## 21.9.276 `salt.modules.netscaler`

Module to provide Citrix Netscaler compatibility to Salt (compatible with netscaler 9.2+)

New in version 2015.2.0.

**depends**

- nsnitro Python module

---

**Note:** You can install nsnitro using:

```bash
pip install nsnitro
```

---

**configuration** This module accepts connection configuration details either as parameters, or as configuration settings in `/etc/salt/minion` on the relevant minions

```yaml
netscaler.host: 1.2.3.4
netscaler.user: user
netscaler.pass: password
```

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

**CLI Examples** Calls relying on configuration passed using `/etc/salt/minion`, grains, or pillars:

```bash
salt-call netscaler.server_exists server_name
```

Calls passing configuration as opts:

```bash
salt-call netscaler.server_exists server_name netscaler_host=1.2.3.4 netscaler_user=username netscaler_pass=password
```

**salt.modules.netscaler.server_add(s_name, s_ip, s_state=None, **connection_args)**

Add a server

**Note:** The default server state is ENABLED

CLI Example:
salt '_salt_\*\_netscaler.server_add' 'serverName' 'serverIpAddress'
salt 'salt\*\_netscaler.server_add' 'serverName' 'serverIpAddress' 'serverState'

salt.modules.netscaler.server_delete(s_name, **connection_args)
Delete a server
  CLI Example:
  ```
salt 'salt\*\_netscaler.server_delete' 'serverName'
  ```

salt.modules.netscaler.server_disable(s_name, **connection_args)
Disable a server globally
  CLI Example:
  ```
salt 'salt\*\_netscaler.server_disable' 'serverName'
  ```

salt.modules.netscaler.server_enable(s_name, **connection_args)
Enables a server globally
  CLI Example:
  ```
salt 'salt\*\_netscaler.server_enable' 'serverName'
  ```

salt.modules.netscaler.server_enabled(s_name, **connection_args)
Check if a server is enabled globally
  CLI Example:
  ```
salt 'salt\*\_netscaler.server_enabled' 'serverName'
  ```

salt.modules.netscaler.server_exists(s_name, ip=None, state=None, **connection_args)
Checks if a server exists
  CLI Example:
  ```
salt 'salt\*\_netscaler.server_exists' 'serverName'
  ```

salt.modules.netscaler.server_update(s_name, s_ip, **connection_args)
Update a server’s attributes
  CLI Example:
  ```
salt 'salt\*\_netscaler.server_update' 'serverName' 'serverIP'
  ```

salt.modules.netscaler.service_disable(s_name, delay=None, **connection_args)
Disable a service
  CLI Example:
  ```
salt 'salt\*\_netscaler.service_disable' 'serviceName'
salt 'salt\*\_netscaler.service_disable' 'serviceName' 'delayInSeconds'
  ```

salt.modules.netscaler.service_enable(s_name, **connection_args)
Enable a service
  CLI Example:
  ```
salt 'salt\*\_netscaler.service_enable' 'serviceName'
  ```
salt.modules.netscaler.service_exists(s_name, **connection_args)
Checks if a service exists

CLI Example:

```
salt 'salt '*' netscaler.service_exists 'serviceName'
```

salt.modules.netscaler.service_up(s_name, **connection_args)
Checks if a service is UP

CLI Example:

```
salt 'salt '*' netscaler.service_up 'serviceName'
```

salt.modules.netscaler.servicegroup_add(sg_name, sg_type='HTTP', **connection_args)
Add a new service group If no service type is specified, HTTP will be used. Most common service types: HTTP, SSL, and SSL_BRIDGE

CLI Example:

```
salt 'salt '*' netscaler.servicegroup_add 'serviceName'
salt 'salt '*' netscaler.servicegroup_add 'serviceName' 'serviceGroupType'
```

salt.modules.netscaler.servicegroup_delete(sg_name, **connection_args)
Delete a new service group

CLI Example:

```
salt 'salt '*' netscaler.servicegroup_delete 'serviceName'
```

salt.modules.netscaler.servicegroup_exists(sg_name, sg_type=None, **connection_args)
Checks if a service group exists

CLI Example:

```
salt 'salt '*' netscaler.servicegroup_exists 'serviceName'
```

salt.modules.netscaler.servicegroup_server_add(sg_name, s_name, s_port, **connection_args)
Add a server:port member to a servicegroup

CLI Example:

```
salt 'salt '*' netscaler.servicegroup_server_add 'serviceName' 'serverName' 'serverPort'
```

salt.modules.netscaler.servicegroup_server_delete(sg_name, s_name, s_port, **connection_args)
Remove a server:port member from a servicegroup

CLI Example:

```
salt 'salt '*' netscaler.servicegroup_server_delete 'serviceName' 'serverName' 'serverPort'
```

salt.modules.netscaler.servicegroup_server_disable(sg_name, s_name, s_port, **connection_args)
Disable a server:port member of a servicegroup

CLI Example:
salt 'salt '*' netscaler.servicegroup_server_disable 'serviceGroupName' 'serverName' 'serverPort'

salt.modules.netscaler.servicegroup_server_enable(\n    sg_name, s_name, s_port, **connection_args)\n
Enable a server:port member of a servicegroup

CLI Example:

salt 'salt '*' netscaler.servicegroup_server_enable 'serviceGroupName' 'serverName' 'serverPort'

salt.modules.netscaler.servicegroup_server_exists(\n    sg_name, s_name, s_port=None, **connection_args)\n
Check if a server:port combination is a member of a servicegroup

CLI Example:

salt 'salt '*' netscaler.servicegroup_server_exists 'serviceGroupName' 'serverName' 'serverPort'

salt.modules.netscaler.servicegroup_server_up(\n    sg_name, s_name, s_port, **connection_args)\n
Check if a server:port combination is in state UP in a servicegroup

CLI Example:

salt 'salt '*' netscaler.servicegroup_server_up 'serviceGroupName' 'serverName' 'serverPort'

salt.modules.netscaler.vserver_add(\n    v_name, v_ip, v_port, v_type, **connection_args)\n
Add a new lb vserver

CLI Example:

salt 'salt '*' netscaler.vserver_add 'vserverName' 'vserverIP' 'vserverPort' 'vserverType'
salt 'salt '*' netscaler.vserver_add 'alex.patate.chaude.443' '1.2.3.4' '443' 'SSL'

salt.modules.netscaler.vserver_delete(\n    v_name, **connection_args)\n
Delete a lb vserver

CLI Example:

salt 'salt '*' netscaler.vserver_delete 'vserverName'

salt.modules.netscaler.vserver_exists(\n    v_name, v_ip=None, v_port=None, v_type=None, **connection_args)\n
Checks if a vserver exists

CLI Example:

salt 'salt '*' netscaler.vserver_exists 'vserverName'

salt.modules.netscaler.vserver_servicegroup_add(\n    v_name, sg_name, **connection_args)\n
Bind a servicegroup to a vserver

CLI Example:
salt '*' netscaler.vserver_servicegroup_add "vserverName" 'serviceGroupName'  

salt.modules.netscaler.vserver_servicegroup_delete(v_name, sg_name, **connection_args)  
Unbind a servicegroup from a vserver  
CLI Example:

```
salt '*' netscaler.vserver_servicegroup_delete 'vserverName' 'serviceGroupName'
```

salt.modules.netscaler.vserver_servicegroup_exists(v_name, sg_name, **connection_args)  
Checks if a servicegroup is tied to a vserver  
CLI Example:

```
salt '*' netscaler.vserver_servicegroup_exists 'vserverName' 'serviceGroupName'
```

salt.modules.netscaler.vserver_sslcert_add(v_name, sc_name, **connection_args)  
Binds a SSL certificate to a vserver  
CLI Example:

```
salt '*' netscaler.vserver_sslcert_add 'vserverName' 'sslCertificateName'
```

salt.modules.netscaler.vserver_sslcert_delete(v_name, sc_name, **connection_args)  
Unbinds a SSL certificate from a vserver  
CLI Example:

```
salt '*' netscaler.vserver_sslcert_delete 'vserverName' 'sslCertificateName'
```

salt.modules.netscaler.vserver_sslcert_exists(v_name, sc_name, **connection_args)  
Checks if a SSL certificate is tied to a vserver  
CLI Example:

```
salt '*' netscaler.vserver_sslcert_exists 'vserverName' 'sslCertificateName'
```

### 21.9.277 salt.modules.network

Module for gathering and managing network information

salt.modules.network.active_tcp()  
Return a dict containing information on all of the running TCP connections (currently linux and solaris only)  
Changed in version 2015.8.4: Added support for SunOS  
CLI Example:

```
salt '*' network.active_tcp
```

salt.modules.network.arp()  
Return the arp table from the minion  
Changed in version 2015.8.0: Added support for SunOS  
CLI Example:
salt '*

salt.modules.network.calc_net(ip_addr, netmask=None)
Returns the CIDR of a subnet based on an IP address (CIDR notation supported) and optional netmask.

CLI Example:

```
salt '*' network.calc_net 172.17.0.5 255.255.255.240
salt '*' network.calc_net 2a02:f6e:a000:80:84d8:8332:7866:4e07/64
```
New in version 2015.8.0.

salt.modules.network.connect(host, port=None, **kwargs)
Test connectivity to a host using a particular port from the minion.

New in version 2014.7.0.

CLI Example:

```
salt '*' network.connect archlinux.org 80
salt '*' network.connect archlinux.org 80 timeout=3
salt '*' network.connect archlinux.org 80 timeout=3 family=ipv4
salt '*' network.connect google-public-dns-a.google.com port=53 proto=udp family=ipv4 timeout=3
```

salt.modules.network.convert_cidr(cidr)
returns the network and subnet mask of a cidr addr

New in version 2016.3.0.

CLI Example:

```
salt '*' network.convert_cidr 172.31.0.0/16
```

salt.modules.network.default_route(family=None)
Return default route(s) from routing table

Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS)

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' network.default_route
```

salt.modules.network.dig(host)
Performs a DNS lookup with dig

CLI Example:

```
salt '*' network.dig archlinux.org
```

salt.modules.network.get_bufsize(iface)
Return network buffer sizes as a dict (currently linux only)

CLI Example:
salt '*' network.get_bufsize eth0

salt.modules.network.get_fqdn()
Get fully qualified domain name

CLI Example:
salt '*' network.get_fqdn

salt.modules.network.get_hostname()
Get hostname

CLI Example:
salt '*' network.get_hostname

salt.modules.network.get_route(ip)
Return routing information for given destination ip

New in version 2015.5.3.
Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS) Added support for OpenBSD
Changed in version 2016.11.4: Added support for AIX

CLI Example:
salt '*' network.get_route 10.10.10.10

salt.modules.network.hw_addr(iface)
Return the hardware address (a.k.a. MAC address) for a given interface

CLI Example:
salt '*' network.hw_addr eth0

salt.modules.network.hwaddr(iface)
This function is an alias of hw_addr.
Return the hardware address (a.k.a. MAC address) for a given interface

CLI Example:
salt '*' network.hw_addr eth0

salt.modules.network.ifacestartswith(cidr)
Retrieve the interface name from a specific CIDR

New in version 2016.11.0.

CLI Example:
salt '*' network.ifacestartswith 10.0

salt.modules.network.in_subnet(cidr)
Returns True if host is within specified subnet, otherwise False.

CLI Example:
salt '*' network.in_subnet 10.0.0.0/16

21.9. execution modules
salt.modules.network.interface(iface)
Return the inet address for a given interface
New in version 2014.7.0.
CLI Example:
```
salt '*' network.interface eth0
```

salt.modules.network.interface_ip(iface)
Return the inet address for a given interface
New in version 2014.7.0.
CLI Example:
```
salt '*' network.interface_ip eth0
```

salt.modules.network.interfaces()
Return a dictionary of information about all the interfaces on the minion
CLI Example:
```
salt '*' network.interfaces
```

salt.modules.network.ip_addrs(interface=None, include_loopback=False, cidr=None, type=None)
Returns a list of IPv4 addresses assigned to the host. 127.0.0.1 is ignored, unless 'include_loopback=True' is indicated. If 'interface' is provided, then only IP addresses from that interface will be returned. Providing a CIDR via 'cidr="10.0.0.0/8"' will return only the addresses which are within that subnet. If 'type' is 'public', then only public addresses will be returned. Ditto for 'type='private'.
CLI Example:
```
salt '*' network.ip_addrs
```

salt.modules.network.ip_addrs6(interface=None, include_loopback=False, cidr=None)
Returns a list of IPv6 addresses assigned to the host. ::1 is ignored, unless 'include_loopback=True' is indicated. If 'interface' is provided, then only IP addresses from that interface will be returned. Providing a CIDR via 'cidr="2000::/3"' will return only the addresses which are within that subnet.
CLI Example:
```
salt '*' network.ip_addrs6
```

salt.modules.network.ip_in_subnet(ip_addr, cidr)
Returns True if given IP is within specified subnet, otherwise False.
CLI Example:
```
salt '*' network.ip_in_subnet 172.17.0.4 172.16.0.0/12
```

salt.modules.network.ipaddr$(interface=None, include_loopback=False, cidr=None, type=None)
This function is an alias of 'ip_addrs'.
Returns a list of IPv4 addresses assigned to the host. 127.0.0.1 is ignored, unless 'include_loopback=True' is indicated. If 'interface' is provided, then only IP addresses from that interface will be returned. Providing a CIDR via 'cidr="10.0.0.0/8"' will return only the addresses which are within that subnet. If 'type' is 'public', then only public addresses will be returned. Ditto for 'type='private'.
CLI Example:
salt.modules.network.ip_addrs6(interface=None, include_loopback=False, cidr=None)

This function is an alias of ip_addrs6.
Returns a list of IPv6 addresses assigned to the host. ::1 is ignored, unless `include_loopback=True` is indicated. If `interface` is provided, then only IP addresses from that interface will be returned. Providing a CIDR via `cidr="2000::/3"` will return only the addresses which are within that subnet.

CLI Example:

```
salt '*' network.ip_addrs6
```

salt.modules.network.iphexval(ip)

Retrieve the hexadecimal representation of an IP address

New in version 2016.11.0.

CLI Example:

```
salt '*' network.iphexval 10.0.0.1
```

salt.modules.network.is_loopback(ip_addr)

Check if the given IP address is a loopback address

New in version 2014.7.0.

Changed in version 2015.8.0: IPv6 support

CLI Example:

```
salt '*' network.is_loopback 127.0.0.1
```

salt.modules.network.is_private(ip_addr)

Check if the given IP address is a private address

New in version 2014.7.0.

Changed in version 2015.8.0: IPv6 support

CLI Example:

```
salt '*' network.is_private 10.0.0.3
```

salt.modules.network.mod_bufsize(iface, *args, **kwargs)

Modify network interface buffers (currently linux only)

CLI Example:

```
salt '*' network.mod_bufsize tx=<val> rx=<val> rx-mini=<val> rx-jumbo=<val>
```

salt.modules.network.mod_hostname(hostname)

Modify hostname

Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS)

CLI Example:

```
salt '*' network.mod_hostname master.saltstack.com
```

salt.modules.network.netstat()

Return information on open ports and states
Note: On BSD minions, the output contains PID info (where available) for each netstat entry, fetched from sockstat/fstat output.

Changed in version 2014.1.4: Added support for OpenBSD, FreeBSD, and NetBSD
Changed in version 2015.8.0: Added support for SunOS
Changed in version 2016.11.4: Added support for AIX

CLI Example:
```
salt '*' network.netstat
```

```
salt.modules.network.ping(host, timeout=False, return_boolean=False)
```
Performs an ICMP ping to a host

Changed in version 2015.8.0: Added support for SunOS

CLI Example:
```
salt '*' network.ping archlinux.org
```

New in version 2015.5.0.
Return a True or False instead of ping output.

```
salt '*' network.ping archlinux.org return_boolean=True
```

Set the time to wait for a response in seconds.

```
salt '*' network.ping archlinux.org timeout=3
```

```
salt.modules.network.reverse_ip(ip_addr)
```
Returns the reversed IP address

Changed in version 2015.8.0: IPv6 support

CLI Example:
```
salt '*' network.reverse_ip 172.17.0.4
```

```
salt.modules.network.routes(family=None)
```
Return currently configured routes from routing table

Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS)
Changed in version 2016.11.4: Added support for AIX

CLI Example:
```
salt '*' network.routes
```

```
salt.modules.network.subnets(interfaces=None)
```
Returns a list of IPv4 subnets to which the host belongs

CLI Example:
```
salt '*' network.subnets
salt '*' network.subnets interfaces=eth1
```
salt.modules.network.subnets6()
Returns a list of IPv6 subnets to which the host belongs

CLI Example:
```
salt '*' network.subnets
```

salt.modules.network.traceroute(host)
Performs a traceroute to a 3rd party host

Changed in version 2015.8.0: Added support for SunOS
Changed in version 2016.11.4: Added support for AIX

CLI Example:
```
salt '*' network.traceroute archlinux.org
```

salt.modules.network.wol(mac, bcast='255.255.255.255', destport=9)
Send Wake On Lan packet to a host

CLI Example:
```
salt '*' network.wol 08-00-27-13-69-77
salt '*' network.wol 080027136977 255.255.255.255 7
salt '*' network.wol 08:00:27:13:69:77 255.255.255.255 7
```

## 21.9.278 salt.modules.neutron

Module for handling OpenStack Neutron calls

**depends**
- neutronclient Python module

**configuration** This module is not usable until the user, password, tenant, and auth URL are specified either in a pillar or in the minion’s config file. For example:

```
keystone.user: 'admin'
keystone.password: 'password'
keystone.tenant: 'admin'
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/
keystone.region_name: 'RegionOne'
keystone.service_type: 'network'
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles. For example:

```
openstack1:
  keystone.user: 'admin'
  keystone.password: 'password'
  keystone.tenant: 'admin'
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/
  keystone.region_name: 'RegionOne'
  keystone.service_type: 'network'

openstack2:
  keystone.user: 'admin'
  keystone.password: 'password'
```

(continues on next page)
With this configuration in place, any of the neutron functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' neutron.network_list profile=openstack1
```

To use keystoneauth1 instead of keystoneclient, include the `use_keystoneauth` option in the pillar or minion config.

**Note:** this is required to use keystone v3 as for authentication.

```yaml
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.1:5000/v3/
keystone.region_name: 'RegionOne'
keystone.service_type: 'network'
keystone.use_keystoneauth: true
keystone.verify: '/path/to/custom/certs/ca-bundle.crt'
```

Note: by default the neutron module will attempt to verify its connection utilizing the system certificates. If you need to verify against another bundle of CA certificates or want to skip verification altogether you will need to specify the `verify` option. You can specify True or False to verify (or not) against system certificates, a path to a bundle or CA certs to check against, or None to allow keystoneauth to search for the certificates on its own.(defaults to True)

```
salt.modules.neutron.add_gateway_router (router, ext_network, profile=None)
```

Adds an external network gateway to the specified router

**CLI Example:**

```
salt '*' neutron.add_gateway_router router-name ext-network-name
```

**Parameters**

- `router` – ID or name of the router
- `ext_network` – ID or name of the external network the gateway
- `profile` – Profile to build on (Optional)

**Returns**  Added Gateway router information

```
salt.modules.neutron.add_interface_router (router, subnet, profile=None)
```

Adds an internal network interface to the specified router

**CLI Example:**

```
salt '*' neutron.add_interface_router router-name subnet-name
```

**Parameters**

- `router` – ID or name of the router
- `subnet` – ID or name of the subnet
- `profile` – Profile to build on (Optional)

**Returns**  Added interface information
salt.modules.neutron.create_firewall_rule(protocol, action, profile=None, **kwargs)

 creates a new firewall rule

 CLI Example:

```
salt '*' neutron.create_firewall_rule protocol action
  tenant_id= TENANT_ID name=NAME description=DESCRIPTION ip_version=IP_VERSION
  source_ip_address=SOURCE_IP_ADDRESS destination_ip_address=DESTINATION_IP_ADDRESS
  source_port=SOURCE_PORT destination_port=DESTINATION_PORT shared=SHARED enabled=ENABLED
```

Parameters

- **protocol** – Protocol for the firewall rule, choose "tcp","udp","icmp" or "None".
- **action** – Action for the firewall rule, choose "allow" or "deny".
- **tenant_id** – The owner tenant ID. (Optional)
- **name** – Name for the firewall rule. (Optional)
- **description** – Description for the firewall rule. (Optional)
- **ip_version** – IP protocol version, default: 4. (Optional)
- **source_ip_address** – Source IP address or subnet. (Optional)
- **destination_ip_address** – Destination IP address or subnet. (Optional)
- **source_port** – Source port (integer in [1, 65535] or range in a:b). (Optional)
- **destination_port** – Destination port (integer in [1, 65535] or range in a:b). (Optional)
- **shared** – Set shared to True, default: False. (Optional)
- **enabled** – To enable this rule, default: True. (Optional)

salt.modules.neutron.create_floatingip(floating_network, port=None, profile=None)

 creates a new floatingIP

 CLI Example:

```
salt '*' neutron.create_floatingip floating_network-name port-name
```

Parameters

- **floating_network** – Network name or ID to allocate floatingIP from
- **port** – Of the port to be associated with the floatingIP (Optional)
- **profile** – Profile to build on (Optional)

 Returns

Created floatingIP information

salt.modules.neutron.create_ikepolicy(name, profile=None, **kwargs)

 creates a new IKEPolicy

 CLI Example:

```
salt '*' neutron.create_ikepolicy ikepolicy-name
  phase1_negotiation_mode=main auth_algorithm=sha1
  encryption_algorithm=aes-128 pfs=group5
```

Parameters

- **name** – Name of the IKE policy
- **phase1_negotiation_mode** – IKE Phase1 negotiation mode in lowercase, default: main (Optional)
- **auth_algorithm** – Authentication algorithm in lowercase, default: sha1 (Optional)
- **encryption_algorithm** – Encryption algorithm in lowercase. default: aes-128 (Optional)
- **pfs** – Prefect Forward Security in lowercase, default: group5 (Optional)
salt.modules.neutron.create_ipsec_site_connection(name, ipsecpolicy, ikepolicy, vpnservice, peer_cidrs, peer_address, peer_id, psk, admin_state_up=True, profile=None, **kwargs)

Creates a new IPsecSiteConnection

CLI Example:

salt '*' neutron.show_ipsec_site_connection connection-name
  ipsecpolicy-name ikepolicy-name vpnservice-name
  192.168.XXX.XXX/24 192.168.XXX.XXX 192.168.XXX.XXX secret

Parameters

- **name** – Set friendly name for the connection
- **ipsecpolicy** – IPSec policy ID or name associated with this connection
- **ikepolicy** – IKE policy ID or name associated with this connection
- **vpnservice** – VPN service instance ID or name associated with this connection
- **peer_cidrs** – Remote subnet(s) in CIDR format
- **peer_address** – Peer gateway public IPv4/IPv6 address or FQDN
- **peer_id** – Peer router identity for authentication Can be IPv4/IPv6 address, e-mail address, key id, or FQDN
- **psk** – Pre-shared key string
- **initiator** – Initiator state in lowercase, default: bi-directional
- **admin_state_up** – Set admin state up to true or false, default: True (Optional)
- **mtu** – size for the connection, default: 1500 (Optional)
- **dpd_action** – Dead Peer Detection attribute: hold/clear/disabled/restart/restart-by-peer (Optional)
- **dpd_interval** – Dead Peer Detection attribute (Optional)
- **dpd_timeout** – Dead Peer Detection attribute (Optional)
- **profile** – Profile to build on (Optional)

Returns Created IPsecSiteConnection information

salt.modules.neutron.create_ipsecpolicy(name, profile=None, **kwargs)

Creates a new IPsecPolicy

CLI Example:

salt '*' neutron.create_ipsecpolicy ipsecpolicy-name
  transform_protocol=esp auth_algorithm=sha1
  encapsulation_mode=tunnel encryption_algorithm=aes-128

Parameters

- **name** – Name of the IPSec policy
- **transform_protocol** – Transform protocol in lowercase, default: esp (Optional)
- **auth_algorithm** – Authentication algorithm in lowercase, default: sha1 (Optional)
- **encapsulation_mode** – Encapsulation mode in lowercase, default: tunnel (Optional)
- **encryption_algorithm** – Encryption algorithm in lowercase, default: aes-128 (Optional)
• **pfs** – Prefect Forward Security in lowercase, default: group5 (Optional)
• **units** – IPSec lifetime attribute. default: seconds (Optional)
• **value** – IPSec lifetime attribute. default: 3600 (Optional)
• **profile** – Profile to build on (Optional)

**Returns** Created IPSec policy information

```python
salt.modules.neutron.create_network(name, router_ext=None, admin_state_up=True, network_type=None, physical_network=None, segmentation_id=None, shared=None, profile=None)
```

Creates a new network

**CLI Example:**
```
salt '*' neutron.create_network network-name
salt '*' neutron.create_network network-name profile=openstack1
```

**Parameters**
- **name** – Name of network to create
- **admin_state_up** – should the state of the network be up? default: True (Optional)
- **router_ext** – True then if create the external network (Optional)
- **network_type** – the Type of network that the provider is such as GRE, VXLAN, VLAN, FLAT, or LOCAL (Optional)
- **physical_network** – the name of the physical network as neutron knows it (Optional)
- **segmentation_id** – the vlan id or GRE id (Optional)
- **shared** – is the network shared or not (Optional)
- **profile** – Profile to build on (Optional)

**Returns** Created network information

```python
salt.modules.neutron.create_port(name, network, device_id=None, admin_state_up=True, profile=None)
```

Creates a new port

**CLI Example:**
```
salt '*' neutron.create_port network-name port-name
```

**Parameters**
- **name** – Name of port to create
- **network** – Network name or ID
- **device_id** – ID of device (Optional)
- **admin_state_up** – Set admin state up to true or false, default: true (Optional)
- **profile** – Profile to build on (Optional)

**Returns** Created port information

```python
salt.modules.neutron.create_router(name, ext_network=None, admin_state_up=True, profile=None)
```

Creates a new router

**CLI Example:**
```
salt '*' neutron.create_router new-router-name
```

**Parameters**
- **name** – Name of router to create (must be first)
- **ext_network** – ID or name of the external for the gateway (Optional)
- **admin_state_up** – Set admin state up to true or false, default: true (Optional)
- **profile** – Profile to build on (Optional)
Returns  Created router information

salt.modules.neutron.create_security_group

    name=None, description=None, profile=None

Creates a new security group

CLI Example:

```
salt '*' neutron.create_security_group security-group-name
default_description='Security group for servers'
```

Parameters

- **name** – Name of security group (Optional)
- **description** – Description of security group (Optional)
- **profile** – Profile to build on (Optional)

Returns  Created security group information

salt.modules.neutron.create_security_group_rule

    security_group, remote_group_id=None, direction='ingress',
    protocol=None, port_range_min=None, port_range_max=None,
    ethertype='IPv4', profile=None

Creates a new security group rule

CLI Example:

```
salt '*' neutron.show_security_group_rule security-group-rule-id
```

Parameters

- **security_group** – Security group name or ID to add rule
- **remote_group_id** – Remote security group name or ID to apply rule (Optional)
- **direction** – Direction of traffic: ingress/egress, default: ingress (Optional)
- **protocol** – Protocol of packet: null/icmp/tcp/udp, default: null (Optional)
- **port_range_min** – Starting port range (Optional)
- **port_range_max** – Ending port range (Optional)
- **ethertype** – IPv4/IPv6, default: IPv4 (Optional)
- **profile** – Profile to build on (Optional)

Returns  Created security group rule information

salt.modules.neutron.create_subnet

    network, cidr, name=None, ip_version=4, profile=None

Creates a new subnet

CLI Example:

```
salt '*' neutron.create_subnet network-name 192.168.1.0/24
```

Parameters

- **network** – Network ID or name this subnet belongs to
- **cidr** – CIDR of subnet to create (Ex. '192.168.1.0/24')
- **name** – Name of the subnet to create (Optional)
- **ip_version** – Version to use, default is 4(IPv4) (Optional)
- **profile** – Profile to build on (Optional)

Returns  Created subnet information

salt.modules.neutron.create_vpnservice

    subnet, router, name, admin_state_up=True, profile=None

Creates a new VPN service

CLI Example:
salt '*' neutron.create_vpnservice router-name name

Parameters

- subnet – Subnet unique identifier for the VPN service deployment
- router – Router unique identifier for the VPN service
- name – Set a name for the VPN service
- admin_state_up – Set admin state up to true or false, default:True (Optional)
- profile – Profile to build on (Optional)

Returns Created VPN service information

salt.modules.neutron.delete_firewall_rule(firewall_rule, profile=None)

Deletes the specified firewall_rule

CLI Example:
salt '*' neutron.delete_firewall_rule firewall-rule

Parameters

- firewall_rule – ID or name of firewall rule to delete
- profile – Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.delete_floatingip(floatingip_id, profile=None)

Deletes the specified floating IP

CLI Example:
salt '*' neutron.delete_floatingip floatingip-id

Parameters

- floatingip_id – ID of floatingIP to delete
- profile – Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.delete_ikepolicy(ikepolicy, profile=None)

Deletes the specified IKEPolicy

CLI Example:
salt '*' neutron.delete_ikepolicy ikepolicy-name

Parameters

- ikepolicy – ID or name of IKE policy to delete
- profile – Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.delete_ipsec_site_connection(ipsec_site_connection, profile=None)

Deletes the specified IPsecSiteConnection

CLI Example:
salt '*' neutron.delete_ipsec_site_connection connection-name

Parameters

- ipsec_site_connection – ID or name of ipsec site connection to delete
- profile – Profile to build on (Optional)

Returns True(Succeed) or False
salt.modules.neutron.delete_ipsecpolicy(ipsecpolicy, profile=None)
Deletes the specified IPsecPolicy

CLI Example:

```
salt '*' neutron.delete_ipsecpolicy ipsecpolicy-name
```

Parameters
- `ipsecpolicy` – ID or name of IPSec policy to delete
- `profile` – Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.delete_network(network, profile=None)
Deletes the specified network

CLI Example:

```
salt '*' neutron.delete_network network-name
```

```
salt '*' neutron.delete_network network-name profile=openstack1
```

Parameters
- `network` – ID or name of network to delete
- `profile` – Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.delete_port(port, profile=None)
Deletes the specified port

CLI Example:

```
salt '*' neutron.delete_port port-name
```

```
salt '*' neutron.delete_port port-name profile=openstack1
```

Parameters
- `port` – port name or ID
- `profile` – Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.delete_quota(tenant_id, profile=None)
Delete the specified tenant’s quota value

CLI Example:

```
salt '*' neutron.update_quota tenant-id
```

```
salt '*' neutron.update_quota tenant-id profile=openstack1
```

Parameters
- `tenant_id` – ID of tenant to quota delete
- `profile` – Profile to build on (Optional)

Returns True(Delete succeed) or False(Delete failed)

salt.modules.neutron.delete_router(router, profile=None)
Delete the specified router

CLI Example:

```
salt '*' neutron.delete_router router-name
```

Parameters
- `router` – ID or name of router to delete
**profile** – Profile to build on (Optional)

Returns True(Succeed) or False

```python
salt.modules.neutron.delete_security_group(security_group, profile=None)
```

Deletes the specified security group

CLI Example:

```bash
salt '*' neutron.delete_security_group security-group-name
```

Parameters

- **security_group** – ID or name of security group to delete
- **profile** – Profile to build on (Optional)

Returns True(Succeed) or False

```python
salt.modules.neutron.delete_security_group_rule(security_group_rule_id, profile=None)
```

Deletes the specified security group rule

CLI Example:

```bash
salt '*' neutron.delete_security_group_rule security-group-rule-id
```

Parameters

- **security_group_rule_id** – ID of security group rule to delete
- **profile** – Profile to build on (Optional)

Returns True(Succeed) or False

```python
salt.modules.neutron.delete_subnet(subnet, profile=None)
```

Deletes the specified subnet

CLI Example:

```bash
salt '*' neutron.delete_subnet subnet-name
salt '*' neutron.delete_subnet subnet-name profile=openstack1
```

Parameters

- **subnet** – ID or name of subnet to delete
- **profile** – Profile to build on (Optional)

Returns True(Succeed) or False

```python
salt.modules.neutron.delete_vpnservice(vpnservice, profile=None)
```

Deletes the specified VPN service

CLI Example:

```bash
salt '*' neutron.delete_vpnservice vpnservice-name
```

Parameters

- **vpnservice** – ID or name of vpn service to delete
- **profile** – Profile to build on (Optional)

Returns True(Succeed) or False

```python
salt.modules.neutron.get_quotas_tenant(profile=None)
```

Fetches tenant info in server’s context for following quota operation

CLI Example:

```bash
salt '*' neutron.get_quotas_tenant
salt '*' neutron.get_quotas_tenant profile=openstack1
```

Parameters **profile** – Profile to build on (Optional)
Returns Quotas information

```
salt.modules.neutron.list_agents(profile=None)
  List agents.
  CLI Example:
  
salt '*' neutron.list_agents
```

Parameters **profile** – Profile to build on (Optional)
Returns agents message.

```
salt.modules.neutron.list_extensions(profile=None)
  Fetches a list of all extensions on server side
  CLI Example:
  
salt '*' neutron.list_extensions
s
alt '*' neutron.list_extensions profile=openstack1
```

Parameters **profile** – Profile to build on (Optional)
Returns List of extensions

```
salt.modules.neutron.list_firewall_rules(profile=None)
  Fetches a list of all firewall rules for a tenant
  CLI Example:
  
  salt '*' neutron.list_firewall_rules
```

Parameters **profile** – Profile to build on (Optional)
Returns List of firewall rules

```
salt.modules.neutron.list_firewalls(profile=None)
  Fetches a list of all firewalls for a tenant
  CLI Example:
  
  salt '*' neutron.list_firewalls
```

Parameters **profile** – Profile to build on (Optional)
Returns List of firewalls

```
salt.modules.neutron.list_floatingips(profile=None)
  Fetch a list of all floatingIPs for a tenant
  CLI Example:
  
  salt '*' neutron.list_floatingips
  salt '*' neutron.list_floatingips profile=openstack1
```

Parameters **profile** – Profile to build on (Optional)
Returns List of floatingIP

```
salt.modules.neutron.list_ikepolicies(profile=None)
  Fetches a list of all configured IKEPolicies for a tenant
  CLI Example:
  
  salt '*' neutron.list_ikepolicies
  salt '*' neutron.list_ikepolicies profile=openstack1
```

Parameters **profile** – Profile to build on (Optional)
Returns List of IKE policy
salt.modules.neutron.list_ipsec_site_connections(profile=None)
Fetched all configured IPSec Site Connections for a tenant

CLI Example:

```
salt '*' neutron.list_ipsec_site_connections
salt '*' neutron.list_ipsec_site_connections profile=openstack1
```

**Parameters**

- **profile** – Profile to build on (Optional)

**Returns**
List of IPSec site connection

salt.modules.neutron.list_ipsecpolicies(profile=None)
Fetched a list of all configured IPsecPolicies for a tenant

CLI Example:

```
salt '*' neutron.list_ipsecpolicies ipsecpolicy-name
salt '*' neutron.list_ipsecpolicies ipsecpolicy-name profile=openstack1
```

**Parameters**

- **profile** – Profile to build on (Optional)

**Returns**
List of IPSec policy

salt.modules.neutron.list_l3_agent_hosting_routers(router, profile=None)
List L3 agents hosting a router.

CLI Example:

```
salt '*' neutron.list_l3_agent_hosting_routers router
```

:Param router: router name or ID to query. :Param profile: Profile to build on (Optional) :Return: L3 agents message.

salt.modules.neutron.list_networks(profile=None)
Fetched a list of all networks for a tenant

CLI Example:

```
salt '*' neutron.list_networks
salt '*' neutron.list_networks profile=openstack1
```

**Parameters**

- **profile** – Profile to build on (Optional)

**Returns**
List of network

salt.modules.neutron.list_ports(profile=None)
Fetches a list of all networks for a tenant

CLI Example:

```
salt '*' neutron.list_ports
salt '*' neutron.list_ports profile=openstack1
```

**Parameters**

- **profile** – Profile to build on (Optional)

**Returns**
List of port

salt.modules.neutron.list_quotas(profile=None)
Fetches all tenants quotas

CLI Example:

```
salt '*' neutron.list_quotas
salt '*' neutron.list_quotas profile=openstack1
```

**Parameters**

- **profile** – Profile to build on (Optional)

**Returns**
List of quotas
Parameters **profile** – Profile to build on (Optional)
Returns List of quotas

```
salt.modules.neutron.list_routers(profile=None)
```

Fetches a list of all routers for a tenant

CLI Example:

```
salt '*' neutron.list_routers
salt '*' neutron.list_routers profile=openstack1
```

Parameters **profile** – Profile to build on (Optional)
Returns List of router

```
salt.modules.neutron.list_security_group_rules(profile=None)
```

Fetches a list of all security group rules for a tenant

CLI Example:

```
salt '*' neutron.list_security_group_rules
salt '*' neutron.list_security_group_rules profile=openstack1
```

Parameters **profile** – Profile to build on (Optional)
Returns List of security group rule

```
salt.modules.neutron.list_security_groups(profile=None)
```

Fetches a list of all security groups for a tenant

CLI Example:

```
salt '*' neutron.list_security_groups
salt '*' neutron.list_security_groups profile=openstack1
```

Parameters **profile** – Profile to build on (Optional)
Returns List of security group

```
salt.modules.neutron.list_subnets(profile=None)
```

Fetches a list of all networks for a tenant

CLI Example:

```
salt '*' neutron.list_subnets
salt '*' neutron.list_subnets profile=openstack1
```

Parameters **profile** – Profile to build on (Optional)
Returns List of subnet

```
salt.modules.neutron.list_vpnservices(retrieve_all=True, profile=None, **kwargs)
```

Fetches a list of all configured VPN services for a tenant

CLI Example:

```
salt '*' neutron.list_vpnservices
```

Parameters

  - **retrieve_all** – True or False, default: True (Optional)
  - **profile** – Profile to build on (Optional)

```
salt.modules.neutron.remove_gateway_router(router, profile=None)
```

Removes an external network gateway from the specified router
CLI Example:

salt '*' neutron.remove_gateway_router router-name

Parameters
- `router` – ID or name of router
- `profile` – Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.remove_interface_router(router, subnet, profile=None)

Removes an internal network interface from the specified router

CLI Example:

salt '*' neutron.remove_interface_router router-name subnet-name

Parameters
- `router` – ID or name of the router
- `subnet` – ID or name of the subnet
- `profile` – Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.show_firewall(firewall, profile=None)

Fetches information of a specific firewall rule

CLI Example:

salt '*' neutron.show_firewall firewall

Parameters
- `firewall` – ID or name of firewall to look up
- `profile` – Profile to build on (Optional)

Returns firewall information

salt.modules.neutron.show_firewall_rule(firewall_rule, profile=None)

Fetches information of a specific firewall rule

CLI Example:

salt '*' neutron.show_firewall_rule firewall-rule-name

Parameters
- `ipsecpolicy` – ID or name of firewall rule to look up
- `profile` – Profile to build on (Optional)

Returns firewall rule information

salt.modules.neutron.show_floatingip(floatingip_id, profile=None)

Fetches information of a certain floatingIP

CLI Example:

salt '*' neutron.show_floatingip floatingip-id

Parameters
- `floatingip_id` – ID of floatingIP to look up
- `profile` – Profile to build on (Optional)

Returns Floating IP information

salt.modules.neutron.show_ikepolicy(ikepolicy, profile=None)

Fetches information of a specific IKEPolicy
CLI Example:

```bash
salt '*' neutron.show_ikepolicy ikepolicy-name
```

Parameters

- **ikepolicy** – ID or name of ikepolicy to look up
- **profile** – Profile to build on (Optional)

Returns IKE policy information

salt.modules.neutron.**show_ipsec_site_connection**(ipsec_site_connection, profile=None)
Fetches information of a specific IPsecSiteConnection

CLI Example:

```bash
gmail
```

Parameters

- **ipsec_site_connection** – ID or name of ipsec site connection to look up
- **profile** – Profile to build on (Optional)

Returns IPSec site connection information

salt.modules.neutron.**show_ipsecpolicy**(ipsecpolicy, profile=None)
Fetches information of a specific IPsecPolicy

CLI Example:

```bash
gmail
```

Parameters

- **ipsecpolicy** – ID or name of IPSec policy to look up
- **profile** – Profile to build on (Optional)

Returns IPSec policy information

salt.modules.neutron.**show_network**(network, profile=None)
Fetches information of a certain network

CLI Example:

```bash
gmail
```

Parameters

- **network** – ID or name of network to look up
- **profile** – Profile to build on (Optional)

Returns Network information

salt.modules.neutron.**show_port**(port, profile=None)
Fetches information of a certain port

CLI Example:

```bash
gmail
```

Parameters

- **port** – ID or name of port to look up
- **profile** – Profile to build on (Optional)

Returns Port information
salt.modules.neutron.show_quota(tenant_id, profile=None)
Fetches information of a certain tenant’s quotas

CLI Example:
```
salt '*' neutron.show_quota tenant-id
salt '*' neutron.show_quota tenant-id profile=openstack1
```

Parameters
- **tenant_id** – ID of tenant
- **profile** – Profile to build on (Optional)

Returns Quota information

salt.modules.neutron.show_router(router, profile=None)
Fetches information of a certain router

CLI Example:
```
salt '*' neutron.show_router router-name
```

Parameters
- **router** – ID or name of router to look up
- **profile** – Profile to build on (Optional)

Returns Router information

salt.modules.neutron.show_security_group(security_group, profile=None)
Fetches information of a certain security group

CLI Example:
```
salt '*' neutron.show_security_group security-group-name
```

Parameters
- **security_group** – ID or name of security group to look up
- **profile** – Profile to build on (Optional)

Returns Security group information

salt.modules.neutron.show_security_group_rule(security_group_rule_id, profile=None)
Fetches information of a certain security group rule

CLI Example:
```
salt '*' neutron.show_security_group_rule security-group-rule-id
```

Parameters
- **security_group_rule_id** – ID of security group rule to look up
- **profile** – Profile to build on (Optional)

Returns Security group rule information

salt.modules.neutron.show_subnet(subnet, profile=None)
Fetches information of a certain subnet

CLI Example:
```
salt '*' neutron.show_subnet subnet-name
```

Parameters
- **subnet** – ID or name of subnet to look up
- **profile** – Profile to build on (Optional)

Returns Subnet information
salt.modules.neutron.show_vpnservice(vpnservice, profile=None, **kwargs)
Fetches information of a specific VPN service

CLI Example:
salt '*' neutron.show_vpnservice vpnservice-name

Parameters
- **vpnservice** – ID or name of vpn service to look up
- **profile** – Profile to build on (Optional)

Returns VPN service information

salt.modules.neutron.update_firewall_rule(firewall_rule, protocol=None, action=None, name=None, description=None, ip_version=None, source_ip_address=None, destination_ip_address=None, source_port=None, destination_port=None, shared=None, enabled=None, profile=None)

Update a firewall rule

CLI Example:
salt '*' neutron.update_firewall_rule firewall_rule protocol=PROTOCOL\n\n\n\n← action=ACTION\n name=NAME description=DESCRIPTION ip_version=IP_VERSION\n source_ip_address=SOURCE_IP_ADDRESS destination_ip_address=DESTINATION_IP_\n\n← ADDRESS source_port=SOURCE_PORT destination_port=DESTINATION_PORT shared=SHARED\n\n← enabled=ENABLED

Parameters
- **firewall_rule** – ID or name of firewall rule to update.
- **protocol** – Protocol for the firewall rule, choose "tcp","udp","icmp" or "None". (Optional)
- **action** – Action for the firewall rule, choose "allow" or "deny". (Optional)
- **name** – Name for the firewall rule. (Optional)
- **description** – Description for the firewall rule. (Optional)
- **ip_version** – IP protocol version, default: 4. (Optional)
- **source_ip_address** – Source IP address or subnet. (Optional)
- **destination_ip_address** – Destination IP address or subnet. (Optional)
- **source_port** – Source port (integer in [1, 65535] or range in a:b). (Optional)
- **destination_port** – Destination port (integer in [1, 65535] or range in a:b). (Optional)
- **shared** – Set shared to True, default: False. (Optional)
- **enabled** – To enable this rule, default: True. (Optional)
- **profile** – Profile to build on (Optional)

salt.modules.neutron.update_floatingip(floatingip_id, port=None, profile=None)

Updates a floatingIP

CLI Example:
salt '*' neutron.update_floatingip network-name port-name

Parameters
- **floatingip_id** – ID of floatingIP
- **port** – ID or name of port, to associate floatingip to None or do not specify to disassociate the floatingip (Optional)
profile – Profile to build on (Optional)

Returns Value of updated floating IP information

`salt.modules.neutron.update_network(network, name, profile=None)`

Updates a network

CLI Example:

```
salt '*' neutron.update_network network-name new-network-name
```

Parameters

- `network` – ID or name of network to update
- `name` – Name of this network
- `profile` – Profile to build on (Optional)

Returns Value of updated network information

`salt.modules.neutron.update_port(port, name, admin_state_up=True, profile=None)`

Updates a port

CLI Example:

```
salt '*' neutron.update_port port-name network-name new-port-name
```

Parameters

- `port` – Port name or ID
- `name` – Name of this port
- `admin_state_up` – Set admin state up to true or false, default: true (Optional)
- `profile` – Profile to build on (Optional)

Returns Value of updated port information

`salt.modules.neutron.update_quota(tenant_id, subnet=None, router=None, network=None, floatingip=None, port=None, security_group=None, security_group_rule=None, profile=None)`

Update a tenant’s quota

CLI Example:

```
salt '*' neutron.update_quota tenant-id subnet=40 router=50
    network=10 floatingip=30 port=30
```

Parameters

- `tenant_id` – ID of tenant
- `subnet` – Value of subnet quota (Optional)
- `router` – Value of router quota (Optional)
- `network` – Value of network quota (Optional)
- `floatingip` – Value of floatingip quota (Optional)
- `port` – Value of port quota (Optional)
- `security_group` – Value of security group (Optional)
- `security_group_rule` – Value of security group rule (Optional)
- `profile` – Profile to build on (Optional)

Returns Value of updated quota

`salt.modules.neutron.update_router(router, name=None, admin_state_up=None, profile=None, **kwargs)`

Updates a router

CLI Example:
salt '*' neutron.update_router router_id name=new-router-name
               admin_state_up=True

Parameters

- **router** – ID or name of router to update
- **name** – Name of this router
- **ext_network** – ID or name of the external for the gateway (Optional)
- **admin_state_up** – Set admin state up to true or false, default: true (Optional)
- **profile** – Profile to build on (Optional)
- **kwargs** –

Returns Value of updated router information

salt.modules.neutron.update_security_group(security_group, name=None, description=None, profile=None)

Updates a security group

CLI Example:
	salt '*' neutron.update_security_group security-group-name new-
           security-group-name

Parameters

- **security_group** – ID or name of security group to update
- **name** – Name of this security group (Optional)
- **description** – Description of security group (Optional)
- **profile** – Profile to build on (Optional)

Returns Value of updated security group information

salt.modules.neutron.update_subnet(subnet, name, profile=None)

Updates a subnet

CLI Example:
	salt '*' neutron.update_subnet subnet-name new-subnet-name

Parameters

- **subnet** – ID or name of subnet to update
- **name** – Name of this subnet
- **profile** – Profile to build on (Optional)

Returns Value of updated subnet information

salt.modules.neutron.update_vpnservice(vpnservice, desc, profile=None)

Updates a VPN service

CLI Example:
	salt '*' neutron.update_vpnservice vpnservice-name desc='VPN Service1'

Parameters

- **vpnservice** – ID or name of vpn service to update
- **desc** – Set a description for the VPN service
- **profile** – Profile to build on (Optional)

Returns Value of updated VPN service information

21.9.279 salt.modules.neutronng

Neutron module for interacting with OpenStack Neutron
New in version 2018.3.0.
:depends: shade

Example configuration

```yaml
neutron:
  cloud: default
```

```yaml
neutron:
  auth:
    username: admin
    password: password123
    user_domain_name: mydomain
    project_name: myproject
    project_domain_name: myproject
    auth_url: https://example.org:5000/v3
    identity_api_version: 3
```

```python
salt.modules.neutronng.compare_changes(obj, **kwargs)
    Compare two dicts returning only keys that exist in the first dict and are different in the second one
```

```python
salt.modules.neutronng.get_openstack_cloud(auth=None)
    Return an openstack_cloud
```

```python
salt.modules.neutronng.get_operator_cloud(auth=None)
    Return an operator_cloud
```

```python
salt.modules.neutronng.list_networks(auth=None, **kwargs)
    List networks
    filters A Python dictionary of filter conditions to push down
    CLI Example:

    ```
salt '*' neutronng.list_networks
salt '*' neutronng.list_networks filters='{"tenant_id": "1dcac318a83b4610b7a7f7ba01465548"}"
    ```
```

```python
salt.modules.neutronng.list_subnets(auth=None, **kwargs)
    List subnets
    filters A Python dictionary of filter conditions to push down
    CLI Example:

    ```
salt '*' neutronng.list_subnets
salt '*' neutronng.list_subnets filters='{"tenant_id": "1dcac318a83b4610b7a7f7ba01465548"}"
    ```
```

```python
salt.modules.neutronng.network_create(auth=None, **kwargs)
    Create a network
    name Name of the network being created
    shared [False] If True, set the network as shared
    admin_state_up [True] If True, Set the network administrative state to "up"
    external [False] Control whether or not this network is externally accessible
    provider An optional Python dictionary of network provider options
    project_id The project ID on which this network will be created
    CLI Example:
```
salt '***' neutronng.network_create name=network2 shared=True admin_state_!
  \-up=True  external=True

salt '***' neutronng.network_create name=network3 provider='{"network_type
  \-": "vlan",  \-"segmentation_id": "4010",  \-"physical_network": "provider"}'
  \-id=1dcac318a83b4610b7a7f7ba01465548

salt.modules.neutronng.network_delete(auth=None, **kwargs)
Delete a network
name_or_id  Name or ID of the network being deleted
CLI Example:

salt '***' neutronng.network_delete name_or_id=network1
salt '***' neutronng.network_delete name_or_id=1dcac318a83b4610b7a7f7ba01465548

salt.modules.neutronng.network_get(auth=None, **kwargs)
Get a single network
filters  A Python dictionary of filter conditions to push down
CLI Example:

salt '***' neutronng.network_get name=XLB4

salt.modules.neutronng.security_group_create(auth=None, **kwargs)
Create a security group. Use security_group_get to create default.
project_id  The project ID on which this security group will be created
CLI Example:

salt '***' neutronng.security_group_create name=secgroup1 description="Very secure security group"
  \-id=1dcac318a83b4610b7a7f7ba01465548

salt.modules.neutronng.security_group_delete(auth=None, **kwargs)
Delete a security group
name_or_id  The name or unique ID of the security group
CLI Example:

salt '***' neutronng.security_group_delete name_or_id=secgroup1

salt.modules.neutronng.security_group_get(auth=None, **kwargs)
Get a single security group. This will create a default security group if one does not exist yet for a particular
project_id.
filters  A Python dictionary of filter conditions to push down
CLI Example:

salt '***' neutronng.security_group_get  \-name=1dcac318a83b4610b7a7f7ba01465548
salt '***' neutronng.security_group_get  \-name=default filters='{
  \-"tenant_id": "2e778bb64ca64a199eb526b5958d8710"}'}

salt.modules.neutronng.security_group_rule_create(auth=None, **kwargs)
Create a rule in a security group
secgroup_name_or_id The security group name or ID to associate with this security group rule. If a non-unique group name is given, an exception is raised.

port_range_min The minimum port number in the range that is matched by the security group rule. If the protocol is TCP or UDP, this value must be less than or equal to the port_range_max attribute value. If nova is used by the cloud provider for security groups, then a value of None will be transformed to -1.

port_range_max The maximum port number in the range that is matched by the security group rule. The port_range_min attribute constrains the port_range_max attribute. If nova is used by the cloud provider for security groups, then a value of None will be transformed to -1.

protocol The protocol that is matched by the security group rule. Valid values are None, tcp, udp, and icmp.

remote_ip_prefix The remote IP prefix to be associated with this security group rule. This attribute matches the specified IP prefix as the source IP address of the IP packet.

remote_group_id The remote group ID to be associated with this security group rule.

direction Either ingress or egress; the direction in which the security group rule is applied. For a compute instance, an ingress security group rule is applied to incoming (ingress) traffic for that instance. An egress rule is applied to traffic leaving the instance.

ethertype Must be IPv4 or IPv6, and addresses represented in CIDR must match the ingress or egress rules.

project_id Specify the project ID this security group will be created on (admin-only)

CLI Example:

```
salt '*' neutronng.security_group_rule_create secgroup_name_or_id=secgroup1
```

```
salt '*' neutronng.security_group_rule_create secgroup_name_or_id=secgroup2 port_range_min=8080 port_range_max=8080 direction='egress'
```

```
salt '*' neutronng.security_group_rule_create secgroup_name_or_id=c0e1d1ce-7296-405e-919d-1c08217be529 protocol=icmp project_id=1dcac318a83b4610b7a7f7ba01465548
```

salt.modules.neutronng.security_group_rule_delete(auth=None, **kwargs)

Delete a security group

name_or_id The unique ID of the security group rule

CLI Example:

```
salt '*' neutronng.security_group_rule_delete name_or_id=1dcac318a83b4610b7a7f7ba01465548
```

salt.modules.neutronng.security_group_update(secgroup=None, auth=None, **kwargs)

Update a security group

secgroup Name, ID or Raw Object of the security group to update

name New name for the security group

description New description for the security group

CLI Example:

```
salt '*' neutronng.security_group_update secgroup=secgroup1 description="Very secure security group"
```

```
salt '*' neutronng.security_group_update secgroup=secgroup1 description="Very secure security group" project_id=1dcac318a83b4610b7a7f7ba01465548
```

salt.modules.neutronng.setup_clouds(auth=None)

Call functions to create Shade cloud objects in __context__ to take advantage of Shade's in-memory caching across several states

salt.modules.neutronng.subnet_create(auth=None, **kwargs)

Create a subnet

21.9. execution modules
network_name_or_id  The unique name or ID of the attached network. If a non-unique name is supplied, an exception is raised.
cidr  The CIDR
ip_version  The IP version, which is 4 or 6.
enable_dhcp  [False] Set to True if DHCP is enabled and False if disabled
subnet_name  The name of the subnet
tenant_id  The ID of the tenant who owns the network. Only administrative users can specify a tenant ID other than their own.
allocation_pools  A list of dictionaries of the start and end addresses for the allocation pools.
gateway_ip  The gateway IP address. When you specify both allocation_pools and gateway_ip, you must ensure that the gateway IP does not overlap with the specified allocation pools.
disable_gateway_ip  [False] Set to True if gateway IP address is disabled and False if enabled. It is not allowed with gateway_ip.
dns_nameservers  A list of DNS name servers for the subnet
host_routes  A list of host route dictionaries for the subnet
ipv6_ra_mode  IPv6 Router Advertisement mode. Valid values are dhcpv6-stateful, dhcpv6-stateless, or slaac.
ipv6_address_mode  IPv6 address mode. Valid values are dhcpv6-stateful, dhcpv6-stateless, or slaac.
use_default_subnetpool  If True, use the default subnetpool for ip_version to obtain a CIDR. It is required to pass None to the cidr argument when enabling this option.

CLI Example:

```shell
salt '*' neutronng.subnet_create network_name_or_id=network1
  subnet_name=subnet1

salt '*' neutronng.subnet_create subnet_name=subnet2 network_name_or_id=network2
  enable_dhcp=True
  gateway_ip='192.168.199.1' cidr=192.168.199.0/24

salt '*' neutronng.subnet_create network_name_or_id=network1 subnet_name=subnet1
dns_nameservers=['8.8.8.8', '8.8.8.7']
```

salt.modules.neutronng.subnet_delete(auth=None, **kwargs)
Delete a subnet
name  Name or ID of the subnet to update

CLI Example:

```shell
salt '*' neutronng.subnet_delete name=subnet1	salt '*' neutronng.subnet_delete name=1dcac318a83b4610b7a7f7ba0f465548
```

salt.modules.neutronng.subnet_get(auth=None, **kwargs)
Get a single subnet
filters  A Python dictionary of filter conditions to push down

CLI Example:

```shell
salt '*' neutronng.subnet_get name=subnet1
```

salt.modules.neutronng.subnet_update(auth=None, **kwargs)
Update a subnet
name_or_id  Name or ID of the subnet to update
subnet_name  The new name of the subnet
enable_dhcp  Set to True if DHCP is enabled and False if disabled
gateway_ip  The gateway IP address. When you specify both allocation_pools and gateway_ip, you must ensure that the gateway IP does not overlap with the specified allocation pools.
**disable_gateway_ip**  [False] Set to True if gateway IP address is disabled and False if enabled. It is not allowed with `gateway_ip`.

**allocation_pools**  A list of dictionaries of the start and end addresses for the allocation pools.

**dns_nameservers**  A list of DNS name servers for the subnet

**host_routes**  A list of host route dictionaries for the subnet

```python
salt '*' neutronng.subnet_update name=subnet1 subnet_name=subnet2
salt '*' neutronng.subnet_update name=subnet1 dns_nameservers='["8.8.8.8", "8.8.8.7"]'
```

### 21.9.280 salt.modules.nfs3

Module for managing NFS version 3.

**salt.modules.nfs3.add_export**(exports="/etc/exports", path=None, hosts=None, options=None)

Add an export

CLI Example:

```bash
salt '*' nfs3.add_export path="/srv/test" hosts='127.0.0.1' options=['rw']
```

**salt.modules.nfs3.del_export**(exports="/etc/exports", path=None)

Remove an export

CLI Example:

```bash
salt '*' nfs.del_export /media/storage
```

**salt.modules.nfs3.list_exports**(exports="/etc/exports")

List configured exports

CLI Example:

```bash
salt '*' nfs.list_exports
```

**salt.modules.nfs3.reload_exports**()

Trigger a reload of the exports file to apply changes

CLI Example:

```bash
salt '*' nfs3.reload_exports
```

### 21.9.281 salt.modules.nftables

Support for nftables

**salt.modules.nftables.append**(table='filter', chain=None, rule=None, family='ipv4')

Append a rule to the specified table & chain.

This function accepts a rule in a standard nftables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:
salt
'*
ntables.append filter input

rule='tcp dport 22 log accept'

IPv6:
salt
'*
ntables.append filter input

rule='tcp dport 22 log accept'

family=ipv6

salt.modules.nftables.
build_rule(table=None, chain=None, command=None, position=",
full=None, family='ipv4', **kwargs)

Build a well-formatted nftables rule based on kwargs. A table and chain are not required, unless full is True.

If full is True, then table, chain and command are required. command may be specified as either insert, append, or delete. This will return the nftables command, exactly as it would be used from the command line.

If a position is required (as with insert or delete), it may be specified as position. This will only be useful if full is True.

If connstate is passed in, it will automatically be changed to state.

CLI Examples:
salt
'*
ntables.build_rule match=state

connstate=RELATED,ESTABLISHED jump=ACCEPT

salt
'*
ntables.build_rule filter input command=insert position=3

full=True match=state state=related,established jump=accept

IPv6:
salt
'*
ntables.build_rule match=state

connstate=related,established jump=accept

family=ipv6
salt
'*
ntables.build_rule filter input command=insert position=3

full=True match=state state=related,established jump=accept

family=ipv6

salt.modules.nftables.
check(table='filter', chain=None, rule=None, family='ipv4')

Check for the existence of a rule in the table and chain

This function accepts a rule in a standard nftables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:
salt
'*
ntables.check filter input

rule='tcp dport 22 log accept'

IPv6:
salt
'*
ntables.check filter input

rule='tcp dport 22 log accept'

family=ipv6

salt.modules.nftables.
check_chain(table='filter', chain=None, family='ipv4')

New in version 2014.7.0.

Check for the existence of a chain in the table

CLI Example:
salt
'*
ntables.check_chain filter input

(continues on next page)
IPv6:
```
salt '*' nftables.check_chain filter input family=ipv6
```

`salt.modules.nftables.check_table(table=None, family='ipv4')`
Check for the existence of a table

CLI Example:
```
salt '*' nftables.check_table nat
```

`salt.modules.nftables.delete(table, chain=None, position=None, rule=None, family='ipv4')`
Delete a rule from the specified table & chain, specifying either the rule in its entirety, or the rule's position in the chain.

This function accepts a rule in a standard nftables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Examples:
```
salt '*' nftables.delete filter input position=3
salt '*' nftables.delete filter input \n rule='tcp dport 22 log accept'
```
IPv6:
```
salt '*' nftables.delete filter input position=3 family=ipv6
```
```
salt '*' nftables.delete filter input \n rule='tcp dport 22 log accept' \n family=ipv6
```

`salt.modules.nftables.delete_chain(table='filter', chain=None, family='ipv4')`
New in version 2014.7.0.

Delete the chain from the specified table.

CLI Example:
```
salt '*' nftables.delete_chain filter
```
IPv6:
```
salt '*' nftables.delete_chain filter family=ipv6
```

`salt.modules.nftables.delete_table(table, family='ipv4')`
New in version 2014.7.0.

Create new custom table.

CLI Example:
```
salt '*' nftables.delete_table filter
```
IPv6:
```
salt '*' nftables.delete_table filter family=ipv6
```
salt.modules.nftables.flush(
    table='filter',
    chain=None,
    family='ipv4'
)

Flush the chain in the specified table, flush all chains in the specified table if chain is not specified.

CLI Example:

```python
salt '*' nftables.flush filter
salt '*' nftables.flush filter input
IPv6:
salt '*' nftables.flush filter input family=ipv6
```

salt.modules.nftables.get_rule_handle(
    table='filter',
    chain=None,
    rule=None,
    family='ipv4'
)

Get the handle for a particular rule

This function accepts a rule in a standard nftables command format, starting with the chain. Trying to
force users to adapt to a new method of creating rules would be irritating at best, and we already have
a parser that can handle it.

CLI Example:

```python
salt '*' nftables.get_rule_handle filter input
    rule='tcp dport 22 log accept'
IPv6:
salt '*' nftables.get_rule_handle filter input
    rule='tcp dport 22 log accept'
    family=ipv6
```

salt.modules.nftables.get_rules(family='ipv4')

Return a data structure of the current, in-memory rules

CLI Example:

```python
salt '*' nftables.get_rules
salt '*' nftables.get_rules family=ipv6
```

salt.modules.nftables.get_saved_rules(conf_file=None)

Return a data structure of the rules in the conf file

CLI Example:

```python
salt '*' nftables.get_saved_rules
```

salt.modules.nftables.insert(
    table='filter',
    chain=None,
    position=None,
    rule=None,
    family='ipv4'
)

Insert a rule into the specified table & chain, at the specified position.

If position is not specified, rule will be inserted in first position.

This function accepts a rule in a standard nftables command format, starting with the chain. Trying to
force users to adapt to a new method of creating rules would be irritating at best, and we already have
a parser that can handle it.

CLI Examples:

```python
salt '*' nftables.insert filter input
    rule='tcp dport 22 log accept'
salt '*' nftables.insert filter input position=3
    rule='tcp dport 22 log accept'
```

(continues on next page)
IPv6:
salt '*' nftables.insert filter input \
  rule='tcp dport 22 log accept' \ 
    family=ipv6
salt '*' nftables.insert filter input position=3 \
  rule='tcp dport 22 log accept' \ 
    family=ipv6

salt.modules.nftables.new_chain(table='filter', chain=None, table_type=None, hook=None, priority=None, family='ipv4')

New in version 2014.7.0.
Create new chain to the specified table.

CLI Example:

salt '*' nftables.new_chain filter input
salt '*' nftables.new_chain filter input \ 
  table_type=filter hook=input priority=0
salt '*' nftables.new_chain filter foo

IPv6:
salt '*' nftables.new_chain filter input family=ipv6
salt '*' nftables.new_chain filter input \ 
  table_type=filter hook=input priority=0 family=ipv6
salt '*' nftables.new_chain filter foo family=ipv6

salt.modules.nftables.new_table(table, family='ipv4')

New in version 2014.7.0.
Create new custom table.

CLI Example:

salt '*' nftables.new_table filter
IPv6:
salt '*' nftables.new_table filter family=ipv6

salt.modules.nftables.save(filename=None, family='ipv4')

Save the current in-memory rules to disk

CLI Example:

salt '*' nftables.save /etc/nftables

salt.modules.nftables.version()

Return version from nftables --version

CLI Example:

salt '*' nftables.version
21.9.282  salt.modules.nginx

Support for nginx

salt.modules.nginx.build_info()
Return server and build arguments

   CLI Example:
   
   salt '*' nginx.build_info

salt.modules.nginx.configtest()
   test configuration and exit

   CLI Example:
   
   salt '*' nginx.configtest

salt.modules.nginx.signal(signal=None)
   Signals nginx to start, reload, reopen or stop.

   CLI Example:
   
   salt '*' nginx.signal reload

salt.modules.nginx.status(url='http://127.0.0.1/status')
   Return the data from an Nginx status page as a dictionary. http://wiki.nginx.org/HttpStubStatusModule
   url The URL of the status page. Defaults to 'http://127.0.0.1/status'

   CLI Example:
   
   salt '*' nginx.status

salt.modules.nginx.version()
   Return server version from nginx -v

   CLI Example:
   
   salt '*' nginx.version

21.9.283  salt.modules.nilrt_ip module

The networking module for NI Linux Real-Time distro

salt.modules.nilrt_ip.apply_network_settings(**settings)
   Apply global network configuration.

   CLI Example:
   
   salt '*' ip.apply_network_settings

salt.modules.nilrt_ip.build_interface(iface, iface_type, enabled, **settings)
   Build an interface script for a network interface.

   CLI Example:
   
   salt '*' ip.build_interface eth0 eth <settings>
salt.modules.nilrt_ip.build_network_settings(**settings)
   Build the global network script.
   
   CLI Example:
   ```
salt '*' ip.build_network_settings <settings>
   ```

salt.modules.nilrt_ip.disable(interface)
   Disable the specified interface
   Change adapter mode to Disabled. If previous adapter mode was EtherCAT, the target will need reboot.
   Parameters `interface (str)` – interface label
   Returns True if the service was disabled, otherwise an exception will be thrown.
   Return type bool
   
   CLI Example:
   ```
salt '*' ip.disable interface-label
   ```

salt.modules.nilrt_ip.down(interface, iface_type=None)
   Disable the specified interface
   Change adapter mode to Disabled. If previous adapter mode was EtherCAT, the target will need reboot.
   Parameters `interface (str)` – interface label
   Returns True if the service was disabled, otherwise an exception will be thrown.
   Return type bool
   
   CLI Example:
   ```
salt '*' ip.down interface-label
   ```

salt.modules.nilrt_ip.enable(interface)
   Enable the specified interface
   Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.
   Parameters `interface (str)` – interface label
   Returns True if the service was enabled, otherwise an exception will be thrown.
   Return type bool
   
   CLI Example:
   ```
salt '*' ip.enable interface-label
   ```

salt.modules.nilrt_ip.get_interface(iface)
   Returns details about given interface.
   
   CLI Example:
   ```
salt '*' ip.get_interface eth0
   ```

salt.modules.nilrt_ip.get_interfaces_details()
   Get details about all the interfaces on the minion
   Returns information about all interfaces omitting loopback
   Return type dictionary
   
   CLI Example:
   ```
salt '*' ip.get_interfaces_details
   ```

salt.modules.nilrt_ip.get_network_settings()
   Return the contents of the global network script.
   
   CLI Example:
salt '*' ip.get_network_settings

salt.modules.nilrt_ip.set_dhcp_linklocal_all(interface)
Configure specified adapter to use DHCP with linklocal fallback
Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.
Parameters
- interface (str) – interface label
Returns
- True if the settings were applied, otherwise an exception will be thrown.
Return type
- bool
CLI Example:
salt '*' ip.set_dhcp_linklocal_all interface-label

salt.modules.nilrt_ip.set_dhcp_only_all(interface)
Configure specified adapter to use DHCP only
Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.
Parameters
- interface (str) – interface label
Returns
- True if the settings were applied, otherwise an exception will be thrown.
Return type
- bool
CLI Example:
salt '*' ip.dhcp_only_all interface-label

salt.modules.nilrt_ip.set_ethercat(interface, master_id)
Configure specified adapter to use EtherCAT adapter mode. If successful, the target will need reboot if it
doesn’t already use EtherCAT adapter mode, otherwise will return true.
Parameters
- interface – interface label
- master_id – EtherCAT Master ID
Returns
- True if the settings were applied, otherwise an exception will be thrown.
CLI Example:
salt '*' ip.set_ethercat interface-label master-id

salt.modules.nilrt_ip.set_linklocal_only_all(interface)
Configure specified adapter to use linklocal only
Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.
Parameters
- interface (str) – interface label
Returns
- True if the settings were applied, otherwise an exception will be thrown.
Return type
- bool
CLI Example:
salt '*' ip.linklocal_only_all interface-label

salt.modules.nilrt_ip.set_static_all(interface, address, netmask, gateway, nameservers)
Configure specified adapter to use ipv4 manual settings
Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.
Parameters
- interface (str) – interface label
- address (str) – ipv4 address
- netmask (str) – ipv4 netmask
- gateway (str) – ipv4 gateway
- nameservers (str) – list of nameservers servers separated by spaces
Returns
- True if the settings were applied, otherwise an exception will be thrown.
Return type  bool

CLI Example:

```
salt '*' ip.set_static_all interface-label address netmask gateway nameservers
```

```
salt.modules.nilrt_ip.up(interface, iface_type=None)
```

Enable the specified interface

Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.

Parameters  **interface** (str) – interface label

Returns  True if the service was enabled, otherwise an exception will be thrown.

Return type  bool

CLI Example:

```
salt '*' ip.up interface-label
```

## 21.9.284 salt.modules.nix

**Work with Nix packages**

New in version 2017.7.0.

Does not require the machine to be Nixos, just have Nix installed and available to use for the user running this command. Their profile must be located in their home, under `$HOME/.nix-profile/`, and the nix store, unless specially set up, should be in `/nix`. To easily use this with multiple users or a root user, set up the `nix-daemon`.

This module exposes most of the common nix operations. Currently not meant to be run as a `pkg` module, but explicitly as `nix.*`.

For more information on nix, see the [nix documentation](https://nixos.org/nix).

```
salt.modules.nix.collect_garbage()
```

Completely removed all currently 'uninstalled' packages in the nix store.

Tells the user how many store paths were removed and how much space was freed.

Returns  How much space was freed and how many derivations were removed

Return type  str

**Warning:** This is a destructive action on the nix store.

```
salt '*' nix.collect_garbage
```

```
salt.modules.nix.install(*pkgs, **kwargs)
```

Installs a single or multiple packages via nix

Parameters

- **pkgs** (list(str)) – packages to update
- **attributes** (bool) – Pass the list of packages or single package as attributes, not package names. default: False

Returns  Installed packages. Example element: `gcc-3.3.2`

Return type  list(str)

```
salt '*' nix.install package [package2 ...]
salt '*' nix.install attributes=True attr.name [attr.name2 ...]
```

### 21.9. Execution modules
salt.modules.nix.list_pkgs(installed=True, attributes=True)

Lists installed packages. Due to how nix works, it defaults to just doing a nix-env -q.

Parameters

- **installed** *(bool)* – list only installed packages. This can be a very long list (12,000+ elements), so caution is advised. Default: True
- **attributes** *(bool)* – show the attributes of the packages when listing all packages. Default: True

Returns

- Packages installed or available, along with their attributes.

Return type

- list(list(str))

```python
salt '*' nix.list_pkgs
salt '*' nix.list_pkgs installed=False
```

salt.modules.nix.uninstall('pkgs')

Erases a package from the current nix profile. Nix uninstalls work differently than other package managers, and the symlinks in the profile are removed, while the actual package remains. There is also a nix.purge function, to clear the package cache of unused packages.

Parameters

- **pkgs** *(list(str))* – List, single package to uninstall

Returns

- Packages that have been uninstalled

Return type

- list(str)

```python
salt '*' nix.uninstall pkg1 [pkg2 ...]
```

salt.modules.nix.upgrade('pkgs')

Runs an update operation on the specified packages, or all packages if none is specified.

Parameters

- **pkgs** *(list(str))* – List of packages to update

Returns

- The upgraded packages. Example element: ['libxslt-1.1.0', 'libxslt-1.1.10']

Return type

- list(tuple(str, str))

```python
salt '*' nix.update
salt '*' nix.update pkgs=one,two
```

21.9.285 salt.modules.nova

Module for handling OpenStack Nova calls

depends

- novaclient Python module

configuration

This module is not usable until the user, password, tenant, and auth URL are specified either in a pillar or in the minion’s config file. For example:

```python
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/
# Optional
keystone.region_name: 'RegionOne'
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles: For example:
With this configuration in place, any of the nova functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' nova.flavor_list profile=openstack1
```

To use keystoneauth1 instead of keystoneclient, include the `use_keystoneauth` option in the pillar or minion config.

Note: This is required to use keystone v3 as for authentication.

```
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.1:5000/v3/'
keystone.use_keystoneauth: true
keystone.verify: '/path/to/custom/certs/ca-bundle.crt'
```

Note: By default the nova module will attempt to verify its connection utilizing the system certificates. If you need to verify against another bundle of CA certificates or want to skip verification altogether you will need to specify the `verify` option. You can specify True or False to verify (or not) against system certificates, a path to a bundle or CA certs to check against, or None to allow keystoneauth to search for the certificates on its own. (defaults to True)

```
salt.modules.nova.boot(name, flavor_id=0, image_id=0, profile=None, timeout=300)
```

Boot (create) a new instance

- **name** Name of the new instance (must be first)
- **flavor_id** Unique integer ID for the flavor
- **image_id** Unique integer ID for the image
- **timeout** How long to wait, after creating the instance, for the provider to return information about it (default 300 seconds).

New in version 2014.1.0.

CLI Example:

```
salt '*' nova.boot myinstance flavor_id=4596 image_id=2
```

The `flavor_id` and `image_id` are obtained from `nova.flavor_list` and `nova.image_list`
salt.modules.nova.delete(instance_id, profile=None)
    Delete an instance
    instance_id ID of the instance to be deleted
    CLI Example:
    ```bash
    salt '*' nova.delete 1138
    ```

salt.modules.nova.flavor_create(name, flavor_id=0, ram=0, disk=0, vcpus=1, profile=None)
    Add a flavor to nova (nova flavor-create). The following parameters are required:
    name Name of the new flavor (must be first)
    flavor_id Unique integer ID for the new flavor
    ram Memory size in MB
    disk Disk size in GB
    vcpus Number of vcpus
    CLI Example:
    ```bash
    salt '*' nova.flavor_create myflavor flavor_id=6 ram=4096 disk=10 vcpus=1
    ```

salt.modules.nova.flavor_delete(flavor_id, profile=None)
    Delete a flavor from nova by id (nova flavor-delete)
    CLI Example:
    ```bash
    salt '*' nova.flavor_delete 7
    ```

salt.modules.nova.flavor_list(profile=None)
    Return a list of available flavors (nova flavor-list)
    CLI Example:
    ```bash
    salt '*' nova.flavor_list
    ```

salt.modules.nova.image_list(name=None, profile=None)
    Return a list of available images (nova images-list + nova image-show) If a name is provided, only that image
    will be displayed.
    CLI Examples:
    ```bash
    salt '*' nova.image_list
    salt '*' nova.image_list myimage
    ```

salt.modules.nova.image_meta_delete(image_id=None, name=None, keys=None, profile=None)
    Delete a key=value pair from the metadata for an image (nova image-meta set)
    CLI Examples:
    ```bash
    salt '*' nova.image_meta_delete 6f52b2ff-0b31-4d84-8fd1-af45b84824f6 keys=cheese
    salt '*' nova.image_meta_delete name=myimage keys=salad,beans
    ```

salt.modules.nova.image_meta_set(image_id=None, name=None, **kwargs)
    Sets a key=value pair in the metadata for an image (nova image-meta set)
    CLI Examples:
    ```bash
    salt '*' nova.image_meta_set 6f52b2ff-0b31-4d84-8fd1-af45b84824f6 cheese=gruyere
    salt '*' nova.image_meta_set name=myimage salad=pasta beans=baked
    ```

salt.modules.nova.keypair_add(name, pubfile=None, pubkey=None, profile=None)
    Add a keypair to nova (nova keypair-add)
CLI Examples:

```
salt '*' nova.keypair_add mykey pubfile=/home/myuser/.ssh/id_rsa.pub
salt '*' nova.keypair_add mykey pubkey='ssh-rsa <key> myuser@mybox'
```

**salt.modules.nova.keypair_delete**(name, profile=None)

Add a keypair to nova (nova keypair-delete)

CLI Example:

```
salt '*' nova.keypair_delete mykey
```

**salt.modules.nova.keypair_list**(profile=None)

Return a list of available keypairs (nova keypair-list)

CLI Example:

```
salt '*' nova.keypair_list
```

**salt.modules.nova.list**(profile=None)

To maintain the feel of the nova command line, this function simply calls the server_list function.

CLI Example:

```
salt '*' nova.list
```

**salt.modules.nova.lock**(instance_id, profile=None)

Lock an instance

```python
instance_id
```

CLI Example:

```
salt '*' nova.lock 1138
```

**salt.modules.nova.resume**(instance_id, profile=None)

Resume an instance

```python
instance_id
```

CLI Example:

```
salt '*' nova.resume 1138
```

**salt.modules.nova.secgroup_create**(name, description, profile=None)

Add a secgroup to nova (nova secgroup-create)

CLI Example:

```
salt '*' nova.secgroup_create mygroup 'This is my security group'
```

**salt.modules.nova.secgroup_delete**(name, profile=None)

Delete a secgroup to nova (nova secgroup-delete)

CLI Example:

```
salt '*' nova.secgroup_delete mygroup
```

**salt.modules.nova.secgroup_list**(profile=None)

Return a list of available security groups (nova items-list)

CLI Example:
Salt Documentation, Release 2019.2.0

```python
salt '*' nova.secgroup_list

salt.modules.nova.server_by_name(name, profile=None)
    Return information about a server
    name  Server Name
    CLI Example:
    salt '*' nova.server_by_name myserver profile=openstack

salt.modules.nova.server_list(profile=None)
    Return list of active servers
    CLI Example:
    salt '*' nova.server_list

salt.modules.nova.server_list_detailed(profile=None)
    Return detailed list of active servers
    CLI Example:
    salt '*' nova.server_list_detailed

salt.modules.nova.server_show(server_id, profile=None)
    Return detailed information for an active server
    CLI Example:
    salt '*' nova.server_show <server_id>

salt.modules.nova.show(server_id, profile=None)
    To maintain the feel of the nova command line, this function simply calls
    the server_show function.
    CLI Example:
    salt '*' nova.show

salt.modules.nova.suspend(instance_id, profile=None)
    Suspend an instance
    instance_id  ID of the instance to be suspended
    CLI Example:
    salt '*' nova.suspend 1138

salt.modules.nova.volume_attach(name, server_name, device='/dev/xvdb', profile=None, timeout=300)
    Attach a block storage volume
    name  Name of the new volume to attach
    server_name  Name of the server to attach to
    device  Name of the device on the server
    profile  Profile to build on
    CLI Example:
    salt '*' nova.volume_attach myblock slice.example.com profile=openstack
    salt '*' nova.volume_attach myblock server.example.com device=/dev/xvdb
    "profile=openstack"
```
salt.modules.nova.volume_create(name, size=100, snapshot=None, voltype=None, profile=None)

Create a block storage volume
name Name of the new volume (must be first)
size Volume size
snapshot Block storage snapshot id
voltype Type of storage
profile Profile to build on
CLI Example:
```
salt '*' nova.volume_create myblock size=300 profile=openstack
```

salt.modules.nova.volume_delete(name, profile=None)

Destroy the volume
name Name of the volume
profile Profile to build on
CLI Example:
```
salt '*' nova.volume_delete myblock profile=openstack
```

salt.modules.nova.volume_detach(name, profile=None, timeout=300)

Attach a block storage volume
name Name of the new volume to attach
server_name Name of the server to detach from
profile Profile to build on
CLI Example:
```
salt '*' nova.volume_detach myblock profile=openstack
```

salt.modules.nova.volume_list(search_opts=None, profile=None)

List storage volumes
search_opts Dictionary of search options
profile Profile to use
CLI Example:
```
salt '*' nova.volume_list search_opts='{"display_name": "myblock"}'' profile=openstack
```

salt.modules.nova.volume_show(name, profile=None)

Create a block storage volume
name Name of the volume
profile Profile to use
CLI Example:
```
salt '*' nova.volume_show myblock profile=openstack
```

21.9.286 salt.modules.npm

Manage and query NPM packages.

salt.modules.npm.cache_clean(path=None, runas=None, env=None, force=False)

Clean cached NPM packages.

If no path for a specific package is provided the entire cache will be cleared.
path The cache subpath to delete, or None to clear the entire cache
runas The user to run NPM with

21.9. execution modules 2207
**env**  Environment variables to set when invoking npm. Uses the same env format as the cmd.run execution function.

**force**  Force cleaning of cache. Required for npm@5 and greater

New in version 2016.11.6.

CLI Example:

```bash
salt '*' npm.cache_clean force=True
```

salt.modules.npm.cache_list(path=None, runas=None, env=None)

List NPM cached packages.

If no path for a specific package is provided this will list all the cached packages.

**path**  The cache subpath to list, or None to list the entire cache

**runas**  The user to run NPM with

**env**  Environment variables to set when invoking npm. Uses the same env format as the cmd.run execution function.

CLI Example:

```bash
salt '*' npm.cache_clean
```

salt.modules.npm.cache_path(runas=None, env=None)

List path of the NPM cache directory.

**runas**  The user to run NPM with

**env**  Environment variables to set when invoking npm. Uses the same env format as the cmd.run execution function.

CLI Example:

```bash
salt '*' npm.cache_path
```

salt.modules.npm.install(pkg=None, pkgs=None, dir=None, runas=None, registry=None, env=None, dry_run=False, silent=True)

Install an NPM package.

If no directory is specified, the package will be installed globally. If no package is specified, the dependencies (from package.json) of the package in the given directory will be installed.

**pkg**  A package name in any format accepted by NPM, including a version identifier

**pkgs**  A list of package names in the same format as the name parameter

New in version 2014.7.0.

**dir**  The target directory in which to install the package, or None for global installation

**runas**  The user to run NPM with

**registry**  The NPM registry to install the package from.

New in version 2014.7.0.

**env**  Environment variables to set when invoking npm. Uses the same env format as the cmd.run execution function.

New in version 2014.7.0.

**silent**  Whether or not to run NPM install with –silent flag.

New in version 2014.7.0.

**dry_run**  Whether or not to run NPM install with –dry-run flag.

New in version 2015.8.4.

**silent**  Whether or not to run NPM install with –silent flag.

New in version 2015.8.5.

CLI Example:
salt '*' npm.install coffee-script
salt '*' npm.install coffee-script@1.0.1

salt.modules.npm.list\((pkg=None, dir=None, runas=None, env=None, depth=None)\)
List installed NPM packages.
If no directory is specified, this will return the list of globally installed packages.
\pkg\ Limit package listing by name
\dir\ The directory whose packages will be listed, or None for global installation
\runas\ The user to run NPM with

\env\ Environment variables to set when invoking npm. Uses the same \env\ format as the \cmd.run\ execution function.

\depth\ Limit the depth of the packages listed

New in version 2014.7.0, 2016.11.6, 2017.7.0.
CLI Example:
salt '*' npm.list

salt.modules.npm.uninstall\((pkg, dir=None, runas=None, env=None)\)
Uninstall an NPM package.
If no directory is specified, the package will be uninstalled globally.
\pkg\ A package name in any format accepted by NPM
\dir\ The target directory from which to uninstall the package, or None for global installation
\runas\ The user to run NPM with
\env\ Environment variables to set when invoking npm. Uses the same \env\ format as the \cmd.run\ execution function.

New in version 2015.5.3.
CLI Example:
salt '*' npm.uninstall coffee-script

21.9.287 salt.modules.nspawn

Manage nspawn containers

New in version 2015.8.0.

\systemd-nspawn(1)\ is a tool used to manage lightweight namespace containers. This execution module provides several functions to help manage these containers.

Minions running systemd >= 219 will place new containers in /var/lib/machines, while those running systemd < 219 will place them in /var/lib/container.

salt.modules.nspawn.bootstrap_container\((name, dist=None, version=None)\)
Bootstrap a container from package servers, if dist is None the os the minion is running as will be created, otherwise the needed bootstrapping tools will need to be available on the host.

CLI Example:
salt myminion nspawn.bootstrap_container <name>

salt.modules.nspawn.bootstrap_salt(name, config=None, approve_key=True, install=True, pub_key=None, priv_key=None, bootstrap_url=None, force_install=False, unconditional_install=False, bootstrap_delay=None, bootstrap_args=None, bootstrap_shell=None)

Bootstrap a container from package servers, if dist is None the os the minion is running as will be created, otherwise the needed bootstrapping tools will need to be available on the host.

CLI Example:

```
salt '*' nspawn.bootstrap_salt arch1
```

salt.modules.nspawn.copy_to(name, source, dest, overwrite=False, makedirs=False)

Copy a file from the host into a container

- **name**: Container name
- **source**: File to be copied to the container
- **dest**: Destination on the container. Must be an absolute path.
- **overwrite** [False] Unless this option is set to True, then if a file exists at the location specified by the dest argument, an error will be raised.
- **makedirs**: False
  - Create the parent directory on the container if it does not already exist.

CLI Example:

```
salt 'minion' nspawn.copy_to /tmp/foo /root/foo
```

salt.modules.nspawn.disable(name)

Set the named container to not be launched at boot

CLI Example:

```
salt myminion nspawn.enable <name>
```

salt.modules.nspawn.enable(name)

Set the named container to be launched at boot

CLI Example:

```
salt myminion nspawn.enable <name>
```

salt.modules.nspawn.exists(name)

Returns true if the named container exists

CLI Example:

```
salt myminion nspawn.exists <name>
```

salt.modules.nspawn.info(name, **kwargs)

Return info about a container

**Note:** The container must be running for machinectl to gather information about it. If the container is stopped, then this function will start it.

- **start** [False] If True, then the container will be started to retrieve the info. A Started key will be in the return data if the container was started.
CLI Example:

```
salt myminion nspawn.info arch1
salt myminion nspawn.info arch1 force_start=False
```

```
salt.modules.nspawn.list_all()
Lists all nspawn containers
```

```
salt myminion nspawn.list_all
```

```
salt.modules.nspawn.list_running()
Lists running nspawn containers
```

Note: nspawn.list also works to list running containers

```
salt myminion nspawn.list_running
salt myminion nspawn.list
```

```
salt.modules.nspawn.list_stopped()
Lists stopped nspawn containers
```

```
salt myminion nspawn.list_stopped
```

```
salt.modules.nspawn.pid(name)
Returns the PID of a container
name  Container name
```

```
salt myminion nspawn.pid arch1
```

```
salt.modules.nspawn.poweroff(name)
Issue a clean shutdown to the container. Equivalent to running machinectl poweroff on the named container.
```

For convenience, running nspawn.stop``(as shown in the CLI examples below) is equivalent to running ```nspawn.poweroff.`

Note: machinectl poweroff is only supported in systemd >= 219. On earlier systemd versions, running this function will simply issue a clean shutdown via systemctl.

```
salt myminion nspawn.poweroff arch1
salt myminion nspawn.stop arch1
```

```
salt.modules.nspawn.pull_dkr(url, name, index)
Execute a machinectl pull-dkr to download a docker image and add it to /var/lib/machines as a new container.
```

21.9. execution modules 2211
CLI Examples:

```bash
salt myminion nspawn.pull_dkr centos/centos6 cent6 index=https://get.docker.com
salt myminion nspawn.pull_docker centos/centos6 cent6 index=https://get.docker.com
```

salt.modules.nspawn.pull_raw(url, name, verify=False)

Execute a machinectl pull-raw to download a .qcow2 or raw disk image, and add it to /var/lib/machines as a new container.

CLI Examples:

```bash
```

salt.modules.nspawn.pull_tar(url, name, verify=False)

Execute a machinectl pull-raw to download a .tar container image, and add it to /var/lib/machines as a new container.

CLI Examples:

```bash
salt myminion nspawn.pull_tar http://foo.domain.tld/containers/archlinux-2015.02.01.tar.gz arch2
```

salt.modules.nspawn.reboot(name, kill=False)

Reboot the container by sending a SIGINT to its init process. Equivalent to running machinectl reboot on the named container.

For convenience, running nspawn.restart (as shown in the CLI examples below) is equivalent to running nspawn.reboot.
Note: `machinectl reboot` is only supported in systemd >= 219. On earlier systemd versions, running this function will instead restart the container via `systemctl`.

CLI Examples:

```
salt myminion nspawn.reboot arch1
salt myminion nspawn.restart arch1
```

`salt.modules.nspawn.remove(name, stop=False)`

Remove the named container

**Warning:** This function will remove all data associated with the container. It will not, however, remove the btrfs subvolumes created by pulling container images (`nspawn.pull_raw`, `nspawn.pull_tar`, `nspawn.pull_dkr`).

**stop** [False] If True, the container will be destroyed even if it is running/frozen.

CLI Examples:

```
salt '*' nspawn.remove foo
salt '*' nspawn.remove foo stop=True
```

`salt.modules.nspawn.retcode(name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)`

Run `cmd.retcode` within a container

- **name** Name of the container in which to run the command
- **cmd** Command to run
- **no_start** [False] If the container is not running, don’t start it
- **preserve_state** [True] After running the command, return the container to its previous state
- **stdin** [None] Standard input to be used for the command
- **output_loglevel** [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.
- **use_vt** [False] Use SaltStack’s utils.vt to stream output to console. Assumes `output=all`.
- **keep_env** [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container’s host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.retcode mycontainer 'ip addr show'
```

`salt.modules.nspawn.run(name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)`

Run `cmd.run` within a container

- **name** Name of the container in which to run the command
- **cmd** Command to run
- **no_start** [False] If the container is not running, don’t start it
- **preserve_state** [True] After running the command, return the container to its previous state
- **stdin** [None] Standard input to be used for the command
- **output_loglevel** [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.
use_vt  [False] Use SaltStack's utils.vt to stream output to console.
keep_env  [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:
```bash
salt myminion nspawn.run mycontainer 'ifconfig -a'
```

```
import salt.modules.nspawn.run_all

salt.modules.nspawn.run_all(
    name='mycontainer',
    cmd='ip addr show',
    no_start=True,
    preserve_state=True,
    stdin=None,
    python_shell=True,
    output_loglevel='debug',
    use_vt=False,
    ignore_retcode=False,
    keep_env=None)
```

**Note:** While the command is run within the container, it is initiated from the host. Therefore, the PID in the return dict is from the host, not from the container.

`name`  Name of the container in which to run the command
`cmd`  Command to run
`no_start`  [False] If the container is not running, don’t start it
`preserve_state`  [True] After running the command, return the container to its previous state
`stdin`  [None] Standard input to be used for the command
`output_loglevel`  [debug] Level at which to log the output from the command. Set to quiet to suppress logging.
`use_vt`  [False] Use SaltStack’s utils.vt to stream output to console. Assumes output=all.
`keep_env`  [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:
```bash
salt myminion nspawn.run_all mycontainer 'ip addr show'
```

```
import salt.modules.nspawn.run_stderr

salt.modules.nspawn.run_stderr(
    name='mycontainer',
    cmd='ip addr show',
    no_start=True,
    preserve_state=True,
    stdin=None,
    python_shell=True,
    output_loglevel='debug',
    use_vt=False,
    ignore_retcode=False,
    keep_env=None)
```

**Note:** While the command is run within the container, it is initiated from the host. Therefore, the PID in the return dict is from the host, not from the container.

`name`  Name of the container in which to run the command
`cmd`  Command to run
`no_start`  [False] If the container is not running, don’t start it
`preserve_state`  [True] After running the command, return the container to its previous state
`stdin`  [None] Standard input to be used for the command
`output_loglevel`  [debug] Level at which to log the output from the command. Set to quiet to suppress logging.
`use_vt`  [False] Use SaltStack’s utils.vt to stream output to console. Assumes output=all.
`keep_env`  [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:
```bash
salt myminion nspawn.run_stderr mycontainer 'ip addr show'
```
salt.modules.nspawn.run_stdout(name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)

Run `cmd.run_stdout` within a container

name  Name of the container in which to run the command

no_start  [False] If the container is not running, don’t start it

preserve_state  [True] After running the command, return the container to its previous state

stdin  [None] Standard input to be used for the command

output_loglevel  [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

use_vt  [False] Use SaltStack’s `utils.vt` to stream output to console. Assumes `output=all`.

keep_env  [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container’s host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```python
salt myminion nspawn.run_stdout mycontainer 'ifconfig -a'
```

salt.modules.nspawn.start(name)

Start the named container

CLI Example:

```python
salt myminion nspawn.start <name>
```

salt.modules.nspawn.state(name)

Return state of container (running or stopped)

CLI Example:

```python
salt myminion nspawn.state <name>
```

salt.modules.nspawn.terminate(name)

Kill all processes in the container without issuing a clean shutdown. Equivalent to running `machinectl terminate` on the named container.

For convenience, running `nspawn.stop` and passing `kill=True` (as shown in the CLI examples below) is equivalent to running `nspawn.terminate`.

**Note:** `machinectl terminate` is only supported in systemd >= 219. On earlier systemd versions, running this function will simply issue a clean shutdown via `systemctl`.

CLI Examples:

```python
salt myminion nspawn.terminate arch1
salt myminion nspawn.stop arch1 kill=True
```

21.9.288  salt.modules.nxos module

Execution module for Cisco NX OS Switches Proxy minions

New in version 2016.11.0.

For documentation on setting up the nxos proxy minion look in the documentation for `salt.proxy.nxos`.  

21.9.  execution modules
salt.modules.nxos.cmd(command, *args, **kwargs)
run commands from __proxy__.salt.proxy.nxos
command function from saltpoxy.nxos to run
args positional args to pass to command function
kwargs key word arguments to pass to command function

salt 'nxos.cmd sendline 'show ver'
salt 'nxos.cmd show_run'
salt 'nxos.cmd check_password username=admin password='\$5$lkjsdfoi$blahblahblah
...\$ encrypted=True

salt.modules.nxos.system_info()
Return system information for grains of the NX OS proxy minion

salt 'nxos.system_info

21.9.289 salt.modules.nxos_api module
Execution module to manage Cisco Nexus Switches (NX-OS) over the NX-API
New in version 2019.2.0.
Execution module used to interface the interaction with a remote or local Nexus switch whether we’re running in a
Proxy Minion or regular Minion (or regular Minion running directly on the Nexus switch).

codeauthor Mircea Ulinic <ping@mirceaulinic.net>
maturity new
platform any

Note: To be able to use this module you need to enable to NX-API on your switch, by executing feature nxapi
in configuration mode.

Configuration example:

switch# conf t
switch(config)# feature nxapi

To check that NX-API is properly enabled, execute show nxapi.

Output example:

switch# show nxapi
nxapi enabled
HTTPS Listen on port 443

Note: NX-API requires modern NXOS distributions, typically at least 7.0 depending on the hardware. Due to
reliability reasons it is recommended to run the most recent version.

guide/b_Cisco_Nexus_7000_Series_NX-OS_Programmability_Guide/b_Cisco_Nexus_7000_Series_NX-OS_
Programmability_Guide_chapter_0101.html for more details.
Usage

This module can equally be used via the `nxos_api` Proxy module or directly from an arbitrary (Proxy) Minion that is running on a machine having access to the network device API. Given that there are no external dependencies, this module can very well used when using the regular Salt Minion directly installed on the switch.

When running outside of the `nxos_api Proxy` (i.e., from another Proxy Minion type, or regular Minion), the NX-API connection arguments can be either specified from the CLI when executing the command, or in a configuration block under the `nxos_api` key in the configuration opts (i.e., (Proxy) Minion configuration file), or Pillar. The module supports these simultaneously. These fields are the exact same supported by the `nxos_api` Proxy Module:

- **transport:** `https` Specifies the type of connection transport to use. Valid values for the connection are `http`, and `https`.
- **host:** `localhost` The IP address or DNS host name of the connection device.
- **username:** `admin` The username to pass to the device to authenticate the NX-API connection.
- **password** The password to pass to the device to authenticate the NX-API connection.
- **port** The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for `http`, or 443 for `https`).
- **timeout:** 60 Time in seconds to wait for the device to respond. Default: 60 seconds.
- **verify:** True Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to True.

    When there is no certificate configuration on the device and this option is set as True (default), the commands will fail with the following error: SSLError: [SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed (_ssl.c:581). In this case, you either need to configure a proper certificate on the device (recommended), or bypass the checks setting this argument as False with all the security risks considered.

Example (when not running in a `nxos_api` Proxy Minion):

```bash
nxos_api:
    username: test
    password: test
```

In case the `username` and `password` are the same on any device you are targeting, the block above (besides other parameters specific to your environment you might need) should suffice to be able to execute commands from outside a `nxos_api` Proxy, e.g.:

```bash
salt-call --local nxos_api.show 'show lldp neighbors' raw_text
# The command above is available when running in a regular Minion where Salt is installed
salt '*' nxos_api.show 'show version' raw_text=False
```

Note: Remember that the above applies only when not running in a `nxos_api` Proxy Minion. If you want to use the `nxos_api Proxy`, please follow the documentation notes for a proper setup.
salt.modules.nxos_api.config(commands=None, config_file=None, template_engine='jinja', context=None, defaults=None, saltenv='base', **kwargs)

Configures the Nexus switch with the specified commands.

This method is used to send configuration commands to the switch. It will take either a string or a list and prepend the necessary commands to put the session into config mode.

**Warning:** All the commands will be applied directly into the running-config.

**config_file** The source file with the configuration commands to be sent to the device.

The file can also be a template that can be rendered using the template engine of choice.

This can be specified using the absolute path to the file, or using one of the following URL schemes:

- salt://, to fetch the file from the Salt fileserver.
- http:// or https://
- ftp://
- s3://
- swift://

**commands** The commands to send to the switch in config mode. If the commands argument is a string it will be cast to a list. The list of commands will also be prepended with the necessary commands to put the session in config mode.

**Note:** This argument is ignored when config_file is specified.

**template_engine:** jinja The template engine to use when rendering the source file. Default: jinja. To simply fetch the file without attempting to render, set this argument to None.

**context** Variables to add to the template context.

**defaults** Default values of the context_dict.

**transport:** https Specifies the type of connection transport to use. Valid values for the connection are http, and https.

**host:** localhost The IP address or DNS host name of the connection device.

**username:** admin The username to pass to the device to authenticate the NX-API connection.

**password** The password to pass to the device to authenticate the NX-API connection.

**port** The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for http, or 443 for https).

**timeout:** 60 Time in seconds to wait for the device to respond. Default: 60 seconds.

**verify:** True Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to True.

**CLI Example:**

```
salt '*' nxos_api.config commands="['spanning-tree mode mstp']"
salt '*' nxos_api.config config_file=salt://config.txt
salt '*' nxos_api.config config_file=https://bit.ly/2LGLcDy context="{'servers': [\n  '1.2.3.4']}"
```

salt.modules.nxos_api.rpc(commands, method='cli', **kwargs)

Execute an arbitrary RPC request via the Nexus API.

**commands** The commands to be executed.

**method:** cli The type of the response, i.e., raw text (cli_ascii) or structured document (cli). Defaults to cli (structured data).

**transport:** https Specifies the type of connection transport to use. Valid values for the connection are http, and https.

**host:** localhost The IP address or DNS host name of the connection device.
username: **admin**  The username to pass to the device to authenticate the NX-API connection.
password  The password to pass to the device to authenticate the NX-API connection.
port  The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for http, or 443 for https).
**timeout:** 60 Time in seconds to wait for the device to respond. Default: 60 seconds.
verify: **True**  Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to True.

CLI Example:

```
salt-call --local nxps_api.rpc 'show version'
```

`salt.modules.nxos_api.show(commands, raw_text=True, **kwargs)`

Execute one or more show (non-configuration) commands.

- **commands**  The commands to be executed.
- **raw_text:**  Whether to return raw text or structured data.
- **transport:**  Specifies the type of connection transport to use. Valid values for the connection are http, https, and local.
- **host:**  The IP address or DNS host name of the connection device.
- **username:**  The username to pass to the device to authenticate the NX-API connection.
- **password**  The password to pass to the device to authenticate the NX-API connection.
- **port**  The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for http, or 443 for https).
- **timeout:** 60 Time in seconds to wait for the device to respond. Default: 60 seconds.
- **verify:**  Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to True.

CLI Example:

```
salt-call --local nxos_api.show 'show version'
salt '*' nxos_api.show 'show bgp sessions' 'show processes' raw_text=False
salt 'regular-minion' nxos_api.show 'show interfaces' host=sw01.example.com &
--username=test password=test
```

### 21.9.290 salt.modules.omapi

This module interacts with an ISC DHCP Server via OMAPI. server_ip and server_port params may be set in the minion config or pillar:

```
omapi.server_ip: 127.0.0.1
omapi.server_port: 7991
```

**depends**  pypureomapi Python module

`salt.modules.omapi.add_host(mac, name=None, ip=None, ddns=False, group=None, super-sede_host=False)`

Add a host object for the given mac.

CLI Example:

```
salt dhcp-server omapi.add_host ab:ab:ab:ab:ab:ab name=host1
```

Add ddns-hostname and a fixed-ip statements:

```
salt dhcp-server omapi.add_host ab:ab:ab:ab:ab:ab name=host1 ip=10.1.1.1 ddns=true
```

`salt.modules.omapi.delete_host(mac=None, name=None)`

Delete the host with the given mac or name.
CLI Examples:

```
salt dhcp-server omapi.delete_host name=host1
salt dhcp-server omapi.delete_host mac=ab:ab:ab:ab:ab:ab
```

### 21.9.291 salt.modules.openbsd_sysctl

Module for viewing and modifying OpenBSD sysctl parameters

salt.modules.openbsd_sysctl.assign(name, value)

Assign a single sysctl parameter for this minion

CLI Example:

```
salt '* sysctl.assign net.inet.ip.forwarding 1
```

salt.modules.openbsd_sysctl.get(name)

Return a single sysctl parameter for this minion

CLI Example:

```
salt '* sysctl.get hw.physmem
```

salt.modules.openbsd_sysctl.persist(name, value, config='/etc/sysctl.conf')

Assign and persist a simple sysctl parameter for this minion

CLI Example:

```
salt '* sysctl.persist net.inet.ip.forwarding 1
```

salt.modules.openbsd_sysctl.show(config_file=False)

Return a list of sysctl parameters for this minion

CLI Example:

```
salt '* sysctl.show
```

### 21.9.292 salt.modules.openbsdpkg

Package support for OpenBSD

**Note:** The package repository is configured on each host using `/etc/installurl` from OpenBSD 6.1 onwards. Earlier releases relied on `/etc/pkg.conf`.

Changed in version 2016.3.5: Package versions on OpenBSD are not normally specified explicitly; instead packages may be available in multiple **flavors**, and **branches** which are specified by the format of the package name. This module allows you to use the same formatting as `pkg_add(1)`, and will select the empty flavor and default branch by default. Examples:

```
- rsync
- vim--no_x11
- ruby%2.3
```
salt.modules.openbsdpkg.install(name=None, pkgs=None, sources=None, **kwargs)
Install the passed package

Return a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example, Install one package:

```
salt '*' pkg.install <package name>
```

CLI Example, Install more than one package:

```
salt '*' pkg.install pkgs='["<package name>", "<package name>"]'
```

CLI Example, Install more than one package from a alternate source (e.g. salt file-server, HTTP, FTP, local filesystem):

```
salt '*' pkg.install sources='[{"<pkg name>": "salt://pkgs/<pkg filename>"}]'
```

salt.modules.openbsdpkg.latest_version(*names, **kwargs)
Return the latest version of the named package available for upgrade or installation. If more than one package
name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
```

salt.modules.openbsdpkg.list_pkgs(versions_as_list=False, **kwargs)
List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

salt.modules.openbsdpkg.purge(name=None, pkgs=None, purge=False, **kwargs)
Remove a package and extra configuration files.

**name** The name of the package to be deleted.

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this
option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

salt.modules.openbsdpkg.remove(name=None, pkgs=None, purge=False, **kwargs)
Remove a single package with pkg_delete

Multiple Package Options:
**pkgs**  A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed. New in version 0.16.0.

Returns a dict containing the changes.

**CLI Example:**

```bash
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

`salt.modules.openbsdtpkg.upgrade(name=None, pkgs=None, **kwargs)` Run a full package upgrade (`pkg_add -u`), or upgrade a specific package if `name` or `pkgs` is provided. `name` is ignored when `pkgs` is specified.

Returns a dictionary containing the changes:

New in version 2019.2.0.

```json
{
'<package>': {
'old': '<old-version>',
'new': '<new-version>'
}}
```

**CLI Example:**

```bash
salt '*' pkg.upgrade
salt '*' pkg.upgrade python%2.7
```

`salt.modules.openbsdtpkg.upgrade_available(name)` Check whether or not an upgrade is available for a given package.

New in version 2019.2.0.

**CLI Example:**

```bash
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.openbsdtpkg.version(*names, **kwargs)` Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

**CLI Example:**

```bash
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

### 21.9.293 salt.modules.openbsdrcctl_service.py

The rcctl service module for OpenBSD

`salt.modules.openbsdrcctl_service.available(name)` Return True if the named service is available.

**CLI Example:**

```bash
salt '*' service.available ssd
```

`salt.modules.openbsdrcctl_service.disable(name, **kwargs)` Disable the named service to not start at boot.
salt.modules.openbsdrcctl_service.disabled(name)
Return True if the named service is disabled at boot, False otherwise.

CLI Example:

```
salt '*' service.disabled <service name>
```

salt.modules.openbsdrcctl_service.enable(name, **kwargs)
Enable the named service to start at boot.
flags [None] Set optional flags to run the service with.
service.flags can be used to change the default flags.

CLI Example:

```
salt '*' service.enable <service name>
salt '*' service.enable <service name> flags=<flags>
```

salt.modules.openbsdrcctl_service.enabled(name, **kwargs)
Return True if the named service is enabled at boot and the provided flags match the configured ones (if any). Return False otherwise.
name Service name

CLI Example:

```
salt '*' service.enabled <service name>
salt '*' service.enabled <service name> flags=<flags>
```

salt.modules.openbsdrcctl_service.get_all()
Return all installed services.

CLI Example:

```
salt '*' service.get_all
```

salt.modules.openbsdrcctl_service.get_disabled()
Return what services are available but not enabled to start at boot.

CLI Example:

```
salt '*' service.get_disabled
```

salt.modules.openbsdrcctl_service.get_enabled()
Return what services are set to run on boot.

CLI Example:

```
salt '*' service.get_enabled
```

salt.modules.openbsdrcctl_service.missing(name)
The inverse of service.available. Return True if the named service is not available.

CLI Example:

```
salt '*' service.missing sshd
```
salt.modules.openbsdrcctl_service.reload_(name)
Reload the named service.

CLI Example:
```
salt '*' service.reload <service name>
```

salt.modules.openbsdrcctl_service.restart(name)
Restart the named service.

CLI Example:
```
salt '*' service.restart <service name>
```

salt.modules.openbsdrcctl_service.start(name)
Start the named service.

CLI Example:
```
salt '*' service.start <service name>
```

salt.modules.openbsdrcctl_service.status(name, sig=None)
Return the status for a service, returns a bool whether the service is running.

CLI Example:
```
salt '*' service.status <service name>
```

salt.modules.openbsdrcctl_service.stop(name)
Stop the named service.

CLI Example:
```
salt '*' service.stop <service name>
```

---

**21.9.294 salt.modules.openbsdservice**

The service module for OpenBSD

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to 'service.start' is not available), see here.

salt.modules.openbsdservice.available(name)
New in version 2014.7.0.
Returns True if the specified service is available, otherwise returns False.

CLI Example:
```
salt '*' service.available sshd
```

salt.modules.openbsdservice.disabled(name)
New in version 2014.7.0.
Return True if the named service is disabled, false otherwise

CLI Example:
salt 'x' service.disabled <service name>

salt.modules.openbsdservice.enabled(name, "**kwargs")
New in version 2014.7.0.
Return True if the named service is enabled, false otherwise
CLI Example:
```
salt 'x' service.enabled <service name>
```

salt.modules.openbsdservice.get_all()
New in version 2014.7.0.
Return all available boot services
CLI Example:
```
salt 'x' service.get_all
```

salt.modules.openbsdservice.get_disabled()
New in version 2014.7.0.
Return a set of services that are installed but disabled
CLI Example:
```
salt 'x' service.get_disabled
```

salt.modules.openbsdservice.get_enabled()
New in version 2014.7.0.
Return a list of service that are enabled on boot
CLI Example:
```
salt 'x' service.get_enabled
```

salt.modules.openbsdservice.missing(name)
New in version 2014.7.0.
The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.
CLI Example:
```
salt 'x' service.missing ssrd
```

salt.modules.openbsdservice.reload_(name)
New in version 2014.7.0.
Reload the named service
CLI Example:
```
salt 'x' service.reload <service name>
```

salt.modules.openbsdservice.restart(name)
Restart the named service
CLI Example:
salt '*' service.restart <service name>

**salt.modules.openbsdservice.start(name)**

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

**salt.modules.openbsdservice.status(name, sig=None)**

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)

**Parameters**

- **name (str)** – The name of the service to check
- **sig (str)** – Signature to use to find the service via ps

**Returns**

True if running, False otherwise dict: Maps service name to True if running, False otherwise

**Return type** bool

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

**salt.modules.openbsdservice.stop(name)**

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

---

**21.9.295 salt.modules.openscap module**

Module for OpenSCAP Management

**salt.modules.openscap.xccdf(params)**

Run oscap xccdf commands on minions. It uses cp.push_dir to upload the generated files to the salt master in the master's minion files cachedir (defaults to /var/cache/salt/master/minions/minion-id/files)

It needs file_recv set to True in the master configuration file.

CLI Example:

```
salt '*' openscap.xccdf "eval --profile Default /usr/share/openscap/scap-\n-yast2sec-xccdf.xml"
```

---

**21.9.296 salt.modules.openstack_config**

Modify, retrieve, or delete values from OpenStack configuration files.

**maintainer** Jeffrey C. Ollie <jeff@ocjtech.us>

**maturity** new

**depends**
platform linux

salt.modules.openstack_config.delete(filename, section, parameter)
Delete a value from an OpenStack configuration file.
filename The full path to the configuration file
section The section from which to delete the parameter
parameter The parameter to delete
CLI Example:
```
salt-call openstack_config.delete /etc/keystone/keystone.conf sql connection
```

salt.modules.openstack_config.get(filename, section, parameter)
Get a value from an OpenStack configuration file.
filename The full path to the configuration file
section The section from which to search for the parameter
parameter The parameter to return
CLI Example:
```
salt-call openstack_config.get /etc/keystone/keystone.conf sql connection
```

salt.modules.openstack_config.set_(filename, section, parameter, value)
Set a value in an OpenStack configuration file.
filename The full path to the configuration file
section The section in which the parameter will be set
parameter The parameter to change
value The value to set
CLI Example:
```
salt-call openstack_config.set /etc/keystone/keystone.conf sql connection foo
```

21.9.297 salt.modules.openstack_mng module

Module for OpenStack Management

codeauthor Konrad Mosoń <mosonkonrad@gmail.com>
maturity new
depends openstack-utils
platform linux

salt.modules.openstack_mng.restart_service(service_name, mini-
mum_running_time=None)
Restart OpenStack service immediately, or only if it’s running longer than specified value
CLI Example:
```
salt '*' openstack_mng.restart_service neutron
salt '*' openstack_mng.restart_service neutron minimum_running_time=600
```

salt.modules.openstack_mng.start_service(service_name)
Start OpenStack service immediately
CLI Example:
```
salt '*' openstack_mng.start_service neutron
```
salt.modules.openstack_mng.stop_service(service_name)
Stop OpenStack service immediately

CLI Example:
```
salt '*' openstack_mng.stop_service neutron
```

21.9.298 salt.modules.openvswitch module

Support for Open vSwitch - module with basic Open vSwitch commands.
Suitable for setting up Openstack Neutron.

codeauthor Jiri Kotlin <jiri.kotlin@ultimum.io>

salt.modules.openvswitch.bridge_create(br, may_exist=True)
Creates a new bridge.
Parameters
- `br` – A string - bridge name
- `may_exist` – Bool, if False - attempting to create a bridge that exists returns False.
Returns True on success, else False.
New in version 2016.3.0.

CLI Example: .. code-block:: bash
  salt '*' openvswitch.bridge_create br0

salt.modules.openvswitch.bridge_delete(br, if_exists=True)
Deletes bridge and all of its ports.
Parameters
- `br` – A string - bridge name
- `if_exists` – Bool, if False - attempting to delete a bridge that does not exist returns False.
Returns True on success, else False.
New in version 2016.3.0.

CLI Example: .. code-block:: bash
  salt '*' openvswitch.bridge_delete br0

salt.modules.openvswitch.bridge_exists(br)
Tests whether bridge exists as a real or fake bridge.
Returns True if Bridge exists, else False.
New in version 2016.3.0.

CLI Example: .. code-block:: bash
  salt '*' openvswitch.bridge_exists br0

salt.modules.openvswitch.bridge_list()
Lists all existing real and fake bridges.
Returns List of bridges (or empty list), False on failure.
New in version 2016.3.0.

CLI Example: .. code-block:: bash
  salt '*' openvswitch.bridge_list

salt.modules.openvswitch.interface_get_options(port)
Port’s interface’s optional parameters.
Parameters
- `port` – A string - port name.
Returns String containing optional parameters of port’s interface, False on failure.
New in version 2016.3.0.

CLI Example: .. code-block:: bash
salt '*' openvswitch.interface_get_options tap0

```
salt.modules.openvswitch.interface_get_type(port)
```

Type of port's interface.

**Parameters**
- `port` – A string - port name.

**Returns**
String - type of interface or empty string, False on failure.

New in version 2016.3.0.

CLI Example: .. code-block:: bash
salt '*' openvswitch.interface_get_type tap0

```
salt.modules.openvswitch.port_add(br, port, may_exist=False)
```

Creates on bridge a new port named `port`.

**Returns**
True on success, else False.

**Parameters**
- `br` – A string - bridge name.
- `port` – A string - port name.
- `may_exist` – Bool, if False - attempting to create a port that exists returns False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash
salt '*' openvswitch.port_add br0 8080

```
salt.modules.openvswitch.port_create_gre(br, port, id, remote)
```

Generic Routing Encapsulation - creates GRE tunnel between endpoints.

**Parameters**
- `br` – A string - bridge name.
- `port` – A string - port name.
- `id` – An integer - unsigned 32-bit number, tunnel's key.
- `remote` – A string - remote endpoint's IP address.

**Returns**
True on success, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash
salt '*' openvswitch.port_create_gre br0 gre1 5001 192.168.1.10

```
salt.modules.openvswitch.port_create_vlan(br, port, id, internal=False)
```

Isolate VM traffic using VLANs.

**Parameters**
- `br` – A string - bridge name.
- `port` – A string - port name.
- `id` – An integer in the valid range 0 to 4095 (inclusive), name of VLAN.
- `internal` – A boolean to create an internal interface if one does not exist.

**Returns**
True on success, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash
salt '*' openvswitch.port_create_vlan br0 tap0 100

```
salt.modules.openvswitch.port_create_vxlan(br, port, id, remote, dst_port=None)
```

Virtual eXtensible Local Area Network - creates VXLAN tunnel between endpoints.

**Parameters**
- `br` – A string - bridge name.
- `port` – A string - port name.
- `id` – An integer - unsigned 64-bit number, tunnel's key.
- `remote` – A string - remote endpoint's IP address.
• **dst_port** – An integer - port to use when creating tunnelport in the switch.

**Returns** True on success, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

salt '*' openvswitch.port_create_vxlan br0 vx1 5001 192.168.1.10 8472

**salt.modules.openvswitch.port_get_tag(port)**

Lists tags of the port.

**Parameters**

- **port** – A string - port name.

**Returns** List of tags (or empty list), False on failure.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

salt '*' openvswitch.port_get_tag tap0

**salt.modules.openvswitch.port_list(br)**

Lists all of the ports within bridge.

**Parameters**

- **br** – A string - bridge name.

**Returns** List of bridges (or empty list), False on failure.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

salt '*' openvswitch.port_list br0

**salt.modules.openvswitch.port_remove(br, port, if_exists=True)**

Deletes port.

**Parameters**

- **br** – A string - bridge name (If bridge is None, port is removed from whatever bridge contains it)

- **port** – A string - port name.

- **if_exists** – Bool, if False - attempting to delete a port that does not exist returns False. (Default True)

**Returns** True on success, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

salt '*' openvswitch.port_remove br0 8080

**21.9.299 salt.modules.opkg module**

Support for Opkg

---

**Important**: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see here.

---

**Note**: For version comparison support on opkg < 0.3.4, the opkg-utils package must be installed.

**salt.modules.opkg.available_version(*names, **kwargs)**

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.
CLI Example:

```plaintext
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.opkg.del_repo(repo, **kwargs)`  
Delete a repo from `/etc/opkg/*.conf`

If the file does not contain any other repo configuration, the file itself will be deleted.

CLI Examples:

```plaintext
salt '*' pkg.del_repo repo
```

`salt.modules.opkg.file_dict(*packages, **kwargs)`  
List the files that belong to a package, grouped by package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```plaintext
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.opkg.file_list(*packages, **kwargs)`  
List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```plaintext
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.opkg.get_repo(repo, **kwargs)`  
Display a repo from the `/etc/opkg/*.conf`

CLI Examples:

```plaintext
salt '*' pkg.get_repo repo
```

`salt.modules.opkg.hold(name=None, pkgs=None, sources=None, **kwargs)`  
Set package in 'hold' state, meaning it will not be upgraded.

- **name**  The name of the package, e.g., 'tmux'

  CLI Example:

  ```plaintext
  salt '*' pkg.hold <package name>
  ```

- **pkgs**  A list of packages to hold. Must be passed as a python list.

  CLI Example:

  ```plaintext
  salt '*' pkg.hold pkgs='["foo", "bar"]'
  ```

`salt.modules.opkg.info_installed(*names, **kwargs)`  
Return the information of the named package(s), installed on the system.

New in version 2017.7.0.

**Parameters**
• **names** – Names of the packages to get information about. If none are specified, will return information for all installed packages.

• **attr** – Comma-separated package attributes. If no 'attr' is specified, all available attributes returned.

  **Valid attributes are:** arch, conffiles, conflicts, depends, description, filename, group, install_date_time_t, md5sum, packager, provides, recommends, replaces, size, source, suggests, url, version

CLI example:

```
salt '*' pkg.info_installed
salt '*' pkg.info_installed attr=version,packager
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
salt '*' pkg.info_installed <package1> attr=version,packager
salt '*' pkg.info_installed <package1> <package2> <package3> ... attr=version,packager
```

salt.modules.opkg.install(name=None, refresh=False, pkgs=None, sources=None, reinstall=False, **kwargs)

Install the passed package, add refresh=True to update the opkg database.

**name**  The name of the package to be installed. Note that this parameter is ignored if either "pkgs" or "sources" is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the "sources" option.

CLI Example:

```
salt '*' pkg.install <package name>
```

**refresh**  Whether or not to refresh the package database before installing.

**version**  Install a specific version of the package, e.g. 1.2.3-0ubuntu0. Ignored if "pkgs" or "sources" is passed.

  New in version 2017.7.0.

**reinstall**  [False]  Specifying reinstall=True will use opkg install --force-reinstall rather than simply opkg install for requested packages that are already installed.

  If a version is specified with the requested package, then opkg install --force-reinstall will only be used if the installed version matches the requested version.

  New in version 2017.7.0.

**Multiple Package Installation Options:**

**pkgs**  A list of packages to install from a software repository. Must be passed as a python list.

  CLI Example:

  ```
salt '*' pkg.install pkgs='["foo", "bar"]'
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3-0ubuntu0"}]'
```

**sources**  A list of IPK packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package. Dependencies are automatically resolved and marked as auto-installed.

  CLI Example:

  ```
salt '*' pkg.install sources='[{"foo": "salt://foo.deb"},{"bar": "salt://bar.deb"}]'
```

**install_recommends**  Whether to install the packages marked as recommended. Default is True.

**only_upgrade**  Only upgrade the packages (disallow downgrades), if they are already installed. Default is False.

  New in version 2017.7.0.
Returns a dict containing the new package names and versions:

```python
{'<package>': {'old': '<old-version>',
             'new': '<new-version>'}}
```

salt.modules.opkg.latest_version(*names, **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.opkg.list_pkgs(versions_as_list=False, **kwargs)

List the packages currently installed in a dict:

```python
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

salt.modules.opkg.list_repos(**kwargs)

Lists all repos on /etc/opkg/*.conf

CLI Example:

```
salt '*' pkg.list_repos
```

salt.modules.opkg.list_upgrades(refresh=True, **kwargs)

List all available package upgrades.

CLI Example:

```
salt '*' pkg.list_upgrades
```

salt.modules.opkg.mod_repo(repo, **kwargs)

Modify one or more values for a repo. If the repo does not exist, it will be created, so long as uri is defined.

The following options are available to modify a repo definition:

- `repo` alias by which opkg refers to the repo.
- `uri` the URI to the repo.
- `compressed` defines (True or False) if the index file is compressed
- `enabled` enable or disable (True or False) repository but do not remove if disabled.
- `refresh` enable or disable (True or False) auto-refresh of the repositories

CLI Examples:

```
salt '*' pkg.mod_repo repo uri=http://new/uri
salt '*' pkg.mod_repo repo enabled=True
```

salt.modules.opkg.owner(*paths, **kwargs)

Return the name of the package that owns the file. Multiple file paths can be passed. Like pkg.version

```python
<salt.modules.opkg.version, if a single path is passed, a string will be returned, and if multiple paths
are passed, a dictionary of file/package name pairs will be returned.
```
If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Example:
```
salt '*' pkg.owner /usr/bin/apachectl
salt '*' pkg.owner /usr/bin/apachectl /usr/bin/basename
```

```python
salt.modules.opkg.purge(name=None, pkgs=None, **kwargs)
```
Package purges are not supported by opkg, this function is identical to `pkg.remove`.

- **name**: The name of the package to be deleted.
- **pkgs**: A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:
```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

```python
salt.modules.opkg.refresh_db(failhard=False, **kwargs)
```
Updates the opkg database to latest packages based upon repositories

Returns a dict, with the keys being package databases and the values being the result of the update attempt.

Values can be one of the following:
- **True**: Database updated successfully
- **False**: Problem updating database

- **failhard**: If False, return results of failed lines as False for the package database that encountered the error.
  If True, raise an error with a list of the package databases that encountered errors.

New in version 2018.3.0.

CLI Example:
```
salt '*' pkg.refresh_db
```

```python
salt.modules.opkg.remove(name=None, pkgs=None, **kwargs)
```
Remove packages using `opkg remove`.

- **name**: The name of the package to be deleted.
- **pkgs**: A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

- **remove_dependencies**: Remove package and all dependencies

New in version 2019.2.0.

- **auto_remove_deps**: Remove packages that were installed automatically to satisfy dependencies

New in version 2019.2.0.

Returns a dict containing the changes.

CLI Example:
```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
salt '*' pkg.remove pkgs='["foo", "bar"]' remove_dependencies=True auto_remove_deps=True
```
Salt Documentation, Release 2019.2.0

salt.modules.opkg.unhold(name=None, pkgs=None, sources=None, **kwargs)
Set package current in 'hold' state to install state, meaning it will be upgraded.

name The name of the package, e.g., 'tmux'

CLI Example:

```
salt '*' pkg.unhold <package name>
```

pkgs A list of packages to hold. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.unhold pkgs='["foo", "bar"]'
```

salt.modules.opkg.upgrade(refresh=True, **kwargs)
Upgrades all packages via opkg upgrade

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
              'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

salt.modules.opkg.upgrade_available(name, **kwargs)
Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

salt.modules.opkg.version(*names, **kwargs)
Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

salt.modules.opkg.version_cmp(pkg1, pkg2, ignore_epoch=False, **kwargs)
Do a cmp-style comparison on two packages. Return -1 if pkg1 < pkg2, 0 if pkg1 == pkg2, and 1 if pkg1 > pkg2. Return None if there was a problem making the comparison.

ignore_epoch [False] Set to True to ignore the epoch when comparing versions

New in version 2016.3.4.

CLI Example:

```
salt '*' pkg.version_cmp '0.2.4-0' '0.2.4.1-0'
```

21.9.300 salt.modules.opsgenie

Module for sending data to OpsGenie

New in version 2018.3.0.
configuration This module can be used in Reactor System for posting data to OpsGenie as a remote-execution function.

For example:

```
opsgenie_event_poster:
  local.opsgenie.post_data:
    - tgt: 'salt-minion'
    - kwarg:
      name: event.reactor
      api_key: XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX
      reason: {{ data['data'][0]['reason'] }}
      action_type: Create
```

salt.modules.opsgenie.post_data(api_key=None, name='OpsGenie Execution Module', reason=None, action_type=None)

Post data to OpsGenie. It’s designed for Salt’s Event Reactor.

After configuring the sls reaction file as shown above, you can trigger the module with your designated tag (og-tag in this case).

CLI Example:

```
salt-call event.send 'og-tag' '{"reason": "Overheating CPU!"}'
```

Required parameters:

api_key It’s the API Key you’ve copied while adding integration in OpsGenie.
reason It will be used as alert’s default message in OpsGenie.
action_type OpsGenie supports the default values Create/Close for action_type. You can customize this field with OpsGenie’s custom actions for other purposes like adding notes or acknowledging alerts.

Optional parameters:

name It will be used as alert’s alias. If you want to use the close functionality you must provide name field for both states like in this case.

21.9.301 salt.modules.oracle

Oracle DataBase connection module

maintainer Vladimir Bormotov <bormotov@gmail.com>
maturity new
depends cx_Oracle

configuration module provide connections for multiple Oracle DB instances.

OS Environment

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORACLE_HOME</td>
<td>path to oracle product</td>
</tr>
<tr>
<td>PATH</td>
<td>path to Oracle Client libs need to be in PATH</td>
</tr>
</tbody>
</table>

pillar

<table>
<thead>
<tr>
<th>Key</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>oracle</td>
<td></td>
</tr>
<tr>
<td></td>
<td>dbs:</td>
</tr>
<tr>
<td></td>
<td>&lt;db&gt;:</td>
</tr>
<tr>
<td></td>
<td>uri: connection credentials in format:</td>
</tr>
</tbody>
</table>

(continues on next page)
(continued from previous page)

```
user/password@host[:port]/sid[ servicename as {sysdba|sysoper}]
  optional keyword servicename will determine whether it is a sid or
<db>:
  uri: ...
```

salt.modules.oracle.client_version()
  Oracle Client Version
  CLI Example:
  ```
salt '*' oracle.client_version
  ```

salt.modules.oracle.run_query(db, query)
  Run SQL query and return result
  CLI Example:
  ```
salt '*' oracle.run_query my_db "select * from my_table"
  ```

salt.modules.oracle.show_dbs("dbs")
  Show databases configuration from pillar. Filter by *args
  CLI Example:
  ```
salt '*' oracle.show_dbs
salt '*' oracle.show_dbs my_db
  ```

salt.modules.oracle.show_env()
  Show Environment used by Oracle Client
  CLI Example:
  ```
salt '*' oracle.show_env
  ```

  Note: at first _connect() NLS_LANG will forced to '.AL32UTF8'

salt.modules.oracle.show_pillar(item=None)
  Show Pillar segment oracle:* and subitem with notation "item:subitem"
  CLI Example:
  ```
salt '*' oracle.show_pillar
salt '*' oracle.show_pillar dbs:my_db
  ```

salt.modules.oracle.version("dbs")
  Server Version (select banner from v$version)
  CLI Example:
  ```
salt '*' oracle.version
salt '*' oracle.version my_db
  ```

---

21.9.302  salt.modules.osquery

21.9.  execution modules
New in version 2015.8.0.

call.modules.osquery.acpi_tables(attrs=None, where=None)
Return acpi_tables information from osquery

CLI Example:
salt '*' osquery.acpi_tables

call.modules.osquery.alf(attrs=None, where=None)
Return alf information from osquery

CLI Example:
salt '*' osquery.alf

call.modules.osquery.alf_exceptions(attrs=None, where=None)
Return alf_exceptions information from osquery

CLI Example:
salt '*' osquery.alf_exceptions

call.modules.osquery.alf_explicit_auths(attrs=None, where=None)
Return alf_explicit_auths information from osquery

CLI Example:
salt '*' osquery.alf_explicit_auths

call.modules.osquery.alf_services(attrs=None, where=None)
Return alf_services information from osquery

CLI Example:
salt '*' osquery.alf_services

call.modules.osquery.apps(attrs=None, where=None)
Return apps information from osquery

CLI Example:
salt '*' osquery.apps

call.modules.osquery.apt_sources(attrs=None, where=None)
Return apt_sources information from osquery

CLI Example:
salt '*' osquery.apt_sources

call.modules.osquery.arp_cache(attrs=None, where=None)
Return arp_cache information from osquery

CLI Example:
salt '*' osquery.arp_cache

call.modules.osquery.block_devices(attrs=None, where=None)
Return block_devices information from osquery

CLI Example:
<table>
<thead>
<tr>
<th>Module</th>
<th>Function Call</th>
<th>Description</th>
<th>CLI Example</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>salt '*' osquery.block_devices</code></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>

<td></td>
<td></td>
</tr>
</tbody>
</table>
salt.modules.osquery.file_changes\(\text{atts}=\text{None}, \text{where}=\text{None}\)

Return file_changes information from osquery

CLI Example:

```bash
salt '*' osquery.file_changes
```

salt.modules.osquery.firefox_addons\(\text{atts}=\text{None}, \text{where}=\text{None}\)

Return firefox_addons information from osquery

CLI Example:

```bash
salt '*' osquery.firefox_addons
```

salt.modules.osquery.groups\(\text{atts}=\text{None}, \text{where}=\text{None}\)

Return groups information from osquery

CLI Example:

```bash
salt '*' osquery.groups
```

salt.modules.osquery.hardware_events\(\text{atts}=\text{None}, \text{where}=\text{None}\)

Return hardware_events information from osquery

CLI Example:

```bash
salt '*' osquery.hardware_events
```

salt.modules.osquery.hash\(\text{atts}=\text{None}, \text{where}=\text{None}\)

Return hash information from osquery

CLI Example:

```bash
salt '*' osquery.hash
```

salt.modules.osquery.homebrew_packages\(\text{atts}=\text{None}, \text{where}=\text{None}\)

Return homebrew_packages information from osquery

CLI Example:

```bash
salt '*' osquery.homebrew_packages
```

salt.modules.osquery.interface_addresses\(\text{atts}=\text{None}, \text{where}=\text{None}\)

Return interface_addresses information from osquery

CLI Example:

```bash
salt '*' osquery.interface_addresses
```

salt.modules.osquery.interface_details\(\text{atts}=\text{None}, \text{where}=\text{None}\)

Return interface_details information from osquery

CLI Example:

```bash
salt '*' osquery.interface_details
```

salt.modules.osquery.iokit_devicetree\(\text{atts}=\text{None}, \text{where}=\text{None}\)

Return iokit_devicetree information from osquery

CLI Example:
salt '*' osquery.iokit_devicetree

salt.modules.osquery.iokit_registry(\texttt{attrs=\texttt{None}}, \texttt{where=\texttt{None}})
Return iokit_registry information from osquery

CLI Example:
salt '*' osquery.iokit_registry

salt.modules.osquery.kernel_extensions(\texttt{attrs=\texttt{None}}, \texttt{where=\texttt{None}})
Return kernel_extensions information from osquery

CLI Example:
salt '*' osquery.kernel_extensions

salt.modules.osquery.kernel_info(\texttt{attrs=\texttt{None}}, \texttt{where=\texttt{None}})
Return kernel_info information from osquery

CLI Example:
salt '*' osquery.kernel_info

salt.modules.osquery.kernel_integrity(\texttt{attrs=\texttt{None}}, \texttt{where=\texttt{None}})
Return kernel_integrity information from osquery

CLI Example:
salt '*' osquery.kernel_integrity

salt.modules.osquery.kernel_modules(\texttt{attrs=\texttt{None}}, \texttt{where=\texttt{None}})
Return kernel_modules information from osquery

CLI Example:
salt '*' osquery.kernel_modules

salt.modules.osquery.keychain_items(\texttt{attrs=\texttt{None}}, \texttt{where=\texttt{None}})
Return keychain_items information from osquery

CLI Example:
salt '*' osquery.keychain_items

salt.modules.osquery.last(\texttt{attrs=\texttt{None}}, \texttt{where=\texttt{None}})
Return last information from osquery

CLI Example:
salt '*' osquery.last

salt.modules.osquery.launchd(\texttt{attrs=\texttt{None}}, \texttt{where=\texttt{None}})
Return launchd information from osquery

CLI Example:
salt '*' osquery.launchd
salt.modules.osquery.listening_ports
Return listening_ports information from osquery

CLI Example:
```
salt '*' osquery.listening_ports
```
	salt.modules.osquery.logged_in_users
Return logged_in_users information from osquery

CLI Example:
```
salt '*' osquery.logged_in_users
```
	salt.modules.osquery.memory_map
Return memory_map information from osquery

CLI Example:
```
salt '*' osquery.memory_map
```
	salt.modules.osquery.mounts
Return mounts information from osquery

CLI Example:
```
salt '*' osquery.mounts
```
	salt.modules.osquery.nfs_shares
Return nfs_shares information from osquery

CLI Example:
```
salt '*' osquery.nfs_shares
```
	salt.modules.osquery.nvram
Return nvram information from osquery

CLI Example:
```
salt '*' osquery.nvram
```
	salt.modules.osquery.os_version
Return os_version information from osquery

CLI Example:
```
salt '*' osquery.os_version
```
	salt.modules.osquery.osquery_extensions
Return osquery_extensions information from osquery

CLI Example:
```
salt '*' osquery.osquery_extensions
```
	salt.modules.osquery.osquery_flags
Return osquery_flags information from osquery

CLI Example:
<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>CLI Example</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>salt '*' osquery.osquery_flags</code></td>
<td>Return osquery_flags information from osquery</td>
<td></td>
</tr>
<tr>
<td><code>salt.modules.osquery.osquery_info(attrs=None, where=None)</code></td>
<td>Return osquery_info information from osquery</td>
<td><code>salt '*' osquery.osquery_info</code></td>
</tr>
<tr>
<td><code>salt.modules.osquery.osquery_registry(attrs=None, where=None)</code></td>
<td>Return osquery_registry information from osquery</td>
<td><code>salt '*' osquery.osquery_registry</code></td>
</tr>
<tr>
<td><code>salt.modules.osquerypasswd_changes(attrs=None, where=None)</code></td>
<td>Return passwd_changes information from osquery</td>
<td><code>salt '*' osquery.passwd_changes</code></td>
</tr>
<tr>
<td><code>salt.modules.osquerypci_devices(attrs=None, where=None)</code></td>
<td>Return pci_devices information from osquery</td>
<td><code>salt '*' osquery.pci_devices</code></td>
</tr>
<tr>
<td><code>salt.modules.osquerypreferences(attrs=None, where=None)</code></td>
<td>Return preferences information from osquery</td>
<td><code>salt '*' osquery.preferences</code></td>
</tr>
<tr>
<td><code>salt.modules.osqueryprocess_envs(attrs=None, where=None)</code></td>
<td>Return process_envs information from osquery</td>
<td><code>salt '*' osquery.process_envs</code></td>
</tr>
<tr>
<td><code>salt.modules.osqueryprocess_memory_map(attrs=None, where=None)</code></td>
<td>Return process_memory_map information from osquery</td>
<td><code>salt '*' osquery.process_memory_map</code></td>
</tr>
<tr>
<td><code>salt.modules.osqueryprocess_open_files(attrs=None, where=None)</code></td>
<td>Return process_open_files information from osquery</td>
<td><code>salt '*' osquery.process_open_files</code></td>
</tr>
</tbody>
</table>
salt.modules.osquery.process_open_sockets\((\text{attrs}=\text{None}, \text{where}=\text{None})\)
Return process_open_sockets information from osquery

CLI Example:
```
salt '*' osquery.process_open_sockets
```

salt.modules.osquery.processes\((\text{attrs}=\text{None}, \text{where}=\text{None})\)
Return processes information from osquery

CLI Example:
```
salt '*' osquery.processes
```

salt.modules.osquery.quarantine\((\text{attrs}=\text{None}, \text{where}=\text{None})\)
Return quarantine information from osquery

CLI Example:
```
salt '*' osquery.quarantine
```

salt.modules.osquery.query\((\text{sql}=\text{None})\)
Return time information from osquery

CLI Example:
```
salt '*' osquery.query "select * from users;"
```

salt.modules.osquery.routes\((\text{attrs}=\text{None}, \text{where}=\text{None})\)
Return routes information from osquery

CLI Example:
```
salt '*' osquery.routes
```

salt.modules.osquery.rpm_packages\((\text{attrs}=\text{None}, \text{where}=\text{None})\)
Return cpuid information from osquery

CLI Example:
```
salt '*' osquery.rpm_packages
```

salt.modules.osquery.safari_extensions\((\text{attrs}=\text{None}, \text{where}=\text{None})\)
Return safari_extensions information from osquery

CLI Example:
```
salt '*' osquery.safari_extensions
```

salt.modules.osquery.shared_memory\((\text{attrs}=\text{None}, \text{where}=\text{None})\)
Return shared_memory information from osquery

CLI Example:
```
salt '*' osquery.shared_memory
```

salt.modules.osquery.shell_history\((\text{attrs}=\text{None}, \text{where}=\text{None})\)
Return shell_history information from osquery

CLI Example:
salt '*

salt.modules.osquery.smbios_tables(attrs=None, where=None)
Return smbios_tables information from osquery
CLI Example:
salt '*

salt.modules.osquery.startup_items(attrs=None, where=None)
Return startup_items information from osquery
CLI Example:
salt '*

salt.modules.osquery.suid_bin(attrs=None, where=None)
Return suid_bin information from osquery
CLI Example:
salt '*

salt.modules.osquery.system_controls(attrs=None, where=None)
Return system_controls information from osquery
CLI Example:
salt '*

salt.modules.osquery.time_(attrs=None)
Return time information from osquery
CLI Example:
salt '*

salt.modules.osquery.usb_devices(attrs=None, where=None)
Return usb_devices information from osquery
CLI Example:
salt '*

salt.modules.osquery.users(attrs=None, where=None)
Return users information from osquery
CLI Example:
salt '*

salt.modules.osquery.version()
Return version of osquery
CLI Example:
salt '*

21.9. execution modules
salt.modules.osquery.xattr_where_from(\(attrs=None, where=None\))

Return xattr_where_from information from osquery

   CLI Example:
   ```
salt '*' osquery.xattr_where_from
   ```

salt.modules.osquery.xprotect_entries(\(attrs=None, where=None\))

Return xprotect_entries information from osquery

   CLI Example:
   ```
salt '*' osquery.xprotect_entries
   ```

salt.modules.osquery.xprotect_reports(\(attrs=None, where=None\))

Return xprotect_reports information from osquery

   CLI Example:
   ```
salt '*' osquery.xprotect_reports
   ```

### 21.9.303 salt.modules.out module

**Output Module**

New in version 2018.3.0.

Execution module that processes JSON serializable data and returns string having the format as processed by the outputters.

Although this does not bring much value on the CLI, it turns very handy in applications that require human readable data rather than Python objects.

For example, inside a Jinja template:

```
{{ salt.out.string_format(complex_object, out='highstate') }}
```

salt.modules.out.html_format(\(data, out='nested', opts=None, **kwargs\))

Return the formatted string as HTML.

- **data**: The JSON serializable object.
- **out**: nested The name of the output to use to transform the data. Default: nested.
- **opts**: Dictionary of configuration options. Default: __opts__.
- **kwargs**: Arguments to sent to the outputter module.

   CLI Example:
   ```
salt '*' out.html_format "\{\'key\': \'value\'}" out=yaml
   ```

salt.modules.out.out_format(\(data, out='nested', opts=None, **kwargs\))

Return the formatted outputter string for the Python object.

- **data**: The JSON serializable object.
- **out**: nested The name of the output to use to transform the data. Default: nested.
- **opts**: Dictionary of configuration options. Default: __opts__.
- **kwargs**: Arguments to sent to the outputter module.

   CLI Example:
   ```
salt '*' out.out_format "\{\'key\': \'value\'}"
   ```
salt.modules.out.string_format  
Return the outputter formatted string, removing the ANSI escape sequences.
  
  **data**  The JSON serializable object.
  **out** nested  The name of the output to use to transform the data. Default: nested.
  **opts** Dictionary of configuration options. Default: __opts__.
  **kwargs**  Arguments to sent to the outputter module.

CLI Example:

```python
salt '*' out.string_format "{"key": 'value'}" out=table
```

### 21.9.304  salt.modules.pacmanpkg

A module to wrap pacman calls, since Arch is the best (https://wiki.archlinux.org/index.php/Arch_is_the_best)

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `pkg.install` is not available), see here.

salt.modules.pacmanpkg.file_dict(“packages”)

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of _every_ file on the system’s package database (not generally recommended).

CLI Examples:

```bash
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

salt.modules.pacmanpkg.file_list(“packages”)

List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system’s package database (not generally recommended).

CLI Examples:

```bash
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

salt.modules.pacmanpkg.group_diff(name)

New in version 2016.11.0.

Lists which of a group’s packages are installed and which are not installed

Compatible with yumpkg.group_diff for easy support of state.pkg.group_installed

CLI Example:

```bash
salt '*' pkg.group_diff 'xorg'
```

salt.modules.pacmanpkg.group_info(name)

New in version 2016.11.0.

Lists all packages in the specified group

CLI Example:

```bash
salt '*' pkg.group_info 'xorg'
```
salt.modules.pacmanpkg.group_list()

New in version 2016.11.0.

Lists all groups known by pacman on this system

CLI Example:

```bash
salt '*' pkg.group_list
```

salt.modules.pacmanpkg.install(name=None, refresh=False, sysupgrade=None, pkgs=None, sources=None, **kwargs)

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon’s control group. This is done to keep systemd from killing any pacman commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Install (pacman -S) the specified packag(s). Add refresh=True to install with -y, add sysupgrade=True to install with -u.

name The name of the package to be installed. Note that this parameter is ignored if either pkgs or sources is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the sources option.

CLI Example:

```bash
salt '*' pkg.install <package name>
```

refresh Whether or not to refresh the package database before installing.

sysupgrade Whether or not to upgrade the system packages before installing. If refresh is set to True but sysupgrade is not specified, -u will be applied.

Multiple Package Installation Options:

pkgs A list of packages to install from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version. As with the version parameter above, comparison operators can be used to target a specific version of a package.

CLI Examples:

```bash
salt '*' pkg.install pkgs='["foo", "bar"]'
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3-4"}]'
salt '*' pkg.install pkgs='["foo", {"bar": "<1.2.3-4"}]'
```

sources A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```bash
salt '*' pkg.install sources=[{"foo": "salt://foo.pkg.tar.xz"}, {"bar": "salt://bar.pkg.tar.xz"}]
```

Returns a dict containing the new package names and versions:

```json
{"<package>": {"old": '<old-version>', 'new': '<new-version>'}}
```

salt.modules.pacmanpkg.latest_version(*names, **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.
CLI Example:
```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

```
salt.modules.pacmanpkg.list_pkgs(versions_as_list=False, **kwargs)
```
List the packages currently installed as a dict:
```
{"<package_name">: '"version>'}
```

CLI Example:
```
salt '*' pkg.list_pkgs
```

```
salt.modules.pacmanpkg.list_repo_pkgs(*args, **kwargs)
```
Returns all available packages. Optionally, package names (and name globs) can be passed and the results will be filtered to packages matching those names.

This function can be helpful in discovering the version or repo to specify in a `pkg.installed` state.

The return data will be a dictionary mapping package names to a list of version numbers, ordered from newest to oldest. If `byrepo` is set to `True`, then the return dictionary will contain repository names at the top level, and each repository will map packages to lists of version numbers. For example:

```
# With byrepo=False (default)
{
    'bash': ['4.4.005-2'],
    'nginx': ['1.10.2-2']
}
# With byrepo=True
{
    'core': {
        'bash': ['4.4.005-2']
    },
    'extra': {
        'nginx': ['1.10.2-2']
    }
}
```

```
fromrepo [None] Only include results from the specified repo(s). Multiple repos can be specified, comma-separated.
byrepo [False] When True, the return data for each package will be organized by repository.
refresh [False] When True, the package database will be refreshed (i.e. `pacman -Sy`) before checking for available versions.
```

CLI Examples:
```
salt '*' pkg.list_repo_pkgs
salt '*' pkg.list_repo_pkgs foo bar baz
salt '*' pkg.list_repo_pkgs 'samba4*' fromrepo=base,updates
salt '*' pkg.list_repo_pkgs 'python2-*' byrepo=True
```

```
salt.modules.pacmanpkg.list_upgrades(refresh=False, root=None, **kwargs)
```
List all available package upgrades on this system

CLI Example:
```
salt '*' pkg.list_upgrades
```

21.9. execution modules
salt.modules.pacmanpkg.owner(*paths)

New in version 2014.7.0.

Return the name of the package that owns the file. Multiple file paths can be passed. Like pkg.version, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Example:
salt '*' pkg.owner /usr/bin/apachectl salt '*' pkg.owner /usr/bin/apachectl /usr/bin/zsh

salt.modules.pacmanpkg.purge(name=None, pkgs=None, **kwargs)

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon’s control group. This is done to keep systemd from killing any pacman commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Recursively remove a package and all dependencies which were installed with it, this will call a pacman -Rsc

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'

salt.modules.pacmanpkg.refresh_db(root=None)

Just run a pacman -Sy, return a dict:

{'<database name>': Bool}

CLI Example:

salt '*' pkg.refresh_db

salt.modules.pacmanpkg.remove(name=None, pkgs=None, **kwargs)

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon’s control group. This is done to keep systemd from killing any pacman commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Remove packages with pacman -R.

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.
New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

```
salt.modules.pacmanpkg.upgrade(refresh=False, root=None, **kwargs)
```

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon’s control group. This is done to keep systemd from killing any pacman commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Run a full system upgrade, a pacman -Syu

**refresh** Whether or not to refresh the package database before installing.

Returns a dictionary containing the changes:

```
{
'<package>': {
'old': '<old-version>',
'new': '<new-version>'
}}
```

```
salt '*' pkg.upgrade
```

```
salt.modules.pacmanpkg.upgrade_available(name)
```

Check whether or not an upgrade is available for a given package

```
salt '*' pkg.upgrade_available <package name>
```

```
salt.modules.pacmanpkg.version( *names, **kwargs)
```

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ... 
```

21.9.305  salt.modules.pagerduty

Module for Firing Events via PagerDuty

New in version 2014.1.0.

**configuration** This module can be used by specifying the name of a configuration profile in the minion config, minion pillar, or master config.

For example:

```
my-pagerduty-account:
   pagerduty.api_key: F3Rbyjbve43rFwF2214
   pagerduty.subdomain: mysubdomain
```
salt.modules.pagerduty.create_event(service_key=None, description=None, details=None, incident_key=None, profile=None)

Create an event in PagerDuty. Designed for use in states.

CLI Example:
```
salt myminion pagerduty.create_event <service_key> <description> <details>  
    profile=my-pagerduty-account
```

The following parameters are required:
- `service_key` This key can be found by using pagerduty.list_services.
- `description` This is a short description of the event.
- `details` This can be a more detailed description of the event.
- `profile` This refers to the configuration profile to use to connect to the PagerDuty service.

salt.modules.pagerduty.list_escalation_policies(profile=None, api_key=None)

This function is an alias of list_policies.
List escalation policies belonging to this account

CLI Example:
```
salt myminion pagerduty.list_policies my-pagerduty-account 
salt myminion pagerduty.list_escalation_policies my-pagerduty-account
```

salt.modules.pagerduty.list_incidents(profile=None, api_key=None)

List incidents belonging to this account

CLI Example:
```
salt myminion pagerduty.list_incidents my-pagerduty-account
```

salt.modules.pagerduty.list_maintenance_windows(profile=None, api_key=None)

This function is an alias of list_windows.
List maintenance windows belonging to this account

CLI Example:
```
salt myminion pagerduty.list_windows my-pagerduty-account 
salt myminion pagerduty.list_maintenance_windows my-pagerduty-account
```

salt.modules.pagerduty.list_policies(profile=None, api_key=None)

List escalation policies belonging to this account

CLI Example:
```
salt myminion pagerduty.list_policies my-pagerduty-account 
salt myminion pagerduty.list_escalation_policies my-pagerduty-account
```

salt.modules.pagerduty.list_schedules(profile=None, api_key=None)

List schedules belonging to this account

CLI Example:
```
salt myminion pagerduty.list_schedules my-pagerduty-account
```

salt.modules.pagerduty.list_services(profile=None, api_key=None)

List services belonging to this account

CLI Example:
```
salt myminion pagerduty.list_services my-pagerduty-account
```

salt.modules.pagerduty.list_users(profile=None, api_key=None)

List users belonging to this account

CLI Example:
```
salt myminion pagerduty.list_users my-pagerduty-account
```
salt.modules.pagerduty.list_windows(*profile=*, *api_key=* )
List maintenance windows belonging to this account

CLI Example:
salt myminion pagerduty.list_windows my-pagerduty-account salt myminion pagerduty.list_maintenance_windows my-pagerduty-account

21.9.306 salt.modules.pagerduty_util

Module for managing PagerDuty resource

configuration This module can be used by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The default configuration profile name is 'pagerduty.'

For example:

```
pagerduty:
pagerduty.api_key: F3Rbyjbve43rfWF2214
pagerduty.subdomain: mysubdomain
```

For PagerDuty API details, see https://developer.pagerduty.com/documentation/rest

salt.modules.pagerduty_util.create_or_update_resource(*resource_name*, *identifier_fields*, *data*, *diff=*, *profile=*, *subdomain=*, *api_key=*)
create or update any pagerduty resource Helper method for present().
Determining if two resources are the same is different for different PD resource, so this method accepts a diff function. The diff function will be invoked as diff(state_information, object_returned_from_pagerduty), and should return a dict of data to pass to the PagerDuty update API method, or None if no update is to be performed. If no diff method is provided, the default behavior is to scan the keys in the state_information, comparing the matching values in the object_returned_from_pagerduty, and update any values that differ.

Examples

create_or_update_resource("user", ["id","name","email"]) create_or_update_resource("escalation_policies", ["id","name"], diff=my_diff_function)

salt.modules.pagerduty_util.delete_resource(*resource_name*, *key*, *identifier_fields*, *profile=*, *subdomain=*, *api_key=*)
delete any pagerduty resource
Helper method for absent()

Example

delete_resource("users", key, ["id","name","email"]) # delete by id or name or email

salt.modules.pagerduty_util.get_escalation_policies(*profile=*, *subdomain=*, *api_key=*)
List escalation_policies belonging to this account

CLI Example:
salt myminion pagerduty.get_escalation_policies
salt.modules.pagerduty_util.get_resource(resource_name, key, identifier_fields, profile='pagerduty', subdomain=None, api_key=None)

Get any single pagerduty resource by key.

We allow flexible lookup by any of a list of identifier_fields. So, for example, you can look up users by email address or name by calling:
```
get_resource('users', key, ['name', 'email'], ...)
```
This method is mainly used to translate state sls into pagerduty id’s for dependent objects. For example, a pagerduty escalation policy contains one or more schedules, which must be passed by their pagerduty id. We look up the schedules by name (using this method), and then translate the names into id’s.

This method is implemented by getting all objects of the resource type (cached into __context__), then brute force searching through the list and trying to match any of the identifier_fields. The __context__ cache is purged after any create, update or delete to the resource.

salt.modules.pagerduty_util.get_schedules(profile='pagerduty', subdomain=None, api_key=None)

List schedules belonging to this account

CLI Example:
```
salt myminion pagerduty.get_schedules
```

salt.modules.pagerduty_util.get_services(profile='pagerduty', subdomain=None, api_key=None)

List services belonging to this account

CLI Example:
```
salt myminion pagerduty.get_services
```

salt.modules.pagerduty_util.get_users(profile='pagerduty', subdomain=None, api_key=None)

List users belonging to this account

CLI Example:
```
salt myminion pagerduty.get_users
```

salt.modules.pagerduty_util.resource_absent(resource, identifier_fields, profile='pagerduty', subdomain=None, api_key=None, **kwargs)

Generic resource.absent state method. Pagerduty state modules should be a thin wrapper over this method, with a custom diff function.

This method calls delete_resource() and formats the result as a salt state return value.

Example
```
resource_absent("users", ["id","name","email"])
```

salt.modules.pagerduty_util.resource_present(resource, identifier_fields, diff=None, profile='pagerduty', subdomain=None, api_key=None, **kwargs)

Generic resource.present state method. Pagerduty state modules should be a thin wrapper over this method, with a custom diff function.

This method calls create_or_update_resource() and formats the result as a salt state return value.

Example
```
resource_present("users", ["id","name","email"])
```
21.9.307 salt.modules.pam

Support for pam

salt.modules.pam.read_file(file_name)
   This is just a test function, to make sure parsing works

   CLI Example:
   ```
salt '*' pam.read_file /etc/pam.d/login
   ```

21.9.308 salt.modules.panos

Module to provide Palo Alto compatibility to Salt

   codeauthor Spencer Ervin <spencer_ervin@hotmail.com>
   maturity new
   depends none
   platform unix

New in version 2018.3.0.

Configuration

This module accepts connection configuration details either as parameters, or as configuration settings in pillar as a Salt proxy. Options passed into opts will be ignored if options are passed into pillar.

See also:
Palo Alto Proxy Module

About

This execution module was designed to handle connections to a Palo Alto based firewall. This module adds support to send connections directly to the device through the XML API or through a brokered connection to Panorama.

salt.modules.panos.add_config_lock()
   Prevent other users from changing configuration until the lock is released.

   CLI Example:
   ```
salt '*' panos.add_config_lock
   ```

salt.modules.panos.check_antivirus()
   Get anti-virus information from PaloAlto Networks server

   CLI Example:
   ```
salt '*' panos.check_antivirus
   ```

salt.modules.panos.check_software()
   Get software information from PaloAlto Networks server.

   CLI Example:
salt 'x' panos.check_software

salt.modules.panos.clear_commit_tasks()
Clear all commit tasks.

CLI Example:

```
salt 'x' panos.clear_commit_tasks
```

salt.modules.panos.commit()
Commits the candidate configuration to the running configuration.

CLI Example:

```
salt 'x' panos.commit
```

salt.modules.panos.deactivate_license(key_name=None)
Deactivates an installed license. Required version 7.0.0 or greater.

key_name(str): The file name of the license key installed.

CLI Example:

```
salt 'x' panos.deactivate_license key_name=License_File_Name.key
```

salt.modules.panos.delete_license(key_name=None)
Remove license keys on disk.

key_name(str): The file name of the license key to be deleted.

CLI Example:

```
salt 'x' panos.delete_license key_name=License_File_Name.key
```

salt.modules.panos.download_antivirus()
Download the most recent anti-virus package.

CLI Example:

```
salt 'x' panos.download_antivirus
```

salt.modules.panos.download_software_file(filename=None, synch=False)
Download software packages by filename.

Parameters
- `filename` (str) - The filename of the PANOS file to download.
- `synch` (bool) - If true then the file will synch to the peer unit.

CLI Example:

```
salt 'x' panos.download_software_file PanOS_5000-8.0.0
salt 'x' panos.download_software_file PanOS_5000-8.0.0 True
```

salt.modules.panos.download_software_version(version=None, synch=False)
Download software packages by version number.

Parameters
- `version` (str) - The version of the PANOS file to download.
- `synch` (bool) - If true then the file will synch to the peer unit.

CLI Example:
salt.modules.panos.fetch_license(auth_code=None)
Get new license(s) using from the Palo Alto Network Server.
auth_code The license authorization code.
CLI Example:
```
salt '*' panos.fetch_license
salt '*' panos.fetch_license auth_code=foobar
```

salt.modules.panos.get_address(address=None, vsys='1')
Get the candidate configuration for the specified get_address object. This will not return address objects that are marked as pre-defined objects.
address(str): The name of the address object.
vsys(str): The string representation of the VSYS ID.
CLI Example:
```
salt '*' panos.get_address myhost
salt '*' panos.get_address myhost 3
```

salt.modules.panos.get_address_group(addressgroup=None, vsys='1')
Get the candidate configuration for the specified address group. This will not return address groups that are marked as pre-defined objects.
addressgroup(str): The name of the address group.
vsys(str): The string representation of the VSYS ID.
CLI Example:
```
salt '*' panos.get_address_group foobar
salt '*' panos.get_address_group foobar 3
```

salt.modules.panos.get_admins_active()
Show active administrators.
CLI Example:
```
salt '*' panos.get_admins_active
```

salt.modules.panos.get_admins_all()
Show all administrators.
CLI Example:
```
salt '*' panos.get_admins_all
```

salt.modules.panos.get_antivirus_info()
Show information about available anti-virus packages.
CLI Example:
```
salt '*' panos.get_antivirus_info
```

salt.modules.panos.get_arp()
Show ARP information.
CLI Example:
```bash
classic '*' panos.get_arp
```

```python
salt.modules.panos.get_cli_idle_timeout()
```
Show timeout information for this administrative session.

CLI Example:
```bash
classic '*' panos.get_cli_idle_timeout
```

```python
salt.modules.panos.get_cli_permissions()
```
Show cli administrative permissions.

CLI Example:
```bash
classic '*' panos.get_cli_permissions
```

```python
salt.modules.panos.get_disk_usage()
```
Report filesystem disk space usage.

CLI Example:
```bash
classic '*' panos.get_disk_usage
```

```python
salt.modules.panos.get_dns_server_config()
```
Get the DNS server configuration from the candidate configuration.

CLI Example:
```bash
classic '*' panos.get_dns_server_config
```

```python
salt.modules.panos.get_domain_config()
```
Get the domain name configuration from the candidate configuration.

CLI Example:
```bash
classic '*' panos.get_domain_config
```

```python
salt.modules.panos.get_dos_blocks()
```
Show the DoS block-ip table.

CLI Example:
```bash
classic '*' panos.get_dos_blocks
```

```python
salt.modules.panos.get_fqdn_cache()
```
Print FQDNs used in rules and their IPs.

CLI Example:
```bash
classic '*' panos.get_fqdn_cache
```

```python
salt.modules.panos.get_ha_config()
```
Get the high availability configuration.

CLI Example:
```bash
classic '*' panos.get_ha_config
```

```python
salt.modules.panos.get_ha_link()
```
Show high-availability link-monitoring state.
CLI Example:

```
salt '*' panos.get_ha_link
```

```python
salt.modules.panos.get_ha_path()
Show high-availability path-monitoring state.
CLI Example:

```
salt '*' panos.get_ha_path
```

```python
salt.modules.panos.get_ha_state()
Show high-availability state information.
CLI Example:

```
salt '*' panos.get_ha_state
```

```python
salt.modules.panos.get_ha_transitions()
Show high-availability transition statistic information.
CLI Example:

```
salt '*' panos.get_ha_transitions
```

```python
salt.modules.panos.get_hostname()
Get the hostname of the device.
CLI Example:

```
salt '*' panos.get_hostname
```

```python
salt.modules.panos.get_interface_counters(name='all')
Get the counter statistics for interfaces.
Parameters name (str) – The name of the interface to view. By default, all interface statistics are viewed.
CLI Example:

```
salt '*' panos.get_interface_counters
salt '*' panos.get_interface_counters ethernet1/1
```

```python
salt.modules.panos.get_interfaces(name='all')
Show interface information.
Parameters name (str) – The name of the interface to view. By default, all interface statistics are viewed.
CLI Example:

```
salt '*' panos.get_interfaces
salt '*' panos.get_interfaces ethernet1/1
```

```python
salt.modules.panos.get_job(jid=None)
List all a single job by ID.
Parameters jid (str) – The ID of the job to retrieve.
CLI Example:

```
salt '*' panos.get_job jid=15
```
**salt.modules.panos.get_jobs** *(state='all')*

List all jobs on the device.

- **state** The state of the jobs to display. Valid options are all, pending, or processed. Pending jobs are jobs that are currently in a running or waiting state. Processed jobs are jobs that have completed execution.

  CLI Example:

  ```
salt '*' panos.get_jobs
salt '*' panos.get_jobs state=pending
  ```

**salt.modules.panos.get_lacp()**

Show LACP state.

  CLI Example:

  ```
salt '*' panos.get_lacp
  ```

**salt.modules.panos.get_license_info()**

Show information about owned license(s).

  CLI Example:

  ```
salt '*' panos.get_license_info
  ```

**salt.modules.panos.get_license_tokens()**

Show license token files for manual license deactivation.

  CLI Example:

  ```
salt '*' panos.get_license_tokens
  ```

**salt.modules.panos.get_lldp_config()**

Show lldp config for interfaces.

  CLI Example:

  ```
salt '*' panos.get_lldp_config
  ```

**salt.modules.panos.get_lldp_counters()**

Show lldp counters for interfaces.

  CLI Example:

  ```
salt '*' panos.get_lldp_counters
  ```

**salt.modules.panos.get_lldp_local()**

Show lldp local info for interfaces.

  CLI Example:

  ```
salt '*' panos.get_lldp_local
  ```

**salt.modules.panos.get_lldp_neighbors()**

Show lldp neighbors info for interfaces.

  CLI Example:

  ```
salt '*' panos.get_lldp_neighbors
  ```

**salt.modules.panos.get_local_admins()**

Show all local administrator accounts.
CLI Example:

```
salt '*' panos.get_local_admins
```

**salt.modules.panos.get_logdb_quota()**
Report the logdb quotas.

CLI Example:

```
salt '*' panos.get_logdb_quota
```

**salt.modules.panos.get_master_key()**
Get the master key properties.

CLI Example:

```
salt '*' panos.get_master_key
```

**salt.modules.panos.get_ntp_config()**
Get the NTP configuration from the candidate configuration.

CLI Example:

```
salt '*' panos.get_ntp_config
```

**salt.modules.panos.get_ntp_servers()**
Get list of configured NTP servers.

CLI Example:

```
salt '*' panos.get_ntp_servers
```

**salt.modules.panos.get_operational_mode()**
Show device operational mode setting.

CLI Example:

```
salt '*' panos.get_operational_mode
```

**salt.modules.panos.get_panorama_status()**
Show panorama connection status.

CLI Example:

```
salt '*' panos.get_panorama_status
```

**salt.modules.panos.get_permitted_ips()**
Get the IP addresses that are permitted to establish management connections to the device.

CLI Example:

```
salt '*' panos.get_permitted_ips
```

**salt.modules.panos.get_platform()**
Get the platform model information and limitations.

CLI Example:

```
salt '*' panos.get_platform
```
salt.modules.panos.get_predefined_application(application=None)
Get the configuration for the specified pre-defined application object. This will only return pre-defined application objects.

application(str): The name of the pre-defined application object.

CLI Example:
```
salt '*' panos.get_predefined_application saltstack
```

salt.modules.panos.get_security_rule(rulename=None, vsys='1')
Get the candidate configuration for the specified security rule.

rulename(str): The name of the security rule.
vsys(str): The string representation of the VSYS ID.

CLI Example:
```
salt '*' panos.get_security_rule rule01
salt '*' panos.get_security_rule rule01 3
```

salt.modules.panos.get_service(service=None, vsys='1')
Get the candidate configuration for the specified service object. This will not return services that are marked as pre-defined objects.

service(str): The name of the service object.
vsys(str): The string representation of the VSYS ID.

CLI Example:
```
salt '*' panos.get_service tcp-443
salt '*' panos.get_service tcp-443 3
```

salt.modules.panos.get_service_group(servicegroup=None, vsys='1')
Get the candidate configuration for the specified service group. This will not return service groups that are marked as pre-defined objects.

servicegroup(str): The name of the service group.
vsys(str): The string representation of the VSYS ID.

CLI Example:
```
salt '*' panos.get_service_group foobar
salt '*' panos.get_service_group foobar 3
```

salt.modules.panos.get_session_info()
Show device session statistics.

CLI Example:
```
salt '*' panos.get_session_info
```

salt.modules.panos.get_snmp_config()
Get the SNMP configuration from the device.

CLI Example:
```
salt '*' panos.get_snmp_config
```
salt.modules.panos.get_software_info()
    Show information about available software packages.
    
    CLI Example:
    
    ```
    salt '*' panos.get_software_info
    ```

salt.modules.panos.get_system_date_time()
    Get the system date/time.
    
    CLI Example:
    
    ```
    salt '*' panos.get_system_date_time
    ```

salt.modules.panos.get_system_files()
    List important files in the system.
    
    CLI Example:
    
    ```
    salt '*' panos.get_system_files
    ```

salt.modules.panos.get_system_info()
    Get the system information.
    
    CLI Example:
    
    ```
    salt '*' panos.get_system_info
    ```

salt.modules.panos.get_system_services()
    Show system services.
    
    CLI Example:
    
    ```
    salt '*' panos.get_system_services
    ```

salt.modules.panos.get_system_state(mask=None)
    Show the system state variables.
    
    mask    Filters by a subtree or a wildcard.
    
    CLI Example:
    
    ```
    salt '*' panos.get_system_state
    salt '*' panos.get_system_state mask=cfg.ha.config.enabled
    salt '*' panos.get_system_state mask=cfg.ha.*
    ```

salt.modules.panos.get_uncommitted_changes()
    Retrieve a list of all uncommitted changes on the device. Requires PANOS version 8.0.0 or greater.
    
    CLI Example:
    
    ```
    salt '*' panos.get_uncommitted_changes
    ```

salt.modules.panos.get_users_config()
    Get the local administrative user account configuration.
    
    CLI Example:
    
    ```
    salt '*' panos.get_users_config
    ```

salt.modules.panos.get_vlans()
    Show all VLAN information.
CLI Example:

```bash
salt '*' panos.get_vlans
```

salt.modules.panos.get_xpath(xpath="")
Retrieve a specified xpath from the candidate configuration.

**xpath** (str): The specified xpath in the candidate configuration.

CLI Example:

```bash
salt '*' panos.get_xpath /config/shared/service
```

salt.modules.panos.get_zone(zone='', vsys='1')
Get the candidate configuration for the specified zone.

**zone** (str): The name of the zone.

**vsys** (str): The string representation of the VSYS ID.

CLI Example:

```bash
salt '*' panos.get_zone trust
salt '*' panos.get_zone trust 2
```

salt.modules.panos.get_zones(vsys='1')
Get all the zones in the candidate configuration.

**vsys** (str): The string representation of the VSYS ID.

CLI Example:

```bash
salt '*' panos.get_zones
salt '*' panos.get_zones 2
```

salt.modules.panos.install_antivirus(version=None, latest=False, synch=False, skip_commit=False)
Install anti-virus packages.

**Parameters**

- **version** (str) – The version of the PANOS file to install.
- **latest** (bool) – If true, the latest anti-virus file will be installed. The specified version option will be ignored.
- **synch** (bool) – If true, the anti-virus will synch to the peer unit.
- **skip_commit** (bool) – If true, the install will skip committing to the device.

CLI Example:

```bash
salt '*' panos.install_antivirus 8.0.0
```

salt.modules.panos.install_license()
Install the license key(s).

CLI Example:

```bash
salt '*' panos.install_license
```

salt.modules.panos.install_software(version=None)
Upgrade to a software package by version.

**Parameters**

- **version** (str) – The version of the PANOS file to install.

CLI Example:
salt '*' panos.install_license 8.0.0

salt.modules.panos.reboot()
    Reboot a running system.
    CLI Example:
    
salt '*' panos.reboot

salt.modules.panos.refresh_fqdn_cache(force=False)
    Force refreshes all FQDNs used in rules.
    force Forces all fqdn refresh
    CLI Example:
    
salt '*' panos.refresh_fqdn_cache
    salt '*' panos.refresh_fqdn_cache force=True

salt.modules.panos.remove_config_lock()
    Release config lock previously held.
    CLI Example:
    
salt '*' panos.remove_config_lock

salt.modules.panos.resolve_address(address=None, vsys=None)
    Resolve address to ip address. Required version 7.0.0 or greater.
    address Address name you want to resolve.
    vsys The vsys name.
    CLI Example:
    
salt '*' panos.resolve_address foo.bar.com
    salt '*' panos.resolve_address foo.bar.com vsys=2

salt.modules.panos.save_device_config(filename=None)
    Save device configuration to a named file.
    filename The filename to save the configuration to.
    CLI Example:
    
salt '*' panos.save_device_config foo.xml

salt.modules.panos.save_device_state()
    Save files needed to restore device to local disk.
    CLI Example:
    
salt '*' panos.save_device_state

salt.modules.panos.set_authentication_profile(profile=None, deploy=False)
    Set the authentication profile of the Palo Alto proxy minion. A commit will be required before this is processed.
    CLI Example:
    Parameters
    • profile (str) – The name of the authentication profile to set.
    • deploy (bool) – If true then commit the full candidate configuration, if false only set pending change.
salt '*' panos.set_authentication_profile foo
salt '*' panos.set_authentication_profile foo deploy=True

salt.modules.panos.set_hostname(hostname=None, deploy=False)
Set the hostname of the Palo Alto proxy minion. A commit will be required before this is processed.

CLI Example:
Parameters
  - hostname (str) – The hostname to set
  - deploy (bool) – If true then commit the full candidate configuration, if false only set pending change.

salt '*' panos.set_hostname newhostname deploy=True

salt.modules.panos.set_management_http(enabled=True, deploy=False)
Enables or disables the HTTP management service on the device.

CLI Example:
Parameters
  - enabled (bool) – If true the service will be enabled. If false the service will be disabled.
  - deploy (bool) – If true then commit the full candidate configuration, if false only set pending change.

salt '*' panos.set_management_http enabled=False deploy=True

salt.modules.panos.set_management_https(enabled=True, deploy=False)
Enables or disables the HTTPS management service on the device.

CLI Example:
Parameters
  - enabled (bool) – If true the service will be enabled. If false the service will be disabled.
  - deploy (bool) – If true then commit the full candidate configuration, if false only set pending change.

salt '*' panos.set_management_https enabled=False deploy=True

salt.modules.panos.set_management_icmp(enabled=True, deploy=False)
Enables or disables the ICMP management service on the device.

CLI Example:
Parameters
  - enabled (bool) – If true the service will be enabled. If false the service will be disabled.
  - deploy (bool) – If true then commit the full candidate configuration, if false only set pending change.

salt '*' panos.set_management_icmp enabled=False deploy=True

salt.modules.panos.set_management_ocsp(enabled=True, deploy=False)
Enables or disables the HTTP OCSP management service on the device.

CLI Example:
Parameters

- **enabled (bool)** – If true the service will be enabled. If false the service will be disabled.
- **deploy (bool)** – If true then commit the full candidate configuration, if false only set pending change.

```python
salt '*' panos.set_management_ocsp
salt '*' panos.set_management_ocsp enabled=False deploy=True
```

**salt.modules.panos.set_management_snmp**(*enabled=True, deploy=False*)

Enables or disables the SNMP management service on the device.

CLI Example:

Parameters

- **enabled (bool)** – If true the service will be enabled. If false the service will be disabled.
- **deploy (bool)** – If true then commit the full candidate configuration, if false only set pending change.

```python
salt '*' panos.set_management_snmp
salt '*' panos.set_management_snmp enabled=False deploy=True
```

**salt.modules.panos.set_management_ssh**(*enabled=True, deploy=False*)

Enables or disables the SSH management service on the device.

CLI Example:

Parameters

- **enabled (bool)** – If true the service will be enabled. If false the service will be disabled.
- **deploy (bool)** – If true then commit the full candidate configuration, if false only set pending change.

```python
salt '*' panos.set_management_ssh
salt '*' panos.set_management_ssh enabled=False deploy=True
```

**salt.modules.panos.set_management_telnet**(*enabled=True, deploy=False*)

Enables or disables the Telnet management service on the device.

CLI Example:

Parameters

- **enabled (bool)** – If true the service will be enabled. If false the service will be disabled.
- **deploy (bool)** – If true then commit the full candidate configuration, if false only set pending change.

```python
salt '*' panos.set_management_telnet
salt '*' panos.set_management_telnet enabled=False deploy=True
```

**salt.modules.panos.set_ntp_authentication**(*target=None, authentication_type=None, key_id=None, authentication_key=None, algorithm=None, deploy=False*)

Set the NTP authentication of the Palo Alto proxy minion. A commit will be required before this is processed.

CLI Example:

Parameters

- **target (str)** – Determines the target of the authentication. Valid options are primary, secondary, or both.
• **authentication_type** *(str)* – The authentication type to be used. Valid options are symmetric, autokey, and none.
• **key_id** *(int)* – The NTP authentication key ID.
• **authentication_key** *(str)* – The authentication key.
• **algorithm** *(str)* – The algorithm type to be used for a symmetric key. Valid options are md5 and sha1.
• **deploy** *(bool)* – If true then commit the full candidate configuration, if false only set pending change.

```python
salt '*' ntp.set_authentication target=both authentication_type=autokey
salt '*' ntp.set_authentication target=primary authentication_type=none
salt '*' ntp.set_authentication target=both authentication_type=symmetric key_id=15 authentication_key=mykey algorithm=md5
salt '*' ntp.set_authentication target=both authentication_type=symmetric key_id=15 authentication_key=mykey algorithm=md5 deploy=True
```

salt.modules.panos.set_ntp_servers *(primary_server=None, secondary_server=None, deploy=False)*

Set the NTP servers of the Palo Alto proxy minion. A commit will be required before this is processed.

CLI Example:

Parameters

• **primary_server** *(str)* – The primary NTP server IP address or FQDN.
• **secondary_server** *(str)* – The secondary NTP server IP address or FQDN.
• **deploy** *(bool)* – If true then commit the full candidate configuration, if false only set pending change.

```python
salt '*' ntp.set_servers 0.pool.ntp.org 1.pool.ntp.org
salt '*' ntp.set_servers primary_server=0.pool.ntp.org secondary_server=1.pool.ntp.org
salt '*' ntp.set_servers 0.pool.ntp.org 1.pool.ntp.org deploy=True
```

salt.modules.panos.set_permitted_ip *(address=None, deploy=False)*

Add an IPv4 address or network to the permitted IP list.

CLI Example:

Parameters

• **address** *(str)* – The IPv4 address or network to allow access to add to the Palo Alto device.
• **deploy** *(bool)* – If true then commit the full candidate configuration, if false only set pending change.

```python
salt '*' panos.set_permitted_ip 10.0.0.1
salt '*' panos.set_permitted_ip 10.0.0.0/24
salt '*' panos.set_permitted_ip 10.0.0.1 deploy=True
```

salt.modules.panos.set_timezone *(tz=None, deploy=False)*

Set the timezone of the Palo Alto proxy minion. A commit will be required before this is processed.

CLI Example:

Parameters

• **tz** *(str)* – The name of the timezone to set.
• **deploy** *(bool)* – If true then commit the full candidate configuration, if false only set pending change.

```python
salt '*' panos.set_timezone UTC
salt '*' panos.set_timezone UTC deploy=True
```
salt.modules.panos.shutdown()
    Shutdown a running system.

    CLI Example:
    ```
salt '*' panos.shutdown
    ```

salt.modules.panos.test_fib_route(ip=None, vr='vr1')
    Perform a route lookup within active route table (fib).

    ip (str): The destination IP address to test.
    vr (str): The name of the virtual router to test.

    CLI Example:
    ```
salt '*' panos.test_fib_route 4.2.2.2
salt '*' panos.test_fib_route 4.2.2.2 my-vr
    ```

salt.modules.panos.test_security_policy(sourcezone=None, destinationzone=None, source=None, destination=None, protocol=None, port=None, application=None, category=None, vsys='1', allrules=False)
    Checks which security policy as connection will match on the device.

    sourcezone (str): The source zone matched against the connection.
    destinationzone (str): The destination zone matched against the connection.
    source (str): The source address. This must be a single IP address.
    destination (str): The destination address. This must be a single IP address.
    protocol (int): The protocol number for the connection. This is the numerical representation of the protocol.
    port (int): The port number for the connection.
    application (str): The application that should be matched.
    category (str): The category that should be matched.
    vsys (int): The numerical representation of the VSYS ID.
    allrules (bool): Show all potential match rules until first allow rule.

    CLI Example:
    ```
salt '*' panos.test_security_policy sourcezone=trust destinationzone=untrust protocol=6 port=22
salt '*' panos.test_security_policy sourcezone=trust destinationzone=untrust protocol=6 port=22 vsys=2
    ```

salt.modules.panos.unlock_admin(username=None)
    Unlocks a locked administrator account.

    username Username of the administrator.

    CLI Example:
    ```
salt '*' panos.unlock_admin username=bob
    ```
21.9.309 salt.modules.parallels module

Manage Parallels Desktop VMs with prctl and prlsrvctl. Only some of the prctl commands implemented so far. Of those that have been implemented, not all of the options may have been provided yet. For a complete reference, see the Parallels Desktop Reference Guide.

This module requires the prctl binary to be installed to run most functions. To run parallels.prlsrvctl, the prlsrvctl binary is required.

What has not been implemented yet can be accessed through parallels.prlctl and parallels.prlsrvctl (note the preceding double dash -- as necessary):

```
salt '*' parallels.prlctl installtools macvm runas=macdev
salt -- '*' parallels.prlctl capture 'macvm --file macvm.display.png' runas=macdev
salt -- '*' parallels.prlsrvctl set '--mem-limit auto' runas=macdev
```

New in version 2016.3.0.

salt.modules.parallels.clone(name, new_name, linked=False, template=False, runas=None)

Clone a VM

New in version 2016.11.0.

Parameters

- name (str) – Name/ID of VM to clone
- new_name (str) – Name of the new VM
- linked (bool) – Create a linked virtual machine.
- template (bool) – Create a virtual machine template instead of a real virtual machine.
- runas (str) – The user that the prctl command will be run as

Example:

```
salt '*' parallels.clone macvm macvm_new runas=macdev
salt '*' parallels.clone macvm macvm_templ template=True runas=macdev
```

salt.modules.parallels.delete(name, runas=None)

Delete a VM

New in version 2016.11.0.

Parameters

- name (str) – Name/ID of VM to clone
- runas (str) – The user that the prlctl command will be run as

Example:

```
salt '*' parallels.exec macvm 'find /etc/paths.d' runas=macdev
```

salt.modules.parallels.delete_snapshot(name, snap_name, runas=None, all=False)

Delete a snapshot

Note: Deleting a snapshot from which other snapshots are dervied will not delete the derived snapshots

Parameters

- name (str) – Name/ID of VM whose snapshot will be deleted
- snap_name (str) – Name/ID of snapshot to delete
- runas (str) – The user that the prlctl command will be run as
- all (bool) – Delete all snapshots having the name given

New in version 2016.11.0.
Example:
```
salt '*' parallels.delete_snapshot macvm 'unneeded snapshot' runas=macdev
salt '*' parallels.delete_snapshot macvm 'Snapshot for linked clone' all=True runas=macdev
```

```python
salt.modules.parallels.exec_(name, command, runas=None)
Run a command on a VM
Parameters
- **name** (*str*) – Name/ID of VM whose exec will be returned
- **command** (*str*) – Command to run on the VM
- **runas** (*str*) – The user that the prlctl command will be run as
```
Example:
```
salt '*' parallels.exec macvm 'find /etc/paths.d' runas=macdev
```

```python
salt.modules.parallels.exists(name, runas=None)
Query whether a VM exists
New in version 2016.11.0.
Parameters
- **name** (*str*) – Name/ID of VM
- **runas** (*str*) – The user that the prlctl command will be run as
```
Example:
```
salt '*' parallels.exists macvm runas=macdev
```

```python
salt.modules.parallels.list_snapshots(name, snap_name=None, tree=False, names=False, runas=None)
List the snapshots
Parameters
- **name** (*str*) – Name/ID of VM whose snapshots will be listed
- **snap_id** (*str*) – Name/ID of snapshot to display information about. If 
  **tree**=True is also specified, display the snapshot subtree having this snapshot as 
  the root snapshot
- **tree** (*bool*) – List snapshots in tree format rather than tabular format
- **names** (*bool*) – List snapshots as ID, name pairs
- **runas** (*str*) – The user that the prlctl command will be run as
```
Example:
```
salt '*' parallels.list_snapshots macvm runas=macdev
salt '*' parallels.list_snapshots macvm tree=True runas=macdev
salt '*' parallels.list_snapshots macvm snap_name=original runas=macdev
salt '*' parallels.list_snapshots macvm names=True runas=macdev
```

```python
salt.modules.parallels.list_vms(name=None, info=False, all=False, args=None, runas=None, template=False)
List information about the VMs
Parameters
- **name** (*str*) – Name/ID of VM to list
  Changed in version 2016.11.0: No longer implies **info**=True
- **info** (*str*) – List extra information
- **all** (*bool*) – List all non-template VMs
- **args** (*tuple*) – Additional arguments given to prctl list
- **runas** (*str*) – The user that the prlctl command will be run as
```

21.9. execution modules
- **template**(bool) – List the available virtual machine templates. The real virtual machines will not be included in the output

   New in version 2016.11.0.

   Example:

   ```
   salt '*' parallels.list_vms runas=macdev
   salt '*' parallels.list_vms name=macvm info=True runas=macdev
   salt '*' parallels.list_vms info=True runas=macdev
   salt '*' parallels.list_vms ' -o uuid,status' all=True runas=macdev
   ```

   `salt.modules.parallels.prlctl(sub_cmd, args=None, runas=None)`

   Execute a prlctl command

   Parameters

   - **sub_cmd**(str) – prlctl subcommand to execute
   - **args**(str) – The arguments supplied to prlctl `<sub_cmd>`
   - **runas**(str) – The user that the prlctl command will be run as

   Example:

   ```
   salt '*' parallels.prlctl user list runas=macdev
   salt '*' parallels.prlctl exec 'macvm uname' runas=macdev
   salt -- '*' parallels.prlctl capture 'macvm --file macvm.display.png' runas=macdev
   ```

   `salt.modules.parallels.prlsrvctl(sub_cmd, args=None, runas=None)`

   Execute a prlsrvctl command

   New in version 2016.11.0.

   Parameters

   - **sub_cmd**(str) – prlsrvctl subcommand to execute
   - **args**(str) – The arguments supplied to prlsrvctl `<sub_cmd>`
   - **runas**(str) – The user that the prlsrvctl command will be run as

   Example:

   ```
   salt '*' parallels.prlsrvctl info runas=macdev
   salt '*' parallels.prlsrvctl usb list runas=macdev
   salt -- '*' parallels.prlsrvctl set '--mem-limit auto' runas=macdev
   ```

   `salt.modules.parallels.reset(name, runas=None)`

   Reset a VM by performing a hard shutdown and then a restart

   Parameters

   - **name**(str) – Name/ID of VM to reset
   - **runas**(str) – The user that the prlctl command will be run as

   Example:

   ```
   salt '*' parallels.reset macvm runas=macdev
   ```

   `salt.modules.parallels.restart(name, runas=None)`

   Restart a VM by gracefully shutting it down and then restarting it

   Parameters

   - **name**(str) – Name/ID of VM to restart
   - **runas**(str) – The user that the prlctl command will be run as

   Example:

   ```
   salt '*' parallels.restart macvm runas=macdev
   ```

   `salt.modules.parallels.revert_snapshot(name, snap_name, runas=None)`

   Revert a VM to a snapshot
Parameters

- **name** *(str)* – Name/ID of VM to revert to a snapshot
- **snap_name** *(str)* – Name/ID of snapshot to revert to
- **runas** *(str)* – The user that the prlctl command will be run as

Example:

```bash
salt '*' parallels.revert_snapshot macvm base-with-updates runas=macdev
```

salt.modules.parallels.snapshot*(name, snap_name=None, desc=None, runas=None)*

Create a snapshot

Parameters

- **name** *(str)* – Name/ID of VM to take a snapshot of
- **snap_name** *(str)* – Name of snapshot
- **desc** *(str)* – Description of snapshot
- **runas** *(str)* – The user that the prlctl command will be run as

Example:

```bash
salt '*' parallels.create_snapshot macvm snap_name=macvm-original runas=macdev
salt '*' parallels.create_snapshot macvm snap_name=macvm-updates desc='clean\n\ninstall with updates' runas=macdev
```

salt.modules.parallels.snapshot_id_to_name*(name, snap_id, strict=False, runas=None)*

Attempt to convert a snapshot ID to a snapshot name. If the snapshot has no name or if the ID is not found or invalid, an empty string will be returned

Parameters

- **name** *(str)* – Name/ID of VM whose snapshots are inspected
- **snap_id** *(str)* – ID of the snapshot
- **strict** *(bool)* – Raise an exception if a name cannot be found for the given snap_id
- **runas** *(str)* – The user that the prlctl command will be run as

Example data

```
ID: {a5b8999f-5d95-4aff-82de-e515b0101b66}
Name: original
Date: 2016-03-04 10:50:34
Current: yes
State: poweroff
Description: original state
```

CLI Example:

```bash
salt '*' parallels.snapshot_id_to_name macvm a5b8999f-5d95-4aff-82de-e515b0101b66 runas=macdev
```

salt.modules.parallels.snapshot_name_to_id*(name, snap_name, strict=False, runas=None)*

Attempt to convert a snapshot name to a snapshot ID. If the name is not found an empty string is returned. If multiple snapshots share the same name, a list will be returned

Parameters

- **name** *(str)* – Name/ID of VM whose snapshots are inspected
- **snap_name** *(str)* – Name of the snapshot
- **strict** *(bool)* – Raise an exception if multiple snapshot IDs are found
- **runas** *(str)* – The user that the prlctl command will be run as

CLI Example:

```bash
salt '*' parallels.snapshot_id_to_name macvm original runas=macdev
```

21.9. execution modules
salt.modules.parallels.start(name, runas=None)
Start a VM
Parameters
- **name** *(str)* – Name/ID of VM to start
- **runas** *(str)* – The user that the prlctl command will be run as
Example:

```shell
salt '*' parallels.start macvm runas=macdev
```

salt.modules.parallels.status(name, runas=None)
Status of a VM
Parameters
- **name** *(str)* – Name/ID of VM whose status will be returned
- **runas** *(str)* – The user that the prlctl command will be run as
Example:

```shell
salt '*' parallels.status macvm runas=macdev
```

salt.modules.parallels.stop(name, kill=False, runas=None)
Stop a VM
Parameters
- **name** *(str)* – Name/ID of VM to stop
- **kill** *(bool)* – Perform a hard shutdown
- **runas** *(str)* – The user that the prlctl command will be run as
Example:

```shell
salt '*' parallels.stop macvm runas=macdev
salt '*' parallels.stop macvm kill=True runas=macdev
```

**21.9.310 salt.modules.parted_partition**

Module for managing partitions on POSIX-like systems.

**depends**

- parted, partprobe, lsblk (usually parted and util-linux packages)

Some functions may not be available, depending on your version of parted.
Check the manpage for parted(8) for more information, or the online docs at:

In light of parted not directly supporting partition IDs, some of this module has been written to utilize sfdisk instead. For further information, please reference the man page for sfdisk(8).

salt.modules.parted_partition.align_check(device, part_type, partition)
Check if partition satisfies the alignment constraint of part_type. Type must be "minimal" or "optimal".

CLI Example:

```shell
salt '*' partition.align_check /dev/sda minimal 1
```

salt.modules.parted_partition.check(device, minor)
Checks if the file system on partition <minor> has any errors.

CLI Example:
salt '*' partition.check

salt.modules.parted_partition.cp(device, from_minor, to_minor)
Copies the file system on the partition <from-minor> to partition <to-minor>, deleting the original contents of the destination partition.

CLI Example:
salt '*' partition.cp /dev/sda 2 3

salt.modules.parted_partition.exists(device=)
Check to see if the partition exists

CLI Example:
salt '*' partition.exists /dev/sdb1

salt.modules.parted_partition.get_block_device()
Retrieve a list of disk devices

New in version 2014.7.0.

CLI Example:
salt '*' partition.get_block_device

salt.modules.parted_partition.get_id(device, minor)
Prints the system ID for the partition. Some typical values are:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>b</td>
<td>FAT32 (vfat)</td>
</tr>
<tr>
<td>7</td>
<td>HPFS/NTFS</td>
</tr>
<tr>
<td>82</td>
<td>Linux Swap</td>
</tr>
<tr>
<td>83</td>
<td>Linux</td>
</tr>
<tr>
<td>8e</td>
<td>Linux LVM</td>
</tr>
<tr>
<td>fd</td>
<td>Linux RAID Auto</td>
</tr>
</tbody>
</table>

CLI Example:
salt '*' partition.get_id /dev/sda 1

salt.modules.parted_partition.list_(device, unit=None)
Prints partition information of given <device>

CLI Examples:
salt '*' partition.list /dev/sda
salt '*' partition.list /dev/sda unit=s
salt '*' partition.list /dev/sda unit=kB

salt.modules.parted_partition.mkfs(device, fs_type)
Makes a file system <fs_type> on partition <device>, destroying all data that resides on that partition. <fs_type> must be one of "ext2", "fat32", "fat16", "linux-swap" or "reiserfs" (if libreiserfs is installed)

CLI Example:
salt '*' partition.mkfs /dev/sda2 fat32

salt.modules.parted_partition.mklabe(label, label_type)
Create a new disklabel (partition table) of label_type.

21.9. execution modules
Type should be one of "aix", "amiga", "bsd", "dvh", "gpt", "loop", "mac", "msdos", "pc98", or "sun".

CLI Example:

```bash
salt '*' partition.mklabel /dev/sda msdos
```

salt.modules.parted_partition.mkpart(devicename, part_type, fs_type=ns, start=None, end=None)

Make a part_type partition for filesystem fs_type, beginning at start and ending at end (by default in megabytes). part_type should be one of "primary", "logical", or "extended".

CLI Examples:

```bash
salt '*' partition.mkpart /dev/sda primary fs_type=fat32 start=0 end=639
salt '*' partition.mkpart /dev/sda primary start=0 end=639
```

salt.modules.parted_partition.mkpartfs(devicename, part_type, fs_type, start, end)

Make a <part_type> partition with a new filesystem of <fs_type>, beginning at <start> and ending at <end> (by default in megabytes).

<part_type> should be one of "primary", "logical", or "extended". <fs_type> must be one of "ext2", "fat32", "fat16", "linux-swap" or "reiserfs" (if libreiserfs is installed)

CLI Example:

```bash
salt '*' partition.mkpartfs /dev/sda logical ext2 440 670
```

salt.modules.parted_partition.name(devicename, partition, name)

Set the name of partition to name. This option works only on Mac, PC98, and GPT disklabels. The name can be placed in quotes, if necessary.

CLI Example:

```bash
salt '*' partition.name /dev/sda 1 'My Documents'
```

salt.modules.parted_partition.probe(devices)

Ask the kernel to update its local partition data. When no args are specified all block devices are tried.

Caution: Generally only works on devices with no mounted partitions and may take a long time to return if specified devices are in use.

CLI Examples:

```bash
salt '*' partition.probe
salt '*' partition.probe /dev/sda
salt '*' partition.probe /dev/sda /dev/sdb
```

salt.modules.parted_partition.rescue(devicename, start, end)

Rescue a lost partition that was located somewhere between start and end. If a partition is found, parted will ask if you want to create an entry for it in the partition table.

CLI Example:

```bash
salt '*' partition.rescue /dev/sda 0 8056
```

salt.modules.parted_partition.resize(devicename, minor, start, end)

Resizes the partition with number <minor>.

The partition will start <start> from the beginning of the disk, and end <end> from the beginning of the disk. resize never changes the minor number. Extended partitions can be resized, so long as the new extended partition completely contains all logical partitions.
salt.modules.parted_partition.rm(device, minor)
Removes the partition with number <minor>.
CLI Example:
salt '*' partition.rm /dev/sda 5

salt.modules.parted_partition.set_(device, minor, flag, state)
Changes a flag on the partition with number <minor>.
A flag can be either "on" or "off" (make sure to use proper quoting, see YAML Idiosyncrasies). Some or all of these flags will be available, depending on what disk label you are using. Valid flags are: bios_grub, legacy_boot, boot, lba, root, swap, hidden, raid, LVM, PALO, PREP, DIAG
CLI Example:
salt '*' partition.set /dev/sda 1 boot "on"

salt.modules.parted_partition.set_id(device, minor, system_id)
Sets the system ID for the partition. Some typical values are:

- b: FAT32 (vfat)
- 7: HPFS/NTFS
- 82: Linux Swap
- 83: Linux
- 8e: Linux LVM
- fd: Linux RAID Auto

CLI Example:
salt '*' partition.set_id /dev/sda 1 83

salt.modules.parted_partition.system_types()
List the system types that are supported by the installed version of sfdisk
CLI Example:
salt '*' partition.system_types

salt.modules.parted_partition.toggle(device, partition, flag)
Toggle the state of <flag> on <partition>. Valid flags are the same as the set command.
CLI Example:
salt '*' partition.toggle /dev/sda 1 boot

21.9.311 salt.modules.pcs module

Configure a Pacemaker/Corosync cluster with PCS

Configure Pacemaker/Corosync clusters with the Pacemaker/Corosync configuration system (PCS)

depends pcs
New in version 2016.3.0.
**salt.modules.pcs.auth** *(nodes, pcsuser='hacluster', pcspasswd='hacluster', extra_args=None)*

Authorize nodes to the cluster

- **nodes** a list of nodes which should be authorized to the cluster
- **pcsuser** user for communication with PCS (default: hacluster)
- **pcspasswd** password for pcsuser (default: hacluster)
- **extra_args** list of extra option for the 'pcs cluster auth' command

CLI Example:

```
salt '*' pcs.auth nodes='[ node1.example.org node2.example.org ]'
  --pcsuser=hacluster pcspasswd=hoonetorg extra_args=[ '('--force' )]
```

**salt.modules.pcs.cib_create** *(cibfile, scope='configuration', extra_args=None)*

Create a CIB-file from the current CIB of the cluster

- **cibfile** name/path of the file containing the CIB
- **scope** specific section of the CIB (default: configuration)
- **extra_args** additional options for creating the CIB-file

CLI Example:

```
salt '*' pcs.cib_create cibfile='/tmp/VIP_apache_1.cib' scope=False
```

**salt.modules.pcs.cib_push** *(cibfile, scope='configuration', extra_args=None)*

Push a CIB-file as the new CIB to the cluster

- **cibfile** name/path of the file containing the CIB
- **scope** specific section of the CIB (default: configuration)
- **extra_args** additional options for creating the CIB-file

CLI Example:

```
salt '*' pcs.cib_push cibfile='/tmp/VIP_apache_1.cib' scope=False
```

**salt.modules.pcs.cluster_node_add** *(node, extra_args=None)*

Add a node to the pacemaker cluster via pcs command

- **node** node that should be added
- **extra_args** list of extra option for the 'pcs cluster node add' command

CLI Example:

```
salt '*' pcs.cluster_node_add node=node2.example.org
```

**salt.modules.pcs.cluster_setup** *(nodes, pcsclustername='pcscluster', extra_args=None)*

Setup pacemaker cluster via pcs command

- **nodes** a list of nodes which should be set up
- **pcsclustername** Name of the Pacemaker cluster (default: pcscluster)
- **extra_args** list of extra option for the 'pcs cluster setup' command

CLI Example:

```
salt '*' pcs.cluster_setup nodes='[ node1.example.org node2.example.org ]'
  --pcsclustername=pcscluster
```

**salt.modules.pcs.config_show** *(cibfile=None)*

Show config of cluster

- **cibfile** name/path of the file containing the CIB

CLI Example:

```
salt '*' pcs.config_show cibfile='/tmp/cib_for_galera'
```

**salt.modules.pcs.is_auth** *(nodes)*

Check if nodes are already authorized
nodes a list of nodes to be checked for authorization to the cluster

CLI Example:

```bash
salt '*' pcs.is_auth nodes='[node1.example.org node2.example.org]'
```

salt.modules.pcs.item_create(item, item_id, item_type, create='create', extra_args=None, cibfile=None)

Create an item via pcs command (mainly for use with the pcs state module)
- **item**: config, property, resource, constraint etc.
- **item_id**: id of the item
- **item_type**: item type
- **create**: create command (create or set f.e., default: create)
- **extra_args**: additional options for the pcs command
- **cibfile**: use cibfile instead of the live CIB

CLI Example:

```bash
salt '*' pcs.item_create item=config, item_id='node1', item_type='cluster', create='create',
cibfile='/tmp/2_node_cluster.cib'
```

salt.modules.pcs.item_show(item, item_id=None, item_type=None, show='show', extra_args=None, cibfile=None)

Show an item via pcs command (mainly for use with the pcs state module)
- **item**: config, property, resource, constraint etc.
- **item_id**: id of the item
- **item_type**: item type
- **show**: show command (probably None, default: show)
- **extra_args**: additional options for the pcs command
- **cibfile**: use cibfile instead of the live CIB

CLI Example:

```bash
salt '*' pcs.item_show item='node1', cibfile='/tmp/2_node_cluster.cib'
```

salt.modules.pcs.prop_set(prop, value, extra_args=None, cibfile=None)

Set the value of a cluster property
- **prop**: name of the property
- **value**: value of the property
- **extra_args**: additional options for the pcs property command
- **cibfile**: use cibfile instead of the live CIB

CLI Example:

```bash
salt '*' pcs.prop_set prop='no-quorum-policy' value='ignore' cibfile='/tmp/2_node_cluster.cib'
```

salt.modules.pcs.prop_show(prop, extra_args=None, cibfile=None)

Show the value of a cluster property
- **prop**: name of the property
- **extra_args**: additional options for the pcs property command
- **cibfile**: use cibfile instead of the live CIB

CLI Example:

```bash
salt '*' pcs.prop_show cibfile='/tmp/2_node_cluster.cib' prop='no-quorum-policy'
```

salt.modules.pcs.resource_create(resource_id, resource_type, resource_options=None, cibfile=None)

Create a resource via pcs command
- **resource_id**: name for the resource
- **resource_type**: resource type (f.e. ocf:heartbeat:IPaddr2 or VirtualIP)
- **resource_options**: additional options for creating the resource
- **cibfile**: use cibfile instead of the live CIB for manipulation

CLI Example:
salt '*' pcs.resource_create resource_id='galera' resource_type=``ocf:heartbeat:galera`` resource_options=['wsrep_cluster_address=gcomm://node1.example.org,node2.example.org,node3.example.org', '--master'] cibfile='/tmp/cib_for_galera.cib'

salt.modules.pcs.resource_show(resource_id, extra_args=None, cibfile=None)
Show a resource via pcs command
resource_id name of the resource
extra_args additional options for the pcs command
cibfile use cibfile instead of the live CIB
CLI Example:
salt '*' pcs.resource_show resource_id='galera' cibfile='/tmp/cib_for_galera.cib'

salt.modules.pcs.stonith_create(stonith_id, stonith_device_type, stonith_device_options=None, cibfile=None)
Create a stonith resource via pcs command
stonith_id name for the stonith resource
stonith_device_type name of the stonith agent fence_eps, fence_xvm f.e.
stonith_device_options additional options for creating the stonith resource
cibfile use cibfile instead of the live CIB for manipulation
CLI Example:
salt '*' pcs.stonith_create stonith_id='eps_fence' stonith_device_type='fence_eps'
stonith_device_options=['pcmk_host_map=node1.example.org:01;node2.example.org:02', 'ipaddr=myepsdevice.example.org', 'action=reboot', 'power_wait=5', 'verbose=1', 'debug=/var/log/pcsd/eps_fence.log', 'login=hidden', 'passwd=hoonetorg'] cibfile='/tmp/cib_for_stonith.cib'

salt.modules.pcs.stonith_show(stonith_id, extra_args=None, cibfile=None)
Show the value of a cluster stonith
stonith_id name for the stonith resource
extra_args additional options for the pcs stonith command
cibfile use cibfile instead of the live CIB
CLI Example:
salt '*' pcs.stonith_show stonith_id='eps_fence' cibfile='/tmp/2_node_cluster.cib'

21.9.312 salt.modules.pdbedit

Manage accounts in Samba’s passdb using pdbedit

maintainer Jorge Schrauwen <sjorge@blackdot.be>
maturity new
platform posix
New in version 2017.7.0.
salt.modules.pdbedit.create(login, password, password_hashed=False, machine_account=False)
Create user account
login [string] login name
password [string] password
password_hashed [boolean] set if password is a nt hash instead of plain text
machine_account [boolean] set to create a machine trust account instead
CLI Example:
```
salt '*' pdbedit.create zoe 9764951149F84E770889011E1DC4A927 nhash
salt '*' pdbedit.create river 1sw4ll0w3d4bug
```

`salt.modules.pdbedit.delete(login)`
Delete user account
- `login` [string] login name

CLI Example:
```
salt '*' pdbedit.delete wash
```

`salt.modules.pdbedit.generate_nt_hash(password)`
Generate a NT HASH

CLI Example:
```
salt '*' pdbedit.generate_nt_hash my_passwd
```

`salt.modules.pdbedit.get_user(login, hashes=False)`
Get user account details
- `login` [string] login name
- `hashes` [boolean] include NTHASH and LMHASH in verbose output

CLI Example:
```
salt '*' pdbedit.get kaylee
```

`salt.modules.pdbedit.list_users( verbose=True, hashes=False)`
List user accounts
- `verbose` [boolean] return all information
- `hashes` [boolean] include NT HASH and LM HASH in verbose output

CLI Example:
```
salt '*' pdbedit.list
```

`salt.modules.pdbedit.modify(login, password=None, password_hashed=False, domain=None, profile=None, script=None, drive=None, homedir=None, fullname=None, account_desc=None, account_control=None, machine_sid=None, user_sid=None, reset_login_hours=False, reset_bad_password_count=False)`
Modify user account
- `login` [string] login name
- `password` [string] password
- `password_hashed` [boolean] set if password is a nt hash instead of plain text
- `domain` [string] users domain
- `profile` [string] profile path
- `script` [string] logon script
- `drive` [string] home drive
- `homedir` [string] home directory
- `fullname` [string] full name
- `account_desc` [string] account description
- `machine_sid` [string] specify the machines new primary group SID or rid
- `user_sid` [string] specify the users new primary group SID or rid
- `account_control` [string] specify user account control properties

**Note:** Only the following can be set: - N: No password required - D: Account disabled - H: Home
directory required - L: Automatic Locking - X: Password does not expire

reset_login_hours [boolean] reset the users allowed logon hours
reset_bad_password_count [boolean] reset the stored bad login counter

Note: if user is absent and password is provided, the user will be created

CLI Example:

```
salt '*' pdbedit.modify inara fullname='Inara Serra'
salt '*' pdbedit.modify simon password=r1v3r
salt '*' pdbedit.modify jane drive='V:' homedir='\serenity\jane\profile'
salt '*' pdbedit.modify mal account_control='NX'
```

21.9.313 salt.modules.pecl

Manage PHP pecl extensions.

salt.modules.pecl.install(pecls, defaults=False, force=False, preferred_state='stable')

New in version 0.17.0.

Installs one or several pecl extensions.

* pecls: The pecl extensions to install.
* defaults: Use default answers for extensions such as pecl_http which ask questions before installation. Without this option, the pecl.installed state will hang indefinitely when trying to install these extensions.
* force: Whether to force the installed version or not

CLI Example:

```
salt '*' pecl.install fuse
```

salt.modules.pecl.list_(channel=None)

List installed pecl extensions.

CLI Example:

```
salt '*' pecl.list
```

salt.modules.pecl.uninstall(pecls)

Uninstall one or several pecl extensions.

* pecls: The pecl extensions to uninstall.

CLI Example:

```
salt '*' pecl.uninstall fuse
```

salt.modules.pecl.update(pecls)

Update one or several pecl extensions.

* pecls: The pecl extensions to update.

CLI Example:

```
salt '*' pecl.update fuse
```

21.9.314 salt.modules.peeringdb module
PeeringDB Module

New in version 2019.2.0.

Execution module for the basic interaction with the PeeringDB API.

While for GET operations (the functions prefixed by `get_`) the credentials are optional, there are some specific details that are visible only to authenticated users. Moreover, the credentials are required when adding or updating information. That means, the module can equally work out of the box without any further configuration with the limitations imposed by the PeeringDB API.

For complete API documentation, please refer to [https://www.peeringdb.com/apidocs/](https://www.peeringdb.com/apidocs/).

Configuration (in the opts or Pillar):

```
peeringdb:
    username: salt
    password: 5@1t
```

salt.modules.peeringdb.get_fac(**kwargs)

Return the details of the facility identified using the search filters specified in the query.

**Note:** If no `id` or filter arguments are specified, it will return all the possible facilities registered in PeeringDB.

The available filters are documented at: [https://www.peeringdb.com/apidocs/#!/netfac/netfac_list](https://www.peeringdb.com/apidocs/#!/netfac/netfac_list)

CLI Example:

```
salt '*' peeringdb.get_fac id=1774
salt '*' peeringdb.get_fac state=UT
```

salt.modules.peeringdb.get_ix(**kwargs)

Return the details of an IX (Internet Exchange) using the search filters specified in the query.

**Note:** If no `id` or filter arguments are specified, it will return all the possible IXs registered in PeeringDB.

The available filters are documented at: [https://www.peeringdb.com/apidocs/#!/ix/ix_list](https://www.peeringdb.com/apidocs/#!/ix/ix_list)

CLI Example:

```
salt '*' peeringdb.get_ix id=1
salt '*' peeringdb.get_ix city='Milwaukee'
```

salt.modules.peeringdb.get_ixfac(**kwargs)

Return the details of an IX (Internet Exchange) facility using the search filters specified in the query.

**Note:** If no `id` or filter arguments are specified, it will return all the possible IX facilities registered in PeeringDB.

The available filters are documented at: [https://www.peeringdb.com/apidocs/#!/ixfac/ixfac_list](https://www.peeringdb.com/apidocs/#!/ixfac/ixfac_list)

CLI Example:

```
salt '*' peeringdb.get_ixfac id=1
salt '*' peeringdb.get_ixfac city='Milwaukee'
```
salt.modules.peeringdb.get_ixlan(**kwargs)
Return the details of an IX (Internet Exchange) together with the networks available in this location (and their
details), using the search filters specified in the query.

Note: If no `id` or filter arguments are specified, it will return all the possible IX LAN facilities registered in
PeeringDB.

The available filters are documented at: https://www.peeringdb.com/apidocs/#!/ixlan/ixlan_list

CLI Example:
```
salt '*' peeringdb.get_ixlan id=780
salt '*' peeringdb.get_ixlan city='Milwaukee'
```

salt.modules.peeringdb.get_ixpfx(**kwargs)
Return the details of an IX (Internet Exchange) together with the PeeringDB IDs of the networks available in
this location, using the search filters specified in the query.

Note: If no `id` or filter arguments are specified, it will return all the possible IX LAN facilities registered in
PeeringDB.

The available filters are documented at: https://www.peeringdb.com/apidocs/#!/ixpfx/ixpfx_list

CLI Example:
```
salt '*' peeringdb.get_ixpfx id=780
salt '*' peeringdb.get_ixpfx city='Milwaukee'
```

salt.modules.peeringdb.get_net(**kwargs)
Return the details of a network identified using the search filters specified in the query.

Note: If no `id` or filter arguments are specified, it will return all the possible networks registered in PeeringDB.

The available filters are documented at: https://www.peeringdb.com/apidocs/#!/net/net_list

CLI Example:
```
salt '*' peeringdb.get_net id=4224
salt '*' peeringdb.get_net asn=13335
salt '*' peeringdb.get_net city='Salt Lake City'
salt '*' peeringdb.get_net name__startswith=GTT
```

salt.modules.peeringdb.get_netfac(**kwargs)
Return the list of facilities used by a particular network, given the `id` or other filters specified in the query.

Note: If no `id` or filter arguments are specified, it will return all the possible network facilities registered in
PeeringDB.

The available filters are documented at: https://www.peeringdb.com/apidocs/#!/netfac/netfac_list

CLI Example:
salt '***' peeringdb.get_netfac id=780
salt '***' peeringdb.get_netfac city='Milwaukee'

```
salt.modules.peeringdb.get_netixlan(**kwargs)
```

Return the IP addresses used by a particular network at all the IXs where it is available. The network is selected either via the id argument or the other filters specified in the query.

**Note:** If no id or filter arguments are specified, it will return all the possible IP addresses, of all networks, at all IXs, registered in PeeringDB.

The available filters are documented at: https://www.peeringdb.com/apidocs/#!/netixlan/netixlan_list

**CLI Example:**

```
salt '***' peeringdb.get_netixlan asn=13335
salt '***' peeringdb.get_netixlan ipaddr4=185.1.114.25
```

salt.modules.peeringdb.get_org(**kwargs)

Return the details of an organisation together with the networks available in this location, using the search filters specified in the query.

**Note:** If no id or filter arguments are specified, it will return all the possible organisations registered in PeeringDB.

The available filters are documented at: https://www.peeringdb.com/apidocs/#!/org/org_list

**CLI Example:**

```
salt '***' peeringdb.get_org id=2
salt '***' peeringdb.get_org city=Duesseldorf
```

salt.modules.peeringdb.get_poc(**kwargs)

Return the details of a person of contact together using the search filters specified in the query.

**Note:** If no id or filter arguments are specified, it will return all the possible contacts registered in PeeringDB.

The available filters are documented at: https://www.peeringdb.com/apidocs/#!/poc/poc_list

**CLI Example:**

```
salt '***' peeringdb.get_poc id=6721
salt '***' peeringdb.get_poc email__contains='@cloudflare.com'
```

### 21.9.3.15 salt.modules.pf

Control the OpenBSD packet filter (PF).

**codeauthor** Jasper Lievisse Adriaanse <<j@jasper.la>>

New in version 2019.2.0.

