI Examples:

```bash
salt '*' kubernetes.node_remove_label node_name="minikube" label_name="foo"
```

salt.modules.kubernetes.nodes(**kwargs)
Return the names of the nodes composing the kubernetes cluster

CLI Examples:

```bash
salt '*' kubernetes.nodes
salt '*' kubernetes.nodes api_url=http://myhost:port api_user=my-user
```

salt.modules.kubernetes.ping(**kwargs)
Checks connections with the kubernetes API server. Returns True if the connection can be established, False otherwise.

CLI Example: salt '*' kubernetes.ping

salt.modules.kubernetes.pods(namespace='default', **kwargs)
Return a list of kubernetes pods defined in the namespace

CLI Examples:

```bash
salt '*' kubernetes.pods
salt '*' kubernetes.pods namespace=default
```

salt.modules.kubernetes.replace_configmap(name, data, source, template, saltenv, namespace='default', **kwargs)
Replaces an existing configmap with a new one defined by name and namespace, having the specified data.

salt.modules.kubernetes.replace_deployment(name, metadata, spec, source, template, saltenv, namespace='default', **kwargs)
Replaces an existing deployment with a new one defined by name and namespace, having the specified metadata and spec.

salt.modules.kubernetes.replace_secret(name, data, source, template, saltenv, namespace='default', **kwargs)
Replaces an existing secret with a new one defined by name and namespace, having the specified data.

salt.modules.kubernetes.replace_service(name, metadata, spec, source, template, old_service, saltenv, namespace='default', **kwargs)
Replaces an existing service with a new one defined by name and namespace, having the specified metadata and spec.

salt.modules.kubernetes.secrets(namespace='default', **kwargs)
Return a list of kubernetes secrets defined in the namespace

CLI Examples:

```bash
salt '*' kubernetes.secrets
salt '*' kubernetes.secrets namespace=default
```

salt.modules.kubernetes.services(namespace='default', **kwargs)
Return a list of kubernetes services defined in the namespace

CLI Examples:
salt '!' kubernetes.services
salt '!' kubernetes.services namespace=default

salt.modules.kubernetes.show_configmap(name, namespace='default', **kwargs)
Return the kubernetes configmap defined by name and namespace.

CLI Examples:
salt '!' kubernetes.show_configmap game-config default
salt '!' kubernetes.show_configmap name=game-config namespace=default

salt.modules.kubernetes.show_deployment(name, namespace='default', **kwargs)
Return the kubernetes deployment defined by name and namespace

CLI Examples:
salt '!' kubernetes.show_deployment my-nginx default
salt '!' kubernetes.show_deployment name=my-nginx namespace=default

salt.modules.kubernetes.show_namespace(name, **kwargs)
Return information for a given namespace defined by the specified name

CLI Examples:
salt '!' kubernetes.show_namespace kube-system

salt.modules.kubernetes.show_pod(name, namespace='default', **kwargs)
Return POD information for a given pod name defined in the namespace

CLI Examples:
salt '!' kubernetes.show_pod guestbook-708336848-fqr2x
salt '!' kubernetes.show_pod name=guestbook-708336848-fqr2x namespace=default

salt.modules.kubernetes.show_secret(name, namespace='default', decode=False, **kwargs)
Return the kubernetes secret defined by name and namespace. The secrets can be decoded if specified by the user. Warning: this has security implications.

CLI Examples:
salt '!' kubernetes.show_secret confidential default
salt '!' kubernetes.show_secret name=confidential namespace=default
salt '!' kubernetes.show_secret name=confidential decode=True

salt.modules.kubernetes.show_service(name, namespace='default', **kwargs)
Return the kubernetes service defined by name and namespace

CLI Examples:
salt '!' kubernetes.show_service my-nginx default
salt '!' kubernetes.show_service name=my-nginx namespace=default

19.9.179 salt.modules.launchctl
Module for the management of MacOS systems that use launchd/launchctl
Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `service.start' is not available), see here.

depends

- `plistlib` Python module

**salt.modules.launchctl.available(job_label)**
Check that the given service is available.

CLI Example:
```
salt '*' service.available com.openssh.sshd
```

**salt.modules.launchctl.disabled(job_label, runas=None)**
Return True if the named service is disabled, false otherwise

CLI Example:
```
salt '*' service.disabled <service label>
```

**salt.modules.launchctl.enabled(job_label, runas=None)**
Return True if the named service is enabled, false otherwise

CLI Example:
```
salt '*' service.enabled <service label>
```

**salt.modules.launchctl.get_all()**
Return all installed services

CLI Example:
```
salt '*' service.get_all
```

**salt.modules.launchctl.missing(job_label)**
The inverse of service.available Check that the given service is not available.

CLI Example:
```
salt '*' service.missing com.openssh.sshd
```

**salt.modules.launchctl.restart(job_label, runas=None)**
Restart the named service

CLI Example:
```
salt '*' service.restart <service label>
```

**salt.modules.launchctl.start(job_label, runas=None)**
Start the specified service

CLI Example:
```
salt '*' service.start <service label>
salt '*' service.start org.ntp.ntpd
salt '*' service.start /System/Library/LaunchDaemons/org.ntp.ntpd.plist
```
Salt Documentation, Release 2017.7.8

salt.modules.launchctl.status(job_label, runas=None)
   Return the status for a service, returns a bool whether the service is running.
   CLI Example:

   ```
salt '*' service.status <service label>
   ```

salt.modules.launchctl.stop(job_label, runas=None)
   Stop the specified service
   CLI Example:

   ```
salt '*' service.stop <service label>
salt '*' service.stop org.ntp.ntpd
salt '*' service.stop /System/Library/LaunchDaemons/org.ntp.ntpd.plist
   ```

19.9.180  salt.modules.layman

Support for Layman

salt.modules.layman.add(overlay)
   Add the given overlay from the cached remote list to your locally installed overlays. Specify `ALL' to add all
   overlays from the remote list.
   Return a list of the new overlay(s) added:
   CLI Example:

   ```
salt '*' layman.add <overlay name>
   ```

salt.modules.layman.delete(overlay)
   Remove the given overlay from the your locally installed overlays. Specify `ALL' to remove all overlays.
   Return a list of the overlays(s) that were removed:
   CLI Example:

   ```
salt '*' layman.delete <overlay name>
   ```

salt.modules.layman.list_all()
   List all overlays, including remote ones.
   Return a list of available overlays:
   CLI Example:

   ```
salt '*' layman.list_all
   ```

salt.modules.layman.list_local()
   List the locally installed overlays.
   Return a list of installed overlays:
   CLI Example:

   ```
salt '*' layman.list_local
   ```

salt.modules.layman.sync(overlay='ALL')
   Update the specified overlay. Use `ALL' to synchronize all overlays. This is the default if no overlay is specified.
   overlay  Name of the overlay to sync. (Defaults to `ALL')
CLI Example:

```
salt '*' layman.sync
```

### 19.9.181 `salt.modules.ldap3`

**Query and modify an LDAP database (alternative interface)**

New in version 2016.3.0.

This is an alternative to the `ldap` interface provided by the `ldapmod` execution module.

**depends**

- ldap Python module

**exception** `salt.modules.ldap3.LDAPError(message, cause=None)`

Base class of all LDAP exceptions raised by backends.

This is only used for errors encountered while interacting with the LDAP server; usage errors (e.g., invalid backend name) will have a different type.

**Variables**

- `cause` -- backend exception object, if applicable

**salt.modules.ldap3.add(connect_spec, dn, attributes)**

Add an entry to an LDAP database.

**Parameters**

- `connect_spec` -- See the documentation for the `connect_spec` parameter for `connect()`.
- `dn` -- Distinguished name of the entry.
- `attributes` -- Non-empty dict mapping each of the new entry's attributes to a non-empty iterable of values.

**Returns**

True if successful, raises an exception otherwise.

CLI example:

```
salt '*' ldap3.add "{" 'url': 'ldaps://ldap.example.com/', 'bind': { 'method': 'simple', 'password': 'secret', }, }" "dn='dc=example,dc=com'" "attributes={'example': 'values'}"
```

**salt.modules.ldap3.change** (connect_spec, dn, before, after)

Modify an entry in an LDAP database.

This does the same thing as `modify()`, but with a simpler interface. Instead of taking a list of directives, it takes a before and after view of an entry, determines the differences between the two, computes the directives, and executes them.

Any attribute value present in `before` but missing in `after` is deleted. Any attribute value present in `after` but missing in `before` is added. Any attribute value in the database that is not mentioned in either `before` or `after` is not altered. Any attribute value that is present in both `before` and `after` is ignored, regardless of whether that attribute value exists in the database.

**Parameters**
• **connect_spec** -- See the documentation for the `connect_spec` parameter for `connect()`.

• **dn** -- Distinguished name of the entry.

• **before** -- The expected state of the entry before modification. This is a dict mapping each attribute name to an iterable of values.

• **after** -- The desired state of the entry after modification. This is a dict mapping each attribute name to an iterable of values.

**Returns**  True if successful, raises an exception otherwise.

CLI example:

```
salt '*' ldap3.change "{
    'url': 'ldaps://ldap.example.com/',
    'bind': {
        'method': 'simple',
        'password': 'secret'}
}"
```

```
dn = 'cn=admin,dc=example,dc=com'
before='{"example_value": "before_val"}'
after='{"example_value": "after_val"}'
```

salt.modules.ldap3.connect (connect_spec=None)

Connect and optionally bind to an LDAP server.

**Parameters**  
**connect_spec** -- This can be an LDAP connection object returned by a previous call to `connect()` (in which case the argument is simply returned), None (in which case an empty dict is used), or a dict with the following keys:

• **'backend'** Optional; default depends on which Python LDAP modules are installed. Name of the Python LDAP module to use. Only 'ldap' is supported at the moment.

• **'url'** Optional; defaults to 'ldapi:///'. URL to the LDAP server.

• **'bind'** Optional; defaults to None. Describes how to bind an identity to the LDAP connection. If None, an anonymous connection is made. Valid keys:

  - **'method'** Optional; defaults to None. The authentication method to use. Valid values include but are not necessarily limited to 'simple', 'sasl', and None. If None, an anonymous connection is made. Available methods depend on the chosen backend.

  - **'mechanism'** Optional; defaults to 'EXTERNAL'. The SASL mechanism to use. Ignored unless the method is 'sasl'. Available methods depend on the chosen backend and the server’s capabilities.

  - **'credentials'** Optional; defaults to None. An object specific to the chosen SASL mechanism and backend that represents the authentication credentials. Ignored unless the method is 'sasl'. For the 'ldap' backend, this is a dictionary. If None, an empty dict is used. Keys:

    - **'args'** Optional; defaults to an empty list. A list of arguments to pass to the SASL mechanism constructor. See the SASL mechanism constructor documentation in the `ldap.sasl` Python module.

    - **'kwargs'** Optional; defaults to an empty dict. A dict of keyword arguments to pass to the SASL mechanism constructor. See the SASL
mechanism constructor documentation in the `ldap.sasl` Python module.

- `dn` Optional; defaults to an empty string. The distinguished name to bind.

- `password` Optional; defaults to an empty string. Password for binding. Ignored if the method is `sasl`.

- `tls` Optional; defaults to None. A backend-specific object containing settings to override default TLS behavior.

For the `ldap` backend, this is a dictionary. Not all settings in this dictionary are supported by all versions of `python-ldap` or the underlying TLS library. If None, an empty dict is used. Possible keys:

- `starttls` If present, initiate a TLS connection using StartTLS. (The value associated with this key is ignored.)

- `cacertdir` Set the path of the directory containing CA certificates.

- `cacertfile` Set the pathname of the CA certificate file.

- `certfile` Set the pathname of the certificate file.

- `cipher_suite` Set the allowed cipher suite.

- `crlcheck` Set the CRL evaluation strategy. Valid values are 'none', 'peer', and 'all'.

- `crlfile` Set the pathname of the CRL file.

- `dhfile` Set the pathname of the file containing the parameters for Diffie-Hellman ephemeral key exchange.

- `keyfile` Set the pathname of the certificate key file.

- `newctx` If present, instruct the underlying TLS library to create a new TLS context. (The value associated with this key is ignored.)

- `protocol_min` Set the minimum protocol version.

- `random_file` Set the pathname of the random file when /dev/random and /dev/urandom are not available.

- `require_cert` Set the certificate validation policy. Valid values are 'never', 'hard', 'demand', 'allow', and 'try'.

- `opts` Optional; defaults to None. A backend-specific object containing options for the backend.

For the `ldap` backend, this is a dictionary of OpenLDAP options to set. If None, an empty dict is used. Each key is a the name of an OpenLDAP option constant without the 'LDAP_OPT_' prefix, then converted to lower case.

Returns

an object representing an LDAP connection that can be used as the connect_spec argument to any of the functions in this module (to avoid the overhead of making and terminating multiple connections).

This object should be used as a context manager. It is safe to nest with statements.

CLI example:
salt '*
ldap3.connect "{
'url': 'ldaps://ldap.example.com/',
'method': 'simple',
'dn': 'cn=admin,dc=example,dc=com',
'password': 'secret'
}"  

salt.modules.ldap3.delete(connect_spec, dn)
Delete an entry from an LDAP database.

Parameters

- **connect_spec** -- See the documentation for the connect_spec parameter for connect().
- **dn** -- Distinguished name of the entry.

Returns True if successful, raises an exception otherwise.

CLI example:

salt '*
ldap3.delete "{
'url': 'ldaps://ldap.example.com/',
'method': 'simple',
'dn': 'cn=admin,dc=example,dc=com'
}" dn='cn=admin,dc=example,dc=com'

salt.modules.ldap3.modify(connect_spec, dn, directives)
Modify an entry in an LDAP database.

Parameters

- **connect_spec** -- See the documentation for the connect_spec parameter for connect().
- **dn** -- Distinguished name of the entry.
- **directives** -- Iterable of directives that indicate how to modify the entry. Each directive is a tuple of the form (op,attr,vals), where:
  - op identifies the modification operation to perform. One of:
    * 'add' to add one or more values to the attribute
    * 'delete' to delete some or all of the values from the attribute. If no values are specified with this operation, all of the attribute's values are deleted. Otherwise, only the named values are deleted.
    * 'replace' to replace all of the attribute's values with zero or more new values
  - attr names the attribute to modify
  - vals is an iterable of values to add or delete

Returns True if successful, raises an exception otherwise.

CLI example:

salt '*
ldap3.modify "{
'url': 'ldaps://ldap.example.com/',
'method': 'simple',
'password': 'secret'
}"
salt.modules.ldap3.search

```
search(connect_spec, base, scope='subtree', filterstr='(objectClass=*)', attrlist=None, attrsonly=0)
```

Search an LDAP database.

**Parameters**

- `connect_spec` -- See the documentation for the `connect_spec` parameter for `connect()`.
- `base` -- Distinguished name of the entry at which to start the search.
- `scope` -- One of the following:
  - `subtree` Search the base and all of its descendants.
  - `base` Search only the base itself.
  - `onelevel` Search only the base's immediate children.
- `filterstr` -- String representation of the filter to apply in the search.
- `attrlist` -- Limit the returned attributes to those in the specified list. If `None`, all attributes of each entry are returned.
- `attrsonly` -- If non-zero, don't return any attribute values.

**Returns** a dict of results. The dict is empty if there are no results. The dict maps each returned entry's distinguished name to a dict that maps each of the matching attribute names to a list of its values.

**CLI example:**

```
salt '*' ldap3.search "{
  'url': 'ldaps://ldap.example.com/",
  'bind': {
    'method': 'simple',
    'dn': 'cn=admin,dc=example,dc=com',
    'password': 'secret',
  },
  'base': 'dc=example,dc=com'
}"
```

### 19.9.182 salt.modules.ldapmod

Salt interface to LDAP commands

**depends**

- ldap Python module

**configuration** In order to connect to LDAP, certain configuration is required in the minion config on the LDAP server. The minimum configuration items that must be set are:

```
ldap.basedn: dc=acme,dc=com (example values, adjust to suit)
```

If your LDAP server requires authentication then you must also set:

```
ldap.anonymous: False
ldap.binddn: admin
ldap.bindpw: password
```
In addition, the following optional values may be set:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>ldap.server</td>
<td>localhost (default=localhost, see warning below)</td>
</tr>
<tr>
<td>ldap.port</td>
<td>389 (default=389, standard port)</td>
</tr>
<tr>
<td>ldap.tls</td>
<td>False (default=False, no TLS)</td>
</tr>
<tr>
<td>ldap.no_verify</td>
<td>False (default=False, verify TLS)</td>
</tr>
<tr>
<td>ldap.anonymous</td>
<td>True (default=True, bind anonymous)</td>
</tr>
<tr>
<td>ldap.scope</td>
<td>2 (default=2, ldap.SCOPE_SUBTREE)</td>
</tr>
<tr>
<td>ldap.attrs</td>
<td>[saltAttr] (default=None, return all attributes)</td>
</tr>
</tbody>
</table>

**Warning:** At the moment this module only recommends connection to LDAP services listening on localhost. This is deliberate to avoid the potentially dangerous situation of multiple minions sending identical update commands to the same LDAP server. It's easy enough to override this behavior, but badness may ensue - you have been warned.

```python
salt.modules.ldapmod.search(filter, dn=None, scope=None, attrs=None, **kwargs)
```

Run an arbitrary LDAP query and return the results.

CLI Example:

```
salt 'ldaphost' ldap.search "filter=cn=myhost"
```

Return data:

```
{'myhost': {'count': 1, 'results': [['cn=myhost,ou=hosts,o=acme,c=gb', {'saltKeyValue': ['ntpserver=ntp.acme.local', 'foo=myfoo'], 'saltState': ['foo', 'bar']]], 'time': {'human': '1.2ms', 'raw': '0.00123'}}}
```

Search and connection options can be overridden by specifying the relevant option as key-value pairs, for example:

```
salt 'ldaphost' ldap.search filter=cn=myhost dn=ou=hosts,o=acme,c=gb scope=1 attrs='' server='localhost' port='7393' tls=True bindpw='ssh'
```

### 19.9.183 salt.modules.libcloud_dns module

Connection module for Apache Libcloud DNS management

New in version 2016.11.0.

**configuration** This module uses a configuration profile for one or multiple DNS providers

```yaml
libcloud_dns:
  profile_test1:
    driver: cloudflare
    key: 12345
    secret: mysecret
  profile_test2:
    driver: godaddy
    key: 12345
    secret: mysecret
    shopper_id: 12345
```
depends apache-libcloud

salt.modules.libcloud_dns.create_record(name, zone_id, type, data, profile)
Create a new record.
Parameters
- **name** (str) -- Record name without the domain name (e.g. www). Note: If you want to create a record for a base domain name, you should specify empty string ("") for this argument.
- **zone_id** (str) -- Zone where the requested record is created.
- **type** (str) -- DNS record type (A, AAAA, ...).
- **data** (str) -- Data for the record (depends on the record type).
- **profile** (str) -- The profile key

CLI Example:
salt myminion libcloud_dns.create_record www google.com A 12.32.12.2 profile1

salt.modules.libcloud_dns.create_zone(domain, profile, type='master', ttl=None)
Create a new zone.
Parameters
- **domain** (str) -- Zone domain name (e.g. example.com)
- **profile** (str) -- The profile key
- **type** (str) -- Zone type (master / slave).
- **ttl** (int) -- TTL for new records. (optional)

CLI Example:
salt myminion libcloud_dns.create_zone google.com profile1

salt.modules.libcloud_dns.delete_record(zone_id, record_id, profile)
Delete a record.
Parameters
- **zone_id** (str) -- Zone to delete.
- **record_id** (str) -- Record to delete.
- **profile** (str) -- The profile key

Return type bool
CLI Example:
salt myminion libcloud_dns.delete_record google.com www profile1

salt.modules.libcloud_dns.delete_zone(zone_id, profile)
Delete a zone.
Parameters
- **zone_id** (str) -- Zone to delete.
- **profile** (str) -- The profile key

Return type bool
CLI Example:
salt myminion libcloud_dns.delete_zone google.com profile1
salt.modules.libcloud_dns.get_bind_data(zone_id, profile)
Export Zone to the BIND compatible format.

Parameters

• zone_id (str) -- Zone to export.
• profile (str) -- The profile key

Returns
Zone data in BIND compatible format.

Return type str

CLI Example:
salt myminion libcloud_dns.get_bind_data google.com profile1

salt.modules.libcloud_dns.get_record(zone_id, record_id, profile)
Get record information for the given zone_id on the given profile

Parameters

• zone_id (str) -- Zone to export.
• record_id (str) -- Record to delete.
• profile (str) -- The profile key

CLI Example:
salt myminion libcloud_dns.get_record google.com www profile1

salt.modules.libcloud_dns.get_zone(zone_id, profile)
Get zone information for the given zone_id on the given profile

Parameters

• zone_id (str) -- Zone to export.
• profile (str) -- The profile key

CLI Example:
salt myminion libcloud_dns.get_zone google.com profile1

salt.modules.libcloud_dns.list_record_types(profile)
List available record types for the given profile, e.g. A, AAAA

Parameters

profile (str) -- The profile key

CLI Example:
salt myminion libcloud_dns.list_record_types profile1

salt.modules.libcloud_dns.list_records(zone_id, profile)
List records for the given zone_id on the given profile

Parameters

• zone_id (str) -- Zone to export.
• profile (str) -- The profile key

CLI Example:
salt myminion libcloud_dns.list_records google.com profile1

salt.modules.libcloud_dns.list_zones(profile)
List zones for the given profile

Parameters

profile (str) -- The profile key

CLI Example:
salt myminion libcloud_dns.list_zones profile1

salt.modules.libcloud_dns.update_zone(zone_id, domain, profile, type='master', ttl=None)

Update an existing zone.

Parameters

- **zone_id** (str) -- Zone ID to update.
- **domain** (str) -- Zone domain name (e.g. example.com)
- **profile** (str) -- The profile key
- **type** (str) -- Zone type (master / slave).
- **ttl** (int) -- TTL for new records. (optional)

CLI Example:
salt myminion libcloud_dns.update_zone google.com google.com profile1 type=slave

19.9.184 salt.modules.linux_acl

Support for Linux File Access Control Lists

The Linux ACL module requires the `getfacl` and `setfacl` binaries.

salt.modules.linux_acl.delfacl(acl_type, acl_name='*', *args, **kwargs)

Remove specific FACL from the specified file(s)

CLI Examples:
salt '*' acl.delfacl user myuser /tmp/house/kitchen
salt '*' acl.delfacl default:group mygroup /tmp/house/kitchen
salt '*' acl.delfacl d:u myuser /tmp/house/kitchen
salt '*' acl.delfacl g myuser /tmp/house/kitchen /tmp/house/livingroom
salt '*' acl.delfacl user myuser /tmp/house/kitchen recursive=True

salt.modules.linux_acl.getfacl(*args, **kwargs)

Return (extremely verbose) map of FACLs on specified file(s)

CLI Examples:
salt '*' acl.getfacl /tmp/house/kitchen
salt '*' acl.getfacl /tmp/house/kitchen /tmp/house/livingroom
salt '*' acl.getfacl /tmp/house/kitchen /tmp/house/livingroom recursive=True

salt.modules.linux_acl.modfacl(acl_type, acl_name='*', perms='*', *args, **kwargs)

Add or modify a FACL for the specified file(s)

CLI Examples:
salt '*' acl.modfacl user myuser rwx /tmp/house/kitchen
salt '*' acl.modfacl default:group mygroup rx /tmp/house/kitchen
salt '*' acl.modfacl d:u myuser 7 /tmp/house/kitchen
salt '*' acl.modfacl g mygroup 0 /tmp/house/kitchen /tmp/house/livingroom
salt '*' acl.modfacl user myuser rwx /tmp/house/kitchen recursive=True

salt.modules.linux_acl.version()

Return facl version from getfacl --version

CLI Example:
salt '*' acl.version

```python
salt.modules.linux_acl.wipefacls(*args, **kwargs)
    Remove all FACLs from the specified file(s)
```

CLI Examples:
```
salt '*' acl.wipefacls /tmp/house/kitchen
salt '*' acl.wipefacls /tmp/house/kitchen /tmp/house/livingroom
salt '*' acl.wipefacls /tmp/house/kitchen /tmp/house/livingroom recursive=True
```

19.9.185 salt.modules.linux_ip module

The networking module for Non-RH/Deb Linux distros
```
salt.modules.linux_ip.down(iface, iface_type=None)
    Shutdown a network interface
```

CLI Example:
```
salt '*' ip.down eth0
```

```
salt.modules.linux_ip.get_interface(iface)
    Return the contents of an interface script
```

CLI Example:
```
salt '*' ip.get_interface eth0
```

```
salt.modules.linux_ip.get_routes(iface=None)
    Return the current routing table
```

CLI Examples:
```
salt '*' ip.get_routes
salt '*' ip.get_routes eth0
```

```
salt.modules.linux_ip.up(iface, iface_type=None)
    Start up a network interface
```

CLI Example:
```
salt '*' ip.up eth0
```

19.9.186 salt.modules.linux_lvm

Support for Linux LVM2
```
salt.modules.linux_lvm.fullversion()
    Return all version info from lvm version
```

CLI Example:
```
salt '*' lvm.fullversion
```
salt.modules.linux_lvm.lvcreate(lvname, vgname, size=None, extents=None, snapshot=None, pv=None, thinpool=False, thinvolume=False, **kwargs)

Create a new logical volume, with option for which physical volume to be used

CLI Examples:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>salt '*' lvm.lvcreate new_volume_name vg_name size=10G</td>
<td></td>
</tr>
<tr>
<td>salt '*' lvm.lvcreate new_volume_name vg_name extents=100 pv=/dev/sdb</td>
<td></td>
</tr>
<tr>
<td>salt '*' lvm.lvcreate new_snapshot vg_name snapshot=volume_name size=3G</td>
<td></td>
</tr>
</tbody>
</table>

New in version to_complete.
Support for thin pools and thin volumes

CLI Examples:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>salt '*' lvm.lvcreate new_thinpool_name vg_name size=20G</td>
<td></td>
</tr>
<tr>
<td></td>
<td>thinpool=True</td>
</tr>
<tr>
<td>salt '*' lvm.lvcreate new_thinvolume_name vg_name/thinpool_name size=10G</td>
<td>thinvolume=True</td>
</tr>
</tbody>
</table>

salt.modules.linux_lvm.lvdisplay(lvname='')

Return information about the logical volume(s)

CLI Examples:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>salt '*' lvm.lvdisplay</td>
<td></td>
</tr>
<tr>
<td>salt '*' lvm.lvdisplay /dev/vg_myserver/root</td>
<td></td>
</tr>
</tbody>
</table>

salt.modules.linux_lvm.lvremove(lvname, vgname)

Remove a given existing logical volume from a named existing volume group

CLI Example:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>salt '*' lvm.lvremove lvname vgname force=True</td>
<td></td>
</tr>
</tbody>
</table>

salt.modules.linux_lvm.lvresize(size, lvpath)

Return information about the logical volume(s)

CLI Examples:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>salt '*' lvm.lvresize +12M /dev/mapper/vg1-test</td>
<td></td>
</tr>
</tbody>
</table>

salt.modules.linux_lvm.pvcreate(devices, override=True, **kwargs)

Set a physical device to be used as an LVM physical volume

override Skip devices, if they are already LVM physical volumes

CLI Examples:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>salt mymachine lvm.pvcreate /dev/sdb1,/dev/sdb2</td>
<td></td>
</tr>
<tr>
<td>salt mymachine lvm.pvcreate /dev/sdb1 dataalignmentoffset=7s</td>
<td></td>
</tr>
</tbody>
</table>

salt.modules.linux_lvm.pvdisplay(pvname='', real=False)

Return information about the physical volume(s)

pvname physical device name
real dereference any symlinks and report the real device

New in version 2015.8.7.

CLI Examples:
salt '*' lvm.pvdisplay
salt '*' lvm.pvdisplay /dev/md0

salt.modules.linux_lvm.pvremove(devices, override=True)
Remove a physical device being used as an LVM physical volume
override Skip devices, if they are already not used as LVM physical volumes
CLI Examples:
salt mymachine lvm.pvremove /dev/sdb1,/dev/sdb2

salt.modules.linux_lvm.version()
Return LVM version from lvm version
CLI Example:
salt '*' lvm.version

salt.modules.linux_lvm.vgcreate(vgname, devices, **kwargs)
Create an LVM volume group
CLI Examples:
salt mymachine lvm.vgcreate my_vg /dev/sdb1,/dev/sdb2
salt mymachine lvm.vgcreate my_vg /dev/sdb1 clustered=y

salt.modules.linux_lvm.vgdisplay(vgname='')
Return information about the volume group(s)
CLI Examples:
salt '*' lvm.vgdisplay
salt '*' lvm.vgdisplay nova-volumes

salt.modules.linux_lvm.vgextend(vgname, devices)
Add physical volumes to an LVM volume group
CLI Examples:
salt mymachine lvm.vgextend my_vg /dev/sdb1,/dev/sdb2
salt mymachine lvm.vgextend my_vg /dev/sdb1

salt.modules.linux_lvm.vgremove(vgname)
Remove an LVM volume group
CLI Examples:
salt mymachine lvm.vgremove vgname
salt mymachine lvm.vgremove vgname force=True

19.9.187 salt.modules.linux_sysctl
Module for viewing and modifying sysctl parameters
salt.modules.linux_sysctl.assign(name, value)
Assign a single sysctl parameter for this minion
CLI Example:
salt '*' sysctl.assign net.ipv4.ip_forward 1

salt.modules.linux_sysctl.default_config()
Linux hosts using systemd 207 or later ignore /etc/sysctl.conf and only load from
/etc/sysctl.d/*.conf. This function will do the proper checks and return a default config file which
will be valid for the Minion. Hosts running systemd >= 207 will use /etc/sysctl.d/99-salt.conf.

CLI Example:
```
salt -G 'kernel:Linux' sysctl.default_config
```

salt.modules.linux_sysctl.get(name)
Return a single sysctl parameter for this minion

CLI Example:
```
salt '*' sysctl.get net.ipv4.ip_forward
```

salt.modules.linux_sysctl.persist(name, value, config=None)
Assign and persist a simple sysctl parameter for this minion. If config is not specified, a sensible default
will be chosen using sysctl.default_config.

CLI Example:
```
salt '*' sysctl.persist net.ipv4.ip_forward 1
```

salt.modules.linux_sysctl.show(config_file=False)
Return a list of sysctl parameters for this minion
config: Pull the data from the system configuration file instead of the live data.

CLI Example:
```
salt '*' sysctl.show
```

**19.9.188 salt.modules.localemod**

Module for managing locales on POSIX-like systems.

salt.modules.localemod.avail(locale)
Check if a locale is available.
New in version 2014.7.0.

CLI Example:
```
salt '*' locale.avail 'en_US.UTF-8'
```

salt.modules.localemod.gen_locale(locale, **kwargs)
Generate a locale. Options:
New in version 2014.7.0.

Parameters **locale** -- Any locale listed in /usr/share/i18n/locales or
/usr/share/i18n/SUPPORTED for Debian and Gentoo based distributions, which re-
quire the charmap to be specified as part of the locale when generating it.
verbose  Show extra warnings about errors that are normally ignored.

CLI Example:
salt '*' locale.gen.locale en_US.UTF-8
salt '*' locale.gen.locale 'en_IE.UTF-8 UTF-8'    # Debian/Gentoo only

salt.modules.localemod.get_locale()
Get the current system locale

CLI Example:
salt '*' locale.get_locale

salt.modules.localemod.list_avail()
Lists available (compiled) locales

CLI Example:
salt '*' locale.list_avail

salt.modules.localemod.set_locale(locale)
Sets the current system locale

CLI Example:
salt '*' locale.set_locale 'en_US.UTF-8'

19.9.189 salt.modules.locate

Module for using the locate utilities

salt.modules.locate.locate(pattern, database='\', limit=0, **kwargs)
Performs a file lookup. Valid options (and their defaults) are:

- basename=\False
- count=\False
- existing=\False
- follow=\True
- ignore=\False
-nofollow=\False
- wholename=\True
- regex=\False
- database=<locate's default database>
- limit=<integer, not set by default>

See the manpage for locate(1) for further explanation of these options.

CLI Example:
salt '*' locate.locate

salt.modules.locate.stats()
Returns statistics about the locate database

CLI Example:
salt '*' locate.stats

salt.modules.locate.updatedb()
Updates the locate database
CLI Example:
```
salt '*' locate.updatedb
```

salt.modules.locate.version()
Returns the version of locate

CLI Example:
```
salt '*' locate.version
```

### 19.9.190 salt.modules.logadm

Module for managing Solaris logadm based log rotations.

salt.modules.logadm.remove(name, conf_file='/etc/logadm.conf')
Remove log pattern from logadm

CLI Example:
```
salt '*' logadm.remove myapplog
```

salt.modules.logadm.rotate(name, pattern=False, count=False, age=False, size=False, copy=True, conf_file='/etc/logadm.conf')
Set up pattern for logging.

CLI Example:
```
salt '*' logadm.rotate myapplog pattern='/var/log/myapp/*.log' count=7
```

salt.modules.logadm.show_conf(conf_file='/etc/logadm.conf')
Show parsed configuration

CLI Example:
```
salt '*' logadm.show_conf
```

### 19.9.191 salt.modules.logmod module

**On-demand logging**

New in version 2017.7.0.

The sole purpose of this module is logging messages in the (proxy) minion. It comes very handy when debugging complex Jinja templates, for example:

```jinja
def
{{ for var in range(10) %}
  {{ do salt.log.info(var) -%}}
{{ endfor %}}
```

CLI Example:
```
salt '*' log.error "Please don't do that, this module is not for CLI use!"
```

salt.modules.logmod.critical(message)
Log message at level CRITICAL.
salt.modules.logmod.debug(message)
Log message at level DEBUG.

salt.modules.logmod.error(message)
Log message at level ERROR.

salt.modules.logmod.exception(message)
Log message at level EXCEPTION.

salt.modules.logmod.info(message)
Log message at level INFO.

salt.modules.logmod.warning(message)
Log message at level WARNING.

19.9.192 salt.modules.logrotate

Module for managing logrotate.

salt.modules.logrotate.get(key, value=None, conf_file='/etc/logrotate.conf')
Get the value for a specific configuration line.

Parameters

- **key** (str) -- The command or stanza block to configure.
- **value** (str) -- The command value or command of the block specified by the key parameter.
- **conf_file** (str) -- The logrotate configuration file.

Returns
The value for a specific configuration line.

Return type bool|int|str

CLI Example:

```
salt '*' logrotate.get rotate
salt '*' logrotate.get /var/log/wtmp rotate /etc/logrotate.conf
```

salt.modules.logrotate.set_(key, value, setting=None, conf_file='/etc/logrotate.conf')
Set a new value for a specific configuration line.

Parameters

- **key** (str) -- The command or block to configure.
- **value** (str) -- The command value or command of the block specified by the key parameter.
- **setting** (str) -- The command value for the command specified by the value parameter.
- **conf_file** (str) -- The logrotate configuration file.

Returns
A boolean representing whether all changes succeeded.

Return type bool

CLI Example:

```
salt '*' logrotate.set rotate 2
```

Can also be used to set a single value inside a multiline configuration block. For instance, to change rotate in the following block:

```
/var/log/wtmp {
  monthly
  create 0664 root root
  rotate 1
}

Use the following command:

```bash
salt '*' logrotate.set /var/log/wtmp rotate 2
```

This module also has the ability to scan files inside an include directory, and make changes in the appropriate file.

```python
salt.modules.logrotate.show_conf(conf_file='/etc/logrotate.conf')
```

Show parsed configuration

**Parameters**

- **conf_file (str)** -- The logrotate configuration file.

**Returns**

The parsed configuration.

**Return type**

dict

**CLI Example:**

```bash
salt '*' logrotate.show_conf
```

## 19.9.193 salt.modules.lvs

Support for LVS (Linux Virtual Server)

```python
salt.modules.lvs.add_server(protocol=None, service_address=None, server_address=None, packet_forward_method='dr', weight=1, **kwargs)
```

Add a real server to a virtual service.

- **protocol** The service protocol(only support tcp, udp and fwmark service).
- **service_address** The LVS service address.
- **server_address** The real server address.
- **packet_forward_method** The LVS packet forwarding method(dr for direct routing, tunnel for tunneling, nat for network access translation).
- **weight** The capacity of a server relative to the others in the pool.

**CLI Example:**

```bash
salt '*' lvs.add_server tcp 1.1.1.1:80 192.168.0.11:8080 nat 1
```

```python
salt.modules.lvs.add_service(protocol=None, service_address=None, scheduler='wlc')
```

Add a virtual service.

- **protocol** The service protocol(only support tcp, udp and fwmark service).
- **service_address** The LVS service address.
- **scheduler** Algorithm for allocating TCP connections and UDP datagrams to real servers.

**CLI Example:**

```bash
salt '*' lvs.add_service tcp 1.1.1.1:80 rr
```

```python
salt.modules.lvs.check_server(protocol=None, service_address=None, server_address=None, **kwargs)
```

Check the real server exists in the specified service.

**CLI Example:**

---

19.9. execution modules 1677
**salt.modules.lvs.check_service**(protocol=None, service_address=None, **kwargs)

Check the virtual service exists.

CLI Example:

```
salt '*' lvs.check_service tcp 1.1.1.1:80
```

**salt.modules.lvs.clear()**

Clear the virtual server table

CLI Example:

```
salt '*' lvs.clear
```

**salt.modules.lvs.delete_server**(protocol=None, service_address=None, server_address=None)

Delete the real server from the virtual service.

- **protocol** The service protocol (only support tcp, udp and fwmark service).
- **service_address** The LVS service address.
- **server_address** The real server address.

CLI Example:

```
salt '*' lvs.delete_server tcp 1.1.1.1:80 192.168.0.11:8080
```

**salt.modules.lvs.delete_service**(protocol=None, service_address=None)

Delete the virtual service.

- **protocol** The service protocol (only support tcp, udp and fwmark service).
- **service_address** The LVS service address.

CLI Example:

```
salt '*' lvs.delete_service tcp 1.1.1.1:80
```

**salt.modules.lvs.edit_server**(protocol=None, service_address=None, server_address=None, packet_forward_method=None, weight=None, **kwargs)

Edit a real server to a virtual service.

- **protocol** The service protocol (only support tcp, udp and fwmark service).
- **service_address** The LVS service address.
- **server_address** The real server address.
- **packet_forward_method** The LVS packet forwarding method (dr for direct routing, tunnel for tunneling, nat for network access translation).
- **weight** The capacity of a server relative to the others in the pool.

CLI Example:

```
salt '*' lvs.edit_server tcp 1.1.1.1:80 192.168.0.11:8080 nat 1
```

**salt.modules.lvs.edit_service**(protocol=None, service_address=None, scheduler=None)

Edit the virtual service.

- **protocol** The service protocol (only support tcp, udp and fwmark service).
- **service_address** The LVS service address.
- **scheduler** Algorithm for allocating TCP connections and UDP datagrams to real servers.

CLI Example:

```
salt '*' lvs.edit_service tcp 1.1.1.1:80 rr
```

**salt.modules.lvs.get_rules()**

Get the virtual server rules
CLI Example:

```
salt '*' lvs.get_rules
```

**salt.modules.lvs.list**( protocol=None, service_address=None )

List the virtual server table if service_address is not specified. If a service_address is selected, list this service only.

CLI Example:

```
salt '*' lvs.list
```

**salt.modules.lvs.zero**( protocol=None, service_address=None )

Zero the packet, byte and rate counters in a service or all services.

CLI Example:

```
salt '*' lvs.zero
```

### 19.9.194 salt.modules.lxc

Control Linux Containers via Salt

**depends** lxc package for distribution

lxc >= 1.0 (even beta alpha) is required

**salt.modules.lxc.add_veth**( name, interface_name, bridge=None, path=None )

Add a veth to a container. Note: this function doesn't update the container config, just add the interface at runtime

- **name** Name of the container
- **interface_name** Name of the interface in the container
- **bridge** Name of the bridge to attach the interface to (facultative)

CLI Examples:

```
salt '*' lxc.add_veth container_name eth1 br1
salt '*' lxc.add_veth container_name eth1
```

**salt.modules.lxc.apply_network_profile**( name, network_profile, nic_opts=None, path=None )

New in version 2015.5.0.

Apply a network profile to a container

- **network_profile** profile name or default values (dict)
- **nic_opts** values to override in defaults (dict) indexed by nic card names
- **path** path to the container parent

New in version 2015.8.0.

CLI Examples:

```
salt 'minion' lxc.apply_network_profile web1 centos
salt 'minion' lxc.apply_network_profile web1 centos \\
  nic_opts="{"eth0": {'mac': 'xx:xx:xx:xx:xx:xx'}}"
salt 'minion' lxc.apply_network_profile web1 \\
  "{"eth0": {'mac': 'xx:xx:xx:xx:yy'}}"
  nic_opts="{"eth0": {'mac': 'xx:xx:xx:xx:xx'}}"
```

The special case to disable use of ethernet nics:
salt 'minion' lxc.apply_network_profile web1 centos \ 
"{eth0: {disable: true}}"

salt.modules.lxc.attachable(name, path=None)
Return True if the named container can be attached to via the lxc-attach command
path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.
CLI Example:
salt 'minion' lxc.attachable ubuntu

salt.modules.lxc.bootstrap(name, config=None, approve_key=True, install=True, pub_key=None,
priv_key=None, bootstrap_url=None, force_install=False, unconditional_install=False, path=None, bootstrap_delay=None, bootstrap_args=None, bootstrap_shell=None)
Install and configure salt in a container.
config Minion configuration options. By default, the master option is set to the target host’s master.
approve_key Request a pre-approval of the generated minion key. Requires that the salt-master be configured to either auto-accept all keys or expect a signing request from the target host. Default: True
path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.
pub_key Explicit public key to pressed the minion with (optional). This can be either a filepath or a string representing the key
priv_key Explicit private key to pressed the minion with (optional). This can be either a filepath or a string representing the key
bootstrap_delay Delay in seconds between end of container creation and bootstrapping. Useful when waiting for container to obtain a DHCP lease.

New in version 2015.5.0.
bootstrap_url url, content or filepath to the salt bootstrap script
bootstrap_args salt bootstrap script arguments
bootstrap_shell shell to execute the script into
install Whether to attempt a full installation of salt-minion if needed.
force_install Force installation even if salt-minion is detected, this is the way to run vendor bootstrap scripts even if a salt minion is already present in the container
unconditional_install Run the script even if the container seems seeded
CLI Examples:
salt 'minion' lxc.bootstrap container_name [config=config_data] \ 
[approve_key=(True|False)] [install=(True|False)]

salt.modules.lxc.clone(name, orig, profile=None, network_profile=None, nic_opts=None, **kwargs)
Create a new container as a clone of another container
name Name of the container
orig Name of the original container to be cloned
profile Profile to use in container cloning (see lxc.get_container_profile). Values in a profile will be overridden by the Container Cloning Arguments listed below.
path path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.
Container Cloning Arguments
snapshot Use Copy On Write snapshots (LVM)
size [1G] Size of the volume to create. Only applicable if backing=lvm.
backing The type of storage to use. Set to lvm to use an LVM group. Defaults to filesystem within /var/lib/lxc.
**network_profile**  
Network profile to use for container  
New in version 2015.8.0.

**nic_opts**  
give extra opts overriding network profile values  
New in version 2015.8.0.

CLI Examples:
```
salt '*' lxc.clone myclone orig=orig_container
salt '*' lxc.clone myclone orig=orig_container snapshot=True
```

```python
salt.modules.lxc.cloud_init(name, vm_=None, **kwargs)
```
Thin wrapper to lxc.init to be used from the saltcloud lxc driver

- `name` Name of the container may be None and then guessed from saltcloud mapping
- `vm_` saltcloud mapping defaults for the vm

CLI Example:
```
salt '*' lxc.cloud_init foo
```

```python
salt.modules.lxc.cloud_init_interface(name, vm_=None, **kwargs)
```
Interface between salt.cloud.lxc driver and lxc.init `vm_` is a mapping of `vm opts` in the salt.cloud format as documented for the lxc driver.

This can be used either:
- from the salt cloud driver
- because you find the argument to give easier here than using directly lxc.init

**Warning:** BE REALLY CAREFUL CHANGING DEFAULTS !!! IT'S A RETRO COMPATIBLE INTERFACE WITH THE SALT CLOUD DRIVER (ask kiorky).

- name  
  name of the lxc container to create
- pub_key  
  public key to preseed the minion with. Can be the keycontent or a filepath
- priv_key  
  private key to preseed the minion with. Can be the keycontent or a filepath
- path  
  path to the container parent directory (default: /var/lib/lxc)

New in version 2015.8.0.

- profile  
  `profile` selection
- network_profile  
  `network profile` selection
- nic_opts  
  per interface settings compatibles with network profile (ipv4/ipv6/link/gateway/mac/netmask)

eg:
```
- {'eth0': {'mac': '00:16:3e:01:29:40',
  'gateway': None, (default)
  'link': 'br0', (default)
  'gateway': None, (default)
  'netmask': '', (default)
  'ip': '22.1.4.25'}}
```

- unconditional_install  
given to lxc.bootstrap (see relative doc)
- force_install  
given to lxc.bootstrap (see relative doc)
- config  
any extra argument for the salt minion config
- dnsservers  
list of DNS servers to set inside the container (Defaults to 8.8.8.8 and 4.4.4.4 until Oxygen release)
- dns_via_dhcp  
do not set the dns servers, let them be set by the dhcp. (Defaults to False until Oxygen release)
- autostart  
autostart the container at boot time
- password  
administrative password for the container
- bootstrap_delay  
delay before launching bootstrap script at Container init
Warning: Legacy but still supported options:

from_container which container we use as a template when running lxc.clone

image which template do we use when we are using lxc.create. This is the default mode unless you specify something in from_container

backing which backing store to use. Values can be: overlayfs, dir(default), lvm, zfs, btrfs

fstype When using a blockdevice level backing store, which filesystem to use on

size When using a blockdevice level backing store, which size for the filesystem to use on

snapshot Use snapshot when cloning the container source

gmname if using LVM: gname

 lname if using LVM: lname

thinpool: if using LVM: thinpool

ip  ip for the primary nic

mac mac address for the primary nic

netmask netmask for the primary nic (24) = 24

bridge bridge for the primary nic (lxcbr0)

gateway network gateway for the container

additional_ips additional ips which will be wired on the main bridge (br0) which is connected to internet.

Be aware that you may use manual virtual mac addresses provided by your provider (online, ovh, etc). This is a list of mappings [ip: '', mac: '', netmask: ''] Set gateway to None and an interface with a gateway to escape from another interface that eth0.

```python
- { 'mac': '00:16:3e:01:29:40',
  'gateway': None, (default)
  'link': 'br0', (default)
  'netmask': '', (default)
  'ip': '22.1.4.25' }
```

users administrative users for the container default: [root] and [root, ubuntu] on ubuntu

default_nic name of the first interface, you should really not override this

CLI Example:

```
salt '*' lxc.cloud_init_interface foo
```

salt.modules.lxc.copy_to(name, source, dest, overwrite=False, makedirs=False, path=None)

Changed in version 2015.8.0: Function renamed from lxc.cp to lxc.copy_to for consistency with other container types. lxc.cp will continue to work, however. For versions 2015.2.x and earlier, use lxc.cp.

Copy a file or directory from the host into a container

name Container name

source File to be copied to the container

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

def path to the container parent default: /var/lib/lxc (system default)

def Destination on the container. Must be an absolute path.

Changed in version 2015.5.0: If the destination is a directory, the file will be copied into that directory.
**overwrite** [False] Unless this option is set to `True`, then if a file exists at the location specified by the `dest` argument, an error will be raised.

New in version 2015.8.0.

**makedirs** : False

Create the parent directory on the container if it does not already exist.

New in version 2015.5.0.

**CLI Example:**

```
salt 'minion' lxc.copy_to /tmp/foo /root/foo
salt 'minion' lxc.cp /tmp/foo /root/foo
```

```python
salt.modules.lxc.create(name, config=None, profile=None, network_profile=None, nic_opts=None, **kwargs)
```

Create a new container.

**name** Name of the container

**config** The config file to use for the container. Defaults to system-wide config (usually in `/etc/lxc/lxc.conf`).

**profile** Profile to use in container creation (see `lxc.get_container_profile`). Values in a profile will be overridden by the **Container Creation Arguments** listed below.

**network_profile** Network profile to use for container

New in version 2015.5.0.

**Container Creation Arguments**

**template** The template to use. For example, `ubuntu` or `fedora`. For a full list of available templates, check out the `lxc.templates` function.

Conflicts with the `image` argument.

**options** Template-specific options to pass to the lxc-create command. These correspond to the long options (ones beginning with two dashes) that the template script accepts. For example:

```
options={"dist": "centos", "release": "6", "arch": "amd64"}
```

For available template options, refer to the lxc template scripts which are usually located under `/usr/share/lxc/templates`, or run `lxc-create -t <template> -h`.

**image** A tar archive to use as the rootfs for the container. Conflicts with the `template` argument.

**backing** The type of storage to use. Set to `lvm` to use an LVM group. Defaults to filesystem within `/var/lib/lxc`.

**fstype** Filesystem type to use on LVM logical volume

**size** [1G] Size of the volume to create. Only applicable if `backing=lvm`.

**vname** [lxc] Name of the LVM volume group in which to create the volume for this container. Only applicable if `backing=lvm`.

**luname** Name of the LVM logical volume in which to create the volume for this container. Only applicable if `backing=lvm`.

**thinpool** Name of a pool volume that will be used for thin-provisioning this container. Only applicable if `backing=lvm`.

**nic_opts** give extra opts overriding network profile values

**path** parent path for the container creation (default: `/var/lib/lxc`)

**zfsroot** Name of the ZFS root in which to create the volume for this container. Only applicable if `backing=zfs`. (default: tank/lxc)
New in version 2015.8.0.

salt.modules.lxc.destroy(name, stop=False, path=None)
Destroy the named container.

**Warning:** Destroys all data associated with the container.

**path** path to the container parent directory (default: /var/lib/lxc)

New in version 2015.8.0.

**stop** [False] If True, the container will be destroyed even if it is running/frozen.

Changed in version 2015.5.0: Default value changed to False. This more closely matches the behavior of lxc-destroy(1), and also makes it less likely that an accidental command will destroy a running container that was being used for important things.

CLI Examples:

```bash
salt '*' lxc.destroy foo
salt '*' lxc.destroy foo stop=True
```

salt.modules.lxc.edit_conf(conf_file, out_format='simple', read_only=False, lxc_config=None, **kwargs)
Edit an LXC configuration file. If a setting is already present inside the file, its value will be replaced. If it does not exist, it will be appended to the end of the file. Comments and blank lines will be kept in tact if they already exist in the file.

**out_format**: Set to simple if you need backward compatibility (multiple items for a simple key is not supported)

**read_only**: return only the edited configuration without applying it to the underlying lxc configuration file

**lxc_config**: List of dict containing lxc configuration items For network configuration, you also need to add the device it belongs to, otherwise it will default to eth0. Also, any change to a network parameter will result in the whole network reconfiguration to avoid mismatches, be aware of that!

After the file is edited, its contents will be returned. By default, it will be returned in simple format, meaning an unordered dict (which may not represent the actual file order). Passing in an **out_format** of commented will return a data structure which accurately represents the order and content of the file.

CLI Example:

```bash
salt 'minion' lxc.edit_conf /etc/lxc/mycontainer.conf \
   out_format=commented lxc.network.type=veth
salt 'minion' lxc.edit_conf /etc/lxc/mycontainer.conf \
   out_format=commented \
   lxc_config="[{'lxc.network.name': 'eth0', \n     'lxc.network.ipv4': '1.2.3.4'}, \n    {'lxc.network.name': 'eth2', \n     'lxc.network.ipv4': '1.2.3.5'},\n    {'lxc.network.gateway': '1.2.3.1'}]"
```

salt.modules.lxc.exists(name, path=None)
Returns whether the named container exists.

**path** path to the container parent directory (default: /var/lib/lxc)

New in version 2015.8.0.

CLI Example:

```bash
salt '*' lxc.exists name
```
**salt.modules.lxc.freeze**(*name*, **kwargs*)
Freeze the named container

- **path** path to the container parent directory default: /var/lib/lxc (system)

  New in version 2015.8.0.

- **start** [False] If True and the container is stopped, the container will be started before attempting to freeze.

  New in version 2015.5.0.

- **use_vt** run the command through VT

  New in version 2015.8.0.

CLI Example:
```
salt '*' lxc.freeze name
```

**salt.modules.lxc.get_container_profile**(*name=None*, **kwargs*)
Gather a pre-configured set of container configuration parameters. If no arguments are passed, an empty profile is returned.

Profiles can be defined in the minion or master config files, or in pillar or grains, and are loaded using **config.get**. The key under which LXC profiles must be configured is `lxc.container_profile.profile_name`. An example container profile would be as follows:

```
lxc.container_profile:
    ubuntu:
        template: ubuntu
        backing: lvm
        vgname: lxc
        size: 1G
```

Parameters set in a profile can be overridden by passing additional container creation arguments (such as the ones passed to **lxc.create**) to this function.

A profile can be defined either as the name of the profile, or a dictionary of variable names and values. See the LXC Tutorial for more information on how to use LXC profiles.

CLI Example:
```
salt-call lxc.get_container_profile centos
salt-call lxc.get_container_profile ubuntu template=ubuntu backing=overlayfs
```

**salt.modules.lxc.get_network_profile**(*name=None*, **kwargs*)
Gather a pre-configured set of network configuration parameters. If no arguments are passed, the following default profile is returned:

```
['eth0': {'link': 'br0', 'type': 'veth', 'flags': 'up'}]
```

Profiles can be defined in the minion or master config files, or in pillar or grains, and are loaded using **config.get**. The key under which LXC profiles must be configured is `lxc.network_profile`. An example network profile would be as follows:

```
lxc.network_profile.centos:
    eth0:
        link: br0
        type: veth
        flags: up
```

19.9. execution modules
To disable networking entirely:

```
lxc.network_profile.centos:
  eth0:
    disable: true
```

Parameters set in a profile can be overridden by passing additional arguments to this function. A profile can be passed either as the name of the profile, or a dictionary of variable names and values. See the `LXC Tutorial` for more information on how to use network profiles.

**Warning:** The `ipv4`, `ipv6`, `gateway`, and `link` (bridge) settings in network profiles will only work if the container doesn't redefine the network configuration (for example in `/etc/sysconfig/network-scripts/ifcfg-<interface_name>` on RHEL/CentOS, or `/etc/network/interfaces` on Debian/Ubuntu/etc.)

CLI Example:

```
salt-call lxc.get_network_profile default
```

`salt.modules.lxc.get_parameter(name, parameter, path=None)`

Returns the value of a cgroup parameter for a container

* path path to the container parent directory default: `/var/lib/lxc` (system)

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.get_parameter container_name memory.limit_in_bytes
```

`salt.modules.lxc.get_pid(name, path=None)`

Returns a container pid. Throw an exception if the container isn't running.

CLI Example:

```
salt '*' lxc.get_pid name
```

`salt.modules.lxc.get_root_path(path)`

Get the configured lxc root for containers

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.get_root_path
```

`salt.modules.lxc.images(dist=None)`

New in version 2015.5.0.

List the available images for LXC's download template.

* dist [None] Filter results to a single Linux distribution

CLI Examples:

```
salt myminion lxc.images
salt myminion lxc.images dist=centos
```

`salt.modules.lxc.info(name, path=None)`

Returns information about a container
path  path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

CLI Example:

```
salt '*!' lxc.info name
```

salt.modules.lxc.init(name, config=None, cpuset=None, cpushare=None, memory=None, profile=None, network_profile=None, nic_opts=None, cpu=None, autostart=True, password=None, password_encrypted=None, users=None, dnsservers=None, searchdomains=None, bridge=None, gateway=None, pub_key=None, priv_key=None, force_install=False, unconditional_install=False, bootstrap_delay=None, bootstrap_args=None, bootstrap_shell=None, bootstrap_url=None, **kwargs)

Initialize a new container.

This is a partial idempotent function as if it is already provisioned, we will reset a bit the lxc configuration file but much of the hard work will be escaped as markers will prevent re-execution of harmful tasks.

name  Name of the container
image  A tar archive to use as the rootfs for the container. Conflicts with the template argument.
cpus  Select a random number of cpu cores and assign it to the cpuset, if the cpuset option is set then this option will be ignored
cpuset  Explicitly define the cpus this container will be bound to
cpushare  cgroups cpu shares
autostart  autostart container on reboot
memory  cgroups memory limit, in MB

Changed in version 2015.5.0: If no value is passed, no limit is set. In earlier Salt versions, not passing this value causes a 1024MB memory limit to be set, and it was necessary to pass memory=0 to set no limit.
gateway  the ipv4 gateway to use the default does nothing more than lxcutils does
bridge  the bridge to use the default does nothing more than lxcutils does
network_profile  Network profile to use for the container

New in version 2015.5.0.
nic_opts  Extra options for network interfaces, will override

```
{"eth0": {"hwaddr": "aa:bb:cc:dd:ee:ff","ipv4": "10.1.1.1","ipv6": "2001:db8::ff00:42:8329"}}
```

or

```
{"eth0": {"hwaddr": "aa:bb:cc:dd:ee:ff","ipv4": "10.1.1.1/24","ipv6": "2001:db8::ff00:42:8329"}}
```

users  Users for which the password defined in the password param should be set. Can be passed as a comma separated list or a python list. Defaults to just the root user.
password  Set the initial password for the users defined in the users parameter
password_encrypted  [False] Set to True to denote a password hash instead of a plaintext password

New in version 2015.5.0.
profile  A LXC profile (defined in config or pillar). This can be either a real profile mapping or a string to retrieve it in configuration
start  Start the newly-created container
dnsservers  list of dns servers to set in the container, default [] (no setting)
seed  Seed the container with the minion config. Default: True
install  If salt-minion is not already installed, install it. Default: True
config  Optional config parameters. By default, the id is set to the name of the container.
master  salt master (default to minion's master)
**master_port** | salt master port (default to minion's master port)
---|---
**pub_key** | Explicit public key to preseed the minion with (optional). This can be either a filepath or a string representing the key
**priv_key** | Explicit private key to preseed the minion with (optional). This can be either a filepath or a string representing the key
**approve_key** | If explicit preseeding is not used; Attempt to request key approval from the master. Default: True
**path** | path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

**clone_from** | Original from which to use a clone operation to create the container. Default: None

**bootstrap_delay** | Delay in seconds between end of container creation and bootstrapping. Useful when waiting for container to obtain a DHCP lease.

New in version 2015.5.0.

**bootstrap_url** | See lxc.bootstrap
**bootstrap_shell** | See lxc.bootstrap
**bootstrap_args** | See lxc.bootstrap

**force_install** | Force installation even if salt-minion is detected, this is the way to run vendor bootstrap scripts even if a salt minion is already present in the container

**unconditional_install** | Run the script even if the container seems seeded

CLI Example:

```
salt 'minion' lxc.init name [cpuset=cgroups_cpuset] \[cpushare=cgroups_cpushare] [memory=cgroups_memory] \[nic=cnic_profile] [profile=lxc_profile] \[nic_opts=nic_opts] [start=(True|False)] \[seed=(True|False)] [install=(True|False)] \[config=minion_config] [approve_key=(True|False)] \[clone_from=original] [autostart=True] \[priv_key=/path_or_content] [pub_key=/path_or_content] \[bridge=lxcbr0] [gateway=10.0.3.1] \[dnsservers=dns1,dns2] \[users=[foo]] [password='secret'] \[password_encrypted=(True|False)]
```

**salt.modules.lxc.list**(extra=False, limit=None, path=None)
List containers classified by state

**extra** | Also get per-container specific info. This will change the return data. Instead of returning a list of containers, a dictionary of containers and each container's output from lxc.info.

**path** | path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

**limit** | Return output matching a specific state (frozen, running, or stopped).

New in version 2015.5.0.

CLI Examples:

```
salt '*' lxc.list
salt '*' lxc.list extra=True
salt '*' lxc.list limit=running
```

**salt.modules.lxc.ls**(active=None, cache=True, path=None)
Return a list of the containers available on the minion

**path** | path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

**active** | If True, return only active (i.e. running) containers
New in version 2015.5.0.

CLI Example:

```bash
salt '*' lxc.ls
salt '*' lxc.ls active=True
```

```python
salt.modules.lxc.read_conf(conf_file, out_format='simple')
```

Read in an LXC configuration file. By default returns a simple, unsorted dict, but can also return a more detailed structure including blank lines and comments.

```python
out_format: set to 'simple' if you need the old and unsupported behavior. This won't support the multiple lxc values (eg: multiple network nics)
```

CLI Examples:

```bash
salt 'minion' lxc.read_conf /etc/lxc/mycontainer.conf
salt 'minion' lxc.read_conf /etc/lxc/mycontainer.conf out_format=commented
```

```python
salt.modules.lxc.reboot(name, path=None)
```

Reboot a container.

```python
path path to the container parent default: /var/lib/lxc (system default)
```

New in version 2015.8.0.

CLI Examples:

```bash
salt 'minion' lxc.reboot myvm
```

```python
salt.modules.lxc.reconfigure(name, cpu=None, cpuset=None, cpushare=None, memory=None, profile=None, network_profile=None, nic_opts=None, bridge=None, gateway=None, autostart=None, utsname=None, rootfs=None, path=None, **kwargs)
```

Reconfigure a container.

This only applies to a few property

```python
name Name of the container.
```

```python
utsname utsname of the container.
```

New in version 2016.3.0.

```python
rootfs rootfs of the container.
```

New in version 2016.3.0.

```python
cpu Select a random number of cpu cores and assign it to the cpuset, if the cpuset option is set then this option will be ignored
```

```python
cpuset Explicitly define the cpus this container will be bound to
cpushare cgroups cpu shares
```

```python
autostart autostart container on reboot
```

```python
memory cgroups memory limit, in MB. (0 for nolimit, None for old default 1024MB)
gateway the ipv4 gateway to use the default does nothing more than lxcutils does
```

```python
bridge the bridge to use the default does nothing more than lxcutils does
```

```python
nic Network interfaces profile (defined in config or pillar).
ic_opts Extra options for network interfaces, will override
```

```python
{"eth0": {"mac": "aa:bb:cc:dd:ee:ff","ipv4": "10.1.1.1","ipv6": "2001:db8::ff00:42:8329"}}
```

```python
or
```

```python
{"eth0": {"mac": "aa:bb:cc:dd:ee:ff","ipv4": "10.1.1.1/24","ipv6": "2001:db8::ff00:42:8329"}}
```

```python
path path to the container parent
```

19.9. execution modules 1689
New in version 2015.8.0.

CLI Example:
```
salt-call -lall mc_lxc_fork.reconfigure foobar nic_opts="{'eth1': {'mac': '00:16:e3:e:dd:ee:44'}}" memory=4
```

salt.modules.lxc.restart(name, path=None, lxc_config=None, force=False)

New in version 2015.5.0.

Restart the named container. If the container was not running, the container will merely be started.

- **name**  The name of the container
- **path**  path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

- **lxc_config**  path to a lxc config file config file will be guessed from container name otherwise

New in version 2015.8.0.

- **force**  [False] If True, the container will be force-stopped instead of gracefully shut down

CLI Example:
```
salt myminion lxc.restart name
```

salt.modules.lxc.retcode(name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, path=None, ignore_retcode=False, chroot_fallback=False, keep_env='http_proxy, https_proxy, no_proxy')

New in version 2015.5.0.

Run `cmd.retcode` within a container

**Warning:** Many shell builtins do not work, failing with stderr similar to the following:
```
lxc_container: No such file or directory - failed to exec 'command'
```

The same error will be displayed in stderr if the command being run does not exist. If the retcode is nonzero and not what was expected, try using `lxc.run_stderr` or `lxc.run_all`.

- **name**  Name of the container in which to run the command
- **cmd**  Command to run
- **no_start**  [False] If the container is not running, don't start it
- **preserve_state**  [True] After running the command, return the container to its previous state
- **path**  path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

- **stdin**  [None] Standard input to be used for the command
- **output_loglevel**  [debug] Level at which to log the output from the command. Set to quiet to suppress logging.
- **use_vt**  [False] Use SaltStack's utils.vt to stream output to console output=all.
- **keep_env**  [http_proxy, https_proxy, no_proxy] A list of env vars to preserve. May be passed as comma-delimited list.
- **chroot_fallback**  if the container is not running, try to run the command using chroot default: false

CLI Example:
```
salt myminion lxc.retcode mycontainer 'ip addr show'
```
salt.modules.lxc.run(name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, path=None, ignore_retcode=False, chroot_fallback=False, keep_env='http_proxy, https_proxy, no_proxy')

New in version 2015.8.0.

Run cmd.run within a container

**Warning:** Many shell builtins do not work, failing with stderr similar to the following:

```
lxc_container: No such file or directory - failed to exec 'command'
```

The same error will be displayed in stderr if the command being run does not exist. If no output is returned using this function, try using lxc.run_stderr or lxc.run_all.

**name** Name of the container in which to run the command

**cmd** Command to run

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

**no_start** [False] If the container is not running, don't start it

**preserve_state** [True] After running the command, return the container to its previous state

**stdin** [None] Standard input to be used for the command

**output_loglevel** [debug] Level at which to log the output from the command. Set to quiet to suppress logging.

**use_vt** [False] Use SaltStack’s utils.vt to stream output to console. Assumes output=all.

**chroot_fallback** if the container is not running, try to run the command using chroot default: false

**keep_env** [http_proxy,https_proxy,no_proxy] A list of env vars to preserve. May be passed as comma-delimited list.

**CLI Example:**

```
salt myminion lxc.run mycontainer 'ifconfig -a'
```

salt.modules.lxc.run_all(name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, path=None, ignore_retcode=False, chroot_fallback=False, keep_env='http_proxy, https_proxy, no_proxy')

New in version 2015.5.0.

Run cmd.run_all within a container

**Note:** While the command is run within the container, it is initiated from the host. Therefore, the PID in the return dict is from the host, not from the container.

**Warning:** Many shell builtins do not work, failing with stderr similar to the following:

```
lxc_container: No such file or directory - failed to exec 'command'
```

The same error will be displayed in stderr if the command being run does not exist.

**name** Name of the container in which to run the command

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

**cmd** Command to run
no_start  [False] If the container is not running, don't start it
preserve_state  [True] After running the command, return the container to its previous state
stdin  [None] Standard input to be used for the command
output_loglevel  [debug] Level at which to log the output from the command. Set to quiet to suppress logging.
use_vt  [False] Use SaltStack's utils.vt to stream output to console output=all.
keep_env  [http_proxy,https_proxy,no_proxy] A list of env vars to preserve. May be passed as comma-delimited list.
chroot_fallback  if the container is not running, try to run the command using chroot default: false

CLI Example:

```bash
salt myminion lxc.run_all mycontainer 'ip addr show'
```

### `salt.modules.lxc.run_stderr`

```python
salt.modules.lxc.run_stderr(name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, path=None, ignore_retcode=False, chroot_fallback=False, keep_env='http_proxy,https_proxy')
```

New in version 2015.5.0.

Run `cmd.run_stderr` within a container

#### Warning

Many shell builtins do not work, failing with stderr similar to the following:

```bash
lxc_container: No such file or directory - failed to exec 'command'
```

The same error will be displayed if the command being run does not exist.

name  Name of the container in which to run the command
cmd  Command to run
path  path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

no_start  [False] If the container is not running, don't start it
preserve_state  [True] After running the command, return the container to its previous state
stdin  [None] Standard input to be used for the command
output_loglevel  [debug] Level at which to log the output from the command. Set to quiet to suppress logging.
use_vt  [False] Use SaltStack's utils.vt to stream output to console output=all.
keep_env  [http_proxy,https_proxy,no_proxy] A list of env vars to preserve. May be passed as comma-delimited list.
chroot_fallback  if the container is not running, try to run the command using chroot default: false

CLI Example:

```bash
salt myminion lxc.run_stderr mycontainer 'ip addr show'
```

### `salt.modules.lxc.run_stdout`

```python
salt.modules.lxc.run_stdout(name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, path=None, ignore_retcode=False, chroot_fallback=False, keep_env='http_proxy,https_proxy')
```

New in version 2015.5.0.

Run `cmd.run_stdout` within a container
**Warning:** Many shell builtins do not work, failing with stderr similar to the following:

```
 lxc_container: No such file or directory - failed to exec 'command'
```

The same error will be displayed in stderr if the command being run does not exist. If no output is returned using this function, try using `lxc.run_stderr` or `lxc.run_all`.

- **name** Name of the container in which to run the command
- **cmd** Command to run
- **path** path to the container parent default: /var/lib/lxc (system default)
  
  New in version 2015.8.0.
- **no_start** [False] If the container is not running, don't start it
- **preserve_state** [True] After running the command, return the container to its previous state
- **stdin** [None] Standard input to be used for the command
- **output_loglevel** [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.
- **use_vt** [False] Use SaltStack's utils.vt to stream output to console output=all.
- **keep_env** [http_proxy, https_proxy, no_proxy] A list of env vars to preserve. May be passed as comma-delimited list.
- **chroot_fallback** if the container is not running, try to run the command using chroot default: false

**CLI Example:**

```
salt myminion lxc.run_stdout mycontainer 'ifconfig -a'
```

**salt.modules.lxc.running_systemd**(name, cache=True, path=None)

Determine if systemd is running

- **path** path to the container parent
  
  New in version 2015.8.0.

**CLI Example:**

```
salt '*' lxc.running_systemd ubuntu
```

**salt.modules.lxc.search_lxc_bridge()**

Search the first bridge which is potentially available as LXC bridge

**CLI Example:**

```
salt '*' lxc.search_lxc_bridge
```

**salt.modules.lxc.search_lxc_bridges()**

Search which bridges are potentially available as LXC bridges

**CLI Example:**

```
salt '*' lxc.search_lxc_bridges
```

**salt.modules.lxc.set_dns**(name, dnsservers=None, searchdomains=None, path=None)

Changed in version 2015.5.0: The dnsservers and searchdomains parameters can now be passed as a comma-separated list.

Update /etc/resolv.conf

- **path** path to the container parent default: /var/lib/lxc (system default)
  
  New in version 2015.8.0.
**CLI Example:**

```
salt myminion lxc.set_dns ubuntu "['8.8.8.8', '4.4.4.4']"
```

salt.modules.lxc.set_parameter(name, parameter, value, path=None)

Set the value of a cgroup parameter for a container.

- **path** path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

**CLI Example:**

```
salt '*' lxc.set_parameter name parameter value
```

salt.modules.lxc.set_password(name, users, password, encrypted=True, path=None)

Changed in version 2015.5.0: Function renamed from set_pass to set_password. Additionally, this function now supports (and defaults to using) a password hash instead of a plaintext password.

- **users** Comma-separated list (or python list) of users to change password
- **password** Password to set for the specified user(s)
- **encrypted** [True] If true, password must be a password hash. Set to False to set a plaintext password (not recommended).

New in version 2015.5.0.

- **path** path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

**CLI Example:**

```
salt '*' lxc.set_pass container-name root '$6$uJ2uAyLU$KoI67t8As/\-0fXtJ0PcHKGXmUpcoYUcVR2K6x93waiNShTCQvjRwq25yIkicB0qgbdKQ5fnAo28/ek6716vEV1'
salt '*' lxc.set_pass container-name root foo encrypted=False
```

salt.modules.lxc.start(name, **kwargs)

Start the named container

- **path** path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

- **lxc_config** path to a lxc config file config file will be guessed from container name otherwise

New in version 2015.8.0.

- **use_vt** run the command through VT

New in version 2015.8.0.

**CLI Example:**

```
salt myminion lxc.start name
```

salt.modules.lxc.state(name, path=None)

Returns the state of a container.

- **path** path to the container parent directory (default: /var/lib/lxc)

New in version 2015.8.0.

**CLI Example:**

```
salt '*' lxc.state name
```

salt.modules.lxc.stop(name, kill=False, path=None, use_vt=None)

Stop the named container
path  path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

kill: False  Do not wait for the container to stop, kill all tasks in the container. Older LXC versions will stop containers like this irrespective of this argument.

Changed in version 2015.5.0: Default value changed to False

use_vt  run the command through VT

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.stop name
```

salt.modules.lxc.systemd_running_state(name, path=None)

Get the operational state of a systemd based container

path  path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.systemd_running_state ubuntu
```

salt.modules.lxc.templatess()  

List the available LXC template scripts installed on the minion

CLI Examples:

```
salt myminion lxc.templatess
```

salt.modules.lxc.test_bare_started_state(name, path=None)

Test if a non systemd container is fully started For now, it consists only to test if the container is attachable

path  path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.test_bare_started_state ubuntu
```

salt.modules.lxc.test_sd_started_state(name, path=None)

Test if a systemd container is fully started

path  path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.test_sd_started_state ubuntu
```

salt.modules.lxc.unfreeze(name, path=None, use_vt=None)

Unfreeze the named container.

path  path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

use_vt  run the command through VT

New in version 2015.8.0.

CLI Example:
salt '***' lxc.unfreeze name

salt.modules.lxc.update_lxc_conf(name, lxc_conf, lxc_conf_unset, path=None)
Edit LXC configuration options

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.
CLI Example:
salt myminion lxc.update_lxc_conf ubuntu 
  lxc_conf="[{'network.ipv4.ip': '10.0.3.5'}]
  lxc_conf_unset=['lxc.utsname']"

salt.modules.lxc.version()
Return the actual lxc client version

New in version 2015.8.0.
CLI Example:
salt '***' lxc.version

salt.modules.lxc.wait_started(name, path=None, timeout=300)
Check that the system has fully inited

This is actually very important for systemd based containers

see https://github.com/saltstack/salt/issues/23847
path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.
CLI Example:
salt myminion lxc.wait_started ubuntu

salt.modules.lxc.write_conf(conf_file, conf)
Write out an LXC configuration file

This is normally only used internally. The format of the data structure must match that which is returned from lxc.read_conf(), with out_format set to commented.

An example might look like:

```
[
    {'lxc.utsname': '$CONTAINER_NAME'},
    '# This is a commented line
    '
    ,
    {'lxc.mount': '$CONTAINER_FSTAB'},
    {'lxc.rootfs': [{'comment': 'This is another test',
            'value': 'This is another test'}]},
    '
    ,
    {'lxc.network.type': 'veth'},
    {'lxc.network.flags': 'up'},
    {'lxc.network.link': 'br0'},
    {'lxc.network.mac': '$CONTAINER_MACADDR'},
    {'lxc.network.ipv4': '$CONTAINER_IPADDR'},
    {'lxc.network.name': '$CONTAINER_DEVICENAME'},
]
```

CLI Example:
salt 'minion' lxc.write_conf /etc/lxc/mycontainer.conf \ out_format=commented

19.9.195 salt.modules.mac_assistive module

This module allows you to manage assistive access on macOS minions with 10.9+

New in version 2016.3.0.

salt '*' assistive.install /usr/bin/osascript

salt.modules.mac_assistive.enable(app_id, enabled=True)
    Enable or disable an existing assistive access application.
    app_id The bundle ID or command to set assistive access status.
    enabled Sets enabled or disabled status. Default is True.
    CLI Example:
    
salt '*' assistive.enable /usr/bin/osascript
    salt '*' assistive.enable com.smileonmymac.textexpander enabled=False

salt.modules.mac_assistive.enabled(app_id)
    Check if a bundle ID or command is listed in assistive access and enabled.
    app_id The bundle ID or command to retrieve assistive access status.
    CLI Example:
    
    salt '*' assistive.enabled /usr/bin/osascript
    salt '*' assistive.enabled com.smileonmymac.textexpander

salt.modules.mac_assistive.install(app_id, enable=True)
    Install a bundle ID or command as being allowed to use assistive access.
    app_id The bundle ID or command to install for assistive access.
    enabled Sets enabled or disabled status. Default is True.
    CLI Example:
    
    salt '*' assistive.install /usr/bin/osascript
    salt '*' assistive.install com.smileonmymac.textexpander

salt.modules.mac_assistive.installed(app_id)
    Check if a bundle ID or command is listed in assistive access. This will not check to see if it's enabled.
    app_id The bundle ID or command to check installed status.
    CLI Example:
    
    salt '*' assistive.installed /usr/bin/osascript
    salt '*' assistive.installed com.smileonmymac.textexpander

salt.modules.mac_assistive.remove(app_id)
    Remove a bundle ID or command as being allowed to use assistive access.
    app_id The bundle ID or command to remove from assistive access list.
    CLI Example:
    
    salt '*' assistive.remove /usr/bin/osascript
    salt '*' assistive.remove com.smileonmymac.textexpander
19.9.196  salt.modules.mac_brew module

Homebrew for macOS

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `pkg.install` is not available), see [here](#).

```python
salt.modules.mac_brew.available_version(*names, **kwargs)
```

This function is an alias of `latest_version`.

Return the latest version of the named package available for upgrade or installation

Currently chooses stable versions, falling back to devel if that does not exist.

**CLI Example:**

```bash
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3>
```

```python
salt.modules.mac_brew.info_installed(*names)
```

Return the information of the named package(s) installed on the system.

New in version 2016.3.1.

**names** The names of the packages for which to return information.

**CLI example:**

```bash
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
```

```python
salt.modules.mac_brew.install(name=None, pkgs=None, taps=None, options=None, **kwargs)
```

Install the passed package(s) with `brew install`

**name** The name of the formula to be installed. Note that this parameter is ignored if `''pkgs''` is passed.

**CLI Example:**

```bash
salt '*' pkg.install <package name>
```

**taps** Unofficial GitHub repos to use when updating and installing formulas.

**CLI Example:**

```bash
salt '*' pkg.install <package name> tap='@tap'
salt '*' pkg.install zlib taps='homebrew/dupes'
salt '*' pkg.install php54 taps=['josegonzalez/php', 'homebrew/dupes']
```

**options** Options to pass to brew. Only applies to initial install. Due to how brew works, modifying chosen options requires a full uninstall followed by a fresh install. Note that if `''pkgs''` is used, all options will be passed to all packages. Unrecognized options for a package will be silently ignored by brew.

**CLI Example:**

```bash
salt '*' pkg.install <package name> tap='@tap'
salt '*' pkg.install php54 taps=['josegonzalez/php', 'homebrew/dupes']
  --options='"--with-fpm"'
```

Multiple Package Installation Options:

**pkgs** A list of formulas to install. Must be passed as a python list.

**CLI Example:**
Returns a dict containing the new package names and versions:

\[
\{
\text{'<package>': \{\text{'old': '<old-version>',
\text{'new': '<new-version>'}\}}}
\]

CLI Example:

```bash
salt '*' pkg.install 'package package package'
```

**salt.modules.mac_brew.latest_version(names, **kwargs)**

Return the latest version of the named package available for upgrade or installation.

Currently chooses stable versions, falling back to devel if that does not exist.

CLI Example:

```bash
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3>
```

**salt.modules.mac_brew.list_pkgs(versions_as_list=False, **kwargs)**

List the packages currently installed in a dict:

\[
\{
\text{'<package_name>': '<version>'}
\]

CLI Example:

```bash
salt '*' pkg.list_pkgs
```

**salt.modules.mac_brew.list_upgrades(refresh=True, **kwargs)**

Check whether or not an upgrade is available for all packages.

CLI Example:

```bash
salt '*' pkg.list_upgrades
```

**salt.modules.mac_brew.refresh_db()**

Update the homebrew package repository.

CLI Example:

```bash
salt '*' pkg.refresh_db
```

**salt.modules.mac_brew.remove(name=None, pkgs=None, **kwargs)**

Removes packages with brew uninstall.

- `name` The name of the package to be deleted.
- `pkgs` A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```bash
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs=['foo', 'bar']
```
salt.modules.mac_brew.upgrade(refresh=True)
Upgrade outdated, unpinned brews.

- **refresh** Fetch the newest version of Homebrew and all formulae from GitHub before installing.

Returns a dictionary containing the changes:

```python
{'<package>': {'old': '<old-version>', 'new': '<new-version>'}}
```

**CLI Example:**

```bash
salt '*' pkg.upgrade
```

salt.modules.mac_brew.upgrade_available(pkg)
Check whether or not an upgrade is available for a given package

**CLI Example:**

```bash
salt '*' pkg.upgrade_available <package name>
```

salt.modules.mac_brew.version("*names", **kwargs)
Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

**CLI Example:**

```bash
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3>
```

### 19.9.197 salt.modules.mac_defaults module

Set defaults on Mac OS

salt.modules.mac_defaults.delete(domain, key, user=None)
Delete a default from the system

**CLI Example:**

```bash
salt '*' macdefaults.delete com.apple.CrashReporter DialogType
salt '*' macdefaults.delete NSGlobalDomain ApplePersistence
```

- **domain** The name of the domain to delete from
- **key** The key of the given domain to delete
- **user** The user to delete the defaults with

salt.modules.mac_defaults.read(domain, key, user=None)
Write a default to the system

**CLI Example:**

```bash
salt '*' macdefaults.read com.apple.CrashReporter DialogType
salt '*' macdefaults.read NSGlobalDomain ApplePersistence
```

- **domain** The name of the domain to read from
- **key** The key of the given domain to read from
- **user** The user to write the defaults to
salt.modules.mac_defaults.write(domain, key, value, type='string', user=None)

Write a default to the system

CLI Example:

```
salt '*' macdefaults.write com.apple.CrashReporter DialogType Server
salt '*' macdefaults.write NSGlobalDomain ApplePersistence True type=bool
```

domain  The name of the domain to write to
key     The key of the given domain to write to
value   The value to write to the given key
type    The type of value to be written, valid types are string, data, int[eger], float, bool[ean], date, array, array-
         add, dict, dict-add
user    The user to write the defaults to

19.9.198   salt.modules.mac_desktop module

macOS implementations of various commands in the ``desktop`` interface

salt.modules.mac_desktop.get_output_volume()

Get the output volume (range 0 to 100)

CLI Example:

```
salt '*' desktop.get_output_volume
```

salt.modules.mac_desktop.lock()

Lock the desktop session

CLI Example:

```
salt '*' desktop.lock
```

salt.modules.mac_desktop.say(*words)

Say some words.

words  The words to execute the say command with.

CLI Example:

```
salt '*' desktop.say <word0> <word1> ... <wordN>
```

salt.modules.mac_desktop.screensaver()

Launch the screensaver.

CLI Example:

```
salt '*' desktop.screensaver
```

salt.modules.mac_desktop.set_output_volume(volume)

Set the volume of sound.

volume  The level of volume. Can range from 0 to 100.

CLI Example:

```
salt '*' desktop.set_output_volume <volume>
```
19.9.199  salt.modules.mac_group

Manage groups on Mac OS 10.7+
salt.modules.mac_group.add(name, gid=None, **kwargs)
Add the specified group

CLI Example:
```
salt '*' group.add foo 3456
```
salt.modules.mac_group.adduser(group, name)
Add a user in the group.

CLI Example:
```
salt '*' group.adduser foo bar
```
Verifies if a valid username `bar` as a member of an existing group `foo`, if not then adds it.
salt.modules.mac_group.chgid(name, gid)
Change the gid for a named group

CLI Example:
```
salt '*' group.chgid foo 4376
```
salt.modules.mac_group.delete(name)
Remove the named group

CLI Example:
```
salt '*' group.delete foo
```
salt.modules.mac_group.deluser(group, name)
Remove a user from the group
New in version 2016.3.0.

CLI Example:
```
salt '*' group.deluser foo bar
```
Removes a member user `bar` from a group `foo`. If group is not present then returns True.
salt.modules.mac_group.getent(refresh=False)
Return info on all groups

CLI Example:
```
salt '*' group.getent
```
salt.modules.mac_group.info(name)
Return information about a group

CLI Example:
```
salt '*' group.info foo
```
salt.modules.mac_group.members(name, members_list)
Replaces members of the group with a provided list.
New in version 2016.3.0.

CLI Example:

    salt '*' group.members foo 'user1,user2,user3,...'

Replaces a membership list for a local group `foo'.

19.9.200 salt.modules.mac_keychain module

Install certificates into the keychain on Mac OS

New in version 2016.3.0.

salt.modules.mac_keychain.get_default_keychain(user=None, domain='user')

Get the default keychain

user: The user to check the default keychain of
domain: The domain to use valid values are user|system|common|dynamic, the default is user

CLI Example:

    salt '*' keychain.get_default_keychain

salt.modules.mac_keychain.get_friendly_name(cert, password)

Get the friendly name of the given certificate
cert: The certificate to install
password: The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section

Note: The password given here will show up as plaintext in the returned job info.

CLI Example:

    salt '*' keychain.get_friendly_name /tmp/test.p12 test123

salt.modules.mac_keychain.get_hash(name, password=None)

Returns the hash of a certificate in the keychain.

name: The name of the certificate (which you can get from keychain.get_friendly_name) or the location of a p12 file.
password: The password that is used in the certificate. Only required if your passing a p12 file. Note: This will be outputted to logs

CLI Example:

    salt '*' keychain.get_hash /tmp/test.p12 test123

salt.modules.mac_keychain.install(cert, password, keychain='/Library/Keychains/System.keychain', allow_any=False, keychain_password=None)

Install a certificate
cert: The certificate to install
password: The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section.

Note: The password given here will show up as plaintext in the job returned info.

keychain: The keychain to install the certificate to, this defaults to /Library/Keychains/System.keychain
allow_any: Allow any application to access the imported certificate without warning
keychain_password: If your keychain is likely to be locked pass the password and it will be unlocked before running the import

Note: The password given here will show up as plaintext in the returned job info.

CLI Example:
salt ' '* keychain.install test.p12 test123

salt.modules.mac_keychain.list_certs(keychain='~/Library/Keychains/System.keychain')
List all of the installed certificates
keychain The keychain to install the certificate to, this defaults to /Library/Keychains/System.keychain
CLI Example:
salt '*' keychain.list_certs

salt.modules.mac_keychain.set_default_keychain(keychain, domain='user', user=None)
Set the default keychain
keychain The location of the keychain to set as default
domain The domain to use valid values are user|system|common|dynamic, the default is user
user The user to set the default keychain as
CLI Example:
salt '*' keychain.set_keychain /Users/fred/Library/Keychains/login.keychain

salt.modules.mac_keychain.uninstall(cert_name, keychain='~/Library/Keychains/System.keychain', keychain_password=None)
Uninstall a certificate from a keychain
cert_name The name of the certificate to remove
keychain The keychain to install the certificate to, this defaults to /Library/Keychains/System.keychain
keychain_password If your keychain is likely to be locked pass the password and it will be unlocked before running the import
Note: The password given here will show up as plaintext in the returned job info.
CLI Example:
salt '*' keychain.install test.p12 test123

salt.modules.mac_keychain.unlock_keychain(keychain, password)
Unlock the given keychain with the password
keychain The keychain to unlock
password The password to use to unlock the keychain.
Note: The password given here will show up as plaintext in the returned job info.
CLI Example:
salt '*' keychain.unlock_keychain /tmp/test.p12 test123

19.9.201 salt.modules.mac_package module
Install pkg, dmg and .app applications on macOS minions.
salt.modules.mac_package.get_mpkg_ids(mpkg)
Attempt to get the package IDs from a mounted .mpkg file
Parameters mpkg (str) -- The location of the mounted mpkg file
Returns List of package IDs
Return type list
CLI Example:
salt '*' macpackage.get_mpkg_ids /dev/disk2
salt.modules.mac_package.get_pkg_id(pkg)
    Attempt to get the package ID from a .pkg file
    Parameters pkg (str) -- The location of the pkg file
    Returns List of all of the package IDs
    Return type list
    CLI Example:

    ```
salt '*' macpackage.get_pkg_id /tmp/test.pkg
    ```

salt.modules.mac_package.install(pkg, target='LocalSystem', store=False, allow_untrusted=False)
    Install a pkg file
    Parameters
    - pkg (str) -- The package to install
    - target (str) -- The target in which to install the package to
    - store (bool) -- Should the package be installed as if it was from the store?
    - allow_untrusted (bool) -- Allow the installation of untrusted packages?
    Returns A dictionary containing the results of the installation
    Return type dict
    CLI Example:

    ```
salt '*' macpackage.install test.pkg
    ```

salt.modules.mac_package.install_app(app, target='/Applications/`
    Install an app file by moving it into the specified Applications directory
    Parameters
    - app (str) -- The location of the .app file
    - target (str) -- The target in which to install the package to Default is `'/Applications/'`
    Returns The results of the rsync command
    Return type str
    CLI Example:

    ```
salt '*' macpackage.install_app /tmp/tmp.app /Applications/
    ```

salt.modules.mac_package.installed_pkgs()
    Return the list of installed packages on the machine
    Returns List of installed packages
    Return type list
    CLI Example:

    ```
salt '*' macpackage.installed_pkgs
    ```

salt.modules.mac_package.mount(dmg)
    Attempt to mount a dmg file to a temporary location and return the location of the pkg file inside
    Parameters dmg (str) -- The location of the dmg file to mount
    Returns Tuple containing the results of the command along with the mount point
    Return type tuple
    CLI Example:
salt '_salt '*' macpackage.mount /tmp/software.dmg

salt.modules.mac_package.uninstall_app(app)
Uninstall an app file by removing it from the Applications directory
Parameters
app (str) -- The location of the .app file
Returns
True if successful, otherwise False
Return type
bool
CLI Example:
salt '*' macpackage.uninstall_app /Applications/app.app

salt.modules.mac_package.unmount(mountpoint)
Attempt to unmount a dmg file from a temporary location
Parameters
mountpoint (str) -- The location of the mount point
Returns
The results of the hdutil detach command
Return type
str
CLI Example:
salt '*' macpackage.unmount /dev/disk2

19.9.202 salt.modules.mac_pkgutil module

Installer support for macOS.
Installer is the native .pkg/.mpkg package manager for macOS.
salt.modules.mac_pkgutil.forget(package_id)
New in version 2016.3.0.
Remove the receipt data about the specified package. Does not remove files.

Warning: DO NOT use this command to fix broken package design

Parameters
package_id (str) -- The name of the package to forget
Returns
True if successful, otherwise False
Return type
bool
CLI Example:
salt '*' pkgutil.forget com.apple.pkg.gcc4.2Leo

salt.modules.mac_pkgutil.install(source, package_id)
Install a .pkg from an URI or an absolute path.
Parameters
• source (str) -- The path to a package.
• package_id (str) -- The package ID
Returns
True if successful, otherwise False
Return type
bool
CLI Example:
salt '*' pkgutil.install source=/vagrant/build_essentials.pkg package_id=com.apple.pkg.gcc4.2Leo
salt.modules.mac_pkgutil.is_installed(package_id)
Returns whether a given package id is installed.
Returns True if installed, otherwise False
Return type bool
CLI Example:
salt '*' pkgutil.is_installed com.apple.pkg.gcc4.2Leo

salt.modules.mac_pkgutil.list_
List the installed packages.
Returns A list of installed packages
Return type list
CLI Example:
salt '*' pkgutil.list

19.9.203 salt.modules.mac_ports module
Support for MacPorts under macOS.
This module has some caveats.

1. Updating the database of available ports is quite resource-intensive. However, refresh=True is the default for all operations that need an up-to-date copy of available ports. Consider refresh=False when you are sure no db update is needed.

2. In some cases MacPorts doesn't always realize when another copy of itself is running and will gleefully tromp all over the available ports database. This makes MacPorts behave in undefined ways until a fresh complete copy is retrieved.

Because of 1 and 2 it is possible to get the salt-minion into a state where salt mac-machine pkg./something/ won't want to return. Use
salt-run jobs.active
on the master to check for potentially long-running calls to port.

