- You can’t create two geolocation resource record sets that specify the same geographic location.
- The value * in the CountryCode element matches all geographic locations that aren’t specified in other geolocation resource record sets that have the same values for the Name and Type elements.
- Geolocation works by mapping IP addresses to locations. However, some IP addresses aren’t mapped to geographic locations, so even if you create geolocation resource record sets that cover all seven continents, Amazon Route 53 will receive some DNS queries from locations that it can’t identify. We recommend that you create a resource record set for which the value of CountryCode is *, which handles both queries that come from locations for which you haven’t created geolocation resource record sets and queries from IP addresses that aren’t mapped to a location. If you don’t create a * resource record set, Amazon Route 53 returns a "no answer" response for queries from those locations.
- You can’t create non-geolocation resource record sets that have the same values for the Name and Type elements as geolocation resource record sets.

TTL The resource record cache time to live (TTL), in seconds. Note the following:

- If you’re creating an alias resource record set, omit TTL. Amazon Route 53 uses the value of TTL for the alias target.
- If you’re associating this resource record set with a health check (if you're adding a HealthCheckId element), we recommend that you specify a TTL of 60 seconds or less so clients respond quickly to changes in health status.
- All of the resource record sets in a group of weighted, latency, geolocation, or failover resource record sets must have the same value for TTL.
- If a group of weighted resource record sets includes one or more weighted alias resource record sets for which the alias target is an ELB load balancer, we recommend that you specify a TTL of 60 seconds for all of the non-alias weighted resource record sets that have the same name and type. Values other than 60 seconds (the TTL for load balancers) will change the effect of the values that you specify for Weight.

ResourceRecords A list, containing one or more values for the resource record. No single value can exceed 4,000 characters. For details on how to format values for different record types, see Supported DNS Resource Record Types in the Amazon Route 53 Developer Guide.

Note: You can specify more than one value for all record types except CNAME and SOA.

It is also possible to pass "magic" strings as resource record values. This functionality can easily be extended, but for the moment supports the following:
Salt Documentation, Release 2019.2.0

'magic:ec2_instance_tag:some_tag_name:some_string:some_instance_attr'
This tells salt to lookup an EC2 instance with a tag 'some_tag_name' which has the value 'some_string'
and substitute the 'some_instance_attr' attribute of that instance as the resource record value being
evaluated.
This should work generally for any EC2 instance tags, as long as the instance attribute being fetched is
available to getattr(instance, 'attribute') as seen in the code below. Anything else will most likely require
this function to be extended to handle it.
The canonical use-case for this (at least at our site) is to query the Name tag (which we always popu-
late with the host's FQDN) to lookup the public or private IPs bound to the instance, so we can then
automatically create Route 53 records for them.

AliasTarget  The rules governing how to define an AliasTarget for the various supported use-cases are obtuse
beyond reason and attempting to paraphrase them (or even worse, cut-and-paste them in their entirety)
would be silly and counterproductive. If you need this feature, then Read The Fine Materials at the
Boto 3 Route 53 page and/or the AWS Route 53 docs and suss them for yourself - I sure won't claim to
understand them particularly well.

region  The region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

21.19.23  salt.states.boto_apigateway module

Manage Apigateway Rest APIs

New in version 2016.11.0.

depends
  • boto >= 2.8.0
  • boto3 >= 1.2.1
  • botocore >= 1.4.49

Create and destroy rest apis depending on a swagger version 2 definition file. Be aware that this interacts with
Amazon’s services, and so may incur charges.

This module uses boto3, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance
Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is neces-
sary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

| vpc.keyid: GKTADJGHEIQSXSMKRRBJ08H |
| vpc.key: askdjghsdfjkgHwupUjasdfldfklgljgjsdfjajkghs |

It’s also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull
from pillars or minion config:

myprofile:
  keyid: GKTADJGHEIQSXSMKRRBJ08H
  key: askdjghsdfjkgHwujasdfldfklgljgjdsdfjajkghs
  region: us-east-1

21.19.   state modules
Ensure Apigateway API exists:

```yaml
boto_apigateway.present:
- name: myfunction
- region: us-east-1
- keyid: GKTADJGHEIQXSXMCKRBJ08H
- key: askdjghsdfjkgHUpUjasdfklkdflgjsdfjajkghs
```

salt.states.boto_apigateway.absent(name, api_name, stage_name, nuke_api=False, region=None, key=None, keyid=None, profile=None)

Ensure the stage_name associated with the given api_name deployed by boto_apigateway's present state is removed. If the currently associated deployment to the given stage_name has no other stages associated with it, the deployment will also be removed.

- **name**: Name of the swagger file in YAML format
- **api_name**: Name of the rest api on AWS ApiGateway to ensure is absent.
- **stage_name**: Name of the stage to be removed irrespective of the swagger file content. If the current deployment associated with the stage_name has no other stages associated with it, the deployment will also be removed.
- **nuke_api**: If True, removes the API itself only if there are no other stages associated with any other deployments once the given stage_name is removed.
- **region**: Region to connect to.
- **key**: Secret key to be used.
- **keyid**: Access key to be used.
- **profile**: A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_apigateway.present(name, api_name, swagger_file, stage_name, api_key_required, lambda_integration_role, lambda_region=None, stage_variables=None, region=None, key=None, keyid=None, profile=None, lambda_funcname_format='{stage}_{api}_{resource}_{method}', authorization_type='NONE', error_response_template=None, response_template=None)

Ensure the specified api_name with the corresponding swagger file is deployed to the given stage_name in AWS ApiGateway.

This state currently only supports ApiGateway integration with AWS Lambda, and CORS support is handled through a Mock integration.

There may be multiple deployments for the API object, each deployment is tagged with a description (i.e. unique label) in pretty printed json format consisting of the following key/values:

```json
{
  "api_name": api_name,
  "swagger_file": basename_of_swagger_file
  "swagger_file_md5sum": md5sum_of_swagger_file,
  "swagger_info_object": info_object_content_in_swagger_file
}
```

Please note that the name of the lambda function to be integrated will be derived via the provided lambda_funcname_format parameters:
- the default lambda_funcname_format is a string with the following substitutable keys: "[stage]_[api]_[resource]_[method]". The user can choose to reorder the known keys.
- the stage key corresponds to the stage_name passed in.
- the api key corresponds to the api_name passed in.
- the resource corresponds to the resource path defined in the passed swagger file.
- the method corresponds to the method for a resource path defined in the passed swagger file.
For the default lambda_funcname_format, given the following input:

```python
api_name = 'Test Service'
stage_name = 'alpha'
basePath = '/api'
path = '/a/{b}/c'
method = 'POST'
```

We will end up with the following Lambda Function Name that will be looked up: 'test_service_alpha_a_b_c_post'

The canonicalization of these input parameters is done in the following order:
1. lambda_funcname_format is formatted with the input parameters as passed,
2. resulting string is stripped for leading/trailing spaces,
3. path parameter’s curly braces are removed from the resource path,
4. consecutive spaces and forward slashes in the paths are replaced with '_'
5. consecutive '_' are replaced with '

Please note that for error response handling, the swagger file must have an error response model with the following schema. The lambda functions should throw exceptions for any non successful responses. An optional pattern field can be specified in errorMessage field to aid the response mapping from Lambda to the proper error return status codes.

```json
Error:  
  type: object  
  properties:  
    stackTrace:  
      type: array  
      items:  
        type: array  
        items:  
          type: string  
          description: call stack  
    errorType:  
      type: string  
      description: error type  
    errorMessage:  
      type: string  
      description: |
        Error message, will be matched based on pattern.  
        If no pattern is specified, the default pattern used for response mapping will be $+$.  
```

**name** The name of the state definition
**api_name** The name of the rest api that we want to ensure exists in AWS API Gateway
**swagger_file** Name of the location of the swagger rest api definition file in YAML format.
**stage_name** Name of the stage we want to be associated with the given api_name and swagger_file definition
**api_key_required** True or False - whether the API Key is required to call API methods
**lambda_integration_role** The name or ARN of the IAM role that the AWS ApiGateway assumes when it executes your lambda function to handle incoming requests
**lambda_region** The region where we expect to find the lambda functions. This is used to determine the region where we should look for the Lambda Function for integration purposes. The region determination is based on the following priority:
1. lambda_region as passed in (is not None)
2. if lambda_region is None, use the region as if a boto_lambda function were executed without explicitly specifying lambda region.
3. if region determined in (2) is different than the region used by boto_apigateway functions, a final lookup will be attempted using the boto_apigateway region.
**stage_variables**  A dict with variables and their values, or a pillar key (string) that contains a dict with variables and their values. `{'string': 'string'}`

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**lambda_funcname_format** Please review the earlier example for the usage. The only substitutable keys in the funcname format are `{stage}`, `{api}`, `{resource}`, `{method}`. Any other keys or positional substitution parameters will be flagged as an invalid input.

**authorization_type** This field can be either 'NONE', or 'AWS_IAM'. This will be applied to all methods in the given swagger spec file. Default is set to 'NONE'.

**error_response_template** String value that defines the response template mapping that should be applied in cases error occurs. Refer to AWS documentation for details: [http://docs.aws.amazon.com/apigateway/latest/developerguide/api-gateway-mapping-template-reference.html](http://docs.aws.amazon.com/apigateway/latest/developerguide/api-gateway-mapping-template-reference.html)

If set to None, the following default value is used:

```python
"#set($inputRoot = $input.path('$'))
"{
  "errorMessage" : "$inputRoot.errorMessage",
  "errorType" : "$inputRoot.errorType",
  "stackTrace" : [
    "#foreach($stackTrace in $inputRoot.stackTrace)"
    " #foreach($elem in $stackTrace)
      "$elem"
    #if($foreach.hasNext),#end
    #end
  #if($foreach.hasNext),#end
    "#end"
  #end"
}
```

New in version 2017.7.0.

**response_template** String value that defines the response template mapping applied in case of success (including OPTIONS method) If set to None, empty (``) template is assumed, which will transfer response from the lambda function as is.

New in version 2017.7.0.

```python
salt.states.boto_apigateway.usage_plan_absent(name, plan_name, region=None, key=None, keyid=None, profile=None)
```

Ensures usage plan identified by name is no longer present

New in version 2017.7.0.

**name** name of the state

**plan_name** name of the plan to remove

```python
usage plan absent:
  boto_apigateway.usage_plan_absent:
    - plan_name: my_usage_plan
    - profile: my_profile
```
salt.states.boto_apigateway.usage_plan_association_absent(name, plan_name, api_stages, region=None, key=None, keyid=None, profile=None)

Ensures usage plan identified by name is removed from provided api_stages. If a plan is associated to stages not listed in api_stages parameter, those associations remain intact.

New in version 2017.7.0.

name name of the state
plan_name name of the plan to use
api_stages list of dictionaries, where each dictionary consists of the following keys:
    apiId apid of the api to detach usage plan from
    stage stage name of the api to detach usage plan from

UsagePlanAssociationAbsent:
    boto_apigateway.usage_plan_association_absent:
        - plan_name: my_plan
        - api_stages:
            - apiId: 9kb6404ec0
              stage: my_stage
            - apiId: l9v7o2aj90
              stage: my_stage
        - profile: my_profile

salt.states.boto_apigateway.usage_plan_association_present(name, plan_name, api_stages, region=None, key=None, keyid=None, profile=None)

Ensures usage plan identified by name is added to provided api_stages.

New in version 2017.7.0.

name name of the state
plan_name name of the plan to use
api_stages list of dictionaries, where each dictionary consists of the following keys:
    apiId apid of the api to attach usage plan to
    stage stage name of the api to attach usage plan to

UsagePlanAssociationPresent:
    boto_apigateway.usage_plan_association_present:
        - plan_name: my_plan
        - api_stages:
            - apiId: 9kb6404ec0
              stage: my_stage
            - apiId: l9v7o2aj90
              stage: my_stage
        - profile: my_profile

salt.states.boto_apigateway.usage_plan_present(name, plan_name, description=None, throttle=None, quota=None, region=None, key=None, keyid=None, profile=None)

Ensure the specified usage plan with the corresponding metrics is deployed.

New in version 2017.7.0.

name name of the state
plan_name [Required] name of the usage plan
throttle [Optional] throttling parameters expressed as a dictionary. If provided, at least one of the throttling parameters must be present
rateLimit rate per second at which capacity bucket is populated
burstLimit maximum rate allowed

quota [Optional] quota on the number of api calls permitted by the plan. If provided, limit and period must be present
limit [Required] number of calls permitted per quota period
offset [Optional] number of calls to be subtracted from the limit at the beginning of the period
period [Required] period to which quota applies. Must be DAY, WEEK or MONTH

UsagePlanPresent:
boto_apigateway.usage_plan_present:
  - plan_name: my_usage_plan
    throttle:
      rateLimit: 70
      burstLimit: 100
    quota:
      limit: 1000
      offset: 0
      period: DAY
    profile: my_profile

21.19.24 salt.states.boto_asg

Manage Autoscale Groups

New in version 2014.7.0.

Create and destroy autoscale groups. Be aware that this interacts with Amazon’s services, and so may incur charges.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit autoscale credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:

asg.keyid: GKTADJGHEIQSXMKKRBJ08H
asg.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1

Ensure myasg exists:
boto_asg.present:
  - name: myasg
  - launch_config_name: mylc
availability_zones:
- us-east-1a
- us-east-1b
min_size: 1
max_size: 1
desired_capacity: 1
load_balancers:
- myelb
suspended_processes:
- AddToLoadBalancer
- AlarmNotification
scaling_policies:
- adjustment_type: ChangeInCapacity
  as_name: api-production-iad
  cooldown: 1800
  min_adjustment_step: None
  name: ScaleDown
  scaling_adjustment: -1
region: us-east-1
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdflkdfklgjsdfajkghs

# Using a profile from pillars.
Ensure myasg exists:
boto_asg.present:
  - name: myasg
  - launch_config_name: mylc
  - availability_zones:
    - us-east-1a
    - us-east-1b
  - min_size: 1
  - max_size: 1
  - desired_capacity: 1
  - load_balancers:
    - myelb
  - profile: myprofile

# Passing in a profile.
Ensure myasg exists:
boto_asg.present:
  - name: myasg
  - launch_config_name: mylc
  - availability_zones:
    - us-east-1a
    - us-east-1b
  - min_size: 1
  - max_size: 1
  - desired_capacity: 1
  - load_balancers:
    - myelb
  - profile:
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfajkghs
    - region: us-east-1

# Deleting an autoscale group with running instances.
Ensure myasg is deleted:

```python
boto_asg.absent:
  - name: myasg
    # If instances exist, we must force the deletion of the asg.
    - force: True
```

It's possible to specify cloudwatch alarms that will be setup along with the ASG. Note the alarm name will be the name attribute defined, plus the ASG resource name.

Ensure myasg exists:

```python
boto_asg.present:
  - name: myasg
    launch_config_name: mylc
    availability_zones:
      - us-east-1a
      - us-east-1b
    min_size: 1
    max_size: 1
    desired_capacity: 1
    load_balancers:
      - myelb
    profile: myprofile
    alarms:
      CPU:
        name: 'ASG CPU **MANAGED BY SALT**'
        attributes:
          metric: CPUUtilization
          namespace: AWS/EC2
          statistic: Average
          comparison: '>= '
          threshold: 65.0
          period: 60
          evaluation_periods: 30
          unit: null
          description: 'ASG CPU'
          alarm_actions: [ 'arn:aws:sns:us-east-1:12345:myalarm' ]
          insufficient_data_actions: []
          ok_actions: [ 'arn:aws:sns:us-east-1:12345:myalarm' ]
```

You can also use alarms from pillars, and override values from the pillar alarms by setting overrides on the resource. Note that 'boto_asg_alarms' will be used as a default value for all resources, if defined and can be used to ensure alarms are always set for an ASG resource.

Setting the alarms in a pillar:

```python
my_asg_alarm:
  CPU:
    name: 'ASG CPU **MANAGED BY SALT**'
    attributes:
      metric: CPUUtilization
      namespace: AWS/EC2
      statistic: Average
      comparison: '>= '
      threshold: 65.0
      period: 60
      evaluation_periods: 30
      unit: null
```

(continues on next page)
Overriding the alarm values on the resource:

```python
Ensure myasg exists:
boto_asg.present:
  - name: myasg
  - launch_config_name: mylc
  - availability_zones:
      - us-east-1a
      - us-east-1b
  - min_size: 1
  - max_size: 1
  - desired_capacity: 1
  - load_balancers:
      - myelb
  - profile: myprofile
  - alarms_from_pillar: my_asg_alarm
# override CPU:attributes:threshold
    - alarms:
      - CPU:
          attributes:
            threshold: 50.0
```

salt.states.boto_asg.absent(name, force=False, region=None, key=None, keyid=None, profile=None, remove_lc=False)

Ensure the named autoscale group is deleted.
  name Name of the autoscale group.
  force Force deletion of autoscale group.
  remove_lc Delete the launch config as well.
  region The region to connect to.
  key Secret key to be used.
  keyid Access key to be used.
  profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_asg.present(name, launch_config_name, availability_zones, min_size, max_size, launch_config=None, desired_capacity=None, load_balancers=None, default_cooldown=None, health_check_type=None, health_check_period=None, placement_group=None, vpc_zone_identifier=None, subnet_names=None, tags=None, termination_policies=None, termination_policies_from_pillar='boto_asg_termination_policies', suspended_processes=None, scaling_policies=None, scaling_policies_from_pillar='boto_asg_scaling_policies', scheduled_actions=None, scheduled_actions_from_pillar='boto_asg_scheduled_actions', alarms=None, alarms_from_pillar='boto_asg_alarms', region=None, key=None, keyid=None, profile=None, notification_arn=None, notification_arn_from_pillar='boto_asg_notification_arn', notification_types=None, notification_types_from_pillar='boto_asg_notification_types')

Ensure the autoscale group exists.
  name Name of the autoscale group.
**launch_config_name** Name of the launch config to use for the group. Or, if `launch_config` is specified, this will be the launch config name’s prefix. (see below)

**launch_config** A dictionary of launch config attributes. If specified, a launch config will be used or created, matching this set of attributes, and the autoscale group will be set to use that launch config. The launch config name will be the `launch_config_name` followed by a hyphen followed by a hash of the `launch_config` dict contents. Example:

```python
my_asg:
  boto_asg.present:
    - launch_config:
        - ebs_optimized: false
        - instance_profile_name: my_iam_profile
        - kernel_id: '
        - ramdisk_id: '
        - key_name: my_ssh_key
        - image_name: aws2015091-hvm
        - instance_type: c3.xlarge
        - instance_monitoring: false
        - security_groups:
            - my_sec_group_01
            - my_sec_group_02
```

**availability_zones** List of availability zones for the group.

**min_size** Minimum size of the group.

**max_size** Maximum size of the group.

**desired_capacity** The desired capacity of the group.

**load_balancers** List of load balancers for the group. Once set this can not be updated (Amazon restriction).

**default_cooldown** Number of seconds after a Scaling Activity completes before any further scaling activities can start.

**health_check_type** The service you want the health status from, Amazon EC2 or Elastic Load Balancer (EC2 or ELB).

**health_check_period** Length of time in seconds after a new EC2 instance comes into service that Auto Scaling starts checking its health.

**placement_group** Physical location of your cluster placement group created in Amazon EC2. Once set this can not be updated (Amazon restriction).

**vpc_zone_identifier** A list of the subnet identifiers of the Virtual Private Cloud.

**subnet_names** For VPC, a list of subnet names (NOT subnet IDs) to deploy into. Exclusive with `vpc_zone_identifier`.

**tags** A list of tags. Example:

```yaml
- key: 'key'
  value: 'value'
  propagate_at_launch: true
```

**termination_policies** A list of termination policies. Valid values are:

- OldestInstance
- NewestInstance
- OldestLaunchConfiguration
- ClosestToNextInstanceHour
- Default

If no value is specified, the Default value is used.

**termination_policies_from_pillar**: name of pillar dict that contains termination policy settings. Termination policies defined for this specific state will override those from pillar.

scaling_policies_from_pillar: name of pillar dict that contains scaling policy settings. Scaling policies defined for this specific state will override those from pillar.

scheduled_actions: a dictionary of scheduled actions. Each key is the name of scheduled action and each value is dictionary of options. For example:

```
- scheduled_actions:
  scale_up_at_10:
    desired_capacity: 4
    min_size: 3
    max_size: 5
    recurrence: "0 9 * * 1-5"
  scale_down_at_7:
    desired_capacity: 1
    min_size: 1
    max_size: 1
    recurrence: "0 19 * * 1-5"
```

scheduled_actions_from_pillar: name of pillar dict that contains scheduled_actions settings. Scheduled actions for this specific state will override those from pillar.

alarms: a dictionary of name->boto_cloudwatch_alarm sections to be associated with this ASG. All attributes should be specified except for dimension which will be automatically set to this ASG.

See the salt.states.boto_cloudwatch_alarm state for information about these attributes.

If any alarm actions include ":self:" this will be replaced with the asg name. For example, alarm_actions reading "[scaling_policy:self:ScaleUp]" will map to the arn for this asg’s scaling policy named "ScaleUp". In addition, any alarms that have only scaling_policy as actions will be ignored if min_size is equal to max_size for this ASG.

alarms_from_pillar: name of pillar dict that contains alarm settings. Alarms defined for this specific state will override those from pillar.

region The region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
notification_arn The AWS arn that notifications will be sent to
notification_arn_from_pillar name of the pillar dict that contains notification_arn settings. A notification_arn defined for this specific state will override the one from pillar.

notification_types A list of event names that will trigger a notification. The list of valid notification types is:
  - autoscaling:EC2_INSTANCE_LAUNCH
  - autoscaling:EC2_INSTANCE_LAUNCH_ERROR
  - autoscaling:EC2_INSTANCE_TERMINATE
  - autoscaling:EC2_INSTANCE_TERMINATE_ERROR
  - autoscaling:TEST_NOTIFICATION

notification_types_from_pillar name of the pillar dict that contains notification_types settings. notification_types defined for this specific state will override those from the pillar.

21.19.25 salt.states.boto_cfn

Connection module for Amazon Cloud Formation

New in version 2015.8.0.

depends boto

configuration This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained

21.19. state modules 3179

If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:

<table>
<thead>
<tr>
<th>keyid</th>
<th>GKTADJGHEIQXSXMKGRRB3G98H</th>
</tr>
</thead>
<tbody>
<tr>
<td>key</td>
<td>askdjghsdfjkgshWupujasdfldfklgjsdfjakghs</td>
</tr>
</tbody>
</table>

```yaml
stack-present:
boto_cfn.present:
  - name: mystack
  - template_body: salt://base/mytemplate.json
  - disable_rollback: true
  - region: eu-west-1
  - keyid: 'AKIAJHMIQ2ASDFLASDF'
  - key: 'fdkjsafkljsASSADFalkfjasdf'
```

```yaml
stack-absent:
boto_cfn.absent:
  - name: mystack
```

```
salt.states.boto_cfn.absent(name, region=None, key=None, keyid=None, profile=None)
Ensure cloud formation stack is absent.

name (string) – The name of the stack to delete.
region (string) - Region to connect to.
key (string) - Secret key to be used.
keyid (string) - Access key to be used.
profile (dict) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
```

```
salt.states.boto_cfn.present(name, template_body=None, template_url=None, parameters=None, notification_arns=None, disable_rollback=None, timeout_in_minutes=None, capabilities=None, tags=None, on_failure=None, stack_policy_body=None, stack_policy_url=None, use_previous_template=None, stack_policy_during_update_body=None, stack_policy_during_update_url=None, region=None, key=None, keyid=None, profile=None)
Ensure cloud formation stack is present.

name (string) - Name of the stack.
template_body (string) – Structure containing the template body. Can also be loaded from a file by using salt://.
template_url (string) – Location of file containing the template body. The URL must point to a template located in an S3 bucket in the same region as the stack.
parameters (list) – A list of key/value tuples that specify input parameters for the stack. A 3-tuple (key, value, bool) may be used to specify the UsePreviousValue option.
notification_arns (list) – The Simple Notification Service (SNS) topic ARNs to publish stack related events. You can find your SNS topic ARNs using the SNS console or your Command Line Interface (CLI).
disable_rollback (bool) – Indicates whether or not to rollback on failure.
timeout_in_minutes (integer) – The amount of time that can pass before the stack status becomes CREATE_FAILED; if DisableRollback is not set or is set to False, the stack will be rolled back.
```
capabilities (list) – The list of capabilities you want to allow in the stack. Currently, the only valid capability is 'CAPABILITY_IAM'.

tags (dict) – A set of user-defined Tags to associate with this stack, represented by key/value pairs. Tags defined for the stack are propagated to EC2 resources that are created as part of the stack. A maximum number of 10 tags can be specified.

on_failure (string) – Determines what action will be taken if stack creation fails. This must be one of: DO NOTHING, ROLLBACK, or DELETE. You can specify either OnFailure or DisableRollback, but not both.

stack_policy_body (string) – Structure containing the stack policy body. Can also be loaded from a file by using salt://.

stack_policy_url (string) – Location of a file containing the stack policy. The URL must point to a policy (max size: 16KB) located in an S3 bucket in the same region as the stack. If you pass StackPolicyBody and StackPolicyURL, only StackPolicyBody is used.

use_previous_template (boolean) – Used only when templates are not the same. Set to True to use the previous template instead of uploading a new one via TemplateBody or TemplateURL.

stack_policy_during_update_body (string) – Used only when templates are not the same. Structure containing the temporary overriding stack policy body. If you pass StackPolicyDuringUpdateBody and StackPolicyDuringUpdateURL, only StackPolicyDuringUpdateBody is used. Can also be loaded from a file by using salt://.

stack_policy_during_update_url (string) – Used only when templates are not the same. Location of a file containing the temporary overriding stack policy. The URL must point to a policy (max size: 16KB) located in an S3 bucket in the same region as the stack. If you pass StackPolicyDuringUpdateBody and StackPolicy-DuringUpdateURL, only StackPolicyDuringUpdateBody is used.

region (string) - Region to connect to.

doesnotapplykey (string) - Secret key to be used.

doesnotapplykeyid (string) - Access key to be used.

doesnotapplyprofile (dict) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.26 salt.states.boto_cloudfront

Manage CloudFront distributions

New in version 2018.3.0.

Create, update and destroy CloudFront distributions.

This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them, either in a pillar file or in the minion’s config file:

```python
cloudfront.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudfront.key: askdjghsdfjkgWupUjasdfsldflkdfklgjdsdfjajkgghs
```

It’s also possible to specify key, keyid, and region via a profile, either passed in as a dict, or a string to pull from pillars or minion config:
myprofile:
  keyid: GKTADJGHEIQXSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1

aws:
  region: us-east-1:
    profile:
      keyid: GKTADJGHEIQXSXMKKRBJ08H
      key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
      region: us-east-1

depends boto3

salt.states.boto_cloudfront.present(name, config, tags, region=None, key=None, keyid=None, profile=None)

Ensure the CloudFront distribution is present.

name (string) Name of the CloudFront distribution
config (dict) Configuration for the distribution
tags (dict) Tags to associate with the distribution
region (string) Region to connect to
key (string) Secret key to use
keyid (string) Access key to use
profile (dict or string) A dict with region, key, and keyid, or a pillar key (string) that contains such a dict.

Example:

Manage my_distribution CloudFront distribution:
  boto_cloudfront.present:
    - name: my_distribution
    - config:
      Comment: 'partial config shown, most parameters elided'
      Enabled: True
    - tags:
      testing_key: testing_value

21.19.27 salt.states.boto_cloudtrail module

Manage CloudTrail Objects

New in version 2016.3.0.

Create and destroy CloudTrail objects. Be aware that this interacts with Amazon’s services, and so may incur charges.

depends

  • boto
  • boto3

The dependencies listed above can be installed via package or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:
It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```yaml
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfajkghs
  region: us-east-1
```

```
Ensure trail exists:
  boto_cloudtrail.present:
    - Name: mytrail
    - S3BucketName: mybucket
    - S3KeyPrefix: prefix
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfajkghs
```

```
salt.states.boto_cloudtrail.absent(name, Name=None, region=None, key=None, keyid=None, profile=None)
```

Ensure trail with passed properties is absent.

```
salt.states.boto_cloudtrail.present(name, Name=None, S3BucketName, S3KeyPrefix=None, SnsTopicName=None, IncludeGlobalServiceEvents=True, IsMultiRegionTrail=None, EnableLogFileValidation=False, CloudWatchLogsLogGroupArn=None, CloudWatchLogsRoleArn=None, KmsKeyId=None, LoggingEnabled=True, Tags=None, region=None, key=None, keyid=None, profile=None)
```

Ensure trail exists.

```
salt.states.boto_cloudtrail.absent(name, Name=None, S3BucketName, S3KeyPrefix=None, SnsTopicName=None, IncludeGlobalServiceEvents=True, IsMultiRegionTrail=None, EnableLogFileValidation=False, CloudWatchLogsLogGroupArn=None, CloudWatchLogsRoleArn=None, KmsKeyId=None, LoggingEnabled=True, Tags=None, region=None, key=None, keyid=None, profile=None)
```

Ensure trail with passed properties is absent.

```
salt.states.boto_cloudtrail.present(name, Name=None, S3BucketName, S3KeyPrefix=None, SnsTopicName=None, IncludeGlobalServiceEvents=True, IsMultiRegionTrail=None, EnableLogFileValidation=False, CloudWatchLogsLogGroupArn=None, CloudWatchLogsRoleArn=None, KmsKeyId=None, LoggingEnabled=True, Tags=None, region=None, key=None, keyid=None, profile=None)
```

Ensure trail exists.

---

**vpc.keyid**: GKTADJGHEIQSXMKKRBJ08H  
**vpc.key**: askdjghsdfjkghWupUjasdflkdfklgjsdfajkghs

### 21.19. state modules

---

3183
an alias name prefixed by ”alias/”, a fully specified ARN to an alias, a fully specified ARN to a key, or a globally unique identifier.

**LoggingEnabled** Whether logging should be enabled for the trail

**Tags** A dictionary of tags that should be set on the trail

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 21.19.28 salt.states.boto_cloudwatch_alarm

Manage Cloudwatch alarms

New in version 2014.7.0.

Create and destroy cloudwatch alarms. Be aware that this interacts with Amazon’s services, and so may incur charges.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:

```yaml
cloudwatch:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfsdfjkgHwupUjasdfklkdflgjsdfjajkghs
```

It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```yaml
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfsdfjkgHwupUjasdfklkdflgjsdfjajkghs
    region: us-east-1
```

```yaml
my test alarm:
    boto_cloudwatch_alarm.present:
        - name: my test alarm
        - attributes:
            metric: ApproximateNumberOfMessagesVisible
            namespace: AWS/SQS
            statistic: Average
            comparison: ">="
            threshold: 20000.0
            period: 60
            evaluation_periods: 1
            description: test alarm via salt
            dimensions:
                QueueName:
                    - the-sqs-queue-name
            alarm_actions:
                - arn:aws:sns:us-east-1:111111:myalerting-action
```
salt.states.boto_cloudwatch_alarm.absent(name, region=None, key=None, keyid=None, profile=None)

Ensure the named cloudwatch alarm is deleted.

name Name of the alarm.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_cloudwatch_alarm.present(name, attributes, region=None, key=None, keyid=None, profile=None)

Ensure the cloudwatch alarm exists.

name Name of the alarm
attributes A dict of key/value cloudwatch alarm attributes.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.29 salt.states.boto_cloudwatch_event module

Manage CloudTrail Objects

New in version 2016.11.0.

Create and destroy CloudWatch event rules. Be aware that this interacts with Amazon’s services, and so may incur charges.

This module uses boto3, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

```
cloudwatch_event.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudwatch_event.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It’s also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

Ensure event rule exists:

```
boto_cloudwatch_event.present:
    - Name: mytrail
    - ScheduleExpression: 'rate(120 minutes)'
    - State: 'DISABLED'
    - Targets:
        - Id: "target1"
```

(continues on next page)
salt.states.boto_cloudwatch_event.absent(name, Name=None, region=None, key=None, keyid=None, profile=None)

Ensure CloudWatch event rule with passed properties is absent.

name The name of the state definition.
Name Name of the event rule. Defaults to the value of the 'name' param if not provided.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_cloudwatch_event.present(name, Name=None, ScheduleExpression=None, EventPattern=None, Description=None, RoleArn=None, State=None, Targets=None, region=None, key=None, keyid=None, profile=None)

Ensure trail exists.

name The name of the state definition.
Name Name of the event rule. Defaults to the value of the 'name' param if not provided.
ScheduleExpression The scheduling expression. For example, cron(0 20 * * ? *), "rate(5 minutes)"
EventPattern The event pattern.
Description A description of the rule.
State Indicates whether the rule is ENABLED or DISABLED.
RoleArn The Amazon Resource Name (ARN) of the IAM role associated with the rule.
Targets A list of resources to be invoked when the rule is triggered.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.30 salt.states.boto_cognitoidentity module

Manage CognitoIdentity Functions

New in version 2016.11.0.

Create and destroy CognitoIdentity identity pools. Be aware that this interacts with Amazon’s services, and so may incur charges.

This module uses boto3, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:
It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfajkghs
  region: us-east-1
```

Ensure function exists:

```
Ensure function exists:
  boto_cognitoidentity.pool_present:
    - PoolName: my_identity_pool
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfajkghs
```

salt.states.boto_cognitoidentity.pool_absent(name, IdentityPoolName, RemoveAllMatched=False, region=None, key=None, keyid=None, profile=None)

Ensure cognito identity pool with passed properties is absent.

- **name** The name of the state definition.
- **IdentityPoolName** Name of the Cognito Identity Pool. Please note that this may match multiple pools with the same given name, in which case, all will be removed.
- **RemoveAllMatched** If True, all identity pools with the matching IdentityPoolName will be removed. If False and there are more than one identity pool with the matching IdentityPoolName, no action will be taken. If False and there is only one identity pool with the matching IdentityPoolName, the identity pool will be removed.
- **region** Region to connect to.
- **key** Secret key to be used.
- **keyid** Access key to be used.
- **profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_cognitoidentity.pool_present(name, IdentityPoolName, AuthenticatedRole, AllowUnauthenticatedIdentities=False, UnauthenticatedRole=None, SupportedLoginProviders=None, DeveloperProviderName=None, OpenIdConnectProviderARNs=None, region=None, key=None, keyid=None, profile=None)

Ensure Cognito Identity Pool exists.

- **name** The name of the state definition.
- **IdentityPoolName** Name of the Cognito Identity Pool
- **AuthenticatedRole** An IAM role name or ARN that will be associated with temporary AWS credentials for an authenticated cognito identity.
- **AllowUnauthenticatedIdentities** Whether to allow anonymous user identities
- **UnauthenticatedRole** An IAM role name or ARN that will be associated with anonymous user identities
- **SupportedLoginProviders** A dictionary or pillar that contains key:value pairs mapping provider names to provider app IDs.
- **DeveloperProviderName** A string which is the domain by which Cognito will refer to your users. This name acts as a placeholder that allows your backend and the Cognito service to communicate about the developer provider. Once you have set a developer provider name, you cannot change it. Please take care in setting this parameter.
OpenIdConnectProviderARNs A list or pillar name that contains a list of OpenID Connect provider ARNs.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.31 salt.states.boto_datapipeline module

Manage Data Pipelines

New in version 2016.3.0.

Be aware that this interacts with Amazon’s services, and so may incur charges.

This module uses boto3, which can be installed via package, or pip.

This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

```
datapipeline.keyid: GKTADJGHEIQSXMKKRBJ08H
datapipeline.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It’s also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

Ensure daily data pipeline exists:
```
boto_datapipeline.present:
- name: my-datapipeline
- pipeline_objects:
  DefaultSchedule:
    name: Every 1 day
    fields:
      period: 1 Day
      type: Schedule
      startAt: FIRST_ACTIVATION_DATE_TIME
- parameter_values:
  myDDBTableName: my-dynamo-table
```

salt.states.boto_datapipeline.absent(name, region=None, key=None, keyid=None, profile=None)

Ensure a pipeline with the service_name does not exist
name Name of the service to ensure a data pipeline does not exist for.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
salt.states.boto_datapipeline.present(name, pipeline_objects=None, pipeline_objects_from_pillars='boto_datapipeline_pipeline_objects', parameter_objects=None, parameter_objects_from_pillars='boto_datapipeline_parameter_objects', parameter_values=None, parameter_values_from_pillars='boto_datapipeline_parameter_values', region=None, key=None, keyid=None, profile=None)

Ensure the data pipeline exists with matching definition.
name Name of the service to ensure a data pipeline exists for.
pipeline_objects Pipeline objects to use. Will override objects read from pillars.
pipeline_objects_from_pillars The pillar key to use for lookup.
pipeline_objects_from_pillars Parameter objects to use. Will override objects read from pillars.
pipeline_objects_from_pillars Parameter objects to use. Will override objects read from pillars.
pipeline_objects_from_pillars Parameter objects to use. Will override objects read from pillars.
pipeline_objects_from_pillars Parameter objects to use. Will override objects read from pillars.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.32 salt.states.boto_dynamodb

Manage DynamoDB Tables

New in version 2015.5.0.

Create and destroy DynamoDB tables. Be aware that this interacts with Amazon’s services, and so may incur charges.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit DynamoDB credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

```
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
region: us-east-1
```

It’s also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

Ensure DynamoDB table does not exist:

```
boto_dynamodb.absent:
  - table_name: new_table
  - keyid: GKTADJGHEIQSXMKKRBJ08H
  - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  - region: us-east-1
```

(continues on next page)
Ensure DynamoDB table exists:
```
boto_dynamodb.present:
  - table_name: new_table
  - read_capacity_units: 1
  - write_capacity_units: 2
  - hash_key: primary_id
  - hash_key_data_type: N
  - range_key: start_timestamp
  - range_key_data_type: N
  - keyid: GKTADJGHEIQSXMKKRBJ08H
  - key: askdjghsdfjdkgWupUjasdfklkgjsdfjajkghs
  - region: us-east-1
  - local_indexes:
    - index:
      - name: "primary_id_end_timestamp_index"
      - hash_key: primary_id
      - hash_key_data_type: N
      - range_key: end_timestamp
      - range_key_data_type: N
  - global_indexes:
    - index:
      - name: "name_end_timestamp_index"
      - hash_key: name
      - hash_key_data_type: S
      - range_key: end_timestamp
      - range_key_data_type: N
      - read_capacity_units: 3
      - write_capacity_units: 4
```
It's possible to specify cloudwatch alarms that will be setup along with the DynamoDB table. Note the alarm name will be defined by the name attribute provided, plus the DynamoDB resource name.

Ensure DynamoDB table exists:
```
boto_dynamodb.present:
  - name: new_table
  - read_capacity_units: 1
  - write_capacity_units: 2
  - hash_key: primary_id
  - hash_key_data_type: N
  - range_key: start_timestamp
  - range_key_data_type: N
  - alarms:
    ConsumedWriteCapacityUnits:
      name: 'DynamoDB ConsumedWriteCapacityUnits **MANAGED BY SALT**'
      attributes:
        metric: ConsumedWriteCapacityUnits
        namespace: AWS/DynamoDB
        statistic: Sum
        comparison: '>=
        # threshold_percent is used to calculate the actual threshold
        # based on the provisioned capacity for the table.
        threshold_percent: 0.75
        period: 300
        evaluation_periods: 2
        unit: Count
```
You can also use alarms from pillars, and override values from the pillar alarms by setting overrides on the resource.

Note that ‘boto_dynamodb_alarms’ will be used as a default value for all resources, if defined and can be used to ensure alarms are always set for a resource.

Setting the alarms in a pillar:

```yaml
boto_dynamodb_alarms:
  ConsumedWriteCapacityUnits:
    name: 'DynamoDB ConsumedWriteCapacityUnits **MANAGED BY SALT**'
    attributes:
      metric: ConsumedWriteCapacityUnits
      namespace: AWS/DynamoDB
      statistic: Sum
      comparison: '>='
      # threshold_percent is used to calculate the actual threshold
      # based on the provisioned capacity for the table.
      threshold_percent: 0.75
      period: 300
      evaluation_periods: 2
      unit: Count
    description: 'DynamoDB ConsumedWriteCapacityUnits'
    alarm_actions: [ 'arn:aws:sns:us-east-1:1234:my-alarm' ]
    insufficient_data_actions: []
    ok_actions: [ 'arn:aws:sns:us-east-1:1234:my-alarm' ]
```

Ensure DynamoDB table exists:

```yaml
boto_dynamodb.present:
  - name: new_table
  - read_capacity_units: 1
  - write_capacity_units: 2
  - hash_key: primary_id
  - hash_key_data_type: N
  - range_key: start_timestamp
  - range_key_data_type: N
  - alarms:
    ConsumedWriteCapacityUnits:
      attributes:
        threshold_percent: 0.90
        period: 900
```

**exception**  
salt.states.boto_dynamodb.GsiNotUpdatableError

Raised when a global secondary index cannot be updated.

salt.states.boto_dynamodb.absent(name, region=None, key=None, keyid=None, profile=None)

Ensure the DynamoDB table does not exist.

name Name of the DynamoDB table.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**salt.states.boto_dynamodb.present**

```python
(name=None, table_name=None, region=None, key=None, keyid=None, profile=None, read_capacity_units=None, write_capacity_units=None, alarms=None, alarms_from_pillar='boto_dynamodb_alarms', hash_key=None, hash_key_data_type=None, range_key=None, range_key_data_type=None, local_indexes=None, global_indexes=None, backup_configs_from_pillars='boto_dynamodb_backup_configs')
```

Ensure the DynamoDB table exists. Table throughput can be updated after table creation.

Global secondary indexes (GSIs) are managed with some exceptions:

- If a GSI deletion is detected, a failure will occur (deletes should be done manually in the AWS console).
- If multiple GSIs are added in a single Salt call, a failure will occur (boto supports one creation at a time).
  
  Note that this only applies after table creation; multiple GSIs can be created during table creation.
- Updates to existing GSIs are limited to read/write capacity only (DynamoDB limitation).

name Name of the DynamoDB table

table_name Name of the DynamoDB table (deprecated)

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

read_capacity_units The read throughput for this table

write_capacity_units The write throughput for this table

hash_key The name of the attribute that will be used as the hash key for this table

hash_key_data_type The DynamoDB datatype of the hash key

range_key The name of the attribute that will be used as the range key for this table

range_key_data_type The DynamoDB datatype of the range key

local_indexes The local indexes you would like to create

global_indexes The global indexes you would like to create

backup_configs_from_pillars Pillars to use to configure DataPipeline backups

### 21.19.33 salt.states.boto_ec2

Manage EC2

New in version 2015.8.0.

This module provides an interface to the Elastic Compute Cloud (EC2) service from AWS.

The below code provides a key pair:

```python
create-key-pair:
    boto_ec2.key_present:
        - name: mykeypair
        - save_private: /root/
        - region: eu-west-1
        - keyid: GKTADJGHEIQSXMKKRBJ08H
        - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

import-key-pair:
    boto_ec2.key_present:
```

(continues on next page)
You can also use salt:// in order to define the public key.

```
import-key-pair:
boto_ec2.key_present:
  - name: mykeypair
  - upload_public: salt://mybase/public_key.pub
  - keyid: GKTADJGHEIQXSXMKKRB08H
  - key: askdjghsdjfkghWupUjasdfklkdfklgjsdfjajkghs
```

The below code deletes a key pair:

```
delete-key-pair:
boto_ec2.key_absent:
  - name: mykeypair
  - region: eu-west-1
  - keyid: GKTADJGHEIQXSXMKKRB08H
  - key: askdjghsdjfkghWupUjasdfklkdfklgjsdfjajkghs
```

salt.states.boto_ec2.eni_absent(name, release_eip=False, region=None, key=None, keyid=None, profile=None)

Ensure the EC2 ENI is absent.

New in version 2016.3.0.
- **name** Name tag associated with the ENI.
- **release_eip** True/False - release any EIP associated with the ENI.
- **region** Region to connect to.
- **key** Secret key to be used.
- **keyid** Access key to be used.
- **profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_ec2.eni_present(name, subnet_id=None, subnet_name=None, private_ip_address=None, description=None, groups=None, source_dest_check=True, allocate_eip=None, arecords=None, region=None, key=None, keyid=None, profile=None)

Ensure the EC2 ENI exists.

New in version 2016.3.0.
- **name** Name tag associated with the ENI.
- **subnet_id** The VPC subnet ID the ENI will exist within.
- **subnet_name** The VPC subnet name the ENI will exist within.
- **private_ip_address** The private ip address to use for this ENI. If this is not specified AWS will automatically assign a private IP address to the ENI. Must be specified at creation time; will be ignored afterward.
- **description** Description of the key.
- **groups** A list of security groups to apply to the ENI.
- **source_dest_check** Boolean specifying whether source/destination checking is enabled on the ENI.
- **allocate_eip** allocate and associate an EIP to the ENI. Could be 'standard' to allocate Elastic IP to EC2 region or 'vpc' to get it for a particular VPC.

Changed in version 2016.11.0.
- **arecords** A list of arecord dicts with attributes needed for the DNS add_record state. By default the boto_route53.add_record state will be used, which requires: name, zone, ttl, and identifier. See the

21.19. state modules
boto_route53 state for information about these attributes. Other DNS modules can be called by specifying the provider keyword. By default, the private ENI IP address will be used, set `public: True` in the arecord dict to use the ENI’s public IP address

New in version 2016.3.0.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_ec2.instance_absent(name, instance_name=None, instance_id=None, release_eip=False, region=None, key=None, keyid=None, profile=None, filters=None)
```

Ensure an EC2 instance does not exist (is stopped and removed).

Changed in version 2016.11.0.

**name** (string) - The name of the state definition.

**instance_name** (string) - The name of the instance.

**instance_id** (string) - The ID of the instance.

**release_eip** (bool) - Release any associated EIPs during termination.

**region** (string) - Region to connect to.

**key** (string) - Secret key to be used.

**keyid** (string) - Access key to be used.

**profile** (variable) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**filters** (dict) - A dict of additional filters to use in matching the instance to delete.

YAML example fragment:
```
- filters:
  vpc-id: vpc-abcdef12
```

```
salt.states.boto_ec2.instance_present(name, instance_name=None, instance_id=None, image_id=None, image_name=None, tags=None, key_name=None, security_groups=None, user_data=None, instance_type=None, placement=None, kernel_id=None, ramdisk_id=None, vpc_name=None, monitoring_enabled=None, subnet_id=None, subnet_name=None, private_ip_address=None, block_device_map=None, disable_api_termination=None, instance_initiated_shutdown_behavior=None, placement_group=None, client_token=None, security_group_ids=None, security_group_names=None, additional_info=None, tenancy=None, instance_profile_arn=None, instance_profile_name=None, ebs_optimized=None, network_interfaces=None, network_interface_name=None, network_interface_id=None, attributes=None, target_state=None, public_ip=None, allocation_id=None, allocate_eip=False, region=None, key=None, keyid=None, profile=None)
```

Ensure an EC2 instance is running with the given attributes and state.

**name** (string) - The name of the state definition. Recommended that this match the instance_name attribute...
instance_name (string) - The name of the instance, generally its FQDN. Exclusive with 'instance_id'.
instance_id (string) - The ID of the instance (if known). Exclusive with 'instance_name'.
image_id (string) – The ID of the AMI image to run.
image_name (string) – The name of the AMI image to run.
tag (dict) - Tags to apply to the instance.
key_name (string) – The name of the key pair with which to launch instances.
security_groups (list of strings) – The names of the EC2 classic security groups with which to associate instances
user_data (string) – The Base64-encoded MIME user data to be made available to the instance(s) in this reservation.
instance_type (string) – The EC2 instance size/type. Note that only certain types are compatible with HVM based AMIs.
placement (string) – The Availability Zone to launch the instance into.
kernel_id (string) – The ID of the kernel with which to launch the instances.
ramdisk_id (string) – The ID of the RAM disk with which to launch the instances.
vpc_id (string) - The ID of a VPC to attach the instance to.
vpc_name (string) - The name of a VPC to attach the instance to.
monitoring_enabled (bool) – Enable detailed CloudWatch monitoring on the instance.
subnet_id (string) – The ID of the subnet within which to launch the instances for VPC.
subnet_name (string) – The name of the subnet within which to launch the instances for VPC.
private_ip_address (string) – If you’re using VPC, you can optionally use this parameter to assign the instance a specific available IP address from the subnet (e.g., 10.0.0.25).
block_device_map (boto.ec2.blockdevicemapping.BlockDeviceMapping) – A BlockDeviceMapping data structure describing the EBS volumes associated with the Image.
disable_api_termination (bool) – If True, the instances will be locked and will not be able to be terminated via the API.
instance_initiated_shutdown_behavior (string) – Specifies whether the instance stops or terminates on instance-initiated shutdown. Valid values are:
• 'stop'
• 'terminate'
placement_group (string) – If specified, this is the name of the placement group in which the instance(s) will be launched.
client_token (string) – Unique, case-sensitive identifier you provide to ensure idempotency of the request. Maximum 64 ASCII characters.
security_group_ids (list of strings) – The IDs of the VPC security groups with which to associate instances.
security_group_names (list of strings) – The names of the VPC security groups with which to associate instances.
additional_info (string) – Specifies additional information to make available to the instance(s).
tenancy (string) – The tenancy of the instance you want to launch. An instance with a tenancy of ‘dedicated’ runs on single-tenant hardware and can only be launched into a VPC. Valid values are: “default” or “dedicated”. NOTE: To use dedicated tenancy you MUST specify a VPC subnet-ID as well.
instance_profile_arn (string) – The Amazon resource name (ARN) of the IAM Instance Profile (IIP) to associate with the instances.
instance_profile_name (string) – The name of the IAM Instance Profile (IIP) to associate with the instances.
ebs_optimized (bool) – Whether the instance is optimized for EBS I/O. This optimization provides dedicated throughput to Amazon EBS and a tuned configuration stack to provide optimal EBS I/O performance. This optimization isn’t available with all instance types.
network_interfaces (boto.ec2.networkinterface.NetworkInterfaceCollection) – A NetworkInterfaceCollection data structure containing the ENI specifications for the instance.

New in version 2016.11.0.
network_interface_name (string) - The name of Elastic Network Interface to attach
 attributes (dict) - Instance attributes and value to be applied to the instance. Available options are:
  • instanceType - A valid instance type (m1.small)
  • kernel - Kernel ID (None)
  • ramdisk - Ramdisk ID (None)
  • userData - Base64 encoded String (None)
  • disableApiTermination - Boolean (true)
  • instanceInitiatedShutdownBehavior - stop|terminate
  • blockDeviceMapping - List of strings - ie: ['/dev/sda=False']
  • sourceDestCheck - Boolean (true)
  • groupSet - Set of Security Groups or IDs
  • ebsOptimized - Boolean (false)
  • sriovNetSupport - String - ie: 'simple'

 target_state (string) - The desired target state of the instance. Available options are:
  • running
  • stopped

 Note that this option is currently UNIMPLEMENTED.

 public_ip: (string) - The IP of a previously allocated EIP address, which will be attached to the instance. EC2
 Classic instances ONLY - for VCP pass in an allocation_id instead.

 allocation_id: (string) - The ID of a previously allocated EIP address, which will be attached to the instance.
 VPC instances ONLY - for Classic pass in a public_ip instead.

 allocate_eip: (bool) - Allocate and attach an EIP on-the-fly for this instance. Note you’ll want to release this
 address when terminating the instance, either manually or via the ‘release_eip’ flag to ‘instance_absent’.

 region (string) - Region to connect to.
 key (string) - Secret key to be used.
 keyid (string) - Access key to be used.
 profile (variable) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region,
 key and keyid.

 New in version 2016.3.0.

 salt.states.boto_ec2.key_absent(name, region=None, key=None, keyid=None, profile=None)
 Deletes a key pair

 salt.states.boto_ec2.key_present(name, save_private=None, upload_public=None, region=None, key=None, keyid=None, profile=None)
 Ensure key pair is present.

 salt.states.boto_ec2.private_ips_absent(name, network_interface_name=None, network_interface_id=None, private_ip_addresses=None, region=None, key=None, keyid=None, profile=None)
 Ensure an ENI does not have secondary private ip addresses associated with it

 name (String) - State definition name
 network_interface_id (String) - The EC2 network interface id, example eni-123456789
 private_ip_addresses (List or String) - The secondary private ip address(es) that should be absent on the ENI.
 region (string) - Region to connect to.
 key (string) - Secret key to be used.
 keyid (string) - Access key to be used.
 profile (variable) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region,
 key and keyid.
salt.states.boto_ec2.private_ips_present(name, network_interface_name=None, network_interface_id=None, private_ip_addresses=None, allow_reassignment=False, region=None, key=None, keyid=None, profile=None)

Ensure an ENI has secondary private ip addresses associated with it

name (String) - State definition name
network_interface_id (String) - The EC2 network interface id, example eni-123456789
private_ip_addresses (List or String) - The secondary private ip address(es) that should be present on the ENI.
allow_reassignment (Boolean) - If true, will reassign a secondary private ip address associated with another ENI. If false, state will fail if the secondary private ip address is associated with another ENI.
region (string) - Region to connect to.
key (string) - Secret key to be used.
keyid (string) - Access key to be used.
profile (variable) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_ec2.snapshot_created(name, ami_name, instance_name, wait_until_available=True, wait_timeout_seconds=300, **kwargs)

Create a snapshot from the given instance

New in version 2016.3.0.

salt.states.boto_ec2.volume_absent(name, volume_name=None, volume_id=None, instance_name=None, instance_id=None, device=None, region=None, key=None, keyid=None, profile=None)

Ensure the EC2 volume is detached and absent.

New in version 2016.11.0.

name State definition name.
volume_name Name tag associated with the volume. For safety, if this matches more than one volume, the state will refuse to apply.
volume_id Resource ID of the volume.
instance_name Only remove volume if it is attached to instance with this Name tag. Exclusive with 'instance_id'. Requires 'device'.
instance_id Only remove volume if it is attached to this instance. Exclusive with 'instance_name'. Requires 'device'.
device Match by device rather than ID. Requires one of 'instance_name' or 'instance_id'.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_ec2.volume_present(name, volume_name=None, volume_id=None, instance_name=None, instance_id=None, device=None, size=None, snapshot_id=None, volume_type=None, iops=None, encrypted=False, kms_key_id=None, region=None, key=None, keyid=None, profile=None)

Ensure the EC2 volume is present and attached.

name State definition name.
volume_name The Name tag value for the volume. If no volume with that matching name tag is found, a new volume will be created. If multiple volumes are matched, the state will fail.
volume_id Resource ID of the volume. Exclusive with 'volume_name'.
instance_name Attach volume to instance with this Name tag. Exclusive with 'instance_id'.
instance_id Attach volume to instance with this ID. Exclusive with 'instance_name'.
device  The device on the instance through which the volume is exposed (e.g. /dev/sdh)
size  The size of the new volume, in GiB. If you’re creating the volume from a snapshot and don’t specify
a volume size, the default is the snapshot size. Optionally specified at volume creation time; will be
ignored afterward. Requires ‘volume_name’.
snapshot_id  The snapshot ID from which the new Volume will be created. Optionally specified at volume
creation time; will be ignored afterward. Requires ‘volume_name’.
volume_type  The type of the volume. Optionally specified at volume creation time; will be ignored afterward.
Requires ‘volume_name’. Valid volume types for AWS can be found here: http://docs.aws.amazon.com/
AWSEC2/latest/UserGuide/EBSVolumeTypes.html
iops  The provisioned IOPS you want to associate with this volume. Optionally specified at volume creation
time; will be ignored afterward. Requires ‘volume_name’.
encrypted  Specifies whether the volume should be encrypted. Optionally specified at volume creation
time; will be ignored afterward. Requires ‘volume_name’.
kms_key_id  If encrypted is True, this KMS Key ID may be specified to encrypt volume with this key. Opti-
ionally specified at volume creation time; will be ignored afterward. Requires ‘volume_name’.  e.g.:
ar:aws:kms:us-east-1:012345678910:key/abcd1234-a12b-a123b4cd56ef
region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and
keyid.
salt.states.boto_ec2.volumes_tagged(name,  tag_maps,  authoritative=False,  region=None,
key=None,  keyid=None,  profile=None)
Ensure EC2 volume(s) matching the given filters have the defined tags.

New in version 2016.11.0.
name  State definition name.
tag_maps  List of dicts of filters and tags, where ‘filters’ is a dict suitable for passing to the ‘filters’ argument
of boto_ec2.get_all_volumes(), and ‘tags’ is a dict of tags to be set on volumes as matched by the given
filters. The filter syntax is extended to permit passing either a list of volume_ids or an instance_name
(with instance_name being the Name tag of the instance to which the desired volumes are mapped).
Each mapping in the list is applied separately, so multiple sets of volumes can be all tagged differently
with one call to this function.

YAML example fragment:

```yaml
- filters:
  - attachment.instance_id: i-abcdef12
tags:
  - Name: dev-int-abcdef12.aws-foo.com
- filters:
  - attachment.device: /dev/sdf
tags:
  - ManagedSnapshots: true
  - BillingGroup: bubba.hotep@aws-foo.com
- filters:
  - instance_name: prd-foo-01.aws-foo.com
tags:
  - Name: prd-foo-01.aws-foo.com
  - BillingGroup: infra-team@aws-foo.com
- filters:
  - volume_ids: [ vol-12345689, vol-abcdef12 ]
tags:
  - BillingGroup: infra-team@aws-foo.com
```

authoritative  Should un-declared tags currently set on matched volumes be deleted? Boolean.
region  Region to connect to.
**key**  Secret key to be used.
**keyid**  Access key to be used.
**profile**  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 21.19.34 salt.states.boto_elasticache

**Manage Elasticache**

New in version 2014.7.0.

Create, destroy and update Elasticache clusters. Be aware that this interacts with Amazon’s services, and so may incur charges.

Note: This module currently only supports creation and deletion of elasticache resources and will not modify clusters when their configuration changes in your state files.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit elasticache credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

```
elasticache.keyid: GKTADJGHEIQSXMKKRBJ08H
elasticache.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It’s also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

Ensure myelasticache exists:

```
boto_elasticache.present:
  - name: myelasticache
  - engine: redis
  - cache_node_type: cache.t1.micro
  - num_cache_nodes: 1
  - region: us-east-1
  - keyid: GKTADJGHEIQSXMKKRBJ08H
  - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

# Using a profile from pillars

Ensure myelasticache exists:

```
boto_elasticache.present:
  - name: myelasticache
  - engine: redis
  - cache_node_type: cache.t1.micro
  - num_cache_nodes: 1
  - region: us-east-1
  - profile: myprofile
```

(continues on next page)
# Passing in a profile

Ensure `myelasticache` exists:

```python
boto_elasticache.present:
- name: myelasticache
  - engine: redis
  - cache_node_type: cache.t1.micro
  - num_cache_nodes: 1
  - region: us-east-1
  - profile:
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

salt.states.boto_elasticache.absent(name, wait=True, region=None, key=None, keyid=None, profile=None)

Ensure the named elasticache cluster is deleted.

- `name` Name of the cache cluster.
- `wait` Boolean. Wait for confirmation from boto that the cluster is in the deleting state.
- `region` Region to connect to.
- `key` Secret key to be used.
- `keyid` Access key to be used.
- `profile` A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_elasticache.cache_cluster_absent(**kwargs)

salt.states.boto_elasticache.cache_cluster_present(**kwargs)

salt.states.boto_elasticache.creategroup(name, primary_cluster_id, replication_group_description, wait=None, region=None, key=None, keyid=None, profile=None)

Ensure the a replication group is create.

- `name` Name of replication group
- `wait` Waits for the group to be available
- `primary_cluster_id` Name of the master cache node
- `replication_group_description` Description for the group
- `region` Region to connect to.
- `key` Secret key to be used.
- `keyid` Access key to be used.
- `profile` A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_elasticache.present(name, engine=None, cache_node_type=None, num_cache_nodes=None, preferred_availability_zone=None, port=None, cache_parameter_group_name=None, cache_security_group_names=None, replication_group_id=None, auto_minor_version_upgrade=True, security_group_ids=None, cache_subnet_group_name=None, engine_version=None, notification_topic_arn=None, preferred_maintenance_window=None, wait=None, region=None, key=None, keyid=None, profile=None)

Ensure the cache cluster exists.

- `name` Name of the cache cluster (cache cluster id).
engine  The name of the cache engine to be used for this cache cluster. Valid values are memcached or redis.
cache_node_type  The compute and memory capacity of the nodes in the cache cluster. cachet1.micro, cache.m1.small, etc. See: https://boto.readthedocs.io/en/latest/ref/elasticache.html#boto.elasticache.layer1.ElastiCacheConnection.create_cache_cluster
num_cache_nodes  The number of cache nodes that the cache cluster will have.
preferred_availability_zone  The EC2 Availability Zone in which the cache cluster will be created. All cache nodes belonging to a cache cluster are placed in the preferred availability zone.
port  The port number on which each of the cache nodes will accept connections.
cache_parameter_group_name  The name of the cache parameter group to associate with this cache cluster. If this argument is omitted, the default cache parameter group for the specified engine will be used.
cache_security_group_names  A list of cache security group names to associate with this cache cluster. Use this parameter only when you are creating a cluster outside of a VPC.
replication_group_id  The replication group to which this cache cluster should belong. If this parameter is specified, the cache cluster will be added to the specified replication group as a read replica; otherwise, the cache cluster will be a standalone primary that is not part of any replication group.
auto_minor_version_upgrade  Determines whether minor engine upgrades will be applied automatically to the cache cluster during the maintenance window. A value of True allows these upgrades to occur; False disables automatic upgrades.
security_group_ids  One or more VPC security groups associated with the cache cluster. Use this parameter only when you are creating a cluster in a VPC.
cache_subnet_group_name  The name of the cache subnet group to be used for the cache cluster. Use this parameter only when you are creating a cluster in a VPC.
engine_version  The version number of the cache engine to be used for this cluster.
notification_topic_arn  The Amazon Resource Name (ARN) of the Amazon Simple Notification Service (SNS) topic to which notifications will be sent. The Amazon SNS topic owner must be the same as the cache cluster owner.
preferred_maintenance_window  The weekly time range (in UTC) during which system maintenance can occur. Example: sun:05:00-sun:09:00
wait  Boolean. Wait for confirmation from boto that the cluster is in the available state.
region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
salt.states.boto_elasticache.replication_group_absent(name, tags=None, region=None, key=None, keyid=None, profile=None)
salt.states.boto_elasticache.replication_group_present(*args, **kwargs)
salt.states.boto_elasticache.subnet_group_absent(name, tags=None, region=None, key=None, keyid=None, profile=None)
salt.states.boto_elasticache.subnet_group_present(name, subnet_ids=None, subnet_names=None, tags=None, description=None, region=None, key=None, keyid=None, profile=None)

Ensure ElastiCache subnet group exists.

New in version 2015.8.0.
name  The name for the ElastiCache subnet group. This value is stored as a lowercase string.
subnet_ids  A list of VPC subnet IDs for the cache subnet group. Exclusive with subnet_names.
subnet_names  A list of VPC subnet names for the cache subnet group. Exclusive with subnet_ids.
description  Subnet group description.
tags  A list of tags.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.35 salt.states.boto_elasticsearch_domain module

Manage Elasticsearch Domains

New in version 2016.11.0.

Create and destroy Elasticsearch domains. Be aware that this interacts with Amazon’s services, and so may incur charges.

This module uses boto3, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

Ensure domain exists:

```
boto_elasticsearch_domain.present:
  - DomainName: mydomain
  - profile='user-credentials'
  - ElasticsearchVersion: "2.3"
  - ElasticsearchClusterConfig:
    InstanceType: "t2.micro.elasticsearch"
    InstanceCount: 1
    DedicatedMasterEnabled: False
    ZoneAwarenessEnabled: False
  - EBSOptions:
    EBSEnabled: True
    VolumeType: "gp2"
    VolumeSize: 10
    Iops: 0
  - AccessPolicies:
    Version: "2012-10-17"
    Statement:
      - Effect: "Allow"
      - Principal:
        AWS: ["*"]
      - Action:
        - "es:*"
```

(continues on next page)
- **Condition**:
  - **IpAddress**:
    - "aws:SourceIp":
      - "127.0.0.1"
      - "127.0.0.2"
- **SnapshotOptions**:
  - **AutomatedSnapshotStartHour**: 0
- **AdvancedOptions**:
  - rest.action.multi.allow_explicit_index": "true"
- **Tags**:
  - a: "b"
  - region: us-east-1
  - keyid: GKTADJGHEIQSXMKKRBJ08H
  - key: askdjghsdfjkgWupUjasdfklksdfajkghs

salt.states.boto_elasticsearch_domain.absent(name, DomainName, region=None, key=None, keyid=None, profile=None)

Ensure domain with passed properties is absent.
- **name** The name of the state definition.
- **DomainName** Name of the domain.
- **region** Region to connect to.
- **key** Secret key to be used.
- **keyid** Access key to be used.
- **profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_elasticsearch_domain.present(name, DomainName, ElasticsearchClusterConfig=None, EBSOptions=None, AccessPolicies=None, SnapshotOptions=None, AdvancedOptions=None, Tags=None, region=None, key=None, keyid=None, profile=None, ElasticsearchVersion='1.5')

Ensure domain exists.
- **name** The name of the state definition
- **DomainName** Name of the domain.
- **ElasticsearchClusterConfig** Configuration options for an Elasticsearch domain. Specifies the instance type and number of instances in the domain cluster.
  - **InstanceType** (string) – The instance type for an Elasticsearch cluster.
  - **InstanceCount** (integer) – The number of instances in the specified domain cluster.
  - **DedicatedMasterEnabled** (boolean) – A boolean value to indicate whether a dedicated master node is enabled. See About Dedicated Master Nodes for more information.
  - **ZoneAwarenessEnabled** (boolean) – A boolean value to indicate whether zone awareness is enabled. See About Zone Awareness for more information.
  - **DedicatedMasterType** (string) – The instance type for a dedicated master node.
  - **DedicatedMasterCount** (integer) – Total number of dedicated master nodes, active and on standby, for the cluster.
- **EBSOptions** Options to enable, disable and specify the type and size of EBS storage volumes.
  - **EBSEnabled** (boolean) – Specifies whether EBS-based storage is enabled.
  - **VolumeType** (string) – Specifies the volume type for EBS-based storage.
VolumeSize (integer) – Integer to specify the size of an EBS volume.

Iops (integer) – Specifies the IOPD for a Provisioned IOPS EBS volume (SSD).

**AccessPolicies** IAM access policy

**SnapshotOptions** Option to set time, in UTC format, of the daily automated snapshot. Default value is 0 hours.

**AutomatedSnapshotStartHour** (integer) – Specifies the time, in UTC format, when the service takes a daily automated snapshot of the specified Elasticsearch domain. Default value is 0 hours.

**AdvancedOptions** Option to allow references to indices in an HTTP request body. Must be false when configuring access to individual sub-resources. By default, the value is true.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**ElasticsearchVersion** String of format X.Y to specify version for the Elasticsearch domain eg. “1.5” or “2.3”.

### 21.19.36 `salt.states.boto_elb`

Manage ELBs

New in version 2014.7.0.

Create and destroy ELBs. Be aware that this interacts with Amazon’s services, and so may incur charges.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit elb credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

```
| elb.keyid: GKTADJGHEIQSXMKKRBJ08H |
| elb.key: askdjghsdfjkgHwupUjadsflkdfklgjsdfjajkghs |
```

It’s also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
| myprofile: |
| keyid: GKTADJGHEIQSXMKKRBJ08H |
| key: askdjghsdfjkgHwupUjadsflkdfklgjsdfjajkghs |
| region: us-east-1 |
```

**Ensure myelb ELB exists:**

```
| boto_elb.present: |
| name: myelb |
| region: us-east-1 |
| availability_zones: |
| - us-east-1a |
| - us-east-1c |
| - us-east-1d |
| keyid: GKTADJGHEIQSXMKKRBJ08H |
| key: askdjghsdfjkgHwupUjadsflkdfklgjsdfjajkghs |
| listeners: |
| - elb_port: 443 |
```

(continues on next page)
instance_port: 80
elb_protocol: HTTPS
instance_protocol: HTTP
certificate: 'arn:aws:iam::111111:server-certificate/mycert'
policies:
- my-ssl-policy
- cookie-policy
- elb_port: 8210
  instance_port: 8210
  elb_protocol: TCP
backends:
- instance_port: 80
  policies:
  - enable-proxy-protocol
health_check:
  target: 'HTTP:80/'
attributes:
cross_zone_load_balancing:
  enabled: true
access_log:
  enabled: true
s3_bucket_name: 'mybucket'
s3_bucket_prefix: 'my-logs'
emit_interval: 5
connecting_settings:
  idle_timeout: 60

- name: mycname.example.com.
  zone: example.com.
  ttl: 60
- name: myothercname.example.com.
  zone: example.com.
security_groups:
- my-security-group
policies:
- policy_name: my-ssl-policy
  policy_type: SSLNegotiationPolicyType
  policy:
    Protocol-TLSv1.2: true
    Protocol-SSLv3: false
    Server-Defined-Cipher-Order: true
    ECDHE-ECDSA-AES128-GCM-SHA256: true
- policy_name: cookie-policy
  policy_type: LBCookieStickinessPolicyType
  policy: {}
  # no policy means this is a session cookie
- policy_name: enable-proxy-protocol
  policy_type: ProxyProtocolPolicyType
  policy:
    ProxyProtocol: true

# Using a profile from pillars
Ensure myelb ELB exists:
  boto_elb.present:
    - name: myelb
    - region: us-east-1
    - profile: myelbprofile
# Passing in a profile

Ensure myelb ELB exists:

```python
to_elb.present:
    - name: myelb
    - region: us-east-1
    - profile:
        keyid: GKTADJGHEIQSXMKKRBJ08H
        key: askdjghsdfjkgWupUjasdflkdfkjsdfsdfjajkghs
```

It's possible to specify attributes from pillars by specifying a pillar. You can override the values defined in the pillard by setting the attributes on the resource. The module will use the default pillar key 'boto_elb_attributes', which allows you to set default attributes for all ELB resources.

