salt '*' netscaler.service_disable 'serviceName' 'delayInSeconds'

salt modules.netscaler.service_enable(s_name, **connection_args)
Enable a service

CLI Example:
salt '*' netscaler.service_enable 'serviceName'
### salt.modules.netscaler.service_exists

Checks if a service exists

**CLI Example:**
```
salt '*' netscaler.service_exists 'serviceName'
```

### salt.modules.netscaler.service_up

Checks if a service is UP

**CLI Example:**
```
salt '*' netscaler.service_up 'serviceName'
```

### salt.modules.netscaler.servicegroup_add

Add a new service group. If no service type is specified, HTTP will be used. Most common service types: HTTP, SSL, and SSL_BRIDGE

**CLI Example:**
```
salt '*' netscaler.servicegroup_add 'serviceGroupName'
salt '*' netscaler.servicegroup_add 'serviceGroupName' 'serviceGroupType'
```

### salt.modules.netscaler.servicegroup_delete

Delete a new service group

**CLI Example:**
```
salt '*' netscaler.servicegroup_delete 'serviceGroupName'
```

### salt.modules.netscaler.servicegroup_exists

Checks if a service group exists

**CLI Example:**
```
salt '*' netscaler.servicegroup_exists 'serviceGroupName'
```

### salt.modules.netscaler.servicegroup_server_add

Add a server:port member to a service group

**CLI Example:**
```
salt '*' netscaler.servicegroup_server_add 'serviceGroupName' 'serverName' serverPort'
```

### salt.modules.netscaler.servicegroup_server_delete

Remove a server:port member from a service group

**CLI Example:**
```
salt '*' netscaler.servicegroup_server_delete 'serviceGroupName' 'serverName' serverPort'
```

### salt.modules.netscaler.servicegroup_server_disable

Disable a server:port member of a service group

**CLI Example:**
```
```
salt.modules.netscaler.servicegroup_server_enable(sg_name, s_name, s_port, **connection_args)

Enable a server:port member of a servicegroup

CLI Example:
salt '*' netscaler.servicegroup_server_enable 'serviceName' 'serverName' 'serverPort'

salt.modules.netscaler.servicegroup_server_exists(sg_name, s_name, s_port=None, **connection_args)

Check if a server:port combination is a member of a servicegroup

CLI Example:
salt '*' netscaler.servicegroup_server_exists 'serviceName' 'serverName' 'serverPort'

salt.modules.netscaler.servicegroup_server_up(sg_name, s_name, s_port, **connection_args)

Check if a server:port combination is in state UP in a servicegroup

CLI Example:
salt '*' netscaler.servicegroup_server_up 'serviceName' 'serverName' 'serverPort'

salt.modules.netscaler.vserver_add(v_name, v_ip, v_port, v_type, **connection_args)

Add a new lb vserver

CLI Example:
salt '*' netscaler.vserver_add 'vserverName' 'vserverIP' 'vserverPort' 'vserverType'
salt '*' netscaler.vserver_add 'alex.patate.chaude.443' '1.2.3.4' '443' 'SSL'

salt.modules.netscaler.vserver_delete(v_name, **connection_args)

Delete a lb vserver

CLI Example:
salt '*' netscaler.vserver_delete 'vserverName'

salt.modules.netscaler.vserver_exists(v_name, v_ip=None, v_port=None, v_type=None, **connection_args)

Checks if a vserver exists

CLI Example:
salt '*' netscaler.vserver_exists 'vserverName'

salt.modules.netscaler.vserver_servicegroup_add(v_name, sg_name, **connection_args)

Bind a servicegroup to a vserver

CLI Example:
**salt.modules.netscaler.vserver_servicegroup_add(v_name, sg_name, **connection_args)**
Unbind a servicegroup from a vserver

CLI Example:
```
salt '*' netscaler.vserver_servicegroup_add 'vserverName' 'serviceGroupName'
```

**salt.modules.netscaler.vserver_servicegroup_delete(v_name, sg_name, **connection_args)**
Checks if a servicegroup is tied to a vserver

CLI Example:
```
salt '*' netscaler.vserver_servicegroup_exists 'vserverName' 'serviceGroupName'
```

**salt.modules.netscaler.vserver_servicegroup_exists(v_name, sg_name, **connection_args)**
Binds a SSL certicate to a vserver

CLI Example:
```
salt '*' netscaler.vserver_sslcert_add 'vserverName' 'sslCertificateName'
```

**salt.modules.netscaler.vserver_sslcert_delete(v_name, sc_name, **connection_args)**
Unbinds a SSL certificate from a vserver

CLI Example:
```
salt '*' netscaler.vserver_sslcert_delete 'vserverName' 'sslCertificateName'
```

**salt.modules.netscaler.vserver_sslcert_exists(v_name, sc_name, **connection_args)**
Checks if a SSL certificate is tied to a vserver

CLI Example:
```
salt '*' netscaler.vserver_sslcert_exists 'vserverName' 'sslCertificateName'
```

### 21.9.277 salt.modules.network

Module for gathering and managing network information

**salt.modules.network.active_tcp()**
Return a dict containing information on all of the running TCP connections (currently linux and solaris only)

Changed in version 2015.8.4: Added support for SunOS

CLI Example:
```
salt '*' network.active_tcp
```

**salt.modules.network.arp()**
Return the arp table from the minion

Changed in version 2015.8.0: Added support for SunOS

CLI Example:
salt '=(' network.arp

salt.modules.network.calc_net(ip_addr, netmask=None)
Returns the CIDR of a subnet based on an IP address (CIDR notation supported) and optional netmask.
CLI Example:

```
salt '=(' network.calc_net 172.17.0.5 255.255.255.240
salt '=(' network.calc_net 2a02:f6e:a000:80:84d8:8332:7866:4e07/64
```
New in version 2015.8.0.

salt.modules.network.connect(host, port=None, **kwargs)
Test connectivity to a host using a particular port from the minion.
New in version 2014.7.0.
CLI Example:

```
salt '=(' network.connect archlinux.org 80
salt '=(' network.connect archlinux.org 80 timeout=3
salt '=(' network.connect archlinux.org 80 timeout=3 family=ipv4
salt '=(' network.connect google-public-dns-a.google.com port=53 proto=udp timeout=3
```

salt.modules.network.convert_cidr(cidr)
returns the network and subnet mask of a cidr addr
New in version 2016.3.0.
CLI Example:

```
salt '=(' network.convert_cidr 172.31.0.0/16
```

salt.modules.network.default_route(family=None)
Return default route(s) from routing table
Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS)
Changed in version 2016.11.4: Added support for AIX
CLI Example:

```
salt '=(' network.default_route
```

salt.modules.network.dig(host)
Performs a DNS lookup with dig
CLI Example:

```
salt '=(' network.dig archlinux.org
```

salt.modules.network.get_bufsize(_iface)
Return network buffer sizes as a dict (currently linux only)
CLI Example:
salt '*' network.get_bufsize eth0

```python
salt.modules.network.get_fqdn()
Get fully qualified domain name
CLI Example:
salt '*' network.get_fqdn
```

```python
salt.modules.network.get_fqdn()
Get hostname
CLI Example:
salt '*' network.get_hostname
```

```python
salt.modules.network.get_route(ip)
Return routing information for given destination ip
New in version 2015.5.3.
Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS) Added support for OpenBSD
Changed in version 2016.11.4: Added support for AIX
CLI Example:
salt '*' network.get_route 10.10.10.10
```

```python
salt.modules.network.hw_addr(iface)
Return the hardware address (a.k.a. MAC address) for a given interface
CLI Example:
salt '*' network.hw_addr eth0
```

```python
salt.modules.network.hwaddr(iface)
This function is an alias of hw_addr.
Return the hardware address (a.k.a. MAC address) for a given interface
CLI Example:
salt '*' network.hw_addr eth0
```

```python
salt.modules.network.ifacestartswith(cidr)
Retrieve the interface name from a specific CIDR
New in version 2016.11.0.
CLI Example:
salt '*' network.ifacestartswith 10.0
```

```python
salt.modules.network.in_subnet(cidr)
Returns True if host is within specified subnet, otherwise False.
CLI Example:
salt '*' network.in_subnet 10.0.0.0/16
```
**Salt Documentation, Release 2019.2.0**

**salt.modules.network.interface** *(iface)*
Return the inet address for a given interface

New in version 2014.7.0.

CLI Example:

```
salt '*' network.interface eth0
```

**salt.modules.network.interface_ip** *(iface)*
Return the inet address for a given interface

New in version 2014.7.0.

CLI Example:

```
salt '*' network.interface_ip eth0
```

**salt.modules.network.interfaces** *
Return a dictionary of information about all the interfaces on the minion

CLI Example:

```
salt '*' network.interfaces
```

**salt.modules.network.ip_addrs** *(interface=None, include_loopback=False, cidr=None, type=None)*
Returns a list of IPv4 addresses assigned to the host. 127.0.0.1 is ignored, unless `include_loopback=True` is indicated. If `interface` is provided, then only IP addresses from that interface will be returned. Providing a CIDR via `cidr=“10.0.0.0/8”` will return only the addresses which are within that subnet. If `type` is `public`, then only public addresses will be returned. Ditto for `type=’private’`.

CLI Example:

```
salt '*' network.ip_addrs
```

**salt.modules.network.ip_addrs6** *(interface=None, include_loopback=False, cidr=None)*
Returns a list of IPv6 addresses assigned to the host. ::1 is ignored, unless `include_loopback=True` is indicated. If `interface` is provided, then only IP addresses from that interface will be returned. Providing a CIDR via `cidr=“2000::/3”` will return only the addresses which are within that subnet.

CLI Example:

```
salt '*' network.ip_addrs6
```

**salt.modules.network.ip_in_subnet** *(ip_addr, cidr)*
Returns True if given IP is within specified subnet, otherwise False.

CLI Example:

```
salt '*' network.ip_in_subnet 172.17.0.4 172.16.0.0/12
```

**salt.modules.network.ipaddrs** *(interface=None, include_loopback=False, cidr=None, type=None)*
This function is an alias of `ip_addrs`.
Returns a list of IPv4 addresses assigned to the host. 127.0.0.1 is ignored, unless `include_loopback=True` is indicated. If `interface` is provided, then only IP addresses from that interface will be returned. Providing a CIDR via `cidr=“10.0.0.0/8”` will return only the addresses which are within that subnet. If `type` is `public`, then only public addresses will be returned. Ditto for `type=’private’`.

CLI Example:
salt.modules.network.ip_addrs6(interface=None, include_loopback=False, cidr=None)

This function is an alias of ip_addrs6.

Returns a list of IPv6 addresses assigned to the host. ::1 is ignored, unless include_loopback=True is indicated. If interface is provided, then only IP addresses from that interface will be returned. Providing a CIDR via cidr="2000::/3" will return only the addresses which are within that subnet.

CLI Example:

```
salt '*' network.ip_addrs6
```

salt.modules.network.iphexval(ip)

Retrieve the hexadecimal representation of an IP address

New in version 2016.11.0.

CLI Example:

```
salt '*' network.iphexval 10.0.0.1
```

salt.modules.network.is_loopback(ip_addr)

Check if the given IP address is a loopback address

New in version 2014.7.0.

Changed in version 2015.8.0: IPv6 support

CLI Example:

```
salt '*' network.is_loopback 127.0.0.1
```

salt.modules.network.is_private(ip_addr)

Check if the given IP address is a private address

New in version 2014.7.0.

Changed in version 2015.8.0: IPv6 support

CLI Example:

```
salt '*' network.is_private 10.0.0.3
```

salt.modules.network.mod_bufsize(iface, *args, **kwargs)

Modify network interface buffers (currently linux only)

CLI Example:

```
salt '*' network.mod_bufsize tx=<val> rx=<val> rx-mini=<val> rx-jumbo=<val>
```

salt.modules.network.mod_hostname(hostname)

Modify hostname

Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS)

CLI Example:

```
salt '*' network.mod_hostname master.saltstack.com
```

salt.modules.network.netstat()

Return information on open ports and states
Note: On BSD minions, the output contains PID info (where available) for each netstat entry, fetched from sockstat/fstat output.

Changed in version 2014.1.4: Added support for OpenBSD, FreeBSD, and NetBSD
Changed in version 2015.8.0: Added support for SunOS
Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' network.netstat
```

`salt.modules.network.ping(host, timeout=False, return_boolean=False)`
Performs an ICMP ping to a host

Changed in version 2015.8.0: Added support for SunOS

CLI Example:

```
salt '*' network.ping archlinux.org
```

New in version 2015.5.0.
Return a True or False instead of ping output.

```
salt '*' network.ping archlinux.org return_boolean=True
```

Set the time to wait for a response in seconds.

```
salt '*' network.ping archlinux.org timeout=3
```

`salt.modules.network.reverse_ip(ip_addr)`
Returns the reversed IP address

Changed in version 2015.8.0: IPv6 support

CLI Example:

```
salt '*' network.reverse_ip 172.17.0.4
```

`salt.modules.network.routes(family=None)`
Return currently configured routes from routing table

Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS)
Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' network.routes
```

`salt.modules.network.subnets(interfaces=None)`
Returns a list of IPv4 subnets to which the host belongs

CLI Example:

```
salt '*' network.subnets
salt '*' network.subnets interfaces=eth1
```
salt.modules.network.subnets6()
Returns a list of IPv6 subnets to which the host belongs

CLI Example:
```
salt '*' network.subnets
```

salt.modules.network.traceroute(host)
Performs a traceroute to a 3rd party host

Changed in version 2015.8.0: Added support for SunOS
Changed in version 2016.11.4: Added support for AIX

CLI Example:
```
salt '*' network.traceroute archlinux.org
```

salt.modules.network.wol(mac, bcast='255.255.255.255', destport=9)
Send Wake On Lan packet to a host

CLI Example:
```
salt '*' network.wol 08-00-27-13-69-77
salt '*' network.wol 08:00:27:13:69:77 255.255.255.255
salt '*' network.wol 08:00:27:13:69:77 255.255.255.255
```

21.9.278  salt.modules.neutron

Module for handling OpenStack Neutron calls

depends

- neutronclient Python module

configuration This module is not usable until the user, password, tenant, and auth URL are specified either in a pillar or in the minion’s config file. For example:

```
keystone.user: 'admin'
keystone.password: 'password'
keystone.tenant: 'admin'
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/
keystone.region_name: 'RegionOne'
keystone.service_type: 'network'
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles: For example:

```
openstack1:
  keystone.user: 'admin'
  keystone.password: 'password'
  keystone.tenant: 'admin'
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/
  keystone.region_name: 'RegionOne'
  keystone.service_type: 'network'

openstack2:
  keystone.user: 'admin'
  keystone.password: 'password'
```

(continues on next page)
With this configuration in place, any of the neutron functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' neutron.network_list profile=openstack1
```

To use keystoneauth1 instead of keystoneclient, include the `use_keystoneauth` option in the pillar or minion config.

**Note:** this is required to use keystone v3 as for authentication.

```
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.1:5000/v3/
keystone.region_name: 'RegionOne'
keystone.service_type: 'network'
keystone.use_keystoneauth: true
keystone.verify: '/path/to/custom/certs/ca-bundle.crt'
```

Note: by default the neutron module will attempt to verify its connection utilizing the system certificates. If you need to verify against another bundle of CA certificates or want to skip verification altogether you will need to specify the `verify` option. You can specify True or False to verify (or not) against system certificates, a path to a bundle or CA certs to check against, or None to allow keystoneauth to search for the certificates on its own.(defaults to True)

salt.modules.neutron.add_gateway_router\( (router, ext_network, profile=None) \)

Adds an external network gateway to the specified router

**CLI Example:**

```
salt '*' neutron.add_gateway_router router-name ext-network-name
```

**Parameters**

- `router` – ID or name of the router
- `ext_network` – ID or name of the external network the gateway
- `profile` – Profile to build on (Optional)

**Returns** Added Gateway router information

salt.modules.neutron.add_interface_router\( (router, subnet, profile=None) \)

Adds an internal network interface to the specified router

**CLI Example:**

```
salt '*' neutron.add_interface_router router-name subnet-name
```

**Parameters**

- `router` – ID or name of the router
- `subnet` – ID or name of the subnet
- `profile` – Profile to build on (Optional)

**Returns** Added interface information
**salt.modules.neutron.create_firewall_rule** *(protocol, action, profile=None, **kwargs)*

Creates a new firewall rule

**CLI Example:**

```bash
salt '*' neutron.create_firewall_rule protocol action
    tenant_id=TENANT_ID name=NAME description=DESCRIPTION ip_version=IP_VERSION
    source_ip_address=SOURCE_IP_ADDRESS destination_ip_address=DESTINATION_IP_ADDRESS
    source_port=SOURCE_PORT destination_port=DESTINATION_PORT shared=SHARED enabled=ENABLED
```

**Parameters**

- **protocol** – Protocol for the firewall rule, choose "tcp", "udp", "icmp" or "None".
- **action** – Action for the firewall rule, choose "allow" or "deny".
- **tenant_id** – The owner tenant ID. (Optional)
- **name** – Name for the firewall rule. (Optional)
- **description** – Description for the firewall rule. (Optional)
- **ip_version** – IP protocol version, default: 4. (Optional)
- **source_ip_address** – Source IP address or subnet. (Optional)
- **destination_ip_address** – Destination IP address or subnet. (Optional)
- **source_port** – Source port (integer in [1, 65535] or range in a:b). (Optional)
- **destination_port** – Destination port (integer in [1, 65535] or range in a:b). (Optional)
- **shared** – Set shared to True, default: False. (Optional)
- **enabled** – To enable this rule, default: True. (Optional)

**salt.modules.neutron.create_floatingip** *(floating_network, port=None, profile=None)*

Creates a new floatingIP

**CLI Example:**

```bash
salt '*' neutron.create_floatingip network-name port-name
```

**Parameters**

- **floating_network** – Network name or ID to allocate floatingIP from
- **port** – Of the port to be associated with the floatingIP (Optional)
- **profile** – Profile to build on (Optional)

**Returns**

Created floatingIP information

**salt.modules.neutron.create_ikepolicy** *(name, profile=None, **kwargs)*

Creates a new IKEPolicy

**CLI Example:**

```bash
salt '*' neutron.create_ikepolicy ikepolicy-name
    phase1_negotiation_mode=main auth_algorithm=sha1 encryption_algorithm=aes-128 pfs=group5
```

**Parameters**

- **name** – Name of the IKE policy
- **phase1_negotiation_mode** – IKE Phase1 negotiation mode in lowercase, default: main (Optional)
- **auth_algorithm** – Authentication algorithm in lowercase, default: sha1 (Optional)
- **encryption_algorithm** – Encryption algorithm in lowercase. default:aes-128 (Optional)
- **pfs** – Prefect Forward Security in lowercase, default: group5 (Optional)
• **units** – IKE lifetime attribute. default: seconds (Optional)
• **value** – IKE lifetime attribute. default: 3600 (Optional)
• **ike_version** – IKE version in lowercase, default: v1 (Optional)
• **profile** – Profile to build on (Optional)
• **kwargs** –

Returns

Created IKE policy information

```python
salt.modules.neutron.create_ipsec_site_connection(
    name, ipsecpolicy, ikepolicy, vnsversion, peer_cidrs, peer_address,
    peer_id, psk, admin_state_up=True, profile=None, **kwargs)
```

Creates a new IPsecSiteConnection

**CLI Example:**

```bash
salt '*' neutron.show_ipsec_site_connection connection-name
  ipsec-policy-name ikepolicy-name vpnservice-name

  192.168.XXX.XXX/24  192.168.XXX.XXX  192.168.XXX.XXX secret
```

**Parameters**

- **name** – Set friendly name for the connection
- **ipsecpolicy** – IPSec policy ID or name associated with this connection
- **ikepolicy** – IKE policy ID or name associated with this connection
- **vpnservice** – VPN service instance ID or name associated with this connection
- **peer_cidrs** – Remote subnet(s) in CIDR format
- **peer_address** – Peer gateway public IPv4/IPv6 address or FQDN
- **peer_id** – Peer router identity for authentication Can be IPv4/IPv6 address, e-mail address, key id, or FQDN
- **psk** – Pre-shared key string
- **initiator** – Initiator state in lowercase, default: bi-directional
- **admin_state_up** – Set admin state up to true or false, default: True (Optional)
- **mtu** – size for the connection, default: 1500 (Optional)
- **dpd_action** – Dead Peer Detection attribute: hold/clear/disabled/restart/restart-by-peer (Optional)
- **dpd_interval** – Dead Peer Detection attribute (Optional)
- **dpd_timeout** – Dead Peer Detection attribute (Optional)
- **profile** – Profile to build on (Optional)

**Returns**

Created IPSec site connection information

```python
salt.modules.neutron.create_ipsecpolicy(
    name, profile=None, **kwargs)
```

Creates a new IPsecPolicy

**CLI Example:**

```bash
salt '*' neutron.create_ipsecpolicy ipsecpolicy-name
  transform_protocol=esp auth_algorithm=sha1
  encapsulation_mode=tunnel encryption_algorithm=aes-128
```

**Parameters**

- **name** – Name of the IPSec policy
- **transform_protocol** – Transform protocol in lowercase, default: esp (Optional)
- **auth_algorithm** – Authentication algorithm in lowercase, default: sha1 (Optional)
- **encapsulation_mode** – Encapsulation mode in lowercase, default: tunnel (Optional)
- **encryption_algorithm** – Encryption algorithm in lowercase, default: aes-128 (Optional)
- **pfs** – Prefect Forward Security in lowercase, default: group5 (Optional)
- **units** – IPSec lifetime attribute. default: seconds (Optional)
- **value** – IPSec lifetime attribute. default: 3600 (Optional)
- **profile** – Profile to build on (Optional)

Returns: Created IPSec policy information

```python
salt.modules.neutron.create_network(name, router_ext=None, admin_state_up=True, network_type=None, physical_network=None, segmentation_id=None, shared=None, profile=None)
```

Creates a new network

CLI Example:

```bash
salt '*' neutron.create_network network-name
salt '*' neutron.create_network network-name profile=openstack1
```

Parameters

- **name** – Name of network to create
- **admin_state_up** – should the state of the network be up? default: True (Optional)
- **router_ext** – True then if create the external network (Optional)
- **network_type** – the Type of network that the provider is such as GRE, VXLAN, VLAN, FLAT, or LOCAL (Optional)
- **physical_network** – the name of the physical network as neutron knows it (Optional)
- **segmentation_id** – the vlan id or GRE id (Optional)
- **shared** – is the network shared or not (Optional)
- **profile** – Profile to build on (Optional)

Returns: Created network information

```python
salt.modules.neutron.create_port(name, network, device_id=None, admin_state_up=True, profile=None)
```

Creates a new port

CLI Example:

```bash
salt '*' neutron.create_port network-name port-name
```

Parameters

- **name** – Name of port to create
- **network** – Network name or ID
- **device_id** – ID of device (Optional)
- **admin_state_up** – Set admin state up to true or false, default: true (Optional)
- **profile** – Profile to build on (Optional)

Returns: Created port information

```python
salt.modules.neutron.create_router(name, ext_network=None, admin_state_up=True, profile=None)
```

Creates a new router

CLI Example:

```bash
salt '*' neutron.create_router new-router-name
```

Parameters

- **name** – Name of router to create (must be first)
- **ext_network** – ID or name of the external for the gateway (Optional)
- **admin_state_up** – Set admin state up to true or false, default: true (Optional)
- **profile** – Profile to build on (Optional)
**Returns**  
Created router information

salt.modules.neutron.create_security_group(*name=None, description=None, profile=None*)  
Creates a new security group

**CLI Example:**

```
salt '*' neutron.create_security_group security-group-name  
  description='Security group for servers'
```

**Parameters**
- **name** – Name of security group (Optional)
- **description** – Description of security group (Optional)
- **profile** – Profile to build on (Optional)

**Returns**  
Created security group information

salt.modules.neutron.create_security_group_rule(*security_group, remote_group_id=None, direction='ingress', protocol=None, port_range_min=None, port_range_max=None, ethertype='IPv4', profile=None*)  
Creates a new security group rule

**CLI Example:**

```
salt '*' neutron.show_security_group_rule security-group-rule-id
```

**Parameters**
- **security_group** – Security group name or ID to add rule
- **remote_group_id** – Remote security group name or ID to apply rule (Optional)
- **direction** – Direction of traffic: ingress/egress, default: ingress (Optional)
- **protocol** – Protocol of packet: null/icmp/tcp/udp, default: null (Optional)
- **port_range_min** – Starting port range (Optional)
- **port_range_max** – Ending port range (Optional)
- **ethertype** – IPv4/IPv6, default: IPv4 (Optional)
- **profile** – Profile to build on (Optional)

**Returns**  
Created security group rule information

salt.modules.neutron.create_subnet(*network, cidr, name=None, ip_version=4, profile=None*)  
Creates a new subnet

**CLI Example:**

```
salt '*' neutron.create_subnet network-name 192.168.1.0/24
```

**Parameters**
- **network** – Network ID or name this subnet belongs to
- **cidr** – CIDR of subnet to create (Ex. '192.168.1.0/24')
- **name** – Name of the subnet to create (Optional)
- **ip_version** – Version to use, default is 4(IPv4) (Optional)
- **profile** – Profile to build on (Optional)

**Returns**  
Created subnet information

salt.modules.neutron.create_vpnservice(*subnet, router, name, admin_state_up=True, profile=None*)  
Creates a new VPN service

**CLI Example:**
salt '*' neutron.create_vpnservice router-name name

Parameters

- subnet – Subnet unique identifier for the VPN service deployment
- router – Router unique identifier for the VPN service
- name – Set a name for the VPN service
- admin_state_up – Set admin state up to true or false, default:True (Optional)
- profile – Profile to build on (Optional)

Returns Created VPN service information

salt.modules.neutron.delete_firewall_rule(firewall_rule, profile=None)

Deletes the specified firewall_rule

CLI Example:
	salt '*' neutron.delete_firewall_rule firewall-rule

Parameters

- firewall_rule – ID or name of firewall rule to delete
- profile – Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.delete_floatingip(floatingip_id, profile=None)

Deletes the specified floating IP

CLI Example:
	salt '*' neutron.delete_floatingip floatingip-id

Parameters

- floatingip_id – ID of floatingIP to delete
- profile – Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.delete_ikepolicy(ikepolicy, profile=None)

Deletes the specified IKEPolicy

CLI Example:
	salt '*' neutron.delete_ikepolicy ikepolicy-name

Parameters

- ikepolicy – ID or name of IKE policy to delete
- profile – Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.delete_ipsec_site_connection(ipsec_site_connection, profile=None)

Deletes the specified IPsecSiteConnection

CLI Example:
	salt '*' neutron.delete_ipsec_site_connection connection-name

Parameters

- ipsec_site_connection – ID or name of ipsec site connection to delete
- profile – Profile to build on (Optional)

Returns True(Succeed) or False
salt.modules.neutron.delete_ipsecpolicy(ipsecpolicy, profile=None)
Deletes the specified IPsecPolicy

CLI Example:
```
salt '*' neutron.delete_ipsecpolicy ipsecpolicy-name
```

Parameters
- **ipsecpolicy** – ID or name of IPSec policy to delete
- **profile** – Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.delete_network(network, profile=None)
Deletes the specified network

CLI Example:
```
salt '*' neutron.delete_network network-name
salt '*' neutron.delete_network network-name profile=openstack1
```

Parameters
- **network** – ID or name of network to delete
- **profile** – Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.delete_port(port, profile=None)
Deletes the specified port

CLI Example:
```
salt '*' neutron.delete_port port-name
salt '*' neutron.delete_port port-name profile=openstack1
```

Parameters
- **port** – port name or ID
- **profile** – Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.delete_quota(tenant_id, profile=None)
Delete the specified tenant’s quota value

CLI Example:
```
salt '*' neutron.update_quota tenant-id
salt '*' neutron.update_quota tenant-id profile=openstack1
```

Parameters
- **tenant_id** – ID of tenant to quota delete
- **profile** – Profile to build on (Optional)

Returns True(Delete succeed) or False(Delete failed)

salt.modules.neutron.delete_router(router, profile=None)
Delete the specified router

CLI Example:
```
salt '*' neutron.delete_router router-name
```

Parameters
- **router** – ID or name of router to delete
.. profile – Profile to build on (Optional)

Returns True(Succeed) or False

```
salt.modules.neutron.delete_security_group(security_group, profile=None)
```

Deletes the specified security group

CLI Example:

```
salt '*' neutron.delete_security_group security-group-name
```

Parameters

- **security_group** – ID or name of security group to delete
- **profile** – Profile to build on (Optional)

Returns True(Succeed) or False

```
 salt.modules.neutron.delete_security_group_rule(security_group_rule_id, profile=None)
```

Deletes the specified security group rule

CLI Example:

```
salt '*' neutron.delete_security_group_rule security-group-rule-id
```

Parameters

- **security_group_rule_id** – ID of security group rule to delete
- **profile** – Profile to build on (Optional)

Returns True(Succeed) or False

```
 salt.modules.neutron.delete_subnet(subnet, profile=None)
```

Deletes the specified subnet

CLI Example:

```
salt '*' neutron.delete_subnet subnet-name
salt '*' neutron.delete_subnet subnet-name profile=openstack1
```

Parameters

- **subnet** – ID or name of subnet to delete
- **profile** – Profile to build on (Optional)

Returns True(Succeed) or False

```
 salt.modules.neutron.delete_vpnservice(vpnservice, profile=None)
```

Deletes the specified VPN service

CLI Example:

```
salt '*' neutron.delete_vpnservice vpnservice-name
```

Parameters

- **vpnservice** – ID or name of vpn service to delete
- **profile** – Profile to build on (Optional)

Returns True(Succeed) or False

```
 salt.modules.neutron.get_quotas_tenant(profile=None)
```

Fetches tenant info in server’s context for following quota operation

CLI Example:

```
salt '*' neutron.get_quotas_tenant
salt '*' neutron.get_quotas_tenant profile=openstack1
```

Parameters **profile** – Profile to build on (Optional)
Returns Quotas information

salt.modules.neutron.list_agents(profile=None)
List agents.

CLI Example:
```
salt '*' neutron.list_agents
```

Parameters profile – Profile to build on (Optional)

Returns agents message.

salt.modules.neutron.list_extensions(profile=None)
Fetches a list of all extensions on server side

CLI Example:
```
salt '*' neutron.list_extensions
salt '*' neutron.list_extensions profile=openstack1
```

Parameters profile – Profile to build on (Optional)

Returns List of extensions

salt.modules.neutron.list_firewall_rules(profile=None)
Fetches a list of all firewall rules for a tenant CLI Example:
```
salt '*' neutron.list_firewall_rules
```

Parameters profile – Profile to build on (Optional)

Returns List of firewall rules

salt.modules.neutron.list_firewalls(profile=None)
Fetches a list of all firewalls for a tenant CLI Example:
```
salt '*' neutron.list_firewalls
```

Parameters profile – Profile to build on (Optional)

Returns List of firewalls

salt.modules.neutron.list_floatingips(profile=None)
Fetch a list of all floatingIPs for a tenant

CLI Example:
```
salt '*' neutron.list_floatingips
salt '*' neutron.list_floatingips profile=openstack1
```

Parameters profile – Profile to build on (Optional)

Returns List of floatingIP

salt.modules.neutron.list_ikepolicies(profile=None)
Fetches a list of all configured IKEPolicies for a tenant

CLI Example:
```
salt '*' neutron.list_ikepolicies
salt '*' neutron.list_ikepolicies profile=openstack1
```

Parameters profile – Profile to build on (Optional)

Returns List of IKE policy
salt.modules.neutron.list_ipsec_site_connections(profile=None)

Fetches all configured IPsec Site Connections for a tenant

CLI Example:
```python
salt '*' neutron.list_ipsec_site_connections
salt '*' neutron.list_ipsec_site_connections profile=openstack1
```

**Parameters** `profile` – Profile to build on (Optional)

**Returns** List of IPsec site connection

salt.modules.neutron.list_ipsec_policies(profile=None)

Fetches a list of all configured IPSecPolicies for a tenant

CLI Example:
```python
salt '*' neutron.list_ipsec_policies ipsecpolicy-name
salt '*' neutron.list_ipsec_policies ipsecpolicy-name profile=openstack1
```

**Parameters** `profile` – Profile to build on (Optional)

**Returns** List of IPSec policy

salt.modules.neutron.list_l3_agent_hosting_routers(router, profile=None)

List L3 agents hosting a router.

CLI Example:
```python
salt '*' neutron.list_l3_agent_hosting_routers router
```

:param router: router name or ID to query.
:param profile: Profile to build on (Optional)
:returns: L3 agents message.

salt.modules.neutron.list_networks(profile=None)

Fetches a list of all networks for a tenant

CLI Example:
```python
salt '*' neutron.list_networks
salt '*' neutron.list_networks profile=openstack1
```

**Parameters** `profile` – Profile to build on (Optional)

**Returns** List of network

salt.modules.neutron.list_ports(profile=None)

Fetches a list of all networks for a tenant

CLI Example:
```python
salt '*' neutron.list_ports
salt '*' neutron.list_ports profile=openstack1
```

**Parameters** `profile` – Profile to build on (Optional)

**Returns** List of port

salt.modules.neutron.list_quotas(profile=None)

Fetches all tenants quotas

CLI Example:
```python
salt '*' neutron.list_quotas
salt '*' neutron.list_quotas profile=openstack1
```
Parameters **profile** – Profile to build on (Optional)

Returns List of quotas

```python
salt.modules.neutron.list_routers(profile=None)
```

Fetches a list of all routers for a tenant

CLI Example:

```bash
salt '*' neutron.list_routers
salt '*' neutron.list_routers profile=openstack1
```

Parameters **profile** – Profile to build on (Optional)

Returns List of router

```python
salt.modules.neutron.list_security_group_rules(profile=None)
```

Fetches a list of all security group rules for a tenant

CLI Example:

```bash
salt '*' neutron.list_security_group_rules
salt '*' neutron.list_security_group_rules profile=openstack1
```

Parameters **profile** – Profile to build on (Optional)

Returns List of security group rule

```python
salt.modules.neutron.list_security_groups(profile=None)
```

Fetches a list of all security groups for a tenant

CLI Example:

```bash
salt '*' neutron.list_security_groups
salt '*' neutron.list_security_groups profile=openstack1
```

Parameters **profile** – Profile to build on (Optional)

Returns List of security group

```python
salt.modules.neutron.list_subnets(profile=None)
```

Fetches a list of all networks for a tenant

CLI Example:

```bash
salt '*' neutron.list_subnets
salt '*' neutron.list_subnets profile=openstack1
```

Parameters **profile** – Profile to build on (Optional)

Returns List of subnet

```python
salt.modules.neutron.list_vpnservices(retrieve_all=True, profile=None, **kwargs)
```

Fetches a list of all configured VPN services for a tenant

CLI Example:

```bash
salt '*' neutron.list_vpnservices
```

Parameters

- **retrieve_all** – True or False, default: True (Optional)
- **profile** – Profile to build on (Optional)

Returns List of VPN service

```python
salt.modules.neutron.remove_gateway_router(router, profile=None)
```

Removes an external network gateway from the specified router
CLI Example:

```
salt '*' neutron.remove_gateway_router router-name
```

**Parameters**
- **router** – ID or name of router
- **profile** – Profile to build on (Optional)

**Returns** True(Succeed) or False

```python
salt.modules.neutron.remove_interface_router(router, subnet, profile=None)
```
Removes an internal network interface from the specified router

CLI Example:

```
salt '*' neutron.remove_interface_router router-name subnet-name
```

**Parameters**
- **router** – ID or name of the router
- **subnet** – ID or name of the subnet
- **profile** – Profile to build on (Optional)

**Returns** True(Succeed) or False

```python
salt.modules.neutron.show_firewall(firewall, profile=None)
```
Fetches information of a specific firewall rule

CLI Example:

```
salt '*' neutron.show_firewall firewall
```

**Parameters**
- **firewall** – ID or name of firewall to look up
- **profile** – Profile to build on (Optional)

**Returns** firewall information

```python
salt.modules.neutron.show_firewall_rule(firewall_rule, profile=None)
```
Fetches information of a specific firewall rule

CLI Example:

```
salt '*' neutron.show_firewall_rule firewall-rule-name
```

**Parameters**
- **ipsecpolicy** – ID or name of firewall rule to look up
- **profile** – Profile to build on (Optional)

**Returns** firewall rule information

```python
salt.modules.neutron.show_floatingip(floatingip_id, profile=None)
```
Fetches information of a certain floatingIP

CLI Example:

```
salt '*' neutron.show_floatingip floatingip-id
```

**Parameters**
- **floatingip_id** – ID of floatingIP to look up
- **profile** – Profile to build on (Optional)

**Returns** Floating IP information

```python
salt.modules.neutron.show_ikepolicy(ikepolicy, profile=None)
```
Fetches information of a specific IKEPolicy
CLI Example:
```
salt '*' neutron.show_ikepolicy ikepolicy-name
```

Parameters
- **ikepolicy** - ID or name of ikepolicy to look up
- **profile** - Profile to build on (Optional)

Returns IKE policy information

```
salt.modules.neutron.show_ipsec_site_connection(ipsec_site_connection, profile=None)
```

Fetches information of a specific IPsecSiteConnection

CLI Example:
```
salt '*' neutron.show_ipsec_site_connection connection-name
```

Parameters
- **ipsec_site_connection** - ID or name of ipsec site connection to look up
- **profile** - Profile to build on (Optional)

Returns IPSec site connection information

```
salt.modules.neutron.show_ipsecpolicy(ipsecpolicy, profile=None)
```

Fetches information of a specific IPsecPolicy

CLI Example:
```
salt '*' neutron.show_ipsecpolicy ipsecpolicy-name
```

Parameters
- **ipsecpolicy** - ID or name of IPSec policy to look up
- **profile** - Profile to build on (Optional)

Returns IPSec policy information

```
salt.modules.neutron.show_network(network, profile=None)
```

Fetches information of a certain network

CLI Example:
```
salt '*' neutron.show_network network-name
salt '*' neutron.show_network network-name profile=openstack1
```

Parameters
- **network** - ID or name of network to look up
- **profile** - Profile to build on (Optional)

Returns Network information

```
salt.modules.neutron.show_port(port, profile=None)
```

Fetches information of a certain port

CLI Example:
```
salt '*' neutron.show_port port-id
salt '*' neutron.show_port port-id profile=openstack1
```

Parameters
- **port** - ID or name of port to look up
- **profile** - Profile to build on (Optional)

Returns Port information
salt.modules.neutron.show_quota(tenant_id, profile=None)
Fetches information of a certain tenant's quotas

CLI Example:
```
salt '*' neutron.show_quota tenant-id
salt '*' neutron.show_quota tenant-id profile=openstack1
```

Parameters
- **tenant_id** – ID of tenant
- **profile** – Profile to build on (Optional)

Returns Quota information

salt.modules.neutron.show_router(router, profile=None)
Fetches information of a certain router

CLI Example:
```
salt '*' neutron.show_router router-name
```

Parameters
- **router** – ID or name of router to look up
- **profile** – Profile to build on (Optional)

Returns Router information

salt.modules.neutron.show_security_group(security_group, profile=None)
Fetches information of a certain security group

CLI Example:
```
salt '*' neutron.show_security_group security-group-name
```

Parameters
- **security_group** – ID or name of security group to look up
- **profile** – Profile to build on (Optional)

Returns Security group information

salt.modules.neutron.show_security_group_rule(security_group_rule_id, profile=None)
Fetches information of a certain security group rule

CLI Example:
```
salt '*' neutron.show_security_group_rule security-group-rule-id
```

Parameters
- **security_group_rule_id** – ID of security group rule to look up
- **profile** – Profile to build on (Optional)

Returns Security group rule information

salt.modules.neutron.show_subnet(subnet, profile=None)
Fetches information of a certain subnet

CLI Example:
```
salt '*' neutron.show_subnet subnet-name
```

Parameters
- **subnet** – ID or name of subnet to look up
- **profile** – Profile to build on (Optional)

Returns Subnet information
salt.modules.neutron.show_vpnservice(vpnservice, profile=None, **kwargs)
    Fetches information of a specific VPN service

    CLI Example:
    ```
salt '*' neutron.show_vpnservice vpnservice-name
    ```

    Parameters
    - **vpnservice** – ID or name of vpn service to look up
    - **profile** – Profile to build on (Optional)

    Returns
    VPN service information

salt.modules.neutron.update_firewall_rule(firewall_rule, protocol=None, action=None, name=None, description=None, ip_version=None, source_ip_address=None, destination_ip_address=None, source_port=None, destination_port=None, shared=None, enabled=None, profile=None)

    Update a firewall rule

    CLI Example:
    ```
salt '*' neutron.update_firewall_rule firewall_rule protocol=PROTOCOL
    action=ACTION
    name=NAME description=DESCRIPTION ip_version=IP_VERSION
    source_ip_address=SOURCE_IP_ADDRESS destination_ip_address=DESTINATION_IP_ADDRESS
    source_port=SOURCE_PORT destination_port=DESTINATION_PORT shared=SHARED
    enabled=ENABLED
    ```

    Parameters
    - **firewall_rule** – ID or name of firewall rule to update.
    - **protocol** – Protocol for the firewall rule, choose "tcp", "udp", "icmp" or "None". (Optional)
    - **action** – Action for the firewall rule, choose "allow" or "deny". (Optional)
    - **name** – Name for the firewall rule. (Optional)
    - **description** – Description for the firewall rule. (Optional)
    - **ip_version** – IP protocol version, default: 4. (Optional)
    - **source_ip_address** – Source IP address or subnet. (Optional)
    - **destination_ip_address** – Destination IP address or subnet. (Optional)
    - **source_port** – Source port (integer in [1, 65535] or range in a:b). (Optional)
    - **destination_port** – Destination port (integer in [1, 65535] or range in a:b). (Optional)
    - **shared** – Set shared to True, default: False. (Optional)
    - **enabled** – To enable this rule, default: True. (Optional)
    - **profile** – Profile to build on (Optional)

salt.modules.neutron.update_floatingip(floatingip_id, port=None, profile=None)

    Updates a floatingIP

    CLI Example:
    ```
salt '*' neutron.update_floatingip network-name port-name
    ```

    Parameters
    - **floatingip_id** – ID of floatingIP
    - **port** – ID or name of port, to associate floatingip to None or do not specify to disassociate the floatingip (Optional)
- **profile** – Profile to build on (Optional)

Returns Value of updated floating IP information

salt.modules.neutron.update_network(network, name, profile=None)

Updates a network

CLI Example:

```
salt '*' neutron.update_network network-name new-network-name
```

Parameters
- **network** – ID or name of network to update
- **name** – Name of this network
- **profile** – Profile to build on (Optional)

Returns Value of updated network information

salt.modules.neutron.update_port(port, name, admin_state_up=True, profile=None)

Updates a port

CLI Example:

```
salt '*' neutron.update_port port-name network-name new-port-name
```

Parameters
- **port** – Port name or ID
- **name** – Name of this port
- **admin_state_up** – Set admin state up to true or false, default: true (Optional)
- **profile** – Profile to build on (Optional)

Returns Value of updated port information

salt.modules.neutron.update_quota(tenant_id, subnet=None, router=None, network=None, floatingip=None, port=None, security_group=None, security_group_rule=None, profile=None)

Update a tenant’s quota

CLI Example:

```
salt '*' neutron.update_quota tenant-id subnet=40 router=50
    network=10 floatingip=30 port=30
```

Parameters
- **tenant_id** – ID of tenant
- **subnet** – Value of subnet quota (Optional)
- **router** – Value of router quota (Optional)
- **network** – Value of network quota (Optional)
- **floatingip** – Value of floatingip quota (Optional)
- **port** – Value of port quota (Optional)
- **security_group** – Value of security group (Optional)
- **security_group_rule** – Value of security group rule (Optional)
- **profile** – Profile to build on (Optional)

Returns Value of updated quota

salt.modules.neutron.update_router(router, name=None, admin_state_up=None, profile=None, **kwargs)

Updates a router

CLI Example:
**salt '***' neutron.update_router**

```
router_id name=new-router-name
admin_state_up=’True’
```

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>router</td>
<td>ID or name of router to update</td>
</tr>
<tr>
<td>name</td>
<td>Name of this router</td>
</tr>
<tr>
<td>ext_network</td>
<td>ID or name of the external for the gateway (Optional)</td>
</tr>
<tr>
<td>admin_state_up</td>
<td>Set admin state up to true or false, default: true (Optional)</td>
</tr>
<tr>
<td>profile</td>
<td>Profile to build on (Optional)</td>
</tr>
<tr>
<td><strong>kwargs</strong></td>
<td></td>
</tr>
</tbody>
</table>

| Returns        | Value of updated router information                               |

**salt.modules.neutron.update_security_group**

```
security_group, name=None, description=None, profile=None
```

Updates a security group

**CLI Example:**

```
salt '***' neutron.update_security_group security-group-name new-security-group-name
```

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>security_group</td>
<td>ID or name of security group to update</td>
</tr>
<tr>
<td>name</td>
<td>Name of this security group (Optional)</td>
</tr>
<tr>
<td>description</td>
<td>Description of security group (Optional)</td>
</tr>
<tr>
<td>profile</td>
<td>Profile to build on (Optional)</td>
</tr>
<tr>
<td><strong>kwargs</strong></td>
<td></td>
</tr>
</tbody>
</table>

| Returns        | Value of updated security group information                      |

**salt.modules.neutron.update_subnet**

```
subnet, name, profile=None
```

Updates a subnet

**CLI Example:**

```
salt '***' neutron.update_subnet subnet-name new-subnet-name
```

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>subnet</td>
<td>ID or name of subnet to update</td>
</tr>
<tr>
<td>name</td>
<td>Name of this subnet</td>
</tr>
<tr>
<td>profile</td>
<td>Profile to build on (Optional)</td>
</tr>
<tr>
<td><strong>kwargs</strong></td>
<td></td>
</tr>
</tbody>
</table>

| Returns        | Value of updated subnet information                               |

**salt.modules.neutron.update_vpnservice**

```
vpnservice, desc, profile=None
```

Updates a VPN service

**CLI Example:**

```
salt '***' neutron.update_vpnservice vpnservice-name desc='VPN Service1'
```

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vpnservice</td>
<td>ID or name of vpn service to update</td>
</tr>
<tr>
<td>desc</td>
<td>Set a description for the VPN service</td>
</tr>
<tr>
<td>profile</td>
<td>Profile to build on (Optional)</td>
</tr>
<tr>
<td><strong>kwargs</strong></td>
<td></td>
</tr>
</tbody>
</table>

| Returns        | Value of updated VPN service information                          |

---

**21.9.279 salt.modules.neutronng**

Neutron module for interacting with OpenStack Neutron
New in version 2018.3.0.
:depends: shade

Example configuration

```
neutron:
  cloud: default

neutron:
  auth:
    username: admin
    password: password123
    user_domain_name: mydomain
    project_name: myproject
    project_domain_name: myproject
    auth_url: https://example.org:5000/v3
    identity_api_version: 3
```

```
salt.modules.neutronng.compare_changes(obj, **kwargs)
  Compare two dicts returning only keys that exist in the first dict and are different in the second one
```

```
salt.modules.neutronng.get_openstack_cloud(auth=None)
  Return an openstack_cloud
```

```
salt.modules.neutronng.get_operator_cloud(auth=None)
  Return an operator_cloud
```

```
salt.modules.neutronng.list_networks(auth=None, **kwargs)
  List networks
  filters A Python dictionary of filter conditions to push down
  CLI Example:
  
  salt '* neutronng.list_networks
  salt '*' neutronng.list_networks filters='{"tenant_id": "1dcac318a83b4610b7a7f7ba01465548"}"
```

```
salt.modules.neutronng.list_subnets(auth=None, **kwargs)
  List subnets
  filters A Python dictionary of filter conditions to push down
  CLI Example:
  
  salt '*' neutronng.list_subnets
  salt '*' neutronng.list_subnets filters='{"tenant_id": "1dcac318a83b4610b7a7f7ba01465548"}"
```

```
salt.modules.neutronng.network_create(auth=None, **kwargs)
  Create a network
  name Name of the network being created
  shared [False] If True, set the network as shared
  admin_state_up [True] If True, Set the network administrative state to "up"
  external [False] Control whether or not this network is externally accessible
  provider An optional Python dictionary of network provider options
  project_id The project ID on which this network will be created
  CLI Example:
```
```
salt '*' neutronng.network_create name=network2 shared=True admin_state_up=True external=True

salt '*' neutronng.network_create name=network3 provider='{"network_type": "vlan", "segmentation_id": "4010", "physical_network": "provider"}' project_id=1dcac318a83b4610b7a7f7ba01465548
```

**salt.modules.neutronng.network_delete**(auth=None, **kwargs)
Delete a network

- **name_or_id** Name or ID of the network being deleted

CLI Example:
```
salt '*' neutronng.network_delete name_or_id=network1
salt '*' neutronng.network_delete name_or_id=1dcac318a83b4610b7a7f7ba01465548
```

**salt.modules.neutronng.network_get**(auth=None, **kwargs)
Get a single network

- **filters** A Python dictionary of filter conditions to push down

CLI Example:
```
salt '*' neutronng.network_get name=XLB4
```

**salt.modules.neutronng.security_group_create**(auth=None, **kwargs)
Create a security group. Use security_group_get to create default.

- **project_id** The project ID on which this security group will be created

CLI Example:
```
salt '*' neutronng.security_group_create name=secgroup1 description="Very secure security group"
salt '*' neutronng.security_group_create name=secgroup1 description="Very secure security group" project_id=1dcac318a83b4610b7a7f7ba01465548
```

**salt.modules.neutronng.security_group_delete**(auth=None, **kwargs)
Delete a security group

- **name_or_id** The name or unique ID of the security group

CLI Example:
```
salt '*' neutronng.security_group_delete name_or_id=secgroup1
```

**salt.modules.neutronng.security_group_get**(auth=None, **kwargs)
Get a single security group. This will create a default security group if one does not exist yet for a particular project id.

- **filters** A Python dictionary of filter conditions to push down

CLI Example:
```
salt '*' neutronng.security_group_get name_or_id=1dcac318a83b4610b7a7f7ba01465548
salt '*' neutronng.security_group_get name=default filters='{"tenant_id": "2e778bb64ca64a199eb526b5958d8710\"\"}'}
```

**salt.modules.neutronng.security_group_rule_create**(auth=None, **kwargs)
Create a rule in a security group
secgroup_name_or_id  The security group name or ID to associate with this security group rule. If a non-unique group name is given, an exception is raised.

port_range_min  The minimum port number in the range that is matched by the security group rule. If the protocol is TCP or UDP, this value must be less than or equal to the port_range_max attribute value. If nova is used by the cloud provider for security groups, then a value of None will be transformed to -1.

port_range_max  The maximum port number in the range that is matched by the security group rule. The port_range_min attribute constrains the port_range_max attribute. If nova is used by the cloud provider for security groups, then a value of None will be transformed to -1.

protocol  The protocol that is matched by the security group rule. Valid values are None, tcp, udp, and icmp.

remote_ip_prefix  The remote IP prefix to be associated with this security group rule. This attribute matches the specified IP prefix as the source IP address of the IP packet.

remote_group_id  The remote group ID to be associated with this security group rule.

direction  Either ingress or egress; the direction in which the security group rule is applied. For a compute instance, an ingress security group rule is applied to incoming (ingress) traffic for that instance. An egress rule is applied to traffic leaving the instance.

ethertype  Must be IPv4 or IPv6, and addresses represented in CIDR must match the ingress or egress rules.

project_id  Specify the project ID this security group will be created on (admin-only)

CLI Example:

```
salt '*' neutronng.security_group_rule_create  
  secgroup_name_or_id=secgroup1

salt '*' neutronng.security_group_rule_create  
  secgroup_name_or_id=secgroup2  
  port_range_min=8080  
  port_range_max=8080  
  direction='egress'

salt '*' neutronng.security_group_rule_create  
  secgroup_name_or_id=c0e1d1ce-7296-405e-919d-1c08217be529  
  protocol=icmp  
  project_id=1dcac318a83b4610b7a7f7fba01465548
```

salt.modules.neutronng.security_group_rule_delete(auth=None, **kwargs)

Delete a security group

name_or_id  The unique ID of the security group rule

CLI Example:

```
salt '*' neutronng.security_group_rule_delete  
  name_or_id=1dcac318a83b4610b7a7f7fba01465548
```

salt.modules.neutronng.security_group_update(secgroup=None, auth=None, **kwargs)

Update a security group

secgroup  Name, ID or Raw Object of the security group to update

name  New name for the security group

description  New description for the security group

CLI Example:

```
salt '*' neutronng.security_group_update  
  secgroup=secgroup1  
  description="Very secure security group"

salt '*' neutronng.security_group_update  
  secgroup=c0e1d1ce-7296-405e-919d-1c08217be529  
  protocol=icmp  
  project_id=1dcac318a83b4610b7a7f7fba01465548
```

salt.modules.neutronng.setup_clouds(auth=None)

Call functions to create Shade cloud objects in __context__ to take advantage of Shade’s in-memory caching across several states.

salt.modules.neutronngsubnet_create(auth=None, **kwargs)

Create a subnet
Salt Documentation, Release 2019.2.0

network_name_or_id The unique name or ID of the attached network. If a non-unique name is supplied, an
exception is raised.
cidr The CIDR
ip_version The IP version, which is 4 or 6.
enable_dhcp [False] Set to True if DHCP is enabled and False if disabled
subnet_name The name of the subnet
tenant_id The ID of the tenant who owns the network. Only administrative users can specify a tenant ID
other than their own.
allocation_pools A list of dictionaries of the start and end addresses for the allocation pools.
gateway_ip The gateway IP address. When you specify both allocation_pools and gateway_ip, you
must ensure that the gateway IP does not overlap with the specified allocation pools.
disable_gateway_ip [False] Set to True if gateway IP address is disabled and False if enabled. It is not
allowed with gateway_ip.
dns_nameservers A list of DNS name servers for the subnet
host_routes A list of host route dictionaries for the subnet
ipv6_ra_mode IPv6 Router Advertisement mode.
Valid values are dhcpv6-stateful,
dhcpv6-stateless, or slaac.
ipv6_address_mode IPv6 address mode. Valid values are dhcpv6-stateful, dhcpv6-stateless, or
slaac.
use_default_subnetpool If True, use the default subnetpool for ip_version to obtain a CIDR. It is required
to pass None to the cidr argument when enabling this option.
CLI Example:
salt '*' neutronng.subnet_create network_name_or_id=network1
subnet_name=subnet1
network_name_or_
salt '*' neutronng.subnet_create subnet_name=subnet2
,→id=network2 enable_dhcp=True
allocation_pools='[{"start": "192.168.
,→199.2",
"end": "192.168.199.254"}]'
,→gateway_ip='192.168.199.1' cidr=192.168.199.0/24
salt '*' neutronng.subnet_create network_name_or_id=network1
,→name=subnet1 dns_nameservers='["8.8.8.8", "8.8.8.7"]'

subnet_

salt.modules.neutronng.subnet_delete(auth=None, **kwargs)
Delete a subnet
name Name or ID of the subnet to update
CLI Example:
salt '*' neutronng.subnet_delete name=subnet1
salt '*' neutronng.subnet_delete
name=1dcac318a83b4610b7a7f7ba01465548

salt.modules.neutronng.subnet_get(auth=None, **kwargs)
Get a single subnet
filters A Python dictionary of filter conditions to push down
CLI Example:
salt '*' neutronng.subnet_get name=subnet1

salt.modules.neutronng.subnet_update(auth=None, **kwargs)
Update a subnet
name_or_id Name or ID of the subnet to update
subnet_name The new name of the subnet
enable_dhcp Set to True if DHCP is enabled and False if disabled
gateway_ip The gateway IP address. When you specify both allocation_pools and gateway_ip, you must
ensure that the gateway IP does not overlap with the specified allocation pools.
2192

Chapter 21. Salt Module Reference


disable_gateway_ip  [False] Set to True if gateway IP address is disabled and False if enabled. It is not allowed with gateway_ip.

allocation_pools  A list of dictionaries of the start and end addresses for the allocation pools.

dns_nameservers  A list of DNS name servers for the subnet

host_routes  A list of host route dictionaries for the subnet

```
# Example of neutronng.netns up
salt '*' neutronng.netns_create name=netns1
salt '*' neutronng.netns_create name=netns2

# Example of neutronng.netns_remove
salt '*' neutronng.netns_remove name=netns1
```

### 21.9.280  salt.modules.nfs3

Module for managing NFS version 3.

salt.modules.nfs3.add_export(exports='/etc/exports', path=None, hosts=None, options=None)

Add an export

**CLI Example:**
```
salt '*' nfs3.add_export path='/srv/test' hosts='127.0.0.1' options=['rw']
```
	salt.modules.nfs3.del_export(exports='/etc/exports', path=None)

Remove an export

**CLI Example:**
```
salt '*' nfs.del_export /media/storage
```
	salt.modules.nfs3.list_exports(exports='/etc/exports')

List configured exports

**CLI Example:**
```
salt '*' nfs.list_exports
```
	salt.modules.nfs3.reload_exports()

Trigger a reload of the exports file to apply changes

**CLI Example:**
```
salt '*' nfs3.reload_exports
```

### 21.9.281  salt.modules.nftables

Support for nftables

salt.modules.nftables.append(table='filter', chain=None, rule=None, family='ipv4')

Append a rule to the specified table & chain.

**This function accepts a rule in a standard nftables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.**

**CLI Example:**
```
salt '*' nftables.append chain='filter:INPUT' rule='proto tcp dport 80 iif 10.0.0.1/24' family='ipv4'
```
salt 'nftables.append filter input \
   rule='tcp dport 22 log accept'

IPv6:
salt 'nftables.append filter input \
   rule='tcp dport 22 log accept' \n   family=ipv6

salt.modules.nftables.build_rule(table=None, chain=None, command=None, position='', full=None, family='ipv4', **kwargs)

Build a well-formatted nftables rule based on kwargs. A table and chain are not required, unless full is True.

If full is True, then table, chain and command are required. command may be specified as either insert, append, or delete. This will return the nftables command, exactly as it would be used from the command line.

If a position is required (as with insert or delete), it may be specified as position. This will only be useful if full is True.

If connstate is passed in, it will automatically be changed to state.

CLI Examples:
salt '*' nftables.build_rule match=state \n   connstate=RELATED,ESTABLISHED jump=ACCEPT
salt '*' nftables.build_rule filter input command=insert position=3 \n   full=True match=state state=related,established jump=accept

IPv6:
salt '*' nftables.build_rule match=state \n   connstate=related,established jump=accept \n   family=ipv6
salt '*' nftables.build_rule filter input command=insert position=3 \n   full=True match=state state=related,established jump=accept \n   family=ipv6

click.modules.nftables.check(table='filter', chain=None, rule=None, family='ipv4')

Check for the existence of a rule in the table and chain

This function accepts a rule in a standard nftables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:
salt '*' nftables.check filter input \n   rule='tcp dport 22 log accept'

IPv6:
salt '*' nftables.check filter input \n   rule='tcp dport 22 log accept' \n   family=ipv6

click.modules.nftables.check_chain(table='filter', chain=None, family='ipv4')

New in version 2014.7.0.

Check for the existence of a chain in the table

CLI Example:
salt '*' nftables.check_chain filter input

(continues on next page)
IPv6:
salt '*' nftables.check_chain filter input family=ipv6

salt.modules.nftables.check_table(table=None, family='ipv4')
Check for the existence of a table

CLI Example:
salt '*' nftables.check_table nat

salt.modules.nftables.delete(table, chain=None, position=None, rule=None, family='ipv4')
Delete a rule from the specified table & chain, specifying either the rule in its entirety, or the rule's position in the chain.

This function accepts a rule in a standard nftables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Examples:
salt '*' nftables.delete filter input position=3
salt '*' nftables.delete filter input \
   rule='tcp dport 22 log accept'
IPv6:
salt '*' nftables.delete filter input position=3 family=ipv6
salt '*' nftables.delete filter input \
   rule='tcp dport 22 log accept' \ 
   family=ipv6

salt.modules.nftables.delete_chain(table='filter', chain=None, family='ipv4')
New in version 2014.7.0.
Delete the chain from the specified table.

CLI Example:
salt '*' nftables.delete_chain filter
salt '*' nftables.delete_chain filter foo
IPv6:
salt '*' nftables.delete_chain filter family=ipv6
salt '*' nftables.delete_chain filter foo family=ipv6

salt.modules.nftables.delete_table(table, family='ipv4')
New in version 2014.7.0.
Create new custom table.

CLI Example:
salt '*' nftables.delete_table filter
IPv6:
salt '*' nftables.delete_table filter family=ipv6
salt.modules.nftables.flush(table='filter', chain='', family='ipv4')
Flush the chain in the specified table, flush all chains in the specified table if chain is not specified.

CLI Example:

```
salt '*' nftables.flush filter
salt '*' nftables.flush filter input
IPv6:
salt '*' nftables.flush filter input family=ipv6
```

salt.modules.nftables.get_rule_handle(table='filter', chain=None, rule=None, family='ipv4')
Get the handle for a particular rule
This function accepts a rule in a standard nftables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```
salt '*' nftables.get_rule_handle filter input \
   rule='tcp dport 22 log accept'
IPv6:
salt '*' nftables.get_rule_handle filter input \
   rule='tcp dport 22 log accept' \
   family=ipv6
```

salt.modules.nftables.get_rules(family='ipv4')
Return a data structure of the current, in-memory rules

CLI Example:

```
salt '*' nftables.get_rules
salt '*' nftables.get_rules family=ipv6
```

salt.modules.nftables.get_saved_rules(conf_file=None)
Return a data structure of the rules in the conf file

CLI Example:

```
salt '*' nftables.get_saved_rules
```

salt.modules.nftables.insert(table='filter', chain=None, position=None, rule=None, family='ipv4')
Insert a rule into the specified table & chain, at the specified position.

If position is not specified, rule will be inserted in first position.
This function accepts a rule in a standard nftables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Examples:

```
salt '*' nftables.insert filter input \ 
   rule='tcp dport 22 log accept'
salt '*' nftables.insert filter input position=3 \ 
   rule='tcp dport 22 log accept'
```
IPv6:
salt '*' nftables.insert filter input \
  rule='tcp dport 22 log accept' \
    family=ipv6
salt '*' nftables.insert filter input position=3 \
  rule='tcp dport 22 log accept' \
    family=ipv6

salt.modules.nftables.new_chain(table=’filter’, chain=None, table_type=None, hook=None, priority=None, family=’ipv4’)

New in version 2014.7.0.
Create new chain to the specified table.

CLI Example:
salt '*' nftables.new_chain filter input
salt '*' nftables.new_chain filter input \
  table_type=filter hook=input priority=0
salt '*' nftables.new_chain filter foo

IPv6:
salt '*' nftables.new_chain filter input family=ipv6
salt '*' nftables.new_chain filter input \
  table_type=filter hook=input priority=0 family=ipv6
salt '*' nftables.new_chain filter foo family=ipv6

salt.modules.nftables.new_table(table, family=’ipv4’)

New in version 2014.7.0.
Create new custom table.

CLI Example:
salt '*' nftables.new_table filter
IPv6:
salt '*' nftables.new_table filter family=ipv6

salt.modules.nftables.save(filename=None, family=’ipv4’)
Save the current in-memory rules to disk

CLI Example:
salt '*' nftables.save /etc/nftables

salt.modules.nftables.version()
Return version from nftables –version

CLI Example:
salt '*' nftables.version
21.9.282  salt.modules.nginx

Support for nginx

salt.modules.nginx.build_info()
Return server and build arguments
   CLI Example:
   
   salt '*' nginx.build_info

salt.modules.nginx.configtest()
Test configuration and exit
   CLI Example:
   
   salt '*' nginx.configtest

salt.modules.nginx.signal(signal=None)
Signals nginx to start, reload, reopen or stop.
   CLI Example:
   
   salt '*' nginx.signal reload

salt.modules.nginx.status(url='http://127.0.0.1/status')
Return the data from an Nginx status page as a dictionary. http://wiki.nginx.org/HttpStubStatusModule
   url  The URL of the status page. Defaults to 'http://127.0.0.1/status'
   CLI Example:
   
   salt '*' nginx.status

salt.modules.nginx.version()
Return server version from nginx -v
   CLI Example:
   
   salt '*' nginx.version

21.9.283  salt.modules.nilrt_ip module

The networking module for NI Linux Real-Time distro

salt.modules.nilrt_ip.apply_network_settings(**settings)
Apply global network configuration.
   CLI Example:
   
   salt '*' ip.apply_network_settings

salt.modules.nilrt_ip.build_interface(iface, iface_type, enabled, **settings)
Build an interface script for a network interface.
   CLI Example:
   
   salt '*' ip.build_interface eth0 eth <settings>
salt.modules.nilrt_ip.build_network_settings(**settings)**

Build the global network script.

CLI Example:

```
salt '*' ip.build_network_settings <settings>
```

salt.modules.nilrt_ip.disable(interface)

Disable the specified interface

Change adapter mode to Disabled. If previous adapter mode was EtherCAT, the target will need reboot.

Parameters **interface (str)** – interface label

Returns True if the service was disabled, otherwise an exception will be thrown.

Return type bool

CLI Example:

```
salt '*' ip.disable interface-label
```

salt.modules.nilrt_ip.down(interface, iface_type=None)

Disable the specified interface

Change adapter mode to Disabled. If previous adapter mode was EtherCAT, the target will need reboot.

Parameters **interface (str)** – interface label

Returns True if the service was disabled, otherwise an exception will be thrown.

Return type bool

CLI Example:

```
salt '*' ip.down interface-label
```

salt.modules.nilrt_ip.enable(interface)

Enable the specified interface

Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.

Parameters **interface (str)** – interface label

Returns True if the service was enabled, otherwise an exception will be thrown.

Return type bool

CLI Example:

```
salt '*' ip.enable interface-label
```

salt.modules.nilrt_ip.get_interface(iface)

Returns details about given interface.

CLI Example:

```
salt '*' ip.get_interface eth0
```

salt.modules.nilrt_ip.get_interfaces_details()

Get details about all the interfaces on the minion

Returns information about all interfaces omitting loopback

Return type dictionary

CLI Example:

```
salt '*' ip.get_interfaces_details
```

salt.modules.nilrt_ip.get_network_settings()

Return the contents of the global network script.

CLI Example:
salt '*' ip.get_network_settings

salt.modules.nilrt_ip.set_dhcp_linklocal_all(interface)
Configure specified adapter to use DHCP with linklocal fallback
Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.
Parameters

interface (str) – interface label
Returns True if the settings were applied, otherwise an exception will be thrown.
Return type bool

CLI Example:
salt '*' ip.set_dhcp_linklocal_all interface-label

salt.modules.nilrt_ip.set_dhcp_only_all(interface)
Configure specified adapter to use DHCP only
Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.
Parameters

interface (str) – interface label
Returns True if the settings were applied, otherwise an exception will be thrown.
Return type bool

CLI Example:
salt '*' ip.dhcp_only_all interface-label

salt.modules.nilrt_ip.set_ethercat(interface, master_id)
Configure specified adapter to use EtherCAT adapter mode. If successful, the target will need reboot if it
doesn’t already use EtherCAT adapter mode, otherwise will return true.
Parameters

• interface – interface label
• master_id – EtherCAT Master ID
Returns True if the settings were applied, otherwise an exception will be thrown.

CLI Example:
salt '*' ip.set_ethercat interface-label master-id

salt.modules.nilrt_ip.set_linklocal_only_all(interface)
Configure specified adapter to use linklocal only
Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.
Parameters

interface (str) – interface label
Returns True if the settings were applied, otherwise an exception will be thrown.
Return type bool

CLI Example:
salt '*' ip.linklocal_only_all interface-label

salt.modules.nilrt_ip.set_static_all(interface, address, netmask, gateway, nameservers)
Configure specified adapter to use ipv4 manual settings
Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.
Parameters

• interface (str) – interface label
• address (str) – ipv4 address
• netmask (str) – ipv4 netmask
• gateway (str) – ipv4 gateway
• nameservers (str) – list of nameservers servers separated by spaces
Returns True if the settings were applied, otherwise an exception will be thrown.
Return type  bool
CLI Example:

```
salt '*' ip.set_static_all interface-label address netmask gateway nameservers
```

```
salt.modules.nilrt_ip.up(interface, iface_type=None)
```

Enable the specified interface
	Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.

Parameters  interface (str) – interface label

Returns  True if the service was enabled, otherwise an exception will be thrown.

Return type  bool
CLI Example:

```
salt '*' ip.up interface-label
```

21.9.284  salt.modules.nix

Work with Nix packages

New in version 2017.7.0.

Does not require the machine to be Nixos, just have Nix installed and available to use for the user running this
command. Their profile must be located in their home, under $HOME/.nix-profile/, and the nix store, unless
specially set up, should be in /nix. To easily use this with multiple users or a root user, set up the nix-daemon.

This module exposes most of the common nix operations. Currently not meant to be run as a pkg module, but
explicitly as nix.*.

For more information on nix, see the nix documentation.

salt.modules.nix.collect_garbage()

Completing removed all currently ‘uninstalled’ packages in the nix store.

Tells the user how many store paths were removed and how much space was freed.

Returns  How much space was freed and how many derivations were removed

Return type  str

Warning:  This is a destructive action on the nix store.

```
salt '*' nix.collect_garbage
```

salt.modules.nix.install(pkg, **kwargs)

Installs a single or multiple packages via nix

Parameters

- pkg (list(str)) – packages to update
- attributes (bool) – Pass the list of packages or single package as attributes, not
  package names. default: False

Returns  Installed packages. Example element: gcc-3.3.2

Return type  list(str)

```
salt '*' nix.install package [package2 ...]
salt '*' nix.install attributes=True attr.name [attr.name2 ...]
```

21.9.  execution modules
salt.modules.nix.list_pkgs(installed=True, attributes=True)

Lists installed packages. Due to how nix works, it defaults to just doing a `nix-env -q`.

Parameters

- **installed** *(bool)* – list only installed packages. This can be a very long list (12,000+ elements), so caution is advised. Default: True
- **attributes** *(bool)* – show the attributes of the packages when listing all packages. Default: True

Returns Packages installed or available, along with their attributes.

Return type `list(list(str))`

```python
salt '*' nix.list_pkgs
salt '*' nix.list_pkgs installed=False
```

salt.modules.nix.uninstall(*pkgs)

Erases a package from the current nix profile. Nix uninstalls work differently than other package managers, and the symlinks in the profile are removed, while the actual package remains. There is also a `nix.purge` function, to clear the package cache of unused packages.

Parameters **pkgs** *(list(str))* – List, single package to uninstall

Returns Packages that have been uninstalled

Return type `list(str)`

```python
salt '*' nix.uninstall pkg1 [pkg2 ...]
```

salt.modules.nix.upgrade(*pkgs)

Runs an update operation on the specified packages, or all packages if none is specified.

Parameters **pkgs** *(list(str))* – List of packages to update

Returns The upgraded packages. Example element: `['libxslt-1.1.0', 'libxslt-1.1.10']`

Return type `list(tuple(str, str))`

```python
salt '*' nix.update
salt '*' nix.update pkgs=one,two
```

21.9.285 salt.modules.nova

Module for handling OpenStack Nova calls

depends

- novaclient Python module

configuration  This module is not usable until the user, password, tenant, and auth URL are specified either in a pillar or in the minion’s config file. For example:

```yaml
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/
# Optional
keystone.region_name: 'RegionOne'
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles: For example:
With this configuration in place, any of the nova functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' nova.flavor_list profile=openstack1
```

To use keystoneauth1 instead of keystoneclient, include the `use_keystoneauth` option in the pillar or minion config.

**Note:** This is required to use keystone v3 as for authentication.

```
keystone.use_keystoneauth: true
keystone.verify: '/path/to/custom/certs/ca-bundle.crt'
```

**Note:** By default the nova module will attempt to verify its connection utilizing the system certificates. If you need to verify against another bundle of CA certificates or want to skip verification altogether you will need to specify the `verify` option. You can specify True or False to verify (or not) against system certificates, a path to a bundle or CA certs to check against, or None to allow keystoneauth to search for the certificates on its own. (defaults to True)

salt.modules.nova.boot(name, flavor_id=0, image_id=0, profile=None, timeout=300)

Boot (create) a new instance

- **name** Name of the new instance (must be first)
- **flavor_id** Unique integer ID for the flavor
- **image_id** Unique integer ID for the image
- **timeout** How long to wait, after creating the instance, for the provider to return information about it (default 300 seconds).

New in version 2014.1.0.

CLI Example:

```
salt '*' nova.boot myinstance flavor_id=4596 image_id=2
```

The `flavor_id` and `image_id` are obtained from nova.flavor_list and nova.image_list
salt.modules.nova.delete(instance_id, profile=None)
    Delete an instance
    instance_id  ID of the instance to be deleted
    CLI Example:

    salt '*' nova.delete 1138

salt.modules.nova.flavor_create(name, flavor_id=None, ram=0, disk=0, vcpus=1, profile=None)
    Add a flavor to nova (nova flavor-create). The following parameters are required:
    name  Name of the new flavor (must be first)
    flavor_id  Unique integer ID for the new flavor
    ram  Memory size in MB
    disk  Disk size in GB
    vcpus  Number of vcpus
    CLI Example:

    salt '*' nova.flavor_create myflavor flavor_id=6 ram=4096 disk=10 vcpus=1

salt.modules.nova.flavor_delete(flavor_id, profile=None)
    Delete a flavor from nova by id (nova flavor-delete)
    CLI Example:

    salt '*' nova.flavor_delete 7

salt.modules.nova.flavor_list(profile=None)
    Return a list of available flavors (nova flavor-list)
    CLI Example:

    salt '*' nova.flavor_list

salt.modules.nova.image_list(name=None, profile=None)
    Return a list of available images (nova images-list + nova image-show) If a name is provided, only that image
    will be displayed.
    CLI Examples:

    salt '*' nova.image_list
    salt '*' nova.image_list myimage

salt.modules.nova.image_meta_delete(image_id=None, name=None, keys=None, profile=None)
    Delete a key=value pair from the metadata for an image (nova image-meta set)
    CLI Examples:

    salt '*' nova.image_meta_delete 6f52b2ff-0b31-4d84-8fd1-af45b84824f6 keys=cheese
    salt '*' nova.image_meta_delete name=myimage keys=salad,beans

salt.modules.nova.image_meta_set(image_id=None, name=None, **kwargs)
    Sets a key=value pair in the metadata for an image (nova image-meta set)
    CLI Examples:

    salt '*' nova.image_meta_set 6f52b2ff-0b31-4d84-8fd1-af45b84824f6 cheese=gruyere
    salt '*' nova.image_meta_set name=myimage salad=pasta beans=baked

salt.modules.nova.keypair_add(name, pubfile=None, pubkey=None, profile=None)
    Add a keypair to nova (nova keypair-add)
CLI Examples:

```
salt '*' nova.keypair_add mykey pubfile=/home/myuser/.ssh/id_rsa.pub
salt '*' nova.keypair_add mykey pubkey='ssh-rsa <key> myuser@mybox'
```

**salt.modules.nova.keypair_delete** *(name, profile=None)*

Add a keypair to nova (nova keypair-delete)

CLI Example:

```
salt '*' nova.keypair_delete mykey
```

**salt.modules.nova.keypair_list** *(profile=None)*

Return a list of available keypairs (nova keypair-list)

CLI Example:

```
salt '*' nova.keypair_list
```

**salt.modules.nova.list** *(profile=None)*

To maintain the feel of the nova command line, this function simply calls the server_list function.

CLI Example:

```
salt '*' nova.list
```

**salt.modules.nova.lock** *(instance_id, profile=None)*

Lock an instance

*instance_id* ID of the instance to be locked

CLI Example:

```
salt '*' nova.lock 1138
```

**salt.modules.nova.resume** *(instance_id, profile=None)*

Resume an instance

*instance_id* ID of the instance to be resumed

CLI Example:

```
salt '*' nova.resume 1138
```

**salt.modules.nova.secggroup_create** *(name, description, profile=None)*

Add a secgroup to nova (nova secggroup-create)

CLI Example:

```
salt '*' nova.secggroup_create mygroup 'This is my security group'
```

**salt.modules.nova.secggroup_delete** *(name, profile=None)*

Delete a secgroup to nova (nova secggroup-delete)

CLI Example:

```
salt '*' nova.secggroup_delete mygroup
```

**salt.modules.nova.secggroup_list** *(profile=None)*

Return a list of available security groups (nova items-list)

CLI Example:
salt 'salt '*' nova.secgroup_list

salt.modules.nova.server_by_name(name, profile=None)
   Return information about a server
   name  Server Name
   CLI Example:
      salt 'salt '*' nova.server_by_name myserver profile=openstack

salt.modules.nova.server_list(profile=None)
   Return list of active servers
   CLI Example:
      salt 'salt '*' nova.server_list

salt.modules.nova.server_list_detailed(profile=None)
   Return detailed list of active servers
   CLI Example:
      salt 'salt '*' nova.server_list_detailed

salt.modules.nova.server_show(server_id, profile=None)
   Return detailed information for an active server
   CLI Example:
      salt 'salt '*' nova.server_show <server_id>

salt.modules.nova.show(server_id, profile=None)
   To maintain the feel of the nova command line, this function simply calls the server_show function.
   CLI Example:
      salt 'salt '*' nova.show

salt.modules.nova.suspend(instance_id, profile=None)
   Suspend an instance
   instance_id  ID of the instance to be suspended
   CLI Example:
      salt 'salt '*' nova.suspend 1138

salt.modules.nova.volume_attach(name, server_name, device=/dev/xvdb, profile=None, timeout=300)
   Attach a block storage volume
   name  Name of the new volume to attach
   server_name  Name of the server to attach to
   device  Name of the device on the server
   profile  Profile to build on
   CLI Example:
      salt 'salt '*' nova.volume_attach myblock slice.example.com profile=openstack
      salt 'salt '*' nova.volume_attach myblock server.example.com device=/dev/xvdb profile=openstack
salt.modules.nova.volume_create(name, size=100, snapshot=None, voltype=None, profile=None)
Create a block storage volume
   name  Name of the new volume (must be first)
   size  Volume size
   snapshot Block storage snapshot id
   voltype Type of storage
   profile Profile to build on
CLI Example:
```
salt '*' nova.volume_create myblock size=300 profile=openstack
```

salt.modules.nova.volume_delete(name, profile=None)
Destroy the volume
   name  Name of the volume
   profile Profile to build on
CLI Example:
```
salt '*' nova.volume_delete myblock profile=openstack
```

salt.modules.nova.volume_detach(name, profile=None, timeout=300)
Attach a block storage volume
   name  Name of the new volume to attach
   server_name Name of the server to detach from
   profile Profile to build on
CLI Example:
```
salt '*' nova.volume_detach myblock profile=openstack
```

salt.modules.nova.volume_list(search_opts=None, profile=None)
List storage volumes
   search_opts Dictionary of search options
   profile Profile to use
CLI Example:
```
salt '*' nova.volume_list search_opts='{"display_name": "myblock"}';
   ->profile=openstack
```

salt.modules.nova.volume_show(name, profile=None)
Create a block storage volume
   name  Name of the volume
   profile Profile to use
CLI Example:
```
salt '*' nova.volume_show myblock profile=openstack
```

21.9.286 salt.modules.npm

Manage and query NPM packages.

salt.modules.npm.cache_clean(path=None, runas=None, env=None, force=False)
Clean cached NPM packages.
   If no path for a specific package is provided the entire cache will be cleared.
   path  The cache subpath to delete, or None to clear the entire cache
   runas  The user to run NPM with

env  Environment variables to set when invoking npm. Uses the same env format as the cmd.run execution function.
force  Force cleaning of cache. Required for npm@5 and greater

New in version 2016.11.6.

CLI Example:

```
salt '*' npm.cache_clean force=True
```

salt.modules.npm.cache_list(path=None, runas=None, env=None)

List NPM cached packages.

If no path for a specific package is provided this will list all the cached packages.

- **path** The cache subpath to list, or None to list the entire cache
- **runas** The user to run NPM with
- **env** Environment variables to set when invoking npm. Uses the same env format as the cmd.run execution function.

CLI Example:

```
salt '*' npm.cache_clean
```

salt.modules.npm.cache_path(runas=None, env=None)

List path of the NPM cache directory.

- **runas** The user to run NPM with
- **env** Environment variables to set when invoking npm. Uses the same env format as the cmd.run execution function.

CLI Example:

```
salt '*' npm.cache_path
```

salt.modules.npm.install(pkg=None, pkgs=None, dir=None, runas=None, registry=None, env=None, dry_run=False, silent=True)

Install an NPM package.

If no directory is specified, the package will be installed globally. If no package is specified, the dependencies (from package.json) of the package in the given directory will be installed.

- **pkg** A package name in any format accepted by NPM, including a version identifier
- **pkgs** A list of package names in the same format as the name parameter
- **dir** The target directory in which to install the package, or None for global installation
- **runas** The user to run NPM with
- **registry** The NPM registry to install the package from.

- **env** Environment variables to set when invoking npm. Uses the same env format as the cmd.run execution function.

New in version 2014.7.0.
- **silent** Whether or not to run NPM install with –silent flag.

New in version 2014.7.0.
- **dry_run** Whether or not to run NPM install with –dry-run flag.

New in version 2015.8.4.
- **silent** Whether or not to run NPM install with –silent flag.

New in version 2015.8.5.

CLI Example:
Salt Documentation, Release 2019.2.0

```
salt '*' npm.install coffee-script
salt '*' npm.install coffee-script@1.0.1
```

```
salt.modules.npm.list_(pkg=None, dir=None, runas=None, env=None, depth=None)

List installed NPM packages.

If no directory is specified, this will return the list of globally- installed packages.

pkg  Limit package listing by name

dir  The directory whose packages will be listed, or None for global installation

runas  The user to run NPM with

env  Environment variables to set when invoking npm. Uses the same env format as the cmd.run execution function.

depth  Limit the depth of the packages listed

New in version 2016.11.6,2017.7.0.

CLI Example:

```
salt '*' npm.list
```

```
salt.modules.npm.uninstall(pkg, dir=None, runas=None, env=None)

Uninstall an NPM package.

If no directory is specified, the package will be uninstalled globally.

pkg  A package name in any format accepted by NPM

dir  The target directory from which to uninstall the package, or None for global installation

runas  The user to run NPM with

env  Environment variables to set when invoking npm. Uses the same env format as the cmd.run execution function.

New in version 2015.5.3.

CLI Example:

```
salt '*' npm.uninstall coffee-script
```

## 21.9.287 salt.modules.nspawn

Manage nspawn containers

New in version 2015.8.0.

systemd-nspawn(1) is a tool used to manage lightweight namespace containers. This execution module provides several functions to help manage these containers.

Minions running systemd >= 219 will place new containers in /var/lib/machines, while those running systemd < 219 will place them in /var/lib/container.

```
salt.modules.nspawn.bootstrap_container(name, dist=None, version=None)

Bootstrap a container from package servers, if dist is None the os the minion is running as will be created, otherwise the needed bootstrapping tools will need to be available on the host.

CLI Example:
```
salt modules.nspawn.bootstrap_salt(name, config=None, approve_key=True, install=True, pub_key=None, priv_key=None, bootstrap_url=None, force_install=False, unconditional_install=False, bootstrap_delay=None, bootstrap_args=None, bootstrap_shell=None)

Bootstrap a container from package servers, if dist is None the os the minion is running as will be created, otherwise the needed bootstrapping tools will need to be available on the host.

CLI Example:
```
salt '*' nspawn.bootstrap_salt arch1
```

salt modules.nspawn.copy_to(name, source, dest, overwrite=False, makedirs=False)
Copy a file from the host into a container

name Container name
source File to be copied to the container
dest Destination on the container. Must be an absolute path.
overwrite [False] Unless this option is set to True, then if a file exists at the location specified by the dest argument, an error will be raised.
makedirs : False
Create the parent directory on the container if it does not already exist.

CLI Example:
```
salt 'minion' nspawn.copy_to /tmp/foo /root/foo
```

salt modules.nspawn.disable(name)
Set the named container to not be launched at boot

CLI Example:
```
salt myminion nspawn.enable <name>
```

salt modules.nspawn.enable(name)
Set the named container to be launched at boot

CLI Example:
```
salt myminion nspawn.enable <name>
```

salt modules.nspawn.exists(name)
Returns true if the named container exists

CLI Example:
```
salt myminion nspawn.exists <name>
```

salt modules.nspawn.info(name, **kwargs)
Return info about a container

Note: The container must be running for machinectl to gather information about it. If the container is stopped, then this function will start it.

start [False] If True, then the container will be started to retrieve the info. A Started key will be in the return data if the container was started.
**CLI Example:**

```
salt myminion nspawn.info arch1
salt myminion nspawn.info arch1 force_start=False
```

- **salt.modules.nspawn.list_all()**
  - Lists all nspawn containers
  - **CLI Example:**
    ```
salt myminion nspawn.list_all
    
    ```

- **salt.modules.nspawn.list_running()**
  - Lists running nspawn containers
  - **Note:** `nspawn.list` also works to list running containers
  - **CLI Example:**
    ```
salt myminion nspawn.list_running
salt myminion nspawn.list
    ```

- **salt.modules.nspawn.list_stopped()**
  - Lists stopped nspawn containers
  - **CLI Example:**
    ```
salt myminion nspawn.list_stopped
    ```

- **salt.modules.nspawn.pid(name)**
  - Returns the PID of a container
  - **name** Container name
  - **CLI Example:**
    ```
salt myminion nspawn.pid arch1
    ```

- **salt.modules.nspawn.poweroff(name)**
  - Issue a clean shutdown to the container. Equivalent to running `machinectl poweroff` on the named container.
  - **For convenience, running `nspawn.stop` (as shown in the CLI examples below) is equivalent to running `nspawn.poweroff`.
  - **Note:** `machinectl poweroff` is only supported in systemd >= 219. On earlier systemd versions, running this function will simply issue a clean shutdown via `systemctl`.
  - **CLI Examples:**
    ```
salt myminion nspawn.poweroff arch1
salt myminion nspawn.stop arch1
    ```

- **salt.modules.nspawn.pull_dkr(url, name, index)**
  - Execute a `machinectl pull-dkr` to download a docker image and add it to `/var/lib/machines` as a new container.
Salt Documentation, Release 2019.2.0

Note: Requires systemd >= 219

url URL from which to download the container
name Name for the new container
index URL of the Docker index server from which to pull (must be an http:// or https:// URL).

CLI Examples:
salt myminion nspawn.pull_dkr centos/centos6 cent6 index=https://get.docker.com
salt myminion nspawn.pull_docker centos/centos6 cent6 index=https://get.docker.com

salt.modules.nspawn.pull_raw(url, name, verify=False)
Execute a machinectl pull-raw to download a .qcow2 or raw disk image, and add it to /var/lib/machines as a new container.

Note: Requires systemd >= 219

url URL from which to download the container
name Name for the new container
verify [False] Perform signature or checksum verification on the container. See the machinectl(1) man page (section titled "Image Transfer Commands") for more information on requirements for image verification. To perform signature verification, use verify=signature. For checksum verification, use verify=checksum. By default, no verification will be performed.

CLI Examples:

salt.modules.nspawn.pull_tar(url, name, verify=False)
Execute a machinectl pull-raw to download a .tar container image, and add it to /var/lib/machines as a new container.

Note: Requires systemd >= 219

url URL from which to download the container
name Name for the new container
verify [False] Perform signature or checksum verification on the container. See the machinectl(1) man page (section titled "Image Transfer Commands") for more information on requirements for image verification. To perform signature verification, use verify=signature. For checksum verification, use verify=checksum. By default, no verification will be performed.

CLI Examples:
salt myminion nspawn.pull_tar http://foo.domain.tld/containers/archlinux-2015.02.01.tar.gz arch2

salt.modules.nspawn.reboot(name, kill=False)
Reboot the container by sending a SIGINT to its init process. Equivalent to running machinectl reboot on the named container.

For convenience, running nspawn.restart (as shown in the CLI examples below) is equivalent to running nspawn.reboot.
Note: machinectl reboot is only supported in systemd >= 219. On earlier systemd versions, running this function will instead restart the container via systemctl.

CLI Examples:

```
salt myminion nspawn.reboot arch1
salt myminion nspawn.restart arch1
```

salt.modules.nspawn.remove(name, stop=False)

Remove the named container

**Warning:** This function will remove all data associated with the container. It will not, however, remove the btrfs subvolumes created by pulling container images (nspawn.pull_raw, nspawn.pull_tar, nspawn.pull_dkr).

```
stop [False] If True, the container will be destroyed even if it is running/frozen.
```

CLI Examples:

```
salt '*' nspawn.remove foo
salt '*' nspawn.remove foo stop=True
```

salt.modules.nspawn.runce(name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)

```
Run cmd.run within a container
name Name of the container in which to run the command
cmd Command to run
no_start [False] If the container is not running, don’t start it
preserve_state [True] After running the command, return the container to its previous state
stdin [None] Standard input to be used for the command
output_loglevel [debug] Level at which to log the output from the command. Set to quiet to suppress logging.
use_vt [False] Use SaltStack’s utils.vt to stream output to console. Assumes output=all.
keep_env [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container’s host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.
```

CLI Example:

```
salt myminion nspawn.run mycontainer 'ip addr show'
```

salt.modules.nspawn.run(name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)

```
Run cmd.run within a container
name Name of the container in which to run the command
cmd Command to run
no_start [False] If the container is not running, don’t start it
preserve_state [True] After running the command, return the container to its previous state
stdin [None] Standard input to be used for the command
output_loglevel [debug] Level at which to log the output from the command. Set to quiet to suppress logging.
```

21.9. execution modules
use_vt  [False] Use SaltStack's utils.vt to stream output to console.
keep_env  [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.run mycontainer 'ifconfig -a'
```

### `salt.modules.nspawn.run_all(name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)`

Run `cmd.run_all` within a container

Note: While the command is run within the container, it is initiated from the host. Therefore, the PID in the return dict is from the host, not from the container.

- **name**  Name of the container in which to run the command
- **cmd**  Command to run
- **no_start**  [False] If the container is not running, don’t start it
- **preserve_state**  [True] After running the command, return the container to its previous state
- **stdin**  [None] Standard input to be used for the command
- **output_loglevel**  [debug] Level at which to log the output from the command. Set to quiet to suppress logging.
- **use_vt**  [False] Use SaltStack's utils.vt to stream output to console. Assumes output=all.
- **keep_env**  [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container’s host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.run_all mycontainer 'ip addr show'
```

### `salt.modules.nspawn.run_stderr(name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)`

Run `cmd.run_stderr` within a container

```
salt myminion nspawn.run_stderr mycontainer 'ip addr show'
```
salt.modules.nspawn.run_stdout(name, cmd, no_start=False, preserve_state=True, stdin=None, 
        python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)

Run :meth:`cmd.run_stdout` within a container

- **name** Name of the container in which to run the command
- **cmd** Command to run
- **no_start** [False] If the container is not running, don’t start it
- **preserve_state** [True] After running the command, return the container to its previous state
- **stdin** [None] Standard input to be used for the command
- **output_loglevel** [debug] Level at which to log the output from the command. Set to "quiet" to suppress logging.
- **use_vt** [False] Use SaltStack’s :func:`utils.vt` to stream output to console. Assumes output=all.
- **keep_env** [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container’s host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.run_stdout mycontainer 'ifconfig -a'
```

salt.modules.nspawn.start(name)

Start the named container

CLI Example:

```
salt myminion nspawn.start <name>
```

salt.modules.nspawn.state(name)

Return state of container (running or stopped)

CLI Example:

```
salt myminion nspawn.state <name>
```

salt.modules.nspawn.terminate(name)

Kill all processes in the container without issuing a clean shutdown. Equivalent to running :cmd:`machinectl terminate` on the named container.

For convenience, running *nspawn.stop* and passing *kill=True* (as shown in the CLI examples below) is equivalent to running *nspawn.terminate*.

**Note:** :cmd:`machinectl terminate` is only supported in systemd >= 219. On earlier systemd versions, running this function will simply issue a clean shutdown via :cmd:`systemctl`.

CLI Examples:

```
salt myminion nspawn.terminate arch1
salt myminion nspawn.stop arch1 kill=True
```

### 21.9.288 salt.modules.nxos module

Execution module for Cisco NX OS Switches Proxy minions

New in version 2016.11.0.

For documentation on setting up the nxos proxy minion look in the documentation for :doc:`salt.proxy.nxos`.
salt.modules.nxos.cmd(command, *args, **kwargs)
run commands from __proxy__ salt.proxy.nxos
command function from salt.proxy.nxos to run
args positional args to pass to command function
kwargs key word arguments to pass to command function

```python
salt '*' nxos.cmd sendline 'show ver'
salt '*' nxos.cmd show_run
salt '*' nxos.cmd check_password username=admin password='$5$lkjsdfoi$blahblahblah' encrypted=True
```

salt.modules.nxos.system_info()
Return system information for grains of the NX OS proxy minion

```python
salt '*' nxos.system_info
```

### 21.9.289 salt.modules.nxos_api module

Execution module to manage Cisco Nexus Switches (NX-OS) over the NX-API

New in version 2019.2.0.

Execution module used to interface the interaction with a remote or local Nexus switch whether we’re running in a Proxy Minion or regular Minion (or regular Minion running directly on the Nexus switch).

- **codeauthor** Mircea Ulinic <ping@mirceaulinic.net>
- **maturity** new
- **platform** any

**Note:** To be able to use this module you need to enable to NX-API on your switch, by executing `feature nxapi` in configuration mode.

Configuration example:

```
switch# conf t
switch(config)# feature nxapi
```

To check that NX-API is properly enabled, execute `show nxapi`.

Output example:

```
switch# show nxapi
nxapi enabled
HTTPS Listen on port 443
```

**Note:** NX-API requires modern NXOS distributions, typically at least 7.0 depending on the hardware. Due to reliability reasons it is recommended to run the most recent version.

Usage

This module can equally be used via the nxos_api Proxy module or directly from an arbitrary (Proxy) Minion that is running on a machine having access to the network device API. Given that there are no external dependencies, this module can very well used when using the regular Salt Minion directly installed on the switch.

When running outside of the nxos_api Proxy (i.e., from another Proxy Minion type, or regular Minion), the NX-API connection arguments can be either specified from the CLI when executing the command, or in a configuration block under the nxos_api key in the configuration opts (i.e., (Proxy) Minion configuration file), or Pillar. The module supports these simultaneously. These fields are the exact same supported by the nxos_api Proxy Module:

- **transport**: `https` Specifies the type of connection transport to use. Valid values for the connection are `http`, and `https`.
- **host**: `localhost` The IP address or DNS host name of the connection device.
- **username**: `admin` The username to pass to the device to authenticate the NX-API connection.
- **password** The password to pass to the device to authenticate the NX-API connection.
- **port** The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for `http`, or 443 for `https`).
- **timeout**: 60 Time in seconds to wait for the device to respond. Default: 60 seconds.
- **verify**: `True` Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to `True`.

  When there is no certificate configuration on the device and this option is set as `True` (default), the commands will fail with the following error: `SSLError: [SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed (_ssl.c:581)`. In this case, you either need to configure a proper certificate on the device (recommended), or bypass the checks setting this argument as `False` with all the security risks considered.

Example (when not running in a nxos_api Proxy Minion):

```yaml
nxos_api:
  username: test
  password: test
```

In case the **username** and **password** are the same on any device you are targeting, the block above (besides other parameters specific to your environment you might need) should suffice to be able to execute commands from outside a nxos_api Proxy, e.g.:

```bash
salt-call --local nxos_api.show 'show lldp neighbors' raw_text
# The command above is available when running in a regular Minion where Salt is installed
salt '*' nxos_api.show 'show version' raw_text=False
```

**Note**: Remember that the above applies only when not running in a nxos_api Proxy Minion. If you want to use the nxos_api Proxy, please follow the documentation notes for a proper setup.
salt.modules.nxos_api.config(commands=None, config_file=None, template_engine='jinja', context=None, defaults=None, saltenv='base', **kwargs)

Configures the Nexus switch with the specified commands.

This method is used to send configuration commands to the switch. It will take either a string or a list and prepend the necessary commands to put the session into config mode.

**Warning:** All the commands will be applied directly into the running-config.

**config_file**  The source file with the configuration commands to be sent to the device.

The file can also be a template that can be rendered using the template engine of choice.

This can be specified using the absolute path to the file, or using one of the following URL schemes:
- `salt://`, to fetch the file from the Salt fileserv.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

**commands**  The commands to send to the switch in config mode. If the commands argument is a string it will be cast to a list. The list of commands will also be prepended with the necessary commands to put the session in config mode.

**Note:** This argument is ignored when `config_file` is specified.

template_engine: jinja  The template engine to use when rendering the source file. Default: jinja. To simply fetch the file without attempting to render, set this argument to `None`.

context  Variables to add to the template context.

defaults  Default values of the context_dict.

transport: https  Specifies the type of connection transport to use. Valid values for the connection are http, and https.

host: localhost  The IP address or DNS host name of the connection device.

username: admin  The username to pass to the device to authenticate the NX-API connection.

password  The password to pass to the device to authenticate the NX-API connection.

port  The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for http, or 443 for https).

timeout: 60  Time in seconds to wait for the device to respond. Default: 60 seconds.

verify: True  Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to True.

CLI Example:
```bash
salt '*' nxos_api.config commands="["spanning-tree mode mstp"]"
salt '*' nxos_api.config config_file=salt://config.txt
salt '*' nxos_api.config config_file=https://bit.ly/2LGLcDy context="{'servers': ['1.2.3.4']}"]"
```

salt.modules.nxos_api.rpc(commands, method='cli', **kwargs)

Execute an arbitrary RPC request via the Nexus API.

commands  The commands to be executed.

method: cli  The type of the response, i.e., raw text (`cli_ascii`) or structured document (`cli`). Defaults to `cli` (structured data).

transport: https  Specifies the type of connection transport to use. Valid values for the connection are http, and https.

host: localhost  The IP address or DNS host name of the connection device.
username: **admin** The username to pass to the device to authenticate the NX-API connection.
password The password to pass to the device to authenticate the NX-API connection.
port The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for http, or 443 for https).
timeout: **60** Time in seconds to wait for the device to respond. Default: 60 seconds.
verify: **True** Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to True.

**CLI Example:**
```
salt-call --local nxps_api.rpc 'show version'
```

salt.modules.nxos_api.show(commands, raw_text=True, **kwargs)
Execute one or more show (non-configuration) commands.
commands The commands to be executed.
raw_text: **True** Whether to return raw text or structured data.
transport: **https** Specifies the type of connection transport to use. Valid values for the connection are http, and https.
host: **localhost** The IP address or DNS host name of the connection device.
username: **admin** The username to pass to the device to authenticate the NX-API connection.
password The password to pass to the device to authenticate the NX-API connection.
port The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for http, or 443 for https).
timeout: **60** Time in seconds to wait for the device to respond. Default: 60 seconds.
verify: **True** Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to True.

**CLI Example:**
```
salt-call --local nxos_api.show 'show version'
salt '*' nxos_api.show 'show bgp sessions' 'show processes' raw_text=False
salt 'regular-minion' nxos_api.show 'show interfaces' host=sw01.example.com
  --username=test password=test
```

### 21.9.290 salt.modules.omapi

This module interacts with an ISC DHCP Server via OMAPI. server_ip and server_port params may be set in the minion config or pillar:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>omapi.server_ip</td>
<td>127.0.0.1</td>
</tr>
<tr>
<td>omapi.server_port</td>
<td>7991</td>
</tr>
</tbody>
</table>

depends pypureomapi Python module

salt.modules.omapi.add_host(mac, name=None, ip=None, ddns=False, group=None, super-sede_host=False)
Add a host object for the given mac:

**CLI Example:**
```
salt dhcp-server omapi.add_host ab:ab:ab:ab:ab:ab name=host1
```

Add ddns-hostname and a fixed-ip statements:
```
salt dhcp-server omapi.add_host ab:ab:ab:ab:ab:ab name=host1 ip=10.1.1.1 ddns=true
```

salt.modules.omapi.delete_host(mac=None, name=None)
Delete the host with the given mac or name.
CLI Examples:

```bash
salt dhcp-server omapi.delete_host name=host1
salt dhcp-server omapi.delete_host mac=ab:ab:ab:ab:ab:ab
```

### 21.9.291 salt.modules.openbsd_sysctl

Module for viewing and modifying OpenBSD sysctl parameters

salt.modules.openbsd_sysctl.assign(name, value)

Assign a single sysctl parameter for this minion

CLI Example:

```bash
salt '*' sysctl.assign net.inet.ip.forwarding 1
```

salt.modules.openbsd_sysctl.get(name)

Return a single sysctl parameter for this minion

CLI Example:

```bash
salt '*' sysctl.get hw.physmem
```

salt.modules.openbsd_sysctl.persist(name, value, config='/etc/sysctl.conf')

Assign and persist a simple sysctl parameter for this minion

CLI Example:

```bash
salt '*' sysctl.persist net.inet.ip.forwarding 1
```

salt.modules.openbsd_sysctl.show(config_file=False)

Return a list of sysctl parameters for this minion

CLI Example:

```bash
salt '*' sysctl.show
```

### 21.9.292 salt.modules.openbsdpkg

Package support for OpenBSD

**Note:** The package repository is configured on each host using `/etc/installurl` from OpenBSD 6.1 onwards. Earlier releases relied on `/etc/pkg.conf`.

Changed in version 2016.3.5: Package versions on OpenBSD are not normally specified explicitly; instead packages may be available in multiple *flavors*, and *branches* which are specified by the format of the package name. This module allows you to use the same formatting as `pkg_add(1)`, and will select the empty flavor and default branch by default. Examples:

- rsync
- vim--no_x11
- ruby%2.3
salt.modules.openbsdpkg.install(name=None, pkgs=None, sources=None, **kwargs)

Install the passed package

Return a dict containing the new package names and versions:

```python
{'<package>': {'old': '<old-version>', 'new': '<new-version>'}}
```

CLI Example, Install one package:

```
salt '*' pkg.install <package name>
```

CLI Example, Install more than one package:

```
salt '*' pkg.install pkgs=['"<package name>"', '"<package name>"']
```

CLI Example, Install more than one package from a alternate source (e.g. salt file-server, HTTP, FTP, local filesystem):

```
salt '*' pkg.install sources=['{"<pkg name>": "salt://pkgs/<pkg filename>"}']
```

salt.modules.openbsdpkg.latest_version('names', **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
```

salt.modules.openbsdpkg.list_pkgs(versions_as_list=False, **kwargs)

List the packages currently installed as a dict:

```python
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

salt.modules.openbsdpkg.purge(name=None, pkgs=None, purge=False, **kwargs)

Remove a package and extra configuration files.

- **name** The name of the package to be deleted.
- **pkgs** A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs=["foo", "bar"]
```

salt.modules.openbsdpkg.remove(name=None, pkgs=None, purge=False, **kwargs)

Remove a single package with pkg_delete

Multiple Package Options:
pkg

A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.
New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```bash
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs=\['"foo", "bar"\']
```

salt.modules.openbsdpkg.upgrade(name=None, pkgs=None, **kwargs)

Run a full package upgrade (pkg_add -u), or upgrade a specific package if name or pkgs is provided. name is ignored when pkgs is specified.

Returns a dictionary containing the changes:

New in version 2019.2.0.

```
{'<package>': {'old': '<old-version>', 'new': '<new-version>'}}
```

CLI Example:

```bash
salt '*' pkg.upgrade
salt '*' pkg.upgrade python%2.7
```

salt.modules.openbsdpkg.upgrade_available(name)

Check whether or not an upgrade is available for a given package

New in version 2019.2.0.

CLI Example:

```bash
salt '*' pkg.upgrade_available <package name>
```

salt.modules.openbsdpkg.version(*names, **kwargs)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```bash
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

21.9.293  salt.modules.openbsdrcctl_service.py

The rcctl service module for OpenBSD

salt.modules.openbsdrcctl_service.available(name)

Return True if the named service is available.

CLI Example:

```bash
salt '*' service.available sshd
```

salt.modules.openbsdrcctl_service.disable(name, **kwargs)

Disable the named service to not start at boot.
CLI Example:
```bash
salt '*' service.disable <service name>
```

```python
salt.modules.openbsdrcctl_service.disabled(name)
Return True if the named service is disabled at boot, False otherwise.
```

CLI Example:
```bash
salt '*' service.disabled <service name>
```

```python
salt.modules.openbsdrcctl_service.enable(name, **kwargs)
Enable the named service to start at boot.
flags [None] Set optional flags to run the service with.
service.flags can be used to change the default flags.
```

CLI Example:
```bash
salt '*' service.enable <service name>
salt '*' service.enable <service name> flags=<flags>
```

```python
salt.modules.openbsdrcctl_service.enabled(name, **kwargs)
Return True if the named service is enabled at boot and the provided flags match the configured ones (if any).
Return False otherwise.
name Service name
```

CLI Example:
```bash
salt '*' service.enabled <service name>
salt '*' service.enabled <service name> flags=<flags>
```

```python
sicl.modules.openbsdrcctl_service.get_all()
Return all installed services.
```

CLI Example:
```bash
salt '*' service.get_all
```

```python
sicl.modules.openbsdrcctl_service.get_disabled()
Return what services are available but not enabled to start at boot.
```

CLI Example:
```bash
salt '*' service.get_disabled
```

```python
sicl.modules.openbsdrcctl_service.get_enabled()
Return what services are set to run on boot.
```

CLI Example:
```bash
salt '*' service.get_enabled
```

```python
sicl.modules.openbsdrcctl_service.missing(name)
The inverse of service available. Return True if the named service is not available.
```

CLI Example:
```bash
salt '*' service.missing sshd
```
salt.modules.openbsdrcctl_service.reload(name)
Reload the named service.

CLI Example:
```
salt '*' service.reload <service name>
```

salt.modules.openbsdrcctl_service.restart(name)
Restart the named service.

CLI Example:
```
salt '*' service.restart <service name>
```

salt.modules.openbsdrcctl_service.start(name)
Start the named service.

CLI Example:
```
salt '*' service.start <service name>
```

salt.modules.openbsdrcctl_service.status(name, sig=None)
Return the status for a service, returns a bool whether the service is running.

CLI Example:
```
salt '*' service.status <service name>
```

salt.modules.openbsdrcctl_service.stop(name)
Stop the named service.

CLI Example:
```
salt '*' service.stop <service name>
```

21.9.294 salt.modules.openbsdservice

The service module for OpenBSD

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to 'service.start' is not available), see [here](#).

salt.modules.openbsdservice.available(name)
New in version 2014.7.0.

Returns True if the specified service is available, otherwise returns False.

CLI Example:
```
salt '*' service.available sshd
```

salt.modules.openbsdservice.disabled(name)
New in version 2014.7.0.

Return True if the named service is disabled, false otherwise

CLI Example:
salt 'service.disabled' <service name>

`salt.modules.openbsdservice.enabled(name, **kwargs)`

- New in version 2014.7.0.
- Return True if the named service is enabled, false otherwise

CLI Example:
```
salt 'service.enabled' <service name>
```

```
salt.modules.openbsdservice.get_all()
```

- New in version 2014.7.0.
- Return all available boot services

CLI Example:
```
salt 'service.get_all'
```

```
salt.modules.openbsdservice.get_disabled()
```

- New in version 2014.7.0.
- Return a set of services that are installed but disabled

CLI Example:
```
salt 'service.get_disabled'
```

```
salt.modules.openbsdservice.get_enabled()
```

- New in version 2014.7.0.
- Return a list of service that are enabled on boot

CLI Example:
```
salt 'service.get_enabled'
```

```
salt.modules.openbsdservice.missing(name)
```

- New in version 2014.7.0.
- The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.

CLI Example:
```
salt 'service.missing sshd'
```

```
salt.modules.openbsdservice.reload_(name)
```

- New in version 2014.7.0.
- Reload the named service

CLI Example:
```
salt 'service.reload <service name>
```

```
salt.modules.openbsdservice.restart(name)
```

- Restart the named service

CLI Example:
salt '*' service.restart <service name>

```
salt.modules.openbsdservice.start(name)
Start the specified service

CLI Example:
salt '*' service.start <service name>
```

salt.modules.openbsdservice.status(name, sig=None)
Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)

Parameters
- name (str) – The name of the service to check
- sig (str) – Signature to use to find the service via ps

Returns True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type bool

CLI Example:
salt '*' service.status <service name> [service signature]

```
salt.modules.openbsdservice.stop(name)
Stop the specified service

CLI Example:
salt '*' service.stop <service name>
```

21.9.295  salt.modules.openscap module

Module for OpenSCAP Management

salt.modules.openscap.xccdf(*params*)
Run oscap xccdf commands on minions. It uses cp.push_dir to upload the generated files to the salt master in the master's minion files cachedir (defaults to /var/cache/salt/master/minions/minion-id/files)

It needs file_recv set to True in the master configuration file.

CLI Example:
```
salt '*' openscap.xccdf "eval --profile Default /usr/share/openscap/scap-yast2sec-xccdf.xml"
```

21.9.296  salt.modules.openstack_config

Modify, retrieve, or delete values from OpenStack configuration files.

maintainer  Jeffrey C. Ollie <jeff@ocjtech.us>
maturity  new
depends
platform linux

salt.modules.openstack_config.delete(filename, section, parameter)
Delete a value from an OpenStack configuration file.
filename The full path to the configuration file
section The section from which to delete the parameter
parameter The parameter to delete
CLI Example:

```
salt-call openstack_config.delete /etc/keystone/keystone.conf sql connection
```

salt.modules.openstack_config.get(filename, section, parameter)
Get a value from an OpenStack configuration file.
filename The full path to the configuration file
section The section from which to search for the parameter
parameter The parameter to return
CLI Example:

```
salt-call openstack_config.get /etc/keystone/keystone.conf sql connection
```

salt.modules.openstack_config.set_(filename, section, parameter, value)
Set a value in an OpenStack configuration file.
filename The full path to the configuration file
section The section in which the parameter will be set
parameter The parameter to change
value The value to set
CLI Example:

```
salt-call openstack_config.set /etc/keystone/keystone.conf sql connection foo
```

21.9.297 salt.modules.openstack_mng module

Module for OpenStack Management

codeauthor Konrad Mosoń <mosonkonrad@gmail.com>
maturity new
depends openstack-utils
platform linux

salt.modules.openstack_mng.restart_service(service_name, minimum_running_time=None)
Restart OpenStack service immediately, or only if it’s running longer than specified value
CLI Example:

```
salt '*' openstack_mng.restart_service neutron
salt '*' openstack_mng.restart_service neutron minimum_running_time=600
```

salt.modules.openstack_mng.start_service(service_name)
Start OpenStack service immediately

CLI Example:

```
salt '*' openstack_mng.start_service neutron
```
**salt.modules.openstack_mng**. **stop_service**(service_name)

Stop OpenStack service immediately

CLI Example:

```
salt '*' openstack_mng.stop_service neutron
```

---

### 21.9.298 salt.modules.openvswitch module

Support for Open vSwitch - module with basic Open vSwitch commands.

Suitable for setting up Openstack Neutron.

**codeauthor** Jiri Kotlin <jiri.kotlin@ultimum.io>

**salt.modules.openvswitch**. **bridge_create**(br, may_exist=True)

Creates a new bridge.

**Parameters**

- **br** – A string - bridge name
- **may_exist** – Bool, if False - attempting to create a bridge that exists returns False.

**Returns** True on success, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

```
salt '*' openvswitch.bridge_create br0
```

**salt.modules.openvswitch**. **bridge_delete**(br, if_exists=True)

Deletes bridge and all of its ports.

**Parameters**

- **br** – A string - bridge name
- **if_exists** – Bool, if False - attempting to delete a bridge that does not exist returns False.

**Returns** True on success, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

```
salt '*' openvswitch.bridge_delete br0
```

**salt.modules.openvswitch**. **bridge_exists**(br)

Tests whether bridge exists as a real or fake bridge.

**Returns** True if Bridge exists, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

```
salt '*' openvswitch.bridge_exists br0
```

**salt.modules.openvswitch**. **bridge_list**( )

Lists all existing real and fake bridges.

**Returns** List of bridges (or empty list), False on failure.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

```
salt '*' openvswitch.bridge_list
```

**salt.modules.openvswitch**. **interface_get_options**(port)

Port’s interface’s optional parameters.

**Parameters** port – A string - port name.

**Returns** String containing optional parameters of port’s interface, False on failure.
New in version 2016.3.0.

CLI Example: .. code-block:: bash
salt '*' openvswitch.interface_get_options tap0

salt.modules.openvswitch.interface_get_type(port)
Type of port's interface.

Parameters  
  port – A string - port name.

Returns String - type of interface or empty string, False on failure.
New in version 2016.3.0.

CLI Example: .. code-block:: bash
salt '*' openvswitch.interface_get_type tap0

salt.modules.openvswitch.port_add(br, port, may_exist=False)
Creates on bridge a new port named port.

Returns True on success, else False.

Parameters  
  • br – A string - bridge name
  • port – A string - port name
  • may_exist – Bool, if False - attempting to create a port that exists returns False.
New in version 2016.3.0.

CLI Example: .. code-block:: bash
salt '*' openvswitch.port_add br0 8080

salt.modules.openvswitch.port_create_gre(br, port, id, remote)
Generic Routing Encapsulation - creates GRE tunnel between endpoints.

Parameters  
  • br – A string - bridge name.
  • port – A string - port name.
  • id – An integer - unsigned 32-bit number, tunnel’s key.
  • remote – A string - remote endpoint’s IP address.

Returns True on success, else False.
New in version 2016.3.0.

CLI Example: .. code-block:: bash
salt '*' openvswitch.port_create_gre br0 gre1 5001 192.168.1.10

salt.modules.openvswitch.port_create_vlan(br, port, id, internal=False)
Isolate VM traffic using VLANs.

Parameters  
  • br – A string - bridge name.
  • port – A string - port name.
  • id – An integer in the valid range 0 to 4095 (inclusive), name of VLAN.
  • internal – A boolean to create an internal interface if one does not exist.

Returns True on success, else False.
New in version 2016.3.0.

CLI Example: .. code-block:: bash
salt '*' openvswitch.port_create_vlan br0 tap0 100

salt.modules.openvswitch.port_create_vxlan(br, port, id, remote, dst_port=None)
Virtual eXtensible Local Area Network - creates VXLAN tunnel between endpoints.

Parameters  
  • br – A string - bridge name.
  • port – A string - port name.
  • id – An integer - unsigned 64-bit number, tunnel’s key.
  • remote – A string - remote endpoint’s IP address.
- **dst_port** – An integer - port to use when creating tunnelport in the switch.
  
  **Returns**  True on success, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash
  
salt '*' openvswitch.port_create_vxlan br0 vx1 5001 192.168.1.10 8472

salt.modules.openvswitch.port_get_tag(port)

Lists tags of the port.

**Parameters**  **port** – A string - port name.

**Returns**  List of tags (or empty list), False on failure.

New in version 2016.3.0.

CLI Example: .. code-block:: bash
  
salt '*' openvswitch.port_get_tag tap0

salt.modules.openvswitch.port_list(br)

Lists all of the ports within bridge.

**Parameters**  **br** – A string - bridge name.

**Returns**  List of bridges (or empty list), False on failure.

New in version 2016.3.0.

CLI Example: .. code-block:: bash
  
salt '*' openvswitch.port_list br0

salt.modules.openvswitch.port_remove(br, port, if_exists=True)

Deletes port.

**Parameters**

- **br** – A string - bridge name (If bridge is None, port is removed from whatever bridge contains it)
- **port** – A string - port name.
- **if_exists** – Bool, if False - attempting to delete a por that does not exist returns False. (Default True)

**Returns**  True on success, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash
  
salt '*' openvswitch.port_remove br0 8080

21.9.299  **salt.modules.opkg module**

Support for Opkg

**Important:**  If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see here.

**Note:**  For version comparison support on opkg < 0.3.4, the opkg-utils package must be installed.

salt.modules.opkg.available_version(*names, **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.
CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

**salt.modules.opkg.del_repo**(*repo*, **kwargs)
Delete a repo from /etc/opkg/*.conf

If the file does not contain any other repo configuration, the file itself will be deleted.

CLI Examples:

```
salt '*' pkg.del_repo repo
```

**salt.modules.opkg.file_dict**(*packages*, **kwargs)
List the files that belong to a package, grouped by package. Not specifying any packages will return a list of _every_ file on the system’s package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

**salt.modules.opkg.file_list**(*packages*, **kwargs)
List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system’s package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

**salt.modules.opkg.get_repo**(*repo*, **kwargs)
Display a repo from the /etc/opkg/*.conf

CLI Examples:

```
salt '*' pkg.get_repo repo
```

**salt.modules.opkg.hold**(*name=None, pkgs=None, sources=None, **kwargs*)
Set package in 'hold' state, meaning it will not be upgraded.

name The name of the package, e.g., 'tmux'

CLI Example:

```
salt '*' pkg.hold <package name>
```

pkgs A list of packages to hold. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.hold pkgs=['"foo", "bar"']
```

**salt.modules.opkg.info_installed**(*names*, **kwargs*)
Return the information of the named package(s), installed on the system.

New in version 2017.7.0.

Parameters
- **names** – Names of the packages to get information about. If none are specified, will return information for all installed packages.
- **attr** – Comma-separated package attributes. If no 'attr' is specified, all available attributes returned.
  
  **Valid attributes are:** arch, conffiles, conflicts, depends, description, filename, group, install_date_time_t, md5sum, packager, provides, recommends, replaces, size, source, suggests, url, version

**CLI example:**

```bash
salt '*' pkg.info_installed
salt '*' pkg.info_installed attr=version,packager
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
salt '*' pkg.info_installed <package1> <package2> <package3> ... attr=version, packager
```

**salt.modules.opkg.install** *(name=None, refresh=False, pkgs=None, sources=None, reinstall=False, **kwargs)*

Install the passed package, add refresh=True to update the opkg database.

**name**  
The name of the package to be installed. Note that this parameter is ignored if either "pkgs" or "sources" is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the "sources" option.

**CLI Example:**

```bash
salt '*' pkg.install <package name>
```

**refresh**  
Whether or not to refresh the package database before installing.

**version**  
Install a specific version of the package, e.g. 1.2.3-0ubuntu0. Ignored if "pkgs" or "sources" is passed.

New in version 2017.7.0.

**reinstall**  
[False] Specifying reinstall=True will use `opkg install --force-reinstall` rather than simply `opkg install` for requested packages that are already installed.

If a version is specified with the requested package, then `opkg install --force-reinstall` will only be used if the installed version matches the requested version.

New in version 2017.7.0.

**Multiple Package Installation Options:**

**pkgs**  
A list of packages to install from a software repository. Must be passed as a python list.

**CLI Example:**

```bash
salt '*' pkg.install pkgs='["foo", "bar"]'
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3-0ubuntu0"}]'
```

**sources**  
A list of IPK packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package. Dependencies are automatically resolved and marked as auto-installed.

**CLI Example:**

```bash
salt '*' pkg.install sources='[{"foo": "salt://foo.deb"},{"bar": "salt://bar.deb"}]'
```

**install_recommends**  
Whether to install the packages marked as recommended. Default is True.

**only_upgrade**  
Only upgrade the packages (disallow downgrades), if they are already installed. Default is False.

New in version 2017.7.0.
Returns a dict containing the new package names and versions:

```python
{'<package>': { 'old': '<old-version>', 'new': '<new-version>'}}
```

**salt.modules.opkg.latest_version(names, **kwargs)**

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```bash
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> <package name> <package name> ...
```

**salt.modules.opkg.list_pkgs(versions_as_list=False, **kwargs)**

List the packages currently installed in a dict:

```python
{'<package_name>': '<version>'}
```

CLI Example:

```bash
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

**salt.modules.opkg.list_repos(**kwargs)**

Lists all repos on /etc/opkg/*.conf

CLI Example:

```bash
salt '*' pkg.list_repos
```

**salt.modules.opkg.list_upgrades(refresh=True, **kwargs)**

List all available package upgrades.

CLI Example:

```bash
salt '*' pkg.list_upgrades
```

**salt.modules.opkg.mod_repo(repo, **kwargs)**

Modify one or more values for a repo. If the repo does not exist, it will be created, so long as uri is defined.

The following options are available to modify a repo definition:

- **repo**: alias by which opkg refers to the repo.
- **uri**: the URI to the repo.
- **compressed**: defines (True or False) if the index file is compressed
- **enabled**: enable or disable (True or False) repository but do not remove if disabled.
- **refresh**: enable or disable (True or False) auto-refresh of the repositories

CLI Examples:

```bash
salt '*' pkg.mod_repo repo uri=http://new/uri
salt '*' pkg.mod_repo repo enabled=False
```

**salt.modules.opkg.owner(**paths, **kwargs)**

Return the name of the package that owns the file. Multiple file paths can be passed. Like pkg.version

```python
<salt.modules.opkg.version, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.
```
If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Example:
```
salt '*' pkg.owner /usr/bin/apachectl
```

```
salt '*' pkg.owner /usr/bin/apachectl /usr/bin/basename
```

**salt.modules.opkg.purge**(name=None, pkgs=None, **kwargs)

Package purges are not supported by opkg, this function is identical to `pkg.remove`.

- **name** The name of the package to be deleted.
- **pkgs** A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:
```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

**salt.modules.opkg.refresh_db**(failhard=False, **kwargs)

Updates the opkg database to latest packages based upon repositories

Returns a dict, with the keys being package databases and the values being the result of the update attempt. Values can be one of the following:

- **True**: Database updated successfully
- **False**: Problem updating database

**failhard** If False, return results of failed lines as False for the package database that encountered the error. If True, raise an error with a list of the package databases that encountered errors.

New in version 2018.3.0.

CLI Example:
```
salt '*' pkg.refresh_db
```

**salt.modules.opkg.remove**(name=None, pkgs=None, **kwargs)

Remove packages using `opkg remove`.

- **name** The name of the package to be deleted.
- **pkgs** A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.
- **remove_dependencies** Remove package and all dependencies
- **auto_remove_deps** Remove packages that were installed automatically to satisfy dependencies

New in version 2019.2.0.

Returns a dict containing the changes.

CLI Example:
```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
salt '*' pkg.remove pkgs='["foo", "bar"]' remove_dependencies=True auto_remove_deps=True
```

---

Chapter 21. Salt Module Reference
salt.modules.opkg.unhold(name=None, pkgs=None, sources=None, **kwargs)
Set package current in 'hold' state to install state, meaning it will be upgraded.

name  The name of the package, e.g., 'tmux'

CLI Example:
salt '*' pkg.unhold <package name>

pkgs  A list of packages to hold. Must be passed as a python list.

CLI Example:
salt '*' pkg.unhold pkgs='["foo", "bar"]'

salt.modules.opkg.upgrade(refresh=True, **kwargs)
Upgrades all packages via opkg upgrade

Returns a dictionary containing the changes:

{ '<package>': { 'old': '<old-version>', 'new': '<new-version>' } }

CLI Example:
salt '*' pkg.upgrade

salt.modules.opkg.upgrade_available(name, **kwargs)
Check whether or not an upgrade is available for a given package

CLI Example:
salt '*' pkg.upgrade_available <package name>

salt.modules.opkg.version(*names, **kwargs)
Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...

salt.modules.opkg.version_cmp(pkg1, pkg2, ignore_epoch=False, **kwargs)
Do a cmp-style comparison on two packages. Return -1 if pkg1 < pkg2, 0 if pkg1 == pkg2, and 1 if pkg1 > pkg2. Return None if there was a problem making the comparison.

ignore_epoch  [False] Set to True to ignore the epoch when comparing versions

New in version 2016.3.4.

CLI Example:
salt '*' pkg.version_cmp '0.2.4-0' '0.2.4.1-0'

21.9.300  salt.modules.opsgenie

Module for sending data to OpsGenie

New in version 2018.3.0.
configuration This module can be used in Reactor System for posting data to OpsGenie as a remote-execution function.

For example:

```yaml
opsgenie_event_poster:
  local.opsgenie.post_data:
    - tgt: 'salt-minion'
    - kwarg:
      name: event.reactor
      api_key: XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX
      reason: {{ data['data']['reason'] }}
      action_type: Create
```

```
salt.modules.opsgenie.post_data(api_key=None, name='OpsGenie Execution Module', reason=None, action_type=None)
```

Post data to OpsGenie. It’s designed for Salt’s Event Reactor.

After configuring the sls reaction file as shown above, you can trigger the module with your designated tag (og-tag in this case).

CLI Example:

```shell
call event.send 'og-tag' '{"reason" : "Overheating CPU!"}'
```

Required parameters:

api_key It’s the API Key you’ve copied while adding integration in OpsGenie.

reason It will be used as alert’s default message in OpsGenie.

action_type OpsGenie supports the default values Create/Close for action_type. You can customize this field with OpsGenie’s custom actions for other purposes like adding notes or acknowledging alerts.

Optional parameters:

name It will be used as alert’s alias. If you want to use the close functionality you must provide name field for both states like in this case.

21.9.301 salt.modules.oracle

Oracle DataBase connection module

maintainer Vladimir Bormotov <bormotov@gmail.com>
maturity new
depends cx_Oracle
platform all

configuration module provide connections for multiple Oracle DB instances.

OS Environment

```
ORACLE_HOME: path to oracle product
PATH: path to Oracle Client libs need to be in PATH
```

pillar

```
oracle:
  dbs:
    <db>:
      uri: connection credentials in format:
```

(continues on next page)
user/password@host[:port]/sid[ servicename as {sysdb|sysoper}]
optional keyword servicename will determine whether it is a sid or
service_name
<db>:
uri: ......

salt.modules.oracle.client_version()
Oracle Client Version
CLI Example:
```sh
gsalt '*' oracle.client_version
```

salt.modules.oracle.run_query(db, query)
Run SQL query and return result
CLI Example:
```sh
gsalt '*' oracle.run_query my_db "select * from my_table"
```

salt.modules.oracle.show_dbs("dbs")
Show databases configuration from pillar. Filter by *args
CLI Example:
```sh
gsalt '*' oracle.show_dbs
gsalt '*' oracle.show_dbs my_db
```

salt.modules.oracle.show_env()
Show Environment used by Oracle Client
CLI Example:
```sh
gsalt '*' oracle.show_env
```

Note: at first _connect() NLS_LANG will forced to '.AL32UTF8'

salt.modules.oracle.show_pillar(item=None)
Show Pillar segment oracle:* and subitem with notation "item:subitem"
CLI Example:
```sh
gsalt '*' oracle.show_pillar
gsalt '*' oracle.show_pillar dbs:my_db
```

salt.modules.oracle.version("dbs")
Server Version (select banner from v$version)
CLI Example:
```sh
gsalt '*' oracle.version
gsalt '*' oracle.version my_db
```

21.9.302 salt.modules.osquery
New in version 2015.8.0.

salt.modules.osquery.acpi_tables\(\texttt{attrs} = \texttt{None}, \texttt{where} = \texttt{None}\)
Return acpi_tables information from osquery

CLI Example:
```
salt '*' osquery.acpi_tables
```

salt.modules.osquery.alf\(\texttt{attrs} = \texttt{None}, \texttt{where} = \texttt{None}\)
Return alf information from osquery

CLI Example:
```
salt '*' osquery.alf
```

salt.modules.osquery.alf_exceptions\(\texttt{attrs} = \texttt{None}, \texttt{where} = \texttt{None}\)
Return alf_exceptions information from osquery

CLI Example:
```
salt '*' osquery.alf_exceptions
```

salt.modules.osquery.alf_explicit_auths\(\texttt{attrs} = \texttt{None}, \texttt{where} = \texttt{None}\)
Return alf_explicit_auths information from osquery

CLI Example:
```
salt '*' osquery.alf_explicit_auths
```

salt.modules.osquery.alf_services\(\texttt{attrs} = \texttt{None}, \texttt{where} = \texttt{None}\)
Return alf_services information from osquery

CLI Example:
```
salt '*' osquery.alf_services
```

salt.modules.osquery.apps\(\texttt{attrs} = \texttt{None}, \texttt{where} = \texttt{None}\)
Return apps information from osquery

CLI Example:
```
salt '*' osquery.apps
```

salt.modules.osquery.apt_sources\(\texttt{attrs} = \texttt{None}, \texttt{where} = \texttt{None}\)
Return apt_sources information from osquery

CLI Example:
```
salt '*' osquery.apt_sources
```

salt.modules.osquery.arp_cache\(\texttt{attrs} = \texttt{None}, \texttt{where} = \texttt{None}\)
Return arp_cache information from osquery

CLI Example:
```
salt '*' osquery.arp_cache
```

salt.modules.osquery.block_devices\(\texttt{attrs} = \texttt{None}, \texttt{where} = \texttt{None}\)
Return block_devices information from osquery

CLI Example:
salt modules.osquery

salt.modules.osquery.certificates
    
    Return certificates information from osquery
    
    CLI Example:

    salt '*' osquery.certificates

salt.modules.osquery.chrome_extensions
    
    Return chrome_extensions information from osquery
    
    CLI Example:

    salt '*' osquery.chrome_extensions

salt.modules.osquery.cpuid
    
    Return cpuid information from osquery
    
    CLI Example:

    salt '*' osquery.cpuid

salt.modules.osquery.crontab
    
    Return crontab information from osquery
    
    CLI Example:

    salt '*' osquery.crontab

salt.modules.osquery.deb_packages
    
    Return deb_packages information from osquery
    
    CLI Example:

    salt '*' osquery.deb_packages

salt.modules.osquery.etc_hosts
    
    Return etc_hosts information from osquery
    
    CLI Example:

    salt '*' osquery.etc_hosts

salt.modules.osquery.etc_services
    
    Return etc_services information from osquery
    
    CLI Example:

    salt '*' osquery.etc_services

salt.modules.osquery.file
    
    Return file information from osquery
    
    CLI Example:

    salt '*' osquery.file
salt.modules.osquery.file_changes

Return file_changes information from osquery

CLI Example:
```
salt '*' osquery.file_changes
```

salt.modules.osquery.firefox_addons

Return firefox_addons information from osquery

CLI Example:
```
salt '*' osquery.firefox_addons
```

salt.modules.osquery.groups

Return groups information from osquery

CLI Example:
```
salt '*' osquery.groups
```

salt.modules.osquery.hardware_events

Return hardware_events information from osquery

CLI Example:
```
salt '*' osquery.hardware_events
```

salt.modules.osquery.hash

Return hash information from osquery

CLI Example:
```
salt '*' osquery.hash
```

salt.modules.osquery.homebrew_packages

Return homebrew_packages information from osquery

CLI Example:
```
salt '*' osquery.homebrew_packages
```

salt.modules.osquery.interface_addresses

Return interface_addresses information from osquery

CLI Example:
```
salt '*' osquery.interface_addresses
```

salt.modules.osquery.interface_details

Return interface_details information from osquery

CLI Example:
```
salt '*' osquery.interface_details
```

salt.modules.osquery.iokit_devicetree

Return iokit_devicetree information from osquery

CLI Example:
salt '*' osquery.iokit_devicetree

salt.modules.osquery.iokit_registry(attrs=None, where=None)

Return iokit_registry information from osquery

CLI Example:
salt '*' osquery.iokit_registry

salt.modules.osquery.kernel_extensions(attrs=None, where=None)

Return kernel_extensions information from osquery

CLI Example:
salt '*' osquery.kernel_extensions

salt.modules.osquery.kernel_info(attrs=None, where=None)

Return kernel_info information from osquery

CLI Example:
salt '*' osquery.kernel_info

salt.modules.osquery.kernel_integrity(attrs=None, where=None)

Return kernel_integrity information from osquery

CLI Example:
salt '*' osquery.kernel_integrity

salt.modules.osquery.kernel_modules(attrs=None, where=None)

Return kernel_modules information from osquery

CLI Example:
salt '*' osquery.kernel_modules

salt.modules.osquery.keychain_items(attrs=None, where=None)

Return keychain_items information from osquery

CLI Example:
salt '*' osquery.keychain_items

salt.modules.osquery.last(attrs=None, where=None)

Return last information from osquery

CLI Example:
salt '*' osquery.last

salt.modules.osquery.launchd(attrs=None, where=None)

Return launchd information from osquery

CLI Example:
salt '*' osquery.launchd
salt.modules.osquery.listening_ports

Return listening_ports information from osquery

CLI Example:
```
salt '*' osquery.listening_ports
```

salt.modules.osquery.logged_in_users

Return logged_in_users information from osquery

CLI Example:
```
salt '*' osquery.logged_in_users
```

salt.modules.osquery.memory_map

Return memory_map information from osquery

CLI Example:
```
salt '*' osquery.memory_map
```

salt.modules.osquery.mounts

Return mounts information from osquery

CLI Example:
```
salt '*' osquery.mounts
```

salt.modules.osquery.nfs_shares

Return nfs_shares information from osquery

CLI Example:
```
salt '*' osquery.nfs_shares
```

salt.modules.osquery.nvram

Return nvram information from osquery

CLI Example:
```
salt '*' osquery.nvram
```

salt.modules.osquery.os_version

Return os_version information from osquery

CLI Example:
```
salt '*' osquery.os_version
```

salt.modules.osquery.osquery_extensions

Return osquery_extensions information from osquery

CLI Example:
```
salt '*' osquery.osquery_extensions
```

salt.modules.osquery.osquery_flags

Return osquery_flags information from osquery

CLI Example:
salt '*' osquery.osquery_flags

salt.modules.osquery.osquery_info(attrs=None, where=None)
Return osquery_info information from osquery

CLI Example:
salt '*' osquery.osquery_info

salt.modules.osquery.osquery_registry(attrs=None, where=None)
Return osquery_registry information from osquery

CLI Example:
salt '*' osquery.osquery_registry

salt.modules.osquery.passwd_changes(attrs=None, where=None)
Return passwd_changes information from osquery

CLI Example:
salt '*' osquery.passwd_changes

salt.modules.osquery.pci_devices(attrs=None, where=None)
Return pci_devices information from osquery

CLI Example:
salt '*' osquery.pci_devices

salt.modules.osquery.preferences(attrs=None, where=None)
Return preferences information from osquery

CLI Example:
salt '*' osquery.preferences

salt.modules.osquery.process_envs(attrs=None, where=None)
Return process_envs information from osquery

CLI Example:
salt '*' osquery.process_envs

salt.modules.osquery.process_memory_map(attrs=None, where=None)
Return process_memory_map information from osquery

CLI Example:
salt '*' osquery.process_memory_map

salt.modules.osquery.process_open_files(attrs=None, where=None)
Return process_open_files information from osquery

CLI Example:
salt '*' osquery.process_open_files
salt.modules.osquery.process_open_sockets(attrs=None, where=None)
Return process_open_sockets information from osquery

    CLI Example:
    
    salt '*' osquery.process_open_sockets

salt.modules.osquery.processes(attrs=None, where=None)
Return processes information from osquery

    CLI Example:
    
    salt '*' osquery.processes

salt.modules.osquery.quarantine(attrs=None, where=None)
Return quarantine information from osquery

    CLI Example:
    
    salt '*' osquery.quarantine

salt.modules.osquery.query(sql=None)
Return time information from osquery

    CLI Example:
    
    salt '*' osquery.query "select * from users;"

salt.modules.osquery.routes(attrs=None, where=None)
Return routes information from osquery

    CLI Example:
    
    salt '*' osquery.routes

salt.modules.osquery.rpm_packages(attrs=None, where=None)
Return cpuid information from osquery

    CLI Example:
    
    salt '*' osquery.rpm_packages

salt.modules.osquery.safari_extensions(attrs=None, where=None)
Return safari_extensions information from osquery

    CLI Example:
    
    salt '*' osquery.safari_extensions

salt.modules.osquery.shared_memory(attrs=None, where=None)
Return shared_memory information from osquery

    CLI Example:
    
    salt '*' osquery.shared_memory

salt.modules.osquery.shell_history(attrs=None, where=None)
Return shell_history information from osquery

    CLI Example:
<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>salt '*' osquery.shell_history</code></td>
<td>Return shell history information from osquery</td>
</tr>
<tr>
<td><code>salt.modules.osquery.smbios_tables</code></td>
<td><code>smbios_tables(attrs=None, where=None)</code></td>
</tr>
<tr>
<td></td>
<td>Return smbios_tables information from osquery</td>
</tr>
<tr>
<td></td>
<td>CLI Example: <code>salt '*' osquery.smbios_tables</code></td>
</tr>
<tr>
<td><code>salt.modules.osquery.startup_items</code></td>
<td><code>startup_items(attrs=None, where=None)</code></td>
</tr>
<tr>
<td></td>
<td>Return startup_items information from osquery</td>
</tr>
<tr>
<td></td>
<td>CLI Example: <code>salt '*' osquery.startup_items</code></td>
</tr>
<tr>
<td><code>salt.modules.osquery.suid_bin</code></td>
<td><code>suid_bin(attrs=None, where=None)</code></td>
</tr>
<tr>
<td></td>
<td>Return suid_bin information from osquery</td>
</tr>
<tr>
<td></td>
<td>CLI Example: <code>salt '*' osquery.suid_bin</code></td>
</tr>
<tr>
<td><code>salt.modules.osquery.system_controls</code></td>
<td><code>system_controls(attrs=None, where=None)</code></td>
</tr>
<tr>
<td></td>
<td>Return system_controls information from osquery</td>
</tr>
<tr>
<td></td>
<td>CLI Example: <code>salt '*' osquery.system_controls</code></td>
</tr>
<tr>
<td><code>salt.modules.osquery.time</code></td>
<td><code>time_(attrs=None)</code></td>
</tr>
<tr>
<td></td>
<td>Return time information from osquery</td>
</tr>
<tr>
<td></td>
<td>CLI Example: <code>salt '*' osquery.time</code></td>
</tr>
<tr>
<td><code>salt.modules.osquery.usb_devices</code></td>
<td><code>usb_devices(attrs=None, where=None)</code></td>
</tr>
<tr>
<td></td>
<td>Return usb_devices information from osquery</td>
</tr>
<tr>
<td></td>
<td>CLI Example: <code>salt '*' osquery.usb_devices</code></td>
</tr>
<tr>
<td><code>salt.modules.osquery.users</code></td>
<td><code>users(attrs=None, where=None)</code></td>
</tr>
<tr>
<td></td>
<td>Return users information from osquery</td>
</tr>
<tr>
<td></td>
<td>CLI Example: <code>salt '*' osquery.users</code></td>
</tr>
<tr>
<td><code>salt.modules.osquery.version</code></td>
<td><code>version()</code></td>
</tr>
<tr>
<td></td>
<td>Return version of osquery</td>
</tr>
<tr>
<td></td>
<td>CLI Example: <code>salt '*' osquery.version</code></td>
</tr>
</tbody>
</table>
salt.modules.osquery.xattr_where_from(attrs=None, where=None)

Return xattr_where_from information from osquery

CLI Example:
```
salt '*' osquery.xattr_where_from
```

salt.modules.osquery.xprotect_entries(attrs=None, where=None)

Return xprotect_entries information from osquery

CLI Example:
```
salt '*' osquery.xprotect_entries
```

salt.modules.osquery.xprotect_reports(attrs=None, where=None)

Return xprotect_reports information from osquery

CLI Example:
```
salt '*' osquery.xprotect_reports
```

21.9.303 salt.modules.out module

Output Module

New in version 2018.3.0.

Execution module that processes JSON serializable data and returns string having the format as processed by the outputters.

Although this does not bring much value on the CLI, it turns very handy in applications that require human readable data rather than Python objects.

For example, inside a Jinja template:
```
{{ salt.out.string_format(complex_object, out='highstate') }}
```

salt.modules.out.html_format(data, out='nested', opts=None, **kwargs)

Return the formatted string as HTML.

data The JSON serializable object.
out: nested The name of the output to use to transform the data. Default: nested.
opts Dictionary of configuration options. Default: __opts__.
kwargs Arguments to sent to the outputer module.

CLI Example:
```
salt '*' out.html_format "{'key': 'value'}" out=yaml
```

salt.modules.out.out_format(data, out='nested', opts=None, **kwargs)

Return the formatted outputer string for the Python object.

data The JSON serializable object.
out: nested The name of the output to use to transform the data. Default: nested.
opts Dictionary of configuration options. Default: __opts__.
kwargs Arguments to sent to the outputer module.

CLI Example:
```
salt '*' out.out_format "{'key': 'value'}"
```
salt.modules.out.string_format(data, out='nested', opts=None, **kwargs)
Return the outputter formatted string, removing the ANSI escape sequences.
data  The JSON serializable object.
out: nested  The name of the output to use to transform the data. Default: nested.
opts  Dictionary of configuration options. Default: __opts__.
kwargs  Arguments to sent to the outputter module.

CLI Example:
```
salt '*' out.string_format '{'key': 'value'}' out=table
```

21.9.304 salt.modules.pacmanpkg

A module to wrap pacman calls, since Arch is the best (https://wiki.archlinux.org/index.php/Arch_is_the_best)

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see here.

salt.modules.pacmanpkg.file_dict('packages')
List the files that belong to a package, grouped by package. Not specifying any packages will return a list of _every_ file on the system’s package database (not generally recommended).

CLI Examples:
```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

salt.modules.pacmanpkg.file_list('packages')
List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system’s package database (not generally recommended).

CLI Examples:
```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

salt.modules.pacmanpkg.group_diff(name)
New in version 2016.11.0.
Lists which of a group’s packages are installed and which are not installed
Compatible with yumpkg.group_diff for easy support of state.pkg.group_installed

CLI Example:
```
salt '*' pkg.group_diff 'xorg'
```

salt.modules.pacmanpkg.group_info(name)
New in version 2016.11.0.
Lists all packages in the specified group

CLI Example:
```
salt '*' pkg.group_info 'xorg'
```

21.9. execution modules
salt.modules.pacmanpkg.group_list()

New in version 2016.11.0.

Lists all groups known by pacman on this system

CLI Example:

```
salt '*' pkg.group_list
```

salt.modules.pacmanpkg.install(name=None, refresh=False, sysupgrade=None, pkg=None, sources=None, **kwargs)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any pacman commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Install (pacman -S) the specified package(s). Add refresh=True to install with -y, add sysupgrade=True to install with -u.

**name** The name of the package to be installed. Note that this parameter is ignored if either pkg or sources is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the sources option.

CLI Example:

```
salt '*' pkg.install <package name>
```

**refresh** Whether or not to refresh the package database before installing.

**sysupgrade** Whether or not to upgrade the system packages before installing. If refresh is set to True but sysupgrade is not specified, -u will be applied

Multiple Package Installation Options:

**pkgs** A list of packages to install from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version. As with the version parameter above, comparison operators can be used to target a specific version of a package.

CLI Examples:

```
salt '*' pkg.install pkgs=['"foo", "bar"']
salt '*' pkg.install pkgs=['"foo", {"bar": "1.2.3-4"}']
salt '*' pkg.install pkgs=['"foo", {"bar": "<1.2.3-4"}']
```

**sources** A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources=[{"foo": "salt://foo.pkg.tar.xz"}, {"bar": "salt://bar.pkg.tar.xz"}]
```

Returns a dict containing the new package names and versions:

```
{"<package>": {"old": "<old-version>", "new": "<new-version>"}}
```

salt.modules.pacmanpkg.latest_version(*names**, **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.
CLI Example:
```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

```python
salt.modules.pacmanpkg.list_pkgs(versions_as_list=False, **kwargs)
```
List the packages currently installed as a dict:

```
{'<package_name>': '<version>'
```

CLI Example:
```
salt '*' pkg.list_pkgs
```

```python
salt.modules.pacmanpkg.list_repo_pkgs(*args, **kwargs)
```
Returns all available packages. Optionally, package names (and name globs) can be passed and the results will be filtered to packages matching those names.

This function can be helpful in discovering the version or repo to specify in a `pkg.installed` state.

The return data will be a dictionary mapping package names to a list of version numbers, ordered from newest to oldest. If `byrepo` is set to `True`, then the return dictionary will contain repository names at the top level, and each repository will map packages to lists of version numbers. For example:

```
# With byrepo=False (default)
{
    'bash': ['4.4.005-2'],
    'nginx': ['1.10.2-2']
}
# With byrepo=True
{
    'core': {
        'bash': ['4.4.005-2']
    },
    'extra': {
        'nginx': ['1.10.2-2']
    }
}
```

`fromrepo` [None] Only include results from the specified repo(s). Multiple repos can be specified, comma-separated.

`byrepo` [False] When `True`, the return data for each package will be organized by repository.

`refresh` [False] When `True`, the package database will be refreshed (i.e. `pacman -Sy`) before checking for available versions.

CLI Examples:
```
salt '*' pkg.list_repo_pkgs
salt '*' pkg.list_repo_pkgs foo bar baz
salt '*' pkg.list_repo_pkgs 'samba4*' fromrepo=base,updates
salt '*' pkg.list_repo_pkgs 'python2-*' byrepo=True
```

```python
salt.modules.pacmanpkg.list_upgrades(refresh=False, root=None, **kwargs)
```
List all available package upgrades on this system

CLI Example:
```
salt '*' pkg.list_upgrades
```
salt.modules.pacmanpkg.owner(*paths)

New in version 2014.7.0.

Return the name of the package that owns the file. Multiple file paths can be passed. Like `pkg.version`, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Example:

```
salt '*' pkg.owner /usr/bin/apachectl salt '*' pkg.owner /usr/bin/apachectl /usr/bin/zsh
```

salt.modules.pacmanpkg.purge(name=None, pkgs=None, **kwargs)

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon’s control group. This is done to keep systemd from killing any pacman commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a config option called `systemd.scope`, with a value of `False` (no quotes).

Recursively remove a package and all dependencies which were installed with it, this will call a pacman `-Rsc`

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

salt.modules.pacmanpkg.refresh_db(root=None)

Just run a pacman `-Sy`, return a dict:

```
{'<database name>': Bool}
```

CLI Example:

```
salt '*' pkg.refresh_db
```

salt.modules.pacmanpkg.remove(name=None, pkgs=None, **kwargs)

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon’s control group. This is done to keep systemd from killing any pacman commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a config option called `systemd.scope`, with a value of `False` (no quotes).

Remove packages with pacman `-R`. 

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.
New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```plaintext
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

```
salt.modules.pacmanpkg.upgrade(refresh=False, root=None, **kwargs)
```

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon’s control group. This is done to keep systemd from killing any pacman commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a `config option` called `systemd.scope`, with a value of `False` (no quotes).

Run a full system upgrade, a pacman -Syu

`refresh` Whether or not to refresh the package database before installing.

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>', 'new': '<new-version>'}}
```

CLI Example:

```plaintext
salt '*' pkg.upgrade
```

```
salt.modules.pacmanpkg.upgrade_available(name)
```

Check whether or not an upgrade is available for a given package

CLI Example:

```plaintext
salt '*' pkg.upgrade_available <package name>
```

```
salt.modules.pacmanpkg.version(*names, **kwargs)
```

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```plaintext
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

### 21.9.305 `salt.modules.pagerduty`

Module for Firing Events via PagerDuty

New in version 2014.1.0.

`configuration` This module can be used by specifying the name of a configuration profile in the minion `config`, minion pillar, or master config.

For example:

```
my-pagerduty-account:
pagerduty.api_key: F3Rbyjbe43rfFwF2214
pagerduty.subdomain: mysubdomain
```
salt.modules.pagerduty.create_event(service_key=None, description=None, details=None, incident_key=None, profile=None)

Create an event in PagerDuty. Designed for use in states.

CLI Example:

```
salt myminion pagerduty.create_event <service_key> <description> <details>  
  profile=my-pagerduty-account
```

The following parameters are required:
- **service_key** This key can be found by using pagerduty.list_services.
- **description** This is a short description of the event.
- **details** This can be a more detailed description of the event.
- **profile** This refers to the configuration profile to use to connect to the PagerDuty service.

salt.modules.pagerduty.list_escalation_policies(profile=None, api_key=None)

This function is an alias of list_policies.

List escalation policies belonging to this account

CLI Example:

```
salt myminion pagerduty.list_policies my-pagerduty-account salt myminion pagerduty.list_escalation_policies my-pagerduty-account
```

salt.modules.pagerduty.list_incidents(profile=None, api_key=None)

List incidents belonging to this account

CLI Example:

```
salt myminion pagerduty.list_incidents my-pagerduty-account
```

salt.modules.pagerduty.list_maintenance_windows(profile=None, api_key=None)

This function is an alias of list_windows.

List maintenance windows belonging to this account

CLI Example:

```
salt myminion pagerduty.list_windows my-pagerduty-account salt myminion pagerduty.list_maintenance_windows my-pagerduty-account
```

salt.modules.pagerduty.list_policies(profile=None, api_key=None)

List escalation policies belonging to this account

CLI Example:

```
salt myminion pagerduty.list_policies my-pagerduty-account salt myminion pagerduty.list_escalation_policies my-pagerduty-account
```

salt.modules.pagerduty.list_schedules(profile=None, api_key=None)

List schedules belonging to this account

CLI Example:

```
salt myminion pagerduty.list_schedules my-pagerduty-account
```

salt.modules.pagerduty.list_services(profile=None, api_key=None)

List services belonging to this account

CLI Example:

```
salt myminion pagerduty.list_services my-pagerduty-account
```

salt.modules.pagerduty.list_users(profile=None, api_key=None)

List users belonging to this account

CLI Example:

```
salt myminion pagerduty.list_users my-pagerduty-account
```
salt.modules.pagerduty.list_windows(profile=None, api_key=None)

List maintenance windows belonging to this account

CLI Example:
    salt myminion pagerduty.list_windows my-pagerduty-account salt myminion pagerduty.list_maintenance_windows my-pagerduty-account

21.9.306 salt.modules.pagerduty_util

Module for managing PagerDuty resource

configuration This module can be used by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The default configuration profile name is 'pagerduty.'

For example:

```
<table>
<thead>
<tr>
<th>configuration</th>
<th>value</th>
</tr>
</thead>
<tbody>
<tr>
<td>pagerduty</td>
<td></td>
</tr>
<tr>
<td>pagerduty.api_key</td>
<td>F3Rbyjbe43rzeF2214</td>
</tr>
<tr>
<td>pagerduty.subdomain</td>
<td>mysubdomain</td>
</tr>
</tbody>
</table>
```

For PagerDuty API details, see https://developer.pagerduty.com/documentation/rest

salt.modules.pagerduty_util.create_or_update_resource(resource_name, identifier_fields, data, diff=None, profile='pagerduty', subdomain=None, api_key=None)

create or update any pagerduty resource Helper method for present().

Determining if two resources are the same is different for different PD resource, so this method accepts a diff function. The diff function will be invoked as diff(state_information, object_returned_from_pagerduty), and should return a dict of data to pass to the PagerDuty update API method, or None if no update is to be performed. If no diff method is provided, the default behavior is to scan the keys in the state_information, comparing the matching values in the object_returned_from_pagerduty, and update any values that differ.

Examples

```
create_or_update_resource("user", ["id","name","email"])
create_or_update_resource("escalation_policies", ["id","name"], diff=my_diff_function)
```

salt.modules.pagerduty_util.delete_resource(resource_name, key, identifier_fields, profile='pagerduty', subdomain=None, api_key=None)

delete any pagerduty resource

Helper method for absent()

Example

```
delete_resource("users", key, ["id","name","email"]))  # delete by id or name or email
```

salt.modules.pagerduty_util.get_escalation_policies(profile='pagerduty', subdomain=None, api_key=None)

List escalation_policies belonging to this account

CLI Example:
    salt myminion pagerduty.get_escalation_policies
Get any single pagerduty resource by key.

We allow flexible lookup by any of a list of identifier_fields. So, for example, you can look up users by email address or name by calling:

```
get_resource('users', key, ['name', 'email'], ...)```

This method is mainly used to translate state sls into pagerduty id’s for dependent objects. For example, a pagerduty escalation policy contains one or more schedules, which must be passed by their pagerduty id. We look up the schedules by name (using this method), and then translate the names into id’s.

This method is implemented by getting all objects of the resource type (cached into __context__), then brute force searching through the list and trying to match any of the identifier_fields. The __context__ cache is purged after any create, update or delete to the resource.

List schedules belonging to this account

CLI Example:
```
salt myminion pagerduty.get_schedules
```

List services belonging to this account

CLI Example:
```
salt myminion pagerduty.get_services
```

List users belonging to this account

CLI Example:
```
salt myminion pagerduty.get_users
```

Generic resource.absent state method. Pagerduty state modules should be a thin wrapper over this method, with a custom diff function.

This method calls delete_resource() and formats the result as a salt state return value.

Example

```
resource_absent("users", ["id","name","email"])
```

Generic resource.present state method. Pagerduty state modules should be a thin wrapper over this method, with a custom diff function.

This method calls create_or_update_resource() and formats the result as a salt state return value.

Example

```
resource_present("users", ["id","name","email"])
```
**21.9.307 salt.modules.pam**

Support for pam

```
salt.modules.pam.read_file(file_name)
```

This is just a test function, to make sure parsing works

CLI Example:

```
salt '*' pam.read_file /etc/pam.d/login
```

**21.9.308 salt.modules.panos**

Module to provide Palo Alto compatibility to Salt

```
codeauthor Spencer Ervin <spencer_ervin@hotmail.com>
maturity new
depends none
platform unix
```

New in version 2018.3.0.

**Configuration**

This module accepts connection configuration details either as parameters, or as configuration settings in pillar as a Salt proxy. Options passed into opts will be ignored if options are passed into pillar.

See also:

* [Palo Alto Proxy Module](https://docs.saltstack.com/en/latest/ref/module/salt.modules.panos.html)

**About**

This execution module was designed to handle connections to a Palo Alto based firewall. This module adds support to send connections directly to the device through the XML API or through a brokered connection to Panorama.

```
salt.modules.panos.add_config_lock()
```

Prevent other users from changing configuration until the lock is released.

CLI Example:

```
salt '*' panos.add_config_lock
```

```
salt.modules.panos.check_antivirus()
```

Get anti-virus information from PaloAlto Networks server

CLI Example:

```
salt '*' panos.check_antivirus
```

```
salt.modules.panos.check_software()
```

Get software information from PaloAlto Networks server.

CLI Example:
salt '*' panos.check_software

```python
salt.modules.panos.clear_commit_tasks()
```
Clear all commit tasks.
CLI Example:
```
salt '*' panos.clear_commit_tasks
```

```python
salt.modules.panos.commit()
```
Commits the candidate configuration to the running configuration.
CLI Example:
```
salt '*' panos.commit
```

```python
salt.modules.panos.deactivate_license(key_name=None)
```
Deactivates an installed license. Required version 7.0.0 or greater.
key_name(str): The file name of the license key installed.
CLI Example:
```
salt '*' panos.deactivate_license key_name=License_File_Name.key
```

```python
salt.modules.panos.delete_license(key_name=None)
```
Remove license keys on disk.
key_name(str): The file name of the license key to be deleted.
CLI Example:
```
salt '*' panos.delete_license key_name=License_File_Name.key
```

```python
salt.modules.panos.download_antivirus()
```
Download the most recent anti-virus package.
CLI Example:
```
salt '*' panos.download_antivirus
```

```python
salt.modules.panos.download_software_file(filename=None, synch=False)
```
Download software packages by filename.
Parameters
- filename(str) - The filename of the PANOS file to download.
- synch(bool) - If true then the file will synch to the peer unit.
CLI Example:
```
salt '*' panos.download_software_file PanOS_5000-8.0.0
salt '*' panos.download_software_file PanOS_5000-8.0.0 True
```

```python
salt.modules.panos.download_software_version(version=None, synch=False)
```
Download software packages by version number.
Parameters
- version(str) - The version of the PANOS file to download.
- synch(bool) - If true then the file will synch to the peer unit.
CLI Example:
salt '***' panos.download_software_version 8.0.0
salt '***' panos.download_software_version 8.0.0 True

salt.modules.panos.fetch_license(auth_code=None)
Get new license(s) using from the Palo Alto Network Server.
auth_code The license authorization code.
CLI Example:
salt '***' panos.fetch_license
salt '***' panos.fetch_license auth_code=foobar

salt.modules.panos.get_address(address=None, vsys='1')
Get the candidate configuration for the specified get_address object. This will not return address objects that are marked as pre-defined objects.
address(str): The name of the address object.
vsys(str): The string representation of the VSYS ID.
CLI Example:
salt '***' panos.get_address myhost
salt '***' panos.get_address myhost 3

salt.modules.panos.get_address_group(addressgroup=None, vsys='1')
Get the candidate configuration for the specified address group. This will not return address groups that are marked as pre-defined objects.
addressgroup(str): The name of the address group.
vsys(str): The string representation of the VSYS ID.
CLI Example:
salt '***' panos.get_address_group foobar
salt '***' panos.get_address_group foobar 3

salt.modules.panos.get_admins_active()
Show active administrators.
CLI Example:
salt '***' panos.get_admins_active

salt.modules.panos.get_admins_all()
Show all administrators.
CLI Example:
salt '***' panos.get_admins_all

salt.modules.panos.get_antivirus_info()
Show information about available anti-virus packages.
CLI Example:
salt '***' panos.get_antivirus_info

salt.modules.panos.get_arp()
Show ARP information.
CLI Example:

```
salt '*' panos.get_arp
```

salt.modules.panos.get_cli_idle_timeout()  
Show timeout information for this administrative session.  
CLI Example:  
```
salt '*' panos.get_cli_idle_timeout
```

salt.modules.panos.get_cli_permissions()  
Show cli administrative permissions.  
CLI Example:  
```
salt '*' panos.get_cli_permissions
```

salt.modules.panos.get_disk_usage()  
Report filesystem disk space usage.  
CLI Example:  
```
salt '*' panos.get_disk_usage
```

salt.modules.panos.get_dns_server_config()  
Get the DNS server configuration from the candidate configuration.  
CLI Example:  
```
salt '*' panos.get_dns_server_config
```

salt.modules.panos.get_domain_config()  
Get the domain name configuration from the candidate configuration.  
CLI Example:  
```
salt '*' panos.get_domain_config
```

salt.modules.panos.get_dos_blocks()  
Show the DoS block-ip table.  
CLI Example:  
```
salt '*' panos.get_dos_blocks
```

salt.modules.panos.get_fqdn_cache()  
Print FQDNs used in rules and their IPs.  
CLI Example:  
```
salt '*' panos.get_fqdn_cache
```

salt.modules.panos.get_ha_config()  
Get the high availability configuration.  
CLI Example:  
```
salt '*' panos.get_ha_config
```

salt.modules.panos.get_ha_link()
Show high-availability link-monitoring state.

CLI Example:
```
salt '*' panos.get_ha_link
```

salt.modules.panos.get_ha_path()
Show high-availability path-monitoring state.

CLI Example:
```
salt '*' panos.get_ha_path
```

salt.modules.panos.get_ha_state()
Show high-availability state information.

CLI Example:
```
salt '*' panos.get_ha_state
```

salt.modules.panos.get_ha.transitions()
Show high-availability transition statistic information.

CLI Example:
```
salt '*' panos.get_ha.transitions
```

salt.modules.panos.get_hostname()
Get the hostname of the device.

CLI Example:
```
salt '*' panos.get_hostname
```

salt.modules.panos.get_interface_counters(name='all')
Get the counter statistics for interfaces.

Parameters

- **name (str)** – The name of the interface to view. By default, all interface statistics are viewed.

CLI Example:
```
salt '*' panos.get_interface_counters
salt '*' panos.get_interface_counters ethernet1/1
```

salt.modules.panos.get_interfaces(name='all')
Show interface information.

Parameters

- **name (str)** – The name of the interface to view. By default, all interface statistics are viewed.

CLI Example:
```
salt '*' panos.get_interfaces
salt '*' panos.get_interfaces ethernet1/1
```

salt.modules.panos.get_job(jid=None)
List all a single job by ID.

- **jid** The ID of the job to retrieve.

CLI Example:
```
salt '*' panos.get_job jid=15
```
salt.modules.panos.get_jobs(state='all')
List all jobs on the device.

state The state of the jobs to display. Valid options are all, pending, or processed. Pending jobs are jobs that
are currently in a running or waiting state. Processed jobs are jobs that have completed execution.

CLI Example:
```
salt '*' panos.get_jobs
salt '*' panos.get_jobs state=pending
```

salt.modules.panos.get_lacp()
Show LACP state.

CLI Example:
```
salt '*' panos.get_lacp
```

salt.modules.panos.get_license_info()
Show information about owned license(s).

CLI Example:
```
salt '*' panos.get_license_info
```

salt.modules.panos.get_license_tokens()
Show license token files for manual license deactivation.

CLI Example:
```
salt '*' panos.get_license_tokens
```

salt.modules.panos.get_lldp_config()
Show lldp config for interfaces.

CLI Example:
```
salt '*' panos.get_lldp_config
```

salt.modules.panos.get_lldp_counters()
Show lldp counters for interfaces.

CLI Example:
```
salt '*' panos.get_lldp_counters
```

salt.modules.panos.get_lldp_local()
Show lldp local info for interfaces.

CLI Example:
```
salt '*' panos.get_lldp_local
```

salt.modules.panos.get_lldp_neighbors()
Show lldp neighbors info for interfaces.

CLI Example:
```
salt '*' panos.get_lldp_neighbors
```

salt.modules.panos.get_local_admins()
Show all local administrator accounts.
salt.modules.panos.get_local_admins()  
Report the logdb quotas.

CLI Example:
```
salt '*' panos.get_local_admins
```

salt.modules.panos.get_logdb_quota()  
Get the logdb quotas.

CLI Example:
```
salt '*' panos.get_logdb_quota
```

salt.modules.panos.get_master_key()  
Get the master key properties.

CLI Example:
```
salt '*' panos.get_master_key
```

salt.modules.panos.get_ntp_config()  
Get the NTP configuration from the candidate configuration.

CLI Example:
```
salt '*' panos.get_ntp_config
```

salt.modules.panos.get_ntp_servers()  
Get list of configured NTP servers.

CLI Example:
```
salt '*' panos.get_ntp_servers
```

salt.modules.panos.get_operational_mode()  
Show device operational mode setting.

CLI Example:
```
salt '*' panos.get_operational_mode
```

salt.modules.panos.get_panorama_status()  
Show panorama connection status.

CLI Example:
```
salt '*' panos.get_panorama_status
```

salt.modules.panos.get_permitted_ips()  
Get the IP addresses that are permitted to establish management connections to the device.

CLI Example:
```
salt '*' panos.get_permitted_ips
```

salt.modules.panos.get_platform()  
Get the platform model information and limitations.

CLI Example:
```
salt '*' panos.get_platform
```
salt.modules.panos.get_predefined_application(application=None)
Get the configuration for the specified pre-defined application object. This will only return pre-defined application objects.

application(str): The name of the pre-defined application object.

CLI Example:

```
salt '*' panos.get_predefined_application saltstack
```

salt.modules.panos.get_security_rule(rulename=None, vsys='1')
Get the candidate configuration for the specified security rule.

rulename(str): The name of the security rule.
vsys(str): The string representation of the VSYS ID.

CLI Example:

```
salt '*' panos.get_security_rule rule01
salt '*' panos.get_security_rule rule01 3
```

salt.modules.panos.get_service(service=None, vsys='1')
Get the candidate configuration for the specified service object. This will not return services that are marked as pre-defined objects.

service(str): The name of the service object.
vsys(str): The string representation of the VSYS ID.

CLI Example:

```
salt '*' panos.get_service tcp-443
salt '*' panos.get_service tcp-443 3
```

salt.modules.panos.get_service_group(servicegroup=None, vsys='1')
Get the candidate configuration for the specified service group. This will not return service groups that are marked as pre-defined objects.

servicegroup(str): The name of the service group.
vsys(str): The string representation of the VSYS ID.

CLI Example:

```
salt '*' panos.get_service_group foobar
salt '*' panos.get_service_group foobar 3
```

salt.modules.panos.get_session_info()
Show device session statistics.

CLI Example:

```
salt '*' panos.get_session_info
```

salt.modules.panos.get_snmp_config()
Get the SNMP configuration from the device.

CLI Example:

```
salt '*' panos.get_snmp_config
```
salt.modules.panos.get_software_info()
   Show information about available software packages.
   CLI Example:
   ```shell
   salt '*' panos.get_software_info
   ```

salt.modules.panos.get_system_date_time()
Get the system date/time.
   CLI Example:
   ```shell
   salt '*' panos.get_system_date_time
   ```

salt.modules.panos.get_system_files()
List important files in the system.
   CLI Example:
   ```shell
   salt '*' panos.get_system_files
   ```

salt.modules.panos.get_system_info()
Get the system information.
   CLI Example:
   ```shell
   salt '*' panos.get_system_info
   ```

salt.modules.panos.get_system_services()
Show system services.
   CLI Example:
   ```shell
   salt '*' panos.get_system_services
   ```

salt.modules.panos.get_system_state(mask=None)
Show the system state variables.
   mask: Filters by a subtree or a wildcard.
   CLI Example:
   ```shell
   salt '*' panos.get_system_state
   salt '*' panos.get_system_state mask=cfg.ha.config.enabled
   salt '*' panos.get_system_state mask=cfg.ha.*
   ```

salt.modules.panos.get_uncommitted_changes()
Retrieve a list of all uncommitted changes on the device. Requires PANOS version 8.0.0 or greater.
   CLI Example:
   ```shell
   salt '*' panos.get_uncommitted_changes
   ```

salt.modules.panos.get_users_config()
Get the local administrative user account configuration.
   CLI Example:
   ```shell
   salt '*' panos.get_users_config
   ```

salt.modules.panos.get_vlans()
Show all VLAN information.
CLI Example:
```
salt '*' panos.get_vlans
```

```
salt.modules.panos.get_xpath(xpath='')
```
Retrieve a specified xpath from the candidate configuration.

- **xpath (str)**: The specified xpath in the candidate configuration.

CLI Example:
```
salt '*' panos.get_xpath /config/shared/service
```

```
salt.modules.panos.get_zone(zone='', vsys='1')
```
Get the candidate configuration for the specified zone.

- **zone (str)**: The name of the zone.
- **vsys (str)**: The string representation of the VSYS ID.

CLI Example:
```
salt '*' panos.get_zone trust
salt '*' panos.get_zone trust 2
```

```
salt.modules.panos.get_zones(vsys='1')
```
Get all the zones in the candidate configuration.

- **vsys (str)**: The string representation of the VSYS ID.

CLI Example:
```
salt '*' panos.get_zones
salt '*' panos.get_zones 2
```

```
salt.modules.panos.install_antivirus(version=None, latest=False, synch=False, skip_commit=False)
```
Install anti-virus packages.

**Parameters**

- **version (str)** – The version of the PANOS file to install.
- **latest (bool)** – If true, the latest anti-virus file will be installed. The specified version option will be ignored.
- **synch (bool)** – If true, the anti-virus will synch to the peer unit.
- **skip_commit (bool)** – If true, the install will skip committing to the device.

CLI Example:
```
salt '*' panos.install_antivirus 8.0.0
```

```
salt.modules.panos.install_license()
```
Install the license key(s).

CLI Example:
```
salt '*' panos.install_license
```

```
salt.modules.panos.install_software(version=None)
```
Upgrade to a software package by version.

**Parameters**

- **version (str)** – The version of the PANOS file to install.

CLI Example:
salt ' '*' panos.install_license 8.0.0

salt.modules.panos.reboot()
Reboot a running system.

   CLI Example:

   salt ' '*' panos.reboot

salt.modules.panos.refresh_fqdn_cache(force=False)
Force refreshes all FQDNs used in rules.
force Forces all fqdn refresh

   CLI Example:

   salt ' '*' panos.refresh_fqdn_cache
   salt ' '*' panos.refresh_fqdn_cache force=True

salt.modules.panos.remove_config_lock()
Release config lock previously held.

   CLI Example:

   salt ' '*' panos.remove_config_lock

salt.modules.panos.resolve_address(address=None, vsys=None)
Resolve address to ip address. Required version 7.0.0 or greater.
address Address name you want to resolve.
vsys The vsys name.

   CLI Example:

   salt ' '*' panos.resolve_address foo.bar.com
   salt ' '*' panos.resolve_address foo.bar.com vsys=2

salt.modules.panos.save_device_config(filename=None)
Save device configuration to a named file.
filename The filename to save the configuration to.

   CLI Example:

   salt ' '*' panos.save_device_config foo.xml

salt.modules.panos.save_device_state()
Save files needed to restore device to local disk.

   CLI Example:

   salt ' '*' panos.save_device_state

salt.modules.panos.set_authentication_profile(profile=None, deploy=False)
Set the authentication profile of the Palo Alto proxy minion. A commit will be required before this is processed.

   CLI Example:

   Parameters
   
   • profile (str) – The name of the authentication profile to set.
   • deploy (bool) – If true then commit the full candidate configuration, if false only set pending change.
```python
salt '*' panos.set_authentication_profile foo
salt '*' panos.set_authentication_profile foo deploy=True
```

salt.modules.panos.set_hostname(*hostname=*, *deploy=*False*)

Set the hostname of the Palo Alto proxy minion. A commit will be required before this is processed.

CLI Example:

```python
Parameters

- *hostname* (*str*) – The hostname to set
- *deploy* (*bool*) – If true then commit the full candidate configuration, if false only set pending change.
```

```python
salt '*' panos.set_hostname newhostname
deploy=True
```

salt.modules.panos.set_management_http(*enabled=*, *deploy=*False*)

Enables or disables the HTTP management service on the device.

CLI Example:

```python
Parameters

- *enabled* (*bool*) – If true the service will be enabled. If false the service will be disabled.
- *deploy* (*bool*) – If true then commit the full candidate configuration, if false only set pending change.
```

```python
salt '*' panos.set_management_http
salt '*' panos.set_management_http enabled=False deploy=True
```

salt.modules.panos.set_management_https(*enabled=*, *deploy=*False*)

Enables or disables the HTTPS management service on the device.

CLI Example:

```python
Parameters

- *enabled* (*bool*) – If true the service will be enabled. If false the service will be disabled.
- *deploy* (*bool*) – If true then commit the full candidate configuration, if false only set pending change.
```

```python
salt '*' panos.set_management_https
salt '*' panos.set_management_https enabled=False deploy=True
```

salt.modules.panos.set_management_icmp(*enabled=*, *deploy=*False*)

Enables or disables the ICMP management service on the device.

CLI Example:

```python
Parameters

- *enabled* (*bool*) – If true the service will be enabled. If false the service will be disabled.
- *deploy* (*bool*) – If true then commit the full candidate configuration, if false only set pending change.
```

```python
salt '*' panos.set_management_icmp
salt '*' panos.set_management_icmp enabled=False deploy=True
```

salt.modules.panos.set_management_ocsp(*enabled=*, *deploy=*False*)

Enables or disables the HTTP OCSP management service on the device.

CLI Example:
Parameters

- **enabled (bool)** – If true the service will be enabled. If false the service will be disabled.
- **deploy (bool)** – If true then commit the full candidate configuration, if false only set pending change.

```bash
salt '*' panos.set_management_ocsp
salt '*' panos.set_management_ocsp enabled=False deploy=True
```

salt.modules.panos.set_management_snmp( enabled=True, deploy=False)

Enables or disables the SNMP management service on the device.

CLI Example:

Parameters

- **enabled (bool)** – If true the service will be enabled. If false the service will be disabled.
- **deploy (bool)** – If true then commit the full candidate configuration, if false only set pending change.

```bash
salt '*' panos.set_management_snmp
salt '*' panos.set_management_snmp enabled=False deploy=True
```

salt.modules.panos.set_management_ssh( enabled=True, deploy=False)

Enables or disables the SSH management service on the device.

CLI Example:

Parameters

- **enabled (bool)** – If true the service will be enabled. If false the service will be disabled.
- **deploy (bool)** – If true then commit the full candidate configuration, if false only set pending change.

```bash
salt '*' panos.set_management_ssh
salt '*' panos.set_management_ssh enabled=False deploy=True
```

salt.modules.panos.set_management_telnet( enabled=True, deploy=False)

Enables or disables the Telnet management service on the device.

CLI Example:

Parameters

- **enabled (bool)** – If true the service will be enabled. If false the service will be disabled.
- **deploy (bool)** – If true then commit the full candidate configuration, if false only set pending change.

```bash
salt '*' panos.set_management_telnet
salt '*' panos.set_management_telnet enabled=False deploy=True
```

salt.modules.panos.set_ntp_authentication( target=None, authentication_type=None, key_id=None, authentication_key=None, algorithm=None, deploy=False)

Set the NTP authentication of the Palo Alto proxy minion. A commit will be required before this is processed.

CLI Example:

Parameters

- **target (str)** – Determines the target of the authentication. Valid options are primary, secondary, or both.
• **authentication_type**(str) – The authentication type to be used. Valid options are symmetric, autokey, and none.
• **key_id**(int) – The NTP authentication key ID.
• **authentication_key**(str) – The authentication key.
• **algorithm**(str) – The algorithm type to be used for a symmetric key. Valid options are md5 and sha1.
• **deploy**(bool) – If true then commit the full candidate configuration, if false only set pending change.

```python
salt '*' ntp.set_authentication target=both authentication_type=autokey
salt '*' ntp.set_authentication target=primary authentication_type=none
salt '*' ntp.set_authentication target=both authentication_type=symmetric key_id=15 authentication_key=mykey algorithm=md5
salt '*' ntp.set_authentication target=both authentication_type=symmetric key_id=15 authentication_key=mykey algorithm=md5 deploy=True
```

**salt.modules.panos.set_ntp_servers**(primary_server=None, secondary_server=None, deploy=False)
Set the NTP servers of the Palo Alto proxy minion. A commit will be required before this is processed.

CLI Example:
Parameters
• **primary_server**(str) – The primary NTP server IP address or FQDN.
• **secondary_server**(str) – The secondary NTP server IP address or FQDN.
• **deploy**(bool) – If true then commit the full candidate configuration, if false only set pending change.

```python
salt '*' ntp.set_servers 0.pool.ntp.org 1.pool.ntp.org
salt '*' ntp.set_servers primary_server=0.pool.ntp.org secondary_server=1.pool.ntp.org
salt '*' ntp.set_servers 0.pool.ntp.org 1.pool.ntp.org deploy=True
```

**salt.modules.panos.set_permitted_ip**(address=None, deploy=False)
Add an IPv4 address or network to the permitted IP list.

CLI Example:
Parameters
• **address**(str) – The IPv4 address or network to allow access to add to the Palo Alto device.
• **deploy**(bool) – If true then commit the full candidate configuration, if false only set pending change.

```python
salt '*' panos.set_permitted_ip 10.0.0.1
salt '*' panos.set_permitted_ip 10.0.0.0/24
salt '*' panos.set_permitted_ip 10.0.0.1 deploy=True
```

**salt.modules.panos.set_timezone**(tz=None, deploy=False)
Set the timezone of the Palo Alto proxy minion. A commit will be required before this is processed.

CLI Example:
Parameters
• **tz**(str) – The name of the timezone to set.
• **deploy**(bool) – If true then commit the full candidate configuration, if false only set pending change.

```python
salt '*' panos.set_timezone UTC
salt '*' panos.set_timezone UTC deploy=True
```
salt.modules.panos.shutdown()

Shutdown a running system.

CLI Example:

```
salt '*' panos.shutdown
```

salt.modules.panos.test_fib_route(ip=None, vr='vr1')

Perform a route lookup within active route table (fib).

ip (str): The destination IP address to test.

vr (str): The name of the virtual router to test.

CLI Example:

```
salt '*' panos.test_fib_route 4.2.2.2
salt '*' panos.test_fib_route 4.2.2.2 my-vr
```

salt.modules.panos.test_security_policy(sourcezone=None, destinationzone=None, source=None, destination=None, protocol=None, port=None, application=None, category=None, vsys='1', allrules=False)

Checks which security policy as connection will match on the device.

sourcezone (str): The source zone matched against the connection.

destinationzone (str): The destination zone matched against the connection.

source (str): The source address. This must be a single IP address.

destination (str): The destination address. This must be a single IP address.

protocol (int): The protocol number for the connection. This is the numerical representation of the protocol.

port (int): The port number for the connection.

application (str): The application that should be matched.

category (str): The category that should be matched.

vsys (int): The numerical representation of the VSYS ID.

allrules (bool): Show all potential match rules until first allow rule.

CLI Example:

```
salt '*' panos.test_security_policy sourcezone=trust destinationzone=untrust
  protocol=6 port=22
salt '*' panos.test_security_policy sourcezone=trust destinationzone=untrust
  protocol=6 port=22 vsys=2
```

salt.modules.panos.unlock_admin(username=None)

Unlocks a locked administrator account.

username Username of the administrator.

CLI Example:

```
salt '*' panos.unlock_admin username=bob
```
21.9.309  salt.modules.parallels module

Manage Parallels Desktop VMs with prlctl and prlsrvctl. Only some of the prlctl commands implemented so far. Of those that have been implemented, not all of the options may have been provided yet. For a complete reference, see the Parallels Desktop Reference Guide.

This module requires the prlctl binary to be installed to run most functions. To run parallels.prlsrvctl, the prlsrvctl binary is required.

What has not been implemented yet can be accessed through parallels.prlctl and parallels.prlsrvctl (note the preceding double dash -- as necessary):

```
salt '*' parallels.prlctl installtools macvm runas=macdev
salt -- '*' parallels.prlctl capture 'macvm --file macvm.display.png' runas=macdev
salt -- '*' parallels.prlsrvctl set '--mem-limit auto' runas=macdev
```

New in version 2016.3.0.

**salt.modules.parallels.clone** (*name, new_name, linked=False, template=False, runas=None*)

Clone a VM

New in version 2016.11.0.

**Parameters**

- name *(str)* – Name/ID of VM to clone
- new_name *(str)* – Name of the new VM
- linked *(bool)* – Create a linked virtual machine.
- template *(bool)* – Create a virtual machine template instead of a real virtual machine.
- runas *(str)* – The user that the prlctl command will be run as

**Example:**

```
salt '*' parallels.clone macvm macvm_new runas=macdev
salt '*' parallels.clone macvm macvm_templ template=True runas=macdev
```

**salt.modules.parallels.delete** (*name, runas=None*)

Delete a VM

New in version 2016.11.0.

**Parameters**

- name *(str)* – Name/ID of VM to clone
- runas *(str)* – The user that the prlctl command will be run as

**Example:**

```
salt '*' parallels.exec macvm 'find /etc/paths.d' runas=macdev
```

**salt.modules.parallels.delete_snapshot** (*name, snap_name, runas=None, all=False*)

Delete a snapshot

**Note:** Deleting a snapshot from which other snapshots are derived will not delete the derived snapshots

**Parameters**

- name *(str)* – Name/ID of VM whose snapshot will be deleted
- snap_name *(str)* – Name/ID of snapshot to delete
- runas *(str)* – The user that the prlctl command will be run as
- all *(bool)* – Delete all snapshots having the name given

New in version 2016.11.0.
Example:

```
salt '*' parallels.delete_snapshot macvm 'unneeded snapshot' runas=macdev
salt '*' parallels.delete_snapshot macvm 'Snapshot for linked clone' all=True runas=macdev
```

**salt.modules.parallels.exec** *(name, command, runas=None)*

Run a command on a VM

Parameters

- `name` *(str)* – Name/ID of VM whose `exec` will be returned
- `command` *(str)* – Command to run on the VM
- `runas` *(str)* – The user that the `prctl` command will be run as

Example:

```
salt '*' parallels.exec macvm 'find /etc/paths.d' runas=macdev
```

**salt.modules.parallels.exists** *(name, runas=None)*

Query whether a VM exists

New in version 2016.11.0.

Parameters

- `name` *(str)* – Name/ID of VM
- `runas` *(str)* – The user that the `prctl` command will be run as

Example:

```
salt '*' parallels.exists macvm runas=macdev
```

**salt.modules.parallels.list_snapshots** *(name, snap_name=None, tree=False, names=False, runas=None)*

List the snapshots

Parameters

- `name` *(str)* – Name/ID of VM whose snapshots will be listed
- `snap_id` *(str)* – Name/ID of snapshot to display information about. If `tree=True` is also specified, display the snapshot subtree having this snapshot as the root snapshot
- `tree` *(bool)* – List snapshots in tree format rather than tabular format
- `names` *(bool)* – List snapshots as ID, name pairs
- `runas` *(str)* – The user that the `prctl` command will be run as

Example:

```
salt '*' parallels.list_snapshots macvm runas=macdev
salt '*' parallels.list_snapshots macvm tree=True runas=macdev
salt '*' parallels.list_snapshots macvm snap_name=original runas=macdev
salt '*' parallels.list_snapshots macvm names=True runas=macdev
```

**salt.modules.parallels.list_vms** *(name=None, info=False, all=False, args=None, runas=None, template=False)*

List information about the VMs

Parameters

- `name` *(str)* – Name/ID of VM to list
- `info` *(str)* – List extra information
- `all` *(bool)* – List all non-template VMs
- `args` *(tuple)* – Additional arguments given to `prctl list`
- `runas` *(str)* – The user that the `prctl` command will be run as

Changed in version 2016.11.0: No longer implies `info=True`
• **template** *(bool)* – List the available virtual machine templates. The real virtual machines will not be included in the output

New in version 2016.11.0.

Example:

```bash
salt '*' parallels.list_vms runas=macdev
salt '*' parallels.list_vms name=macvm info=True runas=macdev
salt '*' parallels.list_vms info=True runas=macdev
salt '*' parallels.list_vms ' -o uuid,status' all=True runas=macdev
```

salt.modules.parallels.prlctl *(sub_cmd, args=None, runas=None)*

Execute a prlctl command

**Parameters**

• **sub_cmd** *(str)* – prlctl subcommand to execute
• **args** *(str)* – The arguments supplied to prlctl `<sub_cmd>
• **runas** *(str)* – The user that the prlctl command will be run as

Example:

```bash
salt '*' parallels.prlctl user list runas=macdev
salt '*' parallels.prlctl exec 'macvm uname' runas=macdev
salt -- '*' parallels.prlctl capture 'macvm --file macvm.display.png' runas=macdev
```

salt.modules.parallels.prlsrvctl *(sub_cmd, args=None, runas=None)*

Execute a prlsrvctl command

New in version 2016.11.0.

**Parameters**

• **sub_cmd** *(str)* – prlsrvctl subcommand to execute
• **args** *(str)* – The arguments supplied to prlsrvctl `<sub_cmd>
• **runas** *(str)* – The user that the prlsvctl command will be run as

Example:

```bash
salt '*' parallels.prlsrvctl info runas=macdev
salt '*' parallels.prlsrvctl usb list runas=macdev
salt -- '*' parallels.prlsrvctl set '--mem-limit auto' runas=macdev
```

salt.modules.parallels.reset *(name, runas=None)*

Reset a VM by performing a hard shutdown and then a restart

**Parameters**

• **name** *(str)* – Name/ID of VM to reset
• **runas** *(str)* – The user that the prlctl command will be run as

Example:

```bash
salt '*' parallels.reset macvm runas=macdev
```

salt.modules.parallels.revert_snapshot *(name, snap_name, runas=None)*

Revert a VM to a snapshot

```bash
salt '*' parallels.list_vms runas=macdev
salt '*' parallels.list_vms name=macvm info=True runas=macdev
salt '*' parallels.list_vms info=True runas=macdev
salt '*' parallels.list_vms ' -o uuid,status' all=True runas=macdev
```
Parameters

- `name (str)` – Name/ID of VM to revert to a snapshot
- `snap_name (str)` – Name/ID of snapshot to revert to
- `runas (str)` – The user that the prlctl command will be run as

Example:

```bash
salt '*' parallels.revert_snapshot macvm base-with-updates runas=macdev
```

```
salt.modules.parallels.snapshot(name, snap_name=None, desc=None, runas=None)
Create a snapshot

Parameters

- `name (str)` – Name/ID of VM to take a snapshot of
- `snap_name (str)` – Name of snapshot
- `desc (str)` – Description of snapshot
- `runas (str)` – The user that the prlctl command will be run as

Example:

```bash
salt '*' parallels.create_snapshot macvm snap_name=macvm-original runas=macdev
salt '*' parallels.create_snapshot macvm snap_name=macvm-updates desc='clean, install with updates' runas=macdev
```

```
salt.modules.parallels.snapshot_id_to_name(name, snap_id, strict=False, runas=None)
Attempt to convert a snapshot ID to a snapshot name. If the snapshot has no name or if the ID is not found or invalid, an empty string will be returned

Parameters

- `name (str)` – Name/ID of VM whose snapshots are inspected
- `snap_id (str)` – ID of the snapshot
- `strict (bool)` – Raise an exception if a name cannot be found for the given snap_id
- `runas (str)` – The user that the prlctl command will be run as

Example data

```
ID: {a5b8999f-5d95-4aff-82de-e515b0101b66}
Name: original
Date: 2016-03-04 10:50:34
Current: yes
State: poweroff
Description: original state
```

```
CLI Example:

```bash
salt '*' parallels.snapshot_id_to_name macvm a5b8999f-5d95-4aff-82de-e515b0101b66 runas=macdev
```

```
salt.modules.parallels.snapshot_name_to_id(name, snap_name, strict=False, runas=None)
Attempt to convert a snapshot name to a snapshot ID. If the name is not found an empty string is returned. If multiple snapshots share the same name, a list will be returned

Parameters

- `name (str)` – Name/ID of VM whose snapshots are inspected
- `snap_name (str)` – Name of the snapshot
- `strict (bool)` – Raise an exception if multiple snapshot IDs are found
- `runas (str)` – The user that the prlctl command will be run as

CLI Example:

```bash
salt '*' parallels.snapshot_name_to_id macvm original runas=macdev
```
**salt.modules.parallels.start** *(name, runas=None)*

Start a VM

**Parameters**

- **name** *(str)* – Name/ID of VM to start
- **runas** *(str)* – The user that the prlctl command will be run as

Example:

```bash
salt '*' parallels.start macvm runas=macdev
```

**salt.modules.parallels.status** *(name, runas=None)*

Status of a VM

**Parameters**

- **name** *(str)* – Name/ID of VM whose status will be returned
- **runas** *(str)* – The user that the prlctl command will be run as

Example:

```bash
salt '*' parallels.status macvm runas=macdev
```

**salt.modules.parallels.stop** *(name, kill=False, runas=None)*

Stop a VM

**Parameters**

- **name** *(str)* – Name/ID of VM to stop
- **kill** *(bool)* – Perform a hard shutdown
- **runas** *(str)* – The user that the prlctl command will be run as

Example:

```bash
salt '*' parallels.stop macvm runas=macdev
salt '*' parallels.stop macvm kill=True runas=macdev
```

### 21.9.310 salt.modules.parted_partition

Module for managing partitions on POSIX-like systems.

**depends**

- parted, partprobe, lsblk (usually parted and util-linux packages)

Some functions may not be available, depending on your version of parted.

Check the manpage for **parted(8)** for more information, or the online docs at:

In light of parted not directly supporting partition IDs, some of this module has been written to utilize sfdisk instead. For further information, please reference the man page for **sfdisk(8)**.

**salt.modules.parted_partition.align_check** *(device, part_type, partition)*

Check if partition satisfies the alignment constraint of part_type. Type must be "minimal" or "optimal".

**CLI Example:**

```bash
salt '*' partition.align_check /dev/sda minimal 1
```

**salt.modules.parted_partition.check** *(device, minor)*

Checks if the file system on partition <minor> has any errors.

**CLI Example:**
### partition.check

**Description:**
Copies the file system on the partition `<from-minor>` to partition `<to-minor>`, deleting the original contents of the destination partition.

**CLI Example:**
```
salt '*' partition.cp /dev/sda 2 3
```

### partition.exists

**Description:**
Check to see if the partition exists

**CLI Example:**
```
salt '*' partition.exists /dev/sdb1
```

### partition.get_block_device

**Description:**
Retrieve a list of disk devices

**New in version 2014.7.0.**

**CLI Example:**
```
salt '*' partition.get_block_device
```

### partition.get_id

**Description:**
Prints the system ID for the partition. Some typical values are:

- **b:** FAT32 (vfat)
- **7:** HPFS/NTFS
- **82:** Linux Swap
- **83:** Linux
- **8e:** Linux LVM
- **fd:** Linux RAID Auto

**CLI Example:**
```
salt '*' partition.get_id /dev/sda 1
```

### partition.list

**Description:**
Prints partition information of given `<device>`

**CLI Examples:**
```
salt '*' partition.list /dev/sda
salt '*' partition.list /dev/sda unit=s
salt '*' partition.list /dev/sda unit=kB
```

### partition.mkfs

**Description:**
Makes a file system `<fs_type>` on partition `<device>`, destroying all data that resides on that partition. `<fs_type>` must be one of "ext2", "fat32", "fat16", "linux-swap" or "reiserfs" (if libreiserfs is installed)

**CLI Example:**
```
salt '*' partition.mkfs /dev/sda2 fat32
```

### partition.mklabel

**Description:**
Create a new disklabel (partition table) of label_type.
Type should be one of "aix", "amiga", "bsd", "dvh", "gpt", "loop", "mac", "msdos", "pc98", or "sun".

CLI Example:

```
salt '*' partition.mklabel /dev/sda msdos
```

**salt.modules.parted_partition.mkpart** *(device, part_type=fs_type=None, start=None, end=None)*

Make a part_type partition for filesystem fs_type, beginning at start and ending at end (by default in megabytes). part_type should be one of "primary", "logical", or "extended".

CLI Examples:

```
salt '*' partition.mkpart /dev/sda primary fs_type=fat32 start=0 end=639
salt '*' partition.mkpart /dev/sda primary start=0 end=639
```

**salt.modules.parted_partition.mkpartfs** *(device, part_type, fs_type, start, end)*

Make a <part_type> partition with a new filesystem of <fs_type>, beginning at <start> and ending at <end> (by default in megabytes).

<part_type> should be one of "primary", "logical", or "extended". <fs_type> must be one of "ext2", "fat32", "fat16", "linux-swap" or "reiserfs" (if libreiserfs is installed)

CLI Example:

```
salt '*' partition.mkpartfs /dev/sda logical ext2 440 670
```

**salt.modules.parted_partition.name** *(device, partition, name)*

Set the name of partition to name. This option works only on Mac, PC98, and GPT disklabels. The name can be placed in quotes, if necessary.

CLI Example:

```
salt '*' partition.name /dev/sda 1 'My Documents'
```

**salt.modules.parted_partition.probe** *(devices)*

Ask the kernel to update its local partition data. When no args are specified all block devices are tried.

Caution: Generally only works on devices with no mounted partitions and may take a long time to return if specified devices are in use.

CLI Examples:

```
salt '*' partition.probe
salt '*' partition.probe /dev/sda
salt '*' partition.probe /dev/sda /dev/sdb
```

**salt.modules.parted_partition.rescue** *(device, start, end)*

Rescue a lost partition that was located somewhere between start and end. If a partition is found, parted will ask if you want to create an entry for it in the partition table.

CLI Example:

```
salt '*' partition.rescue /dev/sda 0 8056
```

**salt.modules.parted_partition.resize** *(device, minor, start, end)*

Resizes the partition with number <minor>.

The partition will start <start> from the beginning of the disk, and end <end> from the beginning of the disk. resize never changes the minor number. Extended partitions can be resized, so long as the new extended partition completely contains all logical partitions.
CLI Example:
```
salt '*' partition.resize /dev/sda 3 200 850
```

salt.modules.parted_partition.rm(device, minor)
Removes the partition with number <minor>.

CLI Example:
```
salt '*' partition.rm /dev/sda 5
```

salt.modules.parted_partition.set_(device, minor, flag, state)
Changes a flag on the partition with number <minor>.

A flag can be either "on" or "off" (make sure to use proper quoting, see YAML Idiosyncrasies). Some or all of these flags will be available, depending on what disk label you are using.

Valid flags are: bios_grub, legacy_boot, boot, lba, root, swap, hidden, raid, LVM, PALO, PREP, DIAG

CLI Example:
```
salt '*' partition.set /dev/sda 1 boot "on"
```

salt.modules.parted_partition.set_id(device, minor, system_id)
Sets the system ID for the partition. Some typical values are:

```
b: FAT32 (vfat)
7: HPFS/NTFS
82: Linux Swap
83: Linux
8e: Linux LVM
fd: Linux RAID Auto
```

CLI Example:
```
salt '*' partition.set_id /dev/sda 1 83
```

salt.modules.parted_partition.system_types()
List the system types that are supported by the installed version of sfdisk

CLI Example:
```
salt '*' partition.system_types
```

salt.modules.parted_partition.toggle(device, partition, flag)
Toggle the state of <flag> on <partition>. Valid flags are the same as the set command.

CLI Example:
```
salt '*' partition.toggle /dev/sda 1 boot
```

### 21.9.311 salt.modules.pcs module

**Configure a Pacemaker/Corosync cluster with PCS**

Configure Pacemaker/Corosync clusters with the Pacemaker/Corosync configuration system (PCS)

**depends** pcs

New in version 2016.3.0.
salt.modules.pcs.auth(nodes, pcsuser='hacluster', pcspasswd='hacluster', extra_args=None)
Authorize nodes to the cluster
- **nodes**: a list of nodes which should be authorized to the cluster
- **pcsuser**: user for communication with PCS (default: hacluster)
- **pcspasswd**: password for pcsuser (default: hacluster)
- **extra_args**: list of extra option for the 'pcs cluster auth' command

CLI Example:
```
salt '*' pcs.auth nodes='[ node1.example.org node2.example.org ]'
  --pcsuser=hacluster pcspasswd=hoonetorg extra_args='[ '--force' ]'
```

salt.modules.pcs.cib_create(cibfile, scope='configuration', extra_args=None)
Create a CIB-file from the current CIB of the cluster
- **cibfile**: name/path of the file containing the CIB
- **scope**: specific section of the CIB (default: configuration)
- **extra_args**: additional options for creating the CIB-file

CLI Example:
```
salt '*' pcs.cib_create cibfile='/tmp/VIP_apache_1.cib'
  scope=configuration
```

salt.modules.pcs.cib_push(cibfile, scope='configuration', extra_args=None)
Push a CIB-file as the new CIB to the cluster
- **cibfile**: name/path of the file containing the CIB
- **scope**: specific section of the CIB (default: configuration)
- **extra_args**: additional options for creating the CIB-file

CLI Example:
```
salt '*' pcs.cib_push cibfile='/tmp/VIP_apache_1.cib'
  scope=configuration
```

salt.modules.pcs.cluster_node_add(node, extra_args=None)
Add a node to the pacemaker cluster via pcs command
- **node**: node that should be added
- **extra_args**: list of extra option for the 'pcs cluster node add' command

CLI Example:
```
salt '*' pcs.cluster_node_add node=node2.example.org
```

salt.modules.pcs.cluster_setup(nodes, pcsclustername='pcscluster', extra_args=None)
Setup pacemaker cluster via pcs command
- **nodes**: a list of nodes which should be set up
- **pcsclustername**: Name of the Pacemaker cluster (default: pcscluster)
- **extra_args**: list of extra option for the 'pcs cluster setup' command

CLI Example:
```
salt '*' pcs.cluster_setup nodes='[ node1.example.org node2.example.org ]'
  --pcsclustername=pcscluster
```

salt.modules.pcs.config_show(cibfile=None)
Show config of cluster
- **cibfile**: name/path of the file containing the CIB

CLI Example:
```
salt '*' pcs.config_show cibfile='/tmp/cib_for_galera'
```

salt.modules.pcs.is_auth(nodes)
Check if nodes are already authorized
nodes a list of nodes to be checked for authorization to the cluster

CLI Example:

```bash
salt '.*' pcs.is_auth nodes='[node1.example.org node2.example.org]'
```

```python
salt.modules.pcs.item_create(item, item_id, item_type, create='create', extra_args=None, cibfile=None)
```

Create an item via pcs command (mainly for use with the pcs state module)

- item config, property, resource, constraint etc.
- item_id id of the item
- item_type item type
- create create command (create or set f.e., default: create)
- extra_args additional options for the pcs command
- cibfile use cibfile instead of the live CIB

```python
salt.modules.pcs.item_show(item, item_id=None, item_type=None, show='show', extra_args=None, cibfile=None)
```

Show an item via pcs command (mainly for use with the pcs state module)

- item config, property, resource, constraint etc.
- item_id id of the item
- item_type item type
- show show command (probably None, default: show)
- extra_args additional options for the pcs command
- cibfile use cibfile instead of the live CIB

```python
salt.modules.pcs.prop_set(prop, value, extra_args=None, cibfile=None)
```

Set the value of a cluster property

- prop name of the property
- value value of the property prop
- extra_args additional options for the pcs property command
- cibfile use cibfile instead of the live CIB

CLI Example:

```bash
salt '.*' pcs.prop_set prop='no-quorum-policy' value='ignore' cibfile='/tmp/2_node_cluster.cib'
```

```python
salt.modules.pcs.prop_show(prop, extra_args=None, cibfile=None)
```

Show the value of a cluster property

- prop name of the property
- extra_args additional options for the pcs property command
- cibfile use cibfile instead of the live CIB

CLI Example:

```bash
salt '.*' pcs.prop_show cibfile='/tmp/2_node_cluster.cib' prop='no-quorum-policy'
```

```python
salt.modules.pcs.resource_create(resource_id, resource_type, resource_options=None, cibfile=None)
```

Create a resource via pcs command

- resource_id name for the resource
- resource_type resource type (f.e. ocf:heartbeat:IPaddr2 or VirtualIP)
- resource_options additional options for creating the resource
- cibfile use cibfile instead of the live CIB for manipulation

CLI Example:
salt '*' pcs.resource_create resource_id='galera' resource_type=ocf:heartbeat:galera resource_options="['wsrep_cluster_address=gcomm://node1.example.org,node2.example.org,node3.example.org', '--master']" cibfile='/tmp/cib_for_galera.cib'

salt.modules.pcs.resource_show(resource_id, extra_args=None, cibfile=None)
   Show a resource via pcs command
   resource_id  name of the resource
   extra_args  additional options for the pcs command
   cibfile  use cibfile instead of the live CIB

   CLI Example:
   salt '*' pcs.resource_show resource_id='galera' cibfile='/tmp/cib_for_galera.cib'

salt.modules.pcs.stonith_create(stonith_id, stonith_device_type, stonith_device_options=None, cibfile=None)
   Create a stonith resource via pcs command
   stonith_id  name for the stonith resource
   stonith_device_type  name of the stonith agent fence_eps, fence_xvm f.e.
   stonith_device_options  additional options for creating the stonith resource
   cibfile  use cibfile instead of the live CIB for manipulation

   CLI Example:
   salt '*' pcs.stonith_create stonith_id='eps_fence' stonith_device_type='fence_eps'
   stonith_device_options="['pcmk_host_map=node1.example.org:01;node2.example.org:02', 'ipaddr=myepsdevice.example.org', 'action=reboot', 'power_wait=5', 'verbose=1', 'debug=/var/log/pcsd/eps_fence.log', 'login=hidden', 'passwd=hoonetorg']" cibfile='/tmp/cib_for_stonith.cib'

salt.modules.pcs.stonith_show(stonith_id, extra_args=None, cibfile=None)
   Show the value of a cluster stonith
   stonith_id  name for the stonith resource
   extra_args  additional options for the pcs stonith command
   cibfile  use cibfile instead of the live CIB

   CLI Example:
   salt '*' pcs.stonith_show stonith_id='eps_fence' cibfile='/tmp/2_node_cluster.cib'

21.9.312 salt.modules.pdbedit

Manage accounts in Samba’s passdb using pdbedit

   maintainer  Jorge Schrauwen <sjorge@blackdot.be>
   maturity  new
   platform  posix

New in version 2017.7.0.

salt.modules.pdbedit.create(login, password, password_hashed=False, machine_account=False)
   Create user account
   login  [string] login name
   password  [string] password
   password_hashed  [boolean] set if password is a nt hash instead of plain text
   machine_account  [boolean] set to create a machine trust account instead
CLI Example:

```bash
salt '*' pdbedit.create zoe 9764951149F84E770889011E1DC4A927 ntlmhash
salt '*' pdbedit.create river 1sw4ll0w3d4bug
```

salt.modules.pdbedit.delete(login)
Delete user account

```bash
salt '*' pdbedit.delete wash
```

salt.modules.pdbedit.generate_nt_hash(password)
Generate a NT HASH

```bash
salt '*' pdbedit.generate_nt_hash my_password
```

salt.modules.pdbedit.get_user(login, hashes=False)
Get user account details

```bash
salt '*' pdbedit.get kaylee
```

salt.modules.pdbedit.list_users(verbose=True, hashes=False)
List user accounts

```bash
salt '*' pdbedit.list
```

salt.modules.pdbedit.modify(login, password=None, password_hashed=False, domain=None, profile=None, script=None, drive=None, homedir=None, fullname=None, account_desc=None, account_control=None, machine_sid=None, user_sid=None, reset_login_hours=False, reset_bad_password_count=False)
Modify user account

```bash
salt '*' pdbedit.modify
```

**Note:** Only the following can be set: - N: No password required - D: Account disabled - H: Home
directory required - L: Automatic Locking - X: Password does not expire

reset_login_hours [boolean] reset the users allowed logon hours
reset_bad_password_count [boolean] reset the stored bad login counter

Note: if user is absent and password is provided, the user will be created

CLI Example:

```
salt '*' pdbedit.modify inara fullname='Inara Serra'
salt '*' pdbedit.modify simon password=r1v3r
salt '*' pdbedit.modify jane drive='V:' homedir='\serenity\jane\profile'
salt '*' pdbedit.modify mal account_control='NX'
```

21.9.313 salt.modules.pecl

Manage PHP pecl extensions.

```
salt.modules.pecl.install(pecls, defaults=False, force=False, preferred_state='stable')
```

New in version 0.17.0.

Installs one or several pecl extensions.

- **pecls** The pecl extensions to install.
- **defaults** Use default answers for extensions such as pecl_http which ask questions before installation. Without this option, the pecl.installed state will hang indefinitely when trying to install these extensions.
- **force** Whether to force the installed version or not

CLI Example:

```
salt '*' pecl.install fuse
```

```
salt.modules.pecl.list_(channel=None)
```

List installed pecl extensions.

CLI Example:

```
salt '*' pecl.list
```

```
salt.modules.pecl.uninstall(pecls)
```

Uninstall one or several pecl extensions.

- **pecls** The pecl extensions to uninstall.

CLI Example:

```
salt '*' pecl.uninstall fuse
```

```
salt.modules.pecl.update(pecls)
```

Update one or several pecl extensions.

- **pecls** The pecl extensions to update.

CLI Example:

```
salt '*' pecl.update fuse
```

21.9.314 salt.modules.peeringdb module
PeeringDB Module

New in version 2019.2.0.

Execution module for the basic interaction with the PeeringDB API.

While for GET operations (the functions prefixed by get_) the credentials are optional, there are some specific details that are visible only to authenticated users. Moreover, the credentials are required when adding or updating information. That means, the module can equally work out of the box without any further configuration with the limitations imposed by the PeeringDB API.

For complete API documentation, please refer to https://www.peeringdb.com/apidocs/.

Configuration (in the opts or Pillar):

```yaml
peeringdb:
  username: salt
  password: 5@1t
```

```
salt.modules.peeringdb.get_fac(**kwargs)
    Return the details of the facility identified using the search filters specified in the query.

    Note: If no id or filter arguments are specified, it will return all the possible facilities registered in PeeringDB.

    The available filters are documented at: https://www.peeringdb.com/apidocs/#!/netfac/netfac_list

    CLI Example:
salt '*' peeringdb.get_fac id=1774
salt '*' peeringdb.get_fac state=UT
```

```
salt.modules.peeringdb.get_ix(**kwargs)
    Return the details of an IX (Internet Exchange) using the search filters specified in the query.

    Note: If no id or filter arguments are specified, it will return all the possible IXs registered in PeeringDB.

    The available filters are documented at: https://www.peeringdb.com/apidocs/#!/ix/ix_list

    CLI Example:
salt '*' peeringdb.get_ix id=1
salt '*' peeringdb.get_ix city='Milwaukee'
```

```
salt.modules.peeringdb.get_ixfac(**kwargs)
    Return the details of an IX (Internet Exchange) facility using the search filters specified in the query.

    Note: If no id or filter arguments are specified, it will return all the possible IX facilities registered in PeeringDB.

    The available filters are documented at: https://www.peeringdb.com/apidocs/#!/ixfac/ixfac_list

    CLI Example:
salt '*' peeringdb.get_ixfac id=1
salt '*' peeringdb.get_ixfac city='Milwaukee'
```
salt.modules.peeringdb.get_ixlan(**kwargs)
Return the details of an IX (Internet Exchange) together with the networks available in this location (and their
details), using the search filters specified in the query.

Note: If no id or filter arguments are specified, it will return all the possible IX LAN facilities registered in PeeringDB.
The available filters are documented at: https://www.peeringdb.com/apidocs/#!/ixlan/ixlan_list

CLI Example:
```
salt '*' peeringdb.get_ixlan id=780
salt '*' peeringdb.get_ixlan city='Milwaukee'
```

salt.modules.peeringdb.get_ixpfx(**kwargs)
Return the details of an IX (Internet Exchange) together with the PeeringDB IDs of the networks available in
this location, using the search filters specified in the query.

Note: If no id or filter arguments are specified, it will return all the possible IX LAN facilities registered in PeeringDB.
The available filters are documented at: https://www.peeringdb.com/apidocs/#!/ixpfx/ixpfx_list

CLI Example:
```
salt '*' peeringdb.get_ixpfx id=780
salt '*' peeringdb.get_ixpfx city='Milwaukee'
```

salt.modules.peeringdb.get_net(**kwargs)
Return the details of a network identified using the search filters specified in the query.

Note: If no id or filter arguments are specified, it will return all the possible networks registered in PeeringDB.
The available filters are documented at: https://www.peeringdb.com/apidocs/#!/net/net_list

CLI Example:
```
salt '*' peeringdb.get_net id=4224
salt '*' peeringdb.get_net asn=13335
salt '*' peeringdb.get_net city='Salt Lake City'
salt '*' peeringdb.get_net name__startswith=GTT
```

salt.modules.peeringdb.get_netfac(**kwargs)
Return the list of facilities used by a particular network, given the id or other filters specified in the query.

Note: If no id or filter arguments are specified, it will return all the possible network facilities registered in PeeringDB.
The available filters are documented at: https://www.peeringdb.com/apidocs/#!/netfac/netfac_list

CLI Example:
salt ',*' peeringdb.get_netfac id=780
salt ',*' peeringdb.get_netfac city='Milwaukee'

salt.modules.peeringdb.get_netixlan(**kwargs)
Return the IP addresses used by a particular network at all the IXs where it is available. The network is selected
either via the id argument or the other filters specified in the query.

Note: If no id or filter arguments are specified, it will return all the possible IP addresses, of all networks, at
all IXs, registered in PeeringDB.
The available filters are documented at: https://www.peeringdb.com/apidocs/#!/netixlan/netixlan_list

CLI Example:
salt ',*' peeringdb.get_netixlan asn=13335
salt ',*' peeringdb.get_netixlan ipaddr4=185.1.114.25

salt.modules.peeringdb.get_org(**kwargs)
Return the details of an organisation together with the networks available in this location, using the search
filters specified in the query.

Note: If no id or filter arguments are specified, it will return all the possible organisations registered in PeeringDB.
The available filters are documented at: https://www.peeringdb.com/apidocs/#!/org/org_list

CLI Example:
salt ',*' peeringdb.get_org id=2
salt ',*' peeringdb.get_org city=Duesseldorf

salt.modules.peeringdb.get_poc(**kwargs)
Return the details of a person of contact together using the search filters specified in the query.

Note: If no id or filter arguments are specified, it will return all the possible contacts registered in PeeringDB.
The available filters are documented at: https://www.peeringdb.com/apidocs/#!/poc/poc_list

CLI Example:
salt ',*' peeringdb.get_poc id=6721
salt ',*' peeringdb.get_poc email__contains='@cloudflare.com'

21.9.315 salt.modules.pf
Control the OpenBSD packet filter (PF).

codeauthor Jasper Lievisse Adriaanse <j@jasper.la>

New in version 2019.2.0.
salt.modules.pf.disable()
Disable the Packet Filter.
CLI example:
```
salt '*' pf.disable
```

**salt.modules.pf.enable()**
Enable the Packet Filter.

CLI example:
```
salt '*' pf.enable
```

**salt.modules.pf.flush(modifier)**
Flush the specified packet filter parameters.

- **modifier**: Should be one of the following:
  - all
  - info
  - osfp
  - rules
  - sources
  - states
  - tables

  Please refer to the OpenBSD `pfctl(8)` documentation for a detailed explanation of each command.

CLI example:
```
salt '*' pf.flush states
```

**salt.modules.pf.load(file=/etc/pf.conf, noop=False)**
Load a ruleset from the specific file, overwriting the currently loaded ruleset.

- **file**: Full path to the file containing the ruleset.
- **noop**: Don’t actually load the rules, just parse them.

CLI example:
```
salt '*' pf.load /etc/pf.conf.d/lockdown.conf
```

**salt.modules.pf.loglevel(level)**
Set the debug level which limits the severity of log messages printed by `pf(4)`.

- **level**: Log level. Should be one of the following: emerg, alert, crit, err, warning, notice, info or debug.

CLI example:
```
salt '*' pf.loglevel emerg
```

**salt.modules.pf.show(modifier)**
Show filter parameters.

- **modifier**: Modifier to apply for filtering. Only a useful subset of what pfctl supports can be used with Salt.
  - rules
  - states
  - tables

CLI example:
```
salt '*' pf.show rules
```

**salt.modules.pf.table(command, table, **kwargs)**
Apply a command on the specified table.

- **table**: Name of the table.
- **command**: Command to apply to the table. Supported commands are:
  - add
• delete
• expire
• flush
• kill
• replace
• show
• test
• zero

Please refer to the OpenBSD pfctl(8) documentation for a detailed explanation of each command.

CLI example:

```
salt '*' pf.table expire table=spam_hosts number=300
salt '*' pf.table add table=local_hosts addresses='["127.0.0.1", "::1"]'
```

### 21.9.316 salt.modules.philips_hue module

Philips HUE lamps module for proxy.

New in version 2015.8.3.

### 21.9.317 salt.modules.pillar

Extract the pillar data for this minion

```
salt.modules.pillar.ext(external, pillar=None)
```

Changed in version 2016.3.6,2016.11.3,2017.7.0: The supported ext_pillar types are now tunable using the on_demand_ext_pillar config option. Earlier releases used a hard-coded default.