```
salt.modules.pf.disable()
```

Disable the Packet Filter.
**salt.modules.pf.enable()**
Enable the Packet Filter.

CLI example:
```
salt '*' pf.enable
```

**salt.modules.pf.flush**(modifier)
Flush the specified packet filter parameters.

modifier: Should be one of the following:
- all
- info
- osfp
- rules
- sources
- states
- tables

Please refer to the OpenBSD pfctl(8) documentation for a detailed explanation of each command.

CLI example:
```
salt '*' pf.flush states
```

**salt.modules.pf.load**(file='/etc/pf.conf', noop=False)
Load a ruleset from the specific file, overwriting the currently loaded ruleset.

file: Full path to the file containing the ruleset.
noop: Don’t actually load the rules, just parse them.

CLI example:
```
salt '*' pf.load /etc/pf.conf.d/lockdown.conf
```

**salt.modules.pf.loglevel**(level)
Set the debug level which limits the severity of log messages printed by pf(4).

level: Log level. Should be one of the following: emerg, alert, crit, err, warning, notice, info or debug.

CLI example:
```
salt '*' pf.loglevel emerg
```

**salt.modules.pf.show**(modifier)
Show filter parameters.

modifier: Modifier to apply for filtering. Only a useful subset of what pfctl supports can be used with Salt.
- rules
- states
- tables

CLI example:
```
salt '*' pf.show rules
```

**salt.modules.pf.table**(command, table, **kwargs)
Apply a command on the specified table.

command: Command to apply to the table. Supported commands are:
- add
• delete
• expire
• flush
• kill
• replace
• show
• test
• zero

Please refer to the OpenBSD *pfctl(8)* documentation for a detailed explanation of each command.

CLI example:

```
salt '*' pf.table expire table=spam_hosts number=300
salt '*' pf.table add table=local_hosts addresses='["127.0.0.1", ":1"]'
```

### 21.9.316 salt.modules.philips_hue module

Philips HUE lamps module for proxy.

New in version 2015.8.3.

### 21.9.317 salt.modules.pillar

Extract the pillar data for this minion

salt.modules.pillar.ext(*external*, *pillar=None*)

Changed in version 2016.3.6, 2016.11.3, 2017.7.0: The supported ext_pillar types are now tunable using the on_demand_ext_pillar config option. Earlier releases used a hard-coded default.

Generate the pillar and apply an explicit external pillar

**external** A single ext_pillar to add to the ext_pillar configuration. This must be passed as a single section from the ext_pillar configuration (see CLI examples below). For more complicated ext_pillar configurations, it can be helpful to use the Python shell to load YAML configuration into a dictionary, and figure out

```python
>>> import salt.utils.yaml
>>> ext_pillar = salt.utils.yaml.safe_load(""
... ext_pillar:
... - git:
... - issue38440 https://github.com/terminalmage/git_pillar:
... - env: base
... ""

``` excite="true" class="highlighter-rouge">
```
```

In the above example, the value to pass would be `{"git": [{"mybranch https://github.com/myuser/myrepo": [{"env": 'base']}]}]}`. Note that this would need to be quoted when passing on the CLI (as in the CLI examples below).

**pillar** [None] If specified, allows for a dictionary of pillar data to be made available to pillar and ext_pillar rendering. These pillar variables will also override any variables of the same name in pillar or ext_pillar.

New in version 2015.5.0.

CLI Examples:
### pillar.fetch

`salt.modules.pillar.fetch(key, default=<class 'KeyError'>, merge=False, merge_nested_lists=None, delimiter=':', pillarenv=None, saltenv=None)`

New in version 0.14.

Attempt to retrieve the named value from in-memory pillar data. If the pillar key is not present in the in-memory pillar, then the value specified in the default option (described below) will be returned.

If the merge parameter is set to True, the default will be recursively merged into the returned pillar data.

The value can also represent a value in a nested dict using a ":" delimiter for the dict. This means that if a dict in pillar looks like this:

```python
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the `apache` key in the `pkg` dict this key can be passed as:

```python
pkg:apache
```

**key**  The pillar key to get value from

**default**  The value specified by this option will be returned if the desired pillar key does not exist.

If a default value is specified, then it will be an empty string, unless `pillar_raise_on_missing` is set to True, in which case an error will be raised.

**merge**  If True, the retrieved values will be merged into the passed default. When the default and the retrieved value are both dictionaries, the dictionaries will be recursively merged.

New in version 2014.7.0.

Changed in version 2016.3.7, 2016.11.4, 2017.7.0: If the default and the retrieved value are not of the same type, then merging will be skipped and the retrieved value will be returned. Earlier releases raised an error in these cases.

**merge_nested_lists**  If set to False, lists nested within the retrieved pillar dictionary will overwrite lists in default. If set to True, nested lists will be merged into lists in default. If unspecified (the default), this option is inherited from the `pillar_merge_lists` minion config option.

**Note:**  This option is ignored when `merge` is set to False.

New in version 2016.11.6.

**delimiter**  Specify an alternate delimiter to use when traversing a nested dict. This is useful for when the desired key contains a colon. See CLI example below for usage.

New in version 2014.7.0.

**pillarenv**  If specified, this function will query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment. Note that this can produce different pillar data than executing this function without an environment, as its normal behavior is just to return a value from minion’s pillar data in memory (which can be sourced from more than one pillar environment).

Using this argument will not affect the pillar data in memory. It will however be slightly slower and use more resources on the master due to the need for the master to generate and send the minion fresh pillar data. This tradeoff in performance however allows for the use case where pillar data is desired only from a single environment.

New in version 2017.7.0.
saltenv  Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.

New in version 2017.7.0.

CLI Example:

```
salt '*' pillar.get pkg:apache
salt '*' pillar.get abc::def|ghi delimiter='|'
```

**salt.modules.pillar.file_exists**(path, saltenv=None)

New in version 2016.3.0.

This is a master-only function. Calling from the minion is not supported.

Use the given path and search relative to the pillar environments to see if a file exists at that path.

If the saltenv argument is given, restrict search to that environment only.

Will only work with pillar_roots, not external pillars.

Returns True if the file is found, and False otherwise.

**path** The path to the file in question. Will be treated as a relative path

**saltenv** Optional argument to restrict the search to a specific saltenv

CLI Example:

```
salt '*' pillar.file_exists foo/bar.sls
```

**salt.modules.pillar.filter_by**(lookup_dict, pillar, merge=None, default='default', base=None)

New in version 2017.7.0.

Look up the given pillar in a given dictionary and return the result

**Parameters**

- **lookup_dict** – A dictionary, keyed by a pillar, containing a value or values relevant to systems matching that pillar. For example, a key could be a pillar for a role and the value could the name of a package on that particular OS.

  The dictionary key can be a globbing pattern. The function will return the corresponding lookup_dict value where the pillar value matches the pattern. For example:

  ```
  # this will render 'got some salt' if `role` begins with
  # 'salt'
  salt '*' pillar.filter_by '{salt*: got some salt, default:if
  # salt is not here} role
  ```

- **pillar** – The name of a pillar to match with the system’s pillar. For example, the value of the "role" pillar could be used to pull values from the lookup_dict dictionary.

  The pillar value can be a list. The function will return the lookup_dict value for a first found item in the list matching one of the lookup_dict keys.

- **merge** – A dictionary to merge with the results of the pillar selection from lookup_dict. This allows another dictionary to override the values in the lookup_dict.

- **default** – default lookup_dict’s key used if the pillar does not exist or if the pillar value has no match on lookup_dict. If unspecified the value is "default".

- **base** – A lookup_dict key to use for a base dictionary. The pillar-selected lookup_dict is merged over this and then finally the merge dictionary is merged. This allows common values for each case to be collected in the base and overridden by the pillar selection dictionary and the merge dictionary. Default is unset.

CLI Example:
salt 'x' pillar.filter_by '{web: Serve it up, db: I query, default: x_x}' role

salt.modules.pillar.get(key, default=<class 'KeyError'>, merge=False, merge_nested_lists=None, delimiter=':', pillarenv=None, saltenv=None)

New in version 0.14.

Attempt to retrieve the named value from in-memory pillar data. If the pillar key is not present in the in-memory pillar, then the value specified in the default option (described below) will be returned.

If the merge parameter is set to True, the default will be recursively merged into the returned pillar data.

The value can also represent a value in a nested dict using a ":" delimiter for the dict. This means that if a dict in pillar looks like this:

```json
{"pkg": {"apache": 'httpd'}}
```

To retrieve the value associated with the apache key in the pkg dict this key can be passed as:

```
pkg:apache
```

**key** The pillar key to get value from

**default** The value specified by this option will be returned if the desired pillar key does not exist.

If a default value is specified, then it will be an empty string, unless pillar.raise_on_missing is set to True, in which case an error will be raised.

**merge** [False] If True, the retrieved values will be merged into the passed default. When the default and the retrieved value are both dictionaries, the dictionaries will be recursively merged.

New in version 2014.7.0.

Changed in version 2016.3.7,2016.11.4,2017.7.0: If the default and the retrieved value are not of the same type, then merging will be skipped and the retrieved value will be returned. Earlier releases raised an error in these cases.

**merge_nested_lists** If set to False, lists nested within the retrieved pillar dictionary will overwrite lists in default. If set to True, nested lists will be merged into lists in default. If unspecified (the default), this option is inherited from the pillar_merge_lists minion config option.

**Note:** This option is ignored when merge is set to False.

New in version 2016.11.6.

**delimiter** Specify an alternate delimiter to use when traversing a nested dict. This is useful for when the desired key contains a colon. See CLI example below for usage.

New in version 2014.7.0.

**pillarenv** If specified, this function will query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment. Note that this can produce different pillar data than executing this function without an environment, as its normal behavior is just to return a value from minion’s pillar data in memory (which can be sourced from more than one pillar environment).

Using this argument will not affect the pillar data in memory. It will however be slightly slower and use more resources on the master due to the need for the master to generate and send the minion fresh pillar data. This tradeoff in performance however allows for the use case where pillar data is desired only from a single environment.

New in version 2017.7.0.

**saltenv** Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.

New in version 2017.7.0.
CLI Example:

```
salt '*' pillar.get pkg:apache
salt '*' pillar.get abc::def|ghi delimiter='|'
```

```
salt.modules.pillar.item('args,'*kwargs')
```

New in version 0.16.2.

Return one or more pillar entries from the in-memory pillar data.

**delimiter**  
Delimiter used to traverse nested dictionaries.

**Note:** This is different from `pillar.get` in that no default value can be specified. `pillar.get` should probably still be used in most cases to retrieve nested pillar values, as it is a bit more flexible. One reason to use this function instead of `pillar.get` however is when it is desirable to retrieve the values of more than one key, since `pillar.get` can only retrieve one key at a time.

New in version 2015.8.0.

**pillarenv**  
If specified, this function will query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment. Note that this can produce different pillar data than executing this function without an environment, as its normal behavior is just to return a value from minion’s pillar data in memory (which can be sourced from more than one pillar environment).

Using this argument will not affect the pillar data in memory. It will however be slightly slower and use more resources on the master due to the need for the master to generate and send the minion fresh pillar data. This tradeoff in performance however allows for the use case where pillar data is desired only from a single environment.

New in version 2017.7.6, 2018.3.1.

**saltenv**  
Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

New in version 2017.7.6, 2018.3.1.

CLI Examples:

```
salt '*' pillar.item foo
salt '*' pillar.item foo:bar
salt '*' pillar.item foo bar baz
```

```
salt.modules.pillar.items('args,'*kwargs')
```

Calls the master for a fresh pillar and generates the pillar data on the fly.

Contrast with `raw()` which returns the pillar data that is currently loaded into the minion.

**pillar**  
If specified, allows for a dictionary of pillar data to be made available to pillar and ext_pillar rendering. these pillar variables will also override any variables of the same name in pillar or ext_pillar.

New in version 2015.5.0.

**pillar_enc**  
If specified, the data passed in the pillar argument will be passed through this renderer to decrypt it.

**Note:** This will decrypt on the minion side, so the specified renderer must be set up on the minion for this to work. Alternatively, pillar data can be decrypted master-side. For more information, see the `Pillar Encryption` documentation. Pillar data that is decrypted master-side, is not decrypted until the end of pillar compilation though, so minion-side decryption will be necessary if the encrypted pillar data must be made available in an decrypted state pillar/ext_pillar rendering.

New in version 2017.7.0.
pillarenv  Pass a specific pillar environment from which to compile pillar data. If not specified, then the minion’s `pillarenv` option is not used, and if that also is not specified then all configured pillar environments will be merged into a single pillar dictionary and returned.

New in version 2016.11.2.

**saltenv**  Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

CLI Example:

```
salt '*' pillar.items
```

**salt.modules.pillar.keys(key, delimiter=':')**

New in version 2015.8.0.

Attempts to retrieve a list of keys from the named value from the pillar.

The value can also represent a value in a nested dict using a `:` delimiter for the dict, similar to how pillar.get works.

**delimiter**  Specify an alternate delimiter to use when traversing a nested dict

CLI Example:

```
salt '*' pillar.keys web:sites
```

**salt.modules.pillar.ls(**`*args`**)**

New in version 2015.8.0.

Calls the master for a fresh pillar, generates the pillar data on the fly (same as `items()`), but only shows the available main keys.

CLI Examples:

```
salt '*' pillar.ls
```

**salt.modules.pillar.obfuscate(**`*args`**)**

New in version 2015.8.0.

Same as `items()`, but replace pillar values with a simple type indication.

This is useful to avoid displaying sensitive information on console or flooding the console with long output, such as certificates. For many debug or control purposes, the stakes lie more in dispatching than in actual values.

In case the value is itself a collection type, obfuscation occurs within the value. For mapping types, keys are not obfuscated. Here are some examples:

- `'secret password' becomes '<str>'`
- `['secret', 1] becomes ['<str>', '<int>']`
- `{'login': 'sometlogin', 'pwd': 'secret'}` becomes `{'login': '<str>', 'pwd': '<str>'}`

CLI Examples:
```
salt '*' pillar.obfuscate
```

**salt.modules.pillar.raw(**`key=None`**)**

Return the raw pillar data that is currently loaded into the minion.

Contrast with `items()` which calls the master to fetch the most up-to-date Pillar.

CLI Example:
```
salt '*' pillar.raw
```

---

Chapter 21. Salt Module Reference
With the optional key argument, you can select a subtree of the pillar raw data:

```
salt 'rol' pillar.raw key='roles'
```

### 21.9.318 `salt.modules.pip`

Install Python packages with pip to either the system or a virtualenv

#### Windows Support

New in version 2014.7.4.

Salt now uses a portable python. As a result the entire pip module is now functional on the salt installation itself. You can pip install dependencies for your custom modules. You can even upgrade salt itself using pip. For this to work properly, you must specify the Current Working Directory (`cwd`) and the Pip Binary (`bin_env`) salt should use. The variable `pip_bin` can be either a virtualenv path or the path to the pip binary itself.

For example, the following command will list all software installed using pip to your current salt environment:

```
salt <minion> pip.list cwd='C:\salt\bin\Scripts' bin_env='C:\salt\bin\Scripts\pip.exe'
```

Specifying the `cwd` and `bin_env` options ensures you're modifying the salt environment. If these are omitted, it will default to the local installation of python. If python is not installed locally it will fail saying it couldn't find pip.

#### State File Support

This functionality works in states as well. If you need to pip install colorama with a state, for example, the following will work:

```
install_colorama:
  pip.installed:
    - name: colorama
    - cwd: 'C:\salt\bin\Scripts'
    - bin_env: 'C:\salt\bin\Scripts\pip.exe'
    - upgrade: True
```

#### Upgrading Salt using Pip

You can now update salt using pip to any version from the 2014.7 branch forward. Previous version require recompiling some of the dependencies which is painful in windows.

To do this you just use pip with git to update to the version you want and then restart the service. Here is a sample state file that upgrades salt to the head of the 2015.5 branch:

```
install_salt:
  pip.installed:
    - cwd: 'C:\salt\bin\Scripts'
    - bin_env: 'C:\salt\bin\Scripts\pip.exe'
    - editable: git+https://github.com/saltstack/salt@2015.5#egg=salt
    - upgrade: True

restart_service:
```

(continues on next page)
**service.running:**
- **name:** salt-minion
- **enable:** True
- **watch:**
  - **pip:** install_salt

---

**Note:** If you’re having problems, you might try doubling the back slashes. For example, `cwd: 'C:\salt\bin\scripts'`. Sometimes python thinks the single back slash is an escape character.

---

**salt.modules.pip.freeze**(bin_env=None, user=None, cwd=None, use_vt=False, env_vars=None, **kwargs)

Return a list of installed packages either globally or in the specified virtualenv

bin_env  Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. `/usr/bin/pip-2.7` or `/usr/bin/pip-2.6`). If a directory path is specified, it is assumed to be a virtualenv.

user  The user under which to run pip

**Note:** If the version of pip available is older than 8.0.3, the list will not include the packages `pip`, `wheel`, `setuptools`, or `distribute` even if they are installed.

CLI Example:

salt '*' pip.freeze bin_env=/home/code/path/to/virtualenv

**salt.modules.pip.install**(pkgs=None, requirements=None, bin_env=None, use_wheel=False, no_use_wheel=False, log=None, proxy=None, timeout=None, editable=None, find_links=None, index_url=None, extra_index_url=None, no_index=False, mirrors=None, build=None, target=None, download=None, download_cache=None, source=None, upgrade=False, force_reinstall=False, ignore_installed=False, exists_action=None, no_deps=False, no_install=False, no_download=False, global_options=None, install_options=None, user=None, cwd=None, pre_releases=False, cert=None, allow_all_external=False, allow_external=None, allow_unverified=None, process_dependency_links=False, saltenv='base', env_vars=None, use_vt=False, trusted_host=None, no_cache_dir=False, cache_dir=None, no_binary=False, **kwargs)

Install packages with pip

Install packages individually or from a pip requirements file. Install packages globally or to a virtualenv.

pkgs  Comma separated list of packages to install

requirements  Path to requirements

bin_env  Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. `/usr/bin/pip-2.7` or `/usr/bin/pip-2.6`). If a directory path is specified, it is assumed to be a virtualenv.

**Note:** For Windows, if the pip module is being used to upgrade the pip package, bin_env should be the path to the virtualenv or to the python binary that should be used. The pip command is unable to upgrade itself in Windows.

use_wheel  Prefer wheel archives (requires pip>=1.4)

no_use_wheel  Force to not use wheel archives (requires pip>=1.4,<10.0.0)
**no_binary** Force to not use binary packages (requires pip >= 7.0.0) Accepts either :all: to disable all binary packages, :none: to empty the set, or one or more package names with commas between them

**log** Log file where a complete (maximum verbosity) record will be kept

**proxy** Specify a proxy in the form user:passwd@proxy.server:port. Note that the user:password@ is optional and required only if you are behind an authenticated proxy. If you provide user@proxy.server:port then you will be prompted for a password.

**timeout** Set the socket timeout (default 15 seconds)

**editable** install something editable (e.g. git+https://github.com/worldcompany/djangoembed.git#egg=djangoembed)

**find_links** URL to search for packages

**index_url** Base URL of Python Package Index

**extra_index_url** Extra URLs of package indexes to use in addition to index_url

**no_index** Ignore package index

**mirrors** Specific mirror URL(s) to query (automatically adds –use-mirrors)

---

**Warning:** This option has been deprecated and removed in pip version 7.0.0. Please use index_url and/or extra_index_url instead.

**build** Unpack packages into build dir

**target** Install packages into target dir

**download** Download packages into download dir instead of installing them

**download_cache | cache_dir** Cache downloaded packages in download_cache or cache_dir dir

**source** Check out editable packages into source dir

**upgrade** Upgrade all packages to the newest available version

**force_reinstall** When upgrading, reinstall all packages even if they are already up-to-date.

**ignore_installed** Ignore the installed packages (reinstalling instead)

**exists_action** Default action when a path already exists: (s)witch, (i)gnore, (w)ipe, (b)ackup

**no_deps** Ignore package dependencies

**no_install** Download and unpack all packages, but don’t actually install them

**no_download** Don’t download any packages, just install the ones already downloaded (completes an install run with --no-install)

**install_options** Extra arguments to be supplied to the setup.py install command (e.g. like --install-option='--install-scripts=/usr/local/bin'). Use multiple –install-option options to pass multiple options to setup.py install. If you are using an option with a directory path, be sure to use absolute path.

**global_options** Extra global options to be supplied to the setup.py call before the install command.

**user** The user under which to run pip

**cwd** Directory from which to run pip

**pre_releases** Include pre-releases in the available versions

**cert** Provide a path to an alternate CA bundle

**allow_all_external** Allow the installation of all externally hosted files

**allow_external** Allow the installation of externally hosted files (comma separated list)

**allow_unverified** Allow the installation of insecure and unverifiable files (comma separated list)

**process_dependency_links** Enable the processing of dependency links

**env_vars** Set environment variables that some builds will depend on. For example, a Python C-module may have a Makefile that needs INCLUDE_PATH set to pick up a header file while compiling. This must be in the form of a dictionary or a mapping.

Example:

```bash
salt '*' pip.install django_app env_vars="{'CUSTOM_PATH': '/opt/django_app'}"
```

**trusted_host** Mark this host as trusted, even though it does not have valid or any HTTPS.

**use_vt** Use VT terminal emulation (see output while installing)
no_cache_dir  Disable the cache.

CLI Example:

```
salt '*' pip.install <package name>,<package2 name>
salt '*' pip.install requirements=/path/to/requirements.txt
salt '*' pip.install <package name> bin_env=/path/to/virtualenv
salt '*' pip.install <package name> bin_env=/path/to/pip_bin
```

Complicated CLI example:

```
salt '*' pip.install markdown,django editable=git+https://github.com/worldcompany/djangoembed.git#egg=djangoembed upgrade=True no_deps=True
```

```
salt.modules.pip.is_installed(pkgname=None, bin_env=None, user=None, cwd=None)
```

New in version 2018.3.0.

Filter list of installed apps from `freeze` and return True or False if `pkgname` exists in the list of packages installed.

**Note:** If the version of pip available is older than 8.0.3, the packages wheel, setuptools, and distribute will not be reported by this function even if they are installed. Unlike `pip.freeze`, this function always reports the version of pip which is installed.

CLI Example:

```
salt '*' pip.is_installed salt
```

```
salt.modules.pip.list_(prefix=None, bin_env=None, user=None, cwd=None, env_vars=None, **kwargs)
```

Filter list of installed apps from `freeze` and check to see if `prefix` exists in the list of packages installed.

**Note:** If the version of pip available is older than 8.0.3, the packages wheel, setuptools, and distribute will not be reported by this function even if they are installed. Unlike `pip.freeze`, this function always reports the version of pip which is installed.

CLI Example:

```
salt '*' pip.list salt
```

```
salt.modules.pip.list_all_versions(pkg, bin_env=None, include_alpha=False, include_beta=False, include_rc=False, user=None, cwd=None, index_url=None, extra_index_url=None)
```

New in version 2017.7.3.

List all available versions of a pip package

pkg  The package to check
bin_env  Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. `/usr/bin/pip-2.7` or `/usr/bin/pip-2.6`. If a directory path is specified, it is assumed to be a virtualenv.
include_alpha  Include alpha versions in the list
include_beta  Include beta versions in the list
include_rc  Include release candidates versions in the list
user  The user under which to run pip
cwd  Directory from which to run pip
index_url  Base URL of Python Package Index

2296 Chapter 21. Salt Module Reference
extra_index_url  Additional URL of Python Package Index .. versionadded:: 2019.2.0

CLI Example:

```
salt '*.' pip.list_all_versions <package name>
```

salt.modules.pip.list_upgrades (bin_env=None, user=None, cwd=None)

Check whether or not an upgrade is available for all packages

CLI Example:

```
salt '*.' pip.list_upgrades
```

salt.modules.pip.uninstall (pkgs=None, requirements=None, bin_env=None, log=None, proxy=None, timeout=None, user=None, cwd=None, saltenv='base', use_vt=False)

Uninstall packages individually or from a pip requirements file

- **pkgs** comma separated list of packages to install
- **requirements** Path to requirements file
- **bin_env** Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. /usr/bin/pip-2.7 or /usr/bin/pip-2.6. If a directory path is specified, it is assumed to be a virtualenv.
- **log** Log file where a complete (maximum verbosity) record will be kept
- **proxy** Specify a proxy in the format user:passwd@proxy.server:port. Note that the user:password@ is optional and required only if you are behind an authenticated proxy. If you provide user@proxy.server:port then you will be prompted for a password.
- **timeout** Set the socket timeout (default 15 seconds)
- **user** The user under which to run pip
- **cwd** Directory from which to run pip
- **use_vt** Use VT terminal emulation (see output while installing)

CLI Example:

```
salt '*.' pip.uninstall <package name>,<package2 name>
salt '*.' pip.uninstall requirements=/path/to/requirements.txt
salt '*.' pip.uninstall <package name> bin_env=/path/to/virtualenv
salt '*.' pip.uninstall <package name> bin_env=/path/to/pip_bin
```

salt.modules.pip.upgrade (bin_env=None, user=None, cwd=None, use_vt=False)

New in version 2015.5.0.

Upgrades outdated pip packages.

**Note:** On Windows you can’t update salt from pip using salt, so salt will be skipped

Returns a dict containing the changes.

```
{'<package>': {'old': '<old-version>', 'new': '<new-version>'}}
```

CLI Example:

```
salt '*.' pip.upgrade
```

salt.modules.pip.upgrade_available (pkg, bin_env=None, user=None, cwd=None)

New in version 2015.5.0.

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*.' pip.upgrade_available <package name>
```
salt.modules.pip.version(bin_env=None)

New in version 0.17.0.

Returns the version of pip. Use `bin_env` to specify the path to a virtualenv and get the version of pip in that
virtualenv.

If unable to detect the pip version, returns `None`.

CLI Example:
```
salt '*' pip.version
```

21.9.319 salt.modules.pkg_resource

Resources needed by pkg providers

salt.modules.pkg_resource.add_pkg(pkgs, name, pkgver)

Add a package to a dict of installed packages.

CLI Example:
```
salt '*' pkg_resource.add_pkg '[]' bind 9
```

salt.modules.pkg_resource.check_extra_requirements(pkgnname, pkgver)

Check if the installed package already has the given requirements. This function will return the result of
pkg.check_extra_requirements if this function exists for the minion, otherwise it will return True.

CLI Example:
```
salt '*' pkg_resource.check_extra_requirements <pkgnname> <extra_requirements>
```

salt.modules.pkg_resource.format_pkg_list(packages, versions_as_list, attr)

Formats packages according to parameters for list_pkgs.

salt.modules.pkg_resource.format_version(epoch, version, release)

Formats a version string for list_pkgs.

salt.modules.pkg_resource.pack_sources(sources, normalize=True)

Accepts list of dicts (or a string representing a list of dicts) and packs the key/value pairs into a single dict.

'[
    "foo": "salt://foo.rpm",
    "bar": "salt://bar.rpm"
]' would become

"foo": "salt://foo.rpm",
"bar": "salt://bar.rpm"

New in version 2015.8.0.

CLI Example:
```
salt '*' pkg_resource.pack_sources '[]'
```

salt.modules.pkg_resource.parse_targets(name=None, pkgs=None, sources=None, saltenv='base', normalize=True, **kwargs)

 Parses the input to pkg.install and returns back the package(s) to be installed. Returns a list of packages, as
well as a string noting whether the packages are to come from a repository or a binary package.

CLI Example:
salt '.*' pkg_resource.parse_targets

salt.modules.pkg_resource.sort_pkglist(pkgs)
Accepts a dict obtained from pkg.list_pkgs() and sorts in place the list of versions for any packages that have multiple versions installed, so that two package lists can be compared to one another.

CLI Example:
salt '.*' pkg_resource.sort_pkglist '3.45, 2.13'

salt.modules.pkg_resource.stringify(pkgs)
Takes a dict of package name/version information and joins each list of installed versions into a string.

CLI Example:
salt '.*' pkg_resource.stringify 'vim: 7.127'

salt.modules.pkg_resource.version("names", **kwargs)
Common interface for obtaining the version of installed packages.

CLI Example:
salt '.*' pkg_resource.version vim
salt '.*' pkg_resource.version foo bar baz
salt '.*' pkg_resource.version 'python*'

salt.modules.pkg_resource.version_clean(versstr)
Clean the version string removing extra data. This function will simply try to call pkg.version_clean.

CLI Example:
salt '.*' pkg_resource.version_clean <version_string>

21.9.320 salt.modules.pkgin

Package support for pkgin based systems, inspired from freebsdpkg module

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see here.

salt.modules.pkgin.available_version("names", **kwargs)
This function is an alias of latest_version.
Return the latest version of the named package available for upgrade or installation.
If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:
salt '*1 pkg.latest_version <package name>
salt '*1 pkg.latest_version <package1> <package2> ...

salt.modules.pkgin.file_dict("packages")
List the files that belong to a package.

CLI Examples:
salt.modules.pkgin.file_list(package)
List the files that belong to a package.

CLI Examples:
```
salt '*' pkg.file_list nginx
```

salt.modules.pkgin.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs)
Install the passed package

name The name of the package to be installed.
refresh Whether or not to refresh the package database before installing.
fromrepo Specify a package repository to install from.

Multiple Package Installation Options:

pkgs A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:
```
salt '*' pkg.install pkgs='["foo","bar"]'
```

sources A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:
```
salt '*' pkg.install sources=[{"foo": "salt://foo.deb"},{"bar": "salt://bar.deb"}]'
```

Return a dict containing the new package names and versions:
```
{ '<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:
```
salt '*' pkg.install <package name>
```

salt.modules.pkgin.latest_version(*names, **kwargs)
Return the latest version of the named package available for upgrade or installation.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:
```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> ...
```

salt.modules.pkgin.list_pkgs(versions_as_list=False, **kwargs)
List the packages currently installed as a dict:
```
{ '<package_name>': '<version>'}
```

CLI Example:
```
salt '*' pkg.list_pkgs
```
salt.modules.pkgin.list_upgrades(refresh=True, **kwargs)
List all available package upgrades.
New in version 2018.3.0.

**refresh** Whether or not to refresh the package database before installing.

CLI Example:

```
salt '*' pkg.list_upgrades
```

salt.modules.pkgin.purge(name=None, pkgs=None, **kwargs)
Package purges are not supported, this function is identical to remove().

**name** The name of the package to be deleted.

Multiple Package Options:

- **pkgs** A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

salt.modules.pkgin.refresh_db(force=False)
Use pkg update to get latest pkg_summary

**force** Pass -f so that the cache is always refreshed.

New in version 2018.3.0.

CLI Example:

```
salt '*' pkg.refresh_db
```

salt.modules.pkgin.remove(name=None, pkgs=None, **kwargs)

**name** The name of the package to be deleted.

Multiple Package Options:

- **pkgs** A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a list containing the removed packages.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

salt.modules.pkgin.search(pkg_name)

Searches for an exact match using pkgin ^package$

CLI Example:

```
salt '*' pkg.search 'mysql-server'
```

salt.modules.pkgin.upgrade(refresh=True, pkgs=None, **kwargs)

Run pkg upgrade, if pkgin used. Otherwise do nothing

**refresh** Whether or not to refresh the package database before installing.
Multiple Package Upgrade Options:

pkgs  A list of packages to upgrade from a software repository. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.upgrade pkgs='["foo","bar"]'
```

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>', 'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

**salt.modules.pkgin.version**(*names, **kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

**21.9.321 salt.modules.pkgng**

Support for pkgng, the new package manager for FreeBSD

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see [here](#).

**Warning:** This module has been completely rewritten. Up to and including version 0.17.x, it was available as the pkgng module, (pkgng.install, pkgng.delete, etc.), but moving forward this module will no longer be available as pkgng, as it will behave like a normal Salt pkg provider. The documentation below should not be considered to apply to this module in versions <= 0.17.x. If your minion is running a 0.17.x release or older, then the documentation for this module can be viewed using the `sys.doc` function:

```
salt bsdminion sys.doc pkgng
```

This module provides an interface to `pkg(8)`. It acts as the default package provider for FreeBSD 10 and newer. For FreeBSD hosts which have been upgraded to use pkgng, you will need to override the pkg provider by setting the

**providers** parameter in your Minion config file, in order to use this module to manage packages, like so:

```
providers:
  pkg: pkgng
```

**salt.modules.pkgng.audit**(*jail=None, chroot=None, root=None*)

Audits installed packages against known vulnerabilities

CLI Example:

```
salt '*' pkg.audit
```
jail  Audit packages within the specified jail

CLI Example:

```bash
salt '*' pkg.audit jail=<jail name or id>
```

chroot  Audit packages within the specified chroot (ignored if jail is specified)
root  Audit packages within the specified root (ignored if jail is specified)

CLI Example:

```bash
salt '*' pkg.audit chroot=/path/to/chroot
```

salt.modules.pkgng.autoremove(jail=None, chroot=None, root=None, dryrun=False)
Delete packages which were automatically installed as dependencies and are not required anymore.
dryrun  Dry-run mode. The list of changes to packages is always printed, but no changes are actually made.

CLI Example:

```bash
salt '*' pkg.autoremove
salt '*' pkg.autoremove jail=<jail name or id>
salt '*' pkg.autoremove dryrun=True
dsalt '*' pkg.autoremove jail=<jail name or id> dryrun=True
```

salt.modules.pkgng.backup(file_name, jail=None, chroot=None, root=None)
Export installed packages into yaml+mtree file

CLI Example:

```bash
salt '*' pkg.backup /tmp/pkg
```

jail  Backup packages from the specified jail. Note that this will run the command within the jail, and so the path to the backup file will be relative to the root of the jail

CLI Example:

```bash
salt '*' pkg.backup /tmp/pkg jail=<jail name or id>
```

chroot  Backup packages from the specified chroot (ignored if jail is specified). Note that this will run the command within the chroot, and so the path to the backup file will be relative to the root of the chroot.
root  Backup packages from the specified root (ignored if jail is specified). Note that this will run the command within the root, and so the path to the backup file will be relative to the root of the root.

CLI Example:

```bash
salt '*' pkg.backup /tmp/pkg chroot=/path/to/chroot
```

salt.modules.pkgng.check(jail=None, chroot=None, root=None, depends=False, recompute=False, checksum=False)
Sanity checks installed packages
jail  Perform the sanity check in the specified jail

CLI Example:

```bash
salt '*' pkg.check jail=<jail name or id>
```

chroot  Perform the sanity check in the specified chroot (ignored if jail is specified)
root  Perform the sanity check in the specified root (ignored if jail is specified)

CLI Example:
Of the below, at least one must be set to True.

**depends** Check for and install missing dependencies.

CLI Example:

```
salt '*' pkg.check recompute=True
```

**recompute** Recompute sizes and checksums of installed packages.

CLI Example:

```
salt '*' pkg.check depends=True
```

**checksum** Find invalid checksums for installed packages.

CLI Example:

```
salt '*' pkg.check checksum=True
```

```python
salt.modules.pkgng.clean(jail=None, chroot=None, root=None, clean_all=False, dryrun=False)
```

Cleans the local cache of fetched remote packages.

CLI Example:

```
salt '*' pkg.clean
```

**jail** Cleans the package cache in the specified jail.

CLI Example:

```
salt '*' pkg.clean jail=<jail name or id>
```

**chroot** Cleans the package cache in the specified chroot (ignored if jail is specified).

**root** Cleans the package cache in the specified root (ignored if jail is specified).

CLI Example:

```
salt '*' pkg.clean chroot=/path/to/chroot
```

**clean_all** Clean all packages from the local cache (not just those that have been superseded by newer versions).

CLI Example:

```
salt '*' pkg.clean clean_all=True
```

**dryrun** Dry-run mode. This list of changes to the local cache is always printed, but no changes are actually made.

CLI Example:

```
salt '*' pkg.clean dryrun=True
```

```python
salt.modules.pkgng.fetch(name, jail=None, chroot=None, root=None, fetch_all=False, quiet=False, fromrepo=None, glob=True, regex=False, pcre=False, local=False, depends=False)
```

Fetches remote packages.

CLI Example:
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>salt '*' pkg.fetch &lt;package name&gt;</code></td>
<td>Fetch package in the specified jail</td>
</tr>
<tr>
<td><code>salt '*' pkg.fetch &lt;package name&gt; jail=&lt;jail name or id&gt;</code></td>
<td>Fetch package in the specified jail</td>
</tr>
<tr>
<td><code>salt '*' pkg.fetch &lt;package name&gt; chroot=/path/to/chroot</code></td>
<td>Fetch package in the specified chroot (ignored if jail is specified)</td>
</tr>
<tr>
<td><code>salt '*' pkg.fetch &lt;package name&gt; chroot=/path/to/chroot</code></td>
<td>Fetch package in the specified root (ignored if jail is specified)</td>
</tr>
<tr>
<td><code>salt '*' pkg.fetch &lt;package name&gt; fetch_all=True</code></td>
<td>Fetch all packages.</td>
</tr>
<tr>
<td><code>salt '*' pkg.fetch &lt;package name&gt; quiet=True</code></td>
<td>Quiet mode. Show less output.</td>
</tr>
<tr>
<td><code>salt '*' pkg.fetch &lt;package name&gt; fromrepo=repo</code></td>
<td>Fetches packages from the given repo if multiple repo support is enabled. See pkg.conf(5).</td>
</tr>
<tr>
<td><code>salt '*' pkg.fetch &lt;package name&gt; glob=True</code></td>
<td>Treat pkg_name as a shell glob pattern.</td>
</tr>
<tr>
<td><code>salt '*' pkg.fetch &lt;package name&gt; regex=True</code></td>
<td>Treat pkg_name as a regular expression.</td>
</tr>
<tr>
<td><code>salt '*' pkg.fetch &lt;package name&gt; pcre=True</code></td>
<td>Treat pkg_name is an extended regular expression.</td>
</tr>
<tr>
<td><code>salt '*' pkg.fetch &lt;package name&gt; local=True</code></td>
<td>Skip updating the repository catalogs with pkg-update(8). Use the local cache only.</td>
</tr>
<tr>
<td><code>salt '*' pkg.fetch &lt;package name&gt; depends=True</code></td>
<td>Fetch the package and its dependencies as well.</td>
</tr>
</tbody>
</table>

salt.modules.pkgng.hold(*name=None, pkgs=None, **kwargs*)

Version-lock packages
Salt Documentation, Release 2019.2.0

Note: This function is provided primarily for compatibility with some parts of `states.pkg`. Consider using `pkg.lock` instead.

**name** The name of the package to be held.

Multiple Package Options:

**pkgs** A list of packages to hold. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.hold <package name>
salt '*' pkg.hold pkgs=['"foo", "bar"]'
```

salt.modules.pkgng.install

```
(name=None, fromrepo=None, pkgs=None, sources=None, jail=None, chroot=None, root=None, orphan=False, force=False, glob=False, local=False, dryrun=False, quiet=False, reinstallRequires=False, regex=False, pcre=False, batch=False, **kwargs)
```

Install package(s) from a repository

**name** The name of the package to install

CLI Example:

```
salt '*' pkg.install <package name>
```

**jail** Install the package into the specified jail

**chroot** Install the package into the specified chroot (ignored if jail is specified)

**root** Install the package into the specified root (ignored if jail is specified)

**orphan** Mark the installed package as orphan. Will be automatically removed if no other packages depend on them. For more information please refer to `pkg-autoremove(8)`.

CLI Example:

```
salt '*' pkg.install <package name> orphan=True
```

**force** Force the reinstallation of the package if already installed.

CLI Example:

```
salt '*' pkg.install <package name> force=True
```

**glob** Treat the package names as shell glob patterns.

CLI Example:

```
salt '*' pkg.install <package name> glob=True
```

**local** Do not update the repository catalogs with pkg-update(8). A value of True here is equivalent to using the -U flag with `pkg install`.

CLI Example:

```
salt '*' pkg.install <package name> local=True
```

**dryrun** Dry-run mode. The list of changes to packages is always printed, but no changes are actually made.

CLI Example:

```
salt '*' pkg.install <package name> dryrun=True
```
quiet Force quiet output, except when dryrun is used, where pkg install will always show packages to be
installed, upgraded or deleted.

CLI Example:
```
salt '*' pkg.install <package name> quiet=True
```

reinstall_requires When used with force, reinstalls any packages that require the given package.

CLI Example:
```
salt '*' pkg.install <package name> reinstall_requires=True force=True
```

changed in version 2014.7.0: require kwarg renamed to reinstall_requires

fromrepo In multi-repo mode, override the pkg.conf ordering and only attempt to download packages from
the named repository.

CLI Example:
```
salt '*' pkg.install <package name> fromrepo=repo
```

regex Treat the package names as a regular expression

CLI Example:
```
salt '*' pkg.install <regular expression> regex=True
```

pcre Treat the package names as extended regular expressions.

CLI Example:
```
```
batch Use BATCH=true for pkg install, skipping all questions. Be careful when using in production.

CLI Example:
```
salt '*' pkg.install <package name> batch=True
```

salt.modules.pkgng.latest_version(*names, **kwargs)
Return the latest version of the named package available for upgrade or installation. If more than one package
name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:
```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> jail=<jail name or id>
salt '*' pkg.latest_version <package name> chroot=/path/to/chroot
```

salt.modules.pkgng.list_locked(**kwargs)
Query the package database those packages which are locked against reinstallation, modification or deletion.

Returns returns a list of package names with version strings

CLI Example:
```
salt '*' pkg.list_locked
```

jail List locked packages within the specified jail

CLI Example:
```
salt '*' pkg.list_locked jail=<jail name or id>
```

**chroot**  List locked packages within the specified chroot (ignored if jail is specified)

CLI Example:
```
salt '*' pkg.list_locked chroot=/path/to/chroot
```

**root**  List locked packages within the specified root (ignored if jail is specified)

CLI Example:
```
salt '*' pkg.list_locked root=/path/to/chroot
```

`salt.modules.pkgng.list_pkgs`(*versions_as_list=False, jail=None, chroot=None, root=None, with_origin=False, **kwargs)*

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

**jail**  List the packages in the specified jail

**chroot**  List the packages in the specified chroot (ignored if jail is specified)

**root**  List the packages in the specified root (ignored if jail is specified)

**with_origin**  [False] Return a nested dictionary containing both the origin name and version for each installed package.

New in version 2014.1.0.

CLI Example:
```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs jail=<jail name or id>
salt '*' pkg.list_pkgs chroot=/path/to/chroot
```

`salt.modules.pkgng.list_upgrades`(*refresh=True, **kwargs)*

List those packages for which an upgrade is available

The fromrepo argument is also supported, as used in pkg states.

CLI Example:
```
salt '*' pkg.list_upgrades
```

**jail**  List upgrades within the specified jail

CLI Example:
```
salt '*' pkg.list_upgrades jail=<jail name or id>
```

**chroot**  List upgrades within the specified chroot (ignored if jail is specified)

CLI Example:
```
salt '*' pkg.list_upgrades chroot=/path/to/chroot
```

**root**  List upgrades within the specified root (ignored if jail is specified)

CLI Example:
```
salt '*' pkg.list_upgrades root=/path/to/chroot
```

`salt.modules.pkgng.lock`(*name, **kwargs)*

Lock the named package against reinstallation, modification or deletion.
Returns True if the named package was successfully locked.

CLI Example:

```
salt '*' pkg.lock <package name>
```

**jail**  Lock packages within the specified jail

CLI Example:

```
salt '*' pkg.lock <package name> jail=<jail name or id>
```

**chroot**  Lock packages within the specified chroot (ignored if jail is specified)

CLI Example:

```
salt '*' pkg.lock <package name> chroot=/path/to/chroot
```

**root**  Lock packages within the specified root (ignored if jail is specified)

CLI Example:

```
salt '*' pkg.lock <package name> root=/path/to/chroot
```

### salt.modules.pkgng.locked(name, **kwargs)

Query the package database to determine if the named package is locked against reinstallation, modification or deletion.

Returns True if the named package is locked, False otherwise.

CLI Example:

```
salt '*' pkg.locked <package name>
```

**jail**  Test if a package is locked within the specified jail

CLI Example:

```
salt '*' pkg.locked <package name> jail=<jail name or id>
```

**chroot**  Test if a package is locked within the specified chroot (ignored if jail is specified)

CLI Example:

```
salt '*' pkg.locked <package name> chroot=/path/to/chroot
```

**root**  Test if a package is locked within the specified root (ignored if jail is specified)

CLI Example:

```
salt '*' pkg.locked <package name> root=/path/to/chroot
```

### salt.modules.pkgng.parse_config(file_name='/usr/local/etc/pkg.conf')

Return dict of uncommented global variables.

CLI Example:

```
salt '*' pkg.parse_config
```

**NOTE:** not working properly right now

### salt.modules.pkgng.refresh_db(jail=None, chroot=None, root=None, force=False)

Refresh PACKAGESITE contents
**Note:** This function can be accessed using `pkg.update` in addition to `pkg.refresh_db`, to more closely match the CLI usage of `pkg(8)`.

**CLI Example:**

```
salt '*' pkg.refresh_db
```

`jail` Refresh the pkg database within the specified jail  
`chroot` Refresh the pkg database within the specified chroot (ignored if `jail` is specified)  
`root` Refresh the pkg database within the specified root (ignored if `jail` is specified)  
`force` Force a full download of the repository catalog without regard to the respective ages of the local and remote copies of the catalog.

**CLI Example:**

```
salt '*' pkg.refresh_db force=True
```

salt.modules.pkgng.remove
```
(name=None, pkgs=None, jail=None, chroot=None, root=None, all_installed=False, force=False, glob=False, dryrun=False, recurse=False, regex=False, pcre=False, **kwargs)
```

Remove a package from the database and system

**Note:** This function can be accessed using `pkg.delete` in addition to `pkg.remove`, to more closely match the CLI usage of `pkg(8)`.

`name` The package to remove

**CLI Example:**

```
salt '*' pkg.remove <package name>
```

`jail` Delete the package from the specified jail  
`chroot` Delete the package from the specified chroot (ignored if `jail` is specified)  
`root` Delete the package from the specified root (ignored if `jail` is specified)  
`all_installed` Deletes all installed packages from the system and empties the database. USE WITH CAUTION!

**CLI Example:**

```
salt '*' pkg.remove all all_installed=True force=True
```

`force` Forces packages to be removed despite leaving unresolved dependencies.

**CLI Example:**

```
salt '*' pkg.remove <package name> force=True
```

`glob` Treat the package names as shell glob patterns.

**CLI Example:**

```
salt '*' pkg.remove <package name> glob=True
```

`dryrun` Dry run mode. The list of packages to delete is always printed, but no packages are actually deleted.

**CLI Example:**

```
salt '*' pkg.remove <package name> dryrun=True
```
**recurse**  Delete all packages that require the listed package as well.

CLI Example:

```
salt '*' pkg.remove <package name> recurse=True
```

**regex**  Treat the package names as regular expressions.

CLI Example:

```
salt '*' pkg.remove <regular expression> regex=True
```

**pcre**  Treat the package names as extended regular expressions.

CLI Example:

```
salt '*' pkg.remove <extended regular expression> pcre=True
```

`salt.modules.pkgng.restore(file_name, jail=None, chroot=None, root=None)`

Reads archive created by `pkg backup -d` and recreates the database.

CLI Example:

```
salt '*' pkg.restore /tmp/pkg
```

**jail**  Restore database to the specified jail. Note that this will run the command within the jail, and so the path to the file from which the pkg database will be restored is relative to the root of the jail.

CLI Example:

```
salt '*' pkg.restore /tmp/pkg jail=<jail name or id>
```

**chroot**  Restore database to the specified chroot (ignored if `jail` is specified). Note that this will run the command within the chroot, and so the path to the file from which the pkg database will be restored is relative to the root of the chroot.

**root**  Restore database to the specified root (ignored if `jail` is specified). Note that this will run the command within the root, and so the path to the file from which the pkg database will be restored is relative to the root of the root.

CLI Example:

```
salt '*' pkg.restore /tmp/pkg chroot=/path/to/chroot
```

`salt.modules.pkgng.search(name, jail=None, chroot=None, root=None, exact=False, glob=False, regex=False, pcre=False, comment=False, desc=False, full=False, depends=False, size=False, quiet=False, origin=False, prefix=False)`

Searches in remote package repositories

CLI Example:

```
salt '*' pkg.search pattern
```

**jail**  Perform the search using the `pkg.conf(5)` from the specified jail

CLI Example:

```
salt '*' pkg.search pattern jail=<jail name or id>
```

**chroot**  Perform the search using the `pkg.conf(5)` from the specified chroot (ignored if `jail` is specified)

**root**  Perform the search using the `pkg.conf(5)` from the specified root (ignored if `jail` is specified)

CLI Example:
```bash
salt '//' pkg.search pattern chroot=/path/to/chroot
```

**exact** Treat pattern as exact pattern.

CLI Example:
```bash
salt '//' pkg.search pattern exact=True
```

**glob** Treat pattern as a shell glob pattern.

CLI Example:
```bash
salt '//' pkg.search pattern glob=True
```

**regex** Treat pattern as a regular expression.

CLI Example:
```bash
salt '//' pkg.search pattern regex=True
```

**pcre** Treat pattern as an extended regular expression.

CLI Example:
```bash
salt '//' pkg.search pattern pcre=True
```

**comment** Search for pattern in the package comment one-line description.

CLI Example:
```bash
salt '//' pkg.search pattern comment=True
```

**desc** Search for pattern in the package description.

CLI Example:
```bash
salt '//' pkg.search pattern desc=True
```

**full** Displays full information about the matching packages.

CLI Example:
```bash
salt '//' pkg.search pattern full=True
```

**depends** Displays the dependencies of pattern.

CLI Example:
```bash
salt '//' pkg.search pattern depends=True
```

**size** Displays the size of the package.

CLI Example:
```bash
salt '//' pkg.search pattern size=True
```

**quiet** Be quiet. Prints only the requested information without displaying many hints.

CLI Example:
```bash
salt '//' pkg.search pattern quiet=True
```

**origin** Displays pattern origin.

CLI Example:
### pkg.search

**prefix** Displays the installation prefix for each package matching pattern.

CLI Example:

```
salt '...' pkg.search pattern prefix=True
```

---

### pkg.stats

**local** Display stats only for the local package database.

CLI Example:

```
salt '...' pkg.stats local=True
```

**remote** Display stats only for the remote package database(s).

CLI Example:

```
salt '...' pkg.stats remote=True
```

**jail** Retrieve stats from the specified jail.

CLI Example:

```
salt '...' pkg.stats jail=<jail name or id>
salt '...' pkg.stats jail=<jail name or id> local=True
salt '...' pkg.stats jail=<jail name or id> remote=True
```

**chroot** Retrieve stats from the specified chroot (ignored if jail is specified).

**root** Retrieve stats from the specified root (ignored if jail is specified).

CLI Example:

```
salt '...' pkg.stats chroot=/path/to/chroot
salt '...' pkg.stats chroot=/path/to/chroot local=True
salt '...' pkg.stats chroot=/path/to/chroot remote=True
```

---

### pkg.unhold

**name** The name of the package to be unheld

Multiple Package Options:

**pkgs** A list of packages to unhold. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```
salt '...' pkg.unhold <package name>
salt '...' pkg.unhold pkgs='["foo", "bar"]'
```

---

### Notes

- **Note:** This function is provided primarily for compatibility with some parts of `states.pkg`. Consider using `pkg.unlock` instead.

---

#### name

The name of the package to be unheld

#### pkgs

A list of packages to unhold. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:
salt.modules.pkgng.unlock(name, **kwargs)
Unlock the named package against reinstallation, modification or deletion.
Returns True if the named package was successfully unlocked.
CLI Example:
salt '*' pkg.unlock <package name>
jail Unlock packages within the specified jail
CLI Example:
salt '*' pkg.unlock <package name> jail=<jail name or id>
chroot Unlock packages within the specified chroot (ignored if jail is specified)
CLI Example:
salt '*' pkg.unlock <package name> chroot=/path/to/chroot
root Unlock packages within the specified root (ignored if jail is specified)
CLI Example:
salt '*' pkg.unlock <package name> root=/path/to/chroot
salt.modules.pkgng.update_package_site(new_url)
Updates remote package repo URL, PACKAGESITE var to be exact.
Must use http://, ftp://, or https:// protocol
CLI Example:
salt '*' pkg.update_package_site http://127.0.0.1/
salt.modules.pkgng.updating(name, jail=None, chroot=None, root=None, filedate=None, filename=None)
Displays UPDATING entries of software packages
CLI Example:
salt '*' pkg.updating foo
jail Perform the action in the specified jail
CLI Example:
salt '*' pkg.updating foo jail=<jail name or id>
chroot Perform the action in the specified chroot (ignored if jail is specified)
root Perform the action in the specified root (ignored if jail is specified)
CLI Example:
salt '*' pkg.updating foo chroot=/path/to/chroot
filedate Only entries newer than date are shown. Use a YYYYMMDD date format.
CLI Example:
salt '*' pkg.updating foo filedate=20130101
filename Defines an alternative location of the UPDATING file.

CLI Example:
```
salt '*' pkg.updating foo filename=/tmp/UPDATING
```

salt.modules.pkgng.upgrade(*names, **kwargs)
Upgrade named or all packages (run a pkg upgrade). If <package name> is omitted, the operation is executed on all packages.

Returns a dictionary containing the changes:
```
{'<package>': {'old': '<old-version>', 'new': '<new-version>'}}
```

CLI Example:
```
salt '*' pkg.upgrade <package name>
```

jail Audit packages within the specified jail

CLI Example:
```
salt '*' pkg.upgrade <package name> jail=<jail name or id>
```

chroot Audit packages within the specified chroot (ignored if jail is specified)
root Audit packages within the specified root (ignored if jail is specified)

CLI Example:
```
salt '*' pkg.upgrade <package name> chroot=/path/to/chroot
```

Any of the below options can also be used with jail or chroot.

force Force reinstalling/upgrading the whole set of packages.

CLI Example:
```
salt '*' pkg.upgrade <package name> force=True
```

local Do not update the repository catalogs with pkg-update(8). A value of True here is equivalent to using the -U flag with pkg upgrade.

CLI Example:
```
salt '*' pkg.upgrade <package name> local=True
```

dryrun Dry-run mode: show what packages have updates available, but do not perform any upgrades. Repository catalogs will be updated as usual unless the local option is also given.

CLI Example:
```
salt '*' pkg.upgrade <package name> dryrun=True
```

salt.modules.pkgng.version(*names, **kwargs)
Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

Note: This function can accessed using pkg.info in addition to pkg.version, to more closely match the CLI usage of pkg(8).
**jail**  Get package version information for the specified jail

**chroot**  Get package version information for the specified chroot (ignored if jail is specified)

**root**  Get package version information for the specified root (ignored if jail is specified)

**with_origin**  [False] Return a nested dictionary containing both the origin name and version for each specified package.

New in version 2014.1.0.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package name> jail=<jail name or id>
salt '*' pkg.version <package1> <package2> <package3> ...
```

**salt.modules.pkgng.version_cmp(pkg1, pkg2, ignore_epoch=False)**

Do a cmp-style comparison on two packages. Return -1 if pkg1 < pkg2, 0 if pkg1 == pkg2, and 1 if pkg1 > pkg2. Return None if there was a problem making the comparison.

CLI Example:

```
salt '*' pkg.version_cmp '2.1.11' '2.1.12'
```

**salt.modules.pkgng.which(path, jail=None, chroot=None, root=None, origin=False, quiet=False)**

Displays which package installed a specific file

CLI Example:

```
salt '*' pkg.which <file name>
```

**jail**  Perform the check in the specified jail

CLI Example:

```
salt '*' pkg.which <file name> jail=<jail name or id>
```

**chroot**  Perform the check in the specified chroot (ignored if jail is specified)

**root**  Perform the check in the specified root (ignored if jail is specified)

CLI Example:

```
salt '*' pkg.which <file name> chroot=/path/to/chroot
```

**origin**  Shows the origin of the package instead of name-version.

CLI Example:

```
salt '*' pkg.which <file name> origin=True
```

**quiet**  Quiet output.

CLI Example:

```
salt '*' pkg.which <file name> quiet=True
```

---

**21.9.322 salt.modules.pkgutil**

Pkgutil support for Solaris
Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see here.

salt.modules.pkgutil.install(name=None, refresh=False, version=None, pkgs=None, **kwargs)

Install packages using the pkgutil tool.

CLI Example:
```
salt '*' pkg.install <package_name>
salt '*' pkg.install SMClgcc346
```

Multiple Package Installation Options:
**pkgs**  A list of packages to install from OpenCSW. Must be passed as a python list.

CLI Example:
```
salt '*' pkg.install pkgs=['"foo", "bar"]
salt '*' pkg.install pkgs=['"foo", {"bar": "1.2.3"}]'
```

Returns a dict containing the new package names and versions:
```
{'<package>': {'old': '<old-version>', 'new': '<new-version>'}}
```

salt.modules.pkgutil.latest_version(names, **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:
```
salt '*' pkgutil.latest_version CSWpython
salt '*' pkgutil.latest_version <package1> <package2> <package3> ...
```

salt.modules.pkgutil.list_pkgs(versions_as_list=False, **kwargs)

List the packages currently installed as a dict:
```
[{'<package_name>': '<version>'}
```

CLI Example:
```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

salt.modules.pkgutil.list_upgrades(refresh=True, **kwargs)

List all available package upgrades on this system

CLI Example:
```
salt '*' pkgutil.list_upgrades
```

salt.modules.pkgutil.purge(name=None, pkgs=None, **kwargs)

Package purges are not supported, this function is identical to remove().

**name**  The name of the package to be deleted.

Multiple Package Options:
**pkgs**  A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

21.9. execution modules
New in version 0.16.0.
Returns a dict containing the changes.

CLI Example:

```bash
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

**salt.modules.pkgutil.refresh_db()**
Updates the pkgutil repo database (pkgutil -U)

CLI Example:

```bash
salt '*' pkgutil.refresh_db
```

**salt.modules.pkgutil.remove**
Remove a package and all its dependencies which are not in use by other packages.

*name* The name of the package to be deleted.

**Multiple Package Options:**

*pkgs* A list of packages to delete. Must be passed as a python list. The *name* parameter will be ignored if this option is passed.

New in version 0.16.0.
Returns a dict containing the changes.

CLI Example:

```bash
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

**salt.modules.pkgutil.upgrade**
Upgrade all of the packages to the latest available version.

Returns a dict containing the changes:

```json
{
'<package>': {
'old': '<old-version>',
'new': '<new-version>'
}}
```

CLI Example:

```bash
salt '*' pkgutil.upgrade
```

**salt.modules.pkgutil.upgrade_available**
Check if there is an upgrade available for a certain package

CLI Example:

```bash
salt '*' pkgutil.upgrade_available CSWpython
```

**salt.modules.pkgutil.version**

Returns a version if the package is installed, else returns an empty string

CLI Example:

```bash
salt '*' pkgutil.version CSWpython
```
21.9.323  salt.modules.portage_config

Configure portage(5)

salt.modules.portage_config.append_to_package_conf(conf, atom=None, flags=None, string=' ', overwrite=False)

Append a string or a list of flags for a given package or DEPEND atom to a given configuration file.

CLI Example:

salt '*' portage_config.append_to_package_conf use string="app-admin/salt ldap - -libvirt"
salt '*' portage_config.append_to_package_conf use atom='>= app-admin/salt-0.14.1' flags=['ldap', '-libvirt']"

salt.modules.portage_config.append_use_flags(atom=None, uses=None, overwrite=False)

Append a list of use flags for a given package or DEPEND atom

CLI Example:

salt '*' portage_config.append_use_flags "app-admin/salt[ldap, -libvirt]"
salt '*' portage_config.append_use_flags ">=app-admin/salt-0.14.1" "["ldap', '- -libvirt']"

salt.modules.portage_config.enforce_nice_config()

Enforce a nice tree structure for /etc/portage/package.* configuration files.

See also:
salt.modules.ebuild.ex_mod_init() for information on automatically running this when pkg is used.

CLI Example:

salt '*' portage_config.enforce_nice_config

salt.modules.portage_config.filter_flags(use, use_expand_hidden, usemasked, useforced)

New in version 2015.8.0.

Filter function to remove hidden or otherwise not normally visible USE flags from a list.

@type use: list @param use: the USE flag list to be filtered. @type use_expand_hidden: list @param use_expand_hidden: list of flags hidden. @type usemasked: list @param usemasked: list of masked USE flags. @type useforced: list @param useforced: the forced USE flags. @rtype: list @return the filtered USE flags.

salt.modules.portage_config.get_all_cpv_use(cp)

New in version 2015.8.0.

Uses portage to determine final USE flags and settings for an emerge.

@type cp: string @param cp: eg cat/pkg @rtype: lists @return use, use_expand_hidden, usemask, useforce

salt.modules.portage_config.get_cleared_flags(cp)

New in version 2015.8.0.

Uses portage for compare use flags which is used for installing package and use flags which now exist int /etc/portage/package.use/

@type cp: string @param cp : eg cat/pkg @rtype: tuple @rparam: tuple with two lists - list of used flags and list of flags which will be used
salt.modules.portage_config.get_flags_from_package_conf(conf, atom)
Get flags for a given package or DEPEND atom. Warning: This only works if the configuration files tree is in the correct format (the one enforced by enforce_nice_config)

CLI Example:
```bash
salt '*' portage_config.get_flags_from_package_conf license salt
```

salt.modules.portage_config.get_installed_use(cp, use='USE')
New in version 2015.8.0.
Gets the installed USE flags from the VARDB.

@type: cp: string @param cp: cat/pkg @type use: string @param use: 1 of ["USE", "PKGUSE"] @rtype list
@returns [] or the list of IUSE flags

salt.modules.portage_config.get_iuse(cp)
New in version 2015.8.0.
Gets the current IUSE flags from the tree.

@type: cpv: string @param cpv: cat/pkg @rtype list @returns [] or the list of IUSE flags

salt.modules.portage_config.get_missing_flags(conf, atom, flags)
Find out which of the given flags are currently not set. CLI Example:
```bash
salt '*' portage_config.get_missing_flags use salt "['ldap', '-libvirt', 'openssl']"
```

salt.modules.portage_config.has_flag(conf, atom, flag)
Verify if the given package or DEPEND atom has the given flag. Warning: This only works if the configuration files tree is in the correct format (the one enforced by enforce_nice_config)

CLI Example:
```bash
salt '*' portage_config.has_flag license salt Apache-2.0
```

salt.modules.portage_config.has_use(atom, use)
Verify if the given package or DEPEND atom has the given use flag. Warning: This only works if the configuration files tree is in the correct format (the one enforced by enforce_nice_config)

CLI Example:
```bash
salt '*' portage_config.has_use salt libvirt
```

salt.modules.portage_config.is_changed_uses(cp)
New in version 2015.8.0.
Uses portage for determine if the use flags of installed package is compatible with use flags in portage configs.

@type cp: string @param cp: eg cat/pkg

salt.modules.portage_config.is_present(conf, atom)
Tell if a given package or DEPEND atom is present in the configuration files tree. Warning: This only works if the configuration files tree is in the correct format (the one enforced by enforce_nice_config)

CLI Example:
```bash
salt '*' portage_config.is_present unmask salt
```
21.9.324 salt.modules.postfix

Support for Postfix

This module is currently little more than a config file viewer and editor. It is able to read the master.cf file (which is one style) and files in the style of main.cf (which is a different style, that is used in multiple postfix configuration files).

The design of this module is such that when files are edited, a minimum of changes are made to them. Each file should look as if it has been edited by hand; order, comments and whitespace are all preserved.

salt.modules.postfix.delete(queue_id)
Delete message(s) from the mail queue

CLI Example:

```shell
salt '*' postfix.delete 5C33CA0DEA
salt '*' postfix.delete ALL
```

salt.modules.postfix.hold(queue_id)
Put message(s) on hold from the mail queue

CLI Example:

```shell
salt '*' postfix.hold 5C33CA0DEA
salt '*' postfix.hold ALL
```

salt.modules.postfix.requeue(queue_id)
Requeue message(s) in the mail queue

CLI Example:

```shell
salt '*' postfix.requeue 5C33CA0DEA
salt '*' postfix.requeue ALL
```

salt.modules.postfix.set_main(key, value, path='/etc/postfix/main.cf')
Set a single config value in the main.cf file. If the value does not already exist, it will be appended to the end.

CLI Example:

```shell
salt <minion> postfix.set_main mailq_path /usr/bin/mailq
```

salt.modules.postfix.set_master(service, conn_type, private='y', unpriv='y', chroot='y',
                                 wakeup='n', maxproc='100', command='', write_conf=True,
                                 path='/etc/postfix/master.cf')
Set a single config value in the master.cf file. If the value does not already exist, it will be appended to the end.

Because of shell parsing issues, '-' cannot be set as a value, as is normal in the master.cf file; either 'y', 'n' or a number should be used when calling this function from the command line. If the value used matches the default, it will internally be converted to a '-'. Calling this function from the Python API is not affected by this limitation

The settings and their default values, in order, are: service (required), conn_type (required), private (y), unpriv (y), chroot (y), wakeup (n), maxproc (100), command (required).

By default, this function will write out the changes to the master.cf file, and then returns the full contents of the file. By setting the write_conf option to False, it will skip writing the file.

CLI Example:
salt <minion> postfix.set_master smtp inet n y n n 100 smtpd

salt.modules.postfix.show_main(path='/etc/postfix/main.cf')
Returns a dict of active config values. This does not include comments, spacing or order. Bear in mind that order is functionally important in the main.cf file, since keys can be referred to as variables. This means that the data returned from this function should not be used for direct modification of the main.cf file; other functions are available for that.

CLI Examples:
salt <minion> postfix.show_main salt <minion> postfix.show_main path=/path/to/main.cf

salt.modules.postfix.show_master(path='/etc/postfix/master.cf')
Returns a dict of active config values. This does not include comments, spacing or order.

The data returned from this function should not be used for direct modification of the main.cf file; other functions are available for that.

CLI Examples:
salt <minion> postfix.show_master salt <minion> postfix.show_master path=/path/to/master.cf

salt.modules.postfix.show_queue()
Show contents of the mail queue

CLI Example:
salt '*' postfix.show_queue

salt.modules.postfix.unhold(queue_id)
Set held message(s) in the mail queue to unheld

CLI Example:
salt '*' postfix.unhold 5C33CA6DEA
salt '*' postfix.unhold ALL

21.9.325 salt.modules.postgres

Module to provide Postgres compatibility to salt.

configuration In order to connect to Postgres, certain configuration is required in /etc/salt/minion on the relevant minions. Some sample configs might look like:

```python
postres.host: 'localhost'
postgres.port: '5432'
postgres.user: 'postgres' -> db user
postgres.pass: ''
postgres.maintenance_db: 'postgres'
```

The default for the maintenance_db is 'postgres' and in most cases it can be left at the default setting. This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar

note This module uses MD5 hashing which may not be compliant with certain security audits.

note When installing postgres from the official postgres repos, on certain linux distributions, either the psql or the initdb binary is not automatically placed on the path. Add a configuration to the location of the postgres bin's path to the relevant minion for this module:
salt.modules.postgres.bins_dir: '/usr/pgsql-9.5/bin/'

salt.modules.postgres.available_extensions(user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

List available postgresql extensions

CLI Example:

```
salt '*' postgres.available_extensions
```

salt.modules.postgres.create_extension(name, if_not_exists=None, schema=None, ext_version=None, from_version=None, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Install a postgresql extension

CLI Example:

```
salt '*' postgres.create_extension 'adminpack'
```

salt.modules.postgres.create_metadata(name, ext_version=None, schema=None, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Get lifecycle information about an extension

CLI Example:

```
salt '*' postgres.create_metadata adminpack
```

salt.modules.postgres.datadir_exists(name)

New in version 2016.3.0.

Checks if postgres data directory has been initialized

CLI Example:

```
salt '*' postgres.datadir_exists '/var/lib/pgsql/data'
```

name Name of the directory to check

salt.modules.postgres.datadir_init(name, auth='password', user=None, password=None, encoding='UTF8', locale=None, waldir=None, checksums=False, runas=None)

New in version 2016.3.0.

Initializes a postgres data directory

CLI Example:

```
salt '*' postgres.datadir_init '/var/lib/pgsql/data'
```

name The name of the directory to initialize

auth The default authentication method for local connections

password The password to set for the postgres user

user The database superuser name

encoding The default encoding for new databases

locale The default locale for new databases

21.9. execution modules 2323
waldir  The transaction log (WAL) directory (default is to keep WAL inside the data directory)

    New in version 2019.2.0.

checksums  If True, the cluster will be created with data page checksums.

    Note: Data page checksums are supported since PostgreSQL 9.3.

    New in version 2019.2.0.

runas  The system user the operation should be performed on behalf of

salt.modules.postgres.db_alter(name, user=None, host=None, port=None, maintenance_db=None, password=None, tablespace=None, owner=None, owner_recurse=False, runas=None)

    Change tablespace or/and owner of database.

    CLI Example:

salt '***' postgres.db_alter dbname owner=otheruser

salt.modules.postgres.db_create(name, user=None, host=None, port=None, maintenance_db=None, password=None, tablespace=None, encoding=None, lc_collate=None, lc_ctype=None, owner=None, template=None, runas=None)

    Adds a databases to the Postgres server.

    CLI Example:

salt '***' postgres.db_create 'dbname'
salt '***' postgres.db_create 'dbname' template=template_postgis

salt.modules.postgres.db_exists(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

    Checks if a database exists on the Postgres server.

    CLI Example:

salt '***' postgres.db_exists 'dbname'

salt.modules.postgres.db_list(user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

    Return dictionary with information about databases of a Postgres server.

    CLI Example:

salt '***' postgres.db_list

salt.modules.postgres.db_remove(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

    Removes a databases from the Postgres server.

    CLI Example:

salt '***' postgres.db_remove 'dbname'

salt.modules.postgres.drop_extension(name, if_exists=None, restrict=None, cascade=None, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

    Drop an installed postgresql extension
CLI Example:
```bash
salt '*' postgres.drop_extension 'adminpack'
```

```python
salt.modules.postgres.get_available_extension(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)
```

Get info about an available postgresql extension

CLI Example:
```bash
salt '*' postgres.get_available_extension plpgsql
```

```python
salt.modules.postgres.get_installed_extension(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)
```

Get info about an installed postgresql extension

CLI Example:
```bash
salt '*' postgres.get_installed_extension plpgsql
```

```python
salt.modules.postgres.group_create(groupname, user=None, host=None, port=None, maintenance_db=None, password=None, createdb=None, createroles=None, encrypted=None, login=None, inherit=None, superuser=None, replication=None, rolepassword=None, groups=None, runas=None)
```

Creates a Postgres group. A group is postgres is similar to a user, but cannot login.

CLI Example:
```bash
salt '*' postgres.group_create 'groupname' user='user'
  host='hostname' port='port' password='password'
  rolepassword='rolepassword'
```

```python
salt.modules.postgres.group_remove(groupname, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)
```

Removes a group from the Postgres server.

CLI Example:
```bash
salt '*' postgres.group_remove 'groupname'
```

```python
salt.modules.postgres.group_update(groupname, user=None, host=None, port=None, maintenance_db=None, password=None, createdb=None, createroles=None, encrypted=None, login=None, inherit=None, superuser=None, replication=None, rolepassword=None, groups=None, runas=None)
```

Updates a postgres group

CLI Examples:
```bash
salt '*' postgres.group_update 'username' user='user'
  host='hostname' port='port' password='password'
  rolepassword='rolepassword'
```

```python
salt.modules.postgres.has_privileges(name, object_name, object_type, privileges=None, grant_option=None, prepend='public', maintenance_db=None, user=None, host=None, port=None, password=None, runas=None)
```

21.9. execution modules
New in version 2016.3.0.

Check if a role has the specified privileges on an object

CLI Example:

```bash
salt '*' postgres.has_privileges user_name table_name table \ SELECT,INSERT maintenance_db=db_name
```

**name** Name of the role whose privileges should be checked on object_type

**object_name** Name of the object on which the check is to be performed

**object_type** The object type, which can be one of the following:
- table
- sequence
- tablespace
- language
- database
- group
- function

**privileges** Comma separated list of privileges to check, from the list below:
- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

**grant_option** If grant_option is set to True, the grant option check is performed

**prepend** Table and Sequence object types live under a schema so this should be provided if the object is not under the default `public` schema

**maintenance_db** The database to connect to

**user** database username if different from config or default

**password** user password if any password for a specified user

**host** Database host if different from config or default

**port** Database port if different from config or default

**runas** System user all operations should be performed on behalf of

---

salt.modules.postgres.installed_extensions(user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

List installed postgresql extensions

CLI Example:

```bash
salt '*' postgres.installed_extensions
```

---

salt.modules.postgres.is_available_extension(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Test if a specific extension is available

---
CLI Example:

```
salt '*' postgres.is_available_extension
```

**salt.modules.postgres.is_installed_extension**(name, user=\None, host=\None, port=\None, maintenance_db=\None, password=\None, runas=\None)

Test if a specific extension is installed

CLI Example:

```
salt '*' postgres.is_installed_extension
```

**salt.modules.postgres.language_create**(name, maintenance_db, user=\None, host=\None, port=\None, password=\None, runas=\None)

New in version 2016.3.0.

Installs a language into a database

CLI Example:

```
salt '*' postgres.language_create plpgsql dbname
```

- **name**: Language to install
- **maintenance_db**: The database to install the language in
- **user**: database username if different from config or default
- **password**: user password if any password for a specified user
- **host**: Database host if different from config or default
- **port**: Database port if different from config or default
- **runas**: System user all operations should be performed on behalf of

**salt.modules.postgres.language_exists**(name, maintenance_db, user=\None, host=\None, port=\None, password=\None, runas=\None)

New in version 2016.3.0.

Checks if language exists in a database.

CLI Example:

```
salt '*' postgres.language_exists plpgsql dbname
```

- **name**: Language to check for
- **maintenance_db**: The database to check in
- **user**: database username if different from config or default
- **password**: user password if any password for a specified user
- **host**: Database host if different from config or default
- **port**: Database port if different from config or default
- **runas**: System user all operations should be performed on behalf of

**salt.modules.postgres.language_list**(maintenance_db, user=\None, host=\None, port=\None, password=\None, runas=\None)

New in version 2016.3.0.

Return a list of languages in a database.

CLI Example:

```
salt '*' postgres.language_list dbname
```

- **maintenance_db**: The database to check
- **user**: database username if different from config or default
New in version 2016.3.0.

Removes a language from a database

CLI Example:

```
salt '*' postgres.language_remove plpgsql dbname
```

**name**  Language to remove

**maintenance_db**  The database to install the language in

**user**  database username if different from config or default

**password**  user password if any password for a specified user

**host**  Database host if different from config or default

**port**  Database port if different from config or default

**runas**  System user all operations should be performed on behalf of

Set the owner of all schemas, functions, tables, views and sequences to the given username.

CLI Example:

```
salt '*' postgres.owner_to 'dbname' 'username'
```

New in version 2016.3.0.

Grant privileges on a postgres object

CLI Example:

```
salt '*' postgres.privileges_grant user_name table_name table \
    SELECT,UPDATE maintenance_db=db_name
```

**name**  Name of the role to which privileges should be granted

**object_name**  Name of the object on which the grant is to be performed

**object_type**  The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

**privileges**  Comma separated list of privileges to grant, from the list below:

- INSERT
- CREATE
- TRUNCATE
grant_option If grant_option is set to True, the recipient of the privilege can in turn grant it to others
prepend Table and Sequence object types live under a schema so this should be provided if the object is not
under the default public schema
maintenance_db The database to connect to
user database username if different from config or default
password user password if any password for a specified user
host Database host if different from config or default
port Database port if different from config or default
runas System user all operations should be performed on behalf of

salt.modules.postgres.privileges_list(name, object_type, prepend='public', maintenance_db=None, user=None, host=None, port=None, password=None, runas=None)

New in version 2016.3.0.
Return a list of privileges for the specified object.

CLI Example:

```bash
salt '*' postgres.privileges_list table_name table maintenance_db=db_name
```

name Name of the object for which the permissions should be returned
object_type The object type, which can be one of the following:
  • table
  • sequence
  • schema
  • tablespace
  • language
  • database
  • group
  • function
prepend Table and Sequence object types live under a schema so this should be provided if the object is not
under the default public schema
maintenance_db The database to connect to
user database username if different from config or default
password user password if any password for a specified user
host Database host if different from config or default
port Database port if different from config or default
runas System user all operations should be performed on behalf of

salt.modules.postgres.privileges_revoke(name, object_name, object_type, privileges=None,
prepend='public', maintenance_db=None, user=None, host=None, port=None, password=None, runas=None)

New in version 2016.3.0.
Revoke privileges on a postgres object
CLI Example:

```bash
salt '*' postgres.privileges_revoke user_name table_name table \
    SELECT,UPDATE maintenance_db=db_name
```

**name** Name of the role whose privileges should be revoked

**object_name** Name of the object on which the revoke is to be performed

**object_type** The object type, which can be one of the following:
- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

**privileges** Comma separated list of privileges to revoke, from the list below:
- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

**maintenance_db** The database to connect to

**user** database username if different from config or default

**password** user password if any password for a specified user

**host** Database host if different from config or default

**port** Database port if different from the config or default

**runas** System user all operations should be performed on behalf of

**salt.modules.postgres.psql_query**(query, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None, write=False)

Run an SQL-Query and return the results as a list. This command only supports SELECT statements. This limitation can be worked around with a query like this:

```
WITH updated AS (UPDATE pg_authid SET rolconnlimit = 2000 WHERE rolname = 'rolename' RETURNING rolconnlimit) SELECT * FROM updated;
```

**query** The query string.

**user** Database username, if different from config or default.

**host** Database host, if different from config or default.

**port** Database port, if different from the config or default.

**maintenance_db** The database to run the query against.

**password** User password, if different from the config or default.

**runas** User to run the command as.

**write** Mark query as READ WRITE transaction.

CLI Example:

```bash
salt '*' postgres.psql_query 'select * from pg_stat_activity'
```
salt.modules.postgres.role_get
(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None, return_password=False)

Return a dict with information about users of a Postgres server.
Set return_password to True to get password hash in the result.

CLI Example:
```
salt '*' postgres.role_get postgres
```

salt.modules.postgres.schema_create
(dbname, name, owner=None, user=None, db_user=None, db_password=None, db_host=None, db_port=None)

Creates a Postgres schema.

CLI Example:
```
salt '*' postgres.schema_create dbname name owner='owner' \ 
    user='user' \ 
    db_user='user' db_password='password' \ 
    db_host='hostname' db_port='port'
```

salt.modules.postgres.schema_exists
(dbname, name, user=None, db_user=None, db_password=None, db_host=None, db_port=None)

Checks if a schema exists on the Postgres server.

CLI Example:
```
salt '*' postgres.schema_exists dbname schemaname
```

dbname Database name we query on
name Schema name we look for
user The system user the operation should be performed on behalf of
db_user database username if different from config or default
db_password user password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

salt.modules.postgres.schema_get
(dbname, name, user=None, db_user=None, db_password=None, db_host=None, db_port=None)

Return a dict with information about schemas in a database.

CLI Example:
```
salt '*' postgres.schema_get dbname name
```

dbname Database name we query on
name Schema name we look for
user The system user the operation should be performed on behalf of
db_user database username if different from config or default
db_password user password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

salt.modules.postgres.schema_list
(dbname, user=None, db_user=None, db_password=None, db_host=None, db_port=None)

Return a dict with information about schemas in a Postgres database.

CLI Example:
salt '*= postgres.schema_list dbname

dbname  Database name we query on
user    The system user the operation should be performed on behalf of
db_user database username if different from config or default
db_password user password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

salt.modules.postgres.schema_remove(dbname, name, user=None, db_user=None, db_password=None, db_host=None, db_port=None)

Removes a schema from the Postgres server.

CLI Example:
salt '*= postgres.schema_remove dbname schemaname

dbname  Database name we work on
schemaname  The schema’s name we’ll remove
user    System user all operations should be performed on behalf of
db_user database username if different from config or default
db_password user password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

salt.modules.postgres.tablespace_alter(name, user=None, host=None, port=None, maintenance_db=None, password=None, new_name=None, new_owner=None, set_option=None, reset_option=None, runas=None)

Change tablespace name, owner, or options.

CLI Example:
salt '*= postgres.tablespace_alter tsname new_owner=otheruser
salt '*= postgres.tablespace_alter index_space new_name=fast_raid
salt '*= postgres.tablespace_alter test set_option="{'seq_page_cost': '1.1'}"
salt '*= postgres.tablespace_alter tsname reset_option=seq_page_cost

New in version 2015.8.0.

salt.modules.postgres.tablespace_create(name, location, options=None, owner=None, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Adds a tablespace to the Postgres server.

CLI Example:
salt '*= postgres.tablespace_create tablespacename '/path/datadir'

New in version 2015.8.0.

salt.modules.postgres.tablespace_exists(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Checks if a tablespace exists on the Postgres server.

CLI Example:
salt '*= postgres.tablespace_exists 'dbname'
New in version 2015.8.0.
salt.modules.postgres.tablespace_list(user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)
Return dictionary with information about tablespaces of a Postgres server.
CLI Example:
```
salt '*' postgres.tablespace_list
```
New in version 2015.8.0.
salt.modules.postgres.tablespace_remove(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)
Removes a tablespace from the Postgres server.
CLI Example:
```
salt '*' postgres.tablespace_remove tsname
```
New in version 2015.8.0.
salt.modules.postgres.user_create(username, user=None, host=None, port=None, maintenance_db=None, password=None, createdb=None, creatoroles=None, inherit=None, login=None, connlimit=None, encrypted=None, superuser=None, replication=None, rolepassword=None, valid_until=None, groups=None, runas=None)
Creates a Postgres user.
CLI Examples:
```
salt '*' postgres.user_create 'username' user='user' \ 
    host='hostname' port='port' password='password' \ 
    rolepassword='rolepassword' valid_until='valid_until'
```
salt.modules.postgres.user_exists(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)
Checks if a user exists on the Postgres server.
CLI Example:
```
salt '*' postgres.user_exists 'username'
```
salt.modules.postgres.user_list(user=None, host=None, port=None, maintenance_db=None, password=None, runas=None, return_password=False)
Return a dict with information about users of a Postgres server.
Set return_password to True to get password hash in the result.
CLI Example:
```
salt '*' postgres.user_list
```
salt.modules.postgres.user_remove(username, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)
Removes a user from the Postgres server.
CLI Example:
```
salt '*' postgres.user_remove 'username'
```
salt.modules.postgres.user_update(username, user=None, host=None, port=None, maintenance_db=None, password=None, createdb=None, createdb=False, encrypted=None, superuser=None, inherit=None, login=None, connlimit=None, replication=None, rolepassword=None, valid_until=None, groups=None, runas=None)

Updates a Postgres user.

CLI Examples:

```
salt '*' postgres.user_update 'username' user='user' \
    host='hostname' port='port' password='password' \
    rolepassword='rolepassword' valid_until='valid_until'
```

salt.modules.postgres.version(user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Return the version of a Postgres server.

CLI Example:

```
salt '*' postgres.version
```

21.9.326 salt.modules.poudriere

Support for poudriere

salt.modules.poudriere.bulk_build(jail, pkg_file, keep=False)

Run bulk build on poudriere server.

Return number of pkg builds, failures, and errors, on error dump to CLI

CLI Example:

```
salt -N buildbox_group poudriere.bulk_build 90amd64 /root/pkg_list
```

salt.modules.poudriere.create_jail(name, arch, version='9.0-RELEASE')

Creates a new poudriere jail if one does not exist

*NOTE* creating a new jail will take some time the master is not hanging

CLI Example:

```
salt '*' poudriere.create_jail 90amd64 amd64
```

salt.modules.poudriere.create_ports_tree()

Not working need to run portfetch non interactive

salt.modules.poudriere.delete_jail(name)

Deletes poudriere jail with name

CLI Example:

```
salt '*' poudriere.delete_jail 90amd64
```

salt.modules.poudriere.is_jail(name)

Return True if jail exists False if not

CLI Example:
salt.modules.poudriere.list_jails()
   Return a list of current jails managed by poudriere
   CLI Example:
   ```
salt '*' poudriere.list_jails
   ```

salt.modules.poudriere.list_ports()
   Return a list of current port trees managed by poudriere
   CLI Example:
   ```
salt '*' poudriere.list_ports
   ```

salt.modules.poudriere.make_pkgng_aware(jname)
   Make jail jname pkgng aware
   CLI Example:
   ```
salt '*' poudriere.make_pkgng_aware <jail name>
   ```

salt.modules.poudriere.parse_config(config_file=None)
   Returns a dict of poudriere main configuration definitions
   CLI Example:
   ```
salt '*' poudriere.parse_config
   ```

salt.modules.poudriere.update_jail(name)
   Run freebsd-update on name poudriere jail
   CLI Example:
   ```
salt '*' poudriere.update_jail freebsd:10:x86:64
   ```

salt.modules.poudriere.update_ports_tree(ports_tree)
   Updates the ports tree, either the default or the ports_tree specified
   CLI Example:
   ```
salt '*' poudriere.update_ports_tree staging
   ```

salt.modules.poudriere.version()
   Return poudriere version
   CLI Example:
   ```
salt '*' poudriere.version
   ```

21.9.327 salt.modules.powerpath

powerpath support.
Assumes RedHat

salt.modules.powerpath.add_license(key)
   Add a license
salt.modules.powerpath.has_powerpath()
salt.modules.powerpath.list_licenses()
    returns a list of applied powerpath license keys
salt.modules.powerpath.remove_license(key)
    Remove a license

21.9.328 salt.modules.proxy module

This module allows you to manage proxy settings

salt '*' network.get_http_proxy

salt.modules.proxy.get_ftp_proxy(network_service='Ethernet')
    Returns the current ftp proxy settings
    network_service  The network service to apply the changes to, this only necessary on macOS
    CLI Example:
        salt '*' proxy.get_ftp_proxy Ethernet

salt.modules.proxy.get_http_proxy(network_service='Ethernet')
    Returns the current http proxy settings
    network_service  The network service to apply the changes to, this only necessary on macOS
    CLI Example:
        salt '*' proxy.get_http_proxy Ethernet

salt.modules.proxy.get_https_proxy(network_service='Ethernet')
    Returns the current https proxy settings
    network_service  The network service to apply the changes to, this only necessary on macOS
    CLI Example:
        salt '*' proxy.get_https_proxy Ethernet

salt.modules.proxy.get_proxy_bypass(network_service='Ethernet')
    Returns the current domains that can bypass the proxy
    network_service  The network service to get the bypass domains from, this is only necessary on macOS
    CLI Example:
        salt '*' proxy.get_proxy_bypass

salt.modules.proxy.get_proxy_win()
    Gets all of the proxy settings in one call, only available on Windows
    CLI Example:
        salt '*' proxy.get_proxy_win

salt.modules.proxy.set_ftp_proxy(server, port, user=None, password=None, network_service='Ethernet', bypass_hosts=None)
    Sets the ftp proxy settings
    server  The proxy server to use
    port    The port used by the proxy server
    user    The username to use for the proxy server if required
    password  The password to use if required by the server
network_service  The network service to apply the changes to, this only necessary on macOS
bypass_hosts  The hosts that are allowed to by pass the proxy. Only used on Windows for other OS’s use
set_proxy_bypass to edit the bypass hosts.
CLI Example:

```
salt '*' proxy.set_ftp_proxy example.com 1080 user=proxy_user password=proxy_pass
```

```
salt.modules.proxy.set_http_proxy(server, port, user=None, password=None, network_service='Ethernet', bypass_hosts=None)
```

Sets the http proxy settings. Note: On Windows this will override any other proxy settings you have, the
preferred method of updating proxies on windows is using set_proxy.
server  The proxy server to use
port  The port used by the proxy server
user  The username to use for the proxy server if required
password  The password to use if required by the server
network_service  The network service to apply the changes to, this only necessary on macOS
bypass_hosts  The hosts that are allowed to by pass the proxy. Only used on Windows for other OS’s use
set_proxy_bypass to edit the bypass hosts.
CLI Example:

```
salt '*' proxy.set_http_proxy example.com 1080 user=proxy_user password=proxy_
```

```
salt.modules.proxy.set_https_proxy(server, port, user=None, password=None, network_service='Ethernet', bypass_hosts=None)
```

Sets the https proxy settings. Note: On Windows this will override any other proxy settings you have, the
preferred method of updating proxies on windows is using set_proxy.
server  The proxy server to use
port  The port used by the proxy server
user  The username to use for the proxy server if required
password  The password to use if required by the server
network_service  The network service to apply the changes to, this only necessary on macOS
bypass_hosts  The hosts that are allowed to by pass the proxy. Only used on Windows for other OS’s use
set_proxy_bypass to edit the bypass hosts.
CLI Example:

```
salt '*' proxy.set_https_proxy example.com 1080 user=proxy_user password=proxy_
```

```
salt.modules.proxy.set_proxy_bypass(domains, network_service='Ethernet')
```

Sets the domains that can bypass the proxy
domains  An array of domains allowed to bypass the proxy
network_service  The network service to apply the changes to, this only necessary on macOS
CLI Example:

```
salt '*' proxy.set_proxy_bypass "['127.0.0.1', 'localhost']"
```

```
salt.modules.proxy.set_proxy_win(server, port, types=None, bypass_hosts=None)
```

Sets the http proxy settings, only works with Windows.
server  The proxy server to use
password  The password to use if required by the server
types  The types of proxy connections should be setup with this server. Valid types are:
  • http
  • https
  • ftp
bypass_hosts  The hosts that are allowed to by pass the proxy.

CLI Example:

```
salt 'x' proxy.set_http_proxy example.com 1080 types="["http", "https"]"
```

21.9.329  salt.modules.ps

A salt interface to psutil, a system and process library. See http://code.google.com/p/psutil.

depends

- psutil Python module, version 0.3.0 or later
- python-utmp package (optional)

salt.modules.ps.boot_time(time_format=None)

Return the boot time in number of seconds since the epoch began.

CLI Example:

```
time_format  Optionally specify a strftime format string. Use time_format='%c' to get a nicely-formatted
locale specific date and time (i.e. Fri May 2 19:08:32 2014).

New in version 2014.1.4.
```

```
salt 'x' ps.boot_time
```

salt.modules.ps.cpu_percent(interval=0.1, per_cpu=False)

Return the percent of time the CPU is busy.

```
interval  the number of seconds to sample CPU usage over
```

```
per_cpu  if True return an array of CPU percent busy for each CPU, otherwise aggregate all percents into one number
```

CLI Example:

```
salt 'x' ps.cpu_percent
```

salt.modules.ps.cpu_times(per_cpu=False)

Return the percent of time the CPU spends in each state, e.g. user, system, idle, nice, iowait, irq, softirq.

```
per_cpu  if True return an array of percent for each CPU, otherwise aggregate all percents into one number
```

CLI Example:

```
salt 'x' ps.cpu_times
```

salt.modules.ps.disk_io_counters(device=None)

Return disk I/O statistics.

CLI Example:

```
salt 'x' ps.disk_io_counters
```

```
salt 'x' ps.disk_io_counters device=sda1
```

salt.modules.ps.disk_partition_usage(all=False)

Return a list of disk partitions plus the mount point, filesystem and usage statistics.

CLI Example:

```
salt 'x' ps.disk_partition_usage
```
salt.modules.ps.disk_partitions(all=False)
   Return a list of disk partitions and their device, mount point, and filesystem type.
   all if set to False, only return local, physical partitions (hard disk, USB, CD/DVD partitions). If True, return all filesystems.
   CLI Example:
   ```
salt '*' ps.disk_partitions
   ```

salt.modules.ps.disk_usage(path)
   Given a path, return a dict listing the total available space as well as the free space, and used space.
   CLI Example:
   ```
salt '*' ps.disk_usage /home
   ```

salt.modules.ps.get_pid_list()
   Return a list of process ids (PIDs) for all running processes.
   CLI Example:
   ```
salt '*' ps.get_pid_list
   ```

salt.modules.ps.get_users()
   Return logged-in users.
   CLI Example:
   ```
salt '*' ps.get_users
   ```

salt.modules.ps.kill_pid(pid, signal=15)
   Kill a process by PID.
   ```
salt 'minion' ps.kill_pid pid [signal=signal_number]
   ```
   pid PID of process to kill.
   signal Signal to send to the process. See manpage entry for kill for possible values. Default: 15 (SIGTERM).
   Example:
   Send SIGKILL to process with PID 2000:
   ```
salt 'minion' ps.kill_pid 2000 signal=9
   ```

salt.modules.ps.lsof(name)
   Retrieve the lsof information of the given process name.
   CLI Example:
   ```
salt '*' ps.lsof apache2
   ```

salt.modules.ps.netstat(name)
   Retrieve the netstat information of the given process name.
   CLI Example:
   ```
salt '*' ps.netstat apache2
   ```

salt.modules.ps.network_io_counters(interface=None)
   Return network I/O statistics.
   CLI Example:
salt '***' ps.network_io_counters
salt '***' ps.network_io_counters interface=eth0

salt.modules.ps.num_cpus()
Return the number of CPUs.

CLI Example:
	salt '***' ps.num_cpus

salt.modules.ps.pgrep(pattern, user=None, full=False)
Return the pids for processes matching a pattern.
If full is true, the full command line is searched for a match, otherwise only the name of the command is searched.

pattern Pattern to search for in the process list.
user Limit matches to the given username. Default: All users.
full A boolean value indicating whether only the name of the command or the full command line should be matched against the pattern.

Examples:
Find all httpd processes on all 'www' minions:
	salt 'www.*' ps.pgrep httpd

Find all bash processes owned by user 'tom':
	salt '***' ps.pgrep bash user=tom

salt.modules.ps.pkill(pattern, user=None, signal=15, full=False)
Kill processes matching a pattern.

pattern Pattern to search for in the process list.
user Limit matches to the given username. Default: All users.
signal Signal to send to the process(es). See manpage entry for kill for possible values. Default: 15 (SIGTERM).
full A boolean value indicating whether only the name of the command or the full command line should be matched against the pattern.

Examples:
Send SIGHUP to all httpd processes on all 'www' minions:
	salt 'www.*' ps.pkill httpd signal=1

Send SIGKILL to all bash processes owned by user 'tom':
	salt '***' ps.pkill bash signal=9 user=tom

salt.modules.ps.proc_info(pid, attrs=None)
Return a dictionary of information for a process id (PID).
**CLI Example:**

```bash
salt '*' ps.proc_info 2322
salt '*' ps.proc_info 2322 attrs='["pid", "name"]'
```

**pid**  PID of process to query.
**attrs**  Optional list of desired process attributes. The list of possible attributes can be found here: [http://pythonhosted.org/psutil/#psutil.Process](http://pythonhosted.org/psutil/#psutil.Process)

**salt.modules.ps.psaux(name)**

Retrieve information corresponding to a "ps aux" filtered with the given pattern. It could be just a name or a regular expression (using python search from "re" module).

**CLI Example:**

```bash
salt '*' ps.psaux www-data.+apache2
```

**salt.modules.ps.ss(name)**

Retrieve the ss information of the given process name.

**CLI Example:**

```bash
salt '*' ps.ss apache2
```

New in version 2016.11.6.

**salt.modules.ps.swap_memory()**

New in version 2014.7.0.

Return a dict that describes swap memory statistics.

**Note:**  This function is only available in psutil version 0.6.0 and above.

**CLI Example:**

```bash
salt '*' ps.swap_memory
```

**salt.modules.ps.top(num_processes=5, interval=3)**

Return a list of top CPU consuming processes during the interval.  
**num_processes** = return the top N CPU consuming processes  
**interval** = the number of seconds to sample CPU usage over.

**CLI Examples:**

```bash
salt '*' ps.top
salt '*' ps.top 5 10
```

**salt.modules.ps.total_physical_memory()**

Return the total number of bytes of physical memory.

**CLI Example:**

```bash
salt '*' ps.total_physical_memory
```

**salt.modules.ps.virtual_memory()**

New in version 2014.7.0.

Return a dict that describes statistics about system memory usage.
Note: This function is only available in psutil version 0.6.0 and above.

CLI Example:

```
salt '*' ps.virtual_memory
```

## 21.9.330 `salt.modules.publish`

Publish a command from a minion to a target

```python
salt.modules.publish.full_data(tgt, fun, arg=None, tgt_type='glob', returner='', timeout=5)
```

Return the full data about the publication, this is invoked in the same way as the publish function

CLI Example:

```
salt system.example.com publish.full_data '*' cmd.run 'ls -la /tmp'
```

**Attention**

If you need to pass a value to a function argument and that value contains an equal sign, you must include the argument name. For example:

```
salt '*' publish.full_data test.kwarg arg='cheese=spam'
```

```python
salt.modules.publish.publish(tgt, fun, arg=None, tgt_type='glob', returner='', timeout=5, via_master=None)
```

Publish a command from the minion out to other minions.

Publications need to be enabled on the Salt master and the minion needs to have permission to publish the command. The Salt master will also prevent a recursive publication loop, this means that a minion cannot command another minion to command another minion as that would create an infinite command loop.

The `tgt_type` argument is used to pass a target other than a glob into the execution, the available options are:

- `glob`
- `pcre`
- `grain`
- `grain_pcre`
- `pillar`
- `pillar_pcre`
- `ipcidr`
- `range`
- `compound`

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Note that for pillar matches must be exact, both in the pillar matcher and the compound matcher. No globbing is supported.

The arguments sent to the minion publish function are separated with commas. This means that for a minion executing a command with multiple args it will look like this:

```
salt system.example.com publish.publish '*' user.add 'foo,1020,1020'
salt system.example.com publish.publish 'os:Fedora' network.interfaces '' grain
```
CLI Example:

```
salt system.example.com publish.publish '*' cmd.run 'ls -la /tmp'
```

**Attention**

If you need to pass a value to a function argument and that value contains an equal sign, you must include the argument name. For example:

```
salt '*' publish.publish test.kwarg arg='cheese=spam'
```

Multiple keyword arguments should be passed as a list.

```
salt '*' publish.publish test.kwarg arg="['cheese=spam','spam=cheese']"
```

When running via salt-call, the `via_master` flag may be set to specific which master the publication should be sent to. Only one master may be specified. If unset, the publication will be sent only to the first master in minion configuration.

salt.modules.publish.run**ner**(fun, arg=None, timeout=5)

Execute a runner on the master and return the data from the runner function

CLI Example:

```
salt publish.runner manage.down
```

### 21.9.331 salt.modules.puppet

Execute puppet routines

salt.modules.puppet.disable*(message=*)

New in version 2014.7.0.

Disable the puppet agent

message New in version 2015.5.2.

Disable message to send to puppet

CLI Example:

```
salt '*' puppet.disable
salt '*' puppet.disable 'Disabled, contact XYZ before enabling'
```

salt.modules.puppet.enable()

New in version 2014.7.0.

Enable the puppet agent

CLI Example:

```
salt '*' puppet.enable
```

salt.modules.puppet.fact(name, puppet=False)

Run facter for a specific fact

CLI Example:
salt '*' puppet.fact kernel

salt.modules.puppet.facts(puppet=False)
Run facter and return the results
CLI Example:
salt 'localhost' puppet.facts

salt.modules.puppet.noop(*args, **kwargs)
Execute a puppet noop run and return a dict with the stderr, stdout, return code, etc. Usage is the same as for puppet.run.
CLI Example:
salt '*' puppet.noop
salt '*' puppet.noop tags=basefiles::edit,apache::server
salt '*' puppet.noop debug
salt '*' puppet.noop apply /a/b/manifest.pp modulepath=/a/b/modules
  → tags=basefiles::edit,apache::server

salt.modules.puppet.plugin_sync()
Runs a plugin sync between the puppet master and agent
CLI Example:
salt '*' puppet.plugin_sync

salt.modules.puppet.run(*args, **kwargs)
Execute a puppet run and return a dict with the stderr, stdout, return code, etc. The first positional argument given is checked as a subcommand. Following positional arguments should be ordered with arguments required by the subcommand first, followed by non-keyword arguments. Tags are specified by a tag keyword and comma separated list of values. – http://docs.puppetlabs.com/puppet/latest/reference/lang_tags.html
CLI Examples:
salt '*' puppet.run
salt '*' puppet.run tags=basefiles::edit,apache::server
salt '*' puppet.run agent onetime no-daemonize no-usecacheonfailure no-splay
  → ignorecache
salt '*' puppet.run debug
salt '*' puppet.run apply /a/b/manifest.pp modulepath=/a/b/modules
  → tags=basefiles::edit,apache::server

salt.modules.puppet.status()
New in version 2014.7.0.
Display puppet agent status
CLI Example:
salt '*' puppet.status

salt.modules.puppet.summary()
New in version 2014.7.0.
Show a summary of the last puppet agent run
CLI Example:
21.9.332 salt.modules.purefa

Management of Pure Storage FlashArray

Installation Prerequisites

- You will need the `purestorage` python package in your python installation path that is running salt.

```bash
pip install purestorage
```

- Configure Pure Storage FlashArray authentication. Use one of the following three methods.
  1) From the minion config

```yaml
pure_tags:
  fa:
    san_ip: management vip or hostname for the FlashArray
    api_token: A valid api token for the FlashArray being managed
```

  2) From environment (PUREFA_IP and PUREFA_API)

  3) From the pillar (PUREFA_IP and PUREFA_API)

**maintainer** Simon Dodsley (simon@purestorage.com)

**maturity** new

**requires** purestorage

**platform** all

New in version 2018.3.0.

salt.modules.purefa.hg_create(name, host=None, volume=None)

Create a hostgroup on a Pure Storage FlashArray.

Will return False if hostgroup already exists, or if named host or volume do not exist.

New in version 2018.3.0.

- name [string] name of hostgroup (truncated to 63 characters)
- host [string] name of host to add to hostgroup
- volume [string] name of volume to add to hostgroup

**CLI Example:**

```bash
salt '*' purefa.hg_create foo host=bar volume=vol
```

salt.modules.purefa.hg_delete(name)

Delete a hostgroup on a Pure Storage FlashArray (removes all volumes and hosts).

Will return False if hostgroup is already in a deleted state.

New in version 2018.3.0.

- name [string] name of hostgroup

**CLI Example:**

```bash
salt '*' purefa.hg_delete foo
```
salt.modules.purefa.hg_remove(name, volume=None, host=None)

Remove a host and/or volume from a hostgroup on a Pure Storage FlashArray.

Will return False if hostgroup does not exist, or named host or volume are not in the hostgroup.

New in version 2018.3.0.

name [string] name of hostgroup
volume [string] name of volume to remove from hostgroup
host [string] name of host to remove from hostgroup

CLI Example:

```
salt '*' purefa.hg_remove foo volume=test host=bar
```

salt.modules.purefa.hg_update(name, host=None, volume=None)

Adds entries to a hostgroup on a Pure Storage FlashArray.

Will return False if hostgroup doesn’t exist, or host or volume do not exist.

New in version 2018.3.0.

name [string] name of hostgroup
host [string] name of host to add to hostgroup
volume [string] name of volume to add to hostgroup

CLI Example:

```
salt '*' purefa.hg_update foo host=bar volume=vol
```

salt.modules.purefa.host_create(name, iqn=None, wwn=None)

Add a host on a Pure Storage FlashArray.

Will return False if host already exists, or the iSCSI or Fibre Channel parameters are not in a valid format. See Pure Storage FlashArray documentation.

New in version 2018.3.0.

name [string] name of host (truncated to 63 characters)
iqn [string] iSCSI IQN of host
wwn [string] Fibre Channel WWN of host

CLI Example:

```
salt '*' purefa.host_create foo iqn='<Valid iSCSI IQN>' wwn='<Valid WWN>'
```

salt.modules.purefa.host_delete(name)

Delete a host on a Pure Storage FlashArray (detaches all volumes).

Will return False if the host doesn’t exist.

New in version 2018.3.0.

name [string] name of host

CLI Example:

```
salt '*' purefa.host_delete foo
```

salt.modules.purefa.host_update(name, iqn=None, wwn=None)

Update a host’s port definitions on a Pure Storage FlashArray.

Will return False if new port definitions are already in use by another host, or are not in a valid format. See Pure Storage FlashArray documentation.

New in version 2018.3.0.

name [string] name of host
iqn [string] Additional iSCSI IQN of host
wwn [string] Additional Fibre Channel WWN of host

CLI Example:
```
salt '*' purefa.host_update foo iqn='<Valid iSCSI IQN>' wnn='<Valid WWN>'
```

salt.modules.purefa.pg_create(name, hostgroup=None, host=None, volume=None, enabled=True)
Create a protection group on a Pure Storage FlashArray.

Will return False is the following cases:

- Protection Group already exists
- Protection Group in a deleted state
- More than one type is specified - protection groups are for only hostgroups, hosts or volumes
- Named type for protection group does not exist

New in version 2018.3.0.

name [string] name of protection group

hostgroup [string] name of hostgroup to add to protection group

host [string] name of host to add to protection group

volume [string] name of volume to add to protection group

CLI Example:
```
salt '*' purefa.pg_create foo [hostgroup=foo | host=bar | volume=vol]!
```

salt.modules.purefa.pg_delete(name, eradicate=False)
Delete a protection group on a Pure Storage FlashArray.

Will return False if protection group is already in a deleted state.

New in version 2018.3.0.

name [string] name of protection group

CLI Example:
```
salt '*' purefa.pg_delete foo
```

salt.modules.purefa.pg_eradicate(name)

Eradicate a deleted protection group on a Pure Storage FlashArray.

Will return False if protection group is not in a deleted state.

New in version 2018.3.0.

name [string] name of protection group

CLI Example:
```
salt '*' purefa.pg_eradicate foo
```

salt.modules.purefa.pg_remove(name, hostgroup=None, host=None, volume=None)

Remove a hostgroup, host or volume from a protection group on a Pure Storage FlashArray.

Will return False in the following cases:

- Protection group does not exist
- Specified type is not currently associated with the protection group

New in version 2018.3.0.

name [string] name of hostgroup

hostgroup [string] name of hostgroup to remove from protection group

host [string] name of host to remove from hostgroup

volume [string] name of volume to remove from hostgroup

CLI Example:
salt '(*' purefa.pg_remove foo [hostgroup=bar | host=test | volume=bar]

salt.modules.purefa.pg_update(name, hostgroup=None, host=None, volume=None)
Update a protection group on a Pure Storage FlashArray.
Will return False in the following cases:
- Protection group does not exist
- Incorrect type selected for current protection group type
- Specified type does not exist
New in version 2018.3.0.
name [string] name of protection group
hostgroup [string] name of hostgroup to add to protection group
host [string] name of host to add to protection group
volume [string] name of volume to add to protection group
CLI Example:
salt '(*' purefa.pg_update foo [hostgroup=foo | host=bar | volume=vol]

salt.modules.purefa.snap_create(name, suffix=None)
Create a volume snapshot on a Pure Storage FlashArray.
Will return False if volume selected to snap does not exist.
New in version 2018.3.0.
name [string] name of volume to snapshot
suffix [string] if specified forces snapshot name suffix. If not specified defaults to timestamp.
CLI Example:
salt '(*' purefa.snap_create foo
salt '(*' purefa.snap_create foo suffix=bar

salt.modules.purefa.snap_delete(name, suffix=None, eradicate=False)
Delete a volume snapshot on a Pure Storage FlashArray.
Will return False if selected snapshot does not exist.
New in version 2018.3.0.
name [string] name of volume
suffix [string] name of snapshot
eradicate [boolean] Eradicate snapshot after deletion if True. Default is False
CLI Example:
salt '(*' purefa.snap_delete foo suffix=snap eradicate=True

salt.modules.purefa.snap_eradicate(name, suffix=None)
Eradicate a deleted volume snapshot on a Pure Storage FlashArray.
Will return False if snapshot is not in a deleted state.
New in version 2018.3.0.
name [string] name of volume
suffix [string] name of snapshot
CLI Example:
salt '(*' purefa.snap_eradicate foo suffix=snap

salt.modules.purefa.snap_volume_create(name, target, overwrite=False)
Create R/W volume from snapshot on a Pure Storage FlashArray.
Will return False if target volume already exists and overwrite is not specified, or selected snapshot doesn’t exist.

New in version 2018.3.0.

**name** [string] name of volume snapshot

**target** [string] name of clone volume

**overwrite** [boolean] overwrite clone if already exists (default: False)

CLI Example:

```
salt '*' purefa.snap_volume_create foo.bar clone overwrite=True
```

salt.modules.purefa.volume_attach(name, host)

Attach a volume to a host on a Pure Storage FlashArray.

Host and volume must exist or else will return False.

New in version 2018.3.0.

**name** [string] name of volume

**host** [string] name of host

CLI Example:

```
salt '*' purefa.volume_attach foo bar
```

salt.modules.purefa.volume_clone(name, target, overwrite=False)

Clone an existing volume on a Pure Storage FlashArray.

Will return False if source volume doesn’t exist, or target volume already exists and overwrite not specified.

New in version 2018.3.0.

**name** [string] name of volume

**target** [string] name of clone volume

**overwrite** [boolean] overwrite clone if already exists (default: False)

CLI Example:

```
salt '*' purefa.volume_clone foo bar overwrite=True
```

salt.modules.purefa.volume_create(name, size=None)

Create a volume on a Pure Storage FlashArray.

Will return False if volume already exists.

New in version 2018.3.0.

**name** [string] name of volume (truncated to 63 characters)

**size** [string] if specified capacity of volume. If not specified default to 1G. Refer to Pure Storage documentation for formatting rules.

CLI Example:

```
salt '*' purefa.volume_create foo
salt '*' purefa.volume_create foo size=10T
```

salt.modules.purefa.volume_delete(name, eradicate=False)

Delete a volume on a Pure Storage FlashArray.

Will return False if volume doesn’t exist is already in a deleted state.

New in version 2018.3.0.

**name** [string] name of volume

**eradicate** [boolean] Eradicate volume after deletion if True. Default is False

CLI Example:
salt '*' purefa.volume_delete foo eradicate=True

salt.modules.purefa.volume_detach(name, host)
Detach a volume from a host on a Pure Storage FlashArray.

Will return False if either host or volume do not exist, or if selected volume isn’t already connected to the host.

New in version 2018.3.0.

name [string] name of volume
host [string] name of host

CLI Example:
	salt '*' purefa.volume_detach foo bar

salt.modules.purefa.volume_eradicate(name)
Eradicate a deleted volume on a Pure Storage FlashArray.

Will return False is volume is not in a deleted state.

New in version 2018.3.0.

name [string] name of volume

CLI Example:
	salt '*' purefa.volume_eradicate foo

salt.modules.purefa.volume_extend(name, size)
Extend an existing volume on a Pure Storage FlashArray.

Will return False if new size is less than or equal to existing size.

New in version 2018.3.0.

name [string] name of volume
size [string] New capacity of volume. Refer to Pure Storage documentation for formatting rules.

CLI Example:
	salt '*' purefa.volume_extend foo 10T

21.9.333 salt.modules.purefb

Management of Pure Storage FlashBlade

Installation Prerequisites

- You will need the purity_fb python package in your python installation path that is running salt.

  pip install purity_fb

- Configure Pure Storage FlashBlade authentication. Use one of the following three methods.

  1) From the minion config

  pure_tags:
   fb:
     san_ip: management vip or hostname for the FlashBlade
     api_token: A valid api token for the FlashBlade being managed

  2) From environment (PUREFB_IP and PUREFB_API)
3) From the pillar (PUREFB_IP and PUREFB_API)

**maintainer** Simon Dodsley (simon@purestorage.com)

**maturity** new

**requires** purestorage

**platform** all

New in version 2019.2.0.

salt.modules.purefb.fs_create(name, size=None, proto='NFS', nfs_rules='*(rw, no_root_squash)', snapshot=False)

Create a filesystem on a Pure Storage FlashBlade.

Will return False if filesystem already exists.

New in version 2019.2.0.

**name** [string] name of filesystem (truncated to 63 characters)

**proto** [string] (Optional) Sharing protocol (NFS, CIFS or HTTP). If not specified default is NFS

**snapshot** [boolean] (Optional) Are snapshots enabled on the filesystem. Default is False

**nfs_rules** [string] (Optional) export rules for NFS. If not specified default is *(rw, no_root_squash)*. Refer to Pure Storage documentation for formatting rules.

**size** [string] if specified capacity of filesystem. If not specified default to 32G. Refer to Pure Storage documentation for formatting rules.

CLI Example:

```bash
salt '*' purefb.fs_create foo proto=CIFS
salt '*' purefb.fs_create foo size=10T
```

salt.modules.purefb.fs_delete(name, eradicate=False)

Delete a share on a Pure Storage FlashBlade.

Will return False if filesystem doesn’t exist or is already in a deleted state.

New in version 2019.2.0.

**name** [string] name of filesystem

**eradicate** [boolean] (Optional) Eradicate filesystem after deletion if True. Default is False

CLI Example:

```bash
salt '*' purefb.fs_delete foo eradicate=True
```

salt.modules.purefb.fs_eradicate(name)

Eradicate a deleted filesystem on a Pure Storage FlashBlade.

Will return False if filesystem is not in a deleted state.

New in version 2019.2.0.

**name** [string] name of filesystem

CLI Example:

```bash
salt '*' purefb.fs_eradicate foo
```

salt.modules.purefb.fs_extend(name, size)

Resize an existing filesystem on a Pure Storage FlashBlade.

Will return False if new size is less than or equal to existing size.

New in version 2019.2.0.

**name** [string] name of filesystem

**size** [string] New capacity of filesystem. Refer to Pure Storage documentation for formatting rules.
## Pure Storage FlashBlade Module Reference

### purefb.fs_extend

**CLI Example:**
```
salt '*' purefb.fs_extend foo 10T
```

**Function:**
`salt.modules.purefb.fs_update(name, rules, snapshot=False)`

**Description:**
Update filesystem on a Pure Storage FlashBlade.

**New in version 2019.2.0.**

- **name** (string) name of filesystem
- **rules** (string) NFS export rules for filesystem Refer to Pure Storage documentation for formatting rules.
- **snapshot** (boolean) (Optional) Enable/Disable snapshots on the filesystem. Default is False

**CLI Example:**
```
salt '*' purefb.fs_nfs_update foo rules='10.234.112.23(ro), 10.234.112.24(rw)'
```

### purefb.snap_create

**CLI Example:**
```
salt '*' purefb.snap_create foo
salt '*' purefb.snap_create foo suffix=bar
```

**Function:**
`salt.modules.purefb.snap_create(name, suffix=None)`

**Description:**
Create a filesystem snapshot on a Pure Storage FlashBlade.

**New in version 2019.2.0.**

- **name** (string) name of filesystem to snapshot
- **suffix** (string) if specified forces snapshot name suffix. If not specified defaults to timestamp.

**CLI Example:**
```
salt '*' purefb.snap_create foo suffix=bar
```

### purefb.snap_delete

**CLI Example:**
```
salt '*' purefb.snap_delete foo suffix=snap eradicate=True
```

**Function:**
`salt.modules.purefb.snap_delete(name, suffix=None, eradicate=False)`

**Description:**
Delete a filesystem snapshot on a Pure Storage FlashBlade.

**New in version 2019.2.0.**

- **name** (string) name of filesystem
- **suffix** (string) name of snapshot
- **eradicate** (boolean) Eradicate snapshot after deletion if True. Default is False

**CLI Example:**
```
salt '*' purefb.snap_delete foo suffix=snap eradicate=True
```

### purefb.snap_eradicate

**CLI Example:**
```
salt '*' purefb.snap_eradicate foo suffix=snap
```

**Function:**
`salt.modules.purefb.snap_eradicate(name, suffix=None)`

**Description:**
Eradicate a deleted filesystem snapshot on a Pure Storage FlashBlade.

**New in version 2019.2.0.**

- **name** (string) name of filesystem
- **suffix** (string) name of snapshot
21.9.334 saltnodes.pushbullet module

Module for sending messages to Pushbullet (https://www.pushbullet.com)
New in version 2015.8.0.
Requires an api_key in /etc/salt/minion:

For example:

```yaml
pushbullet:
  device: "Chrome"
  title: "Example push message"
  body: "Message body."
```

```
salt.modules.pushbullet.push_note(device=None, title=None, body=None)
```

Pushing a text note.

Parameters

- **device** – Pushbullet target device
- **title** – Note title
- **body** – Note body

Returns

Boolean if message was sent successfully.

CLI Example:

```
salt "+" pushbullet.push_note device="Chrome" title="Example title" body="Example body."
```

21.9.335 saltnodes.pushover_notify

Module for sending messages to Pushover (https://www.pushover.net)
New in version 2016.3.0.

**configuration** This module can be used by either passing an api key and version directly or by specifying
both in a configuration profile in the salt master/minion config.

For example:

```
pushover:
  token: abAHuZyCLtdH8P4zhmFZmgUHUsv1e18
```

```
salt.modules.pushover_notify.post_message(user=None, device=None, message=None, title=None, priority=None, expire=None, retry=None, sound=None, api_version=1, token=None)
```

Send a message to a Pushover user or group.

Parameters

- **user** – The user or group to send to, must be key of user or group not email address.
- **message** – The message to send to the PushOver user or group.
- **title** – Specify who the message is from.
- **priority** – The priority of the message, defaults to 0.
- **expire** – The message should expire after N number of seconds.
- **retry** – The number of times the message should be retried.
- **sound** – The sound to associate with the message.
- **api_version** – The PushOver API version, if not specified in the configuration.
- **token** – The PushOver token, if not specified in the configuration.

Returns

Boolean if message was sent successfully.
CLI Example:

```
salt '*' pushover.post_message user='xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx' title=
'Message from Salt' message='Build is done'
salt '*' pushover.post_message user='xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx' title=
'Message from Salt' message='Build is done' priority='2' expire='720' retry='5'
```

21.9.336 salt.modules.pw_group

Manage groups on FreeBSD

**Important:** If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to 'group.info' is not available), see [here](https://docs.saltstack.com/en/latest/).

```
salt.modules.pw_group.add(name, gid=None, **kwargs)
    Add the specified group
    CLI Example:
    salt '*' group.add foo 3456
```

```
salt.modules.pw_group.adduser(name, username)
    Add a user in the group.
    CLI Example:
    salt '*' group.adduser foo bar
```

Verifies if a valid username 'bar' as a member of an existing group 'foo', if not then adds it.

```
salt.modules.pw_group.chgid(name, gid)
    Change the gid for a named group
    CLI Example:
    salt '*' group.chgid foo 4376
```

```
salt.modules.pw_group.delete(name)
    Remove the named group
    CLI Example:
    salt '*' group.delete foo
```

```
salt.modules.pw_group.deluser(name, username)
    Remove a user from the group.
    CLI Example:
    salt '*' group.deluser foo bar
```

Removes a member user 'bar' from a group 'foo'. If group is not present then returns True.

```
salt.modules.pw_group.getent(refresh=False)
    Return info on all groups
    CLI Example:
```
salt '***' group.getent

```
salt.modules.pw_group.info(name)
   Return information about a group
   CLI Example:
   salt '***' group.info foo
```

```
salt.modules.pw_group.members(name, members_list)
   Replaces members of the group with a provided list.
   New in version 2015.5.4.
   CLI Example:
   salt '***' group.members foo 'user1,user2,user3,...'
```

Replaces a membership list for a local group 'foo': foo:x:1234:user1,user2,user3,...

21.9.337 salt.modules.pw_user

Manage users with the pw command

**Important:** If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to 'user.info' is not available), see here.

```
salt.modules.pw_user.add(name, uid=None, gid=None, groups=None, home=None, shell=None, unique=True, fullname='', roomnumber='', workphone='', homephone='', createhome=True, loginclass=None, **kwargs)
   Add a user to the minion
   CLI Example:
   salt '***' user.add name <uid> <gid> <groups> <home> <shell>
```

```
salt.modules.pw_user.chfullname(name, fullname)
   Change the user’s Full Name
   CLI Example:
   salt '***' user.chfullname foo "Foo Bar"
```

```
salt.modules.pw_user.chgid(name, gid)
   Change the default group of the user
   CLI Example:
   salt '***' user.chgid foo 4376
```

```
salt.modules.pw_user.chgroups(name, groups, append=False)
   Change the groups to which a user belongs
   name Username to modify
   groups List of groups to set for the user. Can be passed as a comma-separated list or a Python list.
   append [False] Set to True to append these groups to the user’s existing list of groups. Otherwise, the specified groups will replace any existing groups for the user.
   CLI Example:
```

21.9. execution modules
salt '*' user.chgroups foo wheel,root True

salt.modules.pw_user.chhome(name, home, persist=False)
Set a new home directory for an existing user
name Username to modify
home New home directory to set
persist [False] Set to True to prevent configuration files in the new home directory from being overwritten by the files from the skeleton directory.
CLI Example:
salt '*' user.chhome foo /home/users/foo True

salt.modules.pw_user.chhomephone(name, homephone)
Change the user’s Home Phone
CLI Example:
salt '*' user.chhomephone foo "7735551234"

salt.modules.pw_user.chloginclass(name, loginclass, root=None)
Change the default login class of the user
New in version 2016.3.5.
CLI Example:
salt '*' user.chloginclass foo staff

salt.modules.pw_user.chroomnumber(name, roomnumber)
Change the user’s Room Number
CLI Example:
salt '*' user.chroomnumber foo 123

salt.modules.pw_user.chshell(name, shell)
Change the default shell of the user
CLI Example:
salt '*' user.chshell foo /bin/zsh

salt.modules.pw_user.chuid(name, uid)
Change the uid for a named user
CLI Example:
salt '*' user.chuid foo 4376

salt.modules.pw_user.chworkphone(name, workphone)
Change the user’s Work Phone
CLI Example:
salt '*' user.chworkphone foo "7735550123"

salt.modules.pw_user.delete(name, remove=False, force=False)
Remove a user from the minion
CLI Example:
salt.modules.pw_user.get_loginclass(name)
Get the login class of the user
New in version 2016.3.0.
CLI Example:
```
salt '*' user.get_loginclass foo
```

salt.modules.pw_user.getent(refresh=False)
Return the list of all info for all users
CLI Example:
```
salt '*' user.getent
```

salt.modules.pw_user.info(name)
Return user information
CLI Example:
```
salt '*' user.info root
```

salt.modules.pw_user.list_groups(name)
Return a list of groups the named user belongs to
CLI Example:
```
salt '*' user.list_groups foo
```

salt.modules.pw_user.list_users()
Return a list of all users
CLI Example:
```
salt '*' user.list_users
```

salt.modules.pw_user.rename(name, new_name)
Change the username for a named user
CLI Example:
```
salt '*' user.rename name new_name
```

21.9.338  salt.modules.pyenv
Manage python installations with pyenv.

Note:  Git needs to be installed and available via PATH if pyenv is to be installed automatically by the module.

New in version v2014.04.
salt.modules.pyenv.default(python=None, runas=None)
Returns or sets the currently defined default python.
The version to set as the default. Should match one of the versions listed by `pyenv.versions`. Leave blank to return the current default.

CLI Example:

```
salt '*' pyenv.default
salt '*' pyenv.default 2.0.0-p0
```

salt.modules.pyenv.do(cmdline=None, runas=None)

Execute a python command with pyenv’s shims from the user or the system.

CLI Example:

```
salt '*' pyenv.do 'gem list bundler'
salt '*' pyenv.do 'gem list bundler' deploy
```

salt.modules.pyenv.do_with_python(python, cmdline=None, runas=None)

Execute a python command with pyenv’s shims using a specific python version.

CLI Example:

```
salt '*' pyenv.do_with_python 2.0.0-p0 'gem list bundler'
salt '*' pyenv.do_with_python 2.0.0-p0 'gem list bundler' deploy
```

salt.modules.pyenv.install(runas=None, path=None)

Install pyenv systemwide

CLI Example:

```
salt '*' pyenv.install
```

salt.modules.pyenv.install_python(python, runas=None)

Install a python implementation.

CLI Example:

```
salt '*' pyenv.install_python 2.0.0-p0
```

salt.modules.pyenv.is_installed(runas=None)

Check if pyenv is installed.

CLI Example:

```
salt '*' pyenv.is_installed
```

salt.modules.pyenv.list_(runas=None)

List the installable versions of python.

CLI Example:

```
salt '*' pyenv.list
```

salt.modules.pyenv.rehash(runas=None)

Run pyenv rehash to update the installed shims.

CLI Example:

```
salt '*' pyenv.rehash
```

salt.modules.pyenv.uninstall_python(python, runas=None)

Uninstall a python implementation.
**python** The version of python to uninstall. Should match one of the versions listed by `pyenv.versions`

CLI Example:
```
salt '*' pyenv.uninstall_python 2.0.0-p0
```

**salt.modules.pyenv.update** *(runas=None, path=None)*

Updates the current versions of pyenv and python-Build

CLI Example:
```
salt '*' pyenv.update
```

**salt.modules.pyenv.versions** *(runas=None)*

List the installed versions of python.

CLI Example:
```
salt '*' pyenv.versions
```

### 21.9.339 salt.modules.qemu_img

**Qemu-img Command Wrapper**

The qemu img command is wrapped for specific functions

**depends** qemu-img

**salt.modules.qemu_img.convert** *(orig, dest, fmt)*

Convert an existing disk image to another format using qemu-img

CLI Example:
```
salt '*' qemu_img.convert /path/to/original.img /path/to/new.img qcow2
```

**salt.modules.qemu_img.make_image** *(location, size, fmt)*

Create a blank virtual machine image file of the specified size in megabytes. The image can be created in any format supported by qemu

CLI Example:
```
salt '*' qemu_img.make_image /tmp/image.qcow 2048 qcow2
salt '*' qemu_img.make_image /tmp/image.raw 10240 raw
```

### 21.9.340 salt.modules.qemu_nbd

**Qemu Command Wrapper**

The qemu system comes with powerful tools, such as qemu-img and qemu-nbd which are used here to build up kvm images.

**salt.modules.qemu_nbd.clear** *(mnt)*

Pass in the mnt dict returned from nbd_mount to unmount and disconnect the image from nbd. If all of the partitions are unmounted return an empty dict, otherwise return a dict containing the still mounted partitions

CLI Example:
### salt.modules.qemu_nbd

#### connect(image)
Activate nbd for an image file.

**CLI Example:**
```python
salt '*' qemu_nbd.connect '/dev/nbd0p1
```

#### init(image, root=None)
Mount the named image via qemu-nbd and return the mounted roots

**CLI Example:**
```python
salt '*' qemu_nbd.init /srv/image.qcow2
```

#### mount(nbd, root=None)
Pass in the nbd connection device location, mount all partitions and return a dict of mount points

**CLI Example:**
```python
salt '*' qemu_nbd.mount /dev/nbd0
```

### 21.9.341 salt.modules.quota

Module for managing quotas on POSIX-like systems.

#### get_mode(device)
Report whether the quota system for this device is on or off

**CLI Example:**
```python
salt '*' quota.get_mode
```

#### off(device)
Turns off the quota system

**CLI Example:**
```python
salt '*' quota.off
```

#### on(device)
Turns on the quota system

**CLI Example:**
```python
salt '*' quota.on
```

#### report(mount)
Report on quotas for a specific volume

**CLI Example:**
```python
salt '*' quota.report /media/data
```

#### set_(device, **kwargs)
Calls out to setquota, for a specific user or group

**CLI Example:**
```python
```
salt.modules.quota.stats()
Runs the quotastats command, and returns the parsed output

   CLI Example:

salt.modules.quota.stats

salt.modules.quota.warn()
Runs the warnquota command, to send warning emails to users who are over their quota limit.

   CLI Example:

salt.modules.quota.warn

21.9.342 salt.modules.rabbitmq

Module to provide RabbitMQ compatibility to Salt. Todo: A lot, need to add cluster support, logging, and minion configuration data.

salt.modules.rabbitmq.add_user(name, password=None, runas=None)
Add a rabbitMQ user via rabbitmqctl user_add <user> <password>

   CLI Example:

salt '*' rabbitmq.add_user rabbit_user password

salt.modules.rabbitmq.add_vhost(vhost, runas=None)
Add a vhost via rabbitmqctl add_vhost.

   CLI Example:

salt '*' rabbitmq.add_vhost '<vhost_name>'

salt.modules.rabbitmq.change_password(name, password, runas=None)
Changes a user’s password.

   CLI Example:

salt '*' rabbitmq.change_password rabbit_user password

salt.modules.rabbitmq.check_password(name, password, runas=None)
New in version 2016.3.0.
Checks if a user's password is valid.

   CLI Example:

salt '*' rabbitmq.check_password rabbit_user password

salt.modules.rabbitmq.clear_password(name, runas=None)
Removes a user's password.

   CLI Example:
salt ' '* rabbitmq.clear_password rabbit_user

```python
salt.modules.rabbitmq.cluster_status(runas=None)
return rabbitmq.cluster_status
```

CLI Example:
```
salt ' '* rabbitmq.cluster_status
```

salt.modules.rabbitmq.delete_policy(vhost, name, runas=None)
Delete a policy based on rabbitmqctl clear_policy.

Reference: http://www.rabbitmq.com/ha.html

CLI Example:
```
salt ' '* rabbitmq.delete_policy / HA
```

salt.modules.rabbitmq.delete_user(name, runas=None)
Deletes a user via rabbitmqctl delete_user.

CLI Example:
```
salt ' '* rabbitmq.delete_user rabbit_user
```

salt.modules.rabbitmq.delete_vhost(vhost, runas=None)
Deletes a vhost rabbitmqctl delete_vhost.

CLI Example:
```
salt ' '* rabbitmq.delete_vhost '<vhost_name>'
```

salt.modules.rabbitmq.disable_plugin(name, runas=None)
Disable a RabbitMQ plugin via the rabbitmq-plugins command.

CLI Example:
```
salt ' '* rabbitmq.disable_plugin foo
```

salt.modules.rabbitmq.enable_plugin(name, runas=None)
Enable a RabbitMQ plugin via the rabbitmq-plugins command.

CLI Example:
```
salt ' '* rabbitmq.enable_plugin foo
```

salt.modules.rabbitmq.force_reset(runas=None)
Forcefully Return a RabbitMQ node to its virgin state

CLI Example:
```
salt ' '* rabbitmq.force_reset
```

salt.modules.rabbitmq.join_cluster(host, user='rabbit', ram_node=None, runas=None)
Join a rabbit cluster

CLI Example:
```
salt ' '* rabbitmq.join_cluster rabbit.example.com rabbit
```
salt.modules.rabbitmq.list_available_plugins(runas=None)
Returns a list of the names of all available plugins (enabled and disabled).

CLI Example:
salt '*' rabbitmq.list_available_plugins

salt.modules.rabbitmq.list_enabled_plugins(runas=None)
Returns a list of the names of the enabled plugins.

CLI Example:
salt '*' rabbitmq.list_enabled_plugins

salt.modules.rabbitmq.list_permissions(vhost, runas=None)
Lists permissions for vhost via rabbitmqctl list_permissions

CLI Example:
salt '*' rabbitmq.list_permissions /myvhost

salt.modules.rabbitmq.list_policies(vhost='/', runas=None)
Return a dictionary of policies nested by vhost and name based on the data returned from rabbitmqctl list_policies.

Reference: http://www.rabbitmq.com/ha.html

CLI Example:
salt '*' rabbitmq.list_policies

salt.modules.rabbitmq.list_queues(runas=None, *args)
Returns queue details of the / virtual host

CLI Example:
salt '*' rabbitmq.list_queues messages consumers

salt.modules.rabbitmq.list_queues_vhost(vhost, runas=None, *args)
Returns queue details of specified virtual host. This command will consider first parameter as the vhost name and rest will be treated as queueinfoitem. For getting details on vhost /, use list_queues instead.

CLI Example:
salt '*' rabbitmq.list_queues_vhost messages consumers

salt.modules.rabbitmq.list_user_permissions(name, runas=None)
List permissions for a user via rabbitmqctl list_user_permissions

CLI Example:
salt '*' rabbitmq.list_user_permissions user

salt.modules.rabbitmq.list_users(runas=None)
Return a list of users based off of rabbitmqctl user_list.

CLI Example:
salt '*' rabbitmq.list_users
salt.modules.rabbitmq.list_vhosts(runas=None)
Return a list of vhost based on rabbitmqctl list_vhosts.

CLI Example:
salt '*' rabbitmq.list_vhosts

salt.modules.rabbitmq.plugin_is_enabled(name, runas=None)
Return whether the plugin is enabled.

CLI Example:
salt '*' rabbitmq.plugin_is_enabled rabbitmq_plugin_name

salt.modules.rabbitmq.policy_exists(vhost, name, runas=None)
Return whether the policy exists based on rabbitmqctl list_policies.

Reference: http://www.rabbitmq.com/ha.html
CLI Example:
salt '*' rabbitmq.policy_exists / HA

salt.modules.rabbitmq.reset(runas=None)
Return a RabbitMQ node to its virgin state

CLI Example:
salt '*' rabbitmq.reset

salt.modules.rabbitmq.set_permissions(vhost, user, conf='.*', write='.*', read='.*', runas=None)
Sets permissions for vhost via rabbitmqctl set_permissions

CLI Example:
salt '*' rabbitmq.set_permissions myvhost myuser

salt.modules.rabbitmq.set_policy(vhost, name, pattern, definition, priority=None, runas=None, apply_to=None)
Set a policy based on rabbitmqctl set_policy.

Reference: http://www.rabbitmq.com/ha.html
CLI Example:
salt '*' rabbitmq.set_policy / HA '*.x' '{"ha-mode":"all"}'

salt.modules.rabbitmq.set_user_tags(name, tags, runas=None)
Add user tags via rabbitmqctl set_user_tags

CLI Example:
salt '*' rabbitmq.set_user_tags myadmin administrator

salt.modules.rabbitmq.start_app(runas=None)
Start the RabbitMQ application.

CLI Example:
salt '*' rabbitmq.start_app
salt.modules.rabbitmq.status

return rabbitmq status

CLI Example:

```bash
salt '*' rabbitmq.status
```

salt.modules.rabbitmq.stop_app

Stops the RabbitMQ application, leaving the Erlang node running.

CLI Example:

```bash
salt '*' rabbitmq.stop_app
```

salt.modules.rabbitmq.user_exists

Return whether the user exists based on rabbitmqctl list_users.

CLI Example:

```bash
salt '*' rabbitmq.user_exists rabbit_user
```

salt.modules.rabbitmq.vhost_exists

Return whether the vhost exists based on rabbitmqctl list_vhosts.

CLI Example:

```bash
salt '*' rabbitmq.vhost_exists rabbit_host
```

21.9.343 salt.modules.raet_publish

Publish a command from a minion to a target

salt.modules.raet_publish.full_data

Return the full data about the publication, this is invoked in the same way as the publish function

CLI Example:

```bash
salt system.example.com publish.full_data '*' cmd.run 'ls -la /tmp'
```

Attention

If you need to pass a value to a function argument and that value contains an equal sign, you must include the argument name. For example:

```bash
salt '*' publish.full_data test.kwarg arg='cheese=spam'
```

salt.modules.raet_publish.publish

Publish a command from the minion out to other minions.

Publications need to be enabled on the Salt master and the minion needs to have permission to publish the command. The Salt master will also prevent a recursive publication loop, this means that a minion cannot command another minion to command another minion as that would create an infinite command loop.

The tgt_type argument is used to pass a target other than a glob into the execution, the available options are:

- glob
The arguments sent to the minion publish function are separated with commas. This means that for a minion executing a command with multiple args it will look like this:

```
salt system.example.com publish.publish '*/' user.add 'foo,1020,1020'
salt system.example.com publish.publish 'os:Fedora' network.interfaces '' grain
```

CLI Example:
```
salt system.example.com publish.publish '*/' cmd.run 'ls -la /tmp'
```

**Attention**

If you need to pass a value to a function argument and that value contains an equal sign, you must include the argument name. For example:

```
salt '*/' publish.publish test.kwarg arg='cheese=spam'
```

**salt.modules.raet_publish.runner** *(fun, arg=None, timeout=5)*
Execute a runner on the master and return the data from the runner function

CLI Example:
```
salt publish.runner manage.down
```

## 21.9.344 salt.modules.rallydev

Support for RallyDev

New in version 2015.8.0.

Requires a username and a password in /etc/salt/minion:

**salt.modules.rallydev.list_items(name)**
List items of a particular type

CLI Examples:
```
salt myminion rallydev.list_<item name>s
salt myminion rallydev.list_users
salt myminion rallydev.list_artifacts
```

**salt.modules.rallydev.list_users()**
List the users

CLI Example:
salt myminion rallydev.list_users

salt.modules.rallydev.query_item(name, query_string, order='Rank')
Query a type of record for one or more items. Requires a valid query string. See https://rally1.rallydev.com/slm/doc/webservice/introduction.jsp for information on query syntax.

CLI Example:
salt myminion rallydev.query_<item name> <query string> [<order>]
salt myminion rallydev.query_task '(Name contains github)'
salt myminion rallydev.query_task '(Name contains reactor)' Rank

salt.modules.rallydev.query_user(query_string, order='UserName')
Update a user

CLI Example:
salt myminion rallydev.query_user 'Name contains Jo'

salt.modules.rallydev.show_artifact(id_)
Show an artifact

CLI Example:
salt myminion rallydev.show_artifact <artifact id>

salt.modules.rallydev.show_item(name, id_)
Show an item

CLI Example:
salt myminion rallydev.show_<item name> <item id>

salt.modules.rallydev.show_user(id_)
Show a user

CLI Example:
salt myminion rallydev.show_user <user id>

salt.modules.rallydev.update_item(name, id_, field=None, value=None, postdata=None)
Update an item. Either a field and a value, or a chunk of POST data, may be used, but not both.

CLI Example:
salt myminion rallydev.update_<item name> <item id> field=<field> value=<value>
salt myminion rallydev.update_<item name> <item id> postdata=<post data>

salt.modules.rallydev.update_user(id_, field, value)
Update a user

CLI Example:
salt myminion rallydev.update_user <user id> <field> <new value>

21.9.345 salt.modules.random_org
Module for retrieving random information from Random.org

21.9. execution modules
New in version 2015.5.0.

**configuration** This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

```yaml
random_org:
  api_key: 7be1402d-5719-5bd3-a306-3def9f135da5
  api_version: 1
```

```python
salt.modules.random_org.generateBlobs(api_key=None, api_version=None, **kwargs)
```

List all Slack users.

**Parameters**

- **api_key** – The Random.org api key.
- **api_version** – The Random.org api version.
- **format** – Specifies the format in which the blobs will be returned. Values allowed are base64 and hex.

**Returns** The user list.

**CLI Example:**

```bash
salt '*' get_integers number=5 min=1 max=6
salt '*' get_integers number=5 min=1 max=6
```

```python
salt.modules.random_org.generateDecimalFractions(api_key=None, api_version=None, **kwargs)
```

Generates true random decimal fractions

**Parameters**

- **api_key** – The Random.org api key.
- **api_version** – The Random.org api version.
- **number** – How many random decimal fractions you need. Must be within the [1,1e4] range.
- **decimalPlaces** – The number of decimal places to use. Must be within the [1,20] range.
- **replacement** – Specifies whether the random numbers should be picked with replacement. The default (true) will cause the numbers to be picked with replacement, i.e., the resulting numbers may contain duplicate values (like a series of dice rolls). If you want the numbers picked to be unique (like raffle tickets drawn from a container), set this value to false.

**Returns** A list of decimal fraction

**CLI Example:**

```bash
salt '*' random_org.generateDecimalFractions number=10 decimalPlaces=4
salt '*' random_org.generateDecimalFractions number=10 decimalPlaces=4
  replacement=True
```

```python
salt.modules.random_org.generateGaussians(api_key=None, api_version=None, **kwargs)
```

This method generates true random numbers from a Gaussian distribution (also known as a normal distribution).

**Parameters**

- **api_key** – The Random.org api key.
- **api_version** – The Random.org api version.
- **number** – How many random numbers you need. Must be within the [1,1e4] range.
- **mean** – The distribution’s mean. Must be within the [-1e6,1e6] range.
- `standardDeviation` - The distribution’s standard deviation. Must be within the \([-1e6,1e6]\) range.
- `significantDigits` - The number of significant digits to use. Must be within the \([2,20]\) range.

**Returns** The user list.

**CLI Example:**
```
salt '*' random_org.generateGaussians number=10 mean=0.0 standardDeviation=1.0 significantDigits=8
```

```
salt.modules.random_org.generateIntegers(api_key=None, api_version=None, **kwargs)

Generate random integers

**Parameters**
- `api_key` - The Random.org api key.
- `api_version` - The Random.org api version.
- `number` - The number of integers to generate
- `minimum` - The lower boundary for the range from which the random numbers will be picked. Must be within the \([-1e9,1e9]\) range.
- `maximum` - The upper boundary for the range from which the random numbers will be picked. Must be within the \([-1e9,1e9]\) range.
- `replacement` - Specifies whether the random numbers should be picked with replacement. The default (true) will cause the numbers to be picked with replacement, i.e., the resulting numbers may contain duplicate values (like a series of dice rolls). If you want the numbers picked to be unique (like raffle tickets drawn from a container), set this value to false.
- `base` - Specifies the base that will be used to display the numbers. Values allowed are 2, 8, 10 and 16. This affects the JSON types and formatting of the resulting data as discussed below.

**Returns** A list of integers.

**CLI Example:**
```
salt '*' random_org.generateIntegers number=5 minimum=1 maximum=6
salt '*' random_org.generateIntegers number=5 minimum=2 maximum=255 base=2
```

```
salt.modules.random_org.generateStrings(api_key=None, api_version=None, **kwargs)

Generate random strings.

**Parameters**
- `api_key` - The Random.org api key.
- `api_version` - The Random.org api version.
- `number` - The number of strings to generate.
- `length` - The length of each string. Must be within the \([1,20]\) range. All strings will be of the same length
- `characters` - A string that contains the set of characters that are allowed to occur in the random strings. The maximum number of characters is 80.
- `replacement` - Specifies whether the random strings should be picked with replacement. The default (true) will cause the strings to be picked with replacement, i.e., the resulting list of strings may contain duplicates (like a series of dice rolls). If you want the strings to be unique (like raffle tickets drawn from a container), set this value to false.

**Returns** A list of strings.

**CLI Example:**
```
salt '*' random_org.generateStrings number=5 length=8 characters='abcdefghijklmnopqrstuvwxyz'
```

(continues on next page)
salt '***' random_org.generateStrings number=10 length=16 characters
  ->'abcdefgijklmnopqrstuvwxyz'

salt.modules.random_org.generateUUIDs (api_key=None, api_version=None, **kwargs)
Generate a list of random UUIDs

Parameters
  - api_key – The Random.org api key.
  - number – How many random UUIDs you need. Must be within the [1,1e3] range.

Returns A list of UUIDs

CLI Example:

salt '***' random_org.generateUUIDs number=5

salt.modules.random_org.getUsage (api_key=None, api_version=None)
Show current usages statistics

Parameters
  - api_key – The Random.org api key.

Returns The current usage statistics.

CLI Example:

salt '***' random_org.getUsage
salt '***' random_org.getUsage api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15 api_
  version=1

21.9.346 salt.modules.rbac_solaris
Module for Solaris' Role-Based Access Control

salt.modules.rbac_solaris.auth_add (user, auth)
Add authorization to user

user [string] username
auth [string] authorization name

CLI Example:

salt '***' rbac.auth_add martine solaris.zone.manage
salt '***' rbac.auth_add martine solaris.zone.manage,solaris.mail.mailq

salt.modules.rbac_solaris.auth_get (user, computed=True)
List authorization for user

user [string] username
computed [boolean] merge results from auths command into data from user_attr

CLI Example:

salt '***' rbac.auth_get leo

salt.modules.rbac_solaris.auth_list ()
List all available authorization

CLI Example:
salt * rbac.auth_list

salt.modules.rbac_solaris.auth_rm(user, auth)
Remove authorization from user
  user [string] username
  auth [string] authorization name
CLI Example:
salt * rbac.auth_rm jorge solaris.zone.manage
salt * rbac.auth_rm jorge solaris.zone.manage,solaris.mail.mailq

salt.modules.rbac_solaris.profile_add(user, profile)
Add profile to user
  user [string] username
  profile [string] profile name
CLI Example:
salt * rbac.profile_add martine 'Primary Administrator'
salt * rbac.profile_add martine 'User Management,User Security'

salt.modules.rbac_solaris.profile_get(user, default_hidden=True)
List profiles for user
  user [string] username
  default_hidden [boolean] hide default profiles
CLI Example:
salt * rbac.profile_get leo
salt * rbac.profile_get leo default_hidden=False

salt.modules.rbac_solaris.profile_list(default_only=False)
List all available profiles
  default_only [boolean] return only default profile
CLI Example:
salt * rbac.profile_list

salt.modules.rbac_solaris.profile_rm(user, profile)
Remove profile from user
  user [string] username
  profile [string] profile name
CLI Example:
salt * rbac.profile_rm jorge 'Primary Administrator'
salt * rbac.profile_rm jorge 'User Management,User Security'

salt.modules.rbac_solaris.role_add(user, role)
Add role to user
  user [string] username
  role [string] role name
CLI Example:
salt * rbac.role_add martine netcfg
salt * rbac.role_add martine netcfg,zfssnap

salt.modules.rbac_solaris.role_get(user)
List roles for user
user [string] username
CLI Example:

```
salt '*' rbac.role_get leo
```

salt.modules.rbac_solaris.role_list()
List all available roles
CLI Example:

```
salt '*' rbac.role_list
```

salt.modules.rbac_solaris.role_rm(user, role)
Remove role from user
user [string] username
role [string] role name
CLI Example:

```
salt '*' rbac.role_rm jorge netcfg
salt '*' rbac.role_rm jorge netcfg,zfssnap
```

21.9.347 salt.modules.rbenv

Manage ruby installations with rbenv. rbenv is supported on Linux and macOS. rbenv doesn’t work on Windows (and isn’t really necessary on Windows as there is no system Ruby on Windows). On Windows, the RubyInstaller and/or Pik are both good alternatives to work with multiple versions of Ruby on the same box.

http://misheska.com/blog/2013/06/15/using-rbenv-to-manage-multiple-versions-of-ruby/

New in version 0.16.0.

salt.modules.rbenv.default(ruby=None, runas=None)
Returns or sets the currently defined default ruby
ruby The version to set as the default. Should match one of the versions listed by `rbenv.versions`. Leave blank to return the current default.
CLI Example:

```
salt '*' rbenv.default
salt '*' rbenv.default 2.0.0-p0
```

salt.modules.rbenv.do(cmdline, runas=None, env=None)
Execute a ruby command with rbenv’s shims from the user or the system
CLI Example:

```
salt '*' rbenv.do 'gem list bundler'
salt '*' rbenv.do 'gem list bundler' deploy
```

salt.modules.rbenv.do_with_ruby(ruby, cmdline, runas=None)
Execute a ruby command with rbenv’s shims using a specific ruby version
CLI Example:

```
salt '*' rbenv.do_with_ruby 2.0.0-p0 'gem list bundler'
salt '*' rbenv.do_with_ruby 2.0.0-p0 'gem list bundler' runas=deploy
```

salt.modules.rbenv.install(runas=None, path=None)
Install rbenv systemwide
salt.modules.rbenv.install_ruby(ruby, runas=None)
Install a ruby implementation.
- **ruby** The version of Ruby to install, should match one of the versions listed by rbenv.list
- **runas** The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

Additional environment variables can be configured in pillar / grains / master:

```python
rbenv:
  build_env: 'CONFIGURE_OPTS="--no-tcmalloc" CFLAGS="-fno-tree-dce"'
```

salt.modules.rbenv.is_installed(runas=None)
Check if rbenv is installed

salt.modules.rbenv.list_(runas=None)
List the installable versions of ruby
- **runas** The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

salt.modules.rbenv.rehash(runas=None)
Run rbenv rehash to update the installed shims
- **runas** The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

salt.modules.rbenv.uninstall_ruby(ruby, runas=None)
Uninstall a ruby implementation.
- **ruby** The version of ruby to uninstall. Should match one of the versions listed by rbenv.versions.
- **runas** The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

salt.modules.rbenv.update(runas=None, path=None)
Updates the current versions of rbenv and ruby-build
- **runas** The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.
salt '*' rbenv.update

salt.modules.rbenv.versions(**runas=**None)
List the installed versions of ruby
CLI Example:

```
salt '*' rbenv.versions
```

## 21.9.348 salt.modules.rdp

Manage RDP Service on Windows servers

salt.modules.rdp.disable()
Disable RDP the service on the server
CLI Example:

```
salt '*' rdp.disable
```

salt.modules.rdp.disconnect_session(**session_id=**)  # Default is all sessions.
Disconnect a session.
New in version 2016.11.0.

- **Parameters**
  - **session_id** – The numeric Id of the session.
- **Returns**
  - A boolean representing whether the disconnect succeeded.

CLI Example:

```
salt '*' rdp.disconnect_session session_id
salt '*' rdp.disconnect_session 99
```

salt.modules.rdp.enable()
Enable RDP the service on the server
CLI Example:

```
salt '*' rdp.enable
```

salt.modules.rdp.get_session(**session_id=**)  # Default is all sessions.
Get information about a session.
New in version 2016.11.0.

- **Parameters**
  - **session_id** – The numeric Id of the session.
- **Returns**
  - A dictionary of session information.

CLI Example:

```
salt '*' rdp.get_session session_id
salt '*' rdp.get_session 99
```

salt.modules.rdp.list_sessions(**logged_in_users_only=False**)  # Default is all sessions.
List information about the sessions.
New in version 2016.11.0.

- **Parameters**
  - **logged_in_users_only** – If True, only return sessions with users logged in.
- **Returns**
  - A list containing dictionaries of session information.
CLI Example:

```bash
salt '*' rdp.list_sessions
```

**salt.modules.rdp.logoff_session(session_id)**  
Initiate the logoff of a session.

- **Parameters**  
  - `session_id` - The numeric Id of the session.

- **Returns**  
  A boolean representing whether the logoff succeeded.

CLI Example:

```bash
salt '*' rdp.logoff_session session_id
salt '*' rdp.logoff_session 99
```

**salt.modules.rdp.status()**  
Show if rdp is enabled on the server

CLI Example:

```bash
salt '*' rdp.status
```

---

**21.9.349 salt.modules.redis**

Module to provide redis functionality to Salt

New in version 2014.7.0.

- **configuration**  
  This module requires the redis python module and uses the following defaults which may be overridden in the minion configuration:

```bash
redis.host: 'salt'
redis.port: 6379
redis.db: 0
redis.password: None
```

**salt.modules.redismod.bgrewriteaof(host=None, port=None, db=None, password=None)**  
Asynchronously rewrite the append-only file

CLI Example:

```bash
salt '*' redis.bgrewriteaof
```

**salt.modules.redismod.bgsave(host=None, port=None, db=None, password=None)**  
Asynchronously save the dataset to disk

CLI Example:

```bash
salt '*' redis.bgsave
```

**salt.modules.redismod.config_get(pattern='*', host=None, port=None, db=None, password=None)**  
Get redis server configuration values

CLI Example:

```bash
salt '*' redis.config_get
salt '*' redis.config_get port
```
salt.modules.redismod.config_set(name, value, host=None, port=None, db=None, password=None)

Set redis server configuration values

CLI Example:
```
salt '*' redis.config_set masterauth luv_kittens
```

salt.modules.redismod.dbsize(host=None, port=None, db=None, password=None)

Return the number of keys in the selected database

CLI Example:
```
salt '*' redis.dbsize
```

salt.modules.redismod.delete(*keys, **connection_args)

Deletes the keys from redis, returns number of keys deleted

CLI Example:
```
salt '*' redis.delete foo
```

salt.modules.redismod.exists(key, host=None, port=None, db=None, password=None)

Return true if the key exists in redis

CLI Example:
```
salt '*' redis.exists foo
```

salt.modules.redismod.expire(key, seconds, host=None, port=None, db=None, password=None)

Set a keys time to live in seconds

CLI Example:
```
salt '*' redis.expire foo 300
```

salt.modules.redismod.expireat(key, timestamp, host=None, port=None, db=None, password=None)

Set a keys expire at given UNIX time

CLI Example:
```
salt '*' redis.expireat foo 1400000000
```

salt.modules.redismod.flushall(host=None, port=None, db=None, password=None)

Remove all keys from all databases

CLI Example:
```
salt '*' redis.flushall
```

salt.modules.redismod.flushdb(host=None, port=None, db=None, password=None)

Remove all keys from the selected database

CLI Example:
```
salt '*' redis.flushdb
```

salt.modules.redismod.get_key(key, host=None, port=None, db=None, password=None)

Get redis key value
CLI Example:
```
salt '*' redis.get_key foo
```

`salt.modules.redismod.get_master_ip(host=None, port=None, password=None)`
Get host information about slave

CLI Example:
```
salt '*' redis.get_master_ip
```

`salt.modules.redismod.hdel(key, *fields, **options)`
Delete one or more hash fields.
New in version 2017.7.0.

CLI Example:
```
salt '*' redis.hdel foo_hash bar_field1 bar_field2
```

`salt.modules.redismod.hexists(key, field, host=None, port=None, db=None, password=None)`
Determine if a hash fields exists.
New in version 2017.7.0.

CLI Example:
```
salt '*' redis.hexists foo_hash bar_field
```

`salt.modules.redismod.hget(key, field, host=None, port=None, db=None, password=None)`
Get specific field value from a redis hash, returns dict

CLI Example:
```
salt '*' redis.hget foo_hash bar_field
```

`salt.modules.redismod.hgetall(key, host=None, port=None, db=None, password=None)`
Get all fields and values from a redis hash, returns dict

CLI Example:
```
salt '*' redis.hgetall foo_hash
```

`salt.modules.redismod.hincrby(key, field, increment=1, host=None, port=None, db=None, password=None)`
Increment the integer value of a hash field by the given number.
New in version 2017.7.0.

CLI Example:
```
salt '*' redis.hincrby foo_hash bar_field 5
```

`salt.modules.redismod.hincrbyfloat(key, field, increment=1.0, host=None, port=None, db=None, password=None)`
Increment the float value of a hash field by the given number.
New in version 2017.7.0.

CLI Example:
salt 's' redis.hincrbyfloat foo_hash bar_field 5.17

```
salt.modules.redismod.hlen(key, host=None, port=None, db=None, password=None)
```
Returns number of fields of a hash.
New in version 2017.7.0.
CLI Example:
```
salt 's' redis.hlen foo_hash
```

```
salt.modules.redismod.hmget(key, *fields, **options)
```
Returns the values of all the given hash fields.
New in version 2017.7.0.
CLI Example:
```
salt 's' redis.hmget foo_hash bar_field1 bar_field2
```

```
salt.modules.redismod.hmset(key, **fieldvals)
```
Sets multiple hash fields to multiple values.
New in version 2017.7.0.
CLI Example:
```
salt 's' redis.hmset foo_hash bar_field1=bar_value1 bar_field2=bar_value2
```

```
salt.modules.redismod.hscan(key, cursor=0, match=None, count=None, host=None, port=None, db=None, password=None)
```
Incrementally iterate hash fields and associated values.
New in version 2017.7.0.
CLI Example:
```
salt 's' redis.hscan foo_hash match='field_prefix_*' count=1
```

```
salt.modules.redismod.hset(key, field, value, host=None, port=None, db=None, password=None)
```
Set the value of a hash field.
New in version 2017.7.0.
CLI Example:
```
salt 's' redis.hset foo_hash bar_field bar_value
```

```
salt.modules.redismod.hsetnx(key, field, value, host=None, port=None, db=None, password=None)
```
Set the value of a hash field only if the field does not exist.
New in version 2017.7.0.
CLI Example:
```
salt 's' redis.hsetnx foo_hash bar_field bar_value
```

```
salt.modules.redismod.hvals(key, host=None, port=None, db=None, password=None)
```
Return all the values in a hash.
New in version 2017.7.0.
CLI Example:
salt 'OLLOW redis.hvals foo_hash bar_field1 bar_value1

salt.modules.redismod.info
    (host=None, port=None, db=None, password=None)
    Get information and statistics about the server
    CLI Example:
    
    salt 'OLLOW redis.info

salt.modules.redismod.key_type
    (key, host=None, port=None, db=None, password=None)
    Get redis key type
    CLI Example:

    salt 'OLLOW redis.type foo

salt.modules.redismod.keys
    (pattern='OLLOW', host=None, port=None, db=None, password=None)
    Get redis keys, supports glob style patterns
    CLI Example:

    salt 'OLLOW redis.keys
    salt 'OLLOW redis.keys test*

salt.modules.redismod:lastsave
    (host=None, port=None, db=None, password=None)
    Get the UNIX time in seconds of the last successful save to disk
    CLI Example:

    salt 'OLLOW redis:lastsave

salt.modules.redismod:llen
    (key, host=None, port=None, db=None, password=None)
    Get the length of a list in Redis
    CLI Example:

    salt 'OLLOW redis:llen foo_list

salt.modules.redismod:lrange
    (key, start, stop, host=None, port=None, db=None, password=None)
    Get a range of values from a list in Redis
    CLI Example:

    salt 'OLLOW redis:lranger foo_list 0 10

salt.modules.redismod:ping
    (host=None, port=None, db=None, password=None)
    Ping the server, returns False on connection errors
    CLI Example:

    salt 'OLLOW redis:ping

salt.modules.redismod:save
    (host=None, port=None, db=None, password=None)
    Synchronously save the dataset to disk
    CLI Example:

    salt 'OLLOW redis:save
salt.modules.redismod.sentinel_get_master_ip(master, host=None, port=None, password=None)

Get ip for sentinel master

CLI Example:

```
salt '*' redis.sentinel_get_master_ip 'mymaster'
```

salt.modules.redismod.set_key(key, value, host=None, port=None, db=None, password=None)

Set redis key value

CLI Example:

```
salt '*' redis.set_key foo bar
```

salt.modules.redismod.shutdown(host=None, port=None, db=None, password=None)

Synchronously save the dataset to disk and then shut down the server

CLI Example:

```
salt '*' redis.shutdown
```

salt.modules.redismod.slaveof(master_host=None, master_port=None, host=None, port=None, db=None, password=None)

Make the server a slave of another instance, or promote it as master

CLI Example:

```
# Become slave of redis-n01.example.com:6379
salt '*' redis.slaveof redis-n01.example.com:6379
salt '*' redis.slaveof redis-n01.example.com
# Become master
salt '*' redis.slaveof
```

salt.modules.redismod.smembers(key, host=None, port=None, db=None, password=None)

Get members in a Redis set

CLI Example:

```
salt '*' redis.smembers foo_set
```

salt.modules.redismod.time(host=None, port=None, db=None, password=None)

Return the current server UNIX time in seconds

CLI Example:

```
salt '*' redis.time
```

salt.modules.redismod.zcard(key, host=None, port=None, db=None, password=None)

Get the length of a sorted set in Redis

CLI Example:

```
salt '*' redis.zcard foo_sorted
```

salt.modules.redismod.zrange(key, start, stop, host=None, port=None, db=None, password=None)

Get a range of values from a sorted set in Redis by index

CLI Example:
21.9.350 salt.modules.reg

Manage the Windows registry

Hives

Hives are the main sections of the registry and all begin with the word HKEY.

- **HKEY_LOCAL_MACHINE**
- **HKEY_CURRENT_USER**
- **HKEY_USER**

Keys

Keys are the folders in the registry. Keys can have many nested subkeys. Keys can have a value assigned to them under the (Default)

When passing a key on the CLI it must be quoted correctly depending on the backslashes being used (\ vs \). The following are valid methods of passing the key on the CLI:

- **Using single backslashes**: "SOFTWARE\Python" 'SOFTWARE\Python' (will not work on a Windows Master)
- **Using double backslashes**: SOFTWARE\\Python

Values or Entries

Values or Entries are the name/data pairs beneath the keys and subkeys. All keys have a default name/data pair. The name is (Default) with a displayed value of (value not set). The actual value is Null.

Example

The following example is an export from the Windows startup portion of the registry:

```plaintext
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Run]
"RTHDVCPL"=""C:\\Program Files\\Realtek\\Audio\\HDA\\RtkNGUI64.exe" -s"
"NvBackend"=""C:\\Program Files (x86)\\NVIDIA Corporation\\Update Core\\NvBackend.\~exe"
"BTMTrayAgent"="rundll32.exe "C:\\Program Files (x86)\\Intel\\Bluetooth\\btmshellex.\~dll\\",TrayApp"
```

In this example these are the values for each:

Hive: **HKEY_LOCAL_MACHINE**

Key and subkeys: SOFTWARE\\Microsoft\\Windows\\CurrentVersion\\Run

Value:

- There are 3 value names:
  - **RTHDVCPL**
Each value name has a corresponding value

depends
  • salt.utils.win_reg

salt.modules.reg.broadcast_change()
Refresh the windows environment.

Note: This will only effect new processes and windows. Services will not see the change until the system restarts.

Returns True if successful, otherwise False
Return type bool

CLI Example:
salt '*' reg.broadcast_change

salt.modules.reg.delete_key_recursive(hive, key, use_32bit_registry=False)
New in version 2015.5.4.
Delete a registry key to include all subkeys and value/data pairs.

Parameters
  • hive (str) - The name of the hive. Can be one of the following
    • HKEY_LOCAL_MACHINE or HKLM
    • HKEY_CURRENT_USER or HKCU
    • HKEY_USER or HKU
    • HKEY_CLASSES_ROOT or HKCR
    • HKEY_CURRENT_CONFIG or HKCC
  
  • key (str): The key to remove (looks like a path)
  
  • use_32bit_registry (bool): Deletes the 32bit portion of the registry on 64bit installations.
    On 32bit machines this is ignored.

Returns
A dictionary listing the keys that deleted successfully as well as those that failed to delete.

Return type dict

CLI Example:
The following example will remove delete_me and all its subkeys from the SOFTWARE key in HKEY_LOCAL_MACHINE:
salt '*' reg.delete_key_recursive HKLM SOFTWARE\delete_me

salt.modules.reg.delete_value(hive, key, vname=None, use_32bit_registry=False)
Delete a registry value entry or the default value for a key.

Parameters
  • hive (str) - The name of the hive. Can be one of the following
    • HKEY_LOCAL_MACHINE or HKLM
    • HKEY_CURRENT_USER or HKCU
    • HKEY_USER or HKU
    • HKEY_CLASSES_ROOT or HKCR
    • HKEY_CURRENT_CONFIG or HKCC
  
  • key (str): The key (looks like a path) to the value name.

• **vname** (*str*) – The value name. These are the individual name/data pairs under the key. If not passed, the key (Default) value will be deleted.
  
• **use_32bit_registry** (*bool*) – Deletes the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.

**Returns** True if successful, otherwise False

**Return type** bool

**CLI Example:**
```
salt '*' reg.delete_value HKEY_CURRENT_USER 'SOFTWARE\Salt' 'version'
```

**salt.modules.reg.import_file** (*source*, *use_32bit_registry=False*)

Import registry settings from a Windows REG file by invoking REG.EXE.

New in version 2018.3.0.

**Parameters**

• **source** (*str*) – The full path of the REG file. This can be either a local file path or a URL type supported by salt (e.g. salt://salt_master_path)

• **use_32bit_registry** (*bool*) – If the value of this parameter is True then the REG file will be imported into the Windows 32 bit registry. Otherwise the Windows 64 bit registry will be used.

**Returns** True if successful, otherwise an error is raised

**Return type** bool

**Raises**

• **ValueError** – If the value of source is an invalid path or otherwise causes cp.cache_file to return False

• **CommandExecutionError** – If reg.exe exits with a non-0 exit code

**CLI Example:**
```
salt machine1 reg.import_file salt://win/printer_config/110_Canon/
|postinstall_config.reg
```

**salt.modules.reg.key_exists** (*hive*, *key*, *use_32bit_registry=False*)

Check that the key is found in the registry. This refers to keys and not value/data pairs.

**Parameters**

• **hive** (*str*) – The hive to connect to

• **key** (*str*) – The key to check

• **use_32bit_registry** (*bool*) – Look in the 32bit portion of the registry

**Returns** True if exists, otherwise False

**Return type** bool

**CLI Example:**
```
salt '*' reg.key_exists HKLM SOFTWARE\Microsoft
```

**salt.modules.reg.list_keys** (*hive*, *key=None*, *use_32bit_registry=False*)

Enumerates the subkeys in a registry key or hive.

**Parameters**

• **hive** (*str*) – The name of the hive. Can be one of the following:
  – HKEY_LOCAL_MACHINE or HKLM
  – HKEY_CURRENT_USER or HKCU
  – HKEY_USER or HKU
  – HKEY_CLASSES_ROOT or HKCR
  – HKEY_CURRENT_CONFIG or HKCC

• **key** (*str*) – The key (looks like a path) to the value name. If a key is not passed, the keys under the hive will be returned.

• **use_32bit_registry** (*bool*) – Accesses the 32bit portion of the registry on 64 bit installations. On 32bit machines this is ignored.
Returns A list of keys/subkeys under the hive or key.

Return type list

CLI Example:
salt '*' reg.list_keys HKLM 'SOFTWARE'

salt.modules.reg.list_values(hive, key=None, use_32bit_registry=False, include_default=True)
Enumerates the values in a registry key or hive.

Parameters
- **hive** (str) – The name of the hive. Can be one of the following:
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC
- **key** (str) – The key (looks like a path) to the value name. If a key is not passed, the
  values under the hive will be returned.
- **use_32bit_registry** (bool) – Accesses the 32bit portion of the registry on 64
  bit installations. On 32bit machines this is ignored.
- **include_default** (bool) – Toggle whether to include the '(Default)' value.

Returns A list of values under the hive or key.

Return type list

CLI Example:
salt '*' reg.list_values HKLM 'SYSTEM\CurrentControlSet\Services\Tcpip'

salt.modules.reg.read_value(hive, key, vname=None, use_32bit_registry=False)
Reads a registry value entry or the default value for a key. To read the default value, don’t pass `vname`

Parameters
- **hive** (str) – The name of the hive. Can be one of the following:
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC
- **key** (str) – The key (looks like a path) to the value name.
- **vname** (str) – The value name. These are the individual name/data pairs under the
  key. If not passed, the key (Default) value will be returned.
- **use_32bit_registry** (bool) – Accesses the 32bit portion of the registry on 64
  bit installations. On 32bit machines this is ignored.

Returns
A dictionary containing the passed settings as well as the value_data if successful. If unsuc-

bool: Returns False if the key is not found

If vname is not passed:
  - Returns the first unnamed value (Default) as a string.
  - Returns none if first unnamed value is empty.

Return type dict

CLI Example:
The following will get the value of the version value name in the
HKEY_LOCAL_MACHINE\SOFTWARE\Salt key
CLI Example:
The following will get the default value of the HKEY_LOCAL_MACHINE\SOFTWARE\Salt key

```
salt '*' reg.read_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'version'
```

```python
salt.modules.reg.set_value(hive, key, vname=None, vdata=None, vtype='REG_SZ', use_32bit_registry=False, volatile=False)
```

Sets a value in the registry. If vname is passed, it will be the value for that value name, otherwise it will be the default value for the specified key

**Parameters**

- `hive (str)` – The name of the hive. Can be one of the following
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC
- `key (str)` – The key (looks like a path) to the value name.
- `vname (str)` – The value name. These are the individual name/data pairs under the key. If not passed, the key (Default) value will be set.
- `vdata (str, int, list, bytes)` – The value you’d like to set. If a value name (vname) is passed, this will be the data for that value name. If not, this will be the (Default) value for the key.

The type of data this parameter expects is determined by the value type specified in vtype. The correspondence is as follows:

- REG_BINARY: Binary data (str in Py2, bytes in Py3)
- REG_DWORD: int
- REG_EXPAND_SZ: str
- REG_MULTI_SZ: list of str
- REG_QWORD: int
- REG_SZ: str

**Note:** When setting REG_BINARY, string data will be converted to binary.

**Note:** The type for the (Default) value is always REG_SZ and cannot be changed.

**Note:** This parameter is optional. If vdata is not passed, the Key will be created with no associated item/value pairs.

- `vtype (str)` – The value type. The possible values of the vtype parameter are indicated above in the description of the vdata parameter.
- `use_32bit_registry (bool)` – Sets the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.
- `volatile (bool)` – When this parameter has a value of True, the registry key will be made volatile (i.e. it will not persist beyond a system reset or shutdown). This parameter only has an effect when a key is being created and at no other time.

**Returns** True if successful, otherwise False

**Return type** bool
CLI Example:
This will set the version value to 2015.5.2 in the SOFTWARESalt key in the HKEY_LOCAL_MACHINE hive

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'version' \n  '=' '2015.5.2'
```

CLI Example:
This function is strict about the type of vdata. For instance this example will fail because vtype has a value of REG_SZ and vdata has a type of int (as opposed to str as expected).

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'str_data' 1.2
```

CLI Example:
In this next example vdata is properly quoted and should succeed.

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'str_data' \n  '=' vtype=REG_SZ vdata='"1.2"'
```

CLI Example:
This is an example of using vtype REG_BINARY.

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'bin_data' \n  '=' vtype=REG_BINARY vdata='Salty Data'
```

CLI Example:
An example of using vtype REG_MULTI_SZ is as follows:

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'list_data' \n  '=' vtype=REG_MULTI_SZ vdata='["Salt", "is", "great"]'
```

### 21.9.351 salt.modules.rest_pkg

Package support for the REST example

```python
salt.modules.rest_pkg.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs)
```

```python
salt.modules.rest_pkg.installed(name, version=None, refresh=False, fromrepo=None, skip_verify=False, pkgs=None, sources=None, **kwargs)
```

```python
salt.modules.rest_pkg.list_pkgs(versions_as_list=False, **kwargs)
```

```python
salt.modules.rest_pkg.remove(name=None, pkgs=None, **kwargs)
```

```python
salt.modules.rest_pkg.upgrade(refresh=True, skip_verify=True, **kwargs)
```

```python
salt.modules.rest_pkg.version(*names, **kwargs)
```

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

### 21.9.352 salt.modules.rest_sample_utils module

Utility functions for the rest_sample
salt.modules.rest_sample_utils.fix_outage()
   "Fix" the outage
   CLI Example:
   ```
salt 'rest-sample-proxy' rest_sample.fix_outage
   ```

salt.modules.rest_sample_utils.get_test_string()
   Helper function to test cross-calling to the __proxy__ dunder.
   CLI Example:
   ```
salt 'rest-sample-proxy' rest_sample.get_test_string
   ```

21.9.353 salt.modules.rest_service

Provide the service module for the proxy-minion REST sample

salt.modules.rest_service.enabled(name, sig=None)
   Only the 'redbull' service is 'enabled' in the test

salt.modules.rest_service.get_all()
   Return a list of all available services
   New in version 2015.8.0.
   CLI Example:
   ```
salt '*' service.get_all
   ```

salt.modules.rest_service.list_()
   Return a list of all available services.
   CLI Example:
   ```
salt '*' service.list
   ```

salt.modules.rest_service.restart(name, sig=None)
   Restart the specified service with rest_sample
   New in version 2015.8.0.
   CLI Example:
   ```
salt '*' service.restart <service name>
   ```

salt.modules.rest_service.running(name, sig=None)
   Return whether this service is running.
   New in version 2015.8.0.

salt.modules.rest_service.start(name, sig=None)
   Start the specified service on the rest_sample
   New in version 2015.8.0.
   CLI Example:
salt '*' service.start <service name>

salt.modules.rest_service.status(name, sig=None)
    Return the status for a service via rest_sample. If the name contains globbing, a dict mapping service name to True/False values is returned.
    New in version 2015.8.0.
    Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)

    Parameters
    • name (str) – The name of the service to check
    • sig (str) – Not implemented

    Returns
    True if running, False otherwise dict: Maps service name to True if running, False otherwise

    Return type bool

    CLI Example:
    salt '*' service.status <service name>

salt.modules.rest_service.stop(name, sig=None)
    Stop the specified service on the rest_sample
    New in version 2015.8.0.

    CLI Example:
    salt '*' service.stop <service name>

21.9.354 salt.modules.restartcheck module

checkrestart functionality for Debian and Red Hat Based systems

Identifies services (processes) that are linked against deleted files (for example after downloading an updated binary of a shared library).

Based on checkrestart script from debian-goodies (written by Matt Zimmerman for the Debian GNU/Linux distribution, https://packages.debian.org/debian-goodies) and psdel by Sam Morris.

codeauthor Jiri Kotlin <jiri.kotlin@ultimum.io>

salt.modules.restartcheck.restartcheck(ignorelist=None, blacklist=None, excludepid=None, **kwargs)
    Analyzes files openeded by running processes and seeks for packages which need to be restarted.

    Parameters
    • ignorelist – string or list of packages to be ignored
    • blacklist – string or list of file paths to be ignored
    • excludepid – string or list of process IDs to be ignored
    • verbose – boolean, enables extensive output
    • timeout – int, timeout in minute

    Returns
    { 'result': False, 'comment': '<reason>' } String with checkrestart output if some package seems to need to be restarted or if no packages need restarting.

    Return type Dict on error

    New in version 2015.8.3.

    CLI Example: .. code-block:: bash
salt '*' restartcheck.restartcheck
21.9.355 salt.modules.ret

Module to integrate with the returner system and retrieve data sent to a salt returner

`salt.modules.ret.get_fun(returner, fun)`  
Return info about last time fun was called on each minion  
CLI Example:  
```
salt '*' ret.get_fun mysql network.interfaces
```

`salt.modules.ret.get_jid(returner, jid)`  
Return the information for a specified job id  
CLI Example:  
```
salt '*' ret.get_jid redis 20421104181954700505
```

`salt.modules.ret.get_jids(returner)`  
Return a list of all job ids  
CLI Example:  
```
salt '*' ret.get_jids mysql
```

`salt.modules.ret.get_minions(returner)`  
Return a list of all minions  
CLI Example:  
```
salt '*' ret.get_minions mysql
```

21.9.356 salt.modules.rh_ip

The networking module for RHEL/Fedora based distros

`salt.modules.rh_ip.apply_network_settings(**settings)`  
Apply global network configuration.  
CLI Example:  
```
salt '*' ip.apply_network_settings
```

`salt.modules.rh_ip.build_bond(iface, **settings)`  
Create a bond script in /etc/modprobe.d with the passed settings and load the bonding kernel module.  
CLI Example:  
```
salt '*' ip.build_bond bond0 mode=balance-alb
```

`salt.modules.rh_ip.build_interface(iface, iface_type, enabled, **settings)`  
Build an interface script for a network interface.  
CLI Example:  
```
salt '*' ip.build_interface eth0 eth <settings>
```
salt.modules.rh_ip.build_network_settings(**settings)
Build the global network script.

CLI Example:
```
salt '*' ip.build_network_settings <settings>
```

salt.modules.rh_ip.build_routes(iface, **settings)
Build a route script for a network interface.

CLI Example:
```
salt '*' ip.build_routes eth0 <settings>
```

salt.modules.rh_ip.down(iface, iface_type)
Shutdown a network interface

CLI Example:
```
salt '*' ip.down eth0
```

salt.modules.rh_ip.get_bond(iface)
Return the content of a bond script

CLI Example:
```
salt '*' ip.get_bond bond0
```

salt.modules.rh_ip.get_interface(iface)
Return the contents of an interface script

CLI Example:
```
salt '*' ip.get_interface eth0
```

salt.modules.rh_ip.get_network_settings()
Return the contents of the global network script.

CLI Example:
```
salt '*' ip.get_network_settings
```

salt.modules.rh_ip.get_routes(iface)
Return the contents of the interface routes script.

CLI Example:
```
salt '*' ip.get_routes eth0
```

salt.modules.rh_ip.up(iface, iface_type)
Start up a network interface

CLI Example:
```
salt '*' ip.up eth0
```

21.9.357 salt.modules.rh_service

Service support for RHEL-based systems, including support for both upstart and sysvinit
**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to 'service.start is not available), see [here](#).

salt.modules.rh_service.available

Return True if the named service is available. Use the `limit` param to restrict results to services of that type.

CLI Examples:

```sh
salt '*' service.available sshd
salt '*' service.available sshd limit=upstart
salt '*' service.available sshd limit=sysvinit
```

salt.modules.rh_service.delete

Delete the named service

New in version 2016.3.

CLI Example:

```sh
salt '*' service.delete <service name>
```

salt.modules.rh_service.disable

Disable the named service to start at boot

CLI Example:

```sh
salt '*' service.disable <service name>
```

salt.modules.rh_service.disabled

Check to see if the named service is disabled to start on boot

CLI Example:

```sh
salt '*' service.disabled <service name>
```

salt.modules.rh_service.enable

Enable the named service to start at boot

CLI Example:

```sh
salt '*' service.enable <service name>
```

salt.modules.rh_service.enabled

Check to see if the named service is enabled to start on boot

CLI Example:

```sh
salt '*' service.enabled <service name>
```

salt.modules.rh_service.get_all

Return all installed services. Use the `limit` param to restrict results to services of that type.

CLI Example:

```sh
salt '*' service.get_all
salt '*' service.get_all limit=upstart
salt '*' service.get_all limit=sysvinit
```
salt.modules.rh_service.get_disabled(limit="")
Return the disabled services. Use the limit param to restrict results to services of that type.

CLI Example:
```
salt '*' service.get_disabled
salt '*' service.get_disabled limit=sysvinit
salt '*' service.get_disabled limit=upstart
```

salt.modules.rh_service.get_enabled(limit="")
Return the enabled services. Use the limit param to restrict results to services of that type.

CLI Examples:
```
salt '*' service.get_enabled
salt '*' service.get_enabled limit=sysvinit
salt '*' service.get_enabled limit=upstart
```

salt.modules.rh_service.missing(name, limit="")
The inverse of service.available. Return True if the named service is not available. Use the limit param to restrict results to services of that type.

CLI Examples:
```
salt '*' service.missing sshd
salt '*' service.missing sshd limit=sysvinit
salt '*' service.missing sshd limit=upstart
```

salt.modules.rh_service.reload_(name)
Reload the named service

CLI Example:
```
salt '*' service.reload <service name>
```

salt.modules.rh_service.restart(name)
Restart the named service

CLI Example:
```
salt '*' service.restart <service name>
```

salt.modules.rh_service.start(name)
Start the specified service

CLI Example:
```
salt '*' service.start <service name>
```

salt.modules.rh_service.status(name, sig= None)
Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)

Parameters
• name (str) – The name of the service to check
• sig (str) – Signature to use to find the service via ps

Returns True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type bool
CLI Example:
```
salt '*' service.status <service name> [service signature]
```

```
salt.modules.rh_service.stop(name)
Stop the specified service
```

CLI Example:
```
salt '*' service.stop <service name>
```

## 21.9.358 salt.modules.riak

Riak Salt Module

```
salt.modules.riak.cluster_commit()
Commit Cluster Changes
```

Changed in version 2015.8.0.

CLI Example:
```
salt '*' riak.cluster_commit
```

```
salt.modules.riak.cluster_join(username, hostname)
Join a Riak cluster
```

Changed in version 2015.8.0.

CLI Example:
```
salt '*' riak.cluster_join <user> <host>
```

username - The riak username to join the cluster hostname - The riak hostname you are connecting to

```
salt.modules.riak.cluster_leave(username, hostname)
Leave a Riak cluster
```

New in version 2015.8.0.

CLI Example:
```
salt '*' riak.cluster_leave <username> <host>
```

username - The riak username to join the cluster hostname - The riak hostname you are connecting to

```
salt.modules.riak.cluster_plan()
Review Cluster Plan
```

Changed in version 2015.8.0.

CLI Example:
```
salt '*' riak.cluster_plan
```

```
salt.modules.riak.member_status()
Get cluster member status
```

Changed in version 2015.8.0.

CLI Example:
salt '*' riak.member_status

salt.modules.riak.services()
List available services on a node
New in version 2015.8.0.
CLI Example:
salt '*' riak.services

salt.modules.riak.start()
Start Riak
CLI Example:
salt '*' riak.start

salt.modules.riak.status()
Current node status
New in version 2015.8.0.
CLI Example:
salt '*' riak.status

salt.modules.riak.stop()
Stop Riak
Changed in version 2015.8.0.
CLI Example:
salt '*' riak.stop

salt.modules.riak.test()
Runs a test of a few standard Riak operations
New in version 2015.8.0.
CLI Example:
salt '*' riak.test

21.9.359 salt.modules.rpm_lowpkg

Support for rpm

salt.modules.rpm_lowpkg.bin_pkg_info(path, saltenv='base')
New in version 2015.8.0.

Parses RPM metadata and returns a dictionary of information about the package (name, version, etc.).

path Path to the file. Can either be an absolute path to a file on the minion, or a salt fileserver URL (e.g. salt://path/to/file.rpm). If a salt fileserver URL is passed, the file will be cached to the minion so that it can be examined.
saltenv [base] Salt fileserver environment from which to retrieve the package. Ignored if path is a local file path on the minion.

CLI Example:
salt.modules.rpm_lowpkg.checksum(*paths)
Return if the signature of a RPM file is valid.

CLI Example:

```bash
salt '*' lowpkg.checksum /path/to/package1.rpm
salt '*' lowpkg.checksum /path/to/package1.rpm /path/to/package2.rpm
```

salt.modules.rpm_lowpkg.diff(package_path, path)
Return a formatted diff between current file and original in a package. NOTE: this function includes all files (configuration and not), but does not work on binary content.

Parameters
- **package** – Full pack of the RPM file
- **path** – Full path to the installed file

Returns Difference or empty string. For binary files only a notification.

CLI example:

```bash
salt '*' lowpkg.diff /path/to/apache2.rpm /etc/apache2/httpd.conf
```

salt.modules.rpm_lowpkg.file_dict(*packages)
List the files that belong to a package, sorted by group. Not specifying any packages will return a list of _every_ file on the system’s rpm database (not generally recommended).

CLI Examples:

```bash
salt '*' lowpkg.file_dict httpd
salt '*' lowpkg.file_dict httpd postfix
salt '*' lowpkg.file_dict
```

salt.modules.rpm_lowpkg.file_list(*packages)
List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system’s rpm database (not generally recommended).

CLI Examples:

```bash
salt '*' lowpkg.file_list httpd
salt '*' lowpkg.file_list httpd postfix
salt '*' lowpkg.file_list
```

salt.modules.rpm_lowpkg.info(*packages, **kwargs)
Return a detailed package(s) summary information. If no packages specified, all packages will be returned.

Parameters
- **packages** –
- **attr** – Comma-separated package attributes. If no `attr` is specified, all available attributes returned.

Valid attributes are: version, vendor, release, build_date, build_date_time_t, install_date, install_date_time_t, build_host, group, source_rpm, arch, epoch, size, license, signature, packager, url, summary, description.

- **all_versions** – Return information for all installed versions of the packages

Returns

CLI example:
salt.modules.rpm_lowpkg.list_pkgs("packages")
List the packages currently installed in a dict:

```python
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' lowpkg.list_pkgs
```

salt.modules.rpm_lowpkg.modified("packages", "flags")
List the modified files that belong to a package. Not specifying any packages will return a list of all modified files on the system’s RPM database.

New in version 2015.5.0.

CLI examples:

```
salt '*' lowpkg.modified httpd
salt '*' lowpkg.modified httpd postfix
salt '*' lowpkg.modified
```

salt.modules.rpm_lowpkg.owner("paths")
Return the name of the package that owns the file. Multiple file paths can be passed. If a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Examples:

```
salt '*' lowpkg.owner /usr/bin/apachectl
salt '*' lowpkg.owner /usr/bin/apachectl /etc/httpd/conf/httpd.conf
```

salt.modules.rpm_lowpkg.verify("packages", "kwargs")
Runs an rpm -Va on a system, and returns the results in a dict.

Files with an attribute of config, doc, ghost, license or readme in the package header can be ignored using the ignore_types keyword argument.

CLI Example:

```
salt '*' lowpkg.verify
salt '*' lowpkg.verify httpd
salt '*' lowpkg.verify httpd postfix
salt '*' lowpkg.verify httpd postfix ignore_types=['config', 'doc']
```

salt.modules.rpm_lowpkg.version_cmp(ver1, ver2, ignore_epoch=False)
New in version 2015.8.9.

Do a cmp-style comparison on two packages. Return -1 if ver1 < ver2, 0 if ver1 == ver2, and 1 if ver1 > ver2. Return None if there was a problem making the comparison.
ignore_epoch  [False] Set to True to ignore the epoch when comparing versions

New in version 2015.8.10,2016.3.2.

CLI Example:

```
salt '*' pkg.version_cmp '0.2-001' '0.2.0.1-002'
```

21.9.360  salt.modules.rpmbuild_pkgbuild

RPM Package builder system

New in version 2015.8.0.

This system allows for all of the components to build rpms safely in chrooted environments. This also provides a function to generate yum repositories

This module implements the pkgbuild interface

```
salt.modules.rpmbuild_pkgbuild.build(runas, tgt, dest_dir, spec, sources, deps, env, template, saltenv='base', log_dir='/var/log/salt/pkgbuild')
```

Given the package destination directory, the spec file source and package sources, use mock to safely build the rpm defined in the spec file

CLI Example:

```
salt '*' pkgbuild.build mock epel-7-x86_64 /var/www/html
  https://raw.githubusercontent.com/saltstack/libnacl/master/pkg/rpm/
  python-libnacl.spec
  https://pypi.python.org/packages/source/l/libnacl/libnacl-1.3.5.tar.gz
```

This example command should build the libnacl package for rhel 7 using user mock and place it in /var/www/html/ on the minion

```
salt.modules.rpmbuild_pkgbuild.make_repo(repodir, keyid=None, use_passphrase=False, gnupghome='/etc/salt/gpgkeys', runas='root', timeout=15.0)
```

Make a package repository and optionally sign packages present

Given the repodir, create a yum repository out of the rpms therein and optionally sign it and packages present, the name is directory to turn into a repo. This state is best used with onchanges linked to your package building states.

repodir  The directory to find packages that will be in the repository.

keyid  Changed in version 2016.3.0.

Optional Key ID to use in signing packages and repository. Utilizes Public and Private keys associated with keyid which have been loaded into the minion’s Pillar data.

For example, contents from a Pillar data file with named Public and Private keys as follows:

```
gpg_pkg_priv_key: |
      -----BEGIN PGP PRIVATE KEY BLOCK-----
Version: GnuPG v1

\lQO+BFciIffQBCADAPCtzy7I5Rl32escCMZsPzaEKWe7bIX1em4KCKkB0Xs47IG54b
w82PECE8Y1jf/9Uk2m3RkVwp3Yc1lC7Ap3gj6VQ4ysvVZv28UbnhPxsIk0lf2cq8qc
 .
 .
Ebe+8JCQTwqSXPRTzXmy/b5WXDeM79CkLWvuGpXFor76D+ECMRPv/rawukEcNpntn
```

(continues on next page)
env  Changed in version 2016.3.0.
A dictionary of environment variables to be utilized in creating the repository.

Note: This parameter is not used for making yum repositories.

use_passphrase  [False] New in version 2016.3.0.
Use a passphrase with the signing key presented in keyid. Passphrase is received from Pillar data which could be passed on the command line with pillar parameter. For example:

```
pillar='{ "gpg_passphrase" : "my_passphrase" }'
```

gnupghome  [/etc/salt/gpgkeys] New in version 2016.3.0.
Location where GPG related files are stored, used with keyid.

User to create the repository as, and optionally sign packages.

Note: Ensure the user has correct permissions to any files and directories which are to be utilized.

timeout  [15.0] New in version 2016.3.4.
Timeout in seconds to wait for the prompt for inputting the passphrase.

CLI Example:
```
salt '*' pkgbuild.make_repo /var/www/html/
```

salt.modules.rpmbuild_pkgbuild.make_src_pkg(dest_dir, spec, sources, env='None', template='None', saltenv='base', runas='root')
Create a source rpm from the given spec file and sources

CLI Example:
This example command should build the libnacl SOURCE package and place it in /var/www/html/ on the minion.

Changed in version 2017.7.0.

**dest_dir** The directory on the minion to place the built package(s)

**spec** The location of the spec file (used for rpms)

**sources** The list of package sources

**env** A dictionary of environment variables to be set prior to execution.

**template** Run the spec file through a templating engine Optional argument, allows for no templating engine used to be if none is desired.

**saltenv** The saltenv to use for files downloaded from the salt fileserver

**runas** The user to run the build process as

New in version 2018.3.3.

Note: using SHA256 as digest and minimum level dist el6

### 21.9.361 salt.modules.rsync

Wrapper for rsync

New in version 2014.1.0.

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

#### salt.modules.rsync.config

`salt.modules.rsync.config(`conf_path`=/etc/rsyncd.conf`)`

Changed in version 2016.3.0: Return data now contains just the contents of the rsyncd.conf as a string, instead of a dictionary as returned from `cmd.run_all`.

Returns the contents of the rsync config file

**conf_path** [/etc/rsyncd.conf] Path to the config file

CLI Example:

```bash
salt '*' rsync.config
```

#### salt.modules.rsync.rsync

`salt.modules.rsync.rsync(`src`, `dst`, `delete=False`, `force=False`, `update=False`, `passwordfile=None`, `exclude=None`, `excludefrom=None`, `dryrun=False`, `rsh=None`, `addional_opts=None`, `saltenv='base'`)`

Changed in version 2016.3.0: Return data now contains just the output of the rsync command, instead of a dictionary as returned from `cmd.run_all`.

Rsync files from src to dst

**src** The source location where files will be rsynced from.

**dst** The destination location where files will be rsynced to.

**delete** [False] Whether to enable the rsync –delete flag, which will delete extraneous files from dest dirs

**force** [False] Whether to enable the rsync –force flag, which will force deletion of dirs even if not empty.

**update** [False] Whether to enable the rsync –update flag, which forces rsync to skip any files which exist on the destination and have a modified time that is newer than the source file.
**passwordfile**  A file that contains a password for accessing an rsync daemon. The file should contain just the password.

**exclude**  Whether to enable the rsync --exclude flag, which will exclude files matching a PATTERN.

**excludefrom**  Whether to enable the rsync --excludefrom flag, which will read exclude patterns from a file.

**dryrun**  [False] Whether to enable the rsync --dry-run flag, which will perform a trial run with no changes made.

**rsh**  Whether to enable the rsync --rsh flag, to specify the remote shell to use.

**additional_opts**  Any additional rsync options, should be specified as a list.

**saltenv**  Specify a salt fileserver environment to be used.

**CLI Example:**

```bash
salt '*' rsync.rsync /path/to/src /path/to/dest delete=True update=True

passwordfile=/etc/pass.crt exclude=exclude/dir
salt '*' rsync.rsync /path/to/src delete=True excludefrom=/xx.ini
salt '*' rsync.rsync /path/to/src delete=True exclude=exclude1/dir,exclude2/dir] additional_opts=['"--partial", "--bwlimit=5000"]'
```

**salt.modules.rsync.version()**

Changed in version 2016.3.0: Return data now contains just the version number as a string, instead of a dictionary as returned from `cmd.run_all`.

Returns rsync version

**CLI Example:**

```bash
salt '*' rsync.version
```

**21.9.362 salt.modules.runit**

**runit service module** (http://smarden.org/runit)

This module is compatible with the service states, so it can be used to maintain services using the provider argument:

```yaml
myservice:
  service:
    - running
    - provider: runit
```

Provides virtual service module on systems using runit as init.

Service management rules (sv command):

- service $n is ENABLED if file SERVICE_DIR/$n/run exists
- service $n is AVAILABLE if ENABLED or if file AVAIL_SRV_DIR/$n/run exists
- service $n is DISABLED if AVAILABLE but not ENABLED

SERVICE_DIR/$n is normally a symlink to a AVAIL_SRV_DIR/$n folder

Service auto-start/stop mechanism:

- sv (auto)starts/stops service as soon as SERVICE_DIR/<service> is created/deleted, both on service creation or a boot time.
- autostart feature is disabled if file SERVICE_DIR/<n>/down exists. This does not affect the current’s service status (if already running) nor manual service management.

Service's alias:
Service `sva` is an alias of service `svc` when `AVAIL_SVR_DIR/sva` symlinks to folder `AVAIL_SVR_DIR/svc`. `svc` can’t be enabled if it is already enabled through an alias already enabled, since `sv` files are stored in folder `SERVICE_DIR/svc`.

XBPS package management uses a service’s alias to provide service alternative(s), such as chrony and openntpd both aliased to ntpd.

`salt.modules.runit.add_svc_avail_path(path)`
Add a path that may contain available services. Return `True` if added (or already present), `False` on error.
`path` directory to add to `AVAIL_SVR_DIRS`

`salt.modules.runit.available(name)`
Returns `True` if the specified service is available, otherwise returns `False`.
`name` the service’s name

CLI Example:
```
salt '*' runit.available <service name>
```

`salt.modules.runit.disable(name, stop=False, **kwargs)`
Don’t start service `name` at boot Returns `True` if operation is successful
`name` the service’s name
`stop` if True, also stops the service

CLI Example:
```
salt '*' service.disable <name> [stop=True]
```

`salt.modules.runit.disabled(name)`
Return `True` if the named service is disabled, `False` otherwise
`name` the service’s name

CLI Example:
```
salt '*' service.disabled <service name>
```

`salt.modules.runit.enable(name, start=False, **kwargs)`
Start service `name` at boot. Returns `True` if operation is successful
`name` the service’s name
`start` [False] If True, start the service once enabled.

CLI Example:
```
salt '*' service.enable <name> [start=True]
```

`salt.modules.runit.enabled(name)`
Return `True` if the named service is enabled, `False` otherwise
`name` the service’s name

CLI Example:
```
salt '*' service.enabled <service name>
```

`salt.modules.runit.full_restart(name)`
Calls runit.restart()
`name` the service’s name

CLI Example:
```
salt '*' runit.full_restart <service name>
```

`salt.modules.runit.get_all()`
Return a list of all available services
CLI Example:

```
salt '*' runit.get_all
```

**salt.modules.runit.get_disabled()**
Return a list of all disabled services

CLI Example:

```
salt '*' service.get_disabled
```

**salt.modules.runit.get_enabled()**
Return a list of all enabled services

CLI Example:

```
salt '*' service.get_enabled
```

**salt.modules.runit.get_svc_alias()**
Returns the list of service’s name that are aliased and their alias path(s)

**salt.modules.runit.get_svc_avail_path()**
Return list of paths that may contain available services

**salt.modules.runit.get_svc_broken_path(name='*')**
Return list of broken path(s) in SERVICE_DIR that match name

A path is broken if it is a broken symlink or can not be a runit service
name a glob for service name. default is ‘*’

CLI Example:

```
salt '*' runit.get_svc_broken_path <service name>
```

**salt.modules.runit.missing(name)**
The inverse of runit.available. Returns True if the specified service is not available, otherwise returns False.

name the service’s name

CLI Example:

```
salt '*' runit.missing <service name>
```

**salt.modules.runit.reload_(name)**
Reload service

name the service’s name

CLI Example:

```
salt '*' runit.reload <service name>
```

**salt.modules.runit.remove(name)**
Remove the service <name> from system. Returns True if operation is successful. The service will be also stopped.

name the service’s name

CLI Example:

```
salt '*' service.remove <name>
```

**salt.modules.runit.restart(name)**
Restart service

name the service’s name
CLI Example:

```bash
salt '*' runit.restart <service name>
```

**salt.modules.runit.show**(name)

Show properties of one or more units/jobs or the manager

- **name**: the service's name

CLI Example:

```bash
salt '*' service.show <service name>
```

**salt.modules.runit.start**(name)

Start service

- **name**: the service's name

CLI Example:

```bash
salt '*' runit.start <service name>
```

**salt.modules.runit.status**(name, sig=None)

Return True if service is running

- **name**: the service's name
- **sig**: signature to identify with ps

CLI Example:

```bash
salt '*' runit.status <service name>
```

**salt.modules.runit.status_autostart**(name)

Return True if service <name> is autostarted by sv (file $service_folder/down does not exist) NB: return False if the service is not enabled.

- **name**: the service's name

CLI Example:

```bash
salt '*' runit.status_autostart <service name>
```

**salt.modules.runit.stop**(name)

Stop service

- **name**: the service's name

CLI Example:

```bash
salt '*' runit.stop <service name>
```

### 21.9.363 salt.modules.rvm

Manage ruby installations and gemsets with RVM, the Ruby Version Manager.

**salt.modules.rvm.do**(ruby, command, runas=None, cwd=None, env=None)

Execute a command in an RVM controlled environment.

- **ruby**: Which ruby to use
- **command**: The rvm command to execute
- **runas**: The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.
- **cwd**: The directory from which to run the rvm command. Defaults to the user’s home directory.

CLI Example:

```bash
salt '*' rvm.do 2.0.0 <command>
```
salt.modules.rvm.gemset_copy(source, destination, runas=None)
Copy all gems from one gemset to another.
source The name of the gemset to copy, complete with ruby version
destination The destination gemset
runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:
salt '*' rvm.gemset_copy foobar bazquo

salt.modules.rvm.gemset_create(ruby, gemset, runas=None)
Creates a gemset.
ruby The ruby version for which to create the gemset
gemset The name of the gemset to create
runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:
salt '*' rvm.gemset_create 2.0.0 foobar

salt.modules.rvm.gemset_delete(ruby, gemset, runas=None)
Delete a gemset
ruby The ruby version to which the gemset belongs
gemset The gemset to delete
runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:
salt '*' rvm.gemset_delete 2.0.0 foobar

salt.modules.rvm.gemset_empty(ruby, gemset, runas=None)
Remove all gems from a gemset.
ruby The ruby version to which the gemset belongs
gemset The gemset to empty
runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:
salt '*' rvm.gemset_empty 2.0.0 foobar

salt.modules.rvm.gemset_list(ruby='default', runas=None)
List all gemsets for the given ruby.
ruby [default] The ruby version for which to list the gemsets
runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:
salt '*' rvm.gemset_list

salt.modules.rvm.gemset_list_all(runas=None)
List all gemsets for all installed rubies.

Note that you must have set a default ruby before this can work.
runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:
salt 'x' rvm.gemset_list_all

salt.modules.rvm.get(version='stable', runas=None)
Update RVM

version  [stable] Which version of RVM to install, (e.g. stable or head)

CLI Example:
salt 'x' rvm.get

salt.modules.rvm.install(runas=None)
Install RVM system-wide

runas  The user under which to run the rvm installer script. If not specified, then it be run as the user under which Salt is running.

CLI Example:
salt 'x' rvm.install

salt.modules.rvm.install_ruby(ruby, runas=None, opts=None, env=None)
Install a ruby implementation.

ruby  The version of ruby to install
runas  The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.
env  Environment to set for the install command. Useful for exporting compilation flags such as RUBY_CONFIGURE_OPTS
opts  List of options to pass to the RVM installer (ie -C, –patch, etc)

CLI Example:
salt 'x' rvm.install_ruby 1.9.3-p385

salt.modules.rvm.is_installed(runas=None)
Check if RVM is installed.

CLI Example:
salt 'x' rvm.is_installed

salt.modules.rvm.list_(runas=None)
List all rvm-installed rubies

runas  The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:
salt 'x' rvm.list

salt.modules.rvm.reinstall_ruby(ruby, runas=None, env=None)
Reinstall a ruby implementation

ruby  The version of ruby to reinstall
runas  The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:
salt 'x' rvm.reinstall_ruby 1.9.3-p385

salt.modules.rvm.rubygems(ruby, version, runas=None)
Installs a specific rubygems version in the given ruby

ruby  The ruby for which to install rubygems
version  The version of rubygems to install, or 'remove' to use the version that ships with 1.9
runas  The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```text
salt '*' rvm.rubygems 2.0.0 1.8.24
```

salt.modules.rvm.set_default(ruby, runas=None)
Set the default ruby

- **ruby**  The version of ruby to make the default
- **runas**  The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```text
salt '*' rvm.set_default 2.0.0
```

salt.modules.rvm.wrapper(ruby_string, wrapper_prefix, runas=None, *binaries)
Install RVM wrapper scripts

- **ruby_string**  Ruby/gemset to install wrappers for
- **wrapper_prefix**  What to prepend to the name of the generated wrapper binaries
- **runas**  The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.
- **binaries**  [None] The names of the binaries to create wrappers for. When nothing is given, wrappers for ruby, gem, rake, irb, rdoc, ri and testrb are generated.

CLI Example:

```text
salt '*' rvm.wrapper <ruby_string> <wrapper_prefix>
```

21.9.364  salt.modules.s3

Connection module for Amazon S3

configuration  This module accepts explicit s3 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```text
```

If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:

```text
s3.keyid: GKTADJGHEIQSXMKKRBJ08H
s3.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

(Note: this is literally the pillar key 's3.keyid' or the config option 's3.keyid', not "s3:n keyid: blah")

A service_url may also be specified in the configuration:

```text
s3.service_url: s3.amazonaws.com
```

A role_arn may also be specified in the configuration:

```text
s3.role_arn: arn:aws:iam::111111111111:role/my-role-to-assume
```
If a service_url is not specified, the default is s3.amazonaws.com. This may appear in various documentation as an "endpoint". A comprehensive list for Amazon S3 may be found at:

\[http://docs.aws.amazon.com/general/latest/gr/rande.html#s3_region\]

The service_url will form the basis for the final endpoint that is used to query the service.

Path style can be enabled:

```
s3.path_style: True
```

This can be useful if you need to use salt with a proxy for an s3 compatible storage.

You can use either https protocol or http protocol:

```
s3.https_enable: True
```

SSL verification may also be turned off in the configuration:

```
s3.verify_ssl: False
```

This is required if using S3 bucket names that contain a period, as these will not match Amazon’s S3 wildcard certificates. Certificate verification is enabled by default.

AWS region may be specified in the configuration:

```
s3.location: eu-central-1
```

Default is us-east-1.

This module should be usable to query other S3-like services, such as Eucalyptus.

**depends** requests

**salt.modules.s3.delete**

Delete a bucket, or delete an object from a bucket.

CLI Example to delete a bucket:

```
salt myminion s3.delete mybucket
```

CLI Example to delete an object from a bucket:

```
salt myminion s3.delete mybucket remoteobject
```

**salt.modules.s3.get**

List the contents of a bucket, or return an object from a bucket. Set return_bin to True in order to retrieve an object wholesale. Otherwise, Salt will attempt to parse an XML response.

CLI Example to list buckets:

```
salt myminion s3.get
```

CLI Example to list the contents of a bucket:

```
salt myminion s3.get mybucket
```

CLI Example to return the binary contents of an object:
s3.get

CLI Example to save the binary contents of an object to a local file:

```bash
salt myminion s3.get mybucket myfile.png local_file=/tmp/myfile.png
```

It is also possible to perform an action on a bucket. Currently, S3 supports the following actions:

- acl
- cors
- lifecycle
- policy
- location
- logging
- notification
- tagging
- versions
- requestPayment
- versioning
- website

To perform an action on a bucket:

```bash
salt myminion s3.get mybucket myfile.png action=acl
```

`salt.modules.s3.head` *(bucket, path=*, key=None, keyid=None, service_url=None, verify_ssl=None, kms_keyid=None, location=None, role_arn=None, path_style=None, https_enable=None)*

Return the metadata for a bucket, or an object in a bucket.

CLI Examples:

```bash
salt myminion s3.head mybucket
salt myminion s3.head mybucket myfile.png
```

`salt.modules.s3.put` *(bucket, path=None, return_bin=False, action=None, local_file=None, key=None, keyid=None, service_url=None, verify_ssl=None, kms_keyid=None, location=None, role_arn=None, path_style=None, https_enable=None)*

Create a new bucket, or upload an object to a bucket.

CLI Example to create a bucket:

```bash
salt myminion s3.put mybucket
```

CLI Example to upload an object to a bucket:

```bash
salt myminion s3.put mybucket remotepath local_file=/path/to/file
```

### 21.9.365 salt.modules.s6 module

s6 service module

This module is compatible with the `service` states, so it can be used to maintain services using the `provider` argument:
myservice:
  service:
    - running
    - provider: s6

Note that the enabled argument is not available with this provider.

**codeauthor** Marek Skrobacki <skrobul@skrobul.com>

salt.modules.s6.available(name)

Returns True if the specified service is available, otherwise returns False.

CLI Example:
```
salt '*' s6.available foo
```

salt.modules.s6.full_restart(name)

Calls s6.restart() function

CLI Example:
```
salt '*' s6.full_restart <service name>
```

salt.modules.s6.get_all()

Return a list of all available services

CLI Example:
```
salt '*' s6.get_all
```

salt.modules.s6.missing(name)

The inverse of s6.available. Returns True if the specified service is not available, otherwise returns False.

CLI Example:
```
salt '*' s6.missing foo
```

salt.modules.s6.reload_(name)

Send a HUP to service via s6

CLI Example:
```
salt '*' s6.reload <service name>
```

salt.modules.s6.restart(name)

Restart service via s6. This will stop/start service

CLI Example:
```
salt '*' s6.restart <service name>
```

salt.modules.s6.start(name)

Starts service via s6

CLI Example:
```
salt '*' s6.start <service name>
```

salt.modules.s6.status(name, sig=None)

Return the status for a service via s6, return pid if running

21.9. execution modules
CLI Example:

```
salt '*' s6.status <service name>
```

**salt.modules.s6.stop** *(name)*

Stops service via s6

CLI Example:

```
salt '*' s6.stop <service name>
```

**salt.modules.s6.term** *(name)*

Send a TERM to service via s6

CLI Example:

```
salt '*' s6.term <service name>
```

### 21.9.366 salt.modules.salt_proxy module

Salt proxy module

New in version 2015.8.3.

Module to deploy and manage salt-proxy processes on a minion.

**salt.modules.salt_proxy.configure_proxy** *(proxynname, start=True)*

Create the salt proxy file and start the proxy process if required

*Parameters*

- **proxynname** – Name to be used for this proxy (should match entries in pillar)
- **start** – Boolean indicating if the process should be started default = True

CLI Example:

```
salt deviceminion salt_proxy.configure_proxy p8000
```

**salt.modules.salt_proxy.is_running** *(proxynname)*

Check if the salt-proxy process associated with this proxy (name) is running.

Returns True if the process is running False otherwise

*Parameters** **proxynname** – String name of the proxy (p8000 for example)

CLI Example:

```
salt deviceminion salt_proxy.is_running p8000
```

### 21.9.367 salt.modules.saltcheck

A module for testing the logic of states and highstates

**codeauthor** William Cannon <william.cannon@gmail.com>

**maturity** new

Saltcheck provides unittest like functionality requiring only the knowledge of salt module execution and yaml.

In order to run state and highstate saltcheck tests a sub-folder of a state must be created and named `saltcheck-tests`

Tests for a state should be created in files ending in `*.tst` and placed in the `saltcheck-tests` folder.
Multiple tests can be created in a file. Multiple *.tst files can be created in the saltcheck-tests folder. Salt rendering is supported in test files (e.g. yaml + jinja). The id of a test works in the same manner as in salt state files. They should be unique and descriptive.

Example file system layout:

Example:

```
echo-test-hello:
  module_and_function: test.echo
  args:
    - "hello"
  kwargs:
    assertion: assertEqual
  expected-return: 'hello'
```

class salt.modules.saltcheck.SaltCheck
   This class implements the saltcheck
   ```
call_salt_command(fun, args, kwargs)
   Generic call of salt Caller command
   ```
   ```
cast_expected_to_returned_type(expected, returned)
   Determine the type of variable returned Cast the expected to the type of variable returned
   ```
   ```
get_state_search_path_list()
   For the state file system, return a list of paths to search for states
   ```
   ```
run_test(test_dict)
   Run a single saltcheck test
   ```
class salt.modules.saltcheck.StateTestLoader(search_paths)
   Class loads in test files for a state e.g. state_dir/saltcheck-tests/[1.tst, 2.tst, 3.tst]
   ```
add_test_files_for_sls(sls_path)
   Adding test files
   ```
   ```
convert_sls_to_path(sls)
   Converting sls to paths
   ```
   ```
convert_sls_to_paths(sls_list)
   Converting sls to paths
   ```
   ```
gather_files(filepath)
   Gather files for a test suite
   ```
   ```
load_file(filepath)
   loads in one test file
   ```
   ```
load_file_salt_rendered(filepath)
   loads in one test file
   ```
   ```
load_test_suite()
   Load tests either from one file, or a set of files
   ```
salt.modules.saltcheck.run_highstate_tests()
   Execute all tests for a salt highstate and return results
   ```
   ```
CLI Example:
   ```
salt '*' saltcheck.run_highstate_tests
   ```
salt.modules.saltcheck.run_state_tests(state)

    Execute all tests for a salt state and return results Nested states will also be tested

    Parameters
    
    state (str) – the name of a user defined state

    CLI Example:

    salt '*' saltcheck.run_state_tests postfix

salt.modules.saltcheck.run_test(**kwargs)

    Execute one saltcheck test and return result

    Parameters

    arg test (keyword) –

    CLI Example:

    salt '*' saltcheck.run_test
    test={'"module_and_function": "test.echo",
    "assertion": "assertEqual",
    "expected-return": "This works!",
    "args": ["This works!"] }'

salt.modules.saltcheck.update_master_cache()

    Updates the master cache onto the minion - transfers all salt-check-tests Should be done one time before running tests, and if tests are updated Can be automated by setting "auto_update_master_cache: True" in minion config

    CLI Example:

    salt '*' saltcheck.update_master_cache

21.9.368 salt.modules.saltcloudmod

Control a salt cloud system

salt.modules.saltcloudmod.create(name, profile)

    Create the named vm

    CLI Example:

    salt <minion-id> saltcloud.create webserver rackspace_centos_512

21.9.369 salt.modules.saltutil

The Saltutil module is used to manage the state of the salt minion itself. It is used to manage minion modules as well as automate updates to the salt minion.

    depends

        • esky Python module for update functionality

salt.modules.saltutil.clear_cache()

    Forcibly removes all caches on a minion.

    New in version 2014.7.0.

    WARNING: The safest way to clear a minion cache is by first stopping the minion and then deleting the cache files before restarting it.

    CLI Example:
`salt '*' saltutil.clear_cache`

`salt.modules.saltutil.clear_job_cache(hours=24)`
Forcibly removes job cache folders and files on a minion.

New in version 2018.3.0.

WARNING: The safest way to clear a minion cache is by first stopping the minion and then deleting the cache files before restarting it.

CLI Example:

```
salt '*' saltutil.clear_job_cache hours=12
```

`salt.modules.saltutil.cmd(tgt, fun, arg=(), timeout=None, tgt_type='glob', ret='', kwarg=None, ssh=False, **kwargs)`

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Assuming this minion is a master, execute a salt command

CLI Example:

```
salt '*' saltutil.cmd
```

`salt.modules.saltutil.cmd_iter(tgt, fun, arg=(), timeout=None, tgt_type='glob', ret='', kwarg=None, ssh=False, **kwargs)`

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Assuming this minion is a master, execute a salt command

CLI Example:

```
salt '*' saltutil.cmd_iter
```

`salt.modules.saltutil.find_cached_job(jid)`

Return the data for a specific cached job id. Note this only works if cache_jobs has previously been set to True on the minion.