Setting the attributes pillar:

```python
my_elb_attributes:
    cross_zone_load_balancing:
        enabled: true
    connection_draining:
        enabled: true
    timeout: 20
    access_log:
        enabled: true
    s3_bucket_name: 'mybucket'
    s3_bucket_prefix: 'my-logs'
    emit_interval: 5
```

Overriding the attribute values on the resource:

```python
Ensure myelb ELB exists:
    boto_elb.present:
        - name: myelb
        - region: us-east-1
        - attributes_from_pillar: my_elb_attributes
        # override cross_zone_load_balancing:enabled
        - attributes:
            cross_zone_load_balancing:
                enabled: false
            - profile: myelbprofile
```

It's possible to specify cloudwatch alarms that will be setup along with the ELB. Note the alarm name will be defined by the name attribute provided, plus the ELB resource name.

```python
Ensure myelb ELB exists:
    boto_elb.present:
        - name: myelb
        - region: us-east-1
        - profile: myelbprofile
        - alarms:
            UnHealthyHostCount:
                name: 'ELB UnHealthyHostCount **MANAGED BY SALT**'
                attributes:
                    metric: UnHealthyHostCount
                    namespace: AWS/ELB
                    statistic: Average
                    comparison: '>='
```

(continues on next page)
threshold: 1.0
period: 600
evaluation_periods: 6
unit: null
description: ELB UnHealthyHostCount
insufficient_data_actions: []
ok_actions: ['arn:aws:sns:us-east-1:12345:myalarm']

You can also use alarms from pillars, and override values from the pillar alarms by setting overrides on the resource. Note that `boto_elb_alarms` will be used as a default value for all resources, if defined and can be used to ensure alarms are always set for a resource.

Setting the alarms in a pillar:

```yaml
my_elb_alarm:
  UnHealthyHostCount:
    name: 'ELB UnHealthyHostCount **MANAGED BY SALT**'
    attributes:
      metric: UnHealthyHostCount
      namespace: AWS/ELB
      statistic: Average
      comparison: '>='
      threshold: 1.0
      period: 600
      evaluation_periods: 6
      unit: null
      description: ELB UnHealthyHostCount
      insufficient_data_actions: []
      ok_actions: ['arn:aws:sns:us-east-1:12345:myalarm']
```

Overriding the alarm values on the resource:

```yaml
Ensure myelb ELB exists:
  boto_elb.present:
    - name: myelb
    - region: us-east-1
    - profile: myelbprofile
    - alarms_from_pillar: my_elb_alarm
      # override UnHealthyHostCount:attributes:threshold
    - alarms:
        UnHealthyHostCount:
          attributes:
            threshold: 2.0
```

Tags can also be set:

New in version 2016.3.0.

```yaml
Ensure myelb ELB exists:
  boto_elb.present:
    - name: myelb
    - region: us-east-1
    - profile: myelbprofile
    - tags:
```

(continues on next page)
MyTag: 'My Tag Value'
OtherTag: 'My Other Value'

salt.states.boto_elb.absent(name, region=None, key=None, keyid=None, profile=None)
Ensure an ELB does not exist
name name of the ELB

salt.states.boto_elb.present(name, listeners, availability_zones=None, subnets=None, subnet_names=None, security_groups=None, scheme='internet-facing', health_check=None, attributes=None, attributes_from_pillar='boto_elb_attributes', cnames=None, alarms=None, alarms_from_pillar='boto_elb_alarms', policies=None, policies_from_pillar='boto_elb_policies', backends=None, region=None, key=None, keyid=None, profile=None, wait_for_sync=True, tags=None, instance_ids=None, instance_names=None)
Ensure the ELB exists.
name Name of the ELB.
availability_zones A list of availability zones for this ELB.
listeners A list of listener lists; example:

```
[ ['443', 'HTTPS', 'arn:aws:iam::111111:server-certificate/mycert'],
  ['8443', '80', 'HTTPS', 'HTTP', 'arn:aws:iam::111111:server-certificate/mycert'])
```
subnets A list of subnet IDs in your VPC to attach to your LoadBalancer.
subnet_names A list of subnet names in your VPC to attach to your LoadBalancer.
security_groups The security groups assigned to your LoadBalancer within your VPC. Must be passed either as a list or a comma-separated string.

For example, a list:

```
- security_groups:
  - secgroup-one
  - secgroup-two
```

Or as a comma-separated string:

```
- security_groups: secgroup-one,secgroup-two
```
scheme The type of a LoadBalancer, internet-facing or internal. Once set, can not be modified.
health_check A dict defining the health check for this ELB.
attributes A dict defining the attributes to set on this ELB. Unknown keys will be silently ignored.

See the salt.modules.boto_elb.set_attributes function for recognized attributes.
attributes_from_pillar name of pillar dict that contains attributes. Attributes defined for this specific state will override those from pillar.
cnames A list of cname dicts with attributes needed for the DNS add_record state. By default the boto_route53.add_record state will be used, which requires: name, zone, ttl, and identifier. See the boto_route53 state for information about these attributes. Other DNS modules can be called by specifying the provider keyword. The cnames dict will be passed to the state as kwargs.

See the salt.states.boto_route53 state for information about these attributes.
alarms: a dictionary of name->boto_cloudwatch_alarm sections to be associated with this ELB. All attributes should be specified except for dimension which will be automatically set to this ELB.
See the `salt.states.boto_cloudwatch_alarm` state for information about these attributes.

- **alarms_from_pillar**: name of pillar dict that contains alarm settings. Alarms defined for this specific state will override those from pillar.
- **region**: Region to connect to.
- **key**: Secret key to be used.
- **keyid**: Access key to be used.
- **profile**: A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
- **wait_for_sync**: Wait for an INSYNC change status from Route53.
- **tags**: dict of tags
- **instance_ids**: list of instance ids. The state will ensure that these, and ONLY these, instances are registered with the ELB. This is additive with instance_names.
- **instance_names**: list of instance names. The state will ensure that these, and ONLY these, instances are registered with the ELB. This is additive with instance_ids.

```python
salt.states.boto_elb.register_instances(name, instances, region=None, key=None, keyid=None, profile=None)
```

Add EC2 instance(s) to an Elastic Load Balancer. Removing an instance from the `instances` list does not remove it from the ELB.

- **name**: The name of the Elastic Load Balancer to add EC2 instances to.
- **instances**: A list of EC2 instance IDs that this Elastic Load Balancer should distribute traffic to. This state will only ever append new instances to the ELB. EC2 instances already associated with this ELB will not be removed if they are not in the `instances` list.

New in version 2015.8.0.

```
add-instances:
  boto_elb.register_instances:
    - name: myloadbalancer
    - instances:
      - instance-id1
      - instance-id2
```

### 21.19.37 `salt.states.boto_elbv2` module

Manage AWS Application Load Balancer

New in version 2017.7.0.

Add and remove targets from an ALB target group.

This module uses boto3, which can be installed via package, or pip.

This module accepts explicit alb credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

```
elbv2.keyid: GKTADJGHEIQSXMKKRBJ08H
elbv2.key: askdjghsdfjkgHUpUjasdfklkdfklgjsdfjajkghs
elbv2.region: us-west-2
```

It’s also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:
myprofile:
keyid: GKTADJGHEIQXSXMKRRJB08H
key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
region: us-east-1

salt.states.boto_elbv2.create_target_group(name, protocol, port, vpc_id, region=None, key=None, keyid=None, profile=None, health_check_protocol='HTTP', health_check_port='traffic-port', health_check_path='/', health_check_interval_seconds=30, health_check_timeout_seconds=5, healthy_threshold_count=5, unhealthy_threshold_count=2, **kwargs)

New in version 2017.11.0.

Create target group if not present.

name (string) - The name of the target group.
protocol (string) - The protocol to use for routing traffic to the targets
port (int) - The port on which the targets receive traffic. This port is used unless you specify a port override when registering the traffic.
vpc_id (string) - The identifier of the virtual private cloud (VPC).
health_check_protocol (string) - The protocol the load balancer uses when performing health check on targets. The default is the HTTP protocol.
health_check_port (string) - The port the load balancer uses when performing health checks on targets. The default is 'traffic-port', which indicates the port on which each target receives traffic from the load balancer.
health_check_path (string) - The ping path that is the destination on the targets for health checks. The default is '/'.
health_check_interval_seconds (integer) - The approximate amount of time, in seconds, between health checks of an individual target. The default is 30 seconds.
health_check_timeout_seconds (integer) - The amount of time, in seconds, during which no response from a target means a failed health check. The default is 5 seconds.
healthy_threshold_count (integer) - The number of consecutive health checks successes required before considering an unhealthy target healthy. The default is 5.
unhealthy_threshold_count (integer) - The number of consecutive health check failures required before considering a target unhealthy. The default is 2.
returns (bool) - True on success, False on failure.

CLI example: .. code-block:: yaml
   create-target:
       boto_elb2.create_target_group:
           name: myALB
           protocol: https
           port: 443
           vpc_id: myVPC

salt.states.boto_elbv2.delete_target_group(name, region=None, key=None, keyid=None, profile=None)

Delete target group.

name (string) - The Amazon Resource Name (ARN) of the resource.
returns (bool) - True on success, False on failure.

CLI example:
   check-target:
       boto_elb2.delete_target_group:
salt.states.boto_elbv2.targets_deregistered(name, targets, region=None, key=None, keyid=None, profile=None, **kwargs)

Remove targets to an Application Load Balancer target group.

name  The ARN of the Application Load Balancer Target Group to remove targets from.

targets  A list of target IDs or a string of a single target registered to the target group to be removed

New in version Unknown.

```python
add-targets:
boto_elb.targets_registered:
  - name: arn:myloadbalancer
  - targets:
    - instance-id1
    - instance-id2
```

salt.states.boto_elbv2.targets_registered(name, targets, region=None, key=None, keyid=None, profile=None, **kwargs)

Add targets to an Application Load Balancer target group. This state will not remove targets.

name  The ARN of the Application Load Balancer Target Group to add targets to.

targets  A list of target IDs or a string of a single target that this target group should distribute traffic to.

```python
delete-user:
boto_iam.user_absent:
  - name: myuser
  - delete_keys: true
```

21.19.38  salt.states.boto_iam

Manage IAM objects

New in version 2015.8.0.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit IAM credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

It’s also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config.
**delete-keys:**

```
boto_iam.keys_absent:
  - access_keys:
    - 'AKIAJHTMQ2ASDFLASDF'
    - 'PQIAJHTMQ2ASRLASFR'
    - user_name: myuser
```

**create-user:**

```
boto_iam.user_present:
  - name: myuser
  - policies:
    mypolicy: |
    {
      "Version": "2012-10-17",
      "Statement": [{
        "Effect": "Allow",
        "Action": "*",
        "Resource": "*"}]
    } |
  - password: NewPassword$$1
  - region: eu-west-1
  - keyid: 'AKIAJHTMQ2ASDFLASDF'
  - key: 'fdkjsafkljsASSADFalkfjasdf'
```

**create-group:**

```
boto_iam.group_present:
  - name: mygroup
  - users:
    - myuser
    - myuser1
  - policies:
    mypolicy: |
    {
      "Version": "2012-10-17",
      "Statement": [{
        "Effect": "Allow",
        "Action": "*",
        "Resource": "*"}]
    }
  - region: eu-west-1
  - keyid: 'AKIAJHTMQ2ASDFLASDF'
  - key: 'safsdfsalsdfkjsafkljsASSADFalkfjasdf'
```

**change-policy:**

```
boto_iam.account_policy:
  - change_password: True
  - region: eu-west-1
  - keyid: 'AKIAJHTMQ2ASDFLASDF'
  - key: 'safsdfsalsdfkjsafkljsASSADFalkfjasdf'
```

**create_server_certificate:**

```
boto_iam.server_cert_present:
  - name: mycert
  - public_key: salt://base/mycert.crt
  - private_key: salt://base/mycert.key
  - cert_chain: salt://base/mycert_chain.crt
```

(continues on next page)
- **region**: eu-west-1
- **keyid**: 'AKIAJHTMIQ2ASDFLASDF'
- **key**: 'fdkjsafkljsASSADFalkfjasdf'

**delete server certificate:**
```
boto_iam.server_cert_absent:
  - name: mycert
```

**create keys for user:**
```
boto_iam.keys_present:
  - name: myusername
  - number: 2
  - save_dir: /root
  - region: eu-west-1
  - keyid: 'AKIAJHTMIQ2ASDFLASDF'
  - key: 'fdkjsafkljsASSADFalkfjasdf'
```

**create policy:**
```
boto_iam.policy_present:
  - name: myname
  - region: eu-west-1
  - keyid: 'AKIAJHTMIQ2ASDFLASDF'
  - key: 'fdkjsafkljsASSADFalkfjasdf'
```

**add-saml-provider:**
```
boto_iam.saml_provider_present:
  - name: my_saml_provider
  - saml_metadata_document: salt://base/files/provider.xml
  - keyid: 'AKIAJHTMIQ2ASDFLASDF'
  - key: 'safsdfsadl;fdkjsafkljsASSADFalkfj'
```

salt.states.boto_iam.account_policy(
  name=None,
  allow_users_to_change_password=None,
  hard_expiry=None,
  max_password_age=None,
  minimum_password_length=None,
  password_reuse_prevention=None,
  require_lowercase_characters=None,
  require_numbers=None,
  require_symbols=None,
  require_uppercase_characters=None,
  region=None,
  key=None,
  keyid=None,
  profile=None)

Change account policy.

New in version 2015.8.0.

- **name (string)**: The name of the account policy
- **allow_users_to_change_password (bool)**: Allows all IAM users in your account to use the AWS Management Console to change their own passwords.
- **hard_expiry (bool)**: Prevents IAM users from setting a new password after their password has expired.
- **max_password_age (int)**: The number of days that an IAM user password is valid.
- **minimum_password_length (int)**: The minimum number of characters allowed in an IAM user password.
- **password_reuse_prevention (int)**: Specifies the number of previous passwords that IAM users are prevented from reusing.
- **require_lowercase_characters (bool)**: Specifies whether IAM user passwords must contain at least one lowercase character from the ISO basic Latin alphabet (a to z).
require_numbers (bool) Specifies whether IAM user passwords must contain at least one numeric character (0 to 9).
require_symbols (bool) Specifies whether IAM user passwords must contain at least one of the following non-alphanumeric characters: ! @ # $ % ^ & * ( ) _ + - = [ ] { } | '
require_uppercase_characters (bool) Specifies whether IAM user passwords must contain at least one uppercase character from the ISO basic Latin alphabet (A to Z).
region (string) Region to connect to.
key (string) Secret key to be used.
keyid (string) Access key to be used.
profile (dict) A dict with region, key and keyid, or a pillar key (string)
salt.states.boto_iam.group_absent(name, region=None, key=None, keyid=None, profile=None)
New in version 2015.8.0.
Ensure the IAM group is absent.
name (string) The name of the group.
region (string) Region to connect to.
key (string) Secret key to be used.
keyid (string) Access key to be used.
profile (dict) A dict with region, key and keyid, or a pillar key (string)
salt.states.boto_iam.group_present(name, policies=None, policies_from_pillars=None, managed_policies=None, users=None, path='/', region=None, key=None, keyid=None, profile=None, delete_policies=True)
New in version 2015.8.0.
Ensure the IAM group is present
name (string) The name of the new group.
path (string) The path for the group, defaults to '/'
policies (dict) A dict of IAM group policy documents.
policies_from_pillars (list) A list of pillars that contain role policy dicts. Policies in the pillars will be merged in the order defined in the list and key conflicts will be handled by later defined keys overriding earlier defined keys. The policies defined here will be merged with the policies defined in the policies argument. If keys conflict, the keys in the policies argument will override the keys defined in policies_from_pillars.
managed_policies (list) A list of policy names or ARNs that should be attached to this group.
users (list) A list of users to be added to the group.
region (string) Region to connect to.
key (string) Secret key to be used.
keyid (string) Access key to be used.
profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
delete_policies (boolean) Delete or detach existing policies that are not in the given list of policies. Default value is True. If False is specified, existing policies will not be deleted or detached allowing manual modifications on the IAM group to be persistent.
salt.states.boto_iam.keys_absent(access_keys, user_name, region=None, key=None, keyid=None, profile=None)
New in version 2015.8.0.
Ensure the IAM user access_key_id is absent.
access_key_id (list) A list of access key ids
user_name (string) The username of the user
region (string) Region to connect to.
key (string) Secret key to be used.
keyid (string) Access key to be used.
profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_iam.keys_present(name, number, save_dir, region=None, key=None, keyid=None, profile=None, save_format='{2}\n{0}\n{3}\n{1}\n')

New in version 2015.8.0.

Ensure the IAM access keys are present.
name (string) The name of the new user.
number (int) Number of keys that user should have.
save_dir (string) The directory that the key/keys will be saved. Keys are saved to a file named according to the username provided.
region (string) Region to connect to.
key (string) Secret key to be used.
keyid (string) Access key to be used.
profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
save_format (dict) Save format is repeated for each key. Default format is '{2}\n{0}\n{3}\n{1}\n', where {0} and {1} are placeholders for new key_id and key respectively, whereas {2} and {3} are 'key_id-{number}' and 'key-{number}' strings kept for compatibility.

salt.states.boto_iam.policy_absent(name, region=None, key=None, keyid=None, profile=None)

New in version 2015.8.0.

Ensure the IAM managed policy with the specified name is absent.
name (string) The name of the new policy.
region (string) Region to connect to.
key (string) Secret key to be used.
keyid (string) Access key to be used.
profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_iam.policy_present(name, policy_document, path=None, description=None, region=None, key=None, keyid=None, profile=None)

New in version 2015.8.0.

Ensure the IAM managed policy is present.
name (string) The name of the new policy.
policy_document (dict) The document of the new policy.
path (string) The path in which the policy will be created. Default is '/'.
description (string) Description
region (string) Region to connect to.
key (string) Secret key to be used.
keyid (string) Access key to be used.
profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_iam.saml_provider_absent(name, region=None, key=None, keyid=None, profile=None)

New in version 2016.11.0.

Ensure the SAML provider with the specified name is absent.
name (string) The name of the SAML provider.
saml_metadata_document (string) The xml document of the SAML provider.
region (string) Region to connect to.
key (string) Secret key to be used.
keyid (string) Access key to be used.
profile (dict)  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_iam.saml_provider_present(name, saml_metadata_document, region=None, key=None, keyid=None, profile=None)

New in version 2016.11.0.

Ensure the SAML provider with the specified name is present.
name (string)  The name of the SAML provider.
saml_metadata_document (string)  The xml document of the SAML provider.
region (string)  Region to connect to.
key (string)  Secret key to be used.
keyid (string)  Access key to be used.
profile (dict)  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_iam.server_cert_absent(name, region=None, key=None, keyid=None, profile=None)

Deletes a server certificate.
New in version 2015.8.0.
name (string)  The name for the server certificate. Do not include the path in this value.
region (string)  The name of the region to connect to.
key (string)  The key to be used in order to connect
keyid (string)  The keyid to be used in order to connect
profile (string)  The profile that contains a dict of region, key, keyid

salt.states.boto_iam.server_cert_present(name, public_key, private_key, cert_chain=None, path=None, region=None, key=None, keyid=None, profile=None)

Creates server certificate.
New in version 2015.8.0.
name (string)  The name for the server certificate. Do not include the path in this value.
public_key (string)  The contents of the public key certificate in PEM-encoded format.
private_key (string)  The contents of the private key in PEM-encoded format.
cert_chain (string)  The contents of the certificate chain. This is typically a concatenation of the PEM-encoded public key certificates of the chain.
path (string)  The path for the server certificate.
region (string)  The name of the region to connect to.
key (string)  The key to be used in order to connect
keyid (string)  The keyid to be used in order to connect
profile (string)  The profile that contains a dict of region, key, keyid

salt.states.boto_iam.user_absent(name, delete_keys=True, delete_mfa_devices=True, delete_profile=True, region=None, key=None, keyid=None, profile=None)

New in version 2015.8.0.

Ensure the IAM user is absent. User cannot be deleted if it has keys.
name (string)  The name of the new user.
delete_keys (bool)  Delete all keys from user.
delete_mfa_devices (bool)  Delete all mfa devices from user.
New in version 2016.3.0.
delete_profile (bool)  Delete profile from user.
New in version 2016.3.0.
region (string)  Region to connect to.
key (string)  Secret key to be used.
keyid (string)  Access key to be used.
profile (dict)  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```python
salt.states.boto_iam.user_present(name, policies=None, policies_from_pillars=None, managed_policies=None, password=None, path=None, region=None, key=None, keyid=None, profile=None)
```

New in version 2015.8.0.

Ensure the IAM user is present

name (string)  The name of the new user.
policies (dict)  A dict of IAM group policy documents.
policies_from_pillars (list)  A list of pillars that contain role policy dicts. Policies in the pillars will be merged in the order defined in the list and key conflicts will be handled by later defined keys overriding earlier defined keys. The policies defined here will be merged with the policies defined in the policies argument.

If keys conflict, the keys in the policies argument will override the keys defined in policies_from_pillars.
managed_policies (list)  A list of managed policy names or ARNs that should be attached to this user.
password (string)  The password for the new user. Must comply with account policy.
path (string)  The path of the user. Default is ‘/’.

New in version 2015.8.2.
region (string)  Region to connect to.
key (string)  Secret key to be used.
keyid (string)  Access key to be used.
profile (dict)  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.39  salt.states.boto_iam_role

Manage IAM roles

New in version 2014.7.0.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit IAM credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

```
iam.keyid: GKTADJGHEIQSXMKKRBJ08H
iam.key: askdjghsdfjkghWupUjasdflkdkflgjsdfjajkghs
```

It’s also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askjghsdfjkghWupUjasdflkdkflgjsdfjajkghs
  region: us-east-1
```

Creating a role will automatically create an instance profile and associate it with the role. This is the default behavior of the AWS console.
```yaml
myrole:
  boto_iam_role.present:
    - region: us-east-1
    - key: GKTADJGHEIQSXMKKRBJ08H
    - keyid: askdjghsdfjkgshWupUjasdfklkdfklgjsdfjajkghs
    - policies_from_pillars:
      - shared_iam_bootstrap_policy
    - policies:
      MySQSPolicy:
        Statement:
          - Action:
            - sqs:*
          Effect: Allow
          Resource:
            - arn:aws:sqs:*::*
          Sid: MyPolicySQS1
      MyS3Policy:
        Statement:
          - Action:
            - s3:GetObject
          Effect: Allow
          Resource:
            - arn:aws:s3:*::*:mybucket/*

# Using a credentials profile from pillars
myrole:
  boto_iam_role.present:
    - profile: myiamprofile

# Passing in a credentials profile
myrole:
  boto_iam_role.present:
    - profile:
        key: GKTADJGHEIQSXMKKRBJ08H
        keyid: askdjghsdfjkgshWupUjasdfklkdfklgjsdfjajkghs
        region: us-east-1
```

If delete_policies: False is specified, existing policies that are not in the given list of policies will not be deleted. This allows manual modifications on the IAM role to be persistent. This functionality was added in 2015.8.0.

**Note:** When using the profile parameter and region is set outside of the profile group, region is ignored and a default region will be used.

If region is missing from the profile data set, us-east-1 will be used as the default region.

### salt.states.boto_iam_role.absent(name, region=None, key=None, keyid=None, profile=None)

Ensure the IAM role is deleted.

- **name** Name of the IAM role.
- **region** Region to connect to.
- **key** Secret key to be used.
- **keyid** Access key to be used.
- **profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
salt.states.boto_iam_role.present(name, policy_document=None, policy_document_from_pillars=None, policies=None, policies_from_pillars=None, managed_policies=None, create_instance_profile=True, region=None, key=None, keyid=None, profile=None, delete_policies=True)

Ensure the IAM role exists.

name Name of the IAM role.
policy_document The policy that grants an entity permission to assume the role. (See https://boto.readthedocs.io/en/latest/ref/iam.html#boto.iam.connection.IAMConnection.create_role)
policy_document_from_pillars A pillar key that contains a role policy document. The statements defined here will be appended with the policy document statements defined in the policy_document argument. New in version 2017.7.0.
path The path to the role/instance profile. (See https://boto.readthedocs.io/en/latest/ref/iam.html#boto.iam.connection.IAMConnection.create_role)
policies A dict of IAM role policies.
policies_from_pillars A list of pillars that contain role policy dicts. Policies in the pillars will be merged in the order defined in the list and key conflicts will be handled by later defined keys overriding earlier defined keys. The policies defined here will be merged with the policies defined in the policies argument. If keys conflict, the keys in the policies argument will override the keys defined in policies_from_pillars.
managed_policies A list of (AWS or Customer) managed policies to be attached to the role.
create_instance_profile A boolean of whether or not to create an instance profile and associate it with this role.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
delete_policies Deletes existing policies that are not in the given list of policies. Default value is True. If False is specified, existing policies will not be deleted allowing manual modifications on the IAM role to be persistent. New in version 2015.8.0.

21.19.40  salt.states.boto_iot module

Manage IoT Objects

New in version 2016.3.0.

Create and destroy IoT objects. Be aware that this interacts with Amazon’s services, and so may incur charges.

depends
  - boto
  - boto3

The dependencies listed above can be installed via package or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:
It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```yaml
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

**Ensure policy exists:**

```yaml
boto_iot.policy_present:
  - policyName: mypolicy
  - policyDocument:
    Version: "2012-10-17"
    Statement:
      - Action: iot:Publish
      - Resource: "*
    Effect: "Allow"
  region: us-east-1
  - keyid: GKTADJGHEIQSXMKKRBJ08H
  - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

**Ensure topic rule exists:**

```yaml
boto_iot.topic_rule_present:
  - ruleName: myrule
  - sql: "SELECT * FROM 'iot/test'"
  - description: 'test rule'
  - ruleDisabled: false
  - actions:
    - lambda:
      functionArn: "arn:aws:us-east-1:1234:function/functionname"
  region: us-east-1
  - keyid: GKTADJGHEIQSXMKKRBJ08H
  - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

### salt.states.boto_iot.policy_absent

Ensure policy with passed properties is absent.

- **name** The name of the state definition.
- **policyName** Name of the policy.
- **region** Region to connect to.
- **key** Secret key to be used.
- **keyid** Access key to be used.
- **profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### salt.states.boto_iot.policy_attached

Ensure policy is attached to the given principal.

- **name** The name of the state definition
- **policyName** Name of the policy.
- **principal** The principal which can be a certificate ARN or a Cognito ID.
- **region** Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_iot.policy_detached(name, policyName, principal, region=None, key=None, keyid=None, profile=None)

Ensure policy is attached to the given principal.

name  The name of the state definition.
policyName  Name of the policy.
principal  The principal which can be a certificate ARN or a Cognito ID.
region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_iot.policy_present(name, policyName, policyDocument, region=None, key=None, keyid=None, profile=None)

Ensure policy exists.

name  The name of the state definition.
policyName  Name of the policy.
policyDocument  The JSON document that describes the policy. The length of the policyDocument must be a minimum length of 1, with a maximum length of 2048, excluding whitespace.
region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_iot.thing_type_absent(name, thingTypeName, region=None, key=None, keyid=None, profile=None)

Ensure thing type with passed properties is absent.

New in version 2016.11.0.

name  The name of the state definition.
thingTypeName  Name of the thing type.
region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_iot.thing_type_present(name, thingTypeName, thingTypeDescription, searchableAttributesList, region=None, key=None, keyid=None, profile=None)

Ensure thing type exists.

New in version 2016.11.0.

name  The name of the state definition.
thingTypeName  Name of the thing type.
thingTypeDescription  Description of the thing type.
searchableAttributesList  List of string attributes that are searchable for the thing type.
region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key, keyid, or a pillar key (string) that contains a dict with region, key, and keyid.
salt.states.boto_iot.topic_rule_absent(name, ruleName, region=None, key=None, keyid=None, profile=None)

Ensure topic rule with passed properties is absent.

- **name** The name of the state definition.
- **ruleName** Name of the policy.
- **region** Region to connect to.
- **key** Secret key to be used.
- **keyid** Access key to be used.
- **profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_iot.topic_rule_present(name, ruleName, sql, actions, description="", ruleDisabled=False, region=None, key=None, keyid=None, profile=None)

Ensure topic rule exists.

- **name** The name of the state definition
- **ruleName** Name of the rule.
- **sql** The SQL statement used to query the topic.
- **actions** The actions associated with the rule.
- **description** The description of the rule.
- **ruleDisabled** Specifies whether the rule is disabled.
- **region** Region to connect to.
- **key** Secret key to be used.
- **keyid** Access key to be used.
- **profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.41 salt.states.boto_kinesis module

Manage Kinesis Streams

New in version 2017.7.0.

Create and destroy Kinesis streams. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses boto3, which can be installed via package, or pip.

This module accepts explicit Kinesis credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

```
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdflkdfklgjhsdkfajkghs
region: us-east-1
```

It’s also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjhsdkfajkghs
  region: us-east-1
```
Ensure Kinesis stream does not exist:
boto_kinesis.absent:
  - name: new_stream
  - keyid: GKTADJGHEIQXSXMKRRBJ08H
  - key: askdjghsdfjkgWupUjasdfklgjsdfjajkghs
  - region: us-east-1

Ensure Kinesis stream exists:
boto_kinesis.present:
  - name: new_stream
  - retention_hours: 168
  - enhanced_monitoring: ['ALL']
  - num_shards: 2
  - keyid: GKTADJGHEIQXSXMKRRBJ08H
  - key: askdjghsdfjkgWupUjasdfklgjsdfjajkghs
  - region: us-east-1

salt.states.boto_kinesis.absent(name, region=None, key=None, keyid=None, profile=None)
Delete the kinesis stream, if it exists.
  name (string) Stream name
  region (string) Region to connect to.
  key (string) Secret key to be used.
  keyid (string) Access key to be used.
  profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_kinesis.present(name, retention_hours=None, enhanced_monitoring=None, num_shards=None, do_reshard=True, region=None, key=None, keyid=None, profile=None)
Ensure the kinesis stream is properly configured and scaled.
  name (string) Stream name
  retention_hours (int) Retain data for this many hours. AWS allows minimum 24 hours, maximum 168 hours.
  enhanced_monitoring (list of string) Turn on enhanced monitoring for the specified shard-level metrics.
    Pass in ['ALL'] or True for all metrics, [] or False for no metrics. Turn on individual metrics by passing in a list: ['IncomingBytes', 'OutgoingBytes'] Note that if only some metrics are supplied, the remaining metrics will be turned off.
  num_shards (int) Reshard stream (if necessary) to this number of shards !!! Resharding is expensive! Each split or merge can take up to 30 seconds, and the reshard method balances the partition space evenly. Resharding from N to N+1 can require 2N operations. Resharding is much faster with powers of 2 (e.g. 2^N to 2^(N+1) !!!)
  do_reshard (boolean) If set to False, this script will NEVER reshard the stream, regardless of other input.
    Useful for testing.
  region (string) Region to connect to.
  key (string) Secret key to be used.
  keyid (string) Access key to be used.
  profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.42 salt.states.boto_kms
Manage KMS keys, key policies and grants.
New in version 2015.8.0.
Be aware that this interacts with Amazon’s services, and so may incur charges.
This module uses boto, which can be installed via package, or pip.

This module accepts explicit kms credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

```yaml
elb.keyid: GKTADJGHEIQSXMKKRBJ08H
elb.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It’s also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```yaml
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

```yaml
Ensure mykey key exists:
    boto_kms.key_present:
        - name: mykey
        - region: us-east-1
```

```yaml
# Using a profile from pillars
Ensure mykey key exists:
    boto_kms.key_present:
        - name: mykey
        - region: us-east-1
        - profile: myprofile

# Passing in a profile
Ensure mykey key exists:
    boto_key.key_present:
        - name: mykey
        - region: us-east-1
        - profile:
            keyid: GKTADJGHEIQSXMKKRBJ08H
            key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

salt.states.boto_kms.key_present(name, policy, description=None, key_usage=None, grants=None, manage_grants=False, key_rotation=False, enabled=True, region=None, key=None, keyid=None, profile=None)

Ensure the KMS key exists. KMS keys can not be deleted, so this function must be used to ensure the key is enabled or disabled.

- **name**: Name of the key.
- **policy**: Key usage policy.
- **description**: Description of the key.
- **key_usage**: Specifies the intended use of the key. Can only be set on creation, defaults to ENCRYPT_DECRYPT, which is also the only supported option.
- **grants**: A list of grants to apply to the key. Not currently implemented.
- **manage_grants**: Whether or not to manage grants. False by default, which will not manage any grants.
- **key_rotation**: Whether or not key rotation is enabled for the key. False by default.
- **enabled**: Whether or not the key is enabled. True by default.
- **region**: Region to connect to.
- **key**: Secret key to be used.
**keyid**  Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 21.19.43 salt.states.boto_lambda module

**Manage Lambda Functions**

New in version 2016.3.0.

Create and destroy Lambda Functions. Be aware that this interacts with Amazon’s services, and so may incur charges.

**depends**

- boto
- boto3

The dependencies listed above can be installed via package or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](https://aws.amazon.com/documentation/iam/).

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

```
<table>
<thead>
<tr>
<th>vpc.keyid</th>
<th>GKTADJGHEIQXSXMKRBVJ08H</th>
</tr>
</thead>
<tbody>
<tr>
<td>vpc.key</td>
<td>askdjghsdfjkgwupujasdlfdksjflgjsdfjajkghs</td>
</tr>
</tbody>
</table>
```

It’s also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
<table>
<thead>
<tr>
<th>myprofile</th>
</tr>
</thead>
<tbody>
<tr>
<td>keyid: GKTADJGHEIQXSXMKRBVJ08H</td>
</tr>
<tr>
<td>key: askdjghsdfjkgwupujasdlfdksjflgjsdfjajkghs</td>
</tr>
<tr>
<td>region: us-east-1</td>
</tr>
</tbody>
</table>
```

**Ensure function exists:**

```
<table>
<thead>
<tr>
<th>boto_lambda.function_present:</th>
</tr>
</thead>
<tbody>
<tr>
<td>- FunctionName: myfunction</td>
</tr>
<tr>
<td>- Runtime: python2.7</td>
</tr>
<tr>
<td>- Role: iam_role_name</td>
</tr>
<tr>
<td>- Handler: entry_function</td>
</tr>
<tr>
<td>- ZipFile: code.zip</td>
</tr>
<tr>
<td>- S3Bucket: bucketname</td>
</tr>
<tr>
<td>- S3Key: keyname</td>
</tr>
<tr>
<td>- S3ObjectVersion: version</td>
</tr>
<tr>
<td>- Description: &quot;My Lambda Function&quot;</td>
</tr>
<tr>
<td>- Timeout: 3</td>
</tr>
<tr>
<td>- MemorySize: 128</td>
</tr>
<tr>
<td>- region: us-east-1</td>
</tr>
<tr>
<td>- keyid: GKTADJGHEIQXSXMKRBVJ08H</td>
</tr>
<tr>
<td>- key: askdjghsdfjkgwupujasdlfdksjflgjsdfjajkghs</td>
</tr>
</tbody>
</table>
```

**salt.states.boto_lambda.alias_absent**(name, FunctionName, Name, region=None, key=None, keyid=None, profile=None)

Ensure alias with passed properties is absent.

**name**  The name of the state definition.
FunctionName  Name of the function.
Name  Name of the alias.
region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**salt.states.boto_lambda.alias_present** *(name, FunctionName, Name, FunctionVersion, Description=", region=None, key=None, keyid=None, profile=None)*

Ensure alias exists.

name  The name of the state definition.
FunctionName  Name of the function for which you want to create an alias.
Name  The name of the alias to be created.
FunctionVersion  Function version for which you are creating the alias.
Description  A short, user-defined function description. Lambda does not use this value. Assign a meaningful description as you see fit.
region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**salt.states.boto_lambda.event_source_mapping_absent** *(name, EventSourceArn, FunctionName, region=None, key=None, keyid=None, profile=None)*

Ensure event source mapping with passed properties is absent.

name  The name of the state definition.
EventSourceArn  ARN of the event source.
FunctionName  Name of the lambda function.
region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**salt.states.boto_lambda.event_source_mapping_present** *(name, EventSourceArn, FunctionName, StartingPosition, Enabled=True, BatchSize=100, region=None, key=None, keyid=None, profile=None)*

Ensure event source mapping exists.

name  The name of the state definition.
EventSourceArn  The Amazon Resource Name (ARN) of the Amazon Kinesis or the Amazon DynamoDB stream that is the event source.
FunctionName  The Lambda function to invoke when AWS Lambda detects an event on the stream.

You can specify an unqualified function name (for example, "Thumbnail") or you can specify Amazon Resource Name (ARN) of the function (for example, "arn:aws:lambda:us-west-2:account-id:function:Thumbnail"). AWS Lambda also allows you to specify only the account ID qualifier (for example, "account-id:Thumbnail"). Note that the length constraint applies only to the ARN. If you specify only the function name, it is limited to 64 character in length.

StartingPosition  The position in the stream where AWS Lambda should start reading. (TRIM_HORIZON | LATEST)

Enabled  Indicates whether AWS Lambda should begin polling the event source. By default, Enabled is true.
BatchSize  The largest number of records that AWS Lambda will retrieve from your event source at the time of invoking your function. Your function receives an event with all the retrieved records. The default is 100 records.

region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_lambda.function_absent(name, FunctionName, region=None, key=None, keyid=None, profile=None)

Ensure function with passed properties is absent.
name  The name of the state definition.
FunctionName  Name of the function.
region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_lambda.function_present(name, FunctionName, Runtime, Role, Handler, ZipFile=None, S3Bucket=None, S3Key=None, S3ObjectVersion=None, Description="", Timeout=3, MemorySize=128, Permissions=None, RoleRetries=5, region=None, key=None, keyid=None, profile=None, VpcConfig=None, Environment=None)

Ensure function exists.
name  The name of the state definition
FunctionName  Name of the Function.
Runtime  The Runtime environment for the function. One of 'nodejs', 'java8', or 'python2.7'
Role  The name or ARN of the IAM role that the function assumes when it executes your function to access any other AWS resources.
Handler  The function within your code that Lambda calls to begin execution. For Node.js it is the module-name.*export* value in your function. For Java, it can be package.classname::handler or package.classname.
ZipFile  A path to a .zip file containing your deployment package. If this is specified, S3Bucket and S3Key must not be specified.
S3Bucket  Amazon S3 bucket name where the .zip file containing your package is stored. If this is specified, S3Key must be specified and ZipFile must NOT be specified.
S3Key  The Amazon S3 object (the deployment package) key name you want to upload. If this is specified, S3Key must be specified and ZipFile must NOT be specified.
S3ObjectVersion  The version of S3 object to use. Optional, should only be specified if S3Bucket and S3Key are specified.
Description  A short, user-defined function description. Lambda does not use this value. Assign a meaningful description as you see fit.
Timeout  The function execution time at which Lambda should terminate this function. Because the execution time has cost implications, we recommend you set this value based on your expected execution time. The default is 3 seconds.
MemorySize  The amount of memory, in MB, your function is given. Lambda uses this memory size to infer the amount of CPU and memory allocated to your function. Your function use-case determines your CPU and memory requirements. For example, a database operation might need less memory compared to an image processing function. The default value is 128 MB. The value must be a multiple of 64 MB.
VpcConfig  If your Lambda function accesses resources in a VPC, you must provide this parameter identifying the list of security group IDs/Names and subnet IDs/Name. These must all belong to the same VPC. This is a dict of the form:
VpcConfig:
  SecurityGroupNames:
    - mysecgroup1
    - mysecgroup2
  SecurityGroupIds:
    - sg-abcdef1234
  SubnetNames:
    - mysubnet1
  SubnetIds:
    - subnet-1234abcd
    - subnet-abcd1234

If VpcConfig is provided at all, you MUST pass at least one security group and one subnet.

Permissions  A list of permission definitions to be added to the function’s policy
RoleRetries  IAM Roles may take some time to propagate to all regions once created. During that time function
creation may fail; this state will automatically retry this number of times. The default is 5.
Environment  The parent object that contains your environment’s configuration settings. This is a dictionary
of the form:

```python
{
  'Variables': {
    'VariableName': 'VariableValue'
  }
}
```

New in version 2017.7.0.

region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and
         keyid.

21.19.44  salt.states.boto_lc

Manage Launch Configurations

New in version 2014.7.0.

Create and destroy Launch Configurations. Be aware that this interacts with Amazon’s services, and so may incur
charges.

A limitation of this module is that you can not modify launch configurations once they have been created. If a
launch configuration with the specified name exists, this module will always report success, even if the specified
configuration doesn’t match. This is due to a limitation in Amazon’s launch configuration API, as it only allows
launch configurations to be created and deleted.

Also note that a launch configuration that’s in use by an autoscale group can not be deleted until the autoscale group
is no longer using it. This may affect the way in which you want to order your states.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit autoscale credentials but can also utilize IAM roles assigned to the instance through
Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration
is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:
It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

Credential information is shared with autoscale groups as launch configurations and autoscale groups are completely dependent on each other.

```
Ensure mylc exists:
  boto_lc.present:
    - name: mylc
    - image_id: ami-0b9c9f62
    - key_name: mykey
    - security_groups:
      - mygroup
    - instance_type: m1.small
    - instance_monitoring: true
    - block_device_mappings:
      - '/dev/sda1':
        size: 20
        volume_type: 'io1'
        iops: 220
        delete_on_termination: true
    - cloud_init:
      bootooks:
        'disable-master.sh': |
        #!/bin/bash
        echo "manual" > /etc/init/salt-master.override
      scripts:
        'run_salt.sh': |
        #!/bin/bash
        add-apt-repository -y ppa:saltstack/salt
        apt-get update
        apt-get install -y salt-minion
        salt-call state.highstate
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

# Using a profile from pillars.
```
Ensure mylc exists:
  boto_lc.present:
    - name: mylc
    - image_id: ami-0b9c9f62
    - profile: myprofile
```

# Passing in a profile.
```
Ensure mylc exists:
  boto_lc.present:
    - name: mylc
```

(continues on next page)
- **image_id**: ami-0b9c9f62
- **profile**:
  - **keyid**: GKTADJGHEIQSXMKKRBJ08H
  - **key**: askdjghsdfjkgHUpUjasdflckfklgjsdflajkghs
  - **region**: us-east-1

salt.states.boto_lc.absent(name, region=None, key=None, keyid=None, profile=None)

Ensure the named launch configuration is deleted.

- **name**: Name of the launch configuration.
- **region**: The region to connect to.
- **key**: Access key to be used.
- **keyid**: Secret key to be used.
- **profile**: A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_lc.present(name, image_id, key_name=None, vpc_id=None, vpc_name=None, security_groups=None, user_data=None, cloud_init=None, instance_type='m1.small', kernel_id=None, ramdisk_id=None, block_device_mappings=None, delete_on_termination=None, instance_monitoring=False, spot_price=None, instance_profile_name=None, ebs_optimized=False, associate_public_ip_address=None, region=None, key=None, keyid=None, profile=None)

Ensure the launch configuration exists.

- **name**: Name of the launch configuration.
- **image_id**: AMI to use for instances. AMI must exist or creation of the launch configuration will fail.
- **key_name**: Name of the EC2 key pair to use for instances. Key must exist or creation of the launch configuration will fail.
- **vpc_id**: The VPC ID where the security groups are defined. Only necessary when using named security groups that exist outside of the default VPC. Mutually exclusive with vpc_name.
- **vpc_name**: Name of the VPC where the security groups are defined. Only necessary when using named security groups that exist outside of the default VPC. Mutually exclusive with vpc_id.
- **security_groups**: List of Names or security group id’s of the security groups with which to associate the EC2 instances or VPC instances, respectively. Security groups must exist, or creation of the launch configuration will fail.
- **user_data**: The user data available to launched EC2 instances.
- **cloud_init**: A dict of cloud_init configuration. Currently supported keys: boothooks, scripts and cloud-config. Mutually exclusive with user_data.
- **instance_type**: The instance type. ex: m1.small.
- **kernel_id**: The kernel id for the instance.
- **ramdisk_id**: The RAM disk ID for the instance.
- **block_device_mappings**: A dict of block device mappings that contains a dict with volume_type, delete_on_termination, iops, size, encrypted, snapshot_id.
  - **volume_type**: Indicates what volume type to use. Valid values are standard, io1, gp2. Default is standard.
  - **delete_on_termination**: Whether the volume should be explicitly marked for deletion when its instance is terminated (True), or left around (False). If not provided, or None is explicitly passed, the default AWS behaviour is used, which is True for ROOT volumes of instances, and False for all others.
  - **iops**: For Provisioned IOPS (SSD) volumes only. The number of I/O operations per second (IOPS) to provision for the volume.
  - **size**: Desired volume size (in GiB).
  - **encrypted**: Indicates whether the volume should be encrypted. Encrypted EBS volumes must be attached to instances that support Amazon EBS encryption. Volumes that are created from encrypted snapshots are automatically encrypted. There is no way to create an encrypted volume from an unencrypted snapshot or an unencrypted volume from an encrypted snapshot.
instance_monitoring  Whether instances in group are launched with detailed monitoring.
spot_price  The spot price you are bidding. Only applies if you are building an autoscaling group with spot
instances.
instance_profile_name  The name or the Amazon Resource Name (ARN) of the instance profile associated with
the IAM role for the instance. Instance profile must exist or the creation of the launch configuration will
fail.
ebs_optimized  Specifies whether the instance is optimized for EBS I/O (true) or not (false).
associate_public_ip_address  Used for Auto Scaling groups that launch instances into an Amazon Virtual
Private Cloud. Specifies whether to assign a public IP address to each instance launched in a Amazon
VPC.
region  The region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and
keyid.

21.19.45  salt.states.boto_rds

Manage RDSs

New in version 2015.8.0.

Create and destroy RDS instances. Be aware that this interacts with Amazon’s services, and so may incur charges.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit rds credentials but can also utilize IAM roles assigned to the instance through Instance
Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is neces-
sary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

```yaml
rds.keyid: GKTADJGHEIQSXMKKRBJ08H
rds.key: askdjghsdfjkgWupUjasdfklkgsdfsajkggh
```

It’s also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull
from pillars or minion config:

```yaml
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkgWupUjasdfklkgsdfsajkggh
  region: us-east-1
```

Ensure myrds RDS exists:

```yaml
boto_rds.present:
  - name: myrds
  - allocated_storage: 5
  - storage_type: standard
  - db_instance_class: db.t2.micro
  - engine: MySQL
  - master_username: myuser
  - master_user_password: mypass
  - region: us-east-1
  - keyid: GKTADJGHEIQSXMKKRBJ08H
  - key: askdjghsdfjkgWupUjasdfklkgsdfsajkggh
```

(continues on next page)
Ensure parameter group exists:

```python
- tags:
  key: value

Ensure parameter group exists:
create-parameter-group:
boto_rds.parameter_present:
  - name: myparametergroup
  - db_parameter_group_family: mysql5.6
  - description: "parameter group family"
  - parameters:
    - binlog_cache_size: 32768
    - binlog_checksum: CRC32
  - region: eu-west-1

depends boto3

salt.states.boto_rds.absent(name, skip_final_snapshot=None, final_db_snapshot_identifier=None, tags=None, wait_for_deletion=True, timeout=180, region=None, key=None, keyid=None, profile=None)

Ensure RDS instance is absent.

name Name of the RDS instance.
skip_final_snapshot Whether a final db snapshot is created before the instance is deleted. If True, no snapshot is created. If False, a snapshot is created before deleting the instance.
final_db_snapshot_identifier If a final snapshot is requested, this is the identifier used for that snapshot.
tags A dict of tags.
wait_for_deletion (bool) Wait for the RDS instance to be deleted completely before finishing the state.
timeout (in seconds) The amount of time that can pass before raising an Exception.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_rds.parameter_present(name, db_parameter_group_family, description, parameters=None, apply_method='pending-reboot', tags=None, region=None, key=None, keyid=None, profile=None)

Ensure DB parameter group exists and update parameters.

name The name for the parameter group.
db_parameter_group_family The DB parameter group family name. A DB parameter group can be associated with one and only one DB parameter group family, and can be applied only to a DB instance running a database engine and engine version compatible with that DB parameter group family.

description Parameter group description.
parameters The DB parameters that need to be changed of type dictionary.
apply_method The apply-immediate method can be used only for dynamic parameters; the pending-reboot method can be used with MySQL and Oracle DB instances for either dynamic or static parameters. For Microsoft SQL Server DB instances, the pending-reboot method can be used only for static parameters.
tags A dict of tags.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
```
salt.states.boto_rds.present(name, allocated_storage, db_instance_class, engine, master_username, master_user_password, db_name=None, storage_type=None, db_security_groups=None, vpc_security_group_ids=None, vpc_security_groups=None, availability_zone=None, db_subnet_group_name=None, preferred_maintenance_window=None, db_parameter_group_name=None, db_cluster_identifier=None, tde_credential_arn=None, tde_credential_password=None, storage_encrypted=None, kms_keyid=None, backup_retention_period=None, preferred_backup_window=None, port=None, multi_az=None, engine_version=None, auto_minor_version_upgrade=None, license_model=None, iops=None, option_group_name=None, character_set_name=None, publicly_accessible=None, wait_status=None, tags=None, copy_tags_to_snapshot=None, region=None, domain=None, key=None, keyid=None, monitoring_interval=None, monitoring_role_arn=None, domain_iam_role_name=None, promotion_tier=None, profile=None))
```

Ensure RDS instance exists.

**name**  
Name of the RDS state definition.

**allocated_storage**  
The amount of storage (in gigabytes) to be initially allocated for the database instance.

**db_instance_class**  
The compute and memory capacity of the Amazon RDS DB instance.

**engine**  
The name of the database engine to be used for this instance. Supported engine types are: MySQL, mariadb, oracle-se1, oracle-se, oracle-ee, sqlserver-ee, sqlserver-se, sqlserver-ex, sqlserver-web, postgres and aurora. For more information, please see the `engine` argument in the Boto3 RDS `create_db_instance` documentation.

**master_username**  
The name of master user for the client DB instance.

**master_user_password**  
The password for the master database user. Can be any printable ASCII character except "/", ",", or ":".

**db_name**  
The meaning of this parameter differs according to the database engine you use. See the Boto3 RDS documentation to determine the appropriate value for your configuration. [https://boto3.readthedocs.io/en/latest/reference/services/rds.html#RDS.Client.create_db_instance](https://boto3.readthedocs.io/en/latest/reference/services/rds.html#RDS.Client.create_db_instance)

**storage_type**  
Specifies the storage type to be associated with the DB instance. Options are standard, gp2 and io1. If you specify io1, you must also include a value for the `iops` parameter.

**db_security_groups**  
A list of DB security groups to associate with this DB instance.

**vpc_security_group_ids**  
A list of EC2 VPC security group IDs to associate with this DB instance.

**vpc_security_groups**  
A list of EC2 VPC security groups (IDs or Name tags) to associate with this DB instance.

**availability_zone**  
The EC2 Availability Zone that the database instance will be created in.

**db_subnet_group_name**  
A DB subnet group to associate with this DB instance.

**preferred_maintenance_window**  
The weekly time range (in UTC) during which system maintenance can occur.

**db_parameter_group_name**  
A DB parameter group to associate with this DB instance.

**db_cluster_identifier**  
If the DB instance is a member of a DB cluster, contains the name of the DB cluster that the DB instance is a member of.

**tde_credential_arn**  
The ARN from the Key Store with which the instance is associated for TDE encryption.

**tde_credential_password**  
The password to use for TDE encryption if an encryption key is not used.

**storage_encrypted**  
Specifies whether the DB instance is encrypted.

**kms_keyid**  
The KMS key identifier for the encrypted DB instance.

**backup_retention_period**  
The number of days for which automated backups are retained.

**preferred_backup_window**  
The daily time range during which automated backups are created if automated backups are enabled.

**port**  
The port number on which the database accepts connections.

**multi_az**  
Specifies if the DB instance is a Multi-AZ deployment. You cannot set the AvailabilityZone parameter if the MultiAZ parameter is set to true.
**engine_version**  The version number of the database engine to use.

**auto_minor_version_upgrade**  Indicates that minor engine upgrades will be applied automatically to the DB instance during the maintenance window.

**license_model**  License model information for this DB instance.

**iops**  The amount of Provisioned IOPS (input/output operations per second) to be initially allocated for the DB instance.

**option_group_name**  Indicates that the DB instance should be associated with the specified option group.

**character_set_name**  For supported engines, indicates that the DB instance should be associated with the specified CharacterSet.

**publicly_accessible**  Specifies the accessibility options for the DB instance. A value of true specifies an Internet-facing instance with a publicly resolvable DNS name, which resolves to a public IP address. A value of false specifies an internal instance with a DNS name that resolves to a private IP address.

**wait_status**  Wait for the RDS instance to reach a desired status before finishing the state. Available states: available, modifying, backing-up

**tags**  A dict of tags.

**copy_tags_to_snapshot**  Specifies whether tags are copied from the DB instance to snapshots of the DB instance.

**region**  Region to connect to.

**domain**  The identifier of the Active Directory Domain.

**key**  AWS secret key to be used.

**keyid**  AWS access key to be used.

**monitoring_interval**  The interval, in seconds, between points when Enhanced Monitoring metrics are collected for the DB instance.

**monitoring_role_arn**  The ARN for the IAM role that permits RDS to send Enhanced Monitoring metrics to CloudWatch Logs.

**domain_iam_role_name**  Specify the name of the IAM role to be used when making API calls to the Directory Service.

**promotion_tier**  A value that specifies the order in which an Aurora Replica is promoted to the primary instance after a failure of the existing primary instance. For more information, see Fault Tolerance for an Aurora DB Cluster.

**profile**  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```python
salt.states.boto_rds.replica_present(name, source, db_instance_class=None, availability_zone=None, port=None, auto_minor_version_upgrade=None, iops=None, option_group_name=None, publicly_accessible=None, tags=None, region=None, key=None, keyid=None, profile=None, db_parameter_group_name=None)
```

Ensure RDS replica exists.

```python
Ensure myrds replica RDS exists:
boto_rds.create_replica:
  - name: myreplica
  - source: mydb
```

```python
salt.states.boto_rds.subnet_group_absent(name, tags=None, region=None, key=None, keyid=None, profile=None)
```

```python
salt.states.boto_rds.subnet_group_present(name, description, subnet_ids=None, subnet_names=None, tags=None, region=None, key=None, keyid=None, profile=None)
```

Ensure DB subnet group exists.

**name**  The name for the DB subnet group. This value is stored as a lowercase string.

**subnet_ids**  A list of the EC2 Subnet IDs for the DB subnet group. Either subnet_ids or subnet_names must be provided.
subnet_names  A list of EC2 Subnet names for the DB subnet group. Either subnet_ids or subnet_names must be provided.
description Subnet group description.
tags  A dict of tags.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.46  salt.states.boto_route53

Manage Route53 records

New in version 2014.7.0.

Create and delete Route53 records. Be aware that this interacts with Amazon’s services, and so may incur charges.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit route53 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

```
route53.keyid: GKTADJGHEIQSXMKKRBJ08H
route53.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It’s also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

```
mycname:
  boto_route53.present:
    - name: test.example.com.
    - zone: example.com.
    - ttl: 60
    - record_type: CNAME
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

# Using a profile from pillars
myarecord:
  boto_route53.present:
    - name: test.example.com.
    - value: 1.1.1.1
    - zone: example.com.
    - ttl: 60
    - record_type: A
    - region: us-east-1
```

(continues on next page)
- **profile**: myprofile

# Passing in a profile

```
myarecord:
  - **boto_route53.present**:
    - **name**: test.example.com.
    - **value**: 1.1.1.1
    - **zone**: example.com.
    - **ttl**: 60
    - **record_type**: A
    - **region**: us-east-1
    - **profile**:
      - **keyid**: GKTADJGHEIQSXMKKRBJ08H
      - **key**: askdjghsdfjkgHwupUjasdfklkdsfjdsfjajkghs
```

salt.states.boto_route53.absent(name, zone, record_type, identifier=None, region=None, key=None, keyid=None, profile=None, wait_for_sync=True, split_dns=False, private_zone=False)

Ensure the Route53 record is deleted.

- **name**: Name of the record.
- **zone**: The zone to delete the record from.
- **record_type**: The record type (A, NS, MX, TXT, etc.)
- **identifier**: An identifier to match for deletion.
- **region**: The region to connect to.
- **key**: Secret key to be used.
- **keyid**: Access key to be used.
- **profile**: A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
- **wait_for_sync**: Wait for an INSYNC change status from Route53.
- **split_dns**: Route53 supports a public and private DNS zone with the same names.
- **private_zone**: If using split_dns, specify if this is the private zone.

salt.states.boto_route53.hosted_zone_absent(name, domain_name=None, region=None, key=None, keyid=None, profile=None)

Ensure the Route53 Hostes Zone described is absent

- **name**: The name of the state definition.
- **domain_name**: The FQDN (including final period) of the zone you wish absent. If not provided, the value of name will be used.

salt.states.boto_route53.hosted_zone_present(name, domain_name=None, private_zone=False, caller_ref=None, comment='', vpc_id=None, vpc_name=None, vpc_region=None, region=None, key=None, keyid=None, profile=None)

Ensure a hosted zone exists with the given attributes. Note that most things cannot be modified once a zone is created - it must be deleted and re-spun to update these attributes:

- **private_zone** (AWS API limitation).
- **comment** (the appropriate call exists in the AWS API and in boto3, but has not, as of this writing, been added to boto2).
- **vpc_id** (same story - we really need to rewrite this module with boto3)
- **vpc_name** (really just a pointer to vpc_id anyway).
- **vpc_region** (again, supported in boto3 but not boto2).

If you need the ability to update these attributes, please use the newer boto3_route53 module instead.

- **name**: The name of the state definition.
- **domain_name**: The name of the domain. This must be fully-qualified, terminating with a period. This is the
name you have registered with your domain registrar. It is also the name you will delegate from your registrar to the Amazon Route 53 delegation servers returned in response to this request. Defaults to the value of name if not provided.

**private_zone** Set True if creating a private hosted zone.

**caller_ref** A unique string that identifies the request and that allows create_hosted_zone() calls to be retried without the risk of executing the operation twice. This helps ensure idempotency across state calls, but can cause issues if a zone is deleted and then an attempt is made to recreate it with the same caller_ref. If not provided, a unique UUID will be generated at each state run, which avoids the risk of the above (transient) error. This option is generally not needed. Maximum length of 128.

**comment** Any comments you want to include about the hosted zone.

**vpc_id** When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with vpc_name. Ignored when creating a non-private zone.

**vpc_name** When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with vpc_id. Ignored when creating a non-private zone.

**vpc_region** When creating a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from vpc_id or vpc_name, where possible. If this fails, you’ll need to provide an explicit value for this option. Ignored when creating a non-private zone.

```python
salt.states.boto_route53.present(name, value, zone, record_type, ttl=None, identifier=None, region=None, key=None, keyid=None, profile=None, wait_for_sync=True, split_dns=False, private_zone=False)
```

Ensure the Route53 record is present.

**name** Name of the record.

**value** Value of the record. As a special case, you can pass in: `private:<Name tag>` to have the function autodetermine the private IP or `public:<Name tag>` to have the function autodetermine the public IP.

**zone** The zone to create the record in.

**record_type** The record type (A, NS, MX, TXT, etc.).

**ttl** The time to live for the record.

**identifier** The unique identifier to use for this record.

**region** The region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**wait_for_sync** Wait for an INSYNC change status from Route53 before returning success.

**split_dns** Route53 supports parallel public and private DNS zones with the same name.

**private_zone** If using split_dns, specify if this is the private zone.

```python
salt.states.boto_route53.rr_absent(*args, **kwargs)

salt.states.boto_route53.rr_present(*args, **kwargs)
```

### 21.19.47 salt.states.boto_s3_bucket module

Manage S3 Buckets

New in version 2016.3.0.

Create and destroy S3 buckets. Be aware that this interacts with Amazon’s services, and so may incur charges.

**depends**

- boto
- boto3

---

21.19. state modules 3237
The dependencies listed above can be installed via package or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkgwupUjasdflkdfklgjsdfjajkghs
```

It’s also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkgwupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

Ensure bucket exists:
```
boto_s3_bucket.present:
  - Bucket: mybucket
  - LocationConstraint: EU
  - ACL:
    - GrantRead: "uri=http://acs.amazonaws.com/groups/global/AllUsers"
  - CORSRules:
    - AllowedHeaders: []
    - AllowedMethods: ["GET"]
    - AllowedOrigins: ["*"]
    - ExposeHeaders: []
    - MaxAgeSeconds: 123
  - LifecycleConfiguration:
    - Days: 123
      ID: "idstring"
      Prefix: "prefixstring"
      Status: "enabled",
      ID: "lc1"
    - Transitions:
      - Days: 123
        StorageClass: "GLACIER"
        NoncurrentVersionTransitions:
        - NoncurrentDays: 123
        StorageClass: "GLACIER"
        NoncurrentVersionExpiration:
        - NoncurrentDays: 123
    - Logging:
      - TargetBucket: log_bucket
      - TargetPrefix: prefix
      - TargetGrants:

            ReplaceKeyCodeWith: "string"
  region: us-east-1
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkgHwupUjasdlkdfklkgjsdfjajkghs
salt.states.boto_s3_bucket.absent(name, Bucket, Force=False, region=None, key=None, keyid=None, profile=None)

Ensure bucket with passed properties is absent.

- **name** The name of the state definition.
- **Bucket** Name of the bucket.
- **Force** Empty the bucket first if necessary - Boolean.
- **region** Region to connect to.
- **key** Secret key to be used.
- **keyid** Access key to be used.
- **profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_s3_bucket.present(name, Bucket, LocationConstraint=None, ACL=None, CORSRules=None, LifecycleConfiguration=None, Logging=None, NotificationConfiguration=None, Policy=None,Replication=None, RequestPayment=None, Tagging=None, Versioning=None, Website=None, region=None, key=None, keyid=None, profile=None)

Ensure bucket exists.

- **name** The name of the state definition
- **Bucket** Name of the bucket.
- **LocationConstraint** 'EU'|'eu-west-1'|'us-west-1'|'us-west-2'|'ap-southeast-1'|'ap-southeast-2'|'ap-northeast-1'|'sa-east-1'|'cn-north-1'|'eu-central-1'
- **ACL** The permissions on a bucket using access control lists (ACL).
- **CORSRules** The cors configuration for a bucket.
- **LifecycleConfiguration** Lifecycle configuration for your bucket
- **Logging** The logging parameters for a bucket and to specify permissions for who can view and modify the logging parameters.
- **NotificationConfiguration** notifications of specified events for a bucket
- **Policy** Policy on the bucket
- **Replication** Replication rules. You can add as many as 1,000 rules. Total replication configuration size can be up to 2 MB
- **RequestPayment** The request payment configuration for a bucket. By default, the bucket owner pays for downloads from the bucket. This configuration parameter enables the bucket owner (only) to specify that the person requesting the download will be charged for the download
- **Tagging** A dictionary of tags that should be set on the bucket
- **Versioning** The versioning state of the bucket
- **Website** The website configuration of the bucket
- **region** Region to connect to.
- **key** Secret key to be used.
- **keyid** Access key to be used.
- **profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.48 salt.states.boto_secgroup

Manage Security Groups

New in version 2014.7.0.

Create and destroy Security Groups. Be aware that this interacts with Amazon’s services, and so may incur charges. This module uses boto, which can be installed via package, or pip.

This module accepts explicit EC2 credentials but can also utilize IAM roles assigned to the instance through In-
stance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

```yaml
secgroup.keyid: GKTADJGHEIQXSXMRRB38H
secgroup.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It’s also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```yaml
myprofile:
  keyid: GKTADJGHEIQXSXMRRB38H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

Ensure mysecgroup exists:

```yaml
boto_secgroup.present:
  - name: mysecgroup
  - description: My security group
  - vpc_name: myvpc
  - rules:
    - ip_protocol: tcp
      from_port: 80
      to_port: 80
      cidr_ip:
        - 10.0.0.0/8
        - 192.168.0.0/16
    - ip_protocol: tcp
      from_port: 8080
      to_port: 8080
      cidr_ip:
        - 10.0.0.0/8
        - 192.168.0.0/16
    - ip_protocol: icmp
      from_port: -1
      to_port: -1
      source_group_name: mysecgroup
    - ip_protocol: tcp
      from_port: 8080
      to_port: 8080
      source_group_name: MyOtherSecGroup
      source_group_name_vpc: MyPeeredVPC
  rules_egress:
    - ip_protocol: all
      from_port: -1
      to_port: -1
      cidr_ip:
        - 10.0.0.0/8
        - 192.168.0.0/16
    tags:
      SomeTag: 'My Tag Value'
      SomeOtherTag: 'Other Tag Value'
      region: us-east-1
      keyid: GKTADJGHEIQXSXMRRB38H
      key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

# Using a profile from pillars

(continues on next page)
Ensure mysecgroup exists:

```python
boto_secgroup.present:
- name: mysecgroup
- description: My security group
- profile: myprofile
```

# Passing in a profile

Ensure mysecgroup exists:

```python
boto_secgroup.present:
- name: mysecgroup
- description: My security group
- profile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkgHwupUjasdfldfkgjhsdsfjajkg
  region: us-east-1
```

---

**Note:** When using the `profile` parameter and `region` is set outside of the profile group, `region` is ignored and a default region will be used.

If `region` is missing from the `profile` data set, `us-east-1` will be used as the default region.

---

**salt.states.boto_secgroup.absent**

```python
(name, vpc_id=None, vpc_name=None, region=None, key=None, keyid=None, profile=None)
```

Ensure a security group with the specified name does not exist.

- **name** Name of the security group.
- **vpc_id** The ID of the VPC to remove the security group from, if any. Exclusive with `vpc_name`.
- **vpc_name** The name of the VPC to remove the security group from, if any. Exclusive with `vpc_id`.

New in version 2016.3.0.

- **region** Region to connect to.
- **key** Secret key to be used.
- **keyid** Access key to be used.
- **profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.3.0.

---

**salt.states.boto_secgroup.present**

```python
(name, description, vpc_id=None, vpc_name=None, rules=None, rules_egress=None, delete_ingress_rules=True, delete_egress_rules=True, region=None, key=None, keyid=None, profile=None, tags=None)
```

Ensure the security group exists with the specified rules.

- **name** Name of the security group.
- **description** A description of this security group.
- **vpc_id** The ID of the VPC to create the security group in, if any. Exclusive with `vpc_name`.
- **vpc_name** The name of the VPC to create the security group in, if any. Exclusive with `vpc_id`.

New in version 2016.3.0.

New in version 2015.8.2.

- **rules** A list of ingress rule dicts. If not specified, `rules=None`, the ingress rules will be unmanaged. If set to an empty list, `[]`, then all ingress rules will be removed.
- **rules_egress** A list of egress rule dicts. If not specified, `rules_egress=None`, the egress rules will be unmanaged. If set to an empty list, `[]`, then all egress rules will be removed.
- **delete_ingress_rules** Some tools (EMR comes to mind) insist on adding rules on-the-fly, which salt will happily remove on the next run. Set this param to False to avoid deleting rules which were added outside
of salt.

delete_egress_rules Some tools (EMR comes to mind) insist on adding rules on-the-fly, which salt will happily remove on the next run. Set this param to False to avoid deleting rules which were added outside of salt.

region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key, and keyid.
tags List of key:value pairs of tags to set on the security group

New in version 2016.3.0.