Generate the pillar and apply an explicit external pillar

**external** A single ext_pillar to add to the ext_pillar configuration. This must be passed as a single section from the ext_pillar configuration (see CLI examples below). For more complicated ext_pillar configurations, it can be helpful to use the Python shell to load YAML configuration into a dictionary, and figure out

```python
>>> import salt.utils.yaml
>>> ext_pillar = salt.utils.yaml.safe_load(""
...  ext_pillar:
...  - git:
...    - issue38440 https://github.com/terminalmage/git_pillar:
...      - env: base
...  ""

>>> ext_pillar['ext_pillar'][0]
{'git': [{'mybranch https://github.com/myuser/myrepo': [{'env': 'base'}]}]}
```

In the above example, the value to pass would be `{git: [{mybranch https://github.com/myuser/myrepo: [{'env': 'base'}]}]}`. Note that this would need to be quoted when passing on the CLI (as in the CLI examples below).

**pillar** [None] If specified, allows for a dictionary of pillar data to be made available to pillar and ext_pillar rendering. These pillar variables will also override any variables of the same name in pillar or ext_pillar.

New in version 2015.5.0.

CLI Examples:
salt '*' pillar.ext '{libvirt: _}'
salt '*' pillar.ext '{'git': ['master https://github.com/myuser/myrepo']}'
salt '*' pillar.ext '{'git': [{'mybranch https://github.com/myuser/myrepo': [{'env -=': 'base'}]}]}'

salt.modules.pillar.fetch(key, default=<class 'KeyError'>, merge=False, merge_nested_lists=None, delimiter=':', pillarenv=None, saltenv=None)

New in version 0.14.

Attempt to retrieve the named value from in-memory pillar data. If the pillar key is not present in the in-memory pillar, then the value specified in the default option (described below) will be returned.

If the merge parameter is set to True, the default will be recursively merged into the returned pillar data.

The value can also represent a value in a nested dict using a ":" delimiter for the dict. This means that if a dict in pillar looks like this:

```yaml
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the apache key in the pkg dict this key can be passed as:

```
pkg:apache
```

**key** The pillar key to get value from

**default** The value specified by this option will be returned if the desired pillar key does not exist.

If a default value is specified, then it will be an empty string, unless pillar_raise_on_missing is set to True, in which case an error will be raised.

**merge** [False] If True, the retrieved values will be merged into the passed default. When the default and the retrieved value are both dictionaries, the dictionaries will be recursively merged.

New in version 2014.7.0.

Changed in version 2016.3.7, 2016.11.4, 2017.7.0: If the default and the retrieved value are not of the same type, then merging will be skipped and the retrieved value will be returned. Earlier releases raised an error in these cases.

**merge_nested_lists** If set to False, lists nested within the retrieved pillar dictionary will overwrite lists in default. If set to True, nested lists will be merged into lists in default. If unspecified (the default), this option is inherited from the pillar_merge_lists minion config option.

**Note:** This option is ignored when merge is set to False.

New in version 2016.11.6.

**delimiter** Specify an alternate delimiter to use when traversing a nested dict. This is useful for when the desired key contains a colon. See CLI example below for usage.

New in version 2014.7.0.

**pillarenv** If specified, this function will query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment. Note that this can produce different pillar data than executing this function without an environment, as its normal behavior is just to return a value from minion’s pillar data in memory (which can be sourced from more than one pillar environment).

Using this argument will not affect the pillar data in memory. It will however be slightly slower and use more resources on the master due to the need for the master to generate and send the minion fresh pillar data. This tradeoff in performance however allows for the use case where pillar data is desired only from a single environment.

New in version 2017.7.0.
`saltenv` Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

New in version 2017.7.0.

CLI Example:

```
salt '*' pillar.get pkg:apache
salt '*' pillar.get abc::def|ghi delimiter='|'
```

**salt.modules.pillar.file_exists** (*path*, *saltenv=None*)

New in version 2016.3.0.

This is a master-only function. Calling from the minion is not supported.

Use the given path and search relative to the pillar environments to see if a file exists at that path.

If the `saltenv` argument is given, restrict search to that environment only.

Will only work with `pillar_roots`, not external pillars.

Returns True if the file is found, and False otherwise.

- **path** The path to the file in question. Will be treated as a relative path
- **saltenv** Optional argument to restrict the search to a specific saltenv

CLI Example:

```
salt '*' pillar.file_exists foo/bar.sls
```

**salt.modules.pillar.filter_by** (*lookup_dict*, **pillar**, **merge=None**, **default=default**, **base=None**)

New in version 2017.7.0.

Look up the given pillar in a given dictionary and return the result

**Parameters**

- **lookup_dict** – A dictionary, keyed by a pillar, containing a value or values relevant to systems matching that pillar. For example, a key could be a pillar for a role and the value could the name of a package on that particular OS.

  The dictionary key can be a globbing pattern. The function will return the corresponding `lookup_dict` value where the pillar value matches the pattern. For example:

  ```
  # this will render 'got some salt' if `role` begins with 'salt'
  salt '*' pillar.filter_by '{salt*: got some salt, default:default role=salt is not here}' role
  ```

- **pillar** – The name of a pillar to match with the system’s pillar. For example, the value of the "role" pillar could be used to pull values from the `lookup_dict` dictionary.

  The pillar value can be a list. The function will return the `lookup_dict` value for a first found item in the list matching one of the `lookup_dict` keys.

- **merge** – A dictionary to merge with the results of the pillar selection from `lookup_dict`. This allows another dictionary to override the values in the `lookup_dict`.

- **default** – default `lookup_dict`'s key used if the pillar does not exist or if the pillar value has no match on `lookup_dict`. If unspecified the value is "default".

- **base** – A `lookup_dict` key to use for a base dictionary. The pillar-selected `lookup_dict` is merged over this and then finally the `merge` dictionary is merged. This allows common values for each case to be collected in the base and overridden by the pillar selection dictionary and the merge dictionary. Default is unset.

CLI Example:
New in version 0.14.

Attempt to retrieve the named value from *in-memory pillar data*. If the pillar key is not present in the in-memory pillar, then the value specified in the `default` option (described below) will be returned.

If the `merge` parameter is set to `True`, the default will be recursively merged into the returned pillar data.

The value can also represent a value in a nested dict using a `:` delimiter for the dict. This means that if a dict in pillar looks like this:

```plaintext
{ 'pkg': { 'apache': 'httpd' } }
```

To retrieve the value associated with the `apache` key in the `pkg` dict this key can be passed as:

```plaintext
pkg:apache
```

**key**  The pillar key to get value from

**default**  The value specified by this option will be returned if the desired pillar key does not exist.

If a default value is specified, then it will be an empty string, unless `pillar_raise_on_missing` is set to `True`, in which case an error will be raised.

**merge**  `[False]`  If `True`, the retrieved values will be merged into the passed default. When the default and the retrieved value are both dictionaries, the dictionaries will be recursively merged.

New in version 2014.7.0.

Changed in version 2016.3.7,2016.11.4,2017.7.0: If the default and the retrieved value are not of the same type, then merging will be skipped and the retrieved value will be returned. Earlier releases raised an error in these cases.

**merge_nested_lists**  If set to `False`, lists nested within the retrieved pillar dictionary will *overwrite* lists in `default`. If set to `True`, nested lists will be *merged* into lists in `default`. If unspecified (the default), this option is inherited from the `pillar_merge_lists` minion config option.

New in version 2016.11.6.

---

**Note:**  This option is ignored when `merge` is set to `False`.

New in version 2016.11.6.

**delimiter**  Specify an alternate delimiter to use when traversing a nested dict. This is useful for when the desired key contains a colon. See CLI example below for usage.

New in version 2014.7.0.

**pillarenv**  If specified, this function will query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment. Note that this can produce different pillar data than executing this function without an environment, as its normal behavior is just to return a value from minion’s pillar data in memory (which can be sourced from more than one pillar environment).

Using this argument will not affect the pillar data in memory. It will however be slightly slower and use more resources on the master due to the need for the master to generate and send the minion fresh pillar data. This tradeoff in performance however allows for the use case where pillar data is desired only from a single environment.

New in version 2017.7.0.

**saltenv**  Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

New in version 2017.7.0.
CLI Example:

```bash
salt '*' pillar.get pkg:apache
salt '*' pillar.get abc::def|ghi delimiter='|'
```

salt.modules.pillar.item(*args, **kwargs)
New in version 0.16.2.

Return one or more pillar entries from the in-memory pillar data.

delimiter  Delimiter used to traverse nested dictionaries.

**Note:** This is different from pillar.get in that no default value can be specified. pillar.get should probably still be used in most cases to retrieve nested pillar values, as it is a bit more flexible. One reason to use this function instead of pillar.get however is when it is desirable to retrieve the values of more than one key, since pillar.get can only retrieve one key at a time.

New in version 2015.8.0.

pillarenv  If specified, this function will query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment. Note that this can produce different pillar data than executing this function without an environment, as its normal behavior is just to return a value from minion’s pillar data in memory (which can be sourced from more than one pillar environment).

Using this argument will not affect the pillar data in memory. It will however be slightly slower and use more resources on the master due to the need for the master to generate and send the minion fresh pillar data. This tradeoff in performance however allows for the use case where pillar data is desired only from a single environment.

New in version 2017.7.6,2018.3.1.

saltenv  Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.

New in version 2017.7.6,2018.3.1.

CLI Examples:

```bash
salt '*' pillar.item foo
salt '*' pillar.item foo:bar
salt '*' pillar.item foo bar baz
```

salt.modules.pillar.items(*args, **kwargs)
Calls the master for a fresh pillar and generates the pillar data on the fly

Contrast with raw() which returns the pillar data that is currently loaded into the minion.

pillar  If specified, allows for a dictionary of pillar data to be made available to pillar and ext_pillar rendering. these pillar variables will also override any variables of the same name in pillar or ext_pillar.

New in version 2015.5.0.

pillar_enc  If specified, the data passed in the pillar argument will be passed through this renderer to decrypt it.

**Note:** This will decrypt on the minion side, so the specified renderer must be set up on the minion for this to work. Alternatively, pillar data can be decrypted master-side. For more information, see the Pillar Encryption documentation. Pillar data that is decrypted master-side, is not decrypted until the end of pillar compilation though, so minion-side decryption will be necessary if the encrypted pillar data must be made available in an decrypted state pillar/ext_pillar rendering.

New in version 2017.7.0.
pillarenv Pass a specific pillar environment from which to compile pillar data. If not specified, then the minion’s pillarenv option is not used, and if that also is not specified then all configured pillar environments will be merged into a single pillar dictionary and returned.

New in version 2016.11.2.
saltenv Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.

CLI Example:
```
salt '*' pillar.items
```

salt.modules.pillar.keys(key, delimiter=': ')
New in version 2015.8.0.

Attempt to retrieve a list of keys from the named value from the pillar.

The value can also represent a value in a nested dict using a ":" delimiter for the dict, similar to how pillar.get works.

delimiter Specify an alternate delimiter to use when traversing a nested dict

CLI Example:
```
salt '*' pillar.keys web:sites
```

salt.modules.pillar.ls("args")
New in version 2015.8.0.

Calls the master for a fresh pillar, generates the pillar data on the fly (same as items()), but only shows the available main keys.

CLI Examples:
```
salt '*' pillar.ls
```

salt.modules.pillar.obfuscate("args")
New in version 2015.8.0.

Same as items(), but replace pillar values with a simple type indication.

This is useful to avoid displaying sensitive information on console or flooding the console with long output, such as certificates. For many debug or control purposes, the stakes lie more in dispatching than in actual values.

In case the value is itself a collection type, obfuscation occurs within the value. For mapping types, keys are not obfuscated. Here are some examples:

- 'secret password' becomes '<str>'
- ['secret', 1] becomes ['<str>', '<int>']
- {'login': 'somelogin', 'pwd': 'secret'} becomes {'login': '<str>', 'pwd': '<str>'}

CLI Examples:
```
salt '*' pillar.obfuscate
```

salt.modules.pillar.raw(key=None)
Return the raw pillar data that is currently loaded into the minion.

Contrast with items() which calls the master to fetch the most up-to-date Pillar.

CLI Example:
```
salt '*' pillar.raw
```
With the optional key argument, you can select a subtree of the pillar raw data:

```
salt '*' pillar.raw key='roles'
```

## 21.9.318 salt.modules.pip

Install Python packages with pip to either the system or a virtualenv

### Windows Support

New in version 2014.7.4.

Salt now uses a portable python. As a result the entire pip module is now functional on the salt installation itself. You can pip install dependencies for your custom modules. You can even upgrade salt itself using pip. For this to work properly, you must specify the Current Working Directory (cwd) and the Pip Binary (bin_env) salt should use. The variable `pip_bin` can be either a virtualenv path or the path to the pip binary itself.

For example, the following command will list all software installed using pip to your current salt environment:

```
salt <minion> pip.list cwd='C:\salt\bin\Scripts' bin_env='C:\salt\bin\Scripts\pip.exe'
```

Specifying the `cwd` and `bin_env` options ensures you're modifying the salt environment. If these are omitted, it will default to the local installation of python. If python is not installed locally it will fail saying it couldn't find pip.

### State File Support

This functionality works in states as well. If you need to pip install colorama with a state, for example, the following will work:

```
install_colorama:
    pip.installed:
    - name: colorama
    - cwd: 'C:\salt\bin\Scripts'
    - bin_env: 'C:\salt\bin\Scripts\pip.exe'
    - upgrade: True
```

### Upgrading Salt using Pip

You can now update salt using pip to any version from the 2014.7 branch forward. Previous version require recompiling some of the dependencies which is painful in windows.

To do this you just use pip with git to update to the version you want and then restart the service. Here is a sample state file that upgrades salt to the head of the 2015.5 branch:

```
install_salt:
    pip.installed:
    - cwd: 'C:\salt\bin\Scripts'
    - bin_env: 'C:\salt\bin\Scripts\pip.exe'
    - editable: git+https://github.com/saltstack/salt@2015.5#egg=salt
    - upgrade: True

restart_service:
```

(continues on next page)
service.running:
  - name: salt-minion
  - enable: True
  - watch:
    - pip: install_salt

Note: If you’re having problems, you might try doubling the back slashes. For example, cwd: ‘C:\salt\bin\scripts’. Sometimes python thinks the single back slash is an escape character.

salt.modules.pip.freeze(bin_env=None, user=None, cwd=None, use_vt=False, env_vars=None, **kwargs)
Return a list of installed packages either globally or in the specified virtualenv
bin_env  Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. /usr/bin/pip-2.7 or /usr/bin/pip-2.6. If a directory path is specified, it is assumed to be a virtualenv.
user  The user under which to run pip
cwd  Directory from which to run pip

Note: If the version of pip available is older than 8.0.3, the list will not include the packages pip, wheel, setuptools, or distribute even if they are installed.

CLI Example:

```
salt '*' pip.freeze bin_env=/home/code/path/to/virtualenv
```

salt.modules.pip.install(pkgs=None, requirements=None, bin_env=None, use_wheel=False, no_use_wheel=False, log=None, proxy=None, timeout=None, editable=None, find_links=None, index_url=None, extra_index_url=None, no_index=False, mirrors=None, build=None, target=None, download=None, download_cache=None, source=None, upgrade=False, force_reinstall=False, ignore_installed=False, exists_action=None, no_deps=False, no_install=False, no_download=False, global_options=None, install_options=None, user=None, cwd=None, pre_releases=False, cert=None, allow_all_external=False, allow_external=None, allow_unverified=None, process_dependency_links=False, saltenv='base', env_vars=None, use_vt=False, trusted_host=None, no_cache_dir=False, cache_dir=None, no_binary=False, **kwargs)
Install packages with pip
Install packages individually or from a pip requirements file. Install packages globally or to a virtualenv.

pkgs  Comma separated list of packages to install
requirements  Path to requirements
bin_env  Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. /usr/bin/pip-2.7 or /usr/bin/pip-2.6. If a directory path is specified, it is assumed to be a virtualenv.

Note: For Windows, if the pip module is being used to upgrade the pip package, bin_env should be the path to the virtualenv or to the python binary that should be used. The pip command is unable to upgrade itself in Windows.

use_wheel  Prefer wheel archives (requires pip>=1.4)
no_use_wheel  Force to not use wheel archives (requires pip>=1.4,<10.0.0)
no_binary  Force to not use binary packages (requires pip >= 7.0.0) Accepts either :all: to disable all binary packages, :none: to empty the set, or one or more package names with commas between them
log  Log file where a complete (maximum verbosity) record will be kept
proxy  Specify a proxy in the form user:passwd@proxy.server:port. Note that the user:password@ is optional and required only if you are behind an authenticated proxy. If you provide user@proxy.server:port then you will be prompted for a password.
timeout  Set the socket timeout (default 15 seconds)
editable  install something editable (e.g. git+https://github.com/worldcompany/djangoembed.git#egg=djangoembed)
find_links  URL to search for packages
index_url  Base URL of Python Package Index
extra_index_url  Extra URLs of package indexes to use in addition to index_url
no_index  Ignore package index
mirrors  Specific mirror URL(s) to query (automatically adds --use-mirrors)

Warning:  This option has been deprecated and removed in pip version 7.0.0. Please use index_url and/or extra_index_url instead.

build  Unpack packages into build dir
target  Install packages into target dir
download  Download packages into download instead of installing them
download_cache | cache_dir  Cache downloaded packages in download_cache or cache_dir dir
source  Check out editable packages into source dir
upgrade  Upgrade all packages to the newest available version
force_reinstall  When upgrading, reinstall all packages even if they are already up-to-date.
ignore_installed  Ignore the installed packages (reinstalling instead)
exists_action  Default action when a path already exists: (s)witch, (i)gnore, (w)ipe, (b)ackup
no_deps  Ignore package dependencies
no_install  Download and unpack all packages, but don’t actually install them
no_download  Don’t download any packages, just install the ones already downloaded (completes an install run with --no-install)
install_options  Extra arguments to be supplied to the setup.py install command (e.g. like --install-option='--install-scripts=/usr/local/bin'). Use multiple --install-option options to pass multiple options to setup.py install. If you are using an option with a directory path, be sure to use absolute path.
global_options  Extra global options to be supplied to the setup.py call before the install command.
user  The user under which to run pip
cwd  Directory from which to run pip
pre_releases  Include pre-releases in the available versions
cert  Provide a path to an alternate CA bundle
allow_all_external  Allow the installation of all externally hosted files
allow_external  Allow the installation of externally hosted files (comma separated list)
allow_unverified  Allow the installation of insecure and unverifiable files (comma separated list)
process_dependency_links  Enable the processing of dependency links
env_vars  Set environment variables that some builds will depend on. For example, a Python C-module may have a Makefile that needs INCLUDE_PATH set to pick up a header file while compiling. This must be in the form of a dictionary or a mapping.

Example:
salt '*' pip.install django_app env_vars="{'CUSTOM_PATH': '/opt/django_app'}"

trusted_host  Mark this host as trusted, even though it does not have valid or any HTTPS.
use_vt  Use VT terminal emulation (see output while installing)
no_cache_dir  Disable the cache.

CLI Example:

```
salt '*' pip.install <package name>,<package2 name>
salt '*' pip.install requirements=/path/to/requirements.txt
salt '*' pip.install <package name> bin_env=/path/to/virtualenv
salt '*' pip.install <package name> bin_env=/path/to/pip_bin
```

Complicated CLI example:

```
salt '*' pip.install markdown,django editable=git+https://github.com/worldcompany/djangoembed.git#egg=djangoembed upgrade=True no_deps=True
```

salt.modules.pip.is_installed(pkgname=None, bin_env=None, user=None, cwd=None)

New in version 2018.3.0.

Filter list of installed apps from `freeze` and return True or False if `pkgname` exists in the list of packages installed.

**Note:** If the version of pip available is older than 8.0.3, the packages `wheel`, `setuptools`, and `distribute` will not be reported by this function even if they are installed. Unlike `pip.freeze`, this function always reports the version of pip which is installed.

CLI Example:

```
salt '*' pip.is_installed salt
```

salt.modules.pip.list(prefix=None, bin_env=None, user=None, cwd=None, env_vars=None, **kwargs)

Filter list of installed apps from `freeze` and check to see if `prefix` exists in the list of packages installed.

**Note:** If the version of pip available is older than 8.0.3, the packages `wheel`, `setuptools`, and `distribute` will not be reported by this function even if they are installed. Unlike `pip.freeze`, this function always reports the version of pip which is installed.

CLI Example:

```
salt '*' pip.list salt
```

salt.modules.pip.list_all_versions(pkg, bin_env=None, include_alpha=False, include_beta=False, include_rc=False, user=None, cwd=None, index_url=None, extra_index_url=None)

New in version 2017.7.3.

List all available versions of a pip package

pkg  The package to check
bin_env  Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. `/usr/bin/pip-2.7` or `/usr/bin/pip-2.6`). If a directory path is specified, it is assumed to be a virtualenv.
include_alpha  Include alpha versions in the list
include_beta  Include beta versions in the list
include_rc  Include release candidates versions in the list
user  The user under which to run pip
cwd  Directory from which to run pip
index_url  Base URL of Python Package Index

. versionadded:: 2019.2.0
**extra_index_url** Additional URL of Python Package Index .. versionadded:: 2019.2.0

CLI Example:

```
salt '*' pip.list_all_versions <package name>
```

salt.modules.pip.

**list_upgrades**(*bin_env=None, user=None, cwd=None*)

Check whether or not an upgrade is available for all packages

CLI Example:

```
salt '*' pip.list_upgrades
```

salt.modules.pip.

**uninstall**(*pkgs=None, requirements=None, bin_env=None, log=None, proxy=None, timeout=None, user=None, cwd=None, saltenv='base', use_vt=False*)

Uninstall packages individually or from a pip requirements file

**pkgs** comma separated list of packages to install

**requirements** Path to requirements file

**bin_env** Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. /usr/bin/pip-2.7 or /usr/bin/pip-2.6. If a directory path is specified, it is assumed to be a virtualenv.

**log** Log file where a complete (maximum verbosity) record will be kept

**proxy** Specify a proxy in the format user:password@proxy.server:port. Note that the user:password@ is optional and required only if you are behind an authenticated proxy. If you provide user@proxy.server:port then you will be prompted for a password.

**timeout** Set the socket timeout (default 15 seconds)

**user** The user under which to run pip

**cwd** Directory from which to run pip

**use_vt** Use VT terminal emulation (see output while installing)

CLI Example:

```
salt '*' pip.uninstall <package name>,<package2 name>
salt '*' pip.uninstall requirements=/path/to/requirements.txt
salt '*' pip.uninstall <package name> bin_env=/path/to/virtualenv
salt '*' pip.uninstall <package name> bin_env=/path/to/pip_bin
```

salt.modules.pip.

**upgrade**(*bin_env=None, user=None, cwd=None, use_vt=False*)

New in version 2015.5.0.

Upgrades outdated pip packages.

**Note:** On Windows you can’t update salt from pip using salt, so salt will be skipped

Returns a dict containing the changes.

```
{<package>: {‘old’: <old-version>, ‘new’: <new-version>}}
```

CLI Example:

```
salt '*' pip.upgrade
```

salt.modules.pip.

**upgrade_available**(*pkg, bin_env=None, user=None, cwd=None*)

New in version 2015.5.0.

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pip.upgrade_available <package name>
```
salt.modules.pip.version(*bin_env=*

New in version 0.17.0.

Returns the version of pip. Use bin_env to specify the path to a virtualenv and get the version of pip in that virtualenv.

If unable to detect the pip version, returns None.

CLI Example:

```python
salt '*' pip.version
```

### 21.9.319 salt.modules.pkg_resource

Resources needed by pkg providers

salt.modules.pkg_resource.add_pkg(pkgs, name, pkgver)

Add a package to a dict of installed packages.

CLI Example:

```python
salt '*' pkg_resource.add_pkg 'foo' bind 9
```

salt.modules.pkg_resource.check_extra_requirements(pkgn, pkgver)

Check if the installed package already has the given requirements. This function will return the result of pkg.check_extra_requirements if this function exists for the minion, otherwise it will return True.

CLI Example:

```python
salt '*' pkg_resource.check_extra_requirements <pkgn> <extra_requirements>
```

salt.modules.pkg_resource.format_pkg_list(packages, versions_as_list, attr)

Formats packages according to parameters for list_pkgs.

salt.modules.pkg_resource.format_version(epoch, version, release)

Formats a version string for list_pkgs.

salt.modules.pkg_resource.pack_sources(sources, normalize=True)

Accepts list of dicts (or a string representing a list of dicts) and packs the key/value pairs into a single dict.

```
'foo': "salt://foo.rpm"], "bar": "salt://bar.rpm"
```

```
'foo': "salt://foo.rpm"], "bar": "salt://bar.rpm"
```

normalize [True] Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2015.8.0.

CLI Example:

```python
salt '*' pkg_resource.pack_sources 'foo': "salt://foo.rpm"], "bar": "salt://bar.rpm"
```

salt.modules.pkg_resource.parse_targets(name=None, pkgs=None, sources=None, saltenv='base', normalize=True, **kwargs)

Parses the input to pkg.install and returns back the package(s) to be installed. Returns a list of packages, as well as a string noting whether the packages are to come from a repository or a binary package.

CLI Example:
Salt Documentation, Release 2019.2.0

salt '*' pkg_resource.parse_targets

salt.modules.pkg_resource.sort_pkglist(pkgs)
Accepts a dict obtained from pkg.list_pkgs() and sorts in place the list of versions for any packages that have
multiple versions installed, so that two package lists can be compared to one another.
CLI Example:
salt '*' pkg_resource.sort_pkglist '["3.45", "2.13"]'

salt.modules.pkg_resource.stringify(pkgs)
Takes a dict of package name/version information and joins each list of installed versions into a string.
CLI Example:
salt '*' pkg_resource.stringify 'vim: 7.127'

salt.modules.pkg_resource.version(*names, **kwargs)
Common interface for obtaining the version of installed packages.
CLI Example:
salt '*' pkg_resource.version vim
salt '*' pkg_resource.version foo bar baz
salt '*' pkg_resource.version 'python*'

salt.modules.pkg_resource.version_clean(verstr)
Clean the version string removing extra data. This function will simply try to call pkg.version_clean.
CLI Example:
salt '*' pkg_resource.version_clean <version_string>

21.9.320 salt.modules.pkgin
Package support for pkgin based systems, inspired from freebsdpkg module
Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a
different module (or gives an error similar to ’pkg.install’ is not available), see here.
salt.modules.pkgin.available_version(*names, **kwargs)
This function is an alias of latest_version.
Return the latest version of the named package available for upgrade or installation.
If the latest version of a given package is already installed, an empty string will be returned for
that package.
CLI Example:
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> ...

salt.modules.pkgin.file_dict(*packages)
List the files that belong to a package.
CLI Examples:

21.9. execution modules

2299


salt '*/' pkg.file_dict nginx
salt '*/' pkg.file_dict nginx varnish

salt.modules.pkgin.file_list(package)
List the files that belong to a package.

CLI Examples:
salt '*/' pkg.file_list nginx

salt.modules.pkgin.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs)
Install the passed package
- name The name of the package to be installed.
- refresh Whether or not to refresh the package database before installing.
- fromrepo Specify a package repository to install from.

Multiple Package Installation Options:
- pkgs A list of packages to install from a software repository. Must be passed as a python list.
  CLI Example:
salt '*/' pkg.install pkgs=['"foo","bar"]
- sources A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.
  CLI Example:
salt '*/' pkg.install sources=[{"foo": "salt://foo.deb"},{"bar": "salt://bar.deb"}]

Return a dict containing the new package names and versions:

{"<package>": {"old": '<old-version>',
  "new": '<new-version>'}}

CLI Example:
salt '*/' pkg.install <package name>

salt.modules.pkgin.latest_version(*names, **kwargs)
Return the latest version of the named package available for upgrade or installation.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:
salt '*/' pkg.latest_version <package name>
salt '*/' pkg.latest_version <package1> <package2> ...

salt.modules.pkgin.list_pkgs(versions_as_list=False, **kwargs)
List the packages currently installed as a dict:

{"<package_name>": '<version>'}

CLI Example:
salt '*/' pkg.list_pkgs
salt.modules.pkgin.list_upgrades(refresh=True, **kwargs)
List all available package upgrades.

    New in version 2018.3.0.
    refresh Whether or not to refresh the package database before installing.

    CLI Example:
    
    salt '*' pkg.list_upgrades

salt.modules.pkgin.purge(name=None, pkgs=None, **kwargs)
Package purges are not supported, this function is identical to remove().
name The name of the package to be deleted.
Multiple Package Options:
pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

    New in version 0.16.0.

    Returns a dict containing the changes.

    CLI Example:
    
    salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs=['"foo", "bar"]'

salt.modules.pkgin.refresh_db(force=False)
Use pkg update to get latest pkg_summary
force Pass -f so that the cache is always refreshed.

    New in version 2018.3.0.

    CLI Example:
    
    salt '*' pkg.refresh_db

salt.modules.pkgin.remove(name=None, pkgs=None, **kwargs)
name The name of the package to be deleted.
Multiple Package Options:
pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

    New in version 0.16.0.

    Returns a list containing the removed packages.

    CLI Example:
    
    salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs=['"foo", "bar"]'

salt.modules.pkgin.search(pkg_name)
Searches for an exact match using pkgin ^package$

    CLI Example:
    
    salt '*' pkg.search 'mysql-server'

salt.modules.pkgin.upgrade(refresh=True, pkgs=None, **kwargs)
Run pkg upgrade, if pkgin used. Otherwise do nothing
refresh Whether or not to refresh the package database before installing.

21.9. execution modules
Multiple Package Upgrade Options:

**pkgs** A list of packages to upgrade from a software repository. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.upgrade pkgs='["foo","bar"]'
```

Returns a dictionary containing the changes:

```
{
    '<package>': {
        'old': '<old-version>',
        'new': '<new-version>'
    }
}
```

CLI Example:

```
salt '*' pkg.upgrade
```

**salt.modules.pkgin.version('names', **kwargs)**

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

## 21.9.321 salt.modules.pkgng

Support for pkgng, the new package manager for FreeBSD

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see here.

**Warning:** This module has been completely rewritten. Up to and including version 0.17.x, it was available as the pkgng module, (pkgng.install, pkgng.delete, etc.), but moving forward this module will no longer be available as pkgng, as it will behave like a normal Salt pkg provider. The documentation below should not be considered to apply to this module in versions <= 0.17.x. If your minion is running a 0.17.x release or older, then the documentation for this module can be viewed using the sys.doc function:

```
salt bsdminion sys.doc pkgng
```

This module provides an interface to pkg(8). It acts as the default package provider for FreeBSD 10 and newer. For FreeBSD hosts which have been upgraded to use pkgng, you will need to override the pkg provider by setting the *providers* parameter in your Minion config file, in order to use this module to manage packages, like so:

**providers:**

```
    pkg: pkgng
```

**salt.modules.pkgng.audit(jail=None, chroot=None, root=None)**

Audits installed packages against known vulnerabilities

CLI Example:

```
salt '*' pkg.audit
```
**jail**  Audit packages within the specified jail

CLI Example:
```
salt '*' pkg.audit jail=<jail name or id>
```

**chroot**  Audit packages within the specified chroot (ignored if jail is specified)

**root**  Audit packages within the specified root (ignored if jail is specified)

CLI Example:
```
salt '*' pkg.audit chroot=/path/to/chroot
```

---

**salt.modules.pkgng.autoremove**(jail=None, chroot=None, root=None, dryrun=False)
Delete packages which were automatically installed as dependencies and are not required anymore.

**dryrun**  Dry-run mode. The list of changes to packages is always printed, but no changes are actually made.

CLI Example:
```
salt '*' pkg.autoremove
salt '*' pkg.autoremove jail=<jail name or id>
salt '*' pkg.autoremove dryrun=True
salt '*' pkg.autoremove jail=<jail name or id> dryrun=True
```

---

**salt.modules.pkgng.backup**(file_name, jail=None, chroot=None, root=None)
Export installed packages into yaml+mtree file

CLI Example:
```
salt '*' pkg.backup /tmp/pkg
```

**jail**  Backup packages from the specified jail. Note that this will run the command within the jail, and so the path to the backup file will be relative to the root of the jail

CLI Example:
```
salt '*' pkg.backup /tmp/pkg jail=<jail name or id>
```

**chroot**  Backup packages from the specified chroot (ignored if jail is specified). Note that this will run the command within the chroot, and so the path to the backup file will be relative to the root of the chroot.

**root**  Backup packages from the specified root (ignored if jail is specified). Note that this will run the command within the root, and so the path to the backup file will be relative to the root of the root.

CLI Example:
```
salt '*' pkg.backup /tmp/pkg chroot=/path/to/chroot
```

---

**salt.modules.pkgng.check**(jail=None, chroot=None, root=None, depends=False, recompute=False, checksum=False)
Sanity checks installed packages

**jail**  Perform the sanity check in the specified jail

CLI Example:
```
salt '*' pkg.check jail=<jail name or id>
```

**chroot**  Perform the sanity check in the specified chroot (ignored if jail is specified)

**root**  Perform the sanity check in the specified root (ignored if jail is specified)

CLI Example:
Of the below, at least one must be set to True.

**depends** Check for and install missing dependencies.

CLI Example:
```
salt '*' pkg.check recompute=True
```

**recompute** Recompute sizes and checksums of installed packages.

CLI Example:
```
salt '*' pkg.check depends=True
```

**checksum** Find invalid checksums for installed packages.

CLI Example:
```
salt '*' pkg.check checksum=True
```

---

**salt.modules.pkgng.clean**

(Cmd) **clean**(jail=None, chroot=None, root=None, clean_all=False, dryrun=False)

Cleans the local cache of fetched remote packages

CLI Example:
```
salt '*' pkg.clean
```

**jail** Cleans the package cache in the specified jail

CLI Example:
```
salt '*' pkg.clean jail=<jail name or id>
```

**chroot** Cleans the package cache in the specified chroot (ignored if jail is specified)

**root** Cleans the package cache in the specified root (ignored if jail is specified)

CLI Example:
```
salt '*' pkg.clean chroot=/path/to/chroot
```

**clean_all** Clean all packages from the local cache (not just those that have been superseded by newer versions).

CLI Example:
```
salt '*' pkg.clean clean_all=True
```

**dryrun** Dry-run mode. This list of changes to the local cache is always printed, but no changes are actually made.

CLI Example:
```
salt '*' pkg.clean dryrun=True
```

---

**salt.modules.pkgng.fetch**

(name, jail=None, chroot=None, root=None, fetch_all=False, quiet=False, fromrepo=None, glob=True, regex=False, pcre=False, local=False, depends=False)

Fetches remote packages

CLI Example:
salt 'salt '*' pkg.fetch <package name>

jail Fetch package in the specified jail

CLI Example:

```
salt '*' pkg.fetch <package name> jail=<jail name or id>
```

chroot Fetch package in the specified chroot (ignored if jail is specified)

root Fetch package in the specified root (ignored if jail is specified)

CLI Example:

```
salt '*' pkg.fetch <package name> chroot=/path/to/chroot
```

fetch_all Fetch all packages.

CLI Example:

```
salt '*' pkg.fetch <package name> fetch_all=True
```

quiet Quiet mode. Show less output.

CLI Example:

```
salt '*' pkg.fetch <package name> quiet=True
```

fromrepo Fetches packages from the given repo if multiple repo support is enabled. See pkg.conf(5).

CLI Example:

```
salt '*' pkg.fetch <package name> fromrepo=repo
```

glob Treat pkg_name as a shell glob pattern.

CLI Example:

```
salt '*' pkg.fetch <package name> glob=True
```

regex Treat pkg_name as a regular expression.

CLI Example:

```
salt '*' pkg.fetch <regular expression> regex=True
```

pcre Treat pkg_name is an extended regular expression.

CLI Example:

```
salt '*' pkg.fetch <extended regular expression> pcre=True
```

local Skip updating the repository catalogs with pkg-update(8). Use the local cache only.

CLI Example:

```
salt '*' pkg.fetch <package name> local=True
```

depends Fetch the package and its dependencies as well.

CLI Example:

```
salt '*' pkg.fetch <package name> depends=True
```

salt.modules.pkgng.hold(name=None, pkgs=None, **kwargs)

Version-lock packages
Note: This function is provided primarily for compatibility with some parts of states.pkg. Consider using pkg.lock instead.

name The name of the package to be held.

Multiple Package Options:

pkgs A list of packages to hold. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.hold <package name>
salt '*' pkg.hold pkgs='["foo", "bar"]'
```

salt.modules.pkgng.install(name=None, fromrepo=None, pkgs=None, sources=None, jail=None, chroot=None, root=None, orphan=False, force=False, glob=False, local=False, dryrun=False, quiet=False, reinstall_requires=False, regex=False, pcre=False, batch=False, **kwargs)

Install package(s) from a repository

name The name of the package to install

CLI Example:

```
salt '*' pkg.install <package name>
```

jail Install the package into the specified jail

chroot Install the package into the specified chroot (ignored if jail is specified)

root Install the package into the specified root (ignored if jail is specified)

orphan Mark the installed package as orphan. Will be automatically removed if no other packages depend on them. For more information please refer to pkg-autoremove(8).

CLI Example:

```
salt '*' pkg.install <package name> orphan=True
```

force Force the reinstallation of the package if already installed.

CLI Example:

```
salt '*' pkg.install <package name> force=True
```

glob Treat the package names as shell glob patterns.

CLI Example:

```
salt '*' pkg.install <package name> glob=True
```

local Do not update the repository catalogs with pkg-update(8). A value of True here is equivalent to using the -U flag with pkg install.

CLI Example:

```
salt '*' pkg.install <package name> local=True
```

dryrun Dry-run mode. The list of changes to packages is always printed, but no changes are actually made.

CLI Example:

```
salt '*' pkg.install <package name> dryrun=True
```
quiet  Force quiet output, except when dryrun is used, where pkg install will always show packages to be installed, upgraded or deleted.

    CLI Example:
    
    salt '*' pkg.install <package name> quiet=True

reinstall_requires  When used with force, reinstalls any packages that require the given package.

    CLI Example:
    
    salt '*' pkg.install <package name> reinstallRequires=True force=True

    Changed in version 2014.7.0: require kwarg renamed to reinstall_requires

fromrepo  In multi-repo mode, override the pkg.conf ordering and only attempt to download packages from the named repository.

    CLI Example:
    
    salt '*' pkg.install <package name> fromrepo=repo

regex  Treat the package names as a regular expression

    CLI Example:
    
    salt '*' pkg.install <regular expression> regex=True

pcre  Treat the package names as extended regular expressions.

    CLI Example:
    
    salt.modules.pkgng.latest_version(*names, **kwargs)

    Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

    If the latest version of a given package is already installed, an empty string will be returned for that package.

    CLI Example:
    
    salt '*' pkg.latest_version <package name>
    salt '*' pkg.latest_version <package name> jail=<jail name or id>
    salt '*' pkg.latest_version <package name> chroot=/path/to/chroot

salt.modules.pkgng.list_locked(**kwargs)

    Query the package database those packages which are locked against reinstallation, modification or deletion.

    Returns returns a list of package names with version strings

    CLI Example:
    
    salt '*' pkg.list_locked

    jail  List locked packages within the specified jail

    CLI Example:
jail List locked packages within the specified jail (ignored if jail is specified)

CLI Example:
```
salt '*' pkg.list_locked jail=<jail name or id>
```

chroot List locked packages within the specified chroot (ignored if jail is specified)

CLI Example:
```
salt '*' pkg.list_locked chroot=/path/to/chroot
```

root List locked packages within the specified root (ignored if jail is specified)

CLI Example:
```
salt '*' pkg.list_locked root=/path/to/chroot
```

salt.modules.pkgng.list_pkgs(versions_as_list=False, jail=None, chroot=None, root=None, with_origin=False, **kwargs)
List the packages currently installed as a dict:
```
{"<package_name>' : '<version>'}
```

jail List the packages in the specified jail
chroot List the packages in the specified chroot (ignored if jail is specified)
root List the packages in the specified root (ignored if jail is specified)
with_origin [False] Return a nested dictionary containing both the origin name and version for each installed package.

New in version 2014.1.0.

CLI Example:
```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs jail=<jail name or id>
salt '*' pkg.list_pkgs chroot=/path/to/chroot
```

salt.modules.pkgng.list_upgrades(refresh=True, **kwargs)
List those packages for which an upgrade is available

The fromrepo argument is also supported, as used in pkg states.

CLI Example:
```
salt '*' pkg.list_upgrades
```

jail List upgrades within the specified jail

CLI Example:
```
salt '*' pkg.list_upgrades jail=<jail name or id>
```

chroot List upgrades within the specified chroot (ignored if jail is specified)

CLI Example:
```
salt '*' pkg.list_upgrades chroot=/path/to/chroot
```

root List upgrades within the specified root (ignored if jail is specified)

CLI Example:
```
salt '*' pkg.list_upgrades root=/path/to/chroot
```

salt.modules.pkgng.lock(name, **kwargs)
Lock the named package against reinstallation, modification or deletion.
Returns True if the named package was successfully locked.

CLI Example:

```plaintext
salt '*' pkg.lock <package name>
```

**jail**  Lock packages within the specified jail

CLI Example:

```plaintext
salt '*' pkg.lock <package name> jail=<jail name or id>
```

**chroot**  Lock packages within the specified chroot (ignored if jail is specified)

CLI Example:

```plaintext
salt '*' pkg.lock <package name> chroot=/path/to/chroot
```

**root**  Lock packages within the specified root (ignored if jail is specified)

CLI Example:

```plaintext
salt '*' pkg.lock <package name> root=/path/to/chroot
```

**salt.modules.pkgng.locked**(name, **kwargs)
Query the package database to determine if the named package is locked against reinstallation, modification or deletion.

Returns True if the named package is locked, False otherwise.

CLI Example:

```plaintext
salt '*' pkg.locked <package name>
```

**jail**  Test if a package is locked within the specified jail

CLI Example:

```plaintext
salt '*' pkg.locked <package name> jail=<jail name or id>
```

**chroot**  Test if a package is locked within the specified chroot (ignored if jail is specified)

CLI Example:

```plaintext
salt '*' pkg.locked <package name> chroot=/path/to/chroot
```

**root**  Test if a package is locked within the specified root (ignored if jail is specified)

CLI Example:

```plaintext
salt '*' pkg.locked <package name> root=/path/to/chroot
```

**salt.modules.pkgng.parse_config**(file_name='/usr/local/etc/pkg.conf')  
Return dict of uncommented global variables.

CLI Example:

```plaintext
salt '*' pkg.parse_config
```

**NOTE:** not working properly right now

**salt.modules.pkgng.refresh_db**(jail=None, chroot=None, root=None, force=False)  
Refresh PACKAGESITE contents
Salt Documentation, Release 2019.2.0

Note: This function can be accessed using \texttt{pkg.update} in addition to \texttt{pkg.refresh_db}, to more closely match the CLI usage of \texttt{pkg(8)}.

CLI Example:

\begin{verbatim}
salt '*' pkg.refresh_db
\end{verbatim}

\texttt{jail} Refresh the pkg database within the specified jail
\texttt{chroot} Refresh the pkg database within the specified chroot (ignored if \texttt{jail} is specified)
\texttt{root} Refresh the pkg database within the specified root (ignored if \texttt{jail} is specified)
\texttt{force} Force a full download of the repository catalog without regard to the respective ages of the local and remote copies of the catalog.

CLI Example:

\begin{verbatim}
salt '/*' pkg.refresh_db force=True
\end{verbatim}

\texttt{salt.modules.pkgng.remove} \texttt{(name=None, pkgs=None, jail=None, chroot=None, root=None, all_installed=False, force=False, glob=False, dryrun=False, recurse=False, regex=False, pcre=False, **kwargs)}

Remove a package from the database and system

Note: This function can be accessed using \texttt{pkg.delete} in addition to \texttt{pkg.remove}, to more closely match the CLI usage of \texttt{pkg(8)}.

\texttt{name} The package to remove

CLI Example:

\begin{verbatim}
salt '*' pkg.remove <package name>
\end{verbatim}

\texttt{jail} Delete the package from the specified jail
\texttt{chroot} Delete the package from the specified chroot (ignored if \texttt{jail} is specified)
\texttt{root} Delete the package from the specified root (ignored if \texttt{jail} is specified)
\texttt{all_installed} Deletes all installed packages from the system and empties the database. USE WITH CAUTION!

CLI Example:

\begin{verbatim}
salt '*' pkg.remove all all_installed=True force=True
\end{verbatim}

\texttt{force} Forces packages to be removed despite leaving unresolved dependencies.

CLI Example:

\begin{verbatim}
salt '*' pkg.remove <package name> force=True
\end{verbatim}

\texttt{glob} Treat the package names as shell glob patterns.

CLI Example:

\begin{verbatim}
salt '*' pkg.remove <package name> glob=True
\end{verbatim}

\texttt{dryrun} Dry run mode. The list of packages to delete is always printed, but no packages are actually deleted.

CLI Example:

\begin{verbatim}
salt '*' pkg.remove <package name> dryrun=True
\end{verbatim}
**recurse** Delete all packages that require the listed package as well.

CLI Example:

```
salt '*' pkg.remove <package name> recurse=True
```

**regex** Treat the package names as regular expressions.

CLI Example:

```
salt '*' pkg.remove <regular expression> regex=True
```

**pcre** Treat the package names as extended regular expressions.

CLI Example:

```
salt '*' pkg.remove <extended regular expression> pcre=True
```

salt.modules.pkgng.restore

```
(file_name, jail=None, chroot=None, root=None)
```

Reads archive created by pkg backup -d and recreates the database.

CLI Example:

```
salt '*' pkg.restore /tmp/pkg
```

**jail** Restore database to the specified jail. Note that this will run the command within the jail, and so the path to the file from which the pkg database will be restored is relative to the root of the jail.

CLI Example:

```
salt '*' pkg.restore /tmp/pkg jail=<jail name or id>
```

**chroot** Restore database to the specified chroot (ignored if jail is specified). Note that this will run the command within the chroot, and so the path to the file from which the pkg database will be restored is relative to the root of the chroot.

**root** Restore database to the specified root (ignored if jail is specified). Note that this will run the command within the root, and so the path to the file from which the pkg database will be restored is relative to the root of the root.

CLI Example:

```
salt '*' pkg.restore /tmp/pkg chroot=/path/to/chroot
```

salt.modules.pkgng.search

```
(name, jail=None, chroot=None, root=None, exact=False, glob=False, regex=False, pcre=False, comment=False, desc=False, full=False, depends=False, size=False, quiet=False, origin=False, prefix=False)
```

Searches in remote package repositories

CLI Example:

```
salt '*' pkg.search pattern
```

**jail** Perform the search using the pkg.conf(5) from the specified jail.

CLI Example:

```
salt '*' pkg.search pattern jail=<jail name or id>
```

**chroot** Perform the search using the pkg.conf(5) from the specified chroot (ignored if jail is specified).

**root** Perform the search using the pkg.conf(5) from the specified root (ignored if jail is specified).

CLI Example:
```
salt '*' pkg.search pattern chroot=/path/to/chroot
```

**exact**  Treat pattern as exact pattern.

CLI Example:
```
salt '*' pkg.search pattern exact=True
```

**glob**  Treat pattern as a shell glob pattern.

CLI Example:
```
salt '*' pkg.search pattern glob=True
```

**regex**  Treat pattern as a regular expression.

CLI Example:
```
salt '*' pkg.search pattern regex=True
```

**pcre**  Treat pattern as an extended regular expression.

CLI Example:
```
salt '*' pkg.search pattern pcre=True
```

**comment**  Search for pattern in the package comment one-line description.

CLI Example:
```
salt '*' pkg.search pattern comment=True
```

**desc**  Search for pattern in the package description.

CLI Example:
```
salt '*' pkg.search pattern desc=True
```

**full**  Displays full information about the matching packages.

CLI Example:
```
salt '*' pkg.search pattern full=True
```

**depends**  Displays the dependencies of pattern.

CLI Example:
```
salt '*' pkg.search pattern depends=True
```

**size**  Displays the size of the package

CLI Example:
```
salt '*' pkg.search pattern size=True
```

**quiet**  Be quiet. Prints only the requested information without displaying many hints.

CLI Example:
```
salt '*' pkg.search pattern quiet=True
```

**origin**  Displays pattern origin.

CLI Example:
prefix Displays the installation prefix for each package matching pattern.

CLI Example:
```
salt '*' pkg.search pattern prefix=True
```

salt.modules.pkgng.stats(local=False, remote=False, jail=None, chroot=None, root=None)  
Return pkgng stats.

CLI Example:
```
salt '*' pkg.stats
```

local Display stats only for the local package database.

CLI Example:
```
salt '*' pkg.stats local=True
```

remote Display stats only for the remote package database(s).

CLI Example:
```
salt '*' pkg.stats remote=True
```

jail Retrieve stats from the specified jail.

CLI Example:
```
salt '*' pkg.stats jail=<jail name or id>
```
```
salt '*' pkg.stats jail=<jail name or id> local=True
```
```
salt '*' pkg.stats jail=<jail name or id> remote=True
```

chroot Retrieve stats from the specified chroot (ignored if jail is specified).
root Retrieve stats from the specified root (ignored if jail is specified).

CLI Example:
```
salt '*' pkg.stats chroot=/path/to/chroot
```
```
salt '*' pkg.stats chroot=/path/to/chroot local=True
```
```
salt '*' pkg.stats chroot=/path/to/chroot remote=True
```

salt.modules.pkgng.unhold(name=None, pkgs=None, **kwargs)  
Remove version locks

Note: This function is provided primarily for compatibility with some parts of states.pkg. Consider using pkg.unlock instead.

name The name of the package to be unheld

Multiple Package Options:
pkgs A list of packages to unheld. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:
```
salt '*' pkg.unhold <package name>
salt '*' pkg.unhold pkgs=['"foo", "bar"]
```
salt.modules.pkgng.unlock(name, **kwargs)
Unlock the named package against reinstallation, modification or deletion.
Returns True if the named package was successfully unlocked.

CLI Example:
```
salt '*' pkg.unlock <package name>
```

**jail** Unlock packages within the specified jail

CLI Example:
```
salt '*' pkg.unlock <package name> jail=<jail name or id>
```

**chroot** Unlock packages within the specified chroot (ignored if jail is specified)

CLI Example:
```
salt '*' pkg.unlock <package name> chroot=/path/to/chroot
```

**root** Unlock packages within the specified root (ignored if jail is specified)

CLI Example:
```
salt '*' pkg.unlock <package name> root=/path/to/chroot
```

salt.modules.pkgng.update_package_site(new_url)
Updates remote package repo URL, PACKAGESITE var to be exact.
Must use http://, ftp://, or https:// protocol

CLI Example:
```
salt '*' pkg.update_package_site http://127.0.0.1/
```

salt.modules.pkgng.updating(name, jail=None, chroot=None, root=None, filedate=None, filename=None)
 Displays UPDATING entries of software packages

CLI Example:
```
salt '*' pkg.updating foo
```

**jail** Perform the action in the specified jail

CLI Example:
```
salt '*' pkg.updating foo jail=<jail name or id>
```

**chroot** Perform the action in the specified chroot (ignored if jail is specified)

**root** Perform the action in the specified root (ignored if jail is specified)

CLI Example:
```
salt '*' pkg.updating foo chroot=/path/to/chroot
```

**filedate** Only entries newer than date are shown. Use a YYYYMMDD date format.

CLI Example:
```
salt '*' pkg.updating foo filedate=20130101
```
filename: Defines an alternative location of the UPDATING file.

CLI Example:
salt '*' pkg.updating foo filename=/tmp/UPDATING

salt.modules.pkgng.upgrade(*names, **kwargs)
Upgrade named or all packages (run a pkg upgrade). If <package name> is omitted, the operation is executed on all packages.

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:
salt '*' pkg.upgrade <package name>

jail: Audit packages within the specified jail

CLI Example:
salt '*' pkg.upgrade <package name> jail=<jail name or id>

chroot: Audit packages within the specified chroot (ignored if jail is specified)

root: Audit packages within the specified root (ignored if jail is specified)

CLI Example:
salt '*' pkg.upgrade <package name> chroot=/path/to/chroot

Any of the below options can also be used with jail or chroot.

force: Force reinstalling/upgrading the whole set of packages.

CLI Example:
salt '*' pkg.upgrade <package name> force=True

local: Do not update the repository catalogs with pkg-update(8). A value of True here is equivalent to using the -U flag with pkg upgrade.

CLI Example:
salt '*' pkg.upgrade <package name> local=True

dryrun: Dry-run mode: show what packages have updates available, but do not perform any upgrades. Repository catalogs will be updated as usual unless the local option is also given.

CLI Example:
salt '*' pkg.upgrade <package name> dryrun=True

salt.modules.pkgng.version(*names, **kwargs)
Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

Note: This function can accessed using pkg.info in addition to pkg.version, to more closely match the CLI usage of pkg(8).
**jail**  Get package version information for the specified jail

**chroot**  Get package version information for the specified chroot (ignored if jail is specified)

**root**  Get package version information for the specified root (ignored if jail is specified)

**with_origin**  [False] Return a nested dictionary containing both the origin name and version for each specified package.

New in version 2014.1.0.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package name> jail=<jail name or id>
salt '*' pkg.version <package1> <package2> <package3> ...
```

salt.modules.pkgng.version_cmp(pkg1, pkg2, ignore_epoch=False)

Do a cmp-style comparison on two packages. Return -1 if pkg1 < pkg2, 0 if pkg1 == pkg2, and 1 if pkg1 > pkg2. Return None if there was a problem making the comparison.

CLI Example:

```
salt '*' pkg.version_cmp '2.1.11' '2.1.12'
```

salt.modules.pkgng.which(path, jail=None, chroot=None, root=None, origin=False, quiet=False)

Displays which package installed a specific file

CLI Example:

```
salt '*' pkg.which <file name>
```

**jail**  Perform the check in the specified jail

CLI Example:

```
salt '*' pkg.which <file name> jail=<jail name or id>
```

**chroot**  Perform the check in the specified chroot (ignored if jail is specified)

**root**  Perform the check in the specified root (ignored if jail is specified)

CLI Example:

```
salt '*' pkg.which <file name> chroot=/path/to/chroot
```

**origin**  Shows the origin of the package instead of name-version.

CLI Example:

```
salt '*' pkg.which <file name> origin=True
```

**quiet**  Quiet output.

CLI Example:

```
salt '*' pkg.which <file name> quiet=True
```

### 21.9.322 salt.modules.pkgutil

Pkgutil support for Solaris
Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see here.

salt.modules.pkgutil.install(name=None, refresh=False, version=None, pkgs=None, **kwargs)
Install packages using the pkgutil tool.

CLI Example:
```
salt '*' pkg.install <package_name>
salt '*' pkg.install SMClgcc346
```

Multiple Package Installation Options:

pkgs A list of packages to install from OpenCSW. Must be passed as a python list.

CLI Example:
```
salt '*' pkg.install pkgs='["foo", "bar"]'
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3"}]'
```

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
              'new': '<new-version>'}}
```

salt.modules.pkgutil.latest_version(names, **kwargs)
Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:
```
salt '*' pkgutil.latest_version CSWpython
salt '*' pkgutil.latest_version <package1> <package2> <package3> ...
```

salt.modules.pkgutil.list_pkgs(versions_as_list=False, **kwargs)
List the packages currently installed as a dict:

```
['<package_name>': '<version>']
```

CLI Example:
```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

salt.modules.pkgutil.list_upgrades(refresh=True, **kwargs)
List all available package upgrades on this system

CLI Example:
```
salt '*' pkgutil.list_upgrades
```

salt.modules.pkgutil.purge(name=None, pkgs=None, **kwargs)
Package purges are not supported, this function is identical to remove().

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.
New in version 0.16.0.
Returns a dict containing the changes.

CLI Example:

```bash
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

salt.modules.pkgutil.refresh_db()
Updates the pkgutil repo database (pkgutil -U)

CLI Example:

```bash
salt '*' pkgutil.refresh_db
```

salt.modules.pkgutil.remove(name=None, pkgs=None, **kwargs)
Remove a package and all its dependencies which are not in use by other packages.

name  The name of the package to be deleted.

Multiple Package Options:

pkgs  A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.
Returns a dict containing the changes.

CLI Example:

```bash
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

salt.modules.pkgutil.upgrade(refresh=True)
Upgrade all of the packages to the latest available version.

Returns a dict containing the changes:

```
{"<package>": {"old": '<old-version>',
                "new": '<new-version>'}}
```

CLI Example:

```bash
salt '*' pkgutil.upgrade
```

salt.modules.pkgutil.upgrade_available(name)
Check if there is an upgrade available for a certain package

CLI Example:

```bash
salt '*' pkgutil.upgrade_available CSWpython
```

salt.modules.pkgutil.version(*names, **kwargs)
Returns a version if the package is installed, else returns an empty string

CLI Example:

```bash
salt '*' pkgutil.version CSWpython
```
21.9.323 salt.modules.portage_config

Configure portage(5)

salt.modules.portage_config.append_to_package_conf(conf, atom="", flags=None, string="", overwrite=False)

Append a string or a list of flags for a given package or DEPEND atom to a given configuration file.

CLI Example:

```bash
salt '*' portage_config.append_to_package_conf use string="app-admin/salt ldap - -libvirt"
salt '*' portage_config.append_to_package_conf use atom=" > = app-admin/salt-0.14.1 " flags="[['ldap',' -libvirt']]"
```

salt.modules.portage_config.append_use_flags(atom, uses=None, overwrite=False)

Append a list of use flags for a given package or DEPEND atom

CLI Example:

```bash
salt '*' portage_config.append_use_flags "app-admin/salt[ldap,-libvirt]"
salt '*' portage_config.append_use_flags ">=app-admin/salt-0.14.1" "[['ldap', '- -libvirt']]"
```

salt.modules.portage_config.enforce_nice_config()

Enforce a nice tree structure for /etc/portage/package.* configuration files.

See also:
salt.modules.ebuild.ex_mod_init() for information on automatically running this when pkg is used.

CLI Example:

```bash
salt '*' portage_config.enforce_nice_config
```

salt.modules.portage_config.filter_flags(use, use_expand_hidden, usemasked, useforced)

New in version 2015.8.0.

Filter function to remove hidden or otherwise not normally visible USE flags from a list.

@type use: list @param use: the USE flag list to be filtered. @type use_expand_hidden: list @param use_expand_hidden: list of flags hidden. @type usemasked: list @param usemasked: list of masked USE flags. @type useforced: list @param useforced: the forced USE flags. @rtype: list @return the filtered USE flags.

salt.modules.portage_config.get_all_cpv_use(cp)

New in version 2015.8.0.

Uses portage to determine final USE flags and settings for an emerge.

@type cp: string @param cp: eg cat/pkg @rtype: lists @rparam: tuple with two lists - list of used flags and list of flags which will be used.
salt.modules.portage_config.get_flags_from_package_conf(conf, atom)
Get flags for a given package or DEPEND atom. Warning: This only works if the configuration files tree is in
the correct format (the one enforced by enforce_nice_config)

CLI Example:
```
salt '*' portage_config.get_flags_from_package_conf license salt
```

salt.modules.portage_config.get_installed_use(cp, use='USE')
New in version 2015.8.0.
Gets the installed USE flags from the VARDB.
@type: cp: string @param cp: cat/pkg @type use: string @param use: 1 of ["USE", "PKGUSE"] @rtype list
@returns [] or the list of IUSE flags

salt.modules.portage_config.get_iuse(cp)
New in version 2015.8.0.
Gets the current IUSE flags from the tree.
@type: cpv: string @param cpv: cat/pkg @rtype list @returns [] or the list of IUSE flags

salt.modules.portage_config.get_missing_flags(conf, atom, flags)
Find out which of the given flags are currently not set. CLI Example:
```
salt '*' portage_config.get_missing_flags use salt "['ldap', '-libvirt', 'openssl
-']"
```

salt.modules.portage_config.has_flag(conf, atom, flag)
Verify if the given package or DEPEND atom has the given flag. Warning: This only works if the configuration
files tree is in the correct format (the one enforced by enforce_nice_config)

CLI Example:
```
salt '*' portage_config.has_flag license salt Apache-2.0
```

salt.modules.portage_config.has_use(atom, use)
Verify if the given package or DEPEND atom has the given use flag. Warning: This only works if the configu-
ration files tree is in the correct format (the one enforced by enforce_nice_config)

CLI Example:
```
salt '*' portage_config.has_use salt libvirt
```

salt.modules.portage_config.is_changed_uses(cp)
New in version 2015.8.0.
Uses portage for determine if the use flags of installed package is compatible with use flags in portage configs.
@type cp: string @param cp: eg cat/pkg

salt.modules.portage_config.is_present(conf, atom)
Tell if a given package or DEPEND atom is present in the configuration files tree. Warning: This only works
if the configuration files tree is in the correct format (the one enforced by enforce_nice_config)

CLI Example:
```
salt '*' portage_config.is_present unmask salt
```
21.9.324 salt.modules.postfix

Support for Postfix

This module is currently little more than a config file viewer and editor. It is able to read the master.cf file (which is one style) and files in the style of main.cf (which is a different style, that is used in multiple postfix configuration files).

The design of this module is such that when files are edited, a minimum of changes are made to them. Each file should look as if it has been edited by hand; order, comments and whitespace are all preserved.

salt.modules.postfix.delete(queue_id)
Delete message(s) from the mail queue

CLI Example:

```
salt '*' postfix.delete 5C33CA0DEA
salt '*' postfix.delete ALL
```

salt.modules.postfix.hold(queue_id)
Put message(s) on hold from the mail queue

CLI Example:

```
salt '*' postfix.hold 5C33CA0DEA
salt '*' postfix.hold ALL
```

salt.modules.postfix.requeue(queue_id)
Requeue message(s) in the mail queue

CLI Example:

```
salt '*' postfix.requeue 5C33CA0DEA
salt '*' postfix.requeue ALL
```

salt.modules.postfix.set_main(key, value, path="/etc/postfix/main.cf")
Set a single config value in the main.cf file. If the value does not already exist, it will be appended to the end.

CLI Example:

```
salt <minion> postfix.set_main mailq_path /usr/bin/mailq
```

salt.modules.postfix.set_master(service, conn_type, private='y', unpriv='y', chroot='y',
                           wakeup='n', maxproc='100', command='', write_conf=True,
                           path="/etc/postfix/master.cf")
Set a single config value in the master.cf file. If the value does not already exist, it will be appended to the end.

Because of shell parsing issues, '-' cannot be set as a value, as is normal in the master.cf file; either 'y', 'n' or a number should be used when calling this function from the command line. If the value used matches the default, it will internally be converted to a '-'. Calling this function from the Python API is not affected by this limitation

The settings and their default values, in order, are: service (required), conn_type (required), private (y), unpriv (y), chroot (y), wakeup (n), maxproc (100), command (required).

By default, this function will write out the changes to the master.cf file, and then returns the full contents of the file. By setting the write_conf option to False, it will skip writing the file.

CLI Example:
salt <minion> postfix.set_master smtp inet n y n n 100 smtpd

salt.modules.postfix.show_main(path='/etc/postfix/main.cf')
Return a dict of active config values. This does not include comments, spacing or order. Bear in mind that order is functionally important in the main.cf file, since keys can be referred to as variables. This means that the data returned from this function should not be used for direct modification of the main.cf file; other functions are available for that.

CLI Examples:
salt <minion> postfix.show_main salt <minion> postfix.show_main path=/path/to/main.cf

salt.modules.postfix.show_master(path='/etc/postfix/master.cf')
Return a dict of active config values. This does not include comments, spacing or order.
The data returned from this function should not be used for direct modification of the main.cf file; other functions are available for that.

CLI Examples:
salt <minion> postfix.show_master salt <minion> postfix.show_master path=/path/to/master.cf

salt.modules.postfix.show_queue()
Show contents of the mail queue

CLI Example:
salt '*' postfix.show_queue

salt.modules.postfix.unhold(queue_id)
Set held message(s) in the mail queue to unheld

CLI Example:
salt '*' postfix.unhold 5C33CA6DEA
salt '*' postfix.unhold ALL

21.9.325 salt.modules.postgres
Module to provide Postgres compatibility to salt.

configuration In order to connect to Postgres, certain configuration is required in /etc/salt/minion on the relevant minions. Some sample configs might look like:

```
postgres.host: 'localhost'  
postgres.port: '5432'  
postgres.user: 'postgres' -> db user  
postgres.pass: ''  
postgres.maintenance_db: 'postgres'
```

The default for the maintenance_db is 'postgres' and in most cases it can be left at the default setting. This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar

note This module uses MD5 hashing which may not be compliant with certain security audits.

note When installing postgres from the official postgres repos, on certain linux distributions, either the psql or the initdb binary is not automatically placed on the path. Add a configuration to the location of the postgres bin’s path to the relevant minion for this module:
salt-modules.postgres.available_extensions

List available postgresql extensions

CLI Example:

```
salt '*' postgres.available_extensions
```

salt-modules.postgres.create_extension

Install a postgresql extension

CLI Example:

```
salt '*' postgres.create_extension 'adminpack'
```

salt-modules.postgres.create_metadata

Get lifecycle information about an extension

CLI Example:

```
salt '*' postgres.create_metadata adminpack
```

salt-modules.postgres.datadir_exists

New in version 2016.3.0.
Checks if postgres data directory has been initialized

CLI Example:

```
salt '*' postgres.datadir_exists '/var/lib/pgsql/data'
```

name Name of the directory to check

salt-modules.postgres.datadir_init

New in version 2016.3.0.
Initializes a postgres data directory

CLI Example:

```
salt '*' postgres.datadir_init '/var/lib/pgsql/data'
```

name The name of the directory to initialize
auth The default authentication method for local connections
password The password to set for the postgres user
user The database superuser name
encoding The default encoding for new databases
locale The default locale for new databases
waldir The transaction log (WAL) directory (default is to keep WAL inside the data directory)

New in version 2019.2.0.

checksums If True, the cluster will be created with data page checksums.

Note: Data page checksums are supported since PostgreSQL 9.3.

New in version 2019.2.0.

runas The system user the operation should be performed on behalf of

salt.modules.postgres.db_alter(name, user=None, host=None, port=None, maintenance_db=None, password=None, tablespace=None, owner=None, owner_recurse=False, runas=None)

Change tablespace or/and owner of database.

CLI Example:

```
salt '*' postgres.db_alter dbname owner=otheruser
```

salt.modules.postgres.db_create(name, user=None, host=None, port=None, maintenance_db=None, password=None, tablespace=None, encoding=None, lc_collate=None, lc_ctype=None, owner=None, template=None, runas=None)

Adds a databases to the Postgres server.

CLI Example:

```
salt '*' postgres.db_create 'dbname'
salt '*' postgres.db_create 'dbname' template=template_postgis
```

salt.modules.postgres.db_exists(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Checks if a database exists on the Postgres server.

CLI Example:

```
salt '*' postgres.db_exists 'dbname'
```

salt.modules.postgres.db_list(user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Return dictionary with information about databases of a Postgres server.

CLI Example:

```
salt '*' postgres.db_list
```

salt.modules.postgres.db_remove(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Removes a databases from the Postgres server.

CLI Example:

```
salt '*' postgres.db_remove 'dbname'
```

salt.modules.postgres.drop_extension(name, if_exists=None, restrict=None, cascade=None, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Drop an installed postgresql extension
CLI Example:
```
salt '*' postgres.drop_extension 'adminpack'
```

```
salt.modules.postgres.get_available_extension(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)
```

Get info about an available postgresql extension

CLI Example:
```
salt '*' postgres.get_available_extension plpgsql
```

```
salt.modules.postgres.get_installed_extension(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)
```

Get info about an installed postgresql extension

CLI Example:
```
salt '*' postgres.get_installed_extension plpgsql
```

```
salt.modules.postgres.group_create(groupname, user=None, host=None, port=None, maintenance_db=None, password=None, createdb=None, createroles=None, encrypted=None, login=None, inherit=None, superuser=None, replication=None, rolepassword=None, groups=None, runas=None)
```

Creates a Postgres group. A group is postgres is similar to a user, but cannot login.

CLI Example:
```
salt '*' postgres.group_create 'groupname' user='user' \ host='hostname' port='port' password='password' \ rolepassword='rolepassword'
```

```
salt.modules.postgres.group_remove(groupname, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)
```

Removes a group from the Postgres server.

CLI Example:
```
salt '*' postgres.group_remove 'groupname'
```

```
salt.modules.postgres.group_update(groupname, user=None, host=None, port=None, maintenance_db=None, password=None, createdb=None, createroles=None, encrypted=None, login=None, inherit=None, superuser=None, replication=None, rolepassword=None, groups=None, runas=None)
```

Updates a postgres group

CLI Examples:
```
salt '*' postgres.group_update 'username' user='user' \ host='hostname' port='port' password='password' \ rolepassword='rolepassword'
```

```
salt.modules.postgres.has_privileges(name, object_name, object_type, privileges=None, grant_option=None, prepend='public', maintenance_db=None, user=None, host=None, port=None, password=None, runas=None)
```

21.9. execution modules
New in version 2016.3.0.

Check if a role has the specified privileges on an object

CLI Example:

```bash
salt '*' postgres.has_privileges user_name table_name table
  SELECT,INSERT maintenance_db=db_name
```

- **name**  Name of the role whose privileges should be checked on `object_type`
- **object_name**  Name of the object on which the check is to be performed
- **object_type**  The object type, which can be one of the following:
  - table
  - sequence
  - tablespace
  - language
  - database
  - group
  - function
- **privileges**  Comma separated list of privileges to check, from the list below:
  - INSERT
  - CREATE
  - TRUNCATE
  - CONNECT
  - TRIGGER
  - SELECT
  - USAGE
  - TEMPORARY
  - UPDATE
  - EXECUTE
  - REFERENCES
  - DELETE
  - ALL
- **grant_option**  If `grant_option` is set to True, the grant option check is performed
- **prepend**  Table and Sequence object types live under a schema so this should be provided if the object is not under the default `public` schema
- **maintenance_db**  The database to connect to
- **user**  Database username if different from config or default
- **password**  User password if any password for a specified user
- **host**  Database host if different from config or default
- **port**  Database port if different from config or default
- **runas**  System user all operations should be performed on behalf of

salt.modules.postgres.installed_extensions(*user=None, host=None, port=None, maintenance_db=None, password=None, runas=None*)

List installed postgresql extensions

CLI Example:

```bash
salt '*' postgres.installed_extensions
```

salt.modules.postgres.is_available_extension(*name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None*)

Test if a specific extension is available
**CLI Example:**

```bash
salt '*' postgres.is_available_extension
```

salt.modules.postgres.is_installed_extension(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Test if a specific extension is installed.

**CLI Example:**

```bash
salt '*' postgres.is_installed_extension
```

salt.modules.postgres.language_create(name, maintenance_db, user=None, host=None, port=None, password=None, runas=None)

New in version 2016.3.0.
Installs a language into a database.

**CLI Example:**

```bash
salt '*' postgres.language_create plpgsql dbname
```

- **name**: Language to install
- **maintenance_db**: The database to install the language in
- **user**: database username if different from config or default
- **password**: user password if any password for a specified user
- **host**: Database host if different from config or default
- **port**: Database port if different from config or default
- **runas**: System user all operations should be performed on behalf of

salt.modules.postgres.language_exists(name, maintenance_db, user=None, host=None, port=None, password=None, runas=None)

New in version 2016.3.0.
Checks if language exists in a database.

**CLI Example:**

```bash
salt '*' postgres.language_exists plpgsql dbname
```

- **name**: Language to check for
- **maintenance_db**: The database to check in
- **user**: database username if different from config or default
- **password**: user password if any password for a specified user
- **host**: Database host if different from config or default
- **port**: Database port if different from config or default
- **runas**: System user all operations should be performed on behalf of

salt.modules.postgres.language_list(maintenance_db, user=None, host=None, port=None, password=None, runas=None)

New in version 2016.3.0.
Return a list of languages in a database.

**CLI Example:**

```bash
salt '*' postgres.language_list dbname
```

- **maintenance_db**: The database to check
- **user**: database username if different from config or default
password  user password if any password for a specified user
host    Database host if different from config or default
port    Database port if different from config or default
runas   System user all operations should be performed on behalf of

salt.modules.postgres.language_remove(name, maintenance_db, user=None, host=None,
port=None, password=None, runas=None)

New in version 2016.3.0.
Removes a language from a database

CLI Example:

```bash
salt '*' postgres.language_remove plpgsql dbname
```

name  Language to remove
maintenance_db  The database to install the language in
user  database username if different from config or default
password  user password if any password for a specified user
host    Database host if different from config or default
port    Database port if different from config or default
runas   System user all operations should be performed on behalf of

salt.modules.postgres.owner_to(dbname, ownername, user=None, host=None, port=None, password=None, runas=None)

Set the owner of all schemas, functions, tables, views and sequences to the given username.

CLI Example:

```bash
salt '*' postgres.owner_to 'dbname' 'username'
```

salt.modules.postgres.privileges_grant(name, object_name, object_type, privileges=None,
grant_option=None, prepend='public', maintenance_db=None, user=None, host=None, port=None,
password=None, runas=None)

New in version 2016.3.0.
Grant privileges on a postgres object

CLI Example:

```bash
salt '*' postgres.privileges_grant user_name table_name table \\
SELECT,UPDATE maintenance_db=db_name
```
• CONNECT
• TRIGGER
• SELECT
• USAGE
• TEMPORARY
• UPDATE
• EXECUTE
• REFERENCES
• DELETE
• ALL

grant_option If grant_option is set to True, the recipient of the privilege can in turn grant it to others
prepend Table and Sequence object types live under a schema so this should be provided if the object is not
under the default public schema
maintenance_db The database to connect to
user database username if different from config or default
password user password if any password for a specified user
host Database host if different from config or default
port Database port if different from config or default
runas System user all operations should be performed on behalf of

salt.modules.postgres.privileges_list(name, object_type, prepend='public', maintenance_db=None, user=None, host=None, port=None, password=None, runas=None)

New in version 2016.3.0.
Return a list of privileges for the specified object.

CLI Example:

salt '*' postgres.privileges_list table_name table maintenance_db=db_name

name Name of the object for which the permissions should be returned
object_type The object type, which can be one of the following:
• table
• sequence
• schema
• tablespace
• language
• database
• group
• function
prepend Table and Sequence object types live under a schema so this should be provided if the object is not
under the default public schema
maintenance_db The database to connect to
user database username if different from config or default
password user password if any password for a specified user
host Database host if different from config or default
port Database port if different from config or default
runas System user all operations should be performed on behalf of

salt.modules.postgres.privileges_revoke(name, object_name, object_type, privileges=None, prepend='public', maintenance_db=None, user=None, host=None, port=None, password=None, runas=None)

New in version 2016.3.0.
Revoke privileges on a postgres object
CLI Example:

```bash
salt '*' postgres.privileges_revoke user_name table_name table
SELECT,UPDATE maintenance_db=db_name
```

- **name** Name of the role whose privileges should be revoked.
- **object_name** Name of the object on which the revoke is to be performed.
- **object_type** The object type, which can be one of the following:
  - table
  - sequence
  - schema
  - tablespace
  - language
  - database
  - group
  - function
- **privileges** Comma separated list of privileges to revoke, from the list below:
  - INSERT
  - CREATE
  - TRUNCATE
  - CONNECT
  - TRIGGER
  - SELECT
  - USAGE
  - TEMPORARY
  - UPDATE
  - EXECUTE
  - REFERENCES
  - DELETE
  - ALL
- **maintenance_db** The database to connect to.
- **user** database username if different from config or default.
- **password** user password if any password for a specified user.
- **host** Database host if different from config or default.
- **port** Database port if different from the config or default.
- **runas** System user all operations should be performed on behalf of.

salt.modules.postgres.psql_query(query, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None, write=False)

Run an SQL-Query and return the results as a list. This command only supports SELECT statements. This limitation can be worked around with a query like this:

```sql
WITH updated AS (UPDATE pg_authid SET rolconnlimit = 2000 WHERE rolname = 'rolename' RETURNING rolconnlimit) SELECT * FROM updated;
```

- **query** The query string.
- **user** Database username, if different from config or default.
- **host** Database host, if different from config or default.
- **port** Database port, if different from the config or default.
- **maintenance_db** The database to run the query against.
- **password** User password, if different from the config or default.
- **runas** User to run the command as.
- **write** Mark query as READ WRITE transaction.

CLI Example:

```bash
salt '*' postgres.psql_query 'select * from pg_stat_activity'
```
salt.modules.postgres.role_get(name, user=None, host=None, port=None, maintenance_db=None, 
password=None, runas=None, return_password=False)

Return a dict with information about users of a Postgres server.

Set return_password to True to get password hash in the result.

CLI Example:

```bash
salt '*' postgres.role_get postgres
```

salt.modules.postgres.schema_create(dbname, name, owner=None, user=None, 
db_user=None, db_password=None, db_host=None, db_port=None)

Creates a Postgres schema.

CLI Example:

```bash
salt '*' postgres.schema_create dbname name owner='owner' \ 
user='user' \ 
db_user='user' db_password='password' \ 
db_host='hostname' db_port='port'
```

salt.modules.postgres.schema_exists(dbname, name, user=None, 
db_user=None, db_password=None, db_host=None, db_port=None)

Checks if a schema exists on the Postgres server.

CLI Example:

```bash
salt '*' postgres.schema_exists dbname schemaname
```

database name we query on
name Schema name we look for
user The system user the operation should be performed on behalf of
db_user database username if different from config or default
db_password user password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

salt.modules.postgres.schema_get(dbname, name, user=None, 
db_user=None, db_password=None, 

db_host=None, db_port=None)

Return a dict with information about schemas in a database.

CLI Example:

```bash
salt '*' postgres.schema_get dbname name
```

database name we query on
name Schema name we look for
user The system user the operation should be performed on behalf of
db_user database username if different from config or default
db_password user password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

salt.modules.postgres.schema_list(dbname, user=None, db_user=None, 
db_password=None, 

db_host=None, db_port=None)

Return a dict with information about schemas in a Postgres database.

CLI Example:
salt '*' postgres.schema_list dbname

dbname  Database name we query on
user   The system user the operation should be performed on behalf of
db_user database username if different from config or default
db_password user password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

salt.modules.postgres.schema_remove(name, user=None, db_user=None, db_password=None, db_host=None, db_port=None)

Removes a schema from the Postgres server.

CLI Example:
salt '*' postgres.schema_remove dbname schemaname

database name we work on
schemaname The schema’s name we’ll remove
user System user all operations should be performed on behalf of
db_user database username if different from config or default
db_password user password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

salt.modules.postgres.tablespace_remove(name, user=None, host=None, port=None, maintenance_db=None, password=None, new_name=None, new_owner=None, set_option=None, reset_option=None, runas=None)

Change tablespace name, owner, or options.

CLI Example:
salt '*' postgres.tablespace_remove tsname new_owner=otheruser
salt '*' postgres.tablespace_remove index_space new_name=fast_raid
salt '*' postgres.tablespace_remove test set_option="{'seq_page_cost': '1.1'}"
salt '*' postgres.tablespace_remove tsname reset_option=seq_page_cost

New in version 2015.8.0.

salt.modules.postgres.tablespace_create(name, location, options=None, owner=None, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Adds a tablespace to the Postgres server.

CLI Example:
salt '*' postgres.tablespace_create tablesapename '/path/datadir'

New in version 2015.8.0.

salt.modules.postgres.tablespace_exists(name, owner=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Checks if a tablespace exists on the Postgres server.

CLI Example:
salt '*' postgres.tablespace_exists 'dbname'
New in version 2015.8.0.
salt.modules.postgres.tablespace_list(user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Return dictionary with information about tablespaces of a Postgres server.

CLI Example:

```
salt '*' postgres.tablespace_list
```

New in version 2015.8.0.
salt.modules.postgres.tablespace_remove(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Removes a tablespace from the Postgres server.

CLI Example:

```
salt '*' postgres.tablespace_remove tsname
```

New in version 2015.8.0.
salt.modules.postgres.user_create(username, user=None, host=None, port=None, maintenance_db=None, password=None, createdb=None, createroles=None, inherit=None, login=None, connlimit=None, encrypted=None, superuser=None, replication=None, rolepassword=None, valid_until=None, groups=None, runas=None)

Creates a Postgres user.

CLI Examples:

```
salt '*' postgres.user_create 'username' user='user' \
    host='hostname' port='port' password='password' \
    rolepassword='rolepassword' valid_until='valid_until'
```

salt.modules.postgres.user_exists(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Checks if a user exists on the Postgres server.

CLI Example:

```
salt '*' postgres.user_exists 'username'
```

salt.modules.postgres.user_list(user=None, host=None, port=None, maintenance_db=None, password=None, runas=None, return_password=False)

Return a dict with information about users of a Postgres server.

Set return_password to True to get password hash in the result.

CLI Example:

```
salt '*' postgres.user_list
```

salt.modules.postgres.user_remove(username, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Removes a user from the Postgres server.

CLI Example:

```
salt '*' postgres.user_remove 'username'
```
salt.modules.postgres.user_update(username, user=None, host=None, port=None, maintenance_db=None, password=None, createdb=None, createdb=None, encrypted=None, superuser=None, inherit=None, login=None, conlimit=None, replication=None, rolepassword=None, valid_until=None, groups=None, runas=None)

Updates a Postgres user.

CLI Examples:

```
salt '*' postgres.user_update 'username' user='user' \
    host='hostname' port='port' password='password' \
    rolepassword='rolepassword' valid_until='valid_until'
```

salt.modules.postgres.version(user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Return the version of a Postgres server.

CLI Example:

```
salt '*' postgres.version
```

21.9.326 salt.modules.poudriere

Support for poudriere

salt.modules.poudriere.bulk_build(jail, pkg_file, keep=False)

Run bulk build on poudriere server.

Return number of pkg builds, failures, and errors, on error dump to CLI

CLI Example:

```
salt -N buildbox_group poudriere.bulk_build 90amd64 /root/pkg_list
```

salt.modules.poudriere.create_jail(name, arch, version='9.0-RELEASE')

Creates a new poudriere jail if one does not exist

*NOTE* creating a new jail will take some time the master is not hanging

CLI Example:

```
salt '*' poudriere.create_jail 90amd64 amd64
```

salt.modules.poudriere.create_ports_tree()

Not working need to run portfetch non interactive

salt.modules.poudriere.delete_jail(name)

Deletes poudriere jail with `name`

CLI Example:

```
salt '*' poudriere.delete_jail 90amd64
```

salt.modules.poudriere.is_jail(name)

Return True if jail exists False if not

CLI Example:
salt '*' poudriere.is_jail <jail name>

salt.modules.poudriere.list_jails()
Return a list of current jails managed by poudriere
CLI Example:
salt '*' poudriere.list_jails

salt.modules.poudriere.list_ports()
Return a list of current port trees managed by poudriere
CLI Example:
salt '*' poudriere.list_ports

salt.modules.poudriere.make_pkgng_aware(jname)
Make jail jname pkgng aware
CLI Example:
salt '*' poudriere.make_pkgng_aware <jail name>

salt.modules.poudriere.parse_config(config_file=None)
Returns a dict of poudriere main configuration definitions
CLI Example:
salt '*' poudriere.parse_config

salt.modules.poudriere.update_jail(name)
Run freebsd-update on name poudriere jail
CLI Example:
salt '*' poudriere.update_jail freebsd:10:x86:64

salt.modules.poudriere.update_ports_tree(ports_tree)
Updates the ports tree, either the default or the ports_tree specified
CLI Example:
salt '*' poudriere.update_ports_tree staging

salt.modules.poudriere.version()
Return poudriere version
CLI Example:
salt '*' poudriere.version

21.9.327  salt.modules.powerpath

powerpath support.
Assumes RedHat
salt.modules.powerpath.add_license(key)
Add a license
salt.modules.powerpath\texttt{.has\_powerpath}()

salt.modules.powerpath\texttt{.list\_licenses}()

returns a list of applied powerpath license keys

salt.modules.powerpath\texttt{.remove\_license}(key)

Remove a license

### 21.9.328 salt.modules.proxy module

This module allows you to manage proxy settings

\begin{verbatim}
salt '*' network.get_http_proxy
\end{verbatim}

salt.modules.proxy\texttt{.get\_ftp\_proxy}(\texttt{network\_service='}Ethernet')

Returns the current ftp proxy settings

\begin{verbatim}
network\_service  The network service to apply the changes to, this only necessary on macOS
\end{verbatim}

CLI Example:

\begin{verbatim}
salt '*' proxy.get_ftp_proxy Ethernet
\end{verbatim}

salt.modules.proxy\texttt{.get\_http\_proxy}(\texttt{network\_service='}Ethernet')

Returns the current http proxy settings

\begin{verbatim}
network\_service  The network service to apply the changes to, this only necessary on macOS
\end{verbatim}

CLI Example:

\begin{verbatim}
salt '*' proxy.get_http_proxy Ethernet
\end{verbatim}

salt.modules.proxy\texttt{.get\_https\_proxy}(\texttt{network\_service='}Ethernet')

Returns the current https proxy settings

\begin{verbatim}
network\_service  The network service to apply the changes to, this only necessary on macOS
\end{verbatim}

CLI Example:

\begin{verbatim}
salt '*' proxy.get_https_proxy Ethernet
\end{verbatim}

salt.modules.proxy\texttt{.get\_proxy\_bypass}(\texttt{network\_service='}Ethernet')

Returns the current domains that can bypass the proxy

\begin{verbatim}
network\_service  The network service to get the bypass domains from, this is only necessary on macOS
\end{verbatim}

CLI Example:

\begin{verbatim}
salt '*' proxy.get_proxy_bypass
\end{verbatim}

salt.modules.proxy\texttt{.get\_proxy\_win}()

Gets all of the proxy settings in one call, only available on Windows

CLI Example:

\begin{verbatim}
salt '*' proxy.get_proxy_win
\end{verbatim}

salt.modules.proxy\texttt{.set\_ftp\_proxy}(server, port, user=None, password=None, \texttt{network\_service='}Ethernet', bypass\_hosts=None)

Sets the ftp proxy settings

\begin{verbatim}
server  The proxy server to use
port  The port used by the proxy server
user  The username to use for the proxy server if required
password  The password to use if required by the server
\end{verbatim}
network_service  The network service to apply the changes to, this only necessary on macOS
bypass_hosts  The hosts that are allowed to by pass the proxy. Only used on Windows for other OS’s use
set_proxy_bypass to edit the bypass hosts.

CLI Example:

```
salt '*' proxy.set_ftp_proxy example.com 1080 user=proxy_user password=proxy_pass
  network_service=Ethernet
```

```python
salt.modules.proxy.set_http_proxy(server, port, user=None, password=None, network_service='Ethernet', bypass_hosts=None)
```
Sets the http proxy settings. Note: On Windows this will override any other proxy settings you have, the
preferred method of updating proxies on windows is using set_proxy.

server  The proxy server to use
port  The port used by the proxy server
user  The username to use for the proxy server if required
password  The password to use if required by the server
network_service  The network service to apply the changes to, this only necessary on macOS
bypass_hosts  The hosts that are allowed to by pass the proxy. Only used on Windows for other OS’s use
set_proxy_bypass to edit the bypass hosts.

CLI Example:

```
salt '*' proxy.set_http_proxy example.com 1080 user=proxy_user password=proxy_pass
  network_service=Ethernet
```

```python
salt.modules.proxy.set_https_proxy(server, port, user=None, password=None, network_service='Ethernet', bypass_hosts=None)
```
Sets the https proxy settings. Note: On Windows this will override any other proxy settings you have, the
preferred method of updating proxies on windows is using set_proxy.

server  The proxy server to use
port  The port used by the proxy server
user  The username to use for the proxy server if required
password  The password to use if required by the server
network_service  The network service to apply the changes to, this only necessary on macOS
bypass_hosts  The hosts that are allowed to by pass the proxy. Only used on Windows for other OS’s use
set_proxy_bypass to edit the bypass hosts.

CLI Example:

```
salt '*' proxy.set_https_proxy example.com 1080 user=proxy_user password=proxy_pass
  network_service=Ethernet
```

```python
salt.modules.proxy.set_proxy_bypass(domains, network_service='Ethernet')
```
Sets the domains that can bypass the proxy
domains  An array of domains allowed to bypass the proxy
network_service  The network service to apply the changes to, this only necessary on macOS

CLI Example:

```
salt '*' proxy.set_proxy_bypass "['127.0.0.1', 'localhost']"
```

```python
salt.modules.proxy.set_proxy_win(server, port, types=None, bypass_hosts=None)
```
Sets the http proxy settings, only works with Windows.
server  The proxy server to use
password  The password to use if required by the server
types  The types of proxy connections should be setup with this server. Valid types are:
  •  http
  •  https
  •  ftp
bypass_hosts  The hosts that are allowed to bypass the proxy.

CLI Example:

```
salt '*' proxy.set_http_proxy example.com 1080 types='[http, https]'
```

### 21.9.329 `salt.modules.ps`

A salt interface to psutil, a system and process library. See http://code.google.com/p/psutil.

**depends**

- psutil Python module, version 0.3.0 or later
- python-utmp package (optional)

**salt.modules.ps.boot_time**(*time_format=None*)

Return the boot time in number of seconds since the epoch began.

CLI Example:

```
time_format  Optionally specify a strftime format string. Use time_format='%c' to get a nicely-formatted locale specific date and time (i.e. Fri May 2 19:08:32 2014).
```

New in version 2014.1.4.

```
salt '*' ps.boot_time
```

**salt.modules.ps.cpu_percent**(*interval=0.1, per_cpu=False*)

Return the percent of time the CPU is busy.

*interval*  the number of seconds to sample CPU usage over

*per_cpu*  if True return an array of CPU percent busy for each CPU, otherwise aggregate all percents into one number

CLI Example:

```
salt '*' ps.cpu_percent
```

**salt.modules.ps.cpu_times**(*per_cpu=False*)

Return the percent of time the CPU spends in each state, e.g. user, system, idle, nice, iowait, irq, softirq.

*per_cpu*  if True return an array of percents for each CPU, otherwise aggregate all percents into one number

CLI Example:

```
salt '*' ps.cpu_times
```

**salt.modules.ps.disk_io_counters**(*device=None*)

Return disk I/O statistics.

CLI Example:

```
salt '*' ps.disk_io_counters
salt '*' ps.disk_io_counters device=sda1
```

**salt.modules.ps.disk_partition_usage**(*all=False*)

Return a list of disk partitions plus the mount point, filesystem and usage statistics.

CLI Example:

```
salt '*' ps.disk_partition_usage
```
salt.modules.ps.disk_partitions(all=False)
Return a list of disk partitions and their device, mount point, and filesystem type.
all if set to False, only return local, physical partitions (hard disk, USB, CD/DVD partitions). If True, return all filesystems.
CLI Example:
```
salt '*' ps.disk_partitions
```

salt.modules.ps.disk_usage(path)
Given a path, return a dict listing the total available space as well as the free space, and used space.
CLI Example:
```
salt '*' ps.disk_usage /home
```

salt.modules.ps.get_pid_list()
Return a list of process ids (PIDs) for all running processes.
CLI Example:
```
salt '*' ps.get_pid_list
```

salt.modules.ps.get_users()
Return logged-in users.
CLI Example:
```
salt '*' ps.get_users
```

salt.modules.ps.kill_pid(pid, signal=15)
Kill a process by PID.
```
salt 'minion' ps.kill_pid pid [signal=signal_number]
```

pid PID of process to kill.
signal Signal to send to the process. See manpage entry for kill for possible values. Default: 15 (SIGTERM).
Example:
Send SIGKILL to process with PID 2000:
```
salt 'minion' ps.kill_pid 2000 signal=9
```

salt.modules.ps.lsof(name)
Retrieve the lsof information of the given process name.
```
salt '*' ps.lsof apache2
```

salt.modules.ps.netstat(name)
Retrieve the netstat information of the given process name.
```
salt '*' ps.netstat apache2
```

salt.modules.ps.network_io_counters(interface=None)
Return network I/O statistics.
```
```

21.9. execution modules
salt '*' ps.network_io_counters
salt '*' ps.network_io_counters interface=eth0

salt.modules.ps.num_cpus()
Return the number of CPUs.

CLI Example:
salt '*' ps.num_cpus

salt.modules.ps.pgrep(pattern, user=None, full=False)
Return the pids for processes matching a pattern.

If full is true, the full command line is searched for a match, otherwise only the name of the command is searched.

salt '*' ps.pgrep pattern [user=username] [full=(true|false)]

pattern Pattern to search for in the process list.
user Limit matches to the given username. Default: All users.
full A boolean value indicating whether only the name of the command or the full command line should be matched against the pattern.

Examples:
Find all httpd processes on all 'www' minions:
salt 'www.*' ps.pgrep httpd

Find all bash processes owned by user 'tom':
salt '*' ps.pgrep bash user=tom

salt.modules.ps.pkill(pattern, user=None, signal=15, full=False)
Kill processes matching a pattern.
	salt '*' ps.pkill pattern [user=username] [signal=signal_number] \\
[full=(true|false)]

pattern Pattern to search for in the process list.
user Limit matches to the given username. Default: All users.
signal Signal to send to the process(es). See manpage entry for kill for possible values. Default: 15 (SIGTERM).
full A boolean value indicating whether only the name of the command or the full command line should be matched against the pattern.

Examples:
Send SIGHUP to all httpd processes on all 'www' minions:
salt 'www.*' ps.pkill httpd signal=1

Send SIGKILL to all bash processes owned by user 'tom':
salt '*' ps.pkill bash signal=9 user=tom

salt.modules.ps.proc_info(pid, attrs=None)
Return a dictionary of information for a process id (PID).
**salt Documentation, Release 2019.2.0**

**CLI Example:**
```
salt '*' ps.proc_info 2322
salt '*' ps.proc_info 2322 attrs=['pid', 'name']
```

- **pid** PID of process to query.
- **attrs** Optional list of desired process attributes. The list of possible attributes can be found here: [http://pythonhosted.org/psutil/#psutil.Process](http://pythonhosted.org/psutil/#psutil.Process)

**salt.modules.ps.psaux(name)**

Retrieve information corresponding to a "ps aux" filtered with the given pattern. It could be just a name or a regular expression (using python search from "re" module).

**CLI Example:**
```
salt '*' ps.psaux www-data.+apache2
```

**salt.modules.ps.ss(name)**

Retrieve the ss information of the given process name.

**CLI Example:**
```
salt '*' ps.ss apache2
```

New in version 2016.11.6.

**salt.modules.ps.swap_memory()**

New in version 2014.7.0.

Return a dict that describes swap memory statistics.

**Note:** This function is only available in psutil version 0.6.0 and above.

**CLI Example:**
```
salt '*' ps.swap_memory
```

**salt.modules.ps.top(num_processes=5, interval=3)**

Return a list of top CPU consuming processes during the interval. num_processes = return the top N CPU consuming processes interval = the number of seconds to sample CPU usage over

**CLI Examples:**
```
salt '*' ps.top
salt '*' ps.top 5 10
```

**salt.modules.ps.total_physical_memory()**

Return the total number of bytes of physical memory.

**CLI Example:**
```
salt '*' ps.total_physical_memory
```

**salt.modules.ps.virtual_memory()**

New in version 2014.7.0.

Return a dict that describes statistics about system memory usage.
Note: This function is only available in psutil version 0.6.0 and above.

CLI Example:
salt '*' ps.virtual_memory

21.9.330 salt.modules.publish

Publish a command from a minion to a target

salt.modules.publish.full_data(tgt, fun, arg=None, tgt_type='glob', returner='', timeout=5)

Return the full data about the publication, this is invoked in the same way as the publish function

CLI Example:
salt system.example.com publish.full_data '*' cmd.run 'ls -la /tmp'

Attention

If you need to pass a value to a function argument and that value contains an equal sign, you must include the argument name. For example:
salt '*' publish.full_data test.kwarg arg='cheese=spam'

salt.modules.publish.publish(tgt, fun, arg=None, tgt_type='glob', returner='', timeout=5, via_master=None)

Publish a command from the minion out to other minions.

Publications need to be enabled on the Salt master and the minion needs to have permission to publish the command. The Salt master will also prevent a recursive publication loop, this means that a minion cannot command another minion to command another minion as that would create an infinite command loop.

The tgt_type argument is used to pass a target other than a glob into the execution, the available options are:
- glob
- pcre
- grain
- grain_pcre
- pillar
- pillar_pcre
- ipcidr
- range
- compound

Changed in version 2017.7.0: The expr_form argument has been renamed to tgt_type, earlier releases must use expr_form.

Note that for pillar matches must be exact, both in the pillar matcher and the compound matcher. No globbing is supported.

The arguments sent to the minion publish function are separated with commas. This means that for a minion executing a command with multiple args it will look like this:
salt system.example.com publish.publish '*' user.add 'foo,1020,1020'
salt system.example.com publish.publish 'os:Fedora' network.interfaces '' grain
CLI Example:

```
salt system.example.com publish.publish '*' cmd.run 'ls -la /tmp'
```

**Attention**

If you need to pass a value to a function argument and that value contains an equal sign, you **must** include the argument name. For example:

```
salt '*' publish.publish test.kwarg arg='cheese=spam'
```

Multiple keyword arguments should be passed as a list.

```
salt '*' publish.publish test.kwarg arg="['cheese=spam','spam=cheese']"
```

When running via salt-call, the *via_master* flag may be set to specific which master the publication should be sent to. Only one master may be specified. If unset, the publication will be sent only to the first master in minion configuration.

`salt.modules.publish.runner(fun, arg=None, timeout=5)`

Execute a runner on the master and return the data from the runner function.

CLI Example:

```
salt publish.runner manage.down
```

### 21.9.331 salt.modules.puppet

Execute puppet routines

`salt.modules.puppet.disable(message=None)`

New in version 2014.7.0.

Disable the puppet agent

- **message**: New in version 2015.5.2.
  
  Disable message to send to puppet

CLI Example:

```
salt '*' puppet.disable
salt '*' puppet.disable 'Disabled, contact XYZ before enabling'
```

`salt.modules.puppet.enable()`

New in version 2014.7.0.

Enable the puppet agent

CLI Example:

```
salt '*' puppet.enable
```

`salt.modules.puppet.fact(name, puppet=False)`

Run facter for a specific fact

CLI Example:
salt ' '*' puppet.fact kernel

salt.modules.puppet.facts(puppet=False)
  Run facter and return the results
  CLI Example:
  
salt '*' puppet.facts

salt.modules.puppet.noop('args, **kwargs)
  Execute a puppet noop run and return a dict with the stderr, stdout, return code, etc. Usage is the same as for puppet.run.
  CLI Example:
  
salt '*' puppet.noop
salt '*' puppet.noop tags=basefiles::edit,apache::server
salt '*' puppet.noop debug
salt '*' puppet.noop apply /a/b/manifest.pp modulepath=/a/b/modules
        →tags=basefiles::edit,apache::server

salt.modules.puppet.plugin_sync()
  Runs a plugin sync between the puppet master and agent
  CLI Example:
  
salt '*' puppet.plugin_sync

salt.modules.puppet.run('args, **kwargs)
  Execute a puppet run and return a dict with the stderr, stdout, return code, etc. The first positional argument given is checked as a subcommand. Following positional arguments should be ordered with arguments required by the subcommand first, followed by non-keyword arguments. Tags are specified by a tag keyword and comma separated list of values. – http://docs.puppetlabs.com/puppet/latest/reference/lang_tags.html
  CLI Examples:
  
salt '*' puppet.run
salt '*' puppet.run tags=basefiles::edit,apache::server
salt '*' puppet.run agent onetime no-daemonize no-usecacheonfailure no-splay
        →ignorecache
salt '*' puppet.run debug
salt '*' puppet.run apply /a/b/manifest.pp modulepath=/a/b/modules
        →tags=basefiles::edit,apache::server

salt.modules.puppet.status()
  New in version 2014.7.0.
  Display puppet agent status
  CLI Example:
  
salt '*' puppet.status

salt.modules.puppet.summary()
  New in version 2014.7.0.
  Show a summary of the last puppet agent run
  CLI Example:
Management of Pure Storage FlashArray

Installation Prerequisites

- You will need the `purestorage` python package in your python installation path that is running salt.

  ```
  pip install purestorage
  ```

- Configure Pure Storage FlashArray authentication. Use one of the following three methods.
  1) From the minion config

  ```
  pure_tags:
  fa:
  san_ip: management vip or hostname for the FlashArray
  api_token: A valid api token for the FlashArray being managed
  ```

  2) From environment (PUREFA_IP and PUREFA_API)

  3) From the pillar (PUREFA_IP and PUREFA_API)

  ```
  maintainer Simon Dodsley (simon@purestorage.com)
  ```

  ```
  maturity new
  ```

  ```
  requires purestorage
  ```

  ```
  platform all
  ```

New in version 2018.3.0.

Salt Documentation, Release 2019.2.0

```
salt '*' puppet.summary
```

### 21.9.332 salt.modules.purefa

Salt modules for Pure Storage FlashArray

#### salt.modules.purefa

Management of Pure Storage FlashArray

**Installation Prerequisites**

- You will need the `purestorage` python package in your python installation path that is running salt.

  ```
  pip install purestorage
  ```

- Configure Pure Storage FlashArray authentication. Use one of the following three methods.

  1) From the minion config

    ```
    pure_tags:
    fa:
    san_ip: management vip or hostname for the FlashArray
    api_token: A valid api token for the FlashArray being managed
    ```

  2) From environment (PUREFA_IP and PUREFA_API)

  3) From the pillar (PUREFA_IP and PUREFA_API)

  ```
  maintainer Simon Dodsley (simon@purestorage.com)
  ```

  ```
  maturity new
  ```

  ```
  requires purestorage
  ```

  ```
  platform all
  ```

New in version 2018.3.0.

**salt.modules.purefa.hg_create(name, host=None, volume=None)**

Create a hostgroup on a Pure Storage FlashArray.

Will return False if hostgroup already exists, or if named host or volume do not exist.

New in version 2018.3.0.

- **name** [string] name of hostgroup (truncated to 63 characters)
- **host** [string] name of host to add to hostgroup
- **volume** [string] name of volume to add to hostgroup

CLI Example:

```
salt '*' purefa.hg_create foo host=bar volume=vol
```

**salt.modules.purefa.hg_delete(name)**

Delete a hostgroup on a Pure Storage FlashArray (removes all volumes and hosts).

Will return False is hostgroup is already in a deleted state.

New in version 2018.3.0.

- **name** [string] name of hostgroup

CLI Example:

```
salt '*' purefa.hg_delete foo
```
salt.modules.purefa.hg_remove(name, volume=None, host=None)
Remove a host and/or volume from a hostgroup on a Pure Storage FlashArray.

Will return False is hostgroup does not exist, or named host or volume are not in the hostgroup.

New in version 2018.3.0.
name [string] name of hostgroup
volume [string] name of volume to remove from hostgroup
host [string] name of host to remove from hostgroup

CLI Example:
```
salt '*' purefa.hg_remove foo volume=test host=bar
```

salt.modules.purefa.hg_update(name, host=None, volume=None)
Adds entries to a hostgroup on a Pure Storage FlashArray.

Will return False is hostgroup doesn’t exist, or host or volume do not exist.

New in version 2018.3.0.
name [string] name of hostgroup
host [string] name of host to add to hostgroup
volume [string] name of volume to add to hostgroup

CLI Example:
```
salt '*' purefa.hg_update foo host=bar volume=vol
```

salt.modules.purefa.host_create(name, iqn=None, wwn=None)
Add a host on a Pure Storage FlashArray.

Will return False if host already exists, or the iSCSI or Fibre Channel parameters are not in a valid format. See Pure Storage FlashArray documentation.

New in version 2018.3.0.
name [string] name of host (truncated to 63 characters)
iqn [string] iSCSI IQN of host
wwn [string] Fibre Channel WWN of host

CLI Example:
```
salt '*' purefa.host_create foo iqn='<Valid iSCSI IQN>' wwn='<Valid WWN>'
```

salt.modules.purefa.host_delete(name)
Delete a host on a Pure Storage FlashArray (detaches all volumes).

Will return False if the host doesn’t exist.

New in version 2018.3.0.
name [string] name of host

CLI Example:
```
salt '*' purefa.host_delete foo
```

salt.modules.purefa.host_update(name, iqn=None, wwn=None)
Update a hosts port definitions on a Pure Storage FlashArray.

Will return False if new port definitions are already in use by another host, or are not in a valid format. See Pure Storage FlashArray documentation.

New in version 2018.3.0.
name [string] name of host
iqn [string] Additional iSCSI IQN of host
**wwn** [string] Additional Fibre Channel WWN of host

CLI Example:

```
salt '*' purefa.host_update foo wwn='<Valid WWN>'
```

**salt.modules.purefa.pg_create**(name, hostgroup=None, host=None, volume=None, enabled=True)

Create a protection group on a Pure Storage FlashArray.

**Will return False is the following cases:**
- Protection Group already exists
- Protection Group in a deleted state
- More than one type is specified - protection groups are for only hostgroups, hosts or volumes
- Named type for protection group does not exist

New in version 2018.3.0.

**name** [string] name of protection group

**hostgroup** [string] name of hostgroup to add to protection group

**host** [string] name of host to add to protection group

**volume** [string] name of volume to add to protection group

CLI Example:

```
salt '*purefa.pg_create foo [hostgroup=foo | host=bar | volume=vol] enabled=[true | false]
```

**salt.modules.purefa.pg_delete**(name, eradicate=False)

Delete a protection group on a Pure Storage FlashArray.

**Will return False if protection group is already in a deleted state.**

New in version 2018.3.0.

**name** [string] name of protection group

CLI Example:

```
salt '*purefa.pg_delete foo
```

**salt.modules.purefa.pg_eradicate**(name)

Eradicate a deleted protection group on a Pure Storage FlashArray.

**Will return False if protection group is not in a deleted state.**

New in version 2018.3.0.

**name** [string] name of protection group

CLI Example:

```
salt '*purefa.pg_eradicate foo
```

**salt.modules.purefa.pg_remove**(name, hostgroup=None, host=None, volume=None)

Remove a hostgroup, host or volume from a protection group on a Pure Storage FlashArray.

**Will return False in the following cases:**
- Protection group does not exist
- Specified type is not currently associated with the protection group

New in version 2018.3.0.

**name** [string] name of hostgroup

**hostgroup** [string] name of hostgroup to remove from protection group

**host** [string] name of host to remove from hostgroup

**volume** [string] name of volume to remove from hostgroup

CLI Example:
salt

salt.modules.purefa.pg_remove

salt.modules.purefa.pg_update

salt.modules.purefa.snap_create

salt.modules.purefa.snap_delete

salt.modules.purefa.snap_eradicate

salt.modules.purefa.snap_volume_create
Will return False if target volume already exists and overwrite is not specified, or selected snapshot doesn’t exist.

New in version 2018.3.0.

name [string] name of volume snapshot
target [string] name of clone volume
overwrite [boolean] overwrite clone if already exists (default: False)

CLI Example:

```
salt '*' purefa.snap_volume_create foo.bar clone overwrite=True
```

```
salt.modules.purefa.volume_attach(name, host)
```

Attach a volume to a host on a Pure Storage FlashArray.

Host and volume must exist or else will return False.

New in version 2018.3.0.

name [string] name of volume
host [string] name of host

CLI Example:

```
salt '*' purefa.volume_attach foo bar
```

```
salt.modules.purefa.volume_clone(name, target, overwrite=False)
```

Clone an existing volume on a Pure Storage FlashArray.

Will return False if source volume doesn’t exist, or target volume already exists and overwrite not specified.

New in version 2018.3.0.

name [string] name of volume
target [string] name of clone volume
overwrite [boolean] overwrite clone if already exists (default: False)

CLI Example:

```
salt '*' purefa.volume_clone foo bar overwrite=True
```

```
salt.modules.purefa.volume_create(name, size=None)
```

Create a volume on a Pure Storage FlashArray.

Will return False if volume already exists.

New in version 2018.3.0.

name [string] name of volume (truncated to 63 characters)
size [string] if specified capacity of volume. If not specified default to 1G. Refer to Pure Storage documentation for formatting rules.

CLI Example:

```
salt '*' purefa.volume_create foo
salt '*' purefa.volume_create foo size=10T
```

```
salt.modules.purefa.volume_delete(name, eradicate=False)
```

Delete a volume on a Pure Storage FlashArray.

Will return False if volume doesn’t exist is already in a deleted state.

New in version 2018.3.0.

name [string] name of volume
eradicate [boolean] Eradicate volume after deletion if True. Default is False

CLI Example:
salt '*' purefa.volume_delete foo eradicate=True

```
salt.modules.purefa.volume_detach(name, host)
    Detach a volume from a host on a Pure Storage FlashArray.
    Will return False if either host or volume do not exist, or if selected volume isn’t already connected to the host.
    New in version 2018.3.0.
    name [string] name of volume
    host [string] name of host
    CLI Example:
    salt '*' purefa.volume_detach foo bar
```

salt.modules.purefa.volume_eradicate(name)
    Eradicate a deleted volume on a Pure Storage FlashArray.
    Will return False if volume is not in a deleted state.
    New in version 2018.3.0.
    name [string] name of volume
    CLI Example:
    salt '*' purefa.volume_eradicate foo

salt.modules.purefa.volume_extend(name, size)
    Extend an existing volume on a Pure Storage FlashArray.
    Will return False if new size is less than or equal to existing size.
    New in version 2018.3.0.
    name [string] name of volume
    size [string] New capacity of volume. Refer to Pure Storage documentation for formatting rules.
    CLI Example:
    salt '*' purefa.volume_extend foo 10T

21.9.333 salt.modules.purefb

Management of Pure Storage FlashBlade

**Installation Prerequisites**

- You will need the purity_fb python package in your python installation path that is running salt.
  ```
pip install purity_fb
  ```

- Configure Pure Storage FlashBlade authentication. Use one of the following three methods.
  1) From the minion config
  ```
  pure_tags:
  fb:
    san_ip: management vip or hostname for the FlashBlade
    api_token: A valid api token for the FlashBlade being managed
  ```

  2) From environment (PUREFB_IP and PUREFB_API)
3) From the pillar (PUREFB_IP and PUREFB_API)

maintainer Simon Dodsley (simon@purestorage.com)
maturity new
requires purestorage
platform all

New in version 2019.2.0.

**salt.modules.purefb.fs_create**

```
(name, size=None, proto='NFS', nfs_rules='*(rw, no_root_squash)', snapshot=False)
```

Create a filesystem on a Pure Storage FlashBlade.

Will return False if filesystem already exists.

New in version 2019.2.0.

- **name** [string] name of filesystem (truncated to 63 characters)
- **proto** [string] (Optional) Sharing protocol (NFS, CIFS or HTTP). If not specified default is NFS
- **snapshot** [boolean] (Optional) Are snapshots enabled on the filesystem. Default is False
- **nfs_rules** [string] (Optional) export rules for NFS. If not specified default is *(rw,no_root_squash).* Refer to Pure Storage documentation for formatting rules.
- **size** [string] if specified capacity of filesystem. If not specified default to 32G. Refer to Pure Storage documentation for formatting rules.

CLI Example:

```
salt '*' purefb.fs_create foo proto=CIFS
salt '*' purefb.fs_create foo size=10T
```

**salt.modules.purefb.fs_delete**

```
(name, eradicate=False)
```

Delete a share on a Pure Storage FlashBlade.

Will return False if filesystem doesn’t exist or is already in a deleted state.

New in version 2019.2.0.

- **name** [string] name of filesystem
- **eradicate** [boolean] (Optional) Eradicate filesystem after deletion if True. Default is False

CLI Example:

```
salt '*' purefb.fs_delete foo eradicate=True
```

**salt.modules.purefb.fs_eradicate**

```
(name)
```

Eradicate a deleted filesystem on a Pure Storage FlashBlade.

Will return False if filesystem is not in a deleted state.

New in version 2019.2.0.

- **name** [string] name of filesystem

CLI Example:

```
salt '*' purefb.fs_eradicate foo
```

**salt.modules.purefb.fs_extend**

```
(name, size)
```

Resize an existing filesystem on a Pure Storage FlashBlade.

Will return False if new size is less than or equal to existing size.

New in version 2019.2.0.

- **name** [string] name of filesystem
- **size** [string] New capacity of filesystem. Refer to Pure Storage documentation for formatting rules.
salt.modules.purefb.fs_update(name, rules, snapshot=False)

Update filesystem on a Pure Storage FlashBlade.

Allows for change of NFS export rules and enabling/disabled of snapshotting capability.

New in version 2019.2.0.

- **name** [string] name of filesystem
- **rules** [string] NFS export rules for filesystem Refer to Pure Storage documentation for formatting rules.
- **snapshot** [boolean] (Optional) Enable/Disable snapshots on the filesystem. Default is False

**CLI Example:**

```
salt '*' purefb.fs_update foo rules='10.234.112.23(ro), 10.234.112.24(rw)' snapshot=True
```

salt.modules.purefb.snap_create(name, suffix=None)

Create a filesystem snapshot on a Pure Storage FlashBlade.

Will return False if filesystem selected to snap does not exist.

New in version 2019.2.0.

- **name** [string] name of filesystem to snapshot
- **suffix** [string] if specified forces snapshot name suffix. If not specified defaults to timestamp.

**CLI Example:**

```
salt '*' purefb.snap_create foo
salt '*' purefb.snap_create foo suffix=bar
```

salt.modules.purefb.snap_delete(name, suffix=None, eradicate=False)

Delete a filesystem snapshot on a Pure Storage FlashBlade.

Will return False if selected snapshot does not exist.

New in version 2019.2.0.

- **name** [string] name of filesystem
- **suffix** [string] name of snapshot
- **eradicate** [boolean] Eradicate snapshot after deletion if True. Default is False

**CLI Example:**

```
salt '*' purefb.snap_delete foo suffix=snap eradicate=True
```

salt.modules.purefb.snap_eradicate(name, suffix=None)

Eradicate a deleted filesystem snapshot on a Pure Storage FlashBlade.

Will return False if snapshot is not in a deleted state.

New in version 2019.2.0.

- **name** [string] name of filesystem
- **suffix** [string] name of snapshot

**CLI Example:**

```
salt '*' purefb.snap_eradicate foo suffix=snap
```
21.9.334 salt.modules.pushbullet module

Module for sending messages to Pushbullet (https://www.pushbullet.com)
New in version 2015.8.0.
Requires an api_key in /etc/salt/minion:

For example:

```python
pushbullet:
    device: "Chrome"
    title: "Example push message"
    body: "Message body."
```

```python
salt.modules.pushbullet.push_note(device=None, title=None, body=None)
```

Pushing a text note.

Parameters

- `device` – Pushbullet target device
- `title` – Note title
- `body` – Note body

Returns

Boolean if message was sent successfully.

CLI Example:

```
salt "*" pushbullet.push_note device="Chrome" title="Example title" body="Example body."
```
Salt Documentation, Release 2019.2.0

CLI Example:

```bash
salt '*' pushover.post_message user='xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx' title=
  'Message from Salt' message='Build is done'

salt '*' pushover.post_message user='xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx' title=
  'Message from Salt' message='Build is done' priority='2' expire='720' retry='5'
```

**21.9.336  salt.modules.pw_group**

Manage groups on FreeBSD

**Important:** If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to 'group.info' is not available), see here.

salt.modules.pw_group.add(name, gid=None, **kwargs)

Add the specified group

CLI Example:

```
salt '*' group.add foo 3456
```

salt.modules.pw_group.adduser(name, username)

Add a user in the group.

CLI Example:

```
salt '*' group.adduser foo bar
```

Verifies if a valid username 'bar' as a member of an existing group 'foo', if not then adds it.

salt.modules.pw_group.chgid(name, gid)

Change the gid for a named group

CLI Example:

```
salt '*' group.chgid foo 4376
```

salt.modules.pw_group.delete(name)

Remove the named group

CLI Example:

```
salt '*' group.delete foo
```

salt.modules.pw_group.deluser(name, username)

Remove a user from the group.

CLI Example:

```
salt '*' group.deluser foo bar
```

Removes a member user 'bar' from a group 'foo'. If group is not present then returns True.

salt.modules.pw_group.getent(refresh=False)

Return info on all groups

CLI Example:
salt '*' group.getent

```python
salt.modules.pw_group.info(name)
```

Return information about a group

CLI Example:

```
salt '*' group.info foo
```

```python
salt.modules.pw_group.members(name, members_list)
```

Replaces members of the group with a provided list.

New in version 2015.5.4.

CLI Example:

```
salt '*' group.members foo 'user1,user2,user3,...'
```

Replaces a membership list for a local group 'foo'. foo:x:1234:user1,user2,user3,...

### 21.9.337 salt.modules.pw_user

Manage users with the `pw` command

**Important:** If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to 'user.info' is not available), see [here](#).

```python
salt.modules.pw_user.add(name, uid=None, gid=None, groups=None, home=None, shell=None, unique=True, fullname='', roomnumber='', workphone='', homephone='', createhome=True, loginclass=None, **kwargs)
```

Add a user to the minion

CLI Example:

```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

```python
salt.modules.pw_user.chfullname(name, fullname)
```

Change the user's Full Name

CLI Example:

```
salt '*' user.chfullname foo "Foo Bar"
```

```python
salt.modules.pw_user.chgid(name, gid)
```

Change the default group of the user

CLI Example:

```
salt '*' user.chgid foo 4376
```

```python
salt.modules.pw_user.chgroups(name, groups, append=False)
```

Change the groups to which a user belongs

- **name** Username to modify
- **groups** List of groups to set for the user. Can be passed as a comma-separated list or a Python list.
- **append** [False] Set to True to append these groups to the user's existing list of groups. Otherwise, the specified groups will replace any existing groups for the user.

CLI Example:
salt 'username' user.chgroups foo wheel,root True

salt.modules.pw_user.chhome(name, home, persist=False)
Set a new home directory for an existing user
name Username to modify
home New home directory to set
persist [False] Set to True to prevent configuration files in the new home directory from being overwritten by the files from the skeleton directory.
CLI Example:
salt 'username' user.chhome foo /home/users/foo True

salt.modules.pw_user.chhomephone(name, homephone)
Change the user's Home Phone
CLI Example:
salt 'username' user.chhomephone foo "7735551234"

salt.modules.pw_user.chloginclass(name, loginclass, root=None)
Change the default login class of the user
New in version 2016.3.5.
CLI Example:
salt 'username' user.chloginclass foo staff

salt.modules.pw_user.chroomnumber(name, roomnumber)
Change the user's Room Number
CLI Example:
salt 'username' user.chroomnumber foo 123

salt.modules.pw_user.chshell(name, shell)
Change the default shell of the user
CLI Example:
salt 'username' user.chshell foo /bin/zsh

salt.modules.pw_user.chuid(name, uid)
Change the uid for a named user
CLI Example:
salt 'username' user.chuid foo 4376

salt.modules.pw_user.chworkphone(name, workphone)
Change the user's Work Phone
CLI Example:
salt 'username' user.chworkphone foo "7735550123"

salt.modules.pw_user.delete(name, remove=False, force=False)
Remove a user from the minion
CLI Example:
salt '*' user.delete name remove=True force=True

salt.modules.pw_user.get_loginclass(name)
Get the login class of the user
New in version 2016.3.0.
CLI Example:
salt '*' user.get_loginclass foo

salt.modules.pw_user.getent(refresh=False)
Return the list of all info for all users
CLI Example:
salt '*' user.getent

salt.modules.pw_user.info(name)
Return user information
CLI Example:
salt '*' user.info root

salt.modules.pw_user.list_groups(name)
Return a list of groups the named user belongs to
CLI Example:
salt '*' user.list_groups foo

salt.modules.pw_user.list_users()
Return a list of all users
CLI Example:
salt '*' user.list_users

salt.modules.pw_user.rename(name, new_name)
Change the username for a named user
CLI Example:
salt '*' user.rename name new_name

21.9.338 salt.modules.pyenv
Manage python installations with pyenv.

Note: Git needs to be installed and available via PATH if pyenv is to be installed automatically by the module.

New in version v2014.04.
salt.modules.pyenv.default(python=None, runas=None)
Returns or sets the currently defined default python.
python=None The version to set as the default. Should match one of the versions listed by \texttt{pyenv.versions}. Leave blank to return the current default.

CLI Example:

```
salt '*' pyenv.default
salt '*' pyenv.default 2.0.0-p0
```

\texttt{salt.modules.pyenv.do(cmdline=None, runas=None)}

Execute a python command with pyenv’s shims from the user or the system.

CLI Example:

```
salt '*' pyenv.do 'gem list bundler'
salt '*' pyenv.do 'gem list bundler' deploy
```

\texttt{salt.modules.pyenv.do\_with\_python(python, cmdline=None, runas=None)}

Execute a python command with pyenv’s shims using a specific python version.

CLI Example:

```
salt '*' pyenv.do\_with\_python 2.0.0-p0 'gem list bundler'
salt '*' pyenv.do\_with\_python 2.0.0-p0 'gem list bundler' deploy
```

\texttt{salt.modules.pyenv.install(runas=None, path=None)}

Install pyenv systemwide

CLI Example:

```
salt '*' pyenv.install
```

\texttt{salt.modules.pyenv.install\_python(python, runas=None)}

Install a python implementation.

\texttt{python} The version of python to install, should match one of the versions listed by pyenv.list

CLI Example:

```
salt '*' pyenv.install\_python 2.0.0-p0
```

\texttt{salt.modules.pyenv.is\_installed(runas=None)}

Check if pyenv is installed.

CLI Example:

```
salt '*' pyenv.is\_installed
```

\texttt{salt.modules.pyenv.list_(runas=None)}

List the installable versions of python.

CLI Example:

```
salt '*' pyenv.list
```

\texttt{salt.modules.pyenv.rehash(runas=None)}

Run pyenv rehash to update the installed shims.

CLI Example:

```
salt '*' pyenv.rehash
```

\texttt{salt.modules.pyenv.uninstall\_python(python, runas=None)}

Uninstall a python implementation.
python  The version of python to uninstall. Should match one of the versions listed by `pyenv.versions`
CLI Example:

```
salt '*' pyenv.uninstall_python 2.0.0-p0
```

`salt.modules.pyenv.update(runas=None, path=None)`
Updates the current versions of pyenv and python-Build
CLI Example:

```
salt '*' pyenv.update
```

`salt.modules.pyenv.versions(runas=None)`
List the installed versions of python.
CLI Example:

```
salt '*' pyenv.versions
```

### 21.9.339 salt.modules.qemu_img

**Qemu-img Command Wrapper**

The qemu img command is wrapped for specific functions

- `depends` qemu-img

`salt.modules.qemu_img.convert(orig, dest, fmt)`
Convert an existing disk image to another format using qemu-img

CLI Example:

```
salt '*' qemu_img.convert /path/to/original.img /path/to/new.img qcow2
```

`salt.modules.qemu_img.make_image(location, size, fmt)`
Create a blank virtual machine image file of the specified size in megabytes. The image can be created in any format supported by qemu

CLI Example:

```
salt '*' qemu_img.make_image /tmp/image.qcow 2048 qcow2
salt '*' qemu_img.make_image /tmp/image.raw 10240 raw
```

### 21.9.340 salt.modules.qemu_nbd

**Qemu Command Wrapper**

The qemu system comes with powerful tools, such as qemu-img and qemu-nbd which are used here to build up kvm images.

`salt.modules.qemu_nbd.clear(mnt)`
Pass in the mnt dict returned from nbd_mount to unmount and disconnect the image from nbd. If all of the partitions are unmounted return an empty dict, otherwise return a dict containing the still mounted partitions

CLI Example:
salt '*' qemu_nbd.clear '{"/mnt/foo": "/dev/nbd0p1"}'

salt.modules.qemu_nbd.connect(image)
Activate nbd for an image file.
CLI Example:
salt '*' qemu_nbd.connect /tmp/image.raw

salt.modules.qemu_nbd.init(image, root=None)
Mount the named image via qemu-nbd and return the mounted roots
CLI Example:
salt '*' qemu_nbd.init /srv/image.qcow2

salt.modules.qemu_nbd.mount(nbd, root=None)
Pass in the nbd connection device location, mount all partitions and return a dict of mount points
CLI Example:
salt '*' qemu_nbd.mount /dev/nbd0

21.9.341 salt.modules.quota

Module for managing quotas on POSIX-like systems.
salt.modules.quota.get_mode(device)
Report whether the quota system for this device is on or off
CLI Example:
salt '*' quota.get_mode

salt.modules.quota.off(device)
Turns off the quota system
CLI Example:
salt '*' quota.off

salt.modules.quota.on(device)
Turns on the quota system
CLI Example:
salt '*' quota.on

salt.modules.quota.report(mount)
Report on quotas for a specific volume
CLI Example:
salt '*' quota.report /media/data

salt.modules.quota.set_(device, **kwargs)
Calls out to setquota, for a specific user or group
CLI Example:
salt.modules.quota.stats()
Runs the quotastats command, and returns the parsed output

CLI Example:
salt '*' quota.stats

salt.modules.quota.warn()
Runs the warnquota command, to send warning emails to users who are over their quota limit.

CLI Example:
salt '*' quota.warn

21.9.342 salt.modules.rabbitmq
Module to provide RabbitMQ compatibility to Salt. Todo: A lot, need to add cluster support, logging, and minion configuration data.

salt.modules.rabbitmq.add_user(name, password=None, runas=None)
Add a rabbitMQ user via rabbitmqctl user_add <user> <password>

CLI Example:
salt '*' rabbitmq.add_user rabbit_user password

salt.modules.rabbitmq.add_vhost(vhost, runas=None)
Adds a vhost via rabbitmqctl add_vhost.

CLI Example:
salt '*' rabbitmq.add_vhost '<vhost_name>'

salt.modules.rabbitmq.change_password(name, password, runas=None)
Changes a user's password.

CLI Example:
salt '*' rabbitmq.change_password rabbit_user password

salt.modules.rabbitmq.check_password(name, password, runas=None)
New in version 2016.3.0.
Checks if a user's password is valid.

CLI Example:
salt '*' rabbitmq.check_password rabbit_user password

salt.modules.rabbitmq.clear_password(name, runas=None)
Removes a user's password.

CLI Example:
salt '*' rabbitmq.clear_password rabbit_user

salt.modules.rabbitmq.cluster_status(runas=None)
    return rabbitmq.cluster_status
    CLI Example:
    salt '*' rabbitmq.cluster_status

salt.modules.rabbitmq.delete_policy(vhost, name, runas=None)
    Delete a policy based on rabbitmqctl clear_policy.
    Reference: http://www.rabbitmq.com/ha.html
    CLI Example:
    salt '*' rabbitmq.delete_policy / HA

salt.modules.rabbitmq.delete_user(name, runas=None)
    Deletes a user via rabbitmqctl delete_user.
    CLI Example:
    salt '*' rabbitmq.delete_user rabbit_user

salt.modules.rabbitmq.delete_vhost(vhost, runas=None)
    Deletes a vhost rabbitmqctl delete_vhost.
    CLI Example:
    salt '*' rabbitmq.delete_vhost '<vhost_name>'

salt.modules.rabbitmq.disable_plugin(name, runas=None)
    Disable a RabbitMQ plugin via the rabbitmq-plugins command.
    CLI Example:
    salt '*' rabbitmq.disable_plugin foo

salt.modules.rabbitmq.enable_plugin(name, runas=None)
    Enable a RabbitMQ plugin via the rabbitmq-plugins command.
    CLI Example:
    salt '*' rabbitmq.enable_plugin foo

salt.modules.rabbitmq.force_reset(runas=None)
    Forcefully Return a RabbitMQ node to its virgin state
    CLI Example:
    salt '*' rabbitmq.force_reset

salt.modules.rabbitmq.join_cluster(host, user='rabbit', ram_node=None, runas=None)
    Join a rabbit cluster
    CLI Example:
    salt '*' rabbitmq.join_cluster rabbit.example.com rabbit
salt.modules.rabbitmq.list_available_plugins(runas=None)
    Returns a list of the names of all available plugins (enabled and disabled).
    CLI Example:
    ```
    salt '*' rabbitmq.list_available_plugins
    ```

salt.modules.rabbitmq.list_enabled_plugins(runas=None)
    Returns a list of the names of the enabled plugins.
    CLI Example:
    ```
    salt '*' rabbitmq.list_enabled_plugins
    ```

salt.modules.rabbitmq.list_permissions(vhost, runas=None)
    Lists permissions for vhost via rabbitmqctl list_permissions
    CLI Example:
    ```
    salt '*' rabbitmq.list_permissions /myvhost
    ```

salt.modules.rabbitmq.list_policies(vhost='/', runas=None)
    Return a dictionary of policies nested by vhost and name based on the data returned from rabbitmqctl list_policies.
    Reference: http://www.rabbitmq.com/ha.html
    CLI Example:
    ```
    salt '*' rabbitmq.list_policies
    ```

salt.modules.rabbitmq.list_queues(runas=None, *args)
    Returns queue details of the / virtual host
    CLI Example:
    ```
    salt '*' rabbitmq.list_queues messages consumers
    ```

salt.modules.rabbitmq.list_queues_vhost(vhost, runas=None, *args)
    Returns queue details of specified virtual host. This command will consider first parameter as the vhost name and rest will be treated as queueinfoitem. For getting details on vhost /, use list_queues instead).
    CLI Example:
    ```
    salt '*' rabbitmq.list_queues_vhost messages consumers
    ```

salt.modules.rabbitmq.list_user_permissions(name, runas=None)
    List permissions for a user via rabbitmqctl list_user_permissions
    CLI Example:
    ```
    salt '*' rabbitmq.list_user_permissions user
    ```

salt.modules.rabbitmq.list_users(runas=None)
    Return a list of users based off of rabbitmqctl user_list.
    CLI Example:
    ```
    salt '*' rabbitmq.list_users
```
salt.modules.rabbitmq.list_vhosts(runas=None)
   Return a list of vhost based on rabbitmqctl list_vhosts.
   CLI Example:
   ```
salt '*' rabbitmq.list_vhosts
   ```

salt.modules.rabbitmq.plugin_is_enabled(name, runas=None)
   Return whether the plugin is enabled.
   CLI Example:
   ```
salt '*' rabbitmq.plugin_is_enabled rabbitmq_plugin_name
   ```

salt.modules.rabbitmq.policy_exists(vhost, name, runas=None)
   Return whether the policy exists based on rabbitmqctl list_policies.
   Reference: http://www.rabbitmq.com/ha.html
   CLI Example:
   ```
salt '*' rabbitmq.policy_exists / HA
   ```

salt.modules.rabbitmq.reset(runas=None)
   Return a RabbitMQ node to its virgin state
   CLI Example:
   ```
salt '*' rabbitmq.reset
   ```

salt.modules.rabbitmq.set_permissions(vhost, user, conf='.*', write='.*', read='.*', runas=None)
   Sets permissions for vhost via rabbitmqctl set_permissions
   CLI Example:
   ```
salt '*' rabbitmq.set_permissions myvhost myuser
   ```

salt.modules.rabbitmq.set_policy(vhost, name, pattern, definition, priority=None, runas=None, apply_to=None)
   Set a policy based on rabbitmqctl set_policy.
   Reference: http://www.rabbitmq.com/ha.html
   CLI Example:
   ```
salt '*' rabbitmq.set_policy / HA '.', '"ha-mode":"all"'
   ```

salt.modules.rabbitmq.set_user_tags(name, tags, runas=None)
   Add user tags via rabbitmqctl set_user_tags
   CLI Example:
   ```
salt '*' rabbitmq.set_user_tags myadmin administrator
   ```

salt.modules.rabbitmq.start_app(runas=None)
   Start the RabbitMQ application.
   CLI Example:
   ```
salt '*' rabbitmq.start_app
   ```
salt.modules.rabbitmq.status(runas=None)
    return rabbitmq status

    CLI Example:
    salt '*' rabbitmq.status

salt.modules.rabbitmq.stop_app(runas=None)
    Stops the RabbitMQ application, leaving the Erlang node running.

    CLI Example:
    salt '*' rabbitmq.stop_app

salt.modules.rabbitmq.user_exists(name, runas=None)
    Return whether the user exists based on rabbitmqctl list_users.

    CLI Example:
    salt '*' rabbitmq.user_exists rabbit_user

salt.modules.rabbitmq.vhost_exists(name, runas=None)
    Return whether the vhost exists based on rabbitmqctl list_vhosts.

    CLI Example:
    salt '*' rabbitmq.vhost_exists rabbit_host

21.9.343 salt.modules.raet_publish

Publish a command from a minion to a target

salt.modules.raet_publish.full_data(tgt, fun, arg=None, tgt_type='glob'; returner='', timeout=5)
    Return the full data about the publication, this is invoked in the same way as the publish function.

    CLI Example:
    salt system.example.com publish.full_data '*' cmd.run 'ls -la /tmp'

Attention

If you need to pass a value to a function argument and that value contains an equal sign, you must include the argument name. For example:

    salt '*' publish.full_data test.kwarg arg='cheese=spam'

salt.modules.raet_publish.publish(tgt, fun, arg=None, tgt_type='glob'; returner='', timeout=5)
    Publish a command from the minion out to other minions.

Publications need to be enabled on the Salt master and the minion needs to have permission to publish the command. The Salt master will also prevent a recursive publication loop, this means that a minion cannot command another minion to command another minion as that would create an infinite command loop.

The tgt_type argument is used to pass a target other than a glob into the execution, the available options are:

- glob
- pcre
- grain
- grain_pcre
- pillar
- pillar_pcre
- ipcidr
- range
- compound

Changed in version 2017.7.0: The expr_form argument has been renamed to tgt_type, earlier releases must use expr_form.

The arguments sent to the minion publish function are separated with commas. This means that for a minion executing a command with multiple args it will look like this:

```bash
salt system.example.com publish.publish '* user.add foo,1020,1020'
salt system.example.com publish.publish 'os:Fedora' network.interfaces '' grain
```

CLI Example:

```bash
salt system.example.com publish.publish '* cmd.run ls -la /tmp'
```

**Attention**

If you need to pass a value to a function argument and that value contains an equal sign, you **must** include the argument name. For example:

```bash
salt '*' publish.publish test.kwarg arg='cheese=spam'
```

salt.modules.raet_publish.runner(fun, arg=None, timeout=5)

Execute a runner on the master and return the data from the runner function

CLI Example:

```bash
salt publish.runner manage.down
```

### 21.9.344 salt.modules.rallydev

Support for RallyDev

New in version 2015.8.0.

Requires a **username** and a **password** in `/etc/salt/minion`:

salt.modules.rallydev.list_items(name)

List items of a particular type

CLI Examples:

```bash
salt myminion rallydev.list_<item name>s
salt myminion rallydev.list_users
salt myminion rallydev.list_artifacts
```

salt.modules.rallydev.list_users()

List the users

CLI Example:
salt.myminion.rallydev.list_users

salt.modules.rallydev.query_item(name, query_string, order='Rank')
Query a type of record for one or more items. Requires a valid query string. See https://rally1.rallydev.com/slm/doc/webservice/introduction.jsp for information on query syntax.

CLI Example:
{
  salt.myminion.rallydev.query_<item name> <query string> [order]
  salt.myminion.rallydev.query_task 'Name contains github'
  salt.myminion.rallydev.query_task 'Name contains reactor' order='Rank'
}

salt.modules.rallydev.query_user(query_string, order='UserName')
Update a user

CLI Example:
{
  salt.myminion.rallydev.query_user 'Name contains Jo'
}

salt.modules.rallydev.show_artifact(id_)
Show an artifact

CLI Example:
{
  salt.myminion.rallydev.show_artifact <artifact id>
}

salt.modules.rallydev.show_item(name, id_)
Show an item

CLI Example:
{
  salt.myminion.rallydev.show_<item name> <item id>
}

salt.modules.rallydev.show_user(id_)
Show a user

CLI Example:
{
  salt.myminion.rallydev.show_user <user id>
}

salt.modules.rallydev.update_item(name, id_, field=None, value=None, postdata=None)
Update an item. Either a field and a value, or a chunk of POST data, may be used, but not both.

CLI Example:
{
  salt.myminion.rallydev.update_<item name> <item id> field=<field> value=<value>
  salt.myminion.rallydev.update_<item name> <item id> postdata=<post data>
}

salt.modules.rallydev.update_user(id_, field, value)
Update a user

CLI Example:
{
  salt.myminion.rallydev.update_user <user id> <field> <new value>
}

21.9.345 salt.modules.random_org
Module for retrieving random information from Random.org

21.9. execution modules
New in version 2015.5.0.

**configuration**  This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

```yaml
random_org:
  api_key: 7be1402d-5719-5bd3-a306-3def9f135da5
  api_version: 1
```

```python
salt.modules.random_org.generateBlobs(api_key=None, api_version=None, **kwargs)
```

List all Slack users.

**Parameters**

- `api_key` – The Random.org api key.
- `format` – Specifies the format in which the blobs will be returned. Values allowed are base64 and hex.

**Returns**  The user list.

CLI Example:

```bash
salt '*' get_integers number=5 min=1 max=6
salt '*' get_integers number=5 min=1 max=6
```

```python
salt.modules.random_org.generateDecimalFractions(api_key=None, api_version=None, **kwargs)
```

Generates true random decimal fractions

**Parameters**

- `api_key` – The Random.org api key.
- `number` – How many random decimal fractions you need. Must be within the [1,1e4] range.
- `decimalPlaces` – The number of decimal places to use. Must be within the [1,20] range.
- `replacement` – Specifies whether the random numbers should be picked with replacement. The default (true) will cause the numbers to be picked with replacement, i.e., the resulting numbers may contain duplicate values (like a series of dice rolls). If you want the numbers picked to be unique (like raffle tickets drawn from a container), set this value to false.

**Returns**  A list of decimal fraction

CLI Example:

```bash
salt '*' random_org.generateDecimalFractions number=10 decimalPlaces=4
salt '*' random_org.generateDecimalFractions number=10 decimalPlaces=4
replacement=True
```

```python
salt.modules.random_org.generateGaussians(api_key=None, api_version=None, **kwargs)
```

This method generates true random numbers from a Gaussian distribution (also known as a normal distribution).

**Parameters**

- `api_key` – The Random.org api key.
- `number` – How many random numbers you need. Must be within the [1,1e4] range.
- `mean` – The distribution’s mean. Must be within the [-1e6,1e6] range.
• **standardDeviation** – The distribution’s standard deviation. Must be within the [-1e6,1e6] range.
• **significantDigits** – The number of significant digits to use. Must be within the [2,20] range.

**Returns**  The user list.

**CLI Example:**
```
salt '*' random_org.generateGaussians number=10 mean=0.0 standardDeviation=1.0 significantDigits=8
```

salt.modules.random_org.generateIntegers(*api_key=None, api_version=None, **kwargs*)

Generate random integers

**Parameters**
- **api_key** – The Random.org api key.
- **api_version** – The Random.org api version.
- **number** – The number of integers to generate
- **minimum** – The lower boundary for the range from which the random numbers will be picked. Must be within the [-1e9,1e9] range.
- **maximum** – The upper boundary for the range from which the random numbers will be picked. Must be within the [-1e9,1e9] range.
- **replacement** – Specifies whether the random numbers should be picked with replacement. The default (true) will cause the numbers to be picked with replacement, i.e., the resulting numbers may contain duplicate values (like a series of dice rolls). If you want the numbers picked to be unique (like raffle tickets drawn from a container), set this value to false.
- **base** – Specifies the base that will be used to display the numbers. Values allowed are 2, 8, 10 and 16. This affects the JSON types and formatting of the resulting data as discussed below.

**Returns**  A list of integers.

**CLI Example:**
```
salt '*' random_org.generateIntegers number=5 minimum=1 maximum=6
salt '*' random_org.generateIntegers number=5 minimum=2 maximum=255 base=2
```

salt.modules.random_org.generateStrings(*api_key=None, api_version=None, **kwargs*)

Generate random strings.

**Parameters**
- **api_key** – The Random.org api key.
- **api_version** – The Random.org api version.
- **number** – The number of strings to generate.
- **length** – The length of each string. Must be within the [1,20] range. All strings will be of the same length
- **characters** – A string that contains the set of characters that are allowed to occur in the random strings. The maximum number of characters is 80.
- **replacement** – Specifies whether the random strings should be picked with replacement. The default (true) will cause the strings to be picked with replacement, i.e., the resulting list of strings may contain duplicates (like a series of dice rolls). If you want the strings to be unique (like raffle tickets drawn from a container), set this value to false.

**Returns**  A list of strings.

**CLI Example:**
```
salt '*' random_org.generateStrings number=5 length=8 characters=abcdefghijklmnopqrstuvwxyz
```
salt '***' random_org.generateStrings number=10 length=16 characters ← 'abcdefgijklmnopqrstuvwxyz'

salt.modules.random_org.generateUUIDs(api_key=None, api_version=None, **kwargs)
Generate a list of random UUIDs
Parameters
• api_key – The Random.org api key.
• api_version – The Random.org api version.
• number – How many random UUIDs you need. Must be within the [1,1e3] range.
Returns A list of UUIDs
CLI Example:
salt '***' random_org.generateUUIDs number=5

salt.modules.random_org.getUsage(api_key=None, api_version=None)
Show current usages statistics
Parameters
• api_key – The Random.org api key.
• api_version – The Random.org api version.
Returns The current usage statistics.
CLI Example:
salt '***' random_org.getUsage
salt '***' random_org.getUsage api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15 api_version=1

21.9.346 salt.modules.rbac_solaris
Module for Solaris’ Role-Based Access Control
salt.modules.rbac_solaris.auth_add(user, auth)
Add authorization to user
user [string] username
auth [string] authorization name
CLI Example:
salt '***' rbac.auth_add martine solaris.zone.manage
salt '***' rbac.auth_add martine solaris.zone.manage,solaris.mail.mailq

salt.modules.rbac_solaris.auth_get(user, computed=True)
List authorization for user
user [string] username
computed [boolean] merge results from auths command into data from user_attr
CLI Example:
salt '***' rbac.auth_get leo

salt.modules.rbac_solaris.auth_list()
List all available authorization
CLI Example:
salt '*/' rbac.auth_list

salt.modules.rbac_solaris.auth_rm(user, auth)
Remove authorization from user
user [string] username
auth [string] authorization name
CLI Example:
salt '*/' rbac.auth_rm jorge solaris.zone.manage
salt '*/' rbac.auth_rm jorge solaris.zone.manage,solaris.mail.mailq

salt.modules.rbac_solaris.profile_add(user, profile)
Add profile to user
user [string] username
profile [string] profile name
CLI Example:
salt '*/' rbac.profile_add martine 'Primary Administrator'
salt '*/' rbac.profile_add martine 'User Management,User Security'

salt.modules.rbac_solaris.profile_get(user, default_hidden=True)
List profiles for user
user [string] username
default_hidden [boolean] hide default profiles
CLI Example:
salt '*/' rbac.profile_get leo
salt '*/' rbac.profile_get leo default_hidden=False

salt.modules.rbac_solaris.profile_list(default_only=False)
List all available profiles
default_only [boolean] return only default profile
CLI Example:
salt '*/' rbac.profile_list

salt.modules.rbac_solaris.profile_rm(user, profile)
Remove profile from user
user [string] username
profile [string] profile name
CLI Example:
salt '*/' rbac.profile_rm jorge 'Primary Administrator'
salt '*/' rbac.profile_rm jorge 'User Management,User Security'

salt.modules.rbac_solaris.role_add(user, role)
Add role to user
user [string] username
role [string] role name
CLI Example:
salt '*' rbac.role_add martine netcfg
salt '*' rbac.role_add martine netcfg,zfssnap

salt.modules.rbac_solaris.role_get(user)
List roles for user
user [string] username
   CLI Example:
   
   salt '*' rbac.role_get leo

salt.modules.rbac_solaris.role_list()
   List all available roles
   CLI Example:
   
   salt '*' rbac.role_list

salt.modules.rbac_solaris.role_rm(user, role)
   Remove role from user
   user [string] username
   role [string] role name
   CLI Example:
   
   salt '*' rbac.role_rm jorge netcfg
   salt '*' rbac.role_rm jorge netcfg,zfssnap

21.9.347 salt.modules.rbenv

Manage ruby installations with rbenv. rbenv is supported on Linux and macOS. rbenv doesn’t work on Windows (and isn’t really necessary on Windows as there is no system Ruby on Windows). On Windows, the RubyInstaller and/or Pik are both good alternatives to work with multiple versions of Ruby on the same box.

http://misheska.com/blog/2013/06/15/using-rbenv-to-manage-multiple-versions-of-ruby/

New in version 0.16.0.

salt.modules.rbenv.default(ruby=None, runas=None)
   Returns or sets the currently defined default ruby
   ruby The version to set as the default. Should match one of the versions listed by rbenv.versions. Leave blank to return the current default.
   CLI Example:
   
   salt '*' rbenv.default
   salt '*' rbenv.default 2.0.0-p0

salt.modules.rbenv.do(cmdline, runas=None, env=None)
   Execute a ruby command with rbenv’s shims from the user or the system
   CLI Example:
   
   salt '*' rbenv.do 'gem list bundler'
salt '*' rbenv.do 'gem list bundler' deploy

salt.modules.rbenv.do_with_ruby(ruby, cmdline, runas=None)
   Execute a ruby command with rbenv’s shims using a specific ruby version
   CLI Example:
   
   salt '*' rbenv.do_with_ruby 2.0.0-p0 'gem list bundler'
salt '*' rbenv.do_with_ruby 2.0.0-p0 'gem list bundler' runas=deploy

salt.modules.rbenv.install(runas=None, path=None)
   Install rbenv systemwide
CLI Example:
```
salt '*' rbenv.install  
```

salt.modules.rbenv.install_ruby(ruby, runas=None)
Install a ruby implementation.
ruby The version of Ruby to install, should match one of the versions listed by rbenv.list
runas The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

Additional environment variables can be configured in pillar / grains / master:
```
rbenv:
  build_env: 'CONFIGURE_OPTS="--no-tcmalloc" CFLAGS="-fno-tree-dce"
```

CLI Example:
```
salt '*' rbenv.install_ruby 2.0.0-p0
```

salt.modules.rbenv.is_installed(runas=None)
Check if rbenv is installed

CLI Example:
```
salt '*' rbenv.is_installed
```

salt.modules.rbenv.list_(runas=None)
List the installable versions of ruby
runas The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

CLI Example:
```
salt '*' rbenv.list
```

salt.modules.rbenv.rehash(runas=None)
Run rbenv rehash to update the installed shims
runas The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

CLI Example:
```
salt '*' rbenv.rehash
```

salt.modules.rbenv.uninstall_ruby(ruby, runas=None)
Uninstall a ruby implementation.
ruby The version of ruby to uninstall. Should match one of the versions listed by rbenv.versions.
runas The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

CLI Example:
```
salt '*' rbenv.uninstall_ruby 2.0.0-p0
```

salt.modules.rbenv.update(runas=None, path=None)
Updates the current versions of rbenv and ruby-build
runas The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

CLI Example:
salt '*

salt.modules.rbenv.versions(**runas=None**)
List the installed versions of ruby

CLI Example:
```
salt '*
rbc.versions
```

21.9.348 salt.modules.rdp

Manage RDP Service on Windows servers

salt.modules.rdp.disable()
Disable RDP the service on the server

CLI Example:
```
salt '*
rdb.disable
```

salt.modules.rdp.disconnect_session(**session_id**)
Disconnect a session.

New in version 2016.11.0.

Parameters **session_id** – The numeric Id of the session.

Returns A boolean representing whether the disconnect succeeded.

CLI Example:
```
salt '*
rdb.disconnect_session session_id
```
```
salt '*
rdb.disconnect_session 99
```

salt.modules.rdp.enable()
Enable RDP the service on the server

CLI Example:
```
salt '*
rdb.enable
```

salt.modules.rdp.get_session(**session_id**)
Get information about a session.

New in version 2016.11.0.

Parameters **session_id** – The numeric Id of the session.

Returns A dictionary of session information.

CLI Example:
```
salt '*
rdb.get_session session_id
```
```
salt '*
rdb.get_session 99
```

salt.modules.rdp.list_sessions(**logged_in_users_only=False**)
List information about the sessions.

New in version 2016.11.0.

Parameters **logged_in_users_only** – If True, only return sessions with users logged in.

Returns A list containing dictionaries of session information.
**CLI Example:**

```
salt '*' rdp.list_sessions
```

**salt.modules.rdp.logoff_session(session_id)**

Initiate the logoff of a session.

New in version 2016.11.0.

- **Parameters**
  - `session_id` - The numeric Id of the session.
- **Returns**
  A boolean representing whether the logoff succeeded.

**CLI Example:**

```
salt '*' rdp.logoff_session session_id
salt '*' rdp.logoff_session 99
```

**salt.modules.rdp.status()**

Show if rdp is enabled on the server

**CLI Example:**

```
salt '*' rdp.status
```

---

### 21.9.349 salt.modules.redis

Module to provide redis functionality to Salt

New in version 2014.7.0.

- **configuration** This module requires the redis python module and uses the following defaults which may be overridden in the minion configuration:

  ```
  redis.host: 'salt'
  redis.port: 6379
  redis.db: 0
  redis.password: None
  ```

**salt.modules.redismod.bgrewriteaof(host=None, port=None, db=None, password=None)**

Asynchronously rewrite the append-only file

**CLI Example:**

```
salt '*' redis.bgrewriteaof
```

**salt.modules.redismod.bgsave(host=None, port=None, db=None, password=None)**

Asynchronously save the dataset to disk

**CLI Example:**

```
salt '*' redis.bgsave
```

**salt.modules.redismod.config_get(pattern='*', host=None, port=None, db=None, password=None)**

Get redis server configuration values

**CLI Example:**

```
salt '*' redis.config_get
salt '*' redis.config_get port
```
salt.modules.redismod.config_set(name, value, host=None, port=None, db=None, password=None)

Set redis server configuration values

CLI Example:

```
salt '*' redis.config_set masterauth luv_kittens
```

salt.modules.redismod.dbsize(host=None, port=None, db=None, password=None)

Return the number of keys in the selected database

CLI Example:

```
salt '*' redis.dbsize
```

salt.modules.redismod.delete(*keys, **connection_args)

Deletes the keys from redis, returns number of keys deleted

CLI Example:

```
salt '*' redis.delete foo
```

salt.modules.redismod.exists(key, host=None, port=None, db=None, password=None)

Return true if the key exists in redis

CLI Example:

```
salt '*' redis.exists foo
```

salt.modules.redismod.expire(key, seconds, host=None, port=None, db=None, password=None)

Set a keys time to live in seconds

CLI Example:

```
salt '*' redis.expire foo 300
```

salt.modules.redismod.expireat(key, timestamp, host=None, port=None, db=None, password=None)

Set a keys expire at given UNIX time

CLI Example:

```
salt '*' redis.expireat foo 1400000000
```

salt.modules.redismod.flushall(host=None, port=None, db=None, password=None)

Remove all keys from all databases

CLI Example:

```
salt '*' redis.flushall
```

salt.modules.redismod.flushdb(host=None, port=None, db=None, password=None)

Remove all keys from the selected database

CLI Example:

```
salt '*' redis.flushdb
```

salt.modules.redismod.get_key(key, host=None, port=None, db=None, password=None)

Get redis key value
CLI Example:
```
salt '*\n
```
salt.modules.redismod.get_master_ip(host=None, port=None, password=None)
Get host information about slave

CLI Example:
```
salt '*\n
```
salt.modules.redismod.hdel(key, *fields, **options)
Delete one of more hash fields.
New in version 2017.7.0.

CLI Example:
```
salt '*\n
```
salt.modules.redismod.hexists(key, field, host=None, port=None, db=None, password=None)
Determine if a hash fields exists.
New in version 2017.7.0.

CLI Example:
```
salt '*\n
```
salt.modules.redismod.hget(key, field, host=None, port=None, db=None, password=None)
Get specific field value from a redis hash, returns dict

CLI Example:
```
salt '*\n
```
salt.modules.redismod.hgetall(key, host=None, port=None, db=None, password=None)
Get all fields and values from a redis hash, returns dict

CLI Example:
```
salt '*\n
```
salt.modules.redismod.hincrby(key, field, increment=1, host=None, port=None, db=None, password=None)
Increment the integer value of a hash field by the given number.
New in version 2017.7.0.

CLI Example:
```
salt '*\n
```
salt.modules.redismod.hincrbyfloat(key, field, increment=1.0, host=None, port=None, db=None, password=None)
Increment the float value of a hash field by the given number.
New in version 2017.7.0.

CLI Example:
salt '*/' redis.hincrbyfloat foo_hash bar_field 5.17

salt.modules.redismod.hlen(\texttt{key, host=None, port=None, db=None, password=None})
Returns number of fields of a hash.
New in version 2017.7.0.
CLI Example:
\begin{verbatim}
salt '*/' redis.hlen foo_hash
\end{verbatim}

salt.modules.redismod.hmget(\texttt{key, *fields, **options})
Returns the values of all the given hash fields.
New in version 2017.7.0.
CLI Example:
\begin{verbatim}
salt '*/' redis.hmget foo_hash bar_field1 bar_field2
\end{verbatim}

salt.modules.redismod.hmset(\texttt{key, **fieldsvals})
Sets multiple hash fields to multiple values.
New in version 2017.7.0.
CLI Example:
\begin{verbatim}
salt '*/' redis.hmset foo_hash bar_field1=bar_value1 bar_field2=bar_value2
\end{verbatim}

salt.modules.redismod.hscan(\texttt{key, cursor=0, match=None, count=None, host=None, port=None, db=None, password=None})
Incrementally iterate hash fields and associated values.
New in version 2017.7.0.
CLI Example:
\begin{verbatim}
salt '*/' redis.hscan foo_hash match='field_prefix_*' count=1
\end{verbatim}

salt.modules.redismod.hset(\texttt{key, field, value, host=None, port=None, db=None, password=None})
Set the value of a hash field.
New in version 2017.7.0.
CLI Example:
\begin{verbatim}
salt '*/' redis.hset foo_hash bar_field bar_value
\end{verbatim}

salt.modules.redismod.hsetnx(\texttt{key, field, value, host=None, port=None, db=None, password=None})
Set the value of a hash field only if the field does not exist.
New in version 2017.7.0.
CLI Example:
\begin{verbatim}
salt '*/' redis.hsetnx foo_hash bar_field bar_value
\end{verbatim}

salt.modules.redismod.hvals(\texttt{key, host=None, port=None, db=None, password=None})
Return all the values in a hash.
New in version 2017.7.0.
CLI Example:
salt 'foo_hash' hvals 'bar_field1' 'bar_value1'
salt.modules.redismod.info(host=None, port=None, db=None, password=None)
Get information and statistics about the server
CLI Example:
salt '*' redis.info

salt.modules.redismod.key_type(key, host=None, port=None, db=None, password=None)
Get redis key type
CLI Example:
salt '*' redis.type foo

salt.modules.redismod.keys(pattern='*', host=None, port=None, db=None, password=None)
Get redis keys, supports glob style patterns
CLI Example:
salt '*' redis.keys
salt '*' redis.keys test*

salt.modules.redismod.lastsave(host=None, port=None, db=None, password=None)
Get the UNIX time in seconds of the last successful save to disk
CLI Example:
salt '*' redis.lastsave

salt.modules.redismod.llen(key, host=None, port=None, db=None, password=None)
Get the length of a list in Redis
CLI Example:
salt '*' redis.llen foo_list

salt.modules.redismod.lrange(key, start, stop, host=None, port=None, db=None, password=None)
Get a range of values from a list in Redis
CLI Example:
salt '*' redis.lrange foo_list 0 10

salt.modules.redismod.ping(host=None, port=None, db=None, password=None)
Ping the server, returns False on connection errors
CLI Example:
salt '*' redis.ping

salt.modules.redismod.save(host=None, port=None, db=None, password=None)
Synchronously save the dataset to disk
CLI Example:
salt '*' redis.save
salt.modules.redismod.sentinel_get_master_ip(master, host=None, port=None, password=None)
Get ip for sentinel master

CLI Example:
```
salt '*' redis.sentinel_get_master_ip 'mymaster'
```

salt.modules.redismod.set_key(key, value, host=None, port=None, db=None, password=None)
Set redis key value

CLI Example:
```
salt '*' redis.set_key foo bar
```

salt.modules.redismod.shutdown(host=None, port=None, db=None, password=None)
Synchronously save the dataset to disk and then shut down the server

CLI Example:
```
salt '*' redis.shutdown
```

salt.modules.redismod.slaveof(master_host=None, master_port=None, host=None, port=None, db=None, password=None)
Make the server a slave of another instance, or promote it as master

CLI Example:
```
# Become slave of redis-n01.example.com:6379
salt '*' redis.slaveof redis-n01.example.com:6379
salt '*' redis.slaveof redis-n01.example.com
# Become master
salt '*' redis.slaveof
```

salt.modules.redismod.smembers(key, host=None, port=None, db=None, password=None)
Get members in a Redis set

CLI Example:
```
salt '*' redis.smembers foo_set
```

salt.modules.redismod.time(host=None, port=None, db=None, password=None)
Return the current server UNIX time in seconds

CLI Example:
```
salt '*' redis.time
```

salt.modules.redismod.zcard(key, host=None, port=None, db=None, password=None)
Get the length of a sorted set in Redis

CLI Example:
```
salt '*' redis.zcard foo_sorted
```

salt.modules.redismod.zrange(key, start, stop, host=None, port=None, db=None, password=None)
Get a range of values from a sorted set in Redis by index

CLI Example:
21.9.350 salt.modules.reg

Manage the Windows registry

Hives

Hives are the main sections of the registry and all begin with the word HKEY.

- HKEY_LOCAL_MACHINE
- HKEY_CURRENT_USER
- HKEY_USER

Keys

Keys are the folders in the registry. Keys can have many nested subkeys. Keys can have a value assigned to them under the (Default)

When passing a key on the CLI it must be quoted correctly depending on the backslashes being used (\ vs \\). The following are valid methods of passing the key on the CLI:

Using single backslashes: "SOFTWARE\Python" 'SOFTWARE\Python' (will not work on a Windows Master)
Using double backslashes: SOFTWARE\\Python

Values or Entries

Values or Entries are the name/data pairs beneath the keys and subkeys. All keys have a default name/data pair. The name is (Default) with a displayed value of (value not set). The actual value is Null.

Example

The following example is an export from the Windows startup portion of the registry:

```
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Run]
"RTHDVCPL"=""C:\\Program Files\\Realtek\\Audio\\HDA\\RtkNGUI64.exe" -s"
"NvBackend"=""C:\\Program Files (x86)\\NVIDIA Corporation\\Update Core\\NvBackend.\n--exe"
"BTMTrayAgent"="rundll32.exe "C:\\Program Files (x86)\\Intel\\Bluetooth\\btmshelllex.\n--dll\",TrayApp"
```

In this example these are the values for each:

Hive: HKEY_LOCAL_MACHINE
Key and subkeys: SOFTWARE\Microsoft\Windows\CurrentVersion\Run
Value:

- There are 3 value names:
  - RTHDVCPL
Each value name has a corresponding value

depends
  - salt.utils.win_reg

salt.modules.reg.broadcast_change()

Refresh the windows environment.

Note: This will only effect new processes and windows. Services will not see the change until the system restarts.

Returns True if successful, otherwise False
Return type bool

CLI Example:
salt '*' reg.broadcast_change

salt.modules.reg.delete_key_recursive(hive, key, use_32bit_registry=False)
New in version 2015.5.4.

Delete a registry key to include all subkeys and value/data pairs.

Parameters
  - hive (str) - The name of the hive. Can be one of the following
    - HKEY_LOCAL_MACHINE or HKLM
    - HKEY_CURRENT_USER or HKCU
    - HKEY_USER or HKU
    - HKEY_CLASSES_ROOT or HKCR
    - HKEY_CURRENT_CONFIG or HKCC
  - key (str): The key to remove (looks like a path)
  - use_32bit_registry (bool): Deletes the 32bit portion of the registry on 64bit installations.
    On 32bit machines this is ignored.

Returns
  A dictionary listing the keys that deleted successfully as well as those that failed to delete.
Return type dict

CLI Example:
The following example will remove delete_me and all its subkeys from the SOFTWARE key in
HKEY_LOCAL_MACHINE:
salt '*' reg.delete_key_recursive HKLM SOFTWARE\delete_me

salt.modules.reg.delete_value(hive, key, vname=None, use_32bit_registry=False)

Delete a registry value entry or the default value for a key.

Parameters
  - hive (str) - The name of the hive. Can be one of the following
    - HKEY_LOCAL_MACHINE or HKLM
    - HKEY_CURRENT_USER or HKCU
    - HKEY_USER or HKU
    - HKEY_CLASSES_ROOT or HKCR
    - HKEY_CURRENT_CONFIG or HKCC
  - key (str) - The key (looks like a path) to the value name.
- **vname** *(str)* – The value name. These are the individual name/data pairs under the key. If not passed, the key (Default) value will be deleted.
- **use_32bit_registry** *(bool)* – Deletes the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.

**Returns**  
True if successful, otherwise False

**Return type**  
*bool*

**CLI Example:**
```
salt '*' reg.delete_value HKEY_CURRENT_USER 'SOFTWARE\Salt' 'version'
```

**salt.modules.reg.import_file(source, use_32bit_registry=False)**

Import registry settings from a Windows REG file by invoking REG.EXE.

New in version 2018.3.0.

**Parameters**

- **source** *(str)* – The full path of the REG file. This can be either a local file path or a URL type supported by salt (e.g. salt://salt_master_path)
- **use_32bit_registry** *(bool)* – If the value of this parameter is True then the REG file will be imported into the Windows 32 bit registry. Otherwise the Windows 64 bit registry will be used.

**Returns**  
True if successful, otherwise an error is raised

**Return type**  
*bool*

**Raises**

- **ValueError** – If the value of source is an invalid path or otherwise causes cp.
cache_file to return False
- **CommandExecutionError** – If reg.exe exits with a non-0 exit code

**CLI Example:**
```
salt machine1 reg.import_file salt://win/printer_config/110_Canon/
!postinstall_config.reg
```

**salt.modules.reg.key_exists(hive, key=None, use_32bit_registry=False)**

Check that the key is found in the registry. This refers to keys and not value/data pairs.

**Parameters**

- **hive** *(str)* – The hive to connect to
- **key** *(str)* – The key to check
- **use_32bit_registry** *(bool)* – Look in the 32bit portion of the registry

**Returns**  
True if exists, otherwise False

**Return type**  
*bool*

**CLI Example:**
```
salt '*' reg.key_exists HKLM SOFTWARE\Microsoft
```

**salt.modules.reg.list_keys(hive, key=None, use_32bit_registry=False)**

Enumerates the subkeys in a registry key or hive.

**Parameters**

- **hive** *(str)* – The name of the hive. Can be one of the following:
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC
- **key** *(str)* – The key (looks like a path) to the value name. If a key is not passed, the keys under the hive will be returned.
- **use_32bit_registry** *(bool)* – Accesses the 32bit portion of the registry on 64 bit installations. On 32bit machines this is ignored.
Returns  A list of keys/subkeys under the hive or key.

Return type  list

CLI Example:

```
salt '*' reg.list_keys HKLM 'SOFTWARE'
```

```
salt.modules.reg.list_values(hive, key=None, use_32bit Registry=False, include_default=True)
```

Enumerates the values in a registry key or hive.

**Parameters**

- **hive** *(str)* – The name of the hive. Can be one of the following:
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC

- **key** *(str)* – The key (looks like a path) to the value name. If a key is not passed, the values under the hive will be returned.

- **use_32bit Registry** *(bool)* – Accesses the 32bit portion of the registry on 64 bit installations. On 32bit machines this is ignored.

- **include_default** *(bool)* – Toggle whether to include the '(Default)' value.

Returns  A list of values under the hive or key.

Return type  list

CLI Example:

```
salt '*' reg.list_values HKLM 'SYSTEM\\CurrentControlSet\\Services\\Tcpip ....'
```

```
salt.modules.reg.read_value(hive, key, vname=None, use_32bit Registry=False)
```

Reads a registry value entry or the default value for a key. To read the default value, don’t pass vname.

**Parameters**

- **hive** *(str)* – The name of the hive. Can be one of the following:
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC

- **key** *(str)* – The key (looks like a path) to the value name.

- **vname** *(str)* – The value name. These are the individual name/data pairs under the key. If not passed, the key (Default) value will be returned.

- **use_32bit Registry** *(bool)* – Accesses the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.

Returns  A dictionary containing the passed settings as well as the value_data if successful. If unsuccessful, sets success to False.

bool: Returns False if the key is not found

If vname is not passed:
- Returns the first unnamed value (Default) as a string.
- Returns none if first unnamed value is empty.

Return type  dict

CLI Example:

```
The following will get the value of the version value name in the HKEY_LOCAL_MACHINE\\SOFTWARE\\Salt key
```
salt '* reg.read_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'version'

CLI Example:
The following will get the default value of the HKEY_LOCAL_MACHINE\SOFTWARE\Salt key

```
salt '* reg.read_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt'
```

salt.modules.reg.set_value(hive, key, vname=None, vdata=None, vtype='REG_SZ', use_32bit_registry=False, volatile=False)

Sets a value in the registry. If vname is passed, it will be the value for that value name, otherwise it will be the default value for the specified key.

Parameters
- **hive** *(str)* – The name of the hive. Can be one of the following
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC
- **key** *(str)* – The key (looks like a path) to the value name.
- **vname** *(str)* – The value name. These are the individual name/data pairs under the key. If not passed, the key (Default) value will be set.
- **vdata** *(str, int, list, bytes)* – The value you’d like to set. If a value name (vname) is passed, this will be the data for that value name. If not, this will be the (Default) value for the key.

The type of data this parameter expects is determined by the value type specified in vtype. The correspondence is as follows:
- REG_BINARY: Binary data (str in Py2, bytes in Py3)
- REG_DWORD: int
- REG_EXPAND_SZ: str
- REG_MULTI_SZ: list of str
- REG_QWORD: int
- REG_SZ: str

**Note:** When setting REG_BINARY, string data will be converted to binary.

**Note:** The type for the (Default) value is always REG_SZ and cannot be changed.

**Note:** This parameter is optional. If vdata is not passed, the Key will be created with no associated item/value pairs.

- **vtype** *(str)* – The value type. The possible values of the vtype parameter are indicated above in the description of the vdata parameter.
- **use_32bit_registry** *(bool)* – Sets the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.
- **volatile** *(bool)* – When this parameter has a value of True, the registry key will be made volatile (i.e. it will not persist beyond a system reset or shutdown). This parameter only has an effect when a key is being created and at no other time.

**Returns** True if successful, otherwise False

**Return type** bool
CLI Example:
This will set the version value to 2015.5.2 in the SOFTWARE\Salt key in the HKEY_LOCAL_MACHINE hive

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'version' = '2015.5.2'
```

CLI Example:
This function is strict about the type of vdata. For instance this example will fail because vtype has a value of REG_SZ and vdata has a type of int (as opposed to str as expected).

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'str_data' 1.2
```

CLI Example:
In this next example vdata is properly quoted and should succeed.

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'str_data' "1.2"
```

CLI Example:
This is an example of using vtype REG_BINARY.

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'bin_data' REG_BINARY vdata='Salty Data'
```

CLI Example:
An example of using vtype REG_MULTI_SZ is as follows:

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'list_data' REG_MULTI_SZ vdata='["Salt", "is", "great"]'
```

### 21.9.351 salt.modules.rest_pkg

Package support for the REST example

salt.modules.rest_pkg.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs)

salt.modules.rest_pkg.installed(name, version=None, refresh=False, fromrepo=None, skip_verify=False, pkgs=None, sources=None, **kwargs)

salt.modules.rest_pkg.list_pkgs(versions_as_list=False, **kwargs)

salt.modules.rest_pkg.remove(name=None, pkgs=None, **kwargs)

salt.modules.rest_pkg.upgrade(refresh=True, skip_verify=True, **kwargs)

salt.modules.rest_pkg.version(*names, **kwargs)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:
```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

### 21.9.352 salt.modules.rest_sample_utils module

Utility functions for the rest_sample
salt.modules.rest_sample_utils.fix_outage()
"Fix" the outage

CLI Example:
```bash
salt 'rest-sample-proxy' rest_sample.fix_outage
```

salt.modules.rest_sample_utils.get_test_string()
Helper function to test cross-calling to the __proxy__ dunder.

CLI Example:
```bash
salt 'rest-sample-proxy' rest_sample.get_test_string
```

21.9.353 salt.modules.rest_service

Provide the service module for the proxy-minion REST sample

salt.modules.rest_service.enabled(name, sig=None)
Only the 'redbull' service is 'enabled' in the test

salt.modules.rest_service.get_all()
Return a list of all available services

New in version 2015.8.0.

CLI Example:
```bash
salt '*' service.get_all
```

salt.modules.rest_service.list_()
Return a list of all available services.

CLI Example:
```bash
salt '*' service.list
```

salt.modules.rest_service.restart(name, sig=None)
Restart the specified service with rest_sample

New in version 2015.8.0.

CLI Example:
```bash
salt '*' service.restart <service name>
```

salt.modules.rest_service.running(name, sig=None)
Return whether this service is running.

New in version 2015.8.0.

salt.modules.rest_service.start(name, sig=None)
Start the specified service on the rest_sample

New in version 2015.8.0.

CLI Example:
### salt.modules.rest_service.status

Return the status for a service via `rest_sample`. If the name contains globbing, a dict mapping service name to True/False values is returned.

New in version 2015.8.0.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

**Parameters**

- `name` (str) – The name of the service to check
- `sig` (str) – Not implemented

**Returns**

- True if running, False otherwise
- dict: Maps service name to True if running, False otherwise

**Return type**

bool

**CLI Example:**

```
salt '*' service.status <service name>
```

### salt.modules.rest_service.stop

Stop the specified service on the `rest_sample`

New in version 2015.8.0.

**CLI Example:**

```
salt '*' service.stop <service name>
```

---

### 21.9.354 salt.modules.restartcheck module

Checkrestart functionality for Debian and Red Hat Based systems

Identifies services (processes) that are linked against deleted files (for example after downloading an updated binary of a shared library).

Based on checkrestart script from `debian-goodies` (written by Matt Zimmerman for the Debian GNU/Linux distribution, https://packages.debian.org/debian-goodies) and `psdel` by Sam Morris.

**codeauthor** Jiri Kotlin <jiri.kotlin@ultimum.io>

**salt.modules.restartcheck.restartcheck**

Analyze files opened by running processes and seeks for packages which need to be restarted.

**Parameters**

- `ignorelist` – string or list of packages to be ignored
- `blacklist` – string or list of file paths to be ignored
- `excludepid` – string or list of process IDs to be ignored
- `verbose` – boolean, enables extensive output
- `timeout` – int, timeout in minute

**Returns**

- dict: { 'result': False, 'comment': '<reason>' } String with checkrestart output if some package seems to need to be restarted or if no packages need restarting.

**Return type**

Dict on error

New in version 2015.8.3.

**CLI Example:**

```
salt '*' restartcheck.restartcheck
```
21.9.355 salt.modules.ret

Module to integrate with the returner system and retrieve data sent to a salt returner

salt.modules.ret.get_fun(referrer, fun)

Return info about last time fun was called on each minion

CLI Example:
```
salt '*' ret.get_fun mysql network.interfaces
```

salt.modules.ret.get_jid(referrer, jid)

Return the information for a specified job id

CLI Example:
```
salt '*' ret.get_jid redis 20421104181954700505
```

salt.modules.ret.get_jids(referrer)

Return a list of all job ids

 CLI Example:
```
salt '*' ret.get_jids mysql
```

salt.modules.ret.get_minions(referrer)

Return a list of all minions

CLI Example:
```
salt '*' ret.get_minions mysql
```

21.9.356 salt.modules.rh_ip

The networking module for RHEL/Fedora based distros

salt.modules.rh_ip.apply_network_settings(*)settings)

Apply global network configuration.

CLI Example:
```
salt '*' ip.apply_network_settings
```

salt.modules.rh_ip.build_bond(iface, **)settings)

Create a bond script in /etc/modprobe.d with the passed settings and load the bonding kernel module.

CLI Example:
```
salt '*' ip.build_bond bond0 mode=balance-alb
```

salt.modules.rh_ip.build_interface(iface, iface_type, enabled, **)settings)

Build an interface script for a network interface.

CLI Example:
```
salt '*' ip.build_interface eth0 eth <settings>
```
salt.modules.rh_ip.build_network_settings(**settings)
Build the global network script.

CLI Example:
```
salt '*' ip.build_network_settings <settings>
```

salt.modules.rh_ip.build_routes(iface, **settings)
Build a route script for a network interface.

CLI Example:
```
salt '*' ip.build_routes eth0 <settings>
```

salt.modules.rh_ip.down(iface, iface_type)
Shutdown a network interface

CLI Example:
```
salt '*' ip.down eth0
```

salt.modules.rh_ip.get_bond(iface)
Return the content of a bond script

CLI Example:
```
salt '*' ip.get_bond bond0
```

salt.modules.rh_ip.get_interface(iface)
Return the contents of an interface script

CLI Example:
```
salt '*' ip.get_interface eth0
```

salt.modules.rh_ip.get_network_settings()
Return the contents of the global network script.

CLI Example:
```
salt '*' ip.get_network_settings
```

salt.modules.rh_ip.get_routes(iface)
Return the contents of the interface routes script.

CLI Example:
```
salt '*' ip.get_routes eth0
```

salt.modules.rh_ip.up(iface, iface_type)
Start up a network interface

CLI Example:
```
salt '*' ip.up eth0
```

21.9.357 salt.modules.rh_service

Service support for RHEL-based systems, including support for both upstart and sysvinit
**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `'service.start' is not available`), see [here](#).

`salt.modules.rh_service.available(name, limit='')`
Return True if the named service is available. Use the `limit` param to restrict results to services of that type.

CLI Examples:
```
salt '*' service.available sshd
salt '*' service.available sshd limit=upstart
salt '*' service.available sshd limit=sysvinit
```

`salt.modules.rh_service.delete(name, **kwargs)`
Delete the named service

New in version 2016.3.

CLI Example:
```
salt '*' service.delete <service name>
```

`salt.modules.rh_service.disable(name, **kwargs)`
Disable the named service to start at boot

CLI Example:
```
salt '*' service.disable <service name>
```

`salt.modules.rh_service.disabled(name)`
Check to see if the named service is disabled to start on boot

CLI Example:
```
salt '*' service.disabled <service name>
```

`salt.modules.rh_service.enable(name, **kwargs)`
Enable the named service to start at boot

CLI Example:
```
salt '*' service.enable <service name>
```

`salt.modules.rh_service.enabled(name, **kwargs)`
Check to see if the named service is enabled to start on boot

CLI Example:
```
salt '*' service.enabled <service name>
```

`salt.modules.rh_service.get_all(limit='')`
Return all installed services. Use the `limit` param to restrict results to services of that type.

CLI Example:
```
salt '*' service.get_all
salt '*' service.get_all limit=upstart
salt '*' service.get_all limit=sysvinit
```
salt.modules.rh_service.get_disabled(limit="")

Return the disabled services. Use the `limit` param to restrict results to services of that type.

CLI Example:

```
salt '*' service.get_disabled  
salt '*' service.get_disabled limit=upstart  
salt '*' service.get_disabled limit=sysvinit
```

salt.modules.rh_service.get_enabled(limit="")

Return the enabled services. Use the `limit` param to restrict results to services of that type.

CLI Examples:

```
salt '*' service.get_enabled  
salt '*' service.get_enabled limit=upstart  
salt '*' service.get_enabled limit=sysvinit
```

salt.modules.rh_service.missing(name, limit="")

The inverse of `service.available`. Return `True` if the named service is not available. Use the `limit` param to restrict results to services of that type.

CLI Examples:

```
salt '*' service.missing sshd  
salt '*' service.missing sshd limit=upstart  
salt '*' service.missing sshd limit=sysvinit
```

salt.modules.rh_service.reload_(name)

Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

salt.modules.rh_service.restart(name)

Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

salt.modules.rh_service.start(name)

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

salt.modules.rh_service.status(name, sig=None)

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

Parameters

- `name (str)` - The name of the service to check
- `sig (str)` - Signature to use to find the service via `ps`

Returns

- True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type

`bool`
CLI Example:
```
salt '*' service.status <service name> [service signature]
```

```
salt.modules.rh_service.stop(name)
Stop the specified service

CLI Example:
```
salt '*' service.stop <service name>
```

### 21.9.358 salt.modules.riak

Riak Salt Module

**salt.modules.riak.cluster_commit()**

Commit Cluster Changes

Changed in version 2015.8.0.

CLI Example:
```
salt '*' riak.cluster_commit
```

**salt.modules.riak.cluster_join(username, hostname)**

Join a Riak cluster

Changed in version 2015.8.0.

CLI Example:
```
salt '*' riak.cluster_join <user> <host>
```

username - The riak username to join the cluster
hostname - The riak hostname you are connecting to

**salt.modules.riak.cluster_leave(username, hostname)**

Leave a Riak cluster

New in version 2015.8.0.

CLI Example:
```
salt '*' riak.cluster_leave <username> <host>
```

username - The riak username to join the cluster
hostname - The riak hostname you are connecting to

**salt.modules.riak.cluster_plan()**

Review Cluster Plan

Changed in version 2015.8.0.

CLI Example:
```
salt '*' riak.cluster_plan
```

**salt.modules.riak.member_status()**

Get cluster member status

Changed in version 2015.8.0.

CLI Example:
salt '*' riak.member_status

salt.modules.riak.services()
List available services on a node
New in version 2015.8.0.
CLI Example:
```
salt '*' riak.services
```

salt.modules.riak.start()
Start Riak
CLI Example:
```
salt '*' riak.start
```

salt.modules.riak.status()
Current node status
New in version 2015.8.0.
CLI Example:
```
salt '*' riak.status
```

salt.modules.riak.stop()
Stop Riak
Changed in version 2015.8.0.
CLI Example:
```
salt '*' riak.stop
```

salt.modules.riak.test()
Runs a test of a few standard Riak operations
New in version 2015.8.0.
CLI Example:
```
salt '*' riak.test
```

**21.9.359 salt.modules.rpm_lowpkg**

Support for rpm

salt.modules.rpm_lowpkg.bin_pkg_info(path, saltenv='base')
New in version 2015.8.0.

Parses RPM metadata and returns a dictionary of information about the package (name, version, etc.).

- **path** Path to the file. Can either be an absolute path to a file on the minion, or a salt fileserver URL (e.g. `salt://path/to/file.rpm`). If a salt fileserver URL is passed, the file will be cached to the minion so that it can be examined.

- **saltenv** [base] Salt fileserver environment from which to retrieve the package. Ignored if path is a local file path on the minion.

CLI Example:
salt.modules.rpm_lowpkg.checksum(*paths)
  Return if the signature of a RPM file is valid.

  CLI Example:

  salt '*' lowpkg.checksum /path/to/package1.rpm
  salt '*' lowpkg.checksum /path/to/package1.rpm /path/to/package2.rpm

salt.modules.rpm_lowpkg.diff(package_path, path)
  Return a formatted diff between current file and original in a package. NOTE: this function includes all files (configuration and not), but does not work on binary content.

  Parameters
  - package – Full path of the RPM file
  - path – Full path to the installed file

  Returns Difference or empty string. For binary files only a notification.

  CLI example:

  salt '*' lowpkg.diff /path/to/apache2.rpm /etc/apache2/httpd.conf

salt.modules.rpm_lowpkg.file_dict(*packages)
  List the files that belong to a package, sorted by group. Not specifying any packages will return a list of _every_ file on the system’s rpm database (not generally recommended).

  CLI Examples:

  salt '*' lowpkg.file_dict httpd
  salt '*' lowpkg.file_dict httpd postfix
  salt '*' lowpkg.file_dict

salt.modules.rpm_lowpkg.file_list(*packages)
  List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system’s rpm database (not generally recommended).

  CLI Examples:

  salt '*' lowpkg.file_list httpd
  salt '*' lowpkg.file_list httpd postfix
  salt '*' lowpkg.file_list

salt.modules.rpm_lowpkg.info(*packages, **kwargs)
  Return a detailed package(s) summary information. If no packages specified, all packages will be returned.

  Parameters
  - packages –
  - attr – Comma-separated package attributes. If no ‘attr’ is specified, all available attributes returned.

  Valid attributes are: version, vendor, release, build_date, build_date_time_t, install_date, install_date_time_t, build_host, group, source_rpm, arch, epoch, size, license, signature, packager, url, summary, description.

  Returns

  CLI example:
salt.modules.rpm_lowpkg.list_pkgs("packages")
List the packages currently installed in a dict:

```python
{'<package_name>': '<version>'}
```

CLI Example:

```bash
salt '*' lowpkg.list_pkgs
```

salt.modules.rpm_lowpkg.modified("packages", "flags")
List the modified files that belong to a package. Not specifying any packages will return a list of _all_ modified files on the system’s RPM database.

New in version 2015.5.0.

CLI examples:

```bash
salt '*' lowpkg.modified httpd
salt '*' lowpkg.modified httpd postfix
salt '*' lowpkg.modified
```

salt.modules.rpm_lowpkg.owner("paths")
Return the name of the package that owns the file. Multiple file paths can be passed. If a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Examples:

```bash
salt '*' lowpkg.owner /usr/bin/apachectl
salt '*' lowpkg.owner /usr/bin/apachectl /etc/httpd/conf/httpd.conf
```

salt.modules.rpm_lowpkg.verify("packages", "kwargs")
Runs an rpm -Va on a system, and returns the results in a dict.

Files with an attribute of config, doc, ghost, license or readme in the package header can be ignored using the ignore_types keyword argument.

CLI Example:

```bash
salt '*' lowpkg.verify
salt '*' lowpkg.verify httpd
salt '*' lowpkg.verify httpd postfix
salt '*' lowpkg.verify httpd postfix ignore_types=['config','doc']
```

salt.modules.rpm_lowpkg.version_cmp(ver1, ver2, ignore_epoch=False)
New in version 2015.8.9.

Do a cmp-style comparison on two packages. Return -1 if ver1 < ver2, 0 if ver1 == ver2, and 1 if ver1 > ver2. Return None if there was a problem making the comparison.
ignore_epoch  [False] Set to True to ignore the epoch when comparing versions

New in version 2015.8.10,2016.3.2.

CLI Example:

```bash
salt '*' pkg.version_cmp '0.2-001' '0.2.0.1-002'
```

21.9.360  salt.modules.rpmbuild_pkgbuild

RPM Package builder system

New in version 2015.8.0.

This system allows for all of the components to build rpms safely in chrooted environments. This also provides a function to generate yum repositories

This module implements the pkgbuild interface

```python
salt.modules.rpmbuild_pkgbuild.build(runas, tgt, dest_dir, spec, sources, deps, env, template, saltenv='base', logDir='/var/log/salt/pkgbuild')
```

Given the package destination directory, the spec file source and package sources, use mock to safely build the rpm defined in the spec file

CLI Example:

```bash
salt '*' pkgbuild.build mock epel-7-x86_64 /var/www/html
```

This example command should build the libnacl package for rhel 7 using user mock and place it in /var/www/html/ on the minion

```python
salt.modules.rpmbuild_pkgbuild.make_repo(repodir, use_passphrase=False, 
    keyid=None, gnupghome='/etc/salt/gpgkeys', runas='root', timeout=15.0)
```

Make a package repository and optionally sign packages present

Given the repodir, create a yum repository out of the rpms therein and optionally sign it and packages present, the name is directory to turn into a repo. This state is best used with onchanges linked to your package building states.

repodir The directory to find packages that will be in the repository.

keyid Changed in version 2016.3.0.

Optional Key ID to use in signing packages and repository. Utilizes Public and Private keys associated with keyid which have been loaded into the minion’s Pillar data.

For example, contents from a Pillar data file with named Public and Private keys as follows:

```plaintext
---BEGIN PGP PRIVATE KEY BLOCK---
Version: GnuPG v1

lQO+BFciIFQBCADAPCtzz7I5RL32escCMZsPzaEKW7bIxm4KCKkBoX47IG54b
w82PCE8Y1jF/9Uk2m3RKVwp3YclLc7Ap3gj6VO4ysvVz28UbnhPxsIk0lf2cq8qc
.
.
Ebe+8JQTwqSXPRTzXmy/b5WXDeM79CkLVvuGpXFor76D+ECMRPv/rawukEcNp
---END PGP PRIVATE KEY BLOCK---
```
env  Changed in version 2016.3.0.

A dictionary of environment variables to be utilized in creating the repository.

Note: This parameter is not used for making yum repositories.

use_passphrase  [False] New in version 2016.3.0.

Use a passphrase with the signing key presented in keyid. Passphrase is received from Pillar data which could be passed on the command line with pillar parameter. For example:

```
pillar='\{ "gpg_passphrase" : "my_passphrase" \}'
```

gnupghome  [/etc/salt/gpgkeys] New in version 2016.3.0.

Location where GPG related files are stored, used with keyid.

User to create the repository as, and optionally sign packages.

Note: Ensure the user has correct permissions to any files and directories which are to be utilized.

timeout  [15.0] New in version 2016.3.4.

Timeout in seconds to wait for the prompt for inputting the passphrase.

CLI Example:

```
salt '*' pkgbuild.make_repo /var/www/html/
```

salt.modules.rpmbuild_mkpkg.make_src_pkg(dest_dir, spec, sources, env=None, template=None, saltenv='base', runas='root')

Create a source rpm from the given spec file and sources

CLI Example:
This example command should build the libnacl SOURCE package and place it in /var/www/html/ on the minion.

```
salt '*' pkgbuild.make_src_pkg /var/www/html/
        https://raw.githubusercontent.com/saltstack/libnacl/master/pkg/rpm/python-
        →libnacl.spec
        https://pypi.python.org/packages/source/l/libnacl/libnacl-1.3.5.tar.gz
```

Changed in version 2017.7.0.

- **dest_dir** The directory on the minion to place the built package(s)
- **spec** The location of the spec file (used for rpms)
- **sources** The list of package sources
- **env** A dictionary of environment variables to be set prior to execution.
- **template** Run the spec file through a templating engine Optional argument, allows for no templating engine used to be if none is desired.
- **saltenv** The saltenv to use for files downloaded from the salt fileserver
- **runas** The user to run the build process as

New in version 2018.3.3.

**Note:** using SHA256 as digest and minimum level dist el6

### 21.9.361 salt.modules.rsync

Wrapper for rsync

New in version 2014.1.0.

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

**salt.modules.rsync.config**

```
salt.modules.rsync.config(conf_path='/etc/rsyncd.conf')
```

Changed in version 2016.3.0: Return data now contains just the contents of the rsyncd.conf as a string, instead of a dictionary as returned from `cmd.run_all`.

- **conf_path** [/etc/rsyncd.conf] Path to the config file

CLI Example:

```
salt '*' rsync.config
```

**salt.modules.rsync.rsync**

```
salt.modules.rsync.rsync(src, dst, delete=False, force=False, update=False, passwordfile=None, exclude=None, excludefrom=None, dryrun=False, rsh=None, additional_opts=None, saltenv='base')
```

Changed in version 2016.3.0: Return data now contains just the output of the rsync command, instead of a dictionary as returned from `cmd.run_all`.

Rsync files from src to dst

- **src** The source location where files will be rsynced from.
- **dst** The destination location where files will be rsynced to.
- **delete** [False] Whether to enable the rsync –delete flag, which will delete extraneous files from dest dirs.
- **force** [False] Whether to enable the rsync –force flag, which will force deletion of dirs even if not empty.
- **update** [False] Whether to enable the rsync –update flag, which forces rsync to skip any files which exist on the destination and have a modified time that is newer than the source file.
passwordfile  A file that contains a password for accessing an rsync daemon. The file should contain just the password.
exclude  Whether to enable the rsync \texttt{--exclude} flag, which will exclude files matching a PATTERN.
excludefrom  Whether to enable the rsync \texttt{--excludefrom} flag, which will read exclude patterns from a file.
dryrun  [False] Whether to enable the rsync \texttt{--dry-run} flag, which will perform a trial run with no changes made.
rsh  Whether to enable the rsync \texttt{--rsh} flag, to specify the remote shell to use.
additional_opts  Any additional rsync options, should be specified as a list.
saltenv  Specify a salt fileserver environment to be used.

CLI Example:

```
salt '*' rsync.rsync /path/to/src /path/to/dest delete=True update=True delete=True
passwordfile=/etc/pass.crt exclude=exclude/dir
salt '*' rsync.rsync /path/to/src delete=True excludefrom=/xx.ini
salt '*' rsync.rsync /path/to/src delete=True exclude=['exclude1/dir,
exclude2/dir'] additional_opts=['"--partial", "--bwlimit=5000"]'
```

\texttt{salt.modules.rsync.version}()

Changed in version 2016.3.0: Return data now contains just the version number as a string, instead of a dictionary as returned from \texttt{cmd.run_all}.

Returns rsync version

CLI Example:

```
salt '*' rsync.version
```

\textbf{21.9.362} \texttt{salt.modules.runit}

\texttt{runit service module (http://smarden.org/runit)}

This module is compatible with the \texttt{service} states, so it can be used to maintain services using the \texttt{provider} argument:

```
myservice:
  service:
    - running
    - provider: runit
```

Provides virtual \texttt{service} module on systems using runit as init.

Service management rules (\texttt{sv} command):

- service \texttt{$n} is ENABLED if file \texttt{SERVICE_DIR/$n/run} exists service \texttt{$n} is AVAILABLE if ENABLED or if file \texttt{AVAIL_SVR_DIR/$n/run} exists service \texttt{$n} is DISABLED if AVAILABLE but not ENABLED
- \texttt{SERVICE_DIR/$n} is normally a symlink to a \texttt{AVAIL_SVR_DIR/$n} folder

Service auto-start/stop mechanism:

- \texttt{sv} (auto)starts/stops service as soon as \texttt{SERVICE_DIR/<service>} is created/deleted, both on service creation or a boot time.
- autostart feature is disabled if file \texttt{SERVICE_DIR/<n>/down} exists. This does not affect the current’s service status (if already running) nor manual service management.

Service’s alias:
Service `sva` is an alias of service `svc` when `AVAIL_SVR_DIR/sva` symlinks to folder `AVAIL_SVR_DIR/svc`. `svc` can’t be enabled if it is already enabled through an alias already enabled, since `sv` files are stored in folder `SERVICE_DIR/svc`.

XBPS package management uses a service’s alias to provides service alternative(s), such as chrony and openntpd both aliased to ntpd.

```python
salt.modules.runit.add_svc_avail_path(path)
Add a path that may contain available services. Return True if added (or already present), False on error.

path directory to add to AVAIL_SVR_DIRS
```

```python
salt.modules.runit.available(name)
Returns True if the specified service is available, otherwise returns False.

name the service's name

CLI Example:

```
salt '*' runit.available <service name>
```

```python
salt.modules.runit.disable(name, stop=False, **kwargs)
Don't start service `name` at boot Returns True if operation is successful

name the service's name
stop if True, also stops the service

CLI Example:

```
salt '*' service.disable <name> [stop=True]
```

```python
salt.modules.runit.disabled(name)
Return True if the named service is disabled, False otherwise

name the service's name

CLI Example:

```
salt '*' service.disabled <service name>
```

```python
salt.modules.runit.enable(name, start=False, **kwargs)
Start service `name` at boot. Returns True if operation is successful

name the service's name
start [False] If True, start the service once enabled.

CLI Example:

```
salt '*' service.enable <name> [start=True]
```

```python
salt.modules.runit.enabled(name)
Return True if the named service is enabled, False otherwise

name the service's name

CLI Example:

```
salt '*' service.enabled <service name>
```

```python
salt.modules.runit.full_restart(name)
Calls runit.restart()

name the service's name

CLI Example:

```
salt '*' runit.full_restart <service name>
```

```python
salt.modules.runit.get_all()
Return a list of all available services

21.9. execution modules
CLI Example:

```bash
salt '*' runit.get_all
```

**salt.modules.runit.get_disabled()**

Return a list of all disabled services

CLI Example:

```bash
salt '*' service.get_disabled
```

**salt.modules.runit.get_enabled()**

Return a list of all enabled services

CLI Example:

```bash
salt '*' service.get_enabled
```

**salt.modules.runit.get_svc_alias()**

Returns the list of service's name that are aliased and their alias path(s)

**salt.modules.runit.get_svc_avail_path()**

Return list of paths that may contain available services

**salt.modules.runit.get_svc_broken_path(name='*')**

Return list of broken path(s) in SERVICE_DIR that match name

- A path is broken if it is a broken symlink or can not be a runit service
- name a glob for service name. default is '*'

CLI Example:

```bash
salt '*' runit.get_svc_broken_path <service name>
```

**salt.modules.runit.missing(name)**

The inverse of runit.available. Returns True if the specified service is not available, otherwise returns False.

- name the service's name

CLI Example:

```bash
salt '*' runit.missing <service name>
```

**salt.modules.runit.reload_(name)**

Reload service

- name the service's name

CLI Example:

```bash
salt '*' runit.reload <service name>
```

**salt.modules.runit.remove(name)**

Remove the service <name> from system. Returns True if operation is successful. The service will be also stopped.

- name the service's name

CLI Example:

```bash
salt '*' service.remove <name>
```

**salt.modules.runit.restart(name)**

Restart service

- name the service's name

2402 Chapter 21. Salt Module Reference
CLI Example:
```
salt '*' runit.restart <service name>
```

**salt.modules.runit.show(name)**
Show properties of one or more units/jobs or the manager
- **name** the service's name

CLI Example:
```
salt '*' service.show <service name>
```

**salt.modules.runit.start(name)**
Start service
- **name** the service's name

CLI Example:
```
salt '*' runit.start <service name>
```

**salt.modules.runit.status(name, sig=None)**
Return True if service is running
- **name** the service's name
- **sig** signature to identify with ps

CLI Example:
```
salt '*' runit.status <service name>
```

**salt.modules.runit.status_autostart(name)**
Return True if service <name> is autostarted by sv (file $service_folder/down does not exist) NB: return False if the service is not enabled.
- **name** the service's name

CLI Example:
```
salt '*' runit.status_autostart <service name>
```

**salt.modules.runit.stop(name)**
Stop service
- **name** the service's name

CLI Example:
```
salt '*' runit.stop <service name>
```

### 21.9.363 salt.modules.rvm

Manage ruby installations and gemsets with RVM, the Ruby Version Manager.

**salt.modules.rvm.do(ruby, command, runas=None, cwd=None, env=None)**
Execute a command in an RVM controlled environment.
- **ruby** Which ruby to use
- **command** The rvm command to execute
- **runas** The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.
- **cwd** The directory from which to run the rvm command. Defaults to the user's home directory.

CLI Example:
```
salt '*' rvm.do 2.0.0 <command>
```
salt.modules.rvm.gemset_copy(source, destination, runas=None)
Copy all gems from one gemset to another.

source  The name of the gemset to copy, complete with ruby version
destination  The destination gemset
runas  The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:
salt '*' rvm.gemset_copy foobar bazquo

salt.modules.rvm.gemset_create(ruby, gemset, runas=None)
Creates a gemset.

ruby  The ruby version for which to create the gemset
gemset  The name of the gemset to create
runas  The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:
salt '*' rvm.gemset_create 2.0.0 foobar

salt.modules.rvm.gemset_delete(ruby, gemset, runas=None)
Delete a gemset

ruby  The ruby version to which the gemset belongs
gemset  The gemset to delete
runas  The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:
salt '*' rvm.gemset_delete 2.0.0 foobar

salt.modules.rvm.gemset_empty(ruby, gemset, runas=None)
Remove all gems from a gemset.

ruby  The ruby version to which the gemset belongs
gemset  The gemset to empty
runas  The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:
salt '*' rvm.gemset_empty 2.0.0 foobar

salt.modules.rvm.gemset_list(ruby='default', runas=None)
List all gemsets for the given ruby.

ruby  [default] The ruby version for which to list the gemsets
runas  The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:
salt '*' rvm.gemset_list

salt.modules.rvm.gemset_list_all(runas=None)
List all gemsets for all installed rubies.

Note that you must have set a default ruby before this can work.
runas  The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:
salt '*' rvm.gemset_list_all

```python
salt.modules.rvm.get(version='stable', runas=None)
    Update RVM
    version [stable] Which version of RVM to install, (e.g. stable or head)
    CLI Example:
    salt '*' rvm.get
```

```python
salt.modules.rvm.install(runas=None)
    Install RVM system-wide
    runas The user under which to run the rvm installer script. If not specified, then it be run as the user under which Salt is running.
    CLI Example:
    salt '*' rvm.install
```

```python
salt.modules.rvm.install_ruby(ruby, runas=None, opts=None, env=None)
    Install a ruby implementation.
    ruby The version of ruby to install
    runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.
    env Environment to set for the install command. Useful for exporting compilation flags such as RUBY_CONFIGURE_OPTS
    opts List of options to pass to the RVM installer (ie `-C`, `-patch`, etc)
    CLI Example:
    salt '*' rvm.install_ruby 1.9.3-p385
```

```python
salt.modules.rvm.is_installed(runas=None)
    Check if RVM is installed.
    CLI Example:
    salt '*' rvm.is_installed
```

```python
salt.modules.rvm.list_(runas=None)
    List all rvm-installed rubies
    runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.
    CLI Example:
    salt '*' rvm.list
```

```python
salt.modules.rvm.reinstall_ruby(ruby, runas=None, env=None)
    Reinstall a ruby implementation
    ruby The version of ruby to reinstall
    runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.
    CLI Example:
    salt '*' rvm.reinstall_ruby 1.9.3-p385
```

```python
salt.modules.rvm.rubygems(ruby, version, runas=None)
    Installs a specific rubygems version in the given ruby
    ruby The ruby for which to install rubygems
```

21.9. execution modules
version  The version of rubygems to install, or 'remove' to use the version that ships with 1.9
runas  The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is
running.
CLI Example:
salt '*' rvm.rubygems 2.0.0 1.8.24

salt.modules.rvm.set_default(ruby, runas=None)
Set the default ruby
ruby  The version of ruby to make the default
runas  The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is
running.
CLI Example:
salt '*' rvm.set_default 2.0.0

salt.modules.rvm.wrapper(ruby_string, wrapper_prefix, runas=None, *binaries)
Install RVM wrapper scripts
ruby_string  Ruby/gemset to install wrappers for
wrapper_prefix  What to prepend to the name of the generated wrapper binaries
runas  The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is
running.
binaries  [None] The names of the binaries to create wrappers for. When nothing is given, wrappers for ruby, gem, rake, irb, rdoc, ri and testrb are generated.
CLI Example:
salt '*' rvm.wrapper <ruby_string> <wrapper_prefix>

21.9.364 salt.modules.s3
Connection module for Amazon S3

classification  This module accepts explicit s3 credentials but can also utilize IAM roles assigned to the
instance through Instance Profiles. Dynamic credentials are then automatically obtained from
AWS API and no further configuration is necessary. More Information available at:

http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-Amazon-
ec2.html

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:
s3.keyid: GKTADJGHEIQSXMKKRBJ08H
s3.key: askdjghsdfjkghWupUjasdfdkflgjksdgfdjajkghs

(Note: this is literally the pillar key 's3.keyid' or the config option 's3.keyid', not "s3:n keyid: blah")

A service_url may also be specified in the configuration:
s3.service_url: s3.amazonaws.com

A role_arn may also be specified in the configuration:
s3.role_arn: arn:aws:iam::1111111111:role/my-role-to-assume
If a service_url is not specified, the default is s3.amazonaws.com. This may appear in various
documentation as an "endpoint". A comprehensive list for Amazon S3 may be found at:

http://docs.aws.amazon.com/general/latest/gr/rande.html#s3_region

The service_url will form the basis for the final endpoint that is used to query the service.

Path style can be enabled:

s3.path_style: True

This can be useful if you need to use salt with a proxy for an s3 compatible storage.

You can use either https protocol or http protocol:

s3.https_enable: True

SSL verification may also be turned off in the configuration:

s3.verify_ssl: False

This is required if using S3 bucket names that contain a period, as these will not match Amazon’s
S3 wildcard certificates. Certificate verification is enabled by default.

AWS region may be specified in the configuration:

s3.location: eu-central-1

Default is us-east-1.

This module should be usable to query other S3-like services, such as Eucalyptus.

depends requests

salt.modules.s3.delete(bucket, path=None, action=None, key=None, keyid=None, service_url=None,
verify_ssl=None, kms_keyid=None, location=None, role_arn=None, path_style=None, https_enable=None)

Delete a bucket, or delete an object from a bucket.

CLI Example to delete a bucket:

salt myminion s3.delete mybucket

CLI Example to delete an object from a bucket:

salt myminion s3.delete mybucket remoteobject

salt.modules.s3.get(bucket=", path=", return_bin=False, action=None, local_file=None, key=None,
keyid=None, service_url=None, verify_ssl=None, kms_keyid=None, location=None,
role_arn=None, path_style=None, https_enable=None)

List the contents of a bucket, or return an object from a bucket. Set return_bin to True in order to retrieve an
object wholesale. Otherwise, Salt will attempt to parse an XML response.

CLI Example to list buckets:

salt myminion s3.get

CLI Example to list the contents of a bucket:

salt myminion s3.get mybucket

CLI Example to return the binary contents of an object:
salt myminion s3.get mybucket myfile.png  
return_bin=True

 CLI Example to save the binary contents of an object to a local file:

salt myminion s3.get mybucket myfile.png local_file=/tmp/myfile.png

It is also possible to perform an action on a bucket. Currently, S3 supports the following actions:

```
  acl
cors
lifecycle
policy
location
logging
notification
tagging
versions
requestPayment
versioning
website
```

To perform an action on a bucket:

salt myminion s3.get mybucket myfile.png action=acl

```
salt.modules.s3.head(bucket, path='', key=None, keyid=None, service_url=None, verify_ssl=None, kms_keyid=None, location=None, role_arn=None, path_style=None, https_enable=None)
```

Return the metadata for a bucket, or an object in a bucket.

 CLI Examples:

salt myminion s3.head mybucket
salt myminion s3.head mybucket myfile.png

```
salt.modules.s3.put(bucket, path=None, return_bin=False, action=None, local_file=None, key=None, keyid=None, service_url=None, verify_ssl=None, kms_keyid=None, location=None, role_arn=None, path_style=None, https_enable=None)
```

Create a new bucket, or upload an object to a bucket.

 CLI Example to create a bucket:

salt myminion s3.put mybucket

 CLI Example to upload an object to a bucket:

salt myminion s3.put mybucket remotepath local_file=/path/to/file

21.9.365 salt.modules.s6 module

s6 service module

This module is compatible with the service states, so it can be used to maintain services using the provider argument:
myservice:
   service:
     - running
     - provider: s6

Note that the enabled argument is not available with this provider.

codeauthor  Marek Skrobacki <skrobul@skrobul.com>
salt.modules.s6.available(name)
   Returns True if the specified service is available, otherwise returns False.
   CLI Example:
   
   salt '*' s6.available foo

salt.modules.s6.full_restart(name)
   Calls s6.restart() function
   CLI Example:
   
   salt '*' s6.full_restart <service name>

salt.modules.s6.get_all()
   Return a list of all available services
   CLI Example:
   
   salt '*' s6.get_all

salt.modules.s6.missing(name)
   The inverse of s6.available. Returns True if the specified service is not available, otherwise returns False.
   CLI Example:
   
   salt '*' s6.missing foo

salt.modules.s6.reload_(name)
   Send a HUP to service via s6
   CLI Example:
   
   salt '*' s6.reload <service name>

salt.modules.s6.restart(name)
   Restart service via s6. This will stop/start service
   CLI Example:
   
   salt '*' s6.restart <service name>

salt.modules.s6.start(name)
   Starts service via s6
   CLI Example:
   
   salt '*' s6.start <service name>

salt.modules.s6.status(name, sig=None)
   Return the status for a service via s6, return pid if running

21.9. execution modules
21.9.366 salt.modules.salt_proxy module

Salt proxy module
New in version 2015.8.3.
Module to deploy and manage salt-proxy processes on a minion.
salt.modules.salt_proxy.configure_proxy(proxyname, start=True)
Create the salt proxy file and start the proxy process if required
Parameters
- proxynamet name to be used for this proxy (should match entries in pillar)
- start Boolean indicating if the process should be started default = True
CLI Example:
salt deviceminion salt_proxy.configure_proxy p8000

salt.modules.salt_proxy.is_running(proxyname)
Check if the salt-proxy process associated with this proxy (name) is running.
Returns True if the process is running False otherwise
Parameters proxynamet String name of the proxy (p8000 for example)
CLI Example:
salt deviceminion salt_proxy.is_running p8000

21.9.367 salt.modules.saltcheck

A module for testing the logic of states and highstates
codeauthor William Cannon <william.cannon@gmail.com>
maturity new
Saltcheck provides unittest like functionality requiring only the knowledge of salt module execution and yaml.
In order to run state and highstate saltcheck tests a sub-folder of a state must be created and named saltcheck-tests.
Tests for a state should be created in files ending in *.tst and placed in the saltcheck-tests folder.
Multiple tests can be created in a file. Multiple *.tst files can be created in the saltcheck-tests folder. Salt rendering is supported in test files (e.g. yaml + jinja). The id of a test works in the same manner as in salt state files. They should be unique and descriptive.

Example file system layout:

Example:

```yaml
echo-test-hello:
  module_and_function: test.echo
  args: 
    - "hello"
  kwargs:
    assertion: assertEqual
  expected-return: 'hello'
```

class salt.modules.saltcheck.SaltCheck
This class implements the saltcheck

call_salt_command(fun, args, kwargs)
Generic call of salt Caller command

static cast_expected_to_returned_type(expected, returned)
Determine the type of variable returned Cast the expected to the type of variable returned

static get_state_search_path_list()
For the state file system, return a list of paths to search for states

run_test(test_dict)
Run a single saltcheck test

class salt.modules.saltcheck.StateTestLoader(search_paths)
Class loads in test files for a state e.g. state_dir/saltcheck-tests/[1.tst, 2.tst, 3.tst]

add_test_files_for_sls(sls_path)
Adding test files

static convert_sls_to_path(sls)
Converting sls to paths

static convert_sls_to_paths(sls_list)
Converting sls to paths

gather_files(filepath)
Gather files for a test suite

load_file(filepath)
loads in one test file

load_file_salt_rendered(filepath)
loads in one test file

load_test_suite()
Load tests either from one file, or a set of files

salt.modules.saltcheck.run_highstate_tests()
Execute all tests for a salt highstate and return results

CLI Example:

```
salt '*' saltcheck.run_highstate_tests
```
**salt.modules.saltcheck.run_state_tests**(state)

Execute all tests for a salt state and return results. Nested states will also be tested.

**Parameters**

- **state** *(str)* - the name of a user defined state

**CLI Example:**

```
salt '*' saltcheck.run_state_tests postfix
```

**salt.modules.saltcheck.run_test**(**kwargs)

Execute one saltcheck test and return result.

**Parameters**

- **arg test** *(keyword)* -

**CLI Example:**

```
salt '*' saltcheck.run_test
    test={"module_and_function": "test.echo", "assertion": "assertEqual", "expected-return": "This works!", "args": ["This works!"] }
```

**salt.modules.saltcheck.update_master_cache()**

Updates the master cache onto the minion - transfers all salt-check-tests. Should be done one time before running tests, and if tests are updated Can be automated by setting "auto_update_master_cache: True" in minion config.

**CLI Example:**

```
salt '*' saltcheck.update_master_cache
```

---

**21.9.368 salt.modules.saltcloudmod**

Control a salt cloud system

**salt.modules.saltcloudmod.create**(name, profile)

Create the named vm

**CLI Example:**

```
salt <minion-id> saltcloud.create webserver rackspace_centos_512
```

---

**21.9.369 salt.modules.saltutil**

The Saltutil module is used to manage the state of the salt minion itself. It is used to manage minion modules as well as automate updates to the salt minion.

**depends**

- esky Python module for update functionality

**salt.modules.saltutil.clear_cache()**

Forcibly removes all caches on a minion.

New in version 2014.7.0.

**WARNING:** The safest way to clear a minion cache is by first stopping the minion and then deleting the cache files before restarting it.

**CLI Example:**

salt '!' saltutil.clear_cache

salt.modules.saltutil.clear_job_cache(hours=24)
Forcibly removes job cache folders and files on a minion.
New in version 2018.3.0.

WARNING: The safest way to clear a minion cache is by first stopping the minion and then deleting the cache files before restarting it.

CLI Example:
salt '!' saltutil.clear_job_cache hours=12

salt.modules.saltutil.cmd(tgt, fun, arg=(), timeout=None, tgt_type='glob', ret='', kwarg=None, ssh=False, **kwargs)
Changed in version 2017.7.0: The expr_form argument has been renamed to tgt_type, earlier releases must use expr_form.
Assuming this minion is a master, execute a salt command

CLI Example:
salt '!' saltutil.cmd

salt.modules.saltutil.cmd_iter(tgt, fun, arg=(), timeout=None, tgt_type='glob', ret='', kwarg=None, ssh=False, **kwargs)
Changed in version 2017.7.0: The expr_form argument has been renamed to tgt_type, earlier releases must use expr_form.
Assuming this minion is a master, execute a salt command

CLI Example:
salt '!' saltutil.cmd_iter

salt.modules.saltutil.find_cached_job(jid)
Return the data for a specific cached job id. Note this only works if cache_jobs has previously been set to True on the minion.

CLI Example:

salt '!' saltutil.find_cached_job <job id>

salt.modules.saltutil.find_job(jid)
Return the data for a specific job id that is currently running.
jid The job id to search for and return data.

CLI Example:

salt '!' saltutil.find_job <job id>

Note that the find_job function only returns job information when the job is still running. If the job is currently running, the output looks something like this:

# salt my-minion saltutil.find_job 20160503150049487736
my-minion:
--------
arg:
  - 30

(continues on next page)
fun: test.sleep
jid: 20160503150049487736
pid: 9601
ret:
tgt: my-minion
tgt_type:
glob
user: root

If the job has already completed, the job cannot be found and therefore the function returns an empty dictionary, which looks like this on the CLI:

```
# salt my-minion saltutil.find_job 20160503150049487736
my-minion:  
```

`salt.modules.saltutil.is_running(fun)`

If the named function is running return the data associated with it/them. The argument can be a glob

CLI Example:

```
salt '*' saltutil.is_running state.highstate
```

`salt.modules.saltutil.kill_all_jobs()`

Sends a kill signal (SIGKILL 9) to all currently running jobs

CLI Example:

```
salt '*' saltutil.kill_all_jobs
```

`salt.modules.saltutil.kill_job(jid)`

Sends a kill signal (SIGKILL 9) to the named salt job’s process

CLI Example:

```
salt '*' saltutil.kill_job <job id>
```

`salt.modules.saltutil.list_extmods()`

New in version 2017.7.0.

List Salt modules which have been synced externally

CLI Examples:

```
salt '*' saltutil.list_extmods
```

`salt.modules.saltutil.mmodule(saltenv, fun, *args, **kwargs)`

Loads minion modules from an environment so that they can be used in pillars for that environment

CLI Example:

```
salt '*' saltutil.mmodule base test.ping
```
salt.modules.saltutil.refresh_beacons()
Signal the minion to refresh the beacons.

CLI Example:
```
salt '*' saltutil.refresh_beacons
```

salt.modules.saltutil.refresh_grains(**kwargs)
New in version 2016.3.6,2016.11.4,2017.7.0.
Refresh the minion’s grains without syncing custom grains modules from `salt://_grains`.

**Note:** The available execution modules will be reloaded as part of this process, as grains can affect which modules are available.

`refresh_pillar` [True] Set to `False` to keep pillar data from being refreshed.

CLI Examples:
```
salt '*' saltutil.refresh_grains
```

salt.modules.saltutil.refresh_matchers()
Signal the minion to refresh its matchers.

CLI Example:
```
salt '*' saltutil.refresh_matchers
```

salt.modules.saltutil.refresh_modules(**kwargs)
Signal the minion to refresh the module and grain data

The default is to refresh module asynchronously. To block until the module refresh is complete, set the 'async' flag to False.

CLI Example:
```
salt '*' saltutil.refresh_modules
```

salt.modules.saltutil.refresh_pillar()
Signal the minion to refresh the pillar data.

CLI Example:
```
salt '*' saltutil.refresh_pillar
```

salt.modules.saltutil.regen_keys()
Used to regenerate the minion keys.

CLI Example:
```
salt '*' saltutil.regen_keys
```

salt.modules.saltutil.revoke_auth(`preserve_minion_cache=False`) The minion sends a request to the master to revoke its own key. Note that the minion session will be revoked and the minion may not be able to return the result of this command back to the master.

If the 'preserve_minion_cache' flag is set to True, the master cache for this minion will not be removed.

CLI Example:
salt '*' saltutil.revoke_auth

salt.modules.saltutil.runner(name, arg=None, kwarg=None, full_return=False, saltenv='base', jid=None, **kwargs)

Execute a runner function. This function must be run on the master, either by targeting a minion running on a master or by using salt-call on a master.

New in version 2014.7.0.

name The name of the function to run
kwarg Any keyword arguments to pass to the runner function

CLI Example:

In this example, assume that master_minion is a minion running on a master.