Finally, ports database updates are always handled with port selfupdate as opposed to port sync. This makes sense in the MacPorts user community but may confuse experienced Linux admins as Linux package managers don't upgrade the packaging software when doing a package database update. In other words salt mac-machine pkg.refresh_db is more like apt-get update; apt-get upgrade dpkg apt-get than simply apt-get update.

salt.modules.mac_ports.available_version(*names, **kwargs)
This function is an alias of latest_version.
Return the latest version of the named package available for upgrade or installation
Options:
refresh Update ports with port selfupdate
CLI Example:
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3>

salt.modules.mac_ports.install(name=None, refresh=False, pkgs=None, **kwargs)
Install the passed package(s) with port install
name The name of the formula to be installed. Note that this parameter is ignored if `''pkgs'' is passed.
CLI Example:
`salt '.*' pkg.install <package name>`

**version** Specify a version to `pkg` to install. Ignored if `pkgs` is specified.

CLI Example:

```
salt '.*' pkg.install <package name>
salt '.*' pkg.install git-core version='1.8.5.5'
```

**variant** Specify a variant to `pkg` to install. Ignored if `pkgs` is specified.

CLI Example:

```
salt '.*' pkg.install <package name>
salt '.*' pkg.install git-core version='1.8.5.5' variant='+credential_
osxkeychain+doc+pcre'
```

Multiple Package Installation Options:

**pkgs** A list of formulas to install. Must be passed as a python list.

CLI Example:

```
salt '.*' pkg.install pkgs='["foo","bar"]'
salt '.*' pkg.install pkgs='["foo@1.2","bar"]'
salt '.*' pkg.install pkgs='["foo@1.2+ssl","bar@2.3"]'
```

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
              'new': '<new-version>'}}
```

CLI Example:

```
salt '.*' pkg.install 'package package package'
```

`salt.modules.mac_ports.latest_version('names', **kwargs)`

Return the latest version of the named package available for upgrade or installation

**Options:**

- **refresh** Update ports with `port selfupdate`

CLI Example:

```
salt '.*' pkg.latest_version <package name>
salt '.*' pkg.latest_version <package1> <package2> <package3>
```

`salt.modules.mac_ports.list_pkgs(versions_as_list=False, **kwargs)`

List the packages currently installed in a dict:

```
[{'<package_name>': '<version>'}
```

CLI Example:

```
salt '.*' pkg.list_pkgs
```

`salt.modules.mac_ports.list_upgrades(refresh=True, **kwargs)`

Check whether or not an upgrade is available for all packages

**Options:**

- **refresh** Update ports with `port selfupdate`

CLI Example:
salt '*' pkg.list_upgrades

salt.modules.mac_ports.refresh_db()
    Update ports with port selfupdate

    CLI Example:

    salt mac pkg.refresh_db

salt.modules.mac_ports.remove(name=None, pkgs=None, **kwargs)
    Removes packages with port uninstall.

    Multiple Package Options:
    name The name of the package to be deleted.
    pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if
          this option is passed.

    New in version 0.16.0.

    Returns a dict containing the changes.

    CLI Example:

    salt '*' pkg.remove <package name>
    salt '*' pkg.remove <package1>,<package2>,<package3>
    salt '*' pkg.remove pkgs='["foo", "bar"]'

salt.modules.mac_ports.upgrade(refresh=True)
    Run a full upgrade using MacPorts 'port upgrade outdated'

    Options:
    refresh Update ports with port selfupdate

    Returns a dictionary containing the changes:

    ```
    {'<package>': {'old': '<old-version>',
                   'new': '<new-version>'}}
    ```

    CLI Example:

    salt '*' pkg.upgrade

salt.modules.mac_ports.upgrade_available(pkg, refresh=True)
    Check whether or not an upgrade is available for a given package

    CLI Example:

    salt '*' pkg.upgrade_available <package name>

salt.modules.mac_ports.version(*names, **kwargs)
    Returns a string representing the package version or an empty string if not installed. If more than one package
    name is specified, a dict of name/version pairs is returned.

    CLI Example:

    salt '*' pkg.version <package name>
    salt '*' pkg.version <package1> <package2> <package3>

19.9.204 salt.modules.mac_power module

Module for editing power settings on macOS
New in version 2016.3.0.

salt.modules.mac_power.get_computer_sleep()
Display the amount of idle time until the computer sleeps.
  Returns A string representing the sleep settings for the computer
  Return type str
  CLI Example:
  ..code-block:: bash
    salt '*' power.get_computer_sleep

salt.modules.mac_power.get_display_sleep()
Display the amount of idle time until the display sleeps.
  Returns A string representing the sleep settings for the display
  Return type str
  CLI Example:
  ..code-block:: bash
    salt '*' power.get_display_sleep

salt.modules.mac_power.get_harddisk_sleep()
Display the amount of idle time until the hard disk sleeps.
  Returns A string representing the sleep settings for the hard disk
  Return type str
  CLI Example:
  ..code-block:: bash
    salt '*' power.get_harddisk_sleep

salt.modules.mac_power.get_restart_freeze()
Displays whether `restart on freeze' is on or off if supported
  Returns A string value representing the ```restart on freeze'' settings
  Return type string
  CLI Example:
  salt '*' power.get_restart_freeze

salt.modules.mac_power.get_restart_power_failure()
Displays whether `restart on power failure' is on or off if supported
  Returns A string value representing the ```restart on power failure'' settings
  Return type string
  CLI Example:
  salt '*' power.get_restart_power_failure

salt.modules.mac_power.get_sleep()
Displays the amount of idle time until the machine sleeps. Settings for Computer, Display, and Hard Disk are displayed.
  Returns A dictionary containing the sleep status for Computer, Display, and Hard Disk
  Return type dict
  CLI Example:
  salt '*' power.get_sleep

salt.modules.mac_power.get_sleep_on_power_button()
Displays whether `allow power button to sleep computer' is on or off if supported
  Returns A string value representing the ```allow power button to sleep computer'' settings
  Return type string
CLI Example:

```bash
salt '*' power.get_sleep_on_power_button
```

```
salt.modules.mac_power.get_wake_on_modem()
    Displays whether `wake on modem' is on or off if supported
    Returns A string value representing the `wake on modem' settings
    Return type str
```

CLI Example:

```
salt '*' power.get_wake_on_modem
```

```
salt.modules.mac_power.get_wake_on_network()
    Displays whether `wake on network' is on or off if supported
    Returns A string value representing the `wake on network' settings
    Return type string
```

CLI Example:

```
salt '*' power.get_wake_on_network
```

```
salt.modules.mac_power.set_computer_sleep(minutes)
    Set the amount of idle time until the computer sleeps. Pass `Never' of `Off' to never sleep.
    Parameters minutes -- Can be an integer between 1 and 180 or `Never' or `Off'
    Ptype int, str
    Returns True if successful, False if not
    Return type bool
```

CLI Example:

```
salt '*' power.set_computer_sleep 120
salt '*' power.set_computer_sleep off
```

```
salt.modules.mac_power.set_display_sleep(minutes)
    Set the amount of idle time until the display sleeps. Pass `Never' of `Off' to never sleep.
    Parameters minutes -- Can be an integer between 1 and 180 or `Never' or `Off'
    Ptype int, str
    Returns True if successful, False if not
    Return type bool
```

CLI Example:

```
salt '*' power.set_display_sleep 120
salt '*' power.set_display_sleep off
```

```
salt.modules.mac_power.set_harddisk_sleep(minutes)
    Set the amount of idle time until the harddisk sleeps. Pass `Never' of `Off' to never sleep.
    Parameters minutes -- Can be an integer between 1 and 180 or `Never' or `Off'
    Ptype int, str
    Returns True if successful, False if not
    Return type bool
```

CLI Example:

```
salt '*' power.set_harddisk_sleep 120
salt '*' power.set_harddisk_sleep off
```

```
salt.modules.mac_power.set_restart_freeze(enabled)
    Specifies whether the server restarts automatically after a system freeze. This setting doesn't seem to be
```
editable. The command completes successfully but the setting isn’t actually updated. This is probably a macOS. The functions remain in case they ever fix the bug.

Parameters **enabled (bool)** -- True to enable, False to disable. “On” and “Off” are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not

Return type **bool**

CLI Example:

```bash
salt '*' power.set_restart_freeze True
```

salt.modules.mac_power.set_restart_power_failure**enabled**

Set whether or not the computer will automatically restart after a power failure.

Parameters **enabled (bool)** -- True to enable, False to disable. “On” and “Off” are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not

Return type **bool**

CLI Example:

```bash
salt '*' power.set_restart_power_failure True
```

salt.modules.mac_power.set_sleep**minutes**

Sets the amount of idle time until the machine sleeps. Sets the same value for Computer, Display, and Hard Disk. Pass “Never” or “Off” for computers that should never sleep.

Parameters **minutes --** Can be an integer between 1 and 180 or “Never” or “Off”

Ptype int, str

Returns True if successful, False if not

Return type **bool**

CLI Example:

```bash
salt '*' power.set_sleep 120
salt '*' power.set_sleep never
```

salt.modules.mac_power.set_sleep_on_power_button**enabled**

Set whether or not the power button can sleep the computer.

Parameters **enabled (bool)** -- True to enable, False to disable. “On” and “Off” are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not

Return type **bool**

CLI Example:

```bash
salt '*' power.set_sleep_on_power_button True
```

salt.modules.mac_power.set_wake_on_modem**enabled**

Set whether or not the computer will wake from sleep when modem activity is detected.

Parameters **enabled (bool)** -- True to enable, False to disable. “On” and “Off” are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not

Return type **bool**

CLI Example:

```bash
salt '*' power.set_wake_on_modem True
```

salt.modules.mac_power.set_wake_on_network**enabled**

Set whether or not the computer will wake from sleep when network activity is detected.

Parameters **enabled (bool)** -- True to enable, False to disable. “On” and “Off” are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively
Returns True if successful, False if not
Return type bool
CLI Example:

```
salt '*' power.set_wake_on_network True
```

### 19.9.205 salt.modules.mac_service module

The service module for macOS. versionadded:: 2016.3.0

salt.modules.mac_service.available(name)
Check that the given service is available.

Parameters
- **name** *(str)* -- The name of the service

Returns True if the service is available, otherwise False
Return type bool

CLI Example:

```
salt '*' service.available com.openssh.sshd
```

salt.modules.mac_service.disable(name, runas=None)
Disable a launchd service. Raises an error if the service fails to be disabled

Parameters
- **name** *(str)* -- Service label, file name, or full path
- **runas** *(str)* -- User to run launchctl commands

Returns True if successful or if the service is already disabled
Return type bool

CLI Example:

```
salt '*' service.disable org.cups.cupsd
```

salt.modules.mac_service.disabled(name, runas=None, domain='system')
Check if the specified service is not enabled. This is the opposite of service.enabled

Parameters
- **name** *(str)* -- The name to look up
- **runas** *(str)* -- User to run launchctl commands
- **domain** *(str)* -- domain to check for disabled services. Default is system.

Returns True if the specified service is NOT enabled, otherwise False
Return type bool

CLI Example:

```
salt '*' service.disabled org.cups.cupsd
```

salt.modules.mac_service.enable(name, runas=None)
Enable a launchd service. Raises an error if the service fails to be enabled

Parameters
- **name** *(str)* -- Service label, file name, or full path
- **runas** *(str)* -- User to run launchctl commands

Returns True if successful or if the service is already enabled
Return type bool

CLI Example:
```
salt '*' service.enable org.cups.cupsd
```

**salt.modules.mac_service.enabled**(name, runas=None)
Check if the specified service is enabled

**Parameters**
- **name** *(str)* -- The name of the service to look up
- **runas** *(str)* -- User to run launchctl commands

**Returns**
True if the specified service enabled, otherwise False

**Return type**
bool

**CLI Example:**
```
salt '*' service.enable org.cups.cupsd
```

```
salt '*' service.get_all
```

**salt.modules.mac_service.get_all**(runas=None)
Return a list of services that are enabled or available. Can be used to find the name of a service.

**Parameters**
- **runas** *(str)* -- User to run launchctl commands

**Returns**
A list of all the services available or enabled

**Return type**
list

**CLI Example:**
```
salt '*' service.get_all
```

**salt.modules.mac_service.get_enabled**(runas=None)
Return a list of all services that are enabled. Can be used to find the name of a service.

**Parameters**
- **runas** *(str)* -- User to run launchctl commands

**Returns**
A list of all the services enabled on the system

**Return type**
list

**CLI Example:**
```
salt '*' service.get_enabled
salt '*' service.get_enabled running=True
```

```
salt '*' service.launchctl debug org.cups.cupsd
```

**salt.modules.mac_service.launchctl**(sub_cmd, *args, **kwargs)
Run a launchctl command and raise an error if it fails

**Parameters**
- **sub_cmd** *(str)* -- Sub command supplied to launchctl
- **args** *(tuple)* -- Tuple containing additional arguments to pass to launchctl
- **kwargs** *(dict)* -- Dictionary containing arguments to pass to cmd.run_all
- **return_stdout** *(bool)* -- A keyword argument. If true return the stdout of the launchctl command

**Returns**
False if successful, raise CommandExecutionError if not, or the stdout of the launchctl command if requested

**Return type**
bool, str

**CLI Example:**
```
salt '*' service.launchctl debug org.cups.cupsd
```

**salt.modules.mac_service.list_**(name=None, runas=None)
Run launchctl list and return the output

**Parameters**
- **name** *(str)* -- The name of the service to list
runas (str) -- User to run launchctl commands

Returns If a name is passed returns information about the named service, otherwise returns a list of all services and pids
Return type str

CLI Example:

```bash
salt '*' service.list
salt '*' service.list org.cups.cupsd
```

salt.modules.mac_service.missing(name)
The inverse of service.available Check that the given service is not available.

Parameters name (str) -- The name of the service

Returns True if the service is not available, otherwise False

Return type bool

CLI Example:

```bash
salt '*' service.missing com.openssh.sshd
```

salt.modules.mac_service.restart(name, runas=None)
Unloads and reloads a launchd service. Raises an error if the service fails to reload

Parameters

- name (str) -- Service label, file name, or full path
- runas (str) -- User to run launchctl commands

Returns True if successful

Return type bool

CLI Example:

```bash
salt '*' service.restart org.cups.cupsd
```

salt.modules.mac_service.show(name)
Show properties of a launchctl service

Parameters name (str) -- Service label, file name, or full path

Returns The service information if the service is found

Return type dict

CLI Example:

```bash
salt '*' service.show org.cups.cupsd
salt '*' service.show org.cups.cupsd.plist
salt '*' service.show /System/Library/LaunchDaemons/org.cups.cupsd.plist
```

salt.modules.mac_service.start(name, runas=None)
Start a launchd service. Raises an error if the service fails to start

Note: To start a service in macOS the service must be enabled first. Use service.enable to enable the service.

Parameters

- name (str) -- Service label, file name, or full path
- runas (str) -- User to run launchctl commands

Returns True if successful or if the service is already running

Return type bool
CLI Example:
```
salt '*' service.start org.cups.cupsd
```

salt.modules.mac_service.status(name, sig=None, runas=None)
Return the status for a service.

**Parameters**
- **name** (*str*) -- Used to find the service from launchctl. Can be any part of the service name or a regex expression.
- **sig** (*str*) -- Find the service with status.pid instead. Note that name must still be provided.
- **runas** (*str*) -- User to run launchctl commands

**Returns**
The PID for the service if it is running, otherwise an empty string
Return type *str*

CLI Example:
```
salt '*' service.status cups
```

salt.modules.mac_service.stop(name, runas=None)
Stop a launchd service. Raises an error if the service fails to stop

**Note:** Though service.stop will unload a service in macOS, the service will start on next boot unless it is disabled. Use service.disable to disable the service

**Parameters**
- **name** (*str*) -- Service label, file name, or full path
- **runas** (*str*) -- User to run launchctl commands

**Returns**
True if successful or if the service is already stopped
Return type *bool*

CLI Example:
```
salt '*' service.stop org.cups.cupsd
```

19.9.206 salt.modules.mac_shadow module

New in version 2016.3.0.
Manage macOS local directory passwords and policies.

Note that it is usually better to apply password policies through the creation of a configuration profile.

salt.modules.mac_shadow.del_password(name)
Deletes the account password

**Parameters**
- **name** (*str*) -- The user name of the account

**Returns**
True if successful, otherwise False
Return type *bool*

**Raises**
CommandExecutionError on user not found or any other unknown error

CLI Example:
```
salt '*' shadow.del_password username
```
salt.modules.mac_shadow.get_account_created(name)
Get the date/time the account was created
Parameters name (str) -- The username of the account
Returns The date/time the account was created (yyyy-mm-dd hh:mm:ss)
Return type str
Raises CommandExecutionError on user not found or any other unknown error
CLI Example:
```bash
salt '*' shadow.get_account_created admin
```

salt.modules.mac_shadow.get_change(name)
Gets the date on which the password expires
Parameters name (str) -- The name of the user account
Returns The date the password will expire
Return type str
Raises CommandExecutionError on user not found or any other unknown error
CLI Example:
```bash
salt '*' shadow.get_change username
```

salt.modules.mac_shadow.get_expire(name)
Gets the date on which the account expires
Parameters name (str) -- The name of the user account
Returns The date the account expires
Return type str
Raises CommandExecutionError on user not found or any other unknown error
CLI Example:
```bash
salt '*' shadow.get_expire username
```

salt.modules.mac_shadow.get_last_change(name)
Get the date/time the account was changed
Parameters name (str) -- The username of the account
Returns The date/time the account was modified (yyyy-mm-dd hh:mm:ss)
Return type str
Raises CommandExecutionError on user not found or any other unknown error
CLI Example:
```bash
salt '*' shadow.get_last_change admin
```

salt.modules.mac_shadow.get_login_failed_count(name)
Get the number of failed login attempts
Parameters name (str) -- The username of the account
Returns The number of failed login attempts
Return type int
Raises CommandExecutionError on user not found or any other unknown error
CLI Example:
```bash
salt '*' shadow.get_login_failed_count admin
```

salt.modules.mac_shadow.get_login_failed_last(name)
Get the date/time of the last failed login attempt
Parameters name (str) -- The username of the account
Returns The date/time of the last failed login attempt on this account (yyyy-mm-dd hh:mm:ss)
Return type str
 Raises CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_login_failed_last admin
```

```
salt.modules.mac_shadow.get_maxdays(name)
```

Get the maximum age of the password

Parameters name (str) -- The username of the account

Returns The maximum age of the password in days

Return type int

Raises CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_maxdays admin 90
```

```
salt.modules.mac_shadow.info(name)
```

Return information for the specified user

Parameters name (str) -- The username

Returns A dictionary containing the user’s shadow information

Return type dict

CLI Example:

```
salt '*' shadow.info admin
```

```
salt.modules.mac_shadow.set_change(name, date)
```

Sets the date on which the password expires. The user will be required to change their password. Format is mm/dd/yyyy

Parameters

- name (str) -- The name of the user account

- date (date) -- The date the password will expire. Must be in mm/dd/yyyy format.

Returns True if successful, otherwise False

Return type bool

Raises CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.set_change username 09/21/2016
```

```
salt.modules.mac_shadow.set_expire(name, date)
```

Sets the date on which the account expires. The user will not be able to login after this date. Date format is mm/dd/yyyy

Parameters

- name (str) -- The name of the user account

- date (datetime) -- The date the account will expire. Format must be mm/dd/yyyy.

Returns True if successful, False if not

Return type bool

Raises CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.set_expire username 07/23/2015
```

```
salt.modules.mac_shadow.set_inactdays(name, days)
```

Set the number if inactive days before the account is locked. Not available in macOS

Parameters
- **name** *(str)* -- The user name
- **days** *(int)* -- The number of days

Returns Will always return False until macOS supports this feature.

Return type **bool**

CLI Example:
```bash
curl http://localhost:8000/salt-api
```

```python
salt.modules.mac_shadow.set_inactdays(name, days)
```
Set the maximum age of the password in days

Parameters
- **name** *(str)* -- The username of the account
- **days** *(int)* -- The maximum age of the account in days

Returns True if successful, False if not

Return type **bool**

Raises CommandExecutionError on user not found or any other unknown error

CLI Example:
```bash
curl http://localhost:8000/salt-api
```

```python
salt.modules.mac_shadow.set_maxdays(name, days)
```
Set the maximum password age in days. Not available in macOS.

Parameters
- **name** *(str)* -- The user name
- **days** *(int)* -- The number of days

Returns Will always return False until macOS supports this feature.

Return type **bool**

Raises CommandExecutionError on user not found or any other unknown error

CLI Example:
```bash
curl http://localhost:8000/salt-api
```

```python
salt.modules.mac_shadow.set_mindays(name, days)
```
Set the minimum password age in days. Not available in macOS.

Parameters
- **name** *(str)* -- The user name
- **days** *(int)* -- The number of days

Returns True if successful, otherwise False

Return type **bool**

CLI Example:
```bash
curl http://localhost:8000/salt-api
```

```python
salt.modules.mac_shadow.set_password(name, password)
```
Set the password for a named user (insecure, the password will be in the process list while the command is running)

Parameters
- **name** *(str)* -- The name of the local user, which is assumed to be in the local directory service
- **password** *(str)* -- The plaintext password to set

Returns True if successful, otherwise False

Return type **bool**

CLI Example:
```bash
curl http://localhost:8000/salt-api
```

```python
salt.modules.mac_shadow.set_warndays(name, days)
```
Set the number of days before the password expires that the user will start to see a warning. Not available in macOS

Parameters
- **name** *(str)* -- The user name
- **days** *(int)* -- The number of days
Returns: Will always return False until macOS supports this feature.
Return type: bool

CLI Example:
salt '*' shadow.set_warndays admin 90

19.9.207 `salt.modules.mac_softwareupdate module`

Support for the softwareupdate command on MacOS.

`salt.modules.mac_softwareupdate.download(name)`
Download a named update so that it can be installed later with the `update` or `update_all` functions.
Parameters: `name (str)` -- The update to download.
Returns: True if successful, otherwise False
Return type: bool

CLI Example:
salt '*' softwareupdate.download <update name>

`salt.modules.mac_softwareupdate.download_all(recommended=False, restart=True)`
Download all available updates so that they can be installed later with the `update` or `update_all` functions. It returns a list of updates that are now downloaded.
Parameters:
- `recommended (bool)` -- If set to True, only install the recommended updates. If set to False (default) all updates are installed.
- `restart (bool)` -- Set this to False if you do not want to install updates that require a restart. Default is True
Returns: A list containing all downloaded updates on the system.
Return type: list

CLI Example:
salt '*' softwareupdate.download_all

`salt.modules.mac_softwareupdate.get_catalog()`
New in version 2016.3.0.
Get the current catalog being used for update lookups. Will return a url if a custom catalog has been specified. Otherwise the word 'Default' will be returned.
Returns: The catalog being used for update lookups
Return type: str

CLI Example:
salt '*' softwareupdates.get_catalog

`salt.modules.mac_softwareupdate.ignore(name)`
Ignore a specific program update. When an update is ignored the '-' and version number at the end will be omitted, so ``SecUpd2014-001-1.0`` becomes ``SecUpd2014-001``. It will be removed automatically if present. An update is successfully ignored when it no longer shows up after list_updates.
Parameters: `name` -- The name of the update to add to the ignore list.
Ptype: str
Returns: True if successful, False if not
Return type: bool

CLI Example:
```
salt '*' softwareupdate.ignore <update-name>

salt.modules.mac_softwareupdate.list_available(recommended=False, restart=False)
List all available updates.
Parameters
  • recommended (bool) -- Show only recommended updates.
  • restart (bool) -- Show only updates that require a restart.
Returns Returns a dictionary containing the updates
Return type dict
CLI Example:
salt '*' softwareupdate.list_available

salt.modules.mac_softwareupdate.list_downloads()
Return a list of all updates that have been downloaded locally.
Returns A list of updates that have been downloaded
Return type list
CLI Example:
salt '*' softwareupdate.list_downloads

salt.modules.mac_softwareupdate.list_ignored()
List all updates that have been ignored. Ignored updates are shown without the `-' and version number at
the end, this is how the softwareupdate command works.
Returns The list of ignored updates
Return type list
CLI Example:
salt '*' softwareupdate.list_ignored

salt.modules.mac_softwareupdate.reset_catalog()
New in version 2016.3.0.
Reset the Software Update Catalog to the default.
Returns True if successful, False if not
Return type bool
CLI Example:
salt '*' softwareupdates.reset_catalog

salt.modules.mac_softwareupdate.reset_ignored()
Make sure the ignored updates are not ignored anymore, returns a list of the updates that are no longer
ignored.
Returns True if the list was reset, Otherwise False
Return type bool
CLI Example:
salt '*' softwareupdate.reset_ignored

salt.modules.mac_softwareupdate.schedule_enable(enable)
Enable/disable automatic update scheduling.
Parameters enable -- True/On/Yes/1 to turn on automatic updates. False/No/Off/0 to turn off
automatic updates. If this value is empty, the current status will be returned.
Type bool str
```
Returns  True if scheduling is enabled, False if disabled  
Return type  bool  

CLI Example:
```
salt '*' softwareupdate.schedule_enable on|off
```

```
salt.modules.mac_softwareupdate.schedule_enabled()
```

Check the status of automatic update scheduling.

Returns  True if scheduling is enabled, False if disabled  
Return type  bool  

CLI Example:
```
salt '*' softwareupdate.schedule_enabled
```

```
salt.modules.mac_softwareupdate.set_catalog(url)
```

New in version 2016.3.0.

Set the Software Update Catalog to the URL specified

Parameters  url (str) -- The url to the update catalog

Returns  True if successful, False if not  
Return type  bool  

CLI Example:
```
salt '*' softwareupdates.set_catalog http://swupd.local:8888/index.sucatalog
```

```
salt.modules.mac_softwareupdate.update(name)
```

Install a named update.

Parameters  name (str) -- The name of the update to install.

Returns  True if successfully updated, otherwise False  
Return type  bool  

CLI Example:
```
salt '*' softwareupdate.update <update-name>
```

```
salt.modules.mac_softwareupdate.update_all(recommended=False, restart=True)
```

Install all available updates. Returns a dictionary containing the name of the update and the status of its installation.

Parameters

- **recommended** (bool) -- If set to True, only install the recommended updates. If set to False (default) all updates are installed.
- **restart** (bool) -- Set this to False if you do not want to install updates that require a restart. Default is True

Returns  A dictionary containing the updates that were installed and the status of its installation.
If no updates were installed an empty dictionary is returned.  
Return type  dict  

CLI Example:
```
salt '*' softwareupdate.update_all
```

```
salt.modules.mac_softwareupdate.update_available(name)
```

Check whether or not an update is available with a given name.

Parameters  name (str) -- The name of the update to look for

Returns  True if available, False if not  
Return type  bool  

CLI Example:
19.9.208 salt.modules.mac_sysctl module

Module for viewing and modifying sysctl parameters

salt.modules.mac_sysctl.assign(name, value)
Assign a single sysctl parameter for this minion
name The name of the sysctl value to edit.
value The sysctl value to apply.

CLI Example:
salt '*' sysctl.assign net.inet.icmp.icmplim 50

salt.modules.mac_sysctl.get(name)
Return a single sysctl parameter for this minion
name The name of the sysctl value to display.

CLI Example:
salt '*' sysctl.get hw.physmem

salt.modules.mac_sysctl.persist(name, value, config='/etc/sysctl.conf', apply_change=False)
Assign and persist a simple sysctl parameter for this minion
name The name of the sysctl value to edit.
value The sysctl value to apply.
config The location of the sysctl configuration file.
apply_change Default is False; Default behavior only creates or edits the sysctl.conf file. If apply is set to True, the changes are applied to the system.

CLI Example:
salt '*' sysctl.persist net.inet.icmp.icmplim 50
salt '*' sysctl.persist coretemp_load NO config='/etc/sysctl.conf'

salt.modules.mac_sysctl.show(config_file=False)
Return a list of sysctl parameters for this minion

CLI Example:
salt '*' sysctl.show

19.9.209 salt.modules.mac_system module

New in version 2016.3.0.

System module for sleeping, restarting, and shutting down the system on Mac OS X.

Warning: Using this module will enable atrun on the system if it is disabled.

salt.modules.mac_system.get_boot_arch()
Get the kernel architecture setting from com.apple.Boot.plist

Returns A string value representing the boot architecture setting
Return type  str

CLI Example:
salt '*' system.get_boot_arch

salt.modules.mac_system.get_computer_name()
Gets the computer name

Returns  The computer name

Return type  str

CLI Example:
salt '*' system.get_computer_name

salt.modules.mac_system.get_disable_keyboard_on_lock()
Get whether or not the keyboard should be disabled when the X Serve enclosure lock is engaged.

Returns  True if disable keyboard on lock is on, False if off

Return type  bool

CLI Example:
```
.. code-block:: bash
    salt '*' system.get_disable_keyboard_on_lock
```

salt.modules.mac_system.get_remote_events()
Displays whether remote apple events are on or off.

Returns  True if remote apple events are on, False if off

Return type  bool

CLI Example:
salt '*' system.get_remote_events

salt.modules.mac_system.get_remote_login()
Displays whether remote login (SSH) is on or off.

Returns  True if remote login is on, False if off

Return type  bool

CLI Example:
salt '*' system.get_remote_login

salt.modules.mac_system.get_restart_delay()
Get the number of seconds after which the computer will start up after a power failure.

Returns  A string value representing the number of seconds the system will delay restart after power loss

Return type  str

CLI Example:
salt '*' system.get_restart_delay

salt.modules.mac_system.get_startup_disk()
Displays the current startup disk

Returns  The current startup disk

Return type  str

CLI Example:
salt '*' system.get_startup_disk

salt.modules.mac_system.get_subnet_name()
Gets the local subnet name
Returns The local subnet name
Return type str

CLI Example:

```
salt '*' system.get_subnet_name
```

`salt.modules.mac_system.halt(at_time=None)`

Halt a running system

Parameters `at_time (str)` -- Any valid at expression. For example, some valid at expressions could be:

- noon
- midnight
- fri
- 9:00 AM
- 2:30 PM tomorrow
- now + 10 minutes

**Note:** If you pass a time only, with no `AM/PM` designation, you have to double quote the parameter on the command line. For example: """"14:00"

CLI Example:

```
salt '*' system.halt
salt '*' system.halt 'now + 10 minutes'
```

`salt.modules.mac_system.list_startup_disks()`

List all valid startup disks on the system.

Returns A list of valid startup disks

Return type list

CLI Example:

```
salt '*' system.list_startup_disks
```

`salt.modules.mac_system.restart(at_time=None)`

Restart the system

Parameters `at_time (str)` -- Any valid at expression. For example, some valid at expressions could be:

- noon
- midnight
- fri
- 9:00 AM
- 2:30 PM tomorrow
- now + 10 minutes

**Note:** If you pass a time only, with no `AM/PM` designation, you have to double quote the parameter on the command line. For example: """"14:00"

CLI Example:
salt 's* system.restart
salt 's* system.restart '12:00 PM fri'

salt.modules.mac_system.set_boot_arch(arch='default')
Set the kernel to boot in 32 or 64 bit mode on next boot.

**Note:** When this function fails with the error changes to kernel architecture failed to save!, then the boot arch is not updated. This is either an Apple bug, not available on the test system, or a result of system files being locked down in macOS (SIP Protection).

**Parameters**

- **arch (str)** -- A string representing the desired architecture. If no value is passed, default is assumed. Valid values include:
  - i386
  - x86_64
  - default

**Returns**

True if successful, False if not

**Return type**

bool

**CLI Example:**

```
salt 's* system.set_boot_arch i386
```

salt.modules.mac_system.set_computer_name(name)
Set the computer name

**Parameters**

- **name (str)** -- The new computer name

**Returns**

True if successful, False if not

**Return type**

bool

**CLI Example:**

```
salt 's* system.set_computer_name "Mike's Mac"
```

salt.modules.mac_system.set_disable_keyboard_on_lock(enable)
Get whether or not the keyboard should be disabled when the X Serve enclosure lock is engaged.

**Parameters**

- **enable (bool)** -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

**Returns**

True if successful, False if not

**Return type**

bool

**CLI Example:**

```
salt 's* system.set_disable_keyboard_on_lock False
```

salt.modules.mac_system.set_remote_events(enable)
Set whether the server responds to events sent by other computers (such as AppleScripts)

**Parameters**

- **enable (bool)** -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

**Returns**

True if successful, False if not

**Return type**

bool

**CLI Example:**

```
salt 's* system.set_remote_events On
```

salt.modules.mac_system.set_remote_login(enable)
Set the remote login (SSH) to either on or off.
Parameters `enable` *(bool)* -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not

Return type bool

CLI Example:

```python
salt '*' system.set_remote_login True
```

salt.modules.mac_system.set_restart_delay *(seconds)*

Set the number of seconds after which the computer will start up after a power failure.

**Warning:** This command fails with the following error:

```
Error,IOServiceOpen returned 0x10000003
```

The setting is not updated. This is an apple bug. It seems like it may only work on certain versions of Mac Server X. This article explains the issue in more detail, though it is quite old.

Parameters `seconds` *(int)* -- The number of seconds. Must be a multiple of 30

Returns True if successful, False if not

Return type bool

CLI Example:

```python
salt '*' system.set_restart_delay 180
```

salt.modules.mac_system.set_startup_disk *(path)*

Set the current startup disk to the indicated path. Use `system.list_startup_disks` to find valid startup disks on the system.

Parameters `path` *(str)* -- The valid startup disk path

Returns True if successful, False if not

Return type bool

CLI Example:

```python
salt '*' system.set_startup_disk /System/Library/CoreServices
```

salt.modules.mac_system.set_subnet_name *(name)*

Set the local subnet name

Parameters `name` *(str)* -- The new local subnet name

**Note:** Spaces are changed to dashes. Other special characters are removed.

Returns True if successful, False if not

Return type bool

CLI Example:

```python
The following will be set as 'Mikes-Mac'
salt '*' system.set_subnet_name "Mike's Mac"
```

salt.modules.mac_system.shutdown *(at_time=None)*

Shutdown the system

Parameters `at_time` *(str)* -- Any valid at expression. For example, some valid at expressions could be:
• noon
• midnight
• fri
• 9:00 AM
• 2:30 PM tomorrow
• now + 10 minutes

Note: If you pass a time only, with no `AM/PM' designation, you have to double quote the parameter on the command line. For example: ```14:00''`

CLI Example:
```
salt '*' system.shutdown
salt '*' system.shutdown 'now + 1 hour'
```

salt.modules.mac_system.sleep(at_time=None)
Sleep the system. If a user is active on the system it will likely fail to sleep.

Parameters at_time (str) -- Any valid at expression. For example, some valid at expressions could be:
• noon
• midnight
• fri
• 9:00 AM
• 2:30 PM tomorrow
• now + 10 minutes

Note: If you pass a time only, with no `AM/PM' designation, you have to double quote the parameter on the command line. For example: ```14:00''`

CLI Example:
```
salt '*' system.sleep
salt '*' system.sleep '10:00 PM'
```

19.9.210 salt.modules.mac_timezone module
Module for editing date/time settings on macOS

New in version 2016.3.0.

salt.modules.mac_timezone.get_date()
Displays the current date

Returns the system date

Return type str

CLI Example:
```
salt '*' timezone.get_date
```
salt.modules.mac_timezone.get_hwclock()
Get current hardware clock setting (UTC or localtime)

CLI Example:
salt '*' timezone.get_hwclock

salt.modules.mac_timezone.get_offset()
Displays the current time zone offset

Returns The current time zone offset
Return type str

CLI Example:
salt '*' timezone.get_offset

salt.modules.mac_timezone.get_time()
Get the current system time.

Returns The current time in 24 hour format
Return type str

CLI Example:
salt '*' timezone.get_time

salt.modules.mac_timezone.get_time_server()
Display the currently set network time server.

Returns the network time server
Return type str

CLI Example:
salt '*' timezone.get_time_server

salt.modules.mac_timezone.get_using_network_time()
Display whether network time is on or off

Returns True if network time is on, False if off
Return type bool

CLI Example:
salt '*' timezone.get_using_network_time

salt.modules.mac_timezone.get_zone()
Displays the current time zone

Returns The current time zone
Return type str

CLI Example:
salt '*' timezone.get_zone

salt.modules.mac_timezone.get_zonecode()
Displays the current time zone abbreviated code

Returns The current time zone code
Return type str

CLI Example:
salt '*' timezone.get_zonecode

salt.modules.mac_timezone.list_zones()
Displays a list of available time zones. Use this list when setting a time zone using timezone.set_zone
Returns a list of time zones
Return type list

CLI Example:
salt '*' timezone.list_zones

salt.modules.mac_timezone.set_date(date)
Set the current month, day, and year
Parameters date (str) -- The date to set. Valid date formats are:
  • %m:%d:%y
  • %m:%d:%Y
  • %m/%d/%y
  • %m/%d/%Y
Returns True if successful, False if not
Return type bool
Raises SaltInvocationError on Invalid Date format
Raises CommandExecutionError on failure

CLI Example:
salt '*' timezone.set_date 1/13/2016

salt.modules.mac_timezone.set_hwclock(clock)
Sets the hardware clock to be either UTC or localtime

CLI Example:
salt '*' timezone.set_hwclock UTC

salt.modules.mac_timezone.set_time(time)
Sets the current time. Must be in 24 hour format.
Parameters time (str) -- The time to set in 24 hour format. The value must be double quoted.
  ie: "17:46"
Returns True if successful, False if not
Return type bool
Raises SaltInvocationError on Invalid Time format
Raises CommandExecutionError on failure

CLI Example:
salt '*' timezone.set_time "17:34"

salt.modules.mac_timezone.set_time_server(time_server='time.apple.com')
Designates a network time server. Enter the IP address or DNS name for the network time server.
Parameters time_server -- IP or DNS name of the network time server. If nothing is passed
  the time server will be set to the macOS default of `time.apple.com`
Type str
Returns True if successful, False if not
Return type bool
Raises CommandExecutionError on failure

CLI Example:
salt '*' timezone.set_time_server time.acme.com

salt.modules.mac_timezone.set_using_network_time(enable)
Set whether network time is on or off.
**Parameters enable** -- True to enable, False to disable. Can also use 'on' or 'off'

Type str bool

**Returns** True if successful, False if not

**Return type** bool

**Raises** CommandExecutionError on failure

**CLI Example:**

```
salt '*' timezone.set_using_network_time True
```

```python
salt.modules.mac_timezone.set_zone(time_zone)
```

Set the local time zone. Use timezone.list_zones to list valid time_zone arguments

**Parameters**

- `time_zone` (str) -- The time zone to apply

**Returns** True if successful, False if not

**Return type** bool

**Raises** SaltInvocationError on Invalid Timezone

**Raises** CommandExecutionError on failure

**CLI Example:**

```
salt '*' timezone.set_zone America/Denver
```

```python
salt.modules.mac_timezone.zone_compare(time_zone)
```

Compares the given timezone name with the system timezone name.

**Returns** True if they are the same, False if not

**Return type** bool

**CLI Example:**

```
salt '*' timezone.zone_compare America/Boise
```

## 19.9.211 salt.modules.mac_user

Manage users on Mac OS 10.7+

**Important:** If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to 'user.info' is not available), see [here](#).

```python
salt.modules.mac_user.add(name, uid=None, gid=None, groups=None, home=None, shell=None, fullname=None, createhome=True, **kwargs)
```

Add a user to the minion

**CLI Example:**

```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

```python
salt.modules.mac_user.chfullname(name, fullname)
```

Change the user’s Full Name

**CLI Example:**

```
salt '*' user.chfullname foo 'Foo Bar'
```

```python
salt.modules.mac_user.chgid(name, gid)
```

Change the default group of the user

**CLI Example:**
```
salt '*' user.chgid foo 4376

salt.modules.mac_user.chgroups(name, groups, append=False)
    Change the groups to which the user belongs. Note that the user's primary group does not have to be one of
    the groups passed, membership in the user's primary group is automatically assumed.
    groups  Groups to which the user should belong, can be passed either as a python list or a comma-separated
    string
    append  Instead of removing user from groups not included in the groups parameter, just add user to any
    groups for which they are not members
    CLI Example:
    salt '*' user.chgroups foo wheel,root

salt.modules.mac_user.chhome(name, home, **kwargs)
    Change the home directory of the user
    CLI Example:
    salt '*' user.chhome foo /Users/foo

salt.modules.mac_user.chshell(name, shell)
    Change the default shell of the user
    CLI Example:
    salt '*' user.chshell foo /bin/zsh

salt.modules.mac_user.chuid(name, uid)
    Change the uid for a named user
    CLI Example:
    salt '*' user.chuid foo 4376

salt.modules.mac_user.delete(name, remove=False, force=False)
    Remove a user from the minion
    CLI Example:
    salt '*' user.delete name remove=True force=True

salt.modules.mac_user.disable_auto_login()
    New in version 2016.3.0.
    Disables auto login on the machine
    Returns True if successful, otherwise False
    Return type bool
    CLI Example:
    salt '*' user.disable_auto_login

salt.modules.mac_user.enable_auto_login(name, password)
    New in version 2016.3.0.
    Configures the machine to auto login with the specified user
    Parameters
    • name (str) -- The user account use for auto login
```
- **password** *(str)* -- The password to user for auto login

  New in version 2017.7.3.

  **Returns** True if successful, otherwise False

  **Return type** *bool*

  CLI Example:

  ```sh
salt '*' user.enable_auto_login stevej
  ```

**salt.modules.mac_user.get_auto_login()**

New in version 2016.3.0.

Gets the current setting for Auto Login

**Returns** If enabled, returns the user name, otherwise returns False

**Return type** *str, bool*

CLI Example:

```sh
salt '*' user.get_auto_login
```

**salt.modules.mac_user.getent** *(refresh=False)*

Return the list of all info for all users

CLI Example:

```sh
salt '*' user.getent
```

**salt.modules.mac_user.info** *(name)*

Return user information

CLI Example:

```sh
salt '*' user.info root
```

**salt.modules.mac_user.list_groups** *(name)*

Return a list of groups the named user belongs to.

name

The name of the user for which to list groups. Starting in Salt 2016.11.0, all groups for the user, including groups beginning with an underscore will be listed.

Changed in version 2016.11.0.

CLI Example:

```sh
salt '*' user.list_groups foo
```

**salt.modules.mac_user.list_users()**

Return a list of all users

CLI Example:

```sh
salt '*' user.list_users
```

**salt.modules.mac_user.primary_group** *(name)*

Return the primary group of the named user

New in version 2016.3.0.

CLI Example:
salt '*>*' user.primary_group saltadmin

salt.modules.mac_user.rename(name, new_name)
Change the username for a named user

CLI Example:
```
salt '*>*' user.rename name new_name
```

19.9.212 salt.modules.mac_xattr module

This module allows you to manage extended attributes on files or directories

```
salt '*>*' xattr.list /path/to/file
```

salt.modules.mac_xattr.clear(path)
Causes the all attributes on the file/directory to be removed

- Parameters
  - path (str) -- The file(s) to get attributes from
- Returns
  - True if successful, otherwise False
- Raises
  - CommandExecutionError on file not found or any other unknown error

CLI Example:
```
salt '*>*' xattr.delete /path/to/file "com.test.attr"
```

salt.modules.mac_xattr.delete(path, attribute)
Removes the given attribute from the file

- Parameters
  - path (str) -- The file(s) to get attributes from
  - attribute (str) -- The attribute name to be deleted from the file/directory
- Returns
  - True if successful, otherwise False
- Return type
  - bool
- Raises
  - CommandExecutionError on file not found, attribute not found, and any other unknown error

CLI Example:
```
salt '*>*' xattr.delete /path/to/file "com.test.attr"
```

salt.modules.mac_xattr.list_(path, **kwargs)
List all of the extended attributes on the given file/directory

- Parameters
  - path (str) -- The file(s) to get attributes from
  - hex (bool) -- Return the values with forced hexadecimal values
- Returns
  - A dictionary containing extended attributes and values for the given file
- Return type
  - dict
- Raises
  - CommandExecutionError on file not found or any other unknown error

CLI Example:
```
salt '*>*' xattr.list /path/to/file
salt '*>*' xattr.list /path/to/file hex=True
```

salt.modules.mac_xattr.read(path, attribute, **kwargs)
Read the given attributes on the given file/directory
Parameters

- **path** *(str)* -- The file to get attributes from
- **attribute** *(str)* -- The attribute to read
- **hex** *(bool)* -- Return the values with forced hexadecimal values

Returns A string containing the value of the named attribute

Return type *str*

Raises CommandExecutionError on file not found, attribute not found, and any other unknown error

CLI Example:

```
salt '*' xattr.read /path/to/file com.test.attr
salt '*' xattr.read /path/to/file com.test.attr hex=True
```

```
salt.modules.mac_xattr.write(*path*, *attribute*, *value*, **kwargs)
```

Causes the given attribute name to be assigned the given value

Parameters

- **path** *(str)* -- The file(s) to get attributes from
- **attribute** *(str)* -- The attribute name to be written to the file/directory
- **value** *(str)* -- The value to assign to the given attribute
- **hex** *(bool)* -- Set the values with forced hexadecimal values

Returns True if successful, otherwise False

Return type *bool*

Raises CommandExecutionError on file not found or any other unknown error

CLI Example:

```
salt '*' xattr.write /path/to/file "com.test.attr" "value"
```

**19.9.213 salt.modules.makeconf**

Support for modifying make.conf under Gentoo

```
salt.modules.makeconf.append_cflags(*value*)
```

Add to or create a new CFLAGS in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>', 'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.append_cflags '-pipe'
```

```
salt.modules.makeconf.append_cxxflags(*value*)
```

Add to or create a new CXXFLAGS in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>', 'new': '<new-value>'}}
```

CLI Example:
```python
salt '*' makeconf.append_cxxflags '-pipe'
```

```python
salt.modules.makeconf.append_emerge_default_opts(value)
Add to or create a new EMERGE_DEFAULT_OPTS in the make.conf
Return a dict containing the new value for variable:

```json`
{ '<variable>': { 'old': '<old-value>', 'new': '<new-value>' }}
```

CLI Example:

```bash
salt '*' makeconf.append_emerge_default_opts '--jobs'
```

```python
salt.modules.makeconf.append_features(value)
Add to or create a new FEATURES in the make.conf
Return a dict containing the new value for variable:

```json`
{ '<variable>': { 'old': '<old-value>', 'new': '<new-value>' }}
```

CLI Example:

```bash
salt '*' makeconf.append_features 'webrsync-gpg'
```

```python
salt.modules.makeconf.append_gentoo_mirrors(value)
Add to or create a new GENTOO_MIRRORS in the make.conf
Return a dict containing the new value for variable:

```json`
{ '<variable>': { 'old': '<old-value>', 'new': '<new-value>' }}
```

CLI Example:

```bash
salt '*' makeconf.append_gentoo_mirrors 'http://distfiles.gentoo.org'
```

```python
salt.modules.makeconf.append_makeopts(value)
Add to or create a new MAKEOPTS in the make.conf
Return a dict containing the new value for variable:

```json`
{ '<variable>': { 'old': '<old-value>', 'new': '<new-value>' }}
```

CLI Example:

```bash
salt '*' makeconf.append_makeopts '-j3'
```

```python
salt.modules.makeconf.append_var(var, value)
Add to or create a new variable in the make.conf
Return a dict containing the new value for variable:

```json`
{ '<variable>': { 'old': '<old-value>', 'new': '<new-value>' }}
```

CLI Example:
```
salt '*' makeconf.append_var 'LINGUAS' 'en'

salt.modules.makeconf.cflags_contains(value)
Verify if CFLAGS variable contains a value in make.conf
Return True if value is set for var
CLI Example:
```
salt '*' makeconf.cflags_contains '-pipe'
```

salt.modules.makeconf.chost_contains(value)
Verify if CHOST variable contains a value in make.conf
Return True if value is set for var
CLI Example:
```
salt '*' makeconf.chost_contains 'x86_64-pc-linux-gnu'
```

salt.modules.makeconf.cxxflags_contains(value)
Verify if CXXFLAGS variable contains a value in make.conf
Return True if value is set for var
CLI Example:
```
salt '*' makeconf.cxxflags_contains '-pipe'
```

salt.modules.makeconf.emerge_default_opts_contains(value)
Verify if EMERGE_DEFAULT_OPTS variable contains a value in make.conf
Return True if value is set for var
CLI Example:
```
salt '*' makeconf.emerge_default_opts_contains '--jobs'
```

salt.modules.makeconf.features_contains(value)
Verify if FEATURES variable contains a value in make.conf
Return True if value is set for var
CLI Example:
```
salt '*' makeconf.features_contains 'webrsync-gpg'
```

salt.modules.makeconf.gentoo_mirrors_contains(value)
Verify if GENTOO_MIRRORS variable contains a value in make.conf
Return True if value is set for var
CLI Example:
```
salt '*' makeconf.gentoo_mirrors_contains 'http://distfiles.gentoo.org'
```

salt.modules.makeconf.get_cflags()
Get the value of CFLAGS variable in the make.conf
Return the value of the variable or None if the variable is not in the make.conf
CLI Example:
salt 'x' makeconf.get_cflags

salt.modules.makeconf.get_chost()
Get the value of CHOST variable in the make.conf
Return the value of the variable or None if the variable is not in the make.conf
CLI Example:
salt 'x' makeconf.get_chost

salt.modules.makeconf.get_cxxflags()
Get the value of CXXFLAGS variable in the make.conf
Return the value of the variable or None if the variable is not in the make.conf
CLI Example:
salt 'x' makeconf.get_cxxflags

salt.modules.makeconf.get_emerge_default_opts()
Get the value of EMERGE_DEFAULT_OPTS variable in the make.conf
Return the value of the variable or None if the variable is not in the make.conf
CLI Example:
salt 'x' makeconf.get_emerge_default_opts

salt.modules.makeconf.get_features()
Get the value of FEATURES variable in the make.conf
Return the value of the variable or None if the variable is not in the make.conf
CLI Example:
salt 'x' makeconf.get_features

salt.modules.makeconf.get_gentoo_mirrors()
Get the value of GENTOO_MIRRORS variable in the make.conf
Return the value of the variable or None if the variable is not in the make.conf
CLI Example:
salt 'x' makeconf.get_gentoo_mirrors

salt.modules.makeconf.get_makeopts()
Get the value of MAKEOPTS variable in the make.conf
Return the value of the variable or None if the variable is not in the make.conf
CLI Example:
salt 'x' makeconf.get_makeopts

salt.modules.makeconf.get_sync()
Get the value of SYNC variable in the make.conf
Return the value of the variable or None if the variable is not in the make.conf
CLI Example:
salt '* makeconf.get.sync

salt.modules.makeconf.get_var(var)
Get the value of a variable in make.conf
Return the value of the variable or None if the variable is not in make.conf
CLI Example:
salt '* makeconf.get_var 'LINGUAS'

salt.modules.makeconf.makeopts_contains(value)
Verify if MAKEOPTS variable contains a value in make.conf
Return True if value is set for var
CLI Example:
salt '* makeconf.makeopts_contains '-j3'

salt.modules.makeconf.remove_var(var)
Remove a variable from the make.conf
Return a dict containing the new value for the variable:

{"<variable>": {"old": "<old-value>",
    "new": "<new-value>"}}

CLI Example:
salt '* makeconf.remove_var 'LINGUAS'

salt.modules.makeconf.set_cflags(value)
Set the CFLAGS variable
Return a dict containing the new value for variable:

{"<variable>": {"old": "<old-value>",
    "new": "<new-value>"}}

CLI Example:
salt '* makeconf.set_cflags '-march=native -O2 -pipe'

salt.modules.makeconf.set_chost(value)
Set the CHOST variable
Return a dict containing the new value for variable:

{"<variable>": {"old": "<old-value>",
    "new": "<new-value>"}}

CLI Example:
salt '* makeconf.set_chost 'x86_64-pc-linux-gnu'

salt.modules.makeconf.set_cxxflags(value)
Set the CXXFLAGS variable
Return a dict containing the new value for variable:
CLI Example:
```
salt '*' makeconf.set_cxxflags '-march=native -O2 -pipe'
```

salt.modules.makeconf.set_emerge_default_opts(value)
Set the EMERGE_DEFAULT_OPTS variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
               'new': '<new-value>'}}
```

CLI Example:
```
salt '*' makeconf.set_emerge_default_opts '--jobs'
```

salt.modules.makeconf.set_gentoo_mirrors(value)
Set the GENTOO_MIRRORS variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
               'new': '<new-value>'}}
```

CLI Example:
```
salt '*' makeconf.set_gentoo_mirrors 'http://distfiles.gentoo.org'
```

salt.modules.makeconf.set_makeopts(value)
Set the MAKEOPTS variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
               'new': '<new-value>'}}
```

CLI Example:
```
salt '*' makeconf.set_makeopts '-j3'
```

salt.modules.makeconf.set_sync(value)
Set the SYNC variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
               'new': '<new-value>'}}
```

CLI Example:
```
salt '*' makeconf.set_sync 'rsync://rsync.namerica.gentoo.org/gentoo-portage'
```

salt.modules.makeconf.set_var(var, value)
Set a variable in the make.conf

Return a dict containing the new value for variable:
{'<variable>': {'old': '<old-value>',
 'new': '<new-value>'}}

CLI Example:
salt '*' makeconf.set_var 'LINGUAS' 'en'

salt.modules.makeconf.sync_contains(value)
Verify if SYNC variable contains a value in make.conf
Return True if value is set for var
CLI Example:
salt '*' makeconf.sync_contains 'rsync://rsync.namerica.gentoo.org/gentoo-portage'

salt.modules.makeconf.trim_cflags(value)
Remove a value from CFLAGS variable in the make.conf
Return a dict containing the new value for variable:

{'<variable>': {'old': '<old-value>',
 'new': '<new-value>'}}

CLI Example:
salt '*' makeconf.trim_cflags '-pipe'

salt.modules.makeconf.trim_cxxflags(value)
Remove a value from CXXFLAGS variable in the make.conf
Return a dict containing the new value for variable:

{'<variable>': {'old': '<old-value>',
 'new': '<new-value>'}}

CLI Example:
salt '*' makeconf.trim_cxxflags '-pipe'

salt.modules.makeconf.trim_emerge_default_opts(value)
Remove a value from EMERGE_DEFAULT_OPTS variable in the make.conf
Return a dict containing the new value for variable:

{'<variable>': {'old': '<old-value>',
 'new': '<new-value>'}}

CLI Example:
salt '*' makeconf.trim_emerge_default_opts '--jobs'

salt.modules.makeconf.trim_features(value)
Remove a value from FEATURES variable in the make.conf
Return a dict containing the new value for variable:

{'<variable>': {'old': '<old-value>',
 'new': '<new-value>'}}
CLI Example:

```bash
salt '*' makeconf.trim_features 'webrsync-gpg'
```

**salt.modules.makeconf.trim_gentoo_mirrors**(value)

Remove a value from GENTOO_MIRRORS variable in the make.conf

Return a dict containing the new value for variable:

```python
{'<variable>': {'old': '<old-value>', 'new': '<new-value>'}}
```

CLI Example:

```bash
salt '*' makeconf.trim_gentoo_mirrors 'http://distfiles.gentoo.org'
```

**salt.modules.makeconf.trim_makeopts**(value)

Remove a value from MAKEOPTS variable in the make.conf

Return a dict containing the new value for variable:

```python
{'<variable>': {'old': '<old-value>', 'new': '<new-value>'}}
```

CLI Example:

```bash
salt '*' makeconf.trim_makeopts '-j3'
```

**salt.modules.makeconf.trim_var**(var, value)

Remove a value from a variable in the make.conf

Return a dict containing the new value for variable:

```python
{'<variable>': {'old': '<old-value>', 'new': '<new-value>'}}
```

CLI Example:

```bash
salt '*' makeconf.trim_var 'LINGUAS' 'en'
```

**salt.modules.makeconf.var_contains**(var, value)

Verify if variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```bash
salt '*' makeconf.var_contains 'LINGUAS' 'en'
```

### 19.9.214 salt.modules.marathon module

Module providing a simple management interface to a marathon cluster.

Currently this only works when run through a proxy minion.

New in version 2015.8.2.
salt.modules.marathon.app(id)
Return the current server configuration for the specified app.

CLI Example:
```
salt marathon-minion-id marathon.app my-app
```

salt.modules.marathon.apps()
Return a list of the currently installed app ids.

CLI Example:
```
salt marathon-minion-id marathon.apps
```

salt.modules.marathon.has_app(id)
Return whether the given app id is currently configured.

CLI Example:
```
salt marathon-minion-id marathon.has_app my-app
```

salt.modules.marathon.info()
Return configuration and status information about the marathon instance.

CLI Example:
```
salt marathon-minion-id marathon.info
```

salt.modules.marathon.restart_app(id, restart=False, force=True)
Restart the current server configuration for the specified app.

Parameters
- **restart** -- Restart the app
- **force** -- Override the current deployment

CLI Example:
```
salt marathon-minion-id marathon.restart_app my-app
```

By default, this will only check if the app exists in marathon. It does not check if there are any tasks associated with it or if the app is suspended.
```
salt marathon-minion-id marathon.restart_app my-app true true
```

The restart option needs to be set to True to actually issue a rolling restart to marathon.

The force option tells marathon to ignore the current app deployment if there is one.

salt.modules.marathon.rm_app(id)
Remove the specified app from the server.

CLI Example:
```
salt marathon-minion-id marathon.rm_app my-app
```

salt.modules.marathon.update_app(id, config)
Update the specified app with the given configuration.

CLI Example:
19.9.215 salt.modules.match

The match module allows for match routines to be run and determine target specs

salt.modules.match.comound(tgt, minion_id=None)

Return True if the minion ID matches the given compound target

minion_id  Specify the minion ID to match against the target expression

New in version 2014.7.0.

CLI Example:

```
salt '*' match.compound 'L@cheese,foo and *'
```

salt.modules.match.data(tgt)

Return True if the minion matches the given data target

CLI Example:

```
salt '*' match.data 'spam:eggs'
```

salt.modules.match.filter_by(lookup, tgt_type='compound', minion_id=None, expr_form=None, default='default')

Return the first match in a dictionary of target patterns

New in version 2014.7.0.

CLI Example:

```
salt '*' match.filter_by '{foo*: Foo!, bar*: Bar!}' minion_id=bar03
```

Pillar Example:

```
# Filter the data for the current minion into a variable:
{% set roles = salt['match.filter_by']({
    'web*': ['app', 'caching'],
    'db*': ['db'],
}, default='web*') %}

# Make the filtered data available to Pillar:
roles: {{ roles | yaml() }}
```

salt.modules.match.glob(tgt, minion_id=None)

Return True if the minion ID matches the given glob target

minion_id  Specify the minion ID to match against the target expression

New in version 2014.7.0.

CLI Example:

```
salt '*' match.glob '*'
```

salt.modules.match.grain(tgt, delimiter=': ')

Return True if the minion matches the given grain target. The delimiter argument can be used to specify a different delimiter.

CLI Example:
Salt Documentation, Release 2017.7.8

salt '*' match.grain 'os:Ubuntu'
salt '*' match.grain 'ipv6|2001:db8::ff00:42:8329 delimiter='|'

delimiter Specify an alternate delimiter to use when traversing a nested dict

New in version 2014.7.0.
delim Specify an alternate delimiter to use when traversing a nested dict

New in version 0.16.4.
Depreciated since version 2015.8.0.
salt.modules.match.grain_pcre(tgt, delimiter=':')
Return True if the minion matches the given grain_pcre target. The delimiter argument can be used to specify a different delimiter.

CLI Example:
salt '*' match.grain_pcre 'os:Fedo.*'
salt '*' match.grain_pcre 'ipv6|2001:.*' delimiter='|

delimiter Specify an alternate delimiter to use when traversing a nested dict

New in version 2014.7.0.
delim Specify an alternate delimiter to use when traversing a nested dict

New in version 0.16.4.
Depreciated since version 2015.8.0.
salt.modules.match.ipcidr(tgt)
Return True if the minion matches the given ipcidr target

CLI Example:
salt '*' match.ipcidr '192.168.44.0/24'

delimiter Pillar Example:

'172.16.0.0/12':
  - match: ipcidr
  - nodeclass: internal

salt.modules.match.list_(tgt, minion_id=None)
Return True if the minion ID matches the given list target

minion_id Specify the minion ID to match against the target expression

New in version 2014.7.0.
CLI Example:
salt '*' match.list 'server1,server2'

salt.modules.match.pcre(tgt, minion_id=None)
Return True if the minion ID matches the given pcre target

minion_id Specify the minion ID to match against the target expression

New in version 2014.7.0.
CLI Example:
salt '*' match.pcre '.*'

19.9. execution modules
salt.modules.match.pillar(tgt, delimiter=':')

Return True if the minion matches the given pillar target. The delimiter argument can be used to specify a different delimiter.

CLI Example:

```
salt '*' match.pillar 'cheese:foo'
salt '*' match.pillar 'clone_url|https://github.com/saltstack/salt.git' delimiter='|'
```

delimiter  Specify an alternate delimiter to use when traversing a nested dict

New in version 2014.7.0.

delim  Specify an alternate delimiter to use when traversing a nested dict

New in version 0.16.4.

Deprecated since version 2015.8.0.

salt.modules.match.pillar_pcre(tgt, delimiter=':')

Return True if the minion matches the given pillar_pcre target. The delimiter argument can be used to specify a different delimiter.

CLI Example:

```
salt '*' match.pillar_pcre 'cheese:(swiss|american)'
salt '*' match.pillar_pcre 'clone_url|https://github\.com/.*\.git' delimiter='|'
```

delimiter  Specify an alternate delimiter to use when traversing a nested dict

New in version 2014.7.0.

delim  Specify an alternate delimiter to use when traversing a nested dict

New in version 0.16.4.

Deprecated since version 2015.8.0.

salt.modules.match.search_by(lookup, tgt_type='compound', minion_id=None)

Search a dictionary of target strings for matching targets

This is the inverse of match.filter_by and allows matching values instead of matching keys. A minion can be matched by multiple entries.

New in version 2017.7.0.

CLI Example:

```
salt '*' match.search_by '{web: [node1, node2], db: [node2, node]}'
```

Pillar Example:

```
{% set roles = salt.match.search_by({
    'web': ['G@os_family:Debian not nodeX'],
    'db': ['L@node2,node3 and G@datacenter:west'],
    'caching': ['node3', 'node4'],
}) %}
```

# Make the filtered data available to Pillar:
roles: {{ roles | yaml() |}}
19.9.216 salt.modules.mattermost module

Module for sending messages to Mattermost

New in version 2017.7.0.

configuration This module can be used by either passing an api_url and hook directly or by specifying both in a configuration profile in the salt master/minion config. For example:

```
mattermost:
  hook: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
  api_url: https://example.com
```

salt.modules.mattermost.post_message(message, channel=None, username=None, api_url=None, hook=None)

Send a message to a Mattermost channel.

Parameters

- channel -- The channel name, either will work.
- username -- The username of the poster.
- message -- The message to send to the Mattermost channel.
- api_url -- The Mattermost api url, if not specified in the configuration.
- hook -- The Mattermost hook, if not specified in the configuration.

Returns Boolean if message was sent successfully.

CLI Example:

```
salt '*' mattermost.post_message message='Build is done'
```

19.9.217 salt.modules.mdadm

Salt module to manage RAID arrays with mdadm

salt.modules.mdadm.assemble(name, devices, test_mode=False, **kwargs)

Assemble a RAID device.

CLI Examples:

```
salt '*' raid.assemble /dev/md0 ['/dev/xvdd', '/dev/xvde']
```

**Note:** Adding test_mode=True as an argument will print out the mdadm command that would have been run.

name The name of the array to assemble.
devices The list of devices comprising the array to assemble.
kwargs Optional arguments to be passed to mdadm.

returns

- test_mode=True: Prints out the full command.
- test_mode=False (Default): Executes command on the host(s) and prints out the mdadm output.

For more info, read the mdadm manpage.

salt.modules.mdadm.create(name, level, devices, metadata='default', test_mode=False, **kwargs)

Create a RAID device.
**Warning:** Use with CAUTION, as this function can be very destructive if not used properly!

CLI Examples:

```text
salt '*' raid.create /dev/md0 level=1 chunk=256 devices="[/dev/xvdd, /dev/xvde '->']" test_mode=True
```

**Note:** Adding `test_mode=True` as an argument will print out the mdadm command that would have been run.

- **name**  The name of the array to create.
- **level** The RAID level to use when creating the raid.
- **devices** A list of devices used to build the array.
- **metadata** Version of metadata to use when creating the array.
- **kwargs** Optional arguments to be passed to mdadm.

**returns**

- **test_mode=True**: Prints out the full command.
- **test_mode=False (Default)**: Executes command on remote the host(s) and Prints out the mdadm output.

**Note:** It takes time to create a RAID array. You can check the progress in `''resync_status:`` field of the results from the following command:

```text
salt '*' raid.detail /dev/md0
```

For more info, read the *mdadm*(8) manpage

salt.modules.mdadm.destroy(device)

Destroy a RAID device.

WARNING This will zero the superblock of all members of the RAID array..

CLI Example:

```text
salt '*' raid.destroy /dev/md0
```

salt.modules.mdadm.detail(device='''/dev/md0'')

Show detail for a specified RAID device

CLI Example:

```text
salt '*' raid.detail /dev/md0'
```

salt.modules.mdadm.list()

List the RAID devices.

CLI Example:

```text
salt '*' raid.list
```

salt.modules.mdadm.save_config()

Save RAID configuration to config file.
Same as: mdadm --detail --scan >> /etc/mdadm/mdadm.conf

Fixes this issue with Ubuntu REF: http://askubuntu.com/questions/209702/why-is-my-raid-dev-md1-showing-up-as-dev-md126-is-mdadm-conf-being-ignored

CLI Example:
```
salt '*' raid.save_config
```

salt.modules.mdadm.stop()
Shut down all arrays that can be shut down (i.e. are not currently in use).

CLI Example:
```
salt '*' raid.stop
```

19.9.218 salt.modules.mdata

Module for managing metadata in SmartOS Zones

New in version 2016.3.0.

maintainer Jorge Schrauwen <sjorge@blackdot.be>
maturity new
platform smartos

salt.modules.mdata.delete_(*keyname*)
Delete metadata
prop [string] name of property

CLI Example:
```
salt '*' mdata.get salt:role
salt '*' mdata.get user-script salt:role
```

salt.modules.mdata.get_(*keyname*)
Get metadata
keyname [string] name of key

Note: If no keynames are specified, we get all (public) properties

CLI Example:
```
salt '*' mdata.get salt:role
salt '*' mdata.get user-script salt:role
```

salt.modules.mdata.list_()
List available metadata

CLI Example:
```
salt '*' mdata.list
```

salt.modules.mdata.put_(*keyname, val*)
Put metadata
prop [string] name of property
val [string] value to set
CLI Example:

```
salt '*' mdata.list
```

19.9.219 salt.modules.memcached

Module for Management of Memcached Keys

New in version 2014.1.0.

```
salt.modules.memcached.add(key, value, host='127.0.0.1', port=11211, time=0, min_compress_len=0)
```

Add a key to the memcached server, but only if it does not exist. Returns False if the key already exists.

CLI Example:

```
salt '*' memcached.add <key> <value>
```

```
salt.modules.memcached.decrement(key, delta=1, host='127.0.0.1', port=11211)
```

Decrement the value of a key

CLI Example:

```
salt '*' memcached.decrement <key>
salt '*' memcached.decrement <key> 2
```

```
salt.modules.memcached.delete(key, host='127.0.0.1', port=11211, time=0)
```

Delete a key from memcache server

CLI Example:

```
salt '*' memcached.delete <key>
```

```
salt.modules.memcached.get(key, host='127.0.0.1', port=11211)
```

Retrieve value for a key

CLI Example:

```
salt '*' memcached.get <key>
```

```
salt.modules.memcached.increment(key, delta=1, host='127.0.0.1', port=11211)
```

Increment the value of a key

CLI Example:

```
salt '*' memcached.increment <key>
salt '*' memcached.increment <key> 2
```

```
salt.modules.memcached.replace(key, value, host='127.0.0.1', port=11211, time=0, min_compress_len=0)
```

Replace a key on the memcached server. This only succeeds if the key already exists. This is the opposite of `memcached.add`

CLI Example:

```
salt '*' memcached.replace <key> <value>
```

```
salt.modules.memcached.set_(key, value, host='127.0.0.1', port=11211, time=0, min_compress_len=0)
```

Set a key on the memcached server, overwriting the value if it exists.
**CLI Example:**

```
salt '*' memcached.set <key> <value>
```

**salt.modules.memcached.status** *(host='127.0.0.1'; port=11211)*

Get memcached status

**CLI Example:**

```
salt '*' memcached.status
```

### 19.9.220 salt.modules.mine

The function cache system allows for data to be stored on the master so it can be easily read by other minions

**salt.modules.mine.delete** *(fun)*

Remove specific function contents of minion. Returns True on success.

**CLI Example:**

```
salt '*' mine.delete 'network.interfaces'
```

**salt.modules.mine.flush()**

Remove all mine contents of minion. Returns True on success.

**CLI Example:**

```
salt '*' mine.flush
```

**salt.modules.mine.get** *(tgt, fun, tgt_type='glob', exclude_minion=False, expr_form=None)*

Get data from the mine based on the target, function and tgt_type

Targets can be matched based on any standard matching system that can be matched on the master via these keywords:

- `glob`
- `pcre`
- `grain`
- `grain_pcre`
- `compound`
- `pillar`
- `pillar_pcre`

Note that all pillar matches, whether using the compound matching system or the pillar matching system, will be exact matches, with globbing disabled.

**exclude_minion** Excludes the current minion from the result set

**CLI Example:**

```
salt '*' mine.get '*' network.interfaces
salt '*' mine.get 'os:Fedora' network.interfaces grain
salt '*' mine.get 'os:Fedora and S@192.168.5.8/24' network.ipaddrs compound
```

**See also:**

Retrieving Mine data from Pillar and Orchestrate

This execution module is intended to be executed on minions. Master-side operations such as Pillar or Orchestrate that require Mine data should use the Mine Runner module instead; it can be invoked from a Pillar SLS file using the saltutil.runner module. For example:
```
{% set minion_ips = salt.saltutil.runner('mine.get',
tgt='*',
fun='network.ip_addrs',
tgt_type='glob') %}
```

salt.modules.mine.get_docker (interfaces=None, cidrs=None, with_container_id=False)

Changed in version 2017.7.8,2018.3.3: When docker.update_mine is set to False for a given minion, no mine data will be populated for that minion, and thus none will be returned for it.

Changed in version Fluorine: docker.update_mine now defaults to False

Get all mine data for docker.ps and run an aggregation routine. The interfaces parameter allows for specifying the network interfaces from which to select IP addresses. The cidrs parameter allows for specifying a list of subnets which the IP address must match.

with_container_id Boolean, to expose container_id in the list of results

New in version 2015.8.2.

CLI Example:

```
salt '*' mine.get_docker
salt '*' mine.get_docker interfaces='eth0'
salt '*' mine.get_docker interfaces=['"eth0", "eth1"]'
salt '*' mine.get_docker cidrs='107.170.147.0/24'
salt '*' mine.get_docker cidrs=["107.170.147.0/24", "172.17.42.0/24"]'
salt '*' mine.get_docker interfaces=['"eth0", "eth1"]' cidrs=["107.170.147.0/24
"", "172.17.42.0/24"]'
```

salt.modules.mine.send (func, *args, **kwargs)

Send a specific function to the mine.

CLI Example:

```
salt '*' mine.send network.ip_addrs eth0
salt '*' mine.send eth0_ip_addrs mine_function=network.ip_addrs eth0
```

salt.modules.mine.update (clear=False, mine_functions=None)

Execute the configured functions and send the data back up to the master. The functions to be executed are merged from the master config, pillar and minion config under the option mine_functions:

```python
mine_functions:
    network.ip_addrs:
        - eth0
    disk.usage: []
```

This function accepts the following arguments:

clear: False Boolean flag specifying whether updating will clear the existing mines, or will update. Default: False (update).

mine_functions Update the mine data on certain functions only. This feature can be used when updating the mine for functions that require refresh at different intervals than the rest of the functions specified under mine_functions in the minion/master config or pillar. A potential use would be together with the scheduler, for example:

```python
schedule:
    lldp_mine_update:
        function: mine.update
        kwargs:
            mine_functions:
```
In the example above, the mine for `net.lldp` would be refreshed every 12 hours, while `network.ip_addrs` would continue to be updated as specified in `mine_interval`.

The function cache will be populated with information from executing these functions:

**CLI Example:**
```
salt '*' mine.update
```

**salt.modules.mine.valid()**

List valid entries in mine configuration.

**CLI Example:**
```
salt '*' mine.valid
```

## 19.9.221 salt.modules.minion module

Module to provide information about minions

**salt.modules.minion.kill(timeout=15)**

Kill the salt minion.

- `timeout` int seconds to wait for the minion to die.
- If you have a monitor that restarts `salt-minion` when it dies then this is a great way to restart after a minion upgrade.

**CLI example:**
```
$> salt minion[12] minion.kill
```

minion1:
```
    killed: 7874
    retcode: 0
```

minion2:
```
    killed: 29071
    retcode: 0
```

The result of the salt command shows the process ID of the minions and the results of a kill signal to the minion in as the `retcode` value: 0 is success, anything else is a failure.

**salt.modules.minion.list()**

Return a list of accepted, denied, unaccepted and rejected keys. This is the same output as `salt-key -L`

**CLI Example:**
```
salt 'master' minion.list
```

**salt.modules.minion.restart()**

Kill and restart the salt minion.
The configuration key `minion_restart_command` is an argv list for the command to restart the minion. If `minion_restart_command` is not specified or empty then the argv of the current process will be used.

If the configuration value `minion_restart_command` is not set and the `-d` (daemonize) argument is missing from argv then the minion will be killed but will not be restarted and will require the parent process to perform the restart. This behavior is intended for managed salt minion processes.

CLI example:

```
$ salt minion[12] minion.restart
minion1:
    comment: - Restart using process argv:
    - /home/omniture/install/bin/salt-minion
    - -d
    - -c
    - /home/omniture/install/etc/salt
killed: 10070
restart: ------------
stderr: 
stdout: 
retcode: 0
minion2:
    comment: - Using configuration minion_restart_command:
    - /home/omniture/install/bin/salt-minion
    - --not-an-option
    - -d
    - -c
    - /home/omniture/install/etc/salt
    - Restart failed
killed: 10896
restart: ------------
stderr:
    Usage: salt-minion
    salt-minion: error: no such option: --not-an-option
stdout: 
retcode: 64
```

The result of the command shows the process ID of `minion1` that is shutdown (killed) and the results of the restart. If there is a failure in the restart it will be reflected in a non-zero `retcode` and possibly output in the `stderr` and/or `stdout` values along with addition information in the `comment` field as is demonstrated with `minion2`.

19.9.222  salt.modules.mod_random

Provides access to randomness generators.

New in version 2014.7.0.

salt.modules.mod_random.get_str(length=20)
   New in version 2014.7.0.
   Returns a random string of the specified length.
   length [20] Any valid number of bytes.
   CLI Example:
   ```
   salt '*' random.get_str 128
   ```

salt.modules.mod_random.hash(value, algorithm='sha512')
   New in version 2014.7.0.
   Encodes a value with the specified encoder.
   value The value to be hashed.
   algorithm [sha512] The algorithm to use. May be any valid algorithm supported by hashlib.
   CLI Example:
   ```
   salt '*' random.hash 'I am a string' md5
   ```

salt.modules.mod_random.rand_int(start=1, end=10)
   Returns a random integer number between the start and end number.
   start [1] Any valid integer number
   end [10] Any valid integer number
   CLI Example:
   ```
   salt '*' random.rand_int 1 10
   ```

salt.modules.mod_random.seed(range=10, hash=None)
   Returns a random number within a range. Optional hash argument can be any hashable object. If hash is omitted or None, the id of the minion is used.
   hash: None Any hashable object.
   range: 10 Any valid integer number
   CLI Example:
   ```
   salt '*' random.seed 10 hash=None
   ```

salt.modules.mod_random.shadow_hash(crypt_salt=None, password=None, algorithm='sha512')
   Generates a salted hash suitable for /etc/shadow.
   crypt_salt [None] Salt to be used in the generation of the hash. If one is not provided, a random salt will be generated.
   password [None] Value to be salted and hashed. If one is not provided, a random password will be generated.
   algorithm [sha512] Hash algorithm to use.
   CLI Example:
   ```
   salt '*' random.shadow_hash 'My5alT' 'MyP@sswd' md5
   ```

salt.modules.mod_random.str_encode(value, encoder='base64')
   New in version 2014.7.0.
   value The value to be encoded.
   encoder [base64] The encoder to use on the subsequent string.
CLI Example:

```
salt '*' random.str_encode 'I am a new string' base64
```

### 19.9.223 salt.modules.modjk

Below is an example of the configuration needed for this module. This configuration data can be placed either in grains or pillar.

If using grains, this can be accomplished statically or via a grain module.

If using pillar, the yaml configuration can be placed directly into a pillar SLS file, making this both the easier and more dynamic method of configuring this module.

```yaml
modjk:
  default:
    url: http://localhost/jkstatus
    user: modjk
    pass: secret
    realm: authentication realm for digest passwords
    timeout: 5
  otherVhost:
    url: http://otherVhost/jkstatus
    user: modjk
    pass: secret2
    realm: authentication realm2 for digest passwords
    timeout: 600
```

**salt.modules.modjk.bulk_activate** *(workers, lbn, profile='default')*

Activate all the given workers in the specific load balancer

CLI Examples:

```
salt '*' modjk.bulk_activate node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_activate node1,node2,node3 loadbalancer1 other-profile
salt '*' modjk.bulk_activate ["node1","node2","node3"] loadbalancer1
salt '*' modjk.bulk_activate ["node1","node2","node3"] loadbalancer1 other-profile
```

**salt.modules.modjk.bulk_disable** *(workers, lbn, profile='default')*

Disable all the given workers in the specific load balancer

CLI Examples:

```
salt '*' modjk.bulk_disable node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_disable node1,node2,node3 loadbalancer1 other-profile
salt '*' modjk.bulk_disable ["node1","node2","node3"] loadbalancer1
salt '*' modjk.bulk_disable ["node1","node2","node3"] loadbalancer1 other-profile
```

**salt.modules.modjk.bulk_recover** *(workers, lbn, profile='default')*

Recover all the given workers in the specific load balancer

CLI Examples:
salt 'osg' modjk.bulk_recover node1,node2,node3 loadbalancer1
salt 'osg' modjk.bulk_recover node1,node2,node3 loadbalancer1 other-profile
salt 'osg' modjk.bulk_recover ['node1','node2','node3'] loadbalancer1
salt 'osg' modjk.bulk_recover ['node1','node2','node3'] loadbalancer1 other-profile

salt.modules.modjk.bulk_stop(workers, lbn, profile='default')
Stop all the given workers in the specific load balancer

CLI Examples:
salt 'osg' modjk.bulk_stop node1,node2,node3 loadbalancer1
salt 'osg' modjk.bulk_stop node1,node2,node3 loadbalancer1 other-profile
salt 'osg' modjk.bulk_stop ['node1','node2','node3'] loadbalancer1
salt 'osg' modjk.bulk_stop ['node1','node2','node3'] loadbalancer1 other-profile

salt.modules.modjk.dump_config(profile='default')
Dump the original configuration that was loaded from disk

CLI Examples:
salt 'osg' modjk.dump_config
salt 'osg' modjk.dump_config other-profile

salt.modules.modjk.get_running(profile='default')
Get the current running config (not from disk)

CLI Examples:
salt 'osg' modjk.get_running
salt 'osg' modjk.get_running other-profile

salt.modules.modjk.lb_edit(lbn, settings, profile='default')
Edit the loadbalancer settings

Note: http://tomcat.apache.org/connectors-doc/reference/status.html Data Parameters for the standard Update Action

CLI Examples:
salt 'osg' modjk.lb_edit loadbalancer1 '{'vlr': 1, 'vlt': 60}'
salt 'osg' modjk.lb_edit loadbalancer1 '{'vlr': 1, 'vlt': 60}' other-profile

salt.modules.modjk.list_configured_members(lbn, profile='default')
Return a list of member workers from the configuration files

CLI Examples:
salt 'osg' modjk.list_configured_members loadbalancer1
salt 'osg' modjk.list_configured_members loadbalancer1 other-profile

salt.modules.modjk.recover_all(lbn, profile='default')
Set the all the workers in lbn to recover and activate them if they are not

CLI Examples:
salt 'osg' modjk.recover_all loadbalancer1
salt 'osg' modjk.recover_all loadbalancer1 other-profile
salt.modules.modjk.*reset_stats*(lbn, profile='default')
Reset all runtime statistics for the load balancer

CLI Examples:

```
salt '*' modjk.reset_stats loadbalancer1
salt '*' modjk.reset_stats loadbalancer1 other-profile
```

salt.modules.modjk.*version*(profile='default')
Return the modjk version

CLI Examples:

```
salt '*' modjk.version
salt '*' modjk.version other-profile
```

salt.modules.modjk.*worker_activate*(worker, lbn, profile='default')
Set the worker to activate state in the lbn load balancer

CLI Examples:

```
salt '*' modjk.worker_activate node1 loadbalancer1
salt '*' modjk.worker_activate node1 loadbalancer1 other-profile
```

salt.modules.modjk.*worker_disable*(worker, lbn, profile='default')
Set the worker to disable state in the lbn load balancer

CLI Examples:

```
salt '*' modjk.worker_disable node1 loadbalancer1
salt '*' modjk.worker_disable node1 loadbalancer1 other-profile
```

salt.modules.modjk.*worker_edit*(worker, lbn, settings, profile='default')
Edit the worker settings

CLI Examples:

```
salt '*' modjk.worker_edit node1 loadbalancer1 '{'vwf': 500, 'vwd': 60}'
salt '*' modjk.worker_edit node1 loadbalancer1 '{'vwf': 500, 'vwd': 60}' other-profile
```

salt.modules.modjk.*worker_recover*(worker, lbn, profile='default')
Set the worker to recover this module will fail if it is in OK state

CLI Examples:

```
salt '*' modjk.worker_recover node1 loadbalancer1
salt '*' modjk.worker_recover node1 loadbalancer1 other-profile
```

salt.modules.modjk.*worker_status*(worker, profile='default')
Return the state of the worker

CLI Examples:

```
salt '*' modjk.worker_status node1
salt '*' modjk.worker_status node1 other-profile
```
salt.modules.modjk.worker_stop(worker, lb, profile='default')
Set the worker to stopped state in the lbn load balancer

CLI Examples:
```
salt '*' modjk.worker_activate node1 loadbalancer1
salt '*' modjk.worker_activate node1 loadbalancer1 other-profile
```

salt.modules.modjk.workers(profile='default')
Return a list of member workers and their status

CLI Examples:
```
salt '*' modjk.workers
salt '*' modjk.workers other-profile
```

19.9.224 salt.modules.mongodb

Module to provide MongoDB functionality to Salt

configuration This module uses PyMongo, and accepts configuration details as parameters as well as configuration settings:

```python
mongodb.host: 'localhost'
mongodb.port: 27017
mongodb.user: ''
mongodb.password: ''
```

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

salt.modules.mongodb.db_exists(name, user=None, password=None, host=None, port=None, authdb=None)
Checks if a database exists in Mongodb

CLI Example:
```
salt '*' mongodb.db_exists <name> <user> <password> <host> <port>
```

salt.modules.mongodb.db_list(user=None, password=None, host=None, port=None, authdb=None)
List all Mongodb databases

CLI Example:
```
salt '*' mongodb.db_list <user> <password> <host> <port>
```

salt.modules.mongodb.db_remove(name, user=None, password=None, host=None, port=None, authdb=None)
Remove a Mongodb database

CLI Example:
```
salt '*' mongodb.db_remove <name> <user> <password> <host> <port>
```

salt.modules.mongodb.find(collection, query=None, user=None, password=None, host=None, port=None, database='admin', authdb=None)
Find an object or list of objects in a collection

CLI Example:
salt 'salt' mongdb.find mycollection '[["foo": "FOO", "bar": "BAR"]]' <user>
   <password> <host> <port> <database>

salt.modules.mongdb.insert(objects, collection, user=None, password=None, host=None, port=None, database='admin', authdb=None)
Insert an object or list of objects into a collection
CLI Example:
salt 'salt' mongdb.insert '[["foo": "FOO", "bar": "BAR"], "foo": "BAZ", "bar": "BAM"]' mycollection <user> <password> <host> <port> <database>

salt.modules.mongdb.remove(collection, query=None, user=None, password=None, host=None, port=None, database='admin', w=1, authdb=None)
Remove an object or list of objects into a collection
CLI Example:
salt 'salt' mongdb.remove mycollection '[["foo": "FOO", "bar": "BAR"], "foo": "BAZ", "bar": "BAM"]' <user> <password> <host> <port> <database>

salt.modules.mongdb.update_one(objects, collection, user=None, password=None, host=None, port=None, database='admin', authdb=None)
Update an object into a collection
CLI Example:
salt 'salt' mongdb.update_one '{"_id": "my_minion"} {"bar": "BAR"}' mycollection <user> <password> <host> <port> <database>

salt.modules.mongdb.user_create(name, passwd, user=None, password=None, host=None, port=None, database='admin', authdb=None, roles=None)
Create a Mongodb user
CLI Example:
salt 'salt' mongdb.user_create <user_name> <user_password> <roles> <user> <password> <host> <port> <database>

salt.modules.mongdb.user_exists(name, user=None, password=None, host=None, port=None, database='admin', authdb=None)
Checks if a user exists in Mongodb
CLI Example:
salt 'salt' mongdb.user_exists <name> <user> <password> <host> <port> <database>

salt.modules.mongdb.user_find(name, user=None, password=None, host=None, port=None, database='admin', authdb=None)
Get single user from MongoDB
CLI Example:
salt 'salt' mongdb.user_find <name> <user> <password> <host> <port> <database> <authdb>
salt.modules.mongodb.user_grant_roles(name, roles, database, user=None, password=None, host=None, port=None, authdb=None)

Grant one or many roles to a Mongodb user

CLI Examples:

```bash
salt '*' mongodb.user_grant_roles johndoe '"["readWrite"]' dbname admin adminpwd localhost 27017
```

```bash
salt '*' mongodb.user_grant_roles janedoe '"{"role": "readWrite", "db": "dbname" }\n"{"role": "read", "db": "otherdb"}']' dbname admin adminpwd localhost 27017
```

salt.modules.mongodb.user_list(user=None, password=None, host=None, port=None, database='admin', authdb=None)

List users of a Mongodb database

CLI Example:

```bash
salt '*' mongodb.user_list <user> <password> <host> <port> <database>
```

salt.modules.mongodb.user_remove(name, user=None, password=None, host=None, port=None, database='admin', authdb=None)

Remove a Mongodb user

CLI Example:

```bash
salt '*' mongodb.user_remove <name> <user> <password> <host> <port> <database>
```

salt.modules.mongodb.user_revoke_roles(name, roles, database, user=None, password=None, host=None, port=None, authdb=None)

Revoke one or many roles to a Mongodb user

CLI Examples:

```bash
salt '*' mongodb.user_revoke_roles johndoe '"["readWrite"]' dbname admin adminpwd localhost 27017
```

```bash
salt '*' mongodb.user_revoke_roles janedoe '"{"role": "readWrite", "db": "dbname" }\n{"role": "read", "db": "otherdb"}']' dbname admin adminpwd localhost 27017
```

salt.modules.mongodb.user_roles_exists(name, roles, database, user=None, password=None, host=None, port=None, authdb=None)

Checks if a user of a Mongodb database has specified roles

CLI Examples:

```bash
salt '*' mongodb.user_roles_exists johndoe '"["readWrite"]' dbname admin adminpwd localhost 27017
```

```bash
salt '*' mongodb.user_roles_exists johndoe '"{"role": "readWrite", "db": "dbname" }\n{"role": "read", "db": "otherdb"}']' dbname admin adminpwd localhost 27017
```

salt.modules.mongodb.version(user=None, password=None, host=None, port=None, database='admin', authdb=None)

Get MongoDB instance version

CLI Example:
19.9.225 salt.modules.monit

Monit service module. This module will create a monit type service watcher.

salt.modules.monit.configtest()

New in version 2016.3.0.
Test monit configuration syntax

CLI Example:
salt '*' monit.configtest

salt.modules.monit.id_(reset=False)

New in version 2016.3.0.
Return monit unique id.
reset [False] Reset current id and generate a new id when it's True.

CLI Example:
salt '*' monit.id [reset=True]

salt.modules.monit.monitor(name)

monitor service via monit

CLI Example:
salt '*' monit.monitor <service name>

salt.modules.monit.reload_()

New in version 2016.3.0.
Reload monit configuration

CLI Example:
salt '*' monit.reload

salt.modules.monit.restart(name)

Restart service via monit

CLI Example:
salt '*' monit.restart <service name>

salt.modules.monit.start(name)

CLI Example:
salt '*' monit.start <service name>

salt.modules.monit.status(svc_name='')

Display a process status from monit

CLI Example:
salt 'x' monit.status
salt 'x' monit.status <service name>

salt.modules.monit.stop(name)
    Stops service via monit
    CLI Example:
salt 'x' monit.stop <service name>

salt.modules.monit.summary(svc_name='')
    Display a summary from monit
    CLI Example:
salt 'x' monit.summary
salt 'x' monit.summary <service name>

salt.modules.monit.unmonitor(name)
    Unmonitor service via monit
    CLI Example:
salt 'x' monit.unmonitor <service name>

salt.modules.monit.validate()
    New in version 2016.3.0.
    Check all services
    CLI Example:
salt 'x' monit.validate

salt.modules.monit.version()
    New in version 2016.3.0.
    Return version from monit -V
    CLI Example:
salt 'x' monit.version

19.9.226 salt.modules.moosefs

Module for gathering and managing information about MooseFS
salt.modules.moosefs.dirinfo(path, opts=None)
    Return information on a directory located on the Moose
    CLI Example:
salt 'x' moosefs.dirinfo /path/to/dir/ [-n][h|H]

salt.modules.moosefs.fileinfo(path)
    Return information on a file located on the Moose
    CLI Example:
salt 'x' moosefs.fileinfo /path/to/dir/

salt.modules.moosefs.getgoal(path, opts=None)
Return goal(s) for a file or directory

CLI Example:
```
salt 'x' moosefs.getgoal /path/to/file [-n][h|H]]
salt 'x' moosefs.getgoal /path/to/dir/ [-n][h|H][r]]
```

salt.modules.moosefs.mounts()
Return a list of current MooseFS mounts

CLI Example:
```
salt 'x' moosefs.mounts
```

19.9.227 salt.modules.mount
Salt module to manage Unix mounts and the fstab file

salt.modules.mount.active(extended=False)
List the active mounts.

CLI Example:
```
salt 'x' mount.active
```

salt.modules.mount.automaster(config='/etc/auto_salt')
List the contents of the auto master

CLI Example:
```
salt 'x' mount.automaster
```

salt.modules.mount.fstab(config='/etc/fstab')
Changed in version 2016.3.2.
List the contents of the fstab

CLI Example:
```
salt 'x' mount.fstab
```

salt.modules.mount.is_fuse_exec(cmd)
Returns true if the command passed is a fuse mountable application.

CLI Example:
```
salt 'x' mount.is_fuse_exec sshfs
```

salt.modules.mount.is_mounted(name)
New in version 2014.7.0.
Provide information if the path is mounted

CLI Example:
### Mount Modules

**salt.modules.mount.is_mounted** *(name)*  

Mount a device

**salt.modules.mount.mount** *(name, device, mkmnt=False, fstype='", opts='defaults', user=None, util='mount')*

Mount a device

**salt.modules.mount.remount** *(name, device, mkmnt=False, fstype='", opts='defaults', user=None)*

Attempt to remount a device, if the device is not already mounted, mount is called

**salt.modules.mount.rm_automaster** *(name, device, config='/etc/auto_salt')*

Remove the mount point from the auto_master

**salt.modules.mount.rm_fstab** *(name, device, config='/etc/fstab')*

Remove the mount point from the fstab

**salt.modules.mount.rm_vfstab** *(name, device, config='/etc/vfstab')*

Remove the mount point from the vfstab

**salt.modules.mount.set_automaster** *(name, device, fstype, opts='", config='/etc/auto_salt', test=False, **kwargs)*

Verify that this mount is represented in the auto_salt, change the mount to match the data passed, or add the mount if it is not present.

**salt.modules.mount.set_fstab** *(name, device, fstype, opts='defaults', dump=0, pass_num=0, config='/etc/fstab', test=False, match_on='auto', **kwargs)*

Verify that this mount is represented in the fstab, change the mount to match the data passed, or add the mount if it is not present.

---

19.9. execution modules
salt.modules.mount.set_vfstab(name, device, fstype, opts='-', device_fsck='-', mount_at_boot='yes', config='/etc/vfstab', test=False, match_on='auto', **kwargs)

.. versionadded:: 2016.3.2 Verify that this mount is represented in the fstab, change the mount to match the data passed, or add the mount if it is not present.

CLI Example:

```
salt '*' mount.set_vfstab /mnt/foo /device/c0t0d0p0 ufs
```

salt.modules.mount.swapoff(name)
Deactivate a named swap mount

Changed in version 2016.3.2.

CLI Example:

```
salt '*' mount.swapoff /root/swapfile
```

salt.modules.mount.swapon(name, priority=None)
Activate a swap disk

Changed in version 2016.3.2.

CLI Example:

```
salt '*' mount.swapon /root/swapfile
```

salt.modules.mount.swaps()
Return a dict containing information on active swap

Changed in version 2016.3.2.

CLI Example:

```
salt '*' mount.swaps
```

salt.modules.mount.umount(name, device=None, user=None, util='mount')
Attempt to umount a device by specifying the directory it is mounted on

CLI Example:

```
salt '*' mount.umount /mnt/foo
```

New in version 2015.5.0.

```
salt '*' mount.umount /mnt/foo /dev/xvdc1
```

salt.modules.mount.vfstab(config='/etc/vfstab')
New in version 2016.3.2.

List the contents of the vfstab

CLI Example:

```
salt '*' mount.vfstab
```

19.9.228 salt.modules.mssql

Module to provide MS SQL Server compatibility to salt.
depends

- FreeTDS
- pymssql Python module

configuration In order to connect to MS SQL Server, certain configuration is required in minion configs/pillars on the relevant minions. Some sample pillars might look like:

```python
mssql.server: 'localhost'
mssql.port: 1433
mssql.user: 'sysdba'
mssql.password: 'Some preferable complex password'
mssql.database: ''
```

The default for the port is `1433` and for the database is `'` (empty string); in most cases they can be left at the default setting. Options that are directly passed into functions will overwrite options from configs or pillars.

salt.modules.mssql.db_exists(database_name, **kwargs)
Find if a specific database exists on the MS SQL server.

CLI Example:
```
salt minion mssql.db_exists database_name='DBNAME'
```

salt.modules.mssql.db_list(**kwargs)
Return the database list created on a MS SQL server.

CLI Example:
```
salt minion mssql.db_list
```

salt.modules.mssql.db_remove(database_name, **kwargs)
Drops a specific database from the MS SQL server. It will not drop any of `master`, `model`, `msdb` or `tempdb`.

CLI Example:
```
salt minion mssql.db_remove database_name='DBNAME'
```

salt.modules.mssql.login_exists(login, **kwargs)
Find if a login exists in the MS SQL server.

CLI Example:
```
salt minion mssql.login_exists 'LOGIN'
```

salt.modules.mssql.role_create(role, owner=None, **kwargs)
Creates a new database role. If no owner is specified, the role will be owned by the user that executes CREATE ROLE, which is the user argument or mssql.user option.

CLI Example:
```
salt minion mssql.role_create role=product01 owner=sysdba
```

salt.modules.mssql.role_exists(role, **kwargs)
Checks if a role exists.

CLI Example:
salt minion mssql.role_exists db_owner

```
salt.modules.mssql.role_list(**kwargs)
Lists database roles.

CLI Example:
```
salt minion mssql.role_list
```

salt.modules.mssql.role_remove(role, **kwargs)
Remove a database role.

CLI Example:
```
salt minion mssql.role_create role=test_role01
```

salt.modules.mssql.tsql_query(query, **kwargs)
Run a SQL query and return query result as list of tuples, or a list of dictionaries if as_dict was passed, or an empty list if no data is available.

CLI Example:
```
salt minion mssql.tsql_query 'SELECT @@version as version' as_dict=True
```

salt.modules.mssql.user_create(username, new_login_password=None, **kwargs)
Creates a new user. If new_login_password is not specified, the user will be created without a login.

CLI Example:
```
salt minion mssql.user_create USERNAME database=DBNAME [new_login_password=PASSWORD]
```

salt.modules.mssql.user_exists(username, **kwargs)
Find if an user exists in a specific database on the MS SQL server.

Note: database argument is mandatory

CLI Example:
```
salt minion mssql.user_exists 'USERNAME' [database='DBNAME']
```

salt.modules.mssql.user_list(**kwargs)
Get the user list for a specific database on the MS SQL server.

CLI Example:
```
salt minion mssql.user_list [database='DBNAME']
```

salt.modules.mssql.user_remove(username, **kwargs)
Removes an user.

CLI Example:
```
salt minion mssql.user_remove USERNAME database=DBNAME
```

salt.modules.mssql.version(**kwargs)
Return the version of a MS SQL server.
19.9.229  `salt.modules.msteams module`

Module for sending messages to MS Teams

New in version 2017.7.0.

configuration  This module can be used by either passing a hook_url directly or by specifying it in a configuration profile in the salt master/minion config. For example:

```
msteams:
  hook_url: https://outlook.office.com/webhook/837
```

`salt.modules.msteams.post_card(message, hook_url=None, title=None, theme_color=None)`

Send a message to an MS Teams channel.

:param message: The message to send to the MS Teams channel.
:param hook_url: The Teams webhook URL, if not specified in the configuration.
:param title: Optional title for the posted card
:param theme_color: Optional hex color highlight for the posted card
:return: Boolean if message was sent successfully.

CLI Example:

```
salt '*' msteams.post_card message="Build is done"
```

19.9.230  `salt.modules.munin`

Run munin plugins/checks from salt and format the output as data.

`salt.modules.munin.list_plugins()`  
List all the munin plugins

CLI Example:

```
salt '*' munin.list_plugins
```

`salt.modules.munin.run(plugins)`  
Run one or more named munin plugins

CLI Example:

```
salt '*' munin.run uptime
salt '*' munin.run uptime,cpu,load,memory
```

`salt.modules.munin.run_all()`  
Run all the munin plugins

CLI Example:

```
salt '*' munin.run_all
```

19.9.231  `salt.modules.mysql`

Module to provide MySQL compatibility to salt.

19.9. execution modules
depends

- MySQLdb Python module

**Note:** On CentOS 5 (and possibly RHEL 5) both MySQL-python and python26-mysqldb need to be installed.

**configuration** In order to connect to MySQL, certain configuration is required in /etc/salt/minion on the relevant minions. Some sample configs might look like:

```ini
[mysql]
host: 'localhost'
port: 3306
user: 'root'
pass: '
db: 'mysql'
unix_socket: '/tmp/mysql.sock'
charset: 'utf8'
```

You can also use a defaults file:

```ini
[mysql]
default_file: '/etc/mysql/debian.cnf'
```

Changed in version 2014.1.0: `charset` connection argument added. This is a MySQL charset, not a python one.

Changed in version 0.16.2: Connection arguments from the minion config file can be overridden on the CLI by using the arguments defined [here](https://docs.saltstack.com/en/latest/topics/integration/minion.html). Additionally, it is now possible to setup a user with no password.

**salt.modules.mysql**

**salt.modules.mysql.alter_db**

Modify database using `ALTER DATABASE %(dbname)s CHARACTER SET %(charset)s COLLATE %(collation)s;` query.

CLI Example:

```bash
salt '*' mysql.alter_db testdb charset='latin1'
```

**salt.modules.mysql.db_check**

Repairs the full database or just a given table

CLI Example:

```bash
salt '*' mysql.db_check dbname
salt '*' mysql.db_check dbname dbtable
```

**salt.modules.mysql.db_create**

Adds a databases to the MySQL server.