CLI Example:

```
salt '*' saltutil.find_cached_job <job id>
```

`salt.modules.saltutil.find_job(jid)`

Return the data for a specific job id that is currently running.

`jid` The job id to search for and return data.

CLI Example:

```
salt '*' saltutil.find_job <job id>
```

Note that the `find_job` function only returns job information when the job is still running. If the job is currently running, the output looks something like this:

```
# salt my-minion saltutil.find_job 20160503150049487736
my-minion:
   --------
   arg:
       - 30
```

(continues on next page)
fun:
    test.sleep
jid: 20160503150049487736
pid: 9601
ret:
tgt:
    my-minion
tgt_type:
    glob
user:
    root

If the job has already completed, the job cannot be found and therefore the function returns an empty dictionary, which looks like this on the CLI:

```
# salt my-minion saltutil.find_job 20160503150049487736
my-minion: ----------
```

salt.modules.saltutil.is_running(fun)

If the named function is running return the data associated with it/them. The argument can be a glob

CLI Example:
```
salt '*' saltutil.is_running state.highstate
```

salt.modules.saltutil.kill_all_jobs()

Sends a kill signal (SIGKILL 9) to all currently running jobs

CLI Example:
```
salt '*' saltutil.kill_all_jobs
```

salt.modules.saltutil.kill_job(jid)

Sends a kill signal (SIGKILL 9) to the named salt job's process

CLI Example:
```
salt '*' saltutil.kill_job <job id>
```

salt.modules.saltutil.list_extmods()

New in version 2017.7.0.

List Salt modules which have been synced externally

CLI Examples:
```
salt '*' saltutil.list_extmods
```

salt.modules.saltutil.mmodule(saltenv, fun, *args, **kwargs)

Loads minion modules from an environment so that they can be used in pillars for that environment

CLI Example:
```
salt '*' saltutil.mmodule base test.ping
```
salt_modules.saltutil.refresh_beacons()
Signal the minion to refresh the beacons.

CLI Example:
```
salt '*' saltutil.refresh_beacons
```

salt_modules.saltutil.refresh_grains(**kwargs)
New in version 2016.3.6, 2016.11.4, 2017.7.0.
Refresh the minion’s grains without syncing custom grains modules from salt://_grains.

**Note:** The available execution modules will be reloaded as part of this process, as grains can affect which modules are available.

refresh_pillar [True] Set to False to keep pillar data from being refreshed.

CLI Examples:
```
salt '*' saltutil.refresh_grains
```

salt_modules.saltutil.refresh_matchers()
Signal the minion to refresh its matchers.

CLI Example:
```
salt '*' saltutil.refresh_matchers
```

salt_modules.saltutil.refresh_modules(**kwargs)
Signal the minion to refresh the module and grain data
The default is to refresh module asynchronously. To block until the module refresh is complete, set the 'async' flag to False.

CLI Example:
```
salt '*' saltutil.refresh_modules
```

salt_modules.saltutil.refresh_pillar()
Signal the minion to refresh the pillar data.

CLI Example:
```
salt '*' saltutil.refresh_pillar
```

salt_modules.saltutil.regen_keys()
Used to regenerate the minion keys.

CLI Example:
```
salt '*' saltutil.regen_keys
```

salt_modules.saltutil.revoke_auth(preserve_minion_cache=False)
The minion sends a request to the master to revoke its own key. Note that the minion session will be revoked and the minion may not be able to return the result of this command back to the master.

If the 'preserve_minion_cache' flag is set to True, the master cache for this minion will not be removed.

CLI Example:
salt '*' saltutil.revoke_auth

salt.modules.saltutil.runner(name, arg=None, kwarg=None, full_return=False, saltenv='base', jid=None, **kwargs)

Execute a runner function. This function must be run on the master, either by targeting a minion running on a master or by using salt-call on a master.

New in version 2014.7.0.

name The name of the function to run

kwarg Any keyword arguments to pass to the runner function

CLI Example:

In this example, assume that master_minion is a minion running on a master.

```
salt master_minion saltutil.runner jobs.list_jobs
salt master_minion saltutil.runner test.arg arg='["baz"]' kwarg='{"foo": "bar"}"
```

salt.modules.saltutil.running()

Return the data on all running salt processes on the minion

CLI Example:

```
salt '*' saltutil.running
```

salt.modules.saltutil.signal_job(jid, sig)

Sends a signal to the named salt job’s process

CLI Example:

```
salt '*' saltutil.signal_job <job id> 15
```

salt.modules.saltutil.sync_all(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

Changed in version 2015.8.11, 2016.3.2: On masterless minions, pillar modules are now synced, and refreshed when refresh is set to True.

Sync down all of the dynamic modules from the file server for a specific environment. This function synchronizes custom modules, states, beacons, grains, returners, output modules, renderers, and utils.

refresh [True] Also refresh the execution modules and recompile pillar data available to the minion. This refresh will be performed even if no new dynamic modules are synced. Set to False to prevent this refresh.

Important: If this function is executed using a module.run state, the SLS file will not have access to newly synced execution modules unless a refresh argument is added to the state, like so:

```
load_my_custom_module:
  module.run:
    - name: saltutil.sync_all
      refresh: True
```

See here for a more detailed explanation of why this is necessary.

extmod_whitelist [None] dictionary of modules to sync based on type

extmod_blacklist [None] dictionary of modules to blacklist based on type

CLI Examples:
salt.modules.saltutil.sync_beacons(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 2015.5.1.

Sync beacons from salt://_beacons to the minion
saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for beacons to sync. If no top files are found, then the base environment will be synced.
refresh [True] If True, refresh the available beacons on the minion. This refresh will be performed even if no new beacons are synced. Set to False to prevent this refresh.
extmod_whitelist [None] comma-separated list of modules to sync
extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Example:
salt '*' saltutil.sync_beacons
salt '*' saltutil.sync_beacons saltenv=dev
salt '*' saltutil.sync_beacons saltenv=base,dev

salt.modules.saltutil.sync_clouds(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 2017.7.0.

Sync cloud modules from salt://_cloud to the minion
saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
refresh [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new utility modules are synced. Set to False to prevent this refresh.
extmod_whitelist [None] comma-seperated list of modules to sync
extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Examples:
salt '*' saltutil.sync_clouds
salt '*' saltutil.sync_clouds saltenv=dev
salt '*' saltutil.sync_clouds saltenv=base,dev

salt.modules.saltutil.sync_engines(saltenv=None, refresh=False, extmod_whitelist=None, extmod_blacklist=None)

New in version 2016.3.0.

Sync engine modules from salt://_engines to the minion
saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for engines to sync. If no top files are found, then the base environment will be synced.
refresh [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new engine modules are synced. Set to False to prevent this refresh.
extmod_whitelist [None] comma-seperated list of modules to sync
extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Examples:
salt '★' saltutil.sync_engines
salt '★' saltutil.sync_engines saltenv=base,dev

salt.modules.saltutil.sync_executors(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 2019.2.1.

Sync executors from salt://_executors to the minion

saltenv  The filesystem environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for log handlers to sync. If no top files are found, then the base environment will be synced.

refresh  [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new log handlers are synced. Set to False to prevent this refresh.

extmod_whitelist  [None] comma-separated list of modules to sync
extmod_blacklist  [None] comma-separated list of modules to blacklist based on type

CLI Examples:
salt '★' saltutil.sync_executors
salt '★' saltutil.sync_executors saltenv=dev
salt '★' saltutil.sync_executors saltenv=base,dev

salt.modules.saltutil.sync_grains(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 0.10.0.

Sync grains modules from salt://_grains to the minion

saltenv  The filesystem environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for grains modules to sync. If no top files are found, then the base environment will be synced.

refresh  [True] If True, refresh the available execution modules and recompile pillar data for the minion. This refresh will be performed even if no new grains modules are synced. Set to False to prevent this refresh.

extmod_whitelist  [None] comma-separated list of modules to sync
extmod_blacklist  [None] comma-separated list of modules to blacklist based on type

CLI Examples:
salt '★' saltutil.sync_grains
salt '★' saltutil.sync_grains saltenv=dev
salt '★' saltutil.sync_grains saltenv=base,dev

salt.modules.saltutil.sync_log_handlers(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 2015.8.0.

Sync log handlers from salt://_log_handlers to the minion

saltenv  The filesystem environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for log handlers to sync. If no top files are found, then the base environment will be synced.

refresh  [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new log handlers are synced. Set to False to prevent this refresh.

extmod_whitelist  [None] comma-separated list of modules to sync
extmod_blacklist  [None] comma-separated list of modules to blacklist based on type
CLI Examples:

```shell
salt '*' saltutil.sync_log_handlers
salt '*' saltutil.sync_log_handlers saltenv=dev
salt '*' saltutil.sync_log_handlers saltenv=base,dev
```

```
salt.modules.saltutil.sync_matchers(saltenv=None, refresh=False, extmod_whitelist=None, extmod_blacklist=None)
```

New in version 2019.2.0.

Sync engine modules from salt://_matchers to the minion

- **saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
  
  If not passed, then all environments configured in the top files will be checked for engines to sync. If no top files are found, then the base environment will be synced.

- **refresh** [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new matcher modules are synced. Set to False to prevent this refresh.

- **extmod_whitelist** [None] comma-separated list of modules to sync

- **extmod_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```shell
salt '*' saltutil.sync_matchers
salt '*' saltutil.sync_matchers saltenv=base,dev
```

```
salt.modules.saltutil.sync_modules(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)
```

New in version 0.10.0.

Sync execution modules from salt://_modules to the minion

- **saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

  If not passed, then all environments configured in the top files will be checked for execution modules to sync. If no top files are found, then the base environment will be synced.

- **refresh** [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new execution modules are synced. Set to False to prevent this refresh.

---

**Important**: If this function is executed using a module.run state, the SLS file will not have access to newly synced execution modules unless a refresh argument is added to the state, like so:

```yaml
load_my_custom_module:
    module.run:
      - name: saltutil.sync_modules
        - refresh: True
```

See [here](#) for a more detailed explanation of why this is necessary.

- **extmod_whitelist** [None] comma-separated list of modules to sync
- **extmod_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```shell
salt '*' saltutil.sync_modules
salt '*' saltutil.sync_modules saltenv=dev
salt '*' saltutil.sync_modules saltenv=base,dev
```
salt.modules.saltutil.sync_output(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

Sync outputters from salt://_output to the minion

saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for outputters to sync. If no top files are found, then the base environment will be synced.

refresh [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new outputters are synced. Set to False to prevent this refresh.

extmod_whitelist [None] comma-separated list of modules to sync
extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_output
salt '*' saltutil.sync_output saltenv=dev
salt '*' saltutil.sync_output saltenv=base,dev
```

salt.modules.saltutil.sync_outputters(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

This function is an alias of sync_output.

Sync outputters from salt://_output to the minion

saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for outputters to sync. If no top files are found, then the base environment will be synced.

refresh [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new outputters are synced. Set to False to prevent this refresh.

extmod_whitelist [None] comma-separated list of modules to sync
extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_output
salt '*' saltutil.sync_output saltenv=dev
salt '*' saltutil.sync_output saltenv=base,dev
```

salt.modules.saltutil.sync_pillar(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 2015.8.11, 2016.3.2.

Sync pillar modules from the salt://_pillar directory on the Salt fileserver. This function is environment-aware, pass the desired environment to grab the contents of the _pillar directory from that environment. The default environment, if none is specified, is base.

refresh [True] Also refresh the execution modules available to the minion, and refresh pillar data.

extmod_whitelist [None] comma-separated list of modules to sync
extmod_blacklist [None] comma-separated list of modules to blacklist based on type

Note: This function will raise an error if executed on a traditional (i.e. not masterless) minion

CLI Examples:

```
salt '*' saltutil.sync_pillar
salt '*' saltutil.sync_pillar saltenv=dev
```

salt.modules.saltutil.sync_proxymodules(saltenv=None, refresh=False, extmod_whitelist=None, extmod_blacklist=None)
New in version 2015.8.2.

Sync proxy modules from `salt://_proxy` to the minion

```
saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
```

If not passed, then all environments configured in the `top files` will be checked for proxy modules to sync. If no top files are found, then the base environment will be synced.

```
refresh [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new proxy modules are synced. Set to False to prevent this refresh.
```

```
extmod_whitelist [None] comma-separated list of modules to sync
extmod_blacklist [None] comma-separated list of modules to blacklist based on type
```

CLI Examples:

```
salt '*' saltutil.sync_proxymodules
salt '*' saltutil.sync_proxymodules saltenv=dev
salt '*' saltutil.sync_proxymodules saltenv=base,dev
```

salt.modules.saltutil.sync_renderers(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 0.10.0.

Sync renderers from `salt://_renderers` to the minion

```
saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
```

If not passed, then all environments configured in the `top files` will be checked for renderers to sync. If no top files are found, then the base environment will be synced.

```
refresh [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new renderers are synced. Set to False to prevent this refresh.
```

```
extmod_whitelist [None] comma-separated list of modules to sync
extmod_blacklist [None] comma-separated list of modules to blacklist based on type
```

CLI Examples:

```
salt '*' saltutil.sync_renderers
salt '*' saltutil.sync_renderers saltenv=dev
salt '*' saltutil.sync_renderers saltenv=base,dev
```

salt.modules.saltutil.sync_returners(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 0.10.0.

Sync returners from `salt://_returners` to the minion

```
saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
```

If not passed, then all environments configured in the `top files` will be checked for returners to sync. If no top files are found, then the base environment will be synced.

```
refresh [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new returners are synced. Set to False to prevent this refresh.
```

```
extmod_whitelist [None] comma-separated list of modules to sync
extmod_blacklist [None] comma-separated list of modules to blacklist based on type
```

CLI Examples:

```
salt '*' saltutil.sync_returners
salt '*' saltutil.sync_returners saltenv=dev
```
salt.modules.saltutil.sync_sdb(saltenv=None, extmod_whitelist=None, extmod_blacklist=None)
New in version 2015.5.8, 2015.8.3.

Sync sdb modules from salt://_sdb to the minion

saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for sdb modules to sync. If no top files are found, then the base environment will be synced.

refresh [False] This argument has no affect and is included for consistency with the other sync functions.

extmod_whitelist [None] comma-separated list of modules to sync
extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Example:

```
salt '*' saltutil.sync_sdb
salt '*' saltutil.sync_sdb saltenv=dev
salt '*' saltutil.sync_sdb saltenv=base,dev
```

salt.modules.saltutil.sync_serializers(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)
New in version 2019.2.0.

Sync serializers from salt://_serializers to the minion

saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for serializer modules to sync. If no top files are found, then the base environment will be synced.

refresh [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new serializer modules are synced. Set to False to prevent this refresh.

extmod_whitelist [None] comma-seperated list of modules to sync
extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_serializers
salt '*' saltutil.sync_serializers saltenv=dev
salt '*' saltutil.sync_serializers saltenv=base,dev
```

salt.modules.saltutil.sync_states(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)
New in version 0.10.0.

Sync state modules from salt://_states to the minion

saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for state modules to sync. If no top files are found, then the base environment will be synced.

refresh [True] If True, refresh the available states on the minion. This refresh will be performed even if no new state modules are synced. Set to False to prevent this refresh.

extmod_whitelist [None] comma-seperated list of modules to sync
extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_states
salt '*' saltutil.sync_states saltenv=dev
salt '*' saltutil.sync_states saltenv=base,dev
```
salt.modules.saltutil.sync_thorium(saltenv=None, refresh=False, extmod_whitelist=None, extmod_blacklist=None)

New in version 2018.3.0.

Sync Thorium modules from salt://_thorium to the minion

**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for engines to sync. If no top files are found, then the base environment will be synced.

**refresh**: True If True, refresh the available execution modules on the minion. This refresh will be performed even if no new Thorium modules are synced. Set to False to prevent this refresh.

**extmod_whitelist** comma-separated list of modules to sync

**extmod_blacklist** comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_thorium
salt '*' saltutil.sync_thorium saltenv=base,dev
```

salt.modules.saltutil.sync_utils(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 2014.7.0.

Sync utility modules from salt://_utils to the minion

**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for utility modules to sync. If no top files are found, then the base environment will be synced.

**refresh** [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new utility modules are synced. Set to False to prevent this refresh.

**extmod_whitelist** [None] comma-separated list of modules to sync

**extmod_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_utils
salt '*' saltutil.sync_utils saltenv=dev
salt '*' saltutil.sync_utils saltenv=base,dev
```

salt.modules.saltutil.term_all_jobs()

Sends a termination signal (SIGTERM 15) to all currently running jobs

CLI Example:

```
salt '*' saltutil.term_all_jobs
```

salt.modules.saltutil.term_job(jid)

Sends a termination signal (SIGTERM 15) to the named salt job’s process

CLI Example:

```
salt '*' saltutil.term_job <job id>
```

salt.modules.saltutil.update(version=None)

Update the salt minion from the URL defined in opts[‘update_url’] SaltStack, Inc provides the latest builds here: update_url: https://repo.saltstack.com/windows/

Be aware that as of 2014-8-11 there’s a bug in esky such that only the latest version available in the update_url can be downloaded and installed.
This feature requires the minion to be running a bdist_esky build.

The version number is optional and will default to the most recent version available at opts['update_url'].

Returns details about the transaction upon completion.

CLI Examples:

```
salt '*' saltutil.update
salt '*' saltutil.update 0.10.3
```

```
salt.modules.saltutil.wheel(name, *args, **kwargs)
```

Execute a wheel module and function. This function must be run against a minion that is local to the master.

New in version 2014.7.0.

**name**  The name of the function to run

**args**  Any positional arguments to pass to the wheel function. A common example of this would be the `match` arg needed for key functions.

New in version v2015.8.11.

**kwargs**  Any keyword arguments to pass to the wheel function

CLI Example:

```
salt my-local-minion saltutil.wheel key.accept jerry
salt my-local-minion saltutil.wheel minions.connected
```

**Note:** Since this function must be run against a minion that is running locally on the master in order to get accurate returns, if this function is run against minions that are not local to the master, "empty" returns are expected. The remote minion does not have access to wheel functions and their return data.

### 21.9.370  `salt.modules.schedule`

Module for managing the Salt schedule on a minion

New in version 2014.7.0.

```
salt.modules.schedule.add(name, **kwargs)
```

Add a job to the schedule

CLI Example:

```
salt '*' schedule.add job1 function='test.ping' seconds=3600
# If function have some arguments, use job_args
salt '*' schedule.add job2 function='cmd.run' job_args=['[date >> /tmp/date.log]'] seconds=60
```

```
salt.modules.schedule.build_schedule_item(name, **kwargs)
```

Build a schedule job

CLI Example:

```
salt '*' schedule.build_schedule_item job1 function='test.ping' seconds=3600
```

```
salt.modules.schedule.copy(name, target, **kwargs)
```

Copy scheduled job to another minion or minions.

CLI Example:
salt '*' schedule.copy jobname target

salt.modules.schedule.delete(name, **kwargs)
Delete a job from the minion’s schedule

CLI Example:
	salt '*' schedule.delete job1

salt.modules.schedule.disable(**kwargs)
Disable all scheduled jobs on the minion

CLI Example:
	salt '*' schedule.disable

salt.modules.schedule.disable_job(name, **kwargs)
Disable a job in the minion’s schedule

CLI Example:
	salt '*' schedule.disable_job job1

salt.modules.schedule.enable(**kwargs)
Enable all scheduled jobs on the minion

CLI Example:
	salt '*' schedule.enable

salt.modules.schedule.enable_job(name, **kwargs)
Enable a job in the minion’s schedule

CLI Example:
	salt '*' schedule.enable_job job1

salt.modules.schedule.is_enabled(name)
List a job only if its enabled

New in version 2015.5.3.

CLI Example:
	salt '*' schedule.is_enabled name=job_name

salt.modules.schedule.list_(show_all=False, show_disabled=True, where=None, return_yaml=True)
List the jobs currently scheduled on the minion

CLI Example:
	salt '*' schedule.list

# Show all jobs including hidden internal jobs
salt '*' schedule.list show_all=True

# Hide disabled jobs from list of jobs
salt '*' schedule.list show_disabled=False
salt.modules.schedule.modify(name, **kwargs)
Modify an existing job in the schedule

CLI Example:
```
salt '*' schedule.modify job1 function='test.ping' seconds=3600
```

salt.modules.schedule.move(name, target, **kwargs)
Move scheduled job to another minion or minions.

CLI Example:
```
salt '*' schedule.move jobname target
```

salt.modules.schedule.postpone_job(name, current_time, new_time, **kwargs)
Postpone a job in the minion's schedule

Current time and new time should be in date string format, default value is %Y-%m-%dT%H:%M:%S.

New in version 2018.3.0.

CLI Example:
```
salt '*' schedule.postpone_job job current_time new_time
salt '*' schedule.postpone_job job current_time new_time time_fmt='%Y-%m-%dT%H:%M:%S'
```

salt.modules.schedule.purge(**kwargs)
Purge all the jobs currently scheduled on the minion

CLI Example:
```
salt '*' schedule.purge
```

salt.modules.schedule.reload_()
Reload saved scheduled jobs on the minion

CLI Example:
```
salt '*' schedule.reload
```

salt.modules.schedule.run_job(name, force=False)
Run a scheduled job on the minion immediately

CLI Example:
```
salt '*' schedule.run_job job1
salt '*' schedule.run_job job1 force=True
```
Force the job to run even if it is disabled.

salt.modules.schedule.save(**kwargs)
Save all scheduled jobs on the minion

CLI Example:
```
salt '*' schedule.save
```

salt.modules.schedule.show_next_fire_time(name, **kwargs)
Show the next fire time for scheduled job
New in version 2018.3.0.

CLI Example:

```bash
salt '*' schedule.show_next_fire_time job_name
```

```
salt.modules.schedule.skip_job(name, current_time, **kwargs)
```

Skip a job in the minion’s schedule at specified time.

Time to skip should be specified as date string format, default value is %Y-%m-%dT%H:%M:%S.

New in version 2018.3.0.

CLI Example:

```bash
salt '*' schedule.skip_job job time
```

21.9.371 salt.modules.scp module

SCP Module

New in version 2019.2.0.

Module to copy files via SCP

```
salt.modules.scp_mod.get(remote_path, local_path='', recursive=False, preserve_times=False, **kwargs)
```

Transfer files and directories from remote host to the localhost of the Minion.

- **remote_path** Path to retrieve from remote host. Since this is evaluated by scp on the remote host, shell wildcards and environment variables may be used.
- **recursive** `False` Transfer files and directories recursively.
- **preserve_times** `False` Preserve `mtime` and `atime` of transferred files and directories.
- **hostname** The hostname of the remote device.
- **port** 22 The port of the remote device.
- **username** The username required for SSH authentication on the device.
- **password** Used for password authentication. It is also used for private key decryption if `passphrase` is not given.
- **passphrase** Used for decrypting private keys.
- **pkey** An optional private key to use for authentication.
- **key_filename** The filename, or list of filenames, of optional private key(s) and/or certificates to try for authentication.
- **timeout** An optional timeout (in seconds) for the TCP connect.
- **socket_timeout** 10 The channel socket timeout in seconds.
- **buff_size** 16384 The size of the SCP send buffer.
- **allow_agent** `True` Set to `False` to disable connecting to the SSH agent.
- **look_for_keys** `True` Set to `False` to disable searching for discoverable private key files in `~/.ssh/`
- **banner_timeout** An optional timeout (in seconds) to wait for the SSH banner to be presented.
- **auth_timeout** An optional timeout (in seconds) to wait for an authentication response.
- **auto_add_policy** `False` Automatically add the host to the `known_hosts`.

CLI Example:

```bash
salt '*' scp.get /var/tmp/file /tmp/file hostname=10.10.10.1 auto_add_policy=True
```

```
salt.modules.scp_mod.put(files, remote_path=None, recursive=False, preserve_times=False, **kwargs)
```

Transfer files and directories to remote host.

- **files** A single path or a list of paths to be transferred.
remote_path The path on the remote device where to store the files.
recursive: True Transfer files and directories recursively.
preserve_times: False Preserve mtime and atime of transferred files and directories.
hostname The hostname of the remote device.
port: 22 The port of the remote device.
username The username required for SSH authentication on the device.
password Used for password authentication. It is also used for private key decryption if passphrase is not given.
passphrase Used for decrypting private keys.
pkey An optional private key to use for authentication.
key_filename The filename, or list of filenames, of optional private key(s) and/or certificates to try for authentication.
timeout An optional timeout (in seconds) for the TCP connect.
socket_timeout: 10 The channel socket timeout in seconds.
buff_size: 16384 The size of the SCP send buffer.
allow_agent: True Set to False to disable connecting to the SSH agent.
look_for_keys: True Set to False to disable searching for discoverable private key files in ~/.ssh/
banner_timeout An optional timeout (in seconds) to wait for the SSH banner to be presented.
auth_timeout An optional timeout (in seconds) to wait for an authentication response.
auto_add_policy: False Automatically add the host to the known_hosts.

CLI Example:

```
salt '*' scp.put /path/to/file /var/tmp/file hostname=server1 auto_add_policy=True
```

21.9.372 salt.modules.scsi

SCSI administration module

salt.modules.scsi.ls_(get_size=True)
List SCSI devices, with details

CLI Examples:

```
salt '*' scsi.ls
salt '*' scsi.ls get_size=False
```

get_size [True] Get the size information for scsi devices. This option should be set to False for older OS
distributions (RHEL6 and older) due to lack of support for the '-s' option in lsscsi.

New in version 2015.5.10.
salt.modules.scsi.rescan_all(host)
List scsi devices

CLI Example:

```
salt '*' scsi.rescan_all 0
```

21.9.373 salt.modules.sdb

Module for Manipulating Data via the Salt DB API

salt.modules.sdb.delete(uri)
Delete a value from a db, using a uri in the form of sdb://<profile>/<key>. If the uri provided does
not start with sdb:// or the value is not successfully deleted, return False.
CLI Example:

```
salt '*' sdb.delete sdb://mymemcached/foo
```

**salt.modules.sdb.get(uri)**

Get a value from a db, using a uri in the form of sdb://<profile>/<key>. If the uri provided does not start with sdb://, then it will be returned as-is.

CLI Example:

```
salt '*' sdb.get sdb://mymemcached/foo
```

**salt.modules.sdb.get_or_set_hash(uri, length=8, chars='abcdefghijklmnopqrstuvwxyz0123456789!@#$%^&*(-_=+)')**

Perform a one-time generation of a hash and write it to sdb. If that value has already been set return the value instead.

This is useful for generating passwords or keys that are specific to multiple minions that need to be stored somewhere centrally.

State Example:

```
some_mysql_user:
  mysql_user:
    - present
    - host: localhost
    - password: '{\{ salt['sdb.get_or_set_hash']('some_mysql_user_pass')\}'}
```

CLI Example:

```
salt '*' sdb.get_or_set_hash 'SECRET_KEY' 50
```

**Warning:** This function could return strings which may contain characters which are reserved as directives by the YAML parser, such as strings beginning with %. To avoid issues when using the output of this function in an SLS file containing YAML+Jinja, surround the call with single quotes.

**salt.modules.sdb.set_(uri, value)**

Set a value in a db, using a uri in the form of sdb://<profile>/<key>. If the uri provided does not start with sdb:// or the value is not successfully set, return False.

CLI Example:

```
salt '*' sdb.set sdb://mymemcached/foo bar
```

21.9.374 salt.modules.seed

Virtual machine image management tools

**salt.modules.seed.apply_(path, id_=None, config=None, approve_key=True, install=True, prep_install=False, pub_key=None, priv_key=None, mount_point=None)**

Seed a location (disk image, directory, or block device) with the minion config, approve the minion’s key, and/or install salt-minion.

CLI Example:
salt 'minion' seed.apply path id [config=config_data] \ 
    [gen_key=(true|false)] [approve_key=(true|false)] \ 
    [install=(true|false)]

path  Full path to the directory, device, or disk image on the target minion’s file system.
id     Minion id with which to seed the path.
config Minion configuration options. By default, the 'master' option is set to the target host’s 'master’.
approve_key Request a pre-approval of the generated minion key. Requires that the salt-master be configured to either auto-accept all keys or expect a signing request from the target host. Default: true.
install Install salt-minion, if absent. Default: true.
prep_install Prepare the bootstrap script, but don’t run it. Default: false

salt.modules.seed.mkconfig(config=None, tmp=None, id_=None, approve_key=True, pub_key=None, priv_key=None)
Generate keys and config and put them in a tmp directory.

pub_key absolute path or file content of an optional preseeded salt key
priv_key absolute path or file content of an optional preseeded salt key

CLI Example:
salt 'minion' seed.mkconfig [config=config_data] [tmp=tmp_dir] \ 
    [id_=minion_id] [approve_key=(true|false)]

salt.modules.seed.prep_bootstrap(mpt)
Update and get the random script to a random place

CLI Example:
salt '*' seed.prep_bootstrap /tmp

21.9.375 salt.modules.selinux

Execute calls on selinux

Note: This module requires the semanage, setsebool, and semodule commands to be available on the minion. On RHEL-based distributions, ensure that the policycoreutils and policycoreutils-python packages are installed. If not on a Fedora or RHEL-based distribution, consult the selinux documentation for your distribution to ensure that the proper packages are installed.

salt.modules.selinux.fcontext_add_or_delete_policy(action, name, filetype=None, sel_type=None, sel_user=None, sel_level=None)

New in version 2017.7.0.

Adds or deletes the SELinux policy for a given filespec and other optional parameters.

Returns the result of the call to semanage.

Note that you don’t have to remove an entry before setting a new one for a given filespec and filetype, as adding one with semanage automatically overwrites a previously configured SELinux context.

Warning: Use selinux.fcontext_add_policy(), or selinux.fcontext_delete_policy().
Deprecation

action  The action to perform. Either add or delete.
name  filespec of the file or directory. Regex syntax is allowed.
file_type  The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also man semanage-fcontext. Defaults to 'a' (all files).

sel_type  SELinux context type. There are many.

sel_user  SELinux user. Use semanage login -l to determine which ones are available to you.

sel_level  The MLS range of the SELinux context.

CLI Example:

salt '*' selinux.fcontext_add_or_delete_policy add my-policy

salt.modules.selinux.fcontext_add_policy(name, filetype=None, sel_type=None, sel_user=None, sel_level=None)

New in version 2019.2.0.

Adds the SELinux policy for a given filespec and other optional parameters.

Returns the result of the call to semanage.

Note that you don’t have to remove an entry before setting a new one for a given filespec and filetype, as adding one with semanage automatically overwrites a previously configured SELinux context.

CLI Example:

salt '*' selinux.fcontext_add_policy my-policy

salt.modules.selinux.fcontext_apply_policy(name, recursive=False)

New in version 2017.7.0.

Applies SElinux policies to filespec using restorecon [-R] filespec. Returns dict with changes if successful, the output of the restorecon command otherwise.

name  filespec of the file or directory. Regex syntax is allowed.

recursive  Recursively apply SELinux policies.

CLI Example:

salt '*' selinux.fcontext_apply_policy my-policy

salt.modules.selinux.fcontext_delete_policy(name, filetype=None, sel_type=None, sel_user=None, sel_level=None)

New in version 2019.2.0.

Deletes the SELinux policy for a given filespec and other optional parameters.

Returns the result of the call to semanage.

Note that you don’t have to remove an entry before setting a new one for a given filespec and filetype, as adding one with semanage automatically overwrites a previously configured SELinux context.

name  filespec of the file or directory. Regex syntax is allowed.

CLI Example:

salt '*' selinux.fcontext_delete_policy my-policy
CLI Example:

```bash
salt '*' selinux.fcontext_delete_policy my-policy
```

### `salt.modules.selinux.fcontext_get_policy`

```python
salt.modules.selinux.fcontext_get_policy(name, filetype=None, sel_type=None, sel_user=None, sel_level=None)
```

New in version 2017.7.0.

Returns the current entry in the SELinux policy list as a dictionary. Returns None if no exact match was found.

Returned keys are:
- `filespec` (the name supplied and matched)
- `filetype` (the descriptive name of the filetype supplied)
- `sel_user`, `sel_role`, `sel_type`, `sel_level` (the selinux context)

- **name** filespec of the file or directory. Regex syntax is allowed.
- **filetype** The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also `man semanage-fcontext`
  - Defaults to `a` (all files).

CLI Example:

```bash
salt '*' selinux.fcontext_get_policy my-policy
```

### `salt.modules.selinux.fcontext_policy_is_applied`

```python
salt.modules.selinux.fcontext_policy_is_applied(name, recursive=False)
```

New in version 2017.7.0.

Returns an empty string if the SELinux policy for a given filespec is applied, returns string with differences in policy and actual situation otherwise.

- **name** filespec of the file or directory. Regex syntax is allowed.

CLI Example:

```bash
salt '*' selinux.fcontext_policy_is_applied my-policy
```

### `salt.modules.selinux.filetype_id_to_string`

```python
salt.modules.selinux.filetype_id_to_string(filetype='a')
```

New in version 2017.7.0.

Translates SELinux filetype single-letter representation to a more human-readable version (which is also used in `semanage fcontext -l`).

### `salt.modules.selinux.getconfig`

Return the selinux mode from the config file

CLI Example:

```bash
salt '*' selinux.getconfig
```

### `salt.modules.selinux.getenforce`

Return the mode selinux is running in

CLI Example:

```bash
salt '*' selinux.getenforce
```

### `salt.modules.selinux.getsebool`

Return the information on a specific selinux boolean

CLI Example:
salt '*' selinux.getsebool virt_use_usb

salt.modules.selinux.getsemod(module)
Return the information on a specific selinux module

CLI Example:
salt '*' selinux.getsemod mysql

New in version 2016.3.0.

salt.modules.selinux.install_semod(module_path)
Install custom SELinux module from file

CLI Example:
salt '*' selinux.install_semod [salt://]path/to/module.pp

New in version 2016.11.6.

salt.modules.selinux.list_sebool()
Return a structure listing all of the selinux booleans on the system and what state they are in

CLI Example:
salt '*' selinux.list_sebool

salt.modules.selinux.list_semod()
Return a structure listing all of the selinux modules on the system and what state they are in

CLI Example:
salt '*' selinux.list_semod

New in version 2016.3.0.

salt.modules.selinux.port_add_policy(name, sel_type=None, protocol=None, port=None, sel_range=None)
New in version 2019.2.0.
Adds the SELinux policy for a given protocol and port.

Returns the result of the call to semanage.
name The protocol and port spec. Can be formatted as (tcp|udp)/(port|port-range).
sel_type The SELinux Type. Required.
protocol The protocol for the port, tcp or udp. Required if name is not formatted.
port The port or port range. Required if name is not formatted.

CLI Example:
salt '*' selinux.port_add_policy add tcp/8080 http_port_t
salt '*' selinux.port_add_policy add foobar http_port_t protocol=tcp port=8091

salt.modules.selinux.port_delete_policy(name, protocol=None, port=None)
New in version 2019.2.0.
Deletes the SELinux policy for a given protocol and port.

Returns the result of the call to semanage.
name The protocol and port spec. Can be formatted as (tcp|udp)/(port|port-range).
protocol The protocol for the port, tcp or udp. Required if name is not formatted.
**port** The port or port range. Required if name is not formatted.

CLI Example:
```
salt '*' selinux.port_delete_policy tcp/8080
salt '*' selinux.port_delete_policy foobar protocol=tcp port=8091
```

```
salt.modules.selinux.port_get_policy(name, sel_type=None, protocol=None, port=None)
```

New in version 2019.2.0.

Returns the current entry in the SELinux policy list as a dictionary. Returns None if no exact match was found.

Returned keys are:
- sel_type (the selinux type)
- proto (the protocol)
- port (the port(s) and/or port range(s))

**name** The protocol and port spec. Can be formatted as (tcp|udp)/(port|port-range).

**sel_type** The SELinux Type.

**protocol** The protocol for the port, tcp or udp. Required if name is not formatted.

**port** The port or port range. Required if name is not formatted.

CLI Example:
```
salt '*' selinux.port_get_policy tcp/80
salt '*' selinux.port_get_policy foobar protocol=tcp port=80
```

```
salt.modules.selinux.remove_semod(module)
```

Remove SELinux module

CLI Example:
```
salt '*' selinux.remove_semod module_name
```

New in version 2016.11.6.

```
salt.modules.selinux.selinux_fs_path()
```

Return the location of the SELinux VFS directory

CLI Example:
```
salt '*' selinux.selinux_fs_path
```

```
salt.modules.selinux.setenforce(mode)
```

Set the SELinux enforcing mode

CLI Example:
```
salt '*' selinux.setenforce enforcing
```

```
salt.modules.selinux.setsebool(boolean, value, persist=False)
```

Set the value for a boolean

CLI Example:
```
salt '*' selinux.setsebool virt_use_usb off
```

```
salt.modules.selinux.setsebools(pairs, persist=False)
```

Set the value of multiple booleans

CLI Example:
salt 'salt '*' selinux.setsebools '{virt_use_usb: on, squid_use_tproxy: off}'

```
salt.modules.selinux.setsebool

Enable or disable an SELinux module.
```

CLI Example:

```
salt '*' selinux.setsebool nagios Enabled
```

New in version 2016.3.0.

**21.9.376 salt.modules.sensehat**

Module for controlling the LED matrix or reading environment data on the SenseHat of a Raspberry Pi.

New in version 2017.7.0.

**maintainer** Benedikt Werner <1benediktwerner@gmail.com>, Joachim Werner <joe@suse.com>

**maturity** new

**depends** sense_hat Python module

The rotation of the Pi can be specified in a pillar. This is useful if the Pi is used upside down or sideways to correct the orientation of the image being shown.

Example:

```
sensehat:
    rotation: 90
```

```
salt.modules.sensehat.clear(color=None)

Sets the LED matrix to a single color or turns all LEDs off.
```

CLI Example:

```
salt 'raspberry' sensehat.clear
salt 'raspberry' sensehat.clear '[255, 0, 0]'
```

```
salt.modules.sensehat.get_humidity()

Get the percentage of relative humidity from the humidity sensor.
```

```
salt.modules.sensehat.get_pixel(x, y)

Returns the color of a single pixel on the LED matrix.
```

**Note:** Please read the note for `get_pixels`.

```
salt.modules.sensehat.get_pixels()

Returns a list of 64 smaller lists of [R, G, B] pixels representing the the currently displayed image on the LED matrix.
```

**Note:** When using `set_pixels` the pixel values can sometimes change when you read them again using `get_pixels`. This is because we specify each pixel element as 8 bit numbers (0 to 255) but when they’re passed into the Linux frame buffer for the LED matrix the numbers are bit shifted down to fit into RGB 565.
bits for red, 6 bits for green and 5 bits for blue. The loss of binary precision when performing this conversion (3 bits lost for red, 2 for green and 3 for blue) accounts for the discrepancies you see.

The `get_pixels` method provides an accurate representation of how the pixels end up in frame buffer memory after you have called `set_pixels`.

```python
salt.modules.sensehat.get_pressure()

Gets the current pressure in Millibars from the pressure sensor.

salt.modules.sensehat.get_temperature()

Gets the temperature in degrees Celsius from the humidity sensor. Equivalent to calling `get_temperature_from_humidity`.

If you get strange results try using `get_temperature_from_pressure`.

salt.modules.sensehat.get_temperature_from_humidity()

Gets the temperature in degrees Celsius from the humidity sensor.

salt.modules.sensehat.get_temperature_from_pressure()

Gets the temperature in degrees Celsius from the pressure sensor.

salt.modules.sensehat.low_light(low_light=True)

Sets the LED matrix to low light mode. Useful in a dark environment.

CLI Example:

```sh
salt 'raspberry' sensehat.low_light
salt 'raspberry' sensehat.low_light False
```

salt.modules.sensehat.set_pixel(x, y, color)

Sets a single pixel on the LED matrix to a specified color.

- `x` The x coordinate of the pixel. Ranges from 0 on the left to 7 on the right.
- `y` The y coordinate of the pixel. Ranges from 0 at the top to 7 at the bottom.
- `color` The new color of the pixel as a list of [R, G, B] values.

CLI Example:

```sh
salt 'raspberry' sensehat.set_pixel 0 0 [255, 0, 0]
```

salt.modules.sensehat.set_pixels(pixels)

Sets the entire LED matrix based on a list of 64 pixel values.

- `pixels` A list of 64 [R, G, B] color values.

salt.modules.sensehat.show_image(image)

Displays an 8 x 8 image on the LED matrix.

- `image` The path to the image to display. The image must be 8 x 8 pixels in size.

CLI Example:

```sh
salt 'raspberry' sensehat.show_image /tmp/my_image.png
```

salt.modules.sensehat.show_letter(letter, text_color=None, back_color=None)

Displays a single letter on the LED matrix.

- `letter` The letter to display.
- `text_color` The color in which the letter is shown. Defaults to `[255, 255, 255]` (white).
- `back_color` The background color of the display. Defaults to `[0, 0, 0]` (black).

CLI Example:
salt 'raspberry' sensehat.show_letter O
salt 'raspberry' sensehat.show_letter X '[255, 0, 0]'
salt 'raspberry' sensehat.show_letter B '[0, 0, 255]' '[255, 255, 0]'

salt.modules.sensehat.show_message(message, msg_type=None, text_color=None, back_color=None, scroll_speed=0.1)

Displays a message on the LED matrix.

message The message to display
msg_type The type of the message. Changes the appearance of the message.

Available types are:

- error: red text
- warning: orange text
- success: green text
- info: blue text

scroll_speed The speed at which the message moves over the LED matrix. This value represents the time paused for between shifting the text to the left by one column of pixels. Defaults to '0.1'.
text_color The color in which the message is shown. Defaults to '[255, 255, 255]' (white).
back_color The background color of the display. Defaults to '[0, 0, 0]' (black).

CLI Example:
salt 'raspberry' sensehat.show_message 'Status ok'
salt 'raspberry' sensehat.show_message 'Something went wrong' error
salt 'raspberry' sensehat.show_message 'Red' text_color='[255, 0, 0]'
salt 'raspberry' sensehat.show_message 'Hello world' None '[0, 0, 255]' '[255, 0]' 0.2

21.9.377 salt.modules.sensors

Read lm-sensors

New in version 2014.1.3.
salt.modules.sensors.sense(chip, fahrenheit=False)

Gather lm-sensors data from a given chip

To determine the chip to query, use the 'sensors' command and see the leading line in the block.

Example:
/usr/bin/sensors
coretemp-isa-0000 Adapter: ISA adapter Physical id 0: +56.0°C (high = +87.0°C, crit = +105.0°C) Core 0: +52.0°C (high = +87.0°C, crit = +105.0°C) Core 1: +50.0°C (high = +87.0°C, crit = +105.0°C) Core 2: +56.0°C (high = +87.0°C, crit = +105.0°C) Core 3: +53.0°C (high = +87.0°C, crit = +105.0°C)

Given the above, the chip is 'coretemp-isa-0000'.

21.9.378 salt.modules.serverdensity_device

Wrapper around Server Density API

New in version 2014.7.0.

21.9. execution modules
salt.modules.serverdensity_device.create(name, **params)
Function to create device in Server Density. For more info, see the API docs.

CLI Example:
```bash
salt '*' serverdensity_device.create lama
salt '*' serverdensity_device.create rich_lama group=lama_band installedRAM=32768
```

salt.modules.serverdensity_device.delete(device_id)
Delete a device from Server Density. For more information, see the API docs.

CLI Example:
```bash
salt '*' serverdensity_device.delete 51f7eafcca4bb235e000ae4
```

salt.modules.serverdensity_device.get_sd_auth(val, sd_auth_pillar_name='serverdensity')
Returns requested Server Density authentication value from pillar.

CLI Example:
```bash
salt '*' serverdensity_device.get_sd_auth <val>
```

salt.modules.serverdensity_device.install_agent(agent_key, agent_version=1)
Function downloads Server Density installation agent, and installs sd-agent with agent_key. Optionally the agent_version would select the series to use (defaults on the v1 one).

CLI Example:
```bash
salt '*' serverdensity_device.install_agent c2bbdd6689ff46282bdaa07555641498
salt '*' serverdensity_device.install_agent c2bbdd6689ff46282bdaa07555641498 2
```

salt.modules.serverdensity_device.ls(**params)
List devices in Server Density
Results will be filtered by any params passed to this function. For more information, see the API docs on listing and searching.

CLI Example:
```bash
salt '*' serverdensity_device.ls
salt '*' serverdensity_device.ls name=lama
salt '*' serverdensity_device.ls name=lama group=lama_band installedRAM=32768
```

salt.modules.serverdensity_device.update(device_id, **params)
Updates device information in Server Density. For more information see the API docs.

CLI Example:
```bash
salt '*' serverdensity_device.update 51f7eafcca4bb235e000ae4 name=lama
    group=lama_band
salt '*' serverdensity_device.update 51f7eafcca4bb235e000ae4 name=even_lama
    group=rock_lamas swapSpace=512
```

21.9.379 salt.modules.servicenow module
Module for execution of ServiceNow CI (configuration items)
New in version 2016.11.0.
depends servicenow_rest python module

configuration Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the 'servicenow' key by default, if defined.

For example:

```yaml
servicenow:
    instance_name: ''
    username: ''
    password: ''
```

salt.modules.servicenow.delete_record(table, sys_id)
Delete an existing record
Parameters
- **table**(str) - The table name, e.g. sys_user
- **sys_id**(str) - The unique ID of the record

CLI Example:

```
salt myminion servicenow.delete_record sys_computer 2134566
```

salt.modules.servicenow.non_structured_query(table, query=None, **kwargs)
Run a non-structured (not a dict) query on a servicenow table. See http://wiki.servicenow.com/index.php?title=Encoded_Query_Strings#gsc.tab=0 for help on constructing a non-structured query string.
Parameters
- **table**(str) - The table name, e.g. sys_user
- **query**(str) - The query to run (or use keyword arguments to filter data)

CLI Example:

```
salt myminion servicenow.non_structured_query sys_computer 'role=web'
salt myminion servicenow.non_structured_query sys_computer role=web type=computer
```

salt.modules.servicenow.set_change_request_state(change_id, state='approved')
Set the approval state of a change request/record
Parameters
- **change_id**(str) - The ID of the change request, e.g. CHG123545
- **state**(str) - The target state, e.g. approved

CLI Example:

```
salt myminion servicenow.set_change_request_state CHG000123 declined
salt myminion servicenow.set_change_request_state CHG000123 approved
```

salt.modules.servicenow.update_record_field(table, sys_id, field, value)
Update the value of a record’s field in a servicenow table
Parameters
- **table**(str) - The table name, e.g. sys_user
- **sys_id**(str) - The unique ID of the record
- **field**(str) - The new field name
- **value**(str) - The new value

CLI Example:

```
salt myminion servicenow.update_record_field sys_user 2348234 first_name jimmy
```

21.9. execution modules 2439
21.9.380 salt.modules.slack_notify

Module for sending messages to Slack

New in version 2015.5.0.

**configuration** This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

```
slack:
  api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

salt.modules.slack_notify.call_hook(*message*, *attachment=None*, *color='good'*, *short=False*, *identifier=None*, *channel=None*, *username=None*, *icon_emoji=None*)

Send message to Slack incoming webhook.

**Parameters**

- **message** – The topic of message.
- **attachment** – The message to send to the Slacke WebHook.
- **color** – The color of border of left side
- **short** – An optional flag indicating whether the value is short enough to be displayed side-by-side with other values.
- **identifier** – The identifier of WebHook.
- **channel** – The channel to use instead of the WebHook default.
- **username** – Username to use instead of WebHook default.
- **icon_emoji** – Icon to use instead of WebHook default.

**Returns** Boolean if message was sent successfully.

CLI Example:

```
salt '*' slack.call_hook message='Hello, from SaltStack'
```

salt.modules.slack_notify.find_room(*name*, *api_key=None*)

Find a room by name and return it.

**Parameters**

- **name** – The room name.
- **api_key** – The Slack admin api key.

**Returns** The room object.

CLI Example:

```
salt '*' slack.find_room name="random"
salt '*' slack.find_room name="random" api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

salt.modules.slack_notify.find_user(*name*, *api_key=None*)

Find a user by name and return it.

**Parameters**

- **name** – The user name.
- **api_key** – The Slack admin api key.

**Returns** The user object.

CLI Example:

```
salt '*' slack.find_user name="ThomasHatch"
salt '*' slack.find_user name="ThomasHatch" api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```
salt.modules.slack_notify.list_rooms(api_key=None)
List all Slack rooms.
Parameters api_key – The Slack admin api key.
Returns The room list.
CLI Example:

```
salt '*' slack.list_rooms
salt '*' slack.list_rooms api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

salt.modules.slack_notify.list_users(api_key=None)
List all Slack users.
Parameters api_key – The Slack admin api key.
Returns The user list.
CLI Example:

```
salt '*' slack.list_users
salt '*' slack.list_users api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

salt.modules.slack_notify.post_message(channel, message, from_name, api_key=None, icon=None)
Send a message to a Slack channel.
Parameters

- channel – The channel name, either will work.
- message – The message to send to the Slack channel.
- from_name – Specify who the message is from.
- api_key – The Slack api key, if not specified in the configuration.
- icon – URL to an image to use as the icon for this message
Returns Boolean if message was sent successfully.
CLI Example:

```
salt '*' slack.post_message channel="Development Room" message="Build is done"
   from_name="Build Server"
```

21.9.381 salt.modules.slsutil
Utility functions for use with or in SLS files

salt.modules.slsutil.deserialize(serializer, stream_or_string, **mod_kwargs)
Deserialize a Python object using a serializer module

CLI Example:

```
salt '*' slsutil.deserialize 'json' '{{"foo": "Foo!"}}'
salt '*' --no-parse=stream_or_string slsutil.deserialize 'json' \   stream_or_string='{{"foo": "Foo!"}}'
```

Jinja Example:

```
{%- set python_object = salt.slsutil.deserialize('json', \   '{"foo": "Foo!"}') -%}
```

salt.modules.slsutil.merge(obj_a, obj_b, strategy='smart', renderer='yaml', merge_lists=False)
Merge a data structure into another by choosing a merge strategy

Strategies:
- aggregate
- list
- overwrite
- recurse
- smart

CLI Example:
```
salt '*' slsutil.merge '{foo: Foo}' '{bar: Bar}'
```

salt.modules.slsutil.merge_all(lst, strategy='smart', renderer='yaml', merge_lists=False)

New in version 2019.2.0.

Merge a list of objects into each other in order

Parameters
- **lst** (*Iterable*) – List of objects to be merged.
- **strategy** (*String*) – Merge strategy. See utils.dictupdate.
- **renderer** (*String*) – Renderer type. Used to determine strategy when strategy is 'smart'.
- **merge_lists** (*Bool*) – Defines whether to merge embedded object lists.

CLI Example:
```
$ salt-call --output=txt slsutil.merge_all '[[{foo: Foo}, {foo: Bar}]]' local: {u'foo': u'Bar'}
```

salt.modules.slsutil.renderer(path=None, string=None, default_renderer='jinja|yaml', **kwargs)

Parse a string or file through Salt’s renderer system

Changed in version 2018.3.0: Add support for Salt fileserver URIs.

This is an open-ended function and can be used for a variety of tasks. It makes use of Salt’s "renderer pipes" system to run a string or file through a pipe of any of the loaded renderer modules.

Parameters
- **path** – The path to a file on Salt’s fileserver (any URIs supported by cp.get_url) or on the local file system.
- **string** – An inline string to be used as the file to send through the renderer system. Note, not all renderer modules can work with strings; the ‘py’ renderer requires a file, for example.
- **default_renderer** – The renderer pipe to send the file through; this is overridden by a “she-bang” at the top of the file.
- **kwargs** – Keyword args to pass to Salt’s compile_template() function.

Keep in mind the goal of each renderer when choosing a render-pipe; for example, the Jinja renderer processes a text file and produces a string, however the YAML renderer processes a text file and produces a data structure.

One possible use is to allow writing "map files", as are commonly seen in Salt formulas, but without tying the renderer of the map file to the renderer used in the other sls files. In other words, a map file could use the Python renderer and still be included and used by an sls file that uses the default 'jinja|yaml' renderer.

For example, the two following map files produce identical results but one is written using the normal 'jinja|yaml' and the other is using 'py':

```
#!/jinja|yaml
{% set apache = salt.grains.filter_by({
    ...normal jinja map file here...
}), merge=salt.pillar.get('apache:lookup')) %}
{{ apache | yaml() }}
```
def run():
    apache = __salt__.grains.filter_by({
        ...normal map here but as a python dict...
    }, merge=__salt__.pillar.get('apache:lookup'))
    return apache

Regardless of which of the above map files is used, it can be accessed from any other sls file by calling this function. The following is a usage example in Jinja:

{% set apache = salt.slsutil.renderer('map.sls') %}

CLI Example:

salt '*' slsutil.renderer salt://path/to/file
salt '*' slsutil.renderer /path/to/file
salt '*' slsutil.renderer /path/to/file.jinja 'jinja'
salt '*' slsutil.renderer /path/to/file.sls 'jinja|yaml'
salt '*' slsutil.renderer string='Inline template! {{ saltenv }}'
salt '*' slsutil.renderer string='Hello, {{ name }}.' name='world'

salt.modules.slsutil.serialize(serializer, obj, **mod_kwargs)
Serialize a Python object using a serializer module

CLI Example:

salt '*' --no-parse=obj slsutil.serialize 'json' obj="{'foo': 'Foo!'}"

Jinja Example:

{% set json_string = salt.slsutil.serialize('json',
    {'foo': 'Foo!'}) %}

salt.modules.slsutil.update(dest, upd, recursive_update=True, merge_lists=False)
Merge upd recursively into dest
If merge_lists=True, will aggregate list object types instead of replacing. This behavior is only activated when recursive_update=True.

CLI Example:

salt '*' slsutil.update '{foo: Foo}' '{bar: Bar}'

21.9.382 salt.modules.smartos_imgadm

Module for running imgadm command on SmartOS

salt.modules.smartos_imgadm.avail(search=None, verbose=False)
Return a list of available images
search [string] search keyword
verbose [boolean (False)] toggle verbose output

CLI Example:

salt '*' imgadm.avail [percona]
salt '*' imgadm.avail verbose=True
salt.modules.smartos_imgadm.delete(uuid)
Remove an installed image

**uuid** [string] Specifies uuid to import

CLI Example:

```
salt '*' imgadm.delete e42f8c84-bbea-11e2-b920-078fab2aab1f
```

salt.modules.smartos_imgadm.docker_to_uuid(uuid)
Get the image uuid from an imported docker image

New in version 2019.2.0.

salt.modules.smartos_imgadm.get(uuid)
Return info on an installed image

**uuid** [string] uuid of image

CLI Example:

```
salt '*' imgadm.get e42f8c84-bbea-11e2-b920-078fab2aab1f
salt '*' imgadm.get plexinc/pms-docker:plexpass
```

salt.modules.smartos_imgadm.import_image(uuid, verbose=False)
Import an image from the repository

**uuid** [string] uuid to import

**verbose** [boolean (False)] toggle verbose output

CLI Example:

```
salt '*' imgadm.import e42f8c84-bbea-11e2-b920-078fab2aab1f [verbose=True]
```

salt.modules.smartos_imgadm.list_installed(verbos=False)
Return a list of installed images

**verbose** [boolean (False)] toggle verbose output

Changed in version 2019.2.0: Docker images are now also listed

CLI Example:

```
salt '*' imgadm.list
salt '*' imgadm.list docker=True
salt '*' imgadm.list verbose=True
```

salt.modules.smartos_imgadm.show(uuid)
Show manifest of a given image

**uuid** [string] uuid of image

CLI Example:

```
salt '*' imgadm.show e42f8c84-bbea-11e2-b920-078fab2aab1f
salt '*' imgadm.show plexinc/pms-docker:plexpass
```

salt.modules.smartos_imgadm.source_add(source, source_type='imgapi')
Add a new source

**source** [string] source url to add

**source_type** [string (imgapi)] source type, either imgapi or docker

New in version 2019.2.0.

CLI Example:

```
salt '*' imgadm.source_add https://updates.joyent.com
salt '*' imgadm.source_add https://docker.io docker
```
salt.modules.smartos_imgadm.\texttt{source\_delete}(\texttt{source})

Delete a source
\begin{itemize}
  \item \texttt{source} [string] source url to delete
\end{itemize}
New in version 2019.2.0.

\begin{Verbatim}
\texttt{salt '*' imgadm.source_delete https://updates.joyent.com}
\end{Verbatim}

salt.modules.smartos_imgadm.\texttt{sources}(\texttt{verbose=False})

Return a list of available sources
\begin{itemize}
  \item \texttt{verbose} [boolean (False)] toggle verbose output
\end{itemize}
New in version 2019.2.0.

\begin{Verbatim}
\texttt{salt '*' imgadm.sources}
\end{Verbatim}

salt.modules.smartos_imgadm.\texttt{update\_installed}(\texttt{uuid=\text{"\)}}

Gather info on unknown image(s) (locally installed)
\begin{itemize}
  \item \texttt{uuid} [string] optional uuid of image
\end{itemize}

\begin{Verbatim}
\texttt{salt '*' imgadm.update [uuid]}
\end{Verbatim}

salt.modules.smartos_imgadm.\texttt{vacuum}(\texttt{verbose=False})

Remove unused images
\begin{itemize}
  \item \texttt{verbose} [boolean (False)] toggle verbose output
\end{itemize}

\begin{Verbatim}
\texttt{salt '*' imgadm.vacuum [verbose=True]}
\end{Verbatim}

salt.modules.smartos_imgadm.\texttt{version}()

Return imgadm version

\begin{Verbatim}
\texttt{salt '*' imgadm.version}
\end{Verbatim}

\section{salt.modules.smartos_nictagadm module}

Module for running nictagadm command on SmartOS
\begin{itemize}
  \item maintainer: Jorge Schrauwen \texttt{<sjorge@blackdot.be>}
  \item maturity: new
  \item depends: nictagadm binary, dladm binary
  \item platform: smartos
\end{itemize}
\begin{Verbatim}
\texttt{..versionadded:: 2016.11.0}
\end{Verbatim}

salt.modules.smartos_nictagadm.\texttt{add}(\texttt{name}, \texttt{mac}, \texttt{mtu=1500})

Add a new nictag
\begin{itemize}
  \item \texttt{name} [string] name of new nictag
  \item \texttt{mac} [string] mac of parent interface or ‘etherstub’ to create a ether stub
  \item \texttt{mtu} [int] MTU (ignored for etherstubs)
\end{itemize}

\begin{Verbatim}
\texttt{salt '*' nictagadm.add storage0 etherstub}
\texttt{salt '*' nictagadm.add trunk0 'DE:AD:00:00:BE:EF' 9000}
\end{Verbatim}
salt.modules.smartos_nictagadm.delete(name, force=False)
Delete nictag
name [string] nictag to delete
force [boolean] force delete even if vms attached
CLI Example:
```
salt '*' nictagadm.delete admin
```

salt.modules.smartos_nictagadm.exists(*nictag, **kwargs)
Check if nictag exists
nictag [string] one or more nictags to check
verbose [boolean] return list of nictags
CLI Example:
```
salt '*' nictagadm.exists admin
```

salt.modules.smartos_nictagadm.list_nictags(include_etherstubs=True)
List all nictags
include_etherstubs [boolean] toggle include of etherstubs
CLI Example:
```
salt '*' nictagadm.list
```

salt.modules.smartos_nictagadm.update(name, mac=None, mtu=None)
Update a nictag
name [string] name of nictag
mac [string] optional new mac for nictag
mtu [int] optional new MTU for nictag
CLI Example:
```
salt '*' nictagadm.update trunk mtu=9000
```

salt.modules.smartos_nictagadm.vms(nictag)
List all vms connect to nictag
nictag [string] name of nictag
CLI Example:
```
salt '*' nictagadm.vms admin
```

21.9.384  salt.modules.smartos_virt

virt compatibility module for managing VMs on SmartOS

salt.modules.smartos_virt.get_macs(domain)
Return a list off MAC addresses from the named VM
CLI Example:
```
salt '*' virt.get_macs <domain>
```

salt.modules.smartos_virt.init(**kwargs)
Initialize a new VM
CLI Example:
**salt.modules.smartos_virt.list_active_vms()**
Return a list of uuids for active virtual machine on the minion

CLI Example:
```
salt '*' virt.list_active_vms
```

**salt.modules.smartos_virt.list_domains()**
Return a list of virtual machine names on the minion

CLI Example:
```
salt '*' virt.list_domains
```

**salt.modules.smartos_virt.list_inactive_vms()**
Return a list of uuids for inactive virtual machine on the minion

CLI Example:
```
salt '*' virt.list_inactive_vms
```

**salt.modules.smartos_virt.reboot(domain)**
Reboot a domain via ACPI request

CLI Example:
```
salt '*' virt.reboot <domain>
```

**salt.modules.smartos_virt.setmem(domain, memory)**
Change the amount of memory allocated to VM.  <memory> is to be specified in MB.
Note for KVM : this would require a restart of the VM.

CLI Example:
```
salt '*' virt.setmem <domain> 512
```

**salt.modules.smartos_virt.shutdown(domain)**
Send a soft shutdown signal to the named vm

CLI Example:
```
salt '*' virt.shutdown <domain>
```

**salt.modules.smartos_virt.start(domain)**
Start a defined domain

CLI Example:
```
salt '*' virt.start <domain>
```

**salt.modules.smartos_virt.stop(domain)**
Hard power down the virtual machine, this is equivalent to powering off the hardware.

CLI Example:
```
salt '*' virt.destroy <domain>
```
salt.modules.smartos_virt.vm_info(domain)
   Return a dict with information about the specified VM on this CN
   
   CLI Example:
   ```
salt '*' virt.vm_info <domain>
   ```

salt.modules.smartos_virt.vm_virt_type(domain)
   Return VM virtualization type: OS or KVM
   
   CLI Example:
   ```
salt '*' virt.vm_virt_type <domain>
   ```

**21.9.385 salt.modules.smartos_vmadm**

Module for running vmadm command on SmartOS

salt.modules.smartos_vmadm.create(from_file=None, **kwargs)
   Create a new vm
   
   from_file  [string] json file to create the vm from – if present, all other options will be ignored
   kwargs  [string|int|...] options to set for the vm
   
   CLI Example:
   ```
salt '*' vmadm.create from_file=/tmp/new_vm.json
salt '*' vmadm.create image_uuid='... alias='... nics='[ { "nic_tag": "admin", "ip": "198.51.100.123", ... }, { ... } ]' [...]
   ```

salt.modules.smartos_vmadm.create_snapshot(vm, name, key='uuid')
   Create snapshot of a vm
   
   vm  [string] vm to be targeted
   name  [string]
   
   snapshot name  The snapshot name must be 64 characters or less and must only contain alphanumeric characters and characters in the set [\-_:.\%] to comply with ZFS restrictions.
   key  [string [uuid|alias|hostname]] value type of 'vm' parameter
   
   CLI Example:
   ```
salt '*' vmadm.create_snapshot 186da9ab-7392-4f55-91a5-b8f1fe770543 baseline
salt '*' vmadm.create_snapshot nacl baseline key=alias
   ```

salt.modules.smartos_vmadm.delete(vm, key='uuid')
   Delete a vm
   
   vm  [string] vm to be deleted
   key  [string [uuid|alias|hostname]] value type of 'vm' parameter
   
   CLI Example:
   ```
salt '*' vmadm.delete 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.delete nacl key=alias
   ```

salt.modules.smartos_vmadm.delete_snapshot(vm, name, key='uuid')
   Delete snapshot of a vm
   
   vm  [string] vm to be targeted
   name  [string]
   
   snapshot name  The snapshot name must be 64 characters or less and must only contain alphanumeric characters and characters in the set [\-_:.\%] to comply with ZFS restrictions.
   key  [string [uuid|alias|hostname]] value type of 'vm' parameter
CLI Example:
```
salt '*' vmadm.delete_snapshot 186da9ab-7392-4f55-91a5-b8f1fe770543 baseline
salt '*' vmadm.delete_snapshot nacl baseline key=alias
```

```
salt.modules.smartos_vmadm.get(vm, key='uuid')
Output the JSON object describing a VM
vm [string] vm to be targeted
key [string [uuid|alias|hostname]] value type of 'vm' parameter
CLI Example:
```
salt '*' vmadm.get 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.get nacl key=alias
```

```
salt.modules.smartos_vmadm.info(vm, info_type='all', key='uuid')
Lookup info on running kvm
vm [string] vm to be targeted
info_type [string [all|block|blockstats|chardev|cpus|kvm|pci|spice|version|vnc]] info type to return
key [string [uuid|alias|hostname]] value type of 'vm' parameter
CLI Example:
```
salt '*' vmadm.info 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.info nacl key=alias
salt '*' vmadm.info nacl vnc key=alias
```

```
salt.modules.smartos_vmadm.list_vms(search=None, sort=None, order='uuid,type,ram,alias', keyed=True)
Return a list of VMs
search [string] vmadm filter property
sort [string] vmadm sort (-s) property
order [string] vmadm order (-o) property – Default: uuid,type,ram,state,alias
keyed [boolean] specified if the output should be an array (False) or dict (True) For a dict the key is the first item from the order parameter. Note: If key is not unique last vm wins.
CLI Example:
```
salt '*' vmadm.list
salt '*' vmadm.list order=alias,ram,cpu_cap sort=-ram,-cpu_cap
salt '*' vmadm.list search='type=KVM'
```

```
salt.modules.smartos_vmadm.lookup(search=None, order=None, one=False)
Return a list of VMs using lookup
search [string] vmadm filter property
order [string] vmadm order (-o) property – Default: uuid,type,ram,state,alias
one [boolean] return only one result (vmadm’s -1)
CLI Example:
```
salt '*' vmadm.lookup search='state=running'
salt '*' vmadm.lookup search='state=running' order=uuid,alias,hostname
salt '*' vmadm.lookup search='alias=nacl' one=True
```

```
salt.modules.smartos_vmadm.reboot(vm, force=False, key='uuid')
Reboot a vm
vm [string] vm to be rebooted
force [boolean] force reboot of vm if true
```
key [string [uuid|alias|hostname]] value type of 'vm' parameter
CLI Example:

```
salt '*' vmadm.reboot 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.reboot 186da9ab-7392-4f55-91a5-b8f1fe770543 True
salt '*' vmadm.reboot vm=nacl key=alias
salt '*' vmadm.reboot vm=nina.example.org key=hostname
```

salt.modules.smartos_vmadm.receive(\(uid, source\))

Receive a vm from a directory
uid [string] uuid of vm to be received
source [string] source directory
CLI Example:

```
salt '*' vmadm.receive 186da9ab-7392-4f55-91a5-b8f1fe770543 /opt/backups
```

salt.modules.smartos_vmadm.reprovision(\(vm, image, key='uuid'\))

Reprovision a vm
vm [string] vm to be reprovisioned
image [string] uuid of new image
key [string [uuid|alias|hostname]] value type of 'vm' parameter
CLI Example:

```
salt '*' vmadm.reprovision 186da9ab-7392-4f55-91a5-b8f1fe770543 c02a2044-c1bd-
--11e4-bd8c-dfc1db8b0182
salt '*' vmadm.reprovision nacl c02a2044-c1bd-11e4-bd8c-dfc1db8b0182 key=alias
```

salt.modules.smartos_vmadm.rollback_snapshot(\(vm, name, key='uuid'\))

Rollback snapshot of a vm
vm [string] vm to be targeted
name [string]

```
snapshot name The snapshot must be 64 characters or less and must only contain alphanumeric char-
acters and characters in the set [\-\_:] to comply with ZFS restrictions.
```
key [string [uuid|alias|hostname]] value type of 'vm' parameter
CLI Example:

```
salt '*' vmadm.rollback_snapshot 186da9ab-7392-4f55-91a5-b8f1fe770543 baseline
salt '*' vmadm.rollback_snapshot nacl baseline key=alias
```

salt.modules.smartos_vmadm.send(\(vm, target, key='uuid'\))

Send a vm to a directory
vm [string] vm to be sent
target [string] target directory
key [string [uuid|alias|hostname]] value type of 'vm' parameter
CLI Example:

```
salt '*' vmadm.send 186da9ab-7392-4f55-91a5-b8f1fe770543 /opt/backups
salt '*' vmadm.send vm=nacl target=/opt/backups key=alias
```

salt.modules.smartos_vmadm.start(\(vm, options=None, key='uuid'\))

Start a vm
vm [string] vm to be started
options [string] optional additional options
key [string [uuid|alias|hostname]] value type of 'vm' parameter
CLI Example:
salt.modules.smartos_vmadm.

**stop**(vm, force=False, key='uuid')

Stop a vm

- **vm**: string, vm to be stopped
- **force**: boolean, force stop of vm if true
- **key**: string [uuid|alias|hostname], value type of 'vm' parameter

CLI Example:

```
salt '*' vmadm.stop 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.stop 186da9ab-7392-4f55-91a5-b8f1fe770543 True
salt '*' vmadm.stop vm=nacl key=alias
salt '*' vmadm.stop vm=nina.example.org key=hostname
```

**sysrq**(vm, action='nmi', key='uuid')

Send non-maskable interrupt to vm or capture a screenshot

- **vm**: string, vm to be targeted
- **action**: string, nmi or screenshot – Default: nmi
- **key**: string [uuid|alias|hostname], value type of 'vm' parameter

CLI Example:

```
salt '*' vmadm.sysrq 186da9ab-7392-4f55-91a5-b8f1fe770543 nmi
salt '*' vmadm.sysrq 186da9ab-7392-4f55-91a5-b8f1fe770543 screenshot
salt '*' vmadm.sysrq nacl nmi key=alias
```

**update**(vm, from_file=None, key='uuid', **kwargs)

Update a new vm

- **vm**: string, vm to be updated
- **from_file**: string, json file to update the vm with – if present, all other options will be ignored
- **key**: string [uuid|alias|hostname], value type of 'vm' parameter
- **kwargs**: string|int|..., options to update for the vm

CLI Example:

```
salt '*' vmadm.update vm=186da9ab-7392-4f55-91a5-b8f1fe770543 from_file=/tmp/new_vm.json
salt '*' vmadm.update vm=nacl key=alias from_file=/tmp/new_vm.json
salt '*' vmadm.update vm=186da9ab-7392-4f55-91a5-b8f1fe770543 max_physical_memory=1024
```

21.9.386 salt.modules.smbios

Interface to SMBIOS/DMI

(Parsing through dmidecode)

External References

- Desktop Management Interface (DMI)
- System Management BIOS
- DMidecode

21.9. execution modules 2451
salt.modules.smbios.get(string, clean=True)

Get an individual DMI string from SMBIOS info

string

The string to fetch. DMIdecode supports:

- bios-vendor
- bios-version
- bios-release-date
- system-manufacturer
- system-product-name
- system-version
- system-serial-number
- system-uuid
- baseboard-manufacturer
- baseboard-product-name
- baseboard-version
- baseboard-serial-number
- baseboard-asset-tag
- chassis-manufacturer
- chassis-type
- chassis-version
- chassis-serial-number
- chassis-asset-tag
- processor-family
- processor-manufacturer
- processor-version
- processor-frequency

clean

Don't return well-known false information
(invalid UUID’s, serial 000000000’s, etcetera)

Defaults to True

CLI Example:
salt '*' smbios.get system-uuid clean=False

salt.modules.smbios.records(rec_type=None, fields=None, clean=True)

Return DMI records from SMBIOS

type Return only records of type(s) The SMBIOS specification defines the following DMI types:

<table>
<thead>
<tr>
<th>Type</th>
<th>Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>BIOS</td>
</tr>
<tr>
<td>1</td>
<td>System</td>

**clean**

Don’t return well-known false information
(invalid UUID’s, serial 00000000’s, etcetera)

Defaults to True

CLI Example:

```
salt '*' sbios.records clean=False
salt '*' sbios.records 14
salt '*' sbios.records 4 core_count,thread_count,current_speed
```

**21.9.387 salt.modules.smf_service**

Service support for Solaris 10 and 11, should work with other systems that use SMF also. (e.g. SmartOS)

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to 'service.start' is not available), see [here](#).
salt.modules.smf_service.available(name)
    Returns True if the specified service is available, otherwise returns False.
    We look up the name with the svcs command to get back the FMRI This allows users to use simpler service names
    CLI Example:
    ```
salt '*' service.available net-snmp
    ```

salt.modules.smf_service.disable(name, **kwargs)
    Disable the named service to start at boot
    CLI Example:
    ```
salt '*' service.disable <service name>
    ```

salt.modules.smf_service.disabled(name)
    Check to see if the named service is disabled to start on boot
    CLI Example:
    ```
salt '*' service.disabled <service name>
    ```

salt.modules.smf_service.enable(name, **kwargs)
    Enable the named service to start at boot
    CLI Example:
    ```
salt '*' service.enable <service name>
    ```

salt.modules.smf_service.enabled(name, **kwargs)
    Check to see if the named service is enabled to start on boot
    CLI Example:
    ```
salt '*' service.enabled <service name>
    ```

salt.modules.smf_service.get_all()
    Return all installed services
    CLI Example:
    ```
salt '*' service.get_all
    ```

salt.modules.smf_service.get_disabled()
    Return the disabled services
    CLI Example:
    ```
salt '*' service.get_disabled
    ```

salt.modules.smf_service.get_enabled()
    Return the enabled services
    CLI Example:
    ```
salt '*' service.get_enabled
    ```
salt.modules.smf_service.get_running()
Return the running services

CLI Example:
salt '*' service.get_running

salt.modules.smf_service.get_stopped()
Return the stopped services

CLI Example:
salt '*' service.get_stopped

salt.modules.smf_service.missing(name)
The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.

CLI Example:
salt '*' service.missing net-snmp

salt.modules.smf_service.reload_(name)
Reload the named service

CLI Example:
salt '*' service.reload <service name>

salt.modules.smf_service.restart(name)
Restart the named service

CLI Example:
salt '*' service.restart <service name>

salt.modules.smf_service.start(name)
Start the specified service

CLI Example:
salt '*' service.start <service name>

salt.modules.smf_service.status(name, sig=None)
Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Parameters
- name (str) – The name of the service to check
- sig (str) – Not implemented

Returns True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type bool

CLI Example:
salt '*' service.status <service name>
salt.modules.smf_service.stop(name)
  Stop the specified service

  CLI Example:

  salt '*' service.stop <service name>

21.9.388 salt.modules.smtp

Module for Sending Messages via SMTP

New in version 2014.7.0.

  depends

  • smtplib python module

  configuration This module can be used by either passing a jid and password directly to send_message,
  or by specifying the name of a configuration profile in the minion config, minion pillar, or master
  config.

  For example:

  my-smtp-login:
    smtp.server: smtp.domain.com
    smtp.tls: True
    smtp.sender: admin@domain.com
    smtp.username: myuser
    smtp.password: verybadpass

  The resourcename refers to the resource that is using this account. It is user-definable, and op-
  tional. The following configurations are both valid:

  my-smtp-login:
    smtp.server: smtp.domain.com
    smtp.tls: True
    smtp.sender: admin@domain.com
    smtp.username: myuser
    smtp.password: verybadpass

  another-smtp-login:
    smtp.server: smtp.domain.com
    smtp.tls: True
    smtp.sender: admin@domain.com
    smtp.username: myuser
    smtp.password: verybadpass

salt.modules.smtp.send_msg(recipient, message, subject='Message from Salt', sender=None, server=None, use_ssl='True', username=None, password=None, profile=None, attachments=None)

Send a message to an SMTP recipient. Designed for use in states.

  CLI Examples:

  salt '*' smtp.send_msg 'admin@example.com' 'This is a salt module test' profile=...
  salt '*' smtp.send_msg 'admin@example.com' 'This is a salt module test' username=...
  (continues on next page)
21.9.389 `salt.modules.solaris_fmadm`

Module for running `fmadm` and `fmdump` on Solaris

- **maintainer**: Jorge Schrauwen <sjorge@blackdot.be>
- **maturity**: new
- **platform**: solaris, illumos

New in version 2016.3.0.

`salt.modules.solaris_fmadm.acquit(fmri)`

Acquit resource or acquit case

- **fmri**: string fmri or uuid

CLI Example:

```
salt '*' fmadm.acquit fmri | uuid
```

`salt.modules.solaris_fmadm.config()`

Display fault manager configuration

CLI Example:

```
salt '*' fmadm.config
```

`salt.modules.solaris_fmadm.faulty()`

Display list of faulty resources

CLI Example:

```
salt '*' fmadm.faulty
```

`salt.modules.solaris_fmadm.flush(fmri)`

Flush cached state for resource

- **fmri**: string fmri

CLI Example:

```
salt '*' fmadm.flush fmri
```

`salt.modules.solaris_fmadm.healthy()`

Return whether `fmadm` is reporting faults

CLI Example:

```
salt '*' fmadm.healthy
```

`salt.modules.solaris_fmadm.list_records(after=| after=None, before=| before=None)`

Display fault management logs

- **after**: [string] filter events after time, see man `fmdump` for format
- **before**: [string] filter events before time, see man `fmdump` for format

CLI Example:
salt 'x' fmadm.list

salt.modules.solaris_fmadm.load(path)
    Load specified fault manager module
    path: string  path of fault manager module
    CLI Example:
    salt 'x' fmadm.load /module/path

salt.modules.solaris_fmadm.repaired(fmri)
    Notify fault manager that resource has been repaired
    fmri: string  fmri
    CLI Example:
    salt 'x' fmadm.repaired fmri

salt.modules.solaris_fmadm.replaced(fmri)
    Notify fault manager that resource has been replaced
    fmri: string  fmri
    CLI Example:
    salt 'x' fmadm.replaced fmri

salt.modules.solaris_fmadm.reset(module, serd=None)
    Reset module or sub-component
    module: string  module to unload
    serd [string]  serd sub module
    CLI Example:
    salt 'x' fmadm.reset software-response

salt.modules.solaris_fmadm.show(uuid)
    Display log details
    uuid: string  uuid of fault
    CLI Example:
    salt 'x' fmadm.show 11b4070f-4358-62fa-9e1e-998f485977e1

salt.modules.solaris_fmadm.unload(module)
    Unload specified fault manager module
    module: string  module to unload
    CLI Example:
    salt 'x' fmadm.unload software-response

21.9.390  salt.modules.solaris_group

Manage groups on Solaris

Important:  If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to 'group.info is not available'), see here.
salt.modules.solaris_group.add(name, gid=None, **kwargs)
Add the specified group

CLI Example:
```
salt '*' group.add foo 3456
```

salt.modules.solaris_group.chgid(name, gid)
Change the gid for a named group

CLI Example:
```
salt '*' group.chgid foo 4376
```

salt.modules.solaris_group.delete(name)
Remove the named group

CLI Example:
```
salt '*' group.delete foo
```

salt.modules.solaris_group.getent(refresh=False)
Return info on all groups

CLI Example:
```
salt '*' group.getent
```

salt.modules.solaris_group.info(name)
Return information about a group

CLI Example:
```
salt '*' group.info foo
```

21.9.391 salt.modules.solaris_shadow

Manage the password database on Solaris systems

Important: If you feel that Salt should be using this module to manage passwords on a minion, and it is using a different module (or gives an error similar to 'shadow.info' is not available), see here.

salt.modules.solaris_shadow.default_hash()
Returns the default hash used for unset passwords

CLI Example:
```
salt '*' shadow.default_hash
```

salt.modules.solaris_shadow.del_password(name)
Delete the password from name user

CLI Example:
salt '!' shadow.del_password username

salt.modules.solaris_shadow.gen_password(password, crypt_salt=None, algorithm='sha512')

Generate hashed password

Note: When called this function is called directly via remote-execution, the password argument may be displayed in the system’s process list. This may be a security risk on certain systems.

password  Plaintext password to be hashed.
crypt_salt  Cryptographic salt. If not given, a random 8-character salt will be generated.
algorithm  The following hash algorithms are supported:
   • md5
   • blowfish (not in mainline glibc, only available in distros that add it)
   • sha256
   • sha512 (default)

CLI Example:
salt '!' shadow.gen_password 'I_am_password'
salt '!' shadow.gen_password 'I_am_password' crypt_salt='I_am_salt'
   --algorithm=sha256

salt.modules.solaris_shadow.info(name)
Return information for the specified user

CLI Example:
salt '!' shadow.info root

salt.modules.solaris_shadow.set_maxdays(name, maxdays)
Set the maximum number of days during which a password is valid. See man passwd.

CLI Example:
salt '!' shadow.set_maxdays username 90

salt.modules.solaris_shadow.set_mindays(name, mindays)
Set the minimum number of days between password changes. See man passwd.

CLI Example:
salt '!' shadow.set_mindays username 7

salt.modules.solaris_shadow.set_password(name, password)
Set the password for a named user. The password must be a properly defined hash, the password hash can be generated with this command: openssl passwd -1 <plaintext password>

CLI Example:
salt '!' shadow.set_password root $1$UYCIxa628.9qXjpQcJ4n...

salt.modules.solaris_shadow.set_warndays(name, warndays)
Set the number of days of warning before a password change is required. See man passwd.

CLI Example:
21.9.392 salt.modules.solaris_system

Support for reboot, shutdown, etc

This module is assumes we are using solaris-like shutdown

New in version 2016.3.0.

salt.modules.solaris_system.halt()
  Halt a running system
  
  CLI Example:

  salt '*' system.halt

salt.modules.solaris_system.init(state)
  Change the system runlevel on sysV compatible systems

  CLI Example:

  state [string] Init state
  
  salt '*' system.init 3

salt.modules.solaris_system.poweroff()
  Poweroff a running system

  CLI Example:

  salt '*' system.poweroff

salt.modules.solaris_system.reboot(delay=0, message=None)
  Reboot the system
  
  delay [int] Optional wait time in seconds before the system will be rebooted.
  message [string] Optional message to broadcast before rebooting.

  CLI Example:

  salt '*' system.reboot
  salt '*' system.reboot 60 "=== system upgraded ==="

salt.modules.solaris_system.shutdown(delay=0, message=None)
  Shutdown a running system
  
  delay [int] Optional wait time in seconds before the system will be shutdown.
  message [string] Optional message to broadcast before rebooting.

  CLI Example:

  salt '*' system.shutdown
  salt '*' system.shutdown 60 "=== disk replacement ==="

21.9.393 salt.modules.solaris_user

Manage users with the useradd command
Important: If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to 'user.info' is not available), see here.

salt.modules.solaris_user.add(name, uid=None, gid=None, groups=None, home=None, shell=None, unique=True, fullname='', roomnumber='', workphone='', homophone='', createhome=True, **kwargs)

Add a user to the minion
CLI Example:
salt '*' user.add name <uid> <gid> <groups> <home> <shell>

salt.modules.solaris_user.chfullname(name, fullname)
Change the user's Full Name
CLI Example:
salt '*' user.chfullname foo "Foo Bar"

salt.modules.solaris_user.chgid(name, gid)
Change the default group of the user
CLI Example:
salt '*' user.chgid foo 4376

salt.modules.solaris_user.chgroups(name, groups, append=False)
Change the groups to which a user belongs
name Username to modify
groups List of groups to set for the user. Can be passed as a comma-separated list or a Python list.
append [False] Set to True to append these groups to the user's existing list of groups. Otherwise, the specified groups will replace any existing groups for the user.
CLI Example:
salt '*' user.chgroups foo wheel,root True

salt.modules.solaris_user.chhome(name, home, persist=False)
Set a new home directory for an existing user
name Username to modify
home New home directory to set
persist [False] Set to True to prevent configuration files in the new home directory from being overwritten by the files from the skeleton directory.
CLI Example:
salt '*' user.chhome foo /home/users/foo True

salt.modules.solaris_user.chhomephone(name, homephone)
Change the user's Home Phone
CLI Example:
salt '*' user.chhomephone foo "7735551234"

salt.modules.solaris_user.chroomnumber(name, roomnumber)
Change the user's Room Number
CLI Example:
salt '...' user.chroomnumber foo 123

salt.modules.solaris_user.chshell(name, shell)
    Change the default shell of the user
    CLI Example:
    salt '...' user.chshell foo /bin/zsh

salt.modules.solaris_user.chuid(name, uid)
    Change the uid for a named user
    CLI Example:
    salt '...' user.chuid foo 4376

salt.modules.solaris_user.chworkphone(name, workphone)
    Change the user’s Work Phone
    CLI Example:
    salt '...' user.chworkphone foo "7735550123"

salt.modules.solaris_user.delete(name, remove=False, force=False)
    Remove a user from the minion
    CLI Example:
    salt '...' user.delete name remove=True force=True

salt.modules.solaris_user.getent(refresh=False)
    Return the list of all info for all users
    CLI Example:
    salt '...' user.getent

salt.modules.solaris_user.info(name)
    Return user information
    CLI Example:
    salt '...' user.info root

salt.modules.solaris_user.list_groups(name)
    Return a list of groups the named user belongs to
    CLI Example:
    salt '...' user.list_groups foo

salt.modules.solaris_user.list_users()
    Return a list of all users
    CLI Example:
    salt '...' user.list_users
salt.modules.solaris_user.rename(name, new_name)

Change the username for a named user

CLI Example:

```
salt '*' user.rename name new_name
```

21.9.394 salt.modules.solarisipspkg

IPS pkg support for Solaris

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install’ is not available), see [here](#).

This module provides support for Solaris 11 new package management - IPS (Image Packaging System). This is the default pkg module for Solaris 11 (and later).

If you want to use also other packaging module (e.g. pkgutil) together with IPS, you need to override the pkg provider in sls for each package:

```
mypackage:
  pkg.installed:
    - provider: pkgutil
```

Or you can override it globally by setting the `providers` parameter in your Minion config file like this:

```
providers:
  pkg: pkgutil
```

Or you can override it globally by setting the `providers` parameter in your Minion config file like this:

```
providers:
  pkg: pkgutil
```

salt.modules.solarisipspkg.available_version(*names, **kwargs)

This function is an alias of `latest_version`.

The available version of packages in the repository. Accepts full or partial FMRI. Partial FMRI is returned if the full FMRI could not be resolved.

If the latest version of a given package is already installed, an empty string will be returned for that package.

Please use `pkg.latest_version` as `pkg.available_version` is being deprecated.

Changed in version 2019.2.0: Support for multiple package names added.

CLI Example:

```
salt '*' pkg.latest_version bash
salt '*' pkg.latest_version pkg://solaris/entire
salt '*' pkg.latest_version postfix sendmail
```

salt.modules.solarisipspkg.get_fmri(name, **kwargs)

Returns FMRI from partial name. Returns empty string ('') if not found. In case of multiple match, the function returns list of all matched packages.

CLI Example:
Install the named package using the IPS pkg command. Accepts full or partial FMRI.

Returns a dict containing the new package names and versions:

```python
{
    '<package>': { 'old': '<old-version>', 'new': '<new-version>' }
}
```

**Multiple Package Installation Options:**

- **pkgs** A list of packages to install. Must be passed as a python list.

CLI Example:

```bash
salt '* pkg.install vim
salt '* pkg.install pkg://solaris/editor/vim
salt '* pkg.install pkg://solaris/editor/vim refresh=True
salt '* pkg.install pkgs=['foo', 'bar']
```

**salt.modules.solarisipspkg.is_installed(name, **kwargs)**

Returns True if the package is installed. Otherwise returns False. Name can be full or partial FMRI. In case of multiple match from partial FMRI name, it returns True.

CLI Example:

```bash
salt '*' pkg.is_installed bash
```

**salt.modules.solarisipspkg.latest_version(names, **kwargs)**

The available version of packages in the repository. Accepts full or partial FMRI. Partial FMRI is returned if the full FMRI could not be resolved.

If the latest version of a given package is already installed, an empty string will be returned for that package.

Please use pkg.latest_version as pkg.available_version is being deprecated.

Changed in version 2019.2.0: Support for multiple package names added.

CLI Example:

```bash
salt '*' pkg.latest_version bash
salt '*' pkg.latest_version pkg://solaris/entire
salt '*' pkg.latest_version postfix sendmail
```

**salt.modules.solarisipspkg.list_pkgs(versions_as_list=False, **kwargs)**

List the currently installed packages as a dict:

```python
{
    '<package_name>': '<version>'
}
```

CLI Example:

```bash
salt '*' pkg.list_pkgs
```

**salt.modules.solarisipspkg.list_upgrades(refresh=True, **kwargs)**

Lists all packages available for update.

When run in global zone, it reports only upgradable packages for the global zone.

When run in non-global zone, it can report more upgradable packages than pkg update -vn, because pkg update hides packages that require newer version of pkg://solaris/entire (which means that they
can be upgraded only from the global zone). If pkg://solaris/entire is found in the list of upgrades, then the global zone should be updated to get all possible updates. Use refresh=True to refresh the package database.

**refresh** [True] Runs a full package database refresh before listing. Set to False to disable running the refresh.

Changed in version 2017.7.0.

In previous versions of Salt, refresh defaulted to False. This was changed to default to True in the 2017.7.0 release to make the behavior more consistent with the other package modules, which all default to True.

CLI Example:

```
salt '*' pkg.list_upgrades
salt '*' pkg.list_upgrades refresh=False
```

salt.modules.solarisipspkg.normalize_name(name, **kwargs)

Internal function. Normalizes pkg name to full FMRI before running pkg.install. In case of multiple matches or no match, it returns the name without modifications.

CLI Example:

```
salt '*' pkg.normalize_name vim
```

salt.modules.solarisipspkg.purge(name, **kwargs)

Remove specified package. Accepts full or partial FMRI.

Returns a list containing the removed packages.

CLI Example:

```
salt '*' pkg.purge <package name>
```

salt.modules.solarisipspkg.refresh_db(full=False)

Updates the remote repos database.

- **full** : False, Set to True to force a refresh of the pkg DB from all publishers, regardless of the last refresh time.

CLI Example:

```
salt '*' pkg.refresh_db
salt '*' pkg.refresh_db full=True
```

salt.modules.solarisipspkg.remove(name=None, pkgs=None, **kwargs)

Remove specified package. Accepts full or partial FMRI. In case of multiple match, the command fails and won’t modify the OS.

- **name** The name of the package to be deleted.
- **pkgs** A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a list containing the removed packages.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove tcsh
salt '*' pkg.remove pkg://solaris/shell/tcsh
salt '*' pkg.remove pkgs='["foo", "bar"]'
```
salt.modules.solarisipspkg.search(name, versions_as_list=False, **kwargs)

Searches the repository for given pkg name. The name can be full or partial FMRI. All matches are printed. Globs are also supported.

CLI Example:

```bash
salt '*' pkg.search bash
```

salt.modules.solarisipspkg.upgrade(refresh=False, **kwargs)

Upgrade all packages to the latest possible version. When run in global zone, it updates also all non-global zones. In non-global zones upgrade is limited by dependency constrains linked to the version of pkg://solaris/entire.

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>', 'new': '<new-version>'}}
```

When there is a failure, an explanation is also included in the error message, based on the return code of the pkg update command.

CLI Example:

```bash
salt '*' pkg.upgrade
```

salt.modules.solarisipspkg.upgrade_available(name)

Check if there is an upgrade available for a certain package. Accepts full or partial FMRI. Returns all matches found.

CLI Example:

```bash
salt '*' pkg.upgrade_available apache-22
```

salt.modules.solarisipspkg.version(*names, **kwargs)

Common interface for obtaining the version of installed packages. Accepts full or partial FMRI. If called using pkg_resource, full FMRI is required. Partial FMRI is returned if the package is not installed.

CLI Example:

```bash
salt '*' pkg.version vim
salt '*' pkg.version foo bar baz
salt '*' pkg_resource.version pkg://solaris/entire
```

21.9.395 salt.modules.solarisipspkg

Package support for Solaris

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see here.

salt.modules.solarisipspkg.install(name=None, sources=None, saltenv='base', **kwargs)

Install the passed package. Can install packages from the following sources:
- Locally (package already exists on the minion)
- HTTP/HTTPS server
- FTP server
- Salt master
Returns a dict containing the new package names and versions:

```python
{'<package>': {'old': '<old-version>',
              'new': '<new-version>'}}
```

CLI Examples:

```
# Installing a data stream pkg that already exists on the minion
salt '*' pkg.install sources='[{{"<pkg name>": "/dir/on/minion/<pkg filename>"}}]'
salt '*' pkg.install sources='[{{"SMClgcc346": "/var/spool/pkg/gcc-3.4.6-sol10-sparc-local.pkg"}}]'

# Installing a data stream pkg that exists on the salt master
salt '*' pkg.install sources='[{{"<pkg name>": "salt://pkgs/<pkg filename>"}}]'
salt '*' pkg.install sources='[{{"SMClgcc346": "salt://pkgs/gcc-3.4.6-sol10-sparc-local.pkg"}}]'

# Installing a data stream pkg that exists on a HTTP server
salt '*' pkg.install sources='[{{"<pkg name>": "http://packages.server.com/<pkg filename>"}}]'
salt '*' pkg.install sources='[{{"SMClgcc346": "http://packages.server.com/gcc-3.4.6-sol10-sparc-local.pkg"}}]'
```

If working with solaris zones and you want to install a package only in the global zone you can pass `current_zone_only=True` to salt to have the package only installed in the global zone. (Behind the scenes this is passing `-G` to the pkgadd command.) Solaris default when installing a package in the global zone is to install it in all zones. This overrides that and installs the package only in the global.

CLI Example:

```
# Installing a data stream package only in the global zone:
salt 'global_zone' pkg.install sources='[{{"SMClgcc346": "/var/spool/pkg/gcc-3.4.6-sol10-sparc-local.pkg"}}]'
current_zone_only=True
```

By default salt automatically provides an adminfile, to automate package installation, with these options set:

```python
email=
instance=quit
partial=nocheck
runlevel=nocheck
idepend=nocheck
rdepend=nocheck
space=nocheck
setuid=nocheck
conflict=nocheck
action=nocheck
basedir=default
```

You can override any of these options in two ways. First you can optionally pass any of the options as a kwarg to the module/state to override the default value or you can optionally pass the 'admin_source' option providing your own adminfile to the minions.

Note: You can find all of the possible options to provide to the adminfile by reading the admin man page:
man -s 4 admin

CLI Example:

```
# Overriding the 'instance' adminfile option when calling the module directly
salt '* pkg.install sources='["<pkg name>"="salt://pkgs/<pkg filename>"]'\n\n\n\ninstance="overwrite"
```

SLS Example:

```
# Overriding the 'instance' adminfile option when used in a state
SMClgcc346:
pkg.installed:
    - sources:
        - SMClgcc346: salt://srv/salt/pkgs/gcc-3.4.6-sol10-sparc-local.pkg
        - instance: overwrite
```

Note: The ID declaration is ignored, as the package name is read from the sources parameter.

CLI Example:

```
# Providing your own adminfile when calling the module directly
salt ' '* pkg.install sources='["<pkg name>"="salt://pkgs/<pkg filename>"]'\n\n\n\nadmin_source='salt://pkgs/<adminfile filename>'
```

# Providing your own adminfile when using states

```
<pkg name>:
pkg.installed:
    - sources:
        - <pkg name>: salt://pkgs/<pkg filename>
        - admin_source: salt://pkgs/<adminfile filename>
```

Note: The ID declaration is ignored, as the package name is read from the sources parameter.

salt.modules.solarispkg.latest_version(\'names, **kwargs\)

Return the latest version of the named package available for upgrade or installation. If more than one package
name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt ' '* pkg.latest_version <package name>
salt ' '* pkg.latest_version <package1> <package2> <package3> ...
```

NOTE: As package repositories are not presently supported for Solaris pkgadd, this function will always return
an empty string for a given package.

salt.modules.solarispkg.list_pkgs(\versions_as_list=False, **kwargs\)

List the packages currently installed as a dict:
{'<package_name>': '<version>'}

CLI Example:
salt '*' pkg.list_pkgs

salt.modules.solarispkg.purge

Package purges are not supported, this function is identical to remove().

name The name of the package to be deleted

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'

salt.modules.solarispkg.remove

Remove packages with pkgrm

name The name of the package to be deleted

By default salt automatically provides an adminfile, to automate package removal, with these options set:

email=
instance=quit
partial=nocheck
runlevel=nocheck
idepend=nocheck
rdepend=nocheck
space=nocheck
setuid=nocheck
conflict=nocheck
action=nocheck
basedir=default

You can override any of these options in two ways. First you can optionally pass any of the options as a kwarg to the module/state to override the default value or you can optionally pass the 'admin_source' option providing your own adminfile to the minions.

Note: You can find all of the possible options to provide to the adminfile by reading the admin man page:

man -s 4 admin

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:
salt '*' pkg.remove <package name>
salt '*' pkg.remove SUNWgit
salt.modules.solarispkg.\texttt{upgrade\_available}(name)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

salt.modules.solarispkg.\texttt{version}(*names, **kwargs)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

\section*{21.9.396 \texttt{salt.modules.solr}}

Apache Solr Salt Module

Author: Jed Glazner Version: 0.2.1 Modified: 12/09/2011

This module uses HTTP requests to talk to the apache solr request handlers to gather information and report errors. Because of this the minion doesn’t necessarily need to reside on the actual slave. However if you want to use the signal function the minion must reside on the physical solr host.

This module supports multi-core and standard setups. Certain methods are master/slave specific. Make sure you set the solr.type. If you have questions or want a feature request please ask.

\section*{Coming Features in 0.3}

\begin{itemize}
\item Add command for checking for replication failures on slaves
\item Improve match_index_versions since it’s pointless on busy solr masters
\item Add additional local fs checks for backups to make sure they succeeded
\end{itemize}

\section*{Override these in the minion config}

\begin{description}
\item[solr.cores] A list of core names e.g. ['core1','core2']. An empty list indicates non-multicore setup.
\item[solr.baseurl] The root level URL to access solr via HTTP
\item[solr.request_timeout] The number of seconds before timing out an HTTP/HTTPS/FTP request. If nothing is specified then the python global timeout setting is used.
\item[solr.type] Possible values are 'master' or 'slave'
\item[solr.backup_path] The path to store your backups. If you are using cores and you can specify to append the core name to the path in the backup method.
\item[solr.num_backups] For versions of solr >= 3.5. Indicates the number of backups to keep. This option is ignored if your version is less.
\end{description}
solr.init_script  The full path to your init script with start/stop options
solr.dih.options  A list of options to pass to the DIH.

**Required Options for DIH**

- **clean** [False] Clear the index before importing
- **commit** [True] Commit the documents to the index upon completion
- **optimize** [True] Optimize the index after commit is complete
- **verbose** [True] Get verbose output

```python
salt.modules.solr.abort_import(handler=None, host=None, core_name=None, verbose=False)
```

- **handler** [str] The name of the data import handler.
- **host** [str (None)] The solr host to query. __opts__['host'] is default.
- **core** [str (None)] The core the handler belongs to.
- **verbose** [boolean (False)] Run the command with verbose output.

Return : dict<str,obj>:

```
{ 'success': boolean, 'data': dict, 'errors': list, 'warnings': list }
```

CLI Example:

```
salt '*' solr.abort_import dataimport None music {'clean':True}
```

```python
salt.modules.solr.backup(host=None, core_name=None, append_core_to_path=False)
```

- **host** [str (None)] The solr host to query. __opts__['host'] is default.
- **core_name** [str] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.
- **append_core_to_path** [boolean (False)] If True add the name of the core to the backup path. Assumes that minion backup path is not None.

Return : dict<str,obj>:

```
{ 'success': boolean, 'data': dict, 'errors': list, 'warnings': list }
```

CLI Example:

```
salt '*' solr.backup music
```

```python
salt.modules.solr.core_status(host=None, core_name=None)
```

- **host** [str (None)] The solr host to query. __opts__['host'] is default.
- **core_name** [str] The name of the core to reload

Return : dict<str,obj>:

```
{ 'success': boolean, 'data': dict, 'errors': list, 'warnings': list }
```

CLI Example:
salt '*' solr.core_status None music

salt.modules.solr.delta_import(handler, host=None, core_name=None, options=None, extra=None)

Submits an import command to the specified handler using specified options. This command can only be run if the minion is configured with solr.type=master

* handler [str] The name of the data import handler.
* host [str (None)] The solr host to query. __opts__['host'] is default.
* core [str (None)] The core the handler belongs to.

* options [dict (__opts__)] A list of options such as clean, optimize commit, verbose, and pause_replication. Leave blank to use __opts__ defaults. options will be merged with __opts__
* extra [dict ({})] Extra name value pairs to pass to the handler. e.g. ["name=value"]

Return : dict<str,obj>:

{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}

CLI Example:
salt '*' solr.delta_import dataimport None music {'clean':True}

salt.modules.solr.full_import(handler, host=None, core_name=None, options=None, extra=None)

MASTER ONLY. Submits an import command to the specified handler using specified options. This command can only be run if the minion is configured with solr.type=master

* handler [str] The name of the data import handler.
* host [str (None)] The solr host to query. __opts__['host'] is default.
* core [str (None)] The core the handler belongs to.

* options [dict (__opts__)] A list of options such as clean, optimize commit, verbose, and pause_replication. Leave blank to use __opts__ defaults. options will be merged with __opts__
* extra [dict ({})] Extra name value pairs to pass to the handler. e.g. ["name=value"]

Return : dict<str,obj>:

{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}

CLI Example:
salt '*' solr.full_import dataimport None music {'clean':True}

salt.modules.solr.import_status(handler, host=None, core_name=None, verbose=False)

Submits an import command to the specified handler using specified options. This command can only be run if the minion is configured with solr.type: 'master'

* handler [str] The name of the data import handler.
* host [str (None)] The solr host to query. __opts__['host'] is default.
* core [str (None)] The core the handler belongs to.

* verbose [boolean (False)] Specifies verbose output

Return : dict<str,obj>:

{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}

CLI Example:
salt '*' solr.import_status dataimport None music False

salt.modules.solr.is_replication_enabled(host=None, core_name=None)

SLAVE CALL. Check for errors, and determine if a slave is replicating or not.

* host [str (None)] The solr host to query. __opts__['host'] is default.
**core_name** [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return: dict<str,obj>:

```python
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```bash
salt '*' solr.is_replication_enabled music
```

**salt.modules.solr.lucene_version** *(core_name=None)*

Gets the lucene version that solr is using. If you are running a multi-core setup you should specify a core name since all the cores run under the same servlet container, they will all have the same version.

**core_name** [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return: dict<str,obj>:

```python
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```bash
salt '*' solr.lucene_version
```

**salt.modules.solr.match_index_versions** *(host=None, core_name=None)*

SLAVE CALL Verifies that the master and the slave versions are in sync by comparing the index version. If you are constantly pushing updates the index the master and slave versions will seldom match. A solution to this is pause indexing every so often to allow the slave to replicate and then call this method before allowing indexing to resume.

**host** [str (None)] The solr host to query. __opts__['host'] is default.

**core_name** [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return: dict<str,obj>:

```python
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```bash
salt '*' solr.match_index_versions music
```

**salt.modules.solr.optimize** *(host=None, core_name=None)*

Search queries fast, but it is a very expensive operation. The ideal process is to run this with a master/slave configuration. Then you can optimize the master, and push the optimized index to the slaves. If you are running a single solr instance, or if you are going to run this on a slave be aware than search performance will be horrible while this command is being run. Additionally it can take a LONG time to run and your HTTP request may timeout. If that happens adjust your timeout settings.

**host** [str (None)] The solr host to query. __opts__['host'] is default.

**core_name** [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return: dict<str,obj>:

```python
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```bash
salt '*' solr.optimize music
```
salt.modules.solr.ping( host=None, core_name=None)

Does a health check on solr, makes sure solr can talk to the indexes.

- **host** [str (None)] The solr host to query. __opts__['host'] is default.
- **core_name** [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

**Return**: dict<str,obj>:

- **success** : boolean
- **data** : dict
- **errors** : list
- **warnings** : list

**CLI Example**:

```
salt '*' solr.ping music
```

salt.modules.solr.reload_core( host=None, core_name=None)

MULTI-CORE HOSTS ONLY Load a new core from the same configuration as an existing registered core. While the "new" core is initializing, the "old" one will continue to accept requests. Once it has finished, all new request will go to the "new" core, and the "old" core will be unloaded.

- **host** [str (None)] The solr host to query. __opts__['host'] is default.
- **core_name** [str] The name of the core to reload

**Return**: dict<str,obj>:

- **success** : boolean
- **data** : dict
- **errors** : list
- **warnings** : list

**CLI Example**:

```
salt '*' solr.reload_core None music
```

Return data is in the following format:

```
{'success':bool, 'data':dict, 'errors':list, 'warnings':list}
```

salt.modules.solr.reload_import_config( handler, host=None, core_name=None, verbose=False)

MASTER ONLY re-loads the handler config XML file. This command can only be run if the minion is a 'master' type

- **handler** [str] The name of the data import handler.
- **host** [str (None)] The solr host to query. __opts__['host'] is default.
- **core** [str (None)] The core the handler belongs to.
- **verbose** [boolean (False)] Run the command with verbose output.

**Return**: dict<str,obj>:

- **success** : boolean
- **data** : dict
- **errors** : list
- **warnings** : list

**CLI Example**:

```
salt '*' solr.reload_import_config dataimport None music {'clean':True}
```

salt.modules.solr.replication_details( host=None, core_name=None)

Get the full replication details.

- **host** [str (None)] The solr host to query. __opts__['host'] is default.
- **core_name** [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

**Return**: dict<str,obj>:

- **success** : boolean
- **data** : dict
- **errors** : list
- **warnings** : list

**CLI Example**:

```
salt '*' solr.replication_details music

salt.modules.solr.set_is_polling(polling, host=None, core_name=None)
SLAVE CALL Prevent the slaves from polling the master for updates.
polling [boolean] True will enable polling. False will disable it.
host [str (None)] The solr host to query. __opts__['host'] is default.
core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores
or if you want to check all cores.
Return : dict<str,obj>:
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}

CLI Example:
salt '*' solr.set_is_polling False

salt.modules.solr.set_replication_enabled(status, host=None, core_name=None)
MASTER ONLY Sets the master to ignore poll requests from the slaves. Useful when you don’t want the slaves
replicating during indexing or when clearing the index.
status [boolean] Sets the replication status to the specified state.
host [str (None)] The solr host to query. __opts__['host'] is default.
core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores
or if you want to set the status on all cores.
Return : dict<str,obj>:
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}

CLI Example:
salt '*' solr.set_replication_enabled false, None, music

salt.modules.solr.signal(signal=None)
Signals Apache Solr to start, stop, or restart. Obviously this is only going to work if the minion resides on the
solr host. Additionally Solr doesn’t ship with an init script so one must be created.
signal [str (None)] The command to pass to the apache solr init valid values are ‘start’, ‘stop’, and ‘restart’
CLI Example:
salt '*' solr.signal restart

salt.modules.solr.version(core_name=None)
Gets the solr version for the core specified. You should specify a core here as all the cores will run under the
same servlet container and so will all have the same version.
core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores
or if you want to check all cores.
Return : dict<str,obj>:
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}

CLI Example:
salt '*' solr.version

21.9.397 salt.modules.solrcloud module

Module for solrcloud configuration
New in version 2017.7.0.

For now, module is limited to http-exposed API. It doesn’t implement config upload via Solr zkCli

```
salt.modules.solrcloud.BOOL_PROPS_LIST = ['transient', 'loadOnStartup']
Collections options type definition Reference: https://cwiki.apache.org/confluence/display/solr/Collections+API#CollectionsAPI-api
```

```
salt.modules.solrcloud.DICT_OPTIONS_LIST = ['properties']
Collection unmodifiable options Reference: https://cwiki.apache.org/confluence/display/solr/Collections+API#CollectionsAPI-modifycoll
```

```
salt.modules.solrcloud.alias_exists(alias_name, **kwargs)
Check alias existence
Additional parameters (kwargs) may be passed, they will be proxied to http.query
CLI Example:
```
salt '*' solrcloud.alias_exists my_alias
```

```
salt.modules.solrcloud.alias_get_collections(alias_name, **kwargs)
Get collection list for an alias
Additional parameters (kwargs) may be passed, they will be proxied to http.query
CLI Example:
```
salt '*' solrcloud.alias_get my_alias
```

```
salt.modules.solrcloud.alias_set_collections(alias_name, collections=None, **kwargs)
Define an alias
Additional parameters (kwargs) may be passed, they will be proxied to http.query
CLI Example:
```
salt '*' solrcloud.alias_set my_alias collections=[collection1, collection2]
```

```
salt.modules.solrcloud.cluster_status(**kwargs)
Get cluster status
Additional parameters (kwargs) may be passed, they will be proxied to http.query
CLI Example:
```
salt '*' solrcloud.cluster_status
```

```
salt.modules.solrcloud.collection_backup(collection_name, location, backup_name=None, **kwargs)
Create a backup for a collection.
Additional parameters (kwargs) may be passed, they will be proxied to http.query
CLI Example:
```
salt '*' solrcloud.core_backup collection_name /mnt/nfs_backup
```

```
salt.modules.solrcloud.collection_backup_all(location, backup_name=None, **kwargs)
Create a backup for all collection present on the server.
Additional parameters (kwargs) may be passed, they will be proxied to http.query
CLI Example:
```
salt '...' solrcloud.core_backup /mnt/nfs_backup

salt.modules.solrcloud.collection_check_options(options)
Check collections options
CLI Example:
salt '...' solrcloud.collection_check_options '{}"replicationFactor":4}''

salt.modules.solrcloud.collection_create(collection_name, options=None, **kwargs)
Create a collection,
Additional parameters (kwargs) may be passed, they will be proxied to http.query
CLI Example:
salt '...' solrcloud.collection_create collection_name

Collection creation options may be passed using the "options" parameter. Do not include option "name" since it already specified by the mandatory parameter "collection_name"
salt '...' solrcloud.collection_create collection_name options={"replicationFactor":2, "numShards":3}

Cores options may be passed using the "properties" key in options. Do not include property "name"
salt '...' solrcloud.collection_create collection_name options={"replicationFactor":2, "numShards":3, "properties":{"dataDir":"/srv/solr/hugePartitionSollection"}}

salt.modules.solrcloud.collection_creation_options()
Get collection option list that can only be defined at creation
CLI Example:
salt '...' solrcloud.collection_creation_options

salt.modules.solrcloud.collection_exists(collection_name, **kwargs)
Check if a collection exists
Additional parameters (kwargs) may be passed, they will be proxied to http.query
CLI Example:
salt '...' solrcloud.collection_exists collection_name

salt.modules.solrcloud.collection_get_options(collection_name, **kwargs)
Get collection options
Additional parameters (kwargs) may be passed, they will be proxied to http.query
CLI Example:
salt '...' solrcloud.collection_get_options collection_name

salt.modules.solrcloud.collection_list(**kwargs)
List all collections
Additional parameters (kwargs) may be passed, they will be proxied to http.query
CLI Example:
salt '*' solrcloud.collection_list

```
salt.modules.solrcloud.collection_reload(collection, **kwargs)
```
Check if a collection exists
Additional parameters (kwargs) may be passed, they will be proxied to http.query
CLI Example:
```
salt '*' solrcloud.collection_reload collection_name
```

```
salt.modules.solrcloud.collection_set_options(collection_name, options, **kwargs)
```
Change collection options
Additional parameters (kwargs) may be passed, they will be proxied to http.query
Note that not every parameter can be changed after collection creation
CLI Example:
```
salt '*' solrcloud.collection_set_options collection_name options={
  "replicationFactor":4}
```

```
salt.modules.solrcloud.log = <SaltLoggingClass salt.modules.solrcloud (GARBAGE)>
```
Core properties type definition. Reference: https://cwiki.apache.org/confluence/display/solr/Defining+core.properties

### 21.9.398 salt.modules.splunk

Module for interop with the Splunk API
New in version 2016.3.0..

**depends**
- splunk-sdk python module

**configuration** Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the 'splunk' key by default, if defined.

For example:
```
splunk:
  username: alice
  password: abc123
  host: example.splunkcloud.com
  port: 8080
```

```
salt.modules.splunk.create_user(email, profile='splunk', **kwargs)
```
create a splunk user by name/email
CLI Example:
```
salt myminion splunk.create_user user@example.com roles=['user'] realname="Test User" name=testuser
```

```
salt.modules.splunk.delete_user(email, profile='splunk')
```
delete a splunk user by email
CLI Example:
```
salt myminion splunk_user.delete 'user@example.com'
```

21.9. execution modules
salt.modules.splunk.get_user(email, profile='splunk', **kwargs)
Get a splunk user by name/email

CLI Example:
salt myminion splunk.get_user 'user@example.com' user_details=false
salt myminion splunk.get_user 'user@example.com' user_details=true

salt.modules.splunk.list_users(profile='splunk')
List all users in the splunk DB

CLI Example:
salt myminion splunk.list_users

salt.modules.splunk.update_user(email, profile='splunk', **kwargs)
Create a splunk user by email

CLI Example:
salt myminion splunk.update_user example@domain.com roles=['user'] realname="Test User"

21.9.399 salt.modules.splunk_search

Module for interop with the Splunk API

New in version 2015.5.0.

depends

- splunk-sdk python module

configuration Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the 'splunk' key by default, if defined.

For example:

```
splunk:
  username: alice
  password: abc123
  host: example.splunkcloud.com
  port: 8080
```

salt.modules.splunk_search.create(name, profile='splunk', **kwargs)
Create a splunk search

CLI Example:
splunk_search.create 'my search name' search='error msg'

salt.modules.splunk_search.delete(name, profile='splunk')
Delete a splunk search

CLI Example:
splunk_search.delete 'my search name'

salt.modules.splunk_search.get(name, profile='splunk')
Get a splunk search

CLI Example:
splunk_search.get 'my search name'

salt.modules.splunk_search.list_(profile='splunk')
List splunk searches (names only)

CLI Example: splunk_search.list
salt.modules.splunk_search.list_all(prefix=None, app=None, owner=None, description_contains=None, name_not_contains=None, profile='splunk')

Get all splunk search details. Produces results that can be used to create an sls file.

if app or owner are specified, results will be limited to matching saved searches.

if description_contains is specified, results will be limited to those where "description_contains in description" is true if name_not_contains is specified, results will be limited to those where "name_not_contains not in name" is true.

If prefix parameter is given, alarm names in the output will be prepended with the prefix; alarms that have the prefix will be skipped. This can be used to convert existing alarms to be managed by salt, as follows:

CLI example:
1. Make a "backup" of all existing searches $ salt-call splunk_search.list_all –out=txt | sed "s/local: //" > legacy_searches.sls
2. Get all searches with new prefixed names $ salt-call splunk_search.list_all "prefix="MANAGED BY SALT"" –out=txt | sed "s/local: //" > managed_searches.sls
3. Insert the managed searches into splunk $ salt-call state.sls managed_searches.sls
4. Manually verify that the new searches look right
5. Delete the original searches $ sed s/present/absent/ legacy_searches.sls > remove_legacy_searches.sls
6. Get all searches again, verify no changes $ salt-call splunk_search.list_all –out=txt | sed "s/local: //" > final_searches.sls

salt.modules.splunk_search.update(name, profile='splunk', **kwargs)

Update a splunk search

CLI Example:
splunk_search.update 'my search name' sharing=app

21.9.400 salt.modules.sqlite3

Support for SQLite3

salt.modules.sqlite3.fetch(db=None, sql=None)

Retrieve data from an sqlite3 db (returns all rows, be careful!)

CLI Example:
salt '*' sqlite3.fetch /root/test.db 'SELECT * FROM test;'

salt.modules.sqlite3.indexes(db=None)

Show all indices in the database, for people with poor spelling skills

CLI Example:
salt '*' sqlite3.indexes /root/test.db

salt.modules.sqlite3.indices(db=None)

Show all indices in the database

CLI Example:
salt '*' sqlite3.indices /root/test.db
salt.modules.sqlite3.modify(db=None, sql=None)
   Issue an SQL query to sqlite3 (with no return data), usually used to modify the database in some way (insert, delete, create, etc)
   CLI Example:
   ```
   salt '*' sqlite3.modify /root/test.db 'CREATE TABLE test(id INT, testdata TEXT);'
   ```

salt.modules.sqlite3.sqlite_version()
   Return version of sqlite
   CLI Example:
   ```
   salt '*' sqlite3.sqlite_version
   ```

salt.modules.sqlite3.tables(db=None)
   Show all tables in the database
   CLI Example:
   ```
   salt '*' sqlite3.tables /root/test.db
   ```

salt.modules.sqlite3.version()
   Return version of pysqlite
   CLI Example:
   ```
   salt '*' sqlite3.version
   ```

### 21.9.401 salt.modules.ssh

Manage client ssh components

**Note**: This module requires the use of MD5 hashing. Certain security audits may not permit the use of MD5. For those cases, this module should be disabled or removed.

salt.modules.ssh.auth_keys(user=None, config='.ssh/authorized_keys', fingerprint_hash_type=None)
   Return the authorized keys for users
   CLI Example:
   ```
   salt '*' ssh.auth_keys
   salt '*' ssh.auth_keys root
   salt '*' ssh.auth_keys user=root
   salt '*' ssh.auth_keys user="[user1, user2]"
   ```

salt.modules.ssh.check_key(user, key, enc, comment, options, config='.ssh/authorized_keys', cache_keys=None, fingerprint_hash_type=None)
   Check to see if a key needs updating, returns "update", "add" or "exists"
   CLI Example:
   ```
   salt '*' ssh.check_key <user> <key> <enc> <comment> <options>
   ```
salt.modules.ssh.check_key_file(user, source, config='ssh/authorized_keys', saltenv='base', fingerprint_hash_type=None)

Check a keyfile from a source destination against the local keys and return the keys to change.

CLI Example:
```
salt '*' ssh.check_key_file root salt://ssh/keyfile
```

salt.modules.ssh.check_known_host(user=None, hostname=None, key=None, fingerprint=None, config=None, port=None, fingerprint_hash_type=None)

Check the record in known_hosts file, either by its value or by fingerprint (it's enough to set up either key or fingerprint, you don’t need to set up both).

If provided key or fingerprint doesn’t match with stored value, return "update", if no value is found for a given host, return "add", otherwise return "exists".

If neither key, nor fingerprint is defined, then additional validation is not performed.

CLI Example:
```
salt '*' ssh.check_known_host <user> <hostname> key='AAAA...FAaQ=='
```

salt.modules.ssh.get_known_host(user, hostname, config=None, port=None, fingerprint_hash_type=None)

Deprecated since version 2018.3.0: Use ssh.get_known_host_entries instead.

Return information about known host from the configfile, if any. If there is no such key, return None.

CLI Example:
```
salt '*' ssh.get_known_host <user> <hostname>
```

salt.modules.ssh.get_known_host_entries(user, hostname, config=None, port=None, fingerprint_hash_type=None)

New in version 2018.3.0.

Return information about known host entries from the configfile, if any. If there are no entries for a matching hostname, return None.

CLI Example:
```
salt '*' ssh.get_known_host_entries <user> <hostname>
```

salt.modules.ssh.hash_known_hosts(user=None, config=None)

Hash all the hostnames in the known hosts file.

New in version 2014.7.0.

user hash known hosts of this user
config path to known hosts file: can be absolute or relative to user’s home directory

CLI Example:
```
salt '*' ssh.hash_known_hosts
```

salt.modules.ssh.host_keys(keydir=None, private=True, certs=True)

Return the minion’s host keys.

CLI Example:
```
salt '*' ssh.host_keys
salt '*' ssh.host_keys keydir=/etc/ssh
```
salt.modules.ssh.key_is_encrypted(key)

New in version 2015.8.7.

Function to determine whether or not a private key is encrypted with a passphrase.

Checks key for a Proc-Type header with ENCRYPTED in the value. If found, returns True, otherwise returns False.

CLI Example:

    salt '*' ssh.key_is_encrypted /root/id_rsa

salt.modules.ssh.recv_known_host(hostname, enc=None, port=None, hash_known_hosts=True,
                                  timeout=5, fingerprint_hash_type=None)

Retrieve information about host public key from remote server

Deprecated since version 2018.3.0: Use ssh.recv_known_host_entries instead.

hostname The name of the remote host (e.g. "github.com")
enc Defines what type of key is being used, can be ed25519, ecdsa ssh-rsa or ssh-dss
port Optional parameter, denoting the port of the remote host on which an SSH daemon is running. By default the port 22 is used.
hash_known_hosts [True] Hash all hostnames and addresses in the known hosts file.
timeout [int] Set the timeout for connection attempts. If timeout seconds have elapsed since a connection was initiated to a host or since the last time anything was read from that host, then the connection is closed and the host in question considered unavailable. Default is 5 seconds.

New in version 2016.3.0.

fingerprint_hash_type The fingerprint hash type that the public key fingerprints were originally hashed with. This defaults to sha256 if not specified.

New in version 2016.11.4.

Changed in version 2017.7.0: default changed from md5 to sha256

CLI Example:

    salt '*' ssh.recv_known_host <hostname> enc=<enc> port=<port>

salt.modules.ssh.recv_known_host_entries(hostname, enc=None, port=None,
                                          hash_known_hosts=True, timeout=5, fingerprint_hash_type=None)

New in version 2018.3.0.

Retrieve information about host public keys from remote server

hostname The name of the remote host (e.g. "github.com")
enc Defines what type of key is being used, can be ed25519, ecdsa ssh-rsa or ssh-dss
port Optional parameter, denoting the port of the remote host on which an SSH daemon is running. By default the port 22 is used.
hash_known_hosts [True] Hash all hostnames and addresses in the known hosts file.
timeout [int] Set the timeout for connection attempts. If timeout seconds have elapsed since a connection was initiated to a host or since the last time anything was read from that host, then the connection is closed and the host in question considered unavailable. Default is 5 seconds.
fingerprint_hash_type The fingerprint hash type that the public key fingerprints were originally hashed with. This defaults to sha256 if not specified.

New in version 2016.11.4.
Changed in version 2017.7.0:: default changed from md5 to sha256

CLI Example:

```bash
salt '*' ssh.recv_known_host_entries <hostname> enc=<enc> port=<port>
```

```python
salt.modules.ssh.rm_auth_key(user, key, config='ssh/authorized_keys', fingerprint_hash_type=None)

Remove an authorized key from the specified user's authorized key file

CLI Example:

```bash
salt '*' ssh.rm_auth_key <user> <key>
```

```python
salt.modules.ssh.rm_auth_key_from_file(user, source, config='ssh/authorized_keys', saltenv='base', fingerprint_hash_type=None)

Remove an authorized key from the specified user's authorized key file, using a file as source

CLI Example:

```bash
salt '*' ssh.rm_auth_key_from_file <user> salt://ssh_keys/<user>.id_rsa.pub
```

```python
salt.modules.ssh.rm_known_host(user=None, hostname=None, config=None, port=None)

Remove all keys belonging to hostname from a known_hosts file.

CLI Example:

```bash
salt '*' ssh.rm_known_host <user> <hostname>
```

```python
salt.modules.ssh.set_auth_key(user, key, config='ssh/authorized_keys', cache_keys=None, fingerprint_hash_type=None)

Add a key to the authorized_keys file. The "key" parameter must only be the string of text that is the encoded key. If the key begins with "ssh-rsa" or ends with user@host, remove those from the key before passing it to this function.

CLI Example:

```bash
salt '*' ssh.set_auth_key <user> '<key>' enc='dsa'
```

```python
salt.modules.ssh.set_auth_key_from_file(user, source, config='ssh/authorized_keys', saltenv='base', fingerprint_hash_type=None)

Add a key to the authorized_keys file, using a file as the source.

CLI Example:

```bash
salt '*' ssh.set_auth_key_from_file <user> salt://ssh_keys/<user>.id_rsa.pub
```

```python
salt.modules.ssh.set_known_host(user=None, hostname=None, fingerprint=None, key=None, port=None, config=None, hash_known_hosts=True, timeout=5, fingerprint_hash_type=None)

Download SSH public key from remote host "hostname", optionally validate its fingerprint against "fingerprint" variable and save the record in the known_hosts file.

If such a record does already exist in there, do nothing.

user The user who owns the ssh authorized keys file to modify
hostname The name of the remote host (e.g. "github.com")
fingerprint The fingerprint of the key which must be present in the known_hosts file (optional if key specified)
key The public key which must be presented in the known_hosts file (optional if fingerprint specified)
port optional parameter, denoting the port of the remote host, which will be used in case, if the public key will be requested from it. By default the port 22 is used.
enc Defines what type of key is being used, can be ed25519, ecdsa ssh-rsa or ssh-dss
config The location of the authorized keys file relative to the user’s home directory, defaults to "ssh/known_hosts". If no user is specified, defaults to "/etc/ssh/ssh_known_hosts". If present, must be an absolute path when a user is not specified.
hash_known_hosts [True] Hash all hostnames and addresses in the known hosts file.
timeout [int] Set the timeout for connection attempts. If timeout seconds have elapsed since a connection was initiated to a host or since the last time anything was read from that host, then the connection is closed and the host in question considered unavailable. Default is 5 seconds.

New in version 2016.3.0.

fingerprint_hash_type The public key fingerprint hash type that the public key fingerprint was originally hashed with. This defaults to sha256 if not specified.

New in version 2016.11.4.

Changed in version 2017.7.0: default changed from md5 to sha256

CLI Example:

```
salt '*' ssh.set_known_host <user> fingerprint='xx:xx:..:xx' enc='ssh-rsa' config=..'.ssh/known_hosts'
```

salt.modules.ssh.user_keys(user=None, pubfile=None, prvfile=None)

Return the user’s ssh keys on the minion

New in version 2014.7.0.

CLI Example:

```
salt '*' ssh.user_keys
salt '*' ssh.user_keys user=user1
salt '*' ssh.user_keys user=user1 pubfile=/home/user1/.ssh/id_rsa.pub prvfile=/...home/user1/.ssh/id_rsa
salt '*' ssh.user_keys user=user1 prvfile=False
salt '*' ssh.user_keys user=['user1','user2'] pubfile=id_rsa.pub prvfile=id_rsa
```

As you can see you can tell Salt not to read from the user’s private (or public) key file by setting the file path to False. This can be useful to prevent Salt from publishing private data via Salt Mine or others.

21.9.402 salt.modules.ssh_pkg

Service support for the REST example

salt.modules.ssh_pkg.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs)
salt.modules.ssh_pkg.list_pkgs(versions_as_list=False, **kwargs)
salt.modules.ssh_pkg.remove(name=None, pkgs=None, **kwargs)

21.9.403 salt.modules.ssh_service module

Provide the service module for the proxy-minion SSH sample .. versionadded:: 2015.8.2

salt.modules.ssh_service.enabled(name, sig=None)
Only the 'redbull' service is 'enabled' in the test
salt.modules.ssh_service.get_all()
    Return a list of all available services
    
    CLI Example:
    ```
    salt '*' service.get_all
    ```

salt.modules.ssh_service.list_()
    Return a list of all available services.
    
    CLI Example:
    ```
    salt '*' service.list
    ```

salt.modules.ssh_service.restart(name, sig=None)
    Restart the specified service with rest_sample
    
    CLI Example:
    ```
    salt '*' service.restart <service name>
    ```

salt.modules.ssh_service.running(name, sig=None)
    Return whether this service is running.

salt.modules.ssh_service.start(name, sig=None)
    Start the specified service on the ssh_sample
    
    CLI Example:
    ```
    salt '*' service.start <service name>
    ```

salt.modules.ssh_service.status(name, sig=None)
    Return the status for a service via ssh_sample. If the name contains globbing, a dict mapping service name to True/False values is returned.
    
    Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)

    Parameters
    - name (str) – The name of the service to check
    - sig (str) – Not implemented

    Returns True if running, False otherwise dict: Maps service name to True if running, False otherwise

    Return type bool
    
    CLI Example:
    ```
    salt '*' service.status <service name>
    ```

salt.modules.ssh_service.stop(name, sig=None)
    Stop the specified service on the rest_sample
    
    CLI Example:
    ```
    salt '*' service.stop <service name>
    ```

**21.9.404 salt.modules.snapper module**

Module to manage filesystem snapshots with snapper

New in version 2016.11.0.

**codeauthor** Duncan Mac-Vicar P. <dmacvicar@suse.de>
codeauthor  Pablo Suárez Hernández <psuarezhernandez@suse.de>
depends  dbus Python module.
depends  snapper http://snapper.io, available in most distros
maturity  new
platform  Linux

salt.modules.snapper.changed_files(config='root', num_pre=None, num_post=None)
Returns the files changed between two snapshots
config  Configuration name.
num_pre  first snapshot ID to compare. Default is last snapshot
num_post  last snapshot ID to compare. Default is 0 (current state)

CLI example:
```
salt '*' snapper.changed_files
salt '*' snapper.changed_files num_pre=19 num_post=20
```

salt.modules.snapper.create_baseline(tag='baseline', config='root')
Creates a snapshot marked as baseline
tag  Tag name for the baseline
config  Configuration name.

CLI Example:
```
salt '*' snapper.create_baseline
salt '*' snapper.create_baseline my_custom_baseline
```

salt.modules.snapper.create_config(name=None, subvolume=None, fstype=None, template=None, extra_opts=None)
Creates a new Snapper configuration
name  Name of the new Snapper configuration.
subvolume  Path to the related subvolume.
fstype  Filesystem type of the subvolume.
template  Configuration template to use. (Default: default)
extra_opts  Extra Snapper configuration opts dictionary. It will override the values provided by the given template (if any).

CLI example:
```
salt '*' snapper.create_config name=myconfig subvolume=/foo/bar/ fstype=btrfs
salt '*' snapper.create_config name=myconfig subvolume=/foo/bar/ fstype=btrfs template="default"
salt '*' snapper.create_config name=myconfig subvolume=/foo/bar/ fstype=btrfs extra_opts='{"NUMBER_CLEANUP": False}'
```

salt.modules.snapper.create_snapshot(config='root', snapshot_type='single', pre_number=None, cleanup_algorithm='number', description=None, number=None, **kwargs)
Creates an snapshot
config  Configuration name.
snapshot_type  Specifies the type of the new snapshot. Possible values are single, pre and post.
pre_number  For post snapshots the number of the pre snapshot must be provided.
description  Description for the snapshot. If not given, the salt job will be used.
cleanup_algorithm  Set the cleanup algorithm for the snapshot.
number  Deletes old snapshots when a certain number of snapshots is reached.
timeline  Deletes old snapshots but keeps a number of hourly, daily, weekly, monthly and yearly snapshots.
empty-pre-post Deletes pre/post snapshot pairs with empty diffs.
userdata Set userdata for the snapshot (key-value pairs).
Returns the number of the created snapshot.

CLI example:

```
salt '*' snapper.create_snapshot
```

salt.modules.snapper.delete_snapshot(snapshots_ids=None, config='root')

Deletes an snapshot
config Configuration name. (Default: root)
snapshots_ids List of the snapshots IDs to be deleted.

CLI example:

```
salt '*' snapper.delete_snapshot 54
salt '*' snapper.delete_snapshot config=root 54
salt '*' snapper.delete_snapshot config=root snapshots_ids=[54,55,56]
```

salt.modules.snapper.diff(config='root', filename=None, num_pre=None, num_post=None)

Returns the differences between two snapshots config Configuration name.
filename if not provided the showing differences between snapshots for all "text" files
num_pre first snapshot ID to compare. Default is last snapshot
num_post last snapshot ID to compare. Default is 0 (current state)

CLI Example:

```
salt '*' snapper.diff
salt '*' snapper.diff filename=/var/log/snapper.log num_pre=19 num_post=20
```

salt.modules.snapper.diff_jid(jid, config='root')

Returns the changes applied by a jid
jid The job id to lookup
config Configuration name.

CLI Example:

```
salt '*' snapper.diff_jid jid=20160607130930720112
```

salt.modules.snapper.get_config(name='root')

Retrieves all values from a given configuration

CLI example:

```
salt '*' snapper.get_config
```

salt.modules.snapper.get_snapshot(number=0, config='root')

Get detailed information about a given snapshot

CLI example:

```
salt '*' snapper.get_snapshot
```

salt.modules.snapper.list_configs()

List all available configs

CLI example:

```
salt '*' snapper.list_configs
```
salt.modules.snapper.list_snapshots(config='root')

List available snapshots

CLI example:
salt '*' snapper.list_snapshots config=myconfig

salt.modules.snapper.modify_snapshot(snapshot_id=None, description=None, userdata=None, cleanup=None, config='root')

Modify attributes of an existing snapshot.

config Configuration name. (Default: root)

snapshot_id ID of the snapshot to be modified.

cleanup Change the cleanup method of the snapshot. (str)

description Change the description of the snapshot. (str)

userdata Change the userdata dictionary of the snapshot. (dict)

CLI example:
salt '*' snapper.modify_snapshot 54 description="my snapshot description"
salt '*' snapper.modify_snapshot 54 description="my snapshot description"
salt '*' snapper.modify_snapshot 54 userdata="{"foo": "bar"}"
salt '*' snapper.modify_snapshot snapshot_id=54 cleanup="number"

salt.modules.snapper.run(function, *args, **kwargs)

Runs a function from an execution module creating pre and post snapshots and associating the salt job id with those snapshots for easy undo and cleanup.

function Salt function to call.

config Configuration name. (default: "root")

description A description for the snapshots. (default: None)

userdata Data to include in the snapshot metadata. (default: None)

cleanup_algorithm Snapper cleanup algorithm. (default: "number")

*args args for the function to call. (default: None)

**kwargs kwargs for the function to call (default: None)

This would run append text to /etc/motd using the file.append module, and will create two snapshots, pre and post with the associated metadata. The jid will be available as salt_jid in the userdata of the snapshot.

You can immediately see the changes

CLI Example:
salt '*' snapper.run file.append args='"/etc/motd", "some text"]'

salt.modules.snapper.set_config(name='root', **kwargs)

Set configuration values

CLI example:
salt '*' snapper.set_config SYNC_ACL=True

Keys are case insensitive as they will be always uppercased to snapper convention. The above example is equivalent to:
salt '*' snapper.set_config sync_acl=True

salt.modules.snapper.status(config='root', num_pre=None, num_post=None)

Returns a comparison between two snapshots

config Configuration name.

num_pre first snapshot ID to compare. Default is last snapshot

num_post last snapshot ID to compare. Default is 0 (current state)
CLI example:
```
salt '*' snapper.status
salt '*' snapper.status num_pre=19 num_post=20
```

```{.python}
salt.modules.snapper.status_to_string(dbus_status)
```
Converts a numeric dbus snapper status into a string

CLI Example:
```
salt '*' snapper.status_to_string <dbus_status>
```

```{.python}
salt.modules.snapper.undo(config='root', files=None, num_pre=None, num_post=None)
```
Undo all file changes that happened between num_pre and num_post, leaving the files into the state of num_pre.

**Warning:** If one of the files has changes after num_post, they will be overwritten. The snapshots are used to determine the file list, but the current version of the files will be overwritten by the versions in num_pre. You to undo changes between num_pre and the current version of the files use num_post=0.

CLI Example:
```
salt '*' snapper.undo
```

```{.python}
salt.modules.snapper.undo_jid(jid, config='root')
```
Undo the changes applied by a salt job
- **jid** The job id to lookup
- **config** Configuration name.

CLI Example:
```
salt '*' snapper.undo_jid jid=20160607130930720112
```

### 21.9.405 salt.modules.state

Control the state system on the minion.

**State Caching**

When a highstate is called, the minion automatically caches a copy of the last high data. If you then run a highstate with cache=True it will use that cached highdata and won’t hit the fileserver except for salt:// links in the states themselves.

```{.python}
salt.modules.state.apply_(mods=None, **kwargs)
```
New in version 2015.5.0.

This function will call `state.highstate` or `state.sls` based on the arguments passed to this function. It exists as a more intuitive way of applying states.

**APPLYING ALL STATES CONFIGURED IN TOP.SLS (A.K.A. HIGHSTATE)**

To apply all configured states, simply run `state.apply`:
Salt Documentation, Release 2019.2.0

salt '*' state.apply

The following additional arguments are also accepted when applying all states configured in top.sls:
test Run states in test-only (dry-run) mode
mock The mock option allows for the state run to execute without actually calling any states. This then returns
a mocked return which will show the requisite ordering as well as fully validate the state run.
New in version 2015.8.4.
pillar Custom Pillar values, passed as a dictionary of key-value pairs
salt '*' state.apply stuff pillar='{"foo": "bar"}'

Note: Values passed this way will override Pillar values set via pillar_roots or an external Pillar
source.
exclude Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls
names, or a list of dictionaries containing sls or id keys. Glob-patterns may be used to match multiple
states.
salt '*' state.apply exclude=bar,baz
salt '*' state.apply exclude=foo*
salt '*' state.apply exclude="[{'id': 'id_to_exclude'}, {'sls': 'sls_to_
,→exclude'}]"

queue [False] Instead of failing immediately when another state run is in progress, queue the new state run
to begin running once the other has finished.
This option starts a new thread for each queued state run, so use this option sparingly.
localconfig Optionally, instead of using the minion config, load minion opts from the file specified by this
argument, and then merge them with the options from the minion config. This functionality allows
for specific states to be run with their own custom minion configuration, including different pillars,
file_roots, etc.
salt '*' state.apply localconfig=/path/to/minion.yml

APPLYING INDIVIDUAL SLS FILES (A.K.A. STATE.SLS)
To apply individual SLS files, pass them as a comma-separated list:
# Run the states configured in salt://stuff.sls (or salt://stuff/init.sls)
salt '*' state.apply stuff
# Run the states configured in salt://stuff.sls (or salt://stuff/init.sls)
# and salt://pkgs.sls (or salt://pkgs/init.sls).
salt '*' state.apply stuff,pkgs

The following additional arguments are also accepted when applying individual SLS files:
test Run states in test-only (dry-run) mode
mock The mock option allows for the state run to execute without actually calling any states. This then returns
a mocked return which will show the requisite ordering as well as fully validate the state run.
New in version 2015.8.4.
pillar Custom Pillar values, passed as a dictionary of key-value pairs
salt '*' state.apply stuff pillar='{"foo": "bar"}'

2492

Chapter 21. Salt Module Reference


### Note:
Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

#### queue [False]
Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

#### concurrent [False]
Execute state runs concurrently instead of serially

**Warning:** This flag is potentially dangerous. It is designed for use when multiple state runs can safely be run at the same time. Do *not* use this flag for performance optimization.

### saltenv
Specify a salt fileserver environment to be used when applying states

Changed in version 0.17.0: Argument name changed from `env` to `saltenv`

Changed in version 2014.7.0: If no saltenv is specified, the minion config will be checked for an `environment` parameter and if found, it will be used. If none is found, `base` will be used. In prior releases, the minion config was not checked and `base` would always be assumed when the saltenv was not explicitly set.

#### pillarenv
Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.

#### localconfig
Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, file_roots, etc.

```bash
salt '*' state.apply stuff localconfig=/path/to/minion.yml
```

### sync_mods
If specified, the desired custom module types will be synced prior to running the SLS files:

```bash
salt '*' state.apply stuff sync_mods=states,modules
salt '*' state.apply stuff sync_mods=all
```

**Note:** This option is ignored when no SLS files are specified, as a *highstate* automatically syncs all custom module types.

New in version 2017.7.8, 2018.3.3, 2019.2.0.

#### salt.modules.state.check_request(name=None)
New in version 2015.5.0.

Return the state request information, if any

**CLI Example:**

```bash
salt '*' state.check_request
```

#### salt.modules.state.clear_cache()
Clear out cached state files, forcing even cache runs to refresh the cache on the next state execution.

Remember that the state cache is completely disabled by default, this execution only applies if cache=True is used in states

**CLI Example:**
```python
salt '*' state.clear_cache

salt.modules.state.clear_request(name=None)

New in version 2015.5.0.
Clear out the state execution request without executing it
CLI Example:
salt '*' state.clear_request

salt.modules.state.disable(states)

Disable state runs.
CLI Example:
salt '*' state.disable highstate
salt '*' state.disable highstate,test.succeed_without_changes

Note: To disable a state file from running provide the same name that would be passed in a state.sls call.
salt '*' state.disable bind.config

salt.modules.state.enable(states)

Enable state function or sls run
CLI Example:
salt '*' state.enable highstate
salt '*' state.enable test.succeed_without_changes

Note: To enable a state file from running provide the same name that would be passed in a state.sls call.
salt '*' state.enable bind.config

salt.modules.state.event(tagmatch='*', count=-1, quiet=False, sock_dir=None, pretty=False)

Watch Salt’s event bus and block until the given tag is matched
New in version 2016.3.0.
Changed in version 2019.2.0: `tagmatch` can now be either a glob or regular expression.
This is useful for utilizing Salt’s event bus from shell scripts or for taking simple actions directly from the CLI.
Enable debug logging to see ignored events.

Parameters

- `tagmatch` – the event is written to stdout for each tag that matches this glob or regular expression.
- `count` – this number is decremented for each event that matches the `tagmatch` parameter; pass -1 to listen forever.
- `quiet` – do not print to stdout; just block
- `sock_dir` – path to the Salt master’s event socket file.
- `pretty` – Output the JSON all on a single line if False (useful for shell tools); pretty-print the JSON output if True.
node – Watch the minion-side or master-side event bus.

CLI Example:
```
salt-call --local state.event pretty=True
```

```
Salt.modules.state.get_pauses(jid=None)
```
Get a report on all of the currently paused state runs and pause run settings. Optionally send in a jid if you only desire to see a single pause data set.

```
Salt.modules.state.high(data, test=None, queue=False, **kwargs)
```
Execute the compound calls stored in a single set of high data

This function is mostly intended for testing the state system and is not likely to be needed in everyday usage.

CLI Example:
```
salt '*' state.high '{"vim": {"pkg": ["installed"]}}'
```

```
Salt.modules.state.highstate(test=None, queue=False, **kwargs)
```
Retrieve the state data from the salt master for this minion and execute it

* **test** Run states in test-only (dry-run) mode
* **pillar** Custom Pillar values, passed as a dictionary of key-value pairs

```text
Note: Values passed this way will override Pillar values set via pillar_roots or an external Pillar source.
```

Changed in version 2016.3.0: GPG-encrypted CLI Pillar data is now supported via the GPG renderer. See here for details.

* **pillar_enc** Specify which renderer to use to decrypt encrypted data located within the pillar value. Currently, only gpg is supported.
  
  New in version 2016.3.0.

* **exclude** Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls names, or a list of dictionaries containing sls or id keys. Glob-patterns may be used to match multiple states.

```text
salt '*' state.highstate exclude=bar,baz
salt '*' state.highstate exclude=foo*
salt '*' state.highstate exclude="[{'id': 'id_to_exclude'}, {'sls': 'sls_to_exclude'}]"
```

```
Salt.env Specify a salt fileserver environment to be used when applying states
```

Changed in version 0.17.0: Argument name changed from env to saltenv.

Changed in version 2014.7.0: If no saltenv is specified, the minion config will be checked for a saltenv parameter and if found, it will be used. If none is found, base will be used. In prior releases, the minion config was not checked and base would always be assumed when the saltenv was not explicitly set.

```
Salt.env Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the pillarenv option. When neither the pillarenv minion config option nor this CLI argument is used, all Pillar environments will be merged together.
```

* **queue** [False] Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

  This option starts a new thread for each queued state run, so use this option sparingly.
localconfig  Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, file_roots, etc.

mock  The mock option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.

    New in version 2015.8.4.

    CLI Examples:

```
salt '*' state.highstate
salt '*' state.highstate whitelist=sls1_to_run,sls2_to_run
salt '*' state.highstate exclude=sls_to_exclude
salt '*' state.highstate exclude="[{'id': 'id_to_exclude'}, {'sls': 'sls_to_exclude'}]"
salt '*' state.highstate pillar="{foo: 'Foo!', bar: 'Bar!'}"
```

salt.modules.state.id_exists(ids, mods, test=None, queue=False, **kwargs)
Tests for the existence of a specific ID or list of IDs within the specified SLS file(s). Similar to state.sls_exists, returns True or False. The default environment is base', use saltenv to specify a different environment.

    New in version 2019.2.0.

    saltenv  Specify a salt fileserver environment from which to look for the SLS files specified in the mods argument

    CLI Example:

```
salt '*' state.id_exists create_myfile,update_template filestate saltenv=dev
```

salt.modules.state.list_disabled()
List the states which are currently disabled

    CLI Example:

```
salt '*' state.list_disabled
```

salt.modules.state.low(data, queue=False, **kwargs)
Execute a single low data call

    This function is mostly intended for testing the state system and is not likely to be needed in everyday usage.

    CLI Example:

```
salt '*' state.low '{"state": "pkg", "fun": "installed", "name": "vi"}'
```

salt.modules.state.orchestrate(mods, saltenv='base', test=None, exclude=None, pillar=None, pillarenv=None)

    New in version 2016.11.0.

    Execute the orchestrate runner from a masterless minion.

    See also:

    More Orchestrate documentation

    •  Full Orchestrate Tutorial
    •  Docs for the `salt` state module <salt.states.saltmod>

    CLI Examples:
salt-call --local state.orchestrate webserver
salt-call --local state.orchestrate webserver saltenv=dev test=True
salt-call --local state.orchestrate webserver saltenv=dev pillarenv=aws

salt.modules.state.pause(jid, state_id=None, duration=None)
Set up a state id pause, this instructs a running state to pause at a given state id. This needs to pass in the jid of the running state and can optionally pass in a duration in seconds. If a state_id is not passed then the jid referenced will be paused at the beginning of the next state run.

The given state id is the id got a given state execution, so given a state that looks like this:

```
vim:
    pkg.installed: []
```

The state_id to pass to pause is vim

CLI Examples:

```
salt '*' state.pause 20171130110407769519
salt '*' state.pause 20171130110407769519 vim
salt '*' state.pause 20171130110407769519 vim 20
```

salt.modules.state.pkg(pkg_path, pkg_sum, hash_type, test=None, **kwargs)
Execute a packaged state run, the packaged state run will exist in a tarball available locally. This packaged state can be generated using salt-ssh.

CLI Example:

```
salt '*' state.pkg /tmp/salt_state.tgz 760a9353810e36f6d81416366fc426dc md5
```

salt.modules.state.request(mods=None, **kwargs)
New in version 2015.5.0.

Request that the local admin execute a state run via salt-call state.run_request. All arguments match those of state.apply.

CLI Example:

```
salt '*' state.request
salt '*' state.request stuff
salt '*' state.request stuff,pkgs
```

salt.modules.state.resume(jid, state_id=None)
Remove a pause from a jid, allowing it to continue. If the state_id is not specified then the a general pause will be resumed.

The given state_id is the id got a given state execution, so given a state that looks like this:

```
vim:
    pkg.installed: []
```

The state_id to pass to rm_pause is vim

CLI Examples:

```
salt '*' state.resume 20171130110407769519
salt '*' state.resume 20171130110407769519 vim
```
salt.modules.state.run_request(name='default', **kwargs)

New in version 2015.5.0.

Execute the pending state request

CLI Example:
```
salt '*' state.run_request
```

salt.modules.state.running(concurrent=False)

Return a list of strings that contain state return data if a state function is already running. This function is used to prevent multiple state calls from being run at the same time.

CLI Example:
```
salt '*' state.running
```

salt.modules.state.show_highstate(queue=False, **kwargs)

Retrieve the highstate data from the salt master and display it

Custom Pillar data can be passed with the pillar kwarg.

CLI Example:
```
salt '*' state.show_highstate
```

salt.modules.state.show_low_sls(mods, test=None, queue=False, **kwargs)

Display the low data from a specific sls. The default environment is base, use saltenv to specify a different environment.

saltenv Specify a salt fileserver environment to be used when applying states

pillar Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.show_low_sls stuff pillar='{"foo": "bar"}'
```

Note: Values passed this way will override Pillar values set via pillar_roots or an external Pillar source.

pillarenv Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the pillarenv option. When neither the pillarenv minion config option nor this CLI argument is used, all Pillar environments will be merged together.

CLI Example:
```
salt '*' state.show_low_sls foo
salt '*' state.show_low_sls foo saltenv=dev
```

salt.modules.state.show_lowstate(queue=False, **kwargs)

List out the low data that will be applied to this minion

CLI Example:
```
salt '*' state.show_lowstate
```

salt.modules.state.show_sls(mods, test=None, queue=False, **kwargs)

Display the state data from a specific sls or list of sls files on the master. The default environment is base, use saltenv to specify a different environment.

This function does not support topfiles. For top.sls please use show_top instead.

Custom Pillar data can be passed with the pillar kwarg.
saltenv  Specify a salt fileserver environment to be used when applying states
pillarenv  Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the pillarenv option. When neither the pillarenv minion config option nor this CLI argument is used, all Pillar environments will be merged together.

CLI Example:
```bash
salt '*' state.show_sls core,edit.vim saltenv=dev
```

```
salt.modules.state.show_state_usage(queue=False, **kwargs)
Retrieve the highstate data from the salt master to analyse used and unused states

Custom Pillar data can be passed with the pillar kwarg.

CLI Example:
```bash
salt '*' state.show_state_usage
```

```
salt.modules.state.show_states(queue=False, **kwargs)
Returns the list of states that will be applied on highstate.

CLI Example:
```bash
salt '*' state.show_states
```

New in version 2019.2.0.

```
salt.modules.state.show_top(queue=False, **kwargs)
Return the top data that the minion will use for a highstate

CLI Example:
```bash
salt '*' state.show_top
```

```
salt.modules.state.single(fun, name, test=None, queue=False, **kwargs)
Execute a single state function with the named kwargs, returns False if insufficient data is sent to the command

By default, the values of the kwargs will be parsed as YAML. So, you can specify lists values, or lists of single entry key-value maps, as you would in a YAML salt file. Alternatively, JSON format of keyword values is also supported.

CLI Example:
```bash
salt '*' state.single pkg.installed name=vim
```

```
salt.modules.state.sls(mods, test=None, exclude=None, queue=False, sync_mods=None, **kwargs)
Execute the states in one or more SLS files

test  Run states in test-only (dry-run) mode
pillar  Custom Pillar values, passed as a dictionary of key-value pairs

```bash
salt '*' state.sls stuff pillar='{"foo": "bar"}'
```

**Note:** Values passed this way will override existing Pillar values set via pillar_roots or an external Pillar source. Pillar values that are not included in the kwarg will not be overwritten.

Changed in version 2016.3.0: GPG-encrypted CLI Pillar data is now supported via the GPG renderer. See [here](#) for details.
pillar_enc Specify which renderer to use to decrypt encrypted data located within the pillar value. Currently, only gpg is supported.

New in version 2016.3.0.

exclude Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls names, or a list of dictionaries containing sls or id keys. Glob-patterns may be used to match multiple states.

```bash
salt '*' state.sls foo,bar,baz exclude=bar,baz
salt '*' state.sls foo,bar,baz exclude=ba*
salt '*' state.sls foo,bar,baz exclude="[{'id': 'id_to_exclude'}, {'sls': 'sls_to_exclude'}]"
```

queue [False] Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

concurrent [False] Execute state runs concurrently instead of serially

**Warning:** This flag is potentially dangerous. It is designed for use when multiple state runs can safely be run at the same time. Do not use this flag for performance optimization.

saltenv Specify a salt fileserver environment to be used when applying states

Changed in version 0.17.0: Argument name changed from env to saltenv.

Changed in version 2014.7.0: If no saltenv is specified, the minion config will be checked for an environment parameter and if found, it will be used. If none is found, base will be used. In prior releases, the minion config was not checked and base would always be assumed when the saltenv was not explicitly set.

pillarenv Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the pillarenv option. When neither the pillarenv minion config option nor this CLI argument is used, all Pillar environments will be merged together.

localconfig

Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, file_roots, etc.

mock: The mock option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.

New in version 2015.8.4.

sync_mods If specified, the desired custom module types will be synced prior to running the SLS files:

```bash
salt '*' state.sls stuff sync_mods=states,modules
salt '*' state.sls stuff sync_mods=all
```

New in version 2017.7.8,2018.3.3,2019.2.0.

CLI Example:

```bash
salt '*' state.sls core,edit.vim dev
salt '*' state.sls core exclude="[{'id': 'id_to_exclude'}, {'sls': 'sls_to_exclude'}]"

salt '*' state.sls myslsfile pillar="{foo: 'Foo!', bar: 'Bar!'}"
```
salt.modules.state.sls_exists(mods, test=None, queue=False, **kwargs)
Tests for the existance of a specific SLS or list of SLS files on the master. Similar to state.show_sls, rather than returning state details, returns True or False. The default environment is base, use saltenv to specify a different environment.

New in version 2019.2.0.
saltenv Specify a salt fileserver environment from which to look for the SLS files specified in the mods argument
CLI Example:
salt '*' state.sls_exists core,edit.vim saltenv=dev

salt.modules.state.sls_id(id_, mods, test=None, queue=False, **kwargs)
Call a single ID from the named module(s) and handle all requisites
The state ID comes before the module ID(s) on the command line.
id ID to call
mods Comma-delimited list of modules to search for given id and its requisites
New in version 2014.7.0.
saltenv [base] Specify a salt fileserver environment to be used when applying states
pillarenv Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the pillarenv option. When neither the pillarenv minion config option nor this CLI argument is used, all Pillar environments will be merged together.
pillar Custom Pillar values, passed as a dictionary of key-value pairs

salt '*' state.sls_id my_state my_module pillar='{"foo": "bar"}''

Note: Values passed this way will override existing Pillar values set via pillar_roots or an external Pillar source. Pillar values that are not included in the kwarg will not be overwritten.

New in version 2018.3.0.
CLI Example:
salt '*' state.sls_id my_state my_module
salt '*' state.sls_id my_state my_module,a_common_module

salt.modules.state.soft_kill(jid, state_id=None)
Set up a state run to die before executing the given state id, this instructs a running state to safely exit at a given state id. This needs to pass in the jid of the running state. If a state_id is not passed then the jid referenced will be safely exited at the beginning of the next state run.
The given state id is the id got a given state execution, so given a state that looks like this:

```vim:
    pkg.installed: []
```

The state_id to pass to soft_kill is vim

CLI Examples:
salt '*' state.soft_kill 20171130110407769519
salt '*' state.soft_kill 20171130110407769519 vim

salt.modules.state.template(tem, queue=False, **kwargs)
Execute the information stored in a template file on the minion.
This function does not ask a master for a SLS file to render but instead directly processes the file at the provided path on the minion.

CLI Example:

```
salt '*' state.template '<Path to template on the minion>'
```

```
salt.modules.state.template_str(tem, queue=False, **kwargs)
```
Execute the information stored in a string from an sls template

CLI Example:

```
salt '*' state.template_str '<Template String>'
```

```
salt.modules.state.top(topfn, test=None, queue=False, **kwargs)
```
Execute a specific top file instead of the default. This is useful to apply configurations from a different environment (for example, dev or prod), without modifying the default top file.

queue [False] Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

saltenv Specify a salt fileserver environment to be used when applying states

pillarenv Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the pillarenv option. When neither the pillarenv minion config option nor this CLI argument is used, all Pillar environments will be merged together.

New in version 2017.7.0.

CLI Example:

```
salt '*' state.top reverse_top.sls
salt '*' state.top prod_top.sls exclude=sls_to_exclude
salt '*' state.top dev_top.sls exclude="[{'id': 'id_to_exclude'}, {'sls': 'sls_to_exclude'}]"
```

### 21.9.4.06 salt.modules.status

Module for returning various status data about a minion. These data can be useful for compiling into stats later.

```
salt.modules.status.all_status()
```
Return a composite of all status data and info for this minion. Warning: There is a LOT here!

CLI Example:

```
salt '*' status.all_status
```

```
salt.modules.status.cpuinfo()
```
Changed in version 2016.3.2: Return the CPU info for this minion

Changed in version 2016.11.4: Added support for AIX

Changed in version 2018.3.0: Added support for NetBSD and OpenBSD

CLI Example:

```
salt '*' status.cpuinfo
```

```
salt.modules.status.cpustats()
```
Return the CPU stats for this minion
Changed in version 2016.11.4: Added support for AIX
Changed in version 2018.3.0: Added support for OpenBSD

CLI Example:

```
salt '*' status.cpustats
```

**salt.modules.status.custom()**
Return a custom composite of status data and info for this minion, based on the minion config file. An example config like might be:

```
status.cpustats.custom: [ 'cpu', 'ctxt', 'btime', 'processes' ]
```

Where status refers to status.py, cpustats is the function where we get our data, and custom is this function. It is followed by a list of keys that we want returned.

This function is meant to replace all_status(), which returns anything and everything, which we probably don’t want.

By default, nothing is returned. Warning: Depending on what you include, there can be a LOT here!

CLI Example:

```
salt '*' status.custom
```

**salt.modules.status.diskstats()**
Return the disk stats for this minion

Changed in version 2016.3.2: Return the disk stats for this minion
Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.diskstats
```

**salt.modules.status.diskusage(*args)**
Return the disk usage for this minion

Usage:

```
salt '*' status.diskusage [paths and/or filesystem types]
```

CLI Example:

```
salt '*' status.diskusage       # usage for all filesystems
salt '*' status.diskusage /tmp # usage for / and /tmp
salt '*' status.diskusage ext? # usage for ext[234] filesystems
salt '*' status.diskusage / ext? # usage for / and all ext filesystems
```

**salt.modules.status.loadavg()**
Return the load averages for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.loadavg
```

:raises CommandExecutionError: If the system cannot report loadaverages to Python
salt.modules.status.master(\textit{master=None, connected=True})

New in version 2014.7.0.

Return the connection status with master. Fire an event if the connection to master is not as expected. This function is meant to be run via a scheduled job from the minion. If master_ip is an FQDN/Hostname, it must be resolvable to a valid IPv4 address.

Changed in version 2016.11.4: Added support for AIX

CLI Example:

\begin{verbatim}
salt '*' status.master
\end{verbatim}

salt.modules.status.meminfo()

Return the memory info for this minion

Changed in version 2016.11.4: Added support for AIX

Changed in version 2018.3.0: Added support for OpenBSD

CLI Example:

\begin{verbatim}
salt '*' status.meminfo
\end{verbatim}

salt.modules.status.netdev()

Changed in version 2016.3.2: Return the network device stats for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

\begin{verbatim}
salt '*' status.netdev
\end{verbatim}

salt.modules.status.netstats()

Return the network stats for this minion

Changed in version 2016.11.4: Added support for AIX

Changed in version 2018.3.0: Added support for OpenBSD

CLI Example:

\begin{verbatim}
salt '*' status.netstats
\end{verbatim}

salt.modules.status.nproc()

Return the number of processing units available on this system

Changed in version 2016.11.4: Added support for AIX

Changed in version 2018.3.0: Added support for Darwin, FreeBSD and OpenBSD

CLI Example:

\begin{verbatim}
salt '*' status.nproc
\end{verbatim}

salt.modules.status.pid(sig)

Return the PID or an empty string if the process is running or not. Pass a signature to use to find the process via ps. Note you can pass a Python-compatible regular expression to return all pids of processes matching the regexp.

Changed in version 2016.11.4: Added support for AIX

CLI Example:
salt '*' status.pid <sig>

salt.modules.status.ping_master(master)
New in version 2016.3.0.
Sends ping request to the given master. Fires '__master_failback' event on success. Returns bool result.
CLI Example:
salt '*' status.ping_master localhost

salt.modules.status.procs()
Return the process data
Changed in version 2016.11.4: Added support for AIX
CLI Example:
salt '*' status.procs

salt.modules.status.proxy_reconnect(proxy_name, opts=None)
Forces proxy minion reconnection when not alive.
proxy_name The virtual name of the proxy module.
opts: None Opts dictionary. Not intended for CLI usage.
CLI Example:
salt '*' status.proxy_reconnect rest_sample

salt.modules.status.time_(format='%A, %d, %B %Y %I:%M%p')
New in version 2016.3.0.
Return the current time on the minion, formatted based on the format parameter.
Default date format: Monday, 27. July 2015 07:55AM
CLI Example:
salt '*' status.time
salt '*' status.time '%s'

salt.modules.status.uptime()
Return the uptime for this system.
Changed in version 2015.8.9: The uptime function was changed to return a dictionary of easy-to-read key/value pairs containing uptime information, instead of the output from a cmd.run call.
Changed in version 2016.11.0: Support for OpenBSD, FreeBSD, NetBSD, MacOS, and Solaris
Changed in version 2016.11.4: Added support for AIX
CLI Example:
salt '*' status.uptime

salt.modules.status.version()
Return the system version for this minion
Changed in version 2016.11.4: Added support for AIX
Changed in version 2018.3.0: Added support for OpenBSD
CLI Example:
salt '*' status.version

salt.modules.status.vmstats()

    Changed in version 2016.3.2: Return the virtual memory stats for this minion

    Changed in version 2016.11.4: Added support for AIX

    CLI Example:

    salt '*' status.vmstats

salt.modules.status.w()

    Return a list of logged in users for this minion, using the w command

    CLI Example:

    salt '*' status.w

21.9.407 salt.modules.statuspage

StatusPage

Handle requests for the StatusPage API.

In the minion configuration file, the following block is required:

    statuspage:
      api_key: <API_KEY>
      page_id: <PAGE_ID>

New in version 2017.7.0.

salt.modules.statuspage.create(endpoint='incidents', api_url=None, page_id=None, api_key=None, api_version=None, **kwargs)

    Insert a new entry under a specific endpoint.

    endpoint: incidents Insert under this specific endpoint.

    page_id  Page ID. Can also be specified in the config file.

    api_key  API key. Can also be specified in the config file.

    api_version: 1 API version. Can also be specified in the config file.

    api_url  Custom API URL in case the user has a StatusPage service running in a custom environment.

    CLI Example:

    salt 'minion' statuspage.create endpoint='components' name='my component' group_id='993vgplshj12'

Example output:

    minion:
      ------------
      comment:
      out:
      ------------
      created_at:
        2017-01-05T19:35:27.135Z
      description:
        None
group_id: 993vgplshj12
id: mjkmtt5lhdgc
name: my component
page_id: ksdhgfxiuhaa
position: 7
status: operational
updated_at: 2017-01-05T19:35:27.135Z
result: True

salt.modules.statuspage.delete(endpoint='incidents', id=None, api_url=None, page_id=None, api_key=None, api_version=None)

Remove an entry from an endpoint.
endpoint: incidents Request a specific endpoint.
page_id Page ID. Can also be specified in the config file.
api_key API key. Can also be specified in the config file.
api_version: 1 API version. Can also be specified in the config file.
api_url Custom API URL in case the user has a StatusPage service running in a custom environment.

CLI Example:
salt 'minion' statuspage.delete endpoint='components' id='ftgks51sfs2d'

Example output:
minion: ----------
comment: None
out:
result: True

salt.modules.statuspage.retrieve(endpoint='incidents', api_url=None, page_id=None, api_key=None, api_version=None)

Retrieve a specific endpoint from the Statuspage API.
endpoint: incidents Request a specific endpoint.
page_id Page ID. Can also be specified in the config file.
api_key API key. Can also be specified in the config file.
api_version: 1 API version. Can also be specified in the config file.
api_url Custom API URL in case the user has a StatusPage service running in a custom environment.

CLI Example:
salt 'minion' statuspage.retrieve components

Example output:
minion: ----------
comment:
out:

```
salt.modules.statuspage.update(endpoint='incidents', id=None, api_url=None, page_id=None, api_key=None, api_version=None, **kwargs)
```

Update attribute(s) of a specific endpoint.

- **id** The unique ID of the endpoint entry.
- **endpoint** incidents Endpoint name.
- **page_id** Page ID. Can also be specified in the config file.
- **api_key** API key. Can also be specified in the config file.
- **api_version** 1 API version. Can also be specified in the config file.
- **api_url** Custom API URL in case the user has a StatusPage service running in a custom environment.

CLI Example:

```
salt 'minion' statuspage.update id=dz959yz2nd4l status=resolved
```

Example output:

```
minion: ----------
comment: out: ----------
 created_at: 2017-01-03T15:25:30.718Z
description: None
group_id: 993vgplshj12
id: dz959yz2nd4l
name: Management Portal
page_id: xzwjjdw87vpf
position: 11
```
21.9.408 salt.modules.supervisord

Provide the service module for system supervisord or supervisord in a virtualenv

```python
salt.modules.supervisord.add(name, user=None, conf_file=None, bin_env=None)
```

Activates any updates in config for process/group.

- **user** user to run supervisorctl as
- **conf_file** path to supervisord config file
- **bin_env** path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.add <name>
```

```python
salt.modules.supervisord.custom(command, user=None, conf_file=None, bin_env=None)
```

Run any custom supervisord command

- **user** user to run supervisorctl as
- **conf_file** path to supervisord config file
- **bin_env** path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.custom "mstop '*'gunicorn*'"
```

```python
salt.modules.supervisord.options(name, conf_file=None)
```

New in version 2014.1.0.

Read the config file and return the config options for a given process

- **name** Name of the configured process
- **conf_file** path to supervisord config file

CLI Example:

```
salt '*' supervisord.options foo
```

```python
salt.modules.supervisord.remove(name, user=None, conf_file=None, bin_env=None)
```

Removes process/group from active config

- **user** user to run supervisorctl as
- **conf_file** path to supervisord config file
- **bin_env** path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.remove <name>
```

```python
salt.modules.supervisord.reread(user=None, conf_file=None, bin_env=None)
```

Reload the daemon’s configuration files

- **user** user to run supervisorctl as
- **conf_file** path to supervisord config file
- **bin_env** path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:
salt '\*' supervisord.reread

salt.modules.supervisord.restart(name='all', user=None, conf_file=None, bin_env=None)
    Restart the named service. Process group names should not include a trailing asterisk.
    user  user to run supervisorctl as
    conf_file  path to supervisord config file
    bin_env  path to supervisorctl bin or path to virtualenv with supervisor installed

    CLI Example:
    salt '\*' supervisord.restart <service>
    salt '\*' supervisord.restart <group>:

salt.modules.supervisord.start(name='all', user=None, conf_file=None, bin_env=None)
    Start the named service. Process group names should not include a trailing asterisk.
    user  user to run supervisorctl as
    conf_file  path to supervisord config file
    bin_env  path to supervisorctl bin or path to virtualenv with supervisor installed

    CLI Example:
    salt '\*' supervisord.start <service>
    salt '\*' supervisord.start <group>:

salt.modules.supervisord.status(name=None, user=None, conf_file=None, bin_env=None)
    List programs and its state
    user  user to run supervisorctl as
    conf_file  path to supervisord config file
    bin_env  path to supervisorctl bin or path to virtualenv with supervisor installed

    CLI Example:
    salt '\*' supervisord.status

salt.modules.supervisord.status_raw(name=None, user=None, conf_file=None, bin_env=None)
    Display the raw output of status
    user  user to run supervisorctl as
    conf_file  path to supervisord config file
    bin_env  path to supervisorctl bin or path to virtualenv with supervisor installed

    CLI Example:
    salt '\*' supervisord.status_raw

salt.modules.supervisord.stop(name='all', user=None, conf_file=None, bin_env=None)
    Stop the named service. Process group names should not include a trailing asterisk.
    user  user to run supervisorctl as
    conf_file  path to supervisord config file
    bin_env  path to supervisorctl bin or path to virtualenv with supervisor installed

    CLI Example:
    salt '\*' supervisord.stop <service>
    salt '\*' supervisord.stop <group>:

salt.modules.supervisord.update(user=None, conf_file=None, bin_env=None, name=None)
    Reload config and add/remove/update as necessary
    user  user to run supervisorctl as
    conf_file  path to supervisord config file
    bin_env  path to supervisorctl bin or path to virtualenv with supervisor installed
name  name of the process group to update. if none then update any process group that has changes

CLI Example:

```
salt '*' supervisord.update
```

## 21.9.409 salt.modules.suse_apache

Support for Apache

Please note: The functions in here are SUSE-specific. Placing them in this separate file will allow them to load only on SUSE systems, while still loading under the apache namespace.

**salt.modules.suse_apache.a2dismod**(mod)

- Runs a2dismod for the given mod.

CLI Example:

```
salt '*' apache.a2dismod vhost_alias
```

**salt.modules.suse_apache.a2enmod**(mod)

- Runs a2enmod for the given mod.

CLI Example:

```
salt '*' apache.a2enmod vhost_alias
```

**salt.modules.suse_apache.check_mod_enabled**(mod)

- Checks to see if the specific apache mod is enabled.

This will only be functional on operating systems that support `a2enmod -l` to list the enabled mods.

CLI Example:

```
salt '*' apache.check_mod_enabled status
```

## 21.9.410 salt.modules.svn

Subversion SCM

**salt.modules.svn.add**(cwd, targets, user=None, username=None, password=None, *opts)

- Add files to be tracked by the Subversion working-copy checkout
- **cwd** The path to the Subversion repository
- **targets** [None] files and directories to pass to the command as arguments
- **user** [None] Run svn as a user other than what the minion runs as
- **username** [None] Connect to the Subversion server as another user
- **password** [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.add /path/to/repo /path/to/new/file
```

**salt.modules.svn.checkout**(cwd, remote, target=None, user=None, username=None, password=None, *opts)

- Download a working copy of the remote Subversion repository directory or file
- **cwd** The path to the Subversion repository
- **remote** [None] URL to checkout
target [None] The name to give the file or directory working copy Default: svn uses the remote basename
user [None] Run svn as a user other than what the minion runs as
username [None] Connect to the Subversion server as another user
password [None] Connect to the Subversion server with this password

    New in version 0.17.0.
    CLI Example:

    salt '*' svn.checkout /path/to/repo svn://remote/repo

salt.modules.svn.commit(cwd, targets=None, msg=None, user=None, username=None, password=None, *opts)
Commit the current directory, files, or directories to the remote Subversion repository
    cwd The path to the Subversion repository
    targets [None] files and directories to pass to the command as arguments Default: svn uses ‘’
    msg [None] Message to attach to the commit log
    user [None] Run svn as a user other than what the minion runs as
    username [None] Connect to the Subversion server as another user
    password [None] Connect to the Subversion server with this password

    New in version 0.17.0.
    CLI Example:

    salt '*' svn.commit /path/to/repo

salt.modules.svn.diff(cwd, targets=None, user=None, username=None, password=None, *opts)
Return the diff of the current directory, files, or directories from the remote Subversion repository
    cwd The path to the Subversion repository
    targets [None] files and directories to pass to the command as arguments Default: svn uses ‘’
    user [None] Run svn as a user other than what the minion runs as
    username [None] Connect to the Subversion server as another user
    password [None] Connect to the Subversion server with this password

    New in version 0.17.0.
    CLI Example:

    salt '*' svn.diff /path/to/repo

salt.modules.svn.export(cwd, remote, target=None, user=None, username=None, password=None, revision='HEAD', *opts)
Create an unversioned copy of a tree.
    cwd The path to the Subversion repository
    remote [None] URL and path to file or directory checkout
    target [None] The name to give the file or directory working copy Default: svn uses the remote basename
    user [None] Run svn as a user other than what the minion runs as
    username [None] Connect to the Subversion server as another user
    password [None] Connect to the Subversion server with this password

    New in version 0.17.0.
    CLI Example:

    salt '*' svn.export /path/to/repo svn://remote/repo

salt.modules.svn.info(cwd, targets=None, user=None, username=None, password=None, fmt='str')
Display the Subversion information from the checkout.
    cwd The path to the Subversion repository
    targets [None] files, directories, and URLs to pass to the command as arguments svn uses ’’ by default
user [None] Run svn as a user other than what the minion runs as
username [None] Connect to the Subversion server as another user
password [None] Connect to the Subversion server with this password

   New in version 0.17.0.
fmt [str] How to fmt the output from info. (str, xml, list, dict)

CLI Example:

    salt '*/' svn.info /path/to/svn/repo

salt.modules.svn.remove(cwd, targets=None, user=None, username=None, password=None, *opts)
Remove files and directories from the Subversion repository

cwd The path to the Subversion repository

targets [None] files, directories, and URLs to pass to the command as arguments

CLI Example:

    salt '*/' svn.remove /path/to/repo /path/to/repo/remove

salt.modules.svn.status(cwd, targets=None, user=None, username=None, password=None, *opts)
Display the status of the current directory, files, or directories in the Subversion repository

cwd The path to the Subversion repository

targets [None] files, directories, and URLs to pass to the command as arguments Default: svn uses ‘.’

CLI Example:

    salt '*/' svn.status /path/to/repo

salt.modules.svn.switch(cwd, remote, target=None, user=None, username=None, password=None, *opts)
Switch a working copy of a remote Subversion repository directory

cwd The path to the Subversion repository
remote [None] URL to switch
target [None] The name to give the file or directory working copy Default: svn uses the remote basename
user [None] Run svn as a user other than what the minion runs as
username [None] Connect to the Subversion server as another user
password [None] Connect to the Subversion server with this password

CLI Example:

    salt '*/' svn.switch /path/to/repo svn://remote/repo

salt.modules.svn.update(cwd, targets=None, user=None, username=None, password=None, *opts)
Update the current directory, files, or directories from the remote Subversion repository

cwd The path to the Subversion repository

targets [None] files and directories to pass to the command as arguments Default: svn uses ‘.’
user [None] Run svn as a user other than what the minion runs as
password [None] Connect to the Subversion server with this password

New in version 0.17.0.

username [None] Connect to the Subversion server as another user

CLI Example:

```
salt '*' svn.update /path/to/repo
```

## 21.9.411 salt.modules.swarm

Docker Swarm Module using Docker's Python SDK

**codeauthor** Tyler Jones <jonestyler806@gmail.com>

New in version 2018.3.0.

The Docker Swarm Module is used to manage and create Docker Swarms.

### Dependencies

- Docker installed on the host
- Docker python sdk >= 2.5.1

### Docker Python SDK

```
pip install -U docker
```

**salt.modules.swarm.joinswarm**(remote_addr=<class 'int'>, listen_addr=<class 'int'>, token=<class 'str'>)

Join a Swarm Worker to the cluster

remote_addr The manager node you want to connect to for the swarm
listen_addr Listen address used for inter-manager communication if the node gets promoted to manager, as well as determining the networking interface used for the VXLAN Tunnel Endpoint (VTEP)
token Either the manager join token or the worker join token. You can get the worker or manager token via

```
salt '*' swarm.swarm_tokens
```

CLI Example:

```
salt '*' swarm.joinswarm remote_addr=192.168.50.10 listen_addr='0.0.0.0'
```

**salt.modules.swarm.leave_swarm**(force=<class 'bool'>)

Force the minion to leave the swarm

force Will force the minion/worker/manager to leave the swarm

CLI Example:

```
salt '*' swarm.leave_swarm force=False
```

**salt.modules.swarm.node_ls**(server=<class 'str'>)

Displays Information about Swarm Nodes with passing in the server

```
```
server The minion/server name

CLI Example:

```shell
salt '*' swarm.node_ls server=minion1
```

salt.modules.swarm.remove_node(node_id=<class 'str'>, force=<class 'bool'>)

Remove a node from a swarm and the target needs to be a swarm manager

- **node_id** The node id from the return of swarm.node_ls
- **force** Forcefully remove the node/minion from the service

CLI Example:

```shell
salt '*' swarm.remove_node node_id=z4gjbe9rwmqahc2a91snvolm5 force=false
```

salt.modules.swarm.remove_service(service=<class 'str'>)

Remove Swarm Service

- **service** The name of the service

CLI Example:

```shell
salt '*' swarm.remove_service service=Test_Service
```

salt.modules.swarm.service_create(image=<class 'str'>, name=<class 'str'>, command=<class 'str'>, hostname=<class 'str'>, replicas=<class 'int'>, target_port=<class 'int'>, published_port=<class 'int'>)

Create Docker Swarm Service Create

- **image** The docker image
- **name** Is the service name
- **command** The docker command to run in the container at launch
- **hostname** The hostname of the containers
- **replicas** How many replicas you want running in the swarm
- **target_port** The target port on the container
- **published_port** port that's published on the host/os

CLI Example:

```shell
salt '*' swarm.service_create image=httpd name=Test_Service command=None hostname=salthttpd replicas=6 target_port=80 published_port=80
```

salt.modules.swarm.swarm_init(advertise_addr=<class 'str'>, listen_addr=<class 'int'>, force_new_cluster=<class 'bool'>)

Initialize Docker on Minion as a Swarm Manager

- **advertise_addr** The ip of the manager
- **listen_addr** Listen address used for inter-manager communication, as well as determining the networking interface used for the VXLAN Tunnel Endpoint (VTEP). This can either be an address/port combination in the form 192.168.1.1:4567, or an interface followed by a port number, like eth0:4567
- **force_new_cluster** Force a new cluster if True is passed

CLI Example:

```shell
salt '*' swarm.swarm_init advertise_addr='192.168.50.10' listen_addr='0.0.0.0' force_new_cluster=False
```

salt.modules.swarm.swarm_service_info(service_name=<class 'str'>)

Swarm Service Information

- **service_name** The name of the service that you want information on about the service

CLI Example:

```shell
salt '*' swarm.swarm_service_info service_name=Test_Service
```
salt.modules.swarm.swarm_tokens()
Get the Docker Swarm Manager or Worker join tokens

CLI Example:

```
salt '*' swarm.swarm_tokens
```

salt.modules.swarm.update_node

Updates docker swarm nodes/needs to target a manager node/minion

availability Drain or Active
node_name minion/node
role role of manager or worker
node_id The Id and that can be obtained via swarm.node_ls
version Is obtained by swarm.node_ls

CLI Example:

```
salt '*' docker_util.update_node availability=drain node_name=minion2
role=worker node_id=3k9x7t8m4pel9c0nqr3iajnzp version=19
```

21.9.412 salt.modules.swift

Module for handling OpenStack Swift calls Author: Anthony Stanton <anthony.stanton@gmail.com>
Inspired by the S3 and Nova modules

depends

- swiftclient Python module

configuration This module is not usable until the user, tenant, auth URL, and password or auth_key are specified either in a pillar or in the minion’s config file. For example:

```
keySTONE.user: admin
keySTONE.tenant: admin
keySTONE.auth_url: 'http://127.0.0.1:5000/v2.0/
keySTONE.password: verybadpass
# or
keySTONE.auth_key: 203802934809284k2j34lkj2l3kj43k
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles. For example:

```
openstack1:
  keySTONE.user: admin
  keySTONE.tenant: admin
  keySTONE.auth_url: 'http://127.0.0.1:5000/v2.0/
  keySTONE.password: verybadpass
# or
  keySTONE.auth_key: 203802934809284k2j34lkj2l3kj43k

openstack2:
  keySTONE.user: admin
  keySTONE.tenant: admin
  keySTONE.auth_url: 'http://127.0.0.2:5000/v2.0/
  keySTONE.password: verybadpass
# or
  keySTONE.auth_key: 303802934809284k2j34lkj2l3kj43k
```
With this configuration in place, any of the swift functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' swift.get mycontainer myfile /tmp/file profile=openstack1
```

NOTE: For Rackspace cloud files setting keystone.auth_version = 1 is recommended.

**salt.modules.swift.delete** *(cont, path=None, profile=None)*

Delete a container, or delete an object from a container.

CLI Example to delete a container:

```
salt myminion swift.delete mycontainer
```

CLI Example to delete an object from a container:

```
salt myminion swift.delete mycontainer remoteobject
```

**salt.modules.swift.get** *(cont=None, path=None, local_file=None, return_bin=False, profile=None)*

List the contents of a container, or return an object from a container. Set return_bin to True in order to retrieve an object wholesale. Otherwise, Salt will attempt to parse an XML response.

CLI Example to list containers:

```
salt myminion swift.get
```

CLI Example to list the contents of a container:

```
salt myminion swift.get mycontainer
```

CLI Example to return the binary contents of an object:

```
salt myminion swift.get mycontainer myfile.png return_bin=True
```

CLI Example to save the binary contents of an object to a local file:

```
salt myminion swift.get mycontainer myfile.png local_file=/tmp/myfile.png
```

**salt.modules.swift.head** *

**salt.modules.swift.put** *(cont, path=None, local_file=None, profile=None)*

Create a new container, or upload an object to a container.

CLI Example to create a container:

```
salt myminion swift.put mycontainer
```

CLI Example to upload an object to a container:

```
salt myminion swift.put mycontainer remotepath local_file=/path/to/file
```

**21.9.413 salt.modules.sysbench**

The 'sysbench' module is used to analyze the performance of the minions, right from the master! It measures various system parameters such as CPU, Memory, File I/O, Threads and Mutex.
salt.modules.sysbench.cpu()
Tests for the CPU performance of minions.

CLI Examples:

```
salt '*' sysbench.cpu
```

salt.modules.sysbench.fileio()
This tests for the file read and write operations. Various modes of operations are
- sequential write
- sequential rewrite
- sequential read
- random read
- random write
- random read and write
The test works with 32 files with each file being 1Gb in size. The test consumes a lot of time. Be patient!

CLI Examples:

```
salt '*' sysbench.fileio
```

salt.modules.sysbench.memory()
This tests the memory for read and write operations.

CLI Examples:

```
salt '*' sysbench.memory
```

salt.modules.sysbench.mutex()
Tests the implementation of mutex

CLI Examples:

```
salt '*' sysbench.mutex
```

salt.modules.sysbench.ping()

salt.modules.sysbench.threads()
This tests the performance of the processor’s scheduler

CLI Example:

```
salt '*' sysbench.threads
```

21.9.414 salt.modules.sysfs module

Module for interfacing with SysFS

See also:

https://www.kernel.org/doc/Documentation/filesystems/sysfs.txt

New in version 2016.3.0.

salt.modules.sysfs.attr(key, value=None)
Access/write a SysFS attribute. If the attribute is a symlink, it’s destination is returned

Returns value or bool

CLI example:
salt '*' sysfs.attr block/sda/queue/logical_block_size

```
salt.modules.sysfs.interfaces(root)

Generate a dictionary with all available interfaces relative to root. Symlinks are not followed.

CLI example:
```
salt '*' sysfs.interfaces block/bcache0/bcach
```

Output example:
```
{
    "r": [
        "state",
        "partial_stripes_expensive",
        "writeback_rate_debug",
        "stripe_size",
        "dirty_data",
        "stats_total/cache_hits",
        "stats_total/cache_bypass_misses",
        "stats_total/bypassed",
        "stats_total/cache_readahead",
        "stats_total/cache_hit_ratio",
        "stats_total/cache_miss_collisions",
        "stats_total/cache_misses",
        "stats_total/cache_bypass_hits",
    ],
    "rw": [
        "writeback_rate",
        "writeback_rate_update_seconds",
        "cache_mode",
        "writeback_delay",
        "label",
        "writeback_running",
        "writeback_metadata",
        "running",
        "writeback_rate_p_term_inverse",
        "sequential_cutoff",
        "writeback_percent",
        "writeback_rate_d_term",
        "readahead"
    ],
    "w": [
        "stop",
        "clear_stats",
        "attach",
        "detach"
    ]
}
```

Note:
- 'r' interfaces are read-only
- 'w' interfaces are write-only (e.g. actions)
- 'rw' are interfaces that can both be read or written

```
salt.modules.sysfs.read(key, root="")

Read from SysFS

Parameters key – file or path in SysFS; if key is a list then root will be prefixed on each key
```
Returns the full (tree of) SysFS attributes under key

CLI example:

```
salt '*' sysfs.read class/net/em1/statistics
```

`salt.modules.sysfs.target(key, full=False)`
Return the basename of a SysFS key path

Parameters
- key – the location to resolve within SysFS
- full – full path instead of basename

Returns fullpath or basename of path

CLI example:

```
salt '*' sysfs.read class/ttyS0
```

`salt.modules.sysfs.write(key, value)`
Write a SysFS attribute/action

CLI example:

```
salt '*' sysfs.write devices/system/cpu/cpu0/cpufreq/scaling_governor == 'performance'
```

21.9.415 salt.modules.syslog_ng

Module for getting information about syslog-ng

- maintainer Tibor Benke <btibi@sch.bme.hu>
- maturity new
- depends cmd
- platform all

This module is capable of managing syslog-ng instances which were installed via a package manager or from source. Users can use a directory as a parameter in the case of most functions, which contains the syslog-ng and syslog-ng-ctl binaries.

Syslog-ng can be installed via a package manager or from source. In the latter case, the syslog-ng and syslog-ng-ctl binaries are not available from the PATH, so users should set location of the sbin directory with `syslog_ng.set_binary_path`.

Similarly, users can specify the location of the configuration file with `syslog_ng.set_config_file`, then the module will use it. If it is not set, syslog-ng uses the default configuration file.

```python
class salt.modules.syslog_ng.Argument(value="")
  A TypedParameterValue has one or more Arguments. For example this can be the value of key_file.

  Does not need examples.

build()
```

```python
class salt.modules.syslog_ng.Buildable(iterable, join_body_on=",", append_extra_newline=True)
  Base class of most classes, which have a build method.

  It contains a common build function.

  Does not need examples.
```
build()
Builds the textual representation of the whole configuration object with it’s children.

build_body()
Builds the body of a syslog-ng configuration object.

build_header()
Builds the header of a syslog-ng configuration object.

build_tail()
Builds the tail of a syslog-ng configuration object.

class salt.modules.syslog_ng.GivenStatement(value, add_newline=True)
This statement returns a string without modification. It can be used to use existing configuration snippets. Does not need examples.

build()
Builds the textual representation of the whole configuration object with it’s children.

class salt.modules.syslog_ng.NamedStatement(type, id=", options=None)
It represents a configuration statement, which has a name, e.g. a source.
Does not need examples.

class salt.modules.syslog_ng.Option(type=", params=None)
A Statement class contains Option instances.
An instance of Option can represent a file(), tcp(), udp(), etc. option.
Does not need examples.

add_parameter(param)

build()
Builds the textual representation of the whole configuration object with it’s children.

class salt.modules.syslog_ng.Parameter(iterable=None, join_body_on=")
An Option has one or more Parameter instances.
Does not need examples.

class salt.modules.syslog_ng.ParameterValue(iterable=None, join_body_on=")
A TypedParameter can have one or more values.
Does not need examples.

class salt.modules.syslog_ng.SimpleParameter(value=")
A Parameter is a SimpleParameter, if it’s just a simple type, like a string.

For example:

destination d_file {
    file(
        '/var/log/messages'
    );
}

'/var/log/messages' is a SimpleParameter.
Does not need examples.

build()
Builds the textual representation of the whole configuration object with it’s children.
class salt.modules.syslog_ng.SimpleParameterValue(value=``
A ParameterValue which holds a simple type, like a string or a number.

For example in ip(127.0.0.1) 127.0.0.1 is a SimpleParameterValue.

Does not need examples.

build()
    Builds the textual representation of the whole configuration object with it's children.

class salt.modules.syslog_ng.Statement(type, id=", options=None, has_name=True)
It represents a syslog-ng configuration statement, e.g. source, destination, filter.

Does not need examples.

add_child(option)
build_header()
    Builds the header of a syslog-ng configuration object.

build_tail()
    Builds the tail of a syslog-ng configuration object.

class salt.modules.syslog_ng.SyslogNgError
exception salt.modules.syslog_ng.

class salt.modules.syslog_ng.TypedParameter(type=", values=None)
A Parameter, which has a type:

destination d_tcp {
    tcp(
        ip(127.0.0.1)
    );
};

ip(127.0.0.1) is a TypedParameter.

Does not need examples.

add_value(value)
build()
    Builds the textual representation of the whole configuration object with it's children.

class salt.modules.syslog_ng.TypedParameterValue(type=", arguments=None)
We have to go deeper...

A TypedParameter can have a 'parameter', which also have a type. For example key_file and cert_file:

source demo_tls_source {
    tcp(
        ip(0.0.0.0)
        port(1999)
        tls(
            key_file('/opt/syslog-ng/etc/syslog-ng/key.d/syslog-ng.key')
            cert_file('/opt/syslog-ng/etc/syslog-ng/cert.d/syslog-ng.cert')
        )
    );
};

Does not need examples.

add_argument(arg)
**build()**

Builds the textual representation of the whole configuration object with its children.

```python
class salt.modules.syslog_ng.UnnamedStatement(type, options=None)
```

It represents a configuration statement, which doesn’t have a name, e.g. a log path.

Does not need examples.

```python
salt.modules.syslog_ng.config(name, config, write=True)
```

Builds syslog-ng configuration. This function is intended to be used from the state module, users should not use it directly!

- `name`: the id of the Salt document or it is the format of `<statement name>`.`id`
- `config`: the parsed YAML code
- `write`: if True, it writes the config into the configuration file, otherwise just returns it

CLI Example:

```bash
salt '*' syslog_ng.config name='s_local' config="[{'tcp': [{'ip':'127.0.0.1'}, {'port':1233}]}]
```

**salt.modules.syslog_ng.config_test(syslog_ng_sbin_dir=None, cfgfile=None)**

Runs syntax check against `cfgfile`. If `syslog_ng_sbin_dir` is specified, it is added to the PATH during the test.

CLI Example:

```bash
salt '*' syslog_ng.config_test
salt '*' syslog_ng.config_test /home/user/install/syslog-ng/sbin
salt '*' syslog_ng.config_test /home/user/install/syslog-ng/sbin /etc/syslog-ng/\n\n\nsyslog-ng.conf
```

**salt.modules.syslog_ng.get_config_file()**

Returns the configuration directory, which contains syslog-ng.conf.

CLI Example:

```bash
salt '*' syslog_ng.get_config_file
```

**salt.modules.syslog_ng.modules(syslog_ng_sbin_dir=None)**

Returns the available modules. If `syslog_ng_sbin_dir` is specified, it is added to the PATH during the execution of the command syslog-ng.

CLI Example:

```bash
salt '*' syslog_ng.modules
salt '*' syslog_ng.modules /home/user/install/syslog-ng/sbin
```

**salt.modules.syslog_ng.reload_(name)**

Reloads syslog-ng. This function is intended to be used from states.

If `syslog_ng.set_config_file`, is called before, this function will use the set binary path.

CLI Example:

```bash
salt '*' syslog_ng.reload
```

**salt.modules.syslog_ng.set_binary_path(name)**

Sets the path, where the syslog-ng binary can be found. This function is intended to be used from states.

If syslog-ng is installed via a package manager, users don’t need to use this function.

CLI Example:
**salt.modules.syslog_ng.set_binary_path**

Sets the configuration’s name. This function is intended to be used from states.

CLI Example:

```bash
salt '*' syslog_ng.set_binary_path name=/usr/sbin
```

**salt.modules.syslog_ng.set_config_file**

Sets the configuration’s name. This function is intended to be used from states.

CLI Example:

```bash
salt '*' syslog_ng.set_config_file name=/etc/syslog-ng
```

**salt.modules.syslog_ng.set_parameters**

Sets variables.

CLI Example:

```bash
salt '*' syslog_ng.set_parameters version='3.6'
salt '*' syslog_ng.set_parameters binary_path=/home/user/install/syslog-ng/sbin
  ->config_file=/home/user/install/syslog-ng/etc/syslog-ng.conf
```

**salt.modules.syslog_ng.start**

Ensures, that syslog-ng is started via the given parameters. This function is intended to be used from the state module.

Users shouldn’t use this function, if the service module is available on their system. If **syslog_ng.set_config_file** is called before, this function will use the set binary path.

CLI Example:

```bash
salt '*' syslog_ng.start
```

**salt.modules.syslog_ng.stats**

Returns statistics from the running syslog-ng instance. If syslog_ng_sbin_dir is specified, it is added to the PATH during the execution of the command syslog-ng-ctl.

CLI Example:

```bash
salt '*' syslog_ng.stats
salt '*' syslog_ng.stats /home/user/install/syslog-ng/sbin
```

**salt.modules.syslog_ng.stop**

Kills syslog-ng. This function is intended to be used from the state module.

Users shouldn’t use this function, if the service module is available on their system. If **syslog_ng.set_config_file** is called before, this function will use the set binary path.

CLI Example:

```bash
salt '*' syslog_ng.stop
```

**salt.modules.syslog_ng.version**

Returns the version of the installed syslog-ng. If syslog_ng_sbin_dir is specified, it is added to the PATH during the execution of the command syslog-ng.

CLI Example:
salt '*' syslog_ng.version
salt '*' syslog_ng.version /home/user/install/syslog-ng/sbin

salt.modules.syslog_ng.write_config(config, newlines=2)
Writes the given parameter config into the config file. This function is intended to be used from states.
If syslog-ng.set_config_file, is called before, this function will use the set config file.
CLI Example:
salt '*' syslog_ng.write_config config='# comment'

salt.modules.syslog_ng.write_version(name)
Removes the previous configuration file, then creates a new one and writes the name line. This function is intended to be used from states.
If syslog-ng.set_config_file, is called before, this function will use the set config file.
CLI Example:
salt '*' syslog_ng.write_version name='3.6'

21.9.416 salt.modules.sysmod

The sys module provides information about the available functions on the minion
salt.modules.sysmod.argspec(module='')
Return the argument specification of functions in Salt execution modules.
CLI Example:
salt '*' sys.argspec pkg.install
salt '*' sys.argspec sys
salt '*' sys.argspec

Module names can be specified as globs.
New in version 2015.5.0.
salt '*' sys.argspec 'pkg.*'

salt.modules.sysmod.doc('args')
Return the docstrings for all modules. Optionally, specify a module or a function to narrow the selection.
The strings are aggregated into a single document on the master for easy reading.
Multiple modules/functions can be specified.
CLI Example:
salt '*' sys.doc
salt '*' sys.doc sys
salt '*' sys.doc sys.doc
salt '*' sys.doc network.traceroute user.info

Modules can be specified as globs.
New in version 2015.5.0.
salt.modules.sysmod.list_functions(*args, **kwargs)
List the functions for all modules. Optionally, specify a module or modules from which to list.

CLI Example:
```
salt '*' sys.list_functions
salt '*' sys.list_functions sys
salt '*' sys.list_functions sys user
```

Function names can be specified as globs.

New in version 2015.5.0.
```
salt '*' sys.list_functions 'sys.list_*'
```

New in version ?.
```
salt '*' sys.list_functions 'module.specific_function'
```

salt.modules.sysmod.list_modules(*args)
List the modules loaded on the minion

New in version 2015.5.0.
```
salt '*' sys.list_modules
```

Module names can be specified as globs.
```
salt '*' sys.list_modules 's*'
```

salt.modules.sysmod.list_renderers(*args)
List the renderers loaded on the minion

New in version 2015.5.0.
```
salt '*' sys.list_renderers
```

Render names can be specified as globs.
```
salt '*' sys.list_renderers 'yaml*'
```

salt.modules.sysmod.list_returner_functions(*args, **kwargs)
List the functions for all returner modules. Optionally, specify a returner module or modules from which to list.

New in version 2014.7.0.
```
salt '*' sys.list_returner_functions
salt '*' sys.list_returner_functions mysql
salt '*' sys.list_returner_functions mysql etcd
```
Returner names can be specified as globs.
New in version 2015.5.0.

```
salt '*\*' sys.list_returner_functions 'sqlite3.get_*'
```

salt.modules.sysmod.list_returners(*args)
List the returners loaded on the minion
New in version 2014.7.0.
CLI Example:
```
salt '*\*' sys.list_returners
```

Returner names can be specified as globs.
New in version 2015.5.0.

```
salt '*\*' sys.list_returners 's*'
```

salt.modules.sysmod.list_runner_functions(*args, **kwargs)
List the functions for all runner modules. Optionally, specify a runner module or modules from which to list.
New in version 2014.7.0.
CLI Example:
```
salt '*\*' sys.list_runner_functions
salt '*\*' sys.list_runner_functions state
salt '*\*' sys.list_runner_functions state virt
```

Runner function names can be specified as globs.
New in version 2015.5.0.

```
salt '*\*' sys.list_runner_functions 'state.*' 'virt.*'
```

salt.modules.sysmod.list_runners(*args)
List the runners loaded on the minion
New in version 2014.7.0.
CLI Example:
```
salt '*\*' sys.list_runners
```

Runner names can be specified as globs.
New in version 2015.5.0.

```
salt '*\*' sys.list_runners 'm*'
```

salt.modules.sysmod.list_state_functions(*args, **kwargs)
List the functions for all state modules. Optionally, specify a state module or modules from which to list.
New in version 2014.7.0.
CLI Example:
State function names can be specified as globs.
New in version 2015.5.0.

```bash
salt '*' sys.list_state_functions 'file.*'
salt '*' sys.list_state_functions 'file.s*' 
```
New in version ?.

```bash
salt '*' sys.list_state_functions 'module.specific_function'
```

salt.modules.sysmod.list_state_modules
List the modules loaded on the minion
New in version 2014.7.0.

CLI Example:
```
salt '*' sys.list_state_modules
```
State module names can be specified as globs.
New in version 2015.5.0.

```bash
salt '*' sys.list_state_modules 'mysql_*'
```

salt.modules.sysmod.reload_modules
Tell the minion to reload the execution modules

CLI Example:
```
salt '*' sys.reload_modules
```

salt.modules.sysmod.renderer_doc
Return the docstrings for all renderers. Optionally, specify a renderer or a function to narrow the selection.
The strings are aggregated into a single document on the master for easy reading.
Multiple renderers can be specified.
New in version 2015.5.0.

CLI Example:
```
salt '*' sys.renderer_doc
salt '*' sys.renderer_doc cheetah
salt '*' sys.renderer_doc jinja json
```
Renderer names can be specified as globs.

```
salt '*' sys.renderer_doc 'c*' 'j*' 
```

salt.modules.sysmod.returner_argspec
Return the argument specification of functions in Salt returner modules.
New in version 2015.5.0.

CLI Example:
Returner names can be specified as globs.

```sh
salt '*' sys.returner_argspec 'sqlite3.*'
```

salt.modules.sysmod.returner_doc(\'args\')

Return the docstrings for all returners. Optionally, specify a returner or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple returners/functions can be specified.

New in version 2014.7.0.

CLI Example:

```sh
salt '*' sys.returner_doc sqlite3
salt '*' sys.returner_doc sqlite3.get_fun
salt '*' sys.returner_doc sqlite3.get_fun etcd.get_fun
```

Runner names can be specified as globs.

New in version 2015.5.0.

```sh
salt '*' sys.returner_doc 'sqlite3.get_*'
```

salt.modules.sysmod.runner_argspec(\'module=\')

Return the argument specification of functions in Salt runner modules.

New in version 2015.5.0.

CLI Example:

```sh
salt '*' sys.runner_argspec state
salt '*' sys.runner_argspec http
salt '*' sys.runner_argspec
```

Runner names can be specified as globs.

```sh
salt '*' sys.runner_argspec 'winrepo.*'
```

salt.modules.sysmod.runner_doc(\'args\')

Return the docstrings for all runners. Optionally, specify a runner or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple runners/functions can be specified.

New in version 2014.7.0.

CLI Example:

```sh
salt '*' sys.runner_doc cache
salt '*' sys.runner_doc cache.grains
salt '*' sys.runner_doc cache.grains mine.get
```
Runner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.runner_doc 'cache.clear_*'
```

```
salt.modules.sysmod.state_argspec(module=“”)
Return the argument specification of functions in Salt state modules.
New in version 2015.5.0.
CLI Example:
```
salt '*' sys.state_argspec pkg.installed
salt '*' sys.state_argspec file
salt '*' sys.state_argspec
```

State names can be specified as globs.

```
salt '*' sys.state_argspec 'pkg.*'
```

```
salt.modules.sysmod.state_doc(*args)
Return the docstrings for all states. Optionally, specify a state or a function to narrow the selection.
The strings are aggregated into a single document on the master for easy reading.
Multiple states/functions can be specified.
New in version 2014.7.0.
CLI Example:
```
salt '*' sys.state_doc
salt '*' sys.state_doc service
salt '*' sys.state_doc service.running
salt '*' sys.state_doc service.running ipables.append
```

State names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.state_doc 'service.*' 'iptables.*'
```

```
salt.modules.sysmod.state_schema(module=“”)
Return a JSON Schema for the given state function(s)
New in version 2016.3.0.
CLI Example:
```
salt '*' sys.state_schema
salt '*' sys.state_schema pkg.installed
```

```
salt.modules.sysrc
sysrc module for FreeBSD
salt.modules.sysrc.get(**kwargs)
Return system rc configuration variables
CLI Example:
```

**21.9.417 salt.modules.sysrc**

sysrc module for FreeBSD

```
salt.modules.sysrc.get(**kwargs)
Return system rc configuration variables
CLI Example:
```

**21.9. execution modules**
**21.9.418 salt.modules.system**

Support for reboot, shutdown, etc on POSIX-like systems.

Note: If you have configured a wrapper such as molly-guard to intercept interactive shutdown commands, be aware that calling `system.halt`, `system.poweroff`, `system.reboot`, and `system.shutdown` with `salt-call` will hang indefinitely while the wrapper script waits for user input. Calling them with `salt` will work as expected.

**salt.modules.system.get_computer_desc()**

Get PRETTY_HOSTNAME value stored in /etc/machine-info If this file doesn’t exist or the variable doesn’t exist return False.

- **Returns**: Value of PRETTY_HOSTNAME if this does not exist False.
- **Return type**: str

CLI Example:

```
salt '*' system.get_computer_desc
```

**salt.modules.system.get_computer_name()**

Get hostname.

CLI Example:

```
salt '*' network.get_hostname
```

**salt.modules.system.get_reboot_required_witnessed()**

Determine if at any time during the current boot session the salt minion witnessed an event indicating that a reboot is required.

- **Returns**: True if the a reboot request was witnessed, False otherwise
- **Return type**: bool

CLI Example:

```
salt '*' system.get_reboot_required_witnessed
```

**salt.modules.system.get_system_date(utc_offset=None)**

Get the system date

- **Parameters**
  - **utc_offset** *(str)* – The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of
UTC use ”+0000”. Note: if being passed through the command line will need to be quoted twice to allow negative offsets.

Returns Returns the system date.
Return type str

CLI Example:

```
salt '*' system.get_system_date
```

salt.modules.system.get_system_date_time(utc_offset=None)
Get the system date/time.

Parameters utc_offset (str) – The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use ”+0000”. Note: if being passed through the command line will need to be quoted twice to allow negative offsets.

Returns Returns the system time in YYYY-MM-DD hh:mm:ss format.
Return type str

CLI Example:

```
salt '*' system.get_system_date_time '-0500'
```

salt.modules.system.get_system_time(utc_offset=None)
Get the system time.

Parameters utc_offset (str) – The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use ”+0000”. Note: if being passed through the command line will need to be quoted twice to allow negative offsets.

Returns Returns the system time in HH:MM:SS AM/PM format.
Return type str

CLI Example:

```
salt '*' system.get_system_time
```

salt.modules.system.halt()
Halt a running system

CLI Example:

```
salt '*' system.halt
```

salt.modules.system.has_settable_hwclock()
Returns True if the system has a hardware clock capable of being set from software.

CLI Example:

```
salt '*' system.has_settable_hwclock
```

salt.modules.system.init(runlevel)
Change the system runlevel on sysV compatible systems

CLI Example:

```
salt '*' system.init 3
```

salt.modules.system.poweroff()
Poweroff a running system

CLI Example:
salt '*' system.poweroff

salt.modules.system.reboot(at_time=None)
Reboot the system
  at_time  The wait time in minutes before the system will be rebooted.
  CLI Example:
salt '*' system.reboot

salt.modules.system.set_computer_desc(desc)
Set PRETTY_HOSTNAME value stored in /etc/machine-info This will create the file if it does not exist. If it is
unable to create or modify this file returns False.
  Parameters  desc (str) – The computer description
  Returns  False on failure. True if successful.
  CLI Example:
salt '*' system.set_computer_desc "Michael's laptop"

salt.modules.system.set_computer_name(hostname)
Modify hostname.
  CLI Example:
salt '*' system.set_computer_name master.saltstack.com

salt.modules.system.set_reboot_required_witnessed()
This function is used to remember that an event indicating that a reboot is required was witnessed. This
function writes to a temporary filesystem so the event gets cleared upon reboot.
  Returns  True if successful, otherwise False
  Return type  bool

salt.modules.system.set_system_date(newdate, utc_offset=None)
Set the system date. Use <mm-dd-yy> format for the date.
  Parameters  newdate (str) – The date to set. Can be any of the following formats:
    • YYYY-MM-DD
    • MM-DD-YYYY
    • MM-DD-YY
    • MM/DD/YYYY
    • MM/DD/YY
    • YYYY/MM/DD
  CLI Example:
salt '*' system.set_system_date '03-28-13'

salt.modules.system.set_system_date_time(years=None, months=None, days=None, hours=None, minutes=None, seconds=None, utc_offset=None)
Set the system date and time. Each argument is an element of the date, but not required. If an element is not
passed, the current system value for that element will be used. For example, if you don’t pass the year, the
current system year will be used. (Used by set_system_date and set_system_time)
  Updates hardware clock, if present, in addition to software (kernel) clock.
  Parameters
    • years (int) – Years digit, ie: 2015
**Months** *(int)* – Months digit: 1 - 12
**Days** *(int)* – Days digit: 1 - 31
**Hours** *(int)* – Hours digit: 0 - 23
**Minutes** *(int)* – Minutes digit: 0 - 59
**Seconds** *(int)* – Seconds digit: 0 - 59

**utc_offset** *(str)* – The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use ”+0000”. Note: if being passed through the command line will need to be quoted twice to allow negative offsets.

Returns: True if successful. Otherwise False.
Return type: bool

CLI Example:
salt '*' system.set_system_date_time 2015 5 12 11 37 53 '-0500'

salt.modules.system.set_system_time(*newtime*, **utc_offset**=None)
Set the system time.
Parameters:
- **newtime** *(str)* – The time to set. Can be any of the following formats. - HH:MM:SS AM/PM - HH:MM AM/PM - HH:MM:SS (24 hour) - HH:MM (24 hour)
  Note that the salt command line parser parses the date/time before we obtain the argument (preventing us from doing utc) Therefore the argument must be passed in as a string. Meaning you may have to quote the text twice from the command line.
- **utc_offset** *(str)* – The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use ”+0000”. Note: if being passed through the command line will need to be quoted twice to allow negative offsets.

Returns: Returns True if successful. Otherwise False.
Return type: bool

CLI Example:
salt '*' system.set_system_time "11:20"

salt.modules.system.shutdown(*at_time**=None)
Shutdown a running system
at_time The wait time in minutes before the system will be shutdown.

CLI Example:
salt '*' system.shutdown 5

21.9.419 salt.modules.system_profiler

System Profiler Module

Interface with macOS’s command-line System Profiler utility to get information about package receipts and installed applications.

New in version 2015.5.0.

salt.modules.system_profiler.applications()
Return the results of a call to system_profiler -xml -detail full SPApplicationsDataType as a dictionary. Top-level keys of the dictionary are the names of each set of install receipts, since there can be multiple receipts with the same name. Contents of each key are a list of dictionaries.
Note that this can take a long time depending on how many applications are installed on the target Mac.

CLI Example:
```
salt '*' systemprofiler.applications
```

```
salt.modules.system_profiler.receipts()
```
Return the results of a call to `system_profiler -xml -detail full SPInstallHistoryDataType as a dictionary. Top-level keys of the dictionary are the names of each set of install receipts, since there can be multiple receipts with the same name. Contents of each key are a list of dictionaries.

CLI Example:
```
salt '*' systemprofiler.receipts
```

### 21.9.420 salt.modules.systemd_service

Provides the service module for systemd

New in version 0.10.0.

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to 'service.start’ is not available), see [here](#).

```
salt.modules.systemd_service.available(name)
```
New in version 0.10.4.

Check that the given service is available taking into account template units.

CLI Example:
```
salt '*' service.available sshd
```

```
salt.modules.systemd_service.disable(name, no_block=False, **kwargs)
```
Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon’s control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a config option called `systemd.scope`, with a value of False (no quotes).

Disable the named service to not start when the system boots

**no_block** [False] Set to True to start the service using `--no-block`.

New in version 2017.7.0.

CLI Example:
```
salt '*' service.disable <service name>
```

```
salt.modules.systemd_service.disabled(name)
```
Return if the named service is disabled from starting on boot

CLI Example:
```
salt '*' service.disabled <service name>
```
Salt Documentation, Release 2019.2.0

salt.modules.systemd_service.enable(name, no_block=False, unmask=False, unmask_runtime=False, **kwargs)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the salt-minion daemon’s control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Enable the named service to start when the system boots

no_block [False] Set to True to start the service using --no-block.

New in version 2017.7.0.

unmask [False] Set to True to remove an indefinite mask before attempting to enable the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before enabling. This behavior is no longer the default.

unmask_runtime [False] Set to True to remove a runtime mask before attempting to enable the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before enabling. This behavior is no longer the default.

CLI Example:

salt '*' service.enable <service name>

salt.modules.systemd_service.enabled(name, **kwargs)

Return if the named service is enabled to start on boot

CLI Example:

salt '*' service.enabled <service name>

salt.modules.systemd_service.execs()

New in version 2014.7.0.

Return a list of all files specified as ExecStart for all services.

CLI Example:

salt '*' service.execs

salt.modules.systemd_service.force_reload(name, no_block=True, unmask=False, unmask_runtime=False)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the salt-minion daemon’s control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

New in version 0.12.0.

Force-reload the specified service with systemd

no_block [False] Set to True to start the service using --no-block.

New in version 2017.7.0.

unmask [False] Set to True to remove an indefinite mask before attempting to force-reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before force-reloading. This behavior is no longer the default.

unmask_runtime [False] Set to True to remove a runtime mask before attempting to force-reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before force-reloading. This behavior is no longer the default.
CLI Example:

```
salt '*' service.force_reload <service name>
```

```python
salt.modules.systemd_service.get_all()
```
 Return a list of all available services

CLI Example:

```
salt '*' service.get_all
```

```python
salt.modules.systemd_service.get_disabled()
```
 Return a list of all disabled services

CLI Example:

```
salt '*' service.get_disabled
```

```python
salt.modules.systemd_service.get_enabled()
```
 Return a list of all enabled services

CLI Example:

```
salt '*' service.get_enabled
```

```python
salt.modules.systemd_service.get_running()
```
 Return a list of all running services, so far as systemd is concerned

CLI Example:

```
salt '*' service.get_running
```

```python
salt.modules.systemd_service.get_static()
```
 New in version 2015.8.5.
 Return a list of all static services

CLI Example:

```
salt '*' service.get_static
```

```python
salt.modules.systemd_service.mask(name, runtime=False)
```
 New in version 2015.8.5.
 Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, **systemd-run(1)** is now used to isolate commands run by this function from the salt-minion daemon’s control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of **systemd-run(1)** can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

 Mask the specified service with systemd

 **runtime** [False] Set to True to mask this service only until the next reboot

 New in version 2015.8.5.

 CLI Example:

```python
salt '*' service.mask foo
salt '*' service.mask foo runtime=True
```
salt.modules.systemd_service.masked(name, runtime=False)

New in version 2015.8.0.