```
salt master_minion saltutil.runner jobs.list_jobs
salt master_minion saltutil.runner test.arg
```

salt.modules.saltutil.running()

Return the data on all running salt processes on the minion

CLI Example:

```
salt '*' saltutil.running
```

salt.modules.saltutil.signal_job(jid, sig)

Sends a signal to the named salt job’s process

CLI Example:

```
salt '*' saltutil.signal_job <job id> 15
```

salt.modules.saltutil.sync_all(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

Changed in version 2015.8.11,2016.3.2: On masterless minions, pillar modules are now synced, and refreshed when refresh is set to True.

Sync down all of the dynamic modules from the file server for a specific environment. This function synchronizes custom modules, states, beacons, grains, returners, output modules, renderers, and utils.

refresh [True] Also refresh the execution modules and recompile pillar data available to the minion. This refresh will be performed even if no new dynamic modules are synced. Set to False to prevent this refresh.

Important: If this function is executed using a module.run state, the SLS file will not have access to newly synced execution modules unless a refresh argument is added to the state, like so:

```
load_my_custom_module:
  module.run:
    - name: saltutil.sync_all
      refresh: True
```

See here for a more detailed explanation of why this is necessary.

extmod_whitelist [None] dictionary of modules to sync based on type
extmod_blacklist [None] dictionary of modules to blacklist based on type

CLI Examples:
salt.modules.saltutil.sync_beacons
(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 2015.5.1.

Sync beacons from salt://_beacons to the minion

- saltenv: The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
  
  If not passed, then all environments configured in the top files will be checked for beacons to sync. If no top files are found, then the base environment will be synced.

- refresh: [True] If True, refresh the available beacons on the minion. This refresh will be performed even if no new beacons are synced. Set to False to prevent this refresh.

- extmod_whitelist: [None] comma-separated list of modules to sync

- extmod_blacklist: [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt '*' saltutil.sync_beacons
salt '*' saltutil.sync_beacons saltenv=dev
salt '*' saltutil.sync_beacons saltenv=base,dev
```

salt.modules.saltutil.sync_clouds
(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 2017.7.0.

Sync cloud modules from salt://_cloud to the minion

- saltenv: [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
  
  refresh: [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new utility modules are synced. Set to False to prevent this refresh.

- extmod_whitelist: [None] comma-separated list of modules to sync

- extmod_blacklist: [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_clouds
salt '*' saltutil.sync_clouds saltenv=dev
salt '*' saltutil.sync_clouds saltenv=base,dev
```

salt.modules.saltutil.sync_engines
(saltenv=None, refresh=False, extmod_whitelist=None, extmod_blacklist=None)

New in version 2016.3.0.

Sync engine modules from salt://_engines to the minion

- saltenv: The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
  
  If not passed, then all environments configured in the top files will be checked for engines to sync. If no top files are found, then the base environment will be synced.

- refresh: [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new engine modules are synced. Set to False to prevent this refresh.

- extmod_whitelist: [None] comma-separated list of modules to sync

- extmod_blacklist: [None] comma-separated list of modules to blacklist based on type

CLI Examples:
salt '*' saltutil.sync_engines
salt '*' saltutil.sync_engines saltenv=base,dev

salt.modules.saltutil.sync_executors(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)
New in version 2019.2.1.
Sync executors from salt://_executors to the minion
saltenv  The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
If not passed, then all environments configured in the top files will be checked for log handlers to sync. If no top files are found, then the base environment will be synced.
refresh  [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new log handlers are synced. Set to False to prevent this refresh.
extmod_whitelist  [None] comma-separated list of modules to sync
extmod_blacklist  [None] comma-separated list of modules to blacklist based on type

CLI Examples:
salt '*' saltutil.sync_executors
salt '*' saltutil.sync_executors saltenv=dev
salt '*' saltutil.sync_executors saltenv=base, dev

salt.modules.saltutil.sync_grains(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)
New in version 0.10.0.
Sync grains modules from salt://_grains to the minion
saltenv  The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
If not passed, then all environments configured in the top files will be checked for grains modules to sync. If no top files are found, then the base environment will be synced.
refresh  [True] If True, refresh the available execution modules and recompile pillar data for the minion. This refresh will be performed even if no new grains modules are synced. Set to False to prevent this refresh.
extmod_whitelist  [None] comma-separated list of modules to sync
extmod_blacklist  [None] comma-separated list of modules to blacklist based on type

CLI Examples:
salt '*' saltutil.sync_grains
salt '*' saltutil.sync_grains saltenv=dev
salt '*' saltutil.sync_grains saltenv=base, dev

salt.modules.saltutil.sync_log_handlers(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)
New in version 2015.8.0.
Sync log handlers from salt://_log_handlers to the minion
saltenv  The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
If not passed, then all environments configured in the top files will be checked for log handlers to sync. If no top files are found, then the base environment will be synced.
refresh  [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new log handlers are synced. Set to False to prevent this refresh.
extmod_whitelist  [None] comma-separated list of modules to sync
extmod_blacklist  [None] comma-separated list of modules to blacklist based on type
CLI Examples:

```
salt '*' saltutil.sync_log_handlers
salt '*' saltutil.sync_log_handlers saltenv=dev
salt '*' saltutil.sync_log_handlers saltenv=base,dev
```

```
salt.modules.saltutil.sync_matchers(saltenv=None, refresh=False, extmod_whitelist=None, extmod_blacklist=None)
```

New in version 2019.2.0.

Sync engine modules from `salt://_matchers` to the minion
saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the `top files` will be checked for engines to sync. If no top files are found, then the `base` environment will be synced.

refresh [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new matcher modules are synced. Set to False to prevent this refresh.

extmod_whitelist [None] comma-separated list of modules to sync
extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_matchers
salt '*' saltutil.sync_matchers saltenv=base,dev
```

```
salt.modules.saltutil.sync_modules(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)
```

New in version 0.10.0.

Sync execution modules from `salt://_modules` to the minion
saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the `top files` will be checked for execution modules to sync. If no top files are found, then the `base` environment will be synced.

refresh [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new execution modules are synced. Set to False to prevent this refresh.

---

**Important:** If this function is executed using a `module.run` state, the SLS file will not have access to newly synced execution modules unless a refresh argument is added to the state, like so:

```
load_my_custom_module:
  module.run:
    - name: saltutil.sync_modules
    - refresh: True
```

See [here](#) for a more detailed explanation of why this is necessary.

---

extmod_whitelist [None] comma-separated list of modules to sync
extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt '*' saltutil.sync_modules
salt '*' saltutil.sync_modules saltenv=dev
salt '*' saltutil.sync_modules saltenv=base,dev
```
**salt.modules.saltutil.sync_output**

```
salt.modules.saltutil.sync_output(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)
```

Sync outputters from `salt://_output` to the minion

- **saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
  
  If not passed, then all environments configured in the `top files` will be checked for outputters to sync. If no top files are found, then the base environment will be synced.

- **refresh** [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new outputters are synced. Set to False to prevent this refresh.

- **extmod_whitelist** [None] comma-separated list of modules to sync

- **extmod_blacklist** [None] comma-separated list of modules to blacklist based on type

**CLI Examples:**

```bash
salt '*' saltutil.sync_output
salt '*' saltutil.sync_output saltenv=dev
salt '*' saltutil.sync_output saltenv=base,dev
```

**salt.modules.saltutil.sync_outputters**

This function is an alias of `sync_output`.

```
salt.modules.saltutil.sync_outputters(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)
```

Sync outputters from `salt://_output` to the minion

- **saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
  
  If not passed, then all environments configured in the `top files` will be checked for outputters to sync. If no top files are found, then the base environment will be synced.

- **refresh** [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new outputters are synced. Set to False to prevent this refresh.

- **extmod_whitelist** [None] comma-separated list of modules to sync

- **extmod_blacklist** [None] comma-separated list of modules to blacklist based on type

**CLI Examples:**

```bash
salt '*' saltutil.sync_outputters
salt '*' saltutil.sync_outputters saltenv=dev
salt '*' saltutil.sync_outputters saltenv=base,dev
```

**salt.modules.saltutil.sync_pillar**

```
salt.modules.saltutil.sync_pillar(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)
```

New in version 2015.8.11, 2016.3.2.

Sync pillar modules from the `salt://_pillar` directory on the Salt fileserver. This function is environment-aware, pass the desired environment to grab the contents of the `_pillar` directory from that environment. The default environment, if none is specified, is base.

- **refresh** [True] Also refresh the execution modules available to the minion, and refresh pillar data.

- **extmod_whitelist** [None] comma-separated list of modules to sync

- **extmod_blacklist** [None] comma-separated list of modules to blacklist based on type

**Note:** This function will raise an error if executed on a traditional (i.e. not masterless) minion

**CLI Examples:**

```bash
salt '*' saltutil.sync_pillar
salt '*' saltutil.sync_pillar saltenv=dev
```

**salt.modules.saltutil.sync_proxymodules**

```
salt.modules.saltutil.sync_proxymodules(saltenv=None, refresh=False, extmod_whitelist=None, extmod_blacklist=None)
```

2420 Chapter 21. Salt Module Reference
New in version 2015.8.2.

Sync proxy modules from `salt://_proxy` to the minion

**saltenv** The filesserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the `top files` will be checked for proxy modules to sync. If no top files are found, then the `base` environment will be synced.

**refresh** [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new proxy modules are synced. Set to `False` to prevent this refresh.

**extmod_whitelist** [None] comma-separated list of modules to sync

**extmod_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```bash
salt '*' saltutil.sync_proxymodules
salt '*' saltutil.sync_proxymodules saltenv=dev
salt '*' saltutil.sync_proxymodules saltenv=base,dev
```

```
salt.modules.saltutil.sync_renderers(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)
```

New in version 0.10.0.

Sync renderers from `salt://_renderers` to the minion

**saltenv** The filesserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the `top files` will be checked for renderers to sync. If no top files are found, then the `base` environment will be synced.

**refresh** [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new renderers are synced. Set to `False` to prevent this refresh. Set to `False` to prevent this refresh.

**extmod_whitelist** [None] comma-separated list of modules to sync

**extmod_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```bash
salt '*' saltutil.sync_renderers
salt '*' saltutil.sync_renderers saltenv=dev
salt '*' saltutil.sync_renderers saltenv=base,dev
```

```
salt.modules.saltutil.sync_returners(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)
```

New in version 0.10.0.

Sync returners from `salt://_returners` to the minion

**saltenv** The filesserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the `top files` will be checked for returners to sync. If no top files are found, then the `base` environment will be synced.

**refresh** [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new returners are synced. Set to `False` to prevent this refresh.

**extmod_whitelist** [None] comma-separated list of modules to sync

**extmod_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```bash
salt '*' saltutil.sync_returners
salt '*' saltutil.sync_returners saltenv=dev
```
salt.modules.saltutil.sync_sdb(saltenv=None, extmod_whitelist=None, extmod_blacklist=None)
New in version 2015.5.8,2015.8.3.
Sync sdb modules from salt://_sdb to the minion

**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for sdb modules to sync. If no top files are found, then the base environment will be synced.

**refresh** [False] This argument has no affect and is included for consistency with the other sync functions.

**extmod_whitelist** [None] comma-seperated list of modules to sync
**extmod_blacklist** [None] comma-seperated list of modules to blacklist based on type

CLI Example:

```
salt '*' saltutil.sync_sdb
salt '*' saltutil.sync_sdb saltenv=dev
salt '*' saltutil.sync_sdb saltenv=base,dev
```

salt.modules.saltutil.sync_serializers(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)
New in version 2019.2.0.
Sync serializers from salt://_serializers to the minion

**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for serializer modules to sync. If no top files are found, then the base environment will be synced.

**refresh** [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new serializer modules are synced. Set to False to prevent this refresh.

**extmod_whitelist** [None] comma-seperated list of modules to sync
**extmod_blacklist** [None] comma-seperated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_serializers
salt '*' saltutil.sync_serializers saltenv=dev
salt '*' saltutil.sync_serializers saltenv=base,dev
```

salt.modules.saltutil.sync_states(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)
New in version 0.10.0.
Sync state modules from salt://_states to the minion

**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for state modules to sync. If no top files are found, then the base environment will be synced.

**refresh** [True] If True, refresh the available states on the minion. This refresh will be performed even if no new state modules are synced. Set to False to prevent this refresh.

**extmod_whitelist** [None] comma-seperated list of modules to sync
**extmod_blacklist** [None] comma-seperated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_states
salt '*' saltutil.sync_states saltenv=dev
salt '*' saltutil.sync_states saltenv=base,dev
```
salt.modules.saltutil.sync_thorium(saltenv=None, refresh=False, extmod_whitelist=None, extmod_blacklist=None)

New in version 2018.3.0.

Sync Thorium modules from salt://_thorium to the minion

**saltenv**  The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for engines to sync. If no top files are found, then the base environment will be synced.

**refresh**  If True, refresh the available execution modules on the minion. This refresh will be performed even if no new Thorium modules are synced. Set to False to prevent this refresh.

**extmod_whitelist**  comma-separated list of modules to sync

**extmod_blacklist**  comma-separated list of modules to blacklist based on type

CLI Examples:

```bash
salt '*' saltutil.sync_thorium
salt '*' saltutil.sync_thorium saltenv=base,dev
```

salt.modules.saltutil.sync_utils(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 2014.7.0.

Sync utility modules from salt://_utils to the minion

**saltenv**  The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for utility modules to sync. If no top files are found, then the base environment will be synced.

**refresh**  [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new utility modules are synced. Set to False to prevent this refresh.

**extmod_whitelist**  [None] comma-separated list of modules to sync

**extmod_blacklist**  [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```bash
salt '*' saltutil.sync_utils
salt '*' saltutil.sync_utils saltenv=dev
salt '*' saltutil.sync_utils saltenv=base,dev
```

salt.modules.saltutil.term_all_jobs()

Sends a termination signal (SIGTERM 15) to all currently running jobs

CLI Example:

```bash
salt '*' saltutil.term_all_jobs
```

salt.modules.saltutil.term_job(jid)

Sends a termination signal (SIGTERM 15) to the named salt job’s process

CLI Example:

```bash
salt '*' saltutil.term_job <job id>
```

salt.modules.saltutil.update(version=None)

Update the salt minion from the URL defined in opts['update_url'] SaltStack, Inc provides the latest builds here: update_url: https://repo.saltstack.com/windows/

Be aware that as of 2014-8-11 there's a bug in esky such that only the latest version available in the update_url can be downloaded and installed.
This feature requires the minion to be running a bdist_esky build.

The version number is optional and will default to the most recent version available at opts['update_url'].

Returns details about the transaction upon completion.

CLI Examples:

```bash
salt '*' saltutil.update
salt '*' saltutil.update 0.10.3
```

**salt.modules.saltutil.wheel(name, "args", "**kwargs")**

Execute a wheel module and function. This function must be run against a minion that is local to the master.

New in version 2014.7.0.

- **name** The name of the function to run
- **args** Any positional arguments to pass to the wheel function. A common example of this would be the `match` arg needed for key functions.

New in version v2015.8.11.

- **kwargs** Any keyword arguments to pass to the wheel function

CLI Example:

```bash
salt my-local-minion saltutil.wheel key.accept jerry
salt my-local-minion saltutil.wheel minions.connected
```

**Note**: Since this function must be run against a minion that is running locally on the master in order to get accurate returns, if this function is run against minions that are not local to the master, "empty" returns are expected. The remote minion does not have access to wheel functions and their return data.

### 21.9.370 salt.modules.schedule

Module for managing the Salt schedule on a minion

New in version 2014.7.0.

**salt.modules.schedule.add(name, "**kwargs")**

Add a job to the schedule

CLI Example:

```bash
salt '*' schedule.add job1 function='test.ping' seconds=3600
# If function have some arguments, use job_args
salt '*' schedule.add job2 function='cmd.run' job_args=['[date >> /tmp/date.log]'] seconds=60
```

**salt.modules.schedule.build_schedule_item(name, "**kwargs")**

Build a schedule job

CLI Example:

```bash
salt '*' schedule.build_schedule_item job1 function='test.ping' seconds=3600
```

**salt.modules.schedule.copy(name, target, "**kwargs")**

Copy scheduled job to another minion or minions.

CLI Example:
salt '*' schedule.copy jobname target

salt.modules.schedule.delete(name, **kwargs)
    Delete a job from the minion’s schedule
    CLI Example:
    salt '*' schedule.delete job1

salt.modules.schedule.disable(**kwargs)
    Disable all scheduled jobs on the minion
    CLI Example:
    salt '*' schedule.disable

salt.modules.schedule.disable_job(name, **kwargs)
    Disable a job in the minion’s schedule
    CLI Example:
    salt '*' schedule.disable_job job1

salt.modules.schedule.enable(**kwargs)
    Enable all scheduled jobs on the minion
    CLI Example:
    salt '*' schedule.enable

salt.modules.schedule.enable_job(name, **kwargs)
    Enable a job in the minion’s schedule
    CLI Example:
    salt '*' schedule.enable_job job1

salt.modules.schedule.is_enabled(name)
    List a Job only if its enabled
    New in version 2015.5.3.
    CLI Example:
    salt '*' schedule.is_enabled name=job_name

salt.modules.schedule.list_(show_all=False, show_disabled=True, where=None, return_yaml=True)
    List the jobs currently scheduled on the minion
    CLI Example:
    salt '*' schedule.list
    # Show all jobs including hidden internal jobs
    salt '*' schedule.list show_all=True
    # Hide disabled jobs from list of jobs
    salt '*' schedule.list show_disabled=False
Salt Documentation, Release 2019.2.0

salt.modules.schedule.modify\(\text{name, **kwargs}\\)\)
Modify an existing job in the schedule

CLI Example:
```
salt '*' schedule.modify job1 function='test.ping' seconds=3600
```

salt.modules.schedule.move\(\text{name, target, **kwargs}\\)\)
Move scheduled job to another minion or minions.

CLI Example:
```
salt '*' schedule.move jobname target
```

salt.modules.schedule.postpone_job\(\text{name, current_time, new_time, **kwargs}\\)\)
Postpone a job in the minion’s schedule

Current time and new time should be in date string format, default value is \%Y-\%m-\%dT\%H:\%M:\%S.
New in version 2018.3.0.

CLI Example:
```
salt '*' schedule.postpone_job job current_time new_time
salt '*' schedule.postpone_job job current_time new_time time_fmt='\%Y-\%m-\%dT\%H:\%M:%S'
```

salt.modules.schedule.purge\(**kwargs\)\)
Purge all the jobs currently scheduled on the minion

CLI Example:
```
salt '*' schedule.purge
```

salt.modules.schedule.reload\()\)
Reload saved scheduled jobs on the minion

CLI Example:
```
salt '*' schedule.reload
```

salt.modules.schedule.run_job\(\text{name, force=False}\\)\)
Run a scheduled job on the minion immediately

CLI Example:
```
salt '*' schedule.run_job job1
salt '*' schedule.run_job job1 force=True
```

Force the job to run even if it is disabled.

salt.modules.schedule.save\(**kwargs\)\)
Save all scheduled jobs on the minion

CLI Example:
```
salt '*' schedule.save
```

salt.modules.schedule.show_next_fire_time\(\text{name, **kwargs}\\)\)
Show the next fire time for scheduled job
New in version 2018.3.0.

CLI Example:

```
salt '*' schedule.show_next_fire_time job_name
```

caller\ modules\ schedule.\ skip_job\ (name, current_time, **kwargs)
Skip a job in the minion’s schedule at specified time.

Time to skip should be specified as date string format, default value is %Y-%m-%dT%H:%M:%S.

New in version 2018.3.0.

CLI Example:

```
salt '*' schedule.skip_job job time
```

### 21.9.371 salt.modules.scp module

**SCP Module**

New in version 2019.2.0.

Module to copy files via SCP

```
salt.modules.scp_mod.get\ (remote_path, local_path='', recursive=False, preserve_times=False, **kwargs)
```

Transfer files and directories from remote host to the localhost of the Minion.

- **remote_path** Path to retrieve from remote host. Since this is evaluated by scp on the remote host, shell wildcards and environment variables may be used.
- **recursive:** *False* Transfer files and directories recursively.
- **preserve_times:** *False* Preserve mtime and atime of transferred files and directories.
- **hostname** The hostname of the remote device.
- **port:** *22* The port of the remote device.
- **username** The username required for SSH authentication on the device.
- **password** Used for password authentication. It is also used for private key decryption if **passphrase** is not given.
- **passphrase** Used for decrypting private keys.
- **pkey** An optional private key to use for authentication.
- **key_filename** The filename, or list of filenames, of optional private key(s) and/or certificates to try for authentication.
- **timeout** An optional timeout (in seconds) for the TCP connect.
- **socket_timeout:** *10* The channel socket timeout in seconds.
- **buff_size:** *16384* The size of the SCP send buffer.
- **allow_agent:** *True* Set to False to disable connecting to the SSH agent.
- **look_for_keys:** *True* Set to False to disable searching for discoverable private key files in ~/.ssh/
- **banner_timeout** An optional timeout (in seconds) to wait for the SSH banner to be presented.
- **auth_timeout** An optional timeout (in seconds) to wait for an authentication response.
- **auto_add_policy:** *False* Automatically add the host to the **known_hosts**.

CLI Example:

```
salt '*' scp.get /var/tmp/file /tmp/file hostname=10.10.10.1 auto_add_policy=True
```

```
salt.modules.scp_mod.put\ (files, remote_path=None, recursive=False, preserve_times=False, saltenv='base', **kwargs)
```

Transfer files and directories to remote host.

- **files** A single path or a list of paths to be transferred.
remote_path The path on the remote device where to store the files.
recursive: True Transfer files and directories recursively.
preserve_times: False Preserve mtime and atime of transferred files and directories.
hostname The hostname of the remote device.
port: 22 The port of the remote device.
username The username required for SSH authentication on the device.
password Used for password authentication. It is also used for private key decryption if passphrase is not given.
passphrase Used for decrypting private keys.
pkey An optional private key to use for authentication.
key_filename The filename, or list of filenames, of optional private key(s) and/or certificates to try for authentication.
timeout An optional timeout (in seconds) for the TCP connect.
socket_timeout: 10 The channel socket timeout in seconds.
buff_size: 16384 The size of the SCP send buffer.
allow_agent: True Set to False to disable connecting to the SSH agent.
look_for_keys: True Set to False to disable searching for discoverable private key files in ~/.ssh/
banner_timeout An optional timeout (in seconds) to wait for the SSH banner to be presented.
auth_timeout An optional timeout (in seconds) to wait for an authentication response.
auto_add_policy: False Automatically add the host to the known_hosts.

CLI Example:
```
salt '*' scp.put /path/to/file /var/tmp/file hostname=server1 auto_add_policy=True
```
CLI Example:

```
salt '*' sdb.delete sdb://mymemcached/foo
```

`salt.modules.sdb.get(uri)`

Get a value from a db, using a uri in the form of sdb://<profile>/<key>. If the uri provided does not start with sdb://, then it will be returned as-is.

CLI Example:

```
salt '*' sdb.get sdb://mymemcached/foo
```

`salt.modules.sdb.get_or_set_hash(uri, length=8, chars='abcdefghijklmnopqrstuvwxyz0123456789!@#$%^&*(-_=+))`  

Perform a one-time generation of a hash and write it to sdb. If that value has already been set return the value instead.

This is useful for generating passwords or keys that are specific to multiple minions that need to be stored somewhere centrally.

State Example:

```
some_mysql_user:
  mysql_user:
    - present
    - host: localhost
    - password: '{{ salt['sdb.get_or_set_hash']('some_mysql_user_pass') }}'
```

CLI Example:

```
salt '*' sdb.get_or_set_hash 'SECRET_KEY' 50
```

**Warning:** This function could return strings which may contain characters which are reserved as directives by the YAML parser, such as strings beginning with %. To avoid issues when using the output of this function in an SLS file containing YAML+Jinja, surround the call with single quotes.

`salt.modules.sdb.set_(uri, value)`  
Set a value in a db, using a uri in the form of sdb://<profile>/<key>. If the uri provided does not start with sdb:// or the value is not successfully set, return False.

CLI Example:

```
salt '*' sdb.set sdb://mymemcached/foo bar
```

### 21.9.374 `salt.modules.seed`

Virtual machine image management tools

`salt.modules.seed.apply_(path, id_=None, config=None, approve_key=True, install=True, prep_install=False, pub_key=None, priv_key=None, mount_point=None)`  

Seed a location (disk image, directory, or block device) with the minion config, approve the minion’s key, and/or install salt-minion.

CLI Example:
salt 'minion' seed.apply path id [config=config_data] \
[gen_key=(true|false)] [approve_key=(true|false)] \
[install=(true|false)]

**path**  Full path to the directory, device, or disk image on the target minion’s file system.

**id**  Minion id with which to seed the path.

**config**  Minion configuration options. By default, the 'master' option is set to the target host’s 'master'.

**approve_key**  Request a pre-approval of the generated minion key. Requires that the salt-master be configured to either auto-accept all keys or expect a signing request from the target host. Default: true.

**install**  Install salt-minion, if absent. Default: true.

**prep_install**  Prepare the bootstrap script, but don’t run it. Default: false

```python
salt.modules.seed.mkconfig(config=None, tmp=None, id_=None, approve_key=True, pub_key=None, 
priv_key=None)
```

Generate keys and config and put them in a tmp directory.

**pub_key**  absolute path or file content of an optional preseeded salt key

**priv_key**  absolute path or file content of an optional preseeded salt key

CLI Example:

```bash
salt 'minion' seed.mkconfig [config=config_data] [tmp=tmp_dir] \
[id_=minion_id] [approve_key=(true|false)]
```

```python
salt.modules.seed.prep_bootstrap(mpt)
```

Update and get the random script to a random place

CLI Example:

```bash
salt '*' seed.prep_bootstrap /tmp
```

### 21.9.375 salt.modules.selinux

Execute calls on selinux

**Note:** This module requires the `setsebool`, `semanage`, and `semodule` commands to be available on the minion. On RHEL-based distributions, ensure that the `policycoreutils` and `policycoreutils-python` packages are installed. If not on a Fedora or RHEL-based distribution, consult the selinux documentation for your distribution to ensure that the proper packages are installed.

```python
salt.modules.selinux.fcontext_add_or_delete_policy(action, name, filetype=None, 
sel_type=None, sel_user=None, sel_level=None)
```

New in version 2017.7.0.

Adds or deletes the SELinux policy for a given filespec and other optional parameters.

Returns the result of the call to semanage.

Note that you don’t have to remove an entry before setting a new one for a given filespec and filetype, as adding one with semanage automatically overwrites a previously configured SELinux context.

**Warning:** Use `selinux.fcontext_add_policy()`, or `selinux.fcontext_delete_policy()`.
Deprecation as of version 2019.2.0.

**action** The action to perform. Either **add** or **delete**.

**name** filespec of the file or directory. Regex syntax is allowed.

**file_type** The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also `man semanage-fcontext`. Defaults to 'a' (all files).

**sel_type** SELinux context type. There are many.

**sel_user** SELinux user. Use `semanage login -l` to determine which ones are available to you.

**sel_level** The MLS range of the SELinux context.

CLI Example:

```bash
salt '*' selinux.fcontext_add_or_delete_policy add my-policy
```

**salt.modules.selinux.fcontext_add_policy(name, filetype=None, sel_type=None, sel_user=None, sel_level=None)**

New in version 2019.2.0.

Adds the SELinux policy for a given filespec and other optional parameters.

Returns the result of the call to semanage.

Note that you don’t have to remove an entry before setting a new one for a given filespec and filetype, as adding one with semanage automatically overwrites a previously configured SELinux context.

**name** filespec of the file or directory. Regex syntax is allowed.

**file_type** The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also `man semanage-fcontext`. Defaults to 'a' (all files).

**sel_type** SELinux context type. There are many.

**sel_user** SELinux user. Use `semanage login -l` to determine which ones are available to you.

**sel_level** The MLS range of the SELinux context.

CLI Example:

```bash
salt '*' selinux.fcontext_add_policy my-policy
```

**salt.modules.selinux.fcontext_apply_policy(name, recursive=False)**

New in version 2017.7.0.

Applies SELinux policies to filespec using `restorecon [-R] filespec`. Returns dict with changes if successful, the output of the restorecon command otherwise.

**name** filespec of the file or directory. Regex syntax is allowed.

**recursive** Recursively apply SELinux policies.

CLI Example:

```bash
salt '*' selinux.fcontext_apply_policy my-policy
```

**salt.modules.selinux.fcontext_delete_policy(name, filetype=None, sel_type=None, sel_user=None, sel_level=None)**

New in version 2019.2.0.

Deletes the SELinux policy for a given filespec and other optional parameters.

Returns the result of the call to semanage.

Note that you don’t have to remove an entry before setting a new one for a given filespec and filetype, as adding one with semanage automatically overwrites a previously configured SELinux context.

**name** filespec of the file or directory. Regex syntax is allowed.

**file_type** The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also `man semanage-fcontext`. Defaults to 'a' (all files).

**sel_type** SELinux context type. There are many.

**sel_user** SELinux user. Use `semanage login -l` to determine which ones are available to you.

**sel_level** The MLS range of the SELinux context.
CLI Example:

```sh
salt '*' selinux.fcontext_delete_policy my-policy
```

salt.modules.selinux.fcontext_get_policy(name, filetype=None, sel_type=None, sel_user=None, sel_level=None)

New in version 2017.7.0.

Returns the current entry in the SELinux policy list as a dictionary. Returns None if no exact match was found.

Returned keys are:

- filespec (the name supplied and matched)
- filetype (the descriptive name of the filetype supplied)
- sel_user, sel_role, sel_type, sel_level (the selinux context)

name filespec of the file or directory. Regex syntax is allowed.

filetype The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also man semanage-fcontext.

Defaults to 'a' (all files).

CLI Example:

```sh
salt '*' selinux.fcontext_get_policy my-policy
```

salt.modules.selinux.fcontext_policy_is_applied(name, recursive=False)

New in version 2017.7.0.

Returns an empty string if the SELinux policy for a given filespec is applied, returns string with differences in policy and actual situation otherwise.

name filespec of the file or directory. Regex syntax is allowed.

CLI Example:

```sh
salt '*' selinux.fcontext_policy_is_applied my-policy
```

salt.modules.selinux.filetype_id_to_string(filetype='a')

New in version 2017.7.0.

Translates SELinux filetype single-letter representation to a more human-readable version (which is also used in semanage fcontext -l).

salt.modules.selinux.getconfig()

Return the selinux mode from the config file

CLI Example:

```sh
salt '*' selinux.getconfig
```

salt.modules.selinux.getenforce()

Return the mode selinux is running in

CLI Example:

```sh
salt '*' selinux.getenforce
```

salt.modules.selinux.getsebool(boolean)

Return the information on a specific selinux boolean

CLI Example:
salt ' '*' selinux.getsebool virt_use_usb

salt.modules.selinux.getsemod(module)
Return the information on a specific selinux module
CLI Example:
salt ' '*' selinux.getsemod mysql

New in version 2016.3.0.

salt.modules.selinux.install_semod(module_path)
Install custom SELinux module from file
CLI Example:
salt ' '*' selinux.install_semod [salt://]path/to/module.pp

New in version 2016.11.6.

salt.modules.selinux.list_sebool()
Return a structure listing all of the selinux booleans on the system and what state they are in
CLI Example:
salt ' '*' selinux.list_sebool

salt.modules.selinux.list_semod()
Return a structure listing all of the selinux modules on the system and what state they are in
CLI Example:
salt ' '*' selinux.list_semod

New in version 2016.3.0.

salt.modules.selinux.port_add_policy(name, sel_type=None, protocol=None, port=None, sel_range=None)
New in version 2019.2.0.
Adds the SELinux policy for a given protocol and port.
Returns the result of the call to semanage.
name The protocol and port spec. Can be formatted as (tcp|udp)/(port|port-range).
sel_type The SELinux Type. Required.
protocol The protocol for the port, tcp or udp. Required if name is not formatted.
port The port or port range. Required if name is not formatted.
sel_range The SELinux MLS/MCS Security Range.
CLI Example:
salt ' '*' selinux.port_add_policy add tcp/8080 http_port_t
salt ' '*' selinux.port_add_policy add foobar http_port_t protocol=tcp port=8091

salt.modules.selinux.port_delete_policy(name, protocol=None, port=None)
New in version 2019.2.0.
Deletes the SELinux policy for a given protocol and port.
Returns the result of the call to semanage.
name The protocol and port spec. Can be formatted as (tcp|udp)/(port|port-range).
protocol The protocol for the port, tcp or udp. Required if name is not formatted.
port  The port or port range. Required if name is not formatted.

**CLI Example:**
```
salt '*' selinux.port_delete_policy tcp/80
salt '*' selinux.port_delete_policy foobar protocol=tcp port=8091
```

salt.modules.selinux.**port_get_policy**(name, sel_type=None, protocol=None, port=None)

New in version 2019.2.0.

Returns the current entry in the SELinux policy list as a dictionary. Returns None if no exact match was found.

Returned keys are:
- sel_type (the selinux type)
- proto (the protocol)
- port (the port(s) and/or port range(s))

**name**  The protocol and port spec. Can be formatted as (tcp|udp)/(port|port-range).

**sel_type**  The SELinux Type.

**protocol**  The protocol for the port, tcp or udp. Required if name is not formatted.

**port**  The port or port range. Required if name is not formatted.

**CLI Example:**
```
salt '*' selinux.port_get_policy tcp/80
salt '*' selinux.port_get_policy foobar protocol=tcp port=80
```

salt.modules.selinux.**remove_semod**(module)

Remove SELinux module

**CLI Example:**
```
salt '*' selinux.remove_semod module_name
```

New in version 2016.11.6.

salt.modules.selinux.**selinux_fs_path**()

Return the location of the SELinux VFS directory

**CLI Example:**
```
salt '*' selinux.selinux_fs_path
```

salt.modules.selinux.**setenforce**(mode)

Set the SELinux enforcing mode

**CLI Example:**
```
salt '*' selinux.setenforce enforcing
```

salt.modules.selinux.**setsebool**(boolean, value, persist=False)

Set the value for a boolean

**CLI Example:**
```
salt '*' selinux.setsebool virt_use_usb off
```

salt.modules.selinux.**setsebools**(pairs, persist=False)

Set the value of multiple booleans

**CLI Example:**
```
```
```
salt '*' selinux.setsebools '{virt_use_usb: on, squid_use_tproxy: off}'
```

```
salt.modules.selinux.setsemod(module, state)
    Enable or disable an SELinux module.
    CLI Example:
    
    ```
salt '*' selinux.setsemod nagios Enabled
    ```
    
    New in version 2016.3.0.
```

### 21.9.376 salt.modules.sensehat

Module for controlling the LED matrix or reading environment data on the SenseHat of a Raspberry Pi.

New in version 2017.7.0.

**maintainer** Benedikt Werner <1benediktwerner@gmail.com>, Joachim Werner <joe@suse.com>

**maturity** new

**depends** sense_hat Python module

The rotation of the Pi can be specified in a pillar. This is useful if the Pi is used upside down or sideways to correct the orientation of the image being shown.

Example:

```
sensehat:
    rotation: 90
```

```
salt.modules.sensehat.clear(color=None)
    Sets the LED matrix to a single color or turns all LEDs off.
    CLI Example:
    
    ```
salt 'raspberry' sensehat.clear
    salt 'raspberry' sensehat.clear '[255, 0, 0]'
    ```
```

```
salt.modules.sensehat.get_humidity()
    Get the percentage of relative humidity from the humidity sensor.
```

```
salt.modules.sensehat.get_pixel(x, y)
    Returns the color of a single pixel on the LED matrix.
    x  The x coordinate of the pixel. Ranges from 0 on the left to 7 on the right.
    y  The y coordinate of the pixel. Ranges from 0 at the top to 7 at the bottom.
    
    **Note:** Please read the note for get_pixels
```

```
salt.modules.sensehat.get_pixels()
    Returns a list of 64 smaller lists of [R, G, B] pixels representing the the currently displayed image on the LED matrix.
    
    **Note:** When using set_pixels the pixel values can sometimes change when you read them again using get_pixels. This is because we specify each pixel element as 8 bit numbers (0 to 255) but when they're passed into the Linux frame buffer for the LED matrix the numbers are bit shifted down to fit into RGB 565. 5
bits for red, 6 bits for green and 5 bits for blue. The loss of binary precision when performing this conversion
(3 bits lost for red, 2 for green and 3 for blue) accounts for the discrepancies you see.

The get_pixels method provides an accurate representation of how the pixels end up in frame buffer
memory after you have called set_pixels.

salt.modules.sensehat.get_pressure()
Gets the current pressure in Millibars from the pressure sensor.

class=\texttt{salt.modules.sensehat.get_temperature()}
class=\texttt{salt.modules.sensehat.get_temperature_from_humidity()}
Gets the temperature in degrees Celsius from the humidity sensor. Equivalent to calling
get_temperature_from_humidity.

If you get strange results try using get_temperature_from_pressure.

class=\texttt{salt.modules.sensehat.get_temperature_from_humidity()}
Gets the temperature in degrees Celsius from the humidity sensor.

class=\texttt{salt.modules.sensehat.get_temperature_from_pressure()}
Gets the temperature in degrees Celsius from the pressure sensor.

class=\texttt{salt.modules.sensehat.low_light(low_light=True)}
Sets the LED matrix to low light mode. Useful in a dark environment.

CLI Example:

$ salt \texttt{raspberry} \texttt{sensehat.low_light}$

$ salt \texttt{raspberry} \texttt{sensehat.low_light False}$

class=\texttt{salt.modules.sensehat.set_pixel(x, y, color)}
Sets a single pixel on the LED matrix to a specified color.

\begin{itemize}
  \item \texttt{x} The x coordinate of the pixel. Ranges from 0 on the left to 7 on the right.
  \item \texttt{y} The y coordinate of the pixel. Ranges from 0 at the top to 7 at the bottom.
  \item \texttt{color} The new color of the pixel as a list of \([R, G, B]\) values.
\end{itemize}

CLI Example:

$ salt \texttt{raspberry} \texttt{sensehat.set_pixel 0 0 } [255, 0, 0]$'

class=\texttt{salt.modules.sensehat.set_pixel(x, y, color)}
Sets a single pixel on the LED matrix to a specified color.

\begin{itemize}
  \item \texttt{pixels} A list of 64 \([R, G, B]\) color values.
\end{itemize}

class=\texttt{salt.modules.sensehat.show_image(image)}
Displays an 8 x 8 image on the LED matrix.

\begin{itemize}
  \item \texttt{image} The path to the image to display. The image must be 8 x 8 pixels in size.
\end{itemize}

CLI Example:

$ salt \texttt{raspberry} \texttt{sensehat.show_image /tmp/my_image.png}$

class=\texttt{salt.modules.sensehat.show_letter(letter, text_color=None, back_color=None)}
Displays a single letter on the LED matrix.

\begin{itemize}
  \item \texttt{letter} The letter to display
  \item \texttt{text_color} The color in which the letter is shown. Defaults to \([255, 255, 255]\) (white).
  \item \texttt{back_color} The background color of the display. Defaults to \([0, 0, 0]\) (black).
\end{itemize}

CLI Example:
salt 'raspberry' sensehat.show_letter 'O'
salt 'raspberry' sensehat.show_letter X '[255, 0, 0]'
salt 'raspberry' sensehat.show_letter B '[0, 0, 255]' '[255, 255, 0]'

```python
salt.modules.sensehat.show_message(message, msg_type=None, text_color=None, back_color=None, scroll_speed=0.1)
```

Displays a message on the LED matrix.

- **message** The message to display
- **msg_type** The type of the message. Changes the appearance of the message.
  
  Available types are:
  ```
  error: red text
  warning: orange text
  success: green text
  info: blue text
  ```
  
- **scroll_speed** The speed at which the message moves over the LED matrix. This value represents the time paused for between shifting the text to the left by one column of pixels. Defaults to '0.1'.
- **text_color** The color in which the message is shown. Defaults to '[255, 255, 255]' (white).
- **back_color** The background color of the display. Defaults to '[0, 0, 0]' (black).

CLI Example:

```bash
salt 'raspberry' sensehat.show_message 'Status ok'
salt 'raspberry' sensehat.show_message 'Something went wrong' error
salt 'raspberry' sensehat.show_message 'Red' text_color='[255, 0, 0]'
```

21.9.377 salt.modules.sensors

Read lm-sensors

New in version 2014.1.3.

```python
salt.modules.sensors.sense(chip, fahrenheit=False)
```

Gather lm-sensors data from a given chip

To determine the chip to query, use the 'sensors' command and see the leading line in the block.

Example:

```
/usr/bin/sensors

coretemp-isa-0000 Adapter: ISA adapter Physical id 0: +56.0°C (high = +87.0°C, crit = +105.0°C) Core 0: +52.0°C (high = +87.0°C, crit = +105.0°C) Core 1: +50.0°C (high = +87.0°C, crit = +105.0°C) Core 2: +56.0°C (high = +87.0°C, crit = +105.0°C) Core 3: +53.0°C (high = +87.0°C, crit = +105.0°C)
```

Given the above, the chip is 'coretemp-isa-0000'.

21.9.378 salt.modules.serverdensity_device

Wrapper around Server Density API

New in version 2014.7.0.

21.9. execution modules
salt.modules.serverdensity_device.create(name, **params)
Function to create device in Server Density. For more info, see the API docs.

CLI Example:
```
salt '*' serverdensity_device.create lama
salt '*' serverdensity_device.create rich_lama group=lama_band installedRAM=32768
```

salt.modules.serverdensity_device.delete(device_id)
Delete a device from Server Density. For more information, see the API docs.

CLI Example:
```
salt '*' serverdensity_device.delete 51f7eafdb4bb235e000ae4
```

salt.modules.serverdensity_device.get_sd_auth(val, sd_auth_pillar_name='serverdensity')
Returns requested Server Density authentication value from pillar.

CLI Example:
```
salt '*' serverdensity_device.get_sd_auth <val>
```

salt.modules.serverdensity_device.install_agent(agent_key, agent_version=1)
Function downloads Server Density installation agent, and installs sd-agent with agent_key. Optionally the agent_version would select the series to use (defaults on the v1 one).

CLI Example:
```
salt '*' serverdensity_device.install_agent c2bbdd6689ff46282bda07555641498
salt '*' serverdensity_device.install_agent c2bbdd6689ff46282bda07555641498 2
```

salt.modules.serverdensity_device.ls(**params)
List devices in Server Density

Results will be filtered by any params passed to this function. For more information, see the API docs on listing and searching.

CLI Example:
```
salt '*' serverdensity_device.ls
salt '*' serverdensity_device.ls name=lama
salt '*' serverdensity_device.ls name=lama group=lama_band installedRAM=32768
```

salt.modules.serverdensity_device.update(device_id, **params)
Updates device information in Server Density. For more information see the API docs.

CLI Example:
```
salt '*' serverdensity_device.update 51f7eafdb4bb235e000ae4 name=lama group=lama_band
salt '*' serverdensity_device.update 51f7eafdb4bb235e000ae4 name=better_lama group=rock_lamas swapSpace=512
```

21.9.379 salt.modules.servicenow module
Module for execution of ServiceNow CI (configuration items)

New in version 2016.11.0.
depends servicenow_rest python module

configuration Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the ‘servicenow’ key by default, if defined.

For example:

```
servicenow:
  instance_name: '
  username: '
  password: '
```

salt.modules.servicenow.delete_record(table, sys_id)
Delete an existing record

Parameters
- **table**(str) – The table name, e.g. sys_user
- **sys_id**(str) – The unique ID of the record

CLI Example:
```
salt myminion servicenow.delete_record sys_computer 2134566
```

salt.modules.servicenow.non_structured_query(table, query=None, **kwargs)

Parameters
- **table**(str) – The table name, e.g. sys_user
- **query**(str) – The query to run (or use keyword arguments to filter data)

CLI Example:
```
salt myminion servicenow.non_structured_query sys_computer role=web
salt myminion servicenow.non_structured_query sys_computer role=web type=computer
```

salt.modules.servicenow.set_change_request_state(change_id, state='approved')
Set the approval state of a change request/record

Parameters
- **change_id**(str) – The ID of the change request, e.g. CHG123545
- **state**(str) – The target state, e.g. approved

CLI Example:
```
salt myminion servicenow.set_change_request_state CHG000123 declined
salt myminion servicenow.set_change_request_state CHG000123 approved
```

salt.modules.servicenow.update_record_field(table, sys_id, field, value)
Update the value of a record’s field in a servicenow table

Parameters
- **table**(str) – The table name, e.g. sys_user
- **sys_id**(str) – The unique ID of the record
- **field**(str) – The new value
- **value**(str) – The new value

CLI Example:
```
salt myminion servicenow.update_record_field sys_user 2348234 first_name jimmy
21.9.380  salt.modules.slack_notify

Module for sending messages to Slack

New in version 2015.5.0.

configuration  This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

```
salt:
  api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

salt.modules.slack_notify.call_hook(message, attachment=None, color='good', short=False, identifier=None, channel=None, username=None, icon_emoji=None)

Send message to Slack incoming webhook.

Parameters

- **message** – The topic of message.
- **attachment** – The message to send to the Slacke WebHook.
- **color** – The color of border of left side
- **short** – An optional flag indicating whether the value is short enough to be displayed side-by-side with other values.
- **identifier** – The identifier of WebHook.
- **channel** – The channel to use instead of the WebHook default.
- **username** – Username to use instead of WebHook default.
- **icon_emoji** – Icon to use instead of WebHook default.

Returns  Boolean if message was sent successfully.

CLI Example:

```
salt '*' slack.call_hook message='Hello, from SaltStack'
```

salt.modules.slack_notify.find_room(name, api_key=None)

Find a room by name and return it.

Parameters

- **name** – The room name.
- **api_key** – The Slack admin api key.

Returns  The room object.

CLI Example:

```
salt '*' slack.find_room name="random"
salt '*' slack.find_room name="random" api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

salt.modules.slack_notify.find_user(name, api_key=None)

Find a user by name and return it.

Parameters

- **name** – The user name.
- **api_key** – The Slack admin api key.

Returns  The user object.

CLI Example:

```
salt '*' slack.find_user name="ThomasHatch"
salt '*' slack.find_user name="ThomasHatch" api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```
salt.modules.slack_notify.list_rooms(api_key=None)
List all Slack rooms.

**Parameters**
- **api_key** – The Slack admin api key.

**Returns**
The room list.

**CLI Example:**
```
salt '*' slack.list_rooms
salt '*' slack.list_rooms api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

salt.modules.slack_notify.list_users(api_key=None)
List all Slack users.

**Parameters**
- **api_key** – The Slack admin api key.

**Returns**
The user list.

**CLI Example:**
```
salt '*' slack.list_users
salt '*' slack.list_users api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

salt.modules.slack_notify.post_message(channel, message, from_name, api_key=None, icon=None)
Send a message to a Slack channel.

**Parameters**
- **channel** – The channel name, either will work.
- **message** – The message to send to the Slack channel.
- **from_name** – Specify who the message is from.
- **api_key** – The Slack api key, if not specified in the configuration.
- **icon** – URL to an image to use as the icon for this message

**Returns**
Boolean if message was sent successfully.

**CLI Example:**
```
salt '*' slack.post_message
channel="Development Room" message="Build is done"
from_name="Build Server"
```

21.9.381 salt.modules.slsutil
Utility functions for use with or in SLS files

salt.modules.slsutil.deserialize(serializer, stream_or_string, **mod_kwargs)
Deserializa a Python object using a serializer module

**CLI Example:**
```
salt '*' slsutil.deserialize 'json' '{"foo": "Foo!"}'
salt '*' --no-parse=stream_or_string slsutil.deserialize 'json' \
  stream_or_string='{"foo": "Foo!"}'
```

Jinja Example:
```
{% set python_object = salt.slsutil.deserialize('json', \ '{"foo": "Foo!"}') %}
```

salt.modules.slsutil.merge(obj_a, obj_b, strategy='smart', renderer='yaml', merge_lists=False)
Merge a data structure into another by choosing a merge strategy

**Strategies:**
• aggregate
• list
• overwrite
• recurse
• smart

CLI Example:

```bash
grep 'aggregate' /etc/salt masters
```

salt.modules.slsutil.merge_all(lst, strategy='smart', renderer='yaml', merge_lists=False)

New in version 2019.2.0.

Merge a list of objects into each other in order

Parameters

- **lst** (Iterable) – List of objects to be merged.
- **strategy** (String) – Merge strategy. See util.dictupdate.
- **renderer** (String) – Renderer type. Used to determine strategy when strategy is 'smart'.
- **merge_lists** (Bool) – Defines whether to merge embedded object lists.

CLI Example:

```
salt '*' slsutil.merge '{foo: Foo}' '{bar: Bar}'
```

salt.modules.slsutil.renderer(path=None, string=None, default_renderer='jinja|yaml', **kwargs)

Parse a string or file through Salt’s renderer system

Changed in version 2018.3.0: Add support for Salt fileserver URIs.

This is an open-ended function and can be used for a variety of tasks. It makes use of Salt’s "renderer pipes" system to run a string or file through a pipe of any of the loaded renderer modules.

Parameters

- **path** – The path to a file on Salt’s fileserver (any URIs supported by cp.get_url) or on the local file system.
- **string** – An inline string to be used as the file to send through the renderer system. Note, not all renderer modules can work with strings; the ‘py’ renderer requires a file, for example.
- **default_renderer** – The renderer pipe to send the file through; this is overridden by a "she-bang" at the top of the file.
- **kwargs** – Keyword args to pass to Salt’s compile_template() function.

Keep in mind the goal of each renderer when choosing a render-pipe; for example, the Jinja renderer processes a text file and produces a string, however the YAML renderer processes a text file and produces a data structure.

One possible use is to allow writing "map files", as are commonly seen in Salt formulas, but without tying the renderer of the map file to the renderer used in the other sls files. In other words, a map file could use the Python renderer and still be included and used by an sls file that uses the default 'jinja|yaml' renderer.

For example, the two following map files produce identical results but one is written using the normal 'jinja|yaml' and the other is using 'py':

```yaml
#!jinja|yaml
{% set apache = salt.grains.filter_by({
    ...normal jinja map file here...
}), merge=salt.pillar.get('apache:lookup') %}
{{ apache | yaml() }}
```
```python
#!/py
def run():
    apache = __salt__.grains.filter_by({
        ...normal map here but as a python dict...
    }, merge=__salt__.pillar.get('apache:lookup'))
    return apache
```

Regardless of which of the above map files is used, it can be accessed from any other sls file by calling this function. The following is a usage example in Jinja:

```jinja
{% set apache = salt.slsutil.renderer('map.sls') %}
```

CLI Example:

```
salt '*' slsutil.renderer salt://path/to/file
salt '*' slsutil.renderer /path/to/file
salt '*' slsutil.renderer /path/to/file.jinja 'jinja'
salt '*' slsutil.renderer /path/to/file.sls 'jinjayaml'
salt '*' slsutil.renderer string='Inline template! {{ saltenv }}'
salt '*' slsutil.renderer string='Hello, {{ name }}.' name='world'
```

**salt.modules.slsutil.serialize** *(serializer, obj, **mod_kwargs)*

Serialize a Python object using a serializer module

CLI Example:

```
salt '*' --no-parse=obj slsutil.serialize 'json' obj="{'foo': 'Foo!'}"
```

Jinja Example:

```jinja
{% set json_string = salt.slsutil.serialize('json',
    {'foo': 'Foo!'}) %}
```

**salt.modules.slsutil.update** *(dest, upd, recursive_update=True, merge_lists=False)*

Merge upd recursively into dest

If merge_lists=True, will aggregate list object types instead of replacing. This behavior is only activated when recursive_update=True.

CLI Example:

```
salt '*' slsutil.update '{foo: Foo}' '{bar: Bar}'
```

---

### 21.9.382 salt.modules.smartos_imgadm

Module for running imgadm command on SmartOS

**salt.modules.smartos_imgadm.avail** *(search=None, verbose=False)*

Return a list of available images

- search [string] search keyword
- verbose [boolean (False)] toggle verbose output

CLI Example:

```
salt '*' imgadm.avail [percona]
salt '*' imgadm.avail verbose=True
```
salt.modules.smartos_imgadm.delete(*uuid*)
Remove an installed image
uuid [string] Specifies uuid to import
CLI Example:

```bash
salt '*' imgadm.delete e42f8c84-bbea-11e2-b920-078fab2aab1f
```

salt.modules.smartos_imgadm.docker_to_uuid(*uuid*)
Get the image uuid from an imported docker image
New in version 2019.2.0.

salt.modules.smartos_imgadm.get(*uuid*)
Return info on an installed image
uuid [string] uuid of image
CLI Example:

```bash
salt '*' imgadm.get e42f8c84-bbea-11e2-b920-078fab2aab1f
salt '*' imgadm.get plexinc/pms-docker:plexpass
```

salt.modules.smartos_imgadm.import_image(*uuid*, verbose=False)
Import an image from the repository
uuid [string] uuid to import
verbose [boolean (False)] toggle verbose output
CLI Example:

```bash
salt '*' imgadm.import e42f8c84-bbea-11e2-b920-078fab2aab1f [verbose=True]
```

salt.modules.smartos_imgadm.list_installed(verbose=False)
Return a list of installed images
verbose [boolean (False)] toggle verbose output
Changed in version 2019.2.0: Docker images are now also listed
CLI Example:

```bash
salt '*' imgadm.list
salt '*' imgadm.list docker=True
salt '*' imgadm.list verbose=True
```

salt.modules.smartos_imgadm.show(*uuid*)
Show manifest of a given image
uuid [string] uuid of image
CLI Example:

```bash
salt '*' imgadm.show e42f8c84-bbea-11e2-b920-078fab2aab1f
salt '*' imgadm.show plexinc/pms-docker:plexpass
```

salt.modules.smartos_imgadm.source_add(*source*, source_type='imgapi')
Add a new source
source [string] source url to add
source_type [string (imgapi)] source type, either imgapi or docker
New in version 2019.2.0.
CLI Example:

```bash
salt '*' imgadm.source_add https://updates.joyent.com
salt '*' imgadm.source_add https://docker.io docker
```
salt.modules.smartos_imgadm.source_delete(source)

Delete a source

source [string] source url to delete

New in version 2019.2.0.

CLI Example:

```
salt '*' imgadm.source_delete https://updates.joyent.com
```  

salt.modules.smartos_imgadm.sources(verbosе=False)

Return a list of available sources

verbose [boolean (False)] toggle verbose output

New in version 2019.2.0.

CLI Example:

```
salt '*' imgadm.sources
```  

salt.modules.smartos_imgadm.update_installed(uuid="")

Gather info on unknown image(s) (locally installed)

uuid [string] optional uuid of image

CLI Example:

```
salt '*' imgadm.update [uuid]
```  

salt.modules.smartos_imgadm.vacuum(verbosе=False)

Remove unused images

verbose [boolean (False)] toggle verbose output

CLI Example:

```
salt '*' imgadm.vacuum [verbose=True]
```  

salt.modules.smartos_imgadm.version()

Return imgadm version

CLI Example:

```
salt '*' imgadm.version
```  

### 21.9.383 salt.modules.smartos_nictagadm module

Module for running nictagadm command on SmartOS :maintainer: Jorge Schrauwen <sjorge@blackdot.be> :maturity: new :depends: nictagadm binary, dladm binary :platform: smartos

..versionadded:: 2016.11.0

salt.modules.smartos_nictagadm.add(name, mac, mtu=1500)

Add a new nictag

name [string] name of new nictag

mac [string] mac of parent interface or ‘etherstub’ to create a ether stub

mtu [int] MTU (ignored for etherstubs)

CLI Example:

```
salt '*' nictagadm.add storage0 etherstub
salt '*' nictagadm.add trunk0 'DE:AD:00:00:BE:EF' 9000
```
salt.modules.smartos_nictagadm.delete(name, force=False)
   
   Delete nictag
   
   name [string] nictag to delete
   force [boolean] force delete even if vms attached
   
   CLI Example:
   
   salt '*' nictagadm.exists admin

salt.modules.smartos_nictagadm.exists(*nictag, **kwargs)
   
   Check if nictags exists
   
   nictag [string] one or more nictags to check
   verbose [boolean] return list of nictags
   
   CLI Example:
   
   salt '*' nictagadm.exists admin

salt.modules.smartos_nictagadm.list_nictags(include_etherstubs=True)
   
   List all nictags
   
   include_etherstubs [boolean] toggle include of etherstubs
   
   CLI Example:
   
   salt '*' nictagadm.list

salt.modules.smartos_nictagadm.update(name, mac=None, mtu=None)
   
   Update a nictag
   
   name [string] name of nictag
   mac [string] optional new mac for nictag
   mtu [int] optional new MTU for nictag
   
   CLI Example:
   
   salt '*' nictagadm.update trunk mtu=9000

salt.modules.smartos_nictagadm.vms(*nictag)
   
   List all vms connect to nictag
   
   nictag [string] name of nictag
   
   CLI Example:
   
   salt '*' nictagadm.vms admin

---

21.9.384 salt.modules.smartos_virt

virtst compatibility module for managing VMs on SmartOS

salt.modules.smartos_virt.get_macs(domain)
   
   Return a list off MAC addresses from the named VM
   
   CLI Example:
   
   salt '*' virt.get_macs <domain>

salt.modules.smartos_virt.init(**kwargs)
   
   Initialize a new VM
   
   CLI Example:
salt '*' virt.init image_uuid='...' alias='...' [...] 

salt.modules.smartos_virt.list_active_vms()
Return a list of uuids for active virtual machine on the minion
   CLI Example:
   salt '*' virt.list_active_vms

salt.modules.smartos_virt.list_domains()
Return a list of virtual machine names on the minion
   CLI Example:
   salt '*' virt.list_domains

salt.modules.smartos_virt.list_inactive_vms()
Return a list of uuids for inactive virtual machine on the minion
   CLI Example:
   salt '*' virt.list_inactive_vms

salt.modules.smartos_virt.reboot(domain)
Reboot a domain via ACPI request
   CLI Example:
   salt '*' virt.reboot <domain>

salt.modules.smartos_virt.setmem(domain, memory)
Change the amount of memory allocated to VM. <memory> is to be specified in MB.
Note for KVM : this would require a restart of the VM.
   CLI Example:
   salt '*' virt.setmem <domain> 512

salt.modules.smartos_virt.shutdown(domain)
Send a soft shutdown signal to the named vm
   CLI Example:
   salt '*' virt.shutdown <domain>

salt.modules.smartos_virt.start(domain)
Start a defined domain
   CLI Example:
   salt '*' virt.start <domain>

salt.modules.smartos_virt.stop(domain)
Hard power down the virtual machine, this is equivalent to powering off the hardware.
   CLI Example:
   salt '*' virt.destroy <domain>
salt.modules.smartos_virt.vm_info(domain)

Return a dict with information about the specified VM on this CN

CLI Example:
```
salt '*' virt.vm_info <domain>
```

salt.modules.smartos_virt.vm_virt_type(domain)

Return VM virtualization type: OS or KVM

CLI Example:
```
salt '*' virt.vm_virt_type <domain>
```

## 21.9.385 salt.modules.smartos_vmadm

Module for running vmadm command on SmartOS

salt.modules.smartos_vmadm.create(from_file=None, **kwargs)

Create a new vm
```
from_file  [string] json file to create the vm from – if present, all other options will be ignored
kwargs  [string[int[...]]] options to set for the vm
```

CLI Example:
```
salt '*' vmadm.create from_file=/tmp/new_vm.json
salt '*' vmadm.create image_uuid='...' alias='...' nics='["nic_tag": "admin", ...
"ip": "198.51.100.123", ...], {...}]'
```

salt.modules.smartos_vmadm.create_snapshot(vm, name, key='uuid')

Create snapshot of a vm
```
vm  [string] vm to be targeted
name  [string]
```

   **snapshot name**  The snapname must be 64 characters or less and must only contain alphanumeric characters and characters in the set [-_:%] to comply with ZFS restrictions.
```
key  [string [uuid|alias|hostname]] value type of 'vm' parameter
```

CLI Example:
```
salt '*' vmadm.create_snapshot 186da9ab-7392-4f55-91a5-b8f1fe770543 baseline
salt '*' vmadm.create_snapshot nacl baseline key=alias
```

salt.modules.smartos_vmadm.delete(vm, key='uuid')

Delete a vm
```
vm  [string] vm to be deleted
key  [string [uuid|alias|hostname]] value type of 'vm' parameter
```

CLI Example:
```
salt '*' vmadm.delete 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.delete nacl key=alias
```

salt.modules.smartos_vmadm.delete_snapshot(vm, name, key='uuid')

Delete snapshot of a vm
```
vm  [string] vm to be targeted
name  [string]
```

   **snapshot name**  The snapname must be 64 characters or less and must only contain alphanumeric characters and characters in the set [-_:%] to comply with ZFS restrictions.
```
key  [string [uuid|alias|hostname]] value type of 'vm' parameter
```

```
CLI Example:

```bash
salt '*' vmadm.delete_snapshot 186da9ab-7392-4f55-91a5-b8f1fe770543 baseline
salt '*' vmadm.delete_snapshot nacl baseline key=alias
```

salt.modules.smartos_vmadm.get(vm, key='uuid')
Output the JSON object describing a VM
vm [string] vm to be targeted
key [string [uuid|alias|hostname]] value type of 'vm' parameter
CLI Example:

```bash
salt '*' vmadm.get 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.get nacl key=alias
```

salt.modules.smartos_vmadm.info(vm, info_type='all', key='uuid')
Lookup info on running kvm
vm [string] vm to be targeted
info_type [string [all|block|blockstats|chardev|cpus|kvm|pci|spice|version|vnc]] info type to return
key [string [uuid|alias|hostname]] value type of 'vm' parameter
CLI Example:

```bash
salt '*' vmadm.info 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.info nacl key=alias
salt '*' vmadm.info nacl vnc key=alias
```

salt.modules.smartos_vmadm.list_vms(search=None, sort=None, order='uuid,type,ram,state,alias', keyed=True)
Return a list of VMs
search [string] vmadm filter property
sort [string] vmadm sort (-s) property
order [string] vmadm order (-o) property – Default: uuid,type,ram,state,alias
keyed [boolean]
   specified if the output should be an array (False) or dict (True) For a dict the key is the first item from
   the order parameter. Note: If key is not unique last vm wins.
CLI Example:

```bash
salt '*' vmadm.list
salt '*' vmadm.list order=alias,ram.cpu_cap sort=-ram,-cpu_cap
salt '*' vmadm.list search='type=KVM'
```

salt.modules.smartos_vmadm.lookup(search=None, order=None, one=False)
Return a list of VMs using lookup
search [string] vmadm filter property
order [string] vmadm order (-o) property – Default: uuid,type,ram,state,alias
one [boolean] return only one result (vmadm’s -1)
CLI Example:

```bash
salt '*' vmadm.lookup search='state=running'
salt '*' vmadm.lookup search='state=running' order=uuid,alias,hostname
salt '*' vmadm.lookup search='alias=nacl' one=True
```

salt.modules.smartos_vmadm.reboot(vm, force=False, key='uuid')
Reboot a vm
vm [string] vm to be rebooted
force [boolean] force reboot of vm if true
key [string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```
salt '*' vmadm.reboot 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.reboot 186da9ab-7392-4f55-91a5-b8f1fe770543 True
salt '*' vmadm.reboot vm=nacl key=alias
salt '*' vmadm.reboot vm=nina.example.org key=hostname
```

```
salt.modules.smartos_vmadm.receive(uuid, source)
  Receive a vm from a directory
  uuid [string] uuid of vm to be received
  source [string] source directory
  CLI Example:
  salt '*' vmadm.receive 186da9ab-7392-4f55-91a5-b8f1fe770543 /opt/backups
```

```
salt.modules.smartos_vmadm.reprovision(vm, image, key='uuid')
  Reprovision a vm
  vm [string] vm to be reprovisioned
  image [string] uuid of new image
  key [string [uuid|alias|hostname]] value type of 'vm' parameter
  CLI Example:
  salt '*' vmadm.reprovision 186da9ab-7392-4f55-91a5-b8f1fe770543 c02a2044-c1bd-...11e4-bd8c-dfc1db8b0182
  salt '*' vmadm.reprovision nacl c02a2044-c1bd-11e4-bd8c-dfc1db8b0182 key=alias
```

```
salt.modules.smartos_vmadm.rollback_snapshot(vm, name, key='uuid')
  Rollback snapshot of a vm
  vm [string] vm to be targeted
  name [string]
    snapshot name The snapshot must be 64 characters or less and must only contain alphanumeric characters and characters in the set [\-_:.%] to comply with ZFS restrictions.
  key [string [uuid|alias|hostname]] value type of 'vm' parameter
  CLI Example:
  salt '*' vmadm.rollback_snapshot 186da9ab-7392-4f55-91a5-b8f1fe770543 baseline
  salt '*' vmadm.rollback_snapshot nacl baseline key=alias
```

```
salt.modules.smartos_vmadm.send(vm, target, key='uuid')
  Send a vm to a directory
  vm [string] vm to be sent
  target [string] target directory
  key [string [uuid|alias|hostname]] value type of 'vm' parameter
  CLI Example:
  salt '*' vmadm.send 186da9ab-7392-4f55-91a5-b8f1fe770543 /opt/backups
  salt '*' vmadm.send vm=nacl target=/opt/backups key=alias
```

```
salt.modules.smartos_vmadm.start(vm, options=None, key='uuid')
  Start a vm
  vm [string] vm to be started
  options [string] optional additional options
  key [string [uuid|alias|hostname]] value type of 'vm' parameter
  CLI Example:
```
salt 'vmadm.start 186da9ab-7392-4f55-91a5-b8f1fe770543
salt 'vmadm.start 186da9ab-7392-4f55-91a5-b8f1fe770543 order=c,once=d cdrom=/path/to/image.iso,ide'
salt 'vmadm.start vm=nacl key=alias
salt 'vmadm.start vm=nina.example.org key=hostname

salt.modules.smartos_vmadm.stop (vm, force=False, key='uuid')
Stop a vm
vm [string] vm to be stopped
force [boolean] force stop of vm if true
key [string [uuid|alias|hostname]] value type of ‘vm’ parameter

CLI Example:
salt 'vmadm.stop 186da9ab-7392-4f55-91a5-b8f1fe770543
salt 'vmadm.stop 186da9ab-7392-4f55-91a5-b8f1fe770543 True
salt 'vmadm.stop vm=nacl key=alias
salt 'vmadm.stop vm=nina.example.org key=hostname

salt.modules.smartos_vmadm.sysrq (vm, action='nmi', key='uuid')
Send non-maskable interrupt to vm or capture a screenshot
vm [string] vm to be targeted
action [string] nmi or screenshot – Default: nmi
key [string [uuid|alias|hostname]] value type of ‘vm’ parameter

CLI Example:
salt 'vmadm.sysrq 186da9ab-7392-4f55-91a5-b8f1fe770543 nmi
salt 'vmadm.sysrq 186da9ab-7392-4f55-91a5-b8f1fe770543 screenshot
salt 'vmadm.sysrq nacl nmi key=alias

salt.modules.smartos_vmadm.update (vm, from_file=None, key='uuid', **kwargs)
Update a new vm
vm [string] vm to be updated
from_file [string] json file to update the vm with – if present, all other options will be ignored
key [string [uuid|alias|hostname]] value type of ‘vm’ parameter
kwargs [string|int|...] options to update for the vm

CLI Example:
salt 'vmadm.update vm=186da9ab-7392-4f55-91a5-b8f1fe770543 from_file=/tmp/new_vm.json
salt 'vmadm.update vm=nacl key=alias from_file=/tmp/new_vm.json
salt 'vmadm.update vm=186da9ab-7392-4f55-91a5-b8f1fe770543 max_physical_memory=1024

21.9.386 salt.modules.smbios
Interface to SMBIOS/DMI
(Parsing through dmidecode)

External References
Desktop Management Interface (DMI)
System Management BIOS
DMldecode

21.9. execution modules 2451
salt.modules.smbios.get(string, clean=True)
Get an individual DMI string from SMBIOS info

string
The string to fetch. DMIdecode supports:
- bios-vendor
- bios-version
- bios-release-date
- system-manufacturer
- system-product-name
- system-version
- system-serial-number
- system-uuid
- baseboard-manufacturer
- baseboard-product-name
- baseboard-version
- baseboard-serial-number
- baseboard-asset-tag
- chassis-manufacturer
- chassis-type
- chassis-version
- chassis-serial-number
- chassis-asset-tag
- processor-family
- processor-manufacturer
- processor-version
- processor-frequency

clean
Don’t return well-known false information
(invalid UUID’s, serial 00000000’0’s, etcetera)
Defaults to True

CLI Example:
salt '*' smbios.get system-uuid clean=False

salt.modules.smbios.records(rec_type=None, fields=None, clean=True)
Return DMI records from SMBIOS

type Return only records of type(s) The SMBIOS specification defines the following DMI types:

<table>
<thead>
<tr>
<th>Type</th>
<th>Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>BIOS</td>

clean

Don’t return well-known false information
(invalid UUID’s, serial 00000000’s, etcetera)
Defaults to True
CLI Example:
```
salt '*' smbios.records clean=\False
salt '*' smbios.records 14
salt '*' smbios.records 4 core_count,thread_count,current_speed
```

21.9.387 salt.modules.smf_service

Service support for Solaris 10 and 11, should work with other systems that use SMF also. (e.g. SmartOS)

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to 'service.start' is not available), see [here](#).
salt.modules.smf_service.available(name)
   Returns True if the specified service is available, otherwise returns False.
   We look up the name with the svcs command to get back the FMRI This allows users to use simpler service names
   CLI Example:
   ```
salt '*' service.available net-snmp
   ```

salt.modules.smf_service.disable(name, **kwargs)
   Disable the named service to start at boot
   CLI Example:
   ```
salt '*' service.disable <service name>
   ```

salt.modules.smf_service.disabled(name)
   Check to see if the named service is disabled to start on boot
   CLI Example:
   ```
salt '*' service.disabled <service name>
   ```

salt.modules.smf_service.enable(name, **kwargs)
   Enable the named service to start at boot
   CLI Example:
   ```
salt '*' service.enable <service name>
   ```

salt.modules.smf_service.enabled(name, **kwargs)
   Check to see if the named service is enabled to start on boot
   CLI Example:
   ```
salt '*' service.enabled <service name>
   ```

salt.modules.smf_service.get_all()
   Return all installed services
   CLI Example:
   ```
salt '*' service.get_all
   ```

salt.modules.smf_service.get_disabled()
   Return the disabled services
   CLI Example:
   ```
salt '*' service.get_disabled
   ```

salt.modules.smf_service.get_enabled()
   Return the enabled services
   CLI Example:
   ```
salt '*' service.get_enabled
   ```
salt.modules.smf_service.get_running()  
Return the running services  

CLI Example:  
```
salt '*' service.get_running
```

salt.modules.smf_service.get_stopped()  
Return the stopped services  

CLI Example:  
```
salt '*' service.get_stopped
```

salt.modules.smf_service.missing(name)  
The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.  

CLI Example:  
```
salt '*' service.missing net-snmp
```

salt.modules.smf_service.reload_(name)  
Reload the named service  

CLI Example:  
```
salt '*' service.reload <service name>
```

salt.modules.smf_service.restart(name)  
Restart the named service  

CLI Example:  
```
salt '*' service.restart <service name>
```

salt.modules.smf_service.start(name)  
Start the specified service  

CLI Example:  
```
salt '*' service.start <service name>
```

salt.modules.smf_service.status(name, sig=None)  
Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.  

Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)  

Parameters  
- **name (str)** - The name of the service to check  
- **sig (str)** - Not implemented  

Returns  
- True if running, False otherwise  
- dict: Maps service name to True if running, False otherwise  

Return type  
```
bool
```

CLI Example:  
```
salt '*' service.status <service name>
```
salt.modules.smf_service.stop(name)
Stop the specified service

CLI Example:

```bash
salt '*' service.stop <service name>
```

21.9.388 salt.modules.smtp

Module for Sending Messages via SMTP

New in version 2014.7.0.

depends

- smtplib python module

configuration This module can be used by either passing a jid and password directly to send_message, or by specifying the name of a configuration profile in the minion config, minion pillar, or master config.

For example:

```yaml
my-smtp-login:
  smtp.server: smtp.domain.com
  smtp.tls: True
  smtp.sender: admin@domain.com
  smtp.username: myuser
  smtp.password: verybadpass
```

The resourcename refers to the resource that is using this account. It is user-definable, and optional. The following configurations are both valid:

```yaml
my-smtp-login:
  smtp.server: smtp.domain.com
  smtp.tls: True
  smtp.sender: admin@domain.com
  smtp.username: myuser
  smtp.password: verybadpass

another-smtp-login:
  smtp.server: smtp.domain.com
  smtp.tls: True
  smtp.sender: admin@domain.com
  smtp.username: myuser
  smtp.password: verybadpass
```

salt.modules.smtp.send_msg(recipient, message, subject='Message from Salt', sender= None, server= None, use_ssl='True', username= None, password= None, profile= None, attachments= None)

Send a message to an SMTP recipient. Designed for use in states.

CLI Examples:

```bash
salt '*' smtp.send_msg 'admin@example.com' 'This is a salt module test' profile= →'my-smtp-account'
salt '*' smtp.send_msg 'admin@example.com' 'This is a salt module test' username= →'myuser' password='verybadpass' sender='admin@example.com' server='smtp.domain. →com'
```
21.9.389 salt.modules.solaris_fmadm

Module for running fmadm and fmdump on Solaris

maintainer Jorge Schrauwen <sjorge@blackdot.be>
maturity new
platform solaris,illumos

New in version 2016.3.0.

salt.modules.solaris_fmadm.acquit(fmri)
Acquit resource or acquit case
fmri: string fmri or uuid

CLI Example:

salt '*' fmadm.acquit fmri | uuid

salt.modules.solaris_fmadm.config()
Display fault manager configuration

CLI Example:

salt '*' fmadm.config

salt.modules.solaris_fmadm.faulty()
Display list of faulty resources

CLI Example:

salt '*' fmadm.faulty

salt.modules.solaris_fmadm.flush(fmri)
Flush cached state for resource
fmri: string fmri

CLI Example:

salt '*' fmadm.flush fmri

salt.modules.solaris_fmadm.healthy()
Return whether fmadm is reporting faults

CLI Example:

salt '*' fmadm.healthy

salt.modules.solaris_fmadm.list_records(after=None, before=None)
Display fault management logs
after [string] filter events after time, see man fmdump for format
before [string] filter events before time, see man fmdump for format

CLI Example:
### Salt Modules for Solaris FMADM

- **salt.modules.solaris_fmadm.load(path)**
  Load specified fault manager module
  - **path**: string  path of fault manager module
  - **CLI Example**: `salt '*' fmadm.load /module/path`

- **salt.modules.solaris_fmadm.repaired(fmri)**
  Notify fault manager that resource has been repaired
  - **fmri**: string  fmri
  - **CLI Example**: `salt '*' fmadm.repaired fmri`

- **salt.modules.solaris_fmadm.replaced(fmri)**
  Notify fault manager that resource has been replaced
  - **fmri**: string  fmri
  - **CLI Example**: `salt '*' fmadm.repaired fmri`

- **salt.modules.solaris_fmadm.reset(module, serd=None)**
  Reset module or sub-component
  - **module**: string  module to unload
  - **serd**: [string]  serd sub module
  - **CLI Example**: `salt '*' fmadm.reset software-response`

- **salt.modules.solaris_fmadm.show(uuid)**
  Display log details
  - **uuid**: string  uuid of fault
  - **CLI Example**: `salt '*' fmadm.show 11b4070f-4358-62fa-9e1e-998f485977e1`

- **salt.modules.solaris_fmadm.unload(module)**
  Unload specified fault manager module
  - **module**: string  module to unload
  - **CLI Example**: `salt '*' fmadm.unload software-response`

### 21.9.390 salt.modules.solaris_group

Manage groups on Solaris

**Important**: If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to 'group.info' is not available), see [here](#).
salt.modules.solaris_group.add(name, gid=None, **kwargs)
Add the specified group

CLI Example:
```
salt '*' group.add foo 3456
```

salt.modules.solaris_group.chgid(name, gid)
Change the gid for a named group

CLI Example:
```
salt '*' group.chgid foo 4376
```

salt.modules.solaris_group.delete(name)
Remove the named group

CLI Example:
```
salt '*' group.delete foo
```

salt.modules.solaris_group.getent(refresh=False)
Return info on all groups

CLI Example:
```
salt '*' group.getent
```

salt.modules.solaris_group.info(name)
Return information about a group

CLI Example:
```
salt '*' group.info foo
```

### 21.9.391 salt.modules.solaris_shadow

Manage the password database on Solaris systems

**Important:** If you feel that Salt should be using this module to manage passwords on a minion, and it is using a different module (or gives an error similar to 'shadow.info' is not available), see [here](#).

salt.modules.solaris_shadow.default_hash()
Returns the default hash used for unset passwords

CLI Example:
```
salt '*' shadow.default_hash
```

salt.modules.solaris_shadow.del_password(name)
Delete the password from name user

CLI Example:
salt '=*' shadow.del_password username

salt.modules.solaris_shadow.gen_password(password, crypt_salt=None, algorithm='sha512')

Generate hashed password

**Note:** When called this function is called directly via remote-execution, the password argument may be displayed in the system’s process list. This may be a security risk on certain systems.

**password**    Plaintext password to be hashed.
**crypt_salt**  Cryptographic salt. If not given, a random 8-character salt will be generated.
**algorithm**   The following hash algorithms are supported:
  - md5
  - blowfish (not in mainline glibc, only available in distros that add it)
  - sha256
  - sha512 (default)

CLI Example:

```
salt '=*' shadow.gen_password 'I_am_password'
salt '=*' shadow.gen_password 'I_am_password' crypt_salt='I_am_salt'
  --algorithm=sha256
```

salt.modules.solaris_shadow.info(name)

Return information for the specified user

CLI Example:

```
salt '=*' shadow.info root
```

salt.modules.solaris_shadow.set_maxdays(name, maxdays)

Set the maximum number of days during which a password is valid. See man passwd.

CLI Example:

```
salt '=*' shadow.set_maxdays username 90
```

salt.modules.solaris_shadow.set_mindays(name, mindays)

Set the minimum number of days between password changes. See man passwd.

CLI Example:

```
salt '=*' shadow.set_mindays username 7
```

salt.modules.solaris_shadow.set_password(name, password)

Set the password for a named user. The password must be a properly defined hash, the password hash can be generated with this command: `openssl passwd -1 <plaintext password>`

CLI Example:

```
salt '=*' shadow.set_password root $1$UYCIxa628$9qXjpQCjM4a..
```

salt.modules.solaris_shadow.set_warndays(name, warndays)

Set the number of days of warning before a password change is required. See man passwd.

CLI Example:
21.9.392 salt.modules.solaris_system

Support for reboot, shutdown, etc
This module is assumes we are using solaris-like shutdown

New in version 2016.3.0.

`salt.modules.solaris_system.halt()`
Halt a running system

CLI Example:

```bash
salt '*' system.halt
```

`salt.modules.solaris_system.init(state)`
Change the system runlevel on sysV compatible systems

CLI Example:

```bash
state [string] Init state
salt '*' system.init 3
```

`salt.modules.solaris_system.poweroff()`
Poweroff a running system

CLI Example:

```bash
salt '*' system.poweroff
```

`salt.modules.solaris_system.reboot(delay=0, message=None)`
Reboot the system

delay [int] Optional wait time in seconds before the system will be rebooted.
message [string] Optional message to broadcast before rebooting.

CLI Example:

```bash
salt '*' system.reboot
salt '*' system.reboot 60 "=== system upgraded ==="
```

`salt.modules.solaris_system.shutdown(delay=0, message=None)`
Shutdown a running system

delay [int] Optional wait time in seconds before the system will be shutdown.
message [string] Optional message to broadcast before rebooting.

CLI Example:

```bash
salt '*' system.shutdown
salt '*' system.shutdown 60 "=== disk replacement ==="
```

21.9.393 salt.modules.solaris_user

Manage users with the useradd command
**Important:** If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to `'user.info` is not available`), see [here](#).

```python
salt.modules.solaris_user.add(name, uid=None, gid=None, groups=None, home=None, shell=None, unique=True, fullname=None, roomnumber=None, workphone=None, homephone=None, createhome=True, **kwargs)
```

Add a user to the minion

CLI Example:
```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

```python
salt.modules.solaris_user.chfullname(name, fullname)
```

Change the user’s Full Name

CLI Example:
```
salt '*' user.chfullname foo "Foo Bar"
```

```python
salt.modules.solaris_user.chgid(name, gid)
```

Change the default group of the user

CLI Example:
```
salt '*' user.chgid foo 4376
```

```python
salt.modules.solaris_user.chgroups(name, groups, append=False)
```

Change the groups to which a user belongs

- **name** Username to modify
- **groups** List of groups to set for the user. Can be passed as a comma-separated list or a Python list.
- **append** [False] Set to `True` to append these groups to the user’s existing list of groups. Otherwise, the specified groups will replace any existing groups for the user.

CLI Example:
```
salt '*' user.chgroups foo wheel,root True
```

```python
salt.modules.solaris_user.chhome(name, home, persist=False)
```

Set a new home directory for an existing user

- **name** Username to modify
- **home** New home directory to set
- **persist** [False] Set to `True` to prevent configuration files in the new home directory from being overwritten by the files from the skeleton directory.

CLI Example:
```
salt '*' user.chhome foo /home/users/foo True
```

```python
salt.modules.solaris_user.chhomephone(name, homephone)
```

Change the user’s Home Phone

CLI Example:
```
salt '*' user.chhomephone foo "7735551234"
```

```python
salt.modules.solaris_user.chroomnumber(name, roomnumber)
```

Change the user’s Room Number

CLI Example:
salt '*/' user.chroomnumber foo 123

salt.modules.solaris_user.chshell(name, shell)
   Change the default shell of the user
   CLI Example:
   salt '*/' user.chshell foo /bin/zsh

salt.modules.solaris_user.chuid(name, uid)
   Change the uid for a named user
   CLI Example:
   salt '*/' user.chuid foo 4376

salt.modules.solaris_user.chworkphone(name, workphone)
   Change the user’s Work Phone
   CLI Example:
   salt '*/' user.chworkphone foo "7735550123"

salt.modules.solaris_user.delete(name, remove=False, force=False)
   Remove a user from the minion
   CLI Example:
   salt '*/' user.delete name remove=True force=True

salt.modules.solaris_user.getent(refresh=False)
   Return the list of all info for all users
   CLI Example:
   salt '*/' user.getent

salt.modules.solaris_user.info(name)
   Return user information
   CLI Example:
   salt '*/' user.info root

salt.modules.solaris_user.list_groups(name)
   Return a list of groups the named user belongs to
   CLI Example:
   salt '*/' user.list_groups foo

salt.modules.solaris_user.list_users()
   Return a list of all users
   CLI Example:
   salt '*/' user.list_users
**salt.modules.solaris_user.rename** *(name, new_name)*

Change the username for a named user

CLI Example:

```
salt '*' user.rename name new_name
```

## 21.9.394 salt.modules.solarisipspkg

IPS pkg support for Solaris

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see [here](#).

This module provides support for Solaris 11 new package management - IPS (Image Packaging System). This is the default pkg module for Solaris 11 (and later).

If you want to use also other packaging module (e.g. pkgutil) together with IPS, you need to override the pkg provider in sls for each package:

```
mypackage:
  pkg.installed:
    - provider: pkgutil
```

Or you can override it globally by setting the `providers` parameter in your Minion config file like this:

```
providers:
  pkg: pkgutil
```

Or you can override it globally by setting the `providers` parameter in your Minion config file like this:

```
providers:
  pkg: pkgutil
```

**salt.modules.solarisipspkg.available_version** *(names, **kwargs)*

This function is an alias of latest_version.

The available version of packages in the repository. Accepts full or partial FMRI. Partial FMRI is returned if the full FMRI could not be resolved.

If the latest version of a given package is already installed, an empty string will be returned for that package.

Please use pkg.latest_version as pkg.available_version is being deprecated.

Changed in version 2019.2.0: Support for multiple package names added.

CLI Example:

```
salt '*' pkg.latest_version bash
salt '*' pkg.latest_version pkg://solaris/entire
salt '*' pkg.latest_version postfix sendmail
```

**salt.modules.solarisipspkg.get_fmri** *(name, **kwargs)*

Returns FMRI from partial name. Returns empty string ('') if not found. In case of multiple match, the function returns list of all matched packages.

CLI Example:
salt '*' pkg.get_fmri bash

salt.modules.solarisipspkg.install(name=None, refresh=False, pkgs=None, version=None, test=False, **kwargs)

Install the named package using the IPS pkg command. Accepts full or partial FMRI.

Returns a dict containing the new package names and versions:

```python
{'<package>': {'old': '<old-version>',
              'new': '<new-version>'}}
```

Multiple Package Installation Options:

- `pkgs` A list of packages to install. Must be passed as a python list.

CLI Example:

```bash
salt '*' pkg.install vim
salt '*' pkg.install pkg://solaris/editor/vim
salt '*' pkg.install pkg://solaris/editor/vim refresh=True
salt '*' pkg.install pkgs=['foo', 'bar']
```

salt.modules.solarisipspkg.is_installed(name, **kwargs)

Returns True if the package is installed. Otherwise returns False. Name can be full or partial FMRI. In case of multiple match from partial FMRI name, it returns True.

CLI Example:

```bash
salt '*' pkg.is_installed bash
```

salt.modules.solarisipspkg.latest_version(*names, **kwargs)

The available version of packages in the repository. Accepts full or partial FMRI. Partial FMRI is returned if the full FMRI could not be resolved.

If the latest version of a given package is already installed, an empty string will be returned for that package.

Please use pkg.latest_version as pkg.available_version is being deprecated.

Changed in version 2019.2.0: Support for multiple package names added.

CLI Example:

```bash
salt '*' pkg.latest_version bash
salt '*' pkg.latest_version pkg://solaris/entire
salt '*' pkg.latest_version postfix sendmail
```

salt.modules.solarisipspkg.list_pkgs(versions_as_list=False, **kwargs)

List the currently installed packages as a dict:

```python
{'<package_name>': '<version>'}
```

CLI Example:

```bash
salt '*' pkg.list_pkgs
```

salt.modules.solarisipspkg.list_upgrades(refresh=True, **kwargs)

Lists all packages available for update.

When run in global zone, it reports only upgradable packages for the global zone.

When run in non-global zone, it can report more upgradable packages than pkg update -vn, because pkg update hides packages that require newer version of pkg://solaris/entire (which means that they
can be upgraded only from the global zone). If pkg://solaris/entire is found in the list of upgrades, then the global zone should be updated to get all possible updates. Use refresh=True to refresh the package database.

**refresh** [True] Runs a full package database refresh before listing. Set to False to disable running the refresh.

Changed in version 2017.7.0.

In previous versions of Salt, refresh defaulted to False. This was changed to default to True in the 2017.7.0 release to make the behavior more consistent with the other package modules, which all default to True.

CLI Example:

```bash
salt '*' pkg.list_upgrades
salt '*' pkg.list_upgrades refresh=False
```

**salt.modules.solarisipspkg.normalize_name(name, **kwargs)**

Internal function. Normalizes pkg name to full FMRI before running pkg.install. In case of multiple matches or no match, it returns the name without modifications.

CLI Example:

```bash
salt '*' pkg.normalize_name vim
```

**salt.modules.solarisipspkg.purge(name, **kwargs)**

Remove specified package. Accepts full or partial FMRI.

Returns a list containing the removed packages.

CLI Example:

```bash
salt '*' pkg.purge <package name>
```

**salt.modules.solarisipspkg.refresh_db(full=False)**

Updates the remote repos database.

full : False

Set to True to force a refresh of the pkg DB from all publishers, regardless of the last refresh time.

CLI Example:

```bash
salt '*' pkg.refresh_db
salt '*' pkg.refresh_db full=True
```

**salt.modules.solarisipspkg.remove(name=None, pkgs=None, **kwargs)**

Remove specified package. Accepts full or partial FMRI. In case of multiple match, the command fails and won’t modify the OS.

**name** The name of the package to be deleted.

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a list containing the removed packages.

CLI Example:

```bash
salt '*' pkg.remove <package name>
salt '*' pkg.remove tcsh
salt '*' pkg.remove pkg://solaris/shell/tcsh
salt '*' pkg.remove pkgs='["foo", "bar"]'
```
salt.modules.solarisipspkg.search(name, versions_as_list=False, **kwargs)
    Searches the repository for given pkg name. The name can be full or partial FMRI. All matches are printed. Globs are also supported.

    CLI Example:
    ```
salt '*' pkg.search bash
    ```

salt.modules.solarisipspkg.upgrade(refresh=False, **kwargs)
    Upgrade all packages to the latest possible version. When run in global zone, it updates also all non-global zones. In non-global zones upgrade is limited by dependency constrains linked to the version of pkg://solaris/entire.

    Returns a dictionary containing the changes:
    ```
    {'<package>': {'old': '<old-version>', 'new': '<new-version>'}}
    ```

    When there is a failure, an explanation is also included in the error message, based on the return code of the pkg update command.

    CLI Example:
    ```
salt '*' pkg.upgrade
    ```

salt.modules.solarisipspkg.upgrade_available(name)
    Check if there is an upgrade available for a certain package Accepts full or partial FMRI. Returns all matches found.

    CLI Example:
    ```
salt '*' pkg.upgrade_available apache-22
    ```

salt.modules.solarisipspkg.version(names, **kwargs)
    Common interface for obtaining the version of installed packages. Accepts full or partial FMRI. If called using pkg_resource, full FMRI is required. Partial FMRI is returned if the package is not installed.

    CLI Example:
    ```
salt '*' pkg.version vim
salt '*' pkg.version foo bar baz
salt '*' pkg_resource.version pkg://solaris/entire
    ```

21.9.395 salt.modules.solarisipspkg

Package support for Solaris

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see [here](#).

salt.modules.solarisipspkg.install(name=None, sources=None, saltenv='base', **kwargs)
    Install the passed package. Can install packages from the following sources:
    - Locally (package already exists on the minion)
    - HTTP/HTTPS server
    - FTP server
    - Salt master
Salt Documentation, Release 2019.2.0

Returns a dict containing the new package names and versions:
{'<package>': {'old': '<old-version>',
'new': '<new-version>'}}

CLI Examples:
# Installing a data stream pkg that already exists on the minion
salt '*' pkg.install sources='[{"<pkg name>": "/dir/on/minion/<pkg filename>"}]'
salt '*' pkg.install sources='[{"SMClgcc346": "/var/spool/pkg/gcc-3.4.6-sol10,→sparc-local.pkg"}]'
# Installing a data stream pkg that exists on the salt master
salt '*' pkg.install sources='[{"<pkg name>": "salt://pkgs/<pkg filename>"}]'
salt '*' pkg.install sources='[{"SMClgcc346": "salt://pkgs/gcc-3.4.6-sol10-sparc,→local.pkg"}]'

CLI Example:
# Installing a data stream pkg that exists on a HTTP server
salt '*' pkg.install sources='[{"<pkg name>": "http://packages.server.com/<pkg
,→filename>"}]'
,→6-sol10-sparc-local.pkg"}]'

If working with solaris zones and you want to install a package only in the global zone you can pass ’current_zone_only=True’ to salt to have the package only installed in the global zone. (Behind the scenes this is
passing ’-G’ to the pkgadd command.) Solaris default when installing a package in the global zone is to install
it in all zones. This overrides that and installs the package only in the global.
CLI Example:
# Installing a data stream package only in the global zone:
salt 'global_zone' pkg.install sources='[{"SMClgcc346": "/var/spool/pkg/gcc-3.4.6,→sol10-sparc-local.pkg"}]' current_zone_only=True

By default salt automatically provides an adminfile, to automate package installation, with these options set:
email=
instance=quit
partial=nocheck
runlevel=nocheck
idepend=nocheck
rdepend=nocheck
space=nocheck
setuid=nocheck
conflict=nocheck
action=nocheck
basedir=default

You can override any of these options in two ways. First you can optionally pass any of the options as a
kwarg to the module/state to override the default value or you can optionally pass the ’admin_source’ option
providing your own adminfile to the minions.
Note: You can find all of the possible options to provide to the adminfile by reading the admin man page:

2468

Chapter 21. Salt Module Reference


CLI Example:

```bash
# Overriding the 'instance' adminfile option when calling the module directly
salt '*' pkg.install sources='["<pkg name>": "salt://pkgs/<pkg filename>"]'
instance="overwrite"
```

SLS Example:

```yaml
# Overriding the 'instance' adminfile option when used in a state
SMClgcc346:
  pkg.installed:
    - sources:
      - SMClgcc346: salt://srv/salt/pkgs/gcc-3.4.6-sol10-sparc-local.pkg
      - instance: overwrite
```

**Note:** The ID declaration is ignored, as the package name is read from the `sources` parameter.

CLI Example:

```bash
# Providing your own adminfile when calling the module directly
salt '*' pkg.install sources='["<pkg name>": "salt://pkgs/<pkg filename>"]'
admin_source='salt://pkgs/<adminfile filename>'
```

# Providing your own adminfile when using states
```yaml
<pkg name>:
  pkg.installed:
    - sources:
      - <pkg name>: salt://pkgs/<pkg filename>
      - admin_source: salt://pkgs/<adminfile filename>
```

**Note:** The ID declaration is ignored, as the package name is read from the `sources` parameter.

---

```python
salt.modules.solarispkg.latest_version(*names, **kwargs)
```

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```bash
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

**NOTE:** As package repositories are not presently supported for Solaris pkgadd, this function will always return an empty string for a given package.

```python
salt.modules.solarispkg.list_pkgs(versions_as_list=False, **kwargs)
```

List the packages currently installed as a dict.
{'<package_name>': '<version>'}

**CLI Example:**

```bash
salt '*' pkg.list_pkgs
```

### `salt.modules.solarispkg.purge`

Package purges are not supported, this function is identical to `remove()`.

- **name** The name of the package to be deleted
- **Multiple Package Options:**
  - **pkgs** A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

**CLI Example:**

```bash
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs=['"foo", "bar"]'
```

### `salt.modules.solarispkg.remove`

Remove packages with `pkgrm`

- **name** The name of the package to be deleted

By default salt automatically provides an adminfile, to automate package removal, with these options set:

```bash
e-mail=
instance=quit
partial=nocheck
runlevel=nocheck
idepend=nocheck
rdepend=nocheck
spacenocheck
setuid=nocheck
conflict=nocheck
action=nocheck
basedir=default
```

You can override any of these options in two ways. First you can optionally pass any of the options as a kwarg to the module/state to override the default value or you can optionally pass the 'admin_source' option providing your own adminfile to the minions.

**Note:** You can find all of the possible options to provide to the adminfile by reading the admin man page:

```
man -s 4 admin
```

**Multiple Package Options:**

- **pkgs** A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

**CLI Example:**

```bash
salt '*' pkg.remove <package name>
salt '*' pkg.remove SUNWgit
```
salt.modules.solarispkg.upgrade_available(name)
Check whether or not an upgrade is available for a given package

CLI Example:
salt '*' pkg.upgrade_available <package name>

salt.modules.solarispkg.version(*names, **kwargs)
Returns a string representing the package version or an empty string if not installed. If more than one package
name is specified, a dict of name/version pairs is returned.

CLI Example:
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...

21.9.396 salt.modules.solr
Apache Solr Salt Module
Author: Jed Glazner Version: 0.2.1 Modified: 12/09/2011
This module uses HTTP requests to talk to the apache solr request handlers to gather information and report errors.
Because of this the minion doesn’t necessarily need to reside on the actual slave. However if you want to use the
signal function the minion must reside on the physical solr host.
This module supports multi-core and standard setups. Certain methods are master/slave specific. Make sure you set
the solr.type. If you have questions or want a feature request please ask.

Coming Features in 0.3
1. Add command for checking for replication failures on slaves
2. Improve match_index_versions since it’s pointless on busy solr masters
3. Add additional local fs checks for backups to make sure they succeeded

Override these in the minion config

solr.cores A list of core names e.g. ['core1','core2']. An empty list indicates non-multicore setup.
solr.baseurl The root level URL to access solr via HTTP
solr.request_timeout The number of seconds before timing out an HTTP/HTTPS/FTP request. If nothing is specified
then the python global timeout setting is used.
solr.type Possible values are ‘master’ or ‘slave’
solr.backup_path The path to store your backups. If you are using cores and you can specify to append the core
name to the path in the backup method.
solr.num_backups For versions of solr >= 3.5. Indicates the number of backups to keep. This option is ignored if
your version is less.
**solr.init_script**  The full path to your init script with start/stop options

**solr.dih.options**  A list of options to pass to the DIH.

### Required Options for DIH

- **clean**  [False] Clear the index before importing
- **commit**  [True] Commit the documents to the index upon completion
- **optimize**  [True] Optimize the index after commit is complete
- **verbose**  [True] Get verbose output

**salt.modules.solr.abort_import** *(handler, host=None, core_name=None, verbose=False)*

MASTER ONLY Aborts an existing import command to the specified handler. This command can only be run if the minion is configured with solr.type=master

**salt.modules.solr.backup** *(host=None, core_name=None, append_core_to_path=False)*

Tell solr make a backup. This method can be mis-leading since it uses the backup API. If an error happens during the backup you are not notified. The status: 'OK' in the response simply means that solr received the request successfully.

**salt.modules.solr.core_status** *(host=None, core_name=None)*

MULTI-CORE HOSTS ONLY Get the status for a given core or all cores if no core is specified

---

### CLI Example:

```
salt '*' solr.abort_import dataimport None music {'clean':True}
```

```
salt '*' solr.backup music
```

```
salt '*' solr.core_status
```

---
```python
salt '*' solr.core_status None music
```

```python
class salt.modules.solr

delta_import

(handler, host=None, core_name=None, options=None, extra=None)

Submits an import command to the specified handler using specified options. This command can only be run if the minion is configured with solr.type=master

    handler [str] The name of the data import handler.
    host [str (None)] The solr host to query. __opts__['host'] is default.
    core [str (None)] The core the handler belongs to.
    options [dict (__opts__) A list of options such as clean, optimize commit, verbose, and pause_replication. leave blank to use __opts__ defaults. options will be merged with __opts__
    extra [dict ({}]] Extra name value pairs to pass to the handler. e.g. ["name=value"]

Return : dict<str,obj>:

    {'success':boolean, 'data':dict, 'errors':list, 'warnings':list}

CLI Example:
```
salt '*' solr.delta_import dataimport None music {'clean':True}
```

```python
class salt.modules.solr

delta_import

(full_import, host=None, core_name=None, options=None, extra=None)

MASTER ONLY Submits an import command to the specified handler using specified options. This command can only be run if the minion is configured with solr.type=master

    handler [str] The name of the data import handler.
    host [str (None)] The solr host to query. __opts__['host'] is default.
    core [str (None)] The core the handler belongs to.
    options [dict (__opts__) A list of options such as clean, optimize commit, verbose, and pause_replication. leave blank to use __opts__ defaults. options will be merged with __opts__
    extra [dict ({}]] Extra name value pairs to pass to the handler. e.g. ["name=value"]

Return : dict<str,obj>:

    {'success':boolean, 'data':dict, 'errors':list, 'warnings':list}

CLI Example:
```
salt '*' solr.full_import dataimport None music {'clean':True}
```

```python
class salt.modules.solr

import_status

(handler, host=None, core_name=None, verbose=False)

Submits an import command to the specified handler using specified options. This command can only be run if the minion is configured with solr.type: 'master'

    handler [str] The name of the data import handler.
    host [str (None)] The solr host to query. __opts__['host'] is default.
    core [str (None)] The core the handler belongs to.
    verbose [boolean (False)] Specifies verbose output

Return : dict<str,obj>:

    {'success':boolean, 'data':dict, 'errors':list, 'warnings':list}

CLI Example:
```
salt '*' solr.import_status dataimport None music False
```

```python
class salt.modules.solr

is_replication_enabled

(host=None, core_name=None)

SLAVE CALL Check for errors, and determine if a slave is replicating or not.

    host [str (None)] The solr host to query. __opts__['host'] is default.

```
**core_name** [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return: dict<str,obj>:

```python
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

**CLI Example:**

```
salt '*' solr.is_replication_enabled music
```

**salt.modules.solr.lucene_version**(*core_name=None*)

Gets the lucene version that solr is using. If you are running a multi-core setup you should specify a core name since all the cores run under the same servlet container, they will all have the same version.

**core_name** [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return: dict<str,obj>:

```python
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

**CLI Example:**

```
salt '*' solr.lucene_version
```

**salt.modules.solr.match_index_versions**(*host=None, core_name=None*)

SLAVE CALL Verifies that the master and the slave versions are in sync by comparing the index version. If you are constantly pushing updates the index the master and slave versions will seldom match. A solution to this is pause indexing every so often to allow the slave to replicate and then call this method before allowing indexing to resume.

**host** [str (None)] The solr host to query. __opts__['host'] is default.

**core_name** [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return: dict<str,obj>:

```python
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

**CLI Example:**

```
salt '*' solr.match_index_versions music
```

**salt.modules.solr.optimize**(*host=None, core_name=None*)

Search queries fast, but it is a very expensive operation. The ideal process is to run this with a master/slave configuration. Then you can optimize the master, and push the optimized index to the slaves. If you are running a single solr instance, or if you are going to run this on a slave be aware than search performance will be horrible while this command is being run. Additionally it can take a LONG time to run and your HTTP request may timeout. If that happens adjust your timeout settings.

**host** [str (None)] The solr host to query. __opts__['host'] is default.

**core_name** [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return: dict<str,obj>:

```python
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

**CLI Example:**

```
salt '*' solr.optimize music
```
**salt.modules.solr.ping**(*host=None, core_name=None*)

Does a health check on solr, makes sure solr can talk to the indexes.

- **host** : [str (None)] The solr host to query. __opts__['host'] is default.
- **core_name** : [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict:<str,obj>:

```python
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:
```
salt '*' solr.ping music
```

**salt.modules.solr.reload_core**(*host=None, core_name=None*)

MULTI-CORE HOSTS ONLY Load a new core from the same configuration as an existing registered core. While the "new" core is initializing, the "old" one will continue to accept requests. Once it has finished, all new request will go to the "new" core, and the "old" core will be unloaded.

- **host** : [str (None)] The solr host to query. __opts__['host'] is default.
- **core_name** : [str] The name of the core to reload

Return : dict:<str,obj>:

```python
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:
```
salt '*' solr.reload_core None music
```

Return data is in the following format:

```python
{'success':bool, 'data':dict, 'errors':list, 'warnings':list}
```

**salt.modules.solr.reload_import_config**(*handler, host=None, core_name=None, verbose=False*)

MASTER ONLY re-loads the handler config XML file. This command can only be run if the minion is a 'master' type

- **handler** : [str] The name of the data import handler.
- **host** : [str (None)] The solr host to query. __opts__['host'] is default.
- **core** : [str (None)] The core the handler belongs to.
- **verbose** : [boolean (False)] Run the command with verbose output.

Return : dict:<str,obj>:

```python
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:
```
salt '*' solr.reload_import_config dataimport None music {'clean':True}
```

**salt.modules.solr.replication_details**(*host=None, core_name=None*)

Get the full replication details.

- **host** : [str (None)] The solr host to query. __opts__['host'] is default.
- **core_name** : [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict:<str,obj>:

```python
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:
salt ' '*' solr.replication_details music

```
salt.modules.solr.set_is_polling(polling, host=None, core_name=None)
```

SLAVE CALL Prevent the slaves from polling the master for updates.

- **polling** [boolean] True will enable polling. False will disable it.
- **host** [str (None)] The solr host to query. __opts__['host'] is default.
- **core_name** [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return: dict:<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt ' '*' solr.set_is_polling False
```

```
salt.modules.solr.set_replication_enabled(status, host=None, core_name=None)
```

MASTER ONLY Sets the master to ignore poll requests from the slaves. Useful when you don’t want the slaves replicating during indexing or when clearing the index.

- **status** [boolean] Sets the replication status to the specified state.
- **host** [str (None)] The solr host to query. __opts__['host'] is default.
- **core_name** [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to set the status on all cores.

Return: dict:<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt ' '*' solr.set_replication_enabled false, None, music
```

```
salt.modules.solr.signal(signal=None)
```

Signals Apache Solr to start, stop, or restart. Obviously this is only going to work if the minion resides on the solr host. Additionally Solr doesn’t ship with an init script so one must be created.

- **signal** [str (None)] The command to pass to the apache solr init valid values are ‘start’, ‘stop’, and ‘restart’

CLI Example:

```
salt ' '*' solr.signal restart
```

```
salt.modules.solr.version(core_name=None)
```

Gets the solr version for the core specified. You should specify a core here as all the cores will run under the same servlet container and so will all have the same version.

- **core_name** [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return: dict:<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt ' '*' solr.version
```

**21.9.397 salt.modules.solrcloud module**

Module for solrcloud configuration
New in version 2017.7.0.

For now, module is limited to http-exposed API. It doesn’t implement config upload via Solr zkCli

salt.modules.solrcloud.BOOL_PROPS_LIST = ['transient', 'loadOnStartup']
Collections options type definition Reference: https://cwiki.apache.org/confluence/display/solr/Collections+API#CollectionsAPI-api

salt.modules.solrcloud.DICT_OPTIONS_LIST = ['properties']
Collection unmodifiable options Reference: https://cwiki.apache.org/confluence/display/solr/Collections+API#CollectionsAPI-modifycoll

salt.modules.solrcloud.alias_exists(alias_name, **kwargs)
Check alias existence
Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:
salt '*' solrcloud.alias_exists my_alias

salt.modules.solrcloud.alias_get_collections(alias_name, **kwargs)
Get collection list for an alias
Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:
salt '*' solrcloud.alias_get my_alias

salt.modules.solrcloud.alias_set_collections(alias_name, collections=None, **kwargs)
Define an alias
Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:
salt '*' solrcloud.alias_set my_alias collections=[collection1, collection2]

salt.modules.solrcloud.cluster_status(**kwargs)
Get cluster status
Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:
salt '*' solrcloud.cluster_status

salt.modules.solrcloud.collection_backup(collection_name, location, backup_name=None, **kwargs)
Create a backup for a collection.
Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:
salt '*' solrcloud.core_backup collection_name /mnt/nfs_backup

salt.modules.solrcloud.collection_backup_all(location, backup_name=None, **kwargs)
Create a backup for all collection present on the server.
Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:
salt '!' solrcloud.core_backup /mnt/nfs_backup

salt.modules.solrcloud.collection_check_options(options)
Check collections options

CLI Example:
```
salt '!' solrcloud.collection_check_options '{"replicationFactor":4}'
```

salt.modules.solrcloud.collection_create(collection_name, options=None, **kwargs)
Create a collection,

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:
```
salt '!' solrcloud.collection_create collection_name
```

Collection creation options may be passed using the "options" parameter. Do not include option "name" since it already specified by the mandatory parameter "collection_name"

```
salt '!' solrcloud.collection_create collection_name options={"replicationFactor":2, "numShards":3}
```

Cores options may be passed using the "properties" key in options. Do not include property "name"

```
salt '!' solrcloud.collection_create collection_name options={"replicationFactor":2, "numShards":3, "properties":{"dataDir":"/srv/solr/", "hugePartitionSollection"}}
```

salt.modules.solrcloud.collection_creation_options()
Get collection option list that can only be defined at creation

CLI Example:
```
salt '!' solrcloud.collection_creation_options
```

salt.modules.solrcloud.collection_exists(collection_name, **kwargs)
Check if a collection exists

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:
```
salt '!' solrcloud.collection_exists collection_name
```

salt.modules.solrcloud.collection_get_options(collection_name, **kwargs)
Get collection options

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:
```
salt '!' solrcloud.collection_get_options collection_name
```

salt.modules.solrcloud.collection_list(**kwargs)
List all collections

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:
salt 'salt' solrcloud.collection_list

salt.modules.solrcloud.collection_reload(collection, **kwargs)
Check if a collection exists
Additional parameters (kwargs) may be passed, they will be proxied to http.query
CLI Example:
salt 'salt' solrcloud.collection_reload collection_name

salt.modules.solrcloud.collection_set_options(collection_name, options, **kwargs)
Change collection options
Additional parameters (kwargs) may be passed, they will be proxied to http.query
Note that not every parameter can be changed after collection creation
CLI Example:
salt 'salt' solrcloud.collection_set_options collection_name options={
  "replicationFactor": 4
}

salt.modules.solrcloud.log = <SaltLoggingClass salt.modules.solrcloud (GARBAGE)>
Core properties type definition. Reference: https://cwiki.apache.org/confluence/display/solr/Defining+core.properties

21.9.398 salt.modules.splunk
Module for interop with the Splunk API
New in version 2016.3.0..

depends
  • splunk-sdk python module

configuration Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the 'splunk' key by default, if defined.
For example:
splunk:
  username: alice
  password: abc123
  host: example.splunkcloud.com
  port: 8080

salt.modules.splunk.create_user(email, profile='splunk', **kwargs)
create a splunk user by name/email
CLI Example:
salt myminion splunk.create_user user@example.com roles=['user'] realname="Test User" name=testuser

salt.modules.splunk.delete_user(email, profile='splunk')
Delete a splunk user by email
CLI Example:
salt myminion splunk_user.delete 'user@example.com'
salt.modules.splunk.get_user(email, profile='splunk', **kwargs)
Get a splunk user by name/email

CLI Example:
salt myminion splunk.get_user 'user@example.com' user_details=false salt myminion
splunk.get_user 'user@example.com' user_details=true

salt.modules.splunk.list_users(profile='splunk')
List all users in the splunk DB

CLI Example:
salt myminion splunk.list_users

salt.modules.splunk.update_user(email, profile='splunk', **kwargs)
Create a splunk user by email

CLI Example:
salt myminion splunk.update_user example@domain.com roles=['user'] realname="Test User"

21.9.399 salt.modules.splunk_search

Module for interop with the Splunk API

New in version 2015.5.0.

depends

- splunk-sdk python module

configuration Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the ‘splunk’ key by default, if defined.

For example:

```
splunk:
    username: alice
    password: abc123
    host: example.splunkcloud.com
    port: 8080
```

salt.modules.splunk_search.create(name, profile='splunk', **kwargs)
Create a splunk search

CLI Example:
splunk_search.create 'my search name' search='error msg'

salt.modules.splunk_search.delete(name, profile='splunk')
Delete a splunk search

CLI Example:
splunk_search.delete 'my search name'

salt.modules.splunk_search.get(name, profile='splunk')
Get a splunk search

CLI Example:
splunk_search.get 'my search name'

salt.modules.splunk_search.list_(profile='splunk')
List splunk searches (names only)

CLI Example: splunk_search.list
salt.modules.splunk_search.list_all(prefix=None, app=None, owner=None, description_contains=None, name_not_contains=None, profile='splunk')

Get all splunk search details. Produces results that can be used to create an sls file.

if app or owner are specified, results will be limited to matching saved searches.

if description_contains is specified, results will be limited to those where "description_contains in description" is true if name_not_contains is specified, results will be limited to those where "name_not_contains not in name" is true.

If prefix parameter is given, alarm names in the output will be prepended with the prefix; alarms that have the prefix will be skipped. This can be used to convert existing alarms to be managed by salt, as follows:

CLI example:
1. Make a "backup" of all existing searches $ salt-call splunk_search.list_all –out=txt | sed "s/local: //" > legacy_searches.sls
2. Get all searches with new prefixed names $ salt-call splunk_search.list_all "prefix="**MANAGED BY SALT"" –out=txt | sed "s/local: //" > managed_searches.sls
3. Insert the managed searches into splunk $ salt-call state.sls managed_searches.sls
4. Manually verify that the new searches look right
5. Delete the original searches $ sed s/present/absent/ legacy_searches.sls > remove_legacy_searches.sls
   $ salt-call state.sls remove_legacy_searches.sls
6. Get all searches again, verify no changes $ salt-call splunk_search.list_all –out=txt | sed "s/local: //" > final_searches.sls $ diff final_searches.sls managed_searches.sls

salt.modules.splunk_search.update(name, profile='splunk', **kwargs)

Update a splunk search

CLI Example:
splunk_search.update 'my search name' sharing=app

21.9.400  salt.modules.sqlite3

Support for SQLite3

salt.modules.sqlite3.fetch(db=None, sql=None)
Retrieve data from an sqlite3 db (returns all rows, be careful!)

CLI Example:
salt '*' sqlite3.fetch /root/test.db 'SELECT * FROM test;'

salt.modules.sqlite3.indexes(db=None)
Show all indices in the database, for people with poor spelling skills

CLI Example:
salt '*' sqlite3.indexes /root/test.db

salt.modules.sqlite3.indices(db=None)
Show all indices in the database

CLI Example:
salt '*' sqlite3.indices /root/test.db
salt.modules.sqlite3.modify\(\text{db=None, sql=None}\)  
Issue an SQL query to sqlite3 (with no return data), usually used to modify the database in some way (insert, delete, create, etc)  

CLI Example:
```
salt '*' sqlite3.modify /root/test.db 'CREATE TABLE test(id INT, testdata TEXT);'
```

salt.modules.sqlite3.sqlite_version()  
Return version of sqlite  

CLI Example:
```
salt '*' sqlite3.sqlite_version
```

salt.modules.sqlite3.tables\(\text{db=None}\)  
Show all tables in the database  

CLI Example:
```
salt '*' sqlite3.tables /root/test.db
```

salt.modules.sqlite3.version()  
Return version of pysqlite  

CLI Example:
```
salt '*' sqlite3.version
```

21.9.401 salt.modules.ssh  
Manage client ssh components

**Note:** This module requires the use of MD5 hashing. Certain security audits may not permit the use of MD5. For those cases, this module should be disabled or removed.

salt.modules.ssh.auth_keys\(user=None, \text{config='ssh/authorized_keys', fingerprint_hash_type=None}\)  
Return the authorized keys for users  

CLI Example:
```
salt '*' ssh.auth_keys
salt '*' ssh.auth_keys root
salt '*' ssh.auth_keys user=root
salt '*' ssh.auth_keys user="[user1, user2]"
```

salt.modules.ssh.check_key\(user, key, enc, comment, options, config='ssh/authorized_keys', cache_keys=None, fingerprint_hash_type=None\)  
Check to see if a key needs updating, returns “update”, “add” or “exists”  

CLI Example:
```
salt '*' ssh.check_key <user> <key> <enc> <comment> <options>
```
salt.modules.ssh.check_key_file(user, source, config='ssh/authorized_keys', saltenv='base', fingerprint_hash_type=None)
Check a keyfile from a source destination against the local keys and return the keys to change

CLI Example:
```
salt '*' ssh.check_key_file root salt://ssh/keyfile
```

salt.modules.ssh.check_known_host(user=None, hostname=None, key=None, fingerprint=None, config=None, port=None, fingerprint_hash_type=None)
Check the record in known_hosts file, either by its value or by fingerprint (it's enough to set up either key or fingerprint, you don’t need to set up both).

If provided key or fingerprint doesn’t match with stored value, return "update", if no value is found for a given host, return "add", otherwise return "exists".

If neither key, nor fingerprint is defined, then additional validation is not performed.

CLI Example:
```
salt '*' ssh.check_known_host <user> <hostname> key='AAAA...FAaQ=='
```

salt.modules.ssh.get_known_host(user, hostname, config=None, port=None, fingerprint_hash_type=None)
Deprecated since version 2018.3.0: Use ssh.get_known_host_entries instead.
Return information about known host from the configfile, if any. If there is no such key, return None.

CLI Example:
```
salt '*' ssh.get_known_host <user> <hostname>
```

salt.modules.ssh.get_known_host_entries(user, hostname, config=None, port=None, fingerprint_hash_type=None)
New in version 2018.3.0.
Return information about known host entries from the configfile, if any. If there are no entries for a matching hostname, return None.

CLI Example:
```
salt '*' ssh.get_known_host_entries <user> <hostname>
```

salt.modules.ssh.hash_known_hosts(user=None, config=None)
Hash all the hostnames in the known hosts file.

New in version 2014.7.0.
user hash known hosts of this user
config path to known hosts file: can be absolute or relative to user’s home directory

CLI Example:
```
salt '*' ssh.hash_known_hosts
```

salt.modules.ssh.host_keys(keydir=None, private=True, certs=True)
Return the minion’s host keys

CLI Example:
```
salt '*' ssh.host_keys
salt '*' ssh.host_keys keydir=/etc/ssh
```

(continues on next page)
salt.modules.ssh.key_is_encrypted(key)

New in version 2015.8.7.

Function to determine whether or not a private key is encrypted with a passphrase.

Checks key for a `Proc-Type` header with ENCRYPTED in the value. If found, returns `True`, otherwise returns `False`.

CLI Example:

```
salt '*' ssh.key_is_encrypted /root/id_rsa
```

salt.modules.ssh.recv_known_host(hostname, enc=None, port=None, hash_known_hosts=True, timeout=5, fingerprint_hash_type=None)

Retrieve information about host public key from remote server

Deprecated since version 2018.3.0: Use `ssh.recv_known_host_entries` instead.

hostname The name of the remote host (e.g. "github.com")
enc Defines what type of key is being used, can be ed25519, ecdsa ssh-rsa or ssh-dss
port Optional parameter, denoting the port of the remote host on which an SSH daemon is running. By default the port 22 is used.
hash_known_hosts [True] Hash all hostnames and addresses in the known hosts file.
timeout [int] Set the timeout for connection attempts. If `timeout` seconds have elapsed since a connection was initiated to a host or since the last time anything was read from that host, then the connection is closed and the host in question considered unavailable. Default is 5 seconds.

New in version 2016.3.0.
fingerprint_hash_type The fingerprint hash type that the public key fingerprints were originally hashed with. This defaults to `sha256` if not specified.

New in version 2016.11.4.

Changed in version 2017.7.0:: default changed from `md5` to `sha256`

CLI Example:

```
salt '*' ssh.recv_known_host <hostname> enc=<enc> port=<port>
```

salt.modules.ssh.recv_known_host_entries(hostname, enc=None, port=None, hash_known_hosts=True, timeout=5, fingerprint_hash_type=None)

Retrieve information about host public keys from remote server

hostname The name of the remote host (e.g. "github.com")
enc Defines what type of key is being used, can be ed25519, ecdsa ssh-rsa or ssh-dss
port Optional parameter, denoting the port of the remote host on which an SSH daemon is running. By default the port 22 is used.
hash_known_hosts [True] Hash all hostnames and addresses in the known hosts file.
timeout [int] Set the timeout for connection attempts. If `timeout` seconds have elapsed since a connection was initiated to a host or since the last time anything was read from that host, then the connection is closed and the host in question considered unavailable. Default is 5 seconds.
fingerprint_hash_type The fingerprint hash type that the public key fingerprints were originally hashed with. This defaults to `sha256` if not specified.

New in version 2016.11.4.
Changed in version 2017.7.0: default changed from md5 to sha256

CLI Example:

```plaintext
salt '*' ssh.recv_known_host_entries <hostname> enc=<enc> port=<port>
```

```python
salt.modules.ssh.rm_auth_key(user, key, config='.ssh/authorized_keys', fingerprint_hash_type=None)
```

Remove an authorized key from the specified user’s authorized key file

CLI Example:

```plaintext
salt '*' ssh.rm_auth_key <user> <key>
```

```python
salt.modules.ssh.rm_auth_key_from_file(user, source, config='.ssh/authorized_keys', saltenv='base', fingerprint_hash_type=None)
```

Remove an authorized key from the specified user’s authorized key file, using a file as source

CLI Example:

```plaintext
salt '*' ssh.rm_auth_key_from_file <user> salt://ssh_keys/<user>.id_rsa.pub
```

```python
salt.modules.ssh.rm_known_host(user=None, hostname=None, config=None, port=None)
```

Remove all keys belonging to hostname from a known_hosts file.

CLI Example:

```plaintext
salt '*' ssh.rm_known_host <user> <hostname>
```

```python
salt.modules.ssh.set_auth_key(user, key, enc='ssh-rsa', comment='', options=None, config='.ssh/authorized_keys', cache_keys=None, fingerprint_hash_type=None)
```

Add a key to the authorized_keys file. The "key" parameter must only be the string of text that is the encoded key. If the key begins with "ssh-rsa" or ends with user@host, remove those from the key before passing it to this function.

CLI Example:

```plaintext
salt '*' ssh.set_auth_key <user> '<key>' enc='dsa'
```

```python
salt.modules.ssh.set_auth_key_from_file(user, source, config='.ssh/authorized_keys', saltenv='base', fingerprint_hash_type=None)
```

Add a key to the authorized_keys file, using a file as the source.

CLI Example:

```plaintext
salt '*' ssh.set_auth_key_from_file <user> salt://ssh_keys/<user>.id_rsa.pub
```

```python
salt.modules.ssh.set_known_host(user=None, hostname=None, fingerprint=None, key=None, port=None, enc=None, config=None, hash_known_hosts=True, timeout=5, fingerprint_hash_type=None)
```

Download SSH public key from remote host "hostname", optionally validate its fingerprint against "fingerprint" variable and save the record in the known_hosts file.

If such a record does already exists in there, do nothing.

**user** The user who owns the ssh authorized keys file to modify

**hostname** The name of the remote host (e.g. "github.com")

**fingerprint** The fingerprint of the key which must be present in the known_hosts file (optional if key specified)

**key** The public key which must be presented in the known_hosts file (optional if fingerprint specified)
**port** optional parameter, denoting the port of the remote host, which will be used in case, if the public key will be requested from it. By default the port 22 is used.

**enc** Defines what type of key is being used, can be ed25519, ecdsa ssh-rsa or ssh-dss

**config** The location of the authorized keys file relative to the user’s home directory, defaults to "ssh/known_hosts". If no user is specified, defaults to "/etc/ssh/ssh_known_hosts". If present, must be an absolute path when a user is not specified.

**hash_known_hosts** [True] Hash all hostnames and addresses in the known hosts file.

**timeout** [int] Set the timeout for connection attempts. If timeout seconds have elapsed since a connection was initiated to a host or since the last time anything was read from that host, then the connection is closed and the host in question considered unavailable. Default is 5 seconds.

New in version 2016.3.0.

**fingerprint_hash_type** The public key fingerprint hash type that the public key fingerprint was originally hashed with. This defaults to sha256 if not specified.

New in version 2016.11.4.

Changed in version 2017.7.0:: default changed from md5 to sha256

CLI Example:

```shell
salt '*' ssh.set_known_host <user> fingerprint='xx:xx:..:xx' enc='ssh-rsa' config='~/.ssh/known_hosts'
```

**salt.modules.ssh.user_keys** *(user=None, pubfile=None, prvfile=None)*

Return the user’s ssh keys on the minion

New in version 2014.7.0.

CLI Example:

```shell
salt '*' ssh.user_keys
salt '*' ssh.user_keys user=user1
salt '*' ssh.user_keys user=user1 pubfile=/home/user1/.ssh/id_rsa.pub prvfile=/~home/user1/.ssh/id_rsa
salt '*' ssh.user_keys user=user1 prvfile=False
salt '*' ssh.user_keys user='["user1","user2"]' pubfile=id_rsa.pub prvfile=id_rsa
```

As you can see you can tell Salt not to read from the user’s private (or public) key file by setting the file path to False. This can be useful to prevent Salt from publishing private data via Salt Mine or others.

### 21.9.402 salt.modules.ssh_pkg

Service support for the REST example

```python
salt.modules.ssh_pkg.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs)
```

```python
salt.modules.ssh_pkg.list_pkgs(versions_as_list=False, **kwargs)
```

```python
salt.modules.ssh_pkg.remove(name=None, pkgs=None, **kwargs)
```

### 21.9.403 salt.modules.ssh_service module

Provide the service module for the proxy-minion SSH sample .. versionadded:: 2015.8.2

```python
salt.modules.ssh_service.enabled(name, sig=None)
```

Only the 'redbull' service is 'enabled' in the test
salt.modules.ssh_service.get_all()
    Return a list of all available services
    CLI Example:
    ```
salt '*' service.get_all
    ```

salt.modules.ssh_service.list_()
    Return a list of all available services.
    CLI Example:
    ```
salt '*' service.list
    ```

salt.modules.ssh_service.restart(name, sig=None)
    Restart the specified service with rest_sample
    CLI Example:
    ```
salt '*' service.restart <service name>
    ```

salt.modules.ssh_service.running(name, sig=None)
    Return whether this service is running.

salt.modules.ssh_service.start(name, sig=None)
    Start the specified service on the ssh_sample
    CLI Example:
    ```
salt '*' service.start <service name>
    ```

salt.modules.ssh_service.status(name, sig=None)
    Return the status for a service via ssh_sample. If the name contains globbing, a dict mapping service name to
    True/False values is returned.
    Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)
    Parameters
    • name (str) – The name of the service to check
    • sig (str) – Not implemented
    Returns True if running, False otherwise dict: Maps service name to True if running, False oth-
    erwise
    Return type bool
    CLI Example:
    ```
salt '*' service.status <service name>
    ```

salt.modules.ssh_service.stop(name, sig=None)
    Stop the specified service on the rest_sample
    CLI Example:
    ```
salt '*' service.stop <service name>
    ```

---

21.9.404 salt.modules.snapper module

Module to manage filesystem snapshots with snapper
New in version 2016.11.0.

codeauthor Duncan Mac-Vicar P. <dmacvicar@suse.de>
codeauthor  Pablo Suárez Hernández <psuarezhernandez@suse.de>

depends  dbus Python module.

depends  snapper  http://snapper.io, available in most distros

maturity  new

platform  Linux

salt.modules.snapper.changed_files(config='root', num_pre=None, num_post=None)

Returns the files changed between two snapshots

- **config**: Configuration name.
- **num_pre**: First snapshot ID to compare. Default is last snapshot.
- **num_post**: Last snapshot ID to compare. Default is 0 (current state).

CLI example:

```bash
salt '*' snapper.changed_files
salt '*' snapper.changed_files num_pre=19 num_post=20
```

salt.modules.snapper.create_baseline(tag='baseline', config='root')

Creates a snapshot marked as baseline

- **tag**: Tag name for the baseline.
- **config**: Configuration name.

CLI Example:

```bash
salt '*' snapper.create_baseline
salt '*' snapper.create_baseline my_custom_baseline
```

salt.modules.snapper.create_config(name=None, subvolume=None, fstype=None, template=None, extra_opts=None)

Creates a new Snapper configuration

- **name**: Name of the new Snapper configuration.
- **subvolume**: Path to the related subvolume.
- **fstype**: Filesystem type of the subvolume.
- **template**: Configuration template to use. (Default: default)
- **extra_opts**: Extra Snapper configuration opts dictionary. It will override the values provided by the given template (if any).

CLI example:

```bash
salt '*' snapper.create_config name=myconfig subvolume=/foo/bar/ fstype=btrfs
salt '*' snapper.create_config name=myconfig subvolume=/foo/bar/ fstype=btrfs template="default"
salt '*' snapper.create_config name=myconfig subvolume=/foo/bar/ fstype=btrfs template="default"
  extra_opts='{"NUMBER_CLEANUP": false}'
```

salt.modules.snapper.create_snapshot(config='root', snapshot_type='single', pre_number=None, cleanup_algorithm='number', description=None, userdata=None, **kwargs)

Creates a snapshot

- **config**: Configuration name.
- **snapshot_type**: Specifies the type of the new snapshot. Possible values are single, pre and post.
- **pre_number**: For post snapshots the number of the pre snapshot must be provided.
- **cleanup_algorithm**: Set the cleanup algorithm for the snapshot.
- **description**: Description for the snapshot. If not given, the salt job will be used.
- **userdata**: Deletes old snapshots when a certain number of snapshots is reached.
- **number**: Deletes old snapshots but keeps a number of hourly, daily, weekly, monthly and yearly snapshots.
empty-pre-post  Deletes pre/post snapshot pairs with empty diffs.
userdata   Set userdata for the snapshot (key-value pairs).
          Returns the number of the created snapshot.

CLI example:

    salt '*' snapper.create_snapshot

salt.modules.snapper.delete_snapshot(snapshots_ids=None, config='root')

  Deletes an snapshot
  config  Configuration name. (Default: root)
  snapshots_ids  List of the snapshots IDs to be deleted.

CLI example:

    salt '*' snapper.delete_snapshot 54
    salt '*' snapper.delete_snapshot config=root 54
    salt '*' snapper.delete_snapshot config=root snapshots_ids=[54,55,56]

salt.modules.snapper.diff(config='root', filename=None, num_pre=None, num_post=None)

  Returns the differences between two snapshots
  config  Configuration name.
  filename  if not provided the showing differences between snapshots for all "text" files
  num_pre  first snapshot ID to compare. Default is last snapshot
  num_post  last snapshot ID to compare. Default is 0 (current state)

CLI Example:

    salt '*' snapper.diff
    salt '*' snapper.diff filename=/var/log/snapper.log num_pre=19 num_post=20

salt.modules.snapper.diff_jid(jid, config='root')

  Returns the changes applied by a jid
  jid  The job id to lookup
  config  Configuration name.

CLI Example:

    salt '*' snapper.diff_jid jid=20160607130930720112

salt.modules.snapper.get_config(name='root')

  Retrieves all values from a given configuration

CLI example:

    salt '*' snapper.get_config

salt.modules.snapper.get_snapshot(number=0, config='root')

  Get detailed information about a given snapshot

CLI example:

    salt '*' snapper.get_snapshot 1

salt.modules.snapper.list_configs()

  List all available configs

CLI example:

    salt '*' snapper.list_configs
salt.modules.snapper.list_snapshots(config='root')
    List available snapshots

    CLI example:
    
    ```
salt '*' snapper.list_snapshots config=myconfig
    ```

salt.modules.snapper.modify_snapshot(snapshot_id=None, description=None, userdata=None, cleanup=None, config='root')
    Modify attributes of an existing snapshot.
    
    **config** Configuration name. (Default: root)
    **snapshot_id** ID of the snapshot to be modified.
    **cleanup** Change the cleanup method of the snapshot. (str)
    **description** Change the description of the snapshot. (str)
    **userdata** Change the userdata dictionary of the snapshot. (dict)

    CLI example:
    
    ```
salt '*' snapper.modify_snapshot 54 description="my snapshot description"
salt '*' snapper.modify_snapshot 54 description="my snapshot description"
salt '*' snapper.modify_snapshot 54 userdata='{"foo": "bar"}'
salt '*' snapper.modify_snapshot snapshot_id=54 cleanup="number"
    ```

salt.modules.snapper.run(function, *args, **kwargs)
    Runs a function from an execution module creating pre and post snapshots and associating the salt job id with those snapshots for easy undo and cleanup.
    
    **function** Salt function to call.
    **config** Configuration name. (default: "root")
    **description** A description for the snapshots. (default: None)
    **userdata** Data to include in the snapshot metadata. (default: None)
    **cleanup_algorithm** Snapper cleanup algorithm. (default: "number")
    **args** args for the function to call. (default: None)
    **kwargs** kwargs for the function to call (default: None)

    This would run append text to `/etc/motd` using the file.append module, and will create two snapshots, pre and post with the associated metadata. The jid will be available as salt_jid in the userdata of the snapshot.

    You can immediately see the changes

    CLI Example:
    
    ```
salt '*' snapper.run file.append args=['"/etc/motd", "some text"]'
    ```

salt.modules.snapper.set_config(name='root', **kwargs)
    Set configuration values

    CLI example:
    
    ```
salt '*' snapper.set_config SYNC_ACL=True
    ```

    Keys are case insensitive as they will be always uppercased to snapper convention. The above example is equivalent to:

    ```
salt '*' snapper.set_config sync_acl=True
    ```

salt.modules.snapper.status(config='root', num_pre=None, num_post=None)
    Returns a comparison between two snapshots
    
    **config** Configuration name.
    **num_pre** first snapshot ID to compare. Default is last snapshot
    **num_post** last snapshot ID to compare. Default is 0 (current state)
CLI example:

```
salt '*' snapper.status
salt '*' snapper.status num_pre=19 num_post=20
```

```python
salt.modules.snapper.status_to_string(dbus_status)
```
Converts a numeric dbus snapper status into a string

**CLI Example:**

```
salt '*' snapper.status_to_string <dbus_status>
```

```python
salt.modules.snapper.undo(config='root', files=None, num_pre=None, num_post=None)
```
Undo all file changes that happened between num_pre and num_post, leaving the files into the state of num_pre.

**Warning:** If one of the files has changes after num_post, they will be overwritten. The snapshots are used to determine the file list, but the current version of the files will be overwritten by the versions in num_pre.

You to undo changes between num_pre and the current version of the files use num_post=0.

**CLI Example:**

```
salt '*' snapper.undo
```

```python
salt.modules.snapper.undo_jid(jid, config='root')
```
Undo the changes applied by a salt job

**CLI Example:**

```
salt '*' snapper.undo_jid jid=20160607130930720112
```

## 21.9.405 salt.modules.state

Control the state system on the minion.

### State Caching

When a highstate is called, the minion automatically caches a copy of the last high data. If you then run a highstate with cache=True it will use that cached highdata and won’t hit the fileserver except for salt:// links in the states themselves.

```python
salt.modules.state.apply_(mods=None, **kwargs)
```
New in version 2015.5.0.

This function will call `state.highstate` or `state.sls` based on the arguments passed to this function. It exists as a more intuitive way of applying states.

### APPLYING ALL STATES CONFIGURED IN TOP.SLS (A.K.A. HIGHSTATE)

To apply all configured states, simply run `state.apply`: 

21.9. execution modules
Salt Documentation, Release 2019.2.0

salt '*' state.apply

The following additional arguments are also accepted when applying all states configured in top.sls:
test Run states in test-only (dry-run) mode
mock The mock option allows for the state run to execute without actually calling any states. This then returns
a mocked return which will show the requisite ordering as well as fully validate the state run.
New in version 2015.8.4.
pillar Custom Pillar values, passed as a dictionary of key-value pairs
salt '*' state.apply stuff pillar='{"foo": "bar"}'

Note: Values passed this way will override Pillar values set via pillar_roots or an external Pillar
source.
exclude Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls
names, or a list of dictionaries containing sls or id keys. Glob-patterns may be used to match multiple
states.
salt '*' state.apply exclude=bar,baz
salt '*' state.apply exclude=foo*
salt '*' state.apply exclude="[{'id': 'id_to_exclude'}, {'sls': 'sls_to_
,→exclude'}]"

queue [False] Instead of failing immediately when another state run is in progress, queue the new state run
to begin running once the other has finished.
This option starts a new thread for each queued state run, so use this option sparingly.
localconfig Optionally, instead of using the minion config, load minion opts from the file specified by this
argument, and then merge them with the options from the minion config. This functionality allows
for specific states to be run with their own custom minion configuration, including different pillars,
file_roots, etc.
salt '*' state.apply localconfig=/path/to/minion.yml

APPLYING INDIVIDUAL SLS FILES (A.K.A. STATE.SLS)
To apply individual SLS files, pass them as a comma-separated list:
# Run the states configured in salt://stuff.sls (or salt://stuff/init.sls)
salt '*' state.apply stuff
# Run the states configured in salt://stuff.sls (or salt://stuff/init.sls)
# and salt://pkgs.sls (or salt://pkgs/init.sls).
salt '*' state.apply stuff,pkgs

The following additional arguments are also accepted when applying individual SLS files:
test Run states in test-only (dry-run) mode
mock The mock option allows for the state run to execute without actually calling any states. This then returns
a mocked return which will show the requisite ordering as well as fully validate the state run.
New in version 2015.8.4.
pillar Custom Pillar values, passed as a dictionary of key-value pairs
salt '*' state.apply stuff pillar='{"foo": "bar"}'

2492

Chapter 21. Salt Module Reference


**queue** [False] Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

**concurrent** [False] Execute state runs concurrently instead of serially

**Warning:** This flag is potentially dangerous. It is designed for use when multiple state runs can safely be run at the same time. Do *not* use this flag for performance optimization.

**saltenv** Specify a salt fileserver environment to be used when applying states

Changed in version 0.17.0: Argument name changed from `env` to `saltenv`

Changed in version 2014.7.0: If no saltenv is specified, the minion config will be checked for an `environment` parameter and if found, it will be used. If none is found, `base` will be used. In prior releases, the minion config was not checked and `base` would always be assumed when the saltenv was not explicitly set.

**pillarenv** Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.

**localconfig** Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, file_roots, etc.

```bash
salt '*' state.apply stuff localconfig=/path/to/minion.yml
```

**sync_mods** If specified, the desired custom module types will be synced prior to running the SLS files:

```bash
salt '*' state.apply stuff sync_mods=states,modules
salt '*' state.apply stuff sync_mods=all
```

**Note:** This option is ignored when no SLS files are specified, as a `highstate` automatically syncs all custom module types.

New in version 2017.7.8,2018.3.3,2019.2.0.

**salt.modules.state.check_request**(name=None)

New in version 2015.5.0.

Return the state request information, if any

CLI Example:

```bash
salt '*' state.check_request
```

**salt.modules.state.clear_cache()**

Clear out cached state files, forcing even cache runs to refresh the cache on the next state execution.

Remember that the state cache is completely disabled by default, this execution only applies if `cache=True` is used in states

CLI Example:
salt '*' state.clear_cache

**salt.modules.state.clear_request(name=None)**

New in version 2015.5.0.

Clear out the state execution request without executing it

CLI Example:

```
salt '*' state.clear_request
```

**salt.modules.state.disable(states)**

Disable state runs.

CLI Example:

```
salt '*' state.disable highstate
salt '*' state.disable highstate, test.succeed_without_changes
```

*Note:* To disable a state file from running provide the same name that would be passed in a state.sls call.

```
salt '*' state.disable bind.config
```

**salt.modules.state.enable(states)**

Enable state function or sls run

CLI Example:

```
salt '*' state.enable highstate
salt '*' state.enable test.succeed_without_changes
```

*Note:* To enable a state file from running provide the same name that would be passed in a state.sls call.

```
salt '*' state.enable bind.config
```

**salt.modules.state.event(tagmatch='*', count=-1, quiet=False, sock_dir=None, pretty=False, node='minion')**

Watch Salt’s event bus and block until the given tag is matched

New in version 2016.3.0.

Changed in version 2019.2.0: *tagmatch* can now be either a glob or regular expression.

This is useful for utilizing Salt’s event bus from shell scripts or for taking simple actions directly from the CLI.

Enable debug logging to see ignored events.

*Parameters*

- **tagmatch** – the event is written to stdout for each tag that matches this glob or regular expression.
- **count** – this number is decremented for each event that matches the *tagmatch* parameter; pass -1 to listen forever.
- **quiet** – do not print to stdout; just block
- **sock_dir** – path to the Salt master’s event socket file.
- **pretty** – Output the JSON all on a single line if False (useful for shell tools); pretty-print the JSON output if True.
• **node** – Watch the minion-side or master-side event bus.

CLI Example:

```shell
salt-call --local state.event pretty=True
```

**salt.modules.state.get_pauses**(*jid=None*)

Get a report on all of the currently paused state runs and pause run settings. Optionally send in a jid if you only desire to see a single pause data set.

**salt.modules.state.high**(*data, test=None, queue=False, **kwargs*)

Execute the compound calls stored in a single set of high data

This function is mostly intended for testing the state system and is not likely to be needed in everyday usage.

CLI Example:

```shell
salt '*' state.high '{"vim": {"pkg": ["installed"]}}'
```

**salt.modules.state.highstate**(*test=None, queue=False, **kwargs*)

Retrieve the state data from the salt master for this minion and execute it

- test Run states in test-only (dry-run) mode
- pillar Custom Pillar values, passed as a dictionary of key-value pairs

```shell
salt '*' state.highstate stuff pillar='{"foo": "bar"}'
```

**Note:** Values passed this way will override Pillar values set via pillar_roots or an external Pillar source.

Changed in version 2016.3.0: GPG-encrypted CLI Pillar data is now supported via the GPG renderer. See [here](#) for details.

**pillar_enc** Specify which renderer to use to decrypt encrypted data located within the pillar value. Currently, only gpg is supported.

New in version 2016.3.0.

**exclude** Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls names, or a list of dictionaries containing sls or id keys. Glob-patterns may be used to match multiple states.

```shell
salt '*' state.highstate exclude=bar,baz
salt '*' state.highstate exclude=foo*
salt '*' state.highstate exclude="[{'id': 'id_to_exclude'}, {'sls': 'sls_to_exclude'}]"
```

**saltenv** Specify a salt fileserver environment to be used when applying states

Changed in version 0.17.0: Argument name changed from env to saltenv.

Changed in version 2014.7.0: If no saltenv is specified, the minion config will be checked for a saltenv parameter and if found, it will be used. If none is found, base will be used. In prior releases, the minion config was not checked and base would always be assumed when the saltenv was not explicitly set.

**pillarenv** Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the pillarenv option. When neither the pillarenv minion config option nor this CLI argument is used, all Pillar environments will be merged together.

**queue** [False] Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.
localconfig Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, file_roots, etc.

mock The mock option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.

New in version 2015.8.4.

CLI Examples:

```bash
salt '*' state.highstate
salt '*' state.highstate whitelist=sls1_to_run,sls2_to_run
salt '*' state.highstate exclude=sls_to_exclude
salt '*' state.highstate exclude="[{'id': 'id_to_exclude'}, {'sls': 'sls_to_' exclude}]"
salt '*' state.highstate pillar="{foo: 'Foo!', bar: 'Bar!'}"
```

salt.modules.state.id_exists(ids, mods, test=None, queue=False, **kwargs)
Tests for the existence of a specific ID or list of IDs within the specified SLS file(s). Similar to state.sls_exists, returns True or False. The default environment is base, use saltenv to specify a different environment.

New in version 2019.2.0.

saltenv Specify a salt fileserver environment from which to look for the SLS files specified in the mods argument

CLI Example:

```bash
salt '*' state.id_exists create_myfile,update_template filestate saltenv=dev
```

salt.modules.state.list_disabled()
List the states which are currently disabled

CLI Example:

```bash
salt '*' state.list_disabled
```

salt.modules.state.low(data, queue=False, **kwargs)
Execute a single low data call

This function is mostly intended for testing the state system and is not likely to be needed in everyday usage.

CLI Example:

```bash
salt '*' state.low '{"state": "pkg", "fun": "installed", "name": "vi"}'
```

salt.modules.state.orchestrate(mods, saltenv='base', test=None, exclude=None, pillar=None, pillarenv=None)
New in version 2016.11.0.

Execute the orchestrate runner from a masterless minion.

See also:

More Orchestrate documentation
- Full Orchestrate Tutorial
- Docs for the `salt` state module <salt.states.saltmod>

CLI Examples:
salt-call --local state.orchestrate webserver
salt-call --local state.orchestrate webserver saltenv=dev test=True
salt-call --local state.orchestrate webserver saltenv=dev pillarenv=aws

salt.modules.state.pause(jid, state_id=None, duration=None)
Set up a state id pause, this instructs a running state to pause at a given state id. This needs to pass in the jid of the running state and can optionally pass in a duration in seconds. If a state_id is not passed then the jid referenced will be paused at the beginning of the next state run.

The given state id is the id got a given state execution, so given a state that looks like this:

```
vim:
  pkg.installed: []
```

The state_id to pass to pause is vim

CLI Examples:

```
salt '*' state.pause 20171130110407769519
salt '*' state.pause 20171130110407769519 vim
salt '*' state.pause 20171130110407769519 vim 20
```

salt.modules.state.pkg(pkg_path, pkg_sum, hash_type, test=None, **kwargs)
Execute a packaged state run, the packaged state run will exist in a tarball available locally. This packaged state can be generated using salt-ssh.

CLI Example:

```
salt '*' state.pkg /tmp/salt_state.tgz 760a9353810e36f6d81416366fc426dc md5
```

salt.modules.state.request(mods=None, **kwargs)
New in version 2015.5.0.

Request that the local admin execute a state run via salt-call state.run_request. All arguments match those of state.apply.

CLI Example:

```
salt '*' state.request
salt '*' state.request stuff
salt '*' state.request stuff,pkgs
```

salt.modules.state.resume(jid, state_id=None)
Remove a pause from a jid, allowing it to continue. If the state_id is not specified then the a general pause will be resumed.

The given state_id is the id got a given state execution, so given a state that looks like this:

```
vim:
  pkg.installed: []
```

The state_id to pass to rm_pause is vim

CLI Examples:

```
salt '*' state.resume 20171130110407769519
salt '*' state.resume 20171130110407769519 vim
```
Salt Documentation, Release 2019.2.0

salt.modules.state.run_request(name=’default’, **kwargs)
New in version 2015.5.0.
Execute the pending state request
CLI Example:
salt '*' state.run_request

salt.modules.state.running(concurrent=False)
Return a list of strings that contain state return data if a state function is already running. This function is
used to prevent multiple state calls from being run at the same time.
CLI Example:
salt '*' state.running

salt.modules.state.show_highstate(queue=False, **kwargs)
Retrieve the highstate data from the salt master and display it
Custom Pillar data can be passed with the pillar kwarg.
CLI Example:
salt '*' state.show_highstate

salt.modules.state.show_low_sls(mods, test=None, queue=False, **kwargs)
Display the low data from a specific sls. The default environment is base, use saltenv to specify a different
environment.
saltenv Specify a salt fileserver environment to be used when applying states
pillar Custom Pillar values, passed as a dictionary of key-value pairs
salt '*' state.show_low_sls stuff pillar='{"foo": "bar"}'

Note: Values passed this way will override Pillar values set via pillar_roots or an external Pillar
source.
pillarenv Specify a Pillar environment to be used when applying states. This can also be set in the minion
config file using the pillarenv option. When neither the pillarenv minion config option nor this
CLI argument is used, all Pillar environments will be merged together.
CLI Example:
salt '*' state.show_low_sls foo
salt '*' state.show_low_sls foo saltenv=dev

salt.modules.state.show_lowstate(queue=False, **kwargs)
List out the low data that will be applied to this minion
CLI Example:
salt '*' state.show_lowstate

salt.modules.state.show_sls(mods, test=None, queue=False, **kwargs)
Display the state data from a specific sls or list of sls files on the master. The default environment is base, use
saltenv to specify a different environment.
This function does not support topfiles. For top.sls please use show_top instead.
Custom Pillar data can be passed with the pillar kwarg.
2498

Chapter 21. Salt Module Reference


**saltenv**  Specify a salt fileserver environment to be used when applying states

**pillarenv**  Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.

CLI Example:

```
salt '*' state.show_sls core,edit.vim saltenv=dev
```

salt.modules.state.show_state_usage(queue=False, **kwargs)

Retrieve the highstate data from the salt master to analyse used and unused states.

Custom Pillar data can be passed with the `pillar` kwarg.

CLI Example:

```
salt '*' state.show_state_usage
```

salt.modules.state.show_states(queue=False, **kwargs)

Returns the list of states that will be applied on highstate.

CLI Example:

```
salt '*' state.show_states
```

New in version 2019.2.0.

salt.modules.state.show_top(queue=False, **kwargs)

Return the top data that the minion will use for a highstate.

CLI Example:

```
salt '*' state.show_top
```

salt.modules.state.single(fun, name, test=None, queue=False, **kwargs)

Execute a single state function with the named kwargs, returns False if insufficient data is sent to the command

By default, the values of the kwargs will be parsed as YAML. So, you can specify lists values, or lists of single entry key-value maps, as you would in a YAML salt file. Alternatively, JSON format of keyword values is also supported.

CLI Example:

```
salt '*' state.single pkg.installed name=vim
```

salt.modules.state.sls(mods, test=None, exclude=None, queue=False, sync_mods=None, **kwargs)

Execute the states in one or more SLS files

**test**  Run states in test-only (dry-run) mode

**pillar**  Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.sls stuff pillar='{"foo": "bar"}''
```

**Note:** Values passed this way will override existing Pillar values set via `pillar_roots` or an external Pillar source. Pillar values that are not included in the kwarg will not be overwritten.

Changed in version 2016.3.0: GPG-encrypted CLI Pillar data is now supported via the GPG renderer. See `here` for details.
pillar_enc Specify which renderer to use to decrypt encrypted data located within the pillar value. Currently, only gpg is supported.

New in version 2016.3.0.

exclude Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls names, or a list of dictionaries containing sls or id keys. Glob-patterns may be used to match multiple states.

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>salt '*' state.sls foo,bar,baz exclude=bar,baz</code></td>
<td></td>
</tr>
<tr>
<td><code>salt '*' state.sls foo,bar,baz exclude=bas</code></td>
<td></td>
</tr>
<tr>
<td><code>salt '*' state.sls foo,bar,baz exclude=&quot;[{\'id\': \'id_to_exclude\'}, {\'sls\': \'sls_to_exclude\'}]&quot;</code></td>
<td></td>
</tr>
</tbody>
</table>

queue [False] Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

concurrent [False] Execute state runs concurrently instead of serially

**Warning**: This flag is potentially dangerous. It is designed for use when multiple state runs can safely be run at the same time. Do not use this flag for performance optimization.

saltenv Specify a salt fileserver environment to be used when applying states

Changed in version 0.17.0: Argument name changed from env to saltenv.

Changed in version 2014.7.0: If no saltenv is specified, the minion config will be checked for an environment parameter and if found, it will be used. If none is found, base will be used. In prior releases, the minion config was not checked and base would always be assumed when the saltenv was not explicitly set.

pillarenv Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the pillarenv option. When neither the pillarenv minion config option nor this CLI argument is used, all Pillar environments will be merged together.

localconfig Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, file_roots, etc.

mock: The mock option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.

New in version 2015.8.4.

sync_mods If specified, the desired custom module types will be synced prior to running the SLS files:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>salt '*' state.sls stuff sync_mods=states,modules</code></td>
<td></td>
</tr>
<tr>
<td><code>salt '*' state.sls stuff sync_mods=all</code></td>
<td></td>
</tr>
</tbody>
</table>

New in version 2017.7.8,2018.3.3,2019.2.0.

CLI Example:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>salt '*' state.sls core,edit.vim dev</code></td>
<td></td>
</tr>
<tr>
<td>`salt '*' state.sls core exclude=&quot;[{'id': 'id_to_exclude'}, {'sls': 'sls_to_exclude \n'}]&quot;&quot;</td>
<td></td>
</tr>
<tr>
<td><code>salt '*' state.sls myslsfile pillar=&quot;{\'foo\': \'Foo!\', \'bar\': \'Bar!\'}&quot;&quot;</code></td>
<td></td>
</tr>
</tbody>
</table>
salt.modules.state.sls_exists(mods, test=None, queue=False, **kwargs)
Tests for the existence of a specific SLS or list of SLS files on the master. Similar to state.show_sls, rather than returning state details, returns True or False. The default environment is base, use saltenv to specify a different environment.

New in version 2019.2.0.
saltenv Specify a salt fileserver environment from which to look for the SLS files specified in the mods argument
CLI Example:
```
salt '*' state.sls_exists core,edit.vim saltenv=dev
```

salt.modules.state.sls_id(id_, mods, test=None, queue=False, **kwargs)
Call a single ID from the named module(s) and handle all requisites

The state ID comes before the module ID(s) on the command line.
id ID to call
mods Comma-delimited list of modules to search for given id and its requisites
New in version 2014.7.0.
saltenv [base] Specify a salt fileserver environment to be used when applying states
pillarenv Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the pillarenv option. When neither the pillarenv minion config option nor this CLI argument is used, all Pillar environments will be merged together.
pillar Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.sls_id my_state my_module pillar='{"foo": "bar"}"
```

Note: Values passed this way will override existing Pillar values set via pillar_roots or an external Pillar source. Pillar values that are not included in the kwarg will not be overwritten.

New in version 2018.3.0.
CLI Example:
```
salt '*' state.sls_id my_state my_module
salt '*' state.sls_id my_state my_module,a_common_module
```

salt.modules.state.soft_kill(jid, state_id=None)
Set up a state run to die before executing the given state id, this instructs a running state to safely exit at a given state id. This needs to pass in the jid of the running state. If a state_id is not passed then the jid referenced will be safely exited at the beginning of the next state run.

The given state id is the id got a given state execution, so given a state that looks like this:
```
vim:
  pkg.installed: []
```

The state_id to pass to soft_kill is vim

CLI Examples:
```
salt '*' state.soft_kill 20171130110407769519
salt '*' state.soft_kill 20171130110407769519 vim
```

salt.modules.state.template(tem, queue=False, **kwargs)
Execute the information stored in a template file on the minion.
This function does not ask a master for a SLS file to render but instead directly processes the file at the provided path on the minion.

CLI Example:

```
salt '*' state.template '<Path to template on the minion>'
```

```python
salt.modules.state.template_str(tem, queue=False, **kwargs)
```
Execute the information stored in a string from an sls template

CLI Example:

```
salt '*' state.template_str '<Template String>'
```

```python
salt.modules.state.top(topfn, test=None, queue=False, **kwargs)
```
Execute a specific top file instead of the default. This is useful to apply configurations from a different environment (for example, dev or prod), without modifying the default top file.

queue [False] Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

saltenv Specify a salt fileserver environment to be used when applying states

pillarenv Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.

New in version 2017.7.0.

CLI Example:

```
salt '*' state.top reverse_top.sls
salt '*' state.top prod_top.sls exclude=sls_to_exclude
salt '*' state.top dev_top.sls exclude="[{'id': 'id_to_exclude'}, {'sls': 'sls_to_exclude'}]"
```

### 21.9.406 salt.modules.status

Module for returning various status data about a minion. These data can be useful for compiling into stats later.

```python
salt.modules.status.all_status()
```
Return a composite of all status data and info for this minion. Warning: There is a LOT here!

CLI Example:

```
salt '*' status.all_status
```

```python
salt.modules.status.cpuinfo()
```
Changed in version 2016.3.2: Return the CPU info for this minion

Changed in version 2016.11.4: Added support for AIX

Changed in version 2018.3.0: Added support for NetBSD and OpenBSD

CLI Example:

```
salt '*' status.cpuinfo
```

```python
salt.modules.status.cpustats()
```
Return the CPU stats for this minion
Changed in version 2016.11.4: Added support for AIX

Changed in version 2018.3.0: Added support for OpenBSD

CLI Example:

```bash
salt '*' status.cpustats
```

`salt.modules.status.custom()`  
Return a custom composite of status data and info for this minion, based on the minion config file. An example config like might be:

```
status.cpustats.custom: ['cpu', 'ctxt', 'btime', 'processes']
```

Where `status` refers to status.py, `cpustats` is the function where we get our data, and `custom` is this function. It is followed by a list of keys that we want returned.

This function is meant to replace `all_status()`, which returns anything and everything, which we probably don’t want.

By default, nothing is returned. Warning: Depending on what you include, there can be a LOT here!

CLI Example:

```bash
salt '*' status.custom
```

`salt.modules.status.diskstats()`  
Changed in version 2016.3.2: Return the disk stats for this minion  
Changed in version 2016.11.4: Added support for AIX

CLI Example:

```bash
salt '*' status.diskstats
```

`salt.modules.status.diskusage(*args)`  
Return the disk usage for this minion

Usage:

```
salt '*' status.diskusage [paths and/or filesystem types]
```

CLI Example:

```
salt '*' status.diskusage  # usage for all filesystems
salt '*' status.diskusage /tmp  # usage for / and /tmp
salt '*' status.diskusage ext?  # usage for ext[234] filesystems
salt '*' status.diskusage / ext?  # usage for / and all ext filesystems
```

`salt.modules.status.loadavg()`  
Return the load averages for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.loadavg
```

:raises CommandExecutionError: If the system cannot report load averages to Python
salt.modules.status.master(master=None, connected=True)

New in version 2014.7.0.

Return the connection status with master. Fire an event if the connection to master is not as expected. This function is meant to be run via a scheduled job from the minion. If master_ip is an FQDN/Hostname, it must be resolvable to a valid IPv4 address.

Changed in version 2016.11.4: Added support for AIX

CLI Example:
salt '*' status.master

salt.modules.status.meminfo()

Return the memory info for this minion

Changed in version 2016.11.4: Added support for AIX

Changed in version 2018.3.0: Added support for OpenBSD

CLI Example:
salt '*' status.meminfo

salt.modules.status.netdev()

Changed in version 2016.3.2: Return the network device stats for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:
salt '*' status.netdev

salt.modules.status.netstats()

Return the network stats for this minion

Changed in version 2016.11.4: Added support for AIX

Changed in version 2018.3.0: Added support for OpenBSD

CLI Example:
salt '*' status.netstats

salt.modules.status.nproc()

Return the number of processing units available on this system

Changed in version 2016.11.4: Added support for AIX

Changed in version 2018.3.0: Added support for Darwin, FreeBSD and OpenBSD

CLI Example:
salt '*' status.nproc

salt.modules.status.pid(sig)

Return the PID or an empty string if the process is running or not. Pass a signature to use to find the process via ps. Note you can pass a Python-compatible regular expression to return all pids of processes matching the regexp.

Changed in version 2016.11.4: Added support for AIX

CLI Example:
Salt Documentation, Release 2019.2.0

```
salt '*' status.pid <sig>
```

```
salt.modules.status.ping_master(master)
New in version 2016.3.0.
  Sends ping request to the given master. Fires '__master_failback' event on success. Returns bool result.
  CLI Example:
  ```
salt '*' status.ping_master localhost
  ```
```

```
salt.modules.status.procs()
Return the process data
  Changed in version 2016.11.4: Added support for AIX
  CLI Example:
  ```
salt '*' status.procs
  ```
```

```
salt.modules.status.proxy_reconnect(proxy_name, opts=None)
Forces proxy minion reconnection when not alive.
  proxy_name The virtual name of the proxy module.
  opts: None Opts dictionary. Not intended for CLI usage.
  CLI Example:
  ```
salt '*' status.proxy_reconnect rest_sample
  ```
```

```
salt.modules.status.time_(format='%A, %d. %B %Y %I:%M%p')
New in version 2016.3.0.
  Return the current time on the minion, formatted based on the format parameter.
  Default date format: Monday, 27. July 2015 07:55AM
  CLI Example:
  ```
salt '*' status.time
  ```
```

```
salt '*' status.time_ '%s'
```

```
salt.modules.status.uptime()
Return the uptime for this system.
  Changed in version 2015.8.9: The uptime function was changed to return a dictionary of easy-to-read key/value pairs containing uptime information, instead of the output from a cmd.run call.
  Changed in version 2016.11.0: Support for OpenBSD, FreeBSD, NetBSD, MacOS, and Solaris
  Changed in version 2016.11.4: Added support for AIX
  CLI Example:
  ```
salt '*' status.uptime
  ```
```

```
salt.modules.status.version()
Return the system version for this minion
  Changed in version 2016.11.4: Added support for AIX
  Changed in version 2018.3.0: Added support for OpenBSD
  CLI Example:
```

21.9. execution modules
salt '*' status.version

salt.modules.status.vmstats()
    Changed in version 2016.3.2: Return the virtual memory stats for this minion
    Changed in version 2016.11.4: Added support for AIX
    CLI Example:
    salt '*' status.vmstats

salt.modules.status.w()
    Return a list of logged in users for this minion, using the w command
    CLI Example:
    salt '*' status.w

21.9.407 salt.modules.statuspage

StatusPage

Handle requests for the StatusPage API.

In the minion configuration file, the following block is required:

```
statuspage:
    api_key: <API_KEY>
    page_id: <PAGE_ID>
```

New in version 2017.7.0.

salt.modules.statuspage.create(endpoint='incidents', api_url=None, page_id=None, api_key=None, api_version=None, **kwargs)
    Insert a new entry under a specific endpoint.
    endpoint: incidents  Insert under this specific endpoint.
    page_id  Page ID. Can also be specified in the config file.
    api_key  API key. Can also be specified in the config file.
    api_version: 1  API version. Can also be specified in the config file.
    api_url  Custom API URL in case the user has a StatusPage service running in a custom environment.
    CLI Example:
    salt 'minion' statuspage.create endpoint='components' name='my component' group_
    id='993vgplshj12'

Example output:

```
minion:
    ----------
    comment:
    out:
    ----------
    created_at:
    2017-01-05T19:35:27.135Z
    description:
    None
```

(continues on next page)
group_id: 993vgplshj12
id: mjkmttSlhdgc
name: my component
page_id: ksdhgfyiuhaa
position: 7
status: operational
updated_at: 2017-01-05T19:35:27.135Z
result: True

salt.modules.statuspage.delete(endpoint='incidents', id=None, api_url=None, page_id=None, api_key=None, api_version=None)

Remove an entry from an endpoint.
endpoint: incidents Request a specific endpoint.
page_id Page ID. Can also be specified in the config file.
api_key API key. Can also be specified in the config file.
api_version: 1 API version. Can also be specified in the config file.
api_url Custom API URL in case the user has a StatusPage service running in a custom environment.

CLI Example:
salt 'minion' statuspage.delete endpoint='components' id='ftgks51sfs2d'

Example output:

minion:----------------
comment: None
out: None
result: True

salt.modules.statuspage.retrieve(endpoint='incidents', api_url=None, page_id=None, api_key=None, api_version=None)

Retrieve a specific endpoint from the Statuspage API.
endpoint: incidents Request a specific endpoint.
page_id Page ID. Can also be specified in the config file.
api_key API key. Can also be specified in the config file.
api_version: 1 API version. Can also be specified in the config file.
api_url Custom API URL in case the user has a StatusPage service running in a custom environment.

CLI Example:
salt 'minion' statuspage.retrieve components

Example output:

minion:----------------
<table>

salt.modules.statuspage.update(
    endpoint='incidents', id=None, api_url=None, page_id=None,
    api_key=None, api_version=None, **kwargs)

Update attribute(s) of a specific endpoint.

id  The unique ID of the endpoint entry.
endpoint: incidents  Endpoint name.
page_id  Page ID. Can also be specified in the config file.
api_key  API key. Can also be specified in the config file.
api_version: 1  API version. Can also be specified in the config file.
api_url  Custom API URL in case the user has a StatusPage service running in a custom environment.

CLI Example:

    salt 'minion' statuspage.update id=dz959yz2nd4l status=resolved

Example output:

    minion:  
        comment:  
        created_at:  
            2017-01-03T15:25:30.718Z

(continues on next page)
21.9.408 salt.modules.supervisord

Provide the service module for system supervisord or supervisord in a virtualenv

```python
salt.modules.supervisord.add(name, user=None, conf_file=None, bin_env=None)
```
Activates any updates in config for process/group.

- **user** user to run supervisorctl as
- **conf_file** path to supervisord config file
- **bin_env** path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:
```
salt '*' supervisord.add <name>
```

```python
salt.modules.supervisord.custom(command, user=None, conf_file=None, bin_env=None)
```
Run any custom supervisord command

- **user** user to run supervisorctl as
- **conf_file** path to supervisord config file
- **bin_env** path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:
```
salt '*' supervisord.custom "mstop '*gunicorn*'"
```

```python
salt.modules.supervisord.options(name, conf_file=None)
```
New in version 2014.1.0.

Read the config file and return the config options for a given process

- **name** Name of the configured process
- **conf_file** path to supervisord config file

CLI Example:
```
salt '*' supervisord.options foo
```

```python
salt.modules.supervisord.remove(name, user=None, conf_file=None, bin_env=None)
```
Removes process/group from active config

- **user** user to run supervisorctl as
- **conf_file** path to supervisord config file
- **bin_env** path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:
```
salt '*' supervisord.remove <name>
```

```python
salt.modules.supervisord.reread(user=None, conf_file=None, bin_env=None)
```
Reload the daemon’s configuration files

- **user** user to run supervisorctl as
- **conf_file** path to supervisord config file
- **bin_env** path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:
salt '*' supervisord.reread

salt.modules.supervisord.restart(name='all', user=None, conf_file=None, bin_env=None)
    Restart the named service. Process group names should not include a trailing asterisk.
    user   user to run supervisorctl as
    conf_file   path to supervisord config file
    bin_env   path to supervisorctl bin or path to virtualenv with supervisor installed
    CLI Example:

        salt '*' supervisord.restart <service>
        salt '*' supervisord.restart <group>:

salt.modules.supervisord.start(name='all', user=None, conf_file=None, bin_env=None)
    Start the named service. Process group names should not include a trailing asterisk.
    user   user to run supervisorctl as
    conf_file   path to supervisord config file
    bin_env   path to supervisorctl bin or path to virtualenv with supervisor installed
    CLI Example:

        salt '*' supervisord.start <service>
        salt '*' supervisord.start <group>:

salt.modules.supervisord.status(name=None, user=None, conf_file=None, bin_env=None)
    List programs and its state
    user   user to run supervisorctl as
    conf_file   path to supervisord config file
    bin_env   path to supervisorctl bin or path to virtualenv with supervisor installed
    CLI Example:

        salt '*' supervisord.status

salt.modules.supervisord.status_raw(name=None, user=None, conf_file=None, bin_env=None)
    Display the raw output of status
    user   user to run supervisorctl as
    conf_file   path to supervisord config file
    bin_env   path to supervisorctl bin or path to virtualenv with supervisor installed
    CLI Example:

        salt '*' supervisord.status_raw

salt.modules.supervisord.stop(name='all', user=None, conf_file=None, bin_env=None)
    Stop the named service. Process group names should not include a trailing asterisk.
    user   user to run supervisorctl as
    conf_file   path to supervisord config file
    bin_env   path to supervisorctl bin or path to virtualenv with supervisor installed
    CLI Example:

        salt '*' supervisord.stop <service>
        salt '*' supervisord.stop <group>:

salt.modules.supervisord.update(user=None, conf_file=None, bin_env=None, name=None)
    Reload config and add/remove/update as necessary
    user   user to run supervisorctl as
    conf_file   path to supervisord config file
    bin_env   path to supervisorctl bin or path to virtualenv with supervisor installed
name  name of the process group to update. if none then update any process group that has changes

CLI Example:

```
salt '*' supervisord.update
```

## 21.9.409 salt.modules.suse_apache

Support for Apache

Please note: The functions in here are SUSE-specific. Placing them in this separate file will allow them to load only on SUSE systems, while still loading under the `apache` namespace.

**salt.modules.suse_apache.a2dismod** *(mod)*

Runs `a2dismod` for the given mod.

CLI Example:

```
salt '*' apache.a2dismod vhost_alias
```

**salt.modules.suse_apache.a2enmod** *(mod)*

Runs `a2enmod` for the given mod.

CLI Example:

```
salt '*' apache.a2enmod vhost_alias
```

**salt.modules.suse_apache.check_mod_enabled** *(mod)*

Checks to see if the specific apache mod is enabled.

This will only be functional on operating systems that support `a2enmod -l` to list the enabled mods.

CLI Example:

```
salt '*' apache.check_mod_enabled status
```

## 21.9.410 salt.modules.svn

Subversion SCM

**salt.modules.svn.add** *(cwd, targets, user=None, username=None, password=None, *opts)*

Add files to be tracked by the Subversion working-copy checkout

cwd  The path to the Subversion repository

targets  [None] files and directories to pass to the command as arguments

user  [None] Run svn as a user other than what the minion runs as

username  [None] Connect to the Subversion server as another user

password  [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.add /path/to/repo /path/to/new/file
```

**salt.modules.svn.checkout** *(cwd, remote, target=None, user=None, username=None, password=None, *opts)*

Download a working copy of the remote Subversion repository directory or file

cwd  The path to the Subversion repository

remote  [None] URL to checkout
target  [None] The name to give the file or directory working copy Default: svn uses the remote basename
user    [None] Run svn as a user other than what the minion runs as
username [None] Connect to the Subversion server as another user
password [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:
```
salt '*' svn.checkout /path/to/repo svn://remote/repo
```

salt.modules.svn.commit(cwd, targets=None, msg=None, user=None, username=None, password=None, *opts)
Commit the current directory, files, or directories to the remote Subversion repository
cwd    The path to the Subversion repository
targets [None] files and directories to pass to the command as arguments Default: svn uses ‘.
msg     [None] Message to attach to the commit log
user    [None] Run svn as a user other than what the minion runs as
username [None] Connect to the Subversion server as another user
password [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:
```
salt '*' svn.commit /path/to/repo
```

salt.modules.svn.diff(cwd, targets=None, user=None, username=None, password=None, *opts)
Return the diff of the current directory, files, or directories from the remote Subversion repository
cwd    The path to the Subversion repository
targets [None] files and directories to pass to the command as arguments Default: svn uses ‘.
user    [None] Run svn as a user other than what the minion runs as
username [None] Connect to the Subversion server as another user
password [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:
```
salt '*' svn.diff /path/to/repo
```

salt.modules.svn.export(cwd, remote, target=None, user=None, username=None, password=None, revision='HEAD', *opts)
Create an unversioned copy of a tree.
cwd   The path to the Subversion repository
remote [None] URL and path to file or directory checkout
target [None] The name to give the file or directory working copy Default: svn uses the remote basename
user   [None] Run svn as a user other than what the minion runs as
username [None] Connect to the Subversion server as another user
password [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:
```
salt '*' svn.export /path/to/repo svn://remote/repo
```

salt.modules.svn.info(cwd, targets=None, user=None, username=None, password=None, fmt='str')
Display the Subversion information from the checkout.
cwd   The path to the Subversion repository
targets [None] files, directories, and URLs to pass to the command as arguments svn uses ‘.’ by default
user [None] Run svn as a user other than what the minion runs as
username [None] Connect to the Subversion server as another user
password [None] Connect to the Subversion server with this password

    New in version 0.17.0.
fmt [str] How to fmt the output from info. (str, xml, list, dict)
CLI Example:

    salt '*' svn.info /path/to/svn/repo

salt.modules.svn.remove(cwd, targets, msg=None, user=None, username=None, password=None, *opts)
Remove files and directories from the Subversion repository
    cwd The path to the Subversion repository
    targets [None] files, directories, and URLs to pass to the command as arguments
    msg [None] Message to attach to the commit log
    user [None] Run svn as a user other than what the minion runs as
    username [None] Connect to the Subversion server as another user
    password [None] Connect to the Subversion server with this password

    New in version 0.17.0.
    CLI Example:

    salt '*' svn.remove /path/to/repo /path/to/repo/remove

salt.modules.svn.status(cwd, targets=None, user=None, username=None, password=None, *opts)
Display the status of the current directory, files, or directories in the Subversion repository
    cwd The path to the Subversion repository
    targets [None] files, directories, and URLs to pass to the command as arguments Default: svn uses '.'
    user [None] Run svn as a user other than what the minion runs as
    username [None] Connect to the Subversion server as another user
    password [None] Connect to the Subversion server with this password

    New in version 0.17.0.
    CLI Example:

    salt '*' svn.status /path/to/repo

salt.modules.svn.switch(cwd, remote, target=None, user=None, username=None, password=None, *opts)
Switch a working copy of a remote Subversion repository directory
    cwd The path to the Subversion repository
    remote [None] URL to switch
    target [None] The name to give the file or directory working copy Default: svn uses the remote basename
    user [None] Run svn as a user other than what the minion runs as
    username [None] Connect to the Subversion server as another user
    password [None] Connect to the Subversion server with this password
    CLI Example:

    salt '*' svn.switch /path/to/repo svn://remote/repo

salt.modules.svn.update(cwd, targets=None, user=None, username=None, password=None, *opts)
Update the current directory, files, or directories from the remote Subversion repository
    cwd The path to the Subversion repository
    targets [None] files and directories to pass to the command as arguments Default: svn uses '.'
**user** [None] Run svn as a user other than what the minion runs as
**password** [None] Connect to the Subversion server with this password

    New in version 0.17.0.
**username** [None] Connect to the Subversion server as another user

CLI Example:
```
salt '*' svn.update /path/to/repo
```

### 21.9.411 salt.modules.swarm

**Docker Swarm Module using Docker’s Python SDK**

**codeauthor** Tyler Jones <jonestyler806@gmail.com>

New in version 2018.3.0.

The Docker Swarm Module is used to manage and create Docker Swarms.

**Dependencies**

- Docker installed on the host
- Docker python sdk >= 2.5.1

**Docker Python SDK**

```
pip install -U docker
```

```python
salt.modules.swarm.joinswarm(remote_addr=<class 'int'>, listen_addr=<class 'int'>, token=<class 'str'>)
```

Join a Swarm Worker to the cluster

**remote_addr** The manager node you want to connect to for the swarm
**listen_addr** Listen address used for inter-manager communication if the node gets promoted to manager, as well as determining the networking interface used for the VXLAN Tunnel Endpoint (VTEP)
**token** Either the manager join token or the worker join token. You can get the worker or manager token via

```
salt '*' swarm.swarm_tokens
```

CLI Example:
```
salt '*' swarm.joinswarm remote_addr=192.168.50.10 listen_addr='0.0.0.0'
  ! token='SWMTKN-1-64tux2g0701r84ofq93zppcih0pe081akq45owe9ts61f30x4t-
    ! 06trjugdu7x2z47j938s54il'
```

```python
salt.modules.swarm.leave_swarm(force=<class 'bool'>)
```

Force the minion to leave the swarm

**force** Will force the minion/worker/manager to leave the swarm

CLI Example:
```
salt '*' swarm.leave_swarm force=False
```

```python
salt.modules.swarm.node_ls(server=<class 'str'>)
```

Displays Information about Swarm Nodes with passing in the server

---

21.9. execution modules
server  The minion/server name
CLI Example:

```
salt '*' swarm.node_ls server=minion1
```

salt.modules.swarm.remove_node( node_id=class 'str', force=class 'bool')
Remove a node from a swarm and the target needs to be a swarm manager

node_id  The node id from the return of swarm.node_ls
force  Forcefully remove the node/minion from the service
CLI Example:

```
salt '*' swarm.remove_node node_id=z4gjbe9rwmqahc2a91snvolm5 force=false
```

salt.modules.swarm.remove_service(service=class 'str')
Remove Swarm Service

service  The name of the service
CLI Example:

```
salt '*' swarm.remove_service service=Test_Service
```

salt.modules.swarm.service_create(image=class 'str', name=class 'str', command=class 'str', hostname=class 'str', replicas=class 'int', target_port=class 'int', published_port=class 'int')
Create Docker Swarm Service Create

image  The docker image
name  Is the service name
command  The docker command to run in the container at launch
hostname  The hostname of the containers
replicas  How many replicas you want running in the swarm
target_port  The target port on the container
published_port  port thats published on the host/os
CLI Example:

```
salt '*' swarm.service_create image=httpd name=Test_Service command=None hostname=salthttpd replicas=6 target_port=80 published_port=80
```

salt.modules.swarm.swarm_init(advertise_addr=class 'str', listen_addr=class 'int', force_new_cluster=class 'bool')
Initlalize Docker on Minion as a Swarm Manager

advertise_addr  The ip of the manager
listen_addr  Listen address used for inter-manager communication, as well as determining the networking interface used for the VXLAN Tunnel Endpoint (VTEP). This can either be an address/port combination in the form 192.168.1.1:4567, or an interface followed by a port number, like eth0:4567
force_new_cluster  Force a new cluster if True is passed
CLI Example:

```
salt '*' swarm.swarm_init advertise_addr='192.168.50.10' listen_addr='0.0.0.0' force_new_cluster=False
```

salt.modules.swarm.swarm_service_info(service_name=class 'str')
Swarm Service Information

service_name  The name of the service that you want information on about the service
CLI Example:

```
salt '*' swarm.swarm_service_info service_name=Test_Service
```
salt.modules.swarm.swarm_tokens()
Get the Docker Swarm Manager or Worker join tokens

CLI Example:
```
salt '*' swarm.swarm_tokens
```

salt.modules.swarm.update_node(
    availability=<class 'str'>, node_name=<class 'str'>, role=<class 'str'>, node_id=<class 'str'>, version=<class 'int'>)
Updates docker swarm nodes/needs to target a manager node/minion
availability Drain or Active
node_name minion/node
role role of manager or worker
node_id The Id and that can be obtained via swarm.node_ls
version Is obtained by swarm.node_ls

CLI Example:
```
salt '*' docker_util.update_node availability=dain node_name=minion2 role=worker node_id=3k9x7t8m4pel9c0nqr3iajnzp version=19
```

21.9.412 salt.modules.swift

Module for handling OpenStack Swift calls Author: Anthony Stanton <anthony.stanton@gmail.com>
Inspired by the S3 and Nova modules

depends
- swiftclient Python module

configuration This module is not usable until the user, tenant, auth URL, and password or auth_key are specified either in a pillar or in the minion’s config file. For example:
```
keystone.user: admin
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/
keystone.password: verybadpass
# or
keystone.auth_key: 203802934809284k2j34lkj2l3kj43k
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles: For example:
```
openstack1:
    keystone.user: admin
    keystone.tenant: admin
    keystone.auth_url: 'http://127.0.0.1:5000/v2.0/
    keystone.password: verybadpass
    # or
    keystone.auth_key: 203802934809284k2j34lkj2l3kj43k

openstack2:
    keystone.user: admin
    keystone.tenant: admin
    keystone.auth_url: 'http://127.0.0.2:5000/v2.0/
    keystone.password: verybadpass
    # or
    keystone.auth_key: 303802934809284k2j34lkj2l3kj43k
```
With this configuration in place, any of the swift functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' swift.get mycontainer myfile /tmp/file profile=openstack1
```

NOTE: For Rackspace cloud files setting keystone.auth_version = 1 is recommended.

```
salt.modules.swift.delete(cont, path=None, profile=None)
Delete a container, or delete an object from a container.
```

CLI Example to delete a container:

```
salt myminion swift.delete mycontainer
```

CLI Example to delete an object from a container:

```
salt myminion swift.delete mycontainer remoteobject
```

```
salt.modules.swift.get(cont=None, path=None, local_file=None, return_bin=False, profile=None)
List the contents of a container, or return an object from a container. Set return_bin to True in order to retrieve an object wholesale. Otherwise, Salt will attempt to parse an XML response.
```

CLI Example to list containers:

```
salt myminion swift.get
```

CLI Example to list the contents of a container:

```
salt myminion swift.get mycontainer
```

CLI Example to return the binary contents of an object:

```
salt myminion swift.get mycontainer myfile.png return_bin=True
```

CLI Example to save the binary contents of an object to a local file:

```
salt myminion swift.get mycontainer myfile.png local_file=/tmp/myfile.png
```

```
salt.modules.swift.head()
```

```
salt.modules.swift.put(cont, path=None, local_file=None, profile=None)
Create a new container, or upload an object to a container.
```

CLI Example to create a container:

```
salt myminion swift.put mycontainer
```

CLI Example to upload an object to a container:

```
salt myminion swift.put mycontainer remotepath local_file=/path/to/file
```

### 21.9.413 salt.modules.sysbench

The 'sysbench' module is used to analyze the performance of the minions, right from the master! It measures various system parameters such as CPU, Memory, File I/O, Threads and Mutex.
salt.modules.sysbench.cpu()
    Tests for the CPU performance of minions.
    CLI Examples:
    ```
salt '*' sysbench.cpu
    ```
	salt.modules.sysbench.fileio()
    This tests for the file read and write operations Various modes of operations are
    • sequential write
    • sequential rewrite
    • sequential read
    • random read
    • random write
    • random read and write
    The test works with 32 files with each file being 1Gb in size The test consumes a lot of time. Be patient!
    CLI Examples:
    ```
salt '*' sysbench.fileio
    ```
	salt.modules.sysbench.memory()
    This tests the memory for read and write operations.
    CLI Examples:
    ```
salt '*' sysbench.memory
    ```
	salt.modules.sysbench.mutex()
    Tests the implementation of mutex
    CLI Examples:
    ```
salt '*' sysbench.mutex
    ```
	salt.modules.sysbench.ping()
	salt.modules.sysbench.threads()
    This tests the performance of the processor’s scheduler
    CLI Example:
    ```
salt '*' sysbench.threads
    ```

21.9.414 salt.modules.sysfs module

Module for interfacing with SysFS

See also:

https://www.kernel.org/doc/Documentation/filesystems/sysfs.txt

New in version 2016.3.0.
	salt.modules.sysfs.attr(key, value=None)
    Access/write a SysFS attribute. If the attribute is a symlink, it’s destination is returned
    Returns value or bool
    CLI example:
salt '*' sysfs.attr block/sda/queue/logical_block_size

salt.modules.sysfs.interfaces(root)
Generate a dictionary with all available interfaces relative to root. Symlinks are not followed.
CLI example:
salt '*' sysfs.interfaces block/bcache0/bcache

Output example:

```json
{
    "r": [
        "state",
        "partial_stripes_expensive",
        "writeback_rate_debug",
        "stripe_size",
        "dirty_data",
        "stats_total/cache_hits",
        "stats_total/cache_bypass_misses",
        "stats_total/bypassed",
        "stats_total/cache_readaheads",
        "stats_total/cache_hit_ratio",
        "stats_total/cache_miss_collisions",
        "stats_total/cache_misses",
        "stats_total/cache_bypass_hits",
    ],
    "rw": [
        "writeback_rate",
        "writeback_rate_update_seconds",
        "cache_mode",
        "writeback_delay",
        "label",
        "writeback_running",
        "writeback_metadata",
        "running",
        "writeback_rate_p_term_inverse",
        "sequential_cutoff",
        "writeback_percent",
        "writeback_rate_d_term",
        "readahead"
    ],
    "w": [
        "stop",
        "clear_stats",
        "attach",
        "detach"
    ]
}
```

Note:
- ‘r’ interfaces are read-only
- ‘w’ interfaces are write-only (e.g. actions)
- ‘rw’ are interfaces that can both be read or written

salt.modules.sysfs.read(key, root="")
Read from SysFS

Parameters key – file or path in SysFS; if key is a list then root will be prefixed on each key
Returns the full (tree of) SysFS attributes under key

**CLI example:**

```
salt '*' sysfs.read class/net/em1/statistics
```

```python
salt.modules.sysfs.target(key, full=True)
```

Return the basename of a SysFS key path

**Parameters**

- `key` – the location to resolve within SysFS
- `full` – full path instead of basename

**Returns** fullpath or basename of path

**CLI example:**

```
salt '*' sysfs.read class/ttyS0
```

```python
salt.modules.sysfs.write(key, value)
```

Write a SysFS attribute/action

**CLI example:**

```
salt '*' sysfs.write devices/system/cpu/cpu0/cpufreq/scaling_governor = 'performance'
```

## 21.9.415 salt.modules.syslog_ng

Module for getting information about syslog-ng

- **maintainer** Tibor Benke <btibi@sch.bme.hu>
- **maturity** new
- **depends** cmd
- **platform** all

This module is capable of managing syslog-ng instances which were installed via a package manager or from source. Users can use a directory as a parameter in the case of most functions, which contains the syslog-ng and syslog-ng-ctl binaries.

Syslog-ng can be installed via a package manager or from source. In the latter case, the syslog-ng and syslog-ng-ctl binaries are not available from the PATH, so users should set location of the sbin directory with `syslog_ng.set_binary_path`.

Similarly, users can specify the location of the configuration file with `syslog_ng.set_config_file`, then the module will use it. If it is not set, syslog-ng uses the default configuration file.

```python
class salt.modules.syslog_ng.Argument(value=``)
```

A TypedParameterValue has one or more Arguments. For example this can be the value of key_file.

Does not need examples.

```python
def build()```

```python
class salt.modules.syslog_ng.Buildable(iterable, join_body_on=",", append_extra_newline=True)
```

Base class of most classes, which have a build method.

It contains a common build function.

Does not need examples.
build()
Builds the textual representation of the whole configuration object with it’s children.

build_body()
Builds the body of a syslog-ng configuration object.

build_header()
Builds the header of a syslog-ng configuration object.

build_tail()
Builds the tail of a syslog-ng configuration object.

class salt.modules.syslog_ng.GivenStatement(value, add_newline=True)
This statement returns a string without modification. It can be used to use existing configuration snippets.
Does not need examples.

build()
Builds the textual representation of the whole configuration object with it’s children.

class salt.modules.syslog_ng.NamedStatement(type, id=", options=None)
It represents a configuration statement, which has a name, e.g. a source.
Does not need examples.

class salt.modules.syslog_ng.Option(type=", params=None)
A Statement class contains Option instances.
An instance of Option can represent a file(), tcp(), udp(), etc. option.
Does not need examples.

add_parameter(param)

build()
Builds the textual representation of the whole configuration object with it’s children.

class salt.modules.syslog_ng.Parameter(iterable=None, join_body_on=")
An Option has one or more Parameter instances.
Does not need examples.

class salt.modules.syslog_ng.ParameterValue(iterable=None, join_body_on=")
A TypedParameter can have one or more values.
Does not need examples.

class salt.modules.syslog_ng.SimpleParameter(value=")
A Parameter is a SimpleParameter, if it’s just a simple type, like a string.
For example:

```
destination d_file {
    file(
        '/var/log/messages'
    );
}
```

/var/log/messages is a SimpleParameter.
Does not need examples.

build()
Builds the textual representation of the whole configuration object with it’s children.
class salt.modules.syslog_ng.SimpleParameterValue(value=""")
A ParameterValue which holds a simple type, like a string or a number.

For example in ip(127.0.0.1) 127.0.0.1 is a SimpleParameterValue.

Does not need examples.

build()
Builds the textual representation of the whole configuration object with it’s children.

class salt.modules.syslog_ng.Statement(type, id="", options=None, has_name=True)
It represents a syslog-ng configuration statement, e.g. source, destination, filter.

Does not need examples.

add_child(option)

build_header()
Builds the header of a syslog-ng configuration object.

build_tail()
Builds the tail of a syslog-ng configuration object.

exception salt.modules.syslog_ng.SyslogNgError

class salt.modules.syslog_ng.TypedParameterValue(type="", arguments=None)
We have to go deeper...
A TypedParameter can have a 'parameter', which also have a type. For example key_file and cert_file:

destination d_tcp {
  tcp(
    ip(127.0.0.1)
  );
}

ip(127.0.0.1) is a TypedParameter.

Does not need examples.

add_value(value)

build()
Builds the textual representation of the whole configuration object with it’s children.

class salt.modules.syslog_ng.TypedParameter(type="", values=None)
A Parameter, which has a type:

source demo_tls_source {
  tcp(
    ip(0.0.0.0)
    port(1999)
    tls(
      key_file('/opt/syslog-ng/etc/syslog-ng/key.d/syslog-ng.key')
      cert_file('/opt/syslog-ng/etc/syslog-ng/cert.d/syslog-ng.cert')
    )
  );
}

Does not need examples.

add_argument(arg)
build()

Builds the textual representation of the whole configuration object with its children.

class salt.modules.syslog_ngUnnamedStatement(type, options=None)

It represents a configuration statement, which doesn’t have a name, e.g. a log path.

Does not need examples.

class salt.modules.syslog_ngconfig(name, config, write=True)

Builds syslog-ng configuration. This function is intended to be used from the state module, users should not use it directly!

name : the id of the Salt document or it is the format of <statement name>.id config : the parsed YAML code write : if True, it writes the config into the configuration file, otherwise just returns it

CLI Example:

```
salt '*' syslog_ng.config name='s_local' config="[{'tcp': [{'ip':'127.0.0.1'},{'port':1233}]}]
```

class salt.modules.syslog_ng.config_test(syslog_ng_sbin_dir=None, cfgfile=None)

Runs syntax check against cfgfile. If syslog_ng_sbin_dir is specified, it is added to the PATH during the test.

CLI Example:

```
salt '*' syslog_ng.config_test
salt '*' syslog_ng.config_test /home/user/install/syslog-ng/sbin
salt '*' syslog_ng.config_test /home/user/install/syslog-ng/sbin /etc/syslog-ng/
syslog-ng.conf
```

class salt.modules.syslog_ng.get_config_file()

Returns the configuration directory, which contains syslog-ng.conf.

CLI Example:

```
salt '*' syslog_ng.get_config_file
```

class salt.modules.syslog_ng.modules(syslog_ng_sbin_dir=None)

Returns the available modules. If syslog_ng_sbin_dir is specified, it is added to the PATH during the execution of the command syslog-ng.

CLI Example:

```
salt '*' syslog_ng.modules
salt '*' syslog_ng.modules /home/user/install/syslog-ng/sbin
```

class salt.modules.syslog_ng.reload_(name)

Reloads syslog-ng. This function is intended to be used from states.

If syslog_ng.set_config_file, is called before, this function will use the set binary path.

CLI Example:

```
salt '*' syslog_ng.reload
```

class salt.modules.syslog_ng.set_binary_path(name)

Sets the path, where the syslog-ng binary can be found. This function is intended to be used from states.

If syslog-ng is installed via a package manager, users don’t need to use this function.

CLI Example:
salt 'syslog_ng' set_binary_path name=/usr/sbin

```python
salt.modules.syslog_ng.set_config_file(name)
Sets the configuration’s name. This function is intended to be used from states.
CLI Example:
salt 'syslog_ng' set_config_file name=/etc/syslog-ng
```

```python
salt.modules.syslog_ng.set_parameters(version=None, binary_path=None, config_file=None, *
  args, **kwargs)
Sets variables.
CLI Example:
salt 'syslog_ng' set_parameters version='3.6'
salt 'syslog_ng' set_parameters binary_path=/home/user/install/syslog-ng/sbin
  config_file=/home/user/install/syslog-ng/etc/syslog-ng.conf
```

```python
salt.modules.syslog_ng.start(name=None, user=None, group=None, chroot=None, caps=None,
  no_caps=False, pidfile=None, enable_core=False, fd_limit=None,
  verbose=False, debug=False, trace=False, yydebug=False, persistence=None,
  control=None, worker_threads=None)
Ensures, that syslog-ng is started via the given parameters. This function is intended to be used from the state
module.
Users shouldn’t use this function, if the service module is available on their system. If syslog_ng.
  set_config_file, is called before, this function will use the set binary path.
CLI Example:
salt 'syslog_ng' start
```

```python
salt.modules.syslog_ng.stats(syslog_ng_sbin_dir=None)
Returns statistics from the running syslog-ng instance. If syslog_ng_sbin_dir is specified, it is added to the
PATH during the execution of the command syslog-ng-ctl.
CLI Example:
salt 'syslog_ng' stats
salt 'syslog_ng' stats /home/user/install/syslog-ng/sbin
```

```python
salt.modules.syslog_ng.stop(name=None)
Kills syslog-ng. This function is intended to be used from the state module.
Users shouldn’t use this function, if the service module is available on their system. If syslog_ng.
  set_config_file is called before, this function will use the set binary path.
CLI Example:
salt 'syslog_ng' stop
```

```python
salt.modules.syslog_ng.version(syslog_ng_sbin_dir=None)
Returns the version of the installed syslog-ng. If syslog_ng_sbin_dir is specified, it is added to the PATH during
the execution of the command syslog-ng.
CLI Example:
```
salt '*' syslog_ng.version
salt '*' syslog_ng.version /home/user/install/syslog-ng/sbin

salt.modules.syslog_ng.write_config(config, newlines=2)
  Writes the given parameter config into the config file. This function is intended to be used from states.
  
  If syslog_ng.set_config_file, is called before, this function will use the set config file.
  
  CLI Example:

  salt '*' syslog_ng.write_config config='# comment'

salt.modules.syslog_ng.write_version(name)
  Removes the previous configuration file, then creates a new one and writes the name line. This function is intended to be used from states.
  
  If syslog_ng.set_config_file, is called before, this function will use the set config file.
  
  CLI Example:

  salt '*' syslog_ng.write_version name='3.6'

21.9.416 salt.modules.sysmod

The sys module provides information about the available functions on the minion

salt.modules.sysmod.argspec(module="")
  Return the argument specification of functions in Salt execution modules.
  
  CLI Example:

  salt '*' sys.argspec pkg.install
  salt '*' sys.argspec sys
  salt '*' sys.argspec

  Module names can be specified as globs.
  
  New in version 2015.5.0.

  salt '*' sys.argspec 'pkg.*'

salt.modules.sysmod.doc('args')
  Return the docstrings for all modules. Optionally, specify a module or a function to narrow the selection.

  The strings are aggregated into a single document on the master for easy reading.

  Multiple modules/functions can be specified.

  CLI Example:

  salt '*' sys.doc
  salt '*' sys.doc sys
  salt '*' sys.doc sys.doc
  salt '*' sys.doc network.traceroute user.info

  Modules can be specified as globs.
  
  New in version 2015.5.0.
salt.modules.sysmod.list_functions(*args, **kwargs)

List the functions for all modules. Optionally, specify a module or modules from which to list.

CLI Example:

```
salt '*' sys.list_functions
salt '*' sys.list_functions sys
salt '*' sys.list_functions sys user
```

Function names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_functions 'sys.list_*'
```

New in version ?.

```
salt '*' sys.list_functions 'module.specific_function'
```

salt.modules.sysmod.list_modules(*args)

List the modules loaded on the minion

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.list_modules
```

Module names can be specified as globs.

```
salt '*' sys.list_modules 's*'
```

salt.modules.sysmod.list_renderers(*args)

List the renderers loaded on the minion

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.list_renderers
```

Render names can be specified as globs.

```
salt '*' sys.list_renderers 'yaml*'
```

salt.modules.sysmod.list_returner_functions(*args, **kwargs)

List the functions for all returner modules. Optionally, specify a returner module or modules from which to list.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_returner_functions
salt '*' sys.list_returner_functions mysql
salt '*' sys.list_returner_functions mysql etcd
```
Returner names can be specified as globs.

New in version 2015.5.0.

```python
salt '*' sys.list_returner_functions 'sqlite3.get_*'
```

**salt.modules.sysmod.list_returners(\*args)**
List the returners loaded on the minion

New in version 2014.7.0.

CLI Example:

```python
salt '*' sys.list_returners
```

Returner names can be specified as globs.

New in version 2015.5.0.

```python
salt '*' sys.list_returners 's*'
```

**salt.modules.sysmod.list_runner_functions(\*args, **kwargs)**
List the functions for all runner modules. Optionally, specify a runner module or modules from which to list.

New in version 2014.7.0.

CLI Example:

```python
salt '*' sys.list_runner_functions
salt '*' sys.list_runner_functions state
salt '*' sys.list_runner_functions state virt
```

Runner function names can be specified as globs.

New in version 2015.5.0.

```python
salt '*' sys.list_runner_functions 'state.*' 'virt.*'
```

**salt.modules.sysmod.list_runners(\*args)**
List the runners loaded on the minion

New in version 2014.7.0.

CLI Example:

```python
salt '*' sys.list_runners
```

Runner names can be specified as globs.

New in version 2015.5.0.

```python
salt '*' sys.list_runners 'm*'
```

**salt.modules.sysmod.list_state_functions(\*args, **kwargs)**
List the functions for all state modules. Optionally, specify a state module or modules from which to list.

New in version 2014.7.0.

CLI Example:
State function names can be specified as globs.
New in version 2015.5.0.

```
salt '*' sys.list_state_functions
salt '*' sys.list_state_functions file
salt '*' sys.list_state_functions pkg user
```

```
salt '*' sys.list_state_functions 'file.*'
salt '*' sys.list_state_functions 'file.s*'  
```

New in version ?.

```
salt '*' sys.list_state_functions 'module.specific_function'
```

```python
salt.modules.sysmod.list_state_modules(*args)
List the modules loaded on the minion
New in version 2014.7.0.
CLI Example:

```
salt '*' sys.list_state_modules
```

State module names can be specified as globs.
New in version 2015.5.0.

```
salt '*' sys.list_state_modules 'mysql_*'
```

```python
salt.modules.sysmod.reload_modules()
Tell the minion to reload the execution modules
CLI Example:

```
salt '*' sys.reload_modules
```

```python
salt.modules.sysmod.renderer_doc(*args)
Return the docstrings for all renderers. Optionally, specify a renderer or a function to narrow the selection.
The strings are aggregated into a single document on the master for easy reading.
Multiple renderers can be specified.
New in version 2015.5.0.
CLI Example:

```
salt '*' sys.renderer_doc
salt '*' sys.renderer_doc cheetah
salt '*' sys.renderer_doc jinja json
```

Renderer names can be specified as globs.

```
salt '*' sys.renderer_doc 'c*' 'j*'  
```

```python
salt.modules.sysmod.returner_argspec(module="")
Return the argument specification of functions in Salt returner modules.
New in version 2015.5.0.
CLI Example:
Returner names can be specified as globs.

```
salt 'sys.returner_argspec' 'xmpp'
salt 'sys.returner_argspec' 'xmpp smtp'
salt 'sys.returner_argspec'
```

:salt.modules.sysmod.returner_doc:`args`

Return the docstrings for all returners. Optionally, specify a returner or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple returners/functions can be specified.

New in version 2014.7.0.

CLI Example:

```
salt 'sys.returner_doc'
salt 'sys.returner_doc' 'sqlite3'
salt 'sys.returner_doc' 'sqlite3.get_fun'
salt 'sys.returner_doc' 'sqlite3.get_fun etcd.get_fun'
```

Returner names can be specified as globs.

New in version 2015.5.0.

```
salt 'sys.returner_doc' 'sqlite3.get_*'
```

:salt.modules.sysmod.runner_argspec:`module=`

Return the argument specification of functions in Salt runner modules.

New in version 2015.5.0.

CLI Example:

```
salt 'sys.runner_argspec state'
salt 'sys.runner_argspec http'
salt 'sys.runner_argspec'
```

Runner names can be specified as globs.

```
salt 'sys.runner_argspec' 'winrepo.*'
```

:salt.modules.sysmod.runner_doc:`args`

Return the docstrings for all runners. Optionally, specify a runner or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple runners/functions can be specified.

New in version 2014.7.0.

CLI Example:

```
salt 'sys.runner_doc'
salt 'sys.runner_doc' cache
salt 'sys.runner_doc' cache.grains
salt 'sys.runner_doc' cache.grains mine.get
```
Runner names can be specified as globs.

New in version 2015.5.0.

```bash
salt '*' sys.runner_doc 'cache.clear_*'
```

**salt.modules.sysmod.state_argspec(module=”)**

Return the argument specification of functions in Salt state modules.

New in version 2015.5.0.

CLI Example:

```bash
salt '*' sys.state_argspec pkg.installed
salt '*' sys.state_argspec file
salt '*' sys.state_argspec
```

State names can be specified as globs.

```bash
salt '*' sys.state_argspec 'pkg.*'
```

**salt.modules.sysmod.state_doc(**args)**

Return the docstrings for all states. Optionally, specify a state or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple states/functions can be specified.

New in version 2014.7.0.

CLI Example:

```bash
salt '*' sys.state_doc
salt '*' sys.state_doc service
salt '*' sys.state_doc service.running
salt '*' sys.state_doc service.running ipables.append
```

State names can be specified as globs.

New in version 2015.5.0.

```bash
salt '*' sys.state_doc 'service.*' 'iptables.*'
```

**salt.modules.sysmod.state_schema(module=”)**

Return a JSON Schema for the given state function(s)

New in version 2016.3.0.

CLI Example:

```bash
salt '*' sys.state_schema
salt '*' sys.state_schema pkg.installed
```

### 21.9.417 salt.modules.sysrc

**sysrc module for FreeBSD**

**salt.modules.sysrc.get(**kwargs)**

Return system rc configuration variables

CLI Example:
salt.modules.sysrc.get
includeDefaults=True

salt.modules.sysrc.remove(name, **kwargs)
Remove system rc configuration variables
CLI Example:
salt '*' sysrc.remove name=sshd_enable

salt.modules.sysrc.set_(name, value, **kwargs)
Set system rc configuration variables
CLI Example:
salt '*' sysrc.set name=sshd_flags value='-p 2222'

21.9.418 salt.modules.system
Support for reboot, shutdown, etc on POSIX-like systems.

Note: If you have configured a wrapper such as molly-guard to intercept interactive shutdown commands, be aware that calling system.halt, system.poweroff, system.reboot, and system.shutdown with salt-call will hang indefinitely while the wrapper script waits for user input. Calling them with salt will work as expected.
	salt.modules.system.get_computer_desc()
Get PRETTY_HOSTNAME value stored in /etc/machine-info If this file doesn’t exist or the variable doesn’t exist return False.
Returns Value of PRETTY_HOSTNAME if this does not exist False.
Return type str
CLI Example:
salt '*' system.get_computer_desc

salt.modules.system.get_computer_name()
Get hostname.
CLI Example:
salt '*' network.get_hostname

salt.modules.system.get_reboot_required_witnessed()
Determine if at any time during the current boot session the salt minion witnessed an event indicating that a reboot is required.
Returns True if the a reboot request was witnessed, False otherwise
Return type bool
CLI Example:
salt '*' system.get_reboot_required_witnessed

salt.modules.system.get_system_date(utc_offset=None)
Get the system date
Parameters utc_offset (str) – The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of
UTC use "+0000". Note: if being passed through the command line will need to be quoted twice to allow negative offsets.

**Returns** Returns the system date.

**Return type** str

CLI Example:

```bash
salt '*' system.get_system_date
```

### salt.modules.system.get_system_date_time(utc_offset=None)

Get the system date/time.

**Parameters**
- `utc_offset` *(str)* – The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use "+0000". Note: if being passed through the command line will need to be quoted twice to allow negative offsets.

**Returns** Returns the system time in YYYY-MM-DD hh:mm:ss format.

**Return type** str

CLI Example:

```bash
salt '*' system.get_system_date_time "+0500"
```

### salt.modules.system.get_system_time(utc_offset=None)

Get the system time.

**Parameters**
- `utc_offset` *(str)* – The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use "+0000". Note: if being passed through the command line will need to be quoted twice to allow negative offsets.

**Returns** Returns the system time in HH:MM:SS AM/PM format.

**Return type** str

CLI Example:

```bash
salt '*' system.get_system_time
```

### salt.modules.system.halt()

Halt a running system

CLI Example:

```bash
salt '*' system.halt
```

### salt.modules.system.has_settable_hwclock()

Returns True if the system has a hardware clock capable of being set from software.

CLI Example:

```bash
salt '*' system.has_settable_hwclock
```

### salt.modules.system.init(runlevel)

Change the system runlevel on sysV compatible systems

CLI Example:

```bash
salt '*' system.init 3
```

### salt.modules.system.poweroff()

Poweroff a running system

CLI Example:
salt '*' system.poweroff

salt.modules.system.reboot(at_time=None)
Reboot the system
at_time The wait time in minutes before the system will be rebooted.
CLI Example:
salt '*' system.reboot

salt.modules.system.set_computer_desc(desc)
Set PRETTY_HOSTNAME value stored in /etc/machine-info This will create the file if it does not exist. If it is unable to create or modify this file returns False.
Parameters desc (str) -- The computer description
Returns False on failure. True if successful.
CLI Example:
salt '*' system.set_computer_desc "Michael's laptop"

salt.modules.system.set_computer_name(hostname)
Modify hostname.
CLI Example:
salt '*' system.set_computer_name master.saltstack.com

salt.modules.system.set_reboot_required_witnessed()
This function is used to remember that an event indicating that a reboot is required was witnessed. This function writes to a temporary filesystem so the event gets cleared upon reboot.
Returns True if successful, otherwise False
Return type bool

salt.modules.system.set_system_date(newdate, utc_offset=None)
Set the system date. Use <mm-dd-yy> format for the date.
Parameters newdate (str) -- The date to set. Can be any of the following formats:
• YYYY-MM-DD
• MM-DD-YYYY
• MM-DD-YY
• MM/DD/YYYY
• MM/DD/YY
• YYYY/MM/DD

CLI Example:
salt '*' system.set_system_date '03-28-13'

salt.modules.system.set_system_date_time(years=None, months=None, days=None, hours=None, minutes=None, seconds=None, utc_offset=None)
Set the system date and time. Each argument is an element of the date, but not required. If an element is not passed, the current system value for that element will be used. For example, if you don’t pass the year, the current system year will be used. (Used by set_system_date and set_system_time)
Updates hardware clock, if present, in addition to software (kernel) clock.
Parameters
• years (int) -- Years digit, ie: 2015
- **months** (*int*) – Months digit: 1 - 12
- **days** (*int*) – Days digit: 1 - 31
- **hours** (*int*) – Hours digit: 0 - 23
- **minutes** (*int*) – Minutes digit: 0 - 59
- **seconds** (*int*) – Seconds digit: 0 - 59
- **utc_offset** (*str*) – The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use ”’+0000’”. Note: if being passed through the command line will need to be quoted twice to allow negative offsets.

**Returns** True if successful. Otherwise False.
**Return type** bool

**CLI Example:**
```
salt '*' system.set_system_date_time 2015 5 12 11 37 53 ''-0500''
```

`salt.modules.system.set_system_time(newtime, utc_offset=None)`
Set the system time.
**Parameters**
  
  Note that the salt command line parser parses the date/time before we obtain the argument (preventing us from doing utc) Therefore the argument must be passed in as a string. Meaning you may have to quote the text twice from the command line.
- **utc_offset** (*str*) – The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use ”’+0000’”. Note: if being passed through the command line will need to be quoted twice to allow negative offsets.

**Returns** Returns True if successful. Otherwise False.
**Return type** bool

**CLI Example:**
```
salt '*' system.set_system_time ''11:20''
```

`salt.modules.system.shutdown(at_time=None)`
Shutdown a running system
**at_time** The wait time in minutes before the system will be shutdown.

**CLI Example:**
```
salt '*' system.shutdown 5
```

### 21.9.419 `salt.modules.system_profiler`

**System Profiler Module**

Interface with macOS’s command-line System Profiler utility to get information about package receipts and installed applications.

New in version 2015.5.0.

`salt.modules.system_profiler.applications()`
Return the results of a call to `system_profiler -xml -detail full SPApplicationsDataType` as a dictionary. Top-level keys of the dictionary are the names of each set of install receipts, since there can be multiple receipts with the same name. Contents of each key are a list of dictionaries.
Note that this can take a long time depending on how many applications are installed on the target Mac.

CLI Example:
```
salt '*' systemprofiler.applications
```

```python
type
salt.modules.system_profiler.receipts()
```
Return the results of a call to `system_profiler -xml -detail full SPInstallHistoryDataType` as a dictionary. Top-level keys of the dictionary are the names of each set of install receipts, since there can be multiple receipts with the same name. Contents of each key are a list of dictionaries.

CLI Example:
```
salt '*' systemprofiler.receipts
```

### 21.9.420 salt.modules.systemd_service

Provides the service module for systemd

New in version 0.10.0.

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to "service.start" is not available), see here.

```python
name
salt.modules.systemd_service.available(name)
```
New in version 0.10.4.

Check that the given service is available taking into account template units.

CLI Example:
```
salt '*' service.available sshd
```

```python
name
no_block=False, **kwargs
```
```
type
salt.modules.systemd_service.disable(name, no_block=False, **kwargs)
```
Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, `systemd-run(1)` is now used to isolate commands run by this function from the salt-minion daemon’s control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Disable the named service to not start when the system boots

**no_block** [False] Set to True to start the service using --no-block.

CLI Example:
```
salt '*' service.disable <service name>
```

```python
name
```
```
type
salt.modules.systemd_service.disabled(name)
```
Return if the named service is disabled from starting on boot

CLI Example:
```
salt '*' service.disabled <service name>
```
salt.modules.systemd_service.enable(name, no_block=False, unmask=False, unmask_runtime=False, **kwargs)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the salt-minion daemon’s control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Enable the named service to start when the system boots

no_block [False] Set to True to start the service using --no-block.

New in version 2017.7.0.

unmask [False] Set to True to remove an indefinite mask before attempting to enable the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before enabling. This behavior is no longer the default.

unmask_runtime [False] Set to True to remove a runtime mask before attempting to enable the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before enabling. This behavior is no longer the default.

CLI Example:

```
salt '*' service.enable <service name>
```

salt.modules.systemd_service.enabled(name, **kwargs)

Return if the named service is enabled to start on boot

CLI Example:

```
salt '*' service.enabled <service name>
```

salt.modules.systemd_service.execs()?

New in version 2014.7.0.

Return a list of all files specified as ExecStart for all services.