- name The name of the database to manage
- character_set The character set, if left empty the MySQL default will be used
- collate The collation, if left empty the MySQL default will be used

CLI Example:

```bash
salt '*' mysql.db_create dbname
salt '*' mysql.db_create dbname 'utf8' 'utf8_general_ci'
```

**salt.modules.mysql.db_exists**

Checks if a database exists on the MySQL server.

CLI Example:
Salt Documentation, Release 2017.7.8

```python
salt '*' mysql.db_exists 'dbname'
```

**salt.modules.mysql.db_get(name, **connection_args)**

Return a list of databases of a MySQL server using the output from the SELECT DEFAULT_CHARACTER_SET_NAME,DEFAULT_COLLATION_NAME FROM INFORMATION_SCHEMA.SCHEMATA WHERE SCHEMA_NAME='dbname'; query.

CLI Example:

```bash
salt '*' mysql.db_get test
```

**salt.modules.mysql.db_list(**connection_args)**

Return a list of databases of a MySQL server using the output from the SHOW DATABASES query.

CLI Example:

```bash
salt '*' mysql.db_list
```

**salt.modules.mysql.db_optimize(name, table=None, **connection_args)**

Optimizes the full database or just a given table

CLI Example:

```bash
salt '*' mysql.db_optimize dbname
```

**salt.modules.mysql.db_remove(name, **connection_args)**

Removes a databases from the MySQL server.

CLI Example:

```bash
salt '*' mysql.db_remove 'dbname'
```

**salt.modules.mysql.db_repair(name, table=None, **connection_args)**

Repairs the full database or just a given table

CLI Example:

```bash
salt '*' mysql.db_repair dbname
```

**salt.modules.mysql.db_tables(name, **connection_args)**

Shows the tables in the given MySQL database (if exists)

CLI Example:

```bash
salt '*' mysql.db_tables 'database'
```

**salt.modules.mysql.file_query(database, file_name, **connection_args)**

Run an arbitrary SQL query from the specified file and return the the number of affected rows.

New in version 2017.7.0.

database
database to run script inside

file_name
File name of the script. This can be on the minion, or a file that is reachable by the fileserver

CLI Example:

```bash
salt '*' mysql.file_query mydb file_name=/tmp/sqlfile.sql
salt '*' mysql.file_query mydb file_name=salt://sqlfile.sql
```
Return data:

```
{'query time': {'human': '39.0ms', 'raw': '0.03899'}, 'rows affected': 1L}
```

```python
salt.modules.mysql.free_slave(**connection_args)
```
Frees a slave from its master. This is a WIP, do not use.

CLI Example:

```
salt '*' mysql.free_slave
```

```python
salt.modules.mysql.get_master_status(**connection_args)
```
Retrieves the master status from the minion.

Returns:

```
{'host.domain.com': {'Binlog_Do_DB': ' ',
                    'Binlog_Ignore_DB': ' ',
                    'File': 'mysql-bin.000021',
                    'Position': 107}}
```

CLI Example:

```
salt '*' mysql.get_master_status
```

```python
salt.modules.mysql.get_slave_status(**connection_args)
```
Retrieves the slave status from the minion.

Returns:

```
{'host.domain.com': {'Connect_Retry': 60,
                     'Exec_Master_Log_Pos': 107,
                     'Last_Errno': 0,
                     'Last_Error': ' ',
                     'Last_IO_Errno': 0,
                     'Last_IO_Error': ' ',
                     'Last_SQL_Errno': 0,
                     'Last_SQL_Error': ' ',
                     'Master_Host': 'comet.scion-eng.com',
                     'Master_Log_File': 'mysql-bin.000021',
                     'Master_Port': 3306,
                     'Master_SSL_Allowed': 'No',
                     'Master_SSL_CA_File': ' ',
                     'Master_SSL_CA_Path': ' ',
                     'Master_SSL_Cert': ' ',
                     'Master_SSL_Cipher': ' ',
                     'Master_SSL_Key': ' ',
                     'Master_SSL_Verify_Server_Cert': 'No',
                     'Master_Server_Id': 1,
                     'Master_User': 'replu',
                     'Read_Master_Log_Pos': 107,
                     'Relay_Log_File': 'klo-relay-bin.000071',
                     'Relay_Log_Pos': 253,
                     'Relay_Log_Space': 553,
                     'Relay_Master_Log_File': 'mysql-bin.000021',
                     'Replicate_Do_DB': ' ',
                     'Replicate_Do_Table': ' ',
                     'Replicate_Ignore_DB': ' ',
                     'Replicate_Ignore_Server_Ids': ' '},
```
CLI Example:

```bash
salt '*' mysql.get_slave_status
```

`salt.modules.mysql.grant_add(grant, database, user, host='localhost', grant_option=False, escape=True, ssl_option=False, **connection_args)`

Add a grant to the MySQL server.

For database, make sure you specify database.table or database.*

CLI Example:

```bash
salt '*' mysql.grant_add 'SELECT,INSERT,UPDATE,...' 'database.*' 'frank' host='localhost'
```

`salt.modules.mysql.grant_exists(grant, database, user, host='localhost', grant_option=False, escape=True, **connection_args)`

Checks to see if a grant exists in the database

CLI Example:

```bash
salt '*' mysql.grant_exists 'SELECT,INSERT,UPDATE,...' 'database.*' 'frank' host='localhost'
```

`salt.modules.mysql.grant_revoke(grant, database, user, host='localhost', grant_option=False, escape=True, **connection_args)`

Removes a grant from the MySQL server.

CLI Example:

```bash
salt '*' mysql.grant_revoke 'SELECT,INSERT,UPDATE' 'database.*' 'frank' host='localhost'
```

`salt.modules.mysql.processlist(**connection_args)`

Retrieves the processlist from the MySQL server via `SHOW FULL PROCESSLIST`.

Returns: a list of dicts, with each dict representing a process:

```python
[
    {'Command': 'Query',
     'Host': 'localhost',
     'Id': 39,
     'Info': 'SHOW FULL PROCESSLIST',
     'Rows_examined': 0,
     'Rows_read': 1,
     'Rows_sent': 0,
     'State': 'None',
     'Time': 0,
```

19.9. execution modules
User: 'root',
'db': 'mysql'}

CLI Example:
salt '*' mysql.processlist

salt.modules.mysql.query(database, query, **connection_args)
Run an arbitrary SQL query and return the results or the number of affected rows.

CLI Example:
salt '*' mysql.query mydb "UPDATE mytable set myfield=1 limit 1"

Return data:
{'query time': {'human': '39.0ms', 'raw': '0.03899'}, 'rows affected': 1L}

CLI Example:
salt '*' mysql.query mydb "SELECT id,name,cash from users limit 3"

Return data:
['columns': ('id', 'name', 'cash'),
 'query time': {'human': '1.0ms', 'raw': '0.001'},
 'results': ([1L, 'User 1', Decimal('110.000000')],
            [2L, 'User 2', Decimal('215.636756')],
            [3L, 'User 3', Decimal('0.040000')]),
 'rows returned': 3L]}

CLI Example:
salt '*' mysql.query mydb 'INSERT into users values (null,"user 4", 5)'

Return data:
{'query time': {'human': '25.6ms', 'raw': '0.02563'}, 'rows affected': 1L}

CLI Example:
salt '*' mysql.query mydb 'DELETE from users where id = 4 limit 1'

Return data:
{'query time': {'human': '39.0ms', 'raw': '0.03899'}, 'rows affected': 1L}

Jinja Example: Run a query on mydb and use row 0, column 0's data.

```
{{ salt['mysql.query']('mydb', 'SELECT info from mytable limit 1')[results ->][0][0] }}
```

salt.modules.mysql.quote_identifier(identifier, for_grants=False)
Return an identifier name (column, table, database, etc) escaped for MySQL

This means surrounded by ```'' character and escaping this character inside. It also means doubling the `%' character for MySQLdb internal usage.

Parameters
• **identifier** -- the table, column or database identifier

• **for_grants** -- is False by default, when using database names on grant queries you should set it to True to also escape `\_` and `%` characters as requested by MySQL. Note that these characters should only be escaped when requesting grants on the database level (`my_%db.*`) but not for table level grants (`my_%db.` `foo`).

CLI Example:

```python
salt '!' mysql.quote_identifier 'foo'bar'
```

salt.modules.mysql.showglobal(**connection_args**)
Retrieves the show global variables from the minion.

**Returns:** show global variables full dict

CLI Example:

```python
salt '!' mysql.showglobal
```

salt.modules.mysql.showvariables(**connection_args**)
Retrieves the show variables from the minion.

**Returns:** show variables full dict

CLI Example:

```python
salt '!' mysql.showvariables
```

salt.modules.mysql.slave_lag(**connection_args**)
Return the number of seconds that a slave SQL server is lagging behind the master, if the host is not a slave it will return -1. If the server is configured to be a slave for replication but slave IO is not running then -2 will be returned. If there was an error connecting to the database or checking the slave status, -3 will be returned.

CLI Example:

```python
salt '!' mysql.slave_lag
```

salt.modules.mysql.status(**connection_args**)
Return the status of a MySQL server using the output from the **SHOW STATUS** query.

CLI Example:

```python
salt '!' mysql.status
```

salt.modules.mysql.tokenize_grant(grant)
External wrapper function:

:param grant: 
:return: dict

CLI Example:

```python
salt '!' mysql.tokenize_grant "GRANT SELECT, INSERT ON testdb.* TO 'testuser'@'localhost'"
```

salt.modules.mysql.user_chpass(user, host='localhost', password=None, password_hash=None, allow_passwordless=False, unix_socket=None, password_column=None, **connection_args**)
Change password for a MySQL user

host Host for which this user/password combo applies

password The password to set for the new user. Will take precedence over the password_hash option if both are specified.

password_hash The password in hashed form. Be sure to quote the password because YAML doesn't like the *.

A password hash can be obtained from the mysql command-line client like so:
allow_passwordless If True, then password and password_hash can be omitted (or set to None) to permit a passwordless login.

New in version 0.16.2: The allow_passwordless option was added.

CLI Examples:

```bash
salt '*' mysql.user_chpass frank localhost newpassword
salt '*' mysql.user_chpass frank localhost password_hash='hash'
salt '*' mysql.user_chpass frank localhost allow_passwordless=True
```

salt.modules.mysql.user_create(user, host='localhost', password=None, password_hash=None, allow_passwordless=False, unix_socket=False, password_column=None, **connection_args)

Creates a MySQL user

host Host for which this user/password combo applies

password The password to use for the new user. Will take precedence over the password_hash option if both are specified.

password_hash The password in hashed form. Be sure to quote the password because YAML doesn't like the *

A password hash can be obtained from the mysql command-line client like so:

```bash
mysql> SELECT PASSWORD('mypass');
+---------------------------------------------+
| PASSWORD('mypass')                         |
+---------------------------------------------+
| *6C8989366EAF75BB670AD8EA7A7FC1176A95CEF4 |
+---------------------------------------------+
1 row in set (0.00 sec)
```

allow_passwordless If True, then password and password_hash can be omitted (or set to None) to permit a passwordless login.

unix_socket If True and allow_passwordless is True then will be used unix_socket auth plugin.

New in version 0.16.2: The allow_passwordless option was added.

CLI Examples:

```bash
salt '*' mysql.user_create 'username' 'hostname' 'password'
salt '*' mysql.user_create 'username' 'hostname' password_hash='hash'
salt '*' mysql.user_create 'username' 'hostname' allow_passwordless=True
```

salt.modules.mysql.user_exists(user, host='localhost', password=None, password_hash=None, passwordless=False, unix_socket=False, password_column=None, **connection_args)

Checks if a user exists on the MySQL server. A login can be checked to see if passwordless login is permitted by omitting password and password_hash, and using passwordless=True.

New in version 0.16.2: The passwordless option was added.

CLI Example:

```bash
salt '*' mysql.user_exists 'username' 'hostname' 'password'
salt '*' mysql.user_exists 'username' 'hostname' password_hash='hash'
```
Salt Documentation, Release 2017.7.8

salt 'mysql.user_exists' 'username' passwordless=True
salt 'mysql.user_exists' 'username' password_column='authentication_string'

salt.modules.mysql.user_grants(  
    user, host='localhost', **connection_args
)
    Shows the grants for the given MySQL user (if it exists)
    CLI Example:
    salt '*' mysql.user_grants 'frank' 'localhost'

salt.modules.mysql.user_info(  
    user, host='localhost', **connection_args
)
    Get full info on a MySQL user
    CLI Example:
    salt '*' mysql.user_info root localhost

salt.modules.mysql.user_list(**connection_args)
    Return a list of users on a MySQL server
    CLI Example:
    salt '*' mysql.user_list

salt.modules.mysql.user_remove(  
    user, host='localhost', **connection_args
)
    Delete MySQL user
    CLI Example:
    salt '*' mysql.user_remove frank localhost

salt.modules.mysql.version(**connection_args)
    Return the version of a MySQL server using the output from the SELECT VERSION() query.
    CLI Example:
    salt '*' mysql.version

19.9.232 salt.modules.nacl

This module helps include encrypted passwords in pillars, grains and salt state files.

    depends libnacl, https://github.com/saltstack/libnacl

This is often useful if you wish to store your pillars in source control or share your pillar data with others that you trust. I don't advise making your pillars public regardless if they are encrypted or not.

When generating keys and encrypting passwords use --local when using salt-call for extra security. Also consider using just the salt runner nacl when encrypting pillar passwords.

The nacl lib uses 32byte keys, these keys are base64 encoded to make your life more simple. To generate your key or keyfile you can use:

salt-call --local nacl.keygen keyfile=/root/.nacl

Now with your key, you can encrypt some data:
To decrypt the data:

```bash
salt-call --local nacl.dec data='DRB7Q6/X5gGSRCTpZyxS6hX05LnlJ1IJI4iVbmUlbWj0llUA+uaVvyou3vJ4=
keyfile=/root/.nacl'
```

The following optional configurations can be defined in the minion or master config. Avoid storing the config in pillars!

```bash
cat /etc/salt/master.d/nacl.conf
nacl.config:
    key: 'cKEzd4kXsbeCE7/nLTIqXwnUiD1ulg4NoeeYcCFpd9k=
    keyfile: /root/.nacl
```

When the key is defined in the master config you can use it from the nacl runner:

```bash
salt-run nacl.enc 'myotherpass'
```

Now you can create a pillar with protected data like:

```bash
pillar(example):
    user: root
    password: {{ salt.nacl.dec('DRB7Q6/X5gGSRCTpZyxS6hX05LnlJ1IJI4iVbmUlbWj0llUA+uaVvyou3vJ4=' ,
                                keyfile='/root/.nacl') }}
```

Or do something interesting with grains like:

```bash
salt-call nacl.enc minionname:dbrole
AL24Z2C50lkReer3DuQTFdrNLchLuz3NGbGjZkLtKRYry/b/CksW809yskLwH2AGVLoEXI5jAa
salt minionname grains.setval role 'AL24Z2C50lkReer3DuQTFdrNLchLuz3NGbGjZkLtKRYry/b/
                                CksW809yskLwH2AGVLoEXI5jAa'
{% set r = grains.get('role') %}
{% if r and 'nacl.dec' in salt %}
    {% set role = None %}
    {% set r = salt['nacl.dec'](r, keyfile='/root/.nacl').split(':') %}
    {% if opts['id'] == r[0] %}
        {% set role = r[1] %}
    {% endif %}
{% endif %}
base:
    {'{{ opts['id'] }}':
     - {{ role }}
    }
```

Multi-line text items like certificates require a bit of extra work. You have to strip the new lines and replace them with 'n' characters. Certificates specifically require some leading white space when calling nacl.enc so that the `--` in the first line (commonly -----BEGIN CERTIFICATE-----) doesn't get interpreted as an argument to nacl.enc.

For instance if you have a certificate file that lives in cert.crt:

```bash
cert=$(cat cert.crt | awk '{printf "%s\n",$0} END {print "\n"}'); salt-run nacl.enc "
->cert"
```
Pillar data should look the same, even though the secret will be quite long. However, when calling multiline encrypted secrets from pillar in a state, use the following format to avoid issues with /n creating extra whitespace at the beginning of each line in the cert file:

```yaml
secret.txt:
  file.managed:
    - template: jinja
    - user: user
    - group: group
    - mode: 700
    - contents: "{{- salt['pillar.get']('secret') }}"
```

The `{{-` will tell jinja to strip the whitespace from the beginning of each of the new lines.

```
salt.modules.nacl.dec(data, **kwargs)
Takes a key generated from nacl.keygen and decrypt some data.
```

CLI Examples:
```
salt-call --local nacl.dec pEXHQM6cuaF7A=  
salt-call --local nacl.dec data='pEXHQM6cuaF7A=' keyfile=/root/.nacl  
salt-call --local nacl.dec data='pEXHQM6cuaF7A=' key='cKEzd4kXsbeCE7/mnLTIqXwnUiD1ulg4NoeeYcCfpd9k=
```

```
salt.modules.nacl.enc(data, **kwargs)
Takes a key generated from nacl.keygen and encrypt some data.
```

CLI Examples:
```
salt-call --local nacl.enc datatoenc  
salt-call --local nacl.enc datatoenc keyfile=/root/.nacl  
salt-call --local nacl.enc datatoenc key='cKEzd4kXsbeCE7/mnLTIqXwnUiD1ulg4NoeeYcCfpd9k=
```

```
salt.modules.nacl.keygen(keyfile=None)
Use libnacl to generate a private key
```

CLI Examples:
```
salt-call --local nacl.keygen  
salt-call --local nacl.keygen keyfile=/root/.nacl  
salt-call --local --out=newline_values_only nacl.keygen > /root/.nacl
```

19.9.233 salt.modules.nagios

Run nagios plugins/checks from salt and get the return as data.

```
salt.modules.nagios.list_plugins()
List all the nagios plugins
```

CLI Example:
```
salt '*' nagios.list_plugins
```

```
salt.modules.nagios.retcde(plugin, args='', key_name=None)
Run one nagios plugin and return retcode of the execution
```

19.9. execution modules
salt.modules.nagios.retcode_pillar(pillar_name)

Run one or more nagios plugins from pillar data and get the result of cmd.retcode The pillar have to be in this format:

```
webserver:
    Ping_google:
        - check_icmp: 8.8.8.8
        - check_icmp: google.com
    Load:
        - check_load: -w 0.8 -c 1
    APT:
        - check_apt
```

webserver is the role to check, the next keys are the group and the items the check with the arguments if needed.

You must to group different checks(one o more) and always it will return the highest value of all the checks

CLI Example:

```
salt '*' nagios.retcode webserver
```

salt.modules.nagios.run(plugin, args='")

Run nagios plugin and return all the data execution with cmd.run

CLI Example:

```
salt '*' nagios.run check_apt
salt '*' nagios.run check_icmp '8.8.8.8'
```

salt.modules.nagios.run_all(plugin, args='")

Run nagios plugin and return all the data execution with cmd.run_all

salt.modules.nagios.run_all_pillar(pillar_name)

Run one or more nagios plugins from pillar data and get the result of cmd.run_all The pillar have to be in this format:

```
webserver:
    Ping_google:
        - check_icmp: 8.8.8.8
        - check_icmp: google.com
    Load:
        - check_load: -w 0.8 -c 1
    APT:
        - check_apt
```

webserver is the role to check, the next keys are the group and the items the check with the arguments if needed.

You have to group different checks in a group

CLI Example:

```
salt '*' nagios.run webserver
```
salt.modules.nagios.run_pillar(pillar_name)
Run one or more nagios plugins from pillar data and get the result of cmd.run The pillar have to be in this format:

```
webserver:
  Ping_google:
    - check_icmp: 8.8.8.8
    - check_icmp: google.com
  Load:
    - check_load: -w 0.8 -c 1
  APT:
    - check_apt
```

webserver is the role to check, the next keys are the group and the items the check with the arguments if needed

You have to group different checks in a group

CLI Example:
```
salt '*' nagios.run webserver
```

19.9.234 salt.modules.nagios_rpc

Check Host & Service status from Nagios via JSON RPC.
New in version 2015.8.0.

salt.modules.nagios_rpc.host_status(hostname=None, **kwargs)
Check status of a particular host By default statuses are returned in a numeric format.

Parameters:
hostname The hostname to check the status of the service in Nagios.
numeric Turn to false in order to return status in text format (`OK' instead of 0, `Warning' instead of 1 etc)

Returns status: `OK', `Warning', `Critical' or `Unknown'

CLI Example:
```
salt '*' nagios_rpc.host_status hostname=webserver.domain.com
salt '*' nagios_rpc.host_status hostname=webserver.domain.com numeric=False
```

salt.modules.nagios_rpc.service_status(hostname=None, service=None, **kwargs)
Check status of a particular service on a host on it in Nagios. By default statuses are returned in a numeric format.

Parameters:
hostname The hostname to check the status of the service in Nagios.
service The service to check the status of in Nagios.
numeric Turn to false in order to return status in text format (`OK' instead of 0, `Warning' instead of 1 etc)

Returns status: `OK', `Warning', `Critical' or `Unknown'

CLI Example:
```
salt '*' nagios_rpc.service_status hostname=webserver.domain.com service='HTTP'
salt '*' nagios_rpc.service_status hostname=webserver.domain.com service='HTTP' numeric=False
```
19.9.235 salt.modules.namecheap_dns module

Namecheap DNS Management
New in version 2017.7.0.

Prerequisites

This module uses the requests Python module to communicate to the namecheap API.

Configuration

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

```
namecheap.name: companyname
namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3
namecheap.client_ip: 162.155.30.172
#Real url
namecheap.url: https://api.namecheap.com/xml.response
#Sandbox url
#namecheap.url: https://api.sandbox.namecheap.xml.response
```

```
salt.modules.namecheap_dns.get_hosts(sld, tld)

Retrieves DNS host record settings for the requested domain.

returns a dictionary of information about the requested domain
sld  SLD of the domain name
tld  TLD of the domain name
CLI Example:

    salt 'my-minion' namecheap_domains_dns.get_hosts sld tld
```

```
salt.modules.namecheap_dns.get_list(sld, tld)

Gets a list of DNS servers associated with the requested domain.

returns a dictionary of information about requested domain
sld  SLD of the domain name
tld  TLD of the domain name
CLI Example:

    salt 'my-minion' namecheap_domains_dns.get_list sld tld
```

```
salt.modules.namecheap_dns.set_custom(sld, tld, nameservers)

Sets domain to use custom DNS servers.

returns True if the custom nameservers were set successfully
sld  SLD of the domain name
tld  TLD of the domain name
nameservers  array of strings List of nameservers to be associated with this domain
CLI Example:

    salt 'my-minion' namecheap_domains_dns.set_custom sld tld nameserver
```
salt.modules.namecheap_dns.set_default(sld, tld)
Sets domain to use namecheap default DNS servers. Required for free services like Host record management, URL forwarding, email forwarding, dynamic DNS and other value added services.
sld  SLD of the domain name
tld  TLD of the domain name
Returns True if the domain was successfully pointed at the default DNS servers.

CLI Example:
```
salt 'my-minion' namecheap_domains_dns.set_default sld tld
```

salt.modules.namecheap_dns.set_hosts(sld, tld, hosts)
Sets DNS host records settings for the requested domain.
returns True if the host records were set successfully
sld  SLD of the domain name
tld  TLD of the domain name
hosts  Must be passed as a list of Python dictionaries, with each dictionary containing the following keys:
  • hostname
  • recordtype - One of A, AAAA, CNAME, MX, MXE, TXT, URL, URL301, or FRAME
  • address - URL or IP address
  • ttl - An integer between 60 and 60000 (default: 1800)
Additionally, the mxpref key can be present, but must be accompanied by an emailtype key.

CLI Example:
```
salt 'my-minion' namecheap_domains_dns.set_hosts sld tld hosts
```

19.9.236  salt.modules.namecheap_domains module
Namecheap Domain Management
New in version 2017.7.0.

Prerequisites
This module uses the requests Python module to communicate to the namecheap API.

Configuration
The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.
```
namecheap.name: companyname
namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3
namecheap.client_ip: 162.155.30.172
#Real url
namecheap.url: https://api.namecheap.com/xml.response
#Sandbox url
#namecheap.url: https://api.sandbox.namecheap.xml.response
```

salt.modules.namecheap_domains.check(*domains_to_check)
Checks the availability of domains
domains_to_check  array of strings List of domains to check
Returns a dictionary mapping each domain name to a boolean denoting whether or not it is available.

CLI Example:

```bash
salt 'my-minion' namecheap_domains.check domain-to-check
```

salt.modules.namecheap_domains.create(domain_name, years, **kwargs)

Try to register the specified domain name
domain_name The domain name to be registered
years Number of years to register

Returns the following information:
• Whether or not the domain was renewed successfully
• Whether or not WhoisGuard is enabled
• Whether or not registration is instant
• The amount charged for registration
• The domain ID
• The order ID
• The transaction ID

CLI Example:

```bash
salt 'my-minion' namecheap_domains.create my-domain-name 2
```
	salt.modules.namecheap_domains.get_info(domain_name)

Returns information about the requested domain

returns a dictionary of information about the domain_name
domain_name string Domain name to get information about

CLI Example:

```bash
salt 'my-minion' namecheap_domains.get_info my-domain-name
```
	salt.modules.namecheap_domains.get_list(list_type=None, search_term=None, page=None, page_size=None, sort_by=None)

Returns a list of domains for the particular user as a list of objects offset by page length of page_size
list_type [ALL] One of ALL, EXPIRING, EXPIRED
search_term Keyword to look for on the domain list
page [1] Number of result page to return
page_size [20] Number of domains to be listed per page (minimum: 10, maximum: 100)
sort_by One of NAME, NAME_DESC, EXPIREDATE, EXPIREDATE_DESC, CREATEDATE, or CREATE-DATE_DESC

CLI Example:

```bash
salt 'my-minion' namecheap_domains.get_list
```
	salt.modules.namecheap_domains.get_tld_list()

Returns a list of TLDs as objects

CLI Example:

```bash
salt 'my-minion' namecheap_domains.get_tld_list
```
	salt.modules.namecheap_domains.reactivate(domain_name)

Try to reactivate the expired domain name

Returns the following information:
• Whether or not the domain was reactivated successfully
• The amount charged for reactivation
• The order ID
• The transaction ID

CLI Example:

```
salt 'my-minion' namecheap_domains.reactivate my-domain-name
```

```python
salt.modules.namecheap_domains.renew(domain_name, years, promotion_code=None)
```

Try to renew the specified expiring domain name for a specified number of years

- **domain_name** The domain name to be renewed
- **years** Number of years to renew

Returns the following information:

• Whether or not the domain was renewed successfully
• The domain ID
• The order ID
• The transaction ID
• The amount charged for renewal

CLI Example:

```
salt 'my-minion' namecheap_domains.renew my-domain-name 5
```

### 19.9.237 salt.modules.namecheap_ns module

Namecheap Nameserver Management

New in version 2017.7.0.

**Prerequisites**

This module uses the `requests` Python module to communicate to the namecheap API.

**Configuration**

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

```ini
namecheap.name: companyname
namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3
namecheap.client_ip: 162.155.30.172
# Real url
namecheap.url: https://api.namecheap.com/xml.response
# Sandbox url
#namecheap.url: https://api.sandbox.namecheap.xml.response
```

```python
salt.modules.namecheap_ns.create(sld, tld, nameserver, ip)
```

Creates a new nameserver. Returns `True` if the nameserver was created successfully.

- **sld** SLD of the domain name
- **tld** TLD of the domain name
- **nameserver** Nameserver to create
- **ip** Nameserver IP address

CLI Example:

```
salt '*' namecheap_domains_ns.create sld tld nameserver ip
```

```python
salt.modules.namecheap_ns.delete(sld, tld, nameserver)
```

Deletes a nameserver. Returns `True` if the nameserver was deleted successfully
sld  SLD of the domain name
    tld  TLD of the domain name
nameserver  Nameserver to delete
CLI Example:

    salt '*' namecheap_domains_ns.delete sld tld nameserver

salt.modules.namecheap_ns.get_info(sld, tld, nameserver)
Retrieves information about a registered nameserver. Returns the following information:
- IP Address set for the nameserver
- Domain name which was queried
- A list of nameservers and their statuses

CLI Example:

    salt '*' namecheap_domains_ns.get_info sld tld nameserver

salt.modules.namecheap_ns.update(sld, tld, nameserver, old_ip, new_ip)
Deletes a nameserver. Returns True if the nameserver was updated successfully.
sld  SLD of the domain name
tld  TLD of the domain name
nameserver  Nameserver to create
old_ip  Current ip address
new_ip  New ip address
CLI Example:

    salt '*' namecheap_domains_ns.update sld tld nameserver old_ip new_ip

19.9.238  salt.modules.namecheap_ssl module
Namecheap SSL Certificate Management
New in version 2017.7.0.

Prerequisites
This module uses the requests Python module to communicate to the namecheap API.

Configuration
The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

    namecheap.name: companyname
    namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3
    namecheap.client_ip: 162.155.30.172
    # Real url
    namecheap.url: https://api.namecheap.com/xml.response
    # Sandbox url
    #namecheap.url: https://api.sandbox.namecheap.xml.response
salt.modules.namecheap_ssl.activate(csr_file, certificate_id, web_server_type, approver_email=None, http_dc_validation=False, **kwargs)
Activates a newly-purchased SSL certificate. Returns a dictionary of result values.
csr_file Path to Certificate Signing Request file
certificate_id Unique ID of the SSL certificate you wish to activate
web_server_type The type of certificate format to return. Possible values include:
  • apache2
  • apachepachessl
  • apachepenssl
  • apacheraven
  • apachessl
  • apachessleay
  • c2net
  • cobaltseries
  • cpanel
  • domino
  • dominogo4625
  • dominogo4626
  • ensim
  • hsphere
  • ibmhttp
  • iis
  • iis4
  • iis5
  • ipswitch
  • netscape
  • other
  • plesk
  • tomcat
  • weblogic
  • website
  • webstar
  • zeusv3
approver_email The email ID which is on the approver email list.

Note: http_dc_validation must be set to False if this option is used.

http_dc_validation [False] Whether or not to activate using HTTP-based validation.

Note: For other parameters which may be required, see here.

CLI Example:
salt 'my-minion' namecheap_ssl.activate my-csr-file my-cert-id apachessl

salt.modules.namecheap_ssl.create(years, certificate_type, promotion_code=None, sans_to_add=None)
Creates a new SSL certificate. Returns the following information:
  • Whether or not the SSL order was successful
  • The certificate ID
  • The order ID
  • The transaction ID
  • The amount charged for the order
• The date on which the certificate was created
• The date on which the certificate will expire
• The type of SSL certificate
• The number of years for which the certificate was purchased
• The current status of the SSL certificate

years  [1] Number of years to register

certificate_type  Type of SSL Certificate. Possible values include:
  • EV Multi Domain SSL
  • EV SSL
  • EV SSL SGC
  • EssentialSSL
  • EssentialSSL Wildcard
  • InstantSSL
  • InstantSSL Pro
  • Multi Domain SSL
  • PositiveSSL
  • PositiveSSL Multi Domain
  • PositiveSSL Wildcard
  • PremiumSSL
  • PremiumSSL Wildcard
  • QuickSSL Premium
  • RapidSSL
  • RapidSSL Wildcard
  • SGC Supercert
  • SSL Web Server
  • SSL Webserver EV
  • SSL123
  • Secure Site
  • Secure Site Pro
  • Secure Site Pro with EV
  • Secure Site with EV
  • True BusinessID
  • True BusinessID Multi Domain
  • True BusinessID Wildcard
  • True BusinessID with EV
  • True BusinessID with EV Multi Domain
  • Unified Communications

promotional_code  An optional promo code to use when creating the certificate

sans_to_add  [0] This parameter defines the number of add-on domains to be purchased in addition to the default number of domains included with a multi-domain certificate. Each certificate that supports SANs has the default number of domains included. You may check the default number of domains included and the maximum number of domains that can be added to it in the table below.
<table>
<thead>
<tr>
<th>Provider</th>
<th>Product name</th>
<th>Default number of domains (domain from CSR is counted here)</th>
<th>Maximum number of total domains</th>
<th>Maximum number of domains that can be passed in sans_to_add parameter</th>

</table>

**CLI Example:**
```
salt 'my-minion' namecheap_ssl.create 2 RapidSSL
```

salt.modules.namecheap_ssl.

`get_info(certificate_id, returncertificate=False, returntype=None)`
Retrieves information about the requested SSL certificate. Returns a dictionary of information about the SSL certificate with two keys:
- `ssl` - Contains the metadata information
- `certificate` - Contains the details for the certificate such as the CSR, Approver, and certificate data

`certificate_id` Unique ID of the SSL certificate
`returncertificate` [False] Set to True to ask for the certificate in response
`returntype` Optional type for the returned certificate. Can be either `"Individual"` (for X.509 format) or `"PKCS7"`

**Note:** Required if returncertificate is True

**CLI Example:**
```
salt 'my-minion' namecheap_ssl.get_info my-cert-id
```

salt.modules.namecheap_ssl.

`get_list(**kwargs)`

---

19.9. execution modules 1789
Returns a list of SSL certificates for a particular user

**ListType**  [All] Possible values:
- All
- Processing
- EmailSent
- TechnicalProblem
- InProgress
- Completed
- Deactivated
- Active
- Cancelled
- NewPurchase
- NewRenewal

**SearchTerm**  Keyword to look for on the SSL list

**Page**  [1] Page number to return

**PageSize**  [20] Total number of SSL certificates to display per page (minimum: 10, maximum: 100)

**OrderBy**  One of PURCHASEDATE, PURCHASEDATE_DESC, SSLTYPE, SSLTYPE_DESC, EXPIREDATETIME, EXPIREDATETIME_DESC, Host_Name, or Host_Name_DESC

CLI Example:

```bash
salt 'my-minion' namecheap_ssl.get_list Processing
```

**salt.modules.namecheap_ssl.parse_csr** *(csr_file, certificate_type, httpdc_validation=False)*

Parses the CSR. Returns a dictionary of result values.

**csr_file**  Path to Certificate Signing Request file

**certificate_type**  Type of SSL Certificate. Possible values include:
- EV Multi Domain SSL
- EV SSL
- EV SSL SGC
- EssentialSSL
- EssentialSSL Wildcard
- InstantSSL
- InstantSSL Pro
- Multi Domain SSL
- PositiveSSL
- PositiveSSL Multi Domain
- PositiveSSL Wildcard
- PremiumSSL
- PremiumSSL Wildcard
- QuickSSL Premium
- RapidSSL
- RapidSSL Wildcard
- SGC Supercert
- SSL Web Server
- SSL Webserver EV
- SSL123
- Secure Site
- Secure Site Pro
- Secure Site Pro with EV
- Secure Site with EV
- True BusinessID
- True BusinessID Multi Domain
- True BusinessID Wildcard
- True BusinessID with EV
True BusinessID with EV Multi Domain

Unified Communications

http_dc_validation [False] Set to True if a Comodo certificate and validation should be done with files instead of emails and to return the info to do so

CLI Example:

```
salt 'my-minion' namecheap_ssl.parse_csr my-csr-file PremiumSSL
```

salt.modules.namecheap_ssl.reissue(csr_file, certificate_id, web_server_type, approver_email=None, http_dc_validation=False, **kwargs)

Reissues a purchased SSL certificate. Returns a dictionary of result values.

csr_file  Path to Certificate Signing Request file
certificate_id  Unique ID of the SSL certificate you wish to activate
web_server_type  The type of certificate format to return. Possible values include:

- apache2
- apachepachessl
- apacheopenssl
- apacheraven
- apachessl
- apachessleay
- c2net
- cobaltseries
- cpanel
- domino
- dominogo4625

approver_email  The email ID which is on the approver email list.

**Note:** http_dc_validation must be set to False if this option is used.

http_dc_validation [False] Whether or not to activate using HTTP-based validation.

**Note:** For other parameters which may be required, see here.
salt 'my-minion' namecheap_ssl.reissue my-csr-file my-cert-id apachessl

salt.modules.namecheap_ssl.renew(years, certificate_id, certificate_type, promotion_code=None)
Renews an SSL certificate if it is ACTIVE and Expires <= 30 days. Returns the following information:
- The certificate ID
- The order ID
- The transaction ID
- The amount charged for the order

years [1] Number of years to register

certificate_id Unique ID of the SSL certificate you wish to renew
certificate_type Type of SSL Certificate. Possible values include:
- EV Multi Domain SSL
- EV SSL
- EV SSL SGC
- EssentialSSL
- EssentialSSL Wildcard
- InstantSSL
- InstantSSL Pro
- Multi Domain SSL
- PositiveSSL
- PositiveSSL Multi Domain
- PositiveSSL Wildcard
- PremiumSSL
- PremiumSSL Wildcard
- QuickSSL Premium
- RapidSSL
- RapidSSL Wildcard
- SGC Supercert
- SSL Web Server
- SSL Webserver EV
- SSL123
- Secure Site
- Secure Site Pro
- Secure Site Pro with EV
- Secure Site with EV
- True BusinessID
- True BusinessID Multi Domain
- True BusinessID Wildcard
- True BusinessID with EV
- True BusinessID with EV Multi Domain
- Unified Communications

promotional_code An optional promo code to use when renewing the certificate

CLI Example:
salt 'my-minion' namecheap_ssl.renew 1 my-cert-id RapidSSL

19.9.239 salt.modules.namecheap_users module

Namecheap User Management

New in version 2017.7.0.
Prerequisites

This module uses the requests Python module to communicate to the Namecheap API.

Configuration

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

<table>
<thead>
<tr>
<th>Namecheap.name:</th>
<th>companyname</th>
</tr>
</thead>
<tbody>
<tr>
<td>namecheap.key:</td>
<td>a1b2c3d4e5f67a8b0c0d1e2f3</td>
</tr>
<tr>
<td>namecheap.client_ip:</td>
<td>162.155.30.172</td>
</tr>
<tr>
<td>namecheap.url:</td>
<td><a href="https://api.namecheap.com/xml.response">https://api.namecheap.com/xml.response</a></td>
</tr>
<tr>
<td>namecheap.url:</td>
<td><a href="https://api.sandbox.namecheap.xml.response">https://api.sandbox.namecheap.xml.response</a></td>
</tr>
</tbody>
</table>

salt.modules.namecheap_users.check_balances (minimum=100)
Checks if the provided minimum value is present in the user’s account.

Returns a boolean. Returns False if the user's account balance is less than the provided minimum or True if greater than the minimum.

minimum [100] The value to check

CLI Example:

```
salt 'my-minion' namecheap_users.check_balances
salt 'my-minion' namecheap_users.check_balances minimum=150
```

salt.modules.namecheap_users.get_balances()

Gets information about fund in the user’s account. This method returns the following information: Available Balance, Account Balance, Earned Amount, Withdrawable Amount and Funds Required for AutoRenew.

**Note:** If a domain setup with automatic renewal is expiring within the next 90 days, the FundsRequired-ForAutoRenew attribute shows the amount needed in your Namecheap account to complete auto renewal.

CLI Example:

```
salt 'my-minion' namecheap_users.get_balances
```

19.9.240 salt.modules.napalm module

NAPALM helpers

Helpers for the NAPALM modules.

New in version 2017.7.0.

salt.modules.napalm.alive (*args, **kwargs)

Returns the alive status of the connection layer. The output is a dictionary under the usual dictionary output of the NAPALM modules.

CLI Example:

```
salt '*x' napalm.alive
```
Output Example:

```
result: True
out:
    is_alive: False
comment: ''
```

```
salt.modules.napalm.call(*args, **kwargs)
```

Execute arbitrary methods from the NAPALM library. To see the expected output, please consult the NAPALM documentation.

**Note:** This feature is not recommended to be used in production. It should be used for testing only!

CLI Example:

```
salt '*' napalm.call get_lldp_neighbors
salt '*' napalm.call get_firewall_policies
salt '*' napalm.call get_bgp_config group='my-group'
```

```
salt.modules.napalm.compliance_report(*args, **kwargs)
```

Return the compliance report.

**filepath** The absolute path to the validation file.

CLI Example:

```
salt '*' napalm.compliance_report ~/validate.yml
```

Validation File Example:

```
- get_facts:
  os_version: 4.17

- get_interfaces_ip:
  Management1:
    ipv4:
      10.0.2.14:
        prefix_length: 24
        _mode: strict
```

Output Example:

```
device1:
    ---------
    comment:
    out:
        ---------
        complies:
            False
        get_facts:
            ---------
            complies:
                False
            extra:
            missing:
            present:
                ---------
                os_version:
                ---------
```
salt.modules.napalm.reconnect(*args, **kwargs)

Reconnect the NAPALM proxy when the connection is dropped by the network device. The connection can be forced to be restarted using the force argument.

**Note:** This function can be used only when running proxy minions.

CLI Example:

```bash
salt '*' napalm.reconnect
salt '*' napalm.reconnect force=True
```

## 19.9.241 salt.modules.napalm_acl module

**NAPALM ACL**

Generate and load ACL (firewall) configuration on network devices.

New in version 2017.7.0.

**codeauthor** Mircea Ulinic <mircea@cloudflare.com>

**maturity** new

**depends** capirca, napalm

**platform** unix

### Dependencies

The firewall configuration is generated by Capirca.

To install Capirca, execute: `pip install capirca`.

To be able to load configuration on network devices, it requires NAPALM library to be installed: `pip install napalm`. Please check Installation for complete details.
salt.modules.napalm_acl.get_filter_pillar(filter_name, pillar_key='acl', pillarenv=None, saltenv=None)

Helper that can be used inside a state SLS, in order to get the filter configuration given its name.

- **filter_name**: The name of the filter.
- **pillar_key**: The root key of the whole policy config.
- **pillarenv**: Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.
- **saltenv**: Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.

salt.modules.napalm_acl.get_term_pillar(filter_name, term_name, pillar_key='acl', pillarenv=None, saltenv=None)

Helper that can be used inside a state SLS, in order to get the term configuration given its name, under a certain filter uniquely identified by its name.

- **filter_name**: The name of the filter.
- **term_name**: The name of the term.
- **pillar_key**: The root key of the whole policy config. Default: acl.
- **pillarenv**: Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.
- **saltenv**: Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.

salt.modules.napalm_acl.load_filter_config(*args, **kwargs)

Generate and load the configuration of a policy filter.

**Note:** The order of the terms is very important. The configuration loaded on the device respects the order defined in the terms and/or inside the pillar.

When merging the terms with the pillar data, consider the prepend argument to make sure the order is correct!

- **filter_name**: The name of the policy filter.
- **filter_options**: Additional filter options. These options are platform-specific. See the complete list of options.
- **terms**: List of terms for this policy filter. If not specified or empty, will try to load the configuration from the pillar, unless merge_pillar is set as False.
- **prepend**: True When merge_pillar is set as True, the final list of terms generated by merging the terms from terms with those defined in the pillar (if any): new terms are prepended at the beginning, while existing ones will preserve the position. To add the new terms at the end of the list, set this argument to False.
- **pillar_key**: acl The key in the pillar containing the default attributes values. Default: acl.
- **pillarenv**: Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.
- **saltenv**: Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.
- **merge_pillar**: True Merge the CLI variables with the pillar. Default: True.

The merge logic depends on the prepend argument and the CLI has higher priority than the pillar.

- **only_lower_merge**: False Specify if it should merge only the terms fields. Otherwise it will try to merge also filters fields. Default: False. This option requires merge_pillar, otherwise it is ignored.
- **revision_id**: Add a comment in the filter config having the description for the changes applied.
- **revision_no**: The revision count.
- **revision_date**: True Boolean flag: display the date when the filter configuration was generated. Default: True.

The date format to be used when generating the perforce data. Default: %Y/%m/%d (%year/%month/%day).

- **test**: False Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.
- **commit**: True Commit? Default: True.
**debug**: "False" Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

The output is a dictionary having the same form as `net.load_config`.

CLI Example:

```
salt 'edge01.bjm01' netacl.load_filter_config my-filter pillar_key=netacl
  debug=True
```

Output Example:

```
edge01.bjm01:  
  ---------
  already_configured: False
  comment:
  diff:
    [edit firewall]
    + family inet {
    +   /*
    +   ** $Date: 2017/03/22 $**
    +   */
    +   filter my-filter {

    +       }
    +       then {
    +         reject;
    +       }
    +     }
    +   }
    +   term my-other-term {
    +     from {
    +       protocol tcp;
    +       source-port 5678-5680;
    +     }
    +     then accept;
    +   }
    + }
  loaded_config:
    firewall {
      family inet {
        replace:
          /*
          ** $Date: 2017/03/22 $**
          */
        filter my-filter {
          interface-specific;
          term my-term {
            from {
              source-port [ 1234 1235 ];
            }
            then {
              reject;
            }
          }
        }
      }
    }
```

19.9. execution modules 1797
The filter configuration has been loaded from the pillar, having the following structure:

```
netacl:
  - my-filter:
    terms:
      - my-term:
        source_port:
          - 1234
          - 1235
        action: reject
      - my-other-term:
        source_port:
          - 5678
          - 5680
        protocol: tcp
        action: accept
```

salt.modules.napalm_acl.load_policy_config(*args, **kwargs)

Generate and load the configuration of the whole policy.

**Note:** The order of the filters and their terms is very important. The configuration loaded on the device respects the order defined in the filters and/or inside the pillar.

When merging the filters with the pillar data, consider the prepend argument to make sure the order is correct!

**filters** List of filters for this policy. If not specified or empty, will try to load the configuration from the pillar, unless merge_pillar is set as False.

**prepend:** True When merge_pillar is set as True, the final list of filters generated by merging the filters from filters with those defined in the pillar (if any): new filters are prepended at the beginning, while existing ones will preserve the position. To add the new filters at the end of the list, set this argument to False.

**pillar_key:** acl The key in the pillar containing the default attributes values. Default: acl.

**pillarenv** Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv** Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.

**merge_pillar:** True Merge the CLI variables with the pillar. Default: True.

The merge logic depends on the prepend argument and the CLI has higher priority than the pillar.

**only_lower_merge:** False Specify if it should merge only the filters and terms fields. Otherwise it will try to merge everything at the policy level. Default: False. This option requires merge_pillar,
revision_id Add a comment in the policy config having the description for the changes applied.
revision_no The revision count.
revision_date: True Boolean flag: display the date when the policy configuration was generated. Default: True.
revision_date_format: %Y/%m/%d The date format to be used when generating the perforce data. Default: %Y/%m/%d (<year>/<month>/<day>).
test: False Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.
debug: False Debug mode. Will insert a new key under the output dictionary, as loaded_config containing the raw configuration loaded on the device.

The output is a dictionary having the same form as net.load_config.

CLI Example:

```
salt 'edge01.flw01' netacl.load_policy_config debug=True
```

Output Example:

```
edge01.flw01:
  ----------
  already_configured: False

result:
    True

The policy configuration has been loaded from the pillar, having the following structure:

```
acl:
  - my-filter:
    terms:
      - my-term:
        source_port:
          - 1234
          - 1235
        protocol:
          - tcp
          - udp
        source_address: 1.2.3.4
        action: reject
      - my-other-term:
        source_port:
          - [5678, 5680]
        protocol: tcp
        action: accept
    - block-icmp:
      terms:
        - first-term:
          protocol:
            - icmp
          action: reject
```

```
salt.modules.napalm_acl.load_term_config(*args, **kwargs)
```

Generate and load the configuration of a policy term.

- **filter_name** The name of the policy filter.
- **term_name** The name of the term.
- **filter_options** Additional filter options. These options are platform-specific. See the complete list of options.
- **pillar_key:** acl The key in the pillar containing the default attributes values. Default: acl. If the pillar contains the following structure:

```
firewall:
  - my-filter:
    terms:
      - my-term:
        source_port: 1234
        source_address:
          - 1.2.3.4/32
          - 5.6.7.8/32
```

The pillar_key field would be specified as firewall.

- **pillarenv** Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.
- **saltenv** Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.
- **merge_pillar:** True Merge the CLI variables with the pillar. Default: True.

The properties specified through the CLI have higher priority than the pillar.
revision_id  Add a comment in the term config having the description for the changes applied.
revision_no  The revision count.
revision_date: True  Boolean flag: display the date when the term configuration was generated. Default: True.
revision_date_format: %Y/%m/%d  The date format to be used when generating the perforce data. Default: %Y/%m/%d (%year/%month/%day).
test: False  Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.
debug: False  Debug mode. Will insert a new key under the output dictionary, as loaded_config containing the raw configuration loaded on the device.
source_service  A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a source_port and protocol.

As this module is available on Unix platforms only, it reads the IANA port assignment from /etc/services.

If the user requires additional shortcuts to be referenced, they can add entries under /etc/services, which can be managed using the file state.
destination_service  A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a destination_port and protocol. Allows the same options as source_service.
term_fields  Term attributes. To see what fields are supported, please consult the list of supported keywords. Some platforms have a few other optional keywords.

---

**Note:** The following fields are accepted (some being platform-specific):

- action
- address
- address_exclude
- comment
- counter
- expiration
- destination_address
- destination_address_exclude
- destination_port
- destination_prefix
- forwarding_class
- forwarding_class_except
- logging
- log_name
- loss_priority
- option
- policer
- port
- precedence
- principals
- protocol
- protocol_except
- qos
- pan_application
- routing_instance
- source_address
- source_address_exclude
- source_port
- source_prefix
- verbatim
• packet_length
• fragment_offset
• hop_limit
• icmp_type
• ether_type
• traffic_class_count
• traffic_type
• translated
• dscp_set
• dscp_match
• dscp_except
• next_ip
• flexible_match_range
• source_prefix_except
• destination_prefix_except
• vpn
• source_tag
• destination_tag
• source_interface
• destination_interface
• flattened
• flattened_addr
• flattened_saddr
• flattened_daddr
• priority

Note: The following fields can be also a single value and a list of values:
• action
• address
• address_exclude
• comment
• destination_address
• destination_address_exclude
• destination_port
• destination_prefix
• forwarding_class
• forwarding_class_except
• logging
• option
• port
• precedence
• principals
• protocol
• protocol_except
• pan_application
• source_address
• source_address_exclude
• source_port
• source_prefix
• verbatim
• icmp_type
• ether_type
•traffic_type
•dscp_match
•dscp_except
•flexible_match_range
•source_prefix_except
•destination_prefix_except
•source_tag
•destination_tag
•source_service
•destination_service

Example: destination_address can be either defined as:

```
destination_address: 172.17.17.1/24
```

or as a list of destination IP addresses:

```
destination_address:
- 172.17.17.1/24
- 172.17.19.1/24
```

or a list of services to be matched:

```
source_service:
- ntp
- snmp
- ldap
- bgpd
```

**Note:** The port fields source_port and destination_port can be used as above to select either a single value, either a list of values, but also they can select port ranges. Example:

```
source_port:
- - 1000
- - 2000
- - 3000
- - 4000
```

With the configuration above, the user is able to select the 1000-2000 and 3000-4000 source port ranges.

The output is a dictionary having the same form as `net.load_config`.

**CLI Example:**

```
salt 'edge01.bjm01' netacl.load_term_config filter-name term-name source_address=1.2.3.4 destination_address=5.6.7.8 action=accept test=True debug=True
```

**Output Example:**

```
edge01.bjm01:
  --------
  already_configured: False
  comment: Configuration discarded.
  diff:
```
[edit firewall]
+ family inet {
+ /*
+ ** $Date: 2017/03/22 $
+ **

from {
source-address {
1.2.3.4/32;
}
destination-address {
5.6.7.8/32;
}
}
then accept;
}
}
}
result:
True

19.9.242 salt.modules.napalm_bgp module

NAPALM BGP

Manages BGP configuration on network devices and provides statistics.

codeauthor  Mircea Ulinic <mircea@cloudflare.com> & Jerome Fleury <jf@cloudflare.com>
maturity new
depends napalm
platform unix

Dependencies

- napalm proxy minion

New in version 2016.11.0.

salt.modules.napalm_bgp.config(*args, **kwargs)

Provides the BGP configuration on the device.

Parameters

- **group** -- Name of the group selected to display the configuration.
- **neighbor** -- IP Address of the neighbor to display the configuration. If the group parameter is not specified, the neighbor setting will be ignored.

Returns A dictionary containing the BGP configuration from the network device. The keys of the main dictionary are the group names.

Each group has the following properties:

- type (string)
- description (string)
- apply_groups (string list)
- multipath_ttl (int)
- multipath (True/False)
- local_address (string)
- local_as (int)
- remote_as (int)
- import_policy (string)
- export_policy (string)
- remove_private_as (True/False)
- prefix_limit (dictionary)
- neighbors (dictionary)

Each neighbor in the dictionary of neighbors provides:

- description (string)
- import_policy (string)
- export_policy (string)
- local_address (string)
- local_as (int)
- remote_as (int)
- authentication_key (string)
- prefix_limit (dictionary)
- route_reflector_client (True/False)
- nhs (True/False)

CLI Example:

```
salt '*' bgp.config # entire BGP config
salt '*' bgp.config PEERS-GROUP-NAME # provides detail only about BGP group PEERS-GROUP-NAME
salt '*' bgp.config PEERS-GROUP-NAME 172.17.17.1 # provides details only about BGP neighbor 172.17.17.1, configured in the group PEERS-GROUP-NAME
```

Output Example:
```python
{
    'PEERS-GROUP-NAME': {
        'type': u'external',
        'description': u'Here we should have a nice description',
        'apply_groups': [u'BGP-PREFIX-LIMIT'],
        'import_policy': u'PUBLIC-PEER-IN',
        'export_policy': u'PUBLIC-PEER-OUT',
        'remove_private': True,
        'multipath': True,
        'multihop_ttl': 30,
        'neighbors': {
            '192.168.0.1': {
                'description': 'Facebook [CDN]',
                'prefix_limit': {
                    'inet': {
                        'unicast': {
                            'limit': 100,
                            'teardown': {
                                'threshold': 95,
                                'timeout': 5
                            }
                        }
                    }
                },
                'peer-as': 32934,
                'route_reflector': False,
                'nhs': True
            },
            '172.17.17.1': {
                'description': 'Twitter [CDN]',
                'prefix_limit': {
                    'inet': {
                        'unicast': {
                            'limit': 500,
                            'no-validate': 'IMPORT-FLOW-Routes'
                        }
                    }
                },
                'peer_as': 13414,
                'route_reflector': False,
                'nhs': False
            }
        }
    }
}
```

`salt.modules.napalm_bgp.neighbors(*args, **kwargs)`

Provides details regarding the BGP sessions configured on the network device.

**Parameters**
- `neighbor` -- IP Address of a specific neighbor.

**Returns**
A dictionary with the statistics of the all/selected BGP neighbors. Outer dictionary keys represent the VRF name. Keys of inner dictionary represent the AS numbers, while the values are lists of dictionaries, having the following keys:

- `up` (True/False)
- `local_as` (int)
- remote_as (int)
- local_address (string)
- routing_table (string)
- local_address_configured (True/False)
- local_port (int)
- remote_address (string)
- remote_port (int)
- multihop (True/False)
- multipath (True/False)
- remove_private_as (True/False)
- import_policy (string)
- export_policy (string)
- input_messages (int)
- output_messages (int)
- input_updates (int)
- output_updates (int)
- messages_queued_out (int)
- connection_state (string)
- previous_connection_state (string)
- last_event (string)
- suppress_4byte_as (True/False)
- local_as_prepend (True/False)
- holdtime (int)
- configured_holdtime (int)
- keepalive (int)
- configured_keepalive (int)
- active_prefix_count (int)
- received_prefix_count (int)
- accepted_prefix_count (int)
- suppressed_prefix_count (int)
- advertised_prefix_count (int)
- flap_count (int)

CLI Example:

```
salt '*' bgp.neighbors  # all neighbors
salt '*' bgp.neighbors 172.17.17.1  # only session with BGP neighbor(s) 172.17.17.1
```

Output Example:  

19.9. execution modules
```json
{
  'default': {
    8121: [
      {
        'up' : True,
        'local_as' : 13335,
        'remote_as' : 8121,
        'local_address' : u'172.101.76.1',
        'local_address_configured' : True,
        'local_port' : 179,
        'remote_address' : u'192.247.78.0',
        'router_id' : u'192.168.0.1',
        'remote_port' : 58380,
        'multihop' : False,
        'import_policy' : u'4-NTT-TRANSIT-IN',
        'export_policy' : u'4-NTT-TRANSIT-OUT',
        'input_messages' : 123,
        'output_messages' : 13,
        'input_updates' : 123,
        'output_updates' : 5,
        'messages_queued_out' : 23,
        'connection_state' : u'Established',
        'previous_connection_state' : u'EstabSync',
        'last_event' : u'RecvKeepAlive',
        'suppress_4byte_as' : False,
        'local_as_prepend' : False,
        'holdtime' : 90,
        'configured_holdtime' : 90,
        'keepalive' : 30,
        'configured_keepalive' : 30,
        'active_prefix_count' : 132808,
        'received_prefix_count' : 566739,
        'accepted_prefix_count' : 566479,
        'suppressed_prefix_count' : 0,
        'advertise_prefix_count' : 0,
        'flap_count' : 27
      }
    ]
  }
}
```

19.9.243 salt.modules.napalm_network module

**NAPALM Network**

Basic methods for interaction with the network device through the virtual proxy `napalm`.

- *codeauthor* Mircea Ulinic <mircea@cloudflare.com> & Jerome Fleury <jf@cloudflare.com>
- *maturity* new
- *depends* napalm
- *platform* unix
Dependencies

- **napalm proxy minion**

New in version 2016.11.0.

Changed in version 2017.7.0.

```
salt.modules.napalm_network.arp(*args, **kwargs)
```

NAPALM returns a list of dictionaries with details of the ARP entries.

**Parameters**

- `interface` -- interface name to filter on
- `ipaddr` -- IP address to filter on
- `macaddr` -- MAC address to filter on

**Returns** List of the entries in the ARP table

CLI Example:

```
salt '*' net.arp
salt '*' net.arp macaddr='5c:5e:ab:da:3c:f0'
```

Example output:

```
[{
    'interface': 'MgmtEth0/RSP0/CPU0/0',
    'mac': '5c:5e:ab:da:3c:f0',
    'ip': '172.17.17.1',
    'age': 1454496274.84
},
{
    'interface': 'MgmtEth0/RSP0/CPU0/0',
    'mac': '66:0e:94:96:e0:ff',
    'ip': '172.17.17.2',
    'age': 1435641582.49
}
]
```

```
salt.modules.napalm_network.cli(*args, **kwargs)
```

Returns a dictionary with the raw output of all commands passed as arguments.

**Parameters**

- `commands` -- list of commands to be executed on the device

**Returns** a dictionary with the mapping between each command and its raw output

CLI Example:

```
salt '*' net.cli "show version" "show chassis fan"
```

Example output:

```
{
    u'show version and haiku': u'Hostname: re0.edge01.arn01
    Model: mx480
    Junos: 13.3R6.5
    Help me, Obi-Wan
    I just saw Episode Two
    You're my only hope

    u'show chassis fan': u'Item Status RPM Measurement
```
Top Rear Fan OK 3840 Spinning at intermediate-speed
Bottom Rear Fan OK 3840 Spinning at intermediate-speed
Top Middle Fan OK 3900 Spinning at intermediate-speed
Bottom Middle Fan OK 3840 Spinning at intermediate-speed
Top Front Fan OK 3810 Spinning at intermediate-speed
Bottom Front Fan OK 3840 Spinning at intermediate-speed

```
salt.modules.napalm_network.commit(*args, **kwargs)
Commits the configuration changes made on the network device.

CLI Example:
salt '*' net.commit
```

```
salt.modules.napalm_network.compare_config(*args, **kwargs)
Returns the difference between the running config and the candidate config.

CLI Example:
salt '*' net.compare_config
```

```
salt.modules.napalm_network.config(*args, **kwargs)
New in version 2017.7.0.
Return the whole configuration of the network device. By default, it will return all possible configuration sources supported by the network device. At most, there will be:
• running config
• startup config
• candidate config

To return only one of the configurations, you can use the source argument.

source Which configuration type you want to display, default is all of them.

Options:
• running
• candidate
• startup

Returns
The object returned is a dictionary with the following keys:
• running (string): Representation of the native running configuration.
• candidate (string): Representation of the native candidate configuration. If the device doesn't differentiate between running and startup configuration this will an empty string.
• startup (string): Representation of the native startup configuration. If the device doesn't differentiate between running and startup configuration this will an empty string.

CLI Example:
```
salt '*' net.config
salt '*' net.config source=candidate

salt.modules.napalm_network.config_changed(*args, **kwargs)
Will prompt if the configuration has been changed.

Returns A tuple with a boolean that specifies if the config was changed on the device. And a string that provides more details of the reason why the configuration was not changed.

CLI Example:
salt '*' net.config_changed

salt.modules.napalm_network.config_control(*args, **kwargs)
Will check if the configuration was changed. If differences found, will try to commit. In case commit unsuccessful, will try to rollback.

Returns A tuple with a boolean that specifies if the config was changed/committed/rollbacked on the device. And a string that provides more details of the reason why the configuration was not committed properly.

CLI Example:
salt '*' net.config_control

salt.modules.napalm_network.connected(*args, **kwargs)
Specifies if the connection to the device succeeded.

CLI Example:
salt '*' net.connected

salt.modules.napalm_network.discard_config(*args, **kwargs)
Discards the changes applied.

CLI Example:
salt '*' net.discard_config

salt.modules.napalm_network.environment(*args, **kwargs)
Returns the environment of the device.

CLI Example:
salt '*' net.environment

Example output:

```json
{
    'fans': {
        'Bottom Rear Fan': {
            'status': True
        },
        'Bottom Middle Fan': {
            'status': True
        },
        'Top Middle Fan': {
            'status': True
        },
        'Bottom Front Fan': {
            'status': True
        },
    }
}
```
{'Top Front Fan': {
    'status': True
},
'Top Rear Fan': {
    'status': True
}
},
'memory': {
    'available_ram': 16349,
    'used_ram': 4934
},
'temperature': {
    'FPC 0 Exhaust A': {
        'is_alert': False,
        'temperature': 35.0,
        'is_critical': False
    }
},
'cpu': {
    '1': {
        '%usage': 19.0
    },
    '0': {
        '%usage': 35.0
    }
}
}
salt.modules.napalm_network.facts(*args, **kwargs)

Returns characteristics of the network device.

Return: a dictionary with the following keys:
• uptime - Uptime of the device in seconds.
• vendor - Manufacturer of the device.
• model - Device model.
• hostname - Hostname of the device
• fqdn - Fqdn of the device
• os_version - String with the OS version running on the device.
• serial_number - Serial number of the device
• interface_list - List of the interfaces of the device

CLI Example:
salt '*' net.facts

Example output:

[
    {'os_version': u'13.3R6.5',
     'uptime': 10117140,
     'interface_list': [
        'lc-0/0/0',
        'pfe-0/0/0',
        'pfh-0/0/0',
        'xe-0/0/0',
        'xe-0/0/1',
        'xe-0/0/2',
        'xe-0/0/3',
        'gr-0/0/10',
        'ip-0/0/10'
    ]
]
salt.modules.napalm_network.interfaces(*args, **kwargs)

Returns details of the interfaces on the device.

Returns

A dictionary of dictionaries. The keys for the first dictionary will be the interfaces in the devices.

CLI Example:

```
salt '*' net.interfaces
```

Example output:

```
{
    u'Management1': {
        'is_up': False,
        'is_enabled': False,
        'description': u'',
        'last_flapped': -1,
        'speed': 1000,
        'mac_address': u'dead:beef:dead',
    },
    u'Ethernet1': {
        'is_up': True,
        'is_enabled': True,
        'description': u'foo',
        'last_flapped': 1429978575.1554043,
        'speed': 1000,
        'mac_address': u'beef:dead:beef',
    }
}
```

salt.modules.napalm_network.ipaddrs(*args, **kwargs)

Returns IP addresses configured on the device.

Returns

A dictionary with the IPv4 and IPv6 addresses of the interfaces. Returns all configured IP addresses on all interfaces as a dictionary of dictionaries. Keys of the main dictionary represent the name of the interface. Values of the main dictionary represent are dictionaries that may consist of two keys `ipv4` and `ipv6` (one, both or none) which are themselves dictionaries with the IP addresses as keys.

CLI Example:

```
salt '*' net.ipaddrs
```

Example output:

```
{
    u'FastEthernet8': {
        u'ipv4': {
            u'10.66.43.169': {
                'prefix_length': 22
            }
        }
    }
}```
{  'Loopback555': {  
    'ipv4': {  
      '192.168.1.1': {  
        'prefix_length': 24  
      }  
    },  
    'ipv6': {  
      '1::1': {  
        'prefix_length': 64  
      },  
      '2001:DB8:1::1': {  
        'prefix_length': 64  
      },  
      'FE80::3': {  
        'prefix_length': 'N/A'  
      }  
    }  
  }  
}

salt.modules.napalm_network.lldp(*args, **kwargs)
Returns a detailed view of the LLDP neighbors.

** Parameters **
- **interface** -- interface name to filter on

** Returns **
A dictionary with the LLDP neighbors. The keys are the interfaces with LLDP activated on.

** CLI Example:**
salt '*' net.lldp
salt '*' net.lldp interface='TenGigE0/0/0/8'

** Example output:**
{
  'TenGigE0/0/0/8': [
    {
      'parent_interface': 'Bundle-Ether8',
      'interface_description': 'TenGigE0/0/0/8',
      'remote_chassis_id': '8c60.4f69.e96c',
      'remote_system_name': 'switch',
      'remote_port': 'Eth2/2/1',
      'remote_port_description': 'Ethernet2/2/1',
      'remote_system_description': 'Cisco Nexus Operating System (NX-OS)\nSoftware 7.1(0)N1(1a)
TAC support: http://www.cisco.com/tac
Copyright (c) 2002-2015, Cisco Systems, Inc. All rights reserved.',
      'remote_system_capab': 'B, R',
      'remote_system_enable_capab': 'u'B'
    }
  ]
}

salt.modules.napalm_network.load_config(*args, **kwargs)
Applies configuration changes on the device. It can be loaded from a file or from inline string. If you send both a filename and a string containing the configuration, the file has higher precedence.

By default this function will commit the changes. If there are no changes, it does not commit and the flag already_configured will be set as True to point this out.
To avoid committing the configuration, set the argument `test` to `True` and will discard (dry run).

To keep the changes but not commit, set `commit` to `False`.

To replace the config, set `replace` to `True`.

**filename** Path to the file containing the desired configuration. This can be specified using the absolute path to the file, or using one of the following URL schemes:
- `salt://`, to fetch the template from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

Changed in version 2017.7.3.

**text** String containing the desired configuration. This argument is ignored when `filename` is specified.

**test**: `False` Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

**commit**: `True` Commit? Default: `True`.

**debug**: `False` Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

New in version 2016.11.2.

**replace**: `False` Load and replace the configuration. Default: `False`.

New in version 2016.11.2.

**saltenv**: `base` Specifies the Salt environment name.

New in version 2017.7.3.

**Returns** a dictionary having the following keys:
- `result` (bool): if the config was applied successfully. It is `False` only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still `True` and so will be the `already_configured` flag (example below)
- `comment` (str): a message for the user
- `already_configured` (bool): flag to check if there were no changes applied
- `loaded_config` (str): the configuration loaded on the device. Requires `debug` to be set as `True`
- `diff` (str): returns the config changes applied

**CLI Example**:

```bash
salt '*' net.load_config text='ntp peer 192.168.0.1'
salt '*' net.load_config filename='absolute/path/to/your/file'
salt '*' net.load_config filename='absolute/path/to/your/file' test=True
salt '*' net.load_config filename='absolute/path/to/your/file' commit=False
```

Example output:

```json
{
    'comment': 'Configuration discarded.',
    'already_configured': False,
    'result': True,
    'diff': '[edit interfaces xe-0/0/5]+ description "Adding a description";
}
```

salt.modules.napalm_network.load_template(*args, **kwargs)

Renders a configuration template (default: Jinja) and loads the result on the device.

By default this function will commit the changes. If there are no changes, it does not commit, discards he config and the flag `already_configured` will be set as `True` to point this out.
To avoid committing the configuration, set the argument `test` to `True` and will discard (dry run).

To preserve the changes, set `commit` to `False`. However, this is recommended to be used only in exceptional cases when there are applied few consecutive states and/or configuration changes. Otherwise the user might forget that the config DB is locked and the candidate config buffer is not cleared/merged in the running config.

To replace the config, set `replace` to `True`.

**Warning:** The support for native NAPALM templates will be dropped in Salt Fluorine. Implicitly, the `template_path` argument will be removed.

`template_name` Identifies path to the template source. The template can be either stored on the local machine, either remotely. The recommended location is under the `file_roots` as specified in the master config file. For example, let's suppose the `file_roots` is configured as:

```
file_roots:
    base:
        - /etc/salt/states
```

Placing the template under `/etc/salt/states/templates/example.jinja`, it can be used as `salt://templates/example.jinja`. Alternatively, for local files, the user can specify the absolute path. If remotely, the source can be retrieved via http, https or ftp.

Examples:
- `salt://my_template.jinja`
- `/absolute/path/to/my_template.jinja`
- `http://example.com/template.cheetah`
- `https://example.com/template.mako`
- `ftp://example.com/template.py`

`template_path`: `None` Inline config template to be rendered and loaded on the device.

`template_source`: `None` Required only in case the argument `template_name` provides only the file basename when referencing a local template using the absolute path. E.g.: if `template_name` is specified as `my_template.jinja`, in order to find the template, this argument must be provided: `template_path`: `/absolute/path/to/`.

**Note:** This argument will be deprecated beginning with release codename Fluorine.

`template_hash`: `None` Hash of the template file. Format: `{hash_type: 'md5','hsum': <md5sum>}`

New in version 2016.11.2.

`template_hash_name`: `None` When `template_hash` refers to a remote file, this specifies the filename to look for in that file.

New in version 2016.11.2.

`template_group`: `root` Owner of file.

New in version 2016.11.2.

`template_user`: `root` Group owner of file.

New in version 2016.11.2.

`template_user`: `755` Permissions of file.

New in version 2016.11.2.

`saltdev`: `base` Specifies the template environment. This will influence the relative imports inside the templates.
New in version 2016.11.2.

**template_engine**: jinja  The following templates engines are supported:

- `cheetah`
- `genshi`
- `jinja`
- `mako`
- `py`
- `wempy`

New in version 2016.11.2.

**skip_verify**: True  If `True`, hash verification of remote file sources (http://, https://, ftp://) will be skipped, and the `source_hash` argument will be ignored.

New in version 2016.11.2.

**test**: False  Dry run? If set to `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

**commit**: True  Commit? (default: `True`)

**debug**: False  Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw result after the template was rendered.

New in version 2016.11.2.

**replace**: False  Load and replace the configuration.

New in version 2016.11.2.

**defaults**: None  Default variables/context passed to the template.

New in version 2016.11.2.

**template_vars**  Dictionary with the arguments/context to be used when the template is rendered.

**Note**: Do not explicitly specify this argument. This represents any other variable that will be sent to the template rendering system. Please see the examples below!

Returns a dictionary having the following keys:

- `result` (bool): if the config was applied successfully. It is `False` only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still `True` and so will be the `already_configured` flag (example below)
- `comment` (str): a message for the user
- `already_configured` (bool): flag to check if there were no changes applied
- `loaded_config` (str): the configuration loaded on the device, after rendering the template. Requires debug to be set as `True`
- `diff` (str): returns the config changes applied

The template can use variables from the `grains`, `pillar` or `opts`, for example:

```python
{% set router_model = grains.get('model') %}
{% set router_vendor = grains.get('vendor') %}
{% set os_version = grains.get('version') %}
{% set hostname = pillar.get('proxy', {}).get('host') %}
{% if router_vendor.lower == 'juniper' %}
    system {
        host-name {{hostname}};
    }
{% elif router_vendor.lower == 'cisco' %}
    hostname {{hostname}}
{% endif %}
```

CLI Examples:
```
salt '*' net.load_template set_ntp_peers peers=[192.168.0.1] # uses NAPALM

# inline template:
salt -G 'os:junos' net.load_template set_hostname template_source='system { host-name {{host_name}}; }' host_name='MX480.lab'

# inline template using grains info:
salt -G 'os:junos' net.load_template set_hostname template_source='system { host-name {{grains.model}}.lab; }'

# inline template using pillar data:
salt 'os:junos' net.load_template my_template template_path='/tmp/tpl/' my_param='aaa'

# will commit

test=True # dry run

salt '*' net.load_template my_stuff.jinja template_path=salt://templates/my_stuff.jinja debug=True # equivalent of the next command

test=True # dry run

# in case the template needs to include files that are not under the same path (e. g. http://),
# to help the templating engine find it, you will need to specify the `saltenv` argument:
salt '*' net.load_template my_stuff.jinja template_path=salt://templates saltenv=/path/to/includes debug=True

# render a mako template:
salt '*' net.load_template my_stuff.mako template_engine=mako debug=True

# render remote template
salt -G 'os:junos' net.load_template http://bit.ly/2fReJg7 test=True debug=True peers=['192.168.0.1']
```

Example output:

```
{
    'comment': '',
    'already_configured': False,
    'result': True,
    'diff': '[edit system]+ host-name edge01.bjm01',
    'loaded_config': 'system { host-name edge01.bjm01; }'
}
```

```
salt.modules.napalm_network.mac(**args, **kwargs)
Returns the MAC Address Table on the device.

Parameters

  * address -- MAC address to filter on
```
- **interface** -- Interface name to filter on
- **vlan** -- VLAN identifier

**Returns** A list of dictionaries representing the entries in the MAC Address Table

**CLI Example:**

```
salt '*' net.mac
salt '*' net.mac vlan=10
```

Example output:

```
[
    {
        'mac': '00:1c:58:29:4a:71',
        'interface': 'xe-3/0/2',
        'static': False,
        'active': True,
        'moves': 1,
        'vlan': 10,
        'last_move': 1454417742.58
    },
    {
        'mac': '8c:60:4f:58:e1:c1',
        'interface': 'xe-1/0/1',
        'static': False,
        'active': True,
        'moves': 2,
        'vlan': 42,
        'last_move': 1453191948.11
    }
]
```

**salt.modules.napalm_network.optics(**args, **kwargs)**

New in version 2017.7.0.

Fetches the power usage on the various transceivers installed on the network device (in dBm), and returns a view that conforms with the OpenConfig model openconfig-platform-transceiver.yang.

**Returns**

Returns a dictionary where the keys are as listed below:

- intf_name (unicode)
  - physical_channels
    - channels (list of dicts)
      - index (int)
      - state
        - input_power
          - instant (float)
          - avg (float)
          - min (float)
          - max (float)
        - output_power
          - instant (float)
avg (float)
min (float)
max (float)

laser_bias_current
instant (float)
avg (float)
min (float)
max (float)

CLI Example:
```
salt '*' net.optics
```

salt.modules.napalm_network.ping(*args, **kwargs)
Executes a ping on the network device and returns a dictionary as a result.
destination Hostname or IP address of remote host
source Source address of echo request
ttl IP time-to-live value (IPv6 hop-limit value) (1..255 hops)
timeout Maximum wait time after sending final packet (seconds)
size Size of request packets (0..65468 bytes)
count Number of ping requests to send (1..2000000000 packets)
vrf VRF (routing instance) for ping attempt

New in version 2016.11.4.

CLI Example:
```
salt '*' net.ping 8.8.8.8
classroom_net.ping 8.8.8.8 ttl=3 size=65468
classroom_net.ping 8.8.8.8 source=127.0.0.1 timeout=1 count=100
```

salt.modules.napalm_network.rollback(*args, **kwargs)
Rollbacks the configuration.

CLI Example:
```
salt '*' net.rollback
```

salt.modules.napalm_network.traceroute(*args, **kwargs)
Calls the method traceroute from the NAPALM driver object and returns a dictionary with the result of the traceroute command executed on the device.
destination Hostname or address of remote host
source Source address to use in outgoing traceroute packets
ttl IP maximum time-to-live value (or IPv6 maximum hop-limit value)
timeout Number of seconds to wait for response (seconds)
vrf VRF (routing instance) for traceroute attempt

New in version 2016.11.4.

CLI Example:
```
salt '*' net.traceroute 8.8.8.8
classroom_net.traceroute 8.8.8.8 source=127.0.0.1 ttl=5 timeout=1
```
19.9.244 salt.modules.napalm_ntp module

NAPALM NTP

Manages NTP on network devices.

codeauthor Mircea Ulinic <mircea@cloudflare.com> & Jerome Fleury <jf@cloudflare.com>
maturity new
depends napalm
platform unix

Dependences

- NAPALM proxy minion
- NET basic features

NTP peers management state

New in version 2016.11.0.

salt.modules.napalm_ntp.delete_peers(*args, **kwargs)

Removes NTP peers configured on the device.

Parameters

- peers -- list of IP Addresses/Domain Names to be removed as NTP peers
- (bool) (commit) -- discard loaded config. By default test is False (will not discard the changes)
- (bool) -- commit loaded config. By default commit is True (will commit the changes). Useful when the user does not want to commit after each change, but after a couple.

By default this function will commit the config changes (if any). To load without committing, use the commit option. For a dry run, use the test argument.

CLI Example:

```
salt '*' ntp.delete_peers 8.8.8.8 time.apple.com
salt '*' ntp.delete_peers 172.17.17.1 test=True # only displays the diff
salt '*' ntp.delete_peers 192.168.0.1 commit=False # preserves the changes, but does not commit
```

salt.modules.napalm_ntp.delete_servers(*args, **kwargs)

Removes NTP servers configured on the device.

Parameters

- servers -- list of IP Addresses/Domain Names to be removed as NTP servers
- (bool) (commit) -- discard loaded config. By default test is False (will not discard the changes)
- (bool) -- commit loaded config. By default commit is True (will commit the changes). Useful when the user does not want to commit after each change, but after a couple.

By default this function will commit the config changes (if any). To load without committing, use the commit option. For dry run use the test argument.

CLI Example:
salt.modules.napalm_ntp.peers(*args, **kwargs)

Returns a list the NTP peers configured on the network device.

Returns    configured NTP peers as list.

CLI Example:

```
salt '*' ntp.peers
```

Example output:

```
[
  '192.168.0.1',
  '172.17.17.1',
  '172.17.17.2',
  '2400:cb00:6:1024::c71b:840a'
]
```

salt.modules.napalm_ntp.servers(*args, **kwargs)

Returns a list of the configured NTP servers on the device.

CLI Example:

```
salt '*' ntp.servers
```

salt.modules.napalm_ntp.set_peers(*args, **kwargs)

Configures a list of NTP peers on the device.

Parameters

- **peers** -- list of IP Addresses/Domain Names
- **(bool) (test)** -- discard loaded config. By default test is False (will not discard the changes)

Commit commit (bool) commit loaded config. By default commit is True (will commit the changes). Useful when the user does not want to commit after each change, but after a couple.

By default this function will commit the config changes (if any). To load without committing, use the commit option. For dry run use the test argument.

CLI Example:

```
salt '*' ntp.set_peers 192.168.0.1 172.17.17.1 time.apple.com
salt '*' ntp.set_peers 172.17.17.1 test=True  # only displays the diff
salt '*' ntp.set_peers 192.168.0.1 commit=False  # preserves the changes, but does not commit
```

salt.modules.napalm_ntp.set_servers(*args, **kwargs)

Configures a list of NTP servers on the device.

Parameters

- **servers** -- list of IP Addresses/Domain Names
- **(bool) (test)** -- discard loaded config. By default test is False (will not discard the changes)

Commit commit (bool) commit loaded config. By default commit is True (will commit the changes). Useful when the user does not want to commit after each change, but after a couple.
By default this function will commit the config changes (if any). To load without committing, use the `commit` option. For dry run use the `test` argument.

CLI Example:

```shell
salt '*' ntp.set_servers 192.168.0.1 172.17.17.1 time.apple.com
salt '*' ntp.set_servers 172.17.17.1 test=True  # only displays the diff
salt '*' ntp.set_servers 192.168.0.1 commit=False  # preserves the changes, but does not commit
```

`salt.modules.napalm_ntp.stats(*args, **kwargs)`

Returns a dictionary containing synchronization details of the NTP peers.

Parameters:
- `peer` -- Returns only the details of a specific NTP peer.

Returns:
- a list of dictionaries, with the following keys:
  - `remote`
  - `referenceid`
  - `synchronized`
  - `stratum`
  - `type`
  - `when`
  - `hostpoll`
  - `reachability`
  - `delay`
  - `offset`
  - `jitter`

CLI Example:

```shell
salt '*' ntp.stats
```

Example output:

```python
[
  {
    'remote': u'188.114.101.4',
    'referenceid': u'188.114.100.1',
    'synchronized': True,
    'stratum': 4,
    'type': u'-',
    'when': u'107',
    'hostpoll': 256,
    'reachability': 377,
    'delay': 164.228,
    'offset': -13.866,
    'jitter': 2.695
  }
]
```

19.9.245 salt.modules.napalm_probes module

**NAPALM Probes**

Manages RPM/SLA probes on the network device.

**codeauthor** Mircea Ulinic <mircea@cloudflare.com> & Jerome Fleury <jf@cloudflare.com>
maturity new
depends napalm
platform unix

Dependencies

• napalm proxy minion
• NET basic features

See also:

Probes configuration management state

New in version 2016.11.0.
salt.modules.napalm_probes.config(*args,**kwargs)

Returns the configuration of the RPM probes.

Returns A dictionary containing the configuration of the RPM/SLA probes.

CLI Example:
salt '*' probes.config

Output Example:

```
{
    'probe1':{
        'test1': {  
            'probe_type' : 'icmp-ping',
            'target' : '192.168.0.1',
            'source' : '192.168.0.2',
            'probe_count' : 13,
            'test_interval': 3
        },
        'test2': {  
            'probe_type' : 'http-ping',
            'target' : '172.17.17.1',
            'source' : '192.17.17.2',
            'probe_count' : 5,
            'test_interval': 60
        }
    }
}
```
salt.modules.napalm_probes.delete_probes(*args,**kwargs)

Removes RPM/SLA probes from the network device. Calls the configuration template `delete_probes` from the NAPALM library, providing as input a rich formatted dictionary with the configuration details of the probes to be removed from the configuration of the device.

Parameters

• probes -- Dictionary with a similar format as the output dictionary of the function config(), where the details are not necessary.
• test -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False
• commit -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also,
from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

**Raises** MergeConfigException -- If there is an error on the configuration sent.

**Returns** A dictionary having the following keys:

- **result (bool):** if the config was applied successfully. It is `False` only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still `True` and so will be the already_configured flag (example below)
- **comment (str):** a message for the user
- **already_configured (bool):** flag to check if there were no changes applied
- **diff (str):** returns the config changes applied

**Input example:**

```python
probes = {
    'existing_probe':{
        'existing_test1': {},
        'existing_test2': {}
    }
}
```

salt.modules.napalm_probes.results(*args, **kwargs)

Provides the results of the measurements of the RPM/SLA probes.

:returns: a dictionary with the results of the probes.

**CLI Example:**

```
salt '*' probes.results
```

**Output example:**

```python
{
    'probe1': {
        'test1': {
            'last_test_min_delay': 63.120,
            'global_test_min_delay': 62.912,
            'current_test_avg_delay': 63.190,
            'global_test_max_delay': 177.349,
            'current_test_max_delay': 63.302,
            'global_test_avg_delay': 63.802,
            'last_test_avg_delay': 63.438,
            'last_test_max_delay': 65.356,
            'probe_type': 'icmp-ping',
            'rtt': 63.138,
            'last_test_loss': 0,
            'round_trip_jitter': -59.0,
            'target': '192.168.0.1',
            'source': '192.168.0.2'
        },
        'current_test_min_delay': 63.138
    },
    'test2': {
        'last_test_min_delay': 176.384,
        'global_test_min_delay': 169.226,
        'current_test_avg_delay': 177.098,
        'global_test_max_delay': 292.628,
        'current_test_max_delay': 180.055,
        'global_test_avg_delay': 177.959,
    }
}
```
salt.modules.napalm_probes.schedule_probes(*args, **kwargs)

Will schedule the probes. On Cisco devices, it is not enough to define the probes, it is also necessary to schedule them.

This function calls the configuration template schedule_probes from the NAPALM library, providing as input a rich formatted dictionary with the names of the probes and the tests to be scheduled.

Parameters

- **probes** -- Dictionary with a similar format as the output dictionary of the function config(), where the details are not necessary.
- **test** -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False
- **commit** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

Returns a dictionary having the following keys:

- **result** (bool): if the config was applied successfully. It is False only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still True and so will be the already_configured flag (example below)
- **comment** (str): a message for the user
- **already_configured** (bool): flag to check if there were no changes applied
- **diff** (str): returns the config changes applied

Input example:

```python
probes = {
    'new_probe': {
        'new_test1': {},
        'new_test2': {}
    }
}
```

salt.modules.napalm_probes.set_probes(*args, **kwargs)

Configures RPM/SLA probes on the device. Calls the configuration template `set_probes' from the NAPALM library, providing as input a rich formatted dictionary with the configuration details of the probes to be configured.

Parameters

- **probes** -- Dictionary formatted as the output of the function config()
- **test** -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False
• commit -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

Raises MergeConfigException -- If there is an error on the configuration sent.

Return a dictionary having the following keys

- result (bool): if the config was applied successfully. It is False only in case of failure.
  In case there are no changes to be applied and successfully performs all operations it is still True and so will be the already_configured flag (example below)
- comment (str): a message for the user
- already_configured (bool): flag to check if there were no changes applied
- diff (str): returns the config changes applied

Input example - via state/script:

```python
probes = {
    'new_probe': {
        'new_test1': {
            'probe_type': 'icmp-ping',
            'target': '192.168.0.1',
            'source': '192.168.0.2',
            'probe_count': 13,
            'test_interval': 3
        },
        'new_test2': {
            'probe_type': 'http-ping',
            'target': '172.17.17.1',
            'source': '192.17.17.2',
            'probe_count': 5,
            'test_interval': 60
        }
    }
}
set_probes(probes)
```

CLI Example - to push changes on the fly (not recommended):

```bash
salt 'junos_minion' probes.set_probes "{'new_probe':{'new_test1':{'probe_type':
                        'icmp-ping',
                        'target':'192.168.0.1','source':'192.168.0.2','probe_ 
                        count':13,'test_interval':3}}}" test=True
```

Output example - for the CLI example above:

```
junos_minion:
----------
already_configured: False
comment: Configuration discarded.
diff:
[edit services rpm]
  probe transit { ... }
+ probe new_probe {
  + test new_test1 {
    + probe-type icmp-ping;
    + target address 192.168.0.1;
    + probe-count 13;
```
19.9.246 salt.modules.napalm_route module

NAPALM Route

Retrieves route details from network devices.

- **codeauthor**: Mircea Ulinic <mircea@cloudflare.com>
- **maturity**: new
- **depends**: napalm
- **platform**: unix

**Dependencies**

- *NAPALM proxy minion*

New in version 2016.11.0.

salt.modules.napalm_route.show(*args, **kwargs)

Displays all details for a certain route learned via a specific protocol. If the protocol is not specified, will return all possible routes.

**Note:** This function return the routes from the RIB. In case the destination prefix is too short, there may be too many routes matched. Therefore in cases of devices having a very high number of routes it may be necessary to adjust the prefix length and request using a longer prefix.

- **destination** destination prefix.
- **protocol (optional)** protocol used to learn the routes to the destination.

Changed in version 2017.7.0.

**CLI Example:**

```sh
salt 'my_router' route.show
salt 'my_router' route.show 172.16.0.0/25 bgp
```

**Output example:**

```json
{
 '172.16.0.0/25': [
 {'protocol': 'BGP',
  'last_active': True,
  'current_active': True,
  'age': 1178693,
  'routing_table': 'inet.0',
  
```
19.9.247 salt.modules.napalm_snmp module

NAPALM SNMP

Manages SNMP on network devices.

codeauthor Mircea Ulinic <mircea@cloudflare.com>
maturity new
depends napalm
platform unix

Dependencies

- NAPALM proxy minion
- NET basic features

See also:

SNMP configuration management state

New in version 2016.11.0.

salt.modules.napalm_snmp.config(*args, **kwargs)
Returns the SNMP configuration

CLI Example:

```
salt '*' snmp.config
```

salt.modules.napalm_snmp.remove_config(*args, **kwargs)
Removes a configuration element from the SNMP configuration.

Parameters

- **chassis_id** -- (optional) Chassis ID
- **community** -- (optional) A dictionary having the following optional keys:
  - acl (if any policy / ACL need to be set)
  - mode: rw or ro. Default: ro

Parameters

- **contact** -- Contact details
- **location** -- Location
- **test** -- Dry run? If set as True, will apply the config, discard and return the changes.
  Default: False
- **commit** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

Raises **MergeConfigException** -- If there is an error on the configuration sent.

Returns A dictionary having the following keys:

- **result** (bool): if the config was applied successfully. It is **False** only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still **True** and so will be the **already_configured** flag (example below)
- **comment** (str): a message for the user
- **already_configured** (bool): flag to check if there were no changes applied
- **diff** (str): returns the config changes applied

CLI Example:

```
salt '*' snmp.remove_config community='abcd'
```

salt.modules.napalm_snmp.update_config(*args, **kwargs)
Updates the SNMP configuration.
Parameters

- **chassis_id** -- (optional) Chassis ID
- **community** -- (optional) A dictionary having the following optional keys:
  - acl (if any policy / ACL need to be set)
  - mode: rw or ro. Default: ro

Parameters

- **contact** -- Contact details
- **location** -- Location
- **test** -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False
- **commit** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

Raises **MergeConfigException** -- If there is an error on the configuration sent.

Return a dictionary having the following keys

- `result` (bool): if the config was applied successfully. It is False only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still True and so will be the `already_configured` flag (example below)
- `comment` (str): a message for the user
- `already_configured` (bool): flag to check if there were no changes applied
- `diff` (str): returns the config changes applied

CLI Example:

```
salt 'edge01.lon01' snmp.update_config location="Greenwich, UK" test=True
```

Output example (for the CLI example above):

```
edge01.lon01:
   ----------
   already_configured: False
   comment: Configuration discarded.
   diff:
      [edit snmp]
      - location "London, UK";
      + location "Greenwich, UK";
   result: True
```

19.9.248 salt.modules.napalm_users module

NAPALM Users

Manages the configuration of the users on network devices.

**codeauthor** Mircea Ulinic <mircea@cloudflare.com>

**maturity** new

**depends** napalm
platform  unix

Dependencies

• NAPALM proxy minion

See also:

Users management state

New in version 2016.11.0.

salt.modules.napalm_users.config(*args, **kwargs)

Returns the configuration of the users on the device

CLI Example:

```text
salt '*' users.config
```

Output example:

```json
{
    'mircea': {
        'level': 15,
        'password': '$1$0P70xKPa$4jt5/10cBTckk6I/w/',
        'sshkeys': [
            'ssh-rsa AAAA ...
        ]
    },
}
```

salt.modules.napalm_users.delete_users(*args, **kwargs)

Removes users from the configuration of network devices.

Parameters

• users -- Dictionary formatted as the output of the function config()

• test -- Dry run? If set as True, will apply the config, discard and return the changes.
  Default: False

• commit -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

Raises MergeConfigException -- If there is an error on the configuration sent.

Return a dictionary having the following keys

• result (bool): if the config was applied successfully. It is False only in case of failure.
• comment (str): a message for the user
• already_configured (bool): flag to check if there were no changes applied
• diff (str): returns the config changes applied
### 19.9.249 salt.modules.napalm_yang_mod module

**NAPALM YANG**

NAPALM YANG basic operations.

New in version 2017.7.0.

salt.modules.napalm_yang_mod.compliance_report(*args, **kwargs)

Return the compliance report using YANG objects.

- **data** Dictionary structured with respect to the models referenced.
- **models** A list of models to be used when generating the config.
- **filepath** The absolute path to the validation file.

CLI Example:

```bash
salt '*' napalm_yang.compliance_report {} models.openconfig_interfaces filepath=/~/.validate.yml
```

Output Example:

```json
{
    "skipped": [],
    "complies": true,
    "get_interfaces_ip": {
        "missing": [],
        "complies": true,
        "present": {
```
salt.modules.napalm_yang_mod.diff(candidate, running, models)

Returns the difference between two configuration entities structured according to the YANG model.

**Note:** This function is recommended to be used mostly as a state helper.

candidate  First model to compare.
running  Second model to compare.
models  A list of models to be used when comparing.

CLI Example:

```shell
salt '*' napalm_yang.diff {} {} models.openconfig_interfaces
```

Output Example:

```json
{
  "interfaces": {
    "interface": {
      "both": {
        "Port-Channel1": {
          "config": {
            "mtu": {
              "first": "0",
              "second": "9000"
            }
          }
        }
      },
      "first_only": [
        "Loopback0"
      ],
      "second_only": [
        "Loopback1"
      ]
    }
  }
}
```

salt.modules.napalm_yang_mod.get_config(*args, **kwargs)

Return the native config.

data  Dictionary structured with respect to the models referenced.
models  A list of models to be used when generating the config.
profiles: None  Use certain profiles to generate the config. If not specified, will use the platform default profile(s).

CLI Example:
salt '*' napalm_yang.get_config {} models.openconfig_interfaces

Output Example:

```yaml
interface et1
  ip address 192.168.1.1/24
description Uplink1
  mtu 9000
interface et2
  ip address 192.168.2.1/24
description Uplink2
  mtu 9000
```

salt.modules.napalm_yang_mod.load_config(*args, **kwargs)

Generate and load the config on the device using the OpenConfig or IETF models and device profiles.

data Dictionary structured with respect to the models referenced.

models A list of models to be used when generating the config.

profiles: None Use certain profiles to generate the config. If not specified, will use the platform default profile(s).

test: False Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.

debug: False Debug mode. Will insert a new key under the output dictionary, as loaded_config containing the raw configuration loaded on the device.

replace: False Should replace the config with the new generate one?