Changed in version 2015.8.5: The return data for this function has changed. If the service is masked, the return value will now be the output of the systemctl is-enabled command (so that a persistent mask can be distinguished from a runtime mask). If the service is not masked, then False will be returned.

Changed in version 2017.7.0: This function now returns a boolean telling the user whether a mask specified by the new runtime argument is set. If runtime is False, this function will return True if an indefinite mask is set for the named service (otherwise False will be returned). If runtime is False, this function will return True if a runtime mask is set, otherwise False.

Check whether or not a service is masked

runtime [False] Set to True to check for a runtime mask

New in version 2017.7.0: In previous versions, this function would simply return the output of systemctl is-enabled when the service was found to be masked. However, since it is possible to both have both indefinite and runtime masks on a service simultaneously, this function now only checks for runtime masks if this argument is set to True. Otherwise, it will check for an indefinite mask.

CLI Examples:

```bash
salt '*' service.masked foo
salt '*' service.masked foo runtime=True
```

salt.modules.systemd_service.missing(name)

New in version 2014.1.0.

The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.

CLI Example:

```bash
salt '*' service.missing sshd
```

salt.modules.systemd_service.reload_(name, no_block=False, unmask=False, unmask_runtime=False)

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemctl(1) is now used to isolate commands run by this function from the salt-minion daemon’s control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of systemctl(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Reload the specified service with systemd

no_block [False] Set to True to reload the service using --no-block.

New in version 2017.7.0.

unmask [False] Set to True to remove an indefinite mask before attempting to reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before reloading. This behavior is no longer the default.

unmask_runtime [False] Set to True to remove a runtime mask before attempting to reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before reloading. This behavior is no longer the default.

CLI Example:

```bash
salt '*' service.reload <service name>
```
salt.modules.systemd_service.restart(name, no_block=False, unmask=False, unmask_runtime=False)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the salt-minion daemon’s control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Restart the specified service with systemd

no_block [False] Set to True to start the service using --no-block.

New in version 2017.7.0.

unmask [False] Set to True to remove an indefinite mask before attempting to restart the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before restarting. This behavior is no longer the default.

unmask_runtime [False] Set to True to remove a runtime mask before attempting to restart the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before restarting. This behavior is no longer the default.

CLI Example:

```
salt '*' service.restart <service name>
```

salt.modules.systemd_service.show(name)

New in version 2014.7.0.

Show properties of one or more units/jobs or the manager

CLI Example:

```
salt '*' service.show <service name>
```

salt.modules.systemd_service.start(name, no_block=False, unmask=False, unmask_runtime=False)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the salt-minion daemon’s control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Start the specified service with systemd

no_block [False] Set to True to start the service using --no-block.

New in version 2017.7.0.

unmask [False] Set to True to remove an indefinite mask before attempting to start the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before restarting. This behavior is no longer the default.

unmask_runtime [False] Set to True to remove a runtime mask before attempting to start the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before starting. This behavior is no longer the default.

CLI Example:

```
salt '*' service.start <service name>
```

salt.modules.systemd_service.status(name, sig=None)

Return the status for a service via systemd. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)
Parameters

- **name** *(str)* – The name of the service to check
- **sig** *(str)* – Not implemented

Returns

True if running, False otherwise
dict: Maps service name to True if running, False otherwise

**Return type:** bool

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

**salt.modules.systemd_service**

**stop**(name, no_block=False)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the salt-minion daemon’s control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Stop the specified service with systemd

**no_block** [False] Set to True to start the service using --no-block.

New in version 2017.7.0.

CLI Example:

```
salt '*' service.stop <service name>
```

**systemctl_reload**

New in version 0.15.0.

Reloads systemctl, an action needed whenever unit files are updated.

CLI Example:

```
salt '*' service.systemctl_reload
```

**unmask_**(name, runtime=False)

New in version 2015.5.0.

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the salt-minion daemon’s control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Unmask the specified service with systemd

**runtime** [False] Set to True to unmask this service only until the next reboot

New in version 2017.7.0: In previous versions, this function would remove whichever mask was identified by running systemctl is-enabled on the service. However, since it is possible to both have both indefinite and runtime masks on a service simultaneously, this function now removes a runtime mask only when this argument is set to True, and otherwise removes an indefinite mask.

CLI Example:

```
salt '*' service.unmask foo
salt '*' service.unmask foo runtime=True
```

21.9.421 salt.modules.telegram

Module for sending messages via Telegram.
configuration In order to send a message via the Telegram, certain configuration is required in 
/etc/salt/minion on the relevant minions or in the pillar. Some sample configs might look like:

```
telegram.chat_id: '123456789'
television.token: '00000000:xxxxxxxxxxxxxxxxxxxxxxxxxx'
```

salt.modules.telegram.post_message(message, chat_id=None, token=None)
Send a message to a Telegram chat.

Parameters

- **message** – The message to send to the Telegram chat.
- **chat_id** – (optional) The Telegram chat id.
- **token** – (optional) The Telegram API token.

Returns Boolean if message was sent successfully.

CLI Example:

```
salt '*' telegram.post_message message="Hello Telegram!"
```

21.9.422 salt.modules.telemetry

Connection module for Telemetry

New in version 2016.3.0.

https://github.com/mongolab/mongolab-telemetry-api-docs/blob/master/alerts.md

configuration This module accepts explicit telemetry credentials or can also read api key credentials

In the minion’s config file:

```
telemetry.telemetry_api_keys:
    - abc123   # Key 1
    - efg321   # Backup Key 1

telemetry_api_base_url: https://telemetry-api.mongolab.com/v0
```

depends requests

salt.modules.telemetry.create_alarm(deployment_id, metric_name, data, api_key=None, profile='telemetry')
create an telemetry alarms.
data is a dict of alert configuration data.
Returns (bool success, str message) tuple.

CLI Example:
salt myminion telemetry.create_alarm rs-ds033197 {} profile=telemetry

salt.modules.telemetry.delete_alarms(deployment_id, alert_id=None, metric_name=None, api_key=None, profile='telemetry')
delete an alert specified by alert_id or if not specified blows away all the alerts in the current deployment.
Returns (bool success, str message) tuple.

CLI Example:
salt myminion telemetry.delete_alarms rs-ds033197 profile=telemetry

salt.modules.telemetry.get_alarms(deployment_id, profile='telemetry')
get all the alarms set up against the current deployment

Returns dictionary of alarm information
CLI Example:
   salt myminion telemetry.get_alarms rs-ds033197 profile=telemetry

```
salt.modules.telemetry.get_alert_config(deployment_id, metric_name=None, api_key=None, profile='telemetry')
```

Get all alert definitions associated with a given deployment or if metric_name is specified, obtain the specific alert config

Returns dictionary or list of dictionaries.

CLI Example:
   salt myminion telemetry.get_alert_config rs-ds033197 currentConnections profile=telemetry
   salt myminion telemetry.get_alert_config rs-ds033197 profile=telemetry

```
salt.modules.telemetry.get_notification_channel_id(notify_channel, profile='telemetry')
```

Given an email address, creates a notification-channels if one is not found and also returns the corresponding notification channel id.

- **notify_channel**: Email escalation policy
- **profile**: A dict of telemetry config information.

CLI Example:
   salt myminion telemetry.get_notification_channel_id userx@company.com profile=telemetry

```
salt.modules.telemetry.update_alarm(deployment_id, metric_name, data, api_key=None, profile='telemetry')
```

update an telemetry alarms. data is a dict of alert configuration data.

Returns (bool success, str message) tuple.

CLI Example:
   salt myminion telemetry.update_alarm rs-ds033197 {} profile=telemetry

---

### 21.9.423 salt.modules.temp

Simple module for creating temporary directories and files

This is a thin wrapper around Pythons tempfile module

New in version 2015.8.0.

```
salt.modules.temp.dir(suffix='', prefix='tmp', parent=None)
```

Create a temporary directory

CLI Example:

```bash
salt '*' temp.dir
salt '*' temp.dir prefix='mytemp-' parent='/var/run/'
```

```
salt.modules.temp.file(suffix='', prefix='tmp', parent=None)
```

Create a temporary file

CLI Example:

```bash
salt '*' temp.file
salt '*' temp.file prefix='mytemp-' parent='/var/run/'
```

---

### 21.9.424 salt.modules.test

Module for running arbitrary tests
salt.modules.test.arg(*args, **kwargs)
Print out the data passed into the function *args and `kwargs, this is used to both test the publication data and cli argument passing, but also to display the information available within the publication data. Returns {"args": args, "kwargs": kwargs}.

CLI Example:
```
salt '*' test.arg 1 "two" 3.1 txt="hello" wow='{a: 1, b: "hello"}'
```

salt.modules.test.arg_clean(*args, **kwargs)
Like test.arg but cleans kwargs of the __pub* items CLI Example:
```
salt '*' test.arg_clean 1 "two" 3.1 txt="hello" wow='{a: 1, b: "hello"}'
```

salt.modules.test.arg_repr(*args, **kwargs)
Print out the data passed into the function *args and `kwargs, this is used to both test the publication data and cli argument passing, but also to display the information available within the publication data. Returns {"args": repr(args), "kwargs": repr(kwargs)}.

CLI Example:
```
salt '*' test.arg_repr 1 "two" 3.1 txt="hello" wow='{a: 1, b: "hello"}'
```

salt.modules.test.arg_type(*args, **kwargs)
Print out the types of the args and kwargs. This is used to test the types of the args and kwargs passed down to the minion

CLI Example:
```
salt '*' test.arg_type 1 'int'
```

salt.modules.test.assertion(assertion)
Assert the given argument

CLI Example:
```
salt '*' test.assertion False
```

salt.modules.test.attr_call()
Call grains.items via the attribute

CLI Example:
```
salt '*' test.attr_call
```

salt.modules.test.collatz(start)
Execute the collatz conjecture from the passed starting number, returns the sequence and the time it took to compute. Used for performance tests.

CLI Example:
```
salt '*' test.collatz 3
```

salt.modules.test.conf_test()
Return the value for test.foo in the minion configuration file, or return the default value

CLI Example:
salt '*' test.conf_test

salt.modules.test.cross_test(func, args=None)
    Execute a minion function via the __salt__ object in the test module, used to verify that the minion functions can be called via the __salt__ module.
    CLI Example:
    ```
salt '*' test.cross_test file.gid_to_group 0
    ```

salt.modules.test.echo(text)
    Return a string - used for testing the connection
    CLI Example:
    ```
salt '*' test.echo 'foo bar baz quo qux'
    ```

salt.modules.test.exception(message='Test Exception')
    Raise an exception
    Optionally provide an error message or output the full stack.
    CLI Example:
    ```
salt '*' test.exception 'Oh noes!'"'
    ```

salt.modules.test.false_()
    Always return False
    CLI Example:
    ```
salt '*' test.false
    ```

salt.modules.test.fib(num)
    Return the num-th Fibonacci number, and the time it took to compute in seconds. Used for performance tests.
    This function is designed to have terrible performance.
    CLI Example:
    ```
salt '*' test.fib 3
    ```

salt.modules.test.get_opts()
    Return the configuration options passed to this minion
    CLI Example:
    ```
salt '*' test.get_opts
    ```

salt.modules.test.kwarg(**kwargs)
    Print out the data passed into the function **kwargs, this is used to both test the publication data and cli kwarg passing, but also to display the information available within the publication data.
    CLI Example:
    ```
salt '*' test.kwarg num=1 txt="two" env={'a: 1, b: "hello"'}
    ```

salt.modules.test.missing_func()
salt.modules.test.module_report()
Return a dict containing all of the execution modules with a report on the overall availability via different references

CLI Example:
```
salt '*' test.module_report
```

salt.modules.test.not_loaded()
List the modules that were not loaded by the salt loader system

CLI Example:
```
salt '*' test.not_loaded
```

salt.modules.test.opts_pkg()
Return an opts package with the grains and opts for this minion. This is primarily used to create the options used for master side state compiling routines

CLI Example:
```
salt '*' test.opts_pkg
```

salt.modules.test.outputter(data)
Test the outputter, pass in data to return

CLI Example:
```
salt '*' test.outputter foobar
```

salt.modules.test.ping()
Used to make sure the minion is up and responding. Not an ICMP ping.

Returns True.

CLI Example:
```
salt '*' test.ping
```

salt.modules.test.provider(module)
Pass in a function name to discover what provider is being used

CLI Example:
```
salt '*' test.provider service
```

salt.modules.test.providers()
Return a dict of the provider names and the files that provided them

CLI Example:
```
salt '*' test.providers
```

salt.modules.test.raise_exception(name, *args, **kwargs)
Raise an exception. Built-in exceptions and those in salt.exceptions can be raised by this test function. If no matching exception is found, then no exception will be raised and this function will return False.

This function is designed to test Salt’s exception and return code handling.

CLI Example:
salt '§' test.raise_exception TypeError "An integer is required"
salt '§' test.raise_exception salt.exceptions.CommandExecutionError "Something went wrong"

```
salt.modules.test.rand_sleep(max=60)
  Sleep for a random number of seconds, used to test long-running commands and minions returning at differing intervals
  CLI Example:
  salt '*' test.rand_sleep 60
```

```
salt.modules.test.random_hash(size=9999999999, hash_type=None)
  New in version 2015.5.2.
  Changed in version 2018.3.0: Function has been renamed from test.rand_str to test.random_hash
  Generates a random number between 1 and size, then returns a hash of that number. If no hash_type is passed, the hash_type specified by the minion’s hash_type config option is used.
  CLI Example:
  salt '*' test.random_hash
  salt '*' test.random_hash hash_type=sha512
```

```
salt.modules.test.retc ode(code=42)
  Test that the returncode system is functioning correctly
  CLI Example:
  salt '*' test.retc ode 42
```

```
salt.modules.test.sleep(length)
  Instruct the minion to initiate a process that will sleep for a given period of time.
  CLI Example:
  salt '*' test.sleep 20
```

```
salt.modules.test.stack()
  Return the current stack trace
  CLI Example:
  salt '*' test.stack
```

```
salt.modules.test.true_()
  Always return True
  CLI Example:
  salt '*' test.true
```

```
salt.modules.test.try_(module, return_try_exception=False, **kwargs)
  Try to run a module command. On an exception return None. If return_try_exception is set True return the exception. This can be helpful in templates where running a module might fail as expected.
  CLI Example:
```
salt.modules.test.tty('args, **kwargs')
  Deprecated! Moved to cmdmod.

  CLI Example:

  ```
salt '*' test.tty tty0 'This is a test'
salt '*' test.tty pts3 'This is a test'
```

salt.modules.test.version()
  Return the version of salt on the minion
  CLI Example:

  ```
salt '*' test.version
```

salt.modules.test.versions()
  This function is an alias of versions_report.
  Returns versions of components used by salt
  CLI Example:

  ```
salt '*' test.versions_report
```

salt.modules.test.versions_information()
  Report the versions of dependent and system software
  CLI Example:

  ```
salt '*' test.versions_information
```

salt.modules.test.versions_report()
  Returns versions of components used by salt
  CLI Example:

  ```
salt '*' test.versions_report
```

### 21.9.425 salt.modules.testinframod module

This module exposes the functionality of the TestInfra library for use with SaltStack in order to verify the state of your minions. In order to allow for the addition of new resource types in TestInfra this module dynamically generates wrappers for the various resources by iterating over the values in the `__all__` variable exposed by the testinfra.modules namespace.

### 21.9.426 salt.modules.test_virtual

Module for running arbitrary tests with a `__virtual__` function

salt.modules.test_virtual.ping()
21.9.427 salt.modules.textfsm_mod module

TextFSM

New in version 2018.3.0.

Execution module that processes plain text and extracts data using TextFSM templates. The output is presented in JSON serializable data, and can be easily re-used in other modules, or directly inside the renderer (Jinja, Mako, Genshi, etc.).

depends

• textfsm Python library

Note: For Python 2/3 compatibility, it is more recommended to install the jtextfsm library: pip install jtextfsm.

salt.modules.textfsm_mod.extract(template_path, raw_text=None, raw_text_file=None, saltenv='base')

Extracts the data entities from the unstructured raw text sent as input and returns the data mapping, processing using the TextFSM template.

template_path  The path to the TextFSM template. This can be specified using the absolute path to the file, or using one of the following URL schemes:

• salt://, to fetch the template from the Salt fileserver.
• http:// or https://
• ftp://
• s3://
• swift://

raw_text: None  The unstructured text to be parsed.

raw_text_file: None  Text file to read, having the raw text to be parsed using the TextFSM template. Supports the same URL schemes as the template_path argument.

saltenv: base  Salt fileserv envrionment from which to retrieve the file. Ignored if template_path is not a salt:// URL.

CLI Example:

salt '*' textfsm.extract salt://textfsm/juniper_version_template raw_text=s3://junos_ver.txt
salt '*' textfsm.extract http://some-server/textfsm/juniper_version_template raw_text='Hostname: router.abc ... snip ...

Jinja template example:

{% set raw_text = 'Hostname: router.abc ... snip ...
{%- set textfsm_extract = salt.textfsm.extract('https://some-server/textfsm/
  juniper_version_template', raw_text) %}

Raw text example:

Hostname: router.abc
Model: mx960
JUNOS Base OS boot [9.1S3.5]
JUNOS Base OS Software Suite [9.1S3.5]
JUNOS Kernel Software Suite [9.1S3.5]
JUNOS Crypto Software Suite [9.1S3.5]
JUNOS Packet Forwarding Engine Support (M/T Common) [9.1S3.5]
TextFSM Example:

```
Value Chassis (\S+)
Value Required Model (\S+)
Value Boot (.*)
Value Base (.*
Value Kernel (.*
Value Crypto (.*
Value Documentation (.*
Value Routing (.*

Start
# Support multiple chassis systems.
^\S+:$$ -> Continue.Record
^${Chassis}:$$
^Model: ${Model}
^JUNOS Base OS boot \[${Boot}\]
^JUNOS Software Release \[${Base}\]
^JUNOS Base OS Software Suite \[${Base}\]
^JUNOS Kernel Software Suite \[${Kernel}\]
^JUNOS Crypto Software Suite \[${Crypto}\]
^JUNOS Online Documentation \[${Documentation}\]
^JUNOS Routing Software Suite \[${Routing}\]
```

Output example:

```
{
    "comment": "",
    "result": true,
    "out": [
        {
            "kernel": "9.1S3.5",
            "documentation": "9.1S3.5",
            "boot": "9.1S3.5",
            "crypto": "9.1S3.5",
            "chassis": "",
            "routing": "9.1S3.5",
            "base": "9.1S3.5",
            "model": "mx960"
        }
    ]
}
```

```
salt.modules.textfsm_mod.index(command, platform=None, platform_grain_name=None, platform_column_name=None, output=None, output_file=None, textfsm_path=None, index_file=None, saltenv='base', include_empty=False, include_pat=None, exclude_pat=None)
```

Dynamically identify the template required to extract the information from the unstructured raw text.

The output has the same structure as the `extract` execution function, the difference being that `index` is capable to identify what template to use, based on the platform details and the `command`.

**command** The command executed on the device, to get the output.

**platform** The platform name, as defined in the TextFSM index file.
Note: For ease of use, it is recommended to define the TextFSM index file with values that can be matches using the grains.

**platform_grain_name** The name of the grain used to identify the platform name in the TextFSM index file.

Note: This option can be also specified in the minion configuration file or pillar as `textfsm_platform_grain`.

Note: This option is ignored when `platform` is specified.

**platform_column_name**: *Platform* The column name used to identify the platform, exactly as specified in the TextFSM index file. Default: *Platform*.

Note: This is field is case sensitive, make sure to assign the correct value to this option, exactly as defined in the index file.

Note: This option can be also specified in the minion configuration file or pillar as `textfsm_platform_column_name`.

**output** The raw output from the device, to be parsed and extract the structured data.

**textfsm_path** The path where the TextFSM templates can be found. This can be either absolute path on the server, either specified using the following URL schemes: `file://`, `salt://`, `http://`, `https://`, `ftp://`, `s3://`, `swift://`.

Note: This needs to be a directory with a flat structure, having an index file (whose name can be specified using the `index_file` option) and a number of TextFSM templates.

Note: This option can be also specified in the minion configuration file or pillar as `textfsm_path`.

**index_file**: *index* The name of the TextFSM index file, under the `textfsm_path`. Default: *index*.

Note: This option can be also specified in the minion configuration file or pillar as `textfsm_index_file`.

**saltenv**: *base* Salt fileserver environment from which to retrieve the file. Ignored if `textfsm_path` is not a salt:// URL.

**include_empty**: *False* Include empty files under the `textfsm_path`.

**include_pat** Glob or regex to narrow down the files cached from the given path. If matching with a regex, the regex must be prefixed with `E@`, otherwise the expression will be interpreted as a glob.

**exclude_pat** Glob or regex to exclude certain files from being cached from the given path. If matching with a regex, the regex must be prefixed with `E@`, otherwise the expression will be interpreted as a glob.

Note: If used with `include_pat`, files matching this pattern will be excluded from the subset of files
defined by include_pat.

CLI Example:

```
salt '*' textfsm.index 'sh ver' platform=Juniper output_file=salt://textfsm/juniper_version_example
textfsm_path=ftp://textfsm/ platform_column_name=Vendor
```

TextFSM index file example:
```
salt://textfsm/index
```

```
Template, Hostname, Vendor, Command
juniper_version_template, .*, Juniper, sh[[ow]] ve[[rsion]]
```

The usage can be simplified, by defining (some of) the following options: `textfsm_platform_grain`, `textfsm_path`, `textfsm_platform_column_name`, or `textfsm_index_file`, in the (proxy) minion configuration file or pillar.

Configuration example:
```
textfsm_platform_grain: vendor
textfsm_path: salt://textfsm/
textfsm_platform_column_name: Vendor
```

And the CLI usage becomes as simple as:
```
salt '*' textfsm.index 'sh ver' output_file=salt://textfsm/juniper_version_example
```

Usage inside a Jinja template:
```
{% set command = 'sh ver' -%
{% set output = salt.net.cli(command) -%
{% set textfsm_extract = salt.textfsm.index(command, output=output) -%
```

21.9.428 salt.modules.timezone

Module for managing timezone on POSIX-like systems.

salt.modules.timezone.get_hwclock()  Get current hardware clock setting (UTC or localtime)

CLI Example:
```
salt '*' timezone.get_hwclock
```

salt.modules.timezone.get_offset()  Get current numeric timezone offset from UCT (i.e. -0700)

CLI Example:
```
salt '*' timezone.get_offset
```
salt.modules.timezone.get_zone()
Get current timezone (i.e. America/Denver)
Changed in version 2016.11.4.

Note: On AIX operating systems, Posix values can also be returned 'CST6CDT,M3.2.0/2:00:00,M11.1.0/2:00:00'

CLI Example:
salt '*' timezone.get_zone

salt.modules.timezone.get_zonecode()
Get current timezone (i.e. PST, MDT, etc)
CLI Example:
salt '*' timezone.get_zonecode

salt.modules.timezone.set_hwclock(clock)
Sets the hardware clock to be either UTC or localtime
CLI Example:
salt '*' timezone.set_hwclock UTC

salt.modules.timezone.set_zone(timezone)
Unlinks, then symlinks /etc/localtime to the set timezone.
The timezone is crucial to several system processes, each of which SHOULD be restarted (for instance, whatever you system uses as its cron and syslog daemons). This will not be automagically done and must be done manually!
CLI Example:
salt '*' timezone.set_zone 'America/Denver'

Changed in version 2016.11.4.

Note: On AIX operating systems, Posix values are also allowed, see below

salt '*' timezone.set_zone 'CST6CDT,M3.2.0/2:00:00,M11.1.0/2:00:00'

salt.modules.timezone.zone_compare(timezone)
Compares the given timezone name with the system timezone name. Checks the hash sum between the given timezone, and the one set in /etc/localtime. Returns True if names and hash sums match, and False if not. Mostly useful for running state checks.
Changed in version 2016.3.0.

Note: On Solaris-link operating systems only a string comparison is done.

Changed in version 2016.11.4.

Note: On AIX operating systems only a string comparison is done.
CLI Example:

```
salt '*' timezone.zone_compare 'America/Denver'
```

## 21.9.429 salt.modules.tls

A salt module for SSL/TLS. Can create a Certificate Authority (CA) or use Self-Signed certificates.

**depends**  
PyOpenSSL Python module (0.10 or later, 0.14 or later for X509 extension support)

**configuration**  
Add the following values in `/etc/salt/minion` for the CA module to function properly:

```
ca.cert_base_path: '/etc/pki'
```

CLI Example #1: Creating a CA, a server request and its signed certificate:

```
# salt-call tls.create_ca my_little 
  days=5 \ 
  CN='My Little CA' \ 
  C=US \ 
  ST=Utah \ 
  L=Salt Lake City \ 
  O=Saltstack \ 
  emailAddress=pleasedontemail@example.com

Created Private Key: "/etc/pki/my_little/my_little_ca_cert.key"
Created CA "my_little_ca": "/etc/pki/my_little_ca/my_little_ca_cert.crt"

# salt-call tls.create_csr my_little CN=www.example.com
Created Private Key: "/etc/pki/my_little/certs/www.example.com.key"
Created CSR for "www.example.com": "/etc/pki/my_little/certs/www.example.com.csr"

# salt-call tls.create_ca_signed_cert my_little CN=www.example.com
Created Certificate for "www.example.com": /etc/pki/my_little/certs/www.example.com.crt"
```

CLI Example #2: Creating a client request and its signed certificate

```
# salt-call tls.create_csr my_little CN=DBReplica_No.1 cert_type=client
Created Private Key: "/etc/pki/my_little/certs//DBReplica_No.1.key."
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.1.csr."

# salt-call tls.create_ca_signed_cert my_little CN=DBReplica_No.1
Created Certificate for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.1.crt."
```

CLI Example #3: Creating both a server and client req + cert for the same CN

```
# salt-call tls.create_csr my_little CN=MasterDBReplica_No.2 \ 
  cert_type=client
Created Private Key: "/etc/pki/my_little/certs/MasterDBReplica_No.2.key."
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/MasterDBReplica_No.2.csr."

# salt-call tls.create_ca_signed_cert my_little CN=MasterDBReplica_No.2
Created Certificate for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.1.crt."
```

(continues on next page)
# salt-call tls.create_csr my_little CN=MasterDBReplica_No.2 
  cert_type=server
Certificate "MasterDBReplica_No.2" already exists
(doh!)

# salt-call tls.create_csr my_little CN=MasterDBReplica_No.2 
  cert_type=server type_ext=True
Created Private Key: "/etc/pki/my_little/certs/DBReplica_No.1_client.key."
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.1_client.csr."

# salt-call tls.create_ca_signed_cert my_little CN=MasterDBReplica_No.2
Certificate "MasterDBReplica_No.2" already exists
(DOH!)

# salt-call tls.create_ca_signed_cert my_little CN=MasterDBReplica_No.2 
  cert_type=server type_ext=True
Created Certificate for "MasterDBReplica_No.2": "/etc/pki/my_little/certs/ 
  MasterDBReplica_No.2_server.crt"

CLI Example #4: Create a server req + cert with non-CN filename for the cert

# salt-call tls.create_csr my_little CN=www.anothersometh.ing 
  cert_type=server type_ext=True
Created Private Key: "/etc/pki/my_little/certs/www.anothersometh.ing_server.key."
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/www.anothersometh.ing _server.csr."

# salt-call tls.create_ca_signed_cert my_little CN=www.anothersometh.ing 
  cert_type=server cert_filename="something_completely_different"
Created Certificate for "www.anothersometh.ing": /etc/pki/my_little/certs/something _completely_different.crt

salt.modules.tls.ca_exists(ca_name, cacert_path=None, ca_filename=None)
Verify whether a Certificate Authority (CA) already exists
ca_name name of the CA
cacert_path absolute path to ca certificates root directory
ca_filename alternative filename for the CA

   New in version 2015.5.3.
   CLI Example:
   
   salt '*' tls.ca_exists test_ca /etc/certs

salt.modules.tls.cert_base_path(cacert_path=None)
Return the base path for certs from CLI or from options
cacert_path absolute path to ca certificates root directory

   CLI Example:
   
   salt '*' tls.cert_base_path

salt.modules.tls.cert_info(cert, digest='sha256')
Return information for a particular certificate
cert path to the certificate PEM file or string
Changed in version 2018.3.4.

digest  what digest to use for fingerprinting

CLI Example:

```
salt '*' tls.cert_info /dir/for/certs/cert.pem
```

```
salt.modules.tls.create_ca(ca_name, bits=2048, days=365, CN='localhost', C='US', ST='Utah', L='Salt Lake City', O='SaltStack', OU=None, emailAddress=None, fixmode=False, cacert_path=None, ca_filename=None, digest='sha256', onlyif=None, unless=None, replace=False)
```

Create a Certificate Authority (CA)

- **ca_name**  name of the CA
- **bits**  number of RSA key bits, default is 2048
- **days**  number of days the CA will be valid, default is 365
- **CN**  common name in the request, default is "localhost"
- **C**  country, default is "US"
- **ST**  state, default is "Utah"
- **L**  locality, default is "Centerville", the city where SaltStack originated
- **O**  organization, default is "SaltStack"
- **OU**  organizational unit, default is None
- **emailAddress**  email address for the CA owner, default is None
- **cacert_path**  absolute path to ca certificates root directory
- **ca_filename**  alternative filename for the CA

New in version 2015.5.3.

digest  The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by EVP_get_digestbyname, specifically). For example, "md5" or "sha1". Default: 'sha256'

replace  Replace this certificate even if it exists

New in version 2015.5.1.

Writes out a CA certificate based upon defined config values. If the file already exists, the function just returns assuming the CA certificate already exists.

If the following values were set:

```
ca.cert_base_path='/etc/pki'
ca_name='koji'
```

the resulting CA, and corresponding key, would be written in the following location:

```
/etc/pki/koji/koji_ca_cert.crt
/etc/pki/koji/koji_ca_cert.key
```

CLI Example:

```
salt '*' tls.create_ca test_ca
```

```
salt.modules.tls.create_ca_signed_cert(ca_name, CN, days=365, cacert_path=None, ca_filename=None, cert_path=None, cert_filename=None, digest='sha256', cert_type=None, type_ext=False, replace=False)
```

Create a Certificate (CERT) signed by a named Certificate Authority (CA)

If the certificate file already exists, the function just returns assuming the CERT already exists.

The CN **must** match an existing CSR generated by create_csr. If it does not, this method does nothing.

- **ca_name**  name of the CA
- **CN**  common name matching the certificate signing request
**days**  number of days certificate is valid, default is 365 (1 year)
**cacert_path**  absolute path to ca certificates root directory
**ca_filename**  alternative filename for the CA

New in version 2015.5.3.
**cert_path**  full path to the certificates directory
**cert_filename**  alternative filename for the certificate, useful when using special characters in the CN. If this option is set it will override the certificate filename output effects of cert_type. type_ext will be completely overridden.

New in version 2015.5.3.
**digest**  The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by EVP_get_digestbyname, specifically). For example, "md5" or "sha1". Default: 'sha256'
**replace**  Replace this certificate even if it exists

New in version 2015.5.1.
**cert_type**  string. Either 'server' or 'client' (see create_csr() for details).

If create_csr(type_ext=True) this function must be called with the same cert_type so it can find the CSR file.

**Note:** create_csr() defaults to cert_type='server'; therefore, if it was also called with type_ext, cert_type becomes a required argument for create_ca_signed_cert()

**type_ext**  bool. If set True, use cert_type as an extension to the CN when formatting the filename.

e.g.: some_subject_CN_server.crt or some_subject_CN_client.crt

This facilitates the context where both types are required for the same subject

If cert_filename is not None, setting type_ext has no effect

If the following values were set:

```
ca.cert_base_path='/etc/pki'
ca_name='koji'
CN='test.egavas.org'
```

the resulting signed certificate would be written in the following location:

```
/etc/pki/koji/certs/test.egavas.org.crt
```

CLI Example:
```
salt '*' tls.create_ca_signed_cert test localhost
```

salt.modules.tls.create_csr(ca_name, bits=2048, CN='localhost', C='US', ST='Utah', L='Salt Lake City', O='SaltStack', OU=None, emailAddress=None, subjectAltName=None, cacert_path=None, ca_filename=None, csr_path=None, csr_filename=None, digest='sha256', type_ext=False, cert_type='server', replace=False)

Create a Certificate Signing Request (CSR) for a particular Certificate Authority (CA)

**ca_name**  name of the CA

**bits**  number of RSA key bits, default is 2048

**CN**  common name in the request, default is "localhost"

**C**  country, default is "US"

**ST**  state, default is "Utah"

**L**  locality, default is "Centerville", the city where SaltStack originated

**O**  organization, default is "SaltStack"  NOTE: Must the same as CA certificate or an error will be raised
OU  organizational unit, default is None
emailAddress  email address for the request, default is None
subjectAltName  valid subjectAltNames in full form, e.g. to add DNS entry you would call this function with this value:
examples: ['DNS:somednsname.com', 'DNS:1.2.3.4', 'IP:1.2.3.4', 'IP:2001:4801:7821:77:be76:4eff:fe11:e51', 'email:me@I.like.pie.com']

Note: some libraries do not properly query IP: prefixes, instead looking for the given req. source with a DNS: prefix. To be thorough, you may want to include both DNS: and IP: entries if you are using subjectAltNames for destinations for your TLS connections. e.g.: requests to https://1.2.3.4 will fail from python’s requests library w/out the second entry in the above list

New in version 2015.8.0.
cert_type  Specify the general certificate type. Can be either server or client. Indicates the set of common extensions added to the CSR.

```
server: {
    'basicConstraints': 'CA:FALSE',
    'extendedKeyUsage': 'serverAuth',
    'keyUsage': 'digitalSignature, keyEncipherment'
}
client: {
    'basicConstraints': 'CA:FALSE',
    'extendedKeyUsage': 'clientAuth',
    'keyUsage': 'nonRepudiation, digitalSignature, keyEncipherment'
}
```
type_ext  boolean. Whether or not to extend the filename with CN_[cert_type] This can be useful if a server and client certificate are needed for the same CN. Defaults to False to avoid introducing an unexpected file naming pattern

The files normally named some_subject_CN.csr and some_subject_CN.key will then be saved
replace  Replace this signing request even if it exists

New in version 2015.5.1.
Writes out a Certificate Signing Request (CSR) If the file already exists, the function just returns assuming the CSR already exists.

If the following values were set:

```
ca.cert_base_path='/etc/pki'
ca_name='koji'
CN='test.egavas.org'
```

the resulting CSR, and corresponding key, would be written in the following location:

```
/etc/pki/koji/certs/test.egavas.org.csr
/etc/pki/koji/certs/test.egavas.org.key
```

CLI Example:
```
salt '*' tls.create_csr test
```

salt.modules.tls.create_empty_crl(ca_name, cacert_path=None, ca_filename=None, crl_file=None)
Create an empty Certificate Revocation List.
New in version 2015.8.0.
c_a_name name of the CA
cacert_path absolute path to ca certificates root directory
c_a_filename alternative filename for the CA

    New in version 2015.5.3.
crl_file full path to the CRL file
CLI Example:

salt '*' tls.create_empty_crl ca_name='koji' ca_filename='ca' 0
crl_file='/etc/openvpn/team1/crl.pem'

salt.modules.tls.create_pkcs12(ca_name, CN, passphrase='', cacert_path=None, replace=False)
Create a PKCS#12 browser certificate for a particular Certificate (CN)
c_a_name name of the CA
CN common name matching the certificate signing request
passphrase used to unlock the PKCS#12 certificate when loaded into the browser
cacert_path absolute path to ca certificates root directory
replace Replace this certificate even if it exists

    New in version 2015.5.1.
If the following values were set:

ca.cert_base_path='/etc/pki'
ca_name='koji'
CN='test.egavas.org'

the resulting signed certificate would be written in the following location:

/etc/pki/koji/certs/test.egavas.org.p12

CLI Example:

salt '*' tls.create_pkcs12 test localhost

salt.modules.tls.create_self_signed_cert(tls_dir='tls', bits=2048, days=365, CN='localhost', C='US', ST='Utah', L='Salt Lake City', O='SaltStack', OU=None, emailAddress=None, cacert_path=None, cert_filename=None, digest='sha256', replace=False)
Create a Self-Signed Certificate (CERT)
tls_dir location appended to the ca.cert_base_path, default is 'tls'
bits number of RSA key bits, default is 2048
CN common name in the request, default is "localhost"
C country, default is "US"
ST state, default is "Utah"
L locality, default is "Centerville", the city where SaltStack originated
O organization, default is "SaltStack" NOTE: Must the same as CA certificate or an error will be raised
OU organizational unit, default is None
e-mailAddress email address for the request, default is None
cacert_path absolute path to ca certificates root directory
digest The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL
(by EVP_get_digestbyname, specifically). For example, "md5" or "sha1". Default: 'sha256'
replace Replace this certificate even if it exists

    New in version 2015.5.1.
Writes out a Self-Signed Certificate (CERT). If the file already exists, the function just returns.
If the following values were set:

```python
ca.cert_base_path='/etc/pki'
tls_dir='koji'
CN='test.egavas.org'
```

the resulting CERT, and corresponding key, would be written in the following location:

```
/etc/pki/koji/certs/test.egavas.org.crt
/etc/pki/koji/certs/test.egavas.org.key
```

CLI Example:

```
salt '*' tls.create_self_signed_cert
```

Passing options from the command line:

```
salt 'minion' tls.create_self_signed_cert CN='test.mysite.org'
```

salt.modules.tls.get_ca(ca_name, as_text=False, cacert_path=None)

Get the certificate path or content
- **ca_name**: name of the CA
- **as_text**: if true, return the certificate content instead of the path
- **cacert_path**: absolute path to ca certificates root directory

CLI Example:

```
salt '*' tls.get_ca test_ca as_text=False cacert_path=/etc/certs
```

salt.modules.tls.get_ca_signed_cert(ca_name, CN='localhost', as_text=False, cacert_path=None, cert_filename=None)

Get the certificate path or content
- **ca_name**: name of the CA
- **CN**: common name of the certificate
- **as_text**: if true, return the certificate content instead of the path
- **cacert_path**: absolute path to certificates root directory
- **cert_filename**: alternative filename for the certificate, useful when using special characters in the CN

New in version 2015.5.3.

CLI Example:

```
salt '*' tls.get_ca_signed_cert test_ca CN=localhost as_text=False cacert_path=/
```

salt.modules.tls.get_ca_signed_key(ca_name, CN='localhost', as_text=False, cacert_path=None, key_filename=None)

Get the certificate path or content
- **ca_name**: name of the CA
- **CN**: common name of the certificate
- **as_text**: if true, return the certificate content instead of the path
- **cacert_path**: absolute path to certificates root directory
- **key_filename**: alternative filename for the key, useful when using special characters in the CN

New in version 2015.5.3.

CLI Example:
salt.modules.tls.get_ca_signed_key

```python
salt '*' tls.get_ca_signed_key test_ca CN=localhost as_text=False cacert_path=/etc/certs
```

salt.modules.tls.getExpirationDate

```python
cert = Full path to the certificate
date_format = By default this will return the expiration date in YYYY-MM-DD format, use this to specify a different strftime format string. Note that the expiration time will be in UTC.
```

**CLI Examples:**
```
salt '*' tls.getExpirationDate /path/to/foo.crt
date_format='%d/%m/%Y'
```

salt.modules.tls.get_extensions

```python
cert_type: The type of certificate such as server or client.
```

**CLI Example:**
```
salt '*' tls.get_extensions client
```

salt.modules.tls.maybe_fix_ssl_version

```python
cacert_path = absolute path to ca certificates root directory
ca_filename = alternative filename for the CA
```

New in version 2015.5.3.

**CLI Example:**
```
salt '*' tls.maybe_fix_ssl_version test_ca /etc/certs
cacert_path=None ca_filename=None
```

salt.modules.tls.revoke_cert

```python
cert_path = Path to the cert file.
cert_filename = Alternative filename for the certificate, useful when using special characters in the CN.
crl_file = Full path to the CRL file.
```

New in version 2015.8.0.

**CLI Example:**
```
salt '*' tls.revoke_cert ca_name='koji' ca_filename='ca'
cert_path=None cert_filename=None crl_file=/etc/openvpn/team1/crl.pem
```

salt.modules.tls.set_ca_path

```python
cacert_path = If wanted, store the aforementioned cacert_path in context to be used as the basepath for further operations
```

**CLI Example:**
```
salt '*' tls.set_ca_path cacert_path
```
**21.9.430 salt.modules.tomcat**

Support for Tomcat

This module uses the manager webapp to manage Apache tomcat webapps. If the manager webapp is not configured some of the functions won’t work.

**configuration**

- Java bin path should be in default path
- If ipv6 is enabled make sure you permit manager access to ipv6 interface "0:0:0:0:0:0:1"
- If you are using tomcat.tar.gz it has to be installed or symlinked under `/opt`, preferably using name tomcat
- "tomcat.signal start/stop" works but it does not use the startup scripts

The following grains/pillar should be set:

```
<table>
<thead>
<tr>
<th>tomcat-manager:</th>
</tr>
</thead>
<tbody>
<tr>
<td>user: &lt;username&gt;</td>
</tr>
<tr>
<td>passwd: &lt;password&gt;</td>
</tr>
</tbody>
</table>
```

or the old format:

```
| tomcat-manager.user: <username> |
| tomcat-manager.passwd: <password> |
```

Also configure a user in the conf/tomcat-users.xml file:

```
<?xml version='1.0' encoding='utf-8'?>
<tomcat-users>
  <role rolename="manager-script"/>
  <user username="tomcat" password="tomcat" roles="manager-script"/>
</tomcat-users>
```

**Note:**

- if you use only this module for deployments you’ve might want to strict access to the manager only from localhost for more info: [http://tomcat.apache.org/tomcat-7.0-doc/manager-howto.html#Configuring_Manager_Application_Access](http://tomcat.apache.org/tomcat-7.0-doc/manager-howto.html#Configuring_Manager_Application_Access)
- Tested on:
  - JVM Vendor: Sun Microsystems Inc.
  - JVM Version: 1.6.0_43-b01
  - OS Architecture: amd64
  - OS Name: Linux
  - OS Version: 2.6.32-358.el6.x86_64
  - Tomcat Version: Apache Tomcat/7.0.37

```bash
salt '*' tls.set_ca_path /etc/certs
```
salt.modules.tomcat.deploy_war(war, context, force='no', url='http://localhost:8080/manager', saltenv='base', timeout=180, temp_war_location=None, version=True)

Deploy a WAR file

- **war**: absolute path to WAR file (should be accessible by the user running tomcat) or a path supported by the salt.modules.cp.get_file function
- **context**: the context path to deploy
- **force**: [False] set True to deploy the webapp even one is deployed in the context
- **url**: [http://localhost:8080/manager] the URL of the server manager webapp
- **saltenv**: [base] the environment for WAR file in used by salt.modules.cp.get_url function
- **timeout**: [180] timeout for HTTP request
- **temp_war_location**: [None] use another location to temporarily copy to war file by default the system’s temp directory is used
- **version**: [''] Specify the war version. If this argument is provided, it overrides the version encoded in the war file name, if one is present.

Examples:

```python
salt '*' tomcat.deploy_war salt://salt-2015.8.6.war version=2015.08.r6
```

CLI Examples:

```
cp module
salt '*' tomcat.deploy_war salt://application.war /api
salt '*' tomcat.deploy_war salt://application.war /api no
salt '*' tomcat.deploy_war salt://application.war /api yes http://localhost:8080/
```

minion local file system

```
salt '*' tomcat.deploy_war /tmp/application.war /api
salt '*' tomcat.deploy_war /tmp/application.war /api no
salt '*' tomcat.deploy_war /tmp/application.war /api yes http://localhost:8080/
```

salt.modules.tomcat.extract_war_version(war)

Extract the version from the war file name. There does not seem to be a standard for encoding the version into the war file name

Examples:

```
/path/salt-2015.8.6.war -> 2015.8.6
/path/V6R2013xD5.war -> None
```

salt.modules.tomcat.fullversion()

Return all server information from catalina.sh version

CLI Example:

```
salt '*' tomcat.fullversion
```

salt.modules.tomcat.leaks( url='http://localhost:8080/manager', timeout=180)

Find memory leaks in tomcat

- **url**: [http://localhost:8080/manager] the URL of the server manager webapp
- **timeout**: [180] timeout for HTTP request
CLI Examples:

```
salt '*' tomcat.leaks
```

```
salt.modules.tomcat.ls(url='http://localhost:8080/manager', timeout=180)
```

- **url** [http://localhost:8080/manager] the URL of the server manager webapp
- **timeout** [180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.ls
salt '*' tomcat.ls http://localhost:8080/manager
```

```
salt.modules.tomcat.passwd(passwd, user='', alg='sha1', realm=None)
```

This function replaces the `$CATALINA_HOME/bin/digest.sh` script convert a clear-text password to the `$CATALINA_BASE/conf/tomcat-users.xml` format

CLI Examples:

```
salt '*' tomcat.passwd secret
salt '*' tomcat.passwd secret tomcat sha1 'Protected Realm'
```

```
salt.modules.tomcat.reload_(app, url='http://localhost:8080/manager', timeout=180)
```

- **app** the webapp context path
- **url** [http://localhost:8080/manager] the URL of the server manager webapp
- **timeout** [180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.reload /jenkins
salt '*' tomcat.reload /jenkins http://localhost:8080/manager
```

```
salt.modules.tomcat.serverinfo(url='http://localhost:8080/manager', timeout=180)
```

- **url** [http://localhost:8080/manager] the URL of the server manager webapp
- **timeout** [180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.serverinfo
salt '*' tomcat.serverinfo http://localhost:8080/manager
```

```
salt.modules.tomcat.sessions(app, url='http://localhost:8080/manager', timeout=180)
```

- **app** the webapp context path
- **url** [http://localhost:8080/manager] the URL of the server manager webapp
- **timeout** [180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.sessions /jenkins
salt '*' tomcat.sessions /jenkins http://localhost:8080/manager
```

```
salt.modules.tomcat.signal(signal=None)
```

Signals catalina to start, stop, securestart, forcestop.

CLI Example:
salt '*' tomcat.signal start

call functions
tomcat.start

salt.modules.tomcat.start(app, url='http://localhost:8080/manager', timeout=180)
   Start the webapp
   app  the webapp context path
   url  [http://localhost:8080/manager] the URL of the server manager webapp
   timeout timeout for HTTP request

   CLI Examples:

   salt '*' tomcat.start /jenkins
   salt '*' tomcat.start /jenkins http://localhost:8080/manager

call functions
tomcat.status

salt.modules.tomcat.status(url='http://localhost:8080/manager', timeout=180)
   Used to test if the tomcat manager is up
   url  [http://localhost:8080/manager] the URL of the server manager webapp
   timeout [180] timeout for HTTP request

   CLI Examples:

   salt '*' tomcat.status
   salt '*' tomcat.status http://localhost:8080/manager

call functions
tomcat.status_webapp

salt.modules.tomcat.status_webapp(app, url='http://localhost:8080/manager', timeout=180)
   return the status of the webapp (stopped | running | missing)
   app  the webapp context path
   url  [http://localhost:8080/manager] the URL of the server manager webapp
   timeout [180] timeout for HTTP request

   CLI Examples:

   salt '*' tomcat.status_webapp /jenkins
   salt '*' tomcat.status_webapp /jenkins http://localhost:8080/manager

call functions
tomcat.stop

salt.modules.tomcat.stop(app, url='http://localhost:8080/manager', timeout=180)
   Stop the webapp
   app  the webapp context path
   url  [http://localhost:8080/manager] the URL of the server manager webapp
   timeout [180] timeout for HTTP request

   CLI Examples:

   salt '*' tomcat.stop /jenkins
   salt '*' tomcat.stop /jenkins http://localhost:8080/manager

call functions
tomcat.undeploy

salt.modules.tomcat.undeploy(app, url='http://localhost:8080/manager', timeout=180)
   Undeploy a webapp
   app  the webapp context path
   url  [http://localhost:8080/manager] the URL of the server manager webapp
   timeout [180] timeout for HTTP request

   CLI Examples:

   salt '*' tomcat.undeploy /jenkins
   salt '*' tomcat.undeploy /jenkins http://localhost:8080/manager

call functions
tomcat.version

salt.modules.tomcat.version()
   Return server version from catalina.sh version

   CLI Example:
21.9.431 salt.modules.trafficserver

Apache Traffic Server execution module.

New in version 2015.8.0.

traffic_ctl is used to execute individual Traffic Server commands and to script multiple commands in a shell.

salt.modules.trafficserver.alarms()
List all alarm events that have not been acknowledged (cleared).

salt.modules.trafficserver.bounce_cluster()

salt.modules.trafficserver.bounce_local(drain=False)

This option modifies the restart behavior such that traffic_server is not shut down until the number of active client connections drops to the number given by the proxy.config.restart.active_client_threshold configuration variable.

salt.modules.trafficserver.clear_alarms(alarm)
Clear (acknowledge) an alarm event. The arguments are “all” for all current alarms, a specific alarm number (e.g. “1”), or an alarm string identifier (e.g. “MGMT_ALARM_PROXY_CONFIG_ERROR”).

salt.modules.trafficserver.clear_cluster()
Clears accumulated statistics on all nodes in the cluster.

salt.modules.trafficserver.clear_node()
Clears accumulated statistics on the local node.

salt.modules.trafficserver.match_config(regex)
Display the current values of all configuration variables whose names match the given regular expression.

New in version 2016.11.0.

salt.modules.trafficserver.match_metric(regex)
Display the current values of all metrics whose names match the given regular expression.
New in version 2016.11.0.

```python
salt '*' trafficsserver.match_metric regex
```

`salt.modules.trafficserver.offline(path)`
Mark a cache storage device as offline. The storage is identified by a path which must match exactly a path specified in storage.config. This removes the storage from the cache and redirects requests that would have used this storage to other storage. This has exactly the same effect as a disk failure for that storage. This does not persist across restarts of the traffic_server process.

```python
salt '*' trafficsserver.offline /path/to/cache
```

`salt.modules.trafficserver.read_config(*args)`
Read Traffic Server configuration variable definitions.

New in version 2016.11.0.

```python
salt '*' trafficsserver.read_config proxy.config.http.keep_alive_post_out
```

`salt.modules.trafficserver.read_metric(*args)`
Read Traffic Server one or more metrics.

New in version 2016.11.0.

```python
salt '*' trafficsserver.read_metric proxy.process.http.tcp_hit_count_stat
```

`salt.modules.trafficserver.refresh()`
Initiate a Traffic Server configuration file reread. Use this command to update the running configuration after any configuration file modification.

The timestamp of the last reconfiguration event (in seconds since epoch) is published in the proxy.node.config.reconfigure_time metric.

```python
salt '*' trafficsserver.refresh
```

`salt.modules.trafficserver.restart_cluster()`
Restart the traffic_manager process and the traffic_server process on all the nodes in a cluster.

```python
salt '*' trafficsserver.restart_cluster
```

`salt.modules.trafficserver.restart_local(drain=False)`
Restart the traffic_manager and traffic_server processes on the local node.

`drain` This option modifies the restart behavior such that traffic_server is not shut down until the number of active client connections drops to the number given by the proxy.config.restart.active_client_threshold configuration variable.

```python
salt '*' trafficsserver.restart_local
salt '*' trafficsserver.restart_local drain=True
```

`salt.modules.trafficserver.set_config(variable, value)`
Set the value of a Traffic Server configuration variable.

`variable` Name of a Traffic Server configuration variable.

`value` The new value to set.

New in version 2016.11.0.

```python
salt '*' trafficsserver.set_config proxy.config.http.keep_alive_post_out 0
```
salt.modules.trafficserver.shutdown()
Salt Documentation, Release 2019.2.0
Shut down Traffic Server on the local node.
salt '*' trafficserver.shutdown

salt.modules.trafficserver.startup()
Start Traffic Server on the local node.
salt '*' trafficserver.start

salt.modules.trafficserver.status()
Show the current proxy server status, indicating if we're running or not.
salt '*' trafficserver.status

salt.modules.trafficserver.zero_cluster()
Reset performance statistics to zero across the cluster.
salt '*' trafficserver.zero_cluster

salt.modules.trafficserver.zero_node()
Reset performance statistics to zero on the local node.
salt '*' trafficserver.zero_cluster

21.9.432 salt.modules.travisci
Commands for working with travisci.

depends pyOpenSSL >= 16.0.0

salt.modules.travisci.verify_webhook(signature, body)
Verify the webhook signature from travisci
signature The signature header from the webhook header
body The full payload body from the webhook post

Note: The body needs to be the urlencoded version of the body.

CLI Example:
salt '*' travisci.verify_webhook 'M6NucCX5722bxisQs7e...' 'payload=%7B%22id%22
->%3A183791261%2C%22repository...'

21.9.433 salt.modules.tuned
Interface to Red Hat tuned-adm module

maintainer Syed Ali <alicsyed@gmail.com>
maturity new
depends tuned-adm
platform Linux
salt.modules.tuned.active()
    Return current active profile
    CLI Example:
    ```
salt '*' tuned.active
    ```

salt.modules.tuned.list_()
    List the profiles available
    CLI Example:
    ```
salt '*' tuned.list
    ```

salt.modules.tuned.off()
    Turn off all profiles
    CLI Example:
    ```
salt '*' tuned.off
    ```

salt.modules.tuned.profile(profile_name)
    Activate specified profile
    CLI Example:
    ```
salt '*' tuned.profile virtual-guest
    ```

21.9.434 salt.modules.twilio_notify

Module for notifications via Twilio
New in version 2014.7.0.

depends
    • twilio python module

configuration Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config.
For example:
    ```yaml
    my-twilio-account:
        twilio.account_sid: AC32a3c83990934481add5ce1659f04d2
        twilio.auth_token: mytoken
    ```

salt.modules.twilio_notify.send_sms(profile, body, to, from_)
    Send an sms
    CLI Example:
    ```
twilio.send_sms twilio-account 'Test sms' '+18019999999' '+18011111111'
    ```

21.9.435 salt.modules.udev

Manage and query udev info
New in version 2015.8.0.
salt.modules.udev.env(dev)
Return all environment variables udev has for dev

CLI Example:
```
salt '*' udev.env /dev/sda
salt '*' udev.env /sys/class/net/eth0
```

salt.modules.udev.exportdb()
Return all the udev database

CLI Example:
```
salt '*' udev.exportdb
```

salt.modules.udev.info(dev)
Extract all info delivered by udevadm

CLI Example:
```
salt '*' udev.info /dev/sda
salt '*' udev.info /sys/class/net/eth0
```

salt.modules.udev.links(dev)
Return all udev-created device symlinks

CLI Example:
```
salt '*' udev.links /dev/sda
salt '*' udev.links /sys/class/net/eth0
```

salt.modules.udev.name(dev)
Return the actual dev name(s?) according to udev for dev

CLI Example:
```
salt '*' udev.dev /dev/sda
salt '*' udev.dev /sys/class/net/eth0
```

salt.modules.udev.path(dev)
Return the physical device path(s?) according to udev for dev

CLI Example:
```
salt '*' udev.path /dev/sda
salt '*' udev.path /sys/class/net/eth0
```

### 21.9.436 salt.modules.upstart_service

Module for the management of upstart systems. The Upstart system only supports service starting, stopping and restarting.

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `service.start` is not available), see [here](#).
Currently (as of Ubuntu 12.04) there is no tool available to disable Upstart services (like update-rc.d). This[1] is the recommended way to disable an Upstart service. So we assume that all Upstart services that have not been disabled in this manner are enabled.

But this is broken because we do not check to see that the dependent services are enabled. Otherwise we would have to do something like parse the output of “initctl show-config” to determine if all service dependencies are enabled to start on boot. For example, see the “start on” condition for the lightdm service below[2]. And this would be too hard. So we wait until the upstart developers have solved this problem. :) This is to say that an Upstart service that is enabled may not really be enabled.

Also, when an Upstart service is enabled, should the dependent services be enabled too? Probably not. But there should be a notice about this, at least.

[2] example upstart configuration file:

```
l轻dm
emits login-session-start
emits desktop-session-start
emits desktop-shutdown
start on (((((filesystem and runlevel ![06]) and started dbus) and (drm-device-added --card0 PRIMARYDEVICEFORDISPLAY=1 or stopped udev-fallback-graphics)) or runlevel ![S])
stop on runlevel ![016]
```

**Warning:** This module should not be used on Red Hat systems. For these, the `rh_service` module should be used, as it supports the hybrid upstart/sysvinit system used in RHEL/CentOS 6.

**salt.modules.upstart_service.available(name)**

Returns True if the specified service is available, otherwise returns False.

CLI Example:
```
salt '*' service.available sshd
```

**salt.modules.upstart_service.disable(name, **kwargs)**

Disable the named service from starting on boot

CLI Example:
```
salt '*' service.disable <service name>
```

**salt.modules.upstart_service.disabled(name)**

Check to see if the named service is disabled to start on boot

CLI Example:
```
salt '*' service.disabled <service name>
```

**salt.modules.upstart_service.enable(name, **kwargs)**

Enable the named service to start at boot

CLI Example:
```
salt '*' service.enable <service name>
```
salt.modules.upstart_service.enabled(name, **kwargs)
  Check to see if the named service is enabled to start on boot
  CLI Example:
  ```
  salt '*' service.enabled <service name>
  ```

salt.modules.upstart_service.force_reload(name)
  Force-reload the named service
  CLI Example:
  ```
  salt '*' service.force_reload <service name>
  ```

salt.modules.upstart_service.full_restart(name)
  Do a full restart (stop/start) of the named service
  CLI Example:
  ```
  salt '*' service.full_restart <service name>
  ```

salt.modules.upstart_service.get_all()
  Return all installed services
  CLI Example:
  ```
  salt '*' service.get_all
  ```

salt.modules.upstart_service.get_disabled()
  Return the disabled services
  CLI Example:
  ```
  salt '*' service.get_disabled
  ```

salt.modules.upstart_service.get_enabled()
  Return the enabled services
  CLI Example:
  ```
  salt '*' service.get_enabled
  ```

salt.modules.upstart_service.missing(name)
  The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.
  CLI Example:
  ```
  salt '*' service.missing sshd
  ```

salt.modules.upstart_service.reload_(name)
  Reload the named service
  CLI Example:
  ```
  salt '*' service.reload <service name>
  ```

salt.modules.upstart_service.restart(name)
  Restart the named service
  CLI Example:
salt '*' service.restart <service name>

salt.modules.upstart_service.start(name)
Start the specified service

CLI Example:
```
salt '*' service.start <service name>
```

salt.modules.upstart_service.status(name, sig=None)
Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)

Parameters

- **name** (str) – The name of the service to check
- **sig** (str) – Signature to use to find the service via ps

Returns

True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type bool

CLI Example:
```
salt '!' service.status <service name> [service signature]
```

salt.modules.upstart_service.stop(name)
Stop the specified service

CLI Example:
```
salt '!' service.stop <service name>
```

21.9.437 salt.modules.uptime

Wrapper around uptime API

salt.modules.uptime.check_exists(name)
Check if a given URL is in being monitored by uptime

CLI Example:
```
salt '!' uptime.check_exists http://example.org
```

salt.modules.uptime.checks_list()
List URL checked by uptime

CLI Example:
```
salt '!' uptime.checks_list
```

salt.modules.uptime.create(name, **params)
Create a check on a given URL.

Additional parameters can be used and are passed to API (for example interval, maxTime, etc). See the documentation https://github.com/fzaninotto/uptime for a full list of the parameters.

CLI Example:
**salt.modules.uptime.delete** *(name)*
Delete a check on a given URL

CLI Example:
```
salt '*' uptime.delete http://example.org
```

---

**21.9.438 salt.modules.useradd**

Manage users with the useradd command

**Important:** If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to 'user.info is not available), see [here](#).

**salt.modules.useradd.add** *(name, uid=None, gid=None, groups=None, home=None, shell=None, unique=True, system=False, fullname='', roomnumber='', workphone='', homephone='', other='', createhome=True, loginclass=None, root=None, nologinit=False)*

Add a user to the minion

CLI Example:
```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

**salt.modules.useradd.chfullname** *(name, fullname)*

Change the user’s Full Name

CLI Example:
```
salt '*' user.chfullname foo "Foo Bar"
```

**salt.modules.useradd.chgid** *(name, gid, root=None)*

Change the default group of the user

CLI Example:
```
salt '*' user.chgid foo 4376
```

**salt.modules.useradd.chgroups** *(name, groups, append=False, root=None)*

Change the groups to which this user belongs

**name** User to modify

**groups** Groups to set for the user

**append** [False] If True, append the specified group(s). Otherwise, this function will replace the user’s groups with the specified group(s).

CLI Examples:
```
salt '*' user.chgroups foo wheel,root
salt '*' user.chgroups foo wheel,root append=True
```

**salt.modules.useradd.chhome** *(name, home, persist=False, root=None)*

Change the home directory of the user, pass True for persist to move files to the new home directory if the old home directory exist.
Salt Documentation, Release 2019.2.0

CLI Example:
```
salt '*' user.chhome foo /home/users/foo True
```

```python
class useradd:
    @functools.wraps(chhome)
    def chhome(self, name, homephone):
        ...  
```

**salt.modules.useradd.chhomephone** *(name, homephone)*

Change the user’s Home Phone

CLI Example:
```
salt '*' user.chhomephone foo 7735551234
```

```python
class useradd:
    @functools.wraps(chhomephone)
    def chhomephone(self, name, homephone):
        ...  
```

**salt.modules.useradd.chloginclass** *(name, loginclass, root=None)*

Change the default login class of the user

**Note**: This function only applies to OpenBSD systems.

CLI Example:
```
salt '*' user.chloginclass foo staff
```

```python
class useradd:
    @functools.wraps(chloginclass)
    def chloginclass(self, name, loginclass, root=None):
        ...  
```

**salt.modules.useradd.chother** *(name, other)*

Change the user’s other GECOS attribute

CLI Example:
```
salt '*' user.chother foobar
```

```python
class useradd:
    @functools.wraps(chother)
    def chother(self, name, other):
        ...  
```

**salt.modules.useradd.chroomnumber** *(name, roomnumber)*

Change the user’s Room Number

CLI Example:
```
salt '*' user.chroomnumber foo 123
```

```python
class useradd:
    @functools.wraps(chroomnumber)
    def chroomnumber(self, name, roomnumber):
        ...  
```

**salt.modules.useradd.chshell** *(name, shell, root=None)*

Change the default shell of the user

CLI Example:
```
salt '*' user.chshell foo /bin/zsh
```

```python
class useradd:
    @functools.wraps(chshell)
    def chshell(self, name, shell, root=None):
        ...  
```

**salt.modules.useradd.chuid** *(name, uid)*

Change the uid for a named user

CLI Example:
```
salt '*' user.chuid foo 4376
```

```python
class useradd:
    @functools.wraps(chuid)
    def chuid(self, name, uid):
        ...  
```

**salt.modules.useradd.chworkphone** *(name, workphone)*

Change the user’s Work Phone

CLI Example:
```
salt '*' user.chworkphone foo 7735550123
```

```python
class useradd:
    @functools.wraps(chworkphone)
    def chworkphone(self, name, workphone):
        ...  
```

**salt.modules.useradd.delete** *(name, remove=False, force=False, root=None)*

Remove a user from the minion

CLI Example:
```
salt '*' user.delete foo
```

```
21.9. execution modules 2575
```
<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>salt '*' user.delete name remove=True force=True</code></td>
<td>Remove a user</td>
</tr>
<tr>
<td><code>salt.modules.useradd.get_class(name)</code></td>
<td>Get the login class of the user</td>
</tr>
<tr>
<td><strong>Note:</strong> This function only applies to OpenBSD systems.</td>
<td></td>
</tr>
<tr>
<td><code>salt.modules.useradd.rename(name, new_name, root=None)</code></td>
<td>Change the username for a named user</td>
</tr>
</tbody>
</table>

**CLI Examples:**

- ```salt '*' user.delete name remove=True force=True```  
- ```salt.modules.useradd.get_class(name)```  
- ```salt '*' user.get_loginclass foo```  
- ```salt.modules.useradd.getent(refresh=False)```  
- ```salt '*' user.getent```  
- ```salt.modules.useradd.info(name)```  
- ```salt '*' user.info root```  
- ```salt.modules.useradd.list_groups(name)```  
- ```salt '*' user.list_groups foo```  
- ```salt.modules.useradd.list_users()```  
- ```salt '*' user.list_users```  
- ```salt.modules.useradd.primary_group(name)```  
- ```salt '*' user.primary_group saltadmin```  
- ```salt.modules.useradd.rename(name, new_name, root=None)```  
- ```salt '*' user.rename name new_name```
21.9.439 salt.modules.uwsgi

maintainer Peter Baumgartner <pete@lincolnloop.com>
maturity new
platform all

salt.modules.uwsgi.stats(socket)
    Return the data from uwsgi –connect-and-read as a dictionary.
socket The socket the uWSGI stats server is listening on

CLI Example:

salt '*' uwsgi.stats /var/run/mystatsserver.sock
salt '*' uwsgi.stats 127.0.0.1:5050

21.9.440 salt.modules.vagrant

Work with virtual machines managed by Vagrant.
New in version 2018.3.0.

Mapping between a Salt node id and the Vagrant machine name (and the path to the Vagrantfile where it is de-

defined) is stored in a Salt sdb database on the Vagrant host (minion) machine. In order to use this module, sdb
must be configured. An SQLite database is the recommended storage method. The URI used for the sdb lookup is
"sdb://vagrant_sdb_data".

requirements:

- the VM host machine must have salt-minion, Vagrant and a vm provider installed.
- the VM host must have a valid definition for sdb://vagrant_sdb_data

Configuration example:

# file /etc/salt/minion.d/vagrant_sdb.conf
vagrant_sdb_data:
    driver: sqlite3
    database: /var/cache/salt/vagrant.sqlite
    table: sdb
    create_table: True

salt.modules.vagrant.destroy(name)
    Destroy and delete a virtual machine. (vagrant destroy -f)
This also removes the salt_id name defined by vagrant.init.

CLI Example:

salt <host> vagrant.destroy <salt_id>

salt.modules.vagrant.get_machine_id(machine, cwd)
    returns the salt_id name of the Vagrant VM

Parameters
    - machine – the Vagrant machine name
    - cwd – the path to Vagrantfile

Returns salt_id name
salt.modules.vagrant.get_ssh_config(name, network_mask='', get_private_key=False)

Retrieve hints of how you might connect to a Vagrant VM.

Parameters
- **name** – the salt_id of the machine
- **network_mask** – a CIDR mask to search for the VM’s address
- **get_private_key** – (default: False) return the key used for ssh login

Returns a dict of ssh login information for the VM

CLI Example:
```
salt <host> vagrant.get_ssh_config <salt_id>
salt my_laptop vagrant.get_ssh_config quail1 network_mask=10.0.0.0/8 get_private_key=True
```

The returned dictionary contains:
- **key_filename**: the name of the private key file on the VM host computer
- **ssh_username**: the username to be used to log in to the VM
- **ssh_host**: the IP address used to log in to the VM. (This will usually be 127.0.0.1)
- **ssh_port**: the TCP port used to log in to the VM. (This will often be 2222)
- **[ip_address]** (if **network_mask** is defined. see below)
- **[private_key]** (if **get_private_key** is True) the private key for ssh_username

About **network_mask**:

Vagrant usually uses a redirected TCP port on its host computer to log in to a VM using ssh. This redirected port and its IP address are ”ssh_port” and ”ssh_host”. The ssh_host is usually the localhost (127.0.0.1). This makes it impossible for a third machine (such as a salt-cloud master) to contact the VM unless the VM has another network interface defined. You will usually want a bridged network defined by having a config.vm.network "public_network" statement in your Vagrantfile.

The IP address of the bridged adapter will typically be assigned by DHCP and unknown to you, but you should be able to determine what IP network the address will be chosen from. If you enter a CIDR network mask, Salt will attempt to find the VM’s address for you. The host machine will send an ”ifconfig” command to the VM (using ssh to ssh_host:ssh_port) and return the IP address of the first interface it can find which matches your mask.

salt.modules.vagrant.get_vm_info(name)

get the information for a VM.

Parameters **name** – salt_id name

Returns dictionary of {'machine': x, 'cwd': y, ...}.

salt.modules.vagrant.init(name, cwd=None, machine=", runas=None, start=False, vagrant_provider=", vm=None)

Initialize a new Vagrant VM.

This inputs all the information needed to start a Vagrant VM. These settings are stored in a Salt sdb database on the Vagrant host minion and used to start, control, and query the guest VMs. The salt_id assigned here is the key field for that database and must be unique.

Parameters
- **name** – The salt_id name you will use to control this VM
- **cwd** – The path to the directory where the Vagrantfile is located
- **machine** – The machine name in the Vagrantfile. If blank, the primary machine will be used.
- **runas** – The username on the host who owns the Vagrant work files.
- **start** – (default: False) Start the virtual machine now.
- **vagrant_provider** – The name of a Vagrant VM provider (if not the default).
- **vm** – Optionally, all the above information may be supplied in this dictionary.

Returns A string indicating success, or False.

CLI Example:
salt <host> vagrant.init <salt_id> /path/to/Vagrantfile
salt my_laptop vagrant.init x1 /projects/bevy_master machine=quail1

salt.modules.vagrant.list_active_vms(cwd=None)
Return a list of machine names for active virtual machine on the host, which are defined in the Vagrantfile at the indicated path.

CLI Example:
salt '*' vagrant.list_active_vms cwd=/projects/project_1

salt.modules.vagrant.list_domains()
Return a list of the salt_id names of all available Vagrant VMs on this host without regard to the path where they are defined.

CLI Example:
salt '*' vagrant.list_domains --log-level=info

The log shows information about all known Vagrant environments on this machine. This data is cached and may not be completely up-to-date.

salt.modules.vagrant.list_inactive_vms(cwd=None)
Return a list of machine names for inactive virtual machine on the host, which are defined in the Vagrantfile at the indicated path.

CLI Example:
salt '*' virt.list_inactive_vms cwd=/projects/project_1

salt.modules.vagrant.pause(name)
Pause (vagrant suspend) the named VM.

CLI Example:
salt <host> vagrant.pause <salt_id>

salt.modules.vagrant.reboot(name, provision=False)
Reboot a VM. (vagrant reload)

CLI Example:
salt <host> vagrant.reboot <salt_id> provision=True

Parameters
- name - The salt_id name you will use to control this VM
- provision - (False) also re-run the Vagrant provisioning scripts.

salt.modules.vagrant.shutdown(name)
Send a soft shutdown (vagrant halt) signal to the named vm.

This does the same thing as vagrant.stop. Other-VM control modules use "stop" and "shutdown" to differentiate between hard and soft shutdows.

CLI Example:
salt <host> vagrant.shutdown <salt_id>
salt.modules.vagrant.start(name)
Start (vagrant up) a virtual machine defined by salt_id name. The machine must have been previously defined
using "vagrant.init".

CLI Example:
```
salt <host> vagrant.start <salt_id>
```

salt.modules.vagrant.stop(name)
Hard shutdown the virtual machine. (vagrant halt)

CLI Example:
```
salt <host> vagrant.stop <salt_id>
```

salt.modules.vagrant.version()
Return the version of Vagrant on the minion

CLI Example:
```
salt '*' vagrant.version
```

salt.modules.vagrant.vm_state(name=None, cwd=None)
Return list of information for all the vms indicating their state.
If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will
return all VMs defined by the Vagrantfile in the cwd directory.

CLI Example:
```
salt '*' vagrant.vm_state <name> cwd=/projects/project_1
```

returns a list of dictionaries with machine name, state, provider, and salt_id name.

```
datum = {'machine': _, # Vagrant machine name,
        'state': _, # string indicating machine state, like 'running'
        'provider': _, # the Vagrant VM provider
        'name': _} # salt_id name
```

Known bug: if there are multiple machines in your Vagrantfile, and you request the status of the primary
machine, which you defined by leaving the machine parameter blank, then you may receive the status of all
of them. Please specify the actual machine name for each VM if there are more than one.

21.9.441 salt.modules.varnish

Support for Varnish

New in version 2014.7.0.

Note: These functions are designed to work with all implementations of Varnish from 3.x onwards

salt.modules.varnish.ban(ban_expression)
Add ban to the varnish cache

CLI Example:
**salt**

### salt.modules.varnish

#### salt.modules.varnish.ban_list()

List varnish cache current bans

CLI Example:

```
salt '*' varnish.ban_list
```

#### salt.modules.varnish.param_set(param, value)

Set a param in varnish cache

CLI Example:

```
salt '*' varnish.param_set param value
```

#### salt.modules.varnish.param_show(param=None)

Show params of varnish cache

CLI Example:

```
salt '*' varnish.param_show param
```

#### salt.modules.varnish.purge()

Purge the varnish cache

CLI Example:

```
salt '*' varnish.purge
```

#### salt.modules.varnish.version()

Return server version from varnishd -V

CLI Example:

```
salt '*' varnish.version
```

---

**21.9.442 salt.modules.vault module**

Functions to interact with Hashicorp Vault.

- **maintainer**: SaltStack
- **maturity**: new
- **platform**: all
- **note**: If you see the following error, you'll need to upgrade requests to atleast 2.4.2

```shell
<timestamp> [salt.pillar][CRITICAL][14337] Pillar render error: Failed to load ext_pillar vault: {'error': "request() got an unexpected keyword argument 'json'"}
```

**configuration**  The salt-master must be configured to allow peer-runner configuration, as well as configuration for the module.

Add this segment to the master configuration file, or /etc/salt/master.d/vault.conf:
**vault:**

```yaml
url: https://vault.service.domain:8200
verify: /etc/ssl/certs/ca-certificates.crt
role_name: minion_role
auth:
  method: approle
  role_id: 11111111-2222-3333-4444-1111111111111
  secret_id: 11111111-1111-1111-1111-1111111111111
policies:
  - saltstack/minions
  - saltstack/minion/{minion}
  .. more policies
keys:
  - n63/TbrQuL3xaIW7ZZpuXj/tIfnK1/MbVxO4vT3wYD2A
  - S90wCvMRhErEA4NVVELYBs6w/Me6+urgUr24xGK44Uy3
  - F1j4b7JKq850NS6Kboiy5laJ0xY8dWJvB3fcwA+SraYl
  - 1cYtvjKJNDVam9c7HNqJUfINk4PYyAXIpjkPn/s1uzPv
  - 3pPK5X6vGtwLhNOfvU2elahECz3HpRUFNXJFLw6lid
```

**url**  
Url to your Vault installation. Required.

**verify**  
For details please see  
http://docs.python-requests.org/en/master/user/advanced/
#ssl-certificate-verification

New in version 2018.3.0.

**role_name**  
Role name for minion tokens created. If omitted, minion tokens will be created without any role, thus being able to inherit any master token policy (including token creation capabilities). Optional.

For details please see:  
https://www.vaultproject.io/api/auth/token/index.html#create-token

Example configuration:  
https://www.nomadproject.io/docs/vault-integration/index.html#
vault-token-role-configuration

**auth**  
Currently only token and approle auth types are supported. Required.

Approle is the preferred way to authenticate with Vault as it provide some advanced options to control authentication process. Please visit Vault documentation for more info:  
https://www.vaultproject.io/docs/auth/approle.html

The token must be able to create tokens with the policies that should be assigned to minions.

You can still use the token auth via a OS environment variable via this config example:

And then export the VAULT_TOKEN variable in your OS:

**policies**  
Policies that are assigned to minions when requesting a token. These can either be static, eg saltstack/minions, or templated, eg saltstack/minion/{minion}. `{minion}` is shorthand for grains[id]. Grains are also available, for example like this: my-policies/
{grains[os]}

If a template contains a grain which evaluates to a list, it will be expanded into multiple policies. For example, given the template saltstack/by-role/{grains[roles]}, and a minion having these grains:

The minion will have the policies saltstack/by-role/web and saltstack/
by-role/database. Note however that list members which do not have simple string representations, such as dictionaries or objects, do not work and will throw an exception. Strings and numbers are examples of types which work well.
Optional. If policies is not configured, saltstack/minions and saltstack/{minion} are used as defaults.

**keys** List of keys to use to unseal vault server with the vault.unseal runner.

Add this segment to the master configuration file, or /etc/salt/master.d/peer_run.conf:

```yaml
peer_run:
  .*:
    - vault.generate_token
```

**salt.modules.vault.delete_secret** *(path)*
Delete secret at the path in vault. The vault policy used must allow this.

CLI Example:

```
salt '*' vault.delete_secret "secret/my/secret"
```

**salt.modules.vault.list_secrets** *(path)*
List secret keys at the path in vault. The vault policy used must allow this. The path should end with a trailing slash.

CLI Example:

```
salt '*' vault.list_secrets "secret/my/"
```

**salt.modules.vault.read_secret** *(path, key=None)*
Return the value of key at path in vault, or entire secret

Jinja Example:

```python
my-secret: {{ salt['vault'].read_secret('secret/my/secret', 'some-key') }}
```

```python
{% set supersecret = salt['vault'].read_secret('secret/my/secret') %}
secrets:
  first: {{ supersecret.first }}
  second: {{ supersecret.second }}
```

**salt.modules.vault.write_raw** *(path, raw)*
Set raw data at the path in vault. The vault policy used must allow this.

CLI Example:

```
salt '*' vault.write_raw "secret/my/secret" '{"user":"foo","password": "bar"}'
```

**salt.modules.vault.write_secret** *(path, **kwargs)*
Set secret at the path in vault. The vault policy used must allow this.

CLI Example:

```
salt '*' vault.write_secret "secret/my/secret" user="foo" password="bar"
```

**21.9.443 salt.modules.vbox_guest**

VirtualBox Guest Additions installer

**salt.modules.vbox_guest.additions_install**( **kwargs**)
Install VirtualBox Guest Additions. Uses the CD, connected by VirtualBox.
To connect VirtualBox Guest Additions via VirtualBox graphical interface press 'Host+D' ('Host' is usually 'Right Ctrl').

See https://www.virtualbox.org/manual/ch04.html#idp52733088 for more details.

CLI Example:

```
salt '*' vbox_guest.additions_install
salt '*' vbox_guest.additions_install reboot=True
salt '*' vbox_guest.additions_install upgrade_os=True
```

Parameters

- **reboot (bool)** – reboot computer to complete installation
- **upgrade_os (bool)** – upgrade OS (to ensure the latests version of kernel and developer tools are installed)

Returns version of VirtualBox Guest Additions or string with error

```
salt.modules.vbox_guest.additions_mount()
```

Mount VirtualBox Guest Additions CD to the temp directory.

To connect VirtualBox Guest Additions via VirtualBox graphical interface press 'Host+D' ('Host' is usually 'Right Ctrl').

CLI Example:

```
salt '*' vbox_guest.additions_mount
```

Returns True or OSError exception

```
salt.modules.vbox_guest.additions_remove(**kwargs)
```

Remove VirtualBox Guest Additions.

Firstly it tries to uninstall itself by executing '/opt/VBoxGuestAdditions-VERSION/uninstall.run uninstall'. It uses the CD, connected by VirtualBox if it fails.

CLI Example:

```
salt '*' vbox_guest.additions_remove
salt '*' vbox_guest.additions_remove force=True
```

Parameters **force (bool)** – force VirtualBox Guest Additions removing

Returns True if VirtualBox Guest Additions were removed successfully else False

```
salt.modules.vbox_guest.additions_umount(mount_point)
```

Unmount VirtualBox Guest Additions CD from the temp directory.

CLI Example:

```
salt '*' vbox_guest.additions_umount
```

Parameters **mount_point** – directory VirtualBox Guest Additions is mounted to

Returns True or an string with error

```
salt.modules.vbox_guest.additions_version()
```

Check VirtualBox Guest Additions version.

CLI Example:

```
salt '*' vbox_guest.additions_version
```

Returns version of VirtualBox Guest Additions or False if they are not installed
salt.modules.vbox_guest.grant_access_to_shared_folders_to(name, users=None)
Grant access to auto-mounted shared folders to the users.

User is specified by it’s name. To grant access for several users use argument users. Access will be denied to the users not listed in users argument.

See https://www.virtualbox.org/manual/ch04.html#sf_mount_auto for more details.

CLI Example:

```
salt '*' vbox_guest.grant_access_to_shared_folders_to fred
salt '*' vbox_guest.grant_access_to_shared_folders_to users ['fred', 'roman']
```

Parameters
- **name** (str) – name of the user to grant access to auto-mounted shared folders to
- **users** (list of str) – list of names of users to grant access to auto-mounted shared folders to (if specified, name will not be taken into account)

Returns list of users who have access to auto-mounted shared folders

salt.modules.vbox_guest.list_shared_folders_users()
List users who have access to auto-mounted shared folders.

See https://www.virtualbox.org/manual/ch04.html#sf_mount_auto for more details.

CLI Example:

```
salt '*' vbox_guest.list_shared_folders_users
```

Returns list of users who have access to auto-mounted shared folders

### 21.9.444 salt.modules.vboxmanage module

Support for VirtualBox using the VBoxManage command

New in version 2016.3.0.

If the vboxdrv kernel module is not loaded, this module can automatically load it by configuring autoload_vboxdrv in /etc/salt/minion:

The default for this setting is False.

depends virtualbox

salt.modules.vboxmanage.clonemedium(medium, uuid_in=None, file_in=None, uuid_out=None, file_out=None, mformat=None, variant=None, existing=False, **kwargs)
Clone a new VM from an existing VM

CLI Example:

```
salt 'hypervisor' vboxmanage.clonemedium <name> <new_name>
```

salt.modules.vboxmanage.clonevm(name=None, uuid=None, new_name=None, snapshot_uid=None, snapshot_name=None, mode='machine', options=None, basefolder=None, new_uuid=None, register=False, groups=None, **kwargs)
Clone a new VM from an existing VM

CLI Example:
### salt 'hypervisor' vboxmanage.clonevm <name> <new_name>

salt.modules.vboxmanage.create(name, groups=None, ostype=None, register=True, base_folder=None, new_uuid=None, **kwargs)

Create a new VM

**CLI Example:**

```shell
salt 'hypervisor' vboxmanage.create <name>
```

### salt 'hypervisor' vboxmanage.destroy <name>

Unregister and destroy a VM

**CLI Example:**

```shell
salt 'hypervisor' vboxmanage.destroy my_vm
```

### salt.modules.vboxmanage.list_items(item, details=False, group_by='UUID')

Return a list of a specific type of item. The following items are available:

- vms runningvms ostypes hostdvs hostfloppies inntnets bridgedifs hostonlyifs natnets dhcpservers hostinfo hostcpuids hddbackends hdds dvds flopphies usbserv hostusbhost usbfilter systemproperties extpacks groups webcams screenshotformats

**CLI Example:**

```shell
salt 'hypervisor' vboxmanage.items <item>
salt 'hypervisor' vboxmanage.items <item> details=True
salt 'hypervisor' vboxmanage.items <item> details=True group_by='Name'
```

Some items do not display well, or at all, unless details is set to True. By default, items are grouped by the UUID field, but not all items contain that field. In those cases, another field must be specified.

### salt.modules.vboxmanage.list_nodes()

Return a list of registered VMs

**CLI Example:**

```shell
salt '*' vboxmanage.list_nodes
```

### salt.modules.vboxmanage.list_nodes_full()

Return a list of registered VMs, with detailed information

**CLI Example:**

```shell
salt '*' vboxmanage.list_nodes_full
```

### salt.modules.vboxmanage.list_nodes_min()

Return a list of registered VMs, with minimal information

**CLI Example:**

```shell
salt '*' vboxmanage.list_nodes_min
```

### salt.modules.vboxmanage.list_ostypes()

List the available OS Types

**CLI Example:**

```shell
salt '*' vboxmanage.list_ostypes
```
salt.modules.vboxmanage.register(filename)
    Register a VM
    CLI Example:
    ```
    salt '*' vboxmanage.register my_vm_filename
    ```

salt.modules.vboxmanage.start(name)
    Start a VM
    CLI Example:
    ```
    salt '*' vboxmanage.start my_vm
    ```

salt.modules.vboxmanage.stop(name)
    Stop a VM
    CLI Example:
    ```
    salt '*' vboxmanage.stop my_vm
    ```

salt.modules.vboxmanage.unregister(name, delete=False)
    Unregister a VM
    CLI Example:
    ```
    salt '*' vboxmanage.unregister my_vm_filename
    ```

salt.modules.vboxmanage.vboxcmd()
    Return the location of the VBoxManage command
    CLI Example:
    ```
    salt '*' vboxmanage.vboxcmd
    ```

21.9.445 salt.modules.victorops

Support for VictorOps

New in version 2015.8.0.

Requires an api_key in /etc/salt/minion:

salt.modules.victorops.create_event(message_type=None, routing_key='everybody', **kwargs)
    Create an event in VictorOps. Designed for use in states.
    The following parameters are required:
    Parameters message_type – One of the following values: INFO, WARNING, ACKNOWLEDGEMENT, CRITICAL, RECOVERY.
    The following parameters are optional:
    Parameters
    - routing_key – The key for where messages should be routed. By default, sent to 'everyone' route.
    - entity_id – The name of alerting entity. If not provided, a random name will be assigned.
    - timestamp – Timestamp of the alert in seconds since epoch. Defaults to the time the alert is received at VictorOps.
    :param timestamp_fmt The date format for the timestamp parameter.
Parameters

- **state_start_time** – The time this entity entered its current state (seconds since epoch). Defaults to the time alert is received.
- **state_start_time_fmt** – The date format for the timestamp parameter.
- **state_message** – Any additional status information from the alert item.
- **entity_is_host** – Used within VictorOps to select the appropriate display format for the incident.
- **entity_display_name** – Used within VictorOps to display a human-readable name for the entity.
- **ack_message** – A user entered comment for the acknowledgment.
- **ack_author** – The user that acknowledged the incident.

Returns A dictionary with result, entity_id, and message if result was failure.

CLI Example:

```bash
salt myminion victorops.create_event message_type='CRITICAL' routing_key='everyone' entity_id='hostname/diskspace'

salt myminion victorops.create_event message_type='ACKNOWLEDGEMENT' routing_key='everyone' entity_id='hostname/diskspace' ack_message='Acknowledged' ack_author='username'

salt myminion victorops.create_event message_type='RECOVERY' routing_key='everyone' entity_id='hostname/diskspace'
```

The following parameters are required: message_type

21.9.446 salt.modules.virt

Work with virtual machines managed by libvirt

**depends** libvirt Python module

Connection

The connection to the virtualization host can be either setup in the minion configuration, pillar data or overridden for each individual call.

By default, the libvirt connection URL will be guessed: the first available libvirt hypervisor driver will be used. This can be overridden like this:

```yaml
virt:
  connection:
    uri: lxc:///  
```

If the connection requires an authentication like for ESXi, this can be defined in the minion pillar data like this:

```yaml
virt:
  connection:
    uri: esx://10.1.1.101/?no_verify=1&auto_answer=1
    auth:
      username: user
      password: secret
```

---

Salt Documentation, Release 2019.2.0

2588 Chapter 21. Salt Module Reference
Connecting with SSH protocol

Libvirt can connect to remote hosts using SSH using one of the ssh, libssh and libssh2 transports. Note that libssh2 is likely to fail as it doesn’t read the known_hosts file. Libvirt may also have been built without libssh or libssh2 support.

To use the SSH transport, on the minion setup an SSH agent with a key authorized on the remote libvirt machine.

Per call connection setup

New in version 2019.2.0.

All the calls requiring the libvirt connection configuration as mentioned above can override this configuration using connection, username and password parameters.

This means that the following will list the domains on the local LXC libvirt driver, whatever the virt:connection is.

```
salt 'hypervisor' virt.list_domains connection=lxc:///
```

The calls not using the libvirt connection setup are:

- seed_non_shared_migrate
- virt_type
- is_*hyper
- all migration functions
- libvirt ESX URI format
- libvirt URI format
- libvirt authentication configuration

```
salt.modules.virt.capabilities(**kwargs)
    Return the hypervisor connection capabilities.

    Parameters
    • connection – libvirt connection URI, overriding defaults
    • username – username to connect with, overriding defaults
    • password – password to connect with, overriding defaults

    New in version 2019.2.0.
```

CLI Example:
```
salt '*' virt.capabilities
```

```
salt.modules.virt.cpu_baseline(full=False, migratable=False, out='libvirt', **kwargs)
    Return the optimal ‘custom’ CPU baseline config for VM’s on this minion

    New in version 2016.3.0.

    Parameters
    • full – Return all CPU features rather than the ones on top of the closest CPU model
    • migratable – Exclude CPU features that are unmigratable (libvirt 2.13+)
    • out – ‘libvirt’ (default) for usable libvirt XML definition, ‘salt’ for nice dict
    • connection – libvirt connection URI, overriding defaults

    New in version 2019.2.0.
```
- **username** – username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** – password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
```bash
salt '*' virt.cpu_baseline
```

```python
salt.modules.virt.create_xml_path(path, **kwargs)
```
Start a domain based on the XML-file path passed to the function

**Parameters**
- **path** – path to a file containing the libvirt XML definition of the domain
- **connection** – libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** – username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** – password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
```bash
salt '*' virt.create_xml_path <path to XML file on the node>
```

```python
salt.modules.virt.create_xml_str(xml, **kwargs)
```
Start a domain based on the XML passed to the function

**Parameters**
- **xml** – libvirt XML definition of the domain
- **connection** – libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** – username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** – password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
```bash
salt '*' virt.create_xml_str <XML in string format>
```

```python
salt.modules.virt.ctrl_alt_del(vm, **kwargs)
```
Sends CTRL+ALT+DEL to a VM

**Parameters**
- **vm** – domain name
- **connection** – libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** – username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** – password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
salt 'HOST' virt.ctrl_alt_del <domain>

salt.modules.virt.define_vol_xml_path(path, **kwargs)
Define a volume based on the XML-file path passed to the function
Parameters
- path – path to a file containing the libvirt XML definition of the volume
- connection – libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- username – username to connect with, overriding defaults
  New in version 2019.2.0.
- password – password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
salt 'HOST' virt.define_vol_xml_path <path to XML file on the node>

salt.modules.virt.define_vol_xml_str(xml, **kwargs)
Define a volume based on the XML passed to the function
Parameters
- xml – libvirt XML definition of the storage volume
- connection – libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- username – username to connect with, overriding defaults
  New in version 2019.2.0.
- password – password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
salt 'HOST' virt.define_vol_xml_str <XML in string format>

The storage pool where the disk image will be defined is default unless changed with a configuration like this:

```
virt:
  storagepool: mine
```

class.salt.modules.virt.define_xml_path(path, **kwargs)
Define a domain based on the XML-file path passed to the function
Parameters
- path – path to a file containing the libvirt XML definition of the domain
- connection – libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- username – username to connect with, overriding defaults
  New in version 2019.2.0.
- password – password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
salt 'HOST' virt.define_xml_path <path to XML file on the node>
**Salt Documentation, Release 2019.2.0**

**salt.modules.virt.define_xml_str(xml, **kwargs)**

Define a domain based on the XML passed to the function.

**Parameters**
- `xml` – libvirt XML definition of the domain
- `connection` – libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- `username` – username to connect with, overriding defaults
  
  New in version 2019.2.0.
- `password` – password to connect with, overriding defaults
  
  New in version 2019.2.0.

**CLI Example:**

```
salt '*' virt.define_xml_str <XML in string format>
```

**salt.modules.virt.delete_snapshots(name, *names, **kwargs)**

Delete one or more snapshots of the given VM.

**Parameters**
- `name` – domain name
- `names` – names of the snapshots to remove
- `connection` – libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- `username` – username to connect with, overriding defaults
  
  New in version 2019.2.0.
- `password` – password to connect with, overriding defaults
  
  New in version 2019.2.0.

**New in version 2016.3.0.**

**CLI Example:**

```
salt '*' virt.delete_snapshots <domain> all=True
salt '*' virt.delete_snapshots <domain> <snapshot>
salt '*' virt.delete_snapshots <domain> <snapshot1> <snapshot2> ...
```

**salt.modules.virt.domain_capabilities(emuator= None, arch= None, machine= None, domain= None, **kwargs)**

Return the domain capabilities given an emulator, architecture, machine or virtualization type.

**New in version 2019.2.0.**

**Parameters**
- `emulator` – return the capabilities for the given emulator binary
- `arch` – return the capabilities for the given CPU architecture
- `machine` – return the capabilities for the given emulated machine type
- `domain` – return the capabilities for the given virtualization type.
- `connection` – libvirt connection URI, overriding defaults
- `username` – username to connect with, overriding defaults
- `password` – password to connect with, overriding defaults

The list of the possible emulator, arch, machine and domain can be found in the host capabilities output.

If none of the parameters is provided the libvirt default domain capabilities will be returned.

**CLI Example:**

```
salt '*' virt.domain_capabilities arch='x86_64' domain='kvm'
```
salt.modules.virt.freecpu(**kwargs)

Return an int representing the number of unallocated cpus on this hypervisor

Parameters

- connection – libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- username – username to connect with, overriding defaults
  New in version 2019.2.0.
- password – password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.freecpu
```

salt.modules.virt.freemem(**kwargs)

Return an int representing the amount of memory (in MB) that has not been given to virtual machines on this node

Parameters

- connection – libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- username – username to connect with, overriding defaults
  New in version 2019.2.0.
- password – password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.freemem
```

salt.modules.virt.full_info(**kwargs)

Return the node_info, vm_info and freemem

Parameters

- connection – libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- username – username to connect with, overriding defaults
  New in version 2019.2.0.
- password – password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.full_info
```

salt.modules.virt.get_disks(vm_, **kwargs)

Return the disks of a named vm

Parameters

- vm – name of the domain
- connection – libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- username – username to connect with, overriding defaults
  New in version 2019.2.0.
password – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.get_disks <domain>
```

salt.modules.virt.get_graphics(vm_, **kwargs)

Returns the information on vnc for a given vm

Parameters

- **vm** – name of the domain
- **connection** – libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- **username** – username to connect with, overriding defaults
  
  New in version 2019.2.0.
- **password** – password to connect with, overriding defaults
  
  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.get_graphics <domain>
```

salt.modules.virt.get_hypervisor()

Returns the name of the hypervisor running on this node or None.

Detected hypervisors:

- kvm
- xen

CLI Example:

```
salt '*' virt.get_hypervisor
```

New in version 2019.2.0: the function and the kvm and xen hypervisors support

salt.modules.virt.get_macs(vm_, **kwargs)

Return a list off MAC addresses from the named vm

Parameters

- **vm** – name of the domain
- **connection** – libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- **username** – username to connect with, overriding defaults
  
  New in version 2019.2.0.
- **password** – password to connect with, overriding defaults
  
  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.get_macs <domain>
```

salt.modules.virt.get_nics(vm_, **kwargs)

Return info about the network interfaces of a named vm

Parameters

- **vm** – name of the domain
- **connection** – libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- **username** – username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** – password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.get_nics <domain>
```

`salt.modules.virt.get_on_crash(vm_, **kwargs)`

Return a on_crash from the named vm

Parameters

- **vm** – name of the domain
- **connection** – libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** – username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** – password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.get_on_crash <domain>
```

`salt.modules.virt.get_on_poweroff(vm_, **kwargs)`

Return a on_poweroff from the named vm

Parameters

- **vm** – name of the domain
- **connection** – libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** – username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** – password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.get_on_poweroff <domain>
```

`salt.modules.virt.get_on_reboot(vm_, **kwargs)`

Return a on_reboot from the named vm

Parameters

- **vm** – name of the domain
- **connection** – libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** – username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** – password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
salt '*' virt.get_on_reboot <domain>

salt.modules.virt.get_profiles(hypervisor=None, **kwargs)
Return the virt profiles for hypervisor.

Currently there are profiles for:
• nic
• disk

Parameters
• hypervisor – override the default machine type.
• connection – libvirt connection URI, overriding defaults
  New in version 2019.2.0.
• username – username to connect with, overriding defaults
  New in version 2019.2.0.
• password – password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
salt '*' virt.get_profiles
salt '*' virt.get_profiles hypervisor=esxi

salt.modules.virt.get_xml(vm_, **kwargs)
Returns the XML for a given vm

Parameters
• vm – domain name
• connection – libvirt connection URI, overriding defaults
  New in version 2019.2.0.
• username – username to connect with, overriding defaults
  New in version 2019.2.0.
• password – password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
salt '*' virt.get_xml <domain>
salt.modules.virt.init(name, cpu, mem, image=None, nic='default', interfaces=None, hypervisor=None, start=True, disk='default', disks=None, saltenv='base', seed=True, install=True, pub_key=None, priv_key=None, seed_cmd='seed.apply', enable_vnc=False, enable_qcow=False, graphics=None, os_type=None, arch=None, **kwargs)

Initialize a new vm

Parameters

- **name** – name of the virtual machine to create
- **cpu** – Number of virtual CPUs to assign to the virtual machine
- **mem** – Amount of memory to allocate to the virtual machine in MiB.
- **image** – Path to a disk image to use as the first disk (Default: None). Deprecated in favor of the disks parameter. To set (or change) the image of a disk, add the following to the disks definitions:

```
{
    'name': 'name_of_disk_to_change',
    'image': '/path/to/the/image'
}
```

- **nic** – NIC profile to use (Default: 'default'). The profile interfaces can be customized / extended with the interfaces parameter. If set to None, no profile will be used.

- **interfaces** – List of dictionaries providing details on the network interfaces to create. These data are merged with the ones from the nic profile. The structure of each dictionary is documented in Network Interfaces Definitions.

New in version 2019.2.0.

- **hypervisor** – the virtual machine type. By default the value will be computed according to the virtual host capabilities.

- **start** – True to start the virtual machine after having defined it (Default: True)

- **disk** – Disk profile to use (Default: 'default'). If set to None, no profile will be used.

- **disks** – List of dictionaries providing details on the disk devices to create. These data are merged with the ones from the disk profile. The structure of each dictionary is documented in Disks Definitions.

New in version 2019.2.0.

- **saltenv** – Fileserver environment (Default: 'base'). See cp module for more details

- **seed** – True to seed the disk image. Only used when the image parameter is provided. (Default: True)

- **install** – install salt minion if absent (Default: True)

- **pub_key** – public key to seed with (Default: None)

- **priv_key** – public key to seed with (Default: None)

- **seed_cmd** – Salt command to execute to seed the image. (Default: 'seed.apply')

- **enable_vnc** – True to setup a vnc display for the VM (Default: False)

Depreciated in favor of the graphics parameter. Could be replaced with the following:

```
graphics={'type': 'vnc'}
```

Depreciated since version 2019.2.0.

- **graphics** – Dictionary providing details on the graphics device to create. (Default: None) See Graphics Definition for more details on the possible values.
New in version 2019.2.0.

- **os_type** – type of virtualization as found in the `/os/type` element of the libvirt definition. The default value is taken from the host capabilities, with a preference for hvm.

New in version 2019.2.0.

- **arch** – architecture of the virtual machine. The default value is taken from the host capabilities, but x86_64 is prefed over i686.

New in version 2019.2.0.

- **enable_qcow** – True to create a QCOW2 overlay image, rather than copying the image (Default: False).

Deprecated in favor of `disks` parameter. Add the following to the disks definitions to create an overlay image of a template disk image with an image set:

```json
{
    'name': 'name_of_disk_to_change',
    'overlay_image': True
}
```

Deprecated since version 2019.2.0.

- **pool** – Path of the folder where the image files are located for vmware/esx hypervisors.

Deprecated in favor of `disks` parameter. Add the following to the disks definitions to set the vmware datastore of a disk image:

```json
{
    'name': 'name_of_disk_to_change',
    'pool': 'mydatastore'
}
```

Deprecated since version Fluorine.

- **dmac** – Default MAC address to use for the network interfaces. By default MAC addresses are automatically generated.

Deprecated in favor of `interfaces` parameter. Add the following to the interfaces definitions to force the mac address of a NIC:

```json
{
    'name': 'name_of_nic_to_change',
}
```

Deprecated since version 2019.2.0.

- **config** – minion configuration to use when seeding. See `seed module for more details`

- **boot_dev** – String of space-separated devices to boot from (Default: 'hd')

- **serial_type** – Serial device type. One of 'pty', 'tcp' (Default: None)

- **telnet_port** – Telnet port to use for serial device of type tcp.

- **console** – True to add a console device along with serial one (Default: True)

- **connection** – libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** – username to connect with, overriding defaults

New in version 2019.2.0.
• **password** – password to connect with, overriding defaults

New in version 2019.2.0.

**Network Interfaces Definitions**

Network interfaces dictionaries can contain the following properties:

- **name** Name of the network interface. This is only used as a key to merge with the profile data.
- **type** Network type. One of 'bridge', 'network'.
- **source** The network source, typically the bridge or network name.
- **mac** The desired mac address, computed if **None** (Default: **None**).
- **model** The network card model (Default: depends on the hypervisor).

**Disks Definitions**

Disk dictionaries can contain the following properties:

- **name** Name of the disk. This is mostly used in the name of the disk image and as a key to merge with the profile data.
- **format** Format of the disk image, like 'qcow2', 'raw', 'vmdk'. (Default: depends on the hypervisor)
- **size** Disk size in MiB.
- **pool** Path to the folder or name of the pool where disks should be created. (Default: depends on hypervisor).
- **model** One of the disk busses allowed by libvirt (Default: depends on hypervisor).

See the libvirt disk element documentation for the allowed bus types.

- **image** Path to the image to use for the disk. If no image is provided, an empty disk will be created (Default: **None**).
- **overlay_image** True to create a QCOW2 disk image with image as backing file. If False the file pointed to by the image property will simply be copied. (Default: False).
- **source_file** Absolute path to the disk image to use. Not to be confused with image parameter. This parameter is useful to use disk images that are created outside of this module. Can also be **None** for devices that have no associated image like cdroms.
- **device** Type of device of the disk. Can be one of 'disk', 'cdrom', 'floppy' or 'lun'. (Default: 'disk')

**Graphics Definition**

The graphics dictionary can have the following properties:

- **type** Graphics type. The possible values are **none**, 'spice', 'vnc' and other values allowed as a libvirt graphics type (Default: **None**).

See the libvirt graphics element documentation for more details on the possible types.

- **port** Port to export the graphics on for vnc, spice and rdp types.
- **tls_port** Port to export the graphics over a secured connection for spice type.
- **listen** Dictionary defining on what address to listen on for vnc, spice and rdp. It has a type property with address and **None** as possible values, and an address property holding the IP or hostname to listen on.

By default, not setting the listen part of the dictionary will default to listen on all addresses.

**CLI Example**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>salt 'hypervisor' virt.init vm_name 4 512 salt://path/to/image.raw</code></td>
<td>Initialize a virtual machine with a specified name, CPU cores, RAM, and image.</td>
</tr>
<tr>
<td><code>salt 'hypervisor' virt.init vm_name 4 512 /var/lib/libvirt/images/img.raw</code></td>
<td>Use the disk image file specified.</td>
</tr>
<tr>
<td><code>salt 'hypervisor' virt.init vm_name 4 512 nic=profile disk=profile</code></td>
<td>Configure network settings with the specified profile and disk.</td>
</tr>
</tbody>
</table>
The disk images will be created in an image folder within the directory defined by the `virt:images` option. Its default value is `/srv/salt-images/` but this can changed with such a configuration:

```
virt:
  images: /data/my/vm/images/
```

`salt.modules.virt.is_hyper()`
Returns a bool whether or not this node is a hypervisor of any kind

CLI Example:
```
salt '*' virt.is_hyper
```

`salt.modules.virt.is_kvm_hyper()`
Returns a bool whether or not this node is a KVM hypervisor

CLI Example:
```
salt '*' virt.is_kvm_hyper
```

 Deprecated since version 2019.2.0.

`salt.modules.virt.is_xen_hyper()`
Returns a bool whether or not this node is a XEN hypervisor

CLI Example:
```
salt '*' virt.is_xen_hyper
```

Deprecated since version 2019.2.0.

`salt.modules.virt.list_active_vms(**kwargs)`
Return a list of names for active virtual machine on the minion

Parameters

- `connection` – libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- `username` – username to connect with, overriding defaults
  New in version 2019.2.0.
- `password` – password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
```
salt '*' virt.list_active_vms
```

`salt.modules.virt.list_domains(**kwargs)`
Return a list of available domains.

Parameters

- `connection` – libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- `username` – username to connect with, overriding defaults
  New in version 2019.2.0.
- `password` – password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
salt '*' virt.list_domains

salt.modules.virt.list_inactive_vms(**kwargs)
Return a list of names for inactive virtual machine on the minion

Parameters
- **connection** – libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** – username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** – password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
salt '*' virt.list_inactive_vms

salt.modules.virt.list_networks(**kwargs)
List all virtual networks.

Parameters
- **connection** – libvirt connection URI, overriding defaults
- **username** – username to connect with, overriding defaults
- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:
salt '*' virt.list_networks

salt.modules.virt.list_pools(**kwargs)
List all storage pools.

Parameters
- **connection** – libvirt connection URI, overriding defaults
- **username** – username to connect with, overriding defaults
- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:
salt '*' virt.list_pools

salt.modules.virt.list_snapshots(domain=None, **kwargs)
List available snapshots for certain vm or for all.

Parameters
- **domain** – domain name
- **connection** – libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** – username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** – password to connect with, overriding defaults
  New in version 2019.2.0.

New in version 2016.3.0.

CLI Example:
salt '*' virt.list_snapshots
salt '*' virt.list_snapshots <domain>

```
salt.modules.virt.migrate(vm_, target, ssh=False)
```

Shared storage migration

**Parameters**

- **vm** – domain name
- **target** – target libvirt host name
- **ssh** – True to connect over ssh

**CLI Example:**

```
salt '*' virt.migrate <domain> <target hypervisor>
```

A tunnel data migration can be performed by setting this in the configuration:

```
virt:
    tunnel: True
```

For more details on tunnelled data migrations, report to [https://libvirt.org/migration.html#transporttunnel](https://libvirt.org/migration.html#transporttunnel)

```
salt.modules.virt.migrate_non_shared(vm_, target, ssh=False)
```

Attempt to execute non-shared storage "all" migration

**Parameters**

- **vm** – domain name
- **target** – target libvirt host name
- **ssh** – True to connect over ssh

**CLI Example:**

```
salt '*' virt.migrate_non_shared <vm name> <target hypervisor>
```

A tunnel data migration can be performed by setting this in the configuration:

```
virt:
    tunnel: True
```

For more details on tunnelled data migrations, report to [https://libvirt.org/migration.html#transporttunnel](https://libvirt.org/migration.html#transporttunnel)

```
salt.modules.virt.migrate_non_shared_inc(vm_, target, ssh=False)
```

Attempt to execute non-shared storage "all" migration

**Parameters**

- **vm** – domain name
- **target** – target libvirt host name
- **ssh** – True to connect over ssh

**CLI Example:**

```
salt '*' virt.migrate_non_shared_inc <vm name> <target hypervisor>
```

A tunnel data migration can be performed by setting this in the configuration:

```
virt:
    tunnel: True
```

For more details on tunnelled data migrations, report to [https://libvirt.org/migration.html#transporttunnel](https://libvirt.org/migration.html#transporttunnel)

```
salt.modules.virt.network_define(name, bridge, forward, **kwargs)
```

Create libvirt network.

**Parameters**
**CLI Example:**
```
salt '*' virt.network_define network main bridge openvswitch
```

New in version 2019.2.0.

**salt.modules.virt.network_info**(name=None, **kwargs)
Return informations on a virtual network provided its name.

Parameters
- name – virtual network name
- connection – libvirt connection URI, overriding defaults
- username – username to connect with, overriding defaults
- password – password to connect with, overriding defaults

If no name is provided, return the infos for all defined virtual networks.

New in version 2019.2.0.

**CLI Example:**
```
salt '*' virt.network_info default
```

**salt.modules.virt.network_set_autostart**(name, state='on', **kwargs)
Set the autostart flag on a virtual network so that the network will start with the host system on reboot.

Parameters
- name – virtual network name
- state – ‘on’ to auto start the network, anything else to mark the virtual network not to be started when the host boots
- connection – libvirt connection URI, overriding defaults
- username – username to connect with, overriding defaults
- password – password to connect with, overriding defaults

New in version 2019.2.0.

**CLI Example:**
```
salt "*" virt.network_set_autostart <pool> <on | off>
```

**salt.modules.virt.network_start**(name, **kwargs)
Start a defined virtual network.

Parameters
- name – virtual network name
- connection – libvirt connection URI, overriding defaults
- username – username to connect with, overriding defaults
- password – password to connect with, overriding defaults

New in version 2019.2.0.

**CLI Example:**
salt '*' virt.network_start default

salt.modules.virt.network_stop(name, **kwargs)
Stop a defined virtual network.
Parameters
- **name** – virtual network name
- **connection** – libvirt connection URI, overriding defaults
- **username** – username to connect with, overriding defaults
- **password** – password to connect with, overriding defaults

New in version 2019.2.0.
CLI Example:
salt '*' virt.network_stop default

salt.modules.virt.network_undefine(name, **kwargs)
Remove a defined virtual network. This does not stop the virtual network.
Parameters
- **name** – virtual network name
- **connection** – libvirt connection URI, overriding defaults
- **username** – username to connect with, overriding defaults
- **password** – password to connect with, overriding defaults

New in version 2019.2.0.
CLI Example:
salt '*' virt.network_undefine default

salt.modules.virt.node_info(**kwargs)
Return a dict with information about this node
Parameters
- **connection** – libvirt connection URI, overriding defaults

New in version 2019.2.0.
- **username** – username to connect with, overriding defaults

New in version 2019.2.0.
- **password** – password to connect with, overriding defaults

New in version 2019.2.0.
CLI Example:
salt '*' virt.node_info

salt.modules.virt.pause(vm_, **kwargs)
Pause the named vm
Parameters
- **vm** – domain name
- **connection** – libvirt connection URI, overriding defaults

New in version 2019.2.0.
- **username** – username to connect with, overriding defaults

New in version 2019.2.0.
- **password** – password to connect with, overriding defaults

New in version 2019.2.0.
CLI Example:
salt '.*' virt.pause <domain>

salt.modules.virt.pool_build(name, **kwargs)
Build a defined libvirt storage pool.

Parameters
• name – libvirt storage pool name
• connection – libvirt connection URI, overriding defaults
• username – username to connect with, overriding defaults
• password – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:
salt '.*' virt.pool_build default

salt.modules.virt.pool_define(name, ptype, target=None, permissions=None, source_devices=None, source_dir=None, source_adapter=None, source_hosts=None, source_auth=None, source_name=None, source_format=None, transient=False, start=True, **kwargs)
Create libvirt pool.

Parameters
• name – Pool name
• ptype – Pool type. See libvirt documentation for the possible values.
• target – Pool full path target
• permissions – Permissions to set on the target folder. This is mostly used for filesystem-based pool types. See Permissions definition for more details on this structure.
• source_devices – List of source devices for pools backed by physical devices. (Default: None)
  Each item in the list is a dictionary with path and optionally part_separator keys. The path is the qualified name for iSCSI devices.
  Report to this libvirt page for more informations on the use of part_separator
• source_dir – Path to the source directory for pools of type dir, netfs or gluster. (Default: None)
• source_adapter – SCSI source definition. The value is a dictionary with type, name, parent, managed, parent_wwnn, parent_wwpn, parent_fabric_wwn, wwnn, wwpn and parent_address keys.
  The parent_address value is a dictionary with unique_id and address keys. The address represents a PCI address and is itself a dictionary with domain, bus, slot and function properties. Report to this libvirt page for the meaning and possible values of these properties.
• source_hosts – List of source for pools backed by storage from remote servers. Each item is the hostname optionally followed by the port separated by a colon. (Default: None)
• source_auth – Source authentication details. (Default: None)

The value is a dictionary with type, username and secret keys. The type can be one of ceph for Ceph RBD or chap for iSCSI sources.

The secret value links to a libvirt secret object. It is a dictionary with type and value keys. The type value can be either uuid or usage.

Examples:
source_auth={
    'type': 'ceph',
    'username': 'admin',
    'secret': {
        'type': 'uuid',
        'uuid': '2ec115d7-3a88-3ceb-bc12-0ac909a6fd87'
    }
}

source_auth={
    'type': 'chap',
    'username': 'myname',
    'secret': {
        'type': 'usage',
        'uuid': 'mycluster_mynname'
    }
}

- **source_name**  – Identifier of name-based sources.
- **source_format**  – String representing the source format. The possible values are depending on the source type. See libvirt documentation for the possible values.
- **start**  – Pool start (default True)
- **transient**  – When True, the pool will be automatically undefined after being stopped. Note that a transient pool will force start to True. (Default: False)
- **connection**  – libvirt connection URI, overriding defaults
- **username**  – username to connect with, overriding defaults
- **password**  – password to connect with, overriding defaults

Permissions definition

The permissions are described by a dictionary containing the following keys:

**mode**  The octal representation of the permissions. (Default: 0711)

**owner**  the numeric user ID of the owner. (Default: from the parent folder)

**group**  the numeric ID of the group. (Default: from the parent folder)

**label**  the SELinux label. (Default: None)

CLI Example:

Local folder pool:

```
salt '*' virt.pool_define somepool dir target=/srv/mypool
    permissions="{'mode': '0744' 'ower': 107, 'group': 107 }"
```

CIFS backed pool:

```
salt '*' virt.pool_define myshare netfs source_format=cifs
    source_dir=samba_share source_hosts="['example.com']" target=/mnt/
```

New in version 2019.2.0.

**salt.modules.virt.pool_delete**(name, fast=True, **kwargs)**

Delete the resources of a defined libvirt storage pool.

**Parameters**

- **name**  – libvirt storage pool name
fast – if set to False, zeroes out all the data. Default value is True.
- connection – libvirt connection URI, overriding defaults
- username – username to connect with, overriding defaults
- password – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:
```
salt '*' virt.pool_delete default
```

salt.modules.virt.pool_info(name=None, **kwargs)
Return informations on a storage pool provided its name.

Parameters
- name – libvirt storage pool name
- connection – libvirt connection URI, overriding defaults
- username – username to connect with, overriding defaults
- password – password to connect with, overriding defaults

If no name is provided, return the infos for all defined storage pools.

New in version 2019.2.0.

CLI Example:
```
salt '*' virt.pool_info_default
```

salt.modules.virt.pool_list_volumes(name, **kwargs)
List the volumes contained in a defined libvirt storage pool.

Parameters
- name – libvirt storage pool name
- connection – libvirt connection URI, overriding defaults
- username – username to connect with, overriding defaults
- password – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:
```
salt "*" virt.pool_list_volumes <pool>
```

salt.modules.virt.pool_refresh(name, **kwargs)
Refresh a defined libvirt storage pool.

Parameters
- name – libvirt storage pool name
- connection – libvirt connection URI, overriding defaults
- username – username to connect with, overriding defaults
- password – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:
```
salt '*' virt.pool_refresh default
```

salt.modules.virt.pool_set_autostart(name, state='on', **kwargs)
Set the autostart flag on a libvirt storage pool so that the storage pool will start with the host system on reboot.

Parameters
- name – libvirt storage pool name
- state – 'on' to auto start the pool, anything else to mark the pool not to be started when the host boots
- connection – libvirt connection URI, overriding defaults
• **username** – username to connect with, overriding defaults
• **password** – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```bash
salt "*" virt.pool_set_autostart <pool> <on | off>
```

salt.modules.virt.pool_start(name, **kwargs)

Start a defined libvirt storage pool.

Parameters

• **name** – libvirt storage pool name
• **connection** – libvirt connection URI, overriding defaults
• **username** – username to connect with, overriding defaults
• **password** – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```bash
salt "*" virt.pool_start default
```

salt.modules.virt.pool_stop(name, **kwargs)

Stop a defined libvirt storage pool.

Parameters

• **name** – libvirt storage pool name
• **connection** – libvirt connection URI, overriding defaults
• **username** – username to connect with, overriding defaults
• **password** – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```bash
salt "*" virt.pool_stop default
```

salt.modules.virt.pool_undefine(name, **kwargs)

Remove a defined libvirt storage pool. The pool needs to be stopped before calling.

Parameters

• **name** – libvirt storage pool name
• **connection** – libvirt connection URI, overriding defaults
• **username** – username to connect with, overriding defaults
• **password** – password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```bash
salt "*" virt.pool_undefine default
```

salt.modules.virt.purge(vm_, dirs=False, removables=None, **kwargs)

Recursively destroy and delete a virtual machine, pass True for dir’s to also delete the directories containing the virtual machine disk images - USE WITH EXTREME CAUTION!

Pass removables=False to avoid deleting cdrom and floppy images. To avoid disruption, the default but dangerous value is True. This will be changed to the safer False default value in Sodium.

Parameters

• **vm** – domain name
• **dirs** – pass True to remove containing directories
• **removables** – pass True to remove removable devices
New in version 2019.2.0.

- **connection** – libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- **username** – username to connect with, overriding defaults
  
  New in version 2019.2.0.
- **password** – password to connect with, overriding defaults
  
  New in version 2019.2.0.

CLI Example:

```bash
salt '*' virt.purge <domain> removables=False
```

```bash
salt.modules.virt.reboot(name, **kwargs)
```

Reboot a domain via ACPI request

Parameters

- **vm** – domain name
- **connection** – libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- **username** – username to connect with, overriding defaults
  
  New in version 2019.2.0.
- **password** – password to connect with, overriding defaults
  
  New in version 2019.2.0.

CLI Example:

```bash
salt '*' virt.reboot <domain>
```

```bash
salt.modules.virt.reset(vm_, **kwargs)
```

Reset a VM by emulating the reset button on a physical machine

Parameters

- **vm** – domain name
- **connection** – libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- **username** – username to connect with, overriding defaults
  
  New in version 2019.2.0.
- **password** – password to connect with, overriding defaults
  
  New in version 2019.2.0.

CLI Example:

```bash
salt '*' virt.reset <domain>
```

```bash
salt.modules.virt.resume(vm_, **kwargs)
```

Resume the named vm

Parameters

- **vm** – domain name
- **connection** – libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- **username** – username to connect with, overriding defaults
  
  New in version 2019.2.0.
- **password** – password to connect with, overriding defaults
  
  New in version 2019.2.0.
salt.modules.virt.revert_snapshot(name, vm_snapshot=None, cleanup=False, **kwargs)

Revert snapshot to the previous from current (if available) or to the specific.

Parameters

- `name` – domain name
- `vm_snapshot` – name of the snapshot to revert
- `cleanup` – Remove all newer than reverted snapshots. Values: True or False (default False).
- `connection` – libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- `username` – username to connect with, overriding defaults
  
  New in version 2019.2.0.
- `password` – password to connect with, overriding defaults
  
  New in version 2019.2.0.

New in version 2016.3.0.

CLI Example:

```
salt '*' virt.revert <domain>
salt '*' virt.revert <domain> <snapshot>
```

salt.modules.virt.seed_non_shared_migrate(disks, force=False)

Non shared migration requires that the disks be present on the migration destination, pass the disks information via this function, to the migration destination before executing the migration.

Parameters

- `disks` – the list of disk data as provided by virt.get_disks
- `force` – skip checking the compatibility of source and target disk images if True.
  
  (default: False)

CLI Example:

```
salt '*' virt.seed_non_shared_migrate <disks>
```

salt.modules.virt.set_autostart(vm, state='on', **kwargs)

Set the autostart flag on a VM so that the VM will start with the host system on reboot.

Parameters

- `vm` – domain name
- `state` – ‘on’ to auto start the pool, anything else to mark the pool not to be started when the host boots
- `connection` – libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- `username` – username to connect with, overriding defaults
  
  New in version 2019.2.0.
- `password` – password to connect with, overriding defaults
  
  New in version 2019.2.0.

CLI Example:

```
salt "*" virt.set_autostart <domain> <on | off>
```

salt.modules.virt.setmem(vm, memory, config=False, **kwargs)

Changes the amount of memory allocated to VM. The VM must be shutdown for this to work.
### Parameters
- **vm** – name of the domain
- **memory** – memory amount to set in MB
- **config** – if True then libvirt will be asked to modify the config as well
- **connection** – libvirt connection URI, overriding defaults

New in version 2019.2.0.
- **username** – username to connect with, overriding defaults

New in version 2019.2.0.
- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

**CLI Example:**

```
salt '*' virt.setmem <domain> <size>
salt '*' virt.setmem my_domain 768
```

### `salt.modules.virt.setvcpus(vm_, vcpus, config=False, **kwargs)`
Changes the amount of vcpus allocated to VM. The VM must be shutdown for this to work.

If config is True then we ask libvirt to modify the config as well

**Parameters**
- **vm** – name of the domain
- **vcpus** – integer representing the number of CPUs to be assigned
- **config** – if True then libvirt will be asked to modify the config as well
- **connection** – libvirt connection URI, overriding defaults

New in version 2019.2.0.
- **username** – username to connect with, overriding defaults

New in version 2019.2.0.
- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

**CLI Example:**

```
salt '*' virt.setvcpus <domain> <amount>
salt '*' virt.setvcpus my_domain 4
```

### `salt.modules.virt.shutdown(vm_, **kwargs)`
Send a soft shutdown signal to the named vm

**Parameters**
- **vm** – domain name
- **connection** – libvirt connection URI, overriding defaults

New in version 2019.2.0.
- **username** – username to connect with, overriding defaults

New in version 2019.2.0.
- **password** – password to connect with, overriding defaults

New in version 2019.2.0.

**CLI Example:**

```
salt '*' virt.shutdown <domain>
```

### `salt.modules.virt.snapshot(domain, name=None, suffix=None, **kwargs)`
Create a snapshot of a VM.

**Parameters**
• **domain** – domain name
• **name** – Name of the snapshot. If the name is omitted, then will be used original domain name with ISO 8601 time as a suffix.
• **suffix** – Add suffix for the new name. Useful in states, where such snapshots can be distinguished from manually created.
• **connection** – libvirt connection URI, overriding defaults
  New in version 2019.2.0.
• **username** – username to connect with, overriding defaults
  New in version 2019.2.0.
• **password** – password to connect with, overriding defaults
  New in version 2019.2.0.

New in version 2016.3.0.

CLI Example:

```
salt '*' virt.snapshot <domain>
```

salt.modules.virt.start(name, **kwargs)

Start a defined domain

Parameters

• **vm** – domain name
• **connection** – libvirt connection URI, overriding defaults
  New in version 2019.2.0.
• **username** – username to connect with, overriding defaults
  New in version 2019.2.0.
• **password** – password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.start <domain>
```

salt.modules.virt.stop(name, **kwargs)

Hard power down the virtual machine, this is equivalent to pulling the power.

Parameters

• **vm** – domain name
• **connection** – libvirt connection URI, overriding defaults
  New in version 2019.2.0.
• **username** – username to connect with, overriding defaults
  New in version 2019.2.0.
• **password** – password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.stop <domain>
```

salt.modules.virt.undefine(vm_, **kwargs)

Remove a defined vm, this does not purge the virtual machine image, and this only works if the vm is powered down

Parameters

• **vm** – domain name
- **connection** – libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** – username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** – password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:

```bash
salt '*' virt.undefine <domain>
```

`salt.modules.virt.update(name, cpu=0, mem=0, disk_profile=None, disks=None, nic_profile=None, interfaces=None, graphics=None, live=True, **kwargs)`

Update the definition of an existing domain.

**Parameters**

- **name** – Name of the domain to update
- **cpu** – Number of virtual CPUs to assign to the virtual machine
- **mem** – Amount of memory to allocate to the virtual machine in MiB.
- **disk_profile** – disk profile to use
- **disks** – Disk definitions as documented in the `init()` function. If neither the profile nor this parameter are defined, the disk devices will not be changed. However to clear disks set this parameter to empty list.
- **nic_profile** – network interfaces profile to use
- **interfaces** – Network interface definitions as documented in the `init()` function. If neither the profile nor this parameter are defined, the interface devices will not be changed. However to clear network interfaces set this parameter to empty list.
- **graphics** – The new graphics definition as defined in Graphics Definition. If not set, the graphics will not be changed. To remove a graphics device, set this parameter to {'type': 'none'}.
- **live** – `False` to avoid trying to live update the definition. In such a case, the new definition is applied at the next start of the virtual machine. If `True`, not all aspects of the definition can be live updated, but as much as possible will be attempted. (Default: `True`)
- **connection** – libvirt connection URI, overriding defaults
- **username** – username to connect with, overriding defaults
- **password** – password to connect with, overriding defaults

**Returns**

Returns a dictionary indicating the status of what has been done. It is structured in the following way:

```python
{
    'definition': True,
    'cpu': True,
    'mem': True,
    'disks': {'attached': [list of actually attached disks],
              'detached': [list of actually detached disks]},
    'nics': {'attached': [list of actually attached nics],
             'detached': [list of actually detached nics]},
    'errors': ['error messages for failures']
}
```

New in version 2019.2.0.

CLI Example:
Salt Documentation, Release 2019.2.0

```bash
salt '*' virt.update domain cpu=2 mem=1024
```

salt.modules.virt.virt_type()
Returns the virtual machine type as a string

CLI Example:

```bash
salt '*' virt.virt_type
```

salt.modules.virt.vm_cputime(vm_=None, **kwargs)
Return cputime used by the vms on this hyper in a list of dicts:

Parameters
- **vm** – domain name
- **connection** – libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- **username** – username to connect with, overriding defaults
  
  New in version 2019.2.0.
- **password** – password to connect with, overriding defaults
  
  New in version 2019.2.0.

```
[
    'your-vm': {
        'cputime' <int>,
        'cputime_percent' <int>
    },
    ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```bash
salt '*' virt.vm_cputime
```

salt.modules.virt.vm_diskstats(vm_=None, **kwargs)
Return disk usage counters used by the vms on this hyper in a list of dicts:

Parameters
- **vm** – domain name
- **connection** – libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- **username** – username to connect with, overriding defaults
  
  New in version 2019.2.0.
- **password** – password to connect with, overriding defaults
  
  New in version 2019.2.0.

```
[
    'your-vm': {
        'rd_req' : 0,
        'rd_bytes' : 0,
        'wr_req' : 0,
        'wr_bytes' : 0,
        'errs' : 0
    }
]
```
(continues on next page)
If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_diskstats
```

```python
salt.modules.virt.vm_info(vm_=None, **kwargs)

Return detailed information about the vms on this hyper in a list of dicts:

- **vm** – name of the domain
- **connection** – libvirt connection URI, overriding defaults
  - New in version 2019.2.0.
- **username** – username to connect with, overriding defaults
  - New in version 2019.2.0.
- **password** – password to connect with, overriding defaults
  - New in version 2019.2.0.

```
[
  {'your-vm': {
    'cpu': <int>,
    'maxMem': <int>,
    'mem': <int>,
    'state': '<state>',
    'cputime': <int>
  },
  ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_info
```

```python
salt.modules.virt.vm_netstats(vm_=None, **kwargs)

Return combined network counters used by the vms on this hyper in a list of dicts:

- **vm** – domain name
- **connection** – libvirt connection URI, overriding defaults
  - New in version 2019.2.0.
- **username** – username to connect with, overriding defaults
  - New in version 2019.2.0.
- **password** – password to connect with, overriding defaults
  - New in version 2019.2.0.

```
If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:
```
salt '*' virt.vm_netstats
```

salt.modules.virt.vm_state

Return list of all the vms and their state.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

Parameters
- **vm** – name of the domain
- **connection** – libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** – username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** – password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
```
salt '*' virt.vm_state <domain>
```

21.9.447 salt.modules.virtualenv

Create virtualenv environments.

New in version 0.17.0.

salt.modules.virtualenv_mod.create

Create a virtualenv

```
path, venv_bin=None, system_site_packages=False, distribute=False, clear=False, python=None, extra_search_dir=None, never_download=None, prompt=None, pip=False, symlinks=None, upgrade=None, user=None, use_vt=False, saltenv='base', **kwargs)
```

Create a virtualenv

**path** The path to the virtualenv to be created

**venv_bin** The name (and optionally path) of the virtualenv command. This can also be set globally in the minion config file as virtualenv.venv_bin. Defaults to virtualenv.

**system_site_packages** [False] Passthrough argument given to virtualenv or pyenv
**distribute** [False] Passthrough argument given to virtualenv

**pip** [False] Install pip after creating a virtual environment. Implies `distribute=True`

**clear** [False] Passthrough argument given to virtualenv or pyvenv

**python** [None (default)] Passthrough argument given to virtualenv

**extra_search_dir** [None (default)] Passthrough argument given to virtualenv

**never_download** [None (default)] Passthrough argument given to virtualenv if True

**prompt** [None (default)] Passthrough argument given to virtualenv if not None

**symlinks** [None] Passthrough argument given to pyvenv if True

**upgrade** [None] Passthrough argument given to pyvenv if True

**user** [None] Set ownership for the virtualenv

---

**Note:** On Windows you must also pass a **password** parameter. Additionally, the user must have permissions to the location where the virtual environment is being created

**runas** [None] Set ownership for the virtualenv

  Deprecated since version 2014.1.0: **user** should be used instead

**use_vt** [False] Use VT terminal emulation (see output while installing)

  New in version 2015.5.0.

**saltenv** ['base'] Specify a different environment. The default environment is **base**.

  New in version 2014.1.0.

---

**Note:** The **runas** argument is deprecated as of 2014.1.0. **user** should be used instead.

---

CLI Example:

```
salt '*' virtualenv.create /path/to/new/virtualenv
```

salt.modules.virtualenv_mod.get_distribution_path(venv, distribution)

Return the path to a distribution installed inside a virtualenv

New in version 2016.3.0.

**venv** Path to the virtualenv.

**distribution** Name of the distribution. Note, all non-alphanumeric characters will be converted to dashes.

CLI Example:

```
salt '*' virtualenv.get_distribution_path /path/to/my/venv my_distribution
```

salt.modules.virtualenv_mod.get_resource_content(venv, package=None, resource=None)

Return the content of a package resource installed inside a virtualenv

New in version 2015.5.0.

**venv** Path to the virtualenv

**package** Name of the package in which the resource resides

  New in version 2016.3.0.

**resource** Name of the resource of which the content is to be returned

  New in version 2016.3.0.

CLI Example:

```
salt '*' virtualenv.get_resource_content /path/to/my/venv my_package my/resource.
```
salt.modules.virtualenv_mod.get_resource_path(venv, package=None, resource=None)
Return the path to a package resource installed inside a virtualenv

New in version 2015.5.0.
venv Path to the virtualenv
package Name of the package in which the resource resides

New in version 2016.3.0.
resource Name of the resource of which the path is to be returned

New in version 2016.3.0.
CLI Example:
salt '*' virtualenv.get_resource_path /path/to/my/venv my_package my/resource.xml

salt.modules.virtualenv_mod.get_site_packages(venv)
Return the path to the site-packages directory of a virtualenv

venv Path to the virtualenv.

CLI Example:
salt '*' virtualenv.get_site_packages /path/to/my/venv

21.9.448  salt.modules.vmctl
Manage vms running on the OpenBSD VMM hypervisor using vmctl(8).
New in version 2019.2.0.

codeauthor Jasper Lievisse Adriaanse <jasper@openbsd.org>

Note: This module requires the vmd service to be running on the OpenBSD target machine.

salt.modules.vmctl.create_disk(name, size)
Create a VMM disk with the specified name and size.
size: Size in megabytes, or use a specifier such as M, G, T.

CLI Example:
salt '*' vmctl.create_disk /path/to/disk.img size=10G

salt.modules.vmctl.load(path)
Load additional configuration from the specified file.
path Path to the configuration file.

CLI Example:
salt '*' vmctl.load path=/etc/vm.switches.conf

salt.modules.vmctl.reload()
Remove all stopped VMs and reload configuration from the default configuration file.

CLI Example:
salt '*' vmctl.reload

salt.modules.vmctl.reset(all=False, vms=False, switches=False)
Reset the running state of VMM or a subsystem.
all: Reset the running state.
**Salt Documentation, Release 2019.2.0**

**switches:** Reset the configured switches.

**vms:** Reset and terminate all VMs.

CLI Example:

```
salt '*' vmctl.reset all=True
```

**salt.modules.vmctl.start** *(name=None, id=None, bootpath=None, disk=None, disks=None, local_iface=False, memory=None, nics=0, switch=None)*

Starts a VM defined by the specified parameters. When both a name and id are provided, the id is ignored.

**name:** Name of the defined VM.

**id:** VM id.

**bootpath:** Path to a kernel or BIOS image to load.

**disk:** Path to a single disk to use.

**disks:** List of multiple disks to use.

**local_iface:** Whether to add a local network interface. See "LOCAL INTERFACES" in the vmctl(8) manual page for more information.

**memory:** Memory size of the VM specified in megabytes.

**switch:** Add a network interface that is attached to the specified virtual switch on the host.

CLI Example:

```
salt '*' vmctl.start 2  # start VM with id 2
salt '*' vmctl.start name=web1 bootpath=’/bsd.rd’ nics=2 memory=512M disk=’/disk.~img’
```

**salt.modules.vmctl.status** *(name=None, id=None)*

List VMs running on the host, or only the VM specified by id. When both a name and id are provided, the id is ignored.

**name:** Name of the defined VM.

**id:** VM id.

CLI Example:

```
salt '*' vmctl.status  # to list all VMs
salt '*' vmctl.status name=web1  # to get a single VM
```

**salt.modules.vmctl.stop** *(name=None, id=None)*

Stop (terminate) the VM identified by the given id or name. When both a name and id are provided, the id is ignored.

**name:** Name of the defined VM.

**id:** VM id.

CLI Example:

```
salt '*' vmctl.stop name=alpine
```

**21.9.449 salt.modules.vsphere**

Manage VMware vCenter servers and ESXi hosts.

New in version 2015.8.4.

**codeauthor** Alexandru Bleotu <alexandru.bleotu@morganstaley.com>

**Dependencies**

- pyVmomi Python Module
ESXCLI

pyVmomi

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

**Note:** Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See Issue #29537 for more information.

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==5.5.0.2014.1.1
```

The 5.5.0.2014.1.1 is a known stable version that this original vSphere Execution Module was developed against.

ESXCLI

Currently, about a third of the functions used in the vSphere Execution Module require the ESXCLI package be installed on the machine running the Proxy Minion process.

The ESXCLI package is also referred to as the VMware vSphere CLI, or vCLI. VMware provides vCLI package installation instructions for vSphere 5.5 and vSphere 6.0.

Once all of the required dependencies are in place and the vCLI package is installed, you can check to see if you can connect to your ESXi host or vCenter server by running the following command:

```
esxcli -s <host-location> -u <username> -p <password> system syslog config get
```

If the connection was successful, ESXCLI was successfully installed on your system. You should see output related to the ESXi host’s syslog configuration.

**Note:** Be aware that some functionality in this execution module may depend on the type of license attached to a vCenter Server or ESXi host(s).

For example, certain services are only available to manipulate service state or policies with a VMware vSphere Enterprise or Enterprise Plus license, while others are available with a Standard license. The ntpd service is restricted to an Enterprise Plus license, while ssh is available via the Standard license.

Please see the vSphere Comparison page for more information.

About

This execution module was designed to be able to handle connections both to a vCenter Server, as well as to an ESXi host. It utilizes the pyVmomi Python library and the ESXCLI package to run remote execution functions against either the defined vCenter server or the ESXi host.
Whether or not the function runs against a vCenter Server or an ESXi host depends entirely upon the arguments passed into the function. Each function requires a host location, username, and password. If the credentials provided apply to a vCenter Server, then the function will be run against the vCenter Server. For example, when listing hosts using vCenter credentials, you’ll get a list of hosts associated with that vCenter Server:

```
# salt my-minion vsphere.list_hosts <vcenter-ip> <vcenter-user> <vcenter-password>
my-minion:
  - esxi-1.example.com
  - esxi-2.example.com
```

However, some functions should be used against ESXi hosts, not vCenter Servers. Functionality such as getting a host’s coredump network configuration should be performed against a host and not a vCenter server. If the authentication information you’re using is against a vCenter server and not an ESXi host, you can provide the host name that is associated with the vCenter server in the command, as a list, using the host_names or esxi_host kwarg. For example:

```
# salt my-minion vsphere.get_coredump_network_config <vcenter-ip> <vcenter-user> <vcenter-password> esxi_hosts='[esxi-1.example.com, esxi-2.example.com]'
my-minion:
  ----------------
  esxi-1.example.com:
  ----------------
  Coredump Config:
  _____________
  enabled: False
  esxi-2.example.com:
  _____________
  Coredump Config:
  _____________
  enabled: True
  host_vnic: vmk0
  ip: coredump-location.example.com
  port: 6500
```

You can also use these functions against an ESXi host directly by establishing a connection to an ESXi host using the host’s location, username, and password. If ESXi connection credentials are used instead of vCenter credentials, the host_names and esxi_hosts arguments are not needed.

```
# salt my-minion vsphere.get_coredump_network_config esxi-1.example.com root <host-password>
local:
  ----------------
  10.4.28.150:
  ----------------
  Coredump Config:
  _____________
  enabled: True
  host_vnic: vmk0
  ip: coredump-location.example.com
```

(continues on next page)
port: 6500

salt.modules.vsphere.add_capacity_to_diskgroup(
    cache_disk_id,  
capacity_disk_ids,  
safety_checks=True,  

    service_instance=None
)

Adds capacity disks to the disk group with the specified cache disk.

cache_disk_id  The canonical name of the cache disk.
capacity_disk_ids  A list containing canonical names of the capacity disks to add.
safety_checks  Specify whether to perform safety check or to skip the checks and try performing the required
task. Default value is True.

service_instance  Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

salt '*' vsphere.add_capacity_to_diskgroup  
    cache_disk_id='naa.000000000000001'  
    capacity_disk_ids=['naa.000000000000002', 'naa.000000000000003']

salt.modules.vsphere.add_host_to_dvs(
    host,  
username,  
password,  
vmknic_name,  
vmnic_name,  
dvs_name,  
target_portgroup_name,  
uplink_portgroup_name,  
protocol=None,  
port=None,  
host_names=None
)

Adds an ESXi host to a vSphere Distributed Virtual Switch and migrates the desired adapters to the DVS from
the standard switch.

host  The location of the vCenter server.
username  The username used to login to the vCenter server.
password  The password used to login to the vCenter server.
vmknic_name  The name of the virtual NIC to migrate.
vmnic_name  The name of the physical NIC to migrate.
dvs_name  The name of the Distributed Virtual Switch.
target_portgroup_name  The name of the distributed portgroup in which to migrate the virtual NIC.
uplink_portgroup_name  The name of the uplink portgroup in which to migrate the physical NIC.
protocol  Optionally set to alternate protocol if the vCenter server or ESX/ESXi host is not using the default
protocol. Default protocol is https.
port  Optionally set to alternate port if the vCenter server or ESX/ESXi host is not using the default port.
Default port is 443.

host_names:  An array of VMware host names to migrate

CLI Example:

salt some_host vsphere.add_host_to_dvs  
    host='vsphere.corp.com'  
    username='administrator@vsphere.corp.com'  
    password='vsphere_password'  
    vmknic_name='vmk0'  
    vmnic_name='vmnic0'  
    dvs_name='DSwitch'  
    target_portgroup_name='DPortGroup'  
    uplink_portgroup_name='DSwitch1-DVUplinks-\181'  
    protocol='https'  
    port='443',  
    host_names=['esxi1.corp.com', 'esxi2.corp.com',  
                   'esxi3.corp.com']

Return Example:

somehost:  
    ---------  
    esxi1.corp.com:  
    ---------  
    dvs:  
        DSwitch
This was very difficult to figure out. VMware’s PyVmomi documentation at
says to create the DVS, create distributed portgroups, and then add the host to the DVS specifying which physical NIC to use as the port backing. However, if the physical NIC is in use as the only link from the host to vSphere, this will fail with an unhelpful "busy" error.

There is, however, a Powershell PowerCLI cmdlet called Add-VDSwitchPhysicalNetworkAdapter that does what we want. I used Onyx (https://labs.vmware.com/flings/onyx) to sniff the SOAP stream from Powershell to our vSphere server and got this snippet out:

```
<UpdateNetworkConfig xmlns="urn:vim25">
```

(continues on next page)
The SOAP API maps closely to PyVmomi, so from there it was (relatively) easy to figure out what Python to write.

```python
salt.modules.vsphere.add_license(key, description, safety_checks=True, service_instance=None)
```

Adds a license to the vCenter or ESXi host.

- **key**  License key.
- **description**  License description added in as a label.
- **safety_checks**  Specify whether to perform safety check or to skip the checks and try performing the required task.
- **service_instance**  Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```python
salt '*' vsphere.add_license key=<license_key> desc='License desc'
```

```python
salt.modules.vsphere.assign_default_storage_policy_to_datastore(policy, datastore, service_instance=None)
```

Assigns a storage policy as the default policy to a datastore.
policy  Name of the policy to assign.
datastore Name of the datastore to assign. The datastore needs to be visible to the VMware entity the proxy points to.
service_instance  Service instance (vim.ServiceInstance) of the vCenter. Default is None.

salt '*' vsphere.assign_storage_policy_to_datastore
    policy='policy name' datastore=ds1

salt.modules.vsphere.assign_license(license_key, license_name, entity, entity_display_name,
     safety_checks=True, service_instance=None)

Assigns a license to an entity
license_key  Key of the license to assign See _get_entity docstrings for format.
license_name  Display name of license
entity  Dictionary representation of an entity
entity_display_name  Entity name used in logging
safety_checks  Specify whether to perform safety check or to skip the checks and try performing the required task. Default is False.
service_instance  Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

salt '*' vsphere.assign_license  license_key=00000:00000
     license_name=test entity={type:cluster,datacenter:dc,cluster:cl}

salt.modules.vsphere.compare_vm_configs(new_config, current_config)

Compares virtual machine current and new configuration, the current is the one which is deployed now, and the new is the target config. Returns the differences between the objects in a dictionary, the keys are the configuration parameter keys and the values are differences objects: either list or recursive difference
new_config:  New config dictionary with every available parameter
current_config:  Currently deployed configuration

salt.modules.vsphere.configure_host_cache(enabled, datastore=None, swap_size_MiB=None,
     service_instance=None)

Configures the host cache on the selected host.
enabled  Boolean flag specifying whether the host cache is enabled.
datastore  Name of the datastore that contains the host cache. Must be set if enabled is True.
swap_size_MiB  Swap size in Mibibytes. Needs to be set if enabled is True. Must be smaller than the datastore size.
service_instance  Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

salt '*' vsphere.configure_host_cache enabled=False
salt '*' vsphere.configure_host_cache enabled=True datastore=ds1
     swap_size_MiB=1024

salt.modules.vsphere.coredump_network_enable(host, username, password, enabled, protocol=None, port=None, esxi_hosts=None, credstore=None)

Enable or disable ESXi core dump collection. Returns True if coredump is enabled and returns False if core dump is not enabled. If there was an error, the error will be the value printed in the Error key dictionary for the given host.
host  The location of the host.
username  The username used to login to the host, such as root.
password  The password used to login to the host.
enabled  Python True or False to enable or disable coredumps.
protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port  Optionally set to alternate port if the host is not using the default port. Default port is 443.
esxi_hosts  If host is a vCenter host, then use esxi_hosts to execute this function on a list of one or more
ESXi machines.
credstore  Optionally set to path to the credential store file.
CLI Example:

```bash
# Used for ESXi host connection information
salt '*' vsphere.coredump_network_enable my.esxi.host root bad-password True

# Used for connecting to a vCenter Server
salt '*' vsphere.coredump_network_enable my.vcenter.location root bad-password
esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

```python
salt.modules.vsphere.create_cluster(cluster_dict, datacenter=None, cluster=None, service_instance=None)
```

Creates a cluster.

Note: cluster_dict['name'] will be overridden by the cluster param value

```python
config_dict  Dictionary with the config values of the new cluster.
datacenter  Name of datacenter containing the cluster. Ignored if already contained by proxy details. Default
value is None.
cluster  Name of cluster. Ignored if already contained by proxy details. Default value is None.
service_instance  Service instance (vim.ServiceInstance) of the vCenter. Default is None.
```

```bash
# esxdatacenter proxy
salt '*' vsphere.create_cluster cluster_dict=${cluster_dict} cluster=cl1

# esxcluster proxy
salt '*' vsphere.create_cluster cluster_dict=${cluster_dict}
```

```python
salt.modules.vsphere.create_datacenter(datacenter_name, service_instance=None)
```

Creates a datacenter.

Supported proxies: esxdatacenter
datacenter_name  The datacenter name
service_instance  Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```bash
salt '*' vsphere.create_datacenter dc1
```

```python
salt.modules.vsphere.create_diskgroup(cache_disk_id, capacity_disk_ids, safety_checks=True, service_instance=None)
```

Creates disk group on an ESXi host with the specified cache and capacity disks.

cache_disk_id  The canonical name of the disk to be used as a cache. The disk must be ssd.
capacity_disk_ids  A list containing canonical names of the capacity disks. Must contain at least one id. Default
value is True.
safety_checks  Specify whether to perform safety check or to skip the checks and try performing the required
task. Default value is True.
service_instance  Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```bash
salt '*' vsphere.create_diskgroup cache_disk_id='naa.000000000000001'
capacity_disk_ids='[naa.000000000000002, naa.000000000000003]'
```

```python
salt.modules.vsphere.create_dvportgroup(portgroup_dict, portgroup_name, dvs, service_instance=None)
```

Creates a distributed virtual portgroup.

Note: The portgroup_name param will override any name already set in portgroup_dict.
portgroup_dict  Dictionary with the config values the portgroup should be created with (example in
salt.states.dvs).
portgroup_name  Name of the portgroup to be created.
dvs Name of the DVS that will contain the portgroup.
service_instance  Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```python
salt '*' vsphere.create_dvportgroup portgroup_dict=<dict>
    portgroup_name=pg1 dvs=dvs1
```

salt.modules.vsphere.create_dvs(dvs_dict, dvs_name, service_instance=None)
Creates a distributed virtual switch (DVS).

Note: The dvs_name param will override any name set in dvs_dict.
dvs_dict Dict representation of the new DVS (example in salt.states.dvs)
dvs_name Name of the DVS to be created.
service_instance  Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```python
salt '*' vsphere.create_dvs dvs dict=${dvs_dict} dvs_name=${dvs_name}
```

salt.modules.vsphere.create_storage_policy(policy_name, policy_dict, service_instance=None)
Creates a storage policy.

Supported capability types: scalar, set, range.
policy_name Name of the policy to create. The value of the argument will override any existing name in policy_dict.
policy_dict Dictionary containing the changes to apply to the policy. (example in salt.states.pbm)
service_instance  Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```python
salt '*' vsphere.create_storage_policy policy_name='policy name'
    policy_dict="${policy_dict}"
```

salt.modules.vsphere.create_vm(vm_name, cpu, memory, image, version, datacenter, datastore, placement, interfaces, disks, scsi_devices, ide_controllers=None, sata_controllers=None, cd_drives=None, advanced_configs=None, service_instance=None)
Creates a virtual machine container.

CLI Example:

```python
salt vm_minion vsphere.create_vm vm_name=vmname cpu='{count: 2, nested: True}' ...
```

vm_name  Name of the virtual machine
cpu  Properties of CPUs for freshly created machines
memory  Memory size for freshly created machines
image  Virtual machine guest OS version identifier VirtualMachineGuestOsIdentifier
version  Virtual machine container hardware version
datacenter  Datacenter where the virtual machine will be deployed (mandatory)
datastore  Datastore where the virtual machine files will be placed
placement  Resource pool or cluster or host or folder where the virtual machine will be deployed
devices  interfaces

```python
interfaces:
    adapter: 'Network adapter 1'
    name: vlan100
    switch_type: distributed or standard
    adapter_type: vmxnet3 or vmxnet, vmxnet2, vmxnet3, e1000, e1000e
    mac: '00:11:22:33:44:55'
    connectable:
```
(continues on next page)
allow_guest_control: True
connected: True
start_connected: True

disks:

disks:
adapter: 'Hard disk 1'
size: 16
unit: GB
address: '0:0'
controller: 'SCSI controller 0'
thin_provision: False
eagerly_scrub: False
datastore: 'myshare'
filename: 'vm/mydisk.vmdk'

scsi_devices

scsi_devices:
controller: 'SCSI controller 0'
type: paravirtual
bus_sharing: no_sharing

serial_ports

serial_ports:
adapter: 'Serial port 1'
type: network
backing:
uri: 'telnet://something:port'
direction: <client|server>
filename: 'service_uri'
connectable:
allow_guest_control: True
connected: True
start_connected: True
yield: False

cd_drives

cd_drives:
adapter: 'CD/DVD drive 0'
controller: 'IDE 0'
device_type: datastore_iso_file
datastore_iso_file:
    path: path_to_iso
connectable:
    allow_guest_control: True
    connected: True
    start_connected: True

advanced_config
Advanced config parameters to be set for the virtual machine

salt.modules.vsphere.create_vmfs_datastore(datastore_name, disk_id, vmfs_major_version, safety_checks=True, service_instance=None)

Creates a ESXi host disk group with the specified cache and capacity disks.
datastore_name The name of the datastore to be created.
disk_id    The disk id (canonical name) on which the datastore is created.
vmfs_major_version  The VMFS major version.
safety_checks  Specify whether to perform safety check or to skip the checks and try performing the required
task. Default is True.
service_instance  Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```
salt '*' vsphere.create_vmfs_datastore datastore_name=ds1 disk_id=
  vmfs_major_version=5
```

salt.modules.vsphere.delete_advanced_configs(name, datacenter, advanced_configs,
  service_instance=None)
Removes extra config parameters from a virtual machine

```
salt '*' vsphere.delete_vm name=my_vm datacenter=my_datacenter
```

salt.modules.vsphere.disconnect(service_instance)
Disconnects from a vCenter or ESXi host

*Note:* Should be used by state functions, not invoked directly.

```
salt '*' vsphere.disconnect service_instance=vcenter
```

salt.modules.vsphere.enable_firewall_ruleset(host, username, password, ruleset_enable,
  ruleset_name, protocol=None, port=None, esxi_hosts=None, credstore=None)
Enable or disable an ESXi firewall rule set.

```
salt '*' vsphere.delete_vm name=my_vm datacenter=my_datacenter
```

21.9. execution modules
salt.modules.vsphere.erase_disk_partitions(disk_id=None, scsi_address=None, service_instance=None)

Erases the partitions on a disk. The disk can be specified either by the canonical name, or by the scsi_address.

disk_id Canonical name of the disk. Either disk_id or scsi_address needs to be specified (disk_id supersedes scsi_address).

scsi_address Scsi address of the disk. disk_id or scsi_address needs to be specified (disk_id supersedes scsi_address).

service_instance Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

salt'*' vsphere.erase_disk_partitions scsi_address='vmhaba0:C0:T0:L0'
salt'*' vsphere.erase_disk_partitions disk_id='naa.000000000000001'

salt.modules.vsphere.esxcli_cmd(cmd_str, host=host, username=None, password=None, protocol=None, port=None, esxi_hosts=None, credstore=None)

Run an ESXCLI command directly on the host or list of hosts.

host The location of the host.

username The username used to login to the host, such as root.

password The password used to login to the host.

cmd_str The ESXCLI command to run. Note: This should not include the -s, -u, -p, -h, --protocol, or --portnumber arguments that are frequently passed when using a bare ESXCLI command from the command line. Those arguments are handled by this function via the other args and kwargs.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

esxi_hosts If host is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.

credstore Optionally set to path to the credential store file.

CLI Example:

salt'*' vsphere.esxcli_cmd my.esxi.host root bad-password 'system
coredump network get'

salt'*' vsphere.esxcli_cmd my.vcenter.location root bad-password
'system coredump network get' esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
**host**  The location of the host.

**username**  The username used to login to the host, such as `root`.

**password**  The password used to login to the host.

**protocol**  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port**  Optionally set to alternate port if the host is not using the default port. Default port is `443`.

**esxi_hosts**  If `host` is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.

**credstore**  Optionally set to path to the credential store file.

**Returns**  A dictionary with the network configuration, or, if getting the network config failed, a
an error message retrieved from the standard cmd.run_all dictionary, per host.

**CLI Example:**

```bash
# Used for ESXi host connection information
salt '*' vsphere.get_coredump_network_config my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_coredump_network_config my.vcenter.location root bad-password
esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

---

**salt.modules.vsphere.get_firewall_status**(*host*, *username*, *password*, *protocol=None*, *port=None*, *esxi_hosts=None*, *credstore=None*)

Show status of all firewall rule sets.

**host**  The location of the host.

**username**  The username used to login to the host, such as `root`.

**password**  The password used to login to the host.

**protocol**  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port**  Optionally set to alternate port if the host is not using the default port. Default port is `443`.

**esxi_hosts**  If `host` is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.

**credstore**  Optionally set to path to the credential store file.

**Returns**  Nested dictionary with two toplevel keys `rulesets` and `success` success will be
True or False depending on query success `rulesets` will list the rulesets and their statuses
if `success` was true, per host.

**CLI Example:**

```bash
# Used for ESXi host connection information
salt '*' vsphere.get_firewall_status my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_firewall_status my.vcenter.location root bad-password
esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

---

**salt.modules.vsphere.get_host_cache**(*service_instance=None*)

Returns the host cache configuration on the proxy host.

**service_instance**  Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```
salt '*' vsphere.get_host_cache
e
```

---

**salt.modules.vsphere.get_host_datetime**(*host*, *username*, *password*, *protocol=None*, *port=None*, *host_names=None*)

Get the date/time information for a given host or list of `host_names`.

**host**  The location of the host.
username The username used to login to the host, such as root.
password The password used to login to the host.
protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port Optionally set to alternate port if the host is not using the default port. Default port is 443.
host_names List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to get date/time information.

If host_names is not provided, the date/time information will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:
```bash
# Used for single ESXi host connection information
salt '*' vsphere.get_host_datetime my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_host_datetime my.vcenter.location root bad-password
  --host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.get_ntp_config(host, username, password, protocol=None, port=None, host_names=None)

Get the NTP configuration information for a given host or list of host_names.

host The location of the host.
username The username used to login to the host, such as root.
password The password used to login to the host.
protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port Optionally set to alternate port if the host is not using the default port. Default port is 443.
host_names List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to get ntp configuration information.

If host_names is not provided, the NTP configuration will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:
```bash
# Used for single ESXi host connection information
salt '*' vsphere.get_ntp_config my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_ntp_config my.vcenter.location root bad-password
  --host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.get_proxy_type()

Returns the proxy type retrieved either from the pillar of from the proxy minion’s config. Returns <undefined> otherwise.

CLI Example:
```bash
salt '*' vsphere.get_proxy_type
```

salt.modules.vsphere.get_service_instance_via_proxy(service_instance=None)

Returns a service instance to the proxied endpoint (vCenter/ESXi host).

service_instance Service instance (vim.ServiceInstance) of the vCenter. Default is None.
Note: Should be used by state functions not invoked directly.

CLI Example: See note above

gate.modules.vsphere.get_service_policy(host, username, password, service_name, protocol=None, port=None, host_names=None)

Get the service name’s policy for a given host or list of hosts.

host The location of the host.
username The username used to login to the host, such as root.
password The password used to login to the host.
service_name The name of the service for which to retrieve the policy. Supported service names are:
- DCUI
- TSM
- SSH
- lbtd
- lsassd
- lwiod
- netlogond
- ntpd
- sfcbd-watchdog
- snmpd
- vprobed
- vpxa
- xorg

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port Optionally set to alternate port if the host is not using the default port. Default port is 443.
host_names List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to get service policy information.

If host_names is not provided, the service policy information will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

# Used for single ESXi host connection information
gate '*' vsphere.get_service_policy my.esxi.host root bad-password 'ssh'

# Used for connecting to a vCenter Server
gate '*' vsphere.get_service_policy my.vcenter.location root bad-password 'ntpd' host_names='[esxi-1.host.com, esxi-2.host.com]'

salt.modules.vsphere.get_service_running(host, username, password, service_name, protocol=None, port=None, host_names=None)

Get the service name’s running state for a given host or list of hosts.

host The location of the host.
username The username used to login to the host, such as root.
password The password used to login to the host.
service_name The name of the service for which to retrieve the policy. Supported service names are:
- DCUI
- TSM
- SSH
protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port  Optionally set to alternate port if the host is not using the default port. Default port is `443`.

host_names  List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter the hosts for which to get the service’s running state.

If `host_names` is not provided, the service’s running state will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.get_service_running my.esxi.host root bad-password 'ssh'

# Used for connecting to a vCenter Server
salt '*' vsphere.get_service_running my.vcenter.location root bad-password 'ntpd'
  host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.get_ssh_key(host, username, password, protocol=None, port=None, certificate_verify=False)

Retrieve the authorized_keys entry for root. This function only works for ESXi, not vCenter.

Parameters

- **host** – The location of the ESXi Host
- **username** – Username to connect as
- **password** – Password for the ESXi web endpoint
- **protocol** – defaults to `https`, can be `http` if `ssl` is disabled on ESXi
- **port** – defaults to `443` for `https`
- **certificate_verify** – If true require that the SSL connection present a valid certificate

Returns  True if upload is successful

CLI Example:

```
salt '*' vsphere.get_ssh_key my.esxi.host root bad-password certificate_verify=True
```

salt.modules.vsphere.get_syslog_config(host, username, password, protocol=None, port=None, esxi_hosts=None, credstore=None)

Retrieve the syslog configuration.

- **host**  The location of the host.
- **username**  The username used to login to the host, such as `root`.
- **password**  The password used to login to the host.
- **protocol**  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.
- **port**  Optionally set to alternate port if the host is not using the default port. Default port is `443`.
- **esxi_hosts**  If `host` is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.
credstore  Optionally set to path to the credential store file.

Returns  Dictionary with keys and values corresponding to the syslog configuration, per host.

CLI Example:

```none
# Used for ESXi host connection information
salt '*' vsphere.get_syslog_config my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_syslog_config my.vcenter.location root bad-password
eksi_hosts='[esxi-1.host.com, esxi-2.host.com]'```

salt.modules.vsphere.get_vm(name, datacenter=None, vm_properties=None, traversal_spec=None, parent_ref=None, service_instance=None)

Returns vm object properties.
- **name**  Name of the virtual machine.
- **datacenter**  Datacenter name
- **vm_properties**  List of vm properties.
- **traversal_spec**  Traversal Spec object(s) for searching.
- **parent_ref**  Container Reference object for searching under a given object.
- **service_instance**  Service instance (vim.ServiceInstance) of the vCenter. Default is None.

salt.modules.vsphere.get_vm_config(name, datacenter=None, objects=True, service_instance=None)

Queries and converts the virtual machine properties to the available format from the schema. If the objects attribute is True the config objects will have extra properties, like 'object' which will include the vim.vm.device.VirtualDevice, this is necessary for deletion and update actions.
- **name**  Name of the virtual machine
- **datacenter**  Datacenter's name where the virtual machine is available
- **objects**  Indicates whether to return the vmware object properties (eg. object, key) or just the properties which can be set
- **service_instance**  vCenter service instance for connection and configuration

salt.modules.vsphere.get_vm_config_file(name, datacenter, placement, datastore, service_instance=None)

Queries the virtual machine config file and returns vim.host.DatastoreBrowser.SearchResults object on success None on failure
- **name**  Name of the virtual machine
- **datacenter**  Datacenter name
- **datastore**  Datastore where the virtual machine files are stored
- **service_instance**  Service instance (vim.ServiceInstance) of the vCenter. Default is None.

salt.modules.vsphere.get_vmotion_enabled(host, username, password, protocol=None, port=None, host_names=None)

Get the VMotion enabled status for a given host or a list of host_names. Returns True if VMotion is enabled, False if it is not enabled.
- **host**  The location of the host.
- **username**  The username used to login to the host, such as root.
- **password**  The password used to login to the host.
- **protocol**  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port**  Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **host_names**  List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts to check if VMotion is enabled.

If host_names is not provided, the VMotion status will be retrieved for the host location instead. This
is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.getVmotion_enabled my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.getVmotion_enabled my.vcenter.location root bad-password
  host_names='[esxi-1.host.com, esxi-2.host.com]'
```

```
salt.modules.vsphere.get_vsan_eligible_disks(host, username, password, protocol=None, port=None, host_names=None)

Returns a list of VSAN-eligible disks for a given host or list of host_names.

host  The location of the host.
username  The username used to login to the host, such as root.
password  The password used to login to the host.
protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port  Optionally set to alternate port if the host is not using the default port. Default port is 443.
host_names  List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts to check if any VSAN-eligible disks are available.

If host_names is not provided, the VSAN-eligible disks will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.get_vsan_eligible_disks my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_vsan_eligible_disks my.vcenter.location root bad-password
  host_names='[esxi-1.host.com, esxi-2.host.com]'
```

```
salt.modules.vsphere.get_vsan_enabled(host, username, password, protocol=None, port=None, host_names=None)

Get the VSAN enabled status for a given host or a list of host_names. Returns True if VSAN is enabled, False if it is not enabled, and None if a VSAN Host Config is unset, per host.

host  The location of the host.
username  The username used to login to the host, such as root.
password  The password used to login to the host.
protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port  Optionally set to alternate port if the host is not using the default port. Default port is 443.
host_names  List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts to check if VSAN enabled.

If host_names is not provided, the VSAN status will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.get_vsan_enabled my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_vsan_enabled my.vcenter.location root bad-password
  host_names='[esxi-1.host.com, esxi-2.host.com]'
```

(continues on next page)
salt.modules.vsphere.

**salt.modules.vsphere.gets_service_instance_via_proxy(fn)**  
Decorator that connects to a target system (vCenter or ESXi host) using the proxy details and passes the connection (vim.ServiceInstance) to the decorated function.

Supported proxies: esxi, esxcluster, esxdatacenter.

**Notes**

1. The decorated function must have a `service_instance` parameter or a `**kwargs` type argument (name of argument is not important); 2. If the `service_instance` parameter is already defined, the value is passed through to the decorated function; 3. If the `service_instance` parameter in not defined, the connection is created using the proxy details and the service instance is returned.

**CLI Example:** None, this is a decorator

salt.modules.vsphere.

**salt.modules.vsphere.list_assigned_licenses**(entity, entity_display_name, license_keys=None, service_instance=None)

Lists the licenses assigned to an entity

*entity*  Dictionary representation of an entity. See `_get_entity` docstrings for format.

*entity_display_name*  Entity name used in logging

*license_keys:*  List of license keys to be retrieved. Default is None.

*service_instance*  Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```
salt '*' vsphere.list_assigned_licenses
    entity={type:cluster,datacenter:dc,cluster:cl}
    entity_display_name=cl
```

salt.modules.vsphere.

**salt.modules.vsphere.list_capability_definitions**(service_instance=None)

Returns a list of the metadata of all capabilities in the vCenter.

*service_instance*  Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```
salt '*' vsphere.list_capabilities
```

salt.modules.vsphere.

**salt.modules.vsphere.list_cluster**(datacenter=None, cluster=None, service_instance=None)

Returns a dict representation of an ESX cluster.

*datacenter*  Name of datacenter containing the cluster. Ignored if already contained by proxy details. Default value is None.

*cluster*  Name of cluster. Ignored if already contained by proxy details. Default value is None.

*service_instance*  Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```
# vcenter proxy
salt '*' vsphere.list_cluster datacenter=dc1 cluster=cl1

# esxdatacenter proxy
salt '*' vsphere.list_cluster cluster=cl1

# esxcluster proxy
salt '*' vsphere.list_cluster
```

salt.modules.vsphere.

**salt.modules.vsphere.list_clusters**(host, username, password, protocol=None, port=None)

Returns a list of clusters for the specified host.

*host*  The location of the host.

*username*  The username used to login to the host, such as root.

*password*  The password used to login to the host.
protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port  Optionally set to alternate port if the host is not using the default port. Default port is 443.

CLI Example:

salt '*' vsphere.list_clusters 1.2.3.4 root bad-password

salt.modules.vsphere.list_datacenters(host, username, password, protocol=None, port=None)
Returns a list of datacenters for the specified host.
host  The location of the host.
username  The username used to login to the host, such as root.
password  The password used to login to the host.
protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port  Optionally set to alternate port if the host is not using the default port. Default port is 443.

CLI Example:

salt '*' vsphere.list_datacenters 1.2.3.4 root bad-password

salt.modules.vsphere.list_datacenters_via_proxy(datacenter_names=None, service_instance=None)
Returns a list of dict representations of VMware datacenters. Connection is done via the proxy details.
Supported proxies: esxdatacenter
datacenter_names  List of datacenter names. Default is None.
service_instance  Service instance (vim.ServiceInstance) of the vCenter. Default is None.

salt '*' vsphere.list_datacenters_via_proxy
salt '*' vsphere.list_datacenters_via_proxy dc1
salt '*' vsphere.list_datacenters_via_proxy dc1,dc2
salt '*' vsphere.list_datacenters_via_proxy datacenter_names=[dc1, dc2]

salt.modules.vsphere.list_datastore_clusters(host, username, password, protocol=None, port=None)
Returns a list of datastore clusters for the specified host.
host  The location of the host.
username  The username used to login to the host, such as root.
password  The password used to login to the host.
protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port  Optionally set to alternate port if the host is not using the default port. Default port is 443.

CLI Example:

salt '*' vsphere.list_datastore_clusters 1.2.3.4 root bad-password

salt.modules.vsphere.list_datastores(host, username, password, protocol=None, port=None)
Returns a list of datastores for the specified host.
host  The location of the host.
username  The username used to login to the host, such as root.
password  The password used to login to the host.
protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port  Optionally set to alternate port if the host is not using the default port. Default port is 443.
CLI Example:

```
salt '*' vsphere.list_datastores 1.2.3.4 root bad-password
```

```
salt.modules.vsphere.list_datastores_via_proxy(datastore_names=None, backing_disk_ids=None, backing_disk_scsi_addresses=None, service_instance=None)
```

Returns a list of dict representations of the datastores visible to the proxy object. The list of datastores can be filtered by datastore names, backing disk ids (canonical names) or backing disk scsi addresses.

Supported proxy types: esxi, esxcluster, esxdatacenter

datatstore_names List of the names of datastores to filter on
backing_disk_ids List of canonical names of the backing disks of the datastores to filer. Default is None.
backing_disk_scsi_addresses List of scsi addresses of the backing disks of the datastores to filter. Default is None.

```
salt '*' vsphere.list_datastores_via_proxy datastore_names=[ds1, ds2]
```

```
salt.modules.vsphere.list_default_storage_policy_of_datastore(datastore, service_instance=None)
```

Returns a list of datastores assign the the storage policies.

datastore Name of the datastore to assign. The datastore needs to be visible to the VMware entity the proxy points to.

```
salt '*' vsphere.list_default_storage_policy_of_datastore datastore=ds1
```

```
salt.modules.vsphere.list_default_vsan_policy(service_instance=None)
```

Returns the default vsan storage policy.

```
salt '*' vsphere.list_storage_policies
```

```
salt.modules.vsphere.list_storage_policy policy_names=[policy_name]
```

```
salt.modules.vsphere.list_disk_partitions(disk_id=None, scsi_address=None, service_instance=None)
```

Lists the partitions on a disk. The disk can be specified either by the canonical name, or by the scsi_address. Either disk_id or scsi_address needs to be specified (disk_id supersedes scsi_address).

disk_id Canonical name of the disk. Either disk_id or scsi_address needs to be specified (disk_id supersedes scsi_address).

```
salt '*' vsphere.list_disk_partitions scsi_address='vmhaba0:C0:T0:L0'
salt '*' vsphere.list_disk_partitions disk_id='naa.000000000000001'
```

```
salt.modules.vsphere.list_diskgroups(cache_disk_ids=None, service_instance=None)
```

Returns a list of disk group dict representation on an ESXi host. The list of disk groups can be filtered by the cache disks canonical names. If no filtering is applied, all disk groups are returned.

```
salt '*' vsphere.list_diskgroups
```

```
salt.modules.vsphere.list_disk_partitions disk_id=naa.000000000000001'
```

```
salt.modules.vsphere.list_diskgroups(cache_disk_ids=None, service_instance=None)
```

Use _use_proxy_details_ Specify whether to use the proxy minion’s details instead of the arguments

```
salt '*' vsphere.list_diskgroups use_proxy_details=True
```
**service_instance**  Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```python
salt '*' vsphere.list_diskgroups
salt '*' vsphere.list_diskgroups cache_disk_ids='[naa.000000000000001]'
```

**salt.modules.vsphere.list_disks**(
  ```python
disk_ids=None, scsi_addresses=None, service_instance=None
  ```
)

Returns a list of dict representations of the disks in an ESXi host. The list of disks can be filtered by disk canonical names or scsi addresses.

- **disk_ids**: List of disk canonical names to be retrieved. Default is None.
- **scsi_addresses**: List of scsi addresses of disks to be retrieved. Default is None
- **service_instance**: Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```python
salt '*' vsphere.list_disks
disk_ids='[naa.00, naa.001]'
salt '*' vsphere.list_disks
  scsi_addresses='[vmhba0:C0:T0:L0, vmhba1:C0:T0:L0]'
```

**salt.modules.vsphere.list_dvportgroups**(
  ```python
dvs=None, portgroup_names=None, service_instance=None
  ```
)

Returns a list of distributed virtual switch portgroups. The list can be filtered by the portgroup names or by the DVS.

- **dvs**: Name of the DVS containing the portgroups. Default value is None.
- **portgroup_names**: List of portgroup names to look for. If None, all portgroups are returned. Default value is None
- **service_instance**: Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```python
salt '*' vsphere.list_dvportgroups
salt '*' vsphere.list_dvportgroups dvs=dvs1
salt '*' vsphere.list_dvportgroups portgroup_names=[pg1]
salt '*' vsphere.list_dvportgroups dvs=dvs1 portgroup_names=[pg1]
```

**salt.modules.vsphere.list_dvs**(
  ```python
host, username, password, protocol=None, port=None
  ```
)

Returns a list of distributed virtual switches for the the specified host.

- **host**: The location of the host.
- **username**: The username used to login to the host, such as root.
- **password**: The password used to login to the host.
- **protocol**: Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port**: Optionally set to alternate port if the host is not using the default port. Default port is 443.

**CLI Example:**

```python
salt '*' vsphere.list_dvs 1.2.3.4 root bad-password
```

**salt.modules.vsphere.list_dvss**(
  ```python
datacenter=None, dvs_names=None, service_instance=None
  ```
)

Returns a list of distributed virtual switches (DVSs). The list can be filtered by the datacenter or DVS names.

- **datacenter**: The datacenter to look for DVSs in. Default value is None.
- **dvs_names**: List of DVS names to look for. If None, all DVSs are returned. Default value is None.

**CLI Example:**

```python
salt '*' vsphere.list_dvss
```

(continues on next page)
salt.modules.vsphere.list_dvss(dvs_names=[dvs1,dvs2])

salt.modules.vsphere.list_folders(host, username, password, protocol=None, port=None)
   Returns a list of folders for the specified host.
   host  The location of the host.
   username  The username used to login to the host, such as root.
   password  The password used to login to the host.
   protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
   port  Optionally set to alternate port if the host is not using the default port. Default port is 443.
   CLI Example:

   salt '*' vsphere.list_folders 1.2.3.4 root bad-password

salt.modules.vsphere.list_hosts(host, username, password, protocol=None, port=None)
   Returns a list of hosts for the specified VMware environment.
   host  The location of the host.
   username  The username used to login to the host, such as root.
   password  The password used to login to the host.
   protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
   port  Optionally set to alternate port if the host is not using the default port. Default port is 443.
   CLI Example:

   salt '*' vsphere.list_hosts 1.2.3.4 root bad-password

salt.modules.vsphere.list_hosts_via_proxy(hostnames=None, datacenter=None, cluster=None, service_instance=None)
   Returns a list of hosts for the specified VMware environment. The list of hosts can be filtered by datacenter name and/or cluster name.
   hostnames  Hostnames to filter on.
   datacenter_name  Name of datacenter. Only hosts in this datacenter will be retrieved. Default is None.
   cluster_name  Name of cluster. Only hosts in this cluster will be retrieved. If a datacenter is not specified the first cluster with this name will be considered. Default is None.
   service_instance  Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.
   CLI Example:

   salt '*' vsphere.list_hosts_via_proxy
   salt '*' vsphere.list_hosts_via_proxy hostnames=[esxi1.example.com]
   salt '*' vsphere.list_hosts_via_proxy datacenter=dc1 cluster=cluster1

salt.modules.vsphere.list_licenses(service_instance=None)
   Lists all licenses on a vCenter.
   service_instance  Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

   salt '*' vsphere.list_licenses

salt.modules.vsphere.list_networks(host, username, password, protocol=None, port=None)
   Returns a list of networks for the specified host.
   host  The location of the host.
   username  The username used to login to the host, such as root.
   password  The password used to login to the host.

   salt '*' vsphere.list_networks
**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

CLI Example:

```bash
salt '*' vsphere.list_networks 1.2.3.4 root bad-password
```

**salt.modules.vsphere.list_non_ssds**

```python
salt.modules.vsphere.list_non_ssds(host, username, password, protocol=None, port=None, host_names=None)
```

Returns a list of Non-SSD disks for the given host or list of host_names.

**Note:** In the pyVmomi StorageSystem, ScsiDisks may, or may not have an ssd attribute. This attribute indicates if the ScsiDisk is SSD backed. As this option is optional, if a relevant disk in the StorageSystem does not have ssd = true, it will end up in the non_ssds list here.

**host** The location of the host.

**username** The username used to login to the host, such as root.

**password** The password used to login to the host.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**host_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to retrieve Non-SSD disks.

If host_names is not provided, Non-SSD disks will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```bash
# Used for single ESXi host connection information
salt '*' vsphere.list_non_ssds my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.list_non_ssds my.vcenter.location root bad-password host_names='[esxi-1.host.com, esxi-2.host.com]'
```

**salt.modules.vsphere.list_resourcepools**

```python
salt.modules.vsphere.list_resourcepools(host, username, password, protocol=None, port=None)
```

Returns a list of resource pools for the the specified host.

**host** The location of the host.

**username** The username used to login to the host, such as root.

**password** The password used to login to the host.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

CLI Example:

```bash
salt '*' vsphere.list_resourcepools 1.2.3.4 root bad-password
```

**salt.modules.vsphere.list_ssds**

```python
salt.modules.vsphere.list_ssds(host, username, password, protocol=None, port=None, host_names=None)
```

Returns a list of SSDs for the given host or list of host_names.

**host** The location of the host.

**username** The username used to login to the host, such as root.

**password** The password used to login to the host.
**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.
**host_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to retrieve SSDs.

If host_names is not provided, SSDs will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.list_ssds my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.list_ssds my.vcenter.location root bad-password
host_names='[esxi-1.host.com, esxi-2.host.com]'
```

**salt.modules.vsphere.list_storage_policies**(policy_names=None, service_instance=None)
Returns a list of storage policies.

- **policy_names** Names of policies to list. If None, all policies are listed. Default is None.
- **service_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.list_storage_policies
salt '*' vsphere.list_storage_policy policy_names=[policy_name]
```

**salt.modules.vsphere.list_uplink_dvportgroup**(dvs, service_instance=None)
Returns the uplink portgroup of a distributed virtual switch.

- **dvs** Name of the DVS containing the portgroup.
- **service_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.list_uplink_dvportgroup dvs=dvs_name
```

**salt.modules.vsphere.list_vapps**(host, username, password, protocol=None, port=None)
Returns a list of vApps for the specified host.

- **host** The location of the host.
- **username** The username used to login to the host, such as root.
- **password** The password used to login to the host.
- **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

CLI Example:

```
# List vapps from all minions
salt '*' vsphere.list_vapps 1.2.3.4 root bad-password
```

**salt.modules.vsphere.list_vms**(host, username, password, protocol=None, port=None)
Returns a list of VMs for the specified host.

- **host** The location of the host.
- **username** The username used to login to the host, such as root.
- **password** The password used to login to the host.
- **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

CLI Example:
salt '*' vsphere.list_vms 1.2.3.4 root bad-password

```python
salt.modules.vsphere.power_off_vm(name, datacenter=None, service_instance=None)
```

Powers off a virtual machine specified by its name.

* name Name of the virtual machine
* datacenter Datacenter of the virtual machine
* service_instance Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```python
salt '*' vsphere.power_off_vm name=my_vm
```

```python
salt.modules.vsphere.power_on_vm(name, datacenter=None, service_instance=None)
```

Powers on a virtual machine specified by its name.

* name Name of the virtual machine
* datacenter Datacenter of the virtual machine
* service_instance Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```python
salt '*' vsphere.power_on_vm name=my_vm
```

```python
salt.modules.vsphere.register_vm(name, datacenter, placement, vmx_path, service_instance=None)
```

Registers a virtual machine to the inventory with the given vmx file. Returns comments and change list.

* name Name of the virtual machine
* datacenter Datacenter of the virtual machine
* placement Placement dictionary of the virtual machine, host or cluster
* vmx_path Full path to the vmx file, datastore name should be included
* service_instance Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```python
salt.modules.vsphere.remove_capacity_from_diskgroup(cache_disk_id, capacity_disk_ids, data_evacuation=True, safety_checks=True, service_instance=None)
```

Remove capacity disks from the disk group with the specified cache disk.

* cache_disk_id The canonical name of the cache disk.
* capacity_disk_ids A list containing canonical names of the capacity disks to add.
* data_evacuation Specifies whether to gracefully evacuate the data on the capacity disks before removing them from the disk group. Default value is True.
* safety_checks Specify whether to perform safety check or to skip the checks and try performing the required task. Default value is True.
* service_instance Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```python
salt '*' vsphere.remove_capacity_from_diskgroup
  cache_disk_id='naa.000000000000001'
  capacity_disk_ids='[naa.000000000000002, naa.000000000000003]'
```

```python
salt.modules.vsphere.remove_datastore(datastore, service_instance=None)
```

Removes a datastore. If multiple datastores an error is raised.

* datastore Datastore name
* service_instance Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```python
salt '*' vsphere.remove_datastore ds_name
```

```python
salt.modules.vsphere.remove_diskgroup(cache_disk_id, data_accessibility=True, service_instance=None)
```

Remove the diskgroup with the specified cache disk.

* cache_disk_id The canonical name of the cache disk.
* data_accessibility Specifies whether to ensure data accessibility. Default value is True.
service_instance  Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```
salt '*' vsphere.remove_diskgroup cache_disk_id='naa.000000000000001'
```

salt.modules.vsphere.remove_dvportgroup(portgroup, dvs, service_instance=None)

Removes a distributed virtual portgroup.

- **portgroup** Name of the portgroup to be removed.
- **dvs** Name of the DVS containing the portgroups.
- **service_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```
salt '*' vsphere.remove_dvportgroup portgroup=pg1 dvs=dvs1
```

salt.modules.vsphere.rename_datastore(datastore_name, new_datastore_name, service_instance=None)

Renames a datastore. The datastore needs to be visible to the proxy.

- **datastore_name** Current datastore name.
- **new_datastore_name** New datastore name.
- **service_instance** Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```
salt '*' vsphere.rename_datastore old_name new_name
```

salt.modules.vsphere.reset_syslog_config(host, username, password, protocol=None, port=None, syslog_config=None, esxi_hosts=None, credstore=None)

Reset the syslog service to its default settings.

Valid syslog_config values are logdir, loghost, logdir-unique, default-rotate, default-size, default-timeout, or all for all of these.

- **host** The location of the host.
- **username** The username used to login to the host, such as root.
- **password** The password used to login to the host.
- **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port** Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **syslog_config** List of parameters to reset, provided as a comma-delimited string, or 'all' to reset all syslog configuration parameters. Required.
- **esxi_hosts** If host is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.
- **credstore** Optionally set to path to the credential store file.

**Returns** Dictionary with a top-level key of 'success' which indicates if all the parameters were reset, and individual keys for each parameter indicating which succeeded or failed, per host.

CLI Example:

```
salt '*' vsphere.reset_syslog_config my.esxi.host root bad-password
→ syslog_config='logdir,loghost'
```

```
# Used for ESXi host connection information
salt '*' vsphere.reset_syslog_config my.esxi.host root bad-password
→ syslog_config='logdir,loghost'
```

```
# Used for connecting to a vCenter Server
salt '*' vsphere.reset_syslog_config my.vcenter.location root bad-password
→ syslog_config='logdir,loghost' esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.service_restart(host, username, password, service_name, protocol=None, port=None, host_names=None)
Restart the named service for the given host or list of hosts.

**host**  The location of the host.

**username**  The username used to login to the host, such as `root`.

**password**  The password used to login to the host.

**service_name**

The name of the service for which to set the policy. Supported service names are:

- DCUI
- TSM
- SSH
- lbtld
- lsassd
- lwiod
- netlogond
- ntpd
- sfcbd-watchdog
- snmpd
- vprobed
- vpxa
- xorg

**protocol**  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port**  Optionally set to alternate port if the host is not using the default port. Default port is `443`.

**host_names**  List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to restart the service.

If host_names is not provided, the service will be restarted for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```bash
# Used for single ESXi host connection information
salt '*' vsphere.service_restart my.esxi.host root bad-password 'ntpd'

# Used for connecting to a vCenter Server
salt '*' vsphere.service_restart my.vcenter.location root bad-password 'ntpd'

salt.modules.vsphere.service_start(host, username, password, service_name, protocol=None, port=None, host_names=None)
```

Start the named service for the given host or list of hosts.

**host**  The location of the host.

**username**  The username used to login to the host, such as `root`.

**password**  The password used to login to the host.

**service_name**

The name of the service for which to set the policy. Supported service names are:

- DCUI
- TSM
- SSH
- lbtld
- lsassd
- lwiod
- netlogond
- ntpd
- sfcbd-watchdog
- snmpd
• vprobed
• vpxa
• xorg

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**host_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to start the service.

If host_names is not provided, the service will be started for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```bash
# Used for single ESXi host connection information
salt '*' vsphere.service_start my.esxi.host root bad-password 'ntpd'

# Used for connecting to a vCenter Server
salt '*' vsphere.service_start my.vcenter.location root bad-password 'ntpd'  
  host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.service_stop(host, username, password, service_name, protocol=None, port=None, host_names=None)

Stop the named service for the given host or list of hosts.

**host** The location of the host.

**username** The username used to login to the host, such as root.

**password** The password used to login to the host.

**service_name**

The name of the service for which to set the policy. Supported service names are:

- DCUI
- TSM
- SSH
- lbtd
- lsassd
- lwiod
- netlogond
- ntpd
- sfcbd-watchdog
- snmpd
- vprobed
- vpxa
- xorg

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**host_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to stop the service.

If host_names is not provided, the service will be stopped for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```bash
# Used for single ESXi host connection information
salt '*' vsphere.service_stop my.esxi.host root bad-password 'ssh'
```
# Used for connecting to a vCenter Server

salt '*' vsphere.service_stop my.vcenter.location root bad-password 'ssh'

# Used for ESXi host connection information

salt '*' vsphere.set_coredump_network_config my.esxi.host root bad-password 'dump_ip.host.com'

salt '*' vsphere.set_ntp_config my.esxi.host root bad-password 'dump_ip.host.com' esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'

salt.modules.vsphere.set_advanced_configs(*, vm_name, datacenter, advanced_configs, service_instance)

Aggregates extra config parameters to a virtual machine advanced config list

- **vm_name**: Virtual machine name
- **datacenter**: Datacenter name where the virtual machine is available
- **advanced_configs**: Dictionary with advanced parameter key value pairs
- **service_instance**: vCenter service instance for connection and configuration

salt.modules.vsphere.set_coredump_network_config(*, host, username, password, dump_ip, protocol, port, host_vnic, dump_port, esxi_hosts, credstore)

Set the network parameters for a network coredump collection. Note that ESXi requires that the dumps first be enabled (see coredump_network_enable) before these parameters may be set.

- **host**: The location of the host.
- **username**: The username used to login to the host, such as root.
- **password**: The password used to login to the host.
- **dump_ip**: IP address of host that will accept the dump.
- **protocol**: Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port**: Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **host_vnic**: Host VNIC port through which to communicate. Defaults to vmk0.
- **dump_port**: TCP port to use for the dump, defaults to 6500.
- **esxi_hosts**: If host is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.
- **credstore**: Optionally set to path to the credential store file.

Returns A standard cmd.run_all dictionary with a success key added, per host. success will be True if the set succeeded, False otherwise.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.set_coredump_network_config my.esxi.host root bad-password 'dump_ip.host.com'

# Used for connecting to a vCenter Server
salt '*' vsphere.set_coredump_network_config my.vcenter.location root bad-password 'dump_ip.host.com' esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.set_ntp_config(*, host, username, password, ntp_servers, protocol, port, host_names)

Set NTP configuration for a given host of list of host_names.

- **host**: The location of the host.
- **username**: The username used to login to the host, such as root.
- **password**: The password used to login to the host.
- **ntp_servers**: A list of servers that should be added to and configured for the specified host’s NTP configuration.
- **protocol**: Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port**: Optionally set to alternate port if the host is not using the default port. Default port is 443.
**host_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts to configure ntp servers.

If host_names is not provided, the NTP servers will be configured for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.ntp_configure my.esxi.host root bad-password '[192.174.1.100, 192.174.1.200]'

# Used for connecting to a vCenter Server
salt '*' vsphere.ntp_configure my.vcenter.location root bad-password '[192.174.1.100, 192.174.1.200]' host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.set_service_policy(host, username, password, service_name, service_policy, protocol=None, port=None, host_names=None)

Set the service name’s policy for a given host or list of hosts.

- **host** The location of the host.
- **username** The username used to login to the host, such as root.
- **password** The password used to login to the host.
- **service_name** The name of the service for which to set the policy. Supported service names are:
  - DCUI
  - TSM
  - SSH
  - lbtd
  - lsassd
  - lwiod
  - netlogond
  - ntpd
  - sfcbd-watchdog
  - snmpd
  - vprobed
  - vpxa
  - xorg
- **service_policy** The policy to set for the service. For example, ‘automatic’.
- **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port** Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **host_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to set the service policy.

If host_names is not provided, the service policy information will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.set_service_policy my.esxi.host root bad-password 'ntpd' service_policy='automatic'

# Used for connecting to a vCenter Server
salt '*' vsphere.set_service_policy my.vcenter.location root bad-password 'ntpd' service_policy='automatic' host_names='[esxi-1.host.com, esxi-2.host.com]'
```
salt.modules.vsphere.set_syslog_config(host, username, password, syslog_config, config_value, protocol=None, port=None, firewall=True, reset_service=True, esxi_hosts=None, credstore=None)

Set the specified syslog configuration parameter. By default, this function will reset the syslog service after the configuration is set.

host ESXi or vCenter host to connect to.
username User to connect as, usually root.
password Password to connect with.
syslog_config Name of parameter to set (corresponds to the command line switch for esxcli without the double dashes (–))

Valid syslog_config values are logdir, loghost, default-rotate`, ``default-size, default-timeout, and logdir-unique.
config_value Value for the above parameter. For loghost, URLs or IP addresses to use for logging. Multiple log servers can be specified by listing them, comma-separated, but without spaces before or after commas.

(Reference: https://blogs.vmware.com/vsphere/2012/04/configuring-multiple-syslog-servers-for-esxi-5.html)
protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port Optionally set to alternate port if the host is not using the default port. Default port is 443.
firewall Enable the firewall rule set for syslog. Defaults to True.
reset_service After a successful parameter set, reset the service. Defaults to True.
esxi_hosts If host is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.
credstore Optionally set to path to the credential store file.

Returns Dictionary with a top-level key of 'success' which indicates if all the parameters were reset, and individual keys for each parameter indicating which succeeded or failed, per host.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.set_syslog_config my.esxi.host root bad-password
    →loghost ssl://localhost:5432,tcp://10.1.0.1:1514

# Used for connecting to a vCenter Server
salt '*' vsphere.set_syslog_config my.vcenter.location root bad-password
    →loghost ssl://localhost:5432,tcp://10.1.0.1:1514
    →'[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.supports_proxies('proxy_types')

Decorator to specify which proxy types are supported by a function

proxy_types: Arbitrary list of strings with the supported types of proxies

salt.modules.vsphere.syslog_service_reload(host, username, password, protocol=None, port=None, esxi_hosts=None, credstore=None)

Reload the syslog service so it will pick up any changes.

host The location of the host.
username The username used to login to the host, such as root.
password The password used to login to the host.
protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port  Optionally set to alternate port if the host is not using the default port. Default port is 443.

esxi_hosts  If host is a vCenter host, then use esxi_hosts to execute this function on a list of one or more
ESXi machines.

credstore  Optionally set to path to the credential store file.

Returns  A standard cmd.run_all dictionary. This dictionary will at least have a retcode key. If
retcode is 0 the command was successful.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.syslog_service_reload my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.syslog_service_reload my.vcenter.location root bad-password
  esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.system_info(host, username, password, protocol=None, port=None)

Return system information about a VMware environment.

host  The location of the host.
username  The username used to login to the host, such as root.
password  The password used to login to the host.
protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port  Optionally set to alternate port if the host is not using the default port. Default port is 443.

CLI Example:

```
salt '*' vsphere.system_info 1.2.3.4 root bad-password
```

salt.modules.vsphere.test_vcenter_connection(service_instance=None)

Checks if a connection is to a vCenter

CLI Example:

```
salt '*' vsphere.test_vcenter_connection
```

salt.modules.vsphere.unregister_vm(name, datacenter, placement=None, power_off=False, service_instance=None)

Unregisters a virtual machine defined by name and placement

name  Name of the virtual machine
datacenter  Datacenter of the virtual machine
placement  Placement information of the virtual machine
service_instance  vCenter service instance for connection and configuration

```
salt '*' vsphere.unregister_vm name=my_vm datacenter=my_datacenter
```

salt.modules.vsphere.update_cluster(cluster_dict, datacenter=None, cluster=None, service_instance=None)

Updates a cluster.

config_dict  Dictionary with the config values of the new cluster.
datacenter  Name of datacenter containing the cluster. Ignored if already contained by proxy details. Default value is None.
cluster  Name of cluster. Ignored if already contained by proxy details. Default value is None.
service_instance  Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```
# esxdatacenter proxy
salt '*' vsphere.update_cluster cluster_dict=${cluster_dict} cluster=cl1
```

(continues on next page)
# esxcluster proxy

salt '*' vsphere.update_cluster cluster_dict=${cluster_dict}

salt.modules.vsphere.update_dvportgroup(portgroup_dict, portgroup, dvs, service_instance=True)

Updates a distributed virtual portgroup.

- **portgroup_dict**: Dictionary with the values the portgroup should be update with (example in salt.states.dvs).
- **portgroup**: Name of the portgroup to be updated.
- **dvs**: Name of the DVS containing the portgroups.
- **service_instance**: Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```python
salt '*' vsphere.update_dvportgroup portgroup_dict={
    portgroup: 'pg1',
}
```

```python
salt '*' vsphere.update_dvportgroup portgroup_dict={
    portgroup: 'pg1',
    dvs: 'dvs1',
}
```

salt.modules.vsphere.update_dvs(dvs_dict, dvs, service_instance=None)

Updates a distributed virtual switch (DVS).

Note: Updating the product info, capability, uplinks of a DVS is not supported so the corresponding entries in dvs_dict will be ignored.

- **dvs_dict**: Dictionary with the values the DVS should be update with (example in salt.states.dvs).
- **dvs**: Name of the DVS to be updated.
- **service_instance**: Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```python
salt '*' vsphere.update_dvs dvs_dict=$dvs_dict
dvs='dvs1'
```

salt.modules.vsphere.update_host_datetime(host, username, password, protocol=None, port=None, host_names=None)

Update the date/time on the given host or list of host_names. This function should be used with caution since network delays and execution delays can result in time skews.

- **host**: The location of the host.
- **username**: The username used to login to the host, such as root.
- **password**: The password used to login to the host.
- **protocol**: Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port**: Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **host_names**: List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts should update their date/time.

If host_names is not provided, the date/time will be updated for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```bash
# Used for single ESXi host connection information
salt '*' vsphere.update_date_time my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.update_date_time my.vcenter.location root bad-password
```

salt.modules.vsphere.update_host_password(host, username, password, new_password, protocol=None, port=None)

Update the password for a given host.

2652 Chapter 21. Salt Module Reference
**Note:** Currently only works with connections to ESXi hosts. Does not work with vCenter servers.

**host** The location of the ESXi host.
**username** The username used to login to the ESXi host, such as root.
**password** The password used to login to the ESXi host.
**new_password** The new password that will be updated for the provided username on the ESXi host.
**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

CLI Example:

```bash
salt '*' vsphere.update_host_password my.esxi.host root original-bad-password new-bad-password
```

salt.modules.vsphere.update_storage_policy(policy, policy_dict, service_instance=None)

Updates a storage policy.

- Supported capability types: scalar, set, range.
- **policy** Name of the policy to update.
- **policy_dict** Dictionary containing the changes to apply to the policy. (example in salt.states.pbm)
- **service_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```bash
salt '*' vsphere.update_storage_policy policy='policy name' policy_dict="$policy_dict"
```

salt.modules.vsphere.update_vm(vm_name, cpu=None, memory=None, image=None, version=None, interfaces=None, disks=None, scsi_devices=None, serial_ports=None, datacenter=None, datastore=None, cd_dvd_drives=None, sata_controllers=None, advanced_configs=None, service_instance=None)

Updates the configuration of the virtual machine if the config differs

- **vm_name** Virtual Machine name to be updated
- **cpu** CPU configuration options
- **memory** Memory configuration options
- **version** Virtual machine container hardware version
- **image** Virtual machine guest OS version identifier VirtualMachineGuestOsIdentifier
- **interfaces** Network interfaces configuration options
- **disks** Disks configuration options
- **scsi_devices** SCSI devices configuration options
- **serial_ports** Serial ports configuration options
- **datacenter** Datacenter where the virtual machine is available
- **datastore** Datastore where the virtual machine config files are available
- **cd_dvd_drives** CD/DVD drives configuration options
- **advanced_config** Advanced config parameters to be set for the virtual machine
- **service_instance** vCenter service instance for connection and configuration

salt.modules.vsphere.upload_ssh_key(host, username, password, ssh_key=None, ssh_key_file=None, protocol=None, port=None, certificate_verify=False)

Upload an ssh key for root to an ESXi host via http PUT. This function only works for ESXi, not vCenter. Only one ssh key can be uploaded for root. Uploading a second key will replace any existing key.

**Parameters**

- **host** – The location of the ESXi Host
- **username** – Username to connect as
- **password** – Password for the ESXi web endpoint
- **ssh_key** – Public SSH key, will be added to authorized_keys on ESXi
- **ssh_key_file** – File containing the SSH key. Use ‘ssh_key’ or ssh_key_file, but not both.
- **protocol** – defaults to https, can be http if ssl is disabled on ESXi
- **port** – defaults to 443 for https
- **certificate_verify** – If true require that the SSL connection present a valid certificate

**Returns** Dictionary with a 'status' key, True if upload is successful. If upload is unsuccessful, 'status' key will be False and an 'Error' key will have an informative message.

**CLI Example:**
```
salt '*' vsphere.upload_ssh_key my.esxi.host root bad-password
ssh_key_file='/etc/salt/my_keys/my_key.pub'
```

salt.modules.vsphere.vmotion_disable(host, username, password, protocol=None, port=None, host_names=None)

Disable vMotion for a given host or list of host_names.

- **host** The location of the host.
- **username** The username used to login to the host, such as root.
- **password** The password used to login to the host.
- **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port** Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **host_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts should disable VMotion.

If host_names is not provided, VMotion will be disabled for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

**CLI Example:**
```
# Used for single ESXi host connection information
salt '*' vsphere.vmotion_disable my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.vmotion_disable my.vcenter.location root bad-password host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.vmotion_enable(host, username, password, protocol=None, port=None, host_names=None, device='vmk0')

Enable vMotion for a given host or list of host_names.

- **host** The location of the host.
- **username** The username used to login to the host, such as root.
- **password** The password used to login to the host.
- **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port** Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **host_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts should enable VMotion.

If host_names is not provided, VMotion will be enabled for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

- **device** The device that uniquely identifies the VirtualNic that will be used for VMotion for each host. Defaults to vmk0.

**CLI Example:**
salt.modules.vsphere.vsan_add_disks(host, username, password, protocol=None, port=None, host_names=None)

Add any VSAN-eligible disks to the VSAN System for the given host or list of host_names.

- **host** The location of the host.
- **username** The username used to login to the host, such as root.
- **password** The password used to login to the host.
- **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port** Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **host_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts need to add any VSAN-eligible disks to the host’s VSAN system.

If host_names is not provided, VSAN-eligible disks will be added to the hosts’s VSAN system for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```bash
# Used for single ESXi host connection information
salt '*' vsphere.vsan_add_disks my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.vsan_add_disks my.vcenter.location root bad-password

---

salt.modules.vsphere.vsan_disable(host, username, password, protocol=None, port=None, host_names=None)

Disable VSAN for a given host or list of host_names.

- **host** The location of the host.
- **username** The username used to login to the host, such as root.
- **password** The password used to login to the host.
- **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port** Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **host_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts should disable VSAN.

If host_names is not provided, VSAN will be disabled for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

CLI Example:

```bash
# Used for single ESXi host connection information
salt '*' vsphere.vsan_disable my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.vsan_disable my.vcenter.location root bad-password

---

salt.modules.vsphere.vsan_enable(host, username, password, protocol=None, port=None, host_names=None)
Enable VSAN for a given host or list of host_names.

- **host** The location of the host.
- **username** The username used to login to the host, such as `root`.
- **password** The password used to login to the host.
- **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.
- **port** Optionally set to alternate port if the host is not using the default port. Default port is `443`.
- **host_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts should enable VSAN.

If host_names is not provided, VSAN will be enabled for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

### CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.vsan_enable my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.vsan_enable my.vcenter.location root bad-password
  host_names='[esxi-1.host.com, esxi-2.host.com]'
```

---

### 21.9.450 salt.modules.webutil

Support for htpasswd command. Requires the `apache2-utils` package for Debian-based distros.

New in version 2014.1.0.

The functions here will load inside the `webutil` module. This allows other functions that don’t use htpasswd to use the `webutil` module name.

#### salt.modules.webutil.useradd

Add a user to htpasswd file using the htpasswd command. If the htpasswd file does not exist, it will be created.

- **pwfile** Path to htpasswd file
- **user** User name
- **password** User password
- **opts** Valid options that can be passed are:
  - `n` Don’t update file; display results on stdout.
  - `m` Force MD5 encryption of the password (default).
  - `d` Force CRYPT encryption of the password.
  - `p` Do not encrypt the password (plaintext).
  - `s` Force SHA encryption of the password.
- **runas** The system user to run htpasswd command with

**CLI Examples:**

```
salt '*' webutil.useradd /etc/httpd/htpasswd larry badpassword
salt '*' webutil.useradd /etc/httpd/htpasswd larry badpass
```

#### salt.modules.webutil.userdel

Delete a user from the specified htpasswd file.

- **pwfile** Path to htpasswd file
- **user** User name
- **runas** The system user to run htpasswd command with
- **all_results** Return stdout, stderr, and retcode, not just stdout

**CLI Examples:**

```
salt '*' webutil.userdel /etc/httpd/htpasswd larry badpassword
```
salt 'stagename' webutil.userdel /etc/httpd/htpasswd larry

`salt.modules.webutil.verify(pwfile, user, password, opts='', runas=None)`

Return True if the htpasswd file exists, the user has an entry, and their password matches.

- **pwfile**  Fully qualified path to htpasswd file
- **user**  User name
- **password**  User password
- **opts**  Valid options that can be passed are:
  - `'m'` Force MD5 encryption of the password (default).
  - `'d'` Force CRYPT encryption of the password.
  - `'p'` Do not encrypt the password (plaintext).
  - `'s'` Force SHA encryption of the password.
- **runas**  The system user to run htpasswd command with

CLI Examples:

```
salt 'stagename' webutil.verify /etc/httpd/htpasswd larry maybepassword
salt 'stagename' webutil.verify /etc/httpd/htpasswd larry maybepassword opts=ns
```

### 21.9.451 `salt.modules.win_autoruns`

Module for listing programs that automatically run on startup (very alpha...not tested on anything but my Win 7x64)

`salt.modules.win_autoruns.list()`

Get a list of automatically running programs

CLI Example:

```
salt '*' autoruns.list
```

### 21.9.452 `salt.modules.win_certutil` module

This module allows you to install certificates into the windows certificate manager.

`salt 'stagename' certutil.add_store salt://cert.cer "TrustedPublisher"`

`salt.modules.win_certutil.add_store(source, store, saltenv='base')`

Add the given cert into the given Certificate Store

- **source**  The source certificate file this can be in the form salt://path/to/file
- **store**  The certificate store to add the certificate to
- **saltenv**  The salt environment to use this is ignored if the path is local

CLI Example:

```
salt '*' certutil.add_store salt://cert.cer TrustedPublisher
```

`salt.modules.win_certutil.del_store(source, store, saltenv='base')`

Delete the given cert into the given Certificate Store

- **source**  The source certificate file this can be in the form salt://path/to/file
- **store**  The certificate store to delete the certificate from
- **saltenv**  The salt environment to use this is ignored if the path is local

CLI Example:
21.9.453 salt.modules.win_dacl

Manage DACLs on Windows

depends

• winreg Python module

salt.modules.win_dacl.add_ace(path, objectType, user, permission, acetype, propagation)

add an ace to an object

path: path to the object (i.e. c:\temp\file, HKEY_LOCAL_MACHINE\SOFTWARE\KEY, etc) user: user to add permission: permissions for the user acetype: either allow/deny for each user/permission (ALLOW, DENY) propagation: how the ACE applies to children for Registry Keys and Directories(KEY, KEY&SUBKEYS, SUBKEYS)

CLI Example:

allow domain\fakeuser full control on HKLM\SOFTWARE\somekey, propagate to this key and subkeys
salt 'myminion' win_dacl.add_ace 'HKEY_LOCAL_MACHINE\SOFTWARE\somekey' => 'Registry' 'domain\fakeuser' 'FULLCONTROL' 'ALLOW' 'KEY&SUBKEYS'

salt.modules.win_dacl.check_ace(path, objectType, user, permission=None, acetype=None, propagation=None, exactPermissionMatch=False)

Checks a path to verify the ACE (access control entry) specified exists

Parameters

• **path** – path to the file/reg key
• **objectType** – The type of object (FILE, DIRECTORY, REGISTRY)
• **user** – user that the ACL is for
• **permission** – permission to test for (READ, FULLCONTROL, etc)
• **acetype** – the type of ACE (ALLOW or DENY)
• **propagation** – the propagation type of the ACE (FILES, FOLDERS, KEY, KEY&SUBKEYS, SUBKEYS, etc)
• **exactPermissionMatch** – the ACL must match exactly, IE if READ is specified, the user must have READ exactly and not FULLCONTROL (which also has the READ permission obviously)

Returns (dict): 'Exists' true if the ACE exists, false if it does not

CLI Example:
salt 'minion-id' win_dacl.check_ace c: emp directory <username> fullcontrol

salt.modules.win_dacl.check_inheritance(path, objectType, user=None)
Check a specified path to verify if inheritance is enabled
Parameters
• path – path of the registry key or file system object to check
• objectType – The type of object (FILE, DIRECTORY, REGISTRY)
• user – if provided, will consider only the ACEs for that user
Returns (bool): 'Inheritance' of True/False

CLI Example:
salt 'minion-id' win_dacl.check_inheritance c: emp directory <username>

class salt.modules.win_dacl.daclConstants
DACL constants used throughout the module

getAceTypeBit(t)
returns the acetype bit of a text value

getaAceTypeText(t)
returns the textual representation of a acetype bit

ggetObjectTypeBit(t)
returns the bit value of the string object type

getPermissionBit(t, m)
returns a permission bit of the string permission value for the specified object type

getPermissionText(t, m)
returns the permission textual representation of a specified permission bit/object type

getPropagationBit(t, p)
returns the propagation bit of a text value

getPropagationText(t, p)
returns the textual representation of a propagation bit

getAddress_Hkey(s)
returns the necessary string value for an HKEY for the win32security module

processPath(path, objectType)
processes a path/object type combo and returns: registry types with the correct HKEY text representation files/directories with environment variables expanded

salt.modules.win_dacl.disable_inheritance(path, objectType, copy=True)
Disable inheritance on an object
Parameters
• path – The path to the object
• objectType – The type of object (FILE, DIRECTORY, REGISTRY)
• copy – True will copy the Inherited ACEs to the DACL before disabling inheritance
Returns (dict): A dictionary containing the results

CLI Example:
salt 'minion-id' win_dacl.disable_inheritance c: emp directory

salt.modules.win_dacl.enable_inheritance(path, objectType, clear=False)
enable/disable inheritance on an object
Parameters
• **path** – The path to the object
• **objectType** – The type of object (FILE, DIRECTORY, REGISTRY)
• **clear** – True will remove non-Inherited ACEs from the ACL

Returns (dict): A dictionary containing the results

CLI Example:
```
salt 'minion-id' win_dacl.enable_inheritance c: emp directory
```

salt.modules.win_dacl.get(path, objectType, user=None)
Get the ACL of an object. Will filter by user if one is provided.

Parameters
• **path** – The path to the object
• **objectType** – The type of object (FILE, DIRECTORY, REGISTRY)
• **user** – A user name to filter by

Returns (dict): A dictionary containing the ACL

CLI Example:
```
salt 'minion-id' win_dacl.get c: emp directory
```

salt.modules.win_dacl.rm_ace(path, objectType, user, permission=None, acetype=None, propagation=None)
remove an ace to an object

path: path to the object (i.e. c:\temp\file, HKEY_LOCAL_MACHINE\SOFTWARE\KEY, etc) user: user to remove permission: permissions for the user acetypes: either allow/deny for each user/permission (ALLOW, DENY) propagation: how the ACE applies to children for Registry Keys and Directories(KEY, KEY&SUBKEYS, SUBKEYS)

If any of the optional parameters are omitted (or set to None) they act as wildcards.

CLI Example:
```
remove allow domain\fakeuser full control on HKLM\SOFTWARE\somekey propagated to this key and subkeys
salt 'myminion' win_dacl.rm_ace 'Registry' 'HKEY_LOCAL_MACHINE\SOFTWARE\somekey' 'domain\fakeuser' 'FULLCONTROL' 'ALLOW' 'KEY&SUBKEYS'
```

21.9.454 salt.modules.win_disk

Module for gathering disk information on Windows

depends
• win32api Python module

salt.modules.win_disk.usage()
Return usage information for volumes mounted on this minion

CLI Example:
```
salt '*' disk.usage
```
21.9.455 salt.modules.win_dism module

Install features/packages for Windows using DISM, which is useful for minions not running server versions of Windows. Some functions are only available on Windows 10.