CLI Example:

```
salt '*' service.excs
```

salt.modules.systemd_service.force_reload(name, no_block=True, unmask=False, unmask_runtime=False)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the salt-minion daemon’s control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

New in version 0.12.0.

Force-reload the specified service with systemd

no_block [False] Set to True to start the service using --no-block.

New in version 2017.7.0.

unmask [False] Set to True to remove an indefinite mask before attempting to force-reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before force-reloading. This behavior is no longer the default.

unmask_runtime [False] Set to True to remove a runtime mask before attempting to force-reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before force-reloading. This behavior is no longer the default.
CLI Example:
```bash
salt '*' service.force_reload <service name>
```

```
salt.modules.systemd_service.get_all()
```

Return a list of all available services

CLI Example:
```bash
salt '*' service.get_all
```

```
salt.modules.systemd_service.get_disabled()
```

Return a list of all disabled services

CLI Example:
```bash
salt '*' service.get_disabled
```

```
salt.modules.systemd_service.get_enabled()
```

Return a list of all enabled services

CLI Example:
```bash
salt '*' service.get_enabled
```

```
salt.modules.systemd_service.get_running()
```

Return a list of all running services, so far as systemd is concerned

CLI Example:
```bash
salt '*' service.get_running
```

```
salt.modules.systemd_service.get_static()
```

New in version 2015.8.5.

Return a list of all static services

CLI Example:
```bash
salt '*' service.get_static
```

```
salt.modules.systemd_service.mask(name, runtime=False)
```

New in version 2015.8.5.

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, `systemd-run(1)` is now used to isolate commands run by this function from the salt-minion daemon's control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a `config option` called `systemd.scope`, with a value of `False` (no quotes).

Mask the specified service with systemd

**runtime** [False] Set to `True` to mask this service only until the next reboot

New in version 2015.8.5.

CLI Example:
```bash
salt '*' service.mask foo
salt '*' service.mask foo runtime=True
```
salt.modules.systemd_service.masked(name, runtime=False)

New in version 2015.8.0.

Changed in version 2015.8.5: The return data for this function has changed. If the service is masked, the return value will now be the output of the systemctl is-enabled command (so that a persistent mask can be distinguished from a runtime mask). If the service is not masked, then False will be returned.

Changed in version 2017.7.0: This function now returns a boolean telling the user whether a mask specified by the new runtime argument is set. If runtime is False, this function will return True if an indefinite mask is set for the named service (otherwise False will be returned). If runtime is False, this function will return True if a runtime mask is set, otherwise False.

Check whether or not a service is masked
runtime [False] Set to True to check for a runtime mask

New in version 2017.7.0: In previous versions, this function would simply return the output of systemctl is-enabled when the service was found to be masked. However, since it is possible to both have both indefinite and runtime masks on a service simultaneously, this function now only checks for runtime masks if this argument is set to True. Otherwise, it will check for an indefinite mask.

CLI Examples:

```
salt '*' service.masked foo
salt '*' service.masked foo runtime=True
```

salt.modules.systemd_service.missing(name)

New in version 2014.1.0.

The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.

CLI Example:

```
salt '*' service.missing sshd
```

salt.modules.systemd_service.reload_(name, no_block=False, unmask=False, unmask_runtime=False)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the salt-minion daemon’s control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Reload the specified service with systemd
no_block [False] Set to True to reload the service using --no-block.

New in version 2017.7.0.

unmask [False] Set to True to remove an indefinite mask before attempting to reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before reloading. This behavior is no longer the default.

unmask_runtime [False] Set to True to remove a runtime mask before attempting to reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before reloading. This behavior is no longer the default.

CLI Example:

```
salt '*' service.reload <service name>
```
salt.modules.systemd_service.restart(name, no_block=False, unmask=False, unmask_runtime=False)

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the salt-minion daemon’s control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Restart the specified service with systemd

**no_block** [False] Set to True to start the service using --no-block.

    New in version 2017.7.0.

**unmask** [False] Set to True to remove an indefinite mask before attempting to restart the service.

    New in version 2017.7.0: In previous releases, Salt would simply unmask a service before restarting. This behavior is no longer the default.

**unmask_runtime** [False] Set to True to remove a runtime mask before attempting to restart the service.

    New in version 2017.7.0: In previous releases, Salt would simply unmask a service before restarting. This behavior is no longer the default.

**CLI Example:**

```
salt '*' service.restart <service name>
```

salt.modules.systemd_service.show(name)

New in version 2014.7.0.

Show properties of one or more units/jobs or the manager

**CLI Example:**

```
salt '*' service.show <service name>
```

salt.modules.systemd_service.start(name, no_block=False, unmask=False, unmask_runtime=False)

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the salt-minion daemon’s control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Start the specified service with systemd

**no_block** [False] Set to True to start the service using --no-block.

    New in version 2017.7.0.

**unmask** [False] Set to True to remove an indefinite mask before attempting to start the service.

    New in version 2017.7.0: In previous releases, Salt would simply unmask a service before starting. This behavior is no longer the default.

**unmask_runtime** [False] Set to True to remove a runtime mask before attempting to start the service.

    New in version 2017.7.0: In previous releases, Salt would simply unmask a service before starting. This behavior is no longer the default.

**CLI Example:**

```
salt '*' service.start <service name>
```

salt.modules.systemd_service.status(name, sig=None)

Return the status for a service via systemd. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)
Parameters

- **name** *(str)* – The name of the service to check
- **sig** *(str)* – Not implemented

Returns

True if running, False otherwise
dict: Maps service name to True if running, False otherwise

Return type: bool

CLI Example:
salt '*' service.status <service name> [service signature]

salt.modules.systemd_service.stop(name, no_block=False)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the salt-minion daemon’s control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Stop the specified service with systemd

no_block [False] Set to True to start the service using --no-block.

New in version 2017.7.0.

CLI Example:
salt '*' service.stop <service name>

salt.modules.systemd_service.systemctl_reload()

New in version 0.15.0.

Reloads systemctl, an action needed whenever unit files are updated.

CLI Example:
salt '*' service.systemctl_reload

salt.modules.systemd_service.unmask_(name, runtime=False)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the salt-minion daemon's control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Unmask the specified service with systemd

runtime [False] Set to True to unmask this service only until the next reboot

New in version 2017.7.0: In previous versions, this function would remove whichever mask was identified by running systemctl is-enabled on the service. However, since it is possible to both have both indefinite and runtime masks on a service simultaneously, this function now removes a runtime mask only when this argument is set to True, and otherwise removes an indefinite mask.

CLI Example:
salt '*' service.unmask foo
salt '*' service.unmask foo runtime=True

21.9.421 salt.modules.telegram

Module for sending messages via Telegram.
In order to send a message via the Telegram, certain configuration is required in /etc/salt/minion on the relevant minions or in the pillar. Some sample configs might look like:

```yaml
telegram.chat_id: '123456789'
telegram.token: '00000000:xxxxxxxxxxxxxxxxxxxxxxxxx'
```

```python
salt.modules.telegram.post_message(message, chat_id=None, token=None)
```

Send a message to a Telegram chat.

**Parameters**
- `message` - The message to send to the Telegram chat.
- `chat_id` - (optional) The Telegram chat id.
- `token` - (optional) The Telegram API token.

**Returns**
Boolean if message was sent successfully.

**CLI Example:**

```
salt '*' telegram.post_message message="Hello Telegram!"
```

---

### 21.9.422 salt.modules.telemetry

Connection module for Telemetry

New in version 2016.3.0.

https://github.com/mongolab/mongolab-telemetry-api-docs/blob/master/alerts.md

**configuration**

This module accepts explicit telemetry credentials or can also read api key credentials from a pillar. More Information available here.

In the minion’s config file:

```yaml
# telemetry.telemetry_api_keys:
- abc123    # Key 1
- efg321    # Backup Key 1
```

```yaml
# telemetry_api_base_url: https://telemetry-api.mongolab.com/v0
```

**depends**
requests

```python
salt.modules.telemetry.create_alarm(deployment_id, metric_name, data, api_key=None, profile='telemetry')
```

create a telemetry alarms.

data is a dict of alert configuration data.

Returns (bool success, str message) tuple.

**CLI Example:**

```
salt myminion telemetry.create_alarm rs-ds033197 {} profile=telemetry
```

```python
salt.modules.telemetry.delete_alarms(deployment_id, alert_id=None, metric_name=None, api_key=None, profile='telemetry')
```

delete an alert specified by alert_id or if not specified blows away all the alerts in the current deployment.

Returns (bool success, str message) tuple.

**CLI Example:**

```
salt myminion telemetry.delete_alarms rs-ds033197 profile=telemetry
```

```python
salt.modules.telemetry.get_alarms(deployment_id, profile='telemetry')
```

get all the alarms set up against the current deployment.

Returns dictionary of alarm information.

---
CLI Example:
```
salt myminion telemetry.get_alarms rs-ds033197 profile=telemetry
```

```python
salt.modules.telemetry.get_alert_config(deployment_id, metric_name=None, api_key=None, profile='telemetry')
```

Get all alert definitions associated with a given deployment or if metric_name is specified, obtain the specific alert config.

Returns dictionary or list of dictionaries.

CLI Example:
```
salt myminion telemetry.get_alert_config rs-ds033197 currentConnections profile=telemetry
salt myminion telemetry.get_alert_config rs-ds033197 profile=telemetry
```

```python
salt.modules.telemetry.get_notification_channel_id(notify_channel, profile='telemetry')
```

Given an email address, creates a notification-channels if one is not found and also returns the corresponding notification channel id.

- **notify_channel** Email escalation policy
- **profile** A dict of telemetry config information.

CLI Example:
```
salt myminion telemetry.get_notification_channel_id userx@company.com profile=telemetry
```

```python
salt.modules.telemetry.update_alarm(deployment_id, metric_name, data, api_key=None, profile='telemetry')
```

update an telemetry alarms. data is a dict of alert configuration data.

Returns (bool success, str message) tuple.

CLI Example:
```
salt myminion telemetry.update_alarm rs-ds033197 {} profile=telemetry
```

21.9.423 **salt.modules.temp**

Simple module for creating temporary directories and files

This is a thin wrapper around Python's tempfile module

New in version 2015.8.0.

```python
salt.modules.temp.dir(suffix='", prefix='tmp', parent=None)
```

Create a temporary directory

CLI Example:
```
salt '*' temp.dir
salt '*' temp.dir prefix='mytemp-' parent="/var/run/"
```

```python
salt.modules.temp.file(suffix='", prefix='tmp', parent=None)
```

Create a temporary file

CLI Example:
```
salt '*' temp.file
salt '*' temp.file prefix='mytemp-' parent="/var/run/"
```

21.9.424 **salt.modules.test**

Module for running arbitrary tests
salt.modules.test.arg(*args, **kwargs)
Print out the data passed into the function *args and `kwargs, this is used to both test the publication data
and cli argument passing, but also to display the information available within the publication data. Returns
{"args": args, "kwargs": kwargs}.
CLI Example:
salt '*' test.arg 1 "two" 3.1 txt="hello" wow='a: 1, b: "hello"'}

salt.modules.test.arg_clean(*args, **kwargs)
Like test.arg but cleans kwargs of the __pub* items CLI Example:
salt '*' test.arg_clean 1 "two" 3.1 txt="hello" wow='a: 1, b: "hello"'}

salt.modules.test.arg_repr(*args, **kwargs)
Print out the data passed into the function *args and `kwargs, this is used to both test the publication data
and cli argument passing, but also to display the information available within the publication data. Returns
{"args": repr(args), "kwargs": repr(kwargs)}.
CLI Example:
salt '*' test.arg_repr 1 "two" 3.1 txt="hello" wow='a: 1, b: "hello"'}

salt.modules.test.arg_type(*args, **kwargs)
Print out the types of the args and kwargs. This is used to test the types of the args and kwargs passed down
to the minion
CLI Example:
salt '*' test.arg_type 1 'int'

salt.modules.test.assertion(assertion)
Assert the given argument
CLI Example:
salt '*' test.assertion False

salt.modules.test.attr_call()
Call grains.items via the attribute
CLI Example:
salt '*' test.attr_call

salt.modules.test.collatz(start)
Execute the collatz conjecture from the passed starting number, returns the sequence and the time it took to compute. Used for performance tests.
CLI Example:
salt '*' test.collatz 3

salt.modules.test.conf_test()
Return the value for test.foo in the minion configuration file, or return the default value
CLI Example:
salt '*' test.conf_test

salt.modules.test.cross_test(func, args=None)
Execute a minion function via the __salt__ object in the test module, used to verify that the minion functions can be called via the __salt__ module.

CLI Example:
    salt '*' test.cross_test file.gid_to_group 0

salt.modules.test.echo(text)
Return a string - used for testing the connection

CLI Example:
    salt '*' test.echo 'foo bar baz quo qux'

salt.modules.test.exception(message='Test Exception')
Raise an exception

Optionally provide an error message or output the full stack.

CLI Example:
    salt '*' test.exception 'Oh noes!'  

salt.modules.test.false_()
Always return False

CLI Example:
    salt '*' test.false

salt.modules.test.fib(num)
Return the num-th Fibonacci number, and the time it took to compute in seconds. Used for performance tests.

This function is designed to have terrible performance.

CLI Example:
    salt '*' test.fib 3

salt.modules.test.get_opts()
Return the configuration options passed to this minion

CLI Example:
    salt '*' test.get_opts

salt.modules.test.kwarg(**kwargs)
Print out the data passed into the function **kwargs, this is used to both test the publication data and cli kwarg passing, but also to display the information available within the publication data.

CLI Example:
    salt '*' test.kwarg num=1 txt="two" env='\{a: 1, b: "hello"\}'

salt.modules.test.missing_func()
salt.modules.test.module_report()
Return a dict containing all of the execution modules with a report on the overall availability via different references

CLI Example:
```
salt '*' test.module_report
```

salt.modules.test.not_loaded()
List the modules that were not loaded by the salt loader system

CLI Example:
```
salt '*' test.not_loaded
```

salt.modules.test.opts_pkg()
Return an opts package with the grains and opts for this minion. This is primarily used to create the options used for master side state compiling routines

CLI Example:
```
salt '*' test.opts_pkg
```

salt.modules.test.outputter(data)
Test the outputter, pass in data to return

CLI Example:
```
salt '*' test.outputter foobar
```

salt.modules.test.ping()
Used to make sure the minion is up and responding. Not an ICMP ping.

Returns True.

CLI Example:
```
salt '*' test.ping
```

salt.modules.test.provider(module)
Pass in a function name to discover what provider is being used

CLI Example:
```
salt '*' test.provider service
```

salt.modules.test.providers()
Return a dict of the provider names and the files that provided them

CLI Example:
```
salt '*' test.providers
```

salt.modules.test.raise_exception(name, *args, **kwargs)
Raise an exception. Built-in exceptions and those in salt.exceptions can be raised by this test function. If no matching exception is found, then no exception will be raised and this function will return False.

This function is designed to test Salt’s exception and return code handling.

CLI Example:
salt 'x' test.raise_exception TypeError "An integer is required"
salt 'x' test.raise_exception salt.exceptions.CommandExecutionError "Something went wrong"

salt.modules.test.rand_sleep(max=60)
Sleep for a random number of seconds, used to test long-running commands and minions returning at differing intervals

CLI Example:
salt 'x' test.rand_sleep 60

salt.modules.test.random_hash(size=9999999999, hash_type=None)
New in version 2015.5.2.
Changed in version 2018.3.0: Function has been renamed from test.rand_str to test.random_hash
Generates a random number between 1 and size, then returns a hash of that number. If no hash_type is passed, the hash_type specified by the minion’s hash_type config option is used.

CLI Example:
salt 'x' test.random_hash
salt 'x' test.random_hash hash_type=sha512

salt.modules.test.retcodencode=42)
Test that the returncode system is functioning correctly

CLI Example:
salt 'x' test.retcodencode 42

salt.modules.test.sleep(length)
Instruct the minion to initiate a process that will sleep for a given period of time.

CLI Example:
salt 'x' test.sleep 20

salt.modules.test.stack()
Return the current stack trace

CLI Example:
salt 'x' test.stack

salt.modules.test.true_()
Always return True

CLI Example:
salt 'x' test.true

salt.modules.test.try_(module, return_try_exception=False, **kwargs)
Try to run a module command. On an exception return None. If return_try_exception is set True return the exception. This can be helpful in templates where running a module might fail as expected.

CLI Example:
<pre>
{% for i in range(0,230) %}
    {{ salt['test.try'](module='ipmi.get_users', bmc_host='172.2.2.'+i) | yaml(False) }}
{% endfor %}
</pre>

salt.modules.test.tty('args', **kwargs)
  Deprecated! Moved to cmdmod.

    CLI Example:

    salt '*' test.tty tty0 'This is a test'
    salt '*' test.tty pts3 'This is a test'

salt.modules.test.version()
  Return the version of salt on the minion

    CLI Example:

    salt '*' test.version

salt.modules.test.versions()
  This function is an alias of versions_report.
  Returns versions of components used by salt

    CLI Example:

    salt '*' test.versions_report

salt.modules.test.versions_information()
  Report the versions of dependent and system software

    CLI Example:

    salt '*' test.versions_information

salt.modules.test.versions_report()
  Returns versions of components used by salt

    CLI Example:

    salt '*' test.versions_report

21.9.425 salt.modules.testinframod module

This module exposes the functionality of the TestInfra library for use with SaltStack in order to verify the state of your minions. In order to allow for the addition of new resource types in TestInfra this module dynamically generates wrappers for the various resources by iterating over the values in the __all__ variable exposed by the testinfra.modules namespace.

21.9.426 salt.modules.test_virtual

Module for running arbitrary tests with a __virtual__ function

salt.modules.test_virtual.ping()
**21.9.427 salt.modules.textfsm_mod module**

**TextFSM**

New in version 2018.3.0.

Execution module that processes plain text and extracts data using TextFSM templates. The output is presented in JSON serializable data, and can be easily re-used in other modules, or directly inside the renderer (Jinja, Mako, Genshi, etc).

**depends**

- textfsm Python library

---

**Note:** For Python 2/3 compatibility, it is more recommended to install the jtextfsm library: pip install jtextfsm.

---

```
salt.modules.textfsm_mod.extract(template_path, raw_text=None, raw_text_file=None, saltenv='base')
```

Extracts the data entities from the unstructured raw text sent as input and returns the data mapping, processing using the TextFSM template.

**template_path** The path to the TextFSM template. This can be specified using the absolute path to the file, or using one of the following URL schemes:

- `salt://`, to fetch the template from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

**raw_text**: `None` The unstructured text to be parsed.

**raw_text_file**: `None` Text file to read, having the raw text to be parsed using the TextFSM template. Supports the same URL schemes as the `template_path` argument.

**saltenv**: `base` Salt fileserver environment from which to retrieve the file. Ignored if `template_path` is not a `salt://` URL.

**CLI Example:**

```
salt '*' textfsm.extract salt://textfsm/juniper_version_template raw_text_
   ->file=s3://junos_ver.txt
salt '*' textfsm.extract http://some-server/textfsm/juniper_version_template raw_
   ->text='Hostname: router.abc ... snip ...'
```

**Jinja template example:**

```
{% set raw_text = 'Hostname: router.abc ... snip ...' -%}
{% set textfsm_extract = salt.textfsm.extract('https://some-server/textfsm/
    ->juniper_version_template', raw_text) -%}
```

**Raw text example:**

```
Hostname: router.abc
Model: mx960
JUNOS Base OS boot [9.1S3.5]
JUNOS Base OS Software Suite [9.1S3.5]
JUNOS Kernel Software Suite [9.1S3.5]
JUNOS Crypto Software Suite [9.1S3.5]
JUNOS Packet Forwarding Engine Support (M/T Common) [9.1S3.5]
```

(continues on next page)
JUNOS Packet Forwarding Engine Support (MX Common) [9.1S3.5]  
JUNOS Online Documentation [9.1S3.5]  
JUNOS Routing Software Suite [9.1S3.5]

TextFSM Example:

```
Value Chassis (\S+)
Value Required Model (\S+)
Value Boot (.*)
Value Base (.*)
Value Kernel (.*)
Value Crypto (.*)
Value Documentation (.*)
Value Routing (.*)
```

Start

```
# Support multiple chassis systems.
^\S+:$$ -> Continue.Record
^${Chassis}:$$
^Model: ${Model}
^JUNOS Base OS boot \[${Boot}\]
^JUNOS Software Release \[${Base}\]
^JUNOS Base OS Software Suite \[${Base}\]
^JUNOS Kernel Software Suite \[${Kernel}\]
^JUNOS Crypto Software Suite \[${Crypto}\]
^JUNOS Online Documentation \[${Documentation}\]
^JUNOS Routing Software Suite \[${Routing}\]
```

Output example:

```
{
    "comment": "",
    "result": true,
    "out": [
        {
            "kernel": "9.1S3.5",
            "documentation": "9.1S3.5",
            "boot": "9.1S3.5",
            "crypto": "9.1S3.5",
            "chassis": "",
            "routing": "9.1S3.5",
            "base": "9.1S3.5",
            "model": "mx960"
        }
    ]
}
```

Dynamically identify the template required to extract the information from the unstructured raw text.

The output has the same structure as the extract execution function, the difference being that index is capable to identify what template to use, based on the platform details and the command.

**command** The command executed on the device, to get the output.

**platform** The platform name, as defined in the TextFSM index file.
**platform_grain_name**  The name of the grain used to identify the platform name in the TextFSM index file.

**platform_column_name**: Platform  The column name used to identify the platform, exactly as specified in the TextFSM index file. Default: Platform.

**output**  The raw output from the device, to be parsed and extract the structured data.

**output_file**  The path to a file that contains the raw output from the device, used to extract the structured data. This option supports the usual Salt-specific schemes: file://, salt://, http://, https://, ftp://, s3://, swift://.

**textfsm_path**  The path where the TextFSM templates can be found. This can be either absolute path on the server, either specified using the following URL schemes: file://, salt://, http://, https://, ftp://, s3://, swift://.

**index_file**: index  The name of the TextFSM index file, under the textfsm_path. Default: index.

**saltenv**: base  Salt fileserver environment from which to retrieve the file. Ignored if textfsm_path is not a salt:// URL.

**include_empty**: False  Include empty files under the textfsm_path.

**include_pat**  Glob or regex to narrow down the files cached from the given path. If matching with a regex, the regex must be prefixed with E@, otherwise the expression will be interpreted as a glob.

**exclude_pat**  Glob or regex to exclude certain files from being cached from the given path. If matching with a regex, the regex must be prefixed with E@, otherwise the expression will be interpreted as a glob.

**Note**: For ease of use, it is recommended to define the TextFSM indexfile with values that can be matches using the grains.

**Note**: This option can be also specified in the minion configuration file or pillar as textfsm_platform_grain.

**Note**: This option is ignored when platform is specified.

**Note**: This option can be also specified in the minion configuration file or pillar as textfsm_platform_column_name.

**Note**: This option can be also specified in the minion configuration file or pillar as textfsm_index_file.

**Note**: This needs to be a directory with a flat structure, having an index file (whose name can be specified using the index_file option) and a number of TextFSM templates.

**Note**: This option can be also specified in the minion configuration file or pillar as textfsm_path.

**Note**: This option can be also specified in the minion configuration file or pillar as textfsm_index_file.

**include_empty**: False  Include empty files under the textfsm_path.

**include_pat**  Glob or regex to narrow down the files cached from the given path. If matching with a regex, the regex must be prefixed with E@, otherwise the expression will be interpreted as a glob.

**exclude_pat**  Glob or regex to exclude certain files from being cached from the given path. If matching with a regex, the regex must be prefixed with E@, otherwise the expression will be interpreted as a glob.

**Note**: If used with include_pat, files matching this pattern will be excluded from the subset of files.
defined by include_pat.

CLI Example:

```
salt '*' textfsm.index 'sh ver' platform=Juniper output_file=salt://textfsm/
  --juniper_version_example textfsm_path=salt://textfsm/
salt '*' textfsm.index 'sh ver' output_file=salt://textfsm/juniper_version_example
  --example textfsm_path=ftp://textfsm/ platform_column_name=Vendor
salt '*' textfsm.index 'sh ver' output_file=salt://textfsm/juniper_version_example
  --example textfsm_path=https://some-server/textfsm/ platform_column_name=Vendor
  --platform_grain_name=vendor
```

TextFSM index file example:

```
salt://textfsm/index
```

```
Template, Hostname, Vendor, Command
juniper_version_template, .*, Juniper, sh[\[ow\]] ve[\[rsion\]]
```

The usage can be simplified, by defining (some of) the following options: textfsm_platform_grain, textfsm_path, textfsm_platform_column_name, or textfsm_index_file, in the (proxy) minion configuration file or pillar.

Configuration example:

```
textfsm_platform_grain: vendor
textfsm_path: salt://textfsm/
textfsm_platform_column_name: Vendor
```

And the CLI usage becomes as simple as:

```
salt '*' textfsm.index 'sh ver' output_file=salt://textfsm/juniper_version_example
```

Usage inside a Jinja template:

```
{% set command = 'sh ver' %}
{% set output = salt.net.cli(command) %}
{% set textfsm_extract = salt.textfsm.index(command, output=output) %}
```

21.9.428 salt.modules.timezone

Module for managing timezone on POSIX-like systems.

salt.modules.timezone.get_hwclock()

Get current hardware clock setting (UTC or localtime)

CLI Example:

```
salt '*' timezone.get_hwclock
```

salt.modules.timezone.get_offset()

Get current numeric timezone offset from UCT (i.e. -0700)

CLI Example:

```
salt '*' timezone.get_offset
```
salt.modules.timezone.get_zone()  
Get current timezone (i.e. America/Denver)  
Changed in version 2016.11.4.

**Note:** On AIX operating systems, Posix values can also be returned 'CST6CDT,M3.2.0/2:00:00,M11.1.0/2:00:00'

CLI Example:
```
salt '*' timezone.get_zone
```

salt.modules.timezone.get_zonecode()  
Get current timezone (i.e. PST, MDT, etc)  
CLI Example:
```
salt '*' timezone.get_zonecode
```

salt.modules.timezone.set_hwclock(clock)  
Sets the hardware clock to be either UTC or localtime  
CLI Example:
```
salt '*' timezone.set_hwclock UTC
```

salt.modules.timezone.set_zone(timezone)  
Unlinks, then symlinks /etc/localtime to the set timezone.  
The timezone is crucial to several system processes, each of which SHOULD be restarted (for instance, whatever you system uses as its cron and syslog daemons). This will not be automagically done and must be done manually!  
CLI Example:
```
salt '*' timezone.set_zone 'America/Denver'
```

Changed in version 2016.11.4.

**Note:** On AIX operating systems, Posix values are also allowed, see below
```
salt '*' timezone.set_zone 'CST6CDT,M3.2.0/2:00:00,M11.1.0/2:00:00'
```

salt.modules.timezone.zone_compare(timezone)  
Compares the given timezone name with the system timezone name. Checks the hash sum between the given timezone, and the one set in /etc/localtime. Returns True if names and hash sums match, and False if not. Mostly useful for running state checks.  
Changed in version 2016.3.0.

**Note:** On Solaris-link operating systems only a string comparison is done.

Changed in version 2016.11.4.

**Note:** On AIX operating systems only a string comparison is done.
CLI Example:
salt '*' timezone.zone_compare 'America/Denver'

21.9.429 salt.modules.tls

A salt module for SSL/TLS. Can create a Certificate Authority (CA) or use Self-Signed certificates.

**depends** PyOpenSSL Python module (0.10 or later, 0.14 or later for X509 extension support)

**configuration** Add the following values in /etc/salt/minion for the CA module to function properly:

```
ca.cert_base_path: '/etc/pki'
```

CLI Example #1: Creating a CA, a server request and its signed certificate:

```
# salt-call tls.create_ca my_little \
  days=5 \ 
  CN='My Little CA' \ 
  C=US \ 
  ST=Utah \ 
  L=Salt Lake City \ 
  O=Saltstack \ 
  emailAddress=pleasedontemail@example.com

Created Private Key: "/etc/pki/my_little/my_little_ca_cert.key"
Created CA "my_little_ca": "/etc/pki/my_little_ca/my_little_ca_cert.crt"
```

```
# salt-call tls.create_csr my_little CN=www.example.com

Created Private Key: "/etc/pki/my_little/certs/www.example.com.key"
Created CSR for "www.example.com": "/etc/pki/my_little/certs/www.example.com.csr"
```

```
# salt-call tls.create_ca_signed_cert my_little CN=www.example.com

Created Certificate for "www.example.com": "/etc/pki/my_little/certs/www.example.com.crt"
```

CLI Example #2: Creating a client request and its signed certificate

```
# salt-call tls.create_csr my_little CN=DBReplica_No.1 cert_type=client

Created Private Key: "/etc/pki/my_little/certs//DBReplica_No.1.key."
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.1.csr."
```

```
# salt-call tls.create_ca_signed_cert my_little CN=DBReplica_No.1

Created Certificate for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.1.crt">
```

CLI Example #3: Creating both a server and client req + cert for the same CN

```
# salt-call tls.create_csr my_little CN=MasterDBReplica_No.2 \ 
  cert_type=client

Created Private Key: "/etc/pki/my_little/certs/MasterDBReplica_No.2.key."
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/MasterDBReplica_No.2.csr."
```

```
# salt-call tls.create_ca_signed_cert my_little CN=MasterDBReplica_No.2

Created Certificate for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.1.crt">
```

(continues on next page)
# salt-call tls.create_csr my_little CN=MasterDBReplica_No.2 cert_type=server
Certificate "MasterDBReplica_No.2" already exists
(doh!)

# salt-call tls.create_csr my_little CN=MasterDBReplica_No.2 cert_type=server type_ext=True
Created Private Key: "/etc/pki/my_little/certs/DBReplica_No.1_client.key."  
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.1_client.csr." 

# salt-call tls.create_ca_signed_cert my_little CN=MasterDBReplica_No.2
Certificate "MasterDBReplica_No.2" already exists
(DOH!)

# salt-call tls.create_ca_signed_cert my_little CN=MasterDBReplica_No.2 cert_type=server type_ext=True
Created Certificate for "MasterDBReplica_No.2": "/etc/pki/my_little/certs/MasterDBReplica_No.2_server.crt"

CLI Example #4: Create a server req + cert with non-CN filename for the cert

# salt-call tls.create_csr my_little CN=www.anothersometh.ing cert_type=server type_ext=True
Created Private Key: "/etc/pki/my_little/certs/www.anothersometh.ing_server.key."  
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/www.anothersometh.ing_server.csr." 

# salt-call tls.create_ca_signed_cert my_little CN=www.anothersometh.ing cert_type=server cert_filename="something_completely_different"
Created Certificate for "www.anothersometh.ing": /etc/pki/my_little/certs/something_completely_different.crt

```python
salt.modules.tls.ca_exists(ca_name, cacert_path=None, ca_filename=None)
```
Verify whether a Certificate Authority (CA) already exists
- ca_name name of the CA
- cacert_path absolute path to ca certificates root directory
- ca_filename alternative filename for the CA

New in version 2015.5.3.

CLI Example:

```python
salt '*' tls.ca_exists test_ca /etc/certs
```

```python
salt.modules.tls.cert_base_path(cacert_path=None)
```
Return the base path for certs from CLI or from options
- cacert_path absolute path to ca certificates root directory

CLI Example:

```python
salt '*' tls.cert_base_path
```

```python
salt.modules.tls.cert_info(cert, digest='sha256')
```
Return information for a particular certificate
- cert path to the certificate PEM file or string

21.9. execution modules 2555
Changed in version 2018.3.4.

digest what digest to use for fingerprinting

CLI Example:

```
salt '*' tls.cert_info /dir/for/certs/cert.pem
```

```
salt.modules.tls.create_ca(ca_name, bits=2048, days=365, CN='localhost', C='US', ST='Utah', L='Salt Lake City', O='SaltStack', OU=None, emailAddress=None, fix-mode=False, cacert_path=None, ca_filename=None, digest='sha256', onlyif=None, unless=None, replace=False)
```

Create a Certificate Authority (CA)

da name of the CA

days number of days the CA will be valid, default is 365

CN common name in the request, default is "localhost"

ST state, default is "Utah"

L locality, default is "Centerville", the city where SaltStack originated

O organization, default is "SaltStack"

OU organizational unit, default is None

emailAddress email address for the CA owner, default is None

ca_filename alternative filename for the CA

New in version 2015.5.3.

digest The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by EVP_get_digestbyname, specifically). For example, "md5" or "sha1". Default: 'sha256'

replace Replace this certificate even if it exists

New in version 2015.5.1.

Writes out a CA certificate based upon defined config values. If the file already exists, the function just returns assuming the CA certificate already exists.

If the following values were set:

```
ca.cert_base_path=’/etc/pki’
ca_name=’koji’
```

the resulting CA, and corresponding key, would be written in the following location:

```
/etc/pki/koji/koji_ca_cert.crt
/etc/pki/koji/koji_ca_cert.key
```

CLI Example:

```
salt '*' tls.create_ca test_ca
```

```
salt.modules.tls.create_ca_signed_cert(ca_name, CN, days=365, cacert_path=None, ca_filename=None, cert_path=None, cert_filename=None, digest='sha256', cert_type=None, type_ext=False, replace=False)
```

Create a Certificate (CERT) signed by a named Certificate Authority (CA)

If the certificate file already exists, the function just returns assuming the CERT already exists.

The CN must match an existing CSR generated by create_csr. If it does not, this method does nothing.

cert_path name of the CA

cert_filename common name matching the certificate signing request
**days**  number of days certificate is valid, default is 365 (1 year)

**cacert_path** absolute path to ca certificates root directory

**ca_filename** alternative filename for the CA

New in version 2015.5.3.

**cert_path** full path to the certificates directory

**cert_filename** alternative filename for the certificate, useful when using special characters in the CN. If this option is set it will override the certificate filename output effects of **cert_type**, **type_ext** will be completely overridden.

New in version 2015.5.3.

**digest** The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by EVP_get_digestbyname, specifically). For example, "md5" or "sha1". Default: 'sha256'

**replace** Replace this certificate even if it exists

New in version 2015.5.1.

**cert_type** string. Either 'server' or 'client' (see create_csr() for details).

If create_csr(type_ext=True) this function must be called with the same cert_type so it can find the CSR file.

**Note:** create_csr() defaults to cert_type='server'; therefore, if it was also called with type_ext, cert_type becomes a required argument for create_ca_signed_cert()

**type_ext** bool. If set True, use **cert_type** as an extension to the CN when formatting the filename.

  e.g.: some_subject_CN_server.crt or some_subject_CN_client.crt

This facilitates the context where both types are required for the same subject

If **cert_filename** is **not None**, setting **type_ext** has no effect

If the following values were set:

```python
c.a.cert_base_path='/etc/pki'
c.a_name='koji'
CN='test.egavas.org'
```

the resulting signed certificate would be written in the following location:

```
/etc/pki/koji/certs/test.egavas.org.crt
```

**CLI Example:**

```
salt '*' tls.create_ca_signed_cert test localhost
```

salt.modules.tls.create_csr(ca_name, bits=2048, CN='localhost', C='US', ST='Utah', L='Salt Lake City', O='SaltStack', OU=None, emailAddress=None, subjectAltName=None, cacert_path=None, ca_filename=None, csr_path=None, csr_filename=None, digest='sha256', type_ext=False, cert_type='server', replace=False)

Create a Certificate Signing Request (CSR) for a particular Certificate Authority (CA)

**ca_name** name of the CA

**bits** number of RSA key bits, default is 2048

**CN** common name in the request, default is "localhost"

**C** country, default is "US"

**ST** state, default is "Utah"

**L** locality, default is "Centerville", the city where SaltStack originated

**O** organization, default is "SaltStack"  NOTE: Must the same as CA certificate or an error will be raised
OU organizational unit, default is None
emailAddress email address for the request, default is None
subjectAltName valid subjectAltNames in full form, e.g. to add DNS entry you would call this function with this value:
  examples: ['DNS:somednsname.com', 'DNS:1.2.3.4', 'IP:1.2.3.4', 'IP:2001:4801:7821:77:be76:4eff:fe11:e51', 'email:me@i.like.pie.com']

Note: some libraries do not properly query IP: prefixes, instead looking for the given req. source with a DNS: prefix. To be thorough, you may want to include both DNS: and IP: entries if you are using subjectAltNames for destinations for your TLS connections. e.g: requests to https://1.2.3.4 will fail from python’s requests library w/out the second entry in the above list

New in version 2015.8.0.
cert_type Specify the general certificate type. Can be either server or client. Indicates the set of common extensions added to the CSR.

```
server: {
    'basicConstraints': 'CA:FALSE',
    'extendedKeyUsage': 'serverAuth',
    'keyUsage': 'digitalSignature, keyEncipherment'
}

client: {
    'basicConstraints': 'CA:FALSE',
    'extendedKeyUsage': 'clientAuth',
    'keyUsage': 'nonRepudiation, digitalSignature, keyEncipherment'
}
```

type_ext boolean. Whether or not to extend the filename with CN_[cert_type] This can be useful if a server and client certificate are needed for the same CN. Defaults to False to avoid introducing an unexpected file naming pattern

The files normally named some_subject_CN.csr and some_subject_CN.key will then be saved
replace Replace this signing request even if it exists

New in version 2015.5.1.
Writes out a Certificate Signing Request (CSR) If the file already exists, the function just returns assuming the CSR already exists.

If the following values were set:

```
ca.cert_base_path='/etc/pki'
cia_name='koji'
CN='test.egavas.org'
```

the resulting CSR, and corresponding key, would be written in the following location:

```
/etc/pki/koji/certs/test.egavas.org.csr
/etc/pki/koji/certs/test.egavas.org.key
```

CLI Example:

```
salt '*' tls.create_csr test
```

salt.modules.tls.create_empty_crl(ca_name, cacert_path=None, ca_filename=None, crl_file=None)

Create an empty Certificate Revocation List.
New in version 2015.8.0.
ca_name  name of the CA
cacert_path  absolute path to ca certificates root directory
c_filename  alternative filename for the CA

New in version 2015.5.3.
crl_file  full path to the CRL file

CLI Example:

```
salt '*' tls.create_empty_crl ca_name='koji' ca_filename='ca'
crl_file='/etc/openvpn/team1/crl.pem'
```

salt.modules.tls.create_pkcs12(ca_name, CN, passphrase=", cacert_path=None, replace=False)
Create a PKCS#12 browser certificate for a particular Certificate (CN)
ca_name  name of the CA
CN  common name matching the certificate signing request
passphrase  used to unlock the PKCS#12 certificate when loaded into the browser
cacert_path  absolute path to ca certificates root directory
replace  Replace this certificate even if it exists

New in version 2015.5.1.
If the following values were set:

```
c.a.cert_base_path='/etc/pki'
cia_name='koji'
CN='test.egavas.org'
```

the resulting signed certificate would be written in the following location:

```
/etc/pki/koji/certs/test.egavas.org.p12
```

CLI Example:

```
salt '*' tls.create_pkcs12 test localhost
```

salt.modules.tls.create_self_signed_cert(tls_dir='tls', bits=2048, days=365, CN='localhost', C='US', ST='Utah', L='Salt Lake City', O='SaltStack', OU=None, emailAddress=None, cacert_path=None, cert_filename=None, digest='sha256', replace=False)
Create a Self-Signed Certificate (CERT)
tls_dir  location appended to the ca.cert_base_path, default is 'tls'
bits  number of RSA key bits, default is 2048
CN  common name in the request, default is "localhost"
C  country, default is "US"
ST  state, default is "Utah"
L  locality, default is "Centerville", the city where SaltStack originated
O  organization, default is "SaltStack" NOTE: Must the same as CA certificate or an error will be raised
OU  organizational unit, default is None
eMailAddress  email address for the request, default is None
cacert_path  absolute path to ca certificates root directory
digest  The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL
(reby EVP_get_digestbyname, specifically). For example, "md5" or "sha1". Default: 'sha256'
replace  Replace this certificate even if it exists

New in version 2015.5.1.
Writes out a Self-Signed Certificate (CERT). If the file already exists, the function just returns.
If the following values were set:

```python
ca.cert_base_path='/etc/pki'
tls_dir='koji'
CN='test.egavas.org'
```

the resulting CERT, and corresponding key, would be written in the following location:

```
/etc/pki/koji/certs/test.egavas.org.crt
/etc/pki/koji/certs/test.egavas.org.key
```

CLI Example:

```
salt 'minion' tls.create_self_signed_cert CN='test.mysite.org'
```

**salt.modules.tls.get_ca(ca_name, as_text=False, cacert_path=None)**

Get the certificate path or content
- `ca_name` name of the CA
- `as_text` if true, return the certificate content instead of the path
- `cacert_path` absolute path to ca certificates root directory

CLI Example:

```
salt '*' tls.get_ca test_ca as_text=False cacert_path=/etc/certs
```

**salt.modules.tls.get_ca_signed_cert(ca_name, CN='localhost', as_text=False, cacert_path=None, cert_filename=None)**

Get the certificate path or content
- `ca_name` name of the CA
- `CN` common name of the certificate
- `as_text` if true, return the certificate content instead of the path
- `cacert_path` absolute path to certificates root directory
- `cert_filename` alternative filename for the certificate, useful when using special characters in the CN

New in version 2015.5.3.

CLI Example:

```
salt '*' tls.get_ca_signed_cert test_ca CN=localhost as_text=False cacert_path=/ etc/certs
```

**salt.modules.tls.get_ca_signed_key(ca_name, CN='localhost', as_text=False, cacert_path=None, key_filename=None)**

Get the certificate path or content
- `ca_name` name of the CA
- `CN` common name of the certificate
- `as_text` if true, return the certificate content instead of the path
- `cacert_path` absolute path to certificates root directory
- `key_filename` alternative filename for the key, useful when using special characters in the CN

New in version 2015.5.3.

CLI Example:
salt.modules.tls.get_ca_signed_key(test_ca CN=localhost)
  as_text=False  cacert_path=/etc/certs

salt.modules.tls.get_expiration_date(cert, date_format='%Y-%m-%d')
New in version 2019.2.0.
Get a certificate’s expiration date.
  cert Full path to the certificate.
  date_format By default this will return the expiration date in YYYY-MM-DD format, use this to specify a
different strftime format string. Note that the expiration time will be in UTC.
CLI Examples:
salt '*' tls.get_expiration_date /path/to/foo.crt
salt '*' tls.get_expiration_date /path/to/foo.crt date_format='%d/%m/%Y'

salt.modules.tls.get_extensions(cert_type)
Fetch X509 and CSR extension definitions from tls:extensions: (common|server|client) or set them to standard
defaults.
New in version 2015.8.0.
  cert_type: The type of certificate such as server or client.
CLI Example:
salt '*' tls.get_extensions client

salt.modules.tls.maybe_fix_ssl_version(ca_name, cacert_path=none, ca_filename=none)
Check that the X509 version is correct (was incorrectly set in previous salt versions). This will fix the version
if needed.
  ca_name ca authority name
  cacert_path absolute path to ca certificates root directory
  ca_filename alternative filename for the CA
New in version 2015.5.3.
CLI Example:
salt '*' tls.maybe_fix_ssl_version test_ca /etc/certs

salt.modules.tls.revoke_cert(ca_name, CN, cacert_path=none, ca_filename=none,
cert_path=none, cert_filename=none, crl_file=none)
Revoke a certificate.
New in version 2015.8.0.
  ca_name Name of the CA.
  CN Common name matching the certificate signing request.
  cacert_path Absolute path to ca certificates root directory.
  ca_filename Alternative filename for the CA.
  cert_path Path to the cert file.
  cert_filename Alternative filename for the certificate, useful when using special characters in the CN.
  crl_file Full path to the CRL file.
CLI Example:
salt '*' tls.revoke_cert ca_name='koji'  ca_filename='ca'
crl_file=':/etc/openvpn/team1/crl.pem'

salt.modules.tls.set_ca_path(cacert_path)
If wanted, store the aforementioned cacert_path in context to be used as the basepath for further operations
CLI Example:
21.9.430 salt.modules.tomcat

Support for Tomcat

This module uses the manager webapp to manage Apache tomcat webapps. If the manager webapp is not configured some of the functions won’t work.

configuration

- Java bin path should be in default path
- If ipv6 is enabled make sure you permit manager access to ipv6 interface "0:0:0:0:0:0:1"
- If you are using tomcat.tar.gz it has to be installed or symlinked under /opt, preferably using name tomcat
- "tomcat.signal start/stop" works but it does not use the startup scripts

The following grains/pillar should be set:

<table>
<thead>
<tr>
<th>tomcat-manager:</th>
</tr>
</thead>
<tbody>
<tr>
<td>user: &lt;username&gt;</td>
</tr>
<tr>
<td>passwd: &lt;password&gt;</td>
</tr>
</tbody>
</table>

or the old format:

| tomcat-manager.user: <username> |
| tomcat-manager.passwd: <password> |

Also configure a user in the conf/tomcat-users.xml file:

```xml
<tomcat-users>
    <role rolename="manager-script"/>
    <user username="tomcat" password="tomcat" roles="manager-script"/>
</tomcat-users>
```

Note:

- if you use only this module for deployments you’ve might want to strict access to the manager only from localhost for more info: http://tomcat.apache.org/tomcat-7.0-doc/manager-howto.html#Configuring_Manager_Application_Access
- Tested on:
  - JVM Vendor: Sun Microsystems Inc.
  - JVM Version: 1.6.0_43-b01
  - OS Architecture: amd64
  - OS Name: Linux
  - OS Version: 2.6.32-358.el6.x86_64
  - Tomcat Version: Apache Tomcat/7.0.37
salt.modules.tomcat.deploy_war(
    war, context, force='no', url='http://localhost:8080/manager',
    saltenv='base', timeout=180, temp_war_location=None, version=True)

Deploy a WAR file

- **war**: absolute path to WAR file (should be accessible by the user running tomcat) or a path supported by the salt.modules.cp.get_file function
- **context**: the context path to deploy
- **force** [False] set True to deploy the webapp even one is deployed in the context
- **url** [http://localhost:8080/manager] the URL of the server manager webapp
- **saltenv** [base] the environment for WAR file in used by salt.modules.cp.get_url function
- **timeout** [180] timeout for HTTP request
- **temp_war_location** [None] use another location to temporarily copy to war file by default the system’s temp directory is used
- **version** [''] Specify the war version. If this argument is provided, it overrides the version encoded in the war file name, if one is present.

Examples:

```bash
salt '.*' tomcat.deploy_war salt://salt-2015.8.6.war version=2015.08.r6
```

CLI Examples:

- **cp module**
  ```bash
  salt '.*' tomcat.deploy_war salt:///application.war /api
  salt '.*' tomcat.deploy_war salt:///application.war /api no
  salt '.*' tomcat.deploy_war salt:///application.war /api yes http://localhost:8080/
  ---manager
  ```

- **minion local file system**
  ```bash
  salt '.*' tomcat.deploy_war /tmp/application.war /api
  salt '.*' tomcat.deploy_war /tmp/application.war /api no
  salt '.*' tomcat.deploy_war /tmp/application.war /api yes http://localhost:8080/
  ---manager
  ```

salt.modules.tomcat.extract_war_version(war)

Extract the version from the war file name. There does not seem to be a standard for encoding the version into the war file name

Examples:

```
/path/salt-2015.8.6.war -> 2015.8.6
/path/V6R2013xD5.war -> None
```

salt.modules.tomcat.fullversion()

Return all server information from catalina.sh version

CLI Example:

```bash
salt '.*' tomcat.fullversion
```

salt.modules.tomcat.leaks(url='http://localhost:8080/manager', timeout=180)

Find memory leaks in tomcat

- **url** [http://localhost:8080/manager] the URL of the server manager webapp
- **timeout** [180] timeout for HTTP request

21.9. execution modules
CLI Examples:

```bash
salt '*' tomcat.leaks
```

```bash
salt.modules.tomcat.ls( url='http://localhost:8080/manager', timeout=180 )
list all the deployed webapps
```

```bash
url [http://localhost:8080/manager] the URL of the server manager webapp
timeout [180] timeout for HTTP request
CLI Examples:
```

```bash
salt '*' tomcat.ls
salt '*' tomcat.ls http://localhost:8080/manager
```

```bash
salt.modules.tomcatpasswd( passwd=", user="alg='sha1', realm=None )
This function replaces the $CATALINA_HOME/bin/digest.sh script convert a clear-text password to the
$CATALINA_BASE/conf/tomcat-users.xml format
```

```bash
CLI Examples:
```

```bash
salt '*' tomcat.passwd secret
salt '*' tomcat.passwd secret tomcat sha1 'Protected Realm'
```

```bash
salt.modules.tomcat.reload_( app, url='http://localhost:8080/manager', timeout=180 )
Reload the webapp
```

```bash
app the webapp context path
url [http://localhost:8080/manager] the URL of the server manager webapp
timeout [180] timeout for HTTP request
CLI Examples:
```

```bash
salt '*' tomcat.reload /jenkins
salt '*' tomcat.reload /jenkins http://localhost:8080/manager
```

```bash
salt.modules.tomcat.serverinfo( url='http://localhost:8080/manager', timeout=180 )
return details about the server
```

```bash
url [http://localhost:8080/manager] the URL of the server manager webapp
timeout [180] timeout for HTTP request
CLI Examples:
```

```bash
salt '*' tomcat.serverinfo
salt '*' tomcat.serverinfo http://localhost:8080/manager
```

```bash
salt.modules.tomcat.sessions( app, url='http://localhost:8080/manager', timeout=180 )
return the status of the webapp sessions
```

```bash
app the webapp context path
url [http://localhost:8080/manager] the URL of the server manager webapp
timeout [180] timeout for HTTP request
CLI Examples:
```

```bash
salt '*' tomcat.sessions /jenkins
salt '*' tomcat.sessions /jenkins http://localhost:8080/manager
```

```bash
salt.modules.tomcat.signal(signal=None)
Signals catalina to start, stop, securestart, forcestop.
```

CLI Example:
salt '***' tomcat.start

```python
salt.modules.tomcat.start(app, url='http://localhost:8080/manager', timeout=180)
Start the webapp

app  the webapp context path
url [http://localhost:8080/manager] the URL of the server manager webapp
timeout  timeout for HTTP request
```

CLI Examples:

```bash
salt '***' tomcat.start /jenkins
salt '***' tomcat.start /jenkins http://localhost:8080/manager
```

salt.modules.tomcat.status(url='http://localhost:8080/manager', timeout=180)

```python
Used to test if the tomcat manager is up

url [http://localhost:8080/manager] the URL of the server manager webapp
timeout [180] timeout for HTTP request
```

CLI Examples:

```bash
salt '***' tomcat.status
salt '***' tomcat.status http://localhost:8080/manager
```

salt.modules.tomcat.status_webapp(app, url='http://localhost:8080/manager', timeout=180)

```python
return the status of the webapp (stopped | running | missing)

app  the webapp context path
url [http://localhost:8080/manager] the URL of the server manager webapp
timeout [180] timeout for HTTP request
```

CLI Examples:

```bash
salt '***' tomcat.status_webapp /jenkins
salt '***' tomcat.status_webapp /jenkins http://localhost:8080/manager
```

salt.modules.tomcat.stop(app, url='http://localhost:8080/manager', timeout=180)

```python
Stop the webapp

app  the webapp context path
url [http://localhost:8080/manager] the URL of the server manager webapp
timeout [180] timeout for HTTP request
```

CLI Examples:

```bash
salt '***' tomcat.stop /jenkins
salt '***' tomcat.stop /jenkins http://localhost:8080/manager
```

salt.modules.tomcat.undeploy(app, url='http://localhost:8080/manager', timeout=180)

```python
Undeploy a webapp

app  the webapp context path
url [http://localhost:8080/manager] the URL of the server manager webapp
timeout [180] timeout for HTTP request
```

CLI Examples:

```bash
salt '***' tomcat.undeploy /jenkins
salt '***' tomcat.undeploy /jenkins http://localhost:8080/manager
```

salt.modules.tomcat.version()

```python
Return server version from catalina.sh version
```

CLI Example:
21.9.431 salt.modules.trafficserver

Apache Traffic Server execution module.
New in version 2015.8.0.

traffic_ctl is used to execute individual Traffic Server commands and to script multiple commands in a shell.

salt.modules.trafficserver.alarms()
List all alarm events that have not been acknowledged (cleared).

salt.modules.trafficserver.alarms

salt.modules.trafficserver.bounce_cluster()

salt.modules.trafficserver.bounce_cluster

salt.modules.trafficserver.bounce_local(drain=False)

drain This option modifies the restart behavior such that traffic_server is not shut down until the number of active client connections drops to the number given by the proxy.config.restart.active_client_threshold configuration variable.

salt.modules.trafficserver.bounce_local
salt.modules.trafficserver.bounce_local drain=True

salt.modules.trafficserver.clear_alarms(alarm)
Clear (acknowledge) an alarm event. The arguments are “all” for all current alarms, a specific alarm number (e.g. “1”), or an alarm string identifier (e.g. “MGMT_ALARM_PROXY_CONFIG_ERROR”).

salt.modules.trafficserver.clear_alarms [all | #event | name]

salt.modules.trafficserver.clear_cluster()
Clears accumulated statistics on all nodes in the cluster.

salt.modules.trafficserver.clear_cluster

salt.modules.trafficserver.clear_node()
Clears accumulated statistics on the local node.

salt.modules.trafficserver.clear_node

salt.modules.trafficserver.match_config(regex)
Display the current values of all configuration variables whose names match the given regular expression.
New in version 2016.11.0.

salt.modules.trafficserver.match_config regex

salt.modules.trafficserver.match_metric(regex)
Display the current values of all metrics whose names match the given regular expression.
New in version 2016.11.0.

```python
salt '*' trafficserver.match_metric regex
```

`salt.modules.trafficserver.offline(path)`
Mark a cache storage device as offline. The storage is identified by a path which must match exactly a path specified in storage.config. This removes the storage from the cache and redirects requests that would have used this storage to other storage. This has exactly the same effect as a disk failure for that storage. This does not persist across restarts of the traffic_server process.

```python
salt '*' trafficserver.offline /path/to/cache
```

`salt.modules.trafficserver.read_config(*args)`
Read Traffic Server configuration variable definitions.
New in version 2016.11.0.

```python
salt '*' trafficserver.read_config proxy.config.http.keep_alive_post_out
```

`salt.modules.trafficserver.read_metric(*args)`
Read Traffic Server one or more metrics.
New in version 2016.11.0.

```python
salt '*' trafficserver.read_metric proxy.process.http.tcp_hit_count_stat
```

`salt.modules.trafficserver.refresh()`
Initiate a Traffic Server configuration file reread. Use this command to update the running configuration after any configuration file modification.

The timestamp of the last reconfiguration event (in seconds since epoch) is published in the proxy.node.config.reconfigure_time metric.

```python
salt '*' trafficserver.refresh
```

`salt.modules.trafficserver.restart_cluster()`
Restart the traffic_manager process and the traffic_server process on all the nodes in a cluster.

```python
salt '*' trafficserver.restart_cluster
```

`salt.modules.trafficserver.restart_local(drain=False)`
Restart the traffic_manager and traffic_server processes on the local node.

- **drain** This option modifies the restart behavior such that traffic_server is not shut down until the number of active client connections drops to the number given by the proxy.config.restart.active_client_threshold configuration variable.

```python
salt '*' trafficserver.restart_local
salt '*' trafficserver.restart_local drain=True
```

`salt.modules.trafficserver.set_config(variable, value)`
Set the value of a Traffic Server configuration variable.

- **variable** Name of a Traffic Server configuration variable.
- **value** The new value to set.

New in version 2016.11.0.

```python
salt '*' trafficserver.set_config proxy.config.http.keep_alive_post_out 0
```
salt.modules.trafficserver.shutdown()
Shut down Traffic Server on the local node.

```
salt '*' trafficserver.shutdown
```

salt.modules.trafficserver.startup()
Start Traffic Server on the local node.

```
salt '*' trafficserver.start
```

salt.modules.trafficserver.status()
Show the current proxy server status, indicating if we’re running or not.

```
salt '*' trafficserver.status
```

salt.modules.trafficserver.zero_cluster()
Reset performance statistics to zero across the cluster.

```
salt '*' trafficserver.zero_cluster
```

salt.modules.trafficserver.zero_node()
Reset performance statistics to zero on the local node.

```
salt '*' trafficserver.zero_cluster
```

21.9.432 salt.modules.travisci
Commands for working with travisci.

```
depends pyOpenSSL >= 16.0.0
```

salt.modules.travisci.verify_webhook(signature, body)
Verify the webhook signature from travisci

```
signature The signature header from the webhook header
body The full payload body from the webhook post
```

Note: The body needs to be the urlencoded version of the body.

```
CLI Example:
salt '*' travisci.verify_webhook 'M6NucCX5722bxisQs7e...' 'payload=%7B%22id%22
~%3A183791261%2C%22repository...'
```

21.9.433 salt.modules.tuned
Interface to Red Hat tuned-adm module

```
maintainer Syed Ali <alicsyed@gmail.com>
maturity new
depends tuned-adm
platform Linux
```
salt.modules.tuned.active()
    Return current active profile
    CLI Example:
    ```
salt '*' tuned.active
    ```

salt.modules.tuned.list()
    List the profiles available
    CLI Example:
    ```
salt '*' tuned.list
    ```

salt.modules.tuned.off()
    Turn off all profiles
    CLI Example:
    ```
salt '*' tuned.off
    ```

salt.modules.tuned.profile(profile_name)
    Activate specified profile
    CLI Example:
    ```
salt '*' tuned.profile virtual-guest
    ```

21.9.434 salt.modules.twilio_notify

Module for notifications via Twilio
New in version 2014.7.0.

    depends
        • twilio python module

    configuration  Configure this module by specifying the name of a configuration profile in the minion
cfg, minion pillar, or master config.

    For example:
    ```yaml
    my-twilio-account:
        twilio.account_sid: AC32a3c83990934481add5ce1659f04d2
        twilio.auth_token: mytoken
    ```

salt.modules.twilio_notify.send_sms(profile, body, to, from_)
    Send an sms
    CLI Example:
    ```
twilio.send_sms twilio-account 'Test sms '+'18019999999' '+'18011111111'
    ```

21.9.435 salt.modules.udev

Manage and query udev info
New in version 2015.8.0.
salt.modules.udev.env(dev)
Return all environment variables udev has for dev

CLI Example:
```
salt '*' udev.env /dev/sda
salt '*' udev.env /sys/class/net/eth0
```

salt.modules.udev.exportdb()
Return all the udev database

CLI Example:
```
salt '*' udev.exportdb
```

salt.modules.udev.info(dev)
Extract all info delivered by udevadm

CLI Example:
```
salt '*' udev.info /dev/sda
salt '*' udev.info /sys/class/net/eth0
```

salt.modules.udev.links(dev)
Return all udev-created device symlinks

CLI Example:
```
salt '*' udev.links /dev/sda
salt '*' udev.links /sys/class/net/eth0
```

salt.modules.udev.name(dev)
Return the actual dev name(s?) according to udev for dev

CLI Example:
```
salt '*' udev.name /dev/sda
salt '*' udev.name /sys/class/net/eth0
```

salt.modules.udev.path(dev)
Return the physical device path(s?) according to udev for dev

CLI Example:
```
salt '*' udev.path /dev/sda
salt '*' udev.path /sys/class/net/eth0
```

21.9.436  salt.modules.upstart_service

Module for the management of upstart systems. The Upstart system only supports service starting, stopping and restarting.

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to *service.start* is not available), see [here](#).
Currently (as of Ubuntu 12.04) there is no tool available to disable Upstart services (like update-rc.d). This[1] is the recommended way to disable an Upstart service. So we assume that all Upstart services that have not been disabled in this manner are enabled.

But this is broken because we do not check to see that the dependent services are enabled. Otherwise we would have to do something like parse the output of “initctl show-config” to determine if all service dependencies are enabled to start on boot. For example, see the “start on” condition for the lightdm service below[2]. And this would be too hard. So we wait until the upstart developers have solved this problem. :) This is to say that an Upstart service that is enabled may not really be enabled.

Also, when an Upstart service is enabled, should the dependent services be enabled too? Probably not. But there should be a notice about this, at least.

[2] example upstart configuration file:

```ini
lightdm
  emits login-session-start
  emits desktop-session-start
  emits desktop-shutdown
start on (((filesystem and runlevel ![06]) and started dbus) and (drm-device-added%card0 PRIMARY_DEVICE_FOR_DISPLAY=1 or stopped udev-fallback-graphics)) or runlevel%PREVLEVEL=S
stop on runlevel [016]
```

**Warning:** This module should not be used on Red Hat systems. For these, the `rh_service` module should be used, as it supports the hybrid upstart/sysvinit system used in RHEL/CentOS 6.

```python
salt.modules.upstart_service.available(name)
Returns True if the specified service is available, otherwise returns False.

CLI Example:
salt '*' service.available sshd
```

```python
salt.modules.upstart_service.disable(name, **kwargs)
Disable the named service from starting on boot

CLI Example:
salt '*' service.disable <service name>
```

```python
salt.modules.upstart_service.disabled(name)
Check to see if the named service is disabled to start on boot

CLI Example:
salt '*' service.disabled <service name>
```

```python
salt.modules.upstart_service.enable(name, **kwargs)
Enable the named service to start at boot

CLI Example:
salt '*' service.enable <service name>
```
salt.modules.upstart_service.enabled(name, **kwargs)
    Check to see if the named service is enabled to start on boot
    CLI Example:
    ```
salt '*' service.enabled <service name>
    ```

salt.modules.upstart_service.force_reload(name)
    Force-reload the named service
    CLI Example:
    ```
salt '*' service.force_reload <service name>
    ```

salt.modules.upstart_service.full_restart(name)
    Do a full restart (stop/start) of the named service
    CLI Example:
    ```
salt '*' service.full_restart <service name>
    ```

salt.modules.upstart_service.get_all()
    Return all installed services
    CLI Example:
    ```
salt '*' service.get_all
    ```

salt.modules.upstart_service.get_disabled()
    Return the disabled services
    CLI Example:
    ```
salt '*' service.get_disabled
    ```

salt.modules.upstart_service.get_enabled()
    Return the enabled services
    CLI Example:
    ```
salt '*' service.get_enabled
    ```

salt.modules.upstart_service.missing(name)
    The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.
    CLI Example:
    ```
salt '*' service.missing sshd
    ```

salt.modules.upstart_service.reload_(name)
    Reload the named service
    CLI Example:
    ```
salt '*' service.reload <service name>
    ```

salt.modules.upstart_service.restart(name)
    Restart the named service
    CLI Example:
salt '*x' service.restart <service name>

```
salt.modules.upstart_service.start(name)
```
Start the specified service

CLI Example:
```
salt 'x' service.start <service name>
```

```
salt.modules.upstart_service.status(name, sig=None)
```
Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)

**Parameters**
- `name (str)` – The name of the service to check
- `sig (str)` – Signature to use to find the service via ps

**Returns**
True if running, False otherwise
dict: Maps service name to True if running, False otherwise

**Return type**
bool

CLI Example:
```
salt 'x' service.status <service name> [service signature]
```

```
salt.modules.upstart_service.stop(name)
```
Stop the specified service

CLI Example:
```
salt 'x' service.stop <service name>
```

### 21.9.437 salt.modules.uptime

Wrapper around uptime API

```
salt.modules.uptime.check_exists(name)
```
Check if a given URL is in being monitored by uptime

CLI Example:
```
salt 'x' uptime.check_exists http://example.org
```

```
salt.modules.uptime.checks_list()
```
List URL checked by uptime

CLI Example:
```
salt 'x' uptime.checks_list
```

```
salt.modules.uptime.create(name, **params)
```
Create a check on a given URL.

Additional parameters can be used and are passed to API (for example interval, maxTime, etc). See the documentation [https://github.com/fzaninotto/uptime](https://github.com/fzaninotto/uptime) for a full list of the parameters.

CLI Example:
salt 'ُ' uptime.create http://example.org

salt.modules.uptime.delete(name)
Delete a check on a given URL

CLI Example:
salt 'ُ' uptime.delete http://example.org

21.9.438 salt.modules.useradd

Manage users with the useradd command

Important: If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to 'user.info' is not available), see here.

salt.modules.useradd.add(name, uid=None, gid=None, groups=None, home=None, shell=None, unique=True, system=False, fullname='', roomnumber='', workphone='', homephone='', other='', createhome=True, loginclass=None, root=None, nologinit=False)
Add a user to the minion

CLI Example:
salt 'ُ' user.add name <uid> <gid> <groups> <home> <shell>

salt.modules.useradd.chfullname(name, fullname)
Change the user's Full Name

CLI Example:
salt 'ُ' user.chfullname foo "Foo Bar"

salt.modules.useradd.chgid(name, gid, root=None)
Change the default group of the user

CLI Example:
salt 'ُ' user.chgid foo 4376

salt.modules.useradd.chgroups(name, groups, append=False, root=None)
Change the groups to which this user belongs

name User to modify
groups Groups to set for the user
append [False] If True, append the specified group(s). Otherwise, this function will replace the user’s groups with the specified group(s).

CLI Examples:
salt 'ُ' user.chgroups foo wheel,root
salt 'ُ' user.chgroups foo wheel,root append=True

salt.modules.useradd.chhome(name, home, persist=False, root=None)
Change the home directory of the user, pass True for persist to move files to the new home directory if the old home directory exist.
CLI Example:
```
salt '*' user.chhome foo /home/users/foo True
```

```
salt.modules.useradd.chhomephone(name, homephone)
Change the user’s Home Phone
```

CLI Example:
```
salt '*' user.chhomephone foo 7735551234
```

```
salt.modules.useradd.chloginclass(name, loginclass, root=None)
Change the default login class of the user
```

**Note:** This function only applies to OpenBSD systems.

CLI Example:
```
salt '*' user.chloginclass foo staff
```

```
salt.modules.useradd.chother(name, other)
Change the user’s other GECOS attribute
```

CLI Example:
```
salt '*' user.chother foobar
```

```
salt.modules.useradd.chroomnumber(name, roomnumber)
Change the user’s Room Number
```

CLI Example:
```
salt '*' user.chroomnumber foo 123
```

```
salt.modules.useradd.chshell(name, shell, root=None)
Change the default shell of the user
```

CLI Example:
```
salt '*' user.chshell foo /bin/zsh
```

```
salt.modules.useradd.chuid(name, uid)
Change the uid for a named user
```

CLI Example:
```
salt '*' user.chuid foo 4376
```

```
salt.modules.useradd.chworkphone(name, workphone)
Change the user’s Work Phone
```

CLI Example:
```
salt '*' user.chworkphone foo 7735550123
```

```
salt.modules.useradd.delete(name, remove=False, force=False, root=None)
Remove a user from the minion
```

CLI Example:
salt '*' user.delete name remove=True force=True

salt.modules.useradd.get_loginclass(name)
Get the login class of the user

Note: This function only applies to OpenBSD systems.

CLI Example:

salt '*' user.get_loginclass foo

salt.modules.useradd.getent(refresh=False)
Return the list of all info for all users

CLI Example:

salt '*' user.getent

salt.modules.useradd.info(name)
Return user information

CLI Example:

salt '*' user.info root

salt.modules.useradd.list_groups(name)
Return a list of groups the named user belongs to

CLI Example:

salt '*' user.list_groups foo

salt.modules.useradd.list_users()
Return a list of all users

CLI Example:

salt '*' user.list_users

salt.modules.useradd.primary_group(name)
Return the primary group of the named user

New in version 2016.3.0.

CLI Example:

salt '*' user.primary_group saltadmin

salt.modules.useradd.rename(name, new_name, root=None)
Change the username for a named user

CLI Example:

salt '*' user.rename name new_name
21.9.439 salt.modules.uwsgio

maintainer Peter Baumgartner <pete@lincolnloop.com>
maturity new
platform all

salt.modules.uwsgi.stats(socket)
Return the data from uwsgi -connect-and-read as a dictionary.
socket The socket the uWSGI stats server is listening on

CLI Example:
salt '*' uwsgi.stats /var/run/mystatsserver.sock
salt '*' uwsgi.stats 127.0.0.1:5050

21.9.440 salt.modules.vagrant

Work with virtual machines managed by Vagrant.

New in version 2018.3.0.

Mapping between a Salt node id and the Vagrant machine name (and the path to the Vagrantfile where it is defined) is stored in a Salt sdb database on the Vagrant host (minion) machine. In order to use this module, sdb must be configured. An SQLite database is the recommended storage method. The URI used for the sdb lookup is "sdb://vagrant_sdb_data".

requirements:
- the VM host machine must have salt-minion, Vagrant and a vm provider installed.
- the VM host must have a valid definition for sdb://vagrant_sdb_data

Configuration example:

```
# file /etc/salt/minion.d/vagrant_sdb.conf
vagrant_sdb_data:
  driver: sqlite3
  database: /var/cache/salt/vagrant.sqlite
  table: sdb
  create_table: True
```

salt.modules.vagrant.destroy(name)
Destroy and delete a virtual machine. (vagrant destroy -f)
This also removes the salt_id name defined by vagrant.init.

CLI Example:
salt <host> vagrant.destroy <salt_id>

salt.modules.vagrant.get_machine_id(machine, cwd)
returns the salt_id name of the Vagrant VM

Parameters
- machine - the Vagrant machine name
- cwd - the path to Vagrantfile

Returns salt_id name
salt.modules.vagrant.get_ssh_config(name, network_mask=", get_private_key=False)

Retrieve hints of how you might connect to a Vagrant VM.

Parameters

- **name** – the salt_id of the machine
- **network_mask** – a CIDR mask to search for the VM’s address
- **get_private_key** – (default: False) return the key used for ssh login

Returns a dict of ssh login information for the VM

CLI Example:

```bash
salt <host> vagrant.get_ssh_config <salt_id>
salt my_laptop vagrant.get_ssh_config quail1 network_mask=10.0.0.0/8 get_private_key=True
```

The returned dictionary contains:

- `key_filename`: the name of the private key file on the VM host computer
- `ssh_username`: the username to be used to log in to the VM
- `ssh_host`: the IP address used to log in to the VM. (This will usually be 127.0.0.1)
- `ssh_port`: the TCP port used to log in to the VM. (This will often be 2222)
- `[ip_address]` (if `network_mask` is defined. see below)
- `[private_key:]` (if `get_private_key` is True) the private key for `ssh_username`

About `network_mask`:

Vagrant usually uses a redirected TCP port on its host computer to log in to a VM using ssh. This redirected port and its IP address are "ssh_port" and "ssh_host". The ssh_host is usually the localhost (127.0.0.1). This makes it impossible for a third machine (such as a salt-cloud master) to contact the VM unless the VM has another network interface defined. You will usually want a bridged network defined by having a `config.vm.network "public_network"` statement in your Vagrantfile.

The IP address of the bridged adapter will typically be assigned by DHCP and unknown to you, but you should be able to determine what IP network the address will be chosen from. If you enter a CIDR network mask, Salt will attempt to find the VM’s address for you. The host machine will send an "ifconfig" command to the VM (using ssh to `ssh_host:ssh_port`) and return the IP address of the first interface it can find which matches your mask.

salt.modules.vagrant.get_vm_info(name)

get the information for a VM.

Parameters **name** – salt_id name

Returns dictionary of `{'machine': x, 'cwd': y, ...}`.

salt.modules.vagrant.init(name, cwd=None, machine=", runas=None, start=False, vagrant_provider=", vm=None)

Initialize a new Vagrant VM.

This inputs all the information needed to start a Vagrant VM. These settings are stored in a Salt sdb database on the Vagrant host minion and used to start, control, and query the guest VMs. The salt_id assigned here is the key field for that database and must be unique.

Parameters

- **name** – The salt_id name you will use to control this VM
- **cwd** – The path to the directory where the Vagrantfile is located
- **machine** – The machine name in the Vagrantfile. If blank, the primary machine will be used.
- **runas** – The username on the host who owns the Vagrant work files.
- **start** – (default: False) Start the virtual machine now.
- **vagrant_provider** – The name of a Vagrant VM provider (if not the default).
- **vm** – Optionally, all the above information may be supplied in this dictionary.

Returns A string indicating success, or False.

CLI Example:
salt <host> vagrant.init <salt_id> /path/to/Vagrantfile
salt my_laptop vagrant.init x1 /projects/bevy_master machine=quail1

salt.modules.vagrant.list_active_vms(cwd=None)
Return a list of machine names for active virtual machine on the host, which are defined in the Vagrantfile at the indicated path.

CLI Example:
salt '*' vagrant.list_active_vms cwd=/projects/project_1

salt.modules.vagrant.list_domains()
Return a list of the salt_id names of all available Vagrant VMs on this host without regard to the path where they are defined.

CLI Example:
salt '*' vagrant.list_domains --log-level=info

The log shows information about all known Vagrant environments on this machine. This data is cached and may not be completely up-to-date.

salt.modules.vagrant.list_inactive_vms(cwd=None)
Return a list of machine names for inactive virtual machine on the host, which are defined in the Vagrantfile at the indicated path.

CLI Example:
salt '*' virt.list_inactive_vms cwd=/projects/project_1

salt.modules.vagrant.pause(name)
Pause (vagrant suspend) the named VM.

CLI Example:
salt <host> vagrant.pause <salt_id>

salt.modules.vagrant.reboot(name, provision=False)
Reboot a VM. (vagrant reload)

CLI Example:
salt <host> vagrant.reboot <salt_id> provision=True

Parameters
- name – The salt_id name you will use to control this VM
- provision – (False) also re-run the Vagrant provisioning scripts.

salt.modules.vagrant.shutdown(name)
Send a soft shutdown (vagrant halt) signal to the named vm.

This does the same thing as vagrant.stop. Other-VM control modules use "stop" and "shutdown" to differentiate between hard and soft shutdowns.

CLI Example:
salt <host> vagrant.shutdown <salt_id>
salt.modules.vagrant.start(name)
Start (vagrant up) a virtual machine defined by salt_id name. The machine must have been previously defined using "vagrant.init".

CLI Example:
```
salt <host> vagrant.start <salt_id>
```

salt.modules.vagrant.stop(name)
Hard shutdown the virtual machine. (vagrant halt)

CLI Example:
```
salt <host> vagrant.stop <salt_id>
```

salt.modules.vagrant.version()
Return the version of Vagrant on the minion

CLI Example:
```
salt '*' vagrant.version
```

salt.modules.vagrant.vm_state(name=None, cwd=None)
Return list of information for all the vms indicating their state.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs defined by the Vagrantfile in the cwd directory.

CLI Example:
```
salt '*' vagrant.vm_state <name> cwd=/projects/project_1
```

returns a list of dictionaries with machine name, state, provider, and salt_id name.

| datum | { 'machine': _, # Vagrant machine name,  
|       | 'state': _, # string indicating machine state, like 'running'  
|       | 'provider': _, # the Vagrant VM provider  
|       | 'name': _} # salt_id name |

Known bug: if there are multiple machines in your Vagrantfile, and you request the status of the primary machine, which you defined by leaving the machine parameter blank, then you may receive the status of all of them. Please specify the actual machine name for each VM if there are more than one.

21.9.441 salt.modules.varnish

Support for Varnish

New in version 2014.7.0.

Note: These functions are designed to work with all implementations of Varnish from 3.x onwards

salt.modules.varnish.ban(ban_expression)
Add ban to the varnish cache

CLI Example:
salt '*' varnish.ban ban_expression

salt.modules.varnish.ban_list()
List varnish cache current bans
CLI Example:
salt '*' varnish.ban_list

salt.modules.varnish.param_set(param, value)
Set a param in varnish cache
CLI Example:
salt '*' varnish.param_set param value

salt.modules.varnish.param_show(param=None)
Show params of varnish cache
CLI Example:
salt '*' varnish.param_show param

salt.modules.varnish.purge()
Purge the varnish cache
CLI Example:
salt '*' varnish.purge

salt.modules.varnish.version()
Return server version from varnishd -V
CLI Example:
salt '*' varnish.version

21.9.442 salt.modules.vault module

Functions to interact with Hashicorp Vault.

maintainer SaltStack
maturity new
platform all

note If you see the following error, you'll need to upgrade requests to atleast 2.4.2

configuration The salt-master must be configured to allow peer-runner configuration, as well as config-

Add this segment to the master configuration file, or /etc/salt/master.d/vault.conf:
### vault

<table>
<thead>

</tr>
<tr>
<td>-</td>
<td>3pPK5X6vGtwLhN0Fv1U2elahECz3HpRUFNXFYLw6lid</td>
</tr>
</tbody>
</table>

**url**  
Url to your Vault installation. Required.

**verify**  
For details please see [http://docs.python-requests.org/en/master/user/advanced/#ssl-cert-verification](http://docs.python-requests.org/en/master/user/advanced/#ssl-cert-verification)  
New in version 2018.3.0.

**role_name**  
Role name for minion tokens created. If omitted, minion tokens will be created without any role, thus being able to inherit any master token policy (including token creation capabilities). Optional.  
For details please see: [https://www.vaultproject.io/api/auth/token/index.html#create-token](https://www.vaultproject.io/api/auth/token/index.html#create-token)  
Example configuration: [https://www.nomadproject.io/docs/vault-integration/index.html#vault-token-role-configuration](https://www.nomadproject.io/docs/vault-integration/index.html#vault-token-role-configuration)

**auth**  
Currently only token and approle auth types are supported. Required.  
Approle is the preferred way to authenticate with Vault as it provide some advanced options to control authentication process. Please visit Vault documentation for more info: [https://www.vaultproject.io/docs/auth/approle.html](https://www.vaultproject.io/docs/auth/approle.html)  
The token must be able to create tokens with the policies that should be assigned to minions.  
You can still use the token auth via a OS environment variable via this config example:  
And then export the VAULT_TOKEN variable in your OS:

**policies**  
Policies that are assigned to minions when requesting a token. These can either be static, eg saltstack/minions, or templated, eg saltstack/minion/{minion}. {minion} is shorthand for grains[id]. Grains are also available, for example like this: my-policies/ {grains[os]}  
If a template contains a grain which evaluates to a list, it will be expanded into multiple policies. For example, given the template saltstack/by-role/{grains[roles]}, and a minion having these grains:  
The minion will have the policies saltstack/by-role/web and saltstack/by-role/database. Note however that list members which do not have simple string representations, such as dictionaries or objects, do not work and will throw an exception. Strings and numbers are examples of types which work well.
Optional. If policies is not configured, `saltstack/minions` and `saltstack/{minion}` are used as defaults.

**keys** List of keys to use to unseal vault server with the vault.unseal runner.

Add this segment to the master configuration file, or `/etc/salt/master.d/peer_run.conf`:

```yaml
peer_run:
    .*:
        - vault.generate_token
```

**salt.modules.vault.delete_secret**(*path*)
Delete secret at the path in vault. The vault policy used must allow this.

CLI Example:

```
salt '*' vault.delete_secret "secret/my/secret"
```

**salt.modules.vault.list_secrets**(*path*)
List secret keys at the path in vault. The vault policy used must allow this. The path should end with a trailing slash.

CLI Example:

```
salt '*' vault.list_secrets "secret/my/"
```

**salt.modules.vault.read_secret**(*path*, key=None)
Return the value of key at path in vault, or entire secret

Jinja Example:

```jinja
my-secret: {{ salt['vault'].read_secret('secret/my/secret', 'some-key') }}
```

```python
{% set supersecret = salt['vault'].read_secret('secret/my/secret') %}
secrets:  
    first: {{ supersecret.first }}
    second: {{ supersecret.second }}
```

**salt.modules.vault.write_raw**(*path*, raw)
Set raw data at the path in vault. The vault policy used must allow this.

CLI Example:

```
salt '*' vault.write_raw "secret/my/secret" '{"user":"foo","password": "bar"}'
```

**salt.modules.vault.write_secret**(*path*, **kwargs)
Set secret at the path in vault. The vault policy used must allow this.

CLI Example:

```
salt '*' vault.write_secret "secret/my/secret" user="foo" password="bar"
```

### 21.9.443 salt.modules.vbox_guest

VirtualBox Guest Additions installer

**salt.modules.vbox_guest.additions_install**(**kwargs**)  
Install VirtualBox Guest Additions. Uses the CD, connected by VirtualBox.
To connect VirtualBox Guest Additions via VirtualBox graphical interface press 'Host+D' ('Host' is usually 'Right Ctrl').

See https://www.virtualbox.org/manual/ch04.html#idp52733088 for more details.

CLI Example:

```
salt '*' vbox_guest.additions_install
salt '*' vbox_guest.additions_install reboot=True
salt '*' vbox_guest.additions_install upgrade_os=True
```

**Parameters**

- **reboot** *(bool)* – reboot computer to complete installation
- **upgrade_os** *(bool)* – upgrade OS (to ensure the latests version of kernel and developer tools are installed)

**Returns** version of VirtualBox Guest Additions or string with error

salt.modules.vbox_guest.additions_mount()

Mount VirtualBox Guest Additions CD to the temp directory.

To connect VirtualBox Guest Additions via VirtualBox graphical interface press 'Host+D' ('Host' is usually 'Right Ctrl').

CLI Example:

```
salt '*' vbox_guest.additions_mount
```

**Returns** True or OSError exception

salt.modules.vbox_guest.additions_remove(**kwargs)

Remove VirtualBox Guest Additions.

Firstly it tries to uninstall itself by executing '/opt/VBoxGuestAdditions-VERSION/uninstall.run uninstall'. It uses the CD, connected by VirtualBox if it failes.

CLI Example:

```
salt '*' vbox_guest.additions_remove
salt '*' vbox_guest.additions_remove force=True
```

**Parameters** **force** *(bool)* – force VirtualBox Guest Additions removing

**Returns** True if VirtualBox Guest Additions were removed successfully else False

salt.modules.vbox_guest.additions_umount(*mount_point*)

Unmount VirtualBox Guest Additions CD from the temp directory.

CLI Example:

```
salt '*' vbox_guest.additions_umount
```

**Parameters** **mount_point** – directory VirtualBox Guest Additions is mounted to

**Returns** True or an string with error

salt.modules.vbox_guest.additions_version()

Check VirtualBox Guest Additions version.

CLI Example:

```
salt '*' vbox_guest.additions_version
```

**Returns** version of VirtualBox Guest Additions or False if they are not installed
salt.modules.vbox_guest.grant_access_to_shared_folders_to(name, users=None)
Grant access to auto-mounted shared folders to the users.

User is specified by its name. To grant access for several users use argument users. Access will be denied to the users not listed in users argument.

See https://www.virtualbox.org/manual/ch04.html#sf_mount_auto for more details.

CLI Example:

```
salt '*' vbox_guest.grant_access_to_shared_folders_to fred
salt '*' vbox_guest.grant_access_to_shared_folders_to users ['fred', 'roman']
```

Parameters

- **name (str)** – name of the user to grant access to auto-mounted shared folders to
- **users (list of str)** – list of names of users to grant access to auto-mounted shared folders to (if specified, name will not be taken into account)

Returns list of users who have access to auto-mounted shared folders

salt.modules.vbox_guest.list_shared_folders_users()
List users who have access to auto-mounted shared folders.

See https://www.virtualbox.org/manual/ch04.html#sf_mount_auto for more details.

CLI Example:

```
salt '*' vbox_guest.list_shared_folders_users
```

Returns list of users who have access to auto-mounted shared folders

---

### 21.9.444 salt.modules.vboxmanage module

Support for VirtualBox using the VBoxManage command

New in version 2016.3.0.

If the vboxdrv kernel module is not loaded, this module can automatically load it by configuring autoload_vboxdrv in /etc/salt/minion:

The default for this setting is False.

**depends** virtualbox

salt.modules.vboxmanage.clonemedium(medium, uuid_in=None, file_in=None, uuid_out=None, file_out=None, mformat=None, variant=None, existing=False, **kwargs)

Clone a new VM from an existing VM

CLI Example:

```
salt 'hypervisor' vboxmanage.clonemedium <name> <new_name>
```

salt.modules.vboxmanage.clonevm(name=None, uuid=None, new_name=None, snapshot_uuid=None, snapshot_name=None, mode='machine', options=None, basefolder=None, new_uuid=None, register=False, groups=None, **kwargs)

Clone a new VM from an existing VM

CLI Example:
salt 'hypervisor' vboxmanage.clonevm <name> <new_name>

salt.modules.vboxmanage.create(name, groups=None, ostype=None, register=True, basefolder=None, new_uuid=None, **kwargs)

Create a new VM

CLI Example:

salt 'hypervisor' vboxmanage.create <name>

salt.modules.vboxmanage.destroy(name)

Unregister and destroy a VM

CLI Example:

salt '*' vboxmanage.destroy my_vm

salt.modules.vboxmanage.list_items(item, details=False, group_by='UUID')

Return a list of a specific type of item. The following items are available:
  vms runningvms ostypes hostdvs hostfloppies inntnets bridgedifs hostonlyifs natnets dhcpservers hostinfo hostcpuids hddbackends hdds dvds floppies usbhost usbfilters systemproperties extpacks groups webcams screenshotformats

CLI Example:

salt 'hypervisor' vboxmanage.items <item>
salt 'hypervisor' vboxmanage.items <item> details=True
salt 'hypervisor' vboxmanage.items <item> details=True group_by=Name

Some items do not display well, or at all, unless details is set to True. By default, items are grouped by the UUID field, but not all items contain that field. In those cases, another field must be specified.

salt.modules.vboxmanage.list_nodes()

Return a list of registered VMs

CLI Example:

salt '*' vboxmanage.list_nodes

salt.modules.vboxmanage.list_nodes_full()

Return a list of registered VMs, with detailed information

CLI Example:

salt '*' vboxmanage.list_nodes_full

salt.modules.vboxmanage.list_nodes_min()

Return a list of registered VMs, with minimal information

CLI Example:

salt '*' vboxmanage.list_nodes_min

salt.modules.vboxmanage.list_ostypes()

List the available OS Types

CLI Example:

salt '*' vboxmanage.list_ostypes
salt.modules.vboxmanage.register(filename)
    Register a VM
    CLI Example:
    `salt '*' vboxmanage.register my_vm_filename`

salt.modules.vboxmanage.start(name)
    Start a VM
    CLI Example:
    `salt '*' vboxmanage.start my_vm`

salt.modules.vboxmanage.stop(name)
    Stop a VM
    CLI Example:
    `salt '*' vboxmanage.stop my_vm`

salt.modules.vboxmanage.unregister(name, delete=False)
    Unregister a VM
    CLI Example:
    `salt '*' vboxmanage.unregister my_vm_filename`

salt.modules.vboxmanage.vboxcmd()
    Return the location of the VBoxManage command
    CLI Example:
    `salt '*' vboxmanage.vboxcmd`

**21.9.445 salt.modules.victorops**

Support for VictorOps

New in version 2015.8.0.

Requires an api_key in /etc/salt/minion:

salt.modules.victorops.create_event(message_type=None, routing_key='everybody', **kwargs)
    Create an event in VictorOps. Designed for use in states.
    
The following parameters are required:
    **Parameters** message_type – One of the following values: INFO, WARNING, ACKNOWLEDGEMENT, CRITICAL, RECOVERY.
    
The following parameters are optional:
    **Parameters**
    - routing_key – The key for where messages should be routed. By default, sent to 'everyone' route.
    - entity_id – The name of alerting entity. If not provided, a random name will be assigned.
    - timestamp – Timestamp of the alert in seconds since epoch. Defaults to the time the alert is received at VictorOps.
    
    :param timestamp_fmt The date format for the timestamp parameter.
Parameters

- **state_start_time** – The time this entity entered its current state (seconds since epoch). Defaults to the time alert is received.
- **state_start_time_fmt** – The date format for the timestamp parameter.
- **state_message** – Any additional status information from the alert item.
- **entity_is_host** – Used within VictorOps to select the appropriate display format for the incident.
- **entity_display_name** – Used within VictorOps to display a human-readable name for the entity.
- **ack_message** – A user entered comment for the acknowledgment.
- **ack_author** – The user that acknowledged the incident.

Returns

A dictionary with result, entity_id, and message if result was failure.

CLI Example:

```bash
salt myminion victorops.create_event message_type='CRITICAL' routing_key='everyone' entity_id='hostname/diskspace'
salt myminion victorops.create_event message_type='ACKNOWLEDGEMENT' routing_key='everyone' entity_id='hostname/diskspace' ack_message='Acknowledged' ack_author='username'
salt myminion victorops.create_event message_type='RECOVERY' routing_key='everyone' entity_id='hostname/diskspace'
```

The following parameters are required: **message_type**

---

21.9.446 salt.modules.virt

Work with virtual machines managed by libvirt

**depends**

libvirt Python module

**Connection**

The connection to the virtualization host can be either setup in the minion configuration, pillar data or overridden for each individual call.

By default, the libvirt connection URL will be guessed: the first available libvirt hypervisor driver will be used. This can be overridden like this:

```yaml
virt:
  connection:
    uri: lxc:///  # Default

virt:
  connection:
    uri: esx://10.1.1.101/?no_verify=1&auto_answer=1
    auth:
      username: user
      password: secret
```

Connecting with SSH protocol

Libvirt can connect to remote hosts using SSH using one of the ssh, libssh and libssh2 transports. Note that libssh2 is likely to fail as it doesn’t read the known_hosts file. Libvirt may also have been built without libssh or libssh2 support.

To use the SSH transport, on the minion setup an SSH agent with a key authorized on the remote libvirt machine.

Per call connection setup

New in version 2019.2.0.

All the calls requiring the libvirt connection configuration as mentioned above can override this configuration using connection, username and password parameters.

This means that the following will list the domains on the local LXC libvirt driver, whatever the virt:connection is.

```
salt 'hypervisor' virt.list_domains connection=lxc:///
```

The calls not using the libvirt connection setup are:

- seed_non_shared_migrate
- virt_type
- is_*hyper
- all migration functions
- libvirt ESX URI format
- libvirt URI format
- libvirt authentication configuration

```
salt.modules.virt.capabilities(**kwargs)
```

Return the hypervisor connection capabilities.

Parameters

- connection – libvirt connection URI, overriding defaults
- username – username to connect with, overriding defaults
- password – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.capabilities
```

```
salt.modules.virt.cpu_baseline(full=False, migratable=False, out='libvirt', **kwargs)
```

Return the optimal ‘custom’ CPU baseline config for VM’s on this minion

New in version 2016.3.0.

Parameters

- full – Return all CPU features rather than the ones on top of the closest CPU model
- migratable – Exclude CPU features that are unmigratable (libvirt 2.13+)
- out – ‘libvirt’ (default) for usable libvirt XML definition, ‘salt’ for nice dict
- connection – libvirt connection URI, overriding defaults

New in version 2019.2.0.
- **username** – username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** – password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
```
salt '*' virt.cpu_baseline
```

```python
class modules.virt.create_xml_path(path, **kwargs)
    Start a domain based on the XML-file path passed to the function

    Parameters
    - **path** – path to a file containing the libvirt XML definition of the domain
    - **connection** – libvirt connection URI, overriding defaults
      New in version 2019.2.0.
    - **username** – username to connect with, overriding defaults
      New in version 2019.2.0.
    - **password** – password to connect with, overriding defaults
      New in version 2019.2.0.

CLI Example:
```
salt '*' virt.create_xml_path <path to XML file on the node>
```

```python
class modules.virt.create_xml_str(xml, **kwargs)
    Start a domain based on the XML passed to the function

    Parameters
    - **xml** – libvirt XML definition of the domain
    - **connection** – libvirt connection URI, overriding defaults
      New in version 2019.2.0.
    - **username** – username to connect with, overriding defaults
      New in version 2019.2.0.
    - **password** – password to connect with, overriding defaults
      New in version 2019.2.0.

CLI Example:
```
salt '*' virt.create_xml_str <XML in string format>
```

```python
class modules.virtctrl_alt_del(vm, **kwargs)
    Sends CTRL+ALT+DEL to a VM

    Parameters
    - **vm** – domain name
    - **connection** – libvirt connection URI, overriding defaults
      New in version 2019.2.0.
    - **username** – username to connect with, overriding defaults
      New in version 2019.2.0.
    - **password** – password to connect with, overriding defaults
      New in version 2019.2.0.

CLI Example:
The storage pool where the disk image will be defined is default unless changed with a configuration like this:

```
virt:
  storagepool: mine
```

salt.modules.virt.define_xml_path(path, **kwargs)
Define a domain based on the XML-file path passed to the function

Parameters
- **path** – path to a file containing the libvirt XML definition of the domain
- **connection** – libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** – username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** – password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.define_xml_path <path to XML file on the node>
```
salt.modules.virt.define_xml_str(xml, **kwargs)
Define a domain based on the XML passed to the function
Parameters
- xml – libvirt XML definition of the domain
- connection – libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- username – username to connect with, overriding defaults
  New in version 2019.2.0.
- password – password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
```
salt '*' virt.define_xml_str <XML in string format>
```

salt.modules.virt.delete_snapshots(name, *names, **kwargs)
Delete one or more snapshots of the given VM.
Parameters
- name – domain name
- names – names of the snapshots to remove
- connection – libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- username – username to connect with, overriding defaults
  New in version 2019.2.0.
- password – password to connect with, overriding defaults
  New in version 2019.2.0.

New in version 2016.3.0.

CLI Example:
```
salt '*' virt.delete_snapshots <domain> all=True
salt '*' virt.delete_snapshots <domain> <snapshot>
salt '*' virt.delete_snapshots <domain> <snapshot1> <snapshot2> ...
```

salt.modules.virt.domain_capabilities(emulator=None, arch=None, machine=None, domain=None, **kwargs)
Return the domain capabilities given an emulator, architecture, machine or virtualization type.

New in version 2019.2.0.

Parameters
- emulator – return the capabilities for the given emulator binary
- arch – return the capabilities for the given CPU architecture
- machine – return the capabilities for the given emulated machine type
- domain – return the capabilities for the given virtualization type.
- connection – libvirt connection URI, overriding defaults
- username – username to connect with, overriding defaults
- password – password to connect with, overriding defaults

The list of the possible emulator, arch, machine and domain can be found in the host capabilities output.

If none of the parameters is provided the libvirt default domain capabilities will be returned.

CLI Example:
```
salt '*' virt.domain_capabilities arch='x86_64' domain='kvm'
```
salt.modules.virt.freecpu(**kwargs)

Return an int representing the number of unallocated cpus on this hypervisor

Parameters

- connection – libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- username – username to connect with, overriding defaults
  New in version 2019.2.0.
- password – password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:

    salt '*' virt.freecpu

salt.modules.virt.freemem(**kwargs)

Return an int representing the amount of memory (in MB) that has not been given to virtual machines on this
node

Parameters

- connection – libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- username – username to connect with, overriding defaults
  New in version 2019.2.0.
- password – password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:

    salt '*' virt.freemem

salt.modules.virt.full_info(**kwargs)

Return the node_info, vm_info and freemem

Parameters

- connection – libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- username – username to connect with, overriding defaults
  New in version 2019.2.0.
- password – password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:

    salt '*' virt.full_info

salt.modules.virt.get_disks(vm_, **kwargs)

Return the disks of a named vm

Parameters

- vm – name of the domain
- connection – libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- username – username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** – password to connect with, overriding defaults
  
  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.get_disks <domain>
```

`salt.modules.virt.get_graphics(vm_, **kwargs)`

Returns the information on vnc for a given vm

Parameters
- **vm** – name of the domain
- **connection** – libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- **username** – username to connect with, overriding defaults
  
  New in version 2019.2.0.
- **password** – password to connect with, overriding defaults
  
  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.get_graphics <domain>
```

`salt.modules.virt.get_hypervisor()`

Returns the name of the hypervisor running on this node or None.

Detected hypervisors:
- kvm
- xen

CLI Example:

```
salt '*' virt.get_hypervisor
```

New in version 2019.2.0: the function and the kvm and xen hypervisors support

`salt.modules.virt.get_macs(vm_, **kwargs)`

Return a list off MAC addresses from the named vm

Parameters
- **vm** – name of the domain
- **connection** – libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- **username** – username to connect with, overriding defaults
  
  New in version 2019.2.0.
- **password** – password to connect with, overriding defaults
  
  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.get_macs <domain>
```

`salt.modules.virt.get_nics(vm_, **kwargs)`

Return info about the network interfaces of a named vm

Parameters
- **vm** – name of the domain
- **connection** – libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
• **username** – username to connect with, overriding defaults
  New in version 2019.2.0.
• **password** – password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
```
salt '*' virt.get_nics <domain>
```

```python
salt.modules.virt.get_on_crash(vm_, **kwargs)
```
Return a on_crash from the named vm

Parameters

• **vm** – name of the domain  
• **connection** – libvirt connection URI, overriding defaults  
  New in version 2019.2.0.
• **username** – username to connect with, overriding defaults  
  New in version 2019.2.0.
• **password** – password to connect with, overriding defaults  
  New in version 2019.2.0.

CLI Example:
```
salt '*' virt.get_on_crash <domain>
```

```python
salt.modules.virt.get_on_poweroff(vm_, **kwargs)
```
Return a on_poweroff from the named vm

Parameters

• **vm** – name of the domain  
• **connection** – libvirt connection URI, overriding defaults  
  New in version 2019.2.0.
• **username** – username to connect with, overriding defaults  
  New in version 2019.2.0.
• **password** – password to connect with, overriding defaults  
  New in version 2019.2.0.

CLI Example:
```
salt '*' virt.get_on_poweroff <domain>
```

```python
salt.modules.virt.get_on_reboot(vm_, **kwargs)
```
Return a on_reboot from the named vm

Parameters

• **vm** – name of the domain  
• **connection** – libvirt connection URI, overriding defaults  
  New in version 2019.2.0.
• **username** – username to connect with, overriding defaults  
  New in version 2019.2.0.
• **password** – password to connect with, overriding defaults  
  New in version 2019.2.0.

CLI Example:
salt '*' virt.get_on_reboot <domain>

salt.modules.virt.get_profiles(hypervisor=None, **kwargs)
Return the virt profiles for hypervisor.
Currently there are profiles for:
• nic
• disk

Parameters
• hypervisor – override the default machine type.
• connection – libvirt connection URI, overriding defaults
  New in version 2019.2.0.
• username – username to connect with, overriding defaults
  New in version 2019.2.0.
• password – password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
salt '*' virt.get_profiles
salt '*' virt.get_profiles hypervisor=esxi

salt.modules.virt.get_uuid(vm_, **kwargs)
Return a uuid from the named vm
Parameters
• vm – name of the domain
• connection – libvirt connection URI, overriding defaults
  New in version 2019.2.0.
• username – username to connect with, overriding defaults
  New in version 2019.2.0.
• password – password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
salt '*' virt.get_uuid <domain>

salt.modules.virt.get_xml(vm_, **kwargs)
Returns the XML for a given vm
Parameters
• vm – domain name
• connection – libvirt connection URI, overriding defaults
  New in version 2019.2.0.
• username – username to connect with, overriding defaults
  New in version 2019.2.0.
• password – password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
salt '*' virt.get_xml <domain>
salt.modules.virt.init(name, cpu, mem, image=None, nic='default', interfaces=None, hypervisor=None, start=True, disk='default', disks=None, saltenv='base', seed=True, install=True, pub_key=None, priv_key=None, seed_cmd='seed.apply', enable_vnc=False, enable_qcow=False, graphics=None, os_type=None, arch=None, **kwargs)

Initialize a new vm

Parameters

- **name** – name of the virtual machine to create
- **cpu** – Number of virtual CPUs to assign to the virtual machine
- **mem** – Amount of memory to allocate to the virtual machine in MiB.
- **image** – Path to a disk image to use as the first disk (Default: None). Deprecated in favor of the disks parameter. To set (or change) the image of a disk, add the following to the disks definitions:

```python
{
    'name': 'name_of_disk_to_change',
    'image': '/path/to/the/image'
}
```

- **nic** – NIC profile to use (Default: 'default'). The profile interfaces can be customized / extended with the interfaces parameter. If set to None, no profile will be used.
- **interfaces** – List of dictionaries providing details on the network interfaces to create. These data are merged with the ones from the nic profile. The structure of each dictionary is documented in Network Interfaces Definitions.

New in version 2019.2.0.

- **hypervisor** – the virtual machine type. By default the value will be computed according to the virtual host capabilities.
- **start** – True to start the virtual machine after having defined it (Default: True)
- **disk** – Disk profile to use (Default: 'default'). If set to None, no profile will be used.
- **disks** – List of dictionaries providing details on the disk devices to create. These data are merged with the ones from the disk profile. The structure of each dictionary is documented in Disks Definitions.

New in version 2019.2.0.

- **saltenv** – Fileserver environment (Default: 'base'). See cp module for more details
- **seed** – True to seed the disk image. Only used when the image parameter is provided. (Default: True)
- **install** – install salt minion if absent (Default: True)
- **pub_key** – public key to seed with (Default: None)
- **priv_key** – public key to seed with (Default: None)
- **seed_cmd** – Salt command to execute to seed the image. (Default: 'seed.apply')
- **enable_vnc** – True to setup a vnc display for the VM (Default: False)

Deprecated in favor of the graphics parameter. Could be replaced with the following:

```python
graphics={'type': 'vnc'}
```

Deprecated since version 2019.2.0.

- **graphics** – Dictionary providing details on the graphics device to create. (Default: None) See Graphics Definition for more details on the possible values.

21.9. execution modules 2597
New in version 2019.2.0.

- **os_type** – type of virtualization as found in the `//os/type` element of the libvirt definition. The default value is taken from the host capabilities, with a preference for **hvm**.

New in version 2019.2.0.

- **arch** – architecture of the virtual machine. The default value is taken from the host capabilities, but **x86_64** is preferred over **i686**.

New in version 2019.2.0.

- **enable_qcow** – **True** to create a QCOW2 overlay image, rather than copying the image (Default: **False**).

Deprecated in favor of **disks** parameter. Add the following to the disks definitions to create an overlay image of a template disk image with an image set:

```python
{
    'name': 'name_of_disk_to_change',
    'overlay_image': True
}
```

Deprecated since version 2019.2.0.

- **pool** – Path of the folder where the image files are located for vmware/esx hypervisors.

Deprecated in favor of **disks** parameter. Add the following to the disks definitions to set the vmware datastore of a disk image:

```python
{
    'name': 'name_of_disk_to_change',
    'pool': 'mydatastore'
}
```

Deprecated since version Fluorine.

- **dmac** – Default MAC address to use for the network interfaces. By default MAC addresses are automatically generated.

Deprecated in favor of **interfaces** parameter. Add the following to the interfaces definitions to force the mac address of a NIC:

```python
{
    'name': 'name_of_nic_to_change',
}
```

Deprecated since version 2019.2.0.

- **config** – minion configuration to use when seeding. See **seed module for more details**

- **boot_dev** – String of space-separated devices to boot from (Default: 'hd')

- **serial_type** – Serial device type. One of 'pty', 'tcp' (Default: None)

- **telnet_port** – Telnet port to use for serial device of type tcp.

- **console** – **True** to add a console device along with serial one (Default: **True**)

- **connection** – libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** – username to connect with, overriding defaults

New in version 2019.2.0.
• **password** – password to connect with, overriding defaults

New in version 2019.2.0.

### Network Interfaces Definitions

Network interfaces dictionaries can contain the following properties:
- **name** Name of the network interface. This is only used as a key to merge with the profile data
- **type** Network type. One of 'bridge', 'network'
- **source** The network source, typically the bridge or network name
- **mac** The desired mac address, computed if **None** (Default: **None**).
- **model** The network card model (Default: depends on the hypervisor)

### Disks Definitions

Disk dictionaries can contain the following properties:
- **name** Name of the disk. This is mostly used in the name of the disk image and as a key to merge with the profile data.
- **format** Format of the disk image, like 'qcow2', 'raw', 'vmdk'. (Default: depends on the hypervisor)
- **size** Disk size in MiB
- **pool** Path to the folder or name of the pool where disks should be created. (Default: depends on hypervisor)
- **model** One of the disk busses allowed by libvirt (Default: depends on hypervisor)

See the libvirt disk element documentation for the allowed bus types.
- **image** Path to the image to use for the disk. If no image is provided, an empty disk will be created (Default: **None**)
- **overlay_image** True to create a QCOW2 disk image with **image** as backing file. If False the file pointed to by the **image** property will simply be copied. (Default: False)
- **source_file** Absolute path to the disk image to use. Not to be confused with **image** parameter. This parameter is useful to use disk images that are created outside of this module. Can also be **None** for devices that have no associated image like cdroms.
- **device** Type of device of the disk. Can be one of 'disk', 'cdrom', 'floppy' or 'lun'. (Default: 'disk')

### Graphics Definition

The graphics dictionary can have the following properties:
- **type** Graphics type. The possible values are **none**, 'spice', 'vnc' and other values allowed as a libvirt graphics type (Default: **None**)

See the libvirt graphics element documentation for more details on the possible types.
- **port** Port to export the graphics on for vnc, spice and rdp types.
- **tls_port** Port to export the graphics over a secured connection for spice type.
- **listen** Dictionary defining on what address to listen on for vnc, spice and rdp. It has a type property with address and **None** as possible values, and an address property holding the IP or hostname to listen on.

By default, not setting the **listen** part of the dictionary will default to listen on all addresses.

### CLI Example

```sh
salt 'hypervisor' virt.init vm_name 4 512 salt://path/to/image.raw
salt 'hypervisor' virt.init vm_name 4 512 /var/lib/libvirt/images/img.raw
salt 'hypervisor' virt.init vm_name 4 512 nic=profile disk=profile
```
The disk images will be created in an image folder within the directory defined by the virt:images option. Its default value is /srv/salt-images/ but this can changed with such a configuration:

```
virt:
  images: /data/my/vm/images/
```

salt.modules.virt.is_hyper()
Returns a bool whether or not this node is a hypervisor of any kind

CLI Example:
```
salt '*' virt.is_hyper
```

salt.modules.virt.is_kvm_hyper()
Returns a bool whether or not this node is a KVM hypervisor

CLI Example:
```
salt '*' virt.is_kvm_hyper
```

Deprecated since version 2019.2.0.

salt.modules.virt.is_xen_hyper()
Returns a bool whether or not this node is a XEN hypervisor

CLI Example:
```
salt '*' virt.is_xen_hyper
```

Deprecated since version 2019.2.0.

salt.modules.virt.list_active_vms(**kwargs)
Return a list of names for active virtual machine on the minion

Parameters
- `connection` – libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- `username` – username to connect with, overriding defaults
  New in version 2019.2.0.
- `password` – password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
```
salt '*' virt.list_active_vms
```

salt.modules.virt.list_domains(**kwargs)
Return a list of available domains.

Parameters
- `connection` – libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- `username` – username to connect with, overriding defaults
  New in version 2019.2.0.
- `password` – password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
salt ' '*' virt.list_domains

salt.modules.virt.list_inactive_vms(**kwargs)
Return a list of names for inactive virtual machine on the minion
Parameters
  • connection – libvirt connection URI, overriding defaults
    New in version 2019.2.0.
  • username – username to connect with, overriding defaults
    New in version 2019.2.0.
  • password – password to connect with, overriding defaults
    New in version 2019.2.0.

CLI Example:
salt ' '*' virt.list_inactive_vms

salt.modules.virt.list_networks(**kwargs)
List all virtual networks.
Parameters
  • connection – libvirt connection URI, overriding defaults
  • username – username to connect with, overriding defaults
  • password – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:
salt ' '*' virt.list_networks

salt.modules.virt.list_pools(**kwargs)
List all storage pools.
Parameters
  • connection – libvirt connection URI, overriding defaults
  • username – username to connect with, overriding defaults
  • password – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:
salt ' '*' virt.list_pools

salt.modules.virt.list_snapshots(domain=None, **kwargs)
List available snapshots for certain vm or for all.
Parameters
  • domain – domain name
  • connection – libvirt connection URI, overriding defaults
    New in version 2019.2.0.
  • username – username to connect with, overriding defaults
    New in version 2019.2.0.
  • password – password to connect with, overriding defaults
    New in version 2019.2.0.

New in version 2016.3.0.

CLI Example:
salt '*' virt.list_snapshots
salt '*' virt.list_snapshots <domain>

salt.modules.virt.migrate( vm_, target, ssh=False)
  Shared storage migration
  Parameters
  •  vm – domain name
  •  target – target libvirt host name
  •  ssh – True to connect over ssh
  CLI Example:
  salt '*' virt.migrate <domain> <target hypervisor>

A tunnel data migration can be performed by setting this in the configuration:

```
virt:
  tunnel: True
```

For more details on tunnelled data migrations, report to https://libvirt.org/migration.html#transporthunnel

salt.modules.virt.migrate_non_shared( vm_, target, ssh=False)
  Attempt to execute non-shared storage "all" migration
  Parameters
  •  vm – domain name
  •  target – target libvirt host name
  •  ssh – True to connect over ssh
  CLI Example:
  salt '*' virt.migrate_non_shared <vm name> <target hypervisor>

A tunnel data migration can be performed by setting this in the configuration:

```
virt:
  tunnel: True
```

For more details on tunnelled data migrations, report to https://libvirt.org/migration.html#transporthunnel

salt.modules.virt.migrate_non_shared_inc( vm_, target, ssh=False)
  Attempt to execute non-shared storage "all" migration
  Parameters
  •  vm – domain name
  •  target – target libvirt host name
  •  ssh – True to connect over ssh
  CLI Example:
  salt '*' virt.migrate_non_shared_inc <vm name> <target hypervisor>

A tunnel data migration can be performed by setting this in the configuration:

```
virt:
  tunnel: True
```

For more details on tunnelled data migrations, report to https://libvirt.org/migration.html#transporthunnel

salt.modules.virt.network_define( name, bridge, forward, **kwargs)
  Create libvirt network.
  Parameters
- `name` – Network name
- `bridge` – Bridge name
- `forward` – Forward mode (bridge, router, nat)
- `vport` – Virtual port type
- `tag` – Vlan tag
- `autostart` – Network autostart (default True)
- `start` – Network start (default True)
- `connection` – Libvirt connection URI, overriding defaults
- `username` – Username to connect with, overriding defaults
- `password` – Password to connect with, overriding defaults

CLI Example:
```
salt '*' virt.network_define network main bridge openvswitch
```

New in version 2019.2.0.

`salt.modules.virt.network_info(name=None, **kwargs)`
Return informations on a virtual network provided its name.

Parameters
- `name` – Virtual network name
- `connection` – Libvirt connection URI, overriding defaults
- `username` – Username to connect with, overriding defaults
- `password` – Password to connect with, overriding defaults

If no name is provided, return the infos for all defined virtual networks.

New in version 2019.2.0.

CLI Example:
```
salt '*' virt.network_info default
```

`salt.modules.virt.network_set_autostart(name, state='on', **kwargs)`
Set the autostart flag on a virtual network so that the network will start with the host system on reboot.

Parameters
- `name` – Virtual network name
- `state` – 'on' to auto start the network, anything else to mark the virtual network not to be started when the host boots
- `connection` – Libvirt connection URI, overriding defaults
- `username` – Username to connect with, overriding defaults
- `password` – Password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:
```
salt '*' virt.network_set_autostart <pool> <on | off>
```

`salt.modules.virt.network_start(name, **kwargs)`
Start a defined virtual network.

Parameters
- `name` – Virtual network name
- `connection` – Libvirt connection URI, overriding defaults
- `username` – Username to connect with, overriding defaults
- `password` – Password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:
salt '*' virt.network_start default

salt.modules.virt.network_start(name, **kwargs)
    Stop a defined virtual network.
    Parameters
    - name – virtual network name
    - connection – libvirt connection URI, overriding defaults
    - username – username to connect with, overriding defaults
    - password – password to connect with, overriding defaults
    New in version 2019.2.0.
    CLI Example:
    salt '*' virt.network_start default

salt.modules.virt.network_stop(name, **kwargs)
    Stop a defined virtual network.
    Parameters
    - name – virtual network name
    - connection – libvirt connection URI, overriding defaults
    - username – username to connect with, overriding defaults
    - password – password to connect with, overriding defaults
    New in version 2019.2.0.
    CLI Example:
    salt '*' virt.network_stop default

salt.modules.virt.network_undefine(name, **kwargs)
    Remove a defined virtual network. This does not stop the virtual network.
    Parameters
    - name – virtual network name
    - connection – libvirt connection URI, overriding defaults
    - username – username to connect with, overriding defaults
    - password – password to connect with, overriding defaults
    New in version 2019.2.0.
    CLI Example:
    salt '*' virt.network_undefine default

salt.modules.virt.node_info(**kwargs)
    Return a dict with information about this node
    Parameters
    - connection – libvirt connection URI, overriding defaults
    New in version 2019.2.0.
    - username – username to connect with, overriding defaults
    New in version 2019.2.0.
    - password – password to connect with, overriding defaults
    New in version 2019.2.0.
    CLI Example:
    salt '*' virt.node_info

salt.modules.virt.pause(vm_, **kwargs)
    Pause the named vm
    Parameters
    - vm – domain name
    - connection – libvirt connection URI, overriding defaults
    New in version 2019.2.0.
    - username – username to connect with, overriding defaults
    New in version 2019.2.0.
    - password – password to connect with, overriding defaults
    New in version 2019.2.0.
    CLI Example:
salt '***' virt.pause <domain>

salt.modules.virt.pool_build(name, **kwargs)

Build a defined libvirt storage pool.

Parameters

- name – libvirt storage pool name
- connection – libvirt connection URI, overriding defaults
- username – username to connect with, overriding defaults
- password – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

salt '***' virt.pool_build default

salt.modules.virt.pool_define(name, ptype, target=None, permissions=None, source_devices=None, source_dir=None, source_adapter=None, source_hosts=None, source_auth=None, source_name=None, source_format=None, transient=False, start=True, **kwargs)

Create libvirt pool.

Parameters

- name – Pool name
- ptype – Pool type. See libvirt documentation for the possible values.
- target – Pool full path target
- permissions – Permissions to set on the target folder. This is mostly used for filesystem-based pool types. See Permissions definition for more details on this structure.
- source_devices – List of source devices for pools backed by physical devices. (Default: None)
  Each item in the list is a dictionary with path and optionally part_separator keys. The path is the qualified name for iSCSI devices.
  Report to this libvirt page for more informations on the use of part_separator keys.
- source_dir – Path to the source directory for pools of type dir, netfs or gluster. (Default: None)
- source_adapter – SCSI source definition. The value is a dictionary with type, name, parent, managed, parent_wwnn, parent_wwpn, parent_fabric_wwn, wwnn, wwpn and parent_address keys.
  The parent_address value is a dictionary with unique_id and address keys. The address represents a PCI address and is itself a dictionary with domain, bus, slot and function properties. Report to this libvirt page for the meaning and possible values of these properties.
- source_hosts – List of source for pools backed by storage from remote servers. Each item is the hostname optionally followed by the port separated by a colon. (Default: None)
- source_auth – Source authentication details. (Default: None)
  The value is a dictionary with type, username and secret keys. The type can be one of ceph for Ceph RBD or chap for iSCSI sources.
  The secret value links to a libvirt secret object. It is a dictionary with type and value keys. The type value can be either uuid or usage.

Examples:
source_auth=
  'type': 'ceph',
  'username': 'admin',
  'secret': {
    'type': 'uuid',
    'uuid': '2ec115d7-3a88-3ceb-bc12-0ac909a6fd87'
  }
}

source_auth=
  'type': 'chap',
  'username': 'myname',
  'secret': {
    'type': 'usage',
    'uuid': 'mycluster_myname'
  }

- **source_name** – Identifier of name-based sources.
- **source_format** – String representing the source format. The possible values are depending on the source type. See libvirt documentation for the possible values.
- **start** – Pool start (default True)
- **transient** – When True, the pool will be automatically undefined after being stopped. Note that a transient pool will force start to True. (Default: False)
- **connection** – libvirt connection URI, overriding defaults
- **username** – username to connect with, overriding defaults
- **password** – password to connect with, overriding defaults

Permissions definition

The permissions are described by a dictionary containing the following keys:
- **mode** The octal representation of the permissions. (Default: 0711)
- **owner** the numeric user ID of the owner. (Default: from the parent folder)
- **group** the numeric ID of the group. (Default: from the parent folder)
- **label** the SELinux label. (Default: None)

CLI Example:

Local folder pool:

salt '*' virt.pool_define somepool dir target=/srv/mypool
  !
  permissions="{"mode": '0744' 'owner': 107, 'group': 107 }
"

CIFS backed pool:

salt '*' virt.pool_define myshare netfs source_format=cifs
  !
  source_dir=samba_share source_hosts="['example.com']" target=/mnt/
  !

New in version 2019.2.0.

salt.modules.virt.pool_delete(name, fast=True, **kwargs)
Delete the resources of a defined libvirt storage pool.

Parameters
- **name** – libvirt storage pool name
- **fast** – if set to False, zeroes out all the data. Default value is True.
- **connection** – libvirt connection URI, overriding defaults
- **username** – username to connect with, overriding defaults
- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.pool_delete default
```

**salt.modules.virt.pool_info** *(name=None, **kwargs)*

Return informations on a storage pool provided its name.

Parameters

- **name** – libvirt storage pool name
- **connection** – libvirt connection URI, overriding defaults
- **username** – username to connect with, overriding defaults
- **password** – password to connect with, overriding defaults

If no name is provided, return the infos for all defined storage pools.

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.pool_info default
```

**salt.modules.virt.pool_list_volumes** *(name, **kwargs)*

List the volumes contained in a defined libvirt storage pool.

Parameters

- **name** – libvirt storage pool name
- **connection** – libvirt connection URI, overriding defaults
- **username** – username to connect with, overriding defaults
- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt "*" virt.pool_list_volumes <pool>
```

**salt.modules.virt.pool_refresh** *(name, **kwargs)*

Refresh a defined libvirt storage pool.

Parameters

- **name** – libvirt storage pool name
- **connection** – libvirt connection URI, overriding defaults
- **username** – username to connect with, overriding defaults
- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.pool_refresh default
```

**salt.modules.virt.pool_set_autostart** *(name, state='on', **kwargs)*

Set the autostart flag on a libvirt storage pool so that the storage pool will start with the host system on reboot.

Parameters

- **name** – libvirt storage pool name
- **state** – 'on' to auto start the pool, anything else to mark the pool not to be started when the host boots
- **connection** – libvirt connection URI, overriding defaults
• **username** – username to connect with, overriding defaults
• **password** – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt "*" virt.pool_set_autostart <pool> <on | off>
```

salt.modules.virt.pool_start(name, **kwargs)
Start a defined libvirt storage pool.

Parameters
• **name** – libvirt storage pool name
• **connection** – libvirt connection URI, overriding defaults
• **username** – username to connect with, overriding defaults
• **password** – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*/' virt.pool_start default
```

salt.modules.virt.pool_stop(name, **kwargs)
Stop a defined libvirt storage pool.

Parameters
• **name** – libvirt storage pool name
• **connection** – libvirt connection URI, overriding defaults
• **username** – username to connect with, overriding defaults
• **password** – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*/' virt.pool_stop default
```

salt.modules.virt.pool_undefine(name, **kwargs)
Remove a defined libvirt storage pool. The pool needs to be stopped before calling.

Parameters
• **name** – libvirt storage pool name
• **connection** – libvirt connection URI, overriding defaults
• **username** – username to connect with, overriding defaults
• **password** – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*/' virt.pool_undefine default
```

salt.modules.virt.purge(vm, dirs=False, removables=None, **kwargs)
Recursively destroy and delete a virtual machine, pass True for dir’s to also delete the directories containing the virtual machine disk images - USE WITH EXTREME CAUTION!

Pass removables=False to avoid deleting cdrom and floppy images. To avoid disruption, the default but dangerous value is True. This will be changed to the safer False default value in Sodium.

Parameters
• **vm** – domain name
• **dirs** – pass True to remove containing directories
• **removables** – pass True to remove removable devices
New in version 2019.2.0.

- **connection** – libvirt connection URI, overriding defaults
  
- **username** – username to connect with, overriding defaults
  
- **password** – password to connect with, overriding defaults
  
### CLI Example:

```
salt '*' virt.purge <domain> removables=False
```

### salt.modules.virt.reboot(name, **kwargs)

Reboot a domain via ACPI request

Parameters

- **vm** – domain name
- **connection** – libvirt connection URI, overriding defaults
  
- **username** – username to connect with, overriding defaults
  
- **password** – password to connect with, overriding defaults
  
### CLI Example:

```
salt '*' virt.reboot <domain>
```

### salt.modules.virt.reset(vm_, **kwargs)

Reset a VM by emulating the reset button on a physical machine

Parameters

- **vm** – domain name
- **connection** – libvirt connection URI, overriding defaults
  
- **username** – username to connect with, overriding defaults
  
- **password** – password to connect with, overriding defaults
  
### CLI Example:

```
salt '*' virt.reset <domain>
```

### salt.modules.virt.resume(vm_, **kwargs)

Resume the named vm

Parameters

- **vm** – domain name
- **connection** – libvirt connection URI, overriding defaults
  
- **username** – username to connect with, overriding defaults
  
- **password** – password to connect with, overriding defaults
  
New in version 2019.2.0.
salt.modules.virt.revert_snapshot(name, vm_snapshot=None, cleanup=False, **kwargs)
Revert snapshot to the previous from current (if available) or to the specific.

Parameters

- **name** – domain name
- **vm_snapshot** – name of the snapshot to revert
- **cleanup** – Remove all newer than reverted snapshots. Values: True or False (default False).
- **connection** – libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** – username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** – password to connect with, overriding defaults
  New in version 2019.2.0.

New in version 2016.3.0.

CLI Example:

```
salt '*' virt.revert <domain>
salt '*' virt.revert <domain> <snapshot>
```

salt.modules.virt.seed_non_shared_migrate(disks, force=False)
Non shared migration requires that the disks be present on the migration destination, pass the disks information via this function, to the migration destination before executing the migration.

Parameters

- **disks** – the list of disk data as provided by virt.get_disks
- **force** – skip checking the compatibility of source and target disk images if True.
  (default: False)

CLI Example:

```
salt '*' virt.seed_non_shared_migrate <disks>
```

salt.modules.virt.set_autostart(vm_, state='on', **kwargs)
Set the autostart flag on a VM so that the VM will start with the host system on reboot.

Parameters

- **vm** – domain name
- **state** – ‘on’ to auto start the pool, anything else to mark the pool not to be started when the host boots
- **connection** – libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** – username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** – password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:

```
salt "*" virt.set_autostart <domain> <on | off>
```

salt.modules.virt.setmem(vm_, memory, config=False, **kwargs)
Changes the amount of memory allocated to VM. The VM must be shutdown for this to work.
Parameters

- **vm** – name of the domain
- **memory** – memory amount to set in MB
- **config** – if True then libvirt will be asked to modify the config as well
- **connection** – libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** – username to connect with, overriding defaults

New in version 2019.2.0.

- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.setmem <domain> <size>
salt '*' virt.setmem my_domain 768
```

salt.modules.virt.setvcpus(*vm_*, vcpus, config=False, **kwargs)

Changes the amount of vcpus allocated to VM. The VM must be shutdown for this to work.

If config is True then we ask libvirt to modify the config as well

Parameters

- **vm** – name of the domain
- **vcpus** – integer representing the number of CPUs to be assigned
- **config** – if True then libvirt will be asked to modify the config as well
- **connection** – libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** – username to connect with, overriding defaults

New in version 2019.2.0.

- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.setvcpus <domain> <amount>
salt '*' virt.setvcpus my_domain 4
```

salt.modules.virt.shutdown(*vm_*, **kwargs)

Send a soft shutdown signal to the named vm

Parameters

- **vm** – domain name
- **connection** – libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** – username to connect with, overriding defaults

New in version 2019.2.0.

- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.shutdown <domain>
```

salt.modules.virt.snapshot(domain=None, name=None, suffix=None, **kwargs)

Create a snapshot of a VM.

Parameters
• **domain** – domain name
• **name** – Name of the snapshot. If the name is omitted, then will be used original
domain name with ISO 8601 time as a suffix.
• **suffix** – Add suffix for the new name. Useful in states, where such snapshots can
be distinguished from manually created.
• **connection** – libvirt connection URI, overriding defaults

  New in version 2019.2.0.
• **username** – username to connect with, overriding defaults

  New in version 2019.2.0.
• **password** – password to connect with, overriding defaults

  New in version 2019.2.0.

New in version 2016.3.0.

CLI Example:

```
salt '*' virt.snapshot <domain>
```

salt.modules.virt.start(name, **kwargs)

Start a defined domain

Parameters

• **vm** – domain name
• **connection** – libvirt connection URI, overriding defaults

  New in version 2019.2.0.
• **username** – username to connect with, overriding defaults

  New in version 2019.2.0.
• **password** – password to connect with, overriding defaults

  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.start <domain>
```

salt.modules.virt.stop(name, **kwargs)

Hard power down the virtual machine, this is equivalent to pulling the power.

Parameters

• **vm** – domain name
• **connection** – libvirt connection URI, overriding defaults

  New in version 2019.2.0.
• **username** – username to connect with, overriding defaults

  New in version 2019.2.0.
• **password** – password to connect with, overriding defaults

  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.stop <domain>
```

salt.modules.virt.undefine(vm_, **kwargs)

Remove a defined vm, this does not purge the virtual machine image, and this only works if the vm is powered
down

Parameters

• **vm** – domain name
• **connection** – libvirt connection URI, overriding defaults
  New in version 2019.2.0.
• **username** – username to connect with, overriding defaults
  New in version 2019.2.0.
• **password** – password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
```
salt '*' virt.undefine <domain>
```

salt.modules.virt.update(name, cpu=0, mem=0, disk_profile=None, disks=None, nic_profile=None, interfaces=None, graphics=None, live=True, **kwargs)

Update the definition of an existing domain.

Parameters

- **name** – Name of the domain to update
- **cpu** – Number of virtual CPUs to assign to the virtual machine
- **mem** – Amount of memory to allocate to the virtual machine in MiB.
- **disk_profile** – disk profile to use
- **disks** – Disk definitions as documented in the *init()* function. If neither the profile nor this parameter are defined, the disk devices will not be changed. However to clear disks set this parameter to empty list.
- **nic_profile** – network interfaces profile to use
- **interfaces** – Network interface definitions as documented in the *init()* function. If neither the profile nor this parameter are defined, the interface devices will not be changed. However to clear network interfaces set this parameter to empty list.
- **graphics** – The new graphics definition as defined in *Graphics Definition*. If not set, the graphics will not be changed. To remove a graphics device, set this parameter to {'type': 'none'}.
- **live** – False to avoid trying to live update the definition. In such a case, the new definition is applied at the next start of the virtual machine. If True, not all aspects of the definition can be live updated, but as much as possible will be attempted. (Default: True)
- **connection** – libvirt connection URI, overriding defaults
- **username** – username to connect with, overriding defaults
- **password** – password to connect with, overriding defaults

Returns

Returns a dictionary indicating the status of what has been done. It is structured in the following way:

```
{
    'definition': True,
    'cpu': True,
    'mem': True,
    'disks': {'attached': [list of actually attached disks],
              'detached': [list of actually detached disks]},
    'nics': {'attached': [list of actually attached nics],
             'detached': [list of actually detached nics]},
    'errors': ['error messages for failures']
}
```

New in version 2019.2.0.

CLI Example:
salt ' '*' virt.update domain cpu=2 mem=1024

salt.modules.virt.virt_type()
Returns the virtual machine type as a string

CLI Example:
salt ' '*' virt.virt_type

salt.modules.virt.vm_cputime(vm_=None, **kwargs)
Return cputime used by the vms on this hyper in a list of dicts:

Parameters
  • **vm** – domain name
  • **connection** – libvirt connection URI, overriding defaults
  • **username** – username to connect with, overriding defaults
  • **password** – password to connect with, overriding defaults

[ ]
  'your-vm': {
    'cputime': <int>
    'cputime_percent': <int>
  },
  ...
]

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will
return all VMs.

CLI Example:
salt ' '*' virt.vm_cputime

salt.modules.virt.vm_diskstats(vm_=None, **kwargs)
Return disk usage counters used by the vms on this hyper in a list of dicts:

Parameters
  • **vm** – domain name
  • **connection** – libvirt connection URI, overriding defaults
  • **username** – username to connect with, overriding defaults
  • **password** – password to connect with, overriding defaults

[ ]
  'your-vm': {
    'rd_req' : 0,
    'rd_bytes' : 0,
    'wr_req' : 0,
    'wr_bytes' : 0,
    'errs' : 0
  }

(continues on next page)
If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_diskstats
```

```python
salt.modules.virt.vm_info(**kwargs)
```

Return detailed information about the vms on this hyper in a list of dicts:

Parameters

- `vm` – name of the domain
- `connection` – libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- `username` – username to connect with, overriding defaults
  
  New in version 2019.2.0.
- `password` – password to connect with, overriding defaults
  
  New in version 2019.2.0.

```python
[
    
    'your-vm': {
        'cpu': <int>,
        'maxMem': <int>,
        'mem': <int>,
        'state': '<state>',
        'cputime': <int>
    },
    ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_info
```

```python
salt.modules.virt.vm_netstats(**kwargs)
```

Return combined network counters used by the vms on this hyper in a list of dicts:

Parameters

- `vm` – domain name
- `connection` – libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- `username` – username to connect with, overriding defaults
  
  New in version 2019.2.0.
- `password` – password to connect with, overriding defaults
  
  New in version 2019.2.0.
If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_netstats
```

`salt.modules.virt.vm_state(vm=None, **kwargs)`
Return list of all the vms and their state.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

### Parameters

- **vm** – name of the domain
- **connection** – libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** – username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** – password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.vm_state <domain>
```

### 21.9.447 `salt.modules.virtualenv`

Create virtualenv environments.

New in version 0.17.0.

```
salt.modules.virtualenv_mod.create(path, venv_bin=None, system_site_packages=False, distribute=False, clear=False, python=None, extra_search_dir=None, never_download=None, prompt=None, pip=False, symlinks=None, upgrade=None, user=None, use_vt=False, saltenv='base', **kwargs)
```

Create a virtualenv

- **path** The path to the virtualenv to be created
- **venv_bin** The name (and optionally path) of the virtualenv command. This can also be set globally in the minion config file as `virtualenv.venv_bin`. Defaults to `virtualenv`.
- **system_site_packages** [False] Passthrough argument given to virtualenv or pyenv
**distribute** [False] Passthrough argument given to virtualenv

**pip** [False] Install pip after creating a virtual environment. Implies `distribute=True`

**clear** [False] Passthrough argument given to virtualenv or pyvenv

**python** [None (default)] Passthrough argument given to virtualenv

**extra_search_dir** [None (default)] Passthrough argument given to virtualenv

**never_download** [None (default)] Passthrough argument given to virtualenv if True

**prompt** [None (default)] Passthrough argument given to virtualenv if not None

**symlinks** [None] Passthrough argument given to pyvenv if True

**upgrade** [None] Passthrough argument given to pyvenv if True

**user** [None] Set ownership for the virtualenv

---

**Note:** On Windows you must also pass a password parameter. Additionally, the user must have permissions to the location where the virtual environment is being created

---

**runas** [None] Set ownership for the virtualenv

   Deprecated since version 2014.1.0: `user` should be used instead

**use_vt** [False] Use VT terminal emulation (see output while installing)

   New in version 2015.5.0.

**saltenv** ['base'] Specify a different environment. The default environment is `base`.

   New in version 2014.1.0.

---

**Note:** The `runas` argument is deprecated as of 2014.1.0. `user` should be used instead.

---

**CLI Example:**

```
salt '*' virtualenv.create /path/to/new/virtualenv
```

**salt.modules.virtualenv_mod.get_distribution_path**(venv, distribution)

Return the path to a distribution installed inside a virtualenv

   New in version 2016.3.0.

**venv** Path to the virtualenv.

**distribution** Name of the distribution. Note, all non-alphanumeric characters will be converted to dashes.

   New in version 2016.3.0.

---

**CLI Example:**

```
salt '*' virtualenv.get_distribution_path /path/to/my/venv my_distribution
```

**salt.modules.virtualenv_mod.get_resource_content**(venv, package=None, resource=None)

Return the content of a package resource installed inside a virtualenv

   New in version 2016.3.0.

**venv** Path to the virtualenv

**package** Name of the package in which the resource resides

   New in version 2016.3.0.

**resource** Name of the resource of which the content is to be returned

   New in version 2016.3.0.

---

**CLI Example:**

```
salt '*' virtualenv.get_resource_content /path/to/my/venv my_package my/resource.xml
```
salt.modules.virtualenv_mod.get_resource_path(venv, package=None, resource=None)

Return the path to a package resource installed inside a virtualenv

New in version 2015.5.0.
venv Path to the virtualenv
package Name of the package in which the resource resides

New in version 2016.3.0.
resource Name of the resource of which the path is to be returned

New in version 2016.3.0.
CLI Example:
salt '*' virtualenv.get_resource_path /path/to/my/venv my_package my/resource.xml

salt.modules.virtualenv_mod.get_site_packages(venv)

Return the path to the site-packages directory of a virtualenv
venv Path to the virtualenv.

CLI Example:
salt '*' virtualenv.get_site_packages /path/to/my/venv

21.9.448 salt.modules.vmctl

Manage vms running on the OpenBSD VMM hypervisor using vmctl(8).
New in version 2019.2.0.

codeauthor Jasper Lievisse Adriaanse <jasper@openbsd.org>

Note: This module requires the vmd service to be running on the OpenBSD target machine.

salt.modules.vmctl.create_disk(name, size)
Create a VMM disk with the specified name and size.
size: Size in megabytes, or use a specifier such as M, G, T.

CLI Example:
salt '*' vmctl.create_disk /path/to/disk.img size=10G

salt.modules.vmctl.load(path)
Load additional configuration from the specified file.
path Path to the configuration file.

CLI Example:
salt '*' vmctl.load path=/etc/vm.switches.conf

salt.modules.vmctl.reload()
Remove all stopped VMs and reload configuration from the default configuration file.

CLI Example:
salt '*' vmctl.reload

salt.modules.vmctl.reset(all=False, vms=False, switches=False)
Reset the running state of VMM or a subsystem.
all: Reset the running state.
switches: Reset the configured switches.
vms: Reset and terminate all VMs.

CLI Example:

```bash
salt '*' vmctl.reset all=True
```

salt.modules.vmctl.start(name=None, id=None, bootpath=None, disk=None, disks=None, local_iface=False, memory=None, nics=0, switch=None)

Starts a VM defined by the specified parameters. When both a name and id are provided, the id is ignored.

name: Name of the defined VM.
id: VM id.
bootpath: Path to a kernel or BIOS image to load.
disk: Path to a single disk to use.
disks: List of multiple disks to use.
local_iface: Whether to add a local network interface. See "LOCAL INTERFACES" in the vmctl(8) manual page for more information.
memory: Memory size of the VM specified in megabytes.
switch: Add a network interface that is attached to the specified virtual switch on the host.

CLI Example:

```bash
salt '*' vmctl.start 2 # start VM with id 2
salt '*' vmctl.start name=web1 bootpath='/bsd.rd' nics=2 memory=512M disk='/disk.img'
```

salt.modules.vmctl.status(name=None, id=None)

List VMs running on the host, or only the VM specified by id. When both a name and id are provided, the id is ignored.

name: Name of the defined VM.
id: VM id.

CLI Example:

```bash
salt '*' vmctl.status # to list all VMs
salt '*' vmctl.status name=web1 # to get a single VM
```

salt.modules.vmctl.stop(name=None, id=None)

Stop (terminate) the VM identified by the given id or name. When both a name and id are provided, the id is ignored.

name: Name of the defined VM.
id: VM id.

CLI Example:

```bash
salt '*' vmctl.stop name=alpine
```

21.9.449 salt.modules.vsphere

Manage VMware vCenter servers and ESXi hosts.

New in version 2015.8.4.

codeauthor Alexandru Bleotu <alexandru.bleotu@morganstaley.com>

Dependencies

- pyVmomi Python Module
ESXCLI

PyVmomi

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

**Note:** Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See Issue #29537 for more information.

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==5.5.0.2014.1.1
```

The 5.5.0.2014.1.1 is a known stable version that this original vSphere Execution Module was developed against.

ESXCLI

Currently, about a third of the functions used in the vSphere Execution Module require the ESXCLI package be installed on the machine running the Proxy Minion process.

The ESXCLI package is also referred to as the VMware vSphere CLI, or vCLI. VMware provides vCLI package installation instructions for vSphere 5.5 and vSphere 6.0.

Once all of the required dependencies are in place and the vCLI package is installed, you can check to see if you can connect to your ESXi host or vCenter server by running the following command:

```
esxcli -s <host-location> -u <username> -p <password> system syslog config get
```

If the connection was successful, ESXCLI was successfully installed on your system. You should see output related to the ESXi host’s syslog configuration.

**Note:** Be aware that some functionality in this execution module may depend on the type of license attached to a vCenter Server or ESXi host(s).

For example, certain services are only available to manipulate service state or policies with a VMware vSphere Enterprise or Enterprise Plus license, while others are available with a Standard license. The `ntpd` service is restricted to an Enterprise Plus license, while `ssh` is available via the Standard license.

Please see the vSphere Comparison page for more information.

About

This execution module was designed to be able to handle connections both to a vCenter Server, as well as to an ESXi host. It utilizes the pyVmomi Python library and the ESXCLI package to run remote execution functions against either the defined vCenter server or the ESXi host.
Whether or not the function runs against a vCenter Server or an ESXi host depends entirely upon the arguments passed into the function. Each function requires a `host` location, `username`, and `password`. If the credentials provided apply to a vCenter Server, then the function will be run against the vCenter Server. For example, when listing hosts using vCenter credentials, you’ll get a list of hosts associated with that vCenter Server:

```
# salt my-minion vsphere.list_hosts <vcenter-ip> <vcenter-user> <vcenter-password>
my-minion:
  - esxi-1.example.com
  - esxi-2.example.com
```

However, some functions should be used against ESXi hosts, not vCenter Servers. Functionality such as getting a host’s coredump network configuration should be performed against a host and not a vCenter server. If the authentication information you’re using is against a vCenter server and not an ESXi host, you can provide the host name that is associated with the vCenter server in the command, as a list, using the `host_names` or `esxi_host` kwarg. For example:

```
# salt my-minion vsphere.get_coredump_network_config <vcenter-ip> <vcenter-user> <vcenter-password> esxi_hosts='[esxi-1.example.com, esxi-2.example.com]'
my-minion:
  esxi-1.example.com:
    ------------
    Coredump Config:
    ----------
    enabled:
      False
  esxi-2.example.com:
    ------------
    Coredump Config:
    ----------
    enabled:
      True
    host_vnic:
      vmk0
    ip:
      coredump-location.example.com
    port:
      6500
```

You can also use these functions against an ESXi host directly by establishing a connection to an ESXi host using the host’s location, username, and password. If ESXi connection credentials are used instead of vCenter credentials, the `host_names` and `esxi_hosts` arguments are not needed.

```
# salt my-minion vsphere.get_coredump_network_config esxi-1.example.com root <host-password>
local:
  10.4.28.150:
    ------------
    Coredump Config:
    ----------
    enabled:
      True
    host_vnic:
      vmk0
    ip:
      coredump-location.example.com
```

(continues on next page)
salt.modules.vsphere.add_capacity_to_diskgroup(cache_disk_id, capacity_disk_ids, safety_checks=True, service_instance=None)

Adds capacity disks to the disk group with the specified cache disk.

* cache_disk_id The canonical name of the cache disk.
* capacity_disk_ids A list containing canonical names of the capacity disks to add.
* safety_checks Specify whether to perform safety check or to skip the checks and try performing the required task. Default value is True.
* service_instance Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```python
salt '*' vsphere.add_capacity_to_diskgroup
    cache_disk_id='naa.000000000000001'
    capacity_disk_ids='[naa.0000000000000002, naa.0000000000000003]'
```

salt.modules.vsphere.add_host_to_dvs(host, username, password, vmnic_name, vmnic_name, dvs_name, target_portgroup_name, uplink_portgroup_name, protocol=None, port=None, host_names=None)

Adds an ESXi host to a vSphere Distributed Virtual Switch and migrates the desired adapters to the DVS from the standard switch.

* host The location of the vCenter server.
* username The username used to login to the vCenter server.
* password The password used to login to the vCenter server.
* vmnic_name The name of the virtual NIC to migrate.
* dvs_name The name of the physical NIC to migrate.
* target_portgroup_name The name of the distributed portgroup in which to migrate the virtual NIC.
* uplink_portgroup_name The name of the uplink portgroup in which to migrate the physical NIC.
* protocol Optionally set to alternate protocol if the vCenter server or ESX/ESXi host is not using the default protocol. Default protocol is https.
* port Optionally set to alternate port if the vCenter server or ESX/ESXi host is not using the default port. Default port is 443.
* host_names: An array of VMware host names to migrate

CLI Example:

```python
salt some_host vsphere.add_host_to_dvs host='vsphere.corp.com'
    username='administrator@vsphere.corp.com' password='vsphere_password'
    vmnic_name='vmk0' vmnic_name='vmnic0' dvs_name='DSwitch'
    target_portgroup_name='DPortGroup' uplink_portgroup_name='DSwitch1-DVUplinks-\~181'
    protocol='https' port='443', host_names=['esxi1.corp.com', 'esxi2.corp.com', \~'esxi3.corp.com']"
```

Return Example:

```python
somehost:
    ----------
    esxi1.corp.com:
        ----------
        dvs:
            DSwitch
```

(continues on next page)
This was very difficult to figure out. VMware’s PyVmomi documentation at
https://github.com/vmware/pyvmomi/blob/master/docs/vim/DistributedVirtualSwitch.rst (which is a copy
says to create the DVS, create distributed portgroups, and then add the host to the DVS specifying which
physical NIC to use as the port backing. However, if the physical NIC is in use as the only link from the host
to vSphere, this will fail with an unhelpful "busy" error.

There is, however, a Powershell PowerCLI cmdlet called Add-VDSwitchPhysicalNetworkAdapter that does
what we want. I used Onyx (https://labs.vmware.com/flings/onyx) to sniff the SOAP stream from Powershell
to our vSphere server and got this snippet out:

```xml
<UpdateNetworkConfig xmlns="urn:vim25">
  
</UpdateNetworkConfig>
```
The SOAP API maps closely to PyVmomi, so from there it was (relatively) easy to figure out what Python to write.

**salt.modules.vsphere.add_license** *(key, description, safety_checks=True, service_instance=None)*

Adds a license to the vCenter or ESXi host

- **key** License key.
- **description** License description added in as a label.
- **safety_checks** Specify whether to perform safety check or to skip the checks and try performing the required task
- **service_instance** Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```python
salt '*' vsphere.add_license key=<license_key> desc='License desc'
```

**salt.modules.vsphere.assign_default_storage_policy_to_datastore** *(policy, datastore, service_instance=None)*

Assigns a storage policy as the default policy to a datastore.
policy  Name of the policy to assign.
datastore  Name of the datastore to assign. The datastore needs to be visible to the VMware entity the proxy
points to.
service_instance  Service instance (vim.ServiceInstance) of the vCenter. Default is None.

salt '*' vsphere.assign_storage_policy_to_datastore	policy='policy name' datastore=ds1

salt.modules.vsphere.assign_license(license_key, license_name, entity, entity_display_name, safety_checks=True, service_instance=None)
Assigns a license to an entity
license_key  Key of the license to assign See _get_entity docstrings for format.
license_name  Display name of license
entity  Dictionary representation of an entity
entity_display_name  Entity name used in logging
safety_checks  Specify whether to perform safety check or to skip the checks and try performing the required
task. Default is False.
service_instance  Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

salt '*' vsphere.assign_license  license_key=00000:00000
  license name=test entity={type:cluster,datacenter:dc,cluster:cl}

salt.modules.vsphere.compare_vm_configs(new_config, current_config)
Compares virtual machine current and new configuration, the current is the one which is deployed now, and
the new is the target config. Returns the differences between the objects in a dictionary, the keys are the
configuration parameter keys and the values are differences objects: either list or recursive difference
new_config: New config dictionary with every available parameter
current_config: Currently deployed configuration

salt.modules.vsphere.configure_host_cache(enabled, datastore=None, swap_size_MiB=None, service_instance=None)
Configures the host cache on the selected host.
enabled  Boolean flag specifying whether the host cache is enabled.
datastore  Name of the datastore that contains the host cache. Must be set if enabled is True.
swap_size_MiB  Swap size in Mibibytes. Needs to be set if enabled is True. Must be smaller than the datastore
size.
service_instance  Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

salt '*' vsphere.configure_host_cache enabled=False
salt '*' vsphere.configure_host_cache enabled=True datastore=ds1
  swap_size_MiB=1024

salt.modules.vsphere.coredump_network_enable(host, username, password, enabled, protocol=None, port=None, esxi_hosts=None, credstore=None)
Enable or disable ESXi core dump collection. Returns True if coredump is enabled and returns False if core
dump is not enabled. If there was an error, the error will be the value printed in the Error key dictionary for
the given host.
host  The location of the host.
username  The username used to login to the host, such as root.
password  The password used to login to the host.
enabled  Python True or False to enable or disable coredumps.
protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is
https.
port  Optionally set to alternate port if the host is not using the default port. Default port is 443.
**esxi_hosts** If host is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.

**credstore** Optionally set to path to the credential store file.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.coredump_network_enable my.esxi.host root bad-password True

# Used for connecting to a vCenter Server
salt '*' vsphere.coredump_network_enable my.vcenter.location root bad-password

esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

```
salt.modules.vsphere.create_cluster(cluster_dict, datacenter=None, cluster=None, service_instance=None)
```

Creates a cluster.

Note: cluster_dict['name'] will be overridden by the cluster param value

**config_dict** Dictionary with the config values of the new cluster.

**datacenter** Name of datacenter containing the cluster. Ignored if already contained by proxy details. Default value is None.

**cluster** Name of cluster. Ignored if already contained by proxy details. Default value is None.

**service_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```
# esxdatacenter proxy
salt '*' vsphere.create_cluster cluster_dict=$cluster_dict cluster=cl1

# esxcluster proxy
salt '*' vsphere.create_cluster cluster_dict=$cluster_dict
```

```
salt.modules.vsphere.create_datacenter(datacenter_name, service_instance=None)
```

Creates a datacenter.

Supported proxies: esxdatacenter

**datacenter_name** The datacenter name

**service_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```
salt '*' vsphere.create_datacenter dc1
```

```
salt.modules.vsphere.create_diskgroup(cache_disk_id, capacity_disk_ids, safety_checks=True, service_instance=None)
```

Creates disk group on an ESXi host with the specified cache and capacity disks.

**cache_disk_id** The canonical name of the disk to be used as a cache. The disk must be ssd.

**capacity_disk_ids** A list containing canonical names of the capacity disks. Must contain at least one id. Default is True.

**safety_checks** Specify whether to perform safety check or to skip the checks and try performing the required task. Default value is True.

**service_instance** Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```
salt '*' vsphere.create_diskgroup cache_disk_id='naa.000000000000001'
capacity_disk_ids='[naa.000000000000002, naa.000000000000003]'
```

```
salt.modules.vsphere.create_dvportgroup(portgroup_dict, portgroup_name, dvs, service_instance=None)
```

Creates a distributed virtual portgroup.

Note: The portgroup_name param will override any name already set in portgroup_dict.

**portgroup_dict** Dictionary with the config values the portgroup should be created with (example in salt.states.dvs).
portgroup_name  Name of the portgroup to be created.
dvs  Name of the DVS that will contain the portgroup.
service_instance  Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```python
salt '*' vsphere.create_dvportgroup portgroup_dict={
    'portgroup_name': 'pg1',
    'dvs': 'dvs1'
}
```

**salt.modules.vsphere.create_dvs** *(dvs_dict, dvs_name, service_instance=None)*

Creates a distributed virtual switch (DVS).

Note: The `dvs_name` param will override any name set in `dvs_dict`.

- **dvs_dict** Dict representation of the new DVS (example in salt.states.dvs)
- **dvs_name** Name of the DVS to be created.
- **service_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```python
salt '*' vsphere.create_dvs dvs_dict=$dvs_dict dvs_name=dvs_name
```

**salt.modules.vsphere.create_storage_policy** *(policy_name, policy_dict, service_instance=None)*

Creates a storage policy.

Supported capability types: scalar, set, range.

- **policy_name** Name of the policy to create. The value of the argument will override any existing name in `policy_dict`.
- **policy_dict** Dictionary containing the changes to apply to the policy. (example in salt.states.pbm)
- **service_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```python
salt '*' vsphere.create_storage_policy policy_name='policy name' policy_dict="$policy_dict"
```

**salt.modules.vsphere.create_vm***(vm_name, cpu, memory, image, version, datacenter, datastore, placement, interfaces, disks, scsi_devices, serial_ports=None, ide_controllers=None, sata_controllers=None, cd_drives=None, advanced_configs=None, service_instance=None)*

Creates a virtual machine container.

**CLI Example:**

```bash
salt vm_minion vsphere.create_vm vm_name=vmname cpu='{count: 2, nested: True}' ... 
```

- **vm_name** Name of the virtual machine
- **cpu** Properties of CPUs for freshly created machines
- **memory** Memory size for freshly created machines
- **image** Virtual machine guest OS version identifier VirtualMachineGuestOsIdentifier
- **version** Virtual machine container hardware version
- **datacenter** Datacenter where the virtual machine will be deployed (mandatory)
- **datastore** Datastore where the virtual machine files will be placed
- **placement** Resource pool or cluster or host or folder where the virtual machine will be deployed
- **interfaces**
  ```
  interfaces:
  adapter: 'Network adapter 1'
  name: vlan100
  switch_type: distributed or standard
  adapter_type: vmxnet3 or vmxnet, vmxnet2, vmxnet3, e1000, e1000e
  mac: '00:11:22:33:44:55'
  connectable: ...
  ```

(continues on next page)
allow_guest_control: True
connected: True
start_connected: True

disks

disks:
  adapter: 'Hard disk 1'
  size: 16
  unit: GB
  address: '0:0'
  controller: 'SCSI controller 0'
  thin_provision: False
  eagerly_scrub: False
  datastore: 'myshare'
  filename: 'vm/mydisk.vmdk'

scsi_devices

scsi_devices:
  controller: 'SCSI controller 0'
  type: paravirtual
  bus_sharing: no_sharing

serial_ports

serial_ports:
  adapter: 'Serial port 1'
  type: network
  backing:
    uri: 'telnet://something:port'
    direction: <client|server>
    filename: 'service_uri'
  connectable:
    allow_guest_control: True
    connected: True
    start_connected: True
    yield: False

cd_drives

cd_drives:
  adapter: 'CD/DVD drive 0'
  controller: 'IDE 0'
  device_type: datastore_iso_file
  datastore_iso_file:
    path: path_to_iso
  connectable:
    allow_guest_control: True
    connected: True
    start_connected: True

advanced_config  Advanced config parameters to be set for the virtual machine

salt.modules.vsphere.create_vmfs_datastore(datastore_name, disk_id, vmfs_major_version, safety_checks=True, service_instance=None)

Creates a ESXi host disk group with the specified cache and capacity disks.

datastore_name  The name of the datastore to be created.
disk_id  The disk id (canonical name) on which the datastore is created.
vmfs_major_version  The VMFS major version.
safety_checks  Specify whether to perform safety check or to skip the checks and try performing the required task. Default is True.
service_instance  Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```
salt '*' vsphere.create_vmfs_datastore datastore_name=ds1 disk_id=
    vmfs_major_version=5
```

salt.modules.vsphere.delete_advanced_configs(vm_name, datacenter, advanced_configs,
    service_instance=None)

Removes extra config parameters from a virtual machine

```
vm_name  Virtual machine name
datacenter  Datacenter name where the virtual machine is available
advanced_configs  List of advanced config values to be removed
service_instance  vCenter service instance for connection and configuration
```

```
salt '*' vsphere.delete_vm name=my_vm datacenter=my_datacenter
```

salt.modules.vsphere.disconnect(service_instance)

Disconnects from a vCenter or ESXi host

Note: Should be used by state functions, not invoked directly.

```
service_instance  Service instance (vim.ServiceInstance)
```

CLI Example:
See note above.

salt.modules.vsphere.enable_firewall_ruleset(host, username, password, ruleset_enable,
    ruleset_name, protocol=None, port=None, esxi_hosts=None, credstore=None)

Enable or disable an ESXi firewall rule set.

```
host  The location of the host.
username  The username used to login to the host, such as root.
password  The password used to login to the host.
ruleset_enable  True to enable the ruleset, false to disable.
ruleset_name  Name of ruleset to target.
protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port  Optionally set to alternate port if the host is not using the default port. Default port is 443.
esxi_hosts  If host is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.
credstore  Optionally set to path to the credential store file.
```

Returns  A standard cmd.run_all dictionary, per host.

CLI Example:
salt.modules.vsphere.erase_disk_partitions

Erases the partitions on a disk. The disk can be specified either by the canonical name, or by the scsi_address.

- **disk_id**: Canonical name of the disk. Either disk_id or scsi_address needs to be specified (disk_id supersedes scsi_address).
- **scsi_address**: Scsi address of the disk. disk_id or scsi_address needs to be specified (disk_id supersedes scsi_address).
- **service_instance**: Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

salt.modules.vsphere.esxcli_cmd

Run an ESXCLI command directly on the host or list of hosts.

- **host**: The location of the host.
- **username**: The username used to login to the host, such as root.
- **password**: The password used to login to the host.
- **cmd_str**: The ESXCLI command to run. Note: This should not include the -s, -u, -p, -h, --protocol, or --portnumber arguments that are frequently passed when using a bare ESXCLI command from the command line. Those arguments are handled by this function via the other args and kwargs.
- **protocol**: Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port**: Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **esxi_hosts**: If host is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.
- **credstore**: Optionally set to path to the credential store file.

CLI Example:

salt.modules.vsphere.get_coredump_network_config

Retrieve information on ESXi or vCenter network dump collection and format it into a dictionary.

salt.modules.vsphere.get_advanced_configs

Returns extra config parameters from a virtual machine advanced config list

- **vm_name**: Virtual machine name
- **datacenter**: Datacenter name where the virtual machine is available
- **service_instance**: vCenter service instance for connection and configuration

salt.modules.vsphere.get_coredump_network_config

Retrieve information on ESXi or vCenter network dump collection and format it into a dictionary.
host  The location of the host.
username  The username used to login to the host, such as root.
password  The password used to login to the host.
protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port  Optionally set to alternate port if the host is not using the default port. Default port is 443.
esxi_hosts  If host is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.
credstore  Optionally set to path to the credential store file.

Returns  A dictionary with the network configuration, or, if getting the network config failed, a
an error message retrieved from the standard cmd.run_all dictionary, per host.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.get_coredump_network_config my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_coredump_network_config my.vcenter.location root bad-password
esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.get_firewall_status(host, username, password, protocol=None, port=None, esxi_hosts=None, credstore=None)

Show status of all firewall rule sets.

host  The location of the host.
username  The username used to login to the host, such as root.
password  The password used to login to the host.
protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port  Optionally set to alternate port if the host is not using the default port. Default port is 443.
esxi_hosts  If host is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.
credstore  Optionally set to path to the credential store file.

Returns  Nested dictionary with two toplevel keys rulesets and success success will be
True or False depending on query success rulesets will list the rulesets and their statuses
if success was true, per host.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.get_firewall_status my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_firewall_status my.vcenter.location root bad-password
esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.get_host_cache(service_instance=None)

Returns the host cache configuration on the proxy host.

service_instance  Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```
salt '*' vsphere.get_host_cache
```

salt.modules.vsphere.get_host_datetime(host, username, password, protocol=None, port=None, host_names=None)

Get the date/time information for a given host or list of host_names.

host  The location of the host.
username  The username used to login to the host, such as root.
password  The password used to login to the host.
protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port  Optionally set to alternate port if the host is not using the default port. Default port is 443.
host_names  List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to get date/time information.

If host_names is not provided, the date/time information will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```shell
# Used for single ESXi host connection information
salt '*' vsphere.get_host_datetime my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_host_datetime my.vcenter.location root bad-password
# host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.get_ntp_config(host, username, password, protocol=None, port=None, host_names=None)

Get the NTP configuration information for a given host or list of host_names.

host  The location of the host.
username  The username used to login to the host, such as root.
password  The password used to login to the host.
protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port  Optionally set to alternate port if the host is not using the default port. Default port is 443.
host_names  List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to get ntp configuration information.

If host_names is not provided, the NTP configuration will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```shell
# Used for single ESXi host connection information
salt '*' vsphere.get_ntp_config my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_ntp_config my.vcenter.location root bad-password
# host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.get_proxy_type()

Returns the proxy type retrieved either from the pillar of from the proxy minion's config. Returns <undefined> otherwise.

CLI Example:

```shell
salt '*' vsphere.get_proxy_type
```

salt.modules.vsphere.get_service_instance_via_proxy(service_instance=None)

Returns a service instance to the proxied endpoint (vCenter/ESXi host).

service_instance  Service instance (vim.ServiceInstance) of the vCenter. Default is None.
Note: Should be used by state functions not invoked directly.

CLI Example: See note above

```python
salt.modules.vsphere.get_service_policy(host, username, password, service_name, protocol=None, port=None, host_names=None)
```

Get the service name’s policy for a given host or list of hosts.

- **host** The location of the host.
- **username** The username used to login to the host, such as root.
- **password** The password used to login to the host.
- **service_name**
  - The name of the service for which to retrieve the policy. Supported service names are:
    - DCUI
    - TSM
    - SSH
    - lbtd
    - lsassd
    - lwiod
    - netlogond
    - ntpd
    - sfchd-watchdog
    - snmpd
    - vprobed
    - vpxa
    - xorg

- **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port** Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **host_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to get service policy information.

If host_names is not provided, the service policy information will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```bash
# Used for single ESXi host connection information
salt '*' vsphere.get_service_policy my.esxi.host root bad-password 'ssh'

# Used for connecting to a vCenter Server
salt '*' vsphere.get_service_policy my.vcenter.location root bad-password 'ntpd' |
  host_names='[esxi-1.host.com, esxi-2.host.com]'
```

```python
salt.modules.vsphere.get_service_running(host, username, password, service_name, protocol=None, port=None, host_names=None)
```

Get the service name’s running state for a given host or list of hosts.

- **host** The location of the host.
- **username** The username used to login to the host, such as root.
- **password** The password used to login to the host.
- **service_name**
  - The name of the service for which to retrieve the policy. Supported service names are:
    - DCUI
    - TSM
    - SSH
- lbtd
- lsassd
- lwiod
- netlogond
- ntpd
- sfcbd-watchdog
- snmpd
- vprobed
- vpxa
- xorg

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**host_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to get the service's running state.

If host_names is not provided, the service's running state will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

**CLI Example:**

```
# Used for single ESXi host connection information
salt '*' vsphere.get_service_running my.esxi.host root bad-password 'ssh'
```

```
# Used for connecting to a vCenter Server
salt '*' vsphere.get_service_running my.vcenter.location root bad-password 'ntpd'
# host_names='[esxi-1.host.com, esxi-2.host.com]'
```

**salt.modules.vsphere.get_ssh_key** *(host, username, password, protocol=None, port=None, certificate_verify=False)*

Retrieve the authorized_keys entry for root. This function only works for ESXi, not vCenter.

**Parameters**

- **host** – The location of the ESXi Host
- **username** – Username to connect as
- **password** – Password for the ESXi web endpoint
- **protocol** – defaults to https, can be http if ssl is disabled on ESXi
- **port** – defaults to 443 for https
- **certificate_verify** – If true require that the SSL connection present a valid certificate

**Returns** True if upload is successful

**CLI Example:**

```
salt '*' vsphere.get_ssh_key my.esxi.host root bad-password certificate_verify=True
```

**salt.modules.vsphere.get_syslog_config** *(host, username, password, protocol=None, port=None, esxi_hosts=None, credstore=None)*

Retrieve the syslog configuration.

- **host** The location of the host.
- **username** The username used to login to the host, such as root.
- **password** The password used to login to the host.
- **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port** Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **esxi_hosts** If host is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.
credstore Optionally set to path to the credential store file.

Returns Dictionary with keys and values corresponding to the syslog configuration, per host.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.get_syslog_config my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_syslog_config my.vcenter.location root bad-password
← esxi_hosts=['esxi-1.host.com, esxi-2.host.com']
```

salt.modules.vsphere.get_vm(name, datacenter=None, vm_properties=None, traversal_spec=None, parent_ref=None, service_instance=None)

Returns vm object properties.

- **name**: Name of the virtual machine.
- **datacenter**: Datacenter name
- **vm_properties**: List of vm properties.
- **traversal_spec**: Traversal Spec object(s) for searching.
- **parent_ref**: Container Reference object for searching under a given object.
- **service_instance**: Service instance (vim.ServiceInstance) of the vCenter. Default is None.

salt.modules.vsphere.get_vm_config(name, datacenter=None, objects=True, service_instance=None)

Queries and converts the virtual machine properties to the available format from the schema. If the objects attribute is True the config objects will have extra properties, like 'object' which will include the vim.vm.device.VirtualDevice, this is necessary for deletion and update actions.

- **name**: Name of the virtual machine
- **datacenter**: Datacenter’s name where the virtual machine is available
- **objects**: Indicates whether to return the vmware object properties (eg. object, key) or just the properties which can be set
- **service_instance**: vCenter service instance for connection and configuration

salt.modules.vsphere.get_vm_config_file(name, datacenter, placement, datastore, service_instance=None)

Queries the virtual machine config file and returns vim.host.DatastoreBrowser.SearchResults object on success None on failure

- **name**: Name of the virtual machine
- **datacenter**: Datacenter name
- **datastore**: Datastore where the virtual machine files are stored
- **service_instance**: Service instance (vim.ServiceInstance) of the vCenter. Default is None.

salt.modules.vsphere.get_vmotion_enabled(host, username, password, protocol=None, port=None, host_names=None)

Get the VMotion enabled status for a given host or a list of host_names. Returns True if VMotion is enabled, False if it is not enabled.

- **host**: The location of the host.
- **username**: The username used to login to the host, such as root.
- **password**: The password used to login to the host.
- **protocol**: Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port**: Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **host_names**: List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts to check if VMotion is enabled.

If host_names is not provided, the VMotion status will be retrieved for the host location instead.
is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.get_vmotion_enabled my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_vmotion_enabled my.vcenter.location root bad-password
-> host_names='[esxi-1.host.com, esxi-2.host.com]'
```

```
salt.modules.vsphere.get_vsan_eligible_disks(host, username, password, protocol=None, port=None, host_names=None)
```

Returns a list of VSAN-eligible disks for a given host or list of host_names.

- **host**: The location of the host.
- **username**: The username used to login to the host, such as `root`.
- **password**: The password used to login to the host.
- **protocol**: Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.
- **port**: Optionally set to alternate port if the host is not using the default port. Default port is `443`.
- **host_names**: List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts to check if any VSAN-eligible disks are available.

If host_names is not provided, the VSAN-eligible disks will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.get_vsan_eligible_disks my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_vsan_eligible_disks my.vcenter.location root bad-password
-> host_names='[esxi-1.host.com, esxi-2.host.com]'
```

```
salt.modules.vsphere.get_vsan_enabled(host, username, password, protocol=None, port=None, host_names=None)
```

Get the VSAN enabled status for a given host or a list of host_names. Returns `True` if VSAN is enabled, `False` if it is not enabled, and `None` if a VSAN Host Config is unset, per host.

- **host**: The location of the host.
- **username**: The username used to login to the host, such as `root`.
- **password**: The password used to login to the host.
- **protocol**: Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.
- **port**: Optionally set to alternate port if the host is not using the default port. Default port is `443`.
- **host_names**: List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts to check if VSAN enabled.

If host_names is not provided, the VSAN status will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.get_vsan_enabled my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_vsan_enabled my.vcenter.location root bad-password
-> host_names='[esxi-1.host.com, esxi-2.host.com]'
```
Decorator that connects to a target system (vCenter or ESXi host) using the proxy details and passes the connection (vim.ServiceInstance) to the decorated function.

Supported proxies: esxi, esxcluster, esxdatacenter.

Notes

1. The decorated function must have a service_instance parameter or a **kwarg type argument (name of argument is not important); 2. If the service_instance parameter is already defined, the value is passed through to the decorated function; 3. If the service_instance parameter is not defined, the connection is created using the proxy details and the service instance is returned.

CLI Example: None, this is a decorator

```python
salt '*' vsphere.list_assigned_licenses
entity={type:cluster,datacenter:dc,cluster:cl}
entity_display_name=cl
```

```python
salt '*' vsphere.list_clusters
host=root
username=root
protocol=esxi
port=None
```

```python
salt '*' vsphere.list_cluster
cluster=cl1
```

```python
salt '*' vsphere.list_capabilities
```

```python
salt '*' vsphere.list_capability_definitions
```
protocol

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

port

Optionally set to alternate port if the host is not using the default port. Default port is 443.

CLI Example:

```
salt '*' vsphere.list_clusters 1.2.3.4 root bad-password
```

salt.modules.vsphere.list_datacenters(host, username, password, protocol=None, port=None)

Returns a list of datacenters for the specified host.

host The location of the host.

username The username used to login to the host, such as root.

password The password used to login to the host.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

CLI Example:

```
salt '*' vsphere.list_datacenters 1.2.3.4 root bad-password
```

salt.modules.vsphere.list_datacenters_via_proxy(datacenter_names=None, service_instance=None)

Returns a list of dict representations of VMware datacenters. Connection is done via the proxy details.

Supported proxies: esxdatacenter
datacenter_names List of datacenter names. Default is None.

service_instance Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```
salt '*' vsphere.list_datacenters_via_proxy
salt '*' vsphere.list_datacenters_via_proxy dc1
salt '*' vsphere.list_datacenters_via_proxy dc1,dc2
salt '*' vsphere.list_datacenters_via_proxy datacenter_names=[dc1, dc2]
```

salt.modules.vsphere.list_datastore_clusters(host, username, password, protocol=None, port=None)

Returns a list of datastore clusters for the specified host.

host The location of the host.

username The username used to login to the host, such as root.

password The password used to login to the host.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

CLI Example:

```
salt '*' vsphere.list_datastore_clusters 1.2.3.4 root bad-password
```

salt.modules.vsphere.list_datastores(host, username, password, protocol=None, port=None)

Returns a list of datastores for the specified host.

host The location of the host.

username The username used to login to the host, such as root.

password The password used to login to the host.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.
CLI Example:

```
salt '*' vsphere.list_datastores 1.2.3.4 root bad-password
```

```python
salt.modules.vsphere.list_datastores_via_proxy(datastore_names=None, backing_disk_ids=None, backing_disk_scsi_addresses=None, service_instance=None)
```

Returns a list of dict representations of the datastores visible to the proxy object. The list of datastores can be filtered by datastore names, backing disk ids (canonical names) or backing disk scsi addresses.

Supported proxy types: esxi, esxcluster, esxdatacenter

datastore_names List of the names of datastores to filter on
backing_disk_ids List of canonical names of the backing disks of the datastores to filer. Default is None.
backing_disk_scsi_addresses List of scsi addresses of the backing disks of the datastores to filter. Default is None.

```python
salt '*' vsphere.list_datastores_via_proxy
salt '*' vsphere.list_datastores_via_proxy datastore_names=[ds1, ds2]
```

```python
salt.modules.vsphere.list_default_storage_policy_of_datastore(datastore, service_instance=None)
```

Returns a list of datastores assign the the storage policies.

datastore Name of the datastore to assign. The datastore needs to be visible to the VMware entity the proxy points to.

```python
salt '*' vsphere.list_default_storage_policy_of_datastore datastore=ds1
```

```python
salt.modules.vsphere.list_default_vsan_policy(service_instance=None)
```

Returns the default vsan storage policy.

```python
salt '*' vsphere.list_storage_policies
salt '*' vsphere.list_storage_policy policy_names=[policy_name]
```

```python
salt.modules.vsphere.list_disk_partitions(disk_id=None, scsi_address=None, service_instance=None)
```

List the partitions on a disk. The disk can be specified either by the canonical name, or by the scsi_address.

disk_id Canonical name of the disk. Either disk_id or scsi_address needs to be specified (disk_id supersedes scsi_address).

```python
salt '*' vsphere.list_disk_partitions scsi_address='vmhaba0:C0:T0:L0'
salt '*' vsphere.list_disk_partitions disk_id='naa.000000000000001'
```

```python
salt.modules.vsphere.list_diskgroups(cache_disk_ids=None, service_instance=None)
```

Returns a list of disk group dict representation on an ESXi host. The list of disk groups can be filtered by the cache disks canonical names. If no filtering is applied, all disk groups are returned.

cache_disk_ids: List of cache disk canonical names of the disk groups to be retrieved. Default is None.
use_proxy_details Specify whether to use the proxy minion’s details instead of the arguments.
service_instance  Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

salt '*' vsphere.list_diskgroups
salt '*' vsphere.list_diskgroups cache_disk_ids='[naa.000000000000001]'

salt.modules.vsphere.list_disks(disk_ids=None, scsi_addresses=None, service_instance=None)
Returns a list of dict representations of the disks in an ESXi host. The list of disks can be filtered by disk canonical names or scsi addresses.

disk_ids: List of disk canonical names to be retrieved. Default is None.
scsi_addresses List of scsi addresses of disks to be retrieved. Default is None
service_instance  Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

salt '*' vsphere.list_disks
salt '*' vsphere.list_disks disk_ids='[naa.00, naa.001]'
salt '*' vsphere.list_disks
    scsi_addresses='[vmhba0:C0:T0:L0, vmhba1:C0:T0:L0]'

salt.modules.vsphere.list_dvportgroups(dvs=None, portgroup_names=None, service_instance=None)
Returns a list of distributed virtual switch portgroups. The list can be filtered by the portgroup names or by the DVS.
dvs  Name of the DVS containing the portgroups. Default value is None.
portgroup_names  List of portgroup names to look for. If None, all portgroups are returned. Default value is None
service_instance  Service instance (vim.ServiceInstance) of the vCenter. Default is None.

salt '*' vsphere.list_dvportgroups
salt '*' vsphere.list_dvportgroups dvs=dvs1
salt '*' vsphere.list_dvportgroups portgroup_names=[pg1]
salt '*' vsphere.list_dvportgroups dvs=dvs1 portgroup_names=[pg1]

salt.modules.vsphere.list_dvs(host, username, password, protocol=None, port=None)
Returns a list of distributed virtual switches for the the specified host.
host  The location of the host.
username The username used to login to the host, such as root.
password The password used to login to the host.
protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port  Optionally set to alternate port if the host is not using the default port. Default port is 443.

CLI Example:
salt '*' vsphere.list_dvs 1.2.3.4 root bad-password

salt.modules.vsphere.list_dvss(datacenter=None, dvs_names=None, service_instance=None)
Returns a list of distributed virtual switches (DVSs). The list can be filtered by the datacenter or DVS names.
datacenter  The datacenter to look for DVSs in. Default value is None.
dvs_names  List of DVS names to look for. If None, all DVSs are returned. Default value is None.

salt '*' vsphere.list_dvss
salt.modules.vsphere.list_dvss(dvs_names=['dvs1', 'dvs2'])

salt.modules.vsphere.list_folders(host, username, password, protocol=None, port=None)
    Returns a list of folders for the specified host.
    host The location of the host.
    username The username used to login to the host, such as root.
    password The password used to login to the host.
    protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
    port Optionally set to alternate port if the host is not using the default port. Default port is 443.
    CLI Example:
    salt '*' vsphere.list_folders 1.2.3.4 root bad-password

salt.modules.vsphere.list_hosts(host, username, password, protocol=None, port=None)
    Returns a list of hosts for the specified VMware environment.
    host The location of the host.
    username The username used to login to the host, such as root.
    password The password used to login to the host.
    protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
    port Optionally set to alternate port if the host is not using the default port. Default port is 443.
    CLI Example:
    salt '*' vsphere.list_hosts 1.2.3.4 root bad-password

salt.modules.vsphere.list_hosts_via_proxy(hostnames=None, datacenter=None, cluster=None, service_instance=None)
    Returns a list of hosts for the specified VMware environment. The list of hosts can be filtered by datacenter name and/or cluster name.
    hostnames Hostnames to filter on.
    datacenter_name Name of datacenter. Only hosts in this datacenter will be retrieved. Default is None.
    cluster_name Name of cluster. Only hosts in this cluster will be retrieved. If a datacenter is not specified the first cluster with this name will be considered. Default is None.
    service_instance Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.
    CLI Example:
    salt '*' vsphere.list_hosts_via_proxy
    salt '*' vsphere.list_hosts_via_proxy hostnames=['esxi1.example.com']
    salt '*' vsphere.list_hosts_via_proxy datacenter=dc1 cluster=cluster1

salt.modules.vsphere.list_licenses(service_instance=None)
    Lists all licenses on a vCenter.
    service_instance Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

salt.modules.vsphere.list_networks(host, username, password, protocol=None, port=None)
    Returns a list of networks for the specified host.
    host The location of the host.
    username The username used to login to the host, such as root.
    password The password used to login to the host.
protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port Optionally set to alternate port if the host is not using the default port. Default port is 443.

CLI Example:

```
salt '*' vsphere.list_networks 1.2.3.4 root bad-password
```

code

```python
salt.modules.vsphere.list_non_ssds(host, username, password, protocol=None, port=None, host_names=None)
```

Returns a list of Non-SSD disks for the given host or list of host_names.

**Note:** In the pyVmomi StorageSystem, ScsiDisks may, or may not have an ssd attribute. This attribute indicates if the ScsiDisk is SSD backed. As this option is optional, if a relevant disk in the StorageSystem does not have ssd = true, it will end up in the non_ssds list here.

**host** The location of the host.

**username** The username used to login to the host, such as root.

**password** The password used to login to the host.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**host_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to retrieve Non-SSD disks.

If host_names is not provided, Non-SSD disks will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.list_non_ssds my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.list_non_ssds my.vcenter.location root bad-password
```

code

```python
salt.modules.vsphere.list_resourcepools(host, username, password, protocol=None, port=None)
```

Returns a list of resource pools for the the specified host.

**host** The location of the host.

**username** The username used to login to the host, such as root.

**password** The password used to login to the host.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

CLI Example:

```
salt '*' vsphere.list_resourcepools 1.2.3.4 root bad-password
```

code

```python
salt.modules.vsphere.list_ssds(host, username, password, protocol=None, port=None, host_names=None)
```

Returns a list of SSDs for the given host or list of host_names.

**host** The location of the host.

**username** The username used to login to the host, such as root.

**password** The password used to login to the host.
protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port  Optionally set to alternate port if the host is not using the default port. Default port is 443.
host_names  List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to retrieve SSDs.

If host_names is not provided, SSDs will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.list_ssds my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.list_ssds my.vcenter.location root bad-password host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.list_storage_policies( policy_names=None, service_instance=None)

Returns a list of storage policies.

- **policy_names** Names of policies to list. If None, all policies are listed. Default is None.
- **service_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```
salt '*' vsphere.list_storage_policies

salt '*' vsphere.list_storage_policy policy_names=[policy_name]
```

salt.modules.vsphere.list_uplink_dvportgroup( dvs, service_instance=None)

Returns the uplink portgroup of a distributed virtual switch.

- **dvs** Name of the DVS containing the portgroup.
- **service_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```
salt '*' vsphere.list_uplink_dvportgroup dvs=dvs_name
```

salt.modules.vsphere.list_vapps( host, username, password, protocol=None, port=None)

Returns a list of vApps for the specified host.

- **host** The location of the host.
- **username** The username used to login to the host, such as root.
- **password** The password used to login to the host.
- **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

CLI Example:

```
# List vapps from all minions
salt '*' vsphere.list_vapps 1.2.3.4 root bad-password
```

salt.modules.vsphere.list_vms( host, username, password, protocol=None, port=None)

Returns a list of VMs for the specified host.

- **host** The location of the host.
- **username** The username used to login to the host, such as root.
- **password** The password used to login to the host.
- **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

CLI Example:
salt '*' vsphere.list_vms 1.2.3.4 root bad-password

salt.modules.vsphere.power_off_vm(name, datacenter=None, service_instance=None)
   Powers off a virtual machine specified by it’s name.
   name  Name of the virtual machine
   datacenter  Datacenter of the virtual machine
   service_instance  Service instance (vim.ServiceInstance) of the vCenter. Default is None.

salt '*' vsphere.power_off_vm name=my_vm

salt.modules.vsphere.power_on_vm(name, datacenter=None, service_instance=None)
   Powers on a virtual machine specified by it’s name.
   name  Name of the virtual machine
   datacenter  Datacenter of the virtual machine
   service_instance  Service instance (vim.ServiceInstance) of the vCenter. Default is None.

salt '*' vsphere.power_on_vm name=my_vm

salt.modules.vsphere.register_vm(name, datacenter, placement, vmx_path, service_instance=None)
   Registers a virtual machine to the inventory with the given vmx file. Returns comments and change list
   name  Name of the virtual machine
   datacenter  Datacenter of the virtual machine
   placement  Placement dictionary of the virtual machine, host or cluster
   vmx_path  Full path to the vmx file, datastore name should be included
   service_instance  Service instance (vim.ServiceInstance) of the vCenter. Default is None.

salt.modules.vsphere.remove_capacity_from_diskgroup(cache_disk_id, capacity_disk_ids, data_evacuation=True, safety_checks=True, service_instance=None)
   Remove capacity disks from the disk group with the specified cache disk.
   cache_disk_id  The canonical name of the cache disk.
   capacity_disk_ids  A list containing canonical names of the capacity disks to add.
   data_evacuation  Specifies whether to gracefully evacuate the data on the capacity disks before removing
                    them from the disk group. Default value is True.
   safety_checks  Specify whether to perform safety check or to skip the checks and try performing the required
                   task. Default value is True.
   service_instance  Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

salt '*' vsphere.remove_capacity_from_diskgroup
   cache_disk_id='naa.000000000000001'
   capacity_disk_ids='[naa.000000000000002, naa.000000000000003]'

salt.modules.vsphere.remove_datastore(datastore, service_instance=None)
   Removes a datastore. If multiple datastores an error is raised.
   datastore  Datastore name
   service_instance  Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

salt '*' vsphere.remove_datastore ds_name

salt.modules.vsphere.remove_diskgroup(cache_disk_id, data_accessibility=True, service_instance=None)
   Remove the diskgroup with the specified cache disk.
   cache_disk_id  The canonical name of the cache disk.
   data_accessibility  Specifies whether to ensure data accessibility. Default value is True.
service_instance  Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```
salt '*' vsphere.remove_diskgroup cache_disk_id='naa.000000000000001'
```

salt.modules.vsphere.remove_dvportgroup(portgroup, dvs, service_instance=None)

Removes a distributed virtual portgroup.

**portgroup** Name of the portgroup to be removed.

**dvs** Name of the DVS containing the portgroups.

**service_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```
salt '*' vsphere.remove_dvportgroup portgroup=pg1 dvs=dvs1
```

salt.modules.vsphere.rename_datastore(datastore_name, new_datastore_name, service_instance=None)

Renames a datastore. The datastore needs to be visible to the proxy.

**datastore_name** Current datastore name.

**new_datastore_name** New datastore name.

**service_instance** Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```
salt '*' vsphere.rename_datastore old_name new_name
```

salt.modules.vsphere.reset_syslog_config(host, username, password, protocol=None, port=None, syslog_config=None, esxi_hosts=None, credstore=None)

Reset the syslog service to its default settings.

Valid syslog_config values are logdir, loghost, logdir-unique, default-rotate, default-size, default-timeout, or all for all of these.

**host** The location of the host.

**username** The username used to login to the host, such as root.

**password** The password used to login to the host.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**syslog_config** List of parameters to reset, provided as a comma-delimited string, or 'all' to reset all syslog configuration parameters. Required.

**esxi_hosts** If host is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.

**credstore** Optionally set to path to the credential store file.

**Returns** Dictionary with a top-level key of 'success' which indicates if all the parameters were reset, and individual keys for each parameter indicating which succeeded or failed, per host.

**CLI Example**:

**syslog_config** can be passed as a quoted, comma-separated string, e.g.

```
# Used for ESXi host connection information
salt '*' vsphere.reset_syslog_config my.esxi.host root bad-password
  → syslog_config='logdir,loghost'

# Used for connecting to a vCenter Server
salt '*' vsphere.reset_syslog_config my.vcenter.location root bad-password
  → syslog_config='logdir,loghost' esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.service_restart(host, username, password, service_name, protocol=None, port=None, host_names=None)
Restart the named service for the given host or list of hosts.

**host**   The location of the host.
**username** The username used to login to the host, such as `root`.
**password** The password used to login to the host.
**service_name**

The name of the service for which to set the policy. Supported service names are:

- DCUI
- TSM
- SSH
- lbtd
- lsassd
- lwiod
- netlogond
- ntpd
- sfcbd-watchdog
- snmpd
- vprobed
- vpxa
- xorg

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port** Optionally set to alternate port if the host is not using the default port. Default port is `443`.

**host_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter the hosts for which to restart the service.

If `host_names` is not provided, the service will be restarted for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```bash
# Used for single ESXi host connection information
salt '*' vsphere.service_restart my.esxi.host root bad-password 'ntpd'

# Used for connecting to a vCenter Server
salt '*' vsphere.service_restart my.vcenter.location root bad-password 'ntpd'  
  host_names='[esxi-1.host.com, esxi-2.host.com]'
```

```python
salt.modules.vsphere.service_start(host, username, password, service_name, protocol=None, port=None, host_names=None)
```

Start the named service for the given host or list of hosts.

**host**   The location of the host.
**username** The username used to login to the host, such as `root`.
**password** The password used to login to the host.
**service_name**

The name of the service for which to set the policy. Supported service names are:

- DCUI
- TSM
- SSH
- lbtd
- lsassd
- lwiod
- netlogond
- ntpd
- sfcbd-watchdog
- snmpd
• vprobed
• vpxa
• xorg

**protocol**  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port**  Optionally set to alternate port if the host is not using the default port. Default port is 443.

**host_names**  List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to start the service.

If host_names is not provided, the service will be started for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

**CLI Example:**

```bash
# Used for single ESXi host connection information
salt '*' vsphere.service_start my.esxi.host root bad-password 'ntpd'

# Used for connecting to a vCenter Server
salt '*' vsphere.service_start my.vcenter.location root bad-password 'ntpd'  # host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.service_stop(host, username, password, service_name, protocol=None, port=None, host_names=None)

Stop the named service for the given host or list of hosts.

**host**  The location of the host.

**username**  The username used to login to the host, such as root.

**password**  The password used to login to the host.

**service_name**

The name of the service for which to set the policy. Supported service names are:

• DCUI
• TSM
• SSH
• lbtld
• lsassd
• lwiod
• netlogond
• ntpd
• sfcbd-watchdog
• snmpd
• vprobed
• vpxa
• xorg

**protocol**  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port**  Optionally set to alternate port if the host is not using the default port. Default port is 443.

**host_names**  List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to stop the service.

If host_names is not provided, the service will be stopped for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

**CLI Example:**

```bash
# Used for single ESXi host connection information
salt '*' vsphere.service_stop my.esxi.host root bad-password 'ssh'
```

(continues on next page)
salt.modules.vsphere.set_advanced_configs(vm_name, datacenter, advanced_configs, service_instance=None)

Appends extra config parameters to a virtual machine advanced config list

- **vm_name**: Virtual machine name
- **datacenter**: Datacenter name where the virtual machine is available
- **advanced_configs**: Dictionary with advanced parameter key value pairs
- **service_instance**: vCenter service instance for connection and configuration

salt.modules.vsphere.set_coredump_network_config(host, username, password, dump_ip, protocol=None, port=None, host_vnic='vmk0', dump_port=6500, esxi_hosts=None, credstore=None)

Set the network parameters for a network coredump collection. Note that ESXi requires that the dumps first be enabled (see coredump_network_enable) before these parameters may be set.

- **host**: The location of the host.
- **username**: The username used to login to the host, such as root.
- **password**: The password used to login to the host.
- **dump_ip**: IP address of host that will accept the dump.
- **protocol**: Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port**: Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **esxi_hosts**: If host is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.
- **host_vnic**: Host VNic port through which to communicate. Defaults to vmk0.
- **dump_port**: TCP port to use for the dump, defaults to 6500.
- **credstore**: Optionally set to path to the credential store file.

Returns A standard cmd.run_all dictionary with a success key added, per host. success will be True if the set succeeded, False otherwise.

CLI Example:

```shell
# Used for ESXi host connection information
salt '*' vsphere.set_coredump_network_config my.esxi.host root bad-password 'dump_ip.host.com'

# Used for connecting to a vCenter Server
salt '*' vsphere.set_coredump_network_config my.vcenter.location root bad-password 'dump_ip.host.com' esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.set_ntp_config(host, username, password, ntp_servers, protocol=None, port=None, host_names=None)

Set NTP configuration for a given host or list of host_names.

- **host**: The location of the host.
- **username**: The username used to login to the host, such as root.
- **password**: The password used to login to the host.
- **ntp_servers**: A list of servers that should be added to and configured for the specified host’s NTP configuration.
- **protocol**: Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port**: Optionally set to alternate port if the host is not using the default port. Default port is 443.
**host_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts to configure NTP servers.

If host_names is not provided, the NTP servers will be configured for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.ntp_configure my.esxi.host root bad-password '[192.174.1.100,192.174.1.200]'

# Used for connecting to a vCenter Server
salt '*' vsphere.ntp_configure my.vcenter.location root bad-password '[192.174.1.100,192.174.1.200]' host_names='[esxi-1.host.com, esxi-2.host.com]'
```

**salt.modules.vsphere.set_service_policy**(host, username, password, service_name, service_policy, protocol=None, port=None, host_names=None)

Set the service name’s policy for a given host or list of hosts.

**host** The location of the host.

**username** The username used to login to the host, such as `root`.

**password** The password used to login to the host.

**service_name**

The name of the service for which to set the policy. Supported service names are:

- DCUI
- TSM
- SSH
- lbtd
- lsassd
- lwiod
- netlogond
- ntpd
- sfcbd-watchdog
- snmpd
- vprobed
- vpix
- xorg

**service_policy** The policy to set for the service. For example, 'automatic'.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port** Optionally set to alternate port if the host is not using the default port. Default port is `443`.

**host_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to set the service policy.

If host_names is not provided, the service policy information will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.set_service_policy my.esxi.host root bad-password 'ntpd' service_policy='automatic'

# Used for connecting to a vCenter Server
salt '*' vsphere.set_service_policy my.vcenter.location root bad-password 'ntpd' service_policy='automatic' host_names='[esxi-1.host.com, esxi-2.host.com]'
```
salt.modules.vsphere.set_syslog_config( host, username, password, syslog_config, config_value, protocol=None, port=None, firewall=True, reset_service=True, esxi_hosts=None, credstore=None)

Set the specified syslog configuration parameter. By default, this function will reset the syslog service after the configuration is set.

- **host**: ESXi or vCenter host to connect to.
- **username**: User to connect as, usually root.
- **password**: Password to connect with.
- **syslog_config**: Name of parameter to set (corresponds to the command line switch for esxcli without the double dashes (–))
  - Valid syslog_config values are `logdir`, `loghost`, `default-rotate`, `default-size`, `default-timeout`, and `logdir-unique`.
- **config_value**: Value for the above parameter. For `loghost`, URLs or IP addresses to use for logging. Multiple log servers can be specified by listing them, comma-separated, but without spaces before or after commas.
  
- **protocol**: Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.
- **port**: Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **firewall**: Enable the firewall rule set for syslog. Defaults to `True`.
- **reset_service**: After a successful parameter set, reset the service. Defaults to `True`.
- **esxi_hosts**: If `host` is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.
- **credstore**: Optionally set to path to the credential store file.

**Returns**: Dictionary with a top-level key of 'success' which indicates if all the parameters were reset, and individual keys for each parameter indicating which succeeded or failed, per host.

**CLI Example:**

```bash
# Used for ESXi host connection information
salt '*' vsphere.set_syslog_config my.esxi.host root bad-password
  → loghost ssl://localhost:5432,tcp://10.1.0.1:1514

# Used for connecting to a vCenter Server
salt '*' vsphere.set_syslog_config my.vcenter.location root bad-password
  → loghost ssl://localhost:5432,tcp://10.1.0.1:1514
  → ['esxi-1.host.com, esxi-2.host.com']
```

salt.modules.vsphere.supports_proxies('proxy_types')

Decorator to specify which proxy types are supported by a function

- **proxy_types**: Arbitrary list of strings with the supported types of proxies

salt.modules.vsphere.syslog_service_reload( host, username, password, protocol=None, port=None, esxi_hosts=None, credstore=None)

Reload the syslog service so it will pick up any changes.

- **host**: The location of the host.
- **username**: The username used to login to the host, such as `root`.
- **password**: The password used to login to the host.
- **protocol**: Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.
port  Optionally set to alternate port if the host is not using the default port. Default port is 443.

esxi_hosts  If host is a vCenter host, then use esxi_hosts to execute this function on a list of one or more
ESXi machines.

credstore  Optionally set to path to the credential store file.

Returns  A standard cmd.run_all dictionary. This dictionary will at least have a retcode key. If
retcode is 0 the command was successful.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.syslog_service_reload my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.syslog_service_reload my.vcenter.location root bad-password
←  esxi_hosts=['[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.system_info(host, username, password, protocol=None, port=None)

Return system information about a VMware environment.

- host  The location of the host.
- username  The username used to login to the host, such as root.
- password  The password used to login to the host.
- protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is
https.
- port  Optionally set to alternate port if the host is not using the default port. Default port is 443.

CLI Example:

```
salt '*' vsphere.system_info 1.2.3.4 root bad-password
```

salt.modules.vsphere.test_vcenter_connection(service_instance=None)

Checks if a connection is to a vCenter

CLI Example:

```
salt '*' vsphere.test_vcenter_connection
```

salt.modules.vsphere.unregister_vm(name, datacenter, placement=None, power_off=False, service_instance=None)

Unregisters a virtual machine defined by name and placement

- name  Name of the virtual machine
- datacenter  Datacenter of the virtual machine
- placement  Placement information of the virtual machine
- service_instance  vCenter service instance for connection and configuration

```
salt '*' vsphere.unregister_vm name=my_vm datacenter=my_datacenter
```

salt.modules.vsphere.update_cluster(cluster_dict, datacenter=None, cluster=None, service_instance=None)

Updates a cluster.

- config_dict  Dictionary with the config values of the new cluster.
- datacenter  Name of datacenter containing the cluster. Ignored if already contained by proxy details. Default
value is None.
- cluster  Name of cluster. Ignored if already contained by proxy details. Default value is None.
- service_instance  Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```
# esxdatacenter proxy
salt '*' vsphere.update_cluster cluster_dict=${cluster_dict} cluster=cl1
```
salt.modules.vsphere.update_dvportgroup(portgroup_dict, portgroup, dvs, service_instance=True)

Updates a distributed virtual portgroup.

- **portgroup_dict**: Dictionary with the values the portgroup should be update with (example in salt.states.dvs).
- **portgroup**: Name of the portgroup to be updated.
- **dvs**: Name of the DVS containing the portgroups.
- **service_instance**: Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```python
salt '*' vsphere.update_dvportgroup portgroup_dict=<dict>
portgroup=pg1
```

```python
salt '*' vsphere.update_dvportgroup portgroup_dict=<dict>
portgroup=pg1
dvs=dvs1
```

salt.modules.vsphere.update_dvs(dvs_dict, dvs, service_instance=None)

Updates a distributed virtual switch (DVS).

- **dvs_dict**: Dictionary with the values the DVS should be update with (example in salt.states.dvs).
- **dvs**: Name of the DVS to be updated.
- **service_instance**: Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```python
salt '*' vsphere.update_dvs dvs_dict=$dvs_dict
dvs=dvs1
```

salt.modules.vsphere.update_host_datetime(host, username, password, protocol=None, port=None, host_names=None)

Update the date/time on the given host or list of host_names. This function should be used with caution since network delays and execution delays can result in time skews.

- **host**: The location of the host.
- **username**: The username used to login to the host, such as root.
- **password**: The password used to login to the host.
- **protocol**: Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port**: Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **host_names**: List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts should update their date/time.

    If host_names is not provided, the date/time will be updated for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

**CLI Example:**

```bash
# Used for single ESXi host connection information
salt '*' vsphere.update_date_time my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.update_date_time my.vcenter.location root bad-password
```

salt.modules.vsphere.update_host_password(host, username, password, new_password, protocol=None, port=None)

Update the password for a given host.
**Note:** Currently only works with connections to ESXi hosts. Does not work with vCenter servers.

- **host** The location of the ESXi host.
- **username** The username used to login to the ESXi host, such as `root`.
- **password** The password used to login to the ESXi host.
- **new_password** The new password that will be updated for the provided username on the ESXi host.
- **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.
- **port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**CLI Example:**

```shell
salt '*' vsphere.update_host_password my.esxi.host root original-bad-password new-bad-password
```

`salt.modules.vsphere.update_storage_policy(policy, policy_dict, service_instance=None)`

Updates a storage policy.

- **policy** Name of the policy to update.
- **policy_dict** Dictionary containing the changes to apply to the policy. (example in salt.states.pbm)
- **service_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```shell
salt '*' vsphere.update_storage_policy policy='policy name' policy_dict="$policy_dict"
```

`salt.modules.vsphere.update_vm(vm_name, cpu=None, memory=None, image=None, version=None, interfaces=None, disks=None, scsi_devices=None, serial_ports=None, datacenter=None, datastore=None, cd_dvd_drives=None, sata_controllers=None, advanced_configs=None, service_instance=None)`

Updates the configuration of the virtual machine if the config differs

- **vm_name** Virtual Machine name to be updated
- **cpu** CPU configuration options
- **memory** Memory configuration options
- **version** Virtual machine container hardware version
- **image** Virtual machine guest OS version identifier VirtualMachineGuestOsIdentifier
- **interfaces** Network interfaces configuration options
- **disks** Disks configuration options
- **scsi_devices** SCSI devices configuration options
- **serial_ports** Serial ports configuration options
- **datacenter** Datacenter where the virtual machine is available
- **datastore** Datastore where the virtual machine config files are available
- **cd_dvd_drives** CD/DVD drives configuration options
- **advanced_config** Advanced config parameters to be set for the virtual machine
- **service_instance** vCenter service instance for connection and configuration

`salt.modules.vsphere.upload_ssh_key(host, username, password, ssh_key=None, ssh_key_file=None, protocol=None, port=None, certificate_verify=False)`

Upload an ssh key for root to an ESXi host via http PUT. This function only works for ESXi, not vCenter. Only one ssh key can be uploaded for root. Uploading a second key will replace any existing key.

**Parameters**

- **host** – The location of the ESXi Host
- **username** – Username to connect as
• **password** – Password for the ESXi web endpoint
• **ssh_key** – Public SSH key, will be added to authorized_keys on ESXi
• **ssh_key_file** – File containing the SSH key. Use `ssh_key` or `ssh_key_file`, but not both.
• **protocol** – defaults to https, can be http if ssl is disabled on ESXi
• **port** – defaults to 443 for https
• **certificate_verify** – If true require that the SSL connection present a valid certificate

**Returns** Dictionary with a 'status' key, True if upload is successful. If upload is unsuccessful, 'status' key will be False and an 'Error' key will have an informative message.

CLI Example:

```
salt '*' vsphere.upload_ssh_key my.esxi.host root bad-password ssh_key_file='/etc/salt/my_keys/my_key.pub'
```

salt.modules.vsphere.vmotion_disable(host, username, password, protocol=None, port=None, host_names=None)

Disable vMotion for a given host or list of host_names.

- **host** The location of the host.
- **username** The username used to login to the host, such as `root`.
- **password** The password used to login to the host.
- **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.
- **port** Optionally set to alternate port if the host is not using the default port. Default port is `443`.
- **host_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts should disable VMotion.

If host_names is not provided, VMotion will be disabled for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.vmotion_disable my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.vmotion_disable my.vcenter.location root bad-password ✠
↓host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.vmotion_enable(host, username, password, protocol=None, port=None, host_names=None, device='vmk0')

Enable vMotion for a given host or list of host_names.

- **host** The location of the host.
- **username** The username used to login to the host, such as `root`.
- **password** The password used to login to the host.
- **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.
- **port** Optionally set to alternate port if the host is not using the default port. Default port is `443`.
- **host_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts should enable VMotion.

If host_names is not provided, VMotion will be enabled for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

- **device** The device that uniquely identifies the VirtualNic that will be used for VMotion for each host. Defaults to `vmk0`.

CLI Example:
# Used for single ESXi host connection information
salt '*' vsphere.vmotion_enable my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.vmotion_enable my.vcenter.location root bad-password

```
host_names="[esxi-1.host.com, esxi-2.host.com]"
```

salt.modules.vsphere.vsan_add_disks(
    host, username, password, protocol=None, port=None, host_names=None)

Add any VSAN-eligible disks to the VSAN System for the given host or list of host_names.

- **host** The location of the host.
- **username** The username used to login to the host, such as root.
- **password** The password used to login to the host.
- **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port** Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **host_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts need to add any VSAN-eligible disks to the host’s VSAN system.

If host_names is not provided, VSAN-eligible disks will be added to the hosts’s VSAN system for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.vsan_add_disks my.esxi.host root bad-password
# Used for connecting to a vCenter Server
salt '*' vsphere.vsan_add_disks my.vcenter.location root bad-password

host_names="[esxi-1.host.com, esxi-2.host.com]"
```

salt.modules.vsphere.vsan_disable(
    host, username, password, protocol=None, port=None, host_names=None)

Disable VSAN for a given host or list of host_names.

- **host** The location of the host.
- **username** The username used to login to the host, such as root.
- **password** The password used to login to the host.
- **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port** Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **host_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts should disable VSAN.

If host_names is not provided, VSAN will be disabled for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.vsan_disable my.esxi.host root bad-password
# Used for connecting to a vCenter Server
salt '*' vsphere.vsan_disable my.vcenter.location root bad-password

host_names="[esxi-1.host.com, esxi-2.host.com]"
```

salt.modules.vsphere.vsan_enable(
    host, username, password, protocol=None, port=None, host_names=None)

21.9. execution modules
Enable VSAN for a given host or list of host_names.

- **host**: The location of the host.
- **username**: The username used to login to the host, such as `root`.
- **password**: The password used to login to the host.
- **protocol**: Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.
- **port**: Optionally set to alternate port if the host is not using the default port. Default port is `443`.
- **host_names**: List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts should enable VSAN.

If host_names is not provided, VSAN will be enabled for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```bash
# Used for single ESXi host connection information
salt '*' vsphere.vsan_enable my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.vsan_enable my.vcenter.location root bad-password host_names='[esxi-1.host.com, esxi-2.host.com]'
```

### 21.9.450 salt.modules.webutil

Support for htpasswd command. Requires the apache2-utils package for Debian-based distros.

New in version 2014.1.0.

The functions here will load inside the webutil module. This allows other functions that don’t use htpasswd to use the webutil module name.

*salt.modules.webutil.useradd*(pwfile, user, password, opts=", runas=None)*

Add a user to htpasswd file using the htpasswd command. If the htpasswd file does not exist, it will be created.

- **pwfile**: Path to htpasswd file
- **user**: User name
- **password**: User password
- **opts**: Valid options that can be passed are:
  - `n` Don’t update file; display results on stdout.
  - `m` Force MD5 encryption of the password (default).
  - `d` Force CRYPT encryption of the password.
  - `p` Do not encrypt the password (plaintext).
  - `s` Force SHA encryption of the password.
- **runas**: The system user to run htpasswd command with

CLI Examples:

```bash
salt '*' webutil.useradd /etc/httpd/htpasswd larry badpassword
salt '*' webutil.useradd /etc/httpd/htpasswd larry badpass opts=ns
```

*salt.modules.webutil.userdel*(pwfile, user, runas=None, all_results=False)*

Delete a user from the specified htpasswd file.

- **pwfile**: Path to htpasswd file
- **user**: User name
- **runas**: The system user to run htpasswd command with

**all_results**: Return stdout, stderr, and retcode, not just stdout

CLI Examples:
```bash
salt '*' webutil.userdel /etc/httpd/htpasswd larry
```

**salt.modules.webutil.verify** *(pwfile, user, password, opts='', runas=None)*  
Return True if the htpasswd file exists, the user has an entry, and their password matches.  
**pwfile** Fully qualified path to htpasswd file  
**user** User name  
**password** User password  
**opts** Valid options that can be passed are:  
- ```m``` Force MD5 encryption of the password (default).  
- ```d``` Force CRYPT encryption of the password.  
- ```p``` Do not encrypt the password (plaintext).  
- ```s``` Force SHA encryption of the password.  
**runas** The system user to run htpasswd command with  

CLI Examples:
```bash
salt '*' webutil.verify /etc/httpd/htpasswd larry maybepassword
salt '*' webutil.verify /etc/httpd/htpasswd larry maybepassword opts=ns
```

---

### 21.9.451 salt.modules.win_autoruns

Module for listing programs that automatically run on startup (very alpha...not tested on anything but my Win 7x64)

**salt.modules.win_autoruns.list()**  
Get a list of automatically running programs  

CLI Example:
```bash
salt '*' autoruns.list
```

---

### 21.9.452 salt.modules.win_certutil module

This module allows you to install certificates into the windows certificate manager.

**salt '*' certutil.add_store salt://cert.cer "TrustedPublisher"**

```bash
salt '*' certutil.add_store salt://cert.cer "TrustedPublisher"
```

**salt.modules.win_certutil.add_store** *(source, store, saltenv='base')*  
Add the given cert into the given Certificate Store  
**source** The source certificate file this can be in the form salt://path/to/file  
**store** The certificate store to add the certificate to  
**saltenv** The salt environment to use this is ignored if the path is local  

CLI Example:
```bash
salt '*' certutil.add_store salt://cert.cer TrustedPublisher
```

```bash
salt '*' certutil.add_store salt://cert.cer TrustedPublisher
```

**salt.modules.win_certutil.del_store** *(source, store, saltenv='base')*  
Delete the given cert into the given Certificate Store  
**source** The source certificate file this can be in the form salt://path/to/file  
**store** The certificate store to delete the certificate from  
**saltenv** The salt environment to use this is ignored if the path is local  

CLI Example:
salt 's' certutil.del_store salt://cert.cer TrustedPublisher

salt.modules.win_certutil.get_cert_serial(cert_file)
Get the serial number of a certificate file

cert_file The certificate file to find the serial for

CLI Example:
salt 's' certutil.get_cert_serial <certificate name>

salt.modules.win_certutil.get_stored_cert_serials(store)
Get all of the certificate serials in the specified store

store The store to get all the certificate serials from

CLI Example:
salt 's' certutil.get_stored_cert_serials <store>

21.9.453 salt.modules.win_dacl

Manage DACLs on Windows

depends
  • winreg Python module

salt.modules.win_dacl.add_ace(path, objectType, user, permission, acetype, propagation)
add an ace to an object

path: path to the object (i.e. c:\temp\file, HKEY_LOCAL_MACHINE\SOFTWARE\KEY, etc)
user: user to add permission: permissions for the user acetype: either allow/deny for each user/permission (ALLOW, DENY)
propagation: how the ACE applies to children for Registry Keys and Directories(KEY, KEY&SUBKEYS, SUBKEYS)

CLI Example:
allow domain\fakeuser full control on HKLM\\SOFTWARE\\somekey, propagate to this key and subkeys
salt 'myminion' win_dacl.add_ace 'HKEY_LOCAL_MACHINE\\SOFTWARE\\somekey' => 'Registry' 'domain\fakeuser' 'FULLCONTROL' 'ALLOW' 'KEY&SUBKEYS'

salt.modules.win_dacl.check_ace(path, objectType, user, permission=None, acetype=None, propagation=None, exactPermissionMatch=False)
Checks a path to verify the ACE (access control entry) specified exists

Parameters
  • path – path to the file/reg key
  • objectType – The type of object (FILE, DIRECTORY, REGISTRY)
  • user – user that the ACL is for
  • permission – permission to test for (READ, FULLCONTROL, etc)
  • acetype – the type of ACE (ALLOW or DENY)
  • propagation – the propagation type of the ACE (FILES, FOLDERS, KEY, KEY&SUBKEYS, SUBKEYS, etc)
  • exactPermissionMatch – the ACL must match exactly, IE if READ is specified, the user must have READ exactly and not FULLCONTROL (which also has the READ permission obviously)

Returns (dict): 'Exists' true if the ACE exists, false if it does not

CLI Example:
salt 'minion-id' win_dacl.check_ace c: emp directory <username> fullcontrol

salt.modules.win_dacl.check_inheritance(path, objectType, user=None)
Check a specified path to verify if inheritance is enabled

Parameters:
- **path** – path of the registry key or file system object to check
- **objectType** – The type of object (FILE, DIRECTORY, REGISTRY)
- **user** – if provided, will consider only the ACEs for that user

Returns (bool): 'Inheritance' of True/False

CLI Example:
salt 'minion-id' win_dacl.check_inheritance c: emp directory <username>

class salt.modules.win_dacl.daclConstants
DACL constants used throughout the module

getAceTypeBit(t)
returns the acetype bit of a text value

getaAceTypeText(t)
returns the textual representation of a acetype bit

getAddressObjectBit(t)
returns the bit value of the string object type

getPermissionBit(t, m)
returns a permission bit of the string permission value for the specified object type

getAddressPermissionText(t, m)
returns the permission textual representation of a specified permission bit/object type

getPropagationBit(t, p)
returns the propagation bit of a text value

getPropagationText(t, p)
returns the textual representation of a propagation bit

getSecurityHkey(s)
returns the necessary string value for an HKEY for the win32security module

processPath(path, objectType)
processes a path/object type combo and returns: registry types with the correct HKEY text representation files/directories with environment variables expanded

salt.modules.win_dacl.disable_inheritance(path, objectType, copy=True)
Disable inheritance on an object

Parameters:
- **path** – The path to the object
- **objectType** – The type of object (FILE, DIRECTORY, REGISTRY)
- **copy** – True will copy the Inherited ACEs to the DACL before disabling inheritance

Returns (dict): A dictionary containing the results

CLI Example:
salt 'minion-id' win_dacl.disable_inheritance c: emp directory

salt.modules.win_dacl.enable_inheritance(path, objectType, clear=False)
enable/disable inheritance on an object

Parameters

21.9. execution modules
- **path** – The path to the object
- **objectType** – The type of object (FILE, DIRECTORY, REGISTRY)
- **clear** – True will remove non-Inherited ACEs from the ACL

Returns (dict): A dictionary containing the results

CLI Example:

```
salt 'minion-id' win_dacl.enable_inheritance c: emp directory
```

```python
salt.modules.win_dacl.get(path, objectType, user=None)
```

Get the ACL of an object. Will filter by user if one is provided.

**Parameters**

- **path** – The path to the object
- **objectType** – The type of object (FILE, DIRECTORY, REGISTRY)
- **user** – A user name to filter by

Returns (dict): A dictionary containing the ACL

CLI Example:

```
salt 'minion-id' win_dacl.get c: emp directory
```

```python
salt.modules.win_dacl.rm_ace(path, objectType, user, permission=None, acetype=None, propagation=None)
```

remove an ace to an object

**Parameters**

- **path** – path to the object (i.e. c:\temp\file, HKEY_LOCAL_MACHINE\SOFTWARE\KEY, etc)
- **objectType** – The type of object (FILE, DIRECTORY, REGISTRY)
- **user** – user to remove permission
- **permission** – permissions for the user acetypes: either allow/deny for each user/permission (ALLOW, DENY)
- **propagation** – how the ACE applies to children for Registry Keys and Directories (KEY, KEY&SUBKEYS, SUBKEYS)

If any of the optional parameters are omitted (or set to None) they act as wildcards.

CLI Example:

```
remove allow domain\fakeuser full control on HKLM\SOFTWARE\somekey propagated to this key and subkeys
salt 'myminion' win_dacl.rm_ace 'Registry' 'HKEY_LOCAL_MACHINE\SOFTWARE\somekey' 'domain\fakeuser' 'FULLCONTROL' 'ALLOW' 'KEY&SUBKEYS'
```

21.9.454 **salt.modules.win_disk**

Module for gathering disk information on Windows

**depends**

- win32api Python module

```python
salt.modules.win_disk.usage()
```

Return usage information for volumes mounted on this minion

CLI Example:

```
salt '*' disk.usage
```
21.9.455 salt.modules.win_dism module

Install features/packages for Windows using DISM, which is useful for minions not running server versions of Windows. Some functions are only available on Windows 10.

salt.modules.win_dism.add_capability(capability, source=None, limit_access=False, image=None, restart=False)

Install a capability

Parameters

- **capability**(str) – The capability to install
- **source** (Optional[str]) – The optional source of the capability. Default is set by group policy and can be Windows Update.
- **limit_access** (Optional[bool]) – Prevent DISM from contacting Windows Update for the source package
- **image** (Optional[str]) – The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
- **restart** (Optional[bool]) – Reboot the machine if required by the install

Raises

- **NotImplementedError** – For all versions of Windows that are not Windows 10 and later. Server editions of Windows use ServerManager instead.

Returns

A dictionary containing the results of the command

Return type dict

CLI Example:

```
salt '*' dism.add_capability Tools.Graphics.DirectX~~~~0.0.1.0
```

salt.modules.win_dism.add_feature(feature, package=None, source=None, limit_access=False, enable_parent=False, image=None, restart=False)

Install a feature using DISM

Parameters

- **feature**(str) – The feature to install
- **package** (Optional[str]) – The parent package for the feature. You do not have to specify the package if it is the Windows Foundation Package. Otherwise, use package to specify the parent package of the feature
- **source** (Optional[str]) – The optional source of the capability. Default is set by group policy and can be Windows Update
- **limit_access** (Optional[bool]) – Prevent DISM from contacting Windows Update for the source package
- **enable_parent** (Optional[bool]) – True will enable all parent features of the specified feature
- **image** (Optional[str]) – The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
- **restart** (Optional[bool]) – Reboot the machine if required by the install

Returns

A dictionary containing the results of the command

Return type dict

CLI Example:

```
salt '*' dism.add_feature NetFx3
```

salt.modules.win_dism.add_package(package, ignore_check=False, prevent_pending=False, image=None, restart=False)

Install a package using DISM

Parameters

- **package**(str) – The package to install. Can be a .cab file, a .msu file, or a folder
Note: An .msu package is supported only when the target image is offline, either mounted or applied.