CLI Example:

```
salt '*' napalm_yang.load_config {} models.openconfig_interfaces test=True debug=True
```

Output Example:

```
device1:
  ----------
  already_configured:
    False
  comment:
  diff:
    [edit interfaces ge-0/0/0]
    - mtu 1400;
    [edit interfaces ge-0/0/0 unit 0 family inet]
    - dhcp;
    [edit interfaces lo0]
    - unit 0 {
    -   description lo0.0;
    - }
    + unit 1 {
    +   description "new loopback";
    + }
  loaded_config:
    <configuration>
    <interfaces replace="replace">

</unit>
<description>lo0</description>
</interface>
</interfaces>
</configuration>

result:
True

salt.modules.napalm_yang_mod.parse(*args, **kwargs)
Parse configuration from the device.

models A list of models to be used when parsing.
config: False Parse config.
state: False Parse state.
profiles: None Use certain profiles to parse. If not specified, will use the device default profile(s).

CLI Example:

```
salt '*' napalm_yang.parse_models.openconfig_interfaces
```

Output Example:

```json
{
  "interfaces": {
    "interface": {
      "local": {
        "name": "local",
        "state": {
          "admin-status": "UP",

```

### 19.9.250 salt.modules.netaddress

Module for getting information about network addresses.

New in version 2016.3.0.

**depends** netaddr

**salt.modules.netaddress.cidr_broadcast(cidr)**

Get the broadcast address associated with a CIDR address.

CLI example:

```
salt myminion netaddress.cidr_netmask 192.168.0.0/20
```

**salt.modules.netaddress.cidr_netmask(cidr)**

Get the netmask address associated with a CIDR address.

CLI example:
### 19.9.251 salt.modules.netbsd_sysctl

Module for viewing and modifying sysctl parameters

**salt.modules.netbsd_sysctl.assign(name, value)**

Assign a single sysctl parameter for this minion

**CLI Example:**

```
salt '*' sysctl.assign net.inet.icmp.icmplim 50
```

**salt.modules.netbsd_sysctl.get(name)**

Return a single sysctl parameter for this minion

**CLI Example:**

```
salt '*' sysctl.get hw.physmem
```

**salt.modules.netbsd_sysctl.persist(name, value, config='/etc/sysctl.conf')**

Assign and persist a simple sysctl parameter for this minion

**CLI Example:**

```
salt '*' sysctl.persist net.inet.icmp.icmplim 50
```

**salt.modules.netbsd_sysctl.show(config_file=False)**

Return a list of sysctl parameters for this minion

**CLI Example:**

```
salt '*' sysctl.show
```

### 19.9.252 salt.modules.netbsdservice

The service module for NetBSD

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to 'service.start' is not available), see [here](#).
salt.modules.netbsdservice.available(name)
   Returns True if the specified service is available, otherwise returns False.
   CLI Example:
   
   salt '*' service.available sshd

salt.modules.netbsdservice.disable(name, **kwargs)
   Disable the named service to start at boot
   CLI Example:
   
   salt '*' service.disable <service name>

salt.modules.netbsdservice.disabled(name)
   Return True if the named service is enabled, false otherwise
   CLI Example:
   
   salt '*' service.disabled <service name>

salt.modules.netbsdservice.enable(name, **kwargs)
   Enable the named service to start at boot
   CLI Example:
   
   salt '*' service.enable <service name>

salt.modules.netbsdservice.enabled(name, **kwargs)
   Return True if the named service is enabled, false otherwise
   CLI Example:
   
   salt '*' service.enabled <service name>

salt.modules.netbsdservice.force_reload(name)
   Force-reload the named service
   CLI Example:
   
   salt '*' service.force_reload <service name>

salt.modules.netbsdservice.get_all()
   Return all available boot services
   CLI Example:
   
   salt '*' service.get_all

salt.modules.netbsdservice.get_disabled()
   Return a set of services that are installed but disabled
   CLI Example:
   
   salt '*' service.get_disabled

salt.modules.netbsdservice.get_enabled()
   Return a list of service that are enabled on boot
   CLI Example:
salt '*' service.get_enabled

salt.modules.netbsdservice.missing(name)
The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.

CLI Example:
salt '*' service.missing sshd

salt.modules.netbsdservice.reload_(name)
Reload the named service

CLI Example:
salt '*' service.reload <service name>

salt.modules.netbsdservice.restart(name)
Restart the named service

CLI Example:
salt '*' service.restart <service name>

salt.modules.netbsdservice.start(name)
Start the specified service

CLI Example:
salt '*' service.start <service name>

salt.modules.netbsdservice.status(name, sig=None)
Return the status for a service, returns a bool whether the service is running.

CLI Example:
salt '*' service.status <service name>

salt.modules.netbsdservice.stop(name)
Stop the specified service

CLI Example:
salt '*' service.stop <service name>

19.9.253  salt.modules.netscaler

Module to provide Citrix Netscaler compatibility to Salt (compatible with netscaler 9.2+)

New in version 2015.2.0.

depends
  • nsnitro Python module

Note: You can install nsnitro using:
configuration  This module accepts connection configuration details either as parameters, or as configuration settings in /etc/salt/minion on the relevant minions

```
netscaler.host: 1.2.3.4
netscaler.user: user
netscaler.pass: password
```

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

**CLI Examples** Calls relying on configuration passed using /etc/salt/minion, grains, or pillars: .. code-block:: bash

```
salt-call netscaler.server_exists server_name
```

Calls passing configuration as opts .. code-block:: bash

```
salt-call netscaler.server_exists server_name netscaler_host=1.2.3.4
netscaler_user=username netscaler_pass=password
```

salt.modules.netscaler.server_add(s_name, s_ip, s_state=None, **connection_args)

Add a server  Note: The default server state is ENABLED

CLI Example:

```
salt '*' netscaler.server_add 'serverName' 'serverIpAddress'
salt '*' netscaler.server_add 'serverName' 'serverIpAddress' 'serverState'
```

salt.modules.netscaler.server_delete(s_name, **connection_args)

Delete a server

CLI Example:

```
salt '*' netscaler.server_delete 'serverName'
```

salt.modules.netscaler.server_disable(s_name, **connection_args)

Disable a server globally

CLI Example:

```
salt '*' netscaler.server_disable 'serverName'
```

salt.modules.netscaler.server_enable(s_name, **connection_args)

Enables a server globally

CLI Example:

```
salt '*' netscaler.server_enable 'serverName'
```

salt.modules.netscaler.server_enabled(s_name, **connection_args)

Check if a server is enabled globally

CLI Example:
salt '*' netscaler.server_enabled 'serverName'

```python
salt.modules.netscaler.server_exists(s_name, ip=None, s_state=None, **connection_args)
```
Checks if a server exists

CLI Example:
```
salt '*' netscaler.server_exists 'serverName'
```

```python
salt.modules.netscaler.server_update(s_name, s_ip, **connection_args)
```
Update a server’s attributes

CLI Example:
```
salt '*' netscaler.server_update 'serverName' 'serverIP'
```

```python
salt.modules.netscaler.service_disable(s_name, s_delay=None, **connection_args)
```
Disable a service

CLI Example:
```
salt '*' netscaler.service_disable 'serviceName'
salt '*' netscaler.service_disable 'serviceName' 'delayInSeconds'
```

```python
salt.modules.netscaler.service_enable(s_name, **connection_args)
```
Enable a service

CLI Example:
```
salt '*' netscaler.service_enable 'serviceName'
```

```python
salt.modules.netscaler.service_exists(s_name, **connection_args)
```
Checks if a service exists

CLI Example:
```
salt '*' netscaler.service_exists 'serviceName'
```

```python
salt.modules.netscaler.service_up(s_name, **connection_args)
```
Checks if a service is UP

CLI Example:
```
salt '*' netscaler.service_up 'serviceName'
```

```python
salt.modules.netscaler.servicegroup_add(sg_name, sg_type='HTTP', **connection_args)
```
Add a new service group If no service type is specified, HTTP will be used. Most common service types: HTTP, SSL, and SSL_BRIDGE

CLI Example:
```
salt '*' netscaler.servicegroup_add 'serviceGroupName'
salt '*' netscaler.servicegroup_add 'serviceGroupName' 'serviceGroupType'
```

```python
salt.modules.netscaler.servicegroup_delete(sg_name, **connection_args)
```
Delete a new service group

CLI Example:
salt '*' netscaler.servicegroup_delete 'serviceGroupName'

salt.modules.netscaler.servicegroup_exists(\n    sg_name, sg_type=None, **connection_args\n)  
Checks if a service group exists

    CLI Example:
    
    salt '*' netscaler.servicegroup_exists 'serviceGroupName'

salt.modules.netscaler.servicegroup_server_add(\n    sg_name, s_name, s_port, **connection_args\n)  
Add a server:port member to a servicegroup

    CLI Example:
    
    salt '*' netscaler.servicegroup_server_add 'serviceGroupName' 'serverName' 'serverPort'

salt.modules.netscaler.servicegroup_server_delete(\n    sg_name, s_name, s_port, **connection_args\n)  
Remove a server:port member from a servicegroup

    CLI Example:
    
    salt '*' netscaler.servicegroup_server_delete 'serviceGroupName' 'serverName' 'serverPort'

salt.modules.netscaler.servicegroup_server_disable(\n    sg_name, s_name, s_port, **connection_args\n)  
Disable a server:port member of a servicegroup

    CLI Example:
    
    salt '*' netscaler.servicegroup_server_disable 'serviceGroupName' 'serverName' 'serverPort'

salt.modules.netscaler.servicegroup_server_enable(\n    sg_name, s_name, s_port, **connection_args\n)  
Enable a server:port member of a servicegroup

    CLI Example:
    
    salt '*' netscaler.servicegroup_server_enable 'serviceGroupName' 'serverName' 'serverPort'

salt.modules.netscaler.servicegroup_server_exists(\n    sg_name, s_name, s_port=None, **connection_args\n)  
Check if a server:port combination is a member of a servicegroup

    CLI Example:
    
    salt '*' netscaler.servicegroup_server_exists 'serviceGroupName' 'serverName' 'serverPort'

salt.modules.netscaler.servicegroup_server_up(\n    sg_name, s_name, s_port, **connection_args\n)  
Check if a server:port combination is in state UP in a servicegroup

    CLI Example:
salt '*' netscaler.servicegroup_server_up 'serviceGroupName' 'serverName' →'serverPort'

```python
salt.modules.netscaler.vserver_add(v_name, v_ip, v_port, v_type, **connection_args)
Add a new lb vserver

CLI Example:
salt '*' netscaler.vserver_add 'vserverName' 'vserverIP' 'vserverPort'
→'vserverType'
salt '*' netscaler.vserver_add 'alex.patate.chaude.443' '1.2.3.4' '443' 'SSL'
```

salt.modules.netscaler.vserver_delete(v_name, **connection_args)
Delete a lb vserver

CLI Example:
salt '*' netscaler.vserver_delete 'vserverName'

salt.modules.netscaler.vserver_exists(v_name, v_ip=None, v_port=None, v_type=None, **connection_args)
Checks if a vserver exists

CLI Example:
salt '*' netscaler.vserver_exists 'vserverName'

salt.modules.netscaler.vserver_servicegroup_add(v_name, sg_name, **connection_args)
Bind a servicegroup to a vserver

CLI Example:
salt '*' netscaler.vserver_servicegroup_add 'vserverName' 'serviceGroupName'

salt.modules.netscaler.vserver_servicegroup_delete(v_name, sg_name, **connection_args)
Unbind a servicegroup from a vserver

CLI Example:
salt '*' netscaler.vserver_servicegroup_delete 'vserverName' 'serviceGroupName'

salt.modules.netscaler.vserver_servicegroup_exists(v_name, sg_name, **connection_args)
Checks if a servicegroup is tied to a vserver

CLI Example:
salt '*' netscaler.vserver_servicegroup_exists 'vserverName' 'serviceGroupName'

salt.modules.netscaler.vserver_sslcert_add(v_name, sc_name, **connection_args)
Binds a SSL certificate to a vserver

CLI Example:
salt '*' netscaler.vserver_sslcert_add 'vserverName' 'sslCertificateName'

salt.modules.netscaler.vserver_sslcert_delete(v_name, sc_name, **connection_args)
Unbinds a SSL certificate from a vserver
CLI Example:

```bash
salt '*' netscaler.vserver_sslcert_delete 'vserverName' 'sslCertificateName'
```

salt.modules.netscaler.vserver_sslcert_exists(v_name, sc_name, "connection_args")
Checks if a SSL certificate is tied to a vserver

CLI Example:

```bash
salt '*' netscaler.vserver_sslcert_exists 'vserverName' 'sslCertificateName'
```

19.9.254 salt.modules.network

Module for gathering and managing network information

salt.modules.network.active_tcp()
Return a dict containing information on all of the running TCP connections (currently linux and solaris only)

Changed in version 2015.8.4: Added support for SunOS

CLI Example:

```bash
salt '*' network.active_tcp
```

salt.modules.network.arp()
Return the arp table from the minion

Changed in version 2015.8.0: Added support for SunOS

CLI Example:

```bash
salt '*' network.arp
```

salt.modules.network.calc_net(ip_addr, netmask=None)
Returns the CIDR of a subnet based on an IP address (CIDR notation supported) and optional netmask.

CLI Example:

```bash
salt '*' network.calc_net 172.17.0.5 255.255.255.240
salt '*' network.calc_net 2a02:f6e:a000:80:84d8:8332:7866:4e07/64
```

New in version 2015.8.0.

salt.modules.network.connect(host, port=None, **kwargs)
Test connectivity to a host using a particular port from the minion.

New in version 2014.7.0.

CLI Example:

```bash
salt '*' network.connect archlinux.org 80
salt '*' network.connect archlinux.org 80 timeout=3
salt '*' network.connect archlinux.org 80 timeout=3 family=ipv4
salt '*' network.connect google-public-dns-a.google.com port=53 proto=udp timeout=3
```
salt.modules.network.convert_cidr(cidr)
returns the network and subnet mask of a cidr addr

New in version 2016.3.0.

CLI Example:

```
salt '*' network.convert_cidr 172.31.0.0/16
```

salt.modules.network.default_route(family=None)
Return default route(s) from routing table

Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS) Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' network.default_route
```

salt.modules.network.dig(host)
Performs a DNS lookup with dig

CLI Example:

```
salt '*' network.dig archlinux.org
```

salt.modules.network.get_bufsize(iface)
Return network buffer sizes as a dict (currently linux only)

CLI Example:

```
salt '*' network.get_bufsize eth0
```

salt.modules.network.get_fqdn()
Get fully qualified domain name

CLI Example:

```
salt '*' network.get_fqdn
```

salt.modules.network.get_hostname()
Get hostname

CLI Example:

```
salt '*' network.get_hostname
```

salt.modules.network.get_route(ip)
Return routing information for given destination ip

New in version 2015.5.3.

Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS) Added support for OpenBSD Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' network.get_route 10.10.10.10
```
salt.modules.network.hw_addr(iface)
Return the hardware address (a.k.a. MAC address) for a given interface

CLI Example:
```
salt '*' network.hw_addr eth0
```

salt.modules.network.hwaddr(iface)
This function is an alias of hw_addr.
Return the hardware address (a.k.a. MAC address) for a given interface

CLI Example:
```
salt '*' network.hw_addr eth0
```

salt.modules.network.ifacestartswith(cidr)
Retrieve the interface name from a specific CIDR
New in version 2016.11.0.

CLI Example:
```
salt '*' network.ifacestartswith 10.0
```

salt.modules.network.in_subnet(cidr)
Returns True if host is within specified subnet, otherwise False.

CLI Example:
```
salt '*' network.in_subnet 10.0.0.0/16
```

salt.modules.network.interface(iface)
Return the inet address for a given interface
New in version 2014.7.0.

CLI Example:
```
salt '*' network.interface eth0
```

salt.modules.network.interface_ip(iface)
Return the inet address for a given interface
New in version 2014.7.0.

CLI Example:
```
salt '*' network.interface_ip eth0
```

salt.modules.network.interfaces()
Return a dictionary of information about all the interfaces on the minion

CLI Example:
```
salt '*' network.interfaces
```

salt.modules.network.ip_addrs(interface=None, include_loopback=False, cidr=None, type=None)
Returns a list of IPv4 addresses assigned to the host. 127.0.0.1 is ignored, unless `include_loopback=True` is indicated. If `interface` is provided, then only IP addresses from that interface will be returned. Providing a CIDR via `cidr='10.0.0.0/8'` will return only the addresses which are within that subnet. If `type` is `public`, then only public addresses will be returned. Ditto for `type='private'.
CLI Example:
```
salt '*' network.ip_addrs
```

**salt.modules.network.ip_addrs6** (*interface=None, include_loopback=False, cidr=None*)
Returns a list of IPv6 addresses assigned to the host. ::1 is ignored, unless `include_loopback=True` is indicated. If `interface` is provided, then only IP addresses from that interface will be returned. Providing a CIDR via `cidr="2000::/3"` will return only the addresses which are within that subnet.

CLI Example:
```
salt '*' network.ip_addrs6
```

**salt.modules.network.ip_in_subnet** (*ip_addr, cidr*)
Returns True if given IP is within specified subnet, otherwise False.

CLI Example:
```
salt '*' network.ip_in_subnet 172.17.0.4 172.16.0.0/12
```

**salt.modules.network.ipaddr** (*interface=None, include_loopback=False, cidr=None, type=None*)
This function is an alias of ip_addrs.
Returns a list of IPv4 addresses assigned to the host. 127.0.0.1 is ignored, unless `include_loopback=True` is indicated. If `interface` is provided, then only IP addresses from that interface will be returned. Providing a CIDR via `cidr="10.0.0.0/8"` will return only the addresses which are within that subnet. If `type` is `public`, then only public addresses will be returned. Ditto for `type='private'.

CLI Example:
```
salt '*' network.ip_addrs
```

**salt.modules.network.ip_addrs6** (*interface=None, include_loopback=False, cidr=None*)
This function is an alias of ip_addrs6.
Returns a list of IPv6 addresses assigned to the host. ::1 is ignored, unless `include_loopback=True` is indicated. If `interface` is provided, then only IP addresses from that interface will be returned. Providing a CIDR via `cidr="2000::/3"` will return only the addresses which are within that subnet.

CLI Example:
```
salt '*' network.ip_addrs6
```

**salt.modules.network.iphexval** (*ip*)
Retrieve the hexadecimal representation of an IP address
New in version 2016.11.0.

CLI Example:
```
salt '*' network.iphexval 10.0.0.1
```

**salt.modules.network.is_loopback** (*ip_addr*)
Check if the given IP address is a loopback address
New in version 2014.7.0.
Changed in version 2015.8.0: IPv6 support

CLI Example:
salt '*' network.is_loopback 127.0.0.1

salt.modules.network.is_private(ip_addr)
Check if the given IP address is a private address
New in version 2014.7.0.
Changed in version 2015.8.0: IPv6 support
CLI Example:
salt '*' network.is_private 10.0.0.3

salt.modules.network.mod bufsize(iface, *args, **kwargs)
Modify network interface buffers (currently linux only)
CLI Example:
salt '*' network.mod bufsize tx=<val> rx=<val> rx-mini=<val> rx-jumbo=<val>

salt.modules.network.mod_hostname(hostname)
Modify hostname
Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS)
CLI Example:
salt '*' network.mod_hostname master.saltstack.com

salt.modules.network.netstat()
Return information on open ports and states

Note: On BSD minions, the output contains PID info (where available) for each netstat entry, fetched from sockstat/fstat output.

Changed in version 2014.1.4: Added support for OpenBSD, FreeBSD, and NetBSD
Changed in version 2015.8.0: Added support for SunOS
Changed in version 2016.11.4: Added support for AIX
CLI Example:
salt '*' network.netstat

salt.modules.network.ping(host, timeout=False, return_boolean=False)
Performs an ICMP ping to a host
Changed in version 2015.8.0: Added support for SunOS
CLI Example:
salt '*' network.ping archlinux.org

New in version 2015.5.0.
Return a True or False instead of ping output.
salt '*' network.ping archlinux.org return_boolean=True
Set the time to wait for a response in seconds.

```
salt '*' network.ping archlinux.org timeout=3
```

**salt.modules.network.reverse_ip(ip_addr)**
Returns the reversed IP address

- **Changed in version 2015.8.0:** IPv6 support

**CLI Example:**
```
salt '*' network.reverse_ip 172.17.0.4
```

**salt.modules.network.routes(family=None)**
Return currently configured routes from routing table

- **Changed in version 2015.8.0:** Added support for SunOS (Solaris 10, Illumos, SmartOS)
- **Changed in version 2016.11.4:** Added support for AIX

**CLI Example:**
```
salt '*' network.routes
```

**salt.modules.network.subnets(interfaces=None)**
Returns a list of IPv4 subnets to which the host belongs

**CLI Example:**
```
salt '*' network.subnets
salt '*' network.subnets interfaces=eth1
```

**salt.modules.network.subnets6()**
Returns a list of IPv6 subnets to which the host belongs

**CLI Example:**
```
salt '*' network.subnets
```

**salt.modules.network.traceroute(host)**
Perform a traceroute to a 3rd party host

- **Changed in version 2015.8.0:** Added support for SunOS
- **Changed in version 2016.11.4:** Added support for AIX

**CLI Example:**
```
salt '*' network.traceroute archlinux.org
```

**salt.modules.network.wol(mac, bcast='255.255.255.255', destport=9)**
Send Wake On Lan packet to a host

**CLI Example:**
```
salt '*' network.wol 08-00-27-13-69-77
salt '*' network.wol 080027136977 255.255.255.255 7
salt '*' network.wol 08:00:27:13:69:77 255.255.255.255 7
```
19.9.255 salt.modules.neutron

Module for handling OpenStack Neutron calls

depends

• neutronclient Python module

configuration This module is not usable until the user, password, tenant, and auth URL are specified either in a pillar or in the minion’s config file. For example:

```yaml
keystone.user: 'admin'
keystone.password: 'password'
keystone.tenant: 'admin'
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/
keystone.region_name: 'RegionOne'
keystone.service_type: 'network'
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles: For example:

```yaml
openstack1:
  keystone.user: 'admin'
  keystone.password: 'password'
  keystone.tenant: 'admin'
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/
  keystone.region_name: 'RegionOne'
  keystone.service_type: 'network'

openstack2:
  keystone.user: 'admin'
  keystone.password: 'password'
  keystone.tenant: 'admin'
  keystone.auth_url: 'http://127.0.0.2:5000/v2.0/
  keystone.region_name: 'RegionOne'
  keystone.service_type: 'network'
```

With this configuration in place, any of the neutron functions can make use of a configuration profile by declaring it explicitly. For example:

```bash
salt '*' neutron.network_list profile=openstack1
```

To use keystoneauth1 instead of keystoneclient, include the use_keystoneauth option in the pillar or minion config.

**Note:** this is required to use keystone v3 as for authentication.

```yaml
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.1:5000/v3/
keystone.region_name: 'RegionOne'
keystone.service_type: 'network'
keystone.use_keystoneauth: true
keystone.verify: '/path/to/custom/certs/ca-bundle.crt'
```
Note: by default the neutron module will attempt to verify its connection utilizing the system certificates. If you need to verify against another bundle of CA certificates or want to skip verification altogether you will need to specify the verify option. You can specify True or False to verify (or not) against system certificates, a path to a bundle or CA certs to check against, or None to allow keystoneauth to search for the certificates on its own.(defaults to True)

salt.modules.neutron.add_gateway_router(router, ext_network, profile=None)
Adds an external network gateway to the specified router

CLI Example:
```
salt '*' neutron.add_gateway_router router-name ext-network-name
```

Parameters

- **router** -- ID or name of the router
- **ext_network** -- ID or name of the external network the gateway
- **profile** -- Profile to build on (Optional)

Returns Added Gateway router information

salt.modules.neutron.add_interface_router(router, subnet, profile=None)
Adds an internal network interface to the specified router

CLI Example:
```
salt '*' neutron.add_interface_router router-name subnet-name
```

Parameters

- **router** -- ID or name of the router
- **subnet** -- ID or name of the subnet
- **profile** -- Profile to build on (Optional)

Returns Added interface information

salt.modules.neutron.create_firewall_rule(protocol, action, profile=None, **kwargs)
Creates a new firewall rule

CLI Example:
```
salt '*' neutron.create_firewall_rule protocol action
          tenant_id= TENANT_ID name= NAME description= DESCRIPTION ip_version= IP_VERSION
          source_ip_address= SOURCE_IP_ADDRESS destination_ip_address= DESTINATION_IP_!
          ADDRESS source_port= SOURCE_PORT destination_port= DESTINATION_PORT shared= SHARED enabled= ENABLED
```

Parameters

- **protocol** -- Protocol for the firewall rule, choose ```tcp``",`'udp","icmp" or ```None````.
- **action** -- Action for the firewall rule, choose ```allow`` or ```deny````.
- **tenant_id** -- The owner tenant ID. (Optional)
- **name** -- Name for the firewall rule. (Optional)
- **description** -- Description for the firewall rule. (Optional)
- **ip_version** -- IP protocol version, default: 4. (Optional)
- **source_ip_address** -- Source IP address or subnet. (Optional)
- **destination_ip_address** -- Destination IP address or subnet. (Optional)
- **source_port** -- Source port (integer in [1, 65535] or range in a:b). (Optional)
- **destination_port** -- Destination port (integer in [1, 65535] or range in a:b). (Optional)
- **shared** -- Set shared to True, default: False. (Optional)
- **enabled** -- To enable this rule, default: True. (Optional)
salt.modules.neutron.create_floatingip(floating_network, port=None, profile=None)

Creates a new floatingIP

CLI Example:

```
salt '*' neutron.create_floatingip network-name port
```

Parameters

- **floating_network** -- Network name or ID to allocate floatingIP from
- **port** -- Of the port to be associated with the floatingIP (Optional)
- **profile** -- Profile to build on (Optional)

Returns

Created floatingIP information

salt.modules.neutron.create_ikepolicy(name, profile=None, **kwargs)

Creates a new IKEPolicy

CLI Example:

```
salt '*' neutron.create_ikepolicy ikepolicy-name
```

Parameters

- **name** -- Name of the IKE policy
- **phase1_negotiation_mode** -- IKE Phase1 negotiation mode in lowercase, default: main (Optional)
- **auth_algorithm** -- Authentication algorithm in lowercase, default: sha1 (Optional)
- **encryption_algorithm** -- Encryption algorithm in lowercase. default: aes-128 (Optional)
- **pfs** -- Perfect Forward Security in lowercase, default: group5 (Optional)
- **units** -- IKE lifetime attribute. default: seconds (Optional)
- **value** -- IKE lifetime attribute. default: 3600 (Optional)
- **ike_version** -- IKE version in lowercase, default: v1 (Optional)
- **profile** -- Profile to build on (Optional)
- **kwargs** --

Returns

Created IKE policy information

salt.modules.neutron.create_ipsec_site_connection(name, ipsecpolicy, ikepolicy, vpnservice, peer_cidrs, peer_address, peer_id, psk, admin_state_up=True, profile=None, **kwargs)

Creates a new IPsecSiteConnection

CLI Example:

```
salt '*' neutron.show_ipsec_site_connection connection-name
```

Parameters

- **name** -- Set friendly name for the connection
- **ipsecpolicy** -- IPsec policy ID or name associated with this connection
- **ikepolicy** -- IKE policy ID or name associated with this connection
- **vpnservice** -- VPN service instance ID or name associated with this connection
- **peer_cidrs** -- Remote subnet(s) in CIDR format
- **peer_address** -- Peer gateway public IPv4/IPv6 address or FQDN
- **peer_id** -- Peer router identity for authentication. Can be IPv4/IPv6 address, email address, key id, or FQDN
- **psk** -- Pre-shared key string
- **initiator** -- Initiator state in lowercase, default: bi-directional
- **admin_state_up** -- Set admin state up to true or false, default: True (Optional)
- **mtu** -- Size for the connection, default: 1500 (Optional)
- **dpd_action** -- Dead Peer Detection attribute: hold/clear/disabled/restart/restart-by-peer (Optional)
- **dpd_interval** -- Dead Peer Detection attribute (Optional)
- **dpd_timeout** -- Dead Peer Detection attribute (Optional)
- **profile** -- Profile to build on (Optional)

Returns: Created IPSec site connection information

```
salt.modules.neutron.create_ipsecpolicy(name, profile=None, **kwargs)
```

Creates a new IPsecPolicy

CLI Example:

```
salt '*' neutron.create_ipsecpolicy ipsecpolicy-name
    transform_protocol=esp auth_algorithm=sha1
    encapsulation_mode=tunnel encryption_algorithm=aes-128
```

Parameters:
- **name** -- Name of the IPSec policy
- **transform_protocol** -- Transform protocol in lowercase, default: esp (Optional)
- **auth_algorithm** -- Authentication algorithm in lowercase, default: sha1 (Optional)
- **encapsulation_mode** -- Encapsulation mode in lowercase, default: tunnel (Optional)
- **encryption_algorithm** -- Encryption algorithm in lowercase, default: aes-128 (Optional)
- **pfs** -- Perfect Forward Security in lowercase, default: group5 (Optional)
- **units** -- IPSec lifetime attribute. default: seconds (Optional)
- **value** -- IPSec lifetime attribute. default: 3600 (Optional)
- **profile** -- Profile to build on (Optional)

Returns: Created IPSec policy information

```
salt.modules.neutron.create_network(name, router_ext=None, admin_state_up=True, network_type=None, physical_network=None, segmentation_id=None, shared=None, profile=None)
```

Creates a new network

CLI Example:

```
salt '*' neutron.create_network network-name
salt '*' neutron.create_network network-name profile=openstack1
```

Parameters:
- **name** -- Name of network to create
- **admin_state_up** -- should the state of the network be up? default: True (Optional)
- **router_ext** -- True then if create the external network (Optional)
- **network_type** -- The Type of network that the provider is such as GRE, VXLAN, VLAN, FLAT, or LOCAL (Optional)
- **physical_network** -- The name of the physical network as neutron knows it (Optional)
- **segmentation_id** -- The vlan id or GRE id (Optional)
• **shared** -- is the network shared or not (Optional)
• **profile** -- Profile to build on (Optional)

**Returns** Created network information

```python
salt.modules.neutron.create_port(name, network, device_id=None, admin_state_up=True, profile=None)
```

Creates a new port

**CLI Example:**

```
salt '*' neutron.create_port network-name port-name
```

**Parameters**

• **name** -- Name of port to create
• **network** -- Network name or ID
• **device_id** -- ID of device (Optional)
• **admin_state_up** -- Set admin state up to true or false, default: true (Optional)
• **profile** -- Profile to build on (Optional)

**Returns** Created port information

```python
salt.modules.neutron.create_router(name, ext_network=None, admin_state_up=True, profile=None)
```

Creates a new router

**CLI Example:**

```
salt '*' neutron.create_router new-router-name
```

**Parameters**

• **name** -- Name of router to create (must be first)
• **ext_network** -- ID or name of the external for the gateway (Optional)
• **admin_state_up** -- Set admin state up to true or false, default: true (Optional)
• **profile** -- Profile to build on (Optional)

**Returns** Created router information

```python
salt.modules.neutron.create_security_group(name=None, description=None, profile=None)
```

Creates a new security group

**CLI Example:**

```
salt '*' neutron.create_security_group security-group-name
```

**Parameters**

• **name** -- Name of security group (Optional)
• **description** -- Description of security group (Optional)
• **profile** -- Profile to build on (Optional)

**Returns** Created security group information

```python
salt.modules.neutron.create_security_group_rule(security_group, remote_group_id=None, direction='ingress', protocol=None, port_range_min=None, port_range_max=None, ethertype='IPv4', profile=None)
```

Creates a new security group rule

**CLI Example:**
salt '*' neutron.show_security_group_rule security-group-rule-id

Parameters
- **security_group** -- Security group name or ID to add rule
- **remote_group_id** -- Remote security group name or ID to apply rule (Optional)
- **direction** -- Direction of traffic: ingress/egress, default: ingress (Optional)
- **protocol** -- Protocol of packet: null/icmp/tcp/udp, default: null (Optional)
- **port_range_min** -- Starting port range (Optional)
- **port_range_max** -- Ending port range (Optional)
- **ethertype** -- IPv4/IPv6, default: IPv4 (Optional)
- **profile** -- Profile to build on (Optional)

Returns
Created security group rule information

salt.modules.neutron.create_subnet(network, cidr, name=None, ip_version=4, profile=None)

Creates a new subnet

CLI Example:

```
salt '*' neutron.create_subnet network-name 192.168.1.0/24
```

Parameters
- **network** -- Network ID or name this subnet belongs to
- **cidr** -- CIDR of subnet to create (Ex. `192.168.1.0/24')
- **name** -- Name of the subnet to create (Optional)
- **ip_version** -- Version to use, default is 4(IPv4) (Optional)
- **profile** -- Profile to build on (Optional)

Returns
Created subnet information

salt.modules.neutron.create_vpnservice(subnet, router, name, admin_state_up=True, profile=None)

Creates a new VPN service

CLI Example:

```
salt '*' neutron.create_vpnservice router-name name
```

Parameters
- **subnet** -- Subnet unique identifier for the VPN service deployment
- **router** -- Router unique identifier for the VPN service
- **name** -- Set a name for the VPN service
- **admin_state_up** -- Set admin state up to true or false, default:True (Optional)
- **profile** -- Profile to build on (Optional)

Returns
Created VPN service information

salt.modules.neutron.delete_firewall_rule(firewall_rule, profile=None)

Deletes the specified firewall rule

CLI Example:

```
salt '*' neutron.delete_firewall_rule firewall-rule
```

Parameters
- **firewall_rule** -- ID or name of firewall rule to delete
- **profile** -- Profile to build on (Optional)

Returns
True(Succeed) or False

salt.modules.neutron.delete_floatingip(floatingip_id, profile=None)

Deletes the specified floating IP
CLI Example:

```
salt '*' neutron.delete_floatingip floatingip-id
```

**Parameters**

- **floatingip_id** -- ID of floatingIP to delete
- **profile** -- Profile to build on (Optional)

**Returns** True(Succeed) or False

```
salt.modules.neutron.delete_ikepolicy(ikepolicy, profile=None)
```

Deletes the specified IKEPolicy

CLI Example:

```
salt '*' neutron.delete_ikepolicy ikepolicy-name
```

**Parameters**

- **ikepolicy** -- ID or name of IKE policy to delete
- **profile** -- Profile to build on (Optional)

**Returns** True(Succeed) or False

```
salt.modules.neutron.delete_ipsec_site_connection(ipsec_site_connection, profile=None)
```

Deletes the specified IPsecSiteConnection

CLI Example:

```
salt '*' neutron.delete_ipsec_site_connection connection-name
```

**Parameters**

- **ipsec_site_connection** -- ID or name of ipsec site connection to delete
- **profile** -- Profile to build on (Optional)

**Returns** True(Succeed) or False

```
salt.modules.neutron.delete_ipsecpolicy(ipsecpolicy, profile=None)
```

Deletes the specified IPsecPolicy

CLI Example:

```
salt '*' neutron.delete_ipsecpolicy ipsecpolicy-name
```

**Parameters**

- **ipsecpolicy** -- ID or name of IPSec policy to delete
- **profile** -- Profile to build on (Optional)

**Returns** True(Succeed) or False

```
salt.modules.neutron.delete_network(network, profile=None)
```

Deletes the specified network

CLI Example:

```
salt '*' neutron.delete_network network-name
salt '*' neutron.delete_network network-name profile=openstack1
```

**Parameters**

- **network** -- ID or name of network to delete
- **profile** -- Profile to build on (Optional)

**Returns** True(Succeed) or False
salt.modules.neutron.delete_port(port, profile=None)
    Deletes the specified port
    CLI Example:
    
    salt '*' neutron.delete_network port-name
    salt '*' neutron.delete_network port-name profile=openstack1

    Parameters
    - **port** -- port name or ID
    - **profile** -- Profile to build on (Optional)
    Returns True(Succeed) or False

salt.modules.neutron.delete_quota(tenant_id, profile=None)
    Delete the specified tenant's quota value
    CLI Example:
    
    salt '*' neutron.update_quota tenant-id
    salt '*' neutron.update_quota tenant-id profile=openstack1

    Parameters
    - **tenant_id** -- ID of tenant to quota delete
    - **profile** -- Profile to build on (Optional)
    Returns True(Delete succeed) or False(Delete failed)

salt.modules.neutron.delete_router(router, profile=None)
    Delete the specified router
    CLI Example:
    
    salt '*' neutron.delete_router router-name

    Parameters
    - **router** -- ID or name of router to delete
    - **profile** -- Profile to build on (Optional)
    Returns True(Succeed) or False

salt.modules.neutron.delete_security_group(security_group, profile=None)
    Deletes the specified security group
    CLI Example:
    
    salt '*' neutron.delete_security_group security-group-name

    Parameters
    - **security_group** -- ID or name of security group to delete
    - **profile** -- Profile to build on (Optional)
    Returns True(Succeed) or False

salt.modules.neutron.delete_security_group_rule(security_group_rule_id, profile=None)
    Deletes the specified security group rule
    CLI Example:
    
    salt '*' neutron.delete_security_group_rule security-group-rule-id

    Parameters
    - **security_group_rule_id** -- ID of security group rule to delete
    - **profile** -- Profile to build on (Optional)
Returns True(Succeed) or False

salt.modules.neutron.delete_subnet(subnet, profile=None)
Deletes the specified subnet

CLI Example:

```
salt '*' neutron.delete_subnet subnet-name
salt '*' neutron.delete_subnet subnet-name profile=openstack1
```

Parameters
- **subnet** -- ID or name of subnet to delete
- **profile** -- Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.delete_vpnservice(vpnservice, profile=None)
Deletes the specified VPN service

CLI Example:

```
salt '*' neutron.delete_vpnservice vpnservice-name
```

Parameters
- **vpnservice** -- ID or name of vpn service to delete
- **profile** -- Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.get_quotas_tenant(profile=None)
Fetches tenant info in server's context for following quota operation

CLI Example:

```
salt '*' neutron.get_quotas_tenant
salt '*' neutron.get_quotas_tenant profile=openstack1
```

Parameters **profile** -- Profile to build on (Optional)
Returns Quotas information

salt.modules.neutron.list_agents(profile=None)
List agents.

CLI Example:

```
salt '*' neutron.list_agents
```

Parameters **profile** -- Profile to build on (Optional)
Returns agents message.

salt.modules.neutron.list_extensions(profile=None)
Fetches a list of all extensions on server side

CLI Example:

```
salt '*' neutron.list_extensions
salt '*' neutron.list_extensions profile=openstack1
```

Parameters **profile** -- Profile to build on (Optional)
Returns List of extensions

salt.modules.neutron.list_firewall_rules(profile=None)
Fetches a list of all firewall rules for a tenant

CLI Example:
salt '*' neutron.list_firewall_rules

**Parameters**  
*profile* -- Profile to build on (Optional)  

**Returns**  
List of firewall rules

salt.modules.neutron.list_firewalls(profile=None)

Fetches a list of all firewalls for a tenant  

CLI Example:

```bash
salt '*' neutron.list_firewalls
```

**Parameters**  
*profile* -- Profile to build on (Optional)  

**Returns**  
List of firewalls

salt.modules.neutron.list_floatingips(profile=None)

Fetch a list of all floatingIPs for a tenant  

CLI Example:

```bash
salt '*' neutron.list_floatingips
salt '*' neutron.list_floatingips profile=openstack1
```

**Parameters**  
*profile* -- Profile to build on (Optional)  

**Returns**  
List of floatingIP

salt.modules.neutron.list_ikepolicies(profile=None)

Fetches a list of all configured IKE Policies for a tenant  

CLI Example:

```bash
salt '*' neutron.list_ikepolicies
salt '*' neutron.list_ikepolicies profile=openstack1
```

**Parameters**  
*profile* -- Profile to build on (Optional)  

**Returns**  
List of IKE Policy

salt.modules.neutron.list_ipsec_site_connections(profile=None)

Fetches all configured IPsec Site Connections for a tenant  

CLI Example:

```bash
salt '*' neutron.list_ipsec_site_connections
salt '*' neutron.list_ipsec_site_connections profile=openstack1
```

**Parameters**  
*profile* -- Profile to build on (Optional)  

**Returns**  
List of IPSec site connection

salt.modules.neutron.list_ipsecpolicies(profile=None)

Fetches a list of all configured IPsec Policies for a tenant  

CLI Example:

```bash
salt '*' neutron.list_ipsecpolicies ipsecpolicy-name
salt '*' neutron.list_ipsecpolicies ipsecpolicy-name profile=openstack1
```

**Parameters**  
*profile* -- Profile to build on (Optional)  

**Returns**  
List of IPSec policy

salt.modules.neutron.list_l3_agent_hosting_routers(router, profile=None)

List L3 agents hosting a router.

CLI Example:
salt '*' neutron.list_l3_agent_hosting_routers router

:param router: router name or ID to query. :param profile: Profile to build on (Optional) :return: L3 agents message.

salt.modules.neutron.list_networks(profile=None)
Fetched a list of all networks for a tenant

CLI Example:
	salt '*' neutron.list_networks
	salt '*' neutron.list_networks profile=openstack1

Parameters

profile -- Profile to build on (Optional)

Returns

List of network

salt.modules.neutron.list_ports(profile=None)
Fetched a list of all networks for a tenant

CLI Example:
	salt '*' neutron.list_ports
	salt '*' neutron.list_ports profile=openstack1

Parameters

profile -- Profile to build on (Optional)

Returns

List of port

salt.modules.neutron.list_quotas(profile=None)
Fetched all tenants quotas

CLI Example:
	salt '*' neutron.list_quotas
	salt '*' neutron.list_quotas profile=openstack1

Parameters

profile -- Profile to build on (Optional)

Returns

List of quotas

salt.modules.neutron.list_routers(profile=None)
Fetched a list of all routers for a tenant

CLI Example:
	salt '*' neutron.list_routers
	salt '*' neutron.list_routers profile=openstack1

Parameters

profile -- Profile to build on (Optional)

Returns

List of router

salt.modules.neutron.list_security_group_rules(profile=None)
Fetched a list of all security group rules for a tenant

CLI Example:
	salt '*' neutron.list_security_group_rules
	salt '*' neutron.list_security_group_rules profile=openstack1

Parameters

profile -- Profile to build on (Optional)

Returns

List of security group rule
salt.modules.neutron.list_security_groups(profile=None)
Fetched a list of all security groups for a tenant

CLI Example:
```
salt '*' neutron.list_security_groups
salt '*' neutron.list_security_groups profile=openstack1
```

**Parameters**
- **profile** -- Profile to build on (Optional)

**Returns**
List of security group

salt.modules.neutron.list_subnets(profile=None)
Fetched a list of all networks for a tenant

CLI Example:
```
salt '*' neutron.list_subnets
salt '*' neutron.list_subnets profile=openstack1
```

**Parameters**
- **profile** -- Profile to build on (Optional)

**Returns**
List of subnet

salt.modules.neutron.list_vpnservices(retrieve_all=True, profile=None, **kwargs)
Fetched a list of all configured VPN services for a tenant

CLI Example:
```
salt '*' neutron.list_vpnservices
```

**Parameters**
- **retrieve_all** -- True or False, default: True (Optional)
- **profile** -- Profile to build on (Optional)

**Returns**
List of VPN service

salt.modules.neutron.remove_gateway_router(router, profile=None)
Removes an external network gateway from the specified router

CLI Example:
```
salt '*' neutron.remove_gateway_router router-name
```

**Parameters**
- **router** -- ID or name of router
- **profile** -- Profile to build on (Optional)

**Returns**
True(Succeed) or False

salt.modules.neutron.remove_interface_router(router, subnet, profile=None)
Removes an internal network interface from the specified router

CLI Example:
```
salt '*' neutron.remove_interface_router router-name subnet-name
```

**Parameters**
- **router** -- ID or name of the router
- **subnet** -- ID or name of the subnet
- **profile** -- Profile to build on (Optional)

**Returns**
True(Succeed) or False
Salt Documentation, Release 2017.7.8

salt.modules.neutron.show_firewall(firewall, profile=None)
Fetches information of a specific firewall rule

CLI Example:

```
salt '*' neutron.show_firewall firewall
```

Parameters
- **firewall** -- ID or name of firewall to look up
- **profile** -- Profile to build on (Optional)

Returns firewall information

salt.modules.neutron.show_firewall_rule(firewall_rule, profile=None)
Fetches information of a specific firewall rule

CLI Example:

```
salt '*' neutron.show_firewall_rule firewall-rule-name
```

Parameters
- **ipsecpolicy** -- ID or name of firewall rule to look up
- **profile** -- Profile to build on (Optional)

Returns firewall rule information

salt.modules.neutron.show_floatingip(floatingip_id, profile=None)
Fetches information of a certain floatingIP

CLI Example:

```
salt '*' neutron.show_floatingip floatingip-id
```

Parameters
- **floatingip_id** -- ID of floatingIP to look up
- **profile** -- Profile to build on (Optional)

Returns Floating IP information

salt.modules.neutron.show_ikepolicy(ikepolicy, profile=None)
Fetches information of a specific IKEPolicy

CLI Example:

```
salt '*' neutron.show_ikepolicy ikepolicy-name
```

Parameters
- **ikepolicy** -- ID or name of ikepolicy to look up
- **profile** -- Profile to build on (Optional)

Returns IKE policy information

salt.modules.neutron.show_ipsec_site_connection(ipsec_site_connection, profile=None)
Fetches information of a specific IPsecSiteConnection

CLI Example:

```
salt '*' neutron.show_ipsec_site_connection connection-name
```

Parameters
- **ipsec_site_connection** -- ID or name of ipsec site connection to look up
- **profile** -- Profile to build on (Optional)

Returns IPSec site connection information
salt.modules.neutron.show_ipsecpolicy(ipsecpolicy, profile=None)
Fetches information of a specific IPsecPolicy

CLI Example:
```
salt '*' neutron.show_ipsecpolicy ipsecpolicy-name
```

Parameters
- **ipsecpolicy** -- ID or name of IPsec policy to look up
- **profile** -- Profile to build on (Optional)

Returns  IPSec policy information

salt.modules.neutron.show_network(network, profile=None)
Fetches information of a certain network

CLI Example:
```
salt '*' neutron.show_network network-name
salt '*' neutron.show_network network-name profile=openstack1
```

Parameters
- **network** -- ID or name of network to look up
- **profile** -- Profile to build on (Optional)

Returns  Network information

salt.modules.neutron.show_port(port, profile=None)
Fetches information of a certain port

CLI Example:
```
salt '*' neutron.show_port port-id
salt '*' neutron.show_port port-id profile=openstack1
```

Parameters
- **port** -- ID or name of port to look up
- **profile** -- Profile to build on (Optional)

Returns  Port information

salt.modules.neutron.show_quota(tenant_id, profile=None)
Fetches information of a certain tenant’s quotas

CLI Example:
```
salt '*' neutron.show_quota tenant-id
salt '*' neutron.show_quota tenant-id profile=openstack1
```

Parameters
- **tenant_id** -- ID of tenant
- **profile** -- Profile to build on (Optional)

Returns  Quota information

salt.modules.neutron.show_router(router, profile=None)
Fetches information of a certain router

CLI Example:
```
salt '*' neutron.show_router router-name
```

Parameters
- **router** -- ID or name of router to look up
• **profile** -- Profile to build on (Optional)

    Returns  Router information

salt.modules.neutron.show_security_group(security_group, profile=None)

Fetches information of a certain security group

    CLI Example:

```
salt '*' neutron.show_security_group security-group-name
```

Parameters

• **security_group** -- ID or name of security group to look up
• **profile** -- Profile to build on (Optional)

    Returns  Security group information

salt.modules.neutron.show_security_group_rule(security_group_rule_id, profile=None)

Fetches information of a certain security group rule

    CLI Example:

```
salt '*' neutron.show_security_group_rule security-group-rule-id
```

Parameters

• **security_group_rule_id** -- ID of security group rule to look up
• **profile** -- Profile to build on (Optional)

    Returns  Security group rule information

salt.modules.neutron.show_subnet(subnet, profile=None)

Fetches information of a certain subnet

    CLI Example:

```
salt '*' neutron.show_subnet subnet-name
```

Parameters

• **subnet** -- ID or name of subnet to look up
• **profile** -- Profile to build on (Optional)

    Returns  Subnet information

salt.modules.neutron.show_vpnservice(vpnservice, profile=None, **kwargs)

Fetches information of a specific VPN service

    CLI Example:

```
salt '*' neutron.show_vpnservice vpnservice-name
```

Parameters

• **vpnservice** -- ID or name of vpn service to look up
• **profile** -- Profile to build on (Optional)

    Returns  VPN service information

salt.modules.neutron.update_firewall_rule(firewall_rule, protocol=None, action=None, name=None, description=None, ip_version=None, source_ip_address=None, destination_ip_address=None, source_port=None, destination_port=None, shared=None, enabled=None, profile=None)

Update a firewall rule

    CLI Example:
salt 'id' neutron.update_firewall_rule firewall_rule protocol=PROTOCOL
  --action=ACTION
  name=NAME description=DESCRIPTION ip_version=IP_VERSION
  source_ip_address=SOURCE_IP_ADDRESS destination_ip_address=DESTINATION_IP_
  --ADDRESS
  source_port=SOURCE_PORT destination_port=DESTINATION_PORT shared=SHARED
  --enabled=ENABLED

Parameters

- **firewall_rule** -- ID or name of firewall rule to update.
- **protocol** -- Protocol for the firewall rule, choose `"tcp","udp","icmp"` or `"None"`. (Optional)
- **action** -- Action for the firewall rule, choose `"allow"` or `"deny"`. (Optional)
- **name** -- Name for the firewall rule. (Optional)
- **description** -- Description for the firewall rule. (Optional)
- **ip_version** -- IP protocol version, default: 4. (Optional)
- **source_ip_address** -- Source IP address or subnet. (Optional)
- **destination_ip_address** -- Destination IP address or subnet. (Optional)
- **source_port** -- Source port (integer in [1, 65535] or range in a:b). (Optional)
- **destination_port** -- Destination port (integer in [1, 65535] or range in a:b). (Optional)
- **shared** -- Set shared to True, default: False. (Optional)
- **enabled** -- To enable this rule, default: True. (Optional)
- **profile** -- Profile to build on. (Optional)

salt.modules.neutron.updateFloatingIP(floatingip_id, port=None, profile=None)

Updates a floatingIP

CLI Example:

```bash
salt '*' neutron.updateFloatingIP network-name port-name
```

Parameters

- **floatingip_id** -- ID of floatingIP
- **port** -- ID or name of port, to associate floatingip to None or do not specify to disassociate the floatingip (Optional)
- **profile** -- Profile to build on. (Optional)

Returns Value of updated floating IP information

salt.modules.neutron.updateNetwork(network, name, profile=None)

Updates a network

CLI Example:

```bash
salt '*' neutron.updateNetwork network-name new-network-name
```

Parameters

- **network** -- ID or name of network to update
- **name** -- Name of this network
- **profile** -- Profile to build on. (Optional)

Returns Value of updated network information

salt.modules.neutron.updatePort(port, name, admin_state_up=True, profile=None)

Updates a port

CLI Example:
salt '*' neutron.update_port port-name network-name new-port-name

Parameters
- **port** -- Port name or ID
- **name** -- Name of this port
- **admin_state_up** -- Set admin state up to true or false, default: true (Optional)
- **profile** -- Profile to build on (Optional)

Returns Value of updated port information

salt.modules.neutron.update_quota(tenant_id, subnet=None, router=None, network=None, floatingip=None, port=None, security_group=None, security_group_rule=None, profile=None)

Update a tenant's quota

CLI Example:
salt '*' neutron.update_quota tenant-id subnet=40 router=50 network=10 floatingip=30 port=30

Parameters
- **tenant_id** -- ID of tenant
- **subnet** -- Value of subnet quota (Optional)
- **router** -- Value of router quota (Optional)
- **network** -- Value of network quota (Optional)
- **floatingip** -- Value of floatingip quota (Optional)
- **port** -- Value of port quota (Optional)
- **security_group** -- Value of security group (Optional)
- **security_group_rule** -- Value of security group rule (Optional)
- **profile** -- Profile to build on (Optional)

Returns Value of updated quota

salt.modules.neutron.update_router(router, name=None, admin_state_up=None, profile=None, **kwargs)

Updates a router

CLI Example:
salt '*' neutron.update_router router_id name=new-router-name admin_state_up=True

Parameters
- **router** -- ID or name of router to update
- **name** -- Name of this router
- **ext_network** -- ID or name of the external for the gateway (Optional)
- **admin_state_up** -- Set admin state up to true or false, default: true (Optional)
- **profile** -- Profile to build on (Optional)
- **kwargs** --

Returns Value of updated router information

salt.modules.neutron.update_security_group(security_group, name=None, description=None, profile=None)

Updates a security group

CLI Example:
salt '*' neutron.update_security_group security-group-name new-security-group-name
Parameters

- security_group -- ID or name of security group to update
- name -- Name of this security group (Optional)
- description -- Description of security group (Optional)
- profile -- Profile to build on (Optional)

Returns Value of updated security group information

salt.modules.neutron.update_subnet(subnet, name, profile=None)

Updates a subnet

CLI Example:
```
salt '*' neutron.update_subnet subnet-name new-subnet-name
```

Parameters

- subnet -- ID or name of subnet to update
- name -- Name of this subnet
- profile -- Profile to build on (Optional)

Returns Value of updated subnet information

salt.modules.neutron.update_vpnservice(vpnservice, desc, profile=None)

Updates a VPN service

CLI Example:
```
salt '*' neutron.update_vpnservice vpnservice-name desc='VPN Service1'
```

Parameters

- vpnservice -- ID or name of vpn service to update
- desc -- Set a description for the VPN service
- profile -- Profile to build on (Optional)

Returns Value of updated VPN service information

19.9.256 salt.modules.nfs3

Module for managing NFS version 3.

salt.modules.nfs3.del_export(exports='/etc/exports', path=None)

Remove an export

CLI Example:
```
salt '*' nfs.del_export /media/storage
```

salt.modules.nfs3.list_exports(exports='/etc/exports')

List configured exports

CLI Example:
```
salt '*' nfs.list_exports
```

19.9.257 salt.modules.nftables

Support for nftables

salt.modules.nftables.append(table='filter', chain=None, rule=None, family='ipv4')

Append a rule to the specified table & chain.
This function accepts a rule in a standard nftables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

**CLI Example:**

```bash
salt '*' nftables.append filter input \
    rule='input tcp dport 22 log accept'
IPv6:
salt '*' nftables.append filter input \
    rule='input tcp dport 22 log accept' \
    family=ipv6
```

`salt.modules.nftables.build_rule(table=None, chain=None, command=None, position=None, full=None, family='ipv4', **kwargs)`

Build a well-formatted nftables rule based on kwargs. A table and chain are not required, unless full is True.

If full is True, then table, chain and command are required. command may be specified as either insert, append, or delete. This will return the nftables command, exactly as it would be used from the command line.

If a position is required (as with insert or delete), it may be specified as position. This will only be useful if full is True.

If connstate is passed in, it will automatically be changed to state.

**CLI Examples:**

```bash
salt '*' nftables.build_rule match=state \
    connstate=RELATED,ESTABLISHED jump=ACCEPT
salt '*' nftables.build_rule filter input command=insert position=3 \
    full=True match=state state=related,established jump=accept
IPv6:
salt '*' nftables.build_rule match=state \
    connstate=related,established jump=accept \
    family=ipv6
salt '*' nftables.build_rule filter input command=insert position=3 \
    full=True match=state state=related,established jump=accept \
    family=ipv6
```

`salt.modules.nftables.check(table='filter', chain=None, rule=None, family='ipv4')`

Check for the existence of a rule in the table and chain

This function accepts a rule in a standard nftables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

**CLI Example:**

```bash
salt '*' nftables.check filter input \
    rule='input tcp dport 22 log accept'
IPv6:
salt '*' nftables.check filter input \
    rule='input tcp dport 22 log accept' \
    family=ipv6
```

`salt.modules.nftables.check_chain(table='filter', chain=None, family='ipv4')`

New in version 2014.7.0.

Check for the existence of a chain in the table
CLI Example:

```python
salt '*' nftables.check_chain filter input
IPv6:
salt '*' nftables.check_chain filter input family=ipv6
```

**salt.modules.nftables.check_table**

*table=None, family='ipv4'*

Check for the existence of a table

CLI Example:

```python
salt '*' nftables.check_table nat
```

**salt.modules.nftables.delete**

*table, chain=None, position=None, rule=None, family='ipv4'*

Delete a rule from the specified table & chain, specifying either the rule in its entirety, or the rule's position in the chain.

This function accepts a rule in a standard nftables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Examples:

```python
salt '*' nftables.delete filter input position=3
salt '*' nftables.delete filter input " rule='input tcp dport 22 log accept'"
IPv6:
salt '*' nftables.delete filter input position=3 family=ipv6
salt '*' nftables.delete filter input " rule='input tcp dport 22 log accept' " family=ipv6
```

**salt.modules.nftables.delete_chain**

*table='filter', chain=None, family='ipv4'*

New in version 2014.7.0.

Delete the chain from the specified table.

CLI Example:

```python
salt '*' nftables.delete_chain filter
salt '*' nftables.delete_chain filter foo
IPv6:
salt '*' nftables.delete_chain filter family=ipv6
salt '*' nftables.delete_chain filter foo family=ipv6
```

**salt.modules.nftables.delete_table**

*table, family='ipv4'*

New in version 2014.7.0.

Create new custom table.

CLI Example:

```python
salt '*' nftables.delete_table filter
```
salt.modules.nftables.delete_table filter family=ipv6

salt.modules.nftables.flush(table='filter', chain='*', family='ipv4')
Flush the chain in the specified table, flush all chains in the specified table if chain is not specified.

salt '*' nftables.flush filter
salt '*' nftables.flush filter input
IPv6:
salt '*' nftables.flush filter input family=ipv6

salt.modules.nftables.get_rule_handle(table='filter', chain=None, rule=None, family='ipv4')
Get the handle for a particular rule
This function accepts a rule in a standard nftables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

salt '*' nftables.get_rule_handle filter input
  rule='input tcp dport 22 log accept'
IPv6:
salt '*' nftables.get_rule_handle filter input
  rule='input tcp dport 22 log accept'
  family=ipv6

salt.modules.nftables.get_rules(family='ipv4')
Return a data structure of the current, in-memory rules

salt '*' nftables.get_rules
salt '*' nftables.get_rules family=ipv6

salt.modules.nftables.get_saved_rules(conf_file=None, family='ipv4')
Return a data structure of the rules in the conf file

salt '*' nftables.get_saved_rules

salt.modules.nftables.insert(table='filter', chain=None, position=None, rule=None, family='ipv4')
Insert a rule into the specified table & chain, at the specified position.
If position is not specified, rule will be inserted in first position.
This function accepts a rule in a standard nftables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

salt '*' nftables.insert filter input
  rule='input tcp dport 22 log accept'
salt.nftables.insert filter input position=3 \
    rule='input tcp dport 22 log accept'

IPv6:
salt.nftables.insert filter input \
    rule='input tcp dport 22 log accept' \
    family=ipv6

salt.nftables.insert filter input position=3 \
    rule='input tcp dport 22 log accept' \
    family=ipv6

salt.modules.nftables.new_chain(table='filter', chain=None, table_type=None, hook=None, priority=None, family='ipv4')
New in version 2014.7.0.
Create new chain to the specified table.
CLI Example:
salt.nftables.new_chain filter input
salt.nftables.new_chain filter input \
    table_type=filter hook=input priority=0
salt.nftables.new_chain filter foo

IPv6:
salt.nftables.new_chain filter input family=ipv6
salt.nftables.new_chain filter input \
    table_type=filter hook=input priority=0 family=ipv6
salt.nftables.new_chain filter foo family=ipv6

salt.modules.nftables.new_table(table='filter', family='ipv4')
New in version 2014.7.0.
Create new custom table.
CLI Example:
salt.nftables.new_table filter

IPv6:
salt.nftables.new_table filter family=ipv6

salt.modules.nftables.save(filename=None, family='ipv4')
Save the current in-memory rules to disk
CLI Example:
salt.nftables.save /etc/nftables

salt.modules.nftables.version()
Return version from nftables --version
CLI Example:
19.9.258 salt.modules.nginx

Support for nginx

salt.modules.nginx.build_info()
Return server and build arguments

CLI Example:

```python
salt '*' nginx.build_info
```

salt.modules.nginx.configtest()

See configuration and exit

CLI Example:

```python
salt '*' nginx.configtest
```

salt.modules.nginx.signal(signal=None)
Signals nginx to start, reload, reopen or stop.

CLI Example:

```python
salt '*' nginx.signal reload
```

salt.modules.nginx.status(url='http://127.0.0.1/status')

Return the data from an Nginx status page as a dictionary.

URL The URL of the status page. Defaults to `http://127.0.0.1/status`

CLI Example:

```python
salt '*' nginx.status
```

salt.modules.nginx.version()

Return server version from nginx -v

CLI Example:

```python
salt '*' nginx.version
```

19.9.259 salt.modules.nilrt_ip module

The networking module for NI Linux Real-Time distro

salt.modules.nilrt_ip.apply_network_settings(**settings)
Apply global network configuration.

CLI Example:

```python
salt '*' ip.apply_network_settings
```

salt.modules.nilrt_ip.build_interface(iface, iface_type, enable, **settings)
Build an interface script for a network interface.

CLI Example:
```python
salt '*' ip.build_interface eth0 eth <settings>
```

```python
salt.modules.nilrt_ip.build_network_settings(**settings)
    Build the global network script.
    CLI Example:
    ```
salt '*' ip.build_network_settings <settings>
    ```
```

```python
salt.modules.nilrt_ip.disable(interface)
    Disable the specified interface
    Parameters
        interface (str) -- interface label
    Returns
        True if the service was disabled, otherwise an exception will be thrown.
    Return type
        bool
    CLI Example:
    ```
salt '*' ip.disable interface-label
    ```
```

```python
salt.modules.nilrt_ip.down(interface, iface_type=None)
    Disable the specified interface
    Parameters
        interface (str) -- interface label
    Returns
        True if the service was disabled, otherwise an exception will be thrown.
    Return type
        bool
    CLI Example:
    ```
salt '*' ip.down interface-label
    ```
```

```python
salt.modules.nilrt_ip.enable(interface)
    Enable the specified interface
    Parameters
        interface (str) -- interface label
    Returns
        True if the service was enabled, otherwise an exception will be thrown.
    Return type
        bool
    CLI Example:
    ```
salt '*' ip.enable interface-label
    ```
```

```python
salt.modules.nilrt_ip.get_interface(iface)
    Returns details about given interface.
    CLI Example:
    ```
salt '*' ip.get_interface eth0
    ```
```

```python
salt.modules.nilrt_ip.get_interfaces_details()
    Get details about all the interfaces on the minion
    Returns
        information about all connmans interfaces
    Return type
        dictionary
    CLI Example:
    ```
salt '*' ip.get_interfaces_details
    ```
```

```python
salt.modules.nilrt_ip.get_network_settings()
    Return the contents of the global network script.
    CLI Example:
    ```
```
salt '*' ip.get_network_settings

salt.modules.nilrt_ip.set_dhcp_linklocal_all(interface)
Configure specified adapter to use DHCP with linklocal fallback
   Parameters interface (str) -- interface label
   Returns True if the settings were applied, otherwise an exception will be thrown.
   Return type bool
   CLI Example:
   
   salt '*' ip.dhcp_linklocal_all interface-label

salt.modules.nilrt_ip.set_static_all(interface, address, netmask, gateway, domains)
Configure specified adapter to use ipv4 manual settings
   Parameters
     • interface (str) -- interface label
     • address (str) -- ipv4 address
     • netmask (str) -- ipv4 netmask
     • gateway (str) -- ipv4 gateway
     • domains (str) -- list of domains servers separated by spaces
   Returns True if the settings were applied, otherwise an exception will be thrown.
   Return type bool
   CLI Example:
   
   salt '*' ip.dhcp_linklocal_all interface-label address netmask gateway domains

salt.modules.nilrt_ip.up(interface, iface_type=None)
Enable the specified interface
   Parameters interface (str) -- interface label
   Returns True if the service was enabled, otherwise an exception will be thrown.
   Return type bool
   CLI Example:

   salt '*' ip.up interface-label

19.9.260 salt.modules.nix

Work with Nix packages

New in version 2017.7.0.

Does not require the machine to be Nixos, just have Nix installed and available to use for the user running this command. Their profile must be located in their home, under $HOME/.nix-profile/, and the nix store, unless specially set up, should be in /nix. To easily use this with multiple users or a root user, set up the nix-daemon.

This module exposes most of the common nix operations. Currently not meant to be run as a pkg module, but explicitly as nix.*.

For more information on nix, see the nix documentation.

salt.modules.nix.collect_garbage()
Completely removed all currently `uninstalled' packages in the nix store.
   Tells the user how many store paths were removed and how much space was freed.
   Returns How much space was freed and how many derivations were removed
   Return type str
Warning: This is a destructive action on the nix store.

```python
salt '*' nix.collect_garbage
```

```python
salt.modules.nix.install(*pkgs, **kwargs)
Installs a single or multiple packages via nix
Parameters
  • `pkgs` (list(str)) -- packages to update
  • `attributes` (bool) -- Pass the list of packages or single package as attributes, not
    package names. default: False
Returns Installed packages. Example element: gcc-3.3.2
Return type list(str)
```

```python
salt '*' nix.install package [package2 ...]
salt '*' nix.install attributes=True attr.name [attr.name2 ...]
```

```python
salt.modules.nix.list_pkgs(installed=True, attributes=True)
Lists installed packages. Due to how nix works, it defaults to just doing a nix-env -q.
Parameters
  • `installed` (bool) -- list only installed packages. This can be a very long list
    (12,000+ elements), so caution is advised. Default: True
  • `attributes` (bool) -- show the attributes of the packages when listing all pack-
    ages. Default: True
Returns Packages installed or available, along with their attributes.
Return type list(list(str))
```

```python
salt '*' nix.list_pkgs
salt '*' nix.list_pkgs installed=False
```

```python
salt.modules.nix.uninstall(*pkgs)
Erases a package from the current nix profile. Nix uninstalls work differently than other package managers,
and the symlinks in the profile are removed, while the actual package remains. There is also a nix.purge
function, to clear the package cache of unused packages.
Parameters `pkgs` (list(str)) -- List, single package to uninstall
Returns Packages that have been uninstalled
Return type list(str)
```

```python
salt '*' nix.uninstall pkg1 [pkg2 ...]
```

```python
salt.modules.nix.upgrade(*pkgs)
Runs an update operation on the specified packages, or all packages if none is specified.
Parameters `pkgs` (list(str)) -- List of packages to update
Returns The upgraded packages. Example element: ['libxslt-1.1.0', 'libxslt-1.1.10']
Return type list(tuple(str, str))
```

```python
salt '*' nix.update
salt '*' nix.update pkgs=one,two
```

19.9.261 salt.modules.nova

Module for handling OpenStack Nova calls
depends

- novaclent Python module

**configuration** This module is not usable until the user, password, tenant, and auth URL are specified either in a pillar or in the minion’s config file. For example:

```yaml
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/
# Optional
keystone.region_name: 'RegionOne'
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles: For example:

```yaml
openstack1:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'

openstack2:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.2:5000/v2.0/'
```

With this configuration in place, any of the nova functions can make use of a configuration profile by declaring it explicitly. For example:

```bash
salt '*' nova.flavor_list profile=openstack1
```

To use keystoneauth1 instead of keystoneclient, include the `use_keystoneauth` option in the pillar or minion config.

**Note:** This is required to use keystone v3 as for authentication.

```yaml
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.1:5000/v3/
keystone.use_keystoneauth: true
keystone.verify: '/path/to/custom/certs/ca-bundle.crt'
```

**Note:** By default the nova module will attempt to verify its connection utilizing the system certificates. If you need to verify against another bundle of CA certificates or want to skip verification altogether you will need to specify the `verify` option. You can specify True or False to verify (or not) against system certificates, a path to a bundle or CA certs to check against, or None to allow keystoneauth to search for the certificates on its own. (defaults to True)

```bash
salt.modules.nova.boot(name, flavor_id=0, image_id=0, profile=None, timeout=300)
```

Boot (create) a new instance

- **name** Name of the new instance (must be first)
flavor_id  Unique integer ID for the flavor
image_id   Unique integer ID for the image
timeout   How long to wait, after creating the instance, for the provider to return information about it (default 300 seconds).

New in version 2014.1.0.

CLI Example:
```
salt '*' nova.boot myinstance flavor_id=4596 image_id=2
```

The flavor_id and image_id are obtained from nova.flavor_list and nova.image_list
```
salt '*' nova.flavor_list
salt '*' nova.image_list
```

salt.modules.nova.delete(instance_id, profile=None)
Delete an instance
instance_id ID of the instance to be deleted

CLI Example:
```
salt '*' nova.delete 1138
```

salt.modules.nova.flavor_create(name, flavor_id=0, ram=0, disk=0, vcpus=1, profile=None)
Add a flavor to nova (nova flavor-create). The following parameters are required:
name   Name of the new flavor (must be first)
flavor_id Unique integer ID for the new flavor
ram    Memory size in MB
disk   Disk size in GB
vcpus  Number of vcpus

CLI Example:
```
salt '*' nova.flavor_create myflavor flavor_id=6 ram=4096 disk=10 vcpus=1
```

salt.modules.nova.flavor_delete(flavor_id, profile=None)
Delete a flavor from nova by id (nova flavor-delete)

CLI Example:
```
salt '*' nova.flavor_delete 7
```

salt.modules.nova.flavor_list(profile=None)
Return a list of available flavors (nova flavor-list)

CLI Example:
```
salt '*' nova.flavor_list
```

salt.modules.nova.image_list(name=None, profile=None)
Return a list of available images (nova images-list + nova image-show) If a name is provided, only that image will be displayed.

CLI Examples:
```
salt '*' nova.image_list
salt '*' nova.image_list myimage
```

salt.modules.nova.image_meta_delete(image_id=None, name=None, keys=None, profile=None)
Delete a key=value pair from the metadata for an image (nova image-meta set)
CLI Examples:

```bash
salt '*' nova.image_meta_delete 6f52b2ff-0b31-4d84-8fd1-af45b84824f6 keys=cheese
salt '*' nova.image_meta_delete name=myimage keys=salad,beans
```

**salt.modules.nova.image_meta_set** *(image_id=None, name=None, profile=None, **kwargs)*

Sets a key=value pair in the metadata for an image (nova image-meta set)

CLI Examples:

```bash
salt '*' nova.image_meta_set 6f52b2ff-0b31-4d84-8fd1-af45b84824f6 cheese=gruyere
salt '*' nova.image_meta_set name=myimage salad=pasta beans=baked
```

**salt.modules.nova.keypair_add** *(name, pubfile=None, pubkey=None, profile=None)*

Add a keypair to nova (nova keypair-add)

CLI Examples:

```bash
salt '*' nova.keypair_add mykey pubfile=/home/myuser/.ssh/id_rsa.pub
salt '*' nova.keypair_add mykey pubkey='ssh-rsa <key> myuser@mybox'
```

**salt.modules.nova.keypair_delete** *(name, profile=None)*

Add a keypair to nova (nova keypair-delete)

CLI Example:

```
salt '*' nova.keypair_delete mykey
```

**salt.modules.nova.keypair_list** *(profile=None)*

Return a list of available keypairs (nova keypair-list)

CLI Example:

```
salt '*' nova.keypair_list
```

**salt.modules.nova.list_** *(profile=None)*

To maintain the feel of the nova command line, this function simply calls the server_list function.

CLI Example:

```
salt '*' nova.list
```

**salt.modules.nova.lock** *(instance_id, profile=None)*

Lock an instance

*instance_id* ID of the instance to be locked

CLI Example:

```
salt '*' nova.lock 1138
```

**salt.modules.nova.resume** *(instance_id, profile=None)*

Resume an instance

*instance_id* ID of the instance to be resumed

CLI Example:

```
salt '*' nova.resume 1138
```

**salt.modules.nova.secgroup_create** *(name, description, profile=None)*

Add a secgroup to nova (nova secgroup-create)

CLI Example:
salt '*' nova.secgroup_create mygroup 'This is my security group'

salt.modules.nova.secgroup_delete(name, profile=None)
   Delete a secgroup to nova (nova secgroup-delete)
   CLI Example:
   salt '*' nova.secgroup_delete mygroup

salt.modules.nova.secgroup_list(profile=None)
   Return a list of available security groups (nova items-list)
   CLI Example:
   salt '*' nova.secgroup_list

salt.modules.nova.server_by_name(name, profile=None)
   Return information about a server
   name    Server Name
   CLI Example:
   salt '*' nova.server_by_name myserver profile=openstack

salt.modules.nova.server_list(profile=None)
   Return list of active servers
   CLI Example:
   salt '*' nova.server_list

salt.modules.nova.server_list_detailed(profile=None)
   Return detailed list of active servers
   CLI Example:
   salt '*' nova.server_list_detailed

salt.modules.nova.server_show(server_id, profile=None)
   Return detailed information for an active server
   CLI Example:
   salt '*' nova.server_show <server_id>

salt.modules.nova.show(server_id, profile=None)
   To maintain the feel of the nova command line, this function simply calls the server_show function.
   CLI Example:
   salt '*' nova.show

salt.modules.nova.suspend(instance_id, profile=None)
   Suspend an instance
   instance_id    ID of the instance to be suspended
   CLI Example:
   salt '*' nova.suspend 1138
salt.modules.nova.volume_attach(name, server_name, device='/', profile=None, timeout=300)

Attach a block storage volume
name Name of the new volume to attach
server_name Name of the server to attach to
device Name of the device on the server
profile Profile to build on
CLI Example:

```
salt '*' nova.volume_attach myblock slice.example.com profile=openstack
salt '*' nova.volume_attach myblock server.example.com device=/dev/xvdb
  --profile=openstack
```

salt.modules.nova.volume_create(name, size=100, snapshot=None, voltype=None, profile=None)

Create a block storage volume
name Name of the new volume (must be first)
size Volume size
snapshot Block storage snapshot id
voltype Type of storage
profile Profile to build on
CLI Example:

```
salt '*' nova.volume_create myblock size=300 profile=openstack
```

salt.modules.nova.volume_delete(name, profile=None)

Destroy the volume
name Name of the volume
profile Profile to build on
CLI Example:

```
salt '*' nova.volume_delete myblock profile=openstack
```

salt.modules.nova.volume_detach(name, profile=None, timeout=300)

Attach a block storage volume
name Name of the new volume to attach
server_name Name of the server to detach from
profile Profile to build on
CLI Example:

```
salt '*' nova.volume_detach myblock profile=openstack
```

salt.modules.nova.volume_list(search_opts=None, profile=None)

List storage volumes
search_opts Dictionary of search options
profile Profile to use
CLI Example:

```
salt '*' nova.volume_list search_opts=
  {"display_name": "myblock"} profile=openstack
```

salt.modules.nova.volume_show(name, profile=None)

Create a block storage volume
name Name of the volume
profile Profile to use
CLI Example:
**19.9.262 salt.modules.npm**

Manage and query NPM packages.

`salt.modules.npm.cache_clean(path=None, runas=None, env=None, force=False)`

Clean cached NPM packages.

- **path** The cache subpath to delete, or None to clear the entire cache
- **runas** The user to run NPM with
- **env** Environment variables to set when invoking npm. Uses the same `env` format as the `cmd.run` execution function.
- **force** Force cleaning of cache. Required for npm@5 and greater

New in version 2016.11.6.

CLI Example:

```bash
salt '*' npm.cache_clean force=True
```

`salt.modules.npm.cache_list(path=None, runas=None, env=None)`

List NPM cached packages.

- **path** The cache subpath to list, or None to list the entire cache
- **runas** The user to run NPM with
- **env** Environment variables to set when invoking npm. Uses the same `env` format as the `cmd.run` execution function.

CLI Example:

```bash
salt '*' npm.cache_clean
```

`salt.modules.npm.cache_path(runas=None, env=None)`

List path of the NPM cache directory.

- **runas** The user to run NPM with
- **env** Environment variables to set when invoking npm. Uses the same `env` format as the `cmd.run` execution function.

CLI Example:

```bash
salt '*' npm.cache_path
```

`salt.modules.npm.install(pkg=None, pkgs=None, dir=None, runas=None, registry=None, env=None, dry_run=False, silent=True)`

Install an NPM package.

- **pkg** A package name in any format accepted by NPM, including a version identifier
- **pkgs** A list of package names in the same format as the `name` parameter
- **dir** The target directory in which to install the package, or None for global installation
- **runas** The user to run NPM with
- **registry** The NPM registry to install the package from.

New in version 2014.7.0.

CLI Example:

```bash
salt '*' npm.cache_clean force=True
```
env  Environment variables to set when invoking npm. Uses the same env format as the \texttt{cmd.run} execution function.

   New in version 2014.7.0.

silent  Whether or not to run NPM install with --silent flag.

   New in version 2016.3.0.

dry_run  Whether or not to run NPM install with --dry-run flag.

   New in version 2015.8.4.

silent  Whether or not to run NPM install with --silent flag.

   New in version 2015.8.5.

CLI Example:

\begin{verbatim}
salt '*' npm.install coffee-script
salt '*' npm.install coffee-script@1.0.1
\end{verbatim}

\texttt{salt.modules.npm.list(} \textit{pkg=None, dir=None, runas=None, env=None, depth=None)}

List installed NPM packages.

If no directory is specified, this will return the list of globally-installed packages.

\texttt{pkg}  Limit package listing by name

\texttt{dir}  The directory whose packages will be listed, or None for global installation

\texttt{runas}  The user to run NPM with

   New in version 2014.7.0.

\texttt{env}  Environment variables to set when invoking npm. Uses the same env format as the \texttt{cmd.run} execution function.

   New in version 2014.7.0.

\texttt{depth}  Limit the depth of the packages listed

   New in version 2016.11.6, 2017.7.0.

CLI Example:

\begin{verbatim}
salt '*' npm.list
\end{verbatim}

\texttt{salt.modules.npm.uninstall(} \textit{pkg, dir=None, runas=None, env=None)}

Uninstall an NPM package.

If no directory is specified, the package will be uninstalled globally.

\texttt{pkg}  A package name in any format accepted by NPM

\texttt{dir}  The target directory from which to uninstall the package, or None for global installation

\texttt{runas}  The user to run NPM with

\texttt{env}  Environment variables to set when invoking npm. Uses the same env format as the \texttt{cmd.run} execution function.

   New in version 2015.5.3.

CLI Example:

\begin{verbatim}
salt '*' npm.uninstall coffee-script
\end{verbatim}

19.9.263  \texttt{salt.modules.nspawn}

Manage nspawn containers

New in version 2015.8.0.
systemd-nspawn(1) is a tool used to manage lightweight namespace containers. This execution module provides several functions to help manage these containers.

Minions running systemd \(\geq 219\) will place new containers in /var/lib/machines, while those running systemd \(< 219\) will place them in /var/lib/container.

```
salt.modules.nspawn.bootstrap_container(name, dist=None, version=None)
```
Bootstrap a container from package servers, if dist is None the os the minion is running as will be created, otherwise the needed bootstrapping tools will need to be available on the host.

CLI Example:
```
salt myminion nspawn.bootstrap_container <name>
```

```
salt.modules.nspawn.bootstrap_salt(name, config=None, approve_key=True, install=True, pub_key=None, priv_key=None, bootstrap_url=None, force_install=False, unconditional_install=False, bootstrap_delay=None, bootstrap_args=None, bootstrap_shell=None)
```
Bootstrap a container from package servers, if dist is None the os the minion is running as will be created, otherwise the needed bootstrapping tools will need to be available on the host.

CLI Example:
```
salt '*' nspawn.bootstrap_salt arch1
```

```
salt.modules.nspawn.copy_to(name, *args, **kwargs)
```
Copy a file from the host into a container

name  Container name
source  File to be copied to the container
dest  Destination on the container. Must be an absolute path.
overwrite  [False] Unless this option is set to True, then if a file exists at the location specified by the dest argument, an error will be raised.
makedirs  False
Create the parent directory on the container if it does not already exist.

CLI Example:
```
salt 'minion' nspawn.copy_to /tmp/foo /root/foo
```

```
salt.modules.nspawn.disable(name, *args, **kwargs)
```
Set the named container to not be launched at boot

CLI Example:
```
salt myminion nspawn.enable <name>
```

```
salt.modules.nspawn.enable(name, *args, **kwargs)
```
Set the named container to be launched at boot

CLI Example:
```
salt myminion nspawn.enable <name>
```

```
salt.modules.nspawn.exists(name)
```
Returns true if the named container exists

CLI Example:
salt myminion nspawn.exists <name>

salt.modules.nspawn.info(name, **kwargs)

Return info about a container

**Note:** The container must be running for machinectl to gather information about it. If the container is stopped, then this function will start it.

- **start** [False] If True, then the container will be started to retrieve the info. A Started key will be in the return data if the container was started.

**CLI Example:**
salt myminion nspawn.info arch1
salt myminion nspawn.info arch1 force_start=False

salt.modules.nspawn.list_all()

Lists all nspawn containers

**CLI Example:**
salt myminion nspawn.list_all

salt.modules.nspawn.list_running()

Lists running nspawn containers

**Note:** nspawn.list also works to list running containers

**CLI Example:**
salt myminion nspawn.list_running
salt myminion nspawn.list

salt.modules.nspawn.list_stopped()

Lists stopped nspawn containers

**CLI Example:**
salt myminion nspawn.list_stopped

salt.modules.nspawn.pid(name, *args, **kwargs)

Returns the PID of a container

**CLI Example:**
salt myminion nspawn.pid arch1

salt.modules.nspawn.poweroff(name)

Issue a clean shutdown to the container. Equivalent to running machinectl poweroff on the named container.

For convenience, running nspawn.stop``(as shown in the CLI examples below) is equivalent to running ```nspawn.poweroff.
Note: machinectl poweroff is only supported in systemd >= 219. On earlier systemd versions, running this function will simply issue a clean shutdown via systemctl.

CLI Examples:

```shell
salt myminion nspawn.poweroff arch1
salt myminion nspawn.stop arch1
```

salt.modules.nspawn.pull_dkr(url, name, index)
Execute a machinectl pull-dkr to download a docker image and add it to /var/lib/machines as a new container.

Note: Requires systemd >= 219

url URL from which to download the container
name Name for the new container
index URL of the Docker index server from which to pull (must be an http:// or https:// URL).

CLI Examples:

```shell
salt myminion nspawn.pull_dkr centos/centos6 cent6 index=https://get.docker.com
salt myminion nspawn.pull_docker centos/centos6 cent6 index=https://get.docker.com
```

salt.modules.nspawn.pull_raw(url, name, verify=False)
Execute a machinectl pull-raw to download a .qcow2 or raw disk image, and add it to /var/lib/machines as a new container.

Note: Requires systemd >= 219

url URL from which to download the container
name Name for the new container
verify [False] Perform signature or checksum verification on the container. See the machinectl(1) man page (section titled "Image Transfer Commands") for more information on requirements for image verification. To perform signature verification, use verify=signature. For checksum verification, use verify=checksum. By default, no verification will be performed.

CLI Examples:

```shell
```

salt.modules.nspawn.pull_tar(url, name, verify=False)
Execute a machinectl pull-raw to download a .tar container image, and add it to /var/lib/machines as a new container.

Note: Requires systemd >= 219

url URL from which to download the container
name Name for the new container
verify [False] Perform signature or checksum verification on the container. See the machinectl(1) man page (section titled "Image Transfer Commands") for more information on requirements for image verification.
verification. To perform signature verification, use `verify=signature`. For checksum verification, use `verify=checksum`. By default, no verification will be performed.

CLI Examples:
```
salt myminion nspawn.pull_tar http://foo.domain.tld/containers/archlinux-2015.02.01.tar.gz arch2
```

salt.modules.nspawn.reboot(name, *args, **kwargs)
Reboot the container by sending a SIGINT to its init process. Equivalent to running `machinectl reboot` on the named container.

For convenience, running `nspawn.restart` (as shown in the CLI examples below) is equivalent to running `nspawn.reboot`.

**Note:** `machinectl reboot` is only supported in systemd >= 219. On earlier systemd versions, running this function will instead restart the container via `systemctl`.

CLI Examples:
```
salt myminion nspawn.reboot arch1
salt myminion nspawn.restart arch1
```

salt.modules.nspawn.remove(name, *args, **kwargs)
Remove the named container

**Warning:** This function will remove all data associated with the container. It will not, however, remove the btrfs subvolumes created by pulling container images (`nspawn.pull_raw`, `nspawn.pull_tar`, `nspawn.pull_dkr`).

stop [False] If True, the container will be destroyed even if it is running/frozen.

CLI Examples:
```
salt '*' nspawn.remove foo
salt '*' nspawn.remove foo stop=True
```

salt.modules.nspawn.retcode(name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)

Run `cmd.retcode` within a container

name Name of the container in which to run the command
cmd Command to run
no_start [False] If the container is not running, don't start it
preserve_state [True] After running the command, return the container to its previous state
stdin [None] Standard input to be used for the command
output_loglevel [debug] Level at which to log the output from the command. Set to quiet to suppress logging.
use_vt [False] Use SaltStack's utils.vt to stream output to console. Assumes output=all.
keep_env [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:
salt myminion nspawn.retcode mycontainer 'ip addr show'

salt.modules.nspawn.run(name, cmd, no_start=False, preserve_state=True, stdin=None,
                         python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)

Run cmd.run within a container
name Name of the container in which to run the command
cmd Command to run
no_start [False] If the container is not running, don't start it
preserve_state [True] After running the command, return the container to its previous state
stdin [None] Standard input to be used for the command
output_loglevel [debug] Level at which to log the output from the command. Set to quiet to suppress logging.
use_vt [False] Use SaltStack’s utils.vt to stream output to console.
keep_env [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container’s host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:
salt myminion nspawn.run mycontainer 'ifconfig -a'

salt.modules.nspawn.run_all(name, cmd, no_start=False, preserve_state=True, stdin=None,
                              python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)

Run cmd.run_all within a container
name Name of the container in which to run the command
cmd Command to run
no_start [False] If the container is not running, don't start it
preserve_state [True] After running the command, return the container to its previous state
stdin [None] Standard input to be used for the command
output_loglevel [debug] Level at which to log the output from the command. Set to quiet to suppress logging.
use_vt [False] Use SaltStack’s utils.vt to stream output to console. Assumes output=all.
keep_env [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container’s host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:
salt myminion nspawn.run_all mycontainer 'ip addr show'

salt.modules.nspawn.run_stderr(name, cmd, no_start=False, preserve_state=True, stdin=None,
                               python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)

Run cmd.run_stderr within a container
name Name of the container in which to run the command
cmd Command to run
no_start [False] If the container is not running, don't start it
preserve_state [True] After running the command, return the container to its previous state
stdin [None] Standard input to be used for the command
output_loglevel [debug] Level at which to log the output from the command. Set to quiet to suppress logging.
use_vt [False] Use SaltStack’s utils.vt to stream output to console. Assumes output=all.
keep_env [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container’s host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:
output_loglevel  [debug] Level at which to log the output from the command. Set to quiet to suppress logging.

use_vt  [False] Use SaltStack's utils.vt to stream output to console. Assumes output=all.

keep_env  [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.run_stderr mycontainer 'ip addr show'
```

```
salt.modules.nspawn.run_stdout(name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)
```

Run `cmd.run_stdout` within a container

- **name** Name of the container in which to run the command
- **cmd** Command to run
- **no_start** [False] If the container is not running, don’t start it
- **preserve_state** [True] After running the command, return the container to its previous state
- **stdin** [None] Standard input to be used for the command
- **output_loglevel** [debug] Level at which to log the output from the command. Set to quiet to suppress logging.
- **use_vt** [False] Use SaltStack’s utils.vt to stream output to console. Assumes output=all.
- **keep_env** [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.run_stdout mycontainer 'ifconfig -a'
```

```
salt.modules.nspawn.start(name, *args, **kwargs)
```

Start the named container

CLI Example:

```
salt myminion nspawn.start <name>
```

```
salt.modules.nspawn.state(name, *args, **kwargs)
```

Return state of container (running or stopped)

CLI Example:

```
salt myminion nspawn.state <name>
```

```
salt.modules.nspawn.terminate(name)
```

Kill all processes in the container without issuing a clean shutdown. Equivalent to running `machinectl terminate` on the named container.

For convenience, running `nspawn.stop` and passing `kill=True` (as shown in the CLI examples below) is equivalent to running `nspawn.terminate`.

**Note:** `machinectl terminate` is only supported in systemd >= 219. On earlier systemd versions, running this function will simply issue a clean shutdown via `systemctl`.

CLI Examples:
19.9.264 salt.modules.nxos module

Execution module for Cisco NX OS Switches Proxy minions

New in version 2016.11.0.

For documentation on setting up the nxos proxy minion look in the documentation for `salt.proxy.nxos`.

```python
salt.modules.nxos.cmd(command, *args, **kwargs)
```

run commands from `salt.proxy.nxos` function from `salt.proxy.nxos` to run

*args positional args to pass to `command` function

**kwargs key word arguments to pass to `command` function

```
salt '*' nxos.cmd sendline 'show ver'
salt '*' nxos.cmd show_run
salt '*' nxos.cmd check_password username=admin password='$5lkjsdfoi$blahblahblah $' encrypted=True
```

```python
salt.modules.nxos.system_info()
```

Return system information for grains of the NX OS proxy minion

```
salt '*' nxos.system_info
```

19.9.265 salt.modules.omapi

This module interacts with an ISC DHCP Server via OMAPI. server_ip and server_port params may be set in the minion config or pillar:

```python
omapi.server_ip: 127.0.0.1
omapi.server_port: 7991
```

**depends** pypureomapi Python module

```python
salt.modules.omapi.add_host(mac=None, name=None, ip=None, ddns=False, group=None, supercede_host=False)
```

Add a host object for the given mac.

CLI Example:

```
salt dhcp-server omapi.add_host ab:ab:ab:ab:ab:ab name=host1
```

Add ddns-hostname and a fixed-ip statements:

```
salt dhcp-server omapi.add_host ab:ab:ab:ab:ab:ab name=host1 ip=10.1.1.1 ddns=true
```

```python
salt.modules.omapi.delete_host(mac=None, name=None)
```

Delete the host with the given mac or name.

CLI Examples:

```
salt dhcp-server omapi.delete_host name=host1
salt dhcp-server omapi.delete_host mac=ab:ab:ab:ab:ab:ab
```
19.9.266 salt.modules.openbsd_sysctl

Module for viewing and modifying OpenBSD sysctl parameters

salt.modules.openbsd_sysctl.assign(name, value)

Assign a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.assign net.inet.ip.forwarding 1
```

salt.modules.openbsd_sysctl.get(name)

Return a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.get hw.physmem
```

salt.modules.openbsd_sysctl.persist(name, value, config='/etc/sysctl.conf')

Assign and persist a simple sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.persist net.inet.ip.forwarding 1
```

salt.modules.openbsd_sysctl.show(config_file=False)

Return a list of sysctl parameters for this minion

CLI Example:

```
salt '*' sysctl.show
```

19.9.267 salt.modules.openbsdpkg

Package support for OpenBSD

**Note:** The package repository is configured on each host using /etc/pkg.conf

Changed in version 2016.3.5: Package versions on OpenBSD are not normally specified explicitly; instead packages may be available in multiple flavors, and branches which are specified by the format of the package name. This module allows you to use the same formatting as pkg_add(1), and will select the empty flavor and default branch by default. Examples:

- rsync
- vim--no_x11
- ruby%2.3

salt.modules.openbsdpkg.install(name=None, pkgs=None, sources=None, **kwargs)

Install the passed package

Return a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
              'new': '<new-version>'}}
```

CLI Example, Install one package:
```
salt '*' pkg.install <package name>
```

CLI Example, Install more than one package:
```
salt '*' pkg.install pkgs='["<package name>", "<package name>"]'
```

CLI Example, Install more than one package from an alternate source (e.g. salt file-server, HTTP, FTP, local filesystem):
```
salt '*' pkg.install sources='[{"<pkg name>": "salt://pkgs/<pkg filename>"]']
```

```
salt.modules.openbsdpkg.latest_version(names, **kwargs)
The available version of the package in the repository
```

CLI Example:
```
salt '*' pkg.latest_version <package name>
```

```
salt.modules.openbsdpkg.list_pkgs(versions_as_list=False, **kwargs)
List the packages currently installed as a dict:
```
```
{'<package_name>': '<version>'}
```

CLI Example:
```
salt '*' pkg.list_pkgs
```

```
salt.modules.openbsdpkg.purge(name=None, pkgs=None, **kwargs)
Package purges are not supported, this function is identical to remove().
name The name of the package to be deleted.
Multiple Package Options:
pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.
New in version 0.16.0.
Returns a dict containing the changes.
```

CLI Example:
```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

```
salt.modules.openbsdpkg.remove(name=None, pkgs=None, **kwargs)
Remove a single package with pkg_delete
Multiple Package Options:
pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.
New in version 0.16.0.
Returns a dict containing the changes.
```

CLI Example:
```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```
salt.modules.openbsdpkg.version(*names, **kwargs)
Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...

19.9.268 salt.modules.openbsdrctl
The rcctl service module for OpenBSD

salt.modules.openbsdrctl.available(name)
Return True if the named service is available.

CLI Example:
salt '*' service.available sshd

salt.modules.openbsdrctl.disable(name, **kwargs)
Disable the named service to not start at boot.

CLI Example:
salt '*' service.disable <service name>

salt.modules.openbsdrctl.disabled(name)
Return True if the named service is disabled at boot, False otherwise.

CLI Example:
salt '*' service.disabled <service name>

salt.modules.openbsdrctl.enable(name, **kwargs)
Enable the named service to start at boot.
flags [None] Set optional flags to run the service with.
service.flags can be used to change the default flags.

CLI Example:
salt '*' service.enable <service name>
salt '*' service.enable <service name> flags=<flags>

salt.modules.openbsdrctl.enabled(name, **kwargs)
Return True if the named service is enabled at boot and the provided flags match the configured ones (if any). Return False otherwise.
name Service name

CLI Example:
salt '*' service.enabled <service name>
salt '*' service.enabled <service name> flags=<flags>

salt.modules.openbsdrctl.get_all()
Return all installed services.

CLI Example:
```python
salt '*' service.get_all

salt.modules.openbsdrcctl.get_disabled()
    Return what services are available but not enabled to start at boot.
    CLI Example:
    
    salt '*' service.get_disabled

salt.modules.openbsdrcctl.get_enabled()
    Return what services are set to run on boot.
    CLI Example:
    
    salt '*' service.get_enabled

salt.modules.openbsdrcctl.missing(name)
    The inverse of service.available. Return True if the named service is not available.
    CLI Example:
    
    salt '*' service.missing sshd

salt.modules.openbsdrcctl.reload_(name)
    Reload the named service.
    CLI Example:
    
    salt '*' service.reload <service name>

salt.modules.openbsdrcctl.restart(name)
    Restart the named service.
    CLI Example:
    
    salt '*' service.restart <service name>

salt.modules.openbsdrcctl.start(name)
    Start the named service.
    CLI Example:
    
    salt '*' service.start <service name>

salt.modules.openbsdrcctl.status(name, sig=None)
    Return the status for a service, returns a bool whether the service is running.
    CLI Example:
    
    salt '*' service.status <service name>

salt.modules.openbsdrcctl.stop(name)
    Stop the named service.
    CLI Example:
    
    salt '*' service.stop <service name>
```
19.9.269 salt.modules.openbsdservice

The service module for OpenBSD

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `service.start` is not available), see here.

salt.modules.openbsdservice.available(name)

New in version 2014.7.0.

Returns True if the specified service is available, otherwise returns False.

CLI Example:

```
salt '*' service.available sshd
```

salt.modules.openbsdservice.disabled(name)

New in version 2014.7.0.

Return True if the named service is disabled, false otherwise

CLI Example:

```
salt '*' service.disabled <service name>
```

salt.modules.openbsdservice.enabled(name, **kwargs)

New in version 2014.7.0.

Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.enabled <service name>
```

salt.modules.openbsdservice.get_all()

New in version 2014.7.0.

Return all available boot services

CLI Example:

```
salt '*' service.get_all
```

salt.modules.openbsdservice.get_disabled()

New in version 2014.7.0.

Return a set of services that are installed but disabled

CLI Example:

```
salt '*' service.get_disabled
```

salt.modules.openbsdservice.get_enabled()

New in version 2014.7.0.