```python
salt.modules.win_dism.add_capability(capability, source=None, limit_access=False, image=None, restart=False)
```

Install a capability

**Parameters**

- `capability (str)` – The capability to install
- `source (Optional[str])` – The optional source of the capability. Default is set by group policy and can be Windows Update.
- `limit_access (Optional[bool])` – Prevent DISM from contacting Windows Update for the source package
- `image (Optional[str])` – The path to the root directory of an offline Windows image. If `None` is passed, the running operating system is targeted. Default is `None`.
- `restart (Optional[bool])` – Reboot the machine if required by the install

**Returns**

A dictionary containing the results of the command

**Return type**

`dict`

**CLI Example:**

```bash
salt 'ktor' dism.add_capability Tools.Graphics.DirectX~~~~0.0.1.0
```

```python
salt.modules.win_dism.add_feature(feature, package=None, source=None, limit_access=False, enable_parent=False, image=None, restart=False)
```

Install a feature using DISM

**Parameters**

- `feature (str)` – The feature to install
- `package (Optional[str])` – The parent package for the feature. You do not have to specify the package if it is the Windows Foundation Package. Otherwise, use package to specify the parent package of the feature
- `source (Optional[str])` – The optional source of the capability. Default is set by group policy and can be Windows Update
- `limit_access (Optional[bool])` – Prevent DISM from contacting Windows Update for the source package
- `enable_parent (Optional[bool])` – True will enable all parent features of the specified feature
- `image (Optional[str])` – The path to the root directory of an offline Windows image. If `None` is passed, the running operating system is targeted. Default is `None`.
- `restart (Optional[bool])` – Reboot the machine if required by the install

**Returns**

A dictionary containing the results of the command

**Return type**

`dict`

**CLI Example:**

```bash
salt 'ktor' dism.add_feature NetFx3
```

```python
salt.modules.win_dism.add_package(package, ignore_check=False, prevent_pending=False, image=None, restart=False)
```

Install a package using DISM

**Parameters**

- `package (str)` – The package to install. Can be a .cab file, a .msu file, or a folder
Note: An .msu package is supported only when the target image is offline, either mounted or applied.

- **ignore_check** *(Optional*[bool]*) – Skip installation of the package if the applicability checks fail
- **prevent_pending** *(Optional*[bool]*) – Skip the installation of the package if there are pending online actions
- **image** *(Optional*[str]*) – The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
- **restart** *(Optional*[bool]*) – Reboot the machine if required by the install

**Returns**
A dictionary containing the results of the command

**Return type**
dict

**CLI Example:**
salt '*' dism.add_package C:\Packages\package.cab

```python
salt.modules.win_dism.available_capabilities(image=None)
```

List the capabilities available on the system

**Parameters**
- **image** *(Optional*[str]*) – The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.

**Raises**
- **NotImplementedError** – For all versions of Windows that are not Windows 10 and later. Server editions of Windows use ServerManager instead.

**Returns**
A list of available capabilities

**Return type**
list

**CLI Example:**
salt '*' dism.installed_capabilities

```python
salt.modules.win_dism.available_features(image=None)
```

List the features available on the system

**Parameters**
- **image** *(Optional*[str]*) – The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.

**Returns**
A list of available features

**Return type**
list

**CLI Example:**
salt '*' dism.available_features

```python
salt.modules.win_dism.get_capabilities(image=None)
```

List all capabilities on the system

**Parameters**
- **image** *(Optional*[str]*) – The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.

**Raises**
- **NotImplementedError** – For all versions of Windows that are not Windows 10 and later. Server editions of Windows use ServerManager instead.

**Returns**
A list of capabilities

**Return type**
list

**CLI Example:**
salt '*' dism.get_capabilities
salt.modules.win_dism.get_features

List features on the system or in a package

**Parameters**

- **package** *(Optional [str]*) - The full path to the package. Can be either a .cab file or a folder. Should point to the original source of the package, not to where the file is installed. You cannot use this command to get package information for .msu files

  This can also be the name of a package as listed in `dism.installed_packages`

- **image** *(Optional [str]*) - The path to the root directory of an offline Windows image. If `None` is passed, the running operating system is targeted. Default is `None`.

**Returns** A list of features

**Return type** list

**CLI Example:**

```bash
# Return all features on the system
salt '*' dism.get_features

# Return all features in package.cab
salt '*' dism.get_features C:\packages\package.cab

# Return all features in the calc package
salt '*' dism.get_features Microsoft.Windows.Calc.Demo~6595b6144ccf1df~,!x86~en~1.0.0.0
```

salt.modules.win_dism.installed_capabilities

List the capabilities installed on the system

**Parameters** **image** *(Optional [str]*) - The path to the root directory of an offline Windows image. If `None` is passed, the running operating system is targeted. Default is `None`.

**Raises**

- **NotImplementedError** – For all versions of Windows that are not Windows 10 and later. *Server editions of Windows use ServerManager instead.*

**Returns** A list of installed capabilities

**Return type** list

**CLI Example:**

```bash
salt '*' dism.installed_capabilities
```

salt.modules.win_dism.installed_features

List the features installed on the system

**Parameters** **image** *(Optional [str]*) - The path to the root directory of an offline Windows image. If `None` is passed, the running operating system is targeted. Default is `None`.

**Returns** A list of installed features

**Return type** list

**CLI Example:**

```bash
salt '*' dism.installed_features
```

salt.modules.win_dism.installed_packages

List the packages installed on the system

**Parameters** **image** *(Optional [str]*) - The path to the root directory of an offline Windows image. If `None` is passed, the running operating system is targeted. Default is `None`.

**Returns** A list of installed packages

**Return type** list

**CLI Example:**
salt '*/' dism.installed_packages

salt.modules.win_dism.package_info(package, image=None)
    Display information about a package
    Parameters
    • package (str) – The full path to the package. Can be either a .cab file or a folder. Should point to the original source of the package, not to where the file is installed. You cannot use this command to get package information for .msu files
    • image (Optional[str]) – The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
    Returns A dictionary containing the results of the command
    Return type dict
    CLI Example:
    salt '*/' dism.package_info C:\packages\package.cab

salt.modules.win_dism.remove_capability(capability, image=None, restart=False)
    Uninstall a capability
    Parameters
    • capability (str) – The capability to be removed
    • image (Optional[str]) – The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
    • restart (Optional[bool]) – Reboot the machine if required by the install
    Raises
    • NotImplementedError – For all versions of Windows that are not Windows 10 and later. Server editions of Windows use ServerManager instead.
    Returns A dictionary containing the results of the command
    Return type dict
    CLI Example:
    salt '*/' dism.remove_capability Tools.Graphics.DirectX~~~0.0.1.0

salt.modules.win_dism.remove_feature(feature, remove_payload=False, image=None, restart=False)
    Disables the feature.
    Parameters
    • feature (str) – The feature to uninstall
    • remove_payload (Optional[bool]) – Remove the feature’s payload. Must supply source when enabling in the future.
    • image (Optional[str]) – The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
    • restart (Optional[bool]) – Reboot the machine if required by the install
    Returns A dictionary containing the results of the command
    Return type dict
    CLI Example:
    salt '*/' dism.remove_feature NetFx3

salt.modules.win_dism.remove_package(package, image=None, restart=False)
    Uninstall a package
    Parameters
    • package (str) – The full path to the package. Can be either a .cab file or a folder. Should point to the original source of the package, not to where the file is installed. This can also be the name of a package as listed in dism.installed_packages
- **image** *(Optional*[str]*) – The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

- **restart** *(Optional*[bool]*) – Reboot the machine if required by the install

**Returns** A dictionary containing the results of the command

**Return type** dict

**CLI Example:**
```
# Remove the Calc Package
salt '*' dism.remove_package Microsoft.Windows.Calc.Demo-6595b6144ccf1df-x86~en-1.0.0.0

# Remove the package.cab (does not remove C:\packages\package.cab)
salt '*' dism.remove_package C:\packages\package.cab
```

### 21.9.456 salt.modules.win_dns_client

Module for configuring DNS Client on Windows systems

**salt.modules.win_dns_client.add_dns** *(ip, interface='Local Area Connection', index=1)*

Add the DNS server to the network interface (index starts from 1)

Note: if the interface DNS is configured by DHCP, all the DNS servers will be removed from the interface and the requested DNS will be the only one

**CLI Example:**
```
salt '*' win_dns_client.add_dns <ip> <interface> <index>
```

**salt.modules.win_dns_client.dns_dhcp** *(interface='Local Area Connection')*

Configure the interface to get its DNS servers from the DHCP server

**CLI Example:**
```
salt '*' win_dns_client.dns_dhcp <interface>
```

**salt.modules.win_dns_client.get_dns_config** *(interface='Local Area Connection')*

Get the type of DNS configuration (dhcp / static)

**CLI Example:**
```
salt '*' win_dns_client.get_dns_config 'Local Area Connection'
```

**salt.modules.win_dns_client.get_dns_servers** *(interface='Local Area Connection')*

Return a list of the configured DNS servers of the specified interface

**CLI Example:**
```
salt '*' win_dns_client.get_dns_servers 'Local Area Connection'
```

**salt.modules.win_dns_client.rm_dns** *(ip, interface='Local Area Connection')*

Remove the DNS server from the network interface

**CLI Example:**
```
salt '*' win_dns_client.rm_dns <ip> <interface>
```
21.9.457 salt.modules.win_dsc

Module for working with Windows PowerShell DSC ( Desired State Configuration)

This module is Alpha

This module applies DSC Configurations in the form of PowerShell scripts or MOF (Managed Object Format) schema files.

Use the psget module to manage PowerShell resources.

The idea is to leverage Salt to push DSC configuration scripts or MOF files to the Minion.

depends
  - PowerShell 5.0

salt.modules.win_dsc.apply_config(path, source=None, salt_env='base')

Run an compiled DSC configuration (a folder containing a .mof file). The folder can be cached from the salt master using the source option.

Parameters
  - path (str) – Local path to the directory that contains the .mof configuration file to apply. Required.
  - source (str) – Path to the directory that contains the .mof file on the file_roots. The source directory will be copied to the path directory and then executed. If the path and source directories differ, the source directory will be applied. If source is not passed, the config located at path will be applied. Optional.
  - salt_env (str) – The salt environment to use when copying your source. Default is 'base'

Returns True if successful, otherwise False

Return type bool

CLI Example:

to apply a config that already exists on the the system

```
salt '*' dsc.apply_config C:\DSC\WebSiteConfiguration
```

to cache a configuration from the master and apply it:

```
salt '*' dsc.apply_config C:\DSC\WebSiteConfiguration salt://dsc/configs/\WebSiteConfiguration
```

salt.modules.win_dsc.compile_config(path, source=None, config_name=None, config_data=None, config_data_source=None, script_parameters=None, salt_env='base')

Compile a config from a PowerShell script (.ps1)

Parameters
  - path (str) – Path (local) to the script that will create the .mof configuration file. If no source is passed, the file must exist locally. Required.
  - source (str) – Path to the script on file_roots to cache at the location specified by path. The source file will be cached locally and then executed. If source is not passed, the config script located at path will be compiled. Optional.
  - config_name (str) – The name of the Configuration within the script to apply. If the script contains multiple configurations within the file a config_name must be specified. If the config_name is not specified, the name of the file will be used as the config_name to run. Optional.
  - config_data (str) – Configuration data in the form of a hash table that will be passed to the ConfigurationData parameter when the config_name is com-
compiled. This can be the path to a .psd1 file containing the proper hash table or the PowerShell code to create the hash table.

New in version 2017.7.0.

- **config_data_source** *(str)* – The path to the .psd1 file on file_roots to cache at the location specified by config_data. If this is specified, config_data must be a local path instead of a hash table.

New in version 2017.7.0.

- **script_parameters** *(str)* – Any additional parameters expected by the configuration script. These must be defined in the script itself.

New in version 2017.7.0.

- **salt_env** *(str)* – The salt environment to use when copying the source. Default is 'base'

Returns A dictionary containing the results of the compilation

Return type: dict

CLI Example:

```
to compile a config from a script that already exists on the system:
salt '*' dsc.compile_config C:\DSC\WebsiteConfig.ps1
```

To cache a config script to the system from the master and compile it:

```
salt '*' dsc.compile_config C:\DSC\WebsiteConfig.ps1 salt://dsc/configs/WebsiteConfig.ps1
```

salt.modules.win_dsc.get_config()

Get the current DSC Configuration

Returns A dictionary representing the DSC Configuration on the machine

Return type: dict

Raises CommandExecutionError – On failure

CLI Example:

```
salt '*' dsc.get_config
```

salt.modules.win_dsc.get_config_status()

Get the status of the current DSC Configuration

Returns A dictionary representing the status of the current DSC Configuration on the machine

Return type: dict

CLI Example:

```
salt '*' dsc.get_config_status
```

salt.modules.win_dsc.get_lcm_config()

Get the current Local Configuration Manager settings

Returns A dictionary representing the Local Configuration Manager settings on the machine

Return type: dict

CLI Example:

```
salt '*' dsc.get_lcm_config
```

salt.modules.win_dsc.remove_config(reset=False)

Remove the current DSC Configuration. Removes current, pending, and previous dsc configurations.
**New in version 2017.7.5.**

**Parameters reset (bool)** – Attempts to reset the DSC configuration by removing the following from C:\Windows\System32\Configuration:

- File: DSCStatusHistory.mof
- File: DSCEngineCache.mof
- Dir: ConfigurationStatus

Default is False

**Warning:** remove_config may fail to reset the DSC environment if any of the files in the ConfigurationStatus directory. If you wait a few minutes and run again, it may complete successfully.

**Returns** True if successful

**Return type** bool

**Raises** CommandExecutionError – On failure

**CLI Example:**

```
salt '*' dsc.remove_config True
```

**salt.modules.win_dsc.restore_config()**

Reapplies the previous configuration.

**New in version 2017.7.5.**

**Note:** The current configuration will be come the previous configuration. If run a second time back-to-back it is like toggling between two configs.

**Returns** True if successfully restored

**Return type** bool

**Raises** CommandExecutionError – On failure

**CLI Example:**

```
salt '*' dsc.restore_config
```

**salt.modules.win_dsc.run_config**

Compile a DSC Configuration in the form of a PowerShell script (.ps1) and apply it. The PowerShell script can be cached from the master using the source option. If there is more than one config within the PowerShell script, the desired configuration can be applied by passing the name in the config option.

This command would be the equivalent of running dsc.compile_config followed by dsc.apply_config.

**Parameters**

- **path (str)** – The local path to the PowerShell script that contains the DSC Configuration. Required.
- **source (str)** – The path to the script on file_roots to cache at the location specified by path. The source file will be cached locally and then executed. If source is not passed, the config script located at path will be compiled. Optional.
- **config_name (str)** – The name of the Configuration within the script to apply. If the script contains multiple configurations within the file a config_name must be specified. If the config_name is not specified, the name of the file will be used as the config_name to run. Optional.
• **config_data** *(str)* – Configuration data in the form of a hash table that will be passed to the `ConfigurationData` parameter when the `config_name` is compiled. This can be the path to a .psd1 file containing the proper hash table or the PowerShell code to create the hash table.

    New in version 2017.7.0.

• **config_data_source** *(str)* – The path to the .psd1 file on `file_roots` to cache at the location specified by `config_data`. If this is specified, `config_data` must be a local path instead of a hash table.

    New in version 2017.7.0.

• **script_parameters** *(str)* – Any additional parameters expected by the configuration script. These must be defined in the script itself.

    New in version 2017.7.0.

• **salt_env** *(str)* – The salt environment to use when copying the source. Default is 'base'

    Returns True if successfully compiled and applied, otherwise False

    Return type bool

CLI Example:

To compile a config from a script that already exists on the system:

```bash
salt '*' dsc.run_config C:\DSC\WebsiteConfig.ps1
```

To cache a config script to the system from the master and compile it:

```bash
salt '*' dsc.run_config C:\DSC\WebsiteConfig.ps1 salt://dsc/configs/WebsiteConfig.ps1
```

```python
salt.modules.win_dsc.set_lcm_config(config_mode=None, config_mode_freq=None, refresh_freq=None, reboot_if_needed=None, action_after_reboot=None, refresh_mode=None, certificate_id=None, configuration_id=None, allow_module_overwrite=None, debug_mode=False, status_retention_days=None)
```

For detailed descriptions of the parameters see: [https://msdn.microsoft.com/en-us/PowerShell/DSC/metaConfig](https://msdn.microsoft.com/en-us/PowerShell/DSC/metaConfig)

**config_mode** *(str)*: How the LCM applies the configuration. Valid values are:

- ApplyOnly
- ApplyAndMonitor
- ApplyAndAutoCorrect

**config_mode_freq** *(int)*: How often, in minutes, the current configuration is checked and applied. Ignored if `config_mode` is set to ApplyOnly. Default is 15.

**refresh_mode** *(str)*: How the LCM gets configurations. Valid values are:

- Disabled
- Push
- Pull

**refresh_freq** *(int)*: How often, in minutes, the LCM checks for updated configurations. (pull mode only) Default is 30.

**reboot_if_needed** *(bool)*: Reboot the machine if needed after a configuration is applied. Default is False.

**action_after_reboot** *(str)*: Action to take after reboot. Valid values are:

- ContinueConfiguration
- StopConfiguration

**certificate_id** *(guid)*: A GUID that specifies a certificate used to access the configuration. (pull mode)

**configuration_id** *(guid)*: A GUID that identifies the config file to get from a pull server. (pull mode)
allow_module_overwrite (bool): New configs are allowed to overwrite old ones on the target node.

debug_mode (str): Sets the debug level. Valid values are:
  • None
  • ForceModuleImport
  • All

status_retention_days (int): Number of days to keep status of the current config.

Note: Either config_mode_freq or refresh_freq needs to be a multiple of the other. See documentation on MSDN for more details.

Returns True if successful, otherwise False
Return type bool

CLI Example:
```
salt '*' dsc.set_lcm_config ApplyOnly
```

salt.modules.win_dsc.test_config()
Tests the current applied DSC Configuration

Returns True if successfully applied, otherwise False
Return type bool

CLI Example:
```
salt '*' dsc.test_config
```

21.9.458 salt.modules.win_file

Manage information about files on the minion, set/read user, group data, modify the ACL of files/directories

depends
  • win32api
  • win32file
  • win32con
  • salt.utils.win_dacl

exception salt.modules.win_file.WindowsError

salt.modules.win_file.check_perms(path, ret=None, owner=None, grant perms=None, deny_perms=None, inheritance=True, reset=False)
Check owner and permissions for the passed directory. This function checks the permissions and sets them, returning the changes made. Used by the file state to populate the return dict

Parameters
  • path (str) – The full path to the directory.
  • ret (dict) – A dictionary to append changes to and return. If not passed, will create a new dictionary to return.
  • owner (str) – The owner to set for the directory.
  • grant_perms (dict) – A dictionary containing the user/group and the basic permissions to check/grant, ie: {'user': {'perms': 'basic_permission'}}, Default is None.
  • deny_perms (dict) – A dictionary containing the user/group and permissions to check/deny. Default is None.
- **inheritance** *(bool)* – True will check if inheritance is enabled and enable it. False will check if inheritance is disabled and disable it. Default is True.

- **reset** *(bool)* – True will show what permissions will be removed by resetting the DACL. False will do nothing. Default is False.

**Returns** A dictionary of changes that have been made

**Return type** *dict*

**CLI Example:**

```
# To see changes to `C:\Temp` if the 'Users' group is given 'read & execute'
salt '*' file.check_perms C:\Temp\{} Administrators "{'Users': {'perms': 'read_ & execute'}}"

# Locally using salt call
salt-call file.check_perms C:\Temp\{} Administrators "{'Users': {'perms': 'read_ & execute', 'applies_to': 'this_folder_only'}}"

# Specify advanced attributes with a list
salt '*' file.check_perms C:\Temp\{} Administrators "{'jsnuffy': {'perms': ['read_attributes', 'read_ea'], 'applies_to': 'files_only'}}"
```

salt.modules.win_file.chgrp *(path, group)*

Change the group of a file

Under Windows, this will do nothing.

While a file in Windows does have a 'primary group', this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g., Services For Unix, NFS services).

Salt, therefore, remaps this function to do nothing while still being compatible with Unix behavior. When managing Windows systems, this function is superfluous and will generate an info level log entry if used directly.

If you do actually want to set the 'primary group' of a file, use `file.chpgrp`.

To set group permissions use `file.set_perms`

**Parameters**

- **path** *(str)* – The path to the file or directory
- **group** *(str)* – The group (unused)

**Returns** None

**CLI Example:**

```
salt '*' file.chpgrp c:\temp\test.txt administrators
```

salt.modules.win_file.chown *(path, user, group=None, pgroup=None, follow_symlinks=True)*

Chown a file, pass the file the desired user and group

Under Windows, the group parameter will be ignored.

This is because while files in Windows do have a 'primary group' property, this is rarely used. It generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g., Services For Unix, NFS services).

If you do want to change the 'primary group' property and understand the implications, pass the Windows only parameter, pgroup, instead.

**Parameters**

- **path** *(str)* – The path to the file or directory
• **user** *(str)* – The name of the user to own the file
• **group** *(str)* – The group (not used)
• **pgroup** *(str)* – The primary group to assign
• **follow_symlinks** *(bool)* – If the object specified by path is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns True if successful, otherwise error

Return type **bool**

**CLI Example:**
```
salt '*' file.chown c:\temp\test.txt myusername
salt '*' file.chown c:\temp\test.txt myusername pgroup=Administrators
salt '*' file.chown c:\temp\test.txt myusername "pgroup='None'"
```

**salt.modules.win_file.chpgrp(path, group)**

Change the group of a file

Under Windows, this will set the rarely used primary group of a file. This generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Ensure you know what you are doing before using this function.

Parameters

• **path** *(str)* – The path to the file or directory
• **pgroup** *(str)* – The primary group to assign

Returns True if successful, otherwise error

Return type **bool**

**CLI Example:**
```
salt '*' file.chpgrp c:\temp\test.txt Administrators
salt '*' file.chpgrp c:\temp\test.txt ''None''
```

**salt.modules.win_file.get_attributes(path)**

Return a dictionary object with the Windows file attributes for a file.

Parameters **path** *(str)* – The path to the file or directory

Returns A dictionary of file attributes

Return type **dict**

**CLI Example:**
```
salt '*' file.get_attributes c:\temp\a.txt
```

**salt.modules.win_file.get_gid(path, follow_symlinks=True)**

Return the id of the group that owns a given file

Under Windows, this will return the uid of the file.

While a file in Windows does have a ‘primary group’, this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps this function to provide functionality that somewhat resembles Unix behavior for API compatibility reasons. When managing Windows systems, this function is superfluous and will generate an info level log entry if used directly.

If you do actually want to access the ‘primary group’ of a file, use **file.get_pgid**.

Parameters

• **path** *(str)* – The path to the file or directory
• **follow_symlinks** *(bool)* – If the object specified by path is a symlink, get attributes of the linked file instead of the symlink itself. Default is True
Returns  The gid of the owner
Return type  str

CLI Example:

```
salt '*' file.get_gid c:\temp\test.txt
```

salt.modules.win_file.get_group(path, follow_symlinks=True)

Return the group that owns a given file

Under Windows, this will return the user (owner) of the file.

While a file in Windows does have a ‘primary group’, this rarely used attribute generally has no bearing
on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g.
Services For Unix, NFS services).

Salt, therefore, remaps this function to provide functionality that somewhat resembles Unix behavior for API
compatibility reasons. When managing Windows systems, this function is superfluous and will generate an
info level log entry if used directly.

If you do actually want to access the ‘primary group’ of a file, use file.get_pgroup.

Parameters

- **path** (str) – The path to the file or directory
- **follow_symlinks** (bool) – If the object specified by path is a symlink, get attr-
tributes of the linked file instead of the symlink itself. Default is True

Returns  The name of the owner
Return type  str

CLI Example:

```
salt '*' file.get_group c:\temp\test.txt
```

salt.modules.win_file.get_mode(path)

Return the mode of a file

Right now we’re just returning None because Windows’ doesn’t have a mode like Linux

Parameters  **path** (str) – The path to the file or directory

Returns  None

CLI Example:

```
salt '*' file.get_mode /etc/passwd
```

salt.modules.win_file.get_pgid(path, follow_symlinks=True)

Return the id of the primary group that owns a given file (Windows only)

This function will return the rarely used primary group of a file. This generally has no bearing on permissions
unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For
Unix, NFS services).

Ensure you know what you are doing before using this function.

Parameters

- **path** (str) – The path to the file or directory
- **follow_symlinks** (bool) – If the object specified by path is a symlink, get attr-
tributes of the linked file instead of the symlink itself. Default is True

Returns  The gid of the primary group
Return type  str

CLI Example:

```
salt '*' file.get_pgid c:\temp\test.txt
```
salt.modules.win_file.get_pgroup(path, follow_symlinks=True)

Return the name of the primary group that owns a given file (Windows only)

This function will return the rarely used primary group of a file. This generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g., Services For Unix, NFS services).

Ensure you know what you are doing before using this function.

The return value may be 'None', e.g., if the user is not on a domain. This is a valid group - do not confuse this with the Salt/Python value of None which means no value was returned. To be certain, use the get_pgid function which will return the SID, including for the system 'None' group.

Parameters
- **path** *(str)* – The path to the file or directory
- **follow_symlinks** *(bool)* – If the object specified by path is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns The name of the primary group
Return type str

CLI Example:
salt '*' file.get_pgroup c:\temp\test.txt

salt.modules.win_file.get_uid(path, follow_symlinks=True)

Return the id of the user that owns a given file

Symlinks are followed by default to mimic Unix behavior. Specify follow_symlinks=False to turn off this behavior.

Parameters
- **path** *(str)* – The path to the file or directory
- **follow_symlinks** *(bool)* – If the object specified by path is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns The uid of the owner
Return type str

CLI Example:
salt '*' file.get_uid c:\temp\test.txt
salt '*' file.get_uid c:\temp\test.txt follow_symlinks=False

salt.modules.win_file.get_user(path, follow_symlinks=True)

Return the user that owns a given file

Symlinks are followed by default to mimic Unix behavior. Specify follow_symlinks=False to turn off this behavior.

Parameters
- **path** *(str)* – The path to the file or directory
- **follow_symlinks** *(bool)* – If the object specified by path is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns The name of the owner
Return type str

CLI Example:
salt '*' file.get_user c:\temp\test.txt
salt '*' file.get_user c:\temp\test.txt follow_symlinks=False

salt.modules.win_file.gid_to_group(gid)

Convert the group id to the group name on this system

Under Windows, because groups are just another ACL entity, this function behaves the same as uid_to_user.
For maintaining Windows systems, this function is superfluous and only exists for API compatibility with Unix. Use the uid_to_user function instead; an info level log entry will be generated if this function is used directly.

```
Parameters gid (str) – The gid of the group
Returns The name of the group
Return type str
```

CLI Example:
```
salt '*' file.gid_to_group S-1-5-21-626487655-2533044672-482107328-1010
```

salt.modules.win_file.group_to_gid(group)

Convert the group to the gid on this system

Under Windows, because groups are just another ACL entity, this function behaves the same as user_to_uid, except if None is given, " is returned.

For maintaining Windows systems, this function is superfluous and only exists for API compatibility with Unix. Use the user_to_uid function instead; an info level log entry will be generated if this function is used directly.

```
Parameters group (str) – The name of the group
Returns The gid of the group
Return type str
```

CLI Example:
```
salt '*' file.group_to_gid administrators
```

salt.modules.win_file.is_link(path)

Check if the path is a symlink

This is only supported on Windows Vista or later.

Inline with Unix behavior, this function will raise an error if the path is not a symlink, however, the error raised will be a SaltInvocationError, not an OSError.

```
Parameters path (str) – The path to a file or directory
Returns True if path is a symlink, otherwise False
Return type bool
```

CLI Example:
```
salt '*' file.is_link /path/to/link
```

salt.modules.win_file.lchown(path, user, group=None, pgroup=None)

Chown a file, pass the file the desired user and group without following any symlinks.

Under Windows, the group parameter will be ignored.

This is because while files in Windows do have a 'primary group' property, this is rarely used. It generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

If you do want to change the 'primary group' property and understand the implications, pass the Windows only parameter, pgroup, instead.

To set the primary group to 'None', it must be specified in quotes. Otherwise Salt will interpret it as the Python value of None and no primary group changes will occur. See the example below.

```
Parameters
  • path (str) – The path to the file or directory
  • user (str) – The name of the user to own the file
  • group (str) – The group (not used)
  • pgroup (str) – The primary group to assign
```

Returns True if successful, otherwise error
Return type bool

CLI Example:

```
salt '*' file.lchown c:\temp\test.txt myusername
salt '*' file.lchown c:\temp\test.txt myusername pgroup=Administrators
salt '*' file.lchown c:\temp\test.txt myusername "pgroup='None'"
```

```
salt.modules.win_file.makedirs _(path, owner=None, grant_perms=None, deny_perms=None, inheritance=True, reset=False)_
```

Ensure that the parent directory containing this path is available.

Parameters

- **path (str)** – The full path to the directory.

  Note: The path must end with a trailing slash otherwise the directory(s) will be created up to the parent directory. For example if path is C:\temp\test, then it would be treated as C:\temp\ but if the path ends with a trailing slash like C:\temp\test\, then it would be treated as C:\temp\test\.

- **owner (str)** – The owner of the directory. If not passed, it will be the account that created the directory, likely SYSTEM.

- **grant_perms (dict)** – A dictionary containing the user/group and the basic permissions to grant, ie: `{user: {'perms': 'basic_permission'}`. You can also set the applies_to setting here. The default is this_folder_subfolders_files. Specify another applies_to setting like this:

```
{'user': {'perms': 'full_control', 'applies_to': 'this_folder'}
```

To set advanced permissions use a list for the perms parameter, ie:

```
{'user': {'perms': ['read_attributes', 'read_ea'], 'applies_to': 'this_folder'}
```

- **deny_perms (dict)** – A dictionary containing the user/group and permissions to deny along with the applies_to setting. Use the same format used for the grant_perms parameter. Remember, deny permissions supersede grant permissions.

- **inheritance (bool)** – If True the object will inherit permissions from the parent, if False, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created.

- **reset (bool)** – If True the existing DACL will be cleared and replaced with the settings defined in this function. If False, new entries will be appended to the existing DACL. Default is False.

New in version 2018.3.0.

Returns True if successful, otherwise error
Return type bool

Raises CommandExecutionError – If unsuccessful

CLI Example:

```
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.makedirs C:\Temp\ Administrators "{'Users': {'perms': 'read_execute'}}"
```

(continues on next page)
salt.modules.win_file.makedirs_perms(path, owner=None, grant_perms=None, deny_perms=None, inheritance=True, reset=True)

Set owner and permissions for each directory created.

Parameters

- **path** *(str)* – The full path to the directory.
- **owner** *(str)* – The owner of the directory. If not passed, it will be the account that created the directory, likely SYSTEM.
- **grant_perms** *(dict)* – A dictionary containing the user/group and the basic permissions to grant, ie: `{user: {'perms': 'basic_permission'}}`. You can also set the applies_to setting here. The default is `this_folder_subfolders_files`. Specify another applies_to setting like this:

  ```
  {'user': {'perms': 'full_control', 'applies_to': 'this_folder'}}
  ```

To set advanced permissions use a list for the **perms** parameter, ie:

```
{'user': {'perms': ['read_attributes', 'read_ea'], 'applies_to': 'this_folder'}}
```

- **deny_perms** *(dict)* – A dictionary containing the user/group and permissions to deny along with the applies_to setting. Use the same format used for the **grant_perms** parameter. Remember, deny permissions supersede grant permissions.
- **inheritance** *(bool)* – If True the object will inherit permissions from the parent, if False, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created
- **reset** *(bool)* – If True the existing DACL will be cleared and replaced with the settings defined in this function. If False, new entries will be appended to the existing DACL. Default is False.

New in version 2018.3.0.

Returns  True if successful, otherwise raises an error

Return type  *bool*

CLI Example:

```
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.makedirs_perms C:\Temp\ Administrators "{'Users': {'perms': 'read_execute', 'applies_to': 'this_folder_only'}}"

# Locally using salt call
salt-call file.makedirs_perms C:\Temp\ Administrators "{'Users': {'perms': 'read_execute', 'applies_to': 'this_folder_only'}}"

# Specify advanced attributes with a list
salt '*' file.makedirs_perms C:\Temp\ Administrators "{'jsnuffy': {'perms': ['read_attributes', 'read_ea'], 'applies_to': 'this_folder_files'}}"
```
salt.modules.win_file.mkdir(path, owner=None, grant_perms=None, deny_perms=None, inheritance=True, reset=False)

Ensure that the directory is available and permissions are set.

**Parameters**

- **path (str)** – The full path to the directory.
- **owner (str)** – The owner of the directory. If not passed, it will be the account that created the directory, likely SYSTEM
- **grant_perms (dict)** – A dictionary containing the user/group and the basic permissions to grant, ie: `{'user': {'perms': 'basic_permission'}}`. You can also set the applies_to setting here. The default is this_folder_subfolders_files. Specify another applies_to setting like this:

  ```
  {'user': {'perms': 'full_control', 'applies_to': 'this_folder'}}
  ```

  To set advanced permissions use a list for the perms parameter, ie:

  ```
  {'user': {'perms': ['read_attributes', 'read_ea'], 'applies_to': 'this_folder'}}
  ```

- **deny_perms (dict)** – A dictionary containing the user/group and permissions to deny along with the applies_to setting. Use the same format used for the grant_perms parameter. Remember, deny permissions supersede grant permissions.
- **inheritance (bool)** – If True the object will inherit permissions from the parent, if False, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created.
- **reset (bool)** – If True the existing DACL will be cleared and replaced with the settings defined in this function. If False, new entries will be appended to the existing DACL. Default is False.

New in version 2018.3.0.

**Returns**

True if successful

**Return type**

bool

** Raises **

CommandExecutionError – If unsuccessful

**CLI Example:**

```
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.mkdir C:\Temp\Administrators "{'Users': {'perms': 'read_execute'}}"

# Locally using salt call
salt-call file.mkdir C:\Temp\Administrators "{'Users': {'perms': 'read_execute', 'applies_to': 'this_folder_only'}}"

# Specify advanced attributes with a list
salt '*' file.mkdir C:\Temp\Administrators "{'jsnuffy': {'perms': ['read_attributes', 'read_ea'], 'applies_to': 'this_folder_only'}}"
```

salt.modules.win_file.readlink(path)

Return the path that a symlink points to

This is only supported on Windows Vista or later.

Inline with Unix behavior, this function will raise an error if the path is not a symlink, however, the error raised will be a SaltInvocationError, not an OSError.

**Parameters**

- **path (str)** – The path to the symlink

**Returns**

The path that the symlink points to.
Return type  str

CLI Example:
salt \* file.readlink /path/to/link

salt.modules.win_file.remove\(path, force=False\)
Remove the named file or directory

Parameters
- **path** (str) – The path to the file or directory to remove.
- **force** (bool) – Remove even if marked Read-Only. Default is False

Returns  True if successful, False if unsuccessful

Return type  bool

CLI Example:
salt \* file.remove C:\Temp

salt.modules.win_file.set_attributes\(path, archive=None, hidden=None, normal=None, notIndexed=None, readonly=None, system=None, temporary=None\)
Set file attributes for a file. Note that the normal attribute means that all others are false. So setting it will clear all others.

Parameters
- **path** (str) – The path to the file or directory
- **archive** (bool) – Sets the archive attribute. Default is None
- **hidden** (bool) – Sets the hidden attribute. Default is None
- **normal** (bool) – Resets the file attributes. Cannot be used in conjunction with any other attribute. Default is None
- **notIndexed** (bool) – Sets the indexed attribute. Default is None
- **readonly** (bool) – Sets the readonly attribute. Default is None
- **system** (bool) – Sets the system attribute. Default is None
- **temporary** (bool) – Sets the temporary attribute. Default is None

Returns  True if successful, otherwise False

Return type  bool

CLI Example:
salt \* file.set_attributes c:\temp\a.txt normal=True
salt \* file.set_attributes c:\temp\a.txt readonly=True hidden=True

salt.modules.win_file.set_mode\(path, mode\)
Set the mode of a file

This just calls get_mode, which returns None because we don’t use mode on Windows

Parameters
- **path** – The path to the file or directory
- **mode** – The mode (not used)

Returns  None

CLI Example:
salt \* file.set_mode /etc/passwd 0644

salt.modules.win_file.set_perms\(path, grant_perms=None, deny_perms=None, inheritance=True, reset=False\)
Set permissions for the given path

Parameters
- **path** (str) – The full path to the directory.
- **grant_perms (dict)** – A dictionary containing the user/group and the basic permissions to grant, ie: `{user: {'perms': 'basic_permission'}}`. You can also set the applies_to setting here. The default for applies_to is `this_folder_subfolders_files`. Specify another applies_to setting like this:

```python
{'user': {'perms': 'full_control', 'applies_to': 'this_folder'}
```

To set advanced permissions use a list for the perms parameter, ie:

```python
{'user': {'perms': ['read_attributes', 'read_ea'], 'applies_to': 'this_folder'}}
```

To see a list of available attributes and applies to settings see the documentation for `salt.utils.win_dacl`. A value of `None` will make no changes to the grant portion of the DACL. Default is `None`.

- **deny_perms (dict)** – A dictionary containing the user/group and permissions to deny along with the applies_to setting. Use the same format used for the grant_perms parameter. Remember, deny permissions supersede grant permissions.

A value of `None` will make no changes to the deny portion of the DACL. Default is `None`.

- **inheritance (bool)** – If True the object will inherit permissions from the parent, if False, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created. Default is `False`.

- **reset (bool)** – If True the existing DCL will be cleared and replaced with the settings defined in this function. If False, new entries will be appended to the existing DACL. Default is `False`.

   New in version 2018.3.0.

   Returns True if successful

   Return type bool

   Raises **CommandExecutionError** – If unsuccessful

   CLI Example:

   ```
   # To grant the 'Users' group 'read & execute' permissions.
   salt '*' file.set_perms C:\Temp "{'Users': {'perms': 'read_execute'}}"
   # Locally using salt call
   salt-call file.set_perms C:\Temp "{'Users': {'perms': 'read_execute', 'applies_to': 'this_folder_only'}}"
   # Specify advanced attributes with a list
   salt '*' file.set_perms C:\Temp "{'jsnuffy': {'perms': ['read_attributes', 'read_ea'], 'applies_to': 'this_folder_only'}}"
   ```

`salt.modules.win_file.stats(path, hash_type='sha256', follow_symlinks=True)`

Return a dict containing the stats about a given file

Under Windows, gid will equal uid and group will equal user.

While a file in Windows does have a ‘primary group’, this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).
Salt, therefore, remaps these properties to keep some kind of compatibility with Unix behavior. If the 'primary group' is required, it can be accessed in the `pgroup` and `pgid` properties.

**Parameters**
- `path (str)` - The path to the file or directory
- `hash_type (str)` - The type of hash to return
- `follow_symlinks (bool)` - If the object specified by `path` is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

**Returns** A dictionary of file/directory stats

**Return type** `dict`

**CLI Example:**
```
salt '*' file.stats /etc/passwd
```

salt.modules.win_file.symlink(`src`, `link`)

Create a symbolic link to a file

This is only supported with Windows Vista or later and must be executed by a user with the SeCreateSymbolicLink privilege.

The behavior of this function matches the Unix equivalent, with one exception - invalid symlinks cannot be created. The source path must exist. If it doesn’t, an error will be raised.

**Parameters**
- `src (str)` - The path to a file or directory
- `link (str)` - The path to the link

**Returns** True if successful, otherwise False

**Return type** `bool`

**CLI Example:**
```
salt '*' file.symlink /path/to/file /path/to/link
```

salt.modules.win_file.uid_to_user(`uid`)

Convert a uid to a user name

**Parameters** `uid (str)` - The user id to lookup

**Returns** The name of the user

**Return type** `str`

**CLI Example:**
```
salt '*' file.uid_to_user S-1-5-21-626487655-2533044672-482107328-1010
```

salt.modules.win_file.user_to_uid(`user`)

Convert user name to a uid

**Parameters** `user (str)` - The user to lookup

**Returns** The user id of the user

**Return type** `str`

**CLI Example:**
```
salt '*' file.user_to_uid myusername
```

21.9.459 salt.modules.win_firewall

Module for configuring Windows Firewall using `netsh`

salt.modules.win_firewall.add_rule(`name`, `localport`, `protocol~'tcp'`, `action='allow'`, `dir='in'`, `remoteip='any'`)

New in version 2015.5.0.
Add a new inbound or outbound rule to the firewall policy

Parameters

- **name** (*str*) - The name of the rule. Must be unique and cannot be "all". Required.
- **localport** (*int*) - The port the rule applies to. Must be a number between 0 and 65535. Can be a range. Can specify multiple ports separated by commas. Required.
- **protocol** (*Optional* [*str]*) - The protocol. Can be any of the following:
  - A number between 0 and 255
  - icmpv4
  - icmpv6
  - tcp
  - udp
  - any
- **action** (*Optional* [*str]*) - The action the rule performs. Can be any of the following:
  - allow
  - block
  - bypass
- **dir** (*Optional* [*str]*) - The direction. Can be *in* or *out*.
- **remoteip** (*Optional* [*str]*) - The remote IP. Can be any of the following:
  - any
  - localsubnet
  - dns
  - dhcp
  - wins
  - defaultgateway
  - Any valid IPv4 address (192.168.0.12)
  - Any valid subnet (192.168.1.0/24)
  - Any valid range of IP addresses (192.168.0.1-192.168.0.12)
  - A list of valid IP addresses
  - Can be combinations of the above separated by commas.

Returns  True if successful
Return type  bool

Raises  :class:`CommandExecutionError` - If the command fails

CLI Example:

```
salt '*' firewall.add_rule 'test' '8080' 'tcp'
salt '*' firewall.add_rule 'test' '1' 'icmpv4'
salt '*' firewall.add_rule 'test_remote_ip' '8000' 'tcp' 'allow' 'in' '192.168.0.1'
```

```
salt.modules.win_firewall.delete_rule(name=None, localport=None, protocol=None, dir=None, remoteip=None)
```

New in version 2015.8.0.

Delete an existing firewall rule identified by name and optionally by ports, protocols, direction, and remote IP.

Parameters

- **name** (*str*) - The name of the rule to delete. If the name *all* is used you must specify additional parameters.
- **localport** (*Optional* [*str]*) - The port of the rule. If protocol is not specified, protocol will be set to *tcp*.
- **protocol** (*Optional* [*str]*) - The protocol of the rule. Default is *tcp* when *localport* is specified.
- **dir** (*Optional* [*str]*) - The direction of the rule.
- **remoteip** (*Optional* [*str]*) - The remote IP of the rule.
Returns True if successful
Return type bool
Raises CommandExecutionError – If the command fails

CLI Example:

```
# Delete incoming tcp port 8080 in the rule named 'test'
salt '*' firewall.delete_rule 'test' '8080' 'tcp' 'in'

# Delete the incoming tcp port 8000 from 192.168.0.1 in the rule named
# 'test_remote_ip'
salt '*' firewall.delete_rule 'test_remote_ip' '8000' 'tcp' 'in' '192.168.0.1'

# Delete all rules for local port 80:
salt '*' firewall.delete_rule all 80 tcp

# Delete a rule called 'allow80':
salt '*' firewall.delete_rule allow80
```

salt.modules.win_firewall.disable(profile='allprofiles')
Disable firewall profile

Parameters profile (Optional[str]) – The name of the profile to disable. Default is allprofiles. Valid options are:
  • allprofiles
  • domainprofile
  • privateprofile
  • publicprofile

Returns True if successful
Return type bool
Raises CommandExecutionError – If the command fails

CLI Example:

```
salt '*' firewall.disable
```

sicl.modules.win_firewall.enable(profile='allprofiles')
Enable firewall profile

Parameters profile (Optional[str]) – The name of the profile to enable. Default is allprofiles. Valid options are:
  • allprofiles
  • domainprofile
  • privateprofile
  • publicprofile

Returns True if successful
Return type bool
Raises CommandExecutionError – If the command fails

CLI Example:

```
salt '*' firewall.enable
```

sicl.modules.win_firewall.get_all_profiles(store='local')
Gets all properties for all profiles in the specified store

New in version 2018.3.4.
New in version 2019.2.0.
Parameters **store** *(str)* – The store to use. This is either the local firewall policy or the policy
defined by local group policy. Valid options are:
  - lgpo
  - local
  Default is local
Returns A dictionary containing the specified settings for each profile
Return type *dict*

CLI Example:
```
# Get all firewall settings for all profiles
salt * firewall.get_all_settings

# Get all firewall settings for all profiles as defined by local group policy
salt * firewall.get_all_settings lgpo
```

salt.modules.win_firewall.get_all_settings *(domain, store='local')*
Gets all the properties for the specified profile in the specified store

New in version 2018.3.4.
New in version 2019.2.0.

Parameters
  - **profile** *(str)* – The firewall profile to query. Valid options are:
    - domain
    - public
    - private
  - **store** *(str)* – The store to use. This is either the local firewall policy or the policy
defined by local group policy. Valid options are:
    - lgpo
    - local
    Default is local
Returns A dictionary containing the specified settings
Return type *dict*

CLI Example:
```
# Get all firewall settings for connections on the domain profile
salt * win_firewall.get_all_settings domain

# Get all firewall settings for connections on the domain profile as defined by local group policy
salt * win_firewall.get_all_settings domain lgpo
```

salt.modules.win_firewall.get_config()
Get the status of all the firewall profiles
Returns A dictionary of all profiles on the system
Return type *dict*
 Raises **CommandExecutionError** – If the command fails

CLI Example:
```
salt '*' firewall.get_config
```

salt.modules.win_firewall.get_rule *(name='all')*
New in version 2015.5.0.
Display all matching rules as specified by name
Parameters name (Optional[Optional[Optional['str']]]) – The full name of the rule. all will return all rules.
Default is all
Returns A dictionary of all rules or rules that match the name exactly
Return type dict
Raises CommandExecutionError – If the command fails

CLI Example:
salt '*' firewall.get_rule 'MyAppPort'

salt.modules.win_firewall.get_settings (profile, section, store='local')
Get the firewall property from the specified profile in the specified store as returned by netsh advfirewall.
New in version 2018.3.4.
New in version 2019.2.0.
Parameters

• profile (str) – The firewall profile to query. Valid options are:
  – domain
  – public
  – private
• section (str) – The property to query within the selected profile. Valid options are:
  – firewallpolicy: inbound/outbound behavior
  – logging: firewall logging settings
  – settings: firewall properties
  – state: firewalls state (on | off)
• store (str) – The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  – lgpo
  – local
Default is local
Returns A dictionary containing the properties for the specified profile
Return type dict
Raises

• CommandExecutionError – If an error occurs
• ValueError – If the parameters are incorrect

CLI Example:

```bash
# Get the inbound/outbound firewall settings for connections on the local domain profile
salt '*' win_firewall.get_settings domain firewallpolicy

# Get the inbound/outbound firewall settings for connections on the domain profile as defined by local group policy
salt '*' win_firewall.get_settings domain firewallpolicy lgpo
```

salt.modules.win_firewall.rule_exists (name)
New in version 2016.11.6.
Checks if a firewall rule exists in the firewall policy
Parameters name (str) – The name of the rule
Returns True if exists, otherwise False
Return type bool
CLI Example:
salt.modules.win_firewall.set_firewall_settings(profile, inbound=None, outbound=None, store='local')

Set the firewall inbound/outbound settings for the specified profile and store

New in version 2018.3.4.
New in version 2019.2.0.

Parameters

- **profile** (str) – The firewall profile to query. Valid options are:
  - domain
  - public
  - private

- **inbound** (str) – The inbound setting. If None is passed, the setting will remain unchanged. Valid values are:
  - blockinbound
  - blockinboundalways
  - allowinbound
  - notconfigured

  Default is None

- **outbound** (str) – The outbound setting. If None is passed, the setting will remain unchanged. Valid values are:
  - allowoutbound
  - blockoutbound
  - notconfigured

  Default is None

- **store** (str) – The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - lgpo
  - local

  Default is local

Returns True if successful

Return type bool

Raises

- **CommandExecutionError** – If an error occurs
- **ValueError** – If the parameters are incorrect

CLI Example:

```bash
# Set the inbound setting for the domain profile to block inbound connections
salt '*' firewall.set_firewall_settings domain='domain' inbound='blockinbound'

# Set the outbound setting for the domain profile to allow outbound connections
salt '*' firewall.set_firewall_settings domain='domain' outbound='allowoutbound'

# Set inbound/outbound settings for the domain profile in the group policy to block inbound and allow outbound
salt '*' firewall.set_firewall_settings domain='domain' inbound='blockinbound' outbound='allowoutbound' store='lgpo'
```

salt.modules.win_firewall.set_logging_settings(profile, setting, value, store='local')

Configure logging settings for the Windows firewall.
New in version 2018.3.4.
New in version 2019.2.0.

Parameters

- **profile** *(str)* – The firewall profile to configure. Valid options are:
  - domain
  - public
  - private

- **setting** *(str)* – The logging setting to configure. Valid options are:
  - allowedconnections
  - droppedconnections
  - filename
  - maxfilesize

- **value** *(str)* – The value to apply to the setting. Valid values are dependent upon
  the setting being configured. Valid options are:

  allowedconnections:
  - enable
  - disable
  - notconfigured

  droppedconnections:
  - enable
  - disable
  - notconfigured

  filename:
  - Full path and name of the firewall log file
  - notconfigured

  maxfilesize:
  - 1 - 32767
  - notconfigured

Note: notconfigured can only be used when using the lgpo store

- **store** *(str)* – The store to use. This is either the local firewall policy or the policy
  defined by local group policy. Valid options are:
  - lgpo
  - local

  Default is local

Returns True if successful

Return type bool

Raises

- **CommandExecutionError** – If an error occurs
- **ValueError** – If the parameters are incorrect

CLI Example:

```
# Log allowed connections and set that in local group policy
salt * firewall.set_logging_settings domain allowedconnections enable lgpo

# Don't log dropped connections
salt * firewall.set_logging_settings profile=private setting=droppedconnections
  value=disable

# Set the location of the log file
salt * firewall.set_logging_settings domain filename C:\windows\logs\firewall.log
```

(continues on next page)
# You can also use environment variables
salt * firewall.set_logging_settings domain filename %systemroot\%system32\LogFiles\Firewall\firewall.log

# Set the max file size of the log to 2048 Kb
salt * firewall.set_logging_settings domain maxfilesize 2048

```python
salt.modules.win_firewall.set_settings(profile, setting, value, store='local')
```

Configure firewall settings.

New in version 2018.3.4.
New in version 2019.2.0.

**Parameters**

- **profile (str)** – The firewall profile to configure. Valid options are:
  - domain
  - public
  - private
- **setting (str)** – The firewall setting to configure. Valid options are:
  - localfirewallrules
  - localconsecrules
  - inboundusernotification
  - remotemanagement
  - unicastresponsetomulticast
- **value (str)** – The value to apply to the setting. Valid options are
  - enable
  - disable
  - notconfigured

**Note:** notconfigured can only be used when using the lgpo store

- **store (str)** – The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - lgpo
  - local

Default is local

**Returns** True if successful

**Return type** bool

**Raises**

- **CommandExecutionError** – If an error occurs
- **ValueError** – If the parameters are incorrect

**CLI Example:**

```bash
# Merge local rules with those distributed through group policy
salt * firewall.set_settings domain localfirewallrules enable

# Allow remote management of Windows Firewall
salt * firewall.set_settings domain remotemanagement enable
```

```python
salt.modules.win_firewall.set_state(profile, state, store='local')
```

Configure the firewall state.

New in version 2018.3.4.
New in version 2019.2.0.

**Parameters**
• **profile** *(str)* – The firewall profile to configure. Valid options are:
  - domain
  - public
  - private

• **state** *(str)* – The firewall state. Valid options are:
  - on
  - off
  - notconfigured

  **Note:** *notconfigured* can only be used when using the lgpo store

• **store** *(str)* – The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - lgpo
  - local
  Default is local

  **Returns** *True* if successful
  **Return type** *bool*

  **Raises**
  - **CommandExecutionError** – If an error occurs
  - **ValueError** – If the parameters are incorrect

  **CLI Example:**

```bash
# Turn the firewall off when the domain profile is active
salt * firewall.set_state domain off

# Turn the firewall on when the public profile is active and set that in the local group policy
salt * firewall.set_state public on lgpo
```

## 21.9.460 salt.modules.win_groupadd

Manage groups on Windows

**Important:** If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to *'group.info' is not available*), see [here](#).

**salt.modules.win_groupadd.add** *(name, **kwargs)*

Add the specified group

**Parameters**

- **name** *(str)* – The name of the group to add
  **Returns** *True* if successful, otherwise *False*
  **Return type** *bool*

**CLI Example:**

```
salt '*' group.add foo
```

**salt.modules.win_groupadd.adduser** *(name, username, **kwargs)*

Add a user to a group

**Parameters**

- **name** *(str)* – The name of the group to modify
- **username** *(str)* – The name of the user to add to the group

**Returns** *True* if successful, otherwise *False*

**Return type** *bool*
CLI Example:
```
salt '*' group.adduser foo username
```

```
salt.modules.win_groupadd.delete(name, **kwargs)

Remove the named group

Parameters  
- `name (str)` - The name of the group to remove

Returns  
- `True` if successful, otherwise `False`

Return type  
- `bool`
```

CLI Example:
```
salt '*' group.delete foo
```

```
salt.modules.win_groupadd.deluser(name, username, **kwargs)

Remove a user from a group

Parameters  
- `name (str)` - The name of the group to modify
- `username (str)` - The name of the user to remove from the group

Returns  
- `True` if successful, otherwise `False`

Return type  
- `bool`
```

CLI Example:
```
salt '*' group.deluser foo username
```

```
salt.modules.win_groupadd.getent(refresh=False)

Return info on all groups

Parameters  
- `refresh (bool)` - Refresh the info for all groups in __context__. If False only the groups in __context__ will be returned. If True the __context__ will be refreshed with current data and returned. Default is False

Returns  
- A list of groups and their information
```

CLI Example:
```
salt '*' group.getent
```

```
salt.modules.win_groupadd.info(name)

Return information about a group

Parameters  
- `name (str)` - The name of the group for which to get information

Returns  
- A dictionary of information about the group

Return type  
- `dict`
```

CLI Example:
```
salt '*' group.info foo
```

```
salt.modules.win_groupadd.list_groups(refresh=False)

Return a list of groups

Parameters  
- `refresh (bool)` - Refresh the info for all groups in __context__. If False only the groups in __context__ will be returned. If True, the __context__ will be refreshed with current data and returned. Default is False

Returns  
- A list of groups on the machine

Return type  
- `list`
```

CLI Example:
```
salt '*' group.list_groups
```

```
salt.modules.win_groupadd.members(name, members_list, **kwargs)

Ensure a group contains only the members in the list
Parameters
- **name** *(str)* – The name of the group to modify
- **members_list** *(str)* – A single user or a comma separated list of users. The group will contain only the users specified in this list.

Returns True if successful, otherwise False
Return type bool

CLI Example:
salt '*' group.members foo 'user1,user2,user3'

### 21.9.461 salt.modules.win_iis module

Microsoft IIS site management via WebAdministration powershell module

maintainer Shane Lee <slee@saltstack.com>, Robert Booth <rbooth@saltstack.com>

platform Windows

depends PowerShell

depends WebAdministration module (PowerShell) (IIS)

New in version 2016.3.0.

salt.modules.win_iis.create_app *(name, site, sourcepath, apppool=None)*
Create an IIS application.

Note: This function only validates against the application name, and will return True even if the application already exists with a different configuration. It will not modify the configuration of an existing application.

Parameters
- **name** *(str)* – The IIS application.
- **site** *(str)* – The IIS site name.
- **sourcepath** *(str)* – The physical path.
- **apppool** *(str)* – The name of the IIS application pool.

Returns True if successful, otherwise False
Return type bool

CLI Example:
salt '*' win_iis.create_app name='app0' site='site0' sourcepath='C:\site0' apppool='site0'

salt.modules.win_iis.create_apppool *(name)*
Create an IIS application pool.

Note: This function only validates against the application pool name, and will return True even if the application pool already exists with a different configuration. It will not modify the configuration of an existing application.

Parameters **name** *(str)* – The name of the IIS application pool.

Returns True if successful, otherwise False
Return type bool

CLI Example:
salt '*' win_iis.create_apppool name='MyTestPool'

salt.modules.win_iis.create_backup(name)
Backup an IIS Configuration on the System.

New in version 2017.7.0.

Note: Backups are stored in the $env:Windir\System32\inetsrv\backup folder.

Parameters

name (str) – The name to give the backup

Returns True if successful, otherwise False

Return type bool

CLI Example:
salt '*' win_iis.create_backup good_config_20170209

salt.modules.win_iis.create_binding(site, hostheader='', ipaddress='*', port=80, protocol='http', sslflags=None)
Create an IIS Web Binding.

Note: This function only validates against the binding ipaddress:port:hostname combination, and will return True even if the binding already exists with a different configuration. It will not modify the configuration of an existing binding.

Parameters

- site (str) – The IIS site name.
- hostheader (str) – The host header of the binding. Usually a hostname.
- ipaddress (str) – The IP address of the binding.
- port (int) – The TCP port of the binding.
- protocol (str) – The application protocol of the binding.
- sslflags (str) – The flags representing certificate type and storage of the binding.

Returns True if successful, otherwise False

Return type bool

CLI Example:
salt '*' win_iis.create_binding site='site0' hostheader='example.com' ipaddress='*' port='80'

salt.modules.win_iis.create_cert_binding(name, site, hostheader='', ipaddress='*', port=443, sslflags=0)
Assign a certificate to an IIS Web Binding.

New in version 2016.11.0.

Note: The web binding that the certificate is being assigned to must already exist.

Parameters

- name (str) – The thumbprint of the certificate.
- site (str) – The IIS site name.
- hostheader (str) – The host header of the binding.
- ipaddress (str) – The IP address of the binding.
• **port** *(int)* – The TCP port of the binding.
• **sslflags** *(int)* – Flags representing certificate type and certificate storage of the binding.

**Returns** True if successful, otherwise False
**Return type** bool

CLI Example:

```bash
salt '*' win_iis.create_cert_binding name='AAA000' site='site0' hostheader='example.com' ipaddress='*' port='443'
```

salt.modules.win_iis.create_site(name, sourcepath, apppool='', hostheader='', ipaddress='*', port=80, protocol='http')

Create a basic website in IIS.

**Note:** This function only validates against the site name, and will return True even if the site already exists with a different configuration. It will not modify the configuration of an existing site.

**Parameters**

- **name** *(str)* – The IIS site name.
- **sourcepath** *(str)* – The physical path of the IIS site.
- **apppool** *(str)* – The name of the IIS application pool.
- **hostheader** *(str)* – The host header of the binding. Usually the hostname or website name, ie: www.contoso.com
- **ipaddress** *(str)* – The IP address of the binding.
- **port** *(int)* – The TCP port of the binding.
- **protocol** *(str)* – The application protocol of the binding. (http, https, etc.)

**Returns** True if successful, otherwise False.
**Return type** bool

**Note:** If an application pool is specified, and that application pool does not already exist, it will be created.

CLI Example:

```bash
salt '*' win_iis.create_site name='My Test Site' sourcepath='c:\stage' apppool='TestPool'
```

salt.modules.win_iis.create_vdir(name, site, sourcepath, app='/')

Create an IIS virtual directory.

**Note:** This function only validates against the virtual directory name, and will return True even if the virtual directory already exists with a different configuration. It will not modify the configuration of an existing virtual directory.

**Parameters**

- **name** *(str)* – The virtual directory name.
- **site** *(str)* – The IIS site name.
- **sourcepath** *(str)* – The physical path.
- **app** *(str)* – The IIS application.

**Returns** True if successful, otherwise False.
**Return type** bool

CLI Example:
salt.modules.win_iis.create_vdir(name='vd0', site='site0', sourcepath='C:\inetpub\vdirs\vd0')

salt.modules.win_iis.get_container_setting(name, container, settings)
Get the value of the setting for the IIS container.

New in version 2016.11.0.

Parameters
- name (str) – The name of the IIS container.
- container (str) – The type of IIS container. The container types are: AppPools, Sites, SslBindings
- settings (dict) – A dictionary of the setting names and their values.

Returns A dictionary of the provided settings and their values.

Return type dict

CLI Example:
salt '*' win_iis.get_container_setting name='MyTestPool' container='AppPools' settings='[\'processModel.identityType\']"

salt.modules.win_iis.get_webapp_settings(name, site, settings)
Get the value of the setting for the IIS web application.

New in version 2017.7.0.

Note: Params are case sensitive

Parameters
- name (str) – The name of the IIS web application.
- site (str) – The site name contains the web application. Example: Default Web Site
- settings (str) – A dictionary of the setting names and their values. Available settings: physicalPath, applicationPool, userName, password

Returns A dictionary of the provided settings and their values.

Return type dict

CLI Example:
salt '*' win_iis.get_webapp_settings name='app0' site='Default Web Site' settings='[\'physicalPath\',\'applicationPool\']"

salt.modules.win_iis.list_apppools()
List all configured IIS application pools.

Returns A dictionary of IIS application pools and their details.

Return type dict

CLI Example:
salt '*' win_iis.list_apppools

salt.modules.win_iis.list_apps(site)
Get all configured IIS applications for the specified site.

Parameters site (str) – The IIS site name.

Returns A dictionary of the application names and properties.

CLI Example:
salt ' Examples

salt.modules.win_iis.list_apps site

salt.modules.win_iis.list_backups()
List the IIS Configuration Backups on the System.
New in version 2017.7.0.

Note: Backups are made when a configuration is edited. Manual backups are stored in the $env:Windir\System32\inetsrv\backup folder.

Returns A dictionary of IIS Configurations backed up on the system.
Return type dict

CLI Example:
salt ' Examples

salt.modules.win_iis.list_bindings(site)
Get all configured IIS bindings for the specified site.
Parameters site (str) – The name if the IIS Site
Returns A dictionary of the binding names and properties.
Return type dict

CLI Example:
salt ' Examples

salt.modules.win_iis.list_cert_bindings(site)
List certificate bindings for an IIS site.
New in version 2016.11.0.
Parameters site (str) – The IIS site name.
Returns A dictionary of the binding names and properties.
Return type dict

CLI Example:
salt ' Examples

salt.modules.win_iis.list_sites()
List all the currently deployed websites.
Returns A dictionary of the IIS sites and their properties.
Return type dict

CLI Example:
salt ' Examples

salt.modules.win_iis.list_vdirs(site, app='/')
Get all configured IIS virtual directories for the specified site, or for the combination of site and application.
Parameters
* site (str) – The IIS site name.
* app (str) – The IIS application.
Returns A dictionary of the virtual directory names and properties.
Return type dict

CLI Example:
salt 'salt '*' win_iis.list_vdirs site

salt.modules.win_iis.list_worker_processes(apppool)
Returns a list of worker processes that correspond to the passed application pool.

New in version 2017.7.0.
Parameters
  apppool (str) – The application pool to query
Returns
  A dictionary of worker processes with their process IDs
Return type
dict
CLI Example:
salt '*' win_iis.list_worker_processes 'My App Pool'

salt.modules.win_iis.modify_binding(site, binding, hostheader=None, ipaddress=None, port=None, sslflags=None)
Modify an IIS Web Binding. Use site and binding to target the binding.

New in version 2017.7.0.
Parameters
  • site (str) – The IIS site name.
  • binding (str) – The binding to edit. This is a combination of the IP address, port, and hostheader. It is in the following format: ipaddress:port:hostheader. For example, *:80: or *:80:salt.com
  • hostheader (str) – The host header of the binding. Usually the hostname.
  • ipaddress (str) – The IP address of the binding.
  • port (int) – The TCP port of the binding.
  • sslflags (str) – The flags representing certificate type and storage of the binding.
Returns
  True if successful, otherwise False
Return type
  bool
CLI Example:
The following will seat the host header of binding *:80: for site0 to example.com
salt '*' win_iis.modify_binding site='site0' binding='*:80:' hostheader='example.com'

salt.modules.win_iis.modify_site(name, sourcepath=None, apppool=None)
Modify a basic website in IIS.

New in version 2017.7.0.
Parameters
  • name (str) – The IIS site name.
  • sourcepath (str) – The physical path of the IIS site.
  • apppool (str) – The name of the IIS application pool.
Returns
  True if successful, otherwise False.
Return type
  bool
Note: If an application pool is specified, and that application pool does not already exist, it will be created.

CLI Example:
salt '*' win_iis.modify_site name='My Test Site' sourcepath='c:\new_path' apppool='NewTestPool'

salt.modules.win_iis.remove_app(name, site)
Remove an IIS application.
Parameters

- **name** *(str)* – The application name.
- **site** *(str)* – The IIS site name.

Returns True if successful, otherwise False

Return type *bool*

CLI Example:

```
salt '*' win_iis.remove_app name='app0' site='site0'
```

salt.modules.win_iis.remove_apppool**(name)**

Remove an IIS application pool.

Parameters **name** *(str)* – The name of the IIS application pool.

Returns True if successful, otherwise False

Return type *bool*

CLI Example:

```
salt '*' win_iis.remove_apppool name='MyTestPool'
```

salt.modules.win_iis.remove_backup**(name)**

Remove an IIS Configuration backup from the System.

New in version 2017.7.0.

Parameters **name** *(str)* – The name of the backup to remove

Returns True if successful, otherwise False

Return type *bool*

CLI Example:

```
salt '*' win_iis.remove_backup backup_20170209
```

salt.modules.win_iis.remove_binding**(site, hostheader=", ipaddress='*', port=80)**

Remove an IIS binding.

Parameters

- **site** *(str)* – The IIS site name.
- **hostheader** *(str)* – The host header of the binding.
- **ipaddress** *(str)* – The IP address of the binding.
- **port** *(int)* – The TCP port of the binding.

Returns True if successful, otherwise False

Return type *bool*

CLI Example:

```
salt '*' win_iis.remove_binding site='site0' hostheader='example.com' ipaddress='*' port='80'
```

salt.modules.win_iis.remove_cert_binding**(name, site, hostheader=", ipaddress='*', port=443)**

Remove a certificate from an IIS Web Binding.

New in version 2016.11.0.

Note: This function only removes the certificate from the web binding. It does not remove the web binding itself.

Parameters

- **name** *(str)* – The thumbprint of the certificate.
- **site** *(str)* – The IIS site name.
- **hostheader** *(str)* – The host header of the binding.
salt.modules.win_iis.remove_cert_binding(ipaddress='*', port='443')

Parameters
- ipaddress (str) – The IP address of the binding.
- port (int) – The TCP port of the binding.

Returns True if successful, otherwise False
Return type bool

CLI Example:
salt '*' win_iis.remove_cert_binding name='AAA000' site='site0' hostheader='example.com' ipaddress='*' port='443'

salt.modules.win_iis.remove_site(name)
Delete a website from IIS.

Parameters
- name (str) – The IIS site name.

Returns True if successful, otherwise False
Return type bool

Note: This will not remove the application pool used by the site.

CLI Example:
salt '*' win_iis.remove_site name='My Test Site'

salt.modules.win_iis.remove_vdir(name, site='site0', app='/')
Remove an IIS virtual directory.

Parameters
- name (str) – The virtual directory name.
- site (str) – The IIS site name.
- app (str) – The IIS application.

Returns True if successful, otherwise False
Return type bool

CLI Example:
salt '*' win_iis.remove_vdir name='vdir0' site='site0'

salt.modules.win_iis.restart_apppool(name)
Restart an IIS application pool.

New in version 2016.11.0.

Parameters
- name (str) – The name of the IIS application pool.

Returns True if successful, otherwise False
Return type bool

CLI Example:
salt '*' win_iis.restart_apppool name='MyTestPool'

salt.modules.win_iis.restart_site(name)
Restart a Web Site in IIS.

New in version 2017.7.0.

Parameters
- name (str) – The name of the website to restart.

Returns True if successful, otherwise False
Return type bool

CLI Example:
salt '*' win_iis.restart_site name='My Test Site'
salt.modules.win_iis.set_container_setting(name, container, settings)

Set the value of the setting for an IIS container.

New in version 2016.11.0.

Parameters

- **name** *(str)* – The name of the IIS container.
- **container** *(str)* – The type of IIS container. The container types are: AppPools, Sites, SslBindings
- **settings** *(dict)* – A dictionary of the setting names and their values.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```bash
salt '*' win_iis.set_container_setting name='MyTestPool' container='AppPools' settings='{"managedPipeLineMode": 'Integrated'}"
```

salt.modules.win_iis.set_webapp_settings(name, site, settings)

Configure an IIS application.

New in version 2017.7.0.

Configure an IIS application.

Note: This function only configures an existing app. Params are case sensitive.

Parameters

- **name** *(str)* – The IIS application.
- **site** *(str)* – The IIS site name.
- **settings** *(str)* – A dictionary of the setting names and their values. - physicalPath: The physical path of the webapp. - applicationPool: The application pool for the webapp. - userName: "connectAs" user - password: "connectAs" password for user

Returns A boolean representing whether all changes succeeded.

Return type bool

CLI Example:

```bash
salt '*' win_iis.set_webapp_settings name='app0' site='site0' settings='{"physicalPath": "C:\site0", "apppool": "site0"}"
```

salt.modules.win_iis.start_apppool(name)

Start an IIS application pool.

New in version 2017.7.0.

Parameters **name** *(str)* – The name of the App Pool to start.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```bash
salt '*' win_iis.start_apppool name='MyTestPool'
```

salt.modules.win_iis.start_site(name)

Start a Web Site in IIS.

New in version 2017.7.0.

Parameters **name** *(str)* – The name of the website to start.

Returns True if successful, otherwise False

Return type bool
CLI Example:

```shell
salt '*' win_iis.start_site name='My Test Site'
```

salt.modules.win_iis.stop_apppool(name)
Stop an IIS application pool.
New in version 2017.7.0.

- **Parameters**
  - `name (str)` – The name of the App Pool to stop.
  - **Returns** True if successful, otherwise False
  - **Return type** bool

CLI Example:

```shell
salt '*' win_iis.stop_apppool name='MyTestPool'
```

salt.modules.win_iis.stop_site(name)
Stop a Web Site in IIS.
New in version 2017.7.0.

- **Parameters**
  - `name (str)` – The name of the website to stop.
  - **Returns** True if successful, otherwise False
  - **Return type** bool

CLI Example:

```shell
salt '*' win_iis.stop_site name='My Test Site'
```

### 21.9.462 salt.modules.win_ip

The networking module for Windows based systems

- **Methods**
  - `disable(iface)` Disable an interface
    - CLI Example:
      ```shell
      salt -G 'os_family:Windows' ip.disable 'Local Area Connection #2'
      ```
  - `enable(iface)` Enable an interface
    - CLI Example:
      ```shell
      salt -G 'os_family:Windows' ip.enable 'Local Area Connection #2'
      ```
  - `get_all Interfaces()` Return configs for all interfaces
    - CLI Example:
      ```shell
      salt -G 'os_family:Windows' ip.get_all_interfaces
      ```
  - `get_default_gateway()` Set DNS source to DHCP on Windows
    - CLI Example:
      ```shell
      salt -G 'os_family:Windows' ip.get_default_gateway
      ```
salt.modules.win_ip.get_interface(iface)
    Return the configuration of a network interface
    CLI Example:
    ```
    salt -G 'os_family:Windows' ip.get_interface 'Local Area Connection'
    ```

salt.modules.win_ip.get_subnet_length(mask)
    Convenience function to convert the netmask to the CIDR subnet length
    CLI Example:
    ```
    salt -G 'os_family:Windows' ip.get_subnet_length 255.255.255.0
    ```

salt.modules.win_ip.is_disabled(iface)
    Returns True if interface is disabled, otherwise False
    CLI Example:
    ```
    salt -G 'os_family:Windows' ip.is_disabled 'Local Area Connection #2'
    ```

salt.modules.win_ip.is_enabled(iface)
    Returns True if interface is enabled, otherwise False
    CLI Example:
    ```
    salt -G 'os_family:Windows' ip.is_enabled 'Local Area Connection #2'
    ```

salt.modules.win_ip.raw_interface_configs()
    Return raw configs for all interfaces
    CLI Example:
    ```
    salt -G 'os_family:Windows' ip.raw_interface_configs
    ```

salt.modules.win_ip.set_dhcp_all(iface)
    Set both IP Address and DNS to DHCP
    CLI Example:
    ```
    salt -G 'os_family:Windows' ip.set_dhcp_all 'Local Area Connection'
    ```

salt.modules.win_ip.set_dhcp_dns(iface)
    Set DNS source to DHCP on Windows
    CLI Example:
    ```
    salt -G 'os_family:Windows' ip.set_dhcp_dns 'Local Area Connection'
    ```

salt.modules.win_ip.set_dhcp_ip(iface)
    Set Windows NIC to get IP from DHCP
    CLI Example:
    ```
    salt -G 'os_family:Windows' ip.set_dhcp_ip 'Local Area Connection'
    ```

salt.modules.win_ip.set_static_dns(iface, *addrs)
    Set static DNS configuration on a Windows NIC
    Parameters
    - `iface` *(str)* – The name of the interface to set

21.9. execution modules
- **`addrs`** – One or more DNS servers to be added. To clear the list of DNS servers pass an empty list (`[]`). If undefined or None no changes will be made.

  **Returns** A dictionary containing the new DNS settings

  **Return type** dict

  CLI Example:

  ```
salt -G 'os_family:Windows' ip.set_static_dns 'Local Area Connection' '192.168.1.1'
salt -G 'os_family:Windows' ip.set_static_dns 'Local Area Connection' '192.168.1.252' '192.168.1.253'
  ```

**salt.modules.win_ip.set_static_ip**(iface, addr, gateway=None, append=False)

Set static IP configuration on a Windows NIC

  **iface** The name of the interface to manage

  **addr** IP address with subnet length (ex. `10.1.2.3/24`). The `ip.get_subnet_length` function can be used to calculate the subnet length from a netmask.

  **gateway** [None] If specified, the default gateway will be set to this value.

  **append** [False] If True, this IP address will be added to the interface. Default is False, which overrides any existing configuration for the interface and sets `addr` as the only address on the interface.

  CLI Example:

  ```
salt -G 'os_family:Windows' ip.set_static_ip 'Local Area Connection' 10.1.2.3/24
  -->gateway=10.1.2.1
salt -G 'os_family:Windows' ip.set_static_ip 'Local Area Connection' 10.1.2.4/24
  -->append=True
  ```

### 21.9.463 salt.modules.win_lgpo module

Manage Local Policy on Windows

This module allows configuring local group policy (i.e. `gpedit.msc`) on a Windows server.

New in version 2016.11.0.

**Administrative Templates**

Administrative template policies are dynamically read from ADMX/ADML files on the server.

**Windows Settings**

Policies contained in the "Windows Settings" section of the `gpedit.msc` GUI are statically defined in this module. Each policy is configured for the section (Machine/User) in the module’s `_policy_info` class. The `_policy_info` class contains a "policies" dict on how the module will configure the policy, where the policy resides in the GUI (for display purposes), data validation data, data transformation data, etc.

**Current known limitations**

- At this time, start/shutdown scripts policies are displayed, but are not configurable.
- Not all "Security Settings" policies exist in the `_policy_info` class

  **depends**

  - pywin32 Python module
salt.modules.win_lgpo.get(policy_class=None, return_full_policy_names=True, hierarchical_return=False, adml_language='en-US', return_not_configured=False)

Get a policy value

Parameters

- `policy_class (str)` – Some policies are both user and computer, by default all policies will be pulled, but this can be used to retrieve only a specific policy class User/USER/user = retrieve user policies Machine/MACHINE/machine/Computer/COMPUTER/computer = retrieve machine/computer policies
- `return_full_policy_names (bool)` – True/False to return the policy name as it is seen in the gpedit.msc GUI or to only return the policy key/Id.
- `hierarchical_return (bool)` – True/False to return the policy data in the hierarchy as seen in the gpedit.msc GUI. The default of False will return data split only into User/Computer configuration sections
- `adml_language (str)` – The ADML language to use for processing display/descriptive names and enumeration values of ADMX template data, defaults to en-US
- `return_not_configured (bool)` – Include Administrative Template policies that are 'Not Configured' in the return data

Returns A dictionary containing the policy values for the specified class

Return type dict

CLI Example:
```
salt '*' lgpo.get machine return_full_policy_names=True
```

salt.modules.win_lgpo.get_policy_info(policy_name, policy_class, adml_language='en-US')

Returns information about a specified policy

Parameters

- `policy_name (str)` – The name of the policy to lookup
- `policy_class (str)` – The class of policy, i.e. machine, user, both
- `adml_language (str)` – The ADML language to use for Administrative Template data lookup

Returns Information about the specified policy

Return type dict

CLI Example:
```
salt '*' lgpo.get_policy_info 'Maximum password age' machine
```

You can use lgpo.get_policy_info to get all the possible names that could be used in a state file or from the command line (along with elements that need to be set/etc). The key is to match the text you see in the gpedit.msc gui exactly, including quotes around words or phrases. The "full path" style is really only needed when there are multiple policies that use the same base name. For example, Access data sources across domains exists in ~10 different paths. If you put that through get_policy_info you'll get back a message that it is used for multiple policies and you need to be more specific.

CLI Example:
```
salt-call --local lgpo.get_policy_info ShellRemoveOrderPrints_2 machine
```

(continues on next page)
Escaping can get tricky in cmd/Powershell. The following is an example of escaping in Powershell using backquotes:

```
PS\>salt-call --local lgpo.get_policy_info "Turn off the \"Order Prints\" picture task"
```

This function can then be used to get the options available for specifying Group Policy Objects to be used in state files. Based on the above any of these `should` be usable:

```
internet.communications_settings:
lgpo.set:
  - computer_policy:
    Turn off the "Order Prints" picture task: Enabled
```

When using the full path, it might be a good idea to use single quotes around the path:
internet_communications_settings:
lgpo.set:
  - computer_policy:
    'System\Internet Communication Management\Internet Communication\settings\Turn off the "Order Prints" picture task': 'Enabled'

If you struggle to find the policy from `get_policy_info` using the name as you see in `gpedit.msc`, the names such as "ShellRemoveOrderPrints_2" come from the .admx files. If you know nothing about .admx/.adml relationships (ADML holds what you see in the GUI, ADMX holds the more technical details), then this may be a little bit too much info, but here is an example with the above policy using PowerShell:

```powershell
PS>Get-ChildItem -Path C:\Windows\PolicyDefinitions -Recurse -Filter *.adml |% Select-String "Order Prints"
```

From this grep, we can see id "ShellRemoveOrderPrints" is the ID of the string used to describe this policy, then we search for it in the ADMX:

```powershell
PS>Get-ChildItem -Path C:\Windows\PolicyDefinitions -Recurse -Filter *.admx |% Select-String "ShellRemoveOrderPrints"
```

Now we have two to pick from. And if you notice the class="Machine" and class="User" (which details if it is a computer policy or user policy respectively) the ShellRemoveOrderPrints_2 is the "short name" we could use to pass through `get_policy_info` to see what the module itself is expecting.

```python
salt.modules.win_lgpo.set_(computer_policy=None, user_policy=None, cumulative_rights_assignments=True, adml_language='en-US')
```

Set a local server policy.

Parameters

- **computer_policy** *(dict)* - A dictionary of "policyname: value" pairs of computer policies to set. 'value' should be how it is displayed in the gpedit GUI, i.e. if a setting can be 'Enabled'/"Disabled", then that should be passed

Administrative Template data may require dicts within dicts, to specify each element of the Administrative Template policy. Administrative Templates policies are always cumulative.
Policy names can be specified in a number of ways based on the type of policy:

Windows Settings Policies:
These policies can be specified using the GUI display name
or the key name from the _policy_info class in this module.
The GUI display name is also contained in the _policy_info
class in this module.

Administrative Template Policies:
These can be specified using the policy name as displayed in
the GUI (case sensitive). Some policies have the same name,
but a different location (for example, "Access data sources
across domains"). These can be differentiated by the "path"
in the GUI (for example, "Windows ComponentsInternet Ex-
plorerInternet Control PanelSecurity PageInternet ZoneAc-
cess data sources across domains").

Additionally, policies can be specified using the "name" and
"id" attributes from the ADMX files.

For Administrative Templates that have policy elements,
each element can be specified using the text string as seen in
the GUI or using the ID attribute from the ADMX file. Due to
the way some of the GUI text is laid out, some policy element
names could include descriptive text that appears lbefore the
policy element in the GUI.

Use the get_policy_info function for the policy name to view
the element ID/names that the module will accept.

- **user_policy (dict)** – The same setup as the computer_policy, except with data
to configure the local user policy.
- **cumulative_rights_assignments (bool)** – Determine how user rights as-
signment policies are configured.

  If True, user right assignment specifications are simply added to the existing policy
  If False, only the users specified will get the right (any existing will have the right
  revoked)

- **adml_language (str)** – The language files to use for looking up Administrative
  Template policy data (i.e. how the policy is displayed in the GUI). Defaults to 'en-US'
  (U.S. English).

Returns True is successful, otherwise False

Return type bool

CLI Example:

```
salt '*' lgpo.set computer_policy="{'LockoutDuration': 2, 'RestrictAnonymous':
  'Enabled', 'AuditProcessTracking': 'Success, Failure'}"
```

salt.modules.win_lgpo.set_computer_policy(name, setting, cumulative_rights_assignments=True,
  adml_language='en-US')

Set a single computer policy

Parameters

- **name (str)** – The name of the policy to configure
- **setting (str)** – The setting to configure the named policy with
- **cumulative_rights_assignments (bool)** – Determine how user rights as-
signment policies are configured. If True, user right assignment specifications are
simply added to the existing policy. If False, only the users specified will get the right
(any existing will have the right revoked)
- `adml_language (str)` – The language files to use for looking up Administrative Template policy data (i.e. how the policy is displayed in the GUI). Defaults to 'en-US' (U.S. English).

  **Returns**  True if successful, otherwise False  
  **Return type**  bool

  **CLI Example:**
  ```
salt '*' lgpo.set_computer_policy LockoutDuration 1440
  ```

**salt.modules.win_lgpo.set_user_policy (name, setting, adml_language='en-US')**

Set a single user policy

  **Parameters**
  - `name (str)` – The name of the policy to configure  
  - `setting (str)` – The setting to configure the named policy with  
  - `adml_language (str)` – The language files to use for looking up Administrative Template policy data (i.e. how the policy is displayed in the GUI). Defaults to 'en-US' (U.S. English).

  **Returns**  True if successful, Otherwise False  
  **Return type**  bool

  **CLI Example:**
  ```
salt '*' lgpo.set_user_policy "Control Panel\Display\Disable the Display Control Panel" Enabled
  ```

## 21.9.464 salt.modules.win_license module

This module allows you to manage windows licensing via slmgr.vbs

  **salt '*' license.install XXXXX-XXXXX-XXXXX-XXXXX-XXXXX**

**salt.modules.win_license.activate()**

Attempt to activate the current machine via Windows Activation

  **CLI Example:**
  ```
salt '*' license.activate
  ```

**salt.modules.win_license.info()**

Return information about the license, if the license is not correctly activated this will return None.

  **CLI Example:**
  ```
salt '*' license.info
  ```

**salt.modules.win_license.install(product_key)**

Install the given product key

  **CLI Example:**
  ```
salt '*' license.install XXXXX-XXXXX-XXXXX-XXXXX-XXXXX
  ```

**salt.modules.win_license.installed(product_key)**

Check to see if the product key is already installed.  
**Note:** This is not 100% accurate as we can only see the last 5 digits of the license.

  **CLI Example:**
  ```
salt 'salt' license.installed XXXXX-XXXXX-XXXXX-XXXXX-XXXXX

salt.modules.win_license.licensed()
Return true if the current machine is licensed correctly
CLI Example:
salt '*' license.licensed

salt.modules.win_license.uninstall()
Uninstall the current product key
CLI Example:
salt '*' license.uninstall

21.9.465 salt.modules.win_network
Module for gathering and managing network information

salt.modules.win_network.connect(host, port=None, **kwargs)
Test connectivity to a host using a particular port from the minion.
New in version 2016.3.0.
CLI Example:
salt '*' network.connect archlinux.org 80
salt '*' network.connect archlinux.org 80 timeout=3
salt '*' network.connect archlinux.org 80 timeout=3 family=ipv4
salt '*' network.connect google-public-dns-a.google.com port=53 proto=udp family=ipv4 timeout=3

salt.modules.win_network.dig(host)
Performs a DNS lookup with dig
Note: dig must be installed on the Windows minion
CLI Example:
salt '*' network.dig archlinux.org

salt.modules.win_network.get_route(ip)
Return routing information for given destination ip
New in version 2016.11.5.
CLI Example:
salt '*' network.get_route 10.10.10.10

salt.modules.win_network.hw_addr(iface)
Return the hardware address (a.k.a. MAC address) for a given interface
CLI Example:
salt 'wins' network.hw_addr 'Wireless Connection #1'

salt.modules.win_network.hwaddr(iface)
This function is an alias of hw_addr.
Return the hardware address (a.k.a. MAC address) for a given interface
CLI Example:
```
salt '*' network.hw_addr 'Wireless Connection #1'
```

salt.modules.win_network.in_subnet(cidr)
Returns True if host is within specified subnet, otherwise False
CLI Example:
```
salt '*' network.in_subnet 10.0.0.0/16
```

salt.modules.win_network.interfaces()
Return a dictionary of information about all the interfaces on the minion
CLI Example:
```
salt '*' network.interfaces
```

salt.modules.win_network.interfaces_names()
Return a list of all the interfaces names
CLI Example:
```
salt '*' network.interfaces_names
```

salt.modules.win_network.ip_addrs(interface=None, include_loopback=False, cidr=None, type=None)
Returns a list of IPv4 addresses assigned to the host.
```
interface Only IP addresses from that interface will be returned.
include_loopback [False] Include loopback 127.0.0.1 IPv4 address.
cidr Describes subnet using CIDR notation and only IPv4 addresses that belong to this subnet will be returned.
```
Changed in version 2019.2.0.
type If option set to 'public' then only public addresses will be returned. Ditto for 'private'.
Changed in version 2019.2.0.
CLI Example:
```
salt '*' network.ip_addrs
salt '*' network.ip_addrs cidr=10.0.0.0/8
salt '*' network.ip_addrs cidr=192.168.0.0/16 type=private
```

salt.modules.win_network.ip_addrs6(interface=None, include_loopback=False, cidr=None)
Returns a list of IPv6 addresses assigned to the host.
```
interface Only IP addresses from that interface will be returned.
include_loopback [False] Include loopback ::1 IPv6 address.
cidr Describes subnet using CIDR notation and only IPv6 addresses that belong to this subnet will be returned.
```
Changed in version 2019.2.0.
CLI Example:
salt ' '* network.ip_addrs6
salt ' '* network.ip_addrs6  cidr=2000::/3

salt.modules.win_network.ipaddrs (interface=None,  include_loopback=False,  cidr=None,  type=None)

This function is an alias of ip_addrs.
Returns a list of IPv4 addresses assigned to the host.
interface Only IP addresses from that interface will be returned.
include_loopback [False] Include loopback 127.0.0.1 IPv4 address.
cidr Describes subnet using CIDR notation and only IPv4 addresses that belong to this subnet will be returned.
Changed in version 2019.2.0.
type If option set to 'public' then only public addresses will be returned. Ditto for 'private'.

   Changed in version 2019.2.0.
   CLI Example:
   
   salt ' '* network.ip_addrs
   salt ' '* network.ip_addrs  cidr=10.0.0.0/8
   salt ' '* network.ip_addrs  cidr=192.168.0.0/16  type=private

salt.modules.win_network.ipaddrs6 (interface=None,  include_loopback=False,  cidr=None)

This function is an alias of ip_addrs6.
Returns a list of IPv6 addresses assigned to the host.
interface Only IP addresses from that interface will be returned.
include_loopback [False] Include loopback ::1 IPv6 address.
cidr Describes subnet using CIDR notation and only IPv6 addresses that belong to this subnet will be returned.

   Changed in version 2019.2.0.
   CLI Example:
   
   salt ' '* network.ip_addrs6
   salt ' '* network.ip_addrs6  cidr=2000::/3

salt.modules.win_network.is_private (ip_addr)
Check if the given IP address is a private address

   New in version 2019.2.0.
   CLI Example:
   
   salt ' '* network.is_private 10.0.0.3

salt.modules.win_network.netstat ()
Return information on open ports and states

   CLI Example:
   
   salt ' '* network.netstat

salt.modules.win_network.nslookup (host)
Query DNS for information about a domain or ip address

   CLI Example:
salt ' '*' network.nslookup archlinux.org

**salt.modules.win_network.ping**(*host, timeout=False, return_boolean=False*)
Performs a ping to a host

CLI Example:
```
salt ' '*' network.ping archlinux.org
```

New in version 2016.11.0.
Return a True or False instead of ping output.
```
salt ' '*' network.ping archlinux.org return_boolean=True
```

Set the time to wait for a response in seconds.
```
salt ' '*' network.ping archlinux.org timeout=3
```

**salt.modules.win_network.subnets()**
Returns a list of subnets to which the host belongs

CLI Example:
```
salt ' '*' network.subnets
```

**salt.modules.win_network.traceroute**(*host*)
Performs a traceroute to a 3rd party host

CLI Example:
```
salt ' '*' network.traceroute archlinux.org
```

---

### 21.9.466 salt.modules.win_ntp

Management of NTP servers on Windows
New in version 2014.1.0.

**salt.modules.win_ntp.get_servers()**
Get list of configured NTP servers

CLI Example:
```
salt ' '*' ntp.get_servers
```

**salt.modules.win_ntp.set_servers(**'servers'**)**
Set Windows to use a list of NTP servers

CLI Example:
```
salt ' '*' ntp.set_servers 'pool.ntp.org' 'us.pool.ntp.org'
```

---

### 21.9.467 salt.modules.win_path

Manage the Windows System PATH
Note that not all Windows applications will rehash the PATH environment variable. Only the ones that listen to the WM_SETTINGCHANGE message http://support.microsoft.com/kb/104011

**salt.modules.win_path.add**(path, index=None, **kwargs)
Add the directory to the SYSTEM path in the index location. Returns True if successful, otherwise False.

- **path**: Directory to add to path
- **index**: Optionally specify an index at which to insert the directory
- **rehash**: [True] If the registry was updated, and this value is set to True, sends a WM_SETTINGCHANGE broadcast to refresh the environment variables. Set this to False to skip this broadcast.

**CLI Examples:**

```
# Will add to the beginning of the path
salt '*' win_path.add 'c:\python27' 0

# Will add to the end of the path
salt '*' win_path.add 'c:\python27' index=-1
```

**salt.modules.win_path.exists**(path)
Check if the directory is configured in the SYSTEM path. Case-insensitive and ignores trailing backslash. Returns boolean True if path exists, False if not.

**CLI Example:**

```
salt '*' win_path.exists 'c:\python27'
salt '*' win_path.exists 'c:\python27\'
salt '*' win_path.exists 'C:\pyThon27'
```

**salt.modules.win_path.get_path()**
Returns a list of items in the SYSTEM path

**CLI Example:**

```
salt '*' win_path.get_path
```

**salt.modules.win_path.rehash()**
Send a WM_SETTINGCHANGE Broadcast to Windows to refresh the Environment variables for new processes.

**Note:** This will only affect new processes that aren’t launched by services. To apply changes to the path to services, the host must be restarted. The salt-minion, if running as a service, will not see changes to the environment until the system is restarted. See MSDN Documentation.

**CLI Example:**

```
salt '*' win_path.rehash
```

**salt.modules.win_path.remove**(path, **kwargs)
Remove the directory from the SYSTEM path

- **Returns**: boolean True if successful, False if unsuccessful
- **rehash**: [True] If the registry was updated, and this value is set to True, sends a WM_SETTINGCHANGE broadcast to refresh the environment variables. Set this to False to skip this broadcast.

**CLI Example:**

```
# Will remove C:\Python27 from the path
salt '*' win_path.remove 'c:\\python27'
```
21.9.468 salt.modules.win_pkg

A module to manage software on Windows

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `pkg.install` is not available), see here.

The following functions require the existence of a windows repository metadata DB, typically created by running `pkg.refresh_db`:

- `pkg.get_repo_data`
- `pkg.install`
- `pkg.latest_version`
- `pkg.list_available`
- `pkg.list_pkgs`
- `pkg.list_upgrades`
- `pkg.remove`

If a metadata DB does not already exist and one of these functions is run, then one will be created from the repo SLS files that are present.

As the creation of this metadata can take some time, the `winrepo_cache_expire_min` minion config option can be used to suppress refreshes when the metadata is less than a given number of seconds old.

**Note:** Version numbers can be version number string, latest and Not Found, where Not Found means this module was not able to determine the version of the software installed, it can also be used as the version number in sls definitions file in these cases. Versions numbers are sorted in order of 0, Not Found, order version numbers, ..., latest.

```python
salt.modules.win_pkg.compare_versions(ver1=", oper='\n', ver2=")
```

Compare software package versions

**Parameters**

- `ver1 (str)` – A software version to compare
- `oper (str)` – The operand to use to compare
- `ver2 (str)` – A software version to compare

**Returns**

True if the comparison is valid, otherwise False

**Return type**

bool

**CLI Example:**

```
salt '*' pkg.compare_versions 1.2 >= 1.3
```

```python
salt.modules.win_pkg.genrepo(**kwargs)
```

Generate package metadata db based on files within the winrepo_source_dir

**Kwargs:**

- `saltenv (str)`: Salt environment. Default: base
- `verbose (bool)`: Return verbose data structure which includes `success_list`, a list of all sls files and the package names contained within. Default False.
- `failhard (bool)`: If True, an error will be raised if any repo SLS files failed to process. If False, no error will be raised, and a dictionary containing the full results will be returned.
Note:
- Hidden directories (directories beginning with '.', such as '.git') will be ignored.

Returns A dictionary of the results of the command
Return type dict

CLI Example:
```
salt-run pkg.genrepo
salt -G 'os:windows' pkg.genrepo verbose=true failhard=false
salt -G 'os:windows' pkg.genrepo saltenv=base
```

salt.modules.win_pkg.get_repo_data(saltenv='base')
Returns the existing package metadata db. Will create it, if it does not exist, however will not refresh it.
Parameters saltenv (str) – Salt environment. Default base
Returns A dict containing contents of metadata db.
Return type dict
CLI Example:
```
salt '*' pkg.get_repo_data
```

salt.modules.win_pkg.install(name=None, refresh=False, pkgs=None, **kwargs)
Install the passed package(s) on the system using winrepo
Parameters
- name (str) – The name of a single package, or a comma-separated list of packages to install. (no spaces after the commas)
- refresh (bool) – Boolean value representing whether or not to refresh the winrepo db. Default False.
- pkgs (list) – A list of packages to install from a software repository. All packages listed under pkgs will be installed via a single command.

You can specify a version by passing the item as a dict:
CLI Example:
```
# will install the latest version of foo and bar
salt '*' pkg.install pkgs='["foo", "bar"]'

# will install the latest version of foo and version 1.2.3 of bar
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3"}]'
```

Kwargs:
- version (str): The specific version to install. If omitted, the latest version will be installed. Recommend for use when installing a single package.

If passed with a list of packages in the pkgs parameter, the version will be ignored.
CLI Example:
```
# Version is ignored
salt '*' pkg.install pkgs='["foo", 'bar']" version=1.2.3'
```

If passed with a comma separated list in the name parameter, the version will apply to all packages in the list.
CLI Example:
extra_install_flags (str): Additional install flags that will be appended to the install_flags defined in the software definition file. Only applies when single package is passed.
saltenv (str): Salt environment. Default 'base'
report_reboot_exit_codes (bool): If the installer exits with a recognized exit code indicating that a reboot is required, the module function

```
win_system.set_reboot_required_witnessed
```

will be called, preserving the knowledge of this event for the remainder of the current boot session. For the time being, 3010 is the only recognized exit code. The value of this param defaults to True.

New in version 2016.11.0.

Returns

Return a dict containing the new package names and versions. If the package is already installed, an empty dict is returned.

If the package is installed by pkg.install:

```
{'<package>': {'old': '<old-version>',
'new': '<new-version>'}}
```

Return type  dict

The following example will refresh the winrepo and install a single package, 7zip.

CLI Example:

```
salt '*' pkg.install 7zip refresh=True
```

CLI Example:

```
salt '*' pkg.install 7zip
salt '*' pkg.install 7zip,filezilla
salt '*' pkg.install pkgs='["7zip","filezilla"]'
```

WinRepo Definition File Examples:

The following example demonstrates the use of cache_file. This would be used if you have multiple installers in the same directory that use the same install.ini file and you don’t want to download the additional installers.

```
ntp:
  4.2.8:
    installer: 'salt://win/repo/ntp/ntp-4.2.8-win32-setup.exe'
    full_name: Meinberg NTP Windows Client
    locale: en_US
    reboot: False
    cache_file: 'salt://win/repo/ntp/install.ini'
    install_flags: '/
    --USEFILE=C:salt\var\cache\salt\minion\files\base\win\repo\ntp\install.ini'
    uninstaller: 'NTP/uninst.exe'
```

The following example demonstrates the use of cache_dir. It assumes a file named install.ini resides in the same directory as the installer.
salt.modules.win_pkg.latest_version(*names, **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

Parameters

- names (str) – A single or multiple names to lookup

Kwargs:

- saltenv (str): Salt environment. Default base
- refresh (bool): Refresh package metadata. Default True

Returns

A dictionary of packages with the latest version available

Return type

dict

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.win_pkg.list_available(*names, **kwargs)

Return a list of available versions of the specified package.

Parameters

- names (str) – One or more package names

Kwargs:

- saltenv (str): The salt environment to use. Default base.
- return_dict_always (bool): Default False dict when a single package name is queried.

Returns

The package name with its available versions

Return type

dict

CLI Example:

```
salt '*' pkg.list_available <package name> return_dict_always=True
tsalt '*' pkg.list_available <package name01> <package name02>
```

salt.modules.win_pkg.list_pkgs(versions_as_list=False, include_components=True, include_updates=True, **kwargs)

List the packages currently installed.

Note: To view installed software as displayed in the Add/Remove Programs, set include_components and include_updates to False.

Parameters

- versions_as_list (bool) – Returns the versions as a list
- **include_components** *(bool)* – Include sub components of installed software. Default is True
- **include_updates** *(bool)* – Include software updates and Windows updates. Default is True

**Kwargs:**
- **saltenv** *(str)*: The salt environment to use. Default base
- **refresh** *(bool)*: Refresh package metadata. Default False

**Returns** A dictionary of installed software with versions installed
**Return type** `dict`

```python
{'<package_name>': '<version>'}
```

**CLI Example:**

```bash
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

**salt.modules.win_pkg.list_upgrades**(refresh=True, **kwargs)
List all available package upgrades on this system

**Parameters**
- **refresh** *(bool)* – Refresh package metadata. Default True

**Kwargs:**
- **saltenv** *(str)*: Salt environment. Default base

**Returns** A dictionary of packages with available upgrades
**Return type** `dict`

**CLI Example:**

```bash
salt '*' pkg.list_upgrades
```

**salt.modules.win_pkg.purge**(name=None, pkgs=None, **kwargs)
Package purges are not supported, this function is identical to remove().

New in version 0.16.0.

**Parameters**
- **name** *(str)* – The name of the package to be deleted.
- **version** *(str)* – The version of the package to be deleted. If this option is used in combination with the pkgs option below, then this version will be applied to all targeted packages.
- **pkgs** *(list)* – A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

**Kwargs:**
- **saltenv** *(str)*: Salt environment. Default base
- **refresh** *(bool)*: Refresh package metadata. Default False

**Returns** A dict containing the changes.
**Return type** `dict`

**CLI Example:**

```bash
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs=['"foo", "bar"]'
```

**salt.modules.win_pkg.refresh_db**(**kwargs**)
Generates the local software metadata database *(winrepo.p)* on the minion. The database is stored in a serialized format located by default at the following location:
This module performs the following steps to generate the software metadata database:

- Fetch the package definition files (.sls) from `winrepo_source_dir` (default `salt://win/repo-ng`) and cache them in `<cachedir>-files<saltenv>-<winrepo_source_dir>` (default: `C:\salt\var\cache\salt\minion\files\base\win\repo-ng`).
- Call `pkg.genrepo` to parse the package definition files and generate the repository metadata database file (`winrepo.p`).
- Return the report received from `pkg.genrepo`.

The default winrepo directory on the master is `/srv/salt/win/repo-ng`. All files that end with `.sls` in this and all subdirectories will be used to generate the repository metadata database (`winrepo.p`).

**Note:**

- Hidden directories (directories beginning with `.'`, such as `'.git'`) will be ignored.

**Note:** There is no need to call `pkg.refresh_db` every time you work with the pkg module. Automatic refresh will occur based on the following minion configuration settings:

  - `winrepo_cache_expire_min`
  - `winrepo_cache_expire_max`

However, if the package definition files have changed, as would be the case if you are developing a new package definition, this function should be called to ensure the minion has the latest information about packages available to it.

**Warning:** Directories and files fetched from `<winrepo_source_dir>` (`/srv/salt/win/repo-ng`) will be processed in alphabetical order. If two or more software definition files contain the same name, the last one processed replaces all data from the files processed before it.

For more information see [Windows Software Repository](#).

**Arguments:**

- `saltenv` (str): Salt environment. Default: `base`
- `verbose` (bool): Return a verbose data structure which includes 'success_list', a list of all sls files and the package names contained within. Default is 'False'
- `failhard` (bool): If `True`, an error will be raised if any repo SLS files fails to process. If `False`, no error will be raised, and a dictionary containing the full results will be returned.

**Returns** A dictionary containing the results of the database refresh.

**Return type** dict

**Note:** A result with a `total: 0` generally means that the files are in the wrong location on the master. Try running the following command on the minion: `salt-call -l debug pkg.refresh saltenv=base`

**Warning:** When calling this command from a state using `module.run` be sure to pass `failhard: False`. Otherwise the state will report failure if it encounters a bad software definition file.

**CLI Example:**
salt.modules.win_pkg.remove(name=None, pkgs=None, **kwargs)

Remove the passed package(s) from the system using winrepo

New in version 0.16.0.

Parameters

- **name** *(str)* – The name(s) of the package(s) to be uninstalled. Can be a single package or a comma delimited list of packages, no spaces.
- **pkgs** *(list)* – A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Kwargs:

- **version** *(str)*: The version of the package to be uninstalled. If this option is used to to uninstall multiple packages, then this version will be applied to all targeted packages. Recommended using only when uninstalling a single package. If this parameter is omitted, the latest version will be uninstalled.
- **saltenv** *(str)*: Salt environment. Default `base`
- **refresh** *(bool)*: Refresh package metadata. Default `False`

Returns

Returns a dict containing the changes.

If the package is removed by pkg.remove:

`{<package>: {'old': '<old-version>', 'new': '<new-version>'}}`

If the package is already uninstalled:

`{<package>: {'current': 'not installed'}}`

Return type `dict`

CLI Example:

```bash
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

salt.modules.win_pkg.upgrade(**kwargs)

Upgrade all software. Currently not implemented

Note: This feature is not yet implemented for Windows.

Returns Empty dict, until implemented

Return type `dict`

CLI Example:

```bash
salt '*' pkg.upgrade
```

salt.modules.win_pkg.upgrade_available(name, **kwargs)

Check whether or not an upgrade is available for a given package

Parameters **name** *(str)* – The name of a single package

Kwargs: **refresh** *(bool)*: Refresh package metadata. Default `True` **saltenv** *(str)*: The salt environment. Default `base`
Returns  True if new version available, otherwise False
Return type  bool

CLI Example:
```
salt '*' pkg.upgrade_available <package name>
```

```
salt.modules.win_pkg.version('names', **kwargs)
```
Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

Parameters

name (str) – One or more package names

Returns  version string when a single package is specified. dict: The package name(s) with the installed versions.

Return type  str

```
[{'<version>', '<version>'}, ] OR
[<package name>': ['<version>', '<version>', ]}
```

CLI Example:
```
salt '*' pkg.version <package name>
salt '*' pkg.version <package name01> <package name02>
```

21.9.469  salt.modules.win_pki module

platform  Windows

depends

• PowerShell 4

• PKI Client Module (Windows 8+ / Windows Server 2012+)

New in version 2016.11.0.

```
salt.modules.win_pki.export_cert(name, thumbprint, cert_format='cer', context='LocalMachine', store='My', password='')
```

Export the certificate to a file from the given certificate store.

Parameters

• name (str) – The destination path for the exported certificate file.

• thumbprint (str) – The thumbprint value of the target certificate.

• cert_format (str) – The certificate format. Specify 'cer' for X.509, or 'pfx' for PKCS #12.

• context (str) – The name of the certificate store location context.

• store (str) – The name of the certificate store.

• password (str) – The password of the certificate. Only applicable to pfx format. Note that if used interactively, the password will be seen by all minions. To protect the password, use a state and get the password from pillar.

Returns  A boolean representing whether all changes succeeded.
Return type: bool

CLI Example:

```
salt '*' win_pki.export_cert name='C:\certs\example.cer' thumbprint='AAA000'
```

salt.modules.win_pki.get_cert_file(name, cert_format='cer', password='')

Get the details of the certificate file.

Parameters

- **name** (str) – The filesystem path of the certificate file.
- **cert_format** (str) – The certificate format. Specify ‘cer’ for X.509, or ‘pfx’ for PKCS #12.
- **password** (str) – The password of the certificate. Only applicable to pfx format.

Note that if used interactively, the password will be seen by all minions. To protect the password, use a state and get the password from pillar.

Returns: A dictionary of the certificate thumbprints and properties.

Return type: dict

CLI Example:

```
salt '*' win_pki.get_cert_file name='C:\certs\example.cer'
```

salt.modules.win_pki.get_certs(context='LocalMachine', store='My')

Get the available certificates in the given store.

Parameters

- **context** (str) – The name of the certificate store location context.
- **store** (str) – The name of the certificate store.

Returns: A dictionary of the certificate thumbprints and properties.

Return type: dict

CLI Example:

```
salt '*' win_pki.get_certs
```

salt.modules.win_pki.get_stores()

Get the certificate location contexts and their corresponding stores.

Returns: A dictionary of the certificate location contexts and stores.

Return type: dict

CLI Example:

```
salt '*' win_pki.get_stores
```

salt.modules.win_pki.import_cert(name, cert_format='cer', context='LocalMachine', store='My', exportable=True, password='', saltenv='base')

Import the certificate file into the given certificate store.

Parameters

- **name** (str) – The path of the certificate file to import.
- **cert_format** (str) – The certificate format. Specify ‘cer’ for X.509, or ‘pfx’ for PKCS #12.
- **context** (str) – The name of the certificate store location context.
- **store** (str) – The name of the certificate store.
- **exportable** (bool) – Mark the certificate as exportable. Only applicable to pfx format.
- **password** (str) – The password of the certificate. Only applicable to pfx format.

Note that if used interactively, the password will be seen by all minions. To protect the password, use a state and get the password from pillar.

- **saltenv** (str) – The environment the file resides in.

Returns: A boolean representing whether all changes succeeded.
Return type  bool

CLI Example:

```bash
salt '*' win_pki.import_cert name='salt://cert.cer'
```

```python
salt.modules.win_pki.remove_cert(thumbprint, context='LocalMachine', store='My')
```

Remove the certificate from the given certificate store.

Parameters

- **thumbprint** *(str)* – The thumbprint value of the target certificate.
- **context** *(str)* – The name of the certificate store location context.
- **store** *(str)* – The name of the certificate store.

Returns  A boolean representing whether all changes succeeded.

Return type  bool

CLI Example:

```bash
salt '*' win_pki.remove_cert thumbprint='AAA000'
```

```python
salt.modules.win_pki.test_cert(thumbprint, context='LocalMachine', store='My', untrusted_root=False, dns_name='example.test', eku=)
```

Check the certificate for validity.

Parameters

- **thumbprint** *(str)* – The thumbprint value of the target certificate.
- **context** *(str)* – The name of the certificate store location context.
- **store** *(str)* – The name of the certificate store.
- **untrusted_root** *(bool)* – Whether the root certificate is required to be trusted in chain building.
- **dns_name** *(str)* – The DNS name to verify as valid for the certificate.
- **eku** *(str)* – The enhanced key usage object identifiers to verify for the certificate chain.

Returns  A boolean representing whether the certificate was considered valid.

Return type  bool

CLI Example:

```bash
salt '*' win_pki.test_cert thumbprint='AAA000' dns_name='example.test'
```

### 21.9.470  `salt.modules.win_powercfg`

This module allows you to control the power settings of a windows minion via powercfg.

New in version 2015.8.0.

```bash
# Set monitor to never turn off on Battery power
salt '*' powercfg.set_monitor_timeout 0 power=dc
```

```bash
# Set disk timeout to 120 minutes on AC power
salt '*' powercfg.set_disk_timeout 120 power=ac
```

```python
salt.modules.win_powercfg.get_disk_timeout(scheme=None)
```

Get the current disk timeout of the given scheme

Parameters  scheme *(str)* – The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:

- SCHEME_BALANCED - Balanced
- SCHEME_MAX - Power saver
- SCHEME_MIN - High performance

Returns  A dictionary of both the AC and DC settings

Return type  dict
CLI Example:

```
salt '*' powercfg.get_disk_timeout
```

salt.modules.win_powercfg.get_hibernate_timeout(scheme=None)
Get the current hibernate timeout of the given scheme

scheme (str): The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:
- SCHEME_BALANCED - Balanced
- SCHEME_MAX - Power saver
- SCHEME_MIN - High performance

Returns: A dictionary of both the AC and DC settings
Return type: dict

CLI Example:

```
salt '*' powercfg.get_hibernate_timeout
```

salt.modules.win_powercfg.get_monitor_timeout(scheme=None)
Get the current monitor timeout of the given scheme

Parameters:
- scheme (str) – The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:
  - SCHEME_BALANCED - Balanced
  - SCHEME_MAX - Power saver
  - SCHEME_MIN - High performance

Returns: A dictionary of both the AC and DC settings
Return type: dict

CLI Example:

```
salt '*' powercfg.get_monitor_timeout
```

salt.modules.win_powercfg.get_standby_timeout(scheme=None)
Get the current standby timeout of the given scheme

Parameters:
- scheme (str) – The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:
  - SCHEME_BALANCED - Balanced
  - SCHEME_MAX - Power saver
  - SCHEME_MIN - High performance

Returns: A dictionary of both the AC and DC settings
Return type: dict

CLI Example:

```
salt '*' powercfg.get_standby_timeout
```

salt.modules.win_powercfg.set_disk_timeout(timeout, power='ac', scheme=None)
Set the disk timeout in minutes for the given power scheme

Parameters:
- timeout (int) – The amount of time in minutes before the disk will timeout
- power (str) – Set the value for AC or DC power. Default is ac. Valid options are:
  - ac (AC Power)
  - dc (Battery)
- scheme (str) – The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:
  - SCHEME_BALANCED - Balanced
- SCHEME_MAX - Power saver
- SCHEME_MIN - High performance

Returns True if successful, otherwise False

Return type bool

CLI Example:

```bash
# Sets the disk timeout to 30 minutes on battery
salt '*' powercfg.set_disk_timeout 30 power=dc
```

salt.modules.win_powercfg.set_hibernate_timeout(timeout, power='ac', scheme=None)

Set the hibernate timeout in minutes for the given power scheme

Parameters

- **timeout (int)** – The amount of time in minutes before the computer hibernates
- **power (str)** – Set the value for AC or DC power. Default is ac. Valid options are:
  - ac (AC Power)
  - dc (Battery)
- **scheme (str)** – The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:
  - SCHEME_BALANCED - Balanced
  - SCHEME_MAX - Power saver
  - SCHEME_MIN - High performance

Returns True if successful, otherwise False

Return type bool

CLI Example:

```bash
# Sets the hibernate timeout to 30 minutes on Battery
salt '*' powercfg.set_hibernate_timeout 30 power=dc
```

salt.modules.win_powercfg.set_monitor_timeout(timeout, power='ac', scheme=None)

Set the monitor timeout in minutes for the given power scheme

Parameters

- **timeout (int)** – The amount of time in minutes before the monitor will timeout
- **power (str)** – Set the value for AC or DC power. Default is ac. Valid options are:
  - ac (AC Power)
  - dc (Battery)
- **scheme (str)** – The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:
  - SCHEME_BALANCED - Balanced
  - SCHEME_MAX - Power saver
  - SCHEME_MIN - High performance

Returns True if successful, otherwise False

Return type bool

CLI Example:

```bash
# Sets the monitor timeout to 30 minutes
salt '*' powercfg.set_monitor_timeout 30
```

salt.modules.win_powercfg.set_standby_timeout(timeout, power='ac', scheme=None)

Set the standby timeout in minutes for the given power scheme

Parameters

- **timeout (int)** – The amount of time in minutes before the computer sleeps
- **power (str)** – Set the value for AC or DC power. Default is ac. Valid options are:
  - ac (AC Power)
  - dc (Battery)
- **scheme (str)** – The scheme to use, leave as None to use the current. Default is
None. This can be the GUID or the Alias for the Scheme. Known Aliases are:
- SCHEME_BALANCED - Balanced
- SCHEME_MAX - Power saver
- SCHEME_MIN - High performance

Returns True if successful, otherwise False
Return type bool

CLI Example:

```bash
# Sets the system standby timeout to 30 minutes on Battery
salt '*' powercfg.set_standby_timeout 30 power=dc
```

---

### 21.9.471 salt.modules.win_psget module

Module for managing PowerShell through PowerShellGet (PSGet)

**depends**
- PowerShell 5.0
- PSGet

Support for PowerShell

**salt.modules.win_psgetavail_modules(desc=False)**

List available modules in registered Powershell module repositories.

**Parameters** desc (bool) – If True, the verbose description will be returned.

CLI Example:

```bash
salt 'win01' psget.avail_modules
salt 'win01' psget.avail_modules desc=True
```

**salt.modules.win_psget.bootstrap()**

Make sure that nuget-anycpu.exe is installed. This will download the official nuget-anycpu.exe from the internet.

CLI Example:

```bash
salt 'win01' psget.bootstrap
```

**salt.modules.win_psget.get_repository(name)**

Get the details of a local PSGet repository

**Parameters** name (str) – Name of the repository

CLI Example:

```bash
salt 'win01' psget.get_repository MyRepo
```

**salt.modules.win_psget.install(name, minimum_version=None, required_version=None, scope=None, repository=None)**

Install a Powershell module from powershell gallery on the system.

**Parameters**
- name (str) – Name of a Powershell module
- minimum_version (str) – The maximum version to install, e.g. 1.23.2
- required_version (str) – Install a specific version
- scope (str) – The scope to install the module to, e.g. CurrentUser, Computer
- repository (str) – The friendly name of a private repository, e.g. MyREpo

CLI Example:
salt 'win01' psget.install PowerPlan

```python
salt.modules.win_psget.list_modules(desc=False)
```

List currently installed PSGet Modules on the system.

**Parameters**

- `desc` (bool) – If True, the verbose description will be returned.

**CLI Example:**

```bash
salt 'win01' psget.list_modules
dsalt 'win01' psget.list_modules desc=True
```

```python
salt.modules.win_psget.register_repository(name, location, installation_policy=None)
```

Register a PSGet repository on the local machine

**Parameters**

- `name` (str) – The name for the repository
- `location` (str) – The URI for the repository
- `installation_policy` (str) – The installation policy for packages, e.g. Trusted, Untrusted

**CLI Example:**

```bash
salt 'win01' psget.register_repository MyRepo https://myrepo.mycompany.com/
```

```python
salt.modules.win_psget.remove(name)
```

Remove a Powershell DSC module from the system.

**Parameters**

- `name` (str) – Name of a Powershell DSC module

**CLI Example:**

```bash
salt 'win01' psget.remove PowerPlan
```

```python
salt.modules.win_psget.update(name, maximum_version=None, required_version=None)
```

Update a PowerShell module to a specific version, or the newest

**Parameters**

- `name` (str) – Name of a Powershell module
- `maximum_version` (str) – The maximum version to install, e.g. 1.23.2
- `required_version` (str) – Install a specific version

**CLI Example:**

```bash
salt 'win01' psget.update PowerPlan 21.9.472
```

## 21.9.472 salt.modules.winrepo

Module to manage Windows software repo on a Standalone Minion

**file_client:** local must be set in the minion config file.

For documentation on Salt’s Windows Repo feature, see [here](#).

```python
salt.modules.winrepo.genrepo()
```

Generate winrepo_cachefile based on sls files in the winrepo_dir

**CLI Example:**

```bash
salt-call winrepo.genrepo
```

```python
salt.modules.winrepo.show_sls(name, saltenv='base')
```

New in version 2015.8.0.
Display the rendered software definition from a specific sls file in the local winrepo cache. This will parse all Jinja. Run pkg.refresh_db to pull the latest software definitions from the master.

**Note:** This function does not ask a master for an sls file to render. Instead it directly processes the file specified in `name`.

**Parameters**
- `str (saltenv)` – The name/path of the package you want to view. This can be the path to a file on the minion file system or a file on the local (full) –
- `str (minion)` –
- `full` – The default environment is base

**Returns** Returns a dictionary containing the rendered data structure

**Return type** `dict`

**Note:** To use a file from the minion cache start from the local winrepo root (C:\salt\var\cache\salt\minion\files\base\win\repo-ng). If you have .sls files organized in subdirectories you'll have to denote them with .. For example, if you have a test directory in the winrepo root with a gvim.sls file inside, would target that file like so: test.gvim. Directories can be targeted as well as long as they contain an init.sls inside. For example, if you have a node directory with an init.sls inside, target that like so: node.

**CLI Example:**
```
salt '*' winrepo.show_sls gvim
salt '*' winrepo.show_sls test.npp
salt '*' winrepo.show_sls C:\test\gvim.sls
```

**salt.modules.winrepo.update_git_repos(clean=False)**
Checkout git repos containing *Windows Software Package Definitions*.

**Important:** This function requires Git for Windows to be installed in order to work. When installing, make sure to select an installation option which permits the git executable to be run from the Command Prompt.

**clean** [False] Clean repo cachedirs which are not configured under `winrepo_remotes`.

**Note:** This option only applies if either pygit2 or GitPython is installed into Salt’s bundled Python.

**Warning:** This argument should not be set to True if a mix of git and non-git repo definitions are being used, as it will result in the non-git repo definitions being removed.

New in version 2015.8.0.

**CLI Example:**
```
salt-call winrepo.update_git_repos
```
21.9.473 salt.modules.win_servermanager

Manage Windows features via the ServerManager powershell module. Can list available and installed roles/features. Can install and remove roles/features.

maintainer Shane Lee <slee@saltstack.com>

platform Windows Server 2008R2 or greater

depends PowerShell module ServerManager

salt.modules.win_servermanager.install(feature, recurse=False, restart=False, source=None, exclude=None)

Install a feature

Note: Some features require reboot after un/installation, if so until the server is restarted other features can not be installed!

Note: Some features take a long time to complete un/installation, set -t with a long timeout

Parameters

- **feature**(str, list) – The name of the feature(s) to install. This can be a single feature, a string of features in a comma delimited list (no spaces), or a list of features.
  
  New in version 2018.3.0: Added the ability to pass a list of features to be installed.

- **recurse**(Optional[bool]) – Install all sub-features. Default is False

- **restart**(Optional[bool]) – Restarts the computer when installation is complete, if required by the role/feature installed. Will also trigger a reboot if an item in exclude requires a reboot to be properly removed. Default is False

- **source**(Optional[str]) – Path to the source files if missing from the target system. None means that the system will use windows update services to find the required files. Default is None

- **exclude**(Optional[str]) – The name of the feature to exclude when installing the named feature. This can be a single feature, a string of features in a comma-delimited list (no spaces), or a list of features.

  Warning: As there is no exclude option for the Add-WindowsFeature or Install-WindowsFeature PowerShell commands the features named in exclude will be installed with other sub-features and will then be removed. If the feature named in "exclude" is not a sub-feature of one of the installed items it will still be removed.

Returns A dictionary containing the results of the install

Return type dict

CLI Example:

```
# Install the Telnet Client passing a single string
salt '*' win_servermanager.install Telnet-Client

# Install the TFTP Client and the SNMP Service passing a comma-delimited string. Install all sub-features
salt '*' win_servermanager.install TFTP-Client,SNMP-Service recurse=True
```

(continues on next page)
# Install the TFTP Client from d:\side-by-side
salt '*' win_servermanager.install TFTP-Client source=d:\\side-by-side

# Install the XPS Viewer, SNMP Service, and Remote Access passing a
# list. Install all sub-features, but exclude the Web Server
salt '*' win_servermanager.install "['XPS-Viewer', 'SNMP-Service', 'RemoteAccess']" True recurse=True exclude="Web-Server"

salt.modules.win_servermanager.list_available()
List available features to install
Returns A list of available features as returned by the Get-WindowsFeature PowerShell command
Return type str

salt.modules.win_servermanager.list_installed()
List installed features. Supported on Windows Server 2008 and Windows 8 and newer.
Returns A dictionary of installed features
Return type dict

salt.modules.win_servermanager.remove(feature, remove_payload=False, restart=False)
Remove an installed feature

Note: Some features require a reboot after installation/uninstallation. If one of these features are modified,
then other features cannot be installed until the server is restarted. Additionally, some features take a while
to complete installation/uninstallation, so it is a good idea to use the -t option to set a longer timeout.

Parameters
- feature (str, list) – The name of the feature(s) to remove. This can be a single
  feature, a string of features in a comma delimited list (no spaces), or a list of features.
  New in version 2018.3.0: Added the ability to pass a list of features to be removed.
- remove_payload (Optional[bool]) – True will cause the feature to be re-
  moved from the side-by-side store (%SystemDrive%:\Windows\WinSxS). De-
  fault is False
- restart (Optional[bool]) – Restarts the computer when uninstall is complete,
  if required by the role/feature removed. Default is False

Returns A dictionary containing the results of the uninstall
Return type dict

salt -t 600 '*' win_servermanager.remove Telnet-Client

21.9.474 salt.modules.win_service
Windows Service module.
Changed in version 2016.11.0: - Rewritten to use PyWin32

salt.modules.win_service.available(name)

Check if a service is available on the system.

Parameters:
- **name** *(str)*: The name of the service to check

Returns True if the service is available, False otherwise

Return type: bool

CLI Example:

```bash
salt '*' service.available <service name>
```

salt.modules.win_service.create(name, bin_path, exe_args=None, display_name=None, description=None, service_type='own', start_type='manual', start_delayed=False, error_control='normal', load_order_group=None, dependencies=None, account_name='.\LocalSystem', account_password=None, run_interactive=False, **kwargs)

Create the named service.

New in version 2015.8.0.

Parameters:
- **name** *(str)*: Specifies the service name. This is not the display name
- **bin_path** *(str)*: Specifies the path to the service binary file. Backslashes must be escaped, eg: C:\path\to\binary.exe
- **exe_args** *(str)*: Any additional arguments required by the service binary.
- **display_name** *(str)*: The name to be displayed in the service manager. If not passed, the name will be used
- **description** *(str)*: A description of the service
- **service_type** *(str)*: Specifies the service type. Default is own. Valid options are as follows:
  - kernel: Driver service
  - filesystem: File system driver service
  - adapter: Adapter driver service (reserved)
  - recognizer: Recognizer driver service (reserved)
  - own (default): Service runs in its own process
  - share: Service shares a process with one or more other services
- **start_type** *(str)*: Specifies the service start type. Valid options are as follows:
  - boot: Device driver that is loaded by the boot loader
  - system: Device driver that is started during kernel initialization
  - auto: Service that automatically starts
  - manual (default): Service must be started manually
  - disabled: Service cannot be started
- **start_delayed** *(bool)*: Set the service to Auto(Delayed Start). Only valid if the start_type is set to Auto. If service_type is not passed, but the service is already set to Auto, then the flag will be set. Default is False
- **error_control** *(str)*: The severity of the error, and action taken, if this service fails to start. Valid options are as follows:
  - normal (normal): Error is logged and a message box is displayed
  - severe: Error is logged and computer attempts a restart with the last known good configuration
  - critical: Error is logged, computer attempts to restart with the last known good configuration, system halts on failure
  - ignore: Error is logged and startup continues, no notification is given to the user
- **load_order_group** *(str)*: The name of the load order group to which this ser-
vice belongs

- **dependencies** *(list)* – A list of services or load ordering groups that must start before this service
- **account_name** *(str)* – The name of the account under which the service should run. For `own` type services this should be in the `domain\username` format. The following are examples of valid built-in service accounts:
  - `NT AuthorityLocalService`
  - `NT AuthorityNetworkService`
  - `NT AuthorityLocalSystem`
  - `.LocalSystem`
- **account_password** *(str)* – The password for the account name specified in `account_name`. For the above built-in accounts, this can be None. Otherwise a password must be specified.
- **run_interactive** *(bool)* – If this setting is True, the service will be allowed to interact with the user. Not recommended for services that run with elevated privileges.

Returns A dictionary containing information about the new service

Return type **dict**

CLI Example:

```
salt '*' service.create <service name> <path to exe> display_name='<display name>'
```

salt.modules.win_service.create_win_salt_restart_task()
Create a task in Windows task scheduler to enable restarting the salt-minion

Returns True if successful, otherwise False

Return type **bool**

CLI Example:

```
salt '*' service.create_win_salt_restart_task()
```

salt.modules.win_service.delete(name, timeout=90)
Delete the named service

Parameters

- **name** *(str)* – The name of the service to delete
- **timeout** *(int)* – The time in seconds to wait for the service to be deleted before returning. This is necessary because a service must be stopped before it can be deleted. Default is 90 seconds

New in version 2017.7.9, 2018.3.4.

Returns **True** if successful, otherwise **False**. Also returns **True** if the service is not present

Return type **bool**

CLI Example:

```
salt '*' service.delete <service name>
```

salt.modules.win_service.disable(name, **kwargs)
Disable the named service to start at boot

Parameters

- **name** *(str)* – The name of the service to disable

Returns **True** if disabled, **False** otherwise

Return type **bool**

CLI Example:

```
salt '*' service.disable <service name>
```
salt.modules.win_service.disabled(name)
Check to see if the named service is disabled to start on boot
Parameters name (str) - The name of the service to check
Returns True if the service is disabled
Return type bool
CLI Example:
```
salt '*' service.disabled <service name>
```

salt.modules.win_service.enable(name, start_type='auto', start_delayed=False, **kwargs)
Enable the named service to start at boot
Parameters
  - name (str) - The name of the service to enable.
  - start_type (str) - Specifies the service start type. Valid options are as follows:
     - boot: Device driver that is loaded by the boot loader
     - system: Device driver that is started during kernel initialization
     - auto: Service that automatically starts
     - manual: Service must be started manually
     - disabled: Service cannot be started
  - start_delayed (bool) - Set the service to Auto(Delayed Start). Only valid if the
    start_type is set to Auto. If service_type is not passed, but the service is already set
    to Auto, then the flag will be set.
Returns True if successful, False otherwise
Return type bool
CLI Example:
```
salt '*' service.enable <service name>
```

salt.modules.win_service.enabled(name, **kwargs)
Check to see if the named service is enabled to start on boot
Parameters name (str) - The name of the service to check
Returns True if the service is set to start
Return type bool
CLI Example:
```
salt '*' service.enabled <service name>
```

salt.modules.win_service.execute_salt_restart_task()
Run the Windows Salt restart task
Returns True if successful, otherwise False
Return type bool
CLI Example:
```
salt '*' service.execute_salt_restart_task()
```

salt.modules.win_service.get_all()
Return all installed services
Returns Returns a list of all services on the system.
Return type list
CLI Example:
```
salt '*' service.get_all
```

salt.modules.win_service.get_disabled()
Return a list of disabled services. Disabled is defined as a service that is marked 'Disabled' or 'Manual'.
Returns A list of disabled services.
Return type list
CLI Example:
```
salt '*' service.get_disabled
```

```
salt.modules.win_service.get_enabled()
Return a list of enabled services. Enabled is defined as a service that is marked to Auto Start.
Returns A list of enabled services
Return type list
CLI Example:
```
salt '*' service.get_enabled
```

```
salt.modules.win_service.get_service_name('args)
The Display Name is what is displayed in Windows when services.msc is executed. Each Display Name has an associated Service Name which is the actual name of the service. This function allows you to discover the Service Name by returning a dictionary of Display Names and Service Names, or filter by adding arguments of Display Names.
If no args are passed, return a dict of all services where the keys are the service Display Names and the values are the Service Names.
If arguments are passed, create a dict of Display Names and Service Names
Returns A dictionary of display names and service names
Return type dict
CLI Examples:
```
salt '*' service.get_service_name
salt '*' service.get_service_name 'Google Update Service (gupdate)' 'DHCP Client'
```

```
salt.modules.win_service.getsid(name)
Return the SID for this windows service
Parameters name (str) – The name of the service for which to return the SID
Returns A string representing the SID for the service
Return type str
CLI Example:
```
salt '*' service.getsid <service name>
```

```
salt.modules.win_service.info(name)
Get information about a service on the system
Parameters name (str) – The name of the service. This is not the display name. Use get_service_name to find the service name.
Returns A dictionary containing information about the service.
Return type dict
CLI Example:
```
salt '*' service.info spooler
```

```
salt.modules.win_service.missing(name)
The inverse of service.available.
Parameters name (str) – The name of the service to check
Returns True if the service is missing, False otherwise
Return type bool
CLI Example:
```
```
salt 'service.missing <service name>'

salt.modules.win_service.modify(name, bin_path=None, exe_args=None, display_name=None, description=None, service_type=None, start_type=None, start_delayed=None, error_control=None, load_order_group=None, dependencies=None, account_name=None, account_password=None, run_interactive=None)

Modify a service’s parameters. Changes will not be made for parameters that are not passed.

New in version 2016.11.0.

Parameters
- **name (str)** – The name of the service. Can be found using the `service.get_service_name` function
- **bin_path (str)** – The path to the service executable. Backslashes must be escaped, eg: C:\path\to\binary.exe
- **exe_args (str)** – Any arguments required by the service executable
- **display_name (str)** – The name to display in the service manager
- **description (str)** – The description to display for the service
- **service_type (str)** – Specifies the service type. Default is `own`. Valid options are as follows:
  - kernel: Driver service
  - filesystem: File system driver service
  - adapter: Adapter driver service (reserved)
  - recognizer: Recognizer driver service (reserved)
  - own (default): Service runs in its own process
  - share: Service shares a process with one or more other services
- **start_type (str)** – Specifies the service start type. Valid options are as follows:
  - boot: Device driver that is loaded by the boot loader
  - system: Device driver that is started during kernel initialization
  - auto: Service that automatically starts
  - manual: Service must be started manually
  - disabled: Service cannot be started
- **start_delayed (bool)** – Set the service to Auto(Delayed Start). Only valid if the start_type is set to Auto. If service_type is not passed, but the service is already set to Auto, then the flag will be set.
- **error_control (str)** – The severity of the error, and action taken, if this service fails to start. Valid options are as follows:
  - normal: Error is logged and a message box is displayed
  - severe: Error is logged and computer attempts a restart with the last known good configuration
  - critical: Error is logged, computer attempts to restart with the last known good configuration, system halts on failure
  - ignore: Error is logged and startup continues, no notification is given to the user
- **load_order_group (str)** – The name of the load order group to which this service belongs
- **dependencies (list)** – A list of services or load ordering groups that must start before this service
- **account_name (str)** – The name of the account under which the service should run. For `own` type services this should be in the `domain\username` format. The following are examples of valid built-in service accounts:
  - NT Authority\LocalService
  - NT Authority\NetworkService

2734 Chapter 21. Salt Module Reference
- NT Authority\LocalSystem
- LocalSystem

  - **account_password (str)** – The password for the account name specified in account_name. For the above built-in accounts, this can be None. Otherwise a password must be specified.

  - **run_interactive (bool)** – If this setting is True, the service will be allowed to interact with the user. Not recommended for services that run with elevated privileges.

Returns a dictionary of changes made

Return type: dict

---

CLI Example:

```
salt '*' service.modify spooler start_type=disabled
```

---

**salt.modules.win_service.restart(name, timeout=90)**

Restart the named service. This issues a stop command followed by a start.

### Parameters

- **name** – The name of the service to restart.

**Note:** If the name passed is salt-minion a scheduled task is created and executed to restart the salt-minion service.

- **timeout (int)** – The time in seconds to wait for the service to stop and start before returning. Default is 90 seconds

  **Note:** The timeout is cumulative meaning it is applied to the stop and then to the start command. A timeout of 90 could take up to 180 seconds if the service is long in stopping and starting

New in version 2017.7.9, 2018.3.4.

Returns: True if successful, otherwise False

Return type: bool

---

CLI Example:

```
salt '*' service.restart <service name>
```

---

**salt.modules.win_service.start(name, timeout=90)**

Start the specified service.

**Warning:** You cannot start a disabled service in Windows. If the service is disabled, it will be changed to Manual start.

### Parameters

- **name (str)** – The name of the service to start

- **timeout (int)** – The time in seconds to wait for the service to start before returning.

  Default is 90 seconds

  New in version 2017.7.9, 2018.3.4.

Returns: True if successful, otherwise False. Also returns True if the service is already started

Return type: bool

---

CLI Example:
### salt.modules.win_service

**status** *(name, *args, **kwargs)*  
Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)

**Parameters**  
- **name** *(str)* – The name of the service to check

**Returns** True if running, False otherwise dict: Maps service name to True if running, False otherwise

**Return type** bool

**CLI Example:**
```
salt '*' service.status <service name>
```

**stop** *(name, timeout=90)*  
Stop the specified service

**Parameters**  
- **name** *(str)* – The name of the service to stop  
- **timeout** *(int)* – The time in seconds to wait for the service to stop before returning. Default is 90 seconds

**Returns** True if successful, otherwise False. Also returns True if the service is already stopped

**Return type** bool

**CLI Example:**
```
salt '*' service.stop <service name>
```

### salt.modules.win_shadow

Manage the shadow file

**Important:** If you feel that Salt should be using this module to manage passwords on a minion, and it is using a different module (or gives an error similar to 'shadow.info' is not available), see here.

**info** *(name)*  
Return information for the specified user This is just returns dummy data so that salt states can work.

**Parameters**  
- **name** *(str)* – The name of the user account to show.

**CLI Example:**
```
salt '*' shadow.info root
```

**require_password_change** *(name)*  
Require the user to change their password the next time they log in.

**Parameters**  
- **name** – The name of the user account to require a password change.

**Returns** True if successful. False if unsuccessful.

**Return type** bool

**CLI Example:**
salt '*' shadow.require_password_change <username>

```python
salt.modules.win_shadow.set_expire(name, expire)
```
Set the expiration date for a user account.

**Parameters**

- **name** – The name of the user account to edit.
- **expire** – The date the account will expire.

**Returns** True if successful. False if unsuccessful.

**Return type** bool

CLI Example:

```
salt '*' shadow.set_expire <username> 2016/7/1
```

```python
salt.modules.win_shadow.set_password(name, password)
```
Set the password for a named user.

**Parameters**

- **name** *(str)* – The name of the user account
- **password** *(str)* – The new password

**Returns** True if successful. False if unsuccessful.

**Return type** bool

CLI Example:

```
salt '*' shadow.set_password root mysecretpassword
```

```python
salt.modules.win_shadow.unlock_account(name)
```
Unlocks a user account.

**Parameters**

- **name** – The name of the user account to unlock.

**Returns** True if successful. False if unsuccessful.

**Return type** bool

CLI Example:

```
salt '*' shadow.unlock_account <username>
```

### 21.9.476 `salt.modules.win_smtp_server` module

Module for managing IIS SMTP server configuration on Windows servers. The Windows features 'SMTP-Server' and 'Web-WMI' must be installed.

```python
depends wmi
```

```python
salt.modules.win_smtp_server.get_connection_ip_list(as_wmi_format=False, server='SmtpSvc/1')
```
Get the IPGrant list for the SMTP virtual server.

**Parameters**

- **as_wmi_format** *(bool)* – Returns the connection IPs as a list in the format WMI expects.
- **server** *(str)* – The SMTP server name.

**Returns** A dictionary of the IP and subnet pairs.

**Return type** dict

CLI Example:

```
salt '*' win_smtp_server.get_connection_ip_list
```

```python
salt.modules.win_smtp_server.get_log_format(server='SmtpSvc/1')
```
Get the active log format for the SMTP virtual server.
Parameters **server** *(str)* – The SMTP server name.

Returns A string of the log format name.

Return type **str**

CLI Example:

```
salt '*' win_smtp_server.get_log_format
```

salt.modules.win_smtp_server.get_log_format_types()

Get all available log format names and ids.

Returns A dictionary of the log format names and ids.

Return type **dict**

CLI Example:

```
salt '*' win_smtp_server.get_log_format_types
```

salt.modules.win_smtp_server.get_relay_ip_list(server='SmtpSvc/1')

Get the RelayIpList list for the SMTP virtual server.

Parameters **server** *(str)* – The SMTP server name.

Returns A list of the relay IPs.

Return type **list**

**Note:** A return value of None corresponds to the restrictive ‘Only the list below’ GUI parameter with an empty access list, and setting an empty list/tuple corresponds to the more permissive ‘All except the list below’ GUI parameter.

CLI Example:

```
salt '*' win_smtp_server.get_relay_ip_list
```

salt.modules.win_smtp_server.get_server_setting(settings, server='SmtpSvc/1')

Get the value of the setting for the SMTP virtual server.

Parameters

- **settings** *(str)* – A list of the setting names.
- **server** *(str)* – The SMTP server name.

Returns A dictionary of the provided settings and their values.

Return type **dict**

CLI Example:

```
salt '*' win_smtp_server.get_server_setting settings="['MaxRecipients']"
```

salt.modules.win_smtp_server.get_servers()

Get the SMTP virtual server names.

Returns A list of the SMTP virtual servers.

Return type **list**

CLI Example:

```
salt '*' win_smtp_server.get_servers
```

salt.modules.win_smtp_server.set_connection_ip_list(addresses=None, grant_by_default=False, server='SmtpSvc/1')

Set the IPGrant list for the SMTP virtual server.

Parameters

- **addresses** *(str)* – A dictionary of IP + subnet pairs.
Salt Documentation, Release 2019.2.0

- **grant_by_default** *(bool)* – Whether the addresses should be a blacklist or whitelist.
  
  **server** *(str)* – The SMTP server name.

  **Returns** A boolean representing whether the change succeeded.

  **Return type** *bool*

  **CLI Example:**

  ```
  salt '*' win_smtp_server.set_connection_ip_list addresses="[{'127.0.0.1': '255.255.
  !255.255'}]
  ```

  *salt.modules.win_smtp_server.set_log_format*(log_format, *server*=`SmtpSvc/1`)]
  
  Set the active log format for the SMTP virtual server.

  **Parameters**

  - **log_format** *(str)* – The log format name.
  - **server** *(str)* – The SMTP server name.

  **Returns** A boolean representing whether the change succeeded.

  **Return type** *bool*

  **CLI Example:**

  ```
  salt '*' win_smtp_server.set_log_format 'Microsoft IIS Log File Format'
  ```

  *salt.modules.win_smtp_server.set_relay_ip_list*(addresses=None, *server*=`SmtpSvc/1`)]
  
  Set the RelayIpList list for the SMTP virtual server.

  Due to the unusual way that Windows stores the relay IPs, it is advisable to retrieve the existing list you wish to set from a pre-configured server.

  For example, setting '127.0.0.1' as an allowed relay IP through the GUI would generate an actual relay IP list similar to the following:

  ```
  ['24.0.0.128', '32.0.0.128', '60.0.0.128', '68.0.0.128', '1.0.0.0', '76.0.0.0',
  '0.0.0.0', '0.0.0.0', '1.0.0.0', '1.0.0.0', '2.0.0.0', '2.0.0.0', '4.0.0.0',
  '0.0.0.0', '76.0.0.128', '0.0.0.0', '0.0.0.0', '0.0.0.0', '0.0.0.0',
  '255.255.255.255', '127.0.0.1']
  ```

  **Note:** Setting the list to None corresponds to the restrictive 'Only the list below' GUI parameter with an empty access list configured, and setting an empty list/tuple corresponds to the more permissive 'All except the list below' GUI parameter.

  **Parameters**

  - **addresses** *(str)* – A list of the relay IPs. The order of the list is important.
  - **server** *(str)* – The SMTP server name.

  **Returns** A boolean representing whether the change succeeded.

  **Return type** *bool*

  **CLI Example:**

  ```
  salt '*' win_smtp_server.set_relay_ip_list addresses="[192.168.1.1', '172.16.1.1]
  ```

  *salt.modules.win_smtp_server.set_server_setting*(settings, *server*=`SmtpSvc/1`)]
  
  Set the value of the setting for the SMTP virtual server.

  **Note:** The setting names are case-sensitive.
Parameters

- **settings (str)** – A dictionary of the setting names and their values.
- **server (str)** – The SMTP server name.

Returns A boolean representing whether all changes succeeded.

Return type **bool**

CLI Example:

```shell
salt '*' win_smtp_server.set_server_setting settings="{'MaxRecipients': '500'}"
```

## 21.9.477 salt.modules.win_snmp module

Module for managing SNMP service settings on Windows servers. The Windows feature 'SNMP-Service' must be installed.

salt.modules.win_snmp.get_agent_service_types()
Get the sysServices types that can be configured.

Returns A list of service types.

Return type **list**

CLI Example:

```shell
salt '*' win_snmp.get_agent_service_types
```

salt.modules.win_snmp.get_agent_settings()
Determine the value of the SNMP sysContact, sysLocation, and sysServices settings.

Returns A dictionary of the agent settings.

Return type **dict**

CLI Example:

```shell
salt '*' win_snmp.get_agent_settings
```

salt.modules.win_snmp.get_auth_traps_enabled()
Determine whether the host is configured to send authentication traps.

Returns True if traps are enabled, otherwise False

Return type **bool**

CLI Example:

```shell
salt '*' win_snmp.get_auth_traps_enabled
```

salt.modules.win_snmp.get_community_names()
Get the current accepted SNMP community names and their permissions.

If community names are being managed by Group Policy, those values will be returned instead like this:

```
TestCommunity:
  Managed by GPO
```

Community names managed normally will denote the permission instead:

```
TestCommunity:
  Read Only
```

Returns A dictionary of community names and permissions.

Return type **dict**

CLI Example:
salt '*' win_snmp.get_community_names

salt.modules.win_snmp.get_permission_types()
Get the permission types that can be configured for communities.

    Returns: A list of permission types.

    Return type: list

CLI Example:

salt '*' win_snmp.get_permission_types

salt.modules.win_snmp.set_agent_settings(contact=None, location=None, services=None)
Manage the SNMP sysContact, sysLocation, and sysServices settings.

    Parameters

        • contact (str, optional) – The SNMP contact.
        • location (str, optional) – The SNMP location.
        • services (list, optional) – A list of selected services. The possible service names can be found via win_snmp.get_agent_service_types. To disable all services pass a list of None, ie: ['None']

    Returns: True if successful, otherwise False

    Return type: bool

CLI Example:

salt '*' win_snmp.set_agent_settings contact='Contact Name' location='Place'\n                        services='["Physical"]'

salt.modules.win_snmp.set_auth_traps_enabled(status=True)
Manage the sending of authentication traps.

    Parameters

        status (bool) – True to enable traps. False to disable.

    Returns: True if successful, otherwise False

    Return type: bool

CLI Example:

salt '*' win_snmp.set_auth_traps_enabled status='True'

salt.modules.win_snmp.set_community_names(communities)
Manage the SNMP accepted community names and their permissions.

    Note: Settings managed by Group Policy will always take precedence over those set using the SNMP interface. Therefore if this function finds Group Policy settings it will raise a CommandExecutionError

    Parameters

        communities (dict) – A dictionary of SNMP community names and permissions.

        The possible permissions can be found via win_snmp.get_permission_types.

    Returns: True if successful, otherwise False

    Return type: bool

    Raises: CommandExecutionError – If SNMP settings are being managed by Group Policy

CLI Example:

salt '*' win_snmp.set_community_names communities="{"TestCommunity": 'Read Only'}"
21.9.478  salt.modules.win_status

Module for returning various status data about a minion. These data can be useful for compiling into stats later, or for problem solving if your minion is having problems.

New in version 0.12.0.

depends
  • wmi

salt.modules.win_status.cpuLoad()
New in version 2015.8.0.

Return the processor load as a percentage

CLI Example:
salt '⋆' status.cpuload

salt.modules.win_status.cpustats()
Return information about the CPU.

Returns dict: A dictionary containing information about the CPU stats

CLI Example:
salt '*' status.cpustats

salt.modules.win_status.diskusage(human_readable=False, path=None)
New in version 2015.8.0.

Return the disk usage for this minion
human_readable [False] If True, usage will be in KB/MB/GB etc.

CLI Example:
salt '⋆' status.diskusage path=c:/salt

salt.modules.win_status.loadavg()
Returns counter information related to the load of the machine

Returns A dictionary of counters

Return type dict

CLI Example:
salt '*' status.loadavg

salt.modules.win_status.master(master=None, connected=True)
New in version 2015.5.0.

Fire an event if the minion gets disconnected from its master. This function is meant to be run via a scheduled job from the minion. If master_ip is an FQDN/Hostname, is must be resolvable to a valid IPv4 address.

CLI Example:
salt '*' status.master

salt.modules.win_status.meminfo()
Return information about physical and virtual memory on the system

Returns A dictionary of information about memory on the system

Return type dict

CLI Example:
salt '*' status.meminfo

salt.modules.win_status.procs(count=False)
Return the process data

count [False] If True, this function will simply return the number of processes.

New in version 2015.8.0.

CLI Example:
salt '⋆' status.procs
salt '⋆' status.procs count

salt.modules.win_status.saltmem(human_readable=False)
New in version 2015.8.0.

Returns the amount of memory that salt is using
human_readable [False] return the value in a nicely formatted number
CLI Example:

```
salt '* status.saltmem
salt '* status.saltmem  human_readable=True
```

salt.modules.win_status.uptime(human_readable=False)
New in version 2015.8.0.
Return the system uptime for the machine

Parameters human_readable (bool) – Return uptime in human readable format if True, otherwise return seconds. Default is False

Note: Human readable format is days, hours:min:sec. Days will only be displayed if more than 0

Returns The uptime in seconds or human readable format depending on the value of human_readable
Return type str
CLI Example:

```
salt '* status.uptime
salt '* status.uptime  human_readable=True
```

salt.modules.win_status.vmstats()
Return information about the virtual memory on the machine

Returns A dictionary of virtual memory stats
Return type dict
CLI Example:

```
salt * status.vmstats
```

21.9.479 salt.modules.win_system

Module for managing windows systems.

depends

- pywintypes
- win32api
- win32con
- win32net
- wmi

Support for reboot, shutdown, etc

salt.modules.win_system.get_computer_desc()
Get the Windows computer description

Returns Returns the computer description if found. Otherwise returns False.
Return type str
CLI Example:

```
salt 'minion-id' system.get_computer_desc
```
salt.modules.win_system.get_computer_name()
Get the Windows computer name
Returns  Returns the computer name if found. Otherwise returns False.
Return type  str
CLI Example:
```
salt 'minion-id' system.get_computer_name
```

salt.modules.win_system.get_domain_workgroup()
Get the domain or workgroup the computer belongs to.
New in version 2015.5.7.
New in version 2015.8.2.
Returns  The name of the domain or workgroup
Return type  str
CLI Example:
```
salt 'minion-id' system.get_domain_workgroup
```

salt.modules.win_system.get_hostname()
Get the hostname of the windows minion
New in version 2016.3.0.
Returns  Returns the hostname of the windows minion
Return type  str
CLI Example:
```
salt 'minion-id' system.get_hostname
```

salt.modules.win_system.get_pending_component_servicing()
Determine whether there are pending Component Based Servicing tasks that require a reboot.
New in version 2016.11.0.
Returns  True if there are pending Component Based Servicing tasks, otherwise False
Return type  bool
CLI Example:
```
salt '*' system.get_pending_component_servicing
```

salt.modules.win_system.get_pending_computer_name()
Get a pending computer name. If the computer name has been changed, and the change is pending a system reboot, this function will return the pending computer name. Otherwise, None will be returned. If there was an error retrieving the pending computer name, False will be returned, and an error message will be logged to the minion log.
Returns  Returns the pending name if pending restart. Returns None if not pending restart.
Return type  str
CLI Example:
```
salt 'minion-id' system.get_pending_computer_name
```

salt.modules.win_system.get_pending_domain_join()
Determine whether there is a pending domain join action that requires a reboot.
New in version 2016.11.0.
Returns  True if there is a pending domain join action, otherwise False
Return type  bool
CLI Example:
salt '*' system.get_pending_domain_join

salt.modules.win_system.get_pending_file_rename()
Determine whether there are pending file rename operations that require a reboot.

New in version 2016.11.0.

    Returns True if there are pending file rename operations, otherwise False
    Return type bool

CLI Example:

    salt '*' system.get_pending_file_rename

salt.modules.win_system.get_pending_reboot()
Determine whether there is a reboot pending.

New in version 2016.11.0.

    Returns True if the system is pending reboot, otherwise False
    Return type bool

CLI Example:

    salt '*' system.get_pending_reboot

salt.modules.win_system.get_pending_servermanager()
Determine whether there are pending Server Manager tasks that require a reboot.

New in version 2016.11.0.

    Returns True if there are pending Server Manager tasks, otherwise False
    Return type bool

CLI Example:

    salt '*' system.get_pending_servermanager

salt.modules.win_system.get_pending_update()
Determine whether there are pending updates that require a reboot.

New in version 2016.11.0.

    Returns True if there are pending updates, otherwise False
    Return type bool

CLI Example:

    salt '*' system.get_pending_update

salt.modules.win_system.get_reboot_required_witnessed()
Determine if at any time during the current boot session the salt minion witnessed an event indicating that a
reboot is required.

This function will return True if an install completed with exit code 3010 during the current boot session and
can be extended where appropriate in the future.

New in version 2016.11.0.

    Returns True if the Requires reboot registry flag is set to 1, otherwise False
    Return type bool

CLI Example:

    salt '*' system.get_reboot_required_witnessed

salt.modules.win_system.get_system_date()
Get the Windows system date
Returns
Returns the system date
Return type str

CLI Example:
```
salt '*' system.get_system_date
```

salt.modules.win_system.get_system_info()
Get system information.
Returns Dictionary containing information about the system to include name, description, version, etc...
Return type dict

CLI Example:
```
salt 'minion-id' system.get_system_info
```

salt.modules.win_system.get_system_time()
Get the system time.
Returns Returns the system time in HH:MM:SS AM/PM format.
Return type str

CLI Example:
```
salt 'minion-id' system.get_system_time
```

salt.modules.win_system.halt(
timeout=5, in_seconds=False)
Halt a running system.
Parameters

- **timeout (int)** – Number of seconds before halting the system. Default is 5 seconds.
- **in_seconds (bool)** – Whether to treat timeout as seconds or minutes.

New in version 2015.8.0.
Returns True if successful, otherwise False
Return type bool

CLI Example:
```
salt '*' system.halt 5 True
```

salt.modules.win_system.init(
runlevel)
Change the system runlevel on sysV compatible systems. Not applicable to Windows

CLI Example:
```
salt '*' system.init 3
```

salt.modules.win_system.join_domain(
domain, username=None, password=None, account_ou=None, account_exists=False, restart=False)
Join a computer to an Active Directory domain. Requires a reboot.
Parameters

- **domain (str)** – The domain to which the computer should be joined, e.g. example.com
- **username (str)** – Username of an account which is authorized to join computers to the specified domain. Needs to be either fully qualified like user@domain.tld or simply user
- **password (str)** – Password of the specified user
- **account_ou (str)** – The DN of the OU below which the account for this computer should be created when joining the domain, e.g. ou=computers, ou=departm_432,dc=my-company,dc=com
- **account_exists** *(bool)* – If set to True the computer will only join the domain if the account already exists. If set to False the computer account will be created if it does not exist, otherwise it will use the existing account. Default is False
- **restart** *(bool)* – True will restart the computer after a successful join. Default is False

New in version 2015.8.2/2015.5.7.

Returns

Returns a dictionary if successful, otherwise False

Return type
dict

CLI Example:

```
salt 'minion-id' system.join_domain domain='domain.tld' \ 
   username='joinuser' password='joinpassword' \ 
   account_ou='ou=clients,ou=org,dc=domain,dc=tld' \ 
   account_exists=False, restart=True
```

salt.modules.win_system.lock()

Lock the workstation.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt 'minion-id' system.lock
```

salt.modules.win_system.poweroff(*timeout=5, in_seconds=False*)

Power off a running system.

Parameters

- **timeout** *(int)* – Number of seconds before powering off the system. Default is 5 seconds.
- **in_seconds** *(bool)* – Whether to treat timeout as seconds or minutes.

New in version 2015.8.0.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' system.poweroff 5
```

salt.modules.win_system.reboot(*timeout=5, in_seconds=False, wait_for_reboot=False, only_on_pending_reboot=False*)

Reboot a running system.

Parameters

- **timeout** *(int)* – The number of minutes/seconds before rebooting the system. Use of minutes or seconds depends on the value of in_seconds. Default is 5 minutes.
- **in_seconds** *(bool)* – True will cause the timeout parameter to be in seconds. False will be in minutes. Default is False.

New in version 2015.8.0.

- **wait_for_reboot** *(bool)* – True will sleep for timeout + 30 seconds after reboot has been initiated. This is useful for use in a highstate. For example, you may have states that you want to apply only after the reboot. Default is False.

New in version 2015.8.0.

- **only_on_pending_reboot** *(bool)* – If this is set to True, then the reboot will only proceed if the system reports a pending reboot. Setting this parameter to True could be useful when calling this function from a final housekeeping state intended to be executed at the end of a state run (using order: last). Default is False.
Returns True if successful (a reboot will occur), otherwise False

Return type bool

CLI Example:

```
salt '*' system.reboot 5
salt '*' system.reboot 5 True
```

Invoking this function from a final housekeeping state:

```
final_housekeeping:
  module.run:
    - name: system.reboot
    - only_on_pending_reboot: True
    - order: last
```

```
salt.modules.win_system.set_computer_desc(desc=None)
```

Set the Windows computer description

Parameters desc (str) – The computer description

Returns Description if successful, otherwise False

Return type str

CLI Example:

```
salt 'minion-id' system.set_computer_desc 'This computer belongs to Dave!'
```

```
salt.modules.win_system.set_computer_name(name)
```

Set the Windows computer name

Parameters name (str) – The new name to give the computer. Requires a reboot to take effect.

Returns Returns a dictionary containing the old and new names if successful. False if not.

Return type dict

CLI Example:

```
salt 'minion-id' system.set_computer_name 'DavesComputer'
```

```
salt.modules.win_system.set_hostname(hostname)
```

Set the hostname of the windows minion, requires a restart before this will be updated.

New in version 2016.3.0.

Parameters hostname (str) – The hostname to set

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt 'minion-id' system.set_hostname newhostname
```

```
salt.modules.win_system.set_reboot_required_witnessed()
```

This function is used to remember that an event indicating that a reboot is required was witnessed. This function relies on the salt-minion’s ability to create the following volatile registry key in the HKLM hive:

```
SYSTEM\CurrentControlSet\Services\salt-minion\Volatile-Data
```

Because this registry key is volatile, it will not persist beyond the current boot session. Also, in the scope of this key, the name 'Reboot required' will be assigned the value of 1.

For the time being, this function is being used whenever an install completes with exit code 3010 and can be extended where appropriate in the future.

New in version 2016.11.0.

Returns True if successful, otherwise False

Return type bool
Set the Windows system date. Use <mm-dd-yy> format for the date.

Parameters

- **newdate** *(str)* – The date to set. Can be any of the following formats
  - YYYY-MM-DD
  - MM-DD-YYYY
  - MM-DD-YY
  - MM/DD/YYYY
  - MM/DD/YY
  - YYYY/MM/DD

Returns True if successful, otherwise False

Return type bool

CLI Example:
salt '*' system.set_system_date '03-28-13'

Set the system date and time. Each argument is an element of the date, but not required. If an element is not passed, the current system value for that element will be used. For example, if you don’t pass the year, the current system year will be used. (Used by set_system_date and set_system_time)

Parameters

- **years** *(int)* – Years digit, ie: 2015
- **months** *(int)* – Months digit: 1 - 12
- **days** *(int)* – Days digit: 1 - 31
- **hours** *(int)* – Hours digit: 0 - 23
- **minutes** *(int)* – Minutes digit: 0 - 59
- **seconds** *(int)* – Seconds digit: 0 - 59

Returns True if successful, otherwise False

Return type bool

CLI Example:
salt '*' system.set_system_date_time 2015 5 12 11 37 53

Set the system time.

Parameters

- **newtime** *(str)* – The time to set. Can be any of the following formats:
  - HH:MM:SS AM/PM
  - HH:MM AM/PM
  - HH:MM:SS (24 hour)
  - HH:MM (24 hour)

Returns True if successful, otherwise False

Return type bool

CLI Example:
salt 'minion-id' system.set_system_time 12:01

Shutdown a running system.

Parameters

- **message** *(str)* – The message to display to the user before shutting down.
• **timeout (int)** – The length of time (in seconds) that the shutdown dialog box should be displayed. While this dialog box is displayed, the shutdown can be aborted using the `system.shutdown_abort` function.

If timeout is not zero, `InitiateSystemShutdown` displays a dialog box on the specified computer. The dialog box displays the name of the user who called the function, the message specified by the `lpMessage` parameter, and prompts the user to log off. The dialog box beeps when it is created and remains on top of other windows (system modal). The dialog box can be moved but not closed. A timer counts down the remaining time before the shutdown occurs.

If timeout is zero, the computer shuts down immediately without displaying the dialog box and cannot be stopped by `system.shutdown_abort`.

Default is 5 minutes

• **in_seconds (bool)** – True will cause the `timeout` parameter to be in seconds. False will be in minutes. Default is False.

New in version 2015.8.0.

• **force_close (bool)** – True will force close all open applications. False will display a dialog box instructing the user to close open applications. Default is True.

• **reboot (bool)** – True restarts the computer immediately after shutdown. False powers down the system. Default is False.

• **only_on_pending_reboot (bool)** – If this is set to True, then the shutdown will only proceed if the system reports a pending reboot. To optionally shutdown in a highstate, consider using the shutdown state instead of this module.

Returns True if successful (a shutdown or reboot will occur), otherwise False

Return type bool

CLI Example:

```
salt '*' system.shutdown "System will shutdown in 5 minutes"
```

called

salt.modules.win_system.shutdown_abort()

Abort a shutdown. Only available while the dialog box is being displayed to the user. Once the shutdown has initiated, it cannot be aborted.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt 'minion-id' system.shutdown_abort
```

called

salt.modules.win_system.shutdown_hard()

Shutdown a running system with no timeout or warning.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' system.shutdown_hard
```

called

salt.modules.win_system.start_time_service()

Start the Windows time service

Returns True if successful, otherwise False

Return type bool

CLI Example:
**salt modules.win_system.stop_time_service()**

Stop the Windows time service

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' system.stop_time_service
```

**salt modules.win_system.unjoin_domain()**

Unjoin a computer from an Active Directory Domain. Requires a restart.

Parameters

- **username** (str) – Username of an account which is authorized to manage computer accounts on the domain. Needs to be a fully qualified name like user@domain.tld or domain.tld\user. If the domain is not specified, the passed domain will be used. If the computer account doesn’t need to be disabled after the computer is unjoined, this can be None.
- **password** (str) – The password of the specified user
- **domain** (str) – The domain from which to unjoin the computer. Can be None
- **workgroup** (str) – The workgroup to join the computer to. Default is WORKGROUP

New in version 2015.8.2/2015.5.7.

- **disable** (bool) – True to disable the computer account in Active Directory. Default is False
- **restart** (bool) – True will restart the computer after successful unjoin. Default is False

New in version 2015.8.2/2015.5.7.

Returns Returns a dictionary if successful, otherwise False

Return type dict

CLI Example:

```
salt 'minion-id' system.unjoin_domain
salt 'minion-id' system.unjoin_domain username='unjoinuser' password='unjoinpassword' disable=True restart=True
```

**21.9.480 salt.modules.win_task module**

Windows Task Scheduler Module .. versionadded:: 2016.3.0

A module for working with the Windows Task Scheduler. You can add and edit existing tasks. You can add and clear triggers and actions. You can list all tasks, folders, triggers, and actions.

**salt modules.win_task.add_action()**

Add an action to a task.

Parameters

- **name** (str) – The name of the task to which to add the action.
- **location** (str) – A string value representing the location of the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).
- **action_type** (str) – The type of action to add. There are three action types. Each one requires its own set of Keyword Arguments (kwargs). Valid values are:
- Execute
- Email
- Message

Required arguments for each action_type:

**Execute**

Execute a command or an executable

`cmd (str):` (required) The command or executable to run.

`arguments (str):` (optional) Arguments to be passed to the command or executable.

To launch a script the first command will need to be the interpreter for the script. For example, to run a vbscript you would pass `cscript.exe` in the `cmd` parameter and pass the script in the `arguments` parameter as follows:

- `cmd='cscript.exe' arguments='c:\scripts\myscript.vbs'

Batch files do not need an interpreter and may be passed to the `cmd` parameter directly.

`start_in (str):` (optional) The current working directory for the command.

**Email**

Send and email. Requires `server`, `from`, and `to` or `cc`.

`from (str):` The sender

`reply_to (str):` Who to reply to

`to (str):` The recipient

`cc (str):` The CC recipient

`bcc (str):` The BCC recipient

`subject (str):` The subject of the email

`body (str):` The Message Body of the email

`server (str):` The server used to send the email

`attachments (list):` A list of attachments. These will be the paths to the files to attach. ie: `attachments=['C:\attachment1.txt', 'C:\attachment2.txt']`

**Message**

Display a dialog box. The task must be set to "Run only when user is logged on" in order for the dialog box to display. Both parameters are required.

`title (str):` The dialog box title.

`message (str):` The dialog box message body

**Returns** A dictionary containing the task configuration

**Return type** dict

**CLI Example:**

```
salt 'minion-id' task.add_action <task_name> cmd='del /Q /S C:\\Temp'
```

```
salt.modules.win_task.add_trigger(name=None, location="\", trigger_type=None, trigger_enabled=True, start_date=None, start_time=None, end_date=None, end_time=None, random_delay=None, repeat_interval=None, repeat_duration=None, repeat_stop_at_duration_end=False, execution_time_limit=None, delay=None, **kwargs)
```

Add a trigger to a Windows Scheduled task

**Note:** Arguments are parsed by the YAML loader and are subject to yaml’s idiosyncrasies. Therefore, time
values in some formats (%H:%M:%S and %H:%M) should be quoted. See YAML IDIOSYNCRASIES for more details.

Parameters

- **name** *(str)* – The name of the task to which to add the trigger.
- **location** *(str)* – A string value representing the location of the task. Default is \\ which is the root for the task scheduler (C:\Windows\System32\tasks).
- **trigger_type** *(str)* – The type of trigger to create. This is defined when the trigger is created and cannot be changed later. Options are as follows:
  - Event
  - Once
  - Daily
  - Weekly
  - Monthly
  - MonthlyDay
  - OnIdle
  - OnTaskCreation
  - OnBoot
  - OnLogon
  - OnSessionChange
- **trigger_enabled** *(bool)* – Boolean value that indicates whether the trigger is enabled.
- **start_date** *(str)* – The date when the trigger is activated. If no value is passed, the current date will be used. Can be one of the following formats:
  - %Y-%m-%d
  - %m-%d-%y
  - %m-%d-%Y
  - %m/%d/%y
  - %m/%d/%Y
  - %Y/%m/%d
- **start_time** *(str)* – The time when the trigger is activated. If no value is passed, midnight will be used. Can be one of the following formats:
  - %I:%M:%S %p
  - %I:%M %p
  - %H:%M:%S
  - %H:%M
- **end_date** *(str)* – The date when the trigger is deactivated. The trigger cannot start the task after it is deactivated. Can be one of the following formats:
  - %Y-%m-%d
  - %m-%d-%y
  - %m-%d-%Y
  - %m/%d/%y
  - %m/%d/%Y
  - %Y/%m/%d
- **end_time** *(str)* – The time when the trigger is deactivated. If this is not passed with end_date it will be set to midnight. Can be one of the following formats:
  - %I:%M:%S %p
  - %I:%M %p
  - %H:%M:%S
  - %H:%M
- **random_delay** *(str)* – The delay time that is randomly added to the start time of the trigger. Valid values are:
  - 30 seconds
- 1 minute
- 30 minutes
- 1 hour
- 8 hours
- 1 day

**Note:** This parameter applies to the following trigger types
- Once
- Daily
- Weekly
- Monthly
- MonthlyDay

- **repeat_interval** (*str*) – The amount of time between each restart of the task. Valid values are:
  - 5 minutes
  - 10 minutes
  - 15 minutes
  - 30 minutes
  - 1 hour

- **repeat_duration** (*str*) – How long the pattern is repeated. Valid values are:
  - Indefinitely
  - 15 minutes
  - 30 minutes
  - 1 hour
  - 12 hours
  - 1 day

- **repeat_stop_at_duration_end** (*bool*) – Boolean value that indicates if a running instance of the task is stopped at the end of the repetition pattern duration.

- **execution_time_limit** (*str*) – The maximum amount of time that the task launched by the trigger is allowed to run. Valid values are:
  - 30 minutes
  - 1 hour
  - 2 hours
  - 4 hours
  - 8 hours
  - 12 hours
  - 1 day
  - 3 days (default)

- **delay** (*str*) – The time the trigger waits after its activation to start the task. Valid values are:
  - 15 seconds
  - 30 seconds
  - 1 minute
  - 30 minutes
  - 1 hour
  - 8 hours
  - 1 day

**Note:** This parameter applies to the following trigger types:
- OnLogon
- OnBoot
- Event
- OnTaskCreation
kwarg

There are optional keyword arguments determined by the type of trigger being defined. They are as follows:

- **Event**
  The trigger will be fired by an event.
  
  **subscription (str):** An event definition in xml format that fires the trigger. The easiest way to get this would is to create an event in Windows Task Scheduler and then copy the xml text.

- **Once**
  No special parameters required.

- **Daily**
  The task will run daily.
  
  **days_interval (int):** The interval between days in the schedule. An interval of 1 produces a daily schedule. An interval of 2 produces an every-other day schedule. If no interval is specified, 1 is used. Valid entries are 1 - 999.

- **Weekly**
  The task will run weekly.
  
  **weeks_interval (int):** The interval between weeks in the schedule. An interval of 1 produces a weekly schedule. An interval of 2 produces an every-other week schedule. If no interval is specified, 1 is used. Valid entries are 1 - 52.
  
  **days_of_week (list):** Sets the days of the week on which the task runs. Should be a list. ie: ['Monday', 'Wednesday', 'Friday']. Valid entries are the names of the days of the week.

- **Monthly**
  The task will run monthly.
  
  **months_of_year (list):** Sets the months of the year during which the task runs. Should be a list. ie: ['January', 'July']. Valid entries are the full names of all the months.
  
  **days_of_month (list):** Sets the days of the month during which the task runs. Should be a list. ie: [1, 15, 'Last']. Options are all days of the month 1 - 31 and the word 'Last' to indicate the last day of the month.
  
  **last_day_of_month (bool):** Boolean value that indicates that the task runs on the last day of the month regardless of the actual date of that day.

  **Note:** You can set the task to run on the last day of the month by either including the word 'Last' in the list of days, or setting the parameter 'last_day_of_month' equal to True.

- **MonthlyDay**
  The task will run monthly an the specified day.
  
  **months_of_year (list):** Sets the months of the year during which the task runs. Should be a list. ie: ['January', 'July']. Valid entries are the full names of all the months.
  
  **weeks_of_month (list):** Sets the weeks of the month during which the task runs. Should be a list. ie: ['First', 'Third']. Valid options are:
  - First
  - Second
  - Third
  - Fourth
  
  **last_week_of_month (bool):** Boolean value that indicates that the task runs on the last week of the month.
days_of_week (list): Sets the days of the week during which the task runs. Should be a list. ie: ['Monday', 'Wednesday', 'Friday']. Valid entries are the names of the days of the week.

OnIdle
    No special parameters required.

OnTaskCreation
    No special parameters required.

OnBoot
    No special parameters required.

OnLogon
    No special parameters required.

OnSessionChange
    The task will be triggered by a session change.

    session_user_name (str): Sets the user for the Terminal Server session. When a session state change is detected for this user, a task is started. To detect session status change for any user, do not pass this parameter.

    state_change (str): Sets the kind of Terminal Server session change that would trigger a task launch. Valid options are:
        • ConsoleConnect: When you connect to a user session (switch users)
        • ConsoleDisconnect: When you disconnect a user session (switch users)
        • RemoteConnect: When a user connects via Remote Desktop
        • RemoteDisconnect: When a user disconnects via Remote Desktop
        • SessionLock: When the workstation is locked
        • SessionUnlock: When the workstation is unlocked

Returns True if successful, otherwise False

Return type bool

CLI Example:

```bash
salt 'minion-id' task.add_trigger <task_name> trigger_type=Once trigger_enabled=True start_date=2016/12/1 start_time='"12:01"
```

**Returns**

salt.modules.win_task.clear_triggers(name, location='\')

Remove all triggers from the task.

Parameters

- name (str) – The name of the task from which to clear all triggers.
- location (str) – A string value representing the location of the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

Returns True if successful, otherwise False

Return type bool

CLI Example:

```bash
salt 'minion-id' task.clear_trigger <task_name>
```

**Returns**

salt.modules.win_task.create_folder(name, location='\')

Create a folder in which to create tasks.

Parameters

- name (str) – The name of the folder. This will be displayed in the task scheduler.
- location (str) – A string value representing the location in which to create the folder. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

Returns True if successful, otherwise False

Return type bool

CLI Example:
Create a new task in the designated location. This function has many keyword arguments that are not listed here. For additional arguments see:

- edit_task()
- add_action()
- add_trigger()

Parameters

- **name** *(str)* - The name of the task. This will be displayed in the task scheduler.
- **location** *(str)* - A string value representing the location in which to create the task. Default is `\` which is the root for the task scheduler (C:\Windows\System32\tasks).
- **user_name** *(str)* - The user account under which to run the task. To specify the 'System' account, use 'System'. The password will be ignored.
- **password** *(str)* - The password to use for authentication. This should set the task to run whether the user is logged in or not, but is currently not working.
- **force** *(bool)* - If the task exists, overwrite the existing task.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```bash
salt 'minion-id' task.create_folder <folder_name>
```

Create a task based on XML. Source can be a file or a string of XML.

Parameters

- **name** *(str)* - The name of the task. This will be displayed in the task scheduler.
- **location** *(str)* - A string value representing the location in which to create the task. Default is `\` which is the root for the task scheduler (C:\Windows\System32\tasks).
- **xml_text** *(str)* - A string of xml representing the task to be created. This will be overridden by xml_path if passed.
- **xml_path** *(str)* - The path to an XML file on the local system containing the xml that defines the task. This will override xml_text.
- **user_name** *(str)* - The user account under which to run the task. To specify the 'System' account, use 'System'. The password will be ignored.
- **password** *(str)* - The password to use for authentication. This should set the task to run whether the user is logged in or not, but is currently not working.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```bash
salt 'minion-id' task.create_task <task_name> user_name=System force=True action_ type=Execute cmd='del /Q /S C:\\Temp' trigger_type=Once start_date=2016-12-10 start_time=01:00
```

Delete a folder from the task scheduler.

Parameters

- **name** *(str)* - The name of the folder to delete.
**location (str)** – A string value representing the location of the folder. Default is `\` which is the root for the task scheduler (`C:\Windows\System32\tasks`).

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt 'minion-id' task.delete_folder <folder_name>
```

salt.modules.win_task.delete_task(name, location='\')

Delete a task from the task scheduler.

Parameters

- **name (str)** – The name of the task to delete.
- **location (str)** – A string value representing the location of the task. Default is `\` which is the root for the task scheduler (`C:\Windows\System32\tasks`).

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt 'minion-id' task.delete_task <task_name>
```

salt.modules.win_task.edit_task(name=None, location='\', user_name=None, password=None, description=None, enabled=None, hidden=None, run_if_idle=None, idle_duration=None, idle_wait_timeout=None, idle_stop_on_end=None, idle_restart=None, ac_only=None, stop_if_on_batteries=None, wake_to_run=None, run_if_network=None, network_id=None, network_name=None, allow_demand_start=None, start_when_available=None, restart_every=None, restart_count=3, execution_time_limit=None, force_stop=None, delete_after=None, multiple_instances=None, **kwargs)

Edit the parameters of a task. Triggers and Actions cannot be edited yet.

Parameters

- **name (str)** – The name of the task. This will be displayed in the task scheduler.
- **location (str)** – A string value representing the location in which to create the task. Default is `\` which is the root for the task scheduler (`C:\Windows\System32\tasks`).
- **user_name (str)** – The user account under which to run the task. To specify the 'System' account, use 'System'. The password will be ignored.
- **password (str)** – The password to use for authentication. This should set the task to run whether the user is logged in or not, but is currently not working.
- **description (str)** – A string representing the text that will be displayed in the description field in the task scheduler.
- **enabled (bool)** – A boolean value representing whether or not the task is enabled.
- **hidden (bool)** – A boolean value representing whether or not the task is hidden.
- **run_if_idle (bool)** – Boolean value that indicates that the Task Scheduler will run the task only if the computer is in an idle state.
- **idle_duration (str)** – A value that indicates the amount of time that the com-

Note: The combination of user_name and password determine how the task runs. For example, if a username is passed without at password the task will only run when the user is logged in. If a password is passed as well the task will run whether the user is logged on or not. If you pass 'System' as the username the task will run as the system account (the password parameter is ignored).

- **description (str)** – A string representing the text that will be displayed in the description field in the task scheduler.
- **enabled (bool)** – A boolean value representing whether or not the task is enabled.
- **hidden (bool)** – A boolean value representing whether or not the task is hidden.
- **run_if_idle (bool)** – Boolean value that indicates that the Task Scheduler will run the task only if the computer is in an idle state.
- **idle_duration (str)** – A value that indicates the amount of time that the com-
puter must be in an idle state before the task is run. Valid values are:

- 1 minute
- 5 minutes
- 10 minutes
- 15 minutes
- 30 minutes
- 1 hour

- **idle_wait_timeout (str)** – A value that indicates the amount of time that the Task Scheduler will wait for an idle condition to occur. Valid values are:
  - Do not wait
  - 1 minute
  - 5 minutes
  - 10 minutes
  - 15 minutes
  - 30 minutes
  - 1 hour
  - 2 hours

- **idle_stop_on_end (bool)** – Boolean value that indicates that the Task Scheduler will terminate the task if the idle condition ends before the task is completed.

- **idle_restart (bool)** – Boolean value that indicates whether the task is restarted when the computer cycles into an idle condition more than once.

- **ac_only (bool)** – Boolean value that indicates that the Task Scheduler will launch the task only while on AC power.

- **stop_if_on_batteries (bool)** – Boolean value that indicates that the task will be stopped if the computer begins to run on battery power.

- **wake_to_run (bool)** – Boolean value that indicates that the Task Scheduler will wake the computer when it is time to run the task.

- **run_if_network (bool)** – Boolean value that indicates that the Task Scheduler will run the task only when a network is available.

- **network_id (guid)** – GUID value that identifies a network profile.

- **network_name (str)** – Sets the name of a network profile. The name is used for display purposes.

- **allow_demand_start (bool)** – Boolean value that indicates that the task can be started by using either the Run command or the Context menu.

- **start_when_available (bool)** – Boolean value that indicates that the Task Scheduler can start the task at any time after its scheduled time has passed.

- **restart_every (str)** – A value that specifies the interval between task restart attempts. Valid values are:
  - False (to disable)
  - 1 minute
  - 5 minutes
  - 10 minutes
  - 15 minutes
  - 30 minutes
  - 1 hour
  - 2 hours

- **restart_count (int)** – The number of times the Task Scheduler will attempt to restart the task. Valid values are integers 1 - 999.

- **execution_time_limit (bool, str)** – The amount of time allowed to complete the task. Valid values are:
  - False (to disable)
  - 1 hour
  - 2 hours
  - 4 hours
- 8 hours
- 12 hours
- 1 day
- 3 days

- **force_stop**(bool) – Boolean value that indicates that the task may be terminated by using TerminateProcess.

- **delete_after**(bool, str) – The amount of time that the Task Scheduler will wait before deleting the task after it expires. Requires a trigger with an expiration date. Valid values are:
  - False (to disable)
  - Immediately
  - 30 days
  - 90 days
  - 180 days
  - 365 days

- **multiple_instances**(str) – Sets the policy that defines how the Task Scheduler deals with multiple instances of the task. Valid values are:
  - Parallel
  - Queue
  - No New Instance
  - Stop Existing

Returns True if successful, otherwise False

Return type bool

CLI Example:

```bash
salt '*' task.edit_task <task_name> description='This task is awesome'
```

salt.modules.win_task.info(name, location='\')

Get the details about a task in the task scheduler.

Parameters

- **name**(str) – The name of the task for which to return the status
- **location**(str) – A string value representing the location of the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

Returns A dictionary containing the task configuration

Return type dict

CLI Example:

```bash
salt 'minion-id' task.info <task_name>
```

salt.modules.win_task.list_actions(name, location='\')

List all actions that pertain to a task in the specified location.

Parameters

- **name**(str) – The name of the task for which list actions.
- **location**(str) – A string value representing the location of the task from which to list actions. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

Returns Returns a list of actions.

Return type list

CLI Example:

```bash
# List all actions for a task in the default location
salt 'minion-id' task.list_actions <task_name>

# List all actions for the XblGameSaveTask in the Microsoft\XblGameSave
```
# location
salt 'minion-id' task.list_actions XblGameSaveTask Microsoft\XblGameSave

salt.modules.win_task.list_folders(location='\')
List all folders located in a specific location in the task scheduler.

Parameters
- **location** (str) – A string value representing the folder from which you want to list tasks. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

Returns
Returns a list of folders.

Return type list

CLI Example:

```
# List all folders in the default location
salt 'minion-id' task.list_folders

# List all folders in the Microsoft directory
salt 'minion-id' task.list_folders Microsoft
```

salt.modules.win_task.list_tasks(location='\')
List all tasks located in a specific location in the task scheduler.

Parameters
- **location** (str) – A string value representing the folder from which you want to list tasks. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

Returns
Returns a list of tasks.

Return type list

CLI Example:

```
# List all tasks in the default location
salt 'minion-id' task.list_tasks

# List all tasks in the Microsoft\XblGameSave Directory
salt 'minion-id' task.list_tasks Microsoft\XblGameSave
```

salt.modules.win_task.list_triggers(name, location='\')
List all triggers that pertain to a task in the specified location.

Parameters
- **name** (str) – The name of the task for which list triggers.
- **location** (str) – A string value representing the location of the task from which to list triggers. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

Returns
Returns a list of triggers.

Return type list

CLI Example:

```
# List all triggers for a task in the default location
salt 'minion-id' task.list_triggers <task_name>

# List all triggers for the XblGameSaveTask in the Microsoft\XblGameSave
# location
salt '*' task.list_triggers XblGameSaveTask Microsoft\XblGameSave
```

salt.modules.win_task.run(name, location='\')
Run a scheduled task manually.

Parameters
- **name** (str) – The name of the task to run.
- **location** *(str)* – A string value representing the location of the task. Default is `\` which is the root for the task scheduler (C:\Windows\System32\tasks).

  Returns True if successful, otherwise False

  Return type **bool**

  CLI Example:

  ```
  salt 'minion-id' task.list_run <task_name>
  ```

`salt.modules.win_task.run_wait(name, location='\')`

  Run a scheduled task and return when the task finishes

  Parameters

  - **name** *(str)* – The name of the task to run.
  - **location** *(str)* – A string value representing the location of the task. Default is `\` which is the root for the task scheduler (C:\Windows\System32\tasks).

  Returns True if successful, otherwise False

  Return type **bool**

  CLI Example:

  ```
  salt 'minion-id' task.list_run_wait <task_name>
  ```

`salt.modules.win_task.status(name, location='\')`

  Determine the status of a task. Is it Running, Queued, Ready, etc.

  Parameters

  - **name** *(str)* – The name of the task for which to return the status
  - **location** *(str)* – A string value representing the location of the task. Default is `\` which is the root for the task scheduler (C:\Windows\System32\tasks).

  Returns

  The current status of the task. Will be one of the following:

  - Unknown
  - Disabled
  - Queued
  - Ready
  - Running

  Return type **str**

  CLI Example:

  ```
  salt 'minion-id' task.list_status <task_name>
  ```

`salt.modules.win_task.stop(name, location='\')`

  Stop a scheduled task.

  Parameters

  - **name** *(str)* – The name of the task to stop.
  - **location** *(str)* – A string value representing the location of the task. Default is `\` which is the root for the task scheduler (C:\Windows\System32\tasks).

  Returns True if successful, otherwise False

  Return type **bool**

  CLI Example:

  ```
  salt 'minion-id' task.list_stop <task_name>
  ```

### 21.9.481 **salt.modules.win_timezone**

Module for managing timezone on Windows systems.
class salt.modules.win_timezone.TzMapper(unix_to_win)

    add(k, v)
    get_unix(key, default=None)
    get_win(key, default=None)
    list_unix()
    list_win()
    remove(k)

salt.modules.win_timezone.get_hwclock()
    Get current hardware clock setting (UTC or localtime)

    Note: The hardware clock is always local time on Windows so this will always return "localtime"

    CLI Example:
    salt '*' timezone.get_hwclock

salt.modules.win_timezone.get_offset()
    Get current numeric timezone offset from UTC (i.e. -0700)

    Returns Offset from UTC
    Return type str

    CLI Example:
    salt '*' timezone.get_offset

salt.modules.win_timezone.get_zone()
    Get current timezone (i.e. America/Denver)

    Returns Timezone in unix format
    Return type str

    CLI Example:
    salt '*' timezone.get_zone

salt.modules.win_timezone.get_zonecode()
    Get current timezone (i.e. PST, MDT, etc)

    Returns An abbreviated timezone code
    Return type str

    CLI Example:
    salt '*' timezone.get_zonecode

salt.modules.win_timezone.list(unix_style=True)
    Return a list of Timezones that this module supports. These can be in either Unix or Windows format.

    New in version 2018.3.3.

    Parameters unix_style (bool) – True returns Unix-style timezones. False returns Windows-style timezones. Default is True

    Returns A list of supported timezones
    Return type list

    CLI Example:
# Unix-style timezones

```
salt '*' timezone.list
```

# Windows-style timezones

```
salt '*' timezone.list unix_style=False
```

salt.modules.win_timezone.set_hwclock(clock)

Sets the hardware clock to be either UTC or localtime

**Note:** The hardware clock is always local time on Windows so this will always return False

CLI Example:

```
salt '*' timezone.set_hwclock UTC
```

salt.modules.win_timezone.set_zone(timezone)

Sets the timezone using the tzutil.

- **Parameters**
  - `timezone` *(str)* – A valid timezone
  - **Returns**
    - `True` if successful, otherwise `False`
  - **Return type**
    - `bool`
  - **Raises** `CommandExecutionError` – If invalid timezone is passed

CLI Example:

```
salt '*' timezone.set_zone 'America/Denver'
```

salt.modules.win_timezone.zone_compare(timezone)

Compares the given timezone with the machine timezone. Mostly useful for running state checks.

- **Parameters**
  - `timezone` *(str)* – The timezone to compare. This can be in Windows or Unix format. Can be any of the values returned by the `timezone.list` function
  - **Returns**
    - `True` if they match, otherwise `False`
  - **Return type**
    - `bool`

Example:

```
salt '*' timezone.zone_compare 'America/Denver'
```

### 21.9.482 salt.modules.win_useradd

Module for managing Windows Users

**Important:** If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to *'user.info’ is not available*), see [here](#).

**depends**

- pywintypes
- win32api
- win32con
- win32net
- win32netcon
• win32profile
• win32security
• win32ts
• wmi

Note: This currently only works with local user accounts, not domain accounts

salt.modules.win_useradd.add(name, password=None, fullname=None, description=None, groups=None, home=None, homedrive=None, profile=None, logonscript=None)

Add a user to the minion.
Parameters
• name (str) – User name
• password (str, optional) – User’s password in plain text.
• fullname (str, optional) – The user’s full name.
• description (str, optional) – A brief description of the user account.
• groups (str, optional) – A list of groups to add the user to. (see chgroups)
• home (str, optional) – The path to the user’s home directory.
• homedrive (str, optional) – The drive letter to assign to the home directory. Must be the Drive Letter followed by a colon. ie: U:
• profile (str, optional) – An explicit path to a profile. Can be a UNC or a folder on the system. If left blank, windows uses it’s default profile directory.
• logonscript (str, optional) – Path to a login script to run when the user logs on.
Returns True if successful. False is unsuccessful.
Return type bool

CLI Example:
```
salt '*' user.add name password
```

salt.modules.win_useradd.addgroup(name, group)

Add user to a group
Parameters
• name (str) – The user name to add to the group
• group (str) – The name of the group to which to add the user
Returns True if successful, otherwise False
Return type bool

CLI Example:
```
salt '*' user.addgroup jsnuffy 'Power Users'
```

salt.modules.win_useradd.chfullname(name, fullname)

Change the full name of the user
Parameters
• name (str) – The user name for which to change the full name
• fullname (str) – The new value for the full name
Returns True if successful, otherwise False
Return type bool

CLI Example:
```
salt '*' user.chfullname user 'First Last'
```
salt.modules.win_useradd.chgroups(name, groups, append=True)

Change the groups this user belongs to, add append=False to make the user a member of only the specified groups

Parameters
- **name (str)** – The user name for which to change groups
- **groups (str, list)** – A single group or a list of groups to assign to the user. For multiple groups this can be a comma delimited string or a list.
- **append (bool, optional)** – True adds the passed groups to the user's current groups. False sets the user's groups to the passed groups only. Default is True.

Returns True if successful, otherwise False

Return type bool

CLI Example:
```
salt '*' user.chgroups jsnuffy Administrators,Users True
```

salt.modules.win_useradd.chhome(name, home, **kwargs)

Change the home directory of the user, pass True for persist to move files to the new home directory if the old home directory exist.

Parameters
- **name (str)** – The name of the user whose home directory you wish to change
- **home (str)** – The new location of the home directory

Returns True if successful, otherwise False

Return type bool

CLI Example:
```
salt '*' user.chhome foo \fileserv\home\foo True
```

salt.modules.win_useradd.chprofile(name, profile)

Change the profile directory of the user

Parameters
- **name (str)** – The name of the user whose profile you wish to change
- **profile (str)** – The new location of the profile

Returns True if successful, otherwise False

Return type bool

CLI Example:
```
salt '*' user.chprofile foo \fileserv\profiles\foo
```

salt.modules.win_useradd.current(sam=False)

Get the username that salt-minion is running under. If salt-minion is running as a service it should return the Local System account. If salt is running from a command prompt it should return the username that started the command prompt.

New in version 2015.5.6.

Parameters
- **sam (bool, optional)** – False returns just the username without any domain notation. True returns the domain with the username in the SAM format. Ie: domain\username

Returns Returns username

Return type str

CLI Example:
```
salt '*' user.current
```

salt.modules.win_useradd.delete(name, purge=False, force=False)

Remove a user from the minion

Parameters
- **name (str)** – The name of the user to delete
- **purge (bool, optional)** – Boolean value indicating that the user profile should also be removed when the user account is deleted. If set to True the profile will be removed. Default is False.
- **force (bool, optional)** – Boolean value indicating that the user account should be deleted even if the user is logged in. True will log the user out and delete user.

Returns  True if successful, otherwise False
Return type  bool

CLI Example:
```python
class user.delete name
```

salt.modules.win_useradd.getUserSid (username)
Get the Security ID for the user

Parameters  username (str) – The user name for which to look up the SID

Returns  The user SID
Return type  str

CLI Example:
```python
class user.getUserSid jsnuffy
```

salt.modules.win_useradd.getent (refresh=False)
Return the list of all info for all users

Parameters  refresh (bool, optional) – Refresh the cached user information. Useful when used from within a state function. Default is False.

Returns  A dictionary containing information about all users on the system
Return type  dict

CLI Example:
```python
class user.getent
```

salt.modules.win_useradd.info (name)
Return user information

Parameters  name (str) – Username for which to display information

Returns  A dictionary containing user information

- fullname
- username
- SID
- passwd (will always return None)
- comment (same as description, left here for backwards compatibility)
- description
- active
- logonscript
- profile
- home
- homedrive
- groups
- password_changed
- successful_logon_attempts
- failed_logon_attempts
- last_logon
- account_disabled
- account_locked
- password_never_expires
Salt Documentation, Release 2019.2.0

- disallow_change_password
- gid

Return type: dict

CLI Example:

```sh
salt '*' user.info jsnuffy
```

```
salt.modules.win_useradd.list_groups(name)
```

- Return a list of groups the named user belongs to
- Parameters: name (str) - The user name for which to list groups
- Returns: A list of groups to which the user belongs
- Return type: list

CLI Example:

```sh
salt '*' user.list_groups foo
```

```
salt.modules.win_useradd.list_users()
```

- Return a list of all users on Windows
- Returns: A list of all users on the system
- Return type: list

CLI Example:

```sh
salt '*' user.list_users
```

```
salt.modules.win_useradd.removegroup(name, group)
```

- Remove user from a group
- Parameters:
  - name (str) - The user name to remove from the group
  - group (str) - The name of the group from which to remove the user
- Returns: True if successful, otherwise False
- Return type: bool

CLI Example:

```sh
salt '*' user.removegroup jsnuffy 'Power Users'
```

```
salt.modules.win_useradd.rename(name, new_name)
```

- Change the username for a named user
- Parameters:
  - name (str) - The user name to change
  - new_name (str) - The new name for the current user
- Returns: True if successful, otherwise False
- Return type: bool

CLI Example:

```sh
salt '*' user.rename jsnuffy jshmoe
```

```
salt.modules.win_useradd.setpassword(name, password)
```

- Set the user’s password
- Parameters:
  - name (str) - The user name for which to set the password
  - password (str) - The new password
- Returns: True if successful, otherwise False
- Return type: bool

CLI Example:
salt modules.win_useradd.update

Updates settings for the windows user. Name is the only required parameter. Settings will only be changed if the parameter is passed a value.

New in version 2015.8.0.

Parameters
- **name** *(str)* – The user name to update.
- **password** *(str, optional)* – New user password in plain text.
- **fullname** *(str, optional)* – The user's full name.
- **description** *(str, optional)* – A brief description of the user account.
- **home** *(str, optional)* – The path to the user’s home directory.
- **homedrive** *(str, optional)* – The drive letter to assign to the home directory. Must be the Drive Letter followed by a colon. ie: U:
- **logonscript** *(str, optional)* – The path to the logon script.
- **profile** *(str, optional)* – The path to the user's profile directory.
- **expiration_date** *(date, optional)* – The date and time when the account expires. Can be a valid date/time string. To set to never expire pass the string 'Never'.
- **expired** *(bool, optional)* – Pass True to expire the account. The user will be prompted to change their password at the next logon. Pass False to mark the account as 'not expired'. You can't use this to negate the expiration if the expiration was caused by the account expiring. You’ll have to change the expiration_date as well.
- **account_disabled** *(bool, optional)* – True disables the account. False enables the account.
- **unlock_account** *(bool, optional)* – True unlocks a locked user account. False is ignored.
- **password_never_expires** *(bool, optional)* – True sets the password to never expire. False allows the password to expire.
- **disallow_change_password** *(bool, optional)* – True blocks the user from changing the password. False allows the user to change the password.

Returns
- True if successful. False is unsuccessful.

Return type
- bool

CLI Example:
salt '*' user.update bob password=secret profile=C:\Users\Bob
home=\server\homesharebob homedrive=U:

21.9.483 salt.modules.win_wua

Module for managing Windows Updates using the Windows Update Agent.

List updates on the system using the following functions:
- **win_wua.available**
- **win_wua.list**

This is an easy way to find additional information about updates available to to the system, such as the GUID, KB number, or description.
Once you have the GUID or a KB number for the update you can get information about the update, download, install, or uninstall it using these functions:

- `win_wua.get`
- `win_wua.download`
- `win_wua.install`
- `win_wua.uninstall`

The get function expects a name in the form of a GUID, KB, or Title and should return information about a single update. The other functions accept either a single item or a list of items for downloading/installing/uninstalling a specific list of items.

The `win_wua.list` and `win_wua.get` functions are utility functions. In addition to returning information about updates they can also download and install updates by setting `download=True` or `install=True`. So, with `py:func:win_wua.list <salt.modules.win_wua.list_>` for example, you could run the function with the filters you want to see what is available. Then just add `install=True` to install everything on that list.

If you want to download, install, or uninstall specific updates, use `win_wua.download`, `win_wua.install`, or `win_wua.uninstall`. To update your system with the latest updates use `win_wua.list` and set `install=True`.

You can also adjust the Windows Update settings using the `win_wua.set_wu_settings` function. This function is only supported on the following operating systems:

- Windows Vista / Server 2008
- Windows 7 / Server 2008R2
- Windows 8 / Server 2012
- Windows 8.1 / Server 2012R2

As of Windows 10 and Windows Server 2016, the ability to modify the Windows Update settings has been restricted. The settings can be modified in the Local Group Policy using the `lgpo` module.

New in version 2015.8.0.

```
depends salt.utils.win_update
```

```
salt.modules.win_wua.available(software=True, drivers=True, summary=False, skip_installed=True, skip_hidden=True, skip_mandatory=False, skip_reboot=False, categories=None, severities=None)
```

New in version 2017.7.0.

List updates that match the passed criteria. This allows for more filter options than `list()`. Good for finding a specific GUID or KB.

**Parameters**

- `software (bool)` – Include software updates in the results (default is True)
- `drivers (bool)` – Include driver updates in the results (default is True)
- `summary (bool)` –
  - True: Return a summary of updates available for each category.
  - False (default): Return a detailed list of available updates.
- `skip_installed (bool)` – Skip updates that are already installed. Default is False.
- `skip_hidden (bool)` – Skip updates that have been hidden. Default is True.
- `skip_mandatory (bool)` – Skip mandatory updates. Default is False.
- `skip_reboot (bool)` – Skip updates that require a reboot. Default is False.
- `categories (list)` – Specify the categories to list. Must be passed as a list. All categories returned by default.

Categories include the following:
- Critical Updates
- Definition Updates
- Drivers (make sure you set drivers=True)
- Feature Packs
- Security Updates
- Update Rollups
- Updates
- Update Rollups
- Windows 7
- Windows 8.1
- Windows 8.1 drivers
- Windows 8.1 and later drivers
- Windows Defender

- **severities** ([list]) – Specify the severities to include. Must be passed as a list. All severities returned by default.

  Seversities include the following:
  - Critical
  - Important

Returns

Returns a dict containing either a summary or a list of updates:

```
List of Updates:
{<GUID>: {'Title': <title>,
  'KB': <KB>,
  'GUID': <the globally unique identifier for the update>
  'Description': <description>,
  'Downloaded': <has the update been downloaded>,
  'Installed': <has the update been installed>,
  'Mandatory': <is the update mandatory>,
  'UserInput': <input required>,
  'EULAAccepted': <has the EULA been accepted>,
  'Severity': <update severity>,
  'NeedsReboot': <is the update installed and awaiting reboot>,
  'RebootBehavior': <will the update require a reboot>,
  'Categories': [ '<category 1>',
    '<category 2>',
    ...
  ]
}
```

Summary of Updates:
```
{'Total': <total number of updates returned>,
 'Available': <updates that are not downloaded or installed>,
 'Downloaded': <updates that are downloaded but not installed>,
 'Installed': <updates installed (usually 0 unless installed=True)>,
 'Categories': { '<category 1>: <total for that category>',
    '<category 2>: <total for category 2>',
    ...
  }
}
```

Return type  dict

CLI Examples:
```
# Normal Usage (list all software updates)
salt '*' win_wua.available
```
# List all updates with categories of Critical Updates and Drivers
salt '*' win_wua.available categories=['Critical Updates','Drivers']

# List all Critical Security Updates
salt '*' win_wua.available categories=['Security Updates'] severities=['Critical']

# List all updates with a severity of Critical
salt '*' win_wua.available severities=['Critical']

# A summary of all available updates
salt '*' win_wua.available summary=True

# A summary of all Feature Packs and Windows 8.1 Updates
salt '*' win_wua.available categories=['Feature Packs','Windows 8.1'] summary=True

salt.modules.win_wua.download(names)
New in version 2017.7.0.
Downloads updates that match the list of passed identifiers. It’s easier to use this function by using list_updates and setting install=True.

Parameters names (str, list) – A single update or a list of updates to download. This can be any combination of GUIDs, KB numbers, or names. GUIDs or KBs are preferred.

Note: An error will be raised if there are more results than there are items in the names parameter

Returns A dictionary containing the details about the downloaded updates
Return type dict

CLI Examples:

```
# Normal Usage
salt '*' win_wua.download names=['12345678-abcd-1234-abcd-1234567890ab',
  'KB2131233']
```

salt.modules.win_wua.get(name, download=False, install=False)
New in version 2017.7.0.
Returns details for the named update

Parameters
- **name** (str) – The name of the update you’re searching for. This can be the GUID, a KB number, or any part of the name of the update. GUIDs and KBs are preferred. Run list to get the GUID for the update you’re looking for.
- **download** (bool) – Download the update returned by this function. Run this function first to see if the update exists, then set download=True to download the update.
- **install** (bool) – Install the update returned by this function. Run this function first to see if the update exists, then set install=True to install the update.

Returns
Returns a dict containing a list of updates that match the name if download and install are both set to False. Should usually be a single update, but can return multiple if a partial name is given.

If download or install is set to true it will return the results of the operation.
List of Updates:
{
'GUID': {'Title': <title>,
  'KB': <KB>,
  'GUID': <the globally unique identifier for the update>
  'Description': <description>,
  'Downloaded': <has the update been downloaded>,
  'Installed': <has the update been installed>,
  'Mandatory': <is the update mandatory>,
  'UserInput': <is user input required>,
  'EULAAccepted': <has the EULA been accepted>,
  'Severity': <update severity>,
  'NeedsReboot': <is the update installed and awaiting a reboot>,
  'RebootBehavior': <will the update require a reboot>,
  'Categories': [ '<category 1>',
                'category 2>',
                ...
  ]
}
}

Return type: dict

CLI Examples:

```
# Recommended Usage using GUID without braces
# Use this to find the status of a specific update
salt '*' win_wua.get 12345678-abcd-1234-abcd-1234567890ab

# Use the following if you don't know the GUID:

# Using a KB number
# Not all updates have an associated KB
salt '*' win_wua.get KB3030298

# Using part or all of the name of the update
# Could possibly return multiple results
# Not all updates have an associated KB
salt '*' win_wua.get 'Microsoft Camera Codec Pack'
```

salt.modules.win_wua.get_needs_reboot()
Determines if the system needs to be rebooted.

Returns: True if the system requires a reboot, otherwise False

Return type: bool

CLI Examples:

```
salt '*' win_wua.get_needs_reboot
```

salt.modules.win_wua.get_wu_settings()
Get current Windows Update settings.

Returns:
A dictionary of Windows Update settings:

- **Featured Updates**: Boolean value that indicates whether to display notifications for featured updates.
- **Group Policy Required (Read-only)**: Boolean value that indicates whether Group Policy requires the Automatic Updates service.
- **Microsoft Update**: Boolean value that indicates whether to turn on Microsoft Update for other Microsoft Products

21.9. execution modules 2777
**Needs Reboot:** Boolean value that indicates whether the machine is in a reboot pending state.

**Non Admins Elevated:** Boolean value that indicates whether non-administrators can perform some update-related actions without administrator approval.

**Notification Level:**
- Number 1 to 4 indicating the update level:
  1. Never check for updates
  2. Check for updates but let me choose whether to download and install them
  3. Download updates but let me choose whether to install them
  4. Install updates automatically

**Read Only (Read-only):** Boolean value that indicates whether the Automatic Update settings are read-only.

**Recommended Updates:** Boolean value that indicates whether to include optional or recommended updates when a search for updates and installation of updates is performed.

**Scheduled Day:** Days of the week on which Automatic Updates installs or uninstalls updates.

**Scheduled Time:** Time at which Automatic Updates installs or uninstalls updates.

**Return type** `dict`

**CLI Examples:**
```
salt '*' win_wua.get_wu_settings
```

**salt.modules.win_wua.install(names)**
New in version 2017.7.0.

Installs updates that match the list of identifiers. It may be easier to use the list_updates function and set install=True.

**Parameters**`names (str, list)` – A single update or a list of updates to install. This can be any combination of GUIDs, KB numbers, or names. GUIDs or KBs are preferred.

**Note:** An error will be raised if there are more results than there are items in the names parameter

**Returns** A dictionary containing the details about the installed updates

**Return type** `dict`

**CLI Examples:**
```
# Normal Usage
salt '*' win_wua.install KB12323211
```

**salt.modules.win_wua.list**( `software=True, drivers=False, summary=False, skip_installed=True, categories=None, severities=None, download=False, install=False` )
New in version 2017.7.0.

Returns a detailed list of available updates or a summary. If download or install is True the same list will be downloaded and/or installed.

**Parameters**
- **software (bool)** – Include software updates in the results (default is True)
- **drivers (bool)** – Include driver updates in the results (default is False)
- **summary (bool)** –
  - True: Return a summary of updates available for each category.
  - False (default): Return a detailed list of available updates.
- **skip_installed (bool)** – Skip installed updates in the results (default is False)
• **download**(bool) – (Overrides reporting functionality) Download the list of updates returned by this function. Run this function first with `download=False` to see what will be downloaded, then set `download=True` to download the updates.

• **install**(bool) – (Overrides reporting functionality) Install the list of updates returned by this function. Run this function first with `install=False` to see what will be installed, then set `install=True` to install the updates.

• **categories**(list) – Specify the categories to list. Must be passed as a list. All categories returned by default.

Categories include the following:
- Critical Updates
- Definition Updates
- Drivers (make sure you set `drivers=True`)  
- Feature Packs
- Security Updates
- Update Rollups
- Updates
- Update Rollups
- Windows 7
- Windows 8.1
- Windows 8.1 drivers
- Windows 8.1 and later drivers
- Windows Defender

• **severities**(list) – Specify the severities to include. Must be passed as a list. All severities returned by default.

Severities include the following:
- Critical
- Important

**Returns**

Returns a dict containing either a summary or a list of updates:

```python
List of Updates:
{'<GUID>': {'Title': '<title>',
            'KB': '<KB>',
            'GUID': '<the globally unique identifier for the update'>
            'Description': '<description>',
            'Downloaded': '<has the update been downloaded>',
            'Installed': '<has the update been installed>',
            'Mandatory': '<is the update mandatory>',
            'UserInput': '<is user input required>',
            'EULAAccepted': '<has the EULA been accepted>',
            'Severity': '<update severity>',
            'NeedsReboot': '<is the update installed and awaiting reboot>',
            'RebootBehavior': '<will the update require a reboot>',
            'Categories': ['<category 1>',
                           '<category 2>',
                           ...]
            }
}

Summary of Updates:
{'Total': '<total number of updates returned>',
 'Available': '<updates that are not downloaded or installed>',
 'Downloaded': '<updates that are downloaded but not installed>',
}
```

(continues on next page)
'Installed': <updates installed (usually 0 unless installed=True)>,
'Categories': { <category 1>: <total for that category>,
               <category 2>: <total for category 2>,
               ... }

Return type  dict

CLI Examples:

```python
# Normal Usage (list all software updates)
salt '*' win_wua.list

# List all updates with categories of Critical Updates and Drivers
salt '*' win_wua.list categories=['Critical Updates','Drivers']

# List all Critical Security Updates
salt '*' win_wua.list categories=['Security Updates'] severities=['Critical']

# List all updates with a severity of Critical
salt '*' win_wua.list severities=['Critical']

# A summary of all available updates
salt '*' win_wua.list summary=True

# A summary of all Feature Packs and Windows 8.1 Updates
salt '*' win_wua.list categories=['Feature Packs','Windows 8.1'] summary=True
```

**salt.modules.win_wua.set_wu_settings**(*level=None, recommended=None, featured=None, elevated=None, msupdate=None, day=None, time=None*)

Change Windows Update settings. If no parameters are passed, the current value will be returned.

Supported:
- Windows Vista / Server 2008
- Windows 7 / Server 2008R2
- Windows 8 / Server 2012
- Windows 8.1 / Server 2012R2

**Parameters**
- **level** (*int*) – Number from 1 to 4 indicating the update level:
  1. Never check for updates
  2. Check for updates but let me choose whether to download and install them
  3. Download updates but let me choose whether to install them
  4. Install updates automatically
- **recommended** (*bool*) – Boolean value that indicates whether to include optional or recommended updates when a search for updates and installation of updates is performed.
- **featured** (*bool*) – Boolean value that indicates whether to display notifications for featured updates.
- **elevated** (*bool*) – Boolean value that indicates whether non-administrators can perform some update-related actions without administrator approval.
- **msupdate** (*bool*) – Boolean value that indicates whether to turn on Microsoft Update for other Microsoft products
- **day** (*str*) – Days of the week on which Automatic Updates installs or uninstalls updates. Accepted values:
  - Everyday
  - Monday
  - Tuesday
- Wednesday
- Thursday
- Friday
- Saturday

**time (str)** – Time at which Automatic Updates installs or uninstalls updates. Must be in the `##:##` 24hr format, eg. 3:00 PM would be 15:00. Must be in 1 hour increments.

**Returns** Returns a dictionary containing the results.

**Return type** dict

**CLI Examples:**

```
salt '*' win_wua.set_wu_settings level=4 recommended=True featured=False
```

```python
salt.modules.win_wua.uninstall(names)
```

New in version 2017.7.0.

Uninstall updates.

**Parameters**

**names** *(str, list)* – A single update or a list of updates to uninstall. This can be any combination of GUIDs, KB numbers, or names. GUIDs or KBs are preferred.

**Returns** A dictionary containing the details about the uninstalled updates

**Return type** dict

**CLI Examples:**

```bash
# Normal Usage
salt '*' win_wua.uninstall KB3121212

# As a list
salt '*' win_wua.uninstall guid=['12345678-abcd-1234-abcd-1234567890ab', 'KB1231231']
```

### 21.9.484 salt.modules.x509

Manage X509 certificates

New in version 2015.8.0.

**depends** M2Crypto

```python
salt.modules.x509.create_certificate(path=None, text=False, overwrite=True, ca_server=None, **kwargs)
```

Create an X509 certificate.

**path:** Path to write the certificate to.

**text:** If True, return the PEM text without writing to a file. Default False.

**overwrite:** If True(default), create_certificate will overwrite the entire pem file. Set False to preserve existing private keys and dh params that may exist in the pem file.

**kwargs:** Any of the properties below can be included as additional keyword arguments.

**ca_server:** Request a remotely signed certificate from ca_server. For this to work, a signing_policy must be specified, and that same policy must be configured on the ca_server. See signing_policy for details. Also the salt master must permit peers to call the sign_remote_certificate function.

Example:

```
/etc/salt/master.d/peer.conf
```

```java
peer:
  .*
    - x509.sign_remote_certificate
```
subject properties: Any of the values below can be included to set subject properties. Any other subject properties supported by OpenSSL should also work.

C: 2 letter Country code
CN: Certificate common name, typically the FQDN.
Email: Email address
GN: Given Name
L: Locality
O: Organization
OU: Organization Unit
SN: Surname
ST: State or Province

signing_private_key: A path or string of the private key in PEM format that will be used to sign this certificate. If neither signing_cert, public_key, or csr are included, it will be assumed that this is a self-signed certificate, and the public key matching signing_private_key will be used to create the certificate.

signing_private_key_passphrase: Passphrase used to decrypt the signing_private_key.

signing_cert: A certificate matching the private key that will be used to sign this certificate. This is used to populate the issuer values in the resulting certificate. Do not include this value for self-signed certificates.

public_key: The public key to be included in this certificate. This can be sourced from a public key, certificate, csr, or private key. If a private key is used, the matching public key from the private key will be generated before any processing is done. This means you can request a certificate from a remote CA using a private key file as your public_key and only the public key will be sent across the network to the CA. If neither public_key or csr are specified, it will be assumed that this is a self-signed certificate, and the public key derived from signing_private_key will be used. Specify either public_key or csr, not both. Because you can input a CSR as a public key or as a CSR, it is important to understand the difference. If you import a CSR as a public key, only the public key will be added to the certificate, subject or extension information in the CSR will be lost.

public_key_passphrase: If the public key is supplied as a private key, this is the passphrase used to decrypt it.

csr: A file or PEM string containing a certificate signing request. This will be used to supply the subject, extensions and public key of a certificate. Any subject or extensions specified explicitly will overwrite any in the CSR.

basicConstraints: X509v3 Basic Constraints extension.

extensions: The following arguments set X509v3 Extension values. If the value starts with critical, the extension will be marked as critical.

Some special extensions are subjectKeyIdentifier and authorityKeyIdentifier.

subjectKeyIdentifier can be an explicit value or it can be the special string hash. hash will set the subjectKeyIdentifier equal to the SHA1 hash of the modulus of the public key in this certificate. Note that this is not the exact same hashing method used by OpenSSL when using the hash value.

authorityKeyIdentifier Use values acceptable to the openssl CLI tools. This will automatically populate authorityKeyIdentifier with the subjectKeyIdentifier of signing_cert. If this is a self-signed cert these values will be the same.

basicConstraints: X509v3 Basic Constraints
keyUsage: X509v3 Key Usage
extendedKeyUsage: X509v3 Extended Key Usage
subjectKeyIdentifier: X509v3 Subject Key Identifier
issuerAltName: X509v3 Issuer Alternative Name
subjectAltName: X509v3 Subject Alternative Name
crlDistributionPoints: X509v3 CRL distribution points
issuingDistributionPoint: X509v3 Issuing Distribution Point
certificatePolicies: X509v3 Certificate Policies
Policy Constraints: X509v3 Policy Constraints
inhibitAnyPolicy: X509v3 Inhibit Any Policy
nameConstraints: X509v3 Name Constraints
noCheck: X509v3 OCSP No Check
nsComment: Netscape Comment
nsCertType: Netscape Certificate Type
days_valid: The number of days this certificate should be valid. This sets the notAfter property of the certificate. Defaults to 365.
version: The version of the X509 certificate. Defaults to 3. This is automatically converted to the version value, so version=3 sets the certificate version field to 0x2.
serial_number: The serial number to assign to this certificate. If omitted a random serial number of size serial_bits is generated.
serial_bits: The number of bits to use when randomly generating a serial number. Defaults to 64.
algorithm: The hashing algorithm to be used for signing this certificate. Defaults to sha256.
copypath: An additional path to copy the resulting certificate to. Can be used to maintain a copy of all certificates issued for revocation purposes.
prepend_cn: If set to True, the CN and a dash will be prepended to the copypath’s filename.
Example: /etc/pki/issued_certs/www.example.com-DE:CA:FB:AD:00:00:00:00.crt
signing_policy: A signing policy that should be used to create this certificate. Signing policies should be defined in the minion configuration, or in a minion pillar. It should be a yaml formatted list of arguments which will override any arguments passed to this function. If the minions key is included in the signing policy, only minions matching that pattern (see match.glob and match.compound) will be permitted to remotely request certificates from that policy.

Example:

```yaml
x509_signing_policies:
  www:
    - minions: 'www*
    - signing_private_key: /etc/pki/ca.key
    - signing_cert: /etc/pki/ca.crt
    - C: US
    - ST: Utah
    - L: Salt Lake City
    - basicConstraints: "critical CA:false"
    - keyUsage: "critical cRLSign, keyCertSign"
    - subjectKeyIdentifier: hash
    - authorityKeyIdentifier: keyid,issuer:always
    - days_valid: 90
    - copypath: /etc/pki/issued_certs/
```

The above signing policy can be invoked with signing_policy=www

CLI Example:

```bash
salt '*' x509.create_certificate path=/etc/pki/myca.crt signing_private_key='/etc/pki/myca.key' csr='/etc/pki/myca.csr'"
```

salt.modules.x509.create_crl(path=None, text=False, signing_private_key=None, signing_private_key_passphrase=None, signing_cert=None, revoked=None, include_expired=False, days_valid=100, digest="")

Create a CRL

Depends
- PyOpenSSL Python module

path: Path to write the crl to.
text: If True, return the PEM text without writing to a file. Default False.
signing_private_key: A path or string of the private key in PEM format that will be used to sign this crl. This is required.

signing_private_key_passphrase: Passphrase to decrypt the private key.

signing_cert: A certificate matching the private key that will be used to sign this crl. This is required.

revoked: A list of dicts containing all the certificates to revoke. Each dict represents one certificate. A dict must contain either the key serial_number with the value of the serial number to revoke, or certificate with either the PEM encoded text of the certificate, or a path to the certificate to revoke.

The dict can optionally contain the revocation_date key. If this key is omitted the revocation date will be set to now. If should be a string in the format "%Y-%m-%d %H:%M:%S".

The dict can also optionally contain the not_after key. This is redundant if the certificate key is included. If the Certificate key is not included, this can be used for the logic behind the include_expired parameter. If should be a string in the format "%Y-%m-%d %H:%M:%S".

The dict can also optionally contain the reason key. This is the reason code for the revocation. Available choices are unspecified, keyCompromise, CACompromise, affiliationChanged, superseded, cessationOfOperation and certificateHold.

include_expired: Include expired certificates in the CRL. Default is False.

days_valid: The number of days that the CRL should be valid. This sets the Next Update field in the CRL.

digest: The digest to use for signing the CRL. This has no effect on versions of pyOpenSSL less than 0.14

CLI Example:

```bash
salt '*' x509.create_crl path=/etc/pki/mykey.key signing_private_key=/etc/pki/ca.key signing_cert=/etc/pki/ca.crt revoked="{"compromised-web-key": {"certificate": '/etc/pki/certs/www1.crt', 'revocation_date': '2015-03-01 00:00:00'}}"
```

salt.modules.x509.create_csr(path=None, text=False, **kwargs)
Create a certificate signing request.

path: Path to write the certificate to.

text: If True, return the PEM text without writing to a file. Default False.

algorithm: The hashing algorithm to be used for signing this request. Defaults to sha256.

kwargs: The subject, extension and version arguments from x509.create_certificate can be used.