- **ignore_check** *(Optional*[bool]*) – Skip installation of the package if the applicability checks fail
- **prevent_pending** *(Optional*[bool]*) – Skip the installation of the package if there are pending online actions
- **image** *(Optional*[str]*) – The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
- **restart** *(Optional*[bool]*) – Reboot the machine if required by the install

**Returns** A dictionary containing the results of the command

**Return type** dict

**CLI Example:**

```
salt '*' dism.add_package C:\Packages\package.cab
```

salt.modules.win_dism.available_capabilities *(image=None)*

List the capabilities available on the system

**Parameters**

- **image** *(Optional*[str]*) – The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.

**Raises**

- **NotImplementedError** – For all versions of Windows that are not Windows 10 and later. Server editions of Windows use ServerManager instead.

**Returns** A list of available capabilities

**Return type** list

**CLI Example:**

```
salt '*' dism.installed_capabilities
```

salt.modules.win_dism.available_features *(image=None)*

List the features available on the system

**Parameters**

- **image** *(Optional*[str]*) – The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.

**Returns** A list of available features

**Return type** list

**CLI Example:**

```
salt '*' dism.available_features
```

salt.modules.win_dism.get_capabilities *(image=None)*

List all capabilities on the system

**Parameters**

- **image** *(Optional*[str]*) – The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.

**Raises**

- **NotImplementedError** – For all versions of Windows that are not Windows 10 and later. Server editions of Windows use ServerManager instead.

**Returns** A list of capabilities

**Return type** list

**CLI Example:**

```
salt '*' dism.get_capabilities
```
salt.modules.win_dism.get_features(package=None, image=None)
List features on the system or in a package

Parameters
- **package** *(Optional[str]*) - The full path to the package. Can be either a .cab file or a folder. Should point to the original source of the package, not to where the file is installed. You cannot use this command to get package information for .msu files.
  This can also be the name of a package as listed in dism.installed_packages
- **image** *(Optional[str]*) - The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.

Returns  A list of features
Return type list

CLI Example:
```
# Return all features on the system
salt '*' dism.get_features

# Return all features in package.cab
salt '*' dism.get_features C:\packages\package.cab

# Return all features in the calc package
salt '*' dism.get_features Microsoft.Windows.Calc.Demo~6595b6144ccf1df~x86-en-1.0.0.0
```

salt.modules.win_dism.installed_capabilities(image=None)
List the capabilities installed on the system

Parameters **image** *(Optional[str]*) - The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.

Raises
- **NotImplementedError** - For all versions of Windows that are not Windows 10 and later. Server editions of Windows use ServerManager instead.

Returns  A list of installed capabilities
Return type list

CLI Example:
```
salt '*' dism.installed_capabilities
```

salt.modules.win_dism.installed_features(image=None)
List the features installed on the system

Parameters **image** *(Optional[str]*) - The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.

Returns  A list of installed features
Return type list

CLI Example:
```
salt '*' dism.installed_features
```

salt.modules.win_dism.installed_packages(image=None)
List the packages installed on the system

Parameters **image** *(Optional[str]*) - The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.

Returns  A list of installed packages
Return type list

CLI Example:
salt '/repos' dism.installed_packages

salt.modules.win_dism.package_info(package, image=None)

Display information about a package

Parameters
- **package**(str) – The full path to the package. Can be either a .cab file or a folder. Should point to the original source of the package, not to where the file is installed. You cannot use this command to get package information for .msu files
- **image**(Optional[str]) – The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.

Returns A dictionary containing the results of the command

Return type dict

CLI Example:
salt 'repos' dism.package_info C:\packages\package.cab

salt.modules.win_dism.remove_capability(capability, image=None, restart=False)

Uninstall a capability

Parameters
- **capability**(str) – The capability to be removed
- **image**(Optional[str]) – The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
- **restart**(Optional[bool]) – Reboot the machine if required by the install

Raises
- **NotImplementedError** – For all versions of Windows that are not Windows 10 and later. Server editions of Windows use ServerManager instead.

Returns A dictionary containing the results of the command

Return type dict

CLI Example:
salt 'repos' dism.remove_capability Tools.Graphics.DirectX~~~~0.0.1.0

salt.modules.win_dism.remove_feature(feature, remove_payload=False, image=None, restart=False)

Disables the feature.

Parameters
- **feature**(str) – The feature to uninstall
- **remove_payload**(Optional[bool]) – Remove the feature’s payload. Must supply source when enabling in the future.
- **image**(Optional[str]) – The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
- **restart**(Optional[bool]) – Reboot the machine if required by the install

Returns A dictionary containing the results of the command

Return type dict

CLI Example:
salt 'repos' dism.remove_feature NetFx3

salt.modules.win_dism.remove_package(package, image=None, restart=False)

Uninstall a package

Parameters
- **package**(str) – The full path to the package. Can be either a .cab file or a folder. Should point to the original source of the package, not to where the file is installed. This can also be the name of a package as listed in dism.installed_packages
**image** *(Optional* [**str**] *) – The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.

**restart** *(Optional* [**bool**] *) – Reboot the machine if required by the install

Returns A dictionary containing the results of the command

Return type `dict`

CLI Example:

```bash
# Remove the Calc Package
salt '*' dism.remove_package Microsoft.Windows.Calc.Demo-6595b6144ccf1df-x86~en-1.0.0.0

# Remove the package.cab (does not remove C:\packages\package.cab)
salt '*' dism.remove_package C:\packages\package.cab
```

### 21.9.456 salt.modules.win_dns_client

Module for configuring DNS Client on Windows systems

salt.modules.win_dns_client.**add_dns** *(ip, interface='Local Area Connection', index=1)*

Add the DNS server to the network interface (index starts from 1)

Note: if the interface DNS is configured by DHCP, all the DNS servers will be removed from the interface and the requested DNS will be the only one

CLI Example:

```bash
salt '*' win_dns_client.add_dns <ip> <interface> <index>
```

salt.modules.win_dns_client.**dns_dhcp** *(interface='Local Area Connection')*

Configure the interface to get its DNS servers from the DHCP server

CLI Example:

```bash
salt '*' win_dns_client.dns_dhcp <interface>
```

salt.modules.win_dns_client.**get_dns_config** *(interface='Local Area Connection')*

Get the type of DNS configuration (dhcp / static)

CLI Example:

```bash
salt '*' win_dns_client.get_dns_config 'Local Area Connection'
```

salt.modules.win_dns_client.**get_dns_servers** *(interface='Local Area Connection')*

Return a list of the configured DNS servers of the specified interface

CLI Example:

```bash
salt '*' win_dns_client.get_dns_servers 'Local Area Connection'
```

salt.modules.win_dns_client.**rm_dns** *(ip, interface='Local Area Connection')*

Remove the DNS server from the network interface

CLI Example:

```bash
salt '*' win_dns_client.rm_dns <ip> <interface>
```
21.9.457 salt.modules.win_dsc

Module for working with Windows PowerShell DSC (Desired State Configuration)

This module is Alpha

This module applies DSC Configurations in the form of PowerShell scripts or MOF (Managed Object Format) schema files.

Use the `psget` module to manage PowerShell resources.

The idea is to leverage Salt to push DSC configuration scripts or MOF files to the Minion.

```python
salt.modules.win_dsc.apply_config(path, source=None, salt_env='base')
```

Run an compiled DSC configuration (a folder containing a .mof file). The folder can be cached from the salt master using the `source` option.

- **path** *(str)* - Local path to the directory that contains the .mof configuration file to apply. Required.
- **source** *(str)* - Path to the directory that contains the .mof file on the `file_roots`. The source directory will be copied to the path directory and then executed. If the path and source directories differ, the source directory will be applied. If source is not passed, the config located at `path` will be applied. Optional.
- **salt_env** *(str)* - The salt environment to use when copying your source. Default is 'base'

Returns True if successful, otherwise False

```
salt '*' dsc.apply_config C:\\DSC\\WebSiteConfiguration
```

To cache a configuration from the master and apply it:

```
salt '*' dsc.apply_config C:\\DSC\\WebSiteConfiguration salt://dsc/configs/...WebSiteConfiguration
```

```python
salt.modules.win_dsc.compile_config(path, source=None, config_name=None, config_data=None, config_data_source=None, script_parameters=None, salt_env='base')
```

Compile a config from a PowerShell script (.ps1)

- **path** *(str)* - Path (local) to the script that will create the .mof configuration file. If no source is passed, the file must exist locally. Required.
- **source** *(str)* - Path to the script on `file_roots` to cache at the location specified by `path`. The source file will be cached locally and then executed. If source is not passed, the config script located at `path` will be compiled. Optional.
- **config_name** *(str)* - The name of the Configuration within the script to apply. If the script contains multiple configurations within the file a `config_name` must be specified. If the `config_name` is not specified, the name of the file will be used as the `config_name` to run. Optional.
- **config_data** *(str)* - Configuration data in the form of a hash table that will be passed to the `ConfigurationData` parameter when the `config_name` is com-
piled. This can be the path to a .psd1 file containing the proper hash table or the PowerShell code to create the hash table.

New in version 2017.7.0.

- **config_data_source** *(str)* – The path to the .psd1 file on file_roots to cache at the location specified by config_data. If this is specified, config_data must be a local path instead of a hash table.

New in version 2017.7.0.

- **script_parameters** *(str)* – Any additional parameters expected by the configuration script. These must be defined in the script itself.

New in version 2017.7.0.

- **salt_env** *(str)* – The salt environment to use when copying the source. Default is 'base'

**Returns**
A dictionary containing the results of the compilation

**Return type**
dict

CLI Example:

To compile a config from a script that already exists on the system:

```
salt '*' dsc.compile_config C:\DSC\WebsiteConfig.ps1
```

To cache a config script to the system from the master and compile it:

```
salt '*' dsc.compile_config C:\DSC\WebsiteConfig.ps1 salt://dsc/configs/ →WebsiteConfig.ps1
```

---

salt.modules.win_dsc.get_config()  
Get the current DSC Configuration  

**Returns**  
A dictionary representing the DSC Configuration on the machine

**Return type**
dict

**Raises**  
CommandExecutionError – On failure

CLI Example:

```
salt '*' dsc.get_config
```

---

salt.modules.win_dsc.get_config_status()  
Get the status of the current DSC Configuration

**Returns**  
A dictionary representing the status of the current DSC Configuration on the machine

**Return type**
dict

CLI Example:

```
salt '*' dsc.get_config_status
```

---

salt.modules.win_dsc.get_lcm_config()  
Get the current Local Configuration Manager settings

**Returns**  
A dictionary representing the Local Configuration Manager settings on the machine

**Return type**
dict

CLI Example:

```
salt '*' dsc.get_lcm_config
```

---

salt.modules.win_dsc.remove_config(reset=False)  
Remove the current DSC Configuration. Removes current, pending, and previous dsc configurations.
New in version 2017.7.5.

Parameters `reset(bool)` – Attempts to reset the DSC configuration by removing the following from `C:\Windows\System32\Configuration`:

- File: DSCStatusHistory.mof
- File: DSCEngineCache.mof
- Dir: ConfigurationStatus

Default is False

Warning: `remove_config` may fail to reset the DSC environment if any of the files in the `ConfigurationStatus` directory. If you wait a few minutes and run again, it may complete successfully.

Returns True if successful
Return type bool
Raises `CommandExecutionError` – On failure

CLI Example:

```
salt '*' dsc.remove_config True
```

`salt.modules.win_dsc.restore_config()`
Reapplies the previous configuration.

New in version 2017.7.5.

Note: The current configuration will be come the previous configuration. If run a second time back-to-back it is like toggling between two configs.

Returns True if successfully restored
Return type bool
Raises `CommandExecutionError` – On failure

CLI Example:

```
salt '*' dsc.restore_config
```

`salt.modules.win_dsc.run_config(path=None, source=None, config_name=None, config_data=None, config_data_source=None, script_parameters=None, salt_env='base')`

Compile a DSC Configuration in the form of a PowerShell script (.ps1) and apply it. The PowerShell script can be cached from the master using the `source` option. If there is more than one config within the PowerShell script, the desired configuration can be applied by passing the name in the `config_name` option.

This command would be the equivalent of running `dsc.compile_config` followed by `dsc.apply_config`.

Parameters

- `path (str)` – The local path to the PowerShell script that contains the DSC Configuration. Required.
- `source (str)` – The path to the script on `file_roots` to cache at the location specified by `path`. The source file will be cached locally and then executed. If source is not passed, the config script located at `path` will be compiled. Optional.
- `config_name (str)` – The name of the Configuration within the script to apply. If the script contains multiple configurations within the file a `config_name` must be specified. If the `config_name` is not specified, the name of the file will be used as the `config_name` to run. Optional.
- **config_data** (*str*) – Configuration data in the form of a hash table that will be passed to the `ConfigurationData` parameter when the `config_name` is compiled. This can be the path to a `.psd1` file containing the proper hash table or the PowerShell code to create the hash table.

  New in version 2017.7.0.

- **config_data_source** (*str*) – The path to the `.psd1` file on `file_roots` to cache at the location specified by `config_data`. If this is specified, `config_data` must be a local path instead of a hash table.

  New in version 2017.7.0.

- **script_parameters** (*str*) – Any additional parameters expected by the configuration script. These must be defined in the script itself.

  New in version 2017.7.0.

- **salt_env** (*str*) – The salt environment to use when copying the source. Default is ‘base’

  Returns: True if successfully compiled and applied, otherwise False

  Return type: bool

CLI Example:

To compile a config from a script that already exists on the system:

```bash
salt '*' dsc.run_config C:\\DSC\\WebsiteConfig.ps1
```

To cache a config script to the system from the master and compile it:

```bash
salt '*' dsc.run_config C:\\DSC\\WebsiteConfig.ps1 salt://dsc/configs/WebsiteConfig.ps1
```

`salt.modules.win_dsc.set_lcm_config`(*config_mode=None, config_mode_freq=None, refresh_freq=None, reboot_if_needed=None, action_after_reboot=None, refresh_mode=None, certificate_id=None, configuration_id=None, allow_module_overwrite=None, debug_mode=False, status_retention_days=None*)

For detailed descriptions of the parameters see: https://msdn.microsoft.com/en-us/PowerShell/DSC/metaConfig
cconfig_mode (str): How the LCM applies the configuration. Valid values are:
- ApplyOnly
- ApplyAndMonitor
- ApplyAndAutoCorrect
cconfig_mode_freq (int): How often, in minutes, the current configuration is checked and applied. Ignored if config_mode is set to ApplyOnly. Default is 15.
crefresh_mode (str): How the LCM gets configurations. Valid values are:
- Disabled
- Push
- Pull
crefresh_freq (int): How often, in minutes, the LCM checks for updated configurations. (pull mode only) Default is 30.
creboot_if_needed (bool): Reboot the machine if needed after a configuration is applied. Default is False.
caction_after_reboot (str): Action to take after reboot. Valid values are:
- ContinueConfiguration
- StopConfiguration
certificate_id (guid): A GUID that specifies a certificate used to access the configuration: (pull mode)
cconfiguration_id (guid): A GUID that identifies the config file to get from a pull server. (pull mode)
allow_module_overwrite (bool): New configs are allowed to overwrite old ones on the target node.

debug_mode (str): Sets the debug level. Valid values are:
  - None
  - ForceModuleImport
  - All

status_retention_days (int): Number of days to keep status of the current config.

Note: Either config_mode_freq or refresh_freq needs to be a multiple of the other. See documentation on MSDN for more details.

Returns True if successful, otherwise False
Return type bool

CLI Example:
```
salt '*' dsc.set_lcm_config ApplyOnly
```

salt.modules.win_dsc.test_config()
Tests the current applied DSC Configuration
Returns True if successfully applied, otherwise False
Return type bool
CLI Example:
```
salt '*' dsc.test_config
```

21.9.458 salt.modules.win_file

Manage information about files on the minion, set/read user, group data, modify the ACL of files/directories

depends
  - win32api
  - win32file
  - win32con
  - salt.utils.win_dacl

exception salt.modules.win_file.WindowsError

salt.modules.win_file.check_perms(path, ret=None, owner=None, grant_perms=None, deny_perms=None, inheritance=True, reset=False)
Check owner and permissions for the passed directory. This function checks the permissions and sets them, returning the changes made. Used by the file state to populate the return dict

Parameters
  - path (str) - The full path to the directory.
  - ret (dict) - A dictionary to append changes to and return. If not passed, will create a new dictionary to return.
  - owner (str) - The owner to set for the directory.
  - grant_perms (dict) - A dictionary containing the user/group and the basic permissions to check/grant, ie: {'user': {'perms': 'basic_permission'}}. Default is None.
  - deny_perms (dict) - A dictionary containing the user/group and permissions to check/deny. Default is None.
• **inheritance** *(bool)* – True will check if inheritance is enabled and enable it. False will check if inheritance is disabled and disable it. Default is True.

• **reset**(bool) – True will show what permissions will be removed by resetting the DACL. False will do nothing. Default is False.

**Returns** A dictionary of changes that have been made

**Return type** `dict`

**CLI Example:**

```bash
# To see changes to ``C:\Temp`` if the 'Users' group is given 'read & execute'
salt '*' file.check_perms C:\Temp\ {} Administrators "{'Users': {'perms': 'read_ 
->execute'}}"

# Locally using salt call
salt-call file.check_perms C:\Temp\ {} Administrators "{'Users': {'perms': 'read_ 
->execute', 'applies_to': 'this_folder_only'}}"

# Specify advanced attributes with a list
salt '*' file.check_perms C:\Temp\ {} Administrators "{'jsnuffy': {'perms': [ 
->'read_attributes', 'read_ea'], 'applies_to': 'files_only'}}"
```

**salt.modules.win_file.chgrp(path, group)**

Change the group of a file

Under Windows, this will do nothing.

While a file in Windows does have a 'primary group', this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps this function to do nothing while still being compatible with Unix behavior. When managing Windows systems, this function is superfluous and will generate an info level log entry if used directly.

If you do actually want to set the 'primary group' of a file, use file.chgrp.

To set group permissions use file.set_perms

**Parameters**

- **path**(str) – The path to the file or directory
- **group**(str) – The group (unused)

**Returns** None

**CLI Example:**

```bash
salt '*' file.chgrp c:\temp\test.txt administrators
```

**salt.modules.win_file.chown(path, user, group=\`None\`, pgroup=\`None\`, follow_symlinks=\`True\`)**

Chown a file, pass the file the desired user and group

Under Windows, the group parameter will be ignored.

This is because while files in Windows do have a 'primary group' property, this is rarely used. It generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

If you do want to change the 'primary group' property and understand the implications, pass the Windows only parameter, pgroup, instead.

**Parameters**

- **path**(str) – The path to the file or directory
• **user** *(str)* – The name of the user to own the file
• **group** *(str)* – The group (not used)
• **pgroup** *(str)* – The primary group to assign
• **follow_symlinks** *(bool)* – If the object specified by *path* is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

**Returns** True if successful, otherwise error

**Return type** bool

**CLI Example:**
```
salt '*' file.chown c:\temp\test.txt myusername
salt '*' file.chown c:\temp\test.txt myusername pgroup=Administrators
salt '*' file.chown c:\temp\test.txt myusername "pgroup='None'"
```

**salt.modules.win_file.chpgrp(path, group)**

Change the group of a file

Under Windows, this will set the rarely used primary group of a file. This generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Ensure you know what you are doing before using this function.

**Parameters**

• **path** *(str)* – The path to the file or directory
• **pgroup** *(str)* – The primary group to assign

**Returns** True if successful, otherwise error

**Return type** bool

**CLI Example:**
```
salt '*' file.chpgrp c:\temp\test.txt Administrators
salt '*' file.chpgrp c:\temp\test.txt "'None'"
```

**salt.modules.win_file.get_attributes(path)**

Return a dictionary object with the Windows file attributes for a file.

**Parameters**

• **path** *(str)* – The path to the file or directory

**Returns** A dictionary of file attributes

**Return type** dict

**CLI Example:**
```
salt '*' file.get_attributes c:\temp\a.txt
```

**salt.modules.win_file.get_gid(path, follow_symlinks=True)**

Return the id of the group that owns a given file.

Under Windows, this will return the uid of the file.

While a file in Windows does have a ‘primary group’, this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps this function to provide functionality that somewhat resembles Unix behavior for API compatibility reasons. When managing Windows systems, this function is superfluous and will generate an info level log entry if used directly.

If you do actually want to access the ‘primary group’ of a file, use *file.get_pgid*.

**Parameters**

• **path** *(str)* – The path to the file or directory
• **follow_symlinks** *(bool)* – If the object specified by *path* is a symlink, get attributes of the linked file instead of the symlink itself. Default is True
Returns The gid of the owner
Return type str

CLI Example:
```
salt '*' file.get_gid c:\temp\test.txt
```

```
salt.modules.win_file.get_group(path, follow_symlinks=True)
```
Return the group that owns a given file

Under Windows, this will return the user (owner) of the file.

While a file in Windows does have a ‘primary group’, this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps this function to provide functionality that somewhat resembles Unix behavior for API compatibility reasons. When managing Windows systems, this function is superfluous and will generate an info level log entry if used directly.

If you do actually want to access the ‘primary group’ of a file, use `file.get_pgid`.

Parameters
- **path** (str) – The path to the file or directory
- **follow_symlinks** (bool) – If the object specified by path is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns The name of the owner
Return type str

CLI Example:
```
salt '*' file.get_group c:\temp\test.txt
```

```
salt.modules.win_file.get_mode(path)
```
Return the mode of a file

Right now we're just returning None because Windows' doesn't have a mode like Linux

Parameters **path** (str) – The path to the file or directory

Returns None

CLI Example:
```
salt '*' file.get_mode /etc/passwd
```

```
salt.modules.win_file.get_pgid(path, follow_symlinks=True)
```
Return the id of the primary group that owns a given file (Windows only)

This function will return the rarely used primary group of a file. This generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Ensure you know what you are doing before using this function.

Parameters
- **path** (str) – The path to the file or directory
- **follow_symlinks** (bool) – If the object specified by path is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns The gid of the primary group
Return type str

CLI Example:
```
salt '*' file.get_pgid c:\temp\test.txt
```
salt.modules.win_file.get_pgroup(path, follow_symlinks=True)

Return the name of the primary group that owns a given file (Windows only)

This function will return the rarely used primary group of a file. This generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Ensure you know what you are doing before using this function.

The return value may be 'None', e.g. if the user is not on a domain. This is a valid group - do not confuse this with the Salt/Python value of None which means no value was returned. To be certain, use the get_pgid function which will return the SID, including for the system 'None' group.

Parameters

- **path** *(str)* – The path to the file or directory
- **follow_symlinks** *(bool)* – If the object specified by path is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns The name of the primary group

Return type **str**

CLI Example:

```
salt '*' file.get_pgroup c:\temp\test.txt
```

salt.modules.win_file.get_uid(path, follow_symlinks=True)

Return the id of the user that owns a given file

Symlinks are followed by default to mimic Unix behavior. Specify follow_symlinks=False to turn off this behavior.

Parameters

- **path** *(str)* – The path to the file or directory
- **follow_symlinks** *(bool)* – If the object specified by path is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns The uid of the owner

Return type **str**

CLI Example:

```
salt '*' file.get_uid c:\temp\test.txt
salt '*' file.get_uid c:\temp\test.txt follow_symlinks=False
```

salt.modules.win_file.get_user(path, follow_symlinks=True)

Return the user that owns a given file

Symlinks are followed by default to mimic Unix behavior. Specify follow_symlinks=False to turn off this behavior.

Parameters

- **path** *(str)* – The path to the file or directory
- **follow_symlinks** *(bool)* – If the object specified by path is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns The name of the owner

Return type **str**

CLI Example:

```
salt '*' file.get_user c:\temp\test.txt
salt '*' file.get_user c:\temp\test.txt follow_symlinks=False
```

salt.modules.win_file.gid_to_group(gid)

Convert the group id to the group name on this system

Under Windows, because groups are just another ACL entity, this function behaves the same as uid_to_user.
For maintaining Windows systems, this function is superfluous and only exists for API compatibility with Unix. Use the `uid_to_user` function instead; an info level log entry will be generated if this function is used directly.

```python
Parameters
gid (str) – The gid of the group
Returns The name of the group
Return type str
```

CLI Example:
```
salt '*' file.gid_to_group S-1-5-21-626487655-2533044672-482107328-1010
```

salt.modules.win_file.group_to_gid(group)

Convert the group to the gid on this system

Under Windows, because groups are just another ACL entity, this function behaves the same as `user_to_uid`, except if None is given, " is returned.

For maintaining Windows systems, this function is superfluous and only exists for API compatibility with Unix. Use the `user_to_uid` function instead; an info level log entry will be generated if this function is used directly.

```python
Parameters
group (str) – The name of the group
Returns The gid of the group
Return type str
```

CLI Example:
```
salt '*' file.group_to_gid administrators
```

salt.modules.win_file.is_link(path)

Check if the path is a symlink

This is only supported on Windows Vista or later.

Inline with Unix behavior, this function will raise an error if the path is not a symlink, however, the error raised will be a SaltInvocationError, not an OSError.

```python
Parameters
path (str) – The path to a file or directory
Returns True if path is a symlink, otherwise False
Return type bool
```

CLI Example:
```
salt '*' file.is_link /path/to/link
```

salt.modules.win_file.lchown(path, user, group=None, pgroup=None)

Chown a file, pass the file the desired user and group without following any symlinks.

Under Windows, the group parameter will be ignored.

This is because while files in Windows do have a 'primary group' property, this is rarely used. It generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

If you do want to change the 'primary group' property and understand the implications, pass the Windows only parameter, `pgroup`, instead.

To set the primary group to 'None', it must be specified in quotes. Otherwise Salt will interpret it as the Python value of None and no primary group changes will occur. See the example below.

```python
Parameters
  • path (str) – The path to the file or directory
  • user (str) – The name of the user to own the file
  • group (str) – The group (not used)
  • pgroup (str) – The primary group to assign
```

21.9. execution modules 2675
Returns True if successful, otherwise error
Return type bool

CLI Example:

```bash
salt '*' file.lchown c:\temp\test.txt myusername
salt '*' file.lchown c:\temp\test.txt myusername pgroup=Administrators
salt '*' file.lchown c:\temp\test.txt myusername "pgroup='None'"
```

salt.modules.win_file.makedirs_(*path*, *owner=None*, *grant_perms=None*, *deny_perms=None*, inheritance=True, reset=False)

Ensure that the parent directory containing this path is available.

Parameters

- **path (str)** – The full path to the directory.

  Note: The path must end with a trailing slash otherwise the directory(s) will be created up to the parent directory. For example if path is C:\temp\test, then it would be treated as C:\temp\ but if the path ends with a trailing slash like C:\temp\test\, then it would be treated as C:\temp\test\.

- **owner (str)** – The owner of the directory. If not passed, it will be the account that created the directory, likely SYSTEM.

- **grant_perms (dict)** – A dictionary containing the user/group and the basic permissions to grant, ie: `{user: {perms: 'basic_permission'}}`. You can also set the applies_to setting here. The default is `this_folder_subfolders_files`. Specify another applies_to setting like this:

  ```
  {'user': {'perms': 'full_control', 'applies_to': 'this_folder'}
  ...
  ```

To set advanced permissions use a list for the `perms` parameter, ie:

```python
{'user': {'perms': ['read_attributes', 'read_ea'], 'applies_to': 'this_folder'}}
```

- **deny_perms (dict)** – A dictionary containing the user/group and permissions to deny along with the applies_to setting. Use the same format used for the `grant_perms` parameter. Remember, deny permissions supersede grant permissions.

- **inheritance (bool)** – If True the object will inherit permissions from the parent, if False, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created.

- **reset (bool)** – If True the existing DACL will be cleared and replaced with the settings defined in this function. If False, new entries will be appended to the existing DACL. Default is False.

New in version 2018.3.0.

Returns True if successful
Return type bool

Raises CommandExecutionError – If unsuccessful

CLI Example:

```bash
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.makedirs C:\Temp\ Administrators "{'Users': {'perms': 'read_execute'}}"
```

(continues on next page)
salt.modules.win_file.makedirs_perms(path, owner=None, grant_perms=None, deny_perms=None, inheritance=True, reset=True)

Set owner and permissions for each directory created.

Parameters

- **path** (*str*) – The full path to the directory.
- **owner** (*str*) – The owner of the directory. If not passed, it will be the account that created the directory, likely SYSTEM.
- **grant_perms** (*dict*) – A dictionary containing the user/group and the basic permissions to grant, ie: `{user: {'perms': 'basic_permission'}}`. You can also set the applies_to setting here. The default is `this_folder_subfolders_files`. Specify another applies_to setting like this:

```python
{'user': {'perms': 'full_control', 'applies_to': 'this_folder'}
```

To set advanced permissions use a list for the `perms` parameter, ie:

```python
{'user': {'perms': ['read_attributes', 'read_ea'], 'applies_to': 'this_folder'}
```

- **deny_perms** (*dict*) – A dictionary containing the user/group and permissions to deny along with the applies_to setting. Use the same format used for the `grant_perms` parameter. Remember, deny permissions supersede grant permissions.
- **inheritance** (*bool*) – If True the object will inherit permissions from the parent, if False, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created.
- **reset** (*bool*) – If True the existing DACL will be cleared and replaced with the settings defined in this function. If False, new entries will be appended to the existing DACL. Default is False.

New in version 2018.3.0.

Returns True if successful, otherwise raises an error

Return type **bool**

CLI Example:

```bash
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.makedirs_perms C:\Temp\ Administrators "{'Users': {'perms': 'read_execute'}, 'applies_to': 'this_folder_only'}}"

# Specify advanced attributes with a list
salt '*' file.makedirs_perms C:\Temp\ Administrators "{'jsnuffy': {'perms': ['read_attributes', 'read_ea'], 'applies_to': 'this_folder_files'}}"
```
salt.modules.win_file.mkdir(path, owner=None, grant_perms=None, deny_perms=None, inheritance=True, reset=False)

Ensure that the directory is available and permissions are set.

Parameters

- **path** (str) – The full path to the directory.
- **owner** (str) – The owner of the directory. If not passed, it will be the account that created the directory, likely SYSTEM
- **grant_perms** (dict) – A dictionary containing the user/group and the basic permissions to grant, ie: `{user}: {'perms': 'basic_permission'}`. You can also set the applies_to setting here. The default is this_folder_subfolders_files. Specify another applies_to setting like this:

  ```
  {'user': {'perms': 'full_control', 'applies_to': 'this_folder'}}
  ```

To set advanced permissions use a list for the perms parameter, ie:

  ```
  {'user': {'perms': ['read_attributes', 'read_ea'], 'applies_to': 'this_folder'}}
  ```

- **deny_perms** (dict) – A dictionary containing the user/group and permissions to deny along with the applies_to setting. Use the same format used for the grant_perms parameter. Remember, deny permissions supersede grant permissions.
- **inheritance** (bool) – If True the object will inherit permissions from the parent, if False, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created.
- **reset** (bool) – If True the existing DACL will be cleared and replaced with the settings defined in this function. If False, new entries will be appended to the existing DACL. Default is False.

New in version 2018.3.0.

Returns True if successful

Return type bool

Raises CommandExecutionError – If unsuccessful

CLI Example:

```
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.mkdir C:\Temp\ Administrators "{'Users': {'perms': 'read_execute'}}"

# Locally using salt call
salt-call file.mkdir C:\Temp\ Administrators "{'Users': {'perms': 'read_execute', 'applies_to': 'this_folder_only'}}"

# Specify advanced attributes with a list
salt '*' file.mkdir C:\Temp\ Administrators "{'snnuff': {'perms': ['read_attributes', 'read_ea'], 'applies_to': 'this_folder_only'}}"
```

salt.modules.win_file.readlink(path)

Return the path that a symlink points to

This is only supported on Windows Vista or later.

Inline with Unix behavior, this function will raise an error if the path is not a symlink, however, the error raised will be a SaltInvocationError, not an OSError.

Parameters **path** (str) – The path to the symlink

Returns The path that the symlink points to
Return type  str

CLI Example:

```
salt '*' file.readlink /path/to/link
```

```{.py}
salt.modules.win_file.remove(path, force=False)
```
Remove the named file or directory

**Parameters**

- `path (str)` – The path to the file or directory to remove.
- `force (bool)` – Remove even if marked Read-Only. Default is False

**Returns**

True if successful, False if unsuccessful

**Return type**  bool

CLI Example:

```
salt '*' file.remove C:\Temp
```

```{.py}
salt.modules.win_file.set_attributes(path, archive=None, hidden=None, normal=None, notIndexed=None, readonly=None, system=None, temporary=None)
```
Set file attributes for a file. Note that the normal attribute means that all others are false. So setting it will clear all others.

**Parameters**

- `path (str)` – The path to the file or directory
- `archive (bool)` – Sets the archive attribute. Default is None
- `hidden (bool)` – Sets the hidden attribute. Default is None
- `normal (bool)` – Resets the file attributes. Cannot be used in conjunction with any other attribute. Default is None
- `notIndexed (bool)` – Sets the indexed attribute. Default is None
- `readonly (bool)` – Sets the readonly attribute. Default is None
- `system (bool)` – Sets the system attribute. Default is None
- `temporary (bool)` – Sets the temporary attribute. Default is None

**Returns**

True if successful, otherwise False

**Return type**  bool

CLI Example:

```
salt '*' file.set_attributes c:\temp\a.txt normal=True
salt '*' file.set_attributes c:\temp\a.txt readonly=True hidden=True
```

```{.py}
salt.modules.win_file.set_mode(path, mode)
```
Set the mode of a file

This just calls get_mode, which returns None because we don’t use mode on Windows

**Parameters**

- `path` – The path to the file or directory
- `mode` – The mode (not used)

**Returns**

None

CLI Example:

```
salt '*' file.set_mode /etc/passwd 0644
```

```{.py}
salt.modules.win_file.set_perms(path, grant_perms=None, deny_perms=None, inheritance=True, reset=False)
```
Set permissions for the given path

**Parameters**

- `path (str)` – The full path to the directory.
• **grant_perms (dict)** – A dictionary containing the user/group and the basic permissions to grant, ie: {'user': {'perms': 'basic_permission'}}. You can also set the `applies_to` setting here. The default for `applies_to` is `this_folder_subfolders_files`. Specify another `applies_to` setting like this:

```python
{'user': {'perms': 'full_control', 'applies_to': 'this_folder'}
```

To set advanced permissions use a list for the `perms` parameter, ie:

```python
{'user': {'perms': ['read_attributes', 'read_ea'], 'applies_to': 'this_folder'}
```

To see a list of available attributes and applies to settings see the documentation for `salt.utils.win_dacl`.

A value of `None` will make no changes to the `grant` portion of the DACL. Default is `None`.

• **deny_perms (dict)** – A dictionary containing the user/group and permissions to deny along with the `applies_to` setting. Use the same format used for the `grant_perms` parameter. Remember, deny permissions supersede grant permissions.

A value of `None` will make no changes to the `deny` portion of the DACL. Default is `None`.

• **inheritance (bool)** – If `True` the object will inherit permissions from the parent, if `False`, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created. Default is `False`.

• **reset (bool)** – If `True` the existing DCL will be cleared and replaced with the settings defined in this function. If `False`, new entries will be appended to the existing DACL. Default is `False`.

New in version 2018.3.0.

Returns True if successful
Return type bool
Raises **CommandExecutionError** – If unsuccessful

CLI Example:

```bash
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.set_perms C:\Temp \"{"Users": \{"perms": 'read_execute'}\"

# Locally using salt call
salt-call file.set_perms C:\Temp \"{"Users': \{"perms': 'read_execute', 'applies_to': 'this_folder_only'}}\"

# Specify advanced attributes with a list
salt '*' file.set_perms C:\Temp \"{"jsnuffy': \{"perms': ['read_attributes', 'read_ea'], 'applies_to': 'this_folder_only'}}\"
```

salt.modules.win_file.stats(path, hash_type='sha256', follow_symlinks=True)

Return a dict containing the stats about a given file

Under Windows, `gid` will equal `uid` and `group` will equal `user`.

While a file in Windows does have a 'primary group', this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).
Salt, therefore, remaps these properties to keep some kind of compatibility with Unix behavior. If the 'primary group' is required, it can be accessed in the \textit{pgroup} and \textit{pgid} properties.

\textbf{Parameters}

- \textbf{path (str)} – The path to the file or directory
- \textbf{hash\_type (str)} – The type of hash to return
- \textbf{follow\_symlinks (bool)} – If the object specified by \textit{path} is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

\textbf{Returns} A dictionary of file/directory stats
\textbf{Return type} dict

\noindent\texttt{CLI Example:} 
\texttt{salt '*' file.stats /etc/passwd}

\texttt{salt.modules.win_file.symlink(src, link)}

Create a symbolic link to a file

This is only supported with Windows Vista or later and must be executed by a user with the SeCreateSymbolicLink privilege.

The behavior of this function matches the Unix equivalent, with one exception - invalid symlinks cannot be created. The source path must exist. If it doesn’t, an error will be raised.

\textbf{Parameters}

- \textbf{src (str)} – The path to a file or directory
- \textbf{link (str)} – The path to the link

\textbf{Returns} True if successful, otherwise False
\textbf{Return type} bool

\noindent\texttt{CLI Example:} 
\texttt{salt '*' file.symlink /path/to/file /path/to/link}

\texttt{salt.modules.win_file.uid\_to\_user(uid)}

Convert a uid to a user name

\textbf{Parameters} \texttt{uid (str)} – The user id to lookup

\textbf{Returns} The name of the user

\textbf{Return type} str

\noindent\texttt{CLI Example:} 
\texttt{salt '*' file.uid_to_user S-1-5-21-626487655-2533044672-482107328-1010}

\texttt{salt.modules.win_file.user\_to\_uid(user)}

Convert user name to a uid

\textbf{Parameters} \texttt{user (str)} – The user to lookup

\textbf{Returns} The user id of the user

\textbf{Return type} str

\noindent\texttt{CLI Example:} 
\texttt{salt '*' file.user_to_uid myusername}

\textbf{21.9.459 salt.modules.win_firewall}

Module for configuring Windows Firewall using \texttt{netsh}

\texttt{salt.modules.win_firewall.add\_rule(name, localport, protocol='tcp', action='allow', dir='in', remoteip='any')}

New in version 2015.5.0.
Add a new inbound or outbound rule to the firewall policy

Parameters
- `name (str)` – The name of the rule. Must be unique and cannot be "all". Required.
- `localport (int)` – The port the rule applies to. Must be a number between 0 and 65535. Can be a range. Can specify multiple ports separated by commas. Required.
- `protocol (Optional[str])` – The protocol. Can be any of the following:
  - A number between 0 and 255
  - `icmpv4`
  - `icmpv6`
  - `tcp`
  - `udp`
  - `any`
- `action (Optional[str])` – The action the rule performs. Can be any of the following:
  - `allow`
  - `block`
  - `bypass`
- `dir (Optional[str])` – The direction. Can be `in` or `out`.
- `remoteip (Optional [str])` – The remote IP. Can be any of the following:
  - `any`
  - `localsubnet`
  - `dns`
  - `dhcp`
  - `wins`
  - `defaultgateway`
  - Any valid IPv4 address (192.168.0.12)
  - Any valid subnet (192.168.1.0/24)
  - Any valid range of IP addresses (192.168.0.1-192.168.0.12)
  - A list of valid IP addresses
Can be combinations of the above separated by commas.

Returns  True if successful
Return type  bool
Raises  `CommandExecutionError` – If the command fails

CLI Example:

```python
salt '*' firewall.add_rule 'test' '8080' 'tcp'
salt '*' firewall.add_rule 'test' '1' 'icmpv4'
salt '*' firewall.add_rule 'test_remote_ip' '8000' 'tcp' 'allow' 'in' '192.168.0.1'
```

salt.modules.win_firewall.delete_rule(name=None, localport=None, protocol=None, dir=None, remoteip=None)

New in version 2015.8.0.

Delete an existing firewall rule identified by name and optionally by ports, protocols, direction, and remote IP.

Parameters
- `name (str)` – The name of the rule to delete. If the name `all` is used you must specify additional parameters.
- `localport (Optional[str])` – The port of the rule. If protocol is not specified, protocol will be set to `tcp`
- `protocol (Optional[str])` – The protocol of the rule. Default is `tcp` when `localport` is specified
- `dir (Optional[str])` – The direction of the rule.
- `remoteip (Optional[str])` – The remote IP of the rule.
Returns True if successful
Return type bool
Raises CommandExecutionError – If the command fails

CLI Example:

```bash
# Delete incoming tcp port 8080 in the rule named 'test'
salt '*' firewall.delete_rule 'test' '8080' 'tcp' 'in'

# Delete the incoming tcp port 8000 from 192.168.0.1 in the rule named # 'test_remote_ip'
salt '*' firewall.delete_rule 'test_remote_ip' '8000' 'tcp' 'in' '192.168.0.1'

# Delete all rules for local port 80:
salt '*' firewall.delete_rule all 80 tcp

# Delete a rule called 'allow80':
salt '*' firewall.delete_rule allow80
```

salt.modules.win_firewall.disable(profile='allprofiles')
Disable firewall profile

Parameters profile (Optional[str]) – The name of the profile to disable. Default is allprofiles. Valid options are:
- allprofiles
- domainprofile
- privateprofile
- publicprofile

Returns True if successful
Return type bool
Raises CommandExecutionError – If the command fails

CLI Example:

```bash
salt '*' firewall.disable
```

salt.modules.win_firewall.enable(profile='allprofiles')
New in version 2015.5.0.
Enable firewall profile

Parameters profile (Optional[str]) – The name of the profile to enable. Default is allprofiles. Valid options are:
- allprofiles
- domainprofile
- privateprofile
- publicprofile

Returns True if successful
Return type bool
Raises CommandExecutionError – If the command fails

CLI Example:

```bash
salt '*' firewall.enable
```

salt.modules.win_firewall.get_all_profiles(store='local')
Gets all properties for all profiles in the specified store

New in version 2018.3.4.
New in version 2019.2.0.
Parameters store (str) – The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  • lgpo
  • local
  Default is local

Returns A dictionary containing the specified settings for each profile

Return type dict

CLI Example:

```python
# Get all firewall settings for all profiles
salt '*' firewall.get_all_settings

# Get all firewall settings for all profiles as defined by local group policy
salt '*' firewall.get_all_settings lgpo
```

salt.modules.win_firewall.get_all_settings (domain, store='local')

Gets all the properties for the specified profile in the specified store

New in version 2018.3.4.

New in version 2019.2.0.

Parameters
  • profile (str) – The firewall profile to query. Valid options are:
    – domain
    – public
    – private
  • store (str) – The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
    – lgpo
    – local
    Default is local

Returns A dictionary containing the specified settings

Return type dict

CLI Example:

```python
# Get all firewall settings for connections on the domain profile
salt '*' win_firewall.get_all_settings domain

# Get all firewall settings for connections on the domain profile as defined by local group policy
salt '*' win_firewall.get_all_settings domain lgpo
```

salt.modules.win_firewall.get_config ()

Get the status of all the firewall profiles

Returns A dictionary of all profiles on the system

Return type dict

Raises CommandExecutionError – If the command fails

CLI Example:

```python
salt '*' firewall.get_config
```

salt.modules.win_firewall.get_rule (name='all')

New in version 2015.5.0.

Display all matching rules as specified by name
**Parameters** name (Optional[str]) – The full name of the rule. all will return all rules.

Default is all

**Returns** A dictionary of all rules or rules that match the name exactly

**Return type** dict

**Raises** CommandExecutionError – If the command fails

CLI Example:

```
salt '*' firewall.get_rule 'MyAppPort'
```

salt.modules.win_firewall.get_settings(profile, section, store='local')

Get the firewall property from the specified profile in the specified store as returned by netsh advfirewall.

New in version 2018.3.4.

New in version 2019.2.0.

**Parameters**

- **profile** (str) – The firewall profile to query. Valid options are:
  - domain
  - public
  - private

- **section** (str) – The property to query within the selected profile. Valid options are:
  - firewallpolicy : inbound/outbound behavior
  - logging : firewall logging settings
  - settings : firewall properties
  - state : firewalls state (on | off)

- **store** (str) – The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - lgpo
  - local

Default is local

**Returns** A dictionary containing the properties for the specified profile

**Return type** dict

**Raises**

- CommandExecutionError – If an error occurs
- ValueError – If the parameters are incorrect

CLI Example:

```
# Get the inbound/outbound firewall settings for connections on the
# local domain profile
salt * win_firewall.get_settings domain firewallpolicy
```

```
# Get the inbound/outbound firewall settings for connections on the
# domain profile as defined by local group policy
salt * win_firewall.get_settings domain firewallpolicy lgpo
```

salt.modules.win_firewall.rule_exists(name)

New in version 2016.11.6.

Checks if a firewall rule exists in the firewall policy

**Parameters** name (str) – The name of the rule

**Returns** True if exists, otherwise False

**Return type** bool

CLI Example:
# Is there a rule named RemoteDesktop

```
salt '*' firewall.rule_exists RemoteDesktop
```

```python
salt.modules.win_firewall.set_firewall_settings(profile, inbound=None, outbound=None, store='local')
```

Set the firewall inbound/outbound settings for the specified profile and store

New in version 2018.3.4.

New in version 2019.2.0.

**Parameters**

- **profile (str)** – The firewall profile to query. Valid options are:
  - domain
  - public
  - private

- **inbound (str)** – The inbound setting. If None is passed, the setting will remain unchanged. Valid values are:
  - blockinbound
  - blockinboundalways
  - allowinbound
  - notconfigured
  Default is None

- **outbound (str)** – The outbound setting. If None is passed, the setting will remain unchanged. Valid values are:
  - allowoutbound
  - blockoutbound
  - notconfigured
  Default is None

- **store (str)** – The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - lgpo
  - local
  Default is local

**Returns**

True if successful

**Return type**

bool

**Raises**

- **CommandExecutionError** – If an error occurs
- **ValueError** – If the parameters are incorrect

**CLI Example:**

```
# Set the inbound setting for the domain profile to block inbound
# connections
salt * firewall.set_firewall_settings domain='domain' inbound='blockinbound'

# Set the outbound setting for the domain profile to allow outbound
# connections
salt * firewall.set_firewall_settings domain='domain' outbound='allowoutbound'

# Set inbound/outbound settings for the domain profile in the group
# policy to block inbound and allow outbound
salt * firewall.set_firewall_settings domain='domain' inbound='blockinbound' outbound='allowoutbound' store='lgpo'
```

```python
salt.modules.win_firewall.set_logging_settings(profile, setting, value, store='local')
```

Configure logging settings for the Windows firewall.
New in version 2018.3.4.
New in version 2019.2.0.

Parameters

- **profile** *(str)* – The firewall profile to configure. Valid options are:
  - domain
  - public
  - private
- **setting** *(str)* – The logging setting to configure. Valid options are:
  - allowedconnections
  - droppedconnections
  - filename
  - maxfilesize
- **value** *(str)* – The value to apply to the setting. Valid values are dependent upon the setting being configured. Valid options are:
  - allowedconnections:
    - enable
    - disable
    - notconfigured
  - droppedconnections:
    - enable
    - disable
    - notconfigured
  - filename:
    - Full path and name of the firewall log file
    - notconfigured
  - maxfilesize:
    - 1 - 32767
    - notconfigured

*Note:* `notconfigured` can only be used when using the lgpo store

- **store** *(str)* – The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - lgpo
  - local

Default is local

Returns `True` if successful

Return type `bool`

Raises

- `CommandExecutionError` – If an error occurs
- `ValueError` – If the parameters are incorrect

CLI Example:

```bash
# Log allowed connections and set that in local group policy
salt * firewall.set_logging_settings domain allowedconnections enable lgpo

# Don’t log dropped connections
salt * firewall.set_logging_settings profile=private setting=droppedconnections\n  → value=disable

# Set the location of the log file
salt * firewall.set_logging_settings domain filename C:\windows\logs\firewall.log
```

(continues on next page)
You can also use environment variables

```bash
salt * firewall.set_logging_settings domain filename %systemroot\%system32\LogFiles\Firewall\firewall.log
```

Set the max file size of the log to 2048 Kb

```bash
salt * firewall.set_logging_settings domain maxfilesize 2048
```

salt.modules.win_firewall.set_settings(profile, setting, value, store='local')

Configure firewall settings.

New in version 2018.3.4.

New in version 2019.2.0.

Parameters

- **profile** (str) – The firewall profile to configure. Valid options are:
  - domain
  - public
  - private
- **setting** (str) – The firewall setting to configure. Valid options are:
  - localfirewallrules
  - localconsecrules
  - inboundusernotification
  - remotemanagement
  - unicastresponsetomulticast
- **value** (str) – The value to apply to the setting. Valid options are
  - enable
  - disable
  - notconfigured

Note: notconfigured can only be used when using the lgpo store

- **store** (str) – The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - lgpo
  - local

Default is local

Returns True if successful

Return type bool

Raises

- **CommandExecutionError** – If an error occurs
- **ValueError** – If the parameters are incorrect

CLI Example:

```bash
# Merge local rules with those distributed through group policy
salt * firewall.set_settings domain localfirewallrules enable
```

```bash
# Allow remote management of Windows Firewall
salt * firewall.set_settings domain remotemanagement enable
```

salt.modules.win_firewall.set_state(profile, state, store='local')

Configure the firewall state.

New in version 2018.3.4.

New in version 2019.2.0.

Parameters
• **profile**(str) – The firewall profile to configure. Valid options are:
  – domain
  – public
  – private
• **state**(str) – The firewall state. Valid options are:
  – on
  – off
  – notconfigured

  **Note:** notconfigured can only be used when using the lgpo store

• **store**(str) – The store to use. This is either the local firewall policy or the policy
  defined by local group policy. Valid options are:
  – lgpo
  – local
  Default is local

  **Returns** True if successful
  **Return type** bool

  **Raises**
  • *CommandExecutionError* – If an error occurs
  • *ValueError* – If the parameters are incorrect

**CLI Example:**

```bash
# Turn the firewall off when the domain profile is active
salt * firewall.set_state domain off

# Turn the firewall on when the public profile is active and set that in
# the local group policy
salt * firewall.set_state public on lgpo
```

**21.9.460 salt.modules.win_groupadd**

Manage groups on Windows

**Important:** If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to 'group.info' is not available), see here.

salt.modules.win_groupadd.add(name, **kwargs)

Add the specified group

  **Parameters**
  
  • **name**(str) – The name of the group to add
  
  **Returns** True if successful, otherwise False
  
  **Return type** bool

**CLI Example:**

```bash
salt '*' group.add foo
```

salt.modules.win_groupadd.adduser(name, username, **kwargs)

Add a user to a group

  **Parameters**
  
  • **name**(str) – The name of the group to modify
  
  • **username**(str) – The name of the user to add to the group

  **Returns** True if successful, otherwise False
  
  **Return type** bool
Salt Documentation, Release 2019.2.0

CLI Example:
```
salt '*' group.adduser foo username
```

```python
salt.modules.win_groupadd.delete(name, **kwargs)
Remove the named group
  Parameters name (str) – The name of the group to remove
  Returns True if successful, otherwise False
  Return type bool
CLI Example:
```
salt '*' group.delete foo
```

```python
salt.modules.win_groupadd.deluser(name, username, **kwargs)
Remove a user from a group
  Parameters
    • name (str) – The name of the group to modify
    • username (str) – The name of the user to remove from the group
  Returns True if successful, otherwise False
  Return type bool
CLI Example:
```
salt '*' group.deluser foo username
```

```python
salt.modules.win_groupadd.getent(refresh=False)
Return info on all groups
  Parameters refresh (bool) – Refresh the info for all groups in __context__. If False only
    the groups in __context__ will be returned. If True the __context__ will be refreshed
    with current data and returned. Default is False
  Returns A list of groups and their information
CLI Example:
```
salt '*' group.getent
```

```python
salt.modules.win_groupadd.info(name)
Return information about a group
  Parameters name (str) – The name of the group for which to get information
  Returns A dictionary of information about the group
  Return type dict
CLI Example:
```
salt '*' group.info foo
```

```python
salt.modules.win_groupadd.list_groups(refresh=False)
Return a list of groups
  Parameters refresh (bool) – Refresh the info for all groups in __context__. If False only
    the groups in __context__ will be returned. If True, the __context__ will be re-
    freshed with current data and returned. Default is False
  Returns A list of groups on the machine
  Return type list
CLI Example:
```
salt '*' group.list_groups
```

```python
salt.modules.win_groupadd.members(name, members_list, **kwargs)
Ensure a group contains only the members in the list
```
Parameters

- **name (str)** - The name of the group to modify
- **members_list (str)** - A single user or a comma separated list of users. The group will contain only the users specified in this list.

Returns True if successful, otherwise False

Return type bool

CLI Example:
```
salt '*' group.members foo 'user1,user2,user3'
```

## 21.9.461 salt.modules.win_iis module

Microsoft IIS site management via WebAdministration powershell module

- **maintainer** Shane Lee <slee@saltstack.com>, Robert Booth <rbooth@saltstack.com>
- **platform** Windows
- **depends** PowerShell
- **depends** WebAdministration module (PowerShell) (IIS)

New in version 2016.3.0.

salt.modules.win_iis.create_app(name, site, sourcepath, apppool=None)

Create an IIS application.

**Note:** This function only validates against the application name, and will return True even if the application already exists with a different configuration. It will not modify the configuration of an existing application.

Parameters

- **name (str)** - The IIS application.
- **site (str)** - The IIS site name.
- **sourcepath (str)** - The physical path.
- **apppool (str)** - The name of the IIS application pool.

Returns True if successful, otherwise False

Return type bool

CLI Example:
```
salt '*' win_iis.create_app name='app0' site='site0' sourcepath='C:\site0' apppool='site0'
```

salt.modules.win_iis.create_apppool(name)

Create an IIS application pool.

**Note:** This function only validates against the application pool name, and will return True even if the application pool already exists with a different configuration. It will not modify the configuration of an existing application.

Parameters

- **name (str)** - The name of the IIS application pool.

Returns True if successful, otherwise False

Return type bool

CLI Example:
salt '*' win_iis.create_apppool name='MyTestPool'

salt.modules.win_iis.create_backup(name)
Backup an IIS Configuration on the System.

New in version 2017.7.0.

Note: Backups are stored in the $env:Windir\System32\inetsrv\backup folder.

**Parameters**
- **name (str)** – The name to give the backup
- **Returns** True if successful, otherwise False
- **Return type** bool

CLI Example:
salt '*' win_iis.create_backup good_config_20170209

salt.modules.win_iis.create_binding(site, hostheader='*', ipaddress='*', port=80, protocol='http', sslflags=None)
Create an IIS Web Binding.

Note: This function only validates against the binding ipaddress:port:hostheader combination, and will return True even if the binding already exists with a different configuration. It will not modify the configuration of an existing binding.

**Parameters**
- **site (str)** – The IIS site name.
- **hostheader (str)** – The host header of the binding. Usually a hostname.
- **ipaddress (str)** – The IP address of the binding.
- **port (int)** – The TCP port of the binding.
- **protocol (str)** – The application protocol of the binding.
- **sslflags (str)** – The flags representing certificate type and storage of the binding.
- **Returns** True if successful, otherwise False
- **Return type** bool

CLI Example:
salt '*' win_iis.create_binding site='site0' hostheader='example.com' ipaddress='*' port='80'

salt.modules.win_iis.create_cert_binding(name, site, hostheader='*', ipaddress='*', port=443, sslflags=0)
Assign a certificate to an IIS Web Binding.

New in version 2016.11.0.

Note: The web binding that the certificate is being assigned to must already exist.

**Parameters**
- **name (str)** – The thumbprint of the certificate.
- **site (str)** – The IIS site name.
- **hostheader (str)** – The host header of the binding.
- **ipaddress (str)** – The IP address of the binding.
• `port (int)` – The TCP port of the binding.
• `sslflags (int)` – Flags representing certificate type and certificate storage of the binding.

Returns: True if successful, otherwise False

Return type: bool

CLI Example:

```
salt '*' win_iis.create_cert_binding name='AAA000' site='site0' hostheader='example.com' ipaddress='*' port='443'
```

```
salt.modules.win_iis.create_site(name, sourcepath, apppool='', hostheader='', ipaddress='*', port=80, protocol='http')
```

Create a basic website in IIS.

Note: This function only validates against the site name, and will return True even if the site already exists with a different configuration. It will not modify the configuration of an existing site.

Parameters

• `name (str)` – The IIS site name.
• `sourcepath (str)` – The physical path of the IIS site.
• `apppool (str)` – The name of the IIS application pool.
• `hostheader (str)` – The host header of the binding. Usually the hostname or website name, ie: www.contoso.com
• `ipaddress (str)` – The IP address of the binding.
• `port (int)` – The TCP port of the binding.
• `protocol (str)` – The application protocol of the binding. (http, https, etc.)

Returns: True if successful, otherwise False.

Return type: bool

Note: If an application pool is specified, and that application pool does not already exist, it will be created.

CLI Example:

```
salt '*' win_iis.create_site name='My Test Site' sourcepath='c:\stage' apppool='TestPool'
```

```
salt.modules.win_iis.create_vdir(name, site, sourcepath, app= '/')
```

Create an IIS virtual directory.

Note: This function only validates against the virtual directory name, and will return True even if the virtual directory already exists with a different configuration. It will not modify the configuration of an existing virtual directory.

Parameters

• `name (str)` – The virtual directory name.
• `site (str)` – The IIS site name.
• `sourcepath (str)` – The physical path.
• `app (str)` – The IIS application.

Returns: True if successful, otherwise False

Return type: bool

CLI Example:
salt 'salt '*' win_iis.create_vdir name='vd0' site='site0' sourcepath='C:\inetpub\vdirs\vd0'

salt.modules.win_iis.get_container_setting(name, container, settings)
Get the value of the setting for the IIS container.
New in version 2016.11.0.

Parameters
- **name**(str) – The name of the IIS container.
- **container**(str) – The type of IIS container. The container types are: AppPools, Sites, SslBindings
- **settings**(dict) – A dictionary of the setting names and their values.

Returns A dictionary of the provided settings and their values.
Return type dict

CLI Example:
salt '*' win_iis.get_container_setting name='MyTestPool' container='AppPools' settings='["processModel.identityType"]'

salt.modules.win_iis.get_webapp_settings(name, site, settings)
Get the value of the setting for the IIS web application.
New in version 2017.7.0.

Note: Params are case sensitive

Parameters
- **name**(str) – The name of the IIS web application.
- **site**(str) – The site name contains the web application. Example: Default Web Site
- **settings**(str) – A dictionary of the setting names and their values. Available settings: physicalPath, applicationPool, userName, password

Returns A dictionary of the provided settings and their values.
Return type dict

CLI Example:
salt '*' win_iis.get_webapp_settings name='app0' site='Default Web Site' settings='["physicalPath","applicationPool"]'

salt.modules.win_iis.list_apppools()
List all configured IIS application pools.

Returns A dictionary of IIS application pools and their details.
Return type dict

CLI Example:
salt '*' win_iis.list_apppools

salt.modules.win_iis.list_apps(site)
Get all configured IIS applications for the specified site.
Parameters **site**(str) – The IIS site name.

Returns: A dictionary of the application names and properties.

CLI Example:
salt '*' win_iis.list_apps site

salt.modules.win_iis.list_backups()
List the IIS Configuration Backups on the System.

New in version 2017.7.0.

Note: Backups are made when a configuration is edited. Manual backups are stored in the $env:Windir\System32\inetsrv\backup folder.

Returns A dictionary of IIS Configurations backed up on the system.
Return type dict

CLI Example:
salt '*' win_iis.list_backups

salt.modules.win_iis.list_bindings(site)
Get all configured IIS bindings for the specified site.

Parameters site (str) – The name if the IIS Site
Returns A dictionary of the binding names and properties.
Return type dict

CLI Example:
salt '*' win_iis.list_bindings site

salt.modules.win_iis.list_cert_bindings(site)
List certificate bindings for an IIS site.

New in version 2016.11.0.

Parameters site (str) – The IIS site name.
Returns A dictionary of the binding names and properties.
Return type dict

CLI Example:
salt '*' win_iis.list_cert_bindings site

salt.modules.win_iis.list_sites()
List all the currently deployed websites.

Returns A dictionary of the IIS sites and their properties.
Return type dict

CLI Example:
salt '*' win_iis.list_sites

salt.modules.win_iis.list_vdirs(site, app='/')
Get all configured IIS virtual directories for the specified site, or for the combination of site and application.

Parameters

- site (str) – The IIS site name.
- app (str) – The IIS application.

Returns A dictionary of the virtual directory names and properties.
Return type dict

CLI Example:
salt '*' win_iis.list_vdirs site

salt.modules.win_iis.list_worker_processes(apppool)
Returns a list of worker processes that correspond to the passed application pool.

New in version 2017.7.0.

Parameters
   * apppool (str) – The application pool to query
Returns
   A dictionary of worker processes with their process IDs
Return type
   dict

CLI Example:
salt '*' win_iis.list_worker_processes 'My App Pool'

salt.modules.win_iis.modify_binding(site, binding, hostheader=None, ipaddress=None, port=None, sslflags=None)
Modify an IIS Web Binding. Use site and binding to target the binding.

New in version 2017.7.0.

Parameters
   * site (str) – The IIS site name.
   * binding (str) – The binding to edit. This is a combination of the IP address, port, and hostheader. It is in the following format: ipaddress:port:hostheader. For example, *:80: or *:80:salt.com
   * hostheader (str) – The host header of the binding. Usually the hostname.
   * ipaddress (str) – The IP address of the binding.
   * port (int) – The TCP port of the binding.
   * sslflags (str) – The flags representing certificate type and storage of the binding.
Returns
   True if successful, otherwise False
Return type
   bool

CLI Example:
The following will set the host header of binding *:80: for site0 to example.com

salt '*' win_iis.modify_binding site='site0' binding='*:80:' hostheader='example.com'

salt.modules.win_iis.modify_site(name, sourcepath=None, apppool=None)
Modify a basic website in IIS.

New in version 2017.7.0.

Parameters
   * name (str) – The IIS site name.
   * sourcepath (str) – The physical path of the IIS site.
   * apppool (str) – The name of the IIS application pool.
Returns
   True if successful, otherwise False.
Return type
   bool

Note: If an application pool is specified, and that application pool does not already exist, it will be created.

CLI Example:
salt '*' win_iis.modify_site name='My Test Site' sourcepath='c:\new_path' apppool='NewTestPool'

salt.modules.win_iis.remove_app(name, site)
Remove an IIS application.
Parameters
- **name** *(str)* – The application name.
- **site** *(str)* – The IIS site name.

Returns True if successful, otherwise False

Return type **bool**

CLI Example:

```
salt '*' win_iis.remove_app name='app0' site='site0'
```

salt.modules.win_iis.remove_apppool(*name*)

Remove an IIS application pool.

Parameters **name** *(str)* – The name of the IIS application pool.

Returns True if successful, otherwise False

Return type **bool**

CLI Example:

```
salt '*' win_iis.remove_apppool name='MyTestPool'
```

salt.modules.win_iis.remove_backup(*name*)

Remove an IIS Configuration backup from the System.

New in version 2017.7.0.

Parameters **name** *(str)* – The name of the backup to remove

Returns True if successful, otherwise False

Return type **bool**

CLI Example:

```
salt '*' win_iis.remove_backup backup_20170209
```

salt.modules.win_iis.remove_binding(*site*, **hostheader**='', **ipaddress**='*', **port**=80)

Remove an IIS binding.

Parameters
- **site** *(str)* – The IIS site name.
- **hostheader** *(str)* – The host header of the binding.
- **ipaddress** *(str)* – The IP address of the binding.
- **port** *(int)* – The TCP port of the binding.

Returns True if successful, otherwise False

Return type **bool**

CLI Example:

```
salt '*' win_iis.remove_binding site='site0' hostheader='example.com' ipaddress='*' port='80'
```

salt.modules.win_iis.remove_cert_binding(*name*, **site**, **hostheader**='', **ipaddress**='*', **port**=443)

Remove a certificate from an IIS Web Binding.

New in version 2016.11.0.

Note: This function only removes the certificate from the web binding. It does not remove the web binding itself.

Parameters
- **name** *(str)* – The thumbprint of the certificate.
- **site** *(str)* – The IIS site name.
- **hostheader** *(str)* – The host header of the binding.
- `ipaddress` (str) – The IP address of the binding.
- `port` (int) – The TCP port of the binding.

  Returns: True if successful, otherwise False

  Return type: bool

CLI Example:

```
salt '*' win_iis.remove_cert_binding name='AAA000' site='site0' hostheader=example.com ipaddress='*' port='443'
```

**salt.modules.win_iis.remove_site(name)**

Delete a website from IIS.

  Parameters
  - `name` (str) – The IIS site name.

  Returns: True if successful, otherwise False

  Return type: bool

Note: This will not remove the application pool used by the site.

CLI Example:

```
salt '*' win_iis.remove_site name='My Test Site'
```

**salt.modules.win_iis.remove_vdir(name, site, app='/')**

Remove an IIS virtual directory.

  Parameters
  - `name` (str) – The virtual directory name.
  - `site` (str) – The IIS site name.
  - `app` (str) – The IIS application.

  Returns: True if successful, otherwise False

  Return type: bool

CLI Example:

```
salt '*' win_iis.remove_vdir name='vdir0' site='site0'
```

**salt.modules.win_iis.restart_apppool(name)**

Restart an IIS application pool.

New in version 2016.11.0.

  Parameters
  - `name` (str) – The name of the IIS application pool.

  Returns: True if successful, otherwise False

  Return type: bool

CLI Example:

```
salt '*' win_iis.restart_apppool name='MyTestPool'
```

**salt.modules.win_iis.restart_site(name)**

Restart a Web Site in IIS.

New in version 2017.7.0.

  Parameters
  - `name` (str) – The name of the website to restart.

  Returns: True if successful, otherwise False

  Return type: bool

CLI Example:

```
salt '*' win_iis.restart_site name='My Test Site'
```
salt.modules.win_iis.set_container_setting(name, container, settings)
Set the value of the setting for an IIS container.

New in version 2016.11.0.

Parameters
• name (str) – The name of the IIS container.
• container (str) – The type of IIS container. The container types are: AppPools, Sites, SslBindings
• settings (dict) – A dictionary of the setting names and their values.

Returns True if successful, otherwise False
Return type bool

CLI Example:
```
salt '*' win_iis.set_container_setting name='MyTestPool' container='AppPools' settings="{'managedPipeLineMode': 'Integrated'}"
```

salt.modules.win_iis.set_webapp_settings(name, site, settings)
New in version 2017.7.0.

Configure an IIS application.

Note: This function only configures an existing app. Params are case sensitive.

Parameters
• name (str) – The IIS application.
• site (str) – The IIS site name.
• settings (str) – A dictionary of the setting names and their values. - physicalPath: The physical path of the webapp. - applicationPool: The application pool for the webapp. - userName: "connectAs" user - password: "connectAs" password for user

Returns A boolean representing whether all changes succeeded.
Return type bool

CLI Example:
```
salt '*' win_iis.set_webapp_settings name='app0' site='site0' settings="{"physicalPath": 'C:\site0', 'apppool': 'site0'}"
```

salt.modules.win_iis.start_apppool(name)
Start an IIS application pool.

New in version 2017.7.0.

Parameters name (str) – The name of the App Pool to start.

Returns True if successful, otherwise False
Return type bool

CLI Example:
```
salt '*' win_iis.start_apppool name='MyTestPool'
```

salt.modules.win_iis.start_site(name)
Start a Web Site in IIS.

New in version 2017.7.0.

Parameters name (str) – The name of the website to start.

Returns True if successful, otherwise False
Return type bool
## 21.9.462 salt.modules.win_iis

The networking module for Windows based systems

salt.modules.win_iisdisable(\texttt{iface})

Disable an interface

CLI Example:

```
    salt -G 'os_family:Windows' ip.disable 'Local Area Connection #2'
```

salt.modules.win_iis.enable(\texttt{iface})

Enable an interface

CLI Example:

```
    salt -G 'os_family:Windows' ip.enable 'Local Area Connection #2'
```

salt.modules.win_iis.get_all_interfaces()

Return configs for all interfaces

CLI Example:

```
    salt -G 'os_family:Windows' ip.get_all_interfaces
```

salt.modules.win_iis.get_default_gateway()

Set DNS source to DHCP on Windows

CLI Example:

```
    salt -G 'os_family:Windows' ip.get_default_gateway
```

---

salt.modules.win_iis.stop_apppool(\texttt{name})

Stop an IIS application pool.

New in version 2017.7.0.

Parameters:\name (str) – The name of the App Pool to stop.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
    salt '*' win_iis.stop_apppool name='MyTestPool'
```

salt.modules.win_iis.stop_site(\texttt{name})

Stop a Web Site in IIS.

New in version 2017.7.0.

Parameters:\name (str) – The name of the website to stop.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
    salt '*' win_iis.stop_site name='My Test Site'
```
salt.modules.win_ip.get_interface(iface)
Return the configuration of a network interface

CLI Example:
```
salt -G 'os_family:Windows' ip.get_interface 'Local Area Connection'
```

salt.modules.win_ip.get_subnet_length(mask)
Convenience function to convert the netmask to the CIDR subnet length

CLI Example:
```
salt -G 'os_family:Windows' ip.get_subnet_length 255.255.255.0
```

salt.modules.win_ip.is_disabled(iface)
Returns True if interface is disabled, otherwise False

CLI Example:
```
salt -G 'os_family:Windows' ip.is_disabled 'Local Area Connection #2'
```

salt.modules.win_ip.is_enabled(iface)
Returns True if interface is enabled, otherwise False

CLI Example:
```
salt -G 'os_family:Windows' ip.is_enabled 'Local Area Connection #2'
```

salt.modules.win_ip.raw_interface_configs()
Return raw configs for all interfaces

CLI Example:
```
salt -G 'os_family:Windows' ip.raw_interface_configs
```

salt.modules.win_ip.set_dhcp_all(iface)
Set both IP Address and DNS to DHCP

CLI Example:
```
salt -G 'os_family:Windows' ip.set_dhcp_all 'Local Area Connection'
```

salt.modules.win_ip.set_dhcp_dns(iface)
Set DNS source to DHCP on Windows

CLI Example:
```
salt -G 'os_family:Windows' ip.set_dhcp_dns 'Local Area Connection'
```

salt.modules.win_ip.set_dhcp_ip(iface)
Set Windows NIC to get IP from DHCP

CLI Example:
```
salt -G 'os_family:Windows' ip.set_dhcp_ip 'Local Area Connection'
```

salt.modules.win_ip.set_static_dns(iface, *addrs)
Set static DNS configuration on a Windows NIC

Parameters
- iface (str) – The name of the interface to set
**addrs** – One or more DNS servers to be added. To clear the list of DNS servers pass an empty list ([]). If undefined or None no changes will be made.

**Returns** A dictionary containing the new DNS settings

**Return type** dict

CLI Example:

```
salt -G os_family:Windows ip.set_static_dns 'Local Area Connection' '192.168.1.1'
salt -G os_family:Windows ip.set_static_dns 'Local Area Connection' '192.168.1.253'
```

```
salt.modules.win_ip.set_static_ip(iface, addr, gateway=None, append=False)
```
Set static IP configuration on a Windows NIC

**iface** The name of the interface to manage

**addr** IP address with subnet length (ex. 10.1.2.3/24). The `ip.get_subnet_length` function can be used to calculate the subnet length from a netmask.

**gateway** [None] If specified, the default gateway will be set to this value.

**append** [False] If True, this IP address will be added to the interface. Default is False, which overrides any existing configuration for the interface and sets addr as the only address on the interface.

CLI Example:

```
salt -G os_family:Windows ip.set_static_ip 'Local Area Connection' 10.1.2.3/24
    --gateway=10.1.2.1
salt -G os_family:Windows ip.set_static_ip 'Local Area Connection' 10.1.2.4/24
    --append=True
```

**21.9.463 salt.modules.win_lgpo module**

Manage Local Policy on Windows

This module allows configuring local group policy (i.e. `gppedit.msc`) on a Windows server.

New in version 2016.11.0.

**Administrative Templates**

Administrative template policies are dynamically read from ADMX/ADML files on the server.

**Windows Settings**

Policies contained in the "Windows Settings" section of the `gppedit.msc` GUI are statically defined in this module. Each policy is configured for the section (Machine/User) in the module’s `_policy_info` class. The `_policy_info` class contains a "policies" dict on how the module will configure the policy, where the policy resides in the GUI (for display purposes), data validation data, data transformation data, etc.

**Current known limitations**

- At this time, start/shutdown scripts policies are displayed, but are not configurable.
- Not all "Security Settings" policies exist in the `_policy_info` class

**depends**

- pywin32 Python module
Get a policy value

**Parameters**

- `policy_class (str)` — Some policies are both user and computer, by default all policies will be pulled, but this can be used to retrieve only a specific policy class User/USER/user = retrieve user policies Machine/MACHINE/machine/Computer/COMPUTER/computer = retrieve machine/computer policies
- `return_full_policy_names (bool)` — True/False to return the policy name as it is seen in the `gpedit.msc` GUI or to only return the policy key/id.
- `hierarchical_return (bool)` — True/False to return the policy data in the hierarchy as seen in the `gpedit.msc` GUI. The default of False will return data split only into User/Computer configuration sections
- `adml_language (str)` — The ADML language to use for processing display/descriptive names and enumeration values of ADMX template data, defaults to en-US
- `return_not_configured (bool)` — Include Administrative Template policies that are 'Not Configured' in the return data

**Returns**

A dictionary containing the policy values for the specified class

**Return type**

dict

**CLI Example:**

```bash
salt '*' lgpo.get machine return_full_policy_names=True
```

Get policy information

salt.modules.win_lgpo.get_policy_info(`policy_name, policy_class, adml_language='en-US'`)

**Returns** information about a specified policy

**Parameters**

- `policy_name (str)` — The name of the policy to lookup
- `policy_class (str)` — The class of policy, i.e. machine, user, both
- `adml_language (str)` — The ADML language to use for Administrative Template data lookup

**Returns** Information about the specified policy

**Return type**

dict

**CLI Example:**

```bash
salt '*' lgpo.get_policy_info 'Maximum password age' machine
```

You can use `lgpo.get_policy_info` to get all the possible names that could be used in a state file or from the command line (along with elements that need to be set/etc). The key is to match the text you see in the `gpedit.msc` gui exactly, including titles around words or phrases. The "full path" style is really only needed when there are multiple policies that use the same base name. For example, Access data sources across domains exists in ~10 different paths. If you put that through `get_policy_info` you'll get back a message that it is used for multiple policies and you need to be more specific.

**CLI Example:**

```bash
salt-call --local lgpo.get_policy_info ShellRemoveOrderPrints_2 machine
```

(continues on next page)
Escaping can get tricky in cmd/Powershell. The following is an example of escaping in Powershell using backquotes:

```powershell
PS> salt-call --local lgpo.get_policy_info "Turn off the "Order Prints" picture task"
```

This function can then be used to get the options available for specifying Group Policy Objects to be used in state files. Based on the above any of these *should* be usable:

```
internetcommunications_settings:
lgpo.set:
  - computer_policy:
  Turn off the "Order Prints" picture task: Enabled
```

```
internetcommunications_settings:
lgpo.set:
  - computer_policy:
  ShellRemoveOrderPrints_2: Enabled
```

When using the full path, it might be a good idea to use single quotes around the path:
internet_communications_settings:
  lgpo.set:
    - computer_policy:
      'System\Internet Communication Management\Internet Communication Settings\Turn off the "Order Prints" picture task': 'Enabled'

If you struggle to find the policy from get_policy_info using the name as you see in gpedit.msc, the names such as "ShellRemoveOrderPrints_2" come from the .admx files. If you know nothing about .admx/.adml relationships (ADML holds what you see in the GUI, ADMX holds the more technical details), then this may be a little bit too much info, but here is an example with the above policy using Powershell:

```powershell
PS>Get-ChildItem -Path C:\Windows\PolicyDefinitions -Recurse -Filter *.adml | % Select-String "Order Prints"
```

From this grep, we can see id "ShellRemoveOrderPrints" is the ID of the string used to describe this policy, then we search for it in the ADMX:

```powershell
PS>Get-ChildItem -Path C:\Windows\PolicyDefinitions -Recurse -Filter *.admx | % Select-String "ShellRemoveOrderPrints"
```

Now we have two to pick from. And if you notice the class="Machine" and class="User" (which details if it is a computer policy or user policy respectively) the ShellRemoveOrderPrints_2 is the "short name" we could use to pass through get_policy_info to see what the module itself is expecting.

```python
salt.modules.win_lgpo.set_(computer_policy=None, user_policy=None, cumulative_rights_assignments=True, adml_language='en-US')
```

Set a local server policy.

Parameters

- **computer_policy** (dict) – A dictionary of "policyname: value" pairs of computer policies to set. ‘value’ should be how it is displayed in the gpedit GUI, i.e. if a setting can be 'Enabled'/'Disabled', then that should be passed

  Administrative Template data may require dicts within dicts, to specify each element of the Administrative Template policy. Administrative Templates policies are always cumulative.
Policy names can be specified in a number of ways based on the type of policy:

Windows Settings Policies:
These policies can be specified using the GUI display name or the key name from the _policy_info class in this module. The GUI display name is also contained in the _policy_info class in this module.

Administrative Template Policies:
These can be specified using the policy name as displayed in the GUI (case sensitive). Some policies have the same name, but a different location (for example, "Access data sources across domains"). These can be differentiated by the "path" in the GUI (for example, "Windows Components\Internet Explorer\Internet Control Panel\Security Page\Internet Zone\Access data sources across domains").

Additionally, policies can be specified using the "name" and "id" attributes from the ADMX files.

For Administrative Templates that have policy elements, each element can be specified using the text string as seen in the GUI or using the ID attribute from the ADMX file. Due to the way some of the GUI text is laid out, some policy element names could include descriptive text that appears before the policy element in the GUI.

Use the get_policy_info function for the policy name to view the element ID/names that the module will accept.

- **user_policy** *(dict)* – The same setup as the computer_policy, except with data to configure the local user policy.
- **cumulative_rights_assignments** *(bool)* – Determine how user rights assignment policies are configured.

  If True, user right assignment specifications are simply added to the existing policy

  If False, only the users specified will get the right (any existing will have the right revoked)

- **adml_language** *(str)* – The language files to use for looking up Administrative Template policy data (i.e. how the policy is displayed in the GUI). Defaults to 'en-US' (U.S. English).

Returns True is successful, otherwise False

Return type **bool**

CLI Example:

```shell
salt '*' lgpo.set computer_policy="{"LockoutDuration": 2, "RestrictAnonymous": "Enabled", "AuditProcessTracking": "Success, Failure"}"
```

```python
salt.modules.win_lgpo.set_computer_policy(name, setting, cumulative_rights_assignments=True, adml_language='en-US')
```

Set a single computer policy

Parameters

- **name** *(str)* – The name of the policy to configure
- **setting** *(str)* – The setting to configure the named policy with
- **cumulative_rights_assignments** *(bool)* – Determine how user rights assignment policies are configured. If True, user right assignment specifications are simply added to the existing policy. If False, only the users specified will get the right (any existing will have the right revoked)
- **adml_language** *(str)* – The language files to use for looking up Administrative Template policy data (i.e. how the policy is displayed in the GUI). Defaults to 'en-US' (U.S. English).

  Returns True if successful, otherwise False

  Return type **bool**

  CLI Example:

  ```
salt '*' lgpo.set_computer_policy LockoutDuration 1440
  ```

**salt.modules.win_lgpo.set_user_policy**( *name*, *setting*, *adml_language='en-US'*)

Set a single user policy

Parameters

- **name** *(str)* – The name of the policy to configure
- **setting** *(str)* – The setting to configure the named policy with
- **adml_language** *(str)* – The language files to use for looking up Administrative Template policy data (i.e. how the policy is displayed in the GUI). Defaults to 'en-US' (U.S. English).

  Returns True if successful, Otherwise False

  Return type **bool**

  CLI Example:

  ```
salt '*' lgpo.set_user_policy "Control Panel\Display\Disable the Display Control Panel" Enabled
  ```

### 21.9.464 saltn.modules.win_license module

This module allows you to manage windows licensing via slmgr.vbs

**salt.modules.win_license.install**( *product_key*)

Install the given product key

CLI Example:

```
salt '*' license.install XXXXX-XXXXX-XXXXX-XXXXX-XXXXX
  ```

**salt.modules.win_license.activate()**

Attempt to activate the current machine via Windows Activation

CLI Example:

```
salt '*' license.activate
  ```

**salt.modules.win_license.info()**

Return information about the license, if the license is not correctly activated this will return None.

CLI Example:

```
salt '*' license.info
  ```

**salt.modules.win_license.install**( *product_key*)

Install the given product key

CLI Example:

```
salt '*' license.install XXXXX-XXXXX-XXXXX-XXXXX-XXXXX
  ```

**salt.modules.win_license.installed**( *product_key*)

Check to see if the product key is already installed.

Note: This is not 100% accurate as we can only see the last 5 digits of the license.

CLI Example:
salt ' '*' license.installed XXXX-XXXX-XXXX-XXXX-XXXX

salt.modules.win_license.licensed()  
Return true if the current machine is licensed correctly  
CLI Example:  
salt '*' license.licensed

salt.modules.win_license.uninstall()  
Uninstall the current product key  
CLI Example:  
salt '*' license.uninstall

21.9.465  salt.modules.win_network  
Module for gathering and managing network information

salt.modules.win_network.connect(host, port=None, **kwargs)  
Test connectivity to a host using a particular port from the minion.  
New in version 2016.3.0.  
CLI Example:

salt '*' network.connect archlinux.org 80  
salt '*' network.connect archlinux.org 80 timeout=3  
salt '*' network.connect archlinux.org 80 timeout=3 family=ipv4  
salt '*' network.connect google-public-dns-a.google.com port=53 proto=udp family=ipv4 timeout=3

salt.modules.win_network.dig(host)  
Performs a DNS lookup with dig  
Note: dig must be installed on the Windows minion  
CLI Example:

salt '*' network.dig archlinux.org

salt.modules.win_network.get_route(ip)  
Return routing information for given destination ip  
New in version 2016.11.5.  
CLI Example:

salt '*' network.get_route 10.10.10.10

salt.modules.win_network.hw_addr(iface)  
Return the hardware address (a.k.a. MAC address) for a given interface  
CLI Example:
salt '...' network.hw_addr 'Wireless Connection #1'

salt.modules.win_network.hwaddr(iface)
This function is an alias of hw_addr.
    Return the hardware address (a.k.a. MAC address) for a given interface
    CLI Example:
    salt '...' network.hw_addr 'Wireless Connection #1'

salt.modules.win_network.in_subnet(cidr)
    Returns True if host is within specified subnet, otherwise False
    CLI Example:
    salt '...' network.in_subnet 10.0.0.0/16

salt.modules.win_network.interfaces()
    Return a dictionary of information about all the interfaces on the minion
    CLI Example:
    salt '...' network.interfaces

salt.modules.win_network.interfaces_names()
    Return a list of all the interfaces names
    CLI Example:
    salt '...' network.interfaces_names

salt.modules.win_network.ip_addrs(interface=None, include_loopback=False, cidr=None, type=None)
    Returns a list of IPv4 addresses assigned to the host.
    interface  Only IP addresses from that interface will be returned.
    include_loopback  [False] Include loopback 127.0.0.1 IPv4 address.
    cidr  Describes subnet using CIDR notation and only IPv4 addresses that belong to this subnet will be returned.
    type  If option set to 'public' then only public addresses will be returned. Ditto for 'private'.
    Changed in version 2019.2.0.
    CLI Example:
    salt '...' network.ip_addrs
    salt '...' network.ip_addrs cidr=10.0.0.0/8
    salt '...' network.ip_addrs cidr=192.168.0.0/16 type=private

salt.modules.win_network.ip_addrs6(interface=None, include_loopback=False, cidr=None)
    Returns a list of IPv6 addresses assigned to the host.
    interface  Only IP addresses from that interface will be returned.
    include_loopback  [False] Include loopback ::1 IPv6 address.
    cidr  Describes subnet using CIDR notation and only IPv6 addresses that belong to this subnet will be returned.
    Changed in version 2019.2.0.
    CLI Example:
salt '*/' network.ip_addrs6
cidr=2000::/3

type=None

cidr

type=private

cidr

salt '*/' network.ip_addrs

cidr=10.0.0.0/8

type=private

cidr=192.168.0.0/16

cidr

salt '*/' network.ip_addrs6

cidr=2000::/3

cidr

salt '*/' network.ip_addrs6

cidr=2000::/3

cidr

salt '*/' network.is_private

cidr=10.0.0.3

cidr

salt '*/' network.netstat

cidr

cidr

salt '*/' network.nslookup

cidr

salt '*/' network.nslookup

cidr

salt '*' network.nslookup archlinux.org

**salt.modules.win_network.ping** (*host*, *timeout=False*, *return_boolean=False*)

Performs a ping to a host

CLI Example:

```
salt '*' network.ping archlinux.org
```

New in version 2016.11.0.

Return a True or False instead of ping output.

```
salt '*' network.ping archlinux.org return_boolean=True
```

Set the time to wait for a response in seconds.

```
salt '*' network.ping archlinux.org timeout=3
```

**salt.modules.win_network.subnets()**

Returns a list of subnets to which the host belongs

CLI Example:

```
salt '*' network.subnets
```

**salt.modules.win_network.traceroute** (*host*)

Performs a traceroute to a 3rd party host

CLI Example:

```
salt '*' network.traceroute archlinux.org
```

---

**21.9.466 salt.modules.win_ntp**

Management of NTP servers on Windows

New in version 2014.1.0.

**salt.modules.win_ntp.get_servers()**

Get list of configured NTP servers

CLI Example:

```
salt '*' ntp.get_servers
```

**salt.modules.win_ntp.set_servers** (*servers*)

Set Windows to use a list of NTP servers

CLI Example:

```
salt '*' ntp.set_servers 'pool.ntp.org' 'us.pool.ntp.org'
```

---

**21.9.467 salt.modules.win_path**

Manage the Windows System PATH
Note that not all Windows applications will rehash the PATH environment variable, Only the ones that listen to the WM_SETTINGCHANGE message http://support.microsoft.com/kb/104011

salt.modules.win_path.add(path, index=None, **kwargs)

Add the directory to the SYSTEM path in the index location. Returns True if successful, otherwise False.

- path: Directory to add to path
- index: Optionally specify an index at which to insert the directory
- rehash: [True] If the registry was updated, and this value is set to True, sends a WM_SETTINGCHANGE broadcast to refresh the environment variables. Set this to False to skip this broadcast.

CLI Examples:

```
# Will add to the beginning of the path
salt '*' win_path.add 'c:\python27' 0

# Will add to the end of the path
salt '*' win_path.add 'c:\python27' index='-1'
```

salt.modules.win_path.exists(path)

Check if the directory is configured in the SYSTEM path Case-insensitive and ignores trailing backslash

Returns boolean True if path exists, False if not

CLI Example:

```
salt '*' win_path.exists 'c:\python27'
salt '*' win_path.exists 'c:\\python27'
salt '*' win_path.exists 'c:\python27\'
```

salt.modules.win_path.get_path()

Returns a list of items in the SYSTEM path

CLI Example:

```
salt '*' win_path.get_path
```

salt.modules.win_path.rehash()

Send a WM_SETTINGCHANGE Broadcast to Windows to refresh the Environment variables for new processes.

Note: This will only affect new processes that aren’t launched by services. To apply changes to the path to services, the host must be restarted. The salt-minion, if running as a service, will not see changes to the environment until the system is restarted. See MSDN Documentation

CLI Example:

```
salt '*' win_path.rehash
```

salt.modules.win_path.remove(path, **kwargs)

Remove the directory from the SYSTEM path

Returns boolean True if successful, False if unsuccessful

- rehash: [True] If the registry was updated, and this value is set to True, sends a WM_SETTINGCHANGE broadcast to refresh the environment variables. Set this to False to skip this broadcast.

CLI Example:

```
# Will remove C:\Python27 from the path
salt '*' win_path.remove 'C:\\python27'
```
21.9.468  salt.modules.win_pkg

A module to manage software on Windows

**Important**: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see here.

The following functions require the existence of a windows repository metadata DB, typically created by running `pkg.refresh_db`:

- `pkg.get_repo_data`
- `pkg.install`
- `pkg.latest_version`
- `pkg.list_available`
- `pkg.list_pkgs`
- `pkg.list_upgrades`
- `pkg.remove`

If a metadata DB does not already exist and one of these functions is run, then one will be created from the repo SLS files that are present.

As the creation of this metadata can take some time, the `winrepo_cache_expire_min` minion config option can be used to suppress refreshes when the metadata is less than a given number of seconds old.

**Note**: Version numbers can be version number string, latest and Not Found, where Not Found means this module was not able to determine the version of the software installed, it can also be used as the version number in sls definitions file in these cases. Versions numbers are sorted in order of 0, Not Found, order version numbers, ..., latest.

```
salt.modules.win_pkg.compare_versions( ver1="", oper='==', ver2=""
)

Compare software package versions

Parameters
- ver1 (str) – A software version to compare
- oper (str) – The operand to use to compare
- ver2 (str) – A software version to compare

Returns  True if the comparison is valid, otherwise False

Return type  bool

CLI Example:

```salt '*' pkg.compare_versions 1.2 >= 1.3```

```
salt.modules.win_pkg.genrepo( **kwargs)

Generate package metadata db based on files within the winrepo_source_dir

Kwarg:
- saltenv (str): Salt environment. Default: base
- verbose (bool): Return verbose data structure which includes 'success_list', a list of all sls files and the package names contained within. Default False.
- failhard (bool): If True, an error will be raised if any repo SLS files failed to process. If False, no error will be raised, and a dictionary containing the full results will be returned.
```

21.9. execution modules 2713
Note:

- Hidden directories (directories beginning with '.', such as '.git') will be ignored.

Returns  A dictionary of the results of the command
Return type  dict

CLI Example:

```
salt-run pkg.genrepo
salt -G 'os:windows' pkg.genrepo verbose=true failhard=false
salt -G 'os:windows' pkg.genrepo saltenv=base
```

```
salt.modules.win_pkg.get_repo_data(saltenv='base')
```

Returns the existing package metadata db. Will create it, if it does not exist, however will not refresh it.

Parameters saltenv (str) – Salt environment. Default base

Returns  A dict containing contents of metadata db.

Return type  dict

CLI Example:

```
salt '*' pkg.get_repo_data
```

```
salt.modules.win_pkg.install(name=None, refresh=False, pkgs=None, **kwargs)
```

Install the passed package(s) on the system using winrepo

Parameters

- name (str) – The name of a single package, or a comma-separated list of packages
to install. (no spaces after the commas)

- refresh (bool) – Boolean value representing whether or not to refresh the winrepo
db. Default False.

- pkgs (list) – A list of packages to install from a software repository. All packages
listed under pkgs will be installed via a single command.

You can specify a version by passing the item as a dict:

CLI Example:

```
# will install the latest version of foo and bar
salt '*' pkg.install pkgs='["foo", "bar"]'

# will install the latest version of foo and version 1.2.3 of bar
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3"}]'
```

Kwargs:

- version (str): The specific version to install. If omitted, the latest version will be installed. Rec-
ommend for use when installing a single package.

If passed with a list of packages in the pkgs parameter, the version will be ignored.

CLI Example:

```
# Version is ignored
salt '*' pkg.install pkgs='["foo", 'bar"]' version=1.2.3
```

If passed with a comma separated list in the name parameter, the version will apply to all
packages in the list.

CLI Example:
# Version 1.2.3 will apply to packages foo and bar
salt '*' pkg.install foo,bar version=1.2.3

e extra_install_flags (str): Additional install flags that will be appended to the install_flags defined in the software definition file. Only applies when single package is passed.
salt env (str): Salt environment. Default 'base'
report reboot exit codes (bool): If the installer exists with a recognized exit code indicating that a reboot is required, the module function
   win system set reboot required witnessed
will be called, preserving the knowledge of this event for the remainder of the current boot session. For the time being, 3010 is the only recognized exit code. The value of this param defaults to True.

New in version 2016.11.0.

Returns

Return a dict containing the new package names and versions. If the package is already installed, an empty dict is returned.

If the package is installed by pkg.install:

```
{'<package>': {'old': '<old-version>', 'new': '<new-version>'}}
```

Return type dict

The following example will refresh the winrepo and install a single package, 7zip.

CLI Example:

```
salt '*' pkg.install 7zip refresh=True
```

CLI Example:

```
salt '*' pkg.install 7zip
salt '*' pkg.install 7zip,filezilla
salt '*' pkg.install pkgs='["7zip","filezilla"]'
```

WinRepo Definition File Examples:

The following example demonstrates the use of cache_file. This would be used if you have multiple installers in the same directory that use the same install.ini file and you don’t want to download the additional installers.

```
nntp:
  4.2.8:
    installer: 'salt://win/repo/ntp/ntp-4.2.8-win32-setup.exe'
    full_name: Meinberg NTP Windows Client
    locale: en_US
    reboot: False
    cache_file: 'salt://win/repo/ntp/install.ini'
    install_flags: '/'
    USEFILE=C:|salt\var\cache\salt\minion\files|base\win\repo\ntp\install.ini'
    uninstaller: 'NTP/uninst.exe'
```

The following example demonstrates the use of cache_dir. It assumes a file named install.ini resides in the same directory as the installer.
**ntp: [4.2.8]:**
- **installer:** `salt://win/repo/ntp/ntp-4.2.8-win32-setup.exe`
- **full_name:** Meinberg NTP Windows Client
- **locale:** en_US
- **reboot:** False
- **cache_dir:** True
- **install_flags:** `/~USEFILE=C:salt\var\cache\salt\minion\files\base\win\repo\ntp\install.ini`
- **uninstaller:** `NTP/uninst.exe`

salt.modules.win_pkg.latest_version(*names, **kwargs*)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

**Parameters**

- **names** (*str*) – A single or multiple names to lookup

**Kwargs:**
- **saltenv** (*str*): Salt environment. Default base
- **refresh** (*bool*): Refresh package metadata. Default True

**Returns**

A dictionary of packages with the latest version available

**Return type**

dict

**CLI Example:**

```bash
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.win_pkg.list_available(*names, **kwargs*)

Return a list of available versions of the specified package.

**Parameters**

- **names** (*str*) – One or more package names

**Kwargs:**
- **saltenv** (*str*): The salt environment to use. Default base
- **refresh** (*bool*): Refresh package metadata. Default False
- **return_dict_always** (*bool*): Default False dict when a single package name is queried.

**Returns**

The package name with its available versions

**Return type**

dict

```bash
{'<package name>': ['<version>', '<version>', ]}
```

**CLI Example:**

```bash
salt '*' pkg.list_available <package name> return_dict_always=True
salt '*' pkg.list_available <package name01> <package name02>
```

salt.modules.win_pkg.list_pkgs(*versions_as_list=False, include_components=True, include_updates=True, **kwargs*)

List the packages currently installed.

**Note:** To view installed software as displayed in the Add/Remove Programs, set `include_components` and `include_updates` to False.

**Parameters**

- **versions_as_list** (*bool*) – Returns the versions as a list
- **include_components** *(bool)* – Include sub components of installed software.
  Default is True
- **include_updates** *(bool)* – Include software updates and Windows updates. Default is True

Kwargs:
- **saltenv** *(str)*: The salt environment to use. Default base
- **refresh** *(bool)*: Refresh package metadata. Default False

Returns A dictionary of installed software with versions installed
Return type *dict*

CLI Example:
```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

```python
salt.modules.win_pkg.list_upgrades(refresh=True, **kwargs)
```
List all available package upgrades on this system

Parameters **refresh** *(bool)* – Refresh package metadata. Default True

Kwargs: **saltenv** *(str)*: Salt environment. Default base

Returns A dictionary of packages with available upgrades
Return type *dict*

CLI Example:
```
salt '*' pkg.list_upgrades
```

```python
salt.modules.win_pkg.purge(name=None, pkgs=None, **kwargs)
```
Package purges are not supported, this function is identical to `remove()`.

New in version 0.16.0.

Parameters
- **name** *(str)* – The name of the package to be deleted.
- **version** *(str)* – The version of the package to be deleted. If this option is used in combination with the `pkgs` option below, then this version will be applied to all targeted packages.
- **pkgs** *(list)* – A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

Kwargs: **saltenv** *(str)*: Salt environment. Default base **refresh** *(bool)*: Refresh package metadata. Default False

Returns A dict containing the changes.
Return type *dict*

CLI Example:
```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

```python
salt.modules.win_pkg.refresh_db(**kwargs)
```
Generates the local software metadata database *(winrepo.p)* on the minion. The database is stored in a serialized format located by default at the following location:
This module performs the following steps to generate the software metadata database:

- Fetch the package definition files (.sls) from `winrepo_source_dir` (default `salt://win/repo-ng`) and cache them in `<cachedir>/files/<saltenv>/<winrepo_source_dir>` (default: C:\salt\var\cache\salt\minion\files\base\win\repo-ng)
- Call `pkg.genrepo` to parse the package definition files and generate the repository metadata database file (`winrepo.p`)
- Return the report received from `pkg.genrepo`

The default winrepo directory on the master is /srv/salt/win/repo-ng. All files that end with .sls in this and all subdirectories will be used to generate the repository metadata database (`winrepo.p`).

**Note:**
- Hidden directories (directories beginning with '.', such as '.git') will be ignored.

**Note:** There is no need to call `pkg.refresh_db` every time you work with the pkg module. Automatic refresh will occur based on the following minion configuration settings:
  - `winrepo_cache_expire_min`
  - `winrepo_cache_expire_max`

However, if the package definition files have changed, as would be the case if you are developing a new package definition, this function should be called to ensure the minion has the latest information about packages available to it.

**Warning:** Directories and files fetched from `<winrepo_source_dir>` (/srv/salt/win/repo-ng) will be processed in alphabetical order. If two or more software definition files contain the same name, the last one processed replaces all data from the files processed before it.

For more information see [Windows Software Repository](#).

### Arguments:

- `saltenv (str): Salt environment. Default: base`
- `verbose (bool): Return a verbose data structure which includes 'success_list', a list of all sls files and the package names contained within. Default is 'False'`
- `failhard (bool): If True, an error will be raised if any repo SLS files fails to process. If False, no error will be raised, and a dictionary containing the full results will be returned.`

**Returns** A dictionary containing the results of the database refresh.

**Return type** dict

**Note:** A result with a `total: 0` generally means that the files are in the wrong location on the master. Try running the following command on the minion: `salt-call -l debug pkg.refresh saltenv=base`

**Warning:** When calling this command from a state using `module.run` be sure to pass `failhard: False`. Otherwise the state will report failure if it encounters a bad software definition file.

**CLI Example:**
salt.modules.win_pkg.remove(name=None, pkgs=None, **kwargs)
Remove the passed package(s) from the system using winrepo

New in version 0.16.0.

Parameters

- **name (str)** – The name(s) of the package(s) to be uninstalled. Can be a single package or a comma delimited list of packages, no spaces.
- **pkgs (list)** – A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Kwargs:

- **version (str)**: The version of the package to be uninstalled. If this option is used to un install multiple packages, then this version will be applied to all targeted packages. Recommended using only when uninstalling a single package. If this parameter is omitted, the latest version will be uninstalled.

Returns

Returns a dict containing the changes.

If the package is removed by pkg.remove:

```
{'<package>': {'old': '<old-version>', 'new': '<new-version>'}}
```

If the package is already uninstalled:

```
{'<package>': {'current': 'not installed'}}
```

Return type dict

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs=['"foo", "bar"]'
```

salt.modules.win_pkg.upgrade(**kwargs)
Upgrade all software. Currently not implemented

Note: This feature is not yet implemented for Windows.

Returns Empty dict, until implemented

Return type dict

CLI Example:

```
salt '*' pkg.upgrade
```

salt.modules.win_pkg.upgrade_available(name, **kwargs)
Check whether or not an upgrade is available for a given package

Parameters **name (str)** – The name of a single package

Returns  True if new version available, otherwise False
Return type  bool

CLI Example:
```
salt '*' pkg.upgrade_available <package name>
```

```
salt.modules.win_pkg.version('names', **kwargs)
```

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

Parameters  name (str) – One or more package names

Returns  version string when a single package is specified. dict: The package name(s) with the installed versions.
Return type  str

```
{['<version>', '<version>', ]} OR
{'<package name>': ['<version>', '<version>', ]}
```

CLI Example:
```
salt '*' pkg.version <package name>
salt '*' pkg.version <package name01> <package name02>
```

21.9.469 salt.modules.win_pki module

platform  Windows

depends

• PowerShell 4

• PKI Client Module (Windows 8+ / Windows Server 2012+)

New in version 2016.11.0.

```
salt.modules.win_pki.export_cert(name, thumbprint, cert_format='cer', context='LocalMachine',
store='My', password="")
```

Export the certificate to a file from the given certificate store.

Parameters

• name (str) – The destination path for the exported certificate file.

• thumbprint (str) – The thumbprint value of the target certificate.

• cert_format (str) – The certificate format. Specify 'cer' for X.509, or 'pfx' for PKCS #12.

• context (str) – The name of the certificate store location context.

• store (str) – The name of the certificate store.

• password (str) – The password of the certificate. Only applicable to pfx format. Note that if used interactively, the password will be seen by all minions. To protect the password, use a state and get the password from pillar.

Returns  A boolean representing whether all changes succeeded.
Return type: bool

CLI Example:
```
salt '*' win_pki.export_cert name='C:\certs\example.cer' thumbprint='AAA000'
```

salt.modules.win_pki.get_cert_file(name, cert_format='cer', password="")

Get the details of the certificate file.

**Parameters**
- `name (str)` – The filesystem path of the certificate file.
- `cert_format (str)` – The certificate format. Specify ‘cer’ for X.509, or ‘pfx’ for
  PKCS #12.
- `password (str)` – The password of the certificate. Only applicable to pfx format.
  Note that if used interactively, the password will be seen by all minions. To protect
  the password, use a state and get the password from pillar.

**Returns**
A dictionary of the certificate thumbprints and properties.

Return type: dict

CLI Example:
```
salt '*' win_pki.get_cert_file name='C:\certs\example.cer'
```

salt.modules.win_pki.get_certs(context='LocalMachine', store='My')

Get the available certificates in the given store.

**Parameters**
- `context (str)` – The name of the certificate store location context.
- `store (str)` – The name of the certificate store.

**Returns**
A dictionary of the certificate thumbprints and properties.

Return type: dict

CLI Example:
```
salt '*' win_pki.get_certs
```

salt.modules.win_pki.get_stores()

Get the certificate location contexts and their corresponding stores.

**Returns**
A dictionary of the certificate location contexts and stores.

Return type: dict

CLI Example:
```
salt '*' win_pki.get_stores
```

salt.modules.win_pki.import_cert(name, cert_format='cer', context='LocalMachine', store='My',
exportable=True, password=", saltenv='base'")

Import the certificate file into the given certificate store.

**Parameters**
- `name (str)` – The path of the certificate file to import.
- `cert_format (str)` – The certificate format. Specify ‘cer’ for X.509, or ‘pfx’ for
  PKCS #12.
- `context (str)` – The name of the certificate store location context.
- `store (str)` – The name of the certificate store.
- `exportable (bool)` – Mark the certificate as exportable. Only applicable to pfx
  format.
- `password (str)` – The password of the certificate. Only applicable to pfx format.
  Note that if used interactively, the password will be seen by all minions. To protect
  the password, use a state and get the password from pillar.
- `saltenv (str)` – The environment the file resides in.

**Returns**
A boolean representing whether all changes succeeded.
Return type bool

CLI Example:

```
salt '*' win_pki.import_cert name='salt://cert.cer'
```

salt.modules.win_pki.remove_cert(thumbprint, context='LocalMachine', store='My')

Remove the certificate from the given certificate store.

Parameters

- **thumbprint**(str) – The thumbprint value of the target certificate.
- **context**(str) – The name of the certificate store location context.
- **store**(str) – The name of the certificate store.

Returns A boolean representing whether all changes succeeded.

Return type bool

CLI Example:

```
salt '*' win_pki.remove_cert thumbprint='AAA000'
```

salt.modules.win_pki.test_cert(thumbprint, context='LocalMachine', store='My', untrusted_root=False, dns_name='', eku='')

Check the certificate for validity.

Parameters

- **thumbprint**(str) – The thumbprint value of the target certificate.
- **context**(str) – The name of the certificate store location context.
- **store**(str) – The name of the certificate store.
- **untrusted_root**(bool) – Whether the root certificate is required to be trusted in chain building.
- **dns_name**(str) – The DNS name to verify as valid for the certificate.
- **eku**(str) – The enhanced key usage object identifiers to verify for the certificate chain.

Returns A boolean representing whether the certificate was considered valid.

Return type bool

CLI Example:

```
salt '*' win_pki.test_cert thumbprint='AAA000' dns_name='example.test'
```

21.9.470 salt.modules.win_powercfg

This module allows you to control the power settings of a windows minion via powercfg.

New in version 2015.8.0.

```
# Set monitor to never turn off on Battery power
salt '*' powercfg.set_monitor_timeout 0 power=dc
# Set disk timeout to 120 minutes on AC power
salt '*' powercfg.set_disk_timeout 120 power=ac
```

salt.modules.win_powercfg.get_disk_timeout(scheme=None)

Get the current disk timeout of the given scheme.

Parameters **scheme**(str) – The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:

- **SCHEME_BALANCED** - Balanced
- **SCHEME_MAX** - Power saver
- **SCHEME_MIN** - High performance

Returns A dictionary of both the AC and DC settings

Return type dict
**CLI Example:**

```python
salt '*' powercfg.get_disk_timeout
```

**salt.modules.win_powercfg.get_hibernate_timeout**(scheme=None)

Get the current hibernate timeout of the given scheme

**scheme** (str): The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:

- SCHEME_BALANCED - Balanced
- SCHEME_MAX - Power saver
- SCHEME_MIN - High performance

**Returns** A dictionary of both the AC and DC settings

**Return type** dict

**CLI Example:**

```python
salt '*' powercfg.get_hibernate_timeout
```

**salt.modules.win_powercfg.get_monitor_timeout**(scheme=None)

Get the current monitor timeout of the given scheme

**Parameters**

- **scheme** (str) – The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:
  - SCHEME_BALANCED - Balanced
  - SCHEME_MAX - Power saver
  - SCHEME_MIN - High performance

**Returns** A dictionary of both the AC and DC settings

**Return type** dict

**CLI Example:**

```python
salt '*' powercfg.get_monitor_timeout
```

**salt.modules.win_powercfg.get_standby_timeout**(scheme=None)

Get the current standby timeout of the given scheme

**scheme** (str): The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:

- SCHEME_BALANCED - Balanced
- SCHEME_MAX - Power saver
- SCHEME_MIN - High performance

**Returns** A dictionary of both the AC and DC settings

**Return type** dict

**CLI Example:**

```python
salt '*' powercfg.get_standby_timeout
```

**salt.modules.win_powercfg.set_disk_timeout**(timeout, power='ac', scheme=None)

Set the disk timeout in minutes for the given power scheme

**Parameters**

- **timeout** (int) – The amount of time in minutes before the disk will timeout
- **power** (str) – Set the value for AC or DC power. Default is ac. Valid options are:
  - ac (AC Power)
  - dc (Battery)
- **scheme** (str) – The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:
  - SCHEME_BALANCED - Balanced
- SCHEME_MAX - Power saver
- SCHEME_MIN - High performance

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
# Sets the disk timeout to 30 minutes on battery
salt '*' powercfg.set_disk_timeout 30 power=dc
```

**salt.modules.win_powercfg.set_hibernate_timeout**(*timeout*, *power='ac', scheme=None*)

Set the hibernate timeout in minutes for the given power scheme

Parameters

- **timeout (int)** – The amount of time in minutes before the computer hibernates
- **power (str)** – Set the value for AC or DC power. Default is ac. Valid options are:
  - ac (AC Power)
  - dc (Battery)
- **scheme (str)** – The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:
  - SCHEME_BALANCED - Balanced
  - SCHEME_MAX - Power saver
  - SCHEME_MIN - High performance

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
# Sets the hibernate timeout to 30 minutes on Battery
salt '*' powercfg.set_hibernate_timeout 30 power=dc
```

**salt.modules.win_powercfg.set_monitor_timeout**(*timeout*, *power='ac', scheme=None*)

Set the monitor timeout in minutes for the given power scheme

Parameters

- **timeout (int)** – The amount of time in minutes before the monitor will timeout
- **power (str)** – Set the value for AC or DC power. Default is ac. Valid options are:
  - ac (AC Power)
  - dc (Battery)
- **scheme (str)** – The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:
  - SCHEME_BALANCED - Balanced
  - SCHEME_MAX - Power saver
  - SCHEME_MIN - High performance

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
# Sets the monitor timeout to 30 minutes
salt '*' powercfg.set_monitor_timeout 30
```

**salt.modules.win_powercfg.set_standby_timeout**(*timeout*, *power='ac', scheme=None*)

Set the standby timeout in minutes for the given power scheme

Parameters

- **timeout (int)** – The amount of time in minutes before the computer sleeps
- **power (str)** – Set the value for AC or DC power. Default is ac. Valid options are:
  - ac (AC Power)
  - dc (Battery)
- **scheme (str)** – The scheme to use, leave as None to use the current. Default is
None. This can be the GUID or the Alias for the Scheme. Known Aliases are:

- SCHEME_BALANCED - Balanced
- SCHEME_MAX - Power saver
- SCHEME_MIN - High performance

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
# Sets the system standby timeout to 30 minutes on Battery
salt '*' powercfg.set_standby_timeout 30 power=dc
```

21.9.471 salt.modules.win_psget module

Module for managing PowerShell through PowerShellGet (PSGet)

depends

- PowerShell 5.0
- PSGet

Support for PowerShell

salt.modules.win_psget.avail_modules(desc=False)
List available modules in registered Powershell module repositories.

Parameters desc (bool) – If True, the verbose description will be returned.

CLI Example:

```
salt 'win01' psget.avail_modules
dsalt 'win01' psget.avail_modules desc=True
```

salt.modules.win_psget.bootstrap()
Make sure that nuget-anycpu.exe is installed. This will download the official nuget-anycpu.exe from the internet.

CLI Example:

```
salt 'win01' psget.bootstrap
```

salt.modules.win_psget.get_repository(name)
Get the details of a local PSGet repository

Parameters name (str) – Name of the repository

CLI Example:

```
salt 'win01' psget.get_repository MyRepo
```

salt.modules.win_psget.install(name, minimum_version=None, required_version=None, scope=None, repository=None)
Install a Powershell module from powershell gallery on the system.

Parameters

- name (str) – Name of a Powershell module
- minimum_version (str) – The maximum version to install, e.g. 1.23.2
- required_version (str) – Install a specific version
- scope (str) – The scope to install the module to, e.g. CurrentUser, Computer
- repository (str) – The friendly name of a private repository, e.g. MyREpo

CLI Example:
salt 'win01' psget.install PowerPlan

```python
salt.modules.win_psget.list_modules(desc=False)
```

List currently installed PSGet Modules on the system.

Parameters **desc** *(bool)* – If True, the verbose description will be returned.

CLI Example:

```python
salt 'win01' psget.list_modules
salt 'win01' psget.list_modules desc=True
```

salt.modules.win_psget.register_repository(*name*, *location*, *installation_policy=None*)

Register a PSGet repository on the local machine

Parameters

- **name** *(str)* – The name for the repository
- **location** *(str)* – The URI for the repository
- **installation_policy** *(str)* – The installation policy for packages, e.g. Trusted, Untrusted

CLI Example:

```python
salt 'win01' psget.register_repository MyRepo https://myrepo.mycompany.com/
```

salt.modules.win_psget.remove(*name*)

Remove a Powershell DSC module from the system.

Parameters **name** *(str)* – Name of a Powershell DSC module

CLI Example:

```python
salt 'win01' psget.remove PowerPlan
```

salt.modules.win_psget.update(*name*, *maximum_version=None*, *required_version=None*)

Update a PowerShell module to a specific version, or the newest

Parameters

- **name** *(str)* – Name of a Powershell module
- **maximum_version** *(str)* – The maximum version to install, e.g. 1.23.2
- **required_version** *(str)* – Install a specific version

CLI Example:

```python
salt 'win01' psget.update PowerPlan
```

### 21.9.472 salt.modules.winrepo

Module to manage Windows software repo on a Standalone Minion

**file_client:** local must be set in the minion config file.

For documentation on Salt’s Windows Repo feature, see here.

salt.modules.winrepo.genrepo()

Generate winrepo_cachefile based on sls files in the winrepo_dir

CLI Example:

```python
salt-call winrepo.genrepo
```

salt.modules.winrepo.show_sls(*name*, *saltenv='base'*)

New in version 2015.8.0.
Display the rendered software definition from a specific sls file in the local winrepo cache. This will parse all Jinja. Run pkg.refresh_db to pull the latest software definitions from the master.

**Note:** This function does not ask a master for an sls file to render. Instead it directly processes the file specified in name.

**Parameters**

- `str (saltenv)` – The name/path of the package you want to view. This can be the path to a file on the minion file system or a file on the local (full) cache. (minion) – `str` – The default environment is base

**Returns** Returns a dictionary containing the rendered data structure

**Return type** `dict`

**Note:** To use a file from the minion cache start from the local winrepo root (C:\salt\var\cache\salt\minion\files\base\win\repo-ng). If you have .sls files organized in subdirectories you’ll have to denote them with . For example, if you have a test directory in the winrepo root with a gvim.sls file inside, would target that file like so: test.gvim. Directories can be targeted as well as long as they contain an init.sls inside. For example, if you have a node directory with an init.sls inside, target that like so: node.

**CLI Example:**

```
salt '*' winrepo.show_sls gvim
salt '*' winrepo.show_sls test.npp
salt '*' winrepo.show_sls C:\test\gvim.sls
```

**salt.modules.winrepo.update_git_repos(clean=False)**

Checkout git repos containing *Windows Software Package Definitions*.

**Important:** This function requires Git for Windows to be installed in order to work. When installing, make sure to select an installation option which permits the git executable to be run from the Command Prompt.

**clean** [False] Clean repo cachedirs which are not configured under winrepo_remotes.

**Note:** This option only applies if either pygit2 or GitPython is installed into Salt’s bundled Python.

**Warning:** This argument should not be set to True if a mix of git and non-git repo definitions are being used, as it will result in the non-git repo definitions being removed.

New in version 2015.8.0.

**CLI Example:**

```
salt-call winrepo.update_git_repos
```
21.9.473 salt.modules.win_servermanager

Manage Windows features via the ServerManager powershell module. Can list available and installed roles/features. Can install and remove roles/features.

maintainer Shane Lee <slee@saltstack.com>
platform Windows Server 2008R2 or greater
depends PowerShell module ServerManager

salt.modules.win_servermanager.install(feature, recurse=False, restart=False, source=None, exclude=None)

Install a feature

Note: Some features require reboot after un/installation, if so until the server is restarted other features can not be installed!

Note: Some features take a long time to complete un/installation, set -t with a long timeout

Parameters

- **feature (str, list)** – The name of the feature(s) to install. This can be a single feature, a string of features in a comma delimited list (no spaces), or a list of features.
  
  New in version 2018.3.0: Added the ability to pass a list of features to be installed.

- **recurse (Options[bool])** – Install all sub-features. Default is False

- **restart (Optional[bool])** – Restarts the computer when installation is complete, if required by the role/feature installed. Will also trigger a reboot if an item in exclude requires a reboot to be properly removed. Default is False

- **source (Optional[str])** – Path to the source files if missing from the target system. None means that the system will use windows update services to find the required files. Default is None

- **exclude (Optional[str])** – The name of the feature to exclude when installing the named feature. This can be a single feature, a string of features in a comma-delimited list (no spaces), or a list of features.

Warning: As there is no exclude option for the Add-WindowsFeature or Install-WindowsFeature PowerShell commands the features named in exclude will be installed with other sub-features and will then be removed. If the feature named in “exclude” is not a sub-feature of one of the installed items it will still be removed.

Returns A dictionary containing the results of the install

Return type dict

CLI Example:

```
# Install the Telnet Client passing a single string
salt '*' win_servermanager.install Telnet-Client

# Install the TFTP Client and the SNMP Service passing a comma-delimited
# string. Install all sub-features
salt '*' win_servermanager.install TFTP-Client,SNMP-Service recurse=True
```

(continues on next page)
# Install the TFTP Client from d:\side-by-side
salt '*' win_servermanager.install TFTP-Client source=d:\\side-by-side

# Install the XPS Viewer, SNMP Service, and Remote Access passing a
# list. Install all sub-features, but exclude the Web Server
salt '*' win_servermanager.install ['XPS-Viewer', 'SNMP-Service', 'RemoteAccess']
=> True recurse=True exclude="Web-Server"

salt.modules.win_servermanager.list_available()
List available features to install
Returns A list of available features as returned by the Get-WindowsFeature PowerShell command
Return type str
CLi Example:
salt '*' win_servermanager.list_available

salt.modules.win_servermanager.list_installed()
List installed features. Supported on Windows Server 2008 and Windows 8 and newer.
Returns A dictionary of installed features
Return type dict
CLi Example:
salt '*' win_servermanager.list_installed

salt.modules.win_servermanager.remove(feature, remove_payload=False, restart=False)
Remove an installed feature

Note: Some features require a reboot after installation/uninstallation. If one of these features are modified, then other features cannot be installed until the server is restarted. Additionally, some features take a while to complete installation/uninstallation, so it is a good idea to use the -t option to set a longer timeout.

Parameters
- feature (str, list) - The name of the feature(s) to remove. This can be a single feature, a string of features in a comma delimited list (no spaces), or a list of features.
  New in version 2018.3.0: Added the ability to pass a list of features to be removed.
- remove_payload (Optional[bool]) - True will cause the feature to be removed from the side-by-side store (%SystemDrive%\Windows\WinSxS). Default is False
- restart (Optional[bool]) - Restarts the computer when uninstall is complete, if required by the role/feature removed. Default is False

Returns A dictionary containing the results of the uninstall
Return type dict
CLi Example:
salt -t 600 '*' win_servermanager.remove Telnet-Client

21.9.474 salt.modules.win_service

Windows Service module.

21.9. execution modules
Changed in version 2016.11.0: Rewritten to use PyWin32

salt.modules.win_service.available(name)
Check if a service is available on the system.

Parameters
name (str) – The name of the service to check

Returns
True if the service is available, False otherwise

Return type
bool

CLI Example:

```
salt '*' service.available <service name>
```

salt.modules.win_service.create(name, bin_path, exe_args=None, display_name=None, description=None, service_type='own', start_type='manual', start_delayed=False, error_control='normal', load_order_group=None, dependencies=None, account_name='.\LocalSystem', account_password=None, run_interactive=False, **kwargs)

Create the named service.

New in version 2015.8.0.

Parameters
- name (str) – Specifies the service name. This is not the display_name
- bin_path (str) – Specifies the path to the service binary file. Backslashes must be escaped, eg: C:\path\to\binary.exe
- exe_args (str) – Any additional arguments required by the service binary.
- display_name (str) – The name to be displayed in the service manager. If not passed, the name will be used
- description (str) – A description of the service
- service_type (str) – Specifies the service type. Default is own. Valid options are as follows:
  - kernel: Driver service
  - filesystem: File system driver service
  - adapter: Adapter driver service (reserved)
  - recognizer: Recognizer driver service (reserved)
  - own (default): Service runs in its own process
  - share: Service shares a process with one or more other services
- start_type (str) – Specifies the service start type. Valid options are as follows:
  - boot: Device driver that is loaded by the boot loader
  - system: Device driver that is started during kernel initialization
  - auto: Service that automatically starts
  - manual (default): Service must be started manually
  - disabled: Service cannot be started
- start_delayed (bool) – Set the service to Auto(Delayed Start). Only valid if the start_type is set to Auto. If service_type is not passed, but the service is already set to Auto, then the flag will be set. Default is False
- error_control (str) – The severity of the error, and action taken, if this service fails to start. Valid options are as follows:
  - normal (normal): Error is logged and a message box is displayed
  - severe: Error is logged and computer attempts a restart with the last known good configuration
  - critical: Error is logged, computer attempts to restart with the last known good configuration, system halts on failure
  - ignore: Error is logged and startup continues, no notification is given to the user
- load_order_group (str) – The name of the load order group to which this ser-
vice belongs

- **dependencies (list)** – A list of services or load ordering groups that must start before this service

- **account_name (str)** – The name of the account under which the service should run. For *own* type services this should be in the domain\username format. The following are examples of valid built-in service accounts:
  - NT Authority\LocalService
  - NT Authority\NetworkService
  - NT Authority\LocalSystem
  - .LocalSystem

- **account_password (str)** – The password for the account name specified in account_name. For the above built-in accounts, this can be None. Otherwise a password must be specified.

- **run_interactive (bool)** – If this setting is True, the service will be allowed to interact with the user. Not recommended for services that run with elevated privileges.

Returns A dictionary containing information about the new service
Return type dict

CLI Example:

```
salt '*' service.create <service name> <path to exe> display_name='display name'
```

salt.modules.win_service.create_win_salt_restart_task()
Create a task in Windows task scheduler to enable restarting the salt-minion
Returns True if successful, otherwise False
Return type bool

CLI Example:

```
salt '*' service.create_win_salt_restart_task()
```

salt.modules.win_service.delete(name, timeout=90)
Delete the named service
Parameters
  - **name (str)** – The name of the service to delete
  - **timeout (int)** – The time in seconds to wait for the service to be deleted before returning. This is necessary because a service must be stopped before it can be deleted. Default is 90 seconds

Returns
  - True if successful, otherwise False. Also returns True if the service is not present
Return type bool

CLI Example:

```
salt '*' service.delete <service name>
```

salt.modules.win_service.disable(name, **kwargs)
Disable the named service to start at boot
Parameters
  - **name (str)** – The name of the service to disable

Returns True if disabled, False otherwise
Return type bool

CLI Example:

```
salt '*' service.disable <service name>
```

21.9. execution modules
salt.modules.win_service.disabled(name)
Check to see if the named service is disabled to start on boot

Parameters
name (str) – The name of the service to check

Returns
True if the service is disabled

Return type
bool

CLI Example:
salt '*' service.disabled <service name>

salt.modules.win_service.enable(name, start_type='auto', start_delayed=False, **kwargs)
Enable the named service to start at boot

Parameters
• name (str) – The name of the service to enable.
• start_type (str) – Specifies the service start type. Valid options are as follows:
  – boot: Device driver that is loaded by the boot loader
  – system: Device driver that is started during kernel initialization
  – auto: Service that automatically starts
  – manual: Service must be started manually
  – disabled: Service cannot be started
• start_delayed (bool) – Set the service to Auto(Delayed Start). Only valid if the
  start_type is set to Auto. If service_type is not passed, but the service is already set
to Auto, then the flag will be set.

Returns
True if successful, False otherwise

Return type
bool

CLI Example:
salt '*' service.enable <service name>

salt.modules.win_service.enabled(name, **kwargs)
Check to see if the named service is enabled to start on boot

Parameters
name (str) – The name of the service to check

Returns
True if the service is set to start

Return type
bool

CLI Example:
salt '*' service.enabled <service name>

salt.modules.win_service.execute_salt_restart_task()
Run the Windows Salt restart task

Returns
True if successful, otherwise False

Return type
bool

CLI Example:
salt '*' service.execute_salt_restart_task()

salt.modules.win_service.get_all()
Return all installed services

Returns
Returns a list of all services on the system.

Return type
list

CLI Example:
salt '*' service.get_all

salt.modules.win_service.get_disabled()
Return a list of disabled services. Disabled is defined as a service that is marked 'Disabled' or 'Manual'.

Chapter 21. Salt Module Reference
**Returns** A list of disabled services.
**Return type** list

CLI Example:

```
salt '*' service.get_disabled
```

---

**salt.modules.win_service.get_enabled()**

Return a list of enabled services. Enabled is defined as a service that is marked to Auto Start.

**Returns** A list of enabled services
**Return type** list

CLI Example:

```
salt '*' service.get_enabled
```

---

**salt.modules.win_service.get_service_name(*args)**

The Display Name is what is displayed in Windows when services.msc is executed. Each Display Name has an associated Service Name which is the actual name of the service. This function allows you to discover the Service Name by returning a dictionary of Display Names and Service Names, or filter by adding arguments of Display Names.

If no args are passed, return a dict of all services where the keys are the service Display Names and the values are the Service Names.

If arguments are passed, create a dict of Display Names and Service Names

**Returns** A dictionary of display names and service names
**Return type** dict

CLI Examples:

```
salt '*' service.get_service_name
salt '*' service.get_service_name 'Google Update Service (gupdate)' 'DHCP Client'
```

---

**salt.modules.win_service.getsid(name)**

Return the SID for this windows service

**Parameters**

- **name** *(str)* – The name of the service for which to return the SID

**Returns** A string representing the SID for the service
**Return type** str

CLI Example:

```
salt '*' service.getsid <service name>
```

---

**salt.modules.win_service.info(name)**

Get information about a service on the system

**Parameters**

- **name** *(str)* – The name of the service. This is not the display name. Use get_service_name to find the service name.

**Returns** A dictionary containing information about the service.
**Return type** dict

CLI Example:

```
salt '*' service.info spooler
```

---

**salt.modules.win_service.missing(name)**

The inverse of service.available.

**Parameters**

- **name** *(str)* – The name of the service to check

**Returns** True if the service is missing, False otherwise
**Return type** bool

CLI Example:
salt 'service.missing <service name>'

`salt.modules.win_service.modify(name, bin_path=None, exe_args=None, display_name=None, description=None, service_type=None, start_type=None, start_delayed=None, error_control=None, load_order_group=None, dependencies=None, account_name=None, account_password=None, run_interactive=None)`

Modify a service’s parameters. Changes will not be made for parameters that are not passed.

New in version 2016.11.0.

**Parameters**

- `name (str)` - The name of the service. Can be found using the `service.get_service_name` function
- `bin_path (str)` - The path to the service executable. Backslashes must be escaped, e.g. `C:\path\to\binary.exe`
- `exe_args (str)` - Any arguments required by the service executable
- `display_name (str)` - The name to display in the service manager
- `description (str)` - The description to display for the service
- `service_type (str)` - Specifies the service type. Default is `own`. Valid options are as follows:
  - `kernel`: Driver service
  - `filesystem`: File system driver service
  - `adapter`: Adapter driver service (reserved)
  - `recognizer`: Recognizer driver service (reserved)
  - `own` (default): Service runs in its own process
  - `share`: Service shares a process with one or more other services
- `start_type (str)` - Specifies the service start type. Valid options are as follows:
  - `boot`: Device driver that is loaded by the boot loader
  - `system`: Device driver that is started during kernel initialization
  - `auto`: Service that automatically starts
  - `manual`: Service must be started manually
  - `disabled`: Service cannot be started
- `start_delayed (bool)` - Set the service to Auto(Delayed Start). Only valid if the `start_type` is set to `Auto`. If `service_type` is not passed, but the service is already set to `Auto`, then the flag will be set.
- `error_control (str)` - The severity of the error, and action taken, if this service fails to start. Valid options are as follows:
  - `normal`: Error is logged and a message box is displayed
  - `severe`: Error is logged and computer attempts a restart with the last known good configuration
  - `critical`: Error is logged, computer attempts to restart with the last known good configuration, system halts on failure
  - `ignore`: Error is logged and startup continues, no notification is given to the user
- `load_order_group (str)` - The name of the load order group to which this service belongs
- `dependencies (list)` - A list of services or load ordering groups that must start before this service
- `account_name (str)` - The name of the account under which the service should run. For `own` type services this should be in the `domain\username` format. The following are examples of valid built-in service accounts:
  - `NT Authority\LocalService`
  - `NT Authority\NetworkService`
- NT Authority\LocalSystem
- LocalSystem

- **account_password (str)** – The password for the account name specified in account_name. For the above built-in accounts, this can be None. Otherwise a password must be specified.

- **run_interactive (bool)** – If this setting is True, the service will be allowed to interact with the user. Not recommended for services that run with elevated privileges.

**Returns** a dictionary of changes made

**Return type** dict

CLI Example:
```shell
salt '*' service.modify spooler start_type=disabled
```

**salt.modules.win_service.restart**(name, timeout=90)

Restart the named service. This issues a stop command followed by a start.

**Parameters**

- **name** – The name of the service to restart.

  **Note:** If the name passed is salt-minion a scheduled task is created and executed to restart the salt-minion service.

- **timeout (int)** – The time in seconds to wait for the service to stop and start before returning. Default is 90 seconds

  **Note:** The timeout is cumulative meaning it is applied to the stop and then to the start command. A timeout of 90 could take up to 180 seconds if the service is long in stopping and starting

**New in version 2017.7.9,2018.3.4.**

**Returns** True if successful, otherwise False

**Return type** bool

CLI Example:
```shell
salt '*' service.restart <service name>
```

**salt.modules.win_service.start**(name, timeout=90)

Start the specified service.

**Warning:** You cannot start a disabled service in Windows. If the service is disabled, it will be changed to Manual start.

**Parameters**

- **name (str)** – The name of the service to start

- **timeout (int)** – The time in seconds to wait for the service to start before returning. Default is 90 seconds

  **New in version 2017.7.9,2018.3.4.**

**Returns**

True if successful, otherwise False. Also returns True if the service is already started

**Return type** bool

CLI Example:
salt '*)) service.start <service name>
salt.modules.win_service.status(name, 'args', **'kwargs)
    Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.
    Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)
    Parameters name (str) – The name of the service to check
    Returns True if running, False otherwise dict: Maps service name to True if running, False otherwise
    Return type bool
    CLI Example:
salt '*)) service.status <service name>
salt.modules.win_service.stop(name, timeout=90)
    Stop the specified service
    Parameters
        • name (str) – The name of the service to stop
        • timeout (int) – The time in seconds to wait for the service to stop before returning.
            Default is 90 seconds
    Returns
        True if successful, otherwise False. Also returns True if the service is already stopped
    Return type bool
    CLI Example:
salt '*)) service.stop <service name>

21.9.475 salt.modules.win_shadow

Manage the shadow file

Important: If you feel that Salt should be using this module to manage passwords on a minion, and it is using a different module (or gives an error similar to 'shadow.info' is not available), see here.

salt.modules.win_shadow.info(name)
    Return information for the specified user This is just returns dummy data so that salt states can work.
    Parameters name (str) – The name of the user account to show.
    CLI Example:
salt '*)) shadow.info root

salt.modules.win_shadow.require_password_change(name)
    Require the user to change their password the next time they log in.
    Parameters name – The name of the user account to require a password change.
    Returns True if successful. False if unsuccessful.
    Return type bool
    CLI Example:
```python
salt '*' shadow.require_password_change <username>
```

```python
salt.modules.win_shadow.set_expire(name, expire)
Set the expiration date for a user account.
Parameters
  - **name** – The name of the user account to edit.
  - **expire** – The date the account will expire.
Returns True if successful. False if unsuccessful.
Return type bool
CLI Example:
```
salt '*' shadow.set_expire <username> 2016/7/1
```

```python
salt.modules.win_shadow.set_password(name, password)
Set the password for a named user.
Parameters
  - **name** (**str**) – The name of the user account
  - **password** (**str**) – The new password
Returns True if successful. False if unsuccessful.
Return type bool
CLI Example:
```
salt '*' shadow.set_password root mysecretpassword
```

```python
salt.modules.win_shadow.unlock_account(name)
Unlocks a user account.
Parameters **name** – The name of the user account to unlock.
Returns True if successful. False if unsuccessful.
Return type bool
CLI Example:
```
salt '*' shadow.unlock_account <username>
```

### 21.9.476 `salt.modules.win_smtp_server` module

Module for managing IIS SMTP server configuration on Windows servers. The Windows features 'SMTP-Server' and 'Web-WMI' must be installed.

```python
depends wmi
```

```python
salt.modules.win_smtp_server.get_connection_ip_list(as_wmi_format=False, server='SmtpSvc/1')
Get the IPGrant list for the SMTP virtual server.
Parameters
  - **as_wmi_format** (**bool**) – Returns the connection IPs as a list in the format WMI expects.
  - **server** (**str**) – The SMTP server name.
Returns A dictionary of the IP and subnet pairs.
Return type dict
CLI Example:
```
salt '*' win_smtp_server.get_connection_ip_list
```

```python
salt.modules.win_smtp_server.get_log_format(server='SmtpSvc/1')
Get the active log format for the SMTP virtual server.
```
Parameters `server` *(str)* – The SMTP server name.
Returns A string of the log format name.
Return type `str`

CLI Example:
```
salt '*' win_smtp_server.get_log_format
```

```
salt.modules.win_smtp_server.get_log_format_types()
Get all available log format names and ids.
Returns A dictionary of the log format names and ids.
Return type `dict`

CLI Example:
```
salt '*' win_smtp_server.get_log_format_types
```

```
salt.modules.win_smtp_server.get_relay_ip_list(server='SmtpSvc/1')
Get the RelayIpList list for the SMTP virtual server.
Parameters `server` *(str)* – The SMTP server name.
Returns A list of the relay IPs.
Return type `list`

Note: A return value of None corresponds to the restrictive 'Only the list below' GUI parameter with an empty access list, and setting an empty list/tuple corresponds to the more permissive 'All except the list below' GUI parameter.

CLI Example:
```
salt '*' win_smtp_server.get_relay_ip_list
```

```
salt.modules.win_smtp_server.get_server_setting(settings, server='SmtpSvc/1')
Get the value of the setting for the SMTP virtual server.
Parameters
  - `settings` *(str)* – A list of the setting names.
  - `server` *(str)* – The SMTP server name.
Returns A dictionary of the provided settings and their values.
Return type `dict`

CLI Example:
```
salt '*' win_smtp_server.get_server_setting settings="["MaxRecipients"]"
```

```
salt.modules.win_smtp_server.get_servers()
Get the SMTP virtual server names.
Returns A list of the SMTP virtual servers.
Return type `list`

CLI Example:
```
salt '*' win_smtp_server.get_servers
```

```
salt.modules.win_smtp_server.set_connection_ip_list(addresses=None, grant_by_default=False, server='SmtpSvc/1')
Set the IPGrant list for the SMTP virtual server.
Parameters
  - `addresses` *(str)* – A dictionary of IP + subnet pairs.
- **grant_by_default** *(bool)* – Whether the addresses should be a blacklist or whitelist.
- **server** *(str)* – The SMTP server name.

  **Returns** A boolean representing whether the change succeeded.
  **Return type** *bool*

CLI Example:

```bash
salt '*' win_smtp_server.set_connection_ip_list addresses="{'127.0.0.1': '255.255.255.255'}"
```

salt.modules.win_smtp_server.set_log_format *(log_format, server='SmtpSvc/1')*

Set the active log format for the SMTP virtual server.

  **Parameters**
  - **log_format** *(str)* – The log format name.
  - **server** *(str)* – The SMTP server name.

  **Returns** A boolean representing whether the change succeeded.
  **Return type** *bool*

CLI Example:

```bash
salt '*' win_smtp_server.set_log_format 'Microsoft IIS Log File Format'
```

salt.modules.win_smtp_server.set_relay_ip_list *(addresses=None, server='SmtpSvc/1')*

Set the RelayIpList list for the SMTP virtual server.

Due to the unusual way that Windows stores the relay IPs, it is advisable to retrieve the existing list you wish to set from a pre-configured server.

For example, setting '127.0.0.1' as an allowed relay IP through the GUI would generate an actual relay IP list similar to the following:

```
['24.0.0.128', '32.0.0.128', '60.0.0.128', '68.0.0.128', '1.0.0.0', '76.0.0.0',
'0.0.0.0', '0.0.0.0', '1.0.0.0', '1.0.0.0', '2.0.0.0', '2.0.0.0', '4.0.0.0',
'0.0.0.0', '76.0.0.128', '0.0.0.0', '0.0.0.0', '0.0.0.0', '0.0.0.0', '255.255.255.255', '127.0.0.1']
```

**Note:** Setting the list to None corresponds to the restrictive 'Only the list below' GUI parameter with an empty access list configured, and setting an empty list/tuple corresponds to the more permissive 'All except the list below' GUI parameter.

  **Parameters**
  - **addresses** *(str)* – A list of the relay IPs. The order of the list is important.
  - **server** *(str)* – The SMTP server name.

  **Returns** A boolean representing whether the change succeeded.
  **Return type** *bool*

CLI Example:

```bash
salt '*' win_smtp_server.set_relay_ip_list addresses="['192.168.1.1', '172.16.1.1']"
```

salt.modules.win_smtp_server.set_server_setting *(settings, server='SmtpSvc/1')*

Set the value of the setting for the SMTP virtual server.

**Note:** The setting names are case-sensitive.
Parameters

- **settings** *(str)* – A dictionary of the setting names and their values.
- **server** *(str)* – The SMTP server name.

Returns

A boolean representing whether all changes succeeded.

Return type **bool**

CLI Example:

```
salt '*' win_smtp_server.set_server_setting settings="{'MaxRecipients': '500'}"
```

### 21.9.477 salt.modules.win_snmp module

Module for managing SNMP service settings on Windows servers. The Windows feature 'SNMP-Service' must be installed.

**salt.modules.win_snmp.get_agent_service_types()**

Get the sysServices types that can be configured.

Returns

A list of service types.

Return type **list**

CLI Example:

```
salt '*' win_snmp.get_agent_service_types
```

**salt.modules.win_snmp.get_agent_settings()**

Determine the value of the SNMP sysContact, sysLocation, and sysServices settings.

Returns

A dictionary of the agent settings.

Return type **dict**

CLI Example:

```
salt '*' win_snmp.get_agent_settings
```

**salt.modules.win_snmp.get_auth_traps_enabled()**

Determine whether the host is configured to send authentication traps.

Returns

True if traps are enabled, otherwise False.

Return type **bool**

CLI Example:

```
salt '*' win_snmp.get_auth_traps_enabled
```

**salt.modules.win_snmp.get_community_names()**

Get the current accepted SNMP community names and their permissions.

If community names are being managed by Group Policy, those values will be returned instead like this:

```markdown
TestCommunity:
  Managed by GPO
```

Community names managed normally will denote the permission instead:

```markdown
TestCommunity:
  Read Only
```

Returns

A dictionary of community names and permissions.

Return type **dict**

CLI Example:
salt.modules.win_snmp.get_community_names

Get the permission types that can be configured for communities.

Returns: A list of permission types.
Return type: list

CLI Example:

```
salt '*' win_snmp.get_community_names
```

salt.modules.win_snmp.set_agent_settings(contact=None, location=None, services=None)

Manage the SNMP sysContact, sysLocation, and sysServices settings.

Parameters:
- **contact** *(str, optional)* - The SNMP contact.
- **location** *(str, optional)* - The SNMP location.
- **services** *(list, optional)* - A list of selected services. The possible service names can be found via `win_snmp.get_agent_service_types`. To disable all services pass a list of None, i.e: `['None']`

Returns: True if successful, otherwise False
Return type: bool

CLI Example:

```
salt '*' win_snmp.set_agent_settings contact='Contact Name' location='Place' services='["Physical"]'
```

salt.modules.win_snmp.set_auth_traps_enabled(status=True)

Manage the sending of authentication traps.

Parameters:
- **status** *(bool)* - True to enable traps. False to disable.

Returns: True if successful, otherwise False
Return type: bool

CLI Example:

```
salt '*' win_snmp.set_auth_traps_enabled status='True'
```

salt.modules.win_snmp.set_community_names(community)

Manage the SNMP accepted community names and their permissions.

Note: Settings managed by Group Policy will always take precedence over those set using the SNMP interface. Therefore if this function finds Group Policy settings it will raise a CommandExecutionError

Parameters:
- **community** *(dict)* - A dictionary of SNMP community names and permissions. The possible permissions can be found via `win_snmp.get_permission_types`.

Returns: True if successful, otherwise False
Return type: bool

Raises: CommandExecutionError - If SNMP settings are being managed by Group Policy

CLI Example:

```
salt '*' win_snmp.set_community_names communities="{"TestCommunity": 'Read Only'}"
```
21.9.478  `salt.modules.win_status`

Module for returning various status data about a minion. These data can be useful for compiling into stats later, or for problem solving if your minion is having problems.

New in version 0.12.0.

salt.modules.win_status.cpuload()
New in version 2015.8.0.

Return the processor load as a percentage

CLI Example:
salt 's' status.cpuload

salt.modules.win_status.cpustats()
Return information about the CPU.
Returns dict: A dictionary containing information about the CPU stats
CLI Example:
salt * status.cpustats

salt.modules.win_status.diskusage(human_readable=False, path=None)
New in version 2015.8.0.
Return the disk usage for this minion
human_readable [False] If True, usage will be in KB/MB/GB etc.
CLI Example:
salt 's' status.diskusage path=c:/salt

salt.modules.win_status.loadavg()
Returns counter information related to the load of the machine
Returns A dictionary of counters
Return type dict
CLI Example:
salt * status.loadavg

salt.modules.win_status.master(master=None, connected=True)
New in version 2015.5.0.
Fire an event if the minion gets disconnected from its master. This function is meant to be run via a scheduled job from the minion. If master_ip is an FQDN/Hostname, must be resolvable to a valid IPv4 address.
CLI Example:
salt 's' status.master

salt.modules.win_status.meminfo()
Return information about physical and virtual memory on the system
Returns A dictionary of information about memory on the system
Return type dict
CLI Example:
salt * status.meminfo

salt.modules.win_status.procs(count=False)
Return the process data
count [False] If True, this function will simply return the number of processes.
New in version 2015.8.0.
CLI Example:
salt 's' status.procs
salt 's' status.procs count

salt.modules.win_status.saltmem(human_readable=False)
New in version 2015.8.0.
Returns the amount of memory that salt is using
**human readable**  [False] return the value in a nicely formatted number

**CLI Example:**

```
salt '*' status.saltmem
salt '*' status.saltmem human_readable=True
```

**salt.modules.win_status.uptime(**human_readable=False)**

New in version 2015.8.0.

Return the system uptime for the machine

**Parameters**  
**human_readable** *(bool)* – Return uptime in human readable format if True, otherwise return seconds. Default is False

**Note:** Human readable format is days, hours:min:sec. Days will only be displayed if more than 0

**Returns** The uptime in seconds or human readable format depending on the value of human_readable

**Return type**  
str

**CLI Example:**

```
salt '*' status.uptime
salt '*' status.uptime human_readable=True
```

**salt.modules.win_status.vmstats()**

Return information about the virtual memory on the machine

**Returns** A dictionary of virtual memory stats

**Return type**  
dict

**CLI Example:**

```
salt * status.vmstats
```

### 21.9.479 salt.modules.win_system

Module for managing windows systems.

**depends**

- pywintypes
- win32api
- win32con
- win32net
- wmi

Support for reboot, shutdown, etc

**salt.modules.win_system.get_computer_desc()**

Get the Windows computer description

**Returns** Returns the computer description if found. Otherwise returns False.

**Return type**  
str

**CLI Example:**

```
salt 'minion-id' system.get_computer_desc
```
Salt Documentation, Release 2019.2.0

salt.modules.win_system.get_computer_name()
Get the Windows computer name

Returns
Returns the computer name if found. Otherwise returns False.

Return type str

CLI Example:

```
salt 'minion-id' system.get_computer_name
```

salt.modules.win_system.get_domain_workgroup()
Get the domain or workgroup the computer belongs to.

New in version 2015.5.7.

New in version 2015.8.2.

Returns The name of the domain or workgroup

Return type str

CLI Example:

```
salt 'minion-id' system.get_domain_workgroup
```

salt.modules.win_system.get_hostname()
Get the hostname of the windows minion

New in version 2016.3.0.

Returns Returns the hostname of the windows minion

Return type str

CLI Example:

```
salt 'minion-id' system.get_hostname
```

salt.modules.win_system.get_pending_component_servicing()
Determine whether there are pending Component Based Servicing tasks that require a reboot.

New in version 2016.11.0.

Returns True if there are pending Component Based Servicing tasks, otherwise False

Return type bool

CLI Example:

```
salt '*' system.get_pending_component_servicing
```

salt.modules.win_system.get_pending_computer_name()
Get a pending computer name. If the computer name has been changed, and the change is pending a system
reboot, this function will return the pending computer name. Otherwise, None will be returned. If there was
an error retrieving the pending computer name, False will be returned, and an error message will be logged
to the minion log.

Returns Returns the pending name if pending restart. Returns None if not pending restart.

Return type str

CLI Example:

```
salt 'minion-id' system.get_pending_computer_name
```

salt.modules.win_system.get_pending_domain_join()
Determine whether there is a pending domain join action that requires a reboot.

New in version 2016.11.0.

Returns True if there is a pending domain join action, otherwise False

Return type bool

CLI Example:

```
salt '*' system.get_pending_domain_join
```
salt 'system.get_pending_domain_join

salt.modules.win_system.get_pending_file_rename()
Determine whether there are pending file rename operations that require a reboot.
New in version 2016.11.0.
Returns True if there are pending file rename operations, otherwise False
Return type bool
CLI Example:
salt 'system.get_pending_file_rename

salt.modules.win_system.get_pending_reboot()
Determine whether there is a reboot pending.
New in version 2016.11.0.
Returns True if the system is pending reboot, otherwise False
Return type bool
CLI Example:
salt 'system.get_pending_reboot

salt.modules.win_system.get_pending_servermanager()
Determine whether there are pending Server Manager tasks that require a reboot.
New in version 2016.11.0.
Returns True if there are pending Server Manager tasks, otherwise False
Return type bool
CLI Example:
salt 'system.get_pending_servermanager

salt.modules.win_system.get_pending_update()
Determine whether there are pending updates that require a reboot.
New in version 2016.11.0.
Returns True if there are pending updates, otherwise False
Return type bool
CLI Example:
salt 'system.get_pending_update

salt.modules.win_system.get_reboot_required_witnessed()
Determine if at any time during the current boot session the salt minion witnessed an event indicating that a reboot is required.
This function will return True if an install completed with exit code 3010 during the current boot session and can be extended where appropriate in the future.
New in version 2016.11.0.
Returns True if the Requires reboot registry flag is set to 1, otherwise False
Return type bool
CLI Example:
salt 'system.get_reboot_required_witnessed

salt.modules.win_system.get_system_date()
Get the Windows system date
Returns

Returns the system date

Return type: str

CLI Example:
```
salt '* system.get_system_date
```

```python
class System:
    @staticmethod
    def get_system_date() -> str:
        pass
```

salt.modules.win_system.get_system_info()

Get system information.

Returns: Dictionary containing information about the system to include name, description, version, etc...

Return type: dict

CLI Example:
```
salt 'minion-id' system.get_system_info
```

```python
class System:
    @staticmethod
    def get_system_info() -> Dict[str, Any]:
        pass
```

salt.modules.win_system.get_system_time()

Get the system time.

Returns: Returns the system time in HH:MM:SS AM/PM format.

Return type: str

CLI Example:
```
salt 'minion-id' system.get_system_time
```

```python
class System:
    @staticmethod
    def get_system_time() -> str:
        pass
```

salt.modules.win_system.halt(timeout=5, in_seconds=False)

Halt a running system.

Parameters:
- **timeout** (int) – Number of seconds before halting the system. Default is 5 seconds.
- **in_seconds** (bool) – Whether to treat timeout as seconds or minutes.

New in version 2015.8.0.

Returns: True if successful, otherwise False

Return type: bool

CLI Example:
```
salt '* system.halt 5 True
```

```python
class System:
    @staticmethod
    def halt(timeout: int, in_seconds: bool) -> bool:
        pass
```

salt.modules.win_system.init(runlevel)

Change the system runlevel on sysV compatible systems. Not applicable to Windows

CLI Example:
```
salt '* system.init 3
```

```python
class System:
    @staticmethod
    def init(runlevel: int) -> None:
        pass
```

salt.modules.win_system.join_domain(domain, username=None, password=None, account_ou=None, account_exists=False, restart=False)

Join a computer to an Active Directory domain. Requires a reboot.

Parameters:
- **domain** (str) – The domain to which the computer should be joined, e.g. example.com
- **username** (str) – Username of an account which is authorized to join computers to the specified domain. Needs to be either fully qualified like user@domain.tld or simply user
- **password** (str) – Password of the specified user
- **account_ou** (str) – The DN of the OU below which the account for this computer should be created when joining the domain, e.g. ou=computers, ou=departm_432,dc=my-company,dc=com
- **account_exists** *(bool)* – If set to `True` the computer will only join the domain if the account already exists. If set to `False` the computer account will be created if it does not exist, otherwise it will use the existing account. Default is `False`.

- **restart** *(bool)* – `True` will restart the computer after a successful join. Default is `False`.

New in version 2015.8.2/2015.5.7.

**Returns**
- Returns a dictionary if successful, otherwise `False`.
- **dict**

**CLI Example:**
```
salt 'minion-id' system.join_domain domain='domain.tld' \    username='joinuser' password='joinpassword' \    account_ou='ou=clients,ou=org,dc=domain,dc=tld' \    account_exists=False, restart=True
```

**salt.modules.win_system.lock()**
Lock the workstation.

- **Returns**
  - True if successful, otherwise `False`.
- **bool**

**CLI Example:**
```
salt 'minion-id' system.lock
```

**salt.modules.win_system.poweroff** *(timeout=5, in_seconds=False)*
Power off a running system.

**Parameters**
- **timeout** *(int)* – Number of seconds before powering off the system. Default is 5 seconds.
- **in_seconds** *(bool)* – Whether to treat timeout as seconds or minutes.

New in version 2015.8.0.

- **Returns**
  - True if successful, otherwise `False`.
- **bool**

**CLI Example:**
```
salt '*' system.poweroff 5
```

**salt.modules.win_system.reboot** *(timeout=5, in_seconds=False, wait_for_reboot=False, only_on_pending_reboot=False)*
Reboot a running system.

**Parameters**
- **timeout** *(int)* – The number of minutes/seconds before rebooting the system. Use of minutes or seconds depends on the value of `in_seconds`. Default is 5 minutes.
- **in_seconds** *(bool)* – `True` will cause the timeout parameter to be in seconds. `False` will be in minutes. Default is `False`.

New in version 2015.8.0.

- **wait_for_reboot** *(bool)* – `True` will sleep for `timeout` + 30 seconds after reboot has been initiated. This is useful for use in a highstate. For example, you may have states that you want to apply only after the reboot. Default is `False`.

New in version 2015.8.0.

- **only_on_pending_reboot** *(bool)* – If this is set to `True`, then the reboot will only proceed if the system reports a pending reboot. Setting this parameter to `True` could be useful when calling this function from a final housekeeping state intended to be executed at the end of a state run (using `order: last`). Default is `False`.
Returns  True if successful (a reboot will occur), otherwise False
Return type  bool

CLI Example:
salt '*' system.reboot 5
salt '*' system.reboot 5 True

Invoking this function from a final housekeeping state:

```
final_housekeeping:
  module.run:
    - name: system.reboot
      - only_on_pending_reboot: True
      - order: last
```

```
salt.modules.win_system.set_computer_desc(desc=None)
    Set the Windows computer description
    Parameters  desc (str) – The computer description
    Returns  Description if successful, otherwise False
    Return type  str

CLI Example:
salt 'minion-id' system.set_computer_desc 'This computer belongs to Dave!'
```

```
salt.modules.win_system.set_computer_name(name)
    Set the Windows computer name
    Parameters  name (str) – The new name to give the computer. Requires a reboot to take effect.
    Returns  Returns a dictionary containing the old and new names if successful. False if not.
    Return type  dict

CLI Example:
salt 'minion-id' system.set_computer_name 'DavesComputer'
```

```
salt.modules.win_system.set_hostname(hostname)
    Set the hostname of the windows minion, requires a restart before this will be updated.
    New in version 2016.3.0.
    Parameters  hostname (str) – The hostname to set
    Returns  True if successful, otherwise False
    Return type  bool

CLI Example:
salt 'minion-id' system.set_hostname newhostname
```

```
salt.modules.win_system.set_reboot_required_witnessed()
    This function is used to remember that an event indicating that a reboot is required was witnessed. This
    function relies on the salt-minion’s ability to create the following volatile registry key in the HKLM hive:
    SYSTEM\CurrentControlSet\Services\salt-minion\Volatile-Data
    Because this registry key is volatile, it will not persist beyond the current boot session. Also, in the scope of
    this key, the name ‘Reboot required’ will be assigned the value of 1.
    For the time being, this function is being used whenever an install completes with exit code 3010 and can be
    extended where appropriate in the future.
    New in version 2016.11.0.
    Returns  True if successful, otherwise False
    Return type  bool
```

2752  Chapter 21.  Salt Module Reference
Salt Documentation, Release 2019.2.0

CLI Example:

```sh
salt '* system.set_reboot_required_witnessed
```

salt.modules.win_system.set_system_date(newdate)
Set the Windows system date. Use `<mm-dd-yy>` format for the date.

**Parameters**

- **newdate (str)** – The date to set. Can be any of the following formats:
  - YYYY-MM-DD
  - MM-DD-YYYY
  - MM-DD-YY
  - MM/DD/YYYY
  - MM/DD/YY
  - YYYY/MM/DD

**Returns**

- True if successful, otherwise False

**Return type** bool

CLI Example:

```sh
salt '* system.set_system_date '03-28-13'
```

salt.modules.win_system.set_system_date_time(years=None, months=None, days=None, hours=None, minutes=None, seconds=None)
Set the system date and time. Each argument is an element of the date, but not required. If an element is not passed, the current system value for that element will be used. For example, if you don’t pass the year, the current system year will be used. (Used by set_system_date and set_system_time)

**Parameters**

- **years (int)** – Years digit, ie: 2015
- **months (int)** – Months digit: 1 - 12
- **days (int)** – Days digit: 1 - 31
- **hours (int)** – Hours digit: 0 - 23
- **minutes (int)** – Minutes digit: 0 - 59
- **seconds (int)** – Seconds digit: 0 - 59

**Returns**

- True if successful, otherwise False

**Return type** bool

CLI Example:

```sh
salt '* system.set_system_date_time 2015 5 12 11 37 53
```

salt.modules.win_system.set_system_time(newtime)
Set the system time.

**Parameters**

- **newtime (str)** – The time to set. Can be any of the following formats:
  - HH:MM:SS AM/PM
  - HH:MM AM/PM
  - HH:MM:SS (24 hour)
  - HH:MM (24 hour)

**Returns**

- True if successful, otherwise False

**Return type** bool

CLI Example:

```sh
salt 'minion-id' system.set_system_time 12:01
```

salt.modules.win_system.shutdown(message=None, timeout=5, force_close=True, reboot=False, in_seconds=False, only_on_pending_reboot=False)
Shutdown a running system.

**Parameters**

- **message (str)** – The message to display to the user before shutting down.
- **timeout** *(int)* – The length of time (in seconds) that the shutdown dialog box should be displayed. While this dialog box is displayed, the shutdown can be aborted using the `system.shutdown_abort` function.

If `timeout` is not zero, `InitiateSystemShutdown` displays a dialog box on the specified computer. The dialog box displays the name of the user who called the function, the message specified by the `lpMessage` parameter, and prompts the user to log off. The dialog box beeps when it is created and remains on top of other windows (system modal). The dialog box can be moved but not closed. A timer counts down the remaining time before the shutdown occurs.

If `timeout` is zero, the computer shuts down immediately without displaying the dialog box and cannot be stopped by `system.shutdown_abort`.

Default is 5 minutes

- **in_seconds** *(bool)* – *True* will cause the `timeout` parameter to be in seconds. *False* will be in minutes. Default is *False*.

    New in version 2015.8.0.

- **force_close** *(bool)* – *True* will force close all open applications. *False* will display a dialog box instructing the user to close open applications. Default is *True*.

- **reboot** *(bool)* – *True* restarts the computer immediately after shutdown. *False* powers down the system. Default is *False*.

- **only_on_pending_reboot** *(bool)* – If this is set to *True*, then the shutdown will only proceed if the system reports a pending reboot. To optionally shutdown in a highstate, consider using the shutdown state instead of this module.

- **only_on_pending_reboot** – If *True* the shutdown will only proceed if there is a reboot pending. *False* will shutdown the system. Default is *False*.

    **Returns** *True* if successful (a shutdown or reboot will occur), otherwise *False*

    **Return type** *bool*

    CLI Example:

    ```
salt '*' system.shutdown "System will shutdown in 5 minutes"
```

salt.modules.win_system.shutdown_abort()

Abort a shutdown. Only available while the dialog box is being displayed to the user. Once the shutdown has initiated, it cannot be aborted.

**Returns** *True* if successful, otherwise *False*

**Return type** *bool*

CLI Example:

```
salt 'minion-id' system.shutdown_abort
```

salt.modules.win_system.shutdown_hard()

Shutdown a running system with no timeout or warning.

**Returns** *True* if successful, otherwise *False*

**Return type** *bool*

CLI Example:

```
salt '*' system.shutdown_hard
```

salt.modules.win_system.start_time_service()

Start the Windows time service

**Returns** *True* if successful, otherwise *False*

**Return type** *bool*

CLI Example:
salt '*' system.start_time_service

salt.modules.win_system.stop_time_service()
Stop the Windows time service

Retruns True if successful, otherwise False

Return type bool

CLI Example:
salt '*' system.stop_time_service

salt.modules.win_system.unjoin_domain(username=None, password=None, domain=None, workgroup='WORKGROUP', disable=False, restart=False)

Unjoin a computer from an Active Directory Domain. Requires a restart.

Parameters

- **username (str)** – Username of an account which is authorized to manage computer accounts on the domain. Needs to be a fully qualified name like user@domain.tld or domain.tld\user. If the domain is not specified, the passed domain will be used. If the computer account doesn’t need to be disabled after the computer is unjoined, this can be None.
- **password (str)** – The password of the specified user
- **domain (str)** – The domain from which to unjoin the computer. Can be None
- **workgroup (str)** – The workgroup to join the computer to. Default is WORKGROUP

New in version 2015.8.2/2015.5.7.

- **disable (bool)** – True to disable the computer account in Active Directory. Default is False
- **restart (bool)** – True will restart the computer after successful unjoin. Default is False

New in version 2015.8.2/2015.5.7.

Returns Returns a dictionary if successful, otherwise False

Return type dict

CLI Example:
salt 'minion-id' system.unjoin_domain restart=True

salt 'minion-id' system.unjoin_domain username='unjoinuser' \
password='unjoinpassword' disable=True \ 
restart=True

21.9.480 salt.modules.win_task module

Windows Task Scheduler Module .. versionadded:: 2016.3.0

A module for working with the Windows Task Scheduler. You can add and edit existing tasks. You can add and clear triggers and actions. You can list all tasks, folders, triggers, and actions.

salt.modules.win_task.add_action(name=None, location='\\', action_type='Execute', **kwargs)
Add an action to a task.

Parameters

- **name (str)** – The name of the task to which to add the action.
- **location (str)** – A string value representing the location of the task. Default is \\ which is the root for the task scheduler (C:\Windows\System32\tasks).
- **action_type (str)** – The type of action to add. There are three action types. Each one requires its own set of Keyword Arguments (kwargs). Valid values are:
Required arguments for each action_type:

**Execute**

Execute a command or an executable

- **cmd (str):** (required) The command or executable to run.
- **arguments (str):** (optional) Arguments to be passed to the command or executable.

To launch a script the first command will need to be the interpreter for the script. For example, to run a vbscript you would pass `cscript.exe` in the `cmd` parameter and pass the script in the `arguments` parameter as follows:

```
• cmd='cscript.exe' arguments='c:\scripts\myscript.vbs'
```

Batch files do not need an interpreter and may be passed to the `cmd` parameter directly.

- **start_in (str):** (optional) The current working directory for the command.

**Email**

Send and email. Requires `server`, `from`, and `to` or `cc`.

- **from (str):** The sender
- **reply_to (str):** Who to reply to
- **to (str):** The recipient
- **cc (str):** The CC recipient
- **bcc (str):** The BCC recipient
- **subject (str):** The subject of the email
- **body (str):** The Message Body of the email
- **server (str):** The server used to send the email
- **attachments (list):** A list of attachments. These will be the paths to the files to attach. ie: `attachments=['C:\attachment1.txt', 'C:\attachment2.txt']`

**Message**

Display a dialog box. The task must be set to "Run only when user is logged on" in order for the dialog box to display. Both parameters are required.

- **title (str):** The dialog box title.
- **message (str):** The dialog box message body

**Returns** A dictionary containing the task configuration

**Return type** dict

**CLI Example:**

```
salt 'minion-id' task.add_action <task_name> cmd='del /Q /S C:\\Temp'
```

**salt.modules.win_task.add_trigger**

```
salt.modules.win_task.add_trigger(name=None, location="\", trigger_type=None, trigger_enabled=True, start_date=None, start_time=None, end_date=None, end_time=None, random_delay=None, repeat_interval=None, repeat_duration=None, repeat_stop_at_duration_end=False, execution_time_limit=None, delay=None, **kwargs)
```

Add a trigger to a Windows Scheduled task

**Note:** Arguments are parsed by the YAML loader and are subject to yaml’s idiosyncrasies. Therefore, time
values in some formats (%H:%M:%S and %H:%M) should be quoted. See YAML IDIOSYNCRASIES for more details.

Parameters

- **name** *(str)* – The name of the task to which to add the trigger.
- **location** *(str)* – A string value representing the location of the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).
- **trigger_type** *(str)* – The type of trigger to create. This is defined when the trigger is created and cannot be changed later. Options are as follows:
  - Event
  - Once
  - Daily
  - Weekly
  - Monthly
  - MonthlyDay
  - OnIdle
  - OnTaskCreation
  - OnBoot
  - OnLogon
  - OnSessionChange
- **trigger_enabled** *(bool)* – Boolean value that indicates whether the trigger is enabled.
- **start_date** *(str)* – The date when the trigger is activated. If no value is passed, the current date will be used. Can be one of the following formats:
  - %Y-%m-%d
  - %m-%d-%y
  - %m-%d-%Y
  - %m/%d/%y
  - %m/%d/%Y
  - %Y/%m/%d
- **start_time** *(str)* – The time when the trigger is activated. If no value is passed, midnight will be used. Can be one of the following formats:
  - %I:%M:%S %p
  - %I:%M %p
  - %H:%M:%S
  - %H:%M
- **end_date** *(str)* – The date when the trigger is deactivated. The trigger cannot start the task after it is deactivated. Can be one of the following formats:
  - %Y-%m-%d
  - %m-%d-%y
  - %m-%d-%Y
  - %m/%d/%y
  - %m/%d/%Y
  - %Y/%m/%d
- **end_time** *(str)* – The time when the trigger is deactivated. If this is not passed with end_date it will be set to midnight. Can be one of the following formats:
  - %I:%M:%S %p
  - %I:%M %p
  - %H:%M:%S
  - %H:%M
- **random_delay** *(str)* – The delay time that is randomly added to the start time of the trigger. Valid values are:
  - 30 seconds
• `repeat_interval` *(str)* – The amount of time between each restart of the task. Valid values are:
  - 5 minutes
  - 10 minutes
  - 15 minutes
  - 30 minutes
  - 1 hour

• `repeat_duration` *(str)* – How long the pattern is repeated. Valid values are:
  - Indefinitely
  - 15 minutes
  - 30 minutes
  - 1 hour
  - 12 hours
  - 1 day

• `repeat_stop_at_duration_end` *(bool)* – Boolean value that indicates if a running instance of the task is stopped at the end of the repetition pattern duration.

• `execution_time_limit` *(str)* – The maximum amount of time that the task launched by the trigger is allowed to run. Valid values are:
  - 30 minutes
  - 1 hour
  - 2 hours
  - 4 hours
  - 8 hours
  - 12 hours
  - 1 day
  - 3 days (default)

• `delay` *(str)* – The time the trigger waits after its activation to start the task. Valid values are:
  - 15 seconds
  - 30 seconds
  - 1 minute
  - 30 minutes
  - 1 hour
  - 8 hours
  - 1 day

Note: This parameter applies to the following trigger types:
- Once
- Daily
- Weekly
- Monthly
- MonthlyDay
- OnSessionChange

**kwargs**

There are optional keyword arguments determined by the type of trigger being defined. They are as follows:

**Event**

The trigger will be fired by an event.

- **subscription (str):** An event definition in xml format that fires the trigger. The easiest way to get this would is to create an event in Windows Task Scheduler and then copy the xml text.

**Once**

No special parameters required.

**Daily**

The task will run daily.

- **days_interval (int):** The interval between days in the schedule. An interval of 1 produces a daily schedule. An interval of 2 produces an every-other day schedule. If no interval is specified, 1 is used. Valid entries are 1 - 999.

**Weekly**

The task will run weekly.

- **weeks_interval (int):** The interval between weeks in the schedule. An interval of 1 produces a weekly schedule. An interval of 2 produces an every-other week schedule. If no interval is specified, 1 is used. Valid entries are 1 - 52.

- **days_of_week (list):** Sets the days of the week on which the task runs. Should be a list. ie: ['Monday', 'Wednesday', 'Friday']. Valid entries are the names of the days of the week.

**Monthly**

The task will run monthly.

- **months_of_year (list):** Sets the months of the year during which the task runs. Should be a list. ie: ['January', 'July']. Valid entries are the full names of all the months.

- **days_of_month (list):** Sets the days of the month during which the task runs. Should be a list. ie: [1, 15, 'Last']. Options are all days of the month 1 - 31 and the word 'Last' to indicate the last day of the month.

- **last_day_of_month (bool):** Boolean value that indicates that the task runs on the last day of the month regardless of the actual date of that day.

**MonthlyDay**

The task will run monthly on the specified day.

- **months_of_year (list):** Sets the months of the year during which the task runs. Should be a list. ie: ['January', 'July']. Valid entries are the full names of all the months.

- **weeks_of_month (list):** Sets the weeks of the month during which the task runs. Should be a list. ie: ['First', 'Third']. Valid options are:
  - First
  - Second
  - Third
  - Fourth

- **last_week_of_month (bool):** Boolean value that indicates that the task runs on the last week of the month.

---

**Note:** You can set the task to run on the last day of the month by either including the word 'Last' in the list of days, or setting the parameter 'last_day_of_month' equal to True.
days_of_week (list): Sets the days of the week during which the task runs. Should be a list, i.e: ['Monday', 'Wednesday', 'Friday']. Valid entries are the names of the days of the week.

OnIdle
No special parameters required.

OnTaskCreation
No special parameters required.

OnBoot
No special parameters required.

OnLogon
No special parameters required.

OnSessionChange
The task will be triggered by a session change.

session_user_name (str): Sets the user for the Terminal Server session. When a session state change is detected for this user, a task is started. To detect session status change for any user, do not pass this parameter.

state_change (str): Sets the kind of Terminal Server session change that would trigger a task launch. Valid options are:
- ConsoleConnect: When you connect to a user session (switch users)
- ConsoleDisconnect: When you disconnect a user session (switch users)
- RemoteConnect: When a user connects via Remote Desktop
- RemoteDisconnect: When a user disconnects via Remote Desktop
- SessionLock: When the workstation is locked
- SessionUnlock: When the workstation is unlocked

Returns True if successful, otherwise False
Return type bool

CLI Example:
```
salt 'minion-id' task.add_trigger <task_name> trigger_type=Once trigger_enabled=True start_date=2016/12/1 start_time='12:01'
```

salt.modules.win_task.clear_triggers(name, location='\')
Remove all triggers from the task.

Parameters
- name (str) – The name of the task from which to clear all triggers.
- location (str) – A string value representing the location of the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

Returns True if successful, otherwise False
Return type bool

CLI Example:
```
salt 'minion-id' task.clear_trigger <task_name>
```

salt.modules.win_task.create_folder(name, location='\')
Create a folder in which to create tasks.

Parameters
- name (str) – The name of the folder. This will be displayed in the task scheduler.
- location (str) – A string value representing the location in which to create the folder. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

Returns True if successful, otherwise False
Return type bool

CLI Example:
Salt Documentation, Release 2019.2.0

```bash
salt 'minion-id' task.create_folder <folder_name>
```

```python
salt.modules.win_task.create_task(name, location='\', user_name='System', password=None,
                               force=False, **kwargs)
```

Create a new task in the designated location. This function has many keyword arguments that are not listed here. For additional arguments see:
- `edit_task()`
- `add_action()`
- `add_trigger()`

Parameters

- `name (str)` - The name of the task. This will be displayed in the task scheduler.
- `location (str)` - A string value representing the location in which to create the task. Default is `\` which is the root for the task scheduler (C:\Windows\System32\tasks).
- `user_name (str)` - The user account under which to run the task. To specify the 'System' account, use 'System'. The password will be ignored.
- `password (str)` - The password to use for authentication. This should set the task to run whether the user is logged in or not, but is currently not working.
- `force (bool)` - If the task exists, overwrite the existing task.

Returns 

- `True` if successful, otherwise `False`

Return type `bool`

CLI Example:

```bash
salt 'minion-id' task.create_task <task_name> user_name=System force=True action_
    type=Execute cmd='del /Q /S C:\\Temp' trigger_type=Once start_date=2016-12-10
    start_time=01:00
```

```python
salt.modules.win_task.create_task_from_xml(name, location='\', xml_text=None,
                                            xml_path=None, user_name='System', pass-
                                            word=None)
```

Create a task based on XML. Source can be a file or a string of XML.

Parameters

- `name (str)` - The name of the task. This will be displayed in the task scheduler.
- `location (str)` - A string value representing the location in which to create the task. Default is `\` which is the root for the task scheduler (C:\Windows\System32\tasks).
- `xml_text (str)` - A string of xml representing the task to be created. This will be overridden by `xml_path` if passed.
- `xml_path (str)` - The path to an XML file on the local system containing the xml that defines the task. This will override `xml_text`
- `user_name (str)` - The user account under which to run the task. To specify the 'System' account, use 'System'. The password will be ignored.
- `password (str)` - The password to use for authentication. This should set the task to run whether the user is logged in or not, but is currently not working.

Returns 

- `True` if successful, otherwise `False`

Return type `bool`

CLI Example:

```bash
salt '* task.create_task_from_xml <task_name> xml_path=C:\\task.xml
```

```python
salt.modules.win_task.delete_folder(name, location='\')
```

Delete a folder from the task scheduler.

Parameters

- `name (str)` - The name of the folder to delete.
• **location** *(str)* – A string value representing the location of the folder. Default is `\` which is the root for the task scheduler (`C:\Windows\System32\tasks`).

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt 'minion-id' task.delete_folder <folder_name>
```

```python
salt.modules.win_task.delete_task(name, location='\')
```

Delete a task from the task scheduler.

Parameters

• **name** *(str)* – The name of the task to delete.
• **location** *(str)* – A string value representing the location of the task. Default is `\` which is the root for the task scheduler (`C:\Windows\System32\tasks`).

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt 'minion-id' task.delete_task <task_name>
```

```python
salt.modules.win_task.edit_task(name=None, location='\', user_name=None, password=None, description=None, enabled=None, hidden=None, run_if_idle=None, idle_duration=None, idle_wait_timeout=None, idle_stop_on_end=None, idle_restart=None, ac_only=None, stop_if_on_batteries=None, wake_to_run=None, run_if_network=None, network_id=None, network_name=None, allow_demand_start=None, start_when_available=None, restart_every=None, restart_count=3, execution_time_limit=None, force_stop=None, delete_after=None, multiple_instances=None, **kwargs)
```

Edit the parameters of a task. Triggers and Actions cannot be edited yet.

Parameters

• **name** *(str)* – The name of the task. This will be displayed in the task scheduler.
• **location** *(str)* – A string value representing the location in which to create the task. Default is `\` which is the root for the task scheduler (`C:\Windows\System32\tasks`).
• **user_name** *(str)* – The user account under which to run the task. To specify the 'System' account, use 'System'. The password will be ignored.
• **password** *(str)* – The password to use for authentication. This should set the task to run whether the user is logged in or not, but is currently not working.
• **description** *(str)* – A string representing the text that will be displayed in the description field in the task scheduler.
• **enabled** *(bool)* – A boolean value representing whether or not the task is enabled.
• **hidden** *(bool)* – A boolean value representing whether or not the task is hidden.
• **run_if_idle** *(bool)* – Boolean value that indicates that the Task Scheduler will run the task only if the computer is in an idle state.
• **idle_duration** *(str)* – A value that indicates the amount of time that the computer is in an idle state.

Note: The combination of user_name and password determine how the task runs. For example, if a username is passed without at password the task will only run when the user is logged in. If a password is passed as well the task will run whether the user is logged on or not. If you pass 'System' as the username the task will run as the system account (the password parameter is ignored).

• **description** *(str)* – A string representing the text that will be displayed in the description field in the task scheduler.
• **enabled** *(bool)* – A boolean value representing whether or not the task is enabled.
• **hidden** *(bool)* – A boolean value representing whether or not the task is hidden.
• **run_if_idle** *(bool)* – Boolean value that indicates that the Task Scheduler will run the task only if the computer is in an idle state.
• **idle_duration** *(str)* – A value that indicates the amount of time that the com-
puter must be in an idle state before the task is run. Valid values are:
- 1 minute
- 5 minutes
- 10 minutes
- 15 minutes
- 30 minutes
- 1 hour

• **idle_wait_timeout**(str) – A value that indicates the amount of time that the Task Scheduler will wait for an idle condition to occur. Valid values are:
  - Do not wait
  - 1 minute
  - 5 minutes
  - 10 minutes
  - 15 minutes
  - 30 minutes
  - 1 hour
  - 2 hours

• **idle_stop_on_end**(bool) – Boolean value that indicates that the Task Scheduler will terminate the task if the idle condition ends before the task is completed.

• **idle_restart**(bool) – Boolean value that indicates whether the task is restarted when the computer cycles into an idle condition more than once.

• **ac_only**(bool) – Boolean value that indicates that the Task Scheduler will launch the task only while on AC power.

• **stop_if_on_batteries**(bool) – Boolean value that indicates that the task will be stopped if the computer begins to run on battery power.

• **wake_to_run**(bool) – Boolean value that indicates that the Task Scheduler will wake the computer when it is time to run the task.

• **run_if_network**(bool) – Boolean value that indicates that the Task Scheduler will run the task only when a network is available.

• **network_id**(guid) – GUID value that identifies a network profile.

• **network_name**(str) – Sets the name of a network profile. The name is used for display purposes.

• **allow_demand_start**(bool) – Boolean value that indicates that the task can be started by using either the Run command or the Context menu.

• **start_when_available**(bool) – Boolean value that indicates that the Task Scheduler can start the task at any time after its scheduled time has passed.

• **restart_every**(str) – A value that specifies the interval between task restart attempts. Valid values are:
  - False (to disable)
  - 1 minute
  - 5 minutes
  - 10 minutes
  - 15 minutes
  - 30 minutes
  - 1 hour
  - 2 hours

• **restart_count**(int) – The number of times the Task Scheduler will attempt to restart the task. Valid values are integers 1 - 999.

• **execution_time_limit**(bool, str) – The amount of time allowed to complete the task. Valid values are:
  - False (to disable)
  - 1 hour
  - 2 hours
  - 4 hours
- 8 hours
- 12 hours
- 1 day
- 3 days

- **force_stop (bool)** – Boolean value that indicates that the task may be terminated by using TerminateProcess.
- **delete_after (bool, str)** – The amount of time that the Task Scheduler will wait before deleting the task after it expires. Requires a trigger with an expiration date. Valid values are:
  - False (to disable)
  - Immediately
  - 30 days
  - 90 days
  - 180 days
  - 365 days

- **multiple_instances (str)** – Sets the policy that defines how the Task Scheduler deals with multiple instances of the task. Valid values are:
  - Parallel
  - Queue
  - No New Instance
  - Stop Existing

Returns **True** if successful, otherwise **False**

Return type **bool**

CLI Example:

```
salt '*' task.edit_task <task_name> description='This task is awesome'
```

salt.modules.win_task.info(name, location='\')

Get the details about a task in the task scheduler.

Parameters

- **name (str)** – The name of the task for which to return the status
- **location (str)** – A string value representing the location of the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

Returns A dictionary containing the task configuration

Return type **dict**

CLI Example:

```
salt 'minion-id' task.info <task_name>
```

salt.modules.win_task.list_actions(name, location='\')

List all actions that pertain to a task in the specified location.

Parameters

- **name (str)** – The name of the task for which list actions.
- **location (str)** – A string value representing the location of the task from which to list actions. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

Returns Returns a list of actions.

Return type **list**

CLI Example:

```
# List all actions for a task in the default location
salt 'minion-id' task.list_actions <task_name>

# List all actions for the XblGameSaveTask in the Microsoft\XblGameSave
```
salt.modules.win_task.list_folders( location='\\' )
List all folders located in a specific location in the task scheduler.

Parameters

- **location (str)** – A string value representing the folder from which you want to list tasks. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

Returns

Returns a list of folders.

Return type

list

CLI Example:

```shell
# List all folders in the default location
salt 'minion-id' task.list_folders

# List all folders in the Microsoft directory
salt 'minion-id' task.list_folders Microsoft
```

salt.modules.win_task.list_tasks( location='\\' )
List all tasks located in a specific location in the task scheduler.

Parameters

- **location (str)** – A string value representing the folder from which you want to list tasks. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

Returns

Returns a list of tasks

Return type

list

CLI Example:

```shell
# List all tasks in the default location
salt 'minion-id' task.list_tasks

# List all tasks in the Microsoft\XblGameSave Directory
salt 'minion-id' task.list_tasks Microsoft\XblGameSave
```

salt.modules.win_task.list_triggers( name, location='\\' )
List all triggers that pertain to a task in the specified location.

Parameters

- **name (str)** – The name of the task for which list triggers.
- **location (str)** – A string value representing the location of the task from which to list triggers. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

Returns

Returns a list of triggers.

Return type

list

CLI Example:

```shell
# List all triggers for a task in the default location
salt 'minion-id' task.list_triggers <task_name>

# List all triggers for the XblGameSaveTask in the Microsoft\XblGameSave
# location
salt '*' task.list_triggers XblGameSaveTask Microsoft\XblGameSave
```

salt.modules.win_task.run( name, location='\\' )
Run a scheduled task manually.

Parameters

- **name (str)** – The name of the task to run.
- **location** *(str)* – A string value representing the location of the task. Default is `\` which is the root for the task scheduler (C:\Windows\System32\tasks).
  
  Returns True if successful, otherwise False

  Return type bool

  CLI Example:

  ```
salt 'minion-id' task.list_run <task_name>
  ```

  salt.modules.win_task.run_wait *(name, location='\')*

  Run a scheduled task and return when the task finishes

  Parameters
  - **name** *(str)* – The name of the task to run.
  - **location** *(str)* – A string value representing the location of the task. Default is `\`
    which is the root for the task scheduler (C:\Windows\System32\tasks).

  Returns True if successful, otherwise False

  Return type bool

  CLI Example:

  ```
salt 'minion-id' task.list_run_wait <task_name>
  ```

  salt.modules.win_task.status *(name, location='\')*

  Determine the status of a task. Is it Running, Queued, Ready, etc.

  Parameters
  - **name** *(str)* – The name of the task for which to return the status
  - **location** *(str)* – A string value representing the location of the task. Default is `\`
    which is the root for the task scheduler (C:\Windows\System32\tasks).

  Returns The current status of the task. Will be one of the following:
  - Unknown
  - Disabled
  - Queued
  - Ready
  - Running

  Return type str

  CLI Example:

  ```
salt 'minion-id' task.list_status <task_name>
  ```

  salt.modules.win_task.stop *(name, location='\')*

  Stop a scheduled task.

  Parameters
  - **name** *(str)* – The name of the task to stop.
  - **location** *(str)* – A string value representing the location of the task. Default is `\`
    which is the root for the task scheduler (C:\Windows\System32\tasks).

  Returns True if successful, otherwise False

  Return type bool

  CLI Example:

  ```
salt 'minion-id' task.list_stop <task_name>
  ```

21.9.481 **salt.modules.win_timezone**

Module for managing timezone on Windows systems.
class salt.modules.win_timezone.TzMapper

    add(k, v)
    get_unix(key, default=None)
    get_win(key, default=None)
    list_unix()
    list_win()
    remove(k)

salt.modules.win_timezone.get_hwclock()
    Get current hardware clock setting (UTC or localtime)
    
    Note: The hardware clock is always local time on Windows so this will always return "localtime"
    
    CLI Example:
    salt '*' timezone.get_hwclock

salt.modules.win_timezone.get_offset()
    Get current numeric timezone offset from UTC (i.e. -0700)
    Returns Offset from UTC
    Return type str
    
    CLI Example:
    salt '*' timezone.get_offset

salt.modules.win_timezone.get_zone()
    Get current timezone (i.e. America/Denver)
    Returns Timezone in unix format
    Return type str
    
    CLI Example:
    salt '*' timezone.get_zone

salt.modules.win_timezone.get_zonecode()
    Get current timezone (i.e. PST, MDT, etc)
    Returns An abbreviated timezone code
    Return type str
    
    CLI Example:
    salt '*' timezone.get_zonecode

salt.modules.win_timezone.list(unix_style=True)
    Return a list of Timezones that this module supports. These can be in either Unix or Windows format.
    
    New in version 2018.3.3.
    Parameters unix_style (bool) – True returns Unix-style timezones. False returns Windows-style timezones. Default is True
    Returns A list of supported timezones
    Return type list
    
    CLI Example:
# Unix-style timezones
salt '*' timezone.list

# Windows-style timezones
salt '*' timezone.list unix_style=False

```python
salt.modules.win_timezone.set_hwclock(clock)
Sets the hardware clock to be either UTC or localtime

Note: The hardware clock is always local time on Windows so this will always return False

CLI Example:
salt '*' timezone.set_hwclock UTC
```

```python
salt.modules.win_timezone.set_zone(timezone)
Sets the timezone using the tzutil.
Parameters timezone (str) — A valid timezone
Returns True if successful, otherwise False
Return type bool
Raises CommandExecutionError — If invalid timezone is passed

CLI Example:
salt '*' timezone.set_zone 'America/Denver'
```

```python
salt.modules.win_timezone.zone_compare(timezone)
Compares the given timezone with the machine timezone. Mostly useful for running state checks.
Parameters timezone (str) — The timezone to compare. This can be in Windows or Unix format. Can be any of the values returned by the timezone.list function
Returns True if they match, otherwise False
Return type bool

Example:
salt '*' timezone.zone_compare 'America/Denver'
```

21.9.482  **salt.modules.win_useradd**

Module for managing Windows Users

**Important:** If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to *user.info* is not available), see [here](#).

**depends**
- pywintypes
- win32api
- win32con
- win32net
- win32netcon
• win32profile
• win32security
• win32ts
• wmi

Note: This currently only works with local user accounts, not domain accounts

salt.modules.win_useradd.add(name, password=None, fullname=None, description=None,
groups=None, home=None, homedrive=None, profile=None, logonscript=None)

Add a user to the minion.

Parameters
• name (str) – User name
• password (str, optional) – User’s password in plain text.
• fullname (str, optional) – The user’s full name.
• description (str, optional) – A brief description of the user account.
• groups (str, optional) – A list of groups to add the user to. (see chgroups)
• home (str, optional) – The path to the user’s home directory.
• homedrive (str, optional) – The drive letter to assign to the home directory.
   Must be the Drive Letter followed by a colon. ie: U:
• profile (str, optional) – An explicit path to a profile. Can be a UNC or a folder on the system. If left blank, windows uses it’s default profile directory.
• logonscript (str, optional) – Path to a login script to run when the user logs on.

Returns True if successful. False is unsuccessful.

Return type bool

CLI Example:

```
salt '*' user.add name password
```

salt.modules.win_useradd.addgroup(name, group)

Add user to a group

Parameters
• name (str) – The user name to add to the group
• group (str) – The name of the group to which to add the user

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' user.addgroup jsnuffy 'Power Users'
```

salt.modules.win_useradd.chfullname(name, fullname)

Change the full name of the user

Parameters
• name (str) – The user name for which to change the full name
• fullname (str) – The new value for the full name

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' user.chfullname user 'First Last'
```
salt.modules.win_useradd.chgroups(name, groups, append=True)

Change the groups this user belongs to, add append=False to make the user a member of only the specified groups.

Parameters
- name (str) – The user name for which to change groups
- groups (str, list) – A single group or a list of groups to assign to the user. For multiple groups this can be a comma delimit string or a list.
- append (bool, optional) – True adds the passed groups to the user’s current groups. False sets the user’s groups to the passed groups only. Default is True.

Returns True if successful, otherwise False
Return type bool

CLI Example:
```
salt '*' user.chgroups jsnuffy Administrators,Users True
```

salt.modules.win_useradd.chhome(name, home, **kwargs)

Change the home directory of the user, pass True for persist to move files to the new home directory if the old home directory exist.

Parameters
- name (str) – The name of the user whose home directory you wish to change
- home (str) – The new location of the home directory

Returns True if successful, otherwise False
Return type bool

CLI Example:
```
salt '*' user.chhome foo \\fileserv\home\foo True
```

salt.modules.win_useradd.chprofile(name, profile)

Change the profile directory of the user.

Parameters
- name (str) – The name of the user whose profile you wish to change
- profile (str) – The new location of the profile

Returns True if successful, otherwise False
Return type bool

CLI Example:
```
salt '*' user.chprofile foo \\fileserv\profiles\foo
```

salt.modules.win_useradd.current(sam=False)

Get the username that salt-minion is running under. If salt-minion is running as a service it should return the Local System account. If salt is running from a command prompt it should return the username that started the command prompt.

New in version 2015.5.6.

Parameters sam (bool, optional) – False returns just the username without any domain notation. True returns the domain with the username in the SAM format. Ie: domain\username

Returns Returns username
Return type str

CLI Example:
```
salt '*' user.current
```

salt.modules.win_useradd.delete(name, purge=False, force=False)

Remove a user from the minion

Parameters
• **name** (`str`) – The name of the user to delete
• **purge** (`bool`, optional) – Boolean value indicating that the user profile should also be removed when the user account is deleted. If set to True the profile will be removed. Default is False.
• **force** (`bool`, optional) – Boolean value indicating that the user account should be deleted even if the user is logged in. True will log the user out and delete user.

**Returns**
- True if successful, otherwise False

**Return type**
- `bool`

**CLI Example:**
```
salt '*' user.delete name
```

salt.modules.win_useradd.getUserSid(username)
Get the Security ID for the user

**Parameters**
- **username** (`str`) – The user name for which to look up the SID

**Returns**
- The user SID

**Return type**
- `str`

**CLI Example:**
```
salt '*' user.getUserSid jsnuffy
```

salt.modules.win_useradd.getent(refresh=False)
Return the list of all info for all users

**Parameters**
- **refresh** (`bool`, optional) – Refresh the cached user information. Useful when used from within a state function. Default is False.

**Returns**
- A dictionary containing information about all users on the system

**Return type**
- `dict`

**CLI Example:**
```
salt '*' user.getent
```

salt.modules.win_useradd.info(name)
Return user information

**Parameters**
- **name** (`str`) – Username for which to display information

**Returns**
- A dictionary containing user information
  - **fullname**
  - **username**
  - **SID**
  - **passwd** (will always return None)
  - **comment** (same as description, left here for backwards compatibility)
  - **description**
  - **active**
  - **logonscript**
  - **profile**
  - **home**
  - **homedrive**
  - **groups**
  - **password_changed**
  - **successful_logon_attempts**
  - **failed_logon_attempts**
  - **last_logon**
  - **account_disabled**
  - **account_locked**
  - **password_never_expires**
• disallow_change_password
• gid

Return type dict

CLI Example:
salt '*' user.info jsnuffy

salt.modules.win_useradd.list_groups(name)

Return a list of groups the named user belongs to

Parameters name (str) – The user name for which to list groups

Returns A list of groups to which the user belongs

Return type list

CLI Example:
salt '*' user.list_groups foo

salt.modules.win_useradd.list_users()

Return a list of all users on Windows

Returns A list of all users on the system

Return type list

CLI Example:
salt '*' user.list_users

salt.modules.win_useradd.removegroup(name, group)

Remove user from a group

Parameters
  • name (str) – The user name to remove from the group
  • group (str) – The name of the group from which to remove the user

Returns True if successful, otherwise False

Return type bool

CLI Example:
salt '*' user.removegroup jsnuffy 'Power Users'

salt.modules.win_useradd.rename(name, new_name)

Change the username for a named user

Parameters
  • name (str) – The user name to change
  • new_name (str) – The new name for the current user

Returns True if successful, otherwise False

Return type bool

CLI Example:
salt '*' user.rename jsnuffy jshmoe

salt.modules.win_useradd.setpassword(name, password)

Set the user’s password

Parameters
  • name (str) – The user name for which to set the password
  • password (str) – The new password

Returns True if successful, otherwise False

Return type bool

CLI Example:
salt '*/' user.setpassword jsnuffy sup3rs3cr3t

salt.modules.win_useradd.update(name, password=None, fullname=None, description=None, home=None, homedrive=None, logonscript=None, profile=None, expiration_date=None, expired=None, account_disabled=None, unlock_account=None, password_never_expires=None, disallow_change_password=None)

Updates settings for the windows user. Name is the only required parameter. Settings will only be changed if the parameter is passed a value.

New in version 2015.8.0.

Parameters

- name (str) – The user name to update.
- password (str, optional) – New user password in plain text.
- fullname (str, optional) – The user’s full name.
- description (str, optional) – A brief description of the user account.
- home (str, optional) – The path to the user’s home directory.
- homedrive (str, optional) – The drive letter to assign to the home directory. Must be the Drive Letter followed by a colon. ie: U:
- logonscript (str, optional) – The path to the logon script.
- profile (str, optional) – The path to the user’s profile directory.
- expiration_date (date, optional) – The date and time when the account expires. Can be a valid date/time string. To set to never expire pass the string 'Never'.
- expired (bool, optional) – Pass True to expire the account. The user will be prompted to change their password at the next logon. Pass False to mark the account as ‘not expired’. You can’t use this to negate the expiration if the expiration was caused by the account expiring. You’ll have to change the expiration_date as well.
- account_disabled (bool, optional) – True disables the account. False enables the account.
- unlock_account (bool, optional) – True unlocks a locked user account. False is ignored.
- password_never_expires (bool, optional) – True sets the password to never expire. False allows the password to expire.
- disallow_change_password (bool, optional) – True blocks the user from changing the password. False allows the user to change the password.

Returns True if successful. False is unsuccessful.

Return type bool

CLI Example:

salt '*/' user.update bob password=secret profile=C:\Users\Bob
home=\server\homesharebob homedrive=U:

21.9.483 salt.modules.win_wua

Module for managing Windows Updates using the Windows Update Agent.

List updates on the system using the following functions:

- win_wua.available
- win_wua.list

This is an easy way to find additional information about updates available to the system, such as the GUID, KB number, or description.
Once you have the GUID or a KB number for the update you can get information about the update, download, install, or uninstall it using these functions:

- `win_wua.get`
- `win_wua.download`
- `win_wua.install`
- `win_wua.uninstall`

The get function expects a name in the form of a GUID, KB, or Title and should return information about a single update. The other functions accept either a single item or a list of items for downloading/installing/uninstalling a specific list of items.

The `win_wua.list` and `win_wua.get` functions are utility functions. In addition to returning information about updates they can also download and install updates by setting `download=True` or `install=True`. So, with `py:func:win_wua.list <salt.modules.win_wua.list_>` for example, you could run the function with the filters you want to see what is available. Then just add `install=True` to install everything on that list.

If you want to download, install, or uninstall specific updates, use `win_wua.download`, `win_wua.install`, or `win_wua.uninstall`. To update your system with the latest updates use `win_wua.list` and set `install=True`.

You can also adjust the Windows Update settings using the `win_wua.set_wu_settings` function. This function is only supported on the following operating systems:

- Windows Vista / Server 2008
- Windows 7 / Server 2008R2
- Windows 8 / Server 2012
- Windows 8.1 / Server 2012R2

As of Windows 10 and Windows Server 2016, the ability to modify the Windows Update settings has been restricted. The settings can be modified in the Local Group Policy using the `lgpo` module.

New in version 2015.8.0.