Return a list of service that are enabled on boot

CLI Example:
salt '*' service.get_enabled

salt.modules.openbsdservice.missing(name)
New in version 2014.7.0.
The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.
CLI Example:
salt '*' service.missing sshd

salt.modules.openbsdservice.reload_(name)
New in version 2014.7.0.
Reload the named service
CLI Example:
salt '*' service.reload <service name>

salt.modules.openbsdservice.restart(name)
Start the specified service
CLI Example:
salt '*' service.restart <service name>

salt.modules.openbsdservice.status(name, sig=None)
Return the status for a service, returns a bool whether the service is running.
CLI Example:
salt '*' service.status <service name>

salt.modules.openbsdservice.stop(name)
Stop the specified service
CLI Example:
salt '*' service.stop <service name>

19.9.270 salt.modules.openscap module

salt.modules.openscap.xccdf(params)
Run oscap xccdf commands on minions. It uses cp.push_dir to upload the generated files to the salt master in the master's minion files cachedir (defaults to /var/cache/salt/master/minions/minion-id/files)
It needs file_recv set to True in the master configuration file.
CLI Example:
19.9.271 salt.modules.openstack_config

Modify, retrieve, or delete values from OpenStack configuration files.

maintainer Jeffrey C. Ollie <jeff@ocjtech.us>
maturity new
depends
platform linux

salt.modules.openstack_config.delete(filename, section, parameter)
Delete a value from an OpenStack configuration file.
filename The full path to the configuration file
section The section from which to delete the parameter
parameter The parameter to delete
CLI Example:

```
salt-call openstack_config.delete /etc/keystone/keystone.conf sql connection
```

salt.modules.openstack_config.get(filename, section, parameter)
Get a value from an OpenStack configuration file.
filename The full path to the configuration file
section The section from which to search for the parameter
parameter The parameter to return
CLI Example:

```
salt-call openstack_config.get /etc/keystone/keystone.conf sql connection
```

salt.modules.openstack_config.set_(filename, section, parameter, value)
Set a value in an OpenStack configuration file.
filename The full path to the configuration file
section The section in which the parameter will be set
parameter The parameter to change
value The value to set
CLI Example:

```
salt-call openstack_config.set /etc/keystone/keystone.conf sql connection foo
```

19.9.272 salt.modules.openstack_mng module

Module for OpenStack Management

codeauthor Konrad Mosoń <mosonkonrad@gmail.com>
maturity new
depends openstack-utils
platform linux
salt.modules.openstack_mng.restart_service(service_name, minimum_running_time=None)

Restart OpenStack service immediately, or only if it's running longer than specified value

CLI Example:
```
salt '*' openstack_mng.restart_service neutron
salt '*' openstack_mng.restart_service neutron minimum_running_time=600
```

salt.modules.openstack_mng.start_service(service_name)

Start OpenStack service immediately

CLI Example:
```
salt '*' openstack_mng.start_service neutron
```

salt.modules.openstack_mng.stop_service(service_name)

Stop OpenStack service immediately

CLI Example:
```
salt '*' openstack_mng.stop_service neutron
```

19.9.273 salt.modules.openvswitch module

Support for Open vSwitch - module with basic Open vSwitch commands.

Suitable for setting up Openstack Neutron.

codeauthor Jiri Kotlin <jiri.kotlin@ultimum.io>

salt.modules.openvswitch.bridge_create(br, may_exist=True)

Creates a new bridge.

Parameters
- **br** -- A string - bridge name
- **may_exist** -- Bool, if False - attempting to create a bridge that exists returns False.

Returns True on success, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash
```
salt '*' openvswitch.bridge_create br0
```

salt.modules.openvswitch.bridge_delete(br, if_exists=True)

Deletes bridge and all of its ports.

Parameters
- **br** -- A string - bridge name
- **if_exists** -- Bool, if False - attempting to delete a bridge that does not exist returns False.

Returns True on success, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash
```
salt '*' openvswitch.bridge_delete br0
```

salt.modules.openvswitch.bridge_exists(br)

Tests whether bridge exists as a real or fake bridge.

Returns True if Bridge exists, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash
salt `*' openvswitch.bridge_exists br0

salt.modules.openvswitch.bridge_list()

Lists all existing real and fake bridges.

Returns List of bridges (or empty list), False on failure.

New in version 2016.3.0.

CLI Example: .. code-block:: bash
    salt `*' openvswitch.bridge_list

salt.modules.openvswitch.interface_get_options(port)

Port's interface's optional parameters.

Parameters port -- A string - port name.

Returns String containing optional parameters of port's interface, False on failure.

New in version 2016.3.0.

CLI Example: .. code-block:: bash
    salt `*' openvswitch.interface_get_options tap0

salt.modules.openvswitch.interface_get_type(port)

Type of port's interface.

Parameters port -- A string - port name.

Returns String - type of interface or empty string, False on failure.

New in version 2016.3.0.

CLI Example: .. code-block:: bash
    salt `*' openvswitch.interface_get_type tap0

salt.modules.openvswitch.port_add(br, port, may_exist=False)

Creates on bridge a new port named port.

Returns True on success, else False.

Parameters

- br -- A string - bridge name
- port -- A string - port name
- may_exist -- Bool, if False - attempting to create a port that exists returns False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash
    salt `*' openvswitch.port_add br0 8080

salt.modules.openvswitch.port_create_gre(br, port, id, remote)

Generic Routing Encapsulation - creates GRE tunnel between endpoints.

Parameters

- br -- A string - bridge name.
- port -- A string - port name.
- id -- An integer - unsigned 32-bit number, tunnel's key.
- remote -- A string - remote endpoint's IP address.

Returns True on success, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash
    salt `*' openvswitch.port_create_gre br0 gre1 5001 192.168.1.10

salt.modules.openvswitch.port_create_vlan(br, port, id, internal=False)

Isolate VM traffic using VLANs.

Parameters

- br -- A string - bridge name.
- port -- A string - port name.
- id -- An integer in the valid range 0 to 4095 (inclusive), name of VLAN.
- `internal` -- A boolean to create an internal interface if one does not exist.

  Returns True on success, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash
  salt `*` openvswitch.port_create_vlan br0 tap0 100

salt.modules.openvswitch.port_create_vxlan(`br`, `port`, `id`, `remote`, `dst_port=None`)

Virtual eXtensible Local Area Network - creates VXLAN tunnel between endpoints.

Parameters

- `br` -- A string - bridge name.
- `port` -- A string - port name.
- `id` -- An integer - unsigned 64-bit number, tunnel's key.
- `remote` -- A string - remote endpoint's IP address.
- `dst_port` -- An integer - port to use when creating tunnelport in the switch.

Returns True on success, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash
  salt `*` openvswitch.port_create_vxlan br0 vx1 5001 192.168.1.10 8472

salt.modules.openvswitch.port_get_tag(`port`)

Lists tags of the port.

Parameters `port` -- A string - port name.

Returns List of tags (or empty list), False on failure.

New in version 2016.3.0.

CLI Example: .. code-block:: bash
  salt `*` openvswitch.port_get_tag tap0

salt.modules.openvswitch.port_list(`br`)

Lists all of the ports within bridge.

Parameters `br` -- A string - bridge name.

Returns List of bridges (or empty list), False on failure.

New in version 2016.3.0.

CLI Example: .. code-block:: bash
  salt `*` openvswitch.port_list br0

salt.modules.openvswitch.port_remove(`br`, `port`, `if_exists=True`)

Deletes port.

Parameters

- `br` -- A string - bridge name (If bridge is None, port is removed from whatever bridge contains it)
- `port` -- A string - port name.
- `if_exists` -- Bool, if False - attempting to delete a por that does not exist returns False. (Default True)

Returns True on success, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash
  salt `*` openvswitch.port_remove br0 8080

19.9.274 salt.modules.opkg module

Support for Opkg
**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `pkg.install` is not available), see [here](#).

**Note:** For version comparison support on opkg < 0.3.4, the opkg-utils package must be installed.

```python
salt.modules.opkg.available_version("names", **"kwargs")
```

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```bash
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

```python
salt.modules.opkg.del_repo(alias, **"kwargs")
```

Delete a repo from `/etc/opkg/*.conf`

If the file does not contain any other repo configuration, the file itself will be deleted.

CLI Examples:

```bash
salt '*' pkg.del_repo alias
```

```python
salt.modules.opkg.file_dict("packages", **"kwargs")
```

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```bash
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

```python
salt.modules.opkg.file_list("packages", **"kwargs")
```

List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```bash
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

```python
salt.modules.opkg.get_repo(alias, **"kwargs")
```

Display a repo from the `/etc/opkg/*.conf`

CLI Examples:

```bash
salt '*' pkg.get_repo alias
```

```python
salt.modules.opkg.hold(name=None, pkgs=None, sources=None, **"kwargs")
```

Set package in `hold` state, meaning it will not be upgraded.
**name**  The name of the package, e.g., `tmux`

**pkgs** A list of packages to hold. Must be passed as a python list.

---

salt.modules.opkg.info_installed(*names, **kwargs*)

Return the information of the named package(s), installed on the system.

New in version 2017.7.0.

**Parameters**

- **names** -- Names of the packages to get information about. If none are specified, will return information for all installed packages.
- **attr** -- Comma-separated package attributes. If no `attr` is specified, all available attributes returned.

**Valid attributes are:**  
`arch`, `conffiles`, `conflicts`, `depends`, `description`, `filename`, `group`, `install_date_time_t`, `md5sum`, `packager`, `provides`, `recommends`, `replaces`, `size`, `source`, `suggests`, `url`, `version`

**CLI example:**

```
salt '*' pkg.info_installed
salt '*' pkg.info_installed attr=version,packager
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package> ...
salt '*' pkg.info_installed <package1> <package2> <package3> ...
←attr=version,packager
```

---

salt.modules.opkg.install(name=None, refresh=False, pkgs=None, sources=None, reinstall=False, **kwargs)

Install the passed package, add refresh=True to update the opkg database.

**name**  The name of the package to be installed. Note that this parameter is ignored if either ``pkgs`` or ``sources`` is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the ``sources`` option.

**CLI Example:**

```
salt '*' pkg.install <package name>
```

**refresh** Whether or not to refresh the package database before installing.

**version** Install a specific version of the package, e.g. `1.2.3-0ubuntu0`. Ignored if ``pkgs`` or ``sources`` is passed.

New in version 2017.7.0.

**reinstall** [False] Specifying reinstall=True will use `opkg install --force-reinstall` rather than simply `opkg install` for requested packages that are already installed.

If a version is specified with the requested package, then `opkg install --force-reinstall` will only be used if the installed version matches the requested version.

New in version 2017.7.0.

**Multiple Package Installation Options:**

**pkgs** A list of packages to install from a software repository. Must be passed as a python list.

**CLI Example:**
salt '*' pkg.install pkgs='["foo", "bar"]'
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3-0ubuntu0"}]'

**sources** A list of IPK packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package. Dependencies are automatically resolved and marked as auto-installed.

CLI Example:

```
salt '*' pkg.install sources='[{"foo": "salt://foo.deb"},{"bar": "salt://bar.deb"}]'
```

**install_recommends** Whether to install the packages marked as recommended. Default is True.

**only_upgrade** Only upgrade the packages (disallow downgrades), if they are already installed. Default is False.

New in version 2017.7.0.

Returns a dict containing the new package names and versions:

```
{ '<package>': { 'old': '<old-version>', 'new': '<new-version>' }}
```

salt.modules.opkg.latest_version('names', **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.opkg.list_pkgs(versions_as_list=False, **kwargs)

List the packages currently installed in a dict:

```
{ '<package_name>': '<version>' }
```

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

salt.modules.opkg.list_repos(**kwargs)

Lists all repos on /etc/opkg/*.conf

CLI Example:

```
salt '*' pkg.list_repos
```

salt.modules.opkg.list_upgrades(refresh=True, **kwargs)

List all available package upgrades.

CLI Example:

```
salt '*' pkg.list_upgrades
```

salt.modules.opkg.mod_repo(alias, **kwargs)

Modify one or more values for a repo. If the repo does not exist, it will be created, so long as uri is defined.
The following options are available to modify a repo definition:

- **alias**: alias by which opkg refers to the repo.
- **uri**: the URI to the repo.
- **compressed**: defines (True or False) if the index file is compressed
- **enabled**: enable or disable (True or False) repository but do not remove if disabled.
- **refresh**: enable or disable (True or False) auto-refresh of the repositories

**CLI Examples:**

```bash
salt '*' pkg.mod_repo alias uri=http://new/uri
salt '*' pkg.mod_repo alias enabled=False
```

**salt.modules.opkg.owner(*paths, **kwargs)**

Return the name of the package that owns the file. Multiple file paths can be passed. Like `pkg.version`

<salt.modules.opkg.version, if a single path is passed, a string will be returned, and if multiple
paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned
for that path.

**CLI Example:**

```bash
salt '*' pkg.owner /usr/bin/apachectl
salt '*' pkg.owner /usr/bin/apachectl /usr/bin/basename
```

**salt.modules.opkg.purge(name=None, pkgs=None, **kwargs)**

Package purges are not supported by opkg, this function is identical to `pkg.remove`.

- **name**: The name of the package to be deleted.
- **pkgs**: A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if
  this option is passed.

Returns a dict containing the changes.

**CLI Example:**

```bash
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

**salt.modules.opkg.refresh_db(**kwargs)**

Updates the opkg database to latest packages based upon repositories

Returns a dict, with the keys being package databases and the values being the result of the update attempt.

Values can be one of the following:

- **True**: Database updated successfully
- **False**: Problem updating database

**CLI Example:**

```bash
salt '*' pkg.refresh_db
```

**salt.modules.opkg.remove(name=None, pkgs=None, **kwargs)**

Remove packages using `opkg remove`.

- **name**: The name of the package to be deleted.
- **pkgs**: A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if
  this option is passed.

Returns a dict containing the changes.

**CLI Example:**

```bash
```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs=['"foo", "bar"]'
salt.modules.opkg.unhold(name=None, pkgs=None, sources=None, **kwargs)
Set package current in 'hold' state to install state, meaning it will be upgraded.
name The name of the package, e.g., 'tmux'

CLI Example:
salt '*' pkg.unhold <package name>

pkgs A list of packages to hold. Must be passed as a python list.

CLI Example:
salt '*' pkg.unhold pkgs=['"foo", "bar"]'
salt.modules.opkg.upgrade(refresh=True, **kwargs)
Upgrades all packages via opkg upgrade

Returns a dictionary containing the changes:

{ '<package>': { 'old': '<old-version>',
              'new': '<new-version>' }}

CLI Example:
salt '*' pkg.upgrade

salt.modules.opkg.upgrade_available(name, **kwargs)
Check whether or not an upgrade is available for a given package

CLI Example:
salt '*' pkg.upgrade_available <package name>

salt.modules.opkg.version('names', **kwargs)
Returns a string representing the package version or an empty string if not installed. If more than one package
name is specified, a dict of name/version pairs is returned.

CLI Example:
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...

salt.modules.opkg.version_cmp(pkg1, pkg2, ignore_epoch=False, **kwargs)
Do a cmp-style comparison on two packages. Return -1 if pkg1 < pkg2, 0 if pkg1 == pkg2, and 1 if pkg1 > pkg2. Return None if there was a problem making the comparison.
ignore_epoch [False] Set to True to ignore the epoch when comparing versions

New in version 2016.3.4.
CLI Example:
salt '*' pkg.version_cmp '0.2.4-0' '0.2.4.1-0'
19.9.275 salt.modules.oracle

Oracle DataBase connection module

maintainer  Vladimir Bormotov <bormotov@gmail.com>
maturity new
depends cx_Oracle
platform all
configuration module provide connections for multiple Oracle DB instances.

OS Environment

<table>
<thead>
<tr>
<th>Environment Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORACLE_HOME</td>
<td>path to oracle product</td>
</tr>
<tr>
<td>PATH</td>
<td>path to Oracle Client libs need to be in PATH</td>
</tr>
</tbody>
</table>

pillar

<table>
<thead>
<tr>
<th>Pillar Key</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>oracle.dbs</td>
<td>list of known based</td>
</tr>
<tr>
<td>oracle.dbs.&lt;db&gt;.uri</td>
<td>connection credentials in format: user/password@host[:port]/sid[ as {sysdba</td>
</tr>
</tbody>
</table>

salt.modules.oracle.client_version()

Oracle Client Version

CLI Example:
```
salt '*' oracle.client_version
```

salt.modules.oracle.run_query(db, query)

Run SQL query and return result

CLI Example:
```
salt '*' oracle.run_query my_db "select * from my_table"
```

salt.modules.oracle.show_dbs(*dbs)

Show databases configuration from pillar. Filter by "args"

CLI Example:
```
salt '*' oracle.show_dbs
salt '*' oracle.show_dbs my_db
```

salt.modules.oracle.show_env()

Show Environment used by Oracle Client

CLI Example:
```
salt '*' oracle.show_env
```

Note: at first _connect() NLS_LANG will forced to `.AL32UTF8`

salt.modules.oracle.show_pillar(item=None)

Show Pillar segment oracle.* and subitem with notation "item:subitem"

CLI Example:
```
```
salt 'salt '*' oracle.show_pillar
dsalt 'salt '*' oracle.show_pillar dbs:my_db

salt.modules.oracle.version('dbs')
    Server Version (select banner from v$sversion)
    CLI Example:
    salt 'salt '*' oracle.version
dsalt 'salt '*' oracle.version my_db

19.9.276 salt.modules.osquery

New in version 2015.8.0.
salt.modules.osquery.acpi_tables(*attrs=None, where=None)
    Return acpi_tables information from osquery
    CLI Example:
    salt 'salt '*' osquery.acpi_tables

salt.modules.osquery.alf(*attrs=None, where=None)
    Return alf information from osquery
    CLI Example:
    salt 'salt '*' osquery.alf

salt.modules.osquery.alf_exceptions(*attrs=None, where=None)
    Return alf_exceptions information from osquery
    CLI Example:
    salt 'salt '*' osquery.alf_exceptions

salt.modules.osquery.alf_explicit_auths(*attrs=None, where=None)
    Return alf_explicit_auths information from osquery
    CLI Example:
    salt 'salt '*' osquery.alf_explicit_auths

salt.modules.osquery.alf_services(*attrs=None, where=None)
    Return alf_services information from osquery
    CLI Example:
    salt 'salt '*' osquery.alf_services

salt.modules.osquery.apps(*attrs=None, where=None)
    Return apps information from osquery
    CLI Example:
    salt 'salt '*' osquery.apps
salt.modules.osquery.**apt_sources**(attrs=None, where=None)
Return apt_sources information from osquery

CLI Example:

```
salt '*' osquery.apt_sources
```

salt.modules.osquery.**arp_cache**(attrs=None, where=None)
Return arp_cache information from osquery

CLI Example:

```
salt '*' osquery.arp_cache
```

salt.modules.osquery.**block_devices**(attrs=None, where=None)
Return block_devices information from osquery

CLI Example:

```
salt '*' osquery.block_devices
```

salt.modules.osquery.**certificates**(attrs=None, where=None)
Return certificates information from osquery

CLI Example:

```
salt '*' osquery.certificates
```

salt.modules.osquery.**chrome_extensions**(attrs=None, where=None)
Return chrome_extensions information from osquery

CLI Example:

```
salt '*' osquery.chrome_extensions
```

salt.modules.osquery.**cpuid**(attrs=None, where=None)
Return cpuid information from osquery

CLI Example:

```
salt '*' osquery.cpuid
```

salt.modules.osquery.**crontab**(attrs=None, where=None)
Return crontab information from osquery

CLI Example:

```
salt '*' osquery.crontab
```

salt.modules.osquery.**deb_packages**(attrs=None, where=None)
Return deb_packages information from osquery

CLI Example:

```
salt '*' osquery.deb_packages
```

salt.modules.osquery.**etc_hosts**(attrs=None, where=None)
Return etc_hosts information from osquery

CLI Example:
Salt Documentation, Release 2017.7.8

salt '*' osquery.etc_hosts

salt.modules.osquery.etc_services(attrs=None, where=None)
Return etc_services information from osquery

CLI Example:
salt '*' osquery.etc_services

salt.modules.osquery.file_(attrs=None, where=None)
Return file information from osquery

CLI Example:
salt '*' osquery.file

salt.modules.osquery.file_changes(attrs=None, where=None)
Return file_changes information from osquery

CLI Example:
salt '*' osquery.file_changes

salt.modules.osquery.firefox_addons(attrs=None, where=None)
Return firefox_addons information from osquery

CLI Example:
salt '*' osquery.firefox_addons

salt.modules.osquery.groups(attrs=None, where=None)
Return groups information from osquery

CLI Example:
salt '*' osquery.groups

salt.modules.osquery.hardware_events(attrs=None, where=None)
Return hardware_events information from osquery

CLI Example:
salt '*' osquery.hardware_events

salt.modules.osquery.hash_(attrs=None, where=None)
Return hash information from osquery

CLI Example:
salt '*' osquery.hash

salt.modules.osquery.homebrew_packages(attrs=None, where=None)
Return homebrew_packages information from osquery

CLI Example:
salt '*' osquery.homebrew_packages
salt.modules.osquery.\texttt{interface_addresses}(\texttt{attr=None, where=None})
Return interface_addresses information from osquery

CLI Example:
```
salt '*' osquery.interface_addresses
```

salt.modules.osquery.\texttt{interface_details}(\texttt{attr=None, where=None})
Return interface_details information from osquery

CLI Example:
```
salt '*' osquery.interface_details
```

salt.modules.osquery.\texttt{iokit_devicetree}(\texttt{attr=None, where=None})
Return iokit_devicetree information from osquery

CLI Example:
```
salt '*' osquery.iokit_devicetree
```

salt.modules.osquery.\texttt{iokit_registry}(\texttt{attr=None, where=None})
Return iokit_registry information from osquery

CLI Example:
```
salt '*' osquery.iokit_registry
```

salt.modules.osquery.\texttt{kernel_extensions}(\texttt{attr=None, where=None})
Return kernel_extensions information from osquery

CLI Example:
```
salt '*' osquery.kernel_extensions
```

salt.modules.osquery.\texttt{kernel_info}(\texttt{attr=None, where=None})
Return kernel_info information from osquery

CLI Example:
```
salt '*' osquery.kernel_info
```

salt.modules.osquery.\texttt{kernel_integrity}(\texttt{attr=None, where=None})
Return kernel_integrity information from osquery

CLI Example:
```
salt '*' osquery.kernel_integrity
```

salt.modules.osquery.\texttt{kernel_modules}(\texttt{attr=None, where=None})
Return kernel_modules information from osquery

CLI Example:
```
salt '*' osquery.kernel_modules
```

salt.modules.osquery.\texttt{keychain_items}(\texttt{attr=None, where=None})
Return keychain_items information from osquery

CLI Example:
salt '*' osquery.keychain_items

salt.modules.osquery.last(*attr*, None, *where*, None)
    Return last information from osquery
    CLI Example:
    salt '*' osquery.last

salt.modules.osquery.launchd(*attr*, None, *where*, None)
    Return launchd information from osquery
    CLI Example:
    salt '*' osquery.launchd

salt.modules.osquery.listening_ports(*attr*, None, *where*, None)
    Return listening_ports information from osquery
    CLI Example:
    salt '*' osquery.listening_ports

salt.modules.osquery.logged_in_users(*attr*, None, *where*, None)
    Return logged_in_users information from osquery
    CLI Example:
    salt '*' osquery.logged_in_users

salt.modules.osquery.memory_map(*attr*, None, *where*, None)
    Return memory_map information from osquery
    CLI Example:
    salt '*' osquery.memory_map

salt.modules.osquery.mounts(*attr*, None, *where*, None)
    Return mounts information from osquery
    CLI Example:
    salt '*' osquery.mounts

salt.modules.osquery.nfs_shares(*attr*, None, *where*, None)
    Return nfs_shares information from osquery
    CLI Example:
    salt '*' osquery.nfs_shares

salt.modules.osquery.nvram(*attr*, None, *where*, None)
    Return nvram information from osquery
    CLI Example:
    salt '*' osquery.nvram
salt.modules.osquery.os_version(\texttt{attrs=None, where=None})
Return os_version information from osquery

CLI Example:

```
salt '*' osquery.os_version
```

salt.modules.osquery.osquery_extensions(\texttt{attrs=None, where=None})
Return osquery_extensions information from osquery

CLI Example:

```
salt '*' osquery.osquery_extensions
```

salt.modules.osquery.osquery_flags(\texttt{attrs=None, where=None})
Return osquery_flags information from osquery

CLI Example:

```
salt '*' osquery.osquery_flags
```

salt.modules.osquery.osquery_info(\texttt{attrs=None, where=None})
Return osquery_info information from osquery

CLI Example:

```
salt '*' osquery.osquery_info
```

salt.modules.osquery.osquery_registry(\texttt{attrs=None, where=None})
Return osquery_registry information from osquery

CLI Example:

```
salt '*' osquery.osquery_registry
```

salt.modules.osquery.passwd_changes(\texttt{attrs=None, where=None})
Return passwd_changes information from osquery

CLI Example:

```
salt '*' osquery.passwd_changes
```

salt.modules.osquery.pci_devices(\texttt{attrs=None, where=None})
Return pci_devices information from osquery

CLI Example:

```
salt '*' osquery.pci_devices
```

salt.modules.osquery.preferences(\texttt{attrs=None, where=None})
Return preferences information from osquery

CLI Example:

```
salt '*' osquery.preferences
```

salt.modules.osquery.process_envs(\texttt{attrs=None, where=None})
Return process_envs information from osquery

CLI Example:
salt '*' osquery.process_envs

salt.modules.osquery.process_memory_map(attrs=None, where=None)
Return process_memory_map information from osquery

CLI Example:
salt '*' osquery.process_memory_map

salt.modules.osquery.process_open_files(attrs=None, where=None)
Return process_open_files information from osquery

CLI Example:
salt '*' osquery.process_open_files

salt.modules.osquery.process_open_sockets(attrs=None, where=None)
Return process_open_sockets information from osquery

CLI Example:
salt '*' osquery.process_open_sockets

salt.modules.osquery.processes(attrs=None, where=None)
Return processes information from osquery

CLI Example:
salt '*' osquery.processes

salt.modules.osquery.quarantine(attrs=None, where=None)
Return quarantine information from osquery

CLI Example:
salt '*' osquery.quarantine

salt.modules.osquery.query(sql=None)
Return time information from osquery

CLI Example:
salt '*' osquery.query "select * from users;"

salt.modules.osquery.routes(attrs=None, where=None)
Return routes information from osquery

CLI Example:
salt '*' osquery.routes

salt.modules.osquery.rpm_packages(attrs=None, where=None)
Return cpuid information from osquery

CLI Example:
salt '*' osquery.rpm_packages
salt.modules.osquery.safari_extensions(\texttt{attrs=\textit{None}, where=\textit{None}})
Return \texttt{safari\_extensions} information from osquery

\begin{verbatim}
salt '*' osquery.safari_extensions
\end{verbatim}

salt.modules.osquery.shared_memory(\texttt{atts=\textit{None}, where=\textit{None}})
Return \texttt{shared\_memory} information from osquery

\begin{verbatim}
salt '*' osquery.shared_memory
\end{verbatim}

salt.modules.osquery.shell_history(\texttt{atts=\textit{None}, where=\textit{None}})
Return \texttt{shell\_history} information from osquery

\begin{verbatim}
salt '*' osquery.shell_history
\end{verbatim}

salt.modules.osquery.smbios_tables(\texttt{atts=\textit{None}, where=\textit{None}})
Return \texttt{smbios\_tables} information from osquery

\begin{verbatim}
salt '*' osquery.smbios_tables
\end{verbatim}

salt.modules.osquery.startup_items(\texttt{atts=\textit{None}, where=\textit{None}})
Return \texttt{startup\_items} information from osquery

\begin{verbatim}
salt '*' osquery.startup_items
\end{verbatim}

salt.modules.osquery.suid_bin(\texttt{atts=\textit{None}, where=\textit{None}})
Return \texttt{suid\_bin} information from osquery

\begin{verbatim}
salt '*' osquery.suid_bin
\end{verbatim}

salt.modules.osquery.system_controls(\texttt{atts=\textit{None}, where=\textit{None}})
Return \texttt{system\_controls} information from osquery

\begin{verbatim}
salt '*' osquery.system_controls
\end{verbatim}

salt.modules.osquery.time(\texttt{atts=\textit{None}})
Return \texttt{time} information from osquery

\begin{verbatim}
salt '*' osquery.time
\end{verbatim}

salt.modules.osquery.usb_devices(\texttt{atts=\textit{None}, where=\textit{None}})
Return \texttt{usb\_devices} information from osquery

\begin{verbatim}
salt '*' osquery.usb_devices
\end{verbatim}
salt '*' osquery.usb_devices

salt.modules.osquery.users(attrs=None, where=None)
Return users information from osquery

CLI Example:
salt '*' osquery.users

salt.modules.osquery.version()
Return version of osquery

CLI Example:
salt '*' osquery.version

salt.modules.osquery.xattr_where_from(attrs=None, where=None)
Return xattr_where_from information from osquery

CLI Example:
salt '*' osquery.xattr_where_from

salt.modules.osquery.xprotect_entries(attrs=None, where=None)
Return xprotect_entries information from osquery

CLI Example:
salt '*' osquery.xprotect_entries

salt.modules.osquery.xprotect_reports(attrs=None, where=None)
Return xprotect_reports information from osquery

CLI Example:
salt '*' osquery.xprotect_reports

19.9.277 salt.modules.pacman

A module to wrap pacman calls, since Arch is the best (https://wiki.archlinux.org/index.php/Arch_is_the_best)

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a
different module (or gives an error similar to `pkg.install' is not available), see here.

salt.modules.pacman.file_dict(*packages)
List the files that belong to a package, grouped by package. Not specifying any packages will return a list of
_every_ file on the system's package database (not generally recommended).

CLI Examples:
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
salt.modules.pacman.file_list(*packages)
List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list *
```

salt.modules.pacman.group_diff(name)
New in version 2016.11.0.

Lists which of a group's packages are installed and which are not installed
Compatible with yumpkg.group_diff for easy support of state.pkg.group_installed

CLI Example:

```
salt '*' pkg.group_diff 'xorg'
```

salt.modules.pacman.group_info(name)
New in version 2016.11.0.

Lists all packages in the specified group

CLI Example:

```
salt '*' pkg.group_info 'xorg'
```

salt.modules.pacman.group_list()
New in version 2016.11.0.

Lists all groups known by pacman on this system

CLI Example:

```
salt '*' pkg.group_list
```

salt.modules.pacman.install(name=None, refresh=False, sysupgrade=None, pkgs=None, sources=None, **kwargs)
Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemctl from killing any pacman commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemctl.kill(5) manpage for more information). If desired, usage of systemctl-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Install (pacman -S) the specified packag(s). Add refresh=True to install with -y, add sysupgrade=True to install with -u.

name The name of the package to be installed. Note that this parameter is ignored if either pkgs or sources is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the sources option.

CLI Example:

```
salt '*' pkg.install <package name>
```

refresh Whether or not to refresh the package database before installing.
sysupgrade Whether or not to upgrade the system packages before installing. If refresh is set to True but sysupgrade is not specified, -u will be applied
Multiple Package Installation Options:

**pkgs** A list of packages to install from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version. As with the version parameter above, comparison operators can be used to target a specific version of a package.

CLI Examples:

```
salt '*' pkg.install pkgs=['"foo", "bar"]
salt '*' pkg.install pkgs=['"foo", {"bar": "1.2.3-4"}]'
salt '*' pkg.install pkgs=['"foo", {"bar": "<1.2.3-4"}]
```

**sources** A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources=[{"foo": "salt://foo.pkg.tar.xz"},
{"bar": "salt://bar.pkg.tar.xz"}]
```

Returns a dict containing the new package names and versions:

```
{
'<package>': {
'old': '<old-version>',
'new': '<new-version>'
}}
```

salt.modules.pacman.latest_version(*names*, **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.pacman.list_pkgs(versions_as_list=False, **kwargs)

List the packages currently installed as a dict:

```
{
'<package_name>': '<version>'
}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

salt.modules.pacman.list_repo_pkgs(*args, **kwargs)

Returns all available packages. Optionally, package names (and name globs) can be passed and the results will be filtered to packages matching those names.

This function can be helpful in discovering the version or repo to specify in a `pkg.installed` state.

The return data will be a dictionary mapping package names to a list of version numbers, ordered from newest to oldest. If `byrepo` is set to `True`, then the return dictionary will contain repository names at the top level, and each repository will map packages to lists of version numbers. For example:

```
# With byrepo=False (default)
{
'bash': ['4.4.005-2'],
'nginx': ['1.10.2-2']
}
# With byrepo=True
```
fromrepo [None] Only include results from the specified repo(s). Multiple repos can be specified, comma-separated.

byrepo [False] When True, the return data for each package will be organized by repository.

refresh [False] When True, the package database will be refreshed (i.e. pacman -Sy) before checking for available versions.

CLI Examples:

```
salt '*' pkg.list_repo_pkgs
salt '*' pkg.list_repo_pkgs foo bar baz
salt '*' pkg.list_repo_pkgs 'samba4*' fromrepo=base,updates
salt '*' pkg.list_repo_pkgs 'python2-*' byrepo=True
```

salt.modules.pacman.list_upgrades(refresh=False, root=None, **kwargs)

List all available package upgrades on this system

CLI Example:

```
salt '*' pkg.list_upgrades
```

salt.modules.pacman.owner(*paths)

New in version 2014.7.0.

Return the name of the package that owns the file. Multiple file paths can be passed. Like pkg.version, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Example:

```
salt '*' pkg.owner /usr/bin/apachectl salt '*' pkg.owner /usr/bin/apachectl /usr/bin/zsh
```

salt.modules.pacman.purge(name=None, pkgs=None, **kwargs)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemctl-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any pacman commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemctl-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Recursively remove a package and all dependencies which were installed with it, this will call a pacman -Rsc

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.
CLI Example:

```bash
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

**salt.modules.pacman.refresh_db**(root=None)

Just run a pacman -Sy, return a dict:

```bash
{
'<database name>': Bool
}
```

CLI Example:

```bash
salt '*' pkg.refresh_db
```

**salt.modules.pacman.remove**(name=None, pkgs=None, **kwargs)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any pacman commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Remove packages with pacman -R.

- **name** The name of the package to be deleted.
- **pkgs** A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```bash
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

**salt.modules.pacman.upgrade**(refresh=False, root=None, **kwargs)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any pacman commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Run a full system upgrade, a pacman -Syu.

- **refresh** Whether or not to refresh the package database before installing.

Returns a dictionary containing the changes:

```json
{
'<package>': {'old': '<old-version>',
              'new': '<new-version>'}
}
```

CLI Example:

```bash
salt '*' pkg.upgrade
```
salt.modules.pacman.upgrade_available(name)
Check whether or not an upgrade is available for a given package

CLI Example:
```
salt '*' pkg.upgrade_available <package name>
```

salt.modules.pacman.version(*names, **kwargs)
Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:
```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

19.9.278 salt.modules.pagerduty
Module for Firing Events via PagerDuty
New in version 2014.1.0.

configuration This module can be used by specifying the name of a configuration profile in the minion config, minion pillar, or master config.

For example:
```
my-pagerduty-account:
pagerduty.api_key: F3Rbyjbve43rfFw2214
pagerduty.subdomain: mysubdomain
```

salt.modules.pagerduty.create_event(service_key=None, description=None, details=None, incident_key=None, profile=None)
Create an event in PagerDuty. Designed for use in states.

CLI Example:
```
salt myminion pagerduty.create_event <service_key> <description> <details> profile=my-pagerduty-account
```

The following parameters are required:
- service_key This key can be found by using pagerduty.list_services.
- description This is a short description of the event.
- details This can be a more detailed description of the event.
- profile This refers to the configuration profile to use to connect to the PagerDuty service.

salt.modules.pagerduty.list_escalation_policies(profile=None, api_key=None)
This function is an alias of list_policies.
List escalation policies belonging to this account

CLI Example:
salt myminion pagerduty.list_policies my-pagerduty-account salt myminion pagerduty.list_escalation_policies my-pagerduty-account

salt.modules.pagerduty.list_incidents(profile=None, api_key=None)
List incidents belonging to this account

CLI Example:
salt myminion pagerduty.list_incidents my-pagerduty-account

19.9. execution modules
salt.modules.pagerduty.list_maintenance_windows(profile=None, api_key=None)

This function is an alias of list_windows.
List maintenance windows belonging to this account

CLI Example:
salt myminion pagerduty.list_windows my-pagerduty-account salt myminion pager-
duty.list_maintenance_windows my-pagerduty-account

salt.modules.pagerduty.list_policies(profile=None, api_key=None)
List escalation policies belonging to this account

CLI Example:
salt myminion pagerduty.list_policies my-pagerduty-account salt myminion pager-
duty.list_escalation_policies my-pagerduty-account

salt.modules.pagerduty.list_schedules(profile=None, api_key=None)
List schedules belonging to this account

CLI Example:
salt myminion pagerduty.list_schedules my-pagerduty-account

salt.modules.pagerduty.list_services(profile=None, api_key=None)
List services belonging to this account

CLI Example:
salt myminion pagerduty.list_services my-pagerduty-account

salt.modules.pagerduty.list_users(profile=None, api_key=None)
List users belonging to this account

CLI Example:
salt myminion pagerduty.list_users my-pagerduty-account

salt.modules.pagerduty.list_windows(profile=None, api_key=None)
List maintenance windows belonging to this account

CLI Example:
salt myminion pagerduty.list_windows my-pagerduty-account salt myminion pager-
duty.list_maintenance_windows my-pagerduty-account

19.9.279 salt.modules.pagerduty_util

Module for managing PagerDuty resource

configuration This module can be used by specifying the name of a configuration profile in the minion
config, minion pillar, or master config. The default configuration profile name is `pagerduty.'

For example:

<table>
<thead>
<tr>
<th>pagerduty:</th>
</tr>
</thead>
<tbody>
<tr>
<td>pagerduty.api_key: F3Rbyjbve43rfFw2214</td>
</tr>
<tr>
<td>pagerduty.subdomain: mysubdomain</td>
</tr>
</tbody>
</table>

For PagerDuty API details, see https://developer.pagerduty.com/documentation/rest

salt.modules.pagerduty_util.create_or_update_resource(resource_name, identifier_fields, data, diff=None, profile='pagerduty', subdomain=None, api_key=None)

create or update any pagerduty resource Helper method for present().
Determining if two resources are the same is different for different PD resource, so this method accepts a diff function. The diff function will be invoked as diff(state_information, object_returned_from_pagerduty), and should return a dict of data to pass to the PagerDuty update API method, or None if no update is to be performed. If no diff method is provided, the default behavior is to scan the keys in the state_information, comparing the matching values in the object_returned_from_pagerduty, and update any values that differ.

examples

create_or_update_resource(`user', ["id","name","email"]) create_or_update_resource(`escalation_policies', ["id","name"], diff=my_diff_function)

diff function is called as: diff(state_information, object_returned_from_pagerduty)

salt.modules.pagerduty_util.delete_resource(resource_name, key, identifier_fields, profile='pagerduty', subdomain=None, api_key=None)

delete any pagerduty resource
Helper method for absent()

example

delete_resource(`users', key, ["id","name","email"])) # delete by id or name or email

salt.modules.pagerduty_util.get_escalation_policies(profile='pagerduty', subdomain=None, api_key=None)

List escalation_policies belonging to this account

CLI Example:
salt myminion pagerduty.get_escalation_policies

salt.modules.pagerduty_util.get_resource(resource_name, key, identifier_fields, profile='pagerduty', subdomain=None, api_key=None)

Get any single pagerduty resource by key.

We allow flexible lookup by any of a list of identifier_fields. So, for example, you can look up users by email address or name by calling:

get_resource(`users', key, ["name", "email"], ...)

This method is mainly used to translate state sls into pagerduty id's for dependent objects. For example, a pagerduty escalation policy contains one or more schedules, which must be passed by their pagerduty id. We look up the schedules by name (using this method), and then translate the names into id's.

This method is implemented by getting all objects of the resource type (cached into __context__), then brute force searching through the list and trying to match any of the identifier_fields. The __context__ cache is purged after any create, update or delete to the resource.

salt.modules.pagerduty_util.get_schedules(profile='pagerduty', subdomain=None, api_key=None)

List schedules belonging to this account

CLI Example:
salt myminion pagerduty.get_schedules

salt.modules.pagerduty_util.get_services(profile='pagerduty', subdomain=None, api_key=None)

List services belonging to this account

CLI Example:
salt myminion pagerduty.get_services
salt.modules.pagerduty_util.get_users(profile='pagerduty', subdomain=None, api_key=None)
List users belonging to this account

CLI Example:
salt myminion pagerduty.get_users

salt.modules.pagerduty_util.resource_absent(resource, identifier_fields, profile='pagerduty', subdomain=None, api_key=None, **kwargs)
Generic resource.absent state method. Pagerduty state modules should be a thin wrapper over this method, with a custom diff function.
This method calls delete_resource() and formats the result as a salt state return value.

example

resource_absent(``users'', ["id","name","email"])

salt.modules.pagerduty_util.resource_present(resource, identifier_fields, diff=None, profile='pagerduty', subdomain=None, api_key=None, **kwargs)
Generic resource.present state method. Pagerduty state modules should be a thin wrapper over this method, with a custom diff function.
This method calls create_or_update_resource() and formats the result as a salt state return value.

example

resource_present(``users'', ["id","name","email"])

19.9.280 salt.modules.pam

Support for pam

salt.modules.pam.read_file(file_name)
This is just a test function, to make sure parsing works

CLI Example:
salt '*' pam.read_file /etc/pam.d/login

19.9.281 salt.modules.parallels module

Manage Parallels Desktop VMs with prlctl and prlsrvctl. Only some of the prlctl commands implemented so far. Of those that have been implemented, not all of the options may have been provided yet. For a complete reference, see the Parallels Desktop Reference Guide.

What has not been implemented yet can be accessed through parallels.prlctl and parallels.prlsrvctl (note the preceding double dash -- as necessary):

salt '*' parallels.prlctl installtools macvm runas=macdev
salt -- '*' parallels.prlctl capture 'macvm --file macvm.display.png' runas=macdev
salt -- '*' parallels.prlsrvctl set '--mem-limit auto' runas=macdev

New in version 2016.3.0.
salt.modules.parallels.clone(name, new_name, linked=False, template=False, runas=None)

Clone a VM

New in version 2016.11.0.

Parameters

- **name** *(str)* -- Name/ID of VM to clone
- **new_name** *(str)* -- Name of the new VM
- **linked** *(bool)* -- Create a linked virtual machine.
- **template** *(bool)* -- Create a virtual machine template instead of a real virtual machine.
- **runas** *(str)* -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.clone macvm macvm_new runas=macdev
salt '*' parallels.clone macvm macvmtempl template=True runas=macdev
```

salt.modules.parallels.delete(name, runas=None)

Delete a VM

New in version 2016.11.0.

Parameters

- **name** *(str)* -- Name/ID of VM to clone
- **runas** *(str)* -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.exec macvm 'find /etc/paths.d' runas=macdev
```

salt.modules.parallels.delete_snapshot(name, snap_name, runas=None, all=False)

Delete a snapshot

**Note:** Deleting a snapshot from which other snapshots are derived will not delete the derived snapshots

Parameters

- **name** *(str)* -- Name/ID of VM whose snapshot will be deleted
- **snap_name** *(str)* -- Name/ID of snapshot to delete
- **runas** *(str)* -- The user that the prlctl command will be run as
- **all** *(bool)* -- Delete all snapshots having the name given

New in version 2016.11.0.

Example:

```
salt '*' parallels.delete_snapshot macvm 'unneeded snapshot' runas=macdev
salt '*' parallels.delete_snapshot macvm 'Snapshot for linked clone' all=True runas=macdev
```

salt.modules.parallels.exec_(name, command, runas=None)

Run a command on a VM

Parameters

- **name** *(str)* -- Name/ID of VM whose exec will be returned
- **command** *(str)* -- Command to run on the VM
- **runas** *(str)* -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.exec macvm 'find /etc/paths.d' runas=macdev
```
salt.modules.parallels.exists(name, runas=None)
Query whether a VM exists
New in version 2016.11.0.
Parameters
- **name** (str) -- Name/ID of VM
- **runas** (str) -- The user that the prlctl command will be run as

Example:
```
salt '*' parallels.exists macvm runas=macdev
```

salt.modules.parallels.list_snapshots(name, snap_name=None, tree=False, names=False, runas=None)
List the snapshots
Parameters
- **name** (str) -- Name/ID of VM whose snapshots will be listed
- **snap_id** (str) -- Name/ID of snapshot to display information about. If tree=True is also specified, display the snapshot subtree having this snapshot as the root snapshot
- **tree** (bool) -- List snapshots in tree format rather than tabular format
- **names** (bool) -- List snapshots as ID, name pairs
- **runas** (str) -- The user that the prlctl command will be run as

Example:
```
salt '*' parallels.list_snapshots macvm runas=macdev
salt '*' parallels.list_snapshots macvm tree=True runas=macdev
salt '*' parallels.list_snapshots macvm snap_name=original runas=macdev
salt '*' parallels.list_snapshots macvm names=True runas=macdev
```

salt.modules.parallels.list_vms(name=None, info=False, all=False, args=None, runas=None, template=False)
List information about the VMs
Parameters
- **name** (str) -- Name/ID of VM to list
  Changed in version 2016.11.0: No longer implies info=True
- **info** (str) -- List extra information
- **all** (bool) -- List all non-template VMs
- **args** (tuple) -- Additional arguments given to prctl list
- **runas** (str) -- The user that the prlctl command will be run as
- **template** (bool) -- List the available virtual machine templates. The real virtual machines will not be included in the output

Example:
```
salt '*' parallels.list_vms runas=macdev
salt '*' parallels.list_vms name=macvm info=True runas=macdev
salt '*' parallels.list_vms info=True runas=macdev
salt '*' parallels.list_vms ' -o uuid,status' all=True runas=macdev
```

salt.modules.parallels.prlctl(sub_cmd, args=None, runas=None)
Execute a prlctl command
Parameters
- **sub_cmd** (str) -- prlctl subcommand to execute
- **args** (str) -- The arguments supplied to prlctl <sub_cmd>
- **runas** (str) -- The user that the prlctl command will be run as
Example:

```
salt '*' parallels.prlctl user list runas=macdev
salt '*' parallels.prlctl exec 'macvm uname' runas=macdev
salt -- '*' parallels.prlctl capture 'macvm --file macvm.display.png' runas=macdev
```

```python
salt.modules.parallels.prlsrvtctl(sub_cmd, args=None, runas=None)
```
Execute a prlsrvctl command

New in version 2016.11.0.

**Parameters**
- **sub_cmd** *(str)* -- prlsrvctl subcommand to execute
- **args** *(str)* -- The arguments supplied to prlsrvctl <sub_cmd>
- **runas** *(str)* -- The user that the prlsrvctl command will be run as

Example:

```
salt '*' parallels.prlsrvtctl info runas=macdev
salt '*' parallels.prlsrvtctl usb list runas=macdev
salt -- '*' parallels.prlsrvtctl set '--mem-limit auto' runas=macdev
```

```python
salt.modules.parallels.reset(name, runas=None)
```
Reset a VM by performing a hard shutdown and then a restart

**Parameters**
- **name** *(str)* -- Name/ID of VM to reset
- **runas** *(str)* -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.reset macvm runas=macdev
```

```python
salt.modules.parallels.restart(name, runas=None)
```
Restart a VM by gracefully shutting it down and then restarting it

**Parameters**
- **name** *(str)* -- Name/ID of VM to restart
- **runas** *(str)* -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.restart macvm runas=macdev
```

```python
salt.modules.parallels.revert_snapshot(name, snap_name, runas=None)
```
Revert a VM to a snapshot

**Parameters**
- **name** *(str)* -- Name/ID of VM to revert to a snapshot
- **snap_name** *(str)* -- Name/ID of snapshot to revert to
- **runas** *(str)* -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.revert_snapshot macvm base-with-updates runas=macdev
```

```python
salt.modules.parallels.snapshot(name, snap_name=None, desc=None, runas=None)
```
Create a snapshot

**Parameters**
- **name** *(str)* -- Name/ID of VM to take a snapshot of
- **snap_name** *(str)* -- Name of snapshot
- **desc** *(str)* -- Description of snapshot
- **runas** *(str)* -- The user that the prlctl command will be run as

Example:
salt 'salt '*' parallels.create_snapshot macvm snap_name=macvm-original runas=macdev
salt 'salt '*' parallels.create_snapshot macvm snap_name=macvm-updates desc='clean!, install with updates' runas=macdev

```
salt.modules.parallels.snapshot_id_to_name(name, snap_id, strict=False, runas=None)
```

Attempt to convert a snapshot ID to a snapshot name. If the snapshot has no name or if the ID is not found or invalid, an empty string will be returned

Parameters
- `name (str)` -- Name/ID of VM whose snapshots are inspected
- `snap_id (str)` -- ID of the snapshot
- `strict (bool)` -- Raise an exception if a name cannot be found for the given snap_id
- `runas (str)` -- The user that the prlctl command will be run as

Example data

```
ID: {a5b8999f-5d95-4aff-82de-815b0101b66}
Name: original
Date: 2016-03-04 10:50:34
Current: yes
State: poweroff
Description: original state
```

CLI Example:

```
salt 'salt '*' parallels.snapshot_id_to_name macvm a5b8999f-5d95-4aff-82de-815b0101b66 runas=macdev
```

```
salt.modules.parallels.snapshot_name_to_id(name, snap_name, strict=False, runas=None)
```

Attempt to convert a snapshot name to a snapshot ID. If the name is not found an empty string is returned. If multiple snapshots share the same name, a list will be returned

Parameters
- `name (str)` -- Name/ID of VM whose snapshots are inspected
- `snap_name (str)` -- Name of the snapshot
- `strict (bool)` -- Raise an exception if multiple snapshot IDs are found
- `runas (str)` -- The user that the prlctl command will be run as

CLI Example:

```
salt 'salt '*' parallels.snapshot_id_to_name macvm original runas=macdev
```

```
salt.modules.parallels.start(name, runas=None)
```

Start a VM

Parameters
- `name (str)` -- Name/ID of VM to start
- `runas (str)` -- The user that the prlctl command will be run as

Example:

```
salt 'salt '*' parallels.start macvm runas=macdev
```

```
salt.modules.parallels.status(name, runas=None)
```

Status of a VM

Parameters
- `name (str)` -- Name/ID of VM whose status will be returned
- `runas (str)` -- The user that the prlctl command will be run as

Example:
salt '*' parallels.status macvm runas=macdev

salt.modules.parallels.stop(name, kill=False, runas=None)
Stop a VM

Parameters
- **name (str)** -- Name/ID of VM to stop
- **kill (bool)** -- Perform a hard shutdown
- **runas (str)** -- The user that the prlctl command will be run as

Example:
salt '*' parallels.stop macvm runas=macdev
salt '*' parallels.stop macvm kill=True runas=macdev

19.9.282 salt.modules.parted

Module for managing partitions on POSIX-like systems.

depends
- parted, partprobe, lsbk (usually parted and util-linux packages)

Some functions may not be available, depending on your version of parted.

Check the manpage for parted(8) for more information, or the online docs at:

In light of parted not directly supporting partition IDs, some of this module has been written to utilize sfdisk instead. For further information, please reference the man page for sfdisk(8).

salt.modules.parted.align_check(device, part_type, partition)
Check if partition satisfies the alignment constraint of part_type. Type must be `minimal` or `optimal`

CLI Example:
salt '*' partition.align_check /dev/sda minimal 1

salt.modules.parted.check(device, minor)
Checks if the filesystem on partition <minor> has any errors.

CLI Example:
salt '*' partition.check 1

salt.modules.parted.cp(device, from_minor, to_minor)
Copies the filesystem on the partition <from-minor> to partition <to-minor>, deleting the original contents of the destination partition.

CLI Example:
salt '*' partition.cp /dev/sda 2 3

salt.modules.parted.exists(device='')
Check to see if the partition exists

CLI Example:
salt '*' partition.exists /dev/sdb1
salt.modules.parted.get_block_device()
Retrieve a list of disk devices
New in version 2014.7.0.
CLI Example:
```
salt '*' partition.get_block_device
```

salt.modules.parted.get_id(device, minor)
Prints the system ID for the partition. Some typical values are:
b: FAT32 (vfat)
7: HPFS/NTFS
82: Linux Swap
83: Linux
8e: Linux LVM
fd: Linux RAID Auto

CLI Example:
```
salt '*' partition.get_id /dev/sda 1
```

salt.modules.parted.list_(device, unit=None)
Prints partition information of given <device>
CLI Examples:
```
salt '*' partition.list /dev/sda
salt '*' partition.list /dev/sda unit=s
salt '*' partition.list /dev/sda unit=kB
```

salt.modules.parted.mkfs(device, fs_type)
Makes a file system <fs_type> on partition <device>, destroying all data that resides on that partition.<fs_type> must be one of ``ext2'', ``fat32'', ``fat16'', ``linux-swap'' or ``reiserfs'' (if libreiserfs is installed)
CLI Example:
```
salt '*' partition.mkfs /dev/sda2 fat32
```

salt.modules.parted.mklabel(device, label_type)
Create a new disklabel (partition table) of label_type.
Type should be one of ``aix'', ``amiga'', ``bsd'', ``dvh'', ``gpt'', ``loop'', ``mac'', ``msdos'', ``pc98'', or ``sun''.
CLI Example:
```
salt '*' partition.mklabel /dev/sda msdos
```

salt.modules.parted.mkpart(device, part_type=None, fs_type=None, start=None, end=None)
Make a part_type partition for filesystem fs_type, beginning at start and ending at end (by default in megabytes). part_type should be one of ``primary'', ``logical'', or ``extended''.
CLI Examples:
```
salt '*' partition.mkpart /dev/sda primary fs_type=fat32 start=0 end=639
salt '*' partition.mkpart /dev/sda primary start=0 end=639
```
**salt.modules.parted.mkpartfs**(*device*, part_type, fs_type, start, end)

Make a <part_type> partition with a new filesystem of <fs_type>, beginning at <start> and ending at <end> (by default in megabytes).

<part_type> should be one of "primary", "logical", or "extended". <fs_type> must be one of "ext2", "fat32", "fat16", "linux-swap" or "reiserfs" (if libreiserfs is installed).

CLI Example:

```bash
salt '*' partition.mkpartfs /dev/sda logical ext2 440 670
```

**salt.modules.parted.name**(*device*, partition, name)

Set the name of partition to name. This option works only on Mac, PC98, and GPT disklabels. The name can be placed in quotes, if necessary.

CLI Example:

```bash
salt '*' partition.name /dev/sda 1 'My Documents'
```

**salt.modules.parted.probe**(*devices*)

Ask the kernel to update its local partition data. When no args are specified all block devices are tried.

Caution: Generally only works on devices with no mounted partitions and may take a long time to return if specified devices are in use.

CLI Examples:

```bash
salt '*' partition.probe
salt '*' partition.probe /dev/sda
salt '*' partition.probe /dev/sda /dev/sdb
```

**salt.modules.parted.rescue**(*device*, start, end)

Rescue a lost partition that was located somewhere between start and end. If a partition is found, parted will ask if you want to create an entry for it in the partition table.

CLI Example:

```bash
salt '*' partition.rescue /dev/sda 0 8056
```

**salt.modules.parted.resize**(*device*, minor, start, end)

Resizes the partition with number <minor>.

The partition will start <start> from the beginning of the disk, and end <end> from the beginning of the disk. resize never changes the minor number. Extended partitions can be resized, so long as the new extended partition completely contains all logical partitions.

CLI Example:

```bash
salt '*' partition.resize /dev/sda 3 200 850
```

**salt.modules.parted.rm**(*device*, minor)

Removes the partition with number <minor>.

CLI Example:

```bash
salt '*' partition.rm /dev/sda 5
```

**salt.modules.parted.set_**(*device*, minor, flag, state)

Changes a flag on the partition with number <minor>.

---

19.9. execution modules

1933
A flag can be either "on" or "off" (make sure to use proper quoting, see YAML Idiosyncrasies). Some or all of these flags will be available, depending on what disk label you are using. Valid flags are: bios_grub, legacy_boot, boot, lba, root, swap, hidden, raid, LVM, PALO, PREP, DIAG

CLI Example:
```bash
salt '*' partition.set /dev/sda 1 boot "on"
```

salt.modules.parted.set_id(device, minor, system_id)

Sets the system ID for the partition. Some typical values are:

- b: FAT32 (vfat)
- 7: HPFS/NTFS
- 82: Linux Swap
- 83: Linux
- 8e: Linux LVM
- fd: Linux RAID Auto

CLI Example:
```bash
salt '*' partition.set_id /dev/sda 1 83
```

salt.modules.parted.system_types()

List the system types that are supported by the installed version of sfdisk

CLI Example:
```bash
salt '*' partition.system_types
```

salt.modules.parted.toggle(device, partition, flag)

Toggle the state of <flag> on <partition>. Valid flags are the same as the set command.

CLI Example:
```bash
salt '*' partition.toggle /dev/sda 1 boot
```

19.9.283 salt.modules.pcs module

Configure a Pacemaker/Corosync cluster with PCS

Configure Pacemaker/Corosync clusters with the Pacemaker/Corosync configuration system (PCS)

depends pcs

New in version 2016.3.0.

salt.modules.pcs.auth(nodes, pcsuser='hacluster', pcspasswd='hacluster', extra_args=None)

Authorize nodes to the cluster

- nodes a list of nodes which should be authorized to the cluster
- pcsuser user for communication with PCS (default: hacluster)
- pcspasswd password for pcsuser (default: hacluster)
- extra_args list of extra option for the `pcs cluster auth` command

CLI Example:
```bash
salt '!' pcs.auth nodes='[ node1.example.org node2.example.org ]' pcsuser='hacluster' pcspasswd='hoonetorg' extra_args='[ '--force' ]'
```

salt.modules.pcs.cib_create(cibfile, scope='configuration', extra_args=None)

Create a CIB-file from the current CIB of the cluster
cibfile  name/path of the file containing the CIB
scope  specific section of the CIB (default: configuration)
extra_args  additional options for creating the CIB-file

CLI Example:
```
salt '*' pcs.cib_create cibfile='tmp/VIP_apache_1.cib' scope=False
```

```
salt.modules.pcs.cib_push(cibfile, scope='configuration', extra_args=None)
```

Push a CIB-file as the new CIB to the cluster

cibfile  name/path of the file containing the CIB
scope  specific section of the CIB (default: configuration)
extra_args  additional options for creating the CIB-file

CLI Example:
```
salt '*' pcs.cib_push cibfile='tmp/VIP_apache_1.cib' scope=False
```

```
salt.modules.pcs.cluster_node_add(node, extra_args=None)
```

Add a node to the pacemaker cluster via pcs command

node  node that should be added
extra_args  list of extra option for the `pcs cluster node add' command

CLI Example:
```
salt '*' pcs.cluster_node_add node=node2.example.org
```

```
salt.modules.pcs.cluster_setup(nodes, pcsclustername='pcscluster', extra_args=None)
```

Setup pacemaker cluster via pcs command

nodes  a list of nodes which should be set up
pcsclustername  Name of the Pacemaker cluster (default: pcscluster)
extra_args  list of extra option for the `pcs cluster setup' command

CLI Example:
```
salt '*' pcs.cluster_setup nodes='[ node1.example.org node2.example.org ]'
  pcsclustername=pcscluster
```

```
salt.modules.pcs.config_show(cibfile=None)
```

Show config of cluster
cibfile  name/path of the file containing the CIB

CLI Example:
```
salt '*' pcs.config_show cibfile='/tmp/cib_for_galera'
```

```
salt.modules.pcs.is_auth(nodes)
```

Check if nodes are already authorized

nodes  a list of nodes to be checked for authorization to the cluster

CLI Example:
```
salt '*' pcs.is_auth nodes='[node1.example.org node2.example.org]'
```

```
salt.modules.pcs.item_create(item, item_id, item_type, create='create', extra_args=None, cibfile=None)
```

Create an item via pcs command (mainly for use with the pcs state module)

item  config, property, resource, constraint etc.
item_id  id of the item
item_type  item type
create  create command (create or set f.e., default: create)
extra_args  additional options for the pcs command

19.9. execution modules 1935
cibfile  use cibfile instead of the live CIB

clickboard

salt.modules.pcs.item_show(item, item_id=None, item_type=None, show='show', extra_args=None, cibfile=None)

Show an item via pcs command (mainly for use with the pcs state module)
item  config, property, resource, constraint etc.
item_id  id of the item
item_type  item type
show  show command (probably None, default: show)
extra_args  additional options for the pcs command
cibfile  use cibfile instead of the live CIB

clickboard

salt.modules.pcs.prop_set(prop, value, extra_args=None, cibfile=None)

Set the value of a cluster property
prop  name of the property
value  value of the property prop
extra_args  additional options for the pcs property command
cibfile  use cibfile instead of the live CIB

CLI Example:
salt '*' pcs.prop_set prop='no-quorum-policy' value='ignore' cibfile='/tmp/2_node_cluster.cib'

salt.modules.pcs.prop_show(prop, extra_args=None, cibfile=None)

Show the value of a cluster property
prop  name of the property
elementary_args  additional options for the pcs property command
cibfile  use cibfile instead of the live CIB

CLI Example:
salt '*' pcs.prop_show cibfile='/tmp/2_node_cluster.cib' prop='no-quorum-policy'

salt.modules.pcs.resource_create(resource_id, resource_type, resource_options=None, cibfile=None)

Create a resource via pcs command
resource_id  name for the resource
resource_type  resource type (f.e. ocf:heartbeat:IPaddr2 or VirtualIP)
resource_options  additional options for creating the resource
cibfile  use cibfile instead of the live CIB for manipulation

CLI Example:
salt '*' pcs.resource_create resource_id='galera' resource_type='ocf:heartbeat:galera' resource_options="[['wsrep_cluster_address=gcomm://node1.example.org,node2.example.org,node3.example.org', '--master']]" cibfile='/tmp/cib_for_galera.cib'

salt.modules.pcs.resource_show(resource_id, extra_args=None, cibfile=None)

Show a resource via pcs command
resource_id  name of the resource
elementary_args  additional options for the pcs command
cibfile  use cibfile instead of the live CIB

CLI Example:
salt '*' pcs.resource_show resource_id='galera' cibfile='/tmp/cib_for_galera.cib'
salt.modules.pcs.stonith_create(stonith_id, stonith_device_type, stonith_device_options=None, cibfile=None)

Create a stonith resource via pcs command

stonith_id: name for the stonith resource
stonith_device_type: name of the stonith agent fence_eps, fence_xvm f.e.
stonith_device_options: additional options for creating the stonith resource
cibfile: use cibfile instead of the live CIB for manipulation

CLI Example:
```
salt '*' pcs.stonith_create stonith_id='eps_fence' stonith_device_type='fence_eps' stonith_device_options="["pcmk_host_map=node1.example.org:01;node2.example.org:02', 'ipaddr=mxepsdevice.example.org', 'action=reboot', 'power_wait=5', 'verbose=1', 'debug=/var/log/pcsd/eps_fence.log', 'login=hidden', 'passwd=hoonetorg']" cibfile='/tmp/cib_for_stonith.cib'
```

salt.modules.pcs.stonith_show(stonith_id, extra_args=None, cibfile=None)

Show the value of a cluster stonith

stonith_id: name for the stonith resource
extra_args: additional options for the pcs stonith command
cibfile: use cibfile instead of the live CIB

CLI Example:
```
salt '*' pcs.stonith_show stonith_id='eps_fence' cibfile='/tmp/2_node_cluster.cib'
```

19.9.284 salt.modules.pdbedit

Manage accounts in Samba's passdb using pdbedit

maintainer: Jorge Schrauwen <sjorge@blackdot.be>
maturity: new
platform: posix

New in version 2017.7.0.

salt.modules.pdbedit.create(login, password, password_hashed=False, machine_account=False)

Create user account

login: [string] login name
password: [string] password
password_hashed: [boolean] set if password is a nt hash instead of plain text
machine_account: [boolean] set to create a machine trust account instead

CLI Example:
```
salt '*' pdbedit.create zoe 9764951149F84E7780887011E1DC4A927 nthash
salt '*' pdbedit.create river lsw4ll0w3d4bug
```

salt.modules.pdbedit.delete(login)

Delete user account

login: [string] login name

CLI Example:
```
salt '*' pdbedit.delete wash
```

salt.modules.pdbedit.generate_nt_hash(password)

Generate a NT HASH
CLI Example:

```
salt '*' pdbedit.generate_nt_hash my_passwd
```

```python
salt.modules.pdbedit.get_user(login, hashes=False)
Get user account details
login [string] login name
hashes [boolean] include NTHASH and LMHASH in verbose output
```

CLI Example:

```
salt '*' pdbedit.get kaylee
```

```python
salt.modules.pdbedit.list_users(verbos=True, hashes=False)
List user accounts
verbose [boolean] return all information
hashes [boolean] include NT HASH and LM HASH in verbose output
```

CLI Example:

```
salt '*' pdbedit.list
```

```python
salt.modules.pdbedit.modify(login, password=None, password_hashed=False, domain=None, profile=None, script=None, drive=None, homedir=None, fullname=None, account_desc=None, account_control=None, machine_sid=None, user_sid=None, reset_login_hours=False, reset_bad_password_count=False)
Modify user account
login [string] login name
password [string] password
password_hashed [boolean] set if password is a nt hash instead of plain text
domain [string] users domain
profile [string] profile path
script [string] logon script
drive [string] home drive
homedir [string] home directory
fullname [string] full name
account_desc [string] account description
machine_sid [string] specify the machines new primary group SID or rid
user_sid [string] specify the users new primary group SID or rid
account_control [string] specify user account control properties
```

**Note:** Only the following can be set: - N: No password required - D: Account disabled - H: Home directory required - L: Automatic Locking - X: Password does not expire

```python
reset_login_hours [boolean] reset the users allowed logon hours
reset_bad_password_count [boolean] reset the stored bad login counter
```

**Note:** if user is absent and password is provided, the user will be created

CLI Example:

```
salt '*' pdbedit.modify inara fullname='Inara Serra'
salt '*' pdbedit.modify simon password='r1v3r'
salt '*' pdbedit.modify jane drive='V:' homedir='\serenity\jane\profile'
salt '*' pdbedit.modify mal account_control=NX
```
19.9.285 salt.modules.pecl

Manage PHP pecl extensions.

```
salt.modules.pecl.install(pecls, defaults=False, force=False, preferred_state='stable')
```

New in version 0.17.0.

Installs one or several pecl extensions.

- **pecls** The pecl extensions to install.
- **defaults** Use default answers for extensions such as pecl_http which ask questions before installation. Without this option, the pecl.installed state will hang indefinitely when trying to install these extensions.
- **force** Whether to force the installed version or not

CLI Example:

```
salt '*' pecl.install fuse
```

```
salt.modules.pecl.list_(channel=None)
```

List installed pecl extensions.

CLI Example:

```
salt '*' pecl.list
```

```
salt.modules.pecl.uninstall(pecls)
```

Uninstall one or several pecl extensions.

CLI Example:

```
salt '*' pecl.uninstall fuse
```

```
salt.modules.pecl.update(pecls)
```

Update one or several pecl extensions.

CLI Example:

```
salt '*' pecl.update fuse
```

19.9.286 salt.modules.philips_hue module

Philips HUE lamps module for proxy.

New in version 2015.8.3.

19.9.287 salt.modules.pillar

Extract the pillar data for this minion

```
salt.modules.pillar.ext(external, pillar=None)
```

Changed in version 2016.3.6,2016.11.3,2017.7.0: The supported ext_pillar types are now tunable using the `on_demand_ext_pillar` config option. Earlier releases used a hard-coded default.

Generate the pillar and apply an explicit external pillar.

- **external** A single ext_pillar to add to the ext_pillar configuration. This must be passed as a single section from the ext_pillar configuration (see CLI examples below). For more complicated ext_pillar configurations, it can be helpful to use the Python shell to load YAML configuration into a dictionary, and figure out
```python
>>> import yaml
>>> ext_pillar = yaml.safe_load('"
... ext_pillar:
...    - git:
...      - issue38440 https://github.com/terminalmage/git_pillar:
...      - env: base
...    ""
..."
>>> ext_pillar
{'ext_pillar': [{'git': [{'mybranch https://github.com/myuser/myrepo': {'env': 'base'}}]}]}
>>> ext_pillar['ext_pillar'][0]['git'][0]['mybranch https://github.com/myuser/myrepo']['env': 'base']
```

In the above example, the value to pass would be 

```python
{'git': [{'mybranch https://github.com/myuser/myrepo': {'env': 'base'}}]}
```

Note that this would need to be quoted when passing on the CLI (as in the CLI examples below).

pillar [None] If specified, allows for a dictionary of pillar data to be made available to pillar and ext_pillar rendering. These pillar variables will also override any variables of the same name in pillar or ext_pillar.

New in version 2015.5.0.

CLI Examples:

```bash
salt '*' pillar.ext '{libvirt: _}'
salt '*' pillar.ext "{'git': ['master https://github.com/myuser/myrepo']}"
salt '*' pillar.ext "{'git': [{'mybranch https://github.com/myuser/myrepo': {'env': 'base'}}]}"
```

salt.modules.pillar.fetch(key, default=<type `exceptions.KeyError'>, merge=False, merge_nested_lists=None, delimiter=':', pillarenv=None, saltenv=None)

New in version 0.14.

Attempt to retrieve the named value from in-memory pillar data. If the pillar key is not present in the in-memory pillar, then the value specified in the default option (described below) will be returned.

If the merge parameter is set to True, the default will be recursively merged into the returned pillar data.

The value can also represent a value in a nested dict using a ":" delimiter for the dict. This means that if a dict in pillar looks like this:

```python
{"pkg": {"apache": 'httpd'}}
```

To retrieve the value associated with the apache key in the pkg dict this key can be passed as:

```bash
pkg:apache
```

key The pillar key to get value from

default The value specified by this option will be returned if the desired pillar key does not exist.

If a default value is specified, then it will be an empty string, unless pillar_raise_on_missing is set to True, in which case an error will be raised.

merge [False] If True, the retrieved values will be merged into the passed default. When the default and the retrieved value are both dictionaries, the dictionaries will be recursively merged.

New in version 2014.7.0.

Changed in version 2016.3.7,2016.11.4,2017.7.0: If the default and the retrieved value are not of the same type, then merging will be skipped and the retrieved value will be returned. Earlier releases raised an error in these cases.
merge_nested_lists  If set to False, lists nested within the retrieved pillar dictionary will overwrite lists in default. If set to True, nested lists will be merged into lists in default. If unspecified (the default), this option is inherited from the pillar_merge_lists minion config option.

**Note:** This option is ignored when merge is set to False.

New in version 2016.11.6.

delimiter  Specify an alternate delimiter to use when traversing a nested dict. This is useful for when the desired key contains a colon. See CLI example below for usage.

New in version 2014.7.0.
pillarenv  If specified, this function will query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment. Note that this can produce different pillar data than executing this function without an environment, as its normal behavior is just to return a value from minion’s pillar data in memory (which can be sourced from more than one pillar environment).

Using this argument will not affect the pillar data in memory. It will however be slightly slower and use more resources on the master due to the need for the master to generate and send the minion fresh pillar data. This tradeoff in performance however allows for the use case where pillar data is desired only from a single environment.

New in version 2017.7.0.
saltenv  Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.

New in version 2017.7.0.

CLI Example:

```
salt '*' pillar.get pkg:apache
salt '*' pillar.get abc::def|ghi delimiter='|'
```

salt.modules.pillar.file_exists(path, saltenv=None)

New in version 2016.3.0.

This is a master-only function. Calling from the minion is not supported.

Use the given path and search relative to the pillar environments to see if a file exists at that path.

If the saltenv argument is given, restrict search to that environment only.

Will only work with pillar_roots, not external pillars.

Returns True if the file is found, and False otherwise.

path  The path to the file in question. Will be treated as a relative path

saltenv  Optional argument to restrict the search to a specific saltenv

CLI Example:

```
salt '*' pillar.file_exists foo/bar.sls
```

salt.modules.pillar.filter_by(lookup_dict, pillar, merge=None, default='default', base=None)

New in version 2017.7.0.

Look up the given pillar in a given dictionary and return the result

Parameters

- `lookup_dict` -- A dictionary, keyed by a pillar, containing a value or values relevant to systems matching that pillar. For example, a key could be a pillar for a role and the value could the name of a package on that particular OS.
The dictionary key can be a globbing pattern. The function will return the corresponding `lookup_dict` value where the pillar value matches the pattern. For example:

```
# this will render 'got some salt' if 'role' begins with 'salt'
salt '*' pillar.filter_by '{salt*: got some salt, default: salt
← is not here}' role
```

- **pillar** -- The name of a pillar to match with the system's pillar. For example, the value of the `role` pillar could be used to pull values from the `lookup_dict` dictionary.

The pillar value can be a list. The function will return the `lookup_dict` value for a first found item in the list matching one of the `lookup_dict` keys.

- **merge** -- A dictionary to merge with the results of the pillar selection from `lookup_dict`. This allows another dictionary to override the values in the `lookup_dict`.

- **default** -- default `lookup_dict`'s key used if the pillar does not exist or if the pillar value has no match on `lookup_dict`. If unspecified the value is `"default"`.

- **base** -- A `lookup_dict` key to use for a base dictionary. The pillar-selected `lookup_dict` is merged over this and then finally the `merge` dictionary is merged. This allows common values for each case to be collected in the base and overridden by the pillar selection dictionary and the merge dictionary. Default is unset.

CLI Example:

```
salt '*' pillar.filter_by '{web: Serve it up, db: I query, default: x_x}' role
```

```
salt.modules.pillar.get(key, default=<type `exceptions.KeyError'>, merge=False, merge_nested_lists=None, delimiter=':', pillarenv=None, saltenv=None)
```

New in version 0.14.

Attempt to retrieve the named value from in-memory pillar data. If the pillar key is not present in the in-memory pillar, then the value specified in the `default` option (described below) will be returned.

If the merge parameter is set to `True`, the default will be recursively merged into the returned pillar data.

The value can also represent a value in a nested dict using a `"::"` delimiter for the dict. This means that if a dict in pillar looks like this:

```
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the `apache` key in the `pkg` dict this key can be passed as:

```
pkg:apache
```

- **key** The pillar key to get value from
- **default** The value specified by this option will be returned if the desired pillar key does not exist.

  If a default value is specified, then it will be an empty string, unless `pillar_raise_on_missing` is set to `True`, in which case an error will be raised.

- **merge** `[False]` If `True`, the retrieved values will be merged into the passed default. When the default and the retrieved value are both dictionaries, the dictionaries will be recursively merged.

  New in version 2014.7.0.

  Changed in version 2016.3.7,2016.11.4,2017.7.0: If the default and the retrieved value are not of the same type, then merging will be skipped and the retrieved value will be returned. Earlier releases raised an error in these cases.
merge_nested_lists If set to False, lists nested within the retrieved pillar dictionary will overwrite lists in default. If set to True, nested lists will be merged into lists in default. If unspecified (the default), this option is inherited from the pillar_merge_lists minion config option.

Note: This option is ignored when merge is set to False.

New in version 2016.11.6.

delimiter Specify an alternate delimiter to use when traversing a nested dict. This is useful for when the desired key contains a colon. See CLI example below for usage.

New in version 2014.7.0.

pillarenv If specified, this function will query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment. Note that this can produce different pillar data than executing this function without an environment, as its normal behavior is just to return a value from minion’s pillar data in memory (which can be sourced from more than one pillar environment).

Using this argument will not affect the pillar data in memory. It will however be slightly slower and use more resources on the master due to the need for the master to generate and send the minion fresh pillar data. This tradeoff in performance however allows for the use case where pillar data is desired only from a single environment.

New in version 2017.7.0.

saltenv Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.

New in version 2017.7.0.

CLI Example:

```bash
class 'salt'* pillar.get pkg:apache
class 'salt'* pillar.get abc::def|ghi delimiter='|
```

salt.modules.pillar.item('args', **kwargs)

New in version 0.16.2.

Return one or more pillar entries from the in-memory pillar data.

delimiter Delimiter used to traverse nested dictionaries.

Note: This is different from pillar.get in that no default value can be specified. pillar.get should probably still be used in most cases to retrieve nested pillar values, as it is a bit more flexible. One reason to use this function instead of pillar.get however is when it is desirable to retrieve the values of more than one key, since pillar.get can only retrieve one key at a time.

New in version 2015.8.0.

pillarenv If specified, this function will query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment. Note that this can produce different pillar data than executing this function without an environment, as its normal behavior is just to return a value from minion’s pillar data in memory (which can be sourced from more than one pillar environment).

Using this argument will not affect the pillar data in memory. It will however be slightly slower and use more resources on the master due to the need for the master to generate and send the minion fresh pillar data. This tradeoff in performance however allows for the use case where pillar data is desired only from a single environment.

New in version 2017.7.6,2018.3.1.

saltenv Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.

New in version 2017.7.6,2018.3.1.
CLI Examples:

```bash
salt '*' pillar.item foo
salt '*' pillar.item foo:bar
salt '*' pillar.item foo bar baz
```

```
salt.modules.pillar.items('args, **kwargs)
```
Calls the master for a fresh pillar and generates the pillar data on the fly

Contrast with `row()` which returns the pillar data that is currently loaded into the minion.

- **pillar** If specified, allows for a dictionary of pillar data to be made available to pillar and ext_pillar rendering. These pillar variables will also override any variables of the same name in pillar or ext_pillar.
  
  New in version 2015.5.0.

- **pillar_enc** If specified, the data passed in the pillar argument will be passed through this renderer to decrypt it.

  **Note:** This will decrypt on the minion side, so the specified renderer must be set up on the minion for this to work. Alternatively, pillar data can be decrypted master-side. For more information, see the Pillar Encryption documentation. Pillar data that is decrypted master-side, is not decrypted until the end of pillar compilation though, so minion-side decryption will be necessary if the encrypted pillar data must be made available in an decrypted state pillar/ext_pillar rendering.

  New in version 2017.7.0.

- **pillarenv** Pass a specific pillar environment from which to compile pillar data. If not specified, then the minion’s `pillarenv` option is not used, and if that also is not specified then all configured pillar environments will be merged into a single pillar dictionary and returned.

  New in version 2016.11.2.

- **saltenv** Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

  CLI Example:

  ```bash
  salt '*' pillar.items
  ```

```
salt.modules.pillar.keys(key, delimiter=':')
```
New in version 2015.8.0.

Attempt to retrieve a list of keys from the named value from the pillar.

The value can also represent a value in a nested dict using a `:` delimiter for the dict, similar to how pillar.get works.

- **delimiter** Specify an alternate delimiter to use when traversing a nested dict

  CLI Example:

  ```bash
  salt '*' pillar.keys web:sites
  ```

```
salt.modules.pillar.ls('args)
```
New in version 2015.8.0.

Calls the master for a fresh pillar, generates the pillar data on the fly (same as `items()`), but only shows the available main keys.

CLI Examples:

```bash
salt '*' pillar.ls
```

```
salt.modules.pillar.obfuscate('args)
```
New in version 2015.8.0.
Same as `items()`, but replace pillar values with a simple type indication.

This is useful to avoid displaying sensitive information on console or flooding the console with long output, such as certificates. For many debug or control purposes, the stakes lie more in dispatching than in actual values.

In case the value is itself a collection type, obfuscation occurs within the value. For mapping types, keys are not obfuscated. Here are some examples:

- `'secret password'` becomes `<str>'
- `['secret',1]` becomes `[<str>',<int>']`
- `{'login': 'somelogin','pwd': 'secret'}` becomes `{'login': '<str>','pwd': '<str>'}

CLI Examples:

```shell
salt '*' pillar.obfuscate
```

**salt.modules.pillar.raw**

Return the raw pillar data that is currently loaded into the minion.

Contrast with `items()` which calls the master to fetch the most up-to-date Pillar.

CLI Example:

```shell
salt '*' pillar.raw
```

With the optional key argument, you can select a subtree of the pillar raw data:

```shell
salt '*' pillar.raw key='roles'
```

### 19.9.288 salt.modules.pip

Install Python packages with pip to either the system or a virtualenv

#### Windows Support

New in version 2014.7.4.

Salt now uses a portable python. As a result the entire pip module is now functional on the salt installation itself. You can pip install dependencies for your custom modules. You can even upgrade salt itself using pip. For this to work properly, you must specify the Current Working Directory (cwd) and the Pip Binary (bin_env) salt should use. The variable `pip_bin` can be either a virtualenv path or the path to the pip binary itself.

For example, the following command will list all software installed using pip to your current salt environment:

```shell
salt <minion> pip.list cwd='C:\salt\bin\Scripts' bin_env='C:\salt\bin\Scripts\pip.exe'
```

Specifying the cwd and bin_env options ensures you're modifying the salt environment. If these are omitted, it will default to the local installation of python. If python is not installed locally it will fail saying it couldn't find pip.

#### State File Support

This functionality works in states as well. If you need to pip install colorama with a state, for example, the following will work:
Upgrading Salt using Pip

You can now update salt using pip to any version from the 2014.7 branch forward. Previous version require recompiling some of the dependencies which is painful in windows.

To do this you just use pip with git to update to the version you want and then restart the service. Here is a sample state file that upgrades salt to the head of the 2015.5 branch:

```
install_salt:
  pip.installed:
    - name: colorama
    - cwd: 'C:\salt\bin\scripts'
    - bin_env: 'C:\salt\bin\scripts\pip.exe'
    - editable: git+https://github.com/saltstack/salt@2015.5#egg=salt
    - upgrade: True

restart_service:
  service.running:
    - name: salt-minion
    - enable: True
    - watch:
      - pip: install_salt
```

**Note:** If you’re having problems, you might try doubling the back slashes. For example, cwd: `C:\salt\bin\scripts'. Sometimes python thinks the single back slash is an escape character.

```
salt.modules.pip.freeze(bin_env=None, user=None, cwd=None, use_vt=False, env_vars=None, **kwargs)
```

Return a list of installed packages either globally or in the specified virtualenv

**bin_env** Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. `/usr/bin/pip-2.7` or `/usr/bin/pip-2.6`). If a directory path is specified, it is assumed to be a virtualenv.

**user** The user under which to run pip

**cwd** Directory from which to run pip

**Note:** If the version of pip available is older than 8.0.3, the list will not include the packages pip, wheel, setuptools, or distribute even if they are installed.

CLI Example:

```
salt '*' pip.freeze bin_env=/home/code/path/to/virtualenv
```
salt.modules.pip.install(pkgs=None, requirements=None, bin_env=None, use_wheel=False, no_use_wheel=False, log=None, proxy=None, timeout=None, editable=None, find_links=None, index_url=None, extra_index_url=None, no_index=False, mirrors=None, build=None, target=None, download=None, download_cache=None, source=None, upgrade=False, force_reinstall=False, ignore_installed=False, exists_action=None, no_deps=False, no_install=False, no_download=False, global_options=None, install_options=None, user=None, cwd=None, pre_releases=False, cert=None, allow_all_external=False, allow_external=None, allow_unverified=None, process_dependency_links=False, saltenv='base', env_vars=None, use_vt=False, trusted_host=None, no_cache_dir=False, cache_dir=None, no_binary=None, **kwargs)

Install packages with pip

Install packages individually or from a pip requirements file. Install packages globally or to a virtualenv.

**pkgs** Comma separated list of packages to install

**requirements** Path to requirements

**bin_env** Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. `/usr/bin/pip-2.7` or `/usr/bin/pip-2.6`). If a directory path is specified, it is assumed to be a virtualenv.

**Note:** For Windows, if the pip module is being used to upgrade the pip package, bin_env should be the path to the virtualenv or to the python binary that should be used. The pip command is unable to upgrade itself in Windows.

**use_wheel** Prefer wheel archives (requires pip>=1.4)

**no_use_wheel** Force to not use wheel archives (requires pip>=1.4,<10.0.0)

**no_binary** Force to not use binary packages (requires pip >= 7.0.0) Accepts either :all: to disable all binary packages, :none: to empty the set, or one or more package names with commas between them

**log** Log file where a complete (maximum verbosity) record will be kept

**proxy** Specify a proxy in the form `user:passwd@proxy.server:port`. Note that the `user:password@` is optional and required only if you are behind an authenticated proxy. If you provide `user@proxy.server:port` then you will be prompted for a password.

**timeout** Set the socket timeout (default 15 seconds)

**editable** install something editable (e.g. `git+https://github.com/worldcompany/djangoembed.git#egg=djangoembed`)

**find_links** URL to search for packages

**index_url** Base URL of Python Package Index

**extra_index_url** Extra URLs of package indexes to use in addition to `index_url`

**no_index** Ignore package index

**mirrors** Specific mirror URL(s) to query (automatically adds --use-mirrors)

**Warning:** This option has been deprecated and removed in pip version 7.0.0. Please use `index_url` and/or `extra_index_url` instead.

**build** Unpack packages into `build` dir

**target** Install packages into `target` dir

**download** Download packages into `download` instead of installing them

**download_cache | cache_dir** Cache downloaded packages in `download_cache` or `cache_dir` dir

**source** Check out editable packages into `source` dir

**upgrade** Upgrade all packages to the newest available version

**force_reinstall** When upgrading, reinstall all packages even if they are already up-to-date.

**ignore_installed** Ignore the installed packages (reinstalling instead)
exists_action  Default action when a path already exists: (s)witch, (i)gnore, (w)ipe, (b)ackup
no_deps  Ignore package dependencies
no_install  Download and unpack all packages, but don’t actually install them
no_download  Don’t download any packages, just install the ones already downloaded (completes an install run with --no-install)
install_options  Extra arguments to be supplied to the setup.py install command (e.g. like --install-option='--install-scripts=/usr/local/bin'). Use multiple --install-option options to pass multiple options to setup.py install. If you are using an option with a directory path, be sure to use absolute path.
global_options  Extra global options to be supplied to the setup.py call before the install command.
user  The user under which to run pip
cwd  Directory from which to run pip
pre_releases  Include pre-releases in the available versions
cert  Provide a path to an alternate CA bundle
allow_all_external  Allow the installation of all externally hosted files
allow_external  Allow the installation of externally hosted files (comma separated list)
allow_unverified  Allow the installation of insecure and unverifiable files (comma separated list)
process_dependency_links  Enable the processing of dependency links
env_vars  Set environment variables that some builds will depend on. For example, a Python C-module may have a Makefile that needs INCLUDE_PATH set to pick up a header file while compiling. This must be in the form of a dictionary or a mapping.

Example:

```
salt '*' pip.install django_app env_vars="{'CUSTOM_PATH': '/opt/django_app'}"
```

trusted_host  Mark this host as trusted, even though it does not have valid or any HTTPS.
use_vt  Use VT terminal emulation (see output while installing)
no_cache_dir  Disable the cache.

CLI Example:

```
salt '*' pip.install <package name>,<package2 name>
salt '*' pip.install requirements=/path/to/requirements.txt
salt '*' pip.install <package name> bin_env=/path/to/virtualenv
salt '*' pip.install <package name> bin_env=/path/to/pip_bin
```

Complicated CLI example:

```
salt '*' pip.install markdown,django editable=git+https://github.com/worldcompany/djangoembed.git#egg=djangoembed upgrade=True no_deps=True
```

salt.modules.pip.list_(prefix=None,  bin_env=None,  user=None,  cwd=None,  env_vars=None,  **kwargs)
Filter list of installed apps from freeze and check to see if prefix exists in the list of packages installed.

**Note:** If the version of pip available is older than 8.0.3, the packages wheel, setuptools, and distribute will not be reported by this function even if they are installed. Unlike *pip.freeze*, this function always reports the version of pip which is installed.

CLI Example:

```
salt '*' pip.list salt
```

salt.modules.pip.list_all_versions(pkg,  bin_env=None,  include_alpha=False,  include_beta=False,  include_rc=False,  user=None,  cwd=None)
New in version 2017.7.3.

List all available versions of a pip package

pkg  The package to check

bin_env  Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. /usr/bin/pip-2.7 or /usr/bin/pip-2.6. If a directory path is specified, it is assumed to be a virtualenv.

include_alpha Include alpha versions in the list
include_beta Include beta versions in the list
include_rc Include release candidates versions in the list
user  The user under which to run pip
cwd  Directory from which to run pip

CLI Example:

```
salt '*' pip.list_all_versions <package name>
```

salt.modules.pip.list_upgrades(bin_env=None, user=None, cwd=None)
Check whether or not an upgrade is available for all packages

CLI Example:

```
salt '*' pip.list_upgrades
```

salt.modules.pip.uninstall(pkgs=None, requirements=None, bin_env=None, log=None, proxy=None, timeout=None, user=None, cwd=None, saltenv='base', use_vt=False)
Uninstall packages individually or from a pip requirements file

pkgs  comma separated list of packages to install
requirements  Path to requirements file

bin_env  Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. /usr/bin/pip-2.7 or /usr/bin/pip-2.6. If a directory path is specified, it is assumed to be a virtualenv.

log  Log file where a complete (maximum verbosity) record will be kept
proxy  Specify a proxy in the format user:passwd@proxy.server:port. Note that the user:password@ is optional and required only if you are behind an authenticated proxy. If you provide user@proxy.server:port then you will be prompted for a password.

timeout  Set the socket timeout (default 15 seconds)
user  The user under which to run pip
cwd  Directory from which to run pip
use_vt  Use VT terminal emulation (see output while installing)

CLI Example:

```
salt '*' pip.uninstall <package name>,<package2 name>
salt '*' pip.uninstall requirements=/path/to/requirements.txt
salt '*' pip.uninstall <package name> bin_env=/path/to/virtualenv
salt '*' pip.uninstall <package name> bin_env=/path/to/pip_bin
```

salt.modules.pip.upgrade(bin_env=None, user=None, cwd=None, use_vt=False)
New in version 2015.5.0.

Upgrades outdated pip packages.

Note:  On Windows you can’t update salt from pip using salt, so salt will be skipped

Returns a dict containing the changes.

`{<package>: `{old: `<old-version>`, `new: `<new-version>'}}>`
CLI Example:
```
salt '*' pip.upgrade
```

```python
class: salt.modules.pip
method: upgrade_available
```

**salt.modules.pip.upgrade_available** *(pkg, bin_env=None, user=None, cwd=None)*

New in version 2015.5.0.

Check whether or not an upgrade is available for a given package

CLI Example:
```
salt '*' pip.upgrade_available <package name>
```

```python
class: salt.modules.pip
method: version
```

**salt.modules.pip.version** *(bin_env=None)*

New in version 0.17.0.

Returns the version of pip. Use `bin_env` to specify the path to a virtualenv and get the version of pip in that virtualenv.

If unable to detect the pip version, returns `None`.

CLI Example:
```
salt '*' pip.version
```

### 19.9.289 salt.modules.pkg_resource

Resources needed by pkg providers

```python
class: salt.modules.pkg_resource
method: add_pkg
```

**salt.modules.pkg_resource.add_pkg** *(pkgs, name, pkgver)*

Add a package to a dict of installed packages.

CLI Example:
```
salt '*' pkg_resource.add_pkg '{}' bind 9
```

```python
class: salt.modules.pkg_resource
method: check_extra_requirements
```

**salt.modules.pkg_resource.check_extra_requirements** *(pkgname, pkgver)*

Check if the installed package already has the given requirements. This function will return the result of `pkg.check_extra_requirements` if this function exists for the minion, otherwise it will return `True`.

CLI Example:
```
salt '*' pkg_resource.check_extra_requirements <pkgname> <extra_requirements>
```

```python
class: salt.modules.pkg_resource
method: pack_sources
```

**salt.modules.pkg_resource.pack_sources** *(sources, normalize=True)*

Accepts list of dicts (or a string representing a list of dicts) and packs the key/value pairs into a single dict.

'`["foo": "salt://foo.rpm"],{"bar": "salt://bar.rpm"}']` would become `{"foo": "salt://foo.rpm","bar": "salt://bar.rpm"}

**normalize** [True] Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2015.8.0.

CLI Example:
```
salt '*' pkg_resource.pack_sources '[["foo": "salt://foo.rpm"], {"bar": "salt://bar.rpm"}]'
```
parse_targets

```
salt '*' pkg_resource.parse_targets
```

Parse the input to pkg.install and returns back the package(s) to be installed. Returns a list of packages, as well as a string noting whether the packages are to come from a repository or a binary package.

sort_pkglist

```
salt '*' pkg_resource.sort_pkglist
```

Accepts a dict obtained from pkg.list_pkgs() and sorts in place the list of versions for any packages that have multiple versions installed, so that two package lists can be compared to one another.

stringify

```
salt '*' pkg_resource.stringify
```

Takes a dict of package name/version information and joins each list of installed versions into a string.

version

```
salt '*' pkg_resource.version
```

Common interface for obtaining the version of installed packages.

version_clean

```
salt '*' pkg_resource.version_clean
```

Clean the version string removing extra data. This function will simply try to call pkg.version_clean.

19.9.290 salt.modules.pkgin

Package support for pkgin based systems, inspired from freebsd pkg module

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install is not available), see here.

available_version

```
salt '*' pkg_resource.available_version
```

This function is an alias of latest_version.

- Return the latest version of the named package available for upgrade or installation.
- If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:
salt.modules.pkgin.file_dict(‘packages’)
List the files that belong to a package.

CLI Examples:
salt ' '* pkg.file_dict nginx
salt ' '* pkg.file_dict nginx varnish

salt.modules.pkgin.file_list(package)
List the files that belong to a package.

CLI Examples:
salt ' '* pkg.file_list nginx

salt.modules.pkgin.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs)
Install the passed package
name The name of the package to be installed.
refresh Whether or not to refresh the package database before installing.
fromrepo Specify a package repository to install from.

Multiple Package Installation Options:
pkgs A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:
salt ' '* pkg.install pkgs=['"foo","bar"]
sources A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:
salt ' '* pkg.install sources=[{"foo": "salt://foo.deb"},{"bar": "salt://bar.deb"}]'

Return a dict containing the new package names and versions:

{‘<package>’: {‘old’: ‘<old-version>’,
             ‘new’: ‘<new-version>’}}

CLI Example:
salt ' '* pkg.install <package name>

salt.modules.pkgin.latest_version(*names, **kwargs)
Return the latest version of the named package available for upgrade or installation.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:
salt ' '* pkg.latest_version <package name>
salt ' '* pkg.latest_version <package1> <package2> ...

salt.modules.pkgin.list_pkgs(versions_as_list=False, **kwargs)
List the packages currently installed as a dict:
salt.modules.pkg.in

purge(name=None, pkgs=None, **kwargs)

Package purges are not supported, this function is identical to remove().

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'

refresh_db()

Use pkg update to get latest pkg_summary

CLI Example:
salt '*' pkg.refresh_db

remove(name=None, pkgs=None, **kwargs)

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a list containing the removed packages.

CLI Example:
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'

search(pkg_name)

Searches for an exact match using pkgin ^package$

CLI Example:
salt '*' pkg.search 'mysql-server'

upgrade()

Run pkg upgrade, if pkgin used. Otherwise do nothing

Returns a dictionary containing the changes:

{"package": {"old": "<old-version>",
              "new": "<new-version>"}}
**CLI Example:**

```
salt '*' pkg.upgrade
```

```python
google.modules.pkgng.version(*names, **kwargs)
```

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

**CLI Example:**

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

### 19.9.291 salt.modules.pkgng

Support for pkgng, the new package manager for FreeBSD

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see here.

**Warning:** This module has been completely rewritten. Up to and including version 0.17.x, it was available as the pkgng module, (pkgng.install, pkgng.delete, etc.), but moving forward this module will no longer be available as pkgng, as it will behave like a normal Salt pkg provider. The documentation below should not be considered to apply to this module in versions <= 0.17.x. If your minion is running a 0.17.x release or older, then the documentation for this module can be viewed using the `sys.doc` function:

```
salt bsdminion sys.doc pkgng
```

This module provides an interface to pkg(8). It acts as the default package provider for FreeBSD 10 and newer. For FreeBSD hosts which have been upgraded to use pkgng, you will need to override the pkg provider by setting the `providers` parameter in your Minion config file, in order to use this module to manage packages, like so:

```
pkg: pkgng
```

```python
google.modules.pkgng.audit(jail=None, chroot=None, root=None)
```

Audits installed packages against known vulnerabilities

**CLI Example:**

```
salt '*' pkg.audit
```

**jail** Audit packages within the specified jail

**CLI Example:**

```
salt '*' pkg.audit jail=<jail name or id>
```

**chroot** Audit packages within the specified chroot (ignored if jail is specified)

**root** Audit packages within the specified root (ignored if jail is specified)

**CLI Example:**

```
salt.modules.pkgng.autoremove(jail=None, chroot=None, root=None, dryrun=False)
Delete packages which were automatically installed as dependencies and are not required anymore.
dryrun Dry-run mode. The list of changes to packages is always printed, but no changes are actually made.
CLI Example:
```
salt '*' pkg.autoremove
salt '*' pkg.autoremove jail=<jail name or id>
salt '*' pkg.autoremove dryrun=True
salt '*' pkg.autoremove jail=<jail name or id> dryrun=True
```

salt.modules.pkgng.backup(file_name, jail=None, chroot=None, root=None)
Export installed packages into yaml+mtree file
CLI Example:
```
salt '*' pkg.backup /tmp/pkg
```

jail Backup packages from the specified jail. Note that this will run the command within the jail, and so the path to the backup file will be relative to the root of the jail

CLI Example:
```
salt '*' pkg.backup /tmp/pkg jail=<jail name or id>
```

chroot Backup packages from the specified chroot (ignored if jail is specified). Note that this will run the command within the chroot, and so the path to the backup file will be relative to the root of the chroot.

root Backup packages from the specified root (ignored if jail is specified). Note that this will run the command within the root, and so the path to the backup file will be relative to the root of the root.