CLI Example:

```bash
salt '*' x509.create_csr path=/etc/pki/myca.csr public_key='/etc/pki/myca.key' CN='My Cert'
```

salt.modules.x509.create_private_key(path=None, text=False, bits=2048, passphrase=None, cipher='aes_128_cbc', verbose=True)

Creates a private key in PEM format.

path: The path to write the file to, either path or text are required.

text: If True, return the PEM text without writing to a file. Default False.

bits: Length of the private key in bits. Default 2048

passphrase: Passphrase for encrypting the private key

cipher: Cipher for encrypting the private key. Has no effect if passphrase is None.

verbose: Provide visual feedback on stdout. Default True

New in version 2016.11.0.

CLI Example:

```bash
salt '*' x509.create_private_key path=/etc/pki/mykey.key
```

salt.modules.x509.expired(certificate)

Returns a dict containing limited details of a certificate and whether the certificate has expired.

New in version 2016.11.0.
**certificate**: The certificate to be read. Can be a path to a certificate file, or a string containing the PEM formatted text of the certificate.

CLI Example:
```
salt '*' x509.expired "/etc/pki/mycert.crt"
```

**salt.modules.x509.get_pem_entries(glob_path)**

Returns a dict containing PEM entries in files matching a glob

glob_path: A path to certificates to be read and returned.

CLI Example:
```
salt '*' x509.get_pem_entries "/etc/pki/*/crt"
```

**salt.modules.x509.get_pem_entry(text, pem_type=None)**

Returns a properly formatted PEM string from the input text fixing any whitespace or line-break issues

text: Text containing the X509 PEM entry to be returned or path to a file containing the text.

pem_type: If specified, this function will only return a pem of a certain type, for example ‘CERTIFICATE’ or ‘CERTIFICATE REQUEST’.

CLI Example:
```
salt '*' x509.get_pem_entry "-----BEGIN CERTIFICATE REQUEST-----MIICyzCC Ar8CAQI.. \.-----END CERTIFICATE REQUEST"
```

**salt.modules.x509.get_private_key_size(private_key, passphrase=None)**

Returns the bit length of a private key in PEM format.

private_key: A path or PEM encoded string containing a private key.

CLI Example:
```
salt '*' x509.get_private_key_size "/etc/pki/mycert.key"
```

**salt.modules.x509.get_public_key(key, passphrase=None, asObj=False)**

Returns a string containing the public key in PEM format.

key: A path or PEM encoded string containing a CSR, Certificate or Private Key from which a public key can be retrieved.

CLI Example:
```
salt '*' x509.get_public_key "/etc/pki/mycert.cer"
```

**salt.modules.x509.get_signing_policy(signing_policy_name)**

Returns the details of a names signing policy, including the text of the public key that will be used to sign it. Does not return the private key.

CLI Example:
```
salt '*' x509.get_signing_policy "www"
```

**salt.modules.x509.read_certificate(certificate)**

Returns a dict containing details of a certificate. Input can be a PEM string or file path.

certificate: The certificate to be read. Can be a path to a certificate file, or a string containing the PEM formatted text of the certificate.

CLI Example:
```
salt '*' x509.read_certificate "/etc/pki/mycert.crt"
```

**salt.modules.x509.read_certificates(glob_path)**

Returns a dict containing details of all certificates matching a glob

glob_path: A path to certificates to be read and returned.
CLI Example:
```
salt '*' x509.read_certificates "*/etc/pki/*/*.crt"
```

text_value 1

salt.modules.x509.read_crl(crl)

Returns a dict containing details of a certificate revocation list. Input can be a PEM string or file path.

**Depends**
- OpenSSL command line tool
csl: A path or PEM encoded string containing the CSL to read.

CLI Example:
```
salt '*' x509.read_crl /etc/pki/mycrl.crl
```

text_value 2

salt.modules.x509.read_csr(csr)

Returns a dict containing details of a certificate request.

**Depends**
- OpenSSL command line tool
csr: A path or PEM encoded string containing the CSR to read.

CLI Example:
```
salt '*' x509.read_csr /etc/pki/mycert.csr
```

text_value 3

salt.modules.x509.sign_remote_certificate(argdic, **kwargs)

Request a certificate to be remotely signed according to a signing policy.

argdic: A dict containing all the arguments to be passed into the create_certificate function. This will become kwags when passed to create_certificate.
kwags: kwags delivered from publish.publish

CLI Example:
```
salt '*' x509.sign_remote_certificate argdic="{'public_key': '/etc/pki/www.key', ...
```

text_value 4

salt.modules.x509.verify_crl(crl, cert)

Validate a CRL against a certificate. Parses openssl command line output, this is a workaround for M2Crypto’s inability to get them from CSR objects.
crl: The CRL to verify
cert: The certificate to verify the CRL against

CLI Example:
```
salt '*' x509.verify_crl crl=/etc/pki/myca.crl cert=/etc/pki/myca.crt
```

text_value 5

salt.modules.x509.verify_private_key(private_key, public_key, passphrase=None)

Verify that 'private_key' matches 'public_key'
private_key: The private key to verify, can be a string or path to a private key in PEM format.
public_key: The public key to verify, can be a string or path to a PEM formatted certificate, csr, or another private key.
passphrase: Passphrase to decrypt the private key.

CLI Example:
```
salt '*' x509.verify_private_key private_key=/etc/pki/myca.key \
       public_key=/etc/pki/myca.crt
```

salt.modules.x509.verify_signature(certificate, signing_pub_key=None, signing_pub_key_passphrase=None)

Verify that certificate has been signed by signing_pub_key

certificate: The certificate to verify. Can be a path or string containing a PEM formatted certificate.

signing_pub_key: The public key to verify, can be a string or path to a PEM formatted certificate, csr, or private key.

signing_pub_key_passphrase: Passphrase to the signing_pub_key if it is an encrypted private key.

CLI Example:

```
salt '*' x509.verify_signature /etc/pki/mycert.pem 
    signing_pub_key=/etc/pki/myca.crt
```

salt.modules.x509.will_expire(certificate, days)

Returns a dict containing details of a certificate and whether the certificate will expire in the specified number of days. Input can be a PEM string or file path.

New in version 2016.11.0.

certificate: The certificate to be read. Can be a path to a certificate file, or a string containing the PEM formatted text of the certificate.

CLI Example:

```
salt '*' x509.will_expire "/etc/pki/mycert.crt" days=30
```

salt.modules.x509.write_pem(text, path, overwrite=True, pem_type=None)

Writes out a PEM string fixing any formatting or whitespace issues before writing.

text: PEM string input to be written out.

path: Path of the file to write the pem out to.

overwrite: If True(default), write_pem will overwrite the entire pem file. Set False to preserve existing private keys and dh params that may exist in the pem file.

pem_type: The PEM type to be saved, for example CERTIFICATE or PUBLIC_KEY. Adding this will allow the function to take input that may contain multiple pem types.

CLI Example:

```
salt '*' x509.write_pem "-----BEGIN CERTIFICATE-----MIIGMzCCBBugA..." path=/etc/pki/mycert.crt
```

21.9.485 salt.modules.xapi_virt

This module (mostly) uses the XenAPI to manage Xen virtual machines.

Big fat warning: the XenAPI used in this file is the one bundled with Xen Source, NOT XenServer nor Xen Cloud Platform. As a matter of fact it will fail under those platforms. From what I've read, little work is needed to adapt this code to XS/XCP, mostly playing with XenAPI version, but as XCP is not taking precedence on Xen Source on many platforms, please keep compatibility in mind.

Useful documentation:

- http://docs.vmd.citrix.com/XenServer/6.0.0/1.0/en_gb/api/
- https://github.com/xapi-project/xen-api/tree/master/scripts/examples/python
- http://xenbits.xen.org/gitweb/?p=xen.git;a=tree;f=tools/python/xen/xm;hb=HEAD

salt.modules.xapi_virt.freecpu()

Return an int representing the number of unallocated cpus on this hypervisor

CLI Example:
salt '*' virt.freecpu

salt.modules.xapi_virt.freemem()
    Return an int representing the amount of memory that has not been given to virtual machines on this node
    CLI Example:
    salt '*' virt.freemem

salt.modules.xapi_virt.full_info()
    Return the node_info, vm_info and freemem
    CLI Example:
    salt '*' virt.full_info

salt.modules.xapi_virt.get_disks(vm_)
    Return the disks of a named vm
    CLI Example:
    salt '*' virt.get_disks <vm name>

salt.modules.xapi_virt.get_macs(vm_)
    Return a list off MAC addresses from the named vm
    CLI Example:
    salt '*' virt.get_macs <vm name>

salt.modules.xapi_virt.get_nics(vm_)
    Return info about the network interfaces of a named vm
    CLI Example:
    salt '*' virt.get_nics <vm name>

salt.modules.xapi_virt.is_hyper()
    Returns a bool whether or not this node is a hypervisor of any kind
    CLI Example:
    salt '*' virt.is_hyper

salt.modules.xapi_virt.list_domains()
    Return a list of virtual machine names on the minion
    CLI Example:
    salt '*' virt.list_domains

salt.modules.xapi_virt.migrate(vm_, target, live=1, port=0, node=-1, ssl=None, change_home_server=0)
    Migrates the virtual machine to another hypervisor
    CLI Example:
    salt '*'<vm name> <target hypervisor> [live] [port] [node] [ssl] 0
    ➔ [change_home_server]
Optional values:
live Use live migration
port Use a specified port
node Use specified NUMA node on target
ssl use ssl connection for migration
change_home_server change home server for managed domains

salt.modules.xapi_virt.node_info()
Return a dict with information about this node

CLI Example:
salt '*' xapi_virt.node_info

salt.modules.xapi_virt.pause(vm_)
Pause the named vm

CLI Example:
salt '*' xapi_virt.pause <vm name>

salt.modules.xapi_virt.reboot(vm_)
Reboot a domain via ACPI request

CLI Example:
salt '*' xapi_virt.reboot <vm name>

salt.modules.xapi_virt.reset(vm_)
Reset a VM by emulating the reset button on a physical machine

CLI Example:
salt '*' xapi_virt.reset <vm name>

salt.modules.xapi_virt.resume(vm_)
Resume the named vm

CLI Example:
salt '*' xapi_virt.resume <vm name>

salt.modules.xapi_virt.setmem(vm_, memory)
Changes the amount of memory allocated to VM.
Memory is to be specified in MB

CLI Example:
salt '*' xapi_virt.setmem myvm 768

salt.modules.xapi_virt.setvcpus(vm_, vcpus)
Changes the amount of vcpus allocated to VM.
vcpus is an int representing the number to be assigned

CLI Example:
salt '*' xapi_virt.setvcpus myvm 2
salt.modules.xapi_virt.shutdown(vm_)
    Send a soft shutdown signal to the named vm
    CLI Example:
    ```
salt '*' virt.shutdown <vm name>
    ```

salt.modules.xapi_virt.start(config_)
    Start a defined domain
    CLI Example:
    ```
salt '*' virt.start <path to Xen cfg file>
    ```

salt.modules.xapi_virt.stop(vm_)
    Hard power down the virtual machine, this is equivalent to pulling the power
    CLI Example:
    ```
salt '*' virt.stop <vm name>
    ```

salt.modules.xapi_virt.vcpu_pin(vm_, vcpu, cpus)
    Set which CPUs a VCPU can use.
    CLI Example:
    ```
salt 'foo' virt.vcpu_pin domU-id 2 1
salt 'foo' virt.vcpu_pin domU-id 2 2-6
    ```

salt.modules.xapi_virt.vm_cputime(vm_=None)
    Return cputime used by the vms on this hyper in a list of dicts:
    ```
    [
        'your-vm': {
            'cputime' <int>,
            'cputime_percent' <int>
        },
        ...
    ]
    ```
    If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.
    CLI Example:
    ```
salt '*' virt.vm_cputime
    ```

salt.modules.xapi_virt.vm_diskstats(vm_=None)
    Return disk usage counters used by the vms on this hyper in a list of dicts:
    ```
    [
        'your-vm': {
            'io_read_kbs' : 0,
            'io_write_kbs' : 0
        },
        ...
    ]
    ```
    If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.
CLI Example:

```
salt '*' virt.vm_diskstats
```

salt.modules.xapi_virt.vm_info(vm_=None)
Return detailed information about the vms.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_info
```

salt.modules.xapi_virt.vm_netstats(vm_=None)
Return combined network counters used by the vms on this hyper in a list of dicts:

```
[
    'your-vm': {
        'io_read_kbs': 0,
        'io_total_read_kbs': 0,
        'io_total_write_kbs': 0,
        'io_write_kbs': 0
    },
    ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_netstats
```

salt.modules.xapi_virt.vm_state(vm_=None)
Return list of all the vms and their state.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_state <vm name>
```

21.9.486 salt.modules.xbpspkg module

Package support for XBPS package manager (used by VoidLinux)

New in version 2016.11.0.

salt.modules.xbpspkg.add_repo(repo, conffile="/usr/share/xbps.d/15-saltstack.conf")
Add an XBPS repository to the system.

repo url of repo to add (persistent).

conffile path to xbps conf file to add this repo default: /usr/share/xbps.d/15-saltstack.conf

CLI Examples:

```
salt '*' pkg.add_repo <repo url> [conffile=/path/to/xbps/repo.conf]
```
salt.modules.xbpspkg.available_version(*names, **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```bash
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.xbpspkg.del_repo(repo)

Remove an XBPS repository from the system.

repo url of repo to remove (persistent).

CLI Examples:

```bash
salt '*' pkg.del_repo <repo url>
```

salt.modules.xbpspkg.get_repo(repo, **kwargs)

Display information about the repo.

CLI Examples:

```bash
salt '*' pkg.get_repo 'repo-url'
```

salt.modules.xbpspkg.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs)

Install the passed package

name The name of the package to be installed.

refresh Whether or not to refresh the package database before installing.

fromrepo Specify a package repository (url) to install from.

Multiple Package Installation Options:

pkgs A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:

```bash
salt '*' pkg.install pkgs=['"foo","bar"]
```

sources A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```bash
salt '*' pkg.install sources='[{"foo": "salt://foo.deb"},{"bar": "salt://bar.deb"}]'
```

Return a dict containing the new package names and versions:

```json
{"<package>": {"old": '<old-version>',
               "new": '<new-version>'}}
```

CLI Example:

```bash
salt '*' pkg.install <package name>
```

salt.modules.xbpspkg.latest_version(*names, **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.
CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

**salt.modules.xbpspkg.list_pkgs**

(lists_pkgs)(versions_as_list=False,**kwargs)

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

**salt.modules.xbpspkg.list_repos()**

List all repos known by XBPS

CLI Example:

```
salt '*' pkg.list_repos
```

**salt.modules.xbpspkg.list_upgrades**(refresh=True)

Check whether or not an upgrade is available for all packages

CLI Example:

```
salt '*' pkg.list_upgrades
```

**salt.modules.xbpspkg.refresh_db()**

Update list of available packages from installed repos

CLI Example:

```
salt '*' pkg.refresh_db
```

**salt.modules.xbpspkg.remove**(name=None, pkgs=None, recursive=True,**kwargs)

- **name** The name of the package to be deleted.
- **recursive** Also remove dependent packages (not required elsewhere). Default mode: enabled.
- Multiple Package Options:
  - **pkgs** A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a list containing the removed packages.

CLI Example:

```
salt '*' pkg.remove <package name> [recursive=False]
salt '*' pkg.remove <package1>,<package2>,<package3> [recursive=False]
salt '*' pkg.remove pkgs=['"foo", "bar"]' [recursive=False]
```

**salt.modules.xbpspkg.upgrade**(refresh=True)

Run a full system upgrade

- **refresh** Whether or not to refresh the package database before installing. Default is True.

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>', 'new': '<new-version>'}}
```

CLI Example:
salt.modules.xbpspkg.

**upgrade_available**(name)
Check whether or not an upgrade is available for a given package

CLI Example:

```sh
salt '*' pkg.upgrade_available <package name>
```

salt.modules.xbpspkg.

**version**(names, **kwargs)
Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```sh
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

### 21.9.487 salt.modules.xfs

Module for managing XFS file systems.

salt.modules.xfs.

**defragment**(device)
Defragment mounted XFS filesystem. In order to mount a filesystem, device should be properly mounted and writable.

CLI Example:

```sh
salt '*' xfs.defragment /dev/sda1
```

salt.modules.xfs.

**devices**()
Get known XFS formatted devices on the system.

CLI Example:

```sh
salt '*' xfs.devices
```

salt.modules.xfs.

**dump**(device, destination, level=0, label=None, noerase=None)
Dump filesystem device to the media (file, tape etc).

Required parameters:
- **device**: XFS device, content of which to be dumped.
- **destination**: Specifies a dump destination.

Valid options are:
- **label**: Label of the dump. Otherwise automatically generated label is used.
- **level**: Specifies a dump level of 0 to 9.
- **noerase**: Pre-erase media.

Other options are not used in order to let xfsdump use its default values, as they are most optimal. See the xfsdump(8) manpage for a more complete description of these options.

CLI Example:

```sh
salt '*' xfs.dump /dev/sda1 /destination/on/the/client
salt '*' xfs.dump /dev/sda1 /destination/on/the/client label='Company accountancy'
salt '*' xfs.dump /dev/sda1 /destination/on/the/client noerase=True
```
salt.modules.xfs.estimate(path)
Estimate the space that an XFS filesystem will take. For each directory estimate the space that directory would take if it were copied to an XFS filesystem. Estimation does not cross mount points.

CLI Example:
```
salt '*' xfs.estimate /path/to/file
salt '*' xfs.estimate /path/to/dir/*
```

salt.modules.xfs.info(device)
Get filesystem geometry information.

CLI Example:
```
salt '*' xfs.info /dev/sdal
```

salt.modules.xfs.inventory()
Display XFS dump inventory without restoration.

CLI Example:
```
salt '*' xfs.inventory
```

salt.modules.xfs.mkfs(device, label=None, ssize=None, noforce=None, bso=None, gmo=None, dso=None, ino=None, lso=None, rso=None, nmo=None, dso=None)
Create a file system on the specified device. By default wipes out with force.

General options:
- **label**: Specify volume label.
- **ssize**: Specify the fundamental sector size of the filesystem.
- **noforce**: Do not force create filesystem, if disk is already formatted.

Filesystem geometry options:
- **bso**: Block size options.
- **gmo**: Global metadata options.
- **dso**: Data section options. **These options specify the location, size, and other parameters of the data section of the filesystem.**
- **ino**: Inode options to specify the inode size of the filesystem, and other inode allocation parameters.
- **lso**: Log section options.
- **nmo**: Naming options.
- **rso**: Realtime section options.

See the `mkfs.xfs(8)` manpage for a more complete description of corresponding options description.

CLI Example:
```
salt '*' xfs.mkfs /dev/sdal
salt '*' xfs.mkfs /dev/sdal dso='su=32k,sw=6' noforce=True
salt '*' xfs.mkfs /dev/sdal dso='su=32k,sw=6' lso='logdev=/dev/sda2,size=10000b'
```

salt.modules.xfs.modify(device, label=None, lazy_counting=None, uuid=None)
Modify parameters of an XFS filesystem.

CLI Example:
```
salt '*' xfs.modify /dev/sdal label='My backup' lazy_counting=False
salt '*' xfs.modify /dev/sdal uuid=False
salt '*' xfs.modify /dev/sdal uuid=True
```

salt.modules.xfs.prune_dump(sessionid)
Prunes the dump session identified by the given session id.
CLI Example:
```
salt '*' xfs.prune_dump b74a3586-e52e-4a4a-8775-c3334fa8ea2c
```

21.9.488  **salt.modules.xmpp**

Module for Sending Messages via XMPP (a.k.a. Jabber)

New in version 2014.1.0.

**depends**
- sleekxmpp>=1.3.1
- pyasn1
- pyasn1-modules
- dnspython

**configuration** This module can be used by either passing a jid and password directly to send_message, or by specifying the name of a configuration profile in the minion config, minion pillar, or master config.

For example:

```
my-xmpp-login:
  xmpp.jid: myuser@jabber.example.org/resourcename
  xmpp.password: verybadpass
```

The resourcename refers to the resource that is using this account. It is user-definable, and optional. The following configurations are both valid:

```
my-xmpp-login:
  xmpp.jid: myuser@jabber.example.org/salt
  xmpp.password: verybadpass

my-xmpp-login:
  xmpp.jid: myuser@jabber.example.org
  xmpp.password: verybadpass
```

class salt.modules.xmpp.SendMsgBot(jid, password, recipient, msg)

```
classmethod create_multi(jid, password, msg, recipients=None, rooms=None, nick="SaltStack Bot")
```

Alternate constructor that accept multiple recipients and rooms

```
start(event)
```

class salt.modules.xmpp.SleekXMPPMUC(name=“”)

```
filter(record)
```
Determine if the specified record is to be logged.

Is the specified record to be logged? Returns 0 for no, nonzero for yes. If deemed appropriate, the record may be modified in-place.

```
salt.modules.xmpp.send_msg(recipient, message, jid=None, password=None, profile=None)
```
Send a message to an XMPP recipient. Designed for use in states.
CLI Examples:

```
xmpp.send_msg 'admins@xmpp.example.com' 'This is a salt module test'
pp.send_msg 'admins@xmpp.example.com' 'This is a salt module test'
```

```
profile='my-xmpp-account'
```

```
jid='myuser@xmpp.example.com/salt' password='verybadpass'
```

**salt.modules.xmpp.send_msg_multi** *(message, recipients=None, rooms=None, jid=None, password=None, nick='SaltStack Bot', profile=None)*

Send a message to an XMPP recipient, support send message to multiple recipients or chat room.

CLI Examples:

```
xmpp.send_msg recipients=['admins@xmpp.example.com'] rooms=['secret@conference.xmpp.example.com']
```

```
xmpp.send_msg recipients=['admins@xmpp.example.com'] rooms=['secret@conference.xmpp.example.com']
```

```
profile='my-xmpp-account'
```

```
jid='myuser@xmpp.example.com/salt' password='verybadpass'
```

### 21.9.489 salt.modules.yumpkg

Support for YUM/DNF

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *'pkg.install' is not available*), see [here](#).

**Note:** DNF is fully supported as of version 2015.5.10 and 2015.8.4 (partial support for DNF was initially added in 2015.8.0), and DNF is used automatically in place of YUM in Fedora 22 and newer.

**class** salt.modules.yumpkg.AvailablePackages(*args, **kwargs)*

**salt.modules.yumpkg.clean_metadata**(**kwargs)**

New in version 2014.1.0.

Cleans local yum metadata. Functionally identical to *refresh_db()*.

CLI Example:

```
salt '*' pkg.clean_metadata
```

**salt.modules.yumpkg.del_repo**(repo, basedir=None, **kwargs)**

Delete a repo from `<basedir>` (default basedir: all dirs in *reposdir* yum option).

If the .repo file in which the repo exists does not contain any other repo configuration, the file itself will be deleted.

CLI Examples:

```
salt '*' pkg.del_repo myrepo
```

```
salt '*' pkg.del_repo myrepo basedir=/path/to/dir
```

```
salt '*' pkg.del_repo myrepo basedir=/path/to/dir,/path/to/another/dir
```
salt.modules.yumpkg.diff('paths')
Return a formatted diff between current files and original in a package. NOTE: this function includes all files (configuration and not), but does not work on binary content.

Parameters path – Full path to the installed file

Returns Difference string or raises and exception if examined file is binary.

CLI example:
```
salt '*' pkg.diff /etc/apache2/httpd.conf /etc/sudoers
```

salt.modules.yumpkg.download('packages')
New in version 2015.5.0.
Download packages to the local disk. Requires yumdownloader from yum-utils package.

Note: yum-utils will already be installed on the minion if the package was installed from the Fedora / EPEL repositories.

CLI example:
```
salt '*' pkg.download httpd
salt '*' pkg.download httpd postfix
```

salt.modules.yumpkg.file_dict('packages')
New in version 2014.1.0.
List the files that belong to a package, grouped by package. Not specifying any packages will return a list of every file on the system’s rpm database (not generally recommended).

CLI Examples:
```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

salt.modules.yumpkg.file_list('packages')
New in version 2014.1.0.
List the files that belong to a package. Not specifying any packages will return a list of every file on the system’s rpm database (not generally recommended).

CLI Examples:
```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

salt.modules.yumpkg.get_repo(name, basedir=None, **kwargs)
Display a repo from <basedir> (default basedir: all dirs in reposdir yum option).

CLI Examples:
```
salt '*' pkg.get_repo myrepo
salt '*' pkg.get_repo myrepo basedir=/path/to/dir
salt '*' pkg.get_repo myrepo basedir=/path/to/dir,/path/to/another/dir
```

salt.modules.yumpkg.group_diff(name)
New in version 2014.1.0.
Changed in version 2016.3.0, 2015.8.4, 2015.5.10: Environment groups are now supported. The key names have been renamed, similar to the changes made in `pkg.group_info`.

Lists which of a group’s packages are installed and which are not installed

CLI Example:
```
salt '*' pkg.group_diff 'Perl Support'
```

`salt.modules.yumpkg.group_info(name, expand=False)`

New in version 2014.1.0.

Changed in version 2016.3.0, 2015.8.4, 2015.5.10: The return data has changed. A new key type has been added to distinguish environment groups from package groups. Also, keys for the group name and group ID have been added. The mandatory packages, optional packages, and default packages keys have been renamed to mandatory, optional, and default for accuracy, as environment groups include other groups, and not packages. Finally, this function now properly identifies conditional packages.

Lists packages belonging to a certain group

- **name** Name of the group to query
- **expand** [False] If the specified group is an environment group, then the group will be expanded and the return data will include package names instead of group names.

New in version 2016.3.0.

CLI Example:
```
salt '*' pkg.group_info 'Perl Support'
```

`salt.modules.yumpkg.group_install(name, skip=(), include=(), **kwargs)`

New in version 2014.1.0.

Install the passed package group(s). This is basically a wrapper around `pkg.install`, which performs package group resolution for the user. This function is currently considered experimental, and should be expected to undergo changes.

- **name** Package group to install. To install more than one group, either use a comma-separated list or pass the value as a python list.

CLI Examples:
```
salt '*' pkg.group_install 'Group 1'
salt '*' pkg.group_install 'Group 1,Group 2'
salt '*' pkg.group_install ['"Group 1", "Group 2"]'
```

- **skip** Packages that would normally be installed by the package group ("default" packages), which should not be installed. Can be passed either as a comma-separated list or a python list.

CLI Examples:
```
salt '*' pkg.group_install 'My Group' skip='foo,bar'
salt '*' pkg.group_install 'My Group' skip=['"foo", "bar"]'
```

- **include** Packages which are included in a group, which would not normally be installed by a `yum groupinstall` ("optional" packages). Note that this will not enforce group membership; if you include packages which are not members of the specified groups, they will still be installed. Can be passed either as a comma-separated list or a python list.

CLI Examples:
```
salt '*' pkg.group_install 'My Group' include='foo,bar'
salt '*' pkg.group_install 'My Group' include=['"foo", "bar"]'
```
Note: Because this is essentially a wrapper around pkg.install, any argument which can be passed to pkg.install may also be included here, and it will be passed along wholesale.

salt.modules.yumpkg.group_list()
New in version 2014.1.0.
Lists all groups known by yum on this system
CLI Example:
```
salt '*' pkg.group_list
```

salt.modules.yumpkg.hold(name=None, pkgs=None, sources=None, normalize=True, **kwargs)
New in version 2014.7.0.
Version-lock packages

Note: Requires the appropriate versionlock plugin package to be installed:
- On RHEL 5: yum-versionlock
- On RHEL 6 & 7: yum-plugin-versionlock
- On Fedora: python-dnf-plugins-extras-versionlock

name The name of the package to be held.

Multiple Package Options:
pkgs A list of packages to hold. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:
```
salt '*' pkg.hold <package name>
salt '*' pkg.hold pkgs=["foo", "bar"]
```

salt.modules.yumpkg.info_installed(*names, **kwargs)
Return the information of the named package(s), installed on the system.

Parameters all_versions -- Include information for all versions of the packages installed on the minion.

CLI example:
```
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
salt '*' pkg.info_installed <package1> <package2> <package3> all_versions=True
```

salt.modules.yumpkg.install(name=None, refresh=False, skip_verify=False, pkgs=None, sources=None, downloadonly=False, reinstall=False, normalize=True, update_holds=False, saltenv='base', ignore_epoch=False, **kwargs)
Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon’s control group. This is done to keep systemd from killing any yum/dnf commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemctl(1) manpage for more information). If desired, usage of systemctl-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).
Install the passed package(s), add refresh=True to clean the yum database before package is installed.

**name**  The name of the package to be installed. Note that this parameter is ignored if either "pkgs" or "sources" is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the "sources" option.

32-bit packages can be installed on 64-bit systems by appending the architecture designation (.i686, .i586, etc.) to the end of the package name.

CLI Example:

```
salt '*' pkg.install <package name>
```

**refresh**  Whether or not to update the yum database before executing.

**reinstall**  Specifying reinstall=True will use yum reinstall rather than yum install for requested packages that are already installed.

If a version is specified with the requested package, then yum reinstall will only be used if the installed version matches the requested version.

Works with sources when the package header of the source can be matched to the name and version of an installed package.

New in version 2014.7.0.

**skip_verify**  Skip the GPG verification check (e.g., --nogpgcheck)

**downloadonly**  Only download the packages, do not install.

**version**  Install a specific version of the package, e.g. 1.2.3-4.el5. Ignored if "pkgs" or "sources" is passed.

Changed in version 2018.3.0: version can now contain comparison operators (e.g. >1.2.3, <=2.0, etc.)

**update_holds**  [False]  If True, and this function would update the package version, any packages held using the yum/dnf "versionlock" plugin will be unheld so that they can be updated. Otherwise, if this function attempts to update a held package, the held package(s) will be skipped and an error will be raised.

New in version 2016.11.0.

**setopt**  A comma-separated or Python list of key=value options. This list will be expanded and --setopt prepended to each in the yum/dnf command that is run.

CLI Example:

```
salt '*' pkg.install foo setopt='obsoletes=0,plugins=0'
```

New in version 2019.2.0.

Repository Options:

**fromrepo**  Specify a package repository (or repositories) from which to install. (e.g., yum --disablerepo='*' --enablerepo='somerepo')

**enablerepo**  (ignored if fromrepo is specified)  Specify a disabled package repository (or repositories) to enable. (e.g., yum --enablerepo='somerepo')

**disablerepo**  (ignored if fromrepo is specified)  Specify an enabled package repository (or repositories) to disable. (e.g., yum --disablerepo='somerepo')

**disableexcludes**  Disable exclude from main, for a repo or for everything. (e.g., yum --disableexcludes='main')

New in version 2014.7.0.

**ignore_epoch**  [False]  Only used when the version of a package is specified using a comparison operator (e.g. >4.1). If set to True, then the epoch will be ignored when comparing the currently-installed version to the desired version.

New in version 2018.3.0.

Multiple Package Installation Options:
**pkgs**  A list of packages to install from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version.

CLI Examples:

```
salt '*' pkg.install pkgs='["foo", "bar"]'
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3-4.el5"}]'
```

**sources**  A list of RPM packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources='[{"foo": "salt://foo.rpm"}, {"bar": "salt://bar.rpm"}]'
```

**normalize**  [True] Normalize the package name by removing the architecture. This is useful for poorly created packages which might include the architecture as an actual part of the name such as kernel modules which match a specific kernel version.

```
salt -G role:nsd pkg.install gpfs.gplbin-2.6.32-279.31.1.el6.x86_64
 normalize=False
```

New in version 2014.7.0.

**diff_attr**  If a list of package attributes is specified, returned value will contain them, eg:

```
{"<package>": {
 'old': {
   'version': '<old-version>',
   'arch': '<old-arch>'},
 'new': {
   'version': '<new-version>',
   'arch': '<new-arch>'}}
```

Valid attributes are: epoch, version, release, arch, install_date, install_date_time_t.

If all is specified, all valid attributes will be returned.

New in version 2018.3.0.

Returns a dict containing the new package names and versions:

```
{"<package>": { 'old': '<old-version>',
   'new': '<new-version>'}}
```

If an attribute list in diff_attr is specified, the dict will also contain any specified attribute, eg:

```
{"<package>": {
 'old': {
   'version': '<old-version>',
   'arch': '<old-arch>'},
 'new': {
   'version': '<new-version>',
   'arch': '<new-arch>'}}
```

salt.modules.yumpkg.latest_version(*names, **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.
If the latest version of a given package is already installed, an empty string will be returned for that package.

A specific repo can be requested using the `fromrepo` keyword argument, and the `disableexcludes` option is also supported.

New in version 2014.7.0: Support for the `disableexcludes` option

CLI Example:

```shell
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> fromrepo=epel-testing
salt '*' pkg.latest_version <package name> disableexcludes=main
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.yumpkg.list_downloaded()

New in version 2017.7.0.

List prefetched packages downloaded by Yum in the local disk.

CLI example:

```shell
salt '*' pkg.list_downloaded
```

salt.modules.yumpkg.list_holds(pattern='[w+|\[\w+\][\-]+(?:[\^\-]+)*]', full=True)

Changed in version 2016.3.0,2015.8.4,2015.5.10: Function renamed from `pkg.get_locked_pkgs` to `pkg.list_holds`.

List information on locked packages

Note: Requires the appropriate `versionlock` plugin package to be installed:
- On RHEL 5: `yum-versionlock`
- On RHEL 6 & 7: `yum-plugin-versionlock`
- On Fedora: `python-dnf-plugins-extras-versionlock`

```shell
salt '*' pkg.list_holds
salt '*' pkg.list_holds full=False
```

salt.modules.yumpkg.list_installed_patches()

New in version 2017.7.0.

List installed advisory patches on the system.

CLI Examples:

```shell
salt '*' pkg.list_installed_patches
```

salt.modules.yumpkg.list_patches(refresh=False)

New in version 2017.7.0.

List all known advisory patches from available repos.

```shell
salt '*' pkg.list_patches
```

**CLI Examples:**

```shell
salt '*' pkg.list_patches
```

**Note:**
- `pattern` [w+|\[\w+\][\-]+(?:[\^\-]+)*] Regular expression used to match the package name
- `full` [True] Show the full hold definition including version and epoch. Set to False to return just the name of the package(s) being held.
- `refresh` force a refresh if set to True. If set to False (default) it depends on yum if a refresh is executed.
salt '*' pkg.list_patches

```
salt.modules.yumpkg.list_pkgs(versions_as_list=False, **kwargs)
```

List the packages currently installed as a dict. By default, the dict contains versions as a comma separated string:

```
{'<package_name>': '<version>[,<version>...]'}
```

- **versions_as_list**: If set to true, the versions are provided as a list
  ```
  {'<package_name>': ['<version>', '<version>']}
  ```

- **attr**: If a list of package attributes is specified, returned value will contain them in addition to version, eg.:
  ```
  {'<package_name>': [{'version': 'version', 'arch': 'arch'}]}
  ```

Valid attributes are: epoch, version, release, arch, install_date, install_date_time_t.

If all is specified, all valid attributes will be returned.

New in version 2018.3.0.

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs attr=version,arch
salt '*' pkg.list_pkgs attr=['"version", "arch"]
```

```
salt.modules.yumpkg.list_repo_pkgs(*args, **kwargs)
```

New in version 2014.1.0.

Changed in version 2014.7.0: All available versions of each package are now returned. This required a slight modification to the structure of the return dict. The return data shown below reflects the updated return dict structure. Note that packages which are version-locked using pkg.hold will only show the currently-installed version, as locking a package will make other versions appear unavailable to yum/dnf.

Changed in version 2017.7.0: By default, the versions for each package are no longer organized by repository. To get results organized by repository, use byrepo=True.

Returns all available packages. Optionally, package names (and name globs) can be passed and the results will be filtered to packages matching those names. This is recommended as it speeds up the function considerably.

**Warning:** Running this function on RHEL/CentOS 6 and earlier will be more resource-intensive, as the version of yum that ships with older RHEL/CentOS has no yum subcommand for listing packages from a repository. Thus, a `yum list installed` and `yum list available` are run, which generates a lot of output, which must then be analyzed to determine which package information to include in the return data.

This function can be helpful in discovering the version or repo to specify in a `pkg.installed` state.

The return data will be a dictionary mapping package names to a list of version numbers, ordered from newest to oldest. If byrepo is set to True, then the return dictionary will contain repository names at the top level, and each repository will map packages to lists of version numbers. For example:

```
# With byrepo=False (default)
{
  'bash': ['4.1.2-15.el6_5.2',
```

(continues on next page)
fromrepo [None] Only include results from the specified repo(s). Multiple repos can be specified, comma-separated.

enablerepo (ignored if fromrepo is specified) Specify a disabled package repository (or repositories) to enable. (e.g., yum --enablerepo='somerepo')

New in version 2017.7.0.

disablerepo (ignored if fromrepo is specified) Specify an enabled package repository (or repositories) to disable. (e.g., yum --disablerepo='somerepo')

New in version 2017.7.0.

byrepo [False] When True, the return data for each package will be organized by repository.

New in version 2017.7.0.

cacheonly [False] When True, the repo information will be retrieved from the cached repo metadata. This is equivalent to passing the -C option to yum/dnf.

New in version 2017.7.0.

setopt A comma-separated or Python list of key=value options. This list will be expanded and --setopt prepended to each in the yum/dnf command that is run.

New in version 2019.2.0.

CLI Examples:
salt '...' pkg.list_repo_pkgs
salt '...' pkg.list_repo_pkgs foo bar baz
salt '...' pkg.list_repo_pkgs 'samba4*' fromrepo=base,updates
salt '...' pkg.list_repo_pkgs 'python2-*' byrepo=True

salt.modules.yumpkg.list_repos(basedir=None)
Lists all repos in <basedir> (default: all dirs in reposdir yum option).

CLI Example:
salt '*' pkg.list_repos
salt '*' pkg.list_repos basedir=/path/to/dir
salt '*' pkg.list_repos basedir=/path/to/dir,/path/to/another/dir

salt.modules.yumpkg.list_upgrades(refresh=True, **kwargs)
Check whether or not an upgrade is available for all packages
The fromrepo, enablerepo, and disablerepo arguments are supported, as used in pkg states, and the
disableexcludes option is also supported.
New in version 2014.7.0: Support for the disableexcludes option

CLI Example:
salt '*' pkg.list_upgrades

salt.modules.yumpkg.mod_repo(repo, basedir=None, **kwargs)
Modify one or more values for a repo. If the repo does not exist, it will be created, so long as the following
values are specified:
repo name by which the yum refers to the repo
name a human-readable name for the repo
baseurl the URL for yum to reference
mirrorlist the URL for yum to reference
Key/Value pairs may also be removed from a repo’s configuration by setting a key to a blank value. Bear in
mind that a name cannot be deleted, and a baseurl can only be deleted if a mirrorlist is specified (or vice versa).

CLI Examples:
salt '*' pkg.mod_repo reponame enabled=1 gpgcheck=1
salt '*' pkg.mod_repo reponame basedir=/path/to/dir enabled=1
salt '*' pkg.mod_repo reponame baseurl= mirrorlist=http://host.com/

salt.modules.yumpkg.modified(*packages, *flags)
List the modified files that belong to a package. Not specifying any packages will return a list of _all_ modified
files on the system’s RPM database.
New in version 2015.5.0.
Filtering by flags (True or False):
size Include only files where size changed.
mode Include only files where file’s mode has changed.
checksum Include only files which MD5 checksum has been changed.
device Include only files which major and minor numbers has been changed.
symlink Include only files which are symbolic link contents.
owner Include only files where owner has been changed.
group Include only files where group has been changed.
time Include only files where modification time of the file has been changed.
capabilities Include only files where capabilities differ or not. Note: supported only on newer RPM versions.
CLI Examples:

```
salt '*' pkg.modified
salt '*' pkg.modified httpd
salt '*' pkg.modified httpd postfix
salt '*' pkg.modified httpd owner=True group=False
```

**salt.modules.yumpkg.normalize_name(name)**

Strips the architecture from the specified package name, if necessary. Circumstances where this would be done include:

- If the arch is 32 bit and the package name ends in a 32-bit arch.
- If the arch matches the OS arch, or is noarch.

CLI Example:

```
salt '*' pkg.normalize_name zsh.x86_64
```

**salt.modules.yumpkg.owner(*paths)**

New in version 2014.7.0.

Return the name of the package that owns the file. Multiple file paths can be passed. Like pkg.version, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Examples:

```
salt '*' pkg.owner /usr/bin/apachectl
salt '*' pkg.owner /usr/bin/apachectl /etc/httpd/conf/httpd.conf
```

**salt.modules.yumpkg.purge(name=None, pkgs=None, **kwargs)**

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon’s control group. This is done to keep systemd from killing any yum/dnf commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Package purges are not supported by yum, this function is identical to pkg.remove.

Multiple Package Options:

- **name** The name of the package to be purged
- **pkgs** A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

**salt.modules.yumpkg.refresh_db(**kwargs)**

Check the yum repos for updated packages

Returns:

- True: Updates are available
• False: An error occurred
• None: No updates are available

repo Refresh just the specified repo
disablerepo Do not refresh the specified repo
enablerepo Refresh a disabled repo using this option
branch Add the specified branch when refreshing
disableexcludes Disable the excludes defined in your config files. Takes one of three options: - all - disable all excludes - main - disable excludes defined in [main] in yum.conf - repoid - disable excludes defined for that repo
setopt A comma-separated or Python list of key=value options. This list will be expanded and --setopt prepended to each in the yum/dnf command that is run.

    New in version 2019.2.0.

CLI Example:

    salt '*' pkg.refresh_db

salt.modules.yumpkg.remove(name=None, pkgs=None, **kwargs)

    Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run() is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any yum/dnf commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run() can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

    Remove packages
name The name of the package to be removed

    Multiple Package Options:
pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

    New in version 0.16.0.

    Returns a dict containing the changes.

    CLI Example:

        salt '*' pkg.remove <package name>
        salt '*' pkg.remove <package1>,<package2>,<package3>
        salt '*' pkg.remove pkgs=["foo", "bar"]

salt.modules.yumpkg.unhold(name=None, pkgs=None, sources=None, **kwargs)

    New in version 2014.7.0.

    Remove version locks

    Note: Requires the appropriate versionlock plugin package to be installed:

        • On RHEL 5: yum-versionlock
        • On RHEL 6 & 7: yum-plugin-versionlock
        • On Fedora: python-dnf-plugins-extras-versionlock

name The name of the package to be unheld

    Multiple Package Options:
pkgs A list of packages to unhold. Must be passed as a python list. The name parameter will be ignored if this option is passed.
Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.unhold <package name>
salt '*' pkg.unhold pkgs='["foo", "bar"]'
```

```python
salt.modules.yumpkg.update(name=None, pkgs=None, refresh=True, skip_verify=False, normalize=True, minimal=False, obsoletes=False, **kwargs)
```

New in version 2019.2.0.

Calls `pkg.upgrade` with `obsoletes=False`. Mirrors the CLI behavior of `yum update`. See `pkg.upgrade` for further documentation.

```python
salt '*' pkg.update
```

```python
salt.modules.yumpkg.upgrade(name=None, pkgs=None, refresh=True, skip_verify=False, normalize=True, minimal=False, obsoletes=True, **kwargs)
```

Run a full system upgrade (a `yum upgrade` or `dnf upgrade`), or upgrade specified packages. If the packages aren't installed, they will not be installed.

Changed in version 2019.2.0: Added `obsoletes` and `minimal` arguments

Returns a dictionary containing the changes:

```
{
'<package>': {
'old': '<old-version>',
'new': '<new-version>'
}}
```

CLI Example:

```
salt '*' pkg.upgrade
salt '*' pkg.upgrade name=openssl
```

Repository Options:

- **fromrepo** Specify a package repository (or repositories) from which to install. (e.g., `yum --disablerepo='*' --enablerepo='somerepo'`)
- **enablerepo** (ignored if `fromrepo` is specified) Specify a disabled package repository (or repositories) to enable. (e.g., `yum --enablerepo='somerepo'`)
- **disablerepo** (ignored if `fromrepo` is specified) Specify an enabled package repository (or repositories) to disable. (e.g., `yum --disablerepo='somerepo'`)
- **disableexcludes** Disable exclude from main, for a repo or for everything. (e.g., `yum --disableexcludes='main'`)

New in version 2014.7.

- **name** The name of the package to be upgraded. Note that this parameter is ignored if "pkgs" is passed.

32-bit packages can be upgraded on 64-bit systems by appending the architecture designation (.i686, .i586, etc.) to the end of the package name.

Warning: if you forget 'name=' and run pkg.upgrade openssl, ALL packages are upgraded. This will be addressed in next releases.
CLI Example:

```
salt '*' pkg.upgrade name=openssl
```

New in version 2016.3.0.

**pkgs** A list of packages to upgrade from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version. If the package was not already installed on the system, it will not be installed.

CLI Examples:

```
salt '*' pkg.upgrade pkgs='["foo", "bar"]'
salt '*' pkg.upgrade pkgs='["foo", {"bar": "1.2.3-4.el5"}]'
```

New in version 2016.3.0.

**normalize** [True] Normalize the package name by removing the architecture. This is useful for poorly created packages which might include the architecture as an actual part of the name such as kernel modules which match a specific kernel version.

```
salt -G role:nsd pkg.upgrade gpfs.gplbin-2.6.32-279.31.1.el6.x86_64 --normalize=False
```

New in version 2016.3.0.

**minimal** [False] Use upgrade-minimal instead of upgrade (e.g., yum upgrade-minimal) Goes to the 'newest' package match which fixes a problem that affects your system.

```
salt '*' pkg.upgrade minimal=True
```

New in version 2019.2.0.

**obsoletes** [True] Controls wether yum/dnf should take obsoletes into account and remove them. If set to False yum will use update instead of upgrade and dnf will be run with --obsoletes=False

```
salt '*' pkg.upgrade obsoletes=False
```

New in version 2019.2.0.

**setopt** A comma-separated or Python list of key=value options. This list will be expanded and --setopt prepended to each in the yum/dnf command that is run.

New in version 2019.2.0.

**Note:** To add extra arguments to the yum upgrade command, pass them as key word arguments. For arguments without assignments, pass True

```
salt '*' pkg.upgrade security=True exclude='kernel*'
```

salt.modules.yumpkg.**upgrade_available**(name, **kwargs)
Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

salt.modules.yumpkg.**verify**(names, **kwargs)
New in version 2014.1.0.

Runs an rpm -Va on a system, and returns the results in a dict

Pass options to modify rpm verify behavior using the verify_options keyword argument
Files with an attribute of config, doc, ghost, license or readme in the package header can be ignored using the `ignore_types` keyword argument.

**CLI Example:**

```shell
salt '*' pkg.verify
salt '*' pkg.verify httpd
salt '*' pkg.verify 'httpd postfix'
salt '*' pkg.verify 'httpd postfix' ignore_types=['config', 'doc']
salt '*' pkg.verify 'httpd postfix' verify_options=['nodeps', 'nosize']
```

```python
salt.modules.yumpkg.version(*names, **kwargs)
```

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

**CLI Example:**

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

```python
salt.modules.yumpkg.version_cmp(pkg1, pkg2, ignore_epoch=False)
```

New in version 2015.5.4.

Do a cmp-style comparison on two packages. Return -1 if pkg1 < pkg2, 0 if pkg1 == pkg2, and 1 if pkg1 > pkg2. Return None if there was a problem making the comparison.

- `ignore_epoch` [False] Set to True to ignore the epoch when comparing versions

**CLI Example:**

```
salt '*' pkg.version_cmp '0.2-001' '0.2.0.1-002'
```

### 21.9.490 salt.modules.zabbix module

Support for Zabbix

**optdepends**

- zabbix server

**configuration** This module is not usable until the zabbix user and zabbix password are specified either in a pillar or in the minion’s config file. Zabbix url should be also specified.

```python
zabbix.user: Admin
zabbix.password: mypassword
zabbix.url: http://127.0.0.1/zabbix/api_jsonrpc.php
```

Connection arguments from the minion config file can be overridden on the CLI by using arguments with _connection_ prefix.

```python
zabbix.apiinfo_version _connection_user=Admin _connection_password=zabbix _connection_url=http://host/zabbix/
```

codeauthor Jiri Kotlin <jiri.kotlin@ultimum.io>

```python
salt.modules.zabbix.apiinfo_version(**connection_args)
```

Retrieve the version of the Zabbix API.

New in version 2016.3.0.
Parameters

- `_connection_user` – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- `_connection_password` – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- `_connection_url` – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns

On success string with Zabbix API version, False on failure.

CLI Example: .. code-block:: bash
salt '*' zabbix.apiinfo_version

```
salt.modules.zabbix.compare_params(defined, existing, return_old_value=False)
```

New in version 2017.7.

Compares Zabbix object definition against existing Zabbix object.

Parameters

- `defined` – Zabbix object definition taken from sls file.
- `existing` – Existing Zabbix object taken from result of an API call.
- `return_old_value` – Default False. If True, returns dict("old"=old_val, "new"=new_val) for rollback purpose.

Returns

Params that are different from existing object. Result extended by object ID can be passed directly to Zabbix API update method.

```
salt.modules.zabbix.configuration_import(config_file, rules=None, file_format='xml', **connection_args)
```

New in version 2017.7.

Imports Zabbix configuration specified in file to Zabbix server.

Parameters

- `config_file` – File with Zabbix config (local or remote)
- `rules` – Optional - Rules that have to be different from default (defaults are the same as in Zabbix web UI)
- `file_format` – Config file format (default: xml)
- `_connection_user` – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- `_connection_password` – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- `_connection_url` – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

CLI Example:

```
salt '*' zabbix.configuration_import salt://zabbix/config/zabbix_templates.xml  
  ->  "{'screens': {'createMissing': True, 'updateExisting': True}}"
```

```
salt.modules.zabbix.get_object_id_by_params(obj, params=None, **connection_args)
```

New in version 2017.7.

Get ID of single Zabbix object specified by its name.

Parameters

- `obj` – Zabbix object type
- `params` – Parameters by which object is uniquely identified
- `_connection_user` – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- `_connection_password` – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- `_connection_url` – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)
Returns object ID

salt.modules.zabbix.get_zabbix_id_mapper()
New in version 2017.7.
Make ZABBIX_ID_MAPPER constant available to state modules.
Returns ZABBIX_ID_MAPPER

salt.modules.zabbix.host_create(host, groups, interfaces, **connection_args)
New in version 2016.3.0.
Create new host

Note: This function accepts all standard host properties: keyword argument names differ depending on your zabbix version, see here.

Parameters

- host – technical name of the host
- groups – groupids of host groups to add the host to
- interfaces – interfaces to be created for the host
- _connection_user – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- _connection_password – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- _connection_url – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)
- visible_name – string with visible name of the host, use 'visible_name' instead of 'name' parameter to not mess with value supplied from Salt sls file.

return: ID of the created host.

CLI Example:

```bash
salt '*' zabbix.host_create technicalname 4
     interfaces='{type: 1, main: 1, useip: 1, ip: "192.168.3.1", dns: "", port: 10050}"
     visible_name='Host Visible Name' inventory_mode=0 inventory='{"alias": "something"
...}'}
```

salt.modules.zabbix.host_delete(hostids, **connection_args)
Delete hosts.

New in version 2016.3.0.

Parameters

- hostids – Hosts (hostids) to delete.
- _connection_user – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- _connection_password – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- _connection_url – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns IDs of the deleted hosts.

CLI Example: .. code-block:: bash

generate sh
salt '*' zabbix.host_delete 10106

text

salt.modules.zabbix.host_exists(host=None, hostid=None, name=None, node=None, nodeids=None, **connection_args)
Checks if at least one host that matches the given filter criteria exists.
New in version 2016.3.0.

Parameters
- **host** – technical name of the host
- **hostids** – Hosts (hostids) to delete.
- **name** – visible name of the host
- **node** – name of the node the hosts must belong to (zabbix API < 2.4)
- **nodeids** – IDs of the node the hosts must belong to (zabbix API < 2.4)
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns IDs of the deleted hosts, False on failure.

CLI Example: .. code-block:: bash
salt '*' zabbix.host_exists 'Zabbix server'
salt.modules.zabbix.host_get(**connection_args**)

New in version 2016.3.0.

Retrieve hosts according to the given parameters

Note: This function accepts all optional host.get parameters: keyword argument names differ depending on your zabbix version, see here.

Parameters
- **host** – technical name of the host
- **name** – visible name of the host
- **hostids** – ids of the hosts
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns Array with convenient hosts details, False if no host found or on failure.

CLI Example: .. code-block:: bash
salt '*' zabbix.host_inventory_get(hostids, **connection_args**)

Retrieve host inventory according to the given parameters. See: https://www.zabbix.com/documentation/2.4/manual/api/reference/host/object#host_inventory

New in version 2019.2.0.

Parameters
- **hostids** – Return only host interfaces used by the given hosts.
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns Array with host interfaces details, False if no convenient host interfaces found or on failure.
salt.modules.zabbix.host_inventory_set( hostid, **connection_args )

Update host inventory items
NOTE: This function accepts all standard host: keyword argument names for inventory see: https://www.zabbix.com/documentation/2.4/manual/api/reference/host/object#host_inventory

New in version 2019.2.0.

Parameters

- **hostid** – ID of the host to update
- **clear_old** – Set to True in order to remove all existing inventory items before setting the specified items
- **connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns

ID of the updated host, False on failure.

CLI Example: .. code-block:: bash

```bash
salt '*' zabbix.host_inventory_set 101054 asset_tag=jml3322 type=vm clear_old=True
```

salt.modules.zabbix.host_list(**connection_args)

Retrieve all hosts.

New in version 2016.3.0.

Parameters

- **connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns

Array with details about hosts, False on failure.

CLI Example: .. code-block:: bash

```bash
salt '*' zabbix.host_list
```

salt.modules.zabbix.host_update( hostid, **connection_args )

Update existing hosts

Note: This function accepts all standard host and host.update properties: keyword argument names differ depending on your zabbix version, see the documentation for host objects and the documentation for updating hosts.

Parameters

- **hostid** – ID of the host to update
- **connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)
- **visible_name** – string with visible name of the host, use ‘visible_name’ instead of ‘name’ parameter to not mess with value supplied from Salt sls file.
Returns  ID of the updated host.

CLI Example: .. code-block:: bash
    salt '*' zabbix.host_update 10084 name='Zabbix server2'

salt.modules.zabbix.hostgroup_create(name, **connection_args)
New in version 2016.3.0.
Create a host group

Note: This function accepts all standard host group properties: keyword argument names differ depending on your zabbix version, see here.

Parameters

- **name** – name of the host group
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns  ID of the created host group.

CLI Example: .. code-block:: bash
    salt '*' zabbix.hostgroup_create MyNewGroup

salt.modules.zabbix.hostgroup_delete(hostgroupids, **connection_args)
Delete the host group.

New in version 2016.3.0.
Parameters

- **hostgroupids** – IDs of the host groups to delete
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns  ID of the deleted host groups, False on failure.

CLI Example: .. code-block:: bash
    salt '*' zabbix.hostgroup_delete 23

salt.modules.zabbix.hostgroup_exists(name=None, groupid=None, node=None, nodeids=None, **connection_args)
Checks if at least one host group that matches the given filter criteria exists.

New in version 2016.3.0.
Parameters

- **name** – names of the host groups
- **groupid** – host group IDs
- **node** – name of the node the host groups must belong to (zabbix API < 2.4)
- **nodeids** – IDs of the nodes the host groups must belong to (zabbix API < 2.4)
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
**_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns True if at least one host group exists, False if not or on failure.

CLI Example: .. code-block:: bash

    salt '*' zabbix.hostgroup_exists MyNewGroup

salt.modules.zabbix.hostgroup_get(name=None, groupids=None, hostids=None, **connection_args)

New in version 2016.3.0.

Retrieve host groups according to the given parameters

Note: This function accepts all standard hostgroup.get properities: keyword argument names differ depending on your zabbix version, see here.

Parameters

- **name** – names of the host groups
- **groupid** – host group IDs
- **node** – name of the node the host groups must belong to
- **nodeids** – IDs of the nodes the host groups must belong to
- **hostids** – return only host groups that contain the given hosts
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns Array with host groups details, False if no convenient host group found or on failure.

CLI Example: .. code-block:: bash

    salt '*' zabbix.hostgroup_get MyNewGroup

salt.modules.zabbix.hostgroup_list(**connection_args)

Retrieve all host groups.

New in version 2016.3.0.

Parameters

- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns Array with details about host groups, False on failure.

CLI Example: .. code-block:: bash

    salt '*' zabbix.hostgroup_list

salt.modules.zabbix.hostgroup_update(groupid, name=None, **connection_args)

New in version 2016.3.0.

Update existing hosts group

Note: This function accepts all standard host group properties: keyword argument names differ depending on your zabbix version, see here.
• **groupid** – ID of the host group to update
• **name** – name of the host group
• **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
• **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
• **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns IDs of updated host groups.

CLI Example: .. code-block:: bash
salt '*' zabbix.hostgroup_update 24 name='Renamed Name'

salt.modules.zabbix.hostinterface_create(hostid, ip=, dns=", main=1, if_type=1, useip=1, port=None, **connection_args)

New in version 2016.3.0.
Create new host interface

**Parameters**
- **hostid** – ID of the host the interface belongs to
- **ip** – IP address used by the interface
- **dns** – DNS name used by the interface
- **main** – whether the interface is used as default on the host (0 - not default, 1 - default)
- **port** – port number used by the interface
- **type** – Interface type (1 - agent; 2 - SNMP; 3 - IPMI; 4 - JMX)
- **useip** – Whether the connection should be made via IP (0 - connect using host DNS name; 1 - connect using host IP address for this host interface)
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns ID of the created host interface, False on failure.

CLI Example: .. code-block:: bash
salt '*' zabbix.hostinterface_create 10105 192.193.194.197

salt.modules.zabbix.hostinterface_delete(interfaceids=, **connection_args)

Delete host interface

New in version 2016.3.0.

**Parameters**
- **interfaceids** – IDs of the host interfaces to delete
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns ID of deleted host interfaces, False on failure.

CLI Example: .. code-block:: bash
salt '*' zabbix.hostinterface_delete 50

salt.modules.zabbix.hostinterface_get(hostids, **connection_args)

New in version 2016.3.0.

Retrieve host groups according to the given parameters

Note: This function accepts all standard hostinterface.get properties: keyword argument names differ depending on your zabbix version, see here.

Parameters

- **hostids** – Return only host interfaces used by the given hosts.
- **connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns Array with host interfaces details, False if no convenient host interfaces found or on failure.

CLI Example: .. code-block:: bash

salt '*' zabbix.hostinterface_get 101054

salt.modules.zabbix.hostinterface_update(interfaceid, **connection_args)

New in version 2016.3.0.

Update host interface

Note: This function accepts all standard hostinterface: keyword argument names differ depending on your zabbix version, see here.

Parameters

- **interfaceid** – ID of the hostinterface to update
- **connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns ID of the updated host interface, False on failure.

CLI Example: .. code-block:: bash

salt '*' zabbix.hostinterface_update 6 ip_=0.0.0.2

salt.modules.zabbix.mediatype_create(name, mediatype, **connection_args)

Create new mediatype

Note: This function accepts all standard mediatype properties: keyword argument names differ depending on your zabbix version, see here.

Parameters

- **mediatype** – media type - 0: email, 1: script, 2: sms, 3: Jabber, 100: Ez Texting
• **exec_path** – exec path - Required for script and Ez Texting types, see Zabbix API docs
• **gsm_modem** – exec path - Required for sms type, see Zabbix API docs
• **smtp_email** – email address from which notifications will be sent, required for email type
• **smtp_helo** – SMTP HELO, required for email type
• **smtp_server** – SMTP server, required for email type
• **status** – whether the media type is enabled - 0: enabled, 1: disabled
• **username** – authentication user, required for Jabber and Ez Texting types
• **passwd** – authentication password, required for Jabber and Ez Texting types
• **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
• **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
• **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

return: ID of the created mediatype.

CLI Example:
```bash
grep 'salt '*' zabbix.mediatype_create 'email' 0 smtp_email='noreply@example.com'
smtp_server='mailserver.example.com' smtp_helo='zabbix.example.com'
```
salt.modules.zabbix

**mediatype_update**

```
mediatypeid, name=False, mediatype=False, connection_args`
```

Update existing mediatype

**Note:** This function accepts all standard mediatype properties: keyword argument names differ depending on your zabbix version, see here.

**Parameters**

- **mediatypeid** – ID of the mediatype to update
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

**Returns**

IDs of the updated mediatypes, False on failure.

**CLI Example:**
```
salt '*' zabbix.usergroup_update 8 name="Email update"
```

salt.modules.zabbix.run_query

```
method, params, connection_args`
```

Send Zabbix API call

**Parameters**

- **method** – actual operation to perform via the API
- **params** – parameters required for specific method
- **connection_args** *(optional)*

  - **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
  - **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
  - **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

  all optional template.get parameters: keyword argument names depends on your zabbix version, see:  
  
  https://www.zabbix.com/documentation/2.4/manual/api/reference/

**Returns**

Response from Zabbix API

**CLI Example:**
```
salt '*' zabbix.run_query proxy.create '{"host": "zabbixproxy.domain.com", "status": "5"}'
```

salt.modules.zabbix.substitute_params

```
input_object, extend_params=None, filter_key='name', **kwargs`
```

New in version 2017.7.

Go through Zabbix object params specification and if needed get given object ID from Zabbix API and put it back as a value. Definition of the object is done via dict with keys "query_object" and "query_name".

**Parameters**

- **input_object** – Zabbix object type specified in state file
- **extend_params** – Specify query with params
- **filter_key** – Custom filtering key (default: name)
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

**Returns**

Params structure with values converted to string for further comparison purposes
salt.modules.zabbix.template_get(name=None, host=None, templateids=None, **connection_args)

Retrieve templates according to the given parameters.

Parameters
- **host** – technical name of the template
- **name** – visible name of the template
- **hostids** – ids of the templates
- **connection_args** (optional) – _connection_user: zabbix user (can also be set in opts or pillar, see module’s docstring)_connection_password: zabbix password (can also be set in opts or pillar, see module’s docstring) _connection_url: url of zabbix frontend (can also be set in opts or pillar, see module’s docstring)

all optional template.get parameters: keyword argument names depend on your zabbix version, see:

https://www.zabbix.com/documentation/2.4/manual/api/reference/template/get

Returns
Array with convenient template details, False if no template found or on failure.

CLI Example: .. code-block:: bash
salt '*' zabbix.template_get name='Template OS Linux' salt '*' zabbix.template_get templateids='["10050","10001"]'

salt.modules.zabbix.user_addmedia(userids, active, mediatypeid, period, sendto, severity, **connection_args)

Add new media to multiple users.

New in version 2016.3.0.

Parameters
- **userids** – ID of the user that uses the media
- **active** – Whether the media is enabled (0 enabled, 1 disabled)
- **mediatypeid** – ID of the media type used by the media
- **period** – Time when the notifications can be sent as a time period
- **sendto** – Address, user name or other identifier of the recipient
- **severity** – Trigger severities to send notifications about
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns
IDs of the created media.

CLI Example: .. code-block:: bash
salt '*' zabbix.user_addmedia 4 active=0 mediatypeid=1 period='1-7,00:00-24:00'
sendto='support2@example.com' severity=63

salt.modules.zabbix.user_create(alias, passwd, usgrps, **connection_args)

New in version 2016.3.0.

Create new zabbix user

Note: This function accepts all standard user properties: keyword argument names differ depending on your zabbix version, see here.

Parameters
- **alias** – user alias
- **passwd** – user’s password
- **usgrps** – user groups to add the user to
• `_connection_user` – zabbix user (can also be set in opts or pillar, see module’s docstring)
• `_connection_password` – zabbix password (can also be set in opts or pillar, see module’s docstring)
• `_connection_url` – url of zabbix frontend (can also be set in opts or pillar, see module’s docstring)
• `firstname` – string with firstname of the user, use 'firstname' instead of 'name' parameter to not mess with value supplied from Salt sls file.

**Returns** On success string with id of the created user.

CLI Example: .. code-block:: bash
   
salt '*' zabbix.user_create james password007 '[7, 12]' firstname='James Bond'

```python
salt.modules.zabbix.user_delete(users, **connection_args)
```
Delete zabbix users.

New in version 2016.3.0.

**Parameters**
- `users` – array of users (userids) to delete
- `_connection_user` – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- `_connection_password` – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- `_connection_url` – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

**Returns** On success array with userids of deleted users.

CLI Example: .. code-block:: bash
   
salt '*' zabbix.user_delete 15

```python
salt.modules.zabbix.user_deletemedia(mediaids, **connection_args)
```
Delete media by id.

New in version 2016.3.0.

**Parameters**
- `mediaids` – IDs of the media to delete
- `_connection_user` – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- `_connection_password` – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- `_connection_url` – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

**Returns** IDs of the deleted media, False on failure.

CLI Example: .. code-block:: bash
   
salt '*' zabbix.user_deletemedia 27

```python
salt.modules.zabbix.user_exists(alias, **connection_args)
```
Checks if user with given alias exists.

New in version 2016.3.0.

**Parameters**
- `alias` – user alias
- `_connection_user` – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- `_connection_password` – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- `_connection_url` – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)
Returns    True if user exists, else False.

CLI Example: .. code-block:: bash
    salt '*' zabbix.user_exists james

salt.modules.zabbix.user_get(    *alias=None, userids=None, **connection_args)*
Retrieve users according to the given parameters.

New in version 2016.3.0.

Parameters
    • alias – user alias
    • userids – return only users with the given IDs
    • _connection_user – Optional - zabbix user (can also be set in opts or pillar, see
        module’s docstring)
    • _connection_password – Optional - zabbix password (can also be set in opts or
        pillar, see module’s docstring)
    • _connection_url – Optional - url of zabbix frontend (can also be set in opts,
        pillar, see module’s docstring)

Returns    Array with details of convenient users, False on failure of if no user found.

CLI Example: .. code-block:: bash
    salt '*' zabbix.user_get media james

salt.modules.zabbix.user_getmedia(    *userids=None, **connection_args)*
Retrieve media according to the given parameters

New in version 2016.3.0.

Note: This function accepts all standard usermedia.get properties: keyword argument names differ depending
on your zabbix version, see here.

Parameters
    • userids – return only media that are used by the given users
    • _connection_user – Optional - zabbix user (can also be set in opts or pillar, see
        module’s docstring)
    • _connection_password – Optional - zabbix password (can also be set in opts or
        pillar, see module’s docstring)
    • _connection_url – Optional - url of zabbix frontend (can also be set in opts,
        pillar, see module’s docstring)

Returns    List of retrieved media, False on failure.

CLI Example: .. code-block:: bash
    salt '*' zabbix.user_getmedia

salt.modules.zabbix.user_list(**connection_args)*
Retrieve all of the configured users.

New in version 2016.3.0.

Parameters
    • _connection_user – Optional - zabbix user (can also be set in opts or pillar, see
        module’s docstring)
    • _connection_password – Optional - zabbix password (can also be set in opts or
        pillar, see module’s docstring)
    • _connection_url – Optional - url of zabbix frontend (can also be set in opts,
        pillar, see module’s docstring)

Returns    Array with user details.

CLI Example: .. code-block:: bash
    salt '*' zabbix.user_list
salt.modules.zabbix.user_update(userid, **connection_args)

New in version 2016.3.0.

Update existing users

**Note:** This function accepts all standard user properties: keyword argument names differ depending on your zabbix version, see [here](#).

**Parameters**
- **userid** – id of the user to update
- **connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

**Returns** Id of the updated user on success.

**CLI Example:**
```bash
salt '*' zabbix.user_update 16 visible_name='James Brown'
```

salt.modules.zabbix.usergroup_create(name, **connection_args)

New in version 2016.3.0.

Create new user group

**Note:** This function accepts all standard user group properties: keyword argument names differ depending on your zabbix version, see [here](#).

**Parameters**
- **name** – name of the user group
- **connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

**Returns** IDs of the created user groups.

**CLI Example:**
```bash
salt '*' zabbix.usergroup_create GroupName
```

salt.modules.zabbix.usergroup_delete(usergroupids, **connection_args)

New in version 2016.3.0.

**Parameters**
- **usergroupids** – IDs of the user groups to delete
- **connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

**Returns** IDs of the deleted user groups.

**CLI Example:**
```bash
salt '*' zabbix.usergroup_delete 28
```
salt.modules.zabbix.usergroup_exists(name=None, node=None, nodeids=None, **connection_args)

Checks if at least one user group that matches the given filter criteria exists

New in version 2016.3.0.

Parameters

- **name** – names of the user groups
- **node** – name of the node the user groups must belong to (This will override the nodeids parameter.)
- **nodeids** – IDs of the nodes the user groups must belong to
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns True if at least one user group that matches the given filter criteria exists, else False.

CLI Example: .. code-block:: bash
salt '*' zabbix.usergroup_exists Guests

salt.modules.zabbix.usergroup_get(name=None, usrgrpids=None, userids=None, **connection_args)

Retrieve user groups according to the given parameters

Note: This function accepts all usergroup_get properties: keyword argument names differ depending on your zabbix version, see here.

Parameters

- **name** – names of the user groups
- **usrgrpids** – return only user groups with the given IDs
- **userids** – return only user groups that contain the given users
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns Array with convenient user groups details, False if no user group found or on failure.

CLI Example: .. code-block:: bash
salt '*' zabbix.usergroup_get Guests

salt.modules.zabbix.usergroup_list(**connection_args)

Retrieve all enabled user groups.

New in version 2016.3.0.

Parameters

- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns Array with enabled user groups details, False on failure.
salt.modules.zabbix.usergroup_update(usrgrpid, **connection_args)

New in version 2016.3.0.

Update existing user group

Note: This function accepts all standard user group properties: keyword argument names differ depending on your zabbix version, see here.

Parameters

- **usrgrpid** – ID of the user group to update.
- **connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns

IDs of the updated user group, False on failure.

CLI Example: .. code-block:: bash

salt '*' zabbix.usergroup_update 8 name=guestsRenamed

salt.modules.zabbix.usermacro_create(macro, value, hostid, **connection_args)

Create new host usermacro.

Parameters

- **macro** – name of the host usermacro
- **value** – value of the host usermacro
- **hostid** – hostid or templateid
- **connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

return: ID of the created host usermacro.

CLI Example:

```
salt 'x' zabbix.usermacro_create '{SNMP_COMMUNITY}' 'public' 1
```

salt.modules.zabbix.usermacro_createglobal(macro, value, **connection_args)

Create new global usermacro.

Parameters

- **macro** – name of the global usermacro
- **value** – value of the global usermacro
- **connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

return: ID of the created global usermacro.

CLI Example:
The Salt modules `zabbix.usermacro_delete` and `zabbix.usermacro_deleteglobal` are used to delete host and global user macros, respectively. The `zabbix.usermacro_get` module retrieves user macros based on various parameters, while `zabbix.usermacro_update` updates an existing host user macro.

```python
salt '*' zabbix.usermacro_createglobal '{$SNMP_COMMUNITY}' 'public'
```

```python
salt.modules.zabbix.usermacro_delete(macroids, **connection_args)
Delete host usermacros.
Parameters
- **macroids** – macroids of the host usermacros
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns
- return: IDs of the deleted host usermacro.

CLI Example:
salt '*' zabbix.usermacro_delete 21
```

```python
salt.modules.zabbix.usermacro_deleteglobal(macroids, **connection_args)
Delete global usermacros.
Parameters
- **macroids** – macroids of the global usermacros
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns
- return: IDs of the deleted global usermacro.

CLI Example:
salt '*' zabbix.usermacro_deleteglobal 21
```

```python
salt.modules.zabbix.usermacro_get(macro=None, hostids=None, templateids=None, hostmacroids=None, globalmacroids=None, globalmacro=False, **connection_args)
Retrieve user macros according to the given parameters.
Parameters
- **macro** – name of the usermacro
- **hostids** – Return macros for the given hostids
- **templateids** – Return macros for the given templateids
- **hostmacroids** – Return macros with the given hostmacroids
- **globalmacroids** – Return macros with the given globalmacroids (implies globalmacro=True)
- **globalmacro** – if True, returns only global macros
- **connection_args** (optional) - _connection_user: zabbix user (can also be set in opts or pillar, see module’s docstring) _connection_password: zabbix password (can also be set in opts or pillar, see module’s docstring) _connection_url: url of zabbix frontend (can also be set in opts or pillar, see module’s docstring)

Returns
- Array with usermacro details, False if no usermacro found or on failure.

CLI Example: .. code-block:: bash
salt '*' zabbix.usermacro_get macro='{$SNMP_COMMUNITY}'
```

```python
salt.modules.zabbix.usermacro_update(hostmacroid, value, **connection_args)
Update existing host usermacro.
```

2828 Chapter 21. Salt Module Reference
Parameters

- **hostmacroid** – id of the host usermacro
- **value** – new value of the host usermacro
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

return: ID of the update host usermacro.

CLI Example:

```
salt '*' zabbix.usermacro_update 1 'public'
```

```
salt.modules.zabbix.usermacro_updateglobal(globalmacroid, value, **connection_args)
```

Update existing global usermacro.

Parameters

- **globalmacroid** – id of the host usermacro
- **value** – new value of the host usermacro
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

return: ID of the update global usermacro.

CLI Example:

```
salt '*' zabbix.usermacro_updateglobal 1 'public'
```

### 21.9.491 `salt.modules.zcbuildout`

Management of zc.buildout

New in version 2014.1.0.

This module is inspired by [minitage’s buildout maker](#)

**Note:** The zc.buildout integration is still in beta; the API is subject to change

**General notes**

You have those following methods:

- `upgrade-bootstrap`
- `bootstrap`
- `run-buildout`
- `buildout`

```python
salt.modules.zcbuildout.bootstrap("a", "kw")
```

Run the buildout bootstrap dance (python bootstrap.py).
directory directory to execute in
config alternative buildout configuration file to use
runas User used to run buildout as
env environment variables to set when running
buildout_ver force a specific buildout version (1 | 2)
test_release buildout accept test release
offline are we executing buildout in offline mode
distribute Forcing use of distribute
new_st Forcing use of setuptools >= 0.7
python path to a python executable to use in place of default (salt one)
onlyif Only execute cmd if statement on the host return 0
unless Do not execute cmd if statement on the host return 0
use_vt Use the new salt VT to stream output [experimental]

CLI Example:

```
salt '*' buildout.bootstrap /srv/mybuildout
```

salt.modules.zcbuildout.buildout(*a,**kw)
Run buildout in a directory.

```
directory directory to execute in
config buildout config to use
parts specific buildout parts to run
runas user used to run buildout as
env environment variables to set when running
buildout_ver force a specific buildout version (1 | 2)
test_release buildout accept test release
new_st Forcing use of setuptools >= 0.7
distribute use distribute over setuptools if possible
offline does buildout run offline
python python to use
debug run buildout with -D debug flag
onlyif Only execute cmd if statement on the host return 0
unless Do not execute cmd if statement on the host return 0
newest run buildout in newest mode
verbose run buildout in verbose mode (-vvvvv)
use_vt Use the new salt VT to stream output [experimental]
```

CLI Example:

```
salt '*' buildout.buildout /srv/mybuildout
```

salt.modules.zcbuildout.run_buildout(*a,**kw)
Run a buildout in a directory.

```
directory directory to execute in
config alternative buildout configuration file to use
offline are we executing buildout in offline mode
runas user used to run buildout as
env environment variables to set when running
onlyif Only execute cmd if statement on the host return 0
unless Do not execute cmd if statement on the host return 0
newest run buildout in newest mode
force run buildout unconditionally
verbose run buildout in verbose mode (-vvvvv)
use_vt Use the new salt VT to stream output [experimental]
```

CLI Example:
salt 'salt' buildout.run_buildout /srv/mybuildout

salt.modules.zcbuildout.upgrade_bootstrap(*a, **kw)
Upgrade current bootstrap.py with the last released one.

Indeed, when we first run a buildout, a common source of problem is to have a locally stale bootstrap, we just try to grab a new copy
directory directory to execute in
offline are we executing buildout in offline mode
buildout_ver forcing to use a specific buildout version (1 | 2)
onlyif Only execute cmd if statement on the host return 0
unless Do not execute cmd if statement on the host return 0
CLI Example:
salt 'salt' buildout.upgrade_bootstrap /srv/mybuildout

21.9.492 salt.modules.zenoss

Module for working with the Zenoss API

New in version 2016.3.0.

depends requests
configuration This module requires a 'zenoss' entry in the master/minion config.

For example:

```yaml
zenoss:
  hostname: https://zenoss.example.com
  username: admin
  password: admin123
```

salt.modules.zenoss.add_device(device=None, device_class=None, collector='localhost', prod_state=1000)
A function to connect to a zenoss server and add a new device entry.

Parameters
  - device – (Optional) Will use the grain 'fqdn' by default.
  - device_class – (Optional) The device class to use. If none, will determine based on kernel grain.
  - collector – (Optional) The collector to use for this device. Defaults to 'localhost'.
  - prod_state – (Optional) The prodState to set on the device. If none, defaults to 1000 (production)

CLI Example: salt '*' zenoss.add_device

salt.modules.zenoss.device_exists(device=None)
Check to see if a device already exists in Zenoss.

Parameters device – (Optional) Will use the grain 'fqdn' by default

CLI Example: salt '*' zenoss.device_exists

salt.modules.zenoss.find_device(device=None)
Find a device in Zenoss. If device not found, returns None.

Parameters device – (Optional) Will use the grain 'fqdn' by default

CLI Example: salt '*' zenoss.find_device
salt.modules.zenoss.set_prod_state(prod_state, device=None)

A function to set the prod_state in zenoss.

Parameters

• prod_state – (Required) Integer value of the state
• device – (Optional) Will use the grain 'fqdn' by default.

CLI Example: salt zenoss.set_prod_state 1000 hostname

21.9.493 salt.modules.zfs

Module for running ZFS command

   codeauthor Nitin Madhok <nmadhok@clemson.edu>, Jorge Schrauwen <sjorge@blackdot.be>
   maintainer Jorge Schrauwen <sjorge@blackdot.be>
   maturity new
   depends salt.utils.zfs
   platform illumos,freebsd,linux

Changed in version 2018.3.1: Big refactoring to remove duplicate code, better type conversions and improved consistency in output.

salt.modules.zfs.bookmark(snapshot, bookmark)

Creates a bookmark of the given snapshot

   Note: Bookmarks mark the point in time when the snapshot was created, and can be used as the incremental source for a zfs send command.

   This feature must be enabled to be used. See zpool-features(5) for details on ZFS feature flags and the bookmarks feature.

snapshot [string] name of snapshot to bookmark
bookmark [string] name of bookmark

New in version 2016.3.0.

CLI Example:

    salt '*' zfs.bookmark myzpool/mydataset@yesterday myzpool/mydataset#complete

salt.modules.zfs.clone(name_a, name_b, **kwargs)

Creates a clone of the given snapshot.

name_a [string] name of snapshot
name_b [string] name of filesystem or volume
create_parent [boolean] creates all the non-existing parent datasets. any property specified on the command line using the -o option is ignored.
properties [dict] additional zfs properties (-o)

   Note: ZFS properties can be specified at the time of creation of the filesystem by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

    properties='{"property1": 'value1', 'property2': 'value2'}"
New in version 2016.3.0.

CLI Example:

```bash
salt '*' zfs.clone myzpool/mydataset@yesterday myzpool/mydataset_yesterday
```

**salt.modules.zfs.create(name, **kwargs)**

Create a ZFS File System.

- **name** [string] name of dataset or volume
- **volume_size** [string] if specified, a zvol will be created instead of a dataset
- **sparse** [boolean] create sparse volume
- **create_parent** [boolean] creates all the non-existing parent datasets. any property specified on the command line using the -o option is ignored.
- **properties** [dict] additional zfs properties (-o)

**Note:** ZFS properties can be specified at the time of creation of the filesystem by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

```python
properties="{'property1': 'value1', 'property2': 'value2'}"
```

New in version 2015.5.0.

CLI Example:

```bash
salt '*' zfs.create myzpool/mydataset [create_parent=True|False]
salt '*' zfs.create myzpool/mydataset properties="{'mountpoint': '/export/zfs', 'sharenfs': 'on'}"
salt '*' zfs.create myzpool/mydataset/myvolume volume_size=1G [sparse=True|False]
salt '*' zfs.create myzpool/mydataset/myvolume volume_size=1G properties="{'volblocksize': '512'}" [sparse=True|False]
```

**salt.modules.zfs.destroy(name, **kwargs)**

Destroy a ZFS File System.

- **name** [string] name of dataset, volume, or snapshot
- **force** [boolean] force an unmount of any file systems using the unmount -f command.
- **recursive** [boolean] recursively destroy all children. (-r)
- **recursive_all** [boolean] recursively destroy all dependents, including cloned file systems outside the target hierarchy. (-R)

**Warning:** watch out when using recursive and recursive_all

New in version 2015.5.0.

CLI Example:

```bash
salt '*' zfs.destroy myzpool/mydataset [force=True|False]
```

**salt.modules.zfs.diff(name_a, name_b=None, **kwargs)**

Display the difference between a snapshot of a given filesystem and another snapshot of that filesystem from a later time or the current contents of the filesystem.

- **name_a** [string] name of snapshot
- **name_b** [string] (optional) name of snapshot or filesystem
show_changetime [boolean] display the path’s inode change time as the first column of output. (default = True)
show_indication [boolean] display an indication of the type of file. (default = True)
parsable [boolean] if true we don’t parse the timestamp to a more readable date (default = True)
New in version 2016.3.0.

CLI Example:
```
salt '*' zfs.diff myzpool/mydataset@yesterday myzpool/mydataset
```

```
```

salt.modules.zfs.exists(name, **kwargs)
Check if a ZFS filesystem or volume or snapshot exists.

name [string] name of dataset
type [string] also check if dataset is of a certain type, valid choices are: filesystem, snapshot, volume, bookmark, or all.
New in version 2015.5.0.

CLI Example:
```
salt '*' zfs.exists myzpool/mydataset
salt '*' zfs.exists myzpool/myvolume type=volume
```

```
```

salt.modules.zfs.get(“dataset”, **kwargs)
Displays properties for the given datasets.

dataset [string] name of snapshot(s), filesystem(s), or volume(s)
properties [string] comma-separated list of properties to list, defaults to all
recursive [boolean] recursively list children
depth [int] recursively list children to depth
fields [string] comma-separated list of fields to include, the name and property field will always be added
type [string] comma-separated list of types to display, where type is one of filesystem, snapshot, volume, bookmark, or all.
source [string] comma-separated list of sources to display. Must be one of the following: local, default, inherited, temporary, and none. The default value is all sources.
parsable [boolean] display numbers in parsable (exact) values (default = True) .. versionadded:: 2018.3.0

Note: If no datasets are specified, then the command displays properties for all datasets on the system.

New in version 2016.3.0.

CLI Example:
```
salt '*' zfs.get
salt '*' zfs.get myzpool/mydataset [recursive=True|False]
salt '*' zfs.get myzpool/mydataset properties="sharefs,mountpoint"
→{recursive=True|False}
salt '*' zfs.get myzpool/mydataset myzpool/myotherdataset properties=available
→fields=value depth=1
```

salt.modules.zfs.hold(tag, “snapshot”, **kwargs)
Adds a single reference, named with the tag argument, to the specified snapshot or snapshots.

Note: Each snapshot has its own tag namespace, and tags must be unique within that space.

If a hold exists on a snapshot, attempts to destroy that snapshot by using the zfs destroy command return EBUSY.
tag  [string] name of tag
snapshot  [string] name of snapshot(s)
recursive  [boolean] specifies that a hold with the given tag is applied recursively to the snapshots of all
descendent file systems.

New in version 2016.3.0.
Changed in version 2018.3.1.

**Warning:** As of 2018.3.1 the tag parameter no longer accepts a comma-separated value. It's is now possible
to create a tag that contains a comma, this was impossible before.

CLI Example:

```bash
salt '*' zfs.hold mytag myzpool/mydataset@mysnapshot [recursive=True]
salt '*' zfs.hold mytag myzpool/mydataset@mysnapshot myzpool/
        mydataset@myothersnapshot
```

**salt.modules.zfs.holds**(snapshot, **kwargs)

Lists all existing user references for the given snapshot or snapshots.

snapshot  [string] name of snapshot
recursive  [boolean] lists the holds that are set on the named descendent snapshots also.

New in version 2016.3.0.

CLI Example:

```bash
salt '*' zfs.holds myzpool/mydataset@baseline
```

**salt.modules.zfs.inherit**(prop, name, **kwargs)

Clears the specified property

prop  [string] name of property
name  [string] name of the filesystem, volume, or snapshot
recursive  [boolean] recursively inherit the given property for all children.
revert  [boolean] revert the property to the received value if one exists; otherwise operate as if the -S option
was not specified.

New in version 2016.3.0.

CLI Example:

```bash
salt '*' zfs.inherit canmount myzpool/mydataset [recursive=True|False]
```

**salt.modules.zfs.list_**(name=None, **kwargs)

Return a list of all datasets or a specified dataset on the system and the values of their used, available, refer-
cenced, and mountpoint properties.

name  [string] name of dataset, volume, or snapshot
recursive  [boolean] recursively list children
depth  [int] limit recursion to depth
properties  [string] comma-separated list of properties to list, the name property will always be added
type  [string] comma-separated list of types to display, where type is one of filesystem, snapshot, volume,
       bookmark, or all.
sort  [string] property to sort on (default = name)
order  [string [ascending|descending]] sort order (default = ascending)
parsable  [boolean] display numbers in parsable (exact) values .. versionadded:: 2018.3.0

New in version 2015.5.0.

CLI Example:
```python
salt '*' zfs.list
salt '*' zfs.list myzpool/mydataset [recursive=True|False]
salt '*' zfs.list myzpool/mydataset properties="sharenfs,mountpoint"
```

**salt.modules.zfs.list_mount()**

List mounted zfs filesystems

New in version 2018.3.1.

CLI Example:

```python
salt '*' zfs.list_mount
```

**salt.modules.zfs.mount(name=None, **kwargs)**

Mounts ZFS file systems

- **name** [string] name of the filesystem, having this set to None will mount all filesystems. (this is the default)
- **overlay** [boolean] perform an overlay mount.
- **options** [string] optional comma-separated list of mount options to use temporarily for the duration of the mount.

New in version 2016.3.0.

Changed in version 2018.3.1.

**Warning:** Passing `-a` as name is deprecated and will be removed in Sodium.

CLI Example:

```python
salt '*' zfs.mount
salt '*' zfs.mount myzpool/mydataset
salt '*' zfs.mount myzpool/mydataset options=ro
```

**salt.modules.zfs.promote(name)**

Promotes a clone file system to no longer be dependent on its "origin" snapshot.

**Note:** This makes it possible to destroy the file system that the clone was created from. The clone parent-child dependency relationship is reversed, so that the origin file system becomes a clone of the specified file system.

The snapshot that was cloned, and any snapshots previous to this snapshot, are now owned by the promoted clone. The space they use moves from the origin file system to the promoted clone, so enough space must be available to accommodate these snapshots. No new space is consumed by this operation, but the space accounting is adjusted. The promoted clone must not have any conflicting snapshot names of its own. The rename subcommand can be used to rename any conflicting snapshots.

- **name** [string] name of clone-filesystem

New in version 2016.3.0.

CLI Example:

```python
salt '*' zfs.promote myzpool/myclone
```

**salt.modules.zfs.release(tag, 'snapshot', **kwargs)**

Removes a single reference, named with the tag argument, from the specified snapshot or snapshots.
Note: The tag must already exist for each snapshot. If a hold exists on a snapshot, attempts to destroy that snapshot by using the zfs destroy command return EBUSY.

tag [string] name of tag
snapshot [string] name of snapshot(s)
recursive [boolean] recursively releases a hold with the given tag on the snapshots of all descendent file systems.

New in version 2016.3.0.
Changed in version 2018.3.1.

Warning: As of 2018.3.1 the tag parameter no longer accepts a comma-separated value. It’s is now possible to create a tag that contains a comma, this was impossible before.

CLI Example:

```
salt '*' zfs.release mytag myzpool/mydataset@mysnapshot [recursive=True]
salt '*' zfs.release mytag myzpool/mydataset@mysnapshot myzpool/
    →mydataset@myothersnapshot
```

salt.modules.zfs.rename(name, new_name, **kwargs)
Rename or Relocate a ZFS File System.

name [string] name of dataset, volume, or snapshot
new_name [string] new name of dataset, volume, or snapshot
force [boolean] force unmount any filesystems that need to be unmounted in the process.
create_parent [boolean] creates all the nonexistent parent datasets. Datasets created in this manner are automatically mounted according to the mountpoint property inherited from their parent.
recursive [boolean] recursively rename the snapshots of all descendent datasets. snapshots are the only dataset that can be renamed recursively.

New in version 2015.5.0.

CLI Example:

```
salt '*' zfs.rename myzpool/mydataset myzpool/renameddataset
```

salt.modules.zfs.rollback(name, **kwargs)
Roll back the given dataset to a previous snapshot.

name [string] name of snapshot
recursive [boolean] destroy any snapshots and bookmarks more recent than the one specified.
recursive_all [boolean] destroy any more recent snapshots and bookmarks, as well as any clones of those snapshots.
force [boolean] used with the -R option to force an unmount of any clone file systems that are to be destroyed.

Warning: When a dataset is rolled back, all data that has changed since the snapshot is discarded, and the dataset reverts to the state at the time of the snapshot. By default, the command refuses to roll back to a snapshot other than the most recent one.

In order to do so, all intermediate snapshots and bookmarks must be destroyed by specifying the -r option.

New in version 2016.3.0.

CLI Example:
salt.modules.zfs.set(\'dataset\', **kwargs)
Sets the property or list of properties to the given value(s) for each dataset.

**dataset** [string] name of snapshot(s), filesystem(s), or volume(s)

**properties** [string] additional zfs properties pairs

**Note:** properties are passed as key-value pairs. e.g. `compression=off`

**Note:** Only some properties can be edited.

See the Properties section for more information on what properties can be set and acceptable values.

Numeric values can be specified as exact values, or in a human-readable form with a suffix of B, K, M, G, T, P, E (for bytes, kilobytes, megabytes, gigabytes, terabytes, petabytes, or exabytes respectively).

New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.set myzpool/mydataset compression=off
salt '*' zfs.set myzpool/mydataset myzpool/myotherdataset compression=lz4
  --canmount=off
```

salt.modules.zfs.snapshot(\'snapshot\', **kwargs)
Creates snapshots with the given names.

**snapshot** [string] name of snapshot(s)

**recursive** [boolean] recursively create snapshots of all descendent datasets.

**properties** [dict] additional zfs properties (-o)

**Note:** ZFS properties can be specified at the time of creation of the filesystem by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

```python
properties="{'property1': 'value1', 'property2': 'value2'}"
```

New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.snapshot myzpool/mydataset@yesterday [recursive=True]
salt '*' zfs.snapshot myzpool/mydataset@yesterday myzpool/
  myotherdataset@yesterday [recursive=True]
```

salt.modules.zfs.unmount(name, **kwargs)
Unmounts ZFS file systems

**name** [string] name of the filesystem, you can use None to unmount all mounted filesystems.

**force** [boolean] forcefully unmount the file system, even if it is currently in use.

**Warning:** Using -a for the name parameter will probably break your system, unless your rootfs is not on zfs.
New in version 2016.3.0.
Changed in version 2018.3.1.

Warning: Passing `-a` as name is deprecated and will be removed in Sodium.

CLI Example:
```
salt '*' zfs.unmount myzpool/mydataset [force=True|False]
```

21.9.494 salt.modules.zk_concurrency

Concurrency controls in zookeeper

**depends** kazoo

**configuration** See `salt.modules.zookeeper` for setup instructions.

This module allows you to acquire and release a slot. This is primarily useful for ensuring that no more than N hosts take a specific action at once. This can also be used to coordinate between masters.

```
salt.modules.zk_concurrency.lock(path, zk_hosts=None, identifier=None, max_concurrency=1, timeout=None, ephemeral_lease=False, force=False, profile=None, scheme=None, username=None, password=None, default_acl=None)
```

Get lock (with optional timeout)
- **path** The path in zookeeper where the lock is
- **zk_hosts** zookeeper connect string
- **identifier** Name to identify this minion, if unspecified defaults to the hostname
- **max_concurrency** Maximum number of lock holders
- **timeout** timeout to wait for the lock. A None timeout will block forever
- **ephemeral_lease** Whether the locks in zookeeper should be ephemeral
- **force** Forcibly acquire the lock regardless of available slots

Example:
```
salt.modules.zk_concurrency.lock_holders(path, zk_hosts=None, identifier=None, max_concurrency=1, timeout=None, ephemeral_lease=False, profile=None, scheme=None, username=None, password=None, default_acl=None)
```

Return an un-ordered list of lock holders
- **path** The path in zookeeper where the lock is
- **zk_hosts** zookeeper connect string
- **identifier** Name to identify this minion, if unspecified defaults to hostname
- **max_concurrency** Maximum number of lock holders
- **timeout** timeout to wait for the lock. A None timeout will block forever
- **ephemeral_lease** Whether the locks in zookeeper should be ephemeral

Example:
```
salt.modules.zk_concurrency.party_members(path, zk_hosts=None, min_nodes=1, blocking=False, profile=None, scheme=None, username=None, password=None, default_acl=None)
```

Get the List of identifiers in a particular party, optionally waiting for the specified minimum number of nodes (min_nodes) to appear
**Path** The path in zookeeper where the lock is
**zk_hosts** zookeeper connect string
**min_nodes** The minimum number of nodes expected to be present in the party
**blocking** The boolean indicating if we need to block until min_nodes are available

Example:

```python
salt.modules.zk_concurrency.unlock(path, zk_hosts=None, identifier=None, max_concurrency=1, ephemeral_lease=False, scheme=None, profile=None, user-name=None, password=None, default_acl=None)
```

Remove lease from semaphore

**Path** The path in zookeeper where the lock is
**zk_hosts** zookeeper connect string
**identifier** Name to identify this minion, if unspecified defaults to hostname
**max_concurrency** Maximum number of lock holders
**timeout** timeout to wait for the lock. A None timeout will block forever
**ephemeral_lease** Whether the locks in zookeeper should be ephemeral

Example:

**21.9.495 salt.modules.znc**

znc - An advanced IRC bouncer

New in version 2014.7.0.

Provides an interface to basic ZNC functionality

```python
salt.modules.znc.buildmod("modules")
```

Build module using znc-buildmod

CLI Example:

```bash
salt '*' znc.buildmod module.cpp [...]
```

```python
salt.modules.znc.dumpconf()
```

Write the active configuration state to config file

CLI Example:

```bash
salt '*' znc.dumpconf
```

```python
salt.modules.znc.rehashconf()
```

Rehash the active configuration state from config file

CLI Example:

```bash
salt '*' znc.rehashconf
```

```python
salt.modules.znc.version()
```

Return server version from znc --version

CLI Example:

```bash
salt '*' znc.version
```

**21.9.496 salt.modules.zoneadm**

Module for Solaris 10's zoneadm
maintainer Jorge Schrauwen <sjorge@blackdot.be>
maturity new
platform OmniOS, OpenIndiana, SmartOS, OpenSolaris, Solaris 10

New in version 2017.7.0.

```
Warning: Oracle Solaris 11’s zoneadm is not supported by this module!
```

```
salt.modules.zoneadm.attach(zone, force=False, brand_opts=None)
  Attach the specified zone.
  zone [string] name of the zone
  force [boolean] force the zone into the "installed" state with no validation
  brand_opts [string] brand specific options to pass
  CLI Example:

  salt '*' zoneadm.attach lawrence
  salt '*' zoneadm.attach lawrence True
```

```
salt.modules.zoneadm.boot(zone, single=False, altinit=None, smf_options=None)
  Boot (or activate) the specified zone.
  zone [string] name or uuid of the zone
  single [boolean] boots only to milestone svc:/milestone/single-user:default.
  altinit [string] valid path to an alternative executable to be the primordial process.
  smf_options [string] include two categories of options to control booting behavior of the service management facility: recovery options and messages options.
  CLI Example:

  salt '*' zoneadm.boot clementine
  salt '*' zoneadm.boot maeve single=True
  salt '*' zoneadm.boot teddy single=True smf_options=verbose
```

```
salt.modules.zoneadm.clone(zone, source, snapshot=None)
  Install a zone by copying an existing installed zone.
  zone [string] name of the zone
  source [string] zone to clone from
  snapshot [string] optional name of snapshot to use as source
  CLI Example:

  salt '*' zoneadm.clone clementine dolores
```

```
salt.modules.zoneadm.detach(zone)
  Detach the specified zone.
  zone [string] name or uuid of the zone
  CLI Example:

  salt '*' zoneadm.detach kissy
```

```
salt.modules.zoneadm.halt(zone)
  Halt the specified zone.
  zone [string] name or uuid of the zone

  Note: To cleanly shutdown the zone use the shutdown function.
```
CLI Example:

```
salt '*' zoneadm.halt hector
```

```
salt.modules.zoneadm.install(zone, nodataset=False, brand_opts=None)
```

Install the specified zone from the system.

- **zone** [string] name of the zone
- **nodataset** [boolean] do not create a ZFS file system
- **brand_opts** [string] brand specific options to pass

CLI Example:

```
salt '*' zoneadm.install dolores
```

```
salt '*' zoneadm.install teddy True
```

```
salt.modules.zoneadm.list_zones(verbatim=False, installed=False, configured=False, hide_global=True)
```

List all zones

- **verbatim** [boolean] display additional zone information
- **installed** [boolean] include installed zones in output
- **configured** [boolean] include configured zones in output
- **hide_global** [boolean] do not include global zone

CLI Example:

```
salt '*' zoneadm.list
```

```
salt.modules.zoneadm.move(zone, zonepath)
```

Move zone to new zonepath.

- **zone** [string] name or uuid of the zone
- **zonepath** [string] new zonepath

CLI Example:

```
salt '*' zoneadm.move meave /sweetwater/meave
```

```
salt.modules.zoneadm.ready(zone)
```

Prepares a zone for running applications.

- **zone** [string] name or uuid of the zone

CLI Example:

```
salt '*' zoneadm.ready clementine
```

```
salt.modules.zoneadm.reboot(zone, single=False, altinit=None, smf_options=None)
```

Restart the zone. This is equivalent to a halt boot sequence.

- **zone** [string] name or uuid of the zone
- **single** [boolean] boots only to milestone svc:/milestone/single-user:default.
- **altinit** [string] valid path to an alternative executable to be the primordial process.
- **smf_options** [string] include two categories of options to control booting behavior of the service management facility: recovery options and messages options.

CLI Example:

```
salt '*' zoneadm.reboot dolores
```

```
salt '*' zoneadm.reboot teddy single=True
```

```
salt.modules.zoneadm.shutdown(zone, reboot=False, single=False, altinit=None, smf_options=None)
```

Gracefully shutdown the specified zone.

- **zone** [string] name or uuid of the zone
- **reboot** [boolean] reboot zone after shutdown (equivalent of shutdown -i6 -g0 -y)
single [boolean] boots only to milestone svc:/milestone/single-user:default.
altinit [string] valid path to an alternative executable to be the primordial process.
smf_options [string] include two categories of options to control booting behavior of the service management facility: recovery options and messages options.

CLI Example:
```
salt '*' zoneadm.shutdown peter
salt '*' zoneadm.shutdown armistice reboot=True
```

salt.modules.zoneadm.uninstall(zone)
Uninstall the specified zone from the system.
zone [string] name or uuid of the zone

Warning: The -F flag is always used to avoid the prompts when uninstalling.

CLI Example:
```
salt '*' zoneadm.uninstall teddy
```

salt.modules.zoneadm.verify(zone)
Check to make sure the configuration of the specified zone can safely be installed on the machine.
zone [string] name of the zone

CLI Example:
```
salt '*' zoneadm.verify dolores
```

21.9.497 salt.modules.zonecfg

Module for Solaris 10’s zonecfg

maintainer Jorge Schrauwen <sjorge@blackdot.be>
maturity new
platform OmniOS,OpenIndiana,SmartOS,OpenSolaris,Solaris 10
depend salt.modules.file

New in version 2017.7.0.

Warning: Oracle Solaris 11’s zonecfg is not supported by this module!

salt.modules.zonecfg.add_resource(zone, resource_type, **kwargs)
Add a resource
zone [string] name of zone
resource_type [string] type of resource
kwargs [string|int|...] resource properties

CLI Example:
```
salt '*' zonecfg.add_resource tallgeese rctl name=zone.max-locked-memory value='(priv=privileged,limit=33554432,action=deny)'
```

salt.modules.zonecfg.clear_property(zone, key)
Clear a property
zone [string] name of zone
key [string] name of property

CLI Example:
salt '*' zonecfg.clear_property deathscythe cpu-shares

salt.modules.zonecfg.create(zone, brand, zonepath, force=False)
Create an in-memory configuration for the specified zone.
zone [string] name of zone
brand [string] brand name
zonepath [string] path of zone
force [boolean] overwrite configuration

CLI Example:
salt '*' zonecfg.create deathscythe ipkg /zones/deathscythe

salt.modules.zonecfg.create_from_template(zone, template)
Create an in-memory configuration from a template for the specified zone.
zone [string] name of zone
template [string] name of template

Warning: existing config will be overwritten!

CLI Example:
salt '*' zonecfg.create_from_template leo tallgeese

salt.modules.zonecfg.delete(zone)
Delete the specified configuration from memory and stable storage.
zone [string] name of zone

CLI Example:
salt '*' zonecfg.delete epyon

salt.modules.zonecfg.export(zone, path=None)
Export the configuration from memory to stable storage.
zone [string] name of zone
path [string] path of file to export to

CLI Example:
salt '*' zonecfg.export epyon
salt '*' zonecfg.export epyon /zones/epyon.cfg

salt.modules.zonecfg.import_(zone, path)
Import the configuration to memory from stable storage.
zone [string] name of zone
path [string] path of file to export to

CLI Example:
salt '*' zonecfg.import epyon /zones/epyon.cfg

salt.modules.zonecfg.info(zone, show_all=False)
Display the configuration from memory
zone [string] name of zone
show_all [boolean] also include calculated values like capped-cpu, cpu-shares, ...

CLI Example:

```bash
salt '*' zonecfg.info tallgeese
```

salt.modules.zonecfg.remove_resource(zone, resource_type, resource_key, resource_value)

Remove a resource

- **zone** [string] name of zone
- **resource_type** [string] type of resource
- **resource_key** [string] key for resource selection
- **resource_value** [string] value for resource selection

**Note:** Set resource_selector to None for resource that do not require one.

CLI Example:

```bash
salt '*' zonecfg.remove_resource tallgeese rctl name zone.max-locked-memory
```

salt.modules.zonecfg.set_property(zone, key, value)

Set a property

- **zone** [string] name of zone
- **key** [string] name of property
- **value** [string] value of property

CLI Example:

```bash
salt '*' zonecfg.set_property deathscythe cpu-shares 100
```

salt.modules.zonecfg.update_resource(zone, resource_type, resource_selector, **kwargs)

Add a resource

- **zone** [string] name of zone
- **resource_type** [string] type of resource
- **resource_selector** [string] unique resource identifier
- **kwargs** [string|int|...] resource properties

**Note:** Set resource_selector to None for resource that do not require one.

CLI Example:

```bash
salt '*' zonecfg.update_resource tallgeese rctl name name=zone.max-locked-memory value='(priv=privileged,limit=33554432,action=deny)'
```

21.9.498 salt.modules.zookeeper

Zookeeper Module

- **maintainer** SaltStack
- **maturity** new
- **platform** all
- **depends** kazoo

New in version 2018.3.0.

21.9. execution modules
Configuration

**configuration** This module is not usable until the following are specified either in a pillar or in the minion's config file:

```yaml
zookeeper:
  hosts: zoo1,zoo2,zoo3
  default_acl:
    - username: daniel
      password: test
      read: true
      write: true
      create: true
      delete: true
      admin: true
  username: daniel
  password: test
```

If configuration for multiple zookeeper environments is required, they can be set up as different configuration profiles. For example:

```yaml
zookeeper:
  prod:
    hosts: zoo1,zoo2,zoo3
    default_acl:
      - username: daniel
        password: test
        read: true
        write: true
        create: true
        delete: true
        admin: true
    username: daniel
    password: test
  dev:
    hosts:
      - dev1
      - dev2
      - dev3
    default_acl:
      - username: daniel
        password: test
        read: true
        write: true
        create: true
        delete: true
        admin: true
    username: daniel
    password: test
```

```python
salt.modules.zookeeper.create(path, value=", acls=None, ephemeral=False, sequence=False, makepath=False, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)
```

Create Znode

- **path** path of znode to create
- **value** value to assign to znode (Default: ")
- **acls** list of acl dictionaries to be assigned (Default: None)
- **ephemeral** indicate node is ephemeral (Default: False)
sequence  indicate node is suffixed with a unique index (Default: False)
makepath  Create parent paths if they do not exist (Default: False)
profile  Configured Zookeeper profile to authenticate with (Default: None)
hosts  Lists of Zookeeper Hosts (Default: '127.0.0.1:2181)
scheme  Scheme to authenticate with (Default: 'digest')
username  Username to authenticate (Default: None)
password  Password to authenticate (Default: None)
default_acl  Default acls to assign if a node is created in this connection (Default: None)

CLI Example:
salt minion1 zookeeper.create /test/name daniel profile=prod

salt.modules.zookeeper.delete(path, version=-1, recursive=False, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)

Delete znode
path  path to znode
version  only delete if version matches (Default: -1 (always matches))
profile  Configured Zookeeper profile to authenticate with (Default: None)
hosts  Lists of Zookeeper Hosts (Default: '127.0.0.1:2181)
scheme  Scheme to authenticate with (Default: 'digest')
username  Username to authenticate (Default: None)
password  Password to authenticate (Default: None)
default_acl  Default acls to assign if a node is created in this connection (Default: None)

CLI Example:
salt minion1 zookeeper.delete /test/name profile=prod

salt.modules.zookeeper.ensure_path(path, acls=None, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)

Ensure Znode path exists
path  Parent path to create
acls  list of acls dictionaries to be assigned (Default: None)
profile  Configured Zookeeper profile to authenticate with (Default: None)
hosts  Lists of Zookeeper Hosts (Default: '127.0.0.1:2181)
scheme  Scheme to authenticate with (Default: 'digest')
username  Username to authenticate (Default: None)
password  Password to authenticate (Default: None)
default_acl  Default acls to assign if a node is created in this connection (Default: None)

CLI Example:
salt minion1 zookeeper.ensure_path /test/name profile=prod

salt.modules.zookeeper.exists(path, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)

Check if path exists
path  path to check
profile  Configured Zookeeper profile to authenticate with (Default: None)
hosts  Lists of Zookeeper Hosts (Default: '127.0.0.1:2181)
scheme  Scheme to authenticate with (Default: 'digest')
username  Username to authenticate (Default: None)
password  Password to authenticate (Default: None)
default_acl  Default acls to assign if a node is created in this connection (Default: None)

CLI Example:
salt minion1 zookeeper.exists /test/name profile=prod

salt.modules.zookeeper.get(path, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)

Get value saved in znode
path path to check
profile Configured Zookeeper profile to authenticate with (Default: None)
hosts Lists of Zookeeper Hosts (Default: '127.0.0.1:2181)
scheme Scheme to authenticate with (Default: 'digest')
username Username to authenticate (Default: None)
password Password to authenticate (Default: None)
default_acl Default acls to assign if a node is created in this connection (Default: None)
CLI Example:
salt minion1 zookeeper.get /test/name profile=prod

salt.modules.zookeeper.get_acls(path, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)

Get acls on a znode
path path to znode
profile Configured Zookeeper profile to authenticate with (Default: None)
hosts Lists of Zookeeper Hosts (Default: '127.0.0.1:2181)
scheme Scheme to authenticate with (Default: 'digest')
username Username to authenticate (Default: None)
password Password to authenticate (Default: None)
default_acl Default acls to assign if a node is created in this connection (Default: None)
CLI Example:
salt minion1 zookeeper.get_acls /test/name profile=prod

salt.modules.zookeeper.get_children(path, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)

Get children in znode path
path path to check
profile Configured Zookeeper profile to authenticate with (Default: None)
hosts Lists of Zookeeper Hosts (Default: '127.0.0.1:2181)
scheme Scheme to authenticate with (Default: 'digest')
username Username to authenticate (Default: None)
password Password to authenticate (Default: None)
default_acl Default acls to assign if a node is created in this connection (Default: None)
CLI Example:
salt minion1 zookeeper.get_children /test profile=prod

salt.modules.zookeeper.make_digest_acl(username, password, read=False, write=False, create=False, delete=False, admin=False, allperms=False)

Generate acl object

Note: This is heavily used in the zookeeper state and probably is not useful as a cli module

username  username of acl
password  plain text password of acl
read read acl
write  write acl
create  create acl
delete  delete acl
admin  admin acl
allperms  set all other acls to True

CLI Example:

```bash
salt minion1 zookeeper.make_digest_acl username=daniel password=mypass allperms=True
```

salt.modules.zookeeper.set(path, value, version=-1, profile=None, hosts=None, scheme=None, 
username=None, password=None, default_acl=None)

Update znode with new value
path  znode to update
value  value to set in znode
version  only update znode if version matches (Default: -1 (always matches))
profile  Configured Zookeeper profile to authenticate with (Default: None)
hosts  Lists of Zookeeper Hosts (Default: '127.0.0.1:2181)
scheme  Scheme to authenticate with (Default: 'digest')
username  Username to authenticate (Default: None)
password  Password to authenticate (Default: None)
default_acl  Default acls to assign if a node is created in this connection (Default: None)

CLI Example:

```bash
salt minion1 zookeeper.set /test/name gtmanfred profile=prod
```

salt.modules.zookeeper.set_acls(path, acls, version=-1, profile=None, hosts=None, scheme=None, 
username=None, password=None, default_acl=None)

Set acls on a znode
path  path to znode
acls  list of acl dictionaries to set on the znode
version  only set acls if version matches (Default: -1 (always matches))
profile  Configured Zookeeper profile to authenticate with (Default: None)
hosts  Lists of Zookeeper Hosts (Default: '127.0.0.1:2181)
scheme  Scheme to authenticate with (Default: 'digest')
username  Username to authenticate (Default: None)
password  Password to authenticate (Default: None)
default_acl  Default acls to assign if a node is created in this connection (Default: None)

CLI Example:

```bash
salt minion1 zookeeper.set_acls /test/name acls='["username": "gtmanfred", "password": "test", "all": True]'
```

21.9.499 salt.modules.zpool

Module for running ZFS zpool command

codeauthor  Nitin Madhok <nmadhok@clemson.edu>, Jorge Schrauwen <sjorge@blackdot.be>
maintainer  Jorge Schrauwen <sjorge@blackdot.be>
maturity  new
depends  salt.utils.zfs
platform  illumos,freebsd,linux
Changed in version 2018.3.1: Big refactoring to remove duplicate code, better type conversions and improved consistency in output.

```python
salt.modules.zpool.add(zpool, *vdevs, **kwargs)
    Add the specified vdev's to the given storage pool
    zpool [string] Name of storage pool
    vdevs [string] One or more devices
    force [boolean] Forces use of device
    CLI Example:
    salt '*' zpool.add myzpool /path/to/vdev1 /path/to/vdev2 [...]
```

```python
salt.modules.zpool.attach(zpool, device, new_device, force=False)
    Attach specified device to zpool
    zpool [string] Name of storage pool
    device [string] Existing device name too
    new_device [string] New device name (to be attached to device)
    force [boolean] Forces use of device
    CLI Example:
    salt '*' zpool.attach myzpool /path/to/vdev1 /path/to/vdev2 [...]
```

```python
salt.modules.zpool.clear(zpool, device=None)
    Clears device errors in a pool.
    Warning: The device must not be part of an active pool configuration.
    zpool [string] name of storage pool
    device [string] (optional) specific device to clear
    New in version 2018.3.1.
    CLI Example:
    salt '*' zpool.clear myzpool
    salt '*' zpool.clear myzpool /path/to/dev
```

```python
salt.modules.zpool.create(zpool, *vdevs, **kwargs)
    New in version 2015.5.0.
    Create a simple zpool, a mirrored zpool, a zpool having nested VDEVs, a hybrid zpool with cache, spare and log drives or a zpool with RAIDZ-1, RAIDZ-2 or RAIDZ-3
    zpool [string] Name of storage pool
    vdevs [string] One or move devices
    force [boolean] Forces use of vdevs, even if they appear in use or specify a conflicting replication level.
    mountpoint [string] Sets the mount point for the root dataset
    altroot [string] Equivalent to "-o cachefile=none,altroot=root"
    properties [dict] Additional pool properties
    filesystem_properties [dict] Additional filesystem properties
    createboot [boolean] create a boot partition
    New in version 2018.3.0.
    CLI Examples:
    salt '*' zpool.create myzpool /path/to/vdev1 [...] [force=True|False]
    salt '*' zpool.create myzpool mirror /path/to/vdev1 /path/to/vdev2 [...] [force=True|False]
```

(continues on next page)
salt 'salt '*' zpool.create myzpool raidz1 /path/to/vdev1 /path/to/vdev2 raidz2 /path/to/vdev3 /path/to/vdev4 /path/to/vdev5 [...] [force=True|False]
salt 'salt '*' zpool.create myzpool mirror /path/to/vdev1 [...] mirror /path/to/vdev2 /path/to/vdev3 [...] [force=True|False]
salt 'salt '*' zpool.create myhybridzpool mirror /tmp/file1 [...] log mirror /path/to/vdev1 [...] cache /path/to/vdev2 [...] spare /path/to/vdev3 [...] [force=True|False]

**Note:** Zpool properties can be specified at the time of creation of the pool by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{'property1': 'value1', 'property2': 'value2'}"
```

Filesystem properties can be specified at the time of creation of the pool by passing an additional argument called "filesystem_properties" and specifying the properties with their respective values in the form of a python dictionary:

```
filesystem_properties="{'property1': 'value1', 'property2': 'value2'}"
```

Example:

```
salt 'salt '*' zpool.create myzpool /path/to/vdev1 [...] properties="{'property1': 'value1', 'property2': 'value2'}"
```

CLI Example:

```
salt 'salt '*' zpool.create myzpool /path/to/vdev1 [...] [force=True|False]
salt 'salt '*' zpool.create myzpool mirror /path/to/vdev1 /path/to/vdev2 [...] [force=True|False]
salt 'salt '*' zpool.create myzpool raidz1 /path/to/vdev1 /path/to/vdev2 raidz2 /path/to/vdev3 /path/to/vdev4 /path/to/vdev5 [...] [force=True|False]
salt 'salt '*' zpool.create myzpool mirror /path/to/vdev1 [...] mirror /path/to/vdev2 /path/to/vdev3 [...] [force=True|False]
salt 'salt '*' zpool.create myhybridzpool mirror /tmp/file1 [...] log mirror /path/to/vdev1 [...] cache /path/to/vdev2 [...] spare /path/to/vdev3 [...] [force=True|False]
```

salt.modules.zpool.create_file_vdev(size, *vdevs)

- **Creates file based virtual devices for a zpool**

CLI Example:

```
salt 'salt '*' zpool.create_file_vdev 7G /path/to/vdev1 [...] [force=True|False]
```

**Note:** Depending on file size, the above command may take a while to return.

salt.modules.zpool.destroy(zpool, force=False)

- **Destroys a storage pool**

    - `zpool` [string] Name of storage pool
    - `force` [boolean] Force destroy of pool

CLI Example:
salt '*' zpool.destroy myzpool

salt.modules.zpool.detach(zpool, device)
Detach specified device to zpool
zpool [string] Name of storage pool
device [string] Device to detach
CLI Example:
salt '*' zpool.detach myzpool /path/to/vdev1

salt.modules.zpool.exists(zpool)
Check if a ZFS storage pool is active
zpool [string] Name of storage pool
CLI Example:
salt '*' zpool.exists myzpool

salt.modules.zpool.export(*pools, **kwargs)
New in version 2015.5.0.
Export storage pools
pools [string] One or more storage pools to export
force [boolean] Force export of storage pools
CLI Example:
salt '*' zpool.export myzpool ...
  [force=True|False]
salt '*' zpool.export myzpool2 myzpool2 ...
  [force=True|False]

salt.modules.zpool.get(zpool, prop=None, show_source=False, parsable=True)
New in version 2016.3.0.
Retrieves the given list of properties
zpool [string] Name of storage pool
prop [string] Optional name of property to retrieve
show_source [boolean] Show source of property
parsable [boolean] Display numbers in parsable (exact) values
New in version 2018.3.0.
CLI Example:
salt '*' zpool.get myzpool

salt.modules.zpool.healthy()
Check if all zpools are healthy
New in version 2016.3.0.
CLI Example:
salt '*' zpool.healthy

salt.modules.zpool.history(zpool=None, internal=False, verbose=False)
New in version 2016.3.0.
Displays the command history of the specified pools, or all pools if no pool is specified
zpool [string] Optional storage pool
internal [boolean] Toggle display of internally logged ZFS events
**verbose** [boolean] Toggle display of the user name, the hostname, and the zone in which the operation was performed

CLI Example:

```shell
salt '*' zpool.upgrade myzpool
```

**salt.modules.zpool.import_(zpool=None, new_name=None, **kwargs)**

New in version 2015.5.0.

Import storage pools or list pools available for import

- **zpool** [string] Optional name of storage pool
- **new_name** [string] Optional new name for the storage pool
- **mntopts** [string] Comma-separated list of mount options to use when mounting datasets within the pool.
- **force** [boolean] Forces import, even if the pool appears to be potentially active.
- **altroot** [string] Equivalent to "-o cachefile=none,altroot=root"
- **dir** [string] Searches for devices or files in dir, multiple dirs can be specified as follows: `dir="dir1,dir2"`
- **no_mount** [boolean] Import the pool without mounting any file systems.
- **only_destroyed** [boolean] Imports destroyed pools only. This also sets `force=True`.
- **recovery** [bool|str] false: do not try to recovery broken pools true: try to recovery the pool by rolling back the latest transactions test: check if a pool can be recovered, but don’t import it nolog: allow import without log device, recent transactions might be lost

**Note:** If feature flags are not support this forced to the default of 'false'

**Warning:** When recovery is set to 'test' the result will be have imported set to True if the pool can be imported. The pool might also be imported if the pool was not broken to begin with.

**properties** [dict] Additional pool properties

**Note:** Zpool properties can be specified at the time of creation of the pool by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

```python
properties="{'property1': 'value1', 'property2': 'value2'}"
```

CLI Example:

```shell
salt '*' zpool.import [force=True|False]
salt '*' zpool.import myzpool [mynewzpool] [force=True|False]
salt '*' zpool.import myzpool dir='/tmp'
```

**salt.modules.zpool.iostat(zpool=None, sample_time=5, parsable=True)**

Display I/O statistics for the given pools

- **zpool** [string] optional name of storage pool
- **sample_time** [int] seconds to capture data before output default a sample of 5 seconds is used
- **parsable** [boolean] display data in pythonc values (True, False, Bytes,...)

New in version 2016.3.0.

Changed in version 2018.3.1: Added `parsable` parameter that defaults to True

CLI Example:

```shell
salt '*' zpool.iostat myzpool
```
salt.modules.zpool.labelclear device, force=False

New in version 2018.3.0.

Removes ZFS label information from the specified device

device [string] Device name; must not be part of an active pool configuration.
force [boolean] Treat exported or foreign devices as inactive

CLI Example:

```bash
salt '*' zpool.labelclear /path/to/dev
```

salt.modules.zpool.list_ properties='size, alloc, free, cap, frag, health', zpool=None, parsable=True

New in version 2015.5.0.

Return information about (all) storage pools

zpool [string] optional name of storage pool
properties [string] comma-separated list of properties to list
parsable [boolean] display numbers in parsable (exact) values

New in version 2018.3.0.

Note: The name property will always be included, while the frag property will get removed if not available

zpool [string] optional zpool

Note: Multiple storage pool can be provided as a space separated list

CLI Example:

```bash
salt '*' zpool.list
salt '*' zpool.list zpool=tank
salt '*' zpool.list 'size,free'
salt '*' zpool.list 'size,free' tank
```

salt.modules.zpool.offline zpool, *vdevs, **kwargs

New in version 2015.5.0.

Ensure that the specified devices are offline

Warning: By default, the OFFLINE state is persistent. The device remains offline when the system is rebooted. To temporarily take a device offline, use temporary=True.

zpool [string] name of storage pool
vdevs [string] One or more devices
temporary [boolean] Enable temporarily offline

CLI Example:

```bash
salt '*' zpool.offline myzpool /path/to/vdev1 [...] [temporary=True|False]
```

salt.modules.zpool.online zpool, *vdevs, **kwargs

New in version 2015.5.0.

Ensure that the specified devices are online

zpool [string] name of storage pool
vdevs [string] one or more devices
**expand** [boolean] Expand the device to use all available space.

**Note:** If the device is part of a mirror or raidz then all devices must be expanded before the new space will become available to the pool.

CLI Example:
```
salt '*' zpool.online myzpool /path/to/vdev1 [...]
```

**salt.modules.zpool.reguid(zpool)**
Generates a new unique identifier for the pool

**Warning:** You must ensure that all devices in this pool are online and healthy before performing this action.

**zpool** [string] name of storage pool

New in version 2016.3.0.

CLI Example:
```
salt '*' zpool.reguid myzpool
```

**salt.modules.zpool.reopen(zpool)**
Reopen all the vdevs associated with the pool

**zpool** [string] name of storage pool

New in version 2016.3.0.

CLI Example:
```
salt '*' zpool.reopen myzpool
```

**salt.modules.zpool.replace(zpool, old_device, new_device=None, force=False)**
Replaces **old_device** with **new_device**

**Note:** This is equivalent to attaching **new_device**, waiting for it to resilver, and then detaching **old_device**.

The size of **new_device** must be greater than or equal to the minimum size of all the devices in a mirror or raidz configuration.

**zpool** [string] Name of storage pool
**old_device** [string] Old device to replace
**new_device** [string] Optional new device
**force** [boolean] Forces use of new_device, even if its appears to be in use.

CLI Example:
```
salt '*' zpool.replace myzpool /path/to/vdev1 /path/to/vdev2
```

**salt.modules.zpool.scrub(zpool, stop=False, pause=False)**
Scrub a storage pool

**zpool** [string] Name of storage pool
**stop** [boolean] If True, cancel ongoing scrub
pause  [boolean] If True, pause ongoing scrub

New in version 2018.3.0.

---

**Note:** Pause is only available on recent versions of ZFS.

If both `pause` and `stop` are True, then `stop` will win.

CLI Example:

```
salt '*' zpool.scrub myzpool
```

`salt.modules.zpool.set(zpool, prop, value)`

Sets the given property on the specified pool

- `zpool` [string] Name of storage pool
- `prop` [string] Name of property to set
- `value` [string] Value to set for the specified property

New in version 2016.3.0.

CLI Example:

```
salt '*' zpool.set myzpool readonly yes
```

`salt.modules.zpool.split(zpool, newzpool, **kwargs)`

Splits devices off pool creating newpool.

**Note:** All vdevs in pool must be mirrors. At the time of the split, `newzpool` will be a replica of `zpool`. After splitting, do not forget to import the new pool!

- `zpool` [string] Name of storage pool
- `newzpool` [string] Name of new storage pool
- `mountpoint` [string] Sets the mount point for the root dataset
- `altroot` [string] Sets altroot for `newzpool`
- `properties` [dict] Additional pool properties for `newzpool`

CLI Examples:

```
salt '*' zpool.split datamirror databackup
salt '*' zpool.split datamirror databackup altroot=/backup
```

**Note:** Zpool properties can be specified at the time of creation of the pool by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{'property1': 'value1', 'property2': 'value2'}"
```

Example:

```
salt '*' zpool.split datamirror databackup properties="{'readonly': 'on'}"
```
salt.modules.zpool.status(zpool=None)
Return the status of the named zpool
zpool [string] optional name of storage pool
New in version 2016.3.0.

CLI Example:
salt '*' zpool.status myzpool

salt.modules.zpool.upgrade(zpool=None, version=None)
New in version 2016.3.0.
Enables all supported features on the given pool
zpool [string] Optional storage pool, applies to all otherwise
version [int] Version to upgrade to, if unspecified upgrade to the highest possible

Warning: Once this is done, the pool will no longer be accessible on systems that do not support feature
flags. See zpool-features(5) for details on compatibility with systems that support feature flags, but do not
support all features enabled on the pool.

CLI Example:
salt '*' zpool.upgrade myzpool

21.9.500 salt.modules.zypperpkg
Package support for openSUSE via the zypper package manager

depends
   - rpm Python module. Install with zypper install rpm-python

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a
different module (or gives an error similar to 'pkg.install' is not available), see here.

class salt.modules.zypperpkg.Wildcard(zypper)
New in version 2017.7.0.
Converts string wildcard to a zypper query. .. rubric:: Example
'1.2.3.4' is '1.2.3.4.whatever.is.here' and is equal to: '1.2.3.4 >= and < 1.2.3.5'

Parameters ptn – Pattern

Returns Query range

Z.OP = ['<', '<=', '=', '>=', '>']
salt.modules.zypperpkg.add_lock(packages, **kwargs)
Add a package lock. Specify packages to lock by exact name.

CLI Example:
salt.modules.zypperpkg.add_lock <package name>

salt modules.zypperpkg:added Locker <package name>

salt modules.zypperpkg.add_lock <package1>,<package2>,<package3>

salt modules.zypperpkg.add_lock pkgs=['"foo", "bar"']

salt.modules.zypperpkg.clean_locks()

Remove unused locks that do not currently (with regard to repositories used) lock any package.

CLI Example:

```
salt '*' pkg.clean_locks
```

salt.modules.zypperpkg.del_repo(repo)

Delete a repo.

CLI Examples:

```
salt '*' pkg.del_repo alias
```

salt.modules.zypperpkg.diff(*paths)

Return a formatted diff between current files and original in a package. NOTE: this function includes all files (configuration and not), but does not work on binary content.

Parameters
  path – Full path to the installed file

Returns
  Difference string or raises and exception if examined file is binary.

CLI example:

```
salt '*' pkg.diff /etc/apache2/httpd.conf /etc/sudoers
```

salt.modules.zypperpkg.download(*packages, **kwargs)

Download packages to the local disk.

refresh force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

CLI example:

```
salt '*' pkg.download httpd
salt '*' pkg.download httpd postfix
```

salt.modules.zypperpkg.file_dict(*packages)

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of every file on the system’s rpm database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

salt.modules.zypperpkg.file_list(*packages)

List the files that belong to a package. Not specifying any packages will return a list of every file on the system’s rpm database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

salt.modules.zypperpkg.get_repo(repo, **kwargs)

Display a repo.
CLI Example:

```sh
salt '*' pkg.get_repo alias
```

salt.modules.zypperpkg.info_available(*names, **kwargs)

Return the information of the named package available for the system.

- **refresh**
  - force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed or not.

CLI example:

```sh
salt '*' pkg.info_available <package1>
salt '*' pkg.info_available <package1> <package2> <package3> ...
```

salt.modules.zypperpkg.info_installed(*names, **kwargs)

Return the information of the named package(s), installed on the system.

**Parameters**

- **names**
  - Names of the packages to get information about.
- **attr**
  - Comma-separated package attributes. If no 'attr' is specified, all available attributes returned.

Valid attributes are: version, vendor, release, build_date, build_date_time_t, install_date, install_date_time_t, build_host, group, source_rpm, arch, epoch, size, license, signature, packager, url, summary, description.

- **errors**
  - Handle RPM field errors. If 'ignore' is chosen, then various mistakes are simply ignored and omitted from the texts or strings. If 'report' is chosen, then a field with a mistake is not returned, instead a 'N/A (broken)' (not available, broken) text is placed.

Valid attributes are: ignore, report

- **all_versions**
  - Include information for all versions of the packages installed on the minion.

CLI example:

```sh
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
salt '*' pkg.info_installed <package1> <package2> <package3> all_versions=True
salt '*' pkg.info_installed <package1> attr=version,vendor all_versions=True
salt '*' pkg.info_installed <package1> <package2> <package3> ... attr=version, ~vendor
salt '*' pkg.info_installed <package1> <package2> <package3> ... attr=version, ~vendor errors=ignore
salt '*' pkg.info_installed <package1> <package2> <package3> ... attr=version, ~vendor errors=report
```

salt.modules.zypperpkg.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, downloadonly=None, skip_verify=False, version=None, ignore_repo_failure=False, **kwargs)

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, **systemd-run(1)** is now used to isolate commands which modify installed packages from the **salt-minion** daemon’s control group. This is done to keep systemd from killing any zypper commands spawned by Salt when the **salt-minion** service is restarted. (see **KillMode** in the **systemd.kill(5)** manpage for more information). If desired, usage of **systemd-run(1)** can be suppressed by setting a **config option** called **systemd.scope**, with a value of False (no quotes).

Install the passed package(s), add refresh=True to force a ’zypper refresh’ before package is installed.

**name**
- The name of the package to be installed. Note that this parameter is ignored if either **pkgs** or **sources** is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the **sources** option.
CLI Example:

```bash
salt '*' pkg.install <package name>
```

- **refresh** force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.
- **fromrepo** Specify a package repository to install from.
- **downloadonly** Only download the packages, do not install.
- **skip_verify** Skip the GPG verification check (e.g., `--no-gpg-checks`)
- **version** Can be either a version number, or the combination of a comparison operator (<, >, <=, >=, =) and a version number (ex. '>1.2.3-4'). This parameter is ignored if `pkgs` or `sources` is passed.
- **resolve_capabilities** If this option is set to True zypper will take capabilities into account. In this case names which are just provided by a package will get installed. Default is False.

Multiple Package Installation Options:

- **pkgs** A list of packages to install from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version. As with the `version` parameter above, comparison operators can be used to target a specific version of a package.

CLI Examples:

```bash
salt '*' pkg.install pkgs=["foo", "bar"]
salt '*' pkg.install pkgs=["foo", {"bar": "1.2.3-4"}]
salt '*' pkg.install pkgs=["foo", {"bar": "<1.2.3-4"}]
```

- **sources** A list of RPM packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```bash
salt '*' pkg.install sources=[{"foo": "salt://foo.rpm"},{"bar": "salt://bar.rpm"}]
```

- **ignore_repo_failure** Zypper returns error code 106 if one of the repositories are not available for various reasons. In case to set strict check, this parameter needs to be set to True. Default: False.
- **diff_attr** If a list of package attributes is specified, returned value will contain them, eg:

  ```json
  { '<package>': { 
    'old': { 
      'version': '<old-version>',
      'arch': '<old-arch>'},
    'new': { 
      'version': '<new-version>',
      'arch': '<new-arch>'} }
  }
  ```

  Valid attributes are: epoch, version, release, arch, install_date, install_date_time_t.

  If all is specified, all valid attributes will be returned.

  New in version 2018.3.0.

  Returns a dict containing the new package names and versions:

  ```json
  { '<package>': { 'old': '<old-version>',
    'new': '<new-version>'} }
  ```

  If an attribute list is specified in `diff_attr`, the dict will also contain any specified attribute, eg:
salt.modules.zypperpkg.latest_version(*names, **kwargs)
Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

    If the latest version of a given package is already installed, an empty dict will be returned for that package.
    refresh  force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed or not.
    CLI example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.zypperpkg.list_downloaded()
New in version 2017.7.0.
List prefetched packages downloaded by Zypper in the local disk.

    CLI example:

```
salt '*' pkg.list_downloaded
```

salt.modules.zypperpkg.list_installed_patches()
New in version 2017.7.0.
List installed advisory patches on the system.

    CLI Examples:

```
salt '*' pkg.list_installed_patches
```

salt.modules.zypperpkg.list_installed_patterns()
List installed patterns on the system.

    CLI Examples:

```
salt '*' pkg.list_installed_patterns
```

salt.modules.zypperpkg.list_locks()
List current package locks.
Return a dict containing the locked package with attributes:

```
{'<package>': {'case_sensitive': '<case_sensitive>',
               'match_type': '<match_type>',
               'type': '<type>'}}
```

    CLI Example:

```
salt '*' pkg.list_locks
```
salt.modules.zypperpkg.list_patches(refresh=False)

List all known advisory patches from available repos.

refresh force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

CLI Examples:

```bash
salt '*' pkg.list_patches
```

salt.modules.zypperpkg.list_patterns(refresh=False)

List all known patterns from available repos.

refresh force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

CLI Examples:

```bash
salt '*' pkg.list_patterns
```

salt.modules.zypperpkg.list_pkgs(versions_as_list=False, **kwargs)

List the packages currently installed as a dict. By default, the dict contains versions as a comma separated string:

```python
{{'<package_name>': '<version>[,<version>...]'}}
```

versions_as_list: If set to true, the versions are provided as a list

```python
{{'<package_name>': ['<version>', '<version>']}}
```

attr: If a list of package attributes is specified, returned value will contain them in addition to version, eg.:

```python
{{'<package_name>': [{'version': 'version', 'arch': 'arch'}]}}
```

Valid attributes are: epoch, version, release, arch, install_date, install_date_time_t.

If all is specified, all valid attributes will be returned.

New in version 2018.3.0.

removed: not supported

purge_desired: not supported

CLI Example:

```bash
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs attr=version,arch
salt '*' pkg.list_pkgs attr=['"version", "arch"]'
```

salt.modules.zypperpkg.list_products(all=False, refresh=False)

List all available or installed SUSE products.

all List all products available or only installed. Default is False.

refresh force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

Includes handling for OEM products, which read the OEM productline file and overwrite the release value.

CLI Examples:

```bash
salt '*' pkg.list_products
salt '*' pkg.list_products all=True
```

salt.modules.zypperpkg.list_provides(**kwargs)

New in version 2018.3.0.

List package provides of installed packages as a dict. {

```
{'<provided_name>': ['<package_name>', '<package_name>', ...]}
```
CLI Examples:

```bash
salt '*' pkg.list_provides
```

```
salt.modules.zypperpkg.list_repo_pkgs("*", **kwargs)
```

New in version 2017.7.5, 2018.3.1.

Returns all available packages. Optionally, package names (and name globs) can be passed and the results will be filtered to packages matching those names. This is recommended as it speeds up the function considerably. This function can be helpful in discovering the version or repo to specify in a `pkg.installed` state.

The return data will be a dictionary mapping package names to a list of version numbers, ordered from newest to oldest. If `byrepo` is set to `True`, then the return dictionary will contain repository names at the top level, and each repository will map packages to lists of version numbers. For example:

```python
# With byrepo=False (default)
{
    'bash': ['4.3-83.3.1', '4.3-82.6'],
    'vim': ['7.4.326-12.1']
}
{
    'OSS': {
        'bash': ['4.3-82.6'],
        'vim': ['7.4.326-12.1']
    },
    'OSS Update': {
        'bash': ['4.3-83.3.1']
    }
}
```

```
fromrepo [None] Only include results from the specified repo(s). Multiple repos can be specified, comma-separated.

byrepo [False] When `True`, the return data for each package will be organized by repository.
```

CLI Examples:

```bash
salt '*' pkg.list_repo_pkgs
salt '*' pkg.list_repo_pkgs foo bar baz
salt '*' pkg.list_repo_pkgs 'python2-*' byrepo=True
salt '*' pkg.list_repo_pkgs 'python2-*' fromrepo='OSS Updates'
```

```
salt.modules.zypperpkg.list_repos()
```

Lists all repos.

CLI Example:

```bash
salt '*' pkg.list_repos
```

```
salt.modules.zypperpkg.list_upgrades(refresh=True, **kwargs)
```

List all available package upgrades on this system

- `refresh` force a refresh if set to `True` (default). If set to `False` it depends on `zypper` if a refresh is executed.

CLI Example:

```bash
salt '*' pkg.list_upgrades
```

```
salt.modules.zypperpkg.mod_repo(repo, **kwargs)
```

Modify one or more values for a repo. If the repo does not exist, it will be created, so long as the following values are specified:
repo or alias alias by which Zypper refers to the repo
url, mirrorlist or baseurl the URL for Zypper to reference
enabled Enable or disable (True or False) repository, but do not remove if disabled.
refresh Enable or disable (True or False) auto-refresh of the repository.
cache Enable or disable (True or False) RPM files caching.
gpgcheck Enable or disable (True or False) GPG check for this repository.
gpgautoimport [False] If set to True, automatically trust and import public GPG key for the repository.
Key/Value pairs may also be removed from a repo’s configuration by setting a key to a blank value. Bear in mind that a name cannot be deleted, and a URL can only be deleted if a mirrorlist is specified (or vice versa).

CLI Examples:

```
salt '*' pkg.mod_repo alias alias=new_alias
salt '*' pkg.mod_repo alias url= mirrorlist=http://host.com/
```

```
salt.modules.zypperpkg.modified(*packages, **flags)
List the modified files that belong to a package. Not specifying any packages will return a list of all modified files on the system’s RPM database.
New in version 2015.5.0.
Filtering by flags (True or False):
size Include only files where size changed.
mode Include only files which file’s mode has been changed.
checksum Include only files which MD5 checksum has been changed.
device Include only files which major and minor numbers has been changed.
symlink Include only files which are symbolic link contents.
owner Include only files where owner has been changed.
group Include only files where group has been changed.
time Include only files where modification time of the file has been changed.
capabilities Include only files where capabilities differ or not. Note: supported only on newer RPM versions.

CLI Examples:

```
salt '*' pkg.modified
salt '*' pkg.modified httpd
salt '*' pkg.modified httpd postfix
salt '*' pkg.modified httpd owner=True group=False
```

```
salt.modules.zypperpkg.normalize_name(name)
Strips the architecture from the specified package name, if necessary. Circumstances where this would be done include:
• If the arch is 32 bit and the package name ends in a 32-bit arch.
• If the arch matches the OS arch, or is noarch.

CLI Example:

```
salt '*' pkg.normalize_name zsh.x86_64
```

```
salt.modules.zypperpkg.owner(*paths)
Return the name of the package that owns the file. Multiple file paths can be passed. If a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.
If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Examples:```
salt modules.zypperpkg.purge(name=None, pkgs=None, **kwargs)

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any zypper commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Recursively remove a package and all dependencies which were installed with it, this will call a zypper -n remove -u

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'

salt modules.zypperpkg.refresh_db()

Force a repository refresh by calling zypper refresh --force, return a dict:

{"<database name>": Bool}

CLI Example:

salt '*' pkg.refresh_db

salt modules.zypperpkg.remove(name=None, pkgs=None, **kwargs)

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any zypper commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Remove packages with zypper -n remove

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
salt.modules.zypperpkg.remove_lock(packages, **kwargs)
    Remove specified package lock.

    CLI Example:
    
    ```
    salt '*' pkg.remove_lock <package name>
    salt '*' pkg.remove_lock <package1>,<package2>,<package3>
    salt '*' pkg.remove_lock pkgs='["foo", "bar"]'
    ```

salt.modules.zypperpkg.resolve_capabilities(pkgs, refresh, **kwargs)
    New in version 2018.3.0.

    Convert name provides in pkgs into real package names if resolve_capabilities parameter is set to True. In case of resolve_capabilities is set to False the package list is returned unchanged.

    refresh force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

    resolve_capabilities If this option is set to True the input will be checked if a package with this name exists. If not, this function will search for a package which provides this name. If one is found the output is exchanged with the real package name. In case this option is set to False (Default) the input will be returned unchanged.

    CLI Examples:
    
    ```
    salt '*' pkg.resolve_capabilities resolve_capabilities=True w3m_ssl
    ```

salt.modules.zypperpkg.search(criteria, refresh=False, **kwargs)
    List known packages, available to the system.

    refresh force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

    match (str) One of exact, words, substrings. Search for an exact match or for the whole words only. Default to substrings to patch partial words.

    provides (bool) Search for packages which provide the search strings.

    recommends (bool) Search for packages which recommend the search strings.

    requires (bool) Search for packages which require the search strings.

    suggests (bool) Search for packages which suggest the search strings.

    conflicts (bool) Search packages conflicting with search strings.

    obsoletes (bool) Search for packages which obsolete the search strings.

    file_list (bool) Search for a match in the file list of packages.

    search_descriptions (bool) Search also in package summaries and descriptions.

    case_sensitive (bool) Perform case-sensitive search.

    installed_only (bool) Show only installed packages.

    not_installed_only (bool) Show only packages which are not installed.

    details (bool) Show version and repository

    CLI Examples:
    
    ```
    salt '*' pkg.search <criteria>
    ```

salt.modules.zypperpkg.upgrade(refresh=True, dryrun=False, dist_upgrade=False, fromrepo=None, novendorchange=False, skip_verify=False, **kwargs)
    Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon’s control group. This is done to keep systemd from killing any zypper commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

    Run a full system upgrade, a zypper upgrade

    refresh force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed.

    dryrun If set to True, it creates a debug solver log file and then perform a dry-run upgrade (no changes are made). Default: False
**dist_upgrade**  Perform a system dist-upgrade. Default: False

**fromrepo**  Specify a list of package repositories to upgrade from. Default: None

**novendorchange**  If set to True, no allow vendor changes. Default: False

**skip_verify**  Skip the GPG verification check (e.g., `--no-gpg-checks`).

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>', 'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade dist-upgrade=True fromrepo=['"MyRepoName"']
```

```
salt '*' pkg.upgrade dist-upgrade=True fromrepo=['"MyRepoName"']
```

salt.modules.zypperpkg.upgrade_available(name, **kwargs)

Check whether or not an upgrade is available for a given package.

**refresh**  force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed or not.

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

salt.modules.zypperpkg.verify("names", **kwargs)

Runs an rpm `--Va` on a system, and returns the results in a dict.

Files with an attribute of config, doc, ghost, license or readme in the package header can be ignored using the **ignore_types** keyword argument.

CLI Example:

```
salt '*' pkg.verify httpd
salt '*' pkg.verify httpd postfix
salt '*' pkg.verify httpd postfix ignore_types=['config','doc']
```

salt.modules.zypperpkg.version("names", **kwargs)

Returns a string representing the package version or an empty dict if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

salt.modules.zypperpkg.version_cmp(ver1, ver2, ignore_epoch=False)

- New in version 2015.5.4.
- Do a cmp-style comparison on two packages. Return -1 if ver1 < ver2, 0 if ver1 == ver2, and 1 if ver1 > ver2.
- Return None if there was a problem making the comparison.

**ignore_epoch**  [False] Set to True to ignore the epoch when comparing versions.

- New in version 2015.8.10, 2016.3.2.

CLI Example:

```
salt '*' pkg.version_cmp '0.2-001' '0.2.0.1-002'
```
21.10 netapi modules

21.10.1 rest_cherrypy

- A REST API for Salt
  - Authentication
  - Usage
  - Content negotiation
- Performance Expectations and Recommended Usage
  - Long-Running HTTP Connections
  - Timeouts
  - Best Practices
  - Performance Tuning
  - Future Plans
- Deployment
  - **salt-api** using the CherryPy server
  - Using a WSGI-compliant web server
- REST URI Reference
  - /
  - /login
  - /logout
  - /minions
  - /jobs
  - /run
  - /events
  - /hook
  - /keys
  - /ws
  - /stats

A REST API for Salt

depends

- CherryPy Python module.

Note: there is a known SSL traceback for CherryPy versions 3.2.5 through 3.7.x. Please use version 3.2.3 or the latest 10.x version instead.
optdepends

- ws4py Python module for websockets support.

client_libraries

- Java: https://github.com/SUSE/salt-netapi-client
- Python: https://github.com/saltstack/pepper

setup  All steps below are performed on the machine running the Salt Master daemon. Configuration goes into the Master configuration file.

1. Install `salt-api`. (This step varies between OS and Linux distros. Some package systems have a split package, others include salt-api in the main Salt package. Ensure the `salt-api --version` output matches the `salt --version` output.)

2. Install CherryPy. (Read the version caveat in the section above.)

   Using a secure HTTPS connection is strongly recommended since Salt eauth authentication credentials will be sent over the wire.

   1. Install the PyOpenSSL package.

   2. Generate a self-signed certificate using the `create_self_signed_cert()` execution function.

      ```
      salt-call --local tls.create_self_signed_cert
      ```

4. Edit the master config to create at least one external auth user or group following the full external auth instructions.

5. Edit the master config with the following production-ready example to enable the `rest_cherrypy` module. (Adjust cert paths as needed, or disable SSL (not recommended!).)

   ```
   rest_cherrypy:
   port: 8000
   ssl_crt: /etc/pki/tls/certs/localhost.crt
   ssl_key: /etc/pki/tls/certs/localhost.key
   ```

6. Restart the `salt-master` daemon.

7. Start the `salt-api` daemon.

configuration  All available configuration options are detailed below. These settings configure the CherryPy HTTP server and do not apply when using an external server such as Apache or Nginx.

port  Required

   The port for the webserver to listen on.

host  [0.0.0.0]  The socket interface for the HTTP server to listen on.

debug  [False]  Starts the web server in development mode. It will reload itself when the underlying code is changed and will output more debugging info.

log_access_file  Path to a file to write HTTP access logs.

   New in version 2016.11.0.

log_error_file  Path to a file to write HTTP error logs.

   New in version 2016.11.0.
ssl_crt The path to a SSL certificate. (See below)
ssl_key The path to the private key for your SSL certificate. (See below)
ssl_chain (Optional when using PyOpenSSL) the certificate chain to pass to Context.
load_verify_locations.
disable_ssl A flag to disable SSL. Warning: your Salt authentication credentials will be sent in the clear!
webhook_disable_auth [False] The Webhook URL requires authentication by default but external services cannot always be configured to send authentication. See the Webhook documentation for suggestions on securing this interface.
webhook_url [/hook] Configure the URL endpoint for the Webhook entry point.
thread_pool [100] The number of worker threads to start up in the pool.
socket_queue_size [30] Specify the maximum number of HTTP connections to queue.
expire_responses [True] Whether to check for and kill HTTP responses that have exceeded the default timeout.
    Deprecated since version 2016.11.9,2017.7.3,2018.3.0: The "expire_responses" configuration setting, which corresponds to the timeout_monitor setting in CherryPy, is no longer supported in CherryPy versions >= 12.0.0.
max_request_body_size [1048576] Maximum size for the HTTP request body.
collect_stats [False] Collect and report statistics about the CherryPy server
    Reports are available via the Stats URL.
stats_disable_auth [False] Do not require authentication to access the /stats endpoint.
    New in version 2018.3.0.
static A filesystem path to static HTML/JavaScript/CSS/image assets.
static_path [/static] The URL prefix to use when serving static assets out of the directory specified in the static setting.
enable_sessions [True] Enable or disable all endpoints that rely on session cookies. This can be useful to enforce only header-based authentication.
    New in version 2017.7.0.
app [/index.html] A filesystem path to an HTML file that will be served as a static file. This is useful for bootstrapping a single-page JavaScript app.
    Warning! If you set this option to a custom web application, anything that uses cookie-based authentication is vulnerable to XSRF attacks. Send the custom X-Auth-Token header instead and consider disabling the enable_sessions setting.
    Changed in version 2017.7.0: Add a proof-of-concept JavaScript single-page app.
app_path [/app] The URL prefix to use for serving the HTML file specified in the app setting. This should be a simple name containing no slashes.
    Any path information after the specified path is ignored; this is useful for apps that utilize the HTML5 history API.
root_prefix [/] A URL path to the main entry point for the application. This is useful for serving multiple applications from the same URL.
Authentication

Authentication is performed by passing a session token with each request. Tokens are generated via the Login URL.

The token may be sent in one of two ways: as a custom header or as a session cookie. The latter is far more convenient for clients that support cookies.

- Include a custom header named `X-Auth-Token`.

For example, using curl:

```
curl -sSk https://localhost:8000/login \
  -H 'Accept: application/x-yaml' \
  -d username=saltdev \
  -d password=saltdev \
  -d eauth=pam
```

Copy the token value from the output and include it in subsequent requests:

```
curl -sSk https://localhost:8000 \
  -H 'Accept: application/x-yaml' \
  -H 'X-Auth-Token: 697adbdc8fe971d09ae4c2a3add7248859c87079' \
  -d client=local \
  -d tgt='*' \
  -d fun=test.ping
```

- Sent via a cookie. This option is a convenience for HTTP clients that automatically handle cookie support (such as browsers).

For example, using curl:

```
# Write the cookie file:
curl -sSk https://localhost:8000/login \
  -c ~/cookies.txt \
  -H 'Accept: application/x-yaml' \
  -d username=saltdev \
  -d password=saltdev \
  -d eauth=auto

# Read the cookie file:
curl -sSk https://localhost:8000 \
  -b ~/cookies.txt \
  -H 'Accept: application/x-yaml' \
  -d client=local \
  -d tgt='*' \
  -d fun=test.ping
```

Another example using the `requests` library in Python:

```
>>> import requests
>>> session = requests.Session()
>>> session.post('http://localhost:8000/login', json={
  'username': 'saltdev',
  'password': 'saltdev',
  'eauth': 'auto',
})
<Response [200]>
```
See also:

You can bypass the session handling via the Run URL.

Usage

This interface directly exposes Salt’s *Python API*. Everything possible at the CLI is possible through the Python API. Commands are executed on the Salt Master.

The root URL (/) is RPC-like in that it accepts instructions in the request body for what Salt functions to execute, and the response contains the result of those function calls.

For example:

```bash
% curl -sSi https://localhost:8000 -H 'Content-type: application/json'
-> -d '[[
    "client": "local",
    "tgt": "*",
    "fun": "test.ping"
    ]]
HTTP/1.1 200 OK
Content-Type: application/json
[...snip...]
{"return": [{"jerry": true}]}
```

The request body must be an array of commands. Use this workflow to build a command:

1. Choose a client interface.
2. Choose a function.
3. Fill out the remaining parameters needed for the chosen client.

The `client` field is a reference to the main Python classes used in Salt’s Python API. Read the full Client APIs documentation, but in short:

- "local" uses `LocalClient` which sends commands to Minions. Equivalent to the `salt` CLI command.
- "runner" uses `RunnerClient` which invokes runner modules on the Master. Equivalent to the `salt-run` CLI command.
- "wheel" uses `WheelClient` which invokes wheel modules on the Master. Wheel modules do not have a direct CLI equivalent but they typically manage Master-side resources such as state files, pillar files, the Salt config files, and the `key wheel module` exposes similar functionality as the `salt-key` CLI command.
Most clients have variants like synchronous or asynchronous execution as well as others like batch execution. See the full list of client interfaces.

Each client requires different arguments and sometimes has different syntax. For example, LocalClient requires the tgt argument because it forwards the command to Minions and the other client interfaces do not. LocalClient also takes arg (array) and kwarg (dictionary) arguments because these values are sent to the Minions and used to execute the requested function there. RunnerClient and WheelClient are executed directly on the Master and thus do not need or accept those arguments.

Read the method signatures in the client documentation linked above, but hopefully an example will help illustrate the concept. This example causes Salt to execute two functions – the test.arg execution function using LocalClient and the test.arg runner function using RunnerClient; note the different structure for each command. The results for both are combined and returned as one response.

```bash
% curl -b ~/cookies.txt -sSi localhost:8000 -H 'Content-type: application/json -d
  
  [  
    {  
      "client": "local",  
      "tgt": ",",  
      "fun": "test.arg",  
      "arg": ["positional arg one", "positional arg two"],  
      "kwarg": {  
        "keyword arg one": "Hello from a minion",  
        "keyword arg two": "Hello again from a minion"  
      }  
    },  
    {  
      "client": "runner",  
      "fun": "test.arg",  
      "keyword arg one": "Hello from a master",  
      "keyword arg two": "Runners do not support positional args"  
    }  
  ]

HTTP/1.1 200 OK

[...snip...]

{  
  "return": [  
    {  
      "jerry": {  
        "args": [  
          "positional arg one",  
          "positional arg two"  
        ],  
        "kwargs": {  
          "keyword arg one": "Hello from a minion",  
          "keyword arg two": "Hello again from a minion",  
          [...snip...]
        }  
      },  
      [...snip; other minion returns here...]
    },  
    {  
      "args": [],  
      "kwargs": {  
        "keyword arg two": "Runners do not support positional args",  
        "keyword arg one": "Hello from a master"
      }  
    }
  ]
}
```

(continues on next page)
One more example, this time with more commonly used functions:

```bash
curl -b /tmp/cookies.txt -sSi localhost:8000 -H 'Content-type: application/json' -d ']
[ "client": "local", "tgt": ",", "fun": "state.sls", "kwarg": {
  "mods": "apache", "pillar": {
    "lookup": {
      "wwwdir": "/srv/httpd/htdocs"
    }
  }
},
  "client": "runner", "fun": "cloud.create", "provider": "my-ec2-provider", "instances": "my-centos-6", "image": "ami-1624987f", "delvol_on_destroy", true
}]
```

HTTP/1.1 200 OK

```
{
  "return": [
    {
      "jerry": {
        "pkg_|-install_apache_|-httpd_|-installed": { ...
      }
    },
    {[...snip other minion returns here...]
  },
    {[...snip full salt-cloud output here...]
  }
}
```

Content negotiation

This REST interface is flexible in what data formats it will accept as well as what formats it will return (e.g., JSON, YAML, urlencoded).
• Specify the format of data in the request body by including the `Content-Type` header.
• Specify the desired data format for the response body with the `Accept` header.

We recommend the JSON format for most HTTP requests. urlencoded data is simple and cannot express complex data structures – and that is often required for some Salt commands, such as starting a state run that uses Pillar data. Salt’s CLI tool can reformat strings passed in at the CLI into complex data structures, and that behavior also works via salt-api, but that can be brittle and since salt-api can accept JSON it is best just to send JSON.

Here is an example of sending urlencoded data:

```
curl -sSik https://localhost:8000 
  -b ~/cookies.txt 
  -d client=runner 
  -d fun='jobs.lookup_jid' 
  -d jid='20150129182456704682'
```

urlencoded data caveats

• Only a single command may be sent per HTTP request.
• Repeating the `arg` parameter multiple times will cause those parameters to be combined into a single list.

  Note, some popular frameworks and languages (notably jQuery, PHP, and Ruby on Rails) will automatically append empty brackets onto repeated query string parameters. E.g., `?foo[]=fooone&foo[]=footwo`. This is not supported; send `?foo=fooone&foo=footwo` instead, or send JSON or YAML.

A note about `curl`

The `-d` flag to `curl` does not automatically urlencode data which can affect passwords and other data that contains characters that must be encoded. Use the `--data-urlencode` flag instead. E.g.:

```
curl -ksi http://localhost:8000/login 
  -H "Accept: application/json" 
  -d username='myapiuser' 
  --data-urlencode password='1234+' 
  -d eauth='pam'
```

**Performance Expectations and Recommended Usage**

This module provides a thin wrapper around Salt’s Python API. Executing a Salt command via rest_cherrypy is directly analogous to executing a Salt command via Salt’s CLI (which also uses the Python API) – they share the same semantics, performance characteristics, and 98% of the same code. As a rule-of-thumb: if you wouldn’t do it at the CLI don’t do it via this API.

**Long-Running HTTP Connections**

The CherryPy server is a production-ready, threading HTTP server written in Python. Because it makes use of a thread pool to process HTTP requests it is not ideally suited to maintaining large numbers of concurrent, synchronous connections. On moderate hardware with default settings it should top-out at around 30 to 50 concurrent connections.

That number of long-running, synchronous Salt processes is also not ideal. Like at the CLI, each Salt command run will start a process that instantiates its own `LocalClient`, which instantiates its own listener to the Salt event bus, and sends out its own periodic `saltutil.find_job` queries to determine if a Minion is still running the command. Not exactly a lightweight operation.
Timeouts

In addition to the above resource overhead for long-running connections, there are the usual HTTP timeout semantics for the CherryPy server, any HTTP client being used, as well as any hardware in between such as proxies, gateways, or load balancers. rest_cherrypy can be configured not to time-out long responses via the expire_responses setting, and both LocalClient and RunnerClient have their own timeout parameters that may be passed as top-level keywords:

```bash
curl -b /tmp/cookies.txt -sSi localhost:8000 -H 'Content-type: application/json' -d '
[
  {
    "client": "local",
    "tgt": "*",
    "fun": "test.sleep",
    "kwarg": {"length": 30},
    "timeout": 60
  },
  {
    "client": "runner",
    "fun": "test.sleep",
    "kwarg": {"s_time": 30},
    "timeout": 60
  }
]
'
```

Best Practices

Given the performance overhead and HTTP timeouts for long-running operations described above, the most effective and most scalable way to use both Salt and salt-api is to run commands asynchronously using the local_async, runner_async, and wheel_async clients.

Running asynchronous jobs results in being able to process 3x more commands per second for LocalClient and 17x more commands per second for RunnerClient, in addition to much less network traffic and memory requirements. Job returns can be fetched from Salt’s job cache via the /jobs/<jid> endpoint, or they can be collected into a data store using Salt’s Returner system.

The /events endpoint is specifically designed to handle long-running HTTP connections and it exposes Salt’s event bus which includes job returns. Watching this endpoint first, then executing asynchronous Salt commands second, is the most lightweight and scalable way to use rest_cherrypy while still receiving job returns in real-time. But this requires clients that can properly handle the inherent asynchronicity of that workflow.

Performance Tuning

The thread_pool and socket_queue_size settings can be used to increase the capacity of rest_cherrypy to handle incoming requests. Keep an eye on RAM usage as well as available file handles while testing changes to these settings. As salt-api is a thin wrapper around Salt’s Python API, also keep an eye on the performance of Salt when testing.
Future Plans

Now that Salt uses the Tornado concurrency library internally, we plan to improve performance in the API by taking advantage of existing processes and event listeners and to use lightweight coroutines to facilitate more simultaneous HTTP connections and better support for synchronous operations. That effort can be tracked in issue 26505, but until that issue is closed rest_cherrypy will remain the officially recommended REST API.

Deployment

The rest_cherrypy netapi module is a standard Python WSGI app. It can be deployed one of two ways.

**salt-api using the CherryPy server**

The default configuration is to run this module using **salt-api** to start the Python-based CherryPy server. This server is lightweight, multi-threaded, encrypted with SSL, and should be considered production-ready. See the section above for performance expectations.

**Using a WSGI-compliant web server**

This module may be deployed on any WSGI-compliant server such as Apache with mod_wsgi or Nginx with FastCGI, to name just two (there are many).

Note, external WSGI servers handle URLs, paths, and SSL certs directly. The rest_cherrypy configuration options are ignored and the salt-api daemon does not need to be running at all. Remember Salt authentication credentials are sent in the clear unless SSL is being enforced!

An example Apache virtual host configuration:

```
<VirtualHost *:80>
    ServerName example.com
    ServerAlias *.example.com

    ServerAdmin webmaster@example.com

    LogLevel warn
    ErrorLog /var/www/example.com/logs/error.log
    CustomLog /var/www/example.com/logs/access.log combined

    DocumentRoot /var/www/example.com/htdocs

    WSGIScriptAlias / /path/to/salt/netapi/rest_cherrypy/wsgi.py
</VirtualHost>
```

REST URI Reference

```
/
```

**class** salt.netapi.rest_cherrypy.app.LowDataAdapter

The primary entry point to Salt’s REST API

```
GET()
    An explanation of the API with links of where to go next
```
GET /  
Request Headers  
• **Accept** - the desired response format.  

Status Codes  
• **200** – success  
• **401** – authentication required  
• **406** – requested Content-Type not available

Example request:
```
curl -i localhost:8000
```

GET / HTTP/1.1  
Host: localhost:8000  
Accept: application/json

Example response:
```
HTTP/1.1 200 OK  
Content-Type: application/json
```

POST  
Mock out specified imports.  
This allows autodoc to do its thing without having oodles of req’d installed libs. This doesn’t work with `import *` imports.  
This Mock class can be configured to return a specific values at specific names, if required.  
http://read-the-docs.readthedocs.org/en/latest/faq.html#i-get-import-errors-on-libraries-that-depend-on-c-modules

/login

class salt.netapi.rest_cherrypy.app.Login(*args, **kwargs)  
Log in to receive a session token

Authentication information.

GET()  
Present the login interface

GET /login  
An explanation of how to log in.  

Status Codes  
• **200** – success  
• **401** – authentication required  
• **406** – requested Content-Type not available

Example request:
```
curl -i localhost:8000/login
```

GET /login HTTP/1.1  
Host: localhost:8000  
Accept: text/html

Example response:
POST(**kwargs)

Authenticate against Salt’s eauth system

POST /login

Request Headers
• X-Auth-Token – a session token from Login.
• Accept – the desired response format.
• Content-Type – the format of the request body.

Form Parameters
• eauth – the eauth backend configured for the user
• username – username
• password – password

Status Codes
• 200 – success
• 401 – authentication required
• 406 – requested Content-Type not available

Example request:

curl -si localhost:8000/login
  
  -c ~/cookies.txt
  
  -H "Accept: application/json"
  
  -H "Content-type: application/json"
  
  -d '{
    "username": "saltuser",
    "password": "saltuser",
    "eauth": "auto"
  }'

Example response:

HTTP/1.1 200 OK
Content-Type: application/json
Content-Length: 206
X-Auth-Token: 6d1b722e
Set-Cookie: session_id=6d1b722e; expires=Sat, 17 Nov 2012 03:23:52 GMT;

{"return": {
  "token": "6d1b722e",
  "start": 1363805943.776223,
  "expire": 1363849143.776224,
  "user": "saltuser",
  "eauth": "pam",
  "perms": []
}}

(continues on next page)
"grains.*",
"status.*",
"sys.*",
"test.*"
]
}}

/logout

**class** salt.netapi.rest_cherrypy.app.Logout
Class to remove or invalidate sessions

**POST()**
Destroy the currently active session and expire the session cookie

/minions

**class** salt.netapi.rest_cherrypy.app.Minions
Convenience URLs for working with minions

**GET(mid=None)**
A convenience URL for getting lists of minions or getting minion details

**GET /minions/(mid)**
Request Headers
- **X-Auth-Token** – a session token from Login.
- **Accept** – the desired response format.

Status Codes
- **200** – success
- **401** – authentication required
- **406** – requested Content-Type not available

Example request:
```
curl -i localhost:8000/minions/ms-3
```

Example response:
```
HTTP/1.1 200 OK
Content-Length: 129005
Content-Type: application/x-yaml
return:
- ms-3:
  grains.items:
...`

**POST(**kwargs**)
Start an execution command and immediately return the job id**
**POST /minions**

- **Request Headers**
  - **X-Auth-Token** – a session token from *Login*.
  - **Accept** – the desired response format.
  - **Content-Type** – the format of the request body.

- **Response Headers**
  - **Content-Type** – the format of the response body; depends on the `Accept` request header.

- **Status Codes**
  - **200** – success
  - **400** – bad or malformed request
  - **401** – authentication required
  - **406** – requested Content-Type not available

Lowstate data describing Salt commands must be sent in the request body. The `client` option will be set to `local_async()`.

**Example request:**
```
curl -sSi localhost:8000/minions
   -b ~/cookies.txt
   -H "Accept: application/x-yaml"
   -d '[["tgt": ";", "fun": "status.diskusage"]]
```

**Example response:**
```
HTTP/1.1 202 Accepted
Content-Length: 86
Content-Type: application/x-yaml

return:
- jid: '20130603122505459265'
  minions: [ms-4, ms-3, ms-2, ms-1, ms-0]
  _links:
    jobs:
    - href: /jobs/20130603122505459265
```

### /jobs

**class** salt.netapi.rest_cherrypy.app.Jobs

**GET** *(**jid=None, timeout=**)*

A convenience URL for getting lists of previously run jobs or getting the return from a single job.

**GET /jobs/** *(**jid**)*

List jobs or show a single job from the job cache.

- **Request Headers**
  - **X-Auth-Token** – a session token from *Login*.
  - **Accept** – the desired response format.
Status Codes

- **200** – success
- **401** – authentication required
- **406** – requested Content-Type not available

Example request:

```bash
curl -i localhost:8000/jobs
```

GET /jobs HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml

Example response:

HTTP/1.1 200 OK
Content-Length: 165
Content-Type: application/x-yaml

return:
- '20121130104633606931':
  Arguments:
  - '3'
  Function: test.fib
  Target: jerry
  Target-type: glob

Example request:

```bash
curl -i localhost:8000/jobs/20121130104633606931
```

GET /jobs/20121130104633606931 HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml

Example response:

HTTP/1.1 200 OK
Content-Length: 73
Content-Type: application/x-yaml

info:
- Arguments:
  - '3'
  Function: test.fib
  Minions:
  - jerry
  Target: '*'
  Target-type: glob
  User: saltdev
  jid: '20121130104633606931'
return:
- jerry:
  - 0
  - 1

(continues on next page)
Run commands bypassing the normal session handling

salt-api does not enforce authorization, Salt's eauth system does that. Local/Runner/WheelClient all accept username/password/eauth or token kwargs that are then checked by the eauth system. The session mechanism in rest_cherrypy simply pairs a session with a Salt eauth token and then passes the token kwarg in automatically.

If you already have a Salt eauth token, perhaps generated by the mk_token function in the Auth Runner module, then there is no reason to use sessions.

This endpoint accepts either a username, password, eauth trio, or a token kwarg and does not make use of sessions at all.

**POST(****)kwargs**

Run commands bypassing the normal session handling Other than that this URL is identical to the root URL (/).

**POST /run**

An array of lowstate data describing Salt commands must be sent in the request body.

Status Codes

- **200** – success
- **400** – bad or malformed request
- **401** – authentication required
- **406** – requested Content-Type not available

Example request:

```
curl -sS localhost:8000/run \
-H 'Accept: application/x-yaml' \ 
-H 'Content-type: application/json' \ 
-d '[
    {"client": "local", 
     "tgt": "+", 
     "fun": "test.ping", 
     "username": "saltdev", 
     "password": "saltdev", 
     "eauth": "auto"
    }
]' 
```

Or using a Salt Eauth token:

```
curl -sS localhost:8000/run \
-H 'Accept: application/x-yaml' \ 
-H 'Content-type: application/json' \ 
-d '[
    {"client": "local", 
     "tgt": "+", 
     "fun": "test.ping", 
     "eauth": "auto"
    }
]' 
```
"token": "<salt eauth token here>"
}}]

POST /run HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
Content-Length: 75
Content-Type: application/json

["client": "local", "tgt": "+", "fun": "test.ping", "username": "saltdev",
"password": "saltdev", "eauth": "auto"]

Example response:

HTTP/1.1 200 OK
Content-Length: 73
Content-Type: application/x-yaml

return:
- ms-0: true
ms-1: true
ms-2: true
ms-3: true
ms-4: true

The /run endpoint can also be used to issue commands using the salt-ssh subsystem.

When using salt-ssh, eauth credentials should not be supplied. Instead, authentication should be handled by the SSH layer itself. The use of the salt-ssh client does not require a salt master to be running. Instead, only a roster file must be present in the salt configuration directory.

All SSH client requests are synchronous.

Example SSH client request:

curl -sS localhost:8000/run \
-H 'Accept: application/x-yaml' \
-d client='ssh' \
-d tgt='*' \
-d fun='test.ping'

POST /run HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
Content-Length: 75
Content-Type: application/x-www-form-urlencoded

client=ssh&tgt=*&fun=test.ping

Example SSH response:

return:
- silver:
  fun: test.ping
  fun_args: []
  id: silver

(continues on next page)
Expose the Salt event bus

The event bus on the Salt master exposes a large variety of things, notably when executions are started on the master and also when minions ultimately return their results. This URL provides a real-time window into a running Salt infrastructure.

See also:

Events & Reactor

GET (token=None, salt_token=None)

An HTTP stream of the Salt master event bus

This stream is formatted per the Server Sent Events (SSE) spec. Each event is formatted as JSON.

Example request:

```
curl -NsS localhost:8000/events
```

Example response:

```
GET /events HTTP/1.1
Host: localhost:8000

HTTP/1.1 200 OK
Connection: keep-alive
Cache-Control: no-cache
Content-Type: text/event-stream;charset=utf-8
```

Note, the tag field is not part of the spec. SSE compliant clients should ignore unknown fields. This addition allows non-compliant clients to only watch for certain tags without having to deserialize the JSON object each time.
The event stream can be easily consumed via JavaScript:

```javascript
var source = new EventSource('/events');
source.onopen = function() { console.info('Listening ...'); };
source.onerror = function(err) { console.error(err) };
source.onmessage = function(message) {
    var saltEvent = JSON.parse(message.data);
    console.log(saltEvent.tag, saltEvent.data);
};
```

Note, the SSE stream is fast and completely asynchronous and Salt is very fast. If a job is created using a regular POST request, it is possible that the job return will be available on the SSE stream before the response for the POST request arrives. It is important to take that asynchronicity into account when designing an application. Below are some general guidelines.

- Subscribe to the SSE stream _before_ creating any events.
- Process SSE events directly as they arrive and don’t wait for any other process to "complete" first (like an ajax request).
- Keep a buffer of events if the event stream must be used for synchronous lookups.
- Be cautious in writing Salt’s event stream directly to the DOM. It is very busy and can quickly overwhelm the memory allocated to a browser tab.

A full, working proof-of-concept JavaScript application is available adjacent to this file. It can be viewed by pointing a browser at the /app endpoint in a running rest_cherrypy instance.

Or using CORS:

```javascript
var source = new EventSource('/events?
  token=ecd589e4e01912cf3c4035afad73426dbb8dbab75', {withCredentials: true});
```

It is also possible to consume the stream via the shell.

Records are separated by blank lines; the _data: _ and _tag: _ prefixes will need to be removed manually before attempting to unserialize the JSON.

curl’s -N flag turns off input buffering which is required to process the stream incrementally.

Here is a basic example of printing each event as it comes in:

```bash
curl -NsS localhost:8000/events | \\
  while IFS= read -r line ; do 
    echo $line 
  done
```

Here is an example of using awk to filter events based on tag:
curl -NsS localhost:8000/events |
    awk '{
        BEGIN { RS=""; FS="\n" }
        $1 ~ /^tag: salt\//[0-9]+/new/ { print $0 }
    }'

```
tag: salt/job/20140112010149808995/new
data: {"tag": "20140112010149808995", "data": {"tgt_type": "glob \!
        "jid": "20140112010149808995", "tgt": "jerry", "_stamp": "2014-01-12_01:01:49.809617", "user": "shouse", "arg": [], "fun": "test.ping", "minions": "["jerry"]"}}
tag: 20140112010149808995
data: {"tag": "20140112010149808995", "data": {"fun_args": [], "jid": "20140112010149808995", "return": true, "retcode": 0, "success": true, "cmd": "_return", "_stamp": "2014-01-12_01:01:49.819316", "fun": "test.ping", "id": "jerry"}}
```

/hook

class salt.netapi.rest_cherrypy.app.Webhook
A generic web hook entry point that fires an event on Salt’s event bus

External services can POST data to this URL to trigger an event in Salt. For example, Amazon SNS, Jenkins-CI or Travis-CI, or GitHub web hooks.

**Note:** Be mindful of security
Salt’s Reactor can run any code. A Reactor SLS that responds to a hook event is responsible for validating that the event came from a trusted source and contains valid data.

This is a generic interface and securing it is up to you!

This URL requires authentication however not all external services can be configured to authenticate. For this reason authentication can be selectively disabled for this URL. Follow best practices – always use SSL, pass a secret key, configure the firewall to only allow traffic from a known source, etc.

The event data is taken from the request body. The `Content-Type` header is respected for the payload.

The event tag is prefixed with `salt/netapi/hook` and the URL path is appended to the end. For example, a POST request sent to `/hook/mycompany/myapp/mydata` will produce a Salt event with the tag `salt/netapi/hook/mycompany/myapp/mydata`.

The following is an example `.travis.yml` file to send notifications to Salt of successful test runs:

```
language: python
script: python -m unittest tests
after_success:
  - |
    curl -sSk https://saltapi-url.example.com:8000/hook/travis/build/success
    -d branch="${TRAVIS_BRANCH}"
    -d commit="${TRAVIS_COMMIT}"
```

See also:

* [Events & Reactor, reactor](https://docs.saltstack.com/en/latest/ref/matchers/)

**POST** *(`*args`, **kwargs)*
Fire an event in Salt with a custom event tag and data
POST /hook

Status Codes

- **200** – success
- **401** – authentication required
- **406** – requested Content-Type not available
- **413** – request body is too large

Example request:

curl -sS localhost:8000/hook \
-H 'Content-type: application/json' \
-d '{"foo": "Foo!", "bar": "Bar!"}'

POST /hook HTTP/1.1
Host: localhost:8000
Content-Length: 16
Content-Type: application/json

{"foo": "Foo!", "bar": "Bar!"}

Example response:

HTTP/1.1 200 OK
Content-Length: 14
Content-Type: application/json

{"success": true}

As a practical example, an internal continuous-integration build server could send an HTTP POST request to the URL `https://localhost:8000/hook/mycompany/build/success` which contains the result of a build and the SHA of the version that was built as JSON. That would then produce the following event in Salt that could be used to kick off a deployment via Salt’s Reactor:

Event fired at Fri Feb 14 17:40:11 2014
******************************
Tag: salt/netapi/hook/mycompany/build/success
Data:

{'_stamp': '2014-02-14_17:40:11.440996',
 'headers': {
 'X-My-Secret-Key': 'F0fAgoQjIT@W',
 'Content-Length': '37',
 'Content-Type': 'application/json',
 'Host': 'localhost:8000',
 'Remote-Addr': '127.0.0.1'},
 'post': {'revision': 'aa22a3c4b2e7', 'result': True}}

Salt’s Reactor could listen for the event:

```
reactor:
  - 'salt/netapi/hook/mycompany/build/*':
    - /srv/reactor/react_ci_builds.sls
```

And finally deploy the new build:

```
{% set secret_key = data.get('headers', {}).get('X-My-Secret-Key') %}
{% set build = data.get('post', {}) %}
```
{% if secret_key == 'F0fAgoQjIT@W' and build.result == True %}
deploy_my_app:
  cmd.state.sls:
    - tgt: 'application*'
    - arg:
      - myapp.deploy
    - kwarg:
      pillar:
        revision: {{ revision }}
{% endif %}

/key

class salt.netapi.rest_cherrypy.app.Keys
Convenience URLs for working with minion keys

New in version 2014.7.0.

These URLs wrap the functionality provided by the key wheel module functions.

GET (\textit{mid}=None)
Show the list of minion keys or detail on a specific key

New in version 2014.7.0.

\textbf{GET /keys/ (mid)}
List all keys or show a specific key

Request Headers
- \textbf{X-Auth-Token} – a session token from Login.
- \textbf{Accept} – the desired response format.

Status Codes
- \textbf{200} – success
- \textbf{401} – authentication required
- \textbf{406} – requested Content-Type not available

Example request:

```
curl -i localhost:8000/keys
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 165
Content-Type: application/x-yaml

return:
  local:
    - master.pem
    - master.pub
  minions:
    - jerry
```
minions_pre: []
minions_rejected: []

Example request:

curl -i localhost:8000/keys/jerry

GET /keys/jerry HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml

Example response:

HTTP/1.1 200 OK
Content-Length: 73
Content-Type: application/x-yaml

return:
  minions:

POST(**kwargs)**

Easily generate keys for a minion and auto-accept the new key

Accepts all the same parameters as the `key.gen_accept`.

Note: A note about `curl`. Avoid using the `-i` flag or HTTP headers will be written and produce an invalid tar file.

Example partial kickstart script to bootstrap a new minion:

```bash
%post
  mkdir -p /etc/salt/pki/minion
curl -sSk https://localhost:8000/keys
    -d mid=jerry
    -d username=kickstart
    -d password=kickstart
    -d eauth=pam
  | tar -C /etc/salt/pki/minion -xf -

  mkdir -p /etc/salt/minion.d
  printf 'master: 10.0.0.5\nid: jerry' > /etc/salt/minion.d/id.conf
%end

POST /keys

Generate a public and private key and return both as a tarball

Authentication credentials must be passed in the request.

Status Codes

- **200** – success
- **401** – authentication required
- **406** – requested Content-Type not available

Example request:
curl -sSk https://localhost:8000/keys
   -d mid=jerry
   -d username=kickstart
   -d password=kickstart
   -d eauth=pam
   -o jerry-salt-keys.tar

POST /keys HTTP/1.1
Host: localhost:8000

Example response:

HTTP/1.1 200 OK
Content-Length: 10240
Content-Disposition: attachment; filename="saltkeys-jerry.tar"
Content-Type: application/x-tar

jerry.pub00006440000000000000000000000703000000000000010730 0ustar 0
   00000000000000

/ws

class salt.netapi.rest_cherrypy.app.WebsocketEndpoint
Open a WebSocket connection to Salt's event bus

The event bus on the Salt master exposes a large variety of things, notably when executions are started on the
master and also when minions ultimately return their results. This URL provides a real-time window into a
running Salt infrastructure. Uses websocket as the transport mechanism.

See also:
Events & Reactor

GET(token=None, **kwargs)
Return a websocket connection of Salt's event stream

GET /ws/(token)

Query format_events The event stream will undergo server-side formatting if the
format_events URL parameter is included in the request. This can be useful to
avoid formatting on the client-side:

curl -NsS <...snip...> localhost:8000/ws?format_events

Reqheader X-Auth-Token an authentication token from Login.
Status 101 switching to the websockets protocol
Status 401 authentication required
Status 406 requested Content-Type not available

Example request:

curl -NsSk
   -H 'X-Auth-Token: ffedf49d' \
   -H 'Host: localhost:8000' \
   -H 'Connection: Upgrade' \
   -H 'Upgrade: websocket' \
   -H 'Origin: https://localhost:8000' \

H 'Sec-WebSocket-Version: 13' \
-H 'Sec-WebSocket-Key: "$(echo -n $RANDOM | base64)"' \
localhost:8000/ws

GET /ws HTTP/1.1
Connection: Upgrade
Upgrade: websocket
Host: localhost:8000
Origin: https://localhost:8000
Sec-WebSocket-Version: 13
Sec-WebSocket-Key: s65VsgHigh7v/Jcf4nXHnA==
X-Auth-Token: ffedf49d

Example response:

HTTP/1.1 101 Switching Protocols
Upgrade: websocket
Connection: Upgrade
Sec-WebSocket-Accept: mWZjBV9FCglzn1rIKJAxrTFlnJE=
Sec-WebSocket-Version: 13

An authentication token may optionally be passed as part of the URL for browsers that cannot be configured to send the authentication header or cookie:

curl -NsS <...snip...> localhost:8000/ws/ffedf49d

The event stream can be easily consumed via JavaScript:

```javascript
// Note, you must be authenticated!
var source = new WebSocket('ws://localhost:8000/ws/d0ce6c1a');
source.onerror = function(e) { console.debug('error!', e); }; 
source.onmessage = function(e) { console.debug(e.data); }; 
source.send('websocket client ready')
source.close();
```

Or via Python, using the Python module `websocket-client` for example.

```python
# Note, you must be authenticated!

from websocket import create_connection

ws = create_connection('ws://localhost:8000/ws/d0ce6c1a')
ws.send('websocket client ready')

# Look at https://pypi.python.org/pypi/websocket-client/ for more
# examples.
while listening_to_events:
    print ws.recv()
ws.close()
```

Above examples show how to establish a websocket connection to Salt and activating real time updates from Salt’s event stream by signaling `websocket client ready`. 

(continued from previous page)
/stats

class salt.netapi.rest_cherrypy.app.Stats
   Expose statistics on the running CherryPy server

   GET()
      Return a dump of statistics collected from the CherryPy server

   GET /stats
      Request Headers
         • X-Auth-Token – a session token from Login.
         • Accept – the desired response format.

      Response Headers
         • Content-Type – the format of the response body; depends on the Accept request header.

      Status Codes
         • 200 – success
         • 401 – authentication required
         • 406 – requested Content-Type not available

21.10.2 rest_tornado

A non-blocking REST API for Salt

   depends
      • tornado Python module

   configuration
      All authentication is done through Salt’s external auth system which requires additional configuration not described here.

In order to run rest_tornado with the salt-master add the following to the Salt master config file.

```
rest_tornado:
   # can be any port
   port: 8000
   # address to bind to (defaults to 0.0.0.0)
   address: 0.0.0.0
   # socket backlog
   backlog: 128
   ssl_crt: /etc/pki/api/certs/server.crt
   # no need to specify ssl_key if cert and key
   # are in one single file
   ssl_key: /etc/pki/api/certs/server.key
   debug: False
   disable_ssl: False
   webhook_disable_auth: False
   cors_origin: null
```

Authentication

Authentication is performed by passing a session token with each request. Tokens are generated via the SaltAuthHandler URL.

The token may be sent in one of two ways:
Include a custom header named \texttt{X-Auth-Token}.

Sent via a cookie. This option is a convenience for HTTP clients that automatically handle cookie support (such as browsers).

See also:

You can bypass the session handling via the \texttt{RunSaltAPIHandler} URL.

### CORS

\texttt{rest_tornado} supports Cross-site HTTP requests out of the box. It is by default deactivated and controlled by the \texttt{cors_origin} config key.

You can allow all origins by setting \texttt{cors_origin} to \	exttt{*}.

You can allow only one origin with this configuration:

```
\begin{verbatim}
rest_tornado:
  cors_origin: http://salt.yourcompany.com
\end{verbatim}
```

You can also be more specific and select only a few allowed origins by using a list. For example:

```
\begin{verbatim}
rest_tornado:
  cors_origin:
    - http://salt.yourcompany.com
    - http://salt-preprod.yourcompany.com
\end{verbatim}
```

The format for origin are full URL, with both scheme and port if not standard.

In this case, \texttt{rest_tornado} will check if the Origin header is in the allowed list if it’s the case allow the origin. Else it will returns nothing, effectively preventing the origin to make request.

For reference, CORS is a mechanism used by browser to allow (or disallow) requests made from browser from a different origin than salt-api. It’s complementary to Authentication and mandatory only if you plan to use a salt client developed as a Javascript browser application.

### Usage

Commands are sent to a running Salt master via this module by sending HTTP requests to the URLs detailed below.

#### Content negotiation

This REST interface is flexible in what data formats it will accept as well as what formats it will return (e.g., JSON, YAML, x-www-form-urlencoded).

- Specify the format of data in the request body by including the \texttt{Content-Type} header.
- Specify the desired data format for the response body with the \texttt{Accept} header.

Data sent in \texttt{POST} and \texttt{PUT} requests must be in the format of a list of lowstate dictionaries. This allows multiple commands to be executed in a single HTTP request.

\textbf{lowstate} A dictionary containing various keys that instruct Salt which command to run, where that command lives, any parameters for that command, any authentication credentials, what returner to use, etc.

Salt uses the lowstate data format internally in many places to pass command data between functions. Salt also uses lowstate for the \texttt{LocalClient()} Python API interface.
The following example (in JSON format) causes Salt to execute two commands:

```json
[
  {
    "client": "local",
    "tgt": "*",
    "fun": "test.fib",
    "arg": ["10"]
  },
  {
    "client": "runner",
    "fun": "jobs.lookup_jid",
    "jid": "20130603122505459265"
  }
]
```

Multiple commands in a Salt API request will be executed in serial and makes no guarantees that all commands will run. Meaning that if `test.fib` (from the example above) had an exception, the API would still execute "jobs.lookup_jid".

Responses to these lowstates are an in-order list of dicts containing the return data, a yaml response could look like:

```
- ms-1: true
- ms-2: true
- ms-1: foo
- ms-2: bar
```

In the event of an exception while executing a command the return for that lowstate will be a string, for example if no minions matched the first lowstate we would get a return like:

```
No minions matched the target. No command was sent, no jid was assigned.
- ms-1: true
- ms-2: true
```

---

**x-www-form-urlencoded**

Sending JSON or YAML in the request body is simple and most flexible, however sending data in urlencoded format is also supported with the caveats below. It is the default format for HTML forms, many JavaScript libraries, and the `curl` command.

For example, the equivalent to running `salt '*' test.ping` is sending `fun=test.ping&arg&client=local&tgt=*` in the HTTP request body.

Caveats:

- Only a single command may be sent per HTTP request.
- Repeating the `arg` parameter multiple times will cause those parameters to be combined into a single list.

  Note, some popular frameworks and languages (notably jQuery, PHP, and Ruby on Rails) will automatically append empty brackets onto repeated parameters. E.g., `arg=one, arg=two` will be sent as `arg[]=one, arg[]=two`. This is not supported; send JSON or YAML instead.

---

**A Websockets add-on to saltnado**

```python
depends
  • tornado Python module
```

In order to enable saltnado_websockets you must add `websockets: True` to your saltnado config block.
**rest_tornado:**

- **port**: 8000
- **ssl_crt**: /etc/pki/api/certs/server.crt
- **ssl_key**: /etc/pki/api/certs/server.key
- **debug**: False
- **disable_ssl**: False
- **websockets**: True

---

**All Events**

Exposes all "real-time" events from Salt’s event bus on a websocket connection. It should be noted that "Real-time" here means these events are made available to the server as soon as any salt related action (changes to minions, new jobs etc) happens. Clients are however assumed to be able to tolerate any network transport related latencies. Functionality provided by this endpoint is similar to the /events end point.

The event bus on the Salt master exposes a large variety of things, notably when executions are started on the master and also when minions ultimately return their results. This URL provides a real-time window into a running Salt infrastructure. Uses websocket as the transport mechanism.

Exposes GET method to return websocket connections. All requests should include an auth token. A way to obtain obtain authentication tokens is shown below.

```
% curl -si localhost:8000/login
   -H "Accept: application/json"
   -d username='salt'
   -d password='salt'
   -d eauth='pam'
```

Which results in the response

```
{
   "return": [{
       "perms": [".*", "@runner", "@wheel"],
       "start": 1400556492.277421,
       "token": "d0ce6c1a37e99dcc0374392f272fe19c0090cca7",
       "expire": 1400599692.277422,
       "user": "salt",
       "eauth": "pam"
   }
}
```

In this example the token returned is d0ce6c1a37e99dcc0374392f272fe19c0090cca7 and can be included in subsequent websocket requests (as part of the URL).

The event stream can be easily consumed via JavaScript:

```
// Note, you must be authenticated!

// Get the Websocket connection to Salt
var source = new WebSocket('wss://localhost:8000/all_events/
  -d0ce6c1a37e99dcc0374392f272fe19c0090cca7');

// Get Salt's "real time" event stream.

(continues on next page)
source.onopen = function() { source.send('websocket client ready'); };  

// Other handlers
source.onerror = function(e) { console.debug('error!', e); }; 

// e.data represents Salt's "real time" event data as serialized JSON.
source.onmessage = function(e) { console.debug(e.data); };  

// Terminates websocket connection and Salt's "real time" event stream on the server.
source.close();

Or via Python, using the Python module websocket-client for example. Or the tornado client.

```python
# Note, you must be authenticated!
from websocket import create_connection

# Get the Websocket connection to Salt
ws = create_connection('wss://localhost:8000/all_events/
                        --d0ce6c1a37e99dcc0374392f272fe19c0090cca7')

# Get Salt's "real time" event stream.
ws.send('websocket client ready')

# Simple listener to print results of Salt's "real time" event stream.
# Look at https://pypi.python.org/pypi/websocket-client/ for more examples.
while listening_to_events:
    print ws.recv()  # Salt's "real time" event data as serialized JSON.

# Terminates websocket connection and Salt's "real time" event stream on the server.
ws.close()

# Please refer to https://github.com/liris/websocket-client/issues/81 when using a self signed cert
```

Above examples show how to establish a websocket connection to Salt and activating real time updates from Salt’s event stream by signaling websocket client ready.

**Formatted Events**

Exposes formatted "real-time" events from Salt’s event bus on a websocket connection. It should be noted that "Real-time" here means these events are made available to the server as soon as any salt related action (changes to minions, new jobs etc) happens. Clients are however assumed to be able to tolerate any network transport related latencies. Functionality provided by this endpoint is similar to the /events end point.

The event bus on the Salt master exposes a large variety of things, notably when executions are started on the master and also when minions ultimately return their results. This URL provides a real-time window into a running Salt infrastructure. Uses websocket as the transport mechanism.

Formatted events parses the raw "real time" event stream and maintains a current view of the following:

- minions
- jobs
A change to the minions (such as addition, removal of keys or connection drops) or jobs is processed and clients are updated. Since we use salt's presence events to track minions, please enable `presence_events` and set a small value for the `loop_interval` in the salt master config file.

Exposes GET method to return websocket connections. All requests should include an auth token. A way to obtain authentication tokens is shown below.

```
% curl -si localhost:8000/login \
   -H "Accept: application/json" \
   -d username='salt' \
   -d password='salt' \
   -d eauth='pam'
```

Which results in the response

```
{   "return": [   {      "perms": [".*", "@runner", "@wheel"],      "start": 1400556492.277421,      "token": "d0ce6c1a37e99dcc0374392f272fe19c0090cca7",      "expire": 1400599692.277422,      "user": "salt",      "eauth": "pam"   }  ]}
```

In this example the `token` returned is `d0ce6c1a37e99dcc0374392f272fe19c0090cca7` and can be included in subsequent websocket requests (as part of the URL).

The event stream can be easily consumed via JavaScript:

```
// Note, you must be authenticated!

// Get the Websocket connection to Salt
var source = new WebSocket('wss://localhost:8000/formatted_events/
--d0ce6c1a37e99dcc0374392f272fe19c0090cca7');

// Get Salt's "real time" event stream.
source.onopen = function() { source.send('websocket client ready'); }; // Other handlers
source.onerror = function(e) { console.debug('error!', e); }; // e.data represents Salt's "real time" event data as serialized JSON.
source.onmessage = function(e) { console.debug(e.data); }; // Terminates websocket connection and Salt's "real time" event stream on the server.
source.close();
```

Or via Python, using the Python module `websocket-client` for example. Or the tornado client.

```
# Note, you must be authenticated!

from websocket import create_connection

# Get the Websocket connection to Salt
ws = create_connection('wss://localhost:8000/formatted_events/
--d0ce6c1a37e99dcc0374392f272fe19c0090cca7')
```

(continues on next page)
# Get Salt's "real time" event stream.
ws.send('websocket client ready')

# Simple listener to print results of Salt's "real time" event stream.
# Look at https://pypi.python.org/pypi/websocket-client/ for more examples.
while listening_to_events:
    print ws.recv()  # Salt's "real time" event data as serialized JSON.

# Terminates websocket connection and Salt's "real time" event stream on the server.
ws.close()

# Please refer to https://github.com/liris/websocket-client/issues/81 when using a
# self signed cert

Above examples show how to establish a websocket connection to Salt and activating real time updates from Salt’s event stream by signaling websocket client ready.

**Example responses**

Minion information is a dictionary keyed by each connected minion’s id (mid), grains information for each minion is also included.

Minion information is sent in response to the following minion events:

- connection drops
  - requires running manage.present periodically every loop_interval seconds
- minion addition
- minon removal

```python
# Not all grains are shown
data: {
    "minions": {
        "minion1": {
            "id": "minion1",
            "grains": {
                "kernel": "Darwin",
                "domain": "local",
                "zmqversion": "4.0.3",
                "kernelrelease": "13.2.0"
            }
        }
    }
}
```

Job information is also tracked and delivered.

Job information is also a dictionary in which each job’s information is keyed by salt’s jid.

```python
# Job information is also tracked and delivered.
data: {
    "jobs": {
        "20140609153646699137": {
            "tgt_type": "glob",
        }
    }
}
```
"jid": "20140609153646699137",
"tgt": "*",
"start_time": "2014-06-09T15:36:46.700315",
"state": "complete",
"fun": "test.ping",
"minions": {
  "minion1": {
    "return": true,
    "retcode": 0,
    "success": true
  }
}
}

21.10.3  rest_wsgi

A minimalist REST API for Salt

This rest_wsgi module provides a no-frills REST interface for sending commands to the Salt master. There are no dependencies.

Extra care must be taken when deploying this module into production. Please read this documentation in entirety. All authentication is done through Salt’s external auth system.

Usage

- All requests must be sent to the root URL (/).
- All requests must be sent as a POST request with JSON content in the request body.
- All responses are in JSON.

See also:

rest_cherrypy

The rest_cherrypy module is more full-featured, production-ready, and has built-in security features.

Deployment

The rest_wsgi netapi module is a standard Python WSGI app. It can be deployed one of two ways.
Using a WSGI-compliant web server

This module may be run via any WSGI-compliant production server such as Apache with mod_wsgi or Nginx with FastCGI.

It is strongly recommended that this app be used with a server that supports HTTPS encryption since raw Salt authentication credentials must be sent with every request. Any apps that access Salt through this interface will need to manually manage authentication credentials (either username and password or a Salt token). Tread carefully.

salt-api using a development-only server

If run directly via the salt-api daemon it uses the wsgiref.simple_server() that ships in the Python standard library. This is a single-threaded server that is intended for testing and development. This server does not use encryption; please note that raw Salt authentication credentials must be sent with every HTTP request.

Running this module via salt-api is not recommended!

In order to start this module via the salt-api daemon the following must be put into the Salt master config:

```
rest_wsgi:
  port: 8001
```

Usage examples

**POST /**

Example request for a basic test.ping:

```bash
% curl -sS -i -H 'Content-Type: application/json' -d '[["eauth":"pam","username":"saltdev","password":"saltdev","client":"local","tgt":"*","fun":"test.ping"]]' localhost:8001
```

Example response:

```
HTTP/1.0 200 OK
Content-Length: 89
Content-Type: application/json

{"return": [{"ms--4": true, "ms--3": true, "ms--2": true, "ms--1": true, "ms--0": false, "true"]}
```

Example request for an asynchronous test.ping:

```bash
% curl -sS -i -H 'Content-Type: application/json' -d '[["eauth":"pam","username":"saltdev","password":"saltdev","client":"local_async","tgt":"*","fun":"test.ping"]]' localhost:8001
```

Example response:

```
HTTP/1.0 200 OK
Content-Length: 103
Content-Type: application/json

{"return": [{"jid": "20130412192112593739", "minions": [{"ms--4": "ms--3", "ms--2", "ms--1", "ms--0"}]}]}
```
Example request for looking up a job ID:

```bash
% curl -sS -i \
-H 'Content-Type: application/json' \
-d '
{"eauth":"pam","username":"saltdev","password":"saltdev","client":"runner","fun":"jobs.lookup_jid","jid":"20130412192112593739"}'} localhost:8001
```

Example response:

```
HTTP/1.0 200 OK
Content-Length: 89
Content-Type: application/json

{"return": [{"ms--4": true, "ms--3": true, "ms--2": true, "ms--1": true, "ms--0": 0, true}]}
```

display lowstate  A list of lowstate data appropriate for the client interface you are calling.

status 200 success

status 401 authentication required

### 21.11 output modules

</table>

### 21.11.1 salt.output.highstate

Outputter for displaying results of state runs

The return data from the Highstate command is a standard data structure which is parsed by the highstate outputter to deliver a clean and readable set of information about the HighState run on minions.

Two configurations can be set to modify the highstate outputter. These values can be set in the master config to change the output of the salt command or set in the minion config to change the output of the salt-call command.
command.

**state_verbose** By default *state_verbose* is set to *True*, setting this to *False* will instruct the highstate outputter to omit displaying anything in green, this means that nothing with a result of True and no changes will not be printed.

**state_output**: The highstate outputter has six output modes, full, terse, mixed, changes and filter

- The default is set to full, which will display many lines of detailed information for each executed chunk.
- If terse is used, then the output is greatly simplified and shown in only one line.
- If mixed is used, then terse output will be used unless a state failed, in which case full output will be used.
- If changes is used, then terse output will be used if there was no error and no changes, otherwise full output will be used.
- If filter is used, then either or both of two different filters can be used: exclude or terse.
  - for exclude, state.highstate expects a list of states to be excluded (or None) followed by True for terse output or False for regular output. Because of parsing nuances, if only one of these is used, it must still contain a comma. For instance: exclude=True,
  - for terse, state.highstate expects simply True or False.

These can be set as such from the command line, or in the Salt config as *state_output_exclude* or *state_output_terse*, respectively.

The output modes have one modifier:

- **full_id**, **terse_id**, **mixed_id**, **changes_id** and **filter_id** If _id_ is used, then the corresponding form will be used, but the value for name will be drawn from the state ID. This is useful for cases where the name value might be very long and hard to read.

**state_tabular**: If *state_output* uses the terse output, set this to *True* for an aligned output format. If you wish to use a custom format, this can be set to a string.

Example usage:

If *state_output*: filter is set in the configuration file:

```bash
salt '*' state.highstate exclude=None,True
```

means to exclude no states from the highstate and turn on terse output.

```bash
salt twd state.highstate exclude=problemstate1,problemstate2,False
```

means to exclude states problemstate1 and problemstate2 from the highstate, and use regular output.

Example output for the above highstate call when top.sls defines only one other state to apply to minion twd:

```
twd:
Summary for twd
----------
Succeeded: 1 (changed=1)
Failed: 0
----------
Total states run: 1
```

Example output with no special settings in configuration files:
myminion:
--------
ID: test.ping
Function: module.run
Result: True
Comment: Module function test.ping executed
Changes:
--------
ret:
    True

Summary for myminion
--------
Succeeded: 1
Failed: 0
--------
Total: 0

salt.output.highstate.output(data, **kwargs)
The HighState Outputer is only meant to be used with the state.highstate function, or a function that returns
highstate return data.

21.11.2 salt.output.json_out

Display return data in JSON format

configuration The output format can be configured in two ways: Using the --out-indent CLI flag
and specifying a positive integer or a negative integer to group JSON from each minion to a single
line.

Or setting the output_indent setting in the Master or Minion configuration file with one of
the following values:

- Null: put each minion return on a single line.
- pretty: use four-space indents and sort the keys.
- An integer: specify the indentation level.

Salt’s outputters operate on a per-minion basis. Each minion return will be output as a single JSON object once it
comes in to the master.

Some JSON parsers can guess when an object ends and a new one begins but many can not. A good way to differentiate between each minion return is to use the single-line output format and to parse each line individually. Example output (truncated):

```
{"dave": {"en0": {"hwaddr": "02:b0:26:4c:69", ...}}}
{"jerry": {"en0": {"hwaddr": "02:ab:0d:b9:0d", ...}}}
{"kevin": {"en0": {"hwaddr": "02:6d:7f:ee:9f:ee", ...}}}
{"mike": {"en0": {"hwaddr": "02:48:a2:4b:70:a0", ...}}}
{"phill": {"en0": {"hwaddr": "02:1d:cc:a2:33:55", ...}}}
{"stuart": {"en0": {"hwaddr": "02:9a:e0:ea:9e:3c", ...}}}
```

salt.output.json_out.output(data, **kwargs)
    Print the output data in JSON
21.11.3 salt.output.key

Display salt-key output

The `salt-key` command makes use of this outputer to format its output.

```python
salt.output.key.output(data, **kwargs)
```

Read in the dict structure generated by the salt key API methods and print the structure.

21.11.4 salt.output.nested

Recursively display nested data

This is the default outputer for most execution functions.

Example output:

```plaintext
myminion:
  ------------
  foo:
    ------------
    bar:
      baz
    dictionary:
      ------------
      abc:
        123
      def:
        456
    list:
      - Hello
      - World
```

```python
class salt.output.nested.NestDisplay(retcode=0)
  Manage the nested display contents

  display(ret, indent, prefix, out)
    Recursively iterate down through data structures to determine output

  ustring(indent, color, msg, prefix=",", suffix=",", endc=None)

salt.output.nested.output(ret, **kwargs)
  Display ret data
```

21.11.5 salt.output.newline_values_only

Display values only, separated by newlines

New in version 2015.5.0.

This outputer is designed for Salt CLI return data. It will do the following to the return dict:

1. Get just the values (ignoring the minion IDs).
2. Each value, if it is iterable, is split a separate line.
3. Each minion’s values are separated by newlines.
This results in a single string of return data containing all the values from the various minions.

**Warning:** As noted above, this outputter will discard the minion ID. If the minion ID is important, then an outputter that returns the full return dictionary in a parsable format (such as json, pprint, or yaml) may be more suitable.

### Example 1

**Input**

```python
{
    'myminion': ['127.0.0.1', '10.0.0.1'],
    'second-minion': ['127.0.0.1', '10.0.0.2']
}
```

**Output**

```
127.0.0.1
10.0.0.1
127.0.0.1
10.0.0.2
```

### Example 2

**Input**

```python
{
    'myminion': 8,
    'second-minion': 10
}
```

**Output**

```
8
10
```

```
salt.output.newline_values_only.output(data, **kwargs)
    Display modified ret data
```

### 21.11.6 salt.output.no_out_quiet

**Display no output**

No output is produced when this outputter is selected
salt.output.no_out_quiet.output(ret, **kwargs)
   Don’t display data. Used when you only are interested in the return.

21.11.7 salt.output.no_return

Display output for minions that did not return

This outputer is used to display notices about which minions failed to return when a salt function is run with -v or --verbose. It should not be called directly from the CLI.

Example output:

```
virtucentos:
   Minion did not return
```

class salt.output.no_return.NestDisplay
   Create generator for nested output
   
   display(ret, indent, prefix, out)
      Recursively iterate down through data structures to determine output

salt.output.no_return.output(ret, **kwargs)
   Display ret data

21.11.8 salt.output.overstatestage

Display clean output of an overstate stage

This outputer is used to display Orchestrate Runner stages, and should not be called directly.

salt.output.overstatestage.output(data, **kwargs)
   Format the data for printing stage information from the overstate system

21.11.9 salt.output.pony module

Display Pony output data structure

    depends
       • ponysay CLI program

Display output from a pony. Ponies are better than cows because everybody wants a pony.

Example output:

```
< {'local': True} >
   ------------------
      \  
      \  
```

(continues on next page)
salt.output.pony.output(data, **kwargs)
Mane function

21.11.10 salt.output.pprint_out

Python pretty-print (pprint)

The python pretty-print system was once the default outetter. It simply passes the return data through to pprint. pformat and prints the results.

Example output:

```
{'saltmine': {'foo': {'bar': 'baz',
                      'dictionary': {'abc': 123, 'def': 456},
                      'list': ['Hello', 'World']})}
```

salt.output.pprint_out.output(data, **kwargs)
Print out via pretty print

21.11.11 salt.output.profile

Display profiling data in a table format

Show profile data for returners that would normally show a highstate output.

salt MINION state.apply something --out=profile

Attempt to output the returns of state.sls and state.highstate as a table of names, modules and durations that looks somewhat like the following:

```
<table>
<thead>
<tr>
<th>name</th>
<th>mod.fun</th>
<th>duration (ms)</th>
</tr>
</thead>
<tbody>
<tr>
<td>I-fail-unless-stmt</td>
<td>other.function</td>
<td>-1.0000</td>
</tr>
<tr>
<td>old-minion-config</td>
<td>grains.list_present</td>
<td>1.1200</td>
</tr>
<tr>
<td>salt-data</td>
<td>group.present</td>
<td>48.3800</td>
</tr>
<tr>
<td>/etc/salt/minion</td>
<td>file.managed</td>
<td>63.1450</td>
</tr>
</tbody>
</table>
```

To get the above appearance, use settings something like these:
salt.output.profile.output(data, **kwargs)
    Display the profiling data in a table format.

21.11.12 salt.output.progress

Display return data as a progress bar

salt.output.progress.output(ret, bar, **kwargs)
    Update the progress bar
	salt.output.progress.progress_iter(progress)
    Initialize and return a progress bar iter

21.11.13 salt.output.raw

Display raw output data structure

This outputter simply displays the output as a python data structure, by printing a string representation of it. It is similar to the pprint outputter, only the data is not nicely formatted/indented.

This was the original outputter used by Salt before the outputter system was developed.

Example output:

```
{'myminion': {'foo': {'list': ['Hello', 'World'], 'bar': 'baz', 'dictionary': {'abc': 123, 'def': 456}}}}
```

salt.output.raw.output(data, **kwargs)
    Rather basic....

21.11.14 salt.output.table_out

Display output in a table format

New in version 2017.7.0.

This outputter displays a sequence of rows as table.

Example output:

```
edge01.bjm01:
--------------
    comment:
    ------------
    out:
--------------
<table>
<thead>
<tr>
<th>Active</th>
<th>Interface</th>
<th>Last Move</th>
<th>Mac</th>
<th>Moves</th>
<th>Static</th>
<th>Vlan</th>
</tr>
</thead>
</table>
(continues on next page)
```
class `salt.output.table_out.TableDisplay`:

Manage the table display content.

- `display(ret, indent, out, rows_key=None, labels_key=None)`
  Display table(s).

- `display_rows(rows, labels, indent)`
  Prepares row content and displays.

- `prepare_rows(rows, indent, has_header)`
  Prepare rows content to be displayed.

- `ustring(indent, color, msg, prefix='', suffix='', endc=None)`
  Build the unicode string to be displayed.

- `wrap_onspace(text)`
  When the text inside the column is longer then the width, will split by space and continue on the next line.

- `salt.output.table_out.output(ret, **kwargs)`
  Display the output as table.

Parameters:
- `nested_indent(*)` – integer, specify the left alignment.
- `has_header(*)` – boolean specifying if header should be displayed. Default: True.
- `row_delimiter(*)` – character to separate rows. Default: `_`.
- `delim(*)` – character to separate columns. Default: " | ".
- `separate_rows(*)` – boolean specifying if row separator will be displayed between consecutive rows. Default: True.
- `prefix(*)` – character at the beginning of the row. Default: ": | :".
- `suffix(*)` – character at the end of the row. Default: " | ".
- `width(*)` – column max width. Default: 50.
- `rows_key(*)` – display the rows under a specific key.
- `labels_key(*)` – use the labels under a certain key. Otherwise will try to use the dictionary keys (if any).
- `title(*)` – display title when only one table is selected (using the rows_key argument).
21.11.15 salt.output.txt

Simple text outputter

The txt outputter has been developed to make the output from shell commands on minions appear as they do when the command is executed on the minion.

```
salt.output.txt.output(data, **kwargs)
```

Output the data in lines, very nice for running commands.

21.11.16 salt.output.virt_query

virt.query outputter

Used to display the output from the `virt.query` runner.

```
salt.output.virt_query.output(data, **kwargs)
```

Display output for the salt-run virt.query function.

21.11.17 salt.output.yaml_out

Display return data in YAML format

This ouputter defaults to prinintg in YAML block mode for better readability.

Example output:

```
saltmine:
  foo:
    bar: baz
  dictionary:
    abc: 123
    def: 456
  list:
    - Hello
    - World
```

```
salt.output.yaml_out.output(data, **kwargs)
```

Print out YAML using the block mode.

21.12 pillar modules

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cmd_json</td>
<td>Execute a command and read the output as JSON.</td>
</tr>
<tr>
<td>cmd_yaml</td>
<td>Execute a command and read the output as YAML.</td>
</tr>
<tr>
<td>cmd_yamlex</td>
<td>Execute a command and read the output as YAMLEX.</td>
</tr>
<tr>
<td>cobbler</td>
<td>A module to pull data from Cobbler via its API into the Pillar dictionary.</td>
</tr>
<tr>
<td>confidant</td>
<td>An external pillar module for getting credentials from confidant.</td>
</tr>
<tr>
<td>consul_pillar</td>
<td>Use Consul K/V as a Pillar source with values parsed as YAML.</td>
</tr>
</tbody>
</table>

</tbody>
</table>

Continued on next page
Table 12 – continued from previous page

| vmware_pillar | Pillar data from vCenter or an ESXi host |

21.12.1 salt.pillar.cmd_json

Execute a command and read the output as JSON. The JSON data is then directly overlaid onto the minion’s Pillar data.

```python
salt.pillar.cmd_json.ext_pillar(minion_id, pillar, command)
```

Execute a command and read the output as JSON

21.12.2 salt.pillar.cmd_yaml

Execute a command and read the output as YAML. The YAML data is then directly overlaid onto the minion’s Pillar data

```python
salt.pillar.cmd_yaml.ext_pillar(minion_id, pillar, command)
```

Execute a command and read the output as YAML

21.12.3 salt.pillar.cmd_yamlex

Execute a command and read the output as YAMLEX.

The YAMLEX data is then directly overlaid onto the minion’s Pillar data

```python
salt.pillar.cmd_yamlex.ext_pillar(minion_id, pillar, command)
```

Execute a command and read the output as YAMLEX

21.12.4 salt.pillar.cobbler

A module to pull data from Cobbler via its API into the Pillar dictionary

Configuring the Cobbler ext_pillar

The same cobbler* parameters are used for both the Cobbler tops and Cobbler pillar modules.

```yaml
ext_pillar:
  - cobbler:
      key: cobbler # Nest results within this key. By default, values are not nested.
      only: [parameters] # Add only these keys to pillar.
    cobbler.url: https://example.com/cobbler_api # default is http://localhost/cobbler_api
    cobbler.user: username # default is no username
    cobbler.password: password # default is no password
```

Module Documentation

```python
salt.pillar.cobbler.ext_pillar(minion_id, pillar, key=None, only=())
```

Read pillar data from Cobbler via its API.
## 21.12.5 salt.pillar.confidant

An external pillar module for getting credentials from confidant.

### Configuring the Confidant module

The module can be configured via ext_pillar in the minion config:

```yaml
ext_pillar:
  • confidant:
    profile: # The URL of the confidant web service
      url: 'https://confidant-production.example.com'
      # The context to use for KMS authentication
      auth_context: from: example-production-iad to: confidant-production-iad
      user_type: service
      # The KMS master key to use for authentication
      auth_key: "alias/authnz"
      # Cache file for KMS auth token
      token_cache_file: /run/confidant/confidant_token
      # The duration of the validity of a token, in minutes
      token_duration: 60
      # key, keyid and region can be defined in the profile, but it's generally best to use IAM roles or environment variables for AWS auth.
      keyid: 98nh9h9h908h09kjjk
      key: jhf908gyeghehe0he0g8h9u0j0n09h0j09h0
      region: us-east-1
```

**depends** confidant-common, confidant-client

### Module Documentation

**salt.pillar.confidant.ext_pillar** *(minion_id, pillar, profile=None)*

Read pillar data from Confidant via its API.