```python
depends salt.utils.win_update
```

```python
salt.modules.win_wua.available(software=True, drivers=True, summary=False, skip_installed=True, skip_hidden=True, skip_mandatory=False, skip_reboot=False, categories=None, severities=None)
```

New in version 2017.7.0.

List updates that match the passed criteria. This allows for more filter options than `list()`. Good for finding a specific GUID or KB.

Parameters

- `software (bool)` – Include software updates in the results (default is True)
- `drivers (bool)` – Include driver updates in the results (default is True)
- `summary (bool)` –
  - True: Return a summary of updates available for each category.
  - False (default): Return a detailed list of available updates.
- `skip_installed (bool)` – Skip updates that are already installed. Default is False.
- `skip_hidden (bool)` – Skip updates that have been hidden. Default is True.
- `skip_mandatory (bool)` – Skip mandatory updates. Default is False.
- `skip_reboot (bool)` – Skip updates that require a reboot. Default is False.
- `categories (list)` – Specify the categories to list. Must be passed as a list. All categories returned by default.

Categories include the following:
- Critical Updates
- Definition Updates
- Drivers (make sure you set drivers=True)
- Feature Packs
- Security Updates
- Update Rollups
- Updates
- Update Rollups
- Windows 7
- Windows 8.1
- Windows 8.1 drivers
- Windows 8.1 and later drivers
- Windows Defender

- **severities** *(list)* – Specify the severities to include. Must be passed as a list.

  All severities returned by default.

  Severities include the following:
  - Critical
  - Important

**Returns**

Returns a dict containing either a summary or a list of updates:

```
List of Updates:
{'<GUID>': {'Title': <title>,
'KB': <KB>,
'GUID': <the globally unique identifier for the update>
'Description': <description>,
'Downloaded': <has the update been downloaded>,
'Installed': <has the update been installed>,
'Mandatory': <is the update mandatory>,
'UserInput': <is user input required>,
'EULAAccepted': <has the EULA been accepted>,
'Severity': <update severity>,
'NeedsReboot': <is the update installed and awaiting reboot>,
'RebootBehavior': <will the update require a reboot>,
'Categories': [ '<category 1>',
 '<category 2>',
 ...]
}

Summary of Updates:
{'Total': <total number of updates returned>,
'Available': <updates that are not downloaded or installed>,
'Downloaded': <updates that are downloaded but not installed>,
'Installed': <updates installed (usually 0 unless installed=True)>,
'Categories': { '<category 1>': <total for that category>,
 '<category 2>': <total for category 2>,
 ... }
```

Return type  *dict*

CLI Examples:

```
# Normal Usage (list all software updates)
salt '*' win_wua.available
```

(continues on next page)
# List all updates with categories of Critical Updates and Drivers
salt '*' win_wua.available categories=['Critical Updates','Drivers']

# List all Critical Security Updates
salt '*' win_wua.available categories=['Security Updates'] severities=['Critical']

# List all updates with a severity of Critical
salt '*' win_wua.available severities=['Critical']

# A summary of all available updates
salt '*' win_wua.available summary=True

# A summary of all Feature Packs and Windows 8.1 Updates
salt '*' win_wua.available categories=['Feature Packs','Windows 8.1'] summary=True

salt.modules.win_wua.download(names)
New in version 2017.7.0.
Downloads updates that match the list of passed identifiers. It’s easier to use this function by using list_updates and setting install=True.

Parameters
names (str, list) – A single update or a list of updates to download. This can be any combination of GUIDs, KB numbers, or names. GUIDs or KBs are preferred.

Note: An error will be raised if there are more results than there are items in the names parameter

Returns A dictionary containing the details about the downloaded updates
Return type dict

CLI Examples:

```bash
# Normal Usage
salt '*' win_wua.download names=['12345678-abcd-1234-abcd-1234567890ab','KB2131233']
```

salt.modules.win_wua.get(name, download=False, install=False)
New in version 2017.7.0.
Returns details for the named update

Parameters
- name (str) - The name of the update you’re searching for. This can be the GUID, a KB number, or any part of the name of the update. GUIDs and KBs are preferred. Run list to get the GUID for the update you’re looking for.
- download (bool) – Download the update returned by this function. Run this function first to see if the update exists, then set download=True to download the update.
- install (bool) – Install the update returned by this function. Run this function first to see if the update exists, then set install=True to install the update.

Returns
Returns a dict containing a list of updates that match the name if download and install are both set to False. Should usually be a single update, but can return multiple if a partial name is given.

If download or install is set to true it will return the results of the operation.
Salt Documentation, Release 2019.2.0

List of Updates:
{'<GUID>': {'Title': '<title>', 'KB': '<KB>', 'GUID': '<the globally unique identifier for the update>', 'Description': '<description>', 'Downloaded': '<has the update been downloaded>', 'Installed': '<has the update been installed>', 'Mandatory': '<is the update mandatory>', 'UserInput': '<is user input required>', 'EULAAccepted': '<has the EULA been accepted>', 'Severity': '<update severity>', 'NeedsReboot': '<is the update installed and awaiting reboot>', 'RebootBehavior': '<will the update require a reboot>', 'Categories': ['<category 1>', '<category 2>', ...]}}

Return type: dict

CLI Examples:
```
# Recommended Usage using GUID without braces
# Use this to find the status of a specific update
salt '*' win_wua.get '12345678-abcd-1234-abcd-1234567890ab'

# Use the following if you don't know the GUID:

# Using a KB number
# Not all updates have an associated KB
salt '*' win_wua.get KB3030298

# Using part or all of the name of the update
# Could possibly return multiple results
# Not all updates have an associated KB
salt '*' win_wua.get 'Microsoft Camera Codec Pack'
```

salt.modules.win_wua.get_needs_reboot()
Determines if the system needs to be rebooted.
Returns True if the system requires a reboot, otherwise False
Return type: bool

CLI Examples:
```
salt '*' win_wua.get_needs_reboot
```

salt.modules.win_wua.get_wu_settings()
Get current Windows Update settings.
Returns
A dictionary of Windows Update settings:
**Featured Updates**: Boolean value that indicates whether to display notifications for featured updates.

**Group Policy Required (Read-only)**: Boolean value that indicates whether Group Policy requires the Automatic Updates service.

**Microsoft Update**: Boolean value that indicates whether to turn on Microsoft Update for other Microsoft Products

21.9. execution modules

2777
Needs Reboot: Boolean value that indicates whether the machine is in a reboot pending state.

Non Admins Elevated: Boolean value that indicates whether non-administrators can perform some update-related actions without administrator approval.

Notification Level:
Number 1 to 4 indicating the update level:
1. Never check for updates
2. Check for updates but let me choose whether to download and install them
3. Download updates but let me choose whether to install them
4. Install updates automatically

Read Only (Read-only): Boolean value that indicates whether the Automatic Update settings are read-only.

Recommended Updates: Boolean value that indicates whether to include optional or recommended updates when a search for updates and installation of updates is performed.

Scheduled Day: Days of the week on which Automatic Updates installs or uninstalls updates.

Scheduled Time: Time at which Automatic Updates installs or uninstalls updates.

Return type: dict

CLI Examples:
salt '*' win_wua.get_wu_settings

salt.modules.win_wua.install(names)
New in version 2017.7.0.
Installs updates that match the list of identifiers. It may be easier to use the list_updates function and set install=True.

Parameters names (str, list) – A single update or a list of updates to install. This can be any combination of GUIDs, KB numbers, or names. GUIDs or KBs are preferred.

Note: An error will be raised if there are more results than there are items in the names parameter.

Returns A dictionary containing the details about the installed updates

Return type: dict

CLI Examples:

# Normal Usage
salt '*' win_wua.install KB12323211

salt.modules.win_wua.list(software=True, drivers=False, summary=False, skip_installed=True, categories=None, severities=None, download=False, install=False)

New in version 2017.7.0.
Returns a detailed list of available updates or a summary. If download or install is True the same list will be downloaded and/or installed.

Parameters
- software (bool) – Include software updates in the results (default is True)
- drivers (bool) – Include driver updates in the results (default is False)
- summary (bool) –
  - True: Return a summary of updates available for each category.
  - False (default): Return a detailed list of available updates.
- skip_installed (bool) – Skip installed updates in the results (default is False)
• **download**(bool) – (Overrides reporting functionality) Download the list of updates returned by this function. Run this function first with `download=False` to see what will be downloaded, then set `download=True` to download the updates.

• **install**(bool) – (Overides reporting functionality) Install the list of updates returned by this function. Run this function first with `install=False` to see what will be installed, then set `install=True` to install the updates.

• **categories**(list) – Specify the categories to list. Must be passed as a list. All categories returned by default.

Categories include the following:
- Critical Updates
- Definition Updates
- Drivers (make sure you set `drivers=True`)
- Feature Packs
- Security Updates
- Update Rollups
- Updates
- Update Rollups
- Windows 7
- Windows 8.1
- Windows 8.1 drivers
- Windows 8.1 and later drivers
- Windows Defender

• **severities**(list) – Specify the severities to include. Must be passed as a list. All severities returned by default.

Severities include the following:
- Critical
- Important

Returns

Returns a dict containing either a summary or a list of updates:

```python
List of Updates:
{
    '<GUID>': {'Title': <title>,
                'KB': <KB>,
                'GUID': <the globally unique identifier for the update>
                'Description': <description>,
                'Downloaded': <has the update been downloaded>,
                'Installed': <has the update been installed>,
                'Mandatory': <is the update mandatory>,
                'UserInput': <is user input required>,
                'EULAAccepted': <has the EULA been accepted>,
                'Severity': <update severity>,
                'NeedsReboot': <is the update installed and awaiting reboot>,
                'RebootBehavior': <will the update require a reboot>,
                'Categories': ['<category 1>',
                               '<category 2>',
                               ...]
    }
}

Summary of Updates:
{
    'Total': <total number of updates returned>,
    'Available': <updates that are not downloaded or installed>,
    'Downloaded': <updates that are downloaded but not installed>,
    ...
}
```

(continues on next page)
{'Installed': <updates installed (usually 0 unless installed=True)>, 'Categories': { <category 1>: <total for that category>, <category 2>: <total for category 2>, ... }}

**Return type** `dict`

**CLI Examples:**

```bash
# Normal Usage (list all software updates)
salt '*' win_wua.list

# List all updates with categories of Critical Updates and Drivers
salt '*' win_wua.list categories=['Critical Updates','Drivers']

# List all Critical Security Updates
salt '*' win_wua.list categories=['Security Updates'] severities=['Critical']

# List all updates with a severity of Critical
salt '*' win_wua.list severities=['Critical']

# A summary of all available updates
salt '*' win_wua.list summary=True

# A summary of all Feature Packs and Windows 8.1 Updates
salt '*' win_wua.list categories=['Feature Packs','Windows 8.1'] summary=True
```

```python
salt.modules.win_wua.set_wu_settings(level=None, recommended=None, featured=None, elevated=None, msupdate=None, day=None, time=None)
```

Change Windows Update settings. If no parameters are passed, the current value will be returned.

**Supported:**
- Windows Vista / Server 2008
- Windows 7 / Server 2008R2
- Windows 8 / Server 2012
- Windows 8.1 / Server 2012R2

**Parameters**
- **level** *(int)* – Number from 1 to 4 indicating the update level:
  1. Never check for updates
  2. Check for updates but let me choose whether to download and install them
  3. Download updates but let me choose whether to install them
  4. Install updates automatically
- **recommended** *(bool)* – Boolean value that indicates whether to include optional or recommended updates when a search for updates and installation of updates is performed.
- **featured** *(bool)* – Boolean value that indicates whether to display notifications for featured updates.
- **elevated** *(bool)* – Boolean value that indicates whether non-administrators can perform some update-related actions without administrator approval.
- **msupdate** *(bool)* – Boolean value that indicates whether to turn on Microsoft Update for other Microsoft products
- **day** *(str)* – Days of the week on which Automatic Updates installs or uninstalls updates. Accepted values:
  - Everyday
  - Monday
  - Tuesday
• time (str) – Time at which Automatic Updates installs or uninstalls updates. Must be in the ##:##24hr format, eg. 3:00 PM would be 15:00. Must be in 1 hour increments.

Returns Returns a dictionary containing the results.
Return type dict

CLI Examples:
```
salt '* win_wua.set_wu_settings level=4 recommended=True featured=False
```

salt.modules.win_wua.uninstall(names)

New in version 2017.7.0.

Uninstall updates.

Parameters names (str, list) – A single update or a list of updates to uninstall. This can be any combination of GUIDs, KB numbers, or names. GUIDs or KBs are preferred.

Returns A dictionary containing the details about the uninstalled updates
Return type dict

CLI Examples:
```
# Normal Usage
salt '* win_wua.uninstall KB3121212

# As a list
salt '* win_wua.uninstall guid=['12345678-abcd-1234-abcd-1234567890ab', "KB1231231"]
```

21.9.484 salt.modules.x509

Manage X509 certificates

New in version 2015.8.0.

depends M2Crypto

salt.modules.x509.create_certificate(path=None, text=False, overwrite=True, ca_server=None, **kwargs)

Create an X509 certificate.

Parameters:
path: Path to write the certificate to.
text: If True, return the PEM text without writing to a file. Default False.
overwrite: If True(default), create_certificate will overwrite the entire pem file. Set False to preserve existing private keys and dh params that may exist in the pem file.
kwargs: Any of the properties below can be included as additional keyword arguments.
ca_server: Request a remotely signed certificate from ca_server. For this to work, a signing_policy must be specified, and that same policy must be configured on the ca_server. See signing_policy for details. Also the salt master must permit peers to call the sign_remote_certificate function.

Example:
```
/etc/salt/master.d/peer.conf
```

peer:
  .*:
    - x509.sign_remote_certificate
**subject properties**: Any of the values below can be included to set subject properties. Any other subject properties supported by OpenSSL should also work.

- **C**: 2 letter Country code
- **CN**: Certificate common name, typically the FQDN.
- **Email**: Email address
- **GN**: Given Name
- **L**: Locality
- **O**: Organization
- **OU**: Organization Unit
- **SN**: Surname
- **ST**: State or Province

**signing_private_key**: A path or string of the private key in PEM format that will be used to sign this certificate. If neither `signing_cert`, `public_key`, or `csr` are included, it will be assumed that this is a self-signed certificate, and the public key matching `signing_private_key` will be used to create the certificate.

**signing_private_key_passphrase**: Passphrase used to decrypt the `signing_private_key`.

**signing_cert**: A certificate matching the private key that will be used to sign this certificate. This is used to populate the issuer values in the resulting certificate. Do not include this value for self-signed certificates.

**public_key**: The public key to be included in this certificate. This can be sourced from a public key, certificate, `csr`, or private key. If a private key is used, the matching public key from the private key will be generated before any processing is done. This means you can request a certificate from a remote CA using a private key file as your `public_key` and only the public key will be sent across the network to the CA. If neither `public_key` or `csr` are specified, it will be assumed that this is a self-signed certificate, and the public key derived from `signing_private_key` will be used. Specify either `public_key` or `csr`, not both. Because you can input a CSR as a public key or as a CSR, it is important to understand the difference. If you import a CSR as a public key, only the public key will be added to the certificate, subject or extension information in the CSR will be lost.

**public_key_passphrase**: If the public key is supplied as a private key, this is the passphrase used to decrypt it.

**csr**: A file or PEM string containing a certificate signing request. This will be used to supply the subject, extensions, and public key of a certificate. Any subject or extensions specified explicitly will overwrite any in the CSR.

**basicConstraints**: X509v3 Basic Constraints extension.

**extensions**: The following arguments set X509v3 Extension values. If the value starts with `critical`, the extension will be marked as critical.

Some special extensions are `subjectKeyIdentifier` and `authorityKeyIdentifier`.

- **subjectKeyIdentifier** can be an explicit value or it can be the special string `hash`. `hash` will set the subjectKeyIdentifier equal to the SHA1 hash of the modulus of the public key in this certificate. Note that this is not the exact same hashing method used by OpenSSL when using the hash value.

- **authorityKeyIdentifier** Use values acceptable to the openssl CLI tools. This will automatically populate `authorityKeyIdentifier` with the `subjectKeyIdentifier` of `signing_cert`. If this is a self-signed cert these values will be the same.

**basicConstraints**: X509v3 Basic Constraints

**keyUsage**: X509v3 Key Usage

**extendedKeyUsage**: X509v3 Extended Key Usage

**subjectKeyIdentifier**: X509v3 Subject Key Identifier

**issuerAltName**: X509v3 Issuer Alternative Name

**subjectAltName**: X509v3 Subject Alternative Name

**crlDistributionPoints**: X509v3 CRL distribution points

**issuingDistributionPoint**: X509v3 Issuing Distribution Point

**certificatePolicies**: X509v3 Certificate Policies
**policyConstraints**: X509v3 Policy Constraints

**inhibitAnyPolicy**: X509v3 Inhibit Any Policy

**nameConstraints**: X509v3 Name Constraints

**noCheck**: X509v3 OCSP No Check

**nsComment**: Netscape Comment

**nsCertType**: Netscape Certificate Type

**days_valid**: The number of days this certificate should be valid. This sets the notAfter property of the certificate. Defaults to 365.

**version**: The version of the X509 certificate. Defaults to 3. This is automatically converted to the version value, so version=3 sets the certificate version field to 0x2.

**serial_number**: The serial number to assign to this certificate. If omitted a random serial number of size serial_bits is generated.

**serial_bits**: The number of bits to use when randomly generating a serial number. Defaults to 64.

**algorithm**: The hashing algorithm to be used for signing this certificate. Defaults to sha256.

**copypath**: An additional path to copy the resulting certificate to. Can be used to maintain a copy of all certificates issued for revocation purposes.

**prepend_cn**: If set to True, the CN and a dash will be prepended to the copypath’s filename.

Example: /etc/pki/issued_certs/www.example.com-DE:CA:FB:AD:00:00:00:00.crt

**signing_policy**: A signing policy that should be used to create this certificate. Signing policies should be defined in the minion configuration, or in a minion pillar. It should be a yaml formatted list of arguments which will override any arguments passed to this function. If the minions key is included in the signing policy, only minions matching that pattern (see match.glob and match.compound) will be permitted to remotely request certificates from that policy.

Example:

```yaml
x509_signing_policies:
  www:
    - minions: 'www*'
    - signing_private_key: /etc/pki/ca.key
    - signing_cert: /etc/pki/ca.crt
    - C: US
    - ST: Utah
    - L: Salt Lake City
    - basicConstraints: "critical CA:false"
    - keyUsage: "critical cRLSign, keyCertSign"
    - subjectKeyIdentifier: hash
    - authorityKeyIdentifier: keyid,issuer:always
    - days_valid: 90
    - copypath: /etc/pki/issued_certs/
```

The above signing policy can be invoked with signing_policy=www

CLI Example:

```bash
salt '*' x509.create_certificate path=/etc/pki/myca.crt signing_private_key='/etc/pki/myca.key' csr='/etc/pki/myca.csr'}
```

salt.modules.x509.create_crl(path=None, text=False, signing_private_key=None, signing_private_key_passphrase=None, signing_cert=None, revoked=None, include_expired=False, days_valid=100, digest="")

Create a CRL

Depends

- PyOpenSSL Python module

**path**: Path to write the crl to.

**text**: If True, return the PEM text without writing to a file. Default False.
signing_private_key: A path or string of the private key in PEM format that will be used to sign this crl. This is required.
signing_private_key_passphrase: Passphrase to decrypt the private key.
signing_cert: A certificate matching the private key that will be used to sign this crl. This is required.
revoked: A list of dicts containing all the certificates to revoke. Each dict represents one certificate. A dict must contain either the key serial_number with the value of the serial number to revoke, or certificate with either the PEM encoded text of the certificate, or a path to the certificate to revoke.
    The dict can optionally contain the revocation_date key. If this key is omitted the revocation date will be set to now. If should be a string in the format "%Y-%m-%d %H:%M:%S".
    The dict can also optionally contain the not_after key. This is redundant if the certificate key is included. If the Certificate key is not included, this can be used for the logic behind the include_expired parameter. If should be a string in the format "%Y-%m-%d %H:%M:%S".
    The dict can also optionally contain the reason key. This is the reason code for the revocation. Available choices are unspecified, keyCompromise, CACompromise, affiliationChanged, superseded, cessationOfOperation and certificateHold.
include_expired: Include expired certificates in the CRL. Default is False.
days_valid: The number of days that the CRL should be valid. This sets the Next Update field in the CRL.
digest: The digest to use for signing the CRL. This has no effect on versions of pyOpenSSL less than 0.14

CLI Example:

```bash
salt '*' x509.create_crl path=/etc/pki/mykey.key signing_private_key=/etc/pki/ca.key signing_cert=/etc/pki/ca.crt revoked="{'compromized-web-key': {'certificate': '/etc/pki/certs/www1.crt', 'revocation_date': '2015-03-01 00:00:00'}}"
```

salt.modules.x509.create_csr(path=None, text=False, **kwargs)
Create a certificate signing request.
    path: Path to write the certificate to.
    text: If True, return the PEM text without writing to a file. Default False.
    algorithm: The hashing algorithm to be used for signing this request. Defaults to sha256.
    kwargs: The subject, extension and version arguments from x509.create_certificate can be used.

CLI Example:

```bash
salt '*' x509.create_csr path=/etc/pki/myca.csr public_key='/etc/pki/myca.key' CN='My Cert'
```

salt.modules.x509.create_private_key(path=None, text=False, bits=2048, passphrase=None, cipher='aes_128_cbc', verbose=True)
Creates a private key in PEM format.
    path: The path to write the file to, either path or text are required.
    text: If True, return the PEM text without writing to a file. Default False.
    bits: Length of the private key in bits. Default 2048
    passphrase: Passphrase for encryption of the private key
    cipher: Cipher for encrypting the private key. Has no effect if passphrase is None.
    verbose: Provide visual feedback on stdout. Default True

    New in version 2016.11.0.

CLI Example:

```bash
salt '*' x509.create_private_key path=/etc/pki/mykey.key
```

salt.modules.x509.expired(certificate)
Returns a dict containing limited details of a certificate and whether the certificate has expired.

    New in version 2016.11.0.
**Certificate**
- **Certificate**: The certificate to be read. Can be a path to a certificate file, or a string containing the PEM formatted text of the certificate.
- **CLI Example**:
  ```
salt '*' x509.expires */etc/pki/mycert.crt
  ```

**Salt.modules.x509: get_pem_entries**
- **Function**: Returns a dict containing PEM entries in files matching a glob.
- **Glob Path**: A path to certificates to be read and returned.
- **CLI Example**:
  ```
salt '*' x509.get_pem_entries */etc/pki/*.crt
  ```

**Salt.modules.x509: get_pem_entry**
- **Function**: Returns a properly formatted PEM string from the input text fixing any whitespace or line-break issues.
- **Text**: Text containing the X509 PEM entry to be returned or path to a file containing the text.
- **Pem Type**: If specified, this function will only return a pem of a certain type, for example 'CERTIFICATE' or 'CERTIFICATE REQUEST'.
- **CLI Example**:
  ```
salt '*' x509.get_pem_entry "-----BEGIN CERTIFICATE REQUEST-----MIICyzCC Ar8CAQI...
  ```

**Salt.modules.x509: get_private_key_size**
- **Function**: Returns the bit length of a private key in PEM format.
- **Private Key**: A path or PEM encoded string containing a private key.
- **CLI Example**:
  ```
salt '*' x509.get_private_key_size /etc/pki/mycert.key
  ```

**Salt.modules.x509: get_public_key**
- **Function**: Returns a string containing the public key in PEM format.
- **Key**: A path or PEM encoded string containing a CSR, Certificate or Private Key from which a public key can be retrieved.
- **CLI Example**:
  ```
salt '*' x509.get_public_key /etc/pki/mycert.cer
  ```

**Salt.modules.x509: get_signing_policy**
- **Function**: Returns the details of a names signing policy, including the text of the public key that will be used to sign it. Does not return the private key.
- **Singing Policy Name**: **CLI Example**:
  ```
salt '*' x509.get_signing_policy www
  ```

**Salt.modules.x509: read_certificate**
- **Function**: Returns a dict containing details of a certificate. Input can be a PEM string or file path.
- **Certificate**: The certificate to be read. Can be a path to a certificate file, or a string containing the PEM formatted text of the certificate.
- **CLI Example**:
  ```
salt '*' x509.read_certificate /etc/pki/mycert.crt
  ```

**Salt.modules.x509: read_certificates**
- **Function**: Returns a dict containing details of all certificates matching a glob.
- **Glob Path**: A path to certificates to be read and returned.
Salt Documentation, Release 2019.2.0

CLI Example:

```
salt '*' x509.read_certificates "/etc/pki/*.*crt"
```

salt.modules.x509.read_crl(crl)

Returns a dict containing details of a certificate revocation list. Input can be a PEM string or file path.

- **Depends**
  - OpenSSL command line tool

csl: A path or PEM encoded string containing the CSL to read.

CLI Example:

```
salt '*' x509.read_crl /etc/pki/mycrl.crl
```

salt.modules.x509.read_csr(csr)

Returns a dict containing details of a certificate request.

- **Depends**
  - OpenSSL command line tool

csr: A path or PEM encoded string containing the CSR to read.

CLI Example:

```
salt '*' x509.read_csr /etc/pki/mycert.csr
```

salt.modules.x509.sign_remote_certificate(argdic, **kwargs)

Request a certificate to be remotely signed according to a signing policy.

argdic: A dict containing all the arguments to be passed into the create_certificate function. This will become kwargs when passed to create_certificate.

kwargs: kwargs delivered from publish.publish

CLI Example:

```
salt '*' x509.sign_remote_certificate argdic="{'public_key': '/etc/pki/www.key',
\'signing_policy': 'www'}" __pub_id='www1'
```

salt.modules.x509.verify_crl(crl, cert)

Validate a CRL against a certificate. Parses openssl command line output, this is a workaround for M2Crypto's inability to get them from CSR objects.

crl: The CRL to verify
cert: The certificate to verify the CRL against

CLI Example:

```
salt '*' x509.verify_crl crl=/etc/pki/myca.crl cert=/etc/pki/myca.crt
```

salt.modules.x509.verify_private_key(private_key, public_key, passphrase=None)

Verify that 'private_key' matches 'public_key'

private_key: The private key to verify, can be a string or path to a private key in PEM format.
public_key: The public key to verify, can be a string or path to a PEM formatted certificate, csr, or another private key.

passphrase: Passphrase to decrypt the private key.

CLI Example:

```
salt '*' x509.verify_private_key private_key=/etc/pki/myca.key \
    public_key=/etc/pki/myca.crt
```
salt.modules.x509.verify_signature(certificate, signing_pub_key=None, signing_pub_key_passphrase=None)

Verify that certificate has been signed by signing_pub_key

certificate: The certificate to verify. Can be a path or string containing a PEM formatted certificate.
signing_pub_key: The public key to verify, can be a string or path to a PEM formatted certificate, csr, or private key.
signing_pub_key_passphrase: Passphrase to the signing_pub_key if it is an encrypted private key.

CLI Example:
```
salt '*' x509.verify_signature /etc/pki/mycert.pem 
  signing_pub_key=/etc/pki/myca.crt
```

salt.modules.x509.will_expire(certificate, days)

Returns a dict containing details of a certificate and whether the certificate will expire in the specified number of days. Input can be a PEM string or file path.

New in version 2016.11.0.

certificate: The certificate to be read. Can be a path to a certificate file, or a string containing the PEM formatted text of the certificate.

CLI Example:
```
salt '*' x509.will_expire "/etc/pki/mycert.crt" days=30
```

salt.modules.x509.write_pem(text, path, overwrite=True, pem_type=None)

Writes out a PEM string fixing any formatting or whitespace issues before writing.

text: PEM string input to be written out.
path: Path of the file to write the pem out to.
overwrite: If True(default), write_pem will overwrite the entire pem file. Set False to preserve existing private keys and dh params that may exist in the pem file.
pem_type: The PEM type to be saved, for example CERTIFICATE or PUBLIC_KEY. Adding this will allow the function to take input that may contain multiple pem types.

CLI Example:
```
salt '*' x509.write_pem "-----BEGIN CERTIFICATE-----MIIGMzCCBBugA..." path=/etc/pki/mycert.crt
```

21.9.485 salt.modules.xapi_virt

This module (mostly) uses the XenAPI to manage Xen virtual machines.

Big fat warning: the XenAPI used in this file is the one bundled with Xen Source, NOT XenServer nor Xen Cloud Platform. As a matter of fact it will fail under those platforms. From what I've read, little work is needed to adapt this code to XS/XCP, mostly playing with XenAPI version, but as XCP is not taking precedence on Xen Source on many platforms, please keep compatibility in mind.

Useful documentation:

salt.modules.xapi_virt.freecpu()

Return an int representing the number of unallocated cpus on this hypervisor

CLI Example:
salt '*' virt.freecpu

salt.modules.xapi_virt.freemem()
Return an int representing the amount of memory that has not been given to virtual machines on this node
CLI Example:
salt '*' virt.freemem

salt.modules.xapi_virt.full_info()
Return the node_info, vm_info and freemem
CLI Example:
salt '*' virt.full_info

salt.modules.xapi_virt.get_disks(vm_)
Return the disks of a named vm
CLI Example:
salt '*' virt.get_disks <vm name>

salt.modules.xapi_virt.get_macs(vm_)
Return a list off MAC addresses from the named vm
CLI Example:
salt '*' virt.get_macs <vm name>

salt.modules.xapi_virt.get_nics(vm_)
Return info about the network interfaces of a named vm
CLI Example:
salt '*' virt.get_nics <vm name>

salt.modules.xapi_virt.is_hyper()
Returns a bool whether or not this node is a hypervisor of any kind
CLI Example:
salt '*' virt.is_hyper

salt.modules.xapi_virt.list_domains()
Return a list of virtual machine names on the minion
CLI Example:
salt '*' virt.list_domains

salt.modules.xapi_virt.migrate(vm_, target, live=1, port=0, node=-1, ssl=None, change_home_server=0)
Migrates the virtual machine to another hypervisor
CLI Example:
salt '*' virt.migrate <vm name> <target hypervisor> [live] [port] [node] [ssl] [change_home_server]
Optional values:
- **live**: Use live migration  
- **port**: Use a specified port  
- **node**: Use specified NUMA node on target  
- **ssl**: Use ssl connection for migration  
- **change_home_server**: Change home server for managed domains

salt.modules.xapi_virt.node_info()

Return a dict with information about this node

CLI Example:
```
salt '*'.virt.node_info
```

salt.modules.xapi_virt.pause(vm_)

Pause the named vm

CLI Example:
```
salt '*'.virt.pause <vm name>
```

salt.modules.xapi_virt.reboot(vm_)

Reboot a domain via ACPI request

CLI Example:
```
salt '*'.virt.reboot <vm name>
```

salt.modules.xapi_virt.reset(vm_)

Reset a VM by emulating the reset button on a physical machine

CLI Example:
```
salt '*'.virt.reset <vm name>
```

salt.modules.xapi_virt.resume(vm_)

Resume the named vm

CLI Example:
```
salt '*'.virt.resume <vm name>
```

salt.modules.xapi_virt.setmem(vm_, memory)

Changes the amount of memory allocated to VM.
Memory is to be specified in MB

CLI Example:
```
salt '*'.virt.setmem myvm 768
```

salt.modules.xapi_virt.setvcpus(vm_, vcpus)

Changes the amount of vcpus allocated to VM.

vcpus is an int representing the number to be assigned

CLI Example:
```
salt '*'.virt.setvcpus myvm 2
```

21.9. execution modules
salt.modules.xapi_virt.shutdown(<vm_>)
Send a soft shutdown signal to the named vm

CLI Example:
```
salt '*' virt.shutdown <vm name>
```

salt.modules.xapi_virt.start(<config_>)
Start a defined domain

CLI Example:
```
salt '*' virt.start <path to Xen cfg file>
```

salt.modules.xapi_virt.stop(<vm_>)
Hard power down the virtual machine, this is equivalent to pulling the power

CLI Example:
```
salt '*' virt.stop <vm name>
```

salt.modules.xapi_virt.vcpu_pin(<vm_>, <vcpu>, <cpus>)
Set which CPUs a VCPU can use.

CLI Example:
```
salt 'foo' virt.vcpu_pin domU-id 2 1
salt 'foo' virt.vcpu_pin domU-id 2 2-6
```

salt.modules.xapi_virt.vm_cputime(<vm_=None>)
Return cputime used by the vms on this hyper in a list of dicts:
```
[
    'your-vm': {
        'cputime' <int>
        'cputime_percent' <int>
    },
    ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:
```
salt '*' virt.vm_cputime
```

salt.modules.xapi_virt.vm_diskstats(<vm_=None>)
Return disk usage counters used by the vms on this hyper in a list of dicts:
```
[
    'your-vm': {
        'io_read_kbs' : 0,
        'io_write_kbs' : 0
    },
    ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.
CLI Example:

```
salt '*' virt.vm_diskstats
```

salt.modules.xapi_virt.vm_info(vm_=None)
Return detailed information about the vms.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_info
```

salt.modules.xapi_virt.vm_netstats(vm_=None)
Return combined network counters used by the vms on this hyper in a list of dicts:

```
[
    'your-vm': {
        'io_read_kbs': 0,
        'io_total_read_kbs': 0,
        'io_total_write_kbs': 0,
        'io_write_kbs': 0
    },
    ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_netstats
```

salt.modules.xapi_virt.vm_state(vm_=None)
Return list of all the vms and their state.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_state <vm name>
```

### 21.9.486 salt.modules.xbpspkg module

Package support for XBPS package manager (used by VoidLinux)

New in version 2016.11.0.

salt.modules.xbpspkg.add_repo(repo, conffile='/usr/share/xbps.d/15-saltstack.conf')
Add an XBPS repository to the system.

repo url of repo to add (persistent).
conffile path to xbps conf file to add this repo default: /usr/share/xbps.d/15-saltstack.conf

CLI Examples:

```
salt '*' pkg.add_repo <repo url> [conffile=/path/to/xbps/repo.conf]
```
salt.modules.xbpspkg.available_version(*names, **kwargs)
Return the latest version of the named package available for upgrade or installation. If more than one package
name is specified, a dict of name/version pairs is returned.
If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:
```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.xbpspkg.del_repo(repo)
Remove an XBPS repository from the system.
```
repo url of repo to remove (persistent).
```

CLI Examples:
```
salt '*' pkg.del_repo <repo url>
```

salt.modules.xbpspkg.get_repo(repo, **kwargs)
Display information about the repo.
```
CLI Examples:
```
```
salt '*' pkg.get_repo 'repo-url'
```

salt.modules.xbpspkg.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs)
Install the passed package
```
name The name of the package to be installed.
refresh Whether or not to refresh the package database before installing.
fromrepo Specify a package repository (url) to install from.
```
```
Multiple Package Installation Options:
```
```
pkgs A list of packages to install from a software repository. Must be passed as a python list.
```
```
CLI Example:
```
```
salt '*' pkg.install pkgs='["foo","bar"]'
```
```
sources A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and
the values being the source URI or local path to the package.
```
```
CLI Example:
```
```
salt '*' pkg.install sources='{"foo": "salt://foo.deb"},{"bar": "salt://bar.deb"}]
```
```
Return a dict containing the new package names and versions:
```
```
{["<package>": {
  "old": '<old-version>',
  "new": '<new-version>'}}
```
```
CLI Example:
```
```
salt '*' pkg.install <package name>
```

salt.modules.xbpspkg.latest_version(*names, **kwargs)
Return the latest version of the named package available for upgrade or installation. If more than one package
name is specified, a dict of name/version pairs is returned.
If the latest version of a given package is already installed, an empty string will be returned for that package.
CLI Example:

```bash
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

**salt.modules.xbpspkg.list_pkgs**(versions_as_list=False, **kwargs)

List the packages currently installed as a dict:

```python
{'<package_name>': '<version>'}
```

CLI Example:

```bash
salt '*' pkg.list_pkgs
```

**salt.modules.xbpspkg.list_repos()**

List all repos known by XBPS

CLI Example:

```bash
salt '*' pkg.list_repos
```

**salt.modules.xbpspkg.list_upgrades**(refresh=True)

Check whether or not an upgrade is available for all packages

CLI Example:

```bash
salt '*' pkg.list_upgrades
```

**salt.modules.xbpspkg.refresh_db()**

Update list of available packages from installed repos

CLI Example:

```bash
salt '*' pkg.refresh_db
```

**salt.modules.xbpspkg.remove**(name=None, pkgs=None, recursive=True, **kwargs)

- **name** The name of the package to be deleted.
- **recursive** Also remove dependent packages (not required elsewhere). Default mode: enabled.
- Multiple Package Options:
  - **pkgs** A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a list containing the removed packages.

CLI Example:

```bash
salt '*' pkg.remove <package name> [recursive=False]
salt '*' pkg.remove <package1>,<package2>,<package3> [recursive=False]
salt '*' pkg.remove pkgs='["foo", "bar"]' [recursive=False]
```

**salt.modules.xbpspkg.upgrade**(refresh=True)

Run a full system upgrade

- **refresh** Whether or not to refresh the package database before installing. Default is True.

Returns a dictionary containing the changes:

```python
{'<package>': {'old': '<old-version>', 'new': '<new-version>'}}
```

CLI Example:
salt ' '*' pkg.upgrade

```
salt.modules.xbpspkg.upgrade_available(name)
    Check whether or not an upgrade is available for a given package

    CLI Example:
    salt ' '*' pkg.upgrade_available <package name>
```

```
salt.modules.xbpspkg.version(*names, **kwargs)
    Returns a string representing the package version or an empty string if not installed. If more than one package
    name is specified, a dict of name/version pairs is returned.

    CLI Example:
    salt ' '*' pkg.version <package name>
    salt ' '*' pkg.version <package1> <package2> <package3> ...
```

21.9.487  salt.modules.xfs

Module for managing XFS file systems.

```
salt.modules.xfs.defragment(device)
    Defragment mounted XFS filesystem. In order to mount a filesystem, device should be properly mounted and
    writable.

    CLI Example:
    salt ' '*' xfs.defragment /dev/sda1
```

```
salt.modules.xfs.devices()
    Get known XFS formatted devices on the system.

    CLI Example:
    salt ' '*' xfs.devices
```

```
salt.modules.xfs.dump(device, destination, level=0, label=None, noerase=None)
    Dump filesystem device to the media (file, tape etc).

    Required parameters:
    • device: XFS device, content of which to be dumped.
    • destination: Specifies a dump destination.

    Valid options are:
    • label: Label of the dump. Otherwise automatically generated label is used.
    • level: Specifies a dump level of 0 to 9.
    • noerase: Pre-erase media.

    Other options are not used in order to let xfsdump use its default values, as they are most optimal. See the
    xfsdump(8) manpage for a more complete description of these options.

    CLI Example:
    salt ' '*' xfs.dump /dev/sda1 /destination/on/the/client
    salt ' '*' xfs.dump /dev/sda1 /destination/on/the/client label='Company accountancy'
    salt ' '*' xfs.dump /dev/sda1 /destination/on/the/client noerase=True
```
salt.modules.xfs.estimate(path)

Estimate the space that an XFS filesystem will take. For each directory estimate the space that directory would take if it were copied to an XFS filesystem. Estimation does not cross mount points.

CLI Example:

```
salt '*' xfs.estimate /path/to/file
salt '*' xfs.estimate /path/to/dir/*
```

salt.modules.xfs.info(device)

Get filesystem geometry information.

CLI Example:

```
salt '*' xfs.info /dev/sda1
```

salt.modules.xfs.inventory()

Display XFS dump inventory without restoration.

CLI Example:

```
salt '*' xfs.inventory
```

salt.modules.xfs.mkfs(device, label=None, ssize=None, noforce=None, bso=None, gmo=None, ino=None, lso=None, rso=None, nmo=None, dso=None)

Create a file system on the specified device. By default wipes out with force.

General options:
- label: Specify volume label.
- ssize: Specify the fundamental sector size of the filesystem.
- noforce: Do not force create filesystem, if disk is already formatted.

Filesystem geometry options:
- bso: Block size options.
- gmo: Global metadata options.
- dso: Data section options. These options specify the location, size, and other parameters of the data section of the filesystem.
- ino: Inode options to specify the inode size of the filesystem, and other inode allocation parameters.
- lso: Log section options.
- nmo: Naming options.
- rso: Realtime section options.

See the mkfs.xfs(8) manpage for a more complete description of corresponding options description.

CLI Example:

```
salt '*' xfs.mkfs /dev/sdal
salt '*' xfs.mkfs /dev/sdal dso='su=32k,sw=6' noforce=True
salt '*' xfs.mkfs /dev/sdal dso='su=32k,sw=6' lso='logdev=/dev/sda2,size=10000b'
```

salt.modules.xfs.modify(device, label=None, lazy_counting=None, uuid=None)

Modify parameters of an XFS filesystem.

CLI Example:

```
salt '*' xfs.modify /dev/sdal label='My backup' lazy_counting=False
salt '*' xfs.modify /dev/sdal uuid=False
salt '*' xfs.modify /dev/sdal uuid=True
```

salt.modules.xfs.prune_dump(sessionid)

Prunes the dump session identified by the given session id.
CLI Example:

```
salt '*' xfs.prune_dump b74a3586-e52e-4a4a-8775-c3334fa8ea2c
```

21.9.488 salt.modules.xmpp

Module for Sending Messages via XMPP (a.k.a. Jabber)

New in version 2014.1.0.

**depends**

- sleekxmpp>=1.3.1
- pyasn1
- pyasn1-modules
- dnspython

**configuration**  This module can be used by either passing a jid and password directly to send_message, or by specifying the name of a configuration profile in the minion config, minion pillar, or master config.

For example:

```
my-xmpp-login:
  xmpp.jid: myuser@jabber.example.org/resourcename
  xmpp.password: verybadpass
```

The resourcename refers to the resource that is using this account. It is user-definable, and optional. The following configurations are both valid:

```
my-xmpp-login:
  xmpp.jid: myuser@jabber.example.org/salt
  xmpp.password: verybadpass

my-xmpp-login:
  xmpp.jid: myuser@jabber.example.org
  xmpp.password: verybadpass
```

class salt.modules.xmpp.SendMsgBot(jid, password, recipient, msg)

    classmethod create_multi(jid, password, msg, recipients=None, rooms=None, nick='SaltStack Bot')

    Alternate constructor that accept multiple recipients and rooms

    start(event)

class salt.modules.xmpp.SleekXMPPMUC(name=“”)

    filter(record)

    Determine if the specified record is to be logged.

    Is the specified record to be logged? Returns 0 for no, nonzero for yes. If deemed appropriate, the record may be modified in-place.

    salt.modules.xmpp.send_msg(recipient, message, jid=None, password=None, profile=None)

    Send a message to an XMPP recipient. Designed for use in states.
CLI Examples:

```bash
xmpp.send_msg 'admins@xmpp.example.com' 'This is a salt module test' profile='my-xmpp-account'
xmpp.send_msg 'admins@xmpp.example.com' 'This is a salt module test' jid='myuser@xmpp.example.com/salt' password='verybadpass'
```

salt.modules.xmpp.send_msg_multi(message, recipients=None, rooms=None, jid=None, password=None, nick='SaltStack Bot', profile=None)

Send a message to an XMPP recipient, support send message to multiple recipients or chat room.

CLI Examples:

```bash
xmpp.send_msg recipients=[admins@xmpp.example.com']                  rooms=[
    secret@conference.xmpp.example.com'] 'This is a salt module test'
    profile='my-xmpp-account'
xmpp.send_msg recipients=[admins@xmpp.example.com']                  rooms=[
    secret@conference.xmpp.example.com'] 'This is a salt module test'
    jid='myuser@xmpp.example.com/salt' password='verybadpass'
```

21.9.489 salt.modules.yumpkg

Support for YUM/DNF

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see here.

Note: DNF is fully supported as of version 2015.5.10 and 2015.8.4 (partial support for DNF was initially added in 2015.8.0), and DNF is used automatically in place of YUM in Fedora 22 and newer.

class salt.modules.yumpkg.AvailablePackages(*args, **kwargs)

salt.modules.yumpkg.clean_metadata(**kwargs)

New in version 2014.1.0.

Cleans local yum metadata. Functionally identical to refresh_db().

CLI Example:

```bash
salt '*' pkg.clean_metadata
```

salt.modules.yumpkg.del_repo(repo, basedir=None, **kwargs)

Delete a repo from <basedir> (default basedir: all dirs in reposdir yum option).

If the .repo file in which the repo exists does not contain any other repo configuration, the file itself will be deleted.

CLI Examples:

```bash
salt '*' pkg.del_repo myrepo
salt '*' pkg.del_repo myrepo basedir=/path/to/dir
salt '*' pkg.del_repo myrepo basedir=/path/to/dir,/path/to/another/dir
```
salt.modules.yumpkg.diff('paths')
Return a formatted diff between current files and original in a package. NOTE: this function includes all files (configuration and not), but does not work on binary content.

Parameters path – Full path to the installed file

Returns Difference string or raises and exception if examined file is binary.

CLI example:
```
salt '*' pkg.diff /etc/apache2/httpd.conf /etc/sudoers
```

salt.modules.yumpkg.download('packages')
New in version 2015.5.0.
Download packages to the local disk. Requires yumdownloader from yum-utils package.

Note: yum-utils will already be installed on the minion if the package was installed from the Fedora / EPEL repositories.

CLI example:
```
salt '*' pkg.download httpd
salt '*' pkg.download httpd postfix
```

salt.modules.yumpkg.file_dict('packages')
New in version 2014.1.0.
List the files that belong to a package, grouped by package. Not specifying any packages will return a list of every file on the system’s rpm database (not generally recommended).

CLI Examples:
```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

salt.modules.yumpkg.file_list('packages')
New in version 2014.1.0.
List the files that belong to a package. Not specifying any packages will return a list of every file on the system’s rpm database (not generally recommended).

CLI Examples:
```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

salt.modules.yumpkg.get_repo(name, basedir=None, **kwargs)
Display a repo from <basedir> (default basedir: all dirs in reposdir yum option).

CLI Examples:
```
salt '*' pkg.get_repo myrepo
salt '*' pkg.get_repo myrepo basedir=/path/to/dir
salt '*' pkg.get_repo myrepo basedir=/path/to/dir,/path/to/another/dir
```

salt.modules.yumpkg.group_diff(name)
New in version 2014.1.0.
Changed in version 2016.3.0,2015.8.4,2015.5.10: Environment groups are now supported. The key names have been renamed, similar to the changes made in `pkg.group_info`.

Lists which of a group’s packages are installed and which are not installed

**CLI Example:**

```
salt '*' pkg.group_diff 'Perl Support'
```

salt.modules.yumpkg.**group_info**(name, expand=False)

New in version 2014.1.0.

Changed in version 2016.3.0,2015.8.4,2015.5.10: The return data has changed. A new key `type` has been added to distinguish environment groups from package groups. Also, keys for the group name and group ID have been added. The mandatory packages, optional packages, and default packages keys have been renamed to mandatory, optional, and default for accuracy, as environment groups include other groups, and not packages. Finally, this function now properly identifies conditional packages.

Lists packages belonging to a certain group

**name** Name of the group to query

**expand** [False] If the specified group is an environment group, then the group will be expanded and the return data will include package names instead of group names.

New in version 2016.3.0.

**CLI Example:**

```
salt '*' pkg.group_info 'Perl Support'
```

salt.modules.yumpkg.**group_install**(name, skip=(), include=(), **kwargs)

New in version 2014.1.0.

Install the passed package group(s). This is basically a wrapper around `pkg.install`, which performs package group resolution for the user. This function is currently considered experimental, and should be expected to undergo changes.

**name** Package group to install. To install more than one group, either use a comma-separated list or pass the value as a python list.

**CLI Examples:**

```
salt '*' pkg.group_install 'Group 1'
salt '*' pkg.group_install 'Group 1,Group 2'
salt '*' pkg.group_install ['"Group 1", "Group 2"]'
```

**skip** Packages that would normally be installed by the package group ("default" packages), which should not be installed. Can be passed either as a comma-separated list or a python list.

**CLI Examples:**

```
salt '*' pkg.group_install 'My Group' skip='foo,bar'
salt '*' pkg.group_install 'My Group' skip=['"foo", "bar"]'
```

**include** Packages which are included in a group, which would not normally be installed by a `yum groupinstall` ("optional" packages). Note that this will not enforce group membership; if you include packages which are not members of the specified groups, they will still be installed. Can be passed either as a comma-separated list or a python list.

**CLI Examples:**

```
salt '*' pkg.group_install 'My Group' include='foo,bar'
salt '*' pkg.group_install 'My Group' include=['"foo", "bar"]'
```
Note: Because this is essentially a wrapper around pkg.install, any argument which can be passed to pkg.install may also be included here, and it will be passed along wholesale.

**salt.modules.yumpkg.group_list()**

New in version 2014.1.0.

Lists all groups known by yum on this system

CLI Example:
```
salt '*' pkg.group_list
```

**salt.modules.yumpkg.hold**(name=None, pkgs=None, sources=None, normalize=True, **kwargs)

New in version 2014.7.0.

Version-lock packages

Note: Requires the appropriate `versionlock` plugin package to be installed:

- On RHEL 5: yum-versionlock
- On RHEL 6 & 7: yum-plugin-versionlock
- On Fedora: python-dnf-plugins-extras-versionlock

**name** The name of the package to be held.

Multiple Package Options:

**pkgs** A list of packages to hold. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:
```
salt '*' pkg.hold <package name>
salt '*' pkg.hold pkgs='["foo", "bar"]'
```

**salt.modules.yumpkg.info_installed(**`names`, **kwargs)**

Return the information of the named package(s), installed on the system.

**Parameters**

`all_versions` – Include information for all versions of the packages installed on the minion.

CLI example:
```
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
salt '*' pkg.info_installed <package1> <package2> <package3> all_versions=True
```

**salt.modules.yumpkg.install**(name=None, refresh=False, skip_verify=False, pkgs=None, sources=None, downloadonly=False, reinstall=False, normalize=True, update_holds=False, saltenv='base', ignore_epoch=False, **kwargs)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon’s control group. This is done to keep systemd from killing any yum/dnf commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a config option called `systemd.scope`, with a value of False (no quotes).
Install the passed package(s), add refresh=True to clean the yum database before package is installed.

**name** The name of the package to be installed. Note that this parameter is ignored if either "pkgs" or "sources" is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the "sources" option.

32-bit packages can be installed on 64-bit systems by appending the architecture designation (.i686, .i586, etc.) to the end of the package name.

CLI Example:

```
salt '*' pkg.install <package name>
```

**refresh** Whether or not to update the yum database before executing.

**reinstall** Specifying reinstall=True will use yum reinstall rather than yum install for requested packages that are already installed.

If a version is specified with the requested package, then yum reinstall will only be used if the installed version matches the requested version.

Works with sources when the package header of the source can be matched to the name and version of an installed package.

New in version 2014.7.0.

**skip_verify** Skip the GPG verification check (e.g., --nogpgcheck)

**downloadonly** Only download the packages, do not install.

**version** Install a specific version of the package, e.g. 1.2.3-4.el5. Ignored if "pkgs" or "sources" is passed.

Changed in version 2018.3.0: version can now contain comparison operators (e.g. >1.2.3, <=2.0, etc.)

**update_holds** [False] If True, and this function would update the package version, any packages held using the yum/dnf "versionlock" plugin will be unheld so that they can be updated. Otherwise, if this function attempts to update a held package, the held package(s) will be skipped and an error will be raised.

New in version 2016.11.0.

**setopt** A comma-separated or Python list of key=value options. This list will be expanded and --setopt prepended to each in the yum/dnf command that is run.

CLI Example:

```
salt '*' pkg.install foo setopt='obsoletes=0,plugins=0'
```

New in version 2019.2.0.

Repository Options:

**fromrepo** Specify a package repository (or repositories) from which to install. (e.g., yum --disablerepo='*' --enablerepo='somerepo')

**enablerepo** (ignored if fromrepo is specified) Specify a disabled package repository (or repositories) to enable. (e.g., yum --enablerepo='somerepo')

**disablerepo** (ignored if fromrepo is specified) Specify an enabled package repository (or repositories) to disable. (e.g., yum --disablerepo='somerepo')

**disableexcludes** Disable exclude from main, for a repo or for everything. (e.g., yum --disableexcludes='main')

New in version 2014.7.0.

**ignore_epoch** [False] Only used when the version of a package is specified using a comparison operator (e.g. >4.1). If set to True, then the epoch will be ignored when comparing the currently-installed version to the desired version.

New in version 2018.3.0.

Multiple Package Installation Options:
pkgs A list of packages to install from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version.

CLI Examples:

```
salt '*' pkg.install pkgs='["foo", "bar"]'
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3-4.el5"}]'
```

sources A list of RPM packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources='[{"foo": "salt://foo.rpm"}, {"bar": "salt://bar.rpm"}]'
```

normalize [True] Normalize the package name by removing the architecture. This is useful for poorly created packages which might include the architecture as an actual part of the name such as kernel modules which match a specific kernel version.

```
salt -G role:nsd pkg.install gpfs.gplbin-2.6.32-279.31.1.el6.x86_64
  normalize=False
```

New in version 2014.7.0.

diff_attr: If a list of package attributes is specified, returned value will contain them, eg:

```
{"<package>": {
'old': {
'arch': '<old-arch>',
'version': '<old-version>',
},

'new': {
'arch': '<new-arch>',
'version': '<new-version>',
}}
```

Valid attributes are: epoch, version, release, arch, install_date, install_date_time_t.

If all is specified, all valid attributes will be returned.

New in version 2018.3.0.

Returns a dict containing the new package names and versions:

```
{"<package>": {
'old': '<old-version>',
'new': '<new-version>'
}}
```

If an attribute list in diff_attr is specified, the dict will also contain any specified attribute, eg:

```
{"<package>": {
'old': {
'arch': '<old-arch>',
'version': '<old-version>',
},

'new': {
'arch': '<new-arch>',
'version': '<new-version>',
}}
```

salt.modules.yumpkg.latest_version("names", **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.
If the latest version of a given package is already installed, an empty string will be returned for that package.

A specific repo can be requested using the fromrepo keyword argument, and the disableexcludes option is also supported.

New in version 2014.7.0: Support for the disableexcludes option

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> fromrepo=epel-testing
salt '*' pkg.latest_version <package name> disableexcludes=main
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

```
salt.modules.yumpkg.list_downloaded()
```

New in version 2017.7.0.

List prefetched packages downloaded by Yum in the local disk.

CLI example:

```
salt '*' pkg.list_downloaded
```

```
salt.modules.yumpkg.list_holds(pattern='[w+]?([-][^[-]+]*', full=True)
```

Changed in version 2016.3.0, 2015.8.4, 2015.5.10: Function renamed from pkg.get_locked_pkgs to pkg.list_holds.

List information on locked packages

**Note:** Requires the appropriate versionlock plugin package to be installed:
- On RHEL 5: yum-versionlock
- On RHEL 6 & 7: yum-plugin-versionlock
- On Fedora: python-dnf-plugins-extras-versionlock

```
pattern [w+]?([-][^[-]+]*) Regular expression used to match the package name
full [True] Show the full hold definition including version and epoch. Set to False to return just the name of the package(s) being held.
```

CLI Example:

```
salt '*' pkg.list_holds
salt '*' pkg.list_holds full=False
```

```
salt.modules.yumpkg.list_installed_patches()
```

New in version 2017.7.0.

List installed advisory patches on the system.

CLI Examples:

```
salt '*' pkg.list_installed_patches
```

```
salt.modules.yumpkg.list_patches(refresh=False)
```

New in version 2017.7.0.

List all known advisory patches from available repos.

**refresh** force a refresh if set to True. If set to False (default) it depends on yum if a refresh is executed.

CLI Examples:
salt '*' pkg.list_patches

salt.modules.yumpkg.list_pkgs(versions_as_list=False, **kwargs)
List the packages currently installed as a dict. By default, the dict contains versions as a comma separated string:

```
{'<package_name>': '<version>[,<version>...]'}
```

*versions_as_list*: If set to true, the versions are provided as a list

```
{'<package_name>': ['<version>', '<version>']}
```

*attr*: If a list of package attributes is specified, returned value will contain them in addition to version, eg.:

```
{'<package_name>': [{'version': 'version', 'arch': 'arch'}]}
```

Valid attributes are: epoch, version, release, arch, install_date, install_date_time_t.
If all is specified, all valid attributes will be returned.
New in version 2018.3.0.

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs attr=version,arch
salt '*' pkg.list_pkgs attr=['"version", "arch"]
```

salt.modules.yumpkg.list_repo_pkgs(*args, **kwargs)
New in version 2014.1.0.

Changed in version 2014.7.0: All available versions of each package are now returned. This required a slight modification to the structure of the return dict. The return data shown below reflects the updated return dict structure. Note that packages which are version-locked using pkg.hold will only show the currently-installed version, as locking a package will make other versions appear unavailable to yum/dnf.

Changed in version 2017.7.0: By default, the versions for each package are no longer organized by repository. To get results organized by repository, use byrepo=True.

Returns all available packages. Optionally, package names (and name globs) can be passed and the results will be filtered to packages matching those names. This is recommended as it speeds up the function considerably.

**Warning:** Running this function on RHEL/CentOS 6 and earlier will be more resource-intensive, as the version of yum that ships with older RHEL/CentOS has no yum subcommand for listing packages from a repository. Thus, a yum list installed and yum list available are run, which generates a lot of output, which must then be analyzed to determine which package information to include in the return data.

This function can be helpful in discovering the version or repo to specify in a pkg.installed state.

The return data will be a dictionary mapping package names to a list of version numbers, ordered from newest to oldest. If byrepo is set to True, then the return dictionary will contain repository names at the top level, and each repository will map packages to lists of version numbers. For example:

```
# With byrepo=False (default)
{
    'bash': ['4.1.2-15.el6_5.2',
```

(continues on next page)
fromrepo [None] Only include results from the specified repo(s). Multiple repos can be specified, comma-separated.

enablerepo (ignored if fromrepo is specified) Specify a disabled package repository (or repositories) to enable. (e.g., yum --enablerepo='somerepo')

New in version 2017.7.0.

disablerepo (ignored if fromrepo is specified) Specify an enabled package repository (or repositories) to disable. (e.g., yum --disablerepo='somerepo')

New in version 2017.7.0.

byrepo [False] When True, the return data for each package will be organized by repository.

New in version 2017.7.0.

cacheonly [False] When True, the repo information will be retrieved from the cached repo metadata. This is equivalent to passing the -C option to yum/dnf.

New in version 2017.7.0.

setopt A comma-separated or Python list of key=value options. This list will be expanded and --setopt prepended to each in the yum/dnf command that is run.

New in version 2019.2.0.

CLI Examples:
salt.modules.yumpkg.list_repos(basedir=None)
Lists all repos in <basedir> (default: all dirs in reposdir yum option).

CLI Example:

```
salt '*' pkg.list_repos
salt '*' pkg.list_repos basedir=/path/to/dir
salt '*' pkg.list_repos basedir=/path/to/dir,/path/to/another/dir
```

salt.modules.yumpkg.list_upgrades(refresh=True, **kwargs)
Check whether or not an upgrade is available for all packages
The fromrepo, enablerepo, and disablerepo arguments are supported, as used in pkg states, and the disableexcludes option is also supported.
New in version 2014.7.0: Support for the disableexcludes option

CLI Example:

```
salt '*' pkg.list_upgrades
```

salt.modules.yumpkg.mod_repo(repo, basedir=None, **kwargs)
Modify one or more values for a repo. If the repo does not exist, it will be created, so long as the following values are specified:
- **repo** name by which the yum refers to the repo
- **name** a human-readable name for the repo
- **baseurl** the URL for yum to reference
- **mirrorlist** the URL for yum to reference
Key/Value pairs may also be removed from a repo’s configuration by setting a key to a blank value. Bear in mind that a name cannot be deleted, and a baseurl can only be deleted if a mirrorlist is specified (or vice versa).

CLI Examples:

```
salt '*' pkg.mod_repo reponame enabled=1 gpgcheck=1
salt '*' pkg.mod_repo reponame basedir=/path/to/dir enabled=1
salt '*' pkg.mod_repo reponame basedir=/path/to/dir, mirrorlist=http://host.com/
```

salt.modules.yumpkg.modified(*packages, **flags)
List the modified files that belong to a package. Not specifying any packages will return a list of _all_ modified files on the system’s RPM database.

New in version 2015.5.0.
Filtering by flags (True or False):
- **size** Include only files where size changed.
- **mode** Include only files which file’s mode has been changed.
- **checksum** Include only files which MD5 checksum has been changed.
- **device** Include only files which major and minor numbers has been changed.
- **symlink** Include only files which are symbolic link contents.
- **owner** Include only files where owner has been changed.
- **group** Include only files where group has been changed.
- **time** Include only files where modification time of the file has been changed.
- **capabilities** Include only files where capabilities differ or not. Note: supported only on newer RPM versions.
CLI Examples:

```
salt '*' pkg.modified
salt '*' pkg.modified httpd
salt '*' pkg.modified httpd postfix
salt '*' pkg.modified httpd owner=True group=False
```

salt.modules.yumpkg.normalize_name(name)

Strips the architecture from the specified package name, if necessary. Circumstances where this would be done include:

- If the arch is 32 bit and the package name ends in a 32-bit arch.
- If the arch matches the OS arch, or is noarch.

CLI Example:

```
salt '*' pkg.normalize_name zsh.x86_64
```

salt.modules.yumpkg.owner("paths")

New in version 2014.7.0.

Return the name of the package that owns the file. Multiple file paths can be passed. Like `pkg.version`, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Examples:

```
salt '*' pkg.owner /usr/bin/apachectl
salt '*' pkg.owner /usr/bin/apachectl /etc/httpd/conf/httpd.conf
```

salt.modules.yumpkg.purge(name=None, pkgs=None, **kwargs)

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any yum/dnf commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Package purges are not supported by yum, this function is identical to `pkg.remove`.

name The name of the package to be purged

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

salt.modules.yumpkg.refresh_db(**kwargs)

Check the yum repos for updated packages

Returns:

- True: Updates are available
- **False**: An error occurred
- **None**: No updates are available

**repo** Refresh just the specified repo
**disable** Refresh a disabled repo using this option
**enablerepo** Add the specified branch when refreshing
**disableexclude** Disable the excludes defined in your config files. Takes one of three options: `- all - disable all excludes - main - disable excludes defined in [main] in yum.conf - repoid - disable excludes defined for that repo`
**setopt** A comma-separated or Python list of key=value options. This list will be expanded and `--setopt` prepended to each in the yum/dnf command that is run.

New in version 2019.2.0.

CLI Example:
```
salt '*' pkg.refresh_db
```

salt.modules.yumpkg.remove *(name=None, pkgs=None, **kwargs)*

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemctl from killing any yum/dnf commands spawned by Salt when the salt-minion service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a config option called `systemd.scope`, with a value of `False` (no quotes).

Remove packages
**name** The name of the package to be removed
Multiple Package Options:
**pkgs** A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:
```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

salt.modules.yumpkg.unhold *(name=None, pkgs=None, sources=None, **kwargs)*

New in version 2014.7.0.

Remove version locks

**Note**: Requires the appropriate versionlock plugin package to be installed:
- On RHEL 5: `yum-versionlock`
- On RHEL 6 & 7: `yum-plugin-versionlock`
- On Fedora: `python-dnf-plugins-extras-versionlock`

**name** The name of the package to be unheld

Multiple Package Options:
**pkgs** A list of packages to unhold. Must be passed as a python list. The name parameter will be ignored if this option is passed.
Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.unhold <package name>
salt '*' pkg.unhold pkgs=['"foo", "bar"]
```

salt.modules.yumpkg.update(name=None, pkgs=None, refresh=True, skip_verify=False, normalize=True, minimal=False, obsoletes=False, **kwargs)

New in version 2019.2.0.

Calls pkg.upgrade with obsoletes=False. Mirrors the CLI behavior of yum update. See pkg. upgrade for further documentation.

```
salt '*' pkg.update
```

salt.modules.yumpkg.upgrade(name=None, pkgs=None, refresh=True, skip_verify=False, normalize=True, minimal=False, obsoletes=True, **kwargs)

Run a full system upgrade (a yum upgrade or dnf upgrade), or upgrade specified packages. If the packages aren't installed, they will not be installed.

Changed in version 2014.7.0.

Changed in version 2015.8.12.2016.3.3.2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon’s control group. This is done to keep systemd from killing any yum/dnf commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Changed in version 2019.2.0: Added obsoletes and minimal arguments

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>', 'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
salt '*' pkg.upgrade name=openssl
```

Repository Options:

fromrepo Specify a package repository (or repositories) from which to install. (e.g., yum --disablerepo='*' --enablerepo='somerepo')

enablerepo (ignored if fromrepo is specified) Specify a disabled package repository (or repositories) to enable. (e.g., yum --enablerepo='somerepo')

disablerepo (ignored if fromrepo is specified) Specify an enabled package repository (or repositories) to disable. (e.g., yum --disablerepo='somerepo')

disableexcludes Disable exclude from main, for a repo or for everything. (e.g., yum --disableexcludes='main')

New in version 2014.7.

name The name of the package to be upgraded. Note that this parameter is ignored if "pkgs" is passed.

32-bit packages can be upgraded on 64-bit systems by appending the architecture designation (.i686, .i586, etc.) to the end of the package name.

Warning: if you forget 'name=' and run pkg.upgrade openssl, ALL packages are upgraded. This will be addressed in next releases.
CLI Example:
```
salt '*' pkg.upgrade name=openssl
```
New in version 2016.3.0.

**pkgs** A list of packages to upgrade from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version. If the package was not already installed on the system, it will not be installed.

CLI Examples:
```
salt '*' pkg.upgrade pkgs='["foo", "bar"]'
salt '*' pkg.upgrade pkgs='["foo", {"bar": "1.2.3-4.el5"}]'
```
New in version 2016.3.0.

**normalize** [True] Normalize the package name by removing the architecture. This is useful for poorly created packages which might include the architecture as an actual part of the name such as kernel modules which match a specific kernel version.

```
salt -G role:nsd pkg.upgrade gpfs.gplbin-2.6.32-279.31.1.el6.x86_64
   --normalize=False
```
New in version 2016.3.0.

**minimal** [False] Use upgrade-minimal instead of upgrade (e.g., `yum upgrade-minimal`) Goes to the 'newest' package match which fixes a problem that affects your system.

```
salt '*' pkg.upgrade minimal=True
```
New in version 2019.2.0.

**obsoletes** [True] Controls wether yum/dnf should take obsoletes into account and remove them. If set to False yum will use update instead of upgrade and dnf will be run with `--obsoletes=False`

```
salt '*' pkg.upgrade obsoletes=False
```
New in version 2019.2.0.

**setopt** A comma-separated or Python list of key=value options. This list will be expanded and `--setopt` prepended to each in the yum/dnf command that is run.

New in version 2019.2.0.

**security** [True] New in version 2019.2.0.

---

**Note:** To add extra arguments to the `yum upgrade` command, pass them as key word arguments. For arguments without assignments, pass `True`

```
salt '*' pkg.upgrade security=True exclude='kernel*'
```

```
salt.modules.yumpkg.upgrade_available(name, **kwargs)
```
Check whether or not an upgrade is available for a given package

CLI Example:
```
salt '*' pkg.upgrade_available <package name>
```

```
salt.modules.yumpkg.verify(names, **kwargs)
```
New in version 2014.1.0.

Runs an rpm `-Va` on a system, and returns the results in a dict

Pass options to modify rpm verify behavior using the `verify_options` keyword argument
Files with an attribute of config, doc, ghost, license or readme in the package header can be ignored using the `ignore_types` keyword argument

CLI Example:

```
salt '*' pkg.verify
salt '*' pkg.verify httpd
salt '*' pkg.verify 'httpd postfix' ignore_types=['config','doc']
salt '*' pkg.verify 'httpd postfix' verify_options=['nodeps','nosize']
```

```{.syntoma}
salt.modules.yumpkg.version('names', **kwargs)
```

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

```{.syntoma}
salt.modules.yumpkg.version_cmp(pkg1, pkg2, ignore_epoch=False)
```

New in version 2015.5.4.

Do a cmp-style comparison on two packages. Return -1 if pkg1 < pkg2, 0 if pkg1 == pkg2, and 1 if pkg1 > pkg2. Return None if there was a problem making the comparison.

`ignore_epoch` [False] Set to True to ignore the epoch when comparing versions

New in version 2015.8.10,2016.3.2.

CLI Example:

```
salt '*' pkg.version_cmp '0.2-001' '0.2.0.1-002'
```

## 21.9.490 salt.modules.zabbix module

Support for Zabbix

**optdepends**

- zabbix server

**configuration**  This module is not usable until the zabbix user and zabbix password are specified either in a pillar or in the minion’s config file. Zabbix url should be also specified.

```{.yaml}
zabbix.user: Admin
zabbix.password: mypassword
zabbix.url: http://127.0.0.1/zabbix/api_jsonrpc.php
```

Connection arguments from the minion config file can be overridden on the CLI by using arguments with `_connection_` prefix.

```{.yaml}
zabbix.apiinfo_version _connection_user=Admin _connection_password=zabbix _connection_url=http://host/zabbix/
```

codeauthor  Jiri Kotlin <jiri.kotlin@ultimum.io>

```{.syntoma}
salt.modules.zabbix.apiinfo_version(**connection_args)**
```

Retrieve the version of the Zabbix API.

New in version 2016.3.0.
Parameters

- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns
On success string with Zabbix API version, False on failure.

CLI Example: .. code-block:: bash
salt '*' zabbix.apiinfo_version

salt.modules.zabbix.compare_params(defined, existing, return_old_value=False)

New in version 2017.7.

Compares Zabbix object definition against existing Zabbix object.

Parameters

- **defined** – Zabbix object definition taken from sls file.
- **existing** – Existing Zabbix object taken from result of an API call.
- **return_old_value** – Default False. If True, returns dict("old"=old_val, "new"=new_val) for rollback purpose.

Returns
Params that are different from existing object. Result extended by object ID can be passed directly to Zabbix API update method.

salt.modules.zabbix.configuration_import(config_file, rules=None, file_format='xml', **connection_args)

New in version 2017.7.

Imports Zabbix configuration specified in file to Zabbix server.

Parameters

- **config_file** – File with Zabbix config (local or remote)
- **rules** – Optional - Rules that have to be different from default (defaults are the same as in Zabbix web UI.)
- **file_format** – Config file format (default: xml)
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

CLI Example:

```
salt '*' zabbix.configuration_import salt://zabbix/config/zabbix_templates.xml
↑
"{'screens': {'createMissing': True, 'updateExisting': True}}"
```

salt.modules.zabbix.get_object_id_by_params(obj, params=None, **connection_args)

New in version 2017.7.

Get ID of single Zabbix object specified by its name.

Parameters

- **obj** – Zabbix object type
- **params** – Parameters by which object is uniquely identified
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)
Returns object ID

salt.modules.zabbix.get_zabbix_id_mapper()
New in version 2017.7.

Make ZABBIX_ID_MAPPER constant available to state modules.

Returns ZABBIX_ID_MAPPER

salt.modules.zabbix.host_create(host, groups, interfaces, **connection_args)
New in version 2016.3.0.

Create new host

Note: This function accepts all standard host properties: keyword argument names differ depending on your zabbix version, see here.

Parameters

- **host** – technical name of the host
- **groups** – groupids of host groups to add the host to
- **interfaces** – interfaces to be created for the host
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)
- **visible_name** – string with visible name of the host, use ‘visible_name’ instead of ‘name’ parameter to not mess with value supplied from Salt sls file.

return: ID of the created host.

CLI Example:

```
salt '*' zabbix.host_create technicalname 4
interfaces='{type: 1, main: 1, useip: 1, ip: "192.168.3.1", dns: ", port: 10050}'
visible_name='Host Visible Name' inventory_mode=0 inventory='{"alias": "something else"}'}
```

salt.modules.zabbix.host_delete(hostids, **connection_args)
Delete hosts.

New in version 2016.3.0.

Parameters

- **hostids** – Hosts (hostids) to delete.
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns IDs of the deleted hosts.

CLI Example: .. code-block:: bash

salt '*' zabbix.host_delete 10106

salt.modules.zabbix.host_exists(host=None, hostid=None, name=None, node=None, nodeids=None, **connection_args)

Checks if at least one host that matches the given filter criteria exists.
New in version 2016.3.0.

Parameters

• `host` – technical name of the host
• `hostids` – Hosts (hostids) to delete.
• `name` – visible name of the host
• `node` – name of the node the hosts must belong to (zabbix API < 2.4)
• `nodeids` – IDs of the node the hosts must belong to (zabbix API < 2.4)
• `_connection_user` – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
• `_connection_password` – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
• `_connection_url` – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns IDs of the deleted hosts, False on failure.

CLI Example: .. code-block:: bash
salt '*' zabbix.host_exists 'Zabbix server'

salt.modules.zabbix.host_get(host=None, name=None, hostids=None, **connection_args)

New in version 2016.3.0.

Retrieve hosts according to the given parameters

---

Note: This function accepts all optional host.get parameters: keyword argument names differ depending on your zabbix version, see [here](https://www.zabbix.com/documentation/2.4/manual/api/reference/host/object#host_inventory).

Parameters

• `host` – technical name of the host
• `name` – visible name of the host
• `hostids` – ids of the hosts
• `_connection_user` – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
• `_connection_password` – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
• `_connection_url` – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns Array with convenient hosts details, False if no host found or on failure.

CLI Example: .. code-block:: bash
salt '*' zabbix.host_get 'Zabbix server'

salt.modules.zabbix.host_inventory_get(hostids, **connection_args)

New in version 2019.2.0.

Retrieve host inventory according to the given parameters. See: [https://www.zabbix.com/documentation/2.4/manual/api/reference/host/object#host_inventory](https://www.zabbix.com/documentation/2.4/manual/api/reference/host/object#host_inventory)

Parameters

• `hostids` – Return only host interfaces used by the given hosts.
• `_connection_user` – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
• `_connection_password` – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
• `_connection_url` – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns Array with host interfaces details, False if no convenient host interfaces found or on failure.
salt.modules.zabbix.host_inventory_set(hostid, **connection_args)
Update host inventory items
NOTE: This function accepts all standard host: keyword argument names for inventory
see: https://www.zabbix.com/documentation/2.4/manual/api/reference/host/object#host_inventory
New in version 2019.2.0.

Parameters
- **hostid** – ID of the host to update
- **clear_old** – Set to True in order to remove all existing inventory items before
  setting the specified items
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see
  module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or
  pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts,
  pillar, see module’s docstring)

Returns
ID of the updated host, False on failure.

CLI Example: .. code-block:: bash
salt '*' zabbix.host_inventory_set 101054 asset_tag=jml3322 type=vm clear_old=True

salt.modules.zabbix.host_list(**connection_args)
Retrieve all hosts.
New in version 2016.3.0.

Parameters
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see
  module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or
  pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts,
  pillar, see module’s docstring)

Returns
Array with details about hosts, False on failure.

CLI Example: .. code-block:: bash
salt '*' zabbix.host_list

salt.modules.zabbix.host_update(hostid, **connection_args)
Update existing hosts
New in version 2016.3.0.

Parameters
- **hostid** – ID of the host to update
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see
  module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or
  pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts,
  pillar, see module’s docstring)
- **visible_name** – string with visible name of the host, use ‘visible_name’ instead
  of ‘name’ parameter to not mess with value supplied from Salt sls file.
Returns  ID of the updated host.

CLI Example: .. code-block:: bash
salt '*' zabbix.host_update 10084 name='Zabbix server2'

salt.modules.zabbix.hostgroup_create(name, **connection_args)
New in version 2016.3.0.
Create a host group

Note: This function accepts all standard host group properties: keyword argument names differ depending on your zabbix version, see here.

Parameters

- **name** – name of the host group
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns  ID of the created host group.

CLI Example: .. code-block:: bash
salt '*' zabbix.hostgroup_create MyNewGroup

salt.modules.zabbix.hostgroup_delete(hostgroupids, **connection_args)
Delete the host group.

New in version 2016.3.0.

Parameters

- **hostgroupids** – IDs of the host groups to delete
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns  ID of the deleted host groups, False on failure.

CLI Example: .. code-block:: bash
salt '*' zabbix.hostgroup_delete 23

salt.modules.zabbix.hostgroup_exists(name=None, groupid=None, node=None, nodeids=None, **connection_args)
Checks if at least one host group that matches the given filter criteria exists.

New in version 2016.3.0.

Parameters

- **name** – names of the host groups
- **groupid** – host group IDs
- **node** – name of the node the host groups must belong to (zabbix API < 2.4)
- **nodeids** – IDs of the nodes the host groups must belong to (zabbix API < 2.4)
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
• _connection_url – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns True if at least one host group exists, False if not or on failure.

CLI Example: .. code-block:: bash
salt '*' zabbix.hostgroup_exists MyNewGroup

salt.modules.zabbix.hostgroup_get(name=None, groupids=None, hostids=None, **connection_args)

New in version 2016.3.0.
Retrieve host groups according to the given parameters

Note: This function accepts all standard hostgroup.get properities: keyword argument names differ depending on your zabbix version, see here.

Parameters

- name – names of the host groups
- groupid – host group IDs
- node – name of the node the host groups must belong to
- nodeids – IDs of the nodes the host groups must belong to
- hostids – return only host groups that contain the given hosts
- _connection_user – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- _connection_password – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- _connection_url – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns Array with host groups details, False if no convenient host group found or on failure.

CLI Example: .. code-block:: bash
salt '*' zabbix.hostgroup_get MyNewGroup

salt.modules.zabbix.hostgroup_list(**connection_args)

Retrieve all host groups.

New in version 2016.3.0.

Parameters

- _connection_user – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- _connection_password – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- _connection_url – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns Array with details about host groups, False on failure.

CLI Example: .. code-block:: bash
salt '*' zabbix.hostgroup_list

salt.modules.zabbix.hostgroup_update(groupid, name=None, **connection_args)

New in version 2016.3.0.
Update existing hosts group

Note: This function accepts all standard host group properties: keyword argument names differ depending on your zabbix version, see here.
- **groupid** – ID of the host group to update
- **name** – name of the host group
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

**Returns** IDs of updated host groups.

CLI Example: .. code-block:: bash
salt '*' zabbix.hostgroup_update 24 name='Renamed Name'

salt.modules.zabbix.hostinterface_create(hostid, ip_, dns=", main=1, if_type=1, useip=1, port=None, **connection_args)

New in version 2016.3.0.
Create new host interface

Note: This function accepts all standard host group interface: keyword argument names differ depending on your zabbix version, see here.

**Parameters**
- **hostid** – ID of the host the interface belongs to
- **ip** – IP address used by the interface
- **dns** – DNS name used by the interface
- **main** – whether the interface is used as default on the host (0 - not default, 1 - default)
- **port** – port number used by the interface
- **type** – Interface type (1 - agent; 2 - SNMP; 3 - IPMI; 4 - JMX)
- **useip** – Whether the connection should be made via IP (0 - connect using host DNS name; 1 - connect using host IP address for this host interface)
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

**Returns** ID of the created host interface, False on failure.

CLI Example: .. code-block:: bash
salt '*' zabbix.hostinterface_create 10105 192.193.194.197

salt.modules.zabbix.hostinterface_delete(interfaceids, **connection_args)
Delete host interface

New in version 2016.3.0.

**Parameters**
- **interfaceids** – IDs of the host interfaces to delete
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

**Returns** ID of deleted host interfaces, False on failure.

CLI Example: .. code-block:: bash
salt '*' zabbix.hostinterface_delete 50

salt.modules.zabbix.hostinterface_get(hostids, **connection_args)
New in version 2016.3.0.
Retrieve host groups according to the given parameters

Note: This function accepts all standard hostinterface.get properties: keyword argument names differ depending on your zabbix version, see here.

Parameters

- **hostids** – Return only host interfaces used by the given hosts.
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns Array with host interfaces details, False if no convenient host interfaces found or on failure.

CLI Example: .. code-block:: bash
salt '*' zabbix.hostinterface_get 101054

salt.modules.zabbix.hostinterface_update(interfaceid, **connection_args)
New in version 2016.3.0.
Update host interface

Note: This function accepts all standard hostinterface properties: keyword argument names differ depending on your zabbix version, see here.

Parameters

- **interfaceid** – ID of the hostinterface to update
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns ID of the updated host interface, False on failure.

CLI Example: .. code-block:: bash
salt '*' zabbix.hostinterface_update 6 ip_=0.0.0.2

salt.modules.zabbix.mediatype_create(name, mediatype, **connection_args)
Create new mediatype

Note: This function accepts all standard mediatype properties: keyword argument names differ depending on your zabbix version, see here.

Parameters

- **mediatype** – media type - 0: email, 1: script, 2: sms, 3: Jabber, 100: Ez Texting
- **exec_path** – exec path - Required for script and Ez Texting types, see Zabbix API docs
- **gsm_modem** – exec path - Required for sms type, see Zabbix API docs
- **smtp_email** – email address from which notifications will be sent, required for email type
- **smtp_helo** – SMTP HELO, required for email type
- **smtp_server** – SMTP server, required for email type
- **status** – whether the media type is enabled - 0: enabled, 1: disabled
- **username** – authentication user, required for Jabber and Ez Texting types
- **passwd** – authentication password, required for Jabber and Ez Texting types
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

```
return: ID of the created mediatype.
```

**CLI Example:**

```
salt '*' zabbix.mediatype_create 'Email' 0 smtp_email='noreply@example.com'
salt_server='mailserver.example.com' smtp_helo='zabbix.example.com'
```

salt.modules.zabbix.mediatype_delete(*mediatypeids, **connection_args*)
Delete mediatype

**Parameters**

- **interfaceids** – IDs of the mediatypes to delete
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

**Returns**

ID of deleted mediatype, False on failure.

**CLI Example:**

```
salt '*' zabbix.mediatype_delete 3
```

salt.modules.zabbix.mediatype_get(*name=None, mediatypeids=None, **connection_args*)
Retrieve mediatypes according to the given parameters.

**Parameters**

- **name** – Name or description of the mediatype
- **mediatypeids** – ids of the mediatypes
- **connection_args** *(optional)* – _connection_user: zabbix user (can also be set in opts or pillar, see module’s docstring)_connection_password: zabbix password (can also be set in opts or pillar, see module’s docstring)_connection_url: url of zabbix frontend (can also be set in opts or pillar, see module’s docstring)

all optional mediatype.get parameters: keyword argument names depends on your zabbix version, see:

```
https://www.zabbix.com/documentation/2.2/manual/api/reference/mediatype/get
```

**Returns**

Array with mediatype details, False if no mediatype found or on failure.

**CLI Example:**

```
salt '*' zabbix.mediatype_get name='Email' salt '*' zabbix.mediatype_get mediatypeids='[1, 2, 3]'
```
salt.modules.zabbix.mediatype_update (mediatypeid, name=False, mediatype=False, **connection_args)

Update existing mediatype

**Note:** This function accepts all standard mediatype properties: keyword argument names differ depending on your Zabbix version, see [here](https://www.zabbix.com/documentation/2.4/manual/api/reference).

**Parameters**
- **mediatypeid** – ID of the mediatype to update
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

**Returns** IDs of the updated mediatypes, False on failure.

**CLI Example:** .. code-block:: bash

    salt '*' zabbix.usergroup_update 8 name="Email update"

salt.modules.zabbix.run_query (method, params, **connection_args)

Send Zabbix API call

**Parameters**
- **method** – actual operation to perform via the API
- **params** – parameters required for specific method
- **connection_args** *(optional)* – _connection_user: zabbix user (can also be set in opts or pillar, see module’s docstring)_connection_password: zabbix password (can also be set in opts or pillar, see module’s docstring)_connection_url: url of zabbix frontend (can also be set in opts or pillar, see module’s docstring)

**Returns** Response from Zabbix API

**CLI Example:** .. code-block:: bash

    salt '*' zabbix.run_query proxy.create '{"host": "zabbixproxy.domain.com", "status": "5"}'

salt.modules.zabbix.substitute_params (input_object, extend_params=None, filter_key='name', **kwargs)

New in version 2017.7.

Go through Zabbix object params specification and if needed get given object ID from Zabbix API and put it back as a value. Definition of the object is done via dict with keys "query_object" and "query_name".

**Parameters**
- **input_object** – Zabbix object type specified in state file
- **extend_params** – Specify query with params
- **filter_key** – Custom filtering key (default: name)
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

**Returns** Params structure with values converted to string for further comparison purposes
salt.modules.zabbix.template_get(name=None, host=None, templateids=None, **connection_args)

Retrieve templates according to the given parameters.

Parameters
- **host** – technical name of the template
- **name** – visible name of the template
- **hostids** – ids of the templates
- **connection_args (optional)** – _connection_user: zabbix user (can also be set in opts or pillar, see module’s docstring)_ connection_password: zabbix password (can also be set in opts or pillar, see module’s docstring) _connection_url: url of zabbix frontend (can also be set in opts or pillar, see module’s docstring)

all optional template.get parameters: keyword argument names depends on your zabbix version, see:

https://www.zabbix.com/documentation/2.4/manual/api/reference/template/get

Returns Array with convenient template details, False if no template found or on failure.

CLI Example: .. code-block:: bash

salt '*' zabbix.template_get name='Template OS Linux' salt '*' zabbix.template_get templateids=["10050", '10001']

salt.modules.zabbix.user_addmedia(userids, active, mediatypeid, period, sendto, severity, **connection_args)

Add new media to multiple users.

New in version 2016.3.0.

Parameters
- **userids** – ID of the user that uses the media
- **active** – Whether the media is enabled (0 enabled, 1 disabled)
- **mediatypeid** – ID of the media type used by the media
- **period** – Time when the notifications can be sent as a time period
- **sendto** – Address, user name or other identifier of the recipient
- **severity** – Trigger severities to send notifications about
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns IDs of the created media.

CLI Example: .. code-block:: bash

salt '*' zabbix.user_addmedia 4 active=0 mediatypeid=1 period='1-7,00:00-24:00'

sendto='support2@example.com' severity=63

salt.modules.zabbix.user_create(alias, passwd, usgrps, **connection_args)

New in version 2016.3.0.

Create new zabbix user

Note: This function accepts all standard user properties: keyword argument names differ depending on your zabbix version, see here.

Parameters
- **alias** – user alias
- **passwd** – user’s password
- **usgrps** – user groups to add the user to
Salt Documentation, Release 2019.2.0

- `_connection_user` – zabbix user (can also be set in opts or pillar, see module’s docstring)
- `_connection_password` – zabbix password (can also be set in opts or pillar, see module’s docstring)
- `_connection_url` – url of zabbix frontend (can also be set in opts or pillar, see module’s docstring)
- `firstname` – string with firstname of the user, use 'firstname' instead of 'name' parameter to not mess with value supplied from Salt sls file.

Returns On success string with id of the created user.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.user_create james password007 '[7, 12]' firstname='James Bond'
```

salt.modules.zabbix.user_delete(users, **connection_args)
Delete zabbix users.

New in version 2016.3.0.

Parameters

- `users` – array of users (userids) to delete
- `_connection_user` – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- `_connection_password` – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- `_connection_url` – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns On success array with userids of deleted users.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.user_delete 15
```

salt.modules.zabbix.user_deletemedia(mediaids, **connection_args)
Delete media by id.

New in version 2016.3.0.

Parameters

- `mediaids` – IDs of the media to delete
- `_connection_user` – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- `_connection_password` – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- `_connection_url` – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns IDs of the deleted media, False on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.user_deletemedia 27
```

salt.modules.zabbix.user_exists(alias, **connection_args)
Checks if user with given alias exists.

New in version 2016.3.0.

Parameters

- `alias` – user alias
- `_connection_user` – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- `_connection_password` – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- `_connection_url` – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

21.9. execution modules 2823
**Returns**  
True if user exists, else False.

CLI Example:  
```bash
salt '*' zabbix.user_exists james
```

```python
salt.modules.zabbix.user_get(alias=None, userids=None, **connection_args)
```

Retrieve users according to the given parameters.

New in version 2016.3.0.

**Parameters**

- `alias` – user alias
- `userids` – return only users with the given IDs
- `_connection_user` – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- `_connection_password` – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- `_connection_url` – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

**Returns**  
Array with details of convenient users, False on failure of if no user found.

CLI Example:  
```bash
salt '*' zabbix.user_get james
```

```python
salt.modules.zabbix.user_getmedia(userids=None, **connection_args)
```

New in version 2016.3.0.

Retrieve media according to the given parameters

**Note:** This function accepts all standard usermedia.get properties: keyword argument names differ depending on your zabbix version, see [here](#).

**Parameters**

- `userids` – return only media that are used by the given users
- `_connection_user` – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- `_connection_password` – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- `_connection_url` – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

**Returns**  
List of retrieved media, False on failure.

CLI Example:  
```bash
salt '*' zabbix.user_getmedia
```

```python
salt.modules.zabbix.user_list(**connection_args)
```

Retrieve all of the configured users.

New in version 2016.3.0.

**Parameters**

- `_connection_user` – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- `_connection_password` – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- `_connection_url` – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

**Returns**  
Array with user details.

CLI Example:  
```bash
salt '*' zabbix.user_list
```

2824 Chapter 21. Salt Module Reference
salt.modules.zabbix.user_update(userid, **connection_args)

New in version 2016.3.0.

Update existing users

**Note:** This function accepts all standard user properties: keyword argument names differ depending on your zabbix version, see here.

**Parameters**
- **userid** – id of the user to update
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

**Returns** Id of the updated user on success.

**CLI Example:**
```bash
salt '*' zabbix.user_update 16 visible_name='James Brown'
```

salt.modules.zabbix.usergroup_create(name, **connection_args)

New in version 2016.3.0.

Create new user group

**Note:** This function accepts all standard user group properties: keyword argument names differ depending on your zabbix version, see here.

**Parameters**
- **name** – name of the user group
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

**Returns** IDs of the created user groups.

**CLI Example:**
```bash
salt '*' zabbix.usergroup_create GroupName
```

salt.modules.zabbix.usergroup_delete(usergroupids, **connection_args)

New in version 2016.3.0.

**Parameters**
- **usergroupids** – IDs of the user groups to delete
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

**Returns** IDs of the deleted user groups.

**CLI Example:**
```bash
salt '*' zabbix.usergroup_delete 28
```
salt.modules.zabbix.usergroup_exists(name=None, node=None, nodeids=None, **connection_args)
Checks if at least one user group that matches the given filter criteria exists
New in version 2016.3.0.

Parameters

- **name** – names of the user groups
- **node** – name of the node the user groups must belong to (This will override the nodeids parameter.)
- **nodeids** – IDs of the nodes the user groups must belong to
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns True if at least one user group that matches the given filter criteria exists, else False.

CLI Example: .. code-block:: bash
salt '*' zabbix.usergroup_exists Guests

salt.modules.zabbix.usergroup_get(name=None, usgrgid=None, userids=None, **connection_args)
Retrieve user groups according to the given parameters

Note: This function accepts all usergroup_get properties: keyword argument names differ depending on your zabbix version, see here.

Parameters

- **name** – names of the user groups
- **usgrgid** – return only user groups with the given IDs
- **userids** – return only user groups that contain the given users
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns Array with convenient user groups details, False if no user group found or on failure.

CLI Example: .. code-block:: bash
salt '*' zabbix.usergroup_get Guests

salt.modules.zabbix.usergroup_list(**connection_args)
Retrieve all enabled user groups.
New in version 2016.3.0.

Parameters

- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns Array with enabled user groups details, False on failure.
```bash
salt '*' zabbix.usergroup_list
```
salt modules.zabbix.usermacro_delete(macroids, **connection_args)
Delete host usermacros.
Parameters
- **macroids** – macroids of the host usermacros
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

returns: IDs of the deleted host usermacro.

CLI Example:
salt '*' zabbix.usermacro_delete 21

salt modules.zabbix.usermacro_deleteglobal(macroids, **connection_args)
Delete global usermacros.
Parameters
- **macroids** – macroids of the global usermacros
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

returns: IDs of the deleted global usermacro.

CLI Example:
salt '*' zabbix.usermacro_deleteglobal 21

salt modules.zabbix.usermacro_get(macro=None, hostids=None, templateids=None, hostmacroids=None, globalmacroids=None, globalmacro=False, **connection_args)
Retrieve user macros according to the given parameters.
Parameters
- **macro** – name of the usermacro
- **hostids** – Return macros for the given hostids
- **templateids** – Return macros for the given templateids
- **hostmacroids** – Return macros with the given hostmacroids
- **globalmacroids** – Return macros with the given globalmacroids (implies globalmacro=True)
- **globalmacro** – if True, returns only global macros
- **connection_args (optional)** – _connection_user: zabbix user (can also be set in opts or pillar, see module’s docstring) _connection_password: zabbix password (can also be set in opts or pillar, see module’s docstring) _connection_url: url of zabbix frontend (can also be set in opts or pillar, see module’s docstring)

Returns Array with usermacro details, False if no usermacro found or on failure.

CLI Example: ...
code-block:: bash
salt '*' zabbix.usermacro_get macro='"\"]**SNMP_COMMUNITY}**\"'

salt modules.zabbix.usermacro_update(hostmacroid, value, **connection_args)
Update existing host usermacro.
Parameters

- **hostmacroid** – id of the host usermacro
- **value** – new value of the host usermacro
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

return: ID of the update host usermacro.

CLI Example:

```bash
salt '*' zabbix.usermacro_update 1 'public'
```

salt.modules.zabbix.usermacro_updateglobal(globalmacroid, value, **connection_args)

Update existing global usermacro.

Parameters

- **globalmacroid** – id of the host usermacro
- **value** – new value of the host usermacro
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

return: ID of the update global usermacro.

CLI Example:

```bash
salt '*' zabbix.usermacro_updateglobal 1 'public'
```

**21.9.491 salt.modules.zcbuildout**

Management of zc.buildout

New in version 2014.1.0.

This module is inspired by minitage's buildout maker

Note: The zc.buildout integration is still in beta; the API is subject to change

**General notes**

You have those following methods:

- upgrade_bootstrap
- bootstrap
- run_buildout
- buildout

```python
salt.modules.zcbuildout.bootstrap(*a, **kw)
```

Run the buildout bootstrap dance (python bootstrap.py).
directory  directory to execute in
config alternative buildout configuration file to use
runas  User used to run buildout as
env  environment variables to set when running
buildout_ver  force a specific buildout version (1 | 2)
test_release  buildout accept test release
offline  are we executing buildout in offline mode
distribute  forcing use of distribute
new_st  forcing use of setuptools >= 0.7
python  path to a python executable to use in place of default (salt one)
onlyif  Only execute cmd if statement on the host return 0
unless  Do not execute cmd if statement on the host return 0
use_vt  Use the new salt VT to stream output [experimental]

CLI Example:
```
salt '*' buildout.bootstrap /srv/mybuildout
```

```
salt.modules.zcbuildout.buildout(\*a, **kw)
Run buildout in a directory.
directory  directory to execute in
config buildout config to use
parts specific buildout parts to run
runas user used to run buildout as
env environment variables to set when running
buildout_ver  force a specific buildout version (1 | 2)
test_release  buildout accept test release
new_st  forcing use of setuptools >= 0.7
distribute  use distribute over setuptools if possible
offline  does buildout run offline
python  python to use
debug  run buildout with -D debug flag
onlyif  Only execute cmd if statement on the host return 0
unless  Do not execute cmd if statement on the host return 0
newest  run buildout in newest mode
verbose  run buildout in verbose mode (-vvvvv)
use_vt  Use the new salt VT to stream output [experimental]

CLI Example:
```
salt '*' buildout.buildout /srv/mybuildout
```

```
salt.modules.zcbuildout.run_buildout(\*a, **kw)
Run a buildout in a directory.
directory  directory to execute in
config alternative buildout configuration file to use
offline  are we executing buildout in offline mode
runas user used to run buildout as
env environment variables to set when running
onlyif  Only execute cmd if statement on the host return 0
unless  Do not execute cmd if statement on the host return 0
newest  run buildout in newest mode
force  run buildout unconditionally
verbose  run buildout in verbose mode (-vvvvv)
use_vt  Use the new salt VT to stream output [experimental]

CLI Example:
```
```
salt 'srv/mybuildout' run_buildout

```
salt.modules.zcbuildout.upgrade_bootstrap('a, **kw')
```

Upgrade current bootstrap.py with the last released one.

Indeed, when we first run a buildout, a common source of problem is to have a locally stale bootstrap, we just try to grab a new copy

directory directory to execute in
offline are we executing buildout in offline mode
buildout_ver forcing to use a specific buildout version (1 | 2)
onlyif Only execute cmd if statement on the host return 0
unless Do not execute cmd if statement on the host return 0

CLI Example:
```
salt 'srv/mybuildout' upgrade_bootstrap
```

### 21.9.492 salt.modules.zenoss

Module for working with the Zenoss API

New in version 2016.3.0.

**depends** requests

**configuration** This module requires a 'zenoss' entry in the master/minion config.

For example:
```
zenoss:
  hostname: https://zenoss.example.com
  username: admin
  password: admin123
```

```
salt.modules.zenoss.add_device(device=None, device_class=None, collector='localhost', prod_state=1000)
```

A function to connect to a zenoss server and add a new device entry.

**Parameters**

- **device** – (Optional) Will use the grain 'fqdn' by default.
- **device_class** – (Optional) The device class to use. If none, will determine based on kernel grain.
- **collector** – (Optional) The collector to use for this device. Defaults to 'localhost'.
- **prod_state** – (Optional) The prodState to set on the device. If none, defaults to 1000 (production)

**CLI Example:**
```
salt '*' zenoss.add_device
```

```
salt.modules.zenoss.device_exists(device=None)
```

Check to see if a device already exists in Zenoss.

**Parameters** device – (Optional) Will use the grain 'fqdn' by default

**CLI Example:**
```
salt '*' zenoss.device_exists
```

```
salt.modules.zenoss.find_device(device=None)
```

Find a device in Zenoss. If device not found, returns None.

**Parameters** device – (Optional) Will use the grain 'fqdn' by default

**CLI Example:**
```
salt '*' zenoss.find_device
```

### 21.9. execution modules
salt.modules.zenoss.set_prod_state\[prod_state, device=None\]

A function to set the prod_state in zenoss.

Parameters

- **prod_state** – (Required) Integer value of the state
- **device** – (Optional) Will use the grain 'fqdn' by default.

CLI Example: salt zenoss.set_prod_state 1000 hostname

21.9.493 salt.modules.zfs

Module for running ZFS command

- **codeauthor** Nitin Madhok <nmadhok@clemson.edu>, Jorge Schrauwen <sjorge@blackdot.be>
- **maintainer** Jorge Schrauwen <sjorge@blackdot.be>
- **maturity** new
- **depends** salt.utils.zfs
- **platform** illumos,freebsd,linux

Changed in version 2018.3.1: Big refactor to remove duplicate code, better type conversions and improved consistency in output.

salt.modules.zfs.bookmark\[snapshot, bookmark\]

Creates a bookmark of the given snapshot

**Note:** Bookmarks mark the point in time when the snapshot was created, and can be used as the incremental source for a zfs send command.

This feature must be enabled to be used. See zpool-features(5) for details on ZFS feature flags and the bookmarks feature.

- **snapshot** [string] name of snapshot to bookmark
- **bookmark** [string] name of bookmark

New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.bookmark myzpool/mydataset@yesterday myzpool/mydataset#complete
```

salt.modules.zfs.clone\[name_a, name_b, **kwargs\]

Creates a clone of the given snapshot.

- **name_a** [string] name of snapshot
- **name_b** [string] name of filesystem or volume
- **create_parent** [boolean] creates all the non-existing parent datasets. any property specified on the command line using the -o option is ignored.
- **properties** [dict] additional zfs properties (-o)

**Note:** ZFS properties can be specified at the time of creation of the filesystem by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{'property1': 'value1', 'property2': 'value2'}"
```
New in version 2016.3.0.

CLI Example:

```bash
salt '*' zfs.clone myzpool/mydataset@yesterday myzpool/mydataset_yesterday
```

```python
salt.modules.zfs.create(name, **kwargs)

Create a ZFS File System.

- **name** [string] name of dataset or volume
- **volume_size** [string] if specified, a zvol will be created instead of a dataset
- **sparse** [boolean] create sparse volume
- **create_parent** [boolean] creates all the non-existing parent datasets. any property specified on the command line using the -o option is ignored.
- **properties** [dict] additional zfs properties (-o)

**Note:** ZFS properties can be specified at the time of creation of the filesystem by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

```
properties = {'property1': 'value1', 'property2': 'value2'}
```

New in version 2015.5.0.

CLI Example:

```bash
salt '*' zfs.create myzpool/mydataset [create_parent=True|False]
salt '*' zfs.create myzpool/mydataset properties="{'mountpoint': '/export/zfs', 'sharenfs': 'on'}"
salt '*' zfs.create myzpool/volume volume_size=1G [sparse=True|False]
salt '*' zfs.create myzpool/volume volume_size=1G properties="{'volblocksize': '512'}" [sparse=True|False]
```

```python
salt.modules.zfs.destroy(name, **kwargs)

Destroy a ZFS File System.

- **name** [string] name of dataset, volume, or snapshot
- **force** [boolean] force an unmount of any file systems using the unmount -f command.
- **recursive** [boolean] recursively destroy all children. (-r)
- **recursive_all** [boolean] recursively destroy all dependents, including cloned file systems outside the target hierarchy. (-R)

**Warning:** watch out when using recursive and recursive_all

New in version 2015.5.0.

CLI Example:

```bash
salt '*' zfs.destroy myzpool/mydataset [force=True|False]
```

```python
salt.modules.zfs.diff(name_a, name_b=None, **kwargs)

Display the difference between a snapshot of a given filesystem and another snapshot of that filesystem from a later time or the current contents of the filesystem.

- **name_a** [string] name of snapshot
- **name_b** [string] (optional) name of snapshot or filesystem
show changetime  [boolean] display the path’s inode change time as the first column of output. (default = True)
show indication  [boolean] display an indication of the type of file. (default = True)
parsable  [boolean] if true we don’t parse the timestamp to a more readable date (default = True)
New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.diff myzpool/mydataset@yesterday myzpool/mydataset
```

salt.modules.zfs.exists(name, **kwargs)
Check if a ZFS filesystem or volume or snapshot exists.
name  [string] name of dataset
type  [string] also check if dataset is of a certain type, valid choices are: filesystem, snapshot, volume, bookmark, or all.
New in version 2015.5.0.

CLI Example:

```
salt '*' zfs.exists myzpool/mydataset
salt '*' zfs.exists myzpool/myvolume type=volume
```

salt.modules.zfs.get(*dataset, **kwargs)
Displays properties for the given datasets.
dataset  [string] name of snapshot(s), filesystem(s), or volume(s)
properties  [string] comma-separated list of properties to list, defaults to all
recursive  [boolean] recursively list children
depth  [int] recursively list children to depth
fields  [string] comma-separated list of fields to include, the name and property field will always be added
type  [string] comma-separated list of types to display, where type is one of filesystem, snapshot, volume, bookmark, or all.
source  [string] comma-separated list of sources to display. Must be one of the following: local, default, inherited, temporary, and none. The default value is all sources.
parsable  [boolean] display numbers in parsable (exact) values (default = True) .. versionadded:: 2018.3.0

Note: If no datasets are specified, then the command displays properties for all datasets on the system.

New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.get
salt '*' zfs.get myzpool/mydataset [recursive=True|False]
salt '*' zfs.get myzpool/mydataset properties="sharens,mountpoint" [recursive=True|False]
salt '*' zfs.get myzpool/mydataset myzpool/myotherdataset properties=available fields=value depth=1
```

salt.modules.zfs.hold(tag, *snapshot, **kwargs)
Adds a single reference, named with the tag argument, to the specified snapshot or snapshots.

Note: Each snapshot has its own tag namespace, and tags must be unique within that space.

If a hold exists on a snapshot, attempts to destroy that snapshot by using the zfs destroy command return EBUSY.
tag [string] name of tag
snapshot [string] name of snapshot(s)
recursive [boolean] specifies that a hold with the given tag is applied recursively to the snapshots of all descendant file systems.

New in version 2016.3.0.
Changed in version 2018.3.1.

Warning: As of 2018.3.1 the tag parameter no longer accepts a comma-separated value. It's now possible to create a tag that contains a comma, this was impossible before.

CLI Example:
```
salt '*' zfs.hold mytag myzpool/mydataset@mysnapshot [recursive=True]
salt '*' zfs.hold mytag myzpool/mydataset@mysnapshot myzpool/
   ->mydataset@myothersnapshot
```

salt.modules.zfs.holds(snapshot, **kwargs)
Lists all existing user references for the given snapshot or snapshots.

snapshot [string] name of snapshot
recursive [boolean] lists the holds that are set on the named descendent snapshots also.

New in version 2016.3.0.

CLI Example:
```
salt '*' zfs.holds myzpool/mydataset@baseline
```

salt.modules.zfs.inherit(prop, name, **kwargs)
Clears the specified property

prop [string] name of property
name [string] name of the filesystem, volume, or snapshot
recursive [boolean] recursively inherit the given property for all children.
revert [boolean] revert the property to the received value if one exists; otherwise operate as if the -S option was not specified.

New in version 2016.3.0.

CLI Example:
```
salt '*' zfs.inherit canmount myzpool/mydataset [recursive=True|False]
```

salt.modules.zfs.list_(name=None, **kwargs)
Return a list of all datasets or a specified dataset on the system and the values of their used, available, referenced, and mountpoint properties.

name [string] name of dataset, volume, or snapshot
recursive [boolean] recursively list children
depth [int] limit recursion to depth
properties [string] comma-separated list of properties to list, the name property will always be added
type [string] comma-separated list of types to display, where type is one of filesystem, snapshot, volume, bookmark, or all.

sort [string] property to sort on (default = name)
order [string [ascending|descending]] sort order (default = ascending)
parsable [boolean] display numbers in parsable (exact) values .. versionadded: 2018.3.0

New in version 2015.5.0.

CLI Example:
**salt.modules.zfs.list_mount()**

List mounted zfs filesystems

New in version 2018.3.1.

CLI Example:

```bash
salt '*' zfs.list_mount
```

The `list_mount()` function lists mounted ZFS filesystems.

**salt.modules.zfs.mount(name=None, **kwargs)**

Mounts ZFS file systems

- **name** (string) - name of the filesystem, having this set to None will mount all filesystems. (this is the default)
- **overlay** (boolean) - perform an overlay mount.
- **options** (string) - optional comma-separated list of mount options to use temporarily for the duration of the mount.

New in version 2016.3.0.

Changed in version 2018.3.1.

**Warning:** Passing `-a` as name is deprecated and will be removed in Sodium.

CLI Example:

```bash
salt '*' zfs.mount
salt '*' zfs.mount myzpool/mydataset
salt '*' zfs.mount myzpool/mydataset options=ro
```

**salt.modules.zfs.promote(name)**

Promotes a clone file system to no longer be dependent on its "origin" snapshot.

**Note:** This makes it possible to destroy the file system that the clone was created from. The clone parent-child dependency relationship is reversed, so that the origin file system becomes a clone of the specified file system.

The snapshot that was cloned, and any snapshots previous to this snapshot, are now owned by the promoted clone. The space they use moves from the origin file system to the promoted clone, so enough space must be available to accommodate these snapshots. No new space is consumed by this operation, but the space accounting is adjusted. The promoted clone must not have any conflicting snapshot names of its own. The rename subcommand can be used to rename any conflicting snapshots.

- **name** (string) - name of clone-filesystem

New in version 2016.3.0.

CLI Example:

```bash
salt '*' zfs.promote myzpool/myclone
```

**salt.modules.zfs.release(tag, *snapshot, **kwargs)**

Removes a single reference, named with the tag argument, from the specified snapshot or snapshots.
Note: The tag must already exist for each snapshot. If a hold exists on a snapshot, attempts to destroy that snapshot by using the zfs destroy command return EBUSY.

### zfs.release

#### Description

```
tag [string] name of tag
snapshot [string] name of snapshot(s)
recursive [boolean] recursively releases a hold with the given tag on the snapshots of all descendent file systems.
```

New in version 2016.3.0.

Changed in version 2018.3.1.

**Warning:** As of 2018.3.1 the tag parameter no longer accepts a comma-separated value. It’s is now possible to create a tag that contains a comma, this was impossible before.

**CLI Example:**

```
salt '*' zfs.release mytag myzpool/mydataset@mysnapshot
```

**CLI Example:**

```
salt '*' zfs.release mytag myzpool/mydataset@mysnapshot [recursive=True]
salt '*' zfs.release mytag myzpool/mydataset@mysnapshot myzpool/
    →mydataset@myothersnapshot
```

### zfs.rename

#### Description

Rename or Relocate a ZFS File System.

```
name [string] name of dataset, volume, or snapshot
new_name [string] new name of dataset, volume, or snapshot
force [boolean] force unmount any filesystems that need to be unmounted in the process.
create_parent [boolean] creates all the nonexistent parent datasets. Datasets created in this manner are automatically mounted according to the mountpoint property inherited from their parent.
recursive [boolean] recursively rename the snapshots of all descendent datasets. snapshots are the only dataset that can be renamed recursively.
```

New in version 2015.5.0.

**CLI Example:**

```
salt '*' zfs.rename myzpool/mydataset myzpool/renameddataset
```

### zfs.rollback

#### Description

Roll back the given dataset to a previous snapshot.

```
name [string] name of snapshot
recursive [boolean] destroy any snapshots and bookmarks more recent than the one specified.
recursive_all [boolean] destroy any more recent snapshots and bookmarks, as well as any clones of those snapshots.
force [boolean] used with the -R option to force an unmount of any clone file systems that are to be destroyed.
```

**Warning:** When a dataset is rolled back, all data that has changed since the snapshot is discarded, and the dataset reverts to the state at the time of the snapshot. By default, the command refuses to roll back to a snapshot other than the most recent one.

In order to do so, all intermediate snapshots and bookmarks must be destroyed by specifying the -r option.

New in version 2016.3.0.

**CLI Example:**

---

21.9. execution modules
Sets the property or list of properties to the given value(s) for each dataset.

**dataset** [string] name of snapshot(s), filesystem(s), or volume(s)

**properties** [string] additional zfs properties pairs

**Note:** properties are passed as key-value pairs. e.g. compression=off

**Note:** Only some properties can be edited.

See the Properties section for more information on what properties can be set and acceptable values.

Numeric values can be specified as exact values, or in a human-readable form with a suffix of B, K, M, G, T, P, E (for bytes, kilobytes, megabytes, gigabytes, terabytes, petabytes, or exabytes respectively).

New in version 2016.3.0.

**CLI Example:**

```
salt '*' zfs.set myzpool/mydataset compression=off
salt '*' zfs.set myzpool/mydataset myzpool/myotherdataset compression=lz4
salt '*' zfs.set myzpool/mydataset myzpool/myotherdataset canmount=off
```

Creates snapshots with the given names.

**snapshot** [string] name of snapshot(s)

**recursive** [boolean] recursively create snapshots of all descendent datasets.

**properties** [dict] additional zfs properties (-o)

**Note:** ZFS properties can be specified at the time of creation of the filesystem by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

```
properties='{"property1": "value1", "property2": "value2"}"
```

New in version 2016.3.0.

**CLI Example:**

```
salt '*' zfs.snapshot myzpool/mydataset@yesterday [recursive=True]
salt '*' zfs.snapshot myzpool/mydataset@yesterday myzpool/myotherdataset@yesterday [recursive=True]
```

Unmounts ZFS file systems

**name** [string] name of the filesystem, you can use None to unmount all mounted filesystems.

**force** [boolean] forcefully unmount the file system, even if it is currently in use.

**Warning:** Using -a for the name parameter will probably break your system, unless your rootfs is not on zfs.
New in version 2016.3.0.
Changed in version 2018.3.1.

**Warning:** Passing `-a` as name is deprecated and will be removed in Sodium.

CLI Example:
```
salt '*' zfs.unmount myzpool/mydataset [force=True|False]
```

## 21.9.494 salt.modules.zk_concurrency

Concurrency controls in zookeeper

**depends** kazoo

**configuration** See `salt.modules.zookeeper` for setup instructions.

This module allows you to acquire and release a slot. This is primarily useful for ensuring that no more than N hosts take a specific action at once. This can also be used to coordinate between masters.

salt.modules.zk_concurrency.lock(`path`, `zk_hosts=None`, `identifier=None`, `max_concurrency=1`, `timeout=None`, `ephemeral_lease=False`, `force=False`, `profile=None`, `scheme=None`, `username=None`, `password=None`, `default_acl=None`)

Get lock (with optional timeout)

**path** The path in zookeeper where the lock is

**zk_hosts** zookeeper connect string

**identifier** Name to identify this minion, if unspecified defaults to the hostname

**max_concurrency** Maximum number of lock holders

**timeout** timeout to wait for the lock. A None timeout will block forever

**ephemeral_lease** Whether the locks in zookeeper should be ephemeral

**force** Forcibly acquire the lock regardless of available slots

Example:

salt.modules.zk_concurrency.lock_holders(`path`, `zk_hosts=None`, `identifier=None`, `max_concurrency=1`, `timeout=None`, `ephemeral_lease=False`, `profile=None`, `scheme=None`, `username=None`, `password=None`, `default_acl=None`)

Return an un-ordered list of lock holders

**path** The path in zookeeper where the lock is

**zk_hosts** zookeeper connect string

**identifier** Name to identify this minion, if unspecified defaults to hostname

**max_concurrency** Maximum number of lock holders

**timeout** timeout to wait for the lock. A None timeout will block forever

**ephemeral_lease** Whether the locks in zookeeper should be ephemeral

Example:

salt.modules.zk_concurrency.party_members(`path`, `zk_hosts=None`, `min_nodes=1`, `blocking=False`, `profile=None`, `scheme=None`, `username=None`, `password=None`, `default_acl=None`)

Get the List of identifiers in a particular party, optionally waiting for the specified minimum number of nodes (`min_nodes`) to appear
**path**  The path in zookeeper where the lock is

**zk_hosts**  zookeeper connect string

**min_nodes**  The minimum number of nodes expected to be present in the party

**blocking**  The boolean indicating if we need to block until min_nodes are available

Example:

```python
salt.modules.zk_concurrency.unlock(path, zk_hosts=None, identifier=None, max_concurrency=1, ephemeral_lease=False, scheme=None, profile=None, user_name=None, password=None, default_acl=None)
```

Remove lease from semaphore

**path**  The path in zookeeper where the lock is

**zk_hosts**  zookeeper connect string

**identifier**  Name to identify this minion, if unspecified defaults to hostname

**max_concurrency**  Maximum number of lock holders

**timeout**  timeout to wait for the lock. A None timeout will block forever

**ephemeral_lease**  Whether the locks in zookeeper should be ephemeral

Example:

### 21.9.495 salt.modules.znc

znc - An advanced IRC bouncer

New in version 2014.7.0.

Provides an interface to basic ZNC functionality

```python
salt.modules.znc.buildmod("modules")
```

Build module using znc-buildmod

CLI Example:

```
salt '*' znc.buildmod module.cpp [...]  
```

```python
salt.modules.znc.dumpconf()
```

Write the active configuration state to config file

CLI Example:

```
salt '*' znc.dumpconf  
```

```python
salt.modules.znc.rehashconf()
```

Rehash the active configuration state from config file

CLI Example:

```
salt '*' znc.rehashconf  
```

```python
salt.modules.znc.version()
```

Return server version from znc -version

CLI Example:

```
salt '*' znc.version  
```

### 21.9.496 salt.modules.zoneadm

Module for Solaris 10's zoneadm
maintainer Jorge Schrauwen <sjorge@blackdot.be>
maturity new
platform OmniOS, OpenIndiana, SmartOS, OpenSolaris, Solaris 10

New in version 2017.7.0.

**Warning:** Oracle Solaris 11’s zoneadm is not supported by this module!

```python
salt.modules.zoneadm.attach(zone, force=False, brand_opts=None)
```
Attach the specified zone.

- **zone** [string] name of the zone
- **force** [boolean] force the zone into the "installed" state with no validation
- **brand_opts** [string] brand specific options to pass

CLI Example:

```
salt '*' zoneadm.attach lawrence
salt '*' zoneadm.attach lawrence True
```

```python
salt.modules.zoneadm.boot(zone, single=False, altinit=None, smf_options=None)
```
Boot (or activate) the specified zone.

- **zone** [string] name or uuid of the zone
- **single** [boolean] boots only to milestone svc:/milestone/single-user:default.
- **altinit** [string] valid path to an alternative executable to be the primordial process.
- **smf_options** [string] include two categories of options to control booting behavior of the service management facility: recovery options and messages options.

CLI Example:

```
salt '*' zoneadm.boot clementine
salt '*' zoneadm.boot maeve single=True
salt '*' zoneadm.boot teddy single=True smf_options=verbose
```

```python
salt.modules.zoneadm.clone(zone, source, snapshot=None)
```
Install a zone by copying an existing installed zone.

- **zone** [string] name of the zone
- **source** [string] zone to clone from
- **snapshot** [string] optional name of snapshot to use as source

CLI Example:

```
salt '*' zoneadm.clone clementine dolores
```

```python
salt.modules.zoneadm.detach(zone)
```
Detach the specified zone.

- **zone** [string] name or uuid of the zone

CLI Example:

```
salt '*' zoneadm.detach kissy
```

```python
salt.modules.zoneadm.halt(zone)
```
Halt the specified zone.

- **zone** [string] name or uuid of the zone

**Note:** To cleanly shutdown the zone use the shutdown function.

21.9. execution modules
CLI Example:
```
salt '*' zoneadm.halt hector
```

```
salt.modules.zoneadm.install(zone, nodataset=False, brand_opts=None)
```
Install the specified zone from the system.

- **zone** [string] name of the zone
- **nodataset** [boolean] do not create a ZFS file system
- **brand_opts** [string] brand specific options to pass

CLI Example:
```
salt '*' zoneadm.install dolores
salt '*' zoneadm.install teddy True
```

```
salt.modules.zoneadm.list_zones(verbatim=True, installed=False, configured=False, hide_global=True)
```
List all zones

- **verbatim** [boolean] display additional zone information
- **installed** [boolean] include installed zones in output
- **configured** [boolean] include configured zones in output
- **hide_global** [boolean] do not include global zone

CLI Example:
```
salt '*' zoneadm.list
```

```
salt.modules.zoneadm.move(zone, zonepath)
```
Move zone to new zonepath.

- **zone** [string] name or uuid of the zone
- **zonepath** [string] new zonepath

CLI Example:
```
salt '*' zoneadm.move meave /sweetwater/meave
```

```
salt.modules.zoneadm.ready(zone)
```
Prepares a zone for running applications.

- **zone** [string] name or uuid of the zone

CLI Example:
```
salt '*' zoneadm.ready clementine
```

```
salt.modules.zoneadm.reboot(zone, single=False, altinit=None, smf_options=None)
```
Restart the zone. This is equivalent to a halt boot sequence.

- **zone** [string] name or uuid of the zone
- **single** [boolean] boots only to milestone svc:/milestone/single-user:default.
- **altinit** [string] valid path to an alternative executable to be the primordial process.
- **smf_options** [string] include two categories of options to control booting behavior of the service management facility: recovery options and messages options.

CLI Example:
```
salt '*' zoneadm.reboot dolores
salt '*' zoneadm.reboot teddy single=True
```

```
salt.modules.zoneadm.shutdown(zone, reboot=False, single=False, altinit=None, smf_options=None)
```
Gracefully shutdown the specified zone.

- **zone** [string] name or uuid of the zone
- **reboot** [boolean] reboot zone after shutdown (equivalent of shutdown -i6 -g0 -y)
**single** [boolean] boots only to milestone svc:/milestone/single-user:default.

**altinit** [string] valid path to an alternative executable to be the primordial process.

**smf_options** [string] include two categories of options to control booting behavior of the service management facility: recovery options and messages options.

CLI Example:
```
salt '*' zoneadm.shutdown peter
salt '*' zoneadm.shutdown armistice reboot=True
```

salt.modules.zoneadm.uninstall(**zone**)
Uninstall the specified zone from the system.

**zone** [string] name or uuid of the zone

**Warning:** The -F flag is always used to avoid the prompts when uninstalling.

CLI Example:
```
salt '*' zoneadm.uninstall teddy
```

salt.modules.zoneadm.verify(**zone**)
Check to make sure the configuration of the specified zone can safely be installed on the machine.

**zone** [string] name of the zone

CLI Example:
```
salt '*' zoneadm.verify dolores
```

**21.9.497 salt.modules.zonecfg**

Module for Solaris 10's zonecfg

**maintainer** Jorge Schrauwen <sjorge@blackdot.be>

**maturity** new

**platform** OmniOS,OpenIndiana,SmartOS,OpenSolaris,Solaris 10

**depend** salt.modules.file

New in version 2017.7.0.

**Warning:** Oracle Solaris 11's zonecfg is not supported by this module!

salt.modules.zonecfg.add_resource(**zone**, **resource_type**, **kwargs**)
Add a resource

**zone** [string] name of zone

**resource_type** [string] type of resource

**kwargs** [string|int|...] resource properties

CLI Example:
```
salt '*' zonecfg.add_resource tallgeese rctl name=zone.max-locked-memory value='
→'(priv=privileged,limit=33554432,action=deny)' 
```

salt.modules.zonecfg.clear_property(**zone**, **key**)
Clear a property
zone [string] name of zone
key [string] name of property

CLI Example:
salt '*' zonecfg.clear_property deathscythe cpu-shares

salt.modules.zonecfg.create(zone, brand, zonepath, force=False)
Create an in-memory configuration for the specified zone.
zone [string] name of zone
brand [string] brand name
zonepath [string] path of zone
force [boolean] overwrite configuration

CLI Example:
salt '*' zonecfg.create deathscythe ipkg /zones/deathscythe

salt.modules.zonecfg.create_from_template(zone, template)
Create an in-memory configuration from a template for the specified zone.
zone [string] name of zone
template [string] name of template

Warning: existing config will be overwritten!

CLI Example:
salt '*' zonecfg.create_from_template leo tallgeese

salt.modules.zonecfg.delete(zone)
Delete the specified configuration from memory and stable storage.
zone [string] name of zone

CLI Example:
salt '*' zonecfg.delete epyon

salt.modules.zonecfg.export(zone, path=None)
Export the configuration from memory to stable storage.
zone [string] name of zone
path [string] path of file to export to

CLI Example:
salt '*' zonecfg.export epyon
salt '*' zonecfg.export epyon /zones/epyon.cfg

salt.modules.zonecfg.import_(zone, path)
Import the configuration to memory from stable storage.
zone [string] name of zone
path [string] path of file to export to

CLI Example:
salt '*' zonecfg.import epyon /zones/epyon.cfg

salt.modules.zonecfg.info(zone, show_all=False)
Display the configuration from memory
zone [string] name of zone
show_all [boolean] also include calculated values like capped-cpu, cpu-shares, ...
CLI Example:

```
salt '*/' zonecfg.info tallgeese
```

**salt.modules.zonecfg.remove_resource** (zone, resource_type, resource_key, resource_value)

Remove a resource

- **zone** [string] name of zone
- **resource_type** [string] type of resource
- **resource_key** [string] key for resource selection
- **resource_value** [string] value for resource selection

**Note:** Set resource_selector to None for resource that do not require one.

CLI Example:

```
salt '*/' zonecfg.remove_resource tallgeese rctl name zone.max-locked-memory
```

**salt.modules.zonecfg.set_property** (zone, key, value)

Set a property

- **zone** [string] name of zone
- **key** [string] name of property
- **value** [string] value of property

CLI Example:

```
salt '*/' zonecfg.set_property deathscythe cpu-shares 100
```

**salt.modules.zonecfg.update_resource** (zone, resource_type, resource_selector, **kwargs)

Add a resource

- **zone** [string] name of zone
- **resource_type** [string] type of resource
- **resource_selector** [string] unique resource identifier
- **kwargs** [string|int|…] resource properties

**Note:** Set resource_selector to None for resource that do not require one.

CLI Example:

```
salt '*/' zonecfg.update_resource tallgeese rctl name name=zone.max-locked-memory\value='(priv=privileged,limit=33554432,action=deny)'
```

21.9.498  **salt.modules.zookeeper**

**Zookeeper Module**

- **maintainer** SaltStack
- **maturity** new
- **platform** all
- **depends** kazoo

New in version 2018.3.0.
Configuration

**configuration** This module is not usable until the following are specified either in a pillar or in the minion’s config file:

```yaml
zookeeper:
    hosts: zoo1,zoo2,zoo3
    default_acl:
        - username: daniel
          password: test
          read: true
          write: true
          create: true
          delete: true
          admin: true
          username: daniel
          password: test
```

If configuration for multiple zookeeper environments is required, they can be set up as different configuration profiles. For example:

```yaml
zookeeper:
    prod:
        hosts: zoo1,zoo2,zoo3
        default_acl:
            - username: daniel
              password: test
              read: true
              write: true
              create: true
              delete: true
              admin: true
              username: daniel
              password: test
    dev:
        hosts:
            - dev1
            - dev2
            - dev3
        default_acl:
            - username: daniel
              password: test
              read: true
              write: true
              create: true
              delete: true
              admin: true
              username: daniel
              password: test
```

```python
salt.modules.zookeeper.create(path, value="", acls=None, ephemeral=False, sequence=False, makepath=False, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)
```

Create Znode

- **path** path of znode to create
- **value** value to assign to znode (Default: ")
- **acls** list of acl dictionaries to be assigned (Default: None)
- **ephemeral** indicate node is ephemeral (Default: False)
sequence indicate node is suffixed with a unique index (Default: False)
makepath Create parent paths if they do not exist (Default: False)
profile Configured Zookeeper profile to authenticate with (Default: None)
hosts Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')
scheme Scheme to authenticate with (Default: 'digest')
username Username to authenticate (Default: None)
password Password to authenticate (Default: None)
default_acl Default acls to assign if a node is created in this connection (Default: None)

CLI Example:

```
salt minion1 zookeeper.create /test/name daniel profile=prod
```

salt.modules.zookeeper.delete(path, version=-1, recursive=False, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)

Delete znode

path path to znode
version only delete if version matches (Default: -1 (always matches))
profile Configured Zookeeper profile to authenticate with (Default: None)
hosts Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')
scheme Scheme to authenticate with (Default: 'digest')
username Username to authenticate (Default: None)
password Password to authenticate (Default: None)
default_acl Default acls to assign if a node is created in this connection (Default: None)

CLI Example:

```
salt minion1 zookeeper.delete /test/name profile=prod
```

salt.modules.zookeeper.ensure_path(path, acls=None, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)

Ensure Znode path exists

path Parent path to create
acls list of acls dictionaries to be assigned (Default: None)
profile Configured Zookeeper profile to authenticate with (Default: None)
hosts Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')
scheme Scheme to authenticate with (Default: 'digest')
username Username to authenticate (Default: None)
password Password to authenticate (Default: None)
default_acl Default acls to assign if a node is created in this connection (Default: None)

CLI Example:

```
salt minion1 zookeeper.ensure_path /test/name profile=prod
```

salt.modules.zookeeper.exists(path, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)

Check if path exists

path path to check
profile Configured Zookeeper profile to authenticate with (Default: None)
hosts Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')
scheme Scheme to authenticate with (Default: 'digest')
username Username to authenticate (Default: None)
password Password to authenticate (Default: None)
default_acl Default acls to assign if a node is created in this connection (Default: None)

CLI Example:
salt.minion1 zookeeper.exists /test/name profile=prod

salt.modules.zookeeper.get(path, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)

Get value saved in znode
- **path**: path to check
- **profile**: Configured Zookeeper profile to authenticate with (Default: None)
- **hosts**: Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')
- **scheme**: Scheme to authenticate with (Default: 'digest')
- **username**: Username to authenticate (Default: None)
- **password**: Password to authenticate (Default: None)
- **default_acl**: Default acls to assign if a node is created in this connection (Default: None)

CLI Example:

```
salt minion1 zookeeper.get /test/name profile=prod
```

salt.modules.zookeeper.get_acls(path, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)

Get acls on a znode
- **path**: path to znode
- **profile**: Configured Zookeeper profile to authenticate with (Default: None)
- **hosts**: Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')
- **scheme**: Scheme to authenticate with (Default: 'digest')
- **username**: Username to authenticate (Default: None)
- **password**: Password to authenticate (Default: None)
- **default_acl**: Default acls to assign if a node is created in this connection (Default: None)

CLI Example:

```
salt minion1 zookeeper.get_acls /test/name profile=prod
```

salt.modules.zookeeper.get_children(path, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)

Get children in znode path
- **path**: path to check
- **profile**: Configured Zookeeper profile to authenticate with (Default: None)
- **hosts**: Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')
- **scheme**: Scheme to authenticate with (Default: 'digest')
- **username**: Username to authenticate (Default: None)
- **password**: Password to authenticate (Default: None)
- **default_acl**: Default acls to assign if a node is created in this connection (Default: None)

CLI Example:

```
salt minion1 zookeeper.get_children /test profile=prod
```

salt.modules.zookeeper.make_digest_acl(username, password, read=False, write=False, create=False, delete=False, admin=False, allperms=False)

Generate acl object

**Note**: This is heavily used in the zookeeper state and probably is not useful as a cli module

- **username**: username of acl
- **password**: plain text password of acl
- **read**: read acl
write write acl
create create acl
delete delete acl
admin admin acl
allperms set all other acls to True

CLI Example:
```
salt minion1 zookeeper.make_digest_acl username=daniel password=mypass
  → allperms=True
```

```
salt.modules.zookeeper.set(path, value, version=-1, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)
```

Update znode with new value
- **path** znode to update
- **value** value to set in znode
- **version** only update znode if version matches (Default: -1 (always matches))
- **profile** Configured Zookeeper profile to authenticate with (Default: None)
- **hosts** Lists of Zookeeper Hosts (Default: '127.0.0.1:2181)
- **scheme** Scheme to authenticate with (Default: 'digest')
- **username** Username to authenticate (Default: None)
- **password** Password to authenticate (Default: None)
- **default_acl** Default acls to assign if a node is created in this connection (Default: None)

CLI Example:
```
salt minion1 zookeeper.set /test/name gtmanfred profile=prod
```

```
salt.modules.zookeeper.set_acls(path, acls, version=-1, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)
```

Set acls on a znode
- **path** path to znode
- **acls** list of acl dictionaries to set on the znode
- **version** only set acls if version matches (Default: -1 (always matches))
- **profile** Configured Zookeeper profile to authenticate with (Default: None)
- **hosts** Lists of Zookeeper Hosts (Default: '127.0.0.1:2181)
- **scheme** Scheme to authenticate with (Default: 'digest')
- **username** Username to authenticate (Default: None)
- **password** Password to authenticate (Default: None)
- **default_acl** Default acls to assign if a node is created in this connection (Default: None)

CLI Example:
```
salt minion1 zookeeper.set_acls /test/name gtmanfred profile=prod
```

21.9.499 **salt.modules.zpool**

Module for running ZFS zpool command

- **codeauthor** Nitin Madhok <nmadhok@clemson.edu>, Jorge Schrauwen <sjorge@blackdot.be>
- **maintainer** Jorge Schrauwen <sjorge@blackdot.be>
- **maturity** new
- **depends** salt.utils.zfs
- **platform** illumos,freebsd,linux
Changed in version 2018.3.1: Big refactor to remove duplicate code, better type conversions and improved consistency in output.

```python
salt.modules.zpool.add(zpool, *vdevs, **kwargs)
    Add the specified vdev’s to the given storage pool
    zpool  [string] Name of storage pool
    vdevs  [string] One or more devices
    force  [boolean] Forces use of device

    CLI Example:
    salt '*' zpool.add myzpool /path/to/vdev1 /path/to/vdev2 [...]
```

```python
salt.modules.zpool.attach(zpool, device, new_device, force=False)
    Attach specified device to zpool
    zpool  [string] Name of storage pool
    device  [string] Existing device name too
    new_device  [string] New device name (to be attached to device)
    force  [boolean] Forces use of device

    CLI Example:
    salt '*' zpool.attach myzpool /path/to/vdev1 /path/to/vdev2 [...]
```

```python
salt.modules.zpool.clear(zpool, device=None)
    Clears device errors in a pool.

    Warning: The device must not be part of an active pool configuration.

    zpool  [string] name of storage pool
    device  [string] (optional) specific device to clear

    New in version 2018.3.1.

    CLI Example:
    salt '*' zpool.clear myzpool
    salt '*' zpool.clear myzpool /path/to/dev
```

```python
salt.modules.zpool.create(zpool, *vdevs, **kwargs)
    New in version 2015.5.0.
    Create a simple zpool, a mirrored zpool, a zpool having nested VDEVs, a hybrid zpool with cache, spare and log drives or a zpool with RAIDZ-1, RAIDZ-2 or RAIDZ-3
    zpool  [string] Name of storage pool
    vdevs  [string] One or move devices
    force  [boolean] Forces use of vdevs, even if they appear in use or specify a conflicting replication level.
    mountpoint  [string] Sets the mount point for the root dataset
    altroot  [string] Equivalent to "-o cachefile=none,altroot=root"
    properties  [dict] Additional pool properties
    filesystem_properties  [dict] Additional filesystem properties
    createboot  [boolean] create a boot partition

    New in version 2018.3.0.

    CLI Examples:
    salt '*' zpool.create myzpool /path/to/vdev1 [...][force=True|False]
    salt '*' zpool.create myzpool mirror /path/to/vdev1 /path/to/vdev2 [...][force=True|False]
```
Note: Zpool properties can be specified at the time of creation of the pool by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{"property1": 'value1', 'property2': 'value2'}"
```

Filename properties can be specified at the time of creation of the pool by passing an additional argument called "filesystem_properties" and specifying the properties with their respective values in the form of a python dictionary:

```
filesystem_properties="{"property1": 'value1', 'property2': 'value2'}"
```

Example:

```
salt '*' zpool.create myzpool /path/to/vdev1 [...] properties="{"property1": 'value1', 'property2': 'value2'}"
```

CLI Example:

```
salt '*' zpool.create myzpool /path/to/vdev1 [...] [force=True|False]
salt '*' zpool.create myzpool mirror /path/to/vdev1 /path/to/vdev2 [...] [force=True|False]
salt '*' zpool.create myzpool raidz1 /path/to/vdev1 /path/to/vdev2 raidz2 /path/to/vdev3 /path/to/vdev4 /path/to/vdev5 [...] [force=True|False]
salt '*' zpool.create myzpool mirror /path/to/vdev1 [...] mirror /path/to/vdev2 /path/to/vdev3 [...] [force=True|False]
salt '*' zpool.create myhybridzpool mirror /tmp/file1 [...] log mirror /path/to/vdev1 [...] cache /path/to/vdev2 [...] spare /path/to/vdev3 [...] [force=True|False]
```

```
salt.modules.zpool.create_file_vdev(size, *vdevs)
```

Creates file based virtual devices for a zpool

 CLI Example:

```
salt '*' zpool.create_file_vdev 7G /path/to/vdev1 [...] [force=True|False]
```

Note: Depending on file size, the above command may take a while to return.

```
salt.modules.zpool.destroy(zpool, force=False)
```

Destroys a storage pool

```
zpool [string] Name of storage pool
force [boolean] Force destroy of pool
```

 CLI Example:

```
salt '*' zpool.destroy myzpool [force=True|False]
```
salt ',*' zpool.destroy myzpool

salt.modules.zpool.detach(zpool, device)
    Detach specified device to zpool
    zpool [string] Name of storage pool
    device [string] Device to detach
    CLI Example:
    salt ',*' zpool.detach myzpool /path/to/vdev1

salt.modules.zpool.exists(zpool)
    Check if a ZFS storage pool is active
    zpool [string] Name of storage pool
    CLI Example:
    salt ',*' zpool.exists myzpool

salt.modules.zpool.export(*pools, **kwargs)
    New in version 2015.5.0.
    Export storage pools
    pools [string] One or more storage pools to export
    force [boolean] Force export of storage pools
    CLI Example:
    salt ',*' zpool.export myzpool ...
    salt ',*' zpool.export myzpool2 myzpool2 ...
    [force=True|False]

salt.modules.zpool.get(zpool, prop=None, show_source=False, parsable=True)
    New in version 2016.3.0.
    Retrieves the given list of properties
    zpool [string] Name of storage pool
    prop [string] Optional name of property to retrieve
    show_source [boolean] Show source of property
    parsable [boolean] Display numbers in parsable (exact) values
    New in version 2018.3.0.
    CLI Example:
    salt ',*' zpool.get myzpool

salt.modules.zpool.healthy()
    Check if all zpools are healthy
    New in version 2016.3.0.
    CLI Example:
    salt ',*' zpool.healthy

salt.modules.zpool.history(zpool=None, internal=False, verbose=False)
    New in version 2016.3.0.
    Displays the command history of the specified pools, or all pools if no pool is specified
    zpool [string] Optional storage pool
    internal [boolean] Toggle display of internally logged ZFS events
verbose [boolean] Toggle display of the user name, the hostname, and the zone in which the operation was performed

CLI Example:

```
salt '*' zpool.upgrade myzpool
```

**salt.modules.zpool.import_(zpool=None, new_name=None, **kwargs)**

New in version 2015.5.0.

Import storage pools or list pools available for import

- **zpool** [string] Optional name of storage pool
- **new_name** [string] Optional new name for the storage pool
- **mntopts** [string] Comma-separated list of mount options to use when mounting datasets within the pool.
- **force** [boolean] Forces import, even if the pool appears to be potentially active.
- **altroot** [string] Equivalent to "-o cachefile=none,altroot=root"
- **dir** [string] Searches for devices or files in dir, multiple dirs can be specified as follows: dir="dir1,dir2"
- **no_mount** [boolean] Import the pool without mounting any file systems.
- **only_destroyed** [boolean] Imports destroyed pools only. This also sets force=True.
- **recovery** [bool|str] false: do not try to recovery broken pools true: try to recovery the pool by rolling back the latest transactions test: check if a pool can be recovered, but don’t import it nolog: allow import without log device, recent transactions might be lost

**Note:** If feature flags are not support this forced to the default of 'false'

**Warning:** When recovery is set to 'test' the result will be have imported set to True if the pool can be imported. The pool might also be imported if the pool was not broken to begin with.

**properties** [dict] Additional pool properties

**Note:** Zpool properties can be specified at the time of creation of the pool by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{'property1': 'value1', 'property2': 'value2'}"
```

CLI Example:

```
salt '*' zpool.import [force=True|False]
salt '*' zpool.import myzpool [mynewzpool] [force=True|False]
salt '*' zpool.import myzpool dir='/tmp'
```

**salt.modules.zpool.iostat(zpool=None, sample_time=5, parsable=True)**

Display I/O statistics for the given pools

- **zpool** [string] optional name of storage pool
- **sample_time** [int] seconds to capture data before output default a sample of 5 seconds is used
- **parsable** [boolean] display data in pythonc values (True, False, Bytes,…)

New in version 2016.3.0.

Changed in version 2018.3.1: Added `parsable` parameter that defaults to True

CLI Example:

```
salt '*' zpool.iostat myzpool
```
salt.modules.zpool.labelclear

New in version 2018.3.0.

Removes ZFS label information from the specified device

**device** [string] Device name; must not be part of an active pool configuration.

**force** [boolean] Treat exported or foreign devices as inactive

CLI Example:

```shell
salt '*' zpool.labelclear /path/to/dev
```

salt.modules.zpool.list_

New in version 2015.5.0.

Return information about (all) storage pools

**zpool** [string] optional name of storage pool

**properties** [string] comma-separated list of properties to list

**parsable** [boolean] display numbers in parsable (exact) values

New in version 2018.3.0.

**Note:** The *name* property will always be included, while the *frag* property will get removed if not available

**zpool** [string] optional zpool

**Note:** Multiple storage pool can be provided as a space separated list

CLI Example:

```shell
salt '*' zpool.list
salt '*' zpool.list zpool=tank
salt '*' zpool.list 'size,free'
salt '*' zpool.list 'size,free' tank
```

salt.modules.zpool.offline

New in version 2015.5.0.

Ensure that the specified devices are offline

**Warning:** By default, the OFFLINE state is persistent. The device remains offline when the system is rebooted. To temporarily take a device offline, use temporary=True.

**zpool** [string] name of storage pool

**vdevs** [string] One or more devices

**temporary** [boolean] Enable temporarily offline

CLI Example:

```shell
salt '*' zpool.offline myzpool /path/to/vdev1 [...] [temporary=True|False]
```

salt.modules.zpool.online

New in version 2015.5.0.

Ensure that the specified devices are online

**zpool** [string] name of storage pool

**vdevs** [string] one or more devices
**expand** [boolean] Expand the device to use all available space.

*Note:* If the device is part of a mirror or raidz then all devices must be expanded before the new space will become available to the pool.

CLI Example:

```
salt '*' zpool.online myzpool /path/to/vdev1 [...]
```

**salt.modules.zpool.reguid(zpool)**

Generates a new unique identifier for the pool

*Warning:* You must ensure that all devices in this pool are online and healthy before performing this action.

**zpool** [string] name of storage pool

New in version 2016.3.0.

CLI Example:

```
salt '*' zpool.reguid myzpool
```

**salt.modules.zpool.reopen(zpool)**

Reopen all the vdevs associated with the pool

**zpool** [string] name of storage pool

New in version 2016.3.0.

CLI Example:

```
salt '*' zpool.reopen myzpool
```

**salt.modules.zpool.replace(zpool, old_device, new_device=None, force=False)**

Replaces `old_device` with `new_device`

*Note:* This is equivalent to attaching `new_device`, waiting for it to resilver, and then detaching `old_device`.

The size of `new_device` must be greater than or equal to the minimum size of all the devices in a mirror or raidz configuration.

**zpool** [string] Name of storage pool

**old_device** [string] Old device to replace

**new_device** [string] Optional new device

**force** [boolean] Forces use of `new_device`, even if its appears to be in use.

CLI Example:

```
salt '*' zpool.replace myzpool /path/to/vdev1 /path/to/vdev2
```

**salt.modules.zpool.scrub(zpool, stop=False, pause=False)**

Scrub a storage pool

**zpool** [string] Name of storage pool

**stop** [boolean] If True, cancel ongoing scrub
pause  [boolean] If True, pause ongoing scrub

New in version 2018.3.0.

Note: Pause is only available on recent versions of ZFS.

If both pause and stop are True, then stop will win.

CLI Example:

```
salt '*' zpool.scrub myzpool
```

salt.modules.zpool.set(zpool, prop, value)

Sets the given property on the specified pool

- **zpool** [string] Name of storage pool
- **prop** [string] Name of property to set
- **value** [string] Value to set for the specified property

New in version 2016.3.0.

CLI Example:

```
salt '*' zpool.set myzpool readonly yes
```

salt.modules.zpool.split(zpool, newzpool, **kwargs)

Splits devices off pool creating newpool.

Note: All vdevs in pool must be mirrors. At the time of the split, newzpool will be a replica of zpool.

After splitting, do not forget to import the new pool!

- **zpool** [string] Name of storage pool
- **newzpool** [string] Name of new storage pool
- **mountpoint** [string] Sets the mount point for the root dataset
- **altroot** [string] Sets altroot for newzpool
- **properties** [dict] Additional pool properties for newzpool

CLI Examples:

```
salt '*' zpool.split datamirror databackup
salt '*' zpool.split datamirror databackup altroot=/backup
```

Note: Zpool properties can be specified at the time of creation of the pool by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{'property1': 'value1', 'property2': 'value2'}"
```

Example:

```
salt '*' zpool.split datamirror databackup properties="{'readonly': 'on'}"
```

CLI Example:
salt.modules.zpool.status(zpool=None)

Return the status of the named zpool

zpool [string] optional name of storage pool

New in version 2016.3.0.

CLI Example:
salt '*' zpool.status myzpool

salt.modules.zpool.upgrade(zpool=None, version=None)

New in version 2016.3.0.

Enables all supported features on the given pool

zpool [string] Optional storage pool, applies to all otherwise

version [int] Version to upgrade to, if unspecified upgrade to the highest possible

**Warning:** Once this is done, the pool will no longer be accessible on systems that do not support feature flags. See zpool-features(5) for details on compatibility with systems that support feature flags, but do not support all features enabled on the pool.

CLI Example:
salt '*' zpool.upgrade myzpool

---

21.9.500  
salt.modules.zypperpkg

Package support for openSUSE via the zypper package manager

depends

- rpm Python module. Install with zypper install rpm-python

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see [here](#).

class salt.modules.zypperpkg.Wildcard(zypper)

New in version 2017.7.0.

Converts string wildcard to a zypper query. .. rubric:: Example

'1.2.3.4' is '1.2.3.4.whatever.is.here' and is equal to: '1.2.3.4 >= and < 1.2.3.5'

Parameters

ptn – Pattern

Returns

Query range

Z_OP = ['<', '<=', '=', '>=', '>', '']

salt.modules.zypperpkg.add_lock(packages, **kwargs)

Add a package lock. Specify packages to lock by exact name.

CLI Example:
salt ' '*' pkg.add_lock <package name>
salt ' '*' pkg.add_lock <package1>,<package2>,<package3>
salt ' '* pkg.add_lock pkgs=['"foo", "bar"]'

salt.modules.zypperpkg.clean_locks()
Remove unused locks that do not currently (with regard to repositories used) lock any package.

CLI Example:
salt ' '*' pkg.clean_locks

salt.modules.zypperpkg.del_repo(repo)
Delete a repo.

CLI Examples:
salt ' '*' pkg.del_repo alias

salt.modules.zypperpkg.diff(*paths)
Return a formatted diff between current files and original in a package. NOTE: this function includes all files (configuration and not), but does not work on binary content.

Parameters path – Full path to the installed file

Returns Difference string or raises and exception if examined file is binary.

CLI example:
salt ' '*' pkg.diff /etc/apache2/httpd.conf /etc/sudoers

salt.modules.zypperpkg.download(*packages,**kwargs)
Download packages to the local disk.
refresh force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

CLI example:
salt ' '*' pkg.download httpd
salt ' '*' pkg.download httpd postfix

salt.modules.zypperpkg.file_dict(*packages)
List the files that belong to a package, grouped by package. Not specifying any packages will return a list of every file on the system’s rpm database (not generally recommended).

CLI Examples:
salt ' '*' pkg.file_list httpd
salt ' '*' pkg.file_list httpd postfix
salt ' '*' pkg.file_list

salt.modules.zypperpkg.file_list(*packages)
List the files that belong to a package. Not specifying any packages will return a list of every file on the system’s rpm database (not generally recommended).

CLI Examples:
salt ' '*' pkg.file_list httpd
salt ' '*' pkg.file_list httpd postfix
salt ' '*' pkg.file_list

salt.modules.zypperpkg.get_repo(repo,**kwargs)
Display a repo.
CLI Example:

```
salt '*' pkg.get_repo alias
```

code

```python
salt.modules.zypperpkg.info_available('names', **kwargs)
```

Return the information of the named package available for the system.

- **refresh** force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed or not.

CLI example:

```
salt '*' pkg.info_available <package1>
salt '*' pkg.info_available <package1> <package2> <package3> ...
```

code

```python
salt.modules.zypperpkg.info_installed('names', **kwargs)
```

Return the information of the named package(s), installed on the system.

Parameters

- **names** – Names of the packages to get information about.
- **attr** – Comma-separated package attributes. If no 'attr' is specified, all available attributes returned.
  
  **Valid attributes are:** version, vendor, release, build_date, build_date_time_t, install_date, install_date_time_t, build_host, group, source_rpm, arch, epoch, size, license, signature, packager, url, summary, description.

- **errors** – Handle RPM field errors. If 'ignore' is chosen, then various mistakes are simply ignored and omitted from the texts or strings. If 'report' is chosen, then a field with a mistake is not returned, instead a 'N/A (broken)' (not available, broken) text is placed.
  
  **Valid attributes are:** ignore, report

- **all_versions** – Include information for all versions of the packages installed on the minion.

CLI example:

```
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
salt '*' pkg.info_installed <package1> <package2> <package3> <package4> all_versions=True
salt '*' pkg.info_installed <package1> <package2> <package3> <package4> attr=version,vendor all_versions=True
salt '*' pkg.info_installed <package1> <package2> <package3> <package4> attr=version, --vendor
salt '*' pkg.info_installed <package1> <package2> <package3> <package4> attr=version, --vendor errors=ignore
salt '*' pkg.info_installed <package1> <package2> <package3> <package4> attr=version, --vendor errors=report
```

code

```python
salt.modules.zypperpkg.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, downloadonly=None, skip_verify=False, version=None, ignore_repo_failure=False, **kwargs)
```

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any zypper commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Install the passed package(s), add refresh=True to force a 'zypper refresh' before package is installed.

- **name** The name of the package to be installed. Note that this parameter is ignored if either pkgs or sources is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the sources option.
CLI Example:

```
salt '*' pkg.install <package name>
```

**refresh** force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

**fromrepo** Specify a package repository to install from.

**downloadonly** Only download the packages, do not install.

**skip_verify** Skip the GPG verification check (e.g., `--no-gpg-checks`)

**version** Can be either a version number, or the combination of a comparison operator (`<`, `>`, `<=`, `>=`, `=`) and a version number (ex. `'>1.2.3-4'`). This parameter is ignored if **pkgs** or **sources** is passed.

**resolve_capabilities** If this option is set to True zypper will take capabilities into account. In this case names which are just provided by a package will get installed. Default is False.

Multiple Package Installation Options:

**pkgs** A list of packages to install from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version. As with the **version** parameter above, comparison operators can be used to target a specific version of a package.

CLI Examples:

```
salt '*' pkg.install pkgs=[["foo", "bar"]]
salt '*' pkg.install pkgs=[["foo", {"bar": "1.2.3-4"}]]
salt '*' pkg.install pkgs=[["foo", {"bar": "<1.2.3-4"}]]
```

**sources** A list of RPM packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources=[{"foo": "salt://foo.rpm"},{"bar": "salt://bar.rpm"}]
```

**ignore_repo_failure** Zypper returns error code 106 if one of the repositories are not available for various reasons. In case to set strict check, this parameter needs to be set to True. Default: False.

**diff_attr** If a list of package attributes is specified, returned value will contain them, eg:

```
{"<package>": {
  'old': {
    'version': '<old-version>',
    'arch': '<old-arch>'},
  'new': {
    'version': '<new-version>',
    'arch': '<new-arch>'}}
```

Valid attributes are: epoch, version, release, arch, install_date, install_date_time_t.

If all is specified, all valid attributes will be returned.

New in version 2018.3.0.

Returns a dict containing the new package names and versions:

```
{"<package>": {
  'old': '<old-version>',
  'new': '<new-version>'}}
```

If an attribute list is specified in **diff_attr**, the dict will also contain any specified attribute, eg:
salt.modules.zypperpkg.latest_version(*names, **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty dict will be returned for that package. refresh force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed or not.

CLI example:

```bash
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.zypperpkg.list_downloaded()

New in version 2017.7.0.

List prefetched packages downloaded by Zypper in the local disk.

CLI example:

```bash
salt '*' pkg.list_downloaded
```

salt.modules.zypperpkg.list_installed_patches()

New in version 2017.7.0.

List installed advisory patches on the system.

CLI Examples:

```bash
salt '*' pkg.list_installed_patches
```

salt.modules.zypperpkg.list_installed_patterns()

List installed patterns on the system.

CLI Examples:

```bash
salt '*' pkg.list_installed_patterns
```

salt.modules.zypperpkg.list_locks()

List current package locks.

Return a dict containing the locked package with attributes:

```json
{'<package>']: {'case_sensitive': '<case_sensitive>',
'match_type': '<match_type>',
'type': '<type>'}}
```

CLI Example:

```bash
salt '*' pkg.list_locks
```
salt.modules.zypperpkg.list_patches(refresh=False)

New in version 2017.7.0.

List all known advisory patches from available repos.

refresh force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

CLI Examples:

```
salt '*' pkg.list_patches
```

salt.modules.zypperpkg.list_patterns(refresh=False)

List all known patterns from available repos.

refresh force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

CLI Examples:

```
salt '*' pkg.list_patterns
```

salt.modules.zypperpkg.list_pkgs(versions_as_list=False, **kwargs)

List the packages currently installed as a dict. By default, the dict contains versions as a comma separated string:

```
{'<package_name>': '<version>[,<version>...]'}
```

**versions_as_list:** If set to true, the versions are provided as a list

```
{'<package_name>': ['<version>', '<version>']}
```

**attr:** If a list of package attributes is specified, returned value will contain them in addition to version, eg.:

```
{'<package_name>': [{'version': 'version', 'arch': 'arch'}]}
```

Valid attributes are: epoch, version, release, arch, install_date, install_date_time_t.

If all is specified, all valid attributes will be returned.

New in version 2018.3.0.

removed: not supported

purge_desired: not supported

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs attr=version,arch
salt '*' pkg.list_pkgs attr=["version", "arch"]
```

salt.modules.zypperpkg.list_products(all=False, refresh=False)

List all available or installed SUSE products.

all List all products available or only installed. Default is False.

refresh force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

Includes handling for OEM products, which read the OEM productline file and overwrite the release value.

CLI Examples:

```
salt '*' pkg.list_products
salt '*' pkg.list_products all=True
```

salt.modules.zypperpkg.list_provides(**kwargs)

New in version 2018.3.0.

List package provides of installed packages as a dict. {'<provided_name>': ['<package_name>', '<package_name>', ...]}

```
CLI Examples:

```
salt '*' pkg.list_provides
```

```
salt.modules.zypperpkg.list_repo_pkgs("*", **kwargs)
```

New in version 2017.7.5, 2018.3.1.

Returns all available packages. Optionally, package names (and name globs) can be passed and the results will be filtered to packages matching those names. This is recommended as it speeds up the function considerably.

This function can be helpful in discovering the version or repo to specify in a `pkg.installed` state.

The return data will be a dictionary mapping package names to a list of version numbers, ordered from newest to oldest. If `byrepo` is set to `True`, then the return dictionary will contain repository names at the top level, and each repository will map packages to lists of version numbers. For example:

```
# With byrepo=False (default)
{
  'bash': ['4.3-83.3.1', '4.3-82.6'],
  'vim': ['7.4.326-12.1']
}

{'OSS': {
  'bash': ['4.3-82.6'],
  'vim': ['7.4.326-12.1']
},
'OSS Update': {
  'bash': ['4.3-83.3.1']
}}
```

```
fromrepo [None] Only include results from the specified repo(s). Multiple repos can be specified, comma-separated.
```

```
byrepo [False] When True, the return data for each package will be organized by repository.
```

CLI Examples:

```
salt '*' pkg.list_repo_pkgs
salt '*' pkg.list_repo_pkgs foo bar baz
salt '*' pkg.list_repo_pkgs 'python2-*' byrepo=True
salt '*' pkg.list_repo_pkgs 'python2-*' fromrepo='OSS Updates'
```

```
salt.modules.zypperpkg.list_repos()
```

Lists all repos.

CLI Example:

```
salt '*' pkg.list_repos
```

```
salt.modules.zypperpkg.list_upgrades(refresh=True, **kwargs)
```

List all available package upgrades on this system.

```
refresh force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed.
```

CLI Example:

```
salt '*' pkg.list_upgrades
```

```
salt.modules.zypperpkg.mod_repo(repo, **kwargs)
```

Modify one or more values for a repo. If the repo does not exist, it will be created, so long as the following values are specified:
repo or alias alias by which Zypper refers to the repo
url, mirrorlist or baseurl the URL for Zypper to reference
enabled Enable or disable (True or False) repository, but do not remove if disabled.
refresh Enable or disable (True or False) auto-refresh of the repository.
cache Enable or disable (True or False) RPM files caching.
gpgcheck Enable or disable (True or False) GPG check for this repository.
gpgautoimport [False] If set to True, automatically trust and import public GPG key for the repository.

Key/Value pairs may also be removed from a repo's configuration by setting a key to a blank value. Bear in mind that a name cannot be deleted, and a URL can only be deleted if a mirrorlist is specified (or vice versa).

CLI Examples:

```
salt '*' pkg.mod_repo alias alias=new_alias
salt '*' pkg.mod_repo alias url= mirrorlist=http://host.com/
```

salt.modules.zypperpkg.modified("packages", "flags")
List the modified files that belong to a package. Not specifying any packages will return a list of _all_ modified files on the system's RPM database.

New in version 2015.5.0.

Filtering by flags (True or False):
size Include only files where size changed.
mode Include only files which file's mode has been changed.
checksum Include only files which MD5 checksum has been changed.
device Include only files which major and minor numbers has been changed.
symlink Include only files which are symbolic link contents.
owner Include only files where owner has been changed.
group Include only files where group has been changed.
time Include only files where modification time of the file has been changed.
capabilities Include only files where capabilities differ or not. Note: supported only on newer RPM versions.

CLI Examples:

```
salt '*' pkg.modified
salt '*' pkg.modified httpd
salt '*' pkg.modified httpd postfix
salt '*' pkg.modified httpd owner=True group=False
```

salt.modules.zypperpkg.normalize_name(name)
Strips the architecture from the specified package name, if necessary. Circumstances where this would be done include:
• If the arch is 32 bit and the package name ends in a 32-bit arch.
• If the arch matches the OS arch, or is noarch.

CLI Example:

```
salt '*' pkg.normalize_name zsh.x86_64
```

salt.modules.zypperpkg.owner(paths)
Return the name of the package that owns the file. Multiple file paths can be passed. If a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Examples:
```
salt '*' pkg.owner /usr/bin/apachectl
salt '*' pkg.owner /usr/bin/apachectl /etc/httpd/conf/httpd.conf
```

salt.modules.zypperpkg.purge(name=None, pkgs=None, **kwargs)

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any zypper commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Recursively remove a package and all dependencies which were installed with it, this will call a zypper remove -u name remove -u

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

salt.modules.zypperpkg.refresh_db()

Force a repository refresh by calling zypper refresh --force, return a dict:

```
{
'<database name>': Bool
}
```

CLI Example:

```
salt '*' pkg.refresh_db
```

salt.modules.zypperpkg.remove(name=None, pkgs=None, **kwargs)

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any zypper commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Remove packages with zypper remove -n remove

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```
salt.modules.zypperpkg.remove_lock\(packages, **kwargs\)
Remove specified package lock.

CLI Example:

```
salt '*' pkg.remove_lock <package name>
salt '*' pkg.remove_lock <package1>,<package2>,<package3>
salt '*' pkg.remove_lock pkgs=['"foo", "bar"]
```

salt.modules.zypperpkg.resolve_capabilities\(pkgs, refresh, **kwargs\)
New in version 2018.3.0.
Convert name provides in pkgs into real package names if resolve_capabilities parameter is set to True. In case of resolve_capabilities is set to False the package list is returned unchanged.

refresh force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

resolve_capabilities If this option is set to True the input will be checked if a package with this name exists. If not, this function will search for a package which provides this name. If one is found the output is exchanged with the real package name. In case this option is set to False (Default) the input will be returned unchanged.

CLI Examples:

```
salt '*' pkg.resolve_capabilities resolve_capabilities=True w3m_ssl
```

salt.modules.zypperpkg.search\(criteria, refresh=False, **kwargs\)
List known packages, available to the system.

refresh force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

match (str) One of exact, words, substrings. Search for an exact match or for the whole words only. Default to substrings to patch partial words.

provides (bool) Search for packages which provide the search strings.

requires (bool) Search for packages which require the search strings.

suggests (bool) Search for packages which suggest the search strings.

conflicts (bool) Search packages conflicting with search strings.

obsoletes (bool) Search for packages which obsolete the search strings.

file_list (bool) Search for a match in the file list of packages.

search_descriptions (bool) Search also in package summaries and descriptions.

case_sensitive (bool) Perform case-sensitive search.

installed_only (bool) Show only installed packages.

not_installed_only (bool) Show only packages which are not installed.

details (bool) Show version and repository

CLI Examples:

```
salt '*' pkg.search <criteria>
```

salt.modules.zypperpkg.upgrade\(refresh=True, dryrun=False, dist_upgrade=False, fromrepo=None, novendorchange=False, skip_verify=False, **kwargs\)
Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon’s control group. This is done to keep systemd from killing any zypper commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Run a full system upgrade, a zypper upgrade

refresh force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed.

dryrun If set to True, it creates a debug solver log file and then perform a dry-run upgrade (no changes are made). Default: False
**dist_upgrade** Perform a system dist-upgrade. Default: False
**fromrepo** Specify a list of package repositories to upgrade from. Default: None
**novendorchange** If set to True, no allow vendor changes. Default: False
**skip_verify** Skip the GPG verification check (e.g., --no-gpg-checks)

Returns a dictionary containing the changes:

```
{
    '<package>': {
        'old': '<old-version>',
        'new': '<new-version>'
    }
}
```

**CLI Example:**
```
salt '*' pkg.upgrade
salt '*' pkg.upgrade dist-upgrade=True fromrepo=['"MyRepoName"']
~novendorchange=True
salt '*' pkg.upgrade dist-upgrade=True dryrun=True
```

salt.modules.zypperpkg.**upgrade_available**(name, **kwargs)
Check whether or not an upgrade is available for a given package
**refresh** force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed or not.

**CLI Example:**
```
salt '*' pkg.upgrade_available <package name>
```

salt.modules.zypperpkg.**verify**(names, **kwargs)
Runs an rpm -Va on a system, and returns the results in a dict
Files with an attribute of config, doc, ghost, license or readme in the package header can be ignored using the ignore_types keyword argument

**CLI Example:**
```
salt '*' pkg.verify httpd
salt '*' pkg.verify httpd postfix
salt '*' pkg.verify 'httpd postfix' ignore_types=['config','doc']
```

salt.modules.zypperpkg.**version**(names, **kwargs)
Returns a string representing the package version or an empty dict if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

**CLI Example:**
```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

salt.modules.zypperpkg.**version_cmp**(ver1, ver2, ignore_epoch=False)
Do a cmp-style comparison on two packages. Return -1 if ver1 < ver2, 0 if ver1 == ver2, and 1 if ver1 > ver2.
Return None if there was a problem making the comparison.
**ignore_epoch** [False] Set to True to ignore the epoch when comparing versions

**New in version 2015.8.10,2016.3.2.**

**CLI Example:**
```
salt '*' pkg.version_cmp '0.2-001' '0.2.0.1-002'
```

A REST API for Salt

depends

- CherryPy Python module.

Note: there is a known SSL traceback for CherryPy versions 3.2.5 through 3.7.x. Please use version 3.2.3 or the latest 10.x version instead.
optdepends

• ws4py Python module for websockets support.

client_libraries

• Java: https://github.com/SUSE/salt-netapi-client
• Python: https://github.com/saltstack/pepper

setup All steps below are performed on the machine running the Salt Master daemon. Configuration goes into the Master configuration file.

1. Install salt-api. (This step varies between OS and Linux distros. Some package systems have a split package, others include salt-api in the main Salt package. Ensure the salt-api --version output matches the salt --version output.)

2. Install CherryPy. (Read the version caveat in the section above.)

Using a secure HTTPS connection is strongly recommended since Salt eauth authentication credentials will be sent over the wire.

1. Install the PyOpenSSL package.

2. Generate a self-signed certificate using the create_self_signed_cert() execution function.

   salt-call --local tls.create_self_signed_cert

4. Edit the master config to create at least one external auth user or group following the full external auth instructions.

5. Edit the master config with the following production-ready example to enable the rest_cherrypy module. (Adjust cert paths as needed, or disable SSL (not recommended!).)

   rest_cherrypy:
   port: 8000
   ssl_crt: /etc/pki/tls/certs/localhost.crt
   ssl_key: /etc/pki/tls/certs/localhost.key

6. Restart the salt-master daemon.

7. Start the salt-api daemon.

configuration All available configuration options are detailed below. These settings configure the CherryPy HTTP server and do not apply when using an external server such as Apache or Nginx.

port Required

The port for the webserver to listen on.

host [0.0.0.0] The socket interface for the HTTP server to listen on.

debug [False] Starts the web server in development mode. It will reload itself when the underlying code is changed and will output more debugging info.

log_access_file Path to a file to write HTTP access logs.

   New in version 2016.11.0.

log_error_file Path to a file to write HTTP error logs.

   New in version 2016.11.0.
ssl_crt The path to a SSL certificate. (See below)
ssl_key The path to the private key for your SSL certificate. (See below)
ssl_chain (Optional when using PyOpenSSL) the certificate chain to pass to Context.
load_verify_locations.
disable_ssl A flag to disable SSL. Warning: your Salt authentication credentials will be sent in
the clear!
webhook_disable_auth [False] The Webhook URL requires authentication by default but external
services cannot always be configured to send authentication. See the Webhook document-
ation for suggestions on securing this interface.
webhook_url [/hook] Configure the URL endpoint for the Webhook entry point.
thread_pool [100] The number of worker threads to start up in the pool.
socket_queue_size [30] Specify the maximum number of HTTP connections to queue.
expire_responses [True] Whether to check for and kill HTTP responses that have exceeded the
default timeout.
   Deprecated since version 2016.11.9,2017.7.3,2018.3.0: The "expire_responses" configuration
   setting, which corresponds to the timeout_monitor setting in CherryPy, is no longer
   supported in CherryPy versions >= 12.0.0.
max_request_body_size [1048576] Maximum size for the HTTP request body.
collect_stats [False] Collect and report statistics about the CherryPy server
   Reports are available via the Stats URL.
stats_disable_auth [False] Do not require authentication to access the /stats endpoint.
   New in version 2018.3.0.
static A filesystem path to static HTML/JavaScript/CSS/image assets.
static_path [/static] The URL prefix to use when serving static assets out of the directory
specified in the static setting.
enable_sessions [True] Enable or disable all endpoints that rely on session cookies. This can be
useful to enforce only header-based authentication.
   New in version 2017.7.0.
app [/index.html] A filesystem path to an HTML file that will be served as a static file. This is
useful for bootstrapping a single-page JavaScript app.
   Warning! If you set this option to a custom web application, anything that uses cookie-based
authentication is vulnerable to XSRF attacks. Send the custom X-Auth-Token header
instead and consider disabling the enable_sessions setting.
   Changed in version 2017.7.0: Add a proof-of-concept JavaScript single-page app.
app_path [/app] The URL prefix to use for serving the HTML file specified in the app setting.
   This should be a simple name containing no slashes.
   Any path information after the specified path is ignored; this is useful for apps that utilize
the HTML5 history API.
root_prefix [/] A URL path to the main entry point for the application. This is useful for serving
multiple applications from the same URL.
Authentication

Authentication is performed by passing a session token with each request. Tokens are generated via the Login URL.

The token may be sent in one of two ways: as a custom header or as a session cookie. The latter is far more convenient for clients that support cookies.

- Include a custom header named \texttt{X-Auth-Token}.

For example, using curl:

```
curl -sSk https://localhost:8000/login
  -H 'Accept: application/x-yaml'
  -d username=saltdev
  -d password=saltdev
```

```
\texttt{-d eauth=pam}
```

Copy the token value from the output and include it in subsequent requests:

```
curl -sSk https://localhost:8000
  -H 'Accept: application/x-yaml'
  -H 'X-Auth-Token: 697adbdc8fe971d09ae4c2a3add7248859c87079'
  -d client=local
  -d tgt='*'
  -d fun=test.ping
```

- Sent via a cookie. This option is a convenience for HTTP clients that automatically handle cookie support (such as browsers).

For example, using curl:

```
# Write the cookie file:
curl -sSk https://localhost:8000/login
  -c ~/cookies.txt
  -H 'Accept: application/x-yaml'
  -d username=saltdev
  -d password=saltdev
  -d eauth=auto

# Read the cookie file:
curl -sSk https://localhost:8000
  -b ~/cookies.txt
  -H 'Accept: application/x-yaml'
  -d client=local
  -d tgt='*'
  -d fun=test.ping
```

Another example using the \texttt{requests} library in Python:

```
>>> import requests
>>> session = requests.Session()
>>> session.post('http://localhost:8000/login', json={
  'username': 'saltdev',
  'password': 'saltdev',
  'eauth': 'auto',
})
<Response [200]>
```

(continues on next page)

You can bypass the session handling via the Run URL.

Usage

This interface directly exposes Salt’s Python API. Everything possible at the CLI is possible through the Python API. Commands are executed on the Salt Master.

The root URL (/) is RPC-like in that it accepts instructions in the request body for what Salt functions to execute, and the response contains the result of those function calls.

For example:

```
% curl -sSi https://localhost:8000 -H 'Content-type: application/json' \
   -d '{{
       "client": "local",
       "tgt": ":*",
       "fun": "test.ping",
       "arg": null
     }}'
HTTP/1.1 200 OK
Content-Type: application/json
[...snip...]
{"return": [{"jerry": true}]}
```

The request body must be an array of commands. Use this workflow to build a command:

1. Choose a client interface.
2. Choose a function.
3. Fill out the remaining parameters needed for the chosen client.

The client field is a reference to the main Python classes used in Salt’s Python API. Read the full Client APIs documentation, but in short:

- "local" uses LocalClient which sends commands to Minions. Equivalent to the salt CLI command.
- "runner" uses RunnerClient which invokes runner modules on the Master. Equivalent to the salt-run CLI command.
- "wheel" uses WheelClient which invokes wheel modules on the Master. Wheel modules do not have a direct CLI equivalent but they typically manage Master-side resources such as state files, pillar files, the Salt config files, and the key wheel module exposes similar functionality as the salt-key CLI command.
Most clients have variants like synchronous or asynchronous execution as well as others like batch execution. See the full list of client interfaces.

Each client requires different arguments and sometimes has different syntax. For example, `LocalClient` requires the `tgt` argument because it forwards the command to Minions and the other client interfaces do not. `LocalClient` also takes `arg` (array) and `kTARGET` (dictionary) arguments because these values are sent to the Minions and used to execute the requested function there. `RunnerClient` and `WheelClient` are executed directly on the Master and thus do not need or accept those arguments.

Read the method signatures in the client documentation linked above, but hopefully an example will help illustrate the concept. This example causes Salt to execute two functions – the `test.arg execution function` using `LocalClient` and the `test.arg runner function` using `RunnerClient`; note the different structure for each command. The results for both are combined and returned as one response.

```
% curl -b ~/cookies.txt -sSi localhost:8000 -H 'Content-type: application/json' -d ' [
  {
    "client": "local",
    "tgt": "+",
    "fun": "test.arg",
    "arg": ["positional arg one", "positional arg two"],
    "kTARGET": {
      "keyword arg one": "Hello from a minion",
      "keyword arg two": "Hello again from a minion"
    }
  },
  {
    "client": "runner",
    "fun": "test.arg",
    "keyword arg one": "Hello from a master",
    "keyword arg two": "Runners do not support positional args"
  }
]
'
HTTP/1.1 200 OK
[...snip...]
{
  "return": [
    {
      "jerry": {
        "args": [
          "positional arg one",
          "positional arg two"
        ],
        "kTARGET": {
          "keyword arg one": "Hello from a minion",
          "keyword arg two": "Hello again from a minion",
          [...snip...]
        }
      },
      [...snip; other minion returns here...]
    },
    {
      "args": [],
      "kTARGET": {
        "keyword arg two": "Runners do not support positional args",
        "keyword arg one": "Hello from a master"
      }
    }
  ]
}
```

(continues on next page)
One more example, this time with more commonly used functions:

```bash
curl -b /tmp/cookies.txt -sSi localhost:8000 -H 'Content-type: application/json' -d '"

[ {
   "client": "local",
   "tgt": "*",
   "fun": "state.sls",
   "kwarg": {
      "mods": "apache",
      "pillar": {
         "lookup": {
            "wwwdir": "/srv/httpd/htdocs"
         }
      }
   }

   },

   {
      "client": "runner",
      "fun": "cloud.create",
      "provider": "my-ec2-provider",
      "instances": "my-centos-6",
      "image": "ami-1624987f",
      "delvol_on_destroy", true
   }
}

HTTP/1.1 200 OK

[...snip...]

{ "return": [ { "jerry": { "pkg_|-install_apache_|-httpd_|-installed": { [...snip full state return here...]
   
   }[...snip other minion returns here...]
   
   }, { [...snip full salt-cloud output here...]
   
   } ]

Content negotiation

This REST interface is flexible in what data formats it will accept as well as what formats it will return (e.g., JSON, YAML, urlencoded).
• Specify the format of data in the request body by including the `Content-Type` header.
• Specify the desired data format for the response body with the `Accept` header.

We recommend the JSON format for most HTTP requests. urlencoded data is simple and cannot express complex data structures – and that is often required for some Salt commands, such as starting a state run that uses Pillar data. Salt’s CLI tool can reformat strings passed in at the CLI into complex data structures, and that behavior also works via salt-api, but that can be brittle and since salt-api can accept JSON it is best just to send JSON.

Here is an example of sending urlencoded data:

```bash
curl -sSik https://localhost:8000 \
  -b ~/cookies.txt \
  -d client=runner \
  -d fun='jobs.lookup_jid' \
  -d jid='20150129182456704682'
```

urlencoded data caveats

- Only a single command may be sent per HTTP request.
- Repeating the `arg` parameter multiple times will cause those parameters to be combined into a single list.

  Note, some popular frameworks and languages (notably jQuery, PHP, and Ruby on Rails) will automatically append empty brackets onto repeated query string parameters. E.g., `?foo[]=fooone&foo[]=footwo`.

  This is **not** supported; send `?foo=fooone&foo=footwo` instead, or send JSON or YAML.

A note about `curl`

The `-d` flag to `curl` does **not** automatically urlencode data which can affect passwords and other data that contains characters that must be encoded. Use the `--data-urlencode` flag instead. E.g.:

```bash
curl -ksi http://localhost:8000/login \
  -H "Accept: application/json" \
  -d username='myapiuser' \
  --data-urlencode password='1234+' \
  -d eauth='pam'
```

Performance Expectations and Recommended Usage

This module provides a thin wrapper around Salt’s Python API. Executing a Salt command via `rest_cherrypy` is directly analogous to executing a Salt command via Salt’s CLI (which also uses the Python API) – they share the same semantics, performance characteristics, and 98% of the same code. As a rule-of-thumb: if you wouldn’t do it at the CLI don’t do it via this API.

Long-Running HTTP Connections

The CherryPy server is a production-ready, threading HTTP server written in Python. Because it makes use of a thread pool to process HTTP requests it is not ideally suited to maintaining large numbers of concurrent, synchronous connections. On moderate hardware with default settings it should top-out at around 30 to 50 concurrent connections.

That number of long-running, synchronous Salt processes is also not ideal. Like at the CLI, each Salt command run will start a process that instantiates its own `LocalClient`, which instantiates its own listener to the Salt event bus, and sends out its own periodic `saltutil.find_job` queries to determine if a Minion is still running the command. Not exactly a lightweight operation.
Timeouts

In addition to the above resource overhead for long-running connections, there are the usual HTTP timeout semantics for the CherryPy server, any HTTP client being used, as well as any hardware in between such as proxies, gateways, or load balancers. rest_cherrypy can be configured not to time-out long responses via the `expire_responses` setting, and both `LocalClient` and `RunnerClient` have their own timeout parameters that may be passed as top-level keywords:

```
curl -b /tmp/cookies.txt -ssS localhost:8000 -H 'Content-type: application/json' -d '
[
  {
    "client": "local",
    "tgt": ",",
    "fun": "test.sleep",
    "kwarg": {
      "length": 30,
      "timeout": 60
    },
  },
  {
    "client": "runner",
    "fun": "test.sleep",
    "kwarg": {
      "s_time": 30,
      "timeout": 60
    }
  }
]
```

Best Practices

Given the performance overhead and HTTP timeouts for long-running operations described above, the most effective and most scalable way to use both Salt and salt-api is to run commands asynchronously using the `local_async`, `runner_async`, and `wheel_async` clients.

Running asynchronous jobs results in being able to process 3x more commands per second for `LocalClient` and 17x more commands per second for `RunnerClient`, in addition to much less network traffic and memory requirements. Job returns can be fetched from Salt’s job cache via the `/jobs/<jid>` endpoint, or they can be collected into a data store using Salt’s Returner system.

The `/events` endpoint is specifically designed to handle long-running HTTP connections and it exposes Salt’s event bus which includes job returns. Watching this endpoint first, then executing asynchronous Salt commands second, is the most lightweight and scalable way to use `rest_cherrypy` while still receiving job returns in real-time. But this requires clients that can properly handle the inherent asynchronicity of that workflow.

Performance Tuning

The `thread_pool` and `socket_queue_size` settings can be used to increase the capacity of `rest_cherrypy` to handle incoming requests. Keep an eye on RAM usage as well as available file handles while testing changes to these settings. As salt-api is a thin wrapper around Salt’s Python API, also keep an eye on the performance of Salt when testing.
Future Plans

Now that Salt uses the Tornado concurrency library internally, we plan to improve performance in the API by taking advantage of existing processes and event listeners and to use lightweight coroutines to facilitate more simultaneous HTTP connections and better support for synchronous operations. That effort can be tracked in issue 26505, but until that issue is closed rest_cherrypy will remain the officially recommended REST API.

Deployment

The rest_cherrypy netapi module is a standard Python WSGI app. It can be deployed one of two ways.

salt-api using the CherryPy server

The default configuration is to run this module using salt-api to start the Python-based CherryPy server. This server is lightweight, multi-threaded, encrypted with SSL, and should be considered production-ready. See the section above for performance expectations.

Using a WSGI-compliant web server

This module may be deployed on any WSGI-compliant server such as Apache with mod_wsgi or Nginx with FastCGI, to name just two (there are many).

Note, external WSGI servers handle URLs, paths, and SSL certs directly. The rest_cherrypy configuration options are ignored and the salt-api daemon does not need to be running at all. Remember Salt authentication credentials are sent in the clear unless SSL is being enforced!

An example Apache virtual host configuration:

```xml
<VirtualHost *:80>
    ServerName example.com
    ServerAlias *.example.com

    ServerAdmin webmaster@example.com

    LogLevel warn
    ErrorLog /var/www/example.com/logs/error.log
    CustomLog /var/www/example.com/logs/access.log combined

    DocumentRoot /var/www/example.com/htdocs

    WSGIScriptAlias / /path/to/salt/netapi/rest_cherrypy/wsgi.py
</VirtualHost>
```

REST URI Reference

```
/

class salt.netapi.rest_cherrypy.app.LowDataAdapter
    The primary entry point to Salt’s REST API

    GET()
        An explanation of the API with links of where to go next
```

21.10. netapi modules
GET /  

Request Headers
- **Accept** – the desired response format.

Status Codes
- **200** – success
- **401** – authentication required
- **406** – requested Content-Type not available

Example request:
```
curl -i localhost:8000
```

GET / HTTP/1.1  
Host: localhost:8000  
Accept: application/json

Example response:
```
HTTP/1.1 200 OK  
Content-Type: application/json
```

POST  
Mock out specified imports.

This allows autodoc to do its thing without having oodles of req’d installed libs. This doesn’t work with **import * imports**.

This Mock class can be configured to return a specific values at specific names, if required.

http://read-the-docs.readthedocs.org/en/latest/faq.html#i-get-import-errors-on-libraries-that-depend-on-c-modules

/login  

**class** salt.netapi.rest_cherrypy.app.Login(*args, **kwargs)**  
Log in to receive a session token

* Authentication information.

**GET()**  
Present the login interface

**GET /login**  
An explanation of how to log in.

Status Codes
- **200** – success
- **401** – authentication required
- **406** – requested Content-Type not available

Example request:
```
curl -i localhost:8000/login
```

GET /login HTTP/1.1  
Host: localhost:8000  
Accept: text/html

Example response:
HTTP/1.1 200 OK
Content-Type: text/html

**POST**(**kwargs)

Authenticate against Salt's eauth system

**POST** /login

Request Headers
- **X-Auth-Token** – a session token from Login.
- **Accept** – the desired response format.
- **Content-Type** – the format of the request body.

Form Parameters
- **eauth** – the eauth backend configured for the user
- **username** – username
- **password** – password

Status Codes
- **200** – success
- **401** – authentication required
- **406** – requested Content-Type not available

Example request:
```
curl -si localhost:8000/login \
   -c ~/cookies.txt \
   -H "Accept: application/json" \
   -H "Content-type: application/json" \
   -d '{
      "username": "saltuser",
      "password": "saltuser",
      "eauth": "auto"
    }'
```

POST / HTTP/1.1
Host: localhost:8000
Content-Length: 42
Content-Type: application/json
Accept: application/json

{"username": "saltuser", "password": "saltuser", "eauth": "auto"}

Example response:
```
HTTP/1.1 200 OK
Content-Type: application/json
Content-Length: 206
X-Auth-Token: 6d1b722e
Set-Cookie: session_id=6d1b722e; expires=Sat, 17 Nov 2012 03:23:52 GMT;
Path=/

{"return": {
  "token": "6d1b722e",
  "start": 1363805943.776223,
  "expire": 1363849143.776224,
  "user": "saltuser",
  "eauth": "pam",
  "perms": [

(continues on next page)
"grains.*",
"status.*",
"sys.*",
"test.*"
]
}}

```
/logout

class salt.netapi.rest_cherrypy.app.Logout
Class to remove or invalidate sessions

  POST()
  Destroy the currently active session and expire the session cookie

/minions

class salt.netapi.rest_cherrypy.app.Minions
Convenience URLs for working with minions

  GET(mid=None)
  A convenience URL for getting lists of minions or getting minion details

  GET /minions/(mid)
  Request Headers
  • X-Auth-Token – a session token from Login.
  • Accept – the desired response format.
  Status Codes
  • 200 – success
  • 401 – authentication required
  • 406 – requested Content-Type not available

Example request:

  curl -i localhost:8000/minions/ms-3

Example response:

  HTTP/1.1 200 OK
  Content-Length: 129005
  Content-Type: application/x-yaml

  return:
  - ms-3:
    grains.items:
    ...

  POST(**kwargs)
  Start an execution command and immediately return the job id
```
POST /minions

Request Headers
- X-Auth-Token – a session token from Login.
- Accept – the desired response format.
- Content-Type – the format of the request body.

Response Headers
- Content-Type – the format of the response body; depends on the Accept request header.

Status Codes
- 200 – success
- 400 – bad or malformed request
- 401 – authentication required
- 406 – requested Content-Type not available

Lowstate data describing Salt commands must be sent in the request body. The client option will be set to local_async().

Example request:

curl -sSi localhost:8000/minions \
-b ~/cookies.txt \
-H "Accept: application/x-yaml" \
-d '[["tgt": "+", "fun": "status.diskusage"]]'

Example response:

HTTP/1.1 202 Accepted
Content-Length: 86
Content-Type: application/x-yaml

return:
- jid: '20130603122505459265'
  minions: [ms-4, ms-3, ms-2, ms-1, ms-0]
  _links:
    jobs:
    - href: /jobs/20130603122505459265

/jobs

class salt.netapi.rest_cherrypy.app.Jobs

GET(jid=\None, timeout=\"")
A convenience URL for getting lists of previously run jobs or getting the return from a single job

GET /jobs/(jid)
List jobs or show a single job from the job cache.

Request Headers
- X-Auth-Token – a session token from Login.
- Accept – the desired response format.
Status Codes

- **200** – success
- **401** – authentication required
- **406** – requested Content-Type not available

Example request:

```bash
curl -i localhost:8000/jobs
```

GET /jobs HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml

Example response:

HTTP/1.1 200 OK
Content-Length: 165
Content-Type: application/x-yaml

return:
- '20121130104633606931':
  Arguments:
  - '3'
  Function: test.fib
  Target: jerry
  Target-type: glob

Example request:

```bash
curl -i localhost:8000/jobs/20121130104633606931
```

GET /jobs/20121130104633606931 HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml

Example response:

HTTP/1.1 200 OK
Content-Length: 73
Content-Type: application/x-yaml

info:
- Arguments:
  - '3'
  Function: test.fib
  Minions:
  - jerry
  Target: '*'
  Target-type: glob
  User: saltdev
  jid: '20121130104633606931'

return:
- jerry:
  - 0
  - 1

(continues on next page)
Run commands bypassing the normal session handling. Salt-api does not enforce authorization, Salt’s eauth system does that. Local/Runner/WheelClient all accept username/password/eauth or token kwargs that are then checked by the eauth system. The session mechanism in rest_cherrypy simply pairs a session with a Salt eauth token and then passes the token kwarg in automatically.

If you already have a Salt eauth token, perhaps generated by the mk_token function in the Auth Runner module, then there is no reason to use sessions.

This endpoint accepts either a username, password, eauth trio, or a token kwarg and does not make use of sessions at all.

**POST (**kwargs**)**

Run commands bypassing the normal session handling. Other than that this URL is identical to the root URL (/).

**POST /run**

An array of lowstate data describing Salt commands must be sent in the request body.

**Status Codes**

- **200** – success
- **400** – bad or malformed request
- **401** – authentication required
- **406** – requested Content-Type not available

**Example request:**

```bash
curl -sS localhost:8000/run \
-H 'Accept: application/x-yaml' \
-H 'Content-type: application/json' \
-d '[[
    "client": "local",
    "tgt": "*",
    "fun": "test.ping",
    "username": "saltdev",
    "password": "saltdev",
    "eauth": "auto"
}}
```

Or using a Salt Eauth token:

```bash
curl -sS localhost:8000/run \
-H 'Accept: application/x-yaml' \
-H 'Content-type: application/json' \
-d '[[
    "client": "local",
    "tgt": "*",
    "fun": "test.ping",
    "eauth": "auto"
}}
```
"token": "<salt eauth token here>"
}

```
POST /run HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
Content-Length: 75
Content-Type: application/json

{"client": "local", "tgt": ",", "fun": "test.ping", "username": "saltdev",
 "password": "saltdev", "eauth": "auto"}
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 73
Content-Type: application/x-yaml

return:
- ms-0: true
  ms-1: true
  ms-2: true
  ms-3: true
  ms-4: true
```

The /run endpoint can also be used to issue commands using the salt-ssh subsystem.

When using salt-ssh, eauth credentials should not be supplied. Instead, authentication should be handled by the SSH layer itself. The use of the salt-ssh client does not require a salt master to be running. Instead, only a roster file must be present in the salt configuration directory.

All SSH client requests are synchronous.

Example SSH client request:

```bash
curl -sS localhost:8000/run
   -H 'Accept: application/x-yaml'
   -d client=ssh
   -d tgt='*' 
   -d fun=test.ping
```

Example SSH response:

```bash
return:
- silver:
  fun: test.ping
  fun_args: []
  id: silver
```

(continues on next page)
/events

class salt.netapi.rest_cherrypy.app.Events
    Expose the Salt event bus

    The event bus on the Salt master exposes a large variety of things, notably when executions are started on the master and also when minions ultimately return their results. This URL provides a real-time window into a running Salt infrastructure.

    See also:
    Events & Reactor

    GET(token=None, salt_token=None)
        An HTTP stream of the Salt master event bus

        This stream is formatted per the Server Sent Events (SSE) spec. Each event is formatted as JSON.

        GET /events
            Status Codes
            • 200 – success
            • 401 – authentication required
            • 406 – requested Content-Type not available

            Query Parameters
            • token – optional parameter containing the token ordinarily supplied via the X-Auth-Token header in order to allow cross-domain requests in browsers that do not include CORS support in the EventSource API. E.g., curl -NsS localhost:8000/events?token=308650d
            • salt_token – optional parameter containing a raw Salt eauth token (not to be confused with the token returned from the /login URL). E.g., curl -NsS localhost:8000/events?salt_token=30742765

        Example request:
        curl -NsS localhost:8000/events

        Example response:
        Note, the tag field is not part of the spec. SSE compliant clients should ignore unknown fields. This addition allows non-compliant clients to only watch for certain tags without having to deserialize the JSON object each time.

        HTTP/1.1 200 OK
        Connection: keep-alive
        Cache-Control: no-cache
        Content-Type: text/event-stream;charset=utf-8

(continues on next page)
The event stream can be easily consumed via JavaScript:

```javascript
var source = new EventSource('/events');
source.onerror = function(err) { console.error(err) };
source.onmessage = function(message) {
  var saltEvent = JSON.parse(message.data);
  console.log(saltEvent.tag, saltEvent.data);
};
```

Note, the SSE stream is fast and completely asynchronous and Salt is very fast. If a job is created using a regular POST request, it is possible that the job return will be available on the SSE stream before the response for the POST request arrives. It is important to take that asynchronicity into account when designing an application. Below are some general guidelines.

- Subscribe to the SSE stream _before_ creating any events.
- Process SSE events directly as they arrive and don’t wait for any other process to "complete" first (like an ajax request).
- Keep a buffer of events if the event stream must be used for synchronous lookups.
- Be cautious in writing Salt’s event stream directly to the DOM. It is very busy and can quickly overwhelm the memory allocated to a browser tab.

A full, working proof-of-concept JavaScript application is available adjacent to this file. It can be viewed by pointing a browser at the `/app` endpoint in a running `rest_cherrypy` instance.

Or using CORS:

```javascript
var source = new EventSource('/events?' + token=ecd589e4e01912cf3c4035afad73426dbb8db75', {withCredentials: true});
```

It is also possible to consume the stream via the shell.

Records are separated by blank lines; the `data:` and `tag:` prefixes will need to be removed manually before attempting to unserialize the JSON.

curl’s `-N` flag turns off input buffering which is required to process the stream incrementally.

Here is a basic example of printing each event as it comes in:

```bash
curl -NsS localhost:8000/events |
  while IFS= read -r line ; do
    echo $line
  done
```

Here is an example of using awk to filter events based on tag:
curl -NsS localhost:8000/events |\n   awk 'BEGIN { RS=""; FS="\n" }\n       $1 ~/^tag: salt/job/[0-9]+/new/ { print $0 }',\n
    tag: salt/job/20140112010149808995/new\n    data: {"tag": "salt/job/20140112010149808995/new", "data": {"tgt_type": "glob ~", "jid": "20140112010149808995", "tgt": "jerry", "_stamp": "2014-01-12_01:01:49.809617", "user": "shouse", "arg": [], "fun": "test.ping", "minions ~": ["jerry"]}}\n    tag: 20140112010149808995\n    data: {"tag": "20140112010149808995", "data": {"fun_args": [], "jid": "20140112010149808995", "return": true, "retcode": 0, "success": true, "cmd ~": "_return", "_stamp": "2014-01-12_01:01:49.819316", "fun": "test.ping", ~"id": "jerry"}}

/hook

class salt.netapi.rest_cherrypy.app.Webhook
A generic web hook entry point that fires an event on Salt’s event bus

External services can POST data to this URL to trigger an event in Salt. For example, Amazon SNS, Jenkins-CI or Travis-CI, or GitHub web hooks.

Note: Be mindful of security
Salt’s Reactor can run any code. A Reactor SLS that responds to a hook event is responsible for validating that the event came from a trusted source and contains valid data.

This is a generic interface and securing it is up to you!

This URL requires authentication however not all external services can be configured to authenticate. For this reason authentication can be selectively disabled for this URL. Follow best practices – always use SSL, pass a secret key, configure the firewall to only allow traffic from a known source, etc.

The event data is taken from the request body. The Content-Type header is respected for the payload.

The event tag is prefixed with salt/netapi/hook and the URL path is appended to the end. For example, a POST request sent to /hook/mycompany/myapp/mydata will produce a Salt event with the tag salt/netapi/hook/mycompany/myapp/mydata.

The following is an example .travis.yml file to send notifications to Salt of successful test runs:

```
language: python
script: python -m unittest tests
after_success:
    - |
        curl -sSk https://saltapi-url.example.com:8000/hook/travis/build/success
        -d branch="${TRAVIS_BRANCH}" -d commit="${TRAVIS_COMMIT}"
```

See also:

Events & Reactor, reactor

POST(*args, **kwargs)
Fire an event in Salt with a custom event tag and data

21.10. netapi modules  2887
POST /hook

Status Codes

- 200 – success
- 401 – authentication required
- 406 – requested Content-Type not available
- 413 – request body is too large

Example request:

curl -sS localhost:8000/hook \
-H 'Content-type: application/json' \
-d '{"foo": "Foo!", "bar": "Bar!"}'

Example response:

HTTP/1.1 200 OK
Content-Length: 14
Content-Type: application/json
{"success": true}

As a practical example, an internal continuous-integration build server could send an HTTP POST request to the URL https://localhost:8000/hook/mycompany/build/success which contains the result of a build and the SHA of the version that was built as JSON. That would then produce the following event in Salt that could be used to kick off a deployment via Salt’s Reactor:

Event fired at Fri Feb 14 17:40:11 2014

Tag: salt/netapi/hook/mycompany/build/*

Data:
{
'_stamp': '2014-02-14_17:40:11.440996',
'headers': {
  'X-My-Secret-Key': 'F0fAgoQjIT@W',
  'Content-Length': '37',
  'Content-Type': 'application/json',
  'Host': 'localhost:8000',
  'Remote-Addr': '127.0.0.1'},
'post': {'revision': 'aa22a3c4b2e7', 'result': True}}

Salt’s Reactor could listen for the event:

reactor:
- 'salt/netapi/hook/mycompany/build/*':
  - /srv/reactor/react_ci_builds.sls

And finally deploy the new build:

[% set secret_key = data.get('headers', {}).get('X-My-Secret-Key') %]
[% set build = data.get('post', {}) %]

(continues on next page)
{% if secret_key == 'F0fAgoQjIT@W' and build.result == True %}
deploy_my_app:
  cmd.state.sls:
    - tgt: 'application*' 
    - arg:
      - myapp.deploy
    - kwarg:
      pillar:
        revision: {{ revision }}
{% endif %}

/kkeys

class salt.netapi.rest_cherrypy.app.Keys
Convenience URLs for working with minion keys

New in version 2014.7.0.

These URLs wrap the functionality provided by the key wheel module functions.

GET (mid=None)
Show the list of minion keys or detail on a specific key

New in version 2014.7.0.

GET /keys/(mid)
List all keys or show a specific key

Request Headers
- X-Auth-Token – a session token from Login.
- Accept – the desired response format.

Status Codes
- 200 – success
- 401 – authentication required
- 406 – requested Content-Type not available

Example request:
curl -i localhost:8000/keys

GET /keys HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml

Example response:
HTTP/1.1 200 OK
Content-Length: 165
Content-Type: application/x-yaml

return:
  local:
    - master.pem
    - master.pub
  minions:
    - jerry

(continues on next page)
Example request:

```
curl -i localhost:8000/keys/jerry
```

GET /keys/jerry HTTP/1.1  
Host: localhost:8000  
Accept: application/x-yaml

Example response:

```
HTTP/1.1 200 OK  
Content-Length: 73  
Content-Type: application/x-yaml  

return:
  minions:
```

**POST(** `**kwargs`**)

Easily generate keys for a minion and auto-accept the new key

Accepts all the same parameters as the `key.gen_accept`

---

**Note:** A note about **curl**. Avoid using the `-i` flag or HTTP headers will be written and produce an invalid tar file.

Example partial kickstart script to bootstrap a new minion:

```
%post
  mkdir -p /etc/salt/pki/minion
  curl -sSk https://localhost:8000/keys 
    -d mid=jerry 
    -d username=kickstart 
    -d password=kickstart 
    -d eauth=pam 
    | tar -C /etc/salt/pki/minion -xf -

  mkdir -p /etc/salt/minion.d
  printf 'master: 10.0.0.5\nid: jerry' > /etc/salt/minion.d/id.conf
%end
```

**POST /keys**

Generate a public and private key and return both as a tarball

Authentication credentials must be passed in the request.

**Status Codes**

- 200 – success
- 401 – authentication required
- 406 – requested Content-Type not available

Example request:
curl -sSk https://localhost:8000/keys \
  -d mid=jerry \ 
  -d username=kickstart \ 
  -d password=kickstart \ 
  -d eauth=pam \ 
  -o jerry-salt-keys.tar

POST /keys HTTP/1.1
Host: localhost:8000

Example response:

HTTP/1.1 200 OK
Content-Length: 10240
Content-Disposition: attachment; filename="saltkeys-jerry.tar"
Content-Type: application/x-tar

jerry.pub00006440000000000000000000000703000000000000010730 0ustar 0
~0000000000000

/ws

class salt.netapi.rest_cherrypy.app.WebsocketEndpoint
Open a WebSocket connection to Salt’s event bus

The event bus on the Salt master exposes a large variety of things, notably when executions are started on the master and also when minions ultimately return their results. This URL provides a real-time window into a running Salt infrastructure. Uses websocket as the transport mechanism.

See also:
Events & Reactor

GET (token=None, **kwargs)
Return a websocket connection of Salt’s event stream

GET /ws/ (token)

Query format_events The event stream will undergo server-side formatting if the format_events URL parameter is included in the request. This can be useful to avoid formatting on the client-side:
curl -NsS <...snip...> localhost:8000/ws?format_events

Reqheader X-Auth-Token an authentication token from Login.
Status 101 switching to the websockets protocol
Status 401 authentication required
Status 406 requested Content-Type not available

Example request:
curl -Nssk \ 
  -H 'X-Auth-Token: ffedf49d' \ 
  -H 'Host: localhost:8000' \ 
  -H 'Connection: Upgrade' \ 
  -H 'Upgrade: websocket' \ 
  -H 'Origin: https://localhost:8000' \
(continues on next page)
GET /ws HTTP/1.1
Connection: Upgrade
Upgrade: websocket
Host: localhost:8000
Origin: https://localhost:8000
Sec-WebSocket-Version: 13
Sec-WebSocket-Key: s65VsgHigh7v/Jcf4nXHnA==
X-Auth-Token: ffedf49d

Example response:

HTTP/1.1 101 Switching Protocols
Upgrade: websocket
Connection: Upgrade
Sec-WebSocket-Accept: mWZjBV9FCglzn1rIKJAxrTFlnJE=
Sec-WebSocket-Version: 13

An authentication token may optionally be passed as part of the URL for browsers that cannot be configured to send the authentication header or cookie:

curl -NsS <...snip...> localhost:8000/ws/ffedf49d

The event stream can be easily consumed via JavaScript:

```javascript
// Note, you must be authenticated!
var source = new WebSocket('ws://localhost:8000/ws/d0ce6c1a');
source.onerror = function(e) { console.debug('error!', e); };
source.onmessage = function(e) { console.debug(e.data); };

source.send('websocket client ready')
source.close();
```

Or via Python, using the Python module websocket-client for example.

```python
# Note, you must be authenticated!
from websocket import create_connection

ws = create_connection('ws://localhost:8000/ws/d0ce6c1a')
ws.send('websocket client ready')

# Look at https://pypi.python.org/pypi/websocket-client/ for more # examples.
while listening_to_events:
    print ws.recv()

ws.close()
```

Above examples show how to establish a websocket connection to Salt and activating real time updates from Salt’s event stream by signaling `websocket client ready`.

/stats

```
class salt.netapi.rest_cherrypy.app.Stats:
    # Expose statistics on the running CherryPy server

    GET()
    # Return a dump of statistics collected from the CherryPy server
    # GET /stats
    # Request Headers
    # - X-Auth-Token -- a session token from Login.
    # - Accept -- the desired response format.
    # Response Headers
    # - Content-Type -- the format of the response body; depends on the
    #   Accept request header.
    # Status Codes
    # - 200 -- success
    # - 401 -- authentication required
    # - 406 -- requested Content-Type not available
```

### 21.10.2 rest_tornado

A non-blocking REST API for Salt

```
depends
    # tornado Python module

configuration
    # All authentication is done through Salt’s external auth system which requires additional
    # configuration not described here.
```

In order to run rest_tornado with the salt-master add the following to the Salt master config file.

```yaml
rest_tornado:
    # can be any port
    port: 8000
    # address to bind to (defaults to 0.0.0.0)
    address: 0.0.0.0
    # socket backlog
    backlog: 128
    # ssl_crt: /etc/pki/api/certs/server.crt
    ssl.crt: /etc/pki/api/certs/server.crt
    # no need to specify ssl_key if cert and key
    # are in one single file
    ssl.key: /etc/pki/api/certs/server.key
    debug: False
    disable_ssl: False
    webhook_disable_auth: False
    cors.origin: null
```

**Authentication**

Authentication is performed by passing a session token with each request. Tokens are generated via the `SaltAuthHandler` URL.

The token may be sent in one of two ways:
• Include a custom header named X-Auth-Token.
• Sent via a cookie. This option is a convenience for HTTP clients that automatically handle cookie support (such as browsers).

See also:
You can bypass the session handling via the RunSaltAPIHandler URL.

CORS

rest_tornado supports Cross-site HTTP requests out of the box. It is by default deactivated and controlled by the cors_origin config key.

You can allow all origins by settings cors_origin to *.

You can allow only one origin with this configuration:

```
rest_tornado:
  cors_origin: http://salt.yourcompany.com
```

You can also be more specific and select only a few allowed origins by using a list. For example:

```
rest_tornado:
  cors_origin:
    - http://salt.yourcompany.com
    - http://salt-preprod.yourcompany.com
```

The format for origin are full URL, with both scheme and port if not standard.

In this case, rest_tornado will check if the Origin header is in the allowed list if it’s the case allow the origin. Else it will returns nothing, effectively preventing the origin to make request.

For reference, CORS is a mechanism used by browser to allow (or disallow) requests made from browser from a different origin than salt-api. It’s complementary to Authentication and mandatory only if you plan to use a salt client developed as a Javascript browser application.

Usage

Commands are sent to a running Salt master via this module by sending HTTP requests to the URLs detailed below.

Content negotiation

This REST interface is flexible in what data formats it will accept as well as what formats it will return (e.g., JSON, YAML, x-www-form-urlencoded).

• Specify the format of data in the request body by including the Content-Type header.
• Specify the desired data format for the response body with the Accept header.

Data sent in POST and PUT requests must be in the format of a list of lowstate dictionaries. This allows multiple commands to be executed in a single HTTP request.

lowstate A dictionary containing various keys that instruct Salt which command to run, where that command lives, any parameters for that command, any authentication credentials, what returner to use, etc.

Salt uses the lowstate data format internally in many places to pass command data between functions. Salt also uses lowstate for the LocalClient() Python API interface.
The following example (in JSON format) causes Salt to execute two commands:

```json
[{
    "client": "local",
    "tgt": "*",
    "fun": "test.fib",
    "arg": ["10"]
},
{
    "client": "runner",
    "fun": "jobs.lookup_jid",
    "jid": "20130603122505459265"
}]
```

Multiple commands in a Salt API request will be executed in serial and makes no guarantees that all commands will run. Meaning that if test.fib (from the example above) had an exception, the API would still execute "jobs.lookup_jid". Responses to these lowstates are an in-order list of dicts containing the return data, a yaml response could look like:

```
- ms-1: true
  ms-2: true
- ms-1: foo
  ms-2: bar
```

In the event of an exception while executing a command the return for that lowstate will be a string, for example if no minions matched the first lowstate we would get a return like:

```
- No minions matched the target. No command was sent, no jid was assigned.
- ms-1: true
  ms-2: true
```

**x-www-form-urlencoded**

Sending JSON or YAML in the request body is simple and most flexible, however sending data in urlencoded format is also supported with the caveats below. It is the default format for HTML forms, many JavaScript libraries, and the `curl` command.

For example, the equivalent to running `salt '*' test.ping` is sending `fun=test.ping&arg&client=local&tgt=*` in the HTTP request body.

Caveats:

- Only a single command may be sent per HTTP request.
- Repeating the `arg` parameter multiple times will cause those parameters to be combined into a single list.
  
  Note, some popular frameworks and languages (notably jQuery, PHP, and Ruby on Rails) will automatically append empty brackets onto repeated parameters. E.g., `arg=one, arg=two` will be sent as `arg[]=one, arg[]=two`. This is not supported; send JSON or YAML instead.

**A Websockets add-on to saltnado**

- depends
  - tornado Python module

In order to enable saltnado_websockets you must add websocket: True to your saltnado config block.
All Events

Exposes all "real-time" events from Salt's event bus on a websocket connection. It should be noted that "Real-time" here means these events are made available to the server as soon as any salt related action (changes to minions, new jobs etc) happens. Clients are however assumed to be able to tolerate any network transport related latencies. Functionality provided by this endpoint is similar to the /events end point.

The event bus on the Salt master exposes a large variety of things, notably when executions are started on the master and also when minions ultimately return their results. This URL provides a real-time window into a running Salt infrastructure. Uses websocket as the transport mechanism.

Exposes GET method to return websocket connections. All requests should include an auth token. A way to obtain obtain authentication tokens is shown below.

```bash
% curl -si localhost:8000/login
-H "Accept: application/json"
-d username='salt'
-d password='salt'
-d eauth='pam'
```

Which results in the response

```json
{
   "return": [{
       "perms": [".*", "@runner", "@wheel"],
       "start": 1400556492.277421,
       "token": "d0ce6c1a37e99d0cc0374392f272fe19c00900ca7",
       "expire": 1400599692.277422,
       "user": "salt",
       "eauth": "pam"
   }
}
```

In this example the token returned is d0ce6c1a37e99d0cc0374392f272fe19c00900ca7 and can be included in subsequent websocket requests (as part of the URL).

The event stream can be easily consumed via JavaScript:

```javascript
// Note, you must be authenticated!

// Get the Websocket connection to Salt
var source = new WebSocket('wss://localhost:8000/all_events/
   d0ce6c1a37e99d0cc0374392f272fe19c00900ca7');

// Get Salt's "real time" event stream.
```

(continues on next page)
source.onopen = function() { source.send('websocket client ready'); }

// Other handlers
source.onerror = function(e) { console.debug('error!', e); }

// e.data represents Salt's "real time" event data as serialized JSON.
source.onmessage = function(e) { console.debug(e.data); }

// Terminates websocket connection and Salt's "real time" event stream on the server.
source.close();

Or via Python, using the Python module websocket-client for example. Or the tornado client.

```python
# Note, you must be authenticated!
from websocket import create_connection

# Get the Websocket connection to Salt
ws = create_connection('wss://localhost:8000/all_events/
                        !d0ce6c1a37e99dcc0374392f272fe19c0090cca7')

# Get Salt's "real time" event stream.
w.send('websocket client ready')

# Simple listener to print results of Salt's "real time" event stream.
# Look at https://pypi.python.org/pypi/websocket-client/ for more examples.
while listening_to_events:
    print ws.recv()  # Salt's "real time" event data as serialized JSON.

# Terminates websocket connection and Salt's "real time" event stream on the server.
ws.close()

# Please refer to https://github.com/liris/websocket-client/issues/81 when using a self signed cert
```

Above examples show how to establish a websocket connection to Salt and activating real time updates from Salt’s event stream by signaling websocket client ready.

**Formatted Events**

Exposes formatted "real-time" events from Salt’s event bus on a websocket connection. It should be noted that "Real-time" here means these events are made available to the server as soon as any salt related action (changes to minions, new jobs etc) happens. Clients are however assumed to be able to tolerate any network transport related latencies. Functionality provided by this endpoint is similar to the /events end point.

The event bus on the Salt master exposes a large variety of things, notably when executions are started on the master and also when minions ultimately return their results. This URL provides a real-time window into a running Salt infrastructure. Uses websocket as the transport mechanism.

Formatted events parses the raw "real time" event stream and maintains a current view of the following:

- minions
- jobs
A change to the minions (such as addition, removal of keys or connection drops) or jobs is processed and clients are updated. Since we use salt’s presence events to track minions, please enable `presence_events` and set a small value for the `loop_interval` in the salt master config file.

Exposes GET method to return websocket connections. All requests should include an auth token. A way to obtain authentication tokens is shown below.

```
% curl -si localhost:8000/login \
   -H "Accept: application/json" \
   -d username='salt' \
   -d password='salt' \
   -d eauth='pam'
```

Which results in the response

```
{
    "return": [{
        "perms": [".*", "@runner", "@wheel"],
        "start": 1400556492.277421,
        "token": "d0ce6c1a37e99dcc0374392f272fe19c0090cca7",
        "expire": 1400599692.277422,
        "user": "salt",
        "eauth": "pam"
    }]
}
```

In this example the token returned is `d0ce6c1a37e99dcc0374392f272fe19c0090cca7` and can be included in subsequent websocket requests (as part of the URL).

The event stream can be easily consumed via JavaScript:

```javascript
// Note, you must be authenticated!
// Get the Websocket connection to Salt
var source = new WebSocket('wss://localhost:8000/formatted_events/
   --d0ce6c1a37e99dcc0374392f272fe19c0090cca7');

// Get Salt's "real time" event stream.
source.onopen = function() { source.send('websocket client ready'); }

// Other handlers
source.onerror = function(e) { console.debug('error!', e); }

// e.data represents Salt's "real time" event data as serialized JSON.
source.onmessage = function(e) { console.debug(e.data); }

// Terminates websocket connection and Salt's "real time" event stream on the server.
source.close();
```

Or via Python, using the Python module `websocket-client` for example. Or the tornado `client`.

```python
# Note, you must be authenticated!

from websocket import create_connection

# Get the Websocket connection to Salt
ws = create_connection('wss://localhost:8000/formatted_events/
   --d0ce6c1a37e99dcc0374392f272fe19c0090cca7')
```

(continues on next page)
# Get Salt's "real time" event stream.
ws.send('websocket client ready')

# Simple listener to print results of Salt's "real time" event stream.
# Look at https://pypi.python.org/pypi/websocket-client/ for more examples.
while listening_to_events:
    print ws.recv()  # Salt's "real time" event data as serialized JSON.

# Terminates websocket connection and Salt's "real time" event stream on the server.
ws.close()

# Please refer to https://github.com/liris/websocket-client/issues/81 when using a self signed cert

Above examples show how to establish a websocket connection to Salt and activating real time updates from Salt's event stream by signaling websocket client ready.

**Example responses**

Minion information is a dictionary keyed by each connected minion's id (mid), grains information for each minion is also included.

Minion information is sent in response to the following minion events:

- connection drops
  - requires running `manage.present` periodically every `loop_interval` seconds
- minion addition
- minon removal

```json
# Not all grains are shown
data: {
    "minions": {
        "minion1": {
            "id": "minion1",
            "grains": {
                "kernel": "Darwin",
                "domain": "local",
                "zmqversion": "4.0.3",
                "kernelrelease": "13.2.0"
            }
        }
    }
}
```

Job information is also tracked and delivered.

Job information is also a dictionary in which each job's information is keyed by salt's jid.

```json
data: {
    "jobs": {
        "20140609153646699137": {
            "tgt_type": "glob",
            ...
        }
    }
}
```
"jid": "20140609153646699137",
"tgt": "*",
"start_time": "2014-06-09T15:36:46.700315",
"state": "complete",
"fun": "test.ping",
"minions": {
  "minion1": {
    "return": true,
    "retcode": 0,
    "success": true
  }
}
}

21.10.3 rest_wsgi

A minimalist REST API for Salt

This rest_wsgi module provides a no-frills REST interface for sending commands to the Salt master. There are no dependencies.

Extra care must be taken when deploying this module into production. Please read this documentation in entirety. All authentication is done through Salt’s external auth system.

Usage

- All requests must be sent to the root URL (/).
- All requests must be sent as a POST request with JSON content in the request body.
- All responses are in JSON.

See also:

rest_cherrypy

The rest_cherrypy module is more full-featured, production-ready, and has built-in security features.

Deployment

The rest_wsgi netapi module is a standard Python WSGI app. It can be deployed one of two ways.
Using a WSGI-compliant web server

This module may be run via any WSGI-compliant production server such as Apache with mod_wsgi or Nginx with FastCGI.

It is strongly recommended that this app be used with a server that supports HTTPS encryption since raw Salt authentication credentials must be sent with every request. Any apps that access Salt through this interface will need to manually manage authentication credentials (either username and password or a Salt token). Tread carefully.

salt-api using a development-only server

If run directly via the salt-api daemon it uses the wsgiref.simple_server() that ships in the Python standard library. This is a single-threaded server that is intended for testing and development. This server does not use encryption; please note that raw Salt authentication credentials must be sent with every HTTP request.

Running this module via salt-api is not recommended!

In order to start this module via the salt-api daemon the following must be put into the Salt master config:

```
rest_wsgi:
  port: 8001
```

Usage examples

POST /

Example request for a basic test.ping:

```
% curl -sS -i \
-H 'Content-Type: application/json' \
-d '[["eauth":"pam","username":"saltdev","password":"saltdev","client":"local","tgt":"*","fun":"test.ping"]]' localhost:8001
```

Example response:

```
HTTP/1.0 200 OK
Content-Length: 89
Content-Type: application/json

{"return": [["ms--4": true, "ms--3": true, "ms--2": true, "ms--1": true, "ms--0": @true]]}
```

Example request for an asynchronous test.ping:

```
% curl -sS -i \
-H 'Content-Type: application/json' \
-d '[["eauth":"pam","username":"saltdev","password":"saltdev","client":"local_async","tgt":"*","fun":"test.ping"]]' localhost:8001
```

Example response:

```
HTTP/1.0 200 OK
Content-Length: 103
Content-Type: application/json

{"return": [["jid": "20130412192112593739", "minions": ["ms--4", "ms--3", "ms--2", "ms--1", "ms--0"]]]}
```
Example request for looking up a job ID:

```
curl -sS -i \
  -H 'Content-Type: application/json' \
  -d '{"eauth":"pam","username":"saltdev","password":"saltdev","client":"runner","fun":"jobs.lookup_jid","jid":"20130412192112593739"}' localhost:8001
```

Example response:

```
HTTP/1.0 200 OK
Content-Length: 89
Content-Type: application/json

{"return": [{"ms--4": true, "ms--3": true, "ms--2": true, "ms--1": true, "ms--0": 0, "true"]}
```

form lowstate  A list of lowstate data appropriate for the client interface you are calling.

status 200  success

status 401  authentication required

### 21.11 output modules

Follow one of the below links for further information and examples

<table>

</tbody>
</table>

### 21.11.1 salt.output.highstate

Outputter for displaying results of state runs

The return data from the Highstate command is a standard data structure which is parsed by the highstate outputter to deliver a clean and readable set of information about the HighState run on minions.

Two configurations can be set to modify the highstate outputter. These values can be set in the master config to change the output of the salt command or set in the minion config to change the output of the salt-call
state_verbose  By default state_verbose is set to True, setting this to False will instruct the highstate outputter to omit displaying anything in green, this means that nothing with a result of True and no changes will not be printed

state_output: The highstate outputter has six output modes, full, terse, mixed, changes and filter

- The default is set to full, which will display many lines of detailed information for each executed chunk.
- If terse is used, then the output is greatly simplified and shown in only one line.
- If mixed is used, then terse output will be used unless a state failed, in which case full output will be used.
- If changes is used, then terse output will be used if there was no error and no changes, otherwise full output will be used.
- If filter is used, then either or both of two different filters can be used: exclude or terse.
  - for exclude, state.highstate expects a list of states to be excluded (or None) followed by True for terse output or False for regular output. Because of parsing nuances, if only one of these is used, it must still contain a comma. For instance: exclude=True,
  - for terse, state.highstate expects simply True or False.

These can be set as such from the command line, or in the Salt config as state_output_exclude or state_output_terse, respectively.

The output modes have one modifier:

full_id, terse_id, mixed_id, changes_id and filter_id If _id is used, then the corresponding form will be used, but the value for name will be drawn from the state ID. This is useful for cases where the name value might be very long and hard to read.

state_tabular: If state_output uses the terse output, set this to True for an aligned output format. If you wish to use a custom format, this can be set to a string.

Example usage:

If state_output: filter is set in the configuration file:

```
salt '*' state.highstate exclude=None,True
```

means to exclude no states from the highstate and turn on terse output.

```
salt twd state.highstate exclude=problemstate1,problemstate2,False
```

means to exclude states problemstate1 and problemstate2 from the highstate, and use regular output.

Example output for the above highstate call when top.sls defines only one other state to apply to minion twd:

```
twd:
Summary for twd
-------------
Succeeded: 1 (changed=1)
Failed: 0
-------------
Total states run: 1
```

Example output with no special settings in configuration files:
myminion:
--------
ID: test.ping
Function: module.run
Result: True
Comment: Module function test.ping executed
Changes:
--------
ret:
True

Summary for myminion
--------
Succeeded: 1
Failed: 0
--------
Total: 0

salt.output.highstate.output(data, **kwargs)
The HighState Outputer is only meant to be used with the state.highstate function, or a function that returns highstate return data.

21.11.2 salt.output.json_out

Display return data in JSON format

configuration The output format can be configured in two ways: Using the --out-indent CLI flag and specifying a positive integer or a negative integer to group JSON from each minion to a single line.

Or setting the output_indent setting in the Master or Minion configuration file with one of the following values:

- Null: put each minion return on a single line.
- pretty: use four-space indents and sort the keys.
- An integer: specify the indentation level.

Salt’s outputters operate on a per-minion basis. Each minion return will be output as a single JSON object once it comes in to the master.

Some JSON parsers can guess when an object ends and a new one begins but many can not. A good way to differentiate between each minion return is to use the single-line output format and to parse each line individually. Example output (truncated):

```
{"dave": {"en0": {"hwaddr": "02:b0:26:32:4c:69", ...}}
{"jerry": {"en0": {"hwaddr": "02:26:ab:0d:b9:0d", ...}}
{"kevin": {"en0": {"hwaddr": "02:6d:7f:ce:9f:ee", ...}}
{"mike": {"en0": {"hwaddr": "02:48:a2:4b:70:a0", ...}}
{"phill": {"en0": {"hwaddr": "02:1d:cc:a2:33:55", ...}}
{"stuart": {"en0": {"hwaddr": "02:9a:e0:ea:9e:3c", ...}}
```

salt.output.json_out.output(data, **kwargs)
Print the output data in JSON
21.11.3 salt.output.key

Display salt-key output

The `salt-key` command makes use of this outputer to format its output.

```python
salt.output.key.output(data, **kwargs)
```

Read in the dict structure generated by the salt key API methods and print the structure.

21.11.4 salt.output.nested

Recursively display nested data

This is the default outputer for most execution functions.

Example output:

```plaintext
myminion:
   ------------
   foo:
      ------------
         bar:
             baz
         dictionary:
            ------------
                abc:
                   123
                def:
                   456
         list:
            - Hello
            - World
```

```python
class salt.output.nested.NestDisplay(retcode=0)
    Manage the nested display contents

    display(ret, indent, prefix, out)
        Recursively iterate down through data structures to determine output

    ustring(indent, color, msg, prefix=", suffix=", endc=None)

salt.output.nested.output(ret, **kwargs)
    Display ret data
```

21.11.5 salt.output.newline_values_only

Display values only, separated by newlines

New in version 2015.5.0.

This outputer is designed for Salt CLI return data. It will do the following to the return dict:

1. Get just the values (ignoring the minion IDs).
2. Each value, if it is iterable, is split a separate line.
3. Each minion’s values are separated by newlines.
This results in a single string of return data containing all the values from the various minions.

**Warning:** As noted above, this outputter will discard the minion ID. If the minion ID is important, then an outputter that returns the full return dictionary in a parsable format (such as json, pprint, or yaml) may be more suitable.

**Example 1**

**Input**

```json
{
    'myminion': ['127.0.0.1', '10.0.0.1'],
    'second-minion': ['127.0.0.1', '10.0.0.2']
}
```

**Output**

```
127.0.0.1
10.0.0.1
127.0.0.1
10.0.0.2
```

**Example 2**

**Input**

```json
{
    'myminion': 8,
    'second-minion': 10
}
```

**Output**

```
8
10
```

salt.output.newline_values_only.output(data, **kwargs)

Display modified ret data

**21.11.6 salt.output.no_out_quiet**

**Display no output**

No output is produced when this outputter is selected
21.11.7 salt.output.no_return

Display output for minions that did not return

This outputter is used to display notices about which minions failed to return when a salt function is run with `-v` or `--verbose`. It should not be called directly from the CLI.

Example output:

```
virtucentos:
    Minion did not return
```

```python
class salt.output.no_return.NestDisplay
    Create generator for nested output
    display(ret, indent, prefix, out)
        Recursively iterate down through data structures to determine output

salt.output.no_return.output(ret, **kwargs)
    Display ret data
```

21.11.8 salt.output.overstatestage

Display clean output of an overstate stage

This outputter is used to display Orchestrate Runner stages, and should not be called directly.

```python
salt.output.overstatestage.output(data, **kwargs)
    Format the data for printing stage information from the overstate system
```

21.11.9 salt.output.pony module

Display Pony output data structure

depends
    - ponysay CLI program

Display output from a pony. Ponies are better than cows because everybody wants a pony.

Example output:

```
< {'local': True} >
----------------
  
  ▄▄▄▄▄▄▄
 ▄▀▄▄████▄▄
 ▀▄▄█████▄█▄█▄▄▄
    ▀▀▀ ▀▀▀ ▀▀▀

(continues on next page)
salt.output.pony.output(data, **kwargs)

Mane function

21.11.10 salt.output.pprint_out

Python pretty-print (pprint)

The python pretty-print system was once the default outputter. It simply passes the return data through to pprint.pformat and prints the results.

Example output:

```python
{'saltmine': {'foo': {'bar': 'baz',
    'dictionary': {'abc': 123, 'def': 456},
    'list': ['Hello', 'World']})}
```

salt.output.pprint_out.output(data, **kwargs)

Print out via pretty print

21.11.11 salt.output.profile

Display profiling data in a table format

Show profile data for returners that would normally show a highstate output.

salt MINION state.apply something -out=profile

Attempt to output the returns of state.sls and state.highstate as a table of names, modules and durations that looks somewhat like the following:

<table>
<thead>
<tr>
<th>name</th>
<th>mod.fun</th>
<th>duration (ms)</th>
</tr>
</thead>
<tbody>
<tr>
<td>I-fail-unless-stmt</td>
<td>other.function</td>
<td>-1.0000</td>
</tr>
<tr>
<td>old-minion-config</td>
<td>grains.list_present</td>
<td>1.1200</td>
</tr>
<tr>
<td>salt-data</td>
<td>group.present</td>
<td>48.3800</td>
</tr>
<tr>
<td>/etc/salt/minion</td>
<td>file.managed</td>
<td>63.1450</td>
</tr>
</tbody>
</table>

To get the above appearance, use settings something like these:
salt.output.profile.output(data, **kwargs)
Display the profiling data in a table format.

21.11.12 salt.output.progress
Display return data as a progress bar
salt.output.progress.output(ret, bar, **kwargs)
Update the progress bar
salt.output.progress.progress_iter(progress)
Initialize and return a progress bar iter

21.11.13 salt.output.raw
Display raw output data structure
This outputter simply displays the output as a python data structure, by printing a string representation of it. It is similar to the pprint outputter, only the data is not nicely formatted/indented.
This was the original outputter used by Salt before the outputter system was developed.
Example output:
```python
{'myminion': {'foo': {'list': ['Hello', 'World'], 'bar': 'baz', 'dictionary': {'abc': 40
-123, 'def': 456}}}}
```

salt.output.raw.output(data, **kwargs)
Rather basic....

21.11.14 salt.output.table_out
Display output in a table format
New in version 2017.7.0.
This outputter displays a sequence of rows as table.
Example output:
```bash
edge01.bjm01:
  ------------
  comment:
  ------------
  out:
  ------------
  | Active | Interface | Last Move | Mac | Moves | Static | Vlan |
  (continues on next page)
```
class salt.output.table_out.TableDisplay(has_header=True, row_delimiter='-', delim=' | ', justify='center', separate_rows=True, prefix='| ', suffix=' |', width=50, wrapfunc=None)

Manage the table display content.

display(ret, indent, out, rows_key=None, labels_key=None)
Display table(s).

display_rows(rows, labels, indent)
Prepares row content and displays.

prepare_rows(rows, indent, has_header)
Prepare rows content to be displayed.

ustring(indent, color, msg, prefix='\', suffix='\', endc=None)
Build the unicode string to be displayed.

wrap_onspace(text)
When the text inside the column is longer then the width, will split by space and continue on the next line.

salt.output.table_out.output(ret, **kwargs)
Display the output as table.

Parameters
- nested_indent(*) - integer, specify the left alignment.
- has_header(*) - boolean specifying if header should be displayed. Default: True.
- row_delimiter(*) - character to separate rows. Default: '-'
- delim(*) - character to separate columns. Default: " | ".
- justify(*) - text alignment. Default: center.
- separate_rows(*) - boolean specifying if row separator will be displayed between consecutive rows. Default: True.
- prefix(*) - character at the beginning of the row. Default: " | ".
- suffix(*) - character at the end of the row. Default: " | ".
- width(*) - column max width. Default: 50.
- rows_key(*) - display the rows under a specific key.
- labels_key(*) - use the labels under a certain key. Otherwise will try to use the dictionary keys (if any).
- title(*) - display title when only one table is selected (using the rows_key argument).
21.11.15 salt.output.txt

Simple text outputter

The txt outputter has been developed to make the output from shell commands on minions appear as they do when the command is executed on the minion.

```
salt.output.txt.output(data, **kwargs)
```
Output the data in lines, very nice for running commands

21.11.16 salt.output.virt_query

virt.query outputter

Used to display the output from the `virt.query` runner.

```
salt.output.virt_query.output(data, **kwargs)
```
Display output for the salt-run virt.query function

21.11.17 salt.output.yaml_out

Display return data in YAML format

This outputter defaults to printing in YAML block mode for better readability.

Example output:

```
saltmine:
  foo:
    bar: baz
  dictionary:
    abc: 123
    def: 456
  list:
    - Hello
    - World
```

```
salt.output.yaml_out.output(data, **kwargs)
```
Print out YAML using the block mode

21.12 pillar modules

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cmd_json</td>
<td>Execute a command and read the output as JSON.</td>
</tr>
<tr>
<td>cmd_yaml</td>
<td>Execute a command and read the output as YAML.</td>
</tr>
<tr>
<td>cmd_yamlex</td>
<td>Execute a command and read the output as YAMLEX.</td>
</tr>
<tr>
<td>cobbler</td>
<td>A module to pull data from Cobbler via its API into the Pillar dictionary</td>
</tr>
<tr>
<td>confidant</td>
<td>An external pillar module for getting credentials from confidant.</td>
</tr>
<tr>
<td>consul_pillar</td>
<td>Use Consul K/V as a Pillar source with values parsed as YAML.</td>
</tr>
</tbody>
</table>

Continued on next page
### Table 12 – continued from previous page

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>csvpillar</code></td>
<td>Store key/value pairs in a CSV file</td>
</tr>
<tr>
<td><code>digicert</code></td>
<td>Digicert Pillar Certificates</td>
</tr>
<tr>
<td><code>django_orm</code></td>
<td>Generate Pillar data from Django models through the Django ORM</td>
</tr>
<tr>
<td><code>ec2_pillar</code></td>
<td>Retrieve EC2 instance data for minions for <code>ec2_tags</code> and <code>ec2_tags_list</code></td>
</tr>
<tr>
<td><code>etcd_pillar</code></td>
<td>Use etcd data as a Pillar source</td>
</tr>
<tr>
<td><code>file_tree</code></td>
<td>The <code>file_tree</code> external pillar allows values from all files in a directory tree to be imported as Pillar data.</td>
</tr>
<tr>
<td><code>foreman</code></td>
<td>A module to pull data from Foreman via its API into the Pillar dictionary</td>
</tr>
<tr>
<td><code>git_pillar</code></td>
<td>Use a git repository as a Pillar source</td>

<td>Vault Pillar Module</td>
</tr>
<tr>
<td><code>venafi</code></td>
<td>Venafi Pillar Certificates</td>
</tr>
<tr>
<td><code>virtkey</code></td>
<td>Accept a key from a hypervisor if the virt runner has already submitted an authorization request</td>
</tr>
</tbody>
</table>

**21.12. pillar modules**
Table 12 – continued from previous page

| vmware_pillar | Pillar data from vCenter or an ESXi host |

21.12.1 salt.pillar.cmd_json

Execute a command and read the output as JSON. The JSON data is then directly overlaid onto the minion’s Pillar data.

salt.pillar.cmd_json.ext_pillar(minion_id, pillar, command)
Execute a command and read the output as JSON

21.12.2 salt.pillar.cmd_yaml

Execute a command and read the output as YAML. The YAML data is then directly overlaid onto the minion’s Pillar data

salt.pillar.cmd_yaml.ext_pillar(minion_id, pillar, command)
Execute a command and read the output as YAML

21.12.3 salt.pillar.cmd_yamlex

Execute a command and read the output as YAMLEX.
The YAMLEX data is then directly overlaid onto the minion’s Pillar data

salt.pillar.cmd_yamlex.ext_pillar(minion_id, pillar, command)
Execute a command and read the output as YAMLEX

21.12.4 salt.pillar.cobbler

A module to pull data from Cobbler via its API into the Pillar dictionary

Configuring the Cobbler ext_pillar

The same cobbler* parameters are used for both the Cobbler tops and Cobbler pillar modules.