CLI Example:
```
salt '*' pkg.backup /tmp/pkg chroot=/path/to/chroot
```

salt.modules.pkgng.check(jail=None, chroot=None, root=None, depends=False, recompute=False, checksum=False)
Sanity checks installed packages

jail Perform the sanity check in the specified jail

CLI Example:
```
salt '*' pkg.check jail=<jail name or id>
```

chroot Perform the sanity check in the specified chroot (ignored if jail is specified)

root Perform the sanity check in the specified root (ignored if jail is specified)

CLI Example:
```
salt '*' pkg.check chroot=/path/to/chroot
```

Of the below, at least one must be set to True.
depends Check for and install missing dependencies.

CLI Example:
```
salt '*' pkg.check recompute=True
```

recompute Recompute sizes and checksums of installed packages.

CLI Example:
salt '*' pkg.check depends=True

**checksum** Find invalid checksums for installed packages.

CLI Example:

```bash
salt '*' pkg.check checksum=True
```

**salt.modules.pkgng.clean** (*jail=None, chroot=None, root=None*)

Cleans the local cache of fetched remote packages

CLI Example:

```bash
salt '*' pkg.clean
salt '*' pkg.clean jail=<jail name or id>
salt '*' pkg.clean chroot=/path/to/chroot
```

**salt.modules.pkgng.fetch** (*name, jail=None, chroot=None, root=None, fetch_all=False, quiet=False, fromrepo=None, glob=True, regex=False, pcre=False, local=False, depends=False*)

Fetches remote packages

CLI Example:

```bash
salt '*' pkg.fetch <package name>
```

**jail** Fetch package in the specified jail

CLI Example:

```bash
salt '*' pkg.fetch <package name> jail=<jail name or id>
```

**chroot** Fetch package in the specified chroot (ignored if jail is specified)

**root** Fetch package in the specified root (ignored if jail is specified)

CLI Example:

```bash
salt '*' pkg.fetch <package name> chroot=/path/to/chroot
```

**fetch_all** Fetch all packages.

CLI Example:

```bash
salt '*' pkg.fetch <package name> fetch_all=True
```

**quiet** Quiet mode. Show less output.

CLI Example:

```bash
salt '*' pkg.fetch <package name> quiet=True
```

**fromrepo** Fetches packages from the given repo if multiple repo support is enabled. See pkg.conf(5).

CLI Example:

```bash
salt '*' pkg.fetch <package name> fromrepo=repo
```

**glob** Treat pkg_name as a shell glob pattern.

CLI Example:

```bash
salt '*' pkg.fetch <package name> glob=True
```
regex  Treat pkg_name as a regular expression.
   CLI Example:
   ```
salt '*' pkg.fetch <regular expression> regex=True
   ```

pcre  Treat pkg_name is an extended regular expression.
   CLI Example:
   ```
salt '*' pkg.fetch <extended regular expression> pcre=True
   ```

local  Skip updating the repository catalogs with pkg-update(8). Use the local cache only.
   CLI Example:
   ```
salt '*' pkg.fetch <package name> local=True
   ```

depends  Fetch the package and its dependencies as well.
   CLI Example:
   ```
salt '*' pkg.fetch <package name> depends=True
   ```

salt.modules.pkgng.install(name=None, fromrepo=None, pkgs=None, sources=None, jail=None, chroot=None, root=None, orphan=False, force=False, glob=False, regex=False, pcre=False, batch=False, **kwargs)

Install package(s) from a repository

name  The name of the package to install
   CLI Example:
   ```
salt '*' pkg.install <package name>
   ```

jail  Install the package into the specified jail

chroot  Install the package into the specified chroot (ignored if jail is specified)

root  Install the package into the specified root (ignored if jail is specified)

orphan  Mark the installed package as orphan. Will be automatically removed if no other packages depend on them. For more information please refer to pkg-autoremove(8).
   CLI Example:
   ```
salt '*' pkg.install <package name> orphan=True
   ```

force  Force the reinstallation of the package if already installed.
   CLI Example:
   ```
salt '*' pkg.install <package name> force=True
   ```

glob  Treat the package names as shell glob patterns.
   CLI Example:
   ```
salt '*' pkg.install <package name> glob=True
   ```

local  Do not update the repository catalogs with pkg-update(8). A value of True here is equivalent to using the -U flag with pkg install.
   CLI Example:
   ```
salt '*' pkg.install <package name> local=True
   ```
**dryrun** Dru-run mode. The list of changes to packages is always printed, but no changes are actually made.

CLI Example:
```
salt '*' pkg.install <package name> dryrun=True
```

**quiet** Force quiet output, except when dryrun is used, where pkg install will always show packages to be installed, upgraded or deleted.

CLI Example:
```
salt '*' pkg.install <package name> quiet=True
```

**reinstallRequires** When used with force, reinstalls any packages that require the given package.

CLI Example:
```
salt '*' pkg.install <package name> reinstallRequires=True force=True
```

Changed in version 2014.7.0: require kwarg renamed to reinstallRequires

**fromrepo** In multi-repo mode, override the pkg.conf ordering and only attempt to download packages from the named repository.

CLI Example:
```
salt '*' pkg.install <package name> fromrepo=repo
```

**regex** Treat the package names as a regular expression

CLI Example:
```
salt '*' pkg.install <regular expression> regex=True
```

**pcre** Treat the package names as extended regular expressions.

CLI Example:
```
```

**batch** Use BATCH=true for pkg install, skipping all questions. Be careful when using in production.

CLI Example:
```
salt '*' pkg.install <package name> batch=True
```

### `salt.modules.pkgng.latest_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:
```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> jail=<jail name or id>
salt '*' pkg.latest_version <package name> chroot=/path/to/chroot
```

### `salt.modules.pkgng.list_pkgs(versions_as_list=False, jail=None, chroot=None, root=None, with_origin=False, **kwargs)`

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

**jail** List the packages in the specified jail
chroot  List the packages in the specified chroot (ignored if jail is specified)
root   List the packages in the specified root (ignored if jail is specified)
with_origin  [False] Return a nested dictionary containing both the origin name and version for each installed
package.

New in version 2014.1.0.

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs jail=<jail name or id>
salt '*' pkg.list_pkgs chroot=/path/to/chroot
```

salt.modules.pkgng.parse_config(file_name='/usr/local/etc/pkg.conf')
Return dict of uncommented global variables.

CLI Example:

```
salt '*' pkg.parse_config
```

NOTE: not working properly right now

salt.modules.pkgng.refresh_db(jail=None, chroot=None, root=None, force=False)
Refresh PACKAGESITE contents

**Note:** This function can accessed using pkg.update in addition to pkg.refresh_db, to more closely match
the CLI usage of pkg(8).

CLI Example:

```
salt '*' pkg.refresh_db
```

jail  Refresh the pkg database within the specified jail
chroot Refresh the pkg database within the specified chroot (ignored if jail is specified)
root   Refresh the pkg database within the specified root (ignored if jail is specified)
force  Force a full download of the repository catalog without regard to the respective ages of the local and
remote copies of the catalog.

CLI Example:

```
salt '*' pkg.refresh_db force=True
```

salt.modules.pkgng.remove(name=None, pkgs=None, jail=None, chroot=None, root=None, all_installed=False, force=False, glob=False, dryrun=False, recurse=False, regex=False, pcre=False, **kwargs)
Remove a package from the database and system

**Note:** This function can accessed using pkg.delete in addition to pkg.remove, to more closely match
the CLI usage of pkg(8).

name  The package to remove

CLI Example:

```
salt '*' pkg.remove <package name>
```

jail  Delete the package from the specified jail
chroot  Delete the package from the specified chroot (ignored if jail is specified)
root  Delete the package from the specified root (ignored if jail is specified)
all_installed  Deletes all installed packages from the system and empties the database. USE WITH CAUTION!

   CLI Example:
   ```
salt '*' pkg.remove all all_installed=True force=True
   ```

force  Forces packages to be removed despite leaving unresolved dependencies.

   CLI Example:
   ```
salt '*' pkg.remove <package name> force=True
   ```

glob  Treat the package names as shell glob patterns.

   CLI Example:
   ```
salt '*' pkg.remove <package name> glob=True
   ```

dryrun  Dry run mode. The list of packages to delete is always printed, but no packages are actually deleted.

   CLI Example:
   ```
salt '*' pkg.remove <package name> dryrun=True
   ```

recurse  Delete all packages that require the listed package as well.

   CLI Example:
   ```
salt '*' pkg.remove <package name> recurse=True
   ```

regex  Treat the package names as regular expressions.

   CLI Example:
   ```
salt '*' pkg.remove <regular expression> regex=True
   ```

pcre  Treat the package names as extended regular expressions.

   CLI Example:
   ```
salt '*' pkg.remove <extended regular expression> pcre=True
   ```

salt.modules.pkgng.restore(file_name, jail=None, chroot=None, root=None)
Reads archive created by pkg backup -d and recreates the database.

   CLI Example:
   ```
salt '*' pkg.restore /tmp/pkg
   ```

jail  Restore database to the specified jail. Note that this will run the command within the jail, and so the path to the file from which the pkg database will be restored is relative to the root of the jail.

   CLI Example:
   ```
salt '*' pkg.restore /tmp/pkg jail=<jail name or id>
   ```

chroot  Restore database to the specified chroot (ignored if jail is specified). Note that this will run the command within the chroot, and so the path to the file from which the pkg database will be restored is relative to the root of the chroot.

root  Restore database to the specified root (ignored if jail is specified). Note that this will run the command within the root, and so the path to the file from which the pkg database will be restored is relative to the root of the root.
salt.modules.pkgng.search(name, jail=None, chroot=None, root=None, exact=False, glob=False, regex=False, pcre=False, comment=False, desc=False, full=False, depends=False, size=False, quiet=False, origin=False, prefix=False)

Searches in remote package repositories

CLI Example:

```
salt '*' pkg.restore /tmp/pkg chroot=/path/to/chroot
```

```
salt '*' pkg.search pattern
```

**jail** Perform the search using the pkg.conf(5) from the specified jail

CLI Example:

```
salt '*' pkg.search pattern jail=<jail name or id>
```

**chroot** Perform the search using the pkg.conf(5) from the specified chroot (ignored if jail is specified)

**root** Perform the search using the pkg.conf(5) from the specified root (ignored if jail is specified)

CLI Example:

```
salt '*' pkg.search pattern chroot=/path/to/chroot
```

**exact** Treat pattern as exact pattern.

CLI Example:

```
salt '*' pkg.search pattern exact=True
```

**glob** Treat pattern as a shell glob pattern.

CLI Example:

```
salt '*' pkg.search pattern glob=True
```

**regex** Treat pattern as a regular expression.

CLI Example:

```
salt '*' pkg.search pattern regex=True
```

**pcre** Treat pattern as an extended regular expression.

CLI Example:

```
salt '*' pkg.search pattern pcre=True
```

**comment** Search for pattern in the package comment one-line description.

CLI Example:

```
salt '*' pkg.search pattern comment=True
```

**desc** Search for pattern in the package description.

CLI Example:

```
salt '*' pkg.search pattern desc=True
```

**full** Displays full information about the matching packages.

CLI Example:
salt '* pkg.search pattern full=True

**depends** Displays the dependencies of pattern.

CLI Example:

```
salt '* pkg.search pattern depends=True
```

**size** Displays the size of the package

CLI Example:

```
salt '* pkg.search pattern size=True
```

**quiet** Be quiet. Prints only the requested information without displaying many hints.

CLI Example:

```
salt '* pkg.search pattern quiet=True
```

**origin** Displays pattern origin.

CLI Example:

```
salt '* pkg.search pattern origin=True
```

**prefix** Displays the installation prefix for each package matching pattern.

CLI Example:

```
salt '* pkg.search pattern prefix=True
```

```
salt.modules.pkgng.stats( local=False, remote=False, jail=None, chroot=None, root=None)
```

Return pkgng stats.

CLI Example:

```
salt '* pkg.stats
```

**local** Display stats only for the local package database.

CLI Example:

```
salt '* pkg.stats local=True
```

**remote** Display stats only for the remote package database(s).

CLI Example:

```
salt '* pkg.stats remote=True
```

**jail** Retrieve stats from the specified jail.

CLI Example:

```
salt '* pkg.stats jail=<jail name or id>
salt '* pkg.stats jail=<jail name or id> local=True
salt '* pkg.stats jail=<jail name or id> remote=True
```

**chroot** Retrieve stats from the specified chroot (ignored if jail is specified).

**root** Retrieve stats from the specified root (ignored if jail is specified).

CLI Example:
salt modules pkgng update_package_site(new_url)
Updates remote package repo URL, PACKAGESITE var to be exact.
Must use http://, ftp://, or https:// protocol
CLI Example:
salt '*' pkg.update_package_site http://127.0.0.1/

salt modules pkgng updating(name, jail=None, chroot=None, root=None, filedate=None, filename=None)
' Displays UPDATING entries of software packages
CLI Example:
salt '*' pkg.updating foo

jail Perform the action in the specified jail
CLI Example:
salt '*' pkg.updating foo jail=<jail name or id>

chroot Perform the action in the specified chroot (ignored if jail is specified)

root Perform the action in the specified root (ignored if jail is specified)

CLI Example:
salt '*' pkg.updating foo chroot=/path/to/chroot

filedate Only entries newer than date are shown. Use a YYYYMMDD date format.
CLI Example:
salt '*' pkg.updating foo filedate=20130101

filename Defines an alternative location of the UPDATING file.
CLI Example:
salt '*' pkg.updating foo filename=/tmp/UPDATING

salt modules pkgng upgrade(*names, **kwargs)
Upgrade named or all packages (run a pkg upgrade). If <package name> is omitted, the operation is executed on all packages.

Returns a dictionary containing the changes:

```json
{'<package>': {'old': '<old-version>', 'new': '<new-version>'}}
```

CLI Example:
salt '*' pkg.upgrade <package name>

jail Audit packages within the specified jail

CLI Example:
salt '*/' pkg.upgrade <package name> jail=<jail name or id>

chroot  Audit packages within the specified chroot (ignored if jail is specified)
root   Audit packages within the specified root (ignored if jail is specified)

CLI Example:

```
salt '*/' pkg.upgrade <package name> chroot=/path/to/chroot
```

Any of the below options can also be used with jail or chroot.

force  Force reinstalling/upgrading the whole set of packages.

CLI Example:

```
salt '*/' pkg.upgrade <package name> force=True
```

local  Do not update the repository catalogs with pkg-update(8). A value of True here is equivalent to using the -U flag with pkg upgrade.

CLI Example:

```
salt '*/' pkg.upgrade <package name> local=True
```

dryrun  Dry-run mode: show what packages have updates available, but do not perform any upgrades. Repository catalogs will be updated as usual unless the local option is also given.

CLI Example:

```
salt '*/' pkg.upgrade <package name> dryrun=True
```

salt.modules.pkgng.version('names', **kwargs)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

Note: This function can accessed using pkg.info in addition to pkg.version, to more closely match the CLI usage of pkg(8).

salt    Get package version information for the specified jail
chroot  Get package version information for the specified chroot (ignored if jail is specified)
root    Get package version information for the specified root (ignored if jail is specified)

with_origin  [False] Return a nested dictionary containing both the origin name and version for each specified package.

New in version 2014.1.0.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package name> jail=<jail name or id>
salt '*' pkg.version <package1> <package2> <package3> ...
```

salt.modules.pkgng.version_cmp(pkg1, pkg2, ignore_epoch=False)

Do a cmp-style comparison on two packages. Return -1 if pkg1 < pkg2, 0 if pkg1 == pkg2, and 1 if pkg1 > pkg2. Return None if there was a problem making the comparison.

CLI Example:

```
salt '*' pkg.version_cmp '2.1.11' '2.1.12'
```
salt.modules.pkgng.whch(path, jail=None, chroot=None, root=None, origin=False, quiet=False)

Displays which package installed a specific file

CLI Example:
```
salt '*' pkg.which <file name>
```

jail Perform the check in the specified jail

CLI Example:
```
salt '*' pkg.which <file name> jail=<jail name or id>
```

chroot Perform the check in the specified chroot (ignored if jail is specified)

root Perform the check in the specified root (ignored if jail is specified)

CLI Example:
```
salt '*' pkg.which <file name> chroot=/path/to/chroot
```

origin Shows the origin of the package instead of name-version.

CLI Example:
```
salt '*' pkg.which <file name> origin=True
```

quiet Quiet output.

CLI Example:
```
salt '*' pkg.which <file name> quiet=True
```

19.9.292 salt.modules.pkgutil

Pkgutil support for Solaris

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `pkg.install' is not available), see here.

salt.modules.pkgutil.install(name=None, refresh=False, version=None, pkgs=None, **kwargs)

Install packages using the pkgutil tool.

CLI Example:
```
salt '*' pkg.install <package_name>
salt '*' pkg.install SMClgcc346
```

Multiple Package Installation Options:
pkgs A list of packages to install from OpenCSW. Must be passed as a python list.

CLI Example:
```
salt '*' pkg.install pkgs='["foo", "bar"]'
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3"}]'
```

Returns a dict containing the new package names and versions:
```
{'<package>': {'old': '<old-version>',
              'new': '<new-version>'}}
```
salt.modules.pkgutil.latest_version("names", **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkgutil.latest_version CSWpython
salt '*' pkgutil.latest_version <package1> <package2> <package3> ...
```

salt.modules.pkgutil.list_pkgs(versions_as_list=False, **kwargs)

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'
```

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

salt.modules.pkgutil.list_upgrades(refresh=True, **kwargs)

List all available package upgrades on this system

CLI Example:

```
salt '*' pkgutil.list_upgrades
```

salt.modules.pkgutil.purge(name=None, pkgs=None, **kwargs)

Package purges are not supported, this function is identical to remove().

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

salt.modules.pkgutil.refresh_db()

Updates the pkgutil repo database (pkgutil -U)

CLI Example:

```
salt '*' pkgutil.refresh_db
```

salt.modules.pkgutil.remove(name=None, pkgs=None, **kwargs)

Remove a package and all its dependencies which are not in use by other packages.

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.
CLI Example:
```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

```
salt.modules.pkgutil.upgrade(refresh=True)

Upgrade all of the packages to the latest available version.

Returns a dict containing the changes:
```
{'<package>': {'old': '<old-version>', 'new': '<new-version>'}}
```

CLI Example:
```
salt '*' pkgutil.upgrade
```

```
salt.modules.pkgutil.upgrade_available(name)

Check if there is an upgrade available for a certain package

CLI Example:
```
salt '*' pkgutil.upgrade_available CSWpython
```

```
salt.modules.pkgutil.version('names', **kwargs)

Returns a version if the package is installed, else returns an empty string

CLI Example:
```
salt '*' pkgutil.version CSWpython
```

19.9.293  salt.modules.portage_config

Configure portage(5)

```
salt.modules.portage_config.append_to_package_conf(conf, atom='', flags=None, string='' , overwrite=False)

Append a string or a list of flags for a given package or DEPEND atom to a given configuration file.

CLI Example:
```
salt '*' portage_config.append_to_package_conf use string="app-admin/salt ldap -
-libvirt"
salt '*' portage_config.append_to_package_conf use atom='>' = app-admin/salt-0.14.1
name" flags='["ldap", '-libvirt\']"
```

```
salt.modules.portage_config.append_use_flags(atom, uses=None, overwrite=False)

Append a list of use flags for a given package or DEPEND atom

CLI Example:
```
salt '*' portage_config.append_use_flags "app-admin/salt[ldap, -libvirt]"
salt '*' portage_config.append_use_flags "=app-admin/salt-0.14.1" "["ldap', '-
-libvirt\']"
```

```
salt.modules.portage_config.enforce_nice_config()

Enforce a nice tree structure for /etc/portage/package.* configuration files.
```
See also:

`salt.modules.ebuild.ex_mod_init()` for information on automatically running this when `pkg` is used.

CLI Example:
```
salt '*' portage_config.enforce_nice_config
```

`salt.modules.portage_config.filter_flags(use, use_expanded_hidden, usemasked, useforced)`  
New in version 2015.8.0.  
Filter function to remove hidden or otherwise not normally visible USE flags from a list.

@type use: list @param use: the USE flag list to be filtered. @type use_expanded_hidden: list @param use_expanded_hidden: list of flags hidden. @type usemasked: list @param usemasked: list of masked USE flags. @type useforced: list @param useforced: the forced USE flags. @rtype: list @return the filtered USE flags.

`salt.modules.portage_config.get_all_cpv_use(cp)`  
New in version 2015.8.0.  
Uses portage to determine final USE flags and settings for an emerge.

@type cp: string @param cp: eg cat/pkg @rtype: lists @return use, use_expand_hidden, usemask, useforce

`salt.modules.portage_config.get_cleared_flags(cp)`  
New in version 2015.8.0.  
Uses portage for compare use flags which is used for installing package and use flags which now exist int /etc/portage/package.use/ 

@type cp: string @param cp: eg cat/pkg @rtype: tuple @rparam: tuple with two lists - list of used flags and list of flags which will be used

`salt.modules.portage_config.get_flags_from_package_conf(conf, atom)`  
Get flags for a given package or DEPEND atom. Warning: This only works if the configuration files tree is in the correct format (the one enforced by enforce_nice_config)

CLI Example:
```
salt '*' portage_config.get_flags_from_package_conf license salt
```

`salt.modules.portage_config.get_installed_use(cp, use='USE')`  
New in version 2015.8.0.  
Gets the installed USE flags from the VARDB.

@type: cp: string @param cp: cat/pkg @type use: string @param use: 1 of ["USE", "PKGUSE"] @rtype list @returns [] or the list of IUSE flags

`salt.modules.portage_config.get_iuse(cp)`  
New in version 2015.8.0.  
Gets the current IUSE flags from the tree.

@type: cpv: string @param cpv: cat/pkg @rtype list @returns [] or the list of IUSE flags

`salt.modules.portage_config.get_missing_flags(conf, atom, flags)`  
Find out which of the given flags are currently not set. CLI Example:
```
salt '*' portage_config.get_missing_flags use salt "['ldap', '-libvirt', 'openssl ~']"
```
salt.modules.portage_config.has_flag(conf, atom, flag)
   Verify if the given package or DEPEND atom has the given flag. Warning: This only works if the configuration files tree is in the correct format (the one enforced by enforce_nice_config)
   CLI Example:
   ```
   salt '*' portage_config.has_flag license salt Apache-2.0
   ```

salt.modules.portage_config.has_use(atom, use)
   Verify if the given package or DEPEND atom has the given use flag. Warning: This only works if the configuration files tree is in the correct format (the one enforced by enforce_nice_config)
   CLI Example:
   ```
   salt '*' portage_config.has_use salt libvirt
   ```

salt.modules.portage_config.is_changed_uses(cp)
   New in version 2015.8.0.
   Uses portage for determine if the use flags of installed package is compatible with use flags in portage configs.
   @type cp: string @param cp: eg cat/pkg

salt.modules.portage_config.is_present(conf, atom)
   Tell if a given package or DEPEND atom is present in the configuration files tree. Warning: This only works if the configuration files tree is in the correct format (the one enforced by enforce_nice_config)
   CLI Example:
   ```
   salt '*' portage_config.is_present unmask salt
   ```

19.9.294  salt.modules.postfix

Support for Postfix

This module is currently little more than a config file viewer and editor. It is able to read the master.cf file (which is one style) and files in the style of main.cf (which is a different style, that is used in multiple postfix configuration files).

The design of this module is such that when files are edited, a minimum of changes are made to them. Each file should look as if it has been edited by hand; order, comments and whitespace are all preserved.

salt.modules.postfix.delete(queue_id)
   Delete message(s) from the mail queue
   CLI Example:
   ```
   salt '*' postfix.delete 5C33CA0DEA
   salt '*' postfix.delete ALL
   ```

salt.modules.postfix.hold(queue_id)
   Put message(s) on hold from the mail queue
   CLI Example:
   ```
   salt '*' postfix.hold 5C33CA0DEA
   salt '*' postfix.hold ALL
   ```
salt.modules.postfix.requeue(queue_id)
Requeue message(s) in the mail queue

CLI Example:

```
salt '*' postfix.requeue 5C33CA0DEA
salt '*' postfix.requeue ALL
```

salt.modules.postfix.set_main(key, value, path='/etc/postfix/main.cf')
Set a single config value in the main.cf file. If the value does not already exist, it will be appended to the end.

CLI Example:

```
salt <minion> postfix.set_main mailq_path /usr/bin/mailq
```

salt.modules.postfix.set_master(service, conn_type, private='y', unpriv='y', chroot='y',
wakeups='n', maxproc='100', command='command', write_conf=True,
path='/etc/postfix/master.cf')
Set a single config value in the master.cf file. If the value does not already exist, it will be appended to the end.

Because of shell parsing issues, ``-` cannot be set as a value, as is normal in the master.cf file; either `y`, `n` or a number should be used when calling this function from the command line. If the value used matches the default, it will internally be converted to a ``-` . Calling this function from the Python API is not affected by this limitation.

The settings and their default values, in order, are: service (required), conn_type (required), private (y), unpriv (y), chroot (y), wakeups (n), maxproc (100), command (required).

By default, this function will write out the changes to the master.cf file, and then returns the full contents of the file. By setting the write_conf option to False, it will skip writing the file.

CLI Example:

```
salt <minion> postfix.set_master smtp inet n y n n 100 smtpd
```

salt.modules.postfix.show_main(path='/etc/postfix/main.cf')
Return a dict of active config values. This does not include comments, spacing or order. Bear in mind that order is functionally important in the main.cf file, since keys can be referred to as variables. This means that the data returned from this function should not be used for direct modification of the main.cf file; other functions are available for that.

CLI Examples:

```
salt <minion> postfix.show_main salt <minion> postfix.show_main path=/path/to/main.cf
```

salt.modules.postfix.show_master(path='/etc/postfix/master.cf')
Return a dict of active config values. This does not include comments, spacing or order.

The data returned from this function should not be used for direct modification of the main.cf file; other functions are available for that.

CLI Examples:

```
salt <minion> postfix.show_master salt <minion> postfix.show_master path=/path/to/master.cf
```

salt.modules.postfix.show_queue()
Show contents of the mail queue

CLI Example:

```
salt '*' postfix.show_queue
```

salt.modules.postfix.unhold(queue_id)
Set held message(s) in the mail queue to unheld
CLI Example:

```
salt '*' postfix.unhold SC33CA0DEA
salt '*' postfix.unhold ALL
```

### 19.9.295 salt.modules.postgres

Module to provide Postgres compatibility to salt.

**configuration** In order to connect to Postgres, certain configuration is required in `/etc/salt/minion` on the relevant minions. Some sample configs might look like:

```python
postgres.host: 'localhost'
postgres.port: '5432'
postgres.user: 'postgres' -> db user
postgres.pass: ''
postgres.maintenance_db: 'postgres'
```

The default for the `maintenance_db` is `postgres` and in most cases it can be left at the default setting. This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

**note** This module uses MD5 hashing which may not be compliant with certain security audits.

**note** When installing postgres from the official postgres repos, on certain linux distributions, either the `psql` or the `initdb` binary is *not* automatically placed on the path. Add a configuration to the location of the postgres bin's path to the relevant minion for this module:

```python
postgres.bins_dir: '/usr/pgsql-9.5/bin/
```

salt.modules.postgres.available_extensions(*user=None, host=None, port=None, maintenance_db=None, password=None, runas=None*)

List available postgresql extensions

CLI Example:

```
salt '*' postgres.available_extensions
```

salt.modules.postgres.create_extension(*name, if_not_exists=None, schema=None, ext_version=None, from_version=None, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None*)

Install a postgresql extension

CLI Example:

```
salt '*' postgres.create_extension 'adminpack'
```

salt.modules.postgres.create_metadata(*name, ext_version=None, schema=None, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None*)

Get lifecycle information about an extension

CLI Example:
salt '*' postgres.create_metadata adminpack

salt.modules.postgres.datadir_exists(name)
New in version 2016.3.0.
Checks if postgres data directory has been initialized
CLI Example:
salt '*' postgres.datadir_exists '/var/lib/pgsql/data'

name Name of the directory to check

salt.modules.postgres.datadir_init(name, auth='password', user=None, password=None, encoding='UTF8', locale=None, runas=None)
New in version 2016.3.0.
Initializes a postgres data directory
CLI Example:
salt '*' postgres.datadir_init '/var/lib/pgsql/data'

name The name of the directory to initialize
auth The default authentication method for local connections
password The password to set for the postgres user
user The database superuser name
encoding The default encoding for new databases
locale The default locale for new databases
runas The system user the operation should be performed on behalf of

salt.modules.postgres.db_alter(name, user=None, host=None, port=None, maintenance_db=None, password=None, tablespace=None, owner=None, owner_recurse=False, runas=None)
Change tablespace or/and owner of database.
CLI Example:
salt '*' postgres.db_alter dbname owner=otheruser

salt.modules.postgres.db_create(name, user=None, host=None, port=None, maintenance_db=None, password=None, tablespace=None, encoding=None, lc_collate=None, lc_ctype=None, owner=None, template=None, runas=None)
Adds a databases to the Postgres server.
CLI Example:
salt '*' postgres.db_create 'dbname'
salt '*' postgres.db_create 'dbname' template=template_postgis

salt.modules.postgres.db_exists(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)
Checks if a database exists on the Postgres server.
CLI Example:
salt '*' postgres.db_exists 'dbname'
salt.modules.postgres.db_list(user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Return dictionary with information about databases of a Postgres server.

CLI Example:
salt '*' postgres.db_list

salt.modules.postgres.db_remove(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Removes a databases from the Postgres server.

CLI Example:
salt '*' postgres.db_remove 'dbname'

salt.modules.postgres.drop_extension(name, if_exists=None, restrict=None, cascade=None, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Drop an installed postgresql extension

CLI Example:
salt '*' postgres.drop_extension 'adminpack'

salt.modules.postgres.get_available_extension(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Get info about an available postgresql extension

CLI Example:
salt '*' postgres.get_available_extension plpgsql

salt.modules.postgres.get_installed_extension(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Get info about an installed postgresql extension

CLI Example:
salt '*' postgres.get_installed_extension plpgsql

salt.modules.postgres.group_create(groupname, user=None, host=None, port=None, maintenance_db=None, password=None, createdb=None, createuser=None, createroles=None, encrypted=None, login=None, inherit=None, superuser=None, replication=None, rolepassword=None, groups=None, runas=None)

Creates a Postgres group. A group is postgres is similar to a user, but cannot login.

CLI Example:
salt '*' postgres.group_create 'groupname' user='user' \ host='hostname' port='port' password='password' \ rolepassword='rolepassword'

salt.modules.postgres.group_remove(groupname, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Removes a group from the Postgres server.
CLI Example:

```
salt '*' postgres.group_remove 'groupname'
```

```
salt.modules.postgres.group_update(groupname, user=None, host=None, port=None, maintenance_db=None, password=None, createdb=None, createdb=None, encrypted=None, inherit=None, logins=None, superuser=None, replication=None, rolepassword=None, groups=None, runas=None)
```

Updates a postgres group

CLI Examples:

```
salt '*' postgres.group_update 'username' user='user' \ 
   host='hostname' port='port' password='password' \ 
   rolepassword='rolepassword'
```

```
salt.modules.postgres.has_privileges(name, object_name, object_type, privileges=None, grant_option=None, prepend='public', maintenance_db=None, user=None, host=None, port=None, password=None, runas=None)
```

New in version 2016.3.0.

Check if a role has the specified privileges on an object

CLI Example:

```
salt '*' postgres.has_privileges user_name table_name table \ SELECT,INSERT maintenance_db=db_name
```

**name**  Name of the role whose privileges should be checked on object_type

**object_name**  Name of the object on which the check is to be performed

**object_type**  The object type, which can be one of the following:

- table
- sequence
- schema
- tables
- language
- database
- group
- function

**privileges**  Comma separated list of privileges to check, from the list below:

- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

**grant_option**  If grant_option is set to True, the grant option check is performed
prepend: Table and Sequence object types live under a schema so this should be provided if the object is not under the default public schema.

* maintenance_db: The database to connect to
* user: database username if different from config or default
* password: user password if any password for a specified user
* host: Database host if different from config or default
* port: Database port if different from config or default
* runas: System user all operations should be performed on behalf of

```python
salt.modules.postgres.installed_extensions(user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)
```

List installed postgresql extensions

CLI Example:

```bash
salt '*' postgres.installed_extensions
```

```python
salt.modules.postgres.is_available_extension(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)
```

Test if a specific extension is available

CLI Example:

```bash
salt '*' postgres.is_available_extension
```

```python
salt.modules.postgres.is_installed_extension(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)
```

Test if a specific extension is installed

CLI Example:

```bash
salt '*' postgres.is_installed_extension
```

```python
salt.modules.postgres.language_create(name, maintenance_db, user=None, host=None, port=None, password=None, runas=None)
```

New in version 2016.3.0.

Installs a language into a database

CLI Example:

```bash
salt '*' postgres.language_create plpgsql dbname
```

```python
salt.modules.postgres.language_exists(name, maintenance_db, user=None, host=None, port=None, password=None, runas=None)
```

New in version 2016.3.0.

Checks if language exists in a database

CLI Example:
```
salt '*' postgres.language_exists plpgsql dbname
```

**name**  Language to check for

**maintenance_db**  The database to check in

**user**  database username if different from config or default

**password**  user password if any password for a specified user

**host**  Database host if different from config or default

**port**  Database port if different from config or default

**runas**  System user all operations should be performed on behalf of

### salt.modules.postgres.language_list

```
salt.modules.postgres.language_list(maintenance_db, user=None, host=None, port=None, password=None, runas=None)
```

New in version 2016.3.0.

Return a list of languages in a database.

**CLI Example:**
```
salt '*' postgres.language_list dbname
```

```
salt '*' postgres.language_remove plpgsql dbname
```

**name**  Language to remove

**maintenance_db**  The database to install the language in

**user**  database username if different from config or default

**password**  user password if any password for a specified user

**host**  Database host if different from config or default

**port**  Database port if different from config or default

**runas**  System user all operations should be performed on behalf of

### salt.modules.postgres.owner_to

```
salt.modules.postgres.owner_to(dbname, ownername, user=None, host=None, port=None, password=None, runas=None)
```

Set the owner of all schemas, functions, tables, views and sequences to the given username.

**CLI Example:**
```
salt '*' postgres.owner_to 'dbname' 'username'
```

### salt.modules.postgres.privileges_grant

```
salt.modules.postgres.privileges_grant(name, object_name, object_type, privileges=None, grant_option=None, prepend='public', maintenance_db=None, user=None, host=None, port=None, password=None, runas=None)
```

New in version 2016.3.0.

Grant privileges on a postgres object
CLI Example:

```
salt '* postgres.privileges_grant user_name table_name table \
SELECT,UPDATE maintenance_db=db_name
```

**name** Name of the role to which privileges should be granted

**object_name** Name of the object on which the grant is to be performed

**object_type** The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

**privileges** Comma separated list of privileges to grant, from the list below:

- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

**grant_option** If grant_option is set to True, the recipient of the privilege can in turn grant it to others

**prepend** Table and Sequence object types live under a schema so this should be provided if the object is not under the default `public` schema

**maintenance_db** The database to connect to

**user** database username if different from config or default

**password** user password if any password for a specified user

**host** Database host if different from config or default

**port** Database port if different from config or default

**runas** System user all operations should be performed on behalf of

```
salt.modules.postgres.privileges_list(name, object_type, prepend='public', maintenance_db=None, user=None, host=None, port=None, password=None, runas=None)
```

New in version 2016.3.0.

Return a list of privileges for the specified object.

CLI Example:

```
salt '* postgres.privileges_list table_name table maintenance_db=db_name
```

**name** Name of the object for which the permissions should be returned

**object_type** The object type, which can be one of the following:

- table
- sequence
- schema
Table and Sequence object types live under a schema so this should be provided if the object is not under the default `public` schema.

`prepend` Table and Sequence object types live under a schema so this should be provided if the object is not under the default `public` schema.

`maintenance_db` The database to connect to.

`user` Database username if different from config or default.

`password` User password if any password for a specified user.

`host` Database host if different from config or default.

`port` Database port if different from config or default.

`runas` System user all operations should be performed on behalf of.

**salt.modules.postgres.privileges_revoke**

New in version 2016.3.0.

Revoke privileges on a postgres object.

CLI Example:

```bash
salt '*' postgres.privileges_revoke user_name table_name table \ SELECT,UPDATE maintenance_db=db_name
```

- **name** Name of the role whose privileges should be revoked.
- **object_name** Name of the object on which the revoke is to be performed.
- **object_type** The object type, which can be one of the following:
  - table
  - sequence
  - schema
  - tablespace
  - language
  - database
  - group
  - function
- **privileges** Comma separated list of privileges to revoke, from the list below:
  - INSERT
  - CREATE
  - TRUNCATE
  - CONNECT
  - TRIGGER
  - SELECT
  - USAGE
  - TEMPORARY
  - UPDATE
  - EXECUTE
  - REFERENCES
  - DELETE
  - ALL
- **maintenance_db** The database to connect to.
- **user** Database username if different from config or default.
- **password** User password if any password for a specified user.
- **host** Database host if different from config or default.
port Database port if different from config or default
runas System user all operations should be performed on behalf of

salt.modules.postgres.psql_query(query, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None, write=False)

Run an SQL-Query and return the results as a list. This command only supports SELECT statements. This limitation can be worked around with a query like this:

WITH updated AS (UPDATE pg_authid SET rolconnlimit = 2000 WHERE rolname = `rolename` RETURNING rolconnlimit) SELECT * FROM updated;

query The query string.
user Database username, if different from config or default.
host Database host, if different from config or default.
port Database port, if different from the config or default.
maintenance_db The database to run the query against.
password User password, if different from the config or default.
runas User to run the command as.
write Mark query as READ WRITE transaction.

CLI Example:

```python
salt '*' postgres.psql_query 'select * from pg_stat_activity'
```

salt.modules.postgres.role_get(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None, return_password=False)

Return a dict with information about users of a Postgres server. Set return_password to True to get password hash in the result.

CLI Example:

```python
salt '*' postgres.role_get postgres
```

salt.modules.postgres.schema_create(dbname, name, owner=None, user=None, db_user=None, db_password=None, db_host=None, db_port=None)

Creates a Postgres schema.

CLI Example:

```python
salt '*' postgres.schema_create dbname name owner='owner' \  
  user='user' \  
  db_user='user' db_password='password' \  
  db_host='hostname' db_port='port'
```

salt.modules.postgres.schema_exists(dbname, name, db_user=None, db_password=None, db_host=None, db_port=None)

Checks if a schema exists on the Postgres server.

CLI Example:

```python
salt '*' postgres.schema_exists dbname schemaname
```
salt.modules.postgres.schema_get(dbname, name, db_user=None, db_password=None, db_host=None, db_port=None)

Return a dict with information about schemas in a database.

CLI Example:

```
salt '*' postgres.schema_get dbname name
```

database Database name we query on
name Schema name we look for
db_user database username if different from config or default
db_password user password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

salt.modules.postgres.schema_list(dbname, db_user=None, db_password=None, db_host=None, db_port=None)

Return a dict with information about schemas in a Postgres database.

CLI Example:

```
salt '*' postgres.schema_list dbname
```

database Database name we query on
db_user database username if different from config or default
db_password user password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

salt.modules.postgres.schema_remove(dbname, name, user=None, db_user=None, db_password=None, db_host=None, db_port=None)

Removes a schema from the Postgres server.

CLI Example:

```
salt '*' postgres.schema_remove dbname schemaname
```

database Database name we work on
schema name The schema's name we'll remove
user System user all operations should be performed on behalf of
db_user database username if different from config or default
db_password user password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

salt.modules.postgres.tablespace_alter(name, user=None, host=None, port=None, maintenance_db=None, password=None, new_name=None, new_owner=None, set_option=None, reset_option=None, runas=None)

Change tablespace name, owner, or options.

CLI Example:

```
salt '*' postgres.tablespace_alter tsname new_owner=otheruser
salt '*' postgres.tablespace_alter index_space new_name=fast_raid
salt '*' postgres.tablespace_alter test set_option="{'seq_page_cost': '1.1'}"
salt '*' postgres.tablespace_alter tsname reset_option=seq_page_cost
```

New in version 2015.8.0.
salt.modules.postgres.tablespace_create(name, location, options=None, owner=None, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Adds a tablespace to the Postgres server.

CLI Example:
```
salt '*' postgres.tablespace_create tablespacename '/path/datadir'
```

New in version 2015.8.0.

salt.modules.postgres.tablespace_exists(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Checks if a tablespace exists on the Postgres server.

CLI Example:
```
salt '*' postgres.tablespace_exists 'dbname'
```

New in version 2015.8.0.

salt.modules.postgres.tablespace_list(user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Return dictionary with information about tablespaces of a Postgres server.

CLI Example:
```
salt '*' postgres.tablespace_list
```

New in version 2015.8.0.

salt.modules.postgres.tablespace_remove(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Removes a tablespace from the Postgres server.

CLI Example:
```
salt '*' postgres.tablespace_remove tsname
```

New in version 2015.8.0.

salt.modules.postgres.user_create(username, user=None, host=None, port=None, maintenance_db=None, password=None, createdb=None, createdbuser=None, createroles=None, inherit=None, login=None, connlimit=None, encrypted=None, superuser=None, replication=None, rolepassword=None, groups=None, runas=None)

Creates a Postgres user.

CLI Examples:
```
salt '*' postgres.user_create 'username' user='user' \ host='hostname' port='port' password='password' \ rolepassword='rolepassword'
```

salt.modules.postgres.user_exists(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Checks if a user exists on the Postgres server.

CLI Example:
salt 'postgres.user_exists 'username'"

```
salt.modules.postgres.user_list(user=None, host=None, port=None, maintenance_db=None, password=None, runas=None, return_password=False)
```

Return a dict with information about users of a Postgres server.
Set return_password to True to get password hash in the result.

CLI Example:
```
salt '*' postgres.user_list
```

```
salt.modules.postgres.user_remove(username, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)
```

Removes a user from the Postgres server.

CLI Example:
```
salt '*' postgres.user_remove 'username'
```

```
salt.modules.postgres.user_update(username, user=None, host=None, port=None, maintenance_db=None, password=None, createdb=None, createuser=None, createroles=None, encrypted=None, superuser=None, inherit=None, login=None, connlimit=None, replication=None, rolepassword=None, groups=None, runas=None)
```

Updates a Postgres user.

CLI Examples:
```
salt '*' postgres.user_update 'username' user='user' \
       host='hostname' port='port' password='password' \
       rolepassword='rolepassword'
```

```
salt.modules.postgres.version(user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)
```

Return the version of a Postgres server.

CLI Example:
```
salt '*' postgres.version
```

19.9.296 salt.modules.poudriere

Support for poudriere

```
salt.modules.poudriere.bulk_build(jail, pkg_file, keep=False)
```

Run bulk build on poudriere server.

Return number of pkg builds, failures, and errors, on error dump to CLI

CLI Example:
```
salt -N buildbox_group poudriere.bulk_build 90amd64 /root/pkg_list
```

```
salt.modules.poudriere.create_jail(name, arch, version='9.0-RELEASE')
```

Creates a new poudriere jail if one does not exist

*NOTE* creating a new jail will take some time the master is not hanging
CLI Example:

```bash
salt '*' poudriere.create_jail 90amd64 amd64
```

salt.modules.poudriere.create_ports_tree()
Not working need to run portfetch non interactive

```
salt.modules.poudriere.delete_jail(name)
```

Deletes poudriere jail with name

CLI Example:

```bash
salt '*' poudriere.delete_jail 90amd64
```

salt.modules.poudriere.is_jail(name)
Return True if jail exists False if not

CLI Example:

```bash
salt '*' poudriere.is_jail <jail name>
```

salt.modules.poudriere.list_jails()
Return a list of current jails managed by poudriere

CLI Example:

```bash
salt '*' poudriere.list_jails
```

salt.modules.poudriere.list_ports()
Return a list of current port trees managed by poudriere

CLI Example:

```bash
salt '*' poudriere.list_ports
```

salt.modules.poudriere.make_pkgng_aware(jname)
Make jail jname pkgng aware

CLI Example:

```bash
salt '*' poudriere.make_pkgng_aware <jail name>
```

salt.modules.poudriere.parse_config(config_file=None)
Returns a dict of poudriere main configuration definitions

CLI Example:

```bash
salt '*' poudriere.parse_config
```

salt.modules.poudriere.update_jail(name)
Run freebsd-update on name poudriere jail

CLI Example:

```bash
salt '*' poudriere.update_jail freebsd:10:x86:64
```

salt.modules.poudriere.update_ports_tree(ports_tree)
Updates the ports tree, either the default or the ports_tree specified

CLI Example:

```bash
```
Salt Documentation, Release 2017.7.8

```
salt '*' poudriere.update_ports_tree staging
```

```
salt.modules.poudriere.version()
    Return poudriere version
    CLI Example:
    salt '*' poudriere.version
```

**19.9.297 salt.modules.powerpath**

powerpath support.

Assumes RedHat

```
salt.modules.powerpath.add_license(key)
    Add a license
```

```
salt.modules.powerpath.has_powerpath()
```

```
salt.modules.powerpath.list_licenses()
    returns a list of applied powerpath license keys
```

```
salt.modules.powerpath.remove_license(key)
    Remove a license
```

**19.9.298 salt.modules.proxy module**

This module allows you to manage proxy settings

```
salt '*' network.get_http_proxy
```

```
salt.modules.proxy.get_ftp_proxy(network_service='Ethernet')
    Returns the current ftp proxy settings
    network_service  The network service to apply the changes to, this only necessary on macOS
    CLI Example:
    salt '*' proxy.get_ftp_proxy Ethernet
```

```
salt.modules.proxy.get_http_proxy(network_service='Ethernet')
    Returns the current http proxy settings
    network_service  The network service to apply the changes to, this only necessary on macOS
    CLI Example:
    salt '*' proxy.get_http_proxy Ethernet
```

```
salt.modules.proxy.get_https_proxy(network_service='Ethernet')
    Returns the current https proxy settings
    network_service  The network service to apply the changes to, this only necessary on macOS
    CLI Example:
    salt '*' proxy.get_https_proxy Ethernet
```

```
salt.modules.proxy.get_proxy_bypass(network_service='Ethernet')
    Returns the current domains that can bypass the proxy
    network_service  The network service to get the bypass domains from, this is only necessary on macOS
```
CLI Example:

```
salt '*' proxy.get_proxy_bypass
```

salt.modules.proxy.get_proxy_win()

Gets all of the proxy settings in one call, only available on Windows

CLI Example:

```
salt '*' proxy.get_proxy_win
```

salt.modules.proxy.set_ftp_proxy(server, port, user=None, password=None, network_service='Ethernet', bypass_hosts=None)

Sets the ftp proxy settings

- **server**: The proxy server to use
- **port**: The port used by the proxy server
- **user**: The username to use for the proxy server if required
- **password**: The password to use if required by the server
- **network_service**: The network service to apply the changes to, this only necessary on macOS
- **bypass_hosts**: The hosts that are allowed to by pass the proxy. Only used on Windows for other OS’s use set_proxy_bypass to edit the bypass hosts.

CLI Example:

```
salt '*' proxy.set_ftp_proxy example.com 1080 user=proxy_user password=proxy_pass network_service=Ethernet
```

salt.modules.proxy.set_http_proxy(server, port, user=None, password=None, network_service='Ethernet', bypass_hosts=None)

Sets the http proxy settings. Note: On Windows this will override any other proxy settings you have, the preferred method of updating proxies on windows is using set_proxy.

- **server**: The proxy server to use
- **port**: The port used by the proxy server
- **user**: The username to use for the proxy server if required
- **password**: The password to use if required by the server
- **network_service**: The network service to apply the changes to, this only necessary on macOS
- **bypass_hosts**: The hosts that are allowed to by pass the proxy. Only used on Windows for other OS’s use set_proxy_bypass to edit the bypass hosts.

CLI Example:

```
salt '*' proxy.set_http_proxy example.com 1080 user=proxy_user password=proxy_pass network_service=Ethernet
```

salt.modules.proxy.set_https_proxy(server, port, user=None, password=None, network_service='Ethernet', bypass_hosts=None)

Sets the https proxy settings. Note: On Windows this will override any other proxy settings you have, the preferred method of updating proxies on windows is using set_proxy.

- **server**: The proxy server to use
- **port**: The port used by the proxy server
- **user**: The username to use for the proxy server if required
- **password**: The password to use if required by the server
- **network_service**: The network service to apply the changes to, this only necessary on macOS
- **bypass_hosts**: The hosts that are allowed to by pass the proxy. Only used on Windows for other OS’s use set_proxy_bypass to edit the bypass hosts.

CLI Example:
**salt.modules.proxy.set_https_proxy**

Sets the proxy for HTTPS requests.

```
salt '*' proxy.set_https_proxy example.com 1080 user=proxy_user password=proxy_pass network_service=Ethernet
```

**salt.modules.proxy.set_proxy_bypass**

Sets the domains that can bypass the proxy.

```
salt '*' proxy.set_proxy_bypass 
```

**salt.modules.proxy.set_proxy_win**

Sets the HTTP proxy settings, only works with Windows.

```
salt '*' proxy.set_http_proxy example.com 1080 types="['http', 'https']"
```

---

**19.9.299 salt.modules.ps**

A salt interface to psutil, a system and process library. See [http://code.google.com/p/psutil](http://code.google.com/p/psutil).

**depends**

- psutil Python module, version 0.3.0 or later
- python-utmp package (optional)

**salt.modules.ps.boot_time**

Return the boot time in number of seconds since the epoch began.

```
salt '*' ps.boot_time
```

**salt.modules.ps.cpu_percent**

Return the percent of time the CPU is busy.

```
salt '*' ps.cpu_percent
```

**salt.modules.ps.cpu_times**

Return the percent of time the CPU spends in each state, e.g. user, system, idle, nice, iowait, irq, softirq.
per_cpu  if True return an array of percents for each CPU, otherwise aggregate all percents into one number

CLI Example:

```
salt '*' ps.cpu_times
```

salt.modules.ps.disk_io_counters(device=None)

Return disk I/O statistics.

CLI Example:

```
salt '*' ps.disk_io_counters
salt '*' ps.disk_io_counters device=sda1
```

salt.modules.ps.disk_partition_usage(all=False)

Return a list of disk partitions plus the mount point, filesystem and usage statistics.

CLI Example:

```
salt '*' ps.disk_partition_usage
```

salt.modules.ps.disk_partitions(all=False)

Return a list of disk partitions and their device, mount point, and filesystem type.

all  if set to False, only return local, physical partitions (hard disk, USB, CD/DVD partitions). If True, return all filesystems.

CLI Example:

```
salt '*' ps.disk_partitions
```

salt.modules.ps.disk_usage(path)

Given a path, return a dict listing the total available space as well as the free space, and used space.

CLI Example:

```
salt '*' ps.disk_usage /home
```

salt.modules.ps.get_pid_list()

Return a list of process ids (PIDs) for all running processes.

CLI Example:

```
salt '*' ps.get_pid_list
```

salt.modules.ps.get_users()

Return logged-in users.

CLI Example:

```
salt '*' ps.get_users
```

salt.modules.ps.kill_pid(pid, signal=15)

Kill a process by PID.

```
salt 'minion' ps.kill_pid pid [signal=signal_number]
```

pid  PID of process to kill.

signal  Signal to send to the process. See manpage entry for kill for possible values. Default: 15 (SIGTERM).
Example:

Send SIGKILL to process with PID 2000:

```
salt 'minion' ps.kill_pid 2000 signal=9
```

`salt.modules.ps.lsof(name)`
Retrieve the lsof information of the given process name.

CLI Example:

```
salt '*' ps.lsof apache2
```

`salt.modules.ps.netstat(name)`
Retrieve the netstat information of the given process name.

CLI Example:

```
salt '*' ps.netstat apache2
```

`salt.modules.ps.network_io_counters(interface=None)`
Return network I/O statistics.

CLI Example:

```
salt '*' ps.network_io_counters
salt '*' ps.network_io_counters interface=eth0
```

`salt.modules.ps.num_cpus()`
Return the number of CPUs.

CLI Example:

```
salt '*' ps.num_cpus
```

`salt.modules.ps.pgrep(pattern, user=None, full=False)`
Return the pids for processes matching a pattern.

If full is true, the full command line is searched for a match, otherwise only the name of the command is searched.

```
salt '*' ps.pgrep pattern [user=username] [full=(true|false)]
```

**pattern**  Pattern to search for in the process list.

**user**  Limit matches to the given username. Default: All users.

**full**  A boolean value indicating whether only the name of the command or the full command line should be matched against the pattern.

**Examples:**

Find all httpd processes on all `www` minions:

```
salt 'www.*' ps.pgrep httpd
```

Find all bash processes owned by user `tom`:

```
salt '*' ps.pgrep bash user=tom
```
salt.modules.ps.pkill(pattern, user=None, signal=15, full=False)

Kill processes matching a pattern.

```python
salt '*' ps.pkill pattern [user=username] [signal=signal_number] \n   [full=(true|false)]
```

**pattern** Pattern to search for in the process list.
**user** Limit matches to the given username. Default: All users.
**signal** Signal to send to the process(es). See manpage entry for kill for possible values. Default: 15 (SIGTERM).
**full** A boolean value indicating whether only the name of the command or the full command line should be matched against the pattern.

**Examples:**

Send SIGHUP to all httpd processes on all `www` minions:

```bash
salt 'www.*' ps.pkill httpd signal=1
```

Send SIGKILL to all bash processes owned by user `tom`:

```bash
salt '*' ps.pkill bash signal=9 user=tom
```

salt.modules.ps.proc_info(pid, attrs=None)

Return a dictionary of information for a process id (PID).

**CLI Example:**

```bash
salt '*' ps.proc_info 2322
salt '*' ps.proc_info 2322 attrs=['"pid", "name"]
```

**pid** PID of process to query.
**attrs** Optional list of desired process attributes. The list of possible attributes can be found here: [http://pythonhosted.org/psutil/#psutil.Process](http://pythonhosted.org/psutil/#psutil.Process)

salt.modules.ps.psaux(name)

Retrieve information corresponding to a "ps aux" filtered with the given pattern. It could be just a name or a regular expression (using python search from "re" module).

**CLI Example:**

```bash
salt '*' ps.psaux www-data.+apache2
```

salt.modules.ps.ss(name)

Retrieve the ss information of the given process name.

**CLI Example:**

```bash
salt '*' ps.ss apache2
```

New in version 2016.11.6.

salt.modules.ps.swap_memory()

New in version 2014.7.0.

Return a dict that describes swap memory statistics.

**Note:** This function is only available in psutil version 0.6.0 and above.
CLI Example:

```
salt '*' ps.swap_memory
```

```
salt.modules.ps.top(num_processes=5, interval=3)
```

Return a list of top CPU consuming processes during the interval. `num_processes` = return the top N CPU consuming processes, `interval` = the number of seconds to sample CPU usage over.

CLI Examples:

```
salt '*' ps.top
salt '*' ps.top 5 10
```

```
salt.modules.ps.total_physical_memory()
```

Return the total number of bytes of physical memory.

CLI Example:

```
salt '*' ps.total_physical_memory
```

```
salt.modules.ps.virtual_memory()
```

New in version 2014.7.0.

Return a dict that describes statistics about system memory usage.

**Note:** This function is only available in psutil version 0.6.0 and above.

CLI Example:

```
salt '*' ps.virtual_memory
```

### 19.9.300 salt.modules.publish

Publish a command from a minion to a target

```
salt.modules.publish.full_data(tgt, fun, arg=None, tgt_type='glob', returner='', timeout=5, expr_form=None)
```

Return the full data about the publication, this is invoked in the same way as the publish function.

CLI Example:

```
salt system.example.com publish.full_data '*' cmd.run 'ls -la /tmp'
```

**Attention**

If you need to pass a value to a function argument and that value contains an equal sign, you **must** include the argument name. For example:

```
salt '*' publish.full_data test.kwarg arg='cheese=spam'
```

```
salt.modules.publish.publish(tgt, fun, arg=None, tgt_type='glob', returner='', timeout=5, via_master=None, expr_form=None)
```

Publish a command from the minion out to other minions.
Publications need to be enabled on the Salt master and the minion needs to have permission to publish the command. The Salt master will also prevent a recursive publication loop, this means that a minion cannot command another minion to command another minion as that would create an infinite command loop.

The tgt_type argument is used to pass a target other than a glob into the execution, the available options are:

- glob
- pcre
- grain
- grain_pcre
- pillar
- pillar_pcre
- ipcidr
- range
- compound

Changed in version 2017.7.0: The expr_form argument has been renamed to tgt_type, earlier releases must use expr_form.

Note that for pillar matches must be exact, both in the pillar matcher and the compound matcher. No globbing is supported.

The arguments sent to the minion publish function are separated with commas. This means that for a minion executing a command with multiple args it will look like this:

```bash
salt system.example.com publish.publish '*' user.add 'foo,1020,1020'
salt system.example.com publish.publish 'os:Fedora' network.interfaces '' grain
```

CLI Example:

```
salt system.example.com publish.publish '*' cmd.run 'ls -la /tmp'
```

**Attention**

If you need to pass a value to a function argument and that value contains an equal sign, you must include the argument name. For example:

```bash
salt '*' publish.publish test.kwarg arg='cheese=spam'
```

Multiple keyword arguments should be passed as a list.

```bash
salt '*' publish.publish test.kwarg arg="['cheese=spam','spam=cheese']"
```

When running via salt-call, the via_master flag may be set to specific which master the publication should be sent to. Only one master may be specified. If unset, the publication will be sent only to the first master in minion configuration.

```bash
salt.modules.publish.runner(fun, **arg=\{None\}, timeout=5)
```

Execute a runner on the master and return the data from the runner function

CLI Example:

```
salt publish.runner manage.down
```
19.9.301 salt.modules.puppet

Execute puppet routines

salt.modules.puppet.disable(message=None)
New in version 2014.7.0.
Disable the puppet agent
message New in version 2015.5.2.
  Disable message to send to puppet
CLI Example:

```
salt '*' puppet.disable
salt '*' puppet.disable 'Disabled, contact XYZ before enabling'
```

salt.modules.puppet.enable()
New in version 2014.7.0.
Enable the puppet agent
CLI Example:

```
salt '*' puppet.enable
```

salt.modules.puppet.fact(name, puppet=False)
Run facter for a specific fact
CLI Example:

```
salt '*' puppet.fact kernel
```

salt.modules.puppet.facts(puppet=False)
Run facter and return the results
CLI Example:

```
salt '*' puppet.facts
```

salt.modules.puppet.noop(*args, **kwargs)
Execute a puppet noop run and return a dict with the stderr, stdout, return code, etc. Usage is the same as for puppet.run.
CLI Example:

```
salt '*' puppet.noop
salt '*' puppet.noop tags=basefiles::edit,apache::server
salt '*' puppet.noop debug
salt '*' puppet.noop apply /a/b/manifest.pp modulepath=/a/b/modules
  →tags=basefiles::edit,apache::server
```

salt.modules.puppet.plugin_sync()
Runs a plugin sync between the puppet master and agent
CLI Example:

```
salt '*' puppet.plugin_sync
```

salt.modules.puppet.run(*args, **kwargs)
Execute a puppet run and return a dict with the stderr, stdout, return code, etc. The first positional argument
given is checked as a subcommand. Following positional arguments should be ordered with arguments required by the subcommand first, followed by non-keyword arguments. Tags are specified by a tag keyword and comma separated list of values. -- http://docs.puppetlabs.com/puppet/latest/reference/lang_tags.html

CLI Examples:

```bash
salt '*' puppet.run
salt '*' puppet.run tags=basefiles::edit,apache::server
salt '*' puppet.run agent onetime no-daemonize no-usecacheonfailure no-splay ignorecache
salt '*' puppet.run debug
salt '*' puppet.run apply /a/b/manifest.pp modulepath=/a/b/modules tags=basefiles::edit,apache::server
```

salt.modules.puppet.status()
New in version 2014.7.0.

Display puppet agent status

CLI Example:

```bash
salt '*' puppet.status
```

salt.modules.puppet.summary()
New in version 2014.7.0.

Show a summary of the last puppet agent run

CLI Example:

```bash
salt '*' puppet.summary
```

19.9.302 salt.modules.pushbullet module

Module for sending messages to Pushbullet (https://www.pushbullet.com)

New in version 2015.8.0.

Requires an api_key in /etc/salt/minion:

For example:

```yaml
pushbullet:
  device: "Chrome"
  title: "Example push message"
  body: "Message body."
```

salt.modules.pushbullet.push_note(device=, title=, body=)

Pushing a text note.

Parameters

- **device** -- Pushbullet target device
- **title** -- Note title
- **body** -- Note body

Returns

Boolean if message was sent successfully.

CLI Example:

```bash
salt "*" pushbullet.push_note device="Chrome" title="Example title" body="Example body."
```
19.9.303 salt.modules.pushover_notify

Module for sending messages to Pushover (https://www.pushover.net)

New in version 2016.3.0.

**configuration**  This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

```
pushover:
  token: abAHuZyCLtdH8P4zhmFZmgUHUsv1eI8
```

salt.modules.pushover_notify.post_message(user=None, device=None, message=None, title=None, priority=None, expire=None, retry=None, sound=None, api_version=1, token=None)

Send a message to a Pushover user or group.

**Parameters**
- **user** -- The user or group to send to, must be key of user or group not email address.
- **message** -- The message to send to the PushOver user or group.
- **title** -- Specify who the message is from.
- **priority** -- The priority of the message, defaults to 0.
- **expire** -- The message should expire after N number of seconds.
- **retry** -- The number of times the message should be retried.
- **sound** -- The sound to associate with the message.
- **api_version** -- The PushOver API version, if not specified in the configuration.
- **token** -- The PushOver token, if not specified in the configuration.

**Returns**  Boolean if message was sent successfully.

CLI Example:

```
salt '*' pushover.post_message user='xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx' title='Message from Salt' message='Build is done'
```

```
salt '*' pushover.post_message user='xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx' title='Message from Salt' message='Build is done' priority='2' expire='720' retry='5'
```

19.9.304 salt.modules.pw_group

Manage groups on FreeBSD

**Important**: If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to ‘group.info’ is not available), see here.

salt.modules.pw_group.add(name, gid=None, **kwargs)

Add the specified group

CLI Example:

```
salt '*' group.add foo 3456
```

salt.modules.pw_group.adduser(name, username)

Add a user in the group.

CLI Example:
salt '*' group.adduser foo bar

Verifies if a valid username `bar' as a member of an existing group `foo', if not then adds it.

salt.modules.pw_group.chgid(name, gid)

Change the gid for a named group

CLI Example:

```
salt '*' group.chgid foo 4376
```

salt.modules.pw_group.delete(name)

Remove the named group

CLI Example:

```
salt '*' group.delete foo
```

salt.modules.pw_group.deluser(name, username)

Remove a user from the group.

CLI Example:

```
salt '*' group.deluser foo bar
```

Removes a member user `bar' from a group `foo'. If group is not present then returns True.

salt.modules.pw_group.getent(refresh=False)

Return info on all groups

CLI Example:

```
salt '*' group.getent
```

salt.modules.pw_group.info(name)

Return information about a group

CLI Example:

```
salt '*' group.info foo
```

salt.modules.pw_group.members(name, members_list)

Replaces members of the group with a provided list.

New in version 2015.5.4.

CLI Example:

```
salt '*' group.members foo `user1,user2,user3,...'
```

Replaces a membership list for a local group `foo'. foo:x:1234:user1,user2,user3,...

19.9.305 salt.modules.pw_user

Manage users with the pw command

Important: If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to `user.info is not available), see here.
salt.modules.pw_user.add(name, uid=None, gid=None, groups=None, home=None, shell=None, unique=True, fullname='`, roomnumber='`, workphone='`, homephone='`, createhome=True, loginclass=None, **kwargs)

Add a user to the minion

CLI Example:
```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

salt.modules.pw_user.chfullname(name, fullname)

Change the user's Full Name

CLI Example:
```
salt '*' user.chfullname foo "Foo Bar"
```

salt.modules.pw_user.chgid(name, gid)

Change the default group of the user

CLI Example:
```
salt '*' user.chgid foo 4376
```

salt.modules.pw_user.chgroups(name, groups, append=False)

Change the groups to which a user belongs

CLI Example:
```
salt '*' user.chgroups foo wheel,root True
```

salt.modules.pw_user.chhome(name, home, persist=False)

Set a new home directory for an existing user

CLI Example:
```
salt '*' user.chhome foo /home/users/foo True
```

salt.modules.pw_user.chhomephone(name, homephone)

Change the user's Home Phone

CLI Example:
```
salt '*' user.chhomephone foo "7735551234"
```

salt.modules.pw_user.chloginclass(name, loginclass, root=None)

Change the default login class of the user

New in version 2016.3.5.

CLI Example:
```
salt '*' user.chloginclass foo staff
```

salt.modules.pw_user.chroomnumber(name, roomnumber)
    Change the user's Room Number
    CLI Example:
    ```
salt '*' user.chroomnumber foo 123
    ```

salt.modules.pw_user.chshell(name, shell)
    Change the default shell of the user
    CLI Example:
    ```
salt '*' user.chshell foo /bin/zsh
    ```

salt.modules.pw_user.chuid(name, uid)
    Change the uid for a named user
    CLI Example:
    ```
salt '*' user.chuid foo 4376
    ```

salt.modules.pw_user.chworkphone(name, workphone)
    Change the user's Work Phone
    CLI Example:
    ```
salt '*' user.chworkphone foo "7735550123"
    ```

salt.modules.pw_user.delete(name, remove=False, force=False)
    Remove a user from the minion
    CLI Example:
    ```
salt '*' user.delete name remove=True force=True
    ```

salt.modules.pw_user.get_loginclass(name)
    Get the login class of the user
    New in version 2016.3.0.
    CLI Example:
    ```
salt '*' user.get_loginclass foo
    ```

salt.modules.pw_user.getent(refresh=False)
    Return the list of all info for all users
    CLI Example:
    ```
salt '*' user.getent
    ```

salt.modules.pw_user.info(name)
    Return user information
    CLI Example:
    ```
salt '*' user.info root
    ```

salt.modules.pw_user.list_groups(name)
    Return a list of groups the named user belongs to
CLI Example:

```bash
salt '*' user.list_groups foo
```

**salt.modules.pw_user.list_users()**

Return a list of all users

CLI Example:

```bash
salt '*' user.list_users
```

**salt.modules.pw_user.rename(name, new_name)**

Change the username for a named user

CLI Example:

```bash
salt '*' user.rename name new_name
```

### 19.9.306 salt.modules.pyenv

Manage python installations with pyenv.

**Note:** Git needs to be installed and available via PATH if pyenv is to be installed automatically by the module.

New in version v2014.04.

**salt.modules.pyenv.default(python=None, runas=None)**

Returns or sets the currently defined default python.

- **python=None** The version to set as the default. Should match one of the versions listed by `pyenv.versions`. Leave blank to return the current default.

CLI Example:

```bash
salt '*' pyenv.default
salt '*' pyenv.default 2.0.0-p0
```

**salt.modules.pyenv.do(cmdline=None, runas=None)**

Execute a python command with pyenv's shims from the user or the system.

CLI Example:

```bash
salt '*' pyenv.do 'gem list bundler'
salt '*' pyenv.do 'gem list bundler' deploy
```

**salt.modules.pyenv.do_with_python(python, cmdline, runas=None)**

Execute a python command with pyenv's shims using a specific python version.

CLI Example:

```bash
salt '*' pyenv.do_with_python 2.0.0-p0 'gem list bundler'
salt '*' pyenv.do_with_python 2.0.0-p0 'gem list bundler' deploy
```

**salt.modules.pyenv.install(runas=None, path=None)**

Install pyenv systemwide

CLI Example:
salt ' '*' pyenv.install

salt.modules.pyenv.install_python(python, runas=None)
Install a python implementation.
  python The version of python to install, should match one of the versions listed by pyenv.list
CLI Example:

```
salt ' '*' pyenv.install_python 2.0.0-p0
```

salt.modules.pyenv.is_installed(runas=None)
Check if pyenv is installed.

CLI Example:

```
salt ' '*' pyenv.is_installed
```

salt.modules.pyenv.list_(runas=None)
List the installable versions of python.

CLI Example:

```
salt ' '*' pyenv.list
```

salt.modules.pyenv.rehash(runas=None)
Run pyenv rehash to update the installed shims.

CLI Example:

```
salt ' '*' pyenv.rehash
```

salt.modules.pyenv.uninstall_python(python, runas=None)
Uninstall a python implementation.
  python The version of python to uninstall. Should match one of the versions listed by pyenv.versions
CLI Example:

```
salt ' '*' pyenv.uninstall_python 2.0.0-p0
```

salt.modules.pyenv.update(runas=None, path=None)
Updates the current versions of pyenv and python-Build

CLI Example:

```
salt ' '*' pyenv.update
```

salt.modules.pyenv.versions(runas=None)
List the installed versions of python.

CLI Example:

```
salt ' '*' pyenv.versions
```

19.9.307 salt.modules.qemu_img

Qemu-img Command Wrapper

The qemu-img command is wrapped for specific functions
depends qemu-img

salt.modules.qemu_img.convert(Orig, dest, fmt)
Convert an existing disk image to another format using qemu-img
CLI Example:

```
salt '*' qemu_img.convert /path/to/original.img /path/to/new.img qcow2
```

salt.modules.qemu_img.make_image(location, size, fmt)
Create a blank virtual machine image file of the specified size in megabytes. The image can be created in any format supported by qemu
CLI Example:

```
salt '*' qemu_img.make_image /tmp/image.qcow 2048 qcow2
salt '*' qemu_img.make_image /tmp/image.raw 10240 raw
```

19.9.308 salt.modules.qemu_nbd

Qemu Command Wrapper
The qemu system comes with powerful tools, such as qemu-img and qemu-nbd which are used here to build up kvm images.

salt.modules.qemu_nbd.clear(mnt)
Pass in the mnt dict returned from nbd_mount to unmount and disconnect the image from nbd. If all of the partitions are unmounted return an empty dict, otherwise return a dict containing the still mounted partitions
CLI Example:

```
salt '*' qemu_nbd.clear '{"/mnt/foo": "/dev/nbd@p1"}'
```

salt.modules.qemu_nbd.connect(image)
Activate nbd for an image file.
CLI Example:

```
salt '*' qemu_nbd.connect /tmp/image.raw
```

salt.modules.qemu_nbd.init(image, root=None)
Mount the named image via qemu-nbd and return the mounted roots
CLI Example:

```
salt '*' qemu_nbd.init /srv/image.qcow2
```

salt.modules.qemu_nbd.mount(nbd, root=None)
Pass in the nbd connection device location, mount all partitions and return a dict of mount points
CLI Example:

```
salt '*' qemu_nbd.mount /dev/nbd0
```

19.9.309 salt.modules.quota

Module for managing quotas on POSIX-like systems.
salt.modules.quota.get_mode(device)
Report whether the quota system for this device is on or off

CLI Example:
salt '*' quota.get_mode

salt.modules.quota.off(device)
Turns off the quota system

CLI Example:
salt '*' quota.off

salt.modules.quota.on(device)
Turns on the quota system

CLI Example:
salt '*' quota.on

salt.modules.quota.report(mount)
Report on quotas for a specific volume

CLI Example:
salt '*' quota.report /media/data

salt.modules.quota.set_(device, **kwargs)
Calls out to setquota, for a specific user or group

CLI Example:
salt '*' quota.set /media/data user=larry block-soft-limit=1048576
salt '*' quota.set /media/data group=painters file-hard-limit=1000

salt.modules.quota.stats()
Runs the quotastats command, and returns the parsed output

CLI Example:
salt '*' quota.stats

salt.modules.quota.warn()
Runs the warnquota command, to send warning emails to users who are over their quota limit.

CLI Example:
salt '*' quota.warn

19.9.310 salt.modules.rabbitmq

Module to provide RabbitMQ compatibility to Salt. Todo: A lot, need to add cluster support, logging, and minion configuration data.

salt.modules.rabbitmq.add_user(name, password=None, runas=None)
Add a rabbitMQ user via rabbitmqctl user_add <user> <password>

CLI Example:
salt '*' rabbitmq.add_user rabbit_user password

```
salt.modules.rabbitmq.add_vhost(vhost, runas=None)
    Adds a vhost via rabbitmqctl add_vhost.
```

CLI Example:
```
salt '*' rabbitmq.add_vhost '<vhost_name>'
```

salt.modules.rabbitmq.change_password(name, password, runas=None)

Changes a user's password.

CLI Example:
```
salt '*' rabbitmq.change_password rabbit_user password
```

salt.modules.rabbitmq.check_password(name, password, runas=None)

New in version 2016.3.0.

Checks if a user's password is valid.

CLI Example:
```
salt '*' rabbitmq.check_password rabbit_user password
```

salt.modules.rabbitmq.clear_password(name, runas=None)

Removes a user's password.

CLI Example:
```
salt '*' rabbitmq.clear_password rabbit_user
```

salt.modules.rabbitmq.cluster_status(runas=None)

```
    return rabbitmq cluster_status
```

CLI Example:
```
salt '*' rabbitmq.cluster_status
```

salt.modules.rabbitmq.delete_policy(vhost, name, runas=None)

Delete a policy based on rabbitmqctl clear_policy.

Reference: http://www.rabbitmq.com/ha.html

CLI Example:
```
salt '*' rabbitmq.delete_policy / HA
```

salt.modules.rabbitmq.delete_user(name, runas=None)

Deletes a user via rabbitmqctl delete_user.

CLI Example:
```
salt '*' rabbitmq.delete_user rabbit_user
```

salt.modules.rabbitmq.delete_vhost(vhost, runas=None)

Deletes a vhost rabbitmqctl delete_vhost.

CLI Example:
salt '*' rabbitmq.delete_vhost '<vhost_name>'

salt.modules.rabbitmq.disable_plugin(name, runas=None)
  Disable a RabbitMQ plugin via the rabbitmq-plugins command.
  CLI Example:
  salt '*' rabbitmq.disable_plugin foo

salt.modules.rabbitmq.enable_plugin(name, runas=None)
  Enable a RabbitMQ plugin via the rabbitmq-plugins command.
  CLI Example:
  salt '*' rabbitmq.enable_plugin foo

salt.modules.rabbitmq.force_reset(runas=None)
  Forcefully Return a RabbitMQ node to its virgin state
  CLI Example:
  salt '*' rabbitmq.force_reset

salt.modules.rabbitmq.join_cluster(host, user='rabbit', ram_node=None, runas=None)
  Join a rabbit cluster
  CLI Example:
  salt '*' rabbitmq.join_cluster rabbit.example.com rabbit

salt.modules.rabbitmq.list_available_plugins(runas=None)
  Returns a list of the names of all available plugins (enabled and disabled).
  CLI Example:
  salt '*' rabbitmq.list_available_plugins

salt.modules.rabbitmq.list_enabled_plugins(runas=None)
  Returns a list of the names of the enabled plugins.
  CLI Example:
  salt '*' rabbitmq.list_enabled_plugins

salt.modules.rabbitmq.list_permissions(vhost, runas=None)
  Lists permissions for vhost via rabbitmqctl list_permissions
  CLI Example:
  salt '*' rabbitmq.list_permissions /myvhost

salt.modules.rabbitmq.list_policies(vhost='/', runas=None)
  Return a dictionary of policies nested by vhost and name based on the data returned from rabbitmqctl list_policies.
  Reference: http://www.rabbitmq.com/ha.html
  CLI Example:
salt '*' rabbitmq.list_policies

```python
salt.modules.rabbitmq.list_queues(runas=None, *args)
```

Returns queue details of the / virtual host

CLI Example:
```
salt '*' rabbitmq.list_queues messages consumers
```

salt.modules.rabbitmq.list_queues_vhost(vhost, runas=None, *args)

Returns queue details of specified virtual host. This command will consider first parameter as the vhost name and rest will be treated as queueinfoitem. For getting details on vhost /, use list_queues instead).

CLI Example:
```
salt '*' rabbitmq.list_queues messages consumers
```

salt.modules.rabbitmq.list_user_permissions(name, runas=None)

List permissions for a user via rabbitmqctl list_user_permissions

CLI Example:
```
salt '*' rabbitmq.list_user_permissions user
```

salt.modules.rabbitmq.list_users(runas=None)

Return a list of users based off of rabbitmqctl user_list.

CLI Example:
```
salt '*' rabbitmq.list_users
```

salt.modules.rabbitmq.list_vhosts(runas=None)

Return a list of vhost based on rabbitmqctl list_vhosts.

CLI Example:
```
salt '*' rabbitmq.list_vhosts
```

salt.modules.rabbitmq.plugin_is_enabled(name, runas=None)

Return whether the plugin is enabled.

CLI Example:
```
salt '*' rabbitmq.plugin_is_enabled rabbitmq_plugin_name
```

salt.modules.rabbitmq.policy_exists(vhost, name, runas=None)

Return whether the policy exists based on rabbitmqctl list_policies.

Reference: http://www.rabbitmq.com/ha.html

CLI Example:
```
salt '*' rabbitmq.policy_exists / HA
```

salt.modules.rabbitmq.reset(runas=None)

Return a RabbitMQ node to its virgin state

CLI Example:
salt '*' rabbitmq.reset

```
salt.modules.rabbitmq.set_permissions(vhost, user, conf='.*', write='.*', read='.*', runas=None)
```
Sets permissions for vhost via rabbitmqctl set_permissions

CLI Example:
```
salt '*' rabbitmq.set_permissions myvhost myuser
```

```
salt.modules.rabbitmq.set_policy(vhost, name, pattern, definition, priority=None, runas=None)
```
Set a policy based on rabbitmqctl set_policy.

CLI Example:
```
salt '*' rabbitmq.set_policy / HA '.*' '{"ha-mode":"all"}'
```

```
salt.modules.rabbitmq.set_user_tags(name, tags, runas=None)
```
Add user tags via rabbitmqctl set_user_tags

CLI Example:
```
salt '*' rabbitmq.set_user_tags myadmin administrator
```

```
salt.modules.rabbitmq.start_app(runas=None)
```
Start the RabbitMQ application.

CLI Example:
```
salt '*' rabbitmq.start_app
```

```
salt.modules.rabbitmq.status(runas=None)
```
return rabbitmq status

CLI Example:
```
salt '*' rabbitmq.status
```

```
salt.modules.rabbitmq.stop_app(runas=None)
```
Stops the RabbitMQ application, leaving the Erlang node running.

CLI Example:
```
salt '*' rabbitmq.stop_app
```

```
salt.modules.rabbitmq.user_exists(name, runas=None)
```
Return whether the user exists based on rabbitmqctl list_users.

CLI Example:
```
salt '*' rabbitmq.user_exists rabbit_user
```

```
salt.modules.rabbitmq.vhost_exists(name, runas=None)
```
Return whether the vhost exists based on rabbitmqctl list_vhosts.

CLI Example:
```
salt '*' rabbitmq.vhost_exists rabbit_host
```

19.9. execution modules
19.9.311 salt.modules.raet_publish

Publish a command from a minion to a target

```
salt.modules.raet_publish.full_data(tgt, fun, arg=None, tgt_type='glob', returner='`, timeout=5,
expr_form=None)
```

Return the full data about the publication, this is invoked in the same way as the publish function

CLI Example:

```
salt system.example.com publish.full_data '*' cmd.run 'ls -la /tmp'
```

Attention

If you need to pass a value to a function argument and that value contains an equal sign, you must include the argument name. For example:

```
salt '*' publish.full_data test.kwarg arg='cheese=spam'
```

```
salt.modules.raet_publish.publish(tgt, fun, arg=None, tgt_type='glob', returner='`, timeout=5,
expr_form=None)
```

Publish a command from the minion out to other minions.

Publications need to be enabled on the Salt master and the minion needs to have permission to publish the command. The Salt master will also prevent a recursive publication loop, this means that a minion cannot command another minion to command another minion as that would create an infinite command loop.

The `tgt_type` argument is used to pass a target other than a glob into the execution, the available options are:

- glob
- pcre
- grain
- grain_pcre
- pillar
- pillar_pcre
- ipcidr
- range
- compound

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

The arguments sent to the minion publish function are separated with commas. This means that for a minion executing a command with multiple args it will look like this:

```
salt system.example.com publish.publish '*' user.add 'foo,1020,1020'
salt system.example.com publish.publish 'os:Fedora' network.interfaces '' grain
```

CLI Example:

```
salt system.example.com publish.publish '*' cmd.run 'ls -la /tmp'
```

Attention

If you need to pass a value to a function argument and that value contains an equal sign, you must include the argument name. For example:
salt 'x' publish.publish test.kwarg arg='cheese=spam'

salt.modules.raet_publish.runner(fun, arg=None, timeout=5)
  Execute a runner on the master and return the data from the runner function
  
  CLI Example:
  
  salt publish.runner manage.down

**19.9.312 salt.modules.rallydev**

Support for RallyDev

New in version 2015.8.0.

Requires a username and a password in /etc/salt/minion:

salt.modules.rallydev.list_items(name)
  List items of a particular type
  
  CLI Examples:
  
  salt myminion rallydev.list_<item name>s
  salt myminion rallydev.list_users
  salt myminion rallydev.list_artifacts

salt.modules.rallydev.list_users()
  List the users
  
  CLI Example:
  
  salt myminion rallydev.list_users

salt.modules.rallydev.query_item(name, query_string, order='Rank')
  Query a type of record for one or more items. Requires a valid query string. See https://rally1.rallydev.com/slm/doc/webservice/introduction.jsp for information on query syntax.
  
  CLI Example:
  
  salt myminion rallydev.query_<item name> <query string> [order]'
  salt myminion rallydev.query_task '(Name contains github)'
  salt myminion rallydev.query_task '(Name contains reactor)'

salt.modules.rallydev.query_user(query_string, order='UserName')
  Update a user
  
  CLI Example:
  
  salt myminion rallydev.query_user 'Name contains Jo)'

salt.modules.rallydev.show_artifact(id_)
  Show an artifact
  
  CLI Example:
  
  salt myminion rallydev.show_artifact <artifact id>
salt.modules.rallydev.show_item(name, id_)
    Show an item
    CLI Example:
    salt myminion rallydev.show_<item name> <item id>

salt.modules.rallydev.show_user(id_)
    Show a user
    CLI Example:
    salt myminion rallydev.show_user <user id>

salt.modules.rallydev.update_item(name, id_, field=None, value=None, postdata=None)
    Update an item. Either a field and a value, or a chunk of POST data, may be used, but not both.
    CLI Example:
    salt myminion rallydev.update_<item name> <item id> field=<field> value=<value>
    salt myminion rallydev.update_<item name> <item id> postdata=<post data>

salt.modules.rallydev.update_user(id_, field, value)
    Update a user
    CLI Example:
    salt myminion rallydev.update_user <user id> <field> <new value>

19.9.313 salt.modules.random_org

Module for retrieving random information from Random.org
New in version 2015.5.0.

configuration This module can be used by either passing an api key and version directly or by speci-
    fying both in a configuration profile in the salt master/minion config.
    For example:
    random_org:
      api_key: 7be1402d-5719-5bd3-a306-3def9f135da5
      api_version: 1

salt.modules.random_org.generateBlobs(api_key=None, api_version=None, **kwargs)
    List all Slack users.
    Parameters
      - api_key -- The Random.org api key.
      - api_version -- The Random.org api version.
      - format -- Specifies the format in which the blobs will be returned. Values allowed
        are base64 and hex.
    Returns The user list.
    CLI Example:
    salt '*' get_integers number=5 min=1 max=6
    salt '*' get_integers number=5 min=1 max=6
salt.modules.random_org.generateDecimalFractions(api_key=None, api_version=None, **kwargs)

Generates true random decimal fractions

Parameters

- api_key -- The Random.org api key.
- api_version -- The Random.org api version.
- number -- How many random decimal fractions you need. Must be within the [1,1e4] range.
- decimalPlaces -- The number of decimal places to use. Must be within the [1,20] range.
- replacement -- Specifies whether the random numbers should be picked with replacement. The default (true) will cause the numbers to be picked with replacement, i.e., the resulting numbers may contain duplicate values (like a series of dice rolls). If you want the numbers picked to be unique (like raffle tickets drawn from a container), set this value to false.

Returns A list of decimal fraction

CLI Example:

```
salt '*' random_org.generateDecimalFractions number=10 decimalPlaces=4
```

salt.modules.random_org.generateGaussians(api_key=None, api_version=None, **kwargs)

This method generates true random numbers from a Gaussian distribution (also known as a normal distribution).

Parameters

- api_key -- The Random.org api key.
- api_version -- The Random.org api version.
- number -- How many random numbers you need. Must be within the [1,1e4] range.
- mean -- The distribution's mean. Must be within the [-1e6,1e6] range.
- standardDeviation -- The distribution's standard deviation. Must be within the [-1e6,1e6] range.
- significantDigits -- The number of significant digits to use. Must be within the [2,20] range.

Returns The user list.

CLI Example:

```
salt '*' random_org.generateGaussians number=10 mean=0.0 standardDeviation=1.0 significantDigits=8
```

salt.modules.random_org.generateIntegers(api_key=None, api_version=None, **kwargs)

Generate random integers

Parameters

- api_key -- The Random.org api key.
- api_version -- The Random.org api version.
- number -- The number of integers to generate
- minimum -- The lower boundary for the range from which the random numbers will be picked. Must be within the [-1e9,1e9] range.
- maximum -- The upper boundary for the range from which the random numbers will be picked. Must be within the [-1e9,1e9] range.
- replacement -- Specifies whether the random numbers should be picked with replacement. The default (true) will cause the numbers to be picked with replacement, i.e., the resulting numbers may contain duplicate values (like a series of dice rolls). If you want the numbers picked to be unique (like raffle tickets drawn from a container), set this value to false.

CLI Example:
tainer), set this value to false.

- **base** -- Specifies the base that will be used to display the numbers. Values allowed are 2, 8, 10 and 16. This affects the JSON types and formatting of the resulting data as discussed below.

**Returns** A list of integers.

CLI Example:

```bash
salt '*' random_org.generateIntegers number=5 minimum=1 maximum=6
salt '*' random_org.generateIntegers number=5 minimum=2 maximum=255 base=2
```

salt.modules.random_org.generateStrings

Generate random strings.

**Parameters**

- **api_key** -- The Random.org api key.
- **api_version** -- The Random.org api version.
- **number** -- The number of strings to generate.
- **length** -- The length of each string. Must be within the [1,20] range. All strings will be of the same length
- **characters** -- A string that contains the set of characters that are allowed to occur in the random strings. The maximum number of characters is 80.
- **replacement** -- Specifies whether the random strings should be picked with replacement. The default (true) will cause the strings to be picked with replacement, i.e., the resulting list of strings may contain duplicates (like a series of dice rolls). If you want the strings to be unique (like raffle tickets drawn from a container), set this value to false.

**Returns** A list of strings.

CLI Example:

```bash
salt '*' random_org.generateStrings number=5 length=8 characters=abcdefghijklmnopqrstuvwxyz
salt '*' random_org.generateStrings number=10 length=16 characters=abcdefghijklmnopqrstuvwxyz
```

salt.modules.random_org.generateUUIDs

Generate a list of random UUIDs

**Parameters**

- **api_key** -- The Random.org api key.
- **api_version** -- The Random.org api version.
- **number** -- How many random UUIDs you need. Must be within the [1,1e3] range.

**Returns** A list of UUIDs

CLI Example:

```bash
salt '*' random_org.generateUUIDs number=5
```

salt.modules.random_org.getUsage

Show current usages statistics

**Parameters**

- **api_key** -- The Random.org api key.
- **api_version** -- The Random.org api version.

**Returns** The current usage statistics.

CLI Example:
19.9.314 `salt.modules.rbac_solaris`

Module for Solaris' Role-Based Access Control

`salt.modules.rbac_solaris.auth_add(user, auth)`
Add authorization to user

- `user` [string] username
- `auth` [string] authorization name

CLI Example:

```
salt '*' rbac.auth_add martine solaris.zone.manage
salt '*' rbac.auth_add martine solaris.zone.manage,solaris.mail.mailq
```

`salt.modules.rbac_solaris.auth_get(user, computed=True)`
List authorization for user

- `user` [string] username
- `computed` [boolean] merge results from `auths` command into data from `user_attr`

CLI Example:

```
salt '*' rbac.auth_get leo
```

`salt.modules.rbac_solaris.auth_list()`
List all available authorization

CLI Example:

```
salt '*' rbac.auth_list
```

`salt.modules.rbac_solaris.auth_rm(user, auth)`
Remove authorization from user

- `user` [string] username
- `auth` [string] authorization name

CLI Example:

```
salt '*' rbac.auth_rm jorge solaris.zone.manage
salt '*' rbac.auth_rm jorge solaris.zone.manage,solaris.mail.mailq
```

`salt.modules.rbac_solaris.profile_add(user, profile)`
Add profile to user

- `user` [string] username
- `profile` [string] profile name

CLI Example:

```
salt '*' rbac.profile_add martine 'Primary Administrator'
salt '*' rbac.profile_add martine 'User Management,User Security'
```

`salt.modules.rbac_solaris.profile_get(user, default_hidden=True)`
List profiles for user

- `user` [string] username
- `default_hidden` [boolean] hide default profiles

19.9. execution modules
**CLI Example:**

```bash
salt '*' rbac.profile_get leo
salt '*' rbac.profile_get leo default_hidden=False
```

salt.modules.rbac_solaris.profile_list(*default_only=False*)

List all available profiles

- `default_only` [boolean] return only default profile

**CLI Example:**

```bash
salt '*' rbac.profile_list
```

salt.modules.rbac_solaris.profile_rm(*user, profile*)

Remove profile from user

- `user` [string] username
- `profile` [string] profile name

**CLI Example:**

```bash
salt '*' rbac.profile_rm jorge 'Primary Administrator'
salt '*' rbac.profile_rm jorge 'User Management,User Security'
```

salt.modules.rbac_solaris.role_add(*user, role*)

Add role to user

- `user` [string] username
- `role` [string] role name

**CLI Example:**

```bash
salt '*' rbac.role_add martine netcfg
salt '*' rbac.role_add martine netcfg,zfssnap
```

salt.modules.rbac_solaris.role_get(*user*)

List roles for user

- `user` [string] username

**CLI Example:**

```bash
salt '*' rbac.role_get leo
```

salt.modules.rbac_solaris.role_list()

List all available roles

**CLI Example:**

```bash
salt '*' rbac.role_list
```

salt.modules.rbac_solaris.role_rm(*user, role*)

Remove role from user

- `user` [string] username
- `role` [string] role name

**CLI Example:**

```bash
salt '*' rbac.role_rm jorge netcfg
salt '*' rbac.role_rm jorge netcfg,zfssnap
```
19.9.315 salt.modules.rbenv

Manage ruby installations with rbenv. rbenv is supported on Linux and macOS. rbenv doesn't work on Windows (and isn't really necessary on Windows as there is no system Ruby on Windows). On Windows, the RubyInstaller and/or Pik are both good alternatives to work with multiple versions of Ruby on the same box.

http://misheska.com/blog/2013/06/15/using-rbenv-to-manage-multiple-versions-of-ruby/

New in version 0.16.0.

salt.modules.rbenv.default(ruby=None, runas=None)

Returns or sets the currently defined default ruby

`ruby` The version to set as the default. Should match one of the versions listed by `rbenv.versions`. Leave blank to return the current default.

CLI Example:

```
salt '*' rbenv.default
salt '*' rbenv.default 2.0.0-p0
```

salt.modules.rbenv.do(cmdline, runas=None, env=None)

Execute a ruby command with rbenv's shims from the user or the system

CLI Example:

```
salt '*' rbenv.do 'gem list bundler'
salt '*' rbenv.do 'gem list bundler' deploy
```

salt.modules.rbenv.do_with_ruby(ruby, cmdline, runas=None)

Execute a ruby command with rbenv's shims using a specific ruby version

CLI Example:

```
salt '*' rbenv.do_with_ruby 2.0.0-p0 'gem list bundler'
salt '*' rbenv.do_with_ruby 2.0.0-p0 'gem list bundler' runas=deploy
```

salt.modules.rbenv.install(runas=None, path=None)

Install rbenv systemwide

CLI Example:

```
salt '*' rbenv.install
```

salt.modules.rbenv.install_ruby(ruby, runas=None)

Install a ruby implementation.

`ruby` The version of Ruby to install, should match one of the versions listed by `rbenv.list`

`runas` The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

Additional environment variables can be configured in pillar / grains / master:

```
rbenv:
   build_env: 'CONFIGURE_OPTS="--no-tcmalloc" CFLAGS="-fno-tree-dce"
```

CLI Example:

```
salt '*' rbenv.install_ruby 2.0.0-p0
```

salt.modules.rbenv.is_installed(runas=None)

Check if rbenv is installed

CLI Example:
salt 'x' rbenv.is_installed

salt.modules.rbenv.list_(runas=None)
List the installable versions of ruby
    runas The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.
    CLI Example:
        salt 'x' rbenv.list

salt.modules.rbenv.rehash(runas=None)
Run rbenv rehash to update the installed shims
    runas The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.
    CLI Example:
        salt 'x' rbenv.rehash

salt.modules.rbenv.uninstall_ruby(ruby, runas=None)
Uninstall a ruby implementation.
    ruby The version of ruby to uninstall. Should match one of the versions listed by rbenv.versions.
    runas The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.
    CLI Example:
        salt 'x' rbenv.uninstall_ruby 2.0.0-p0

salt.modules.rbenv.update(runas=None, path=None)
Updates the current versions of rbenv and ruby-build
    runas The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.
    CLI Example:
        salt 'x' rbenv.update

salt.modules.rbenv.versions(runas=None)
List the installed versions of ruby
    CLI Example:
        salt 'x' rbenv.versions

19.9.316 salt.modules.rdp
Manage RDP Service on Windows servers
salt.modules.rdp.disable()
    Disable RDP the service on the server
    CLI Example:
        salt 'x' rdp.disable

salt.modules.rdp.disconnect_session(session_id)
    Disconnect a session.
New in version 2016.11.0.

**Parameters**
- `session_id` -- The numeric Id of the session.

**Returns**
A boolean representing whether the disconnect succeeded.

**CLI Example:**

```bash
salt '*' rdp.disconnect_session session_id
salt '*' rdp.disconnect_session 99
```

**salt.modules.rdp.enable()**

Enable RDP the service on the server

**CLI Example:**

```bash
salt '*' rdp.enable
```

**salt.modules.rdp.get_session(session_id)**

Get information about a session.

New in version 2016.11.0.

**Parameters**
- `session_id` -- The numeric Id of the session.

**Returns**
A dictionary of session information.

**CLI Example:**

```bash
salt '*' rdp.get_session session_id
salt '*' rdp.get_session 99
```

**salt.modules.rdp.list_sessions(logged_in_users_only=False)**

List information about the sessions.

New in version 2016.11.0.

**Parameters**
- `logged_in_users_only` -- If True, only return sessions with users logged in.

**Returns**
A list containing dictionaries of session information.

**CLI Example:**

```bash
salt '*' rdp.list_sessions
```

**salt.modules.rdp.logoff_session(session_id)**

Initiate the logoff of a session.

New in version 2016.11.0.

**Parameters**
- `session_id` -- The numeric Id of the session.

**Returns**
A boolean representing whether the logoff succeeded.

**CLI Example:**

```bash
salt '*' rdp.logoff_session session_id
salt '*' rdp.logoff_session 99
```

**salt.modules.rdp.status()**

Show if rdp is enabled on the server

**CLI Example:**

```bash
salt '*' rdp.status
```
19.9.317 salt.modules.redis

Module to provide redis functionality to Salt

New in version 2014.7.0.

configuration  This module requires the redis python module and uses the following defaults which
may be overridden in the minion configuration:

```python
redis.host: 'salt'
redis.port: 6379
redis.db: 0
redis.password: None
```

salt.modules.redismod.bgrewriteaof(**connection_args)**

Asynchronously rewrite the append-only file

CLI Example:

```
salt '*' redis.bgrewriteaof
```

salt.modules.redismod.bgsave(**connection_args)**

Asynchronously save the dataset to disk

CLI Example:

```
salt '*' redis.bgsave
```

salt.modules.redismod.config_get(pattern='*', **connection_args)**

Get redis server configuration values

CLI Example:

```
salt '*' redis.config_get
salt '*' redis.config_get port
```

salt.modules.redismod.config_set(name, value, **connection_args)**

Set redis server configuration values

CLI Example:

```
salt '*' redis.config_set masterauth luv_kittens
```

salt.modules.redismod.dbsize(**connection_args)**

Return the number of keys in the selected database

CLI Example:

```
salt '*' redis.dbsize
```

salt.modules.redismod.delete(**connection_args)**

Deletes the keys from redis, returns number of keys deleted

CLI Example:

```
salt '*' redis.delete foo
```
**salt.modules.redismod.exists**(key, host=None, port=None, db=None, password=None)

Return true if the key exists in redis

CLI Example:
```
salt '*' redis.exists foo
```

**salt.modules.redismod.expire**(key, seconds, host=None, port=None, db=None, password=None)

Set a keys time to live in seconds

CLI Example:
```
salt '*' redis.expire foo 300
```

**salt.modules.redismod.expireat**(key, timestamp, host=None, port=None, db=None, password=None)

Set a keys expire at given UNIX time

CLI Example:
```
salt '*' redis.expireat foo 1400000000
```

**salt.modules.redismod.flushall**(host=None, port=None, db=None, password=None)

Remove all keys from all databases

CLI Example:
```
salt '*' redis.flushall
```

**salt.modules.redismod.flushdb**(host=None, port=None, db=None, password=None)

Remove all keys from the selected database

CLI Example:
```
salt '*' redis.flushdb
```

**salt.modules.redismod.get_key**(key, host=None, port=None, db=None, password=None)

Get redis key value

CLI Example:
```
salt '*' redis.get_key foo
```

**salt.modules.redismod.get_master_ip**(host=None, port=None, password=None)

Get host information about slave

CLI Example:
```
salt '*' redis.get_master_ip
```

**salt.modules.redismod.hdel**(key, *fields, **options)

Delete one of more hash fields.

New in version 2017.7.0.

CLI Example:
```
salt '*' redis.hdel foo_hash bar_field1 bar_field2
```

**salt.modules.redismod.hexists**(key, field, host=None, port=None, db=None, password=None)

Determine if a hash fields exists.
New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hexists foo_hash bar_field
```

```
salt.modules.redismod.hget(key, field, host=None, port=None, db=None, password=None)
```
Get specific field value from a redis hash, returns dict

CLI Example:

```
salt '!' redis.hget foo_hash bar_field
```

```
salt.modules.redismod.hgetall(key, host=None, port=None, db=None, password=None)
```
Get all fields and values from a redis hash, returns dict

CLI Example:

```
salt '!' redis.hgetall foo_hash
```

```
salt.modules.redismod.hincrby(key, field, increment=1, host=None, port=None, db=None, password=None)
```
Increment the integer value of a hash field by the given number.