21.19.49 salt.states.boto_sns

Manage SNS Topics

Create and destroy SNS topics. Be aware that this interacts with Amazon’s services, and so may incur charges.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

```yaml
sns.keyid: GKTADJGHEIQXSXMKKRBJ08H
sns.key: askdjghsdfjkghWupUjasdflkdfklgjsdfajkghs
```

It’s also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```yaml
myprofile:
  keyid: GKTADJGHEIQXSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfajkghs
  region: us-east-1

mytopic:
  boto_sns.present:
    - region: us-east-1
    - keyid: GKTADJGHEIQXSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfajkghs

# Using a profile from pillars
mytopic:
  boto_sns.present:
    - region: us-east-1
    - profile: mysnsprofile

# Passing in a profile
mytopic:
  boto_sns.present:
    - region: us-east-1
    - profile:
      keyid: GKTADJGHEIQXSXMKKRBJ08H
      key: askdjghsdfjkghWupUjasdflkdfklgjsdfajkghs
```

21.19. state modules
salt.states.boto_sns.absent(name, region=None, key=None, keyid=None, profile=None, unsubscribe=False)

Ensure the named sns topic is deleted.

- **name**: Name of the SNS topic.
- **region**: Region to connect to.
- **key**: Secret key to be used.
- **keyid**: Access key to be used.
- **profile**: A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
- **unsubscribe**: If True, unsubscribe all subscriptions to the SNS topic before deleting the SNS topic

New in version 2016.11.0.

salt.states.boto_sns.present(name, subscriptions=None, region=None, key=None, keyid=None, profile=None)

Ensure the SNS topic exists.

- **name**: Name of the SNS topic.
- **subscriptions**: List of SNS subscriptions.

Each subscription is a dictionary with a protocol and endpoint key:

```python
[
    {'protocol': 'https', 'endpoint': 'https://www.example.com/sns-endpoint'},
    {'protocol': 'sqs', 'endpoint': 'arn:aws:sqs:us-west-2:123456789012:MyQueue'}
]
```

- **region**: Region to connect to.
- **key**: Secret key to be used.
- **keyid**: Access key to be used.
- **profile**: A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.50 salt.states.boto_sqs

Manage SQS Queues

New in version 2014.7.0.

Create and destroy SQS queues. Be aware that this interacts with Amazon’s services, and so may incur charges.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit SQS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

```yaml
sqs.keyid: GKTADJGHEIQSXMKKRBJ08H
sqs.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It’s also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```yaml
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```
myqueue:
    boto_sqs.present:
      - region: us-east-1
      - keyid: GKTADJGHEIQSXMKKRBJ08H
      - key: askdjghsdfjkdghWwpUjasdfsdklgsdfjajkghs
      - attributes:
          ReceiveMessageWaitTimeSeconds: 20

# Using a profile from pillars
myqueue:
    boto_sqs.present:
      - region: us-east-1
      - profile: mysqsprofile

# Passing in a profile
myqueue:
    boto_sqs.present:
      - region: us-east-1
      - profile:
          keyid: GKTADJGHEIQSXMKKRBJ08H
          key: askdjghsdfjkdghWwpUjasdfsdklgsdfjajkghs

salt.states.boto_sqs.absent(name, region=None, key=None, keyid=None, profile=None)
Ensure the named sqs queue is deleted.
name Name of the SQS queue.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_sqs.present(name, attributes=None, region=None, key=None, keyid=None, profile=None)
Ensure the SQS queue exists.
name Name of the SQS queue.
attributes A dict of key/value SQS attributes.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

21.19.51 salt.states.boto_vpc
Manage VPCs
New in version 2015.8.0.

depends
  • boto >= 2.8.0
  • boto3 >= 1.2.6
Create and destroy VPCs. Be aware that this interacts with Amazon’s services, and so may incur charges.
This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

```
<table>
<thead>
<tr>
<th>vpc.keyid</th>
<th>GKTADJGHEIQSXMKKRBJ08H</th>
</tr>
</thead>
<tbody>
<tr>
<td>vpc.key</td>
<td>askdjghsdfjkgWupUjasdflkdfklgjsdfjajkghs</td>
</tr>
</tbody>
</table>
```

It’s also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
<table>
<thead>
<tr>
<th>myprofile</th>
</tr>
</thead>
<tbody>
<tr>
<td>keyid</td>
</tr>
<tr>
<td>key</td>
</tr>
<tr>
<td>region</td>
</tr>
</tbody>
</table>
```

```
<table>
<thead>
<tr>
<th>aws</th>
</tr>
</thead>
<tbody>
<tr>
<td>region:</td>
</tr>
<tr>
<td>us-east-1:</td>
</tr>
<tr>
<td>profile:</td>
</tr>
<tr>
<td>keyid: GKTADJGHEIQSXMKKRBJ08H</td>
</tr>
<tr>
<td>key: askdjghsdfjkgWupUjasdflkdfklgjsdfjajkghs</td>
</tr>
<tr>
<td>region: us-east-1</td>
</tr>
</tbody>
</table>
```

Ensure VPC exists:
```
| boto_vpc.present: |
|                   - name: myvpc |
|                   - cidr_block: 10.10.11.0/24 |
|                   - dns_hostnames: True |
|                   - region: us-east-1 |
|                   - keyid: GKTADJGHEIQSXMKKRBJ08H |
|                   - key: askdjghsdfjkgWupUjasdflkdfklgjsdfjajkghs |
```

Ensure subnet exists:
```
| boto_vpc.subnet_present: |
|                   - name: mysubnet |
|                   - vpc_id: vpc-123456 |
|                   - cidr_block: 10.0.0.0/16 |
|                   - region: us-east-1 |
|                   - profile: myprofile |
```

```
{% set profile = salt['pillar.get']('aws:region:us-east-1:profile' ) %}
```

Ensure internet gateway exists:
```
| boto_vpc.internet_gateway_present: |
|                   - name: myigw |
|                   - vpc_name: myvpc |
|                   - profile: {{ profile }} |
```

Ensure route table exists:
```
| boto_vpc.route_table_present: |
|                   - name: my_route_table |
|                   - vpc_id: vpc-123456 |
|                   - routes: |
|                       - destination_cidr_block: 0.0.0.0/0 |
|                       - instance_id: i-123456 |
|                       - subnet_names: |
```

(continues on next page)
- subnet1
- subnet2
- region: us-east-1
- profile:
  - keyid: GKTADJGHEIQSXMKKRBJ08H
  - key: askdjghsdfjkgWupUjasdfklkflgjsdfjajkggs

New in version 2016.11.0.

Request, accept and delete VPC peering connections. VPC peering connections can be named allowing the name to be used throughout the state file. Following example shows how to request and accept a VPC peering connection.

```
accept the vpc peering connection:
boto_vpc.accept_vpc_peering_connection:
  - conn_name: salt_vpc_peering
  - region: us-west-2
  - require:
    - boto_vpc: request a vpc peering connection

request a vpc peering connection:
boto_vpc.request_vpc_peering_connection:
  - requester_vpc_id: vpc-4a3d522e
  - peer_vpc_id: vpc-ae81e9ca
  - region: us-west-2
  - conn_name: salt_vpc_peering
```

VPC peering connections need not be named. In this case the VPC peering connection ID should be used in the state file.

```
accept the vpc peering connection:
boto_vpc.accept_vpc_peering_connection:
  - conn_id: pcx-1873c371
  - region: us-west-2
```

VPC peering connections can be deleted, as shown below.

```
delete a named vpc peering connection:
boto_vpc.delete_vpc_peering_connection:
  - conn_name: salt_vpc_peering

delete a vpc peering connection by id:
boto_vpc.delete_vpc_peering_connection:
  - conn_id: pcx-1873c371
```

Delete also accepts a VPC peering connection id.

```
salt.states.boto_vpc.absent(name, tags=None, region=None, key=None, keyid=None, profile=None)
```

Ensure VPC with passed properties is absent.

- `name`: Name of the VPC.
- `tags`: A list of tags. All tags must match.
- `region`: Region to connect to.
- `key`: Secret key to be used.
- `keyid`: Access key to be used.
- `profile`: A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
salt.states.boto_vpc.accept_vpc_peering_connection(name=None, conn_id=None, conn_name=None, region=None, key=None, keyid=None, profile=None)

Accept a VPC pending requested peering connection between two VPCs.

name Name of this state
conn_id The connection ID to accept. Exclusive with conn_name. String type.
conn_name The name of the VPC peering connection to accept. Exclusive with conn_id. String type.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.11.0.

Example:

```
boto_vpc.accept_vpc_peering_connection:
   - conn_name: salt_peering_connection
# usage with vpc peering connection id and region
boto_vpc.accept_vpc_peering_connection:
   - conn_id: pbx-1873d472
   - region: us-west-2
```

salt.states.boto_vpc.delete_vpc_peering_connection(name, conn_id=None, conn_name=None, region=None, key=None, keyid=None, profile=None)

name Name of the state
conn_id ID of the peering connection to delete. Exclusive with conn_name.
conn_name The name of the peering connection to delete. Exclusive with conn_id.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.11.0.

Example:

```
delete a vpc peering connection:
    boto_vpc.delete_vpc_peering_connection:
        - region: us-west-2
        - conn_id: pcx-4613b12e
```

Connection name can be specified (instead of ID). Specifying both conn_name and conn_id will result in an error.

```
delete a vpc peering connection:
    boto_vpc.delete_vpc_peering_connection:
        - conn_name: salt_vpc_peering
```

salt.states.boto_vpc.dhcp_options_absent(name=None, dhcp_options_id=None, region=None, key=None, keyid=None, profile=None)

Ensure a set of DHCP options with the given settings exist.

name (string) Name of the DHCP options set.
dhcp_options_id (string) Id of the DHCP options set.
region (string) Region to connect to.
key (string) Secret key to be used.
keyid (string) Access key to be used.
profile (various) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.3.0.

salt.states.boto_vpc.dhcp_options_present(name, dhcp_options_id=None, vpc_name=None, vpc_id=None, domain_name=None, domain_name_servers=None, ntp_servers=None, netbios_name_servers=None, netbios_node_type=None, tags=None, region=None, key=None, keyid=None, profile=None)

Ensure a set of DHCP options with the given settings exist. Note that the current implementation only SETS values during option set creation. It is unable to update option sets in place, and thus merely verifies the set exists via the given name and/or dhcp_options_id param.

name (string) Name of the DHCP options.
vpc_name (string) Name of a VPC to which the options should be associated. Either vpc_name or vpc_id must be provided.
vpc_id (string) Id of a VPC to which the options should be associated. Either vpc_name or vpc_id must be provided.
domain_name (string) Domain name to be assiciated with this option set.
domain_name_servers (list of strings) The IP address(es) of up to four domain name servers.
ntp_servers (list of strings) The IP address(es) of up to four desired NTP servers.
etbios_name_servers (list of strings) The IP address(es) of up to four NetBIOS name servers.
etbios_node_type (string) The NetBIOS node type (1, 2, 4, or 8). For more information about the allowed values, see RFC 2132. The recommended is 2 at this time (broadcast and multicast are currently not supported).
tags (dict of key:value pairs) A set of tags to be added.
region (string) Region to connect to.
key (string) Secret key to be used.
keyid (string) Access key to be used.
profile (various) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.3.0.

salt.states.boto_vpc.internet_gateway_absent(name, detach=False, region=None, key=None, keyid=None, profile=None)

Ensure the named internet gateway is absent.

name Name of the internet gateway.
detach First detach the internet gateway from a VPC, if attached.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_vpc.internet_gateway_present(name, vpc_name=None, vpc_id=None, tags=None, region=None, key=None, keyid=None, profile=None)

Ensure an internet gateway exists.

name Name of the internet gateway.
vpc_name Name of the VPC to which the internet gateway should be attached.
vpc_id Id of the VPC to which the internet_gateway should be attached. Only one of vpc_name or vpc_id may be provided.
tags  A list of tags.
region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and

salt.states.boto_vpc.nat_gateway_absent(name=None, subnet_name=None, subnet_id=None, region=None, key=None, keyid=None, profile=None, wait_for_delete_retries=0)

Ensure the nat gateway in the named subnet is absent.
This function requires boto3.
New in version 2016.11.0.
name  Name of the state.
subnet_name  Name of the subnet within which the nat gateway should exist
subnet_id  Id of the subnet within which the nat gateway should exist. Either subnet_name or subnet_id must
be provided.
region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and
wait_for_delete_retries  NAT gateway may take some time to be go into deleted or failed state. During the
deletion process, subsequent release of elastic IPs may fail; this state will automatically retry this number
of times to ensure the NAT gateway is in deleted or failed state before proceeding. Default is set to 0 for
backward compatibility.

salt.states.boto_vpc.nat_gateway_present(name, subnet_name=None, subnet_id=None, region=None, key=None, keyid=None, profile=None, allocation_id=None)

Ensure a nat gateway exists within the specified subnet.
This function requires boto3.
New in version 2016.11.0.
Example:

boto_vpc.nat_gateway_present:
  - subnet_name: my-subnet

name  Name of the state
subnet_name  Name of the subnet within which the nat gateway should exist
subnet_id  Id of the subnet within which the nat gateway should exist. Either subnet_name or subnet_id must
be provided.
allocation_id  If specified, the elastic IP address referenced by the ID is associated with the gateway. Other-
wise, a new allocation_id is created and used.
region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and

salt.states.boto_vpc.present(name, cidr_block, instance_tenancy=None, dns_support=None, dns_hostnames=None, tags=None, region=None, key=None, keyid=None, profile=None)

Ensure VPC exists.
name Name of the VPC.
cidr_block The range of IPs in CIDR format, for example: 10.0.0.0/24. Block size must be between /16 and /28 netmask.
instance_tenancy Instances launched in this VPC will be single-tenant or dedicated hardware.
dns_support Indicates whether the DNS resolution is supported for the VPC.
dns_hostnames Indicates whether the instances launched in the VPC get DNS hostnames.
tags A list of tags.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
salt.states.boto_vpc.request_vpc_peering_connection(name, requester_vpc_id=None, requester_vpc_name=None, peer_vpc_id=None, peer_vpc_name=None, conn_name=None, peer_owner_id=None, region=None, key=None, keyid=None, profile=None)

name Name of the state
requester_vpc_id ID of the requesting VPC. Exclusive with requester_vpc_name. String type.
requester_vpc_name Name tag of the requesting VPC. Exclusive with requester_vpc_id. String type.
peer_vpc_id ID of the VPC to create VPC peering connection with. This can be a VPC in another account. Exclusive with peer_vpc_name. String type.
peer_vpc_name Name tag of the VPC to create VPC peering connection with. This can only be a VPC the same account. Exclusive with peer_vpc_id. String type.
conn_name The (optional) name to use for this VPC peering connection. String type.
peer_owner_id ID of the owner of the peer VPC. String type. If this isn’t supplied AWS uses your account ID. Required if peering to a different account.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.11.0.

Example:

```
request a vpc peering connection:
boto_vpc.request_vpc_peering_connection:
    - requester_vpc_id: vpc-4b3522e
    - peer_vpc_id: vpc-ae83f9ca
    - conn_name: salt_peering_connection
```
salt.states.boto_vpc.route_table_absent(name, region=None, key=None, keyid=None, profile=None)

Ensure the named route table is absent.
name Name of the route table.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
salt.states.boto_vpc.route_table_present(name, vpc_name=None, vpc_id=None, routes=None, subnet_ids=None, subnet_names=None, tags=None, region=None, key=None, keyid=None, profile=None)

Ensure route table with routes exists and is associated to a VPC.

This function requires boto3 to be installed if nat gateways are specified.

Example:

```
boto_vpc.route_table_present:
  - name: my_route_table
  - vpc_id: vpc-123456
  - routes:
    - destination_cidr_block: 0.0.0.0/0
      internet_gateway_name: InternetGateway
    - destination_cidr_block: 10.10.11.0/24
      instance_id: i-123456
    - destination_cidr_block: 10.10.12.0/24
      interface_id: eni-123456
    - destination_cidr_block: 10.10.13.0/24
      instance_name: mygatewayserver
  - subnet_names:
    - subnet1
    - subnet2
```

name Name of the route table.
vpc_name Name of the VPC with which the route table should be associated.
vpc_id Id of the VPC with which the route table should be associated. Either vpc_name or vpc_id must be provided.
routes A list of routes. Each route has a cidr and a target.
subnet_ids A list of subnet ids to associate
subnet_names A list of subnet names to associate
tags A list of tags.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_vpc.subnet_absent(name=None, subnet_id=None, region=None, key=None, keyid=None, profile=None)

Ensure subnet with passed properties is absent.

name Name of the subnet.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_vpc.subnet_present(name, cidr_block, vpc_name=None, vpc_id=None, availability_zone=None, tags=None, region=None, key=None, keyid=None, profile=None, route_table_id=None, route_table_name=None, auto_assign_public_ipv4=False)

Ensure a subnet exists.

name Name of the subnet.
**cidr_block** The range of IPs for the subnet, in CIDR format. For example: 10.0.0.0/24. Block size must be between /16 and /28 netmask.

**vpc_name** Name of the VPC in which the subnet should be placed. Either vpc_name or vpc_id must be provided.

**vpc_id** Id of the VPC in which the subnet should be placed. Either vpc_name or vpc_id must be provided.

**availability_zone** AZ in which the subnet should be placed.

**tags** A list of tags.

**route_table_id** A route table ID to explicitly associate the subnet with. If both route_table_id and route_table_name are specified, route_table_id will take precedence.

New in version 2016.11.0.

**route_table_name** A route table name to explicitly associate the subnet with. If both route_table_id and route_table_name are specified, route_table_id will take precedence.

New in version 2016.11.0.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```python
salt.states.boto_vpc.vpc_peering_connection_absent(name, conn_id=None, conn_name=None, region=None, key=None, keyid=None, profile=None)

salt.states.boto_vpc.vpc_peering_connection_present(name, requester_vpc_id=None, requester_vpc_name=None, peer_vpc_id=None, peer_vpc_name=None, conn_name=None, peer_owner_id=None, region=None, key=None, keyid=None, profile=None)
```

**name** Name of the state

**requester_vpc_id** ID of the requesting VPC. Exclusive with requester_vpc_name.

**requester_vpc_name** Name tag of the requesting VPC. Exclusive with requester_vpc_id.

**peer_vpc_id** ID of the VPC to create VPC peering connection with. This can be a VPC in another account. Exclusive with peer_vpc_name.

**peer_vpc_name** Name tag of the VPC to create VPC peering connection with. This can only be a VPC in the same account, else resolving it into a vpc ID will fail. Exclusive with peer_vpc_id.

**conn_name** The name to use for this VPC peering connection.

**peer_owner_id** ID of the owner of the peer VPC. Defaults to your account ID, so a value is required if peering with a VPC in a different account.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.11.0.

Example:

```python
eensure peering twixt local vpc and the other guys:
boto_vpc.vpc_peering_connection_present:
  - requester_vpc_name: my_local_vpc
```

(continues on next page)
21.19.52 salt.states.bower

Installation of Bower Packages

These states manage the installed packages using Bower. Note that npm, git and bower must be installed for these states to be available, so bower states should include requisites to pkg.installed states for the packages which provide npm and git (simply npm and git in most cases), and npm.installed state for the package which provides bower.

Example:

```yaml
- peer_vpc_name: some_other_guys_vpc
- conn_name: peering_from_here_to_there
- peer_owner_id: 012345654321
```

```
npm:
  pkg.installed

git:
  pkg.installed

bower:
  npm.installed
  require:
    - pkg: npm
    - pkg: git

underscore:
  bower.installed:
    - dir: /path/to/project
    - require:
      - npm: bower
```

```python
salt.states.bower.bootstrap(name, user=None)

Bootstraps a frontend distribution.

Will execute 'bower install' on the specified directory.

user The user to run Bower with

salt.states.bower.installed(name, dir, pkgs=None, user=None, env=None)

Verify that the given package is installed and is at the correct version (if specified).
```

```yaml
underscore:
  bower.installed:
    - dir: /path/to/project
    - user: someuser

jquery#2.0:
  bower.installed:
    - dir: /path/to/project
```

name The package to install
dir The target directory in which to install the package
pkgs A list of packages to install with a single Bower invocation; specifying this argument will ignore the name argument
user The user to run Bower with
env A list of environment variables to be set prior to execution. The format is the same as the cmd.run state function.
salt.states.bower.pruned(name, user=None, env=None)

New in version 2017.7.0.

Cleans up local bower_components directory.

Will execute 'bower prune' on the specified directory (param: name)

user The user to run Bower with

salt.states.bower.removed(name, dir, user=None)

Verify that the given package is not installed.

dir The target directory in which to install the package

user The user to run Bower with

21.19.53 salt.states.cabal

Installation of Cabal Packages

New in version 2015.8.0.

These states manage the installed packages for Haskell using cabal. Note that cabal-install must be installed for these states to be available, so cabal states should include a requisite to a pkg.installed state for the package which provides cabal (cabal-install in case of Debian based distributions). Example:

```yaml
.. code-block:: yaml

  cabal-install: pkg.installed
  ShellCheck:
    cabal.installed:
      - require: - pkg: cabal-install

salt.states.cabal.installed(name, pkgs=None, user=None, install_global=False, env=None)

Verify that the given package is installed and is at the correct version (if specified).

salt.states.cabal.removed(name, user=None, env=None)

Verify that given package is not installed.

21.19.54 salt.states.ceph module

Manage ceph with salt.

New in version 2016.11.0.

salt.states.ceph.quorum(name, **kwargs)

Quorum state
This state checks the mon daemons are in quorum. It does not alter the cluster but can be used in formula as a dependency for many cluster operations.

Example usage in sls file:

```yaml
quorum:
  sesceph.quorum:
    - require:
      - sesceph: mon_running
```

## 21.19.55 salt.states.chef

### Execute Chef client runs

Run chef-client or chef-solo

```yaml
my-chef-run:
  chef.client:
    - override-runlist: 'demo1,demo2'
    - server: 'https://chef.domain.com'

default-chef-run:
  chef.client: []

my-solo-run:
  chef.solo:
    - environment: dev
```

salt.states.chef.client(name, **kwargs)

- **name**: Unique identifier for the state. Does not affect the Chef run.
- **server**: The chef server URL
- **client_key**: Set the client key file location
- **config**: The configuration file to use
- **config-file-jail**: Directory under which config files are allowed to be loaded (no client.rb or knife.rb outside this path will be loaded).
- **environment**: Set the Chef Environment on the node
- **group**: Group to set privilege to
- **json-attributes**: Load attributes from a JSON file or URL
- **localmode**: Point chef-client at local repository if True
- **log_level**: Set the log level (debug, info, warn, error, fatal)
- **logfile**: Set the log file location
- **node-name**: The node name for this client
- **override-runlist**: Replace current run list with specified items for a single run
- **pid**: Set the PID file location, defaults to /tmp/chef-client.pid
- **run-lock-timeout**: Set maximum duration to wait for another client run to finish, default is indefinitely.
- **runlist**: Permanently replace current run list with specified items
- **user**: User to set privilege to
- **validation_key**: Set the validation key file location, used for registering new clients

salt.states.chef.solo(name, **kwargs)

- **name**: Unique identifier for the state. Does not affect the Chef run.
- **config**: The configuration file to use
- **environment**: Set the Chef Environment on the node
- **group**: Group to set privilege to
- **json-attributes**: Load attributes from a JSON file or URL
log_level  Set the log level (debug, info, warn, error, fatal)
logfile   Set the log file location
node-name The node name for this client
override-runlist Replace current run list with specified items for a single run
recipe-url Pull down a remote gzipped tarball of recipes and untar it to the cookbook cache
run-lock-timeout Set maximum duration to wait for another client run to finish, default is indefinitely.
user     User to set privilege to

21.19.56 salt.states.chocolatey module

Manage Chocolatey package installs .. versionadded:: 2016.3.0

Note: Chocolatey pulls data from the Chocolatey internet database to determine current versions, find available versions, etc. This is normally a slow operation and may be optimized by specifying a local, smaller chocolatey repo.

salt.states.chocolatey.installed(name, version=None, source=None, force=False, pre_versions=False, install_args=None, override_args=False, force_x86=False, package_args=None, allow_multiple=False)

Installs a package if not already installed

Parameters

• name (str) – The name of the package to be installed. Required.
• version (str) – Install a specific version of the package. Defaults to latest version. If the version is different to the one installed then the specified version will be installed. Default is None.
• source (str) – Chocolatey repository (directory, share or remote URL, feed). Defaults to the official Chocolatey feed. Default is None.
• force (bool) – Reinstall the current version of an existing package. Do not use with allow_multiple. Default is False.
• pre_versions (bool) – Include pre-release packages. Default is False.
• install_args (str) – Install arguments you want to pass to the installation process, i.e product key or feature list. Default is None.
• override_args (bool) – Set to True if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False install_args will be appended to the end of the default arguments. Default is False.
• force_x86 (bool) – Force x86 (32bit) installation on 64 bit systems. Default is False.
• package_args (str) – Arguments you want to pass to the package. Default is None.
• allow_multiple (bool) – Allow multiple versions of the package to be installed. Do not use with force. Does not work with all packages. Default is False.

New in version 2017.7.0.

Install package:

chocolatey.installed:
  - name: packagename
  - version: '12.04'
  - source: 'mychocolatey/source'
  - force: True

salt.states.chocolatey.uninstalled(name, version=None, uninstall_args=None, override_args=False)

Uninstalls a package
name  The name of the package to be uninstalled
version Uninstalls a specific version of the package. Defaults to latest version installed.
uninstall_args A list of uninstall arguments you want to pass to the uninstallation process i.e product key or
feature list
override_args Set to true if you want to override the original uninstall arguments (for the native uninstaller)in
the package and use your own. When this is set to False uninstall_args will be appended to the end of
the default arguments

salt.states.chocolatey.upgraded(name, version=None, source=None, force=False,
pre_versions=False, install_args=None, override_args=False,
force_x86=False, package_args=None)

Upgrades a package. Will install the package if not installed.

New in version 2018.3.0.

Parameters

- name (str) – The name of the package to be installed. Required.
- version (str) – Install a specific version of the package. Defaults to latest ver-
sion. If the version is greater than the one installed then the specified version will be
installed. Default is None.
- source (str) – Chocolatey repository (directory, share or remote URL, feed). De-
faults to the official Chocolatey feed. Default is None.
- force (bool) – True will reinstall an existing package with the same version. De-
fault is False.
- pre_versions (bool) – True will include pre-release packages. Default is
False.
- install_args (str) – Install arguments you want to pass to the installation pro-
cess, i.e product key or feature list. Default is None.
- override_args (bool) – True will override the original install arguments (for
the native installer) in the package and use those specified in install_args. False
will append install_args to the end of the default arguments. Default is
False.
- force_x86 (bool) – True forces 32bit installation on 64 bit systems. Default is
False.
- package_args (str) – Arguments you want to pass to the package. Default is
None.

upgrade_some_package:
    chocolatey.upgraded:
        - name: packagename
        - version: '12.04'
        - source: 'mychocolatey/source'

21.19.57 salt.states.chronos_job module

Configure Chronos jobs via a salt proxy.

my_job:
    chronos_job.config:
        - config:
            schedule: "R//PT2S"
            command: "echo 'hi'"
            owner: "me@example.com"

New in version 2015.8.2.
salt.states.chronos_job.absent(name)
Ensure that the chronos job with the given name is not present.

Parameters name – The app name

Returns A standard Salt changes dictionary

salt.states.chronos_job.config(name, config)
Ensure that the chronos job with the given name is present and is configured to match the given config values.

Parameters
• name – The job name
• config – The configuration to apply (dict)

Returns A standard Salt changes dictionary

21.19.58 salt.states.cimc

A state module to manage Cisco UCS chassis devices.

codeauthor Spencer Ervin <spencer_ervin@hotmail.com>
maturity new
depends none
platform unix

About

This state module was designed to handle connections to a Cisco Unified Computing System (UCS) chassis. This module relies on the CIMC proxy module to interface with the device.

See also:

CIMC Proxy Module

salt.states.cimc.hostname(name, hostname=None)
Ensures that the hostname is set to the specified value.

New in version 2019.2.0.

name: The name of the module function to execute.
hostname(str): The hostname of the server.

SLS Example:

```
set_name:
    cimc.hostname:
        - hostname: foobar
```

salt.states.cimc.logging_levels(name, remote=None, local=None)
Ensures that the logging levels are set on the device. The logging levels must match the following options: emergency, alert, critical, error, warning, notice, informational, debug.

New in version 2019.2.0.

name: The name of the module function to execute.
remote(str): The logging level for SYSLOG logs.
local(str): The logging level for the local device.

SLS Example:
logging_levels:
  cimc.logging_levels:
    - remote: informational
    - local: notice

salt.states.cimc.ntp(name, servers)
Ensures that the NTP servers are configured. Servers are provided as an individual string or list format. Only four NTP servers will be reviewed. Any entries past four will be ignored.

name: The name of the module function to execute.
servers(str, list): The IP address or FQDN of the NTP servers.

SLS Example:

ntp_configuration_list:
  cimc.ntp:
    - servers:
      - foo.bar.com
      - 10.10.10.10

ntp_configuration_str:
  cimc.ntp:
    - servers: foo.bar.com

salt.states.cimc.power_configuration(name, policy=None, delayType=None, delayValue=None)
Ensures that the power configuration is configured on the system. This is only available on some C-Series servers.

New in version 2019.2.0.

name: The name of the module function to execute.
policy(str): The action to be taken when chassis power is restored after an unexpected power loss. This can be one of the following:
  - reset: The server is allowed to boot up normally when power is restored. The server can restart immediately or, optionally, after a fixed or random delay.
  - stay-off: The server remains off until it is manually restarted.
  - last-state: The server restarts and the system attempts to restore any processes that were running before power was lost.
delayType(str): If the selected policy is reset, the restart can be delayed with this option. This can be one of the following:
  - fixed: The server restarts after a fixed delay.
  - random: The server restarts after a random delay.
delayValue(int): If a fixed delay is selected, once chassis power is restored and the Cisco IMC has finished rebooting, the system waits for the specified number of seconds before restarting the server. Enter an integer between 0 and 240.

SLS Example:

reset_power:
  cimc.power_configuration:
    - policy: reset
    - delayType: fixed
    - delayValue: 0
(continues on next page)
power_off:
  cimc.power_configuration:
    - policy: stay-off

salt.states.cimc.syslog(name, primary=None, secondary=None)
    Ensures that the syslog servers are set to the specified values. A value of None will be ignored.
    name: The name of the module function to execute.
    primary(str): The IP address or FQDN of the primary syslog server.
    secondary(str): The IP address or FQDN of the secondary syslog server.
    SLS Example:
    syslog_configuration:
      cimc.syslog:
        - primary: 10.10.10.10
        - secondary: foo.bar.com

salt.states.cimc.user(name, id=None, user=None, priv=None, password=None, status='active')
    Ensures that a user is configured on the device. Due to being unable to verify the user password. This is a
    forced operation.
    New in version 2019.2.0.
    name: The name of the module function to execute.
    id(int): The user ID slot on the device.
    user(str): The username of the user.
    priv(str): The privilege level of the user.
    password(str): The password of the user.
    status(str): The status of the user. Can be either active or inactive.
    SLS Example:
    user_configuration:
      cimc.user:
        - id: 11
        - user: foo
        - priv: admin
        - password: mypassword
        - status: active

21.19.59 salt.states.cisconso

State module for Cisco NSO Proxy minions

For documentation on setting up the cisconso proxy minion look in the documentation for salt.proxy.cisconso.
salt.states.cisconso.value_present(name, datastore, path, config)
    Ensure a specific value exists at a given path
    Parameters
        • name (str) - The name for this rule
• **datastore** (DatastoreType (str enum)) – The datastore, e.g. running, operational. One of the NETCONF store IETF types
• **path** (list, str OR tuple) – The device path to set the value at, a list of element names in order, / separated
• **config** (dict) – The new value at the given path

Examples:

```python
enable pap auth:
   ciscoconf2.config_present:
      - name: enable_pap_auth
      - datastore: running
      - path: devices/device/ex0/config/sys/interfaces/serial/ppp0/authentication
      - config:
        authentication:
           method: pap
           "list-name": foobar
```

### 21.19.60 salt.states.cloud

**Using states instead of maps to deploy clouds**

New in version 2014.1.0.

Use this minion to spin up a cloud instance:

```python
my-ec2-instance:
   cloud.profile:
      my-ec2-config
```

**salt.states.cloud.absent**(name, onlyif=None, unless=None)

Ensure that no instances with the specified names exist.

CAUTION: This is a destructive state, which will search all configured cloud providers for the named instance, and destroy it.

- **name** The name of the instance to destroy
- **onlyif** Do run the state only if is unless succeed
- **unless** Do not run the state at least unless succeed

**salt.states.cloud.present**(name, cloud_provider, onlyif=None, unless=None, opts=None, **kwargs)

Spin up a single instance on a cloud provider, using salt-cloud. This state does not take a profile argument; rather, it takes the arguments that would normally be configured as part of the state.

Note that while this function does take any configuration argument that would normally be used to create an instance, it will not verify the state of any of those arguments on an existing instance. Stateful properties of an instance should be configured using their own individual state (i.e., cloud.tagged, cloud.untagged, etc).

- **name** The name of the instance to create
- **cloud_provider** The name of the cloud provider to use
- **onlyif** Do run the state only if is unless succeed
- **unless** Do not run the state at least unless succeed
- **opts** Any extra opts that need to be used

**salt.states.cloud.profile**(name, profile, onlyif=None, unless=None, opts=None, **kwargs)

Create a single instance on a cloud provider, using a salt-cloud profile.

Note that while profiles used this function do take any configuration argument that would normally be used to create an instance using a profile, this state will not verify the state of any of those arguments on an
existing instance. Stateful properties of an instance should be configured using their own individual state (i.e., cloud.tagged, cloud.untagged, etc).

- **name** The name of the instance to create
- **profile** The name of the cloud profile to use
- **onlyif** Do run the state only if is unless succeed
- **unless** Do not run the state at least unless succeed
- **kwargs** Any profile override or addition
- **opts** Any extra opts that need to be used

```python
salt.states.cloud.volume_absent(name, provider=None, **kwargs)
```
Check that a block volume exists.

```python
salt.states.cloud.volume_attached(name, server_name, provider=None, **kwargs)
```
Check if a block volume is attached.

```python
salt.states.cloud.volume_detached(name, server_name=None, provider=None, **kwargs)
```
Check if a block volume is attached.

Returns True if server or Volume do not exist.

```python
salt.states.cloud.volume_present(name, provider=None, **kwargs)
```
Check that a block volume exists.

### 21.19.61 salt.states.cmd

#### Execution of arbitrary commands

The cmd state module manages the enforcement of executed commands, this state can tell a command to run under certain circumstances.

A simple example to execute a command:

```python
# Store the current date in a file
'date > /tmp/salt-run':
  cmd.run
```

Only run if another execution failed, in this case truncate syslog if there is no disk space:

```python
'&gt; /var/log/messages/: cmd.run:
  - unless: echo 'foo' &gt; /tmp/.test &amp;&amp; rm -f /tmp/.test
```

Only run if the file specified by `creates` does not exist, in this case touch /tmp/foo if it does not exist:

```python
touch /tmp/foo:
  cmd.run:
    - creates: /tmp/foo
```

`creates` also accepts a list of files:

```python
"echo 'foo' | tee /tmp/bar &gt; /tmp/baz":
  cmd.run:
    - creates:
      - /tmp/bar
      - /tmp/baz
```
Sometimes when running a command that starts up a daemon, the init script doesn’t return properly which causes Salt to wait indefinitely for a response. In situations like this try the following:

```bash
run_installer:
    cmd.run:
        - name: /tmp/installer.bin > /dev/null 2>&1
```

Salt determines whether the `cmd` state is successfully enforced based on the exit code returned by the command. If the command returns a zero exit code, then salt determines that the state was successfully enforced. If the script returns a non-zero exit code, then salt determines that it failed to successfully enforce the state. If a command returns a non-zero exit code but you wish to treat this as a success, then you must place the command in a script and explicitly set the exit code of the script to zero.

Please note that the success or failure of the state is not affected by whether a state change occurred nor the stateful argument.

When executing a command or script, the state (i.e., changed or not) of the command is unknown to Salt’s state system. Therefore, by default, the `cmd` state assumes that any command execution results in a changed state.

This means that if a `cmd` state is watched by another state then the state that’s watching will always be executed due to the `changed` state in the `cmd` state.

**Using the "Stateful" Argument**

Many state functions in this module now also accept a `stateful` argument. If `stateful` is specified to be true then it is assumed that the command or script will determine its own state and communicate it back by following a simple protocol described below:

1. **If there’s nothing in the stdout of the command, then assume no changes.** Otherwise, the stdout must be either in JSON or its last non-empty line must be a string of key=value pairs delimited by spaces (no spaces on either side of `=`).
2. **If it’s JSON then it must be a JSON object (e.g., `{}`).** If it’s key=value pairs then quoting may be used to include spaces. (Python’s shlex module is used to parse the key=value string)

Two special keys or attributes are recognized in the output:

- `changed`: bool (i.e., 'yes', 'no', 'true', 'false', case-insensitive)
- `comment`: str (i.e., any string)

So, only if `changed` is True then assume the command execution has changed the state, and any other key values or attributes in the output will be set as part of the changes.

3. **If there’s a comment then it will be used as the comment of the state.**

Here’s an example of how one might write a shell script for use with a stateful command:

```bash
#!/bin/bash
#
echo "Working hard..."
#
writing the state line
echo # an empty line here so the next line will be the last.
echo "changed=yes comment='something has changed' whatever=123"
```
And an example SLS file using this module:

```
Run myscript:
  cmd.run:
    - name: /path/to/myscript
    - cwd: /
    - stateful: True

Run only if myscript changed something:
  cmd.run:
    - name: echo hello
    - cwd: /
    - onchanges:
      - cmd: Run myscript
```

Note that if the second `cmd.run` state also specifies `stateful: True` it can then be watched by some other states as well.

4. The `stateful` argument can optionally include a `test_name` parameter.

This is used to specify a command to run in test mode. This command should return stateful data for changes that would be made by the command in the name parameter.

New in version 2015.2.0.

```
Run myscript:
  cmd.run:
    - name: /path/to/myscript
    - cwd: /
    - stateful:
      - test_name: /path/to/myscript test

Run masterscript:
  cmd.script:
    - name: masterscript
    - source: salt://path/to/masterscript
    - cwd: /
    - stateful:
      - test_name: masterscript test
```

Should I use `cmd.run` or `cmd.wait`?

**Note:** Use `cmd.run` together with `onchanges` instead of `cmd.wait`.

These two states are often confused. The important thing to remember about them is that `cmd.run` states are run each time the SLS file that contains them is applied. If it is more desirable to have a command that only runs after some other state changes, then `cmd.wait` does just that. `cmd.wait` is designed to watch other states, and is executed when the state it is watching changes. Example:

```
/usr/local/bin/postinstall.sh:
  cmd.wait:
    - watch:
      - pkg: mycustompkg

  file.managed:
    - source: salt://utils/scripts/postinstall.sh
```

(continues on next page)
mycustompkg:
  pkg.installed:
    - require:
      - file: /usr/local/bin/postinstall.sh

`cmd.wait` itself does not do anything; all functionality is inside its `mod_watch` function, which is called by `watch` on changes.

The preferred format is using the `onchanges Requisite`, which works on `cmd.run` as well as on any other state. The example would then look as follows:

```
/usr/local/bin/postinstall.sh:
  cmd.run:
    - onchanges:
      - pkg: mycustompkg
  file.managed:
    - source: salt://utils/scripts/postinstall.sh

mycustompkg:
  pkg.installed:
    - require:
      - file: /usr/local/bin/postinstall.sh
```

How do I create an environment from a pillar map?

The map that comes from a pillar can be directly consumed by the `env` option! To use it, one may pass it like this. Example:

```
printenv:
  cmd.run:
    - env: {{ salt['pillar.get']('example:val', {}) }}
```

```
salt.states.cmd.call(name, func, args=(), kws=(), onlyif=None, unless=None, creates=None, out_put_loglevel='debug', hide_output=False, use_vt=False, **kwargs)
```

Invoke a pre-defined Python function with arguments specified in the state declaration. This function is mainly used by the `salt.renderers.pydsl` renderer.

The interpretation of `onlyif` and `unless` arguments are identical to those of `cmd.run`, and all other arguments(`cwd`, `runas`, ...) allowed by `cmd.run` are allowed here, except that their effects apply only to the commands specified in `onlyif` and `unless` rather than to the function to be invoked.

In addition, the `stateful` argument has no effects here.

The return value of the invoked function will be interpreted as follows.

If it’s a dictionary then it will be passed through to the state system, which expects it to have the usual structure returned by any salt state function.

Otherwise, the return value (denoted as `result` in the code below) is expected to be a JSON serializable object, and this dictionary is returned:

```
{
  'name': name,
  'changes': {'retval': result},
  'result': True if result is None else bool(result),
}
```
Salt Documentation, Release 2019.2.0

(continued from previous page)

```python
'comment': result if isinstance(result, six.string_types) else ''
```

salt.states.cmd.mod_run_check(cmd_kwargs, onlyif, unless, creates)

Execute the onlyif and unless logic. Return a result dict if: *onlyif failed (onlyif != 0)" unless succeeded (unless == 0) else return True

salt.states.cmd.mod_watch(name, **kwargs)

Execute a cmd function based on a watch call

**Note:** This state exists to support special handling of the watch requisite. It should not be called directly. Parameters for this function should be set by the state being triggered.

salt.states.cmd.run(name, onlyif=None, unless=None, creates=None, cwd=None, runas=None, shell=None, env=None, prepend_path=None, stateful=False, umask=None, output_loglevel='debug', hide_output=False, timeout=None, ignore_timeout=False, use_vt=False, success_retcodes=None, **kwargs)

Run a command if certain circumstances are met. Use cmd.wait if you want to use the watch requisite.

- **name**: The command to execute, remember that the command will execute with the path and permissions of the salt-minion.
- **onlyif**: A command to run as a check, run the named command only if the command passed to the onlyif option returns a zero exit status.
- **unless**: A command to run as a check, only run the named command if the command passed to the unless option returns a non-zero exit status.
- **cwd**: The current working directory to execute the command in, defaults to /root.
- **runas**: The user name to run the command as.
- **shell**: The shell to use for execution, defaults to the shell grain.
- **env**: A list of environment variables to be set prior to execution. Example:

  ```bash
  script-foo:
  cmd.run:
    - env:
      - BATCH: 'yes'
  ```

**Warning:** The above illustrates a common PyYAML pitfall, that yes, no, on, off, true, and false are all loaded as boolean True and False values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found here.

Variables as values are not evaluated. So $PATH in the following example is a literal '$PATH':

```bash
script-bar:
  cmd.run:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing $PATH by using a bit of Jinja:

```bash
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}
mycommand:
  cmd.run:
    - name: ls -l /
```

(continues on next page)
- env:
  - PATH: {{ [current_path, '/my/special/bin']|join(':') }}

prepend_path  $PATH segment to prepend (trailing ' :' not necessary) to $PATH. This is an easier alternative to the Jinja workaround.

New in version 2018.3.0.

stateful  The command being executed is expected to return data about executing a state. For more information, see the Using the "Stateful" Argument section.

umask  The umask (in octal) to use when running the command.

output_loglevel  [debug] Control the loglevel at which the output from the command is logged to the minion log.

Note: The command being run will still be logged at the debug loglevel regardless, unless quiet is used for this value.

hide_output  [False] Suppress stdout and stderr in the state's results.

Note: This is separate from output_loglevel, which only handles how Salt logs to the minion log.

New in version 2018.3.0.

quiet  This option no longer has any functionality and will be removed, please set output_loglevel to quiet to suppress logging of the command.

Deprecated since version 2014.1.0.

timeout  If the command has not terminated after timeout seconds, send the subprocess sigterm, and if sigterm is ignored, follow up with sigkill

ignore_timeout  Ignore the timeout of commands, which is useful for running nohup processes.

New in version 2015.8.0.

creates  Only run if the file or files specified by creates do not exist.

New in version 2014.7.0.

use_vt  [False] Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

New in version 2016.3.6.

success_retcodes: This parameter will be allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

Note: cmd.run supports the usage of reload_modules. This functionality allows you to force Salt to reload all modules. You should only use reload_modules if your cmd.run does some sort of installation (such as pip), if you do not reload the modules future items in your state which rely on the software being installed will fail.

getpip:

    cmd.run:
        - name: /usr/bin/python /usr/local/sbin/get-pip.py
        - unless: which pip
        - require:
            - pkg: python
- file: /usr/local/sbin/get-pip.py
- reload_modules: True

salt.states.cmd.script(name, source=source, template=template, onlyif=onlyif, unless=unless, creates=create, 
cwd=cwd, runas=runas, shell=shell, env=env, stateful=stateful, umask=umask, 
timeout=timeout, use_vt=use_vt, output_loglevel=output_loglevel, 'debug', hide_output=hide_output, defaults=defaults, context=context, success_retcodes=successe_retcodes, **kwargs)

Download a script and execute it with specified arguments.

source The location of the script to download. If the file is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs

template If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported

name Either "cmd arg1 arg2 arg3..." (cmd is not used) or a source "salt://...".

onlyif Run the named command only if the command passed to the onlyif option returns true

unless Run the named command only if the command passed to the unless option returns false

cwd The current working directory to execute the command in, defaults to /root

runas The name of the user to run the command as

shell The shell to use for execution. The default is set in grains['shell']

env A list of environment variables to be set prior to execution. Example:

```
salt://scripts/foo.sh:
  cmd.script:
    - env:
      - BATCH: 'yes'
```

**Warning:** The above illustrates a common PyYAML pitfall, that yes, no, on, off, true, and false are all loaded as boolean True and False values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So $PATH in the following example is a literal '$PATH':

```
salt://scripts/bar.sh:
  cmd.script:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing $PATH by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}
mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

saltenv [base] The Salt environment to use
umask The umask (in octal) to use when running the command.
stateful The command being executed is expected to return data about executing a state. For more information, see the Using the "Stateful" Argument section.
timeout If the command has not terminated after timeout seconds, send the subprocess sigterm, and if sigterm is ignored, follow up with sigkill
args String of command line args to pass to the script. Only used if no args are specified as part of the name
argument. To pass a string containing spaces in YAML, you will need to doubly-quote it: "arg1 'arg two' arg3"

creates Only run if the file or files specified by creates do not exist.

New in version 2014.7.0.

use_vt Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

context New in version 2016.3.0.

Overrides default context variables passed to the template.

defaults New in version 2016.3.0.

Default context passed to the template.

output_loglevel [debug] Control the loglevel at which the output from the command is logged to the minion log.

Note: The command being run will still be logged at the debug loglevel regardless, unless quiet is used for this value.

hide_output [False] Suppress stdout and stderr in the state's results.

Note: This is separate from output_loglevel, which only handles how Salt logs to the minion log.

New in version 2018.3.0.

success_retcodes: This parameter will be allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

Example:

```python
script-foo:
  cmd.wait:
    - env:
      - BATCH: 'yes'
```
**Warning:** The above illustrates a common PyYAML pitfall, that *yes*, *no*, *on*, *off*, *true*, and *false* are all loaded as boolean *True* and *False* values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So `$PATH` in the following example is a literal `$PATH`:

```yaml
script-bar:
  cmd.wait:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing `$PATH` by using a bit of Jinja:

```yaml
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}
mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

- **umask** The umask (in octal) to use when running the command.
- **stateful** The command being executed is expected to return data about executing a state. For more information, see the Using the "Stateful" Argument section.
- **creates** Only run if the file or files specified by creates do not exist.

New in version 2014.7.0.

- **output_loglevel** [debug] Control the loglevel at which the output from the command is logged to the minion log.

**Note:** The command being run will still be logged at the debug loglevel regardless, unless quiet is used for this value.

- **hide_output** [False] Suppress stdout and stderr in the state’s results.

**Note:** This is separate from output_loglevel, which only handles how Salt logs to the minion log.

New in version 2018.3.0.

- **use_vt** Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

- **success_retcodes**: This parameter will be allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

```python
salt.states.cmd.wait_call(name, func, args=(), kws=None, onlyif=None, unless=None, creates=None, stateful=False, use_vt=False, output_loglevel='debug', hide_output=False, **kwargs)
```

```python
salt.states.cmd.wait_script(name, source=None, template=None, onlyif=None, unless=None, cwd=None, runas=None, shell=None, env=None, stateful=False, umask=None, use_vt=False, output_loglevel='debug', hide_output=False, **kwargs)
```

Download a script from a remote source and execute it only if a watch statement calls it.
source  The source script being downloaded to the minion, this source script is hosted on the salt master server.
If the file is located on the master in the directory named spam, and is called eggs, the source string is
salt://spam/eggs

template  If this setting is applied then the named templating engine will be used to render the downloaded
file, currently jinja, mako, and wempy are supported

name  The command to execute, remember that the command will execute with the path and permissions of the
salt-minion.

onlyif  A command to run as a check, run the named command only if the command passed to the onlyif
option returns true

unless  A command to run as a check, only run the named command if the command passed to the unless
option returns false

cwd  The current working directory to execute the command in, defaults to /root

runas  The user name to run the command as

shell  The shell to use for execution, defaults to the shell grain

env  A list of environment variables to be set prior to execution. Example:

    salt://scripts/foo.sh:
        cmd.wait_script:
            - env:
                - BATCH: 'yes'

Warnings: The above illustrates a common PyYAML pitfall, that yes, no, on, off, true, and false are
all loaded as boolean True and False values, and must be enclosed in quotes to be used as strings.
More info on this (and other) PyYAML idiosyncrasies can be found here.

Variables as values are not evaluated. So $PATH in the following example is a literal $PATH:

    salt://scripts/bar.sh:
        cmd.wait_script:
            - env: "PATH=/some/path:$PATH"

One can still use the existing $PATH by using a bit of Jinja:

    {% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

    mycommand:
        cmd.run:
            - name: ls -l /
            - env:
                - PATH: {{ [current_path, '/my/special/bin']|join(':') }}

umask  The umask (in octal) to use when running the command.

stateful  The command being executed is expected to return data about executing a state. For more informa-
tion, see the Using the "Stateful" Argument section.

use_vt  Use VT utils (saltstack) to stream the command output more interactively to the console and the logs.
This is experimental.

output_loglevel [debug] Control the loglevel at which the output from the command is logged to the minion
log.

Note: The command being run will still be logged at the debug loglevel regardless, unless quiet is
used for this value.

hide_output [False] Suppress stdout and stderr in the state’s results.
Note: This is separate from output_loglevel, which only handles how Salt logs to the minion log.

New in version 2018.3.0.

success_retcodes: This parameter will allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

21.19.62 salt.states.composer

Installation of Composer Packages

These states manage the installed packages for composer for PHP. Note that either composer is installed and accessible via a bin directory or you can pass the location of composer in the state.

```yaml
get-composer:
  cmd.run:
    - name: 'CURL=`which curl`; $CURL -sS https://getcomposer.org/installer | php'
    - unless: test -f /usr/local/bin/composer
    - cwd: /root/

install-composer:
  cmd.wait:
    - name: mv /root/composer.phar /usr/local/bin/composer
    - cwd: /root/
    - watch:
      - cmd: get-composer

/path/to/project:
  composer.installed:
    - no_dev: true
    - require:
      - cmd: install-composer

# Without composer installed in your PATH
# Note: composer.phar must be executable for state to work properly
/path/to/project:
  composer.installed:
    - composer: /path/to/composer.phar
    - php: /usr/local/bin/php
    - no_dev: true
```

salt.states.composer.installed(name, composer=None, php=None, user=None, prefer_source=None, prefer_dist=None, no_scripts=None, no_plugins=None, optimize=None, no_dev=None, quiet=False, composer_home='/root', always_check=True, env=None)

Verify that the correct versions of composer dependencies are present.

- **name** Directory location of the composer.json file.
- **composer** Location of the composer.phar file. If not set composer will just execute composer as if it is installed globally. (i.e. /path/to/composer.phar)
- **php** Location of the php executable to use with composer. (i.e. /usr/bin/php)
- **user** Which system user to run composer as.

New in version 2014.1.4.
prefer_source --prefer-source option of composer.
prefer_dist --prefer-dist option of composer.
no_scripts --no-scripts option of composer.
no_plugins --no-plugins option of composer.
optimize --optimize-autoloader option of composer. Recommended for production.
no_dev --no-dev option for composer. Recommended for production.
quiet --quiet option for composer. Whether or not to return output from composer.

composer_home $COMPOSER_HOME environment variable
always_check If True, always run composer install in the directory. This is the default behavior. If False, only run composer install if there is no vendor directory present.
env A list of environment variables to be set prior to execution.

salt.states.composer.update(name, composer=None, php=None, user=None, prefer_source=None,
prefer_dist=None, no_scripts=None, no_plugins=None, optimize=None,
no_dev=None, quiet=False, composer_home=None, env=None)

Composer update the directory to ensure we have the latest versions of all project dependencies.

name Directory location of the composer.json file.
composer Location of the composer.phar file. If not set composer will just execute composer as if it is installed globally. (i.e. /path/to/composer.phar)
php Location of the php executable to use with composer. (i.e. /usr/bin/php)
user Which system user to run composer as.

New in version 2014.1.4.

prefer_source --prefer-source option of composer.
prefer_dist --prefer-dist option of composer.
no_scripts --no-scripts option of composer.
no_plugins --no-plugins option of composer.
optimize --optimize-autoloader option of composer. Recommended for production.
no_dev --no-dev option for composer. Recommended for production.
quiet --quiet option for composer. Whether or not to return output from composer.
composer_home $COMPOSER_HOME environment variable
env A list of environment variables to be set prior to execution.

21.19.63 salt.states.cron

Management of cron, the Unix command scheduler

Cron declarations require a number of parameters. The following are the parameters used by Salt to define the various timing values for a cron job:

- minute
- hour
- daymonth
- month
- dayweek (0 to 6 are Sunday through Saturday, 7 can also be used for Sunday)

Warning: Any timing arguments not specified take a value of *. This means that setting hour to 5, while not defining the minute param, will result in Salt adding a job that will execute every minute between 5 and 6 A.M.!

Additionally, the default user for these states is root. Therefore, if the cron job is for another user, it is necessary to specify that user with the user parameter.
A long time ago (before 2014.2), when making changes to an existing cron job, the name declaration is the parameter used to uniquely identify the job, so if an existing cron that looks like this:

```bash
date > /tmp/crontest:
cron.present:
  - user: root
  - minute: 5
```

Is changed to this:

```bash
date > /tmp/crontest:
cron.present:
  - user: root
  - minute: 7
  - hour: 2
```

Then the existing cron will be updated, but if the cron command is changed, then a new cron job will be added to the user's crontab.

The current behavior is still relying on that mechanism, but you can also specify an identifier to identify your crontabs:

```bash
date > /tmp/crontest:
cron.present:
  - identifier: SUPERCRON
  - user: root
  - minute: 7
  - hour: 2
```

New in version 2014.1.2.

And, some months later, you modify it:

```bash
superscript > /tmp/crontest:
cron.present:
  - identifier: SUPERCRON
  - user: root
  - minute: 3
  - hour: 4
```

New in version 2014.1.2.

The old `date > /tmp/crontest` will be replaced by `superscript > /tmp/crontest`.

Additionally, Salt also supports running a cron every `x minutes` very similarly to the Unix convention of using `*/5` to have a job run every five minutes. In Salt, this looks like:

```bash
date > /tmp/crontest:
cron.present:
  - user: root
  - minute: '*/5'
```

The job will now run every 5 minutes.

Additionally, the temporal parameters (minute, hour, etc.) can be randomized by using `random` instead of using a specific value. For example, by using the `random` keyword in the `minute` parameter of a cron state, the same cron job can be pushed to hundreds or thousands of hosts, and they would each use a randomly-generated minute. This can be helpful when the cron job accesses a network resource, and it is not desirable for all hosts to run the job concurrently.
**/path/to/cron/script:**
```yaml
cron.present:
- user: root
- minute: random
- hour: 2
```

New in version 0.16.0.

Since Salt assumes a value of * for unspecified temporal parameters, adding a parameter to the state and setting it to random will change that value from * to a randomized numeric value. However, if that field in the cron entry on the minion already contains a numeric value, then using the random keyword will not modify it.

Added the opportunity to set a job with a special keyword like '@reboot' or '@hourly'. Quotes must be used, otherwise PyYAML will strip the '@' sign.

```yaml
/cron.present:
- user: root
- special: '@hourly'
```

The script will be executed every reboot if cron daemon support this option.

```yaml
/other.script
```

This counter part definition will ensure than a job with a special keyword is not set.

```python
salt.states.cron.absent(name, user='root', identifier=False, special=None, **kwargs)
```

Verifies that the specified cron job is absent for the specified user; only the name is matched when removing a cron job.

- **name**: The command that should be absent in the user crontab.
- **user**: The name of the user whose crontab needs to be modified, defaults to the root user
- **identifier**: Custom-defined identifier for tracking the cron line for future crontab edits. This defaults to the state name
- **special**: The special keyword used in the job (eg. @reboot, @hourly...). Quotes must be used, otherwise PyYAML will strip the '@' sign.

```python
salt.states.cron.env_absent(name, user='root')
```

Verifies that the specified environment variable is absent from the crontab for the specified user

- **name**: The name of the environment variable to remove from the user crontab
- **user**: The name of the user whose crontab needs to be modified, defaults to the root user

```python
salt.states.cron.env_present(name, value=None, user='root')
```

Verifies that the specified environment variable is present in the crontab for the specified user.

- **name**: The name of the environment variable to set in the user crontab
- **user**: The name of the user whose crontab needs to be modified, defaults to the root user
- **value**: The value to set for the given environment variable

```python
salt.states.cron.file(name, source_hash='', source_hash_name=None, user='root', template=None, context=None, replace=True, defaults=None, backup='', **kwargs)
```

Provides file.managed-like functionality (templating, etc.) for a pre-made crontab file, to be assigned to a given user.

- **name**: The source file to be used as the crontab. This source file can be hosted on either the salt master server, or on an HTTP or FTP server. For files hosted on the salt file server, if the file is located on the master in the directory named spam, and is called eggs, the source string is `salt://spam/eggs`
- **user**: The name of the user whose crontab needs to be modified, defaults to the root user

If the file is hosted on a HTTP or FTP server then the source_hash argument is also required.
source_hash  This can be either a file which contains a source hash string for the source, or a source hash string.  The source hash string is the hash algorithm followed by the hash of the file:  
\text{md5=}e138491e9d5b97023cea823fe17bac22

source_hash_name  When source_hash refers to a hash file, Salt will try to find the correct hash by matching the filename/URI associated with that hash.  By default, Salt will look for the filename being managed.  When managing a file at path /tmp/foo.txt, then the following line in a hash file would match:

\begin{verbatim}
acbd18db4cc2f85cedef654fccc4a4d8  foo.txt
\end{verbatim}

However, sometimes a hash file will include multiple similar paths:

\begin{verbatim}
37b51d19a7513e45b56f6524f2d51f2  ./dir1/foo.txt
acbd18db4cc2f85cedef654fccc4a4d8  ./dir2/foo.txt
73feffa4b7f6bb68e44cf984c85f6e88  ./dir3/foo.txt
\end{verbatim}

In cases like this, Salt may match the incorrect hash.  This argument can be used to tell Salt which filename to match, to ensure that the correct hash is identified.  For example:

\begin{verbatim}
foo_crontab:
  cron.file:
    - name: https://mydomain.tld/dir2/foo.txt
    - source_hash: https://mydomain.tld/hashes
    - source_hash_name: ./dir2/foo.txt
\end{verbatim}

\textbf{Note: } This argument must contain the full filename entry from the checksum file, as this argument is meant to disambiguate matches for multiple files that have the same basename.  So, in the example above, simply using \texttt{foo.txt} would not match.

New in version 2016.3.5.

user  The user to whom the crontab should be assigned.  This defaults to root.

template  If this setting is applied then the named templating engine will be used to render the downloaded file.  Currently, jinja and mako are supported.

context  Overrides default context variables passed to the template.

replace  If the crontab should be replaced, if False then this command will be ignored if a crontab exists for the specified user.  Default is True.

defaults  Default context passed to the template.

backup  Overrides the default backup mode for the user’s crontab.

\texttt{salt.states.cron.present(name, user='root', minute='*', hour='*', daymonth='*', month='*', dayweek='*', comment=None, commented=False, identifier=False, special=None)}

Verifies that the specified cron job is present for the specified user.  It is recommended to use identifier.  Otherwise the cron job is installed twice if you change the name.  For more advanced information about what exactly can be set in the cron timing parameters, check your cron system’s documentation.  Most Unix-like systems’ cron documentation can be found via the crontab man page: man 5 crontab.

name  The command that should be executed by the cron job.

user  The name of the user whose crontab needs to be modified, defaults to the root user.

minute  The information to be set into the minute section, this can be any string supported by your cron system’s minute field.  Default is *

hour  The information to be set in the hour section.  Default is *

daymonth  The information to be set in the day of month section.  Default is *

month  The information to be set in the month section.  Default is *

dayweek  The information to be set in the day of week section.  Default is *

comment  User comment to be added on line previous the cron job
commented The cron job is set commented (prefixed with #DISABLED#). Defaults to False.

New in version 2016.3.0.

identifier Custom-defined identifier for tracking the cron line for future crontab edits. This defaults to the state name

special A special keyword to specify periodicity (eg. @reboot, @hourly...). Quotes must be used, otherwise PyYAML will strip the '@' sign.

New in version 2016.3.0.

21.19.64 salt.states.csf module

CSF Ip tables management

depends

- csf utility

configuration See http://download.configserver.com/csf/install.txt for setup instructions.

```
Simply allow/deny rules:
  csf.rule_present:
    ip: 1.2.3.4
    method: allow
```

salt.states.csf.nics_skip(name, nics, ipv6)

Alias for csf.nics_skipped

salt.states.csf.nics_skipped(name, nics, ipv6=False)

name Meaningless arg, but required for state.

nics A list of nics to skip.

ipv6 Boolean. Set to true if you want to skip the ipv6 interface. Default false (ipv4).

salt.states.csf.option_present(name, value, reload=False)

Ensure the state of a particular option/setting in csf.

name The option name in csf.conf

value The value it should be set to.

reload Boolean. If set to true, csf will be reloaded after.

salt.states.csf.ports_open(name, ports, proto='tcp', direction='in')

Ensure ports are open for a protocol, in a direction. e.g. - proto='tcp', direction='in' would set the values for TCP_IN in the csf.conf file.

ports A list of ports that should be open.

proto The protocol. May be one of 'tcp', 'udp', 'tcp6', or 'udp6'.

direction Choose 'in', 'out', or both to indicate the port should be opened for inbound traffic, outbound traffic, or both.

salt.states.csf.rule_absent(name, method, port=None, proto='tcp', direction='in', port_origin='d', ip_origin='s', ttl=None, reload=False)

Ensure iptable is not present.

name The ip address or CIDR for the rule.

method The type of rule. Either 'allow' or 'deny'.

port Optional port to be open or closed for the iptables rule.

proto The protocol. Either 'tcp', 'udp'. Only applicable if port is specified.

direction The direction of traffic to apply the rule to. Either 'in', 'out'. Only applicable if port is specified.

port_origin Specifies either the source or destination port is relevant for this rule. Only applicable if port is specified. Either 's', or 'd'.

ip_origin  Specifies whether the ip in this rule refers to the source or destination ip. Either 's', or 'd'. Only applicable if port is specified.

ttl  How long the rule should exist. If supplied, csf.tempallow() or csf.tempdeny() are used.

reload  Reload the csf service after applying this rule. Default false.

salt.states.csf.rule_present(name, method, port=None, proto='tcp', direction='in', port_origin='d', ip_origin='s', ttl=None, comment='', reload=False)

Ensure iptable rule exists.

name  The ip address or CIDR for the rule.

method  The type of rule. Either 'allow' or 'deny'.

port  Optional port to be open or closed for the iptables rule.

proto  The protocol. Either 'tcp', or 'udp'. Only applicable if port is specified.

direction  The direction of traffic to apply the rule to. Either 'in', or 'out'. Only applicable if port is specified.

port_origin  Specifies either the source or destination port is relevant for this rule. Only applicable if port is specified. Either 's', or 'd'.

ip_origin  Specifies whether the ip in this rule refers to the source or destination ip. Either 's', or 'd'. Only applicable if port is specified.

ttl  How long the rule should exist. If supplied, csf.tempallow() or csf.tempdeny() are used.

comment  An optional comment to appear after the rule as a #comment .

reload  Reload the csf service after applying this rule. Default false.

salt.states.csf.testing_off(name, reload=False)

Ensure testing mode is enabled in csf.

reload  Reload CSF after changing the testing status. Default false.

salt.states.csf.testing_on(name, reload=False)

Ensure testing mode is enabled in csf.

reload  Reload CSF after changing the testing status. Default false.

21.19.65 salt.states.cyg

Installation of Cygwin packages.

A state module to manage cygwin packages. Packages can be installed or removed.

dos2unix:

cyg.installed

class salt.states.cyg.DictDiffer(current_dict, past_dict)

Calculate the difference between two dictionaries.

1) items added
2) items removed
3) keys same in both but changed values
4) keys same in both and unchanged values

added()

Return a set of additions to past_dict.

changed()

Return a set of the keys with changed values.

removed()

Return a set of things removed from past_dict.

same()

True if the two dicts are the same.

unchanged()

Return a set of the keys with unchanged values.
salt.states.cyg.installed(name, cyg_arch='x86_64', mirrors=None)
Make sure that a package is installed.
name The name of the package to install
cyg_arch [x86_64] The cygwin architecture to install the package into. Current options are x86 and x86_64
mirrors [None] List of mirrors to check. None will use a default mirror (kernel.org)

CLI Example:
```
rsync:
 cyg.installed:
   - mirrors:
     - http://mirror/without/public/key: ""
```

salt.states.cyg.removed(name, cyg_arch='x86_64', mirrors=None)
Make sure that a package is not installed.
name The name of the package to uninstall
cyg_arch [x86_64] The cygwin architecture to remove the package from. Current options are x86 and x86_64
mirrors [None] List of mirrors to check. None will use a default mirror (kernel.org)

CLI Example:
```
rsync:
 cyg.removed:
   - mirrors:
     - http://mirror/without/public/key: ""
```

salt.states.cyg.updated(name=None, cyg_arch='x86_64', mirrors=None)
Make sure all packages are up to date.
name [None] No affect, salt fails poorly without the arg available
cyg_arch [x86_64] The cygwin architecture to update. Current options are x86 and x86_64
mirrors [None] List of mirrors to check. None will use a default mirror (kernel.org)

CLI Example:
```
rsync:
 cyg.updated:
   - mirrors:
     - http://mirror/without/public/key: ""
```

21.19.66  salt.states.ddns

Dynamic DNS updates

Ensure a DNS record is present or absent utilizing RFC 2136 type dynamic updates.

depends
- dnspython

Note: The dnspython module is required when managing DDNS using a TSIG key. If you are not using a TSIG key, DDNS is allowed by ACLs based on IP address and the dnspython module is not required.

Example:
webserver:
  ddns.present:
    - zone: example.com
    - ttl: 60
    - data: 111.222.333.444
    - nameserver: 123.234.345.456
    - keyfile: /srv/salt/dnspy_tsig_key.txt

salt.states.ddns.absent(name, zone, data=None, rdtype=None, **kwargs)
Ensures that the named DNS record is absent.
  name  The host portion of the DNS record, e.g., 'webserver'. Name and zone are concatenated when the entry
         is created unless name includes a trailing dot, so make sure that information is not duplicated in these
         two arguments.
  zone  The zone to check
  data  Data for the DNS record. E.g., the IP address for an A record. If omitted, all records matching name (and
         rdtype, if provided) will be purged.
  rdtype  DNS resource type. If omitted, all types will be purged.
  **kwargs  Additional arguments the ddns.update function may need (e.g. nameserver, keyfile, keyname).
  Note that the nsupdate key file can't be reused by this function, the keyfile and other arguments must
         follow the dnspython spec.

salt.states.ddns.present(name, zone, ttl, data, rdtype='A', **kwargs)
Ensures that the named DNS record is present with the given ttl.
  name  The host portion of the DNS record, e.g., 'webserver'. Name and zone are concatenated when the entry
         is created unless name includes a trailing dot, so make sure that information is not duplicated in these
         two arguments.
  zone  The zone to check/update
  ttl   TTL for the record
  data  Data for the DNS record. E.g., the IP address for an A record.
  rdtype  DNS resource type. Default 'A'.
  **kwargs  Additional arguments the ddns.update function may need (e.g. nameserver, keyfile, keyname).
  Note that the nsupdate key file can't be reused by this function, the keyfile and other arguments must
         follow the dnspython spec.

21.19.67  salt.states.debconfmod

Management of debconf selections

depends
  - debconf-utils package

The debconfmod state module manages the enforcement of debconf selections, this state can set those selections
prior to package installation.

Available Functions

The debconfmod state has two functions, the set and set_file functions
set  Set debconf selections from the state itself
set_file  Set debconf selections from a file
nullmailer-debconf:
    debconf.set:
      - name: nullmailer
      - data:
        - 'shared/mailname': {'type': 'string', 'value': 'server.domain.tld'}
        - 'nullmailer/relayhost': {'type': 'string', 'value': 'mail.domain.tld'}

ferm-debconf:
    debconf.set:
      - name: ferm
      - data:
        - 'ferm/enable': {'type': 'boolean', 'value': True}

Note: Due to how PyYAML imports nested dicts (see here), the values in the data dict must be indented four spaces instead of two.

salt.states.debconfmod.set(name, data, **kwargs)
Set debconf selections

<state_id>:
    debconf.set:
      - name: <name>
      - data:
        - <question>: {'type': <type>, 'value': <value>}
        - <question>: {'type': <type>, 'value': <value>}

name: The package name to set answers for.
data: A set of questions/answers for debconf. Note that everything under this must be indented twice.
question: The question the is being pre-answered
type: The type of question that is being asked (string, boolean, select, etc.)
value: The answer to the question

salt.states.debconfmod.set_file(name, source, template=None, context=None, defaults=None, **kwargs)
Set debconf selections from a file or a template

<state_id>:
    debconf.set_file:
      - source: salt://path/to/pkg.selections

<state_id>:
    debconf.set_file:
      - source: salt://path/to/pkg.selections?saltenv=myenvironment

<state_id>:
    debconf.set_file:
      - source: salt://path/to/pkg.selections.jinja2
      - template: jinja
      - context:
        some_value: "false"
source: The location of the file containing the package selections

template If this setting is applied then the named templating engine will be used to render the package selections file, currently jinja, mako, and wempy are supported

context Overrides default context variables passed to the template.
defaults Default context passed to the template.

21.19.68 salt.states.dellchassis

Manage chassis via Salt Proxies.

New in version 2015.8.2.

Below is an example state that sets basic parameters:

```
my-dell-chassis:
  dellchassis.chassis:
    - chassis_name: my-dell-chassis
    - datacenter: dc-1-us
    - location: my-location
    - mode: 2
    - idrac_launch: 1
    - slot_names:
        - server-1: my-slot-name
        - server-2: my-other-slot-name
    - blade_power_states:
        - server-1: on
        - server-2: off
        - server-3: powercycle
```

However, it is possible to place the entire set of chassis configuration data in pillar. Here’s an example pillar structure:

```
proxy:
  host: 10.27.20.18
  admin_username: root
  fallback_admin_username: root
  passwords:
    - super-secret
    - old-secret
  proxytype: fx2

chassis:
  name: fx2-1
  username: root
  password: saltstack1
  datacenter: london
  location: rack-1-shelf-3
  management_mode: 2
  idrac_launch: 0
  slot_names:
    - 'server-1': blade1
    - 'server-2': blade2

servers:
  server-1:
    idrac_password: saltstack1
    ipmi_over_lan: True
    ip: 172.17.17.132
```

(continues on next page)
netmask: 255.255.0.0
gateway: 172.17.17.1
server-2:
idrac_password: saltstack1
ipmi_over_lan: True
ip: 172.17.17.2
netmask: 255.255.0.0
gateway: 172.17.17.1
server-3:
idrac_password: saltstack1
ipmi_over_lan: True
ip: 172.17.17.20
netmask: 255.255.0.0
gateway: 172.17.17.1
server-4:
idrac_password: saltstack1
ipmi_over_lan: True
ip: 172.17.17.2
netmask: 255.255.0.0
gateway: 172.17.17.1

switches:
switch-1:
ip: 192.168.1.2
netmask: 255.255.255.0
gateway: 192.168.1.1
snmp: nonpublic
password: saltstack1
switch-2:
ip: 192.168.1.3
netmask: 255.255.255.0
gateway: 192.168.1.1
snmp: nonpublic
password: saltstack1

And to go with it, here’s an example state that pulls the data from the pillar stated above:

```{%
set details = pillar.get('proxy:chassis', { })
%
standup-step1:
dellchassis.chassis:
- name: {{ details['name'] }}
- location: {{ details['location'] }}
- mode: {{ details['management_mode'] }}
- idrac_launch: {{ details['idrac_launch'] }}
- slot_names:
  {% for entry in details['slot_names'] %}
    - {{ entry.keys()[0] }}: {{ entry[entry.keys()[0]] }}
  {% endfor %}

blade_powercycle:
dellchassis.chassis:
- blade_power_states:
  - server-1: powercycle
  - server-2: powercycle
  - server-3: powercycle
  - server-4: powercycle
```
# Set idrac_passwords for blades. racadm needs them to be called 'server-x'
{% for k, v in details['servers'].iteritems() %}
  {{ k }}:
  dellchassis.blade_idrac:
    idrac_password: {{ v['idrac_password'] }}
{% endfor %}

# Set management ip addresses, passwords, and snmp strings for switches
{% for k, v in details['switches'].iteritems() %}
  {{ k }}-switch-setup:
    dellchassis.switch:
      - name: {{ k }}
      - ip: {{ v['ip'] }}
      - netmask: {{ v['netmask'] }}
      - gateway: {{ v['gateway'] }}
      - password: {{ v['password'] }}
      - snmp: {{ v['snmp'] }}
{% endfor %}

Note: This state module relies on the dracr.py execution module, which runs racadm commands on the chassis, blades, etc. The racadm command runs very slowly and, depending on your state, the proxy minion return might timeout before the racadm commands have completed. If you are repeatedly seeing minions timeout after state calls, please use the `-t` CLI argument to increase the timeout variable.

For example:

```bash
salt '*' state.sls my-dell-chasis-state-name -t 60
```

Note: The Dell CMC units perform adequately but many iDRACs are excruciatingly slow. Some functions can take minutes to execute.