```yaml
ext_pillar:
  - cobbler:
      key: cobbler # Nest results within this key. By default, values are not nested.
      only: [parameters] # Add only these keys to pillar.
  cobbler.url: https://example.com/cobbler_api #default is http://localhost/cobbler_api
  cobbler.user: username # default is no username
  cobbler.password: password # default is no password
```

Module Documentation

salt.pillar.cobbler.ext_pillar(minion_id, pillar, key=None, only=())
Read pillar data from Cobbler via its API.
21.12.5 salt.pillar.confidant

An external pillar module for getting credentials from confidant.

Configuring the Confidant module

The module can be configured via ext_pillar in the minion config:

```
ext_pillar:
  - confidant:
      profile: # The URL of the confidant web service url: 'https://confidant-production.example.com'
      # The context to use for KMS authentication auth_context: from: example-production-iad to: confidant-production-iad user_type: service # The KMS master key to use for authentication auth_key: "alias/authnz" # Cache file for KMS auth token token_cache_file: /run/confidant/confidant_token # The duration of the validity of a token, in minutes token_duration: 60 # key, keyid and region can be defined in the profile, but it’s # generally best to use IAM roles or environment variables for AWS # auth. key: jhf908gyeghehe0he0g8h9u0j0n0n09h09h0 region: us-east-1

depends confidant-common, confidant-client
```

Module Documentation

salt.pillar.confidant.ext_pillar(minion_id, pillar, profile=None)

Read pillar data from Confidant via its API.

21.12.6 salt.pillar.consul_pillar module

Use Consul K/V as a Pillar source with values parsed as YAML

```
depends
  - python-consul
```

In order to use an consul server, a profile must be created in the master configuration file:

```
my_consul_config:
  consul.host: 127.0.0.1
  consul.port: 8500
  consul.token: b6376768-a8bb-edd5-fcd9-33bc13bfc556
  consul.scheme: http
  consul.consistency: default
  consul.dc: dev
  consul.verify: True
```

All parameters are optional.

The consul.token requires python-consul >= 0.4.7.

If you have a multi-datacenter Consul cluster you can map your pillarenv``s to your data centers by providing a dictionary of mappings in ``consul.dc field:
In the example above we specifying static mapping between Pillar environments and data centers: the data for `dev` and `prod` Pillar environments will be fetched from `us-east-1` and `us-west-1` datacenter respectively.

In fact when `consul.dc` is set to dictionary keys are processed as regular expressions (that can capture named parameters) and values are processed as string templates as per PEP 3101.

This example maps all Pillar environments starting with `dev-` to `dev-datacenter` whereas Pillar environment like `eu-prod` will be mapped to `prod-datacenter-eu`.

Before evaluation patterns are sorted by length in descending order.

If Pillar environment names correspond to data center names a single pattern can be used:

After the profile is created, configure the external pillar system to use it. Optionally, a root may be specified.

Using these configuration profiles, multiple consul sources may also be used:

Either the `minion_id`, or the `role`, or the `environment` grain may be used in the `root` path to expose minion-specific information stored in consul.

Minion-specific values may override shared values when the minion-specific root appears after the shared root:

If using the `role` or `environment` grain in the consul key path, be sure to define it using `/etc/salt/grains`, or similar:
It's possible to lock down where the pillar values are shared through minion targeting. Note that double quotes " are required around the target value and cannot be used inside the matching statement. See the section on Compound Matchers for more examples.

```yaml
ext_pillar:
  - consul: my_consul_config root=salt target="L@salt.example.com and G@osarch:x86_64"
```

The data from Consul can be merged into a nested key in Pillar.

```yaml
ext_pillar:
  - consul: my_consul_config pillar_root=consul_data
```

By default, keys containing YAML data will be deserialized before being merged into Pillar. This behavior can be disabled by setting `expand_keys` to `false`.

```yaml
ext_pillar:
  - consul: my_consul_config expand_keys=false
```

salt.pillar.consul_pillar.consul_fetch(client, path)
Query consul for all keys/values within base path

salt.pillar.consul_pillar.ext_pillar(minion_id, pillar, conf)
Check consul for all data

salt.pillar.consul_pillar.fetch_tree(client, path, expand_keys)
Grab data from consul, trim base path and remove any keys which are folders. Take the remaining data and send it to be formatted in such a way as to be used as pillar data.

salt.pillar.consul_pillar.get_conn(opts, profile)
Return a client object for accessing consul

salt.pillar.consul_pillar.pillar_format(ret, keys, value, expand_keys)
Perform data formatting to be used as pillar data and merge it with the current pillar data

### 21.12.7 salt.pillar.csvpillar module

Store key/value pairs in a CSV file

New in version 2016.11.0.

Example configuration:

```yaml
ext_pillar:
  - csv: /path/to/file.csv
```

# or

```yaml
ext_pillar:
  - csv:
    path: /path/to/file.csv
    namespace: 'subkey'
    fieldnames:
      - col1
      - col2
      - col3
```
The first column must be minion IDs and the first row must be dictionary keys. E.g.:

<table>
<thead>
<tr>
<th>id</th>
<th>role</th>
<th>env</th>
</tr>
</thead>
<tbody>
<tr>
<td>jerry</td>
<td>web</td>
<td>prod</td>
</tr>
<tr>
<td>stuart</td>
<td>web</td>
<td>stage</td>
</tr>
<tr>
<td>dave</td>
<td>web</td>
<td>qa</td>
</tr>
<tr>
<td>phil</td>
<td>db</td>
<td>prod</td>
</tr>
<tr>
<td>kevin</td>
<td>db</td>
<td>stage</td>
</tr>
<tr>
<td>mike</td>
<td>db</td>
<td>qa</td>
</tr>
</tbody>
</table>

Will produce the following Pillar values for a minion named "jerry":

```
{
    'role': 'web',
    'env': 'prod',
}
```

`salt.pillar.csvpillar.ext_pillar(mid, pillar, path, idkey='id', namespace=None, fieldnames=None, restkey=None, restval=None, dialect='excel')`

Read a CSV into Pillar

Parameters
- `path` *(str)* - Absolute path to a CSV file.
- `idkey` *(str)* - (Optional) The column name of minion IDs.
- `namespace` *(str)* - (Optional) A pillar key to namespace the values under.
- `fieldnames` *(list)* - (Optional) if the first row of the CSV is not column names they may be specified here instead.

### 21.12.8 `salt.pillar.digicert` module

Digicert Pillar Certificates

This module will only return pillar data if the `digicert` runner module has already been used to create certificates.

To configure this module, set `digicert` to `True` in the `ext_pillar` section of your master configuration file:

```
  ext_pillar:
    - digicert: True
```

`salt.pillar.digicert.ext_pillar(minion_id, pillar, conf)`

Return an existing set of certificates

### 21.12.9 `salt.pillar.django_orm`

Generate Pillar data from Django models through the Django ORM

Maintainer Micah Hausler <micah.hausler@gmail.com>

Maturity new

Configuring the `django_orm` ext_pillar

To use this module, your Django project must be on the salt master server with database access. This assumes you are using virtualenv with all the project’s requirements installed.
ext_pillar:
- django_orm:
  pillar_name: my_application
  project_path: /path/to/project/
  settings_module: my_application.settings
  env_file: /path/to/env/file.sh
  # Optional: If your project is not using the system python,
  # add your virtualenv path below.
  env: /path/to/virtualenv/

django_app:

  # Required: the app that is included in INSTALLED_APPS
  my_application.clients:

    # Required: the model name
    Client:

      # Required: model field to use as the key in the rendered
      # Pillar. Must be unique; must also be included in the
      # ''fields'' list below.
      name: shortname

      # Optional:
      # See Django's QuerySet documentation for how to use .filter()
      filter: {'kw': 'args'}

      # Required: a list of field names
      # List items will be used as arguments to the .values() method.
      # See Django's QuerySet documentation for how to use .values()
      fields:
        - field_1
        - field_2

This would return pillar data that would look like

```
my_application:
  my_application.clients:
    Client:
      client_1:
        field_1: data_from_field_1
        field_2: data_from_field_2
      client_2:
        field_1: data_from_field_1
        field_2: data_from_field_2
```

As another example, data from multiple database tables can be fetched using Django’s regular lookup syntax. Note, using ManyToManyFields will not currently work since the return from values() changes if a ManyToMany is present.

```
ext_pillar:
- django_orm:
  pillar_name: djangotutorial
  project_path: /path/to/mysite
  settings_module: mysite.settings

  django_app:
    mysite.polls:

(continues on next page)```
Module Documentation

salt.pillar.django_orzech_pillar(minion_id, pillar, pillar_name, project_path, settings_module, django_app, env=’None’, env_file=’None’, *args, **kwargs)

Connect to a Django database through the ORM and retrieve model fields

Parameters

- pillar_name (str) – The name of the pillar to be returned
- project_path (str) – The full path to your Django project (the directory manage.py is in)
- settings_module (str) – The settings module for your project. This can be found in your manage.py file
- django_app (str) – A dictionary containing your apps, models, and fields
- env (str) – The full path to the virtualenv for your Django project
- env_file (str) – An optional bash file that sets up your environment. The file is run in a subprocess and the changed variables are then added

21.12.10 salt.pillar.ec2_pillar

Retrieve EC2 instance data for minions for ec2_tags and ec2_tags_list

The minion id must be the AWS instance-id or value in tag_match_key. For example set tag_match_key to Name to have the minion-id matched against the tag ‘Name’. The tag contents must be unique. The value of tag_match_value can be ‘uqdn’ or ‘asis’. If ‘uqdn’, then the domain will be stripped before comparison.

Additionally, the use_grain option can be set to True. This allows the use of an instance-id grain instead of the minion-id. Since this is a potential security risk, the configuration can be further expanded to include a list of minions that are trusted to only allow the alternate id of the instances to specific hosts. There is no glob matching at this time.

Note: If you are using use_grain: True in the configuration for this external pillar module, the minion must have metadata_server_grains enabled in the minion config file (see also here).

It is important to also note that enabling the use_grain option allows the minion to manipulate the pillar data returned, as described above.

The optional tag_list_key indicates which keys should be added to ec2_tags_list and be split by tag_list_sep (by default ;). If a tag key is included in tag_list_key it is removed from ec2_tags. If a tag does not exist it is still included as an empty list.

..note:: As with any master configuration change, restart the salt-master daemon for changes to take effect.
This is a very simple pillar configuration that simply retrieves the instance data from AWS. Currently the only portion implemented are EC2 tags, which returns a list of key/value pairs for all of the EC2 tags assigned to the instance.

```python
salt.pillar.ec2_pillar.ext_pillar(minion_id, pillar, use_grain=False, minion_ids=None, tag_match_key=None, tag_match_value='asis', tag_list_key=None, tag_list_sep=';')

Execute a command and read the output as YAML
```

21.12.11 salt.pillar.etcd_pillar

Use etcd data as a Pillar source

New in version 2014.7.0.

```yaml
depends
  - python-etcd
```

In order to use an etcd server, a profile must be created in the master configuration file:

```yaml
my_etcd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

After the profile is created, configure the external pillar system to use it. Optionally, a root may be specified.

```yaml
ext_pillar:
  - etcd: my_etcd_config

ext_pillar:
  - etcd: my_etcd_config root=/salt
```

Using these configuration profiles, multiple etcd sources may also be used:

```yaml
ext_pillar:
  - etcd: my_etcd_config
  - etcd: my_other_etcd_config
```

The `minion_id` may be used in the `root` path to expose minion-specific information stored in etcd.

```yaml
ext_pillar:
  - etcd: my_etcd_config root=/salt/%(minion_id)s
```

Minion-specific values may override shared values when the minion-specific root appears after the shared root:
Using the configuration above, the following commands could be used to share a key with all minions but override its value for a specific minion:

```
  etcdctl set /salt-shared/mykey my_value
  etcdctl set /salt-private/special_minion_id/mykey my_other_value
```

```
salt.pillar.etcd_pillar.ext_pillar(minion_id, pillar, conf)
```

Check etcd for all data

### 21.12.12 salt.pillar.file_tree

The `file_tree` external pillar allows values from all files in a directory tree to be imported as Pillar data.

**Note:** This is an external pillar and is subject to the *rules and constraints* governing external pillars.

**New in version 2015.5.0.**

In this pillar, data is organized by either Minion ID or Nodergroup name. To setup pillar data for a specific Minion, place it in `<root_dir>/hosts/<minion_id>`. To setup pillar data for an entire Nodergroup, place it in `<root_dir>/nodegroups/<node_group>` where `<node_group>` is the Nodergroup's name.

**Example file_tree Pillar**

**Master Configuration**

```
ext_pillar:
  - file_tree:
      root_dir: /srv/ext_pillar
      follow_dir_links: False
      keep_newline: True
```

The `root_dir` parameter is required and points to the directory where files for each host are stored. The `follow_dir_links` parameter is optional and defaults to False. If `follow_dir_links` is set to True, this external pillar will follow symbolic links to other directories.

**Warning:** Be careful when using `follow_dir_links`, as a recursive symlink chain will result in unexpected results.

Changed in version 2018.3.0: If `root_dir` is a relative path, it will be treated as relative to the `pillar_roots` of the environment specified by `pillarenv`. If an environment specifies multiple roots, this module will search for files relative to all of them, in order, merging the results.

If `keep_newline` is set to True, then the pillar values for files ending in newlines will keep that newline. The default behavior is to remove the end-of-file newline. `keep_newline` should be turned on if the pillar data is intended to be used to deploy a file using `contents_pillar` with a `file.managed` state.

Changed in version 2015.8.4: The `raw_data` parameter has been renamed to `keep_newline`. In earlier releases, `raw_data` must be used. Also, this parameter can now be a list of globs, allowing for more granular control over
which pillar values keep their end-of-file newline. The globs match paths relative to the directories named for minion IDs and nodegroups underneath the root_dir (see the layout examples in the below sections).

```
ext_pillar:
    - file_tree:
        root_dir: /path/to/root/directory
        keep_newline:
            - files/testdir/*
```

**Note:** In earlier releases, this documentation incorrectly stated that binary files would not affected by the keep_newline configuration. However, this module does not actually distinguish between binary and text files.

Changed in version 2017.7.0: Templating/rendering has been added. You can now specify a default render pipeline and a black- and whitelist of (dis)allowed renderers.

**template** must be set to True for templating to happen.

```
ext_pillar:
    - file_tree:
        root_dir: /path/to/root/directory
        render_default: jinja|yaml
        renderer_blacklist:
            - gpg
        renderer_whitelist:
            - jinja
            - yaml
        template: True
```

**Assigning Pillar Data to Individual Hosts**

To configure pillar data for each host, this external pillar will recursively iterate over root_dir/hosts/id (where id is a minion ID), and compile pillar data with each subdirectory as a dictionary key and each file as a value.

For example, the following root_dir tree:

```
./hosts/
./hosts/test-host/
./hosts/test-host/files/
./hosts/test-host/files/testdir/
./hosts/test-host/files/testdir/file1.txt
./hosts/test-host/files/testdir/file2.txt
./hosts/test-host/files/another-testdir/
./hosts/test-host/files/another-testdir/symlink-to-file1.txt
```

will result in the following pillar tree for minion with ID test-host:

```
test-host:
    ----------
    apache:
        ----------
        config.d:
            ----------
            00_important.conf:
                <important_config important_setting="yes" />
            20_bob_extra.conf:
```

(continues on next page)
<bob_specific_cfg has_freeze_ray="yes" />

**corporate_app:**

```
---------
settings:
---------

common_settings:
// This is the main settings file for the corporate
// internal web app
main_setting: probably

bob_settings:
role: bob
```

**Note:** The leaf data in the example shown is the contents of the pillar files.

### `salt.pillar.file_tree` `ext_pillar`

```
salt.pillar.file_tree.ext_pillar(minion_id, pillar=, root_dir=\None, follow_dir_links=False, debug=False, keep_newline=False, render_default=\None, renderer_blacklist=\None, renderer_whitelist=\None, template=False)
```

Compile pillar data from the given `root_dir` specific to Nodegroup names and Minion IDs.

If a Minion’s ID is not found at `<root_dir>/host/<minion_id>` or if it is not included in any Nodegroups named at `<root_dir>/nodegroups/<node_group>`, no pillar data provided by this pillar module will be available for that Minion.

**Changed in version 2017.7.0:** Templating/rendering has been added. You can now specify a default render pipeline and a black- and whitelist of (dis)allowed renderers.

**template** must be set to `True` for templating to happen.

```
ext_pillar:
  - file_tree:
      root_dir: /path/to/root/directory
      render_default: jinja|yaml
      renderer_blacklist:
        - gpg
      renderer_whitelist:
        - jinja
        - yaml
      template: True
```

**Parameters**

- **minion_id** – The ID of the Minion whose pillar data is to be collected
- **pillar** – Unused by the `file_tree` pillar module
- **root_dir** – Filesystem directory used as the root for pillar data (e.g. `/srv/` `ext_pillar`)

**Changed in version 2018.3.0:** If `root_dir` is a relative path, it will be treated as relative to the `pillar_roots` of the environment specified by `pillarenv`. If an environment specifies multiple roots, this module will search for files relative to all of them, in order, merging the results.

- **follow_dir_links** – Follow symbolic links to directories while collecting pillar files. Defaults to `False`. 
Warning: Care should be exercised when enabling this option as it will follow links that point outside of root_dir.

Warning: Symbolic links that lead to infinite recursion are not filtered.

- **debug** – Enable debug information at log level debug. Defaults to False. This option may be useful to help debug errors when setting up the file_tree pillar module.

- **keep_newline** – Preserve the end-of-file newline in files. Defaults to False. This option may either be a boolean or a list of file globs (as defined by the Python fnmatch package) for which end-of-file newlines are to be kept.

keep_newline should be turned on if the pillar data is intended to be used to deploy a file using contents_pillar with a file.managed state.

Changed in version 2015.8.4: The raw_data parameter has been renamed to keep_newline. In earlier releases, raw_data must be used. Also, this parameter can now be a list of globs, allowing for more granular control over which pillar values keep their end-of-file newline. The globs match paths relative to the directories named for Minion IDs and Nodegroup names underneath the root_dir.

```yaml
ext_pillar:
  - file_tree:
      root_dir: /srv/ext_pillar
      keep_newline:
        - apache/config.d/*
        - corporate_app/settings/*
```

Note: In earlier releases, this documentation incorrectly stated that binary files would not affected by the keep_newline. However, this module does not actually distinguish between binary and text files.

- **render_default** – Override Salt’s default global renderer for the file_tree pillar.

```yaml
render_default: jinja
```

- **renderer_blacklist** – Disallow renderers for pillar files.

```yaml
renderer_blacklist:
  - json
```

- **renderer_whitelist** – Allow renderers for pillar files.

```yaml
renderer_whitelist:
  - yaml
  - jinja
```

- **template** – Enable templating of pillar files. Defaults to False.

### 21.12.13 salt.pillar.foreman

A module to pull data from Foreman via its API into the Pillar dictionary
Configuring the Foreman ext_pillar

Set the following Salt config to setup Foreman as external pillar source:

```
ext_pillar:
  - foreman:
      key: foreman # Nest results within this key
      only: ['hostgroup_name', 'parameters'] # Add only these keys to pillar

foreman.url: https://example.com/foreman_api
foreman.user: username # default is admin
foreman.password: password # default is changeme
```

The following options are optional:

```
foreman.api: apiversion # default is 2 (1 is not supported yet)
foreman.verifyssl: False # default is True
foreman.certfile: /etc/ssl/certs/mycert.pem # default is None
foreman.keyfile: /etc/ssl/private/mykey.pem # default is None
foreman.cafile: /etc/ssl/certs/mycert.ca.pem # default is None
foreman.lookup_parameters: True # default is True
```

An alternative would be to use the Foreman modules integrating Salt features in the Smart Proxy and the webinterface.

Further information can be found on GitHub.

Module Documentation

```
salt.pillar.foreman.ext_pillar(minion_id, pillar, key=None, only=())
```

Read pillar data from Foreman via its API.

**21.12.14 salt.pillar.git_pillar**

Use a git repository as a Pillar source

This external pillar allows for a Pillar top file and Pillar SLS files to be sourced from a git repository.

However, since git_pillar does not have an equivalent to the `pillar_roots` parameter, configuration is slightly different. A Pillar top file is required to be in the git repository and must still contain the relevant environment, like so:

```
base:
  '*':
    - foo
```

The branch/tag which maps to that environment must then be specified along with the repo’s URL. Configuration details can be found below.

**Important:** Each branch/tag used for git_pillar must have its own top file. This is different from how the top file works when configuring `States`. The reason for this is that each git_pillar branch/tag is processed separately from the rest. Therefore, if the qa branch is to be used for git_pillar, it would need to have its own top file, with the qa environment defined within it, like this:
Additionally, while `git_pillar` allows for the branch/tag to be overridden (see here), keep in mind that the top file must reference the actual environment name. It is common practice to make the environment in a `git_pillar` top file match the branch/tag name, but when remapping, the environment of course no longer matches the branch/tag, and the top file needs to be adjusted accordingly. When expected Pillar values configured in `git_pillar` are missing, this is a common misconfiguration that may be to blame, and is a good first step in troubleshooting.

### Configuring `git_pillar` for Salt

Beginning with Salt version 2015.8.0, `pygit2` is now supported in addition to `GitPython`. The requirements for `GitPython` and `pygit2` are the same as for `GitFS`, as described here.

**Important:** `git_pillar` has its own set of global configuration parameters. While it may seem intuitive to use the global `gitfs` configuration parameters (`gitfs_base`, etc.) to manage `git_pillar`, this will not work. The main difference for this is the fact that the different components which use Salt’s git backend code do not all function identically. For instance, in `git_pillar` it is necessary to specify which branch/tag to be used for `git_pillar` remotes. This is the reverse behavior from `gitfs`, where branches/tags make up your environments.

See here for documentation on the `git_pillar` configuration options and their usage.

Here is an example `git_pillar` configuration:

```yaml
qa:
  'dev-*':
    - bar
```

The main difference between this and the old way of configuring `git_pillar` is that multiple remotes can be configured under one `git` section under `ext_pillar`. More than one `git` section can be used, but it is not necessary. Remotes will be evaluated sequentially.
Per-remote configuration parameters are supported (similar to \textit{gitfs}), and global versions of the \texttt{git\_pillar} configuration parameters can also be set.

To remap a specific branch to a specific Pillar environment, use the \texttt{env} per-remote parameter:

```
\texttt{ext\_pillar:}
  - \texttt{git:}
    - \texttt{production} https://gitserver/git-pillar.git:
      - \texttt{env}: prod
```

If \texttt{__env__} is specified as the branch name, then \texttt{git\_pillar} will decide which branch to use based on the following criteria:

- If the minion has a \texttt{pillarenv} configured, it will use that pillar environment. (2016.11.2 and later)
- Otherwise, if the minion has an \texttt{environment} configured, it will use that environment.
- Otherwise, the master's \texttt{git\_pillar\_base} will be used.

\textbf{Note}: The use of \texttt{environment} to choose the pillar environment dates from a time before the \texttt{pillarenv} parameter was added. In a future release, it will be ignored and either the minion's \texttt{pillarenv} or the master's \texttt{git\_pillar\_base} will be used.

Here's an example of using \texttt{__env__} as the \texttt{git\_pillar} environment:

```
\texttt{ext\_pillar:}
  - \texttt{git:}
    - \texttt{__env__} https://gitserver/git-pillar.git:
      - \texttt{root}: pillar
```

The corresponding Pillar top file would look like this:

```
"{{saltenv}}":
  '*':
    - bar
```

With the addition of \texttt{pygit2} support, \texttt{git\_pillar} can now interact with authenticated remotes. Authentication works just like in \texttt{gitfs} (as outlined in the \textit{Git Fileserver Backend Walkthrough}), only with the global authentication parameter names prefixed with \texttt{git\_pillar} instead of \texttt{gitfs} (e.g. \texttt{git\_pillar\_pubkey}, \texttt{git\_pillar\_privkey}, \texttt{git\_pillar\_passphrase}, etc.).

\textbf{Note}: The \texttt{name} parameter can be used to further differentiate between two remotes with the same URL and branch. When using two remotes with the same URL, the \texttt{name} option is required.

\textbf{How Multiple Remotes Are Handled}

As noted above, multiple remotes can be included in the same \texttt{git ext\_pillar} configuration. Consider the following:

```
\texttt{my\_etcd\_config:}
  \texttt{etcd\_host:} 127.0.0.1
  \texttt{etcd\_port:} 4001

\texttt{ext\_pillar:}
  - \texttt{etcd: my\_etcd\_config}
```

(continues on next page)
To understand how pillar data from these repos will be compiled, it’s important to know how Salt will process them. The following points should be kept in mind:

1. Each ext_pillar is called separately from the others. So, in the above example, the etcd ext_pillar will be evaluated first, with the first group of git_pillar remotes evaluated next (and merged into the etcd pillar data). Lastly, the second group of git_pillar remotes will be evaluated, and then merged into the ext_pillar data evaluated before it.

2. Within a single group of git_pillar remotes, each remote will be evaluated in order, with results merged together as each remote is evaluated.

Note: Prior to the 2017.7.0 release, remotes would be evaluated in a non-deterministic order.

3. By default, when a repo is evaluated, other remotes’ which share its pillar environment will have their files made available to the remote being processed.

The first point should be straightforward enough, but the second and third could use some additional clarification.

First, point #2. In the first group of git_pillar remotes, the top file and pillar SLS files in the foo remote will be evaluated first. The bar remote will be evaluated next, and its results will be merged into the pillar data compiled when the foo remote was evaluated. As the subsequent remotes are evaluated, their data will be merged in the same fashion.

But wait, don’t these repositories belong to more than one pillar environment? Well, yes. The default method of generating pillar data compiles pillar data from all environments. This behavior can be overridden using a pillarenv. Setting a pillarenv in the minion config file will make that minion tell the master to ignore any pillar data from environments which don’t match that pillarenv. A pillarenv can also be specified for a given minion or set of minions when running states, by using the pillarenv argument. The CLI pillarenv will override one set in the minion config file. So, assuming that a pillarenv of base was set for a minion, it would not get any of the pillar variables configured in the qux remote, since that remote is assigned to the dev environment. The only way to get its pillar data would be to specify a pillarenv of dev, which would mean that it would then ignore any items from the base pillarenv. A more detailed explanation of pillar environments can be found here.

Moving on to point #3, and looking at the example ext_pillar configuration, as the foo remote is evaluated, it will also have access to the files from the bar and baz remotes, since all three are assigned to the base pillar environment. So, if an SLS file referenced by the foo remote’s top file does not exist in the foo remote, it will be searched for in the bar remote, followed by the baz remote. When it comes time to evaluate the bar remote, SLS files referenced by the bar remote’s top file will first be looked for in the bar remote, followed by foo, and baz, and when the baz remote is processed, SLS files will be looked for in baz, followed by foo and bar. This “failover” logic is called a directory overlay, and it is also used by file_roots and :conf_minion:pillar_roots’. The ordering of which remote is checked for SLS files is determined by the order they are listed. First the remote being processed is checked, then the others that share the same environment are checked. However, before the 2017.7.0 release, since evaluation was unordered, the remote being processed would be checked, followed in no specific order by the other repos which share the same environment.

Beginning with the 2017.7.0 release, this behavior of git_pillar remotes having access to files in other repos which
share the same environment can be disabled by setting `git_pillar_includes` to False. If this is done, then all `git_pillar` remotes will only have access to their own SLS files. Another way of ensuring that a `git_pillar` remote will not have access to SLS files from other `git_pillar` remotes which share the same pillar environment is to put them in a separate `git` section under `ext_pillar`. Look again at the example configuration above. In the second group of `git_pillar` remotes, the `abc` remote would not have access to the SLS files from the `foo`, `bar`, and `baz` remotes, and vice-versa.

**Mountpoints**

New in version 2017.7.0.

Assume the following pillar top file:

```yaml
base:
  'web*':
    - common
    - web.server.nginx
    - web.server.appdata
```

Now, assume that you would like to configure the `web.server.nginx` and `web.server.appdata` SLS files in separate repos. This could be done using the following `ext_pillar` configuration (assuming that `git_pillar_includes` has not been set to False):

```yaml
ext_pillar:
  - git:
      master https://mydomain.tld/pillar-common.git
      master https://mydomain.tld/pillar-nginx.git
      master https://mydomain.tld/pillar-appdata.git
```

However, in order to get the files in the second and third `git_pillar` remotes to work, you would need to first create the directory structure underneath it (i.e. place them underneath `web/server/` in the repository). This also makes it tedious to reorganize the configuration, as changing `web.server.nginx` to `web.nginx` in the top file would require you to also move the SLS files in the `pillar-nginx` up a directory level.

For these reasons, much like `gitfs`, `git_pillar` now supports a "mountpoint" feature. Using the following `ext_pillar` configuration, the SLS files in the second and third `git_pillar` remotes can be placed in the root of the git repository:

```yaml
ext_pillar:
  - git:
      master https://mydomain.tld/pillar-common.git
      master https://mydomain.tld/pillar-nginx.git:
        mountpoint: web/server/
      master https://mydomain.tld/pillar-appdata.git:
        mountpoint: web/server/
```

Now, if the top file changed the SLS target from `web.server.nginx`, instead of reorganizing the git repository, you would just need to adjust the mountpoint to `web/` (and restart the `salt-master` daemon).

**Note:**

- Leading and trailing slashes on the mountpoints are optional.
- Use of the `mountpoint` feature requires that `git_pillar_includes` is not disabled.
- Content from mounted `git_pillar` repos can only be referenced by a top file in the same pillar environment.
- Salt versions prior to 2018.3.4 ignore the `root` parameter when `mountpoint` is set.
all_saltenvs

New in version 2018.3.4.

When __env__ is specified as the branch name, all_saltenvs per-remote configuration parameter overrides the logic Salt uses to map branches/tags to pillar environments (i.e. pillarenvs). This allows a single branch/tag to appear in all saltenvs. Example:

```
ext_pillar:
  - git:
    - __env__ https://mydomain.tld/top.git
    - all_saltenvs: master
    - __env__ https://mydomain.tld/pillar-nginx.git:
      - mountpoint: web/server/
    - __env__ https://mydomain.tld/pillar-appdata.git:
      - mountpoint: web/server/
```

salt.pillar.git_pillar.ext_pillar(minion_id, pillar, *repos)

Checkout the ext_pillar sources and compile the resulting pillar SLS

21.12.15 salt.pillar.gpg module

Decrypt pillar data through the builtin GPG renderer

In most cases, you'll want to make this the last external pillar used. For example, to pair with the builtin stack pillar you could do something like this:

```
ext_pillar:
  - stack: /path/to/stack.cfg
  - gpg: {}
```

Set gpg_keydir in your config to adjust the homedir the renderer uses.

salt.pillar.gpg.ext_pillar(minion_id, pillar, *args, **kwargs)

21.12.16 salt.pillar.hg_pillar

Use remote Mercurial repository as a Pillar source.

New in version 2015.8.0.

The module depends on the hglib python module being available. This is the same requirement as for hgfs_ so should not pose any extra hurdles.

This external Pillar source can be configured in the master config file as such:

```
ext_pillar:
  - hg: ssh://hg@example.co/user/repo
```

class salt.pillar.hg_pillar.Repo(repo_uri)

Deal with remote hg (mercurial) repository for Pillar

    close()
    Cleanup mercurial command server

    pull()
**update** *(branch='default')*

Ensure we are using the latest revision in the hg repository

```
salt.pillar.hg_pillar.ext_pillar(minion_id, pillar, repo, branch='default', root=None)
```

Extract pillar from an hg repository

```
salt.pillar.hg_pillar.update(repo_uri)
```

Execute an hg pull on all the repos

### 21.12.17 salt.pillar.hiera

Use hiera data as a Pillar source

```
salt.pillar.hiera.ext_pillar(minion_id, pillar, conf)
```

Execute hiera and return the data

### 21.12.18 salt.pillar.http_json module

A module that adds data to the Pillar structure retrieved by an http request

#### Configuring the HTTP_JSON ext_pillar

Set the following Salt config to setup http json result as external pillar source:

```
ext_pillar:
  - http_json:
      url: http://example.com/api/minion_id
      ::TODO::
      username: username
      password: password
```

If the with_grains parameter is set, grain keys wrapped in can be provided (wrapped in <> brackets) in the url in order to populate pillar data based on the grain value.

```
ext_pillar:
  - http_json:
      url: http://example.com/api/<nodename>
      with_grains: True
```

Changed in version 2018.3.0: If %s is present in the url, it will be automatically replaced by the minion_id:

```
ext_pillar:
  - http_json:
      url: http://example.com/api/%s
```

#### Module Documentation

```
salt.pillar.http_json.ext_pillar(minion_id, pillar, url, with_grains=False)
```

Read pillar data from HTTP response.

- **url**(str) – Url to request.
- **with_grains**(bool) – Whether to substitute strings in the url with their grain values.
**Returns**  A dictionary of the pillar data to add.

**Return type**  dict

### 21.12.19 salt.pillar.http_yaml module

A module that adds data to the Pillar structure retrieved by an http request

#### Configuring the HTTP_YAML ext_pillar

Set the following Salt config to setup an http endpoint as the external pillar source:

```
ext_pillar:
  - http_yaml:
      url: http://example.com/api/minion_id
      ::TODO::
      username: username
      password: password
```

If the with_grains parameter is set, grain keys wrapped in can be provided (wrapped in <> brackets) in the url in order to populate pillar data based on the grain value.

```
ext_pillar:
  - http_yaml:
      url: http://example.com/api/<nodename>
      with_grains: True
```

Changed in version 2018.3.0: If %s is present in the url, it will be automatically replaced by the minion_id:

```
ext_pillar:
  - http_json:
      url: http://example.com/api/%s
```

#### Module Documentation

salt.pillar.http_yaml.ext_pillar(minion_id, pillar, url, with_grains=False)

Read pillar data from HTTP response.

- **Parameters**
  - `url (str)` - Url to request.
  - `with_grains (bool)` - Whether to substitute strings in the url with their grain values.

- **Returns**  A dictionary of the pillar data to add.

- **Return type**  dict

### 21.12.20 salt.pillar.libvirt

Load up the libvirt keys into Pillar for a given minion if said keys have been generated using the libvirt key runner depends certtool

salt.pillar.libvirt.ext_pillar(minion_id, pillar, command)

Read in the generated libvirt keys
salt.pillar.libvirt.*gen_hyper_keys*(minion_id, country='US', state='Utah', locality='Salt Lake City', organization='Salted', expiration_days='365')

Generate the keys to be used by libvirt hypervisors, this routine gens the keys and applies them to the pillar for the hypervisor minions

### 21.12.21 salt.pillar.makostack module

Simple and flexible YAML ext_pillar which can read pillar from within pillar.

New in version 2016.3.0.

This custom saltstack ext_pillar is a direct ripoff of the 'stack' ext_pillar, simply ported to use mako instead of jinja2 for templating.

It supports the following features:

- multiple config files that are mako templates with support for pillar, __grains__, __salt__, __opts__ objects.
- a config file renders as an ordered list of files. Unless absolute, the paths of these files are relative to the current config file - if absolute, they will be treated literally.
- this list of files are read in order as mako templates with support for stack, pillar, __grains__, __salt__, __opts__ objects.
- all these rendered files are then parsed as yaml.
- then all yaml dicts are merged in order, with support for the following, merging strategies: merge-first, merge-last, remove, and overwrite.
- stack config files can be matched based on pillar, grains, or opts values, which make it possible to support kind of self-contained environments.

#### Configuration in Salt

Like any other external pillar, its configuration takes place through the ext_pillar key in the master config file. However, you can configure MakoStack in 3 different ways:

**Single config file**

This is the simplest option, you just need to set the path to your single MakoStack config file like below:

```
ext_pillar:
  - makostack: /path/to/stack.cfg
```

**List of config files**

You can also provide a list of config files:

```
ext_pillar:
  - makostack:
    - /path/to/stack1.cfg
    - /path/to/stack2.cfg
```
Select config files through grains|pillar|opts matching

You can also opt for a much more flexible configuration: MakoStack allows one to select the config files for the current minion based on matching values from either grains, or pillar, or opts objects.

Here is an example of such a configuration, which should speak by itself:

```yaml
ext_pillar:
  - makostack:
      pillar:environment:
        dev: /path/to/dev/stack.cfg
        prod: /path/to/prod/stack.cfg
      grains:custom:grain:
        value:
          - /path/to/stack1.cfg
          - /path/to/stack2.cfg
      opts:custom:opt:
        value: /path/to/stack0.cfg
```

Grafting data from files to arbitrary namespaces

An extended syntax for config files permits defining "graft points" on a per-config-file basis. As an example, if the file foo.cfg would produce the following:

```yaml
foo:
  - bar
  - baz
```

and you specified the cfg file as /path/to/foo.cfg:yummy:fur, the following would actually end up in pillar after all merging was complete:

```yaml
yummy:
  fur:
    foo:
      - bar
      - baz
```

MakoStack configuration files

The config files that are referenced in the above `ext_pillar` configuration are mako templates which must render as a simple ordered list of yaml files that will then be merged to build pillar data.

Unless an absolute path name is specified, the path of these yaml files is assumed to be relative to the directory containing the MakoStack config file. If a path begins with '/', however, it will be treated literally and can be anywhere on the filesystem.

The following variables are available in mako templating of makostack configuration files:

- `pillar`: the pillar data (as passed by Salt to our `ext_pillar` function)
- `minion_id`: the minion id ;-)  
- `__opts__`: a dictionary of mostly Salt configuration options
- `__grains__`: a dictionary of the grains of the minion making this pillar call
• __salt__: a dictionary of Salt module functions, useful so you don’t have to duplicate functions that already exist (note: runs on the master)

So you can use all the power of mako to build your list of yaml files that will be merged in pillar data.

For example, you could have a MakoStack config file which looks like:

```
$ cat /path/to/stack/config.cfg
core.yml
osarchs/%{ __grains__['osarch']} }.yml
oscodenames/%{ __grains__['oscodename']} }.yml
% for role in pillar.get('roles', []):
  roles/%{ role }.yml
% endfor
minions/%{ minion_id }.yml
```

And the whole directory structure could look like:

```
$ tree /path/to/stack/
/path/to/stack/  
├── config.cfg
├── core.yml
│   ├── osarchs/
│   │   └── amd64.yml
│   │   └── armhf.yml
│   └── oscodenames/
│       └── wheezy.yml
│           └── jessie.yml
└── roles/
    └── web.yml
        └── db.yml
    └── minions/
        └── test-1-dev.yml
        └── test-2-dev.yml
```

**Overall process**

In the above MakoStack configuration, given that test-1-dev minion is an amd64 platform running Debian Jessie, and which pillar roles is ['db'], the following yaml files would be merged in order:

- core.yml
- osarchs/amd64.yml
- oscodenames/jessie.yml
- roles/db.yml
- minions/test-1-dev.yml

Before merging, every files above will be preprocessed as mako templates. The following variables are available in mako templating of yaml files:

- stack: the MakoStack pillar data object that has currently been merged (data from previous yaml files in MakoStack configuration)
- pillar: the pillar data (as passed by Salt to our ext_pillar function)
- minion_id: the minion id ;-)
• __opts__: a dictionary of mostly Salt configuration options
• __grains__: a dictionary of the grains of the minion making this pillar call
• __salt__: a dictionary of Salt module functions, useful so you don’t have to duplicate functions that already exist (note: runs on the master)

So you can use all the power of mako to build your pillar data, and even use other pillar values that has already been merged by MakoStack (from previous yaml files in MakoStack configuration) through the stack variable.

Once a yaml file has been preprocessed by mako, we obtain a Python dict - let’s call it yaml_data - then, MakoStack will merge this yaml_data dict in the main stack dict (which contains already merged MakoStack pillar data). By default, MakoStack will deeply merge yaml_data in stack (similarly to the recurse salt pillar_source_merging_strategy), but 3 merging strategies are currently available for you to choose (see next section).

Once every yaml files have been processed, the stack dict will contain your whole own pillar data, merged in order by MakoStack. So MakoStack ext_pillar returns the stack dict, the contents of which Salt takes care to merge in with all of the other pillars and finally return the whole pillar to the minion.

Merging strategies

The way the data from a new yaml_data dict is merged with the existing stack data can be controlled by specifying a merging strategy. Right now this strategy can either be merge-last (the default), merge-first, remove, or overwrite.

Note that scalar values like strings, integers, booleans, etc. are always evaluated using the overwrite strategy (other strategies don’t make sense in that case).

The merging strategy can be set by including a dict in the form of:

```
__: <merging_strategy>
```

as the first item of the dict or list. This allows fine grained control over the merging process.

merge-last (default) strategy

If the merge-last strategy is selected (the default), then content of dict or list variables is merged recursively with previous definitions of this variable (similarly to the recurse salt pillar_source_merging_strategy). This allows for extending previously defined data.

merge-first strategy

If the merge-first strategy is selected, then the content of dict or list variables are swapped between the yaml_data and stack objects before being merged recursively with the merge-last previous strategy.

remove strategy

If the remove strategy is selected, then content of dict or list variables in stack are removed only if the corresponding item is present in the yaml_data dict. This allows for removing items from previously defined data.
**overwrite strategy**

If the *overwrite* strategy is selected, then the content of dict or list variables in *stack* is overwritten by the content of *yaml_data* dict. So this allows one to overwrite variables from previous definitions.

**Merging examples**

Let’s go through small examples that should clarify what’s going on when a *yaml_data* dict is merged in the *stack* dict.

When you don’t specify any strategy, the default `merge-last` strategy is selected:

<table>
<thead>
<tr>
<th>stack</th>
<th>yaml_data</th>
<th>stack (after merge)</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>users:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>tom:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>uid:</strong></td>
<td>500</td>
<td></td>
</tr>
<tr>
<td><strong>roles:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>- sysadmin</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>root:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>uid:</strong></td>
<td>0</td>
<td></td>
</tr>
<tr>
<td><strong>users:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>tom:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>uid:</strong></td>
<td>1000</td>
<td></td>
</tr>
<tr>
<td><strong>roles:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>- developer</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>mat:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>uid:</strong></td>
<td>1001</td>
<td></td>
</tr>
</tbody>
</table>

Then you can select a custom merging strategy using the **_key** in a dict:
### Stack

<table>
<thead>
<tr>
<th>Stack</th>
<th>Yaml Data</th>
<th>Stack (After Merge)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| **users:**
| **tom:**
| uid: 500 |
| roles: |
| - sysadmin |
| root: |
| uid: 0 |
| **users:**
| **tom:**
| uid: 1000 |
| roles: |
| - developer |
| mat: |
| uid: 1001 |
| **users:**
| **tom:**
| uid: 500 |
| roles: |
| - sysadmin |
| root: |
| uid: 0 |
| **users:**
| **tom:**
| uid: 1000 |
| roles: |
| - developer |
| mat: |
| uid: 1001 |
| **users:**
| **tom:**
| uid: 500 |
| roles: |
| - sysadmin |
| root: |
| uid: 0 |
| **users:**
| **tom:**
| uid: 1000 |
| roles: |
| - developer |
| mat: |
| uid: 1001 |
| **users:**
| **tom:**
| uid: 500 |
| roles: |
| - sysadmin |
| root: |
| uid: 0 |
| **users:**
| **tom:**
| uid: 1000 |
| roles: |
| - developer |
| mat: |
| uid: 1001 |

You can also select a custom merging strategy using a `__` object in a list:
### stack

<table>
<thead>
<tr>
<th>users:</th>
<th>yaml_data</th>
<th>stack (after merge)</th>
</tr>
</thead>
</table>
| - tom
- root | - __: merge-last
- mat | - tom
- root
- mat |

<table>
<thead>
<tr>
<th>users:</th>
<th>yaml_data</th>
<th>stack (after merge)</th>
</tr>
</thead>
</table>
| - tom
- root | - __: merge-first
- mat | - mat
- to
- root |

<table>
<thead>
<tr>
<th>users:</th>
<th>yaml_data</th>
<th>stack (after merge)</th>
</tr>
</thead>
</table>
| - tom
- root | - __: remove
- mat
- tom | - root |

<table>
<thead>
<tr>
<th>users:</th>
<th>yaml_data</th>
<th>stack (after merge)</th>
</tr>
</thead>
</table>
| - tom
- root | - __: overwrite
- mat | - mat |

---

salt.pillar.makostack.ext_pillar

#### 21.12.22 salt.pillar.mongo

Read Pillar data from a mongodb collection

**depends** pymongo (for salt-master)

This module will load a node-specific pillar dictionary from a mongo collection. It uses the node’s id for lookups and can load either the whole document, or just a specific field from that document as the pillar dictionary.

**Salt Master Mongo Configuration**

The module shares the same base mongo connection variables as `salt.returners.mongo_return`. These variables go in your master config file.

- **mongo.db** - The mongo database to connect to. Defaults to 'salt'.
- **mongo.host** - The mongo host to connect to. Supports replica sets by specifying all hosts in the set, comma-delimited. Defaults to 'salt'.
- **mongo.port** - The port that the mongo database is running on. Defaults to 27017.
- **mongo.user** - The username for connecting to mongo. Only required if you are using mongo authentication. Defaults to ''. 
- **mongo.password** - The password for connecting to mongo. Only required if you are using mongo authentication. Defaults to ''. 

---

2940 Chapter 21. Salt Module Reference
Configuring the Mongo ext_pillar

The Mongo ext_pillar takes advantage of the fact that the Salt Master configuration file is yaml. It uses a sub-dictionary of values to adjust specific features of the pillar. This is the explicit single-line dictionary notation for yaml. One may be able to get the easier-to-read multi-line dict to work correctly with some experimentation.

```yaml
ext_pillar:
  - mongo: {collection: vm, id_field: name, re_pattern: \.example\.com, fields: [customer_id, software, apache_vhosts]}
```

In the example above, we've decided to use the `vm` collection in the database to store the data. Minion ids are stored in the `name` field on documents in that collection. And, since minion ids are FQDNs in most cases, we'll need to trim the domain name in order to find the minion by hostname in the collection. When we find a minion, return only the `customer_id`, `software`, and `apache_vhosts` fields, as that will contain the data we want for a given node. They will be available directly inside the `pillar` dict in your SLS templates.

Module Documentation

```python
salt.pillar.mongo.ext_pillar(minion_id, pillar, collection='pillar', id_field='_id', re_pattern=None, re_replace='\', fields=None)
```

Connect to a mongo database and read per-node pillar information.

**Parameters**

- `collection (*)` - The mongodb collection to read data from. Defaults to `pillar`.
- `id_field (*)` - The field in the collection that represents an individual minion id. Defaults to `_id`.
- `re_pattern (*)` - If your naming convention in the collection is shorter than the minion id, you can use this to trim the name. `re_pattern` will be used to match the name, and `re_replace` will be used to replace it. Backrefs are supported as they are in the Python standard library. If `None`, no mangling of the name will be performed - the collection will be searched with the entire minion id. Defaults to `None`.
- `re_replace (*)` - Use as the replacement value in node ids matched with `re_pattern`. Defaults to `\`. Feel free to use backreferences here.
- `fields (*)` - The specific fields in the document to use for the pillar data. If `None`, will use the entire document. If using the entire document, the `_id` field will be converted to string. Be careful with other fields in the document as they must be string serializable. Defaults to `None`.

21.12.23 salt.pillar.mysql

Retrieve Pillar data by doing a MySQL query

MariaDB provides Python support through the MySQL Python package. Therefore, you may use this module with both MySQL or MariaDB.

This module is a concrete implementation of the sql_base ext_pillar for MySQL.

```ini
maturity new
depends python-mysqldb
platform all
```
Configuring the mysql ext_pillar

Use the 'mysql' key under ext_pillar for configuration of queries.
MySQL configuration of the MySQL returner is being used (mysql.db, mysql.user, mysql.pass, mysql.port, mysql.host) for database connection info.
Required python modules: MySQLdb

Complete example

```python
mysql:
  user: 'salt'
  pass: 'super_secret_password'
  db: 'salt_db'
  port: 3306
  ssl:
    cert: /etc/mysql/client-cert.pem
    key: /etc/mysql/client-key.pem

ext_pillar:
  - mysql:
    fromdb:
      query: 'SELECT col1,col2,col3,col4,col5,col6,col7
               FROM some_random_table
               WHERE minion_pattern LIKE %s'
      depth: 5
      as_list: True
      with_lists: [1,3]
```

class salt.pillar.mysql.MySQLExtPillar
This class receives and processes the database rows from MySQL.

`extract_queries(args, kwargs)`
This function normalizes the config block into a set of queries we can use. The return is a list of consistently laid out dicts.

salt.pillar.mysql.ext_pillar(minion_id, pillar, *args, **kwargs)
Execute queries against MySQL, merge and return as a dict

21.12.24 salt.pillar.netbox

A module that adds data to the Pillar structure from a NetBox API.
New in version 2019.2.0.

Configuring the NetBox ext_pillar

```yaml
ext_pillar:
  - netbox:
      api_url: http://netbox_url.com/api/
      api_token: 123abc
```
Create a token in your NetBox instance at http://netbox_url.com/user/api-tokens/
The following options are optional, and determine whether or not the module will attempt to configure the proxy pillar data for use with the napalm proxy-minion:

```
proxy_return: True
proxy_username: admin
```

By default, this module will query the NetBox API for the platform associated with the device, and use the 'NAPALM driver' field to set the napalm proxy-minion driver. (Currently only 'napalm' is supported for drivertype.)

This module currently only supports the napalm proxy minion and assumes you will use SSH keys to authenticate to the network device. If password authentication is desired, it is recommended to create another proxy key in pillar_roots (or git_pillar) with just the passwd key and use `salt.renderers.gpg` to encrypt the value. If any additional options for the proxy setup are needed they should also be configured in pillar_roots.

Other available options:

- `site_details`: True Whether should retrieve details of the site the device belongs to.
- `site_prefixes`: True Whether should retrieve the prefixes of the site the device belongs to.

```
salt.pillar.netbox.ext_pillar(minion_id, pillar, *args, **kwargs)
  Query NetBox API for minion data
```

### 21.12.25 salt.pillar.neutron module

Use Openstack Neutron data as a Pillar source. Will list all networks listed inside of Neutron, to all minions.

New in version 2015.5.1.

```
depends
  - python-neutronclient
```

A keystone profile must be used for the pillar to work (no generic keystone configuration here). For example:

```
my_openstack_config:
  keystone.user: 'admin'
  keystone.password: 'password'
  keystone.tenant: 'admin'
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/
  keystone.region_name: 'RegionOne'
  keystone.service_type: 'network'
```

After the profile is created, configure the external pillar system to use it.

```
ext_pillar:
  - neutron: my_openstack_config
```

Using these configuration profiles, multiple neutron sources may also be used:

```
ext_pillar:
  - neutron: my_openstack_config
  - neutron: my_other_openstack_config
```

By default, these networks will be returned as a pillar item called `networks`. In order to have them returned under a different name, add the name after the Keystone profile name:

```
ext_pillar:
  - neutron: my_openstack_config neutron_networks
```
salt.pillar.neutron.ext_pillar(minion_id, pillar, conf)
Check neutron for all data

21.12.26 salt.pillar.nodegroups

Nodegroups Pillar

Introspection: to which nodegroups does my minion belong? Provides a pillar with the default name of nodegroups which contains a list of nodegroups which match for a given minion.

New in version 2016.11.0.

Command Line

```bash
salt-call pillar.get nodegroups
local:
  - class_infra
  - colo_sj
  - state_active
  - country_US
  - type_saltmaster
```

Configuring Nodegroups Pillar

```yaml
extension_modules: /srv/salt/ext
ext_pillar:
  - nodegroups:
      pillar_name: 'nodegroups'
```

salt.pillar.nodegroups.ext_pillar(minion_id, pillar, pillar_name=None)
A salt external pillar which provides the list of nodegroups of which the minion is a member.

Parameters
- minion_id – used for compound matching nodegroups
- pillar – provided by salt, but not used by nodegroups ext_pillar
- pillar_name – optional name to use for the pillar, defaults to ‘nodegroups’

Returns a dictionary which is included by the salt master in the pillars returned to the minion

21.12.27 salt.pillar.pepa

Pepa

Configuration templating for SaltStack using Hierarchical substitution and Jinja.

Configuring Pepa

```yaml
extension_modules: /srv/salt/ext
ext_pillar:
  - pepa:
```

(continues on next page)
### Pillar Configuration

**resource:** host  # Name of resource directory and sub-key in pillars

**sequence:**  # Sequence used for hierarchical substitution
    - **hostname:**  
      - name: input  # Alias used for template directory
        base_only: True  # Only use templates from Base environment, i.e.

**no staging**  
    - default:
      - environment:  
        - location..region:  
          name: region
        - location..country:  
          name: country
        - location..datacenter:  
          name: datacenter
      - roles:  
        - osfinger:
          name: os
        - hostname:
          name: override
        base_only: True  # Only use templates from Base environment, i.e.

**subkey:** True  # Create a sub-key in pillars, named after the resource in this case [host]

**subkey_only:** True  # Only create a sub-key, and leave the top level untouched

**pepa_roots:**  
    - base: /srv/pepa/base  
      # Base directory for each environment
    - dev: /srv/pepa/base  
      # Path for base environment
    - qa: /srv/pepa/qa  
      # Associate dev with base
    - prod: /srv/pepa/prod  
      # Use a different delimiter for nested dictionaries, defaults to '..' since some keys may use '.' in the name

**pepa_delimiter:** ..

**pepa_grains:**  
    - environment: dev  
      # Supply Grains for Pepa, this should **ONLY** be used for testing or validation

**pepa_pillars:**  
    - saltversion: 0.17.4  
      # Supply Pillar for Pepa, this should **ONLY** be used for testing or validation

**log_level:** debug  

**log_granular_levels:**  
    - salt: warning  
      # Enable debug for Pepa, and keep Salt on warning

Pepa can also be used in Master-less SaltStack setup.
Command line

```

positional arguments:
  hostname  Hostname

optional arguments:
  -h, --help    show this help message and exit
  -c CONFIG, --config CONFIG  Configuration file
  -d, --debug    Print debug info
  -g GRAINS, --grains GRAINS  Input Grains as YAML
  -p PILLAR, --pillar PILLAR  Input Pillar as YAML
  -n, --no-color  No color output
  -v, --validate  Validate output
```

Templates

Templates is configuration for a host or software, that can use information from Grains or Pillars. These can then be used for hierarchically substitution.

Example File: host/input/test_example_com.yaml

```yaml
location..region: emea
location..country: nl
location..datacenter: foobar
environment: dev
roles:
  - salt.master
network..gateway: 10.0.0.254
network..interfaces..eth0..hwaddr: 00:20:26:a1:12:12
network..interfaces..eth0..dhcp: False
network..interfaces..eth0..ipv4: 10.0.0.3
network..interfaces..eth0..netmask: 255.255.255.0
network..interfaces..eth0..fqdn: {{ hostname }}
cobbler..profile: fedora-19-x86_64
```

As you see in this example you can use Jinja directly inside the template.

Example File: host/region/amer.yaml

```yaml
network..dns..servers:
  - 10.0.0.1
  - 10.0.0.2
time..ntp..servers:
  - ntp1.amer.example.com
  - ntp2.amer.example.com
  - ntp3.amer.example.com
time..timezone: America/Chihuahua
yum..mirror: yum.amer.example.com
```

Each template is named after the value of the key using lowercase and all extended characters are replaced with underscore.
Example:

osfinger: Fedora-19

Would become:

fedora_19.yaml

**Nested dictionaries**

In order to create nested dictionaries as output you can use double dot "." as a delimiter. You can change this using "pepa_delimiter" we choose double dot since single dot is already used by key names in some modules, and using ":" requires quoting in the YAML.

Example:

```yaml
network..dns..servers:
  - 10.0.0.1
  - 10.0.0.2

network..dns..options:
  - timeout:2
  - attempts:1
  - ndots:1

network..dns..search:
  - example.com
```

Would become:

```yaml
network:
  dns:
    servers:
      - 10.0.0.1
      - 10.0.0.2
    options:
      - timeout:2
      - attempts:1
      - ndots:1
    search:
      - example.com
```

**Operators**

Operators can be used to merge/unset a list/hash or set the key as immutable, so it can’t be changed.

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>merge()</td>
<td>Merge list or hash</td>
</tr>
<tr>
<td>unset()</td>
<td>Unset key</td>
</tr>
<tr>
<td>immutable()</td>
<td>Set the key as immutable, so it can’t be changed</td>
</tr>
<tr>
<td>imerge()</td>
<td>Set immutable and merge</td>
</tr>
<tr>
<td>iunset()</td>
<td>Set immutable and unset</td>
</tr>
</tbody>
</table>

Example:
Validation

Since it’s very hard to test Jinja as is, the best approach is to run all the permutations of input and validate the output, i.e. Unit Testing.

To facilitate this in Pepa we use YAML, Jinja and Cerberus <https://github.com/nicolaiarocci/cerberus>.

Schema

So this is a validation schema for network configuration, as you see it can be customized with Jinja just as Pepa templates.

This was designed to be run as a build job in Jenkins or similar tool. You can provide Grains/Pillar input using either the config file or command line arguments.

File Example: host/validation/network.yaml

```yaml
network..dns..search..merge():
  - foobar.com
  - dummy.nl

owner..immutable(): Operations

host..printers..unset():

Validation

Since it’s very hard to test Jinja as is, the best approach is to run all the permutations of input and validate the output, i.e. Unit Testing.

To facilitate this in Pepa we use YAML, Jinja and Cerberus <https://github.com/nicolaiarocci/cerberus>.

Schema

So this is a validation schema for network configuration, as you see it can be customized with Jinja just as Pepa templates.

This was designed to be run as a build job in Jenkins or similar tool. You can provide Grains/Pillar input using either the config file or command line arguments.

File Example: host/validation/network.yaml

```yaml
network..dns..search:
  type: list
  allowed:
    - example.com

network..dns..options:
  type: list
  allowed: ['timeout:2', 'attempts:1', 'ndots:1']

network..dns..servers:
  type: list
  schema:
    regex: ^([0-9]{1,3}\.)\{3\}[0-9]{1,3}$

network..gateway:
  type: string
  regex: ^([0-9]{1,3}\.)\{3\}[0-9]{1,3}$

{% if network.interfaces is defined %}
{% for interface in network.interfaces %}

network..interfaces..{{ interface }}..dhcp:
  type: boolean

network..interfaces..{{ interface }}..fqdn:
  type: string
  regex: ^([a-z0-9]\([a-z0-9-]\\{0,61\}[a-z0-9]\\?\.)+[a-zA-Z]\{2,6\}$

network..interfaces..{{ interface }}..hwaddr:
  type: string
  regex: ^([0-9a-f]\{1,2\}\:)[5][0-9a-f]\{1,2\}$

(continues on next page)
network..interfaces..{{ interface }}..ipv4:
  type: string
  regex: ^([0-9]{1,3}\.){3}[0-9]{1,3}$

network..interfaces..{{ interface }}..netmask:
  type: string
  regex: ^([0-9]{1,3}\.){3}[0-9]{1,3}$

{% endfor %}
{% endif %}

salt.pillar.pepa.ext_pillar(minion_id, pillar, resource, sequence, subkey=False, subkey_only=False)

Evaluate Pepa templates

salt.pillar.pepa.key_value_to_tree(data)

Convert key/value to tree

salt.pillar.pepa.validate(output, resource)

Validate Pepa templates

21.12.28 salt.pillar.pillar_ldap

Use LDAP data as a Pillar source

This pillar module executes a series of LDAP searches. Data returned by these searches are aggregated, whereby data returned by later searches override data by previous searches with the same key.

The final result is merged with existing pillar data.

The configuration of this external pillar module is done via an external file which provides the actual configuration for the LDAP searches.

Configuring the LDAP ext_pillar

The basic configuration is part of the master configuration.

```yaml
ext_pillar:
  - pillar_ldap: /etc/salt/master.d/pillar_ldap.yaml
```

Note: When placing the file in the master.d directory, make sure its name doesn’t end in .conf, otherwise the salt-master process will attempt to parse its content.

Warning: Make sure this file has very restrictive permissions, as it will contain possibly sensitive LDAP credentials!
The only required key in the master configuration is pillar_ldap pointing to a file containing the actual configuration.

Configuring the LDAP searches

The file is processed using Salt’s Renderers <renderers> which makes it possible to reference grains within the configuration.

Warning: When using Jinja in this file, make sure to do it in a way which prevents leaking sensitive information. A rogue minion could send arbitrary grains to trick the master into returning secret data. Use only the ‘id’ grain which is verified through the minion’s key/cert.

Map Mode

The it-admins configuration below returns the Pillar it-admins by:

- filtering for: - members of the group it-admins - objects with objectclass=user
- returning the data of users, where each user is a dictionary containing the configured string or list attributes.

Configuration

```yaml
salt-users:
  server: ldap.company.tld
  port: 389
  tls: true
  dn: 'dc=company,dc=tld'
  binddn: 'cn=salt-pillars,ou=users,dc=company,dc=tld'
  bindpw: bi7ieBai5Ano
  referrals: false
  anonymous: false
  mode: map
  dn: 'ou=users,dc=company,dc=tld'
  filter: '(&(memberof=cn=it-admins,ou=groups,dc=company,dc=tld)(objectclass=user))
  attrs:
    - cn
    - displayName
    - givenName
    - sn
  lists:
    -memberOf

search_order:
  - salt-users
```

Result
salt.pillar.pillar_ldap.ext_pillar(minion_id, pillar, config_file)

Execute LDAP searches and return the aggregated data

21.12.29 salt.pillar.postgres module

Retrieve Pillar data by doing a postgres query

New in version 2017.7.0.

maturity new
depends psycopg2
platform all

Complete Example

```
postgres:
  user: 'salt'
  pass: 'super_secret_password'
  db: 'salt_db'

ext_pillar:
  - postgres:
      fromdb:
        query: 'SELECT col1,col2,col3,col4,col5,col6,col7
               FROM some_random_table
               WHERE minion_pattern LIKE %s'
        depth: 5
        as_list: True
        with_lists: [1,3]
```
class salt.pillar.postgres.POSTGRESExtPillar
This class receives and processes the database rows from POSTGRES.

def extract_queries(args, kwargs):
    This function normalizes the config block into a set of queries we can use. The return is a list of consistently laid out dicts.

salt.pillar.postgres.ext_pillar(minion_id, pillar, *args, **kwargs)
Execute queries against POSTGRES, merge and return as a dict

21.12.30 salt.pillar.puppet
Execute an unmodified puppet_node_classifier and read the output as YAML. The YAML data is then directly overlaid onto the minion’s Pillar data.

salt.pillar.puppet.ext_pillar(minion_id, pillar, command)
Execute an unmodified puppet_node_classifier and read the output as YAML

21.12.31 salt.pillar.reclass_adapter
Use the "reclass" database as a Pillar source

This ext_pillar plugin provides access to the reclass database, such that Pillar data for a specific minion are fetched using reclass.

You can find more information about reclass at http://reclass.pantsfullofunix.net.

To use the plugin, add it to the ext_pillar list in the Salt master config and tell reclass by way of a few options how and where to find the inventory:

```
ext_pillar:
    - reclass:
        storage_type: yaml_fs
        inventory_base_uri: /srv/salt
```

This would cause reclass to read the inventory from YAML files in /srv/salt/nodes and /srv/salt/classes.

If you are also using reclass as master_tops plugin, and you want to avoid having to specify the same information for both, use YAML anchors (take note of the differing data types for ext_pillar and master_tops):

```
reclass: &reclass
    storage_type: yaml_fs
    inventory_base_uri: /srv/salt
    reclass_source_path: ~/code/reclass

ext_pillar:
    - reclass: *reclass

master_tops:
    reclass: *reclass
```

If you want to run reclass from source, rather than installing it, you can either let the master know via the PYTHONPATH environment variable, or by setting the configuration option, like in the example above.

salt.pillar.reclass_adapter.ext_pillar(minion_id, pillar, **kwargs)
Obtain the Pillar data from reclass for the given minion_id.
21.12.32  salt.pillar.redismod

Read pillar data from a Redis backend

New in version 2014.7.0.

depends

  - redis Python module (on master)

Salt Master Redis Configuration

The module shares the same base Redis connection variables as `salt.returners.redis_return`. These variables go in your master config file.

  - `redis.db` - The Redis database to use. Defaults to 0.
  - `redis.host` - The Redis host to connect to. Defaults to 'salt'.
  - `redis.port` - The port that the Redis database is listening on. Defaults to 6379.
  - `redis.password` - The password for authenticating with Redis. Only required if you are using master auth. Defaults to None.

Configuring the Redis ext_pillar

```
ext_pillar:
  - redis: {function: key_value}
```

salt.pillar.redismod.ext_pillar(minion_id, pillar, function, **kwargs)
Grabs external pillar data based on configured function

salt.pillar.redismod.key_json(minion_id, pillar, pillar_key=None)
Pulls a string from redis and deserializes it from json. Deserialized dictionary data loaded directly into top level if pillar_key is not set.

    pillar_key  Pillar key to return data into

salt.pillar.redismod.key_value(minion_id, pillar, pillar_key='redis_pillar')
Looks for key in redis matching minion_id, returns a structure based on the data type of the redis key. String for string type, dict for hash type and lists for lists, sets and sorted sets.

    pillar_key  Pillar key to return data into

21.12.33  salt.pillar.s3

Copy pillar data from a bucket in Amazon S3

The S3 pillar can be configured in the master config file with the following options

```
ext_pillar:
  - s3:
      bucket: my.fancy.pillar.bucket
      keyid: KASKFJWAKJASJKDAJKSD
      key: ksladfDLKDALSFKSD93q032sdDasdfasdfsadkf
      multiple_env: False
      environment: base
      prefix: somewhere/overthere
```

(continues on next page)
The `bucket` parameter specifies the target S3 bucket. It is required.

The `keyid` parameter specifies the key id to use when access the S3 bucket. If it is not provided, an attempt to fetch it from EC2 instance meta-data will be made.

The `key` parameter specifies the key to use when access the S3 bucket. If it is not provided, an attempt to fetch it from EC2 instance meta-data will be made.

The `multiple_env` defaults to False. It specifies whether the pillar should interpret top level folders as pillar environments (see mode section below).

The `environment` defaults to 'base'. It specifies which environment the bucket represents when in single environments mode (see mode section below). It is ignored if `multiple_env` is True.

The `prefix` defaults to ".". It specifies a key prefix to use when searching for data in the bucket for the pillar. It works when `multiple_env` is True or False. Essentially it tells ext_pillar to look for your pillar data in a ‘subdirectory’ of your S3 bucket.

The `verify_ssl` parameter defaults to True. It specifies whether to check for valid S3 SSL certificates. NOTE If you use bucket names with periods, this must be set to False else an invalid certificate error will be thrown (issue #12200).

The `service_url` parameter defaults to 's3.amazonaws.com'. It specifies the base url to use for accessing S3.

The `kms_keyid` parameter is optional. It specifies the ID of the Key Management Service (KMS) master key that was used to encrypt the object.

The `s3_cache_expire` parameter defaults to 30s. It specifies expiration time of S3 metadata cache file.

The `s3_sync_on_update` parameter defaults to True. It specifies if cache is synced on update rather than jit.

The `path_style` parameter defaults to False. It specifies whether to use path style requests or dns style requests.

The `https_enable` parameter defaults to True. It specifies whether to use https protocol or http protocol.

This pillar can operate in two modes, single environment per bucket or multiple environments per bucket.

Single environment mode must have this bucket structure:

```
s3://<bucket name>/<prefix>/files
```

Multiple environment mode must have this bucket structure:

```
s3://<bucket name>/<prefix>/<environment>/files
```

If you wish to define your pillar data entirely within S3 it’s recommended that you use the `prefix=` parameter and specify one entry in ext_pillar for each environment rather than specifying `multiple_env`. This is due to issue #22471 (https://github.com/saltstack/salt/issues/22471)

```python
class salt.pillar.s3.S3Credentials(key, keyid, bucket, service_url, verify_ssl=True, kms_keyid=None, location=None, path_style=False, https_enable=True)
```
salt.pillar.s3.ext_pillar(minion_id, pillar, bucket, key=None, keyid=None, verify_ssl=True, location=None, multiple_env=False, environment='base', prefix='', service_url=None, kms_keyid=None, s3_cache_expire=30, s3_sync_on_update=True, path_style=False, https_enable=True)

Execute a command and read the output as YAML

21.12.34 salt.pillar.saltclass

SaltClass Pillar Module

```python
ext_pillar:
  - saltclass:
      path: /srv/saltclass
```

For additional configuration instructions, see the saltclass module

```python
salt.pillar.saltclass.ext_pillar(minion_id, pillar, *args, **kwargs)
```

Compile pillar data

21.12.35 salt.pillar.sql_base module

Retrieve Pillar data by doing a SQL query

This module is not meant to be used directly as an ext_pillar. It is a place to put code common to PEP 249 compliant SQL database adapters. It exposes a python ABC that can be subclassed for new database providers.

```python
maturity new
platform all
```

Theory of sql_base ext_pillar

Ok, here’s the theory for how this works...

- First, any non-keyword args are processed in order.
- Then, remaining keywords are processed.

We do this so that it’s backward compatible with older configs. Keyword arguments are sorted before being appended, so that they’re predictable, but they will always be applied last so overall it’s moot.

For each of those items we process, it depends on the object type:

- Strings are executed as is and the pillar depth is determined by the number of fields returned.
- A list has the first entry used as the query, the second as the pillar depth.
- A mapping uses the keys "query" and "depth" as the tuple

You can retrieve as many fields as you like, how they get used depends on the exact settings.

Configuring a sql_base ext_pillar

The sql_base ext_pillar cannot be used directly, but shares query configuration with its implementations. These examples use a fake 'sql_base' adapter, which should be replaced with the name of the adapter you are using.

A list of queries can be passed in
The query can be provided as a string as we have just shown, but they can be provided as lists:

```
ext_pillar:
  - sql_base:
    - "SELECT pillar, value FROM pillars WHERE minion_id = %s"
    - "SELECT pillar, value FROM more_pillars WHERE minion_id = %s"
```

Or you can pass in a mapping:

```
ext_pillar:
  - sql_base:
    main: "SELECT pillar, value FROM pillars WHERE minion_id = %s"
    extras: "SELECT pillar, value FROM more_pillars WHERE minion_id = %s"
```

The depth defines how the dicts are constructed. Essentially if you query for fields a,b,c,d for each row you’ll get:

- With depth 1: {a: {b: b, c: c, d: d}}
- With depth 2: {a: {b: {c: c, d: d}}}
- With depth 3: {a: {b: {c: d}}}

Depth greater than 3 wouldn’t be different from 3 itself. Depth of 0 translates to the largest depth needed, so 3 in this case. (max depth == key count - 1)

Then they are merged in a similar way to plain pillar data, in the order returned by the SQL database.

Thus subsequent results overwrite previous ones when they collide.

The ignore_null option can be used to change the overwrite behavior so that only non-NULL values in subsequent results will overwrite. This can be used to selectively overwrite default values.

```
ext_pillar:
  - sql_base:
    - query: "SELECT pillar, value FROM pillars WHERE minion_id = %s"
    depth: 2
    ignore_null: True
```

If you specify as_list: True in the mapping expression it will convert collisions to lists.

If you specify with_lists: ‘…’ in the mapping expression it will convert the specified depths to list. The string provided is a sequence numbers that are comma separated. The string ’1,3’ will result in:
These columns define list grouping

```python
{a: [
    {c: [
        {e: 1},
        {g: 2}
    ]},
    {h: [
        {j: 3, k: 4 }
    ]}
]}
```

The range for with_lists is 1 to number_of_fields, inclusive. Numbers outside this range are ignored.

Finally, if you pass the queries in via a mapping, the key will be the first level name where as passing them in as a list will place them in the root. This isolates the query results into their own subtrees. This may be a help or hindrance to your aims and can be used as such.

You can basically use any SELECT query that gets you the information, you could even do joins or subqueries in case your minion_id is stored elsewhere. It is capable of handling single rows or multiple rows per minion.

Configuration of the connection depends on the adapter in use.

**More complete example for MySQL (to also show configuration)**

```yaml
mysql:
  user: 'salt'
  pass: 'super_secret_password'
  db: 'salt_db'

ext_pillar:
  - mysql:
      fromdb:
        query: 'SELECT col1,col2,col3,col4,col5,col6,col7
                FROM some_random_table
                WHERE minion_pattern LIKE %s'
        depth: 5
        as_list: True
        with_lists: [1,3]
```

**class salt.pillar.sql_base.SqlBaseExtPillar**

This class receives and processes the database rows in a database agnostic way.

```python
as_list = False
def depth = 0
def enter_root(root)
    Set self.focus for kwarg queries
```
**extract_queries** *(args, kwargs)*

This function normalizes the config block into a set of queries we can use. The return is a list of consistently laid out dicts.

**fetch** *(minion_id, pillar, *args, **kwargs)*

Execute queries, merge and return as a dict.

```python
field_names = None
focus = None
ignore_null = False
num_fields = 0
process_fields(field_names, depth)
```

The primary purpose of this function is to store the sql field list and the depth to which we process.

```python
process_results(rows)
```

This function takes a list of database results and iterates over, merging them into a dict form.

```python
result = None
with_lists = None
```

### 21.12.36 salt.pillar.sqlcipher module

Retrieve Pillar data by running a SQLCipher query

New in version 2016.3.0.

Python SQLCipher support is provided by the pysqlcipher Python package. You need this module installed to query Pillar data from a SQLCipher database.

This module is a concrete implementation of the sql_base ext_pillar for SQLCipher.

- **maturity**: new
- **depends**: pysqlcipher (for py2) or pysqlcipher3 (for py3)
- **platform**: all

#### Configuring the sqlcipher ext_pillar

Use the `sqlcipher` key under ext_pillar for configuration of queries.

SQLCipher database connection configuration requires the following values configured in the master config:

- `sqlcipher.database` - The SQLCipher database to connect to. Defaults to `/var/lib/salt/pillar-sqlcipher.db`.
- `sqlcipher.pass` - The SQLCipher database decryption password.
- `sqlcipher.timeout` - The connection timeout in seconds.

Example configuration

```yaml
sqlcipher:
  database: /var/lib/salt/pillar-sqlcipher.db
  pass: strong_pass_phrase
  timeout: 5.0
```
Complete Example

```yaml
sqlcipher:
    database: '/var/lib/salt/pillar-sqlcipher.db'
    pass: strong_pass_phrase
    timeout: 5.0

ext_pillar:
    - sqlcipher:
        fromdb:
            query: 'SELECT col1,col2,col3,col4,col5,col6,col7
                    FROM some_random_table
                    WHERE minion_pattern LIKE ?'
            depth: 5
            as_list: True
            with_lists: [1,3]
```

class salt.pillar.sqlcipher.SQLCipherExtPillar

This class receives and processes the database rows from SQLCipher.

```python
class salt.pillar.sqlcipher.SQLCipherExtPillar
    def __init__(self, minion_id, pillar, *args, **kwargs):
        self.minion_id = minion_id
        self.pillar = pillar
        self.args = args
        self.kwargs = kwargs

    def __call__(self, *args, **kwargs):
        query = 'SELECT col1,col2,col3,col4,col5,col6,col7
                FROM some_random_table
                WHERE minion_pattern LIKE ?'
        depth = 5
        as_list = True
        with_lists = [1,3]
        results = self._query(query, depth, as_list, with_lists)
        return results
```

21.12.37 salt.pillar.sqlite3 module

Retrieve Pillar data by doing a SQLite3 query

New in version 2015.8.0.

**sqlite3** is included in the stdlib since Python 2.5.

This module is a concrete implementation of the sql_base ext_pillar for SQLite3.

```python
platform all
```

Configuring the sqlite3 ext_pillar

Use the 'sqlite3' key under ext_pillar for configuration of queries.

SQLite3 database connection configuration requires the following values configured in the master config:

Note, timeout is in seconds.

```yaml
sqlite3.database: /var/lib/salt/pillar.db
sqlite3.timeout: 5.0
```

Complete Example

```yaml
sqlite3:
    database: '/var/lib/salt/pillar.db'
    timeout: 5.0

ext_pillar:
    - sqlite3:
        fromdb:
```

(continues on next page)
query: 'SELECT col1,col2,col3,col4,col5,col6,col7
    FROM some_random_table
    WHERE minion_pattern LIKE ?'
default:
    depth: 5
    as_list: True
    with_lists: [1,3]

class salt.pillar.sqlite3.SQLite3ExtPillar
    This class receives and processes the database rows from SQLite3.
salt.pillar.sqlite3.ext_pillar(minion_id, pillar, *args, **kwargs)
    Execute queries against SQLite3, merge and return as a dict

21.12.38 salt.pillar.stack

Simple and flexible YAML ext_pillar which can read pillar from within pillar.
New in version 2016.3.0.
PillarStack is a custom saltstack ext_pillar which was inspired by varstack but is heavily based on Jinja2 for maximum flexibility.
Any issue should be reported to the upstream project at: https://github.com/bbinet/pillarstack/issues

It supports the following features:

- multiple config files that are jinja2 templates with support for pillar, __grains__, __salt__, __opts__ objects
- a config file renders as an ordered list of files (paths of these files are relative to the current config file)
- this list of files are read in ordered as jinja2 templates with support for stack, pillar, __grains__, __salt__, __opts__ objects
- all these rendered files are then parsed as yaml
- then all yaml dicts are merged in order with support for the following merging strategies: merge-first, merge-last, remove, and overwrite
- stack config files can be matched based on pillar, grains, or opts values, which make it possible to support kind of self-contained environments

Installation

PillarStack is already bundled with Salt since 2016.3.0 version so there is nothing to install from version 2016.3.0.
If you use an older Salt version or you want to override PillarStack with a more recent one, follow the installation procedure below.
Installing the PillarStack ext_pillar is as simple as dropping the stack.py file in the <extension_modules>/pillar directory (no external python module required), given that extension_modules is set in your salt-master configuration, see: http://docs.saltstack.com/en/latest/ref/configuration/master.html#extension-modules
Configuration in Salt

Like any other external pillar, its configuration takes place through the `ext_pillar` key in the master config file. However, you can configure PillarStack in 3 different ways:

**Single config file**

This is the simplest option, you just need to set the path to your single PillarStack config file like below:

```
ext_pillar:
  - stack: /path/to/stack.cfg
```

**List of config files**

You can also provide a list of config files:

```
ext_pillar:
  - stack: 
    - /path/to/stack1.cfg
    - /path/to/stack2.cfg
```

**Select config files through grains|pillar|opts matching**

You can also opt for a much more flexible configuration: PillarStack allows one to select the config files for the current minion based on matching values from either grains, or pillar, or opts objects.

Here is an example of such a configuration, which should speak by itself:

```
ext_pillar:
  - stack:
    pillar:environment:
      dev: /path/to/dev/stack.cfg
      prod: /path/to/prod/stack.cfg
    grains:custom:grain:
      value:
        - /path/to/stack1.cfg
        - /path/to/stack2.cfg
    opts:custom:opt:
      value: /path/to/stack0.cfg
```

**PillarStack configuration files**

The config files that are referenced in the above `ext_pillar` configuration are jinja2 templates which must render as a simple ordered list of yaml files that will then be merged to build pillar data.

The path of these yaml files must be relative to the directory of the PillarStack config file. These paths support unix style pathname pattern expansion through the Python `glob` module -<https://docs.python.org/2/library/glob.html>-

The following variables are available in jinja2 templating of PillarStack configuration files:

- `pillar`: the pillar data (as passed by Salt to our `ext_pillar` function)
- `minion_id`: the minion id ;-)
- `__opts__`: a dictionary of mostly Salt configuration options
- `__grains__`: a dictionary of the grains of the minion making this pillar call
- `__salt__`: a dictionary of Salt module functions, useful so you don’t have to duplicate functions that already exist (note: runs on the master)

So you can use all the power of jinja2 to build your list of yaml files that will be merged in pillar data.

For example, you could have a PillarStack config file which looks like:

```
$ cat /path/to/stack/config.cfg
core.yml
common/*/yml
osarchs/{{ __grains__['osarch'] }}.yml
oscodenames/{{ __grains__['oscodename'] }}.yml
{% for role in pillar.get('roles', []) %}
roles/{{ role }}.yml
{% endfor %}
minions/{{ minion_id }}.yml
```

And the whole directory structure could look like:

```
$ tree /path/to/stack/
/path/to/stack/
├── config.cfg
│   ├── core.yml
│   │   ├── common/
│   │   │   └── xxx.yml
│   │   └── yyy.yml
│   └── osarchs/
│       ├── amd64.yml
│       └── armhf.yml
├── oscodenames/
│   ├── wheezy.yml
│   └── jessie.yml
├── roles/
│   ├── web.yml
│   └── db.yml
└── minions/
    ├── test-1-dev.yml
    └── test-2-dev.yml
```

**Overall process**

In the above PillarStack configuration, given that test-1-dev minion is an amd64 platform running Debian Jessie, and which pillar roles is "db", the following yaml files would be merged in order:

- `core.yml`
- `common/xxx.yml`
- `common/yyy.yml`
- `osarchs/amd64.yml`
- `oscodenames/jessie.yml`
Before merging, every file above will be preprocessed as Jinja2 templates. The following variables are available in Jinja2 templating of YAML files:

- **stack**: the PillarStack pillar data object that has currently been merged (data from previous YAML files in PillarStack configuration)
- **pillar**: the pillar data (as passed by Salt to our `ext_pillar` function)
- **minion_id**: the minion id ;-) 
- **__opts__**: a dictionary of mostly Salt configuration options
- **__grains__**: a dictionary of the grains of the minion making this pillar call
- **__salt__**: a dictionary of Salt module functions, useful so you don’t have to duplicate functions that already exist (note: runs on the master)

So you can use all the power of Jinja2 to build your pillar data, and even use other pillar values that has already been merged by PillarStack (from previous YAML files in PillarStack configuration) through the `stack` variable.

Once a YAML file has been preprocessed by Jinja2, we obtain a Python dict - let’s call it `yaml_data` - then, PillarStack will merge this `yaml_data` dict in the main `stack` dict (which contains already merged PillarStack pillar data). By default, PillarStack will deeply merge `yaml_data` in `stack` (similarly to the `recurse salt pillar_source_merging_strategy`), but 3 merging strategies are currently available for you to choose (see next section).

Once every YAML file has been processed, the `stack` dict will contain your whole own pillar data, merged in order by PillarStack. So PillarStack `ext_pillar` returns the `stack` dict, the contents of which Salt takes care to merge in with all of the other pillars and finally return the whole pillar to the minion.

### Merging strategies

The way the data from a new `yaml_data` dict is merged with the existing `stack` data can be controlled by specifying a merging strategy. Right now this strategy can either be `merge-last` (the default), `merge-first`, `remove`, or `overwrite`.

Note that scalar values like strings, integers, booleans, etc. are always evaluated using the `overwrite` strategy (other strategies don’t make sense in that case).

The merging strategy can be set by including a dict in the form of:

```
__: <merging_strategy>
```

as the first item of the dict or list. This allows fine grained control over the merging process.

### `merge-last` (default) strategy

If the `merge-last` strategy is selected (the default), then content of dict or list variables is merged recursively with previous definitions of this variable (similarly to the `recurse salt pillar_source_merging_strategy`). This allows for extending previously defined data.
**merge-first strategy**

If the `merge-first` strategy is selected, then the content of dict or list variables are swapped between the `yaml_data` and `stack` objects before being merged recursively with the `merge-last` previous strategy.

**remove strategy**

If the `remove` strategy is selected, then content of dict or list variables in `stack` are removed only if the corresponding item is present in the `yaml_data` dict. This allows for removing items from previously defined data.

**overwrite strategy**

If the `overwrite` strategy is selected, then the content of dict or list variables in `stack` is overwritten by the content of `yaml_data` dict. So this allows one to overwrite variables from previous definitions.

**Merging examples**

Let’s go through small examples that should clarify what’s going on when a `yaml_data` dict is merged in the `stack` dict.

When you don’t specify any strategy, the default `merge-last` strategy is selected:

<table>
<thead>
<tr>
<th>stack</th>
<th>yaml_data</th>
<th>stack (after merge)</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>users:</strong></td>
<td><strong>users:</strong></td>
<td><strong>users:</strong></td>
</tr>
<tr>
<td><strong>tom:</strong></td>
<td><strong>tom:</strong></td>
<td><strong>tom:</strong></td>
</tr>
<tr>
<td><strong>uid:</strong> 500</td>
<td><strong>uid:</strong> 1000</td>
<td><strong>uid:</strong> 1000</td>
</tr>
<tr>
<td><strong>roles:</strong></td>
<td><strong>roles:</strong></td>
<td><strong>roles:</strong></td>
</tr>
<tr>
<td>- sysadmin</td>
<td>- developer</td>
<td>- sysadmin</td>
</tr>
<tr>
<td><strong>root:</strong></td>
<td><strong>mat:</strong></td>
<td><strong>mat:</strong></td>
</tr>
<tr>
<td><strong>uid:</strong> 0</td>
<td><strong>uid:</strong> 1001</td>
<td><strong>uid:</strong> 1001</td>
</tr>
</tbody>
</table>

Then you can select a custom merging strategy using the `__` key in a dict:
You can also select a custom merging strategy using a `__` object in a list:
<table>
<thead>
<tr>
<th>stack</th>
<th>yaml_data</th>
<th>stack (after merge)</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>users:</strong></td>
<td><strong>users:</strong></td>
<td><strong>users:</strong></td>
</tr>
<tr>
<td>- tom</td>
<td>- __: merge-last</td>
<td>- tom</td>
</tr>
<tr>
<td>- root</td>
<td>- mat</td>
<td>- root</td>
</tr>
<tr>
<td><strong>users:</strong></td>
<td><strong>users:</strong></td>
<td><strong>users:</strong></td>
</tr>
<tr>
<td>- tom</td>
<td>- __: merge-first</td>
<td>- mat</td>
</tr>
<tr>
<td>- root</td>
<td>- mat</td>
<td>- root</td>
</tr>
<tr>
<td><strong>users:</strong></td>
<td><strong>users:</strong></td>
<td><strong>users:</strong></td>
</tr>
<tr>
<td>- tom</td>
<td>- __: remove</td>
<td>- root</td>
</tr>
<tr>
<td>- root</td>
<td>- mat</td>
<td>- tom</td>
</tr>
<tr>
<td><strong>users:</strong></td>
<td><strong>users:</strong></td>
<td><strong>users:</strong></td>
</tr>
<tr>
<td>- tom</td>
<td>- __: overwrite</td>
<td>- mat</td>
</tr>
<tr>
<td>- root</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

salt.pillar.stack.ext_pillar(*minion_id, pillar, *args, **kwargs*)

21.12.39 salt.pillar.svn_pillar

Clone a remote SVN repository and use the filesystem as a Pillar source

This external Pillar source can be configured in the master config file like so:

```yaml
ext_pillar:
  - svn: trunk svn://svnserver/repo root=subdirectory
```

The `root=` parameter is optional and used to set the subdirectory from where to look for Pillar files (such as top.sls).

Changed in version 2014.7.0: The optional `root` parameter will be added.

Note that this is not the same thing as configuring pillar data using the `pillar_roots` parameter. The branch referenced in the `ext_pillar` entry above (master), would evaluate to the `base` environment, so this branch needs to contain a top.sls with a `base` section in it, like this:

```yaml
base:
  '*':
    - foo
```

To use other environments from the same SVN repo as svn_pillar sources, just add additional lines, like so:

```yaml
ext_pillar:
  - svn: trunk svn://svnserver/repo
  - svn: dev svn://svnserver/repo
```

In this case, the `dev` branch would need its own top.sls with a `dev` section in it, like this:
dev:
    'bar':
      - bar

```python
class salt.pillar.svn_pillar.SvnPillar(branch, repo_location, root, opts)
    Deal with the remote SVN repository for Pillar

    pillar_dir()
    Returns the directory of the pillars (repo cache + branch + root)

    update()
```
salt.pillar.svn_pillar.ext_pillar(minion_id, pillar, repo_string)
Execute a command and read the output as YAML

### 21.12.40 salt.pillar.varstack_pillar

Use Varstack data as a Pillar source

#### Configuring Varstack

Using varstack in Salt is fairly simple. Just put the following into the config file of your master:

```yaml
ext_pillar:
  - varstack: /etc/varstack.yaml
```

Varstack will then use `/etc/varstack.yaml` to determine which configuration data to return as pillar information. From there you can take a look at the README of varstack on how this file is evaluated.

salt.pillar.varstack_pillar.ext_pillar(minion_id, pillar, conf)
Parse varstack data and return the result

### 21.12.41 salt.pillar.vault module

Vault Pillar Module

- maintainer SaltStack
- maturity New
- platform all

New in version 2016.11.0.

This module allows pillar data to be stored in Hashicorp Vault.

Base configuration instructions are documented in the `execution module docs`. Below are noted extra configuration required for the pillar module, but the base configuration must also be completed.

After the base Vault configuration is created, add the configuration below to the ext_pillar section in the Salt master configuration.

```yaml
ext_pillar:
  - vault: path=secret/salt
```
Each key needs to have all the key-value pairs with the names you require. Avoid naming every key ’password’ as you they will collide:

If you want to nest results under a nesting_key name use the following format:

**ext_pillar:**
- **vault:** conf: path=secret/salt nesting_key: vault_key_name

```
$ vault write secret/salt auth=my_password master=127.0.0.1
```

The above will result in two pillars being available, auth and master.

You can then use normal pillar requests to get each key pair directly from pillar root. Example:

```
$ salt-ssh '*pillar.get auth
```

Multiple Vault sources may also be used:

```
ext_pillar:
- vault: path=secret/salt
- vault: path=secret/root
- vault: path=secret/minions/{minion}/pass
```

You can also use nesting here as well. Identical nesting keys will get merged.

```
ext_pillar:
- vault:
  conf: path=secret/salt
  nesting_key: keyname1
- vault:
  conf: path=secret/root
  nesting_key: keyname1
- vault:
  conf: path=secret/minions/{minion}/pass
  nesting_key: keyname2
```

The difference between the return with and without the nesting key is shown below. This example takes the key value pairs returned from vault as follows:

path=secret/salt
Key Value -- salt-passwd badpasswd1
path=secret/root
Key Value -- root-passwd rootbadpasswd1
path=secret/minions/{minion}/pass
Key Value -- minion-passwd minionbadpasswd1

```
#Nesting Key not defined
local:------
salt-passwd:
  badpasswd1
root-passwd:
  rootbadpasswd1
minion-passwd:
```

(continues on next page)
minionbadpasswd1

# Nesting Key defined

local:

keyname1:

salt-passwd: badpasswd1
root-passwd: rootbadpasswd1

keyname2:

minion-passwd: minionbadpasswd1

salt.pillar.vault.ext_pillar(minion_id, pillar, conf, nesting_key=\None)
Get pillar data from Vault for the configuration conf.

21.12.42 salt.pillar.venafi module

Venafi Pillar Certificates
This module will only return pillar data if the venafi runner module has already been used to create certificates.
To configure this module, set venafi to True in the ext_pillar section of your master configuration file:

ext_pillar:
  - venafi: True

salt.pillar.venafi.ext_pillar(minion_id, pillar, conf)
Return an existing set of certificates

21.12.43 salt.pillar.virtkey

Accept a key from a hypervisor if the virt runner has already submitted an authorization request
salt.pillar.virtkey.ext_pillar(hyper_id, pillar, name, key)
Accept the key for the VM on the hyper, if authorized.

21.12.44 salt.pillar.vmware_pillar module

Pillar data from vCenter or an ESXi host
New in version 2017.7.0.

depends
  - pyVmomi

This external pillar can pull attributes from objects in vCenter or an ESXi host and provide those attributes as pillar data to minions. This can allow for pillar based targeting of minions on ESXi host, Datastore, VM configuration, etc. This setup requires only the salt master have access to the vCenter server/ESXi hosts.
The pillar will return an empty dict if the 'os' or 'virtual' grain are not 'VMWare', 'ESXi', or 'VMWare ESXi'.

21.12. pillar modules
Defaults

- The external pillar will search for Virtual Machines with the VM name matching the minion id.
- Data will be returned into the ‘vmware’ pillar key.
- The external pillar has a default set of properties to return for both VirtualMachine and HostSystem types.

Configuring the VMWare pillar

The required minimal configuration in the salt master ext_pillar setup:

```yaml
ext_pillar:
  - vmware:
    host: <vcenter/esx host>
    username: <user to connect with>
    password: <password>
```

Optionally, the following keyword arguments can be passed to the ext_pillar for customized configuration:

- **pillar_key** Optionally set the pillar key to return the data into. Default is `vmware`.
- **protocol** Optionally set to alternate protocol if the vCenter server or ESX/ESXi host is not using the default protocol. Default protocol is `https`.
- **port** Optionally set to alternate port if the vCenter server or ESX/ESXi host is not using the default port. Default port is 443.
- **property_name** Property name to match the minion id against. Defaults to `name`.
- **property_types** Optionally specify a list of pyVmomi vim types to search for the minion id in 'property_name'. Default is `['VirtualMachine']`.

For example, to search both vim.VirtualMachine and vim.HostSystem object types:

```yaml
ext_pillar:
  - vmware:
    host: myesx
    username: root
    password: complex_password
    property_types:
      - VirtualMachine
      - HostSystem
```

Additionally, the list of property types can be dicts, the item of the dict being a list specifying the attribute to return for that vim object type.

The pillar will attempt to recurse the attribute and return all child attributes.

To explicitly specify deeper attributes without attempting to recurse an attribute, convert the list item to a dict with the item of the dict being the child attributes to return. Follow this pattern to return attributes as deep within the object as necessary.

**Note:** Be careful when specifying custom attributes! Many attributes have objects as attributes which have the parent object as an attribute and which will cause the pillar to fail due to the attempt to convert all sub-objects recursively (i.e. infinite attribute loops). Specifying only the sub-attributes you would like returned will keep the infinite recursion from occurring.

A maximum recursion exception will occur in this case and the pillar will not return as desired.
ext_pillar:
  - vmware:
    host: myvcenter
    username: my_user
    password: my_pass
    replace_default_attributes: True
    property_types:
    - VirtualMachine:
      - config:
        bootOptions:
        - bootDelay
        - bootRetryDelay
    - HostSystem:
      - datastore:
        name

The above ext_pillar example would return a pillar like the following for a VirtualMachine object that’s name matched the minion id:

```python
vmware:
  config:
    bootOptions:
      bootDelay: 1000
      bootRetryDelay: 1000
```

If you were to retrieve these virtual machine attributes via pyVmomi directly, this would be the same as

```python
vmObject.config.bootOptions.bootDelay
vmObject.config.bootOptionis.bootRetryDelay
```

The above ext_pillar example would return a pillar like the following for a HostySystem object that’s name matched the minion id:

```python
vmware:
  datastore:
  - name: Datastore1
  - name: Datastore2
```

The ‘datastore’ property of a HostSystem object is a list of datastores, thus a list is returned.

replace_default_attributes If custom attributes are specified by the property_types parameter, replace_default_attributes determines if those will be added to default attributes (False) or replace the default attributes completely (True). The default setting is 'False'.

Note: vCenter "Custom Attributes” (i.e. Annotations) will always be returned if it exists on the object as part of the pillar regardless of this setting.

```
salt.pillar.vmware_pillar.ext_pillar(minion_id, pillar, **kwargs)
Check vmware/vcenter for all data
```

### 21.13 proxy modules

### 21.13.1 salt.proxy.arista_pyeapi

**Arista pyeapi**

New in version 2019.2.0.

Proxy module for managing Arista switches via the eAPI using the pyeapi library.

- **codeauthor** Mircea Ulinic <ping@mirceaulinic.net>
- **maturity** new
- **depends** pyeapi
- **platform** unix

**Note:** To understand how to correctly enable the eAPI on your switch, please check https://eos.arista.com/arista-eapi-101/.
Dependencies

The `pyeapi` Proxy module requires `pyeapi` to be installed: `pip install pyeapi`.

**Pillar**

The `pyeapi` proxy configuration requires the following parameters in order to connect to the network device:

- **transport**: `https` Specifies the type of connection transport to use. Valid values for the connection are `socket`, `http_local`, `http`, and `https`.
- **host**: `localhost` The IP address or DNS host name of the connection device.
- **username**: `admin` The username to pass to the device to authenticate the eAPI connection.
- **password** The password to pass to the device to authenticate the eAPI connection.
- **port** The TCP port of the endpoint for the eAPI connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for `http`, or 443 for `https`).
- **enablepwd** The enable mode password if required by the destination node.

All the arguments may be optional, depending on your setup.

**Proxy Pillar Example**

```yaml
proxy:
    proxytype: pyeapi
    host: router1.example.com
    username: example
    password: example
```

salt.proxy.arista_pyeapi.call(*method, *args, **kwargs*)

Calls an arbitrary `pyeapi` method.

salt.proxy.arista_pyeapi.conn()

Return the connection object.

salt.proxy.arista_pyeapi.init(*opts*)

Open the connection to the Arista switch over the eAPI.

salt.proxy.arista_pyeapi.initialized()

Connection finished initializing?

salt.proxy.arista_pyeapi.ping()

Connection open successfully?

salt.proxy.arista_pyeapi.shutdown(*opts*)

Closes connection with the device.

### 21.13.2 salt.proxy.cimc module

Proxy Minion interface module for managing Cisco Integrated Management Controller devices

New in version 2018.3.0.

**codeauthor** Spencer Ervin <spencer_ervin@hotmail.com>
This proxy minion enables Cisco Integrated Management Controller devices (hereafter referred to as simply 'cimc' devices to be treated individually like a Salt Minion.

The cimc proxy leverages the XML API functionality on the Cisco Integrated Management Controller. The Salt proxy must have access to the cimc on HTTPS (tcp/443).

More in-depth conceptual reading on Proxy Minions can be found in the Proxy Minion section of Salt’s documentation.

**Configuration**

To use this integration proxy module, please configure the following:

**Pillar**

Proxy minions get their configuration from Salt’s Pillar. Every proxy must have a stanza in Pillar and a reference in the Pillar top-file that matches the ID.

```yaml
proxy:
  proxytype: cimc
  host: <ip or dns name of cimc host>
  username: <cimc username>
  password: <cimc password>
```

**proxytype**

The `proxytype` key and value pair is critical, as it tells Salt which interface to load from the `proxy` directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this cimc Proxy Module, set this to `cimc`.

**host**

The location, or ip/dns, of the cimc host. Required.

**username**

The username used to login to the cimc host. Required.

**password**

The password used to login to the cimc host. Required.

```python
salt.proxy.cimc.get_config_resolver_class(cid=None, hierarchical=False)
```

The configResolveClass method returns requested managed object in a given class.
salt.proxy.cimc.grains()
Get the grains from the proxied device

salt.proxy.cimc.grains_refresh()
Refresh the grains from the proxied device

salt.proxy.cimc.init(opts)
This function gets called when the proxy starts up.

salt.proxy.cimc.initialized()
Since grains are loaded in many different places and some of those places occur before the proxy can be initialized, return whether our init() function has been called

salt.proxy.cimc.logon()
Logs into the cimc device and returns the session cookie.

salt.proxy.cimc.logout(cookie=None)
Closes the session with the device.

salt.proxy.cimc.ping()
Returns true if the device is reachable, else false.

salt.proxy.cimc.prepare_return(x)
Converts the etree to dict

salt.proxy.cimc.set_config_modify(dn=None, inconfig=None, hierarchical=False)
The configConfMo method configures the specified managed object in a single subtree (for example, DN).

salt.proxy.cimc.shutdown()
Shutdown the connection to the proxy device. For this proxy, shutdown is a no-op.

21.13.3 salt.proxy.chronos module

Chronos
Proxy minion for managing a Chronos cluster.

Dependencies

- chronos execution module (salt.modules.chronos)

Pillar

The chronos proxy configuration requires a 'base_url' property that points to the chronos endpoint:

<table>
<thead>
<tr>
<th>proxy:</th>
</tr>
</thead>
<tbody>
<tr>
<td>proxytype: chronos</td>
</tr>
<tr>
<td>base_url: <a href="http://my-chronos-master.mydomain.com:4400">http://my-chronos-master.mydomain.com:4400</a></td>
</tr>
</tbody>
</table>

New in version 2015.8.2.

salt.proxy.chronos.init(opts)
Perform any needed setup.

salt.proxy.chronos.ping()
Is the chronos api responding?
salt.proxy.chronos.shutdown*(opts)*
   For this proxy shutdown is a no-op

### 21.13.4 salt.proxy.cisconso

Proxy Minion interface module for managing (practically) any network device with Cisco Network Services Orchestrator (Cisco NSO). Cisco NSO uses a series of remote polling agents, APIs and SSH commands to fetch network configuration and represent it in a data model. PyNSO, the Python module used by this proxy minion does the task of converting native Python dictionaries into NETCONF/YANG syntax that the REST API for Cisco NSO can then use to set the configuration of the target network device.

**Supported devices:**

- A10 AX Series
- Arista 7150 Series
- Ciena 3000, 5000, ESM
- H3c S5800 Series
- Overture 1400, 2200, 5000, 5100, 6000
- Accedian MetroNID
- Avaya ERS 4000, SR8000, VSP 9000
- Cisco: APIC-DC, ASA, IOS, IOS XE, IOS XR, er, ME-4600, NX OS, Prime Network Registrar, Quantum, StarOS, UCS ManagWSA
- Huawei: NE40E, quidway series, Enterprise Network Simulation Framework
- PaloAlto PA-2000, PA-3000, Virtualized Firewalls
- Adtran 900 Series
- Brocade ADX, MLX, Netiron, Vyatta
- Dell Force 10 Networking S-Series
- Infinera DTN-X Multi-Terabit Packet Optical Network Platform
- Pulsecom SuperG
- Adva 150CC Series
- CableLabs Converged Cable Access Platform
- Ericsson EFN324 Series, SE family
- Juniper: Contrail, EX, M, MX, QFX, SRX, Virtual SRX
- Quagga Routing Software
- Affirmed Networks
- Citrix Netscaler
- F5 BIG-IP
- NEC iPasolink
- Riverbed Steelhead Series
- Alcatel-Lucent 7XXX, SAM
- Clavister
• Fortinet
• Nominum DCS
• Sonus SBC 5000 Series
• Allied Telesys
• Open vSwitch

New in version 2016.11.0.

codeauthor Anthony Shaw <anthony.shaw@dimensiondata.com>

This proxy minion enables a consistent interface to fetch, control and maintain the configuration of network devices via a NETCONF-compliant control plane. Cisco Network Services Orchestrator.

More in-depth conceptual reading on Proxy Minions can be found in the Proxy Minion section of Salt’s documentation.

Dependencies

• pynso Python module

PyNSO

PyNSO can be installed via pip:

```
pip install pynso
```

Configuration

To use this integration proxy module, please configure the following:

**Pillar**

Proxy minions get their configuration from Salt’s Pillar. Every proxy must have a stanza in Pillar and a reference in the Pillar top-file that matches the ID. At a minimum for communication with the NSO host, the pillar should look like this:

```
proxy:
    proxytype: cisconso
    host: <ip or dns name of host>
    port: 8080
    use_ssl: false
    username: <username>
    password: password
```

**proxytype**

The proxytype key and value pair is critical, as it tells Salt which interface to load from the proxy directory in Salt’s install hierarchy, or from /srv/salt/_proxy on the Salt Master (if you have created your own proxy module, for example). To use this Cisco NSO Proxy Module, set this to cisconso.
host

The location, or IP/dns, of the Cisco NSO API host. Required.

username

The username used to login to the Cisco NSO host, such as admin. Required.

passwords

The password for the given user. Required.

use_ssl

Whether to use HTTPS messaging to speak to the API.

port

The port that the Cisco NSO API is running on, 8080 by default

Salt Proxy

After your pillar is in place, you can test the proxy. The proxy can run on any machine that has network connectivity to your Salt Master and to the Cisco NSO host in question. SaltStack recommends that the machine running the salt-proxy process also run a regular minion, though it is not strictly necessary.

On the machine that will run the proxy, make sure there is an /etc/salt/proxy file with at least the following in it:

```
master: <ip or hostname of salt-master>
```

You can then start the salt-proxy process with:

```
salt-proxy --proxyid <id you want to give the host>
```

You may want to add `-l debug` to run the above in the foreground in debug mode just to make sure everything is OK.

Next, accept the key for the proxy on your salt-master, just like you would for a regular minion:

```
salt-key -a <id you gave the cisconso host>
```

You can confirm that the pillar data is in place for the proxy:

```
salt <id> pillar.items
```

And now you should be able to ping the Cisco NSO host to make sure it is responding:

```
salt <id> test.ping
```
salt.proxy.cisconso.apply_rollback(datastore, name)
Apply a system rollback
Parameters
- datastore (DatastoreType (str enum)) – The datastore, e.g. running, operational. One of the NETCONF store IETF types
- name (str) – an ID of the rollback to restore

salt.proxy.cisconso.get_data(datastore, path)
Get the configuration of the device tree at the given path
Parameters
- datastore (DatastoreType (str enum)) – The datastore, e.g. running, operational. One of the NETCONF store IETF types
- path (list of str OR tuple) – The device path, a list of element names in order, comma separated
Returns The network configuration at that tree
Return type dict

salt proxy.nso cisconso.get_data devices

salt.proxy.cisconso.get_rollback(name)
Get the backup of stored a configuration rollback
Parameters
- name (str) – Typically an ID of the backup
Return type str
Returns the contents of the rollback snapshot

salt.proxy.cisconso.get_rollbacks()
Get a list of stored configuration rollbacks

salt.proxy.cisconso.grains()
Get the grains from the proxy device.

salt.proxy.cisconso.init(opts)
salt.proxy.cisconso.ping()
Check to see if the host is responding. Returns False if the host didn’t respond, True otherwise.
CLI Example:
salt cisco-nso test.ping

salt.proxy.cisconso.set_data_value(datastore, path, data)
Get a data entry in a datastore
Parameters
- datastore (DatastoreType (str enum)) – The datastore, e.g. running, operational. One of the NETCONF store IETF types
- path (list of str OR tuple) – The device path to set the value at, a list of element names in order, comma separated
- data (dict) – The new value at the given path
Return type bool
Returns True if successful, otherwise error.

salt.proxy.cisconso.shutdown()
Shutdown the connection to the proxy device. For this proxy, shutdown is a no-op.

21.13.5 salt.proxy.dummy module
This is a dummy proxy-minion designed for testing the proxy minion subsystem.
salt.proxy.dummy.fns()
salt.proxy.dummy.grains()
    Make up some grains
salt.proxy.dummy.grains_refresh()
    Refresh the grains
salt.proxy.dummy.init(opts)
salt.proxy.dummy.initialized()
    Since grains are loaded in many different places and some of those places occur before the proxy can be initialized, return whether our init() function has been called
salt.proxy.dummy.package_install(name, **kwargs)
    Install a "package" on the REST server
salt.proxy.dummy.package_list()
    List "packages" installed on the REST server
salt.proxy.dummy.package_remove(name)
    Remove a "package" on the REST server
salt.proxy.dummy.package_status(name)
    Check the installation status of a package on the REST server
salt.proxy.dummy.ping()
    Degenerate ping
salt.proxy.dummy.service_list()
    List "services" on the REST server
salt.proxy.dummy.service_restart(name)
    Restart a "service" on the REST server
salt.proxy.dummy.service_start(name)
    Start a "service" on the dummy server
salt.proxy.dummy.service_status(name)
    Check if a service is running on the REST server
salt.proxy.dummy.service_stop(name)
    Stop a "service" on the dummy server
salt.proxy.dummy.shutdown(opts)
    For this proxy shutdown is a no-op
salt.proxy.dummy.test_from_state()
    Test function so we have something to call from a state :return:
salt.proxy.dummy.upgrade()
    "Upgrade" packages
salt.proxy.dummy.uptodate()
    Call the REST endpoint to see if the packages on the "server" are up to date.

21.13.6 salt.proxy.esxi

Proxy Minion interface module for managing VMware ESXi hosts.

New in version 2015.8.4.

Special Note: SaltStack thanks Adobe Corporation for their support in creating this Proxy Minion integration.
This proxy minion enables VMware ESXi (hereafter referred to as simply 'ESXi') hosts to be treated individually like a Salt Minion.

Since the ESXi host may not necessarily run on an OS capable of hosting a Python stack, the ESXi host can’t run a Salt Minion directly. Salt’s “Proxy Minion” functionality enables you to designate another machine to host a minion process that "proxies" communication from the Salt Master. The master does not know nor care that the target is not a "real" Salt Minion.

More in-depth conceptual reading on Proxy Minions can be found in the Proxy Minion section of Salt’s documentation.

**Dependencies**

- pyVmomi Python Module
- ESXCLI

**pyVmomi**

PyVmomi can be installed via pip:

```
$ pip install pyVmomi
```

**Note:** Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.6, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See Issue #29537 for more information.

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
$ pip install pyVmomi==5.5.0.2014.1.1
```

The 5.5.0.2014.1.1 is a known stable version that this original ESXi State Module was developed against.

**ESXCLI**

Currently, about a third of the functions used in the vSphere Execution Module require the ESXCLI package be installed on the machine running the Proxy Minion process.

The ESXCLI package is also referred to as the VMware vSphere CLI, or vCLI. VMware provides vCLI package installation instructions for vSphere 5.5 and vSphere 6.0.

Once all of the required dependencies are in place and the vCLI package is installed, you can check to see if you can connect to your ESXi host or vCenter server by running the following command:

```
esxcli -s <host-location> -u <username> -p <password> system syslog config get
```

If the connection was successful, ESXCLI was successfully installed on your system. You should see output related to the ESXi host’s syslog configuration.
Configuration

To use this integration proxy module, please configure the following:

Pillar

Proxy minions get their configuration from Salt’s Pillar. Every proxy must have a stanza in Pillar and a reference in the Pillar top-file that matches the ID. At a minimum for communication with the ESXi host, the pillar should look like this:

```
proxy:
    proxytype: esxi
    host: <ip or dns name of esxi host>
    username: <ESXi username>
    passwords:
        - first_password
        - second_password
        - third_password
    credstore: <path to credential store>
```

proxytype

The `proxytype` key and value pair is critical, as it tells Salt which interface to load from the `proxy` directory in Salt’s install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this ESXi Proxy Module, set this to `esxi`.

host

The location, or ip/dns, of the ESXi host. Required.

username

The username used to login to the ESXi host, such as `root`. Required.

passwords

A list of passwords to be used to try and login to the ESXi host. At least one password in this list is required.

The proxy integration will try the passwords listed in order. It is configured this way so you can have a regular password and the password you may be updating for an ESXi host either via the `vsphere.update_host_password` execution module function or via the `esxi.password_present` state function. This way, after the password is changed, you should not need to restart the proxy minion—it should just pick up the the new password provided in the list. You can then change pillar at will to move that password to the front and retire the unused ones.

This also allows you to use any number of potential fallback passwords.

Note: When a password is changed on the host to one in the list of possible passwords, the further down on the list the password is, the longer individual commands will take to return. This is due to the nature of pyVmomi’s login system. We have to wait for the first attempt to fail before trying the next password on the list.
This scenario is especially true, and even slower, when the proxy minion first starts. If the correct password is not the first password on the list, it may take up to a minute for `test.ping` to respond with a `True` result. Once the initial authorization is complete, the responses for commands will be a little faster.

To avoid these longer waiting periods, SaltStack recommends moving the correct password to the top of the list and restarting the proxy minion at your earliest convenience.

**protocol**

If the ESXi host is not using the default protocol, set this value to an alternate protocol. Default is `https`.

**port**

If the ESXi host is not using the default port, set this value to an alternate port. Default is 443.

**credstore**

If the ESXi host is using an untrusted SSL certificate, set this value to the file path where the credential store is located. This file is passed to `esxcli`. Default is `<HOME>/vmware/credstore/vicredentials.xml` on Linux and `<APPDATA>/VMware/credstore/vicredentials.xml` on Windows.

**Note:** The `HOME` variable is sometimes not set for processes running as system services. If you want to rely on the default credential store location, make sure `HOME` is set for the proxy process.

**Salt Proxy**

After your pillar is in place, you can test the proxy. The proxy can run on any machine that has network connectivity to your Salt Master and to the ESXi host in question. SaltStack recommends that the machine running the salt-proxy process also run a regular minion, though it is not strictly necessary.

On the machine that will run the proxy, make sure there is an `/etc/salt/proxy` file with at least the following in it:

```text
master: <ip or hostname of salt-master>
```

You can then start the salt-proxy process with:

```
salt-proxy --proxyid <id you want to give the host>
```

You may want to add `-l debug` to run the above in the foreground in debug mode just to make sure everything is OK.

Next, accept the key for the proxy on your salt-master, just like you would for a regular minion:

```
salt-key -a <id you gave the esxi host>
```

You can confirm that the pillar data is in place for the proxy:

```
salt <id> pillar.items
```

### 21.13. proxy modules

2983
And now you should be able to ping the ESXi host to make sure it is responding:

```
salt <id> test.ping
```

At this point you can execute one-off commands against the host. For example, you can get the ESXi host’s system information:

```
salt <id> esxi.cmd system_info
```

Note that you don’t need to provide credentials or an ip/hostname. Salt knows to use the credentials you stored in Pillar.

It’s important to understand how this particular proxy works. `Salt.modules.vsphere` is a standard Salt execution module. If you pull up the docs for it you’ll see that almost every function in the module takes credentials and a target host. When credentials and a host aren’t passed, Salt runs commands through `pyVmomi` against the local machine. If you wanted, you could run functions from this module on any host where an appropriate version of `pyVmomi` is installed, and that host would reach out over the network and communicate with the ESXi host.

`esxi.cmd` acts as a "shim" between the execution module and the proxy. Its first parameter is always the function from `salt.modules.vsphere`. If the function takes more positional or keyword arguments you can append them to the call. It’s this shim that speaks to the ESXi host through the proxy, arranging for the credentials and hostname to be pulled from the Pillar section for this Proxy Minion.

Because of the presence of the shim, to lookup documentation for what functions you can use to interface with the ESXi host, you’ll want to look in `salt.modules.vsphere` instead of `salt.modules.esxi`.

### States

Associated states are thoroughly documented in `salt.states.esxi`. Look there to find an example structure for Pillar as well as an example `.sls` file for standing up an ESXi host from scratch.

```
salt.proxy.esxi.ch_config(cmd, *args, **kwargs)
```

This function is called by the `salt.modules.esxi.cmd` shim. It then calls whatever is passed in `cmd` inside the `salt.modules.vsphere` module. Passes the return through from the vsphere module.

- `cmd` The command to call inside salt.modules.vsphere.
- `args` Arguments that need to be passed to that command.
- `kwargs` Keyword arguments that need to be passed to that command.

```
salt.proxy.esxi.find_credentials(host)
```

Cycle through all the possible credentials and return the first one that works.

```
salt.proxy.esxi.get_details()
```

Return the proxy details.

```
salt.proxy.esxi.grains()
```

Get the grains from the proxy device.

```
salt.proxy.esxi.grains_refresh()
```

Refresh the grains from the proxy device.

```
salt.proxy.esxi.init(opts)
```

This function gets called when the proxy starts up. For ESXi devices, the host, login credentials, and, if configured, the protocol and port are cached.

```
salt.proxy.esxi.is_connected_via_vcenter()
```

Returns True if connection is to be done via a vCenter (no connection is attempted). Check to see if the host is responding when connecting directly via an ESXi host.
CLI Example:

```
salt esxi-host test.ping
```

```
salt.proxy.esxi.shutdown()
```

Shutdown the connection to the proxy device. For this proxy, shutdown is a no-op.

## 21.13.7 salt.proxy.fx2

### Dell FX2 chassis

New in version 2015.8.2.

Proxy minion interface module for managing Dell FX2 chassis (Dell Chassis Management Controller version 1.2 and above, iDRAC8 version 2.00 and above)

### Dependencies

- iDRAC Remote execution module (`salt.modules.dracr`)
- Chassis command shim (`salt.modules.chassis`)
- Dell Chassis States (`salt.states.dellchassis`)
- Dell's `racadm` command line interface to CMC and iDRAC devices.

**Special Note:** SaltStack thanks Adobe Corporation for their support in creating this proxy minion integration.

This proxy minion enables Dell FX2 and FX2s (hereafter referred to as simply "chassis", "CMC", or "FX2") chassis to be treated individually like a salt-minion.

Since the CMC embedded in the chassis does not run an OS capable of hosting a Python stack, the chassis can’t run a minion directly. Salt’s "Proxy Minion" functionality enables you to designate another machine to host a minion process that "proxies" communication from the salt-master. The master does not know nor care that the target is not a real minion.

More in-depth conceptual reading on Proxy Minions can be found in the Proxy Minion section of Salt’s documentation.

To configure this integration, follow these steps:

### Pillar

Proxy minions get their configuration from Salt’s Pillar. Every proxy must have a stanza in Pillar, and a reference in the Pillar topfile that matches the ID. At a minimum for communication with the chassis the pillar should look like this:

```
proxy:
    host: <ip or dns name of chassis controller>
    admin_username: <iDRAC username for the CMC, usually 'root'>
    fallback_admin_username: <username to try if the first fails>
    passwords:
        - first_password
        - second_password
        - third_password
    proxytype: fx2
```
The `proxytype` line above is critical, it tells Salt which interface to load from the `proxy` directory in Salt’s install hierarchy, or from `/srv/salt/_proxy` on the salt-master (if you have created your own proxy module, for example).

The proxy integration will try the passwords listed in order. It is configured this way so you can have a regular password, a potential fallback password, and the third password can be the one you intend to change the chassis to use. This way, after it is changed, you should not need to restart the proxy minion—it should just pick up the third password in the list. You can then change pillar at will to move that password to the front and retire the unused ones.

Beware, many Dell CMC and iDRAC units are configured to lockout IP addresses or users after too many failed password attempts. This can generate user panic in the form of "I no longer know what the password is‼!". To mitigate panic try the web interface from a different IP, or setup a emergency administrator user in the CMC before doing a wholesale password rotation.

The automatic lockout can be disabled via Salt with the following:

```bash
salt <cmc> chassis.cmd set_general cfgRacTuning cfgRacTuneIpBlkEnable 0
```

and then verified with

```bash
salt <cmc> chassis.cmd get_general cfgRacTuning cfgRacTuneIpBlkEnable
```

salt-proxy

After your pillar is in place, you can test the proxy. The proxy can run on any machine that has network connectivity to your salt-master and to the chassis in question. SaltStack recommends that this machine also run a regular minion, though it is not strictly necessary.

On the machine that will run the proxy, make sure there is an `/etc/salt/proxy` file with at least the following in it:

```
master: <ip or hostname of salt-master>
```

You can start the proxy with

```
salt-proxy --proxyid <id you want to give the chassis>
```

You may want to add `-l debug` to run the above in the foreground in debug mode just to make sure everything is OK.

Next, accept the key for the proxy on your salt-master, just like you would for a regular minion:

```
salt-key -a <id you want to give the chassis>
```

You can confirm that the pillar data is in place for the proxy:

```
salt <id> pillar.items
```

And now you should be able to ping the chassis to make sure it is responding:

```
salt <id> test.ping
```

At this point you can execute one-off commands against the chassis. For example, you can get the chassis inventory:

```
salt <id> chassis.cmd inventory
```
Note that you don’t need to provide credentials or an ip/hostname. Salt knows to use the credentials you stored in Pillar.

It’s important to understand how this particular proxy works. `Salt.modules.dracr` is a standard Salt execution module. If you pull up the docs for it you’ll see that almost every function in the module takes credentials and a target host. When credentials and a host aren’t passed, Salt runs `racadm` against the local machine. If you wanted you could run functions from this module on any host where an appropriate version of `racadm` is installed, and that host would reach out over the network and communicate with the chassis.

`Chassis.cmd` acts as a "shim" between the execution module and the proxy. It’s first parameter is always the function from `salt.modules.dracr` to execute. If the function takes more positional or keyword arguments you can append them to the call. It’s this shim that speaks to the chassis through the proxy, arranging for the credentials and hostname to be pulled from the pillar section for this proxy minion.

Because of the presence of the shim, to lookup documentation for what functions you can use to interface with the chassis, you’ll want to look in `salt.modules.dracr` instead of `salt.modules.chassis`.

### States

Associated states are thoroughly documented in `salt.states.dellchassis`. Look there to find an example structure for pillar as well as an example `.sls` file for standing up a Dell Chassis from scratch.

#### `salt.proxy.fx2.admin_password()`

Return the admin_password in the DETAILS dictionary, or ‘calvin’ (the Dell default) if there is none present.

#### `salt.proxy.fx2.admin_username()`

Return the admin_username in the DETAILS dictionary, or root if there is none present.

#### `salt.proxy.fx2.chconfig(cmd, *args, **kwargs)`

This function is called by the `salt.modules.chassis.cmd` shim. It then calls whatever is passed in `cmd` inside the `salt.modules.dracr` module.

**Parameters**

- `cmd` – The command to call inside salt.modules.dracr
- `args` – Arguments that need to be passed to that command
- `kwargs` – Keyword arguments that need to be passed to that command

**Returns**

Passthrough the return from the dracr module.

#### `salt.proxy.fx2.find_credentials()`

Cycle through all the possible credentials and return the first one that works.

#### `salt.proxy.fx2.grains()`

Get the grains from the proxied device.

#### `salt.proxy.fx2.grains_refresh()`

Refresh the grains from the proxied device.

#### `salt.proxy.fx2.host()`

#### `salt.proxy.fx2.init(opts)`

This function gets called when the proxy starts up. We check opts to see if a fallback user and password are supplied. If they are present, and the primary credentials don’t work, then we try the backup before failing. Whichever set of credentials works is placed in the persistent DETAILS dictionary and will be used for further communication with the chassis.

#### `salt.proxy.fx2.ping()`

Is the chassis responding?

**Returns**

Returns False if the chassis didn’t respond, True otherwise.
salt.proxy.fx2.shutdown\(\text{opts}\)

Shutdown the connection to the proxied device. For this proxy shutdown is a no-op.

### 21.13.8 salt.proxy.junos

Interface with a Junos device via proxy-minion. To connect to a junos device via junos proxy, specify the host information in the pillar in `/srv/pillar/details.sls`

```yaml
proxy:
  proxysite: junos
  host: <ip or dns name of host>
  username: <username>
  port: 830
  password: <secret>
```

In `/srv/pillar/top.sls` map the device details with the proxy name.

```yaml
base:
  'vmx':
    - details
```

After storing the device information in the pillar, configure the proxy in `/etc/salt/proxy`

```yaml
master: <ip or hostname of salt-master>
```

Run the salt proxy via the following command:

```
salt-proxy --proxyid=vmx
```

salt.proxy.junos.alive\(\text{opts}\)

Validate and return the connection status with the remote device.

New in version 2018.3.0.

salt.proxy.junos.conn()

salt.proxy.junos.get_serialized_facts()

salt.proxy.junos.init\(\text{opts}\)

Open the connection to the Junos device, login, and bind to the Resource class

salt.proxy.junos.initialized()

salt.proxy.junos.ping()

Ping? Pong!

salt.proxy.junos.proxytype()

Returns the name of this proxy

salt.proxy.junos.shutdown\(\text{opts}\)

This is called when the proxy-minion is exiting to make sure the connection to the device is closed cleanly.

### 21.13.9 salt.proxy.marathon module

Marathon

Proxy minion for managing a Marathon cluster.
Dependencies

- marathon execution module (salt.modules.marathon)

Pillar

The marathon proxy configuration requires a 'base_url' property that points to the marathon endpoint:

```
proxy:
  proxitype: marathon
  base_url: http://my-marathon-master.mydomain.com:8080
```

New in version 2015.8.2.

salt.proxy.marathon.init(opts)

Perform any needed setup.

salt.proxy.marathon.ping()

Is the marathon api responding?

salt.proxy.marathon.shutdown(opts)

For this proxy shutdown is a no-op

21.13.10 salt.proxy.napalm

NAPALM: Network Automation and Programmability Abstraction Layer with Multivendor support

New in version 2016.11.0.

Proxy minion for managing network devices via NAPALM library.

```
codeauthor    Mircea Ulinic <mircea@cloudflare.com> & Jerome Fleury <jf@cloudflare.com>
maturity      new
depends       napalm
platform      unix
```

Dependencies

The napalm proxy module requires NAPALM library to be installed: pip install napalm Please check Installation for complete details.

**Note:** Beginning with Salt release 2017.7.3, it is recommended to use napalm >= 2.0.0. The library has been unified into a monolithic package, as in opposite to separate packages per driver. For more details you can check this document. While it will still work with the old packages, bear in mind that the NAPALM core team will maintain only the main napalm package.

Moreover, for additional capabilities, the users can always define a library that extends NAPALM’s base capabilities and configure the provider option (see below).
Pillar

The napalm proxy configuration requires the following parameters in order to connect to the network device:

**driver** Specifies the network device operating system. For a complete list of the supported operating systems please refer to the NAPALM Read the Docs page.

**host** The IP Address or FQDN to use when connecting to the device. Alternatively, the following field names can be used instead: hostname, fqdn, ip.

**username** The username to be used when connecting to the device.

**passwd** The password needed to establish the connection.

**Note:** This field may not be mandatory when working with SSH-based drivers, and the username has a SSH key properly configured on the device targeted to be managed.

**optional_args** Dictionary with the optional arguments. Check the complete list of supported optional arguments.

**always_alive**: True In certain less dynamic environments, maintaining the remote connection permanently open with the network device is not always beneficial. In that case, the user can select to initialize the connection only when needed, by specifying this field to false. Default: true (maintains the connection with the remote network device).

New in version 2017.7.0.

**provider**: napalm_base The library that provides the get_network_device function. This option is useful when the user has more specific needs and requires to extend the NAPALM capabilities using a private library implementation. The only constraint is that the alternative library needs to have the get_network_device function available.

New in version 2017.7.1.

**multiprocessing**: False Overrides the multiprocessing option, per proxy minion. The multiprocessing option must be turned off for SSH-based proxies. However, some NAPALM drivers (e.g. Arista, NX-OS) are not SSH-based. As multiple proxy minions may share the same configuration file, this option permits the configuration of the multiprocessing option more specifically, for some proxy minions.

New in version 2017.7.2.

Proxy pillar file example:

```yaml
proxy:
  proxytype: napalm
  driver: junos
  host: core05.nrt02
  username: my_username
  passwd: my_password
  optional_args:
    port: 12201
```

Example using a user-specific library, extending NAPALM’s capabilities, e.g. custom_napalm_base:

```yaml
proxy:
  proxytype: napalm
  driver: ios
  fqdn: cr1.th2.par.as1234.net
  username: salt
```

(continues on next page)
password: ''
provider: custom_napalm_base

- SNMP configuration module
- Users configuration management

Note: Beginning with release codename 2019.2.0, any NAPALM command executed when running under a NAPALM Proxy Minion supports the `force_reconnect` magic argument.

Proxy Minions generally establish a connection with the remote network device at the time of the Minion startup and that connection is going to be used forever.

If one would need execute a command on the device but connecting using different parameters (due to various causes, e.g., unable to authenticate the user specified in the Pillar as the authentication system - say TACACS+ is not available, or the DNS resolver is currently down and would like to temporarily use the IP address instead, etc.), it implies updating the Pillar data and restarting the Proxy Minion process restart. In particular cases like that, you can pass the `force_reconnect=True` keyword argument, together with the alternative connection details, to enforce the command to be executed over a separate connection.

For example, if the usual command is `salt '*' net.arp`, you can use the following to connect using a different username instead: `salt '*' net.arp username=my-alt-usr force_reconnect=True`.

salt.proxy.napalm.alive(\*args)

Return the connection status with the remote device.

New in version 2017.7.0.

salt.proxy.napalm.call(method, *args, **kwargs)

Calls a specific method from the network driver instance. Please check the readthedocs page for the updated list of getters.

Parameters

- **method** – specifies the name of the method to be called
- **params** – contains the mapping between the name and the values of the parameters needed to call the method

Returns A dictionary with three keys:

- `result` (True/False): if the operation succeeded
- `out` (object): returns the object as-is from the call
• comment (string): provides more details in case the call failed
• traceback (string): complete traceback in case of exception. Please submit an issue including this traceback on the correct driver repo and make sure to read the FAQ

Example:

```python
__proxy__['napalm.call']['cli'
  **{
    'commands': [
      'show version',
      'show chassis fan'
    ]
  }
}
```

salt.proxy.napalm.fns()
Method called by NAPALM grains module.
salt.proxy.napalm.get_device()
Returns the network device object.
salt.proxy.napalm.get_grains()
Retrieve facts from the network device.
salt.proxy.napalm.grains_refresh()
Refresh the grains.
salt.proxy.napalm.init(opts)
Opens the connection with the network device.
salt.proxy.napalm.initialized()
Connection finished initializing?
salt.proxy.napalm.ping()
Connection open successfully?
salt.proxy.napalm.shutdown(opts)
Closes connection with the device.

21.13.11 salt.proxy.netmiko_px

Netmiko

New in version 2019.2.0.
Proxy module for managing network devices via Netmiko.

codeauthor Mircea Ulinic <ping@mirceaulinic.net> & Kirk Byers <ktbyers@twb-tech.com>
maturity new
depends netmiko
platform unix

Dependencies

The netmiko proxy modules requires Netmiko to be installed: pip install netmiko.
The netmiko proxy configuration requires the following parameters in order to connect to the network device:

- **device_type** - Class selection based on device type. Supported options:
  - a10: A10 Networks
  - accedian: Accedian Networks
  - alcatel_aos: Alcatel AOS
  - alcatel_sros: Alcatel SROS
  - apresia_aeos: Apresia AEOS
  - arista_eos: Arista EOS
  - aruba_os: Aruba
  - avaya_ers: Avaya ERS
  - avaya_vsp: Avaya VSP
  - brocade_fastiron: Brocade Fastiron
  - brocade_netiron: Brocade Netiron
  - brocade_nos: Brocade NOS
  - brocade_vdx: Brocade NOS
  - brocade_vyos: VyOS
  - checkpoint_gaia: Check Point GAiA
  - calix_b6: Calix B6
  - ciena_saos: Ciena SAOS
  - cisco_asa: Cisco SA
  - cisco_ios: Cisco IOS
  - cisco_nxos: Cisco NX-os
  - cisco_s300: Cisco S300
  - cisco_tp: Cisco TpTcCe
  - cisco_wlc: Cisco WLC
  - cisco_xe: Cisco IOS
  - cisco_xr: Cisco XR
  - coriant: Coriant
  - dell_force10: Dell Force10
  - dell_os10: Dell OS10
  - dell_powerconnect: Dell PowerConnect
  - eltex: Eltex
  - enterasys: Enterasys
  - extreme: Extreme
  - extreme_wing: Extreme Wing
- f5_ltm: F5 LTM
- fortinet: Fortinet
- generic_termserver: TerminalServer
- hp_comware: HP Comware
- hp_procurve: HP Procurve
- huawei: Huawei
- huawei_vrpv8: Huawei VRPv8
- juniper: Juniper Junos
- juniper_junos: Juniper Junos
- linux: Linux
- mellanox: Mellanox
- mrv_optiswitch: MrvOptiswitch
- netapp_cdot: NetAppcDot
- netscaler: Netscaler
- ovs_linux: OvsLinux
- paloalto_panos: PaloAlto Panos
- pluribus: Pluribus
- quanta_mesh: Quanta Mesh
- ruckus_fastiron: Ruckus Fastiron
- ubiquiti_edge: Ubiquiti Edge
- ubiquiti_edgeswitch: Ubiquiti Edge
- vyatta_vyos: VyOS
- vyos: VyOS
- brocade_fastiron_telnet: Brocade Fastiron over Telnet
- brocade_netiron_telnet: Brocade Netiron over Telnet
- cisco_ios_telnet: Cisco IOS over Telnet
- apresia_aeos_telnet: Apresia AEOS over Telnet
- arista_eos_telnet: Arista EOS over Telnet
- hp_procurve_telnet: HP Procurve over Telnet
- hp_comware_telnet: HP Comware over Telnet
- juniper_junos_telnet: Juniper Junos over Telnet
- calix_b6_telnet: Calix B6 over Telnet
- dell_powerconnect_telnet: Dell PowerConnect over Telnet
- generic_termserver_telnet: TerminalServer over Telnet
- extreme_telnet: Extreme Networks over Telnet
- ruckus_fastiron_telnet: Ruckus Fastiron over Telnet
- cisco_ios_serial: Cisco IOS over serial port
  
  • ip - IP address of target device (not required if host is provided)
  • host - Hostname of target device (not required if ip is provided)
  • username - Username to authenticate against target device, if required
  • password - Password to authenticate against target device, if required
  • secret - The enable password if target device requires one
  • port - The destination port used to connect to the target device
  • global_delay_factor - Multiplication factor affecting Netmiko delays (default: 1)
  • use_keys - Connect to target device using SSH keys (default: False)
  • key_file - Filename path of the SSH key file to use
  • allow_agent - Enable use of SSH key-agent
  • ssh_strict - Automatically reject unknown SSH host keys (default: False, which means unknown SSH host keys will be accepted)
  • system_host_keys - Load host keys from the user's "known_hosts" file (default: False)
  • alt_host_keys - If True, host keys will be loaded from the file specified in alt_key_file (default: False)
  • alt_key_file - SSH host key file to use (if alt_host_keys=True)
  • ssh_config_file - File name of OpenSSH configuration file
  • timeout - Connection timeout, in seconds (default: 90)
  • session_timeout - Set a timeout for parallel requests, in seconds (default: 60)
  • keepalive - Send SSH keepalive packets at a specific interval, in seconds. Currently defaults to 0, for backwards compatibility (it will not attempt to keep the connection alive using the KEEPALIVE packets).
  • default_enter - Character(s) to send to correspond to enter key (default: \n)
  • response_return - Character(s) to use in normalized return data to represent enter key (default: \n)
  • always_alive - In certain less dynamic environments, maintaining the remote connection permanently open with the network device is not always beneficial. In that case, the user can select to initialize the connection only when needed, by setting this option to False. By default this option is set to True (maintains the connection with the remote network device)
  • multiprocessing - Overrides the multiprocessing option, per proxy minion, as the Netmiko communication channel is mainly SSH (default: False)

Proxy Pillar Example

```yaml
proxy:
  proxytype: netmiko
  device_type: juniper_junos
  host: router1.example.com
  username: example
  password: example
```

21.13. proxy modules
Proxy Minion for Cisco NX OS Switches

The Cisco NX OS Proxy Minion uses the built in SSHConnection module in salt.utils.vt_helper

To configure the proxy minion:

```
proxy:
  proxytype: nxos
  host: 192.168.187.100
  username: admin
  password: admin
  prompt_name: switch
  ssh_args: '-o PubkeyAuthentication=no'
  key_accept: True
```

proxytype (REQUIRED) Use this proxy minion nxos
host (REQUIRED) ip address or hostname to connect to
username (REQUIRED) username to login with
password (REQUIRED) password to use to login with
prompt_name (REQUIRED, this or prompt_regex below, but not both) The name in the prompt on the switch. Recommended to use your device's hostname.
**prompt_regex** (REQUIRED, this or **prompt_name** above, but not both) A regular expression that matches the prompt on the switch and any other possible prompt at which you need the proxy minion to continue sending input. This feature was specifically developed for situations where the switch may ask for confirmation. **prompt_name** above would not match these, and so the session would timeout.

Example:

```
dc01-switch-01#.*|\(y\/n\)\?.*
```

This should match

```
dc01-switch-01#
```

or

```
Flash complete. Reboot this switch (y/n)? [n]
```

If neither **prompt_name** nor **prompt_regex** is specified the prompt will be defaulted to

```
.*
```

which should match any number of characters followed by a # at the end of the line. This may be far too liberal for most installations.

**ssh_args** Any extra args to use to connect to the switch.

**key_accept** Whether or not to accept a the host key of the switch on initial login. Defaults to False.

The functions from the proxy minion can be run from the salt commandline using the `salt.modules.nxos` execution module.

**salt.proxy.nxos.add_config**(lines)

Add one or more config lines to the switch running config

```
salt '*' nxos.cmd add_config 'snmp-server community TESTSTRINGHERE group network-operator'
```

**Note:** For more than one config added per command, lines should be a list.

**salt.proxy.nxos.check_password**(username, password, encrypted=False)

Check if passed password is the one assigned to user

**salt.proxy.nxos.check_role**(username, role)

Check if user is assigned a specific role on switch

```
salt '*' nxos.cmd check_role username=admin role=network-admin
```

**salt.proxy.nxos.delete_config**(lines)

Delete one or more config lines to the switch running config

```
salt '*' nxos.cmd delete_config 'snmp-server community TESTSTRINGHERE group network-operator'
```

**Note:** For more than one config deleted per command, lines should be a list.
salt.proxy.nxos.find(pattern)
Find all instances where the pattern is in the running command

```
salt '*' nxos.cmd find '^snmp-server.*$'
```

**Note:** This uses the `re.MULTILINE` regex format for python, and runs the regex against the whole show_run output.

salt.proxy.nxos.get_roles(username)
Get roles that the username is assigned from switch

salt.proxy.nxos.get_user(username)
Get username line from switch

salt.proxy.nxos.grains()
Get grains for proxy minion

salt.proxy.nxos.grains_refresh()
Refresh the grains from the proxy device.

salt.proxy.nxos.init(opts=None)
Required. Can be used to initialize the server connection.

salt.proxy.nxos.initialized()

salt.proxy.nxos.ping()
Ping the device on the other end of the connection

salt.proxy.nxos.remove_user(username)
Remove user from switch

```
salt '*' nxos.cmd remove_user username=daniel
```

salt.proxy.nxos.replace(old_value, new_value, full_match=False)
Replace string or full line matches in switch's running config

If `full_match` is set to True, then the whole line will need to be matched as part of the old value.

```
salt '*' nxos.cmd replace 'TESTSTRINGHERE' 'NEWTESTSTRINGHERE'
```

salt.proxy.nxos.sendline(command)
Run command through switch's cli

salt.proxy.nxos.set_password(username, password, encrypted=False, role=None, crypt_salt=None, algorithm='sha256')
Set users password on switch

```
salt '*' nxos.cmd set_password admin TestPass
salt '*' nxos.cmd set_password admin \
    password='5$52FwO2vK$s7.Hr3YltMNHuhywQQ3nfO0d.gAPHgs3S0BYYdGT3E.A' \
    encrypted=True
```

salt.proxy.nxos.set_role(username, role)
Assign role to username

```
salt '*' nxos.cmd set_role username=daniel role=vdc-admin
```

salt.proxy.nxos.show_run()
Shortcut to run `show run` on switch
salt 'nxos.cmd show_run

salt.proxy.nxos.show_ver()
    Shortcut to run show ver on switch

salt.proxy.nxos.shutdown(opts)
    Disconnect

salt.proxy.nxos.system_info()
    Return system information for grains of the NX OS proxy minion

salt.proxy.nxos.unset_role(username, role)
    Remove role from username

salt 'nxos.cmd unset_role username=daniel role=vdc-admin

21.13.13  salt.proxy.nxos_api module

Proxy Minion to manage Cisco Nexus Switches (NX-OS) over the NX-API
New in version 2019.2.0.
Proxy module for managing Cisco Nexus switches via the NX-API.
    codeauthor  Mircea Ulinic <ping@mirceaulinic.net>
    maturity   new
    platform   any

Usage

Note:  To be able to use this module you need to enable to NX-API on your switch, by executing feature nxapi in configuration mode.
Configuration example:

switch# conf t
switch(config)# feature nxapi

To check that NX-API is properly enabled, execute show nxapi.
Output example:

switch# show nxapi
nxapi enabled
HTTPS Listen on port 443

Note:  NX-API requires modern NXOS distributions, typically at least 7.0 depending on the hardware. Due to reliability reasons it is recommended to run the most recent version.
Pillar

The **nxos_api** proxy configuration requires the following parameters in order to connect to the network switch:

**transport:** **https** Specifies the type of connection transport to use. Valid values for the connection are **http**, and **https**.

**host:** **localhost** The IP address or DNS host name of the connection device.

**username:** **admin** The username to pass to the device to authenticate the NX-API connection.

**password** The password to pass to the device to authenticate the NX-API connection.

**port** The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for **http**, or 443 for **https**).

**timeout:** **60** Time in seconds to wait for the device to respond. Default: 60 seconds.

**verify:** **True** Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to **True**.

When there is no certificate configuration on the device and this option is set as **True** (default), the commands will fail with the following error: **SSLError: [SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed (_ssl.c:581)**. In this case, you either need to configure a proper certificate on the device (**recommended**), or bypass the checks setting this argument as **False** with all the security risks considered.

All the arguments may be optional, depending on your setup.

**Proxy Pillar Example**

```yaml
proxy:
  proxytype: nxos_api
  host: switch1.example.com
  username: example
  password: example

salt.proxy.nxos_api.get_conn_args()
  Returns the connection arguments of the Proxy Minion.

salt.proxy.nxos_api.init(opts)
  Open the connection to the Nexus switch over the NX-API.

  As the communication is HTTP based, there is no connection to maintain, however, in order to test the connectivity and make sure we are able to bring up this Minion, we are executing a very simple command (**show clock**) which doesn’t come with much overhead and it’s sufficient to confirm we are indeed able to connect to the NX-API endpoint as configured.

salt.proxy.nxos_api.initialized()
  Connection finished initializing?
```

---

salt.proxy.nxos_api.ping()
Connection open successfully?
salt.proxy.nxos_api.rpc(commands, method='cli', **kwargs)
Executes an RPC request over the NX-API.
salt.proxy.nxos_api.shutdown(opts)
Closes connection with the device.

21.13.14  salt.proxy.panos module

Proxy Minion interface module for managing Palo Alto firewall devices

New in version 2018.3.0.

codeauthor  Spencer Ervin <spencer_ervin@hotmail.com>
maturity  new
depends  none
platform  unix

This proxy minion enables Palo Alto firewalls (hereafter referred to as simply ‘panos’) to be treated individually like a Salt Minion.

The panos proxy leverages the XML API functionality on the Palo Alto firewall. The Salt proxy must have access to the Palo Alto firewall on HTTPS (tcp/443).

More in-depth conceptual reading on Proxy Minions can be found in the Proxy Minion section of Salt’s documentation.

Configuration

To use this integration proxy module, please configure the following:

Pillar

Proxy minions get their configuration from Salt’s Pillar. Every proxy must have a stanza in Pillar and a reference in the Pillar top-file that matches the ID. There are four connection options available for the panos proxy module.

- Direct Device (Password)
- Direct Device (API Key)
- Panorama Pass-Through (Password)
- Panorama Pass-Through (API Key)

Direct Device (Password)

The direct device configuration configures the proxy to connect directly to the device with username and password.
proxy:
  proxytype: panos
  host: <ip or dns name of panos host>
  username: <panos username>
  password: <panos password>

proxytype

The proxytype key and value pair is critical, as it tells Salt which interface to load from the proxy directory in Salt’s install hierarchy, or from /srv/salt/_proxy on the Salt Master (if you have created your own proxy module, for example). To use this panos Proxy Module, set this to panos.

host

The location, or ip/dns, of the panos host. Required.

username

The username used to login to the panos host. Required.

password

The password used to login to the panos host. Required.

Direct Device (API Key)

Palo Alto devices allow for access to the XML API with a generated 'API key' instead of username and password.

proxy:
  proxytype: panos
  host: <ip or dns name of panos host>
  apikey: <panos generated api key>

proxytype

The proxytype key and value pair is critical, as it tells Salt which interface to load from the proxy directory in Salt’s install hierarchy, or from /srv/salt/_proxy on the Salt Master (if you have created your own proxy module, for example). To use this panos Proxy Module, set this to panos.

host

The location, or ip/dns, of the panos host. Required.

apikey

The generated XML API key for the panos host. Required.
Panorama Pass-Through (Password)

The Panorama pass-through method sends all connections through the Panorama management system. It passes the connections to the appropriate device using the serial number of the Palo Alto firewall.

This option will reduce the number of connections that must be present for the proxy server. It will only require a connection to the Panorama server.

The username and password will be for authentication to the Panorama server, not the panos device.

```
proxy:
    proxytype: panos
    serial: <serial number of panos host>
    host: <ip or dns name of the panorama server>
    username: <panorama server username>
    password: <panorama server password>
```

proxytype

The `proxytype` key and value pair is critical, as it tells Salt which interface to load from the `proxy` directory in Salt’s install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this panos Proxy Module, set this to `panos`.

serial

The serial number of the panos host. Required.

host

The location, or ip/dns, of the Panorama server. Required.

username

The username used to login to the Panorama server. Required.

password

The password used to login to the Panorama server. Required.

Panorama Pass-Through (API Key)

The Panorama server can also utilize a generated 'API key' for authentication.

```
proxy:
    proxytype: panos
    serial: <serial number of panos host>
    host: <ip or dns name of the panorama server>
    apikey: <panos generated api key>
```
proxytype

The proxytype key and value pair is critical, as it tells Salt which interface to load from the proxy directory in Salt’s install hierarchy, or from /srv/salt/_proxy on the Salt Master (if you have created your own proxy module, for example). To use this panos Proxy Module, set this to panos.

serial

The serial number of the panos host. Required.

host

The location, or ip/dns, of the Panorama server. Required.

apikey

The generated XML API key for the Panorama server. Required.

salt.proxy.panos.call(payload=None)

This function captures the query string and sends it to the Palo Alto device.

salt.proxy.panos.grains()

Get the grains from the proxied device

salt.proxy.panos.grains_refresh()

Refresh the grains from the proxied device

salt.proxy.panos.init(opts)

This function gets called when the proxy starts up. For panos devices, a determination is made on the connection type and the appropriate connection details that must be cached.

salt.proxy.panos.initialized()

Since grains are loaded in many different places and some of those places occur before the proxy can be initialized, return whether our init() function has been called

salt.proxy.panos.is_required_version(required_version='0.0.0')

Because different versions of Palo Alto support different command sets, this function will return true if the current version of Palo Alto supports the required command.

salt.proxy.panos.ping()

Returns true if the device is reachable, else false.

salt.proxy.panos.shutdown()

Shutdown the connection to the proxy device. For this proxy, shutdown is a no-op.

21.13.15 salt.proxy.philips_hue module

Philips HUE lamps module for proxy.

New in version 2015.8.3.

First create a new user on the Hue bridge by following the Meet hue instructions.

To configure the proxy minion:
proxy:
  proxtype: philips_hue
  host: [hostname or ip]
  user: [username]

class salt.proxy.philips_hue.Const
  Constants for the lamp operations.
  COLOR_BLUE = {'hue': 46920, 'sat': 254}
  COLOR_DAYLIGHT = {'xy': [0.3806, 0.3576]}
  COLOR_GREEN = {'hue': 25500, 'sat': 254}
  COLOR_ORANGE = {'hue': 12000, 'sat': 254}
  COLOR_PINK = {'xy': [0.3688, 0.2095]}
  COLOR_PURPLE = {'xy': [0.3787, 0.1724]}
  COLOR_RED = {'hue': 0, 'sat': 254}
  COLOR_WHITE = {'xy': [0.3227, 0.329]}
  COLOR_YELLOW = {'xy': [0.4432, 0.5154]}
  LAMP_OFF = {'on': False, 'transitiontime': 0}
  LAMP_ON = {'on': True, 'transitiontime': 0}

salt.proxy.philips_hue.call_alert(*args, **kwargs)
  Lamp alert
  Options:
  • id: Specifies a device ID. Can be a comma-separated values. All, if omitted.
  • on: Turns on or off an alert. Default is True.

  CLI Example:

  salt '*' hue.alert
  salt '*' hue.alert id=1
  salt '*' hue.alert id=1,2,3 on=false

salt.proxy.philips_hue.call_blink(*args, **kwargs)
  Blink a lamp. If lamp is ON, then blink ON-OFF-ON, otherwise OFF-ON-OFF.
  Options:
  • id: Specifies a device ID. Can be a comma-separated values. All, if omitted.
  • pause: Time in seconds. Can be less than 1, i.e. 0.7, 0.5 sec.

  CLI Example:

  salt '*' hue.blink id=1
  salt '*' hue.blink id=1,2,3

salt.proxy.philips_hue.call_brightness(*args, **kwargs)
  Set an effect to the lamp.
  Arguments:
  • value: 0~255 brightness of the lamp.
  Options:
  • id: Specifies a device ID. Can be a comma-separated values. All, if omitted.
  • transition: Transition 0~200. Default 0.

  CLI Example:
salt.proxy.philips_hue.call_color(*args, **kwargs)
Set a color to the lamp.

Options:
- **id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.
- **color**: Fixed color. Values are: red, green, blue, orange, pink, white, yellow, daylight, purple. Default white.
- **transition**: Transition 0~200.

Advanced:
- **gamut**: XY coordinates. Use gamut according to the Philips HUE devices documentation. More: http://www.developers.meethue.com/documentation/hue-xy-values

CLI Example:

```
salt '*' hue.color
salt '*' hue.color id=1
salt '*' hue.color id=1,2,3 color=red transition=30
salt '*' hue.color id=1 gamut=0.3,0.5
```

salt.proxy.philips_hue.call_effect(*args, **kwargs)
Set an effect to the lamp.

Options:
- **id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.
- **type**: Type of the effect. Possible values are "none" or "colorloop". Default "none".

CLI Example:

```
salt '*' hue.effect
salt '*' hue.effect id=1
salt '*' hue.effect id=1,2,3 type=colorloop
```

salt.proxy.philips_hue.call_lights(*args, **kwargs)
Get info about all available lamps.

Options:
- **id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.

CLI Example:

```
salt '*' hue.lights
salt '*' hue.lights id=1
salt '*' hue.lights id=1,2,3
```

salt.proxy.philips_hue.call_ping(*args, **kwargs)
Ping the lamps by issuing a short inversion blink to all available devices.

CLI Example:

```
salt '*' hue.ping
```

salt.proxy.philips_hue.call_rename(*args, **kwargs)
Rename a device.

Options:
- **id**: Specifies a device ID. Only one device at a time.
- **title**: Title of the device.
CLI Example:
```
salt '*' hue.rename id=1 title='WC for cats'
```

```python
salt.proxy.philips_hue.call_status(*args, **kwargs)
```
Return the status of the lamps.

Options:
- id: Specifies a device ID. Can be a comma-separated values. All, if omitted.

CLI Example:
```
salt '*' hue.status
salt '*' hue.status id=1
salt '*' hue.status id=1,2,3
```

```python
salt.proxy.philips_hue.call_switch(*args, **kwargs)
```
Switch lamp ON/OFF.

If no particular state is passed, then lamp will be switched to the opposite state.

Options:
- id: Specifies a device ID. Can be a comma-separated values. All, if omitted.
- on: True or False. Inverted current, if omitted

CLI Example:
```
salt '*' hue.switch
salt '*' hue.switch id=1
salt '*' hue.switch id=1,2,3 on=True
```

```python
salt.proxy.philips_hue.call_temperature(*args, **kwargs)
```

Arguments:
- value: 150~500.

Options:
- id: Specifies a device ID. Can be a comma-separated values. All, if omitted.

CLI Example:
```
salt '*' hue.temperature value=150
salt '*' hue.temperature value=150 id=1
salt '*' hue.temperature value=150 id=1,2,3
```

```python
salt.proxy.philips_hue.init(cnf)
```
Initialize the module.

```python
salt.proxy.philips_hue.ping(*args, **kw)
```
Ping the lamps.

```python
salt.proxy.philips_hue.shutdown(opts, *args, **kw)
```
Shuts down the service.

### 21.13.16 salt.proxy.rest_sample

This is a simple proxy-minion designed to connect to and communicate with the bottle-based web service contained in [https://github.com/saltstack/salt-contrib/tree/master/proxyminion_rest_example](https://github.com/saltstack/salt-contrib/tree/master/proxyminion_rest_example)

```python
salt.proxy.rest_sample.alive(opts)
salt.proxy.rest_sample.fix_outage()
```
salt.proxy.rest_sample.fns()
salt.proxy.rest_sample.grains()
    Get the grains from the proxied device
salt.proxy.rest_sample.grains_refresh()
    Refresh the grains from the proxied device
salt.proxy.rest_sample.id(opts)
    Return a unique ID for this proxy minion. This ID MUST NOT CHANGE. If it changes while the proxy is running the salt-master will get really confused and may stop talking to this minion
salt.proxy.rest_sample.init(opts)
salt.proxy.rest_sample.initialized()
    Since grains are loaded in many different places and some of those places occur before the proxy can be initialized, return whether our init() function has been called
salt.proxy.rest_sample.package_install(name, **kwargs)
    Install a "package" on the REST server
salt.proxy.rest_sample.package_list()
    List "packages" installed on the REST server
salt.proxy.rest_sample.package_remove(name)
    Remove a "package" on the REST server
salt.proxy.rest_sample.package_status(name)
    Check the installation status of a package on the REST server
salt.proxy.rest_sample.ping()
    Is the REST server up?
salt.proxy.rest_sample.service_list()
    List "services" on the REST server
salt.proxy.rest_sample.service_restart(name)
    Restart a "service" on the REST server
salt.proxy.rest_sample.service_start(name)
    Start a "service" on the REST server
salt.proxy.rest_sample.service_status(name)
    Check if a service is running on the REST server
salt.proxy.rest_sample.service_stop(name)
    Stop a "service" on the REST server
salt.proxy.rest_sample.shutdown(opts)
    For this proxy shutdown is a no-op
salt.proxy.rest_sample.test_from_state()
    Test function so we have something to call from a state :return:
salt.proxy.rest_sample.uptodate(name)
    Call the REST endpoint to see if the packages on the "server" are up to date.

21.13.17 salt.proxy.ssh_sample

This is a simple proxy-minion designed to connect to and communicate with a server that exposes functionality via SSH. This can be used as an option when the device does not provide an api over HTTP and doesn’t have the python stack to run a minion.
salt.proxy.ssh_sample.fns()
salt.proxy.ssh_sample.grains()
  Get the grains from the proxied device
salt.proxy.ssh_sample.grains_refresh()
  Refresh the grains from the proxied device
salt.proxy.ssh_sample.init(opts)
  Required. Can be used to initialize the server connection.
salt.proxy.ssh_sample.initialized()
  Since grains are loaded in many different places and some of those places occur before the proxy can be
  initialized, return whether our init() function has been called
salt.proxy.ssh_sample.package_install(name, **kwargs)
  Install a "package" on the ssh server
salt.proxy.ssh_sample.package_list()
  List "packages" by executing a command via ssh This function is called in response to the salt command
  ..code-block::bash
     salt target_minion pkg.list_pkgs
salt.proxy.ssh_sample.package_remove(name)
  Remove a "package" on the ssh server
salt.proxy.ssh_sample.parse(out)
  Extract json from out.
  Parameter out: Type string. The data returned by the ssh command.
salt.proxy.ssh_sample.ping()
  Required. Ping the device on the other end of the connection
salt.proxy.ssh_sample.service_list()
  Start a "service" on the ssh server
  New in version 2015.8.2.
salt.proxy.ssh_sample.service_restart(name)
  Restart a "service" on the ssh server
  New in version 2015.8.2.
salt.proxy.ssh_sample.service_start(name)
  Start a "service" on the ssh server
  New in version 2015.8.2.
salt.proxy.ssh_sample.service_stop(name)
  Stop a "service" on the ssh server
  New in version 2015.8.2.
salt.proxy.ssh_sample.shutdown(opts)
  Disconnect

21.14  queue modules

pgjsonb_queue  New in version 2016.3.0.

Continued on next page
New in version 2016.3.0.

This is a queue with postgres as the backend. It uses the jsonb store to store information for queues.

```sql
CREATE DATABASE salt WITH ENCODING 'utf-8';
```

---

-- Table structure for table `salt`
---

```sql
DROP TABLE IF EXISTS salt;
CREATE OR REPLACE TABLE salt(
    id SERIAL PRIMARY KEY,
    data jsonb NOT NULL
);
```

Use the following Pg database schema:

```sql
salt-run queue.insert test '{"name": "redis", "host": "172.16.0.8", "port": 6379}" backend=pgjsonb
salt-run queue.process_queue test all backend=pgjsonb
```

**salt.queues.pgjsonb_queue module**

New in version 2016.3.0.

This is a queue with postgres as the backend. It uses the jsonb store to store information for queues.

```sql
CREATE DATABASE salt WITH ENCODING 'utf-8';
```

---

-- Table structure for table `salt`
---

```sql
DROP TABLE IF EXISTS salt;
CREATE OR REPLACE TABLE salt(
    id SERIAL PRIMARY KEY,
    data jsonb NOT NULL
);
```

Use the following Pg database schema:

```sql
salt-run queue.insert test '{"name": "redis", "host": "172.16.0.8", "port": 6379}" backend=pgjsonb
salt-run queue.process_queue test all backend=pgjsonb
```

**salt.queues.pgjsonb_queue module**

New in version 2016.3.0.

This is a queue with postgres as the backend. It uses the jsonb store to store information for queues.

```sql
CREATE DATABASE salt WITH ENCODING 'utf-8';
```

---

-- Table structure for table `salt`
---

```sql
DROP TABLE IF EXISTS salt;
CREATE OR REPLACE TABLE salt(
    id SERIAL PRIMARY KEY,
    data jsonb NOT NULL
);
```

Use the following Pg database schema:

```sql
salt-run queue.insert test '{"name": "redis", "host": "172.16.0.8", "port": 6379}" backend=pgjsonb
salt-run queue.process_queue test all backend=pgjsonb
```

**salt.queues.pgjsonb_queue module**

New in version 2016.3.0.

This is a queue with postgres as the backend. It uses the jsonb store to store information for queues.

```sql
CREATE DATABASE salt WITH ENCODING 'utf-8';
```

---

-- Table structure for table `salt`
---

```sql
DROP TABLE IF EXISTS salt;
CREATE OR REPLACE TABLE salt(
    id SERIAL PRIMARY KEY,
    data jsonb NOT NULL
);
```

Use the following Pg database schema:

```sql
salt-run queue.insert test '{"name": "redis", "host": "172.16.0.8", "port": 6379}" backend=pgjsonb
salt-run queue.process_queue test all backend=pgjsonb
```

**salt.queues.pgjsonb_queue module**

New in version 2016.3.0.

This is a queue with postgres as the backend. It uses the jsonb store to store information for queues.

```sql
CREATE DATABASE salt WITH ENCODING 'utf-8';
```

---

-- Table structure for table `salt`
---

```sql
DROP TABLE IF EXISTS salt;
CREATE OR REPLACE TABLE salt(
    id SERIAL PRIMARY KEY,
    data jsonb NOT NULL
);
```

Use the following Pg database schema:

```sql
salt-run queue.insert test '{"name": "redis", "host": "172.16.0.8", "port": 6379}" backend=pgjsonb
salt-run queue.process_queue test all backend=pgjsonb
```

**salt.queues.pgjsonb_queue module**

New in version 2016.3.0.

This is a queue with postgres as the backend. It uses the jsonb store to store information for queues.

```sql
CREATE DATABASE salt WITH ENCODING 'utf-8';
```

---

-- Table structure for table `salt`
---

```sql
DROP TABLE IF EXISTS salt;
CREATE OR REPLACE TABLE salt(
    id SERIAL PRIMARY KEY,
    data jsonb NOT NULL
);
```

Use the following Pg database schema:

```sql
salt-run queue.insert test '{"name": "redis", "host": "172.16.0.8", "port": 6379}" backend=pgjsonb
salt-run queue.process_queue test all backend=pgjsonb
```
21.14.2 salt_queues.sqlite_queue module

New in version 2014.7.0.

This is the default local master event queue built on sqlite. By default, an sqlite3 database file is created in the `sqlite_queue_dir` which is found at:

```
/var/cache/salt/master/queues
```

It’s possible to store the sqlite3 database files by setting `sqlite_queue_dir` to another location:

```
sqlite_queue_dir: /home/myuser/salt/master/queues
```

- `salt_queues.sqlite_queue.delete(queue, items)`: Delete an item or items from a queue
- `salt_queues.sqlite_queue.insert(queue, items)`: Add an item or items to a queue
- `salt_queues.sqlite_queue.list_items(queue)`: List contents of a queue
- `salt_queues.sqlite_queue.list_length(queue)`: Provide the number of items in a queue
- `salt_queues.sqlite_queue.list_queues()`: Return a list of Salt Queues on the Salt Master
- `salt_queues.sqlite_queue.pop(queue, quantity=1, is_runner=False)`: Pop one or more or all items from the queue return them.

21.15 roster modules

<table>
<thead>
<tr>
<th>roster module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ansible</td>
<td>Read in an Ansible inventory file or script</td>
</tr>
<tr>
<td>cache</td>
<td>The cache roster provides a flexible interface to the Salt Masters' minion cache to access regular minions over salt-ssh.</td>
</tr>
<tr>
<td>cloud</td>
<td>Use the cloud cache on the master to derive IPv4 addresses based on minion ID.</td>
</tr>
<tr>
<td>clustershell</td>
<td>This roster resolves hostname in a pdsh/clustershell style.</td>
</tr>
<tr>
<td>flat</td>
<td>Read in the roster from a flat file using the renderer system</td>
</tr>
<tr>
<td>range</td>
<td>This roster resolves targets from a range server.</td>
</tr>
<tr>
<td>scan</td>
<td>Scan a netmask or ipaddr for open ssh ports</td>
</tr>
<tr>
<td>sshconfig</td>
<td>Parses roster entries out of Host directives from SSH config</td>
</tr>
<tr>
<td>terraform</td>
<td>Dynamic roster from terraform current state</td>
</tr>
</tbody>
</table>

21.15.1 salt.roster.ansible

Read in an Ansible inventory file or script

Flat inventory files should be in the regular ansible inventory format.
then salt-ssh can be used to hit any of them

```
[~]# salt-ssh -N all test.ping
salt.gtmanfred.com:
  True
home:
  True
[~]# salt-ssh -N desktop test.ping
home:
  True
[~]# salt-ssh -N computers test.ping
salt.gtmanfred.com:
  True
home:
  True
[~]# salt-ssh salt.gtmanfred.com test.ping
salt.gtmanfred.com:
  True
```

There is also the option of specifying a dynamic inventory, and generating it on the fly

```
#!/bin/bash
echo '{
  "servers": [
    "salt.gtmanfred.com"
  ],
  "desktop": [
    "home"
  ],
  "computers": {
    "hosts": [],
    "children": [
      "desktop",
      "servers"
    ]
  },
  "_meta": {
    "hostvars": {
      "salt.gtmanfred.com": {
        "ansible_ssh_user": "gtmanfred",
        "ansible_ssh_host": "127.0.0.1",
        "ansible_sudo_pass": "password"
      }
    }
  }
}'
```

(continues on next page)
This is the format that an inventory script needs to output to work with ansible, and thus here.

```
[-]# salt-ssh --roster-file /etc/salt/hosts salt.gtmanfred.com test.ping
salt.gtmanfred.com: True
```

Any of the [groups] or direct hostnames will return. The ‘all’ is special, and returns everything.

```
salt.roster.ansible.targets(tgt, tgt_type='glob', **kwargs)
    Return the targets from the ansible inventory_file Default: /etc/salt/roster
```

## 21.15.2 salt.roster.cache

The `cache` roster provides a flexible interface to the Salt Masters’ minion cache to access regular minions over `salt-ssh`.

New in version 2017.7.0: grains, pillar, mine data matching SDB URLs IPv6 support roster_order per config key default order changed to industry-wide best practices CIDR range selection

### Targeting

This roster supports all matching and targeting of the Salt Master. The matching will be done using only the Salt Master’s cache.

### The Roster Order

The roster’s composition can be configured using `roster_order`. In the `roster_order` you can define any roster key and fill it with a parameter overriding the one in `roster_defaults`:

- `roster_order`:
  - `host`: id  # use the minion id as hostname

You can define lists of parameters as well, the first result from the list will become the value.

### Selecting a host

```
# default
roster_order:
    host:
```

(continues on next page)
This is the default `roster_order`. It prefers IPv6 over IPv4 addresses and private addresses over public ones. The relevant data will be fetched from the cache in-order, and the first match will fill the `host` key.

Other address selection parameters are also possible:

```
roster_order:
  host:
    - global|public|private|local  # Both IPv6 and IPv4 addresses in that range
    - 2000::/3  # CIDR networks, both IPv4 and IPv6 are supported
```

Using cached data

Several cached libraries can be selected using the `library:` ```` prefix, followed by the library key. This can be referenced using the same ```` syntax as e.g. `pillar.get`. Lists of references are also supported during the lookup, as are Salt SDB URLs.

This should be especially useful for the other roster keys:

```
roster_order:
  host:
    - grain: fqdn_ip4  # Lookup this grain
    - mine: network.ip_addrs  # Mine data lookup works the same
  password: sdb://vault/ssh_pass  # Salt SDB URLs are also supported
  user:
    - pillar: ssh:auth:user  # Lookup this pillar key
    - sdb://osenv/USER  # Lookup this env var through sdb
  priv:
    - pillar:  # Lists are also supported
      - salt:ssh:private_key
      - ssh:auth:private_key
```

`salt.roster.cache.targets(tgt, tgt_type='glob', **kwargs)`

Return the targets from the Salt Masters’ minion cache. All targets and matchers are supported.

The resulting roster can be configured using `roster_order` and `roster_default`.

### 21.15.3 salt.roster.cloud

Use the cloud cache on the master to derive IPv4 addresses based on minion ID.

This roster requires that the minion in question was created using at least the 2015.5.0 version of Salt Cloud. Starting with the 2015.5.0 release, Salt Cloud maintains an index of minions that it creates and deletes. This index tracks the provider and profile configuration used to provision the minion, including authentication information. So long as this configuration remains current, it can be used by Salt SSH to log into any minion in the index.
To connect as a user other than root, modify the cloud configuration file usually located at /etc/salt/cloud. For example, add the following:

```yaml
ssh_username: my_user
sudo: True
```

```
salt.roster.cloud.extract_ipv4(roster_order, ipv4)
Extract the preferred IP address from the ipv4 grain
```

```
salt.roster.cloud.targets(tgt, tgt_type='glob', **kwargs)
Return the targets from the flat yaml file, checks opts for location but defaults to /etc/salt/roster
```

### 21.15.4 salt.roster.clustershell

This roster resolves hostname in a pdsh/clustershell style.

```python
depends clustershell, https://github.com/cea-hpc/clustershell
```

When you want to use host globs for target matching, use `--roster clustershell`. For example:

```
salt-ssh --roster clustershell 'server_[1-10,21-30],test_server[5,7,9]' test.ping
```

```
salt.roster.clustershell.targets(tgt, tgt_type='glob', **kwargs)
Return the targets
```

### 21.15.5 salt.roster.flat

Read in the roster from a flat file using the renderer system

```
salt.roster.flat.targets(tgt, tgt_type='glob', **kwargs)
Return the targets from the flat yaml file, checks opts for location but defaults to /etc/salt/roster
```

### 21.15.6 salt.roster.range module

This roster resolves targets from a range server.

```python
depends seco.range, https://github.com/ytoolshed/range
```

When you want to use a range query for target matching, use `--roster range`. For example:

```
salt-ssh --roster range '%%%example.range.cluster' test.ping
```

```
salt.roster.range.target_glob(tgt, hosts)
salt.roster.range.target_range(tgt, hosts)
salt.roster.range.targets(tgt, tgt_type='range', **kwargs)
Return the targets from a range query
```

### 21.15.7 salt.roster.scan

Scan a netmask or ipaddr for open ssh ports

```python
class salt.roster.scan.RosterMatcher(tgt, tgt_type)
Matcher for the roster data structure
```

---

**21.15. roster modules**
targets()
Return ip addr based on netmask, sitting in the "glob" spot because it is the default

salt.roster.scan.targets(tgt, tgt_type='glob', **kwargs)
Return the targets from the flat yaml file, checks opts for location but defaults to /etc/salt/roster

21.15.8 salt.roster.sshconfig

Parses roster entries out of Host directives from SSH config

salt-ssh --roster sshconfig '*' -r "echo hi"

class salt.roster.sshconfig.RosterMatcher(raw, tgt, tgt_type)
Matcher for the roster data structure

get_data(minion)
Return the configured ip

ret_glob_minions()
Return minions that match via glob

targets()
Execute the correct tgt_type routine and return

salt.roster.sshconfig.parse_ssh_config(lines)
Parses lines from the SSH config to create roster targets.

Parameters

- **lines** – Individual lines from the ssh config file

Returns

Dictionary of targets in similar style to the flat roster

salt.roster.sshconfig.targets(tgt, tgt_type='glob', **kwargs)
Return the targets from the flat yaml file, checks opts for location but defaults to /etc/salt/roster

21.15.9 salt.roster.terraform

Dynamic roster from terraform current state

This roster module allows you dynamically generate the roster from the terraform resources defined with the Terraform Salt provider.

It exposes all salt_host resources with the same attributes to the salt-ssh roster, making it completely independent of the type of terraform resource, and providing the integration using terraform constructs with interpolation.

Basic Example

Given a simple salt-ssh tree with a Saltfile:

```yaml
salt-ssh:
  config_dir: etc/salt
  max_procs: 30
  wipe_ssh: True
```

and etc/salt/master:
In the same folder as your Saltfile, create terraform file with resources like cloud instances, virtual machines, etc. For every single one of those that you want to manage with Salt, create a `salt_host` resource:

```terraform
resource "salt_host" "dbminion" {
  salt_id = "dbserver"
  host = "${libvirt_domain.vm-db.network_interface.0.addresses.0}"
  user = "root"
  passwd = "linux"
}
```

You can use the count attribute to create multiple roster entries with a single definition. Please refer to the Terraform Salt provider for more detailed examples.

```
salt.roster.terraform.targets(tgt, tgt_type='glob', **kwargs)
    Returns the roster from the terraform state file, checks opts for location, but defaults to terraform.tfstate
```

## 21.16 runner modules

<table>
<thead>
<tr>
<th>Runner Module</th>
<th>Description</th>

**maintainer** SaltStack

### 21.16.1 salt.runners.asam

**Novell ASAM Runner**

New in version Beryllium.

Runner to interact with Novell ASAM Fan-Out Driver

**codeauthor** Nitin Madhok <nmadhok@clemson.edu>

To use this runner, set up the Novell Fan-Out Driver URL, username and password in the master configuration at /etc/salt/master or /etc/salt/master.d/asam.conf:
asam:
  prov1.domain.com
  username: "testuser"
  password: "verybadpass"
  prov2.domain.com
  username: "testuser"
  password: "verybadpass"

Note: Optionally, protocol and port can be specified if the Fan-Out Driver server is not using the defaults. Default is protocol: https and port: 3451.

salt.runners.asam.add_platform(name, platform_set, server_url)
To add an ASAM platform using the specified ASAM platform set on the Novell Fan-Out Driver

CLI Example:
salt-run asam.add_platform my-test-vm test-platform-set prov1.domain.com

salt.runners.asam.list_platform_sets(server_url)
To list all ASAM platform sets present on the Novell Fan-Out Driver

CLI Example:
salt-run asam.list_platform_sets prov1.domain.com

salt.runners.asam.list_platforms(server_url)
To list all ASAM platforms present on the Novell Fan-Out Driver

CLI Example:
salt-run asam.list_platforms prov1.domain.com

salt.runners.asam.remove_platform(name, server_url)
To remove specified ASAM platform from the Novell Fan-Out Driver

CLI Example:
salt-run asam.remove_platform my-test-vm prov1.domain.com

21.16.2 salt.runners.auth

Authentication runner for creating, deleting, and managing eauth tokens.
New in version 2016.11.0.

salt.runners.auth.del_token(token)
Delete an eauth token by name

CLI Example:
salt-run auth.del_token 6556760736e4077daa601baec2b67c24

salt.runners.auth.mk_token(**load)
Create an eauth token using provided credentials
Non-root users may specify an expiration date – if allowed via the `token_expire_user_override` setting – by passing an additional `token_expire` param. This overrides the `token_expire` setting of the same name in the Master config and is how long a token should live in seconds.

CLI Example:

```
salt-run auth.mk_token username=saltdev password=saltdev eauth=auto
# Create a token valid for three years.
salt-run auth.mk_token username=saltdev password=saltdev eauth=auto \
  token_expire=94670856
# Calculate the number of seconds using expr.
salt-run auth.mk_token username=saltdev password=saltdev eauth=auto \
  token_expire=$((365 * 24 * 60 * 60)) * 3
```

21.16.3 `salt.runners.bgp`

**BGP Finder**

New in version 2017.7.0.

Runner to search BGP neighbors details.

**Configuration**

- **Minion (proxy) config**

  The `bgp.neighbors` function must be appended in the list of `mine_functions`:

  ```
  mine_functions:
  bgp.neighbors: []
  ```

  Which instructs Salt to cache the data returned by the `neighbors` function from the `NAPALM BGP module`.

  How often the mines are refreshed, can be specified using:

  ```
  mine_interval: <X minutes>
  ```

- **Master config**

  By default the following options can be configured on the master. They are not mandatory, but available in case the user has different requirements.

  `tgt`: ★ From what minions will collect the mine data. Default: ★ (collect mine data from all minions)

  `return_fields` What fields to return in the output. It can display all the fields from the `neighbors` function from the `NAPALM BGP module`.

  Some fields cannot be removed:

  - `as_number`: the AS number of the neighbor
  - `device`: the minion ID
neighbor_address: the neighbor remote IP address

By default, the following extra fields are returned (displayed):

- connection_stats: connection stats, as described below
- import_policy: the name of the import policy
- export_policy: the name of the export policy

Special fields:

- vrf: return the name of the VRF.
- connection_stats: returning an output of the form <State> <Active>/<Received>/<Accepted>/<Damped>, e.g. Established 398/399/399/0 similar to the usual output from network devices.
- interface_description: matches the neighbor details with the corresponding interface and returns its description. This will reuse functionality from the net runner, so the user needs to enable the mines as specified in the documentation.
- interface_name: matches the neighbor details with the corresponding interface and returns the name. Similar to interface_description, this will reuse functionality from the net runner, so the user needs to enable the mines as specified in the documentation.

display: True Display on the screen or return structured object? Default: True (return on the CLI).

outputter: table Specify the outputter name when displaying on the CLI. Default: table.

Configuration example:

```python
runners:
  bgp:
    tgt: 'edge*
    tgt_type: 'glob'
    return_fields:
      - up
      - connection_state
      - previous_connection_state
      - suppress_4byte_as
      - holdtime
      - flap_count
    outputter: yaml
```

salt.runners.bgp.neighbors(*asns, **kwargs)

Search for BGP neighbors details in the mines of the bgp.neighbors function.

Arguments:

- asns A list of AS numbers to search for. The runner will return only the neighbors of these AS numbers.
- device Filter by device name (minion ID).
- ip Search BGP neighbor using the IP address. In multi-VRF environments, the same IP address could be used by more than one neighbors, in different routing tables.
- network Search neighbors within a certain IP network.
- title Custom title.
- display: True Display on the screen or return structured object? Default: True (return on the CLI).
- outputter: table Specify the outputter name when displaying on the CLI. Default: table.

In addition, any field from the output of the neighbors function from the NAPALM BGP module can be used as a filter.
### CLI Example:

```
salt-run bgp.neighbors 13335 15169
salt-run bgp.neighbors 13335 ip=172.17.19.1
salt-run bgp.neighbors multipath=True
salt-run bgp.neighbors up=False export_policy=my-export-policy multihop=False
salt-run bgp.neighbors network=192.168.0.0/16
```

Output example:

```
BGP Neighbors for 13335, 15169

<table>
<thead>
<tr>

</table>
```

### 21.16.4 salt.runners.cache

Return cached data from minions

```
salt.runners.cache.clear_all(tgt=None, tgt_type='glob')
```

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Clear the cached pillar, grains, and mine data of the targeted minions
CLI Example:

```
salt-run cache.clear_all
```

```python
salt.runners.cache.clear_git_lock(role, remote=None, **kwargs)
```

New in version 2015.8.2.

Remove the update locks for Salt components (gitfs, git_pillar, winrepo) which use gitfs backend code from `salt.utils.gitfs`.

**Note:** Running `cache.clear_all` will not include this function as it does for pillar, grains, and mine. Additionally, executing this function with a role of gitfs is equivalent to running `salt-run fileserver.clear_lock backend=git`.

- **role** Which type of lock to remove (gitfs, git_pillar, or winrepo)
- **remote** If specified, then any remotes which contain the passed string will have their lock cleared. For example, a remote value of `github` will remove the lock from all `github.com` remotes.
- **type** `[update, checkout, mountpoint]` The types of lock to clear. Can be one or more of `update`, `checkout`, and `mountpoint`, and can be passed either as a comma-separated or Python list.

Changed in version 2018.3.0: `mountpoint` lock type added

CLI Examples:

```
salt-run cache.clear_git_lock gitfs
salt-run cache.clear_git_lock git_pillar
salt-run cache.clear_git_lock git_pillar type=update
salt-run cache.clear_git_lock git_pillar type=update,checkout
salt-run cache.clear_git_lock git_pillar type='["update", "mountpoint"]'
```

```python
salt.runners.cache.clear_grains(tgt=None, tgt_type='glob')
```

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Clear the cached grains data of the targeted minions

CLI Example:

```
salt-run cache.clear_grains
```

```python
salt.runners.cache.clear_mine(tgt=None, tgt_type='glob')
```

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Clear the cached mine data of the targeted minions

CLI Example:

```
salt-run cache.clear_mine
```

```python
salt.runners.cache.clear_mine_func(tgt=None, tgt_type='glob', clear_mine_func_flag=None)
```

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Clear the cached mine function data of the targeted minions

CLI Example:
salt-run cache.clear_mine_func tgt='*' clear_mine_func_flag='network.interfaces'

salt.runners.cache.clear_pillar(tgt=None, tgt_type='glob')
Changed in version 2017.7.0: The expr_form argument has been renamed to tgt_type, earlier releases must use expr_form.
Clear the cached pillar data of the targeted minions

CLI Example:
salt-run cache.clear_pillar

salt.runners.cache.cloud(tgt, provider=None)
Return cloud cache data for target.

Note: Only works with glob matching

tgt  Glob Target to match minion ids
provider  Cloud Provider

CLI Example:
salt-run cache.cloud 'salt*'
salt-run cache.cloud glance.example.org provider=openstack

salt.runners.cache.fetch(bank, key, cachedir=None)
Fetch data from a salt.cache bank.

CLI Example:
salt-run cache.fetch cloud/active/ec2/myec2 myminion cachedir=/var/cache/salt/

salt.runners.cache.flush(bank, key=None, cachedir=None)
Remove the key from the cache bank with all the key content. If no key is specified remove the entire bank with all keys and sub-banks inside.

CLI Examples:
salt-run cache.flush cloud/active/ec2/myec2 cachedir=/var/cache/salt/
salt-run cache.flush cloud/active/ec2/myec2 myminion cachedir=/var/cache/salt/

salt.runners.cache.grains(tgt=None, tgt_type='glob', **kwargs)
Changed in version 2017.7.0: The expr_form argument has been renamed to tgt_type, earlier releases must use expr_form.
Return cached grains of the targeted minions.

tgt  Target to match minion ids.

Changed in version 2017.7.5,2018.3.0: The tgt argument is now required to display cached grains. If not used, the function will not return grains. This optional argument will become mandatory in the Salt Sodium release.
tgt_type  The type of targeting to use for matching, such as glob, list, etc.

CLI Example:
salt-run cache.grains '*'

salt.runners.cache.list_(bank, cachedir=None)
Lists entries stored in the specified bank.
CLI Example:

```
salt-run cache.list cloud/active/ec2/myec2 cachedir=/var/cache/salt/
```

salt.runners.cache.mine(tgt=None, tgt_type='glob', **kwargs)

Changed in version 2017.7.0: The expr_form argument has been renamed to tgt_type, earlier releases must use expr_form.

Return cached mine data of the targeted minions

CLI Example:

```
salt-run cache.mine
```

salt.runners.cache.pillar(tgt=None, tgt_type='glob', **kwargs)

Changed in version 2017.7.0: The expr_form argument has been renamed to tgt_type, earlier releases must use expr_form.

Return cached pillars of the targeted minions

CLI Example:

```
salt-run cache.pillar
```

salt.runners.cache.store(bank, key, data, cachedir=None)

Lists entries stored in the specified bank.

CLI Example:

```
salt-run cache.store mycache mykey 'The time has come the walrus said'
```

### 21.16.5 salt.runners.cloud

The Salt Cloud Runner

This runner wraps the functionality of salt cloud making salt cloud routines available to all internal apis via the runner system

salt.runners.cloud.action(func=None, cloudmap=None, instances=None, provider=None, instance=None, opts=None, **kwargs)

Execute a single action on the given map/provider/instance

CLI Example:

```
salt-run cloud.action start my-salt-vm
```

salt.runners.cloud.create(provider, instances, opts=None, **kwargs)

Create an instance using Salt Cloud

CLI Example:

```
salt-run cloud.create my-ec2-config myinstance image=ami-1624987f size=t1.micro ssh_username=ec2-user on_destroy=True securitygroup=default delvol_
```

salt.runners.cloud.destroy(instances, opts=None)

Destroy the named vm(s)
salt.runners.cloud.full_query(query_type='list_nodes_full')
List all available cloud provider data

salt.runners.cloud.list_images(provider='all')
List cloud provider images for the given providers

salt.runners.cloud.list_locations(provider='all')
List cloud provider sizes for the given providers

salt.runners.cloud.list_sizes(provider='all')
List cloud provider sizes for the given providers

salt.runners.cloud.map_run(path=None, opts=None, **kwargs)
Execute a salt cloud map file

salt.runners.cloud.profile(prof=None, instances=None, opts=None, **kwargs)
Create a cloud vm with the given profile and instances, instances can be a list or comma-delimited string

CLI Example:
salt-run cloud.profile prof=my-ec2 instances=node1,node2,node3

salt.runners.cloud.query(query_type='list_nodes')
List cloud provider data for all providers

salt.runners.cloud.select_query(query_type='list_nodes_select')
List selected nodes

21.16.6 salt.runners.ddns

Dynamic DNS Runner

New in version Beryllium.

Runner to interact with DNS server and create/delete/update DNS records

codeauthor Nitin Madhok <nmadhok@clemson.edu>

salt.runners.ddns.add_host(zone, name, ttl, ip, keyname, keyfile, nameserver, timeout, port=53, keyalgorithm='hmac-md5')
Create both A and PTR (reverse) records for a host.

CLI Example:
salt-run ddns.add_host domain.com my-test-vm 3600 10.20.30.40 my-tsig-key /etc/
...salt/tsig.keyring 10.0.0.1

salt.runners.ddns.create(zone, name, rdtype, data, keyname, keyfile, nameserver, timeout, port=53, keyalgorithm='hmac-md5')
Create a DNS record. The nameserver must be an IP address and the master running this runner must have create privileges on that server.

CLI Example:
salt-run ddns.create domain.com my-test-vm 3600 A 10.20.30.40 my-tsig-key /etc/
...salt/tsig.keyring 10.0.0.1

salt.runners.ddns.delete(zone, name, keyname, keyfile, nameserver, timeout, rdtype=None, data=None, port=53, keyalgorithm='hmac-md5')
Delete a DNS record.
CLI Example:

```
salt-run ddns.delete domain.com my-test-vm my-tsig-key /etc/salt/tsig.keyring 10.0.0.1 5 A
```

```python
salt.runners.ddns.delete_host(zone, name, keyname, keyfile, nameserver, timeout, port=53,
                              keyalgorithm='hmac-md5')
```

Delete both forward (A) and reverse (PTR) records for a host only if the forward (A) record exists.

CLI Example:

```
salt-run ddns.delete_host domain.com my-test-vm my-tsig-key /etc/salt/tsig.keyring 10.0.0.1 5
```

```python
salt.runners.ddns.update(zone, name, ttl, rdtype, data, keyname, keyfile, nameserver, timeout,
                         replace=False, port=53, keyalgorithm='hmac-md5')
```

Replace, or update a DNS record. The nameserver must be an IP address and the master running this runner must have update privileges on that server.

**Note:** If `replace` is set to `True`, all records for this name and type will first be deleted and then recreated. Default is `replace=False`.

CLI Example:

```
salt-run ddns.update domain.com my-test-vm 3600 A 10.20.30.40 my-tsig-key /etc/salt/tsig.keyring 10.0.0.1 5
```

21.16.7 `salt.runners.digicertapi`

Support for Digicert. Heavily based on the Venafi runner by Joseph Hall (jphall@saltstack.com).

Before using this module you need to register an account with Digicert’s CertCentral.

Login to CertCentral, ensure you have a payment method configured and/or there are adequate funds attached to your account. Click the Account item in the left sidebar, and select Account Access. The right hand pane should show "Account Access" and a link to create an API key. Create a new API key and assign it to the user that should be attached to requests coming from Salt.

NOTE CertCentral will not show the API key again after revealing it the first time. Make sure you copy it right away or you will have to revoke it and generate a new one.

Now open `/etc/salt/master` and add the API key as shown below.

```
digicert:
  api_key: 8
    ABCDEFGHIJKLMNOPQRSTUVWXYZABCDEF
```

Restart your Salt Master.

You can also include default values of the following variables to help with creating CSRs:

```
digicert:
  api_key: 8
    ABCDEFGHIJKLMNOPQRSTUVWXYZABCDEF
  shatype: sha256
```

This API currently only supports RSA key types. Support for other key types will be added if interest warrants.
salt.runners.digicertapi.del_cached_domain(domains)
Delete cached domains from the master

CLI Example:
```
salt-run digicert.del_cached_domain domain1.example.com,domain2.example.com
```

salt.runners.digicertapi.gen_csr(minion_id, dns_name, organization_id, ou_name=None, key_len=2048, shatype='sha256', password=None)

CLI Example:
```
salt-run digicert.gen_csr <minion_id> <dns_name>
```

salt.runners.digicertapi.gen_key(minion_id, dns_name=None, password=None, key_len=2048)
Generate and return a private_key. If a dns_name is passed in, the private_key will be cached under that name.

CLI Example:
```
salt-run digicert.gen_key <minion_id> [dns_name] [password]
```

salt.runners.digicertapi.get_certificate(order_id=None, certificate_id=None, minion_id=None, cert_format='pem_all', filename=None)
Retrieve a certificate by order_id or certificate_id and write it to stdout or a filename.

A list of permissible cert Formats is here: https://www.digicert.com/services/v2/documentation/appendix-certificate-formats

CLI Example:
```
salt-run digicert.get_certificate order_id=48929454 cert_format=apache
```

Including a 'filename' will write the certificate to the desired file. Note that some cert formats are zipped files, and some are binary.

If the certificate has not been issued, this function will return the order details inside of which will be a status (one of pending, rejected, processing, issued, revoked, canceled, needs_csr, and needs_approval)

If for some reason you want to pipe the output of this command to a file or other command you will want to leave off the filename argument and make sure to include --no-color so there will be no terminal ANSI escape sequences.

salt.runners.digicertapi.get_org_details(organization_id)
Return the details for an organization

CLI Example:
```
salt-run digicert.get_org_details 34
```

Returns a dictionary with the org details, or with 'error' and 'status' keys.

salt.runners.digicertapi.list_domain_cache()
List domains that have been cached

CLI Example:
```
salt-run digicert.list_domain_cache
```

salt.runners.digicertapi.list_domains(container_id=None)
List domains that CertCentral knows about. You can filter by container_id (also known as "Division") by passing a container_id.
CLI Example:
```
salt-run digicert.list_domains
```

```python
salt.runners.digicertapi.list_orders(status=None)
List certificate orders made to CertCentral.
```

CLI Example:
```
salt-run digicert.list_orders
```

```python
salt.runners.digicertapi.list_organizations(container_id=None, include_validation=True)
List organizations that CertCentral knows about. You can filter by container_id (also known as "Division") by passing a container_id. This function returns validation information by default; pass include_validation=False to turn it off.
```

CLI Example:
```
salt-run digicert.list_organizations
```

```python
salt.runners.digicertapi.list_requests(status=None)
List certificate requests made to CertCentral. You can filter by status: pending, approved, rejected
```

CLI Example:
```
salt-run digicert.list_requests pending
```

```python
salt.runners.digicertapi.order_certificate(minion_id, common_name, organization_id, validity_years, cert_key_passphrase=None, signature_hash=None, key_len=2048, dns_names=None, organization_units=None, server_platform=None, custom_expiration_date=None, comments=None, disable_renewal_notifications=False, product_type_hint=None, renewal_of_order_id=None)
Order a certificate. Requires that an Organization has been created inside Digicert’s CertCentral.
```

See here for API documentation: https://www.digicert.com/services/v2/documentation/order/order-ssl-determinator

CLI Example:
```
salt-run digicert.order_certificate my_minionid my.domain.com 10
  signature_hash=sha256
dns_names=['this.domain.com', 'that.domain.com'
  organization_units='My Domain Org Unit'
  comments='Comment goes here for the approver'
```

This runner can also be used to renew a certificate by passing renewal_of_order_id. Previous order details can be retrieved with digicertapi.list_orders.

```python
salt.runners.digicertapi.show_csrs()
Show certificate requests for this API key
```

CLI Example:
```
salt-run digicert.show_csrs
```
salt.runners.digicertapi.show_organization(\textit{domain})
Show organization information, especially the company id

CLI Example:
```
salt-run digicert.show_company example.com
```

salt.runners.digicertapi.show_rsa(\textit{minion_id, dns_name})
Show a private RSA key

CLI Example:
```
salt-run digicert.show_rsa myminion domain.example.com
```

21.16.8 \texttt{salt.runners.doc}

A runner module to collect and display the inline documentation from the various module types

salt.runners.doc.execution()
Collect all the sys.doc output from each minion and return the aggregate

CLI Example:
```
salt-run doc.execution
```

salt.runners.doc.runner()
Return all inline documentation for runner modules

CLI Example:
```
salt-run doc.runner
```

salt.runners.doc.wheel()
Return all inline documentation for wheel modules

CLI Example:
```
salt-run doc.wheel
```

21.16.9 \texttt{salt.runners.drac}

Manage Dell DRAC from the Master

The login credentials need to be configured in the Salt master configuration file.

salt.runners.drac.poweroff(\textit{hostname, timeout=20, username=None, password=None})
Power server off

CLI Example:
```
salt-run drac.poweroff example.com
```

salt.runners.drac.poweron(\textit{hostname, timeout=20, username=None, password=None})
Power server on

CLI Example:
Connect to the Dell DRAC and have the boot order set to PXE and power cycle the system to PXE boot

CLI Example:

```
salt-run drac.pxe example.com
```

Reboot a server using the Dell DRAC

CLI Example:

```
salt-run drac.reboot example.com
```

Display the version of DRAC

CLI Example:

```
salt-run drac.version example.com
```

## 21.16.10 salt.runners.error

Error generator to enable integration testing of salt runner error handling

```
salt.runners.error.error(name=None, message='')
```

If name is None Then return empty dict

Otherwise raise an exception with __name__ from name, message from message

CLI Example:

```
salt-run error
salt-run error.error name="Exception" message="This is an error."
```

## 21.16.11 salt.runners.event

Module for sending events using the runner system.

New in version 2016.11.0.

```
salt.runners.event.send(tag, data=None)
```

Send an event with the given tag and data.

This is useful for sending events directly to the master from the shell with salt-run. It is also quite useful for sending events in orchestration states where the fire_event requisite isn’t sufficient because it does not support sending custom data with the event.

Note that event tags will not be namespaced like events sent with the fire_event requisite! Whereas events produced from fire_event are prefixed with salt/state_result/<jid>/<minion_id>/<name>, events sent using this runner module will have no such prefix. Make sure your reactors don’t expect a prefix!

**Parameters**

- **tag** – the tag to send with the event
- **data** – an optional dictionary of data to send with the event
CLI Example:

```text
salt-run event.send my/custom/event '{"foo": "bar"}'
```

Orchestration Example:

```yaml
# orch/command.sls

run_a_command:
  salt.function:
    - name: cmd.run
    - tgt: my_minion
    - arg:
      - exit {{ pillar['exit_code'] }}

send_success_event:
  salt.runner:
    - name: event.send
    - tag: my_event/success
    - data:
      foo: bar
    - require:
        - salt: run_a_command

send_failure_event:
  salt.runner:
    - name: event.send
    - tag: my_event/failure
    - data:
      baz: qux
    - onfail:
      - salt: run_a_command
```

```text
salt-run state.orchestrate orch.command pillar='{"exit_code": 0}'
salt-run state.orchestrate orch.command pillar='{"exit_code": 1}'
```

### 21.16.12 salt.runners.f5

Runner to provide F5 Load Balancer functionality

depends

- pycontrol Python module

configuration In order to connect to a F5 Load Balancer, you must specify in the Salt master configuration the currently available load balancers

```yaml
load_balancers:
  bigip1.example.com
  username: admin
  password: secret
  bigip2.example.com:
  username: admin
  password: secret
```

```python
class salt.runners.f5.F5Mgmt(lb, username, password)
```
**add_pool_member** *(name, port, pool_name)*  
Add a node to a pool

**check_member_pool** *(member, pool_name)*  
Check a pool member exists in a specific pool

**check_pool** *(name)*  
Check to see if a pool exists

**check_virtualserver** *(name)*  
Check to see if a virtual server exists

**create_pool** *(name, method='ROUND_ROBIN')*  
Create a pool on the F5 load balancer

**create_vs** *(name, ip, port, protocol, profile, pool_name)*  
Create a virtual server

**lbmethods** *(no args)*  
List all the load balancer methods

```
salt.runner.f5.add_pool_member(lb, name, port, pool_name)  
Add a node to a pool

   CLI Examples:
   salt-run f5.add_pool_member load_balancer 10.0.0.1 80 my_pool
```

```
salt.runner.f5.check_member_pool(lb, member, pool_name)  
Check a pool member exists in a specific pool

   CLI Examples:
   salt-run f5.check_member_pool load_balancer 10.0.0.1 my_pool
```

```
salt.runner.f5.check_pool(lb, name)  
Check to see if a pool exists

   CLI Examples:
   salt-run f5.check_pool load_balancer pool_name
```

```
salt.runner.f5.check_virtualserver(lb, name)  
Check to see if a virtual server exists

   CLI Examples:
   salt-run f5.check_virtualserver load_balancer virtual_server
```

```
salt.runner.f5.create_pool(lb, name, method='ROUND_ROBIN')  
Create a pool on the F5 load balancer

   CLI Examples:
   salt-run f5.create_pool load_balancer pool_name loadbalance_method
   salt-run f5.create_pool load_balancer my_pool ROUND_ROBIN
```

```
salt.runner.f5.create_vs(lb, name, ip, port, protocol, profile, pool_name)  
Create a virtual server

   CLI Examples:
```
21.16.13 salt.runners.fileserver

Directly manage the Salt fileserver plugins

**salt.runners.fileserver.clear_cache** *(backend=None)*

New in version 2015.5.0.

Clear the fileserver cache from VCS fileserver backends *(git, hg, svn)*. Executing this runner with no arguments will clear the cache for all enabled VCS fileserver backends, but this can be narrowed using the `backend` argument.

`backend` Only clear the update lock for the specified backend(s). If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

CLI Example:

```
salt-run fileserver.clear_cache
salt-run fileserver.clear_cache backend=git,hg
salt-run fileserver.clear_cache hg
salt-run fileserver.clear_cache -roots
```

**salt.runners.fileserver.clear_file_list_cache** *(saltenv=None, backend=None)*

New in version 2016.11.0.

The Salt fileserver caches the files/directories/symlinks for each fileserver backend and environment as they are requested. This is done to help the fileserver scale better. Without this caching, when hundreds/thousands of minions simultaneously ask the master what files are available, this would cause the master’s CPU load to spike as it obtains the same information separately for each minion.

`saltenv` By default, this runner will clear the file list caches for all environments. This argument allows for a list of environments to be passed, to clear more selectively. This list can be passed either as a comma-separated string, or a Python list.

`backend` Similar to the `saltenv` parameter, this argument will restrict the cache clearing to specific fileserver backends (the default behavior is to clear from all enabled fileserver backends). This list can be passed either as a comma-separated string, or a Python list.

Since the ability to clear these caches is often required by users writing custom runners which add/remove files, this runner can easily be called from within a custom runner using any of the following examples:

```
# Clear all file list caches
__salt__['fileserver.clear_file_list_cache']()
# Clear just the 'base' saltenv file list caches
__salt__['fileserver.clear_file_list_cache'](saltenv='base')
# Clear just the 'base' saltenv file list caches from just the 'roots'
# fileserver backend
__salt__['fileserver.clear_file_list_cache'](saltenv='base', backend='roots')
# Clear all file list caches from the 'roots' fileserver backend
__salt__['fileserver.clear_file_list_cache'](backend='roots')
```

**Note:** In runners, the `__salt__` dictionary will likely be renamed to `__runner__` in a future Salt release to distinguish runner functions from remote execution functions. See this GitHub issue for discussion_updates on this.

If using Salt’s Python API (not a runner), the following examples are equivalent to the ones above:
import salt.config
import salt.runner

opts = salt.config.master_config('/etc/salt/master')
opts['fun'] = 'fileserver.clear_file_list_cache'

# Clear all file list caches
opts['arg'] = []  # No arguments
runner = salt.runner.Runner(opts)
cleared = runner.run()

# Clear just the 'base' saltenv file list caches
opts['arg'] = ['base', None]
runner = salt.runner.Runner(opts)
cleared = runner.run()

# Clear just the 'base' saltenv file list caches from just the 'roots' fileserver backend
opts['arg'] = ['base', 'roots']
runner = salt.runner.Runner(opts)
cleared = runner.run()

# Clear all file list caches from the 'roots' fileserver backend
opts['arg'] = [None, 'roots']
runner = salt.runner.Runner(opts)
cleared = runner.run()

This function will return a dictionary showing a list of environments which were cleared for each backend. An empty return dictionary means that no changes were made.

CLI Examples:

```
# Clear all file list caches
salt-run fileserver.clear_file_list_cache
# Clear just the 'base' saltenv file list caches
salt-run fileserver.clear_file_list_cache saltenv=base
# Clear just the 'base' saltenv file list caches from just the 'roots' fileserver backend
salt-run fileserver.clear_file_list_cache saltenv=base backend=roots
# Clear all file list caches from the 'roots' fileserver backend
salt-run fileserver.clear_file_list_cache backend=roots
```

salt.runners.fileserver.clear_lock(backend=None, remote=None)

New in version 2015.5.0.

Clear the fileserver update lock from VCS fileserver backends (git, hg, svn). This should only need to be done if a fileserver update was interrupted and a remote is not updating (generating a warning in the Master’s log file). Executing this runner with no arguments will remove all update locks from all enabled VCS fileserver backends, but this can be narrowed by using the following arguments:

**backend** Only clear the update lock for the specified backend(s).

**remote** If specified, then any remotes which contain the passed string will have their lock cleared. For example, a remote value of github will remove the lock from all github.com remotes.

CLI Example:

```
salt-run fileserver.clear_lock
salt-run fileserver.clear_lock backend=git,hg
salt-run fileserver.clear_lock backend=git remote=github
salt-run fileserver.clear_lock remote=bitbucket
```
salt.runners.fileserver.dir_list(saltenv='base', backend=None)

Return a list of directories in the given environment

- saltenv [base] The salt fileserver environment to be listed
- backend Narrow fileserver backends to a subset of the enabled ones. If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: backend=-roots,git) then the ones starting with a minus sign will be disregarded.

New in version 2015.5.0.

CLI Example:

```bash
salt-run fileserver.dir_list
salt-run fileserver.dir_list saltenv=prod
salt-run fileserver.dir_list saltenv=dev backend=git
salt-run fileserver.dir_list base hg,roots
salt-run fileserver.dir_list -git
```

salt.runners.fileserver.empty_dir_list(saltenv='base', backend=None)

New in version 2015.5.0.

Return a list of empty directories in the given environment

- saltenv [base] The salt fileserver environment to be listed
- backend Narrow fileserver backends to a subset of the enabled ones. If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: backend=-roots,git) then the ones starting with a minus sign will be disregarded.

Note: Some backends (such as git and hg) do not support empty directories. So, passing backend=git or backend=hg will result in an empty list being returned.

CLI Example:

```bash
salt-run fileserver.empty_dir_list
salt-run fileserver.empty_dir_list saltenv=prod
salt-run fileserver.empty_dir_list backend=roots
```

salt.runners.fileserver.envs(backend=None, sources=False)

Return the available fileserver environments. If no backend is provided, then the environments for all configured backends will be returned.

- backend Narrow fileserver backends to a subset of the enabled ones.

Changed in version 2015.5.0: If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: backend=-roots,git) then the ones starting with a minus sign will be disregarded.

Additionally, fileserver backends can now be passed as a comma-separated list. In earlier versions, they needed to be passed as a python list (ex: backend=['roots', 'git'])

CLI Example:

```bash
salt-run fileserver.envs
salt-run fileserver.envs backend=roots,git
salt-run fileserver.envs git
```

salt.runners.fileserver.file_list(saltenv='base', backend=None)

Return a list of files from the salt fileserver

- saltenv [base] The salt fileserver environment to be listed
backend  Narrow fileserver backends to a subset of the enabled ones. If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: backend=-roots,git) then the ones starting with a minus sign will be disregarded.

New in version 2015.5.0.

CLI Examples:

```
salt-run fileserver.file_list
salt-run fileserver.file_list saltenv=prod
salt-run fileserver.file_list saltenv=dev backend=git
salt-run fileserver.file_list base hg,roots
salt-run fileserver.file_list -git
```

salt.runners.fileserver.lock(backend=None, remote=None)

Set a fileserver update lock for VCS fileserver backends (git, hg, svn).

**Note:** This will only operate on enabled backends (those configured in *fileserver_backend*).

backend  Only set the update lock for the specified backend(s).
remote  If not None, then any remotes which contain the passed string will have their lock cleared. For example, a remote value of *github.com* will remove the lock from all github.com remotes.

CLI Example:

```
salt-run fileserver.lock
salt-run fileserver.lock backend=git,hg
salt-run fileserver.lock backend=git remote='*github.com*'
salt-run fileserver.lock remote=bitbucket
```

salt.runners.fileserver.symlink_list(saltenv='base', backend=None)

Return a list of symlinked files and dirs

saltenv  [base] The salt fileserver environment to be listed
backend  Narrow fileserver backends to a subset of the enabled ones. If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: backend=-roots,git) then the ones starting with a minus sign will be disregarded.

New in version 2015.5.0.

CLI Example:

```
salt-run fileserver.symlink_list
salt-run fileserver.symlink_list saltenv=prod
salt-run fileserver.symlink_list saltenv=dev backend=git
salt-run fileserver.symlink_list base hg,roots
salt-run fileserver.symlink_list -git
```

salt.runners.fileserver.update(backend=None)

Update the fileserver cache. If no backend is provided, then the cache for all configured backends will be updated.

backend  Narrow fileserver backends to a subset of the enabled ones.

Changed in version 2015.5.0: If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: backend=-roots,git) then the ones starting with a minus sign will be disregarded.
Additionally, fileserver backends can now be passed as a comma-separated list. In earlier versions, they needed to be passed as a python list (ex: `backend=['roots', 'git']`)

CLI Example:

```
salt-run fileserver.update
salt-run fileserver.update backend=roots,git
```

## 21.16.14 salt.runners.git_pillar

Runner module to directly manage the git external pillar

**salt.runners.git_pillar.update** (*branch=None, repo=None*)

New in version 2014.1.0.

Changed in version 2015.8.4: This runner function now supports the *git_pillar configuration schema* introduced in 2015.8.0. Additionally, the branch and repo can now be omitted to update all *git_pillar* remotes. The return data has also changed to a dictionary. The values will be **True** only if new commits were fetched, and **False** if there were errors or no new commits were fetched.

Changed in version 2018.3.0: The return for a given *git_pillar* remote will now be **None** when no changes were fetched. **False** now is reserved only for instances in which there were errors.

Fetch one or all configured *git_pillar* remotes.

**Note:** This will *not* fast-forward the *git_pillar* cachedir on the master. All it does is perform a *git fetch*. If this runner is executed with `-l debug`, you may see a log message that says that the repo is up-to-date. Keep in mind that Salt automatically fetches *git_pillar* repos roughly every 60 seconds (or whatever *loop_interval* is set to). So, it is possible that the repo was fetched automatically in the time between when changes were pushed to the repo, and when this runner was executed. When in doubt, simply refresh pillar data using `saltutil.refresh_pillar` and then use `pillar.item` to check if the pillar data has changed as expected.

CLI Example:

```
# Update specific branch and repo
salt-run git_pillar.update branch='branch' repo='https://foo.com/bar.git'
# Update all repos
salt-run git_pillar.update
# Run with debug logging
salt-run git_pillar.update -l debug
```

## 21.16.15 salt.runners.http

Module for making various web calls. Primarily designed for webhooks and the like, but also useful for basic http testing.

New in version 2015.5.0.

**salt.runners.http.query** (*url, output=True, **kwargs*)

Query a resource, and decode the return data

Passes through all the parameters described in the *utils.http.query function*:

CLI Example:
salt-run http.query http://somelink.com/
salt-run http.query http://somelink.com/ method=POST params='key1=val1&key2=val2'
salt.runners.http.update_ca_bundle(target=None, source=None, merge_files=None)

Update the local CA bundle file from a URL
New in version 2015.5.0.

CLI Example:

salt-run http.update_ca_bundle
salt-run http.update_ca_bundle target=/path/to/cacerts.pem
salt-run http.update_ca_bundle source=https://example.com/cacerts.pem

If the target is not specified, it will be pulled from the ca_cert configuration variable available to the master. If it cannot be found there, it will be placed at <<FILE_ROOTS>>/cacerts.pem.

If the source is not specified, it will be pulled from the ca_cert_url configuration variable available to the master. If it cannot be found, it will be downloaded from the cURL website, using an http (not https) URL. USING THE DEFAULT URL SHOULD BE AVOIDED!

merge_files may also be specified, which includes a string or list of strings representing a file or files to be appended to the end of the CA bundle, once it is downloaded.

CLI Example:

salt-run http.update_ca_bundle merge_files=/path/to/mycert.pem

21.16.16 salt.runners.jobs

A convenience system to manage jobs, both active and already run

salt.runners.jobs.active(display_progress=False)
Return a report on all actively running jobs from a job id centric perspective

CLI Example:

salt-run jobs.active

salt.runners.jobs.exit_success(jid, ext_source=None)
Check if a job has been executed and exit successfully
jid The jid to look up.
ext_source The external job cache to use. Default: None.

CLI Example:

salt-run jobs.exit_success 20160520145827701627

salt.runners.jobs.last_run(ext_source=None, outputter=None, metadata=None, function=None, target=None, display_progress=False)
New in version 2015.8.0.
List all detectable jobs and associated functions

CLI Example:
salt-run jobs.last_run
salt-run jobs.last_run **target**=nodename
salt-run jobs.last_run **function**='cmd.run'

```python
salt.runners.jobs.list_job(jid, **ext_source**=None, **display_progress**=False)
```

List a specific job given by its jid.

- **ext_source** If provided, specifies which external job cache to use.
- **display_progress** [False] If True, fire progress events.

**CLI Example:**

```
salt-run jobs.list_job 20130916125524463507
salt-run jobs.list_job 20130916125524463507 --out=pprint
```

```python
salt.runners.jobs.list_jobs(**ext_source**=None, **outputter**=None, **search_metadata**=None,
**search_function**=None, **search_target**=None, **start_time**=None,
**end_time**=None, **display_progress**=False)
```

List all detectable jobs and associated functions.

- **ext_source** If provided, specifies which external job cache to use.

**FILTER OPTIONS**

**Note:** If more than one of the below options are used, only jobs which match all of the filters will be returned.

- **search_metadata** Specify a dictionary to match to the job’s metadata. If any of the key-value pairs in this dictionary match, the job will be returned. Example:

  ```
salt-run jobs.list_jobs search_metadata='{"foo": "bar", "baz": "qux"}''
  ```

- **search_function** Can be passed as a string or a list. Returns jobs which match the specified function. Globbing is allowed. Example:

  ```
salt-run jobs.list_jobs search_function='test.*'
salt-run jobs.list_jobs search_function=['"test.*", "pkg.install"]'
  ```

  Changed in version 2015.8.8: Multiple targets can now also be passed as a comma-separated list. For example:

  ```
salt-run jobs.list_jobs search_function='test.*,pkg.install'
  ```

- **search_target** Can be passed as a string or a list. Returns jobs which match the specified minion name. Globbing is allowed. Example:

  ```
salt-run jobs.list_jobs search_target='*:mydomain.tld'
salt-run jobs.list_jobs search_target=['"db\*", "myminion"]'
  ```

  Changed in version 2015.8.8: Multiple targets can now also be passed as a comma-separated list. For example:

  ```
salt-run jobs.list_jobs search_target='db*,myminion'
  ```

- **start_time** Accepts any timestamp supported by the dateutil Python module (if this module is not installed, this argument will be ignored). Returns jobs which started after this timestamp.

- **end_time** Accepts any timestamp supported by the dateutil Python module (if this module is not installed, this argument will be ignored). Returns jobs which started before this timestamp.
CLI Example:

```bash
classroom two

salt-run jobs.list_jobs
salt-run jobs.list_jobs search_function='test.*' search_target='localhost' search__metadata='{"bar": "foo"}''
salt-run jobs.list_jobs start_time='2015, Mar 16 19:00' end_time='2015, Mar 18 22:00'
```

**salt.runners.jobs.list_jobs_filter** (count, filter_find_job=True, ext_source=None, outputter=None, display_progress=False)

List all detectable jobs and associated functions

- **ext_source** The external job cache to use. Default: *None*.

CLI Example:

```bash
classroom two

salt-run jobs.list_jobs_filter 50
salt-run jobs.list_jobs_filter 100 filter_find_job=False
```

**salt.runners.jobs.lookup_jid** (jid, ext_source=None, returned=True, missing=False, display_progress=False)

Return the printout from a previously executed job

- **jid** The jid to look up.
- **ext_source** The external job cache to use. Default: *None*.
- **returned** [True] If True, include the minions that did return from the command.
- **missing** [False] If True, include the minions that did not return from the command.
- **display_progress** [False] If True, fire progress events.

New in version 2015.8.0.

CLI Example:

```bash
classroom two

salt-run jobs.lookup_jid 20130916125524463507
salt-run jobs.lookup_jid 20130916125524463507 --out=highstate
```

**salt.runners.jobs.print_job** (jid, ext_source=None)

Print a specific job's detail given by it's jid, including the return data.