New in version 2017.7.0.

CLI Example:

```
salt '!' redis.hincrby foo_hash bar_field 5
```

```
salt.modules.redismod.hincrbyfloat(key, field, increment=1.0, host=None, port=None, db=None, password=None)
```
Increment the float value of a hash field by the given number.

New in version 2017.7.0.

CLI Example:

```
salt '!' redis.hincrbyfloat foo_hash bar_field 5.17
```

```
salt.modules.redismod.hlen(key, host=None, port=None, db=None, password=None)
```
Returns number of fields of a hash.

New in version 2017.7.0.

CLI Example:

```
salt '!' redis.hlen foo_hash
```

```
salt.modules.redismod.hmget(key, *fields, **options)
```
Returns the values of all the given hash fields.

New in version 2017.7.0.

CLI Example:

```
salt '!' redis.hmget foo_hash bar_field1 bar_field2
```

```
salt.modules.redismod.hmset(key, **fieldsvs)
```
Sets multiple hash fields to multiple values.

New in version 2017.7.0.
CLI Example:

```
salt '*' redis.hmset foo_hash bar_field1=bar_value1 bar_field2=bar_value2
```

```
salt.modules.redismod.hscan(key=cursor=0, match=None, count=None, host=None, port=None, db=None, password=None)
```
Incrementally iterate hash fields and associated values.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hscan foo_hash match='field_prefix_*' count=1
```

```
salt.modules.redismod.hset(key=field, value=host=None, port=None, db=None, password=None)
```
Set the value of a hash field.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hset foo_hash bar_field bar_value
```

```
salt.modules.redismod.hsetnx(key=field, value=host=None, port=None, db=None, password=None)
```
Set the value of a hash field only if the field does not exist.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hsetnx foo_hash bar_field bar_value
```

```
salt.modules.redismod.hvals(key=host=None, port=None, db=None, password=None)
```
Return all the values in a hash.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hvals foo_hash bar_field1 bar_value1
```

```
salt.modules.redismod.info(host=None, port=None, db=None, password=None)
```
Get information and statistics about the server

CLI Example:

```
salt '*' redis.info
```

```
salt.modules.redismod.key_type(key=host=None, port=None, db=None, password=None)
```
Get redis key type

CLI Example:

```
salt '*' redis.type foo
```

```
salt.modules.redismod.keys(pattern='*', host=None, port=None, db=None, password=None)
```
Get redis keys, supports glob style patterns

CLI Example:

```
salt '*' redis.keys
salt '*' redis.keys test*
```
salt.modules.redismod.lastsave(host=None, port=None, db=None, password=None)
Get the UNIX time in seconds of the last successful save to disk
CLI Example:
salt '*' redis.lastsave

salt.modules.redismod.llen(key, host=None, port=None, db=None, password=None)
Get the length of a list in Redis
CLI Example:
salt '*' redis.llen foo_list

salt.modules.redismod.lrange(key, start, stop, host=None, port=None, db=None, password=None)
Get a range of values from a list in Redis
CLI Example:
salt '*' redis.lrange foo_list 0 10

salt.modules.redismod.ping(host=None, port=None, db=None, password=None)
Ping the server, returns False on connection errors
CLI Example:
salt '*' redis.ping

salt.modules.redismod.save(host=None, port=None, db=None, password=None)
Synchronously save the dataset to disk
CLI Example:
salt '*' redis.save

salt.modules.redismod.sentinel_get_master_ip(master, host=None, port=None, password=None)
Get ip for sentinel master
CLI Example:
salt '*' redis.sentinel_get_master_ip 'mymaster'

salt.modules.redismod.set_key(key, value, host=None, port=None, db=None, password=None)
Set redis key value
CLI Example:
salt '*' redis.set_key foo bar

salt.modules.redismod.shutdown(host=None, port=None, db=None, password=None)
Synchronously save the dataset to disk and then shut down the server
CLI Example:
salt '*' redis.shutdown

salt.modules.redismod.slaveof(master_host=None, master_port=None, host=None, port=None, db=None, password=None)
Make the server a slave of another instance, or promote it as master
CLI Example:

```
# Become slave of redis-n01.example.com:6379
salt '*' redis.slaveof redis-n01.example.com:6379
salt '*' redis.slaveof redis-n01.example.com

# Become master
salt '*' redis.slaveof
```

`salt.modules.redismod.smembers(key, host=None, port=None, db=None, password=None)`

Get members in a Redis set

CLI Example:

```
salt '*' redis.smembers foo_set
```

`salt.modules.redismod.time(host=None, port=None, db=None, password=None)`

Return the current server UNIX time in seconds

CLI Example:

```
salt '*' redis.time
```

`salt.modules.redismod.zcard(key, host=None, port=None, db=None, password=None)`

Get the length of a sorted set in Redis

CLI Example:

```
salt '*' redis.zcard foo_sorted
```

`salt.modules.redismod.zrange(key, start, stop, host=None, port=None, db=None, password=None)`

Get a range of values from a sorted set in Redis by index

CLI Example:

```
salt '*' redis.zrange foo_sorted 0 10
```

### 19.9.318 salt.modules.reg

**Manage the Windows registry**

**Hives**

Hives are the main sections of the registry and all begin with the word HKEY. - HKEY_LOCAL_MACHINE - HKEY_CURRENT_USER - HKEY_USER

**Keys**

Keys are the folders in the registry. Keys can have many nested subkeys. Keys can have a value assigned to them under the (Default)

When passing a key on the CLI it must be quoted correctly depending on the backslashes being used (\ vs \\). The following are valid methods of passing the the key on the CLI:

- Using single backslashes: "SOFTWARE\Python" 'SOFTWARE\Python' (will not work on a Windows Master)
- Using double backslashes: SOFTWARE\Python
Values or Entries

Values/Entries are name/data pairs. There can be many values in a key. The (Default) value corresponds to the Key, the rest are their own value pairs.

```python
def depends
    • PyWin32
```

```python
class salt.modules.reg.Registry
    Delay usage until this module is used
salt.modules.reg.broadcast_change()
    Refresh the windows environment.
    Returns True if successful, otherwise False
    Return type bool
    CLI Example:
    salt '*' reg.broadcast_change
```

```python
salt.modules.reg.delete_key_recursive(hive, key, use_32bit_registry=False)
    New in version 2015.5.4.
    Delete a registry key to include all subkeys.
    Parameters
    • hive (str) -- The name of the hive. Can be one of the following:
      - HKEY_LOCAL_MACHINE or HKLM
      - HKEY_CURRENT_USER or HKCU
      - HKEY_USER or HKU
      - HKEY_CLASSES_ROOT or HKCR
      - HKEY_CURRENT_CONFIG or HKCC
    • key (str) -- The key to remove (looks like a path)
    • use_32bit_registry (bool) -- Deletes the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.
    Returns A dictionary listing the keys that deleted successfully as well as those that failed to delete.
    Return type dict
    The following example will remove salt and all its subkeys from the SOFTWARE key in HKEY_LOCAL_MACHINE:
    CLI Example:
    salt '*' reg.delete_key_recursive HKLM 'SOFTWARE\salt'
```

```python
salt.modules.reg.delete_value(hive, key, vname=None, use_32bit_registry=False)
    Delete a registry value entry or the default value for a key.
    Parameters
    • hive (str) -- The name of the hive. Can be one of the following
      - HKEY_LOCAL_MACHINE or HKLM
      - HKEY_CURRENT_USER or HKCU
      - HKEY_USER or HKU
      - HKEY_CLASSES_ROOT or HKCR
      - HKEY_CURRENT_CONFIG or HKCC
    • key (str) -- The key (looks like a path) to the value name.
    • vname (str) -- The value name. These are the individual name/data pairs under the key. If not passed, the key (Default) value will be deleted.
```
- **use_32bit_registry**(bool) -- Deletes the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.

  Returns True if successful, otherwise False

  Return type bool

CLI Example:

```
salt '*' reg.delete_value HKEY_CURRENT_USER "SOFTWARE\Salt" version
```

**salt.modules.reg.key_exists**(hive, key, use_32bit_registry=False)

Check that the key is found in the registry. This refers to keys and not value/data pairs.

Parameters

- **hive**(str) -- The hive to connect to
- **key**(str) -- The key to check
- **use_32bit_registry**(bool) -- Look in the 32bit portion of the registry

Returns True if found, otherwise False

Return type bool

CLI Example

```
salt '*' reg.key_exists HKLM "SYSTEM\CurrentControlSet\Services\Tcpip"
```

**salt.modules.reg.list_keys**(hive, key=None, use_32bit_registry=False)

Enumerates the subkeys in a registry key or hive.

Parameters

- **hive**(str) -- The name of the hive. Can be one of the following:
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC
- **key**(str) -- The key (looks like a path) to the value name. If a key is not passed, the keys under the hive will be returned.
- **use_32bit_registry**(bool) -- Accesses the 32bit portion of the registry on 64 bit installations. On 32bit machines this is ignored.

Returns A list of keys/subkeys under the hive or key.

Return type list

CLI Example:

```
salt '*' reg.list_keys HKLM SOFTWARE\Python
```

**salt.modules.reg.list_values**(hive, key=None, use_32bit_registry=False, include_default=True)

Enumerates the values in a registry key or hive.

Parameters

- **hive**(str) -- The name of the hive. Can be one of the following:
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC
- **key**(str) -- The key (looks like a path) to the value name. If a key is not passed, the values under the hive will be returned.
- **use_32bit_registry**(bool) -- Accesses the 32bit portion of the registry on 64 bit installations. On 32bit machines this is ignored.
- **include_default**(bool) -- Toggle whether to include the `(Default)` value.

Returns A list of values under the hive or key.

Return type list
salt.modules.reg.read_value(hive, key, vname=None, use_32bit_registry=False)
Reads a registry value entry or the default value for a key.

Parameters
- **hive (str)** -- The name of the hive. Can be one of the following:
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC
- **key (str)** -- The key (looks like a path) to the value name.
- **vname (str)** -- The value name. These are the individual name/data pairs under the key. If not passed, the key (Default) value will be returned
- **use_32bit_registry (bool)** -- Accesses the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.

Returns
A dictionary containing the passed settings as well as the value_data if successful. If unsuccessful, sets success to False.
If vname is not passed:
- Returns the first unnamed value (Default) as a string.
- Returns none if first unnamed value is empty.
- Returns False if key not found.

Return type: dict

CLI Example:
```
salt '*' reg.read_value HKEY_LOCAL_MACHINE "SOFTWARE\Salt" version
```

salt.modules.reg.set_value(hive, key, vname=None, vdata=None, vtype=u'REG_SZ', use_32bit_registry=False, volatile=False)
Sets a registry value entry or the default value for a key.

Parameters
- **hive (str)** -- The name of the hive. Can be one of the following:
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC
- **key (str)** -- The key (looks like a path) to the value name.
- **vname (str)** -- The value name. These are the individual name/data pairs under the key. If not passed, the key (Default) value will be set.
- **vdata (bin, int, str, list)** -- The value data to be set. Which type this parameter should be is determined by the value of the vtype parameter. The correspondence is as follows:
  - REG_BINARY binary data (i.e. str in python version < 3 and bytes in version >=3)
  - REG_DWORD int
  - REG_EXPAND_SZ str
  - REG_MULTI_SZ list of objects of type str
  - REG_SZ str
- **vtype (str)** -- The value type. The possible values of the vtype parameter are indicated above in the description of the vdata parameter.
- **use_32bit_registry (bool)** -- Sets the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.
• volatile (bool) -- When this parameter has a value of True, the registry key will be made volatile (i.e. it will not persist beyond a system reset or shutdown). This parameter only has an effect when a key is being created and at no other time.

Returns True if successful, otherwise False
Return type bool

CLI Example:
```
salt '*' reg.set_value HKEY_LOCAL_MACHINE "SOFTWARE\Salt" version 2015.5.2
```

This function is strict about the type of vdata. For instance the next example will fail because vtype has a value of REG_SZ and vdata has a type of int (as opposed to str as expected).

CLI Example:
```
salt '*' reg.set_value HKEY_LOCAL_MACHINE "SOFTWARE\Salt" version \n  vtype=REG_SZ vdata=0
```

However, this next example where vdata is properly quoted should succeed.

CLI Example:
```
salt '*' reg.set_value HKEY_LOCAL_MACHINE "SOFTWARE\Salt" version \n  vtype=REG_SZ vdata='0'
```

An example of using vtype REG_BINARY is as follows:

CLI Example:
```
On a Linux master, the `!!binary` needs to be single quoted
On a Windows master, the `!!binary` to be double quoted
salt '*' reg.set_value HKEY_LOCAL_MACHINE "SOFTWARE\Salt" version vtype=REG_\n  -BINARY vdata='!!binary d2hhdCdzIHRoZSBwb2ludA=='
```

An example of using vtype REG_MULTI_SZ is as follows:

CLI Example:
```
salt '*' reg.set_value HKEY_LOCAL_MACHINE "SOFTWARE\Salt" version vtype=REG_MULTI_\n  -SZ vdata="[a,b,c]"
```

19.9.319 salt.modules.rest_package

Package support for the REST example

salt.modules.rest_package.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs)
salt.modules.rest_package.installed(name, version=None, refresh=False, fromrepo=None, skip_verify=False, pkgs=None, sources=None, **kwargs)
salt.modules.rest_package.list_pkgs(versions_as_list=False, **kwargs)
salt.modules.rest_package.remove(name=None, pkgs=None, **kwargs)
salt.modules.rest_package.upgrade(refresh=True, skip_verify=True, **kwargs)
salt.modules.rest_package.version(*names, **kwargs)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.
CLI Example:
```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

19.9.320 salt.modules.rest_sample_utils module

Utility functions for the rest_sample

salt.modules.rest_sample_utils.fix_outage()

``Fix'' the outage

CLI Example:
```
salt 'rest-sample-proxy' rest_sample.fix_outage
```

salt.modules.rest_sample_utils.get_test_string()

Helper function to test cross-calling to the __proxy__ dunder.

CLI Example:
```
salt 'rest-sample-proxy' rest_sample.get_test_string
```

19.9.321 salt.modules.rest_service

Provide the service module for the proxy-minion REST sample

salt.modules.rest_service.enabled(name, sig=None)

Only the `redbull' service is `enabled' in the test

salt.modules.rest_service.get_all()

Return a list of all available services

New in version 2015.8.0.

CLI Example:
```
salt '*' service.get_all
```

salt.modules.rest_service.list()

Return a list of all available services.

CLI Example:
```
salt '*' service.list
```

salt.modules.rest_service.restart(name, sig=None)

Restart the specified service with rest_sample

New in version 2015.8.0.

CLI Example:
```
salt '*' service.restart <service name>
```
salt.modules.rest_service.running(name, sig=None)
    Return whether this service is running.
    New in version 2015.8.0.

salt.modules.rest_service.start(name, sig=None)
    Start the specified service on the rest_sample
    New in version 2015.8.0.
    CLI Example:
    
    salt '*' service.start <service name>

salt.modules.rest_service.status(name, sig=None)
    Return the status for a service via rest_sample, returns a bool whether the service is running.
    New in version 2015.8.0.
    CLI Example:
    
    salt '*' service.status <service name>

salt.modules.rest_service.stop(name, sig=None)
    Stop the specified service on the rest_sample
    New in version 2015.8.0.
    CLI Example:
    
    salt '*' service.stop <service name>

19.9.322 salt.modules.restartcheck module

checkrestart functionality for Debian and Red Hat Based systems
Identifies services (processes) that are linked against deleted files (for example after downloading an updated binary
of a shared library).

Based on checkrestart script from debian-goodies (written by Matt Zimmerman for the Debian GNU/Linux distri-
bution, https://packages.debian.org/debian-goodies) and psdel by Sam Morris.

codeauthor Jiri Kotlin <jiri.kotlin@ultimum.io>

salt.modules.restartcheck.restartcheck(ignorelist=None, blacklist=None, excludepid=None, verbose=True)
    Analyzes files opened by running processes and seeks for packages which need to be restarted.
    Parameters
    - ignorelist -- string or list of packages to be ignored
    - blacklist -- string or list of file paths to be ignored
    - excludepid -- string or list of process IDs to be ignored
    - verbose -- boolean, enables extensive output
    Returns True if no packages for restart found. False on failure. String with checkrestart output
    if some package seems to need to be restarted.
    New in version 2015.8.3.
    CLI Example: .. code-block:: bash
    salt '*' restartcheck.restartcheck

19.9. execution modules
19.9.323 salt.modules.ret

Module to integrate with the returner system and retrieve data sent to a salt returner

salt.modules.ret.get_fun(returner, fun)
    Return info about last time fun was called on each minion
    CLI Example:
    
    salt '*' ret.get_fun mysql network.interfaces

salt.modules.ret.get_jid(returner, jid)
    Return the information for a specified job id
    CLI Example:
    
    salt '*' ret.get_jid redis 20421104181954700505

salt.modules.ret.get_jids(returner)
    Return a list of all job ids
    CLI Example:
    
    salt '*' ret.get_jids mysql

salt.modules.ret.get_minions(returner)
    Return a list of all minions
    CLI Example:
    
    salt '*' ret.get_minions mysql

19.9.324 salt.modules.rh_ip

The networking module for RHEL/Fedora based distros

salt.modules.rh_ip.apply_network_settings(**settings)
    Apply global network configuration.
    CLI Example:
    
    salt '*' ip.apply_network_settings

salt.modules.rh_ip.build_bond(iface, **settings)
    Create a bond script in /etc/modprobe.d with the passed settings and load the bonding kernel module.
    CLI Example:
    
    salt '*' ip.build_bond bond0 mode=balance-alb

salt.modules.rh_ip.build_interface(iface, iface_type, enabled, **settings)
    Build an interface script for a network interface.
    CLI Example:
    
    salt '*' ip.build_interface eth0 eth <settings>
salt.modules.rh_ip.**build_network_settings**(``settings``)

Build the global network script.

CLI Example:

```
salt '*' ip.build_network_settings <settings>
```

salt.modules.rh_ip.**build_routes**(_iface, ``settings``)

Build a route script for a network interface.

CLI Example:

```
salt '*' ip.build_routes eth0 <settings>
```

salt.modules.rh_ip.**down**(_iface, iface_type)

Shutdown a network interface

CLI Example:

```
salt '*' ip.down eth0
```

salt.modules.rh_ip.**get_bond**(iface)

Return the content of a bond script

CLI Example:

```
salt '*' ip.get_bond bond0
```

salt.modules.rh_ip.**get_interface**(iface)

Return the contents of an interface script

CLI Example:

```
salt '*' ip.get_interface eth0
```

salt.modules.rh_ip.**get_network_settings**()

Return the contents of the global network script.

CLI Example:

```
salt '*' ip.get_network_settings
```

salt.modules.rh_ip.**get_routes**(iface)

Return the contents of the interface routes script.

CLI Example:

```
salt '*' ip.get_routes eth0
```

salt.modules.rh_ip.**up**(iface, iface_type)

Start up a network interface

CLI Example:

```
salt '*' ip.up eth0
```

19.9.325  **salt.modules.rh_service**

Service support for RHEL-based systems, including support for both upstart and sysvinit
Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `service.start' is not available), see here.

**salt.modules.rh_service.available**(*name*, *limit='*')

Return True if the named service is available. Use the limit param to restrict results to services of that type.

CLI Examples:

```
salt '*' service.available sshd
salt '*' service.available sshd limit=upstart
salt '*' service.available sshd limit=sysvinit
```

**salt.modules.rh_service.delete**(*name*, **kwargs)

Delete the named service

New in version 2016.3.

CLI Example:

```
salt '*' service.delete <service name>
```

**salt.modules.rh_service.disable**(*name*, **kwargs)

Disable the named service to start at boot

CLI Example:

```
salt '*' service.disable <service name>
```

**salt.modules.rh_service.disabled**(*name*)

Check to see if the named service is disabled to start on boot

CLI Example:

```
salt '*' service.disabled <service name>
```

**salt.modules.rh_service.enable**(*name*, **kwargs)

Enable the named service to start at boot

CLI Example:

```
salt '*' service.enable <service name>
```

**salt.modules.rh_service.enabled**(*name*, **kwargs)

Check to see if the named service is enabled to start on boot

CLI Example:

```
salt '*' service.enabled <service name>
```

**salt.modules.rh_service.get_all**(*limit='*')

Return all installed services. Use the limit param to restrict results to services of that type.

CLI Example:

```
salt '*' service.get_all
salt '*' service.get_all limit=upstart
salt '*' service.get_all limit=sysvinit
```
salt.modules.rh_service.get_disabled(limit=``)
Return the disabled services. Use the limit param to restrict results to services of that type.

CLI Example:

```
salt '*' service.get_disabled
salt '*' service.get_disabled limit=upstart
salt '*' service.get_disabled limit=sysvinit
```

salt.modules.rh_service.get_enabled(limit=``)
Return the enabled services. Use the limit param to restrict results to services of that type.

CLI Examples:

```
salt '*' service.get_enabled
salt '*' service.get_enabled limit=upstart
salt '*' service.get_enabled limit=sysvinit
```

salt.modules.rh_service.missing(name, limit=``)
The inverse of service.available. Return True if the named service is not available. Use the limit param to restrict results to services of that type.

CLI Examples:

```
salt '*' service.missing sshd
salt '*' service.missing sshd limit=upstart
salt '*' service.missing sshd limit=sysvinit
```

salt.modules.rh_service.reload_(name)
Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

salt.modules.rh_service.restart(name)
Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

salt.modules.rh_service.start(name)
Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

salt.modules.rh_service.status(name, sig=None)
Return the status for a service, returns a bool whether the service is running.

CLI Example:

```
salt '*' service.status <service name>
```

salt.modules.rh_service.stop(name)
Stop the specified service

CLI Example:
19.9.326 salt.modules.riak

Riak Salt Module

salt.modules.riak.cluster_commit()
Commit Cluster Changes

  Changed in version 2015.8.0.
  CLI Example:

  salt '*' riak.cluster_commit

salt.modules.riak.cluster_join(username, hostname)
Join a Riak cluster

  Changed in version 2015.8.0.
  CLI Example:

  salt '*' riak.cluster_join <user> <host>

  username - The riak username to join the cluster
  hostname - The riak hostname you are connecting to

salt.modules.riak.cluster_leave(username, hostname)
Leave a Riak cluster

  New in version 2015.8.0.
  CLI Example:

  salt '*' riak.cluster_leave <username> <host>

  username - The riak username to join the cluster
  hostname - The riak hostname you are connecting to

salt.modules.riak.cluster_plan()
Review Cluster Plan

  Changed in version 2015.8.0.
  CLI Example:

  salt '*' riak.cluster_plan

salt.modules.riak.member_status()
Get cluster member status

  Changed in version 2015.8.0.
  CLI Example:

  salt '*' riak.member_status

salt.modules.riak.services()
List available services on a node

  New in version 2015.8.0.
  CLI Example:
salt modules.riak.start()
Start Riak
CLI Example:
```
salt '*' riak.start
```

salt modules.riak.status()
Current node status
New in version 2015.8.0.
CLI Example:
```
salt '*' riak.status
```

salt modules.riak.stop()
Stop Riak
Changed in version 2015.8.0.
CLI Example:
```
salt '*' riak.stop
```

salt modules.riak.test()
Runs a test of a few standard Riak operations
New in version 2015.8.0.
CLI Example:
```
salt '*' riak.test
```

19.9.327 salt modules.rpm

Support for rpm

salt modules.rpm.bin_pkg_info(path, saltenv='base')
New in version 2015.8.0.

Parses RPM metadata and returns a dictionary of information about the package (name, version, etc.).

path Path to the file. Can either be an absolute path to a file on the minion, or a salt fileserver URL (e.g. `salt://path/to/file.rpm`). If a salt fileserver URL is passed, the file will be cached to the minion so that it can be examined.

saltenv [base] Salt fileserver environment from which to retrieve the package. Ignored if path is a local file path on the minion.

CLI Example:
```
salt '*' lowpkg.bin_pkg_info /root/salt-2015.5.1-2.el7.noarch.rpm
salt '*' lowpkg.bin_pkg_info salt://salt-2015.5.1-2.el7.noarch.rpm
```

salt modules.rpm.checksum(*paths)
Return if the signature of a RPM file is valid.

CLI Example:
salt '.*' lowpkg.checksum /path/to/package1.rpm
salt '.*' lowpkg.checksum /path/to/package1.rpm /path/to/package2.rpm

salt.modules.rpm.diff(package, path)
Return a formatted diff between current file and original in a package. NOTE: this function includes all files (configuration and not), but does not work on binary content.

Parameters
- package -- The name of the package
- path -- Full path to the installed file

Returns Difference or empty string. For binary files only a notification.

CLI example:
salt '.*' lowpkg.diff apache2 /etc/apache2/httpd.conf

salt.modules.rpm.file_dict('packages)
List the files that belong to a package, sorted by group. Not specifying any packages will return a list of _every_ file on the system's rpm database (not generally recommended).

CLI Examples:
salt '.*' lowpkg.file_dict httpd
salt '.*' lowpkg.file_dict httpd postfix
salt '.*' lowpkg.file_dict

salt.modules.rpm.file_list('packages)
List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system's rpm database (not generally recommended).

CLI Examples:
salt '.*' lowpkg.file_list httpd
salt '.*' lowpkg.file_list httpd postfix
salt '.*' lowpkg.file_list

salt.modules.rpm.info('packages, **attr')
Return a detailed package(s) summary information. If no packages specified, all packages will be returned.

Parameters
- packages --
- attr -- Comma-separated package attributes. If no 'attr' is specified, all available attributes returned.

Valid attributes are: version, vendor, release, build_date, build_date_time_t, install_date, install_date_time_t, build_host, group, source_rpm, arch, epoch, size, license, signature, packager, url, summary, description.

Returns

CLI example:
salt '.*' lowpkg.info apache2 bash
salt '.*' lowpkg.info apache2 bash attr=version
salt '.*' lowpkg.info apache2 bash attr=version,build_date_iso,size

salt.modules.rpm.list_pkgs('packages)
List the packages currently installed in a dict:

{"<package_name>": "<version>"}

CLI Example:
```
salt '*' lowpkg.list_pks
```

salt.modules.rpm.modified(*packages, **flags)
List the modified files that belong to a package. Not specifying any packages will return a list of _all_ modified files on the system's RPM database.

New in version 2015.5.0.

CLI examples:
```
salt '*' lowpkg.modified httpd
salt '*' lowpkg.modified httpd postfix
salt '*' lowpkg.modified
```

salt.modules.rpm.owner(*paths)
Return the name of the package that owns the file. Multiple file paths can be passed. If a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Examples:
```
salt '*' lowpkg.owner /usr/bin/apachectl
salt '*' lowpkg.owner /usr/bin/apachectl /etc/httpd/conf/httpd.conf
```

salt.modules.rpm.verify(*packages, **kwargs)
Runs an rpm -Va on a system, and returns the results in a dict

Files with an attribute of config, doc, ghost, license or readme in the package header can be ignored using the ignore_types keyword argument

CLI Example:
```
salt '*' lowpkg.verify
salt '*' lowpkg.verify httpd
salt '*' lowpkg.verify httpd postfix
salt '*' lowpkg.verify httpd postfix ignore_types=['config','doc']
```

salt.modules.rpm.version_cmp(ver1, ver2, ignore_epoch=False)
Do a cmp-style comparison on two packages. Return -1 if ver1 < ver2, 0 if ver1 == ver2, and 1 if ver1 > ver2. Return None if there was a problem making the comparison.

ignore_epoch [False] Set to True to ignore the epoch when comparing versions

New in version 2015.8.10,2016.3.2.

CLI Example:
```
salt '*' pkg.version_cmp '0.2-001' '0.2.0.1-002'
```

19.9.328  salt.modules.rpmbuild
RPM Package builder system
New in version 2015.8.0.

19.9. execution modules
This system allows for all of the components to build rpms safely in chrooted environments. This also provides a function to generate yum repositories.

This module implements the pkgbuild interface.

`salt.modules.rpmbuild.build(runas, tgt, dest_dir, spec, sources, deps, env, template, saltenv='base', log_dir='/var/log/salt/pkgbuild')`

Given the package destination directory, the spec file source and package sources, use mock to safely build the rpm defined in the spec file.

CLI Example:

```
salt '*' pkgbuild.build mock epel-7-x86_64 /var/www/html https://raw.githubusercontent.com/saltstack/libnacl/master/pkg/rpm/python-libnacl.spec
https://pypi.python.org/packages/source/l/libnacl/libnacl-1.3.5.tar.gz
```

This example command should build the libnacl package for rhel 7 using user mock and place it in /var/www/html/ on the minion.

`salt.modules.rpmbuild.make_repo(repodir, keyid=None, env=None, use_passphrase=False, gnupghome='/etc/salt/gpgkeys', runas='root', timeout=15.0)`

Make a package repository and optionally sign packages present.

Given the repodir, create a yum repository out of the rpms therein and optionally sign it and packages present, the name is directory to turn into a repo. This state is best used with onchanges linked to your package building states.

- `repodir` The directory to find packages that will be in the repository.
- `keyid` Changed in version 2016.3.0.

Optional Key ID to use in signing packages and repository. Utilizes Public and Private keys associated with keyid which have been loaded into the minion's Pillar data.

For example, contents from a Pillar data file with named Public and Private keys as follows:

```
gpg_pkg_priv_key: |
-----BEGIN PGP PRIVATE KEY BLOCK-----
Version: GnuPG v1

LQO+BFCi1FQBcadAPCtzx7i5RL32escCMZsPzaEKWe7bIX1em4KCKkBoX47IG54b

4Q1e+-/trC6QRPw2m2dHk6aAeq/J0Sc7ilZufwnNA71h95zRIwcFMsLx4iLLKi
inNqW9c=
```
env  Changed in version 2016.3.0.
    A dictionary of environment variables to be utilized in creating the repository.

    **Note:** This parameter is not used for making yum repositories.

use_passphrase  [False] New in version 2016.3.0.
    Use a passphrase with the signing key presented in keyid. Passphrase is received from Pillar data which could be passed on the command line with pillar parameter. For example:

    ```
    pillar={ "gpg_passphrase" : "my_passphrase" }
    ```

gnupghome  [/etc/salt/gpgkeys] New in version 2016.3.0.
    Location where GPG related files are stored, used with keyid.

    User to create the repository as, and optionally sign packages.

    **Note:** Ensure the user has correct permissions to any files and directories which are to be utilized.

timeout  [15.0] New in version 2016.3.4.
    Timeout in seconds to wait for the prompt for inputing the passphrase.

    CLI Example:

    ```
    salt '*' pkgbuild.make_repos /var/www/html/
    ```

salt.modules.rpmbuild.make_src_pkg  
    Create a source rpm from the given spec file and sources

    CLI Example:

    ```
    ```

This example command should build the libnacl SOURCE package and place it in /var/www/html/ on the minion

    Changed in version 2017.7.0.

    **Note:** using SHA256 as digest and minimum level dist el6

19.9.329  salt.modules.rsync

Wrapper for rsync

New in version 2014.1.0.
This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

```python
salt.modules.rsync.config(conf_path='/etc/rsyncd.conf')
```

Changed in version 2016.3.0: Return data now contains just the contents of the rsyncd.conf as a string, instead of a dictionary as returned from `cmd.run_all`.

Returns the contents of the rsync config file

```bash
conf_path [/etc/rsyncd.conf] Path to the config file
```

CLI Example:

```bash
salt '*' rsync.config
```

```python
salt.modules.rsync.rsync(src, dst, delete=False, force=False, update=False, passwordfile=None, exclude=None, excludefrom=None, dryrun=False, rsh=None)
```

Changed in version 2016.3.0: Return data now contains just the output of the rsync command, instead of a dictionary as returned from `cmd.run_all`.

Rsync files from src to dst

CLI Example:

```bash
salt '*' rsync.rsync {src} {dst} {delete=True} {update=True} {passwordfile=/etc/pass.crt} {exclude=xx} {rsh}
```

```bash
salt '*' rsync.rsync {src} {dst} {delete=True} {excludefrom=/xx.ini} {rsh}
```

```python
salt.modules.rsync.version()
```

Changed in version 2016.3.0: Return data now contains just the version number as a string, instead of a dictionary as returned from `cmd.run_all`.

Returns rsync version

CLI Example:

```bash
salt '*' rsync.version
```

### 19.9.330 salt.modules.runit

runit service module ([http://smarden.org/runit](http://smarden.org/runit))

This module is compatible with the `service` states, so it can be used to maintain services using the `provider` argument:

```yaml
myservice:
  service:
    - running
    - provider: runit
```

Provides virtual `service` module on systems using runit as init.

Service management rules (`sv command`):

- service $n is ENABLED if file SERVICE_DIR/$n/run exists service $n is AVAILABLE if ENABLED or if file AVAIL_SVR_DIR/$n/run exists service $n is DISABLED if AVAILABLE but not ENABLED
- SERVICE_DIR/$n is normally a symlink to a AVAIL_SVR_DIR/$n folder

Service auto-start/stop mechanism:

- `sv (auto)starts/stops service as soon as SERVICE_DIR/<service> is created/deleted, both on service creation or a boot time.`
autostart feature is disabled if file SERVICE_DIR/<n>/down exists. This does not affect the current's service status (if already running) nor manual service management.

Service's alias:

Service sva is an alias of service svc when AVAIL_SVR_DIR/sva symlinks to folder AVAIL_SVR_DIR/svc. svc can't be enabled if it is already enabled through an alias already enabled, since sv files are stored in folder SERVICE_DIR/svc/.

XBPS package management uses a service's alias to provides service alternative(s), such as chrony and openntpd both aliased to ntpd.

salt.modules.runit.add_svc_avail_path(path)
Add a path that may contain available services. Return True if added (or already present), False on error.
path directory to add to AVAIL_SVR_DIRS

salt.modules.runit.available(name)
Returns True if the specified service is available, otherwise returns False.
name the service's name

CLI Example:
salt '*' runit.available <service name>

salt.modules.runit.disable(name, stop=False, **kwargs)
Don't start service name at boot Returns True if operation is successful
name the service's name
stop if True, also stops the service

CLI Example:
salt '*' service.disable <name> [stop=True]

salt.modules.runit.disabled(name)
Return True if the named service is disabled, False otherwise
name the service's name

CLI Example:
salt '*' service.disabled <service name>

salt.modules.runit.enable(name, start=False, **kwargs)
Start service name at boot. Returns True if operation is successful
name the service's name
start [False] If True, start the service once enabled.

CLI Example:
salt '*' service.enable <name> [start=True]

salt.modules.runit.enabled(name)
Return True if the named service is enabled, False otherwise
name the service's name

CLI Example:
salt '*' service.enabled <service name>

salt.modules.runit.full_restart(name)
Calls runit.restart()
name the service's name

CLI Example:
salt '.*' runit.full_restart <service name>

salt.modules.runit.get_all()

Return a list of all available services

CLI Example:

salt '.*' runit.get_all

salt.modules.runit.get_disabled()

Return a list of all disabled services

CLI Example:

salt '.*' service.get_disabled

salt.modules.runit.get_enabled()

Return a list of all enabled services

CLI Example:

salt '.*' service.get_enabled

salt.modules.runit.get_svc_alias()

Returns the list of service’s name that are aliased and their alias path(s)

salt.modules.runit.get_svc_avail_path()

Return list of paths that may contain available services

salt.modules.runit.get_svc_broken_path(name='*')

Return list of broken path(s) in SERVICE_DIR that match name

A path is broken if it is a broken symlink or can not be a runit service name a glob for service name. default is ‘*’

CLI Example:

salt '.*' runit.get_svc_broken_path <service name>

salt.modules.runit.missing(name)

The inverse of runit.available. Returns True if the specified service is not available, otherwise returns False.

name the service’s name

CLI Example:

salt '.*' runit.missing <service name>

salt.modules.runit.reload_(name)

Reload service

name the service’s name

CLI Example:

salt '.*' runit.reload <service name>

salt.modules.runit.remove(name)

Remove the service <name> from system. Returns True if operation is successful. The service will be also stopped.

name the service’s name

CLI Example:
salt '*' service.remove <name>

```py
salt.modules.runit.restart(name)
```

Restart service

- **name** the service's name

CLI Example:

```py
salt '*' runit.restart <service name>
```

```py
salt.modules.runit.show(name)
```

Show properties of one or more units/jobs or the manager

- **name** the service's name

CLI Example:

```py
salt ' service.show <service name>
```

```py
class

salt.modules.runit.start(name)
```

Start service

- **name** the service's name

CLI Example:

```py
salt ' runit.start <service name>
```

```py
class

salt.modules.runit.status(name, sig=None)
```

Return True if service is running

- **name** the service's name
- **sig** signature to identify with ps

CLI Example:

```py
salt ' runit.status <service name>
```

```py
class

salt.modules.runit.status_autostart(name)
```

Return True if service <name> is autostarted by sv (file $service_folder/down does not exist) NB: return False if the service is not enabled.

- **name** the service's name

CLI Example:

```py
salt ' runit.status_autostart <service name>
```

```py
class

salt.modules.runit.stop(name)
```

Stop service

- **name** the service's name

CLI Example:

```py
salt ' runit.stop <service name>
```

## 19.9.331 salt.modules.rvm

Manage ruby installations and gemsets with RVM, the Ruby Version Manager.

```py
salt.modules.rvm.do(ruby, command, runas=None, cwd=None)
```

Execute a command in an RVM controlled environment.

- **ruby** Which ruby to use
- **command** The rvm command to execute
- **runas** The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.
cwd  The directory from which to run the rvm command. Defaults to the user's home directory.

CLI Example:

```
salt '*' rvm.do 2.0.0 <command>
```

`salt.modules.rvm.gemset_copy(source, destination, runas=None)`

Copy all gems from one gemset to another.

- **source**  The name of the gemset to copy, complete with ruby version
- **destination**  The destination gemset
- **runas**  The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_copy foobar bazquo
```

`salt.modules.rvm.gemset_create(ruby, gemset, runas=None)`

Creates a gemset.

- **ruby**  The ruby version for which to create the gemset
- **gemset**  The name of the gemset to create
- **runas**  The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_create 2.0.0 foobar
```

`salt.modules.rvm.gemset_delete(ruby, gemset, runas=None)`

Delete a gemset

- **ruby**  The ruby version to which the gemset belongs
- **gemset**  The gemset to delete
- **runas**  The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_delete 2.0.0 foobar
```

`salt.modules.rvm.gemset_empty(ruby, gemset, runas=None)`

Remove all gems from a gemset.

- **ruby**  The ruby version to which the gemset belongs
- **gemset**  The gemset to empty
- **runas**  The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_empty 2.0.0 foobar
```

`salt.modules.rvm.gemset_list(ruby='default', runas=None)`

List all gemsets for the given ruby.

- **ruby**  [default]  The ruby version for which to list the gemsets
- **runas**  The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_list
```

`salt.modules.rvm.gemset_list_all(runas=None)`

List all gemsets for all installed rubies.
Note that you must have set a default ruby before this can work.

**runas** The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```bash
salt '*' rvm.gemset_list_all
```

salt.modules.rvm.get(version='stable', runas=None)
Update RVM
```
version [stable] Which version of RVM to install, (e.g. stable or head)
```
CLI Example:

```bash
salt '*' rvm.get
```

salt.modules.rvm.install(runas=None)
Install RVM system-wide
```
runas The user under which to run the rvm installer script. If not specified, then it be run as the user under which Salt is running.
```
CLI Example:

```bash
salt '*' rvm.install
```

salt.modules.rvm.install_ruby(ruby, runas=None)
Install a ruby implementation.
```
ruby The version of ruby to install
runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.
```
CLI Example:

```bash
salt '*' rvm.install_ruby 1.9.3-p385
```

salt.modules.rvm.is_installed(runas=None)
Check if RVM is installed.

CLI Example:

```bash
salt '*' rvm.is_installed
```

salt.modules.rvm.list_(runas=None)
List all rvm-installed rubies
```
runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.
```
CLI Example:

```bash
salt '*' rvm.list
```

salt.modules.rvm.reinstall_ruby(ruby, runas=None)
Reinstall a ruby implementation
```
ruby The version of ruby to reinstall
runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.
```
CLI Example:

```bash
salt '*' rvm.reinstall_ruby 1.9.3-p385
```

salt.modules.rvm.rubygems(ruby, version, runas=None)
Installs a specific rubygems version in the given ruby
The ruby for which to install rubygems

version
The version of rubygems to install, or `remove' to use the version that ships with 1.9

runas
The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```salt '*' rvm.rubygems 2.0.0 1.8.24```

salt.modules.rvm.set_default(ruby, runas=None)

Set the default ruby

ruby
The version of ruby to make the default

runas
The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```salt '*' rvm.set_default 2.0.0```

salt.modules.rvm.wrapper(ruby_string, wrapper_prefix, runas=None, "binaries")

Install RVM wrapper scripts

ruby_string
Ruby/gemset to install wrappers for

wrapper_prefix
What to prepend to the name of the generated wrapper binaries

runas
The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

binaries
[None] The names of the binaries to create wrappers for. When nothing is given, wrappers for ruby, gem, rake, irb, rdoc, ri and testrb are generated.

CLI Example:

```salt '*' rvm.wrapper <ruby_string> <wrapper_prefix>```

19.9.332 salt.modules.s3

Connection module for Amazon S3

configuration
This module accepts explicit s3 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```yaml
s3.keyid: GKTADJGHEIQSXMKKRBJ08H
s3.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

(Note: this is literally the pillar key `s3.keyid' or the config option `s3.keyid', not `s3:n keyid: blah'.)

A service_url may also be specified in the configuration:

```yaml
s3.service_url: s3.amazonaws.com
```

A role_arn may also be specified in the configuration:

```yaml
s3.role_arn: arn:aws:iam::1111111111:role/my-role-to-assume
```
If a service_url is not specified, the default is s3.amazonaws.com. This may appear in various
documentation as an `endpoint`. A comprehensive list for Amazon S3 may be found at:

\[http://docs.aws.amazon.com/general/latest/gr/\texttt{rande.html#s3_region}\]

The service_url will form the basis for the final endpoint that is used to query the service.
Path style can be enabled:
\[s3.path_style: \text{True}\]
This can be useful if you need to use salt with a proxy for an s3 compatible storage
You can use either https protocol or http protocol:
\[s3.\text{https}\textunderscore\text{enable}: \text{True}\]
SSL verification may also be turned off in the configuration:
\[s3.\text{verify}\textunderscore\text{ssl}: \text{False}\]
This is required if using S3 bucket names that contain a period, as these will not match Amazon's
S3 wildcard certificates. Certificate verification is enabled by default.
AWS region may be specified in the configuration:
\[s3.\text{location} \text{eu-central-1}\]
Default is us-east-1.
This module should be usable to query other S3-like services, such as Eucalyptus.

depends requests

```python
salt.modules.s3.delete(bucket=None, path=None, action=None, key=None, keyid=None, service_url=None,
verify_ssl=None, kms_keyid=None, location=None, role_arn=None, path_style=None, https_enable=None)
```
Delete a bucket, or delete an object from a bucket.

CLI Example to delete a bucket:

```
salt myminion s3.delete mybucket
```

CLI Example to delete an object from a bucket:

```
salt myminion s3.delete mybucket remoteobject
```

```python
salt.modules.s3.get(bucket='', path='', return_bin=False, action=None, local_file=None, key=None, keyid=None, service_url=None, verify_ssl=None, kms_keyid=None, location=None, role_arn=None, path_style=None, https_enable=None)
```
List the contents of a bucket, or return an object from a bucket. Set return_bin to True in order to retrieve an
object wholesale. Otherwise, Salt will attempt to parse an XML response.

CLI Example to list buckets:

```
salt myminion s3.get
```

CLI Example to list the contents of a bucket:

```
salt myminion s3.get mybucket
```

CLI Example to return the binary contents of an object:
CLI Example to save the binary contents of an object to a local file:

```
salt myminion s3.get mybucket myfile.png local_file=/tmp/myfile.png
```

It is also possible to perform an action on a bucket. Currently, S3 supports the following actions:

- acl
- cors
- lifecycle
- policy
- location
- logging
- notification
- tagging
- versions
- requestPayment
- versioning
- website

To perform an action on a bucket:

```
salt myminion s3.get mybucket myfile.png action=ACL
```

```
salt.modules.s3.head(bucket, path='', key=None, keyid=None, service_url=None, verify_ssl=None, kms_keyid=None, location=None, role_arn=None, path_style=None, https_enable=None)
```

Return the metadata for a bucket, or an object in a bucket.

CLI Examples:

```
salt myminion s3.head mybucket
salt myminion s3.head mybucket myfile.png
```

```
salt.modules.s3.put(bucket, path=None, return_bin=False, action=None, local_file=None, key=None, keyid=None, service_url=None, verify_ssl=None, kms_keyid=None, location=None, role_arn=None, path_style=None, https_enable=None)
```

Create a new bucket, or upload an object to a bucket.

CLI Example to create a bucket:

```
salt myminion s3.put mybucket
```

CLI Example to upload an object to a bucket:

```
salt myminion s3.put mybucket remotepath local_file=/path/to/file
```

### 19.9.333 salt.modules.s6 module

s6 service module

This module is compatible with the `service` states, so it can be used to maintain services using the `provider` argument:
myservice:
  service:
    - running
    - provider: s6

Note that the `enabled` argument is not available with this provider.

**codeauthor**  Marek Skrobacki <skrobul@skrobul.com>

salt.modules.s6.available(name)
Returns `True` if the specified service is available, otherwise returns `False`.

CLI Example:
```
salt '*' s6.available foo
```

salt.modules.s6.full_restart(name)
Calls `s6.restart()` function

CLI Example:
```
salt '*' s6.full_restart <service name>
```

salt.modules.s6.get_all()
Return a list of all available services

CLI Example:
```
salt '*' s6.get_all
```

salt.modules.s6.missing(name)
The inverse of `s6.available`. Returns `True` if the specified service is not available, otherwise returns `False`.

CLI Example:
```
salt '*' s6.missing foo
```

salt.modules.s6.reload_(name)
Send a HUP to service via s6

CLI Example:
```
salt '*' s6.reload <service name>
```

salt.modules.s6.restart(name)
Restart service via s6. This will stop/start service

CLI Example:
```
salt '*' s6.restart <service name>
```

salt.modules.s6.start(name)
Starts service via s6

CLI Example:
```
salt '*' s6.start <service name>
```

salt.modules.s6.status(name, sig=None)
Return the status for a service via s6, return pid if running

19.9. execution modules
CLI Example:

```bash
salt '*' s6.status <service name>
```

**salt.modules.s6.stop(name)**

Stops service via s6

CLI Example:

```bash
salt '*' s6.stop <service name>
```

**salt.modules.s6.term(name)**

Send a TERM to service via s6

CLI Example:

```bash
salt '*' s6.term <service name>
```

### 19.9.334 salt.modules.salt_proxy module

Salt proxy module

New in version 2015.8.3.

Module to deploy and manage salt-proxy processes on a minion.

**salt.modules.salt_proxy.configure_proxy(proxyname, start=True)**

Create the salt proxy file and start the proxy process if required

Parameters

- `proxyname` -- Name to be used for this proxy (should match entries in pillar)
- `start` -- Boolean indicating if the process should be started default = True

CLI Example:

```bash
salt deviceminion salt_proxy.configure_proxy p8000
```

**salt.modules.salt_proxy.is_running(proxyname)**

Check if the salt-proxy process associated with this proxy (name) is running.

Returns True if the process is running False otherwise

Parameters `proxyname` -- String name of the proxy (p8000 for example)

CLI Example:

```bash
salt deviceminion salt_proxy.is_running p8000
```

### 19.9.335 salt.modules.saltcloudmod

Control a salt cloud system

**salt.modules.saltcloudmod.create(name, profile)**

Create the named vm

CLI Example:

```bash
salt <minion-id> saltcloud.create webserver rackspace_centos_512
```
19.9.336 salt.modules.saltutil

The Saltutil module is used to manage the state of the salt minion itself. It is used to manage minion modules as well as automate updates to the salt minion.

depends

- esky Python module for update functionality

salt.modules.saltutil.clear_cache()

Forcibly removes all caches on a minion.

New in version 2014.7.0.

WARNING: The safest way to clear a minion cache is by first stopping the minion and then deleting the cache files before restarting it.

CLI Example:
salt '*' saltutil.clear_cache

salt.modules.saltutil.cmd(tgt, fun, arg=(), timeout=None, tgt_type='glob', ret='*', kwarg=None, ssh=False, **kwargs)

Changed in version 2017.7.0: The expr_form argument has been renamed to tgt_type, earlier releases must use expr_form.

Assuming this minion is a master, execute a salt command

CLI Example:
salt '*' saltutil.cmd

salt.modules.saltutil.cmd_iter(tgt, fun, arg=(), timeout=None, tgt_type='glob', ret='*', kwarg=None, ssh=False, **kwargs)

Changed in version 2017.7.0: The expr_form argument has been renamed to tgt_type, earlier releases must use expr_form.

Assuming this minion is a master, execute a salt command

CLI Example:
salt '*' saltutil.cmd_iter

salt.modules.saltutil.find_cached_job(jid)

Return the data for a specific cached job id. Note this only works if cache_jobs has previously been set to True on the minion.

CLI Example:
salt '*' saltutil.find_cached_job <job id>

salt.modules.saltutil.find_job(jid)

Return the data for a specific job id that is currently running.

jid The job id to search for and return data.

CLI Example:
salt '*' saltutil.find_job <job id>

Note that the find_job function only returns job information when the job is still running. If the job is currently running, the output looks something like this:
If the job has already completed, the job cannot be found and therefore the function returns an empty dictionary, which looks like this on the CLI:

```
# salt my-minion saltutil.find_job 20160503150049487736
my-minion:
  ----------
  pid: 9601
  ret:
  tgt: my-minion
  tgt_type: glob
  user: root
```

salt.modules.saltutil.is_running(fun)
If the named function is running return the data associated with it/them. The argument can be a glob

CLI Example:

```
salt '*' saltutil.is_running state.highstate
```

salt.modules.saltutil.kill_all_jobs()
Sends a kill signal (SIGKILL 9) to all currently running jobs

CLI Example:

```
salt '*' saltutil.kill_all_jobs
```

salt.modules.saltutil.kill_job(jid)
Sends a kill signal (SIGKILL 9) to the named salt job's process

CLI Example:

```
salt '*' saltutil.kill_job <job id>
```

salt.modules.saltutil.list_extmods()
New in version 2017.7.0.
List Salt modules which have been synced externally

CLI Examples:

```
salt '*' saltutil.list_extmods
```

salt.modules.saltutil.mmodule(saltenv, fun, *args, **kwargs)
Loads minion modules from an environment so that they can be used in pillars for that environment

CLI Example:
salt '*' saltutil.mmodule base test.ping

salt.modules.saltutil.refresh_beacons()
Signal the minion to refresh the beacons.

CLI Example:

    salt '*' saltutil.refresh_beacons

salt.modules.saltutil.refresh_grains(**kwargs)
New in version 2016.3.6, 2016.11.4, 2017.7.0.
Refresh the minion’s grains without syncing custom grains modules from salt://_grains.

    refresh_pillar [True] Set to False to keep pillar data from being refreshed.

    CLI Examples:

    salt '*' saltutil.refresh_grains

salt.modules.saltutil.refresh_modules(async=True)
Signal the minion to refresh the module and grain data
The default is to refresh module asynchronously. To block until the module refresh is complete, set the `async' flag to False.

CLI Example:

    salt '*' saltutil.refresh_modules

salt.modules.saltutil.refresh_pillar()
Signal the minion to refresh the pillar data.

CLI Example:

    salt '*' saltutil.refresh_pillar

salt.modules.saltutil.regen_keys()
Used to regenerate the minion keys.

CLI Example:

    salt '*' saltutil.regen_keys

salt.modules.saltutil.revoke_auth(preserve_minion_cache=False)
The minion sends a request to the master to revoke its own key. Note that the minion session will be revoked and the minion may not be able to return the result of this command back to the master.

    If the `preserve_minion_cache' flag is set to True, the master cache for this minion will not be removed.

    CLI Example:

    salt '*' saltutil.revoke_auth

---

19.9. execution modules

---

2051
salt.modules.saltutil.runner(name, arg=None, kwarg=None, full_return=False, saltenv='base', jid=None, **kwargs)

Execute a runner function. This function must be run on the master, either by targeting a minion running on a master or by using salt-call on a master.

New in version 2014.7.0.

name The name of the function to run
kwarg Any keyword arguments to pass to the runner function

CLI Example:

In this example, assume that master_minion is a minion running on a master.

```
salt master_minion saltutil.runner jobs.list_jobs
salt master_minion saltutil.runner test.arg arg='[\'baz\']' kwarg='\{\'foo\': \'bar\'\}'
```

salt.modules.saltutil.running()

Return the data on all running salt processes on the minion

CLI Example:

```
salt '*' saltutil.running
```

salt.modules.saltutil.signal_job(jid, sig)

Sends a signal to the named salt job's process

CLI Example:

```
salt '*' saltutil.signal_job <job id> 15
```

salt.modules.saltutil.sync_all(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

Changed in version 2015.8.11,2016.3.2: On masterless minions, pillar modules are now synced, and refreshed when refresh is set to True.

Sync down all of the dynamic modules from the file server for a specific environment. This function synchronizes custom modules, states, beacons, grains, returners, output modules, renderers, and utils.

refresh [True] Also refresh the execution modules and recompile pillar data available to the minion. This refresh will be performed even if no new dynamic modules are synced. Set to False to prevent this refresh.

**Important:** If this function is executed using a module.run state, the SLS file will not have access to newly synced execution modules unless a refresh argument is added to the state, like so:

```
load_my_custom_module:
  module.run:
    - name: saltutil.sync_all
    - refresh: True
```

See here for a more detailed explanation of why this is necessary.

extmod_whitelist [None] dictionary of modules to sync based on type
extmod_blacklist [None] dictionary of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_all
salt '*' saltutil.sync_all saltenv=dev
salt '*' saltutil.sync_all saltenv=base,dev
salt '*' saltutil.sync_all extmod_whitelist={'modules': ['custom_module']}
```
salt.modules.saltutil.sync_beacons

New in version 2015.5.1.

Sync beacons from salt://_beacons to the minion

* saltenv* The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

  If not passed, then all environments configured in the top files will be checked for beacons to sync. If no top files are found, then the base environment will be synced.

* refresh* [True] If True, refresh the available beacons on the minion. This refresh will be performed even if no new beacons are synced. Set to False to prevent this refresh.

* extmod_whitelist* [None] comma-separated list of modules to sync

* extmod_blacklist* [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt '*' saltutil.sync_beacons
salt '*' saltutil.sync_beacons saltenv=dev
salt '*' saltutil.sync_beacons saltenv=base,dev
```

salt.modules.saltutil.sync_clouds

New in version 2017.7.0.

Sync utility modules from salt://_cloud to the minion

* saltenv* [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

* refresh* [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new utility modules are synced. Set to False to prevent this refresh.

* extmod_whitelist* [None] comma-separated list of modules to sync

* extmod_blacklist* [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_clouds
salt '*' saltutil.sync_clouds saltenv=dev
salt '*' saltutil.sync_clouds saltenv=base,dev
```

salt.modules.saltutil.sync_engines

New in version 2016.3.0.

Sync engine modules from salt://_engines to the minion

* saltenv* The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

  If not passed, then all environments configured in the top files will be checked for engines to sync. If no top files are found, then the base environment will be synced.

* refresh* [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new engine modules are synced. Set to False to prevent this refresh.

* extmod_whitelist* [None] comma-separated list of modules to sync

* extmod_blacklist* [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_engines
salt '*' saltutil.sync_engines saltenv=base,dev
```
salt.modules.saltutil.sync_grains(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 0.10.0.

Sync grains modules from salt://_grains to the minion

* saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

  If not passed, then all environments configured in the top files will be checked for grains modules to sync. If no top files are found, then the base environment will be synced.

* refresh [True] If True, refresh the available execution modules and recompile pillar data for the minion. This refresh will be performed even if no new grains modules are synced. Set to False to prevent this refresh.

* extmod_whitelist [None] comma-separated list of modules to sync

* extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_grains
salt '*' saltutil.sync_grains saltenv=dev
salt '*' saltutil.sync_grains saltenv=base,dev
```

salt.modules.saltutil.sync_log_handlers(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 2015.8.0.

Sync log handlers from salt://_log_handlers to the minion

* saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

  If not passed, then all environments configured in the top files will be checked for log handlers to sync. If no top files are found, then the base environment will be synced.

* refresh [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new log handlers are synced. Set to False to prevent this refresh.

* extmod_whitelist [None] comma-separated list of modules to sync

* extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_log_handlers
salt '*' saltutil.sync_log_handlers saltenv=dev
salt '*' saltutil.sync_log_handlers saltenv=base,dev
```

salt.modules.saltutil.sync_modules(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 0.10.0.

Sync execution modules from salt://_modules to the minion

* saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

  If not passed, then all environments configured in the top files will be checked for execution modules to sync. If no top files are found, then the base environment will be synced.

* refresh [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new execution modules are synced. Set to False to prevent this refresh.

**Important:** If this function is executed using a module.run state, the SLS file will not have access to newly synced execution modules unless a refresh argument is added to the state, like so:

```
load_my_custom_module:
  module.run:
```

Chapter 19. Salt Module Reference
- name: saltutil.sync_modules
- refresh: True

See here for a more detailed explanation of why this is necessary.

**extmod_whitelist** [None] comma-separated list of modules to sync
**extmod_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```bash
salt '*' saltutil.sync_modules
salt '*' saltutil.sync_modules saltenv=dev
salt '*' saltutil.sync_modules saltenv=base,dev
```

salt.modules.saltutil.sync_output(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

Sync outputters from salt://_output to the minion

**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for outputters to sync. If no top files are found, then the base environment will be synced.

**refresh** [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new outputters are synced. Set to False to prevent this refresh.

**extmod_whitelist** [None] comma-separated list of modules to sync
**extmod_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```bash
salt '*' saltutil.sync_output
salt '*' saltutil.sync_output saltenv=dev
salt '*' saltutil.sync_output saltenv=base,dev
```

salt.modules.saltutil.sync_outputters(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

This function is an alias of sync_output.

Sync outputters from salt://_output to the minion

**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for outputters to sync. If no top files are found, then the base environment will be synced.

**refresh** [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new outputters are synced. Set to False to prevent this refresh.

**extmod_whitelist** [None] comma-separated list of modules to sync
**extmod_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```bash
salt '*' saltutil.sync_output
salt '*' saltutil.sync_output saltenv=dev
salt '*' saltutil.sync_output saltenv=base,dev
```

salt.modules.saltutil.sync_pillar(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 2015.8.11, 2016.3.2.

Sync pillar modules from the salt://_pillar directory on the Salt fileserver. This function is environment-aware, pass the desired environment to grab the contents of the _pillar directory from that
environment. The default environment, if none is specified, is base.

**refresh** [True] Also refresh the execution modules available to the minion, and refresh pillar data.

**extmod_whitelist** [None] comma-separated list of modules to sync

**extmod_blacklist** [None] comma-separated list of modules to blacklist based on type

**Note:** This function will raise an error if executed on a traditional (i.e. not masterless) minion

**CLI Examples:**

```
salt '*' saltutil.sync_pillar
salt '*' saltutil.sync_pillar saltenv=dev
```

```python
salt.modules.saltutil.sync_proxymodules(saltenv=None, refresh=False, extmod_whitelist=None, extmod_blacklist=None)
```

New in version 2015.8.2.

Sync proxy modules from salt://_proxy to the minion

**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for proxy modules to sync. If no top files are found, then the base environment will be synced.

**refresh** [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new proxy modules are synced. Set to False to prevent this refresh.

**extmod_whitelist** [None] comma-separated list of modules to sync

**extmod_blacklist** [None] comma-separated list of modules to blacklist based on type

**CLI Examples:**

```
salt '*' saltutil.sync_proxymodules
salt '*' saltutil.sync_proxymodules saltenv=dev
salt '*' saltutil.sync_proxymodules saltenv=base,dev
```

```python
salt.modules.saltutil.sync_renderers(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)
```

New in version 0.10.0.

Sync renderers from salt://_renderers to the minion

**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for renderers to sync. If no top files are found, then the base environment will be synced.

**refresh** [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new renderers are synced. Set to False to prevent this refresh. Set to False to prevent this refresh.

**extmod_whitelist** [None] comma-separated list of modules to sync

**extmod_blacklist** [None] comma-separated list of modules to blacklist based on type

**CLI Examples:**

```
salt '*' saltutil.sync_renderers
salt '*' saltutil.sync_renderers saltenv=dev
salt '*' saltutil.sync_renderers saltenv=base,dev
```

```python
salt.modules.saltutil.sync_returners(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)
```

New in version 0.10.0.

Sync beacons from salt://_returners to the minion
**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for returners to sync. If no top files are found, then the base environment will be synced.

**refresh** [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new returners are synced. Set to False to prevent this refresh.

**extmod_whitelist** [None] comma-separated list of modules to sync

**extmod_blacklist** [None] comma-separated list of modules to blacklist based on type

**CLI Examples:**

```
salt '*' saltutil.sync_returners
salt '*' saltutil.sync_returners saltenv=dev
```

salt.modules.saltutil.sync_sdb(saltenv=None, extmod_whitelist=None, extmod_blacklist=None)

New in version 2015.5.8, 2015.8.3.

Sync sdb modules from salt://_sdb to the minion

**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for sdb modules to sync. If no top files are found, then the base environment will be synced.

**refresh** [False] This argument has no affect and is included for consistency with the other sync functions.

**extmod_whitelist** [None] comma-separated list of modules to sync

**extmod_blacklist** [None] comma-separated list of modules to blacklist based on type

**CLI Examples:**

```
salt '*' saltutil.sync_sdb
salt '*' saltutil.sync_sdb saltenv=dev
salt '*' saltutil.sync_sdb saltenv=base,dev
```

salt.modules.saltutil.sync_states(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 0.10.0.

Sync state modules from salt://_states to the minion

**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for state modules to sync. If no top files are found, then the base environment will be synced.

**refresh** [True] If True, refresh the available states on the minion. This refresh will be performed even if no new state modules are synced. Set to False to prevent this refresh.

**extmod_whitelist** [None] comma-separated list of modules to sync

**extmod_blacklist** [None] comma-separated list of modules to blacklist based on type

**CLI Examples:**

```
salt '*' saltutil.sync_states
salt '*' saltutil.sync_states saltenv=dev
salt '*' saltutil.sync_states saltenv=base,dev
```

salt.modules.saltutil.sync_utils(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 2014.7.0.

Sync utility modules from salt://_utils to the minion

**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

19.9. execution modules
If not passed, then all environments configured in the top files will be checked for utility modules to sync. If no top files are found, then the base environment will be synced.

refresh  [True]  If True, refresh the available execution modules on the minion. This refresh will be performed even if no new utility modules are synced. Set to False to prevent this refresh.

extmod_whitelist  [None]  comma-separated list of modules to sync

extmod_blacklist  [None]  comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_utils
salt '*' saltutil.sync_utils saltenv=dev
salt '*' saltutil.sync_utils saltenv=base,dev
```

```python
salt.modules.saltutil.term_all_jobs()
```

Sends a termination signal (SIGTERM 15) to all currently running jobs

CLI Example:

```
salt '*' saltutil.term_all_jobs
```

```python
salt.modules.saltutil.term_job(jid)
```

Sends a termination signal (SIGTERM 15) to the named salt job's process

CLI Example:

```
salt '*' saltutil.term_job <job id>
```

```python
salt.modules.saltutil.update(version=None)
```

Update the salt minion from the URL defined in opts['update_url'] SaltStack, Inc provides the latest builds here: update_url: https://repo.saltstack.com/windows/

Be aware that as of 2014-8-11 there's a bug in esky such that only the latest version available in the update_url can be downloaded and installed.

This feature requires the minion to be running a bdist_esky build.

The version number is optional and will default to the most recent version available at opts['update_url'].

Returns details about the transaction upon completion.

CLI Examples:

```
salt '*' saltutil.update
salt 'y'* saltutil.update 0.10.3
```

```python
salt.modules.saltutil.wheel(name, *args, **kwargs)
```

Execute a wheel module and function. This function must be run against a minion that is local to the master.

New in version 2014.7.0.

name  The name of the function to run

args  Any positional arguments to pass to the wheel function. A common example of this would be the match arg needed for key functions.

    New in version v2015.8.11.

kwargs  Any keyword arguments to pass to the wheel function

CLI Example:

```
salt my-local-minion saltutil.wheel key.accept jerry
salt my-local-minion saltutil.wheel minions.connected
```
Note: Since this function must be run against a minion that is running locally on the master in order to get accurate returns, if this function is run against minions that are not local to the master, "empty" returns are expected. The remote minion does not have access to wheel functions and their return data.

19.9.337 salt.modules.schedule

Module for managing the Salt schedule on a minion

New in version 2014.7.0.

salt.modules.schedule.add(name, **kwargs)
Add a job to the schedule

CLI Example:

```
salt '*' schedule.add job1 function='test.ping' seconds=3600
# If function have some arguments, use job_args
salt '*' schedule.add job2 function='cmd.run' job_args=['date >> /tmp/date.log']
```

salt.modules.schedule.build_schedule_item(name, **kwargs)
Build a schedule job

CLI Example:

```
salt '*' schedule.build_schedule_item job1 function='test.ping' seconds=3600
```

salt.modules.schedule.copy(name, target, **kwargs)
Copy scheduled job to another minion or minions.

CLI Example:

```
salt '*' schedule.copy jobname target
```

salt.modules.schedule.delete(name, **kwargs)
Delete a job from the minion's schedule

CLI Example:

```
salt '*' schedule.delete job1
```

salt.modules.schedule.disable(**kwargs)
Disable all scheduled jobs on the minion

CLI Example:

```
salt '*' schedule.disable
```

salt.modules.schedule.disable_job(name, **kwargs)
Disable a job in the minion's schedule

CLI Example:

```
salt '*' schedule.disable_job job1
```

salt.modules.schedule.enable(**kwargs)
Enable all scheduled jobs on the minion
Salt Documentation, Release 2017.7.8

CLI Example:

```python
salt '*' schedule.enable
```

`salt.modules.schedule.enable_job(name, **kwargs)`
Enable a job in the minion's schedule

CLI Example:

```python
salt '*' schedule.enable_job job1
```

`salt.modules.schedule.is_enabled(name)`
List a Job only if its enabled

New in version 2015.5.3.

CLI Example:

```python
salt '*' schedule.is_enabled name=job_name
```

`salt.modules.schedule.list_(show_all=False, show_disabled=True, where=None, return_yaml=True)`
List the jobs currently scheduled on the minion

CLI Example:

```python
salt '*' schedule.list

# Show all jobs including hidden internal jobs
salt '*' schedule.list show_all=True

# Hide disabled jobs from list of jobs
salt '*' schedule.list show_disabled=False
```

`salt.modules.schedule.modify(name, **kwargs)`
Modify an existing job in the schedule

CLI Example:

```python
salt '*' schedule.modify job1 function='test.ping' seconds=3600
```

`salt.modules.schedule.move(name, target, **kwargs)`
Move scheduled job to another minion or minions.

CLI Example:

```python
salt '*' schedule.move jobname target
```

`salt.modules.schedule.purge(**kwargs)`
Purge all the jobs currently scheduled on the minion

CLI Example:

```python
salt '*' schedule.purge
```

`salt.modules.schedule.reload_()`
Reload saved scheduled jobs on the minion

CLI Example:
salt '*' schedule.reload

salt.modules.schedule.run_job(name, force=False)
Run a scheduled job on the minion immediately

CLI Example:

salt '*' schedule.run_job job1
salt '*' schedule.run_job job1 force=True
Force the job to run even if it is disabled.

salt.modules.schedule.save(**kwargs)
Save all scheduled jobs on the minion

CLI Example:

salt '*' schedule.save

19.9.338 salt.modules.scsi

SCSI administration module

salt.modules.scsi.ls_(get_size=True)
List SCSI devices, with details

CLI Examples:

salt '*' scsi.ls
salt '*' scsi.ls get_size=False

get_size [True] Get the size information for scsi devices. This option should be set to False for older OS
distributions (RHEL6 and older) due to lack of support for the `-s` option in lsscsi.

New in version 2015.5.10.

salt.modules.scsi.rescan_all(host)
List scsi devices

CLI Example:

salt '*' scsi.rescan_all 0

19.9.339 salt.modules.sdb

Module for Manipulating Data via the Salt DB API

salt.modules.sdb.delete(uri)
Delete a value from a db, using a uri in the form of sdb://<profile>/<key>. If the uri provided does
not start with sdb:// or the value is not successfully deleted, return False.

CLI Example:

salt '*' sdb.delete sdb://mymemcached/foo
salt.modules.sdb.get(uri)
Get a value from a db, using a uri in the form of sdb://<profile>/<key>. If the uri provided does not start with sdb://, then it will be returned as-is.

CLI Example:
```
salt '*' sdb.get sdb://mymemcached/foo
```

salt.modules.sdb.get_or_set_hash(uri, length=8, chars='abcdefghijklmnopqrstuvwxyz0123456789!@#$%^&*(-_=+)')
Perform a one-time generation of a hash and write it to sdb. If that value has already been set return the value instead.

This is useful for generating passwords or keys that are specific to multiple minions that need to be stored somewhere centrally.

State Example:
```
some_mysql_user:
  mysql_user:
    - present
    - host: localhost
    - password: ' {{ salt['sdb.get_or_set_hash']('some_mysql_user_pass') }}'
```

CLI Example:
```
salt '*' sdb.get_or_set_hash 'SECRET_KEY' 50
```

**Warning:** This function could return strings which may contain characters which are reserved as directives by the YAML parser, such as strings beginning with %. To avoid issues when using the output of this function in an SLS file containing YAML+Jinja, surround the call with single quotes.

salt.modules.sdb.set_(uri, value)
Set a value in a db, using a uri in the form of sdb://<profile>/<key>. If the uri provided does not start with sdb:// or the value is not successfully set, return False.

CLI Example:
```
salt '*' sdb.set sdb://mymemcached/foo bar
```

19.9.340 salt.modules.seed
Virtual machine image management tools
salt.modules.seed.apply_(path, id_=None, config=None, approve_key=True, install=True, prep_install=False, pub_key=None, priv_key=None, mount_point=None)
Seed a location (disk image, directory, or block device) with the minion config, approve the minion’s key, and/or install salt-minion.

CLI Example:
```
salt 'minion' seed.apply path id [config=config_data] \
  [gen_key=(true|false)] [approve_key=(true|false)] \
  [install=(true|false)]
```

path Full path to the directory, device, or disk image on the target minion’s file system.
id  Minion id with which to seed the path.
config Minion configuration options. By default, the `master' option is set to the target host's `master'.
approve_key Request a pre-approval of the generated minion key. Requires that the salt-master be configured to either auto-accept all keys or expect a signing request from the target host. Default: true.
install Install salt-minion, if absent. Default: true.
prep_install Prepare the bootstrap script, but don't run it. Default: false

```
salt.modules.seed.mkconfig(config=None, tmp=None, id_=None, approve_key=True, pub_key=None, priv_key=None)
```
Generate keys and config and put them in a tmp directory.

```
salt.modules.seed.prep_bootstrap(mpt)
```
Update and get the random script to a random place

```
salt '*' selinux.fcontext_add_or_delete_policy add my-policy
```

19.9.341 salt.modules.selinux

Execute calls on selinux

**Note:** This module requires the `semanage`, `setsebool`, and `semodule` commands to be available on the minion. On RHEL-based distributions, ensure that the `policycoreutils` and `policycoreutils-python` packages are installed. If not on a Fedora or RHEL-based distribution, consult the selinux documentation for your distribution to ensure that the proper packages are installed.

```
salt.modules.selinux.fcontext_add_or_delete_policy(action, name, filetype=None, sel_type=None, sel_user=None, sel_level=None)
```
New in version 2017.7.0.

Sets or deletes the SELinux policy for a given filespec and other optional parameters.

Returns the result of the call to semanage.

Note that you don't have to remove an entry before setting a new one for a given filespec and filetype, as adding one with semanage automatically overwrites a previously configured SELinux context.

name filespec of the file or directory. Regex syntax is allowed.
file_type The SELinux filetype specification. Use one of `[a, f, d, c, b, s, l, p]`. See also man `semanage-fcontext`. Defaults to `a` (all files).
sel_type SELinux context type. There are many.
sel_user SELinux user. Use `semanage login -l` to determine which ones are available to you.
sel_level The MLS range of the SELinux context.

CLI Example:

```
salt '*' selinux.fcontext_add_or_delete_policy add my-policy
```
salt.modules.selinux.fcontext_apply_policy(name, recursive=False)

New in version 2017.7.0.

Applies SELinux policies to filespec using restorecon [-R] filespec. Returns dict with changes if successful, the output of the restorecon command otherwise.

name  filespec of the file or directory. Regex syntax is allowed.
recursive  Recursively apply SELinux policies.

CLI Example:

```bash
salt '*' selinux.fcontext_apply_policy my-policy
```

salt.modules.selinux.fcontext_get_policy(name, filetype=None, sel_type=None, sel_user=None, sel_level=None)

New in version 2017.7.0.

Returns the current entry in the SELinux policy list as a dictionary. Returns None if no exact match was found.

Returned keys are:
- filespec (the name supplied and matched)
- filetype (the descriptive name of the filetype supplied)
- sel_user, sel_role, sel_type, sel_level (the selinux context)

name  filespec of the file or directory. Regex syntax is allowed.
filetype  The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also man semanage-fcontext. Defaults to ‘a’ (all files).

CLI Example:

```bash
salt '*' selinux.fcontext_get_policy my-policy
```

salt.modules.selinux.fcontext_policy_is_applied(name, recursive=False)

New in version 2017.7.0.

Returns an empty string if the SELinux policy for a given filespec is applied, returns string with differences in policy and actual situation otherwise.

name  filespec of the file or directory. Regex syntax is allowed.

CLI Example:

```bash
salt '*' selinux.fcontext_policy_is_applied my-policy
```

salt.modules.selinux.filetype_id_to_string(filetype='a')

New in version 2017.7.0.

Translates SELinux filetype single-letter representation to a more human-readable version (which is also used in semanage fcontext -l).

salt.modules.selinux.getconfig()

Return the selinux mode from the config file

CLI Example:

```bash
salt '*' selinux.getconfig
```

salt.modules.selinux.getenforce()

Return the mode selinux is running in

CLI Example:
salt ' '*' selinux.getenforce

salt.modules.selinux.getsebool(boolean)
    Return the information on a specific selinux boolean
    CLI Example:
    salt ' '* selinux.getsebool virt_use_usb

salt.modules.selinux.getsemod(module)
    Return the information on a specific selinux module
    CLI Example:
    salt ' '* selinux.getsemod mysql

New in version 2016.3.0.

salt.modules.selinux.install_semod(module_path)
    Install custom SELinux module from file
    CLI Example:
    salt ' '* selinux.install_semod [salt://]path/to/module.pp

New in version 2016.11.6.

salt.modules.selinux.list_sebool()
    Return a structure listing all of the selinux booleans on the system and what state they are in
    CLI Example:
    salt ' '* selinux.list_sebool

salt.modules.selinux.list_semod()
    Return a structure listing all of the selinux modules on the system and what state they are in
    CLI Example:
    salt ' '* selinux.list_semod

New in version 2016.3.0.

salt.modules.selinux.remove_semod(module)
    Remove SELinux module
    CLI Example:
    salt ' '* selinux.remove_semod module_name

New in version 2016.11.6.

salt.modules.selinux.selinux_fs_path(*args, **kwargs)
    Return the location of the SELinux VFS directory
    CLI Example:
    salt ' '* selinux.selinux_fs_path

19.9. execution modules
salt.modules.selinux.setenforce(mode)
Set the SELinux enforcing mode
 CLI Example:
salt '*' selinux.setenforce enforcing

salt.modules.selinux.setsebool(boolean, value, persist=False)
Set the value for a boolean
 CLI Example:
salt '*' selinux.setsebool virt_use_usb off

salt.modules.selinux.setsebools(pairs, persist=False)
Set the value of multiple booleans
 CLI Example:
salt '*' selinux.setsebools '{virt_use_usb: on, squid_use_tproxy: off}'

salt.modules.selinux.setsemod(module, state)
Enable or disable an SELinux module.
 CLI Example:
salt '*' selinux.setsemod nagios Enabled
 New in version 2016.3.0.

19.9.342 salt.modules.sensehat
Module for controlling the LED matrix or reading environment data on the SenseHat of a Raspberry Pi.
 New in version 2017.7.0.

 maintainer Benedikt Werner <1benediktwerner@gmail.com>, Joachim Werner <joe@suse.com>
maturity new
depends sense_hat Python module

You can specify the rotation of the Pi in a pillar. This is useful if it is used upside down or sideways to correct the orientation of the image being shown.

Example:
sensehat:
 rotation: 90

salt.modules.sensehat.clear(color=None)
Sets the LED matrix to a single color or turns all LEDs off.
 CLI Example:
salt 'raspberry' sensehat.clear
salt 'raspberry' sensehat.clear '[255, 0, 0]'

salt.modules.sensehat.get_humidity()
Get the percentage of relative humidity from the humidity sensor.
salt.modules.sensehat.get_pixel(x, y)
    Returns the color of a single pixel on the LED matrix.
    
    x  The x coordinate of the pixel. Ranges from 0 on the left to 7 on the right.
    y  The y coordinate of the pixel. Ranges from 0 at the top to 7 at the bottom.

    **Note:** Please read the note for get_pixels

salt.modules.sensehat.get_pixels()
    Returns a list of 64 smaller lists of [R, G, B] pixels representing the currently displayed image on the LED matrix.

    **Note:** When using set_pixels the pixel values can sometimes change when you read them again using get_pixels. This is because we specify each pixel element as 8 bit numbers (0 to 255) but when they're passed into the Linux frame buffer for the LED matrix the numbers are bit shifted down to fit into RGB 565. 5 bits for red, 6 bits for green and 5 bits for blue. The loss of binary precision when performing this conversion (3 bits lost for red, 2 for green and 3 for blue) accounts for the discrepancies you see.

    The get_pixels method provides an accurate representation of how the pixels end up in frame buffer memory after you have called set_pixels.

salt.modules.sensehat.get_pressure()
    Gets the current pressure in Millibars from the pressure sensor.

salt.modules.sensehat.get_temperature()
    Gets the temperature in degrees Celsius from the humidity sensor. Equivalent to calling get_temperature_from_humidity.

    If you get strange results try using `get_temperature_from_pressure`.

salt.modules.sensehat.get_temperature_from_humidity()
    Gets the temperature in degrees Celsius from the humidity sensor.

salt.modules.sensehat.get_temperature_from_pressure()
    Gets the temperature in degrees Celsius from the pressure sensor.

salt.modules.sensehat.low_light(low_light=True)
    Sets the LED matrix to low light mode. Useful in a dark environment.

    CLI Example:

    
    ```
    salt 'raspberry' sensehat.low_light
    salt 'raspberry' sensehat.low_light False
    ```

salt.modules.sensehat.set_pixel(x, y, color)
    Sets the a single pixel on the LED matrix to a specified color.
    
    x  The x coordinate of the pixel. Ranges from 0 on the left to 7 on the right.
    y  The y coordinate of the pixel. Ranges from 0 at the top to 7 at the bottom.
    color  The new color of the pixel as a list of [R, G, B] values.

    CLI Example:

    ```
    salt 'raspberry' sensehat.set_pixel 0 0 '[255, 0, 0]'
    ```

salt.modules.sensehat.set_pixels(pixels)
    Sets the entire LED matrix based on a list of 64 pixel values

    pixels  A list of 64 color values [R, G, B].
salt.modules.sensehat.show_image(image)
  Displays a 8 x 8 image on the LED matrix.
  image  The path to the image to display. The image must be 8 x 8 pixels in size.
  CLI Example:

  salt 'raspberry' sensehat.show_image /tmp/my_image.png

salt.modules.sensehat.show_letter(letter, text_color=None, back_color=None)
  Displays a single letter on the LED matrix.
  letter  The letter to display
  text_color  The color in which the letter is shown. Defaults to \([255, 255, 255]\) (white).
  back_color  The background color of the display. Defaults to \([0, 0, 0]\) (black).
  CLI Example:

  salt 'raspberry' sensehat.show_letter O
  salt 'raspberry' sensehat.show_letter X \([255, 0, 0]\)
  salt 'raspberry' sensehat.show_letter B \([0, 0, 255]\) \([255, 255, 0]\)

salt.modules.sensehat.show_message(message, msg_type=None, text_color=None, back_color=None, scroll_speed=None)
  Displays a message on the LED matrix.
  message  The message to display
  msg_type  The type of the message. Changes the appearance of the message.
  Available types are:

<table>
<thead>
<tr>
<th>text</th>
<th>number</th>
</tr>
</thead>
<tbody>
<tr>
<td>error</td>
<td>red</td>
</tr>
<tr>
<td>warning</td>
<td>orange</td>
</tr>
<tr>
<td>success</td>
<td>green</td>
</tr>
<tr>
<td>info</td>
<td>blue</td>
</tr>
</tbody>
</table>

  scroll_speed  The speed at which the message moves over the LED matrix. This value represents the time
  paused for between shifting the text to the left by one column of pixels. Defaults to `0.1`.
  text_color  The color in which the message is shown. Defaults to \([255, 255, 255]\) (white).
  back_color  The background color of the display. Defaults to \([0, 0, 0]\) (black).
  CLI Example:

  salt 'raspberry' sensehat.show_message 'Status ok'
  salt 'raspberry' sensehat.show_message 'Something went wrong' error
  salt 'raspberry' sensehat.show_message 'Red' text_color='[255, 0, 0]'
  salt 'raspberry' sensehat.show_message 'Hello world' None '[0, 0, 255]' '[255, 0]
  -255, 0]' 0.2

19.9.343  salt.modules.sensors

Read lm-sensors

New in version 2014.1.3.

salt.modules.sensors.sense(chip, fahrenheit=False)
  Gather lm-sensors data from a given chip
  To determine the chip to query, use the `sensors` command and see the leading line in the block.
  Example:

  /usr/bin/sensors
coretemp-isa-0000 Adapter: ISA adapter Physical id 0: +56.0°C (high = +87.0°C, crit = +105.0°C) Core 0: +52.0°C (high = +87.0°C, crit = +105.0°C) Core 1: +50.0°C (high = +87.0°C, crit = +105.0°C) Core 2: +56.0°C (high = +87.0°C, crit = +105.0°C) Core 3: +53.0°C (high = +87.0°C, crit = +105.0°C)

Given the above, the chip is `coretemp-isa-0000'.

**19.9.344 salt.modules.serverdensity_device**

Wrapper around Server Density API

New in version 2014.7.0.

`salt.modules.serverdensity_device.create(name, **params)`

Function to create device in Server Density. For more info, see the API docs.

CLI Example:

```
salt '*' serverdensity_device.create lama
salt '*' serverdensity_device.create rich_lama group=lama_band installedRAM=32768
```

`salt.modules.serverdensity_device.delete(device_id)`

Delete a device from Server Density. For more information, see the API docs.

CLI Example:

```
salt '*' serverdensity_device.delete 51f7eafcdbea4bb3e000ae4
```

`salt.modules.serverdensity_device.get_sd_auth(val, sd_auth_pillar_name='serverdensity')`

Returns requested Server Density authentication value from pillar.

CLI Example:

```
salt '*' serverdensity_device.get_sd_auth <val>
```

`salt.modules.serverdensity_device.install_agent(agent_key, agent_version=1)`

Function downloads Server Density installation agent, and installs sd-agent with agent_key. Optionally the agent_version would select the series to use (defaults on the v1 one).

CLI Example:

```
salt '*' serverdensity_device.install_agent c2bbdd6689ff46282bdaa07555641498
salt '*' serverdensity_device.install_agent c2bbdd6689ff46282bdaa07555641498 2
```

`salt.modules.serverdensity_device.ls(**params)`

List devices in Server Density

Results will be filtered by any params passed to this function. For more information, see the API docs on listing and searching.

CLI Example:

```
salt '*' serverdensity_device.ls
salt '*' serverdensity_device.ls name=lama
salt '*' serverdensity_device.ls name=lama group=lama_band installedRAM=32768
```

`salt.modules.serverdensity_device.update(device_id, **params)`

Updates device information in Server Density. For more information see the API docs.

CLI Example:
19.9.345  

salt.modules.servicenow module

Module for execution of ServiceNow CI (configuration items)

New in version 2016.11.0.

**depends**  servicenow_rest python module

**configuration**  Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the `servicenow` key by default, if defined.

For example:

```yaml
servicenow:
  instance_name: ''
  username: ''
  password: ''
```

**salt.modules.servicenow.delete_record** *(table, sys_id)*

Delete an existing record

**Parameters**

- **table** *(str)* -- The table name, e.g. sys_user
- **sys_id** *(str)* -- The unique ID of the record

**CLI Example:**

```bash
salt myminion servicenow.delete_record sys_computer 2134566
```

**salt.modules.servicenow.non_structured_query** *(table, query=None, **kwargs)*

**Parameters**

- **table** *(str)* -- The table name, e.g. sys_user
- **query** *(str)* -- The query to run (or use keyword arguments to filter data)

**CLI Example:**

```bash
salt myminion servicenow.non_structured_query sys_computer role=web
salt myminion servicenow.non_structured_query sys_computer role=web type=computer
```

**salt.modules.servicenow.set_change_request_state** *(change_id, state='approved')*

Set the approval state of a change request/record

**Parameters**

- **change_id** *(str)* -- The ID of the change request, e.g. CHG123545
- **state** *(str)* -- The target state, e.g. approved

**CLI Example:**

```bash
salt myminion servicenow.set_change_request_state CHG000123 declined
salt myminion servicenow.set_change_request_state CHG000123 approved
```

**salt.modules.servicenow.update_record_field** *(table, sys_id, field, value)*

Update the value of a record's field in a servicenow table

```bash
salt '***' serverdensity_device.update 51f7eafcdba4bb235e000ae4 name=lama
   --group=lama_band
salt '***' serverdensity_device.update 51f7eafcdba4bb235e000ae4 name=better_lama
   --group=rock_lamas swapSpace=512
```
Parameters

- **table** (str) -- The table name, e.g. sys_user
- **sys_id** (str) -- The unique ID of the record
- **field** (str) -- The new value
- **value** (str) -- The new value

CLI Example:

```
salt myminion servicenow.update_record_field sys_user 2348234 first_name jimmy
```

## 19.9.346 salt.modules.slack_notify

Module for sending messages to Slack

New in version 2015.5.0.

**configuration**  This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

```
slack:
  api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

salt.modules.slack_notify.call_hook

Send message to Slack incoming webhook.

- **message** -- The topic of message.
- **attachment** -- The message to send to the Slack WebHook.
- **color** -- The color of border of left side
- **short** -- An optional flag indicating whether the value is short enough to be displayed side-by-side with other values.
- **identifier** -- The identifier of WebHook.
- **channel** -- The channel to use instead of the WebHook default.
- **username** -- Username to use instead of WebHook default.
- **icon_emoji** -- Icon to use instead of WebHook default.

Returns

Boolean if message was sent successfully.

CLI Example:

```
salt '*' slack.post_hook message='Hello, from SaltStack'
```

salt.modules.slack_notify.find_room

Find a room by name and return it.

- **name** -- The room name.
- **api_key** -- The Slack admin api key.

Returns

The room object.

CLI Example:

```
salt '*' slack.find_room name="random"
```

```
salt '*' slack.find_room name="random" api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

salt.modules.slack_notify.find_user

Find a user by name and return it.

19.9. execution modules
Parameters

- **name** -- The user name.
- **api_key** -- The Slack admin api key.

Returns
The user object.

CLI Example:

```bash
salt '*' slack.find_user name="ThomasHatch"
```

```bash
salt '*' slack.find_user name="ThomasHatch" api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

**salt.modules.slack_notify.list_rooms(api_key=None)**

List all Slack rooms.

Parameters **api_key** -- The Slack admin api key.

Returns
The room list.

CLI Example:

```bash
salt '*' slack.list_rooms
```

```bash
salt '*' slack.list_rooms api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

**salt.modules.slack_notify.list_users(api_key=None)**

List all Slack users.

Parameters **api_key** -- The Slack admin api key.

Returns
The user list.