```python
salt.states.dellchassis.blade_idrac(name,
                                 idrac_password=None, idrac_ipmi=None,
                                 idrac_ip=None, idrac_netmask=None,
                                 idrac_gateway=None, idrac_dnsname=None,
                                 idrac_dhcp=None)
```

Set parameters for iDRAC in a blade.

**Parameters**

- `idrac_password` – Password to use to connect to the iDRACs directly (idrac_ipmi and idrac_dnsname must be set directly on the iDRAC. They can’t be set through the CMC. If this password is present, use it instead of the CMC password)
- `idrac_ipmi` – Enable/Disable IPMI over LAN
- `idrac_ip` – Set IP address for iDRAC
- `idrac_netmask` – Set netmask for iDRAC
- `idrac_gateway` – Set gateway for iDRAC
- `idrac_dhcp` – Turn on DHCP for iDRAC (True turns on, False does nothing because setting a static IP will disable DHCP).

**Returns** A standard Salt changes dictionary

NOTE: If any of the IP address settings is configured, all of ip, netmask, and gateway must be present
salt.states.dellchassis.chassis(name, chassis_name=None, password=None, datacenter=None, location=None, mode=None, idrac_launch=None, slot_names=None, blade_power_states=None)

Manage a Dell Chassis.

chassis_name The name of the chassis.
datacenter The datacenter in which the chassis is located
location The location of the chassis.
password Password for the chassis. Note: If this password is set for the chassis, the current implementation of this state will set this password both on the chassis and the iDrac passwords on any configured blades. If the password for the blades should be distinct, they should be set separately with the blade_idrac function.
mode The management mode of the chassis. Viable options are:
  • 0: None
  • 1: Monitor
  • 2: Manage and Monitor
idrac_launch The iDRAC launch method of the chassis. Viable options are:
  • 0: Disabled (launch iDRAC using IP address)
  • 1: Enabled (launch iDRAC using DNS name)
slot_names The names of the slots, provided as a list identified by their slot numbers.
blade_power_states The power states of a blade server, provided as a list and identified by their server numbers. Viable options are:
  • on: Ensure the blade server is powered on.
  • off: Ensure the blade server is powered off.
  • powercycle: Power cycle the blade server.

Example:

```
my-dell-chassis:
  dellchassis.chassis:
    - chassis_name: my-dell-chassis
    - location: my-location
    - datacenter: london
    - mode: 2
    - idrac_launch: 1
    - slot_names:
      - 1: my-slot-name
      - 2: my-other-slot-name
    - blade_power_states:
      - server-1: on
      - server-2: off
      - server-3: powercycle
```

salt.states.dellchassis.firmware_update(hosts=None, directory="")
State to update the firmware on host using the racadm command

firmwarefile filename (string) starting with salt://
host string representing the hostname supplied to the racadm command
directory Directory name where firmwarefile will be downloaded

```
dell-chassis-firmware-update:
  dellchassis.firmware_update:
    hosts:
      cmc:
        - salt://firmware_cmc.exe
      server-1:
        - salt://firmware.exe
    directory: /opt/firmwares
```
salt.states.dellchassis.switch(name, ip=None, netmask=None, gateway=None, dhcp=None, password=None, snmp=None)

Manage switches in a Dell Chassis.

- **name**: The switch designation (e.g. switch-1, switch-2)
- **ip**: The Static IP Address of the switch
- **netmask**: The netmask for the static IP
- **gateway**: The gateway for the static IP
- **dhcp**: True: Enable DHCP False: Do not change DHCP setup (disabling DHCP is automatic when a static IP is set)
- **password**: The access (root) password for the switch
- **snmp**: The SNMP community string for the switch

Example:

```yaml
my-dell-chassis:
  dellchassis.switch:
    - switch: switch-1
    - ip: 192.168.1.1
    - netmask: 255.255.255.0
    - gateway: 192.168.1.254
    - dhcp: True
    - password: secret
    - snmp: public
```

### 21.19.69 salt.states.disk

Disk monitoring state

Monitor the state of disk resources.

The `disk.status` function can be used to report that the used space of a filesystem is within the specified limits.

```yaml
used_space:
  disk.status:
    - name: /dev/xda1
    - maximum: 79%
    - minimum: 11%
```

It can be used with an `onfail` requisite, for example, to take additional action in response to or in preparation for other states.

```yaml
storage_threshold:
  disk.status:
    - name: /dev/xda1
    - maximum: 97%

clear_cache:
  cmd.run:
    - name: rm -r /var/cache/app
    - onfail:
      - disk: storage_threshold
```

To use kilobytes (KB) for minimum and maximum rather than percents, specify the `absolute` flag:

```yaml
used_space:
  disk.status:
    - name: /dev/xda1
```

(continues on next page)
- **minimum**: 1024 KB
- **maximum**: 1048576 KB
- **absolute**: True

salt.states.disk.status(\textit{name}, \textit{maximum}=None, \textit{minimum}=None, \textit{absolute}=False)

Return the current disk usage stats for the named mount point

- \textit{name} Disk mount with which to check used space
- \textit{maximum} The maximum disk utilization
- \textit{minimum} The minimum disk utilization
- \textit{absolute} By default, the utilization is measured in percentage. Set the \textit{absolute} flag to use kilobytes.

New in version 2016.11.0.

### 21.19.70 salt.states.docker_container

Management of Docker containers

New in version 2017.7.0.

- \textit{depends} docker Python module

**Note:** Older releases of the Python bindings for Docker were called docker-py in PyPI. All releases of docker, and releases of docker-py $\geq$ 1.6.0 are supported. These python bindings can easily be installed using \texttt{pip.install}:

```
salt myminion pip.install docker
```

To upgrade from docker-py to docker, you must first uninstall docker-py, and then install docker:

```
salt myminion pip.uninstall docker-py
salt myminion pip.install docker
```

These states were moved from the docker state module (formerly called dockerng) in the 2017.7.0 release. When running the docker_container.running state for the first time after upgrading to 2017.7.0, your container(s) may be replaced. The changes may show diffs for certain parameters which say that the old value was an empty string, and the new value is None. This is due to the fact that in prior releases Salt was passing empty strings for these values when creating the container if they were undefined in the SLS file, where now Salt simply does not pass any arguments not explicitly defined in the SLS file. Subsequent runs of the state should not replace the container if the configuration remains unchanged.

**Note:** To pull from a Docker registry, authentication must be configured. See here for more information on how to configure access to docker registries in Pillar data.

salt.states.docker_container.absent(\textit{name}, \textit{force}=False)

Ensure that a container is absent

- \textit{name} Name of the container
- \textit{force} [False] Set to True to remove the container even if it is running

Usage Examples:

```
mycontainer:
  docker_container.absent
```

(continues on next page)
multiple_containers:
  docker_container.absent:
    - names:
      - foo
      - bar
      - baz

salt.states.docker_container.mod_run_check(onlyif, unless, creates)
  Execute the onlyif/unless/creates logic. Returns a result dict if any of the checks fail, otherwise returns True

salt.states.docker_container.mod_watch(name, sfun=None, **kwargs)
  The docker_container watcher, called to invoke the watch command.
  
  **Note:** This state exists to support special handling of the watch requisite. It should not be called directly.
  Parameters for this function should be set by the state being triggered.

salt.states.docker_container.run(name, image=None, onlyif=None, unless=None, creates=None, bg=False, failhard=True, replace=False, force=False, skip_translate=None, ignore_collisions=False, validate_ip_addrs=True, client_timeout=60, **kwargs)
  New in version 2018.3.0.
  
  **Note:** If no tag is specified in the image name, and nothing matching the specified image is pulled on the minion, the docker pull that retrieves the image will pull all tags for the image. A tag of latest is not implicit for the pull. For this reason, it is recommended to specify the image in repo:tag notation.

Like the cmd.run state, only for Docker. Does the equivalent of a docker run and returns information about the container that was created, as well as its output.

This state accepts the same arguments as docker_container.running, with the exception of watch_action, start, and shutdown_timeout (though the force argument has a different meaning in this state).

In addition, this state accepts the arguments from docker.logs, with the exception of follow, to control how logs are returned.

Additionally, the following arguments are supported:
  onlyif  A command or list of commands to run as a check. The container will only run if any of the specified commands returns a zero exit status.
  unless  A command or list of commands to run as a check. The container will only run if any of the specified commands returns a non-zero exit status.
  creates  A path or list of paths. Only run if one or more of the specified paths do not exist on the minion.
  bg  [False] If True, run container in background and do not await or deliver its results.

  **Note:** This may not be useful in cases where other states depend on the results of this state. Also, the logs will be inaccessible once the container exits if auto_remove is set to True, so keep this in mind.

  failhard  [True] If True, the state will return a False result if the exit code of the container is non-zero. When this argument is set to False, the state will return a True result regardless of the container’s exit code.
Note: This has no effect if bg is set to True.

replace [False] If True, and if the named container already exists, this will remove the existing container. The default behavior is to return a False result when the container already exists.

force [False] If True, and the named container already exists, and replace is also set to True, then the container will be forcibly removed. Otherwise, the state will not proceed and will return a False result.

CLI Examples:

```bash
salt myminion docker.run_container myuser/myimage command=/usr/local/bin/myscript. --sh
```

**USAGE EXAMPLE**

```python
{% set pkg_version = salt.pillar.get('pkg_version', '1.0-1') %}

build_package:
  docker_container.run:
    - image: myuser/builder:latest
    - binds: /home/myuser/builds:/build_dir
    - command: /scripts/build.sh {{ pkg_version }}
    - creates: /home/myuser/builds/myapp-{{ pkg_version }}.noarch.rpm
    - replace: True
    - networks:
    - mynet
    - require:
    - docker_network: mynet
```

salt.states.docker_container.running(name, image=None, skip_translate=None, ignore_collisions=False, validate_ip_addrs=True, force=False, watch_action='force', start=True, shutdown_timeout=None, client_timeout=60, networks=None, **kwargs)

Ensure that a container with a specific configuration is present and running

**name** Name of the container

**image** Image to use for the container

**Note:** This state will pull the image if it is not present. However, if the image needs to be built from a Dockerfile or loaded from a saved image, or if you would like to use requisites to trigger a replacement of the container when the image is updated, then the docker_image.present state should be used to manage the image.

Changed in version 2018.3.0: If no tag is specified in the image name, and nothing matching the specified image is pulled on the minion, the docker pull that retrieves the image will pull all tags for the image. A tag of latest is no longer implicit for the pull. For this reason, it is recommended to specify the image in repo:tag notation.

**skip_translate** This function translates Salt CLI or SLS input into the format which docker-py expects. However, in the event that Salt’s translation logic fails (due to potential changes in the Docker Remote API, or to bugs in the translation code), this argument can be used to exert granular control over which arguments are translated and which are not.

Pass this argument as a comma-separated list (or Python list) of arguments, and translation for each passed argument name will be skipped. Alternatively, pass True and all translation will be skipped.

Skipping translation allows for arguments to be formatted directly in the format which docker-py expects. This allows for API changes and other issues to be more easily worked around. An example of using this option to skip translation would be:
For example, imagine that there is an issue with processing the port_bindings argument, and the following configuration no longer works as expected:

```yaml
mycontainer:
  docker_container.running:
    - image: 7.3.1611
    - port_bindings: 10.2.9.10:8080:80
```

By using skip_translate, you can forego the input translation and configure the port binding in the format docker-py needs:

```yaml
mycontainer:
  docker_container.running:
    - image: 7.3.1611
    - skip_translate: port_bindings
    - port_bindings: {8080: [('10.2.9.10', 80)], '4193/udp': 9314}
```

See the following links for more information:
- docker-py Low-level API
- Docker Engine API

**ignore_collisions** [False] Since many of docker-py’s arguments differ in name from their CLI counterparts (with which most Docker users are more familiar), Salt detects usage of these and aliases them to the docker-py version of that argument so that both CLI and API versions of a given argument are supported. However, if both the alias and the docker-py version of the same argument (e.g. env and environment) are used, an error will be raised. Set this argument to True to suppress these errors and keep the docker-py version of the argument.

**validate_ip_addrs** [True] For parameters which accept IP addresses as input, IP address validation will be performed. To disable, set this to False.

**force** [False] Set this parameter to True to force Salt to re-create the container irrespective of whether or not it is configured as desired.

**watch_action** [force] Control what type of action is taken when this state watches another state that has changes. The default action is force, which runs the state with force set to True, triggering a rebuild of the container.

If any other value is passed, it will be assumed to be a kill signal. If the container matches the specified configuration, and is running, then the action will be to send that signal to the container. Kill signals can be either strings or numbers, and are defined in the Standard Signals section of the signal(7) manpage. Run man 7 signal on a Linux host to browse this manpage. For example:

```yaml
mycontainer:
  docker_container.running:
    - image: busybox
    - watch_action: SIGHUP
    - watch:
      - file: some_file
```

**Note:** If the container differs from the specified configuration, or is not running, then instead of sending a signal to the container, the container will be re-created/started and no signal will be sent.

**start** [True] Set to False to suppress starting of the container if it exists, matches the desired configuration, but is not running. This is useful for data-only containers, or for non-daemonized container processes, such as the Django migrate and collectstatic commands. In instances such as this, the container only needs to be started the first time.
shutdown_timeout If the container needs to be replaced, the container will be stopped using `docker.stop`. If a `shutdown_timeout` is not set, and the container was created using `stop_timeout`, that timeout will be used. If neither of these values were set, then a timeout of 10 seconds will be used.

Changed in version 2017.7.0: This option was renamed from `stop_timeout` to `shutdown_timeout` to accommodate the `stop_timeout` container configuration setting.

client_timeout [60] Timeout in seconds for the Docker client. This is not a timeout for this function, but for receiving a response from the API.

Note: This is only used if Salt needs to pull the requested image.

NETWORK MANAGEMENT

New in version 2018.3.0.

Changed in version 2019.2.0: If the `networks` option is used, any networks (including the default bridge network) which are not specified will be disconnected.

The `networks` argument can be used to ensure that a container is attached to one or more networks. Optionally, arguments can be passed to the networks. In the example below, `net1` is being configured with arguments, while `net2` and `bridge` are being configured without arguments:

```yaml
foo:
  docker_container.running:
    - image: myuser/myimage:foo
    - networks:
      - net1:
        - aliases:
          - bar
          - baz
        - ipv4_address: 10.0.20.50
      - net2
      - bridge
    - require:
      - docker_network: net1
      - docker_network: net2
```

The supported arguments are the ones from the docker-py’s `connect_container_to_network` function (other than `container` and `net_id`).

Important: Unlike with the arguments described in the CONTAINER CONFIGURATION PARAMETERS section below, these network configuration parameters are not translated at all. Consult the `connect_container_to_network` documentation for the correct type/format of data to pass.

To start a container with no network connectivity (only possible in 2019.2.0 and later) pass this option as an empty list. For example:

```yaml
foo:
  docker_container.running:
    - image: myuser/myimage:foo
    - networks: []
```

CONTAINER CONFIGURATION PARAMETERS

auto_remove (or `rm`) [False] Enable auto-removal of the container on daemon side when the container’s process exits (analogous to running a docker container with `--rm` on the CLI).
foo:
   docker_container.running:
     - image: bar/baz:latest
     - auto_remove: True

**binds** Files/directories to bind mount. Each bind mount should be passed in one of the following formats:

- `<host_path>:<container_path>` - `host_path` is mounted within the container as `container_path` with read-write access.
- `<host_path>:<container_path>:<selinux_context>` - `host_path` is mounted within the container as `container_path` with read-write access. Additionally, the specified selinux context will be set within the container.
- `<host_path>:<container_path>:<read_only>` - `host_path` is mounted within the container as `container_path`, with the read-only or read-write setting explicitly defined.
- `<host_path>:<container_path>:<read_only>,<selinux_context>` - `host_path` is mounted within the container as `container_path`, with the read-only or read-write setting explicitly defined. Additionally, the specified selinux context will be set within the container.

`<read_only>` can be either `rw` for read-write access, or `ro` for read-only access. When omitted, it is assumed to be read-write.

`<selinux_context>` can be `z` if the volume is shared between multiple containers, or `Z` if the volume should be private.

**Note:** When both `<read_only>` and `<selinux_context>` are specified, there must be a comma before `<selinux_context>`.

Binds can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

<table>
<thead>
<tr>
<th>foo:</th>
</tr>
</thead>
<tbody>
<tr>
<td>docker_container.running:</td>
</tr>
<tr>
<td>- image: bar/baz:latest</td>
</tr>
<tr>
<td>- binds: /srv/www:/var/www:ro,/etc/foo.conf:/usr/local/etc/foo.conf:rw</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>foo:</th>
</tr>
</thead>
<tbody>
<tr>
<td>docker_container.running:</td>
</tr>
<tr>
<td>- image: bar/baz:latest</td>
</tr>
<tr>
<td>- binds:</td>
</tr>
<tr>
<td>- /srv/www:/var/www:ro</td>
</tr>
<tr>
<td>- /home/myuser/conf/foo.conf:/etc/foo.conf:rw</td>
</tr>
</tbody>
</table>

However, in cases where both ro/rw and an selinux context are combined, the only option is to use a YAML list, like so:

<table>
<thead>
<tr>
<th>foo:</th>
</tr>
</thead>
<tbody>
<tr>
<td>docker_container.running:</td>
</tr>
<tr>
<td>- image: bar/baz:latest</td>
</tr>
<tr>
<td>- binds:</td>
</tr>
<tr>
<td>- /srv/www:/var/www:ro,Z</td>
</tr>
<tr>
<td>- /home/myuser/conf/foo.conf:/etc/foo.conf:rw,Z</td>
</tr>
</tbody>
</table>

Since the second bind in the previous example is mounted read-write, the `rw` and comma can be dropped. For example:

<table>
<thead>
<tr>
<th>foo:</th>
</tr>
</thead>
<tbody>
<tr>
<td>docker_container.running:</td>
</tr>
</tbody>
</table>

(continues on next page)
- **image**: bar/baz:latest
- **binds**:
  - /srv/www:/var/www:ro,Z
  - /home/myuser/conf/foo.conf:/etc/foo.conf:Z

### blkio_weight
Block IO weight (relative weight), accepts a weight value between 10 and 1000.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - blkio_weight: 100
```

### blkio_weight_device
Block IO weight (relative device weight), specified as a list of expressions in the format `PATH:RATE`

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - blkio_weight_device: /dev/sda:100
```

### cap_add
List of capabilities to add within the container. Can be expressed as a comma-separated list or a Python list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - cap_add: SYS_ADMIN,MKNOD

foo:
  docker_container.running:
    - image: bar/baz:latest
    - cap_add:
      - SYS_ADMIN
      - MKNOD
```

**Note**: This option requires Docker 1.2.0 or newer.

### cap_drop
List of capabilities to drop within the container. Can be expressed as a comma-separated list or a Python list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - cap_drop: SYS_ADMIN,MKNOD

foo:
  docker_container.running:
    - image: bar/baz:latest
    - cap_drop:
      - SYS_ADMIN
      - MKNOD
```

**Note**: This option requires Docker 1.2.0 or newer.

### command (or cmd)
Command to run in the container
foo:
  docker_container.running:
    - image: bar/baz:latest
    - command: bash

cpuset_cpus (or cpuset) CPUs on which which to allow execution, specified as a string containing a range (e.g. 0–3) or a comma-separated list of CPUs (e.g. 0,1).

foo:
  docker_container.running:
    - image: bar/baz:latest
    - cpuset_cpus: "0,1"

cpuset_mems Memory nodes on which which to allow execution, specified as a string containing a range (e.g. 0–3) or a comma-separated list of MEMs (e.g. 0,1). Only effective on NUMA systems.

foo:
  docker_container.running:
    - image: bar/baz:latest
    - cpuset_mems: "0,1"

cpu_group The length of a CPU period in microseconds

foo:
  docker_container.running:
    - image: bar/baz:latest
    - cpu_group: 100000

cpu_period Microseconds of CPU time that the container can get in a CPU period

foo:
  docker_container.running:
    - image: bar/baz:latest
    - cpu_period: 50000

cpu_shares CPU shares (relative weight), specified as an integer between 2 and 1024.

foo:
  docker_container.running:
    - image: bar/baz:latest
    - cpu_shares: 512

detach [False] If True, run the container’s command in the background (daemon mode)

foo:
  docker_container.running:
    - image: bar/baz:latest
    - detach: True

devices List of host devices to expose within the container. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices: /dev/net/tun,/dev/xvda1:/dev/xvda1,/dev/xvdb1:/dev/xvdb1:r

foo:
  docker_container.running:
    - image: bar/baz:latest

(continues on next page)
- **devices**:  
  - /dev/net/tun  
  - /dev/xvda1:/dev/xvda1  
  - /dev/xvdb1:/dev/xvdb1:r

**device_read_bps** Limit read rate (bytes per second) from a device, specified as a list of expressions in the format **PATH:RATE**, where **RATE** is either an integer number of bytes, or a string ending in **kb**, **mb**, or **gb**. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_read_bps: /dev/sda:1mb,/dev/sdb:5mb
```

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_read_bps:
      - /dev/sda:1mb
      - /dev/sdb:5mb
```

**device_read_iops** Limit read rate (I/O per second) from a device, specified as a list of expressions in the format **PATH:RATE**, where **RATE** is a number of I/O operations. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_read_iops: /dev/sda:1000,/dev/sdb:500
```

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_read_iops:
      - /dev/sda:1000
      - /dev/sdb:500
```

**device_write_bps** Limit write rate (bytes per second) from a device, specified as a list of expressions in the format **PATH:RATE**, where **RATE** is either an integer number of bytes, or a string ending in **kb**, **mb**, or **gb**. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_write_bps: /dev/sda:1mb,/dev/sdb:5mb
```

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_write_bps:
      - /dev/sda:1mb
      - /dev/sdb:5mb
```

**device_read_iops** Limit write rate (I/O per second) from a device, specified as a list of expressions in the format **PATH:RATE**, where **RATE** is a number of I/O operations. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_read_iops: /dev/sda:1000, /dev/sdb:500

foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_read_iops: /dev/sda:1000
    - /dev/sdb:500

**dns** List of DNS nameservers. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns: 8.8.8.8, 8.8.4.4

foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns:
      - 8.8.8.8
      - 8.8.4.4

**Note:** To skip IP address validation, use `validate_ip_addrs=False`

**dns_opt** Additional options to be added to the container's `resolv.conf` file. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns_opt: ndots:9

foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns_opt:
      - ndots:9

**dns_search** List of DNS search domains. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns_search: foo1.domain.tld, foo2.domain.tld

foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns_search:

(continues on next page)
- foo1.domain.tld
- foo2.domain.tld

domainname The domain name to use for the container

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - domainname: domain.tld
```

entrypoint Entrypoint for the container

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - entrypoint: "mycmd --arg1 --arg2"
```

This argument can also be specified as a list:

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - entrypoint:
        - mycmd
        - --arg1
        - --arg2
```

environment Either a list of variable/value mappings, or a list of strings in the format VARNAME=value.
The below three examples are equivalent:

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - environment:
        - VAR1: value
        - VAR2: value

foo:
  docker_container.running:
    - image: bar/baz:latest
    - environment: 'VAR1=value,VAR2=value'

foo:
  docker_container.running:
    - image: bar/baz:latest
    - environment: VAR1=value,VAR2=value
```

extra_hosts Additional hosts to add to the container’s /etc/hosts file. Can be expressed as a comma-separated list or a Python list. The below two examples are equivalent:

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - extra_hosts: web1:10.9.8.7,web2:10.9.8.8
```
foo:
  docker_container.running:
  - image: bar/baz:latest
  - extra_hosts:
    - web1:10.9.8.7
    - web2:10.9.8.8

Note: To skip IP address validation, use validate_ip_addrs=False

Note: This option requires Docker 1.3.0 or newer.

group_add  List of additional group names and/or IDs that the container process will run as. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

foo:
  docker_container.running:
  - image: bar/baz:latest
  - group_add: web,network

foo:
  docker_container.running:
  - image: bar/baz:latest
  - group_add:
    - web
    - network

hostname  Hostname of the container. If not provided, the value passed as the container’s ‘name’ will be used for the hostname.

foo:
  docker_container.running:
  - image: bar/baz:latest
  - hostname: web1

Warning: hostname cannot be set if network_mode is set to host. The below example will result in an error:

foo:
  docker_container.running:
  - image: bar/baz:latest
  - hostname: web1
  - network_mode: host

interactive (or stdin_open)  [False] Leave stdin open, even if not attached

foo:
  docker_container.running:
  - image: bar/baz:latest
  - interactive: True

ipc_mode (or ipc)  Set the IPC mode for the container. The default behavior is to create a private IPC namespace for the container, but this option can be used to change that behavior:
  • container:<container_name_or_id> reuses another container shared memory, semaphores and message queues
- **host**: use the host’s shared memory, semaphores and message queues

```yaml
foo:
docker_container.running:
  - image: bar/baz:latest
  - ipc_mode: container:foo
```

```yaml
foo:
docker_container.running:
  - image: bar/baz:latest
  - ipc_mode: host
```

**Warning**: Using **host** gives the container full access to local shared memory and is therefore considered insecure.

**isolation**  Specifies the type of isolation technology used by containers

```yaml
foo:
docker_container.running:
  - image: bar/baz:latest
  - isolation: hyperv
```

**Note**: The default value on Windows server is **process**, while the default value on Windows client is **hyperv**. On Linux, only **default** is supported.

**labels**  Add metadata to the container. Labels can be set both with and without values, and labels with values can be passed either as **key=value** or **key: value** pairs. For example, while the below would be very confusing to read, it is technically valid, and demonstrates the different ways in which labels can be passed:

```yaml
mynet:
docker_network.present:
  - labels:
    - foo
    - bar=baz
    - hello: world
```

The labels can also simply be passed as a YAML dictionary, though this can be error-prone due to some *idiosyncrasies* with how PyYAML loads nested data structures:

```yaml
foo:
docker_network.present:
  - labels:
    - foo: '
    - bar: baz
    - hello: world
```

Changed in version 2018.3.0: Methods for specifying labels can now be mixed. Earlier releases required either labels with or without values.

**links**  Link this container to another. Links can be specified as a list of mappings or a comma-separated or Python list of expressions in the format `<container_name_or_id>:<link_alias>`. The below three examples are equivalent:
**log_driver** and **log_opt** Set container’s logging driver and options to configure that driver. Requires Docker 1.6 or newer.

```yaml
foo:
docker_container.running:
  - image: bar/baz:latest
  - log_driver: syslog
  - log_opt:
    - syslog-address: tcp://192.168.0.42
    - syslog-facility: daemon
```

The `log_opt` can also be expressed as a comma-separated or YAML list of `key=value` pairs. The below two examples are equivalent to the above one:

```yaml
foo:
docker_container.running:
  - image: bar/baz:latest
  - log_driver: syslog
  - log_opt: "syslog-address=tcp://192.168.0.42,syslog-facility=daemon"
```

```yaml
foo:
docker_container.running:
  - image: bar/baz:latest
  - log_driver: syslog
  - log_opt:
    - syslog-address=tcp://192.168.0.42
    - syslog-facility=daemon
```

---

**Note:** The logging driver feature was improved in Docker 1.13 introducing option name changes. Please see Docker’s [Configure logging drivers](https://docs.docker.com/config/containers/logging/) documentation for more information.

**lxc_conf** Additional LXC configuration parameters to set before starting the container. Either a list of variable/value mappings, or a list of strings in the format `VARNAME=value`. The below three examples are equivalent:
foo:
  docker_container.running:
    - image: bar/baz:latest
    - lxc_conf:
      - lxc.utsname: docker
      - lxc.arch: x86_64

foo:
  docker_container.running:
    - image: bar/baz:latest
    - lxc_conf: lxc.utsname=docker,lxc.arch=x86_64

foo:
  docker_container.running:
    - image: bar/baz:latest
    - lxc_conf:
      - lxc.utsname=docker
      - lxc.arch=x86_64

Note: These LXC configuration parameters will only have the desired effect if the container is using the LXC execution driver, which has been deprecated for some time.

mac_address  MAC address to use for the container. If not specified, a random MAC address will be used.

foo:
  docker_container.running:
    - image: bar/baz:latest
    - mac_address: 01:23:45:67:89:0a

mem_limit (or memory) [0] Memory limit. Can be specified in bytes or using single-letter units (i.e. 512M, 2G, etc.). A value of 0 (the default) means no memory limit.

foo:
  docker_container.running:
    - image: bar/baz:latest
    - mem_limit: 512M

mem_swappiness  Tune a container’s memory swappiness behavior. Accepts an integer between 0 and 100.

foo:
  docker_container.running:
    - image: bar/baz:latest
    - mem_swappiness: 60

memswap_limit (or memory_swap) [-1] Total memory limit (memory plus swap). Set to -1 to disable swap. A value of 0 means no swap limit.

foo:
  docker_container.running:
    - image: bar/baz:latest
    - memswap_limit: 1G

network_disabled  [False] If True, networking will be disabled within the container.

foo:
  docker_container.running:
    - image: bar/baz:latest
    - network_disabled: True
network_mode  [bridge] One of the following:
  - bridge - Creates a new network stack for the container on the docker bridge
  - none - No networking (equivalent of the Docker CLI argument `--net=none`). Not to be confused with Python’s None.
  - container:<name_or_id> - Reuses another container’s network stack
  - host - Use the host’s network stack inside the container
  - Any name that identifies an existing network that might be created with docker.

network_present

Warning: Using host mode gives the container full access to the hosts system’s services (such as D-bus), and is therefore considered insecure.

foo:
  docker_container.running:
    - image: bar/baz:latest
    - network_mode: "none"

foo:
  docker_container.running:
    - image: bar/baz:latest
    - network_mode: container:web1

oom_kill_disable  Whether to disable OOM killer

foo:
  docker_container.running:
    - image: bar/baz:latest
    - oom_kill_disable: False

oom_score_adj An integer value containing the score given to the container in order to tune OOM killer preferences

foo:
  docker_container.running:
    - image: bar/baz:latest
    - oom_score_adj: 500

pid_mode Set to host to use the host container’s PID namespace within the container. Requires Docker 1.5.0 or newer.

foo:
  docker_container.running:
    - image: bar/baz:latest
    - pid_mode: host

Note: This option requires Docker 1.5.0 or newer.

pids_limit Set the container’s PID limit. Set to -1 for unlimited.

foo:
  docker_container.running:
    - image: bar/baz:latest
    - pids_limit: 2000

port_bindings (or publish) Bind exposed ports. Port bindings should be passed in the same way as the `--publish` argument to the docker run CLI command:
• **ip:hostPort:containerPort** - Bind a specific IP and port on the host to a specific port within the container.
• **ip::containerPort** - Bind a specific IP and an ephemeral port to a specific port within the container.
• **hostPort:containerPort** - Bind a specific port on all of the host’s interfaces to a specific port within the container.
• **containerPort** - Bind an ephemeral port on all of the host’s interfaces to a specific port within the container.

Multiple bindings can be separated by commas, or expressed as a YAML list, and port ranges can be defined using dashes. The below two examples are equivalent:

```yaml
foo:
  docker_container.running:
  - image: bar/baz:latest
  - port_bindings: "4505-4506:14505-14506,2123:2123/udp,8080"
```

```yaml
foo:
  docker_container.running:
  - image: bar/baz:latest
  - port_bindings:
    - 4505-4506:14505-14506
    - 2123:2123/udp
    - 8080
```

**Note:** When specifying a protocol, it must be passed in the `containerPort` value, as seen in the examples above.

**ports** A list of ports to expose on the container. Can either be a comma-separated list or a YAML list. If the protocol is omitted, the port will be assumed to be a TCP port. The below two examples are equivalent:

```yaml
foo:
  docker_container.running:
  - image: bar/baz:latest
  - ports:
    - 1111
    - 2222/udp
```

```yaml
foo:
  docker_container.running:
  - image: bar/baz:latest
  - ports:
    - 1111
    - 2222/
```

**privileged** [False] If True, runs the exec process with extended privileges

```yaml
foo:
  docker_container.running:
  - image: bar/baz:latest
  - privileged: True
```

**publish_all_ports (or publish_all)** [False] Publish all ports to the host

```yaml
foo:
  docker_container.running:
  - image: bar/baz:latest
  - ports: 8080
  - publish_all_ports: True
```
read_only  [False] If True, mount the container’s root filesystem as read only

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - read_only: True
```

restart_policy (or restart) Set a restart policy for the container. Must be passed as a string in the format policy[:retry_count] where policy is one of always, unless-stopped, or on-failure, and retry_count is an optional limit to the number of retries. The retry count is ignored when using the always or unless-stopped restart policy.

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - restart_policy: on-failure:5

bar:
  docker_container.running:
    - image: bar/baz:latest
    - restart_policy: always
```

security_opt (or security_opts): Security configuration for MLS systems such as SELinux and AppArmor. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - security_opt: apparmor:unconfined

foo:
  docker_container.running:
    - image: bar/baz:latest
    - security_opt:
      - apparmor:unconfined
```

**Important:** Some security options can contain commas. In these cases, this argument *must* be passed as a Python list, as splitting by comma will result in an invalid configuration.

**Note:** See the documentation for security_opt at https://docs.docker.com/engine/reference/run/#security-configuration

shm_size  Size of /dev/shm

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - shm_size: 128M
```

stop_signal  Specify the signal docker will send to the container when stopping. Useful when running systemd as PID 1 inside the container.

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - stop_signal: SIGRTMIN+3
```
salt documentation, release 2019.2.0

Note: This option requires Docker 1.9.0 or newer and docker-py 1.7.0 or newer.

New in version 2016.11.0.

**stop_timeout**  Timeout to stop the container, in seconds

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - stop_timeout: 5
```

Note: In releases prior to 2017.7.0, this option was not set in the container configuration, but rather this timeout was enforced only when shutting down an existing container to replace it. To remove the ambiguity, and to allow for the container to have a stop timeout set for it, the old `stop_timeout` argument has been renamed to `shutdown_timeout`, while `stop_timeout` now refers to the container's configured stop timeout.

**storage_opt**  Storage driver options for the container. Can be either a list of strings in the format `option=value`, or a list of mappings between option and value. The below three examples are equivalent:

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - storage_opt:
      - dm.basesize: 40G

foo:
  docker_container.running:
    - image: bar/baz:latest
    - storage_opt:
      - dm.basesize=40G

foo:
  docker_container.running:
    - image: bar/baz:latest
    - storage_opt:
      - dm.basesize=40G
```

**sysctls**  (or **sysctl**)  Set sysctl options for the container. Can be either a list of strings in the format `option=value`, or a list of mappings between option and value. The below three examples are equivalent:

```yaml
foo:
  docker_container.running:
    - image: bar/baz:latest
    - sysctls:
      - fs.nr_open: 1048576
      - kernel.pid_max: 32768

foo:
  docker_container.running:
    - image: bar/baz:latest
    - sysctls: fs.nr_open=1048576,kernel.pid_max=32768
```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - sysctls:
      - fs.nr_open=1048576
      - kernel.pid_max=32768

**tmpfs** A map of container directories which should be replaced by tmpfs mounts and their corresponding mount options.

foo:
  docker_container.running:
    - image: bar/baz:latest
    - tmpfs:
      - /run: rw,noexec,nosuid,size=65536k

tty [False] Attach TTYs

foo:
  docker_container.running:
    - image: bar/baz:latest
    - tty: True

**ulimits** List of ulimits. These limits should be passed in the format `<ulimit_name>::<soft_limit>::<hard_limit>`, with the hard limit being optional. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

foo:
  docker_container.running:
    - image: bar/baz:latest
    - ulimits: nofile=1024:1024,nproc=60

foo:
  docker_container.running:
    - image: bar/baz:latest
    - ulimits:
      - nofile=1024:1024
      - nproc=60

**user** User under which to run exec process

foo:
  docker_container.running:
    - image: bar/baz:latest
    - user: foo

**usersns_mode (or user_ns_mode)** Sets the user namespace mode, when the user namespace remapping option is enabled

foo:
  docker_container.running:
    - image: bar/baz:latest
    - usersns_mode: host

**volumes (or volume)** List of directories to expose as volumes. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

foo:
  docker_container.running:
- **image**: bar/baz:latest
- **volumes**: /mnt/vol1,/mnt/vol2

```yaml
foo:
docker_container.running:
- image: bar/baz:latest
- volumes: /mnt/vol1
- /mnt/vol2
```

**volumes_from** Container names or IDs from which the container will get volumes. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```yaml
foo:
docker_container.running:
- image: bar/baz:latest
- volumes_from: foo
```

```yaml
foo:
docker_container.running:
- image: bar/baz:latest
- volumes_from: foo
```

**volume_driver** sets the container’s volume driver

```yaml
foo:
docker_container.running:
- image: bar/baz:latest
- volume_driver: foobar
```

**working_dir** (or **workdir**) Working directory inside the container

```yaml
foo:
docker_container.running:
- image: bar/baz:latest
- working_dir: /var/log/nginx
```

**salt.states.docker_container.stopped** *(name=None, containers=None, shutdown_timeout=None, unpause=False, error_on_absent=True, **kwargs)*

Ensure that a container (or containers) is stopped

- **name** Name or ID of the container
- **containers** Run this state on more than one container at a time. The following two examples accomplish the same thing:

```yaml
stopped_containers:
docker_container.stopped:
- names:
  - foo
  - bar
  - baz
```

```yaml
stopped_containers:
docker_container.stopped:
- containers:
```

(continues on next page)
- foo
- bar
- baz

However, the second example will be a bit quicker since Salt will stop all specified containers in a single run, rather than executing the state separately on each image (as it would in the first example).

**shutdown_timeout**  Timeout for graceful shutdown of the container. If this timeout is exceeded, the container will be killed. If this value is not passed, then the container’s configured stop_timeout will be observed. If stop_timeout was also unset on the container, then a timeout of 10 seconds will be used.

**unpause**  [False] Set to True to unpause any paused containers before stopping. If unset, then an error will be raised for any container that was paused.

**error_on_absent**  [True] By default, this state will return an error if any of the specified containers are absent. Set this to False to suppress that error.

### 21.19.71 salt.states.docker_image

Management of Docker images

New in version 2017.7.0.

**depends**  docker Python module

**Note:**  Older releases of the Python bindings for Docker were called docker-py in PyPI. All releases of docker, and releases of docker-py >= 1.6.0 are supported. These python bindings can easily be installed using `pip.install`:

```
salt myminion pip.install docker
```

To upgrade from docker-py to docker, you must first uninstall docker-py, and then install docker:

```
salt myminion pip.uninstall docker-py
salt myminion pip.install docker
```

These states were moved from the docker state module (formerly called dockerng) in the 2017.7.0 release.

**Note:**  To pull from a Docker registry, authentication must be configured. See here for more information on how to configure access to docker registries in Pillar data.

```
salt.states.docker_image.absent(name=None, images=None, force=False)
```

Ensure that an image is absent from the Minion. Image names can be specified either using repo:tag notation, or just the repo name (in which case a tag of latest is assumed).

**images**  Run this state on more than one image at a time. The following two examples accomplish the same thing:

```
remove_images:
  docker_image.absent:
    - names:
      - busybox
      - centos:6
      - nginx
```
However, the second example will be a bit quicker since Salt will do all the deletions in a single run, rather than executing the state separately on each image (as it would in the first example).

**force** [False] Salt will fail to remove any images currently in use by a container. Set this option to true to remove the image even if it is already present.

---

Note: This option can also be overridden by Pillar data. If the Minion has a pillar variable named `docker.running.force` which is set to `True`, it will turn on this option. This pillar variable can even be set at runtime. For example:

```
salt myminion state.sls docker_stuff pillar="{docker.force: True}""
```

If this pillar variable is present and set to `False`, then it will turn off this option.

For more granular control, setting a pillar variable named `docker.force.image_name` will affect only the named image.

---

**salt.states.docker_image.mod_watch**(name, sfun=None, **kwargs)

The docker_image watcher, called to invoke the watch command.

**Note:** This state exists to support special handling of the `watch` requisite. It should not be called directly.

Parameters for this function should be set by the state being triggered.

**salt.states.docker_image.present**(name, tag=None, build=None, load=None, force=False, insecure_registry=False, client_timeout=60, dockerfile=None, sls=None, base='opensuse/python', saltenv='base', pillarenv=None, pillar=None, **kwargs)

Changed in version 2018.3.0: The `tag` argument has been added. It is now required unless pulling from a registry.

Ensure that an image is present. The image can either be pulled from a Docker registry, built from a Dockerfile, loaded from a saved image, or built by running SLS files against a base image.

If none of the `build`, `load`, or `sls` arguments are used, then Salt will pull from the `configured registries`. If the specified image already exists, it will not be pulled unless `force` is set to `True`. Here is an example of a state that will pull an image from the Docker Hub:

```
myuser/myimage:
  docker_image.present:
    - tag: mytag
```

tag  Tag name for the image. Required when using `build`, `load`, or `sls` to create the image, but optional if pulling from a repository.

New in version 2018.3.0.

**build** Path to directory on the Minion containing a Dockerfile
myuser/myimage:
  docker_image.present:
  - build: /home/myuser/docker/myimage
  - tag: mytag

myuser/myimage:
  docker_image.present:
  - build: /home/myuser/docker/myimage
  - tag: mytag
  - dockerfile: Dockerfile.alternative

The image will be built using `docker.build` and the specified image name and tag will be applied to it.

New in version 2016.11.0.

Changed in version 2018.3.0: The `tag` must be manually specified using the `tag` argument.

load  Loads a tar archive created with `docker.load` (or the `docker load` Docker CLI command), and assigns it the specified repo and tag.

myuser/myimage:
  docker_image.present:
  - load: salt://path/to/image.tar
  - tag: mytag

Changed in version 2018.3.0: The `tag` must be manually specified using the `tag` argument.

force [False] Set this parameter to `True` to force Salt to pull/build/load the image even if it is already present.

client_timeout  Timeout in seconds for the Docker client. This is not a timeout for the state, but for receiving a response from the API.

dockerfile  Allows for an alternative Dockerfile to be specified. Path to alternative Dockefile is relative to the build path for the Docker container.

New in version 2016.11.0.

sls  Allow for building of image with `docker.sls_build` by specifying the SLS files with which to build. This can be a list or comma-seperated string.

myuser/myimage:
  docker_image.present:
  - tag: latest
  - sls:
    - webapp1
    - webapp2
  - base: centos
  - saltenv: base

Changed in version 2018.3.0: The `tag` must be manually specified using the `tag` argument.

base  Base image with which to start `docker.sls_build`

New in version 2017.7.0.

saltenv  Specify the environment from which to retrieve the SLS indicated by the `mods` parameter.

New in version 2017.7.0.

Changed in version 2018.3.0: Now uses the effective saltenv if not explicitly passed. In earlier versions, `base` was assumed as a default.

pillarenv  Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.
New in version 2018.3.0.

**pillar** Custom Pillar values, passed as a dictionary of key-value pairs

**Note:** Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

New in version 2018.3.0.

### 21.19.72 **salt.states.docker_network**

Management of Docker networks

New in version 2017.7.0.

**depends** docker Python module

**Note:** Older releases of the Python bindings for Docker were called `docker-py` in PyPI. All releases of `docker`, and releases of `docker-py` >= 1.6.0 are supported. These python bindings can easily be installed using `pip.install`:

```bash
salt myminion pip.install docker
```

To upgrade from `docker-py` to `docker`, you must first uninstall `docker-py`, and then install `docker`:

```bash
salt myminion pip.uninstall docker-py
salt myminion pip.install docker
```

These states were moved from the `docker` state module (formerly called `dockerng`) in the 2017.7.0 release.

**salt.states.docker_network.absent**(`name`)  
Ensure that a network is absent.  
**name** Name of the network  
**Usage Example:**

```yaml
network_foo:  
docker_network.absent
```

**salt.states.docker_network.present**(`name`, `skip_translate=None`, `ignore_collisions=False`, `validate_ip_addrs=True`, `containers=None`, `reconnect=True`, **kwargs)  
Changed in version 2018.3.0: Support added for network configuration options other than `driver` and `driver_opts`, as well as IPAM configuration.  
Ensure that a network is present

**Note:** This state supports all arguments for network and IPAM pool configuration which are available for the release of docker-py installed on the minion. For that reason, the arguments described below in the NETWORK CONFIGURATION and IP ADDRESS MANAGEMENT (IPAM) sections may not accurately reflect what is available on the minion. The `docker.get_client_args` function can be used to check the available arguments for the installed version of docker-py (they are found in the network_config and ipam_config sections of the return data), but Salt will not prevent a user from attempting to use an argument which is unsupported in the release of Docker which is installed. In those cases, network creation be attempted but will fail.
**name**  Network name

**skip_translate**  This function translates Salt SLS input into the format which docker-py expects. However, in the event that Salt’s translation logic fails (due to potential changes in the Docker Remote API, or to bugs in the translation code), this argument can be used to exert granular control over which arguments are translated and which are not.

Pass this argument as a comma-separated list (or Python list) of arguments, and translation for each passed argument name will be skipped. Alternatively, pass `True` and all translation will be skipped.

Skipping translation allows for arguments to be formatted directly in the format which docker-py expects. This allows for API changes and other issues to be more easily worked around. See the following links for more information:
- docker-py Low-level API
- Docker Engine API

New in version 2018.3.0.

**ignore_collisions** [False] Since many of docker-py’s arguments differ in name from their CLI counterparts (with which most Docker users are more familiar), Salt detects usage of these and aliases them to the docker-py version of that argument. However, if both the alias and the docker-py version of the same argument (e.g. `options` and `driver_opts`) are used, an error will be raised. Set this argument to `True` to suppress these errors and keep the docker-py version of the argument.

New in version 2018.3.0.

**validate_ip_addrs** [True] For parameters which accept IP addresses/subnets as input, validation will be performed. To disable, set this to `False`.

New in version 2018.3.0.

**containers**  A list of containers which should be connected to this network.

**Note:** As of the 2018.3.0 release, this is not the recommended way of managing a container’s membership in a network, for a couple reasons:

1. It does not support setting static IPs, aliases, or links in the container’s IP configuration.
2. If a `docker_container.running` state replaces a container, it will not be reconnected to the network until the `docker_network.present` state is run again. Since containers often have `require` requisites to ensure that the network is present, this means that the `docker_network.present` state ends up being run before the `docker_container.running`, leaving the container unattached at the end of the Salt run.

For these reasons, it is recommended to use `docker_container.running`'s network management support.

**reconnect** [True] If `containers` is not used, and the network is replaced, then Salt will keep track of the containers which were connected to the network and reconnect them to the network after it is replaced. Salt will first attempt to reconnect using the same IP the container had before the network was replaced. If that fails (for instance, if the network was replaced because the subnet was modified), then the container will be reconnected without an explicit IP address, and its IP will be assigned by Docker.

Set this option to `False` to keep Salt from trying to reconnect containers. This can be useful in some cases when managing static IPs in `docker_container.running`. For instance, if a network’s subnet is modified, it is likely that the static IP will need to be updated in the `docker_container.running` state as well. When the network is replaced, the initial reconnect attempt would fail, and the container would be reconnected with an automatically-assigned IP address. Then, when the `docker_container.running` state executes, it would disconnect the network `again` and reconnect using the new static IP. Disabling the reconnect behavior in these cases would prevent the unnecessary extra reconnection.

New in version 2018.3.0.

**NETWORK CONFIGURATION ARGUMENTS**
driver  Network driver

```yaml
mynet:
  docker_network.present:
    - driver: macvlan
```

driver_opts (or driver_opt, or options)  Options for the network driver. Either a dictionary of option names and values or a Python list of strings in the format `varname=value`. The below three examples are equivalent:

```yaml
mynet:
  docker_network.present:
    - driver: macvlan
    - driver_opts: macvlan_mode=bridge,parent=eth0
```

```yaml
mynet:
  docker_network.present:
    - driver: macvlan
    - driver_opts:
        - macvlan_mode=bridge
        - parent=eth0
```

```yaml
mynet:
  docker_network.present:
    - driver: macvlan
    - driver_opts:
        macvlan_mode: bridge
        parent: eth0
```

The options can also simply be passed as a dictionary, though this can be error-prone due to some idiosyncrasies with how PyYAML loads nested data structures:

```yaml
mynet:
  docker_network.present:
    - driver: macvlan
    - driver_opts:
        macvlan_mode: bridge
        parent: eth0
```

check_duplicate  [True] If True, checks for networks with duplicate names. Since networks are primarily keyed based on a random ID and not on the name, and network name is strictly a user-friendly alias to the network which is uniquely identified using ID, there is no guaranteed way to check for duplicates. This option provides a best effort, checking for any networks which have the same name, but it is not guaranteed to catch all name collisions.

```yaml
mynet:
  docker_network.present:
    - check_duplicate: False
```

internal  [False] If True, restricts external access to the network

```yaml
mynet:
  docker_network.present:
    - internal: True
```

labels  Add metadata to the network. Labels can be set both with and without values, and labels with values can be passed either as `key=value` or `key: value` pairs. For example, while the below would be very confusing to read, it is technically valid, and demonstrates the different ways in which labels can be passed:

```yaml
mynet:
  docker_network.present:
    - labels:
        id: 12345
        name: My Network
```

The labels can also simply be passed as a YAML dictionary, though this can be error-prone due to some idiosyncrasies with how PyYAML loads nested data structures:

```
foo:
  docker_network.present:
    - labels:
      foo: ''
      bar: baz
      hello: world
```

Changed in version 2018.3.0: Methods for specifying labels can now be mixed. Earlier releases required either labels with or without values.

**enable_ipv6 (or ipv6)** [False] Enable IPv6 on the network

```
mynet:
  docker_network.present:
    - enable_ipv6: True
```

**Note:** While it should go without saying, this argument must be set to `True` to configure an IPv6 subnet. Also, if this option is turned on without an IPv6 subnet explicitly configured, you will get an error unless you have set up a fixed IPv6 subnet. Consult the [Docker IPv6 docs](https://docs.docker.com/network/ip-address/) for information on how to do this.

**attachable** [False] If `True`, and the network is in the global scope, non-service containers on worker nodes will be able to connect to the network.

```
mynet:
  docker_network.present:
    - attachable: True
```

**Note:** This option cannot be reliably managed on CentOS 7. This is because while support for this option was added in API version 1.24, its value was not added to the inspect results until API version 1.26. The version of Docker which is available for CentOS 7 runs API version 1.24, meaning that while Salt can pass this argument to the API, it has no way of knowing the value of this config option in an existing Docker network.

**scope** Specify the network’s scope (`local`, `global` or `swarm`)

```
mynet:
  docker_network.present:
    - scope: local
```

**ingress** [False] If `True`, create an ingress network which provides the routing-mesh in swarm mode

```
mynet:
  docker_network.present:
    - ingress: True
```

**IP ADDRESS MANAGEMENT (IPAM)**
This state supports networks with either IPv4, or both IPv4 and IPv6. If configuring IPv4, then you can pass the IPAM pool arguments below as individual arguments. However, if configuring IPv4 and IPv6, the arguments must be passed as a list of dictionaries, in the ipam_pools argument (click here for some examples). These docs also have more information on these arguments.

**IPAM ARGUMENTS**

**ipam_driver** IPAM driver to use, if different from the default one

```yaml
mynet:
  docker_network.present:
    - ipam_driver: foo
```

**ipam_opts** Options for the IPAM driver. Either a dictionary of option names and values or a Python list of strings in the format varname=value. The below three examples are equivalent:

```yaml
mynet:
  docker_network.present:
    - ipam_driver: foo
    - ipam_opts: foo=bar,baz=qux

mynet:
  docker_network.present:
    - ipam_driver: foo
    - ipam_opts:
      - foo: bar
      - baz: qux

mynet:
  docker_network.present:
    - ipam_driver: foo
    - ipam_opts:
      foo: bar
      baz: qux
```

The options can also simply be passed as a dictionary, though this can be error-prone due to some idiosyncrasies with how PyYAML loads nested data structures:

```yaml
mynet:
  docker_network.present:
    - ipam_driver: macvlan
    - ipam_opts:
      foo: bar
      baz: qux
```

**IPAM POOL ARGUMENTS**

**subnet** Subnet in CIDR format that represents a network segment

**iprange (or ip_range)** Allocate container IP from a sub-range within the subnet

Subnet in CIDR format that represents a network segment

**gateway** IPv4 or IPv6 gateway for the master subnet

**aux_addresses (or aux_address)** A dictionary of mapping container names to IP addresses which should be allocated for them should they connect to the network. Either a dictionary of option names and values or a Python list of strings in the format host=ipaddr.

**IPAM CONFIGURATION EXAMPLES**

Below is an example of an IPv4-only network (keep in mind that subnet is the only required argument).
**mynet:**

```yaml
    docker_network.present:
        - subnet: 10.0.20.0/24
        - iprange: 10.0.20.128/25
        - gateway: 10.0.20.254
        - aux_addresses:
            - foo.bar.tld: 10.0.20.50
            - hello.world.tld: 10.0.20.51
```

**Note:** The aux_addresses can be passed differently, in the same way that driver_opts and ipam_opts can.

This same network could also be configured this way:

```yaml
    mynet:
        docker_network.present:
            - ipam_pools:
                - subnet: 10.0.20.0/24
                  iprange: 10.0.20.128/25
                  gateway: 10.0.20.254
                  aux_addresses:
                      foo.bar.tld: 10.0.20.50
                      hello.world.tld: 10.0.20.51
```

Here is an example of a mixed IPv4/IPv6 subnet.

```yaml
    mynet:
        docker_network.present:
            - ipam_pools:
                - subnet: 10.0.20.0/24
                  gateway: 10.0.20.1
                - subnet: fe3f:2180:26:1::/123
                  gateway: fe3f:2180:26:1::1
```

**21.19.73 salt.states.docker_volume**

Management of Docker volumes

New in version 2017.7.0.

**depends** docker Python module

**Note:** Older releases of the Python bindings for Docker were called docker-py in PyPI. All releases of docker, and releases of docker-py >= 1.6.0 are supported. These python bindings can easily be installed using `pip.install`:

```
salt myminion pip.install docker
```

To upgrade from docker-py to docker, you must first uninstall docker-py, and then install docker:

```
salt myminion pip.uninstall docker-py
salt myminion pip.install docker
```

These states were moved from the docker state module (formerly called dockerng) in the 2017.7.0 release.

**21.19. state modules**
salt.states.docker_volume.absent(name, driver=None)

Ensure that a volume is absent.

New in version 2015.8.4.

Changed in version 2017.7.0: This state was renamed from docker.volume_absent to docker_volume.absent

name Name of the volume

Usage Examples:

```
volume_foo:
  docker_volume.absent
```

salt.states.docker_volume.present(name, driver=None, driver_opts=None, force=False)

Ensure that a volume is present.

New in version 2015.8.4.

Changed in version 2015.8.6: This state no longer deletes and re-creates a volume if the existing volume's driver does not match the driver parameter (unless the force parameter is set to True).

Changed in version 2017.7.0: This state was renamed from docker.volume.present to docker_volume.present

name Name of the volume
driver Type of driver for that volume. If None and the volume does not yet exist, the volume will be created using Docker’s default driver. If None and the volume does exist, this function does nothing, even if the existing volume’s driver is not the Docker default driver. (To ensure that an existing volume’s driver matches the Docker default, you must explicitly name Docker’s default driver here.)
driver_opts Options for the volume driver
force [False] If the volume already exists but the existing volume’s driver does not match the driver specified by the driver parameter, this parameter controls whether the function errors out (if False) or deletes and re-creates the volume (if True).

Usage Examples:

```
volume_foo:
  docker_volume.present

volume_bar:
  docker_volume.present
  - name: bar
  - driver: local
  - driver_opts:
    foo: bar

volume_bar:
  docker_volume.present
  - name: bar
  - driver: local
  - driver_opts:
    - foo: bar
    - option: value
```

21.19.74 salt.states.drac

Management of Dell DRAC

The DRAC module is used to create and manage DRAC cards on Dell servers
Ensure the user damian is present

```
[damian]
  drac.present:
    - name: damian
    - password: secret
    - permission: login,test_alerts,clear_logs
```

Ensure the user damian does not exist

```
[damian]
  drac.absent:
    - name: damian
```

Ensure DRAC network is in a consistent state

```
[my_network]
  drac.network:
    - ip: 10.225.108.29
    - netmask: 255.255.255.224
    - gateway: 10.225.108.1
```

salt.states.drac.absent(name)
Ensure a user does not exist on the Dell DRAC
name: The users username

salt.states.drac.network(ip, netmask, gateway)
Ensure the DRAC network settings are consistent

salt.states.drac.present(name, password, permission)
Ensure the user exists on the Dell DRAC
name: The users username
password: The password used to authenticate
permission: The permissions that should be assigned to a user

### 21.19.75 salt.states.elasticsearch

State module to manage Elasticsearch.
New in version 2017.7.0.

salt.states.elasticsearch.alias_absent(name, index)
Ensure that the index alias is absent.
name: Name of the index alias to remove
index: Name of the index for the alias

salt.states.elasticsearch.alias_present(name, index, definition=None)
Ensure that the named index alias is present.
name: Name of the alias
index: Name of the index
Example:

```
[mytestalias]
  elasticsearch.alias_present:
    - index: testindex
```

(continues on next page)
salt.states.elasticsearch.index_absent(name)
Ensure that the named index is absent.
name Name of the index to remove

salt.states.elasticsearch.index_present(name, definition=None)
Ensure that the named index is present.
name Name of the index to add
definition Optional dict for creation parameters as per https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-create-index.html
Example:

```
# Default settings
mytestindex:
    elasticsearch_index.present

# Extra settings
mytestindex2:
    elasticsearch_index.present:
        - definition:
            settings:
                index:
                    number_of_shards: 10
```

salt.states.elasticsearch.index_template_absent(name)
Ensure that the named index template is absent.
name Name of the index to remove

salt.states.elasticsearch.index_template_present(name, definition, check_definition=False)
Ensure that the named index template is present.
name Name of the index to add
definition Required dict for creation parameters as per https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-templates.html
check_definition If the template already exists and the definition is up to date
Example:

```
mytestindex2_template:
    elasticsearch.index_template_present:
        - definition:
            template: logstash-*
            order: 1
            settings:
                number_of_shards: 1
```

salt.states.elasticsearch.pipeline_absent(name)
Ensure that the named pipeline is absent
name Name of the pipeline to remove

salt.states.elasticsearch.pipeline_present(name, definition)
Ensure that the named pipeline is present.
name Name of the index to add
**definition** Required dict for creation parameters as per https://www.elastic.co/guide/en/elasticsearch/reference/master/pipeline.html

Example:

```yaml
test_pipeline:
  elasticsearch.pipeline_present:
    - definition:
        description: example pipeline
        processors:
          - set:
              field: collector_timestamp_millis
              value: '[[ '][}][ingest.timestamp[}][ ]'
```

salt.states.elasticsearch.search_template_absent(name)

Ensure that the search template is absent.

- `name` Name of the search template to remove

salt.states.elasticsearch.search_template_present(name, definition)

Ensure that the named search template is present.

- `name` Name of the search template to add
- `definition` Required dict for creation parameters as per http://www.elastic.co/guide/en/elasticsearch/reference/current/search-template.html

Example:

```yaml
test_pipeline:
  elasticsearch.search_template_present:
    - definition:
        inline:
          size: 10
```

## 21.19.76 salt.states.elasticsearch_index

State module to manage Elasticsearch indices

New in version 2015.8.0.

Deprecated since version 2017.7.0: Use elasticsearch state instead

salt.states.elasticsearch_index.absent(name)

Ensure that the named index is absent.

- `name` Name of the index to remove

salt.states.elasticsearch_index.present(name, definition=None)

New in version 2015.8.0.

Changed in version 2017.3.0: Marked definition as optional.

Ensure that the named index is present.

- `name` Name of the index to add

Example:

```yaml
# Default settings
mytestindex:
  elasticsearch_index.present
```
21.19.77 salt.states.elasticsearch_index_template

State module to manage Elasticsearch index templates
New in version 2015.8.0.
Depreciated since version 2017.7.0: Use elasticsearch state instead

salt.states.elasticsearch_index_template.absent(name)
Ensure that the named index template is absent.
name Name of the index to remove

salt.states.elasticsearch_index_template.present(name, definition)
New in version 2015.8.0.
Changed in version 2017.3.0: Marked definition as required.
Ensure that the named index template is present.
name Name of the index to add
definition Required dict for creation parameters as per https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-templates.html
Example:

mytestindex2_template:
  elasticsearch_index_template.present:
    - definition:
      template: logstash-*
      order: 1
      settings:
       number_of_shards: 1

21.19.78 salt.states.environ

Support for getting and setting the environment variables of the current salt process.
salt.states.environ.setenv(name, value, false_unsets=False, clear_all=False, update_minion=False, permanent=False)
Set the salt process environment variables.
name The environment key to set. Must be a string.
value Either a string or dict. When string, it will be the value set for the environment key of 'name' above.
    When a dict, each key/value pair represents an environment variable to set.
false_unsets If a key’s value is False and false_unsets is True, then the key will be removed from the salt
    processes environment dict entirely. If a key’s value is False and false_unsets is not True, then the key’s
    value will be set to an empty string. Default: False
clear_all USE WITH CAUTION! This option can unset environment variables needed for salt to function
    properly. If clear_all is True, then any environment variables not defined in the environ dict will be
    deleted. Default: False
**update_minion** If True, apply these environ changes to the main salt-minion process. If False, the environ changes will only affect the current salt subprocess. Default: False

**permanent** On Windows minions this will set the environment variable in the registry so that it is always added as a environment variable when applications open. If you want to set the variable to HKLM instead of HKCU just pass in "HKLM" for this parameter. On all other minion types this will be ignored. Note: This will only take affect on applications opened after this has been set.

Example:

```python
a_string_env:
environ.setenv:
- name: foo
- value: bar
- update_minion: True

a_dict_env:
environ.setenv:
- name: does_not_matter
- value:
  foo: bar
  baz: quux
```

### 21.19.79 salt.states.eselect

**Management of Gentoo configuration using eselect**

A state module to manage Gentoo configuration via eselect

```python
salt.states.eselect.set_(name, target, module_parameter=None, action_parameter=None)
```

Verify that the given module is set to the given target

- **name** The name of the module
- **target** The target to be set for this module
- **module_parameter** additional params passed to the defined module
- **action_parameter** additional params passed to the defined action

Example:

```python
profile:
estselect.set:
- target: hardened/linux/amd64
```

### 21.19.80 salt.states.etcd_mod

**Manage etcd Keys**

New in version 2015.8.0.

```python
depends
- python-etcd
```

This state module supports setting and removing keys from etcd.