## 21.12.6 salt.pillar.consul_pillar module

Use Consul K/V as a Pillar source with values parsed as YAML

**depends**

- python-consul

In order to use an consul server, a profile must be created in the master configuration file:

```yaml
my_consul_config:
  consul.host: 127.0.0.1
  consul.port: 8500
  consul.token: b6376760-a8bb-edd5-fcda-33bc13bfc556
  consul.scheme: http
  consul.consistency: default
  consul.dc: dev
  consul.verify: True
```

All parameters are optional.

The **consul.token** requires python-consul >= 0.4.7.

If you have a multi-datacenter Consul cluster you can map your pillarenv's to your data centers by providing a dictionary of mappings in ``consul.dc field:
In the example above we specifying static mapping between Pillar environments and data centers: the data for `dev` and `prod` Pillar environments will be fetched from `us-east-1` and `us-west-1` datacenter respectively.

In fact when `consul.dc` is set to dictionary keys are processed as regular expressions (that can capture named parameters) and values are processed as string templates as per PEP 3101.

This example maps all Pillar environments starting with `dev-` to `dev-datacenter` whereas Pillar environment like `eu-prod` will be mapped to `prod-datacenter-eu`.

Before evaluation patterns are sorted by length in descending order.

If Pillar environment names correspond to data center names a single pattern can be used:

```
my_consul_config:
  consul.dc:
    ^dev-.*$: dev-datacenter
    ^(?P<region>\-prod)$: prod-datacenter-{region}
```

After the profile is created, configure the external pillar system to use it. Optionally, a root may be specified.

```
ext_pillar:
  - consul: my_consul_config
```

```
ext_pillar:
  - consul: my_consul_config root=salt
```

Using these configuration profiles, multiple consul sources may also be used:

```
ext_pillar:
  - consul: my_consul_config
  - consul: my_other_consul_config
```

Either the `minion_id`, or the `role`, or the `environment` grain may be used in the `root` path to expose minion-specific information stored in consul.

```
ext_pillar:
  - consul: my_consul_config root=salt/%(minion_id)s
  - consul: my_consul_config root=salt/%(role)s
  - consul: my_consul_config root=salt/%(environment)s
```

Minion-specific values may override shared values when the minion-specific root appears after the shared root:

```
ext_pillar:
  - consul: my_consul_config root=salt-shared
  - consul: my_other_consul_config root=salt-private/%(minion_id)s
```

If using the `role` or `environment` grain in the consul key path, be sure to define it using `/etc/salt/grains`, or similar:
It's possible to lock down where the pillar values are shared through minion targeting. Note that double quotes " are required around the target value and cannot be used inside the matching statement. See the section on Compound Matchers for more examples.

The data from Consul can be merged into a nested key in Pillar.

By default, keys containing YAML data will be deserialized before being merged into Pillar. This behavior can be disabled by setting `expand_keys` to `false`.

salt.pillar.consul_pillar.**consul_fetch**(*client*, *path*)
Query consul for all keys/values within base path

salt.pillar.consul_pillar.**ext_pillar**(*minion_id*, *pillar*, *conf*)
Check consul for all data

salt.pillar.consul_pillar.**fetch_tree**(*client*, *path*, *expand_keys*)
Grab data from consul, trim base path and remove any keys which are folders. Take the remaining data and send it to be formatted in such a way as to be used as pillar data.

salt.pillar.consul_pillar.**get_conn**(*opts*, *profile*)
Return a client object for accessing consul

salt.pillar.consul_pillar.**pillar_format**(*ret*, *keys*, *value*, *expand_keys*)
Perform data formatting to be used as pillar data and merge it with the current pillar data

### 21.12.7 salt.pillar.csvpillar module

Store key/value pairs in a CSV file

New in version 2016.11.0.

Example configuration:
The first column must be minion IDs and the first row must be dictionary keys. E.g.:

<table>
<thead>
<tr>
<th>id</th>
<th>role</th>
<th>env</th>
</tr>
</thead>
<tbody>
<tr>
<td>jerry</td>
<td>web</td>
<td>prod</td>
</tr>
<tr>
<td>stuart</td>
<td>web</td>
<td>stage</td>
</tr>
<tr>
<td>dave</td>
<td>web</td>
<td>qa</td>
</tr>
<tr>
<td>phil</td>
<td>db</td>
<td>prod</td>
</tr>
<tr>
<td>kevin</td>
<td>db</td>
<td>stage</td>
</tr>
<tr>
<td>mike</td>
<td>db</td>
<td>qa</td>
</tr>
</tbody>
</table>

Will produce the following Pillar values for a minion named "jerry":

```python
{
    'role': 'web',
    'env': 'prod',
}
```

```
salt.pillar.csvpillar.ext_pillar(mid, pillar, path, idkey='id', namespace=None, fieldnames=None, restkey=None, restval=None, dialect='excel')
```

Read a CSV into Pillar

Parameters

- **path** *(str)* – Absolute path to a CSV file.
- **idkey** *(str)* – (Optional) The column name of minion IDs.
- **namespace** *(str)* – (Optional) A pillar key to namespace the values under.
- **fieldnames** *(list)* – (Optional) if the first row of the CSV is not column names they may be specified here instead.

### 21.12.8 salt.pillar.digicert module

Digicert Pillar Certificates

This module will only return pillar data if the `digicert` runner module has already been used to create certificates.

To configure this module, set `digicert` to `True` in the `ext_pillar` section of your master configuration file:

```
  ext_pillar:
    - digicert: True
```

```
salt.pillar.digicert.ext_pillar(minion_id, pillar, conf)
```

Return an existing set of certificates

### 21.12.9 salt.pillar.django_orm

Generate Pillar data from Django models through the Django ORM

- **maintainer** Micah Hausler <micah.hausler@gmail.com>
- **maturity** new

**Configuring the django_orm ext_pillar**

To use this module, your Django project must be on the salt master server with database access. This assumes you are using virtualenv with all the project's requirements installed.
ext_pillar:
  - django_orm:
      pillar_name: my_application
      project_path: /path/to/project/
      settings_module: my_application.settings
      env_file: /path/to/env/file.sh
      # Optional: If your project is not using the system python, 
      # add your virtualenv path below.
      env: /path/to/virtualenv/

      django_app:

        # Required: the app that is included in INSTALLED_APPS
        my_application.clients:

        # Required: the model name
        Client:

        # Required: model field to use as the key in the rendered
        # Pillar. Must be unique; must also be included in the
        # `fields` list below.
        name: shortname

        # Optional:
        # See Django's QuerySet documentation for how to use .filter()
        filter: {'kw': 'args'}

        # Required: a list of field names
        # List items will be used as arguments to the .values() method.
        # See Django's QuerySet documentation for how to use .values()
        fields:
          - field_1
          - field_2

This would return pillar data that would look like

```
my_application:
  my_application.clients:
    Client:
      client_1:
        field_1: data_from_field_1
        field_2: data_from_field_2
      client_2:
        field_1: data_from_field_1
        field_2: data_from_field_2
```

As another example, data from multiple database tables can be fetched using Django’s regular lookup syntax. Note, using ManyToManyFields will not currently work since the return from values() changes if a ManyToMany is present.

ext_pillar:
  - django_orm:
    pillar_name: djangotutorial
    project_path: /path/to/mysite
    settings_module: mysite.settings

    django_app:
      mysite.polls:

(continues on next page)
**Module Documentation**

**salt.pillar.django_or०.ext_pillar** *(minion_id, pillar, pillar_name, project_path, settings_module, django_app, env=’None’, env_file=’None’, *args, **kwargs)*

Connect to a Django database through the ORM and retrieve model fields

**Parameters**

- **pillar_name** *(str)* – The name of the pillar to be returned
- **project_path** *(str)* – The full path to your Django project (the directory manage.py is in)
- **settings_module** *(str)* – The settings module for your project. This can be found in your manage.py file
- **django_app** *(str)* – A dictionary containing your apps, models, and fields
- **env** *(str)* – The full path to the virtualenv for your Django project
- **env_file** *(str)* – An optional bash file that sets up your environment. The file is run in a subprocess and the changed variables are then added

**21.12.10 salt.pillar.ec2_pillar**

Retrieve EC2 instance data for minions for ec2_tags and ec2_tags_list

The minion id must be the AWS instance-id or value in *tag_match_key*. For example set *tag_match_key* to *Name* to have the minion-id matched against the tag ‘Name’. The tag contents must be unique. The value of *tag_match_value* can be ‘uqdn’ or ‘asis’. If ‘uqdn’, then the domain will be stripped before comparison.

Additionally, the *use_grain* option can be set to True. This allows the use of an instance-id grain instead of the minion-id. Since this is a potential security risk, the configuration can be further expanded to include a list of minions that are trusted to only allow the alternate id of the instances to specific hosts. There is no glob matching at this time.

**Note:** If you are using *use_grain*: True in the configuration for this external pillar module, the minion must have *metadata_server_grains* enabled in the minion config file (see also here).

It is important to also note that enabling the *use_grain* option allows the minion to manipulate the pillar data returned, as described above.

The optional *tag_list_key* indicates which keys should be added to ec2_tags_list and be split by *tag_list_sep* (by default ;). If a tag key is included in *tag_list_key* it is removed from ec2_tags. If a tag does not exist it is still included as an empty list.

**..note:** As with any master configuration change, restart the salt-master daemon for changes to take effect.

```python
ext_pillar:
  - ec2_pillar:
```

This is a very simple pillar configuration that simply retrieves the instance data from AWS. Currently the only portion implemented are EC2 tags, which returns a list of key/value pairs for all of the EC2 tags assigned to the instance.

```python
tag_match_key: 'Name'
tag_match_value: 'asis'
tag_list_key:
  - Role
>tag_list_sep: ','
use_grain: True
minion_ids:
  - trusted-minion-1
  - trusted-minion-2
  - trusted-minion-3
```

21.12.11 salt.pillar.etcd_pillar

Use etcd data as a Pillar source

New in version 2014.7.0.

```yaml
depends
  - python-etcd
```

In order to use an etcd server, a profile must be created in the master configuration file:

```yaml
my_etcd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

After the profile is created, configure the external pillar system to use it. Optionally, a root may be specified.

```yaml
ext_piller:
  - etcd: my_etcd_config
ext_piller:
  - etcd: my_etcd_config root=/salt
```

Using these configuration profiles, multiple etcd sources may also be used:

```yaml
ext_piller:
  - etcd: my_etcd_config
  - etcd: my_other_etcd_config
```

The `minion_id` may be used in the `root` path to expose minion-specific information stored in etcd.

```yaml
ext_piller:
  - etcd: my_etcd_config root=/salt/%(minion_id)s
```

Minion-specific values may override shared values when the minion-specific root appears after the shared root:
Using the configuration above, the following commands could be used to share a key with all minions but override its value for a specific minion:

```shell
etcdctl set /salt-shared/mykey my_value
etcdctl set /salt-private/special_minion_id/mykey my_other_value
```

salt.pillar.ext_pillar

```
ext_pillar:
- etcd: my_etcd_config root=/salt-shared
- etcd: my_other_etcd_config root=/salt-private/%(minion_id)s
```

21.12.12 salt.pillar.file_tree

The file_tree external pillar allows values from all files in a directory tree to be imported as Pillar data.

**Note:** This is an external pillar and is subject to the rules and constraints governing external pillars.

New in version 2015.5.0.

In this pillar, data is organized by either Minion ID or Nodegroup name. To setup pillar data for a specific Minion, place it in `<root_dir>/hosts/<minion_id>`. To setup pillar data for an entire Nodegroup, place it in `<root_dir>/nodegroups/<node_group>` where `<node_group>` is the Nodegroup's name.

**Example file_tree Pillar**

**Master Configuration**

```
ext_pillar:
- file_tree:
  root_dir: /srv/ext_pillar
  follow_dir_links: False
  keep_newline: True
```

The root_dir parameter is required and points to the directory where files for each host are stored. The follow_dir_links parameter is optional and defaults to False. If follow_dir_links is set to True, this external pillar will follow symbolic links to other directories.

**Warning:** Be careful when using follow_dir_links, as a recursive symlink chain will result in unexpected results.

Changed in version 2018.3.0: If root_dir is a relative path, it will be treated as relative to the pillar_roots of the environment specified by pillarenv. If an environment specifies multiple roots, this module will search for files relative to all of them, in order, merging the results.

If keep_newline is set to True, then the pillar values for files ending in newlines will keep that newline. The default behavior is to remove the end-of-file newline. keep_newline should be turned on if the pillar data is intended to be used to deploy a file using contents_pillar with a file.managed state.

Changed in version 2015.8.4: The raw_data parameter has been renamed to keep_newline. In earlier releases, raw_data must be used. Also, this parameter can now be a list of globs, allowing for more granular control over
which pillar values keep their end-of-file newline. The globs match paths relative to the directories named for minion IDs and nodegroups underneath the root_dir (see the layout examples in the below sections).

```
ext_pillar:
  - file_tree:
    root_dir: /path/to/root/directory
    keep_newline:
      - files/testdir/*
```

**Note:** In earlier releases, this documentation incorrectly stated that binary files would not affect the keep_newline configuration. However, this module does not actually distinguish between binary and text files.

Changed in version 2017.7.0: Templating/rendering has been added. You can now specify a default render pipeline and a black- and whitelist of (dis)allowed renderers.

`template` must be set to `True` for templating to happen.

```
ext_pillar:
  - file_tree:
    root_dir: /path/to/root/directory
    render_default: jinja|yaml
    renderer_blacklist:
    - gpg
    renderer_whitelist:
    - jinja
    - yaml
    template: True
```

### Assigning Pillar Data to Individual Hosts

To configure pillar data for each host, this external pillar will recursively iterate over `root_dir/hosts/id` (where `id` is a minion ID), and compile pillar data with each subdirectory as a dictionary key and each file as a value.

For example, the following `root_dir` tree:

```
./hosts/
./hosts/test-host/
./hosts/test-host/files/
./hosts/test-host/files/testdir/
./hosts/test-host/files/testdir/file1.txt
./hosts/test-host/files/testdir/file2.txt
./hosts/test-host/files/another-testdir/
./hosts/test-host/files/another-testdir/symlink-to-file1.txt
```

will result in the following pillar tree for minion with ID `test-host`:

```
test-host:
  ----------
  apache:
    ----------
    config.d:
      ----------
      00_important.conf:
        <important_config important_setting="yes" />
      20_bob_extra.conf:
```

(continues on next page)
Note: The leaf data in the example shown is the contents of the pillar files.

salt.pillar.file_tree.ext_pillar(minion_id, pillar, root_dir=None, follow_dir_links=False, debug=False, keep_newline=False, render_default=None, renderer_blacklist=None, renderer_whitelist=None, template=False)

Compile pillar data from the given root_dir specific to Nodegroup names and Minion IDs.

If a Minion’s ID is not found at <root_dir>/host/<minion_id> or if it is not included in any Nodegroups named at <root_dir>/nodegroups/<node_group>, no pillar data provided by this pillar module will be available for that Minion.

Changed in version 2017.7.0: Templating/rendering has been added. You can now specify a default render pipeline and a black- and whitelist of (dis)allowed renderers.

template must be set to True for templating to happen.

ext_pillar:
  - file_tree:
    root_dir: /path/to/root/directory
    render_default: jinja|yaml
    renderer_blacklist:
    - gpg
    renderer_whitelist:
    - jinja
    - yaml
    template: True

Parameters:
- **minion_id** – The ID of the Minion whose pillar data is to be collected
- **pillar** – Unused by the file_tree pillar module
- **root_dir** – Filesystem directory used as the root for pillar data (e.g. /srv/ ext_pillar)

Changed in version 2018.3.0: If root_dir is a relative path, it will be treated as relative to the pillar_roots of the environment specified by pillarenv. If an environment specifies multiple roots, this module will search for files relative to all of them, in order, merging the results.

- **follow_dir_links** – Follow symbolic links to directories while collecting pillar files. Defaults to False.
Warning: Care should be exercised when enabling this option as it will follow links that point outside of root_dir.

Warning: Symbolic links that lead to infinite recursion are not filtered.

- **debug** – Enable debug information at log level debug. Defaults to False. This option may be useful to help debug errors when setting up the file_tree pillar module.

- **keep_newline** – Preserve the end-of-file newline in files. Defaults to False. This option may either be a boolean or a list of file globs (as defined by the Python fnmatch package) for which end-of-file newlines are to be kept.

keep_newline should be turned on if the pillar data is intended to be used to deploy a file using contents_pillar with a file.managed state.

Changed in version 2015.8.4: The raw_data parameter has been renamed to keep_newline. In earlier releases, raw_data must be used. Also, this parameter can now be a list of globs, allowing for more granular control over which pillar values keep their end-of-file newline. The globs match paths relative to the directories named for Minion IDs and Nodegroup names underneath the root_dir.

```yaml
ext_pillar:
  - file_tree:
      root_dir: /srv/ext_pillar
      keep_newline:
        - apache/config.d/*
        - corporate_app/settings/*
```

Note: In earlier releases, this documentation incorrectly stated that binary files would not affected by the keep_newline. However, this module does not actually distinguish between binary and text files.

- **render_default** – Override Salt's default global renderer for the file_tree pillar.

```yaml
render_default: jinja
```

- **renderer_blacklist** – Disallow renderers for pillar files.

```yaml
renderer_blacklist:
  - json
```

- **renderer_whitelist** – Allow renderers for pillar files.

```yaml
renderer_whitelist:
  - yaml
  - jinja
```

- **template** – Enable templating of pillar files. Defaults to False.

### 21.12.13 salt.pillar.foreman

A module to pull data from Foreman via its API into the Pillar dictionary
Configuring the Foreman ext_pillar

Set the following Salt config to setup Foreman as external pillar source:

```yaml
ext_pillar:
  - foreman:
      key: foreman # Nest results within this key
      only: ['hostgroup_name', 'parameters'] # Add only these keys to pillar

foreman.url: https://example.com/foreman_api
foreman.user: username # default is admin
foreman.password: password # default is changeme
```

The following options are optional:

```yaml
foreman.api: apiversion # default is 2 (1 is not supported yet)
foreman.verifyssl: False # default is True
foreman.certfile: /etc/ssl/certs/mycert.pem # default is None
foreman.keyfile: /etc/ssl/private/mykey.pem # default is None
foreman.cafile: /etc/ssl/certs/mycert.ca.pem # default is None
foreman.lookup_parameters: True # default is True
```

An alternative would be to use the Foreman modules integrating Salt features in the Smart Proxy and the webinterface.

Further information can be found on [GitHub](https://github.com).

Module Documentation

`salt.pillar.foreman.ext_pillar` *(minion_id, pillar, key=None, only=())*

Read pillar data from Foreman via its API.

### 21.12.14 salt.pillar.git_pillar

**Use a git repository as a Pillar source**

This external pillar allows for a Pillar top file and Pillar SLS files to be sourced from a git repository.

However, since `git_pillar` does not have an equivalent to the `pillar_roots` parameter, configuration is slightly different. A Pillar top file is required to be in the git repository and must still contain the relevant environment, like so:

```yaml
base:
  '*':
    - foo
```

The branch/tag which maps to that environment must then be specified along with the repo’s URL. Configuration details can be found below.

**Important:** Each branch/tag used for `git_pillar` must have its own top file. This is different from how the top file works when configuring `States`. The reason for this is that each `git_pillar` branch/tag is processed separately from the rest. Therefore, if the qa branch is to be used for `git_pillar`, it would need to have its own top file, with the qa environment defined within it, like this:
Additionally, while git_pillar allows for the branch/tag to be overridden (see here), keep in mind that the top file must reference the actual environment name. It is common practice to make the environment in a git_pillar top file match the branch/tag name, but when remapping, the environment of course no longer matches the branch/tag, and the top file needs to be adjusted accordingly. When expected Pillar values configured in git_pillar are missing, this is a common misconfiguration that may be to blame, and is a good first step in troubleshooting.

### Configuring git_pillar for Salt

Beginning with Salt version 2015.8.0, pygit2 is now supported in addition to GitPython. The requirements for GitPython and pygit2 are the same as for GitFS, as described here.

**Important:** git_pillar has its own set of global configuration parameters. While it may seem intuitive to use the global gitfs configuration parameters (gitfs_base, etc.) to manage git_pillar, this will not work. The main difference for this is the fact that the different components which use Salt’s git backend code do not all function identically. For instance, in git_pillar it is necessary to specify which branch/tag to be used for git_pillar remotes. This is the reverse behavior from gitfs, where branches/tags make up your environments.

See here for documentation on the git_pillar configuration options and their usage.

Here is an example git_pillar configuration:

```
> ext_pillar:
  - git:
      # Use 'prod' instead of the branch name 'production' as the environment
      - production https://gitserver/git-pillar.git:
        - env: prod
      # Use 'dev' instead of the branch name 'develop' as the environment
      - develop https://gitserver/git-pillar.git:
        - env: dev
      # No per-remote config parameters (and no trailing colon), 'qa' will be used as the environment
      - qa https://gitserver/git-pillar.git
      # SSH key authentication
      - master git@other-git-server:pillardata-ssh.git:
        # Pillar SLS files will be read from the 'pillar' subdirectory in this repository
        - root: pillar
        - privkey: /path/to/key
        - pubkey: /path/to/key.pub
        - passphrase: CorrectHorseBatteryStaple
      # HTTPS authentication
      - master https://other-git-server/pillardata-https.git:
        # Get user information for this remote
        - user: git
        - password: CorrectHorseBatteryStaple
```

The main difference between this and the old way of configuring git_pillar is that multiple remotes can be configured under one git section under ext_pillar. More than one git section can be used, but it is not necessary. Remotes will be evaluated sequentially.
Per-remote configuration parameters are supported (similar to *gitfs*), and global versions of the git_pillar configuration parameters can also be set.

To remap a specific branch to a specific Pillar environment, use the `env` per-remote parameter:

```
ext_pillar:
  - git:
    - production https://gitserver/git-pillar.git:
      - env: prod
```

If `__env__` is specified as the branch name, then git_pillar will decide which branch to use based on the following criteria:

- If the minion has a pillarenv configured, it will use that pillar environment. (2016.11.2 and later)
- Otherwise, if the minion has an environment configured, it will use that environment.
- Otherwise, the master’s `git_pillar_base` will be used.

**Note:** The use of `environment` to choose the pillar environment dates from a time before the pillarenv parameter was added. In a future release, it will be ignored and either the minion’s pillarenv or the master’s `git_pillar_base` will be used.

Here’s an example of using `__env__` as the git_pillar environment:

```
ext_pillar:
  - git:
    - __env__ https://gitserver/git-pillar.git:
      - root: pillar
```

The corresponding Pillar top file would look like this:

```
"{{saltenv}}":
  '*':
    - bar
```

With the addition of pygit2 support, git_pillar can now interact with authenticated remotes. Authentication works just like in gitfs (as outlined in the *Git Fileserver Backend Walkthrough*), only with the global authentication parameter names prefixed with `git_pillar` instead of `gitfs` (e.g. `git_pillar_pubkey`, `git_pillar_privkey`, `git_pillar_passphrase`, etc.).

**Note:** The name parameter can be used to further differentiate between two remotes with the same URL and branch. When using two remotes with the same URL, the name option is required.

### How Multiple Remotes Are Handled

As noted above, multiple remotes can be included in the same git ext_pillar configuration. Consider the following:

```
my_etcd_config:
  etcd_host: 127.0.0.1
  etcd_port: 4001
ext_pillar:
  - etcd: my_etcd_config
```

(continues on next page)
To understand how pillar data from these repos will be compiled, it’s important to know how Salt will process them. The following points should be kept in mind:

1. Each ext_pillar is called separately from the others. So, in the above example, the etcd ext_pillar will be evaluated first, with the first group of git_pillar remotes evaluated next (and merged into the etcd pillar data). Lastly, the second group of git_pillar remotes will be evaluated, and then merged into the ext_pillar data evaluated before it.

2. Within a single group of git_pillar remotes, each remote will be evaluated in order, with results merged together as each remote is evaluated.

**Note:** Prior to the 2017.7.0 release, remotes would be evaluated in a non-deterministic order.

3. By default, when a repo is evaluated, other remotes’ which share its pillar environment will have their files made available to the remote being processed.

The first point should be straightforward enough, but the second and third could use some additional clarification.

First, point #2. In the first group of git_pillar remotes, the top file and pillar SLS files in the foo remote will be evaluated first. The bar remote will be evaluated next, and its results will be merged into the pillar data compiled when the foo remote was evaluated. As the subsequent remotes are evaluated, their data will be merged in the same fashion.

But wait, don’t these repositories belong to more than one pillar environment? Well, yes. The default method of generating pillar data compiles pillar data from all environments. This behavior can be overridden using a pillarenv. Setting a pillarenv in the minion config file will make that minion tell the master to ignore any pillar data from environments which don’t match that pillarenv. A pillarenv can also be specified for a given minion or set of minions when running states, by using the pillarenv argument. The CLI pillarenv will override one set in the minion config file. So, assuming that a pillarenv of base was set for a minion, it would not get any of the pillar variables configured in the qux remote, since that remote is assigned to the dev environment. The only way to get its pillar data would be to specify a pillarenv of dev, which would mean that it would then ignore any items from the base pillarenv. A more detailed explanation of pillar environments can be found here.

Moving on to point #3, and looking at the example ext_pillar configuration, as the foo remote is evaluated, it will also have access to the files from the bar and baz remotes, since all three are assigned to the base pillar environment. So, if an SLS file referenced by the foo remote’s top file does not exist in the foo remote, it will be searched for in the bar remote, followed by the baz remote. When it comes time to evaluate the bar remote, SLS files referenced by the bar remote’s top file will first be looked for in the bar remote, followed by foo, and baz, and when the baz remote is processed, SLS files will be looked for in baz, followed by foo and bar. This "failover" logic is called a directory overlay, and it is also used by file_roots and :conf_minion'pillar_roots'. The ordering of which remote is checked for SLS files is determined by the order they are listed. First the remote being processed is checked, then the others that share the same environment are checked. However, before the 2017.7.0 release, since evaluation was unordered, the remote being processed would be checked, followed in no specific order by the other repos which share the same environment.

Beginning with the 2017.7.0 release, this behavior of git_pillar remotes having access to files in other repos which
share the same environment can be disabled by setting `git_pillar_includes` to `False`. If this is done, then all `git_pillar` remotes will only have access to their own SLS files. Another way of ensuring that a `git_pillar` remote will not have access to SLS files from other `git_pillar` remotes which share the same pillar environment is to put them in a separate `git` section under `ext_pillar`. Look again at the example configuration above. In the second group of `git_pillar` remotes, the `abc` remote would not have access to the SLS files from the `foo`, `bar`, and `baz` remotes, and vice-versa.

**Mountpoints**

New in version 2017.7.0.

Assume the following pillar top file:

```yaml
base:
  'web*':
    - common
    - web.server.nginx
    - web.server.appdata
```

Now, assume that you would like to configure the `web.server.nginx` and `web.server.appdata` SLS files in separate repos. This could be done using the following `ext_pillar` configuration (assuming that `git_pillar_includes` has not been set to `False`):

```yaml
ext_pillar:
  - git:
    - master https://mydomain.tld/pillar-common.git
    - master https://mydomain.tld/pillar-nginx.git
    - master https://mydomain.tld/pillar-appdata.git
```

However, in order to get the files in the second and third `git_pillar` remotes to work, you would need to first create the directory structure underneath it (i.e. place them underneath `web/server/` in the repository). This also makes it tedious to reorganize the configuration, as changing `web.server.nginx` to `web.nginx` in the top file would require you to also move the SLS files in the `pillar-nginx` up a directory level.

For these reasons, much like `gitfs`, `git_pillar` now supports a "mountpoint" feature. Using the following `ext_pillar` configuration, the SLS files in the second and third `git_pillar` remotes can be placed in the root of the git repository:

```yaml
ext_pillar:
  - git:
    - master https://mydomain.tld/pillar-common.git
    - master https://mydomain.tld/pillar-nginx.git:
      - mountpoint: web/server/
    - master https://mydomain.tld/pillar-appdata.git:
      - mountpoint: web/server/
```

Now, if the top file changed the SLS target from `web.server.nginx`, instead of reorganizing the git repository, you would just need to adjust the mountpoint to `web/` (and restart the `salt-master` daemon).

**Note:**

- Leading and trailing slashes on the mountpoints are optional.
- Use of the `mountpoint` feature requires that `git_pillar_includes` is not disabled.
- Content from mounted `git_pillar` repos can only be referenced by a top file in the same pillar environment.
- Salt versions prior to 2018.3.4 ignore the `root` parameter when `mountpoint` is set.
**all_saltenvs**

New in version 2018.3.4.

When `__env__` is specified as the branch name, `all_saltenvs` per-remote configuration parameter overrides the logic Salt uses to map branches/tags to pillar environments (i.e. `pillarenvs`). This allows a single branch/tag to appear in all saltenvs. Example:

```
all_saltenvs
```

```
ext_pillar:
  - git:
    - __env__ https://mydomain.tld/top.git
    - all_saltenvs: master
    - __env__ https://mydomain.tld/pillar-nginx.git:
      - mountpoint: web/server/
    - __env__ https://mydomain.tld/pillar-appdata.git:
      - mountpoint: web/server/
```

```
salt.pillar.git_pillar.ext_pillar(minion_id, pillar, *repos)
```

Checkout the `ext_pillar` sources and compile the resulting pillar SLS.

### 21.12.15 salt.pillar.gpg module

Decrypt pillar data through the builtin GPG renderer

In most cases, you’ll want to make this the last external pillar used. For example, to pair with the builtin stack pillar you could do something like this:

```
ext_pillar:
  - stack: /path/to/stack.cfg
  - gpg: {}
```

Set `gpg_keydir` in your config to adjust the homedir the renderer uses.

```
salt.pillar.gpg.ext_pillar(minion_id, pillar, *args, **kwargs)
```

### 21.12.16 salt.pillar.hg_pillar

Use remote Mercurial repository as a Pillar source.

New in version 2015.8.0.

The module depends on the `hglib` python module being available. This is the same requirement as for `hgfs_` so should not pose any extra hurdles.

This external Pillar source can be configured in the master config file as such:

```
ext_pillar:
  - hg: ssh://hg@example.co/user/repo
```

```
class salt.pillar.hg_pillar.Repo(repo_uri)
```

Deal with remote hg (mercurial) repository for Pillar

```
close()
```

Cleanup mercurial command server

```
pull()
```

21.12. pillar modules
**update** *(branch='default')*

Ensure we are using the latest revision in the hg repository

```
salt.pillar.hg_pillar.*ext_pillar*(minion_id, pillar, repo, branch='default', root=None)
```

Extract pillar from an hg repository

```
salt.pillar.hg_pillar.*update*(repo_uri)
```

Execute an hg pull on all the repos

### 21.12.17 salt.pillar.hiera

Use hiera data as a Pillar source

```
salt.pillar.hiera.*ext_pillar*(minion_id, pillar, conf)
```

Execute hiera and return the data

### 21.12.18 salt.pillar.http_json module

A module that adds data to the Pillar structure retrieved by an http request

**Configuring the HTTP_JSON ext_pillar**

Set the following Salt config to setup http json result as external pillar source:

```
ext_pillar:
  - http_json:
      url: http://example.com/api/minion_id
      ::TODO::
      username: username
      password: password
```

If the with_grains parameter is set, grain keys wrapped in can be provided (wrapped in <> brackets) in the url in order to populate pillar data based on the grain value.

```
ext_pillar:
  - http_json:
      url: http://example.com/api/<nodename>
      with_grains: True
```

Changed in version 2018.3.0: If %s is present in the url, it will be automatically replaced by the minion_id:

```
ext_pillar:
  - http_json:
      url: http://example.com/api/%s
```

**Module Documentation**

```
salt.pillar.http_json.*ext_pillar*(minion_id, pillar, url, with_grains=False)
```

Read pillar data from HTTP response.

**Parameters**

- **url**(str) – Url to request.
- **with_grains**(bool) – Whether to substitute strings in the url with their grain values.
Returns A dictionary of the pillar data to add.
Return type dict

21.12.19 salt.pillar.http_yaml module

A module that adds data to the Pillar structure retrieved by an http request

Configuring the HTTP_YAML ext_pillar

Set the following Salt config to setup an http endpoint as the external pillar source:

```yaml
ext_pillar:
  - http_yaml:
    url: http://example.com/api/minion_id
    username: username
    password: password
```

If the with_grains parameter is set, grain keys wrapped in can be provided (wrapped in <> brackets) in the url in order to populate pillar data based on the grain value.

```yaml
ext_pillar:
  - http_yaml:
    url: http://example.com/api/<nodename>
    with_grains: True
```

Changed in version 2018.3.0: If %s is present in the url, it will be automatically replaced by the minion_id:

```yaml
ext_pillar:
  - http_json:
    url: http://example.com/api/%s
```

Module Documentation

salt.pillar.http_yaml.ext_pillar(minion_id, pillar, url, with_grains=False)
Read pillar data from HTTP response.

Parameters
- **url** (str) – Url to request.
- **with_grains** (bool) – Whether to substitute strings in the url with their grain values.

Returns A dictionary of the pillar data to add.
Return type dict

21.12.20 salt.pillar.libvirt

Load up the libvirt keys into Pillar for a given minion if said keys have been generated using the libvirt key runner

depends certtool

salt.pillar.libvirt.ext_pillar(minion_id, pillar, command)
Read in the generated libvirt keys
salt.pillar.libvirt\texttt{.gen\_hyper\_keys}(\texttt{minion\_id, country='US', state='Utah', locality='Salt Lake City', organization='Salted', expiration\_days='365'})

Generate the keys to be used by libvirt hypervisors, this routine gens the keys and applies them to the pillar for the hypervisor minions

### 21.12.21 salt.pillar.makostack module

Simple and flexible YAML ext\_pillar which can read pillar from within pillar.

New in version 2016.3.0.

This custom saltstack ext\_pillar is a direct ripoff of the 'stack' ext\_pillar, simply ported to use mako instead of jinja2 for templating.

It supports the following features:

- multiple config files that are mako templates with support for pillar, \_grains\_, \_salt\_, \_opts\_ objects.
- a config file renders as an ordered list of files. Unless absolute, the paths of these files are relative to the current config file - if absolute, they will be treated literally.
- this list of files are read in order as mako templates with support for stack, pillar, \_grains\_, \_salt\_, \_opts\_ objects.
- all these rendered files are then parsed as yaml.
- then all yaml dicts are merged in order, with support for the following. merging strategies: \texttt{merge-first}, \texttt{merge-last}, \texttt{remove}, and \texttt{overwrite}.
- stack config files can be matched based on pillar, grains, or opts values, which make it possible to support kind of self-contained environments.

#### Configuration in Salt

Like any other external pillar, its configuration takes place through the ext\_pillar key in the master config file.

However, you can configure MakoStack in 3 different ways:

**Single config file**

This is the simplest option, you just need to set the path to your single MakoStack config file like below:

```yaml
ext\_pillar:
  - makostack: /path/to/stack.cfg
```

**List of config files**

You can also provide a list of config files:

```yaml
ext\_pillar:
  - makostack:
    - /path/to/stack1.cfg
    - /path/to/stack2.cfg
```
Select config files through grains|pillar|opts matching

You can also opt for a much more flexible configuration: MakoStack allows one to select the config files for the current minion based on matching values from either grains, or pillar, or opts objects.

Here is an example of such a configuration, which should speak by itself:

```
ext_pillar:
    - makostack:
        pillar:environment:
            dev: /path/to/dev/stack.cfg
            prod: /path/to/prod/stack.cfg
        grains:custom:grain:
            value:
                - /path/to/stack1.cfg
                - /path/to/stack2.cfg
        opts:custom:opt:
            value: /path/to/stack0.cfg
```

Grafting data from files to arbitrary namespaces

An extended syntax for config files permits defining "graft points" on a per-config-file basis. As an example, if the file foo.cfg would produce the following:

```
foo:
    - bar
    - baz
```

and you specified the cfg file as /path/to/foo.cfg:yummy:fur, the following would actually end up in pillar after all merging was complete:

```
yummy:
    fur:
        foo:
            - bar
            - baz
```

MakoStack configuration files

The config files that are referenced in the above `ext_pillar` configuration are mako templates which must render as a simple ordered list of yaml files that will then be merged to build pillar data.

Unless an absolute path name is specified, the path of these yaml files is assumed to be relative to the directory containing the MakoStack config file. If a path begins with '/', however, it will be treated literally and can be anywhere on the filesystem.

The following variables are available in mako templating of makostack configuration files:

- `pillar`: the pillar data (as passed by Salt to our `ext_pillar` function)
- `minion_id`: the minion id ;-)  
- `__opts__`: a dictionary of mostly Salt configuration options
- `__grains__`: a dictionary of the grains of the minion making this pillar call
• __salt__: a dictionary of Salt module functions, useful so you don’t have to duplicate functions that already exist (note: runs on the master)

So you can use all the power of mako to build your list of yaml files that will be merged in pillar data.

For example, you could have a MakoStack config file which looks like:

```
$ cat /path/to/stack/config.cfg
core.yml
osarchs/%{ __grains__['osarch'] }}.yml
oscodenames/%{ __grains__['oscodename'] }}.yml
% for role in pillar.get('roles', []):
    roles/%{ role }.yml
% endfor
minions/%{ minion_id }.yml
```

And the whole directory structure could look like:

```
$ tree /path/to/stack/
/path/to/stack/
    ├── config.cfg
    │
    ├── core.yml
    │
    │   ├── osarchs/
    │   │       └── amd64.yml
    │   │
    │   │       └── armhf.yml
    │
    │   └── oscodenames/
    │       └── wheezy.yml
    │       └── jessie.yml
    │
    │   └── roles/
    │       └── web.yml
    │       └── db.yml
    │
    └── minions/
        └── test-1-dev.yml
        └── test-2-dev.yml
```

**Overall process**

In the above MakoStack configuration, given that test-1-dev minion is an amd64 platform running Debian Jessie, and which pillar roles is ["db"], the following yaml files would be merged in order:

• core.yml
• osarchs/amd64.yml
• oscodenames/jessie.yml
• roles/db.yml
• minions/test-1-dev.yml

Before merging, every files above will be preprocessed as mako templates. The following variables are available in mako templating of yaml files:

• stack: the MakoStack pillar data object that has currently been merged (data from previous yaml files in MakoStack configuration)
• pillar: the pillar data (as passed by Salt to our ext_pillar function)
• minion_id: the minion id ;-)
- **__opts__**: a dictionary of mostly Salt configuration options
- **__grains__**: a dictionary of the grains of the minion making this pillar call
- **__salt__**: a dictionary of Salt module functions, useful so you don’t have to duplicate functions that already exist (note: runs on the master)

So you can use all the power of mako to build your pillar data, and even use other pillar values that has already been merged by MakoStack (from previous yaml files in MakoStack configuration) through the stack variable.

Once a yaml file has been preprocessed by mako, we obtain a Python dict - let’s call it yaml_data - then, MakoStack will merge this yaml_data dict in the main stack dict (which contains already merged MakoStack pillar data). By default, MakoStack will deeply merge yaml_data in stack (similarly to the recurse salt pillar_source_merging_strategy), but 3 merging strategies are currently available for you to choose (see next section).

Once every yaml files have been processed, the stack dict will contain your whole own pillar data, merged in order by MakoStack. So MakoStack ext_pillar returns the stack dict, the contents of which Salt takes care to merge in with all of the other pillars and finally return the whole pillar to the minion.

### Merging strategies

The way the data from a new yaml_data dict is merged with the existing stack data can be controlled by specifying a merging strategy. Right now this strategy can either be merge-last (the default), merge-first, remove, or overwrite.

Note that scalar values like strings, integers, booleans, etc. are always evaluated using the overwrite strategy (other strategies don’t make sense in that case).

The merging strategy can be set by including a dict in the form of:

```
___: <merging_strategy>
```

as the first item of the dict or list. This allows fine grained control over the merging process.

#### merge-last (default) strategy

If the merge-last strategy is selected (the default), then content of dict or list variables is merged recursively with previous definitions of this variable (similarly to the recurse salt pillar_source_merging_strategy). This allows for extending previously defined data.

#### merge-first strategy

If the merge-first strategy is selected, then the content of dict or list variables are swapped between the yaml_data and stack objects before being merged recursively with the merge-last previous strategy.

#### remove strategy

If the remove strategy is selected, then content of dict or list variables in stack are removed only if the corresponding item is present in the yaml_data dict. This allows for removing items from previously defined data.
overwrite strategy

If the `overwrite` strategy is selected, then the content of dict or list variables in `stack` is overwritten by the content of `yaml_data` dict. So this allows one to overwrite variables from previous definitions.

Merging examples

Let’s go through small examples that should clarify what’s going on when a `yaml_data` dict is merged in the `stack` dict.

When you don’t specify any strategy, the default `merge-last` strategy is selected:

<table>
<thead>
<tr>
<th>stack</th>
<th>yaml_data</th>
<th>stack (after merge)</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>users:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>tom:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>uid:</strong>: 500</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>roles:</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>root:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>uid:</strong>: 0</td>
</tr>
<tr>
<td><strong>users:</strong></td>
<td></td>
<td><strong>uid:</strong>: 1000</td>
</tr>
<tr>
<td></td>
<td><strong>tom:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>roles:</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>mat:</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Then you can select a custom merging strategy using the `__` key in a dict:
You can also select a custom merging strategy using a `__` object in a list:
salt.pillar.makostack.ext_pillar(minion_id, pillar, *args, **kwargs)

21.12.22 salt.pillar.mongo

Read Pillar data from a mongodb collection

    depends  pymongo (for salt-master)

This module will load a node-specific pillar dictionary from a mongo collection. It uses the node’s id for lookups and can load either the whole document, or just a specific field from that document as the pillar dictionary.

Salt Master Mongo Configuration

The module shares the same base mongo connection variables as salt.returners.mongo_return. These variables go in your master config file.

- **mongo.db** - The mongo database to connect to. Defaults to 'salt'.
- **mongo.host** - The mongo host to connect to. Supports replica sets by specifying all hosts in the set, comma-delimited. Defaults to 'salt'.
- **mongo.port** - The port that the mongo database is running on. Defaults to 27017.
- **mongo.user** - The username for connecting to mongo. Only required if you are using mongo authentication. Defaults to ''.  
- **mongo.password** - The password for connecting to mongo. Only required if you are using mongo authentication. Defaults to ''.  

<table>
<thead>
<tr>
<th>stack</th>
<th>yaml_data</th>
<th>stack (after merge)</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>users:</strong></td>
<td><strong>users:</strong></td>
<td><strong>users:</strong></td>
</tr>
<tr>
<td><code>tom</code></td>
<td><code>__</code>: merge-last</td>
<td><code>tom</code></td>
</tr>
<tr>
<td><code>root</code></td>
<td><code>mat</code></td>
<td><code>root</code></td>
</tr>
<tr>
<td><strong>users:</strong></td>
<td><strong>users:</strong></td>
<td><strong>users:</strong></td>
</tr>
<tr>
<td><code>tom</code></td>
<td><code>__</code>: merge-first</td>
<td><code>mat</code></td>
</tr>
<tr>
<td><code>root</code></td>
<td><code>mat</code></td>
<td><code>tom</code></td>
</tr>
<tr>
<td><strong>users:</strong></td>
<td><strong>users:</strong></td>
<td><strong>users:</strong></td>
</tr>
<tr>
<td><code>tom</code></td>
<td><code>__</code>: remove</td>
<td><code>root</code></td>
</tr>
<tr>
<td><code>root</code></td>
<td><code>mat</code></td>
<td><code>tom</code></td>
</tr>
<tr>
<td><strong>users:</strong></td>
<td><strong>users:</strong></td>
<td><strong>users:</strong></td>
</tr>
<tr>
<td><code>tom</code></td>
<td><code>__</code>: overwrite</td>
<td><code>mat</code></td>
</tr>
<tr>
<td><code>root</code></td>
<td><code>mat</code></td>
<td><code>tom</code></td>
</tr>
</tbody>
</table>
Configuring the Mongo ext_pillar

The Mongo ext_pillar takes advantage of the fact that the Salt Master configuration file is yaml. It uses a sub-dictionary of values to adjust specific features of the pillar. This is the explicit single-line dictionary notation for yaml. One may be able to get the easier-to-read multi-line dict to work correctly with some experimentation.

```
ext_pillar:
  - mongo: {collection: vm, id_field: name, re_pattern: \.example\.com, fields: [customer_id, software, apache_vhosts]}
```

In the example above, we’ve decided to use the `vm` collection in the database to store the data. Minion ids are stored in the `name` field on documents in that collection. And, since minion ids are FQDNs in most cases, we’ll need to trim the domain name in order to find the minion by hostname in the collection. When we find a minion, return only the `customer_id`, `software`, and `apache_vhosts` fields, as that will contain the data we want for a given node. They will be available directly inside the `pillar` dict in your SLS templates.

Module Documentation

salt.pillar.mongo.ext_pillar(minion_id, pillar, collection='pillar', id_field='_id', re_pattern=None, re_replace=", fields=None)

Connect to a mongo database and read per-node pillar information.

Parameters

- **collection** (**) – The mongodb collection to read data from. Defaults to 'pillar'.
- **id_field** (*) – The field in the collection that represents an individual minion id. Defaults to '_id'.
- **re_pattern** (*) – If your naming convention in the collection is shorter than the minion id, you can use this to trim the name. `re_pattern` will be used to match the name, and `re_replace` will be used to replace it. Backrefs are supported as they are in the Python standard library. If `None`, no mangling of the name will be performed - the collection will be searched with the entire minion id. Defaults to `None`.
- **re_replace** (*) – Use as the replacement value in node ids matched with `re_pattern`. Defaults to ". Feel free to use backreferences here.
- **fields** (*) – The specific fields in the document to use for the pillar data. If `None`, will use the entire document. If using the entire document, the `_id` field will be converted to string. Be careful with other fields in the document as they must be string serializable. Defaults to `None`.

21.12.23 salt.pillar.mysql

Retrieve Pillar data by doing a MySQL query

MariaDB provides Python support through the MySQL Python package. Therefore, you may use this module with both MySQL or MariaDB.

This module is a concrete implementation of the sql_base ext_pillar for MySQL.

- **maturity** new
- **depends** python-mysqldb
- **platform** all
Configuring the mysql ext_pillar

Use the 'mysql' key under ext_pillar for configuration of queries.

MySQL configuration of the MySQL returner is being used (mysql.db, mysql.user, mysql.pass, mysql.port, mysql.host) for database connection info.

Required python modules: MySQLdb

Complete example

```python
mysql:
    user: 'salt'
    pass: 'super_secret_password'
    db: 'salt_db'
    port: 3306
    ssl:
        cert: /etc/mysql/client-cert.pem
        key: /etc/mysql/client-key.pem

ext_pillar:
    - mysql:
        fromdb: query
        query: 'SELECT col1,col2,col3,col4,col5,col6,col7
            FROM some_random_table
            WHERE minion_pattern LIKE %%s'
        depth: 5
        as_list: True
        with_lists: [1,3]
```

class salt.pillar.mysql.MySQLExtPillar

    This class receives and processes the database rows from MySQL.

    extract_queries(args, kwargs)

        This function normalizes the config block into a set of queries we can use. The return is a list of consistently laid out dicts.

salt.pillar.mysql.ext_pillar(minion_id, pillar, *args, **kwargs)

    Execute queries against MySQL, merge and return as a dict

21.12.24 salt.pillar.netbox

A module that adds data to the Pillar structure from a NetBox API.

New in version 2019.2.0.

Configuring the NetBox ext_pillar

```yaml
ext_pillar:
    - netbox:
        api_url: http://netbox_url.com/api/
        api_token: 123abc
```

Create a token in your NetBox instance at http://netbox_url.com/user/api-tokens/
The following options are optional, and determine whether or not the module will attempt to configure the proxy pillar data for use with the napalm proxy-minion:

```
proxy_return: True
proxy_username: admin
```

By default, this module will query the NetBox API for the platform associated with the device, and use the 'NAPALM driver' field to set the napalm proxy-minion driver. (Currently only 'napalm' is supported for drivertype.)

This module currently only supports the napalm proxy minion and assumes you will use SSH keys to authenticate to the network device. If password authentication is desired, it is recommended to create another proxy key in pillar_roots (or git_pillar) with just the passwd key and use `salt.renderers.gpg` to encrypt the value. If any additional options for the proxy setup are needed they should also be configured in pillar_roots.

Other available options:

- `site_details`: `True` Whether should retrieve details of the site the device belongs to.
- `site_prefixes`: `True` Whether should retrieve the prefixes of the site the device belongs to.

```
salt.pillar.netbox.ext_pillar(minion_id, pillar, *args, **kwargs)
```

Query NetBox API for minion data

### 21.12.25 salt.pillar.neutron module

Use Openstack Neutron data as a Pillar source. Will list all networks listed inside of Neutron, to all minions.

New in version 2015.5.1.

- `depends`
  - python-neutronclient

A keystone profile must be used for the pillar to work (no generic keystone configuration here). For example:

```
my_openstack_config:
    keystone.user: 'admin'
    keystone.password: 'password'
    keystone.tenant: 'admin'
    keystone.auth_url: 'http://127.0.0.1:5000/v2.0/
    keystone.region_name: 'RegionOne'
    keystone.service_type: 'network'
```

After the profile is created, configure the external pillar system to use it.

```
ext_pillar:
  - neutron: my_openstack_config
```

Using these configuration profiles, multiple neutron sources may also be used:

```
ext_pillar:
  - neutron: my_openstack_config
  - neutron: my_other_openstack_config
```

By default, these networks will be returned as a pillar item called networks. In order to have them returned under a different name, add the name after the Keystone profile name:

```
ext_pillar:
  - neutron: my_openstack_config neutron_networks
```

---

21.12. pillar modules 2943
salt.pillar.neutron.ext_pillar(minion_id, pillar, conf)
   Check neutron for all data

21.12.26 salt.pillar.nodegroups

Nodegroups Pillar

Introspection: to which nodegroups does my minion belong? Provides a pillar with the default name of nodegroups which contains a list of nodegroups which match for a given minion.

New in version 2016.11.0.

Command Line

```
salt-call pillar.get nodegroups
local:
   - class_infra
   - colo_sj
   - state_active
   - country_US
   - type_saltmaster
```

Configuring Nodegroups Pillar

```
extension_modules: /srv/salt/ext
ext_pillar:
   - nodegroups:
     pillar_name: 'nodegroups'
```

salt.pillar.nodegroups.ext_pillar(minion_id, pillar, pillar_name=None)
   A salt external pillar which provides the list of nodegroups of which the minion is a member.

Parameters
   • minion_id – used for compound matching nodegroups
   • pillar – provided by salt, but not used by nodegroups ext_pillar
   • pillar_name – optional name to use for the pillar, defaults to 'nodegroups'

Returns a dictionary which is included by the salt master in the pillars returned to the minion

21.12.27 salt.pillar.pepa

Pepa

Configuration templating for SaltStack using Hierarchical substitution and Jinja.

Configuring Pepa

```
extension_modules: /srv/salt/ext
ext_pillar:
   - pepa:
```
(continues on next page)
resource: host

# Name of resource directory and sub-key in pillars

pillars

# Sequence used for hierarchical substitution

- hostname:
  name: input
  base_only: True

  # Alias used for template directory

- no staging
  - default:
    - environment:
      - location..region:
        name: region
      - location..country:
        name: country
      - location..datacenter:
        name: datacenter
      - roles:
        - osfinger:
          name: os
      - hostname:
        name: override
        base_only: True

    # Create a sub-key in pillars, named after the resource in this case [host]
    subkey: True
    subkey_only: True

    # Only create a sub-key, and leave the top level untouched

pepa_roots:

# Base directory for each environment

- base: /srv/pepa/base
  # Path for base environment
- dev: /srv/pepa/base
  # Associate dev with base
- qa: /srv/pepa/qa
- prod: /srv/pepa/prod

# Use a different delimiter for nested dictionaries, defaults to '..' since some keys may use '.' in the name
#pepa_delimiter: ..

# Supply Grains for Pepa, this should **ONLY** be used for testing or validation
#pepa_grains:
#  # environment: dev

# Supply Pillar for Pepa, this should **ONLY** be used for testing or validation
#pepa_pillars:
#  # saltversion: 0.17.4

# Enable debug for Pepa, and keep Salt on warning
#log_level: debug

#log_granular_levels:
#  # salt: warning
#  # salt.loaded.ext.pillar.pepa: debug

Pepa can also be used in Master-less SaltStack setup.
Command line

```

positional arguments:
    hostname               Hostname

optional arguments:
    -h, --help             show this help message and exit
    -c CONFIG, --config CONFIG
                           Configuration file
    -d, --debug
    -g GRAINS, --grains GRAINS
                           Input Grains as YAML
    -p PILLAR, --pillar PILLAR
                           Input Pillar as YAML
    -n, --no-color
    -v, --validate
```

Templates

Templates is configuration for a host or software, that can use information from Grains or Pillars. These can then be used for hierarchically substitution.

Example File: host/input/test_example_com.yaml

```
location..region: emea
location..country: nl
location..datacenter: foobar
environment: dev
roles:
    - salt.master
network..gateway: 10.0.0.254
network..interfaces..eth0..hwaddr: 00:20:26:a1:12:12
network..interfaces..eth0..dhcp: False
network..interfaces..eth0..ipv4: 10.0.0.3
network..interfaces..eth0..netmask: 255.255.255.0
network..interfaces..eth0..fqdn: {{ hostname }}
cobbler..profile: fedora-19-x86_64
```

As you see in this example you can use Jinja directly inside the template.

Example File: host/region/amer.yaml

```
network..dns..servers:
    - 10.0.0.1
    - 10.0.0.2

time..ntp..servers:
    - ntp1.amer.example.com
    - ntp2.amer.example.com
    - ntp3.amer.example.com

time..timezone: America/Chihuahua
yum..mirror: yum.amer.example.com
```

Each template is named after the value of the key using lowercase and all extended characters are replaced with underscore.
Example:

osfinger: Fedora-19

Would become:

fedora_19.yaml

**Nested dictionaries**

In order to create nested dictionaries as output you can use double dot ".." as a delimiter. You can change this using "pepa_delimiter" we choose double dot since single dot is already used by key names in some modules, and using ":" requires quoting in the YAML.

Example:

```yaml
network..dns..servers:
  - 10.0.0.1
  - 10.0.0.2

network..dns..options:
  - timeout: 2
  - attempts: 1
  - ndots: 1

network..dns..search:
  - example.com
```

Would become:

```yaml
network:
  dns:
    servers:
      - 10.0.0.1
      - 10.0.0.2
    options:
      - timeout: 2
      - attempts: 1
      - ndots: 1
    search:
      - example.com
```

**Operators**

Operators can be used to merge/unset a list/hash or set the key as immutable, so it can’t be changed.

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>merge()</td>
<td>Merge list or hash</td>
</tr>
<tr>
<td>unset()</td>
<td>Unset key</td>
</tr>
<tr>
<td>immutable()</td>
<td>Set the key as immutable, so it can’t be changed</td>
</tr>
<tr>
<td>imerge()</td>
<td>Set immutable and merge</td>
</tr>
<tr>
<td>iunset()</td>
<td>Set immutable and unset</td>
</tr>
</tbody>
</table>

Example:
network..dns..search..merge():
    - foobar.com
    - dummy.nl
owner..immutable(): Operations
host..printers..unset():

Validation

Since it’s very hard to test Jinja as is, the best approach is to run all the permutations of input and validate the output, i.e. Unit Testing.

To facilitate this in Pepa we use YAML, Jinja and Cerberus <https://github.com/nicolaiarocci/cerberus>.

Schema

So this is a validation schema for network configuration, as you see it can be customized with Jinja just as Pepa templates.

This was designed to be run as a build job in Jenkins or similar tool. You can provide Grains/Pillar input using either the config file or command line arguments.

File Example: host/validation/network.yaml

```yaml
network..dns..search:
    type: list
    allowed:
        - example.com

network..dns..options:
    type: list
    allowed: ['timeout:2', 'attempts:1', 'ndots:1']

network..dns..servers:
    type: list
    schema:
        regex: ^([0-9]{1,3}\.)\{3\}[0-9]{1,3}$

network..gateway:
    type: string
    regex: ^([0-9]{1,3}\.)\{3\}[0-9]{1,3}$

{% if network.interfaces is defined %}
{% for interface in network.interfaces %}

network..interfaces..{{ interface }}..dhcp:
    type: boolean

network..interfaces..{{ interface }}..fqdn:
    type: string
    regex: ^([a-z0-9-]\{0,61\}[a-z0-9]?\.)+[a-zA-Z]\{2,6}$

network..interfaces..{{ interface }}..hwaddr:
    type: string
    regex: ^([0-9a-f]{1,2}:){5}[0-9a-f]{1,2}$

{% endfor %}
{% endif %}
```

(continues on next page)
network..interfaces..{ { interface } }..ipv4:
  type: string
  regex: ^([0-9]{1,3}\.){3}[0-9]{1,3}$

network..interfaces..{ { interface } }..netmask:
  type: string
  regex: ^([0-9]{1,3}\.){3}[0-9]{1,3}$

{% endfor %}
{% endif %}

21.12.28 salt.pillar.pillar_ldap

Use LDAP data as a Pillar source

This pillar module executes a series of LDAP searches. Data returned by these searches are aggregated, whereby data returned by later searches override data by previous searches with the same key.

The final result is merged with existing pillar data.

The configuration of this external pillar module is done via an external file which provides the actual configuration for the LDAP searches.

Configuring the LDAP ext_pillar

The basic configuration is part of the master configuration.

```yaml
ext_pillar:
  - pillar_ldap: /etc/salt/master.d/pillar_ldap.yaml
```

Note: When placing the file in the master.d directory, make sure its name doesn’t end in .conf, otherwise the salt-master process will attempt to parse its content.

Warning: Make sure this file has very restrictive permissions, as it will contain possibly sensitive LDAP credentials!

21.12. pillar modules
The only required key in the master configuration is `pillar_ldap` pointing to a file containing the actual configuration.

Configuring the LDAP searches

The file is processed using Salt’s Renderers `<renderers>` which makes it possible to reference grains within the configuration.

**Warning:** When using Jinja in this file, make sure to do it in a way which prevents leaking sensitive information. A rogue minion could send arbitrary grains to trick the master into returning secret data. Use only the ‘id’ grain which is verified through the minion’s key/cert.

Map Mode

The `it-admins` configuration below returns the Pillar `it-admins` by:

- filtering for: - members of the group `it-admins` - objects with `objectclass=user`
- returning the data of users, where each user is a dictionary containing the configured string or list attributes.

Configuration

```yaml
salt-users:
  server:  ldap.company.tld
  port:  389
  tls:  true
  dn:  'dc=company,dc=tld'
  binddn:  'cn=salt-pillars,ou=users,dc=company,dc=tld'
  bindpw:  bi7ieBai5Ano
  referrals:  false
  anonymous:  false
  mode:  map
  dn:  'ou=users,dc=company,dc=tld'
  filter:  '(&(memberof=cn=it-admins,ou=groups,dc=company,dc=tld)(objectclass=user))'
  attrs:  
    - cn
    - displayName
    - givenName
    - sn
  lists:  
    - memberOf

search_order:  
- salt-users
```

Result
salt.pillar.pillar_ldap.ext_pillar(minion_id, pillar, config_file)
 Execute LDAP searches and return the aggregated data

21.12.29 salt.pillar.postgres module

Retrieve Pillar data by doing a postgres query

New in version 2017.7.0.

maturity  new
 depends  psycopg2
 platform  all

Complete Example

postgres:
    user: 'salt'
    pass: 'super_secret_password'
    db: 'salt_db'

ext_pillar:
    postgres:
        fromdb:
            query: 'SELECT col1,col2,col3,col4,col5,col6,col7
                   FROM some_random_table
                   WHERE minion_pattern LIKE %s'
            depth: 5
            as_list: True
            with_lists: [1,3]
**class** `salt.pillar.postgres.POSTGRESExtPillar`

This class receives and processes the database rows from POSTGRES.

`extract_queries(args, kwargs)`

This function normalizes the config block into a set of queries we can use. The return is a list of consistently laid out dicts.

`salt.pillar.postgres.ext_pillar(minion_id, pillar, *args, **kwargs)`

Execute queries against POSTGRES, merge and return as a dict

### 21.12.30 `salt.pillar.puppet`

Execute an unmodified puppet_node_classifier and read the output as YAML. The YAML data is then directly overlaid onto the minion’s Pillar data.

`salt.pillar.puppet.ext_pillar(minion_id, pillar, command)`

Execute an unmodified puppet_node_classifier and read the output as YAML

### 21.12.31 `salt.pillar.reclass_adapter`

Use the "reclass" database as a Pillar source

This `ext_pillar` plugin provides access to the reclass database, such that Pillar data for a specific minion are fetched using reclass.

You can find more information about reclass at http://reclass.pantsfullofunix.net.

To use the plugin, add it to the `ext_pillar` list in the Salt master config and tell reclass by way of a few options how and where to find the inventory:

```python
ext_pillar:
    - reclass:
        storage_type: yaml_fs
        inventory_base_uri: /srv/salt
```

This would cause reclass to read the inventory from YAML files in /srv/salt/nodes and /srv/salt/classes.

If you are also using reclass as master_tops plugin, and you want to avoid having to specify the same information for both, use YAML anchors (take note of the differing data types for `ext_pillar` and `master_tops`):

```python
reclass: &reclass
    storage_type: yaml_fs
    inventory_base_uri: /srv/salt
    reclass_source_path: ~/code/reclass

ext_pillar:
    - reclass: *reclass

master_tops:
    reclass: *reclass
```

If you want to run reclass from source, rather than installing it, you can either let the master know via the PYTHONPATH environment variable, or by setting the configuration option, like in the example above.

`salt.pillar.reclass_adapter.ext_pillar(minion_id, pillar, **kwargs)`

Obtain the Pillar data from reclass for the given minion_id.
21.12.32 salt.pillar.redismod

Read pillar data from a Redis backend

New in version 2014.7.0.

depends

- redis Python module (on master)

Salt Master Redis Configuration

The module shares the same base Redis connection variables as `salt.returners.redis_return`. These variables go in your master config file.

- `redis.db` - The Redis database to use. Defaults to 0.
- `redis.host` - The Redis host to connect to. Defaults to 'salt'.
- `redis.port` - The port that the Redis database is listening on. Defaults to 6379.
- `redis.password` - The password for authenticating with Redis. Only required if you are using master auth. Defaults to None.

Configuring the Redis `ext_pillar`

```
  ext_pillar:
     - redis: {function: key_value}
```

`salt.pillar.redismod.ext_pillar(minion_id, pillar, function, **kwargs)`

Grabs external pillar data based on configured function

`salt.pillar.redismod.key_json(minion_id, pillar, pillar_key=None)`

Pulls a string from redis and deserializes it from json. Deserialized dictionary data loaded directly into top level if pillar_key is not set.

`pillar_key` Pillar key to return data into

`salt.pillar.redismod.key_value(minion_id, pillar, pillar_key='redis_pillar')`

Looks for key in redis matching minion_id, returns a structure based on the data type of the redis key. String for string type, dict for hash type and lists for lists, sets and sorted sets.

`pillar_key` Pillar key to return data into

21.12.33 salt.pillar.s3

Copy pillar data from a bucket in Amazon S3

The S3 pillar can be configured in the master config file with the following options

```
  ext_pillar:
    - s3:
      bucket: my.fancy.pillar.bucket
      keyid: KASKFJWAKJASJKDAJKSD
      key: ksladfDLKDALSFKSD93q032sdDasdfasdfsadkf
      multiple_env: False
      environment: base
      prefix: somewhere/overthere
```

(continues on next page)
The `bucket` parameter specifies the target S3 bucket. It is required.

The `keyid` parameter specifies the key id to use when access the S3 bucket. If it is not provided, an attempt to fetch it from EC2 instance meta-data will be made.

The `key` parameter specifies the key to use when access the S3 bucket. If it is not provided, an attempt to fetch it from EC2 instance meta-data will be made.

The `multiple_env` defaults to False. It specifies whether the pillar should interpret top level folders as pillar environments (see mode section below).

The `environment` defaults to 'base'. It specifies which environment the bucket represents when in single environments mode (see mode section below). It is ignored if multiple_env is True.

The `prefix` defaults to "". It specifies a key prefix to use when searching for data in the bucket for the pillar. It works when multiple_env is True or False. Essentially it tells ext_pillar to look for your pillar data in a 'subdirectory' of your S3 bucket.

The `verify_ssl` parameter defaults to True. It specifies whether to check for valid S3 SSL certificates. `NOTE` If you use bucket names with periods, this must be set to False else an invalid certificate error will be thrown (issue #12200).

The `service_url` parameter defaults to 's3.amazonaws.com'. It specifies the base url to use for accessing S3.

The `kms_keyid` parameter is optional. It specifies the ID of the Key Management Service (KMS) master key that was used to encrypt the object.

The `s3_cache_expire` parameter defaults to 30s. It specifies expiration time of S3 metadata cache file.

The `s3_sync_on_update` parameter defaults to True. It specifies if cache is synced on update rather than jit.

The `path_style` parameter defaults to False. It specifies whether to use path style requests or dns style requests.

The `https_enable` parameter defaults to True. It specifies whether to use https protocol or http protocol.

This pillar can operate in two modes, single environment per bucket or multiple environments per bucket.

Single environment mode must have this bucket structure:

```
s3://<bucket name>/<prefix>/<files>
```

Multiple environment mode must have this bucket structure:

```
s3://<bucket name>/<prefix>/<environment>/<files>
```

If you wish to define your pillar data entirely within S3 it’s recommended that you use the `prefix=` parameter and specify one entry in ext_pillar for each environment rather than specifying multiple_env. This is due to issue #22471 (https://github.com/saltstack/salt/issues/22471)

```python
class salt.pillar.s3.S3Credentials(key, keyid, bucket, service_url, verify_ssl=True, kms_keyid=None, location=None, path_style=False, https_enable=True)
```
salt.pillar.s3.ext_pillar(minion_id, pillar, bucket, key=None, keyid=None, verify_ssl=True, location=None, multiple_env=False, environment='base', prefix='', service_url=None, kms_keyid=None, s3_cache_expire=30, s3_sync_on_update=True, path_style=False, https_enable=True)

Execute a command and read the output as YAML

21.12.34 salt.pillar.saltclass

SaltClass Pillar Module

```yaml
ext_pillar:
  - saltclass:
      - path: /srv/saltclass
```

For additional configuration instructions, see the saltclass module

salt.pillar.saltclass.ext_pillar(minion_id, pillar, *args, **kwargs)

Compile pillar data

21.12.35 salt.pillar.sql_base module

Retrieve Pillar data by doing a SQL query

This module is not meant to be used directly as an ext_pillar. It is a place to put code common to PEP 249 compliant SQL database adapters. It exposes a python ABC that can be subclassed for new database providers.

```yaml
maturity: new
platform: all
```

Theory of sql_base ext_pillar

Ok, here’s the theory for how this works...

- First, any non-keyword args are processed in order.
- Then, remaining keywords are processed.

We do this so that it’s backward compatible with older configs. Keyword arguments are sorted before being appended, so that they’re predictable, but they will always be applied last so overall it’s moot.

For each of those items we process, it depends on the object type:

- Strings are executed as is and the pillar depth is determined by the number of fields returned.
- A list has the first entry used as the query, the second as the pillar depth.
- A mapping uses the keys "query" and "depth" as the tuple

You can retrieve as many fields as you like, how they get used depends on the exact settings.

Configuring a sql_base ext_pillar

The sql_base ext_pillar cannot be used directly, but shares query configuration with its implementations. These examples use a fake 'sql_base' adapter, which should be replaced with the name of the adapter you are using.

A list of queries can be passed in
The query can be provided as a string as we have just shown, but they can be provided as lists

```yaml
ext_pillar:
  - sql_base:
      main: "SELECT pillar,value FROM pillars WHERE minion_id = %s"
      extras: "SELECT pillar,value FROM more_pillars WHERE minion_id = %s"
```

Or as a mapping

```yaml
ext_pillar:
  - sql_base:
      query: "SELECT pillar,value FROM pillars WHERE minion_id = %s"
      depth: 2
```

The depth defines how the dicts are constructed. Essentially if you query for fields a,b,c,d for each row you’ll get:

- With depth 1: `{a: {"b": b, "c": c, "d": d}}`
- With depth 2: `{a: {b: {"c": c, "d": d}}}`
- With depth 3: `{a: {b: {c: d}}}`

Depth greater than 3 wouldn’t be different from 3 itself. Depth of 0 translates to the largest depth needed, so 3 in this case. (max depth == key count - 1)

Then they are merged in a similar way to plain pillar data, in the order returned by the SQL database. Thus subsequent results overwrite previous ones when they collide.

The `ignore_null` option can be used to change the overwrite behavior so that only non-NULL values in subsequent results will overwrite. This can be used to selectively overwrite default values.

```yaml
ext_pillar:
  - sql_base:
      query: "SELECT pillar,value FROM pillars WHERE minion_id = 'default' and minion_id != %s"
      depth: 2
      query: "SELECT pillar,value FROM pillars WHERE minion_id = %s"
      depth: 2
      ignore_null: True
```

If you specify `as_list: True` in the mapping expression it will convert collisions to lists.

If you specify `with_lists: '...'` in the mapping expression it will convert the specified depths to list. The string provided is a sequence numbers that are comma separated. The string '1,3' will result in:
These columns define list grouping

```
{a: [
    {c: [
      {e: 1},
      {g: 2}
    ],
    {h: [
      {j: 3, k: 4}
    ]
  ]
]}
```

The range for with_lists is 1 to number_of_fields, inclusive. Numbers outside this range are ignored.

Finally, if you pass the queries in via a mapping, the key will be the first level name where as passing them in as a list will place them in the root. This isolates the query results into their own subtrees. This may be a help or hindrance to your aims and can be used as such.

You can basically use any SELECT query that gets you the information, you could even do joins or subqueries in case your minion_id is stored elsewhere. It is capable of handling single rows or multiple rows per minion.

Configuration of the connection depends on the adapter in use.

More complete example for MySQL (to also show configuration)

```yaml
mysql:
  user: 'salt'
  pass: 'super_secret_password'
  db: 'salt_db'

ext_pillar:
  - mysql:
      fromdb:
        query: 'SELECT col1,col2,col3,col4,col5,col6,col7 FROM some_random_table WHERE minion_pattern LIKE %s'
        depth: 5
        as_list: True
        with_lists: [1,3]
```

class salt.pillar.sql_base.SqlBaseExtPillar

This class receives and processes the database rows in a database agnostic way.

```python
as_list = False
depth = 0

enter_root(root)
    Set self.focus for kwarg queries
```
extract_queries(args, kwargs)
    This function normalizes the config block into a set of queries we can use. The return is a list of consistently laid out dicts.

fetch(minion_id, pillar, *args, **kwargs)
    Execute queries, merge and return as a dict.

field_names = None
focus = None
ignore_null = False
num_fields = 0

process_fields(field_names, depth)
    The primary purpose of this function is to store the sql field list and the depth to which we process.

process_results(rows)
    This function takes a list of database results and iterates over, merging them into a dict form.

result = None
with_lists = None

21.12.36 salt.pillar.sqlcipher module

Retrieve Pillar data by running a SQLCipher query
New in version 2016.3.0.
Python SQLCipher support is provided by the pysqlcipher Python package. You need this module installed to query Pillar data from a SQLCipher database.
This module is a concrete implementation of the sql_base ext_pillar for SQLCipher.

    maturity new
depends pysqlcipher (for py2) or pysqlcipher3 (for py3)
platform all

Configuring the sqlcipher ext_pillar

Use the 'sqlcipher' key under ext_pillar for configuration of queries.
SQLCipher database connection configuration requires the following values configured in the master config:

• sqlcipher.database - The SQLCipher database to connect to. Defaults to '/var/lib/salt/pillar-sqlcipher.db'.
• sqlcipher.pass - The SQLCipher database decryption password.
• sqlcipher.timeout - The connection timeout in seconds.

Example configuration

sqlcipher:
    database: /var/lib/salt/pillar-sqlcipher.db
    pass: strong_pass_phrase
    timeout: 5.0
Complete Example

```yaml
sqlcipher:
  database: '/var/lib/salt/pillar-sqlcipher.db'
  pass: strong_pass_phrase
  timeout: 5.0

ext_pillar:
  - sqlcipher:
      fromdb:
        query: 'SELECT col1,col2,col3,col4,col5,col6,col7
               FROM some_random_table
               WHERE minion_pattern LIKE ?'
        depth: 5
        as_list: True
        with_lists: [1,3]
```

class `salt.pillar.sqlcipher.SQLCipherExtPillar`

This class receives and processes the database rows from SQLCipher.

`salt.pillar.sqlcipher.ext_pillar(minion_id, pillar, *args, **kwargs)`

Execute queries against SQLCipher, merge and return as a dict

---

21.12.37 salt.pillar.sqlite3 module

Retrieve Pillar data by doing a SQLite3 query

New in version 2015.8.0.

SQLite3 is included in the stdlib since Python 2.5.

This module is a concrete implementation of the sql_base ext_pillar for SQLite3.

```
platform all
```

Configuring the sqlite3 ext_pillar

Use the 'sqlite3' key under ext_pillar for configuration of queries.

SQLite3 database connection configuration requires the following values configured in the master config:

Note, timeout is in seconds.

```yaml
sqlite3.database: /var/lib/salt/pillar.db
sqlite3.timeout: 5.0
```

Complete Example

```yaml
sqlite3:
  database: '/var/lib/salt/pillar.db'
  timeout: 5.0

ext_pillar:
  - sqlite3:
      fromdb:
```
class salt.pillar.sqlite3.SQLite3ExtPillar

This class receives and processes the database rows from SQLite3.

salt.pillar.sqlite3.ext_pillar(minion_id, pillar, *args, **kwargs)

Execute queries against SQLite3, merge and return as a dict

21.12.38 salt.pillar.stack

Simple and flexible YAML ext_pillar which can read pillar from within pillar.

New in version 2016.3.0.

PillarStack is a custom saltstack ext_pillar which was inspired by varstack but is heavily based on Jinja2 for maximum flexibility.

Any issue should be reported to the upstream project at: https://github.com/bbinet/pillarstack/issues

It supports the following features:

- multiple config files that are jinja2 templates with support for pillar, __grains__, __salt__, __opts__ objects
- a config file renders as an ordered list of files (paths of these files are relative to the current config file)
- this list of files are read in ordered as jinja2 templates with support for stack, pillar, __grains__, __salt__, __opts__ objects
- all these rendered files are then parsed as yaml
- then all yaml dicts are merged in order with support for the following merging strategies: merge-first, merge-last, remove, and overwrite
- stack config files can be matched based on pillar, grains, or opts values, which make it possible to support kind of self-contained environments

Installation

PillarStack is already bundled with Salt since 2016.3.0 version so there is nothing to install from version 2016.3.0.

If you use an older Salt version or you want to override PillarStack with a more recent one, follow the installation procedure below.

Installing the PillarStack ext_pillar is as simple as dropping the stack.py file in the <extension_modules>/pillar directory (no external python module required), given that extension_modules is set in your salt-master configuration, see: http://docs.saltstack.com/en/latest/ref/configuration/master.html#extension-modules
Configuration in Salt

Like any other external pillar, its configuration takes place through the `ext_pillar` key in the master config file. However, you can configure PillarStack in 3 different ways:

**Single config file**

This is the simplest option, you just need to set the path to your single PillarStack config file like below:

```yaml
ext_pillar:
  - stack: /path/to/stack.cfg
```

**List of config files**

You can also provide a list of config files:

```yaml
ext_pillar:
  - stack:
      - /path/to/stack1.cfg
      - /path/to/stack2.cfg
```

**Select config files through grains|pillar|opts matching**

You can also opt for a much more flexible configuration: PillarStack allows one to select the config files for the current minion based on matching values from either grains, or pillar, or opts objects.

Here is an example of such a configuration, which should speak by itself:

```yaml
ext_pillar:
  - stack:
      pillar:environment:
        dev: /path/to/dev/stack.cfg
        prod: /path/to/prod/stack.cfg
      grains:custom:grain:
        value:
          - /path/to/stack1.cfg
          - /path/to/stack2.cfg
      opts:custom:opt:
        value: /path/to/stack0.cfg
```

**PillarStack configuration files**

The config files that are referenced in the above `ext_pillar` configuration are jinja2 templates which must render as a simple ordered list of yaml files that will then be merged to build pillar data.

The path of these yaml files must be relative to the directory of the PillarStack config file. These paths support unix style pathname pattern expansion through the Python glob module [https://docs.python.org/2/library/glob.html](https://docs.python.org/2/library/glob.html).

The following variables are available in jinja2 templating of PillarStack configuration files:

- `pillar`: the pillar data (as passed by Salt to our `ext_pillar` function)
- `minion_id`: the minion id ;-)
Salt Documentation, Release 2019.2.0

- __opts__ - a dictionary of mostly Salt configuration options
- __grains__ - a dictionary of the grains of the minion making this pillar call
- __salt__ - a dictionary of Salt module functions, useful so you don’t have to duplicate functions that already exist (note: runs on the master)

So you can use all the power of jinja2 to build your list of `yaml` files that will be merged in pillar data.

For example, you could have a PillarStack config file which looks like:

```
$ cat /path/to/stack/config.cfg
core.yml
common/*.yml
osarchs/{{ __grains__['osarch'] }}.yml
oscodenames/{{ __grains__['oscodename'] }}.yml
{% for role in pillar.get('roles', []) %}
roles/{{ role }}.yml
{% endfor %}
minions/{{ minion_id }}.yml
```

And the whole directory structure could look like:

```
$ tree /path/to/stack/
/path/to/stack/
├── config.cfg
├── core.yml
├── common/
│   ├── xxx.yml
│   └── yyy.yml
├── osarchs/
│   ├── amd64.yml
│   └── armhf.yml
├── oscodenames/
│   ├── wheezy.yml
│   └── jessie.yml
├── roles/
│   ├── web.yml
│   └── db.yml
└── minions/
    ├── test-1-dev.yml
    └── test-2-dev.yml
```

**Overall process**

In the above PillarStack configuration, given that test-1-dev minion is an amd64 platform running Debian Jessie, and which pillar roles is "db", the following `yaml` files would be merged in order:

- core.yml
- common/xxx.yml
- common/yyy.yml
- osarchs/amd64.yml
- oscodenames/jessie.yml
Before merging, every files above will be preprocessed as Jinja2 templates. The following variables are available in Jinja2 templating of yaml files:

- **stack**: the PillarStack pillar data object that has currently been merged (data from previous yaml files in PillarStack configuration)
- **pillar**: the pillar data (as passed by Salt to our ext_pillar function)
- **minion_id**: the minion id ;-)
- **__opts__**: a dictionary of mostly Salt configuration options
- **__grains__**: a dictionary of the grains of the minion making this pillar call
- **__salt__**: a dictionary of Salt module functions, useful so you don’t have to duplicate functions that already exist (note: runs on the master)

So you can use all the power of jinja2 to build your pillar data, and even use other pillar values that has already been merged by PillarStack (from previous yaml files in PillarStack configuration) through the `stack` variable.

Once a yaml file has been preprocessed by Jinja2, we obtain a Python dict - let’s call it `yaml_data` - then, PillarStack will merge this `yaml_data` dict in the main `stack` dict (which contains already merged PillarStack pillar data). By default, PillarStack will deeply merge `yaml_data` in `stack` (similarly to the `recurse salt pillar_source_merging_strategy`), but 3 merging strategies are currently available for you to choose (see next section).

Once every yaml files have been processed, the `stack` dict will contain your whole own pillar data, merged in order by PillarStack. So PillarStack `ext_pillar` returns the `stack` dict, the contents of which Salt takes care to merge in with all of the other pillars and finally return the whole pillar to the minion.

### Merging strategies

The way the data from a new `yaml_data` dict is merged with the existing `stack` data can be controlled by specifying a merging strategy. Right now this strategy can either be `merge-last` (the default), `merge-first`, `remove`, or `overwrite`.

Note that scalar values like strings, integers, booleans, etc. are always evaluated using the `overwrite` strategy (other strategies don’t make sense in that case).

The merging strategy can be set by including a dict in the form of:

```yaml
__: <merging strategy>
```

as the first item of the dict or list. This allows fine grained control over the merging process.

**merge-last** (default) strategy

If the `merge-last` strategy is selected (the default), then content of dict or list variables is merged recursively with previous definitions of this variable (similarly to the `recurse salt pillar_source_merging_strategy`). This allows for extending previously defined data.
**merge-first strategy**

If the `merge-first` strategy is selected, then the content of dict or list variables are swapped between the `yaml_data` and `stack` objects before being merged recursively with the `merge-last` previous strategy.

**remove strategy**

If the `remove` strategy is selected, then content of dict or list variables in `stack` are removed only if the corresponding item is present in the `yaml_data` dict. This allows for removing items from previously defined data.

**overwrite strategy**

If the `overwrite` strategy is selected, then the content of dict or list variables in `stack` is overwritten by the content of `yaml_data` dict. So this allows one to overwrite variables from previous definitions.

**Merging examples**

Let's go through small examples that should clarify what’s going on when a `yaml_data` dict is merged in the `stack` dict.

When you don’t specify any strategy, the default `merge-last` strategy is selected:

<table>
<thead>
<tr>
<th>stack</th>
<th>yaml_data</th>
<th>stack (after merge)</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>users:</code></td>
<td><code>users:</code></td>
<td><code>users:</code></td>
</tr>
<tr>
<td><code>tom:</code></td>
<td><code>tom:</code></td>
<td><code>tom:</code></td>
</tr>
<tr>
<td><code>uid: 500</code></td>
<td><code>uid: 1000</code></td>
<td><code>uid: 1000</code></td>
</tr>
<tr>
<td><code>roles:</code></td>
<td><code>roles:</code></td>
<td><code>roles:</code></td>
</tr>
<tr>
<td><code>- sysadmin</code></td>
<td><code>- developer</code></td>
<td><code>- sysadmin</code></td>
</tr>
<tr>
<td><code>root:</code></td>
<td><code>mat:</code></td>
<td><code>mat:</code></td>
</tr>
<tr>
<td><code>uid: 0</code></td>
<td><code>uid: 1001</code></td>
<td><code>uid: 1001</code></td>
</tr>
</tbody>
</table>

Then you can select a custom merging strategy using the `__` key in a dict:
You can also select a custom merging strategy using a `__` object in a list:
salt.pillar.stack.ext_pillar(minion_id, pillar, *args, **kwargs)

21.12.39 salt.pillar.svn_pillar

Clone a remote SVN repository and use the filesystem as a Pillar source

This external Pillar source can be configured in the master config file like so:

```
  ext_pillar:
    - svn: trunk svn://svnserver/repo root=subdirectory
```

The root= parameter is optional and used to set the subdirectory from where to look for Pillar files (such as top.sls).

Changed in version 2014.7.0: The optional root parameter will be added.

Note that this is not the same thing as configuring pillar data using the pillar_roots parameter. The branch referenced in the ext_pillar entry above (master), would evaluate to the base environment, so this branch needs to contain a top.sls with a base section in it, like this:

```
  base:
    '*' :
      - foo
```

To use other environments from the same SVN repo as svn_pillar sources, just add additional lines, like so:

```
  ext_pillar:
    - svn: trunk svn://svnserver/repo
    - svn: dev svn://svnserver/repo
```

In this case, the dev branch would need its own top.sls with a dev section in it, like this:
dev:
  *+*
  - bar

class salt.pillar.svn_pillar.SvnPillar(branch, repo_location, root, opts)
  Deal with the remote SVN repository for Pillar

  pillar_dir()
    Returns the directory of the pillars (repo cache + branch + root)

  update()

salt.pillar.svn_pillar.ext_pillar(minion_id, pillar, repo_string)
  Execute a command and read the output as YAML

21.12.40 salt.pillar.varstack_pillar

Use Varstack data as a Pillar source

Configuring Varstack

Using varstack in Salt is fairly simple. Just put the following into the config file of your master:

```yaml
ext_pillar:
  - varstack: /etc/varstack.yaml
```

Varstack will then use /etc/varstack.yaml to determine which configuration data to return as pillar information. From there you can take a look at the README of varstack on how this file is evaluated.

salt.pillar.varstack_pillar.ext_pillar(minion_id, pillar, conf)
  Parse varstack data and return the result

21.12.41 salt.pillar.vault module

Vault Pillar Module

  maintainer SaltStack
  maturity New
  platform all

New in version 2016.11.0.

This module allows pillar data to be stored in Hashicorp Vault.

Base configuration instructions are documented in the execution module docs. Below are noted extra configuration required for the pillar module, but the base configuration must also be completed.

After the base Vault configuration is created, add the configuration below to the ext_pillar section in the Salt master configuration.

```yaml
ext_pillar:
  - vault: path=secret/salt
```
Each key needs to have all the key-value pairs with the names you require. Avoid naming every key ‘password’ as you they will collide:

If you want to nest results under a nesting_key name use the following format:

```shell
ext_pillar:
  • vault: conf: path=secret/salt nesting_key: vault_key_name
```

```shell
$ vault write secret/salt auth=my_password master=127.0.0.1
```

The above will result in two pillars being available, auth and master.

You can then use normal pillar requests to get each key pair directly from pillar root. Example:

```shell
$ salt-ssh '*' pillar.get auth
```

Multiple Vault sources may also be used:

```shell
ext_pillar:
  - vault: path=secret/salt
  - vault: path=secret/root
  - vault: path=secret/minions/{minion}/pass
```

You can also use nesting here as well. Identical nesting keys will get merged.

```shell
ext_pillar:
  - vault:
      conf: path=secret/salt
      nesting_key: keyname1
  - vault:
      conf: path=secret/root
      nesting_key: keyname1
  - vault:
      conf: path=secret/minions/{minion}/pass
      nesting_key: keyname2
```

The difference between the return with and without the nesting key is shown below. This example takes the key value pairs returned from vault as follows:

- path=secret/salt
  Key Value — —— salt-passwd badpasswd1
- path=secret/root
  Key Value — —— root-passwd rootbadpasswd1
- path=secret/minions/{minion}/pass
  Key Value — —— minion-passwd minionbadpasswd1

```
#Nesting Key not defined
local:
  ---------
  salt-passwd:
    badpasswd1
  root-passwd:
    rootbadpasswd1
  minion-passwd:
```

(continues on next page)
minionbadpasswd1

#Nesting Key defined

local:
-------
keyname1:
-------
salt-passwd:
badpasswd1
root-passwd:
rootbadpasswd1

keyname2:
-------
minion-passwd:
minionbadpasswd1

salt.pillar.vault.ext_pillar(minion_id, pillar, conf, nesting_key=None)
Get pillar data from Vault for the configuration conf.

21.12.42 salt.pillar.venafi module

Venafi Pillar Certificates
This module will only return pillar data if the venafi runner module has already been used to create certificates.
To configure this module, set venafi to True in the ext_pillar section of your master configuration file:

```python
ext_pillar:
- venafi: True
```

salt.pillar.venafi.ext_pillar(minion_id, pillar, conf)
Return an existing set of certificates

21.12.43 salt.pillar.virtkey

Accept a key from a hypervisor if the virt runner has already submitted an authorization request

```python
salt.pillar.virtkey.ext_pillar(hyper_id, pillar, name, key)
Accept the key for the VM on the hyper, if authorized.
```

21.12.44 salt.pillar.vmware_pillar module

Pillar data from vCenter or an ESXi host
New in version 2017.7.0.

```python
depends
- pyVmomi
```
This external pillar can pull attributes from objects in vCenter or an ESXi host and provide those attributes as pillar data to minions. This can allow for pillar based targeting of minions on ESXi host, Datastore, VM configuration, etc. This setup requires only the salt master have access to the vCenter server/ESXi hosts.
The pillar will return an empty dict if the 'os' or 'virtual' grain are not 'VMWare', 'ESXi', or 'VMWare ESXi'.
Defaults

- The external pillar will search for Virtual Machines with the VM name matching the minion id.
- Data will be returned into the 'vmware' pillar key.
- The external pillar has a default set of properties to return for both VirtualMachine and HostSystem types.

Configuring the VMWare pillar

The required minimal configuration in the salt master ext_pillar setup:

```
ext_pillar:
  - vmware:
    host: <vcenter/esx host>
    username: <user to connect with>
    password: <password>
```

Optionally, the following keyword arguments can be passed to the ext_pillar for customized configuration:

- **pillar_key**  Optionally set the pillar key to return the data into. Default is `vmware`.
- **protocol**  Optionally set to alternate protocol if the vCenter server or ESX/ESXi host is not using the default protocol. Default protocol is `https`.
- **port**  Optionally set to alternate port if the vCenter server or ESX/ESXi host is not using the default port. Default port is 443.
- **property_name**  Property name to match the minion id against. Defaults to `name`.
- **property_types**  Optionally specify a list of pyVmomi vim types to search for the minion id in 'property_name'. Default is `['VirtualMachine']`.

For example, to search both vim.VirtualMachine and vim.HostSystem object types:

```
ext_pillar:
  - vmware:
    host: myesx
    username: root
    password: complex_password
    property_types:
      - VirtualMachine
      - HostSystem
```

Additionally, the list of property types can be dicts, the item of the dict being a list specifying the attribute to return for that vim object type.

The pillar will attempt to recurse the attribute and return all child attributes.

To explicitly specify deeper attributes without attempting to recurse an attribute, convert the list item to a dict with the item of the dict being the child attributes to return. Follow this pattern to return attributes as deep within the object as necessary.

**Note:** Be careful when specifying custom attributes! Many attributes have objects as attributes which have the parent object as an attribute and which will cause the pillar to fail due to the attempt to convert all sub-objects recursively (i.e. infinite attribute loops). Specifying only the sub-attributes you would like returned will keep the infinite recursion from occurring.

A maximum recursion exception will occur in this case and the pillar will not return as desired.
ext_pillar:
  - vmware:
    host: myvcenter
    username: my_user
    password: my_pass
    replace_default_attributes: True
    property_types:
      - VirtualMachine:
        - config:
          bootOptions:
            bootDelay
            bootRetryDelay
      - HostSystem:
        - datastore:
          - name

The above ext_pillar example would return a pillar like the following for a VirtualMachine object that’s name matched the minion id:

vmware:
  config:
    bootOptions:
      bootDelay: 1000
      bootRetryDelay: 1000

If you were to retrieve these virtual machine attributes via pyVmomi directly, this would be the same as

vmObject.config.bootOptions.bootDelay
vmObject.config.bootOptionis.bootRetryDelay

The above ext_pillar example would return a pillar like the following for a HostySystem object that’s name matched the minion id:

vmware:
  datastore:
    - name: Datastore1
    - name: Datastore2

The 'datastore' property of a HostSystem object is a list of datastores, thus a list is returned.

replace_default_attributes If custom attributes are specified by the property_types parameter, replace_default_attributes determines if those will be added to default attributes (False) or replace the default attributes completely (True). The default setting is 'False'.

Note: vCenter "Custom Attributes" (i.e. Annotations) will always be returned if it exists on the object as part of the pillar regardless of this setting.

salt.pillar.vmware_pillar.ext_pillar(minion_id, pillar, **kwargs)
Check vmware/vcenter for all data

21.13 proxy modules
## 21.13.1 salt.proxy.arista_pyeapi

**Arista pyeapi**

New in version 2019.2.0.

Proxy module for managing Arista switches via the eAPI using the pyeapi library.

- **codeauthor**: Mircea Ulinic <ping@mirceaulinic.net>
- **maturity**: new
- **depends**: pyeapi
- **platform**: unix

**Note:** To understand how to correctly enable the eAPI on your switch, please check [https://eos.arista.com/arista-eapi-101/](https://eos.arista.com/arista-eapi-101/).
## Dependencies

The pyeapi Proxy module requires pyeapi to be installed: `pip install pyeapi`.

## Pillar

The pyeapi proxy configuration requires the following parameters in order to connect to the network device:

**transport:** `https` Specifies the type of connection transport to use. Valid values for the connection are `socket`, `http_local`, `http`, and `https`.

**host:** `localhost` The IP address or DNS host name of the connection device.

**username:** `admin` The username to pass to the device to authenticate the eAPI connection.

**password** The password to pass to the device to authenticate the eAPI connection.

**port** The TCP port of the endpoint for the eAPI connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for `http`, or 443 for `https`).

**enablepwd** The enable mode password if required by the destination node.

All the arguments may be optional, depending on your setup.

### Proxy Pillar Example

```yaml
proxy:
    proxytype: pyeapi
    host: router1.example.com
    username: example
    password: example
```

- `salt.proxy.arista_pyeapi.call(method, *args, **kwargs)`
  - Calls an arbitrary pyeapi method.
- `salt.proxy.arista_pyeapi.conn()`
  - Return the connection object.
- `salt.proxy.arista_pyeapi.init(opts)`
  - Open the connection to the Arista switch over the eAPI.
- `salt.proxy.arista_pyeapi.initialized()`
  - Connection finished initializing?
- `salt.proxy.arista_pyeapi.ping()`
  - Connection open successfully?
- `salt.proxy.arista_pyeapi.shutdown(opts)`
  - Closes connection with the device.

## 21.13.2 salt.proxy.cimc module

Proxy Minion interface module for managing Cisco Integrated Management Controller devices

New in version 2018.3.0.

**codeauthor** Spencer Ervin <spencer_ervin@hotmail.com>
maturity  new
depends  none
platform  unix

This proxy minion enables Cisco Integrated Management Controller devices (hereafter referred to as simply 'cimc' devices to be treated individually like a Salt Minion.

The cimc proxy leverages the XML API functionality on the Cisco Integrated Management Controller. The Salt proxy must have access to the cimc on HTTPS (tcp/443).

More in-depth conceptual reading on Proxy Minions can be found in the Proxy Minion section of Salt’s documentation.

Configuration

To use this integration proxy module, please configure the following:

Pillar

Proxy minions get their configuration from Salt’s Pillar. Every proxy must have a stanza in Pillar and a reference in the Pillar top-file that matches the ID.

```
proxy:
  proxytype: cimc
  host: <ip or dns name of cimc host>
  username: <cimc username>
  password: <cimc password>
```

proxytype

The proxytype key and value pair is critical, as it tells Salt which interface to load from the proxy directory in Salt’s install hierarchy, or from /srv/salt/_proxy on the Salt Master (if you have created your own proxy module, for example). To use this cimc Proxy Module, set this to cimc.

host

The location, or ip/dns, of the cimc host. Required.

username

The username used to login to the cimc host. Required.

password

The password used to login to the cimc host. Required.

```
salt.proxy.cimc.get_config_resolver_class(cid=None, hierarchical=False)
```

The configResolveClass method returns requested managed object in a given class.
salt.proxy.cimc.grains()
    Get the grains from the proxied device

salt.proxy.cimc.grains_refresh()
    Refresh the grains from the proxied device

salt.proxy.cimc.init(opts)
    This function gets called when the proxy starts up.

salt.proxy.cimc.initialized()
    Since grains are loaded in many different places and some of those places occur before the proxy can be initialized, return whether our init() function has been called

salt.proxy.cimc.logon()
    Logs into the cimc device and returns the session cookie.

salt.proxy.cimc.logout(cookie=None)
    Closes the session with the device.

salt.proxy.cimc.ping()
    Returns true if the device is reachable, else false.

salt.proxy.cimc.prepare_return(x)
    Converts the etree to dict

salt.proxy.cimc.set_config_modify(dn=None, inconfig=None, hierarchical=False)
    The configConfMo method configures the specified managed object in a single subtree (for example, DN).

salt.proxy.cimc.shutdown()
    Shutdown the connection to the proxy device. For this proxy, shutdown is a no-op.

### 21.13.3 salt.proxy.chronos module

Chronos

Proxy minion for managing a Chronos cluster.

Dependencies

- *chronos execution module (salt.modules.chronos)*

Pillar

The chronos proxy configuration requires a 'base_url' property that points to the chronos endpoint:

```yaml
proxy:
    proxytype: chronos
    base_url: http://my-chronos-master.mydomain.com:4400
```

New in version 2015.8.2.

salt.proxy.chronos.init(opts)
    Perform any needed setup.

salt.proxy.chronos.ping()
    Is the chronos api responding?
salt.proxy.chronos.shutdown(opts)
   For this proxy shutdown is a no-op

21.13.4 salt.proxy.ciscoos

Proxy Minion interface module for managing (practically) any network device with Cisco Network Services Orche-
strator (Cisco NSO). Cisco NSO uses a series of remote polling agents, APIs and SSH commands to fetch network
configuration and represent it in a data model. PyNSO, the Python module used by this proxy minion does the task
of converting native Python dictionaries into NETCONF/YANG syntax that the REST API for Cisco NSO can then
use to set the configuration of the target network device.

Supported devices:
   • A10 AX Series
   • Arista 7150 Series
   • Ciena 3000, 5000, ESM
   • H3c S5800 Series
   • Overture 1400, 2200, 5000, 5100, 6000
   • Accedian MetroNID
   • Avaya ERS 4000, SR8000, VSP 9000
   • Cisco: APIC-DC, ASA, IOS, IOS XE, IOS XR, er, ME-4600, NX OS, Prime Network Registrar, Quantum,
     StarOS, UCS ManagWSA
   • Huawei: NE40E, quidway series, Enterprise Network Simulation Framework
   • PaloAlto PA-2000, PA-3000, Virtualized Firewalls
   • Adtran 900 Series
   • Brocade ADX, MLX, Netiron, Vyatta
   • Dell Force 10 Networking S-Series
   • Infinera DTN-X Multi-Terabit Packet Optical Network Platform
   • Pulsecom SuperG
   • Adva 150CC Series
   • CableLabs Converged Cable Access Platform
   • Ericsson EFN324 Series, SE family
   • Juniper: Contrail, EX, M, MX, QFX, SRX, Virtual SRX
   • Quagga Routing Software
   • Affirmed Networks
   • Citrix Netscaler
   • F5 BIG-IP
   • NEC iPasolink
   • Riverbed Steelhead Series
   • Alcatel-Lucent 7XXX, SAM
   • Clavister
This proxy minion enables a consistent interface to fetch, control and maintain the configuration of network devices via a NETCONF-compliant control plane. Cisco Network Services Orchestrator.

More in-depth conceptual reading on Proxy Minions can be found in the Proxy Minion section of Salt’s documentation.

Dependencies

- pynso Python module

PyNSO

PyNSO can be installed via pip:

```
pip install pynso
```

Configuration

To use this integration proxy module, please configure the following:

Pillar

Proxy minions get their configuration from Salt’s Pillar. Every proxy must have a stanza in Pillar and a reference in the Pillar top-file that matches the ID. At a minimum for communication with the NSO host, the pillar should look like this:

```
proxy:
  proxytype: cisconso
  host: <ip or dns name of host>
  port: 8080
  use_ssl: false
  username: <username>
  password: password
```

The proxytype key and value pair is critical, as it tells Salt which interface to load from the proxy directory in Salt’s install hierarchy, or from /srv/salt/_proxy on the Salt Master (if you have created your own proxy module, for example). To use this Cisco NSO Proxy Module, set this to cisconso.
host

The location, or IP/dns, of the Cisco NSO API host. Required.

username

The username used to login to the Cisco NSO host, such as \texttt{admin}. Required.

passwords

The password for the given user. Required.

use_ssl

Whether to use HTTPS messaging to speak to the API.

port

The port that the Cisco NSO API is running on, 8080 by default

Salt Proxy

After your pillar is in place, you can test the proxy. The proxy can run on any machine that has network connectivity to your Salt Master and to the Cisco NSO host in question. SaltStack recommends that the machine running the salt-proxy process also run a regular minion, though it is not strictly necessary.

On the machine that will run the proxy, make sure there is an \texttt{/etc/salt/proxy} file with at least the following in it:

\begin{verbatim}
master: <ip or hostname of salt-master>
\end{verbatim}

You can then start the salt-proxy process with:

\begin{verbatim}
salt-proxy --proxyid <id you want to give the host>
\end{verbatim}

You may want to add \texttt{-l debug} to run the above in the foreground in debug mode just to make sure everything is OK.

Next, accept the key for the proxy on your salt-master, just like you would for a regular minion:

\begin{verbatim}
salt-key -a <id you gave the cisconso host>
\end{verbatim}

You can confirm that the pillar data is in place for the proxy:

\begin{verbatim}
salt <id> pillar.items
\end{verbatim}

And now you should be able to ping the Cisco NSO host to make sure it is responding:

\begin{verbatim}
salt <id> test.ping
\end{verbatim}
salt.proxy.cisconso.apply_rollback(datastore, name)
   Apply a system rollback
   Parameters
   - datastore (DatastoreType (str enum)) – The datastore, e.g. running, operational. One of the NETCONF store IETF types
   - name (str) – An ID of the rollback to restore

salt.proxy.cisconso.get_data(datastore, path)
   Get the configuration of the device tree at the given path
   Parameters
   - datastore (DatastoreType (str enum)) – The datastore, e.g. running, operational. One of the NETCONF store IETF types
   - path (list of str OR tuple) – The device path, a list of element names in order, comma separated
   Returns The network configuration at that tree
   Return type dict

salt proxy.cisconso.get_rollback(name)
   Get the backup of stored a configuration rollback
   Parameters name (str) – Typically an ID of the backup
   Return type str
   Returns the contents of the rollback snapshot

salt.proxy.cisconso.get_rollbacks()  
   Get a list of stored configuration rollbacks

salt.proxy.cisconso.grains()  
   Get the grains from the proxy device.

salt.proxy.cisconso.init(opts)

salt.proxy.cisconso.ping()  
   Check to see if the host is responding. Returns False if the host didn’t respond, True otherwise.
   CLI Example:

salt proxy.cisconso.test.ping

salt.proxy.cisconso.set_data_value(datastore, path, data)
   Get a data entry in a datastore
   Parameters
   - datastore (DatastoreType (str enum)) – The datastore, e.g. running, operational. One of the NETCONF store IETF types
   - path (list of str OR tuple) – The device path to set the value at, a list of element names in order, comma separated
   - data (dict) – The new value at the given path
   Return type bool
   Returns True if successful, otherwise error.

salt.proxy.cisconso.shutdown()  
   Shutdown the connection to the proxy device. For this proxy, shutdown is a no-op.

21.13.5 salt.proxy.dummy module

This is a dummy proxy-minion designed for testing the proxy minion subsystem.
salt.proxy.dummy.fns()
salt.proxy.dummy.grains()
    Make up some grains
salt.proxy.dummy.grains_refresh()
    Refresh the grains
salt.proxy.dummy.init(opts)
salt.proxy.dummy.initialized()
    Since grains are loaded in many different places and some of those places occur before the proxy can be
    initialized, return whether our init() function has been called
salt.proxy.dummy.package_install(name, **kwargs)
    Install a "package" on the REST server
salt.proxy.dummy.package_list()
    List "packages" installed on the REST server
salt.proxy.dummy.package_remove(name)
    Remove a "package" on the REST server
salt.proxy.dummy.package_status(name)
    Check the installation status of a package on the REST server
salt.proxy.dummy.ping()
    Degenerate ping
salt.proxy.dummy.service_list()
    List "services" on the REST server
salt.proxy.dummy.service_restart(name)
    Restart a "service" on the REST server
salt.proxy.dummy.service_start(name)
    Start a "service" on the dummy server
salt.proxy.dummy.service_status(name)
    Check if a service is running on the REST server
salt.proxy.dummy.service_stop(name)
    Stop a "service" on the dummy server
salt.proxy.dummy.shutdown(opts)
    For this proxy shutdown is a no-op
salt.proxy.dummy.test_from_state()
    Test function so we have something to call from a state :return:
salt.proxy.dummy.upgrade()
    "Upgrade" packages
salt.proxy.dummy.uptodate()
    Call the REST endpoint to see if the packages on the "server" are up to date.

21.13.6 salt.proxy.esxi

Proxy Minion interface module for managing VMware ESXi hosts.

New in version 2015.8.4.

Special Note: SaltStack thanks Adobe Corporation for their support in creating this Proxy Minion integration.
This proxy minion enables VMware ESXi (hereafter referred to as simply 'ESXi') hosts to be treated individually like a Salt Minion.

Since the ESXi host may not necessarily run on an OS capable of hosting a Python stack, the ESXi host can’t run a Salt Minion directly. Salt’s "Proxy Minion" functionality enables you to designate another machine to host a minion process that "proxies" communication from the Salt Master. The master does not know nor care that the target is not a "real" Salt Minion.

More in-depth conceptual reading on Proxy Minions can be found in the Proxy Minion section of Salt’s documentation.

Dependencies

- pyVmomi Python Module
- ESXCLI

**pyVmomi**

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

**Note:** Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.6, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See Issue #29537 for more information.

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==5.5.0.2014.1.1
```

The 5.5.0.2014.1.1 is a known stable version that this original ESXi State Module was developed against.

**ESXCLI**

Currently, about a third of the functions used in the vSphere Execution Module require the ESXCLI package be installed on the machine running the Proxy Minion process.

The ESXCLI package is also referred to as the VMware vSphere CLI, or vCLI. VMware provides vCLI package installation instructions for vSphere 5.5 and vSphere 6.0.

Once all of the required dependencies are in place and the vCLI package is installed, you can check to see if you can connect to your ESXi host or vCenter server by running the following command:

```
esxcli -s <host-location> -u <username> -p <password> system syslog config get
```

If the connection was successful, ESXCLI was successfully installed on your system. You should see output related to the ESXi host’s syslog configuration.
Configuration

To use this integration proxy module, please configure the following:

Pillar

Proxy minions get their configuration from Salt’s Pillar. Every proxy must have a stanza in Pillar and a reference in the Pillar top-file that matches the ID. At a minimum for communication with the ESXi host, the pillar should look like this:

```
proxy:
  proxytype: esxi
  host: <ip or dns name of esxi host>
  username: <ESXi username>
  passwords:
    - first_password
    - second_password
    - third_password
  credstore: <path to credential store>
```

proxytype

The `proxytype` key and value pair is critical, as it tells Salt which interface to load from the `proxy` directory in Salt’s install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this ESXi Proxy Module, set this to `esxi`.

host

The location, or ip/dns, of the ESXi host. Required.

username

The username used to login to the ESXi host, such as `root`. Required.

passwords

A list of passwords to be used to try and login to the ESXi host. At least one password in this list is required.

The proxy integration will try the passwords listed in order. It is configured this way so you can have a regular password and the password you may be updating for an ESXi host either via the `vsphere.update_host_password` execution module function or via the `esxi.password_present` state function. This way, after the password is changed, you should not need to restart the proxy minion—it should just pick up the the new password provided in the list. You can then change pillar at will to move that password to the front and retire the unused ones.

This also allows you to use any number of potential fallback passwords.

**Note:** When a password is changed on the host to one in the list of possible passwords, the further down on the list the password is, the longer individual commands will take to return. This is due to the nature of pyVmomi’s login system. We have to wait for the first attempt to fail before trying the next password on the list.
This scenario is especially true, and even slower, when the proxy minion first starts. If the correct password is not the first password on the list, it may take up to a minute for test.ping to respond with a True result. Once the initial authorization is complete, the responses for commands will be a little faster.

To avoid these longer waiting periods, SaltStack recommends moving the correct password to the top of the list and restarting the proxy minion at your earliest convenience.

**protocol**

If the ESXi host is not using the default protocol, set this value to an alternate protocol. Default is https.

**port**

If the ESXi host is not using the default port, set this value to an alternate port. Default is 443.

**credstore**

If the ESXi host is using an untrusted SSL certificate, set this value to the file path where the credential store is located. This file is passed to esxcli. Default is <HOME>/vmware/credstore/vicredentials.xml on Linux and <APPDATA>/VMware/credstore/vicredentials.xml on Windows.

**Note:** HOME variable is sometimes not set for processes running as system services. If you want to rely on the default credential store location, make sure HOME is set for the proxy process.

**Salt Proxy**

After your pillar is in place, you can test the proxy. The proxy can run on any machine that has network connectivity to your Salt Master and to the ESXi host in question. SaltStack recommends that the machine running the salt-proxy process also run a regular minion, though it is not strictly necessary.

On the machine that will run the proxy, make sure there is an /etc/salt/proxy file with at least the following in it:

```yaml
master: <ip or hostname of salt-master>
```

You can then start the salt-proxy process with:

```
salt-proxy --proxyid <id you want to give the host>
```

You may want to add `-l debug` to run the above in the foreground in debug mode just to make sure everything is OK.

Next, accept the key for the proxy on your salt-master, just like you would for a regular minion:

```
salt-key -a <id you gave the esxi host>
```

You can confirm that the pillar data is in place for the proxy:

```
salt <id> pillar.items
```
And now you should be able to ping the ESXi host to make sure it is responding:

```bash
salt <id> test.ping
```

At this point you can execute one-off commands against the host. For example, you can get the ESXi host’s system information:

```bash
salt <id> esxi.cmd system_info
```

Note that you don’t need to provide credentials or an ip/hostname. Salt knows to use the credentials you stored in Pillar.

It’s important to understand how this particular proxy works. `Salt.modules.vsphere` is a standard Salt execution module. If you pull up the docs for it you’ll see that almost every function in the module takes credentials and a target host. When credentials and a host aren’t passed, Salt runs commands through `pyVmomi` against the local machine. If you wanted, you could run functions from this module on any host where an appropriate version of `pyVmomi` is installed, and that host would reach out over the network and communicate with the ESXi host.

`esxi.cmd` acts as a "shim" between the execution module and the proxy. Its first parameter is always the function from `salt.modules.vsphere`. If the function takes more positional or keyword arguments you can append them to the call. It’s this shim that speaks to the ESXi host through the proxy, arranging for the credentials and hostname to be pulled from the Pillar section for this Proxy Minion.

Because of the presence of the shim, to lookup documentation for what functions you can use to interface with the ESXi host, you’ll want to look in `salt.modules.vsphere` instead of `salt.modules.esxi`.

**States**

Associated states are thoroughly documented in `salt.states.esxi`. Look there to find an example structure for Pillar as well as an example `.sls` file for standing up an ESXi host from scratch.

```python
salt.proxy.esxi.ch_config(cmd, *args, **kwargs)
```

This function is called by the `salt.modules.esxi.cmd` shim. It then calls whatever is passed in `cmd` inside the `salt.modules.vsphere` module. Passes the return through from the vsphere module.

- `cmd` The command to call inside salt.modules.vsphere
- `args` Arguments that need to be passed to that command.
- `kwargs` Keyword arguments that need to be passed to that command.

```python
salt.proxy.esxi.find_credentials(host)
```

Cycle through all the possible credentials and return the first one that works.

```python
salt.proxy.esxi.get_details()
```

Return the proxy details

```python
salt.proxy.esxi.grains()
```

Get the grains from the proxy device.

```python
salt.proxy.esxi.grains_refresh()
```

Refresh the grains from the proxy device.

```python
salt.proxy.esxi.init(opts)
```

This function gets called when the proxy starts up. For ESXi devices, the host, login credentials, and, if configured, the protocol and port are cached.

```python
salt.proxy.esxi.is_connected_via_vcenter()
```

Returns True if connection is to be done via a vCenter (no connection is attempted). Check to see if the host is responding when connecting directly via an ESXi host.
CLI Example:
```
salt esxi-host test.ping
```

```
salt.proxy.esxi.shutdown()
```
Shutdown the connection to the proxy device. For this proxy, shutdown is a no-op.

## 21.13.7 salt.proxy.fx2

**Dell FX2 chassis**

New in version 2015.8.2.

Proxy minion interface module for managing Dell FX2 chassis (Dell Chassis Management Controller version 1.2 and above, iDRAC8 version 2.00 and above)

### Dependencies

- iDRAC Remote execution module (salt.modules.dracr)
- Chassis command shim (salt.modules.chassis)
- Dell Chassis States (salt.states.dellchassis)
- Dell’s racadm command line interface to CMC and iDRAC devices.

**Special Note:** SaltStack thanks Adobe Corporation for their support in creating this proxy minion integration.

This proxy minion enables Dell FX2 and FX2s (hereafter referred to as simply "chassis", "CMC", or "FX2") chassis to be treated individually like a salt-minion.

Since the CMC embedded in the chassis does not run an OS capable of hosting a Python stack, the chassis can’t run a minion directly. Salt’s "Proxy Minion" functionality enables you to designate another machine to host a minion process that "proxies" communication from the salt-master. The master does not know nor care that the target is not a real minion.

More in-depth conceptual reading on Proxy Minions can be found in the Proxy Minion section of Salt’s documentation.

To configure this integration, follow these steps:

### Pillar

Proxy minions get their configuration from Salt’s Pillar. Every proxy must have a stanza in Pillar, and a reference in the Pillar topfile that matches the ID. At a minimum for communication with the chassis the pillar should look like this:

```
proxy:
    host: <ip or dns name of chassis controller>
    admin_username: <iDRAC username for the CMC, usually 'root'>
    fallback_admin_username: <username to try if the first fails>
    passwords:
      - first_password
      - second_password
      - third_password
    proxytype: fx2
```

21.13. proxy modules 2985
The `proxytype` line above is critical, it tells Salt which interface to load from the proxy directory in Salt’s install hierarchy, or from `/srv/salt/_proxy` on the salt-master (if you have created your own proxy module, for example).

The proxy integration will try the passwords listed in order. It is configured this way so you can have a regular password, a potential fallback password, and the third password can be the one you intend to change the chassis to use. This way, after it is changed, you should not need to restart the proxy minion—it should just pick up the third password in the list. You can then change pillar at will to move that password to the front and retire the unused ones.

Beware, many Dell CMC and iDRAC units are configured to lockout IP addresses or users after too many failed password attempts. This can generate user panic in the form of “I no longer know what the password is‼️!”. To mitigate panic try the web interface from a different IP, or setup a emergency administrator user in the CMC before doing a wholesale password rotation.

The automatic lockout can be disabled via Salt with the following:

```bash
salt <cmc> chassis.cmd set_general cfgRacTuning cfgRacTuneIpBlkEnable 0
```

and then verified with

```bash
salt <cmc> chassis.cmd get_general cfgRacTuning cfgRacTuneIpBlkEnable
```

**salt-proxy**

After your pillar is in place, you can test the proxy. The proxy can run on any machine that has network connectivity to your salt-master and to the chassis in question. SaltStack recommends that this machine also run a regular minion, though it is not strictly necessary.

On the machine that will run the proxy, make sure there is an `/etc/salt/proxy` file with at least the following in it:

```
master: <ip or hostname of salt-master>
```

You can start the proxy with

```bash
salt-proxy --proxyid <id you want to give the chassis>
```

You may want to add `-l debug` to run the above in the foreground in debug mode just to make sure everything is OK.

Next, accept the key for the proxy on your salt-master, just like you would for a regular minion:

```bash
salt-key -a <id you want to give the chassis>
```

You can confirm that the pillar data is in place for the proxy:

```bash
salt <id> pillar.items
```

And now you should be able to ping the chassis to make sure it is responding:

```bash
salt <id> test.ping
```

At this point you can execute one-off commands against the chassis. For example, you can get the chassis inventory:

```bash
salt <id> chassis.cmd inventory
```
Note that you don’t need to provide credentials or an ip_hostname. Salt knows to use the credentials you stored in Pillar.

It’s important to understand how this particular proxy works. `Salt.modules.dracr` is a standard Salt execution module. If you pull up the docs for it you’ll see that almost every function in the module takes credentials and a target host. When credentials and a host aren’t passed, Salt runs `racadm` against the local machine. If you wanted you could run functions from this module on any host where an appropriate version of `racadm` is installed, and that host would reach out over the network and communicate with the chassis.

`Chassis.cmd` acts as a "shim" between the execution module and the proxy. It’s first parameter is always the function from `salt.modules.dracr` to execute. If the function takes more positional or keyword arguments you can append them to the call. It’s this shim that speaks to the chassis through the proxy, arranging for the credentials and hostname to be pulled from the pillar section for this proxy minion.

Because of the presence of the shim, to lookup documentation for what functions you can use to interface with the chassis, you’ll want to look in `salt.modules.dracr` instead of `salt.modules.chassis`.

### States

Associated states are thoroughly documented in `salt.states.dellchassis`. Look there to find an example structure for pillar as well as an example `.sls` file for standing up a Dell Chassis from scratch.

```python
salt.proxy.fx2.admin_password()
    Return the admin_password in the DETAILS dictionary, or 'calvin' (the Dell default) if there is none present
salt.proxy.fx2.admin_username()
    Return the admin_username in the DETAILS dictionary, or root if there is none present
salt.proxy.fx2.chconfig(cmd, *args, **kwargs)
    This function is called by the `salt.modules.chassis.cmd` shim. It then calls whatever is passed in `cmd` inside the `salt.modules.dracr` module.
    
    Parameters
    
    - `cmd` – The command to call inside salt.modules.dracr
    - `args` – Arguments that need to be passed to that command
    - `kwargs` – Keyword arguments that need to be passed to that command
    
    Returns Passthrough the return from the dracr module.

salt.proxy.fx2.find_credentials()
    Cycle through all the possible credentials and return the first one that works
salt.proxy.fx2.grains()
    Get the grains from the proxied device
salt.proxy.fx2.grains_refresh()
    Refresh the grains from the proxied device
salt.proxy.fx2.host()

salt.proxy.fx2.init(opts)
    This function gets called when the proxy starts up. We check opts to see if a fallback user and password are supplied. If they are present, and the primary credentials don’t work, then we try the backup before failing.

    Whichever set of credentials works is placed in the persistent DETAILS dictionary and will be used for further communication with the chassis.

salt.proxy.fx2.ping()
    Is the chassis responding?
    
    Returns Returns False if the chassis didn’t respond, True otherwise.
```
salt.proxy.fx2.shutdown(opts)
    Shutdown the connection to the proxied device. For this proxy shutdown is a no-op.

21.13.8 salt.proxy.junos

Interface with a Junos device via proxy-minion. To connect to a junos device via junos proxy, specify the host information in the pillar in `/srv/pillar/details.sls`

```yaml
proxy:
    proxysite: junos
    host: <ip or dns name of host>
    username: <username>
    port: 830
    password: <secret>
```

In `/srv/pillar/top.sls` map the device details with the proxy name.

```yaml
base:
    'vmx':
        - details
```

After storing the device information in the pillar, configure the proxy in `/etc/salt/proxy`

```yaml
master: <ip or hostname of salt-master>
```

Run the salt proxy via the following command:

```
salt-proxy --proxyid=vmx
```

salt.proxy.junos.alive(opts)
    Validate and return the connection status with the remote device.
    New in version 2018.3.0.
salt.proxy.junos.conn()
salt.proxy.junos.get Serialized_facts()  
   Open the connection to the Junos device, login, and bind to the Resource class
salt.proxy.junos.initialized()
salt.proxy.junos.ping()
    Ping? Pong!
salt.proxy.junos.proxytype()
    Returns the name of this proxy
salt.proxy.junos.shutdown(opts)
    This is called when the proxy-minion is exiting to make sure the connection to the device is closed cleanly.

21.13.9 salt.proxy.marathon module

Marathon

Proxy minion for managing a Marathon cluster.
Dependencies

- marathon execution module (salt.modules.marathon)

Pillar

The marathon proxy configuration requires a 'base_url' property that points to the marathon endpoint:

```
proxy:
  proxytype: marathon
  base_url: http://my-marathon-master.mydomain.com:8080
```

New in version 2015.8.2.

```
salt.proxy.marathon.init(opts)
    Perform any needed setup.

salt.proxy.marathon.ping()
    Is the marathon api responding?

salt.proxy.marathon.shutdown(opts)
    For this proxy shutdown is a no-op
```

21.13.10 salt.proxy.napalm

NAPALM: Network Automation and Programmability Abstraction Layer with Multivendor support

New in version 2016.11.0.

Proxy minion for managing network devices via NAPALM library.

```
codeauthor Mircea Ulinic <mircea@cloudflare.com> & Jerome Fleury <jf@cloudflare.com>
maturity new
depends napalm
platform unix
```

Dependencies

The napalm proxy module requires NAPALM library to be installed: pip install napalm Please check Installation for complete details.

Note: Beginning with Salt release 2017.7.3, it is recommended to use napalm >= 2.0.0. The library has been unified into a monolithic package, as in opposite to separate packages per driver. For more details you can check this document. While it will still work with the old packages, bear in mind that the NAPALM core team will maintain only the main napalm package.

Moreover, for additional capabilities, the users can always define a library that extends NAPALM’s base capabilities and configure the provider option (see below).
Pillar

The napalm proxy configuration requires the following parameters in order to connect to the network device:

**driver** Specifies the network device operating system. For a complete list of the supported operating systems please refer to the NAPALM Read the Docs page.

**host** The IP Address or FQDN to use when connecting to the device. Alternatively, the following field names can be used instead: hostname, fqdn, ip.

**username** The username to be used when connecting to the device.

**passwd** The password needed to establish the connection.

---

**Note:** This field may not be mandatory when working with SSH-based drivers, and the username has a SSH key properly configured on the device targeted to be managed.

---

**optional_args** Dictionary with the optional arguments. Check the complete list of supported optional arguments.

**always_alive:** **True** In certain less dynamic environments, maintaining the remote connection permanently open with the network device is not always beneficial. In that case, the user can select to initialize the connection only when needed, by specifying this field to false. Default: true (maintains the connection with the remote network device).

New in version 2017.7.0.

**provider:** **napalm_base** The library that provides the get_network_device function. This option is useful when the user has more specific needs and requires to extend the NAPALM capabilities using a private library implementation. The only constraint is that the alternative library needs to have the get_network_device function available.

New in version 2017.7.1.

**multiprocessing:** **False** Overrides the multiprocessing option, per proxy minion. The multiprocessing option must be turned off for SSH-based proxies. However, some NAPALM drivers (e.g. Arista, NX-OS) are not SSH-based. As multiple proxy minions may share the same configuration file, this option permits the configuration of the multiprocessing option more specifically, for some proxy minions.

New in version 2017.7.2.

Proxy pillar file example:

```yaml
proxy:
    proxitype: napalm
    driver: junos
    host: core05.nrt02
    username: my_user
    passwd: my_password
    optional_args:
        port: 12201
```

Example using a user-specific library, extending NAPALM’s capabilities, e.g. custom_napalm_base:

```yaml
proxy:
    proxitype: napalm
    driver: ios
    fqdn: cr1.th2.par.as1234.net
    username: salt
```

(continues on next page)
password: ''
provider: custom_napalm_base

Note: Beginning with release codename 2019.2.0, any NAPALM command executed when running under a NAPALM Proxy Minion supports the `force_reconnect` magic argument.

Proxy Minions generally establish a connection with the remote network device at the time of the Minion startup and that connection is going to be used forever.

If one would need execute a command on the device but connecting using different parameters (due to various causes, e.g., unable to authenticate the user specified in the Pillar as the authentication system - say TACACS+ is not available, or the DNS resolver is currently down and would like to temporarily use the IP address instead, etc.), it implies updating the Pillar data and restarting the Proxy Minion process restart. In particular cases like that, you can pass the `force_reconnect=True` keyword argument, together with the alternative connection details, to enforce the command to be executed over a separate connection.

For example, if the usual command is `salt '*' net.arp`, you can use the following to connect using a different username instead: `salt '*' net.arp username=my-alt-usr force_reconnect=True`.

```
salt.proxy.napalm.alive(*opts)
    Return the connection status with the remote device.

New in version 2017.7.0.

salt.proxy.napalm.call(*method, **args, **kwargs)
    Calls a specific method from the network driver instance. Please check the readthedocs page for the updated list of getters.

Parameters
    - method – specifies the name of the method to be called
    - params – contains the mapping between the name and the values of the parameters needed to call the method

Returns A dictionary with three keys:
    - result (True/False): if the operation succeeded
    - out (object): returns the object as-is from the call
```
• comment (string): provides more details in case the call failed
• traceback (string): complete traceback in case of exception. Please submit an issue including this traceback on the correct driver repo and make sure to read the FAQ.

Example:

```python
__proxy__['napalm.call']('cli'  
  **{  
    'commands': [  
      'show version',  
      'show chassis fan'  
    ]  
  })
```

salt.proxy.napalm.fns()
Method called by NAPALM grains module.
salt.proxy.napalm.get_device()
Returns the network device object.
salt.proxy.napalm.get_grains()
Retrieve facts from the network device.
salt.proxy.napalm.grains_refresh()
Refresh the grains.
salt.proxy.napalm.init(opts)
Opens the connection with the network device.
salt.proxy.napalm.initialized()
Connection finished initializing?
salt.proxy.napalm.ping()
Connection open successfully?
salt.proxy.napalm.shutdown(opts)
Closes connection with the device.

21.13.11 salt.proxy.netmiko_px

Netmiko
New in version 2019.2.0.
Proxy module for managing network devices via Netmiko.

codeauthor Mircea Ulinic <ping@mirceaulinic.net> & Kirk Byers <ktyers@twb-tech.com>
maturity new
depends netmiko
platform unix

Dependencies

The netmiko proxy modules requires Netmiko to be installed: pip install netmiko.
The netmiko proxy configuration requires the following parameters in order to connect to the network device:

- **device_type** - Class selection based on device type. Supported options:
  - a10: A10 Networks
  - accedian: Accedian Networks
  - alcatel_aos: Alcatel AOS
  - alcatel_sros: Alcatel SROS
  - apresia_aeos: Apresia AEOS
  - arista_eos: Arista EOS
  - aruba_os: Aruba
  - avaya_ers: Avaya ERS
  - avaya_vsp: Avaya VSP
  - brocade_fastiron: Brocade Fastiron
  - brocade_netiron: Brocade Netiron
  - brocade_nos: Brocade NOS
  - brocade_vdx: Brocade NOS
  - brocade_vyos: VyOS
  - checkpoint_gaia: Check Point GAIA
  - calix_b6: Calix B6
  - ciena_saos: Ciena SAOS
  - cisco_asa: Cisco SA
  - cisco_ios: Cisco IOS
  - cisco_nxos: Cisco NX-os
  - cisco_s300: Cisco S300
  - cisco_tp: Cisco TpTcCe
  - cisco_wlc: Cisco WLC
  - cisco_xe: Cisco IOS
  - cisco_xr: Cisco XR
  - coriant: Coriant
  - dell_force10: Dell Force10
  - dell_os10: Dell OS10
  - dell_powerconnect: Dell PowerConnect
  - extelex: Eltex
  - enterasys: Enterasys
  - extreme: Extreme
  - extreme_wing: Extreme Wing
- f5_ltm: F5 LTM
- fortinet: Fortinet
- generic_termserver: TerminalServer
- hp_comware: HP Comware
- hp_procurve: HP Procurve
- huawei: Huawei
- huawei_vrpv8: Huawei VRPV8
- juniper: Juniper Junos
- juniper_junos: Juniper Junos
- linux: Linux
- mellanox: Mellanox
- mrv_optiswitch: MrvOptiswitch
- netapp_cdot: NetAppcDot
- netscaler: Netscaler
- ovs_linux: OvsLinux
- paloalto_panos: PaloAlto Panos
- pluribus: Pluribus
- quanta_mesh: Quanta Mesh
- ruckus_fastiron: Ruckus Fastiron
- ubiquiti_edge: Ubiquiti Edge
- ubiquiti_edgeswitch: Ubiquiti Edge
- vyatta_vyos: VyOS
- vyos: VyOS
- brocade_fastiron_telnet: Brocade Fastiron over Telnet
- brocade_netiron_telnet: Brocade Netiron over Telnet
- cisco_ios_telnet: Cisco IOS over Telnet
- apresia_aeos_telnet: Apresia AEOS over Telnet
- arista_eos_telnet: Arista EOS over Telnet
- hp_procurve_telnet: HP Procurve over Telnet
- hp_comware_telnet: HP Comware over Telnet
- juniper_junos_telnet: Juniper Junos over Telnet
- calix_b6_telnet: Calix B6 over Telnet
- dell_powerconnect_telnet: Dell PowerConnect over Telnet
- generic_termserver_telnet: TerminalServer over Telnet
- extreme_telnet: Extreme Networks over Telnet
- ruckus_fastiron_telnet: Ruckus Fastiron over Telnet
- `cisco_ios_serial`: Cisco IOS over serial port

- `ip` - IP address of target device (not required if `host` is provided)
- `host` - Hostname of target device (not required if `ip` is provided)
- `username` - Username to authenticate against target device, if required
- `password` - Password to authenticate against target device, if required
- `secret` - The enable password if target device requires one
- `port` - The destination port used to connect to the target device
- `global_delay_factor` - Multiplication factor affecting Netmiko delays (default: 1)
- `use_keys` - Connect to target device using SSH keys (default: `False`)
- `key_file` - Filename path of the SSH key file to use
- `allow_agent` - Enable use of SSH key-agent
- `ssh_strict` - Automatically reject unknown SSH host keys (default: `False`, which means unknown SSH host keys will be accepted)
- `system_host_keys` - Load host keys from the user’s "known_hosts" file (default: `False`)
- `alt_host_keys` - If `True`, host keys will be loaded from the file specified in `alt_key_file` (default: `False`)
- `alt_key_file` - SSH host key file to use (if `alt_host_keys=True`)
- `ssh_config_file` - File name of OpenSSH configuration file
- `timeout` - Connection timeout, in seconds (default: 90)
- `session_timeout` - Set a timeout for parallel requests, in seconds (default: 60)
- `keepalive` - Send SSH keepalive packets at a specific interval, in seconds. Currently defaults to 0, for backwards compatibility (it will not attempt to keep the connection alive using the KEEPALIVE packets).
- `default_enter` - Character(s) to send to correspond to enter key (default: `\n`)
- `response_return` - Character(s) to use in normalized return data to represent enter key (default: `\n`)
- `always_alive` - In certain less dynamic environments, maintaining the remote connection permanently open with the network device is not always beneficial. In that case, the user can select to initialize the connection only when needed, by setting this option to `False`. By default this option is set to `True` (maintains the connection with the remote network device)
- `multiprocessing` - Overrides the `multiprocessing` option, per proxy minion, as the Netmiko communication channel is mainly SSH (default: `False`)

### Proxy Pillar Example

```
proxy:
    proxytype: netmiko
    device_type: juniper_junos
    host: router1.example.com
    username: example
    password: example
```
proxy:
  proxytype: netmiko
  device_type: cisco_ios
  ip: 1.2.3.4
  username: test
  use_keys: true
  secret: w3@k

salt.proxy.netmiko_px.alive(opts)
    Return the connection status with the network device.
	salt.proxy.netmiko_px.args()
    Return the Netmiko device args.
	salt.proxy.netmiko_px.call(method, *args, **kwargs)
    Calls an arbitrary netmiko method.
	salt.proxy.netmiko_px.conn()
    Return the connection object.

salt.proxy.netmiko_px.init(opts)
    Open the connection to the network device managed through netmiko.

salt.proxy.netmiko_px.initialized()
    Connection finished initializing?

salt.proxy.netmiko_px.ping()
    Connection open successfully?

salt.proxy.netmiko_px.shutdown(opts)
    Closes connection with the device.

21.13.12 salt.proxy.nxos module

Proxy Minion for Cisco NX OS Switches

The Cisco NX OS Proxy Minion uses the built in SSHConnection module in salt.utils.vt_helper

To configure the proxy minion:

proxy:
  proxytype: nxos
  host: 192.168.187.100
  username: admin
  password: admin
  prompt_name: switch
  ssh_args: '-o PubkeyAuthentication=no'
  key_accept: True

proxytype (REQUIRED) Use this proxy minion nxos
host (REQUIRED) ip address or hostname to connect to
username (REQUIRED) username to login with
password (REQUIRED) password to use to login with
prompt_name (REQUIRED, this or prompt_regex below, but not both) The name in the prompt on the switch. Recommended to use your device's hostname.
prompt_regex  (REQUIRED, this or prompt_name above, but not both) A regular expression that matches the prompt on the switch and any other possible prompt at which you need the proxy minion to continue sending input. This feature was specifically developed for situations where the switch may ask for confirmation. prompt_name above would not match these, and so the session would timeout.

Example:

```
dc01-switch-01#.*|\(y|n\)\?.*
```

This should match

```
dc01-switch-01#
```

or

```
Flash complete. Reboot this switch (y/n)? [n]
```

If neither prompt_name nor prompt_regex is specified the prompt will be defaulted to

```
.+#$
```

which should match any number of characters followed by a # at the end of the line. This may be far too liberal for most installations.

**ssh_args**  Any extra args to use to connect to the switch.

**key_accept**  Whether or not to accept a the host key of the switch on initial login. Defaults to False.

The functions from the proxy minion can be run from the salt commandline using the `salt.modules.nxos` execution module.

**salt.proxy.nxos.add_config(lines)**

Add one or more config lines to the switch running config

```
salt '*' nxos.cmd add_config 'snmp-server community TESTSTRINGHERE group network-operator'
```

**Note:** For more than one config added per command, lines should be a list.

**salt.proxy.nxos.check_password(username, password, encrypted=False)**

Check if passed password is the one assigned to user

**salt.proxy.nxos.check_role(username, role)**

Check if user is assigned a specific role on switch

```
salt '*' nxos.cmd check_role username=admin role=network-admin
```

**salt.proxy.nxos.delete_config(lines)**

Delete one or more config lines to the switch running config

```
salt '*' nxos.cmd delete_config 'snmp-server community TESTSTRINGHERE group
<network-operator>'
```

**Note:** For more than one config deleted per command, lines should be a list.
salt.proxy.nxos.find(pattern)
Find all instances where the pattern is in the running command

```
salt '*' nxos.cmd find '^snmp-server.*$'
```

**Note:** This uses the `re.MULTILINE` regex format for python, and runs the regex against the whole show_run output.

salt.proxy.nxos.get_roles(username)
Get roles that the username is assigned from switch

salt.proxy.nxos.get_user(username)
Get username line from switch

salt.proxy.nxos.grains()
Get grains for proxy minion

salt.proxy.nxos.grains_refresh()
Refresh the grains from the proxy device.

salt.proxy.nxos.init(opts=None)
Required. Can be used to initialize the server connection.

salt.proxy.nxos.initialized()

salt.proxy.nxos.ping()
Ping the device on the other end of the connection

salt.proxy.nxos.remove_user(username)
Remove user from switch

```
salt '*' nxos.cmd remove_user username=daniel
```

salt.proxy.nxos.replace(old_value, new_value, full_match=False)
Replace string or full line matches in switch’s running config

If full_match is set to True, then the whole line will need to be matched as part of the old value.

```
salt '*' nxos.cmd replace 'TESTSTRINGHERE' 'NEWTESTSTRINGHERE'
```

salt.proxy.nxos.sendline(command)
Run command through switch’s cli

salt.proxy.nxos.set_password(username, password, encrypted=False, role=None, crypt_salt=None, algorithm='sha256')
Set users password on switch

```
salt '*' nxos.cmd set_password admin TestPass
salt '*' nxos.cmd set_password admin \password='55$2Fw02vK$s7.Hr3YltMNHuhywQQ3nf0d.gAPHgs3SOBYYdGT3E.A' \encrypted=True
```

salt.proxy.nxos.set_role(username, role)
Assign role to username

```
salt '*' nxos.cmd set_role username=daniel role=vdc-admin
```

salt.proxy.nxos.show_run()
Shortcut to run show run on switch
salt '*(nxos.cmd show_run

salt.proxy.nxos.show_ver() 
Shortcut to run show ver on switch

salt '*(nxos.cmd show_ver

salt.proxy.nxos.shutdown(opts)
Disconnect

salt.proxy.nxos.system_info() 
Return system information for grains of the NX OS proxy minion

salt '*(nxos.system_info

salt.proxy.nxos.unset_role(username, role)
Remove role from username

salt '*(nxos.cmd unset_role username=daniel role=vdc-admin

21.13.13 salt.proxy.nxos_api module
Proxy Minion to manage Cisco Nexus Switches (NX-OS) over the NX-API
New in version 2019.2.0.
Proxy module for managing Cisco Nexus switches via the NX-API.

codeauthor  Mircea Ulinic <ping@mirceaulinic.net>
maturity  new
platform  any

Usage

Note: To be able to use this module you need to enable to NX-API on your switch, by executing feature nxapi in configuration mode.

Configuration example:

switch# conf t
switch(config)# feature nxapi

To check that NX-API is properly enabled, execute show nxapi.

Output example:

switch# show nxapi
nxapi enabled
HTTPS Listen on port 443

Note: NX-API requires modern NXOS distributions, typically at least 7.0 depending on the hardware. Due to reliability reasons it is recommended to run the most recent version.
Pillar

The `nxos_api` proxy configuration requires the following parameters in order to connect to the network switch:

- **transport**: `https` Specifies the type of connection transport to use. Valid values for the connection are `http`, and `https`.
- **host**: `localhost` The IP address or DNS host name of the connection device.
- **username**: `admin` The username to pass to the device to authenticate the NX-API connection.
- **password** The password to pass to the device to authenticate the NX-API connection.
- **port** The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for `http`, or 443 for `https`).
- **timeout**: `60` Time in seconds to wait for the device to respond. Default: 60 seconds.
- **verify**: `True` Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to `True`.

When there is no certificate configuration on the device and this option is set as `True` (default), the commands will fail with the following error: `SSLError: [SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed (_ssl.c:581)`. In this case, you either need to configure a proper certificate on the device (recommended), or bypass the checks setting this argument as `False` with all the security risks considered.

All the arguments may be optional, depending on your setup.

**Proxy Pillar Example**

```yaml
proxy:
  proxytype: nxos_api
  host: switch1.example.com
  username: example
  password: example

salt.proxy.nxos_api.get_conn_args()
  Returns the connection arguments of the Proxy Minion.

salt.proxy.nxos_api.init(opts)
  Open the connection to the Nexus switch over the NX-API.

  As the communication is HTTP based, there is no connection to maintain, however, in order to test the connectivity and make sure we are able to bring up this Minion, we are executing a very simple command (`show clock`) which doesn’t come with much overhead and it’s sufficient to confirm we are indeed able to connect to the NX-API endpoint as configured.

salt.proxy.nxos_api.initialized()
  Connection finished initializing?
```
salt.proxy.nxos_api.ping()
    Connection open successfully?

salt.proxy.nxos_api.rpc(commands, method='cli', **kwargs)
    Executes an RPC request over the NX-API.

salt.proxy.nxos_api.shutdown(opts)
    Closes connection with the device.

## 21.13.14 salt.proxy.panos module

Proxy Minion interface module for managing Palo Alto firewall devices

New in version 2018.3.0.

  codeauthor Spencer Ervin <spencer_ervin@hotmail.com>

  maturity new

  depends none

  platform unix

This proxy minion enables Palo Alto firewalls (hereafter referred to as simply 'panos') to be treated individually like a Salt Minion.

The panos proxy leverages the XML API functionality on the Palo Alto firewall. The Salt proxy must have access to the Palo Alto firewall on HTTPS (tcp/443).

More in-depth conceptual reading on Proxy Minions can be found in the Proxy Minion section of Salt’s documentation.

### Configuration

To use this integration proxy module, please configure the following:

### Pillar

Proxy minions get their configuration from Salt’s Pillar. Every proxy must have a stanza in Pillar and a reference in the Pillar top-file that matches the ID. There are four connection options available for the panos proxy module.

- Direct Device (Password)
- Direct Device (API Key)
- Panorama Pass-Through (Password)
- Panorama Pass-Through (API Key)

### Direct Device (Password)

The direct device configuration configures the proxy to connect directly to the device with username and password.
proxy:
  proxytype: panos
  host: <ip or dns name of panos host>
  username: <panos username>
  password: <panos password>

The `proxytype` key and value pair is critical, as it tells Salt which interface to load from the `proxy` directory in Salt’s install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this panos Proxy Module, set this to `panos`.

host
The location, or ip/dns, of the panos host. Required.

username
The username used to login to the panos host. Required.

password
The password used to login to the panos host. Required.

Direct Device (API Key)
Palo Alto devices allow for access to the XML API with a generated 'API key' instead of username and password.

proxy:
  proxytype: panos
  host: <ip or dns name of panos host>
  apikey: <panos generated api key>

The `proxytype` key and value pair is critical, as it tells Salt which interface to load from the `proxy` directory in Salt’s install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this panos Proxy Module, set this to `panos`.

host
The location, or ip/dns, of the panos host. Required.

apikey
The generated XML API key for the panos host. Required.
Panorama Pass-Through (Password)

The Panorama pass-through method sends all connections through the Panorama management system. It passes the connections to the appropriate device using the serial number of the Palo Alto firewall.

This option will reduce the number of connections that must be present for the proxy server. It will only require a connection to the Panorama server.

The username and password will be for authentication to the Panorama server, not the panos device.

```yaml
proxy:
  proxytype: panos
  serial: <serial number of panos host>
  host: <ip or dns name of the panorama server>
  username: <panorama server username>
  password: <panorama server password>
```

**proxytype**

The `proxytype` key and value pair is critical, as it tells Salt which interface to load from the `proxy` directory in Salt’s install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this panos Proxy Module, set this to `panos`.

**serial**

The serial number of the panos host. Required.

**host**

The location, or ip/dns, of the Panorama server. Required.

**username**

The username used to login to the Panorama server. Required.

**password**

The password used to login to the Panorama server. Required.

Panorama Pass-Through (API Key)

The Panorama server can also utilize a generated ’API key’ for authentication.

```yaml
proxy:
  proxytype: panos
  serial: <serial number of panos host>
  host: <ip or dns name of the panorama server>
  apikey: <panos generated api key>
```

21.13. proxy modules
proxytype

The `proxytype` key and value pair is critical, as it tells Salt which interface to load from the `proxy` directory in Salt’s install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this panos Proxy Module, set this to `panos`.

serial

The serial number of the panos host. Required.

host

The location, or ip/dns, of the Panorama server. Required.

apikey

The generated XML API key for the Panorama server. Required.

`salt.proxy.panos.call(payload=None)`

This function captures the query string and sends it to the Palo Alto device.

`salt.proxy.panos.grains()`

Get the grains from the proxied device

`salt.proxy.panos.grains_refresh()`

Refresh the grains from the proxied device

`salt.proxy.panos.init(opts)`

This function gets called when the proxy starts up. For panos devices, a determination is made on the connection type and the appropriate connection details that must be cached.

`salt.proxy.panos.initialized()`

Since grains are loaded in many different places and some of those places occur before the proxy can be initialized, return whether our init() function has been called

`salt.proxy.panos.is_required_version(required_version='0.0.0')`

Because different versions of Palo Alto support different command sets, this function will return true if the current version of Palo Alto supports the required command.

`salt.proxy.panos.ping()`

Returns true if the device is reachable, else false.

`salt.proxy.panos.shutdown()`

Shutdown the connection to the proxy device. For this proxy, shutdown is a no-op.

21.13.15 salt.proxy.philips_hue module

Philips HUE lamps module for proxy.

New in version 2015.8.3.

First create a new user on the Hue bridge by following the Meet hue instructions.

To configure the proxy minion:
proxy:
proxytype: philips_hue
host: [hostname or ip]
user: [username]

class salt.proxy.philips_hue.Const
    Constants for the lamp operations.
    COLOR_BLUE = {'hue': 46920, 'sat': 254}
    COLOR_DAYLIGHT = {'xy': [0.3806, 0.3576]}
    COLOR_GREEN = {'hue': 25500, 'sat': 254}
    COLOR_ORANGE = {'hue': 12000, 'sat': 254}
    COLOR_PINK = {'xy': [0.3688, 0.2095]}
    COLOR_PURPLE = {'xy': [0.3787, 0.1724]}
    COLOR_RED = {'hue': 0, 'sat': 254}
    COLOR_WHITE = {'xy': [0.3227, 0.329]}
    COLOR_YELLOW = {'xy': [0.4432, 0.5154]}
    LAMP_OFF = {'on': False, 'transitiontime': 0}
    LAMP_ON = {'on': True, 'transitiontime': 0}

salt.proxy.philips_hue.call_alert(*args, **kwargs)
    Lamp alert
    Options:
    • id: Specifies a device ID. Can be a comma-separated values. All, if omitted.
    • on: Turns on or off an alert. Default is True.
    CLI Example:
    ```
salt '*' hue.alert
    salt '*' hue.alert id=1
    salt '*' hue.alert id=1,2,3 on=false
    ```

salt.proxy.philips_hue.call_blink(*args, **kwargs)
    Blink a lamp. If lamp is ON, then blink ON-OFF-ON, otherwise OFF-ON-OFF.
    Options:
    • id: Specifies a device ID. Can be a comma-separated values. All, if omitted.
    • pause: Time in seconds. Can be less than 1, i.e. 0.7, 0.5 sec.
    CLI Example:
    ```
salt '*' hue.blink id=1
    salt '*' hue.blink id=1,2,3
    ```

salt.proxy.philips_hue.call_brightness(*args, **kwargs)
    Set an effect to the lamp.
    Arguments:
    • value: 0~255 brightness of the lamp.
    Options:
    • id: Specifies a device ID. Can be a comma-separated values. All, if omitted.
    • transition: Transition 0~200. Default 0.
    CLI Example:
salt.proxy.philips_hue.call_color("args, **kwargs)
Set a color to the lamp.

Options:
- **id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.
- **color**: Fixed color. Values are: red, green, blue, orange, pink, white, yellow, daylight, purple. Default white.
- **transition**: Transition 0~200.

Advanced:
- **gamut**: XY coordinates. Use gamut according to the Philips HUE devices documentation. More:
  http://www.developers.meethue.com/documentation/hue-xy-values

CLI Example:

```
salt '*' hue.color
salt '*' hue.color id=1
salt '*' hue.color id=1,2,3 color=red transition=30
salt '*' hue.color id=1 gamut=0.3,0.5
```

salt.proxy.philips_hue.call_effect("args, **kwargs)
Set an effect to the lamp.

Options:
- **id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.
- **type**: Type of the effect. Possible values are "none" or "colorloop". Default "none".

CLI Example:

```
salt '*' hue.effect
salt '*' hue.effect id=1
salt '*' hue.effect id=1,2,3 type=colorloop
```

salt.proxy.philips_hue.call_lights("args, **kwargs)
Get info about all available lamps.

Options:
- **id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.

CLI Example:

```
salt '*' hue.lights
salt '*' hue.lights id=1
salt '*' hue.lights id=1,2,3
```

salt.proxy.philips_hue.call_ping("args, **kwargs)
Ping the lamps by issuing a short inversion blink to all available devices.

CLI Example:

```
salt '*' hue.ping
```

salt.proxy.philips_hue.call_rename("args, **kwargs)
Rename a device.

Options:
- **id**: Specifies a device ID. Only one device at a time.
- **title**: Title of the device.
CLI Example:

```bash
salt '* hue.rename id=1 title='WC for cats'
```

```
salt.proxy.philips_hue.call_status(*args, **kwargs)
Return the status of the lamps.
``` Options:
- **id**: Specifies a device ID. Can be a comma-separated values. All, if omitted. CLI Example:

```bash
salt '* hue.status
salt '* hue.status id=1
salt '* hue.status id=1,2,3
```

```
salt.proxy.philips_hue.call_switch(*args, **kwargs)
Switch lamp ON/OFF.
If no particular state is passed, then lamp will be switched to the opposite state.
``` Options:
- **id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.
- **on**: True or False. Inverted current, if omitted
CLI Example:

```bash
salt '* hue.switch
salt '* hue.switch id=1
salt '* hue.switch id=1,2,3 on=True
```

```
salt.proxy.philips_hue.call_temperature(*args, **kwargs)
Set the mired color temperature. More: http://en.wikipedia.org/wiki/Mired
``` Arguments:
- **value**: 150~500.
Options:
- **id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.
CLI Example:

```bash
salt '* hue.temperature value=150
salt '* hue.temperature value=150 id=1
salt '* hue.temperature value=150 id=1,2,3
```

```
salt.proxy.philips_hue.init(cnf)
Initialize the module.
```

```
salt.proxy.philips_hue.ping(*args, **kw)
Ping the lamps.
```

```
salt.proxy.philips_hue.shutdown(opts, *args, **kw)
Shuts down the service.
```

### 21.13.16 salt.proxy.rest_sample

This is a simple proxy-minion designed to connect to and communicate with the bottle-based web service contained in https://github.com/saltstack/salt-contrib/tree/master/proxyminion_rest_example

```
salt.proxy.rest_sample.alive(opts)
salt.proxy.rest_sample.fix_outage()
```

21.13. proxy modules
salt.proxy.rest_sample.fns()

salt.proxy.rest_sample.grains()
    Get the grains from the proxied device

salt.proxy.rest_sample.grains_refresh()
    Refresh the grains from the proxied device

salt.proxy.rest_sample.id(opts)
    Return a unique ID for this proxy minion. This ID MUST NOT CHANGE. If it changes while the proxy is running the salt-master will get really confused and may stop talking to this minion

salt.proxy.rest_sample.init(opts)

salt.proxy.rest_sample.initialized()
    Since grains are loaded in many different places and some of those places occur before the proxy can be initialized, return whether our init() function has been called

salt.proxy.rest_sample.package_install(name, **kwargs)
    Install a "package" on the REST server

salt.proxy.rest_sample.package_list()
    List "packages" installed on the REST server

salt.proxy.rest_sample.package_remove(name)
    Remove a "package" on the REST server

salt.proxy.rest_sample.package_status(name)
    Check the installation status of a package on the REST server

salt.proxy.rest_sample.ping()
    Is the REST server up?

salt.proxy.rest_sample.service_list()
    List "services" on the REST server

salt.proxy.rest_sample.service_restart(name)
    Restart a "service" on the REST server

salt.proxy.rest_sample.service_start(name)
    Start a "service" on the REST server

salt.proxy.rest_sample.service_status(name)
    Check if a service is running on the REST server

salt.proxy.rest_sample.service_stop(name)
    Stop a "service" on the REST server

salt.proxy.rest_sample.shutdown(opts)
    For this proxy shutdown is a no-op

salt.proxy.rest_sample.test_from_state()
    Test function so we have something to call from a state :return:

salt.proxy.rest_sample.uptodate(name)
    Call the REST endpoint to see if the packages on the "server" are up to date.

21.13.17 salt.proxy.ssh_sample

This is a simple proxy-minion designed to connect to and communicate with a server that exposes functionality via SSH. This can be used as an option when the device does not provide an api over HTTP and doesn't have the python stack to run a minion.
salt.proxy.ssh_sample.fns()

salt.proxy.ssh_sample.grains()
  Get the grains from the proxied device

salt.proxy.ssh_sample.grains_refresh()
  Refresh the grains from the proxied device

salt.proxy.ssh_sample.init(opts)
  Required. Can be used to initialize the server connection.

salt.proxy.ssh_sample.initialized()
  Since grains are loaded in many different places and some of those places occur before the proxy can be
  initialized, return whether our init() function has been called

salt.proxy.ssh_sample.package_install(name, **kwargs)
  Install a "package" on the ssh server

salt.proxy.ssh_sample.package_list()
  List "packages" by executing a command via ssh This function is called in response to the salt command
  ..code-block::bash
     salt target_minion pkg.list_pkgs

salt.proxy.ssh_sample.package_remove(name)
  Remove a "package" on the ssh server

salt.proxy.ssh_sample.parse(out)
  Extract json from out.
  Parameter out: Type string. The data returned by the ssh command.

salt.proxy.ssh_sample.ping()
  Required. Ping the device on the other end of the connection

salt.proxy.ssh_sample.service_list()
  Start a "service" on the ssh server
  New in version 2015.8.2.

salt.proxy.ssh_sample.service_restart(name)
  Restart a "service" on the ssh server
  New in version 2015.8.2.

salt.proxy.ssh_sample.service_start(name)
  Start a "service" on the ssh server
  New in version 2015.8.2.

salt.proxy.ssh_sample.service_stop(name)
  Stop a "service" on the ssh server
  New in version 2015.8.2.

salt.proxy.ssh_sample.shutdown(opts)
  Disconnect

21.14 queue modules

---

pgjsonb_queue

New in version 2016.3.0.
Table 14 – continued from previous page

SQLite Queue

New in version 2014.7.0.

21.14.1 salt.queues.pgjsonb_queue module

New in version 2016.3.0.

This is a queue with postgres as the backend. It uses the jsonb store to store information for queues.

   depends python-psycopg2

To enable this queue, the following needs to be configured in your master config. These are the defaults:

```
queue.pgjson.host: 'salt'
queue.pgjson.user: 'salt'
queue.pgjson.pass: 'salt'
queue.pgjson.db: 'salt'
queue.pgjson.port: 5432
```

Use the following Pg database schema:

```
CREATE DATABASE salt WITH ENCODING 'utf-8';

-- Table structure for table `salt`

DROP TABLE IF EXISTS salt;
CREATE OR REPLACE TABLE salt(
    id SERIAL PRIMARY KEY,
    data jsonb NOT NULL
);
```

```
salt-run queue.insert test '{"name": "redis", "host": "172.16.0.8", "port": 6379}''
...backend=pgjsonb
salt-run queue.process_queue test all backend=pgjsonb
```

```
salt.queues.pgjsonb_queue.delete(queue, items)
    Delete an item or items from a queue

salt.queues.pgjsonb_queue.handle_queue_creation(queue)

salt.queues.pgjsonb_queue.insert(queue, items)
    Add an item or items to a queue

salt.queues.pgjsonb_queue.list_items(queue)
    List contents of a queue

salt.queues.pgjsonb_queue.list_length(queue)
    Provide the number of items in a queue

salt.queues.pgjsonb_queue.list_queues()
    Return a list of Salt Queues on the Salt Master

salt.queues.pgjsonb_queue.pop(queue, quantity=1, is_runner=False)
    Pop one or more or all items from the queue return them.
```
21.14.2 salt.queues.sqlite_queue module

New in version 2014.7.0.

This is the default local master event queue built on sqlite. By default, an sqlite3 database file is created in the 
\texttt{sqlite_queue_dir} which is found at:

\begin{verbatim}
/var/cache/salt/master/queues
\end{verbatim}

It's possible to store the sqlite3 database files by setting \texttt{sqlite_queue_dir} to another location:

\begin{verbatim}
sqlite_queue_dir: /home/myuser/salt/master/queues
\end{verbatim}

\begin{verbatim}
salt.queues.sqlite_queue.delete(queue, items)
  Delete an item or items from a queue

salt.queues.sqlite_queue.insert(queue, items)
  Add an item or items to a queue

salt.queues.sqlite_queue.list_items(queue)
  List contents of a queue

salt.queues.sqlite_queue.list_length(queue)
  Provide the number of items in a queue

salt.queues.sqlite_queue.list_queues()
  Return a list of Salt Queues on the Salt Master

salt.queues.sqlite_queue.pop(queue, quantity=1, is_runner=False)
  Pop one or more or all items from the queue return them.
\end{verbatim}

21.15 roster modules

\begin{tabular}{ll}
\textbf{ansible} & Read in an Ansible inventory file or script \\
\textbf{cache} & The \texttt{cache} roster provides a flexible interface to the 
Salt Masters' minion cache to access regular minions 
over \texttt{salt-ssh}. \\
\textbf{cloud} & Use the cloud cache on the master to derive IPv4 ad-
dresses based on minion ID. \\
\textbf{clustershell} & This roster resolves hostname in a pdsh/clustershell 
style. \\
\textbf{flat} & Read in the roster from a flat file using the renderer 
system \\
\textbf{range} & This roster resolves targets from a range server. \\
\textbf{scan} & Scan a netmask or ipaddr for open ssh ports \\
\textbf{sshconfig} & Parses roster entries out of Host directives from SSH 
config \\
\textbf{terraform} & Dynamic roster from terraform current state
\end{tabular}

21.15.1 salt.roster.ansible

Read in an Ansible inventory file or script

Flat inventory files should be in the regular ansible inventory format.
then salt-ssh can be used to hit any of them

```bash
[-# salt-ssh -N all test.ping
salt.gtmanfred.com: True
home: True
[-# salt-ssh -N desktop test.ping
home: True
[-# salt-ssh -N computers test.ping
salt.gtmanfred.com: True
home: True
[-# salt-ssh salt.gtmanfred.com test.ping
salt.gtmanfred.com: True
```

There is also the option of specifying a dynamic inventory, and generating it on the fly

```bash
#!/bin/bash
echo '{
    "servers": [
        "salt.gtmanfred.com"
    ],
    "desktop": [
        "home"
    ],
    "computers": {
        "hosts": [],
        "children": [
            "desktop",
            "servers"
        ]
    },
    "_meta": {
        "hostvars": {
            "salt.gtmanfred.com": {
                "ansible_ssh_user": "gtmanfred",
                "ansible_ssh_host": "127.0.0.1",
                "ansible_ssh_pass": "password"
            }
        }
    }
}'
```

(continues on next page)
This is the format that an inventory script needs to output to work with ansible, and thus here.

```
[~]# salt-ssh --roster-file /etc/salt/hosts salt.gtmanfred.com test.ping
salt.gtmanfred.com: True
```

Any of the [groups] or direct hostnames will return. The ‘all’ is special, and returns everything.

```
salt.roster.ansible.targets(tgt, tgt_type='glob', **kwargs)
Return the targets from the ansible inventory_file Default: /etc/salt/roster
```

### 21.15.2 salt.roster.cache

The cache roster provides a flexible interface to the Salt Masters’ minion cache to access regular minions over `salt-ssh`.

New in version 2017.7.0: grains, pillar, mine data matching SDB URLs IPv6 support roster_order per config key default order changed to industry-wide best practices CIDR range selection

#### Targeting

This roster supports all matching and targeting of the Salt Master. The matching will be done using only the Salt Master’s cache.

#### The Roster Order

The roster’s composition can be configured using `roster_order`. In the `roster_order` you can define any roster key and fill it with a parameter overriding the one in `roster_defaults`:

- `roster_order:
  
  host: id  # use the minion id as hostname

You can define lists of parameters as well, the first result from the list will become the value.

#### Selecting a host

```
# default
roster_order:
  host:
```

(continues on next page)
This is the default `roster_order`. It prefers IPv6 over IPv4 addresses and private addresses over public ones. The relevant data will be fetched from the cache in-order, and the first match will fill the host key.

Other address selection parameters are also possible:

```
roster_order:
  host:
    - global|public|private|local   # Both IPv6 and IPv4 addresses in that range
    - 2000::/3                         # CIDR networks, both IPv4 and IPv6 are supported
```

### Using cached data

Several cached libraries can be selected using the `library:` ```` prefix, followed by the library key. This can be referenced using the same ```` syntax as e.g. `pillar.get`. Lists of references are also supported during the lookup, as are Salt SDB URLs.

This should be especially useful for the other roster keys:

```
roster_order:
  host:
    - grain: fqdn_ip4     # Lookup this grain
    - mine: network.ip_addrs  # Mine data lookup works the same
  password: sdb://vault/ssh_pass     # Salt SDB URLs are also supported
  user:
    - pillar: ssh:auth:user    # Lookup this pillar key
    - sdb://osenv/USER          # Lookup this env var through sdb
  priv:
    - pillar:                 # Lists are also supported
      - salt:ssh:private_key
      - ssh:auth:private_key
```

`salt.roster.cache.targets(tgt, tgt_type='glob', **kwargs)`

Return the targets from the Salt Masters’ minion cache. All targets and matchers are supported.

The resulting roster can be configured using `roster_order` and `roster_default`.

### 21.15.3 `salt.roster.cloud`

Use the cloud cache on the master to derive IPv4 addresses based on minion ID.

This roster requires that the minion in question was created using at least the 2015.5.0 version of Salt Cloud. Starting with the 2015.5.0 release, Salt Cloud maintains an index of minions that it creates and deletes. This index tracks the provider and profile configuration used to provision the minion, including authentication information. So long as this configuration remains current, it can be used by Salt SSH to log into any minion in the index.
To connect as a user other than root, modify the cloud configuration file usually located at /etc/salt/cloud. For example, add the following:

```yaml
ssh_username: my_user
sudo: True
```

salt.roster.cloud.extract_ipv4(roster_order, ipv4)
Extract the preferred IP address from the ipv4 grain

salt.roster.cloud.targets(tgt, tgt_type='glob', **kwargs)
Return the targets from the flat yaml file, checks opts for location but defaults to /etc/salt/roster

### 21.15.4 salt.roster.clustershell

This roster resolves hostname in a pdsh/clustershell style.

```bash
depends clustershell, https://github.com/cea-hpc/clustershell
```

When you want to use host globs for target matching, use `--roster clustershell`. For example:

```bash
salt-ssh --roster clustershell 'server_[1-10,21-30],test_server[5,7,9]' test.ping
```

salt.roster.clustershell.targets(tgt, tgt_type='glob', **kwargs)
Return the targets

### 21.15.5 salt.roster.flat

Read in the roster from a flat file using the renderer system

salt.roster.flat.targets(tgt, tgt_type='glob', **kwargs)
Return the targets from the flat yaml file, checks opts for location but defaults to /etc/salt/roster

### 21.15.6 salt.roster.range module

This roster resolves targets from a range server.

```bash
depends seco.range, https://github.com/ytoolshed/range
```

When you want to use a range query for target matching, use `--roster range`. For example:

```bash
salt-ssh --roster range '%%%example.range.cluster' test.ping
```

salt.roster.range.target_glob(tgt, hosts)
salt.roster.range.target_range(tgt, hosts)
salt.roster.range.targets(tgt, tgt_type='range', **kwargs)
Return the targets from a range query

### 21.15.7 salt.roster.scan

Scan a netmask or ipaddr for open ssh ports

```bash
class salt.roster.scan.RosterMatcher(tgt, tgt_type)
Matcher for the roster data structure
```
targets()
    Return ip addr based on netmask, sitting in the "glob" spot because it is the default

salt.roster.scan.targets(tgt, tgt_type='glob', **kwargs)
    Return the targets from the flat yaml file, checks opts for location but defaults to /etc/salt/roster

21.15.8 salt.roster.sshconfig

Parses roster entries out of Host directives from SSH config

```bash
salt-ssh --roster sshconfig '*' -r "echo hi"
```

class salt.roster.sshconfig.RosterMatcher(raw, tgt, tgt_type)
    Matcher for the roster data structure

    get_data(minion)
        Return the configured ip

    ret_glob_minions()
        Return minions that match via glob

    targets()
        Execute the correct tgt_type routine and return

salt.roster.sshconfig.parse_ssh_config(lines)
    Parses lines from the SSH config to create roster targets.
    Parameters lines – Individual lines from the ssh config file
    Returns Dictionary of targets in similar style to the flat roster

salt.roster.sshconfig.targets(tgt, tgt_type='glob', **kwargs)
    Return the targets from the flat yaml file, checks opts for location but defaults to /etc/salt/roster

21.15.9 salt.roster.terraform

Dynamic roster from terraform current state

This roster module allows you dynamically generate the roster from the terraform resources defined with the Terraform Salt provider.

It exposes all salt_host resources with the same attributes to the salt-ssh roster, making it completely independent of the type of terraform resource, and providing the integration using terraform constructs with interpolation.

Basic Example

Given a simple salt-ssh tree with a Saltfile:

```
salt-ssh:
    config_dir: etc/salt
    max_procs: 30
    wipe_ssh: True
```

and etc/salt/master:
In the same folder as your Saltfile, create a Terraform file with resources like cloud instances, virtual machines, etc. For every single one of those that you want to manage with Salt, create a `salt_host` resource:

```salt
resource "salt_host" "dbminion" {
  salt_id = "dbserver"
  host = "${libvirt_domain.vm-db.network_interface.0.addresses.0}"
  user = "root"
  passwd = "linux"
}
```

You can use the count attribute to create multiple roster entries with a single definition. Please refer to the Terraform Salt provider for more detailed examples.

```
salt.roster.terraform.targets(tgt, tgt_type='glob', **kwargs)
```

Returns the roster from the Terraform state file, checks opts for location, but defaults to terraform.tfstate.

## 21.16 runner modules

<table>
<thead>
<tr>
<th>runner module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>asam</strong></td>
<td>Novell ASAM Runner</td>

21.16.1 salt.runners.asam

Novell ASAM Runner

New in version Beryllium.

Runner to interact with Novell ASAM Fan-Out Driver

codeauthor  Nitin Madhok <nmadhok@clemson.edu>

To use this runner, set up the Novell Fan-Out Driver URL, username and password in the master configuration at /etc/salt/master or /etc/salt/master.d/asam.conf:
Note: Optionally, protocol and port can be specified if the Fan-Out Driver server is not using the defaults. Default is protocol: https and port: 3451.

salt.runners.asam.add_platform(name, platform_set, server_url)
To add an ASAM platform using the specified ASAM platform set on the Novell Fan-Out Driver

CLI Example:
salt-run asam.add_platform my-test-vm test-platform-set prov1.domain.com

salt.runners.asam.list_platform_sets(server_url)
To list all ASAM platform sets present on the Novell Fan-Out Driver

CLI Example:
salt-run asam.list_platform_sets prov1.domain.com

salt.runners.asam.list_platforms(server_url)
To list all ASAM platforms present on the Novell Fan-Out Driver

CLI Example:
salt-run asam.list_platforms prov1.domain.com

salt.runners.asam.remove_platform(name, server_url)
To remove specified ASAM platform from the Novell Fan-Out Driver

CLI Example:
salt-run asam.remove_platform my-test-vm prov1.domain.com

21.16.2 salt.runners.auth

Authentication runner for creating, deleting, and managing eauth tokens.

New in version 2016.11.0.

salt.runners.auth.del_token(token)
Delete an eauth token by name

CLI Example:
salt-run auth.del_token 6556760736e4077daa601baec2b67c24

salt.runners.auth.mk_token(**load)
Create an eauth token using provided credentials
Non-root users may specify an expiration date – if allowed via the `token_expire_user_override` setting – by passing an additional `token_expire` param. This overrides the `token_expire` setting of the same name in the Master config and is how long a token should live in seconds.

CLI Example:

```
salt-run auth.mk_token username=saltdev password=saltdev eauth=auto

# Create a token valid for three years.
salt-run auth.mk_token username=saltdev password=saltdev eauth=auto \
    token_expire=94670856

# Calculate the number of seconds using expr.
salt-run auth.mk_token username=saltdev password=saltdev eauth=auto \
    token_expire=$(expr \( 365 \* 24 \* 60 \* 60 \)) \* 3
```

### 21.16.3 salt.runners.bgp

**BGP Finder**

New in version 2017.7.0.

Runner to search BGP neighbors details.

**Configuration**

- **Minion (proxy) config**
  
  The `bgp.neighbors` function must be appended in the list of `mine_functions`:

  ```
  mine_functions:
  bgp.neighbors: []
  ```

  Which instructs Salt to cache the data returned by the `neighbors` function from the `NAPALM BGP module`.

  How often the mines are refreshed, can be specified using:

  ```
  mine_interval: <X minutes>
  ```

- **Master config**

  By default the following options can be configured on the master. They are not mandatory, but available in case the user has different requirements.

  tgt: * From what minions will collect the mine data. Default: * (collect mine data from all minions)

  return_fields What fields to return in the output. It can display all the fields from the `neighbors` function from the `NAPALM BGP module`.

  Some fields cannot be removed:

  - as_number: the AS number of the neighbor
  - device: the minion ID
- neighbor_address: the neighbor remote IP address

By default, the following extra fields are returned (displayed):
- connection_stats: connection stats, as described below
- import_policy: the name of the import policy
- export_policy: the name of the export policy

Special fields:
- vrf: return the name of the VRF.
- connection_stats: returning an output of the form <State> <Active>/
  <Received>/<Accepted>/<Damped>, e.g. Established 398/399/399/0 similar to the usual output from network devices.
- interface_description: matches the neighbor details with the corresponding interface and returns its description. This will reuse functionality from the net runner, so the user needs to enable the mines as specified in the documentation.
- interface_name: matches the neighbor details with the corresponding interface and returns the name. Similar to interface_description, this will reuse functionality from the net runner, so the user needs to enable the mines as specified in the documentation.

display: True Display on the screen or return structured object? Default: True (return on the CLI).

outputter: table Specify the outputter name when displaying on the CLI. Default: table.

Configuration example:

```python
classifiers =

salt.runners.bgp.neighbors(*asns, **kwargs)
Search for BGP neighbors details in the mines of the bgp.neighbors function.
Arguments:
asns A list of AS numbers to search for. The runner will return only the neighbors of these AS numbers.
device Filter by device name (minion ID).
ip Search BGP neighbor using the IP address. In multi-VRF environments, the same IP address could be used
  by more than one neighbors, in different routing tables.
network Search neighbors within a certain IP network.
title Custom title.
display: True Display on the screen or return structured object? Default: True (return on the CLI).
outputter: table Specify the outputter name when displaying on the CLI. Default: table.
In addition, any field from the output of the neighbors function from the NAPALM BGP module can be used as a filter.
**CLI Example:**

```
salt-run bgp.neighbors 13335 15169  
salt-run bgp.neighbors 13335 ip=172.17.19.1  
salt-run bgp.neighbors multipath=True  
salt-run bgp.neighbors up=False  export_policy=my-export-policy  multihop=False  
salt-run bgp.neighbors network=192.168.0.0/16
```

**Output example:**

```
<table>
<thead>
<tr>
<th>Device</th>
<th>AS Number</th>
<th>Neighbor Address</th>
<th>State/Active/Established</th>
<th>0/398/398/0</th>
<th>import-policy</th>
<th>export-policy</th>
</tr>
</thead>
<tbody>
<tr>
<td>edge01.bjm01</td>
<td>13335</td>
<td>172.17.109.11</td>
<td>Established</td>
<td>0/398/398/0</td>
<td>import-policy</td>
<td>export-policy</td>
</tr>
<tr>
<td>edge01.flw01</td>
<td>13335</td>
<td>192.168.172.11</td>
<td>Established</td>
<td>1/398/398/0</td>
<td>import-policy</td>
<td>export-policy</td>
</tr>
<tr>
<td>edge01.tbg01</td>
<td>13335</td>
<td>192.168.172.17</td>
<td>Established</td>
<td>0/1/1/0</td>
<td>import-policy</td>
<td>export-policy</td>
</tr>
</tbody>
</table>
```

### 21.16.4 salt.runners.cache

Return cached data from minions

**salt.runners.cache.clear_all**(tgt=None, tgt_type='glob')

Changed in version 2017.7.0: The expr_form argument has been renamed to tgt_type, earlier releases must use expr_form.

Clear the cached pillar, grains, and mine data of the targeted minions.
CLI Example:

```
salt-run cache.clear_all
```

`salt.runners.cache.clear_git_lock(role, remote=None, **kwargs)`  
New in version 2015.8.2.  
Remove the update locks for Salt components (gitfs, git_pillar, winrepo) which use gitfs backend code from salt.utils.gitfs.  

Note: Running `cache.clear_all` will not include this function as it does for pillar, grains, and mine.  
Additionally, executing this function with a role of gitfs is equivalent to running `salt-run fileserver.clear_lock backend=git`.  

```
role Which type of lock to remove (gitfs, git_pillar, or winrepo)
remote If specified, then any remotes which contain the passed string will have their lock cleared. For example, a remote value of github will remove the lock from all github.com remotes.
type [update,checkout,mountpoint] The types of lock to clear. Can be one or more of update, checkout, and mountpoint, and can be passed either as a comma-separated or Python list.
```

Changed in version 2018.3.0: mountpoint lock type added  

CLI Examples:

```
salt-run cache.clear_git_lock gitfs
salt-run cache.clear_git_lock git_pillar
salt-run cache.clear_git_lock git_pillar type=update
salt-run cache.clear_git_lock git_pillar type=update,checkout
salt-run cache.clear_git_lock git_pillar type=['update', 'mountpoint']
```

`salt.runners.cache.clear_grains(tgt=None, tgt_type='glob')`  
Changed in version 2017.7.0: The expr_form argument has been renamed to tgt_type, earlier releases must use expr_form.  
Clear the cached grains data of the targeted minions  

CLI Example:

```
salt-run cache.clear_grains
```

`salt.runners.cache.clear_mine(tgt=None, tgt_type='glob')`  
Changed in version 2017.7.0: The expr_form argument has been renamed to tgt_type, earlier releases must use expr_form.  
Clear the cached mine data of the targeted minions  

CLI Example:

```
salt-run cache.clear_mine
```

`salt.runners.cache.clear_mine_func(tgt=None, tgt_type='glob', clear_mine_func_flag=None)`  
Changed in version 2017.7.0: The expr_form argument has been renamed to tgt_type, earlier releases must use expr_form.  
Clear the cached mine function data of the targeted minions  

CLI Example:
salt-run cache.clear_mine_func tgt='*' clear_mine_func_flag='network.interfaces'

salt.runners.cache.clear_pillar(tgt=None, tgt_type='glob')
Changed in version 2017.7.0: The expr_form argument has been renamed to tgt_type, earlier releases must use expr_form.
Clear the cached pillar data of the targeted minions
CLI Example:
salt-run cache.clear_pillar

salt.runners.cache.cloud(tgt, provider=None)
Return cloud cache data for target.

Note: Only works with glob matching

tgt  Glob Target to match minion ids
provider  Cloud Provider

CLI Example:
salt-run cache.cloud 'salt*'
salt-run cache.cloud glance.example.org provider=openstack

salt.runners.cache.fetch(bank, key, cachedir=None)
Fetch data from a salt.cache bank.

CLI Example:
salt-run cache.fetch cloud/active/ec2/myec2/myminion cachedir=/var/cache/salt/

salt.runners.cache.flush(bank, key=None, cachedir=None)
Remove the key from the cache bank with all the key content. If no key is specified remove the entire bank with all keys and sub-banks inside.

CLI Examples:
salt-run cache.flush cloud/active/ec2/myec2 cachedir=/var/cache/salt/
salt-run cache.flush cloud/active/ec2/myec2/myminion cachedir=/var/cache/salt/

salt.runners.cache.grains(tgt=None, tgt_type='glob', **kwargs)
Changed in version 2017.7.0: The expr_form argument has been renamed to tgt_type, earlier releases must use expr_form.
Return cached grains of the targeted minions.
tgt  Target to match minion ids.

Changed in version 2017.7.5,2018.3.0: The tgt argument is now required to display cached grains. If not used, the function will not return grains. This optional argument will become mandatory in the Salt Sodium release.
tgt_type  The type of targeting to use for matching, such as glob, list, etc.

CLI Example:
salt-run cache.grains '***'

salt.runners.cache.list_(bank, cachedir=None)
Lists entries stored in the specified bank.
CLI Example:

```bash
salt-run cache.list cloud/active/ec2/myec2 cachedir=/var/cache/salt/
```

**salt.runners.cache.mine**

```python
salt.runners.cache.mine(tgt=None, tgt_type='glob', **kwargs)
```

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Return cached mine data of the targeted minions

CLI Example:

```bash
salt-run cache.mine
```

**salt.runners.cache.pillar**

```python
salt.runners.cache.pillar(tgt=None, tgt_type='glob', **kwargs)
```

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Return cached pillars of the targeted minions

CLI Example:

```bash
salt-run cache.pillar
```

**salt.runners.cache.store**

```python
salt.runners.cache.store(bank, key, data, cachedir=None)
```

Lists entries stored in the specified bank.

CLI Example:

```bash
salt-run cache.store mycache mykey 'The time has come the walrus said'
```

### 21.16.5 salt.runners.cloud

**The Salt Cloud Runner**

This runner wraps the functionality of salt cloud making salt cloud routines available to all internal apis via the runner system

**salt.runners.cloud.action**

```python
salt.runners.cloud.action(func=None, cloudmap=None, instances=None, provider=None, instance=None, opts=None, **kwargs)
```

Execute a single action on the given map/provider/instance

CLI Example:

```bash
salt-run cloud.action start my-salt-vm
```

**salt.runners.cloud.create**

```python
salt.runners.cloud.create(provider, instances, opts=None, **kwargs)
```

Create an instance using Salt Cloud

CLI Example:

```bash
salt-run cloud.create my-ec2-config myinstance
```

**salt.runners.cloud.destroy**

```python
salt.runners.cloud.destroy(instances, opts=None)
```

Destroy the named vm(s)
salt.runners.cloud.full_query(query_type='list_nodes_full')
   List all available cloud provider data

salt.runners.cloud.list_images(provider='all')
   List cloud provider images for the given providers

salt.runners.cloud.list_locations(provider='all')
   List cloud provider sizes for the given providers

salt.runners.cloud.list_sizes(provider='all')
   List cloud provider sizes for the given providers

salt.runners.cloud.map_run(path=None, opts=None, **kwargs)
   Execute a salt cloud map file

salt.runners.cloud.profile(prof=None, instances=None, opts=None, **kwargs)
   Create a cloud vm with the given profile and instances, instances can be a list or comma-delimited string

   CLI Example:
   ```
   salt-run cloud.profile prof=my-ec2 instances=node1,node2,node3
   ```

salt.runners.cloud.query(query_type='list_nodes')
   List cloud provider data for all providers

salt.runners.cloud.select_query(query_type='list_nodes_select')
   List selected nodes

---

21.16.6 salt.runners.ddns

Dynamic DNS Runner

New in version Beryllium.

Runner to interact with DNS server and create/delete/update DNS records

   codeauthor Nitin Madhok <nmadhok@clemson.edu>

salt.runners.ddns.add_host(zone, name, ttl, ip, keyname, keyfile, nameserver, timeout, port=53, keyalgorithm='hmac-md5')
   Create both A and PTR (reverse) records for a host.

   CLI Example:
   ```
   salt-run ddns.add_host domain.com my-test-vm 3600 10.20.30.40 my-tsig-key /etc/salt/tsig.keyring 10.0.0.1 5
   ```

salt.runners.ddns.create(zone, name, ttl, rdtype, data, keyname, keyfile, nameserver, timeout, port=53, keyalgorithm='hmac-md5')
   Create a DNS record. The nameserver must be an IP address and the master running this runner must have create privileges on that server.

   CLI Example:
   ```
   salt-run ddns.create domain.com my-test-vm 3600 A 10.20.30.40 my-tsig-key /etc/salt/tsig.keyring 10.0.0.1 5
   ```

salt.runners.ddns.delete(zone, name, keyname, keyfile, nameserver, timeout, rdtype=None, data=None, port=53, keyalgorithm='hmac-md5')
   Delete a DNS record.
**CLI Example:**
```
salt-run ddns.delete domain.com my-test-vm my-tsig-key /etc/salt/tsig.keyring 10.0.0.1 5 A
```

```
salt.runners.ddns.delete_host(zone, name, keyname, keyfile, nameserver, timeout, port=53, keyalgorithm='hmac-md5')
```
Delete both forward (A) and reverse (PTR) records for a host only if the forward (A) record exists.

**CLI Example:**
```
salt-run ddns.delete_host domain.com my-test-vm my-tsig-key /etc/salt/tsig.keyring 10.0.0.1 5
```

```
salt.runners.ddns.update(zone, name, ttl, rdtype, data, keyname, keyfile, nameserver, timeout, replace=False, port=53, keyalgorithm='hmac-md5')
```
Replace, or update a DNS record. The nameserver must be an IP address and the master running this runner must have update privileges on that server.

**Note:** If `replace` is set to True, all records for this name and type will first be deleted and then recreated. Default is `replace=False`.

**CLI Example:**
```
salt-run ddns.update domain.com my-test-vm 3600 A 10.20.30.40 my-tsig-key /etc/salt/tsig.keyring 10.0.0.1 5
```

## 21.16.7 salt.runners.digicertapi

Support for Digicert. Heavily based on the Venafi runner by Joseph Hall (jphall@saltstack.com).

Before using this module you need to register an account with Digicert’s CertCentral.

Login to CertCentral, ensure you have a payment method configured and/or there are adequate funds attached to your account. Click the Account item in the left sidebar, and select Account Access. The right hand pane should show "Account Access" and a link to create an API key. Create a new API key and assign it to the user that should be attached to requests coming from Salt.

NOTE CertCentral will not show the API key again after revealing it the first time. Make sure you copy it right away or you will have to revoke it and generate a new one.

Now open `/etc/salt/master` and add the API key as shown below.

```
digicert:
  api_key:  
    ABCDEFGHIJKLMNOPQRSTUVWXYZ0123456789
```

Restart your Salt Master.

You can also include default values of the following variables to help with creating CSRs:

```
digicert:
  api_key:  
    ABCDEFGHIJKLMNOPQRSTUVWXYZ0123456789
  shatype: sha256
```

This API currently only supports RSA key types. Support for other key types will be added if interest warrants.
salt.runners.digicertapi.del_cached_domain(domains)
Delete cached domains from the master

CLI Example:
```
salt-run digicert.del_cached_domain domain1.example.com,domain2.example.com
```

salt.runners.digicertapi.gen_csr(minion_id, dns_name, organization_id, ou_name=None, key_len=2048, shatype='sha256', password=None)

CLI Example:
```
salt-run digicert.gen_csr <minion_id> <dns_name>
```

salt.runners.digicertapi.gen_key(minion_id, dns_name=None, password=None, key_len=2048)
Generate and return a private_key. If a dns_name is passed in, the private_key will be cached under that name.

CLI Example:
```
salt-run digicert.gen_key <minion_id> [dns_name] [password]
```

salt.runners.digicertapi.get_certificate(order_id=None, certificate_id=None, minion_id=None, cert_format='pem_all', filename=None)
Retrieve a certificate by order_id or certificate_id and write it to stdout or a filename.
A list of permissible certFormats is here: https://www.digicert.com/services/v2/documentation/appendix-certificate-formats

CLI Example:
```
salt-run digicert.get_certificate order_id=48929454 cert_format=apache
```

Including a 'filename' will write the certificate to the desired file. Note that some cert formats are zipped files, and some are binary.

If the certificate has not been issued, this function will return the order details inside of which will be a status (one of pending, rejected, processing, issued, revoked, canceled, needs_csr, and needs_approval)

If for some reason you want to pipe the output of this command to a file or other command you will want to leave off the filename argument and make sure to include --no-color so there will be no terminal ANSI escape sequences.

salt.runners.digicertapi.get_org_details(organization_id)
Return the details for an organization

CLI Example:
```
salt-run digicert.get_org_details 34
```

Returns a dictionary with the org details, or with 'error' and 'status' keys.

salt.runners.digicertapi.list_domain_cache()
List domains that have been cached

CLI Example:
```
salt-run digicert.list_domain_cache
```

salt.runners.digicertapi.list_domains(container_id=None)
List domains that CertCentral knows about. You can filter by container_id (also known as "Division") by passing a container_id.
CLI Example:

```
salt-run digicert.list_domains
```

```python
salt.runners.digicertapi.list_orders(status=None)
```

List certificate orders made to CertCentral.

CLI Example:

```
salt-run digicert.list_orders
```

```python
salt.runners.digicertapi.list_organizations(container_id=None, include_validation=True)
```

List organizations that CertCentral knows about. You can filter by container_id (also known as "Division") by passing a container_id. This function returns validation information by default; pass include_validation=False to turn it off.

CLI Example:

```
salt-run digicert.list_organizations
```

```python
salt.runners.digicertapi.list_requests(status=None)
```

List certificate requests made to CertCentral. You can filter by status: pending, approved, rejected

CLI Example:

```
salt-run digicert.list_requests pending
```

```python
salt.runners.digicertapi.order_certificate(minion_id, common_name, organization_id, validity_years, cert_key_passphrase=None, signature_hash=None, key_len=2048, dns_names=None, organization_units=None, server_platform=None, custom_expiration_date=None, comments=None, disable_renewal_notifications=False, product_type_hint=None, renewal_of_order_id=None)
```

Order a certificate. Requires that an Organization has been created inside Digicert’s CertCentral.

See here for API documentation: https://www.digicert.com/services/v2/documentation/order/order-ssl-determinator

CLI Example:

```
salt-run digicert.order_certificate my_minionid my.domain.com 10
   ...signature_hash=sha256
   ...dns_names=['this.domain.com', 'that.domain.com'
   ...]'organization_units='My Domain Org Unit'
   ...'comments='Comment goes here for the approver'
```

This runner can also be used to renew a certificate by passing renewal_of_order_id. Previous order details can be retrieved with digicertapi.list_orders.

```python
salt.runners.digicertapi.show_csrs()
```

Show certificate requests for this API key

CLI Example:

```
salt-run digicert.show_csrs
```
salt.runners.digicertapi.show_organization(domain)
Show organization information, especially the company id
CLI Example:
```
salt-run digicert.show_company example.com
```

salt.runners.digicertapi.show_rsa(minion_id, dns_name)
Show a private RSA key
CLI Example:
```
salt-run digicert.show_rsa myminion domain.example.com
```

### 21.16.8 salt.runners.doc

A runner module to collect and display the inline documentation from the various module types

salt.runners.doc.execution()
Collect all the sys.doc output from each minion and return the aggregate
CLI Example:
```
salt-run doc.execution
```

salt.runners.doc.runner()
Return all inline documentation for runner modules
CLI Example:
```
salt-run doc.runner
```

salt.runners.doc.wheel()
Return all inline documentation for wheel modules
CLI Example:
```
salt-run doc.wheel
```

### 21.16.9 salt.runners.drac

Manage Dell DRAC from the Master

The login credentials need to be configured in the Salt master configuration file.

salt.runners.drac.poweroff(hostname, timeout=20, username=None, password=None)
Power server off
CLI Example:
```
salt-run drac.poweroff example.com
```

salt.runners.drac.poweron(hostname, timeout=20, username=None, password=None)
Power server on
CLI Example:
salt-run drac.poweron example.com

salt.runners.drac.pxe( hostname, timeout=20, username=None, password=None)
    Connect to the Dell DRAC and have the boot order set to PXE and power cycle the system to PXE boot
    CLI Example:
    salt-run drac.pxe example.com

salt.runners.drac.reboot( hostname, timeout=20, username=None, password=None)
    Reboot a server using the Dell DRAC
    CLI Example:
    salt-run drac.reboot example.com

salt.runners.drac.version( hostname, timeout=20, username=None, password=None)
    Display the version of DRAC
    CLI Example:
    salt-run drac.version example.com

21.16.10 salt.runners.error

Error generator to enable integration testing of salt runner error handling

salt.runners.error.error( name=None, message="")
    If name is None Then return empty dict
    Otherwise raise an exception with __name__ from name, message from message
    CLI Example:
    salt-run error
    salt-run error.error name="Exception" message="This is an error."

21.16.11 salt.runners.event

Module for sending events using the runner system.
New in version 2016.11.0.

salt.runners.event.send( tag, data=None)
    Send an event with the given tag and data.
    This is useful for sending events directly to the master from the shell with salt-run. It is also quite useful for
    sending events in orchestration states where the fire_event requisite isn’t sufficient because it does not
    support sending custom data with the event.
    Note that event tags will not be namespaced like events sent with the fire_event requisite! Whereas
    events produced from fire_event are prefixed with salt/state_result/<jid>/<minion_id>/
    <name>, events sent using this runner module will have no such prefix. Make sure your reactors don’t expect
    a prefix!
    Parameters
    • tag – the tag to send with the event
    • data – an optional dictionary of data to send with the event

21.16 runner modules
CLI Example:

```bash
salt-run event.send my/custom/event '{"foo": "bar"}"
```

Orchestration Example:

```bash
# orch/command.sls

run_a_command:
  salt.function:
    - name: cmd.run
    - tgt: my_minion
    - arg:
      - exit {{ pillar['exit_code'] }}

send_success_event:
  salt.runner:
    - name: event.send
    - tag: my_event/success
    - data:
      - foo: bar
    - require:
      - salt: run_a_command

send_failure_event:
  salt.runner:
    - name: event.send
    - tag: my_event/failure
    - data:
      - baz: qux
    - onfail:
      - salt: run_a_command
```

```bash
salt-run state.orchestrate orch.command pillar='{"exit_code": 0}"
salt-run state.orchestrate orch.command pillar='{"exit_code": 1}"
```

21.16.12 salt.runners.f5

Runner to provide F5 Load Balancer functionality

```
depends
  - pycontrol Python module
```

class configuration In order to connect to a F5 Load Balancer, you must specify in the Salt master configuration the currently available load balancers

```
load_balancers:
  bigip1.example.com
  username: admin
  password: secret
bigip2.example.com:
  username: admin
  password: secret
```

class salt.runners.f5.F5Mgmt(lb, username, password)
add_pool_member(name, port, pool_name)
Add a node to a pool

cHECK_Member_pOOL(member, pool_name)
Check a pool member exists in a specific pool

cHECK_POOL(name)
Check to see if a pool exists

cHECK_virtualserver(name)
Check to see if a virtual server exists

cReaTe_pooL(name, method='ROUND_ROBIN')
Create a pool on the F5 load balancer

cReaTe_vs(name, ip, port, protocol, profile, pool_name)
Create a virtual server

lbmethods()
List all the load balancer methods

salt.runners.f5.add_pool_member(lb, name, port, pool_name)
Add a node to a pool

CLI Examples:
salt-run f5.add_pool_member load_balancer 10.0.0.1 80 my_pool

salt.runners.f5.check_member_pool(lb, member, pool_name)
Check a pool member exists in a specific pool

CLI Examples:
salt-run f5.check_member_pool load_balancer 10.0.0.1 my_pool

salt.runners.f5.check_pool(lb, name)
Check to see if a pool exists

CLI Examples:
salt-run f5.check_pool load_balancer pool_name

salt.runners.f5.check_virtualserver(lb, name)
Check to see if a virtual server exists

CLI Examples:
salt-run f5.check_virtualserver load_balancer virtual_server

salt.runners.f5.create_pool(lb, name, method='ROUND_ROBIN')
Create a pool on the F5 load balancer

CLI Examples:
salt-run f5.create_pool load_balancer pool_name loadbalance_method
salt-run f5.create_pool load_balancer my_pool ROUND_ROBIN

salt.runners.f5.create_vs(lb, name, ip, port, protocol, profile, pool_name)
Create a virtual server

CLI Examples:
21.16.13 salt.runners.fileserver

Directly manage the Salt fileserver plugins

salt.runners.fileserver.clear_cache(backend=None)
New in version 2015.5.0.

Clear the fileserver cache from VCS fileserver backends (git, hg, svn). Executing this runner with no arguments will clear the cache for all enabled VCS fileserver backends, but this can be narrowed using the backend argument.

backend Only clear the update lock for the specified backend(s). If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: backend=-roots,git) then the ones starting with a minus sign will be disregarded.

CLI Example:

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>salt-run fileserver.clear_cache</td>
</tr>
<tr>
<td>salt-run fileserver.clear_cache backend=git,hg</td>
</tr>
<tr>
<td>salt-run fileserver.clear_cache backend=hg</td>
</tr>
<tr>
<td>salt-run fileserver.clear_cache -roots</td>
</tr>
</tbody>
</table>

salt.runners.fileserver.clear_file_list_cache(saltenv=None, backend=None)
New in version 2016.11.0.

The Salt fileserver caches the files/directories/symlinks for each fileserver backend and environment as they are requested. This is done to help the fileserver scale better. Without this caching, when hundreds/thousands of minions simultaneously ask the master what files are available, this would cause the master’s CPU load to spike as it obtains the same information separately for each minion.

saltenv By default, this runner will clear the file list caches for all environments. This argument allows for a list of environments to be passed, to clear more selectively. This list can be passed either as a comma-separated string, or a Python list.

backend Similar to the saltenv parameter, this argument will restrict the cache clearing to specific fileserver backends (the default behavior is to clear from all enabled fileserver backends). This list can be passed either as a comma-separated string, or a Python list.

Since the ability to clear these caches is often required by users writing custom runners which add/remove files, this runner can easily be called from within a custom runner using any of the following examples:

```
# Clear all file list caches
__salt__['fileserver.clear_file_list_cache']()
# Clear just the 'base' saltenv file list caches
__salt__['fileserver.clear_file_list_cache'](saltenv='base')
# Clear just the 'base' saltenv file list caches from just the 'roots'
# fileserver backend
__salt__['fileserver.clear_file_list_cache'](saltenv='base', backend='roots')
# Clear all file list caches from the 'roots' fileserver backend
__salt__['fileserver.clear_file_list_cache'](backend='roots')
```

Note: In runners, the __salt__ dictionary will likely be renamed to __runner__ in a future Salt release to distinguish runner functions from remote execution functions. See this GitHub issue for discussion/updates on this.

If using Salt’s Python API (not a runner), the following examples are equivalent to the ones above:
import salt.config
import salt.runner

opts = salt.config.master_config('/etc/salt/master')
opts['fun'] = 'fileserver.clear_file_list_cache'

# Clear all file list caches
opts['arg'] = []  # No arguments
runner = salt.runner.Runner(opts)
cleared = runner.run()

# Clear just the 'base' saltenv file list caches
opts['arg'] = ['base', None]
runner = salt.runner.Runner(opts)
cleared = runner.run()

# Clear just the 'base' saltenv file list caches from just the 'roots'
# fileserver backend
opts['arg'] = ['base', 'roots']
runner = salt.runner.Runner(opts)
cleared = runner.run()

# Clear all file list caches from the 'roots' fileserver backend
opts['arg'] = [None, 'roots']
runner = salt.runner.Runner(opts)
cleared = runner.run()

This function will return a dictionary showing a list of environments which were cleared for each backend. An empty return dictionary means that no changes were made.

CLI Examples:

# Clear all file list caches
salt-run fileserver.clear_file_list_cache
# Clear just the 'base' saltenv file list caches
salt-run fileserver.clear_file_list_cache saltenv=base
# Clear just the 'base' saltenv file list caches from just the 'roots'
# fileserver backend
salt-run fileserver.clear_file_list_cache saltenv=base backend=roots
# Clear all file list caches from the 'roots' fileserver backend
salt-run fileserver.clear_file_list_cache backend=roots

salt.runners.fileserver.clear_lock(backend=None, remote=None)

New in version 2015.5.0.

Clear the fileserver update lock from VCS fileserver backends (git, hg, svn). This should only need to be done if a fileserver update was interrupted and a remote is not updating (generating a warning in the Master's log file). Executing this runner with no arguments will remove all update locks from all enabled VCS fileserver backends, but this can be narrowed by using the following arguments:

backend Only clear the update lock for the specified backend(s).
remote If specified, then any remotes which contain the passed string will have their lock cleared. For example, a remote value of github will remove the lock from all github.com remotes.

CLI Example:

salt-run fileserver.clear_lock
salt-run fileserver.clear_lock backend=git,hg
salt-run fileserver.clear_lock backend=git remote=github
salt-run fileserver.clear_lock remote=bitbucket
salt.runners.fileserver.dir_list(saltenv='base', backend=None)

Return a list of directories in the given environment
	nsaltenv [base] The salt fileserver environment to be listed

tbackend Narrow fileserver backends to a subset of the enabled ones. If all passed backends start with a minus
sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of
backends with and without a minus sign (ex: backend=-roots,git) then the ones starting with a
minus sign will be disregarded.

New in version 2015.5.0.

CLI Example:

```
salt-run fileserver.dir_list
salt-run fileserver.dir_list saltenv=prod
salt-run fileserver.dir_list saltenv=dev backend=git
salt-run fileserver.dir_list base hg,roots
salt-run fileserver.dir_list -git
```

salt.runners.fileserver.empty_dir_list(saltenv='base', backend=None)

New in version 2015.5.0.

Return a list of empty directories in the given environment
	nsaltenv [base] The salt fileserver environment to be listed
	nbackend Narrow fileserver backends to a subset of the enabled ones. If all passed backends start with a minus
sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of
backends with and without a minus sign (ex: backend=-roots,git) then the ones starting with a
minus sign will be disregarded.

**Note:** Some backends (such as git and hg) do not support empty directories. So, passing
backend=git or backend=hg will result in an empty list being returned.

CLI Example:

```
salt-run fileserver.empty_dir_list
salt-run fileserver.empty_dir_list saltenv=prod
salt-run fileserver.empty_dir_list backend=roots
```

salt.runners.fileserver.envs(backend=None, sources=False)

Return the available fileserver environments. If no backend is provided, then the environments for all config-
ured backends will be returned.

backend Narrow fileserver backends to a subset of the enabled ones.

Changed in version 2015.5.0: If all passed backends start with a minus sign (-), then these backends
will be excluded from the enabled backends. However, if there is a mix of backends with and without a
minus sign (ex: backend=-roots,git) then the ones starting with a minus sign will be disregarded.

Additionally, fileserver backends can now be passed as a comma-separated list. In earlier versions, they
needed to be passed as a python list (ex: backend=roots,git)

CLI Example:

```
salt-run fileserver.envs
salt-run fileserver.envs backend=roots,git
salt-run fileserver.envs git
```

salt.runners.fileserver.file_list(saltenv='base', backend=None)

Return a list of files from the salt fileserver
	nsaltenv [base] The salt fileserver environment to be listed
backend Narrow fileserver backends to a subset of the enabled ones. If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: backend=-roots,git) then the ones starting with a minus sign will be disregarded.

New in version 2015.5.0.

CLI Examples:

```
salt-run fileserver.file_list
salt-run fileserver.file_list saltenv=prod
salt-run fileserver.file_list saltenv=dev backend=git
salt-run fileserver.file_list base hg,roots
salt-run fileserver.file_list -git
```

salt.runners.fileserver.lock(backend=None, remote=None)

Set a fileserver update lock for VCS fileserver backends (git, hg, svn).

Note: This will only operate on enabled backends (those configured in fileserver_backend).

backend Only set the update lock for the specified backend(s).
remote If not None, then any remotes which contain the passed string will have their lock cleared. For example, a remote value of *github.com* will remove the lock from all github.com remotes.

CLI Example:

```
salt-run fileserver.lock
salt-run fileserver.lock backend=git,hg
salt-run fileserver.lock backend=git remote='*github.com*'
salt-run fileserver.lock remote=bitbucket
```

salt.runners.fileserver.symlink_list(saltenv='base', backend=None)

Return a list of symlinked files and dirs

saltenv [base] The salt fileserver environment to be listed
backend Narrow fileserver backends to a subset of the enabled ones. If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: backend=-roots,git) then the ones starting with a minus sign will be disregarded.

New in version 2015.5.0.

CLI Example:

```
salt-run fileserver.symlink_list
salt-run fileserver.symlink_list saltenv=prod
salt-run fileserver.symlink_list saltenv=dev backend=git
salt-run fileserver.symlink_list base hg,roots
salt-run fileserver.symlink_list -git
```

salt.runners.fileserver.update(backend=None)

Update the fileserver cache. If no backend is provided, then the cache for all configured backends will be updated.

backend Narrow fileserver backends to a subset of the enabled ones.

Changed in version 2015.5.0: If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: backend=-roots,git) then the ones starting with a minus sign will be disregarded.
Additionally, fileserver backends can now be passed as a comma-separated list. In earlier versions, they needed to be passed as a python list (ex: `backend="[roots', 'git']"`) CLI Example:

```
salt-run fileserver.update
salt-run fileserver.update backend=roots,git
```

21.16.14 salt.runners.git_pillar

Runner module to directly manage the git external pillar

```
salt.runners.git_pillar.update(branch=None, repo=None)
```

New in version 2014.1.0.

Changed in version 2015.8.4: This runner function now supports the `git_pillar configuration schema` introduced in 2015.8.0. Additionally, the branch and repo can now be omitted to update all git_pillar remotes. The return data has also changed to a dictionary. The values will be `True` only if new commits were fetched, and `False` if there were errors or no new commits were fetched.

Changed in version 2018.3.0: The return for a given git_pillar remote will now be `None` when no changes were fetched. `False` now is reserved only for instances in which there were errors.

Fetch one or all configured git_pillar remotes.

**Note:** This will not fast-forward the git_pillar cachedir on the master. All it does is perform a `git fetch`. If this runner is executed with `-l debug`, you may see a log message that says that the repo is up-to-date. Keep in mind that Salt automatically fetches git_pillar repos roughly every 60 seconds (or whatever `loop_interval` is set to). So, it is possible that the repo was fetched automatically in the time between when changes were pushed to the repo, and when this runner was executed. When in doubt, simply refresh pillar data using `saltutil.refresh_pillar` and then use `pillar.item` to check if the pillar data has changed as expected.

CLI Example:

```
# Update specific branch and repo
salt-run git_pillar.update branch='branch' repo='https://foo.com/bar.git'
# Update all repos
salt-run git_pillar.update
# Run with debug logging
salt-run git_pillar.update -l debug
```

21.16.15 salt.runners.http

Module for making various web calls. Primarily designed for webhooks and the like, but also useful for basic http testing.

New in version 2015.5.0.