CLI Example:

```bash
salt '*' slack.list_users
```

```bash
salt '*' slack.list_users api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

**salt.modules.slack_notify.post_message(channel, message, from_name, api_key=None, icon=None)**

Send a message to a Slack channel.

Parameters

- **channel** -- The channel name, either will work.
- **message** -- The message to send to the Slack channel.
- **from_name** -- Specify who the message is from.
- **api_key** -- The Slack api key, if not specified in the configuration.
- **icon** -- URL to an image to use as the icon for this message

Returns
Boolean if message was sent successfully.

CLI Example:

```bash
salt '*' slack.post_message channel="Development Room" message="Build is done" from_name="Build Server"
```

**19.9.347 salt.modules.slsutil**

Utility functions for use with or in SLS files

**salt.modules.slsutil.merge(obj_a, obj_b, strategy='smart', renderer='yaml', merge_lists=False)**

Merge a data structure into another by choosing a merge strategy

Strategies:

- aggregate
- list
salt.modules.slsutil.renderer(path=None, string=None, default_renderer='jinja|yaml', **kwargs)

Parse a string or file through Salt's renderer system

This is an open-ended function and can be used for a variety of tasks. It makes use of Salt's ``renderer pipes`` system to run a string or file through a pipe of any of the loaded renderer modules.

Parameters
- **path** -- The path to a file on the filesystem.
- **string** -- An inline string to be used as the file to send through the renderer system.
  Note, not all renderer modules can work with strings; the `py` renderer requires a file, for example.
- **default_renderer** -- The renderer pipe to send the file through; this is overridden by a ``she-bang`` at the top of the file.
- **kwargs** -- Keyword args to pass to Salt's compile_template() function.

Keep in mind the goal of each renderer when choosing a render-pipe; for example, the Jinja renderer processes a text file and produces a string, however the YAML renderer processes a text file and produces a data structure.

One possible use is to allow writing ``map files``, as are commonly seen in Salt formulas, but without tying the renderer of the map file to the renderer used in the other sls files. In other words, a map file could use the Python renderer and still be included and used by an sls file that uses the default `jinja|yaml` renderer.

For example, the two following map files produce identical results but one is written using the normal `jinja|yaml` and the other is using `py`:

```jinja|yaml
{% set apache = salt.grains.filter_by({
    ...normal jinja map file here...
}, merge=salt.pillar.get('apache:lookup')) %}
{{ apache | yaml() }}
```

```py
def run():
    apache = __salt__.grains.filter_by({
        ...normal map here but as a python dict...
    }, merge=__salt__.pillar.get('apache:lookup'))
    return apache
```

Regardless of which of the above map files is used, it can be accessed from any other sls file by calling this function. The following is a usage example in Jinja:

```jinja
{% set apache = salt.slsutil.renderer('map.sls') %}
```

CLI Example:

```
salt '*' slsutil.renderer /path/to/file
salt '*' slsutil.renderer /path/to/file.sls 'jinja'
salt '*' slsutil.renderer /path/to/file.jinja
salt '*' slsutil.renderer string='Hello, {{ name }}.' name='world'
```

2073
salt.modules.slsutil.update(dest, upd, recursive_update=True, merge_lists=False)

Merge upd recursively into dest

If merge_lists=True, will aggregate list object types instead of replacing. This behavior is only activated when recursive_update=True.

CLI Example:

```
salt '*' slsutil.update '{foo: Foo}' '{bar: Bar}'
```

### 19.9.348 salt.modules.smartos_imgadm

Module for running imgadm command on SmartOS

salt.modules.smartos_imgadm.avail(search=None, verbose=False)

Return a list of available images

**search** [string] search keyword

**verbose** [boolean (False)] toggle verbose output

CLI Example:

```
salt '*' imgadm.avail [percona]
salt '*' imgadm.avail verbose=True
```

salt.modules.smartos_imgadm.delete(uuid)

Remove an installed image

**uuid** [string] Specifies uuid to import

CLI Example:

```
salt '*' imgadm.delete e42f8c84-bbea-11e2-b920-078fab2a9b1f
```

salt.modules.smartos_imgadm.get(uuid)

Return info on an installed image

**uuid** [string] uuid of image

CLI Example:

```
salt '*' imgadm.get e42f8c84-bbea-11e2-b920-078fab2a9b1f
```

salt.modules.smartos_imgadm.import_image(uuid, verbose=False)

Import an image from the repository

**uuid** [string] uuid to import

**verbose** [boolean (False)] toggle verbose output

CLI Example:

```
salt '*' imgadm.import e42f8c84-bbea-11e2-b920-078fab2a9b1f [verbose=True]
```

salt.modules.smartos_imgadm.list_installed(verbose=False)

Return a list of installed images

**verbose** [boolean (False)] toggle verbose output

CLI Example:

```
salt '*' imgadm.list [verbose=True]
```

salt.modules.smartos_imgadm.show(uuid)

Show manifest of a given image

**uuid** [string] uuid of image

CLI Example:
salt.modules.smartos_imgadm.update_installed(uuid='')
    Gather info on unknown image(s) (locally installed)
    uuid [string] optional uuid of image
    CLI Example:
    `salt '*' imgadm.update [uuid]`

salt.modules.smartos_imgadm.vacuum(verbos=False)
    Remove unused images
    verbose [boolean (False)] toggle verbose output
    CLI Example:
    `salt '*' imgadm.vacuum [verbose=True]`

salt.modules.smartos_imgadm.version()
    Return imgadm version
    CLI Example:
    `salt '*' imgadm.version`

19.9.349 salt.modules.smartos_nictagadm module

Module for running nictagadm command on SmartOS :maintainer: Jorge Schrauwen <sjorge@blackdot.be> :maturity: new :depends: nictagadm binary, dladm binary :platform: smartos
.. versionadded:: 2016.11.0

salt.modules.smartos_nictagadm.add(name, mac, mtu=1500)
    Add a new nictag
    name [string] name of new nictag
    mac [string] mac of parent interface or `etherstub' to create a ether stub
    mtu [int] MTU
    CLI Example:
    `salt '*' nictagadm.add storage etherstub`
    `salt '*' nictagadm.add trunk 'DE:AD:00:00:BE:EF' 9000`

salt.modules.smartos_nictagadm.delete(name, force=False)
    Delete nictag
    name [string] nictag to delete
    force [boolean] force delete even if vms attached
    CLI Example:
    `salt '*' nictagadm.delete admin`

salt.modules.smartos_nictagadm.exists('nictag, **kwargs)
    Check if nictags exists
    nictag [string] one or more nictags to check
    verbose [boolean] return list of nictags
    CLI Example:
List all nictags

```
salt '*' nictagadm.list
```

Update a nictag

```
salt '*' nictagadm.update trunk mtu=9000
```

List all vms connect to nictag

```
salt '*' nictagadm.vms admin
```

---

### 19.9.350 `salt.modules.smartos_virt`

virst compatibility module for managing VMs on SmartOS

List all VMs

```
salt '*' virt.list_active_vms
```

Initialize a new VM

```
salt '*' virt.init image_uuid='...' alias='...' [...]
```

Return a list of uuids for active virtual machine on the minion

```
salt '*' virt.list_active_vms
```

Return a list of virtual machine names on the minion

```
salt '*' virt.list_domains
```
salt '*' virt.listDomains

salt.modules.smartos_virt.list_inactive_vms()
Return a list of uuids for inactive virtual machine on the minion

CLI Example:
```
salt '*' virt.list_inactive_vms
```

salt.modules.smartos_virt.reboot(domain)
Reboot a domain via ACPI request

CLI Example:
```
salt '*' virt.reboot <domain>
```

salt.modules.smartos_virt.setmem(domain, memory)
Change the amount of memory allocated to VM. <memory> is to be specified in MB.
Note for KVM: this would require a restart of the VM.

CLI Example:
```
salt '*' virt.setmem <domain> 512
```

salt.modules.smartos_virt.shutdown(domain)
Send a soft shutdown signal to the named vm

CLI Example:
```
salt '*' virt.shutdown <domain>
```

salt.modules.smartos_virt.start(domain)
Start a defined domain

CLI Example:
```
salt '*' virt.start <domain>
```

salt.modules.smartos_virt.stop(domain)
Hard power down the virtual machine, this is equivalent to powering off the hardware.

CLI Example:
```
salt '*' virt.destroy <domain>
```

salt.modules.smartos_virt.vm_info(domain)
Return a dict with information about the specified VM on this CN

CLI Example:
```
salt '*' virt.vm_info <domain>
```

salt.modules.smartos_virt.vm_virt_type(domain)
Return VM virtualization type: OS or KVM

CLI Example:
```
salt '*' virt.vm_virt_type <domain>
```

19.9. execution modules
### 19.9.351 `salt.modules.smartos_vmadm`

Module for running `vmadm` command on SmartOS

**`salt.modules.smartos_vmadm.create`**

Create a new VM

```python
from_file=None, **kwargs)
```

- `from_file` [string] json file to create the VM from -- if present, all other options will be ignored
- `kwargs` [string|int|...] options to set for the VM

**CLI Example:**

```bash
salt '*' vmadm.create from_file=/tmp/new_vm.json
salt '*' vmadm.create image_uuid='... alias='... nics='[ { "nic_tag": "admin", "ip": "198.51.100.123", ...}], [...]}' ...
```

**`salt.modules.smartos_vmadm.create_snapshot`**

Create snapshot of a VM

```python
(vm, name, key='uuid')
```

- `vm` [string] VM to be targeted
- `name` [string]
  - `snapshot name` The snapshot name must be 64 characters or less and must only contain alphanumeric characters and characters in the set [-_:%] to comply with ZFS restrictions.
- `key` [string [uuid|alias|hostname]] value type of `vm` parameter

**CLI Example:**

```bash
salt '*' vmadm.create_snapshot 186da9ab-7392-4f55-91a5-b8f1fe770543 baseline
salt '*' vmadm.create_snapshot nacl baseline key=alias
```

**`salt.modules.smartos_vmadm.delete`**

Delete a VM

```python
(vm, key='uuid')
```

- `vm` [string] VM to be deleted
- `key` [string [uuid|alias|hostname]] value type of `vm` parameter

**CLI Example:**

```bash
salt '*' vmadm.delete 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.delete nacl key=alias
```

**`salt.modules.smartos_vmadm.delete_snapshot`**

Delete snapshot of a VM

```python
(vm, name, key='uuid')
```

- `vm` [string] VM to be targeted
- `name` [string]
  - `snapshot name` The snapshot name must be 64 characters or less and must only contain alphanumeric characters and characters in the set [-_:%] to comply with ZFS restrictions.
- `key` [string [uuid|alias|hostname]] value type of `vm` parameter

**CLI Example:**

```bash
salt '*' vmadm.delete_snapshot 186da9ab-7392-4f55-91a5-b8f1fe770543 baseline
salt '*' vmadm.delete_snapshot nacl baseline key=alias
```

**`salt.modules.smartos_vmadm.get`**

Output the JSON object describing a VM

```python
(vm, key='uuid')
```

- `vm` [string] VM to be targeted
- `key` [string [uuid|alias|hostname]] value type of `vm` parameter

**CLI Example:**

```bash
salt '*' vmadm.get 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.get nacl key=alias
```
salt.modules.smartos_vmadm.info(vm, info_type='all', key='uuid')
Lookup info on running kvm
vm [string] vm to be targeted
info_type [string [all|block|blockstats|chardev|cpus|kvm|pci|spice|version|vnc]] info type to return
key [string [uuid|alias|hostname]] value type of `vm` parameter
CLI Example:
salt '*' vmadm.info 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.info 186da9ab-7392-4f55-91a5-b8f1fe770543 vnc
salt '*' vmadm.info nacl key=alias
salt '*' vmadm.info nacl vnc key=alias

salt.modules.smartos_vmadm.list_vms(search=None, sort=None, order='uuid,type,ram,state,alias', keyed=True)
Return a list of VMs
search [string] vmadm filter property
sort [string] vmadm sort (-s) property
order [string] vmadm order (-o) property -- Default: uuid,type,ram,state,alias
keyed [boolean] specified if the output should be an array (False) or dict (True) For a dict the key is the first item from the order parameter. Note: If key is not unique last vm wins.
CLI Example:
salt '*' vmadm.list
salt '*' vmadm.list order=alias,ram,cpu_cap sort=-ram,-cpu_cap
salt '*' vmadm.list search='type=KVM'

salt.modules.smartos_vmadm.lookup(search=None, order=None, one=False)
Return a list of VMs using lookup
search [string] vmadm filter property
order [string] vmadm order (-o) property -- Default: uuid,type,ram,state,alias
one [boolean] return only one result (vmadm's -1)
CLI Example:
salt '*' vmadm.lookup search='state=running'
salt '*' vmadm.lookup search='state=running' order=uuid,alias,hostname
salt '*' vmadm.lookup search='alias=nacl' one=True

salt.modules.smartos_vmadm.reboot(vm, force=False, key='uuid')
Reboot a vm
vm [string] vm to be rebooted
force [boolean] force reboot of vm if true
key [string [uuid|alias|hostname]] value type of `vm` parameter
CLI Example:
salt '*' vmadm.reboot 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.reboot 186da9ab-7392-4f55-91a5-b8f1fe770543 True
salt '*' vmadm.reboot vm=nacl key=alias
salt '*' vmadm.reboot vm=nina.example.org key=hostname

salt.modules.smartos_vmadm.receive(uuid, source)
Receive a vm from a directory
uuid [string] uuid of vm to be received
source [string] source directory
CLI Example:
salt 'vmadm.receive 186da9ab-7392-4f55-91a5-b8f1fe770543 /opt/backups

```python
salt.modules.smartos_vmadm.reprovision(vm, image, key='uuid')
    Reprovision a vm
    vm [string] vm to be reprovisioned
    image [string] uuid of new image
    key [string [uuid|alias|hostname]] value type of `vm' parameter
    CLI Example:

    salt '*' vmadm.reprovision 186da9ab-7392-4f55-91a5-b8f1fe770543 c02a2044-c1bd-11e4-bd8c-dfc1db8b0182
    salt '*' vmadm.reprovision nacl c02a2044-c1bd-11e4-bd8c-dfc1db8b0182 key=alias
```

```python
salt.modules.smartos_vmadm.rollback_snapshot(vm, name, key='uuid')
    Rollback snapshot of a vm
    vm [string] vm to be targeted
    name [string] snapshot name
    The snapshot name must be 64 characters or less and must only contain alphanumeric characters and characters in the set [\-_:\%] to comply with ZFS restrictions.
    key [string [uuid|alias|hostname]] value type of `vm' parameter
    CLI Example:

    salt '*' vmadm.rollback_snapshot 186da9ab-7392-4f55-91a5-b8f1fe770543 baseline
    salt '*' vmadm.rollback_snapshot nacl baseline key=alias
```

```python
salt.modules.smartos_vmadm.send(vm, target, key='uuid')
    Send a vm to a directory
    vm [string] vm to be sent
    target [string] target directory
    key [string [uuid|alias|hostname]] value type of `vm' parameter
    CLI Example:

    salt '*' vmadm.send 186da9ab-7392-4f55-91a5-b8f1fe770543 /opt/backups
    salt '*' vmadm.send vm=nacl target=/opt/backups key=alias
```

```python
salt.modules.smartos_vmadm.start(vm, options=None, key='uuid')
    Start a vm
    vm [string] vm to be started
    options [string] optional additional options
    key [string [uuid|alias|hostname]] value type of `vm' parameter
    CLI Example:

    salt '*' vmadm.start 186da9ab-7392-4f55-91a5-b8f1fe770543
    salt '*' vmadm.start 186da9ab-7392-4f55-91a5-b8f1fe770543 order=c,once=d cdrom=/
    path/to/image.iso,idc'
    salt '*' vmadm.start vm=nacl key=alias
    salt '*' vmadm.start vm=nina.example.org key=hostname
```

```python
salt.modules.smartos_vmadm.stop(vm, force=False, key='uuid')
    Stop a vm
    vm [string] vm to be stopped
    force [boolean] force stop of vm if true
    key [string [uuid|alias|hostname]] value type of `vm' parameter
    CLI Example:
```
salt 'vmadm.stop 186da9ab-7392-4f55-91a5-b8f1fe770543
salt 'vmadm.stop 186da9ab-7392-4f55-91a5-b8f1fe770543 True
salt 'vmadm.stop vm=nacl key=alias
salt 'vmadm.stop vm=nina.example.org key=hostname

salt.modules.smartos_vmadm.sysrq(vm, action='nmi', key='uuid')
Send non-maskable interrupt to vm or capture a screenshot
vm [string] vm to be targeted
action [string] nmi or screenshot -- Default: nmi
key [string [uuid|alias|hostname]] value type of `vm' parameter
CLI Example:
salt 'vmadm.sysrq 186da9ab-7392-4f55-91a5-b8f1fe770543 nmi
salt 'vmadm.sysrq 186da9ab-7392-4f55-91a5-b8f1fe770543 screenshot
salt 'vmadm.sysrq nacl nmi key=alias

salt.modules.smartos_vmadm.update(vm, from_file=None, key='uuid', **kwargs)
Update a new vm
vm [string] vm to be updated
from_file [string] json file to update the vm with -- if present, all other options will be ignored
key [string [uuid|alias|hostname]] value type of `vm' parameter
kwargs [string|int...] options to update for the vm
CLI Example:
salt 'vmadm.update vm=186da9ab-7392-4f55-91a5-b8f1fe770543 from_file=/tmp/new_vm.json
salt 'vmadm.update vm=nacl key=alias from_file=/tmp/new_vm.json
salt 'vmadm.update vm=186da9ab-7392-4f55-91a5-b8f1fe770543 max_physical_memory=1024

19.9.352 salt.modules.smbios
Interface to SMBIOS/DMI
(Parsing through dmidecode)

External References
Desktop Management Interface (DMI)
System Management BIOS
DMidecode

salt.modules.smbios.get(string, clean=True)
Get an individual DMI string from SMBIOS info
string
The string to fetch. DMidecode supports:
• bios-vendor
• bios-version
• bios-release-date
• system-manufacturer
• system-product-name
• system-version

19.9. execution modules
• system-serial-number
• system-uuid
• baseboard-manufacturer
• baseboard-product-name
• baseboard-version
• baseboard-serial-number
• baseboard-asset-tag
• chassis-manufacturer
• chassis-type
• chassis-version
• chassis-serial-number
• chassis-asset-tag
• processor-family
• processor-manufacturer
• processor-version
• processor-frequency

clean

Don’t return well-known false information
(invalid UUID’s, serial 000000000’s, etcetera)
Defaults to True

CLI Example:

```
salt '*' smbios.get system-uuid clean=False
```

`salt.modules.smbios.records` *(rec_type=None, fields=None, clean=True)*

Return DMI records from SMBIOS

**type** Return only records of type(s) The SMBIOS specification defines the following DMI types:

<table>
<thead>
<tr>
<th>Type</th>
<th>Information</th>

clean
Don't return well-known false information
(invalid UUID's, serial 000000000's, etcetera)
Defaults to True

CLI Example:

```bash
salt '*' smbios.records clean=False
salt '*' smbios.records 14
salt '*' smbios.records 4 core_count,thread_count,current_speed
```

19.9.353 salt.modules.smf

Service support for Solaris 10 and 11, should work with other systems that use SMF also. (e.g. SmartOS)

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `service.start' is not available), see [here](#).

salt.modules.smf.available(name)

Returns True if the specified service is available, otherwise returns False.

We look up the name with the svcs command to get back the FMRI This allows users to use simpler service names

CLI Example:

```bash
salt '*' service.available net-snmp
```

salt.modules.smf.disable(name, **kwargs)

Disable the named service to start at boot
CLI Example:

```
salt '*' service.disable <service name>
```

`salt.modules.smf.disabled(name)`
Check to see if the named service is disabled to start on boot

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.smf.enable(name, **kwargs)`
Enable the named service to start at boot

CLI Example:

```
salt '*' service.enable <service name>
```

`salt.modules.smf.enabled(name, **kwargs)`
Check to see if the named service is enabled to start on boot

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.smf.get_all()`
Return all installed services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.smf.get_disabled()`
Return the disabled services

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.smf.get_enabled()`
Return the enabled services

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.smf.get_running()`
Return the running services

CLI Example:

```
salt '*' service.get_running
```

`salt.modules.smf.get_stopped()`
Return the stopped services

CLI Example:

```
salt '*' service.get_stopped
```
**salt.modules.smf.missing(name)**

The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.

CLI Example:
```
salt '*' service.missing net-snmp
```

**salt.modules.smf.reload_(name)**

Reload the named service

CLI Example:
```
salt '*' service.reload <service name>
```

**salt.modules.smf.restart(name)**

Restart the named service

CLI Example:
```
salt '*' service.restart <service name>
```

**salt.modules.smf.start(name)**

Start the specified service

CLI Example:
```
salt '*' service.start <service name>
```

**salt.modules.smf.status(name, sig=None)**

Return the status for a service, returns a bool whether the service is running.

CLI Example:
```
salt '*' service.status <service name>
```

**salt.modules.smf.stop(name)**

Stop the specified service

CLI Example:
```
salt '*' service.stop <service name>
```

---

**19.9.354 salt.modules.smtp**

Module for Sending Messages via SMTP

New in version 2014.7.0.

**depends**

- smtplib python module

**configuration**

This module can be used by either passing a jid and password directly to `send_message`, or by specifying the name of a configuration profile in the minion config, minion pillar, or master config.

For example:
The resourcename refers to the resource that is using this account. It is user-definable, and optional. The following configurations are both valid:

```
my-smtp-login:
  smtp.server: smtp.domain.com
  smtp.tls: True
  smtp.sender: admin@domain.com
  smtp.username: myuser
  smtp.password: verybadpass

another-smtp-login:
  smtp.server: smtp.domain.com
  smtp.tls: True
  smtp.sender: admin@domain.com
  smtp.username: myuser
  smtp.password: verybadpass
```

salt.modules.smtp.send_msg(recipient, message, subject='Message from Salt', sender=None, server=None, use_ssl='True', username=None, password=None, profile=None)

Send a message to an SMTP recipient. Designed for use in states.

CLI Examples:

```
salt.send_msg 'admin@example.com' 'This is a salt module test' profile='my-smtp-account'
salt.send_msg 'admin@example.com' 'This is a salt module test' username='myuser' password='verybadpass' sender='admin@example.com'
salt.send_msg 'admin@example.com' 'This is a salt module test' server='smtp.domain.com'
```

19.9.355 salt.modules.solaris_fmadm

Module for running fmadm and fmdump on Solaris

maintainer Jorge Schrauwen <sjorge@blackdot.be>
maturity new
platform solaris,illumos

New in version 2016.3.0.

salt.modules.solaris_fmadm.acquit(fmri)

Acquit resource or acquit case

fmri: string fmri or uuid

CLI Example:

```
salt '*' fmadm.acquit fmri | uuid
```

salt.modules.solaris_fmadm.config()

Display fault manager configuration
CLI Example:

```
salt '*' fmadm.config
```

`salt.modules.solaris_fmadm.faulty()`  
Display list of faulty resources  

CLI Example:

```
salt '*' fmadm.faulty
```

`salt.modules.solaris_fmadm.flush(fmri)`  
Flush cached state for resource  
 fmri: string fmri  

CLI Example:

```
salt '*' fmadm.flush fmri
```

`salt.modules.solaris_fmadm.healthy()`  
Return whether fmadm is reporting faults  

CLI Example:

```
salt '*' fmadm.healthy
```

`salt.modules.solaris_fmadm.list_records(after=None, before=None)`  
Display fault management logs  
 after [string] filter events after time, see man fmdump for format  
 before [string] filter events before time, see man fmdump for format  

CLI Example:

```
salt '*' fmadm.list
```

`salt.modules.solaris_fmadm.load(path)`  
Load specified fault manager module  
 path: string path of fault manager module  

CLI Example:

```
salt '*' fmadm.load /module/path
```

`salt.modules.solaris_fmadm.repaired(fmri)`  
Notify fault manager that resource has been repaired  
 fmri: string fmri  

CLI Example:

```
salt '*' fmadm.repaired fmri
```

`salt.modules.solaris_fmadm.replaced(fmri)`  
Notify fault manager that resource has been replaced  
 fmri: string fmri  

CLI Example:

```
salt '*' fmadm.replaced fmri
```

`salt.modules.solaris_fmadm.reset(module, serd=None)`  
Reset module or sub-component  
 module: string module to unload
serd  [string] serd sub module
CLI Example:

```
salt '*' fmadm.reset software-response
```

salt.modules.solaris_fmadm.show(uuid)
Display log details
uuid: string  uuid of fault
CLI Example:

```
salt '*' fmadm.show 11b4070f-4358-62fa-9e1e-998f485977e1
```

salt.modules.solaris_fmadm.unload(module)
Unload specified fault manager module
module: string  module to unload
CLI Example:

```
salt '*' fmadm.unload software-response
```

**19.9.356  salt.modules.solaris_group**

Manage groups on Solaris

**Important:** If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to `group.info` is not available), see here.

salt.modules.solaris_group.add(name, gid=None, **kwargs)
Add the specified group
CLI Example:

```
salt '*' group.add foo 3456
```

salt.modules.solaris_group.chgid(name, gid)
Change the gid for a named group
CLI Example:

```
salt '*' group.chgid foo 4376
```

salt.modules.solaris_group.delete(name)
Remove the named group
CLI Example:

```
salt '*' group.delete foo
```

salt.modules.solaris_group.getent(refresh=False)
Return info on all groups
CLI Example:

```
salt '*' group.getent
```
salt.modules.solaris_group.info(name)

Return information about a group

CLI Example:

```
salt '*' group.info foo
```

## 19.9.357 salt.modules.solaris_shadow

Manage the password database on Solaris systems

**Important:** If you feel that Salt should be using this module to manage passwords on a minion, and it is using a different module (or gives an error similar to `shadow.info` is not available), see here.

salt.modules.solaris_shadow.default_hash()

Returns the default hash used for unset passwords

CLI Example:

```
salt '*' shadow.default_hash
```

salt.modules.solaris_shadow.del_password(name)

Delete the password from name user

CLI Example:

```
salt '*' shadow.del_password username
```

salt.modules.solaris_shadow.gen_password(password, crypt_salt=None, algorithm='sha512')

Generate hashed password

**Note:** When called this function is called directly via remote-execution, the password argument may be displayed in the system's process list. This may be a security risk on certain systems.

password  Plaintext password to be hashed.
crypt_salt  Cryptographic salt. If not given, a random 8-character salt will be generated.
algorithm  The following hash algorithms are supported:

-  md5
-  blowfish (not in mainline glibc, only available in distros that add it)
-  sha256
-  sha512 (default)

CLI Example:

```
salt '*' shadow.gen_password 'I_am_password'
salt '*' shadow.gen_password 'I_am_password' crypt_salt='I_am_salt'
⇒ algorithm=sha256
```

salt.modules.solaris_shadow.info(name)

Return information for the specified user
CLI Example:
```bash
salt '*' shadow.info root
```

salt.modules.solaris_shadow.set_maxdays(name, maxdays)
Set the maximum number of days during which a password is valid. See man passwd.
CLI Example:
```bash
salt '*' shadow.set_maxdays username 90
```

salt.modules.solaris_shadow.set_mindays(name, mindays)
Set the minimum number of days between password changes. See man passwd.
CLI Example:
```bash
salt '*' shadow.set_mindays username 7
```

salt.modules.solaris_shadow.set_password(name, password)
Set the password for a named user. The password must be a properly defined hash, the password hash can
be generated with this command: openssl passwd -1 <plaintext password>
CLI Example:
```bash
salt '*' shadow.set_password root $1$UYCIxa628.9qXjpQcJ4a..
```

salt.modules.solaris_shadow.set_warndays(name, warndays)
Set the number of days of warning before a password change is required. See man passwd.
CLI Example:
```bash
salt '*' shadow.set_warndays username 7
```

19.9.358 salt.modules.solaris_system

Support for reboot, shutdown, etc

This module is assumes we are using solaris-like shutdown

New in version 2016.3.0.

salt.modules.solaris_system.halt()
Halt a running system
CLI Example:
```bash
salt '*' system.halt
```

salt.modules.solaris_system.init(state)
Change the system runlevel on sysV compatible systems
CLI Example:
```
state [string] Init state
``` 
```
salt '*' system.init 3
```

salt.modules.solaris_system.poweroff()
Poweroff a running system
CLI Example:
salt '*' system.poweroff

```python
salt.modules.solaris_system.reboot(delay=0, message=None)

Reboot the system

delay  [int]  Optional wait time in seconds before the system will be rebooted.
message  [string]  Optional message to broadcast before rebooting.

CLI Example:

```
salt '*' system.reboot
salt '*' system.reboot 60 "=== system upgraded ==="
```
```
salt.modules.solaris_system.shutdown(delay=0, message=None)

Shutdown a running system

delay  [int]  Optional wait time in seconds before the system will be shutdown.
message  [string]  Optional message to broadcast before rebooting.

CLI Example:

```
salt '*' system.shutdown
salt '*' system.shutdown 60 "=== disk replacement ==="
```
```

## 19.9.359 salt.modules.solaris_user

Manage users with the useradd command

**Important:** If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to `'user.info' is not available`), see here.

```python
salt.modules.solaris_user.add(name, uid=None, gid=None, groups=None, home=None, shell=None, unique=True, fullname='`, roomnumber='`, workphone='`, homephone='`, createhome=True, **kwargs)

Add a user to the minion

```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

```python
salt.modules.solaris_user.chfullname(name, fullname)

Change the user's Full Name

```
salt '*' user.chfullname foo "Foo Bar"
```

```python
salt.modules.solaris_user.chgid(name, gid)

Change the default group of the user

```
salt '*' user.chgid foo 4376
```

```python
salt.modules.solaris_user.chgroups(name, groups, append=False)

Change the groups to which a user belongs

name  Username to modify

groups  List of groups to set for the user. Can be passed as a comma-separated list or a Python list.

```

```

## 19.9. execution modules

2091
append [False] Set to True to append these groups to the user's existing list of groups. Otherwise, the specified groups will replace any existing groups for the user.

CLI Example:
```
salt '*' user.chgroups foo wheel,root True
```

salt.modules.solaris_user.chhome(name, home, persist=False)
Set a new home directory for an existing user
- name Username to modify
- home New home directory to set
- persist [False] Set to True to prevent configuration files in the new home directory from being overwritten by the files from the skeleton directory.

CLI Example:
```
salt '*' user.chhome foo /home/users/foo True
```

salt.modules.solaris_user.chhomephone(name, homephone)
Change the user's Home Phone

CLI Example:
```
salt '*' user.chhomephone foo "7735551234"
```

salt.modules.solaris_user.chroomnumber(name, roomnumber)
Change the user's Room Number

CLI Example:
```
salt '*' user.chroomnumber foo 123
```

salt.modules.solaris_user.chshell(name, shell)
Change the default shell of the user

CLI Example:
```
salt '*' user.chshell foo /bin/zsh
```

salt.modules.solaris_user.chuid(name, uid)
Change the uid for a named user

CLI Example:
```
salt '*' user.chuid foo 4376
```

salt.modules.solaris_user.chworkphone(name, workphone)
Change the user's Work Phone

CLI Example:
```
salt '*' user.chworkphone foo "7735550123"
```

salt.modules.solaris_user.delete(name, remove=False, force=False)
Remove a user from the minion

CLI Example:
```
salt '*' user.delete name remove=True force=True
```
salt.modules.solaris_user.getent(refresh=False)
Return the list of all info for all users

- CLI Example:
  
  ```
salt '*' user.getent
  ```

salt.modules.solaris_user.info(name)
Return user information

- CLI Example:

  ```
salt '*' user.info root
  ```

salt.modules.solaris_user.list_groups(name)
Return a list of groups the named user belongs to

- CLI Example:

  ```
salt '*' user.list_groups foo
  ```

salt.modules.solaris_user.list_users()
Return a list of all users

- CLI Example:

  ```
salt '*' user.list_users
  ```

salt.modules.solaris_user.rename(name, new_name)
Change the username for a named user

- CLI Example:

  ```
salt '*' user.rename name new_name
  ```

### 19.9.360 salt.modules.solarisips

IPS pkg support for Solaris

**Important**: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `pkg.install` is not available), see [here](#).

This module provides support for Solaris 11 new package management - IPS (Image Packaging System). This is the default pkg module for Solaris 11 (and later).

If you want to use also other packaging module (e.g. pkgutil) together with IPS, you need to override the pkg provider in sls for each package:

```
mypackage:
pkg.installed:
  - provider: pkgutil
```

Or you can override it globally by setting the `providers` parameter in your Minion config file like this:

```
providers:
pkg: pkgutil
```
Or you can override it globally by setting the `providers` parameter in your Minion config file like this:

```
providers:
  pkg: pkgutil
```

salt.modules.solarisips.available_version(name, **kwargs)

This function is an alias of `latest_version`. The available version of the package in the repository. In case of multiple matches, it returns list of all matched packages. Accepts full or partial FMRI. Please use `pkg.latest_version` as `pkg.available_version` is being deprecated.

CLI Example:
```
salt '*' pkg.latest_version pkg://solaris/entire
```

salt.modules.solarisips.get_fmri(name, **kwargs)

Returns FMRI from partial name. Returns empty string ('') if not found. In case of multiple match, the function returns list of all matched packages.

CLI Example:
```
salt '*' pkg.get_fmri bash
```

salt.modules.solarisips.install(name=None, refresh=False, pkgs=None, version=None, test=False, **kwargs)

Install the named package using the IPS pkg command. Accepts full or partial FMRI.

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
              'new': '<new-version>'}}
```

Multiple Package Installation Options:
- `pkgs` A list of packages to install. Must be passed as a python list.

CLI Example:
```
salt '*' pkg.install vim
salt '*' pkg.install pkg://solaris/editor/vim
salt '*' pkg.install pkg://solaris/editor/vim refresh=True
salt '*' pkg.install pkgs='["foo", "bar"]'
```

salt.modules.solarisips.is_installed(name, **kwargs)

Returns True if the package is installed. Otherwise returns False. Name can be full or partial FMRI. In case of multiple match from partial FMRI name, it returns True.

CLI Example:
```
salt '*' pkg.is_installed bash
```

salt.modules.solarisips.latest_version(name, **kwargs)

The available version of the package in the repository. In case of multiple matches, it returns list of all matched packages. Accepts full or partial FMRI. Please use `pkg.latest_version` as `pkg.available_version` is being deprecated.

CLI Example:
```
salt '*' pkg.latest_version pkg://solaris/entire
```
salt.modules.solarisips.list_pkgs(versions_as_list=False, **kwargs)
List the currently installed packages as a dict:

```python
{'<package_name>': '<version>'
}
```

CLI Example:
```
salt '*' pkg.list_pkgs
```

salt.modules.solarisips.list_upgrades(refresh=True, **kwargs)
Lists all packages available for update.

When run in global zone, it reports only upgradable packages for the global zone.

When run in non-global zone, it can report more upgradable packages than `pkg update -vn`, because `pkg update` hides packages that require newer version of `pkg://solaris/entire` (which means that they can be upgraded only from the global zone). If `pkg://solaris/entire` is found in the list of upgrades, then the global zone should be updated to get all possible updates. Use `refresh=True` to refresh the package database.

refresh [True] Runs a full package database refresh before listing. Set to False to disable running the refresh.

Changed in version 2017.7.0.

In previous versions of Salt, refresh defaulted to False. This was changed to default to True in the 2017.7.0 release to make the behavior more consistent with the other package modules, which all default to True.

CLI Example:
```
salt '*' pkg.list_upgrades
salt '*' pkg.list_upgrades refresh=False
```

salt.modules.solarisips.normalize_name(name, **kwargs)
Internal function. Normalizes pkg name to full FMRI before running pkg.install. In case of multiple matches or no match, it returns the name without modifications.

CLI Example:
```
salt '*' pkg.normalize_name vim
```

salt.modules.solarisips.purge(name, **kwargs)
Remove specified package. Accepts full or partial FMRI.

Returns a list containing the removed packages.

CLI Example:
```
salt '*' pkg.purge <package name>
```

salt.modules.solarisips.refresh_db(full=False)
Updates the remote repos database.

full: False
Set to True to force a refresh of the pkg DB from all publishers, regardless of the last refresh time.

CLI Example:
```
salt '*' pkg.refresh_db
salt '*' pkg.refresh_db full=True
```
salt.modules.solarisips.remove(name=None, pkgs=None, **kwargs)
Remove specified package. Accepts full or partial FMRI. In case of multiple match, the command fails and won't modify the OS.
name The name of the package to be deleted.
Multiple Package Options:
pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.
Returns a list containing the removed packages.

CLI Example:
```
salt '*' pkg.remove <package name>
salt '*' pkg.remove tcsh
dead '*' pkg.remove pkg://solaris/shell/tcsh
dead '*' pkg.remove pkgs='["foo", "bar"]'
```

salt.modules.solarisips.search(name, versions_as_list=False, **kwargs)
Searches the repository for given pkg name. The name can be full or partial FMRI. All matches are printed. Globes are also supported.

CLI Example:
```
salt '*' pkg.search bash
```

salt.modules.solarisips.upgrade(refresh=False, **kwargs)
Upgrade all packages to the latest possible version. When run in global zone, it updates also all non-global zones. In non-global zones upgrade is limited by dependency constrains linked to the version of pkg://solaris/entire.

Returns a dictionary containing the changes:
```
{'<package>': {'old': '<old-version>',
              'new': '<new-version>'}}
```

When there is a failure, an explanation is also included in the error message, based on the return code of the pkg upgrade command.

CLI Example:
```
salt '*' pkg.upgrade
```

salt.modules.solarisips.upgrade_available(name)
Check if there is an upgrade available for a certain package Accepts full or partial FMRI. Returns all matches found.

CLI Example:
```
salt '*' pkg.upgrade_available apache-22
```

salt.modules.solarisips.version(names, **kwargs)
Common interface for obtaining the version of installed packages. Accepts full or partial FMRI. If called using pkg_resource, full FMRI is required.

CLI Example:
```
salt '*' pkg.version vim
salt '*' pkg.version foo bar baz
salt '*' pkg_resource.version pkg://solaris/entire
```
19.9.361 salt.modules.solarispkg

Package support for Solaris

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `pkg.install' is not available), see here.

salt.modules.solarispkg.install(name=None, sources=None, saltenv='base', **kwargs)

Install the passed package. Can install packages from the following sources:

- Locally (package already exists on the minion)
- HTTP/HTTPS server
- FTP server
- Salt master

Returns a dict containing the new package names and versions:

```python
{'<package>': {'old': '<old-version>',
              'new': '<new-version>'}}
```

CLI Examples:

```
# Installing a data stream pkg that already exists on the minion
salt '*' pkg.install sources='[{"<pkg name>": "/dir/on/minion/<pkg filename>"}]'
salt '*' pkg.install sources='[{"SMC-lgcc346": "/var/spool/pkg/gcc-3.4.6-sol10-sparc-local.pkg"}]'

# Installing a data stream pkg that exists on the salt master
salt '*' pkg.install sources='[{"<pkg name>": ":salt://pkgs/<pkg filename>"}]'
salt '*' pkg.install sources='[{"SMC-lgcc346": ":salt://pkgs/gcc-3.4.6-sol10-sparc-local.pkg"}]'
```

CLI Example:

```
# Installing a data stream pkg that exists on a HTTP server
salt '*' pkg.install sources='[{"<pkg name>": "http://packages.server.com/<pkg filename>"}]'
salt '*' pkg.install sources='[{"SMC-lgcc346": "http://packages.server.com/gcc-3.4.6-sol10-sparc-local.pkg"}]'
```

If working with solaris zones and you want to install a package only in the global zone you can pass `current_zone_only=True' to salt to have the package only installed in the global zone. (Behind the scenes this is passing `-G' to the pkgadd command.) Solaris default when installing a package in the global zone is to install it in all zones. This overrides that and installs the package only in the global.

CLI Example:

```
# Installing a data stream package only in the global zone:
salt 'global_zone' pkg.install sources='["SMC-lgcc346": "/var/spool/pkg/gcc-3.4.6-sol10-sparc-local.pkg"]' current_zone_only=True
```

By default salt automatically provides an adminfile, to automate package installation, with these options set:

```python
tuple('adminfile',
      'instance=quit',
      'partial=nocheck'
)`
runlevel=nocheck
depend=nocheck
rdepend=nocheck
space=nocheck
setuid=nocheck
conflict=nocheck
action=nocheck
basedir=default

You can override any of these options in two ways. First you can optionally pass any of the options as a kwarg to the module/state to override the default value or you can optionally pass the `admin_source` option providing your own adminfile to the minions.

Note: You can find all of the possible options to provide to the adminfile by reading the admin man page:

```
man -s 4 admin
```

**CLI Example:**

```
# Overriding the 'instance' adminfile option when calling the module directly
salt '*' pkg.install sources='["<pkg name>": "salt://pkgs/<pkg filename>"]'
  --instance="overwrite"
```

**SLS Example:**

```
# Overriding the 'instance' adminfile option when used in a state
SMClgcc346:
  pkg.installed:
    - sources:
      - SMClgcc346: salt://srv/salt/pkgs/gcc-3.4.6-sol10-sparc-local.pkg
      - instance: overwrite
```

**Note:** The ID declaration is ignored, as the package name is read from the `sources` parameter.

**CLI Example:**

```
# Providing your own adminfile when calling the module directly
salt '*' pkg.install sources='["<pkg name>": "salt://pkgs/<pkg filename>"]'
  --admin_source='salt://pkgs/<adminfile filename>'

# Providing your own adminfile when using states
<pkg name>:
  pkg.installed:
    - sources:
      - <pkg name>: salt://pkgs/<pkg filename>
      - admin_source: salt://pkgs/<adminfile filename>
```

**Note:** The ID declaration is ignored, as the package name is read from the `sources` parameter.

```
salt.modules.solarispkg.latest_version("names", **kwargs)
```

Return the latest version of the named package available for upgrade or installation. If more than one package
name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```bash
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

NOTE: As package repositories are not presently supported for Solaris pkgadd, this function will always return an empty string for a given package.

```python
salt.modules.solarispkg.list_pkgs(versions_as_list=False, **kwargs)
```

List the packages currently installed as a dict:

```python
{'<package_name>': '<version>'}
```

CLI Example:

```bash
salt '*' pkg.list_pkgs
```

```python
salt.modules.solarispkg.purge(name=None, pkgs=None, **kwargs)
```

Package purges are not supported, this function is identical to remove().

**name** The name of the package to be deleted

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The **name** parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```bash
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs=['"foo", "bar"]'
```

```python
salt.modules.solarispkg.remove(name=None, pkgs=None, saltenv='base', **kwargs)
```

Remove packages with pkgrm

**name** The name of the package to be deleted

By default salt automatically provides an adminfile, to automate package removal, with these options set:

```python
email=
instance=quit
partial=nocheck
runlevel=nocheck
idepend=nocheck
rdepend=nocheck
space=nocheck
setuid=nocheck
conflict=nocheck
action=nocheck
basedir=default
```

You can override any of these options in two ways. First you can optionally pass any of the options as a kwarg to the module/state to override the default value or you can optionally pass the `admin_source' option providing your own adminfile to the minions.

Note: You can find all of the possible options to provide to the adminfile by reading the admin man page:
Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove SUNWgit
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

salt.modules.solarispkg.upgrade_available(name)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

salt.modules.solarispkg.version(*names, **kwargs)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

19.9.362 salt.modules.solr

Apache Solr Salt Module

Author: Jed Glazner Version: 0.2.1 Modified: 12/09/2011

This module uses HTTP requests to talk to the apache solr request handlers to gather information and report errors. Because of this the minion doesn't necessarily need to reside on the actual slave. However if you want to use the signal function the minion must reside on the physical solr host.

This module supports multi-core and standard setups. Certain methods are master/slave specific. Make sure you set the solr.type. If you have questions or want a feature request please ask.

**Coming Features in 0.3**

1. Add command for checking for replication failures on slaves
2. Improve match_index_versions since it's pointless on busy solr masters
3. Add additional local fs checks for backups to make sure they succeeded

**Override these in the minion config**

solr.cores A list of core names e.g. ['core1';'core2']. An empty list indicates non-multicore setup.
solr.baseurl  The root level URL to access solr via HTTP

solr.request_timeout  The number of seconds before timing out an HTTP/HTTPS/FTP request. If nothing is specified then the python global timeout setting is used.

solr.type  Possible values are `master` or `slave`

solr.backup_path  The path to store your backups. If you are using cores and you can specify to append the core name to the path in the backup method.

solr.num_backups  For versions of solr >= 3.5. Indicates the number of backups to keep. This option is ignored if your version is less.

solr.init_script  The full path to your init script with start/stop options

solr.dih.options  A list of options to pass to the DIH.

**Required Options for DIH**

clean  [False] Clear the index before importing

commit  [True] Commit the documents to the index upon completion

optimize  [True] Optimize the index after commit is complete

verbose  [True] Get verbose output

salt.modules.solr.abort_import(handler, host=None, core_name=None, verbose=False)

MASTER ONLY Aborts an existing import command to the specified handler. This command can only be run if the minion is configured with solr.type=master

handler  [str] The name of the data import handler.

host  [str (None)] The solr host to query. __opts__['host'] is default.

core  [str (None)] The core the handler belongs to.

verbose  [boolean (False)] Run the command with verbose output.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

**CLI Example:**

```
salt '*' solr.abort_import dataimport None music {'clean':True}
```

salt.modules.solr.backup(host=None, core_name=None, append_core_to_path=False)

Tell solr make a backup. This method can be mis-leading since it uses the backup API. If an error happens during the backup you are not notified. The status: `OK` in the response simply means that solr received the request successfully.

host  [str (None)] The solr host to query. __opts__['host'] is default.

core_name  [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

append_core_to_path  [boolean (False)] If True add the name of the core to the backup path. Assumes that minion backup path is not None.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

**CLI Example:**

```
salt '*' solr.backup music
```

19.9.  execution modules
salt.modules.solr.core_status(host=None, core_name=None)
    MULTI-CORE HOSTS ONLY Get the status for a given core or all cores if no core is specified
    host [str (None)] The solr host to query. __opts__['host'] is default.
    core_name [str] The name of the core to reload
    Return : dict<str,obj>:
        {'success':boolean, 'data':dict, 'errors':list, 'warnings':list}

    CLI Example:
    salt '*' solr.core_status None music

salt.modules.solr.delta_import(handler, host=None, core_name=None, options=None, extra=None)
    Submits an import command to the specified handler using specified options. This command can only be run
    if the minion is configured with solr.type=master
    handler [str] The name of the data import handler.
    host [str (None)] The solr host to query. __opts__['host'] is default.
    core [str (None)] The core the handler belongs to.
    options [dict (__opts__)] A list of options such as clean, optimize commit, verbose, and pause_replication.
        leave blank to use __opts__ defaults. options will be merged with __opts__
    extra [dict ([])]: Extra name value pairs to pass to the handler. e.g. ['name=value']
    Return : dict<str,obj>:
        {'success':boolean, 'data':dict, 'errors':list, 'warnings':list}

    CLI Example:
    salt '*' solr.delta_import dataimport None music {'clean':True}

salt.modules.solr.full_import(handler, host=None, core_name=None, options=None, extra=None)
    MASTER ONLY Submits an import command to the specified handler using specified options. This command
    can only be run if the minion is configured with solr.type: `master`
    handler [str] The name of the data import handler.
    host [str (None)] The solr host to query. __opts__['host'] is default.
    core [str (None)] The core the handler belongs to.
    options [dict (__opts__)] A list of options such as clean, optimize commit, verbose, and pause_replication.
        leave blank to use __opts__ defaults. options will be merged with __opts__
    extra [dict ([])]: Extra name value pairs to pass to the handler. e.g. ['name=value']
    Return : dict<str,obj>:
        {'success':boolean, 'data':dict, 'errors':list, 'warnings':list}

    CLI Example:
    salt '*' solr.full_import dataimport None music {'clean':True}

salt.modules.solr.import_status(handler, host=None, core_name=None, verbose=False)
    Submits an import command to the specified handler using specified options. This command can only be run
    if the minion is configured with solr.type: `master`
    handler [str] The name of the data import handler.
    host [str (None)] The solr host to query. __opts__['host'] is default.
    core [str (None)] The core the handler belongs to.
    verbose [boolean (False)] Specifies verbose output
    Return : dict<str,obj>:
CLI Example:
```
salt '*' solr.import_status dataimport None music False
```

salt.modules.solr.is_replication_enabled(host=None, core_name=None)
SLAVE CALL Check for errors, and determine if a slave is replicating or not.

```
{'success': boolean, 'data': dict, 'errors': list, 'warnings': list}
```

CLI Example:
```
salt '*' solr.is_replication_enabled music
```

salt.modules.solr.lucene_version(core_name=None)
Gets the lucene version that solr is using. If you are running a multi-core setup you should specify a core name since all the cores run under the same servlet container, they will all have the same version.

```
{'success': boolean, 'data': dict, 'errors': list, 'warnings': list}
```

CLI Example:
```
salt '*' solr.lucene_version
```

salt.modules.solr.match_index_versions(host=None, core_name=None)
SLAVE CALL Verifies that the master and the slave versions are in sync by comparing the index version. If you are constantly pushing updates the index the master and slave versions will seldom match. A solution to this is pause indexing every so often to allow the slave to replicate and then call this method before allowing indexing to resume.

```
{'success': boolean, 'data': dict, 'errors': list, 'warnings': list}
```

CLI Example:
```
salt '*' solr.match_index_versions music
```

salt.modules.solr.optimize(host=None, core_name=None)
Search queries fast, but it is a very expensive operation. The ideal process is to run this with a master/slave configuration. Then you can optimize the master, and push the optimized index to the slaves. If you are running a single solr instance, or if you are going to run this on a slave be aware than search performance will be horrible while this command is being run. Additionally it can take a LONG time to run and your HTTP request may timeout. If that happens adjust your timeout settings.

```
{'success': boolean, 'data': dict, 'errors': list, 'warnings': list}
```

CLI Example:
```
salt '*' solr.optimize music
```
core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```json
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.optimize music
```

salt.modules.solr.ping(host=None, core_name=None)

Does a health check on solr, makes sure solr can talk to the indexes.

host [str (None)] The solr host to query. __opts__['host'] is default.

core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```json
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.ping music
```

salt.modules.solr.reload_core(host=None, core_name=None)

MULTI-CORE HOSTS ONLY Load a new core from the same configuration as an existing registered core. While the "new" core is initializing, the "old" one will continue to accept requests. Once it has finished, all new request will go to the "new" core, and the "old" core will be unloaded.

host [str (None)] The solr host to query. __opts__['host'] is default.

core_name [str] The name of the core to reload

Return : dict<str,obj>:

```json
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.reload_core None music
```

Return data is in the following format:

```json
{'success':bool, 'data':dict, 'errors':list, 'warnings':list}
```

salt.modules.solr.reload_import_config(handler, host=None, core_name=None, verbose=False)

MASTER ONLY Re-loads the handler config XML file. This command can only be run if the minion is a "master" type

handler [str] The name of the data import handler.

host [str (None)] The solr host to query. __opts__['host'] is default.

core [str (None)] The core the handler belongs to.

verbose [boolean (False)] Run the command with verbose output.

Return : dict<str,obj>:

```json
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:
salt '*' solr.reload_import_config dataimport None music {'clean':True}

salt.modules.solr.replication_details (host=None, core_name=None)
Get the full replication details.
host [str (None)] The solr host to query. __opts__['host'] is default.
core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores
or if you want to check all cores.
Return: dict<str,obj>:

{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}

CLI Example:
salt '*' solr.replication_details music

salt.modules.solr.set_is_polling (polling, host=None, core_name=None)
SLAVE CALL Prevent the slaves from polling the master for updates.
polling [boolean] True will enable polling. False will disable it.
host [str (None)] The solr host to query. __opts__['host'] is default.
core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores
or if you want to check all cores.
Return: dict<str,obj>:

{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}

CLI Example:
salt '*' solr.set_is_polling False

salt.modules.solr.set_replication_enabled (status, host=None, core_name=None)
MASTER ONLY Sets the master to ignore poll requests from the slaves. Useful when you don't want the slaves
replicating during indexing or when clearing the index.
status [boolean] Sets the replication status to the specified state.
host [str (None)] The solr host to query. __opts__['host'] is default.
core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores
or if you want to set the status on all cores.
Return: dict<str,obj>:

{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}

CLI Example:
salt '*' solr.set_replication_enabled false, None, music

salt.modules.solr.signal (signal=None)
Signals Apache Solr to start, stop, or restart. Obviously this is only going to work if the minion resides on the
solr host. Additionally Solr doesn't ship with an init script so one must be created.
signal [str (None)] The command to pass to the apache solr init valid values are 'start', 'stop', and 'restart'
CLI Example:
salt '*' solr.signal restart

salt.modules.solr.version (core_name=None)
Gets the solr version for the core specified. You should specify a core here as all the cores will run under the
same servlet container and so will all have the same version.
core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```py
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.version
```

## 19.9.363 salt.modules.solrcloud module

Module for solrcloud configuration

New in version 2017.7.0.

For now, module is limited to http-exposed API. It doesn't implement config upload via Solr zkCli

```py
salt.modules.solrcloud.BOOL_PROPS_LIST = ['transient', 'loadOnStartup']

Collections options type definition Reference: https://cwiki.apache.org/confluence/display/solr/Collections+API#CollectionsAPI-api1

salt.modules.solrcloud.DICT_OPTIONS_LIST = ['properties']

Collection unmodifiable options Reference: https://cwiki.apache.org/confluence/display/solr/Collections+API#CollectionsAPI-modifycoll
```

```py
salt.modules.solrcloud.alias_exists(alias_name, **kwargs)

Check alias existence

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.alias_exists my_alias
```

```py
salt.modules.solrcloud.alias_get_collections(alias_name, **kwargs)

Get collection list for an alias

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.alias_get my_alias
```

```py
salt.modules.solrcloud.alias_set_collections(alias_name, collections=None, **kwargs)

Define an alias

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.alias_set my_alias collections=[collection1, collection2]
```

```py
salt.modules.solrcloud.cluster_status(**kwargs)

Get cluster status

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
```python
salt '*' solrcloud.cluster_status

salt.modules.solrcloud.collection_backup(
collection_name, location, backup_name=None,
**kwargs)

Create a backup for a collection.
Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:
salt '*' solrcloud.core_backup collection_name /mnt/nfs_backup

salt.modules.solrcloud.collection_backup_all(location, backup_name=None, **kwargs)

Create a backup for all collection present on the server.
Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:
salt '*' solrcloud.core_backup /mnt/nfs_backup

salt.modules.solrcloud.collection_check_options(options)

Check collections options

CLI Example:
salt '*' solrcloud.collection_check_options '{"replicationFactor":4}'

salt.modules.solrcloud.collection_create(
collection_name, options=None, **kwargs)

Create a collection.
Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:
salt '*' solrcloud.collection_create collection_name

Collection creation options may be passed using the ``options`` parameter. Do not include option ``name`` since it already specified by the mandatory parameter ``collection_name``

salt '*' solrcloud.collection_create collection_name options={"replicationFactor": 2, "numShards": 3}

Cores options may be passed using the ``properties`` key in options. Do not include property ``name``

salt '*' solrcloud.collection_create collection_name options={"replicationFactor": 2, "numShards": 3, "properties": {"dataDir": "/srv/solr/", "hugePartitionSollection": true}}

salt.modules.solrcloud.collection_creation_options()

Get collection option list that can only be defined at creation

CLI Example:
salt '*' solrcloud.collection_creation_options

salt.modules.solrcloud.collection_exists(collection_name, **kwargs)

Check if a collection exists
Additional parameters (kwargs) may be passed, they will be proxied to http.query
CLI Example:
```
salt '*' solrcloud.collection_exists collection_name
```

**salt.modules.solrcloud.collection_get_options(collection_name, **kwargs)**
Get collection options

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:
```
salt '*' solrcloud.collection_get_options collection_name
```

**salt.modules.solrcloud.collection_list(**kwargs)**
List all collections

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:
```
salt '*' solrcloud.collection_list
```

**salt.modules.solrcloud.collection_reload(collection, **kwargs)**
Check if a collection exists

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:
```
salt '*' solrcloud.collection_reload collection_name
```

**salt.modules.solrcloud.collection_set_options(collection_name, options, **kwargs)**
Change collection options

Additional parameters (kwargs) may be passed, they will be proxied to http.query

Note that not every parameter can be changed after collection creation

CLI Example:
```
salt '*' solrcloud.collection_set_options collection_name options={
  "replicationFactor":4}
```

**salt.modules.solrcloud.log = <salt.log.setup.SaltLoggingClass object>**
Core properties type definition. Reference: https://cwiki.apache.org/confluence/display/solr/Defining+core.properties

**19.9.364 salt.modules.splunk**

Module for interop with the Splunk API

New in version 2016.3.0..

  **depends**

  * splunk-sdk python module

  **configuration**  Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the `splunk` key by default, if defined.

  For example:
salt.modules.splunk.create_user(email, profile='splunk', **kwargs)
create a splunk user by name/email

CLI Example:
salt myminion splunk.create_user user@example.com roles=['user'] realname="Test User" name=testuser

salt.modules.splunk.delete_user(email, profile='splunk')
Delete a splunk user by email

CLI Example:
salt myminion splunk_user.delete `user@example.com`

salt.modules.splunk.get_user(email, profile='splunk', **kwargs)
Get a splunk user by name/email

CLI Example:
salt myminion splunk.get_user `user@example.com` user_details=false salt myminion splunk.get_user `user@example.com` user_details=true

salt.modules.splunk.list_users(profile='splunk')
List all users in the splunk DB

CLI Example:
salt myminion splunk.list_users

salt.modules.splunk.update_user(email, profile='splunk', **kwargs)
Create a splunk user by email

CLI Example:
salt myminion splunk.update_user example@domain.com roles=['user'] realname="Test User"

19.9.365 salt.modules.splunk_search

Module for interop with the Splunk API

New in version 2015.5.0.

depends

• splunk-sdk python module

configuration Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the `splunk` key by default, if defined.

For example:
splunk:
    username: alice
    password: abc123
    host: example.splunkcloud.com
    port: 8080
salt.modules.splunk_search.create(name, profile='splunk', **kwargs)

Create a splunk search

CLI Example:
splunk_search.create 'my search name' search='error msg'

salt.modules.splunk_search.delete(name, profile='splunk')

Delete a splunk search

CLI Example:
splunk_search.delete 'my search name'

salt.modules.splunk_search.get(name, profile='splunk')

Get a splunk search

CLI Example:
splunk_search.get 'my search name'

salt.modules.splunk_search.list_(profile='splunk')

List splunk searches (names only)

CLI Example: splunk_search.list

salt.modules.splunk_search.list_all(prefix=None, app=None, owner=None, description_contains=None, name_not_contains=None, profile='splunk')

Get all splunk search details. Produces results that can be used to create an sls file.

if app or owner are specified, results will be limited to matching saved searches.

if description_contains is specified, results will be limited to those where `description_contains in description` is true if name_not_contains is specified, results will be limited to those where `name_not_contains not in name` is true.

If prefix parameter is given, alarm names in the output will be prepended with the prefix; alarms that have the prefix will be skipped. This can be used to convert existing alarms to be managed by salt, as follows:

CLI example:

1. Make a `backup` of all existing searches
   $ salt-call splunk_search.list_all --out=txt | sed `s/local: //` > legacy_searches.sls

2. Get all searches with new prefixed names
   $ salt-call splunk_search.list_all `prefix="MANAGED BY SALT"` --out=txt | sed `s/local: //` > managed_searches.sls

3. Insert the managed searches into splunk
   $ salt-call state.sls managed_searches.sls

4. Manually verify that the new searches look right

5. Delete the original searches
   $ sed s/present/absent/ legacy_searches.sls > remove_legacy_searches.sls
   $ salt-call state.sls remove_legacy_searches.sls

6. Get all searches again, verify no changes
   $ salt-call splunk_search.list_all --out=txt | sed `s/local: //` > final_searches.sls
   $ diff final_searches.sls managed_searches.sls

salt.modules.splunk_search.update(name, profile='splunk', **kwargs)

Update a splunk search

CLI Example:
splunk_search.update 'my search name' sharing=app

19.9.366 salt.modules.sqlite3

Support for SQLite3

salt.modules.sqlite3.fetch(db=None, sql=None)

Retrieve data from an sqlite3 db (returns all rows, be careful!)
CLI Example:
```
salt '*' sqlite3.fetch /root/test.db 'SELECT * FROM test;'
```

salt.modules.sqlite3.indexes
Show all indices in the database, for people with poor spelling skills
CLI Example:
```
salt '*' sqlite3.indexes /root/test.db
```

salt.modules.sqlite3.indices
Show all indices in the database
CLI Example:
```
salt '*' sqlite3.indices /root/test.db
```

salt.modules.sqlite3.modify
Issue an SQL query to sqlite3 (with no return data), usually used to modify the database in some way (insert, delete, create, etc)
CLI Example:
```
salt '*' sqlite3.modify /root/test.db 'CREATE TABLE test(id INT, testdata TEXT);'
```

salt.modules.sqlite3.sqlite_version
Return version of sqlite
CLI Example:
```
salt '*' sqlite3.sqlite_version
```

salt.modules.sqlite3.tables
Show all tables in the database
CLI Example:
```
salt '*' sqlite3.tables /root/test.db
```

salt.modules.sqlite3.version
Return version of pysqlite
CLI Example:
```
salt '*' sqlite3.version
```

19.9.367 salt.modules.ssh

Manage client ssh components

**Note:** This module requires the use of MD5 hashing. Certain security audits may not permit the use of MD5. For those cases, this module should be disabled or removed.

salt.modules.ssh.auth_keys
Return the authorized keys for users
CLI Example:

```bash
salt '*' ssh.auth_keys
salt '*' ssh.auth_keys root
salt '*' ssh.auth_keys user=root
salt '*' ssh.auth_keys user="[user1, user2]"
```

`salt.modules.ssh.check_key` *(user, key, enc, comment, options, config='ssh/authorized_keys', cache_keys=None, fingerprint_hash_type=None)*

Check to see if a key needs updating, returns ``update``, ``add`` or ``exists``

CLI Example:

```bash
salt '*' ssh.check_key <user> <key> <enc> <comment> <options>
```

`salt.modules.ssh.check_key_file` *(user, source, config='ssh/authorized_keys', saltenv='base', fingerprint_hash_type=None)*

Check a keyfile from a source destination against the local keys and return the keys to change

CLI Example:

```bash
salt '*' ssh.check_key_file root salt://ssh/keyfile
```

`salt.modules.ssh.check_known_host` *(user=None, hostname=None, key=None, fingerprint=None, config=None, port=None, fingerprint_hash_type=None)*

Check the record in known_hosts file, either by its value or by fingerprint (it's enough to set up either key or fingerprint, you don't need to set up both).

If provided key or fingerprint doesn't match with stored value, return ``update``, if no value is found for a given host, return ``add``, otherwise return ``exists``.

If neither key, nor fingerprint is defined, then additional validation is not performed.

CLI Example:

```bash
salt '*' ssh.check_known_host <user> <hostname> key='AAAA...FAaQ=='
```

`salt.modules.ssh.get_known_host` *(user, hostname, config=None, port=None, fingerprint_hash_type=None)*

Return information about known host from the configfile, if any. If there is no such key, return None.

CLI Example:

```bash
salt '*' ssh.get_known_host <user> <hostname>
```

`salt.modules.ssh.hash_known_hosts` *(user=None, config=None)*

Hash all the hostnames in the known hosts file.

New in version 2014.7.0.

CLI Example:

```bash
salt '*' ssh.hash_known_hosts
```

`salt.modules.ssh.host_keys` *(keydir=None, private=True)*

Return the minion's host keys

CLI Example:
salt.modules.ssh.key_is_encrypted(key)

New in version 2015.8.7.

Function to determine whether or not a private key is encrypted with a passphrase.

Checks key for a Proc-Type header with ENCRYPTED in the value. If found, returns True, otherwise returns False.

CLI Example:

```
salt '*' ssh.key_is_encrypted /root/id_rsa
```

salt.modules.ssh.recv_known_host(hostname, enc=None, port=None, hash_known_hosts=True, timeout=5, fingerprint_hash_type=None)

Retrieve information about host public key from remote server.

hostname The name of the remote host (e.g. `github.com`)
enc Defines what type of key is being used, can be ed25519, ecdsa ssh-rsa or ssh-dss
port optional parameter, denoting the port of the remote host, which will be used in case, if the public key will be requested from it. By default the port 22 is used.
hash_known_hosts [True] Hash all hostnames and addresses in the known hosts file.
timeout [int] Set the timeout for connection attempts. If timeout seconds have elapsed since a connection was initiated to a host or since the last time anything was read from that host, then the connection is closed and the host in question considered unavailable. Default is 5 seconds.

New in version 2016.3.0.
fingerprint_hash_type The public key fingerprint hash type that the public key fingerprint was originally hashed with. This defaults to sha256 if not specified.

New in version 2016.11.4.

Changed in version 2017.7.0: default changed from md5 to sha256

CLI Example:

```
salt '*' ssh.recv_known_host <hostname> enc=<enc> port=<port>
```

salt.modules.ssh.rm_auth_key(user, key, config='.ssh/authorized_keys', fingerprint_hash_type=None)

Remove an authorized key from the specified user's authorized key file

CLI Example:

```
salt '*' ssh.rm_auth_key <user> <key>
```

salt.modules.ssh.rm_auth_key_from_file(user, source, config='.ssh/authorized_keys', saltenv='base', fingerprint_hash_type=None)

Remove an authorized key from the specified user's authorized key file, using a file as source

CLI Example:

```
salt '*' ssh.rm_auth_key_from_file <user> salt://ssh_keys/<user>.id_rsa.pub
```

salt.modules.ssh.rm_known_host(user=None, hostname=None, config=None, port=None)

Remove all keys belonging to hostname from a known_hosts file.

CLI Example:
salt '*

' ssh.rm_known_host <user> <hostname>

salt.modules.ssh.set_auth_key(user, key, enc='ssh-rsa', comment=' ', options=None, config='.ssh/authorized_keys', cache_keys=None, fingerprint_hash_type=None)

Add a key to the authorized_keys file. The "key" parameter must only be the string of text that is the encoded key. If the key begins with "ssh-rsa" or ends with user@host, remove those from the key before passing it to this function.

CLI Example:

salt '*' ssh.set_auth_key <user> '<key>' enc='dsa'

salt.modules.ssh.set_auth_key_from_file(user, source, config='.ssh/authorized_keys', saltenv='base', fingerprint_hash_type=None)

Add a key to the authorized_keys file, using a file as the source.

CLI Example:

salt '*' ssh.set_auth_key_from_file <user> salt://ssh_keys/<user>.id_rsa.pub

salt.modules.ssh.set_known_host(user=None, hostname=None, fingerprint=None, key=None, port=None, enc=None, config=None, hash_known_hosts=True, timeout=5, fingerprint_hash_type=None)

Download SSH public key from remote host "hostname", optionally validate its fingerprint against "fingerprint" variable and save the record in the known_hosts file.

If such a record does already exists in there, do nothing.
user The user who owns the ssh authorized keys file to modify
hostname The name of the remote host (e.g. "github.com")
fingerprint The fingerprint of the key which must be present in the known_hosts file (optional if key specified)
key The public key which must be presented in the known_hosts file (optional if fingerprint specified)
port optional parameter, denoting the port of the remote host, which will be used in case, if the public key will be requested from it. By default the port 22 is used.
enc Defines what type of key is being used, can be ed25519, ecdsa ssh-rsa or ssh-dss
cfg The location of the authorized_keys file relative to the user's home directory, defaults to "ssh/known_hosts". If no user is specified, defaults to "etc/ssh/ssh_known_hosts". If present, must be an absolute path when a user is not specified.
hash_known_hosts [True] Hash all hostnames and addresses in the known hosts file.
timeout [int] Set the timeout for connection attempts. If timeout seconds have elapsed since a connection was initiated to a host or since the last time anything was read from that host, then the connection is closed and the host in question considered unavailable. Default is 5 seconds.

New in version 2016.3.0.

fingerprint_hash_type The public key fingerprint hash type that the public key fingerprint was originally hashed with. This defaults to sha256 if not specified.

New in version 2016.11.4.

Changed in version 2017.7.0: default changed from md5 to sha256

CLI Example:

salt '*' ssh.set_known_host <user> fingerprint='xx:xx:...:xx' enc='ssh-rsa' config=".ssh/known_hosts"

salt.modules.ssh.user_keys(user=None, pubfile=None, prvfile=None)

Return the user's ssh keys on the minion
New in version 2014.7.0.

CLI Example:

```
salt '*' ssh.user_keys
salt '*' ssh.user_keys user=user1
salt '*' ssh.user_keys user=user1 pubfile=/home/user1/.ssh/id_rsa.pub prvfile=/home/user1/.ssh/id_rsa
salt '*' ssh.user_keys user=user1 prvfile=False
salt '*' ssh.user_keys user=['user1','user2'] pubfile=id_rsa.pub prvfile=id_rsa
```

As you can see you can tell Salt not to read from the user's private (or public) key file by setting the file path to False. This can be useful to prevent Salt from publishing private data via Salt Mine or others.

### 19.9.368 salt.modules.ssh_package module

Service support for the REST example

salt.modules.ssh_package.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs)
salt.modules.ssh_package.list_pkgs(versions_as_list=False, **kwargs)
salt.modules.ssh_package.remove(name=None, pkgs=None, **kwargs)

### 19.9.369 salt.modules.ssh_service module

Provide the service module for the proxy-minion SSH sample .. versionadded:: 2015.8.2

salt.modules.ssh_service.enabled(name, sig=None)

Only the `redbull' service is `enabled' in the test

salt.modules.ssh_service.get_all()

Return a list of all available services

CLI Example:

```
salt '*' service.get_all
```

salt.modules.ssh_service.list_()

Return a list of all available services.

CLI Example:

```
salt '*' service.list
```

salt.modules.ssh_service.restart(name, sig=None)

Restart the specified service with rest_sample CLI Example:

```
salt '*' service.restart <service name>
```

salt.modules.ssh_service.running(name, sig=None)

Return whether this service is running.

salt.modules.ssh_service.start(name, sig=None)

Start the specified service on the rest_sample

CLI Example:
salt '*/' service.start <service name>

```
salt.modules.ssh_service.status(name, sig=None)
    Return the status for a service via rest_sample, returns a bool whether the service is running.
    CLI Example:
    salt '*/' service.status <service name>
```

salt.modules.ssh_service.stop(name, sig=None)
    Stop the specified service on the rest_sample
    CLI Example:
    salt '*/' service.stop <service name>

19.9.370 salt.modules.snapper module

Module to manage filesystem snapshots with snapper
New in version 2016.11.0.

- codeauthor Duncan Mac-Vicar P. <dmacvicar@suse.de>
- codeauthor Pablo Suárez Hernández <psuarezhernandez@suse.de>
- depends dbus Python module.
- depends snapper http://snapper.io, available in most distros
- maturity new
- platform Linux

```
salt.modules.snapper.changed_files(config='root', num_pre=None, num_post=None)
    Returns the files changed between two snapshots
    config Configuration name.
    num_pre first snapshot ID to compare. Default is last snapshot
    num_post last snapshot ID to compare. Default is 0 (current state)
    CLI example:
    salt '*' snapper.changed_files
    salt '*' snapper.changed_files num_pre=19 num_post=20
```

```
salt.modules.snapper.create_baseline(tag='baseline', config='root')
    Creates a snapshot marked as baseline
    tag Tag name for the baseline
    config Configuration name.
    CLI Example:
    salt '*' snapper.create_baseline
    salt '*' snapper.create_baseline my_custom_baseline
```

```
salt.modules.snapper.create_config(name=None, subvolume=None, fstype=None, template=None, extra_opts=None)
    Creates a new Snapper configuration
    name Name of the new Snapper configuration.
    subvolume Path to the related subvolume.
    fstype Filesystem type of the subvolume.
```
**template**  
Configuration template to use. (Default: default)

**extra_opts**  
Extra Snapper configuration opts dictionary. It will override the values provided by the given template (if any).

CLI example:
```
salt '*' snapper.create_config name=myconfig subvolume=/foo/bar/ fstype=btrfs
salt '*' snapper.create_config name=myconfig subvolume=/foo/bar/ fstype=btrfs template="default"
salt '*' snapper.create_config name=myconfig subvolume=/foo/bar/ fstype=btrfs extra_opts={"NUMBER_CLEANUP": False}
```

```python
salt.modules.snapper.create_snapshot(config='root', snapshot_type='single', pre_number=None, description=None, cleanup_algorithm='number', userdata=None, **kwargs)
```

Creates a snapshot.

**config**  
Configuration name.

**snapshot_type**  
Specifies the type of the new snapshot. Possible values are single, pre and post.

**pre_number**  
For post snapshots the number of the pre snapshot must be provided.

**description**  
Description for the snapshot. If not given, the salt job will be used.

**cleanup_algorithm**  
Set the cleanup algorithm for the snapshot.

**number**  
Deletes old snapshots when a certain number of snapshots is reached.

**timeline**  
Deletes old snapshots but keeps a number of hourly, daily, weekly, monthly and yearly snapshots.

**empty-pre-post**  
Deletes pre/post snapshot pairs with empty diffs.

**userdata**  
Set userdata for the snapshot (key-value pairs).

Returns the number of the created snapshot.

CLI example:
```
salt '*' snapper.create_snapshot
```

```python
salt.modules.snapper.delete_snapshot(snapshots_ids=None, config='root')
```

Deletes a snapshot.

**config**  
Configuration name. (Default: root)

**snapshots_ids**  
List of the snapshots IDs to be deleted.

CLI example:
```
salt '*' snapper.delete_snapshot 54
salt '*' snapper.delete_snapshot config=root 54
salt '*' snapper.delete_snapshot config=root snapshots_ids=[54,55,56]
```

```python
salt.modules.snapper.diff(config='root', filename=None, num_pre=None, num_post=None, **kwargs)
```

Returns the differences between two snapshots.

**config**  
Configuration name.

**filename**  
If not provided the showing differences between snapshots for all `text` files

**num_pre**  
First snapshot ID to compare. Default is last snapshot

**num_post**  
Last snapshot ID to compare. Default is 0 (current state)

CLI Example:
```
salt '*' snapper.diff
salt '*' snapper.diff filename=/var/log/snapper.log num_pre=19 num_post=20
```

```python
salt.modules.snapper.diff_jid(jid, config='root')
```

Returns the changes applied by a jid.

**jid**  
The job id to lookup

**config**  
Configuration name.

19.9. execution modules
CLI Example:

```
salt '*' snapper.diff_jid jid=20160607130930720112
```

salt.modules.snapper.get_config(name='root')
Retrieves all values from a given configuration

CLI example:

```
salt '*' snapper.get_config
```

salt.modules.snapper.get_snapshot(number=0, config='root')
Get detailed information about a given snapshot

CLI example:

```
salt '*' snapper.get_snapshot 1
```

salt.modules.snapper.list_configs()
List all available configs

CLI example:

```
salt '*' snapper.list_configs
```

salt.modules.snapper.list_snapshots(config='root')
List available snapshots

CLI example:

```
salt '*' snapper.list_snapshots config=myconfig
```

salt.modules.snapper.modify_snapshot(snapshot_id=None, description=None, userdata=None, cleanup=None, config='root')
Modify attributes of an existing snapshot.
config Configuration name. (Default: root)
snapshot_id ID of the snapshot to be modified.
cleanup Change the cleanup method of the snapshot. (str)
description Change the description of the snapshot. (str)
userdata Change the userdata dictionary of the snapshot. (dict)

CLI example:

```
salt '*' snapper.modify_snapshot 54 description="my snapshot description"
salt '*' snapper.modify_snapshot 54 description="my snapshot description"
salt '*' snapper.modify_snapshot 54 userdata={"foo": "bar"}
salt '*' snapper.modify_snapshot snapshot_id=54 cleanup="number"
```

salt.modules.snapper.run(function, *args, **kwargs)
Runs a function from an execution module creating pre and post snapshots and associating the salt job id with those snapshots for easy undo and cleanup.

function Salt function to call.
config Configuration name. (default: ``root``)
description A description for the snapshots. (default: None)
userdata Data to include in the snapshot metadata. (default: None)
cleanup_algorithm Snapper cleanup algorithm. (default: ``number``)
*args args for the function to call. (default: None)
**kwargs kwargs for the function to call (default: None)
This would run append text to /etc/motd using the file.append module, and will create two snapshots, pre and post with the associated metadata. The jid will be available as salt_jid in the userdata of the snapshot.

You can immediately see the changes

**CLI Example:**

```bash
salt '*' snapper.run file.append args=['"/etc/motd", "some text"]'
```

```python
salt.modules.snapper.set_config(name='root', **kwargs)
```

Set configuration values

**CLI example:**

```bash
salt '*' snapper.set_config SYNC_ACL=True
```

Keys are case insensitive as they will be always uppcased to snapper convention. The above example is equivalent to:

```bash
salt '*' snapper.set_config sync_acl=True
```

```python
salt.modules.snapper.status(config='root', num_pre=None, num_post=None)
```

Returns a comparison between two snapshots

**config** Configuration name.

**num_pre** first snapshot ID to compare. Default is last snapshot

**num_post** last snapshot ID to compare. Default is 0 (current state)

**CLI example:**

```bash
salt '*' snapper.status
salt '*' snapper.status num_pre=19 num_post=20
```

```python
salt.modules.snapper.status_to_string(dbus_status)
```

Converts a numeric dbus snapper status into a string

**CLI Example:**

```bash
salt '*' snapper.status_to_string <dbus_status>
```

```python
salt.modules.snapper.undo(config='root', files=None, num_pre=None, num_post=None)
```

Undo all file changes that happened between num_pre and num_post, leaving the files into the state of num_pre.

**Warning:** If one of the files has changes after num_post, they will be overwritten. The snapshots are used to determine the file list, but the current version of the files will be overwritten by the versions in num_pre.

You to undo changes between num_pre and the current version of the files use num_post=0.

**CLI Example:**

```bash
salt '*' snapper.undo
```

```python
salt.modules.snapper.undo_jid(jid, config='root')
```

Undo the changes applied by a salt job

**jid** The job id to lookup

**config** Configuration name.

**CLI Example:**
19.9.371 salt.modules.state

Control the state system on the minion.

State Caching

When a highstate is called, the minion automatically caches a copy of the last high data. If you then run a highstate with cache=True it will use that cached highdata and won't hit the fileserver except for salt:// links in the states themselves.

salt.modules.state.apply_(mods=None, **kwargs)

New in version 2015.5.0.

This function will call state.highstate or state.sls based on the arguments passed to this function. It exists as a more intuitive way of applying states.

APPLYING ALL STATES CONFIGURED IN TOP.SLS (A.K.A. HIGHSTATE)

To apply all configured states, simply run state.apply:

salt '*' state.apply

The following additional arguments are also accepted when applying all states configured in top.sls:

- test Run states in test-only (dry-run) mode
- mock The mock option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.
  
  New in version 2015.8.4.
- pillar Custom Pillar values, passed as a dictionary of key-value pairs

salt '*' state.apply test pillar="{"foo": "bar"}""}

Note: Values passed this way will override Pillar values set via pillar_roots or an external Pillar source.

- exclude Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls names, or a list of dictionaries containing sls or id keys. Glob-patterns may be used to match multiple states.

salt '*' state.apply exclude=bar,baz
salt '*' state.apply exclude=foo*
salt '*' state.apply exclude="[{"id": 'id_to_exclude'}, {'sls': 'sls_to_exclude'}]"

- queue [False] Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

  This option starts a new thread for each queued state run, so use this option sparingly.
- localconfig Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows
Salt Documentation, Release 2017.7.8

for specific states to be run with their own custom minion configuration, including diﬀerent pillars,
file_roots, etc.
salt '*' state.apply localconfig=/path/to/minion.yml

APPLYING INDIVIDUAL SLS FILES (A.K.A. STATE.SLS)
To apply individual SLS files, pass them as a comma-separated list:
# Run the states configured in salt://test.sls (or salt://test/init.sls)
salt '*' state.apply test
# Run the states configured in salt://test.sls (or salt://test/init.sls)
# and salt://pkgs.sls (or salt://pkgs/init.sls).
salt '*' state.apply test,pkgs

The following additional arguments are also accepted when applying individual SLS files:
test Run states in test-only (dry-run) mode
mo The mock option allows for the state run to execute without actually calling any states. This then
returns a mocked return which will show the requisite ordering as well as fully validate the state run.
New in version 2015.8.4.
pillar Custom Pillar values, passed as a dictionary of key-value pairs
salt '*' state.apply test pillar='{"foo": "bar"}'

Note: Values passed this way will override Pillar values set via pillar_roots or an external Pillar
source.
queue [False] Instead of failing immediately when another state run is in progress, queue the new state run
to begin running once the other has finished.
This option starts a new thread for each queued state run, so use this option sparingly.
concurrent [False] Execute state runs concurrently instead of serially
Warning: This flag is potentially dangerous. It is designed for use when multiple state runs can
safely be run at the same time. Do not use this flag for performance optimization.
saltenv Specify a salt fileserver environment to be used when applying states
Changed in version 0.17.0: Argument name changed from env to saltenv
Changed in version 2014.7.0: If no saltenv is specified, the minion config will be checked for an environment parameter and if found, it will be used. If none is found, base will be used. In prior
releases, the minion config was not checked and base would always be assumed when the saltenv was
not explicitly set.
pillarenv Specify a Pillar environment to be used when applying states. This can also be set in the minion
config file using the pillarenv option. When neither the pillarenv minion config option nor this
CLI argument is used, all Pillar environments will be merged together.
localconﬁg Optionally, instead of using the minion config, load minion opts from the file specified by this
argument, and then merge them with the options from the minion config. This functionality allows
for specific states to be run with their own custom minion configuration, including diﬀerent pillars,
file_roots, etc.

19.9. execution modules

2121


salt '*' state.apply test localconfig=/path/to/minion.yml

**sync_mods** If specified, the desired custom module types will be synced prior to running the SLS files:

salt '*' state.apply test sync_mods=states,modules
salt '*' state.apply test sync_mods=all

**Note:** This option is ignored when no SLS files are specified, as a *highstate* automatically syncs all custom module types.

New in version 2017.7.8, 2018.3.3, Fluorine.

salt.modules.state.check_request(name=None)

New in version 2015.5.0.

Return the state request information, if any

CLI Example:

salt '*' state.check_request

salt.modules.state.clear_cache()

Clear out cached state files, forcing even cache runs to refresh the cache on the next state execution.

Remember that the state cache is completely disabled by default, this execution only applies if cache=True is used in states

CLI Example:

salt '*' state.clear_cache

salt.modules.state.clear_request(name=None)

New in version 2015.5.0.

Clear out the state execution request without executing it

CLI Example:

salt '*' state.clear_request

salt.modules.state.disable(states)

Disable state runs.

CLI Example:

salt '*' state.disable highstate
salt '*' state.disable highstate,test.succeed_without_changes

**Note:** To disable a state file from running provide the same name that would be passed in a state.sls call.

salt '*' state.disable bind.config

salt.modules.state.enable(states)

Enable state function or sls run

CLI Example:
salt '*' state.enable highstate
salt '*' state.enable test.succeed_without_changes

**Note:** To enable a state file from running provide the same name that would be passed in a state.sls call.
salt '*' state.disable bind.config

salt.modules.state.event(tagmatch='*', count=-1, quiet=False, sock_dir=None, pretty=False, node='minion')
Watch Salt's event bus and block until the given tag is matched
New in version 2016.3.0.
This is useful for utilizing Salt's event bus from shell scripts or for taking simple actions directly from the CLI.
Enable debug logging to see ignored events.

**Parameters**
- **tagmatch** -- the event is written to stdout for each tag that matches this pattern; uses the same matching semantics as Salt's Reactor.
- **count** -- this number is decremented for each event that matches the tagmatch parameter; pass −1 to listen forever.
- **quiet** -- do not print to stdout; just block
- **sock_dir** -- path to the Salt master's event socket file.
- **pretty** -- Output the JSON all on a single line if False (useful for shell tools); pretty-print the JSON output if True.
- **node** -- Watch the minion-side or master-side event bus.

**CLI Example:**
salt-call --local state.event pretty=True

salt.modules.state.high(data, test=None, queue=False, **kwargs)
Execute the compound calls stored in a single set of high data
This function is mostly intended for testing the state system and is not likely to be needed in everyday usage.

**CLI Example:**
salt '*' state.high '{"vim": {"pkg": ["installed"]}}'

salt.modules.state.highstate(test=None, queue=False, **kwargs)
Retrieve the state data from the salt master for this minion and execute it
test Run states in test-only (dry-run) mode
pillar Custom Pillar values, passed as a dictionary of key-value pairs

**Note:** Values passed this way will override Pillar values set via pillar_roots or an external Pillar source.

Changed in version 2016.3.0: GPG-encrypted CLI Pillar data is now supported via the GPG renderer. See here for details.

**pillar_enc** Specify which renderer to use to decrypt encrypted data located within the pillar value. Currently, only gpg is supported.
New in version 2016.3.0.

**exclude**  Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls names, or a list of dictionaries containing sls or id keys. Glob-patterns may be used to match multiple states.

```py
salt '*' state.highstate exclude=bar,baz
salt '*' state.highstate exclude=foo
salt '*' state.highstate exclude="[{'id': 'id_to_exclude'}, {'sls': 'sls_to_exclude'}]"
```

**saltenv**  Specify a salt fileserver environment to be used when applying states

Changed in version 0.17.0: Argument name changed from env to saltenv.

Changed in version 2014.7.0: If no saltenv is specified, the minion config will be checked for a saltenv parameter and if found, it will be used. If none is found, base will be used. In prior releases, the minion config was not checked and base would always be assumed when the saltenv was not explicitly set.

**pillarenv**  Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the pillarenv option. When neither the pillarenv minion config option nor this CLI argument is used, all Pillar environments will be merged together.

**queue**  [False] Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

**localconfig**  Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, file_roots, etc.

**mock**  The mock option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.

New in version 2015.8.4.

CLI Examples:

```py
salt '*' state.highstate
salt '*' state.highstate whitelist=sls1_to_run,sls2_to_run
salt '*' state.highstate exclude=sls_to_exclude
salt '*' state.highstate exclude="[{'id': 'id_to_exclude'}, {'sls': 'sls_to_exclude'}]"

salt '*' state.highstate pillar="{foo: 'Foo!', bar: 'Bar!'}"
```

**salt.modules.state.list_disabled()**  List the states which are currently disabled

CLI Example:

```py
salt '*' state.list_disabled
```

**salt.modules.state.low(data, queue=False, **kwargs)**  Execute a single low data call

This function is mostly intended for testing the state system and is not likely to be needed in everyday usage.

CLI Example:

```py
salt '*' state.low '{"state": "pkg", "fun": "installed", "name": "vi"}'
```
salt.modules.state.orchestrate(mods, saltenv='base', test=None, exclude=None, pillar=None, pillarenv=None)

New in version 2016.11.0.

Execute the orchestrate runner from a masterless minion.

See also:

More Orchestrate documentation

- Full Orchestrate Tutorial
- Docs for the ``salt`` state module <salt.states.saltmod>

CLI Examples:

salt-call --local state.orchestrate webserver
salt-call --local state.orchestrate webserver saltenv=dev test=True
salt-call --local state.orchestrate webserver saltenv=dev pillarenv=aws

salt.modules.state.pkg(pkg_path, pkg_sum, hash_type, test=None, **kwargs)

Execute a packaged state run, the packaged state run will exist in a tarball available locally. This packaged state can be generated using salt-ssh.

CLI Example:

salt '*' state.pkg /tmp/salt_state.tgz 760a9353810e36f6d81416366fc426dc md5

salt.modules.state.request(mods=None, **kwargs)

New in version 2015.5.0.

Request that the local admin execute a state run via salt-call state.run_request All arguments match state.apply

CLI Example:

salt '*' state.request
salt '*' state.request test
salt '*' state.request test,pkgs

salt.modules.state.run_request(name='default', **kwargs)

New in version 2015.5.0.

Execute the pending state request

CLI Example:

salt '*' state.run_request

salt.modules.state.running(concurrent=False)

Return a list of strings that contain state return data if a state function is already running. This function is used to prevent multiple state calls from being run at the same time.

CLI Example:

salt '*' state.running

salt.modules.state.show_highstate(queue=False, **kwargs)

Retrieve the highstate data from the salt master and display it

Custom Pillar data can be passed with the pillar kwarg.

CLI Example:

salt '*' state.show_highstate
salt.modules.state.show_low_sls(mods, test=None, queue=False, **kwargs)
Display the low data from a specific sls. The default environment is base, use saltenv to specify a different environment.
saltenv Specify a salt fileserver environment to be used when applying states
pillarenv Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the pillarenv option. When neither the pillarenv minion config option nor this CLI argument is used, all Pillar environments will be merged together.

CLI Example:
```
salt '*' state.show_low_sls foo
salt '*' state.show_low_sls foo saltenv=dev
```

salt.modules.state.show_lowstate(queue=False, **kwargs)
List out the low data that will be applied to this minion

CLI Example:
```
salt '*' state.show_lowstate
```

salt.modules.state.show_sls(mods, test=None, queue=False, **kwargs)
Display the state data from a specific sls or list of sls files on the master. The default environment is base, use saltenv to specify a different environment.

This function does not support topfiles. For top.sls please use show_top instead.

Custom Pillar data can be passed with the pillar kwarg.
saltenv Specify a salt fileserver environment to be used when applying states
pillarenv Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the pillarenv option. When neither the pillarenv minion config option nor this CLI argument is used, all Pillar environments will be merged together.

CLI Example:
```
salt '*' state.show_sls core,edit.vim dev
```

salt.modules.state.show_state_usage(queue=False, **kwargs)
Retrieve the highstate data from the salt master to analyse used and unused states

Custom Pillar data can be passed with the pillar kwarg.

CLI Example:
```
salt '*' state.show_state_usage
```

salt.modules.state.show_top(queue=False, **kwargs)
Return the top data that the minion will use for a highstate

CLI Example:
```
salt '*' state.show_top
```

salt.modules.state.single(fun, name, test=None, queue=False, **kwargs)
Execute a single state function with the named kwargs, returns False if insufficient data is sent to the command

By default, the values of the kwargs will be parsed as YAML. So, you can specify lists values, or lists of single entry key-value maps, as you would in a YAML salt file. Alternatively, JSON format of keyword values is also supported.

CLI Example:
salt '*

**state.single** **pkg.installed**

```
name=vim
```

salt.modules.state.sls(
`mods, test=None, exclude=None, queue=False, sync_mods=None, **kwargs`
)

Execute the states in one or more SLS files

**test** Run states in test-only (dry-run) mode

**pillar** Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*

state.apply test pillar='{"foo": "bar"}"
```

**Note:** Values passed this way will override Pillar values set via pillar_roots or an external Pillar source.

Changed in version 2016.3.0: GPG-encrypted CLI Pillar data is now supported via the GPG renderer. See [here](#) for details.

**pillar_enc** Specify which renderer to use to decrypt encrypted data located within the pillar value. Currently, only gpg is supported.

New in version 2016.3.0.

**exclude** Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls names, or a list of dictionaries containing sls or id keys. Glob-patterns may be used to match multiple states.

```
salt '*

state.sls foo,bar,baz exclude=bar,baz
salt '*

state.sls foo,bar,baz exclude=ba*
salt '*

state.sls foo,bar,baz exclude="[{'id': 'id_to_exclude'}, {'sls': "'sls_to_exclude'}]"
```

**queue** [False] Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

**concurrent** [False] Execute state runs concurrently instead of serially

**Warning:** This flag is potentially dangerous. It is designed for use when multiple state runs can safely be run at the same time. Do **not** use this flag for performance optimization.

**saltenv** Specify a salt fileserver environment to be used when applying states

Changed in version 0.17.0: Argument name changed from `env` to `saltenv`.

Changed in version 2014.7.0: If no saltenv is specified, the minion config will be checked for an environment parameter and if found, it will be used. If none is found, base will be used. In prior releases, the minion config was not checked and base would always be assumed when the saltenv was not explicitly set.

**pillarenv** Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.

**localconfig**

Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, file_roots, etc.

**mock**

The mock option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.
New in version 2015.8.4.

**sync_mods** If specified, the desired custom module types will be synced prior to running the SLS files:

```bash
salt '*' state.sls test sync_mods=states,modules
salt '*' state.sls test sync_mods=all
```

New in version 2017.7.8, 2018.3.3, Fluorine.

CLI Example:

```bash
salt '*' state.sls core,edit.vim dev
salt '*' state.sls core exclude="[\'id\': \'id_to_exclude\'], [\'sls\': \'sls_to_exclude\']"
salt '*' state.sls myslsfile pillar="\{foo: \'Foo!', bar: \'Bar!'\}"
```

```python
salt.modules.state.sls_id(id_, mods, test=None, queue=False, **kwargs)
```

Call a single ID from the named module(s) and handle all requisites.

The state ID comes before the module ID(s) on the command line.

- **id** ID to call
- **mods** Comma-delimited list of modules to search for given id and its requisites

New in version 2014.7.0.

```python
saltenv [base] Specify a salt fileserver environment to be used when applying states
pillarenv Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.
```

CLI Example:

```bash
salt '*' state.sls_id my_state my_module
salt '*' state.sls_id my_state my_module,a_common_module
```

```python
salt.modules.state.template(tem, queue=False, **kwargs)
```

Execute the information stored in a template file on the minion.

This function does not ask a master for a SLS file to render but instead directly processes the file at the provided path on the minion.

CLI Example:

```bash
salt '*' state.template '<Path to template on the minion>'
```

```python
salt.modules.state.template_str(tem, queue=False, **kwargs)
```

Execute the information stored in a string from an sls template.

CLI Example:

```bash
salt '*' state.template_str '<Template String>'
```

```python
salt.modules.state.top(topfn, test=None, queue=False, **kwargs)
```

Execute a specific top file instead of the default. This is useful to apply configurations from a different environment (for example, dev or prod), without modifying the default top file.

- **queue** [False] Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

```python
saltenv Specify a salt fileserver environment to be used when applying states
```
pillarenv Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the pillarenv option. When neither the pillarenv minion config option nor this CLI argument is used, all Pillar environments will be merged together.

New in version 2017.7.0.

CLI Example:

```
salt '*' state.top reverse_top.sls
salt '*' state.top prod_top.sls exclude=sls_to_exclude
salt '*' state.top dev_top.sls exclude=[{'id': 'id_to_exclude'}, {'sls': 'sls_to_exclude'}]
```

19.9.372 salt.modules.status

Module for returning various status data about a minion. These data can be useful for compiling into stats later.

salt.modules.status.all_status()

Return a composite of all status data and info for this minion. Warning: There is a LOT here!

CLI Example:

```
salt '*' status.all_status
```

salt.modules.status.cpuinfo()

Changed in version 2016.3.2: Return the CPU info for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.cpuinfo
```

salt.modules.status.cpustats()

Return the CPU stats for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.cpustats
```

salt.modules.status.custom()

Return a custom composite of status data and info for this minion, based on the minion config file. An example config like might be:

```
status.cpustats.custom: ['cpu', 'ctxt', 'mtime', 'processes']
```

Where status refers to status.py, cpustats is the function where we get our data, and custom is this function. It is followed by a list of keys that we want returned.

This function is meant to replace all_status(), which returns anything and everything, which we probably don't want.

By default, nothing is returned. Warning: Depending on what you include, there can be a LOT here!

CLI Example:

```
salt '*' status.custom
```
salt.modules.status.diskstats()
   Changed in version 2016.3.2: Return the disk stats for this minion
   Changed in version 2016.11.4: Added support for AIX
   CLI Example:
   ```
   salt '*' status.diskstats
   ```

salt.modules.status.diskusage(*args)
   Return the disk usage for this minion
   Usage:
   ```
   salt '*' status.diskusage [paths and/or filesystem types]
   ```
   CLI Example:
   ```
   salt '*' status.diskusage # usage for all filesystems
   salt '*' status.diskusage /tmp # usage for / and /tmp
   salt '*' status.diskusage ext? # usage for ext[234] filesystems
   salt '*' status.diskusage / ext? # usage for / and all ext filesystems
   ```

salt.modules.status.loadavg()
   Return the load averages for this minion
   Changed in version 2016.11.4: Added support for AIX
   CLI Example:
   ```
   salt '*' status.loadavg
   :raises CommandExecutionError: If the system cannot report loadaverages to Python
   ```

salt.modules.status.master(master=None, connected=True)
   New in version 2014.7.0.
   Return the connection status with master. Fire an event if the connection to master is not as expected. This
   function is meant to be run via a scheduled job from the minion. If master_ip is an FQDN/Hostname, it must
   be resolvable to a valid IPv4 address.
   Changed in version 2016.11.4: Added support for AIX
   CLI Example:
   ```
   salt '*' status.master
   ```

salt.modules.status.meminfo()
   Return the memory info for this minion
   Changed in version 2016.11.4: Added support for AIX
   CLI Example:
   ```
   salt '*' status.meminfo
   ```

salt.modules.status.netdev()
   Changed in version 2016.3.2: Return the network device stats for this minion
   Changed in version 2016.11.4: Added support for AIX
   CLI Example:
salt ' '*'status.netdev

salt.modules.status.netstats()
Return the network stats for this minion

   Changed in version 2016.11.4: Added support for AIX

   CLI Example:

   salt '* status.netstats

salt.modules.status.nproc()  
Return the number of processing units available on this system

   Changed in version 2016.11.4: Added support for AIX

   CLI Example:

   salt '* status.nproc

salt.modules.status.pid(sig)
Return the PID or an empty string if the process is running or not. Pass a signature to use to find the process via ps. Note you can pass a Python-compatible regular expression to return all pids of processes matching the regexp.

   Changed in version 2016.11.4: Added support for AIX

   CLI Example:

   salt '* status.pid <sig>

salt.modules.status.ping_master(master)
New in version 2016.3.0.
Sends ping request to the given master. Fires `__master_failback' event on success. Returns bool result.

   CLI Example:

   salt '* status.ping_master localhost

salt.modules.status.procs()
Return the process data

   Changed in version 2016.11.4: Added support for AIX

   CLI Example:

   salt '* status.procs

salt.modules.status.proxy_reconnect(proxy_name, opts=None)
Forces proxy minion reconnection when not alive.
   proxy_name: The virtual name of the proxy module.
   opts: None:_opts dictionary. Not intended for CLI usage.

   CLI Example:

   salt '*' status.proxy_reconnect rest_sample

salt.modules.status.time_(format='%%A, %%d. %%B %%Y %%I:%%M%%p')
New in version 2016.3.0.
Return the current time on the minion, formatted based on the format parameter.
Default date format: Monday, 27. July 2015 07:55AM

CLI Example:

```bash
salt '*' status.time
salt '*' status.time '%s'
```

salt.modules.status.uptime()
Return the uptime for this system.

Changed in version 2015.8.9: The uptime function was changed to return a dictionary of easy-to-read key/value pairs containing uptime information, instead of the output from a cmd.run call.

Changed in version 2016.11.0: Support for OpenBSD, FreeBSD, NetBSD, MacOS, and Solaris

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```bash
salt '*' status.uptime
```

salt.modules.status.version()
Return the system version for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```bash
salt '*' status.version
```

salt.modules.status.vmstats()
Changed in version 2016.3.2: Return the virtual memory stats for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```bash
salt '*' status.vmstats
```

salt.modules.status.w()
Return a list of logged in users for this minion, using the w command

CLI Example:

```bash
salt '*' status.w
```

19.9.373 salt.modules.statuspage

StatusPage

Handle requests for the StatusPage API.

In the minion configuration file, the following block is required:

```yaml
statuspage:
    api_key: <API_KEY>
    page_id: <PAGE_ID>