**Configuration**

To work with an etcd server you must configure an etcd profile. The etcd config can be set in either the Salt Minion configuration file or in pillar:
my_etd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001

It is technically possible to configure etcd without using a profile, but this is not considered to be a best practice, especially when multiple etcd servers or clusters are available.

etcd.host: 127.0.0.1
etcd.port: 4001

Note: The etcd configuration can also be set in the Salt Master config file, but in order to use any etcd configurations defined in the Salt Master config, the `pillar_opts` must be set to True.

Be aware that setting `pillar_opts` to True has security implications as this makes all master configuration settings available in all minion’s pillars.

Etcd profile configuration can be overridden using following arguments: host, port, username, password, ca, client_key and client_cert.

my-value:
  etcd.set:
    - name: /path/to/key
    - value: value
    - host: 127.0.0.1
    - port: 2379
    - username: user
    - password: pass

Available Functions

• set
  This will set a value to a key in etcd. Changes will be returned if the key has been created or the value of the key has been updated. This means you can watch these states for changes.

/foo/bar/baz:
  etcd.set:
    - value: foo
    - profile: my_etcd_config

• wait_set
  Performs the same functionality as set but only if a watch requisite is True.

/some/file.txt:
  file.managed:
    - source: salt://file.txt

/foo/bar/baz:
  etcd.wait_set:
    - value: foo
    - profile: my_etcd_config
    - watch:
      - file: /some/file.txt
• **rm**

This will delete a key from etcd. If the key exists then changes will be returned and thus you can watch for changes on the state, if the key does not exist then no changes will occur.

```
/foo/bar/baz:
etcd.rm:
  - profile: my_etcd_config
```

• **wait_rm**

Performs the same functionality as `rm` but only if a watch requisite is `True`.

```
/some/file.txt:
  file.managed:
    - source: salt://file.txt

/foo/bar/baz:
etcd.wait_rm:
  - profile: my_etcd_config
  - watch:
    - file: /some/file.txt
```

```{.Mustache}
salt.states.etcd_mod.directory(name, profile=None, **kwargs)

Create a directory in etcd.

- **name** The etcd directory name, for example: `/foo/bar/baz`.
- **profile** Optional, defaults to `None`. Sets the etcd profile to use which has been defined in the Salt Master config.

```{.Mustache}
```

```
my_etd_config:
etcd.host: 127.0.0.1
etcd.port: 4001
```

```{.Mustache}
salt.states.etcd_mod.mod_watch(name, **kwargs)

The etcd watcher, called to invoke the watch command. When called, execute a etcd function based on a watch call requisite.

- **Note:** This state exists to support special handling of the `watch` requisite. It should not be called directly.

Parameters for this function should be set by the state being triggered.

```{.Mustache}
salt.states.etcd_mod.rm(name, recurse=False, profile=None, **kwargs)

Deletes a key from etcd.

- **name** The etcd key name to remove, for example `/foo/bar/baz`.
- **recurse** Optional, defaults to `False`. If `True` performs a recursive delete.
- **profile** Optional, defaults to `None`. Sets the etcd profile to use which has been defined in the Salt Master config.

```{.Mustache}
```

```
my_etd_config:
etcd.host: 127.0.0.1
etcd.port: 4001
```

```{.Mustache}
salt.states.etcd_mod.set_(name, value, profile=None, **kwargs)

Set a key in etcd.

- **name** The etcd key name, for example: `/foo/bar/baz`.
- **value** The value the key should contain.
profile  Optional, defaults to None. Sets the etcd profile to use which has been defined in the Salt Master config.

```python
my_etd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

```
salt.states.etcd_mod.wait_rm(name, recurse=False, profile=None, **kwargs)
```

Deletes a key from etcd only if the watch statement calls it. This function is also aliased as `wait_rm`.

- **name**  The etcd key name to remove, for example `/foo/bar/baz`.
- **recurse**  Optional, defaults to False. If True performs a recursive delete, see: https://python-etcd.readthedocs.io/en/latest/#delete-a-key.
- **profile**  Optional, defaults to None. Sets the etcd profile to use which has been defined in the Salt Master config.

```
salt.states.etcd_mod.wait_set(name, value, profile=None, **kwargs)
```

Set a key in etcd only if the watch statement calls it. This function is also aliased as `wait_set`.

- **name**  The etcd key name, for example: `/foo/bar/baz`.
- **value**  The value the key should contain.
- **profile**  The etcd profile to use that has been configured on the Salt Master, this is optional and defaults to None.

```
my_etd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

### 21.19.81 salt.states.ethtool module

Configuration of network device

New in version 2016.11.0.

- **codeauthor**  Krzysztof Pawlowski <msciciel@msciciel.eu>
- **maturity**  new
- **depends**  python-ethtool
- **platform**  linux

```
eth0:
  ethtool.coalesce:
    - name: eth0
    - rx_usecns: 24
    - tx_usecns: 48

eth0:
  ethtool.ring:
    - name: eth0
    - rx: 1024
    - tx: 1024
```

(continues on next page)
ethtool.offload:
- name: eth0
- tcp_segmentation_offload: on

salt.states.ethtool.coalesce(name, **kwargs)
Manage coalescing settings of network device
name  Interface name to apply coalescing settings

eth0:

ethtool.coalesce:
- name: eth0
- adaptive_rx: on
- adaptive_tx: on
- rx_usecs: 24
- rx_frame: 0
- rx_usecs_irq: 0
- rx_frames_irq: 0
- tx_usecs: 48
- tx_frames: 0
- tx_usecs_irq: 0
- tx_frames_irq: 0
- stats_block_usecs: 0
- pkt_rate_low: 0
- rx_usecs_low: 0
- rx_frames_low: 0
- tx_usecs_low: 0
- tx_frames_low: 0
- pkt_rate_high: 0
- rx_usecs_high: 0
- rx_frames_high: 0
- tx_usecs_high: 0
- tx_frames_high: 0
- sample_interval: 0

salt.states.ethtool.offload(name, **kwargs)
Manage protocol offload and other features of network device
name  Interface name to apply coalescing settings

eth0:

ethtool.offload:
- name: eth0
- tcp_segmentation_offload: on

salt.states.ethtool.ring(name, **kwargs)
Manage rx/tx ring parameters of network device
Use ‘max’ word to set with factory maximum
name  Interface name to apply ring parameters

eth0:

ethtool.ring:
- name: eth0
- rx: 1024
- rx_mini: 0
- rx_jumbo: 0
- tx: max

21.19. state modules
21.19.82 salt.states.esxi

Manage VMware ESXi Hosts.
New in version 2015.8.4.

Dependencies

• pyVmomi Python Module
  • ESXCLI

pyVmomi

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

Note: Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.6, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See Issue #29537 for more information.

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==5.5.0.2014.1.1
```

The 5.5.0.2014.1.1 is a known stable version that this original ESXi State Module was developed against.

ESXCLI

Currently, about a third of the functions used in the vSphere Execution Module require the ESXCLI package be installed on the machine running the Proxy Minion process.

The ESXCLI package is also referred to as the VMware vSphere CLI, or vCLI. VMware provides vCLI package installation instructions for vSphere 5.5 and vSphere 6.0.

Once all of the required dependencies are in place and the vCLI package is installed, you can check to see if you can connect to your ESXi host or vCenter server by running the following command:

```
esxcli -s <host-location> -u <username> -p <password> system syslog config get
```

If the connection was successful, ESXCLI was successfully installed on your system. You should see output related to the ESXi host’s syslog configuration.

Note: Be aware that some functionality in this state module may depend on the type of license attached to the ESXi host.

For example, certain services are only available to manipulate service state or policies with a VMware vSphere Enterprise or Enterprise Plus license, while others are available with a Standard license. The ntpd service is restricted to an Enterprise Plus license, while ssh is available via the Standard license.
Please see the vSphere Comparison page for more information.

About

This state module was written to be used in conjunction with Salt’s ESXi Proxy Minion. For a tutorial on how to use Salt’s ESXi Proxy Minion, please refer to the ESXi Proxy Minion Tutorial for configuration examples, dependency installation instructions, how to run remote execution functions against ESXi hosts via a Salt Proxy Minion, and a larger state example.

`salt.states.esxi.coredump_configured(name, enabled, dump_ip, host_vnic='vmk0', dump_port=6500)`

Ensures a host’s core dump configuration.

- **name** Name of the state.
- **enabled** Sets whether or not ESXi core dump collection should be enabled. This is a boolean value set to True or False to enable or disable core dumps.

  Note that ESXi requires that the core dump must be enabled before any other parameters may be set. This also affects the changes results in the state return dictionary. If enabled is False, we can’t obtain any previous settings to compare other state variables, resulting in many old references returning None.

  Once enabled is True the changes dictionary comparisons will be more accurate. This is due to the way the system coredump network configuration command returns data.

- **dump_ip** The IP address of host that will accept the dump.
- **host_vnic** Host VNic port through which to communicate. Defaults to vmk0.
- **dump_port** TCP port to use for the dump. Defaults to 6500.

Example:

```bash
configure-host-coredump:
  esxi.coredump_configured:
    - enabled: True
    - dump_ip: 'my-coredump-ip.example.com'
```

`salt.states.esxi.diskgroups_configured(name, diskgroups, erase_disks=False)`

Configures the disk groups to use for vsan.

This function will do the following:

1. Check whether or not all disks in the diskgroup spec exist, and raises and errors if they do not.
2. Create diskgroups with the correct disk configurations if diskgroup (identified by the cache disk canonical name) doesn’t exist.
3. Adds extra capacity disks to the existing diskgroup.

Example:

```bash
{
    'cache_scsi_addr': 'vmhba1:C0:T0:L0',
    'capacity_scsi_addr': [
        'vmhba2:C0:T0:L0',
        'vmhba3:C0:T0:L0',
        'vmhba4:C0:T0:L0',
    ]
}
```

- **name** Mandatory state name
- **diskgroups** Disk group representation containing scsi disk addresses. Scsi addresses are expected for disks in the diskgroup.
**erase_disks**  Specifies whether to erase all partitions on all disks member of the disk group before the disk group is created. Default value is False.

```python
salt.states.esxi.host_cache_configured(name, enabled, datastore, swap_size='100%',
dedicated_backing_disk=False,
erase_backing_disk=False)
```

Configures the host cache used for swapping.

It will do the following:

1. Checks if backing disk exists
2. Creates the VMFS datastore if doesn’t exist (datastore partition will be created and use the entire disk)
3. Raises an error if `dedicated_backing_disk` is `True` and partitions already exist on the backing disk
4. Configures host_cache to use a portion of the datastore for caching (either a specific size or a percentage of the datastore)

**Examples**

**Percentage swap size (can’t be 100%)**

```python
{
'enabled': true,
'datastore': {
 'backing_disk_scsi_addr': 'vmhba0:C0:T0:L0',
 'vmfs_version': 5,
 'name': 'hostcache'
 }
'dedicated_backing_disk': false
'swap_size': '98%',
}
```

**Fixed sized swap size**

```python
{
'enabled': true,
'datastore': {
 'backing_disk_scsi_addr': 'vmhba0:C0:T0:L0',
 'vmfs_version': 5,
 'name': 'hostcache'
 }
'dedicated_backing_disk': true
'swap_size': '10GiB',
}
```

**name**  Mandatory state name.

**enabled**  Specifies whether the host cache is enabled.

**datastore**  Specifies the host cache datastore.

**swap_size**  Specifies the size of the host cache swap. Can be a percentage or a value in GiB. Default value is 100%.

**dedicated_backing_disk**  Specifies whether the backing disk is dedicated to the host cache which means it must have no other partitions. Default is False

**erase_backing_disk**  Specifies whether to erase all partitions on the backing disk before the datastore is created. Default value is False.

```python
salt.states.esxi.ntp_configured(name, service_running, ntp_servers=None, service_policy=None,
service_restart=False, update_datetime=False)
```

Ensures a host’s NTP server configuration such as setting NTP servers, ensuring the NTP daemon is running or stopped, or restarting the NTP daemon for the ESXi host.

**name**  Name of the state.
service_running Ensures the running state of the ntp daemon for the host. Boolean value where True indicates that ntpd should be running and False indicates that it should be stopped.

ntp_servers A list of servers that should be added to the ESXi host’s NTP configuration.

service_policy The policy to set for the NTP service.

Note: When setting the service policy to off or on, you must quote the setting. If you don’t, the yaml parser will set the string to a boolean, which will cause trouble checking for stateful changes and will error when trying to set the policy on the ESXi host.

service_restart If set to True, the ntp daemon will be restarted, regardless of its previous running state. Default is False.

update_datetime If set to True, the date/time on the given host will be updated to UTC. Default setting is False. This option should be used with caution since network delays and execution delays can result in time skews.

Example:

```
configure-host-ntp:
esxi.ntp_configured:
  - service_running: True
  - ntp_servers:
    - 192.174.1.100
    - 192.174.1.200
  - service_policy: 'on'
  - service_restart: True
```

salt.states.esxi.password_present(name, password)
Ensures the given password is set on the ESXi host. Passwords cannot be obtained from host, so if a password is set in this state, the vsphere.update_host_password function will always run (except when using test=True functionality) and the state’s changes dictionary will always be populated.

The username for which the password will change is the same username that is used to authenticate against the ESXi host via the Proxy Minion. For example, if the pillar definition for the proxy username is defined as root, then the username that the password will be updated for via this state is root.

name Name of the state.

password The new password to change on the host.

Example:

```
configure-host-password:
esxi.password_present:
  - password: 'new-bad-password'
```

cell.states.esxi.ssh_configured(name, service_running, ssh_key=None, ssh_key_file=None, service_policy=None, service_restart=False, certificate_verify=False)
Manage the SSH configuration for a host including whether or not SSH is running or the presence of a given SSH key. Note: Only one ssh key can be uploaded for root. Uploading a second key will replace any existing key.

name Name of the state.

service_running Ensures whether or not the SSH service should be running on a host. Represented as a boolean value where True indicates that SSH should be running and False indicates that SSH should stopped.

In order to update SSH keys, the SSH service must be running.

ssh_key Public SSH key to added to the authorized_keys file on the ESXi host. You can use ssh_key or ssh_key_file, but not both.
**ssh_key_file**  File containing the public SSH key to be added to the authorized_keys file on the ESXi host. You can use `ssh_key_file` or `ssh_key`, but not both.

**service_policy**  The policy to set for the NTP service.

---

**Note:** When setting the service policy to `off` or `on`, you *must* quote the setting. If you don’t, the yaml parser will set the string to a boolean, which will cause trouble checking for stateful changes and will error when trying to set the policy on the ESXi host.

---

**service_restart**  If set to `True`, the SSH service will be restarted, regardless of its previous running state. Default is `False`.

**certificate_verify**  If set to `True`, the SSL connection must present a valid certificate. Default is `False`.

Example:

```yaml
configure-host-ssh:
  esxi.ssh_configured:
    - service_running: True
    - ssh_key_file: /etc/salt/ssh_keys/my_key.pub
    - service_policy: 'on'
    - service_restart: True
    - certificate_verify: True
```

---

**salt.states.esxi.syslog_configured** *(name, syslog_configs, firewall=True, reset_service=True, reset_syslog_config=False, reset_configs=None)*

Ensures the specified syslog configuration parameters. By default, this state will reset the syslog service after any new or changed parameters are set successfully.

- **name**  Name of the state.
- **syslog_configs**  Name of parameter to set (corresponds to the command line switch for esxcli without the double dashes (-))

  Valid syslog_config values are `logdir`, `loghost`, `logdir-unique`, `default-rotate`, `default-size`, and `default-timeout`.

  Each syslog_config option also needs a configuration value to set. For example, `loghost` requires URLs or IP addresses to use for logging. Multiple log servers can be specified by listing them, comma-separated, but without spaces before or after commas.

- **firewall**  Enable the firewall rule set for syslog. Defaults to `True`.
- **reset_service**  After a successful parameter set, reset the service. Defaults to `True`.
- **reset_syslog_config**  Resets the syslog service to it's default settings. Defaults to `False`. If set to `True`, default settings defined by the list of syslog configs in `reset_configs` will be reset before running any other syslog settings.
- **reset_configs**  A comma-delimited list of parameters to reset. Only runs if `reset_syslog_config` is set to `True`. If `reset_syslog_config` is set to `True`, but no syslog configs are listed in `reset_configs`, then `reset_configs` will be set to `all` by default.

  See `syslog_configs` parameter above for a list of valid options.

Example:

```yaml
configure-host-syslog:
  esxi.syslog_configured:
    syslog_configs:
      default-timeout: 120
      firewall: True
```

(continues on next page)
salt.states.esxi.vmotion_configured(name, enabled, device='vmk0')

Configures a host’s VMotion properties such as enabling VMotion and setting the device VirtualNic that VMotion will use.

- **name** Name of the state.
- **enabled** Ensures whether or not VMotion should be enabled on a host as a boolean value where True indicates that VMotion should be enabled and False indicates that VMotion should be disabled.
- **device** The device that uniquely identifies the VirtualNic that will be used for VMotion for the host. Defaults to vmk0.

Example:
```
configure-vmotion:
  esxi.vmotion_configured:
    - enabled: True
    - device: sample-device
```

salt.states.esxi.vsan_configured(name, enabled, add_disks_to_vsan=False)

Configures a host’s VSAN properties such as enabling or disabling VSAN, or adding VSAN-eligible disks to the VSAN system for the host.

- **name** Name of the state.
- **enabled** Ensures whether or not VSAN should be enabled on a host as a boolean value where True indicates that VSAN should be enabled and False indicates that VSAN should be disabled.
- **add_disks_to_vsan** If set to True, any VSAN-eligible disks for the given host will be added to the host’s VSAN system. Default is False.

Example:
```
configure-host-vsan:
  esxi.vsan_configured:
    - enabled: True
    - add_disks_to_vsan: True
```

21.19.83 salt.states.event

Send events through Salt’s event system during state runs

salt.states.event.send(name, data=None, preload=None, with_env=False, with_grains=False, with_pillar=False, show_changed=True, **kwargs)

Send an event to the Salt Master

New in version 2014.7.0.

Accepts the same arguments as the event.send execution module of the same name, with the additional argument:

- **Parameters show_changed** – If True, state will show as changed with the data argument as the change value. If False, shows as unchanged.

Example:
```
# ...snip bunch of states above
mycompany/mystaterun/status/update:
  event.send:
```
- **data:**
  - **status:** "Half-way through the state run!"

# ...snip bunch of states below

```python
salt.states.event.wait(name, sfun=None)
```

Fire an event on the Salt master event bus if called from a watch statement

New in version 2014.7.0.

Example:

```python
# Stand up a new web server.
apache:
  pkg:
    - installed
    - name: httpd
  service:
    - running
    - enable: True
    - name: httpd

# Notify the load balancer to update the pool once Apache is running.
refresh_pool:
  event:
    - wait
    - name: mycompany/loadbalancer/pool/update
    - data:
      - new_web_server_ip: {{ grains['ipv4'] | first() }}
    - watch:
      - pkg: apache
```

### 21.19.84 salt.states.file

**Operations on regular files, special files, directories, and symlinks**

Salt States can aggressively manipulate files on a system. There are a number of ways in which files can be managed.

Regular files can be enforced with the `file.managed` state. This state downloads files from the salt master and places them on the target system. Managed files can be rendered as a jinja, mako, or wempy template, adding a dynamic component to file management. An example of `file.managed` which makes use of the jinja templating system would look like this:

```python
/etc/http/conf/http.conf:
  file.managed:
    - source: salt://apache/http.conf
    - user: root
    - group: root
    - mode: 644
    - attrs: ai
    - template: jinja
    - defaults:
      - custom_var: "default value"
      - other_var: 123
{% if grains['os'] == 'Ubuntu' %}
```
It is also possible to use the `py` renderer as a templating option. The template would be a Python script which would need to contain a function called `run()`, which returns a string. All arguments to the state will be made available to the Python script as globals. The returned string will be the contents of the managed file. For example:

```python
def run():
    lines = ['foo', 'bar', 'baz']
    lines.extend([source, name, user, context])  # Arguments as globals
    return '\n\n'.join(lines)
```

**Note:** The `defaults` and `context` arguments require extra indentation (four spaces instead of the normal two) in order to create a nested dictionary. More information.

If using a template, any user-defined template variables in the file defined in `source` must be passed in using the `defaults` and/or `context` arguments. The general best practice is to place default values in `defaults`, with conditional overrides going into `context`, as seen above.

The template will receive a variable `custom_var`, which would be accessed in the template using `{{ custom_var }}`. If the operating system is Ubuntu, the value of the variable `custom_var` would be `override`, otherwise it is the default default value

The `source` parameter can be specified as a list. If this is done, then the first file to be matched will be the one that is used. This allows you to have a default file on which to fall back if the desired file does not exist on the salt fileserver. Here's an example:

```
/etc/foo.conf:
  file.managed:
    - source:
      - salt://foo.conf
      - salt://foo.conf.fallback
      - user: foo
      - group: users
      - mode: 644
      - attrs: i
      - backup: minion
```

**Note:** Salt supports backing up managed files via the backup option. For more details on this functionality please review the backup_mode documentation.

The `source` parameter can also specify a file in another Salt environment. In this example `foo.conf` in the dev environment will be used instead.

```
/etc/foo.conf:
  file.managed:
    - source:
      - 'salt://foo.conf?saltenv=dev'
      - user: foo
      - group: users
      - mode: '0644'
      - attrs: i
```
**Warning:** When using a mode that includes a leading zero you must wrap the value in single quotes. If the value is not wrapped in quotes it will be read by YAML as an integer and evaluated as an octal.

The `names` parameter, which is part of the state compiler, can be used to expand the contents of a single state declaration into multiple, single state declarations. Each item in the `names` list receives its own individual state name and is converted into its own low-data structure. This is a convenient way to manage several files with similar attributes.

```yaml
salt_master_conf:
  file.managed:
    - user: root
    - group: root
    - mode: '0644'
    - names:
      - /etc/salt/master.d/master.conf:
        - source: salt://saltmaster/master.conf
      - /etc/salt/minion.d/minion-99.conf:
        - source: salt://saltmaster/minion.conf
```

**Note:** There is more documentation about this feature in the `Names declaration` section of the `Highstate docs`.

Special files can be managed via the `mknod` function. This function will create and enforce the permissions on a special file. The function supports the creation of character devices, block devices, and FIFO pipes. The function will create the directory structure up to the special file if it is needed on the minion. The function will not overwrite or operate on (change major/minor numbers) existing special files with the exception of user, group, and permissions. In most cases the creation of some special files require root permissions on the minion. This would require that the minion to be run as the root user. Here is an example of a character device:

```yaml
/var/named/chroot/dev/random:
  file.mknod:
    - ntype: c
    - major: 1
    - minor: 8
    - user: named
    - group: named
    - mode: 660
```

Here is an example of a block device:

```yaml
/var/named/chroot/dev/loop0:
  file.mknod:
    - ntype: b
    - major: 7
    - minor: 0
    - user: named
    - group: named
    - mode: 660
```

Here is an example of a fifo pipe:

```yaml
/var/named/chroot/var/log/logfifo:
  file.mknod:
    - ntype: p
    - user: named
```

(continues on next page)
Directories can be managed via the `directory` function. This function can create and enforce the permissions on a directory. A directory statement will look like this:

```
/srv/stuff/substuf:
  file.directory:
    - user: fred
    - group: users
    - mode: 755
    - makedirs: True
```

If you need to enforce user and/or group ownership or permissions recursively on the directory’s contents, you can do so by adding a `recurse` directive:

```
/srv/stuff/substuf:
  file.directory:
    - user: fred
    - group: users
    - mode: 755
    - makedirs: True
    - recurse:
      - user
      - group
      - mode
```

As a default, `mode` will resolve to `dir_mode` and `file_mode`, to specify both directory and file permissions, use this form:

```
/srv/stuff/substuf:
  file.directory:
    - user: fred
    - group: users
    - file_mode: 744
    - dir_mode: 755
    - makedirs: True
    - recurse:
      - user
      - group
      - mode
```

Symlinks can be easily created; the symlink function is very simple and only takes a few arguments:

```
/etc/grub.conf:
  file.symlink:
    - target: /boot/grub/grub.conf
```

Recursive directory management can also be set via the `recurse` function. Recursive directory management allows for a directory on the salt master to be recursively copied down to the minion. This is a great tool for deploying large code and configuration systems. A state using `recurse` would look something like this:

```
/opt/code/flask:
  file.recurse:
    - source: salt://code/flask
    - include_empty: True
```
A more complex `recurse` example:

```yaml
{% set site_user = 'testuser' %}
{% set site_name = 'test_site' %}
{% set project_name = 'test_proj' %}
{% set sites_dir = 'test_dir' %}

django-project:
  file.recurse:
    - name: {{sites_dir}}/{{site_name}}/{{project_name}}
    - user: {{site_user}}
    - dir_mode: 2775
    - file_mode: '0644'
    - template: jinja
    - source: salt://project/templates_dir
    - include_empty: True
```

Retention scheduling can be applied to manage contents of backup directories. For example:

```yaml
/var/backups/example_directory:
  file.retention_schedule:
    - strptime_format: example_name_%Y%m%dT%H%M%S.tar.bz2
    - retain:
      most_recent: 5
      first_of_hour: 4
      first_of_day: 14
      first_of_week: 6
      first_of_month: 6
      first_of_year: all
```

salt.states.file.absent(name, **kwargs)

Make sure that the named file or directory is absent. If it exists, it will be deleted. This will work to reverse any of the functions in the file state module. If a directory is supplied, it will be recursively deleted.

- name The path which should be deleted

salt.states.file.accumulated(name, filename, text, **kwargs)

Prepare accumulator which can be used in template in file.managed state. Accumulator dictionary becomes available in template. It can also be used in file.blockreplace.

- name Accumulator name
- filename Filename which would receive this accumulator (see file.managed state documentation about name)
- text String or list for adding in accumulator
- require_in / watch_in One of them required for sure we fill up accumulator before we manage the file. Probably the same as filename

Example:

Given the following:

```yaml
animals_doing_things:
  file.accumulated:
    - filename: /tmp/animal_file.txt
    - text: 'jumps over the lazy dog.'
    - require_in:
      - file: animal_file

animal_file:
  file.managed:
    - name: /tmp/animal_file.txt
```

(continues on next page)
One might write a template for `animal_file.txt` like the following:

```template
The quick brown fox{% for animal in accumulator['animals_doing_things'] %}{%--animal %}{% endfor %}
```

Collectively, the above states and template file will produce:

```
The quick brown fox jumps over the lazy dog.
```

Multiple accumulators can be "chained" together.

**Note:** The 'accumulator' data structure is a Python dictionary. Do not expect any loop over the keys in a deterministic order!

### `salt.states.file.append`

```python
salt.states.file.append(name, text=None, makedirs=False, source=None, source_hash=None, template='jinja', sources=None, source_hashes=None, defaults=None, context=None, ignore_whitespace=True)
```

Ensure that some text appears at the end of a file.

The text will not be appended if it already exists in the file. A single string of text or a list of strings may be appended.

- **name** The location of the file to append to.
- **text** The text to be appended, which can be a single string or a list of strings.
- **makedirs** If the file is located in a path without a parent directory, then the state will fail. If makedirs is set to True, then the parent directories will be created to facilitate the creation of the named file. Defaults to False.
- **source** A single source file to append. This source file can be hosted on either the salt master server, or on an HTTP or FTP server. Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials (see s3.get state documentation). File retrieval from Openstack Swift object storage is supported via swift://container/object_path URLs (see swift.get documentation).
  
  For files hosted on the salt file server, if the file is located on the master in the directory named spam, and is called eggs, the source string is `salt://spam/eggs`.
  
  If the file is hosted on an HTTP or FTP server, the source_hash argument is also required.
- **source_hash**
  
  This can be one of the following:
  
  1. a source hash string
  2. the URI of a file that contains source hash strings

  The function accepts the first encountered long unbroken alphanumeric string of correct length as a valid hash, in order from most secure to least secure:

<table>
<thead>
<tr>
<th>Type</th>
<th>Length</th>
</tr>
</thead>
<tbody>
<tr>
<td>sha512</td>
<td>128</td>
</tr>
<tr>
<td>sha384</td>
<td>96</td>
</tr>
<tr>
<td>sha256</td>
<td>64</td>
</tr>
<tr>
<td>sha224</td>
<td>56</td>
</tr>
<tr>
<td>sha1</td>
<td>40</td>
</tr>
<tr>
<td>md5</td>
<td>32</td>
</tr>
</tbody>
</table>
See the `source_hash` parameter description for `file.managed` function for more details and examples.

**template**  The named templating engine will be used to render the appended-to file. Defaults to `jinja`. The following templates are supported:

- `cheetah`
- `genshi`
- `jinja`
- `mako`
- `py`
- `wempy`

**sources**  A list of source files to append. If the files are hosted on an HTTP or FTP server, the `source_hashes` argument is also required.

**source_hashes**  A list of `source_hashes` corresponding to the `sources` list specified in the `sources` argument.

**defaults**  Default context passed to the template.

**context**  Overrides default context variables passed to the template.

**ignore_whitespace**  New in version 2015.8.4. Spaces and Tabs in text are ignored by default, when searching for the appending content, one space or multiple tabs are the same for salt. Set this option to `False` if you want to change this behavior.

Multi-line example:

```
/etc/motd:
    file.append:
        - text:
            Thou hadst better eat salt with the Philosophers of Greece,
            than sugar with the Courtiers of Italy.
            ~ Benjamin Franklin
```

Multiple lines of text:

```
/etc/motd:
    file.append:
        - text:
            - Trust no one unless you have eaten much salt with him.
            - "Salt is born of the purest of parents: the sun and the sea."
```

Gather text from multiple template files:

```
/etc/motd:
    file:
        - append
        - template: jinja
        - sources:
            - salt://motd/devops-messages.tmpl
            - salt://motd/hr-messages.tmpl
            - salt://motd/general-messages.tmpl
```

New in version 0.9.5.

```salt.states.file.blockreplace```

```
(name, marker_start='"#– start managed zone –"', marker_end='"#–
end managed zone –"', source=source, source_hash=source_hash,
template='jinja', sources=source, source_hashes=source_hashes, de-
defaults=source, context=source, content=", append_if_not_found=False,
prepend_if_not_found=False, backup='.bak', show_changes=True,
append_newline=None)
```

Maintain an edit in a file in a zone delimited by two line markers

New in version 2014.1.0.
Changed in version 2017.7.5, 2018.3.1: append_newline argument added. Additionally, to improve idempotence, if the string represented by marker_end is found in the middle of the line, the content preceding the marker will be removed when the block is replaced. This allows one to remove append_newline: False from the SLS and have the block properly replaced if the end of the content block is immediately followed by the marker_end (i.e. no newline before the marker).

A block of content delimited by comments can help you manage several lines entries without worrying about old entries removal. This can help you maintaining an un-managed file containing manual edits.

---

**Note:** This function will store two copies of the file in-memory (the original version and the edited version) in order to detect changes and only edit the targeted file if necessary.

Additionally, you can use `file.accumulated` and target this state. All accumulated data dictionaries’ content will be added in the content block.

---

**name**  Filesystem path to the file to be edited

**marker_start**  The line content identifying a line as the start of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output

**marker_end**  The line content identifying the end of the content block. As of versions 2017.7.5 and 2018.3.1, everything up to the text matching the marker will be replaced, so it’s important to ensure that your marker includes the beginning of the text you wish to replace.

**content**  The content to be used between the two lines identified by marker_start and marker_end

**source**  The source file to download to the minion, this source file can be hosted on either the salt master server, or on an HTTP or FTP server. Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials. (see s3.get state documentation) File retrieval from Openstack Swift object storage is supported via swift://container/object_path URLs, see swift.get documentation. For files hosted on the salt file server, if the file is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs. If source is left blank or None (use ~ in YAML), the file will be created as an empty file and the content will not be managed. This is also the case when a file already exists and the source is undefined; the contents of the file will not be changed or managed.

If the file is hosted on a HTTP or FTP server then the source_hash argument is also required.

A list of sources can also be passed in to provide a default source and a set of fallbacks. The first source in the list that is found to exist will be used and subsequent entries in the list will be ignored.

---

```yaml
file_override_example:
  file.blockreplace:
  - name: /etc/example.conf
  - source:
    - salt://file_that_does_not_exist
    - salt://file_that_exists
```

**source_hash**  This can be one of the following:

1. a source hash string
2. the URI of a file that contains source hash strings

The function accepts the first encountered long unbroken alphanumeric string of correct length as a valid hash, in order from most secure to least secure:

<table>
<thead>
<tr>
<th>Type</th>
<th>Length</th>
</tr>
</thead>
<tbody>
<tr>
<td>sha512</td>
<td>128</td>
</tr>
<tr>
<td>sha384</td>
<td>96</td>
</tr>
</tbody>
</table>

(continues on next page)
See the `source_hash` parameter description for `file.managed` function for more details and examples.

**template** [jinja] Templating engine to be used to render the downloaded file. The following engines are supported:

- cheetah
- genshi
- jinja
- mako
- py
- wempy

**context** Overrides default context variables passed to the template

**defaults** Default context passed to the template

**append_if_not_found** [False] If markers are not found and this option is set to True, the content block will be appended to the file.

**prepend_if_not_found** [False] If markers are not found and this option is set to True, the content block will be prepended to the file.

**backup** The file extension to use for a backup of the file if any edit is made. Set this to `False` to skip making a backup.

**dry_run** [False] If True, do not make any edits to the file and simply return the changes that would be made.

**show_changes** [True] Controls how changes are presented. If True, the Changes section of the state return will contain a unified diff of the changes made. If False, then it will contain a boolean (True if any changes were made, otherwise False).

**append_newline** Controls whether or not a newline is appended to the content block. If the value of this argument is True then a newline will be added to the content block. If it is False, then a newline will not be added to the content block. If it is unspecified, then a newline will only be added to the content block if it does not already end in a newline.

New in version 2017.7.5, 2018.3.1.

Example of usage with an accumulator and with a variable:

```yaml
{% set myvar = 42 %}
hosts-config-block-{{ myvar }}:
  file.blockreplace:
    - name: /etc/hosts
    - marker_start: "# START managed zone {{ myvar }} --DO-NOT-EDIT--"
    - marker_end: "# END managed zone {{ myvar }} --"
    - content: 'First line of content'
    - append_if_not_found: True
    - backup: '.bak'
    - show_changes: True

hosts-config-block-{{ myvar }}-accumulated1:
  file.accumulated:
    - filename: /etc/hosts
    - name: my-accumulator-{{ myvar }}
    - text: "text 2"
    - require_in:
      - file: hosts-config-block-{{ myvar }}
```

(continues on next page)
hosts-config-block-{{ myvar }}-accumulated2:
  file.accumulated:
    - filename: /etc/hosts
    - name: my-accumulator-{{ myvar }}
    - text: |
      text 3
      text 4
    - require_in:
      - file: hosts-config-block-{{ myvar }}

will generate and maintain a block of content in /etc/hosts:

```
# START managed zone 42  DO-NOT-EDIT-
First line of content
text 2
text 3
text 4
# END managed zone 42  --
```

salt.states.file.cached(name, source_hash=", source_hash_name=None, skip_verify=False, saltenv='base')

New in version 2017.7.3.

Ensures that a file is saved to the minion’s cache. This state is primarily invoked by other states to ensure that we do not re-download a source file if we do not need to.

**name** The URL of the file to be cached. To cache a file from an environment other than base, either use the saltenv argument or include the saltenv in the URL (e.g. salt://path/to/file.conf?saltenv=dev).

**Note:** A list of URLs is not supported, this must be a single URL. If a local file is passed here, then the state will obviously not try to download anything, but it will compare a hash if one is specified.

**source_hash** See the documentation for this same argument in the file.managed state.

**Note:** For remote files not originating from the salt:// fileserver, such as http(s) or ftp servers, this state will not re-download the file if the locally-cached copy matches this hash. This is done to prevent unnecessary downloading on repeated runs of this state. To update the cached copy of a file, it is necessary to update this hash.

**source_hash_name** See the documentation for this same argument in the file.managed state.

**skip_verify** See the documentation for this same argument in the file.managed state.

**Note:** Setting this to True will result in a copy of the file being downloaded from a remote (http(s), ftp, etc.) source each time the state is run.

**saltenv** Used to specify the environment from which to download a file from the Salt fileserver (i.e. those with salt:// URL).

This state will in most cases not be useful in SLS files, but it is useful when writing a state or remote-execution module that needs to make sure that a file at a given URL has been downloaded to the cachedir. One example of this is in the archive.extracted state:

```
result = __states__['file.cached'](source_match, 
  source_hash=source_hash,
```

(continues on next page)
This will return a dictionary containing the state’s return data, including a result key which will state whether or not the state was successful. Note that this will not catch exceptions, so it is best used within a try/except.

Once this state has been run from within another state or remote-execution module, the actual location of the cached file can be obtained using cp.is_cached:

```
cached = __salt__['cp.is_cached'](source_match, saltenv=__env__)
```

This function will return the cached path of the file, or an empty string if the file is not present in the minion cache.

salt.states.file.comment(name, regex, char='#', backup='.bak')

Comment out specified lines in a file.

- **name**: The full path to the file to be edited
- **regex**: A regular expression used to find the lines that are to be commented; this pattern will be wrapped in parenthesis and will move any preceding/trailing ^ or $ characters outside the parenthesis (e.g., the pattern ^foo$ will be rewritten as ^foo$) Note that you _need_ the leading ^, otherwise each time you run highstate, another comment char will be inserted.
- **char** ["#"] The character to be inserted at the beginning of a line in order to comment it out
- **backup** [".bak"] The file will be backed up before edit with this file extension

**Warning**: This backup will be overwritten each time sed / comment / uncomment is called. Meaning the backup will only be useful after the first invocation.

Set to False/None to not keep a backup.

Usage:

```
/etc/fstab:
  file.comment:
    - regex: ^bind 127.0.0.1
```

New in version 0.9.5.

salt.states.file.copy_(name, source, force=False, makedirs=False, preserve=False, user=None, group=None, mode=None, subdir=False, **kwargs)

If the file defined by the source option exists on the minion, copy it to the named path. The file will not be overwritten if it already exists, unless the force option is set to True.

**Note**: This state only copies files from one location on a minion to another location on the same minion. For copying files from the master, use a file.managed state.

- **name**: The location of the file to copy to
- **source**: The location of the file to copy to the location specified with name
- **force**: If the target location is present then the file will not be moved, specify "force: True" to overwrite the target file
- **makedirs**: If the target subdirectories don’t exist create them
- **preserve**: New in version 2015.5.0.
Set `preserve`: `True` to preserve user/group ownership and mode after copying. Default is `False`. If `preserve` is set to `True`, then user/group/mode attributes will be ignored.

**user** New in version 2015.5.0.

The user to own the copied file, this defaults to the user salt is running as on the minion. If `preserve` is set to `True`, then this will be ignored

**group** New in version 2015.5.0.

The group to own the copied file, this defaults to the group salt is running as on the minion. If `preserve` is set to `True` or on Windows this will be ignored

**mode** New in version 2015.5.0.

The permissions to set on the copied file, aka 644, '0775', '4664'. If `preserve` is set to `True`, then this will be ignored. Not supported on Windows.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it’s not enforced.

**subdir** New in version 2015.5.0.

If the name is a directory then place the file inside the named directory

---

**Note:** The copy function accepts paths that are local to the Salt minion. This function does not support salt://, http://, or the other additional file paths that are supported by `states.file.managed` and `states.file.recurse`.

---

**salt.states.file.decode**

```
(name, encoded_data=None, contents_pillar=None, encoding_type='base64', checksum='md5')
```

Decode an encoded file and write it to disk

New in version 2016.3.0.

**name** Path of the file to be written.

**encoded_data** The encoded file. Either this option or `contents_pillar` must be specified.

**contents_pillar** A Pillar path to the encoded file. Uses the same path syntax as `pillar.get`. The `hashutil.base64_encodefile` function can load encoded content into Pillar. Either this option or `encoded_data` must be specified.

**encoding_type** [base64] The type of encoding.

**checksum** [md5] The hashing algorithm to use to generate checksums. Wraps the `hashutil.digest` execution function.

**Usage:**

```
write_base64_encoded_string_to_a_file:
    file.decode:
        - name: /tmp/new_file
        - encoding_type: base64
        - contents_pillar: mypillar:thefile
```

# or

```
write_base64_encoded_string_to_a_file:
    file.decode:
        - name: /tmp/new_file
        - encoding_type: base64
        - encoded_data: Z2V0IHNhbHRlZAo=
```

Be careful with multi-line strings that the YAML indentation is correct. E.g.,
write_base64_encoded_string_to_a_file:
  file.decode:
    - name: /tmp/new_file
    - encoding_type: base64
    - encoded_data: |
      {{ salt.pillar.get('path:to:data') | indent(8) }}

salt.states.file.directory(name, user=None, group=None, recurse=None, max_depth=None,
dir_mode=None, file_mode=None, makedirs=False, clean=False, require=None, exclude_pat=None, follow_symlinks=False, force=False,
backupname=None, allow_symlink=True, children_only=False, win_owner=None, win_perms=None, win_deny_perms=None,
win_inheritance=True, win_perms_reset=False, **kwargs)

Ensure that a named directory is present and has the right perms

name The location to create or manage a directory, as an absolute path
user The user to own the directory; this defaults to the user salt is running as on the minion
group The group ownership set for the directory; this defaults to the group salt is running as on the minion.
On Windows, this is ignored
recurse Enforce user/group ownership and mode of directory recursively. Accepts a list of strings representing what you would like to recurse. If mode is defined, will recurse on both file_mode and dir_mode if they are defined. If ignore_files or ignore_dirs is included, files or directories will be left unchanged respectively. Example:

/var/log/httpd:
  file.directory:
    - user: root
    - group: root
    - dir_mode: 755
    - file_mode: 644
    - recurse:
      - user
      - group
      - mode

Leave files or directories unchanged:

/var/log/httpd:
  file.directory:
    - user: root
    - group: root
    - dir_mode: 755
    - file_mode: 644
    - recurse:
      - user
      - group
      - mode
      - ignore_dirs

New in version 2015.5.0.
max_depth Limit the recursion depth. The default is no limit=None. 'max_depth' and 'clean' are mutually exclusive.

New in version 2016.11.0.
dir_mode / mode The permissions mode to set any directories created. Not supported on Windows.
The default mode for new files and directories corresponds umask of salt process. For existing files and directories it’s not enforced.
file_mode The permissions mode to set any files created if ‘mode’ is run in ‘recurse’. This defaults to dir_mode. Not supported on Windows.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it’s not enforced.
makedirs If the directory is located in a path without a parent directory, then the state will fail. If makedirs is set to True, then the parent directories will be created to facilitate the creation of the named file.
clean Make sure that only files that are set up by salt and required by this function are kept. If this option is set then everything in this directory will be deleted unless it is required. ‘clean’ and ‘max_depth’ are mutually exclusive.
require Require other resources such as packages or files
exclude.pat When ‘clean’ is set to True, exclude this pattern from removal list and preserve in the destination.
follow_symlinks [False] If the desired path is a symlink (or recurse is defined and a symlink is encountered while recursing), follow it and check the permissions of the directory/file to which the symlink points.

New in version 2014.1.4.
force If the name of the directory exists and is not a directory and force is set to False, the state will fail. If force is set to True, the file in the way of the directory will be deleted to make room for the directory, unless backupname is set, then it will be renamed.

New in version 2014.7.0.
backupname If the name of the directory exists and is not a directory, it will be renamed to the backupname. If the backupname already exists and force is False, the state will fail. Otherwise, the backupname will be removed first.

New in version 2014.7.0.
allow_symlink [True] If allow_symlink is True and the specified path is a symlink, it will be allowed to remain if it points to a directory. If allow_symlink is False then the state will fail, unless force is also set to True, in which case it will be removed or renamed, depending on the value of the backupname argument.

New in version 2014.7.0.
children_only [False] If children_only is True the base of a path is excluded when performing a recursive operation. In case of /path/to/base, base will be ignored while all of /path/to/base/* are still operated on.
win_owner [None] The owner of the directory. If this is not passed, user will be used. If user is not passed, the account under which Salt is running will be used.

New in version 2017.7.0.
win_perms [None] A dictionary containing permissions to grant and their propagation. For example: {'Administrators': {'perms': 'full_control', 'applies_to': 'this_folder_only'}} Can be a single basic perm or a list of advanced perms. perms must be specified. applies_to is optional and defaults to this_folder_subfolder_files.

New in version 2017.7.0.
win_deny_perms [None] A dictionary containing permissions to deny and their propagation. For example: {'Administrators': {'perms': 'full_control', 'applies_to': 'this_folder_only'}} Can be a single basic perm or a list of advanced perms.

New in version 2017.7.0.
win_inheritance [True] True to inherit permissions from the parent directory, False not to inherit permission.

New in version 2017.7.0.
win_perms_reset [False] If True the existing DACL will be cleared and replaced with the settings defined in this function. If False, new entries will be appended to the existing DACL. Default is False.

New in version 2018.3.0.

Here’s an example using the above win_* parameters:
create_config_dir:
file.directory:
  - name: 'C:\config\'
  - win_owner: Administrators
  - win_perms:
    # Basic Permissions
    dev_ops:
      perms: full_control
    # List of advanced permissions
    appuser:
      perms:
        - read_attributes
        - read_ea
        - create_folders
        - read_permissions
      applies_to: this_folder_only
    joe_snuffy:
      perms: read
      applies_to: this_folder_files
  - win_deny_perms:
    fred_snuffy:
      perms: full_control
  - win_inheritance: False

salt.states.file.exists(name, **kwargs)
Verify that the named file or directory is present or exists. Ensures pre-requisites outside of Salt’s purview (e.g., keytabs, private keys, etc.) have been previously satisfied before deployment.

This function does not create the file if it doesn’t exist, it will return an error.
name Absolute path which must exist

salt.states.file.line(name, content=None, match=None, mode=None, location=None, before=None, after=None, show_changes=True, backup=False, quiet=False, indent=True, create=False, user=None, group=None, file_mode=None)
Line-based editing of a file.
New in version 2015.8.0.
Parameters

- **name** – Filesystem path to the file to be edited.
- **content** – Content of the line. Allowed to be empty if mode=delete.
- **match** – Match the target line for an action by a fragment of a string or regular expression.
  
  If neither before nor after are provided, and match is also None, match becomes the content value.

- **mode** – Defines how to edit a line. One of the following options is required:
  - ensure If line does not exist, it will be added.
  - replace If line already exists, it will be replaced.
  - delete Delete the line, once found.
  - insert Insert a line.

  **Note**: If mode=insert is used, at least one of the following options must also be defined: location, before, or after. If location is used, it takes precedence over the other two options.

- **location** – Defines where to place content in the line. Note this option is only used when mode=insert is specified. If a location is passed in, it takes precedence over
both the `before` and `after` kwargs. Valid locations are:
- `start` Place the content at the beginning of the file.
- `end` Place the content at the end of the file.
- `before` – Regular expression or an exact case-sensitive fragment of the string. This option is only used when either the `ensure` or `insert` mode is defined.
- `after` – Regular expression or an exact case-sensitive fragment of the string. This option is only used when either the `ensure` or `insert` mode is defined.
- `show_changes` – Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made. Default is `True`

Note: Using this option will store two copies of the file in-memory (the original version and the edited version) in order to generate the diff.

- `backup` – Create a backup of the original file with the extension: "Year-Month-Day-Hour-Minutes-Seconds".
- `quiet` – Do not raise any exceptions. E.g. ignore the fact that the file that is tried to be edited does not exist and nothing really happened.
- `indent` – Keep indentation with the previous line. This option is not considered when the `delete` mode is specified.
- `create` – Create an empty file if doesn’t exists.
  New in version 2016.11.0.
- `user` – The user to own the file, this defaults to the user salt is running as on the minion.
  New in version 2016.11.0.
- `group` – The group ownership set for the file, this defaults to the group salt is running as on the minion. On Windows, this is ignored.
  New in version 2016.11.0.
- `file_mode` – The permissions to set on this file, aka 644, 0775, 4664. Not supported on Windows.
  New in version 2016.11.0.

If an equal sign (=) appears in an argument to a Salt command, it is interpreted as a keyword argument in the format of `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```python
update_config:
  file.line:
    - name: /etc/myconfig.conf
    - mode: ensure
    - content: my key = my value
    - before: somekey.*?
```

Manage a given file, this function allows for a file to be downloaded from the salt master and potentially run
through a templating system.

**name**  The location of the file to manage, as an absolute path.

**source**  The source file to download to the minion, this source file can be hosted on either the salt master server (salt://), the salt minion local file system (/), or on an HTTP or FTP server (http(s)://, ftp://).

Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials. (see s3.get state documentation) File retrieval from Openstack Swift object storage is supported via swift://container/object_path URLs, see swift.get documentation. For files hosted on the salt file server, if the file is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs. If source is left blank or None (use ~ in YAML), the file will be created as an empty file and the content will not be managed. This is also the case when a file already exists and the source is undefined; the contents of the file will not be changed or managed.

If the file is hosted on a HTTP or FTP server then the source_hash argument is also required.

A list of sources can also be passed in to provide a default source and a set of fallbacks. The first source in the list that is found to exist will be used and subsequent entries in the list will be ignored. Source list functionality only supports local files and remote files hosted on the salt master server or retrievable via HTTP, HTTPS, or FTP.

```yaml
file_override_example:
  file.managed:
    - source:
      - salt://file_that_does_not_exist
      - salt://file_that_exists
```

**source_hash**

This can be one of the following:

1. a source hash string
2. the URI of a file that contains source hash strings

The function accepts the first encountered long unbroken alphanumeric string of correct length as a valid hash, in order from most secure to least secure:

<table>
<thead>
<tr>
<th>Type</th>
<th>Length</th>
</tr>
</thead>
<tbody>
<tr>
<td>sha512</td>
<td>128</td>
</tr>
<tr>
<td>sha384</td>
<td>96</td>
</tr>
<tr>
<td>sha256</td>
<td>64</td>
</tr>
<tr>
<td>sha224</td>
<td>56</td>
</tr>
<tr>
<td>sha1</td>
<td>40</td>
</tr>
<tr>
<td>md5</td>
<td>32</td>
</tr>
</tbody>
</table>

**Using a Source Hash File**  The file can contain several checksums for several files. Each line must contain both the file name and the hash. If no file name is matched, the first hash encountered will be used, otherwise the most secure hash with the correct source file name will be used.

When using a source hash file the source_hash argument needs to be a url, the standard download urls are supported, ftp, http, salt etc:

Example:

```yaml
tomdroid-src-0.7.3.tar.gz:
  file.managed:
    - name: /tmp/tomdroid-src-0.7.3.tar.gz
    - source: https://launchpad.net/tomdroid/beta/0.7.3/+download/
      tomdroid-src-0.7.3.tar.gz
```

(continues on next page)
- `source_hash`: https://launchpad.net/tomdroid/beta/0.7.3/+download/tomdroid-src-0.7.3.hash

The following lines are all supported formats:

```
/etc/rc.conf ef6e82e40e66e563d98da2a2a8a27
sha254c8525aee419eb649f0233e9151178b30f0df8ebbdcc8de71b5c8bce06a
/etc/resolv.conf
ead48423783509d37c4a90e60d53e143b6f268
```

Debian file type *.dsc files are also supported.

**Inserting the Source Hash in the SLS Data**

The `source_hash` can be specified as a simple checksum, like so:

```
tomdroid-src-0.7.3.tar.gz:
file.managed:
  - name: /tmp/tomdroid-src-0.7.3.tar.gz
  - source: https://launchpad.net/tomdroid/beta/0.7.3/+download/tomdroid-src-0.7.3.tar.gz
  - source_hash: 79eef25f9b0b2c642c62b7f737d4f53f
```

**Note:** Releases prior to 2016.11.0 must also include the hash type, like in the below example:

```
tomdroid-src-0.7.3.tar.gz:
file.managed:
  - name: /tmp/tomdroid-src-0.7.3.tar.gz
  - source: https://launchpad.net/tomdroid/beta/0.7.3/+download/tomdroid-src-0.7.3.tar.gz
  - source_hash: md5=79eef25f9b0b2c642c62b7f737d4f53f
```

**Known issues:** If the remote server URL has the hash file as an apparent sub-directory of the source file, the module will discover that it has already cached a directory where a file should be cached. For example:

```
tomdroid-src-0.7.3.tar.gz:
file.managed:
  - name: /tmp/tomdroid-src-0.7.3.tar.gz
  - source: https://launchpad.net/tomdroid/beta/0.7.3/+download/tomdroid-src-0.7.3.tar.gz
  - source_hash: https://launchpad.net/tomdroid/beta/0.7.3/+download/tomdroid-src-0.7.3.tar.gz/+md5

source_hash_name When `source_hash` refers to a hash file, Salt will try to find the correct hash by matching the filename/URI associated with that hash. By default, Salt will look for the filename being managed. When managing a file at path /tmp/foo.txt, then the following line in a hash file would match:

```
acbd18db4cc2f85cedef654fccc4a4d8 foo.txt
```

However, sometimes a hash file will include multiple similar paths:

```
37b51d194a7513e45b6656f2d51f2 ./dir1/foo.txt
acbd18db4cc2f85cedef654fccc4a4d8 ./dir2/foo.txt
73feff4b7f66be44cf984c856e88 ./dir3/foo.txt
```
In cases like this, Salt may match the incorrect hash. This argument can be used to tell Salt which filename to match, to ensure that the correct hash is identified. For example:

```
/tmp/foo.txt:
  file.managed:
    - source: https://mydomain.tld/dir2/foo.txt
    - source_hash: https://mydomain.tld/hashes
    - source_hash_name: ./dir2/foo.txt
```

**Note:** This argument must contain the full filename entry from the checksum file, as this argument is meant to disambiguate matches for multiple files that have the same basename. So, in the example above, simply using `foo.txt` would not match.

New in version 2016.3.5.

keep_source [True] Set to False to discard the cached copy of the source file once the state completes. This can be useful for larger files to keep them from taking up space in minion cache. However, keep in mind that discarding the source file will result in the state needing to re-download the source file if the state is run again.

New in version 2017.7.3.

user The user to own the file, this defaults to the user salt is running as on the minion

group The group ownership set for the file, this defaults to the group salt is running as on the minion. On Windows, this is ignored

mode The permissions to set on this file, e.g. 644, 0775, or 4664.

The default mode for new files and directories corresponds to the umask of the salt process. The mode of existing files and directories will only be changed if `mode` is specified.

**Note:** This option is not supported on Windows.

Changed in version 2016.11.0: This option can be set to `keep`, and Salt will keep the mode from the Salt fileserver. This is only supported when the `source` URL begins with `salt://`, or for files local to the minion. Because the `source` option cannot be used with any of the `contents` options, setting the `mode` to `keep` is also incompatible with the `contents` options.

**Note:** `keep` does not work with salt-ssh.

As a consequence of how the files are transferred to the minion, and the inability to connect back to the master with salt-ssh, salt is unable to stat the file as it exists on the fileserver and thus cannot mirror the mode on the salt-ssh minion

attrs The attributes to have on this file, e.g. a, i. The attributes can be any or a combination of the following characters: aAcCdDeijPsStTu.

**Note:** This option is not supported on Windows.

New in version 2018.3.0.

template If this setting is applied, the named templating engine will be used to render the downloaded file. The following templates are supported:

- `cheetah`
- `genshi`
- `jinja`
• mako
• py
• wempy

makedirs [False] If set to True, then the parent directories will be created to facilitate the creation of the named file. If False, and the parent directory of the destination file doesn’t exist, the state will fail.

dir_mode If directories are to be created, passing this option specifies the permissions for those directories. If this is not set, directories will be assigned permissions by adding the execute bit to the mode of the files.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it’s not enforced.

replace [True] If set to False and the file already exists, the file will not be modified even if changes would otherwise be made. Permissions and ownership will still be enforced, however.

context Overrides default context variables passed to the template.

defaults Default context passed to the template.

backup Overrides the default backup mode for this specific file. See backup_mode documentation for more details.

show_changes Output a unified diff of the old file and the new file. If False return a boolean if any changes were made.

create [True] If set to False, then the file will only be managed if the file already exists on the system.

contents Specify the contents of the file. Cannot be used in combination with source. Ignores hashes and does not use a templating engine.

This value can be either a single string, a multiline YAML string or a list of strings. If a list of strings, then the strings will be joined together with newlines in the resulting file. For example, the below two example states would result in identical file contents:

```
/path/to/file1:
file.managed:
  - contents:
    - This is line 1
    - This is line 2

/path/to/file2:
file.managed:
  - contents: |
    This is line 1
    This is line 2
```

contents_pillar New in version 0.17.0.

Changed in version 2016.11.0: contents_pillar can also be a list, and the pillars will be concatenated together to form one file.

Operates like contents, but draws from a value stored in pillar, using the pillar path syntax used in pillar.get. This is useful when the pillar value contains newlines, as referencing a pillar variable using a jinja/mako template can result in YAML formatting issues due to the newlines causing indentation mismatches.

For example, the following could be used to deploy an SSH private key:

```
/home/deployer/.ssh/id_rsa:
file.managed:
  - user: deployer
  - group: deployer
  - mode: 600
  - attrs: a
  - contents_pillar: userdata:deployer:id_rsa
```
This would populate `/home/deployer/.ssh/id_rsa` with the contents of `pillar['userdata']['deployer']['id_rsa'`. An example of this pillar setup would be like so:

```yaml
userdata:
  deployer:
    id_rsa: |
      -----BEGIN RSA PRIVATE KEY-----
      MIIEowIBAAKCAQEAoQiw033HbquPAa1QF9qP1lLZNVjYM1swMe2HcWUVBgh+vY
      U7sCwX/dH6+VvNwmCqmnNp+8gTPKG11vgAObJAnMT623dMXjvKwnEagZPRJ1XyDy
      B/HuAre9euNiY3LvIzBTWRSefMt+rwWjKVBpwwlGrfgz70m8pqxu+UyFbAGlin+
      GpxzZAMaFpZw4sBISlRuissXZj/shPqBp9MS5ieO4Z3rjkCP1cxI
      -----END RSA PRIVATE KEY-----
```

**Note:** The private key above is shortened to keep the example brief, but shows how to do multiline string in YAML. The key is followed by a pipe character, and the multiline string is indented two more spaces.

To avoid the hassle of creating an indented multiline YAML string, the `file_tree_external pillar` can be used instead. However, this will not work for binary files in Salt releases before 2015.8.4.

`contents_grains` New in version 2014.7.0.

Operates like `contents`, but draws from a value stored in grains, using the grains path syntax used in `grains.get`. This functionality works similarly to `contents_pillar`, but with grains.

For example, the following could be used to deploy a "message of the day" file:

```yaml
write_motd:
  file.managed:
    - name: /etc/motd
    - contents_grains: motd
```

This would populate `/etc/motd` file with the contents of the `motd` grain. The `motd` grain is not a default grain, and would need to be set prior to running the state:

```bash
salt '*' grains.set motd 'Welcome! This system is managed by Salt.'
```

Changed in version 2015.8.4: This option is now ignored if the contents being deployed contain binary data.

If `True`, files managed using `contents`, `contents_pillar`, or `contents_grains` will have a newline added to the end of the file if one is not present. Setting this option to `False` will omit this final newline.

`contents_delimiter` New in version 2015.8.4.

Can be used to specify an alternate delimiter for `contents_pillar` or `contents_grains`. This delimiter will be passed through to `pillar.get` or `grains.get` when retrieving the contents.

`encoding` If specified, then the specified encoding will be used. Otherwise, the file will be encoded using the system locale (usually UTF-8). See [https://docs.python.org/3/library/codecs.html#standard-encodings](https://docs.python.org/3/library/codecs.html#standard-encodings) for the list of available encodings.

New in version 2017.7.0.

`encoding_errors` ['strict'] Error encoding scheme. Default is `'strict'`. See [https://docs.python.org/2/library/codecs.html#codec-base-classes](https://docs.python.org/2/library/codecs.html#codec-base-classes) for the list of available schemes.

New in version 2017.7.0.

If set to False, then the state will fail if the contents specified by contents_pillar or contents_grains are empty.

If the desired path is a symlink follow it and make changes to the file to which the symlink points.

cHECK_cmd  New in version 2014.7.0.

The specified command will be run with an appended argument of a temporary file containing the new managed contents. If the command exits with a zero status the new managed contents will be written to the managed destination. If the command exits with a nonzero exit code, the state will fail and no changes will be made to the file.

For example, the following could be used to verify sudoers before making changes:

```
/etc/sudoers:
  file.managed:
  - user: root
  - group: root
  - mode: 0440
  - attrs: i
  - source: salt://sudoers/files/sudoers.jinja
  - template: jinja
  - check_cmd: /usr/sbin/visudo -c -f
```

NOTE: This check_cmd functions differently than the requisite check_cmd.

tmp_dir  Directory for temp file created by check_cmd. Useful for checkers dependent on config file location (e.g. daemons restricted to their own config directories by an apparmor profile).

```
/etc/dhcp/dhcpd.conf:
  file.managed:
  - user: root
  - group: root
  - mode: 0755
  - tmp_dir: '/etc/dhcp'
  - contents: "# Managed by Salt"
  - check_cmd: dhcpd -t -cf
```

tmp_ext  Suffix for temp file created by check_cmd. Useful for checkers dependent on config file extension (e.g. the init-checkconf upstart config checker).

```
/etc/init/test.conf:
  file.managed:
  - user: root
  - group: root
  - mode: 0440
  - tmp_ext: '.conf'
  - contents:
    - 'description "Salt Minion"
    - 'start on started mountall'
    - 'stop on shutdown'
    - 'respinaw'
    - 'exec salt-minion'
  - check_cmd: init-checkconf -f
```

skip_verify  [False] If True, hash verification of remote file sources (http://, https://, ftp://) will be skipped, and the source_hash argument will be ignored.

New in version 2016.3.0.
win_owner [None] The owner of the directory. If this is not passed, user will be used. If user is not passed, the account under which Salt is running will be used.

New in version 2017.7.0.

win_perms [None] A dictionary containing permissions to grant and their propagation. For example: {'Administrators': {'perms': 'full_control'}} Can be a single basic perm or a list of advanced perms. perms must be specified. applies_to does not apply to file objects.

New in version 2017.7.0.

win_deny_perms [None] A dictionary containing permissions to deny and their propagation. For example: {'Administrators': {'perms': 'full_control'}} Can be a single basic perm or a list of advanced perms. perms must be specified. applies_to does not apply to file objects.

New in version 2017.7.0.

win_inheritance [True] True to inherit permissions from the parent directory, False not to inherit permission.

New in version 2017.7.0.

win_perms_reset [False] If True the existing DACL will be cleared and replaced with the settings defined in this function. If False, new entries will be appended to the existing DACL. Default is False.

New in version 2018.3.0.

Here's an example using the above win_* parameters:

```python
create_config_file:
file.managed:
  - name: C:\config\settings.cfg
  - source: salt://settings.cfg
  - win_owner: Administrators
  - win_perms:
    # Basic Permissions
    dev_ops:
      perms: full_control
    # List of advanced permissions
    appuser:
      perms:
      - read_attributes
      - read_ea
      - create_folders
      - read_permissions
    joe_snuffy:
      perms: read
  - win_deny_perms:
    fred_snuffy:
      perms: full_control
  - win_inheritance: False
```

salt.states.file.missing(name, **kwargs)
Verify that the named file or directory is missing, this returns True only if the named file is missing but does not remove the file if it is present.

name Absolute path which must NOT exist

salt.states.file.mknod(name, ntype, major=0, minor=0, user=None, group=None, mode='0600')
Create a special file similar to the `nix mknod command. The supported device types are p (fifo pipe), c (character device), and b (block device). Provide the major and minor numbers when specifying a character device or block device. A fifo pipe does not require this information. The command will create the necessary dirs if needed. If a file of the same name not of the same type/major/minor exists, it will not be overwritten or unlinked (deleted). This is logically in place as a safety measure because you can really shoot yourself in the foot here and it is the behavior of `nix mknod. It is also important to note that not just anyone can create
special devices. Usually this is only done as root. If the state is executed as none other than root on a minion, you may receive a permission error.

name name of the file
ntype node type 'p' (fifo pipe), 'c' (character device), or 'b' (block device)
major major number of the device does not apply to a fifo pipe
minor minor number of the device does not apply to a fifo pipe
user owning user of the device/pipe
group owning group of the device/pipe
mode permissions on the device/pipe

Usage:

```
/dev/chr:
  file.mknod:
    - ntype: c
    - major: 180
    - minor: 31
    - user: root
    - group: root
    - mode: 660

/dev/blk:
  file.mknod:
    - ntype: b
    - major: 8
    - minor: 999
    - user: root
    - group: root
    - mode: 660

/dev/fifo:
  file.mknod:
    - ntype: p
    - user: root
    - group: root
    - mode: 660
```

New in version 0.17.0.

```
salt.states.file.mod_run_check_cmd(cmd, filename, **check_cmd_opts)
```

Execute the check_cmd logic.

Return a result dict if check_cmd succeeds (check_cmd == 0) otherwise return True

```
salt.states.file.not_cached(name, saltenv='base')
```

New in version 2017.7.3.

Ensures that a file is saved to the minion’s cache. This state is primarily invoked by other states to ensure that we do not re-download a source file if we do not need to.

name The URL of the file to be cached. To cache a file from an environment other than base, either use the saltenv argument or include the saltenv in the URL (e.g. salt://path/to/file.conf?saltenv=dev).

Note: A list of URLs is not supported, this must be a single URL. If a local file is passed here, the state will take no action.

saltenv Used to specify the environment from which to download a file from the Salt fileserver (i.e. those with salt:// URL).
salt.states.file.patch

(name, source=None, source_hash=None, source_hash_name=None,
 skip_verify=False, template=None, context=None, defaults=None, options=",",
 reject_file=None, strip=None, saltenv=None, **kwargs)

Ensure that a patch has been applied to the specified file or directory.

Changed in version 2019.2.0: The hash and dry_run_first options are now ignored, as the logic which
determines whether or not the patch has already been applied no longer requires them. Additionally, this state
now supports patch files that modify more than one file. To use these sort of patches, specify a directory (and,
if necessary, the strip option) instead of a file.

Note: A suitable patch executable must be available on the minion. Also, keep in mind that the pre-check
this state does to determine whether or not changes need to be made will create a temp file and send all patch
output to that file. This means that, in the event that the patch would not have applied cleanly, the comment
included in the state results will reference a temp file that will no longer exist once the state finishes running.

name The file or directory to which the patch should be applied
source The patch file to apply

Changed in version 2019.2.0: The source can now be from any file source supported by Salt (salt://,
http://, https://, ftp://, etc.). Templating is also now supported.

source_hash Works the same way as in file.managed.

New in version 2019.2.0.

source_hash_name Works the same way as in file.managed

New in version 2019.2.0.

skip_verify Works the same way as in file.managed

New in version 2019.2.0.

template Works the same way as in file.managed

New in version 2019.2.0.

context Works the same way as in file.managed

New in version 2019.2.0.

defaults Works the same way as in file.managed

New in version 2019.2.0.

options Extra options to pass to patch. This should not be necessary in most cases.

Note: For best results, short opts should be separate from one another. The -N and -r, and \-c
options are used internally by this state and cannot be used here. Additionally, instead of using \-pN or
\--strip=N, use the strip option documented below.

reject_file If specified, any rejected hunks will be written to this file. If not specified, then they will be written
to a temp file which will be deleted when the state finishes running.

Important: The parent directory must exist. Also, this will overwrite the file if it is already present.

New in version 2019.2.0.

strip Number of directories to strip from paths in the patch file. For example, using the below SLS would
instruct Salt to use \-p1 when applying the patch:

/etc/myfile.conf:

file.patch:
New in version 2019.2.0: In previous versions, `-p1` would need to be passed as part of the `options` value.

**saltenv** Specify the environment from which to retrieve the patch file indicated by the `source` parameter. If not provided, this defaults to the environment from which the state is being executed.

**Note:** Ignored when the patch file is from a non-salt:// source.

Usage:

```
/opt/myfile.txt:    # Equivalent to `patch --forward /opt/myfile.txt myfile.patch`
file.patch:
  - source: salt://myfile.patch
```

salt.states.file.prepend(name, text=None, makedirs=False, source=None, source_hash=None, template='jinja', sources=None, source_hashes=None, defaults=None, context=None, header=None)

Ensure that some text appears at the beginning of a file

The text will not be prepended again if it already exists in the file. You may specify a single line of text or a list of lines to append.