```
salt.runners.http.query(url, output=True, **kwargs)
```

Query a resource, and decode the return data

Passes through all the parameters described in the `utils.http.query function`:

CLI Example:
salt-run http.query http://somelink.com/
salt-run http.query http://somelink.com/ method=POST params="key1=val1&key2=val2"
salt-run http.query http://somelink.com/ method=POST data='"somecontent"'

salt.runners.http.update_ca_bundle(target=None, source=None, merge_files=None)

Update the local CA bundle file from a URL

New in version 2015.5.0.

CLI Example:

salt-run http.update_ca_bundle
salt-run http.update_ca_bundle target=/path/to/cacerts.pem
salt-run http.update_ca_bundle source=https://example.com/cacerts.pem

If the target is not specified, it will be pulled from the ca_cert configuration variable available to the master. If it cannot be found there, it will be placed at $FILE_ROOTS/cacerts.pem.

If the source is not specified, it will be pulled from the ca_cert_url configuration variable available to the master. If it cannot be found, it will be downloaded from the cURL website, using an http (not https) URL. USING THE DEFAULT URL SHOULD BE AVOIDED!

merge_files may also be specified, which includes a string or list of strings representing a file or files to be appended to the end of the CA bundle, once it is downloaded.

CLI Example:

salt-run http.update_ca_bundle merge_files=/path/to/mycert.pem

21.16.16 salt.runners.jobs

A convenience system to manage jobs, both active and already run

salt.runners.jobs.active(display_progress=False)

Return a report on all actively running jobs from a job id centric perspective

CLI Example:

salt-run jobs.active

salt.runners.jobs.exit_success(jid, ext_source=None)

Check if a job has been executed and exit successfully
jid The jid to look up.
ext_source The external job cache to use. Default: None.

CLI Example:

salt-run jobs.exit_success 20160520145827701627

salt.runners.jobs.last_run(ext_source=None, outputter=None, metadata=None, function=None, target=None, display_progress=False)

New in version 2015.8.0.

List all detectable jobs and associated functions

CLI Example:
```
salt-run jobs.last_run
salt-run jobs.last_run target=nodename
salt-run jobs.last_run function='cmd.run'
salt-run jobs.last_run metadata="{'foo': 'bar'}"
```

```python
salt.runners.jobs.list_job(jid, ext_source=None, display_progress=False)
```

List a specific job given by its jid

**ext_source** If provided, specifies which external job cache to use.

**display_progress** [False] If True, fire progress events.

**CLI Example:**
```
salt-run jobs.list_job 20130916125524463507
salt-run jobs.list_job 20130916125524463507 --out=pprint
```

```python
salt.runners.jobs.list_jobs(ext_source=None, outputter=None,
search_metadata=None, search_function=None,
search_target=None, start_time=None,
end_time=None, display_progress=False)
```

List all detectable jobs and associated functions

**ext_source** If provided, specifies which external job cache to use.

**FILTER OPTIONS**

**Note:** If more than one of the below options are used, only jobs which match *all* of the filters will be returned.

**search_metadata** Specify a dictionary to match to the job’s metadata. If any of the key-value pairs in this dictionary match, the job will be returned. Example:
```
salt-run jobs.list_jobs search_metadata='{"foo": "bar", "baz": "qux"}"
```

**search_function** Can be passed as a string or a list. Returns jobs which match the specified function. Globbing is allowed. Example:
```
salt-run jobs.list_jobs search_function='test.*'
salt-run jobs.list_jobs search_function=['"test.*", "pkg.install"]'
```

Changed in version 2015.8.8: Multiple targets can now also be passed as a comma-separated list. For example:
```
salt-run jobs.list_jobs search_function='test.*,pkg.install'
```

**search_target** Can be passed as a string or a list. Returns jobs which match the specified minion name. Globbing is allowed. Example:
```
salt-run jobs.list_jobs search_target='*.mydomain.tld'
salt-run jobs.list_jobs search_target=['"db*", "myminion"]'
```

Changed in version 2015.8.8: Multiple targets can now also be passed as a comma-separated list. For example:
```
salt-run jobs.list_jobs search_target='db*,myminion'
```

**start_time** Accepts any timestamp supported by the dateutil Python module (if this module is not installed, this argument will be ignored). Returns jobs which started after this timestamp.

**end_time** Accepts any timestamp supported by the dateutil Python module (if this module is not installed, this argument will be ignored). Returns jobs which started before this timestamp.
CLI Example:

```
salt-run jobs.list_jobs
salt-run jobs.list_jobs  search_function='test.*' search_target='localhost' search_ 
  metadata='{"bar": "foo"}''
salt-run jobs.list_jobs  start_time='2015, Mar 16 19:00' end_time='2015, Mar 18 22:00'
```

```
salt.runners.jobs.list_jobs_filter(count, filter_find_job=True, ext_source=None, output-
  ter=None, display_progress=False)
```

List all detectable jobs and associated functions

```python
ext_source = The external job cache to use. Default: None.
```

CLI Example:

```
salt-run jobs.list_jobs_filter 50
salt-run jobs.list_jobs_filter 100 filter_find_job=False
```

```
salt.runners.jobs.lookup_jid(jid, ext_source=None, returned=True, missing=False, dis-
  play_progress=False)
```

Return the printout from a previously executed job

```python
jid = The jid to look up.
```

```python
ext_source = The external job cache to use. Default: None.
```

```python
returned [True] If True, include the minions that did return from the command.
```

```python
missing [False] If True, include the minions that did not return from the command.
```

```python
display_progress [False] If True, fire progress events.
```

CLI Example:

```
salt-run jobs.lookup_jid 20130916125524463507
salt-run jobs.lookup_jid 20130916125524463507 --out=highstate
```

```
salt.runners.jobs.print_job(jid, ext_source=None)
```

Print a specific job’s detail given by it’s jid, including the return data.

CLI Example:

```
salt-run jobs.print_job 20130916125524463507
```

21.16.17 salt.runners.launchd

Manage launchd plist files

```
salt.runners.launchd.write_launchd_plist(program)
```

Write a launchd plist for managing salt-master or salt-minion

CLI Example:

```
salt-run launchd.write_launchd_plist salt-master
```

21.16.18 salt.runners.lxc

Control Linux Containers via Salt
depends lxc execution module

salt.runners.lxc.cloud_init(names, host=None, quiet=False, **kwargs)
Wrapper for using lxc.init in saltcloud compatibility mode

names Name of the containers, supports a single name or a comma delimited list of names.
host Minion to start the container on. Required.
path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.
saltcloud_mode init the container with the saltcloud opts format instead

salt.runners.lxc.find_guest(name, quiet=False, path=None)
Returns the host for a container.
path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.
salt-run lxc.find_guest name

salt.runners.lxc.find_guests(names, path=None)
Return a dict of hosts and named guests
path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.
salt-run lxc.find_guests names

salt.runners.lxc.freeze(name, quiet=False, path=None)
Freeze the named container
path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.
salt-run lxc.freeze name

salt.runners.lxc.info(name, quiet=False, path=None)
Returns information about a container.
path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.
salt-run lxc.info name

salt.runners.lxc.init(names, host=None, saltcloud_mode=False, quiet=False, **kwargs)
Initialize a new container

```bash
salt-run lxc.init name host=minion_id [cpuset=cgroups_cpuset] \ 
[cpushare=cgroups_cpushare] [memory=cgroups_memory] \ 
[template=lxc_template_name] [clone=original name] \ 
[profile=lxc_profile] [network_profile=network_profile] \ 
[nic=network_profile] [nic_opts=nic_opts] \ 
[start=(true|false)] [seed=(true|false)] \ 
[install=(true|false)] [config=minion_config] \ 
[snapshot=(true|false)]
```

names Name of the containers, supports a single name or a comma delimited list of names.
host Minion on which to initialize the container (required)
path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.
saltcloud_mode init the container with the saltcloud opts format instead See lxc.init_interface module documentation
cpuset cgroups cpuset.
cpushare cgroups cpu shares.
memory cgroups memory limit, in MB

Changed in version 2015.5.0: If no value is passed, no limit is set. In earlier Salt versions, not passing this value causes a 1024MB memory limit to be set, and it was necessary to pass memory=0 to set no limit.

template Name of LXC template on which to base this container
clonedn This container from an existing container
profile A LXC profile (defined in config or pillar).
network_profile Network profile to use for the container

New in version 2015.5.2.
nic Deprecated since version 2015.5.0: Use network_profile instead
nic_opts Extra options for network interfaces. E.g.:

{"eth0": {"mac": "aa:bb:cc:dd:ee:ff", "ipv4": "10.1.1.1", "ipv6": "2001:db8::ff00:42:8329"}}

start Start the newly created container.
seed Seed the container with the minion config and autosign its key. Default: true
install If salt-minion is not already installed, install it. Default: true
config Optional config parameters. By default, the id is set to the name of the container.

salt.runners.lxc.list(host=None, quiet=False, path=None)
List defined containers (running, stopped, and frozen) for the named (or all) host(s).
path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.list [host=minion_id]
```

salt.runners.lxc.purge(name, delete_key=True, quiet=False, path=None)
Purge the named container and delete its minion key if present. WARNING: Destroys all data associated with the container.
path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.purge name
```

salt.runners.lxc.start(name, quiet=False, path=None)
Start the named container.
path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.start name
```

salt.runners.lxc.stop(name, quiet=False, path=None)
Stop the named container.
path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.stop name
```

salt.runners.lxc.unfreeze(name, quiet=False, path=None)
Unfreeze the named container
path  path to the container parent default: /var/lib/lxc (system default)
        New in version 2015.8.0.

salt-run lxc.unfreeze name

21.16.19 salt.runners.manage

General management functions for salt, tools like seeing what hosts are up and what hosts are down

salt.runners.manage.alived(subset=None, show_ip=False, show_ipv4=None)
    New in version 2015.8.0.
    Changed in version 2019.2.0: The 'show_ipv4' argument has been renamed to 'show_ip' as it now includes
    IPv6 addresses for IPv6-connected minions.

    Print a list of all minions that are up according to Salt’s presence detection (no commands will be sent to
    minions)
    subset [None] Pass in a CIDR range to filter minions by IP address.
    show_ip [False] Also show the IP address each minion is connecting from.
    CLI Example:
    
    salt-run manage.alived

salt.runners.manage.allowed(subset=None, show_ip=False, show_ipv4=None)
    New in version 2015.8.0.
    Changed in version 2019.2.0: The 'show_ipv4' argument has been renamed to 'show_ip' as it now includes
    IPv6 addresses for IPv6-connected minions.

    Print a list of all minions that are up according to Salt’s presence detection (no commands will be sent to
    minions)
    subset [None] Pass in a CIDR range to filter minions by IP address.
    show_ip [False] Also show the IP address each minion is connecting from.
    CLI Example:

    salt-run manage.allowed

salt.runners.manage.bootstrap(version='develop', script=None, hosts='', script_args='', roster='flat', ssh_user=None, ssh_password=None, ssh_priv_key=None, tmp_dir='/tmp/.bootstrap', http_backend='tornado')

    Bootstrap minions with salt-bootstrap

    version [develop] Git tag of version to install
    script [https://bootstrap.saltstack.com] URL containing the script to execute
    hosts Comma-separated hosts [example: hosts='host1.local,host2.local’]. These hosts need to exist in the
    specified roster.
    script_args Any additional arguments that you want to pass to the script.

    New in version 2016.11.0.

    roster [flat] The roster to use for Salt SSH. More information about roster files can be found in Salt’s Roster
    Documentation.

    A full list of roster types, see the builtin roster modules documentation.

    New in version 2016.11.0.

    ssh_user If user isn’t found in the roster, a default SSH user can be set here. Keep in mind that ssh_user
    will not override the roster user value if it is already defined.

    New in version 2016.11.0.
**ssh_password**  If `passwd` isn’t found in the roster, a default SSH password can be set here. Keep in mind that `ssh_password` will not override the roster `passwd` value if it is already defined.

New in version 2016.11.0.

**ssh_privkey**  If `priv` isn’t found in the roster, a default SSH private key can be set here. Keep in mind that `ssh_password` will not override the roster `passwd` value if it is already defined.

New in version 2016.11.0.

**tmp_dir**  `[/tmp/.bootstrap]`  The temporary directory to download the bootstrap script in. This directory will have `<uuid4>` appended to it. For example: `/tmp/.bootstrap-a19a728e-d40a-4801-aba9-d00655c143a7/

New in version 2016.11.0.

**http_backend**  `[tornado]` The backend library to use to download the script. If you need to use a `file://` URL, then you should set this to `urllib2`.

New in version 2016.11.0.

CLI Example:

```
salt-run manage.bootstrap hosts='host1,host2'
salt-run manage.bootstrap hosts='host1,host2' version='v0.17' script='https://bootstrap.saltstack.com/develop'
```

**salt.runners.manage.bootstrap_psexec**  `(hosts='', master=None, version=None, arch='win32', installer_url=None, username=None, password=None)`  

Bootstrap Windows minions via PsExec.

- **hosts**  Comma separated list of hosts to deploy the Windows Salt minion.
- **master**  Address of the Salt master passed as an argument to the installer.
- **version**  Point release of installer to download. Defaults to the most recent.
- **arch**  Architecture of installer to download. Defaults to win32.
- **installer_url**  URL of minion installer executable. Defaults to the latest version from `https://repo.saltstack.com/windows/`
- **username**  Optional user name for login on remote computer.
- **password**  Password for optional username. If omitted, PsExec will prompt for one to be entered for each host.

CLI Example:

```
salt-run manage.bootstrap_psexec hosts='host1,host2' version='0.17' installer_url='http://exampledomain/salt-installer.exe' username='DOMAIN\Administrator'
```

**salt.runners.manage.down**  `(removekeys=False, tgt='', tgt_type='glob', timeout=None, gather_job_timeout=None)`  

Print a list of all the down or unresponsive salt minions Optionally remove keys of down minions

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

CLI Example:

```
salt-run manage.down
salt-run manage.down removekeys=True
tgt=webservers tgt_type=nodegroup
```

**salt.runners.manage.get_stats**  `(estate=None, stack='road')`  

Print the stack stats

- **estate**  [None]  The name of the target estate. Master stats would be requested by default
stack ['road'] Show stats on either road or lane stack Allowed values are 'road' or 'lane'.
CLI Example:

```bash
salt-run manage.get_stats [estate=alpha_minion] [stack=lane]
```

**salt.runners.manage.joined(subset=None, show_ip=False, show_ipv4=None)**

New in version 2015.8.0.

Changed in version 2019.2.0: The 'show_ipv4' argument has been renamed to 'show_ip' as it now includes IPv6 addresses for IPv6-connected minions.

Print a list of all minions that are up according to Salt’s presence detection (no commands will be sent to minions)
subset [None] Pass in a CIDR range to filter minions by IP address.
show_ip [False] Also show the IP address each minion is connecting from.
CLI Example:

```bash
salt-run manage.joined
```

**salt.runners.manage.key_regen()**

This routine is used to regenerate all keys in an environment. This is invasive! ALL KEYS IN THE SALT ENVIRONMENT WILL BE REGENERATED‼

The key_regen routine sends a command out to minions to revoke the master key and remove all minion keys, it then removes all keys from the master and prompts the user to restart the master. The minions will all reconnect and keys will be placed in pending.

After the master is restarted and minion keys are in the pending directory execute a salt-key -A command to accept the regenerated minion keys.

The master must be restarted within 60 seconds of running this command or the minions will think there is something wrong with the keys and abort.

Only Execute this runner after upgrading minions and master to 0.15.1 or higher!
CLI Example:

```bash
salt-run manage.key_regen
```

**salt.runners.manage.lane_stats(estate=None)**

Print the estate manor lane stack stats
estate [None] The name of the target estate. Master stats would be requested by default
CLI Example:

```bash
salt-run manage.lane_stats [estate=alpha_minion]
```

**salt.runners.manage.list_not_state(subset=None, show_ip=False, show_ipv4=None, state=None)**

New in version 2015.8.0.

Changed in version 2019.2.0: The 'show_ipv4' argument has been renamed to 'show_ip' as it now includes IPv6 addresses for IPv6-connected minions.

Print a list of all minions that are NOT up according to Salt’s presence detection (no commands will be sent to minions)
subset [None] Pass in a CIDR range to filter minions by IP address.
show_ip [False] Also show the IP address each minion is connecting from.
state ['available'] Show minions being in specific state that is one of 'available', 'joined', 'allowed', 'alived' or 'reaped'.
CLI Example:
salt-run manage.list_not_state

salt.runners.manage.list_state(subset=None, show_ip=False, show_ipv4=None, state=None)
New in version 2015.8.0.
Changed in version 2019.2.0: The 'show_ipv4' argument has been renamed to 'show_ip' as it now includes IPv6 addresses for IPv6-connected minions.
Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)
subset [None] Pass in a CIDR range to filter minions by IP address.
show_ip [False] Also show the IP address each minion is connecting from.
state ['available'] Show minions being in specific state that is one of 'available', 'joined', 'allowed', 'alived' or 'reaped'.
CLI Example:
salt-run manage.list_state

salt.runnersmanage.not_alived(subset=None, show_ip=False, show_ipv4=None)
New in version 2015.8.0.
Changed in version 2019.2.0: The 'show_ipv4' argument has been renamed to 'show_ip' as it now includes IPv6 addresses for IPv6-connected minions.
Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)
subset [None] Pass in a CIDR range to filter minions by IP address.
show_ip [False] Also show the IP address each minion is connecting from.
CLI Example:
salt-run manage.not_alived

salt.runners.manage.not_allowed(subset=None, show_ip=False, show_ipv4=None)
New in version 2015.8.0.
Changed in version 2019.2.0: The 'show_ipv4' argument has been renamed to 'show_ip' as it now includes IPv6 addresses for IPv6-connected minions.
Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)
subset [None] Pass in a CIDR range to filter minions by IP address.
show_ip [False] Also show the IP address each minion is connecting from.
CLI Example:
salt-run manage.not_allowed

salt.runners.manage.not_joined(subset=None, show_ip=False, show_ipv4=None)
New in version 2015.8.0.
Changed in version 2019.2.0: The 'show_ipv4' argument has been renamed to 'show_ip' as it now includes IPv6 addresses for IPv6-connected minions.
Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)
subset [None] Pass in a CIDR range to filter minions by IP address.
show_ip [False] Also show the IP address each minion is connecting from.
CLI Example:
salt-run manage.not_joined

salt.runners.manage.not_present(subset=None, show_ip=False, show_ipv4=None)
New in version 2015.5.0.
Changed in version 2019.2.0: The 'show_ipv4' argument has been renamed to 'show_ip' as it now includes IPv6 addresses for IPv6-connected minions.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)

**subset** [None] Pass in a CIDR range to filter minions by IP address.

**show_ip** [False] Also show the IP address each minion is connecting from.

CLI Example:

```bash
salt-run manage.not_present
```

**salt.runners.manage.not_reaped**(*subset=None, show_ip=False, show_ipv4=None*)

New in version 2015.8.0.

Changed in version 2019.2.0: The 'show_ipv4' argument has been renamed to 'show_ip' as it now includes IPv6 addresses for IPv6-connected minions.

Print a list of all minions that are NOT up according to Salt’s presence detection (no commands will be sent)

**subset** [None] Pass in a CIDR range to filter minions by IP address.

**show_ip** [False] Also show the IP address each minion is connecting from.

CLI Example:

```bash
salt-run manage.not_reaped
```

**salt.runners.manage.present**(*subset=None, show_ip=False, show_ipv4=None*)

Changed in version 2019.2.0: The 'show_ipv4' argument has been renamed to 'show_ip' as it now includes IPv6 addresses for IPv6-connected minions.

Print a list of all minions that are up according to Salt’s presence detection (no commands will be sent to minions)

**subset** [None] Pass in a CIDR range to filter minions by IP address.

**show_ip** [False] Also show the IP address each minion is connecting from.

CLI Example:

```bash
salt-run manage.present
```

**salt.runners.manage.reaped**(*subset=None, show_ip=False, show_ipv4=None*)

New in version 2015.8.0.

Changed in version 2019.2.0: The 'show_ipv4' argument has been renamed to 'show_ip' as it now includes IPv6 addresses for IPv6-connected minions.

Print a list of all minions that are up according to Salt’s presence detection (no commands will be sent to minions)

**subset** [None] Pass in a CIDR range to filter minions by IP address.

**show_ip** [False] Also show the IP address each minion is connecting from.

CLI Example:

```bash
salt-run manage.reaped
```

**salt.runners.manage.road_stats**(*estate=None*)

Print the estate road stack stats

**estate** [None] The name of the target estate. Master stats would be requested by default

CLI Example:

```bash
salt-run manage.road_stats [estate=alpha_minion]
```

**salt.runners.manage.safe_accept**(*target, tgt_type='glob'*)

Changed in version 2017.7.0: The expr_form argument has been renamed to tgt_type, earlier releases must use expr_form.
Accept a minion’s public key after checking the fingerprint over salt-ssh

CLI Example:

```bash
salt-run manage.safe_accept my_minion
salt-run manage.safe_accept minion1,minion2 tgt_type=list
```

```python
salt.runners.manage.status(output=True, tgt='*', tgt_type='glob', timeout=None, gather_job_timeout=None)
```

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Print the status of all known salt minions

CLI Example:

```bash
salt-run manage.status
target=minion1,tgt_type=nodegroup
timeout=5 gather_job_timeout=10
```

```python
salt.runners.manage.up(tgt='*', tgt_type='glob', timeout=None, gather_job_timeout=None)
```

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Print a list of all of the minions that are up

CLI Example:

```bash
classic=management
```

```python
salt.runners.manage.versions()
```

Check the version of active minions

CLI Example:

```bash
salt-run manage.versions
```

### 21.16.20 `salt.runners.mattermost`

**Note for 2017.7 releases!**

Due to the `salt.runners.config` module not being available in this release series, importing the `salt.runners.config` module from the develop branch is required to make this module work.

*Ref:* Mattermost runner failing to retrieve config values due to unavailable config runner #43479

Module for sending messages to Mattermost

New in version 2017.7.0.

**configuration** This module can be used by either passing an `api_url` and `hook` directly or by specifying both in a configuration profile in the salt master/minion config. For example:

```yaml
mattermost:
    hook: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
    api_url: https://example.com
```
salt.runners.mattermost.post_event(event, channel=None, username=None, api_url=None, 
    hook=None)

Send an event to a Mattermost channel.  
:param channel: The channel name, either will work.  
:param username: The username of the poster.  
:param event: The event to send to the Mattermost channel.  
:param api_url: The Mattermost api url, if not specified in the configuration.  
:param hook: The Mattermost hook, if not specified in the configuration.  
:return: Boolean if message was sent successfully.

salt.runners.mattermost.post_message(message, channel=None, username=None, api_url=None, 
    hook=None)

Send a message to a Mattermost channel.  
:param channel: The channel name, either will work.  
:param username: The username of the poster.  
:param message: The message to send to the Mattermost channel.  
:param api_url: The Mattermost api url, if not specified in the configuration.  
:param hook: The Mattermost hook, if not specified in the configuration.  
:return: Boolean if message was sent successfully.

CLI Example:

```bash
salt-run mattermost.post_message message='Build is done'
```

### 21.16.21 salt.runners.mine

A runner to access data from the salt mine

salt.runners.mine.get(tgt, fun, tgt_type='glob')

Gathers the data from the specified minions' mine, pass in the target, function to look up and the target type

CLI Example:

```bash
salt-run mine.get '*'' network.interfaces
```

salt.runners.mine.update(tgt, tgt_type='glob', clear=False, mine_functions=None)

New in version 2017.7.0.

Update the mine data on a certain group of minions.

tgt Which minions to target for the execution.

tgt_type: glob The type of tgt.

clear: False Boolean flag specifying whether updating will clear the existing mines, or will update. Default: False (update).

mine_functions Update the mine data on certain functions only. This feature can be used when updating the mine for functions that require refresh at different intervals than the rest of the functions specified under mine_functions in the minion/master config or pillar.

CLI Example:

```bash
salt-run mine.update '*'
salt-run mine.update 'juniper-edges' tgt_type='nodegroup'
```

### 21.16.22 salt.runners.nacl

This module helps include encrypted passwords in pillars, grains and salt state files.

depends libnacl, https://github.com/saltstack/libnacl

This is often useful if you wish to store your pillars in source control or share your pillar data with others that you trust. I don’t advise making your pillars public regardless if they are encrypted or not.

configuration The following configuration defaults can be define (pillar or config files) Avoid storing private keys in pillars! Ensure master does not have pillar_opts=True:
# cat /etc/salt/master.d/nacl.conf

nacl.config:

# NOTE: `key` and `key_file` have been renamed to `sk`, `sk_file`  
# also `box_type` default changed from secretbox to sealedbox.

box_type: sealedbox (default)  
sk_file: /etc/salt/pki/master/nacl (default)  
pk_file: /etc/salt/pki/master/nacl.pub (default)  

sk: None  
pk: None

Usage can override the config defaults:

```
salt-run nacl.enc sk_file=/etc/salt/pki/master/nacl pk_file=/etc/salt/pki/master/nacl.pub
```

The nacl lib uses 32byte keys, these keys are base64 encoded to make your life more simple. To generate your `sk_file` and `pk_file` use:

```
salt-run nacl.keygen sk_file=/etc/salt/pki/master/nacl  
        # or if you want to work without files.  
salt-run nacl.keygen local:  
            
            pk: /kfGX7PbWeu099702PbbkWLPg/9p06IQRswkdWHCDk0=  
            sk: SVWut5SqPnuPeNzb1b9y6b2eXg2PLIo43GBzp48Sow=  
```

Now with your keypair, you can encrypt data:

You have two option, `sealedbox` or `secretbox`.

SecretBox is data encrypted using private key `pk`. Sealedbox is encrypted using public key `pk`.

Recommend using Sealedbox because the one way encryption permits developers to encrypt data for source control but not decrypt. Sealedbox only has one key that is for both encryption and decryption.

```
salt-run nacl.enc asecretpass pk=/kfGX7PbWeu099702PbbkWLPg/9p06IQRswkdWHCDk0=  
tqXzeI3nTAM9XF0mdLcpEdk1MbfBGpJ2oTKmlgrm3S1DTVVHNNn9h8mU1GKllGq/+/cYsk6m5WhGdk58=  
```

To decrypt the data:

```
salt-run nacl.dec data=  
    "tqXzeI3nTAM9XF0mdLcpEdk1MbfBGpJ2oTKmlgrm3S1DTVVHNNn9h8mU1GKllGq/+/cYsk6m5WhGdk58="  
```

When the keys are defined in the master config you can use them from the nacl runner without extra parameters:

```
# cat /etc/salt/master.d/nacl.conf

nacl.config:  
    sk_file: /etc/salt/pki/master/nacl  
    pk: 'cTIqXwnU1E1ulg4KxsbvCE7/NoeKEzd4nLeYccFpd9k='

salt-run nacl.enc 'asecretpass'  
salt-run nacl.dec 'tqXzeI3nTAM9XF0mdLcpEdk1MbfBGpJ2oTKmlgrm3S1DTVVHNNn9h8mU1GKllGq/  
    +/cYsk6m5WhGdk58='  
```
A salt developers minion could have pillar data that includes a nacl public key

```
nacl.config:
  pk: '/kfGX7PbWeu099702PBbKWlpG/9p6G1QRsWkdWHCDk0='
```

The developer can then use a less-secure system to encrypt data.

```
salt-run nacl.enc apassword
```

Pillar files can include protected data that the salt master decrypts:

```
pillarexample:
  user: root
  password1: {{salt.nacl.dec('DRB7Q6/X5gSRCTpZyxs6hlWj0llUA+uaVyyou3vJ4=')|json}}
  cert_key: {{salt.nacl.dec_file('/srv/salt/certs/example.com/key.nacl')|json}}
  cert_key2: {{salt.nacl.dec_file('salt:///certs/example.com/key.nacl')|json}}
```

Larger files like certificates can be encrypted with:

```
salt-run nacl.enc_file /tmp/cert.crt out=/tmp/cert.nacl
```

```
salt.runners.nacl.dec(data,**kwargs)
    Alias to [box_type].decrypt
    box_type: secretbox, sealedbox(default)
```

```
salt.runners.nacl.dec_file(name, out=None,**kwargs)
    This is a helper function to decrypt a file and return its contents.
    You can provide an optional output file using out
    name can be a local file or when not using salt-run can be a url like salt://, https:// etc.
    CLI Examples:
```
```
salt-run nacl.dec_file name=/tmp/id_rsa.nacl
salt-run nacl.dec_file name=/tmp/id_rsa.nacl box_type=secretbox sk_file=/etc/salt/pki/master/nacl.pub
```

```
salt.runners.nacl.enc(data,**kwargs)
    Alias to [box_type].encrypt
    box_type: secretbox, sealedbox(default)
```

```
salt.runners.nacl.enc_file(name, out=None,**kwargs)
    This is a helper function to encrypt a file and return its contents.
    You can provide an optional output file using out
    name can be a local file or when not using salt-run can be a url like salt://, https:// etc.
    CLI Examples:
```
```
salt-run nacl.enc_file name=/tmp/id_rsa
salt-run nacl.enc_file name=/tmp/id_rsa box_type=secretbox sk_file=/
```

```
salt.runners.nacl.keygen(sk_file=None, pk_file=None,**kwargs)
    Use libnacl to generate a keypair.
    If no sk_file is defined return a keypair.
    If only the sk_file is defined pk_file will use the same name with a postfix .pub.
```
When the `sk_file` is already existing, but `pk_file` is not. The `pk_file` will be generated using the `sk_file`.

CLI Examples:

```bash
salt-run nacl.keygen
salt-run nacl.keygen sk_file=/etc/salt/pki/master/nacl
salt-run nacl.keygen sk_file=/etc/salt/pki/master/nacl pk_file=/etc/salt/pki/master/nacl.pub
salt-run nacl.keygen
```

salt.runners.nacl.sealedbox_decrypt(data, **kwargs)
Decrypt data using a secret key that was encrypted using a public key with `nacl.sealedbox_encrypt`.

CLI Examples:

```bash
salt-run nacl.sealedbox_decrypt pEXHQM6cuaF7A=
salt-run nacl.sealedbox_decrypt data='pEXHQM6cuaF7A=' sk_file=/etc/salt/pki/master/nacl
salt-run nacl.sealedbox_decrypt data='pEXHQM6cuaF7A=' sk='YmFkcGFzcwo='
```

salt.runners.nacl.sealedbox_encrypt(data, **kwargs)
Encrypt data using a public key generated from `nacl.keygen`. The encryptd data can be decrypted using `nacl.sealedbox_decrypt` only with the secret key.

CLI Examples:

```bash
salt-run nacl.sealedbox_encrypt datatoenc
```

salt.runners.nacl.secretbox_decrypt(data, **kwargs)
Decrypt data that was encrypted using `nacl.secretbox_encrypt` using the secret key that was generated from `nacl.keygen`.

CLI Examples:

```bash
salt-run nacl.secretbox_decrypt pEXHQM6cuaF7A=
salt-run nacl.secretbox_decrypt data='pEXHQM6cuaF7A=' sk_file=/etc/salt/pki/master/nacl
salt-run nacl.secretbox_decrypt data='pEXHQM6cuaF7A=' sk='YmFkcGFzcwo='
```

salt.runners.nacl.secretbox_encrypt(data, **kwargs)
Encrypt data using a secret key generated from `nacl.keygen`. The same secret key can be used to decrypt the data using `nacl.secretbox_decrypt`.

CLI Examples:

```bash
salt-run nacl.secretbox_encrypt datatoenc
salt-run nacl.secretbox_encrypt datatoenc sk_file=/etc/salt/pki/master/nacl
salt-run nacl.secretbox_encrypt datatoenc sk='YmFkcGFzcwo='
```

21.16.23 salt.runners.net

NET Finder

New in version 2017.7.0.

A runner to find network details easily and fast. It’s smart enough to know what you are looking for.
Configuration

- Minion (proxy) config

To have the complete features, one needs to add the following mine configuration in the minion (proxy) config file:

```yaml
mine_functions:
  net.ipaddrs: []
  net.lldp: []
  net.mac: []
  net.arp: []
  net.interfaces: []
```

Which instructs Salt to cache the data returned by the NAPALM-functions. While they are not mandatory, the less functions configured, the less details will be found by the runner.

How often the mines are refreshed, can be specified using:

```yaml
mine_interval: <X minutes>
```

- Master config

By default the following options can be configured on the master. They are not necessary, but available in case the user has different requirements.

- **target:** ∗ From what minions will collect the mine data. Default: ∗ (collect from all minions).
- **expr_form:** glob Minion matching expression form. Default: glob.
- **ignore_interfaces** A list of interfaces name to ignore. By default will consider all interfaces.
- **display:** True Display on the screen or return structured object? Default: True (return on the CLI).
- **outputter:** table Specify the outputter name when displaying on the CLI. Default: table.

Configuration example:

```yaml
runners:
  net.find:
    target: 'edge*'
    expr_form: 'glob'
    ignore_interfaces:
      - lo0
      - em1
      - jsrv
      - fxp0
    outputter: yaml
```

`salt.runners.net.find(addr, best=True, display=True)`

Search in all possible entities (Interfaces, MAC tables, ARP tables, LLDP neighbors), using the following mine functions:
- net.mac
- net.arp
- net.lldp
- net.ipaddrs
- net.interfaces

This function has the advantage that it knows where to look, but the output might become quite long as returns all possible matches.
Optional arguments:

best: True  Return only the best match with the interfaces IP networks when the searching pattern is a valid IP Address or Network.

display: True  Display on the screen or return structured object? Default: True (return on the CLI).

CLI Example:

```bash
$sudo salt-run net.find 10.10.10.7
```

Output Example:

```
Details for all interfaces that include network 10.10.10.7/32 - only best match
------------------------------------------------------------------------------------------------------------------------
| Device | Interface | Interface Description | UP | Enabled | Speed | MAC Address | IP Addresses |
------------------------------------------------------------------------------------------------------------------------
| edge01.flw01 | irb | | True | True | -1 | 5C:5E:AB:AC:52:B4 | 10.10.10.1/22 |
------------------------------------------------------------------------------------------------------------------------

ARP Entries for IP 10.10.10.7
------------------------------------------------------------------------------------------------------------------------
| Device | Interface | MAC | IP | Age |
------------------------------------------------------------------------------------------------------------------------
| edge01.flw01 | irb.349 [ae0.349] | 2C:60:0F:78:EC:41 | 10.10.10.7 | 832.0 |
------------------------------------------------------------------------------------------------------------------------
```

```
salt.runners.net.findarp(device=None, interface=None, mac=None, ip=None, display=True)
Search for entries in the ARP tables using the following mine functions:
• net.arp

Optional arguments:

device  Return interface data from a certain device only.
interface  Return data selecting by interface name.
mac  Search using a specific MAC Address.
ip  Search using a specific IP Address.

display: True  Display on the screen or return structured object? Default: True, will return on the CLI.

CLI Example:

```bash
$sudo salt-run net.findarp mac=8C:60:0F:78:EC:41
```

Output Example:

```
ARP Entries for MAC 8C:60:0F:78:EC:41
------------------------------------------------------------------------------------------------------------------------
| Device | Interface | MAC | IP | Age |
------------------------------------------------------------------------------------------------------------------------
| edge01.bjm01 | irb.171 [ae0.171] | 8C:60:0F:78:EC:41 | 172.172.17.19 | 956.0 |
------------------------------------------------------------------------------------------------------------------------
```

```
salt.runners.net.findmac(device=None, mac=None, interface=None, vlan=None, display=True)
Search in the MAC Address tables, using the following mine functions:
• net.mac

Optional arguments:

device  Return interface data from a certain device only.

CLI Example:

```bash
```
interface  Return data selecting by interface name.
mac    Search using a specific MAC Address.
vlan   Search using a VLAN ID.
display: True  Display on the screen or return structured object? Default: True, will return on the CLI.

CLI Example:

$ sudo salt-run net.findmac mac=8C:60:0F:78:EC:41

Output Example:

<table>
<thead>
<tr>
<th>Device</th>
<th>Interface</th>
<th>MAC</th>
<th>VLAN</th>
<th>Static</th>
<th>Active</th>
<th>Moves</th>
</tr>
</thead>
<tbody>
<tr>
<td>edge01</td>
<td>ae0.171</td>
<td>8C:60:0F:78:EC:41</td>
<td>171</td>
<td>False</td>
<td>True</td>
<td>0</td>
</tr>
</tbody>
</table>

salt.runners.net.interfaces(device=None, interface=None, title=None, pattern=None, ipnet=None, best=True, display=True)

Search for interfaces details in the following mine functions:

- net.interfaces
- net.ipaddrs

Optional arguments:

device  Return interface data from a certain device only.
interface Return data selecting by interface name.
pattern Return interfaces that contain a certain pattern in their description.
ipnet   Return interfaces whose IP networks associated include this IP network.
bestrue When ipnet is specified, this argument says if the runner should return only the best match (the output will contain at most one row). Default: True (return only the best match).
display: True Display on the screen or return structured object? Default: True (return on the CLI).
title   Display a custom title for the table.

CLI Example:

$ sudo salt-run net.interfaces interface=vt-0/0/10

Output Example:

Details for interface xe-0/0/0
__________________________________________________________________________________
<table>
<thead>
<tr>
<th>Device</th>
<th>Interface</th>
<th>Interface Description</th>
<th>UP</th>
<th>Enabled</th>
<th>Speed</th>
</tr>
</thead>
<tbody>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
salt.runners.net.lldp(<device=None, interface=None, title=None, pattern=None, chassis=None, display=True>)

Search in the LLDP neighbors, using the following mine functions:

- net.lldp

Optional arguments:

device Return interface data from a certain device only.

interface Return data selecting by interface name.

pattern Return LLDP neighbors that have contain this pattern in one of the following fields:
  - Remote Port ID
  - Remote Port Description
  - Remote System Name
  - Remote System Description

chassis Search using a specific Chassis ID.

display: True Display on the screen or return structured object? Default: True (return on the CLI).

display: True Display on the screen or return structured object? Default: True (return on the CLI).

title Display a custom title for the table.

CLI Example:

$ sudo salt-run net.lldp pattern=Ethernet1/48

Output Example:

Pattern "Ethernet1/48" found in one of the following LLDP details

<table>
<thead>
<tr>
<th>Device</th>
<th>Interface</th>
<th>Parent Interface</th>
<th>Remote Chassis ID</th>
<th>Remote PortID</th>
<th>Remote Port Description</th>

</tr>
</tbody>
</table>

(continues on next page)
salt.runners.net.multi_find(patterns, **kwargs)

Execute multiple search tasks. This function is based on the find function. Depending on the search items, some information might overlap.

Optional arguments:

best: True Return only the best match with the interfaces IP networks when the searching pattern is a valid IP Address or Network.

display: True Display on the screen or return structured object? Default: True (return on the CLI).

CLI Example:

```bash
$ sudo salt-run net.multi_find Ethernet1/49 xe-0/1/2
```

Output Example:

```
Pattern "Ethernet1/49" found in one of the following LLDP details

<table>

21.16.24 salt.runners.network

Network tools to run from the Master

salt.runners.network.wol(mac, bcast='255.255.255.255', destport=9)
Send a "Magic Packet" to wake up a Minion

CLI Example:

```
salt-run network.wol 08-00-27-13-69-77
salt-run network.wol 080027136977 255.255.255.255 7
salt-run network.wol 08:00:27:13:69:77 255.255.255.255 7
```

salt.runners.network.wollist(maclist, bcast='255.255.255.255', destport=9)
Send a "Magic Packet" to wake up a list of Minions. This list must contain one MAC hardware address per line

CLI Example:
salt-run network.wollist '/path/to/maclist'
salt-run network.wollist '/path/to/maclist' 255.255.255.255
salt-run network.wollist '/path/to/maclist' 255.255.255.255

salt.runners.network.wolmatch(tgt, tgt_type='glob', bcast='255.255.255.255', destport=9)
   Send a "Magic Packet" to wake up Minions that are matched in the grains cache
   CLI Example:
   
   salt-run network.wolmatch minion_id
   salt-run network.wolmatch 192.168.0.0/16 tgt_type='ipcidr' bcast=255.255.255.255! destport=7

21.16.25 salt.runners.pagerduty

Runner Module for Firing Events via PagerDuty

New in version 2014.1.0.

configuration This module can be used by specifying the name of a configuration profile in the master config.
   For example:

   my-pagerduty-account:
      pagerduty.api_key: F3Rbyjbve43rfFw2214
      pagerduty.subdomain: mysubdomain

salt.runners.pagerduty.create_event(service_key=None, description=None, details=None, incident_key=None, profile=None)
   Create an event in PagerDuty. Designed for use in states.
   CLI Example:
   
   salt-run pagerduty.create_event <service_key> <description> <details>
   --profile=my-pagerduty-account

   The following parameters are required:
   service_key  This key can be found by using pagerduty.list_services.
   description  This is a short description of the event.
   details      This can be a more detailed description of the event.
   profile      This refers to the configuration profile to use to connect to the PagerDuty service.

salt.runners.pagerduty.list_escalation_policies(profile=None, api_key=None)
   List escalation policies belonging to this account
   CLI Example:
   
   salt-run pagerduty.list_policies my-pagerduty-account
   salt-run pagerduty.list_escalation_policies my-pagerduty-account

This function is an alias of list_policies.

salt.runners.pagerduty.list_incidents(profile=None, api_key=None)
   List incidents belonging to this account
   CLI Example:
   
   salt-run pagerduty.list_incidents my-pagerduty-account

salt.runners.pagerduty.list_maintenance_windows(profile=None, api_key=None)
   This function is an alias of list_windows.
List maintenance windows belonging to this account

CLI Example:
```
salt-run pagerduty.list_windows my-pagerduty-account
salt-run pagerduty.list_maintenance_windows my-pagerduty-account
```

```
salt.runners.pagerduty.list_policies(profile=None, api_key=None)
```
List escalation policies belonging to this account

CLI Example:
```
salt-run pagerduty.list_policies my-pagerduty-account
salt-run pagerduty.list_escalation_policies my-pagerduty-account
```

```
salt.runners.pagerduty.list_schedules(profile=None, api_key=None)
```
List schedules belonging to this account

CLI Example:
```
salt-run pagerduty.list_schedules my-pagerduty-account
```

```
salt.runners.pagerduty.list_services(profile=None, api_key=None)
```
List services belonging to this account

CLI Example:
```
salt-run pagerduty.list_services my-pagerduty-account
```

```
salt.runners.pagerduty.list_users(profile=None, api_key=None)
```
List users belonging to this account

CLI Example:
```
salt-run pagerduty.list_users my-pagerduty-account
```

```
salt.runners.pagerduty.list_windows(profile=None, api_key=None)
```
List maintenance windows belonging to this account

CLI Example:
```
salt-run pagerduty.list_windows my-pagerduty-account
salt-run pagerduty.list_maintenance_windows my-pagerduty-account
```

---

21.16.26 salt.runners.pillar

Functions to interact with the pillar compiler on the master

```
salt.runners.pillar.show_pillar(minion='*', **kwargs)
```

Returns the compiled pillar either of a specific minion or just the global available pillars. This function assumes that no minion has the id *. Function also accepts pillarenv as attribute in order to limit to a specific pillar branch of git

CLI Example:
```
salt-run pillar.show_pillar 'www.example.com'
salt-run pillar.show_pillar
```

shows global for 'dev' pillar environment: (note that not specifying pillarenv will merge all pillar environments using the master config option pillar_source_merging_strategy.)
shows global pillar for 'dev' pillar environment and specific pillarenv = dev:

```
salt-run pillar.show_pillar 'pillarenv=dev'
```

API Example:

```python
import salt.config
import salt.runner
opts = salt.config.master_config('/etc/salt/master')
runner = salt.runner.RunnerClient(opts)
pillar = runner.cmd('pillar.show_pillar', [])
print(pillar)
```

```
salt.runners.pillar.show_top(minion=None, saltenv='base')
```

Returns the compiled top data for pillar for a specific minion. If no minion is specified, we use the first minion we find.

CLI Example:

```
salt-run pillar.show_top
```

### 21.16.27 salt.runners.pkg

Package helper functions using `salt.modules.pkg`

New in version 2015.8.0.

```
salt.runners.pkg.list_upgrades(jid, style='group', outputter='nested', ext_source=None)
```

Show list of available pkg upgrades using a specified format style

CLI Example:

```
salt-run pkg.list_upgrades jid=2014112011414117719 style=group
```

### 21.16.28 salt.runners.queue

General management and processing of queues.

This runner facilitates interacting with various queue backends such as the included sqlite3 queue or the planned AWS SQS and Redis queues.

The queue functions such as `insert`, `delete`, and `pop` can be used for typical management of the queue.

The `process_queue` function pops the requested number of items from the queue and creates a Salt Event that can then be processed by a Reactor. The `process_queue` function can be called manually, or can be configured to run on a schedule with the Salt Scheduler or regular system cron. It is also possible to use the peer system to allow a minion to call the runner.

This runner, as well as the Queues system, is not api stable at this time.

There are many things that could potentially be done with queues within Salt. For the time being the focus will be on queueing infrastructure actions on specific minions. The queues generally will be populated with minion IDs.

When the `process_queue` runner function is called events are created on the Salt Event bus that indicate the queue and a list of one or more minion IDs. The reactor is set up to match on event tags for a specific queue and then take
infrastructure actions on those minion IDs. These actions might be to delete the minion’s key from the master, use salt-cloud to destroy the vm, or some other custom action.

**Queued runners**

Using the Salt Queues, references to the commandline arguments of other runners can be saved to be processed later. The queue runners require a queue backend that can store json data (default: *pgjsonb*).

Once the queue is setup, the `runner_queue` will need to be configured.

```
runner_queue:
  queue: runners
  backend: pgjsonb
```

**Note:** only the queue is required, this defaults to using pgjsonb

Once this is set, then the following can be added to the scheduler on the master and it will run the specified amount of commands per time period.

```
schedule:
  runner_queue:
    schedule:
      function: queue.process_runner
      minutes: 1
      kwargx: quantity: 2
```

The above configuration will pop 2 runner jobs off the runner queue, and then run them. And it will do this every minute, unless there are any jobs that are still running from the last time the process_runner task was executed.

salt.runners.queue.delete(queue, items, backend='sqlite')

Delete an item or items from a queue

CLI Example:

```
salt-run queue.delete myqueue myitem
salt-run queue.delete myqueue myitem backend=sqlite
salt-run queue.delete myqueue 
['item1', 'item2', 'item3']
```

salt.runners.queue.insert(queue, items, backend='sqlite')

Add an item or items to a queue

CLI Example:

```
salt-run queue.insert myqueue myitem
salt-run queue.insert myqueue 
['item1', 'item2', 'item3']
```

salt.runners.queue.insert_runner(fun, args=None, kwargs=None, queue=None, backend=None)

Insert a reference to a runner into the queue so that it can be run later.

*fun* The runner function that is going to be run
*args* list or comma-separated string of args to send to fun
*kwargs* dictionary of keyword arguments to send to fun
*queue* queue to insert the runner reference into
*backend* backend that to use for the queue
CLI Example:

```
salt-run queue.insert_runner test.stdout_print
salt-run queue.insert_runner event.send test_insert_runner kwarg="{"data": {"foo": "bar"}}"
```

salt.runners.queue.list_items(queue, backend='sqlite')
List contents of a queue

CLI Example:

```
salt-run queue.list_items myqueue
salt-run queue.list_items myqueue backend=sqlite
```

salt.runners.queue.list_length(queue, backend='sqlite')
Provide the number of items in a queue

CLI Example:

```
salt-run queue.list_length myqueue
salt-run queue.list_length myqueue backend=sqlite
```

salt.runners.queue.list_queues(backend='sqlite')
Return a list of Salt Queues on the backend

CLI Example:

```
salt-run queue.list_queues
salt-run queue.list_queues backend=sqlite
```

salt.runners.queue.pop(queue, quantity=1, backend='sqlite', is_runner=False)
Pop one or more or all items from a queue

CLI Example:

```
salt-run queue.pop myqueue
salt-run queue.pop myqueue 6
salt-run queue.pop myqueue all
salt-run queue.pop myqueue 6 backend=sqlite
salt-run queue.pop myqueue all backend=sqlite
```

salt.runners.queue.process_queue(queue, quantity=1, backend='sqlite', is_runner=False)
Pop items off a queue and create an event on the Salt event bus to be processed by a Reactor.

CLI Example:

```
salt-run queue.process_queue myqueue
salt-run queue.process_queue myqueue 6
salt-run queue.process_queue myqueue all backend=sqlite
```

salt.runners.queue.process_runner(quantity=1, queue=None, backend=None)
Process queued runners

```
salt-run queue.process_runner
salt-run queue.process_runner 5
```

Chapter 21. Salt Module Reference
21.16.29 salt.runners.reactor

A convenience system to manage reactors

Beginning in the 2017.7 release, the reactor runner requires that the reactor system is running. This is accomplished one of two ways, either by having reactors configured or by including reactor in the engine configuration for the Salt master.

```
engines:
  - reactor

salt.runners.reactor.add(event, reactors, saltenv='base', test=None)
  Add a new reactor

  CLI Example:
  ```
salt-run reactor.add 'salt/cloud/*/destroyed' reactors='/srv/reactor/destroy/*.sls'
  ```

salt.runners.reactor.delete(event, saltenv='base', test=None)
  Delete a reactor

  CLI Example:
  ```
salt-run reactor.delete 'salt/cloud/*/destroyed'
  ```

salt.runners.reactor.list_(saltenv='base', test=None)
  List currently configured reactors

  CLI Example:
  ```
salt-run reactor.list
  ```

21.16.30 salt.runners.salt

This runner makes Salt’s execution modules available on the salt master.

New in version 2016.11.0. Salt’s execution modules are normally available on the salt minion. Use this runner to call execution modules on the salt master. Salt execution modules are the functions called by the salt command.

Execution modules can be called with salt-run:

```
salt-run salt.cmd test.ping
  # call functions with arguments and keyword arguments
  salt-run salt.cmd test.arg 1 2 3 key=value a=1
```

Execution modules are also available to salt runners:

```
__salt__['salt.cmd'](fun=fun, args=ARGS, kwargs=kwargs)
```

salt.runners.salt.cmd(fun, *args, **kwargs)
  Changed in version 2018.3.0: Added with_pillar argument

  Execute fun with the given args and kwargs. Parameter fun should be the string name of the execution module to call.
Note: Execution modules will be loaded every time this function is called. Additionally, keep in mind that since runners execute on the master, custom execution modules will need to be synced to the master using `salt-run saltutil.sync_modules`, otherwise they will not be available.

`with_pillar [False] If True, pillar data will be compiled for the master`

Note: To target the master in the pillar top file, keep in mind that the default id for the master is `<hostname>_master`. This can be overridden by setting an id configuration parameter in the master config file.

CLI example:

```bash
salt-run salt.cmd test.ping
salt-run salt.cmd test.arg 1 2 3 a=1
salt-run salt.cmd mymod.myfunc with_pillar=True
```

salt.runners.salt.execute( `tgt`, `fun`, `arg=()`, `timeout=None`, `tgt_type='glob'`, `ret='', `jid='`, `kwarg=None`, **kwargs)``

New in version 2017.7.0.

Execute `fun` on all minions matched by `tgt` and `tgt_type`. Parameter `fun` is the name of execution module function to call.

This function should mainly be used as a helper for runner modules, in order to avoid redundant code. For example, when inside a runner one needs to execute a certain function on arbitrary groups of minions, only has to:

```python
ret1 = __salt__['salt.execute']('*', 'mod.fun')
ret2 = __salt__['salt.execute']('my_nodegroup', 'mod2.fun2', tgt_type='nodegroup')
```

It can also be used to schedule jobs directly on the master, for example:

```json
schedule:
  collect_bgp_stats:
    function: salt.execute
    args:
      - edge-routers
      - bgp.neighbors
    kwarg:
      tgt_type: nodegroup
defays: 1
  returner: redis
```

21.16.31 salt.runners.saltutil

The Saltutil runner is used to sync custom types to the Master. See the `saltutil module` for documentation on managing updates to minions.

New in version 2016.3.0.

```python
salt.runners.saltutil.sync_all(saltenv='base', extmod_whitelist=None, extmod_blacklist=None)
```

Sync all custom types
saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] dictionary of modules to sync based on type

extmod_blacklist [None] dictionary of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_all
salt-run saltutil.sync_all extmod_whitelist=['runners': ['custom_runner'], 'grains': []]
```

```
salt.runners.saltutil.sync_cache(saltenv='base', extmod_whitelist=None, extmod_blacklist=None)
```

New in version 2017.7.0.

Sync cache modules from `salt://_cache` to the master

```
salt.runners.saltutil.sync_clouds(saltenv='base', extmod_whitelist=None, extmod_blacklist=None)
```

New in version 2017.7.0.

Sync cloud modules from `salt://_clouds` to the master

```
salt.runners.saltutil.sync_eauth_tokens(saltenv='base', extmod_whitelist=None, extmod_blacklist=None)
```

New in version 2018.3.0.

Sync eauth token modules from `salt://_tokens` to the master

```
salt.runners.saltutil.sync_engines(saltenv='base', extmod_whitelist=None, extmod_blacklist=None)
```

Sync engines from `salt://_engines` to the master

21.16. runner modules
### salt-run saltutil.sync_engines

```python
class salt.runners.saltutil.sync_executors:
    def __init__(self, saltenv='base', extmod_whitelist=None, extmod_blacklist=None):
        pass
```

New in version 2019.2.1.

Sync executor modules from `salt:///_executors` to the master

- **saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
- **extmod_whitelist** [None] comma-separated list of modules to sync
- **extmod_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```bash
salt-run saltutil.sync_executors
```

### salt-run saltutil.sync_fileserver

```python
class salt.runners.saltutil.sync_fileserver:
    def __init__(self, saltenv='base', extmod_whitelist=None, extmod_blacklist=None):
        pass
```

New in version 2018.3.0.

Sync fileserver modules from `salt:///_fileserver` to the master

- **saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
- **extmod_whitelist** [None] comma-separated list of modules to sync
- **extmod_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```bash
salt-run saltutil.sync_fileserver
```

### salt-run saltutil.sync_grains

```python
class salt.runners.saltutil.sync_grains:
    def __init__(self, saltenv='base', extmod_whitelist=None, extmod_blacklist=None):
        pass
```

Sync grains modules from `salt:///_grains` to the master

- **saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
- **extmod_whitelist** [None] comma-separated list of modules to sync
- **extmod_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```bash
salt-run saltutil.sync_grains
```

### salt-run saltutil.sync_modules

```python
class salt.runners.saltutil.sync_modules:
    def __init__(self, saltenv='base', extmod_whitelist=None, extmod_blacklist=None):
        pass
```

Sync execution modules from `salt:///_modules` to the master

- **saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
- **extmod_whitelist** [None] comma-separated list of modules to sync
- **extmod_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```bash
salt-run saltutil.sync_modules
```

### salt-run saltutil.sync_output

```python
class salt.runners.saltutil.sync_output:
    def __init__(self, saltenv='base', extmod_whitelist=None, extmod_blacklist=None):
        pass
```

Sync output modules from `salt:///_output` to the master

- **saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
- **extmod_whitelist** [None] comma-separated list of modules to sync
- **extmod_blacklist** [None] comma-separated list of modules to blacklist based on type
CLI Example:

```bash
salt-run saltutil.sync_output
```

```
salt.runners.saltutil.sync_pillar
```

```
salt.runners.saltutil.sync_proxymodules
```

```
salt.runners.saltutil.sync_queues
```

```
salt.runners.saltutil.sync_renderers
```

```
salt.runners.saltutil.sync_returners
```

21.16. runner modules
salt-run saltutil.sync_returners

salt.runners.saltutil.sync_roster(saltenv='base', extmod_whitelist=None, extmod_blacklist=None)

New in version 2017.7.0.
Sync roster modules from salt://_roster to the master
saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
extmod_whitelist [None] comma-separated list of modules to sync
extmod_blacklist [None] comma-seperated list of modules to blacklist based on type
CLI Example:
salt-run saltutil.sync_roster

salt.runners.saltutil.sync_runners(saltenv='base', extmod_whitelist=None, extmod_blacklist=None)
Sync runners from salt://_runners to the master
saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
extmod_whitelist [None] comma-separated list of modules to sync
extmod_blacklist [None] comma-seperated list of modules to blacklist based on type
CLI Example:
salt-run saltutil.sync_runners

salt.runners.saltutil.sync_sdb(saltenv='base', extmod_whitelist=None, extmod_blacklist=None)
New in version 2017.7.0.
Sync sdb modules from salt://_sdb to the master
saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
extmod_whitelist [None] comma-separated list of modules to sync
extmod_blacklist [None] comma-seperated list of modules to blacklist based on type
CLI Example:
salt-run saltutil.sync_sdb

salt.runners.saltutil.sync_serializers(saltenv='base', extmod_whitelist=None, extmod_blacklist=None)
New in version 2019.2.0.
Sync serializer modules from salt://_serializers to the master
saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
extmod_whitelist [None] comma-separated list of modules to sync
extmod_blacklist [None] comma-seperated list of modules to blacklist based on type
CLI Example:
salt-run saltutil.sync_serializers

salt.runners.saltutil.sync_states(saltenv='base', extmod_whitelist=None, extmod_blacklist=None)
Sync state modules from salt://_states to the master
saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
extmod_whitelist [None] comma-separated list of modules to sync

extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Example:
```
salt-run saltutil.sync_states
```

```
salt.runners.saltutil.sync_thorium(saltenv='base', extmod_whitelist=None, extmod_blacklist=None)
```
New in version 2018.3.0.
Sync Thorium from `salt://_thorium` to the master

```
saltenv: base The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
```

```
extmod_whitelist comma-separated list of modules to sync
```

```
extmod_blacklist comma-separated list of modules to blacklist based on type
```

CLI Example:
```
salt-run saltutil.sync_thorium
```

```
salt.runners.saltutil.sync_tops(saltenv='base', extmod_whitelist=None, extmod_blacklist=None)
```
New in version 2016.3.7, 2016.11.4, 2017.7.0.
Sync `master_tops` modules from `salt://_tops` to the master

```
saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
```

CLI Example:
```
salt-run saltutil.sync_tops
```

```
salt.runners.saltutil.sync_utils(saltenv='base', extmod_whitelist=None, extmod_blacklist=None)
```
New in version 2016.11.0.
Sync `utils` modules from `salt://_utils` to the master

```
saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
```

```
extmod_whitelist [None] comma-seperated list of modules to sync
```

```
extmod_blacklist [None] comma-seperated list of modules to blacklist based on type
```

CLI Example:
```
salt-run saltutil.sync_utils
```

```
salt.runners.saltutil.sync_wheel(saltenv='base', extmod_whitelist=None, extmod_blacklist=None)
```
Sync `wheel` modules from `salt://_wheel` to the master

```
saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
```

```
extmod_whitelist [None] comma-seperated list of modules to sync
```

```
extmod_blacklist [None] comma-seperated list of modules to blacklist based on type
```

CLI Example:
```
salt-run saltutil.sync_wheel
```

## 21.16.32 salt.runners.sdb

Runner for setting and querying data via the sdb API on the master
salt.runners.sdb.delete(uri)
Delete a value from a db, using a uri in the form of sdb://<profile>/<key>. If the uri provided does not start with sdb:// or the value is not successfully deleted, return False.

CLI Example:
```
salt-run sdb.delete sdb://mymemcached/foo
```

salt.runners.sdb.get(uri)
Get a value from a db, using a uri in the form of sdb://<profile>/<key>. If the uri provided does not start with sdb://, then it will be returned as-is.

CLI Example:
```
salt-run sdb.get sdb://mymemcached/foo
```

salt.runners.sdb.get_or_set_hash(uri, length=8, chars='abcdefghijklmnopqrstuvwxyz0123456789!@#$%^&*(-_=+))
Perform a one-time generation of a hash and write it to sdb. If that value has already been set return the value instead.

This is useful for generating passwords or keys that are specific to multiple minions that need to be stored somewhere centrally.

CLI Example:
```
salt-run sdb.get_or_set_hash 'SECRET_KEY' 50
```

**Warning:** This function could return strings which may contain characters which are reserved as directives by the YAML parser, such as strings beginning with %. To avoid issues when using the output of this function in an SLS file containing YAML+Jinja, surround the call with single quotes.

salt.runners.sdb.set_(uri, value)
Set a value in a db, using a uri in the form of sdb://<profile>/<key>. If the uri provided does not start with sdb:// or the value is not successfully set, return False.

CLI Example:
```
salt-run sdb.set sdb://mymemcached/foo bar
```

### 21.16.33 salt.runners.smartos_vmadm

Runner for SmartOS minions control vmadm

salt.runners.smartos_vmadm.get(search, one=True)
Return information for vms

search [string] filter vms, see the execution module.

one [boolean] return only one vm

**Note:** If the search parameter does not contain an equal (=) symbol it will be assumed it will be tried as uuid, hostname, and alias.

CLI Example:
salt.run vmadm.get 91244bba-1146-e4ec-c07e-e825e0223aa9
salt.run vmadm.get search='alias=saskia'

salt.runners.smartos_vmadm.is_running(search)
Return true if vm is running
search [string] filter vms, see the execution module.

Note: If the search parameter does not contain an equal (=) symbol it will be assumed it will be tried as uuid, hostname, and alias.

Note: If multiple vms are matched, the result will be true of ALL vms are running

CLI Example:
salt-run vmadm.is_running 91244bba-1146-e4ec-c07e-e825e0223aa9
salt-run vmadm.is_running search='alias=julia'

salt.runners.smartos_vmadm.list_vms(search=None, verbose=False)
List all vms
search [string] filter vms, see the execution module
verbose [boolean] print additional information about the vm

CLI Example:
salt-run vmadm.list
salt-run vmadm.list search='type=KVM'
salt-run vmadm.list verbose=True

salt.runners.smartos_vmadm.nodes( verbose=False)
List all compute nodes
verbose [boolean] print additional information about the node e.g. platform version, hvm capable, ...

CLI Example:
salt-run vmadm.nodes
salt-run vmadm.nodes verbose=True

salt.runners.smartos_vmadm.reboot(search, one=True, force=False)
Reboot one or more vms
search [string] filter vms, see the execution module.
one [boolean] reboot only one vm
force [boolean] force reboot, faster but no graceful shutdown

Note: If the search parameter does not contain an equal (=) symbol it will be assumed it will be tried as uuid, hostname, and alias.

CLI Example:
salt-run vmadm.reboot 91244bba-1146-e4ec-c07e-e825e0223aa9
salt-run vmadm.reboot search='alias=marije'
salt-run vmadm.reboot search='type=KVM' one=False

salt.runners.smartos_vmadm.start(search, one=True)
Start one or more vms
search [string] filter vms, see the execution module.
one [boolean] start only one vm

Note: If the search parameter does not contain an equal (=) symbol it will be assumed it will be tried as uuid, hostname, and alias.

CLI Example:

```bash
salt-run vmadm.start 91244bba-1146-e4ec-c07e-e825e0223aa9
salt-run vmadm.start search='alias=jiska'
salt-run vmadm.start search='type=KVM' one=False
```

salt.runners.smartos_vmadm.stop(search, one=True)
Stop one or more vms

search [string] filter vms, see the execution module.
one [boolean] stop only one vm

Note: If the search parameter does not contain an equal (=) symbol it will be assumed it will be tried as uuid, hostname, and alias.

CLI Example:

```bash
salt-run vmadm.stop 91244bba-1146-e4ec-c07e-e825e0223aa9
salt-run vmadm.stop search='alias=jody'
salt-run vmadm.stop search='type=KVM' one=False
```

21.16.34 salt.runners.spacewalk

Spacewalk Runner

New in version 2016.3.0.

Runner to interact with Spacewalk using Spacewalk API

codeauthor Nitin Madhok <nmadhok@clemson.edu>, Joachim Werner <joe@suse.com>, Benedikt Werner <1benediktwerner@gmail.com>
maintainer Benedikt Werner <1benediktwerner@gmail.com>

To use this runner, set up the Spacewalk URL, username and password in the master configuration at /etc/salt/master or /etc/salt/master.d/spacewalk.conf:

```yaml
spacewalk:
  spacewalk01.domain.com:
    username: 'testuser'
    password: 'verybadpass'
  spacewalk02.domain.com:
    username: 'testuser'
    password: 'verybadpass'
```

Note: Optionally, protocol can be specified if the spacewalk server is not using the defaults. Default is protocol: https.

salt.runners.spacewalk.addGroupsToKey(server, activation_key, groups)
Add server groups to a activation key
CLI Example:
```
salt-run spacewalk.addGroupsToKey spacewalk01.domain.com 1-my-key '[group1, group2]'  
```

```
salt.runners.spacewalk.api(server, command, *args, **kwargs)  
Call the Spacewalk xmlrpc api.  
```

CLI Example:
```
salt-run spacewalk.api spacewalk01.domain.com systemgroup.create MyGroup Description  
salt-run spacewalk.api spacewalk01.domain.com systemgroup.create arguments='[ "MyGroup", "Description"]'  
```

State Example:
```
create_group:  
salt.runner:  
- name: spacewalk.api  
- server: spacewalk01.domain.com  
- command: systemgroup.create  
- arguments:  
  - MyGroup  
  - Description  
```

```
salt.runners.spacewalk.deleteAllActivationKeys(server)  
Delete all activation keys from Spacewalk  
```

CLI Example:
```
salt-run spacewalk.deleteAllActivationKeys spacewalk01.domain.com  
```

```
salt.runners.spacewalk.deleteAllGroups(server)  
Delete all server groups from Spacewalk  
salt.runners.spacewalk.deleteAllSystems(server)  
Delete all systems from Spacewalk  
```

CLI Example:
```
salt-run spacewalk.deleteAllSystems spacewalk01.domain.com  
```

```
salt.runners.spacewalk.unregister(name, server_url)  
Unregister specified server from Spacewalk  
```

CLI Example:
```
salt-run spacewalk.unregister my-test-vm spacewalk01.domain.com  
```

21.16.35  salt.runners.ssh

A Runner module interface on top of the salt-ssh Python API.
This allows for programmatic use from salt-api, the Reactor, Orchestrate, etc.
```
salt.runners.ssh.cmd(tgt, fun, arg=(), timeout=None, tgt_type='glob', kwarg=None)  
New in version 2015.5.0.  
```
Changed in version 2017.7.0: The expr_form argument has been renamed to tgt_type, earlier releases must use expr_form.

Execute a single command via the salt-ssh subsystem and return all routines at once
A wrapper around the SSHClient.cmd method.

**21.16.36 salt.runners.state**

Execute orchestration functions

```python
salt.runners.state.event(tagmatch='*', count=-1, quiet=False, sock_dir=None, pretty=False,
    node='master')
```

Watch Salt’s event bus and block until the given tag is matched

New in version 2014.7.0.

Changed in version 2019.2.0: tagmatch can now be either a glob or regular expression.

This is useful for utilizing Salt’s event bus from shell scripts or for taking simple actions directly from the CLI.

Enable debug logging to see ignored events.

**Parameters**

- **tagmatch** – the event is written to stdout for each tag that matches this glob or regular expression.
- **count** – this number is decremented for each event that matches the tagmatch parameter; pass -1 to listen forever.
- **quiet** – do not print to stdout; just block
- **sock_dir** – path to the Salt master’s event socket file.
- **pretty** – Output the JSON all on a single line if False (useful for shell tools); pretty-print the JSON output if True.
- **node** – Watch the minion-side or master-side event bus. .. versionadded:: 2016.3.0

**CLI Examples:**

```
# Reboot a minion and run highstate when it comes back online
salt 'jerry' system.reboot &&
    salt-run state.event 'salt/minion/jerry/start' count=1 quiet=TRUE &&
    salt 'jerry' state.highstate

# Reboot multiple minions and run highstate when all are back online
salt -L 'kevin,stewart,dave' system.reboot &&
    salt-run state.event 'salt/minion/*/start' count=3 quiet=True &&
    salt -L 'kevin,stewart,dave' state.highstate

# Watch the event bus forever in a shell while-loop.
salt-run state.event | while read -r tag data; do
    echo $tag
    echo $data | jq --color-output .
done
```

See also:

See https://github.com/saltstack/salt/blob/develop/tests/eventlisten.sh for an example of usage within a shell script.

```python
salt.runners.state.orchestrate(mods, saltenv='base', test=None, exclude=None, pillar=None, pil-
larenv=None, pillar_enc=None, orchestration_jid=None)
```

New in version 0.17.0.

Execute a state run from the master, used as a powerful orchestration system.
See also:

More Orchestrate documentation
  • Full Orchestrate Tutorial
  • Docs for the master-side state module

CLI Examples:

salt-run state.orchestrate webserver
salt-run state.orchestrate webserver saltenv=dev test=True
salt-run state.orchestrate webserver saltenv=dev pillarenv=aws

Changed in version 2014.1.1: Runner renamed from state.sls to state.orchestrate

Changed in version 2014.7.0: Runner uses the pillar variable

Changed in version develop: Runner uses the pillar_enc variable that allows renderers to render the pillar. This is usable when supplying the contents of a file as pillar, and the file contains gpg-encrypted entries.

See also:

GPG renderer documentation

CLI Examples:

salt-run state.orchestrate webserver pillar_enc=gpg pillar="$(cat somefile.json)"

salt.runners.state.orchestrate_high(data, test=None, queue=False, pillar=None, **kwargs)

Execute a single state orchestration routine

New in version 2015.5.0.

CLI Example:

```
salt-run state.orchestrate_high '{
    stage_one:
        {salt.state: [{tgt: "db*"}, {sls: postgres_setup}]}],
    stage_two:
        {salt.state: [{tgt: "web*"}, {sls: apache_setup}, {
        require: [{salt: stage_one}],
        }],
    }
}'
```

salt.runners.state.orchestrate_show_sls(mods, saltenv='base', test=None, queue=False, pillar=None, pillarenv=None, pillar_enc=None)

Display the state data from a specific sls, or list of sls files, after being render using the master minion.

Note, the master minion adds a "_master" suffix to it's minion id.

See also:

The state.show_sls module function

CLI Example: .. code-block:: bash

```
salt-run state.orch_shov_sls my-orch-formula.my-orch-state 'pillar={ nodegroup: ng1 }'
```

salt.runners.state.orchestrate_single(fun, name, test=None, queue=False, pillar=None, **kwargs)

Execute a single state orchestration routine

New in version 2015.5.0.

CLI Example:
salt.run state.orchestrate_single fun=salt.wheel name=key.list_all

```
salt.runners.state.pause(jid, state_id=None, duration=None)
```
Set up a state id pause, this instructs a running state to pause at a given state id. This needs to pass in the jid of the running state and can optionally pass in a duration in seconds.

```
salt.runners.state.resume(jid, state_id=None)
```
Remove a pause from a jid, allowing it to continue

```
salt.runners.state.rm_pause(jid, state_id=None)
```
This function is an alias of resume.
Remove a pause from a jid, allowing it to continue

```
salt.runners.state.set_pause(jid, state_id=None, duration=None)
```
This function is an alias of pause.
Set up a state id pause, this instructs a running state to pause at a given state id. This needs to pass in the jid of the running state and can optionally pass in a duration in seconds.

```
salt.runners.state.soft_kill(jid, state_id=None)
```
Set up a state run to die before executing the given state id, this instructs a running state to safely exit at a given state id. This needs to pass in the jid of the running state. If a state_id is not passed then the jid referenced will be safely exited at the beginning of the next state run.

### 21.16.37 `salt.runners.survey`

A general map/reduce style salt runner for aggregating results returned by several different minions.

New in version 2014.7.0.

Aggregated results are sorted by the size of the minion pools which returned matching results.

Useful for playing the game: "some of these things are not like the others..." when identifying discrepancies in a large infrastructure managed by salt.

```
salt.runners.survey.diff(*args, **kwargs)
```
Return the DIFFERENCE of the result sets returned by each matching minion pool

New in version 2014.7.0.

These pools are determined from the aggregated and sorted results of a salt command.

This command displays the "diffs" as a series of 2-way differences – namely the difference between the FIRST displayed minion pool (according to sort order) and EACH SUBSEQUENT minion pool result set.

Differences are displayed according to the Python difflib.unified_diff() as in the case of the salt execution module file.get_diff.

This command is submitted via a salt runner using the general form:

```
salt-run survey.diff [survey_sort=up/down] <target> <salt-execution-module> <salt-execution-module parameters>
```

Optionally accept a `survey_sort=` parameter. Default: `survey_sort=down`

CLI Example #1: (Example to display the "differences of files")

```
salt-run survey.diff survey_sort=up "*" cp.get_file_str file:///etc/hosts
```

```
salt.runners.survey.hash(*args, **kwargs)
```
Return the MATCHING minion pools from the aggregated and sorted results of a salt command
New in version 2014.7.0.

This command is submitted via a salt runner using the general form:

```
salt-run survey.hash [survey_sort=up/down] <target> <salt-execution-module> <salt-execution-module parameters>
```

Optionally accept a `survey_sort=` parameter. Default: `survey_sort=down`

CLI Example #1: (functionally equivalent to `salt-run manage.up`)

```
salt-run survey.hash "*" test.ping
```

CLI Example #2: (find an "outlier" minion config file)

```
salt-run survey.hash "*" file.get_hash /etc/salt/minion survey_sort=up
```

---

21.16.38 `salt.runners.test`

This runner is used only for test purposes and servers no production purpose

```
salt.runners.test.arg(*args, **kwargs)
```

Output the given `args` and `kwargs`

```
salt.runners.test.get_opts()
```

New in version 2018.3.0.

Return the configuration options of the master.

```
salt-run test.get_opts
```

```
salt.runners.test.metasyntactic(locality='us')
```

Return common metasyntactic variables for the given locality

```
salt.runners.test.raw_arg(*args, **kwargs)
```

Output the given `args` and `kwargs`

```
salt.runners.test.sleep(s_time=10)
```

Sleep `t` seconds, then return True

```
salt.runners.test.stdout_print()
```

Print 'foo' and return 'bar'

```
salt.runners.test.stream()
```

Return True

---

21.16.39 `salt.runners.thin`

The thin runner is used to manage the salt thin systems.

Salt Thin is a transport-less version of Salt that can be used to run routines in a standalone way. This runner has tools which generate the standalone salt system for easy consumption.
salt.runners.thin.generate

Generate the salt-thin tarball and print the location of the tarball. Optional additional mods to include (e.g. mako) can be supplied as a comma delimited string. Permits forcing an overwrite of the output file as well.

CLI Example:

```bash
salt-run thin.generate
salt-run thin.generate mako
salt-run thin.generate mako, wempy
salt-run thin.generate overwrite=1
```

salt.runners.thin.generate_min

Generate the salt-thin tarball and print the location of the tarball. Optional additional mods to include (e.g. mako) can be supplied as a comma delimited string. Permits forcing an overwrite of the output file as well.

CLI Example:

```bash
salt-run thin.generate_min
```

### 21.16.40 salt.runners.vault

- **maintainer** SaltStack
- **maturity** new
- **platform** all

Runner functions supporting the Vault modules. Configuration instructions are documented in the execution module docs.

salt.runners.vault.generate_token

Generate a Vault token for minion minion_id

- **minion_id** The id of the minion that requests a token
- **signature** Cryptographic signature which validates that the request is indeed sent by the minion (or the master, see impersonated_by_master).
- **impersonated_by_master** If the master needs to create a token on behalf of the minion, this is True. This happens when the master generates minion pillars.

CLI Example:

```bash
salt-run vault.generate_token myminion
```

salt.runners.vault.show_policies

Show the Vault policies that are applied to tokens for the given minion

- **minion_id** The minions id

CLI Example:

```bash
salt-run vault.show_policies myminion
```

salt.runners.vault.unseal

Unseal Vault server

This function uses the 'keys' from the 'vault' configuration to unseal vault server

- **vault**: keys:
  - n63/TbrQuL3xlW7ZZpuXjtlfnK1/MBVxO4vT3wYD2A
  - S90wCvMrhErEa4NVvelBY86w/M6+urgUr24xGK44Uy3
  - F1j4b7Jkq850N6kBoiy51aj0xY8dWjvB3fcwaA+SraYl
  - 1cYtvjKJNDVam9c7HNqJUfNk4PYYvAXIpjkpN/sluzPv
  - 3pPK5X6vGtwLhNOFv1U2elahECz3HpRufNXJFYrLw6lid
Salt Documentation, Release 2019.2.0

CLI Examples:

```
salt-run vault.unseal
```

## 21.16.41 salt.runners.venafiapi

Support for Venafi

Before using this module you need to register an account with Venafi, and configure it in your master configuration file.

First, you need to add a placeholder to the master file. This is because the module will not load unless it finds an api_key setting, valid or not. Open up /etc/salt/master and add:

```
venafi:
  api_key: None
```

Then register your email address with Venafi using the following command:

```
salt-run venafi.register <youremail@yourdomain.com>
```

This command will not return an api_key to you; that will be sent to you via email from Venafi. Once you have received that key, open up your master file and set the api_key to it:

```
venafi:
  api_key: abcdef01-2345-6789-abcd-ef0123456789
```

salt.runners.venafiapi.del_cached_domain(domains)
Delete cached domains from the master

CLI Example:

```
salt-run venafi.del_cached_domain domain1.example.com, domain2.example.com
```

salt.runners.venafiapi.gen_csr(minion_id, dns_name=None, zone='default', country=None, state=None, loc=None, org=None, org_unit=None, password=None)
Generate a csr using the host's private_key. Analogous to:

```
```

CLI Example:

```
salt-run venafi.gen_csr <minion_id> <dns_name>
```

salt.runners.venafiapi.gen_key(minion_id, dns_name=None, zone='default', password=None)
Generate and return an private_key. If a dns_name is passed in, the private_key will be cached under that name. The type of key and the parameters used to generate the key are based on the default certificate use policy associated with the specified zone.

CLI Example:

```
salt-run venafi.gen_key <minion_id> [dns_name] [zone] [password]
```

salt.runners.venafiapi.get_zone_id(zone_name)
Get the zone ID for the given zone name

CLI Example:
salt-run venafi.get_zone_id default

salt.runners.venafiapi.list_domain_cache()
List domains that have been cached

CLI Example:

salt-run venafi.list_domain_cache

salt.runners.venafiapi.pickup(id_)
Show certificate requests for this API key

CLI Example:

salt-run venafi.show_cert 01234567-89ab-cdef-0123-456789abcdef

salt.runners.venafiapi.register(email)
Register a new user account

CLI Example:

salt-run venafi.register email@example.com

salt.runners.venafiapi.renew(minion_id, dns_name=None, zone='default', request_id=None, country='US', state='California', loc='Palo Alto', org='Beta Organization', org_unit='Beta Group', password=None, zone_id=None)
Request a new certificate
Uses the following command:

VCert enroll -z <zone> -k <api key> -cn <domain name>

CLI Example:

salt-run venafi.request <minion_id> <dns_name>

salt.runners.venafiapi.request(minion_id, dns_name=None, zone='default', request_id=None, country='US', state='California', loc='Palo Alto', org='Beta Organization', org_unit='Beta Group', password=None, zone_id=None)
Request a new certificate
Uses the following command:

VCert enroll -z <zone> -k <api key> -cn <domain name>

CLI Example:

salt-run venafi.request <minion_id> <dns_name>

salt.runners.venafiapi.show_cert(id_)
Show certificate requests for this API key

CLI Example:

salt-run venafi.show_cert 01234567-89ab-cdef-0123-456789abcdef

salt.runners.venafiapi.show_company(domain)
Show company information, especially the company id
CLI Example:

```
salt-run venafi.show_company example.com
```

salt.runners.venafiapi.show_csrs()  
Show certificate requests for this API key

CLI Example:

```
salt-run venafi.show_csrs
```

salt.runners.venafiapi.show_policies()  
Show zone details for the API key owner’s company

CLI Example:

```
salt-run venafi.show_zones
```

salt.runners.venafiapi.show_rsa(minion_id, dns_name)  
Show a private RSA key

CLI Example:

```
salt-run venafi.show_rsa myminion domain.example.com
```

salt.runners.venafiapi.show_zones()  
Show zone details for the API key owner’s company

CLI Example:

```
salt-run venafi.show_zones
```

### 21.16.42 salt.runners.virt

Control virtual machines via Salt

salt.runners.virt.force_off(name)  
Force power down the named virtual machine

salt.runners.virt.host_info(host=None)  
Return information about the host connected to this master

salt.runners.virt.init(name, cpu, mem, image, hypervisor='kvm', host=None, seed=True, nic='default', install=True, start=True, disk='default', saltenv='base', enable_vnc=False, seed_cmd='seed.apply', enable_qcow=False)  
This routine is used to create a new virtual machine. This routine takes a number of options to determine what the newly created virtual machine will look like.

**name** The mandatory name of the new virtual machine. The name option is also the minion id, all minions must have an id.

**cpu** The number of cpus to allocate to this new virtual machine.

**mem** The amount of memory to allocate to this virtual machine. The number is interpreted in megabytes.

**image** The network location of the virtual machine image, commonly a location on the salt fileserver, but http, https and ftp can also be used.

**hypervisor** The hypervisor to use for the new virtual machine. Default is *kvm*.

**host** The host to use for the new virtual machine, if this is omitted Salt will automatically detect what host to use.

**seed** Set to *False* to prevent Salt from seeding the new virtual machine.
nic  The nic profile to use, defaults to the "default" nic profile which assumes a single network interface per VM associated with the "br0" bridge on the master.
install  Set to False to prevent Salt from installing a minion on the new VM before it spins up.
disk  The disk profile to use
saltenv  The Salt environment to use
enable_vnc  Whether a VNC screen is attached to resulting VM. Default is False.
seed_cmd  If seed is True, use this execution module function to seed new VM. Default is seed.apply.
enable_qcow  Clone disk image as a copy-on-write qcow2 image, using downloaded image as backing file.
salt.runners.virt.list(host=None, quiet=False, hyper=None)
  List the virtual machines on each host, this is a simplified query, showing only the virtual machine names belonging to each host. A single host can be passed in to specify an individual host to list.
salt.runners.virt.migrate(name, target="")
  Migrate a VM from one host to another. This routine will just start the migration and display information on how to look up the progress.
salt.runners.virt.next_host()
  Return the host to use for the next autodeployed VM. This queries the available host and executes some math the determine the most "available" next host.
salt.runners.virt.pause(name)
  Pause the named VM
salt.runners.virt.purge(name, delete_key=True)
  Destroy the named VM
salt.runners.virt.query(host=None, quiet=False)
  Query the virtual machines. When called without options all hosts are detected and a full query is returned. A single host can be passed in to specify an individual host to query.
salt.runners.virt.reset(name)
  Force power down and restart an existing VM
salt.runners.virt.resume(name)
  Resume a paused VM
salt.runners.virt.start(name)
  Start a named virtual machine
salt.runners.virt.vm_info(name, quiet=False)
  Return the information on the named VM

21.16.43 salt.runners.vistara

Vistara Runner

Runner to interact with the Vistara (http://www.vistarait.com/) REST API

codeauthor  Brad Thurber <brad.thurber@gmail.com>

To use this runner, the Vistara client_id and Vistara oauth2 client_key and client_secret must be set in the master config.

For example /etc/salt/master.d/_vistara.conf:

```
vistara:
  client_id: client_012345
  client_key: NotReallyARealKeyButShouldBe12345
  client_secret: ThisISAreallyLongsecretKeyIwonderwhyTheyMakesThemSoBigTheseDays00
```
**salt.runners.vistara.delete_device**(*name*, *safety_on=True*)

Deletes a device from Vistara based on DNS name or partial name. By default, delete_device will only perform the delete if a single host is returned. Set safety_on=False to delete all matches (up to default API search page size)

CLI Example:

```
salt-run vistara.delete_device 'hostname-101.mycompany.com'
salt-run vistara.delete_device 'hostname-101'
salt-run vistara.delete_device 'hostname-1' safety_on=False
```

---

**21.16.44 salt.runners.winrepo**

Runner to manage Windows software repo

**salt.runners.winrepo.genrepo**(*opts=None, fire_event=True*)

Generate winrepo_cachefile based on sls files in the winrepo_dir

*opts* Specify an alternate opts dict. Should not be used unless this function is imported into an execution module.

*fire_event* [True] Fire an event on failure. Only supported on the master.

CLI Example:

```
salt-run winrepo.genrepo
```

**salt.runners.winrepo.update_git_repos**(*opts=None, clean=False, masterless=False*)

Checkout git repos containing Windows Software Package Definitions

*opts* Specify an alternate opts dict. Should not be used unless this function is imported into an execution module.

*clean* [False] Clean repo cachedirs which are not configured under `winrepo_remotes`.

**Warning:** This argument should not be set to **True** if a mix of git and non-git repo definitions are being used, as it will result in the non-git repo definitions being removed.

New in version 2015.8.0.

CLI Examples:

```
salt-run winrepo.update_git_repos
salt-run winrepo.update_git_repos clean=True
```

21.17.1 salt.sdb.cache module

cache Module

Maintainer: SaltStack

Maturity: New

Platform: all

New in version 2017.7.0.

This module provides access to Salt’s cache subsystem.

Like all sdb modules, the cache module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
mastercloudcache:
  driver: cache
  bank: cloud/active/ec2/my-ec2-conf/saltmaster
  cachedir: /var/cache/salt
```

The `driver` refers to the cache module, `bank` refers to the cache bank that contains the data and `cachedir` (optional), if used, points to an alternate directory for cache data storage.

```
master_ip: sdb://mastercloudcache/public_ips
```

It is also possible to override both the `bank` and `cachedir` options inside the SDB URI:

```
```

For this reason, both the `bank` and `cachedir` options can be omitted from the SDB profile. However, if the `bank` option is omitted, it must be specified in the URI:

```
  ...saltmaster
```

`salt.sdb.cache.delete(key, service=None, profile=None)`

Get a value from the cache service

`salt.sdb.cache.get(key, service=None, profile=None)`

Get a value from the cache service

`salt.sdb.cache.set_(key, value, service=None, profile=None)`

Set a key/value pair in the cache service

21.17.2 salt.sdb.confidant

An SDB module for getting credentials from confidant.
Configuring the Confidant module

The module can be configured via sdb in the minion config:

```yaml
confidant:
    driver: confidant
    # The URL of the confidant web service
    url: 'https://confidant-production.example.com'
    # The context to use for KMS authentication
    auth_context:
        from: example-production-iad
        to: confidant-production-iad
        user_type: service
    # The KMS master key to use for authentication
    auth_key: "alias/authnz"
    # Cache file for KMS auth token
    token_cache_file: /run/confidant/confidant_token
    # The duration of the validity of a token, in minutes
    token_duration: 60
    # key, keyid and region can be defined in the profile, but it's generally
    # best to use IAM roles or environment variables for AWS auth.
    keyid: 98nh9h9h08h09kjkk
    key: jhf908gyeghehe0he0g8h9u0j0n0n09hj09h0
    region: us-east-1
```

depends confidant-common, confidant-client

Module Documentation

salt.sdb.confidant.get(key, profile=None)
Read pillar data from Confidant via its API.

CLI Example:
salt myminion sdb.get 'sdb://confidant/credentials'
Valid keys are: credentials, credentials_metadata, result. credentials returns a dict of joined credential_pairs, credentials_metadata returns a dict of metadata relevant to the credentials mapped to the confidant service, and result returns a bool that can be used to determine if the sdb call succeeded or failed to fetch credentials from confidant (or from local cache). If result is false, the data in credentials or credentials_metadata can’t be trusted.

21.17.3 salt.sdb.consul module

Consul sdb Module

maintainer SaltStack
maturity New
platform all

This module allows access to Consul using an sdb:// URI

Like all sdb modules, the Consul module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. For example:
myconsul:
  driver: consul
  host: 127.0.0.1
  port: 8500
  token: b6376760-a8bb-edd5-fcda-33bc13bfc556
  scheme: http
  consistency: default
dc: dev
  verify: True

The driver refers to the Consul module, all other options are optional. For option details see: https://python-consul.readthedocs.io/en/latest/#consul

salt.sdb.consul.get(key, profile=None)
salt.sdb.consul.get_conn(profile)
  Return a client object for accessing consul
salt.sdb.consul.set_(key, value, profile=None)

21.17.4 salt.sdb.couchdb

CouchDB sdb Module
  maintainer SaltStack
  maturity New
  depends python2-couchdb
  platform all

This allow interaction between Salt and a CouchDB [couchdb.apache.org] database. It uses salt’s sdb system to allow for inserts and retrievals using the sdb:// prefix in salt configuration files.

To use the couchbase sdb module, it must first be configured in the salt master or minion config. The following arguments are required:

couchdb_sdb:
  driver: couchdb
  host: localhost
  port: 5984
  database: salt_sdb

One could then query the CouchDB instance via an sdb:// URI such as the following:

password: sdb://couchdb_sdb/mykey

To use this interface, you must track IDs on your own or have another source to do the map-reduce logic necessary to calculate the ID you wish to fetch.

Additional contributions to build true map-reduce functionality into this module would be welcome.

salt.sdb.couchdb.get(key, profile=None)
  Get a value from couchdb by id
salt.sdb.couchdb.set_(key, value, profile=None)
  Set a key/value pair in couchdb
21.17.5 salt.sdb.env module

Environment sdb Module

maintainer SaltStack

maturity New

depends None

platform all

This module allows access to environment variables using an sdb:// URI.

Example configuration for this module:

```yaml
osenv:
  driver: env
```

**WARNING:**

OS environment variables will be available to read via SDB. Please make sure you don’t have any sensitive data in your environment variables‼

Example usage of sdb env module:

```yaml
set some env var:
  cmd.run:
    - name: echo {{ salt['sdb.set']('sdb://osenv/foo', 'bar') }}
    - order: 1
%

{% if salt['sdb.get']('sdb://osenv/foo') == 'bar' %}
always-changes-and-succeeds:
  test.succeed_with_changes:
    - name: foo
{% else %}
always-changes-and-fails:
  test.fail_with_changes:
    - name: foo
{% endif %}
```

The above example will return success.

The env sdb module can also be used with salt cloud. Assuming you have exported the environment variable named compute (and have osenv defined). The example below will look for the salt cloud config key compute_name in the environment:

```yaml
my-openstack-config:
  compute_name: sdb://osenv/compute
..snip
```

salt.sdb.env.get(key, profile=None)
  Get a value

salt.sdb.env.set_(key, value, profile=None)
  Set a key/value pair
21.17.6  salt.sdb.etcd_db

etcd Database Module

maintainer  SaltStack
maturity  New
depends  python-etcd
platform  all

New in version 2015.5.0.

This module allows access to the etcd database using an sdb:// URL. This package is located at https://pypi.python.org/pypi/python-etcd.

Like all sdb modules, the etcd module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
myetcd:
    driver: etcd
    etcd.host: 127.0.0.1
    etcd.port: 2379
```

The driver refers to the etcd module, etcd.host refers to the host that is hosting the etcd database and etcd.port refers to the port on that host.

```
password: sdb://myetcd/mypassword
```

salt.sdb.etcd_db.delete(key, service=None, profile=None)
Get a value from the etcd service

salt.sdb.etcd_db.get(key, service=None, profile=None)
Get a value from the etcd service

salt.sdb.etcd_db.set_(key, value, service=None, profile=None)
Set a key/value pair in the etcd service

21.17.7  salt.sdb.keyring_db

Keyring Database Module

maintainer  SaltStack
maturity  New
depends  keyring
platform  all

This module allows access to the keyring package using an sdb:// URL. This package is located at https://pypi.python.org/pypi/keyring.

Care must be taken when using keyring. Not all keyend backends are supported on all operating systems. Also, many backends require an agent to be running in order to work. For instance, the "Secret Service" backend requires a compatible agent such as gnome-keyring-daemon or kwallet to be running. The keyczar backend does not seem to enjoy the benefits of an agent, and so using it will require either that the password is typed in manually (which is unreasonable for the salt-minion and salt-master daemons, especially in production) or an agent is written for it.
Like all sdb modules, the keyring module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```yaml
mykeyring:
  driver: keyring
  service: system
```

The `driver` refers to the keyring module, `service` refers to the service that will be used inside of keyring (which may be likened unto a database table) and `mykeyring` refers to the name that will appear in the URI:

```plaintext
password: sdb://mykeyring/mypassword
```

The underlying backend configuration must be configured via keyring itself. For examples and documentation, see keyring:

https://pypi.python.org/pypi/keyring

New in version 2014.1.4.

```python
salt.sdb.keyring_db.get(key, service=None, profile=None)
  Get a value from a keyring service
salt.sdb.keyring_db.set_(key, value, service=None, profile=None)
  Set a key/value pair in a keyring service
```

### 21.17.8 salt.sdb.memcached

Memcached sdb Module

- maintainer SaltStack
- maturity New
- depends python-memcached
- platform all

This module allows access to memcached using an `sdb://` URI. This package is located at https://pypi.python.org/pypi/python-memcached.

Like all sdb modules, the memcached module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```yaml
mymemcache:
  driver: memcached
  host: localhost
  port: 11211
```

The `driver` refers to the memcached module, `host` and `port` the memcached server to connect to (defaults to `localhost` and `11211`, and `mymemcached` refers to the name that will appear in the URI:

```plaintext
password: sdb://mymemcached/mykey
```

```python
salt.sdb.memcached.get(key, profile=None)
  Get a value from memcached
salt.sdb.memcached.set_(key, value, profile=None)
  Set a key/value pair in memcached
```
21.17.9 salt.sdb.redis_sdb module

Redis SDB module

New in version 2019.2.0.

This module allows access to Redis using an sdb:// URI.

Like all SDB modules, the Redis module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. For example:

```yaml
sdb_redis:
  driver: redis
  host: 127.0.0.1
  port: 6379
  password: pass
  db: 1
```

The `driver` refers to the Redis module, all other options are optional. For option details see: https://redis-py.readthedocs.io/en/latest/

```python
salt.sdb.redis_sdb.delete(key, profile=None)
Delete a key from the Redis SDB.
```

```python
salt.sdb.redis_sdb.get(key, profile=None)
Get a value from the Redis SDB.
```

```python
salt.sdb.redis_sdb.set_(key, value, profile=None)
Set a value into the Redis SDB.
```

21.17.10 salt.sdb.rest module

Generic REST API SDB Module

maintainer SaltStack

maturity New

platform all

New in version 2015.8.0.

This module allows access to a REST interface using an sdb:// URI.

Like all REST modules, the REST module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```yaml
my-rest-api:
  driver: rest
  urls:
    url: https://api.github.com/
  keys:
    url: https://api.github.com/users/{{user}}/keys
  backend: requests
```

The `driver` refers to the REST module, and must be set to rest in order to use this driver. Each of the other items inside this block refers to a separate set of HTTP items, including a URL and any options associated with it. The options used here should match the options available in `salt.utils.http.query()`.

In order to call the `urls` item in the example, the following reference can be made inside a configuration file:
**github_urls**: sdb://my-rest-api/urls

Key/Value pairs may also be used with this driver, and merged into the URL using the configured renderer (jinja, by default). For instance, in order to use the keys item in the example, the following reference can be made:

```
[github_urls]: sdb://my-rest-api/keys?user=myuser
```

This will cause the following URL to actually be called:

```
https://api.github.com/users/myuser/keys
```

Key/Value pairs will NOT be passed through as GET data. If GET data needs to be sent to the URL, then it should be configured in the SDB configuration block. For instance:

```
another-rest-api:
  driver: rest
  user_data:
    url: https://api.example.com/users/
    params:
      user: myuser
```

```python
salt.sdb.rest.get(key, service=None, profile=None)
Get a value from the REST interface
```

```python
salt.sdb.rest.query(key, value=None, service=None, profile=None)
Get a value from the REST interface
```

```python
salt.sdb.rest.set_(key, value, service=None, profile=None)
Set a key/value pair in the REST interface
```

### 21.17.11 salt.sdb.sqlite3

SQLite sdb Module

- **maintainer**: SaltStack
- **maturity**: New
- **platform**: all

This module allows access to sqlite3 using an sdb:// URI

Like all sdb modules, the sqlite3 module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. For example:

```
mysqlite:
  driver: sqlite3
  database: /tmp/sdb.sqlite
  table: sdb
  create_table: True
```

The `driver` refers to the sqlite3 module, `database` refers to the sqlite3 database file. `table` is the table within the db that will hold keys and values (defaults to sdb). The database and table will be created if they do not exist.

**Advanced Usage:**

Instead of a table name, it is possible to provide custom SQL statements to create the table(s) and get and set values.
salt.sdb.sqlite3.get(key, profile=None)
  Get a value from sqlite3

color = salt.sdb.sqlite3.set_(key, value, profile=None)
  Set a key/value pair in sqlite3

21.17.12 salt.sdb.tism module

tISM - the Immutable Secrets Manager SDB Module
  maintainer tISM
  maturity New
  platform all

New in version 2017.7.0.

This module will decrypt PGP encrypted secrets against a tISM server.

```
sdb://<profile>/*<encrypted*secret>
```

A profile must be setup in the minion configuration or pillar. If you want to use sdb in a runner or pillar you must also place a profile in the master configuration.

```
tism:
  driver: tism
  url: https://my.tismd:8080/decrypt
  token: eyJhbGciOiJIUzI1NiIsInR5cCI6IkpXVCJ9.
      eyJhZG1pbiI6MSwiZXhwIjoxNTg1MTExNDYwLCJqdGkiOiI3NnA5cWNiMWhtdmv4Iiwia2V5cyI6WyJBTEwiXX0.
      RtAqG6Uorf5xnSF4Ya_GwJnoHkCsq14r1_h10eDSLzo
```

```
salt.sdb.tism.get(key, service=None, profile=None)
  Get a decrypted secret from the tISMD API
```

21.17.13 salt.sdb.vault module

Vault SDB Module
  maintainer SaltStack
  maturity New
  platform all

New in version 2016.11.0.

This module allows access to Hashicorp Vault using an sdb:// URL.

Base configuration instructions are documented in the execution module docs. Below are noted extra configuration required for the sdb module, but the base configuration must also be completed.

Like all sdb modules, the vault module requires a configuration profile to be configured in either the minion configuration file or a pillar. This profile requires only setting the driver parameter to vault:
Once configured you can access data using a URL such as:

```
password: sdb://myvault/secret/passwords/mypassword
```

In this URL, `myvault` refers to the configuration profile, `secret/passwords` is the path where the data resides, and `mypassword` is the key of the data to return.

The above URI is analogous to running the following vault command:

```
$ vault read -field=mypassword secret/passwords
```

Salt's `sdb.vault.get` function:

`salt.sdb.vault.get(key, profile=None)`

Get a value from the vault service

Salt's `sdb.vault.set_` function:

`salt.sdb.vault.set_(key, value, profile=None)`

Set a key/value pair in the vault service

## 21.17.14 salt.sdb.yaml module

Pull `sdb` values from a YAML file

```
maintainer: SaltStack
maturity: New
platform: all
```

New in version 2017.7.0.

Configuration:

```
my-yaml-file:
    driver: yaml
    files:
    - /path/to/foo.yaml
    - /path/to/bar.yaml
```

The files are merged together and the result is searched using the same mechanism Salt uses for searching Grains and Pillar data structures.

Optional configuration:

```
my-yaml-file:
    driver: yaml
    files:
    - /path/to/foo.yaml
    - /path/to/bar.yaml
    merge:
        strategy: smart
        merge_list: false
    gpg: true
```

Setting the `gpg` option to `true` (default is `false`) will decrypt embedded GPG-encrypted data using the GPG renderer.
salt.sdb.yaml.get(key, profile=None)
    Get a value from the dictionary

salt.sdb.yaml.set_(*args, **kwargs)
    Setting a value is not supported; edit the YAML files directly

## 21.18 serializer modules

<table>

</tr>
</tbody>
</table>

### 21.18.1 salt.serializers.configparser module

salt.serializers.configparser

New in version 2016.3.0.

Implements a configparser serializer.

salt.serializers.configparser.deserializestream_or_string, **options)
    Deserialize any string or stream like object into a Python data structure.
    Parameters
    - **stream_or_string** – stream or string to deserialize.
    - **options** – options given to lower configparser module.

salt.serializers.configparser.serialize(obj, **options)
    Serialize Python data to a configparser formatted string or file.
    Parameters
    - **obj** – the data structure to serialize
    - **options** – options given to lower configparser module.

### 21.18.2 salt.serializers.json

salt.serializers.json

Implements JSON serializer.

It's just a wrapper around json (or simplejson if available).

salt.serializers.json.deserializestream_or_string, **options)
    Deserialize any string or stream like object into a Python data structure.
    Parameters
    - **stream_or_string** – stream or string to deserialize.
    - **options** – options given to lower json/simplejson module.

salt.serializers.json.serialize(obj, **options)
    Serialize Python data to JSON.
    Parameters
    - **obj** – the data structure to serialize
- **options** – options given to lower json/simplejson module.

### 21.18.3 salt.serializers.msgpack

*salt.serializers.msgpack*

Implements MsgPack serializer.

**salt.serializers.msgpack.deserialize(stream_or_string, **options)**

Deserialize any string of stream like object into a Python data structure.

**Parameters**
- **stream_or_string** – stream or string to deserialize.
- **options** – options given to lower msgpack module.

**salt.serializers.msgpack.serialize(obj, **options)**

Serialize Python data to MsgPack.

**Parameters**
- **obj** – the data structure to serialize
- **options** – options given to lower msgpack module.

### 21.18.4 salt.serializers.python module

*salt.serializers.python*

New in version 2016.3.0.

Implements a Python serializer (via pprint.format)

**salt.serializers.python.serialize(obj, **options)**

Serialize Python data to a Python string representation (via pprint.format)

**Parameters**
- **obj** – the data structure to serialize
- **options** – options given to pprint.format

### 21.18.5 salt.serializers.yaml

*salt.serializers.yaml*

Implements YAML serializer.

Underneath, it is based on pyyaml and use the safe dumper and loader. It also use C bindings if they are available.

**salt.serializers.yaml.deserialize(stream_or_string, **options)**

Deserialze any string of stream like object into a Python data structure.

**Parameters**
- **stream_or_string** – stream or string to deserialize.
- **options** – options given to lower yaml module.

**salt.serializers.yaml.serialize(obj, **options)**

Serialize Python data to YAML.

**Parameters**
- **obj** – the data structure to serialize
- **options** – options given to lower yaml module.
21.18.6 salt.serializers.yamlex

salt.serializers.yamlex

YAMLEX is a format that allows for things like sls files to be more intuitive.

It’s an extension of YAML that implements all the salt magic: - it implies omap for any dict like. - it implies that string like data are str, not unicode - ...

For example, the file states.sls has this contents:

```yaml
foo:
  bar: 42
  baz: [1, 2, 3]
```

The file can be parsed into Python like this:

```python
from salt.serializers import yamlex
with open('state.sls', 'r') as stream:
    obj = yamlex.deserialize(stream)
```

Check that `obj` is an OrderedDict

```python
from salt.utils.odict import OrderedDict
assert isinstance(obj, dict)
assert isinstance(obj, OrderedDict)
```

Yamlex `__repr__` and `__str__` objects’ methods render YAML understandable string. It means that they are template friendly.

```python
print '{0}'.format(obj)
```

returns:

```yaml
{foo: {bar: 42, baz: [1, 2, 3]}}
```

and they are still valid YAML:

```python
from salt.serializers import yaml
yml_obj = yaml.deserialize(str(obj))
assert yml_obj == obj
```

Yamlex implements also custom tags:

`!aggregate`

this tag allows structures aggregation.

For example:

```yaml
placeholder: !aggregate foo
placeholder: !aggregate bar
placeholder: !aggregate baz
```

is rendered as
```python
placeholder: [foo, bar, baz]

!reset
documentation of the salt project

this tag flushes the computing value.

```python
placeholder: {
  "aggregate": {
    "foo": 42,
  }
}
placeholder: {
  "aggregate": {
    "bar": null,
  }
}
!reset placeholder: {
  "aggregate": {
    "baz": "inga",
  }
}

is roughly equivalent to

```python
placeholder: {
  "aggregate": {
    "baz": "inga",
  }
}
```

Document is defacto an aggregate mapping.

```python
salt.serializers.yamlex.deserialize(stream_or_string, **options)

Deserialize any string of stream like object into a Python data structure.

Parameters
- stream_or_string – stream or string to deserialize.
- options – options given to lower yaml module.

salt.serializers.yamlex.serialize(obj, **options)

Serialize Python data to YAML.

Parameters
- obj – the data structure to serialize
- options – options given to lower yaml module.

21.19 state modules

<table>
<thead>
<tr>
<th>State</th>

### 21.19.1 salt.states.acme module

**ACME / Let’s Encrypt certificate management state**

See also the module documentation

```python
reload-gitlab:
  cmd.run:
    - name: gitlab-ctl hup

dev.example.com:
  acme.cert:
    - aliases:
      - gitlab.example.com
    - email: acmemaster@example.com
    - webroot: /opt/gitlab/embedded/service/gitlab-rails/public
    - renew: 14
    - fire_event: acme/dev.example.com
    - onchanges_in:
      - cmd: reload-gitlab

salt.states.acme.cert(name, aliases=None, email=None, webroot=None, test_cert=False, renew=None, keysize=None, server=None, owner='root', group='root', mode='0640', certname=None, preferred_challenges=None, tls_sni_01_port=None, tls_sni_01_address=None, http_01_port=None, http_01_address=None, dns_plugin=None, dns_plugin_credentials=None)
```

Obtain/renew a certificate from an ACME CA, probably Let’s Encrypt.

**Parameters**
- **name** – Common Name of the certificate (DNS name of certificate)
- **aliases** – subjectAltNames (Additional DNS names on certificate)
- **email** – e-mail address for interaction with ACME provider
- **webroot** – True or a full path to webroot. Otherwise use standalone mode
- **test_cert** – Request a certificate from the Happy Hacker Fake CA (mutually exclusive with 'server')
- **renew** – 'True/force' to force a renewal, or a window of renewal before expiry in days
- **keysize** – RSA key bits
- **server** – API endpoint to talk to
- **owner** – owner of the private key file
- **group** – group of the private key file
- **mode** – mode of the private key file
- **certname** – Name of the certificate to save
- **preferred_challenges** – A sorted, comma delimited list of the preferred challenge to use during authorization with the most preferred challenge listed first.
- **tls_sni_01_port** – Port used during tls-sni-01 challenge. This only affects the port Certbot listens on. A conforming ACME server will still attempt to connect on port 443.
- **tls_sni_01_address** – The address the server listens to during tls-sni-01 challenge.
- **http_01_port** – Port used in the http-01 challenge. This only affects the port Certbot listens on. A conforming ACME server will still attempt to connect on port 80.
- **https_01_address** – The address the server listens to during http-01 challenge.
- **dns_plugin** – Name of a DNS plugin to use (currently only 'cloudflare')
- **dns_plugin_credentials** – Path to the credentials file if required by the specified DNS plugin

### 21.19.2 salt.states.alias

Configuration of email aliases

The mail aliases file can be managed to contain definitions for specific email aliases:

**username:**

```yaml
alias.present:
  - target: user@example.com
```

**thomas:**

```yaml
alias.present:
  - target: thomas@example.com
```

The default alias file is set to `/etc/aliases`, as defined in Salt's `config execution module`. To change the alias file from the default location, set the following in your minion config:

```yaml
aliases.file: /my/alias/file
```

**salt.states.alias.absent(name)**

Ensure that the named alias is absent

*name* The alias to remove

**salt.states.alias.present(name, target)**

Ensures that the named alias is present with the given target or list of targets. If the alias exists but the target

**21.19. state modules**
differs from the previous entry, the target(s) will be overwritten. If the alias does not exist, the alias will be created.

name The local user/address to assign an alias to
target The forwarding address

## 21.19.3 salt.states.alternatives

Configuration of the alternatives system

Control the alternatives system

```python
{% set my_hadoop_conf = '/opt/hadoop/conf' %}

{{ my_hadoop_conf }}:
  file.directory

hadoop-0.20-conf:
  alternatives.install:
    - name: hadoop-0.20-conf
    - link: /etc/hadoop-0.20/conf
    - path: {{ my_hadoop_conf }}
    - priority: 30
    - require:
      - file: {{ my_hadoop_conf }}

hadoop-0.20-conf:
  alternatives.remove:
    - name: hadoop-0.20-conf
    - path: {{ my_hadoop_conf }}

salt.states.alternatives.auto(name)
New in version 0.17.0.
Instruct alternatives to use the highest priority path for `<name>`

name is the master name for this link group (e.g. pager)

salt.states.alternatives.install(name, link, path, priority)
Install new alternative for defined `<name>`

name is the master name for this link group (e.g. pager)
link is the symlink pointing to `/etc/alternatives/<name>`. (e.g. `/usr/bin/pager`)
path is the location of the new alternative target. NB: This file / directory must already exist. (e.g. `/usr/bin/less`)
priority is an integer; options with higher numbers have higher priority in automatic mode.

salt.states.alternatives.remove(name, path)
Removes installed alternative for defined `<name>` and `<path>` or fallback to default alternative, if some defined before.

name is the master name for this link group (e.g. pager)
path is the location of one of the alternative target files. (e.g. `/usr/bin/less`)

salt.states.alternatives.set_(name, path)
New in version 0.17.0.
Sets alternative for `<name>` to `<path>`, if `<path>` is defined as an alternative for `<name>`.

name is the master name for this link group (e.g. pager)
path is the location of one of the alternative target files. (e.g. `/usr/bin/less`)}
foo:
    alternatives.set:
    - path: /usr/bin/foo-2.0

21.19.4 salt.states.ansiblegate

Execution of Ansible modules from within states

With `ansible.call` these states allow individual Ansible module calls to be made via states. To call an Ansible module function use a `module.run` state:

```
some_set_of_tasks:
    ansible:
        - system.ping
        - packaging.os.zypper
        - name: emacs
        - state: installed
```

```text
class salt.states.ansiblegate.AnsibleState
    Ansible state caller.

    get_args(argset)
        Get args and kwargs from the argset.
        Parameters argset –
        Returns

salt.states.ansiblegate.playbooks(name, rundir=None, git_repo=None, git_kwargs=None, ansible_kwargs=None)
    Run Ansible Playbooks
    Parameters
        • name – path to playbook. This can be relative to rundir or the git repo
        • rundir – location to run ansible-playbook from.
        • git_repo – git repository to clone for ansible playbooks. This is cloned using the
          `git.latest` state, and is cloned to the rundir if specified, otherwise it is clone to the
          cache_dir
        • git_kwargs – extra kwargs to pass to `git.latest` state module besides the name and
          target
        • ansible_kwargs – extra kwargs to pass to `ansible.playbooks` execution module
          besides the name and target
    Returns Ansible playbook output.
```

```
run nginx install:
    ansible.playbooks:
        - name: install.yml
        - git_repo: git://github.com/gituser/playbook.git
        - git_kwargs:
            rev: master
```

21.19.5 salt.states.apache

Apache state

New in version 2014.7.0.
Allows for inputting a yaml dictionary into a file for apache configuration files.

The variable this is special and signifies what should be included with the above word between angle brackets (<>).

```
/etc/httpd/conf.d/website.com.conf:
apache.configfile:
  - config:
    - VirtualHost:
      this: '*:80'
    ServerName:
      - website.com
    ServerAlias:
      - www.website.com
      - dev.website.com
    ErrorLog: logs/website.com-error_log
    CustomLog: logs/website.com-access_log combined
    DocumentRoot: /var/www/vhosts/website.com
    Directory:
      this: /var/www/vhosts/website.com
      Order: Deny,Allow
      Deny from: all
      Allow from:
        - 127.0.0.1
        - 192.168.100.0/24
    Options:
      - Indexes
      - FollowSymlinks
    AllowOverride: All
```

Changed in version 2018.3.

Allows having the same section container multiple times (e.g. `<Directory /path/to/dir>`).

YAML structure stays the same only replace dictionary with a list.

When a section container does not have mandatory attribute, such as `<Else>`, it still needs keyword this with empty string (or "" if nicer output is required - without space).

```
/etc/httpd/conf.d/website.com.conf:
apache.configfile:
  - config:
    - VirtualHost:
      this: '*:80'
    ServerName:
      - website.com
    DocumentRoot: /var/www/vhosts/website.com
    Directory:
      this: /var/www/vhosts/website.com/private
```

(continues on next page)
- **Order**: Deny, Allow
- **Deny from**: all
- **Allow from**:
  - 127.0.0.1
  - 192.168.100.0/24
- **If**:
  - **this**: some condition
  - **do**: something
- **Else**:
  - **this**: something else
- **Else**:
  - **this**: ""
  - **do**: another thing

salt.states.apache.configfile(name, config)

### 21.19.6 salt.states.apache_conf module

Manage Apache Confs

New in version 2016.3.0.

Enable and disable apache confs.

```
Enable security conf:
  apache_conf.enabled:
    - name: security

Disable security conf:
  apache_conf.disabled:
    - name: security
```

salt.states.apache_conf.disabled(name)

Ensure an Apache conf is disabled.

- **name**: Name of the Apache conf

salt.states.apache_conf.enabled(name)

Ensure an Apache conf is enabled.

- **name**: Name of the Apache conf

### 21.19.7 salt.states.apache_module

Manage Apache Modules

New in version 2014.7.0.

Enable and disable apache modules.

```
Enable cgi module:
  apache_module.enabled:
    - name: cgi

Disable cgi module:
  apache_module.disabled:
    - name: cgi
```
salt.states.apache_module.disabled(name)
    Ensure an Apache module is disabled.
    New in version 2016.3.0.
    name Name of the Apache module

salt.states.apache_module.enabled(name)
    Ensure an Apache module is enabled.
    New in version 2016.3.0.
    name Name of the Apache module

21.19.8 salt.states.apache_site module
Manage Apache Sites
New in version 2016.3.0.
Enable and disable apache sites.

Enable default site:
    apache_site.enabled:
        - name: default

Disable default site:
    apache_site.disabled:
        - name: default

salt.states.apache_site.disabled(name)
    Ensure an Apache site is disabled.
    name Name of the Apache site

salt.states.apache_site.enabled(name)
    Ensure an Apache site is enabled.
    name Name of the Apache site

21.19.9 salt.states.aptpkg
Package management operations specific to APT- and DEB-based systems

salt.states.aptpkg.held(name)
    Set package in 'hold' state, meaning it will not be upgraded.
    name The name of the package, e.g., 'tmux'

21.19.10 salt.states.archive
Extract an archive
New in version 2014.1.0.
salt.states.archive.extracted(name, source, source_hash=None, source_hash_name=None, source_hash_update=False, skip_verify=False, password=None, options=None, list_options=None, force=False, overwrite=False, clean=False, user=None, group=None, if_missing=None, trim_output=False, use_cmd_unzip=None, extract_perms=True, enforce_toplevel=True, enforce_ownership_on=None, archive_format=None, **kwargs)

New in version 2014.1.0.

Changed in version 2016.11.0: This state has been rewritten. Some arguments are new to this release and will not be available in the 2016.3 release cycle (and earlier). Additionally, the ZIP Archive Handling section below applies specifically to the 2016.11.0 release (and newer).

Ensure that an archive is extracted to a specific directory.

**Important: Changes for 2016.11.0**

In earlier releases, this state would rely on the if_missing argument to determine whether or not the archive needed to be extracted. When this argument was not passed, then the state would just assume if_missing is the same as the name argument (i.e. the parent directory into which the archive would be extracted).

This caused a number of annoyances. One such annoyance was the need to know beforehand a path that would result from the extraction of the archive, and setting if_missing to that directory, like so:

```python
extract_myapp:
  archive.extracted:
    - name: /var/www
    - source: salt://apps/src/myapp-16.2.4.tar.gz
    - user: www
    - group: www
    - if_missing: /var/www/myapp-16.2.4
```

If /var/www already existed, this would effectively make if_missing a required argument, just to get Salt to extract the archive.

Some users worked around this by adding the top-level directory of the archive to the end of the name argument, and then used --strip or --strip-components to remove that top-level dir when extracting:

```python
extract_myapp:
  archive.extracted:
    - name: /var/www/myapp-16.2.4
    - source: salt://apps/src/myapp-16.2.4.tar.gz
    - user: www
    - group: www
```

With the rewrite for 2016.11.0, these workarounds are no longer necessary. if_missing is still a supported argument, but it is no longer required. The equivalent SLS in 2016.11.0 would be:

```python
extract_myapp:
  archive.extracted:
    - name: /var/www
    - source: salt://apps/src/myapp-16.2.4.tar.gz
    - user: www
    - group: www
```

Salt now uses a function called archive.list to get a list of files/directories in the archive. Using this information, the state can now check the minion to see if any paths are missing, and know whether or not the
archive needs to be extracted. This makes the `if_missing` argument unnecessary in most use cases.

---

**Important: ZIP Archive Handling**

*Note: this information applies to 2016.11.0 and later.*

Salt has two different functions for extracting ZIP archives:

1. `archive.unzip`, which uses Python’s `zipfile` module to extract ZIP files.
2. `archive.cmd_unzip`, which uses the `unzip` CLI command to extract ZIP files.

Salt will prefer the use of `archive.cmd_unzip` when CLI options are specified (via the `options` argument), and will otherwise prefer the `archive.unzip` function. Use of `archive.cmd_unzip` can be forced however by setting the `use_cmd_unzip` argument to `True`. By contrast, setting this argument to `False` will force usage of `archive.unzip`. For example:

```
/var/www:
archive.extracted:
  - source: salt://foo/bar/myapp.zip
  - use_cmd_unzip: True
```

When `use_cmd_unzip` is omitted, Salt will choose which extraction function to use based on the source archive and the arguments passed to the state. When in doubt, simply do not set this argument; it is provided as a means of overriding the logic Salt uses to decide which function to use.

There are differences in the features available in both extraction functions. These are detailed below.

- **Command-line options** (only supported by `archive.cmd_unzip`): When the `options` argument is used, `archive.cmd_unzip` is the only function that can be used to extract the archive. Therefore, if `use_cmd_unzip` is specified and set to `False`, and `options` is also set, the state will not proceed.
- **Permissions**: Due to an upstream bug in Python, permissions are not preserved when the `zipfile` module is used to extract an archive. As of the 2016.11.0 release, `archive.unzip` (as well as this state) has an `extract_perms` argument which, when set to `True` (the default), will attempt to match the permissions of the extracted files/directories to those defined within the archive. To disable this functionality and have the state not attempt to preserve the permissions from the ZIP archive, set `extract_perms` to `False`:

```
/var/www:
archive.extracted:
  - source: salt://foo/bar/myapp.zip
  - extract_perms: False
```

**name** Directory into which the archive should be extracted

**source** Archive to be extracted

*Note: This argument uses the same syntax as its counterpart in the `file.managed` state.*

**source_hash** Hash of source file, or file with list of hash-to-file mappings

*Note: This argument uses the same syntax as its counterpart in the `file.managed` state.*

Changed in version 2016.11.0: If this argument specifies the hash itself, instead of a URI to a file containing hashes, the hash type can now be omitted and Salt will determine the hash type based on the length of the hash. For example, both of the below states are now valid, while before only the second one would be:
foo_app:
    archive.extracted:
      - name: /var/www
      - source: https://mydomain.tld/foo.tar.gz
      - source_hash: 3360db35e682f1c5f9c58aa307de16d41361618c

bar_app:
    archive.extracted:
      - name: /var/www
      - source: https://mydomain.tld/bar.tar.gz
      - source_hash: sha1=5edb7d584b82ddcbf76e311601f5d4442974aaa5

source_hash_name

When source_hash refers to a hash file, Salt will try to find the correct hash by matching
the filename part of the source URI. When managing a file with a source of salt://files/
foo.tar.gz, then the following line in a hash file would match:

acbd18db4cc2f85cedef654fccc4a4d8  foo.tar.gz

This line would also match:

acbd18db4cc2f85cedef654fccc4a4d8  ./dir1/foo.tar.gz

However, sometimes a hash file will include multiple similar paths:

37b51d194a7513e45b56f6524f2d51f2  ./dir1/foo.txt
acbd18db4cc2f85cedef654fccc4a4d8  ./dir2/foo.txt
73feffa4b7f6bb68e44cf984c85f6e88  ./dir3/foo.txt

In cases like this, Salt may match the incorrect hash. This argument can be used to tell Salt which
filename to match, to ensure that the correct hash is identified. For example:

/var/www:
    archive.extracted:
      - source: https://mydomain.tld/dir2/foo.tar.gz
      - source_hash: https://mydomain.tld/hashes
      - source_hash_name: ./dir2/foo.tar.gz

Note: This argument must contain the full filename entry from the checksum file, as this argument
is meant to disambiguate matches for multiple files that have the same basename. So, in the example
above, simply using foo.txt would not match.

New in version 2016.11.0.

source_hash_update [False] Set this to True if archive should be extracted if source_hash has changed. This
would extract regardless of the if_missing parameter.

New in version 2016.3.0.

skip_verify [False] If True, hash verification of remote file sources (http://, https://, ftp://) will
be skipped, and the source_hash argument will be ignored.

New in version 2016.3.4.

keep_source [True] For source archives not local to the minion (i.e. from the Salt files server or a remote
source such as http(s) or ftp), Salt will need to download the archive to the minion cache before
they can be extracted. To remove the downloaded archive after extraction, set this argument to False.

New in version 2017.7.3.

keep [True] Same as keep_source, kept for backward-compatibility.
Note: If both keep_source and keep are used, keep will be ignored.

password For ZIP archives only. Password used for extraction.

New in version 2016.3.0.

Changed in version 2016.11.0: The newly-added `archive.is_encrypted` function will be used to determine if the archive is password-protected. If it is, then the `password` argument will be required for the state to proceed.

options For tar and zip archives only. This option can be used to specify a string of additional arguments to pass to the tar/zip command.

If this argument is not used, then the minion will attempt to use Python’s native `tarfile/zipfile` support to extract it. For zip archives, this argument is mostly used to overwrite existing files with `o`.

Using this argument means that the `tar` or `unzip` command will be used, which is less platform-independent, so keep this in mind when using this option; the CLI options must be valid options for the `tar/unzip` implementation on the minion’s OS.

New in version 2016.11.0.

Changed in version 2015.8.11,2016.3.2: XZ-compressed tar archives no longer require `J` to manually be set in the options, they are now detected automatically and decompressed using the `xz` CLI command and extracted using `tar xvf`. This is a more platform-independent solution, as not all tar implementations support the `J` argument for extracting archives.

Note: For tar archives, main operators like `-x`, `--extract`, `--get`, `-c` and `-f/--file` should not be used here.

list_options For tar archives only. This state uses `archive.list` to discover the contents of the source archive so that it knows which file paths should exist on the minion if the archive has already been extracted. For the vast majority of tar archives, `archive.list “just works”. Archives compressed using gzip, bzip2, and xz/lzma (with the help of the `xz` CLI command) are supported automatically. However, for archives compressed using other compression types, CLI options must be passed to `archive.list`.

This argument will be passed through to `archive.list` as its `options` argument, to allow it to successfully list the archive’s contents. For the vast majority of archives, this argument should not need to be used, it should only be needed in cases where the state fails with an error stating that the archive’s contents could not be listed.

New in version 2016.11.0.

force [False] If a path that should be occupied by a file in the extracted result is instead a directory (or vice-versa), the state will fail. Set this argument to `True` to force these paths to be removed in order to allow the archive to be extracted.

Warning: Use this option very carefully.

New in version 2016.11.0.

overwrite [False] Set this to `True` to force the archive to be extracted. This is useful for cases where the filenames/directories have not changed, but the content of the files have.

New in version 2016.11.1.

clean [False] Set this to `True` to remove any top-level files and recursively remove any top-level directory paths before extracting.
Note: Files will only be cleaned first if extracting the archive is deemed necessary, either by paths missing on the minion, or if overwrite is set to True.

New in version 2016.11.1.

user The user to own each extracted file. Not available on Windows.

New in version 2015.8.0.

Changed in version 2016.3.0: When used in combination with if_missing, ownership will only be enforced if if_missing is a directory.

Changed in version 2016.11.0: Ownership will be enforced only on the file/directory paths found by running archive.list on the source archive. An alternative root directory on which to enforce ownership can be specified using the enforce_ownership_on argument.

group The group to own each extracted file. Not available on Windows.

New in version 2015.8.0.

Changed in version 2016.3.0: When used in combination with if_missing, ownership will only be enforced if if_missing is a directory.

Changed in version 2016.11.0: Ownership will be enforced only on the file/directory paths found by running archive.list on the source archive. An alternative root directory on which to enforce ownership can be specified using the enforce_ownership_on argument.

if_missing If specified, this path will be checked, and if it exists then the archive will not be extracted. This path can be either a directory or a file, so this option can also be used to check for a semaphore file and conditionally skip extraction.

Changed in version 2016.3.0: When used in combination with either user or group, ownership will only be enforced when if_missing is a directory.

Changed in version 2016.11.0: Ownership enforcement is no longer tied to this argument, it is simply checked for existence and extraction will be skipped if it is present.

trim_output [False] Useful for archives with many files in them. This can either be set to True (in which case only the first 100 files extracted will be in the state results), or it can be set to an integer for more exact control over the max number of files to include in the state results.

New in version 2016.3.0.

use_cmd_unzip [False] Set to True for zip files to force usage of the archive.cmd_unzip function to extract.

New in version 2016.11.0.

extract_perms [True] For ZIP archives only. When using archive.unzip to extract ZIP archives, Salt works around an upstream bug in Python to set the permissions on extracted files/directories to match those encoded into the ZIP archive. Set this argument to False to skip this workaround.

New in version 2016.11.0.

enforce_toplevel [True] This option will enforce a single directory at the top level of the source archive, to prevent extracting a ‘tar-bomb’. Set this argument to False to allow archives with files (or multiple directories) at the top level to be extracted.

New in version 2016.11.0.

enforce_ownership_on When user or group is specified, Salt will default to enforcing permissions on the file/directory paths detected by running archive.list on the source archive. Use this argument to specify an alternate directory on which ownership should be enforced.

Note: This path must be within the path specified by the name argument.
New in version 2016.11.0.

archive_format One of tar, zip, or rar.

Changed in version 2016.11.0: If omitted, the archive format will be guessed based on the value of the source argument. If the minion is running a release older than 2016.11.0, this option is required.

Examples

1. tar with lmza (i.e. xz) compression:

```yaml
graylog2-server:
  archive.extracted:
    - name: /opt/
    - source: https://github.com/downloads/Graylog2/graylog2-server/graylog2-server-0.9.6p1.tar.lzma
    - source_hash: md5=499ae16dcae71eeb7c3a30c75ea7a1a6
```

2. tar archive with flag for verbose output, and enforcement of user/group ownership:

```yaml
graylog2-server:
  archive.extracted:
    - name: /opt/
    - source: https://github.com/downloads/Graylog2/graylog2-server/graylog2-server-0.9.6p1.tar.gz
    - source_hash: md5=499ae16dcae71eeb7c3a30c75ea7a1a6
    - options: v
    - user: foo
    - group: foo
```

3. tar archive, with source_hash_update set to True to prevent state from attempting extraction unless the source_hash differs from the previous time the archive was extracted:

```yaml
graylog2-server:
  archive.extracted:
    - name: /opt/
    - source: https://github.com/downloads/Graylog2/graylog2-server/graylog2-server-0.9.6p1.tar.lzma
    - source_hash: md5=499ae16dcae71eeb7c3a30c75ea7a1a6
    - source_hash_update: True
```

21.19.11 salt.states.artifactory

This state downloads artifacts from artifactory.

```python
salt.states.artifactory.downloaded(name, artifact, target_dir='/tmp', target_file=None, use_literal_group_id=False)
```

Ensures that the artifact from artifactory exists at given location. If it doesn’t exist, then it will be downloaded. If it already exists then the checksum of existing file is checked against checksum in artifactory. If it is different then the step will fail.

artifact Details of the artifact to be downloaded from artifactory. Various options are:

- artifact_url: URL of the artifactory instance
- repository: Repository in artifactory
- artifact_id: Artifact ID
- group_id: Group ID
- packaging: Packaging
- classifier: Classifier .. versionadded:: 2015.8.0
- version: Version One of the following: - Version to download - latest - Download the latest release of this artifact - latest_snapshot - Download the latest snapshot for this artifact
- username: Artifactory username .. versionadded:: 2015.8.0
• password: Artifactory password .. versionadded:: 2015.8.0
target_dir Directory where the artifact should be downloaded. By default it is downloaded to /tmp directory.
target_file Target file to download artifact to. By default file name is resolved by artifactory.
An example to download an artifact to a specific file:

```
jboss_module_downloaded:
  artifactory.downloaded:
    - artifact:
      artifactory_url: http://artifactory.intranet.example.com/artifactory
      repository: 'libs-release-local'
      artifact_id: 'module'
      group_id: 'com.company.module'
      packaging: 'jar'
      classifier: 'sources'
      version: '1.0'
    - target_file: /opt/jboss7/modules/com/company/lib/module.jar
```

Download artifact to the folder (automatically resolves file name):

```
jboss_module_downloaded:
  artifactory.downloaded:
    - artifact:
      artifactory_url: http://artifactory.intranet.example.com/artifactory
      repository: 'libs-release-local'
      artifact_id: 'module'
      group_id: 'com.company.module'
      packaging: 'jar'
      classifier: 'sources'
      version: '1.0'
    - target_dir: /opt/jboss7/modules/com/company/lib
```

21.19.12 salt.states.at

Configuration disposable regularly scheduled tasks for at.
The at state can be add disposable regularly scheduled tasks for your system.
salt.states.at.absent(name, jobid=None, **kwargs)

Changed in version 2017.7.0.
Remove a job from queue
jobid: string|int Specific jobid to remove
tag [string] Job's tag
runas [string] Runs user-specified jobs
kwargs Addition kwargs can be provided to filter jobs. See output of at.jobcheck for more.

```
examp1:
at.absent:
```

Warning: this will remove all jobs!
```
example2:
at.absent:
  - year: 13
```

21.19. state modules
example3:
  at.absent:
    - tag: rose

example4:
  at.absent:
    - tag: rose
    - day: 13
    - hour: 16

example5:
  at.absent:
    - jobid: 4

salt.states.at.mod_watch(name, **kwargs)
The at watcher, called to invoke the watch command.

Note: This state exists to support special handling of the watch requisite. It should not be called directly. Parameters for this function should be set by the state being triggered.

  name The name of the atjob

salt.states.at.present(name, timespec, tag=None, user=None, job=None, unique_tag=False)
Add a job to queue.

job [string] Command to run.
timespec [string] The 'timespec' follows the format documented in the at(1) manpage.
tag [string] Make a tag for the job.
user [string] The user to run the at job .. versionadded:: 2014.1.4
unique_tag [boolean] If set to True job will not be added if a job with the tag exists. .. versionadded:: 2017.7.0

rose:
  at.present:
    - job: 'echo "I love saltstack" > love'
    - timespec: '9:09 11/09/13'
    - tag: love
    - user: jam

salt.states.at.watch(name, timespec, tag=None, user=None, job=None, unique_tag=False)
New in version 2017.7.0.

Add an at job if trigger by watch

job [string] Command to run.
timespec [string] The 'timespec' follows the format documented in the at(1) manpage.
tag [string] Make a tag for the job.
user [string] The user to run the at job .. versionadded:: 2014.1.4
unique_tag [boolean] If set to True job will not be added if a job with the tag exists. .. versionadded:: 2017.7.0

minion_restart:
  at.watch:
    - job: 'salt-call --local service.restart salt-minion'
    - timespec: 'now +1 min'
    - tag: minion_restart

(continues on next page)
21.19.13 salt.states.augeas

Configuration management using Augeas

New in version 0.17.0.

This state requires the augeas Python module.

Augeas can be used to manage configuration files.

Warning: Minimal installations of Debian and Ubuntu have been seen to have packaging bugs with python-augeas, causing the augeas module to fail to import. If the minion has the augeas module installed, and the state fails with a comment saying that the state is unavailable, first restart the salt-minion service. If the problem persists past that, the following command can be run from the master to determine what is causing the import to fail:

```
salt minion-id cmd.run 'python -c "from augeas import Augeas"'
```

For affected Debian/Ubuntu hosts, installing libpython2.7 has been known to resolve the issue.

salt.states.augeas.change

New in version 2014.7.0.

This state replaces setvalue().

Issue changes to Augeas, optionally for a specific context, with a specific lens.

name State name

context A file path, prefixed by /files. Should resolve to an actual file (not an arbitrary augeas path). This is used to avoid duplicating the file name for each item in the changes list (for example, set bind 0.0.0.0 in the example below operates on the file specified by context). If context is not specified, a file path prefixed by /files should be included with the set command.

The file path is examined to determine if the specified changes are already present.

```
redis-conf:
  augeas.change:
    - context: /files/etc/redis/redis.conf
    - changes:
      - set bind 0.0.0.0
      - set maxmemory 1G
```

changes List of changes that are issued to Augeas. Available commands are set, setm, move, ins/insert, and rm/remove.

lens The lens to use, needs to be suffixed with .lns, e.g.: Nginx.lns. See the list of stock lenses shipped with Augeas.

New in version 2016.3.0.

load_path A list of directories that modules should be searched in. This is in addition to the standard load path and the directories in AUGEAS_LIB.

Usage examples:

Set the bind parameter in /etc/redis/redis.conf:
redis-conf:
  augeas.change:
    - changes:
      - set /files/etc/redis/redis.conf/bind 0.0.0.0

Note: Use the context parameter to specify the file you want to manipulate. This way you don’t have to include this in the changes every time:

redis-conf:
  augeas.change:
    - context: /files/etc/redis/redis.conf
    - changes:
      - set bind 0.0.0.0
      - set databases 4
      - set maxmemory 1G

Augeas is aware of a lot of common configuration files and their syntax. It knows the difference between for example ini and yaml files, but also files with very specific syntax, like the hosts file. This is done with lenses, which provide mappings between the Augeas tree and the file.

There are many preconfigured lenses that come with Augeas by default, and they specify the common locations for configuration files. So most of the time Augeas will know how to manipulate a file. In the event that you need to manipulate a file that Augeas doesn’t know about, you can specify the lens to use like this:

redis-conf:
  augeas.change:
    - lens: redis.lns
    - context: /files/etc/redis/redis.conf
    - changes:
      - set bind 0.0.0.0

Note: Even though Augeas knows that /etc/redis/redis.conf is a Redis configuration file and knows how to parse it, it is recommended to specify the lens anyway. This is because by default, Augeas loads all known lenses and their associated file paths. All these files are parsed when Augeas is loaded, which can take some time. When specifying a lens, Augeas is loaded with only that lens, which speeds things up quite a bit.

A more complex example, this adds an entry to the services file for Zabbix, and removes an obsolete service:

zabbix-service:
  augeas.change:
    - lens: services.lns
    - context: /files/etc/services
    - changes:
      - ins service-name after service-name[last()]
      - set service-name[.last()]/"zabbix-agent"
      - set "service-name[. = 'zabbix-agent']/port" 10050
      - set "service-name[. = 'zabbix-agent']/protocol" tcp
      - set "service-name[. = 'zabbix-agent']/#comment" "Zabbix Agent service"
      - rm "service-name[. = 'im-obsolete']"
      - unless: grep "zabbix-agent" /etc/services
Warning: Don’t forget the unless here, otherwise it will fail on next runs because the service is already defined. Additionally you have to quote lines containing service-name[. = 'zabbix-agent'] otherwise augeas_cnf execute will fail because it will receive more parameters than expected.

Note: Order is important when defining a service with Augeas, in this case it’s port, protocol and #comment. For more info about the lens check services lens documentation.

http://augeas.net/docs/references/lenses/files/services-aug.html#Services.record

21.19.14 salt.states.aws_sqs

Manage SQS Queues
Create and destroy SQS queues. Be aware that this interacts with Amazon’s services, and so may incur charges.
This module uses the awscli tool provided by Amazon. This can be downloaded from pip. Also check the documentation for awscli for configuration information.

```yaml
myqueue:
  aws_sqs.exists:
    - region: eu-west-1
```

salt.states.aws_sqs.absent(name, region, user=None, opts=False)
Remove the named SQS queue if it exists.
name Name of the SQS queue.
region Region to remove the queue from
user Name of the user performing the SQS operations
opts Include additional arguments and options to the aws command line

salt.states.aws_sqs.exists(name, region, user=None, opts=False)
Ensure the SQS queue exists.
name Name of the SQS queue.
region Region to create the queue
user Name of the user performing the SQS operations
opts Include additional arguments and options to the aws command line

21.19.15 salt.states.azurearm_compute

Azure (ARM) Compute State Module
New in version 2019.2.0.

maintainer <devops@decisionlab.io>
maturity new
depends
  - azure >= 2.0.0
  - azure-common >= 1.1.8
  - azure-mgmt >= 1.0.0
  - azure-mgmt-compute >= 1.0.0
• azure-mgmt-network >= 1.7.1
• azure-mgmt-resource >= 1.1.0
• azure-mgmt-storage >= 1.0.0
• azure-mgmt-web >= 0.32.0
• azure-storage >= 0.34.3
• msrestazure >= 0.4.21

platform linux

configuration This module requires Azure Resource Manager credentials to be passed as a dictionary of keyword arguments to the connection_auth parameter in order to work properly. Since the authentication parameters are sensitive, it’s recommended to pass them to the states via pillar.

Required provider parameters:

if using username and password:
  • subscription_id
  • username
  • password

if using a service principal:
  • subscription_id
  • tenant
  • client_id
  • secret

Optional provider parameters:

cloud_environment: Used to point the cloud driver to different API endpoints, such as Azure GovCloud. Possible values:

  • AZURE_PUBLIC_CLOUD (default)
  • AZURE_CHINA_CLOUD
  • AZURE_US_GOV_CLOUD
  • AZURE_GERMAN_CLOUD

Example Pillar for Azure Resource Manager authentication:

```yaml
azurearm:
  user_pass_auth:
    subscription_id: 3287abc8-f98a-c678-3bde-326766fd3617
    username: fletch
    password: 123pass
  mysubscription:
    subscription_id: 3287abc8-f98a-c678-3bde-326766fd3617
    tenant: ABCDEFAB-1234-ABCD-1234-ABCDEFABCD
    client_id: ABCDEFAB-1234-ABCD-1234-ABCDEFABCD
    secret: XXXXXXXXXXXXXXXXXXXXXXXXXXX
    cloud_environment: AZURE_PUBLIC_CLOUD
```

Example states using Azure Resource Manager authentication:
Ensure availability set exists:

```yaml
set profile = salt['pillar.get']('azurearm:mysubscription')

Ensure availability set exists:
  azurearm_compute.availability_set_present:
    - name: my_avail_set
    - resource_group: my_rg
    - virtual_machines:
      - my_vm1
      - my_vm2
    - tags:
      how_awesome: very
      contact_name: Elmer Fudd Gantry
    - connection_auth: {{ profile }}

Ensure availability set is absent:
  azurearm_compute.availability_set_absent:
    - name: other_avail_set
    - resource_group: my_rg
    - connection_auth: {{ profile }}
```

salt.states.azurearm_compute.availability_set_absent(name, resource_group, connection_auth=None)

New in version 2019.2.0.

Ensure an availability set does not exist in a resource group.

Parameters

- **name** – Name of the availability set.
- **resource_group** – Name of the resource group containing the availability set.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

salt.states.azurearm_compute.availability_set_present(name, resource_group, tags=None, platform_update_domain_count=None, platform_fault_domain_count=None, virtual_machines=None, sku=None, connection_auth=None, **kwargs)

New in version 2019.2.0.

Ensure an availability set exists.

Parameters

- **name** – Name of the availability set.
- **resource_group** – The resource group assigned to the availability set.
- **tags** – A dictionary of strings can be passed as tag metadata to the availability set object.
- **platform_update_domain_count** – An optional parameter which indicates groups of virtual machines and underlying physical hardware that can be rebooted at the same time.
- **platform_fault_domain_count** – An optional parameter which defines the group of virtual machines that share a common power source and network switch.
- **virtual_machines** – A list of names of existing virtual machines to be included in the availability set.
- **sku** – The availability set SKU, which specifies whether the availability set is managed or not. Possible values are 'Aligned' or 'Classic'. An 'Aligned' availability set is managed, 'Classic' is not.
- **connection_auth** – A dict with subscription and authentication parameters to be
used in connecting to the Azure Resource Manager API.

Example usage:

```
Ensure availability set exists:
  azurearm_compute.availability_set_present:
    - name: aset1
    - resource_group: group1
    - platform_update_domain_count: 5
    - platform_fault_domain_count: 3
    - sku: aligned
    - tags:
      - contact_name: Elmer Fudd Gantry
    - connection_auth: {{ profile }}
    - require:
      - azurearm_resource: Ensure resource group exists
```

## 21.19.16 salt.states.azurearm_network

Azure (ARM) Network State Module

New in version 2019.2.0.

**maintainer**  
<devops@decisionlab.io>

**maturity**  
new

**depends**

- azure >= 2.0.0
- azure-common >= 1.1.8
- azure-mgmt >= 1.0.0
- azure-mgmt-compute >= 1.0.0
- azure-mgmt-network >= 1.7.1
- azure-mgmt-resource >= 1.1.0
- azure-mgmt-storage >= 1.0.0
- azure-mgmt-web >= 0.32.0
- azure-storage >= 0.34.3
- msrestazure >= 0.4.21

**platform**  
linux

**configuration**  
This module requires Azure Resource Manager credentials to be passed as a dictionary of keyword arguments to the `connection_auth` parameter in order to work properly. Since the authentication parameters are sensitive, it’s recommended to pass them to the states via pillar.

Required provider parameters:

**if using username and password:**

- subscription_id
- username
- password

**if using a service principal:**
• subscription_id
• tenant
• client_id
• secret

Optional provider parameters:

cloud_environment: Used to point the cloud driver to different API endpoints, such as Azure GovCloud. Possible values:

• AZURE_PUBLIC_CLOUD (default)
• AZURE_CHINA_CLOUD
• AZURE_US_GOV_CLOUD
• AZURE_GERMAN_CLOUD

Example Pillar for Azure Resource Manager authentication:

```yaml
azurearm:
  user_pass_auth:
    subscription_id: 3287abc8-f98a-c678-3bde-326766fd3617
    username: fletch
    password: 123pass

mysubscription:
  subscription_id: 3287abc8-f98a-c678-3bde-326766fd3617
  tenant: ABCDEFA-B1234-ABCD-1234-ABCDEFABCDEF
  client_id: ABCDEFA-B1234-ABCD-1234-ABCDEFABCDEF
  secret: XXXXXXXXXXXXXXXXXXXXXXXXXXX
  cloud_environment: AZURE_PUBLIC_CLOUD
```

Example states using Azure Resource Manager authentication:

```yaml
{% set profile = salt['pillar.get']('azurearm:mysubscription') %}

Ensure virtual network exists:
azurearm_network.virtual_network_present:
  - name: my_vnet
  - resource_group: my_rg
  - address_prefixes:
    - '10.0.0.0/8'
    - '192.168.0.0/16'
  - dns_servers:
    - '8.8.8.8'
  - tags:
    how_awesome: very
    contact_name: Elmer Fudd Gantry
  - connection_auth: {{ profile }}

Ensure virtual network is absent:
azurearm_network.virtual_network_absent:
  - name: other_vnet
  - resource_group: my_rg
  - connection_auth: {{ profile }}
```

salt.states.azurearm_network.load_balancer_absent(name, resource_group, connection_auth=None)

New in version 2019.2.0.

Ensure a load balancer does not exist in the resource group.
Parameters

- **name** – Name of the load balancer.
- **resource_group** – The resource group assigned to the load balancer.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

```python
salt.states.azurearm_network.load_balancer_present(name, resource_group=None, frontend_ip_configurations=None, backend_address_pools=None, load_balancing_rules=None, probes=None, inbound_nat_rules=None, inbound_nat_pools=None, outbound_nat_rules=None, tags=None, connection_auth=None, **kwargs)
```

New in version 2019.2.0.

Ensure a load balancer exists.

Parameters

- **name** – Name of the load balancer.
- **resource_group** – The resource group assigned to the load balancer.
- **sku** – The load balancer SKU, which can be 'Basic' or 'Standard'.
- **tags** – A dictionary of strings can be passed as tag metadata to the load balancer object.
- **frontend_ip_configurations** – An optional list of dictionaries representing valid FrontendIPConfiguration objects. A frontend IP configuration can be either private (using private IP address and subnet parameters) or public (using a reference to a public IP address object). Valid parameters are:
  - **name**: The name of the resource that is unique within a resource group.
  - **private_ip_address**: The private IP address of the IP configuration. Required if 'private_ip_allocation_method' is 'Static'.
  - **private_ip_allocation_method**: The Private IP allocation method. Possible values are: 'Static' and 'Dynamic'.
  - **subnet**: Name of an existing subnet inside of which the frontend IP will reside.
  - **public_ip_address**: Name of an existing public IP address which will be assigned to the frontend IP object.
- **backend_address_pools** – An optional list of dictionaries representing valid BackendAddressPool objects. Only the 'name' parameter is valid for a BackendAddressPool dictionary. All other parameters are read-only references from other objects linking to the backend address pool. Inbound traffic is randomly load balanced across IPs in the backend IPs.
- **probes** – An optional list of dictionaries representing valid Probe objects. Valid parameters are:
  - **name**: The name of the resource that is unique within a resource group.
  - **protocol**: The protocol of the endpoint. Possible values are 'Http' or 'Tcp'. If 'Tcp' is specified, a received ACK is required for the probe to be successful. If 'Http' is specified, a 200 OK response from the specified URI is required for the probe to be successful.
  - **port**: The port for communicating the probe. Possible values range from 1 to 65535, inclusive.
  - **interval_in_seconds**: The interval, in seconds, for how frequently to probe the endpoint for health status. Typically, the interval is slightly less than half the allocated timeout period (in seconds) which allows two full probes before taking the instance out of rotation. The default value is 15, the minimum
value is 5.
- number_of_probes: The number of probes where if no response, will result in stopping further traffic from being delivered to the endpoint. This values allows endpoints to be taken out of rotation faster or slower than the typical times used in Azure.
- request_path: The URI used for requesting health status from the VM. Path is required if a protocol is set to 'Http'. Otherwise, it is not allowed. There is no default value.

- **load_balancing_rules** – An optional list of dictionaries representing valid LoadBalancingRule objects. Valid parameters are:
  - name: The name of the resource that is unique within a resource group.
  - load_distribution: The load distribution policy for this rule. Possible values are 'Default', 'SourceIP', and 'SourceIPProtocol'.
  - frontend_port: The port for the external endpoint. Port numbers for each rule must be unique within the Load Balancer. Acceptable values are between 0 and 65534. Note that value 0 enables 'Any Port'.
  - backend_port: The port used for internal connections on the endpoint. Acceptable values are between 0 and 65535. Note that value 0 enables 'Any Port'.
  - idle_timeout_in_minutes: The timeout for the TCP idle connection. The value can be set between 4 and 30 minutes. The default value is 4 minutes. This element is only used when the protocol is set to TCP.
  - enable_floating_ip: Configures a virtual machine’s endpoint for the floating IP capability required to configure a SQL AlwaysOn Availability Group. This setting is required when using the SQL AlwaysOn Availability Groups in SQL server. This setting can’t be changed after you create the endpoint.
  - disable_outbound_snat: Configures SNAT for the VMs in the backend pool to use the public IP address specified in the frontend of the load balancing rule.
  - frontend_ip_configuration: Name of the frontend IP configuration object used by the load balancing rule object.
  - backend_address_pool: Name of the backend address pool object used by the load balancing rule object. Inbound traffic is randomly load balanced across IPs in the backend IPs.
  - probe: Name of the probe object used by the load balancing rule object.

- **inbound_nat_rules** – An optional list of dictionaries representing valid InboundNatRule objects. Defining inbound NAT rules on your load balancer is mutually exclusive with defining an inbound NAT pool. Inbound NAT pools are referenced from virtual machine scale sets. NICs that are associated with individual virtual machines cannot reference an Inbound NAT pool. They have to reference individual inbound NAT rules. Valid parameters are:
  - name: The name of the resource that is unique within a resource group.
  - frontend_ip_configuration: Name of the frontend IP configuration object used by the inbound NAT rule object.
  - protocol: Possible values include 'Udp', 'Tcp', or 'All'.
  - frontend_port: The port for the external endpoint. Port numbers for each rule must be unique within the Load Balancer. Acceptable values range from 1 to 65534.
  - backend_port: The port used for the internal endpoint. Acceptable values range from 1 to 65535.
  - idle_timeout_in_minutes: The timeout for the TCP idle connection. The value can be set between 4 and 30 minutes. The default value is 4 minutes. This element is only used when the protocol is set to TCP.
  - enable_floating_ip: Configures a virtual machine’s endpoint for the floating IP capability required to configure a SQL AlwaysOn Availability Group.
This setting is required when using the SQL AlwaysOn Availability Groups in SQL server. This setting can't be changed after you create the endpoint.

- **inbound_nat_pools** – An optional list of dictionaries representing valid InboundNatPool objects. They define an external port range for inbound NAT to a single backend port on NICs associated with a load balancer. Inbound NAT rules are created automatically for each NIC associated with the Load Balancer using an external port from this range. Defining an Inbound NAT pool on your Load Balancer is mutually exclusive with defining inbound NAT rules. Inbound NAT pools are referenced from virtual machine scale sets. NICs that are associated with individual virtual machines cannot reference an inbound NAT pool. They have to reference individual inbound NAT rules. Valid parameters are:
  - **name**: The name of the resource that is unique within a resource group.
  - **frontend_ip_configuration**: Name of the frontend IP configuration object used by the inbound NAT pool object.
  - **protocol**: Possible values include 'Udp', 'Tcp', or 'All'.
  - **frontend_port_range_start**: The first port number in the range of external ports that will be used to provide Inbound NAT to NICs associated with a load balancer. Acceptable values range between 1 and 65534.
  - **frontend_port_range_end**: The last port number in the range of external ports that will be used to provide Inbound NAT to NICs associated with a load balancer. Acceptable values range between 1 and 65535.
  - **backend_port**: The port used for internal connections to the endpoint. Acceptable values are between 1 and 65535.

- **outbound_nat_rules** – An optional list of dictionaries representing valid OutboundNatRule objects. Valid parameters are:
  - **name**: The name of the resource that is unique within a resource group.
  - **frontend_ip_configuration**: Name of the frontend IP configuration object used by the outbound NAT rule object.
  - **backend_address_pool**: Name of the backend address pool object used by the outbound NAT rule object. Outbound traffic is randomly load balanced across IPs in the backend IPs.
  - **allocated_outbound_ports**: The number of outbound ports to be used for NAT.

- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```python
Ensure load balancer exists:
  azuerearm_network.load_balancer_present:
    - name: lb1
    - resource_group: group1
    - location: eastus
    - frontend_ip_configurations:
      - name: lb1_feip1
        public_ip_address: pub_ip1
    - backend_address_pools:
      - name: lb1_bepool1
    - probes:
      - name: lb1_webprobe1
        protocol: tcp
        port: 80
        interval_in_seconds: 5
        number_of_probes: 2
    - load_balancing_rules:
      - name: lb1_webprobe1
```

(continues on next page)
```python
protocol: tcp
frontend_port: 80
backend_port: 80
idle_timeout_in_minutes: 4
frontend_ip_configuration: lb1_feip1
backend_address_pool: lb1_bepool1
probe: lb1_webprobe1

- require:
  - azurearm_resource: Ensure resource group exists
  - azurearm_network: Ensure public IP exists
```

salt.states.azurearm_network.network_interface_absent(name, resource_group, connection_auth=None)

New in version 2019.2.0.

Ensure a network interface does not exist in the resource group.

Parameters

- **name** – Name of the network interface.
- **resource_group** – The resource group assigned to the network interface.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

salt.states.azurearm_network.network_interface_present(name, ip_configurations, subnet, virtual_network, resource_group, tags=None, virtual_machine=None, network_security_group=None, dns_settings=None, mac_address=None, primary=None, enable_accelerated_networking=None, enable_ip_forwarding=None, connection_auth=None, **kwargs)

New in version 2019.2.0.

Ensure a network interface exists.

Parameters

- **name** – Name of the network interface.
- **ip_configurations** – A list of dictionaries representing valid NetworkInterfaceIPConfiguration objects. The 'name' key is required at minimum. At least one IP Configuration must be present.
- **subnet** – Name of the existing subnet assigned to the network interface.
- **virtual_network** – Name of the existing virtual network containing the subnet.
- **resource_group** – The resource group assigned to the virtual network.
- **tags** – A dictionary of strings can be passed as tag metadata to the network interface object.
- **network_security_group** – The name of the existing network security group to assign to the network interface.
- **virtual_machine** – The name of the existing virtual machine to assign to the network interface.
• **dns_settings** – An optional dictionary representing a valid NetworkInterfaceDnsSettings object. Valid parameters are:
  - **dns_servers** – List of DNS server IP addresses. Use 'AzureProvidedDNS' to switch to Azure provided DNS resolution. 'AzureProvidedDNS' value cannot be combined with other IPs, it must be the only value in dns_servers collection.
  - **internal_dns_name_label** – Relative DNS name for this NIC used for internal communications between VMs in the same virtual network.
  - **internal_fqdn** – Fully qualified DNS name supporting internal communications between VMs in the same virtual network.
  - **internal_domain_name_suffix** – Even if internal_dns_name_label is not specified, a DNS entry is created for the primary NIC of the VM. This DNS name can be constructed by concatenating the VM name with the value of internal_domain_name_suffix.

• **mac_address** – Optional string containing the MAC address of the network interface.

• **primary** – Optional boolean allowing the interface to be set as the primary network interface on a virtual machine with multiple interfaces attached.

• **enable_accelerated_networking** – Optional boolean indicating whether accelerated networking should be enabled for the interface.

• **enable_ip_forwarding** – Optional boolean indicating whether IP forwarding should be enabled for the interface.

• **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```yaml
Ensure network interface exists:
  azurearm_network.network_interface_present:
    - name: iface1
    - subnet: vnet1_sn1
    - virtual_network: vnet1
    - resource_group: group1
    - ip_configurations:
      - name: iface1_ipc1
        public_ip_address: pub_ip2
        dns_settings:
          - internal_dns_name_label: decisionlab-int-test-label
          - primary: True
          - enable_accelerated_networking: True
          - enable_ip_forwarding: False
          - network_security_group: nsg1
          - connection_auth: {{ profile }}
    - require:
      - azurearm_network: Ensure subnet exists
      - azurearm_network: Ensure network security group exists
      - azurearm_network: Ensure another public IP exists

salt.states.azurearm_network.network_security_group_absent(name, resource_group, connection_auth=None)
```

New in version 2019.2.0.

Ensure a network security group does not exist in the resource group.

Parameters

• **name** – Name of the network security group.

• **resource_group** – The resource group assigned to the network security group.

• **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.
salt.states.azurearm_network.network_security_group_present

New in version 2019.2.0.

Ensure a network security group exists.

**Parameters**

- **name** – Name of the network security group.
- **resource_group** – The resource group assigned to the network security group.
- **tags** – A dictionary of strings can be passed as tag metadata to the network security group object.
- **security_rules** – An optional list of dictionaries representing valid SecurityRule objects. See the documentation for the security_rule_present state or security_rule_create_or_update execution module for more information on required and optional parameters for security rules. The rules are only managed if this parameter is present. When this parameter is absent, implemented rules will not be removed, and will merely become unmanaged.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

**Example usage:**

```python
Ensure network security group exists:

azurearm_network.network_security_group_present:
  - name: nsg1
  - resource_group: group1
  - security_rules:
    - name: nsg1_rule1
      priority: 100
      protocol: tcp
      access: allow
      direction: outbound
      source_address_prefix: virtualnetwork
      destination_address_prefix: internet
      source_port_range: '*'
      destination_port_range: '*'
    - name: nsg1_rule2
      priority: 101
      protocol: tcp
      access: allow
      direction: inbound
      source_address_prefix: internet
      destination_address_prefix: virtualnetwork
      source_port_range: '*'
      destination_port_ranges:
        - '80'
        - '443'
  - tags:
    - contact_name: Elmer Fudd Gantry
  - connection_auth: {{ profile }}
  - require:
    - azurearm_resource: Ensure resource group exists
```

salt.states.azurearm_network.public_ip_address_absent

21.19. state modules
New in version 2019.2.0.

Ensure a public IP address does not exist in the resource group.

Parameters
- `name` – Name of the public IP address.
- `resource_group` – The resource group assigned to the public IP address.
- `connection_auth` – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

```python
salt.states.azurearm_network.public_ip_address_present(name, resource_group, tags=None, sku=None, public_ip_allocation_method=None, public_ip_address_version=None, dns_settings=None, idle_timeout_in_minutes=None, connection_auth=None, **kwargs)
```

New in version 2019.2.0.

Ensure a public IP address exists.

Parameters
- `name` – Name of the public IP address.
- `resource_group` – The resource group assigned to the public IP address.
- `dns_settings` – An optional dictionary representing a valid PublicIPAddressDnsSettings object. Parameters include 'domain_name_label' and 'reverse_fqdn', which accept strings. The 'domain_name_label' parameter is concatenated with the region-ralized DNS zone make up the fully qualified domain name associated with the public IP address. If a domain name label is specified, an A DNS record is created for the public IP in the Microsoft Azure DNS system. The 'reverse_fqdn' parameter is a user-visible, fully qualified domain name that resolves to this public IP address. If the reverse FQDN is specified, then a PTR DNS record is created pointing from the IP address in the in-addr.arpa domain to the reverse FQDN.
- `sku` – The public IP address SKU, which can be 'Basic' or 'Standard'.
- `public_ip_allocation_method` – The public IP allocation method. Possible values are: 'Static' and 'Dynamic'.
- `public_ip_address_version` – The public IP address version. Possible values are: 'IPv4' and 'IPv6'.
- `idle_timeout_in_minutes` – An integer representing the idle timeout of the public IP address.
- `tags` – A dictionary of strings can be passed as tag metadata to the public IP address object.
- `connection_auth` – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```yaml
Ensure public IP exists:
    azurearm_network.public_ip_address_present:
        - name: pub_ip1
        - resource_group: group1
        - dns_settings:
            domain_name_label: decisionlab-ext-test-label
        - sku: basic
        - public_ip_allocation_method: static
        - public_ip_address_version: ipv4
        - idle_timeout_in_minutes: 4
```

  - **connection_auth**: `{{ profile }}`

salt.states.azurearm_network.route_absent(name, route_table, resource_group, connection_auth=None)

New in version 2019.2.0.

Ensure a route table does not exist in the resource group.

**Parameters**

- **name** – Name of the route table.
- **route_table** – The name of the existing route table containing the route.
- **resource_group** – The resource group assigned to the route table.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

salt.states.azurearm_network.route_present(name, address_prefix, next_hop_type, route_table, resource_group, next_hop_ip_address=None, connection_auth=None, **kwargs)

New in version 2019.2.0.

Ensure a route exists within a route table.

**Parameters**

- **name** – Name of the route.
- **address_prefix** – The destination CIDR to which the route applies.
- **next_hop_type** – The type of Azure hop the packet should be sent to. Possible values are: 'VirtualNetworkGateway', 'VnetLocal', 'Internet', 'VirtualAppliance', and 'None'.
- **next_hop_ip_address** – The IP address packets should be forwarded to. Next hop values are only allowed in routes where the next hop type is 'VirtualAppliance'.
- **route_table** – The name of the existing route table which will contain the route.
- **resource_group** – The resource group assigned to the route table.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```python
Ensure route exists:
    azurearm_network.route_present:
    - name: rt1_route2
    - route_table: rt1
    - resource_group: group1
    - address_prefix: '192.168.0.0/16'
    - next_hop_type: vnetlocal
    - connection_auth: {{ profile }}
    - require:
        - azurearm_network: Ensure route table exists
```

salt.states.azurearm_network.route_table_absent(name, resource_group, connection_auth=None)

New in version 2019.2.0.

Ensure a route table does not exist in the resource group.

**Parameters**

- **name** – Name of the route table.
• **resource_group** – The resource group assigned to the route table.
• **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

```python
salt.states.azurearm_network.route_table_present(name, resource_group, tags=None, routes=None, disable_bgp_route_propagation=None, connection_auth=None, **kwargs)
```

New in version 2019.2.0.

Ensure a route table exists.

Parameters

- **name** – Name of the route table.
- **resource_group** – The resource group assigned to the route table.
- **routes** – An optional list of dictionaries representing valid Route objects contained within a route table. See the documentation for the `route_present` state or `route_create_or_update` execution module for more information on required and optional parameters for routes. The routes are only managed if this parameter is present. When this parameter is absent, implemented routes will not be removed, and will merely become unmanaged.
- **disable_bgp_route_propagation** – An optional boolean parameter setting whether to disable the routes learned by BGP on the route table.
- **tags** – A dictionary of strings can be passed as tag metadata to the route table object.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```
Ensure route table exists:
azurearm_network.route_table_present:
  - name: rt1
  - resource_group: group1
  - routes:
    - name: rt1_route1
      address_prefix: '0.0.0.0/0'
      next_hop_type: internet
    - name: rt1_route2
      address_prefix: '192.168.0.0/16'
      next_hop_type: vnetlocal
  - tags:
    - contact_name: Elmer Fudd Gantry
  - connection_auth: {{{ profile }}}
  - require:
    - azurearm_resource: Ensure resource group exists
```

```python
salt.states.azurearm_network.security_rule_absent(name, security_group, resource_group, connection_auth=None)
```

New in version 2019.2.0.

Ensure a security rule does not exist in the network security group.

Parameters

- **name** – Name of the security rule.
- **security_group** – The network security group containing the security rule.
- **resource_group** – The resource group assigned to the network security group.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.
salt.states.azurearm_network.security_rule_present(name, access, direction, priority, protocol, security_group, resource_group, destination_address_prefix=None, destination_port_range=None, source_address_prefix=None, source_port_range=None, description=None, destination_address_prefixes=None, destination_port_ranges=None, source_address_prefixes=None, source_port_ranges=None, connection_auth=None, **kwargs)

New in version 2019.2.0.

Ensure a security rule exists.

Parameters

- **name** – Name of the security rule.
- **access** – ‘allow’ or ‘deny’
- **direction** – ‘inbound’ or ‘outbound’
- **priority** – Integer between 100 and 4096 used for ordering rule application.
- **protocol** – ‘tcp’, ‘udp’, or ‘*’
- **security_group** – The name of the existing network security group to contain the security rule.
- **resource_group** – The resource group assigned to the network security group.
- **description** – Optional description of the security rule.
- **destination_address_prefix** – The CIDR or destination IP range. Asterix ‘*’ can also be used to match all destination IPs. Default tags such as ‘VirtualNetwork’, ‘AzureLoadBalancer’ and ‘Internet’ can also be used. If this is an ingress rule, specifies where network traffic originates from.
- **destination_port_range** – The destination port or range. Integer or range between 0 and 65535. Asterix ‘*’ can also be used to match all ports.
- **source_address_prefix** – The CIDR or source IP range. Asterix ‘*’ can also be used to match all source IPs. Default tags such as ‘VirtualNetwork’, ‘AzureLoadBalancer’ and ‘Internet’ can also be used. If this is an ingress rule, specifies where network traffic originates from.
- **source_port_range** – The source port or range. Integer or range between 0 and 65535. Asterix ‘*’ can also be used to match all ports.
- **destination_address_prefixes** – A list of destination_address_prefix values. This parameter overrides destination_address_prefix and will cause any value entered there to be ignored.
- **destination_port_ranges** – A list of destination_port_range values. This parameter overrides destination_port_range and will cause any value entered there to be ignored.
- **source_address_prefixes** – A list of source_address_prefix values. This parameter overrides source_address_prefix and will cause any value entered there to be ignored.
- **source_port_ranges** – A list of source_port_range values. This parameter overrides source_port_range and will cause any value entered there to be ignored.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

Ensure security rule exists:
azurearm_network.security_rule_present:
- name: nsg1_rule2
- security_group: nsg1
- resource_group: group1
- priority: 101
- protocol: tcp
- access: allow
- direction: inbound
- source_address_prefix: internet
- destination_address_prefix: virtualnetwork
- source_port_range: '*'
- destination_port_ranges:
  - '80'
  - '443'
- connection_auth: {{ profile }}
- require:
  - azurearm_network: Ensure network security group exists

salt.states.azurearm_network.subnet_absent(name, virtual_network, resource_group, connection_auth=None)

New in version 2019.2.0.

Ensure a virtual network does not exist in the virtual network.

Parameters

- **name** – Name of the subnet.
- **virtual_network** – Name of the existing virtual network containing the subnet.
- **resource_group** – The resource group assigned to the virtual network.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

salt.states.azurearm_network.subnet_present(name, address_prefix, virtual_network, resource_group, security_group=None, route_table=None, connection_auth=None, **kwargs)

New in version 2019.2.0.

Ensure a subnet exists.

Parameters

- **name** – Name of the subnet.
- **address_prefix** – A CIDR block used by the subnet within the virtual network.
- **virtual_network** – Name of the existing virtual network to contain the subnet.
- **resource_group** – The resource group assigned to the virtual network.
- **security_group** – The name of the existing network security group to assign to the subnet.
- **route_table** – The name of the existing route table to assign to the subnet.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

Ensure subnet exists:

```
azurearm_network.subnet_present:
- name: vnet1_sn1
- virtual_network: vnet1
- resource_group: group1
- address_prefix: '192.168.1.0/24'
- security_group: nsg1
```

(continues on next page)
- **route_table**: rt1
- **connection_auth**: `{{ profile }}`
- **require**:
  - **azurearm_network**: Ensure virtual network exists
  - **azurearm_network**: Ensure network security group exists
  - **azurearm_network**: Ensure route table exists

salt.states.azurearm_network.virtual_network_absent(name, resource_group, connection_auth=None)

New in version 2019.2.0.

Ensure a virtual network does not exist in the resource group.

Parameters

- **name** – Name of the virtual network.
- **resource_group** – The resource group assigned to the virtual network.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

salt.states.azurearm_network.virtual_network_present(name, address_prefixes, resource_group, dns_servers=None, tags=None, connection_auth=None, **kwargs)

New in version 2019.2.0.

Ensure a virtual network exists.

Parameters

- **name** – Name of the virtual network.
- **resource_group** – The resource group assigned to the virtual network.
- **address_prefixes** – A list of CIDR blocks which can be used by subnets within the virtual network.
- **dns_servers** – A list of DNS server addresses.
- **tags** – A dictionary of strings can be passed as tag metadata to the virtual network object.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```python
Ensure virtual network exists:
azurearm_network.virtual_network_present:
  - name: vnet1
  - resource_group: group1
  - address_prefixes:
    - '10.0.0.0/8'
    - '192.168.0.0/16'
  - dns_servers:
    - '8.8.8.8'
  - tags:
    - contact_name: Elmer Fudd Gantry
  - connection_auth: `{{ profile }}`
  - require:
    - azurearm_resource: Ensure resource group exists
```
Salt Documentation, Release 2019.2.0

21.19.17 salt.states.azurearm_resource

Azure (ARM) Resource State Module
New in version 2019.2.0.

maintainer <devops@decisionlab.io>
maturity new
depends

• azure >= 2.0.0
• azure-common >= 1.1.8
• azure-mgmt >= 1.0.0
• azure-mgmt-compute >= 1.0.0
• azure-mgmt-network >= 1.7.1
• azure-mgmt-resource >= 1.1.0
• azure-mgmt-storage >= 1.0.0
• azure-mgmt-web >= 0.32.0
• azure-storage >= 0.34.3
• msrestazure >= 0.4.21

platform linux

configuration This module requires Azure Resource Manager credentials to be passed as a dictionary of keyword arguments to the connection_auth parameter in order to work properly. Since the authentication parameters are sensitive, it’s recommended to pass them to the states via pillar.

Required provider parameters:
if using username and password:

• subscription_id
• username
• password

if using a service principal:

• subscription_id
• tenant
• client_id
• secret

Optional provider parameters:

cloud_environment: Used to point the cloud driver to different API endpoints, such as Azure GovCloud. Possible values:

• AZURE_PUBLIC_CLOUD (default)
• AZURE_CHINA_CLOUD
• AZURE_US_GOV_CLOUD
• AZURE_GERMAN_CLOUD
Example Pillar for Azure Resource Manager authentication:

```
azurearm:
  user_pass_auth:
    subscription_id: 3287abc8-f98a-c678-3bde-326766fd3617
    username: fletch
    password: 123pass

mysubscription:
  subscription_id: 3287abc8-f98a-c678-3bde-326766fd3617
  tenant: ABCDEFAB-1234-ABCD-1234-ABCDEFABCDEF
  client_id: ABCDEFAB-1234-ABCD-1234-ABCDEFABCDEF
  secret: XXXXXXXXXXXXXXXXXXXXXXXX
  cloud_environment: AZURE_PUBLIC_CLOUD
```

Example states using Azure Resource Manager authentication:

```
{% set profile = salt['pillar.get']('azurearm:mysubscription') %}

Ensure resource group exists:
```
salt.states.azurearm_resource.resource_group_present:
  - name: my_rg
  - location: westus
  - tags:
    how_awesome: very
    contact_name: Elmer Fudd Gantry
  - connection_auth: {{ profile }}
```

Ensure resource group is absent:
```
salt.states.azurearm_resource.resource_group_absent:
  - name: other_rg
  - connection_auth: {{ profile }}
```

salt.states.azurearm_resource.policy_assignment_absent(name, scope, connection_auth=None)

New in version 2019.2.0.

Ensure a policy assignment does not exist in the provided scope.

Parameters

- **name** – Name of the policy assignment.
- **scope** – The scope of the policy assignment.
- **connection_auth** A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

salt.states.azurearm_resource.policy_assignment_present(name, scope, definition_name, display_name=None, description=None, assignment_type=None, parameters=None, connection_auth=None, **kwargs)

New in version 2019.2.0.

Ensure a security policy assignment exists.

Parameters

- **name** – Name of the policy assignment.
- **scope** – The scope of the policy assignment.
- **definition_name** – The name of the policy definition to assign.
- **display_name** – The display name of the policy assignment.
- **description** – The policy assignment description.
- **assignment_type** – The type of policy assignment.
- **parameters** – Required dictionary if a parameter is used in the policy rule.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```
Ensure policy assignment exists:
  azurearm_resource.policy_assignment_present:
    - name: testassign
    - scope: /subscriptions/bc75htn-a0fhsi-349b-56gh-4fghti-f84852
    - definition_name: testpolicy
    - display_name: Test Assignment
    - description: Test assignment for testing assignments.
    - connection_auth: {{ profile }}
```

```python
salt.states.azurearm_resource.policy_definition_absent(name, connection_auth=None)
```

New in version 2019.2.0.

Ensure a policy definition does not exist in the current subscription.

Parameters

- **name** – Name of the policy definition.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

```python
salt.states.azurearm_resource.policy_definition_present(name, policy_rule=None, policy_rule_json=None, policy_rule_file=None, template='jinja', source_hash=None, source_hash_name=None, skip_verify=False, connection_auth=None, **kwargs)
```

New in version 2019.2.0.

Ensure a security policy definition exists.

Parameters

- **name** – Name of the policy definition.
- **policy_rule** – A YAML dictionary defining the policy rule. See Azure Policy Definition documentation for details on the structure. One of `policy_rule`, `policy_rule_json`, or `policy_rule_file` is required, in that order of precedence for use if multiple parameters are used.
- **policy_rule_json** – A text field defining the entirety of a policy definition in JSON. See Azure Policy Definition documentation for details on the structure. One of `policy_rule`, `policy_rule_json`, or `policy_rule_file` is required, in that order of precedence for use if multiple parameters are used. Note that the `name` field in the JSON will override the `name` parameter in the state.
- **policy_rule_file** – The source of a JSON file defining the entirety of a policy definition. See Azure Policy Definition documentation for details on the struc-
One of `policy_rule`, `policy_rule_json`, or `policy_rule_file` is required, in that order of precedence for use if multiple parameters are used. Note that the `name` field in the JSON will override the `name` parameter in the state.

- **skip_verify** – Used for the `policy_rule_file` parameter. If `True`, hash verification of remote file sources (http://, https://, ftp://) will be skipped, and the `source_hash` argument will be ignored.

- **source_hash** – This can be a source hash string or the URI of a file that contains source hash strings.

- **source_hash_name** – When `source_hash` refers to a hash file, Salt will try to find the correct hash by matching the filename/URI associated with that hash.

- **policy_type** – The type of policy definition. Possible values are NotSpecified, BuiltIn, and Custom. Only used with the `policy_rule` parameter.

- **mode** – The policy definition mode. Possible values are NotSpecified, Indexed, and All. Only used with the `policy_rule` parameter.

- **display_name** – The display name of the policy definition. Only used with the `policy_rule` parameter.

- **description** – The policy definition description. Only used with the `policy_rule` parameter.

- **metadata** – The policy definition metadata defined as a dictionary. Only used with the `policy_rule` parameter.

- **parameters** – Required dictionary if a parameter is used in the policy rule. Only used with the `policy_rule` parameter.

- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```python
Ensure policy definition exists:

```azurearm_resource.policy_definition_present```
- name: testpolicy
- display_name: Test Policy
- description: Test policy for testing policies.
- policy_rule:
  if:
    allOf:
    - equals: Microsoft.Compute/virtualMachines/write
      source: action
      field: location
    in:
      - eastus
      - eastus2
      - centralus
  then:
    effect: deny
- connection_auth: {{ profile }}
```

salt.states.azurearm_resource.resource_group_absent(name, connection_auth=None)

New in version 2019.2.0.

Ensure a resource group does not exist in the current subscription.

**Parameters**

- **name** – Name of the resource group.

- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

salt.states.azurearm_resource.resource_group_present(name, location, managed_by=None, tags=None, connection_auth=None, **kwargs)
New in version 2019.2.0.

Ensure a resource group exists.

Parameters

- **name** – Name of the resource group.
- **location** – The Azure location in which to create the resource group. This value cannot be updated once the resource group is created.
- **managed_by** – The ID of the resource that manages this resource group. This value cannot be updated once the resource group is created.
- **tags** – A dictionary of strings can be passed as tag metadata to the resource group object.
- **connection_auth** – A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```python
Ensure resource group exists:
azurearm_resource.resource_group_present:
  - name: group1
  - location: eastus
  - tags:
    contact_name: Elmer Fudd Gantry
  - connection_auth: {{ profile }}
```

21.19.18 salt.states.beacon

Management of the Salt beacons

New in version 2015.8.0.

```python
ps:
  beacon.present:
    - save: True
    - enable: False
    - services:
      salt-master: running
      apache2: stopped

sh:
  beacon.present: []

load:
  beacon.present:
    - averages:
      1m:
        - 0.0
        - 2.0
      5m:
        - 0.0
        - 1.5
      15m:
        - 0.1
        - 1.0

salt.states.beacon.absent(name, save=False, **kwargs)
  Ensure beacon is absent.
  name  The name of the beacon ensured absent.
```
save  True/False, if True the beacons.conf file be updated too. Default is False.

```python
salt.states.beacon.disabled(name, **kwargs)
```
Disable a beacon.

- **name** The name of the beacon to disable.

```python
salt.states.beacon.enabled(name, **kwargs)
```
Enable a beacon.

- **name** The name of the beacon to enable.

```python
salt.states.beacon.present(name, save=False, **kwargs)
```
Ensure beacon is configured with the included beacon data.

- **name** The name of the beacon ensure is configured.
- **save** True/False, if True the beacons.conf file be updated too. Default is False.

## 21.19.19 salt.states.bigip

A state module designed to enforce load-balancing configurations for F5 Big-IP entities.

- **maturity** develop
- **platform** f5_bigip_11.6

```python
salt.states.bigip.add_pool_member(hostname, username, password, name, member)
```
A function to connect to a bigip device and add a new member to an existing pool.

- **hostname** The host/address of the bigip device
- **username** The iControl REST username
- **password** The iControl REST password
- **name** The name of the pool to modify
- **member** The member to add to the pool

```python
salt.states.bigip.create_monitor(hostname, username, password, monitor_type, name, **kwargs)
```
A function to connect to a bigip device and create a monitor.

- **hostname** The host/address of the bigip device
- **username** The iControl REST username
- **password** The iControl REST password
- **monitor_type** The type of monitor to create
- **name** The name of the monitor to create
- **kwargs** [ arg=val ] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

```python
salt.states.bigip.create_node(hostname, username, password, name, address)
```
Create a new node if it does not already exist.

- **hostname** The host/address of the bigip device
- **username** The iControl REST username
- **password** The iControl REST password
- **name** The name of the node to create
- **address** The address of the node
salt.states.bigip.create_pool(hostname, username, password, name, members=None, allow_nat=None, allow_snat=None, description=None, gateway_failsafe_device=None, ignore_persisted_weight=None, ip_tos_to_client=None, ip_tos_to_server=None, link_qos_to_client=None, link_qos_to_server=None, load_balancing_mode=None, min_active_members=None, min_up_members=None, min_up_members_action=None, min_up_members_checking=None, monitor=None, profiles=None, queue_depth_limit=None, queue_on_connection_limit=None, queue_time_limit=None, reselect_tries=None, service_down_action=None, slow_ramp_time=None)

Create a new node if it does not already exist.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the pool to create
members List of members to be added to the pool
allow_nat [yes | no]

salt.states.bigip.create_profile(hostname, username, password, profile_type, name, **kwargs)
A function to connect to a bigip device and create a profile.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
profile_type The type of profile to create
name The name of the profile to create
kwargs [ arg=val ] ...

Consult F5 BIGIP user guide for specific options for each profile type. Typically, tmsh arg names are used.
Special Characters |, , and : must be escaped using \ when used within strings.

```
salt.states.bigip.create_virtual(hostname, username, password, name, destination, pool=None, address_status=None, auto_lasthop=None, bwc_policy=None, cmp_enabled=None, connection_limit=None, dhcp_relay=None, description=None, fallback_persistence=None, flow_eviction_policy=None, gtm_score=None, ip_forward=None, ip_protocol=None, internal=None, twelve_forward=None, last_hop_pool=None, mask=None, mirror=None, nat64=None, persist=None, profiles=None, policies=None, rate_class=None, rate_limit=None, rate_limit_mode=None, rate_limit_dst=None, rate_limit_src=None, rules=None, related_rules=None, reject=None, source=None, source_address_translation=None, source_port=None, virtual_state=None, traffic_classes=None, translate_address=None, translate_port=None, vlans=None)
```

A function to connect to a bigip device and create a virtual server if it does not already exists.

- **hostname**: The host/address of the bigip device
- **username**: The iControl REST username
- **name**: The name of the virtual to create
- **destination**: [virtual_address_name:port] | [ipv4:port] | [ipv6:port]

    enabled [true | false]
salt.states.bigip.delete_monitor(hostname, username, password, monitor_type, name)
    Modify an existing monitor. If it does exists, only the parameters specified will be enforced.
    hostname The host/address of the bigip device
    username The iControl REST username
    password The iControl REST password
    monitor_type The type of monitor to create
    name The name of the monitor to create
    kwargs [arg=val] ...

    Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.
salt.states.bigip.delete_node(hostname, username, password, name)
    Delete an existing node.
    hostname The host/address of the bigip device
    username The iControl REST username
    password The iControl REST password
    name The name of the node which will be deleted.
salt.states.bigip.delete_pool(hostname, username, password, name)
    Delete an existing pool.
    hostname The host/address of the bigip device
    username The iControl REST username
    password The iControl REST password
    name The name of the pool which will be deleted
salt.states.bigip.delete_pool_member(hostname, username, password, name, member)
    Delete an existing pool member.
    hostname The host/address of the bigip device
    username The iControl REST username
    password The iControl REST password
    name The name of the pool to be modified
    member The name of the member to delete from the pool
salt.states.bigip.delete_profile(hostname, username, password, profile_type, name)
    Modify an existing profile. If it does exists, only the parameters specified will be enforced.
    hostname The host/address of the bigip device
    username The iControl REST username
    password The iControl REST password
    profile_type The type of profile to create
    name The name of the profile to create
    kwargs [arg=val] ...

    Consult F5 BIGIP user guide for specific options for each profile type. Typically, tmsh arg names are used.
salt.states.bigip.delete_virtual(hostname, username, password, name)
    Delete an existing virtual.
hostname  The host/address of the bigip device
username  The iControl REST username
password  The iControl REST password
name      The name of the virtual which will be deleted

salt.states.bigip.list_monitor(hostname, username, password, monitor_type, name)
A function to list an existing monitor.
hostname  The host/address of the bigip device
username  The iControl REST username
password  The iControl REST password
monitor_type  The type of monitor to list
name      The name of the monitor to list

salt.states.bigip.list_node(hostname, username, password, name)
A function to connect to a bigip device and list a specific node.
hostname  The host/address of the bigip device
username  The iControl REST username
password  The iControl REST password
name      The name of the node to list.

salt.states.bigip.list_pool(hostname, username, password, name)
A function to connect to a bigip device and list a specific pool.
hostname  The host/address of the bigip device
username  The iControl REST username
password  The iControl REST password
name      The name of the pool to list.

salt.states.bigip.list_profile(hostname, username, password, profile_type, name)
A function to list an existing profile.
hostname  The host/address of the bigip device
username  The iControl REST username
password  The iControl REST password
profile_type  The type of profile to list
name      The name of the profile to list

salt.states.bigip.list_virtual(hostname, username, password, name)
A function to list a specific virtual.
hostname  The host/address of the bigip device
username  The iControl REST username
password  The iControl REST password
name      The name of the virtual to list

salt.states.bigip.manage_monitor(hostname, username, password, monitor_type, name, **kwargs)
Create a new monitor if a monitor of this type and name does not already exists. If it does exists, only the
parameters specified will be enforced.
hostname  The host/address of the bigip device
username  The iControl REST username
password  The iControl REST password
monitor_type  The type of monitor to create
name      The name of the monitor to create
kwargs  [ arg=val ] ...
Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are
used.
salt.states.bigip.manage_node(hostname, username, password, name, address, connection_limit=None, description=None, dynamic_ratio=None, logging=None, monitor=None, rate_limit=None, ratio=None, session=None, node_state=None)

Manages a node of a given bigip device. If the node does not exist it will be created, otherwise, only the properties which are different than the existing will be updated.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the node to manage.
address The address of the node
connection_limit [integer]
description [string]
dynamic_ratio: [integer]
logging [enabled | disabled]
monitor [[name] | none | default]
ratio [integer]
session [user-enabled | user-disabled]
node_state (state) [user-down | user-up ]

salt.states.bigip.manage_pool(hostname, username, password, name, allow_nat=None, allow_snat=None, description=None, gateway_failsafe_device=None, ignore_persisted_weight=None, ip_tos_to_client=None, ip_tos_to_server=None, link_qos_to_client=None, link_qos_to_server=None, load_balancing_mode=None, min_active_members=None, min_up_members=None, min_up_members_action=None, min_up_members_checking=None, monitor=None, profiles=None, queue_depth_limit=None, queue_on_connection_limit=None, queue_time_limit=None, reselect_tries=None, service_down_action=None, slow_ramp_time=None)

Create a new pool if it does not already exist. Pool members are managed separately. Only the parameters specified are enforced.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the pool to create
allow_nat [yes | no]
allow_snat [yes | no]
description [string]
gateway_failsafe_device [string]
ignore_persisted_weight [enabled | disabled]
ip_tos_to_client [pass-through | [integer]]
ip_tos_to_server [pass-through | [integer]]
link_qos_to_client [pass-through | [integer]]

min_active_members [integer]
min_up_members [integer]
min_up_members_action [failover | reboot | restart-all]
min_up_members_checking [enabled | disabled]
monitor [name]
profiles [none | profile_name]
queue_depth_limit [integer]
queue_on_connection_limit [enabled | disabled]
queue_time_limit [integer]
reselect_tries [integer]
service_down_action [drop | none | reselect | reset]
slow_ramp_time [integer]

salt.states.bigip.manage_pool_members (hostname, username, password, name, members)
Manage the members of an existing pool. This function replaces all current pool members. Only the parameters specified are enforced.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the pool to modify
members list of pool members to manage.

salt.states.bigip.manage_profile (hostname, username, password, profile_type, name, **kwargs)
Create a new profile if a monitor of this type and name does not already exists. If it does exists, only the parameters specified will be enforced.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
profile_type The type of profile to create
name The name of the profile to create
kwargs [ arg=val ] ...
Consult F5 BIGIP user guide for specific options for each profile type. Typically, tmsh arg names are used.

salt.states.bigip.manage_virtual (hostname, username, password, name, destination, pool=None, address_status=None, auto_lasthop=None, bwc_policy=None, cmp_enabled=None, connection_limit=None, dhcp_relay=None, description=None, fallback_persistence=None, flow_eviction_policy=None, gtm_score=None, ip_forward=None, ip_protocol=None, internal=None, twelve_forward=None, last_hop_pool=None, mask=None, mirror=None, nat64=None, persist=None, profiles=None, policies=None, rate_class=None, rate_limit=None, rate_limit_mode=None, rate_limit_dst=None, rate_limit_src=None, rules=None, related_rules=None, reject=None, source=None, source_address_translation=None, source_port=None, virtual_state=None, traffic_classes=None, translate_address=None, translate_port=None, vlans=None)
Manage a virtual server. If a virtual does not exists it will be created, otherwise only the parameters specified will be enforced.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the virtual to create
destination [ [virtual_address_name:port] | [ipv4:port] | [ipv6:port] ]
pool [ [pool_name] | none ]
address_status [yes | no]
auto_lasthop [default | enabled | disabled ]
Modify an existing monitor. If it does exists, only the parameters specified will be enforced.

salt.states.bigip.modify_monitor(hostname, username, password, monitor_type, name, **kwargs)

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.
salt.states.bigip.modify_node(hostname, username, password, name, connection_limit=None, description=None, dynamic_ratio=None, logging=None, monitor=None, rate_limit=None, ratio=None, session=None, node_state=None)

Modify an existing node. Only a node which already exists will be modified and only the parameters specified will be enforced.

- **hostname**: The host/address of the bigip device
- **username**: The iControl REST username
- **password**: The iControl REST password
- **name**: The name of the node to modify

**queue_on_connection_limit** [enabled | disabled]
**queue_time_limit** [integer]
**reselect_tries** [integer]
**service_down_action** [drop | none | reselect | reset]
**slow_ramp_time** [integer]

salt.states.bigip.modify_pool_member(\n    hostname, username, password, name, member, \n    connection_limit=None, description=None, dynamic_ratio=None, inherit_profile=None, logging=None, \n    monitor=None, priority_group=None, profiles=None, \n    rate_limit=None, ratio=None, session=None, member_state=None)\n
A function to connect to a bigip device and modify a member of an existing pool.

- **hostname** The host/address of the bigip device
- **username** The iControl REST username
- **password** The iControl REST password
- **name** The name of the pool to modify
- **member** The member modify
- **connection_limit** [integer]
- **description** [string]
- **dynamic_ratio** [integer]
- **inherit_profile** [enabled | disabled]
- **logging** [enabled | disabled]
- **monitor** [name]
- **priority_group** [integer]
- **profiles** [none | profile_name]
- **rate_limit** [integer]
- **ratio** [integer]
- **session** [user-enabled | user-disabled]
- **member_state** [state] [user-up | user-down]

salt.states.bigip.modify_profile(\n    hostname, username, password, profile_type, name, **kwargs)\n
Modify an existing profile. If it does exists, only the parameters specified will be enforced.

- **hostname** The host/address of the bigip device
- **username** The iControl REST username
- **password** The iControl REST password
- **profile_type** The type of profile to create
- **name** The name of the profile to create
- **kwargs** [ arg=val ] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.
Modify an virtual server. modify an existing virtual. Only parameters specified will be enforced.

hostname  The host/address of the bigip device
username  The iControl REST username
password  The iControl REST password
name  The name of the virtual to create
destination  [ [virtual_address_name:port] | [ipv4:port] | [ipv6:port] ]

21.19.20 salt.states.blockdev

Management of Block Devices
A state module to manage blockdevices

```
/dev/sda:
    blockdev.tuned:
        - read-only: True

master-data:
    blockdev.tuned:
        - name: /dev/vg/master-data
        - read-only: True
        - read-ahead: 1024
```

New in version 2014.7.0.

**salt.states.blockdev.formatted**(name, fs_type='ext4', force=False, **kwargs)
Manage filesystems of partitions.

- name The name of the block device
- fs_type The filesystem it should be formatted as
- force Force mke2fs to create a filesystem, even if the specified device is not a partition on a block special device. This option is only enabled for ext and xfs filesystems

This option is dangerous, use it with caution.

New in version 2016.11.0.

**salt.states.blockdev.tuned**(name, **kwargs)
Manage options of block device

- name The name of the block device
- opts:
  - read-ahead Read-ahead buffer size
  - filesystem-read-ahead Filesystem Read-ahead buffer size
  - read-only Set Read-Only
  - read-write Set Read-Write

21.19.21 salt.states.boto3_elasticache module

Manage Elasticache with boto3

New in version 2017.7.0.

Create, destroy and update Elasticache clusters. Be aware that this interacts with Amazon’s services, and so may incur charges.
This module uses boto3 behind the scenes - as a result it inherits any limitations it boto3’s implementation of the AWS API. It is also designed to as directly as possible leverage boto3’s parameter naming and semantics. This allows one to use http://boto3.readthedocs.io/en/latest/reference/services/elasticache.html as an excellent source for details too involved to reiterate here.

Note: This module is designed to be transparent (“intentionally ignorant” is the phrase I used to describe it to my boss) to new AWS / boto options - since all AWS API params are passed directly through both the state and executions modules, any new args to existing functions which become available after this documentation is written should work immediately.

Brand new API calls, of course, would still require new functions to be added :)

This module accepts explicit elasticache credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information is available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

```yaml
elasticache.keyid: GKTADJGHEIQSXMKKRBJ08H
elasticache.key: askdjghsdfbjkgWupUjasdflkdfklgjsdfjajkghs
```

It’s also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```yaml
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfbjkgWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

```
Ensure myelasticache exists:
boto3_elasticache.present:
    - name: myelasticache
      - engine: redis
      - cache_node_type: cache.t1.micro
      - num_cache_nodes: 1
      - region: us-east-1
      - keyid: GKTADJGHEIQSXMKKRBJ08H
      - key: askdjghsdfbjkgWupUjasdflkdfklgjsdfjajkghs
```

# Using a profile from pillars
Ensure myelasticache exists:
```
boto3_elasticache.present:
    - name: myelasticache
      - engine: redis
      - cache_node_type: cache.t1.micro
      - num_cache_nodes: 1
      - region: us-east-1
      - profile: myprofile
```

# Passing in a profile
Ensure myelasticache exists:
```
boto3_elasticache.present:
    - name: myelasticache
      - engine: redis
      - cache_node_type: cache.t1.micro
```

(continues on next page)
- `num_cache_nodes`: 1
- `region`: us-east-1
- `profile`:
  - `keyid`: GKTADJGHEIQSXMKKRBJ08H
  - `key`: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

salt.states.boto3_elasticache.cache_cluster_absent(name, wait=600, region=None, key=None, keyid=None, profile=None, **args)

Ensure a given cache cluster is deleted.

- `name` Name of the cache cluster.
- `wait` Integer describing how long, in seconds, to wait for confirmation from AWS that the resource is in the desired state. Zero meaning to return success or failure immediately of course. Note that waiting for the cluster to become available is generally the better course, as failure to do so will often lead to subsequent failures when managing dependent resources.
- `CacheClusterId` The node group (shard) identifier. Note: In general this parameter is not needed, as 'name' is used if it's not provided.
- `FinalSnapshotIdentifier` The user-supplied name of a final cache cluster snapshot. This is the unique name that identifies the snapshot. ElastiCache creates the snapshot, and then deletes the cache cluster immediately afterward.
- `region` Region to connect to.
- `key` Secret key to be used.
- `keyid` Access key to be used.
- `profile` A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto3_elasticache.cache_cluster_present(name, wait=900, security_groups=None, region=None, key=None, keyid=None, profile=None, **args)

Ensure a given cache cluster exists.

- `name` Name of the cache cluster (cache cluster id).
- `wait` Integer describing how long, in seconds, to wait for confirmation from AWS that the resource is in the desired state. Zero meaning to return success or failure immediately of course. Note that waiting for the cluster to become available is generally the better course, as failure to do so will often lead to subsequent failures when managing dependent resources.
- `security_groups` One or more VPC security groups (names and/or IDs) associated with the cache cluster.

Note: This is additive with any sec groups provided via the SecurityGroupIds parameter below. Use this parameter ONLY when you are creating a cluster in a VPC.

- `CacheClusterId` The node group (shard) identifier. This parameter is stored as a lowercase string.

  Constraints:
  - A name must contain from 1 to 20 alphanumeric characters or hyphens.
  - The first character must be a letter.
  - A name cannot end with a hyphen or contain two consecutive hyphens.

Note: In general this parameter is not needed, as 'name' is used if it's not provided.

- `ReplicationGroupId` The ID of the replication group to which this cache cluster should belong. If this parameter is specified, the cache cluster is added to the specified replication group as a read replica; otherwise, the cache cluster is a standalone primary that is not part of any replication group. If the specified repli-
cation group is Multi-AZ enabled and the Availability Zone is not specified, the cache cluster is created in Availability Zones that provide the best spread of read replicas across Availability Zones.

**AZMode** Specifies whether the nodes in this Memcached cluster are created in a single Availability Zone or created across multiple Availability Zones in the cluster’s region. If the AZMode and PreferredAvailabilityZones are not specified, ElastiCache assumes single-az mode.

**Note:** This parameter is ONLY supported for Memcached cache clusters.

**PreferredAvailabilityZone** The EC2 Availability Zone in which the cache cluster is created. All nodes belonging to this Memcached cache cluster are placed in the preferred Availability Zone. If you want to create your nodes across multiple Availability Zones, use PreferredAvailabilityZones.

Default: System chosen Availability Zone.

**PreferredAvailabilityZones** A list of the Availability Zones in which cache nodes are created. The order of the zones in the list is not important. The number of Availability Zones listed must equal the value of NumCacheNodes. If you want all the nodes in the same Availability Zone, use PreferredAvailabilityZone instead, or repeat the Availability Zone multiple times in the list.

Default: System chosen Availability Zones.

**Note:** This option is ONLY supported on Memcached.

If you are creating your cache cluster in an Amazon VPC (recommended) you can only locate nodes in Availability Zones that are associated with the subnets in the selected subnet group.

**NumCacheNodes** The initial (integer) number of cache nodes that the cache cluster has.

**Note:** For clusters running Redis, this value must be 1.

For clusters running Memcached, this value must be between 1 and 20.

**CacheNodeType** The compute and memory capacity of the nodes in the node group (shard). Valid node types (and pricing for them) are exhaustively described at [https://aws.amazon.com/elasticache/pricing/](https://aws.amazon.com/elasticache/pricing/)

**Note:**

All T2 instances must be created in a VPC

Redis backup/restore is not supported for Redis (cluster mode disabled) T1 and T2 instances. Backup/restore is supported on Redis (cluster mode enabled) T2 instances.

Redis Append-only files (AOF) functionality is not supported for T1 or T2 instances.

**Engine** The name of the cache engine to be used for this cache cluster. Valid values for this parameter are: memcached | redis

**EngineVersion** The version number of the cache engine to be used for this cache cluster. To view the supported cache engine versions, use the DescribeCacheEngineVersions operation.

**Note:** You can upgrade to a newer engine version but you cannot downgrade to an earlier engine version. If you want to use an earlier engine version, you must delete the existing cache cluster or replication group and create it anew with the earlier engine version.

**CacheParameterGroupName** The name of the parameter group to associate with this cache cluster. If this argument is omitted, the default parameter group for the specified engine is used. You cannot use any parameter group which has cluster-enabled='yes' when creating a cluster.
**CacheSubnetGroupName**  The name of the Cache Subnet Group to be used for the cache cluster. Use this parameter ONLY when you are creating a cache cluster within a VPC.

**Note:** If you’re going to launch your cluster in an Amazon VPC, you need to create a subnet group before you start creating a cluster.

**CacheSecurityGroupNames**  A list of Cache Security Group names to associate with this cache cluster. Use this parameter ONLY when you are creating a cache cluster outside of a VPC.

**SecurityGroupIds**  One or more VPC security groups associated with the cache cluster. Use this parameter ONLY when you are creating a cache cluster within a VPC.

**Tags**  A list of tags to be added to this resource. Note that due to shortcomings in the AWS API for Elasticache, these can only be set during resource creation - later modification is not (currently) supported.

**SnapshotArns**  A single-element string list containing an Amazon Resource Name (ARN) that uniquely identifies a Redis RDB snapshot file stored in Amazon S3. The snapshot file is used to populate the node group (shard). The Amazon S3 object name in the ARN cannot contain any commas.

**Note:** This parameter is ONLY valid if the Engine parameter is redis.

**SnapshotName**  The name of a Redis snapshot from which to restore data into the new node group (shard). The snapshot status changes to restoring while the new node group (shard) is being created.

**Note:** This parameter is ONLY valid if the Engine parameter is redis.

**PreferredMaintenanceWindow**  Specifies the weekly time range during which maintenance on the cache cluster is permitted. It is specified as a range in the format ddd:hh24:mi-ddd:hh24:mi (24H Clock UTC). The minimum maintenance window is a 60 minute period. Valid values for ddd are: sun, mon, tue, wed, thu, fri, sat

Example: sun:23:00-mon:01:30

**Port**  The port number on which each of the cache nodes accepts connections.

Default: 6379

**NotificationTopicArn**  The Amazon Resource Name (ARN) of the Amazon Simple Notification Service (SNS) topic to which notifications are sent.

**Note:** The Amazon SNS topic owner must be the same as the cache cluster owner.

**AutoMinorVersionUpgrade**  This (boolean) parameter is currently disabled.

**SnapshotRetentionLimit**  The number of days for which ElastiCache retains automatic snapshots before deleting them.

Default: 0 (i.e., automatic backups are disabled for this cache cluster).

**Note:** This parameter is ONLY valid if the Engine parameter is redis.

**SnapshotWindow**  The daily time range (in UTC) during which ElastiCache begins taking a daily snapshot of your node group (shard). If you do not specify this parameter, ElastiCache automatically chooses an appropriate time range.

Example: 05:00-09:00

**Note:** This parameter is ONLY valid if the Engine parameter is redis.
AuthToken  The password used to access a password protected server.

Password constraints:
- Must be only printable ASCII characters.
- Must be at least 16 characters and no more than 128 characters in length.
- Cannot contain any of the following characters: '/', ',', or '@'.

CacheNodeIdsToRemove  A list of cache node IDs to be removed. A node ID is a numeric identifier (0001, 0002, etc.). This parameter is only valid when NumCacheNodes is less than the existing number of cache nodes. The number of cache node IDs supplied in this parameter must match the difference between the existing number of cache nodes in the cluster or pending cache nodes, whichever is greater, and the value of NumCacheNodes in the request.

NewAvailabilityZones  The list of Availability Zones where the new Memcached cache nodes are created. This parameter is only valid when NumCacheNodes in the request is greater than the sum of the number of active cache nodes and the number of cache nodes pending creation (which may be zero). The number of Availability Zones supplied in this list must match the cache nodes being added in this request. Note: This option is only supported on Memcached clusters.

NotificationTopicStatus  The status of the SNS notification topic. Notifications are sent only if the status is active.

Valid values: active | inactive
region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto3_elasticache.cache_subnet_group_absent(name, region=None, key=None, keyid=None, profile=None, **args)

Ensure a given cache subnet group is deleted.

name  Name of the cache subnet group.
CacheSubnetGroupName  A name for the cache subnet group. Note: In general this parameter is not needed, as 'name' is used if it's not provided.
region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto3_elasticache.cache_subnet_group_present(name, subnets=None, region=None, key=None, keyid=None, profile=None, **args)

Ensure cache subnet group exists.

name  A name for the cache subnet group. This value is stored as a lowercase string. Constraints: Must contain no more than 255 alphanumeric characters or hyphens.
subnets  A list of VPC subnets (IDs, Names, or a mix) for the cache subnet group.
CacheSubnetGroupName  A name for the cache subnet group. This value is stored as a lowercase string. Constraints: Must contain no more than 255 alphanumeric characters or hyphens. Note: In general this parameter is not needed, as 'name' is used if it’s not provided.
CacheSubnetGroupDescription  A description for the cache subnet group.
SubnetIds  A list of VPC subnet IDs for the cache subnet group. This is ADDITIVE with 'subnets' above.
region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and
salt.states.boto3_elasticache.replication_group_absent(name, wait=600, region=None, key=None, keyid=None, profile=None, **args)

Ensure a given replication group is deleted.

**name** Name of the replication group.

**wait** Integer describing how long, in seconds, to wait for confirmation from AWS that the resource is in the desired state. Zero meaning to return success or failure immediately of course. Note that waiting for the cluster to become available is generally the better course, as failure to do so will often lead to subsequent failures when managing dependent resources.

**ReplicationGroupId** The replication group identifier. Note: In general this parameter is not needed, as ‘name’ is used if it’s not provided.

**RetainPrimaryCluster** If set to true, all of the read replicas are deleted, but the primary node is retained.

**FinalSnapshotIdentifier** The name of a final node group (shard) snapshot. ElastiCache creates the snapshot from the primary node in the cluster, rather than one of the replicas; this is to ensure that it captures the freshest data. After the final snapshot is taken, the replication group is immediately deleted.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto3_elasticache.replication_group_present(name, wait=900, security_groups=None, region=None, key=None, keyid=None, profile=None, **args)

Ensure a replication group exists and is in the given state.

**name** Name of replication group

**wait** Integer describing how long, in seconds, to wait for confirmation from AWS that the resource is in the desired state. Zero meaning to return success or failure immediately of course. Note that waiting for the cluster to become available is generally the better course, as failure to do so will often lead to subsequent failures when managing dependent resources.

**security_groups** One or more VPC security groups (names and/or IDs) associated with the cache cluster.

**ReplicationGroupId** The replication group identifier. This parameter is stored as a lowercase string.

Constraints:
- A name must contain from 1 to 20 alphanumeric characters or hyphens.
- The first character must be a letter.
- A name cannot end with a hyphen or contain two consecutive hyphens.

**Note:** In general this parameter is not needed, as ‘name’ is used if it’s not provided.

**ReplicationGroupDescription** A user-created description for the replication group.

**PrimaryClusterId** The identifier of the cache cluster that serves as the primary for this replication group. This cache cluster must already exist and have a status of available. This parameter is not required if NumCacheClusters, NumNodeGroups, or ReplicasPerNodeGroup is specified.

**AutomaticFailoverEnabled** Specifies whether a read-only replica is automatically promoted to read/write primary if the existing primary fails. If true, Multi-AZ is enabled for this replication group. If false,
Multi-AZ is disabled for this replication group.
Default: False

**Note:** AutomaticFailoverEnabled must be enabled for Redis (cluster mode enabled) replication groups.

ElastiCache Multi-AZ replication groups is not supported on:
- Redis versions earlier than 2.8.6.
- Redis (cluster mode disabled): T1 and T2 node types.
- Redis (cluster mode enabled): T2 node types.

**NumCacheClusters** The number of clusters this replication group initially has. This parameter is not used if there is more than one node group (shard). You should use ReplicasPerNodeGroup instead. If Multi-AZ is enabled, the value of this parameter must be at least 2. The maximum permitted value for NumCacheClusters is 6 (primary plus 5 replicas).

**PreferredCacheClusterAZs** A list of EC2 Availability Zones in which the replication group’s cache clusters are created. The order of the Availability Zones in the list is the order in which clusters are allocated. The primary cluster is created in the first AZ in the list. This parameter is not used if there is more than one node group (shard). You should use NodeGroupConfiguration instead. The number of Availability Zones listed must equal the value of NumCacheClusters.
Default: System chosen Availability Zones.

**Note:** If you are creating your replication group in an Amazon VPC (recommended), you can only locate cache clusters in Availability Zones associated with the subnets in the selected subnet group.

**NumNodeGroups** An optional parameter that specifies the number of node groups (shards) for this Redis (cluster mode enabled) replication group. For Redis (cluster mode disabled) either omit this parameter or set it to 1.
Default: 1

**ReplicasPerNodeGroup** An optional parameter that specifies the number of replica nodes in each node group (shard). Valid values are: 0 to 5

**NodeGroupConfiguration** A list of node group (shard) configuration options. Each node group (shard) configuration has the following: Slots, PrimaryAvailabilityZone, ReplicaAvailabilityZones, ReplicaCount. If you’re creating a Redis (cluster mode disabled) or a Redis (cluster mode enabled) replication group, you can use this parameter to configure one node group (shard) or you can omit this parameter. For fiddly details of the expected data layout of this param, see [http://boto3.readthedocs.io/en/latest/reference/services/elasticache.html#ElastiCache.Client.create_replication_group](http://boto3.readthedocs.io/en/latest/reference/services/elasticache.html#ElastiCache.Client.create_replication_group)

**CacheNodeType** The compute and memory capacity of the nodes in the node group (shard). See [https://aws.amazon.com/elasticache/pricing/](https://aws.amazon.com/elasticache/pricing/) for current sizing, prices, and constraints.

**Engine** The name of the cache engine to be used for the cache clusters in this replication group.

**EngineVersion** The version number of the cache engine to be used for the cache clusters in this replication group. To view the supported cache engine versions, use the DescribeCacheEngineVersions operation.

**Note:** You can upgrade to a newer engine version but you cannot downgrade to an earlier engine version. If you want to use an earlier engine version, you must delete the existing cache cluster or replication group and create it anew with the earlier engine version.

**CacheParameterGroupName** The name of the parameter group to associate with this replication group. If this argument is omitted, the default cache parameter group for the specified engine is used.

**Note:** If you are running Redis version 3.2.4 or later, only one node group (shard), and want to use a default parameter group, we recommend that you specify the parameter group by name.
To create a Redis (cluster mode disabled) replication group, use `CacheParameterGroupName=default.redis3.2`

To create a Redis (cluster mode enabled) replication group, use `CacheParameterGroupName=default.redis3.2.cluster.on`

**CacheSubnetGroupName** The name of the cache subnet group to be used for the replication group.

**Note:** If you’re going to launch your cluster in an Amazon VPC, you need to create a subnet group before you start creating a cluster. For more information, see Subnets and Subnet Groups.

**CacheSecurityGroupNames** A list of cache security group names to associate with this replication group.

**SecurityGroupIds** One or more Amazon VPC security groups associated with this replication group. Use this parameter only when you are creating a replication group in an VPC.

**Tags** A list of tags to be added to this resource. Note that due to shortcomings in the AWS API for ElastiCache, these can only be set during resource creation - later modification is not (currently) supported.

**SnapshotArns** A list of ARNs that uniquely identify the Redis RDB snapshot files stored in Amazon S3. These snapshot files are used to populate the replication group. The Amazon S3 object name in the ARN cannot contain any commas. The list must match the number of node groups (shards) in the replication group, which means you cannot repartition.

**Note:** This parameter is only valid if the Engine parameter is redis.

**SnapshotName** The name of a snapshot from which to restore data into the new replication group. The snapshot status changes to restoring while the new replication group is being created. Note: This parameter is only valid if the Engine parameter is redis.

**PreferredMaintenanceWindow** Specifies the weekly time range during which maintenance on the cluster is performed. It is specified as a range in the format ddd:hh24:mi-ddd:hh24:mi (24H Clock UTC). The minimum maintenance window is a 60 minute period. Valid values for ddd are: sun, mon, tue, wed, thu, fri, sat

Example: sun:23:00-mon:01:30

**Port** The port number on which each member of the replication group accepts connections.

**NotificationTopicArn** The ARN of an SNS topic to which notifications are sent.

**Note:** The SNS topic owner must be the same as the cache cluster owner.

**AutoMinorVersionUpgrade** This parameter is currently disabled.

**SnapshotRetentionLimit** The number of days for which ElastiCache will retain automatic snapshots before deleting them.

Default: 0 (that is, automatic backups are disabled for this cache cluster).

**Note:** This parameter is only valid if the Engine parameter is redis.

**SnapshotWindow** The daily time range (in UTC) during which ElastiCache begins taking a daily snapshot of your node group (shard). If you do not specify this parameter, ElastiCache automatically chooses an appropriate time range.

Example: 05:00-09:00

**Note:** This parameter is only valid if the Engine parameter is redis.
AuthToken  The password used to access a password protected server. Password constraints:
• Must be only printable ASCII characters.
• Must be at least 16 characters and no more than 128 characters in length.
• Cannot contain any of the following characters: '/', '..', or '@'.

SnapshottigClusterId  The cache cluster ID that is used as the daily snapshot source for the replication group.

NotificationTopicStatus  The status of the SNS notification topic. Notifications are sent only if the status is active. Valid values: active | inactive

region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.22 salt.states.boto3_route53 module

Manage Route53 records with Boto 3

New in version 2017.7.0.

Create and delete Route53 records. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses boto3, which can be installed via package, or pip.

This module accepts explicit route53 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
route53.keyid: GKTADJGHEIQSXMKKRBJ08H
route53.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

An exciting new AWS Route 53 Hosted Zone:

```
boto_route53.hosted_zone_present:
  - Name: example.com.
  - PrivateZone: true

(continues on next page)
- **DomainName**: example.com.
- **TTL**: 60
- **Type**: CNAME
- **region**: us-east-1
- **keyid**: GKTADJGHEIQSXMKKRBJ08H
- **key**: askdjghsdfjkghWupUjasdlfkjdlkaskjdfkasdjkghs

salt.states.boto3_route53.**hosted_zone_absent**(name, Name=None, PrivateZone=False, region=None, key=None, keyid=None, profile=None)

Ensure the Route53 Hostes Zone described is absent

**name** The name of the state definition.

**Name** The name of the domain. This should be a fully-specified domain, and should terminate with a period. If not provided, the value of name will be used.

**PrivateZone** Set True if deleting a private hosted zone.

salt.states.boto3_route53.**hosted_zone_present**(name, Name=None, PrivateZone=False, CallerReference=None, Comment=None, VPCs=None, region=None, key=None, keyid=None, profile=None)

Ensure a hosted zone exists with the given attributes.

**name** The name of the state definition.

**Name** The name of the domain. This should be a fully-specified domain, and should terminate with a period. This is the name you have registered with your DNS registrar. It is also the name you will delegate from your registrar to the Amazon Route 53 delegation servers returned in response to this request. If not provided, the value of name will be used.

**PrivateZone** Set True if creating a private hosted zone. If true, then 'VPCs' is also required.

**Comment** Any comments you want to include about the hosted zone.

**CallerReference** A unique string that identifies the request and that allows create_hosted_zone() calls to be retried without the risk of executing the operation twice. This helps ensure idempotency across state calls, but can cause issues if a zone is deleted and then an attempt is made to recreate it with the same CallerReference. If not provided, a unique UUID will be generated at each state run, which can potentially lead to duplicate zones being created if the state is run again while the previous zone creation is still in PENDING status (which can occasionally take several minutes to clear). Maximum length of 128.

**VPCs** A list of dicts, each dict composed of a VPCRegion, and either a VPCId or a VPCName. Note that this param is ONLY used if PrivateZone == True

**VPCId** When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCName.

**VPCName** When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCId.

**VPCRegion** When creating a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from VPCId or VPCName, if possible. This will fail if a given VPCName exists in multiple regions visible to the bound account, in which case you’ll need to provide an explicit value for VPCRegion.

salt.states.boto3_route53.**rr_absent**(name, HostedZoneld=None, DomainName=None, PrivateZone=False, Name=None, Type=None, SetIdentifier=None, region=None, key=None, keyid=None, profile=None)

Ensure the Route53 record is deleted.

**name** The name of the state definition. This will be used for Name if the latter is not provided.

**HostedZoneld** The ID of the zone to delete the record from. Exclusive with DomainName.

**DomainName** The domain name of the zone to delete the record from. Exclusive with HostedZoneld.

**PrivateZone** Set to True if the RR to be removed is in a private zone, False if public.

**Name** Name of the resource record.
Type  The record type (A, NS, MX, TXT, etc.)

SetIdentifier  Valid for Weighted, Latency, Geolocation, and Failover resource record sets only. An identifier that differentiates among multiple resource record sets that have the same combination of DNS name and type. The value of SetIdentifier must be unique for each resource record set that has the same combination of DNS name and type. Omit SetIdentifier for any other types of record sets.

region  The region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

```
salt.states.boto3_route53.rr_present(name, HostedZoneId=None, DomainName=None, PrivateZone=False, Name=None, Type=None, SetIdentifier=None, Weight=None, Region=None, GeoLocation=None, Failover=None, TTL=None, ResourceRecords=None, AliasTarget=None, HealthCheckId=None, TrafficPolicyInstanceId=None, region=None, key=None, keyid=None, profile=None)
```

Ensure the Route53 record is present.

name  The name of the state definition. This will be used for Name if the latter is not provided.

HostedZoneId  The ID of a zone to create the record in. Exclusive with DomainName.

DomainName  The domain name of a zone to create the record in. Exclusive with HostedZoneId.

PrivateZone  Set to True if the resource record should be in a private zone, False if public.

Name  Name of the Route 53 resource record being managed.

Type  The record type (A, NS, MX, TXT, etc.)

SetIdentifier  Valid for Weighted, Latency, Geolocation, and Failover resource record sets only. An identifier that differentiates among multiple resource record sets that have the same combination of DNS name and type. The value of SetIdentifier must be unique for each resource record set that has the same combination of DNS name and type. Omit SetIdentifier for any other types of record sets.

Weight  Valid for Weighted resource record sets only. Among resource record sets that have the same combination of DNS name and type, a value that determines the proportion of DNS queries that Amazon Route 53 responds to using the current resource record set. Amazon Route 53 calculates the sum of the weights for the resource record sets that have the same combination of DNS name and type. Amazon Route 53 then responds to queries based on the ratio of a resource's weight to the total.

Note the following:
- You must specify a value for the Weight element for every weighted resource record set.
- You can only specify one ResourceRecord per weighted resource record set.
- You can’t create latency, failover, or geolocation resource record sets that have the same values for the Name and Type elements as weighted resource record sets.
- You can create a maximum of 100 weighted resource record sets that have the same values for the Name and Type elements.
- For weighted (but not weighted alias) resource record sets, if you set Weight to 0 for a resource record set, Amazon Route 53 never responds to queries with the applicable value for that resource record set. However, if you set Weight to 0 for all resource record sets that have the same combination of DNS name and type, traffic is routed to all resources with equal probability. The effect of setting Weight to 0 is different when you associate health checks with weighted resource record sets. For more information, see Options for Configuring Amazon Route 53 Active-Active and Active-Passive Failover in the Amazon Route 53 Developer Guide.

Region  Valid for Latency-based resource record sets only. The Amazon EC2 Region where the resource that is specified in this resource record set resides. The resource typically is an AWS resource, such as an EC2 instance or an ELB load balancer, and is referred to by an IP address or a DNS domain name, depending on the record type.

GeoLocation  Geo location resource record sets only. A dict that lets you control how Route 53 responds to DNS queries based on the geographic origin of the query. For example, if you want all queries from Africa to be routed to a web server with an IP address of 192.0.2.111, create a resource record set with a
Type of A and a ContinentCode of AF.

<table>
<thead>
<tr>
<th>ContinentCode</th>
</tr>
</thead>
<tbody>
<tr>
<td>The two-letter code for the continent.</td>
</tr>
<tr>
<td>Valid values: AF</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>CountryCode</th>
</tr>
</thead>
<tbody>
<tr>
<td>The two-letter code for the country.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>SubdivisionCode</th>
</tr>
</thead>
<tbody>
<tr>
<td>The code for the subdivision, for example, a state in the United States or a province in Canada.</td>
</tr>
</tbody>
</table>

Notes

- Creating geolocation and geolocation alias resource record sets in private hosted zones is not supported.
- If you create separate resource record sets for overlapping geographic regions (for example, one resource record set for a continent and one for a country on the same continent), priority goes to the smallest geographic region. This allows you to route most queries for a continent to one resource and to route queries for a country on that continent to a different resource.
- You can’t create two geolocation resource record sets that specify the same geographic location.
- The value * in the CountryCode element matches all geographic locations that aren’t specified in other geolocation resource record sets that have the same values for the Name and Type elements.
- Geolocation works by mapping IP addresses to locations. However, some IP addresses aren’t mapped to geographic locations, so even if you create geolocation resource record sets that cover all seven continents, Amazon Route 53 will receive some DNS queries from locations that it can’t identify. We recommend that you create a resource record set for which the value of CountryCode is *, which handles both queries that come from locations for which you haven’t created geolocation resource record sets and queries from IP addresses that aren’t mapped to a location. If you don’t create a * resource record set, Amazon Route 53 returns a "no answer" response for queries from those locations.
- You can’t create non-geolocation resource record sets that have the same values for the Name and Type elements as geolocation resource record sets.

TTL

- The resource record cache time to live (TTL), in seconds. Note the following:
  - If you’re creating an alias resource record set, omit TTL. Amazon Route 53 uses the value of TTL for the alias target.
  - If you’re associating this resource record set with a health check (if you’re adding a HealthCheckId element), we recommend that you specify a TTL of 60 seconds or less so clients respond quickly to changes in health status.
  - All of the resource record sets in a group of weighted, latency, geolocation, or failover resource record sets must have the same value for TTL.
  - If a group of weighted resource record sets includes one or more weighted alias resource record sets for which the alias target is an ELB load balancer, we recommend that you specify a TTL of 60 seconds for all of the non-alias weighted resource record sets that have the same name and type. Values other than 60 seconds (the TTL for load balancers) will change the effect of the values that you specify for Weight.

ResourceRecords

- A list, containing one or more values for the resource record. No single value can exceed 4,000 characters. For details on how to format values for different record types, see Supported DNS Resource Record Types in the Amazon Route 53 Developer Guide.

Note: You can specify more than one value for all record types except CNAME and SOA.

It is also possible to pass "magic" strings as resource record values. This functionality can easily be extended, but for the moment supports the following:
This tells salt to lookup an EC2 instance with a tag 'some_tag_name' which has the value 'some_string' and substitute the 'some_instance_attr' attribute of that instance as the resource record value being evaluated.

This should work generally for any EC2 instance tags, as long as the instance attribute being fetched is available to getattr(instance, 'attribute') as seen in the code below. Anything else will most likely require this function to be extended to handle it.

The canonical use-case for this (at least at our site) is to query the Name tag (which we always populate with the host's FQDN) to lookup the public or private IPs bound to the instance, so we can then automictically create Route 53 records for them.

AliasTarget  The rules governing how to define an AliasTarget for the various supported use-cases are obtuse beyond reason and attempting to paraphrase them (or even worse, cut-and-paste them in their entirety) would be silly and counterproductive. If you need this feature, then Read The Fine Materials at the Boto 3 Route 53 page and/or the AWS Route 53 docs and suss them for yourself - I sure won't claim to understand them particularly well.

region  The region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

21.19.23 salt.states.boto_apigateway module

Manage Apigateway Rest APIs

New in version 2016.11.0.

depends

- boto >= 2.8.0
- boto3 >= 1.2.1
- botocore >= 1.4.49

Create and destroy rest apis depending on a swagger version 2 definition file. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses boto3, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It’s also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```
Ensure Apigateway API exists:

```python
boto_apigateway.present:
    - name: myfunction
      region: us-east-1
      keyid: GKTADJGHEIQSXMKKRBJ08H
      key: askdjghsdfjkgWupUjasdfklkdfklgjsdfajasjgkhs
```

```python
salt.states.boto_apigateway.absent(name, api_name, stage_name, nuke_api=False, region=None, key=None, keyid=None, profile=None)
```

Ensure the stage_name associated with the given api_name deployed by boto_apigateway’s present state is removed. If the currently associated deployment to the given stage_name has no other stages associated with it, the deployment will also be removed.

- **name** Name of the swagger file in YAML format
- **api_name** Name of the rest api on AWS ApiGateway to ensure is absent.
- **stage_name** Name of the stage to be removed irrespective of the swagger file content. If the current deployment associated with the stage_name has no other stages associated with it, the deployment will also be removed.
- **nuke_api** If True, removes the API itself only if there are no other stages associated with any other deployments once the given stage_name is removed.
- **region** Region to connect to.
- **key** Secret key to be used.
- **keyid** Access key to be used.
- **profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```python
salt.states.boto_apigateway.present(name, api_name, swagger_file, stage_name, api_key_required, lambda_integration_role, lambda_region=None, stage_variables=None, region=None, key=None, keyid=None, profile=None, lambda_funcname_format='{stage}_{api}_{resource}_{method}', authorization_type='NONE', error_response_template=None, response_template=None)
```

Ensure the specified api_name with the corresponding swagger file is deployed to the given stage_name in AWS ApiGateway.