CLI Example:

```bash
classroom two

salt-run jobs.print_job 20130916125524463507
```

## 21.16.17 salt.runners.launchd

Manage launchd plist files

**salt.runners.Launchd.write_launchd_plist** (program)

Write a launchd plist for managing salt-master or salt-minion

CLI Example:

```bash
classroom two

salt-run launchd.write_launchd_plist salt-master
```

## 21.16.18 salt.runners.lxc

Control Linux Containers via Salt
depends lxc execution module

salt.runners.lxc.cloud_init(names, host=None, quiet=False, **kwargs)
Wrapper for using lxc.init in saltcloud compatibility mode

names Name of the containers, supports a single name or a comma delimited list of names.
host Minion to start the container on. Required.
path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.
saltcloud_mode init the container with the saltcloud opts format instead

salt.runners.lxc.find_guest(name, quiet=False, path=None)
Returns the host for a container.

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.
salt-run lxc.find_guest name

salt.runners.lxc.find_guests(names, path=None)
Return a dict of hosts and named guests

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.
salt-run lxc.find_guests name

salt.runners.lxc.freeze(name, quiet=False, path=None)
Freeze the named container

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.
salt-run lxc.freeze name

salt.runners.lxc.info(name, quiet=False, path=None)
Returns information about a container.

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.
salt-run lxc.info name

salt.runners.lxc.init(names, host=None, saltcloud_mode=False, quiet=False, **kwargs)
Initialize a new container

salt-run lxc.init name host=minion_id [cpuset=cgroups_cpuset] \ 
[cpushare=cgroups_cpushare] [memory=cgroups_memory] \ 
[template=lxc_template_name] [clone=original name] \ 
[profile=lxc_profile] [network_profile=network_profile] \ 
[nic=network_profile] [nic_opts=nic_opts] \ 
[start=(true|false)] [seed=(true|false)] \ 
[install=(true|false)] [config=minion_config] \ 
[snapshot=(true|false)]

names Name of the containers, supports a single name or a comma delimited list of names.
host Minion on which to initialize the container (required)
path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.
saltcloud_mode init the container with the saltcloud opts format instead See lxc.init_interface module documentation
**cpuset**  cgroups cpuset.
**cpushare**  cgroups cpu shares.
**memory**  cgroups memory limit, in MB

Changed in version 2015.5.0: If no value is passed, no limit is set. In earlier Salt versions, not passing this value causes a 1024MB memory limit to be set, and it was necessary to pass `memory=0` to set no limit.

**template**  Name of LXC template on which to base this container
**clone**  Clone this container from an existing container
**profile**  A LXC profile (defined in config or pillar).
**network_profile**  Network profile to use for the container

New in version 2015.5.2.

**nic**  Deprecated since version 2015.5.0: Use `network_profile` instead

**nic_opts**  Extra options for network interfaces. E.g.:

```
{"eth0": {"mac": "aa:bb:cc:dd:ee:ff", "ipv4": "10.1.1.1", "ipv6": "2001:db8::ff00:42:8329"}}
```

**start**  Start the newly created container.

**seed**  Seed the container with the minion config and autosign its key. Default: true

**install**  If salt-minion is not already installed, install it. Default: true

**config**  Optional config parameters. By default, the id is set to the name of the container.

```
salt.runners.lxc.list_(host=None, quiet=False, path=None)
```

List defined containers (running, stopped, and frozen) for the named (or all) host(s).

**path**  path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.list [host=minion_id]
```

```
salt.runners.lxc.purge(name, delete_key=True, quiet=False, path=None)
```

Purge the named container and delete its minion key if present. WARNING: Destroys all data associated with the container.

**path**  path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.purge name
```

```
salt.runners.lxc.start(name, quiet=False, path=None)
```

Start the named container.

**path**  path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.start name
```

```
salt.runners.lxc.stop(name, quiet=False, path=None)
```

Stop the named container.

**path**  path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.stop name
```

```
salt.runners.lxc.unfreeze(name, quiet=False, path=None)
```

Unfreeze the named container.
path  path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.unfreeze name
```

21.16.19 salt.runners.manage

General management functions for salt, tools like seeing what hosts are up and what hosts are down

```
salt.runners.manage.alived(subset=None, show_ip=False, show_ipv4=None)
```
New in version 2015.8.0.

Changed in version 2019.2.0: The 'show_ipv4' argument has been renamed to 'show_ip' as it now includes IPv6 addresses for IPv6-connected minions.

Print a list of all minions that are up according to Salt’s presence detection (no commands will be sent to minions)

- **subset** [None] Pass in a CIDR range to filter minions by IP address.
- **show_ip** [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.alived
```

```
salt.runners.manage.allowed(subset=None, show_ip=False, show_ipv4=None)
```
New in version 2015.8.0.

Changed in version 2019.2.0: The 'show_ipv4' argument has been renamed to 'show_ip' as it now includes IPv6 addresses for IPv6-connected minions.

Print a list of all minions that are up according to Salt’s presence detection (no commands will be sent to minions)

- **subset** [None] Pass in a CIDR range to filter minions by IP address.
- **show_ip** [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.allowed
```

```
salt.runners.manage.bootstrap(version='develop', script=None, hosts='', script_args='', roster='flat', ssh_user=None, ssh_password=None, ssh_priv_key=None, tmp_dir='/tmp/.bootstrap', http_backend='tornado')
```

Bootstrap minions with salt-bootstrap

- **version** [develop] Git tag of version to install
- **script** [https://bootstrap.saltstack.com] URL containing the script to execute
- **hosts** Comma-separated hosts [example: hosts='host1.local,host2.local']. These hosts need to exist in the specified roster.
- **script_args** Any additional arguments that you want to pass to the script.

New in version 2016.11.0.

- **roster** [flat] The roster to use for Salt SSH. More information about roster files can be found in *Salt’s Roster Documentation*.

A full list of roster types, see the **builtin roster modules** documentation.

New in version 2016.11.0.

- **ssh_user** If user isn’t found in the **roster**, a default SSH user can be set here. Keep in mind that **ssh_user** will not override the roster **user** value if it is already defined.

New in version 2016.11.0.
ssh_password  If passwd isn't found in the roster, a default SSH password can be set here. Keep in mind that ssh_password will not override the roster passwd value if it is already defined.

New in version 2016.11.0.

ssh_privkey  If priv isn't found in the roster, a default SSH private key can be set here. Keep in mind that ssh_password will not override the roster passwd value if it is already defined.

New in version 2016.11.0.

tmp_dir  [/tmp/.bootstrap]  The temporary directory to download the bootstrap script in. This directory will have -<uuid4> appended to it. For example: /tmp/.bootstrap-a19a728e-d40a-4801-aba9-d00655c143a7/

New in version 2016.11.0.

http_backend  [tornado]  The backend library to use to download the script. If you need to use a file:// URL, then you should set this to urllib2.

New in version 2016.11.0.

CLI Example:

```bash
salt-run manage.bootstrap hosts='host1,host2'
salt-run manage.bootstrap hosts='host1,host2' version='v0.17'
salt-run manage.bootstrap hosts='host1,host2' version='v0.17' script='https://bootstrap.saltstack.com/develop'
```

**salt.runners.manage.bootstrap_psexec**(hosts=",  master=None,  version=None,  arch='win32',  installer_url=None,  username=None,  password=None)

Bootstrap Windows minions via PsExec.

hosts  Comma separated list of hosts to deploy the Windows Salt minion.

master  Address of the Salt master passed as an argument to the installer.

version  Point release of installer to download. Defaults to the most recent.

arch  Architecture of installer to download. Defaults to win32.

installer_url  URL of minion installer executable. Defaults to the latest version from https://repo.saltstack.com/windows/

username  Optional user name for login on remote computer.

password  Password for optional username. If omitted, PsExec will prompt for one to be entered for each host.

CLI Example:

```bash
salt-run manage.bootstrap_psexec hosts='host1,host2'
salt-run manage.bootstrap_psexec hosts='host1,host2' version='0.17' username='\DOMAين\Administrator'
salt-run manage.bootstrap_psexec hosts='host1,host2' installer_url='http://exampledomain/salt-installer.exe'
```

**salt.runners.manage.down**(removekeys=False,  tgt='*',  tgt_type='glob',  timeout=None,  gather_job_timeout=None)

Changed in version 2017.7.0: The expr_form argument has been renamed to tgt_type, earlier releases must use expr_form.

Print a list of all the down or unresponsive salt minions Optionally remove keys of down minions

CLI Example:

```bash
salt-run manage.down
salt-run manage.down removekeys=True
salt-run manage.down tgt="webservers"  tgt_type="nodegroup"
```

**salt.runners.manage.get_stats**(estate=None,  stack='road')

Print the stack stats

estate  [None]  The name of the target estate. Master stats would be requested by default
stack ['road'] Show stats on either road or lane stack Allowed values are 'road' or 'lane'.
CLI Example:

```shell
salt-run manage.get_stats [estate=alpha_minion] [stack=lane]
```

**salt.runners.manage.joined(subset=None, show_ip=False, show_ipv4=None)**

New in version 2015.8.0.

Changed in version 2019.2.0: The 'show_ipv4' argument has been renamed to 'show_ip' as it now includes IPv6 addresses for IPv6-connected minions.

Print a list of all minions that are up according to Salt’s presence detection (no commands will be sent to minions)
subset [None] Pass in a CIDR range to filter minions by IP address.
show_ip [False] Also show the IP address each minion is connecting from.
CLI Example:

```shell
salt-run manage.joined
```

**salt.runners.manage.key_regen()**

This routine is used to regenerate all keys in an environment. This is invasive! ALL KEYS IN THE SALT ENVIRONMENT WILL BE REGENERATED‼

The key_regen routine sends a command out to minions to revoke the master key and remove all minion keys, it then removes all keys from the master and prompts the user to restart the master. The minions will all reconnect and keys will be placed in pending.

After the master is restarted and minion keys are in the pending directory execute a salt-key -A command to accept the regenerated minion keys.

The master must be restarted within 60 seconds of running this command or the minions will think there is something wrong with the keys and abort.

Only Execute this runner after upgrading minions and master to 0.15.1 or higher!
CLI Example:

```shell
salt-run manage.key_regen
```

**salt.runners.manage.lane_stats(estate=None)**

Print the estate manor lane stack stats
estate [None] The name of the target estate. Master stats would be requested by default
CLI Example:

```shell
salt-run manage.lane_stats [estate=alpha_minion]
```

**salt.runners.manage.list_not_state(subset=None, show_ip=False, show_ipv4=None, state=None)**

New in version 2015.8.0.

Changed in version 2019.2.0: The 'show_ipv4' argument has been renamed to 'show_ip' as it now includes IPv6 addresses for IPv6-connected minions.

Print a list of all minions that are NOT up according to Salt’s presence detection (no commands will be sent to minions)
subset [None] Pass in a CIDR range to filter minions by IP address.
show_ip [False] Also show the IP address each minion is connecting from.
state ['available'] Show minions being in specific state that is one of 'available', 'joined', 'allowed', 'alived' or 'reaped'.
CLI Example:
salt-run manage.list_not_state

salt.runners.manage.list_state(subset=None, show_ip=False, show_ipv4=None, state=None)

New in version 2015.8.0.
Changed in version 2019.2.0: The 'show_ipv4' argument has been renamed to 'show_ip' as it now includes IPv6 addresses for IPv6-connected minions.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

subset [None] Pass in a CIDR range to filter minions by IP address.
show_ip [False] Also show the IP address each minion is connecting from.
state ['available'] Show minions being in specific state that is one of 'available', 'joined', 'allowed', 'alived' or 'reaped'.

CLI Example:
salt-run manage.list_state

salt.runners.manage.not_alived(subset=None, show_ip=False, show_ipv4=None)

New in version 2015.8.0.
Changed in version 2019.2.0: The 'show_ipv4' argument has been renamed to 'show_ip' as it now includes IPv6 addresses for IPv6-connected minions.

Print a list of all minions that are NOT up according to Salt’s presence detection (no commands will be sent)

subset [None] Pass in a CIDR range to filter minions by IP address.
show_ip [False] Also show the IP address each minion is connecting from.

CLI Example:
salt-run manage.not_alived

salt.runners.manage.not_allowed(subset=None, show_ip=False, show_ipv4=None)

New in version 2015.8.0.
Changed in version 2019.2.0: The 'show_ipv4' argument has been renamed to 'show_ip' as it now includes IPv6 addresses for IPv6-connected minions.

Print a list of all minions that are NOT up according to Salt’s presence detection (no commands will be sent)

subset [None] Pass in a CIDR range to filter minions by IP address.
show_ip [False] Also show the IP address each minion is connecting from.

CLI Example:
salt-run manage.not_allowed

salt.runners.manage.not_joined(subset=None, show_ip=False, show_ipv4=None)

New in version 2015.8.0.
Changed in version 2019.2.0: The 'show_ipv4' argument has been renamed to 'show_ip' as it now includes IPv6 addresses for IPv6-connected minions.

Print a list of all minions that are NOT up according to Salt’s presence detection (no commands will be sent)

subset [None] Pass in a CIDR range to filter minions by IP address.
show_ip [False] Also show the IP address each minion is connecting from.

CLI Example:
salt-run manage.not_joined

salt.runners.manage.not_present(subset=None, show_ip=False, show_ipv4=None)

New in version 2015.5.0.
Changed in version 2019.2.0: The ‘show_ipv4’ argument has been renamed to ‘show_ip’ as it now includes IPv6 addresses for IPv6-connected minions.

Print a list of all minions that are NOT up according to Salt’s presence detection (no commands will be sent)
subset [None] Pass in a CIDR range to filter minions by IP address.
show_ip [False] Also show the IP address each minion is connecting from.
CLI Example:

```bash
salt-run manage.not_present
```

salt.runners.manage.not_reaped(subset=None, show_ip=False, show_ipv4=None)
New in version 2015.8.0.

Changed in version 2019.2.0: The ‘show_ipv4’ argument has been renamed to ‘show_ip’ as it now includes IPv6 addresses for IPv6-connected minions.

Print a list of all minions that are NOT up according to Salt’s presence detection (no commands will be sent)
subset [None] Pass in a CIDR range to filter minions by IP address.
show_ip [False] Also show the IP address each minion is connecting from.
CLI Example:

```bash
salt-run manage.not_reaped
```

salt.runners.manage.present(subset=None, show_ip=False, show_ipv4=None)

Changed in version 2019.2.0: The ‘show_ipv4’ argument has been renamed to ‘show_ip’ as it now includes IPv6 addresses for IPv6-connected minions.

Print a list of all minions that are up according to Salt’s presence detection (no commands will be sent to minions)
subset [None] Pass in a CIDR range to filter minions by IP address.
show_ip [False] Also show the IP address each minion is connecting from.
CLI Example:

```bash
salt-run manage.present
```

salt.runners.manage.reaped(subset=None, show_ip=False, show_ipv4=None)
New in version 2015.8.0.

Changed in version 2019.2.0: The ‘show_ipv4’ argument has been renamed to ‘show_ip’ as it now includes IPv6 addresses for IPv6-connected minions.

Print a list of all minions that are up according to Salt’s presence detection (no commands will be sent to minions)
subset [None] Pass in a CIDR range to filter minions by IP address.
show_ip [False] Also show the IP address each minion is connecting from.
CLI Example:

```bash
salt-run manage.reaped
```

salt.runners.manage.road_stats(estate=None)
Print the estate road stack stats
estate [None] The name of the target estate. Master stats would be requested by default
CLI Example:

```bash
salt-run manage.road_stats [estate=alpha_minion]
```

salt.runners.manage.safe_accept(target, tgt_type='glob')
Changed in version 2017.7.0: The expr_form argument has been renamed to tgt_type, earlier releases must use expr_form.
Accept a minion’s public key after checking the fingerprint over salt-ssh

CLI Example:

```
salt-run manage.safe_accept my_minion
salt-run manage.safe_accept minion1,minion2 tgt_type=list
```

```python
salt.runners.manage.status(output=True, tgt='*', tgt_type='glob', timeout=None, gather_job_timeout=None)
```

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Print the status of all known salt minions

CLI Example:

```
salt-run manage.status
salt-run manage.status tgt='webservers' tgt_type='nodegroup'
salt-run manage.status timeout=5 gather_job_timeout=10
```

```python
salt.runners.manage.up(tgt='*', tgt_type='glob', timeout=None, gather_job_timeout=None)
```

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Print a list of all of the minions that are up

CLI Example:

```
salt-run manage.up
salt-run manage.up tgt='webservers' tgt_type='nodegroup'
salt-run manage.up timeout=5 gather_job_timeout=10
```

```python
sicth unfore manage.versions()
```

Check the version of active minions

CLI Example:

```
salt-run manage.versions
```

### 21.16.20 salt.runners.mattermost

**Note for 2017.7 releases!**

Due to the `salt.runners.config` module not being available in this release series, importing the `salt.runners.config` module from the develop branch is required to make this module work.

Relevant issue: [Mattermost runner failing to retrieve config values due to unavailable config runner](https://github.com/saltstack/salt/issues/43479)

New in version 2017.7.0.

**configuration** This module can be used by either passing an `api_url` and `hook` directly or by specifying both in a configuration profile in the salt master/minion config. For example:

```
mattermost:
  hook: peWcbIMOS9HrZG15peWcbIMOS9HrZG15
  api_url: https://example.com
```

21.16. runner modules
salt.runners.mattermost.post_event(event, channel=None, username=None, api_url=None, hook=None)

Send an event to a Mattermost channel.

- param channel: The channel name, either will work.
- param username: The username of the poster.
- param event: The event to send to the Mattermost channel.
- param api_url: The Mattermost api url, if not specified in the configuration.
- param hook: The Mattermost hook, if not specified in the configuration.

:return: Boolean if message was sent successfully.

salt.runners.mattermost.post_message(message, channel=None, username=None, api_url=None, hook=None)

Send a message to a Mattermost channel.

- param channel: The channel name, either will work.
- param username: The username of the poster.
- param message: The message to send to the Mattermost channel.
- param api_url: The Mattermost api url, if not specified in the configuration.
- param hook: The Mattermost hook, if not specified in the configuration.

:return: Boolean if message was sent successfully.

CLI Example:

```
salt-run mattermost.post_message message='Build is done'
```

21.16.21 salt.runners.mine

A runner to access data from the salt mine

salt.runners.mine.get(tgt, fun, tgt_type='glob')

Gathers the data from the specified minions’ mine, pass in the target, function to look up and the target type

CLI Example:

```
salt-run mine.get '*' network.interfaces
```

salt.runners.mine.update(tgt, tgt_type='glob', clear=False, mine_functions=None)

New in version 2017.7.0.

Update the mine data on a certain group of minions.

- tgt: Which minions to target for the execution.
- tgt_type: glob The type of tgt.
- clear: False Boolean flag specifying whether updating will clear the existing mines, or will update. Default: False (update).
- mine_functions: Update the mine data on certain functions only. This feature can be used when updating the mine for functions that require refresh at different intervals than the rest of the functions specified under mine_functions in the minion/master config or pillar.

CLI Example:

```
salt-run mine.update '*'
salt-run mine.update 'juniper-edges' tgt_type='nodegroup'
```

21.16.22 salt.runners.nacl

This module helps include encrypted passwords in pillars, grains and salt state files.

depends libnacl, https://github.com/saltstack/libnacl

This is often useful if you wish to store your pillars in source control or share your pillar data with others that you trust. I don’t advise making your pillars public regardless if they are encrypted or not.

configuration The following configuration defaults can be define (pillar or config files) Avoid storing private keys in pillars! Ensure master does not have pillar_opts=True:
Salt Documentation, Release 2019.2.0

```
# cat /etc/salt/master.d/nacl.conf
nacl.config:
  # NOTE: `key` and `key_file` have been renamed to `sk`, `sk_file`
  # also `box_type` default changed from secretbox to sealedbox.
  box_type: sealedbox (default)
  sk_file: /etc/salt/pki/master/nacl (default)
  pk_file: /etc/salt/pki/master/nacl.pub (default)
  sk: None
  pk: None

Usage can override the config defaults:

```
salt-run nacl.enc sk_file=/etc/salt/pki/master/nacl pk_file=/etc/salt/ ←pki/master/nacl.pub
```

The nacl lib uses 32byte keys, these keys are base64 encoded to make your life more simple. To generate your sk_file and pk_file use:

```
salt-run nacl.keygen sk_file=/etc/salt/pki/master/nacl
# or if you want to work without files.
salt-run nacl.keygen local:
  ---------
  pk: /
kfGX7PbWeu0997822PbbKWLpG/9p06IQRswkdcVHDCk0=
  sk: SVWut5SqNpuPeNzb1b9y6b2eXg2PLIo43GBzp48Sow=
```

Now with your keypair, you can encrypt data:

You have two option, sealedbox or secretbox.

SecretBox is data encrypted using private key pk. Sealedbox is encrypted using public key pk.

Recommend using Sealedbox because the one way encryption permits developers to encrypt data for source control but not decrypt. Sealedbox only has one key that is for both encryption and decryption.

```
salt-run nacl.enc asecretpass pk=/kfGX7PbWeu0997822PbbKWLpG/9p06IQRswkdcVHDCk0= '
tqXzeI3nTAM9xF6mdLcpEdkLmbfBGpj20Tkmlgrm3S1DTVHNnh9h8mU1GKllGq/+cYsk6m5WhGdk58=
```

To decrypt the data:

```
salt-run nacl.dec data='tqXzeI3nTAM9xF6mdLcpEdkLmbfBGpj20Tkmlgrm3S1DTVHNnh9h8mU1GKllGq/+cYsk6m5WhGdk58='
```

When the keys are defined in the master config you can use them from the nacl runner without extra parameters:

```
# cat /etc/salt/master.d/nacl.conf
nacl.config:
  sk_file: /etc/salt/pki/master/nacl
  pk: 'cTIqXwnUi1ul5Gk4X5seCE7/NoeKEzd4nLeYcCFpd9k='
```

```
salt-run nacl.enc 'asecretpass'
salt-run nacl.dec 'tqXzeI3nTAM9xF6mdLcpEdkLmbfBGpj20Tkmlgrm3S1DTVHNnh9h8mU1GKllGq/ ←+cYsk6m5WhGdk58='
```
A salt developer minion could have pillar data that includes a NaCL public key:

```yaml
nacl.config:
  pk: '
/kfGX7PbWeu099782P8bKWLpG/9p6IQRswkDWHCDk8=
```

The developer can then use a less-secure system to encrypt data.

```
salt-run nacl.enc apassword
```

Pillar files can include protected data that the salt master decrypts:

```yaml
pillarexample:
  user: root
  password1: {{salt.nacl.dec('DRB7Q6/X5gGSRCTpZyxxS6h1bWj0LLUA+uaVyvou3vJ4=')|json}}
  cert_key: {{salt.nacl.dec_file('/srv/salt/certs/example.com/key.nacl')|json}}
  cert_key2: {{salt.nacl.dec_file('salt://certs/example.com/key.nacl')|json}}
```

Larger files like certificates can be encrypted with:

```
salt-run nacl.enc_file /tmp/cert.crt out=/tmp/cert.nacl
```

```python
salt.runners.nacl.dec(data, **kwargs)
   Alias to [box_type]_decrypt
   box_type: secretbox, sealedbox(default)
```

```python
salt.runners.nacl.dec_file(name, out=None, **kwargs)
   This is a helper function to decrypt a file and return its contents.
   You can provide an optional output file using `out`
   `name` can be a local file or when not using `salt-run` can be a url like `salt://`, `https://` etc.
   CLI Examples:
   ```
salt-run nacl.dec_file name=/tmp/id_rsa.nacl
salt-run nacl.dec_file name=/tmp/id_rsa.nacl box_type=secretbox sk_file=/etc/salt/pki/master/nacl.pub
   ```
```

```python
salt.runners.nacl.enc(data, **kwargs)
   Alias to [box_type]_encrypt
   box_type: secretbox, sealedbox(default)
```

```python
salt.runners.nacl.enc_file(name, out=None, **kwargs)
   This is a helper function to encrypt a file and return its contents.
   You can provide an optional output file using `out`
   `name` can be a local file or when not using `salt-run` can be a url like `salt://`, `https://` etc.
   CLI Examples:
   ```
salt-run nacl.enc_file name=/tmp/id_rsa
salt-run nacl.enc_file name=/tmp/id_rsa box_type=secretbox sk_file=/etc/salt/pki/master/nacl.pub
   ```
```

```python
salt.runners.nacl.keygen(sk_file=None, pk_file=None, **kwargs)
   Use libnacl to generate a keypair.
   If no `sk_file` is defined return a keypair.
   If only the `sk_file` is defined `pk_file` will use the same name with a postfix `.pub`.
```

```python
```

Chapter 21. Salt Module Reference
When the `sk_file` is already existing, but `pk_file` is not. The `pk_file` will be generated using the `sk_file`.

CLI Examples:

```
salt-run nacl.keygen
salt-run nacl.keygen sk_file=/etc/salt/pki/master/nacl
salt-run nacl.keygen sk_file=/etc/salt/pki/master/nacl pk_file=/etc/salt/pki/master/nacl
salt-run nacl.keygen
```

**salt.runners.nacl.sealedbox_decrypt**(*data*, **kwargs)

Decrypt data using a secret key that was encrypted using a public key with `nacl.sealedbox_encrypt`.

CLI Examples:

```
salt-run nacl.sealedbox_decrypt pEXHQM6cuaF7A=
salt-run nacl.sealedbox_decrypt data=pEXHQM6cuaF7A= sk_file=/etc/salt/pki/master/nacl
salt-run nacl.sealedbox_decrypt data=pEXHQM6cuaF7A= sk='YmFkcGFzcwo='
```

**salt.runners.nacl.sealedbox_encrypt**(*data*, **kwargs)

Encrypt data using a public key generated from `nacl.keygen`. The encryptd data can be decrypted using `nacl.sealedbox_decrypt` only with the secret key.

CLI Examples:

```
salt-run nacl.sealedbox_encrypt datatoenc
```

**salt.runners.nacl.secretbox_decrypt**(*data*, **kwargs)

Decrypt data that was encrypted using `nacl.secretbox_encrypt` using the secret key that was generated from `nacl.keygen`.

CLI Examples:

```
salt-run nacl.secretbox_decrypt pEXHQM6cuaF7A=
salt-run nacl.secretbox_decrypt data=pEXHQM6cuaF7A= sk_file=/etc/salt/pki/master/nacl
salt-run nacl.secretbox_decrypt data=pEXHQM6cuaF7A= sk='YmFkcGFzcwo='
```

**salt.runners.nacl.secretbox_encrypt**(*data*, **kwargs)

Encrypt data using a secret key generated from `nacl.keygen`. The same secret key can be used to decrypt the data using `nacl.secretbox_decrypt`.

CLI Examples:

```
salt-run nacl.secretbox_encrypt datatoenc
salt-run nacl.secretbox_encrypt datatoenc sk_file=/etc/salt/pki/master/nacl
salt-run nacl.secretbox_encrypt datatoenc sk='YmFkcGFzcwo='
```

**21.16.23 salt.runners.net**

**NET Finder**

New in version 2017.7.0.

A runner to find network details easily and fast. It’s smart enough to know what you are looking for.
Configuration

- Minion (proxy) config

To have the complete features, one needs to add the following mine configuration in the minion (proxy) config file:

```yaml
mine_functions:
    net.ipaddrs: []
    net.lldp: []
    net.mac: []
    net.arp: []
    net.interfaces: []
```

Which instructs Salt to cache the data returned by the NAPALM-functions. While they are not mandatory, the less functions configured, the less details will be found by the runner.

How often the mines are refreshed, can be specified using:

```yaml
mine_interval: <X minutes>
```

- Master config

By default the following options can be configured on the master. They are not necessary, but available in case the user has different requirements.

target: * From what minions will collect the mine data. Default: * (collect from all minions).
ignore_interfaces A list of interfaces name to ignore. By default will consider all interfaces.
display: True Display on the screen or return structured object? Default: True (return on the CLI).
outputter: table Specify the outputter name when displaying on the CLI. Default: table.

Configuration example:

```yaml
runners:
    net.find:
        target: 'edge*'
        expr_form: 'glob'
        ignore_interfaces:
            - lo0
            - em1
            - jsrv
            - fxp0
        outputter: yaml
```

`salt.runners.net.find(addr, best=True, display=True)`

Search in all possible entities (Interfaces, MAC tables, ARP tables, LLDP neighbors), using the following mine functions:

- net.mac
- net.arp
- net.lldp
- net.ipaddrs
- net.interfaces

This function has the advantage that it knows where to look, but the output might become quite long as returns all possible matches.
Optional arguments:

**best**: `True` Return only the best match with the interfaces IP networks when the searching pattern is a valid IP Address or Network.

**display**: `True` Display on the screen or return structured object? Default: `True` (return on the CLI).

CLI Example:

```bash
$ sudo salt-run net.find 10.10.10.7
```

Output Example:

```
Details for all interfaces that include network 10.10.10.7/32 - only best match returned

<table>
<thead>
<tr>
<th>Device</th>
<th>Interface</th>
<th>Interface Description</th>
<th>UP</th>
<th>Enabled</th>
<th>Speed [Mbps]</th>
<th>MAC Address</th>
<th>IP Addresses</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>irb</td>
<td></td>
<td>True</td>
<td>True</td>
<td>-1</td>
<td>5C:5E:AB:AC:52:B4</td>
<td>10.10.10.1/22</td>
</tr>
</tbody>
</table>

ARP Entries for IP 10.10.10.7

<table>
<thead>
<tr>
<th>Device</th>
<th>Interface</th>
<th>MAC</th>
<th>IP</th>
<th>Age</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>irb.349</td>
<td>2C:60:0C:2A:4C:0A</td>
<td>10.10.10.7</td>
<td>832.0</td>
</tr>
</tbody>
</table>
```

salt.runners.net.findarp(**device=None, interface=None, mac=None, ip=None, display=True**)

Search for entries in the ARP tables using the following mine functions:

- `net.arp`

Optional arguments:

- **device** Return interface data from a certain device only.
- **interface** Return data selecting by interface name.
- **mac** Search using a specific MAC Address.
- **ip** Search using a specific IP Address.

**display**: `True` Display on the screen or return structured object? Default: `True`, will return on the CLI.

CLI Example:

```bash
$ sudo salt-run net.findarp mac=8C:60:0F:78:EC:41
```

Output Example:

```
ARP Entries for MAC 8C:60:0F:78:EC:41

<table>
<thead>
<tr>
<th>Device</th>
<th>Interface</th>
<th>MAC</th>
<th>IP</th>
<th>Age</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>irb.171</td>
<td>8C:60:0F:78:EC:41</td>
<td>172.172.17.19</td>
<td>956.0</td>
</tr>
</tbody>
</table>
```

salt.runners.net.findmac(**device=None, mac=None, interface=None, vlan=None, display=True**)

Search in the MAC Address tables, using the following mine functions:

- `net.mac`

Optional arguments:

- **device** Return interface data from a certain device only.
interface  Return data selecting by interface name.
mac    Search using a specific MAC Address.
vlan   Search using a VLAN ID.
display: True Display on the screen or return structured object? Default: True, will return on the CLI.

CLI Example:

$ sudo salt-run net.findmac mac=8C:60:0F:78:EC:41

Output Example:

<table>
<thead>
<tr>
<th>Device</th>
<th>Interface</th>
<th>MAC</th>
<th>VLAN</th>
<th>Static</th>
<th>Active</th>
<th>Moves</th>
<th>Last move</th>
</tr>
</thead>
<tbody>
<tr>
<td>edge01.bjm01</td>
<td>ae0.171</td>
<td>8C:60:0F:78:EC:41</td>
<td>171</td>
<td>False</td>
<td>True</td>
<td>0</td>
<td>0.0</td>
</tr>
</tbody>
</table>

salt.runners.net.interfaces (device=None, interface=None, title=None, pattern=None, ipnet=None, best=True, display=True)

Search for interfaces details in the following mine functions:

• net.interfaces
• net.ipaddrs

Optional arguments:
device  Return interface data from a certain device only.
interface Return data selecting by interface name.
pattern  Return interfaces that contain a certain pattern in their description.
ipnet    Return interfaces whose IP networks associated include this IP network.
best: True When ipnet is specified, this argument says if the runner should return only the best match (the output will contain at most one row). Default: True (return only the best match).
display: True Display on the screen or return structured object? Default: True (return on the CLI).
title    Display a custom title for the table.

CLI Example:

$ sudo salt-run net.interfaces interface=vt-0/0/10

Output Example:

Details for interface xe-0/0/0

<table>
<thead>
<tr>
<th>Device</th>
<th>Interface</th>
<th>Interface Description</th>
<th>UP</th>
<th>Enabled</th>
<th>Speed</th>
</tr>
</thead>
<tbody>
<tr>
<td>edge01.bjm01</td>
<td>vt-0/0/10</td>
<td></td>
<td>True</td>
<td>True</td>
<td>1000</td>
</tr>
<tr>
<td>edge01.flw01</td>
<td>vt-0/0/10</td>
<td></td>
<td>True</td>
<td>True</td>
<td>1000</td>
</tr>
</tbody>
</table>
salt.runners.net.lldp(device=None, interface=None, title=None, pattern=None, chassis=None, display=True)

Search in the LLDP neighbors, using the following mine functions:

- net.lldp

Optional arguments:
device Return interface data from a certain device only.
interface Return data selecting by interface name.
pattern Return LLDP neighbors that have contain this pattern in one of the following fields:
  - Remote Port ID
  - Remote Port Description
  - Remote System Name
  - Remote System Description
chassis Search using a specific Chassis ID.
display: True Display on the screen or return structured object? Default: True (return on the CLI).
display: True Display on the screen or return structured object? Default: True (return on the CLI).
title Display a custom title for the table.

CLI Example:

```bash
$ sudo salt-run net.lldp pattern=Ethernet1/48
```

Output Example:

```
Pattern "Ethernet1/48" found in one of the following LLDP details

<table>
<thead>
<tr>
<th>Device</th>
<th>Interface</th>
<th>Parent Interface</th>
<th>Remote Chassis ID</th>
<th>Remote Port ID</th>
<th>Remote Port Description</th>
<th>Remote System Name</th>
<th>Remote System Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edge01.bjm01</td>

<td></td>
<td>22:00:00</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

```
salt.runners.net.multi_find(*patterns, **kwargs)

Execute multiple search tasks. This function is based on the find function. Depending on the search items, some information might overlap.

Optional arguments:

best: True Return only the best match with the interfaces IP networks when the searching pattern is a valid IP Address or Network.

display: True Display on the screen or return structured object? Default: True (return on the CLI).

CLI Example:

$ sudo salt-run net.multi_find Ethernet1/49 xe-0/1/2

Output Example:

Pattern "Ethernet1/49" found in one of the following LLDP details

<table>
<thead>
<tr>
<th>Device</th>
<th>Interface</th>
<th>Parent Interface</th>
<th>Remote Chassis ID</th>
<th>Remote Port Description</th>
<th>Remote Port ID</th>

21.16.24 salt.runners.network

Network tools to run from the Master

salt.runners.network.wol(mac, bcast='255.255.255.255', destport=9)
Send a "Magic Packet" to wake up a Minion

CLI Example:

```
salt-run network.wol 08-00-27-13-69-77
salt-run network.wol 080027136977 255.255.255.255 7
salt-run network.wol 08:00:27:13:69:77 255.255.255.255 7
```

salt.runners.network.wollist(maclist, bcast='255.255.255.255', destport=9)
Send a "Magic Packet" to wake up a list of Minions. This list must contain one MAC hardware address per line

CLI Example:
salt-run network.wollist '/path/to/macolist'
salt-run network.wollist '/path/to/macolist' 255.255.255.255 7
salt-run network.wollist '/path/to/macolist' 255.255.255.255 7

salt.runners.network.wolmatch(tgt, tgt_type='glob', bcast='255.255.255.255', destport=9)
  Send a "Magic Packet" to wake up Minions that are matched in the grains cache

  CLI Example:

  salt-run network.wolmatch minion_id
  salt-run network.wolmatch 192.168.0.0/16 tgt_type='ipcidr' bcast=255.255.255.255
  ...destport=7

21.16.25 salt.runners.pagerduty

Runner Module for Firing Events via PagerDuty

New in version 2014.1.0.

configuration This module can be used by specifying the name of a configuration profile in the master
  config.

  For example:

  my-pagerduty-account:
    pagerduty.api_key: F3Rbyjbve43rfWFf2214
    pagerduty.subdomain: mysubdomain

salt.runners.pagerduty.create_event(service_key=None, description=None, details=None, incident_key=None, profile=None)
  Create an event in PagerDuty. Designed for use in states.

  CLI Example:

  salt-run pagerduty.create_event <service_key> <description> <details>
  ...profile=my-pagerduty-account

  The following parameters are required:

  service_key  This key can be found by using pagerduty.list_services.
  description  This is a short description of the event.
  details  This can be a more detailed description of the event.
  profile  This refers to the configuration profile to use to connect to the PagerDuty service.

salt.runners.pagerduty.list_escalation_policies(profile=None, api_key=None)
  This function is an alias of list_policies.

  List escalation policies belonging to this account

  CLI Example:

  salt-run pagerduty.list_policies my-pagerduty-account
  salt-run pagerduty.list_escalation_policies my-pagerduty-account

salt.runners.pagerduty.list_incidents(profile=None, api_key=None)
  List incidents belonging to this account

  CLI Example:

  salt-run pagerduty.list_incidents my-pagerduty-account

salt.runners.pagerduty.list_maintenance_windows(profile=None, api_key=None)
  This function is an alias of list_windows.
List maintenance windows belonging to this account

CLI Example:
```
salt-run pagerduty.list_windows my-pagerduty-account
```
```
salt-run pagerduty.list_maintenance_windows my-pagerduty-account
```

`salt.runners.pagerduty.list_policies(profile=None, api_key=None)`
List escalation policies belonging to this account

CLI Example:
```
salt-run pagerduty.list_policies my-pagerduty-account
```
```
salt-run pagerduty.list_escalation_policies my-pagerduty-account
```

`salt.runners.pagerduty.list_schedules(profile=None, api_key=None)`
List schedules belonging to this account

CLI Example:
```
salt-run pagerduty.list_schedules my-pagerduty-account
```

`salt.runners.pagerduty.list_services(profile=None, api_key=None)`
List services belonging to this account

CLI Example:
```
salt-run pagerduty.list_services my-pagerduty-account
```

`salt.runners.pagerduty.list_users(profile=None, api_key=None)`
List users belonging to this account

CLI Example:
```
salt-run pagerduty.list_users my-pagerduty-account
```

`salt.runners.pagerduty.list_windows(profile=None, api_key=None)`
List maintenance windows belonging to this account

CLI Example:
```
salt-run pagerduty.list_windows my-pagerduty-account
```
```
salt-run pagerduty.list_maintenance_windows my-pagerduty-account
```

## 21.16.26 `salt.runners.pillar`

Functions to interact with the pillar compiler on the master

`salt.runners.pillar.show_pillar(minion='*', **kwargs)`
Returns the compiled pillar either of a specific minion or just the global available pillars. This function assumes that no minion has the id `. Function also accepts pillarenv as attribute in order to limit to a specific pillarenv branch of git

CLI Example:
```
salt-run pillar.show_pillar 'www.example.com'
```
```
salt-run pillar.show_pillar
```
```
salt-run pillar.show_pillar
```
```
shows global pillar for 'dev' pillar environment: (note that not specifying pillarenv will merge all pillar environments using the master config option pillar_source_merging_strategy.)

## 21.16. runner modules
shows global pillar for 'dev' pillar environment and specific pillarenv = dev:

```
salt-run pillar.show_pillar 'pillarenv=dev'
```

API Example:

```
import salt.config
import salt.runner

opts = salt.config.master_config('/etc/salt/master')
runner = salt.runner.RunnerClient(opts)
pillar = runner.cmd('pillar.show_pillar', [])
print(pillar)
```

```
salt.runners.pillar.show_top(minion=None, saltenv='base')
```

Returns the compiled top data for pillar for a specific minion. If no minion is specified, we use the first minion we find.

CLI Example:

```
salt-run pillar.show_top
```

21.16.27 salt.runners.pkg

Package helper functions using salt.modules.pkg

New in version 2015.8.0.

```
salt.runners.pkg.list_upgrades(jid, style='group', outputter='nested', ext_source=None)
```

Show list of available pkg upgrades using a specified format style

CLI Example:

```
salt-run pkg.list_upgrades jid=201411201141417719 style=group
```

21.16.28 salt.runners.queue

General management and processing of queues.

This runner facilitates interacting with various queue backends such as the included sqlite3 queue or the planned AWS SQS and Redis queues.

The queue functions such as insert, delete, and pop can be used for typical management of the queue.

The process_queue function pops the requested number of items from the queue and creates a Salt Event that can then be processed by a Reactor. The process_queue function can be called manually, or can be configured to run on a schedule with the Salt Scheduler or regular system cron. It is also possible to use the peer system to allow a minion to call the runner.

This runner, as well as the Queues system, is not api stable at this time.

There are many things that could potentially be done with queues within Salt. For the time being the focus will be on queueing infrastructure actions on specific minions. The queues generally will be populated with minion IDs. When the process_queue runner function is called events are created on the Salt Event bus that indicate the queue and a list of one or more minion IDs. The reactor is set up to match on event tags for a specific queue and then take
infrastructure actions on those minion IDs. These actions might be to delete the minion’s key from the master, use
salt-cloud to destroy the vm, or some other custom action.

**Queued runners**

Using the Salt Queues, references to the commandline arguments of other runners can be saved to be processed later. The queue runners require a queue backend that can store json data (default: `pgjsonb`).

Once the queue is setup, the `runner_queue` will need to be configured.

```yaml
runner_queue:
  queue: runners
  backend: pgjsonb
```

**Note:** only the queue is required, this defaults to using `pgjsonb`

Once this is set, then the following can be added to the scheduler on the master and it will run the specified amount of commands per time period.

```yaml
schedule:
  runner_queue:
    schedule:
      function: queue.process_runner
      minutes: 1
      kwargs:
        quantity: 2
```

The above configuration will pop 2 runner jobs off the runner queue, and then run them. And it will do this every minute, unless there are any jobs that are still running from the last time the `process_runner` task was executed.

salt.runners.queue.delete*(queue, items, backend='sqlite')*

Delete an item or items from a queue

CLI Example:

```bash
salt-run queue.delete myqueue myitem
salt-run queue.delete myqueue myitem backend=sqlite
salt-run queue.delete myqueue "['item1', 'item2', 'item3']"
```

salt.runners.queue.insert*(queue, items, backend='sqlite')*

Add an item or items to a queue

CLI Example:

```bash
salt-run queue.insert myqueue myitem
salt-run queue.insert myqueue "['item1', 'item2', 'item3']"
salt-run queue.insert myqueue myitem backend=sqlite
salt-run queue.insert myqueue "['item1', 'item2', 'item3']" backend=sqlite
```

salt.runners.queue.insert_runner*(fun, args=None, kwargs=None, queue=None, backend=None)*

Insert a reference to a runner into the queue so that it can be run later.

fun  The runner function that is going to be run
args  list or comma-seperated string of args to send to fun
kwargs  dictionary of keyword arguments to send to fun
queue  queue to insert the runner reference into
backend  backend that to use for the queue
salt-run queue.insert_runner test.stdout_print
salt-run queue.insert_runner event.send test_insert_runner kwargs="{"data": {"foo": "bar"}}"

salt.runners.queue.list_items(queue, backend='sqlite')
List contents of a queue

salt-run queue.list_items myqueue
salt-run queue.list_items myqueue backend=sqlite

salt.runners.queue.list_length(queue, backend='sqlite')
Provide the number of items in a queue

salt-run queue.list_length myqueue
salt-run queue.list_length myqueue backend=sqlite

salt.runners.queue.list_queues(backend='sqlite')
Return a list of Salt Queues on the backend

salt-run queue.list_queues
salt-run queue.list_queues backend=sqlite

salt.runners.queue.pop(queue, quantity=1, backend='sqlite', is_runner=False)
Pop one or more or all items from a queue

salt-run queue.pop myqueue
salt-run queue.pop myqueue 6
salt-run queue.pop myqueue all
salt-run queue.pop myqueue 6 backend=sqlite
salt-run queue.pop myqueue all backend=sqlite

salt.runners.queue.process_queue(queue, quantity=1, backend='sqlite', is_runner=False)
Pop items off a queue and create an event on the Salt event bus to be processed by a Reactor.

salt-run queue.process_queue myqueue
salt-run queue.process_queue myqueue 6
salt-run queue.process_queue myqueue all backend=sqlite

salt.runners.queue.process_runner(quantity=1, queue=None, backend=None)
Process queued runners

salt-run queue.process_runner
salt-run queue.process_runner 5
21.16.29 salt.runners.reactor

A convenience system to manage reactors

Beginning in the 2017.7 release, the reactor runner requires that the reactor system is running. This is accomplished one of two ways, either by having reactors configured or by including reactor in the engine configuration for the Salt master.

```
engines:
  - reactor
```

`salt.runners.reactor.add(event, reactors, saltenv='base', test=None)`

Add a new reactor

CLI Example:

```
salt-run reactor.add 'salt/cloud/*/destroyed' reactors='/srv/reactor/destroy/*.sls'
```

`salt.runners.reactor.delete(event, saltenv='base', test=None)`

Delete a reactor

CLI Example:

```
salt-run reactor.delete 'salt/cloud/*/destroyed'
```

`salt.runners.reactor.list_(saltenv='base', test=None)`

List currently configured reactors

CLI Example:

```
salt-run reactor.list
```

21.16.30 salt.runners.salt

This runner makes Salt’s execution modules available on the salt master.

New in version 2016.11.0. Salt’s execution modules are normally available on the salt minion. Use this runner to call execution modules on the salt master. Salt execution modules are the functions called by the salt command.

Execution modules can be called with `salt-run`:

```
salt-run salt.cmd test.ping
# call functions with arguments and keyword arguments
salt-run salt.cmd test.arg 1 2 3 key=value a=1
```

Execution modules are also available to salt runners:

```
__salt__['salt.cmd'](fun=fun, args=argv, kwargs=kwargv)
```

`salt.runners.salt.cmd(fun, *args, **kwargs)`

Changed in version 2018.3.0: Added with_pillar argument

Execute fun with the given args and kwargs. Parameter fun should be the string name of the execution module to call.
Salt Documentation, Release 2019.2.0

**Note:** Execution modules will be loaded every time this function is called. Additionally, keep in mind that since runners execute on the master, custom execution modules will need to be synced to the master using `salt-run saltutil.sync_modules`, otherwise they will not be available.

**with_pillar** [False] If True, pillar data will be compiled for the master

**Note:** To target the master in the pillar top file, keep in mind that the default id for the master is `<hostname>_master`. This can be overridden by setting an id configuration parameter in the master config file.

CLI example:

```
salt-run salt.cmd test.ping
salt-run salt.cmd test.arg 1 2 3 a=1
salt-run salt.cmd mymod.myfunc with_pillar=True
```

`salt.runners.salt.execute(tgt, fun, arg=(), timeout=None, tgt_type='glob', ret='', jid='', kwarg=None, **kwargs)`

New in version 2017.7.0.

Execute `fun` on all minions matched by `tgt` and `tgt_type`. Parameter `fun` is the name of execution module function to call.

This function should mainly be used as a helper for runner modules, in order to avoid redundant code. For example, when inside a runner one needs to execute a certain function on arbitrary groups of minions, only has to:

```
ret1 = __salt__['salt.execute']('*','mod.fun')
ret2 = __salt__['salt.execute']('my_nodegroup','mod2.fun2', tgt_type='nodegroup')
```

It can also be used to schedule jobs directly on the master, for example:

```
schedule:
  collect_bgp_stats:
    function: salt.execute
    args:
      - edge-routers
      - bgp.neighbors
    kwargs:
      tgt_type: nodegroup
    days: 1
    returner: redis
```

### 21.16.31 salt.runners.saltutil

The Saltutil runner is used to sync custom types to the Master. See the `saltutil module` for documentation on managing updates to minions.

New in version 2016.3.0.

`salt.runners.saltutil.sync_all(saltenv='base', extmod_whitelist=None, extmod_blacklist=None)`

Sync all custom types
saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] dictionary of modules to sync based on type

extmod_blacklist [None] dictionary of modules to blacklist based on type

CLI Example:

```sh
salt-run saltutil.sync_all
salt-run saltutil.sync_all extmod_whitelist=[{'runners': ['custom_runner'], 'grains': []}]
```

salt.runners.saltutil.sync_cache(saltenv='base', extmod_whitelist=None, extmod_blacklist=None)

New in version 2017.7.0.

Sync cache modules from salt://_cache to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Example:

```sh
classic-run saltutil.sync_cache
```

salt.runners.saltutil.sync_clouds(saltenv='base', extmod_whitelist=None, extmod_blacklist=None)

New in version 2017.7.0.

Sync cloud modules from salt://_clouds to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Example:

```sh
classic-run saltutil.sync_clouds
```

salt.runners.saltutil.sync_eauth_tokens(saltenv='base', extmod_whitelist=None, extmod_blacklist=None)

New in version 2018.3.0.

Sync eauth token modules from salt://_tokens to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Example:

```sh
classic-run saltutil.sync_eauth_tokens
```

salt.runners.saltutil.sync_engines(saltenv='base', extmod_whitelist=None, extmod_blacklist=None)

Sync engines from salt://_engines to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Example:
salt-run saltutil.sync_engines

salt.runners.saltutil.sync_executors(saltenv='base',
                                           extmod_whitelist=None,
                                           extmod_blacklist=None)

New in version 2019.2.1.
Sync executor modules from salt://_executors to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-seperated list of modules to sync
extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Example:
salt-run saltutil.sync_executors

salt.runners.saltutil.sync_fileserver(saltenv='base',
                                           extmod_whitelist=None,
                                           extmod_blacklist=None)

New in version 2018.3.0.
Sync fileserver modules from salt://_fileserver to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-seperated list of modules to sync
extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Example:
salt-run saltutil.sync_fileserver

salt.runners.saltutil.sync_grains(saltenv='base',
                                           extmod_whitelist=None,
                                           extmod_blacklist=None)

Sync grains modules from salt://_grains to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-seperated list of modules to sync
extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Example:
salt-run saltutil.sync_grains

salt.runners.saltutil.sync_modules(saltenv='base',
                                           extmod_whitelist=None,
                                           extmod_blacklist=None)

Sync execution modules from salt://_modules to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-seperated list of modules to sync
extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Example:
salt-run saltutil.sync_modules

salt.runners.saltutil.sync_output(saltenv='base',
                                           extmod_whitelist=None,
                                           extmod_blacklist=None)

Sync output modules from salt://_output to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-seperated list of modules to sync
extmod_blacklist [None] comma-seperated list of modules to blacklist based on type
CLI Example:
```
salt-run saltutil.sync_output
```

```
salt.runners.saltutil.sync_pillar(saltenv='base', extmod_whitelist=None, 
                          extmod_blacklist=None)
```
Sync pillar modules from salt://_pillar to the master

- **saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
- **extmod_whitelist** [None] comma-separated list of modules to sync
- **extmod_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:
```
salt-run saltutil.sync_pillar
```

```
salt.runners.saltutil.sync_proxymodules(saltenv='base', extmod_whitelist=None, 
                                      extmod_blacklist=None)
```
Sync proxy modules from salt://_proxy to the master

- **saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
- **extmod_whitelist** [None] comma-separated list of modules to sync
- **extmod_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:
```
salt-run saltutil.sync_proxy
```

```
salt.runners.saltutil.sync_queues(saltenv='base', extmod_whitelist=None, 
                                   extmod_blacklist=None)
```
Sync queue modules from salt://_queues to the master

- **saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
- **extmod_whitelist** [None] comma-separated list of modules to sync
- **extmod_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:
```
salt-run saltutil.sync_queues
```

```
salt.runners.saltutil.sync_renderers(saltenv='base', extmod_whitelist=None, 
                                      extmod_blacklist=None)
```
Sync renderer modules from from salt://_renderers to the master

- **saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
- **extmod_whitelist** [None] comma-separated list of modules to sync
- **extmod_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:
```
salt-run saltutil.sync_renderers
```

```
salt.runners.saltutil.sync_returners(saltenv='base', extmod_whitelist=None, 
                                      extmod_blacklist=None)
```
Sync returner modules from salt://_returners to the master

- **saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
- **extmod_whitelist** [None] comma-separated list of modules to sync
- **extmod_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:
salt-run saltutil.sync_returns

salt.runners.saltutil.sync_roster(*saltenv='base',* extmod_whitelist=None,
 extmod_blacklist=None*)

New in version 2017.7.0.

Sync roster modules from salt://_roster to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment,
pass a comma-separated list.

extmod_whitelist [None] comma-separated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Example:

salt-run saltutil.sync_roster

salt.runners.saltutil.sync_runners(*saltenv='base',* extmod_whitelist=None,
 extmod_blacklist=None*)

Sync runners from salt://_runners to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment,
pass a comma-separated list.

extmod_whitelist [None] comma-separated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Example:

salt-run saltutil.sync_runners

salt.runners.saltutil.sync_sdb(*saltenv='base', extmod_whitelist=None,
 extmod_blacklist=None*)

New in version 2017.7.0.

Sync sdb modules from salt://_sdb to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment,
pass a comma-separated list.

extmod_whitelist [None] comma-separated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Example:

salt-run saltutil.sync_sdb

salt.runners.saltutil.sync_serializers(*saltenv='base',* extmod_whitelist=None,
 extmod_blacklist=None*)

New in version 2019.2.0.

Sync serializer modules from salt://_serializers to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment,
pass a comma-separated list.

extmod_whitelist [None] comma-separated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Example:

salt-run saltutil.sync_serializers

salt.runners.saltutil.sync_states(*saltenv='base',* extmod_whitelist=None,
 extmod_blacklist=None*)

Sync state modules from salt://_states to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment,
pass a comma-separated list.

extmod_whitelist [None] comma-separated list of modules to sync

extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Example:
```
salt-run saltutil.sync_states
```

```
salt.runners.saltutil.sync_thorium(saltenv='base',
        extmod_whitelist=None,
        extmod_blacklist=None)
```

New in version 2018.3.0.

Sync Thorium from `salt://_thorium` to the master

saltenv: **base** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist comma-separated list of modules to sync

extmod_blacklist comma-separated list of modules to blacklist based on type

CLI Example:
```
salt-run saltutil.sync_thorium
```

```
salt.runners.saltutil.sync_tops(saltenv='base',
        extmod_whitelist=None,
        extmod_blacklist=None)
```

New in version 2016.3.7, 2016.11.4, 2017.7.0.

Sync master_tops modules from `salt://_tops` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

CLI Example:
```
salt-run saltutil.sync_tops
```

```
salt.runners.saltutil.sync_utils(saltenv='base',
        extmod_whitelist=None,
        extmod_blacklist=None)
```

New in version 2016.11.0.

Sync utils modules from `salt://_utils` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-separated list of modules to sync

extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Example:
```
salt-run saltutil.sync_utils
```

```
salt.runners.saltutil.sync_wheel(saltenv='base',
        extmod_whitelist=None,
        extmod_blacklist=None)
```

Sync wheel modules from `salt://_wheel` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-separated list of modules to sync

extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Example:
```
salt-run saltutil.sync_wheel
```

**21.16.32 salt.runners.sdb**

Runner for setting and querying data via the sdb API on the master
salt.runners.sdb.delete\(\text{uri}\)
Delete a value from a db, using a uri in the form of \text{sdb://<profile>/<key>}. If the uri provided does not start with \text{sdb://} or the value is not successfully deleted, return \text{False}.

CLI Example:
```
salt-run sdb.delete sdb://mymemcached/foo
```

salt.runners.sdb.get\(\text{uri}\)
Get a value from a db, using a uri in the form of \text{sdb://<profile>/<key>}. If the uri provided does not start with \text{sdb://}, then it will be returned as-is.

CLI Example:
```
salt-run sdb.get sdb://mymemcached/foo
```

salt.runners.sdb.get_or_set_hash\(\text{uri}, \text{length=8}, \text{chars='abcdefghijklmnopqrstuvwxyz0123456789!@#$%^&*(-_=+')}\)
Perform a one-time generation of a hash and write it to sdb. If that value has already been set return the value instead.
This is useful for generating passwords or keys that are specific to multiple minions that need to be stored somewhere centrally.

CLI Example:
```
salt-run sdb.get_or_set_hash 'SECRET_KEY' 50
```

\textbf{Warning:} This function could return strings which may contain characters which are reserved as directives by the YAML parser, such as strings beginning with \%. To avoid issues when using the output of this function in an SLS file containing YAML+Jinja, surround the call with single quotes.

salt.runners.sdb.set\(\text{uri}, \text{value}\)
Set a value in a db, using a uri in the form of \text{sdb://<profile>/<key>}. If the uri provided does not start with \text{sdb://} or the value is not successfully set, return \text{False}.

CLI Example:
```
salt-run sdb.set sdb://mymemcached/foo bar
```

\subsection*{21.16.33 salt.runners.smartos_vmadm}
Runner for SmartOS minions control vmadm

salt.runners.smartos_vmadm.get\(\text{search, one=True}\)
Return information for vms
\textbf{search} [string] filter vms, see the execution module.
\textbf{one} [boolean] return only one vm

\textbf{Note:} If the search parameter does not contain an equal (=) symbol it will be assumed it will be tried as uuid, hostname, and alias.

CLI Example:
salt-run vmadm.get 91244bba-1146-e4ec-c07e-e825e0223aa9
salt-run vmadm.get search='alias=saskia'

salt.runners.smartos_vmadm.is_running(search)
Return true if vm is running
search [string] filter vms, see the execution module.

Note: If the search parameter does not contain an equal (=) symbol it will be assumed it will be tried as uuid, hostname, and alias.

Note: If multiple vms are matched, the result will be true of ALL vms are running

CLI Example:
salt-run vmadm.is_running 91244bba-1146-e4ec-c07e-e825e0223aa9
salt-run vmadm.is_running search='alias=julia'

salt.runners.smartos_vmadm.list_vms(search=None, verbose=False)
List all vms
search [string] filter vms, see the execution module
verbose [boolean] print additional information about the vm

CLI Example:
salt-run vmadm.list
salt-run vmadm.list search='type=KVM'
salt-run vmadm.list verbose=True

salt.runners.smartos_vmadm.nodes( verbose=False)
List all compute nodes
verbose [boolean] print additional information about the node e.g. platform version, hvm capable, ...

CLI Example:
salt-run vmadm.nodes
salt-run vmadm.nodes verbose=True

salt.runners.smartos_vmadm.reboot(search, one=True, force=False)
Reboot one or more vms
search [string] filter vms, see the execution module.
one [boolean] reboot only one vm
force [boolean] force reboot, faster but no graceful shutdown

Note: If the search parameter does not contain an equal (=) symbol it will be assumed it will be tried as uuid, hostname, and alias.

CLI Example:
salt-run vmadm.reboot 91244bba-1146-e4ec-c07e-e825e0223aa9
salt-run vmadm.reboot search='alias=marije'
salt-run vmadm.reboot search='type=KVM' one=False

salt.runners.smartos_vmadm.start(search, one=True)
Start one or more vms
search [string] filter vms, see the execution module.
one  [boolean] start only one vm

Note: If the search parameter does not contain an equal (=) symbol it will be assumed it will be tried as uuid, hostname, and alias.

CLI Example:

```
salt-run vmadm.start 91244bba-1146-e4ec-c07e-e825e0223aa9
salt-run vmadm.start search='alias=jiska'
salt-run vmadm.start search='type=KVM' one=False
```

```
salt.runners.smartos_vmadm.stop(search, one=True)
```

Stop one or more vms

```
search  [string] filter vms, see the execution module.
```

```
one  [boolean] stop only one vm
```

Note: If the search parameter does not contain an equal (=) symbol it will be assumed it will be tried as uuid, hostname, and alias.

```
salt-run vmadm.stop 91244bba-1146-e4ec-c07e-e825e0223aa9
salt-run vmadm.stop search='alias=jody'
salt-run vmadm.stop search='type=KVM' one=False
```

21.16.34 salt.runners.spacewalk

Spacewalk Runner

New in version 2016.3.0.

Runner to interact with Spacewalk using Spacewalk API

```
codeauthor Nitin Madhok <nmadhok@clemson.edu>, Joachim Werner <joe@suse.com>, Benedikt Werner <1benediktwerner@gmail.com>
maintainer Benedikt Werner <1benediktwerner@gmail.com>
```

To use this runner, set up the Spacewalk URL, username and password in the master configuration at `/etc/salt/master.conf` or `/etc/salt/master.d/spacewalk.conf`:

```
spacewalk:
  spacewalk01.domain.com:
    username: 'testuser'
    password: 'verybadpass'
  spacewalk02.domain.com:
    username: 'testuser'
    password: 'verybadpass'
```

Note: Optionally, protocol can be specified if the spacewalk server is not using the defaults. Default is protocol: https.

```
salt.runners.spacewalk.addGroupsToKey(server, activation_key, groups)
```

Add server groups to a activation key
CLI Example:

```
salt-run spacewalk.addGroupsToKey spacewalk01.domain.com 1-my-key '[group1,\n\n  group2]'
```

```
salt.runners.spacewalk.api(server, command, *args, **kwargs)
Call the Spacewalk xmlrpc api.

CLI Example:

```
salt-run spacewalk.api spacewalk01.domain.com systemgroup.create MyGroup\n  Description
salt-run spacewalk.api spacewalk01.domain.com systemgroup.create arguments='[
  "MyGroup", "Description"]'
```

State Example:

```
create_group:
salt.runner:
  - name: spacewalk.api
  - server: spacewalk01.domain.com
  - command: systemgroup.create
  - arguments:
    - MyGroup
    - Description
```

```
salt.runners.spacewalk.deleteAllActivationKeys(server)
Delete all activation keys from Spacewalk

CLI Example:

```
salt-run spacewalk.deleteAllActivationKeys spacewalk01.domain.com
```

```
salt.runners.spacewalk.deleteAllGroups(server)
Delete all server groups from Spacewalk

salt.runners.spacewalk.deleteAllSystems(server)
Delete all systems from Spacewalk

CLI Example:

```
salt-run spacewalk.deleteAllSystems spacewalk01.domain.com
```

```
salt.runners.spacewalk.unregister(name, server_url)
Unregister specified server from Spacewalk

CLI Example:

```
salt-run spacewalk.unregister my-test-vm spacewalk01.domain.com
```

21.16.35 salt.runners.ssh

A Runner module interface on top of the salt-ssh Python API.
This allows for programmatic use from salt-api, the Reactor, Orchestrate, etc.
```
salt.runners.ssh.cmd(tgt, fun, arg=(), timeout=None, tgt_type='glob', kwarg=None)
New in version 2015.5.0.
```
Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Execute a single command via the salt-ssh subsystem and return all routines at once.

A wrapper around the `SSHClient.cmd` method.

### 21.16.36 `salt.runners.state`

Execute orchestration functions.

```python
salt.runners.state.event(tagmatch='*', count=-1, quiet=False, sock_dir=None, pretty=False, node='master')
```

Watch Salt’s event bus and block until the given tag is matched.

New in version 2014.7.0.

Changed in version 2019.2.0: `tagmatch` can now be either a glob or regular expression.

This is useful for utilizing Salt’s event bus from shell scripts or for taking simple actions directly from the CLI.

Enable debug logging to see ignored events.

**Parameters**

- `tagmatch` – the event is written to stdout for each tag that matches this glob or regular expression.
- `count` – this number is decremented for each event that matches the `tagmatch` parameter; pass `-1` to listen forever.
- `quiet` – do not print to stdout; just block.
- `sock_dir` – path to the Salt master’s event socket file.
- `pretty` – Output the JSON all on a single line if `False` (useful for shell tools); pretty-print the JSON output if `True`.
- `node` – Watch the minion-side or master-side event bus. .. versionadded:: 2016.3.0

**CLI Examples:**

```bash
# Reboot a minion and run highstate when it comes back online
salt 'jerry' system.reboot &&
   salt-run state.event 'salt/minion/jerry/start' count=1 quiet=True &&
   salt 'jerry' state.highstate

# Reboot multiple minions and run highstate when all are back online
salt -L 'kevin,stewart,dave' system.reboot &&
   salt-run state.event 'salt/minion/*/start' count=3 quiet=True &&
   salt -L 'kevin,stewart,dave' state.highstate

# Watch the event bus forever in a shell while-loop.
salt-run state.event | while read -r tag data; do
echo $tag
echo $data | jq --color-output .
done
```

See also:

See [https://github.com/saltstack/salt/blob/develop/tests/eventlisten.sh](https://github.com/saltstack/salt/blob/develop/tests/eventlisten.sh) for an example of usage within a shell script.

```python
salt.runners.state.orchestrate(mods, saltenv='base', test=None, exclude=None, pillar=None, pil-larenv=None, pillar_enc=None, orchestration_jid=None)
```

New in version 0.17.0.

Execute a state run from the master, used as a powerful orchestration system.
Salt Documentation, Release 2019.2.0

See also:
More Orchestrate documentation
  • Full Orchestrate Tutorial
  • Docs for the master-side state module

CLI Examples:

```
salt-run state.orchestrate webserver
salt-run state.orchestrate webserver saltenv=dev test=True
salt-run state.orchestrate webserver saltenv=dev pillarenv=aws
```

Changed in version 2014.1.1: Runner renamed from state.sls to state.orchestrate

Changed in version 2014.7.0: Runner uses the pillar variable

Changed in version develop: Runner uses the pillar_enc variable that allows renderers to render the pillar. This is usable when supplying the contents of a file as pillar, and the file contains gpg-encrypted entries.

See also:
GPG renderer documentation

CLI Examples:

```
salt-run state.orchestrate webserver pillar_enc=gpg pillar="$(cat somefile.json)"
```

```
salt.runners.state.orchestrate_high(data, test=None, queue=False, pillar=None, **kwargs)
```

Execute a single state orchestration routine

New in version 2015.5.0.

CLI Example:

```
salt-run state.orchestrate_high '{
    stage_one:
        {salt.state: [{tgt: "db*"}, {sls: postgres_setup}]],
    stage_two:
        {salt.state: [{tgt: "web*"}, {sls: apache_setup}, {
            require: [{salt: stage_one}],
        }],
},
}'
```

```
salt.runners.state.orchestrate_show_sls(mods, saltenv='base', test=None, queue=False, pillar=None, pillarenv=None, pillar_enc=None)
```

Display the state data from a specific sls, or list of sls files, after being render using the master minion.

Note, the master minion adds a "_master" suffix to it’s minion id.

See also:
The state.show_sls module function

CLI Example: .. code-block:: bash

```
salt-run state.orch_shows_ls my-orch-formula.my-orch-state 'pillar={ nodegroup: ng1 }'
```

```
salt.runners.state.orchestrate_single(fun, name, test=None, queue=False, pillar=None, **kwargs)
```

Execute a single state orchestration routine

New in version 2015.5.0.

CLI Example:
salt-run state.orchestrate_single fun=salt.wheel name=key.list_all

salt.runners.state.pause\((jid, state_id=None, duration=None)\)
Set up a state id pause, this instructs a running state to pause at a given state id. This needs to pass in the jid of the running state and can optionally pass in a duration in seconds.

salt.runners.state.resume\((jid, state_id=None)\)
Remove a pause from a jid, allowing it to continue

salt.runners.state.rm_pause\((jid, state_id=None)\)
This function is an alias of resume.
Remove a pause from a jid, allowing it to continue

salt.runners.state.set_pause\((jid, state_id=None, duration=None)\)
This function is an alias of pause.
Set up a state id pause, this instructs a running state to pause at a given state id. This needs to pass in the jid of the running state and can optionally pass in a duration in seconds.

salt.runners.state.soft_kill\((jid, state_id=None)\)
Set up a state run to die before executing the given state id, this instructs a running state to safely exit at a given state id. This needs to pass in the jid of the running state. If a state_id is not passed then the jid referenced will be safely exited at the beginning of the next state run.

21.16.37 salt.runners.survey

A general map/reduce style salt runner for aggregating results returned by several different minions.
New in version 2014.7.0.
Aggregated results are sorted by the size of the minion pools which returned matching results.
Useful for playing the game: "some of these things are not like the others..." when identifying discrepancies in a large infrastructure managed by salt.

salt.runners.survey.diff\(\*args, **kwargs\)
Return the DIFFERENCE of the result sets returned by each matching minion pool
New in version 2014.7.0.
These pools are determined from the aggregated and sorted results of a salt command.
This command displays the "diffs" as a series of 2-way differences – namely the difference between the FIRST displayed minion pool (according to sort order) and EACH SUBSEQUENT minion pool result set.
Differences are displayed according to the Python difflib.unified_diff() as in the case of the salt execution module file.get_diff.
This command is submitted via a salt runner using the general form:

```
salt-run survey.diff [survey_sort=up/down] <target>
   <salt-execution-module> <salt-execution-module parameters>
```

Optionally accept a survey_sort= parameter. Default: survey_sort=down

CLI Example #1: (Example to display the "differences of files")

```
salt-run survey.diff survey_sort=up ":*" cp.get_file_str file:///etc/hosts
```

salt.runners.survey.hash\(\*args, **kwargs\)
Return the MATCHING minion pools from the aggregated and sorted results of a salt command
New in version 2014.7.0.
This command is submitted via a salt runner using the general form:

```
salt-run survey.hash [survey_sort=up/down] <target> <salt-execution-module> <salt-execution-module parameters>
```

Optionally accept a `survey_sort=` parameter. Default: `survey_sort=down`

CLI Example #1: (functionally equivalent to `salt-run manage.up`)

```
salt-run survey.hash "*" test.ping
```

CLI Example #2: (find an "outlier" minion config file)

```
salt-run survey.hash "*" file.get_hash /etc/salt/minion survey_sort=up
```

### 21.16.38 salt.runners.test

This runner is used only for test purposes and servers no production purpose

#### salt.runners.test.arg`

```
salt.runners.test.arg(*args,**kwargs)
Output the given args and kwargs
Kwargs will be filtered for 'private' keynames.
```

#### salt.runners.test.get_opts`

```
salt.runners.test.get_opts()
New in version 2018.3.0.
Return the configuration options of the master.
```

CLI Example:

```
salt-run test.get_opts
```

#### salt.runners.test.metasyntactic`

```
salt.runners.test.metasyntactic(locality='us')
Return common metasyntactic variables for the given locality
```

#### salt.runners.test.raw_arg`

```
salt.runners.test.raw_arg(*args,**kwargs)
Output the given args and kwargs
```

#### salt.runners.test.sleep`

```
salt.runners.test.sleep(s_time=10)
Sleep t seconds, then return True
```

#### salt.runners.test.stdout_print`

```
salt.runners.test.stdout_print()
Print 'foo' and return 'bar'
```

#### salt.runners.test.stream`

```
salt.runners.test.stream()
Return True
```

### 21.16.39 salt.runners.thin

The thin runner is used to manage the salt thin systems.

Salt Thin is a transport-less version of Salt that can be used to run routines in a standalone way. This runner has tools which generate the standalone salt system for easy consumption.
salt.runners.thin.generate(*extra_mods=", overwrite=False, so_mods=", python2_bin=’python2’, python3_bin=’python3’, absonly=True, compress=’gzip’*)

Generate the salt-thin tarball and print the location of the tarball. Optional additional mods to include (e.g. mako) can be supplied as a comma delimited string. Permits forcing an overwrite of the output file as well.

CLI Example:

```
salt-run thin.generate
salt-run thin.generate mako
salt-run thin.generate mako,wempy
salt-run thin.generate overwrite=1
```

salt.runners.thin.generate_min(*extra_mods=", overwrite=False, so_mods=", python2_bin=’python2’, python3_bin=’python3’*)

Generate the salt-thin tarball and print the location of the tarball. Optional additional mods to include (e.g. mako) can be supplied as a comma delimited string. Permits forcing an overwrite of the output file as well.

CLI Example:

```
salt-run thin.generate_min
```

## 21.16.40 salt.runners.vault

maintainer SaltStack

maturity new

platform all

Runner functions supporting the Vault modules. Configuration instructions are documented in the execution module docs.

salt.runners.vault.generate_token(*minion_id, signature, impersonated_by_master=False*)

Generate a Vault token for minion minion_id

**minion_id** The id of the minion that requests a token

**signature** Cryptographic signature which validates that the request is indeed sent by the minion (or the master, see impersonated_by_master).

**impersonated_by_master** If the master needs to create a token on behalf of the minion, this is True. This happens when the master generates minion pillars.

salt.runners.vault.show_policies(*minion_id*)

Show the Vault policies that are applied to tokens for the given minion

**minion_id** The minions id

CLI Example:

```
salt-run vault.show_policies myminion
```

salt.runners.vault.unseal()

Unseal Vault server

This function uses the ’keys’ from the ’vault’ configuration to unseal vault server

```
vault:
  keys:
    - n63/TbrQuL3xlW7ZZpuXj/tlfnkK1/MbVxO4vT3wYD2A
    - S9OwCvMrhEzEA4NVVELYB6w/Me6+urgUr24xGK44Uy3
    - F1j4b7JKq850NS6Kboiy5la0IxY8dWjvByb3fCwA+SraYI
    - 1cYtvjKJNDVam9c7HNqfNk4PYyAXIpjkpN/sIuzPv
    - 3pPK5X6vGtwLhNOfv1U2elahECz3HpRuXJFYIw6id
```
CLI Examples:

```
salt-run vault.unseal
```

### 21.16.41 salt.runners.venafiapi

Support for Venafi

Before using this module you need to register an account with Venafi, and configure it in your `master` configuration file.

First, you need to add a placeholder to the `master` file. This is because the module will not load unless it finds an `api_key` setting, valid or not. Open up `/etc/salt/master` and add:

```
venafi:
  api_key: None
```

Then register your email address with Venafi using the following command:

```
salt-run venafi.register <youremail@yourdomain.com>
```

This command will not return an `api_key` to you; that will be sent to you via email from Venafi. Once you have received that key, open up your `master` file and set the `api_key` to it:

```
venafi:
  api_key: abcdef01-2345-6789-abcd-ef0123456789
```

```python
salt.runners.venafiapi.del_cached_domain(domains)
```

Delete cached domains from the master

CLI Example:

```
salt-run venafi.del_cached_domain domain1.example.com,domain2.example.com
```

```python
salt.runners.venafiapi.gen_csr(minion_id, dns_name=None, zone='default', country=None, state=None, loc=None, org=None, org_unit=None, password=None)
```

Generate a csr using the host's private_key. Analogous to:

```
```

CLI Example:

```
salt-run venafi.gen_csr <minion_id> <dns_name>
```

```python
salt.runners.venafiapi.gen_key(minion_id, dns_name=None, zone='default', password=None)
```

Generate and return an private_key. If a `dns_name` is passed in, the private_key will be cached under that name. The type of key and the parameters used to generate the key are based on the default certificate use policy associated with the specified zone.

CLI Example:

```
salt-run venafi.gen_key <minion_id> [dns_name] [zone] [password]
```

```python
salt.runners.venafiapi.get_zone_id(zone_name)
```

Get the zone ID for the given zone name

CLI Example:
salt-run venafi.get_zone_id default

```
salt.runners.venafiapi.list_domain_cache()
List domains that have been cached
CLI Example:
salt-run venafi.list_domain_cache
```

```
salt.runners.venafiapi.pickup(id_)
Show certificate requests for this API key
CLI Example:
salt-run venafi.show_cert 01234567-89ab-cdef-0123-456789abcdef
```

```
salt.runners.venafiapi.register(email)
Register a new user account
CLI Example:
salt-run venafi.register email@example.com
```

```
salt.runners.venafiapi.renew(minion_id, dns_name=None, zone='default', request_id=None, country='US', state='California', loc='Palo Alto', org='Beta Organization', org_unit='Beta Group', password=None, zone_id=None)
Request a new certificate
Uses the following command:
VCert enroll -z <zone> -k <api key> -cn <domain name>
CLI Example:
salt-run venafi.request <minion_id> <dns_name>
```

```
salt.runners.venafiapi.request(minion_id, dns_name=None, zone='default', request_id=None, country='US', state='California', loc='Palo Alto', org='Beta Organization', org_unit='Beta Group', password=None, zone_id=None)
Request a new certificate
Uses the following command:
VCert enroll -z <zone> -k <api key> -cn <domain name>
CLI Example:
salt-run venafi.request <minion_id> <dns_name>
```

```
salt.runners.venafiapi.show_cert(id_)
Show certificate requests for this API key
CLI Example:
salt-run venafi.show_cert 01234567-89ab-cdef-0123-456789abcdef
```

```
salt.runners.venafiapi.show_company(domain)
Show company information, especially the company id
```

Chapter 21. Salt Module Reference
CLI Example:

```
salt-run venafi.show_company example.com
```

salt.runners.venafiapi.show_csrs()
Show certificate requests for this API key

CLI Example:

```
salt-run venafi.show_csrs
```

salt.runners.venafiapi.show_policies()
Show zone details for the API key owner’s company

CLI Example:

```
salt-run venafi.show_zones
```

salt.runners.venafiapi.show_rsa(minion_id, dns_name)
Show a private RSA key

CLI Example:

```
salt-run venafi.show_rsa myminion domain.example.com
```

salt.runners.venafiapi.show_zones()
Show zone details for the API key owner’s company

CLI Example:

```
salt-run venafi.show_zones
```

## 21.16.42 salt.runners.virt

Control virtual machines via Salt

salt.runners.virt.force_off(name)
Force power down the named virtual machine

salt.runners.virt.host_info(host=None)
Return information about the host connected to this master

salt.runners.virt.init(name, cpu, mem, image, hypervisor='kvm', host=None, seed=True, nic='default', install=False, start=False, disk='default', saltenv='base', enable_vnc=False, seed_cmd='seed.apply', enable_qcow=False)

This routine is used to create a new virtual machine. This routines takes a number of options to determine what the newly created virtual machine will look like.

name  The mandatory name of the new virtual machine. The name option is also the minion id, all minions must have an id.

cpu  The number of cpus to allocate to this new virtual machine.

mem  The amount of memory to allocate to this virtual machine. The number is interpreted in megabytes.

image  The network location of the virtual machine image, commonly a location on the salt fileserver, but http, https and ftp can also be used.

hypervisor  The hypervisor to use for the new virtual machine. Default is kvm.

host  The host to use for the new virtual machine, if this is omitted Salt will automatically detect what host to use.

seed  Set to False to prevent Salt from seeding the new virtual machine.
The nic profile to use, defaults to the "default" nic profile which assumes a single network interface per VM associated with the "br0" bridge on the master.

**install** Set to False to prevent Salt from installing a minion on the new VM before it spins up.

**disk** The disk profile to use

**saltenv** The Salt environment to use

**enable_vnc** Whether a VNC screen is attached to resulting VM. Default is `False`.

**seed_cmd** If seed is `True`, use this execution module function to seed new VM. Default is `seed.apply`.

**enable_qcow** Clone disk image as a copy-on-write qcow2 image, using downloaded image as backing file.

### salt.runners.virt.list(args)

List the virtual machines on each host, this is a simplified query, showing only the virtual machine names belonging to each host. A single host can be passed in to specify an individual host to list.

### salt.runners.virt.migrate(name, target="")

Migrate a VM from one host to another. This routine will just start the migration and display information on how to look up the progress.

### salt.runners.virt.next_host()

Return the host to use for the next autodeployed VM. This queries the available host and executes some math to determine the most "available" next host.

### salt.runners.virt.pause(name)

Pause the named VM

### salt.runners.virt.purge(name, delete_key=True)

Destroy the named VM

### salt.runners.virt.query(args)

Query the virtual machines. When called without options all hosts are detected and a full query is returned. A single host can be passed in to specify an individual host to query.

### salt.runners.virt.reset(name)

Force power down and restart an existing VM

### salt.runners.virt.resume(name)

Resume a paused VM

### salt.runners.virt.start(name)

Start a named virtual machine

### salt.runners.virt.vm_info(name, quiet=False)

Return the information on the named VM

### 21.16.43 salt.runners.vistara

Vistara Runner

Runner to interact with the Vistara (http://www.vistarait.com/) REST API

**codeauthor** Brad Thurber <brad.thurber@gmail.com>

To use this runner, the Vistara client_id and Vistara oauth2 client_key and client_secret must be set in the master config.

For example /etc/salt/master.d/_vistara.conf:

```yaml
vistara:
  client_id: client_012345
  client_key: N0tReallyaR3alKeyButShouldB12345
  client_secret: ThisISAreallyLongsecretKeyIwonderwhyTheyMakeThemSoBigTheseDays00
```
salt.runners.vistara.delete_device\(name, safety\_on=True\)
Deletes a device from Vistara based on DNS name or partial name. By default, delete_device will only perform the delete if a single host is returned. Set safety\_on=False to delete all matches (up to default API search page size)

CLI Example:

```
salt-run vistara.delete_device 'hostname-101.mycompany.com'
salt-run vistara.delete_device 'hostname-101'
salt-run vistara.delete_device 'hostname-1' safety\_on=False
```

21.16.44 salt.runners.winrepo

Runner to manage Windows software repo

salt.runners.winrepo.genrepo\(opts=None, fire\_event=True\)
Generate winrepo_cachefile based on sls files in the winrepo_dir
\textbf{opts} Specify an alternate opts dict. Should not be used unless this function is imported into an execution module.
\textbf{fire\_event} [True] Fire an event on failure. Only supported on the master.

CLI Example:

```
salt-run winrepo.genrepo
```

salt.runners.winrepo.update_git_repos\(opts=None, clean=False, masterless=False\)
Checkout git repos containing Windows Software Package Definitions
\textbf{opts} Specify an alternate opts dict. Should not be used unless this function is imported into an execution module.
\textbf{clean} [False] Clean repo cachedirs which are not configured under winrepo_remotes.

\textbf{Warning:} This argument should not be set to True if a mix of git and non-git repo definitions are being used, as it will result in the non-git repo definitions being removed.

New in version 2015.8.0.

CLI Examples:

```
salt-run winrepo.update_git_repos
salt-run winrepo.update_git_repos clean=True
```

21.17.1 salt.sdb.cache module

cache Module

maintainer SaltStack
maturity New
platform all

New in version 2017.7.0.

This module provides access to Salt’s cache subsystem.

Like all sdb modules, the cache module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
mastercloudcache:
  driver: cache
  bank: cloud/active/ec2/my-ec2-conf/saltmaster
  cachedir: /var/cache/salt
```

The `driver` refers to the cache module, `bank` refers to the cache bank that contains the data and `cachedir` (optional), if used, points to an alternate directory for cache data storage.

```
master_ip: sdb://mastercloudcache/public_ips
```

It is also possible to override both the `bank` and `cachedir` options inside the SDB URI:

```
```

For this reason, both the `bank` and the `cachedir` options can be omitted from the SDB profile. However, if the `bank` option is omitted, it must be specified in the URI:

```
  ...saltmaster
```

salt.sdb.cache.delete(key, service=None, profile=None)
Get a value from the cache service

salt.sdb.cache.get(key, service=None, profile=None)
Get a value from the cache service

salt.sdb.cache.set_(key, value, service=None, profile=None)
Set a key/value pair in the cache service

21.17.2 salt.sdb.confidant

An SDB module for getting credentials from confidant.
Configuring the Confidant module

The module can be configured via sdb in the minion config:

```yaml
confidant:
    driver: confidant
    # The URL of the confidant web service
    url: 'https://confidant-production.example.com'
    # The context to use for KMS authentication
    auth_context:
        from: example-production-iad
        to: confidant-production-iad
        user_type: service
        # The KMS master key to use for authentication
    auth_key: "alias/authnz"
    # Cache file for KMS auth token
    token_cache_file: /run/confidant/confidant_token
    # The duration of the validity of a token, in minutes
    token_duration: 60
    # key, keyid and region can be defined in the profile, but it's generally
    # best to use IAM roles or environment variables for AWS auth.
    keyid: 98nh9h9h08h09kjjk
    key: jhf908gyeghehe0he0g8h9u0j0n0n09hj09h0
    region: us-east-1
```

```yaml
depends
confidant-common, confidant-client
```

Module Documentation

salt.sdb.confidant.get(key, profile=None)

Read pillar data from Confidant via its API.

CLI Example:

```
salt myminion sdb.get 'sdb://confidant/credentials'
```

Valid keys are: credentials, credentials_metadata, result. credentials returns a dict of joined credential_pairs, credentials_metadata returns a dict of metadata relevant to the credentials mapped to the confidant service, and result returns a bool that can be used to determine if the sdb call succeeded or failed to fetch credentials from confidant (or from local cache). If result is false, the data in credentials or credentials_metadata can’t be trusted.

21.17.3 salt.sdb.consul module

Consul sdb Module

```yaml
maintainer SaltStack
maturity New
platform all
```

This module allows access to Consul using an sdb:// URI.

Like all sdb modules, the Consul module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. For example:
myconsul:
  driver: consul
  host: 127.0.0.1
  port: 8500
  scheme: http
  token: b6376760-a8bb-edd5-fcda-33bc13bfc556
  dc: dev
  verify: True

The driver refers to the Consul module, all other options are optional. For option details see: https://python-consul.readthedocs.io/en/latest/#consul

salt.sdb.consul.get(key, profile=None)
salt.sdb.consul.get_conn(profile)
  Return a client object for accessing consul
salt.sdb.consul.set_(key, value, profile=None)

21.17.4 salt.sdb.couchdb

CouchDB sdb Module

  maintainer SaltStack
  maturity New
  depends python2-couchdb
  platform all

This allow interaction between Salt and a CouchDB [couchdb.apache.org] database. It uses salt’s sdb system to allow for inserts and retrievals using the sdb:// prefix in salt configuration files.

To use the couchbase sdb module, it must first be configured in the salt master or minion config. The following arguments are required:

couchdb_sdb:
  driver: couchdb
  host: localhost
  port: 5984
  database: salt_sdb

One could then query the CouchDB instance via an sdb:// URI such as the following:

password: sdb://couchdb_sdb/mykey

To use this interface, you must track IDs on your own or have another source to do the map-reduce logic necessary to calculate the ID you wish to fetch.

Additional contributions to build true map-reduce functionality into this module would be welcome.

salt.sdb.couchdb.get(key, profile=None)
  Get a value from couchdb by id
salt.sdb.couchdb.set_(key, value, profile=None)
  Set a key/value pair in couchdb
21.17.5 salt.sdb.env module

Environment sdb Module

maintainer SaltStack

maturity New

depends None

platform all

This module allows access to environment variables using an sdb:// URI.

Example configuration for this module:

```yaml
osenv:
  driver: env
```

WARNING:

OS environment variables will be available to read via SDB. Please make sure you don’t have any sensitive data in your environment variables‼

Example usage of sdb env module:

```python
set some env var:
  cmd.run:
    - name: echo {{ salt['sdb.set']('sdb://osenv/foo', 'bar') }}
    - order: 1

{% if salt['sdb.get']('sdb://osenv/foo') == 'bar' %}
always-changes-and-succeeds:
  test.succeed_with_changes:
    - name: foo
{% else %}
always-changes-and-fails:
  test.fail_with_changes:
    - name: foo
{% endif %}
```

The above example will return success.

The env sdb module can also be used with salt cloud. Assuming you have exported the environment variable named compute (and have osenv defined). The example below will look for the salt cloud config key compute_name in the environment:

```yaml
my-openstack-config:
  compute_name: sdb://osenv/compute
..snip
```

salt.sdb.env.get(key, profile=None)

Get a value

salt.sdb.env.set_(key, value, profile=None)

Set a key/value pair
21.17.6 salt.sdb.etcd_db

etcd Database Module

maintainer SaltStack
maturity New
depends python-etcd
platform all

New in version 2015.5.0.

This module allows access to the etcd database using an sdb:// URL. This package is located at https://pypi.python.org/pypi/python-etcd.

Like all sdb modules, the etcd module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```yaml
myetcd:
  driver: etcd
  etcd.host: 127.0.0.1
  etcd.port: 2379
```

The driver refers to the etcd module, etcd.host refers to the host that is hosting the etcd database and etcd.port refers to the port on that host.

```yaml
password: sdb://myetcd/mypassword
```

salt.sdb.etcd_db.delete(key, service=None, profile=None)
Get a value from the etcd service

salt.sdb.etcd_db.get(key, service=None, profile=None)
Get a value from the etcd service

salt.sdb.etcd_db.set_(key, value, service=None, profile=None)
Set a key/value pair in the etcd service

21.17.7 salt.sdb.keyring_db

Keyring Database Module

maintainer SaltStack
maturity New
depends keyring
platform all

This module allows access to the keyring package using an sdb:// URL. This package is located at https://pypi.python.org/pypi/keyring.

Care must be taken when using keyring. Not all keyend backends are supported on all operating systems. Also, many backends require an agent to be running in order to work. For instance, the "Secret Service" backend requires a compatible agent such as gnome-keyring-daemon or kwallet to be running. The keyczar backend does not seem to enjoy the benefits of an agent, and so using it will require either that the password is typed in manually (which is unreasonable for the salt-minion and salt-master daemons, especially in production) or an agent is written for it.
Like all sdb modules, the keyring module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
mykeyring:
  driver: keyring
  service: system
```

The `driver` refers to the keyring module, `service` refers to the service that will be used inside of keyring (which may be likened unto a database table) and `mykeyring` refers to the name that will appear in the URI:

```
password: sdb://mykeyring/mypassword
```

The underlying backend configuration must be configured via keyring itself. For examples and documentation, see keyring:

https://pypi.python.org/pypi/keyring

New in version 2014.1.4.

```
salt.sdb.keyring_db.get(key, service=None, profile=None)
    Get a value from a keyring service

salt.sdb.keyring_db.set_(key, value, service=None, profile=None)
    Set a key/value pair in a keyring service
```

### 21.17.8 salt.sdb.memcached

Memcached sdb Module

```
maintainer SaltStack
maturity New
depends python-memcached
platform all
```

This module allows access to memcached using an `sdb://` URI. This package is located at https://pypi.python.org/pypi/python-memcached.

Like all sdb modules, the memcached module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
mymemcache:
  driver: memcached
  host: localhost
  port: 11211
```

The `driver` refers to the memcached module, `host` and `port` the memcached server to connect to (defaults to localhost and 11211, and `mymemcached` refers to the name that will appear in the URI:

```
password: sdb://mymemcached/mykey
```

```
salt.sdb.memcached.get(key, profile=None)
    Get a value from memcached

salt.sdb.memcached.set_(key, value, profile=None)
    Set a key/value pair in memcached
```
21.17.9 salt.sdb.redis_sdb module

Redis SDB module

New in version 2019.2.0.

This module allows access to Redis using an sdb:// URI.

Like all SDB modules, the Redis module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. For example:

```
sdb_redis:
    driver: redis
    host: 127.0.0.1
    port: 6379
    password: pass
    db: 1
```

The `driver` refers to the Redis module, all other options are optional. For option details see: https://redis-py.readthedocs.io/en/latest/

- `salt.sdb.redis_sdb.delete(key, profile=None)`: Delete a key from the Redis SDB.
- `salt.sdb.redis_sdb.get(key, profile=None)`: Get a value from the Redis SDB.
- `salt.sdb.redis_sdb.set_(key, value, profile=None)`: Set a value into the Redis SDB.

21.17.10 salt.sdb.rest module

Generic REST API SDB Module

- `maintainer` SaltStack
- `maturity` New
- `platform` all

New in version 2015.8.0.

This module allows access to a REST interface using an sdb:// URI.

Like all REST modules, the REST module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
my-rest-api:
    driver: rest
    urls:
        url: https://api.github.com/
    keys:
        url: https://api.github.com/users/{{user}}/keys
    backend: requests
```

The `driver` refers to the REST module, and must be set to `rest` in order to use this driver. Each of the other items inside this block refers to a separate set of HTTP items, including a URL and any options associated with it. The options used here should match the options available in `salt.utils.http.query()`.

In order to call the `urls` item in the example, the following reference can be made inside a configuration file:
**github_urls**: sdb://my-rest-api/urls

Key/Value pairs may also be used with this driver, and merged into the URL using the configured renderer (jinja, by default). For instance, in order to use the keys item in the example, the following reference can be made:

**github_urls**: sdb://my-rest-api/keys?user=myuser

This will cause the following URL to actually be called:

https://api.github.com/users/myuser/keys

Key/Value pairs will NOT be passed through as GET data. If GET data needs to be sent to the URL, then it should be configured in the SDB configuration block. For instance:

```yaml
another-rest-api:
  driver: rest
  user_data:
    url: https://api.example.com/users/
    params:
      user: myuser
```

salt.sdb.rest.get(key, service=None, profile=None)
Get a value from the REST interface

salt.sdb.rest.query(key, value=None, service=None, profile=None)
Get a value from the REST interface

salt.sdb.rest.set_(key, value, service=None, profile=None)
Set a key/value pair in the REST interface

### 21.17.11 salt.sdb.sqlite3

SQLite sdb Module

- **maintainer**: SaltStack
- **maturity**: New
- **platform**: all

This module allows access to sqlite3 using an sdb:// URI.

Like all sdb modules, the sqlite3 module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. For example:

```yaml
mysqlite:
  driver: sqlite3
  database: /tmp/sdb.sqlite
  table: sdb
  create_table: True
```

The **driver** refers to the sqlite3 module, **database** refers to the sqlite3 database file. **table** is the table within the db that will hold keys and values (defaults to sdb). The database and table will be created if they do not exist.

**Advanced Usage:**

Instead of a table name, it is possible to provide custom SQL statements to create the table(s) and get and set values.
salt.sdb.sqlite3.get(key, profile=None)
    Get a value from sqlite3

count.sdb.sqlite3.set_(key, value, profile=None)
    Set a key/value pair in sqlite3

21.17.12 salt.sdb.tism module

tISM - the Immutable Secrets Manager SDB Module
    maintainer tISM
    maturity New
    platform all

New in version 2017.7.0.

This module will decrypt PGP encrypted secrets against a tISM server.

```
sdb://<profile>/<encrypted secret>
```

A profile must be setup in the minion configuration or pillar. If you want to use sdb in a runner or pillar you must also place a profile in the master configuration.

```
tism:
    driver: tism
    url: https://my.tismd:8080/decrypt
    token: eyJhbGciOiJIUzI1NiIsInR5cCI6IkpXVCJ9.
        eyJhZG1pbiI6MSwiZXhwIjoxNTg1MTExNDYwLCJqdGkiOiI3NnA5cWNiMWMiLCJzdWIiOiIwNjU3MjA4NSIsImlhdCI6MTU2MjI5MDEwNn0.
        RtAhG6Uorf5xHs4Ya_gw3noHkCsq14r1_h10edSLzo
```

count.sdb.tism.get(key, service=None, profile=None)
    Get a decrypted secret from the tISMD API

21.17.13 salt.sdb.vault module

Vault SDB Module
    maintainer SaltStack
    maturity New
    platform all

New in version 2016.11.0.

This module allows access to Hashicorp Vault using an sdb:// URL.

Base configuration instructions are documented in the execution module docs. Below are noted extra configuration required for the sdb module, but the base configuration must also be completed.

Like all sdb modules, the vault module requires a configuration profile to be configured in either the minion configuration file or a pillar. This profile requires only setting the driver parameter to vault:
myvault:
  driver: vault

Once configured you can access data using a URL such as:

`myvault: sdb://myvault/secret/passwords/mypassword`

In this URL, `myvault` refers to the configuration profile, `secret/passwords` is the path where the data resides, and `mypassword` is the key of the data to return.

The above URI is analogous to running the following vault command:

```
$ vault read -field=mypassword secret/passwords
```

salt.sdb.vault.get(key, profile=None)
Get a value from the vault service

salt.sdb.vault.set_(key, value, profile=None)
Set a key/value pair in the vault service

### 21.17.14 salt.sdb.yaml module

Pull sdb values from a YAML file

- maintainer SaltStack
- maturity New
- platform all

New in version 2017.7.0.

Configuration:

```
my-yaml-file:
  driver: yaml
  files:
    - /path/to/foo.yaml
    - /path/to/bar.yaml
```

The files are merged together and the result is searched using the same mechanism Salt uses for searching Grains and Pillar data structures.

Optional configuration:

```
my-yaml-file:
  driver: yaml
  files:
    - /path/to/foo.yaml
    - /path/to/bar.yaml
  merge: strategy: smart
    merge_list: false
  gpg: true
```

Setting the `gpg` option to `true` (default is `false`) will decrypt embedded GPG-encrypted data using the `GPG renderer`. 
salt.sdb.yaml.get(key, profile=None)
    Get a value from the dictionary

salt.sdb.yaml.set_(*args, **kwargs)
    Setting a value is not supported; edit the YAML files directly

## 21.18 serializer modules

<table>
<thead>
<tr>
<th>Module</th>
<th>Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>configparser</td>
<td>salt.serializers.configparser</td>
</tr>
<tr>
<td>json</td>
<td>salt.serializers.json</td>
</tr>
<tr>

<td>salt.serializers.msgpack</td>
</tr>
<tr>
<td>python</td>
<td>salt.serializers.python</td>
</tr>
<tr>
<td>yaml</td>
<td>salt.serializers.yaml</td>
</tr>
<tr>
<td>yamlex</td>
<td>salt.serializers.yamlex</td>
</tr>
</tbody>
</table>

### 21.18.1 salt.serializers.configparser module

salt.serializers.configparser

New in version 2016.3.0.

Implements a configparser serializer.

salt.serializers.configparser.deserialize(stream_or_string, **options)
    Deserialize any string or stream like object into a Python data structure.
    Parameters
    • stream_or_string – stream or string to deserialize.
    • options – options given to lower configparser module.

salt.serializers.configparser.serialize(obj, **options)
    Serialize Python data to a configparser formatted string or file.
    Parameters
    • obj – the data structure to serialize
    • options – options given to lower configparser module.

### 21.18.2 salt.serializers.json

salt.serializers.json

Implements JSON serializer.

It's just a wrapper around json (or simplejson if available).

salt.serializers.json.deserialize(stream_or_string, **options)
    Deserialize any string or stream like object into a Python data structure.
    Parameters
    • stream_or_string – stream or string to deserialize.
    • options – options given to lower json/simplejson module.

salt.serializers.json.serialize(obj, **options)
    Serialize Python data to JSON.
    Parameters
    • obj – the data structure to serialize
- **options** – options given to lower json/simplejson module.

### 21.18.3 salt.serializers.msgpack

salt.serializers.msgpack

Implements MsgPack serializer.

salt.serializers.msgpack.deserializestream_or_string,**options

Deserializes any string of stream-like object into a Python data structure.

- **stream_or_string** – stream or string to deserialize.
- **options** – options given to lower msgpack module.

salt.serializers.msgpack.serializeobj,**options

Serializes Python data to MsgPack.

- **obj** – the data structure to serialize
- **options** – options given to lower msgpack module.

### 21.18.4 salt.serializers.python module

salt.serializers.python

New in version 2016.3.0.

Implements a Python serializer (via pprint.format)

salt.serializers.python.serializeobj,**options

Serializes Python data to a Python string representation (via pprint.format)

- **obj** – the data structure to serialize
- **options** – options given to pprint.format

### 21.18.5 salt.serializers.yaml

salt.serializers.yaml

Implements YAML serializer.

Underneath, it is based on pyyaml and use the safe dumper and loader. It also use C bindings if they are available.

salt.serializers.yaml.deserializestream_or_string,**options

Deserializes any string of stream-like object into a Python data structure.

- **stream_or_string** – stream or string to deserialize.
- **options** – options given to lower yaml module.

salt.serializers.yaml.serializeobj,**options

Serializes Python data to YAML.

- **obj** – the data structure to serialize
- **options** – options given to lower yaml module.
YAMLEX is a format that allows for things like sls files to be more intuitive.

It’s an extension of YAML that implements all the salt magic: - it implies omap for any dict like. - it implies that string like data are str, not unicode - ...

For example, the file `states.sls` has this contents:

```yaml
foo:
  bar: 42
  baz: [1, 2, 3]
```

The file can be parsed into Python like this

```python
from salt.serializers import yamlex
with open('state.sls', 'r') as stream:
    obj = yamlex.deserialize(stream)
```

Check that `obj` is an OrderedDict

```python
from salt.utils.odict import OrderedDict
assert isinstance(obj, dict)
assert isinstance(obj, OrderedDict)
```

yamlex `__repr__` and `__str__` objects’ methods render YAML understandable string. It means that they are template friendly.

```python
print '{0}'.format(obj)
```

returns:

```yaml
{foo: {bar: 42, baz: [1, 2, 3]}}
```

and they are still valid YAML:

```python
from salt.serializers import yaml
yml_obj = yaml.deserialize(str(obj))
assert yml_obj == obj
```

yamlex implements also custom tags:

```text
!aggregate
```

this tag allows structures aggregation.

For example:

```yaml
placeholder: !aggregate foo
placeholder: !aggregate bar
placeholder: !aggregate baz
```

is rendered as
```python
placeholder: [foo, bar, baz]

!reset

document

this tag flushes the computing value.

```python
placeholder: {{!aggregate foo: {foo: 42}}}
placeholder: {{!aggregate foo: {bar: null}}}
placeholder: {{!reset placeholder: {{!aggregate foo: {baz: inga}}}}}
```

is roughly equivalent to

```python
{{!aggregate foo: {baz: inga}}}
```

Document is defacto an aggregate mapping.

```python
salt.serializers.yamlex.deserialize(stream_or_string, **options)
```

Deserialize any string of stream like object into a Python data structure.

**Parameters**

- `stream_or_string` – stream or string to deserialize.
- `options` – options given to lower yaml module.

```python
salt.serializers.yamlex.serialize(obj, **options)
```

Serialize Python data to YAML.

**Parameters**

- `obj` – the data structure to serialize
- `options` – options given to lower yaml module.

### 21.19.1 salt.states.acme module

**ACME / Let’s Encrypt certificate management state**

See also the module documentation

```yaml
reload-gitlab:
    cmd.run:
      - name: gitlab-ctl hup

develop.example.com:
  acme.cert:
    - aliases:
    - gitlab.example.com
    - email: acmemaster@example.com
    - webroot: /opt/gitlab/embedded/service/gitlab-rails/public
    - renew: 14
    - fire_event: acme/develop.example.com
    - onchanges_in:
      - cmd: reload-gitlab
```

**salt.states.acme.cert**

```python
salt.states.acme.cert(name, aliases=None, email=None, webroot=None, test_cert=False, renew=None, keysize=None, server=None, owner='root', group='root', mode='0640', certname=None, preferred_challenges=None, tls_sni_01_port=None, tls_sni_01_address=None, http_01_port=None, http_01_address=None, dns_plugin=None, dns_plugin_credentials=None)
```

Obtain/renew a certificate from an ACME CA, probably Let’s Encrypt.

**Parameters**
• **name** – Common Name of the certificate (DNS name of certificate)
• **aliases** – subjectAltNames (Additional DNS names on certificate)
• **email** – e-mail address for interaction with ACME provider
• **webroot** – True or a full path to webroot. Otherwise use standalone mode
• **test_cert** – Request a certificate from the Happy Hacker Fake CA (mutually exclusive with 'server')
• **renew** – ‘True/force’ to force a renewal, or a window of renewal before expiry in days
• **keysize** – RSA key bits
• **server** – API endpoint to talk to
• **owner** – owner of the private key file
• **group** – group of the private key file
• **mode** – mode of the private key file
• **certname** – Name of the certificate to save
• **preferred_challenges** – A sorted, comma delimited list of the preferred challenge to use during authorization with the most preferred challenge listed first.
• **tls_sni_01_port** – Port used during tls-sni-01 challenge. This only affects the port Certbot listens on. A conforming ACME server will still attempt to connect on port 443.
• **tls_sni_01_address** – The address the server listens to during tls-sni-01 challenge.
• **http_01_port** – Port used in the http-01 challenge. This only affects the port Certbot listens on. A conforming ACME server will still attempt to connect on port 80.
• **https_01_address** – The address the server listens to during http-01 challenge.
• **dns_plugin** – Name of a DNS plugin to use (currently only 'cloudflare')
• **dns_plugin_credentials** – Path to the credentials file if required by the specified DNS plugin

### 21.19.2 salt.states.alias

Configuration of email aliases

The mail aliases file can be managed to contain definitions for specific email aliases:

```yaml
username:
    alias.present:
        - target: user@example.com

thomas:
    alias.present:
        - target: thomas@example.com
```

The default alias file is set to `/etc/aliases`, as defined in Salt’s config execution module. To change the alias file from the default location, set the following in your minion config:

```yaml
aliases.file: /my/alias/file
```

salt.states.alias.absent(name)

Ensure that the named alias is absent

name The alias to remove

salt.states.alias.present(name, target)

Ensures that the named alias is present with the given target or list of targets. If the alias exists but the target
differs from the previous entry, the target(s) will be overwritten. If the alias does not exist, the alias will be
created.
name  The local user/address to assign an alias to
target  The forwarding address

21.19.3 salt.states.alternatives

Configuration of the alternatives system

Control the alternatives system

```yaml
{% set my_hadoop_conf = '/opt/hadoop/conf' %}

{{ my_hadoop_conf }}:
- file.directory
  hadoop-0.20-conf:
  - alternatives.install:
    - name: hadoop-0.20-conf
      - link: /etc/hadoop-0.20/conf
      - path: {{ my_hadoop_conf }}
      - priority: 30
      - require:
        - file: {{ my_hadoop_conf }}
  hadoop-0.20-conf:
  - alternatives.remove:
    - name: hadoop-0.20-conf
    - path: {{ my_hadoop_conf }}

salt.states.alternatives.auto(name)
New in version 0.17.0.
Instruct alternatives to use the highest priority path for <name>
name  is the master name for this link group (e.g. pager)

salt.states.alternatives.install(name, link, path, priority)
Install new alternative for defined <name>
name  is the master name for this link group (e.g. pager)
link  is the symlink pointing to /etc/alternatives/<name>. (e.g. /usr/bin/pager)
path  is the location of the new alternative target. NB: This file / directory must already exist. (e.g. /
usr/bin/less)
priority  is an integer; options with higher numbers have higher priority in automatic mode.

salt.states.alternatives.remove(name, path)
Removes installed alternative for defined <name> and <path> or fallback to default alternative, if some defined
before.
name  is the master name for this link group (e.g. pager)
path  is the location of one of the alternative target files. (e.g. /usr/bin/less)

salt.states.alternatives.set_(name, path)
New in version 0.17.0.
Sets alternative for <name> to <path>, if <path> is defined as an alternative for <name>.
name  is the master name for this link group (e.g. pager)
path  is the location of one of the alternative target files. (e.g. /usr/bin/less)
foo:
  alternatives.set:
    path: /usr/bin/foo-2.0

21.19.4 salt.states.ansiblegate

Execution of Ansible modules from within states

With `ansible.call` these states allow individual Ansible module calls to be made via states. To call an Ansible module function use a `module.run` state:

```yaml
some_set_of_tasks:
  ansible:
    - system.ping
    - packaging.os.zypper
    - name: emacs
      state: installed
```

```python
class salt.states.ansiblegate.AnsibleState
    Ansible state caller.

    get_args(argset)
    Get args and kwargs from the argset.
    Parameters argset –
    Returns

class salt.states.ansiblegate.Playbooks
    Run Ansible Playbooks
    Parameters
    • name – path to playbook. This can be relative to rundir or the git repo
    • rundir – location to run ansible-playbook from.
    • git_repo – git repository to clone for ansible playbooks. This is cloned using the
      git.latest state, and is cloned to the rundir if specified, otherwise it is clone to the
      cache_dir
    • git_kwargs – extra kwargs to pass to git.latest state module besides the name and
      target
    • ansible_kwargs – extra kwargs to pass to ansible.playbooks execution module
      besides the name and target
    Returns Ansible playbook output.
```

```yaml
run nginx install:
  ansible.playbooks:
    name: install.yml
    git_repo: git://github.com/gituser/playbook.git
    git_keywords: master
```

21.19.5 salt.states.apache

Apache state

New in version 2014.7.0.
Allows for inputting a yaml dictionary into a file for apache configuration files.

The variable `this` is special and signifies what should be included with the above word between angle brackets (`<>`).

```
/etc/httpd/conf.d/website.com.conf:
apache.configfile:
  - config:
    - VirtualHost:
      this: `*:80'
    ServerName:
      - website.com
    ServerAlias:
      - www.website.com
      - dev.website.com
    ErrorLog: logs/website.com-error_log
    CustomLog: logs/website.com-access_log combined
    DocumentRoot: /var/www/vhosts/website.com
    Directory:
      this: /var/www/vhosts/website.com
      Order: Deny,Allow
      Deny from: all
      Allow from:
        - 127.0.0.1
        - 192.168.100.0/24
    Options:
      - Indexes
      - FollowSymlinks
    AllowOverride: All
```

Changed in version 2018.3.

Allows having the same section container multiple times (e.g. `<Directory /path/to/dir>`).

YAML structure stays the same only replace dictionary with a list.

When a section container does not have mandatory attribute, such as `<Else>`, it still needs keyword `this` with empty string (or "" if nicer output is required - without space).

```
/etc/httpd/conf.d/website.com.conf:
apache.configfile:
  - config:
    - VirtualHost:
      this: `*:80'
    ServerName:
      - website.com
    DocumentRoot: /var/www/vhosts/website.com
    Directory:
      this: /var/www/vhosts/website.com
      Order: Deny,Allow
      Deny from: all
      Allow from:
        - 127.0.0.1
        - 192.168.100.0/24
    Options:
      - Indexes
      - FollowSymlinks
    AllowOverride: All
    Directory:
      this: /var/www/vhosts/website.com/private
```
- **Order**: Deny, Allow
- **Deny from**: all
- **Allow from**:
  - 127.0.0.1
  - 192.168.100.0/24
- **If**:
  - **this**: some condition
  - **do**: something
- **Else**:
  - **this**: something else
- **Else**:
  - **this**: ""
  - **do**: another thing

salt.states.apache.configfile(name, config)

### 21.19.6 salt.states.apache_conf module

Manage Apache Confs

New in version 2016.3.0.

Enable and disable apache confs.

```yaml
Enable security conf:
  apache_conf.enabled:
    - name: security

Disable security conf:
  apache_conf.disabled:
    - name: security
```

salt.states.apache_conf.disabled(name)

Ensure an Apache conf is disabled.

*name* Name of the Apache conf

salt.states.apache_conf.enabled(name)

Ensure an Apache conf is enabled.

*name* Name of the Apache conf

### 21.19.7 salt.states.apache_module

Manage Apache Modules

New in version 2014.7.0.

Enable and disable apache modules.

```yaml
Enable cgi module:
  apache_module.enabled:
    - name: cgi

Disable cgi module:
  apache_module.disabled:
    - name: cgi
```
salt.states.apache_module.disabled(name)
Ensure an Apache module is disabled.

    New in version 2016.3.0.
    name Name of the Apache module

salt.states.apache_module.enabled(name)
Ensure an Apache module is enabled.

    New in version 2016.3.0.
    name Name of the Apache module

21.19.8 salt.states.apache_site module

Manage Apache Sites

New in version 2016.3.0.

Enable and disable apache sites.

```yaml
Enable default site:
  apache_site.enabled:
    - name: default

Disable default site:
  apache_site.disabled:
    - name: default
```

salt.states.apache_site.disabled(name)
Ensure an Apache site is disabled.

    name Name of the Apache site

salt.states.apache_site.enabled(name)
Ensure an Apache site is enabled.

    name Name of the Apache site

21.19.9 salt.states.aptpkg

Package management operations specific to APT- and DEB-based systems

salt.states.aptpkg.held(name)
Set package in 'hold' state, meaning it will not be upgraded.

    name The name of the package, e.g., 'tmux'

21.19.10 salt.states.archive

Extract an archive

New in version 2014.1.0.
salt.states.archive.extracted(name, source, source_hash=None, source_hash_name=None, source_hash_update=False, skip_verify=False, password=None, options=None, list_options=None, force=False, overwrite=False, clean=False, user=None, group=None, if_missing=None, trim_output=False, use_cmd_unzip=None, extract_perms=True, enforce_toplevel=True, enforce_ownership_on=None, archive_format=None, **kwargs)

New in version 2014.1.0.

Changed in version 2016.11.0: This state has been rewritten. Some arguments are new to this release and will not be available in the 2016.3 release cycle (and earlier). Additionally, the ZIP Archive Handling section below applies specifically to the 2016.11.0 release (and newer).

Ensure that an archive is extracted to a specific directory.

**Important:** Changes for 2016.11.0

In earlier releases, this state would rely on the if_missing argument to determine whether or not the archive needed to be extracted. When this argument was not passed, then the state would just assume if_missing is the same as the name argument (i.e. the parent directory into which the archive would be extracted).

This caused a number of annoyances. One such annoyance was the need to know beforehand a path that would result from the extraction of the archive, and setting if_missing to that directory, like so:

```
extract_myapp:
  archive.extracted:
    - name: /var/www
    - source: salt://apps/src/myapp-16.2.4.tar.gz
    - user: www
    - group: www
    - if_missing: /var/www/myapp-16.2.4
```

If /var/www already existed, this would effectively make if_missing a required argument, just to get Salt to extract the archive.

Some users worked around this by adding the top-level directory of the archive to the end of the name argument, and then used --strip or --strip-components to remove that top-level dir when extracting:

```
extract_myapp:
  archive.extracted:
    - name: /var/www/myapp-16.2.4
    - source: salt://apps/src/myapp-16.2.4.tar.gz
    - user: www
    - group: www
```

With the rewrite for 2016.11.0, these workarounds are no longer necessary. if_missing is still a supported argument, but it is no longer required. The equivalent SLS in 2016.11.0 would be:

```
extract_myapp:
  archive.extracted:
    - name: /var/www
    - source: salt://apps/src/myapp-16.2.4.tar.gz
    - user: www
    - group: www
```

Salt now uses a function called archive.list to get a list of files/directories in the archive. Using this information, the state can now check the minion to see if any paths are missing, and know whether or not the
archive needs to be extracted. This makes the if_missing argument unnecessary in most use cases.

---

**Important: ZIP Archive Handling**

*Note: this information applies to 2016.11.0 and later.*

Salt has two different functions for extracting ZIP archives:

1. `archive.unzip`, which uses Python’s `zipfile` module to extract ZIP files.
2. `archive.cmd_unzip`, which uses the `unzip` CLI command to extract ZIP files.

Salt will prefer the use of `archive.cmd_unzip` when CLI options are specified (via the `options` argument), and will otherwise prefer the `archive.unzip` function. Use of `archive.cmd_unzip` can be forced however by setting the `use_cmd_unzip` argument to True. By contrast, setting this argument to False will force usage of `archive.unzip`. For example:

```
/var/www:
archive.extracted:
- source: salt://foo/bar/myapp.zip
- use_cmd_unzip: True
```

When `use_cmd_unzip` is omitted, Salt will choose which extraction function to use based on the source archive and the arguments passed to the state. When in doubt, simply do not set this argument; it is provided as a means of overriding the logic Salt uses to decide which function to use.

There are differences in the features available in both extraction functions. These are detailed below.

- **Command-line options** (only supported by `archive.cmd_unzip`) - When the `options` argument is used, `archive.cmd_unzip` is the only function that can be used to extract the archive. Therefore, if `use_cmd_unzip` is specified and set to False, and `options` is also set, the state will not proceed.
- **Permissions** - Due to an upstream bug in Python, permissions are not preserved when the `zipfile` module is used to extract an archive. As of the 2016.11.0 release, `archive.unzip` (as well as this state) has an `extract_perms` argument which, when set to True (the default), will attempt to match the permissions of the extracted files/directories to those defined within the archive. To disable this functionality and have the state not attempt to preserve the permissions from the ZIP archive, set `extract_perms` to False:

```
/var/www:
archive.extracted:
- source: salt://foo/bar/myapp.zip
- extract_perms: False
```

**name** Directory into which the archive should be extracted

**source** Archive to be extracted

*Note: This argument uses the same syntax as its counterpart in the `file.managed` state.*

**source_hash** Hash of source file, or file with list of hash-to-file mappings

*Note: This argument uses the same syntax as its counterpart in the `file.managed` state.*

Changed in version 2016.11.0: If this argument specifies the hash itself, instead of a URI to a file containing hashes, the hash type can now be omitted and Salt will determine the hash type based on the length of the hash. For example, both of the below states are now valid, while before only the second one would be:

```
```
foo_app:
  archive.extracted:
    - name: /var/www
    - source: https://mydomain.tld/foo.tar.gz
    - source_hash: 3360db35e682f1c5f9c58aa307de16d41361618c

bar_app:
  archive.extracted:
    - name: /var/www
    - source: https://mydomain.tld/bar.tar.gz
    - source_hash: sha1=5edb7d584b82ddcbf76e311601f5d4442974aaa5

source_hash_name  When source_hash refers to a hash file, Salt will try to find the correct hash by matching the filename part of the source URI. When managing a file with a source of salt://files/ foo.tar.gz, then the following line in a hash file would match:

    acbd18db4cc2f85cedef654fccc4a4d8 foo.tar.gz

This line would also match:

    acbd18db4cc2f85cedef654fccc4a4d8 ./dir1/foo.tar.gz

However, sometimes a hash file will include multiple similar paths:

    37b51d194a7513e45b56f6524f2d51f2 ./dir1/foo.txt
    acbd18db4cc2f85cedef654fccc4a4d8 ./dir2/foo.txt
    73feffa4b7f6bb68e44cf984c85f6e88 ./dir3/foo.txt

In cases like this, Salt may match the incorrect hash. This argument can be used to tell Salt which filename to match, to ensure that the correct hash is identified. For example:

/[var/www:
  archive.extracted:
    - source: https://mydomain.tld/dir2/foo.tar.gz
    - source_hash: https://mydomain.tld/hashes
    - source_hash_name: ./dir2/foo.tar.gz

Note: This argument must contain the full filename entry from the checksum file, as this argument is meant to disambiguate matches for multiple files that have the same basename. So, in the example above, simply using foo.txt would not match.

New in version 2016.11.0.

source_hash_update  [False] Set this to True if archive should be extracted if source_hash has changed. This would extract regardless of the if_missing parameter.

New in version 2016.3.0.

skip_verify  [False] If True, hash verification of remote file sources (http://, https://, ftp://) will be skipped, and the source_hash argument will be ignored.

New in version 2016.3.4.

keep_source  [True] For source archives not local to the minion (i.e. from the Salt fileserver or a remote source such as http(s) or ftp), Salt will need to download the archive to the minion cache before they can be extracted. To remove the downloaded archive after extraction, set this argument to False.

New in version 2017.7.3.

keep  [True] Same as keep_source, kept for backward-compatibility.
Note: If both keep_source and keep are used, keep will be ignored.

**password**  For ZIP archives only. Password used for extraction.

New in version 2016.3.0.

Changed in version 2016.11.0: The newly-added `archive.is_encrypted` function will be used to determine if the archive is password-protected. If it is, then the password argument will be required for the state to proceed.

**options**  For tar and zip archives only. This option can be used to specify a string of additional arguments to pass to the tar/zip command.

If this argument is not used, then the minion will attempt to use Python’s native `tarfile/zipfile` support to extract it. For zip archives, this argument is mostly used to overwrite existing files with o.

Using this argument means that the `tar` or `unzip` command will be used, which is less platform-independent, so keep this in mind when using this option; the CLI options must be valid options for the `tar/unzip` implementation on the minion’s OS.

New in version 2016.11.0.

Changed in version 2015.8.11,2016.3.2: XZ-compressed tar archives no longer require J to manually be set in the options, they are now detected automatically and decompressed using the `xz` CLI command and extracted using `tar xvf`. This is a more platform-independent solution, as not all tar implementations support the J argument for extracting archives.

Note: For tar archives, main operators like `-x, --extract, --get, -c and -f/--file` should **not** be used here.

**list_options**  For tar archives only. This state uses `archive.list` to discover the contents of the source archive so that it knows which file paths should exist on the minion if the archive has already been extracted. For the vast majority of tar archives, `archive.list"just works"`. Archives compressed using gzip, bzip2, and xz/lzma (with the help of the `xz` CLI command) are supported automatically. However, for archives compressed using other compression types, CLI options must be passed to `archive.list`.

This argument will be passed through to `archive.list` as its `options` argument, to allow it to successfully list the archive’s contents. For the vast majority of archives, this argument should not need to be used, it should only be needed in cases where the state fails with an error stating that the archive’s contents could not be listed.

New in version 2016.11.0.

**force**  [False] If a path that should be occupied by a file in the extracted result is instead a directory (or vice-versa), the state will fail. Set this argument to `True` to force these paths to be removed in order to allow the archive to be extracted.

Warning: Use this option very carefully.

New in version 2016.11.0.

**overwrite**  [False] Set this to `True` to force the archive to be extracted. This is useful for cases where the filenames/directories have not changed, but the content of the files have.

New in version 2016.11.1.

**clean**  [False] Set this to `True` to remove any top-level files and recursively remove any top-level directory paths before extracting.
Note: Files will only be cleaned first if extracting the archive is deemed necessary, either by paths missing on the minion, or if overwrite is set to True.

New in version 2016.11.1.

user The user to own each extracted file. Not available on Windows.

New in version 2015.8.0.

Changed in version 2016.3.0: When used in combination with if_missing, ownership will only be enforced if if_missing is a directory.

Changed in version 2016.11.0: Ownership will be enforced only on the file/directory paths found by running archive.list on the source archive. An alternative root directory on which to enforce ownership can be specified using the enforce_ownership_on argument.

group The group to own each extracted file. Not available on Windows.

New in version 2015.8.0.

Changed in version 2016.3.0: When used in combination with if_missing, ownership will only be enforced if if_missing is a directory.

Changed in version 2016.11.0: Ownership will be enforced only on the file/directory paths found by running archive.list on the source archive. An alternative root directory on which to enforce ownership can be specified using the enforce_ownership_on argument.

if_missing If specified, this path will be checked, and if it exists then the archive will not be extracted. This path can be either a directory or a file, so this option can also be used to check for a semaphore file and conditionally skip extraction.

Changed in version 2016.3.0: When used in combination with either user or group, ownership will only be enforced when if_missing is a directory.

Changed in version 2016.11.0: Ownership enforcement is no longer tied to this argument, it is simply checked for existence and extraction will be skipped if if is present.

trim_output [False] Useful for archives with many files in them. This can either be set to True (in which case only the first 100 files extracted will be in the state results), or it can be set to an integer for more exact control over the max number of files to include in the state results.

New in version 2016.3.0.

use_cmd_unzip [False] Set to True for zip files to force usage of the archive.cmd_unzip function to extract.

New in version 2016.11.0.

extract_perms [True] For ZIP archives only. When using archive.unzip to extract ZIP archives, Salt works around an upstream bug in Python to set the permissions on extracted files/directories to match those encoded into the ZIP archive. Set this argument to False to skip this workaround.

New in version 2016.11.0.

enforce_toplevel [True] This option will enforce a single directory at the top level of the source archive, to prevent extracting a ‘tar-bomb’. Set this argument to False to allow archives with files (or multiple directories) at the top level to be extracted.

New in version 2016.11.0.

enforce_ownership_on When user or group is specified, Salt will default to enforcing permissions on the file/directory paths detected by running archive.list on the source archive. Use this argument to specify an alternate directory on which ownership should be enforced.

Note: This path must be within the path specified by the name argument.
New in version 2016.11.0.

archive_format One of tar, zip, or rar.

Changed in version 2016.11.0: If omitted, the archive format will be guessed based on the value of the source argument. If the minion is running a release older than 2016.11.0, this option is required.

Examples
1. tar with lmza (i.e. xz) compression:

```
graylog2-server:
archive.extracted:
  - name: /opt/
  - source: https://github.com/downloads/Graylog2/graylog2-server/graylog2-server-0.9.6p1.tar.lzma
  - source_hash: md5=499ae16dcae71eeb7c3a30c75ea7a1a6
```

2. tar archive with flag for verbose output, and enforcement of user/group ownership:

```
graylog2-server:
archive.extracted:
  - name: /opt/
  - source: https://github.com/downloads/Graylog2/graylog2-server/graylog2-server-0.9.6p1.tar.gz
  - source_hash: md5=499ae16dcae71eeb7c3a30c75ea7a1a6
  - options: v
  - user: foo
  - group: foo
```

3. tar archive, with source_hash_update set to True to prevent state from attempting extraction unless the source_hash differs from the previous time the archive was extracted:

```
graylog2-server:
archive.extracted:
  - name: /opt/
  - source: https://github.com/downloads/Graylog2/graylog2-server/graylog2-server-0.9.6p1.tar.lzma
  - source_hash: md5=499ae16dcae71eeb7c3a30c75ea7a1a6
  - source_hash_update: True
```

21.19.11 salt.states.artifactory

This state downloads artifacts from artifactory.

```python
salt.states.artifactory.downloaded(name, artifact, target_dir='/tmp', target_file=None, use_literal_group_id=False)
```

Ensures that the artifact from artifactory exists at given location. If it doesn’t exist, then it will be downloaded. If it already exists then the checksum of existing file is checked against checksum in artifactory. If it is different then the step will fail.

artifact Details of the artifact to be downloaded from artifactory. Various options are:
- artifact_url: URL of the artifactory instance
- repository: Repository in artifactory
- artifact_id: Artifact ID
- group_id: Group ID
- packaging: Packaging
- classifier: Classifier .. versionadded:: 2015.8.0
- version: Version One of the following: - Version to download - latest - Download the latest release of this artifact - latest_snapshot - Download the latest snapshot for this artifact
- username: Artifactory username .. versionadded:: 2015.8.0
• password: Artifactory password .. versionadded:: 2015.8.0

target_dir  Directory where the artifact should be downloaded. By default it is downloaded to /tmp directory.
target_file  Target file to download artifact to. By default file name is resolved by artifactory.

An example to download an artifact to a specific file:

```
jboss_module_downloaded:
artifactory.downloaded:
  - artifact:
      artifactory_url: http://artifactory.intranet.example.com/artifactory
      repository: 'libs-release-local'
      artifact_id: 'module'
      group_id: 'com.company.module'
      packaging: 'jar'
      classifier: 'sources'
      version: '1.0'
      target_file: /opt/jboss7/modules/com/company/lib/module.jar
```

Download artifact to the folder (automatically resolves file name):

```
jboss_module_downloaded:
artifactory.downloaded:
  - artifact:
      artifactory_url: http://artifactory.intranet.example.com/artifactory
      repository: 'libs-release-local'
      artifact_id: 'module'
      group_id: 'com.company.module'
      packaging: 'jar'
      classifier: 'sources'
      version: '1.0'
      target_dir: /opt/jboss7/modules/com/company/lib
```

21.19.12  salt.states.at

Configuration disposable regularly scheduled tasks for at.

The at state can be add disposable regularly scheduled tasks for your system.

```
salt.states.at.absent(name, jobid=None, **kwargs)
```

Changed in version 2017.7.0.

Remove a job from queue

jobid: string|int  Specific jobid to remove
tag  [string] Job's tag
runas  [string] Runs user-specified jobs
kwargs  Addition kwargs can be provided to filter jobs. See output of at.jobcheck for more.

```
example1:
at.absent:
```

```
Warning: this will remove all jobs!
```

```
example2:
at.absent:
  - year: 13
```
example3:
  at.absent:
    - tag: rose

example4:
  at.absent:
    - tag: rose
    - day: 13
    - hour: 16

example5:
  at.absent:
    - jobid: 4

salt.states.at.mod_watch(name, **kwargs)

The at watcher, called to invoke the watch command.

Note: This state exists to support special handling of the watch requisite. It should not be called directly.
Parameters for this function should be set by the state being triggered.

name The name of the atjob

salt.states.at.present(name, timespec, tag=None, user=None, job=None, unique_tag=False)

Changed in version 2017.7.0.
Add a job to queue.
job [string] Command to run.
timespec [string] The ‘timespec’ follows the format documented in the at(1) manpage.
tag [string] Make a tag for the job.
user [string] The user to run the at job .. versionadded:: 2014.1.4
unique_tag [boolean] If set to True job will not be added if a job with the tag exists. .. versionadded:: 2017.7.0

rose:
  at.present:
    - job: 'echo "I love saltstack" > love'
    - timespec: '9:09 11/09/13'
    - tag: love
    - user: jam

salt.states.at.watch(name, timespec, tag=None, user=None, job=None, unique_tag=False)

New in version 2017.7.0.
Add an at job if trigger by watch
job [string] Command to run.
timespec [string] The ‘timespec’ follows the format documented in the at(1) manpage.
tag [string] Make a tag for the job.
user [string] The user to run the at job .. versionadded:: 2014.1.4
unique_tag [boolean] If set to True job will not be added if a job with the tag exists. .. versionadded:: 2017.7.0

minion_restart:
  at.watch:
    - job: 'salt-call --local service.restart salt-minion'
    - timespec: 'now +1 min'
    - tag: minion_restart

(continues on next page)
21.19.13 salt.states.augeas

Configuration management using Augeas
New in version 0.17.0.
This state requires the augeas Python module.
Augeas can be used to manage configuration files.

Warning: Minimal installations of Debian and Ubuntu have been seen to have packaging bugs with python-augeas, causing the augeas module to fail to import. If the minion has the augeas module installed, and the state fails with a comment saying that the state is unavailable, first restart the salt-minion service. If the problem persists past that, the following command can be run from the master to determine what is causing the import to fail:

```
salt minion-id cmd.run 'python -c "from augeas import Augeas"'
```

For affected Debian/Ubuntu hosts, installing libpython2.7 has been known to resolve the issue.

salt.states.augeas.change(name, context=None, changes=None, lens=None, load_path=None, **kwargs)

New in version 2014.7.0.
This state replaces setvalue().

Issue changes to Augeas, optionally for a specific context, with a specific lens.

name State name
context A file path, prefixed by /files. Should resolve to an actual file (not an arbitrary augeas path). This is used to avoid duplicating the file name for each item in the changes list (for example, set bind 0.0.0.0 in the example below operates on the file specified by context). If context is not specified, a file path prefixed by /files should be included with the set command.

The file path is examined to determine if the specified changes are already present.

```
redis-conf:
augeas.change:
  - context: /files/etc/redis/redis.conf
  - changes:
    - set bind 0.0.0.0
    - set maxmemory 1G
```

dict

changes List of changes that are issued to Augeas. Available commands are set, setm, mv/move, ins/insert, and rm/remove.
lens The lens to use, needs to be suffixed with .lns, e.g.: Nginx.lns. See the list of stock lenses shipped with Augeas.
load_path A list of directories that modules should be searched in. This is in addition to the standard load path and the directories in AUGEAS_LIB.
Usage examples:

Set the bind parameter in /etc/redis/redis.conf:
### redis-conf

**augeas.change:**
- **changes:**
  - set /files/etc/redis/redis.conf/bind 0.0.0.0

**Note:** Use the `context` parameter to specify the file you want to manipulate. This way you don’t have to include this in the changes every time:

```yaml
redis-conf:
  augeas.change:
    - context: /files/etc/redis/redis.conf
    - changes:
      - set bind 0.0.0.0
      - set databases 4
      - set maxmemory 1G
```

Augeas is aware of a lot of common configuration files and their syntax. It knows the difference between for example ini and yaml files, but also files with very specific syntax, like the hosts file. This is done with lenses, which provide mappings between the Augeas tree and the file.

There are many preconfigured lenses that come with Augeas by default, and they specify the common locations for configuration files. So most of the time Augeas will know how to manipulate a file. In the event that you need to manipulate a file that Augeas doesn’t know about, you can specify the lens to use like this:

```yaml
redis-conf:
  augeas.change:
    - lens: redis.lns
    - context: /files/etc/redis/redis.conf
    - changes:
      - set bind 0.0.0.0
```

**Note:** Even though Augeas knows that `/etc/redis/redis.conf` is a Redis configuration file and knows how to parse it, it is recommended to specify the lens anyway. This is because by default, Augeas loads all known lenses and their associated file paths. All these files are parsed when Augeas is loaded, which can take some time. When specifying a lens, Augeas is loaded with only that lens, which speeds things up quite a bit.

A more complex example, this adds an entry to the services file for Zabbix, and removes an obsolete service:

```yaml
zabbix-service:
  augeas.change:
    - lens: services.lns
    - context: /files/etc/services
    - changes:
      - ins service-name after service-name[last()]
      - set service-name[last()] "zabbix-agent"
      - set "service-name[. = 'zabbix-agent']/port" 10050
      - set "service-name[. = 'zabbix-agent']/protocol" tcp
      - set "service-name[. = 'zabbix-agent']/#comment" "Zabbix Agent service"
      - rm "service-name[. = 'im-obsolete']"
      - unless: grep "zabbix-agent" /etc/services
```
Warning: Don’t forget the `unless` here, otherwise it will fail on next runs because the service is already defined. Additionally you have to quote lines containing service-name[. = 'zabbix-agent'] otherwise `augeas_cfg` execute will fail because it will receive more parameters than expected.

Note: Order is important when defining a service with Augeas, in this case it’s `port`, `protocol` and `#comment`. For more info about the lens check `services lens documentation`.

http://augeas.net/docs/references/lenses/files/services-aug.html#Services.record

21.19.14 salt.states.aws_sqs

Manage SQS Queues

Create and destroy SQS queues. Be aware that this interacts with Amazon’s services, and so may incur charges.

This module uses the awscli tool provided by Amazon. This can be downloaded from pip. Also check the documentation for awscli for configuration information.

```yaml
myqueue:
  aws_sqs.exists:
    - region: eu-west-1

salt.states.aws_sqs.absent(name, region, user=None, opts=False)
Removes the named SQS queue if it exists.
name Name of the SQS queue.
region Region to remove the queue from.
user Name of the user performing the SQS operations.
opts Include additional arguments and options to the aws command line

salt.states.aws_sqs.exists(name, region, user=None, opts=False)
Ensures the SQS queue exists.
name Name of the SQS queue.
region Region to create the queue.
user Name of the user performing the SQS operations.
opts Include additional arguments and options to the aws command line
```

21.19.15 salt.states.azurearm_compute

Azure (ARM) Compute State Module

New in version 2019.2.0.

maintainer <devops@decisionlab.io>
maturity new
depends
  • azure >= 2.0.0
  • azure-common >= 1.1.8
  • azure-mgmt >= 1.0.0
  • azure-mgmt-compute >= 1.0.0
configuration  This module requires Azure Resource Manager credentials to be passed as a dictionary of keyword arguments to the `connection_auth` parameter in order to work properly. Since the authentication parameters are sensitive, it’s recommended to pass them to the states via pillar.

Required provider parameters:

**if using username and password:**

- `subscription_id`
- `username`
- `password`

**if using a service principal:**

- `subscription_id`
- `tenant`
- `client_id`
- `secret`

Optional provider parameters:

`cloud_environment`: Used to point the cloud driver to different API endpoints, such as Azure GovCloud. Possible values:

- `AZURE_PUBLIC_CLOUD` (default)
- `AZURE_CHINA_CLOUD`
- `AZURE_US_GOV_CLOUD`
- `AZURE_GERMAN_CLOUD`

Example Pillar for Azure Resource Manager authentication:

```yaml
azurearm:
  user_pass_auth:
    subscription_id: 3287abc8-f98a-c678-3bde-326766fd3617
    username: fletch
    password: 123pass
  mysubscription:
    subscription_id: 3287abc8-f98a-c678-3bde-326766fd3617
    tenant: ABCDEFAB-1234-ABCD-1234-ABCDEFABCDEF
    client_id: ABCDEFAB-1234-ABCD-1234-ABCDEFABCDEF
    secret: XXXXXXXXXXXXXXXXXXXXXXXX
    cloud_environment: AZURE_PUBLIC_CLOUD
```

Example states using Azure Resource Manager authentication:
salt.states.azurearm_compute.availability_set_absent(name, resource_group, connection_auth=None)

New in version 2019.2.0.

Ensure an availability set does not exist in a resource group.

Parameters

- **name** – Name of the availability set.
- **resource_group** – Name of the resource group containing the availability set.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

salt.states.azurearm_compute.availability_set_present(name, resource_group, tags=None, platform_update_domain_count=None, platform_fault_domain_count=None, virtual_machines=None, sku=None, connection_auth=None, **kwargs)

New in version 2019.2.0.

Ensure an availability set exists.

Parameters

- **name** – Name of the availability set.
- **resource_group** – The resource group assigned to the availability set.
- **tags** – A dictionary of strings can be passed as tag metadata to the availability set object.
- **platform_update_domain_count** – An optional parameter which indicates groups of virtual machines and underlying physical hardware that can be rebooted at the same time.
- **platform_fault_domain_count** – An optional parameter which defines the group of virtual machines that share a common power source and network switch.
- **virtual_machines** – A list of names of existing virtual machines to be included in the availability set.
- **sku** – The availability set SKU, which specifies whether the availability set is managed or not. Possible values are 'Aligned' or 'Classic'. An 'Aligned' availability set is managed, 'Classic' is not.
- **connection_auth** – A dict with subscription and authentication parameters to be
used in connecting to the Azure Resource Manager API.

Example usage:

```
Ensure availability set exists:
  azurearm_compute.availability_set_present:
    - name: aset1
    - resource_group: group1
    - platform_update_domain_count: 5
    - platform_fault_domain_count: 3
    - sku: aligned
    - tags:
      contact_name: Elmer Fudd Gantry
    - connection_auth: {{ profile }}
    - require:
      - azurearm_resource: Ensure resource group exists
```

21.19.16 salt.states.azurearm_network

Azure (ARM) Network State Module

New in version 2019.2.0.

maintainer <devops@decisionlab.io>
maturity new
depends
  • azure >= 2.0.0
  • azure-common >= 1.1.8
  • azure-mgmt >= 1.0.0

  • azure-storage >= 0.34.3
  • msrestazure >= 0.4.21

platform linux

configuration This module requires Azure Resource Manager credentials to be passed as a dictionary of keyword arguments to the connection_auth parameter in order to work properly. Since the authentication parameters are sensitive, it’s recommended to pass them to the states via pillar.

Required provider parameters:

if using username and password:
  • subscription_id
  • username
  • password

if using a service principal:
- subscription_id
- tenant
- client_id
- secret

Optional provider parameters:

cloud_environment: Used to point the cloud driver to different API endpoints, such as Azure GovCloud. Possible values:

- AZURE_PUBLIC_CLOUD (default)
- AZURE_CHINA_CLOUD
- AZURE_US_GOV_CLOUD
- AZURE_GERMAN_CLOUD

Example Pillar for Azure Resource Manager authentication:

```yaml
azurearm:
  user_pass_auth:
    subscription_id: 3287abc8-f98a-c678-3bde-326766fd3617
    username: fletch
    password: 123pass
  mysubscription:
    subscription_id: 3287abc8-f98a-c678-3bde-326766fd3617
    tenant: ABCDEFA1234-ABCD-1234-ABCDEFAB123
    client_id: ABCDEFA1234-ABCD-1234-ABCDEFAB123
    secret: XXXXXXXXXXXXXXXXXXXXX
    cloud_environment: AZURE_PUBLIC_CLOUD
```

Example states using Azure Resource Manager authentication:

```python
{% set profile = salt['pillar.get']('azurearm:mysubscription') %}
Ensure virtual network exists:
  azurearm_network.virtual_network_present:
    - name: my_vnet
    - resource_group: my_rg
    - address_prefixes:
      - '10.0.0.0/8'
      - '192.168.0.0/16'
    - dns_servers:
      - '8.8.8.8'
    - tags:
      how_awesome: very
      contact_name: Elmer Fudd Gantry
    - connection_auth: {{ profile }}

Ensure virtual network is absent:
  azurearm_network.virtual_network_absent:
    - name: other_vnet
    - resource_group: my_rg
    - connection_auth: {{ profile }}

salt.states.azurearm_network.load_balancer_absent(name, resource_group, connection_auth=None)

New in version 2019.2.0.

Ensure a load balancer does not exist in the resource group.
Parameters

- **name** – Name of the load balancer.
- **resource_group** – The resource group assigned to the load balancer.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

```
salt.states.azurearm_network.load_balancer_present(name, resource_group, sku=None, frontend_ip_configurations=None, backend_address_pools=None, load_balancing_rules=None, probes=None, inbound_nat_rules=None, inbound_nat_pools=None, outbound_nat_rules=None, tags=None, connection_auth=None, **kwargs)
```

New in version 2019.2.0.

Ensure a load balancer exists.

Parameters

- **name** – Name of the load balancer.
- **resource_group** – The resource group assigned to the load balancer.
- **sku** – The load balancer SKU, which can be 'Basic' or 'Standard'.
- **tags** – A dictionary of strings can be passed as tag metadata to the load balancer object.
- **frontend_ip_configurations** – An optional list of dictionaries representing valid FrontendIPConfiguration objects. A frontend IP configuration can be either private (using private IP address and subnet parameters) or public (using a reference to a public IP address object). Valid parameters are:
  - **name**: The name of the resource that is unique within a resource group.
  - **private_ip_address**: The private IP address of the IP configuration. Required if 'private_ip_allocation_method' is 'Static'.
  - **private_ip_allocation_method**: The Private IP allocation method. Possible values are: 'Static' and 'Dynamic'.
  - **subnet**: Name of an existing subnet inside of which the frontend IP will reside.
  - **public_ip_address**: Name of an existing public IP address which will be assigned to the frontend IP object.
- **backend_address_pools** – An optional list of dictionaries representing valid BackendAddressPool objects. Only the 'name' parameter is valid for a BackendAddressPool dictionary. All other parameters are read-only references from other objects linking to the backend address pool. Inbound traffic is randomly load balanced across IPs in the backend IP.
- **probes** – An optional list of dictionaries representing valid Probe objects. Valid parameters are:
  - **name**: The name of the resource that is unique within a resource group.
  - **protocol**: The protocol of the endpoint. Possible values are 'Http' or 'Tcp'. If 'Tcp' is specified, a received ACK is required for the probe to be successful. If 'Http' is specified, a 200 OK response from the specified URI is required for the probe to be successful.
  - **port**: The port for communicating the probe. Possible values range from 1 to 65535, inclusive.
  - **interval_in_seconds**: The interval, in seconds, for how frequently to probe the endpoint for health status. Typically, the interval is slightly less than half the allocated timeout period (in seconds) which allows two full probes before taking the instance out of rotation. The default value is 15, the minimum
value is 5.
- **number_of_probes**: The number of probes where if no response, will result in stopping further traffic from being delivered to the endpoint. This value allows endpoints to be taken out of rotation faster or slower than the typical times used in Azure.
- **request_path**: The URI used for requesting health status from the VM. Path is required if a protocol is set to 'Http'. Otherwise, it is not allowed. There is no default value.

* **load_balancing_rules** – An optional list of dictionaries representing valid LoadBalancingRule objects. Valid parameters are:
  - **name**: The name of the resource that is unique within a resource group.
  - **load_distribution**: The load distribution policy for this rule. Possible values are 'Default', 'SourceIP', and 'SourceIPProtocol'.
  - **frontend_port**: The port for the external endpoint. Port numbers for each rule must be unique within the Load Balancer. Acceptable values are between 0 and 65534. Note that value 0 enables 'Any Port'.
  - **backend_port**: The port used for internal connections on the endpoint. Acceptable values are between 0 and 65535. Note that value 0 enables 'Any Port'.
  - **idle_timeout_in_minutes**: The timeout for the TCP idle connection. The value can be set between 4 and 30 minutes. The default value is 4 minutes. This element is only used when the protocol is set to TCP.
  - **enable_floating_ip**: Configures a virtual machine’s endpoint for the floating IP capability required to configure a SQL AlwaysOn Availability Group. This setting is required when using the SQL AlwaysOn Availability Groups in SQL server. This setting can't be changed after you create the endpoint.
  - **disable_outbound_snat**: Configures SNAT for the VMs in the backend pool to use the public IP address specified in the frontend of the load balancing rule.
  - **frontend_ip_configuration**: Name of the frontend IP configuration object used by the load balancing rule object.
  - **backend_address_pool**: Name of the backend address pool object used by the load balancing rule object. Inbound traffic is randomly load balanced across IPs in the backend IPs.
  - **probe**: Name of the probe object used by the load balancing rule object.

* **inbound_nat_rules** – An optional list of dictionaries representing valid InboundNatRule objects. Defining inbound NAT rules on your load balancer is mutually exclusive with defining an inbound NAT pool. Inbound NAT pools are referenced from virtual machine scale sets. NICs that are associated with individual virtual machines cannot reference an Inbound NAT pool. They have to reference individual inbound NAT rules. Valid parameters are:
  - **name**: The name of the resource that is unique within a resource group.
  - **frontend_ip_configuration**: Name of the frontend IP configuration object used by the inbound NAT rule object.
  - **protocol**: Possible values include 'Udp', 'Tcp', or 'All'.
  - **frontend_port**: The port for the external endpoint. Port numbers for each rule must be unique within the Load Balancer. Acceptable values range from 1 to 65534.
  - **backend_port**: The port used for the internal endpoint. Acceptable values range from 1 to 65535.
  - **idle_timeout_in_minutes**: The timeout for the TCP idle connection. The value can be set between 4 and 30 minutes. The default value is 4 minutes. This element is only used when the protocol is set to TCP.
  - **enable_floating_ip**: Configures a virtual machine’s endpoint for the floating IP capability required to configure a SQL AlwaysOn Availability Group.
This setting is required when using the SQL AlwaysOn Availability Groups in SQL server. This setting can’t be changed after you create the endpoint.

**inbound_nat_pools** – An optional list of dictionaries representing valid InboundNatPool objects. They define an external port range for inbound NAT to a single backend port on NICs associated with a load balancer. Inbound NAT rules are created automatically for each NIC associated with the Load Balancer using an external port from this range. Defining an Inbound NAT pool on your Load Balancer is mutually exclusive with defining inbound NAT rules. Inbound NAT pools are referenced from virtual machine scale sets. NICs that are associated with individual virtual machines cannot reference an inbound NAT pool. They have to reference individual inbound NAT rules. Valid parameters are:

- **name**: The name of the resource that is unique within a resource group.
- **frontend_ip_configuration**: Name of the frontend IP configuration object used by the inbound NAT pool object.
- **protocol**: Possible values include 'Udp', 'Tcp', or 'All'.
- **frontend_port_range_start**: The first port number in the range of external ports that will be used to provide Inbound NAT to NICs associated with a load balancer. Acceptable values range between 1 and 65534.
- **frontend_port_range_end**: The last port number in the range of external ports that will be used to provide Inbound NAT to NICs associated with a load balancer. Acceptable values range between 1 and 65535.
- **backend_port**: The port used for internal connections to the endpoint. Acceptable values are between 1 and 65535.

**outbound_nat_rules** – An optional list of dictionaries representing valid OutboundNatRule objects. Valid parameters are:

- **name**: The name of the resource that is unique within a resource group.
- **frontend_ip_configuration**: Name of the frontend IP configuration object used by the outbound NAT rule object.
- **backend_address_pool**: Name of the backend address pool object used by the outbound NAT rule object. Outbound traffic is randomly load balanced across IPs in the backend IPs.
- **allocated_outbound_ports**: The number of outbound ports to be used for NAT.

**connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```python
Ensure load balancer exists:
azurearm_network.load_balancer_present:
  - name: lb1
  - resource_group: group1
  - location: eastus
  - frontend_ip_configurations:
    - name: lb1_feip1
      public_ip_address: pub_ip1
  - backend_address_pools:
    - name: lb1_bepool1
  - probes:
    - name: lb1_webprobe1
      protocol: tcp
      port: 80
      interval_in_seconds: 5
      number_of_probes: 2
  - load_balancing_rules:
    - name: lb1_webprobe1
```

(continues on next page)
Salt Documentation, Release 2019.2.0

(continued from previous page)

```yaml
protocol: tcp
frontend_port: 80
backend_port: 80
idle_timeout_in_minutes: 4
frontend_ip_configuration: lb1_feip1
backend_address_pool: lb1_bepool1
probe: lb1_webprobe1
- tags:
  - contact_name: Elmer Fudd Gantry
  - connection_auth: {{ profile }}
  - require:
    - azurearm_resource: Ensure resource group exists
    - azurearm_network: Ensure public IP exists
```

salt.states.azurearm_network.network_interface_absent(name, resource_group, connection_auth=None)

New in version 2019.2.0.

Ensure a network interface does not exist in the resource group.

Parameters

- **name** – Name of the network interface.
- **resource_group** – The resource group assigned to the network interface.
- **connection_auth** – A dict with subscription and authentication parameters to be
  used in connecting to the Azure Resource Manager API.

salt.states.azurearm_network.network_interface_present(name, ip_configurations, subnet, virtual_network, resource_group, tags=None, virtual_machine=None, network_security_group=None, dns_settings=None, mac_address=None, primary=None, enable_accelerated_networking=None, enable_ip_forwarding=None, connection_auth=None, **kwargs)

New in version 2019.2.0.

Ensure a network interface exists.

Parameters

- **name** – Name of the network interface.
- **ip_configurations** – A list of dictionaries representing valid NetworkInterfaceIPConfiguration objects. The 'name' key is required at minimum. At least one IP Configuration must be present.
- **subnet** – Name of the existing subnet assigned to the network interface.
- **virtual_network** – Name of the existing virtual network containing the subnet.
- **resource_group** – The resource group assigned to the virtual network.
- **tags** – A dictionary of strings can be passed as tag metadata to the network interface object.
- **network_security_group** – The name of the existing network security group to assign to the network interface.
- **virtual_machine** – The name of the existing virtual machine to assign to the network interface.
- **dns_settings** – An optional dictionary representing a valid NetworkInterfaceDnsSettings object. Valid parameters are:
  - **dns_servers**: List of DNS server IP addresses. Use 'AzureProvidedDNS' to switch to Azure provided DNS resolution. 'AzureProvidedDNS' value cannot be combined with other IPs, it must be the only value in dns_servers collection.
  - **internal_dns_name_label**: Relative DNS name for this NIC used for internal communications between VMs in the same virtual network.
  - **internal_fqdn**: Fully qualified DNS name supporting internal communications between VMs in the same virtual network.
  - **internal_domain_name_suffix**: Even if internal_dns_name_label is not specified, a DNS entry is created for the primary NIC of the VM. This DNS name can be constructed by concatenating the VM name with the value of internal_domain_name_suffix.

- **mac_address** – Optional string containing the MAC address of the network interface.

- **primary** – Optional boolean allowing the interface to be set as the primary network interface on a virtual machine with multiple interfaces attached.

- **enable_accelerated_networking** – Optional boolean indicating whether accelerated networking should be enabled for the interface.

- **enable_ip_forwarding** – Optional boolean indicating whether IP forwarding should be enabled for the interface.

- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```python
Ensure network interface exists:
  azurearm_network.network_interface_present:
    - name: iface1
    - subnet: vnet1_sn1
    - virtual_network: vnet1
    - resource_group: group1
    - ip_configurations:
      - name: iface1_ipc1
        public_ip_address: pub_ip2
    - dns_settings:
      internal_dns_name_label: decisionlab-int-test-label
      primary: True
      enable_accelerated_networking: True
      enable_ip_forwarding: False
      network_security_group: nsg1
      connection_auth: {{ profile }}
    require:
      - azurearm_network: Ensure subnet exists
      - azurearm_network: Ensure network security group exists
      - azurearm_network: Ensure another public IP exists
```

salt.states.azurearm_network.network_security_group_absent(name, resource_group, connection_auth= None)

New in version 2019.2.0.

Ensure a network security group does not exist in the resource group.

Parameters
- **name** – Name of the network security group.
- **resource_group** – The resource group assigned to the network security group.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.
salt.states.azurearm_network.network_security_group_present(name, resource_group, tags=None, security_rules=None, connection_auth=None, **kwargs)

New in version 2019.2.0.

Ensure a network security group exists.

Parameters

- **name** – Name of the network security group.
- **resource_group** – The resource group assigned to the network security group.
- **tags** – A dictionary of strings can be passed as tag metadata to the network security group object.
- **security_rules** – An optional list of dictionaries representing valid SecurityRule objects. See the documentation for the security_rule_present state or security_rule_create_or_update execution module for more information on required and optional parameters for security rules. The rules are only managed if this parameter is present. When this parameter is absent, implemented rules will not be removed, and will merely become unmanaged.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```yaml
Ensure network security group exists:
    azurearm_network.network_security_group_present:
      - name: nsg1
      - resource_group: group1
      - security_rules:
        - name: nsg1_rule1
          priority: 100
          protocol: tcp
          access: allow
          direction: outbound
          source_address_prefix: virtualnetwork
          destination_address_prefix: internet
          source_port_range: '*'
          destination_port_range: '*'
        - name: nsg1_rule2
          priority: 101
          protocol: tcp
          access: allow
          direction: inbound
          source_address_prefix: internet
          destination_address_prefix: virtualnetwork
          source_port_range: '*'
          destination_port_ranges:
            - '80'
            - '443'
      - tags:
        contact_name: Elmer Fudd Gantry
      - connection_auth: {{ profile }}
      - require:
        - azurearm_resource: Ensure resource group exists
```

salt.states.azurearm_network.public_ip_address_absent(name, resource_group, connection_auth=None)
New in version 2019.2.0.

Ensure a public IP address does not exist in the resource group.

Parameters

- **name** – Name of the public IP address.
- **resource_group** – The resource group assigned to the public IP address.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

```python
salt.states.azurearm_network.public_ip_address_present(
    name, resource_group,
    tags=None, sku=None, public_ip_allocation_method=None,
    public_ip_address_version=None, dns_settings=None,
    idle_timeout_in_minutes=None,
    connection_auth=None,
    **kwargs)
```

New in version 2019.2.0.

Ensure a public IP address exists.

Parameters

- **name** – Name of the public IP address.
- **resource_group** – The resource group assigned to the public IP address.
- **dns_settings** – An optional dictionary representing a valid PublicKeyAddressDnsSettings object. Parameters include 'domain_name_label' and 'reverse_fqdn', which accept strings. The 'domain_name_label' parameter is concatenated with the regionalized DNS zone make up the fully qualified domain name associated with the public IP address. If a domain name label is specified, an A DNS record is created for the public IP in the Microsoft Azure DNS system. The 'reverse_fqdn' parameter is a user-visible, fully qualified domain name that resolves to this public IP address. If the reverse FQDN is specified, then a PTR DNS record is created pointing from the IP address in the in-addr.arpa domain to the reverse FQDN.
- **sku** – The public IP address SKU, which can be 'Basic' or 'Standard'.
- **public_ip_allocation_method** – The public IP allocation method. Possible values are: 'Static' and 'Dynamic'.
- **public_ip_address_version** – The public IP address version. Possible values are: 'IPv4' and 'IPv6'.
- **idle_timeout_in_minutes** – An integer representing the idle timeout of the public IP address.
- **tags** – A dictionary of strings can be passed as tag metadata to the public IP address object.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```
Ensure public IP exists:
    azurearm_network.public_ip_address_present:
        - name: pub_ip1
        - resource_group: group1
        - dns_settings:
             domain_name_label: decisionlab-ext-test-label
        - sku: basic
        - public_ip_allocation_method: static
        - public_ip_address_version: ipv4
        - idle_timeout_in_minutes: 4
```

(continues on next page)
- **tags:**
  - **contact_name:** Elmer Fudd Gantry
  - **connection_auth:** `{{ profile }}`
  - **require:**
    - **azurearm_resource:** Ensure resource group exists

**Salt States:**

salt.states.azurearm_network.route_absent(name, route_table, resource_group, connection_auth=None)

New in version 2019.2.0.

Ensure a route table does not exist in the resource group.

**Parameters**

- **name** – Name of the route table.
- **route_table** – The name of the existing route table containing the route.
- **resource_group** – The resource group assigned to the route table.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

salt.states.azurearm_network.route_present(name, address_prefix, next_hop_type, route_table, resource_group, next_hop_ip_address=None, connection_auth=None, **kwargs)

New in version 2019.2.0.

Ensure a route exists within a route table.

**Parameters**

- **name** – Name of the route.
- **address_prefix** – The destination CIDR to which the route applies.
- **next_hop_type** – The type of Azure hop the packet should be sent to. Possible values are: 'VirtualNetworkGateway', 'VnetLocal', 'Internet', 'VirtualAppliance', and 'None'.
- **next_hop_ip_address** – The IP address packets should be forwarded to. Next hop values are only allowed in routes where the next hop type is 'VirtualAppliance'.
- **route_table** – The name of the existing route table which will contain the route.
- **resource_group** – The resource group assigned to the route table.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

**Example usage:**

**Ensure route exists:**

```python
salt.states.azurearm_network.route_present:
    - name: rtp_route2
    - route_table: rtt
    - resource_group: group1
    - address_prefix: '192.168.0.0/16'
    - next_hop_type: vnetlocal
    - connection_auth: {{ profile }}
    - require:
      - **azurearm_network:** Ensure route table exists
```

salt.states.azurearm_network.route_table_absent(name, resource_group, connection_auth=None)

New in version 2019.2.0.

Ensure a route table does not exist in the resource group.

**Parameters**

- **name** – Name of the route table.
• **resource_group** – The resource group assigned to the route table.
• **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

```python
salt.states.azurearm_network.route_table_present(name, resource_group, 
tags=..., routes=..., 

disable_bgp_route_propagation=..., 
connection_auth=..., **kwargs)
```

New in version 2019.2.0.

Ensure a route table exists.

Parameters

• **name** – Name of the route table.
• **resource_group** – The resource group assigned to the route table.
• **routes** – An optional list of dictionaries representing valid Route objects contained within a route table. See the documentation for the route_present state or route_create_or_update execution module for more information on required and optional parameters for routes. The routes are only managed if this parameter is present. When this parameter is absent, implemented routes will not be removed, and will merely become unmanaged.
• **disable_bgp_route_propagation** – An optional boolean parameter setting whether to disable the routes learned by BGP on the route table.
• **tags** – A dictionary of strings can be passed as tag metadata to the route table object.
• **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```yaml
table exists:
    azurearm_network.route_table_present:
        - name: rt1
        - resource_group: group1
        - routes:
            - name: rt1_route1
              address_prefix: '0.0.0.0/0'
              next_hop_type: internet
            - name: rt1_route2
              address_prefix: '192.168.0.0/16'
              next_hop_type: vnetlocal
            - tags:
                contact_name: Elmer Fudd Gantry
            - connection_auth: {{ profile }}
            - require:
                - azurearm_resource: Ensure resource group exists
```

salt.states.azurearm_network.security_rule_absent(name, security_group, 
resource_group, 
connection_auth=...)
New in version 2019.2.0.

Ensure a security rule exists.

Parameters

- **name** – Name of the security rule.
- **access** – 'allow' or 'deny'
- **direction** – 'inbound' or 'outbound'
- **priority** – Integer between 100 and 4096 used for ordering rule application.
- **protocol** – 'tcp', 'udp', or '*'
- **security_group** – The name of the existing network security group to contain the security rule.
- **resource_group** – The resource group assigned to the network security group.
- **description** – Optional description of the security rule.
- **destination_address_prefix** – The CIDR or destination IP range. Asterix '*' can also be used to match all destination IPs. Default tags such as 'VirtualNetwork', 'AzureLoadBalancer' and 'Internet' can also be used. If this is an ingress rule, specifies where network traffic originates from.
- **destination_port_range** – The destination port or range. Integer or range between 0 and 65535. Asterix '*' can also be used to match all ports.
- **source_address_prefix** – The CIDR or source IP range. Asterix '*' can also be used to match all source IPs. Default tags such as 'VirtualNetwork', 'AzureLoadBalancer' and 'Internet' can also be used. If this is an ingress rule, specifies where network traffic originates from.
- **source_port_range** – The source port or range. Integer or range between 0 and 65535. Asterix '*' can also be used to match all ports.
- **destination_address_prefixes** – A list of destination_address_prefix values. This parameter overrides destination_address_prefix and will cause any value entered there to be ignored.
- **destination_port_ranges** – A list of destination_port_range values. This parameter overrides destination_port_range and will cause any value entered there to be ignored.
- **source_address_prefixes** – A list of source_address_prefix values. This parameter overrides source_address_prefix and will cause any value entered there to be ignored.
- **source_port_ranges** – A list of source_port_range values. This parameter overrides source_port_range and will cause any value entered there to be ignored.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```bash
Ensure security rule exists:
```
azurearm_network.security_rule_present:
  - name: nsg1_rule2
  - security_group: nsg1
  - resource_group: group1
  - priority: 101
  - protocol: tcp
  - access: allow
  - direction: inbound
  - source_address_prefix: internet
  - destination_address_prefix: virtualnetwork
  - source_port_range: '*'
  - destination_port_ranges:
    - '80'
    - '443'
  - connection_auth: {{ profile }}
  - require:
    - azurearm_network: Ensure network security group exists

salt.states.azurearm_network.subnet_absent(name, virtual_network, resource_group, connection_auth=None)

New in version 2019.2.0.

Ensure a virtual network does not exist in the virtual network.

Parameters

- name – Name of the subnet.
- virtual_network – Name of the existing virtual network containing the subnet.
- resource_group – The resource group assigned to the virtual network.
- connection_auth – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

salt.states.azurearm_network.subnet_present(name, address_prefix, virtual_network, resource_group, security_group=None, route_table=None, connection_auth=None, **kwargs)

New in version 2019.2.0.

Ensure a subnet exists.

Parameters

- name – Name of the subnet.
- address_prefix – A CIDR block used by the subnet within the virtual network.
- virtual_network – Name of the existing virtual network to contain the subnet.
- resource_group – The resource group assigned to the virtual network.
- security_group – The name of the existing network security group to assign to the subnet.
- route_table – The name of the existing route table to assign to the subnet.
- connection_auth – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

Ensure subnet exists:

azurearm_network.subnet_present:
  - name: vnet1_sn1
  - virtual_network: vnet1
  - resource_group: group1
  - address_prefix: '192.168.1.0/24'
  - security_group: nsg1

(continues on next page)
- route_table: rt1
- connection_auth: {{ profile }}
- require:
  - azurearm_network: Ensure virtual network exists
  - azurearm_network: Ensure network security group exists
  - azurearm_network: Ensure route table exists

salt.states.azurearm_network.virtual_network_absent(name, resource_group, connection_auth=None)

New in version 2019.2.0.

Ensure a virtual network does not exist in the resource group.

Parameters

- name – Name of the virtual network.
- resource_group – The resource group assigned to the virtual network.
- connection_auth – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

salt.states.azurearm_network.virtual_network_present(name, address_prefixes, resource_group, dns_servers=None, tags=None, connection_auth=None, **kwargs)

New in version 2019.2.0.

Ensure a virtual network exists.

Parameters

- name – Name of the virtual network.
- resource_group – The resource group assigned to the virtual network.
- address_prefixes – A list of CIDR blocks which can be used by subnets within the virtual network.
- dns_servers – A list of DNS server addresses.
- tags – A dictionary of strings can be passed as tag metadata to the virtual network object.
- connection_auth – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```yaml
Ensure virtual network exists:
  azurearm_network.virtual_network_present:
    - name: vnet1
    - resource_group: group1
    - address_prefixes:
      - '10.0.0.0/8'
      - '192.168.0.0/16'
    - dns_servers:
      - '8.8.8.8'
    - tags:
      contact_name: Elmer Fudd Gantry
    - connection_auth: {{ profile }}
    - require:
      - azurearm_resource: Ensure resource group exists
```
21.19.17 salt.states.azurearm_resource

Azure (ARM) Resource State Module
New in version 2019.2.0.

maintainer <devops@decisionlab.io>
maturity new
depends
  • azure >= 2.0.0
  • azure-common >= 1.1.8
  • azure-mgmt >= 1.0.0
  • azure-mgmt-compute >= 1.0.0
  • azure-mgmt-network >= 1.7.1
  • azure-mgmt-resource >= 1.1.0
  • azure-mgmt-storage >= 1.0.0
  • azure-mgmt-web >= 0.32.0
  • azure-storage >= 0.34.3
  • msrestazure >= 0.4.21

platform linux

configuration This module requires Azure Resource Manager credentials to be passed as a dictionary of keyword arguments to the connection_auth parameter in order to work properly. Since the authentication parameters are sensitive, it’s recommended to pass them to the states via pillar. Required provider parameters:
if using username and password:
  • subscription_id
  • username
  • password
if using a service principal:
  • subscription_id
  • tenant
  • client_id
  • secret

Optional provider parameters:
  cloud_environment: Used to point the cloud driver to different API endpoints, such as Azure GovCloud. Possible values:
  • AZURE_PUBLIC_CLOUD (default)
  • AZURE_CHINA_CLOUD
  • AZURE_US_GOV_CLOUD
  • AZURE_GERMAN_CLOUD
Example Pillar for Azure Resource Manager authentication:

```yaml
azurearm:
    user_pass_auth:
        subscription_id: 3287abc8-f98a-c678-3bde-326766fd3617
        username: fletch
        password: 123pass
    mysubscription:
        subscription_id: 3287abc8-f98a-c678-3bde-326766fd3617
        tenant: ABCDEFAB-1234-ABCD-1234-ABCDEFABCDEF
        client_id: ABCDEFAB-1234-ABCD-1234-ABCDEFABCDEF
        secret: XXXXXXXXXXXXXXXXXXXXXXXX
        cloud_environment: AZURE_PUBLIC_CLOUD
```

Example states using Azure Resource Manager authentication:

```python
{% set profile = salt['pillar.get']('azurearm:mysubscription') %}
Ensure resource group exists:
    azurearm_resource.resource_group_present:
        - name: my_rg
        - location: westus
        - tags:
            how_awesome: very
            contact_name: Elmer Fudd Gantry
        - connection_auth: {{ profile }}

Ensure resource group is absent:
    azurearm_resource.resource_group_absent:
        - name: other_rg
        - connection_auth: {{ profile }}
```

```python
salt.states.azurearm_resource.policy_assignment_absent(name, scope, connection_auth=None)
New in version 2019.2.0.
Ensure a policy assignment does not exist in the provided scope.
Parameters

- name – Name of the policy assignment.
- scope – The scope of the policy assignment.
- connection_auth A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.
```

```python
salt.states.azurearm_resource.policy_assignment_present(name, scope, definition_name, display_name=None, description=None, assignment_type=None, parameters=None, connection_auth=None, **kwargs)
New in version 2019.2.0.
Ensure a security policy assignment exists.
Parameters

- name – Name of the policy assignment.
- scope – The scope of the policy assignment.
- definition_name – The name of the policy definition to assign.
- display_name – The display name of the policy assignment.
```
• **description** – The policy assignment description.
• **assignment_type** – The type of policy assignment.
• **parameters** – Required dictionary if a parameter is used in the policy rule.
• **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```yaml
salt.states.azurearm_resource.policy_assignment_present:
  - name: testassign
  - scope: /subscriptions/bc75htn-a0fhsi-349b-56gh-4fghti-f84852
  - definition_name: testpolicy
  - display_name: Test Assignment
  - description: Test assignment for testing assignments.
  - connection_auth: {{ profile }}
```

salt.states.azurearm_resource.policy_definition_absent(name, connection_auth=None)

New in version 2019.2.0.

Ensure a policy definition does not exist in the current subscription.

Parameters

• **name** – Name of the policy definition.
• **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

salt.states.azurearm_resource.policy_definition_present(name, policy_rule=None, policy_type=None, mode=None, display_name=None, description=None, metadata=None, parameters=None, policy_rule_json=None, policy_rule_file=None, template='jinja', source_hash=None, source_hash_name=None, skip_verify=False, connection_auth=None, **kwargs)

New in version 2019.2.0.

Ensure a security policy definition exists.

Parameters

• **name** – Name of the policy definition.
• **policy_rule** – A YAML dictionary defining the policy rule. See Azure Policy Definition documentation for details on the structure. One of `policy_rule`, `policy_rule_json`, or `policy_rule_file` is required, in that order of precedence for use if multiple parameters are used.
• **policy_rule_json** – A text field defining the entirety of a policy definition in JSON. See Azure Policy Definition documentation for details on the structure. One of `policy_rule`, `policy_rule_json`, or `policy_rule_file` is required, in that order of precedence for use if multiple parameters are used. Note that the `name` field in the JSON will override the `name` parameter in the state.
• **policy_rule_file** – The source of a JSON file defining the entirety of a policy definition. See Azure Policy Definition documentation for details on the struc-
One of `policy_rule`, `policy_rule_json`, or `policy_rule_file` is required, in that order of precedence for use if multiple parameters are used. Note that the `name` field in the JSON will override the name parameter in the state.

- **skip_verify** – Used for the `policy_rule_file` parameter. If True, hash verification of remote file sources (http://, https://, ftp://) will be skipped, and the `source_hash` argument will be ignored.
- **source_hash** – This can be a source hash string or the URI of a file that contains source hash strings.
- **source_hash_name** – When `source_hash` refers to a hash file, Salt will try to find the correct hash by matching the filename/URI associated with that hash.
- **policy_type** – The type of policy definition. Possible values are `NotSpecified`, `BuiltIn`, and `Custom`. Only used with the `policy_rule` parameter.
- **mode** – The policy definition mode. Possible values are `NotSpecified`, `Indexed`, and `All`. Only used with the `policy_rule` parameter.
- **display_name** – The display name of the policy definition. Only used with the `policy_rule` parameter.
- **description** – The policy definition description. Only used with the `policy_rule` parameter.
- **metadata** – The policy definition metadata defined as a dictionary. Only used with the `policy_rule` parameter.
- **parameters** – Required dictionary if a parameter is used in the policy rule. Only used with the `policy_rule` parameter.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```Python
Ensure policy definition exists:
azurearm_resource.policy_definition_present:
  - name: testpolicy
  - display_name: Test Policy
  - description: Test policy for testing policies.
  - policy_rule:
    if:
      allOf:
        - equals: Microsoft.Compute/virtualMachines/write
          source: action
        - field: location
          in:
            - eastus
            - eastus2
            - centralus
      then:
        effect: deny
  - connection_auth: {{ profile }}

salt.states.azurearm_resource.resource_group_absent(name, connection_auth=None)
New in version 2019.2.0.

Ensure a resource group does not exist in the current subscription.
Parameters
- **name** – Name of the resource group.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

salt.states.azurearm_resource.resource_group_present(name, location, managed_by=None, tags=None, connection_auth=None, **kwargs)
New in version 2019.2.0.

Ensure a resource group exists.

Parameters

- **name** – Name of the resource group.
- **location** – The Azure location in which to create the resource group. This value cannot be updated once the resource group is created.
- **managed_by** – The ID of the resource that manages this resource group. This value cannot be updated once the resource group is created.
- **tags** – A dictionary of strings can be passed as tag metadata to the resource group object.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```
Ensure resource group exists:
azurearm_resource.resource_group_present:
  - name: group1
  - location: eastus
  - tags:
    - contact_name: Elmer Fudd Gantry
  - connection_auth: {{ profile }}
```

21.19.18  salt.states.beacon

Management of the Salt beacons

New in version 2015.8.0.

```
ps:
  beacon.present:
    - save: True
    - enable: False
    - services:
      salt-master: running
      apache2: stopped

sh:
  beacon.present: []

load:
  beacon.present:
    - averages:
      1m:
        - 0.0
        - 2.0
      5m:
        - 0.0
        - 1.5
      15m:
        - 0.1
        - 1.0

salt.states.beacon.absent(name, save=False, **kwargs)
Ensure beacon is absent.
  name The name of the beacon ensured absent.
```
save True/False, if True the beacons.conf file be updated too. Default is False.

salt.states.beacon.disabled(name, **kwargs)
    Disable a beacon.
    name The name of the beacon to disable.

salt.states.beacon.enabled(name, **kwargs)
    Enable a beacon.
    name The name of the beacon to enable.

salt.states.beacon.present(name, save=False, **kwargs)
    Ensure beacon is configured with the included beacon data.
    name The name of the beacon ensure is configured.
    save True/False, if True the beacons.conf file be updated too. Default is False.

21.19.19 salt.states.bigip

A state module designed to enforce load-balancing configurations for F5 Big-IP entities.

    maturity  develop
    platform f5_bigip_11.6

salt.states.bigip.add_pool_member(hostname, username, password, name, member)
    A function to connect to a bigip device and add a new member to an existing pool.
    hostname The host/address of the bigip device
    username The iControl REST username
    password The iControl REST password
    name The name of the pool to modify
    member The member to add to the pool

salt.states.bigip.create_monitor(hostname, username, password, monitor_type, name, **kwargs)
    A function to connect to a bigip device and create a monitor.
    hostname The host/address of the bigip device
    username The iControl REST username
    password The iControl REST password
    monitor_type The type of monitor to create
    name The name of the monitor to create
    kwargs [ arg=val ] ...

        Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are
        used.

salt.states.bigip.create_node(hostname, username, password, name, address)
    Create a new node if it does not already exist.
    hostname The host/address of the bigip device
    username The iControl REST username
    password The iControl REST password
    name The name of the node to create
    address The address of the node
salt.states.bigip.create_pool(hostname, username, password, name, members=None, allow_nat=None, allow_snat=None, description=None, gateway_failsafe_device=None, ignore_persisted_weight=None, ip_tos_to_client=None, ip_tos_to_server=None, link_qos_to_client=None, link_qos_to_server=None, load_balancing_mode=None, min_active_members=None, min_up_members=None, min_up_members_action=None, min_up_members_checking=None, monitor=None, profiles=None, queue_depth_limit=None, queue_on_connection_limit=None, queue_time_limit=None, reselect_tries=None, service_down_action=None, slow_ramp_time=None)

Create a new node if it does not already exist.

salt.states.bigip.create_profile (hostname, username, password, profile_type, name, **kwargs)

A function to connect to a bigip device and create a profile.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
profile_type The type of profile to create
name The name of the profile to create
kwargs [ arg=val ] ...

Consult F5 BIGIP user guide for specific options for each profile type. Typically, tmsh arg names are used.
Special Characters |, , and : must be escaped using \ when used within strings.

salt.states.bigip.create_virtual(hostname, username, password, name, destination, pool=None, address_status=None, auto_lasthop=None, bwc_policy=None, cmp_enabled=None, connection_limit=None, dhcp_relay=None, description=None, fallback_persistence=None, flow_eviction_policy=None, gtm_score=None, ip_forward=None, ip_protocol=None, internal=None, twelve_forward=None, last_hop_pool=None, mask=None, mirror=None, nat64=None, persist=None, profiles=None, policies=None, rate_class=None, rate_limit=None, rate_limit_mode=None, rate_limit_dst=None, rate_limit_src=None, rules=None, related_rules=None, reject=None, source=None, source_address_translation=None, source_port=None, virtual_state=None, traffic_classes=None, translate_address=None, translate_port=None, vlans=None)

A function to connect to a bigip device and create a virtual server if it does not already exists.

salt.states.bigip.delete_monitor( hostname, username, password, monitor_type, name )
  Modify an existing monitor. If it does exists, only the parameters specified will be enforced.
  hostname The host/address of the bigip device
  username The iControl REST username
  password The iControl REST password
  monitor_type The type of monitor to create
  name The name of the monitor to create
  kwargs [ arg=val ] ...
    Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are
    used.
salt.states.bigip.delete_node( hostname, username, password, name )
  Delete an existing node.
  hostname The host/address of the bigip device
  username The iControl REST username
  password The iControl REST password
  name The name of the node which will be deleted.
salt.states.bigip.delete_pool( hostname, username, password, name )
  Delete an existing pool.
  hostname The host/address of the bigip device
  username The iControl REST username
  password The iControl REST password
  name The name of the pool which will be deleted
salt.states.bigip.delete_pool_member( hostname, username, password, name, member )
  Delete an existing pool member.
  hostname The host/address of the bigip device
  username The iControl REST username
  password The iControl REST password
  name The name of the pool to be modified
  member The name of the member to delete from the pool
salt.states.bigip.delete_profile( hostname, username, password, profile_type, name )
  Modify an existing profile. If it does exists, only the parameters specified will be enforced.
  hostname The host/address of the bigip device
  username The iControl REST username
  password The iControl REST password
  profile_type The type of profile to create
  name The name of the profile to create
  kwargs [ arg=val ] ...
    Consult F5 BIGIP user guide for specific options for each profile type. Typically, tmsh arg names are
    used.
salt.states.bigip.delete_virtual( hostname, username, password, name )
  Delete an existing virtual.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the virtual which will be deleted

salt.states.bigip.list_monitor(hostname, username, password, monitor_type, name)
A function to list an existing monitor.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
monitor_type The type of monitor to list
name The name of the monitor to list

salt.states.bigip.list_node(hostname, username, password, name)
A function to connect to a bigip device and list a specific node.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the node to list.

salt.states.bigip.list_pool(hostname, username, password, name)
A function to connect to a bigip device and list a specific pool.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the pool to list.

salt.states.bigip.list_profile(hostname, username, password, profile_type, name)
A function to list an existing profile.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
profile_type The type of profile to list
name The name of the profile to list

salt.states.bigip.list_virtual(hostname, username, password, name)
A function to list a specific virtual.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the virtual to list

salt.states.bigip.manage_monitor(hostname, username, password, monitor_type, name, **kwargs)
Create a new monitor if a monitor of this type and name does not already exist. If it does exist, only the
parameters specified will be enforced.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
monitor_type The type of monitor to create
name The name of the monitor to create
kwargs [ arg=val ] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are
used.
salt.states.bigip.manage_node(hostname, username, password, name, address, connection_limit=None, description=None, dynamic_ratio=None, logging=None, monitor=None, rate_limit=None, ratio=None, session=None, node_state=None)

Manages a node of a given bigip device. If the node does not exist it will be created, otherwise, only the properties which are different than the existing will be updated.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the node to manage.
address The address of the node
connection_limit [integer]
description [string]
dynamic_ratio [integer]
logging [enabled | disabled]
monitor [[name] | none | default]
ratio [integer]
session [user-enabled | user-disabled]
node_state (state) [user-down | user-up ]

salt.states.bigip.manage_pool(hostname, username, password, name, allow_nat=None, allow_snat=None, description=None, gateway_failsafe_device=None, ignore_persisted_weight=None, ip_tos_to_client=None, ip_tos_to_server=None, link_qos_to_client=None, link_qos_to_server=None, load_balancing_mode=None, min_active_members=None, min_up_members=None, min_up_members_action=None, min_up_members_checking=None, monitor=None, profiles=None, queue_depth_limit=None, queue_on_connection_limit=None, queue_time_limit=None, reselect_tries=None, service_down_action=None, slow_ramp_time=None)

Create a new pool if it does not already exist. Pool members are managed separately. Only the parameters specified are enforced.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the pool to create
allow_nat [yes | no]
allow_snat [yes | no]
description [string]

```python
salt.states.bigip.manage_pool_members(hostname, username, password, name, members)
```
Manage the members of an existing pool. This function replaces all current pool members. Only the parameters specified are enforced.

- `hostname`: The host/address of the bigip device
- `username`: The iControl REST username
- `password`: The iControl REST password
- `name`: The name of the pool to modify
- `members`: list of pool members to manage.

```python
salt.states.bigip.manage_profile(hostname, username, password, profile_type, name, **kwargs)
```
Create a new profile if a monitor of this type and name does not already exists. If it does exists, only the parameters specified will be enforced.

- `hostname`: The host/address of the bigip device
- `username`: The iControl REST username
- `password`: The iControl REST password
- `profile_type`: The type of profile to create
- `name`: The name of the profile to create
- `kwargs`: [arg=val] ...

Consult F5 BIGIP user guide for specific options for each profile type. Typically, tmsh arg names are used.

```python
salt.states.bigip.manage_virtual(hostname, username, password, name, destination, pool=None, address_status=None, auto_lasthop=None, bwc_policy=None, cmp_enabled=None, connection_limit=None, dhcp_relay=None, description=None, fallback_persistence=None, flow_eviction_policy=None, gtm_score=None, ip_forward=None, ip_protocol=None, internal=None, twelve_forward=None, last_hop_pool=None, mask=None, mirror=None, nat64=None, persist=None, profiles=None, policies=None, rate_class=None, rate_limit=None, rate_limit_mode=None, rate_limit_dst=None, rate_limit_src=None, reject=None, source=None, source_address_translation=None, source_port=None, virtual_state=None, traffic_classes=None, translate_address=None, translate_port=None, vlans=None)
```
Manage a virtual server. If a virtual does not exists it will be created, otherwise only the parameters specified will be enforced.

- `hostname`: The host/address of the bigip device
- `username`: The iControl REST username
- `password`: The iControl REST password
- `name`: The name of the virtual to create
- `destination`: [virtual_address_name:port] | [ipv4:port] | [ipv6:port]
- `pool`: [pool_name] | none
- `address_status`: [yes | no]
- `auto_lasthop`: [default | enabled | disabled]

**salt.states.bigip.modify_monitor**(hostname, username, password, monitor_type, name, **kwargs)

Modify an existing monitor. If it does exists, only the parameters specified will be enforced.

- **hostname** The host/address of the bigip device
- **username** The iControl REST username
- **password** The iControl REST password
- **monitor_type** The type of monitor to create
- **name** The name of the monitor to create
- **kwargs**

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.
salt.states.bigip.modify_node(hostname, username, password, name, connection_limit=None, description=None, dynamic_ratio=None, logging=None, monitor=None, rate_limit=None, ratio=None, session=None, node_state=None)

Modify an existing node. Only a node which already exists will be modified and only the parameters specified will be enforced.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the node to modify
collection_limit [integer]
description [string]
dynamic_ratio [integer]
logging [enabled | disabled]
monitor [(name) | none | default]
ratio [integer]
session [user-enabled | user-disabled]
node_state (state) [user-down | user-up]

21.19.20 salt.states.blockdev

Management of Block Devices

A state module to manage blockdevices

```
/dev/sda:
  blockdev.tuned:
    - read-only: True

master-data:
  blockdev.tuned:
    - name: /dev/vg/master-data
    - read-only: True
    - read-ahead: 1024
```

New in version 2014.7.0.

salt.states.blockdev.formatted(name, fs_type='ext4', force=False, **kwargs)

Manage filesystems of partitions.
name The name of the block device
fs_type The filesystem it should be formatted as
force Force mke2fs to create a filesystem, even if the specified device is not a partition on a block special
device. This option is only enabled for ext and xfs filesystems
This option is dangerous, use it with caution.

New in version 2016.11.0.

salt.states.blockdev.tuned(name, **kwargs)

Manage options of block device
name The name of the block device

opts:
  • read-ahead Read-ahead buffer size
  • filesystem-read-ahead Filesystem Read-ahead buffer size
  • read-only Set Read-Only
  • read-write Set Read-Write

21.19.21 salt.states.boto3_elasticache module

Manage Elasticache with boto3

New in version 2017.7.0.

Create, destroy and update Elasticache clusters. Be aware that this interacts with Amazon’s services, and so may
incur charges.
This module uses boto3 behind the scenes - as a result it inherits any limitations it boto3’s implementation of the AWS API. It is also designed to as directly as possible leverage boto3’s parameter naming and semantics. This allows one to use http://boto3.readthedocs.io/en/latest/reference/services/elasticache.html as an excellent source for details too involved to reiterate here.

Note: This module is designed to be transparent ("intentionally ignorant" is the phrase I used to describe it to my boss) to new AWS / boto options - since all AWS API params are passed directly through both the state and executions modules, any new args to existing functions which become available after this documentation is written should work immediately.

Brand new API calls, of course, would still require new functions to be added :)

This module accepts explicit elasticache credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information is available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

```
elasticache.keyid: GKTADJGHEIQSXMKKRBJ08H
elasticache.key: askdjghsdfjkgHwupUjasdflkdfklgjsdfjajkghs
```

It’s also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkgHwupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

```yaml
Ensure myelasticache exists:
boto3_elasticache.present:
  - name: myelasticache
    - engine: redis
    - cache_node_type: cache.t1.micro
    - num_cache_nodes: 1
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkgHwupUjasdflkdfklgjsdfjajkghs
```

```yaml
# Using a profile from pillars
Ensure myelasticache exists:
boto3_elasticache.present:
  - name: myelasticache
    - engine: redis
    - cache_node_type: cache.t1.micro
    - num_cache_nodes: 1
    - region: us-east-1
    - profile: myprofile
```

```yaml
# Passing in a profile
Ensure myelasticache exists:
boto3_elasticache.present:
  - name: myelasticache
    - engine: redis
    - cache_node_type: cache.t1.micro
```

(continues on next page)
- `num_cache_nodes`: 1
- `region`: us-east-1
- `profile`:
  - `keyid`: GKTADJGHEIQSXMKKRBJ08H
  - `key`: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

salt.states.boto3_elasticache.cache_cluster_absent(name, wait=600, region=None, key=None, keyid=None, profile=None, **args)

Ensure a given cache cluster is deleted.

- `name` Name of the cache cluster.
- `wait` Integer describing how long, in seconds, to wait for confirmation from AWS that the resource is in the desired state. Zero meaning to return success or failure immediately of course. Note that waiting for the cluster to become available is generally the better course, as failure to do so will often lead to subsequent failures when managing dependent resources.
- `CacheClusterId` The node group (shard) identifier. Note: In general this parameter is not needed, as 'name' is used if it's not provided.
- `FinalSnapshotIdentifier` The user-supplied name of a final cache cluster snapshot. This is the unique name that identifies the snapshot. ElastiCache creates the snapshot, and then deletes the cache cluster immediately afterward.
- `region` Region to connect to.
- `key` Secret key to be used.
- `keyid` Access key to be used.
- `profile` A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto3_elasticache.cache_cluster_present(name, wait=900, security_groups=None, region=None, key=None, keyid=None, profile=None, **args)

Ensure a given cache cluster exists.

- `name` Name of the cache cluster (cache cluster id).
- `wait` Integer describing how long, in seconds, to wait for confirmation from AWS that the resource is in the desired state. Zero meaning to return success or failure immediately of course. Note that waiting for the cluster to become available is generally the better course, as failure to do so will often lead to subsequent failures when managing dependent resources.
- `security_groups` One or more VPC security groups (names and/or IDs) associated with the cache cluster.

Note: This is additive with any sec groups provided via the SecurityGroupIds parameter below. Use this parameter ONLY when you are creating a cluster in a VPC.

- `CacheClusterId` The node group (shard) identifier. This parameter is stored as a lowercase string.
  
  Constraints:
  
  - A name must contain from 1 to 20 alphanumeric characters or hyphens.
  - The first character must be a letter.
  - A name cannot end with a hyphen or contain two consecutive hyphens.
  
  Note: In general this parameter is not needed, as 'name' is used if it’s not provided.

- `ReplicationGroupId` The ID of the replication group to which this cache cluster should belong. If this parameter is specified, the cache cluster is added to the specified replication group as a read replica; otherwise, the cache cluster is a standalone primary that is not part of any replication group. If the specified repli-
cation group is Multi-AZ enabled and the Availability Zone is not specified, the cache cluster is created in Availability Zones that provide the best spread of read replicas across Availability Zones.

**AZMode** Specifies whether the nodes in this Memcached cluster are created in a single Availability Zone or created across multiple Availability Zones in the cluster’s region. If the AZMode and PreferredAvailabilityZones are not specified, ElastiCache assumes single-az mode.

**Note:** This parameter is ONLY supported for Memcached cache clusters.

**PreferredAvailabilityZone** The EC2 Availability Zone in which the cache cluster is created. All nodes belonging to this Memcached cache cluster are placed in the preferred Availability Zone. If you want to create your nodes across multiple Availability Zones, use PreferredAvailabilityZones.

Default: System chosen Availability Zone.

**PreferredAvailabilityZones** A list of the Availability Zones in which cache nodes are created. The order of the zones in the list is not important. The number of Availability Zones listed must equal the value of NumCacheNodes. If you want all the nodes in the same Availability Zone, use PreferredAvailabilityZone instead, or repeat the Availability Zone multiple times in the list.

Default: System chosen Availability Zones.

**Note:** This option is ONLY supported on Memcached.

If you are creating your cache cluster in an Amazon VPC (recommended) you can only locate nodes in Availability Zones that are associated with the subnets in the selected subnet group.

**NumCacheNodes** The initial (integer) number of cache nodes that the cache cluster has.

**Note:**
For clusters running Redis, this value must be 1.
For clusters running Memcached, this value must be between 1 and 20.

**CacheNodeType** The compute and memory capacity of the nodes in the node group (shard). Valid node types (and pricing for them) are exhaustively described at [https://aws.amazon.com/elasticache/pricing/](https://aws.amazon.com/elasticache/pricing/)

**Note:**
All T2 instances must be created in a VPC
Redis backup/restore is not supported for Redis (cluster mode disabled) T1 and T2 instances. Backup/restore is supported on Redis (cluster mode enabled) T2 instances.
Redis Append-only files (AOF) functionality is not supported for T1 or T2 instances.

**Engine** The name of the cache engine to be used for this cache cluster. Valid values for this parameter are: memcached | redis

**EngineVersion** The version number of the cache engine to be used for this cache cluster. To view the supported cache engine versions, use the DescribeCacheEngineVersions operation.

**Note:**
You can upgrade to a newer engine version but you cannot downgrade to an earlier engine version. If you want to use an earlier engine version, you must delete the existing cache cluster or replication group and create it anew with the earlier engine version.

**CacheParameterGroupName** The name of the parameter group to associate with this cache cluster. If this argument is omitted, the default parameter group for the specified engine is used. You cannot use any parameter group which has cluster-enabled='yes' when creating a cluster.
CacheSubnetGroupName  The name of the Cache Subnet Group to be used for the cache cluster. Use this parameter ONLY when you are creating a cache cluster within a VPC.

Note: If you’re going to launch your cluster in an Amazon VPC, you need to create a subnet group before you start creating a cluster.

CacheSecurityGroupNames  A list of Cache Security Group names to associate with this cache cluster. Use this parameter ONLY when you are creating a cache cluster outside of a VPC.

SecurityGroupIds  One or more VPC security groups associated with the cache cluster. Use this parameter ONLY when you are creating a cache cluster within a VPC.

Tags  A list of tags to be added to this resource. Note that due to shortcomings in the AWS API for Elasticache, these can only be set during resource creation - later modification is not (currently) supported.

SnapshotArns  A single-element string list containing an Amazon Resource Name (ARN) that uniquely identifies a Redis RDB snapshot file stored in Amazon S3. The snapshot file is used to populate the node group (shard). The Amazon S3 object name in the ARN cannot contain any commas.

Note: This parameter is ONLY valid if the Engine parameter is redis.

SnapshotName  The name of a Redis snapshot from which to restore data into the new node group (shard). The snapshot status changes to restoring while the new node group (shard) is being created.

Note: This parameter is ONLY valid if the Engine parameter is redis.

PreferredMaintenanceWindow  Specifies the weekly time range during which maintenance on the cache cluster is permitted. It is specified as a range in the format ddd:hh24:mi-ddd:hh24:mi (24H Clock UTC). The minimum maintenance window is a 60 minute period. Valid values for ddd are: sun, mon, tue, wed, thu, fri, sat

Example: sun:23:00-mon:01:30

Port  The port number on which each of the cache nodes accepts connections.

Default: 6379

NotificationTopicArn  The Amazon Resource Name (ARN) of the Amazon Simple Notification Service (SNS) topic to which notifications are sent.

Note: The Amazon SNS topic owner must be the same as the cache cluster owner.

AutoMinorVersionUpgrade  This (boolean) parameter is currently disabled.

SnapshotRetentionLimit  The number of days for which ElastiCache retains automatic snapshots before deleting them.

Default: 0 (i.e., automatic backups are disabled for this cache cluster).

Note: This parameter is ONLY valid if the Engine parameter is redis.

SnapshotWindow  The daily time range (in UTC) during which ElastiCache begins taking a daily snapshot of your node group (shard). If you do not specify this parameter, ElastiCache automatically chooses an appropriate time range.

Example: 05:00-09:00

Note: This parameter is ONLY valid if the Engine parameter is redis.
AuthToken The password used to access a password protected server.

Password constraints:
- Must be only printable ASCII characters.
- Must be at least 16 characters and no more than 128 characters in length.
- Cannot contain any of the following characters: '/', '"', or '@'.

CacheNodeIdsToRemove A list of cache node IDs to be removed. A node ID is a numeric identifier (0001, 0002, etc.). This parameter is only valid when NumCacheNodes is less than the existing number of cache nodes. The number of cache node IDs supplied in this parameter must match the difference between the existing number of cache nodes in the cluster or pending cache nodes, whichever is greater, and the value of NumCacheNodes in the request.

NewAvailabilityZones The list of Availability Zones where the new Memcached cache nodes are created. This parameter is only valid when NumCacheNodes in the request is greater than the sum of the number of active cache nodes and the number of cache nodes pending creation (which may be zero). The number of Availability Zones supplied in this list must match the cache nodes being added in this request. Note: This option is only supported on Memcached clusters.

NotificationTopicStatus The status of the SNS notification topic. Notifications are sent only if the status is active.

Valid values: active | inactive

region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto3_elasticache.cache_subnet_group_absent(name, region=None, key=None, keyid=None, profile=None, **args)
```

Ensure a given cache subnet group is deleted.

name Name of the cache subnet group.

```
salt.states.boto3_elasticache.cache_subnet_group_present(name, subnets=None, region=None, key=None, keyid=None, profile=None, **args)
```

Ensure cache subnet group exists.

name A name for the cache subnet group. This value is stored as a lowercase string. Constraints: Must contain no more than 255 alphanumeric characters or hyphens.

subnets A list of VPC subnets (IDs, Names, or a mix) for the cache subnet group.

CacheSubnetGroupName A name for the cache subnet group. This value is stored as a lowercase string. Constraints: Must contain no more than 255 alphanumeric characters or hyphens. Note: In general this parameter is not needed, as 'name' is used if it’s not provided.

```
salt.states.boto3_elasticache.cache_subnet_group_description(name, region=None, key=None, keyid=None, profile=None, **args)
```

CacheSubnetGroupDescription A description for the cache subnet group.

```
salt.states.boto3_elasticache.cache_subnet_group_termination(name, region=None, key=None, keyid=None, profile=None, **args)
```

Ensure cache subnet group termination is successful.

name Name of the cache subnet group.

```
salt.states.boto3_elasticache.cache_subnet_group_termination(name, region=None, key=None, keyid=None, profile=None, **args)
```

Ensure cache subnet group termination is successful.

name Name of the cache subnet group.

SubnetIds A list of VPC subnet IDs for the cache subnet group. This is ADDITIVE with 'subnets' above.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
keyid.

```
salt.states.boto3_elasticache.replication_group_absent(
    name,           wait=600,       region=None,   key=None,
    region=None,   keyid=None,    profile=None,
    **args)
```

Ensure a given replication group is deleted.

- **name**: Name of the replication group.
- **wait**: Integer describing how long, in seconds, to wait for confirmation from AWS that the resource is in the desired state. Zero meaning to return success or failure immediately of course. Note that waiting for the cluster to become available is generally the better course, as failure to do so will often lead to subsequent failures when managing dependent resources.
- **ReplicationGroupId**: The replication group identifier. Note: In general this parameter is not needed, as 'name' is used if it's not provided.
- **RetainPrimaryCluster**: If set to true, all of the read replicas are deleted, but the primary node is retained.
- **FinalSnapshotIdentifier**: The name of a final node group (shard) snapshot. ElastiCache creates the snapshot from the primary node in the cluster, rather than one of the replicas; this is to ensure that it captures the freshest data. After the final snapshot is taken, the replication group is immediately deleted.
- **region**: Region to connect to.
- **key**: Secret key to be used.
- **keyid**: Access key to be used.
- **profile**: A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto3_elasticache.replication_group_present(
    name,          wait=900,      security_groups=None,
    region=None,   key=None,     keyid=None,    profile=None,
    **args)
```

Ensure a replication group exists and is in the given state.

- **name**: Name of replication group
- **wait**: Integer describing how long, in seconds, to wait for confirmation from AWS that the resource is in the desired state. Zero meaning to return success or failure immediately of course. Note that waiting for the cluster to become available is generally the better course, as failure to do so will often lead to subsequent failures when managing dependent resources.
- **security_groups**: One or more VPC security groups (names and/or IDs) associated with the cache cluster.

---

**Note**: This is additive with any sec groups provided via the SecurityGroupIds parameter below. Use this parameter ONLY when you are creating a cluster in a VPC.

- **ReplicationGroupId**: The replication group identifier. This parameter is stored as a lowercase string.

  Constraints:
  - A name must contain from 1 to 20 alphanumeric characters or hyphens.
  - The first character must be a letter.
  - A name cannot end with a hyphen or contain two consecutive hyphens.

  **Note**: In general this parameter is not needed, as 'name' is used if it's not provided.

- **ReplicationGroupDescription**: A user-created description for the replication group.
- **PrimaryClusterId**: The identifier of the cache cluster that serves as the primary for this replication group. This cache cluster must already exist and have a status of available. This parameter is not required if NumCacheClusters, NumNodeGroups, or ReplicasPerNodeGroup is specified.
- **AutomaticFailoverEnabled**: Specifies whether a read-only replica is automatically promoted to read/write primary if the existing primary fails. If true, Multi-AZ is enabled for this replication group. If false,
Multi-AZ is disabled for this replication group.
Default: False

Note: AutomaticFailoverEnabled must be enabled for Redis (cluster mode enabled) replication groups.

ElastiCache Multi-AZ replication groups is not supported on:
- Redis versions earlier than 2.8.6.
- Redis (cluster mode disabled): T1 and T2 node types.
- Redis (cluster mode enabled): T2 node types.

NumCacheClusters The number of clusters this replication group initially has. This parameter is not used if there is more than one node group (shard). You should use ReplicasPerNodeGroup instead. If Multi-AZ is enabled, the value of this parameter must be at least 2. The maximum permitted value for NumCacheClusters is 6 (primary plus 5 replicas).

PreferredCacheClusterAZs A list of EC2 Availability Zones in which the replication group’s cache clusters are created. The order of the Availability Zones in the list is the order in which clusters are allocated. The primary cluster is created in the first AZ in the list. This parameter is not used if there is more than one node group (shard). You should use NodeGroupConfiguration instead. The number of Availability Zones listed must equal the value of NumCacheClusters.
Default: System chosen Availability Zones.

Note: If you are creating your replication group in an Amazon VPC (recommended), you can only locate cache clusters in Availability Zones associated with the subnets in the selected subnet group.

NumNodeGroups An optional parameter that specifies the number of node groups (shards) for this Redis (cluster mode enabled) replication group. For Redis (cluster mode disabled) either omit this parameter or set it to 1.
Default: 1

ReplicasPerNodeGroup An optional parameter that specifies the number of replica nodes in each node group (shard). Valid values are: 0 to 5

NodeGroupConfiguration A list of node group (shard) configuration options. Each node group (shard) configuration has the following: Slots, PrimaryAvailabilityZone, ReplicaAvailabilityZones, ReplicaCount. If you’re creating a Redis (cluster mode disabled) or a Redis (cluster mode enabled) replication group, you can use this parameter to configure one node group (shard) or you can omit this parameter. For fiddly details of the expected data layout of this param, see http://boto3.readthedocs.io/en/latest/reference/services/elasticache.html?#ElastiCache.Client.create_replication_group

CacheNodeType The compute and memory capacity of the nodes in the node group (shard). See https://aws.amazon.com/elasticache/pricing/ for current sizing, prices, and constraints.

Engine The name of the cache engine to be used for the cache clusters in this replication group.

EngineVersion The version number of the cache engine to be used for the cache clusters in this replication group. To view the supported cache engine versions, use the DescribeCacheEngineVersions operation.

Note: You can upgrade to a newer engine version but you cannot downgrade to an earlier engine version. If you want to use an earlier engine version, you must delete the existing cache cluster or replication group and create it anew with the earlier engine version.

CacheParameterGroupName The name of the parameter group to associate with this replication group. If this argument is omitted, the default cache parameter group for the specified engine is used.

Note: If you are running Redis version 3.2.4 or later, only one node group (shard), and want to use a default parameter group, we recommend that you specify the parameter group by name.
To create a Redis (cluster mode disabled) replication group, use `CacheParameterGroupName=default.redis3.2`

To create a Redis (cluster mode enabled) replication group, use `CacheParameterGroupName=default.redis3.2.cluster.on`

**CacheSubnetGroupName**  The name of the cache subnet group to be used for the replication group.

**Note:** If you’re going to launch your cluster in an Amazon VPC, you need to create a subnet group before you start creating a cluster. For more information, see Subnets and Subnet Groups.

**CacheSecurityGroupNames**  A list of cache security group names to associate with this replication group.

**SecurityGroupIds**  One or more Amazon VPC security groups associated with this replication group. Use this parameter only when you are creating a replication group in an VPC.

**Tags**  A list of tags to be added to this resource. Note that due to shortcomings in the AWS API for ElastiCache, these can only be set during resource creation - later modification is not (currently) supported.

**SnapshotArns**  A list of ARNs that uniquely identify the Redis RDB snapshot files stored in Amazon S3. These snapshot files are used to populate the replication group. The Amazon S3 object name in the ARN cannot contain any commas. The list must match the number of node groups (shards) in the replication group, which means you cannot repartition.

**Note:** This parameter is only valid if the Engine parameter is redis.

**SnapshotName**  The name of a snapshot from which to restore data into the new replication group. The snapshot status changes to restoring while the new replication group is being created. Note: This parameter is only valid if the Engine parameter is redis.

**PreferredMaintenanceWindow**  Specifies the weekly time range during which maintenance on the cluster is performed. It is specified as a range in the format `ddd:hh24:mi-ddd:hh24:mi` (24H Clock UTC). The minimum maintenance window is a 60 minute period. Valid values for `ddd` are: sun, mon, tue, wed, thu, fri, sat

Example: `sun:23:00-mon:01:30`

**Port**  The port number on which each member of the replication group accepts connections.

**NotificationTopicArn**  The ARN of an SNS topic to which notifications are sent.

**Note:** The SNS topic owner must be the same as the cache cluster owner.

**AutoMinorVersionUpgrade**  This parameter is currently disabled.

**SnapshotRetentionLimit**  The number of days for which ElastiCache will retain automatic snapshots before deleting them.

Default: 0 (that is, automatic backups are disabled for this cache cluster).

**Note:** This parameter is only valid if the Engine parameter is redis.

**SnapshotWindow**  The daily time range (in UTC) during which ElastiCache begins taking a daily snapshot of your node group (shard). If you do not specify this parameter, ElastiCache automatically chooses an appropriate time range.

Example: `05:00-09:00`

**Note:** This parameter is only valid if the Engine parameter is redis.
AuthToken  The password used to access a password protected server. Password constraints:
- Must be only printable ASCII characters.
- Must be at least 16 characters and no more than 128 characters in length.
- Cannot contain any of the following characters: '/', '"', or '@'.

SnapshotsClusterId  The cache cluster ID that is used as the daily snapshot source for the replication group.

NotificationTopicStatus  The status of the SNS notification topic. Notifications are sent only if the status is active. Valid values: active | inactive

region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.22  salt.states.boto3_route53 module

Manage Route53 records with Boto 3

New in version 2017.7.0.

Create and delete Route53 records. Be aware that this interacts with Amazon’s services, and so may incur charges.

This module uses boto3, which can be installed via package, or pip.

This module accepts explicit route53 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](https://aws.amazon.com/documentation/boto3/).

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

```
route53.keyid: GKTADJGHEIQSXMKKRBJ08H
route53.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It’s also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

**An exciting new AWS Route 53 Hosted Zone:**

```
boto_route53.hosted_zone_present:
  - Name: example.com.
  - PrivateZone: true
  - VPCs:
    - VPCName: MyLittleVPC
      VPCRegion: us-east-1
    - VPCId: vpc-12345678
      region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

```
mycnamerecord:
  boto_route53.rr_present:
    - Name: test.example.com.
    - ResourceRecords:
      - my-elb.us-east-1.elb.amazonaws.com.
```

(continues on next page)
- **DomainName**: example.com.
- **TTL**: 60
- **Type**: CNAME
- **region**: us-east-1
- **keyid**: GKTADJGHEIQSXMKKRBJ08H
- **key**: askdjghsdfjkghWupUjasdfklfklgjhsdfjajkghs

```
salt.states.boto3_route53.hosted_zone_absent(name, Name=None, PrivateZone=False, region=None, key=None, keyid=None, profile=None)
```

Ensure the Route53 Hosted Zone described is absent

**name** The name of the state definition.

**Name** The name of the domain. This should be a fully-specified domain, and should terminate with a period. If not provided, the value of name will be used.

**PrivateZone** Set True if deleting a private hosted zone.

```
salt.states.boto3_route53.hosted_zone_present(name, Name=None, PrivateZone=False, CallerReference=None, Comment=None, VPCs=None, region=None, key=None, keyid=None, profile=None)
```

Ensure a hosted zone exists with the given attributes.

**name** The name of the state definition.

**Name** The name of the domain. This should be a fully-specified domain, and should terminate with a period. This is the name you have registered with your DNS registrar. It is also the name you will delegate from your registrar to the Amazon Route 53 delegation servers returned in response to this request. If not provided, the value of name will be used.

**PrivateZone** Set True if creating a private hosted zone. If true, then 'VPCs' is also required.

**Comment** Any comments you want to include about the hosted zone.

**CallerReference** A unique string that identifies the request and that allows create_hosted_zone() calls to be retried without the risk of executing the operation twice. This helps ensure idempotency across state calls, but can cause issues if a zone is deleted and then an attempt is made to recreate it with the same CallerReference. If not provided, a unique UUID will be generated at each state run, which can potentially lead to duplicate zones being created if the state is run again while the previous zone creation is still in PENDING status (which can occasionally take several minutes to clear). Maximum length of 128.

**VPCs** A list of dicts, each dict composed of a VPCRegion, and either a VPCId or a VPCName. Note that this param is ONLY used if PrivateZone == True

- **VPCId** When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCName.
- **VPCName** When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCId.
- **VPCRegion** When creating a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from VPCId or VPCName, if possible. This will fail if a given VPCName exists in multiple regions visible to the bound account, in which case you’ll need to provide an explicit value for VPCRegion.

```
salt.states.boto3_route53.rr_absent(name, HostedZoneld=None, DomainName=None, PrivateZone=False, Name=None, Type=None, SetIdentifier=None, region=None, key=None, keyid=None, profile=None)
```

Ensure the Route53 record is deleted.

**name** The name of the state definition. This will be used for Name if the latter is not provided.

**HostedZoneld** The ID of the zone to delete the record from. Exclusive with DomainName.

**DomainName** The domain name of the zone to delete the record from. Exclusive with HostedZoneld.

**PrivateZone** Set to True if the RR to be removed is in a private zone, False if public.

**Name** Name of the resource record.
Type  The record type (A, NS, MX, TXT, etc.)

SetIdentifier  Valid for Weighted, Latency, Geolocation, and Failover resource record sets only. An identifier that differentiates among multiple resource record sets that have the same combination of DNS name and type. The value of SetIdentifier must be unique for each resource record set that has the same combination of DNS name and type. Omit SetIdentifier for any other types of record sets.

region  The region to connect to.

key  Secret key to be used.

keyid  Access key to be used.

profile  Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

salt.states.boto3_route53.rr_present(name, HostedZoneId=None, DomainName=None, PrivateZone=False, Name=None, Type=None, SetIdentifier=None, Weight=None, Region=None, GeoLocation=None, Failover=None, TTL=None, ResourceRecords=None, AliasTarget=None, HealthCheckId=None, TrafficPolicyInstanceId=None, region=None, key=None, keyid=None, profile=None)

Ensure the Route53 record is present.

name  The name of the state definition. This will be used for Name if the latter is not provided.

HostedZoneId  The ID of a zone to create the record in. Exclusive with DomainName.

DomainName  The domain name of a zone to create the record in. Exclusive with HostedZoneId.

PrivateZone  Set to True if the resource record should be in a private zone, False if public.

Name  Name of the Route 53 resource record being managed.

Type  The record type (A, NS, MX, TXT, etc.)

SetIdentifier  Valid for Weighted, Latency, Geolocation, and Failover resource record sets only. An identifier that differentiates among multiple resource record sets that have the same combination of DNS name and type. The value of SetIdentifier must be unique for each resource record set that has the same combination of DNS name and type. Omit SetIdentifier for any other types of record sets.

Weight  Valid for Weighted resource record sets only. Among resource record sets that have the same combination of DNS name and type, a value that determines the proportion of DNS queries that Amazon Route 53 responds to using the current resource record set. Amazon Route 53 calculates the sum of the weights for the resource record sets that have the same combination of DNS name and type. Amazon Route 53 then responds to queries based on the ratio of a resource’s weight to the total.

Note the following:

- You must specify a value for the Weight element for every weighted resource record set.
- You can only specify one ResourceRecord per weighted resource record set.
- You can’t create latency, failover, or geolocation resource record sets that have the same values for the Name and Type elements as weighted resource record sets.
- You can create a maximum of 100 weighted resource record sets that have the same values for the Name and Type elements.
- For weighted (but not weighted alias) resource record sets, if you set Weight to 0 for a resource record set, Amazon Route 53 never responds to queries with the applicable value for that resource record set. However, if you set Weight to 0 for all resource record sets that have the same combination of DNS name and type, traffic is routed to all resources with equal probability. The effect of setting Weight to 0 is different when you associate health checks with weighted resource record sets. For more information, see Options for Configuring Amazon Route 53 Active-Active and Active-Passive Failover in the Amazon Route 53 Developer Guide.

Region  Valid for Latency-based resource record sets only. The Amazon EC2 Region where the resource that is specified in this resource record set resides. The resource typically is an AWS resource, such as an EC2 instance or an ELB load balancer, and is referred to by an IP address or a DNS domain name, depending on the record type.

GeoLocation  Geo location resource record sets only. A dict that lets you control how Route 53 responds to DNS queries based on the geographic origin of the query. For example, if you want all queries from Africa to be routed to a web server with an IP address of 192.0.2.111, create a resource record set with a
Type of A and a ContinentCode of AF.

<table>
<thead>
<tr>
<th>ContinentCode</th>
</tr>
</thead>
<tbody>
<tr>
<td>The two-letter code for the continent.</td>
</tr>
<tr>
<td>Valid values: AF</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>CountryCode</th>
</tr>
</thead>
<tbody>
<tr>
<td>The two-letter code for the country.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>SubdivisionCode</th>
</tr>
</thead>
<tbody>
<tr>
<td>The code for the subdivision, for example, a state in the United States or a province in Canada.</td>
</tr>
</tbody>
</table>

Notes

- Creating geolocation and geolocation alias resource record sets in private hosted zones is not supported.
- If you create separate resource record sets for overlapping geographic regions (for example, one resource record set for a continent and one for a country on the same continent), priority goes to the smallest geographic region. This allows you to route most queries for a continent to one resource and to route queries for a country on that continent to a different resource.