**name** The location of the file to append to.

**text** The text to be appended, which can be a single string or a list of strings.

**makedirs** If the file is located in a path without a parent directory, then the state will fail. If makedirs is set to True, then the parent directories will be created to facilitate the creation of the named file. Defaults to False.

**source** A single source file to append. This source file can be hosted on either the salt master server, or on an HTTP or FTP server. Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials (see s3.get state documentation). File retrieval from Openstack Swift object storage is supported via swift://container/object_path URLs (see swift.get documentation).

For files hosted on the salt file server, if the file is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs.

If the file is hosted on an HTTP or FTP server, the source_hash argument is also required.

**source_hash**

This can be one of the following:

1. a source hash string
2. the URI of a file that contains source hash strings

The function accepts the first encountered long unbroken alphanumeric string of correct length as a valid hash, in order from most secure to least secure:

<table>
<thead>
<tr>
<th>Type</th>
<th>Length</th>
</tr>
</thead>
<tbody>
<tr>
<td>sha512</td>
<td>128</td>
</tr>
<tr>
<td>sha384</td>
<td>96</td>
</tr>
<tr>
<td>sha256</td>
<td>64</td>
</tr>
<tr>
<td>sha224</td>
<td>56</td>
</tr>
<tr>
<td>sha1</td>
<td>40</td>
</tr>
<tr>
<td>md5</td>
<td>32</td>
</tr>
</tbody>
</table>
See the `source_hash` parameter description for `file.managed` function for more details and examples.

**template** The named templating engine will be used to render the appended-to file. Defaults to `jinja`. The following templates are supported:

- `cheetah`
- `genshi`
- `jinja`
- `mako`
- `py`
- `wempy`

**sources** A list of source files to append. If the files are hosted on an HTTP or FTP server, the `source_hashes` argument is also required.

**source_hashes** A list of source hashes corresponding to the sources list specified in the `sources` argument.

**defaults** Default context passed to the template.

**context** Overrides default context variables passed to the template.

**ignore_whitespace** New in version 2015.8.4.

Spaces and Tabs in text are ignored by default, when searching for the appending content, one space or multiple tabs are the same for salt. Set this option to `False` if you want to change this behavior.

Multi-line example:

```
/etc/motd:
  file.prepend:
    - text: |
      Thou hadst better eat salt with the Philosophers of Greece, than sugar with the Courtiers of Italy.
      ~ Benjamin Franklin
```

Multiple lines of text:

```
/etc/motd:
  file.prepend:
    - text:
      - Trust no one unless you have eaten much salt with him.
      - "Salt is born of the purest of parents: the sun and the sea."
```

Optionally, require the text to appear exactly as specified (order and position). Combine with multi-line or multiple lines of input.

```
/etc/motd:
  file.prepend:
    - header: True
    - text:
      - This will be the very first line in the file.
      - The 2nd line, regardless of duplicates elsewhere in the file.
      - These will be written anew if they do not appear verbatim.
```

Gather text from multiple template files:

```
/etc/motd:
  file:
    - prepend
    - template: jinja
    - sources:
      - salt://motd/devops-messages.tmpl
      - salt://motd/hr-messages.tmpl
      - salt://motd/general-messages.tmpl
```
New in version 2014.7.0.

```
salt.states.file.recurse(name, source, keep_source=True, clean=False, require=None, user=None, group=None, dir_mode=None, file_mode=None, sym_mode=None, template=None, context=None, replace=True, defaults=None, include_empty=False, backup='', include_pat=None, exclude_pat=None, maxdepth=None, keep_symlinks=False, force_symlinks=False, win_owner=None, win_perms=None, win_deny_perms=None, win_inheritance=True, **kwargs)
```

Recurse through a subdirectory on the master and copy said subdirectory over to the specified path.

**name** The directory to set the recursion in

**source** The source directory, this directory is located on the salt master file server and is specified with the `salt://` protocol. If the directory is located on the master in the directory named spam, and is called eggs, the source string is `salt://spam/eggs`

**keep_source** [True] Set to `False` to discard the cached copy of the source file once the state completes. This can be useful for larger files to keep them from taking up space in minion cache. However, keep in mind that discarding the source file will result in the state needing to re-download the source file if the state is run again.

New in version 2017.7.3.

**clean** Make sure that only files that are set up by salt and required by this function are kept. If this option is set then everything in this directory will be deleted unless it is required.

**require** Require other resources such as packages or files

**user** The user to own the directory. This defaults to the user salt is running as on the minion

**group** The group ownership set for the directory. This defaults to the group salt is running as on the minion.

On Windows, this is ignored

**dir_mode** The permissions mode to set on any directories created.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it’s not enforced.

**Note:** This option is not supported on Windows.

**file_mode** The permissions mode to set on any files created.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it’s not enforced.

**Note:** This option is not supported on Windows.

Changed in version 2016.11.0: This option can be set to `keep`, and Salt will keep the mode from the Salt fileserver. This is only supported when the source URL begins with `salt://`, or for files local to the minion. Because the `source` option cannot be used with any of the `contents` options, setting the mode to `keep` is also incompatible with the `contents` options.

**sym_mode** The permissions mode to set on any symlink created.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it’s not enforced.

**Note:** This option is not supported on Windows.

**template** If this setting is applied, the named templating engine will be used to render the downloaded file. The following templates are supported:

- `cheetah`
- `genshi`
• jinja
• mako
• py
• wempy

Note: The template option is required when recursively applying templates.

replace [True] If set to False and the file already exists, the file will not be modified even if changes would otherwise be made. Permissions and ownership will still be enforced, however.

context Overrides default context variables passed to the template.

defaults Default context passed to the template.

include_empty Set this to True if empty directories should also be created (default is False)

backup Overrides the default backup mode for all replaced files. See backup_mode documentation for more details.

include_pat When copying, include only this pattern from the source. Default is glob match; if prefixed with 'E@', then regexp match. Example:

<table>
<thead>
<tr>
<th>Pattern</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>include_pat: hello*</code></td>
<td>:: glob matches 'hello01', 'hello02'</td>
</tr>
<tr>
<td></td>
<td>... but not 'otherhello'</td>
</tr>
<tr>
<td><code>include_pat: E@hello</code></td>
<td>:: regexp matches 'otherhello',</td>
</tr>
<tr>
<td></td>
<td>'hello01' ...</td>
</tr>
</tbody>
</table>

exclude_pat Exclude this pattern from the source when copying. If both include_pat and exclude_pat are supplied, then it will apply conditions cumulatively. i.e. first select based on include_pat, and then within that result apply exclude_pat.

Also, when 'clean=True', exclude this pattern from the removal list and preserve in the destination. Example:

<table>
<thead>
<tr>
<th>Pattern</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>exclude_pat: APPDATA*</code></td>
<td>:: glob matches APPDATA.01,</td>
</tr>
<tr>
<td></td>
<td>APPDATA.02,... for exclusion</td>
</tr>
<tr>
<td>`exclude_pat: E@((APPDATA)</td>
<td>(TEMPDATA))`</td>
</tr>
<tr>
<td></td>
<td>or TEMPDATA for exclusion</td>
</tr>
</tbody>
</table>

maxdepth When copying, only copy paths which are of depth maxdepth from the source path. Example:

<table>
<thead>
<tr>
<th>maxdepth</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>maxdepth: 0</code></td>
<td>:: Only include files located in the source directory</td>
</tr>
<tr>
<td></td>
<td><code>maxdepth: 1</code> :: Only include files located in the source</td>
</tr>
<tr>
<td></td>
<td>... or immediate subdirectories</td>
</tr>
</tbody>
</table>

keep_symlinks Keep symlinks when copying from the source. This option will cause the copy operation to terminate at the symlink. If desire behavior similar to rsync, then set this to True.

force_symlinks Force symlink creation. This option will force the symlink creation. If a file or directory is obstructing symlink creation it will be recursively removed so that symlink creation can proceed. This option is usually not needed except in special circumstances.

win_owner [None] The owner of the symlink and directories if makedirs is True. If this is not passed, user will be used. If user is not passed, the account under which Salt is running will be used.

New in version 2017.7.7.

win_perms [None] A dictionary containing permissions to grant

New in version 2017.7.7.

win_deny_perms [None] A dictionary containing permissions to deny

New in version 2017.7.7.

win_inheritance [None] True to inherit permissions from parent, otherwise False

New in version 2017.7.7.
salt.states.file.rename(name, source, force=False, makedirs=False)

If the source file exists on the system, rename it to the named file. The named file will not be overwritten if it already exists unless the force option is set to True.

name The location of the file to rename to
source The location of the file to move to the location specified with name
force If the target location is present then the file will not be moved, specify "force: True" to overwrite the target file
makedirs If the target subdirectories don’t exist create them

salt.states.file.replace(name, pattern, repl, count=0, flags=8, bufsize=1, append_if_not_found=False, prepend_if_not_found=False, not_found_content=None, backup='.bak', show_changes=True, ignore_if_missing=False, backslash_literal=False)

Maintain an edit in a file.

New in version 0.17.0.
name Filesystem path to the file to be edited. If a symlink is specified, it will be resolved to its target.
pattern A regular expression, to be matched using Python’s re.search().

Note: If you need to match a literal string that contains regex special characters, you may want to use salt’s custom Jinja filter, regex_escape.

```python
{{ 'http://example.com?foo=bar%20baz' | regex_escape }}
```

repl The replacement text
count Maximum number of pattern occurrences to be replaced. Defaults to 0. If count is a positive integer n, no more than n occurrences will be replaced, otherwise all occurrences will be replaced.
flags A list of flags defined in the re module documentation from the Python standard library. Each list item should be a string that will correlate to the human-friendly flag name. E.g., ['IGNORECASE', 'MULTILINE']. Optionally, flags may be an int, with a value corresponding to the XOR (|) of all the desired flags. Defaults to 8 (which equates to ['MULTILINE']).

Note: file.replace reads the entire file as a string to support multiline regex patterns. Therefore, when using anchors such as ^ or $ in the pattern, those anchors may be relative to the line OR relative to the file. The default for file.replace is to treat anchors as relative to the line, which is implemented by setting the default value of flags to ['MULTILINE']. When overriding the default value for flags, if 'MULTILINE' is not present then anchors will be relative to the file. If the desired behavior is for anchors to be relative to the line, then simply add 'MULTILINE' to the list of flags.

bufsize How much of the file to buffer into memory at once. The default value 1 processes one line at a time. The special value file may be specified which will read the entire file into memory before processing.
append_if_not_found [False] If set to True, and pattern is not found, then the content will be appended to the file.

New in version 2014.7.0.
prepend_if_not_found [False] If set to True and pattern is not found, then the content will be prepended to the file.

New in version 2014.7.0.
not_found_content Content to use for append/prepend if not found. If None (default), uses repl. Useful when repl uses references to group in pattern.

New in version 2014.7.0.
backup The file extension to use for a backup of the file before editing. Set to False to skip making a backup.
show_changes  [True]  Output a unified diff of the old file and the new file. If False return a boolean if any changes were made. Returns a boolean or a string.

ignore_if_missing  [False] New in version 2016.3.4.

Controls what to do if the file is missing. If set to False, the state will display an error raised by the execution module. If set to True, the state will simply report no changes.

Interpret backslashes as literal backslashes for the repl and not escape characters. This will help when using append/prepend so that the backslashes are not interpreted for the repl on the second run of the state.

For complex regex patterns, it can be useful to avoid the need for complex quoting and escape sequences by making use of YAML’s multiline string syntax.

```yaml
complex_search_and_replace:
  file.replace:
    # <...snip...>
    - pattern: |
        CentOS (2.6.32[^\n]+\n\s+root[^\n]+\n)+
```

Note: When using YAML multiline string syntax in pattern:, make sure to also use that syntax in the repl: part, or you might lose line feeds.

salt.states.file.retention_schedule(name, retain, strftime_format=None, timezone=None)
Apply retention scheduling to backup storage directory.

New in version 2016.11.0.

Parameters

- name – The filesystem path to the directory containing backups to be managed.
- retain – Delete the backups, except for the ones we want to keep. The N below should be an integer but may also be the special value of all, which keeps all files matching the criteria. All of the retain options default to None, which means to not keep files based on this criteria.
  - most_recent N Keep the most recent N files.
  - first_of_hour N For the last N hours from now, keep the first file after the hour.
  - first_of_day N For the last N days from now, keep the first file after midnight. See also timezone.
  - first_of_week N For the last N weeks from now, keep the first file after Sunday midnight.
  - first_of_month N For the last N months from now, keep the first file after the start of the month.
  - first_of_year N For the last N years from now, keep the first file after the start of the year.
- strftime_format – A python strftime format string used to first match the filenames of backups and then parse the filename to determine the datetime of the file. https://docs.python.org/2/library/datetime.html#datetime.datetime.strptime
  Defaults to None, which considers all files in the directory to be backups eligible for deletion and uses os.path.getmtime() to determine the datetime.
- timezone – The timezone to use when determining midnight. This is only used when datetime is pulled from os.path.getmtime(). Defaults to None which uses the timezone from the locale.

Usage example:
salt.states.file.serialize(name, dataset=None, dataset_pillar=None, user=None, group=None, mode=None, backup=None, makedirs=False, show_changes=True, create=True, merge_if_exists=False, encoding=None, encoding_errors='strict', serializer_opts=None, deserializer_opts=None, **kwargs)

Serializes dataset and store it into managed file. Useful for sharing simple configuration files.

**name**  The location of the file to create

**dataset**  The dataset that will be serialized

**dataset_pillar**  Operates like `dataset`, but draws from a value stored in pillar, using the pillar path syntax used in `pillar.get`. This is useful when the pillar value contains newlines, as referencing a pillar variable using a jinja/mako template can result in YAML formatting issues due to the newlines causing indentation mismatches.

New in version 2015.8.0.

**formatter**  Write the data as this format. See the list of serializer modules for supported output formats.

**encoding**  If specified, then the specified encoding will be used. Otherwise, the file will be encoded using the system locale (usually UTF-8). See https://docs.python.org/3/library/codecs.html#standard-encodings for the list of available encodings.

New in version 2017.7.0.

**encoding_errors**  `['strict']` Error encoding scheme. Default is `''strict'`. See https://docs.python.org/2/library/codecs.html#codec-base-classes for the list of available schemes.

New in version 2017.7.0.

**user**  The user to own the directory, this defaults to the user salt is running as on the minion

**group**  The group ownership set for the directory, this defaults to the group salt is running as on the minion

**mode**  The permissions to set on this file, e.g. 644, 0775, or 4664.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it’s not enforced.

**Note:** This option is not supported on Windows.

**backup**  Overrides the default backup mode for this specific file.

**makedirs**  Create parent directories for destination file.

New in version 2014.1.3.

**show_changes**  Output a unified diff of the old file and the new file. If False return a boolean if any changes were made.

**create**  Default is True, if create is set to False then the file will only be managed if the file already exists on the system.

**merge_if_exists**  Default is False, if merge_if_exists is True then the existing file will be parsed and the dataset passed in will be merged with the existing content.
New in version 2014.7.0.

**serializer_opts** Pass through options to serializer. For example:

```
/etc/dummy/package.yaml
file.serialize:
  - formatter: yaml
  - serializer_opts:
    - explicit_start: True
    - default_flow_style: True
    - indent: 4
```

The valid opts are the additional opts (i.e. not the data being serialized) for the function used to serialize the data. Documentation for the these functions can be found in the list below:

- For **yaml**: `yaml.dump()`
- For **json**: `json.dumps()`
- For **python**: `pprint.pformat()`

**deserializer_opts** Like **serializer_opts** above, but only used when merging with an existing file (i.e. when **merge_if_exists** is set to True).

The options specified here will be passed to the deserializer to load the existing data, before merging with the specified data and re-serializing.

```
/etc/dummy/package.yaml
file.serialize:
  - formatter: yaml
  - serializer_opts:
    - explicit_start: True
    - default_flow_style: True
    - indent: 4
  - deserializer_opts:
    - encoding: latin-1
    - merge_if_exists: True
```

The valid opts are the additional opts (i.e. not the data being deserialized) for the function used to deserialize the data. Documentation for theses functions can be found in the list below:

- For **yaml**: `yaml.load()`
- For **json**: `json.loads()`

However, note that not all arguments are supported. For example, when deserializing JSON, arguments like `parse_float` and `parse_int` which accept a callable object cannot be handled in an SLS file.

New in version 2019.2.0.

For example, this state:

```
/etc/dummy/package.json:
file.serialize:
  - dataset:
    name: naive
    description: A package using naive versioning
    author: A confused individual <iam@confused.com>
    dependencies:
      express: '>= 1.2.0'
      optimist: '>= 0.1.0'
    engine: node 0.4.1
    - formatter: json
```

will manage the file `/etc/dummy/package.json`:

---

3366 Chapter 21. Salt Module Reference
salt.states.file.shortcut(name, target, arguments=None, working_dir=None, description=None, icon_location=None, force=False, backupname=None, makedirs=False, user=None, **kwargs)

Create a Windows shortcut

If the file already exists and is a shortcut pointing to any location other than the specified target, the shortcut will be replaced. If it is a regular file or directory then the state will return False. If the regular file or directory is desired to be replaced with a shortcut pass force: True, if it is to be renamed, pass a backupname.

name The location of the shortcut to create. Must end with either ".lnk" or ".url"

target The location that the shortcut points to

arguments Any arguments to pass in the shortcut

working_dir Working directory in which to execute target

description Description to set on shortcut

icon_location Location of shortcut's icon

force If the name of the shortcut exists and is not a file and force is set to False, the state will fail. If force is set to True, the link or directory in the way of the shortcut file will be deleted to make room for the shortcut, unless backupname is set, when it will be renamed

backupname If the name of the shortcut exists and is not a file, it will be renamed to the backupname. If the backupname already exists and force is False, the state will fail. Otherwise, the backupname will be removed first.

makedirs If the location of the shortcut does not already have a parent directory then the state will fail, setting makedirs to True will allow Salt to create the parent directory. Setting this to True will also create the parent for backupname if necessary.

user The user to own the file, this defaults to the user salt is running as on the minion

The default mode for new files and directories corresponds unmask of salt process. For existing files and directories it’s not enforced.

salt.states.file.symlink(name, target, force=False, backupname=None, makedirs=False, user=None, group=None, mode=None, win_owner=None, win_perms=None, win_deny_perms=None, win_inheritance=None, **kwargs)

Create a symbolic link (symlink, soft link)

If the file already exists and is a symlink pointing to any location other than the specified target, the symlink will be replaced. If the symlink is a regular file or directory then the state will return False. If the regular file or directory is desired to be replaced with a symlink pass force: True, if it is to be renamed, pass a backupname.

name The location of the symlink to create

target The location that the symlink points to

force If the name of the symlink exists and is not a symlink and force is set to False, the state will fail. If force is set to True, the file or directory in the way of the symlink file will be deleted to make room for the symlink, unless backupname is set, when it will be renamed

backupname If the name of the symlink exists and is not a symlink, it will be renamed to the backupname. If the backupname already exists and force is False, the state will fail. Otherwise, the backupname will be removed first. An absolute path OR a basename file/directory name must be provided. The latter will be placed relative to the symlink destination’s parent directory.
**makedirs** If the location of the symlink does not already have a parent directory then the state will fail, setting makedirs to True will allow Salt to create the parent directory

**user** The user to own the file, this defaults to the user salt is running as on the minion

**group** The group ownership set for the file, this defaults to the group salt is running as on the minion. On Windows, this is ignored

**mode** The permissions to set on this file, aka 644, 0775, 4664. Not supported on Windows.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it’s not enforced.

**win_owner** [None] The owner of the symlink and directories if makedirs is True. If this is not passed, user will be used. If user is not passed, the account under which Salt is running will be used.

New in version 2017.7.7.

**win_perms** [None] A dictionary containing permissions to grant

New in version 2017.7.7.

**win_deny_perms** [None] A dictionary containing permissions to deny

New in version 2017.7.7.

**win_inheritance** [None] True to inherit permissions from parent, otherwise False

New in version 2017.7.7.

---

### salt.states.file.tidied

```python
(name, age=0, matches=None, rmdirs=False, size=0, **kwargs)
```

Remove unwanted files based on specific criteria. Multiple criteria are OR’d together, so a file that is too large but is not old enough will still get tidied.

If neither age nor size is given all files which match a pattern in matches will be removed.

**name** The directory tree that should be tidied

**age** Maximum age in days after which files are considered for removal

**matches** List of regular expressions to restrict what gets removed. Default: ['*']

**rmdirs** Whether or not it’s allowed to remove directories

**size** Maximum allowed file size. Files greater or equal to this size are removed. Doesn’t apply to directories or symbolic links

```yaml
cleanup:
  file.tidied:
    - name: /tmp/salt_test
    - rmdirs: True
    - matches:
      - foo
      - b.*r
```

---

### salt.states.file.touch

```python
(name, atime=None, mtime=None, makedirs=False)
```

Replicate the 'nix "touch" command to create a new empty file or update the atime and mtime of an existing file.

Note that if you just want to create a file and don’t care about atime or mtime, you should use file.managed instead, as it is more feature-complete. (Just leave out the source/template/contents arguments, and it will just create the file and/or check its permissions, without messing with contents)

**name** name of the file

**atime** atime of the file

**mtime** mtime of the file

**makedirs** whether we should create the parent directory/directories in order to touch the file

Usage:

```bash
/var/log/httpd/logrotate.empty:
  file.touch
```
New in version 0.9.5.

**salt.states.file.uncomment** *(name, regex, char='#', backup='.bak')*

Uncomment specified commented lines in a file

- **name** The full path to the file to be edited
- **regex** A regular expression used to find the lines that are to be uncommented. This regex should not include the comment character. A leading `^` character will be stripped for convenience (for easily switching between `comment()` and `uncomment()`). The regex will be searched for from the beginning of the line, ignoring leading spaces (we prepend `^[ t]*`)
- **char** `[#]` The character to remove in order to uncomment a line
- **backup** `[.bak]` The file will be backed up before edit with this file extension;

**Warning:** This backup will be overwritten each time `sed / comment / uncomment` is called. Meaning the backup will only be useful after the first invocation.

Set to False/None to not keep a backup.

Usage:

```
/etc/adduser.conf:
file.uncomment:
  - regex: EXTRA_GROUPS
```

New in version 0.9.5.

### 21.19.85 salt.states.firewall module

State to check firewall configurations

New in version 2016.3.0.

**salt.states.firewall.check** *(name, port=None, **kwargs)*

Checks if there is an open connection from the minion to the defined host on a specific port.

- **name** host name or ip address to test connection to
- **port** The port to test the connection on

Additional parameters, parameters allowed are: proto (tcp or udp) family (ipv4 or ipv6) timeout

```
testgoogle:
  firewall.check:
    - name: 'google.com'
    - port: 80
    - proto: 'tcp'
```

### 21.19.86 salt.states.firewalld

Management of firewalld

New in version 2015.8.0.

The following example applies changes to the public zone, blocks echo-reply and echo-request packets, does not set the zone to be the default, enables masquerading, and allows ports 22/tcp and 25/tcp. It will be applied permanently and directly before restart/reload.
The following example applies changes to the public zone, enables masquerading and configures port forwarding TCP traffic from port 22 to 2222, and forwards TCP traffic from port 80 to 443 at 192.168.0.1.

```yaml
my_zone:
  firewalld.present:
    - name: public
    - masquerade: True
    - port_fwd:
      - 22:2222:tcp
      - 80:443:tcp:192.168.0.1
```

The following example binds the public zone to interface eth0 and to all packets coming from the 192.168.1.0/24 subnet. It also removes the zone from all other interfaces or sources.

```yaml
public:
  firewalld.present:
    - name: public
    - interfaces:
      - eth0
    - sources:
      - 192.168.1.0/24
```

Here, we define a new service that encompasses TCP ports 4505 4506:

```yaml
saltmaster:
  firewalld.service:
    - name: saltmaster
    - ports:
      - 4505/tcp
      - 4506/tcp
```

To make this new service available in a zone, the following can be used, which would allow access to the salt master from the 10.0.0.0/8 subnet:

```yaml
saltzone:
  firewalld.present:
    - name: saltzone
    - services:
      - saltmaster
    - sources:
      - 10.0.0.0/8
```

**class** `salt.states.firewalld.ForwardingMapping(srcport, destport, protocol, destaddr)`

Represents a port forwarding statement mapping a local port to a remote port for a specific protocol (TCP or UDP).
todict()

Returns a pretty dictionary meant for command line output.

salt.states.firewalld.present(name, block_icmp=None, prune_block_icmp=False, default=None, masquerade=False, ports=None, prune_ports=False, port_fwd=None, prune_port_fwd=False, services=None, prune_services=False, interfaces=None, prune_interfaces=False, sources=None, prune_sources=False, rich_rules=None, prune_rich_rules=False)

Ensure a zone has specific attributes.

name The zone to modify.
default [None] Set this zone as the default zone if True.
masquerade [False] Enable or disable masquerade for a zone.
block_icmp [None] List of ICMP types to block in the zone.
prune_block_icmp [False] If True, remove all but the specified block_icmp from the zone.
ports [None] List of ports to add to the zone.
prune_ports [False] If True, remove all but the specified ports from the zone.
port_fwd [None] List of port forwards to add to the zone.
prune_port_fwd [False] If True, remove all but the specified port_fwd from the zone.
services [None] List of services to add to the zone.
prune_services [True] If True, remove all but the specified services from the zone. .. note:: Currently defaults to True for compatibility, but will be changed to False in a future release.
interfaces [None] List of interfaces to add to the zone.
prune_interfaces [False] If True, remove all but the specified interfaces from the zone.
sources [None] List of sources to add to the zone.
prune_sources [False] If True, remove all but the specified sources from the zone.
rich_rules [None] List of rich rules to add to the zone.
prune_rich_rules [False] If True, remove all but the specified rich rules from the zone.

salt.states.firewalld.service(name, ports=None, protocols=None)

Ensure the service exists and encompasses the specified ports and protocols.

New in version 2016.11.0.

21.19.87 salt.states.gem

Installation of Ruby modules packaged as gems

A state module to manage rubygems. Gems can be set up to be installed or removed. This module will use RVM or rbenv if they are installed. In that case, you can specify what ruby version and gemset to target.

addressable:
gem.installed:
  - user: rvm
  - ruby: jruby@jgemset

salt.states.gem.installed(name, ruby=None, gem_bin=None, user=None, version=None, rdoc=False, ri=False, pre_releases=False, proxy=None, source=None)

Make sure that a gem is installed.

name The name of the gem to install
ruby: None Only for RVM or rbenv installations: the ruby version and gemset to target.
gem_bin: None Custom gem command to run instead of the default. Use this to install gems to a non-default ruby install. If you are using rvm or rbenv use the ruby argument instead.
user: None The user under which to run the gem command

New in version 0.17.0.
version [None] Specify the version to install for the gem. Doesn’t play nice with multiple gems at once
rdoc [False] Generate RDoc documentation for the gem(s).
ri [False] Generate RI documentation for the gem(s).
pre_releases [False] Install pre-release version of gem(s) if available.
proxy [None] Use the specified HTTP proxy server for all outgoing traffic. Format: http://hostname[:port]
source [None] Use the specified HTTP gem source server to download gem. Format: http://hostname[:port]
salt.states.gem.removed(name, ruby=None, user=None, gem_bin=None)
Make sure that a gem is not installed.
  name The name of the gem to uninstall
  gem_bin [None] Full path to gem binary to use.
  ruby [None] If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if gem_bin is specified.
  user: None The user under which to run the gem command

New in version 0.17.0.
salt.states.gem.sources_add(name, ruby=None, user=None)
Make sure that a gem source is added.
  name The URL of the gem source to be added
  ruby: None For RVM or rbenv installations: the ruby version and gemset to target.
  user: None The user under which to run the gem command

New in version 0.17.0.
salt.states.gem.sources_remove(name, ruby=None, user=None)
Make sure that a gem source is removed.
  name The URL of the gem source to be removed
  ruby: None For RVM or rbenv installations: the ruby version and gemset to target.
  user: None The user under which to run the gem command

New in version 0.17.0.

21.19.88 salt.states.git

States to manage git repositories and git configuration

Important: Before using git over ssh, make sure your remote host fingerprint exists in your ~/.ssh/known_hosts file.

Changed in version 2015.8.8: This state module now requires git 1.6.5 (released 10 October 2009) or newer.
salt.states.git.cloned(name, target=None, branch=None, user=None, password=None, identity=None, https_user=None, https_pass=None, output_encoding=None)
New in version 2018.3.3,2019.2.0.

Ensure that a repository has been cloned to the specified target directory. If not, clone that repository. No fetches will be performed once cloned.
  name Address of the remote repository
  target Name of the target directory where repository should be cloned
  branch Remote branch to check out. If unspecified, the default branch (i.e. the one to the remote HEAD points) will be checked out.

Note: The local branch name will match the remote branch name. If the branch name is changed, then that branch will be checked out locally, but keep in mind that remote repository will not be fetched.
If your use case requires that you keep the clone up to date with the remote repository, then consider using `git.latest`.

**user**  User under which to run git commands. By default, commands are run by the user under which the minion is running.

**password**  Windows only. Required when specifying **user**. This parameter will be ignored on non-Windows platforms.

**identity**  Path to a private key to use for ssh URLs. Works the same way as in `git.latest`, see that state's documentation for more information.

**https_user**  HTTP Basic Auth username for HTTPS (only) clones

**https_pass**  HTTP Basic Auth password for HTTPS (only) clones

**output_encoding**  Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

```python
salt.states.git.config_set(name, value=None, multivar=None, repo=None, user=None, password=None, output_encoding=None, **kwargs)
```

New in version 2014.7.0.

Changed in version 2015.8.0: Renamed from `git.config` to `git.config_set`. For earlier versions, use `git.config`.

Ensure that a config value is set to the desired value(s)

**name**  Name of the git config value to set

**value**  Set a single value for the config item

**multivar**  Set multiple values for the config item

**Note:** The order matters here, if the same parameters are set but in a different order, they will be removed and replaced in the order specified.

New in version 2015.8.0.

**repo**  Location of the git repository for which the config value should be set. Required unless `global` is set to `True`.

**user**  User under which to run git commands. By default, the commands are run by the user under which the minion is running.

**password**  Windows only. Required when specifying **user**. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**global**  [False]  If `True`, this will set a global git config option

**output_encoding**  Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

Local Config Example:
# Single value

```
mylocalrepo:
  git.config_set:
    - name: user.email
      value: foo@bar.net
    - repo: /path/to/repo
```

# Multiple values

```
mylocalrepo:
  git.config_set:
    - name: mysection.myattribute
      multivar:
        - foo
        - bar
        - baz
    - repo: /path/to/repo
```

Global Config Example (User “foo”):

```
mylocalrepo:
  git.config_set:
    - name: user.name
    - value: Foo Bar
    - user: foo
    - global: True
```

salt.states.git.config_unset(name, value_regex=None, repo=None, user=None, password=None, output_encoding=None, **kwargs)

New in version 2015.8.0.

Ensure that the named config key is not present

name The name of the configuration key to unset. This value can be a regex, but the regex must match the entire key name. For example, `foo\.` would not match all keys in the `foo` section, it would be necessary to use `foo\..+` to do so.

value_regex Regex indicating the values to unset for the matching key(s)

Note: This option behaves differently depending on whether or not all is set to True. If it is, then all values matching the regex will be deleted (this is the only way to delete multiple values from a multivar). If all is set to False, then this state will fail if the regex matches more than one value in a multivar.

all [False] If True, unset all matches

repo Location of the git repository for which the config value should be set. Required unless global is set to True.

user User under which to run git commands. By default, commands are run by the user under which the minion is running.

password Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

global [False] If True, this will set a global git config option

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an
encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

Examples:

```yaml
# Value matching 'baz'
mylocalrepo:
  git.config_unset:
    - name: foo.bar
    - value_regex: 'baz'
    - repo: /path/to/repo

# Ensure entire multivar is unset
mylocalrepo:
  git.config_unset:
    - name: foo.bar
    - all: True

# Ensure all variables in 'foo' section are unset, including multivars
mylocalrepo:
  git.config_unset:
    - name: 'foo\..+'
    - all: True

# Ensure that global config value is unset
mylocalrepo:
  git.config_unset:
    - name: foo.bar
    - global: True
```

```
salt.states.git.detached(name, rev, target=None, remote='origin', user=None, password=None, force_clone=False, force_checkout=False, fetch_remote=True, hard_reset=False, submodules=False, identity=None, https_user=None, https_pass=None, onlyif=None, unless=None, output_encoding=None, **kwargs)
```

New in version 2016.3.0.

Make sure a repository is cloned to the given target directory and is a detached HEAD checkout of the commit ID resolved from `rev`.

**name**  Address of the remote repository.

**rev**  The branch, tag, or commit ID to checkout after clone. If a branch or tag is specified it will be resolved to a commit ID and checked out.

**target**  Name of the target directory where repository is about to be cloned.

**remote**  [origin]  Git remote to use. If this state needs to clone the repo, it will clone it using this value as the initial remote name. If the repository already exists, and a remote by this name is not present, one will be added.

**user**  User under which to run git commands. By default, commands are run by the user under which the minion is running.

**password**  Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**force_clone**  [False]  If the `target` directory exists and is not a git repository, then this state will fail. Set this argument to `True` to remove the contents of the target directory and clone the repo into it.

**force_checkout**  [False]  When checking out the revision ID, the state will fail if there are unwritten changes. Set this argument to `True` to discard unwritten changes when checking out.
fetch_remote  [True] If False a fetch will not be performed and only local refs will be reachable.

hard_reset  [False] If True a hard reset will be performed before the checkout and any uncommitted modifications to the working directory will be discarded. Untracked files will remain in place.

Note: Changes resulting from a hard reset will not trigger requisites.

submodules  [False] Update submodules

identity A path on the minion (or a SaltStack fileserver URL, e.g. salt://path/to/identity_file) to a private key to use for SSH authentication.

https_user HTTP Basic Auth username for HTTPS (only) clones

https_pass HTTP Basic Auth password for HTTPS (only) clones

onlyif A command to run as a check, run the named command only if the command passed to the onlyif option returns true

unless A command to run as a check, only run the named command if the command passed to the unless option returns false

output_encoding Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

salt.states.git.latest( name, rev='HEAD', target=None, branch=None, user=None, password=None, update_head=True, force_checkout=False, force_clone=False, force_fetch=False, force_reset=False, submodules=False, bare=False, mirror=False, remote='origin', fetch_tags=True, sync_tags=True, depth=None, identity=None, https_user=None, https_pass=None, onlyif=None, unless=None, refspec_branch='*', refspec_tag='*', output_encoding=None, **kwargs)

Make sure the repository is cloned to the given directory and is up-to-date.

name Address of the remote repository, as passed to git clone

Note: From the Git documentation, there are two URL formats supported for SSH authentication. The below two examples are equivalent:

# ssh:// URL
ssh://user@server/project.git

# SCP-like syntax
user@server:project.git

A common mistake is to use an ssh:// URL, but with a colon after the domain instead of a slash. This is invalid syntax in Git, and will therefore not work in Salt. When in doubt, confirm that a git clone works for the URL before using it in Salt.

It has been reported by some users that SCP-like syntax is incompatible with git repos hosted on Atlassian Stash/BitBucket Server. In these cases, it may be necessary to use ssh:// URLs for SSH authentication.

rev [HEAD] The remote branch, tag, or revision ID to checkout after clone / before update. If specified, then Salt will also ensure that the tracking branch is set to <remote>/<rev>, unless rev refers to a tag or SHA1, in which case Salt will ensure that the tracking branch is unset.

If rev is not specified, it will be assumed to be HEAD, and Salt will not manage the tracking branch at
all.

Changed in version 2015.8.0: If not specified, rev now defaults to the remote repository’s HEAD.

target Name of the target directory where repository is about to be cloned

branch Name of the local branch into which to checkout the specified rev. If not specified, then Salt will not care what branch is being used locally and will just use whatever branch is currently there.

New in version 2015.8.0.

---

**Note:** If this argument is not specified, this means that Salt will not change the local branch if the repository is reset to another branch/tag/SHA1. For example, assume that the following state was run initially:

```
foo_app:
  git.latest:
    - name: https://mydomain.tld/apps/foo.git
    - target: /var/www/foo
    - user: www
```

This would have cloned the HEAD of that repo (since a rev wasn’t specified), and because branch is not specified, the branch in the local clone at /var/www/foo would be whatever the default branch is on the remote repository (usually master, but not always). Now, assume that it becomes necessary to switch this checkout to the dev branch. This would require rev to be set, and probably would also require force_reset to be enabled:

```
foo_app:
  git.latest:
    - name: https://mydomain.tld/apps/foo.git
    - target: /var/www/foo
    - user: www
    - rev: dev
    - force_reset: True
```

The result of this state would be to perform a hard-reset to origin/dev. Since branch was not specified though, while /var/www/foo would reflect the contents of the remote repo’s dev branch, the local branch would still remain whatever it was when it was cloned. To make the local branch match the remote one, set branch as well, like so:

```
foo_app:
  git.latest:
    - name: https://mydomain.tld/apps/foo.git
    - target: /var/www/foo
    - user: www
    - rev: dev
    - branch: dev
    - force_reset: True
```

This may seem redundant, but Salt tries to support a wide variety of use cases, and doing it this way allows for the use case where the local branch doesn’t need to be strictly managed.

**user** Local system user under which to run git commands. By default, commands are run by the user under which the minion is running.

**Note:** This is not to be confused with the username for http(s)/SSH authentication.

New in version 0.17.0.
password  Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

update_head  [True] If set to False, then the remote repository will be fetched (if necessary) to ensure that the commit to which rev points exists in the local checkout, but no changes will be made to the local HEAD.

New in version 2015.8.3.

force_checkout  [False] When checking out the local branch, the state will fail if there are unwritten changes. Set this argument to True to discard unwritten changes when checking out.

force_clone  [False] If the target directory exists and is not a git repository, then this state will fail. Set this argument to True to remove the contents of the target directory and clone the repo into it.

force_fetch  [False] If a fetch needs to be performed, non-fast-forward fetches will cause this state to fail. Set this argument to True to force the fetch even if it is a non-fast-forward update.

New in version 2015.8.0.

force_reset  [False] If the update is not a fast-forward, this state will fail. Set this argument to True to force a hard-reset to the remote revision in these cases.

Changed in version 2019.2.0: This option can now be set to remote-changes, which will instruct Salt not to discard local changes if the repo is up-to-date with the remote repository.

submodules  [False] Update submodules on clone or branch change

bare  [False] Set to True if the repository is to be a bare clone of the remote repository.

mirror  Set to True if the repository is to be a mirror of the remote repository. This implies that bare set to True, and thus is incompatible with rev.

remote  [origin] Git remote to use. If this state needs to clone the repo, it will clone it using this value as the initial remote name. If the repository already exists, and a remote by this name is not present, one will be added.

fetch_tags  [True] If True, then when a fetch is performed all tags will be fetched, even those which are not reachable by any branch on the remote.

sync_tags  [True] If True, then Salt will delete tags which exist in the local clone but are not found on the remote repository.

New in version 2019.2.0:

depth  Defines depth in history when git a clone is needed in order to ensure latest. E.g. depth: 1 is useful when deploying from a repository with a long history. Use rev to specify branch or tag. This is not compatible with revision IDs.

Changed in version 2019.2.0: This option now supports tags as well as branches, on Git 1.8.0 and newer.

identity  Path to a private key to use for ssh URLs. This can be either a single string, or a list of strings. For example:

```bash
# Single key
git@github.com:user/repo.git:
  git.latest:
    - user: deployer
    - identity: /home/deployer/.ssh/id_rsa

# Two keys
git@github.com:user/repo.git:
  git.latest:
    - user: deployer
    - identity:
      - /home/deployer/.ssh/id_rsa
      - /home/deployer/.ssh/id_rsa_alternate
```

If multiple keys are specified, they will be tried one-by-one in order for each git command which needs

Salt Documentation, Release 2019.2.0
to authenticate.

**Warning:** Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphrase-less. For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Changed in version 2016.3.0: Key can now be specified as a SaltStack fileserver URL (e.g. `salt:// path/to/identity_file`).

- **https_user** HTTP Basic Auth username for HTTPS (only) clones
  - New in version 2015.5.0.
- **https_pass** HTTP Basic Auth password for HTTPS (only) clones
  - New in version 2015.5.0.
- **onlyif** A command to run as a check, run the named command only if the command passed to the `onlyif` option returns true
- **unless** A command to run as a check, only run the named command if the command passed to the `unless` option returns false
- **refspec_branch** `[*]` A glob expression defining which branches to retrieve when fetching. See `git-fetch(1)` for more information on how refspecs work.
  - New in version 2017.7.0.
- **refspec_tag** `[*]` A glob expression defining which tags to retrieve when fetching. See `git-fetch(1)` for more information on how refspecs work.
  - New in version 2017.7.0.
- **output_encoding** Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.
  - New in version 2018.3.1.

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

Note: Clashing ID declarations can be avoided when including different branches from the same git repository in the same SLS file by using the `name` argument. The example below checks out the `gh-pages` and `gh-pages-prod` branches from the same repository into separate directories. The example also sets up the `ssh_known_hosts` ssh key required to perform the git checkout.

Also, it has been reported that the SCP-like syntax for

```
gitlab.example.com:
  ssh_known_hosts:
    - present
    - user: root
    - enc: edsa

git-website-staging:
  git.latest:
    - name: git@gitlab.example.com:user/website.git
    - rev: gh-pages
```

(continues on next page)
```yaml
- **target**: /usr/share/nginx/staging
- **identity**: /root/.ssh/website_id_rsa
- **require**:
  - **pkg**: git
  - **ssh_known_hosts**: gitlab.example.com

**git-website-staging**:
- **git.latest**:
  - **name**: git@gitlab.example.com:user/website.git
  - **rev**: gh-pages
  - **target**: /usr/share/nginx/staging
  - **identity**: salt://website/id_rsa
  - **require**:
    - **pkg**: git
    - **ssh_known_hosts**: gitlab.example.com

**git-website-prod**:
- **git.latest**:
  - **name**: git@gitlab.example.com:user/website.git
  - **rev**: gh-pages-prod
  - **target**: /usr/share/nginx/prod
  - **identity**: /root/.ssh/website_id_rsa
  - **require**:
    - **pkg**: git
    - **ssh_known_hosts**: gitlab.example.com
```

**salt.states.git.mod_run_check**(*cmd_kwargs*, *onlyif*, *unless*)
Execute the onlyif and unless logic. Return a result dict if:
- onlyif failed (onlyif != 0)
- unless succeeded (unless == 0)
Otherwise, returns True

**salt.states.git.present**(*name*, *force=False*, *bare=True*, *template=None*, *separate_git_dir=None*, *shared=None*, *user=None*, *password=None*, *output_encoding=None*)
Ensure that a repository exists in the given directory

---

**Warning**: If the minion has Git 2.5 or later installed, **name** points to a worktree, and **force** is set to True, then the worktree will be deleted. This has been corrected in Salt 2015.8.0.

**name** Path to the directory

Changed in version 2015.8.0: This path must now be absolute

**force** [False] If True, and if name points to an existing directory which does not contain a git repository, then the contents of that directory will be recursively removed and a new repository will be initialized in its place.

**bare** [True] If True, and a repository must be initialized, then the repository will be a bare repository.

**Note**: This differs from the default behavior of **git.init**, make sure to set this value to False if a bare repo is not desired.

**template** If a new repository is initialized, this argument will specify an alternate template directory.

New in version 2015.8.0.

**separate_git_dir** If a new repository is initialized, this argument will specify an alternate $GIT_DIR
New in version 2015.8.0.

**shared**  Set sharing permissions on git repo. See `git-init(1)` for more details.

New in version 2015.5.0.

**user**  User under which to run git commands. By default, commands are run by the user under which the minion is running.

New in version 0.17.0.

**password**  Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**output_encoding**  Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

**21.19.89  salt.states.github module**

Github User State Module

New in version 2016.3.0..

This state is used to ensure presence of users in the Organization.

```
ensure user test is present in github:
    github.present:
        - name: 'Example TestUser1'
        - email: example@domain.com
        - username: 'gitexample'
```

`salt.states.github.absent(name, profile='github', **kwargs)`

Ensure a github user is absent

```
ensure user test is absent in github:
    github.absent:
        - name: 'Example TestUser1'
        - email: example@domain.com
        - username: 'gitexample'
```

The following parameters are required:
- **name**  Github handle of the user in organization

```
salt.states.github.present(name, profile='github', **kwargs)
```

Ensure a user is present

```
ensure user test is present in github:
    github.present:
        - name: 'gitexample'
```

The following parameters are required:
- **name**  This is the github handle of the user in the organization
**salt.states.github.repo_absent**(name, profile=’github’, **kwargs)

Ensure a repo is absent.

Example:
```
ensure repo test is absent in github:
    github.repo_absent:
        - name: 'test'
```

The following parameters are required:
- **name** This is the name of the repository in the organization.

New in version 2016.11.0.

**salt.states.github.repo_present**(name, description=None, homepage=None, private=None, has_issues=None, has_wiki=None, has_downloads=None, auto_init=False, gitignore_template=None, license_template=None, teams=None, profile=’github’, **kwargs)

Ensure a repository is present

- **name** This is the name of the repository.
- **description** The description of the repository.
- **homepage** The URL with more information about the repository.
- **private** The visibility of the repository. Note that private repositories require a paid GitHub account.
- **has_issues** Whether to enable issues for this repository.
- **has_wiki** Whether to enable the wiki for this repository.
- **has_downloads** Whether to enable downloads for this repository.
- **auto_init** Whether to create an initial commit with an empty README.
- **gitignore_template** The desired language or platform for a .gitignore, e.g "Haskell".
- **license_template** The desired LICENSE template to apply, e.g "mit" or "mozilla".
- **teams** The teams for which this repo should belong to, specified as a dict of team name to permission (‘pull’, ‘push’ or ‘admin’).

New in version 2017.7.0.

Example:
```
Ensure repo my-repo is present in github:
    github.repo_present:
        - name: 'my-repo'
        - description: 'My very important repository'
```

New in version 2016.11.0.

**salt.states.github.team_absent**(name, profile=’github’, **kwargs)

Ensure a team is absent.

Example:
```
ensure team test is present in github:
    github.team_absent:
        - name: 'test'
```

The following parameters are required:
- **name** This is the name of the team in the organization.

New in version 2016.11.0.

**salt.states.github.team_present**(name, description=None, repo_names=None, privacy=’secret’, permission=’pull’, members=None, enforce_mfa=False, no_mfa_grace_seconds=0, profile=’github’, **kwargs)

Ensure a team is present

- **name** This is the name of the team in the organization.
description  The description of the team.
repo_names  The names of repositories to add the team to.
privacy  The level of privacy for the team, can be 'secret' or 'closed'. Defaults to secret.
permission  The default permission for new repositories added to the team, can be 'pull', 'push' or 'admin'. Defaults to pull.
members  The members belonging to the team, specified as a dict of member name to optional configuration. Options include 'enforce_mfa_from' and 'mfa_exempt'.
enforce_mfa  Whether to enforce MFA requirements on members of the team. If True then all members without mfa_exempt: True configured will be removed from the team. Note that no_mfa_grace_seconds may be set to allow members a grace period.
no_mfa_grace_seconds  The number of seconds of grace time that a member will have to enable MFA before being removed from the team. The grace period will begin from enforce_mfa_from on the member configuration, which defaults to 1970/01/01.

Example:

```
Ensure team test is present in github:
github.team_present:
  - name: 'test'
  - members:
    user1: {}
    user2: {}

Ensure team test_mfa is present in github:
github.team_present:
  - name: 'test_mfa'
  - members:
    user1:
      enforce_mfa_from: 2016/06/15
    enforce_mfa: True
```

New in version 2016.11.0.

21.19.90  salt.states.glance

Managing Images in OpenStack Glance

salt.states.glance.image_present(name, visibility='public', protected=None, checksum=None, location=None, disk_format='raw', wait_for=None, timeout=30)

Checks if given image is present with properties set as specified.

An image should go through the stages 'queued', 'saving' before becoming 'active'. The attribute 'checksum' can only be checked once the image is active. If you don’t specify 'wait_for' but 'checksum' the function will wait for the image to become active before comparing checksums. If you don’t specify checksum either the function will return when the image reached 'saving'. The default timeout for both is 30 seconds.

Supported properties:
- visibility ('public' or 'private')
- protected (bool)
- checksum (string, md5sum)
- location (URL, to copy from)
- disk_format ('raw' (default), 'vhd', 'vhdx', 'vmdk', 'vdi', 'iso', 'qcow2', 'aki', 'ari' or 'ami')

21.19.91  salt.states.glance_image
Management of OpenStack Glance Images

New in version 2018.3.0.

depends shade

configuration see `salt.modules.glanceng` for setup instructions

Example States

create image:
  `glance_image.present`
  - `name`: cirros
  - `filename`: cirros.raw
  - `image_format`: raw

delete image:
  `glance_image.absent`
  - `name`: cirros

`salt.states.glance_image.absent(name, auth=None)`
  Ensure image does not exist
  name Name of the image

`salt.states.glance_image.present(name, auth=None, **kwargs)`
  Ensure image exists and is up-to-date
  name Name of the image
  enabled Boolean to control if image is enabled
  description An arbitrary description of the image

21.19.92 salt.states.glusterfs

Manage GlusterFS pool.

`salt.states.glusterfs.add_volume_bricks(name, bricks)`
  Add brick(s) to an existing volume
  name Volume name
  bricks List of bricks to add to the volume

```
myvolume:
  glusterfs.add_volume_bricks:
    - bricks:
      - host1:/srv/gluster/drive1
      - host2:/srv/gluster/drive2

Replicated Volume:
  glusterfs.add_volume_bricks:
    - name: volume2
    - bricks:
      - host1:/srv/gluster/drive2
      - host2:/srv/gluster/drive3
```

`salt.states.glusterfs.max_op_version(name)`
  New in version 2019.2.0.
  Add brick(s) to an existing volume
  name Volume name
myvolume:
  glusterfs.max_op_version:
    - name: volume1
    - version: 30707

salt.states.glusterfs.op_version(name, version)
New in version 2019.2.0.
Add brick(s) to an existing volume
name Volume name
version Version to which the cluster.op-version should be set

myvolume:
  glusterfs.op_version:
    - name: volume1
    - version: 30707

salt.states.glusterfs.peered(name)
Check if node is peered.
name The remote host with which to peer.

peer-cluster:
  glusterfs.peered:
    - name: two
peer-clusters:
  glusterfs.peered:
    - names:
      - one
      - two
      - three
      - four

salt.states.glusterfs.started(name)
Check if volume has been started
name name of the volume

mycluster:
  glusterfs.started: []

salt.states.glusterfs.volume_present(name, bricks, stripe=False, replica=False, device_vg=False, transport='tcp', start=False, force=False, arbiter=False)
Ensure that the volume exists
name name of the volume
bricks list of brick paths
replica replica count for volume
arbiter use every third brick as arbiter (metadata only)
New in version 2019.2.0.
start ensure that the volume is also started

myvolume:
  glusterfs.volume_present:
    - bricks:
      - host1:/srv/gluster/drive1
      - host2:/srv/gluster/drive2

(continues on next page)
Replicated Volume:

```yaml
replicated_volume:
  name: volume2
  bricks:
    - host1:/srv/gluster/drive2
    - host2:/srv/gluster/drive3
  replica: 2
  start: True
```

Replicated Volume with arbiter brick:

```yaml
replicated_volume:
  name: volume3
  bricks:
    - host1:/srv/gluster/drive2
    - host2:/srv/gluster/drive3
    - host3:/srv/gluster/drive4
  replica: 3
  arbiter: True
  start: True
```

21.19.93 salt.states.gnomedesktop

Configuration of the GNOME desktop

Control the GNOME settings

```yaml
localdesktop_wm_prefs:
  gnomedesktop.wm_preferences:
    - user: username
    - audible_bell: false
    - action_double_click_titlebar: 'toggle-maximize'
    - visual_bell: true
    - num_workspaces: 6

localdesktop_lockdown:
  gnomedesktop.desktop_lockdown:
    - user: username
    - disable_user_switching: true

localdesktop_interface:
  gnomedesktop.desktop_interface:
    - user: username
    - clock_show_date: true
    - clock_format: 12h
```
salt.states.gnomedesktop.**desktop_interface**(name, user=None, automatic_mnemonics=None, buttons_have_icons=None, can_change_accels=None, clock_format=None, clock_show_date=None, clock_show_seconds=None, cursor_blink=None, cursor_blink_time=None, cursor_blink_timeout=None, cursor_size=None, cursor_theme=None, document_font_name=None, enable_animations=None, font_name=None, gtk_color_palette=None, gtk_color_scheme=None, gtk_im_module=None, gtk_im_preedit_style=None, gtk_im_status_style=None, gtk_key_theme=None, gtk_theme=None, gtk_timeout_initial=None, gtk_timeout_repeat=None, icon_theme=None, menubar_accel=None, menubar_detachable=None, menus_have_icons=None, menus_have_tearoff=None, monospace_font_name=None, show_input_method_menu=None, show_unicode_menu=None, text_scaling_factor=None, toolbar_detachable=None, toolbar_icons_size=None, toolbar_style=None, toolkit_accessibility=None, **kwargs)

desktop_interface: sets values in the org.gnome.desktop.interface schema

salt.states.gnomedesktop.**desktop_lockdown**(name, user=None, disable_application_handlers=None, disable_command_line=None, disable_lock_screen=None, disable_log_out=None, disable_print_setup=None, disable_printing=None, disable_save_to_disk=None, disable_user_switching=None, user_administration_disabled=None, **kwargs)

desktop_lockdown: sets values in the org.gnome.desktop.lockdown schema
salt.states.gnomedesktop.wm_preferences(name, user=None, action_double_click_titlebar=None, action_middle_click_titlebar=None, action_right_click_titlebar=None, application_based=None, audible_bell=None, auto_raise=None, auto_raise_delay=None, button_layout=None, disable_workarounds=None, focus_mode=None, focus_new_windows=None, mouse_button_modifier=None, num_workspaces=None, raise_on_click=None, resize_with_right_button=None, theme=None, titlebar_font=None, titlebar_uses_system_font=None, visual_bell=None, visual_bell_type=None, workspace_names=None, **kwargs)

wm_preferences: sets values in the org.gnome.desktop.wm.preferences schema

21.19.94 salt.states.gpg module

Management of the GPG keychains

New in version 2016.3.0.

salt.states.gpg.absent(name, keys=None, user=None, gnupghome=None, **kwargs)
    Ensure GPG public key is absent in keychain
    name The unique name or keyid for the GPG public key.
    keys The keyId or keyIds to add to the GPG keychain.
    user Remove GPG keys from the specified user’s keychain
    gnupghome Override GNUPG Home directory

salt.states.gpg.present(name, keys=None, user=None, keyserver=None, gnupghome=None, trust=None, **kwargs)
    Ensure GPG public key is present in keychain
    name The unique name or keyid for the GPG public key.
    keys The keyId or keyIds to add to the GPG keychain.
    user Add GPG keys to the specified user’s keychain
    keyserver The keyservers to retrieve the keys from.
    gnupghome Override GNUPG Home directory
    trust Trust level for the key in the keychain, ignored by default. Valid trust levels: expired, unknown, not_trusted, marginally, fully, ultimately

21.19.95 salt.states.grafana

Manage Grafana Dashboards

This module uses elasticsearch, which can be installed via package, or pip.

You can specify elasticsearch hosts directly to the module, or you can use an elasticsearch profile via pillars:

```
mygrafanaprofile:
    hosts:
        - es1.example.com:9200
        - es2.example.com:9200
    index: grafana-dash
```
# Basic usage (uses default pillar profile key 'grafana')

Ensure myservice dashboard is managed:
```
grafana.dashboard_present:
    - name: myservice
      - dashboard_from_pillar: default
      - rows_from_pillar:
        - systemhealth
        - requests
```

# Passing hosts in

Ensure myservice dashboard is managed:
```
grafana.dashboard_present:
    - name: myservice
      - dashboard_from_pillar: default
      - rows:
        - collapse: false
          editable: true
          height: 150px
          title: System Health
          panels:
            - aliasColors: {}
              id: 200000
              annotate:
                enable: false
                bars: false
                datasource: null
                editable: true
                error: false
                fill: 7
              grid:
                leftMax: 100
                leftMin: null
                rightMax: null
                rightMin: null
                threshold1: 60
                threshold1Color: rgb(216, 27, 27)
                threshold2: null
                threshold2Color: rgba(234, 112, 112, 0.22)
                leftYAxisLabel: ''
              legend:
                avg: false
                current: false
                max: false
                min: false
                show: false
                total: false
                values: false
              lines: true
              linewidth: 1
              nullPointMode: connected
              percentage: false

The behavior of this module is to create dashboards if they do not exist, to add rows if they do not exist in existing dashboards, and to update rows if they exist in dashboards. The module will not manage rows that are not defined, allowing users to manage their own custom rows.

salt.states.grafana.dashboard_absent(name, hosts=None, profile='grafana')
Ensure the named grafana dashboard is deleted.

    name Name of the grafana dashboard.
    profile A pillar key or dict that contains a list of hosts and an elasticsearch index to use.

salt.states.grafana.dashboard_present(name, dashboard=None, dashboard_from_pillar=None, rows=None, rows_from_pillar=None, profile='grafana')
Ensure the grafana dashboard exists and is managed.

    name Name of the grafana dashboard.
    dashboard A dict that defines a dashboard that should be managed.
    dashboard_from_pillar A pillar key that contains a grafana dashboard dict. Mutually exclusive with dashboard.
    rows A list of grafana rows.
    rows_from_pillar A list of pillar keys that contain lists of grafana dashboard rows. Rows defined in the pillars will be appended to the rows defined in the state.
    profile A pillar key or dict that contains a list of hosts and an elasticsearch index to use.
21.19.96 salt.states.grafana4_dashboard module

Manage Grafana v4.0 Dashboards

New in version 2017.7.0.

**configuration** This state requires a configuration profile to be configured in the minion config, minion pillar, or master config. The module will use the 'grafana' key by default, if defined.

Example configuration using basic authentication:

```yaml
grafana:
    grafana_url: http://grafana.localhost
    grafana_user: admin
    grafana_password: admin
    grafana_timeout: 3
```

Example configuration using token based authentication:

```yaml
grafana:
    grafana_url: http://grafana.localhost
    grafana_token: token
    grafana_timeout: 3
```

The behavior of this module is to create dashboards if they do not exist, to add rows if they do not exist in existing dashboards, and to update rows if they exist in dashboards. The module will not manage rows that are not defined, allowing users to manage their own custom rows.

**Ensure minimum dashboard is managed:**

```yaml
salt.states.grafana4_dashboard.present:
  - name: insightful-dashboard
    base_dashboards_from_pillar:
      - default_dashboard
    base_rows_from_pillar:
      - default_row
    base_panels_from_pillar:
      - default_panel
    dashboard:
      rows:
        - title: Usage
          panels:
            - targets:
              - target: alias(constantLine(50), 'max')
              title: Imaginary
              type: graph
```

**salt.states.grafana4_dashboard.absent**(name, orgname=None, profile='grafana')

Ensure the named grafana dashboard is absent.

- **name** Name of the grafana dashboard.
- **orgname** Name of the organization in which the dashboard should be present.
- **profile** Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

**salt.states.grafana4_dashboard.present**(name, base_dashboards_from_pillar=None,
  base_panels_from_pillar=None,
  base_rows_from_pillar=None,
  dashboard=None,
  orgname=None, profile='grafana')

Ensure the grafana dashboard exists and is managed.

- **name** Name of the grafana dashboard.
- **base_dashboards_from_pillar** A pillar key that contains a list of dashboards to inherit from.
base_panels_from_pillar  A pillar key that contains a list of panels to inherit from
base_rows_from_pillar  A pillar key that contains a list of rows to inherit from
dashboard  A dict that defines a dashboard that should be managed.
orgname  Name of the organization in which the dashboard should be present.
profile  Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

21.19.97 salt.states.grafana4_datasource module

Manage Grafana v4.0 data sources
New in version 2017.7.0.

configuration  This state requires a configuration profile to be configured in the minion config, minion
pillar, or master config. The module will use the 'grafana' key by default, if defined.

Example configuration using basic authentication:

```
grafana:
  grafana_url: http://grafana.localhost
  grafana_user: admin
  grafana_password: admin
  grafana_timeout: 3
```

Example configuration using token based authentication:

```
grafana:
  grafana_url: http://grafana.localhost
  grafana_token: token
  grafana_timeout: 3
```

The behavior of this module is to create data sources if they do not exist, and to update data sources if they already
exist.

```
Ensure influxdb data source is present:
grafana4_datasource.present:
  - name: influxdb
  - type: influxdb
  - url: http://localhost:8086
  - access: proxy
  - basic_auth: true
  - basic_auth_user: myuser
  - basic_auth_password: mypass
  - is_default: true
```

salt.states.grafana4_datasource.absent(name, orgname=None, profile='grafana')
Ensure that a data source is present.
name  Name of the data source to remove.
orgname  Name of the organization from which the data source should be absent.
profile  Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

salt.states.grafana4_datasource.present(name, type, url, access=None, user=None, pass
word=None, database=None, basic_auth=None, basic_auth_user=None, basic_auth_password=None,
tls_auth=None, json_data=None, is_default=None, with_credentials=None, type_logo_url=None,
orname=None, profile='grafana')

Ensure that a data source is present.
name  Name of the data source.
type  Type of the datasource (‘graphite’, ‘influxdb’ etc.).
access Use proxy or direct. Default: proxy
url  The URL to the data source API.
user  Optional - user to authenticate with the data source.
password  Optional - password to authenticate with the data source.
database  Optional - database to use with the data source.
basic_auth  Optional - set to True to use HTTP basic auth to authenticate with the data source.
basic_auth_user  Optional - HTTP basic auth username.
basic_auth_password  Optional - HTTP basic auth password.
json_data  Optional - additional json data to post (eg. “timeInterval”).
is_default  Optional - set data source as default.
with_credentials  Optional - Whether credentials such as cookies or auth headers should be sent with cross-site requests.
type_logo_url  Optional - Logo to use for this datasource.
orgname  Name of the organization in which the data source should be present.
profile  Configuration profile used to connect to the Grafana instance. Default is ‘grafana’.

21.19.98  salt.states.grafana4_org module

Manage Grafana v4.0 orgs

New in version 2017.7.0.

configuration  This state requires a configuration profile to be configured in the minion config, minion pillar, or master config. The module will use the ‘grafana’ key by default, if defined.

Example configuration using basic authentication:

```yaml
grafana:
  grafana_url: http://grafana.localhost
  grafana_user: admin
  grafana_password: admin
  grafana_timeout: 3
```

Example configuration using token based authentication:

```yaml
grafana:
  grafana_url: http://grafana.localhost
  grafana_token: token
  grafana_timeout: 3
```

Ensure foobar org is present:

```yaml
grafana4_org.present:
  - name: foobar
  - theme: 
  - home_dashboard_id: 0
  - timezone: "utc"
  - address1: 
  - address2: 
  - city: 
  - zip_code: 
  - state: 
  - country: 
```

salt.states.grafana4_org.absent(name, profile='grafana')

Ensure that a org is present.
name  Name of the org to remove.
profile  Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

**salt.states.grafana4_org.present**

(name, users=None, theme=None, home_dashboard_id=None, timezone=None, address1=None, address2=None, city=None, zip_code=None, address_state=None, country=None, profile='grafana')

Ensure that an organization is present.
**name**  Name of the org.
**users**  Optional - Dict of user/role associated with the org. Example:

```
users:
  foo: Viewer
  bar: Editor
```

**theme**  Optional - Selected theme for the org.
**home_dashboard_id**  Optional - Home dashboard for the org.
**timezone**  Optional - Timezone for the org (one of: "browser", "utc", or ".").
**address1**  Optional - address1 of the org.
**address2**  Optional - address2 of the org.
**city**  Optional - city of the org.
**zip_code**  Optional - zip_code of the org.
**address_state**  Optional - state of the org.
**country**  Optional - country of the org.
**profile**  Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

### 21.19.99 salt.states.grafana4_user module

Manage Grafana v4.0 users

New in version 2017.7.0.

**configuration**  This state requires a configuration profile to be configured in the minion config, minion pillar, or master config. The module will use the 'grafana' key by default, if defined.

Example configuration using basic authentication:

```
grafana:
  grafana_url: http://grafana.localhost
  grafana_user: admin
  grafana_password: admin
  grafana_timeout: 3
```

Example configuration using token based authentication:

```
grafana:
  grafana_url: http://grafana.localhost
  grafana_token: token
  grafana_timeout: 3
```

**Ensure foobar user is present:**

```
grafana4_user.present:
  - name: foobar
  - password: mypass
  - email: "foobar@localhost"
  - fullname: Foo Bar
  - is_admin: true
```
salt.states.grafana4_user.absent(name, profile='grafana')

Ensure that a user is present.

- **name** Name of the user to remove.
- **profile** Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

salt.states.grafana4_user.present(name, password, email, is_admin=False, fullname=None, theme=None, profile='grafana')

Ensure that a user is present.

- **name** Name of the user.
- **password** Password of the user.
- **email** Email of the user.
- **is_admin** Optional - Set user as admin user. Default: False
- **fullname** Optional - Full name of the user.
- **theme** Optional - Selected theme of the user.
- **profile** Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

### 21.19.100 salt.states.grafana_dashboard module

Manage Grafana v2.0 Dashboards

New in version 2016.3.0.

```yaml
grafana:
  grafana_timeout: 3
  grafana_token: qwertyuiop
  grafana_url: 'https://url.com'
```

**Ensure minimum dashboard is managed:**

```yaml
grafana_dashboard.present:
  - name: insightful-dashboard
  - base_dashboards_from_pillar:
    - default_dashboard
  - base_rows_from_pillar:
    - default_row
  - base_panels_from_pillar:
    - default_panel
  - dashboard:
    rows:
      - title: Usage
        panels:
          - targets:
            - target: alias(constantLine(50), 'max')
          title: Imaginary
          type: graph
```

The behavior of this module is to create dashboards if they do not exist, to add rows if they do not exist in existing dashboards, and to update rows if they exist in dashboards. The module will not manage rows that are not defined, allowing users to manage their own custom rows.

salt.states.grafana_dashboard.absent(name, profile='grafana')

Ensure the named grafana dashboard is absent.

- **name** Name of the grafana dashboard.
- **profile** A pillar key or dict that contains grafana information
salt.states.grafana_dashboard.present(name, base_dashboards_from_pillar=None,
                                      base_panels_from_pillar=None, 
                                      base_rows_from_pillar=None, 
                                      dashboard=None, 
                                      profile='grafana')

Ensure the grafana dashboard exists and is managed.

name Name of the grafana dashboard.
base_dashboards_from_pillar A pillar key that contains a list of dashboards to inherit from
base_panels_from_pillar A pillar key that contains a list of panels to inherit from
base_rows_from_pillar A pillar key that contains a list of rows to inherit from
dashboard A dict that defines a dashboard that should be managed.
profile A pillar key or dict that contains grafana information

21.19.101 salt.states.grafana_datasource module

Manage Grafana v2.0 data sources

New in version 2016.3.0.

grafana:
  grafana_timeout: 3
  grafana_token: qwertyuiop
  grafana_url: 'https://url.com'

Ensure influxdb data source is present:
grafana_datasource.present:
  - name: influxdb
  - type: influxdb
  - url: http://localhost:8086
  - access: proxy
  - basic_auth: true
  - basic_auth_user: myuser
  - basic_auth_password: mypass
  - is_default: true

salt.states.grafana_datasource.absent(name, profile='grafana')

Ensure that a data source is present.

name Name of the data source to remove.

salt.states.grafana_datasource.present(name, type, url, access='proxy', user='', password='', 
                                          database='', basic_auth=False, basic_auth_user='', 
                                          basic_auth_password='', is_default=False, 
                                          json_data=None, profile='grafana')

Ensure that a data source is present.

name Name of the data source.
type Which type of data source it is ('graphite', 'influxdb' etc.).
url The URL to the data source API.
user Optional - user to authenticate with the data source
password Optional - password to authenticate with the data source
basic_auth Optional - set to True to use HTTP basic auth to authenticate with the data source.
basic_auth_user Optional - HTTP basic auth username.
basic_auth_password Optional - HTTP basic auth password.
is_default Default: False

21.19.102 salt.states.grains
Manage grains on the minion

This state allows for grains to be set.

Grains set or altered with this module are stored in the 'grains' file on the minions. By default, this file is located at: /etc/salt/grains

Note: This does NOT override any grains set in the minion config file.

salt.states.grains.absent(name, destructive=False, delimiter=':', force=False)
New in version 2014.7.0.

Delete a grain from the grains config file
name The grain name
destructive If destructive is True, delete the entire grain. If destructive is False, set the grain’s value to None. Defaults to False.
force If force is True, the existing grain will be overwritten regardless of its existing or provided value type. Defaults to False

New in version v2015.8.2.
delimiter A delimiter different from the default can be provided.

New in version v2015.8.2.
Changed in version v2015.8.2.
This state now support nested grains and complex values. It is also more conservative: if a grain has a value that is a list or a dict, it will not be removed unless the force parameter is True.

```yaml
grain_name:
  grains.absent
```

salt.states.grains.append(name, value, convert=False, delimiter=': ')
New in version 2014.7.0.

Append a value to a list in the grains config file. The grain that is being appended to (name) must exist before the new value can be added.
name The grain name
value The value to append
convert If convert is True, convert non-list contents into a list. If convert is False and the grain contains non-list contents, an error is given. Defaults to False.
delimiter A delimiter different from the default can be provided.

New in version v2015.8.2.

```yaml
grain_name:
  grains.append:
    - value: to_be_appended
```

salt.states.grains.exists(name, delimiter=': ')
Ensure that a grain is set
name The grain name
delimiter A delimiter different from the default can be provided.
Check whether a grain exists. Does not attempt to check or set the value.

salt.states.grains.list_absent(name, value, delimiter=': ')
Delete a value from a grain formed as a list.
New in version 2014.1.0.
name  The grain name.
value  The value to delete from the grain list.
delimiter  A delimiter different from the default : can be provided.

New in version v2015.8.2.
The grain should be list type

```
roles:
  grains.list_absent:
    - value: db
```

For multiple grains, the syntax looks like:

```
roles:
  grains.list_absent:
    - value:
      - web
      - dev
```

salt.states.grains.list_present(name, value, delimiter=': ')
New in version 2014.1.0.

Ensure the value is present in the list-type grain. Note: If the grain that is provided in name is not present on the system, this new grain will be created with the corresponding provided value.

name  The grain name.
value  The value is present in the list type grain.
delimiter  A delimiter different from the default : can be provided.

New in version v2015.8.2.
The grain should be list type

```
roles:
  grains.list_present:
    - value: web
```

For multiple grains, the syntax looks like:

```
roles:
  grains.list_present:
    - value:
      - web
      - dev
```

salt.states.grains.present(name, value, delimiter=': ', force=False)
Ensure that a grain is set

Changed in version v2015.8.2.
name  The grain name
value  The value to set on the grain
force  If force is True, the existing grain will be overwritten regardless of its existing or provided value type.
Defaults to False

New in version v2015.8.2.
delimiter  A delimiter different from the default can be provided.

New in version v2015.8.2.
It is now capable to set a grain to a complex value (ie. lists and dicts) and supports nested grains as well.

If the grain does not yet exist, a new grain is set to the given value. For a nested grain, the necessary keys are created if they don’t exist. If a given key is an existing value, it will be converted, but an existing value
different from the given key will fail the state.

If the grain with the given name exists, its value is updated to the new value unless its existing or provided value is complex (list or dict). Use `force: True` to overwrite.

```python
cheese:
  grains.present:
    - value: edam

nested_grain_with_complex_value:
  grains.present:
    - name: icinga:Apache SSL
    - value:
      - command: check_https
      - params: -H localhost -p 443 -S

with,a,custom,delimiter:
  grains.present:
    - value: yay
    - delimiter: ', '
```

### 21.19.103 salt.states.group

Management of user groups

The group module is used to create and manage group settings, groups can be either present or absent. User/Group names can be passed to the `adduser`, `deluser`, and `members` parameters. `adduser` and `deluser` can be used together but not with `members`.

In Windows, if no domain is specified in the user or group name (i.e. `DOMAIN\username`) the module will assume a local user or group.

```python
cheese:
  group.present:
    - gid: 7648
    - system: True
    - addusers:
      - user1
      - users2
    - delusers:
      - foo

cheese:
  group.present:
    - gid: 7648
    - system: True
    - members:
      - foo
      - bar
      - user1
      - user2

salt.states.group.absent(name)

Ensure that the named group is absent

**Parameters**

- `name` *(str)* – The name of the group to remove

**Example:**
salt.states.group.present(name, gid=None, system=False, addusers=None, delusers=None, members=None)

Ensure that a group is present

Parameters

- **name** *(str)* – The name of the group to manage
- **gid** *(str)* – The group id to assign to the named group; if left empty, then the next available group id will be assigned. Ignored on Windows
- **system** *(bool)* – Whether or not the named group is a system group. This is essentially the ‘-r’ option of ‘groupadd’. Ignored on Windows
- **addusers** *(list)* – List of additional users to be added as a group members. Cannot conflict with names in delusers. Cannot be used in conjunction with members.
- **delusers** *(list)* – Ensure these user are removed from the group membership. Cannot conflict with names in addusers. Cannot be used in conjunction with members.
- **members** *(list)* – Replace existing group members with a list of new members. Cannot be used in conjunction with addusers or delusers.

Example:

```
# Adds DOMAIN\db_admins and Administrators to the local db_admin group
# Removes Users
db_admin:
  group.present:
    - addusers:
      - DOMAIN\db_admins
      - Administrators
    - delusers:
      - Users

# Ensures only DOMAIN\domain_admins and the local Administrator are # members of the local Administrators group. All other users are # removed
Administrators:
  group.present:
    - members:
      - DOMAIN\domain_admins
      - Administrator
```

### 21.19.104 salt.states.heat module

Management of Heat

New in version 2017.7.0.

**depends**

- heat Python module

**configuration** See *salt.modules.heat* for setup instructions.

The heat module is used to create, show, list and delete Heat staks. Stack can be set as either absent or deploy.
### heat.deployed:
- **name:**
- **template:** #Required
- **environment:**
- **params:** {}
- **poll:** 5
- **rollback:** False
- **timeout:** 60

### heat.absent:
- **name:**
- **poll:** 5

### mysql:

  heat.deployed:
  
  - template: salt://templates/mysql.heat.yaml
  - params: image: Debian 7
  - rollback: True

New in version 2017.7.5,2018.3.1: The spelling mistake in parameter enviroment was corrected to environment. The misspelled version is still supported for backward compatibility, but will be removed in Salt Neon.

#### salt.states.heat.absent(...)
Ensure that the named stack is absent
- **name** The name of the stack to remove
- **poll** Poll(in sec.) and report events until stack complete
- **timeout** Stack creation timeout in minutes
- **profile** Profile to use

#### salt.states.heat.deployed(...)
Deploy stack with the specified properties
- **name** The name of the stack
- **template** File of template
- **environment** File of environment
- **params** Parameter dict used to create the stack
- **poll** Poll (in sec.) and report events until stack complete
- **rollback** Enable rollback on create failure
- **timeout** Stack creation timeout in minutes
- **profile** Profile to use

New in version 2017.7.5,2018.3.1: The spelling mistake in parameter enviroment was corrected to environment. The misspelled version is still supported for backward compatibility, but will be removed in Salt Neon.

### 21.19.105 salt.states.hg

#### Interaction with Mercurial repositories

Before using hg over ssh, make sure the remote host fingerprint already exists in ~/.ssh/known_hosts, and the remote host has this host’s public key.

```
https://bitbucket.org/example_user/example_repo:

  hg.latest:
```

(continues on next page)
- **rev**: tip
- **target**: /tmp/example_repo

salt.states.hg.latest(name, rev=None, target=None, clean=False, user=None, identity=None, force=False, opts=False, update_head=True)

Make sure the repository is cloned to the given directory and is up to date

- **name**: Address of the remote repository as passed to "hg clone"
- **rev**: The remote branch, tag, or revision hash to clone/pull
- **target**: Target destination directory path on minion to clone into
- **clean**: Force a clean update with -C (Default: False)
- **user**: Name of the user performing repository management operations

  New in version 0.17.0.

- **identity**: Private SSH key on the minion server for authentication (ssh://)

  New in version 2015.5.0.

- **force**: Force hg to clone into pre-existing directories (deletes contents)
- **opts**: Include additional arguments and options to the hg command line
- **update_head**: Should we update the head if new changes are found? Defaults to True

  New in version 2017.7.0.

### 21.19.106 salt.states.hipchat

**Send a message to Hipchat**

This state is useful for sending messages to Hipchat during state runs.

The property api_url is optional. By default will use the public HipChat API at [https://api.hipchat.com](https://api.hipchat.com)

New in version 2015.5.0.

```python
hipchat-message:

   hipchat.send_message:
   - room_id: 123456
   - from_name: SuperAdmin
   - message: 'This state was executed successfully.'
   - api_url: https://hipchat.myteam.com
   - api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
   - api_version: v1
```

The api key can be specified in the master or minion configuration like below:

```python
hipchat:
   api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
   api_version: v1
```

salt.states.hipchat.send_message(name, room_id, from_name, message, api_url=None, api_key=None, api_version=None, message_color='yellow', notify=False)

Send a message to a Hipchat room.

```python
hipchat-message:

   hipchat.send_message:
   - room_id: 123456
   - from_name: SuperAdmin
```

(continues on next page)
message: 'This state was executed successfully.'
api_url: https://hipchat.myteam.com
api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
api_version: v1
message_color: green
notify: True

The following parameters are required:
name The unique name for this event.
room_id The room to send the message to. Can either be the ID or the name.
from_name The name of that is to be shown in the "from" field. If not specified, defaults to.
message The message that is to be sent to the Hipchat room.

The following parameters are optional:
api_url The API URL to be used. If not specified here or in the configuration options of master or minion, will use the public HipChat API: https://api.hipchat.com
api_key The api key for Hipchat to use for authentication, if not specified in the configuration options of master or minion.
api_version The api version for Hipchat to use, if not specified in the configuration options of master or minion.
message_color The color the Hipchat message should be displayed in. One of the following, default: yellow "yellow", "red", "green", "purple", "gray", or "random".
notify Should a notification in the room be raised.

21.19.107 salt.states.host

Management of addresses and names in hosts file

The /etc/hosts file can be managed to contain definitions for specific hosts:
salt-master:
host.present:
  - ip: 192.168.0.42

Or using the names directive, you can put several names for the same IP. (Do not try one name with space-separated values).

server1:
host.present:
  - ip: 192.168.0.42
  - names:
    - server1
    - florida

Note: Changing the names in host.present does not cause an update to remove the old entry.

server1:
host.present:
  - ip:
    - 192.168.0.42
    - 192.168.0.43
    - 192.168.0.44

(continues on next page)
You can replace all existing names for a particular IP address:

```
127.0.0.1:
    host.only:
        - hostnames:
            - foo.example.com
            - foo
```

Or delete all existing names for an address:

```
203.0.113.25:
    host.only:
        - hostnames: []
```

```python
salt.states.host.absent(name, ip)
```
Ensure that the named host is absent

- `name` The host to remove
- `ip` The ip addr(s) of the host to remove

```python
salt.states.host.only(name, hostnames)
```
Ensure that only the given hostnames are associated with the given IP address.

- `name` The IP address to associate with the given hostnames.
- `hostnames` Either a single hostname or a list of hostnames to associate with the given IP address in the given order. Any other hostname associated with the IP address is removed. If no hostnames are specified, all hostnames associated with the given IP address are removed.

```python
salt.states.host.present(name, ip, clean=False)
```
Ensures that the named host is present with the given ip

- `name` The host addr to apply to the host. Can be a single IP or a list of IP addresses.
- `clean` [False] Remove any entries which don’t match those configured in the `ip` option.

New in version 2018.3.4.

### 21.19.108 salt.states.http

HTTP monitoring states

Perform an HTTP query and statefully return the result

New in version 2015.5.0.

```python
salt.states.http.query(name, match=None, match_type='string', status=None, wait_for=None, **kwargs)
```
Perform an HTTP query and statefully return the result

- `name` The name of the query.
- `match` Specifies a pattern to look for in the return text. By default, this will perform a string comparison of looking for the value of match in the return text.
- `match_type` Specifies the type of pattern matching to use. Default is `string`, but can also be set to `pcre` to use regular expression matching if a more complex pattern matching is required.
Note: Despite the name of `match_type` for this argument, this setting actually uses Python's `re.search()` function rather than Python's `re.match()` function.

`status` The status code for a URL for which to be checked. Can be used instead of or in addition to the `match` setting.

If both `match` and `status` options are set, both settings will be checked. However, note that if only one option is `True` and the other is `False`, then `False` will be returned. If this case is reached, the comments in the return data will contain troubleshooting information.

For more information about the `http.query` state, refer to the HTTP Tutorial.

```python
query_example:
  http.query:
    - name: 'http://example.com/
    - status: 200
```

**salt.states.http.wait_for_successful_query(name, wait_for=300, **kwargs)**

Like query but, repeat and wait until `match/match_type` or `status` is fulfilled. State returns result from last query state in case of success or if no successful query was made within `wait_for` timeout.

- `name` The name of the query.
- `wait_for` Total time to wait for requests that succeed.
- `request_interval` Optional interval to delay requests by N seconds to reduce the number of requests sent.

Note: All other arguments are passed to the `http.query` state.

## 21.19.109 salt.states.icinga2 module

**Icinga2 state**

New in version 2017.7.0.

- `depends`  
  - Icinga2 Python module

- `configuration` See `salt.modules.icinga2` for setup instructions.

The icinga2 module is used to execute commands. Its output may be stored in a file or in a grain.

```python
command_id:
  icinga2.generate_ticket
    - name: domain.tld
    - output: "/tmp/query_id.txt"
```

**salt.states.icinga2.generate_cert(name)**

Generate an icinga2 certificate and key on the client.

- `name` The domain name for which this certificate and key will be generated

**salt.states.icinga2.generate_ticket(name, output=None, grain=None, key=None, overwrite=True)**

Generate an icinga2 ticket on the master.

- `name` The domain name for which this ticket will be generated
- `output` grain: output in a grain other: the file to store results `None`: output to the result comment (default)
- `grain` grain to store the output (need `output=grain`)
key: the specified grain will be treated as a dictionary, the result of this state will be stored under the specified key.
overwrite: The file or grain will be overwritten if it already exists (default)
salt.states.icinga2.node_setup(name, master, ticket)
Setup the icinga2 node.
  name The domain name for which this certificate will be saved
  master Icinga2 master node for which this certificate will be saved
  ticket Authentication ticket generated on icinga2 master
salt.states.icinga2.request_cert(name, master, ticket, port='5665')
Request CA certificate from master icinga2 node.
  name The domain name for which this certificate will be saved
  master Icinga2 master node for which this certificate will be saved
  ticket Authentication ticket generated on icinga2 master
  port Icinga2 port, defaults to 5665
salt.states.icinga2.save_cert(name, master)
Save the certificate on master icinga2 node.
  name The domain name for which this certificate will be saved
  master Icinga2 master node for which this certificate will be saved

21.19.110 salt.states.ifttt

Trigger an event in IFTTT

This state is useful for trigging events in IFTTT.
New in version 2015.8.0.

```yaml
ifttt-event:
  ifttt.trigger_event:
    event: TestEvent
    value1: 'This state was executed successfully.'
    value2: 'Another value we can send.'
    value3: 'A third value we can send.'
```

The api key can be specified in the master or minion configuration like below: .. code-block:: yaml

```yaml
ifttt: secret_key: bzMRb-KKIAaNOwKEEw792J7Eb-B3z7muhdhYbIjn4V6
```
salt.states.ifttt.trigger_event(name, event, value1=None, value2=None, value3=None)
Trigger an event in IFTTT

```yaml
ifttt-event:
  ifttt.trigger_event:
    event: TestEvent
    value1: 'A value that we want to send.'
    value2: 'A second value that we want to send.'
    value3: 'A third value that we want to send.'
```

The following parameters are required:
name The unique name for this event.
event The name of the event to trigger in IFTTT.
The following parameters are optional:
value1 One of the values that we can send to IFTT.
value2 One of the values that we can send to IFTT.
One of the values that we can send to IFTT.

21.19.111 salt.states.incron

Management of incron, the inotify cron

The incron state module allows for user incrontabs to be cleanly managed.

Incron declarations require a number of parameters. The parameters needed to be declared: path, mask, and cmd. The user whose incrontab is to be edited also needs to be defined.

When making changes to an existing incron job, the path declaration is the unique factor, so if an existing cron that looks like this:

```
Watch for modifications in /home/user:
  incron.present:
    - user: root
    - path: /home/user
    - mask: IN_MODIFY
    - cmd: 'echo \"$$ $@\"'
```

Is changed to this:

```
Watch for modifications and access in /home/user:
  incron.present:
    - user: root
    - path: /home/user
    - mask: IN_MODIFY IN_ACCESS
    - cmd: 'echo \"$$ $@\"'
```

Then the existing cron will be updated, but if the cron command is changed, then a new cron job will be added to the user’s crontab.

New in version 0.17.0.

salt.states.incron.absent(name, path, mask, cmd, user='root')

Verifies that the specified incron job is absent for the specified user; only the name is matched when removing a incron job.

name Unique comment describing the entry
path The path that should be watched
user The name of the user who’s crontab needs to be modified, defaults to the root user
mask The mask of events that should be monitored for
cmd The cmd that should be executed

salt.states.incron.present(name, path, mask, cmd, user='root')

Verifies that the specified incron job is present for the specified user. For more advanced information about what exactly can be set in the cron timing parameters, check your incron system’s documentation. Most Unix-like systems’ incron documentation can be found via the incrontab man page: man 5 incrontab.

name Unique comment describing the entry
path The path that should be watched
user The name of the user who’s crontab needs to be modified, defaults to the root user
mask The mask of events that should be monitored for
cmd The cmd that should be executed
21.19.112 salt.states.influxdb08_database module

Management of Influxdb 0.8 databases

(compatible with InfluxDB version 0.5-0.8)

New in version 2014.7.0.

salt.states.influxdb08_database.absent(name, user=None, password=None, host=None, port=None)

Ensure that the named database is absent
name The name of the database to remove
user The user to connect as (must be able to remove the database)
password The password of the user
host The host to connect to
port The port to connect to

salt.states.influxdb08_database.present(name, user=None, password=None, host=None, port=None)

Ensure that the named database is present
name The name of the database to create
user The user to connect as (must be able to remove the database)
password The password of the user
host The host to connect to
port The port to connect to

21.19.113 salt.states.influxdb08_user module

Management of InfluxDB 0.8 users

(compatible with InfluxDB version 0.5-0.8)

New in version 2014.7.0.

salt.states.influxdb08_user.absent(name, database=None, user=None, password=None, host=None, port=None)

Ensure that the named cluster admin or database user is absent.
name The name of the user to remove
database The database to remove the user from
user The user to connect as (must be able to remove the user)
password The password of the user
host The host to connect to
port The port to connect to

salt.states.influxdb08_user.present(name, passwd, database=None, user=None, password=None, host=None, port=None)

Ensure that the cluster admin or database user is present.
name The name of the user to manage
passwd The password of the user
database The database to create the user in
user The user to connect as (must be able to create the user)
password The password of the user
host The host to connect to
port The port to connect to
21.19.114 salt.states.influxdb_continuous_query module

Management of Influxdb continuous queries

New in version 2017.7.0.
(compatible with InfluxDB version 0.9+)

salt.states.influxdb_continuous_query.absent(name, database, **client_args)
    Ensure that given continuous query is absent.
    name Name of the continuous query to remove.
    database Name of the database that the continuous query was defined on.

salt.states.influxdb_continuous_query.present(name, database, query, resample_time=None, coverage_period=None, **client_args)
    Ensure that given continuous query is present.
    name Name of the continuous query to create.
    database Database to create continuous query on.
    query The query content
    resample_time [None] Duration between continuous query resampling.
    coverage_period [None] Duration specifying time period per sample.

21.19.115 salt.states.influxdb_database

Management of Influxdb databases

(compatible with InfluxDB version 0.9+)

salt.states.influxdb_database.absent(name, **client_args)
    Ensure that given database is absent.
    name Name of the database to remove.

salt.states.influxdb_database.present(name, **client_args)
    Ensure that given database is present.
    name Name of the database to create.

21.19.116 salt.states.influxdb_retention_policy module

Management of Influxdb retention policies

New in version 2017.7.0.
(compatible with InfluxDB version 0.9+)

salt.states.influxdb_retention_policy.absent(name, database, **client_args)
    Ensure that given retention policy is absent.
    name Name of the retention policy to remove.
    database Name of the database that the retention policy was defined on.

salt.states.influxdb_retention_policy.convert_duration(duration)
    Convert the a duration string into XXhYYmZZs format
    duration Duration to convert
    Returns: duration_string String representation of duration in XXhYYmZZs format
salt.states.influxdb_retention_policy.present(name, database, duration='7d', replication=1, default=False, **client_args)

Ensure that given retention policy is present.
name Name of the retention policy to create.
database Database to create retention policy on.

21.19.117 salt.states.influxdb_user

Management of InfluxDB users

(compatible with InfluxDB version 0.9+)

salt.states.influxdb_user.absent(name, **client_args)

Ensure that given user is absent.
name The name of the user to manage

salt.states.influxdb_user.present(name, passwd, admin=False, grants=None, **client_args)

Ensure that given user is present.
name Name of the user to manage
passwd Password of the user
admin [False] Whether the user should have cluster administration privileges or not.
grants Optional - Dict of database:privilege items associated with the user. Example:
grants: foo_db: read bar_db: all

Example:

```
eample user present in influxdb:
influxdb_user.present:
  - name: example
  - passwd: somepassword
  - admin: False
  - grants:
    foo_db: read
    bar_db: all
```

21.19.118 salt.states.infoblox_a

Infoblox A record managment.

functions accept api_opts:

api_verifyssl: verify SSL [default to True or pillar value]
api_url: server to connect to [default to pillar value]
api_username: [default to pillar value]
api_password: [default to pillar value]

salt.states.infoblox_a.absent(name=None, ipv4addr=None, **api_opts)

Ensure infoblox A record is removed.

State example:

```
infoblox_a.absent:
  - name: example-ha-0.domain.com

infoblox_a.absent:
  - name:
    - ipv4addr: 127.0.23.23
```
salt.states.infoblox_a.present(name=None, ipv4addr=None, data=None, ensure_data=True, **api_opts)

Ensure infoblox A record.

When you wish to update a hostname ensure name is set to the hostname of the current record. You can give a new name in the data.name.

State example:

```
infoblox_a.present:
  - name: example-ha-0.domain.com
  - data:
      name: example-ha-0.domain.com
      ipv4addr: 123.0.31.2
      view: Internal
```

21.19.119 salt.states.infoblox_cname

Infoblox CNAME managment.

functions accept api_opts:

api_verifyssl: verify SSL [default to True or pillar value]
api_url: server to connect to [default to pillar value]
api_username: [default to pillar value]
api_password: [default to pillar value]

salt.states.infoblox_cname.absent(name=None, canonical=None, **api_opts)

Ensure the CNAME with the given name or canonical name is removed

salt.states.infoblox_cname.present(name=None, data=None, ensure_data=True, **api_opts)

Ensure the CNAME with the given data is present.

name CNAME of record
data raw CNAME api data see: https://INFOBLOX/wapidoc

State example:

```
infoblox_cname.present:
  - name: example-ha-0.domain.com
  - data:
      name: example-ha-0.domain.com
      canonical: example.domain.com
      zone: example.com
      view: Internal
      comment: Example comment

infoblox_cname.present:
  - name: example-ha-0.domain.com
  - data:
      name: example-ha-0.domain.com
      canonical: example.domain.com
      zone: example.com
      view: Internal
      comment: Example comment
  - api_url: https://INFOBLOX/wapi/v1.2.1
  - api_username: username
  - api_password: passwd
```
21.19.120  `salt.states.infoblox_host_record`

Infoblox host record management.

functions accept api_opts:

- api_verifyssl: verify SSL [default to True or pillar value]
- api_url: server to connect to [default to pillar value]
- api_username: [default to pillar value]
- api_password: [default to pillar value]

`salt.states.infoblox_host_record.absent(name=None, ipv4addr=None, mac=None, **api_opts)`

Ensure the host with the given Name ipv4addr or mac is removed.

State example:

```python
infoblox_host_record.absent:
  - name: hostname.of.record.to.remove

infoblox_host_record.absent:
  - name:
    - ipv4addr: 192.168.0.1

infoblox_host_record.absent:
  - name:
    - mac: 12:02:12:31:23:43
```

`salt.states.infoblox_host_record.present(name=None, data=None, ensure_data=True, **api_opts)`

This will ensure that a host with the provided name exists. This will try to ensure that the state of the host matches the given data If the host is not found then one will be created.

When trying to update a hostname ensure `name` is set to the hostname of the current record. You can give a new name in the `data.name`.

Avoid race conditions, use `func:nextavailableip`:

- `func:nextavailableip:network/ZG54dfgsrDFEFsfslzA:10.0.0.0/8/default`
- `func:nextavailableip:10.0.0.0/8`
- `func:nextavailableip:10.0.0.0/8,externalconfigure_for_dns`
- `func:nextavailableip:10.0.0.3-10.0.0.10`

State Example:

```python
# this would update `original_hostname.example.ca` to changed `data`.
infoblox_host_record.present:
  - name: original_hostname.example.ca
  - data: {'namhostname.example.ca': 'hostname.example.ca',
    'aliases': ['hostname.math.example.ca'],
    'extattrs': [{'Business Contact': {'value': 'EXAMPLE@example.ca'}},
               'configure_for_dhcp': True,
               'ipv4addr': 'func:nextavailableip:129.97.139.0/24',
               'mac': '00:50:56:84:6e:ae'],
    'ipv6addrs': []}
```

21.19.121  `salt.states.infoblox_range`

Infoblox host record management.

functions accept api_opts:
api_verifyssl: verify SSL [default to True or pillar value]
api_url: server to connect to [default to pillar value]
api_username: [default to pillar value]
api_password: [default to pillar value]

```python
salt.states.infoblox_range.absent(name=None, start_addr=None, end_addr=None, data=None, **api_opts)
```

Ensure the range is removed
Supplying the end of the range is optional.

State example:
```python
infoblox_range.absent:
    - name: 'vlan10'

infoblox_range.absent:
    - name: '127.0.1.20'
```

```python
salt.states.infoblox_range.present(name=None, start_addr=None, end_addr=None, data=None, **api_opts)
```

Ensure range record is present.

infoblox_range.present: start_addr: '129.97.150.160', end_addr: '129.97.150.170',

Verbose state example:
```python
infoblox_range.present:
    data:
        'always_update_dns': False,
        'authority': False,
        'comment': 'range of IP addresses used for salt.. was used for ghost images deployment',
        'ddns_generate_hostname': True,
        'deny_all_clients': False,
        'deny_bootp': False,
        'disable': False,
        'email_list': [],
        'enable_ddns': False,
        'enable_dhcp_thresholds': False,
        'enable_email_warnings': False,
        'enable_ifmap_publishing': False,
        'enable_snmp_warnings': False,
        'end_addr': '129.97.150.169',
        'exclude': [],
        'extattrs': {},
        'fingerprint_filter_rules': [],
        'high_water_mark': 95,
        'high_water_mark_reset': 85,
        'ignore_dhcp_option_list_request': False,
        'lease_scavenge_time': -1,
        'logic_filter_rules': [],
        'low_water_mark': 0,
        'low_water_mark_reset': 10,
        'mac_filter_rules': [],
        'member': {'_struct': 'dhcpmember',
                   'ipv4addr': '129.97.128.9',
                   'name': 'cn-dhcp-mc.example.ca'},
        'ms_options': [],
        'nac_filter_rules': [],
        'name': 'ghost-range',
        'network': '129.97.150.0/24',
```
(continues on next page)
network_view: 'default',
option_filter_rules: [],
options: [
    {'name': 'dhcp-lease-time',
     'num': 51,
     'use_option': False,
     'value': '43200',
     'vendor_class': 'DHCP'}],
recycle_leases: True,
relay_agent_filter_rules: [],
server_association_type: 'MEMBER',
start_addr: '129.97.150.160',
update_dns_on_lease_renewal: False,

use_bootfile: False,
use_bootserver: False,
use_ddns_domainname: False,
use_ddns_generate_hostname: True,
use_deny_bootp: False,
use_email_list: False,
use_enable_ddns: False,
use_enable_dhcp_thresholds: False,
use_enable_ifmap_publishing: False,
use_ignore_dhcp_option_list_request: False,
use_known_clients: False,
use_lease_scavenge_time: False,
use_nextserver: False,
use_options: False,
use_recycle_leases: False,
use_unknown_clients: False,
use_update_dns_on_lease_renewal: False
}

21.19.122 salt.states.ini_manage

Manage ini files

maintainer <akilesh1597@gmail.com>
maturity new
depends re
platform all

salt.states.ini_manage.options_absent(name, sections=None, separator='=')

/home/saltminion/api-paste.ini:
ini.options_absent:
    - separator: '=
    - sections:
        test:
            - testkey
            - secondoption
        test1:
            - testkey1
options present in file and not specified in sections dict will be untouched
changes dict will contain the list of changes made

salt.states.ini_manage.options_present(name, sections=None, separator='=', strict=False)

```
/home/saltminion/api-paste.ini:
ini.options_present:
    - separator: '='
    - strict: True
    - sections:
        test:
            testkey: 'testval'
            secondoption: 'secondvalue'
        test1:
            testkey1: 'testval121'
```

options present in file and not specified in sections dict will be untouched, unless strict: True flag is used
changes dict will contain the list of changes made

salt.states.ini_manage.sections_absent(name, sections=None, separator='=')

```
/home/saltminion/api-paste.ini:
in.sections_absent:
    - separator: '='
    - sections:
        - test
        - test1
```

options present in file and not specified in sections will be deleted changes dict will contain the sections that changed

salt.states.ini_manage.sections_present(name, sections=None, separator='=')

```
/home/saltminion/api-paste.ini:
in.sections_present:
    - separator: '='
    - sections:
        - section_one
        - section_two
```

This will only create empty sections. To also create options, use options_present state

options present in file and not specified in sections will be deleted changes dict will contain the sections that changed

21.19.123 salt.states.ipmi

Manage IPMI devices over LAN

The following configuration defaults can be defined in the minion, master config or pillar:
ipmi.config:

  api_host: 127.0.0.1
  api_user: admin
  api_pass: apassword
  api_port: 623
  api_kg: None

Every call can override the config defaults:

salt.states.ipmi.boot_device(name='default', **kwargs)

  Request power state change

  name = default
    • network – Request network boot
    • hd – Boot from hard drive
    • safe – Boot from hard drive, requesting ‘safe mode’
    • optical – boot from CD/DVD/BD drive
    • setup – Boot into setup utility
    • default – remove any IPMI directed boot device request

  kwargs
    • api_host=localhost
    • api_user=admin
    • api_pass=
    • api_port=623
    • api_kg=None

salt.states.ipmi.power(name='power_on', wait=300, **kwargs)

  Request power state change

  name
    Ensure power state one of:
      • power_on – system turn on
      • power_off – system turn off (without waiting for OS)
      • shutdown – request OS proper shutdown
      • reset – reset (without waiting for OS)
      • boot – If system is off, then ‘on’, else ‘reset’

  wait  wait X seconds for the job to complete before forcing. (defaults to 300 seconds)

  kwargs
    • api_host=localhost
    • api_user=admin
    • api_pass=
    • api_port=623
    • api_kg=None
salt.states.ipmi.user_absent(name, channel=14, **kwargs)

Remove user

Remove all user (uid) records having the matching name.

name string name of user to delete

channel channel to remove user access from defaults to 14 for auto.

kwargs

- api_host=localhost
- api_user=admin
- api_pass=
- api_port=623
- api_kg=None

salt.states.ipmi.user_present(name, uid, password, channel=14, callback=False, link_auth=True, ipmi_msg=True, privilege_level='administrator', **kwargs)

Ensure IPMI user and user privileges.

name name of user (limit 16 bytes)

uid user id number (1 to 7)

password user password (limit 16 bytes)

channel ipmi channel defaults to 14 for auto

callback User Restricted to Callback

False = User Privilege Limit is determined by the User Privilege Limit parameter privilege_level, for both callback and non-callback connections.

True = User Privilege Limit is determined by the privilege_level parameter for callback connections, but is restricted to Callback level for non-callback connections. Thus, a user can only initiate a Callback when they ‘call in’ to the BMC, but once the callback connection has been made, the user could potentially establish a session as an Operator.

link_auth User Link authentication True/False user name and password information will be used for link authentication, e.g. PPP CHAP) for the given channel. Link authentication itself is a global setting for the channel and is enabled/disabled via the serial/modem configuration parameters.

ipmi_msg User IPMI Messaging True/False user name and password information will be used for IPMI Messaging. In this case, ‘IPMI Messaging’ refers to the ability to execute generic IPMI commands that are not associated with a particular payload type. For example, if IPMI Messaging is disabled for a user, but that user is enabled for activating the SOL payload type, then IPMI commands associated with SOL and session management, such as Get SOL Configuration Parameters and Close Session are available, but generic IPMI commands such as Get SEL Time are unavailable.) ipmi_msg

privilege_level

- callback
- user
- operator
- administrator
- proprietary
- no_access

kwargs

- api_host=localhost
- api_user=admin
- api_pass=
- api_port=623
- api_kg=None

21.19.124 salt.states.ipset

Management of ipsets

This is an ipset-specific module designed to manage IPSets for use in IPTables Firewalls.
```yaml
setname:
ipset.set_present:
  - set_type: bitmap:ip
  - range: 192.168.0.0/16
  - comment: True

setname:
ipset.set_absent:
  - set_type: bitmap:ip
  - range: 192.168.0.0/16
  - comment: True

setname_entries:
ipset.present:
  - set_name: setname
  - entry: 192.168.0.3
  - comment: Hello
  - require:
    - ipset: baz

setname_entries:
ipset.present:
  - set_name: setname
  - entry:
    - 192.168.0.3
    - 192.168.1.3
  - comment: Hello
  - require:
    - ipset: baz

setname_entries:
ipset.absent:
  - set_name: setname
  - entry:
    - 192.168.0.3
    - 192.168.1.3
  - comment: Hello
  - require:
    - ipset: baz

setname:
ipset.flush:
```

```python
salt.states.ipset.absent(name, entry=None, entries=None, family='ipv4', **kwargs)

New in version 2014.7.0.

Remove a entry or entries from a chain

name A user-defined name to call this entry by in another part of a state or formula. This should not be an actual entry.

family Network family, ipv4 or ipv6.

salt.states.ipset.flush(name, family='ipv4', **kwargs)

New in version 2014.7.0.

Flush current ipset set

family Networking family, either ipv4 or ipv6

salt.states.ipset.present(name, entry=None, family='ipv4', **kwargs)

New in version 2014.7.0.
```
Append a entry to a set

- **name**: A user-defined name to call this entry by in another part of a state or formula. This should not be an actual entry.
- **entry**: A single entry to add to a set or a list of entries to add to a set
- **family**: Network family, ipv4 or ipv6.

```python
salt.states.ipset.set_absent(name, family='ipv4', **kwargs)
```

New in version 2014.7.0.

Verify the set is absent.

```python
salt.states.ipset.set_present(name, set_type, family='ipv4', **kwargs)
```

New in version 2014.7.0.

Verify the set exists.

- **name**: A user-defined set name.
- **set_type**: The type for the set.
- **family**: Networking family, either ipv4 or ipv6

### 21.19.125 salt.states.iptables

Management of iptables

This is an iptables-specific module designed to manage Linux firewalls. It is expected that this state module, and other system-specific firewall states, may at some point be deprecated in favor of a more generic `firewall` state.

```
httpd:
   iptables.append:
   - table: filter
   - chain: INPUT
   - jump: ACCEPT
   - match: state
   - connstate: NEW
   - dport: 80
   - protocol: tcp
   - sport: 1025:65535
   - save: True

httpd:
   iptables.append:
   - table: filter
   - chain: INPUT
   - jump: ACCEPT
   - match:
     - state
     - comment
     - comment: "Allow HTTP"
   - connstate: NEW
   - dport: 80
   - protocol: tcp
   - sport: 1025:65535
   - save: True
```

(continues on next page)
- chain: INPUT
- jump: ACCEPT
- match:
  - state
  - comment
  - comment: "Allow HTTP"
- connstate: NEW

    - jump: ACCEPT
    - match:
      - state
      - comment
      - comment: "Allow HTTP"
    - connstate: NEW
    - source: 'not 127.0.0.1'
    - dport: 80
    - protocol: tcp
    - sport: 1025:65535
    - save: True

httpd:
  iptables.append:
    - table: filter
    - family: ipv6
    - chain: INPUT
    - jump: ACCEPT
    - match: state
    - connstate: NEW
    - dport: 80
    - protocol: tcp
sport: 1025:65535
save: True

httpd:
  iptables.append:
    - table: filter
    - family: ipv4
    - chain: INPUT
    - jump: ACCEPT
    - match: state
    - connstate: NEW
    - dports:
      - 80
      - 443
    - protocol: tcp
    - sport: 1025:65535
    - save: True

httpd:
  iptables.insert:
    - position: 1
    - table: filter
    - chain: INPUT
    - jump: ACCEPT
    - match: state
    - connstate: NEW
    - dport: 80
    - protocol: tcp
    - sport: 1025:65535
    - save: True

httpd:
  iptables.insert:
    - position: 1
    - table: filter
    - family: ipv6
    - chain: INPUT
    - jump: ACCEPT
    - match: state
    - connstate: NEW
    - dport: 80
    - protocol: tcp
    - sport: 1025:65535
    - save: True

httpd:
  iptables.delete:
    - table: filter
    - chain: INPUT
    - jump: ACCEPT
    - match: state
    - connstate: NEW
    - dport: 80
    - protocol: tcp
    - sport: 1025:65535
    - save: True
httpd:
  iptables.delete:
  - position: 1
  - table: filter
  - chain: INPUT
  - jump: ACCEPT
  - match: state
  - connstate: NEW
  - dport: 80
  - protocol: tcp
  - sport: 1025:65535
  - save: True

httpd:
  iptables.delete:
  - table: filter
  - family: ipv6
  - chain: INPUT
  - jump: ACCEPT
  - match: state
  - connstate: NEW
  - dport: 80
  - protocol: tcp
  - sport: 1025:65535
  - save: True

Default to accept:
  iptables.set_policy:
  - chain: INPUT
  - policy: ACCEPT

Note: Whereas iptables will accept `--proto[co[l]]` as synonyms of `-p --protocol`, if `-p` appears in an iptables command after the appearance of `-m policy`, it is interpreted as the `--proto` option of the policy extension (see the `iptables-extensions(8)` man page).

Example rules for IPSec policy:

accept esp_in:
  iptables.append:
  - table: filter
  - chain: INPUT
  - jump: ACCEPT
  - source: 10.20.0.0/24
  - destination: 10.18.0.0/24
  - in-interface: eth0
  - match: policy
  - dir: in
  - pol: ipsec
  - reqid: 1
  - proto: esp
accept esp_forward_in:
  iptables.append:
  - use:
accept_esp_out:
  iptables.append:
    - table: filter
    - chain: OUTPUT
    - jump: ACCEPT
    - source: 10.10.0.0/24
    - destination: 10.20.0.0/24
    - out-interface: eth0
    - match: policy
    - dir: out
    - pol: ipsec
    - reqid: 1
    - proto: esp

accept_esp_forward_out:
  iptables.append:
    - use:
      - iptables: accept_esp_out
      - chain: FORWARD

Note: Various functions of the `iptables` module use the `--check` option. If the version of `iptables` on the target system does not include this option, an alternate version of this check will be performed using the output of `iptables-save`. This may have unintended consequences on legacy releases of `iptables`.

salt.states.iptables.append(name, table='filter', family='ipv4', **kwargs)
New in version 0.17.0.

Add a rule to the end of the specified chain.
name A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.
table The table that owns the chain which should be modified
family Network family, ipv4 or ipv6.
All other arguments are passed in with the same name as the long option that would normally be used for iptables, with one exception: `--state` is specified as `connstate` instead of `state` (not to be confused with `ctstate`).

Jump options that doesn’t take arguments should be passed in with an empty string.

salt.states.iptables.chain_absent(name, table='filter', family='ipv4')
New in version 2014.1.0.

Verify the chain is absent.
table The table to remove the chain from
family Networking family, either ipv4 or ipv6

salt.states.iptables.chain_present(name, table='filter', family='ipv4')
New in version 2014.1.0.

Verify the chain is exist.
name A user-defined chain name.
table The table to own the chain.
family Networking family, either ipv4 or ipv6

salt.states.iptables.delete(name, table='filter', family='ipv4', **kwargs)

3424 Chapter 21. Salt Module Reference
New in version 2014.1.0.

Delete a rule to a chain

**name** A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

**table** The table that owns the chain that should be modified

**family** Networking family, either ipv4 or ipv6

All other arguments are passed in with the same name as the long option that would normally be used for iptables, with one exception: `--state` is specified as `connstate` instead of `state` (not to be confused with `ctstate`).

Jump options that don’t take arguments should be passed in with an empty string.

```python
salt.states.iptables.flush(name, table='filter', family='ipv4', **kwargs)
```

Flush current iptables state

**table** The table that owns the chain that should be modified

**family** Networking family, either ipv4 or ipv6

```python
salt.states.iptables.insert(name, table='filter', family='ipv4', **kwargs)
```

New in version 2014.1.0.

Insert a rule into a chain

**name** A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

**table** The table that owns the chain that should be modified

**family** Networking family, either ipv4 or ipv6

**position** The numerical representation of where the rule should be inserted into the chain. Note that -1 is not a supported position value.

All other arguments are passed in with the same name as the long option that would normally be used for iptables, with one exception: `--state` is specified as `connstate` instead of `state` (not to be confused with `ctstate`).

Jump options that don’t take arguments should be passed in with an empty string.

```python
salt.states.iptables.mod_aggregate(low, chunks, running)
```

The mod_aggregate function which looks up all rules in the available low chunks and merges them into a single rules ref in the present low data

```python
salt.states.iptables.set_policy(name, table='filter', family='ipv4', **kwargs)
```

New in version 2014.1.0.

Sets the default policy for iptables firewall tables

**table** The table that owns the chain that should be modified

**family** Networking family, either ipv4 or ipv6

**policy** The requested table policy

---

### 21.19.126 `salt.states.jboss7`

Manage JBoss 7 Application Server via CLI interface

New in version 2015.5.0.

This state uses the jboss-cli.sh script from a JBoss or Wildfly installation and parses its output to determine the execution result.

In order to run each state, a jboss_config dictionary with the following properties must be passed:
If the controller doesn’t require a password, then the cli_user and cli_password parameters are optional.

Since same dictionary with configuration will be used in all the states, it may be more convenient to move JBoss configuration and other properties to the pillar.

Example of application deployment from local filesystem:

```yaml
application_deployed:
  jboss7.deployed:
    - salt_source:
    - target_file: '/tmp/webapp.war'
    - jboss_config: {{ pillar["jboss"] }}
```

For the sake of brevity, examples for each state assume that jboss_config is contained in the pillar.

salt.states.jboss7.bindings_exist(name, jboss_config, bindings, profile=None)

Ensures that given JNDI binding are present on the server. If a binding doesn’t exist on the server it will be created. If it already exists its value will be changed.

- **name**: Datasource property name
- **jboss_config**: Dict with connection properties (see state description)
- **bindings**: Dict with bindings to set.
- **profile**: The profile name (domain mode only)

Example:

```yaml
jndi_entries_created:
  jboss7.bindings_exist:
    - bindings:
      - "java:global/sampleapp/environment": 'DEV'
      - "java:global/sampleapp/configurationFile": '/var/opt/sampleapp/config.
  - jboss_config: {{ pillar["jboss"] }}
```

salt.states.jboss7.datasource_exists(name, jboss_config, datasource_properties, recreate=False, profile=None)

Ensures that a datasource with given properties exist on the jboss instance. If datasource doesn’t exist, it is created, otherwise only the properties that are different will be updated.

- **name**: Datasource property name
- **jboss_config**: Dict with connection properties (see state description)
- **datasource_properties**: Dict with datasource properties
- **recreate**: [False] If set to True and datasource exists it will be removed and created again. However, if there are deployments that depend on the datasource, it will not me possible to remove it.
- **profile**: [None] The profile name for this datasource (domain mode only)

Example:

```yaml
sampleDS:
  jboss7.datasource_exists:
    - recreate: False
    - datasource_properties:
      - driver-name: mysql
      - connection-url: 'jdbc:mysql://localhost:3306/sampleDatabase'
      - jndi-name: 'java:jboss/datasources/sampleDS'
      - user-name: sampleuser
```

(continues on next page)
password: secret
min-pool-size: 3
use-java-context: True
  - jboss_config: {{ pillar['jboss'] }}
  - profile: full-ha

salt.states.jboss7.deployed(name, jboss_config, salt_source=None)
Ensures that the given application is deployed on server.

  jboss_config: Dict with connection properties (see state description)
salt_source:
  How to find the artifact to be deployed.
  target_file: Where to look in the minion’s file system for the artifact to be deployed (e.g. '/tmp/application-web-0.39.war'). When source is specified, also specifies where to save the retrieved file.
  source: (optional) File on salt master (e.g. salt://application-web-0.39.war). If absent, no files will be retrieved and the artifact in target_file will be used for the deployment.
  undeploy: (optional) Regular expression to match against existing deployments. When present, if there is a deployment that matches the regular expression, it will be undeployed before the new artifact is deployed.

Examples:

Deployment of a file from minion’s local file system:

```
application_deployed:
  jboss7.deployed:
    - salt_source:
      target_file: '/tmp/webapp.war'
    - jboss_config: {{ pillar['jboss'] }}
```

It is assumed that /tmp/webapp.war was made available by some other means. No applications will be undeployed; if an existing deployment that shares that name exists, then it will be replaced with the updated version.

Deployment of a file from the Salt master’s file system:

```application_deployed:
  jboss7.deployed:
    - salt_source:
        source: salt://application-web-0.39.war
        target_file: '/tmp/application-web-0.39.war'
        undeploy: 'application-web-.*'
    - jboss_config: {{ pillar['jboss'] }}
```

Here, application-web-0.39.war file is downloaded from Salt file system to /tmp/application-web-0.39.war file on minion. Existing deployments are checked if any of them matches 'application-web-.*' regular expression, and if so then it is undeployed before deploying the application. This is useful to automate deployment of new application versions.

If the source parameter of salt_source is specified, it can use any protocol that the file states use. This includes not only downloading from the master but also HTTP, HTTPS, FTP, Amazon S3, and OpenStack Swift.

salt.states.jboss7.reloaded(name, jboss_config, timeout=60, interval=5)
Reloads configuration of jboss server.

  jboss_config: Dict with connection properties (see state description)
timeout: Time to wait until jboss is back in running state. Default timeout is 60s.
interval: Interval between state checks. Default interval is 5s. Decreasing the interval may slightly decrease
waiting time but be aware that every status check is a call to jboss-cli which is a java process. If interval is smaller than process cleanup time it may easily lead to excessive resource consumption.

This step performs the following operations:
- Ensures that server is in running or reload-required state (by reading server-state attribute)
- Reloads configuration
- Waits for server to reload and be in running state

Example:

```
configuration_reloaded:
  jboss7.reloaded:
    - jboss_config: {{ pillar['jboss'] }}
```

21.19.127 salt.states.jenkins module

Management of Jenkins

New in version 2016.3.0.

```
salt.states.jenkins.absent(name, **kwargs)
  Ensure the job is absent from the Jenkins configured jobs
  name The name of the Jenkins job to remove
```

```
salt.states.jenkins.present(name, config=None, **kwargs)
  Ensure the job is present in the Jenkins configured jobs
  name The unique name for the Jenkins job
  config The Salt URL for the file to use for configuring the job
```

21.19.128 salt.states.junos module

State modules to interact with Junos devices.

```
maturity new
```

```
dependencies junos-eznc, jxmlease
```

Note: Those who wish to use junos-eznc (PyEZ) version >= 2.1.0, must use the latest salt code from github until the next release.

Refer to junos for information on connecting to junos proxy.

```
salt.states.junos.cli(name, **kwargs)
  Executes the CLI commands and reuturns the text output.
```

```
show version:
  junos:
    - cli
    - format: xml
```

Parameters
- **Required** –
  - command: The command that need to be executed on Junos CLI (default = None)
- **Optional** –
Salt Documentation, Release 2019.2.0

- `kwargs`: Keyworded arguments which can be provided like:
  - format: Format in which to get the CLI output. (text or xml, default = 'text')
  - timeout: Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default = 30 seconds)
  - dest: The destination file where the CLI output can be stored. (default = None)

`salt.states.junos.commit(name, **kwargs)`
Commits the changes loaded into the candidate configuration.

```
commits the changes:
  junos:
    - commit
    - confirm: 10
```

Parameters **Optional**
- `kwargs`: Keyworded arguments which can be provided like:
  - timeout: Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default = 30 seconds)
  - comment: Provide a comment to the commit. (default = None)
  - confirm: Provide time in minutes for commit confirmation. If this option is specified, the commit will be rollbacked in the given time unless the commit is confirmed.
  - sync: On dual control plane systems, requests that the candidate configuration on one control plane be copied to the other control plane, checked for correct syntax, and committed on both Routing Engines. (default = False)
  - force_sync: On dual control plane systems, force the candidate configuration on one control plane to be copied to the other control plane.
  - full: When set to True requires all the daemons to check and evaluate the new configuration.
  - detail: When set to True return commit detail.

`salt.states.junos.commit_check(name)`
Perform a commit check on the configuration.

```
perform commit check:
  junos.commit_check
```

`salt.states.junos.diff(name, d_id)`
Gets the difference between the candidate and the current configuration.

```
get the diff:
  junos:
    - diff
    - id: 10
```

Parameters **Optional**
- `id`: The rollback id value [0-49]. (default = 0)

`salt.states.junos.file_copy(name, dest=None, **kwargs)`
Copies the file from the local device to the junos device.

```
/home/m2/info.txt:
  junos:
```

(continues on next page)
```
- file_copy
- dest: info_copy.txt
```

Parameters **Required** –
- `src`: The source path where the file is kept.
- `dest`: The destination path where the file will be copied.

**salt.states.junos.install_config**(name, **kwargs)

Loads and commits the configuration provided.

```
Install the mentioned config:
  junos:
  - install_config
  - path: salt://configs/interface.set
  - timeout: 100
  - diffs_file: '/var/log/diff'
```

```
Install the mentioned config:
  junos:
  - install_config
  - template_path: salt://configs/interface.set
  - timeout: 100
  - template_vars:
    interface_name: lo0
    description: Creating interface via SaltStack.
```

**name** Path where the configuration/template file is present. If the file has a `*.conf` extension, the content is treated as text format. If the file has a `*.xml` extension, the content is treated as XML format. If the file has a `*.set` extension, the content is treated as Junos OS set commands

**template_vars** The dictionary of data for the jinja variables present in the jinja template

**timeout** [30] Set NETCONF RPC timeout. Can be used for commands which take a while to execute.

**overwrite** [False]  
Set to True if you want this file to completely replace the configuration file.

**replace** [False] Specify whether the configuration file uses "replace:" statements. Only those statements under the 'replace' tag will be changed.

**comment** Provide a comment to the commit. (default = None)

**confirm** Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the given time unless the commit is confirmed.

**diffs_file** Path to the file where the diff (difference in old configuration and the committed configuration) will be stored.

---

**Note:** The file will be stored on the proxy minion. To push the files to the master use `cp.push`.

**salt.states.junos.install_os**(name, **kwargs)

Installs the given image on the device. After the installation is complete the device is rebooted, if reboot=True is given as a keyworded argument.

```
salt://images/junos_image.tgz:
  junos:
  - install_os
  - timeout: 100
  - reboot: True
```

Parameters
- **Required**
  - path: Path where the image file is present on the proxy minion.
- **Optional**
  - kwargs: keyworded arguments to be given such as timeout, reboot etc
    * timeout: Set NETCONF RPC timeout. Can be used to RPCs which take a while to execute. (default = 30 seconds)
    * reboot: Whether to reboot after installation (default = False)
    * no_copy: When True the software package will not be SCP’d to the device. (default = False)

```python
salt.states.junos.load(name, **kwargs)
```

Loads the configuration provided onto the junos device.

<table>
<thead>
<tr>
<th>Install the mentioned config:</th>
</tr>
</thead>
<tbody>
<tr>
<td>junos:</td>
</tr>
<tr>
<td>load</td>
</tr>
<tr>
<td>path: salt//configs/interface.set</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Install the mentioned config:</th>
</tr>
</thead>
<tbody>
<tr>
<td>junos:</td>
</tr>
<tr>
<td>load</td>
</tr>
<tr>
<td>template_path: salt//configs/interface.set</td>
</tr>
<tr>
<td>template_vars:</td>
</tr>
<tr>
<td>interface_name: lo0</td>
</tr>
<tr>
<td>description: Creating interface via SaltStack.</td>
</tr>
</tbody>
</table>

- name Path where the configuration/template file is present. If the file has a *.conf extension, the content is treated as text format. If the file has a *.xml extension, the content is treated as XML format. If the file has a *.set extension, the content is treated as Junos OS set commands.
- overwrite [False] Set to True if you want this file is to completely replace the configuration file.
- replace [False] Specify whether the configuration file uses "replace:" statements. Only those statements under the 'replace' tag will be changed.
- format: Determines the format of the contents.
- update [False] Compare a complete loaded configuration against the candidate configuration. For each hierarchy level or configuration object that is different in the two configurations, the version in the loaded configuration replaces the version in the candidate configuration. When the configuration is later committed, only system processes that are affected by the changed configuration elements parse the new configuration. This action is supported from PyEZ 2.1 (default = False)
- template_vars Variables to be passed into the template processing engine in addition to those present in __pillar__, __opts__, __grains__, etc. You may reference these variables in your template like so: {{ template_vars["var_name"] }}

```python
salt.states.junos.lock(name)
```

Attempts an exclusive lock on the candidate configuration. This is a non-blocking call.

**Note:** Any user who wishes to use lock, must necessarily unlock the configuration too. Ensure unlock is called in the same orchestration run in which the lock is called.

```python
lock the config: |
junos.lock      |
```

```python
salt.states.junos.rollback(name, id, **kwargs)
```

Rollbacks the committed changes.
rollback the changes:

    junos:
    - rollback
    - id: 5

Parameters  **Optional** –
- id: The rollback id value [0-49]. (default = 0)
- kwargs: **Keyworded arguments which can be provided like**-
  - timeout: Set NETCONF RPC timeout. Can be used for commands which
take a while to execute. (default = 30 seconds)
  - comment: Provide a comment to the commit. (default = None)
  - confirm: Provide time in minutes for commit confirmation. If this option
  is specified, the commit will be rollbacked in the given time unless the
  commit is confirmed.
  - diffs_file: Path to the file where any diffs will be written. (default = None)

salt.states.junos.rpc(name, dest=None, format='xml', args=None, **kwargs)
Executes the given rpc. The returned data can be stored in a file by specifying the destination path with dest
as an argument

```python
get-interface-information:
    junos:
    - rpc
    - dest: /home/user/rpc.log
    - interface_name: lo0
```

Parameters
- **Required** –
  - cmd: The rpc to be executed. (default = None)
- **Optional** –
  - dest: Destination file where the rpc output is stored. (default = None) Note that
  the file will be stored on the proxy minion. To push the files to the master use
  the salt’s following execution module: cp.push
  - format: The format in which the rpc reply must be stored in file specified in the
  dest (used only when dest is specified) (default = xml)
  - kwargs: **Keyworded arguments taken by rpc call like**-
    - timeout: Set NETCONF RPC timeout. Can be used for commands which
take a while to execute. (default= 30 seconds)
    - filter: Only to be used with 'get-config' rpc to get specific configuration.
    - terse: Amount of information you want.
    - interface_name: Name of the interface whose information you
    want.

salt.states.junos.set_hostname(name, **kwargs)
Changes the hostname of the device.

```
device_name:
    junos:
    - set_hostname
    - comment: "Host-name set via saltstack."
```

Parameters
- **Required** –
  - hostname: The name to be set. (default = None)
- **Optional** –
salt.states.junos.shutdown(name, **kwargs)
Shuts down the device.

Parameters

Optional –

- **kwargs:
  - reboot: Whether to reboot instead of shutdown. (default=False)
  - at: Specify time for reboot. (To be used only if reboot=yes)
  - in_min: Specify delay in minutes for shutdown

salt.states.junos.unlock(name)
Unlocks the candidate configuration.

salt.states.junos.zeroize(name)
Resets the device to default factory settings.

name: can be anything

21.19.129 salt.states.kapacitor module

Kapacitor state module.

configuration This module accepts connection configuration details either as parameters or as configuration settings in /etc/salt/minion on the relevant minions:

```
kapacitor.unsafe_ssl: 'false'
kapacitor.protocol: 'http'
kapacitor.host: 'localhost'
kapacitor.port: 9092
```

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

New in version 2016.11.0.

salt.states.kapacitor.task_absent(name)
Ensure that a task is absent from Kapacitor.

name Name of the task.
salt.states.kapacitor.task_present(name, tick_script, task_type='stream', database=None, retention_policy='default', enable=True, dbrips=None)

Ensure that a task is present and up-to-date in Kapacitor.

- **name**: Name of the task.
- **tick_script**: Path to the TICK script for the task. Can be a salt:// source.
- **task_type**: Task type. Defaults to 'stream'
- **dbrips**: A list of databases and retention policies in "dbname","rpname" format to fetch data from. For backward compatibility, the value of 'database' and 'retention_policy' will be merged as part of dbrips.

New in version 2019.2.0.

- **database**: Which database to fetch data from. Defaults to None, which will use the default database in InfluxDB.
- **retention_policy**: Which retention policy to fetch data from. Defaults to 'default'.
- **enable**: Whether to enable the task or not. Defaults to True.

21.19.130 salt.states.kernelpkg

Manage kernel packages and active kernel version

Example state to install the latest kernel from package repositories:

```yaml
install-latest-kernel:
  kernel.latest_installed: []
```

Example state to boot the system if a new kernel has been installed:

```yaml
boot-latest-kernel:
  kernel.latest_active:
    - at_time: 1
```

Example state chaining the install and reboot operations:

```yaml
install-latest-kernel:
  kernel.latest_installed: []

boot-latest-kernel:
  kernel.latest_active:
    - at_time: 1
    - onchanges:
      - kernel: install-latest-kernel
```

Chaining can also be achieved using wait/listen requisites:

```yaml
install-latest-kernel:
  kernel.latest_installed: []

boot-latest-kernel:
  kernel.latest_wait:
    - at_time: 1
    - listen:
      - kernel: install-latest-kernel
```

salt.states.kernelpkg.latest_active(name, at_time=None, **kwargs)

Initiate a reboot if the running kernel is not the latest one installed.

**Note**: This state does not install any patches. It only compares the running kernel version number to other kernel versions also installed in the system. If the running version is not the latest one installed, this state will
reboot the system.

See `kernelpkg.upgrade` and `latest_installed()` for ways to install new kernel packages.

This module does not attempt to understand or manage boot loader configurations it is possible to have a new kernel installed, but a boot loader configuration that will never activate it. For this reason, it would not be advisable to schedule this state to run automatically.

Because this state function may cause the system to reboot, it may be preferable to move it to the very end of the state run. See `latest_wait()` for a waitable state that can be called with the `listen` requisite.

```
name Arbitrary name for the state. Does not affect behavior.
```

```
at_time The wait time in minutes before the system will be rebooted.
```

```
salt.states.kernelpkg.latest_installed(name, **kwargs)
Ensure that the latest version of the kernel available in the repositories is installed.
```

**Note:** This state only installs the kernel, but does not activate it. The new kernel should become active at the next reboot. See `kernelpkg.needs_reboot` for details on how to detect this condition, and `latest_active()` to initiate a reboot when needed.

```
name Arbitrary name for the state. Does not affect behavior.
```

```
salt.states.kernelpkg.latest_wait(name, at_time=None, **kwargs)
Initiate a reboot if the running kernel is not the latest one installed. This is the waitable version of `latest_active()` and will not take any action unless triggered by a watch or listen requisite.
```

**Note:** Because this state function may cause the system to reboot, it may be preferable to move it to the very end of the state run using `listen` or `listen_in` requisites.

```
system-up-to-date:
  pkg.uptodate:
    - refresh: true
boot-latest-kernel:
  kernelpkg.latest_wait:
    - at_time: 1
    - listen:
      - pkg: system-up-to-date
```

```
name Arbitrary name for the state. Does not affect behavior.
at_time The wait time in minutes before the system will be rebooted.
```

```
salt.states.kernelpkg.mod_watch(name, sfun, **kwargs)
Execute a kernelpkg state based on a watch or listen call
```

## 21.19.131 salt.states.keyboard

Management of keyboard layouts

The keyboard layout can be managed for the system:

```
us:
  keyboard.system
```
Or it can be managed for XOrg:

```python
salt.states.keyboard.xorg
```

**salt.states.keyboard.system**(name)

Set the keyboard layout for the system

- name The keyboard layout to use

**salt.states.keyboard.xorg**(name)

Set the keyboard layout for XOrg

- layout The keyboard layout to use

### 21.19.132 salt.states.keystone

Management of Keystone users

```yaml
depends
  - keystoneclient Python module
```

**configuration** See `salt.modules.keystone` for setup instructions.

---

**Keystone tenants:**

- `keystone.tenant_present`

  ```yaml
  - names:
    - admin
    - demo
    - service
  ```

**Keystone roles:**

- `keystone.role_present`

  ```yaml
  - names:
    - admin
    - Member
  ```

**admin:**

- `keystone.user_present`

  ```yaml
  - password: R00T_4CC3SS
  - email: admin@domain.com
  - roles:
    - admin: # tenants
      - admin # roles
    - service:
      - admin
      - Member
  - require:
    - keystone: Keystone tenants
    - keystone: Keystone roles
  ```

**nova:**

- `keystone.user_present`

  ```yaml
  - password: "$up3rn0v4"
  - email: nova@domain.com
  - tenant: service
  - roles:
    - service:
  ```

(continues on next page)
- admin
- require:
  - keystone: Keystone tenants
  - keystone: Keystone roles

demo:
  keystone.user_present:
  - password: 'd3m0n$trati0n'
  - email: demo@domain.com
  - tenant: demo
  - roles:
    - demo:
      - Member
  - require:
    - keystone: Keystone tenants
    - keystone: Keystone roles

nova service:
  keystone.service_present:
  - name: nova
  - service_type: compute
  - description: OpenStack Compute Service

salt.states.keystone.endpoint_absent(name, region=None, profile=None, interface=None, **connection_args)

  Ensure that the endpoint for a service doesn’t exist in Keystone catalog

  name The name of the service whose endpoints should not exist

  region (optional) The region of the endpoint. Defaults to RegionOne.

  interface The interface type, which describes the visibility of the endpoint. (for V3 API)

salt.states.keystone.endpoint_present(name, publicurl=None, internalurl=None, adminurl=None, region=None, profile=None, url=None, interface=None, **connection_args)

  Ensure the specified endpoints exists for service

  name The Service name

  publicurl The public url of service endpoint (for V2 API)

  internalurl The internal url of service endpoint (for V2 API)

  adminurl The admin url of the service endpoint (for V2 API)

  region The region of the endpoint

  url The endpoint URL (for V3 API)

  interface The interface type, which describes the visibility of the endpoint. (for V3 API)

salt.states.keystone.project_absent(name, profile=None, **connection_args)

  Ensure that the keystone project is absent. Alias for tenant_absent from V2 API to fulfill V3 API naming convention.

  New in version 2016.11.0.

  name The name of the project that should not exist

salt.states.keystone.project_present(name, description=None, enabled=True, profile=None, **connection_args)

  Ensures that the keystone project exists Alias for tenant_present from V2 API to fulfill V3 API naming convention.
New in version 2016.11.0.

name  The name of the project to manage

description  The description to use for this project

enabled  Availability state for this project

```yaml
[72x720] nova:
  keystone.project_present:
    - enabled: True
    - description: 'Nova Compute Service'
```

salt.states.keystone.role_absent(name, profile=None, **connection_args)

Ensure that the keystone role is absent.

name  The name of the role that should not exist

salt.states.keystone.role_present(name, profile=None, **connection_args)

Ensures that the keystone role exists

name  The name of the role that should be present

salt.states.keystone.service_absent(name, profile=None, **connection_args)

Ensure that the service doesn't exist in Keystone catalog

name  The name of the service that should not exist

salt.states.keystone.service_present(name, service_type, description=None, profile=None, **connection_args)

Ensure service present in Keystone catalog

name  The name of the service

service_type  The type of Openstack Service

description (optional)  Description of the service

salt.states.keystone.tenant_absent(name, profile=None, **connection_args)

Ensure that the keystone tenant is absent.

name  The name of the tenant that should not exist

salt.states.keystone.tenant_present(name, description=None, enabled=True, profile=None, **connection_args)

Ensures that the keystone tenant exists

name  The name of the tenant to manage

description  The description to use for this tenant

enabled  Availability state for this tenant

salt.states.keystone.user_absent(name, profile=None, **connection_args)

Ensure that the keystone user is absent.

name  The name of the user that should not exist

salt.states.keystone.user_present(name, password, email, tenant=None, enabled=True, roles=None, profile=None, password_reset=True, project=None, **connection_args)

Ensure that the keystone user is present with the specified properties.

name  The name of the user to manage

password  The password to use for this user

password_reset  Whether or not to reset password after initial set. Defaults to True.

description  The email address for this user

tenant  The tenant (name) for this user

Note: If the user already exists and a different password was set for the user than the one specified here, the password for the user will be updated. Please set the password_reset option to False if this is not the desired behavior.
**project**  The project (name) for this user (overrides tenant in api v3)

**enabled**  Availability state for this user

**roles**  The roles the user should have under given tenants. Passed as a dictionary mapping tenant names to a list of roles in this tenant, i.e.:

```
roles:
    admin:  # tenant
        - admin  # role
    service:
        - admin
        - Member
```

### 21.19.133  salt.states.keystone_domain

Management of OpenStack Keystone Domains

New in version 2018.3.0.

**depends**  shade

**configuration**  see `salt.modules.keystoneng` for setup instructions

Example States

```
create domain:
    keystone_domain.present:
        - name: domain1

create domain with optional params:
    keystone_domain.present:
        - name: domain1
        - enabled: False
        - description: 'my domain'

delete domain:
    keystone_domain.absent:
        - name: domain1
```

**salt.states.keystone_domain.absent**(name, auth=None)

Ensure domain does not exist

- **name**  Name of the domain

**salt.states.keystone_domain.present**(name, auth=None, **kwargs)

Ensure domain exists and is up-to-date

- **name**  Name of the domain
- **enabled**  Boolean to control if domain is enabled
- **description**  An arbitrary description of the domain

### 21.19.134  salt.states.keystone_endpoint

Management of OpenStack Keystone Endpoints

New in version 2018.3.0.

**depends**  shade
configuration see salt.modules.keystoneng for setup instructions

Example States

```
create endpoint:
  keystone_endpoint.present:
    - name: public
    - url: https://example.org:9292
    - region: RegionOne
    - service_name: glance

destroy endpoint:
  keystone_endpoint.absent:
    - name: public
    - url: https://example.org:9292
    - region: RegionOne
    - service_name: glance

create multiple endpoints:
  keystone_endpoint.absent:
    - names:
      - public
      - admin
      - internal
    - url: https://example.org:9292
    - region: RegionOne
    - service_name: glance
```

salt.states.keystone_endpoint.absent(name, service_name, auth=None, **kwargs)
  Ensure an endpoint does not exists
  name Interface name
  url URL of the endpoint
  service_name Service name or ID
  region The region name to assign the endpoint

salt.states.keystone_endpoint.present(name, service_name, auth=None, **kwargs)
  Ensure an endpoint exists and is up-to-date
  name Interface name
  url URL of the endpoint
  service_name Service name or ID
  region The region name to assign the endpoint
  enabled Boolean to control if endpoint is enabled

21.19.135 salt.states.keystone_group

Management of OpenStack Keystone Groups

New in version 2018.3.0.

    depends shade

    configuration see salt.modules.keystoneng for setup instructions

Example States

```
create group:
  keystone_group.present:
```

(continues on next page)
- name: group1

delete group:
  keystone_group.absent:
    - name: group1

create group with optional params:
  keystone_group.present:
    - name: group1
    - domain: domain1
    - description: 'my group'

salt.states.keystone_group.absent(name, auth=None, **kwargs)
  Ensure group does not exist
  name Name of the group
  domain The name or id of the domain

salt.states.keystone_group.present(name, auth=None, **kwargs)
  Ensure an group exists and is up-to-date
  name Name of the group
  domain The name or id of the domain
  description An arbitrary description of the group

21.19.136 salt.states.keystone_project

Management of OpenStack Keystone Projects

New in version 2018.3.0.

depends shade

configuration see salt.modules.keystoneng for setup instructions

Example States

create project:
  keystone_project.present:
    - name: project1

delete project:
  keystone_project.absent:
    - name: project1

create project with optional params:
  keystone_project.present:
    - name: project1
    - domain: domain1
    - enabled: False
    - description: 'my project'

salt.states.keystone_project.absent(name, auth=None, **kwargs)
  Ensure a project does not exist
  name Name of the project
  domain The name or id of the domain
salt.states.keystone_project.present(name, auth=None, **kwargs)
    Ensure a project exists and is up-to-date
    name Name of the project
domain The name or id of the domain
description An arbitrary description of the project

21.19.137 salt.states.keystone_role

Management of OpenStack Keystone Roles

New in version 2018.3.0.
    depends shade
    configuration see salt.modules.keystoneng for setup instructions

Example States

create role:
    keystone_role.present:
        - name: role1

delete role:
    keystone_role.absent:
        - name: role1

create role with optional params:
    keystone_role.present:
        - name: role1
        - description: 'my group'

salt.states.keystone_role.absent(name, auth=None, **kwargs)
    Ensure role does not exist
    name Name of the role

salt.states.keystone_role.present(name, auth=None, **kwargs)
    Ensure an role exists
    name Name of the role
description An arbitrary description of the role

21.19.138 salt.states.keystone_role_grant

Management of OpenStack Keystone Role Grants

New in version 2018.3.0.
    depends shade
    configuration see salt.modules.keystoneng for setup instructions

Example States

create group:
    keystone_group.present:
        - name: group1

(continues on next page)
delete group:
  keystone_group.absent:
    - name: group1

create group with optional params:
  keystone_group.present:
    - name: group1
    - domain: domain1
    - description: 'my group'

salt.states.keystone_role_grant.absent(name, auth=None, **kwargs)
salt.states.keystone_role_grant.present(name, auth=None, **kwargs)

21.19.139 salt.states.keystone_service

Management of OpenStack Keystone Services

New in version 2018.3.0.

depends shade

configuration see salt.modules.keystoneng for setup instructions

Example States

create service:
  keystone_service.present:
    - name: glance
    - type: image

delete service:
  keystone_service.absent:
    - name: glance

create service with optional params:
  keystone_service.present:
    - name: glance
    - type: image
    - enabled: False
    - description: 'OpenStack Image'

salt.states.keystone_service.absent(name, auth=None)
  Ensure service does not exist
  name Name of the service
salt.states.keystone_service.present(name, auth=None, **kwargs)
  Ensure an service exists and is up-to-date
  name Name of the group
  type Service type
  enabled Boolean to control if service is enabled
  description An arbitrary description of the service

21.19.140 salt.states.keystone_user
Management of OpenStack Keystone Users

New in version 2018.3.0.

depends shade
configuration see salt.modules.keystoneng for setup instructions

Example States

```python
create user:
    keystone_user.present:
        - name: user1

delete user:
    keystone_user.absent:
        - name: user1

create user with optional params:
    keystone_user.present:
        - name: user1
        - domain: domain1
        - enabled: False
        - password: password123
        - email: "user1@example.org"
        - description: 'my user'
```

```python
salt.states.keystone_user.absent(name, auth=None, **kwargs)
Ensure user does not exists
name Name of the user
domain The name or id of the domain

salt.states.keystone_user.present(name, auth=None, **kwargs)
Ensure domain exists and is up-to-date
name Name of the domain
domain The name or id of the domain
enabled Boolean to control if domain is enabled
description An arbitrary description of the domain
password The user password
email The users email address
```

21.19.141 salt.states.kmod

Loading and unloading of kernel modules

The Kernel modules on a system can be managed cleanly with the kmod state module:

```python
add_kvm:
    kmod.present:
        - name: kvm_amd

remove_beep:
    kmod.absent:
        - name: pcspkr
```

Multiple modules can be specified for both kmod.present and kmod.absent.
add_sound:
  kmod.present:
    - mods:
      - snd_hda_codec_hdmi
      - snd_hda_codec
      - snd_hwdep
      - snd_hda_core
      - snd_pcm
      - snd_timer
      - snd

salt.states.kmod.absent(name, persist=False, comment=True, mods=None)
Verify that the named kernel module is not loaded
name The name of the kernel module to verify is not loaded
persist Remove module from /etc/modules
comment Comment out module in /etc/modules rather than remove it
mods A list of modules to verify are unloaded. If this argument is used, the name argument, although still required, is not used, and becomes a placeholder

New in version 2016.3.0.

salt.states.kmod.present(name, persist=False, mods=None)
Ensure that the specified kernel module is loaded
name The name of the kernel module to verify is loaded
persist Also add module to /etc/modules
mods A list of modules to verify are loaded. If this argument is used, the name argument, although still required, is not used, and becomes a placeholder

New in version 2016.3.0.

21.19.142 salt.states.kubernetes

Manage kubernetes resources as salt states

NOTE: This module requires the proper pillar values set. See salt.modules.kubernetesmod for more information.

Warning: Configuration options will change in 2019.2.0.

The kubernetes module is used to manage different kubernetes resources.

my-nginx:
  kubernetes.deployment_present:
    - namespace: default
      metadata:
        app: frontend
      spec:
        replicas: 1

salt.states.kubernetes.configmap_absent(name, namespace='default', **kwargs)

Ensures that the named configmap is absent from the given namespace.

name The name of the configmap
namespace The namespace holding the configmap. The 'default' one is going to be used unless a different one
           is specified.

salt.states.kubernetes.configmap_present(name, namespace='default', data=None, source=None, template=None, **kwargs)
Ensures that the named configmap is present inside of the specified namespace with the given data. If the configmap exists it will be replaced.

- **name** The name of the configmap.
- **namespace** The namespace holding the configmap. The 'default' one is going to be used unless a different one is specified.
- **data** The dictionary holding the configmaps.
- **source** A file containing the data of the configmap in plain format.
- **template** Template engine to be used to render the source file.

```python
salt.states.kubernetes.deployment_absent(name, namespace='default', **kwargs)
```
Ensures that the named deployment is absent from the given namespace.

- **name** The name of the deployment
- **namespace** The name of the namespace

```python
salt.states.kubernetes.deployment_present(name, namespace='default', metadata=None, spec=None, source='''', template='''', **kwargs)
```
Ensures that the named deployment is present inside of the specified namespace with the given metadata and spec. If the deployment exists it will be replaced.

- **name** The name of the deployment.
- **namespace** The namespace holding the deployment. The 'default' one is going to be used unless a different one is specified.
- **metadata** The metadata of the deployment object.
- **spec** The spec of the deployment object.
- **source** A file containing the definition of the deployment (metadata and spec) in the official kubernetes format.
- **template** Template engine to be used to render the source file.

```python
salt.states.kubernetes.namespace_absent(name, **kwargs)
```
Ensures that the named namespace is absent.

- **name** The name of the namespace

```python
salt.states.kubernetes.namespace_present(name, **kwargs)
```
Ensures that the named namespace is present.

- **name** The name of the namespace

```python
salt.states.kubernetes.node_label_absent(name, node, **kwargs)
```
Ensures that the named label is absent from the node.

- **name** The name of the label
- **node** The name of the node

```python
salt.states.kubernetes.node_label_folder_absent(name, node, **kwargs)
```
Ensures the label folder doesn’t exist on the specified node.

- **name** The name of label folder
- **node** The name of the node

```python
salt.states.kubernetes.node_label_present(name, node, value, **kwargs)
```
Ensures that the named label is set on the named node with the given value. If the label exists it will be replaced.

- **name** The name of the label.
- **value** Value of the label.
- **node** Node to change.

```python
salt.states.kubernetes.pod_absent(name, namespace='default', **kwargs)
```
Ensures that the named pod is absent from the given namespace.

- **name** The name of the pod
- **namespace** The name of the namespace

```python
salt.states.kubernetes.pod_present(name, namespace='default', metadata=None, spec=None, source='''', template='''', **kwargs)
```
Ensures that the named pod is present inside of the specified namespace with the given metadata and spec. If
the pod exists it will be replaced.

name  The name of the pod.
namespace  The namespace holding the pod. The ‘default’ one is going to be used unless a different one is specified.
metadata  The metadata of the pod object.
spec  The spec of the pod object.
source  A file containing the definition of the pod (metadata and spec) in the official kubernetes format.
template  Template engine to be used to render the source file.

salt.states.kubernetes.secret_absent(name, namespace='default', **kwargs)
Ensures that the named secret is absent from the given namespace.

name  The name of the secret
namespace  The name of the namespace

salt.states.kubernetes.secret_present(name, namespace='default', data=None, source=None, template=None, **kwargs)
Ensures that the named secret is present inside of the specified namespace with the given data. If the secret exists it will be replaced.

name  The name of the secret
namespace  The namespace holding the secret. The ‘default’ one is going to be used unless a different one is specified.
data  The dictionary holding the secrets.
source  A file containing the data of the secret in plain format.
template  Template engine to be used to render the source file.

salt.states.kubernetes.service_absent(name, namespace='default', **kwargs)
Ensures that the named service is absent from the given namespace.

name  The name of the service
namespace  The name of the namespace

salt.states.kubernetes.service_present(name, namespace='default', metadata=None, spec=None, source='', template='', **kwargs)
Ensures that the named service is present inside of the specified namespace with the given metadata and spec. If the deployment exists it will be replaced.

name  The name of the service
namespace  The namespace holding the service. The ‘default’ one is going to be used unless a different one is specified.
metadata  The metadata of the service object.
spec  The spec of the service object.
source  A file containing the definition of the service (metadata and spec) in the official kubernetes format.
template  Template engine to be used to render the source file.

21.19.143  salt.states.layman

Management of Gentoo Overlays using layman

A state module to manage Gentoo package overlays via layman

sunrise:
   layman.present
salt.states.layman.absent(name)
Verify that the overlay is absent
name  The name of the overlay to delete
salt.states.layman.present(name)
Verify that the overlay is present
name  The name of the overlay to add

21.19.144 salt.states.ldap

Manage entries in an LDAP database

New in version 2016.3.0.
The states.ldap state module allows you to manage LDAP entries and their attributes.
salt.states.ldap.managed(name, entries, connect_spec=None)
Ensure the existence (or not) of LDAP entries and their attributes

Example:

```yaml
ldap://://:
    ldap.managed:
        - connect_spec:
            bind:
                method: sasl
        - entries:
            # make sure the entry doesn't exist
            - cn=foo,ou=users,dc=example,dc=com:
                - delete_others: True
            # make sure the entry exists with only the specified
            # attribute values
            - cn=admin,dc=example,dc=com:
                - delete_others: True
                - replace:
                    cn:
                        - admin
description:
                - LDAP administrator
objectClass:
                    - simpleSecurityObject
                    - organizationalRole
userPassword:
                    - {{ pillar.ldap_admin_password }}
            # make sure the entry exists, its olcRootDN attribute
            # has only the specified value, the olcRootDN attribute
            # doesn't exist, and all other attributes are ignored
            - 'olcDatabase={1}hdb,cn=config':
                - replace:
                    olcRootDN:
                        - cn=admin,dc=example,dc=com
                # the admin entry has its own password attribute
                olcRootPW: []

            # note the use of 'default'. also note how you don't
            # have to use list syntax if there is only one attribute
            # value
```

(continues on next page)
- cn=foo,ou=users,dc=example,dc=com:
  - delete_others: True
  - default:
    userPassword: changeme
    shadowLastChange: 0
    # keep sshPublicKey if present, but don't create
    # the attribute if it is missing
    sshPublicKey: []
  - replace:
    cn: foo
    uid: foo
    uidNumber: 1000
    gidNumber: 1000
    gecos: Foo Bar
    givenName: Foo
    sn: Bar
    homeDirectory: /home/foo
    loginShell: /bin/bash
    objectClass:
      - inetOrgPerson
      - posixAccount
      - top
      - ldapPublicKey
      - shadowAccount

Parameters

- **name** – The URL of the LDAP server. This is ignored if connect_spec is either a connection object or a dict with a 'url' entry.

- **entries** – A description of the desired state of zero or more LDAP entries.

  entries is an iterable of dicts. Each of these dict’s keys are the distinguished names (DNs) of LDAP entries to manage. Each of these dicts is processed in order. A later dict can reference an LDAP entry that was already mentioned in an earlier dict, which makes it possible for later dicts to enhance or alter the desired state of an LDAP entry.

  The DNs are mapped to a description of the LDAP entry’s desired state. These LDAP entry descriptions are themselves iterables of dicts. Each dict in the iterable is processed in order. They contain directives controlling the entry’s state. The key names the directive type and the value is state information for the directive. The specific structure of the state information depends on the directive type.

  The structure of entries looks like this:

  ```
  [{dn1: [{directive1: directive1_state,
           directive2: directive2_state},
          {directive3: directive3_state}],
   dn2: [{directive4: directive4_state,
          directive5: directive5_state}]
   {dn3: [{directive6: directive6_state}]]}
  ```

  These are the directives:

  - **delete_others** Boolean indicating whether to delete attributes not mentioned in this dict or any of the other directive dicts for this DN. Defaults to False.

    If you don’t want to delete an attribute if present, but you also don’t want to add it if it is missing or modify it if it is present, you can use either the
A dict mapping an attribute name to an iterable of default values for that attribute. If the attribute already exists, it is left alone. If not, it is created using the given list of values.

An empty value list is useful when you don’t want to create an attribute if it is missing but you do want to preserve it if the 'delete_others' key is True.

- **add** Attribute values to add to the entry. This is a dict mapping an attribute name to an iterable of values to add.

An empty value list is useful when you don’t want to create an attribute if it is missing but you do want to preserve it if the 'delete_others' key is True.

- **delete** Attribute values to remove from the entry. This is a dict mapping an attribute name to an iterable of values to delete from the attribute. If the iterable is empty, all of the attribute’s values are deleted.

- **replace** Attributes to replace. This is a dict mapping an attribute name to an iterable of values. Any existing values for the attribute are deleted, then the given values are added. The iterable may be empty.

In the above directives, the iterables of attribute values may instead be None, in which case an empty list is used, or a scalar such as a string or number, in which case a new list containing the scalar is used.

Note that if all attribute values are removed from an entry, the entire entry is deleted.

**connect_spec** – See the description of the connect_spec parameter of the ldap3.connect function in the ldap3 execution module. If this is a dict and the 'url' entry is not specified, the 'url' entry is set to the value of the name parameter.

**Returns**

A dict with the following keys:

- **name** This is the same object passed to the name parameter.

- **changes** This is a dict describing the changes made (or, in test mode, the changes that would have been attempted). If no changes were made (or no changes would have been attempted), then this dict is empty. Only successful changes are included.

Each key is a DN of an entry that was changed (or would have been changed). Entries that were not changed (or would not have been changed) are not included. The value is a dict with two keys:

- **old** The state of the entry before modification. If the entry did not previously exist, this key maps to None. Otherwise, the value is a dict mapping each of the old entry’s attributes to a list of its values before any modifications were made. Unchanged attributes are excluded from this dict.

- **new** The state of the entry after modification. If the entry was deleted, this key maps to None. Otherwise, the value is a dict mapping each of the entry’s attributes to a list of its values after the modifications were made. Unchanged attributes are excluded from this dict.

Example 'changes' dict where a new entry was created with a single attribute containing two values:

```json
{ 'dn1': { 'old': None, 'new': { 'attr1': ['val1', 'val2'] } } }
```

Example 'changes' dict where a new attribute was added to an existing en-
try:

```python
{'dnl': {'old': {},
         'new': {'attr2': ['val3']})}
```

- **result**: One of the following values:
  - True if no changes were necessary or if all changes were applied successfully.
  - False if at least one change was unable to be applied.
  - None if changes would be applied but it is in test mode.

21.19.145 salt.states.libcloud_dns module

Manage DNS records and zones using libcloud

**codeauthor** Anthony Shaw `<anthonyshaw@apache.org>`

New in version 2016.11.0.

Create and delete DNS records or zones through Libcloud. Libcloud’s DNS system supports over 20 DNS providers including Amazon, Google, GoDaddy, Softlayer.

This module uses `libcloud`, which can be installed via package, or pip.

**configuration** This module uses a configuration profile for one or multiple DNS providers

```python
libcloud_dns:
  profile1:
    driver: godaddy
    key: 2orgk34kgk34g
  profile2:
    driver: route53
    key: blah
    secret: blah
```

Example:

```yaml
my-zone:
  libcloud_dns.zone_present:
    - name: mywebsite.com
      profile: profile1

my-website:
  libcloud_dns.record_present:
    - name: www
      zone: mywebsite.com
      type: A
      data: 12.34.32.3
      profile: profile1
      require:
        - libcloud_dns: my-zone
```

depends apache-libcloud

salt.states.libcloud_dns.record_absent(name, zone, type, data, profile)
Ensures a record is absent.

**Parameters**

- **name** (str) – Record name without the domain name (e.g. www). Note: If you want to create a record for a base domain name, you should specify empty string ("") for this argument.
• zone (str) – Zone where the requested record is created, the domain name
• type (str) – DNS record type (A, AAAA, ...).
• data (str) – Data for the record (depends on the record type).
• profile (str) – The profile key

salt.states.libcloud_dns.record_present(name, zone, type, data, profile)
Ensures a record is present.

Parameters
• name (str) – Record name without the domain name (e.g. www). Note: If you want
to create a record for a base domain name, you should specify empty string ("") for this
argument.
• zone (str) – Zone where the requested record is created, the domain name
• type (str) – DNS record type (A, AAAA, ...).
• data (str) – Data for the record (depends on the record type).
• profile (str) – The profile key

salt.states.libcloud_dns.state_result(result, message, name, changes=None)
salt.states.libcloud_dns.zone_absent(domain, profile)
Ensures a record is absent.

Parameters
• domain (str) – Zone name, i.e. the domain name
• profile (str) – The profile key

salt.states.libcloud_dns.zone_present(domain, type, profile)
Ensures a record is present.

Parameters
• domain (str) – Zone name, i.e. the domain name
• type (str) – Zone type (master / slave), defaults to master
• profile (str) – The profile key

21.19.146 salt.states.libcloud_loadbalancer module

Apache Libcloud Load Balancer State

Manage load balancers using libcloud

codeauthor Anthony Shaw <anthonyshaw@apache.org>

Apache Libcloud load balancer management for a full list of supported clouds, see http://libcloud.readthedocs.io/en/latest/loadbalancer/supported_providers.html

Clouds include Amazon ELB, ALB, Google, Aliyun, CloudStack, Softlayer

New in version 2018.3.0.

configuration This module uses a configuration profile for one or multiple Cloud providers

```yaml
libcloud_loadbalancer:
  profile_test1:
    driver: gce
    key: G00G80123456789ABCDXYZ
    secret: mysecret
  profile_test2:
    driver: alb
    key: 12345
    secret: mysecret
```
Example:

Using States to deploy a load balancer with extended arguments to specify region

```yaml
lb_test:
  libcloud_loadbalancer.balancer_present:
    - name: example
    - port: 80
    - protocol: http
    - profile: google
    - ex_region: us-east1
```

depends  apache-libcloud

salt.states.libcloud_loadbalancer.balancer_absent(name, profile, **libcloud_kwargs)

Ensures a load balancer is absent.

Parameters

- `name (str)` - Load Balancer name
- `profile (str)` - The profile key

salt.states.libcloud_loadbalancer.balancer_present(name, port, protocol, profile, algorithm=None, members=None, **libcloud_kwargs)

Ensures a load balancer is present.

Parameters

- `name (str)` - Load Balancer name
- `port (str)` - Port the load balancer should listen on, defaults to 80
- `protocol (str)` - Loadbalancer protocol, defaults to http.
- `profile (str)` - The profile key
- `algorithm (str)` - Load balancing algorithm, defaults to ROUND_ROBIN. See Algorithm type in Libcloud documentation for a full listing.
- `members (list of dict (ip, port))` - An optional list of members to create on deployment

salt.states.libcloud_loadbalancer.member_absent(ip, port, balancer_id, profile, **libcloud_kwargs)

Ensure a load balancer member is absent, based on IP and Port

Parameters

- `ip (str)` - IP address for the member
- `port (int)` - Port for the member
- `balancer_id (str)` - id of a load balancer you want to detach the member from
- `profile (str)` - The profile key

salt.states.libcloud_loadbalancer.member_present(ip, port, balancer_id, profile, **libcloud_kwargs)

Ensure a load balancer member is present

Parameters

- `ip (str)` - IP address for the new member
- `port (int)` - Port for the new member
- `balancer_id (str)` - id of a load balancer you want to attach the member to
- `profile (str)` - The profile key

salt.states.libcloud_loadbalancer.state_result(result, message, name, changes=None)
Apache Libcloud Storage State

Manage cloud storage using libcloud

**codeauthor** Anthony Shaw <anthonyshaw@apache.org>

Clouds include Amazon S3, Google Storage, Aliyun, Azure Blobs, Ceph, OpenStack swift

New in version 2018.3.0.

**configuration** This module uses a configuration profile for one or multiple Storage providers

```yaml
libcloud_storage:
  profile_test1:
    driver: google_storage
    key: GOOG0123456789ABCXYZ
    secret: mysecret
  profile_test2:
    driver: s3
    key: 12345
    secret: mysecret
```

Examples

Creating a container and uploading a file

```yaml
web_things:
  libcloud_storage.container_present:
    name: my_container_name
    profile: profile1
  libcloud_storage.object_present:
    name: my_file.jpg
    container: my_container_name
    path: /path/to/local/file.jpg
    profile: profile1
```

Downloading a file

This example will download the file from the remote cloud and keep it locally

```yaml
web_things:
  libcloud_storage.file_present:
    name: my_file.jpg
    container: my_container_name
    path: /path/to/local/file.jpg
    profile: profile1
```

```yaml
depends apache-libcloud
salt.states.libcloud_storage.container_absent(name, profile)
Ensures a container is absent.
Parameters
  • name (str) – Container name
```
...profile (str) – The profile key

salt.states.libcloud_storage.container_present(name, profile)
Ensures a container is present.
Parameters
  • name (str) – Container name
  • profile (str) – The profile key

salt.states.libcloud_storage.file_present(container, name, path, profile, overwrite_existing=False)
Ensures a object is downloaded locally.
Parameters
  • container (str) – Container name
  • name (str) – Object name in cloud
  • path (str) – Local path to file
  • profile (str) – The profile key
  • overwrite_existing (bool) – Replace if already exists

salt.states.libcloud_storage.object_absent(container, name, profile)
Ensures a object is absent.
Parameters
  • container (str) – Container name
  • name (str) – Object name in cloud
  • profile (str) – The profile key

salt.states.libcloud_storage.object_present(container, name, path, profile)
Ensures a object is present.
Parameters
  • container (str) – Container name
  • name (str) – Object name in cloud
  • path (str) – Local path to file
  • profile (str) – The profile key

salt.states.libcloud_storage.state_result(result, message, name, changes)

21.19.148 salt.states.linux_acl

Linux File Access Control Lists
The Linux ACL state module requires the getfacl and setfacl binaries.

Ensure a Linux ACL is present

```
root:
  acl.present:
    - name: /root
    - acl_type: user
    - acl_name: damian
    - perms: rwx
```

Ensure a Linux ACL does not exist

```
root:
  acl.absent:
    - name: /root
    - acl_type: user
    - acl_name: damian
    - perms: rwx
```
Ensure a Linux ACL list is present

```yaml
root:
  acl.list_present:
    - name: /root
    - acl_type: user
    - acl_name:
      - damian
      - homer
    - perms: rwx
```

Ensure a Linux ACL list does not exist

```yaml
root:
  acl.list_absent:
    - name: /root
    - acl_type: user
    - acl_name:
      - damian
      - homer
    - perms: rwx
```

`salt.states.linux_acl.absent(name, acl_type, acl_name=", perms=", recurse=False)`

Ensure a Linux ACL does not exist

- **name**: The acl path
- **acl_type**: The type of the acl is used for, it can be 'user' or 'group'
- **acl_names**: The user or group
- **perms**: Remove the permissions eg.: rwx
- **recurse**: Set the permissions recursive in the path

`salt.states.linux_acl.list_absent(name, acl_type, acl_names=None, recurse=False)`

Ensure a Linux ACL list does not exist

- Takes a list of acl names and remove them from the given path
- **name**: The acl path
- **acl_type**: The type of the acl is used for, it can be 'user' or 'group'
- **acl_names**: The list of users or groups
- **perms**: Remove the permissions eg.: rwx
- **recurse**: Set the permissions recursive in the path

`salt.states.linux_acl.list_present(name, acl_type, acl_names=None, perms=", recurse=False, force=False)`

Ensure a Linux ACL list is present

- Takes a list of acl names and add them to the given path
- **name**: The acl path
- **acl_type**: The type of the acl is used for it can be 'user' or 'group'
- **acl_names**: The list of users or groups
- **perms**: Set the permissions eg.: rwx
- **recurse**: Set the permissions recursive in the path
- **force**: Wipe out old permissions and ensure only the new permissions are set

`salt.states.linux_acl.present(name, acl_type, acl_name=", perms=", recurse=False, force=False)`

Ensure a Linux ACL is present

- **name**: The acl path
- **acl_type**: The type of the acl is used for it can be 'user' or 'group'
- **acl_name**: The user or group
- **perms**: Set the permissions eg.: rwx
recurse  Set the permissions recursive in the path
force  Wipe out old permissions and ensure only the new permissions are set

21.19.149  salt.states.locale

Management of languages/locales

Manage the available locales and the system default:

```
us_locale:
  locale.present:
    - name: en_US.UTF-8

default_locale:
  locale.system:
    - name: en_US.UTF-8
    - require:
      - locale: us_locale
```

**salt.states.locale.present(name)**
Generate a locale if it is not present

New in version 2014.7.0.

- **name** The name of the locale to be present. Some distributions require the charmap to be specified as part of the locale at this point.

**salt.states.locale.system(name)**
Set the locale for the system

- **name** The name of the locale to use

21.19.150  salt.states.logadm module

Management of logs using Solaris logadm.

- **maintainer** Jorge Schrauwen <sjorge@blackdot.be>
- **maturity** new
- **depends** salt.module.logadm
- **platform** Oracle Solaris, Sun Solaris, illumos

New in version nitrogen.

```
.. note::
    TODO
```

**salt.states.logadm.remove(name, log_file=None)**
Remove a log from the logadm configuration

- **name** [string] entryname
- **log_file** [string] (optional) log file path

Note: If log_file is specified it will be used instead of the entry name.

**salt.states.logadm.rotate(name, **kwargs)**
Add a log to the logadm configuration
name  [string] alias for entryname
kwargs  [boolean|string|int] optional additional flags and parameters

21.19.151 salt.states.logrotate module

Module for managing logrotate.
New in version 2017.7.0.
salt.states.logrotate.set_  
(name, key, value, setting=None, conf_file='/etc/logrotate.conf')
Set a new value for a specific configuration line.
Parameters
- key (str) – The command or block to configure.
- value (str) – The command value or command of the block specified by the key parameter.
- setting (str) – The command value for the command specified by the value parameter.
- conf_file (str) – The logrotate configuration file.
Example of usage with only the required arguments:

```
logrotate-rotate:
  logrotate.set:
    - key: rotate
      value: 2
```

Example of usage specifying all available arguments:

```
logrotate-wtmp-rotate:
  logrotate.set:
    - key: /var/log/wtmp
      value: rotate
      setting: 2
      conf_file: /etc/logrotate.conf
```

21.19.152 salt.states.loop module

Loop state
Allows for looping over execution modules.
New in version 2017.7.0.

```
wait_for_service_to_be_healthy:
  loop.until:
    - name: boto_elb.get_instance_health
      condition: m_ret[0]['state'] == 'InService'
      period: 5
      timeout: 20
      m_args:
        - {{ elb }}
      m_kwargs:
        keyid: {{ access_key }}
        key: {{ secret_key }}
        instances: "{{ instance }}"
```
Warning: This state allows arbitrary python code to be executed through the condition parameter which is literally evaluated within the state. Please use caution.

```
salt.states.loop.until(name, m_args=None, m_kwargs=None, condition=None, period=0, timeout=604800)
```

Loop over an execution module until a condition is met.
- **name** The name of the execution module
- **m_args** The execution module's positional arguments
- **m_kwargs** The execution module's keyword arguments
- **condition** The condition which must be met for the loop to break. This should contain `m_ret` which is the return from the execution module.
- **period** The number of seconds to wait between executions
- **timeout** The number of seconds to wait before exiting

### 21.19.153 salt.states.lvm

Management of Linux logical volumes

A state module to manage LVMs

```
/dev/sda:
  lvm.pv_present

my_vg:
  lvm.vg_present:
    - devices: /dev/sda

lvroot:
  lvm.lv_present:
    - vgname: my_vg
    - size: 10G
    - stripes: 5
    - stripesize: 8K
```

```
salt.states.lvm.lv_absent(name, vgname=None)
```

Remove a given existing Logical Volume from a named existing volume group
- **name** The Logical Volume to remove
- **vgname** The name of the Volume Group on which the Logical Volume resides

```
salt.states.lvm.lv_present(name, vgname=None, size=None, extents=None, snapshot=None, pv="", thinvolume=False, thinpool=False, force=False, **kwargs)
```

Create a new Logical Volume
- **name** The name of the Logical Volume
- **vgname** The name of the Volume Group on which the Logical Volume resides
- **size** The initial size of the Logical Volume
- **extents** The number of logical extents to allocate
- **snapshot** The name of the snapshot
- **pv** The Physical Volume to use
- **kwargs** Any supported options to lvcreate. See `linux_lvm` for more details.

New in version 2018.3.0.
- **thinvolume** Logical Volume is thinly provisioned
- **thinpool** Logical Volume is a thin pool

New in version 2018.3.0.
- **force** Assume yes to all prompts
salt.states.lvm.pv_absent(name)
   Ensure that a Physical Device is not being used by lvm
   name  The device name to initialize.

salt.states.lvm.pv_present(name, **kwargs)
   Set a Physical Device to be used as an LVM Physical Volume
   name  The device name to initialize.
   kwargs  Any supported options to pvcreate. See linux_lvm for more details.

salt.states.lvm.vg_absent(name)
   Remove an LVM volume group
   name  The volume group to remove

salt.states.lvm.vg_present(name, devices=None, **kwargs)
   Create an LVM Volume Group
   name  The Volume Group name to create
   devices  A list of devices that will be added to the Volume Group
   kwargs  Any supported options to vgcreate. See linux_lvm for more details.

21.19.154  salt.states.lvs_server

Management of LVS (Linux Virtual Server) Real Server

salt.states.lvs_server.absent(name, protocol=None, service_address=None, server_address=None)
   Ensure the LVS Real Server in specified service is absent.
   name  The name of the LVS server.
   protocol  The service protocol(only support tcp, udp and fwmark service).
   service_address  The LVS service address.
   server_address  The LVS real server address.

salt.states.lvs_server.present(name, protocol=None, service_address=None, server_address=None, packet_forward_method='dr', weight=1)
   Ensure that the named service is present.
   name  The LVS server name
   protocol  The service protocol
   service_address  The LVS service address
   server_address  The real server address.
   packet_forward_method  The LVS packet forwarding method(dr for direct routing, tunnel for tunneling, nat for network access translation).
   weight  The capacity of a server relative to the others in the pool.

```yaml
lvsrs:
  lvs_server.present:
    protocol: tcp
    service_address: 1.1.1.1:80
    server_address: 192.168.0.11:8080
    packet_forward_method: dr
    weight: 10
```

21.19.155  salt.states.lvs_service
Management of LVS (Linux Virtual Server) Service

salt.states.lvs_service.absent(name, protocol=None, service_address=None)
Ensure the LVS service is absent.
   name  The name of the LVS service
   protocol The service protocol
   service_address The LVS service address

salt.states.lvs_service.present(name, protocol=None, service_address=None, scheduler='wlc')
Ensure that the named service is present.
   name  The LVS service name
   protocol The service protocol
   service_address The LVS service address
   scheduler Algorithm for allocating TCP connections and UDP datagrams to real servers.

```
lvstest:
lvs_service.present:
   - service_address: 1.1.1.1:80
   - protocol: tcp
   - scheduler: rr
```

21.19.156 salt.states.lxc

Manage Linux Containers

salt.states.lxc.absent(name, stop=False, path=None)
Ensure a container is not present, destroying it if present
   name  Name of the container to destroy
   stop  stop before destroying default: false

   New in version 2015.5.2.
   path  path to the container parent default: /var/lib/lxc (system default)

   New in version 2015.8.0.

```
web01:
lxc.absent
```

salt.states.lxc.edited_conf(name, lxc_conf=None, lxc_conf_unset=None)

**Warning:** This state is unsuitable for setting parameters that appear more than once in an LXC config file, or parameters which must appear in a certain order (such as when configuring more than one network interface).

Issue #35523 was opened to track the addition of a suitable replacement or fix.

Edit LXC configuration options

   Deprecated since version 2015.5.0.
   path  path to the container parent default: /var/lib/lxc (system default)

   New in version 2015.8.0.
setconf:
  lxc.edited_conf:
    - name: ubuntu
      lxc_conf:
        - network.ipv4.ip: 10.0.3.6
    lxc_conf_unset:
      - lxc.utsname

salt.states.lxc.frozen(name, start=True, path=None)
New in version 2015.5.0.

Ensure that a container is frozen

Note: This state does not enforce the existence of the named container, it just freezes the container if it is running. To ensure that the named container exists, use lxc.present.

name The name of the container
path path to the container parent default: /var/lib/lxc (system default)
  New in version 2015.8.0.
start [True] Start container first, if necessary. If False, then this state will fail if the container is not running.

web01:
  lxc.frozen
web02:
  lxc.frozen:
    - start: False

salt.states.lxc.present(name, running=None, clone_from=None, snapshot=False, profile=None, network_profile=None, template=None, options=None, image=None, config=None, fstype=None, size=None, backing=None, vgname=None, lvname=None, thinpool=None, path=None)
Changed in version 2015.8.0: The lxc.created state has been renamed to lxc.present, and the lxc.cloned state has been merged into this state.

Create the named container if it does not exist
name The name of the container to be created
path path to the container parent default: /var/lib/lxc (system default)
  New in version 2015.8.0.
running [False]
  • If True, ensure that the container is running
  • If False, ensure that the container is stopped
  • If None, do nothing with regards to the running state of the container
  New in version 2015.8.0.
clone_from Create named container as a clone of the specified container
snapshot [False] Use Copy On Write snapshots (LVM). Only supported with clone_from.
profile Profile to use in container creation (see the LXC Tutorial for more information). Values in a profile will be overridden by the parameters listed below.
network_profile Network Profile to use in container creation (see the LXC Tutorial for more information). Values in a profile will be overridden by the parameters listed below.

New in version 2015.5.2.
Container Creation Arguments
**template**  The template to use. For example, `ubuntu` or `fedora`. For a full list of available templates, check out the `lxc.templates` function.

Conflicts with the `image` argument.

**Note:** The `download` template requires the following three parameters to be defined in `options`:
- `dist` - The name of the distribution
- `release` - Release name/version
- `arch` - Architecture of the container

The available images can be listed using the `lxc.images` function.

**options**

New in version 2015.5.0.

Template-specific options to pass to the `lxc-create` command. These correspond to the long options (ones beginning with two dashes) that the template script accepts. For example:

```yaml
web01:
  lxc.present:
    - template: download
    - options:
      dist: centos
      release: 6
      arch: amd64
```

Remember to double-indent the options, due to how `PyYAML` works.

For available template options, refer to the `lxc` template scripts which are usually located under `/usr/share/lxc/templates`, or run `lxc-create -t <template> -h`.

**image**  A tar archive to use as the rootfs for the container. Conflicts with the `template` argument.

**backing**  The type of storage to use. Set to `lvm` to use an LVM group. Defaults to filesystem within `/var/lib/lxc`.

**fstype**  Filesystem type to use on LVM logical volume

**size**  Size of the volume to create. Only applicable if `backing` is set to `lvm`.

**vgname**  [lxc] Name of the LVM volume group in which to create the volume for this container. Only applicable if `backing` is set to `lvm`.

**lvname**  Name of the LVM logical volume in which to create the volume for this container. Only applicable if `backing` is set to `lvm`.

**thinpool**  Name of a pool volume that will be used for thin-provisioning this container. Only applicable if `backing` is set to `lvm`.

**salt.states.lxc.running**(name, restart=False, path=None)

Changed in version 2015.5.0: The `lxc.started` state has been renamed to `lxc.running`

Ensure that a container is running

**Note:** This state does not enforce the existence of the named container, it just starts the container if it is not running. To ensure that the named container exists, use `lxc.present`.

**name**  The name of the container

**path**  path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

**restart**  [False] Restart container if it is already running
### lxc.set_pass

salt.states.lxc.set_pass(name, **kwargs)

**Deprecated since version 2015.5.0.**

This state function has been disabled, as it did not conform to design guidelines. Specifically, due to the fact that lxc.set_password uses chpasswd(8) to set the password, there was no method to make this action idempotent (in other words, the password would be changed every time). This makes this state redundant, since the following state will do the same thing:

```yaml
setpass:
  module.run:
    - name: set_pass
    - m_name: root
    - password: secret
```

### lxc.stopped

salt.states.lxc.stopped(name, kill=False, path=None)

Ensure that a container is stopped

**Note:** This state does not enforce the existence of the named container, it just stops the container if it running or frozen. To ensure that the named container exists, use lxc.present, or use the lxc.absent state to ensure that the container does not exist.

- **name** The name of the container
- **path** path to the container parent default: /var/lib/lxc (system default)
  
  New in version 2015.8.0.
- **kill** [False] Do not wait for the container to stop, kill all tasks in the container. Older LXC versions will stop containers like this irrespective of this argument.

  New in version 2015.5.0.

```yaml
web01:
  lxc.stopped
```

### salt.states.mac_assistive module

This state allows you to manage assistive access on macOS minions with 10.9+

Install, enable and disable assistive access on macOS minions

```bash
/usr/bin/osascript
  assistive.installed:
    - enabled: True
```

salt.states.mac_assistive.installed(name, enabled=True)

Make sure that we have the given bundle ID or path to command installed in the assistive access panel.

- **name** The bundle ID or path to command
- **enable** Should assistive access be enabled on this application?
21.19.158 salt.states.macdefaults

Writing/reading defaults from a macOS minion

salt.states.macdefaults.absent(name, domain, user=None)

Make sure the defaults value is absent

name The key of the given domain to remove
domain The name of the domain to remove from
user The user to write the defaults to

salt.states.macdefaults.write(name, domain, value, vtype='string', user=None)

Write a default to the system

name The key of the given domain to write to
domain The name of the domain to write to
value The value to write to the given key
vtype The type of value to be written, valid types are string, data, int[eger], float, bool[ean], date, array, array-add, dict, dict-add
user The user to write the defaults to

21.19.159 salt.states.mac_keychain module

Installing of certificates to the keychain

Install certificates to the macOS keychain

/mnt/test.p12:
  keychain.installed:
    - password: test123

salt.states.mac_keychain.default_keychain(name, domain='user', user=None)

Set the default keychain to use

name The chain in which to use as the default
domain The domain to use valid values are user|system|common|dynamic, the default is user
user The user to run as

salt.states.mac_keychain.installed(name, password, keychain='/Library/Keychains/System.keychain', **kwargs)

Install a p12 certificate file into the macOS keychain

name The certificate to install
password The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section
keychain The keychain to install the certificate to, this defaults to /Library/Keychains/System.keychain
allow_any Allow any application to access the imported certificate without warning
keychain_password If your keychain is likely to be locked pass the password and it will be unlocked before running the import

salt.states.mac_keychain.uninstalled(name, password, keychain='/Library/Keychains/System.keychain', keychain_password=None)

Uninstall a p12 certificate file from the macOS keychain

name The certificate to uninstall, this can be a path for a .p12 or the friendly name
password The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section
cert_name The friendly name of the certificate, this can be used instead of giving a certificate
keychain The keychain to remove the certificate from, this defaults to /Library/Keychains/System.keychain
**keychain_password**  If your keychain is likely to be locked pass the password and it will be unlocked before running the import

### 21.19.160 salt.states.macpackage

#### Installing of mac pkg files

Install any kind of pkg, dmg or app file on macOS:

```
/mnt/test.pkg:
    macpackage.installed:
        - store: True

/mnt/test.dmg:
    macpackage.installed:
        - dmg: True

/mnt/xcode.dmg:
    macpackage.installed:
        - dmg: True
        - app: True
        - target: /Applications/Xcode.app
        - version_check: xcodebuild -version=Xcode 7.1
          #7B91b
```

**salt.states.macpackage.installed**(name, target='LocalSystem', dmg=False, store=False, app=False, mpkg=False, user=None, onlyif=None, unless=None, force=False, allow_untrusted=False, version_check=None)

Install a Mac OS Package from a pkg or dmg file, if given a dmg file it will first be mounted in a temporary location

**name**  The pkg or dmg file to install

**target**  The location in which to install the package. This can be a path or LocalSystem

**dmg**  Is the given file a dmg file?

**store**  Should the pkg be installed as if it was from the Mac OS Store?

**app**  Is the file a .app? If so then we’ll just copy that to /Applications/ or the given target

**mpkg**  Is the file a .mpkg? If so then we’ll check all of the .pkg files found are installed

**user**  Name of the user performing the unless or onlyif checks

**onlyif**  A command to run as a check, run the named command only if the command passed to the onlyif option returns true

**unless**  A command to run as a check, only run the named command if the command passed to the unless option returns false

**force**  Force the package to be installed even if its already been found installed

**allow_untrusted**  Allow the installation of untrusted packages

**version_check**  The command and version that we want to check against, the version number can use regex.

```
version_check: python --version_check=2.7.[0-9]
```

### 21.19.161 salt.states.mac_xattr module

Allows you to manage extended attributes on files or directories

Install, enable and disable assistive access on macOS minions
**salt.states.mac_xattr.delete** *(name, attributes)*

Make sure the given attributes are deleted from the file/directory

- **name** The path to the file/directory
- **attributes** The attributes that should be removed from the file/directory, this is accepted as an array.

**salt.states.mac_xattr.exists** *(name, attributes)*

Make sure the given attributes exist on the file/directory

- **name** The path to the file/directory
- **attributes** The attributes that should exist on the file/directory, this is accepted as an array, with key and value split with an equals sign, if you want to specify a hex value then add 0x to the beginning of the value.

### 21.19.162 salt.states.makeconf

**Management of Gentoo make.conf**

A state module to manage Gentoo’s `make.conf` file

- **makeopts:**
  - **makeconf.present:**
    - **value:** `'-j3'`

**salt.states.makeconf.absent** *(name)*

Verify that the variable is not in the `make.conf`

- **name** The variable name. This will automatically be converted to upper case since variables in `make.conf` are in upper case

**salt.states.makeconf.present** *(name, value=None, contains=None, excludes=None)*

Verify that the variable is in the `make.conf` and has the provided settings. If value is set, contains and excludes will be ignored.

- **name** The variable name. This will automatically be converted to upper case since variables in `make.conf` are in upper case
- **value** Enforce that the value of the variable is set to the provided value
- **contains** Enforce that the value of the variable contains the provided value
- **excludes** Enforce that the value of the variable does not contain the provided value.

### 21.19.163 salt.states.marathon_app module

Configure Marathon apps via a salt proxy.

- **my_app:**
  - **marathon_app.config:**
    - **config:**
      - **cmd:** "while [ true ] ; do echo 'Hello Marathon' ; sleep 5 ; done"
      - **cpus:** 0.1
      - **mem:** 10
      - **instances:** 3

New in version 2015.8.2.
salt.states.marathon_app.absent(name)
   Ensure that the marathon app with the given id is not present.
   Parameters name – The app name/id
   Returns  A standard Salt changes dictionary

salt.states.marathon_app.config(name, config)
   Ensure that the marathon app with the given id is present and is configured to match the given config values.
   Parameters
   • name – The app name/id
   • config – The configuration to apply (dict)
   Returns  A standard Salt changes dictionary

salt.states.marathon_app.running(name, restart=False, force=True)
   Ensure that the marathon app with the given id is present and restart if set.
   Parameters
   • name – The app name/id
   • restart – Restart the app
   • force – Override the current deployment
   Returns  A standard Salt changes dictionary

21.19.164  salt.states.mdadm_raid

Managing software RAID with mdadm

depends  mdadm

A state module for creating or destroying software RAID devices.

/dev/md0:
   raid.present:
   - level: 5
   - devices:
     - /dev/xvdd
     - /dev/xvde
     - /dev/xvdf
   - chunk: 256
   - run: True

salt.states.mdadm_raid.absent(name)
   Verify that the raid is absent
   name  The name of raid device to be destroyed

   /dev/md0:
   raid:
   - absent

salt.states.mdadm_raid.present(name, level, devices, **kwargs)
   Verify that the raid is present
   Changed in version 2014.7.0.
   name  The name of raid device to be created
   level The RAID level to use when creating the raid.
   devices A list of devices used to build the array.
   kwargs  Optional arguments to be passed to mdadm.
   Example:
21.19.165 salt.states.memcached

States for Management of Memcached Keys

New in version 2014.1.0.

salt.states.memcached.absent(name, value=None, host='127.0.0.1', port=11211, time=0)

Ensure that a memcached key is not present.

name The key
value [None] If specified, only ensure that the key is absent if it matches the specified value.
host The memcached server IP address
port The memcached server port

foo:
  memcached.absent

bar:
  memcached.absent:
    - host: 10.0.0.1

salt.states.memcached.managed(name, value=None, host='127.0.0.1', port=11211, time=0, min_compress_len=0)

Manage a memcached key.

name The key to manage
value The value to set for that key
host The memcached server IP address
port The memcached server port

foo:
  memcached.managed:
    - value: bar

21.19.166 salt.states.modjk

State to control Apache modjk

salt.states.modjk.worker_activated(name, workers=None, profile='default')

Activate all the workers in the modjk load balancer

Example:

loadbalancer:
  modjk.worker_activated:
    - workers:
salt.states.modjk.worker_disabled(name, workers=None, profile='default')

Disable all the workers in the modjk load balancer

Example:

```
loadbalancer:
  modjk.worker_disabled:
    - workers:
      - app1
      - app2
```

salt.states.modjk.worker_recover(name, workers=None, profile='default')

Recover all the workers in the modjk load balancer

Example:

```
loadbalancer:
  modjk.worker_recover:
    - workers:
      - app1
      - app2
```

salt.states.modjk.worker_stopped(name, workers=None, profile='default')

Stop all the workers in the modjk load balancer

Example:

```
loadbalancer:
  modjk.worker_stopped:
    - workers:
      - app1
      - app2
```

21.19.167 salt.states.modjk_worker

Manage modjk workers

Send commands to a modjk load balancer via the peer system.

This module can be used with the prereq requisite to remove/add the worker from the load balancer before deploying/restarting service.

Mandatory Settings:

- The minion needs to have permission to publish the modjk.* functions (see here for information on configuring peer publishing permissions)
- The modjk load balancer must be configured as stated in the modjk execution module documentation

salt.states.modjk_worker.activate(name, lbn, target, profile='default', tgt_type='glob')

Changed in version 2017.7.0: The expr_form argument has been renamed to tgt_type, earlier releases must use expr_form.

Activate the named worker from the lbn load balancers at the targeted minions
Example:

```yaml
disable-before-deploy:
  modjk_worker.activate:
    - name: {{ grains['id'] }}
    - lbn: application
    - target: 'roles:balancer'
    - tgt_type: grain
```

```python
salt.states.modjk_worker.disable(name, lbn, target, profile='default', tgt_type='glob')
```

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Disable the named worker from the lbn load balancers at the targeted minions. The worker will get traffic only for current sessions and won’t get new ones.

Example:

```yaml
disable-before-deploy:
  modjk_worker.disable:
    - name: {{ grains['id'] }}
    - lbn: application
    - target: 'roles:balancer'
    - tgt_type: grain
```

```python
salt.states.modjk_worker.stop(name, lbn, target, profile='default', tgt_type='glob')
```

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Stop the named worker from the lbn load balancers at the targeted minions. The worker won’t get any traffic from the lbn.

Example:

```yaml
disable-before-deploy:
  modjk_worker.stop:
    - name: {{ grains['id'] }}
    - lbn: application
    - target: 'roles:balancer'
    - tgt_type: grain
```

**21.19.168 salt.states.module**

Execution of Salt modules from within states

**Note:** There are two styles of calling `module.run`. The legacy style will no longer be available starting in the Sodium release. To opt-in early to the new style you must add the following to your `/etc/salt/minion` config file:

```yaml
use_superseded:
  - module.run
```

With `module.run` these states allow individual execution module calls to be made via states. Here’s a contrived example, to show you how it’s done:
In the new style, the state ID (test.random_hash, in this case) is irrelevant when using `module.run`. It could have very well been written:

```plaintext
Generate a random hash:
module.run:
  - test.random_hash:
    - size: 42
    - hash_type: sha256
```

For a simple state like that it's not a big deal, but if the module you're using has certain parameters, things can get cluttered, fast. Using the contrived custom module (stuck in `/srv/salt/_modules/foo.py`, or your configured `file_roots`):

```python
def bar(name, names, fun, state, saltenv):
    return "Name: {name} Names: {names} Fun: {fun} State: {state} Saltenv: {saltenv}".format(**locals())
```

Your legacy state has to look like this:

```plaintext
# Legacy style
Unfortunate example:
module.run:
  - name: foo.bar
  - m_name: Some name
  - m_names:
    - Such names
    - very wow
  - m_state: Arkansas
  - m_fun: Such fun
  - m_saltenv: Salty
```

With the new style it's much cleaner:

```plaintext
# New style
Better:
module.run:
  - foo.bar:
    - name: Some name
    - names:
      - Such names
      - very wow
    - state: Arkansas
    - fun: Such fun
    - saltenv: Salty
```
The new style also allows multiple modules in one state. For instance, you can do this:

```yaml
Do many things:
  module.run:
    - test.random_hash:
      - size: 10
      - hash_type: md5
    # Note the `:` at the end
    - test.true:
    - test.arg:
      - this
      - has
      - args
      - and: kwargs
    - isn't: that neat?
    # Note the `:` at the end, too
    - test.version:
    - test.fib:
      - 4
```

Where in the legacy style you would have had to split your states like this:

```yaml
test.random_hash:
  module.run:
    - size: 10
    - hash_type: md5

test.nop:
  module.run

test.arg:
  module.run:
    - args:
      - this
      - has
      - args
    - kwargs:
      - and: kwargs
      - isn't: that neat?

test.version:
  module.run
```

Another difference is that in the legacy style, unconsumed arguments to the `module` state were simply passed into the module function being executed:

```yaml
show off module.run with args:
  module.run:
    - name: test.random_hash
    - size: 42
    - hash_type: sha256
```

The new style is much more explicit, with the arguments and keyword arguments being nested under the name of the function:

```yaml
show off module.run with args:
  module.run:
    # Note the lack of `name: `, and trailing `:`
```
- **test.random_hash:**
  - **size:** 42
  - **hash_type:** sha256

If the function takes *args, they can be passed in as well:

```python
args and kwargs:
    module.run:
        - **test.arg**:
            - isn't
            - this
            - fun
            - **this:** that
            - **salt:** stack
```

### Modern Examples

Here are some other examples using the modern `module.run`:

```python
fetch_out_of_band:
    module.run:
        - **git.fetch**:
            - **cwd:** /path/to/my/repo
            - **user:** myuser
            - **opts:** '--all'

A more complex example:

```python
eventsviewer:
    module.run:
        - **task.create_task**:
            - **name:** events-viewer
            - **user_name:** System
            - **action_type:** Execute
            - **cmd:** 'c:\netops\scripts\events_viewer.bat'
            - **trigger_type:** 'Daily'
            - **start_date:** '2017-1-20'
            - **start_time:** '11:59PM'
```

It is sometimes desirable to trigger a function call after a state is executed, for this the `module.wait` state can be used:

```python
add example to hosts:
    file.append:
        - **name:** /etc/hosts
        - **text:** 203.0.113.13 example.com

# New Style
mine.send:
    module.wait:
        # Again, note the trailing `:'
        - **hosts.list_hosts**:
        - **watch**:
            - **file:** add example to hosts
```
Legacy (Default) Examples

If you’re using the legacy `module.run`, due to how the state system works, if a module function accepts an argument called, `name`, then `m_name` must be used to specify that argument, to avoid a collision with the `name` argument.

Here is a list of keywords hidden by the state system, which must be prefixed with `m_`:

- `fun`
- `name`
- `names`
- `state`
- `saltenv`

For example:

```python
disable_nfs:
    module.run:
    - name: service.disable
    - m_name: nfs
```

Note that some modules read all or some of the arguments from a list of keyword arguments. For example:

```python
mine.send:
    module.run:
    - func: network.ip_addrs
    - kwargs:
        interface: eth0
```

```python
cloud.create:
    module.run:
    - func: cloud.create
    - provider: test-provider
    - m_names:
        - test-vlad
    - kwargs:
        ssh_username: 'ubuntu',
        image: 'ami-8d6d9daa',
        securitygroup: 'default',
        size: 'c3.large',
        location: 'ap-northeast-1',
        delvol_on_destroy: 'True'
```

Other modules take the keyword arguments using this style:

```python
mac_enable_ssh:
    module.run:
    - name: system.set_remote_login
    - enable: True
```

Another example that creates a recurring task that runs a batch file on a Windows system:

```python
eventsviewer:
    module.run:
```

(continues on next page)
- **name**: `task.create_task`
- **m_name**: 'events-viewer'
- **user_name**: System
- **kwargs**: {
  - **action_type**: 'Execute',
  - **cmd**: 'c:\netops\scripts\events_viewer.bat',
  - **trigger_type**: 'Daily',
  - **start_date**: '2017-1-20',
  - **start_time**: '11:59PM'
}

```python
salt.states.module.run(**kwargs)
```

Run a single module function or a range of module functions in a batch. Supersedes `module.run` function, which requires `m_` prefix to function-specific parameters.

**Parameters**

- **returner** – Specify a common returner for the whole batch to send the return data
- **kwargs** – Pass any arguments needed to execute the function(s)

```python
some_id_of_state:
module.run:
  - **network.ip_addrs**: 
    - **interface**: eth0
  - **cloud.create**: 
    - **names**: 
      - test-isbm-1
      - test-isbm-2
    - **ssh_username**: sles
    - **image**: sles12sp2
    - **securitygroup**: default
    - **size**: 'c3.large'
    - **location**: ap-northeast-1
    - **delvol_on_destroy**: True

Returns

```python
salt.states.module.wait(name, **kwargs)
```

Run a single module function only if the watch statement calls it

**Parameters**

- **name** The module function to execute
- **kwargs** Pass any arguments needed to execute the function

**Note:** Like the `cmd.run` state, this state will return `True` but not actually execute, unless one of the following two things happens:

1. The state has a `watch requisite`, and the state which it is watching changes.
2. Another state has a `watch_in requisite` which references this state, and the state with the `watch_in` changes.

1. `21.19.169 salt.states.mongodb_database`

Management of MongoDB Databases

**depends**

- `pymongo Python module`
Only deletion is supported, creation doesn’t make sense and can be done using `mongodb_user.present`.

```
salt.states.mongodb_database.absent(name, user=None, password=None, host=None, port=None, authdb=None)
```

Ensure that the named database is absent. Note that creation doesn’t make sense in MongoDB.

- **name**: The name of the database to remove
- **user**: The user to connect as (must be able to create the user)
- **password**: The password of the user
- **host**: The host to connect to
- **port**: The port to connect to
- **authdb**: The database in which to authenticate

### 21.19.170 salt.states.mongodb_user

**Management of MongoDB Users**

```
salt.states.mongodb_user.absent(name, user=None, password=None, host=None, port=None, database='admin', authdb=None)
```

Ensure that the named user is absent

- **name**: The name of the user to remove
- **user**: MongoDB user with sufficient privilege to create the user
- **password**: Password for the admin user specified by the `user` parameter
- **host**: The hostname/IP address of the MongoDB server
- **port**: The port on which MongoDB is listening
- **database**: The database from which to remove the user specified by the `name` parameter
- **authdb**: The database in which to authenticate

```
salt.states.mongodb_user.present(name, passwd, database='admin', user=None, password=None, host='localhost', port=27017, authdb=None, roles=None)
```

Ensure that the user is present with the specified properties

- **name**: The name of the user to manage
- **passwd**: The password of the user to manage
- **user**: MongoDB user with sufficient privilege to create the user
- **password**: Password for the admin user specified with the `user` parameter
- **host**: The hostname/IP address of the MongoDB server
- **port**: The port on which MongoDB is listening
- **database**: The database in which to create the user

**Note**: If the database doesn’t exist, it will be created.

- **authdb**: The database in which to authenticate
- **roles**: The roles assigned to user specified with the `name` parameter

Example:

```
mongouser-myapp:
  mongodb_user.present:
    - name: myapp
    - passwd: password-of-myapp
    - database: admin
    # Connect as admin:sekrit
    - user: admin
```

(continues on next page)
- **password**: sekrit
- **roles**:
  - readWrite
  - userAdmin
  - dbOwner

21.19.171 salt.states.monit

Monit state

Manage monit states

```yaml
monit_enable_service_monitoring:
  monit.monitor:
    - name: service

monit_disable_service_monitoring:
  monit.unmonitor:
    - name: service
```

**Note**: Use of these states require that the monit execution module is available.

**salt.states.monit.monitor(name)**
- Get the summary from module monit and try to see if service is being monitored. If not then monitor the service.

**salt.states.monit.unmonitor(name)**
- Get the summary from module monit and try to see if service is being monitored. If it is then stop monitoring the service.

21.19.172 salt.states.mount

Mounting of filesystems

Mount any type of mountable filesystem with the mounted function:

```yaml
/mnt/sdb:
  mount.mounted:
    - device: /dev/sdb1
    - fstype: ext4
    - mkmnt: True
    - opts: defaults

/srv/bigdata:
  mount.mounted:
    - device: UUID=066e8200-2867-4ebe-b9e6-f30026ca2314
    - fstype: xfs
    - opts: nobootwait,noatime,nodiratime,nobarrier,logbufs=8
    - dump: 0
    - pass_num: 2
```

- **persist**: True
- **mkmnt**: True

/var/lib/bigdata:

`mount.mounted`:
- **device**: /srv/bigdata
- **fstype**: none
- **opts**: bind
- **dump**: 0
- **pass_num**: 0
- **persist**: True
- **mkmnt**: True

```python
salt.states.mount.mod_watch(name, user=None, **kwargs)
```

The mounted watcher, called to invoke the watch command.

**Note:** This state exists to support special handling of the `watch` requisite. It should not be called directly.

Parameters for this function should be set by the state being triggered.

```python
salt.states.mount.mounted(name, device, fstype, mkmnt=False, opts=’defaults’,
dump=0, pass_num=0, config=’/etc/fstab’, persist=True,
mount=True, user=None, match_on=’auto’, device_name_regex=None,
extra_mount_invisible_options=None, extra_mount_invisible_keys=None,
extra_mount_ignore_fs_keys=None, extra_mount_translate_options=None,
hidden_opts=None, **kwargs)
```

Verify that a device is mounted.

- **name**: The name of the mount point
- **device**: The path to the location where the device is to be mounted
- **fstype**: The filesystem type, this will be `xfs`, `ext2/3/4` in the case of classic filesystems, `fuse` in the case of fuse mounts, and `nfs` in the case of nfs mounts
- **mkmnt**: If the mount point is not present then the state will fail, set `mkmnt: True` to create the mount point if it is otherwise not present
- **opts**: A list object of options or a comma delimited list
- **dump**: The dump value to be passed into the fstab, Default is 0
- **pass_num**: The pass value to be passed into the fstab, Default is 0
- **config**: Set an alternative location for the fstab, Default is `/etc/fstab`
- **persist**: Set if the mount should be saved in the fstab, Default is True
- **mount**: Set if the mount should be mounted immediately, Default is True
- **user**: The account used to execute the mount; this defaults to the user salt is running as on the minion
- **match_on**: A name or list of fstab properties on which this state should be applied. Default is `auto`, a special value indicating to guess based on fstype. In general, `auto` matches on name for recognized special devices and device otherwise.
- **device_name_regex**: A list of device exact names or regular expressions which should not force a remount.
  For example, glusterfs may be mounted with a comma-separated list of servers in fstab, but the `/proc/self/mountinfo` will show only the first available server.

```python
{% set glusterfs_ip_list = [‘10.0.0.1’, ‘10.0.0.2’, ‘10.0.0.3’] %}
```

mount glusterfs volume:
mount.mounted:
- name: /mnt/glusterfs_mount_point
- device: {{ glusterfs_ip_list|join('')}}:/volume_name
- fstype: glusterfs
- opts: _netdev, rw, defaults, direct-io-mode=disable
- mkmnt: True
- persist: True
- dump: 0
- pass_num: 0
- device_name_regex:
  - {{ glusterfs_ip_list|join('|')}}:/volume_name

New in version 2016.11.0.

extra_mount_invisible_options A list of extra options that are not visible through the /proc/self/mountinfo interface.

If a option is not visible through this interface it will always remount the device. This option extends the builtin mount_invisible_options list.

extra_mount_invisible_keys A list of extra key options that are not visible through the /proc/self/mountinfo interface.

If a key option is not visible through this interface it will always remount the device. This option extends the builtin mount_invisible_keys list.

A good example for a key option is the password option:

    password=badsecret

extra_mount_ignore_fs_keys A dict of filesystem options which should not force a remount. This will update the internal dictionary. The dict should look like this:

    {
        'ramfs': ['size']
    }

extra_mount_translate_options A dict of mount options that gets translated when mounted. To prevent a remount add additional options to the default dictionary. This will update the internal dictionary. The dictionary should look like this:

    {
        'tcp': 'proto=tcp',
        'udp': 'proto=udp'
    }

hidden_opts A list of mount options that will be ignored when considering a remount as part of the state application

New in version 2015.8.2.

salt.states.mount.swap(name, persist=True, config='/etc/fstab')

Activates a swap device

/root/swapfile:

    mount.swap

Note: swap does not currently support LABEL
salt.states.mount.unmounted(name, device=None, config='/etc/fstab', persist=False, user=None, **kwargs)

New in version 0.17.0.
Verify that a device is not mounted
name The path to the location where the device is to be unmounted from
device The device to be unmounted. This is optional because the device could be mounted in multiple places.

New in version 2015.5.0.
config Set an alternative location for the fstab, Default is /etc/fstab
persist Set if the mount should be purged from the fstab, Default is False
user The user to own the mount; this defaults to the user salt is running as on the minion

21.19.173 salt.states.msteams module

Send a message card to Microsoft Teams
This state is useful for sending messages to Teams during state runs.
New in version 2017.7.0.

teams-message:
  msteams.post_card:
    - message: 'This state was executed successfully.'
    - hook_url: https://outlook.office.com/webhook/837

The hook_url can be specified in the master or minion configuration like below:

msteams:
  hook_url: https://outlook.office.com/webhook/837

salt.states.msteams.post_card(name, message, hook_url=None, title=None, theme_color=None)
Send a message to a Microsft Teams channel

send-msteams-message:
  msteams.post_card:
    - message: 'This state was executed successfully.'
    - hook_url: https://outlook.office.com/webhook/837

The following parameters are required:
message The message that is to be sent to the MS Teams channel.
The following parameters are optional:
hook_url The webhook URL given configured in Teams interface, if not specified in the configuration options of master or minion.
title The title for the card posted to the channel
theme_color A hex code for the desired highlight color

21.19.174 salt.states.mysql_database

Management of MySQL databases (schemas)
depends
  • MySQLdb Python module
configuration See salt.modules.mysql for setup instructions.
The mysql_database module is used to create and manage MySQL databases. Databases can be set as either absent or present.

```
frank:
  mysql_database.present
```

salt.states.mysql_database.absent(name, **connection_args)
Ensure that the named database is absent
name  The name of the database to remove

salt.states.mysql_database.present(name, character_set=None, collate=None, **connection_args)
Ensure that the named database is present with the specified properties
name  The name of the database to manage

21.19.175  salt.states.mysql_grants

Management of MySQL grants (user permissions)

depends
  • MySQLdb Python module

configuration  See salt.modules.mysql for setup instructions.

The mysql_grants module is used to grant and revoke MySQL permissions.
The name you pass in purely symbolic and does not have anything to do with the grant itself.
The database parameter needs to specify a 'priv_level' in the same specification as defined in the MySQL documentation:

  • `*`
  • `**`
  • `db_name.*`
  • `db_name.tbl_name`
  • etc...

This state is not able to set password for the permission from the specified host. See salt.states.mysql_user for further instructions.

```
frank_exampledb:
  mysql_grants.present:
    - grant: select,insert,update
    - database: exampledb.*
    - user: frank
    - host: localhost

frank_otherdb:
  mysql_grants.present:
    - grant: all privileges
    - database: otherdb.*
    - user: frank

restricted_singletable:
  mysql_grants.present:
```

(continues on next page)
salt.states.mysql_grants.absent

Ensure that the grant is absent

- **name** The name (key) of the grant to add
- **grant** The grant priv_type (i.e. select, insert, update OR all privileges)
- **database** The database priv_level (i.e. db.tbl OR db.*)
- **user** The user to apply the grant to
- **host** The network/host that the grant should apply to

salt.states.mysql_grants.present

Ensure that the grant is present with the specified properties

- **name** The name (key) of the grant to add
- **grant** The grant priv_type (i.e. select, insert, update OR all privileges)
- **database** The database priv_level (i.e. db.tbl OR db.*)
- **user** The user to apply the grant to
- **host** The network/host that the grant should apply to
- **grant_option** Adds the WITH GRANT OPTION to the defined grant. Default is False
- **escape** Defines if the database value gets escaped or not. Default is True
- **revoke_first** By default, MySQL will not do anything if you issue a command to grant privileges that are more restrictive than what’s already in place. This effectively means that you cannot downgrade permissions without first revoking permissions applied to a db.table/user pair first.

To have Salt forcibly revoke perms before applying a new grant, enable the `revoke_first` options.

**WARNING:** This will remove permissions for a database before attempting to apply new permissions. There is no guarantee that new permissions will be applied correctly which can leave your database security in an unknown and potentially dangerous state. Use with caution!

- **ssl_option** Adds the specified ssl options for the connecting user as requirements for this grant. Value is a list of single-element dicts corresponding to the list of ssl options to use.

Possible key/value pairings for the dicts in the value:

- SSL: True
- X509: True
- SUBJECT: <subject>
- ISSUER: <issuer>
- CIPHER: <cipher>

The non-boolean ssl options take a string as their values, which should be an appropriate value as specified by the MySQL documentation for these options.

Default is False (no ssl options will be used)

**21.19.176 salt.states.mysql_query**

Execution of MySQL queries

New in version 2014.7.0.
depends

- MySQLdb Python module

configuration See salt.modules.mysql for setup instructions.

The mysql_query module is used to execute queries on MySQL databases. Its output may be stored in a file or in a grain.

query_id:

mysql_query.run
- database: my_database
- query:  "SELECT * FROM table;"
- output:  "/tmp/query_id.txt"

salt.states.mysql_query.run(name, database, query, output=None, grain=None, key=None, overwrite=False, check_db_exists=True, **connection_args)

Execute an arbitrary query on the specified database

name Used only as an ID
database The name of the database to execute the query on
query The query to execute
output grain: output in a grain other: the file to store results None: output to the result comment (default)
grain: grain to store the output (need output=grain)
key: the specified grain will be treated as a dictionary, the result of this state will be stored under the specified key.
overwrite: The file or grain will be overwritten if it already exists (default)
check_db_exists: The state run will check that the specified database exists (default=True) before running any queries

salt.states.mysql_query.run_file(name, database, query_file=None, output=None, grain=None, key=None, overwrite=False, saltenv=None, check_db_exists=True, **connection_args)

Execute an arbitrary query on the specified database

New in version 2017.7.0.

name Used only as an ID
database The name of the database to execute the query_file on
query_file The file of mysql commands to run
output grain: output in a grain other: the file to store results None: output to the result comment (default)
grain: grain to store the output (need output=grain)
key: the specified grain will be treated as a dictionary, the result of this state will be stored under the specified key.
overwrite: The file or grain will be overwritten if it already exists (default)
saltenv: The saltenv to pull the query_file from
check_db_exists: The state run will check that the specified database exists (default=True) before running any queries

21.19.177 salt.states.mysql_user

Management of MySQL users

depends

- MySQLdb Python module

configuration See salt.modules.mysql for setup instructions.
New in version 0.16.2: Authentication overrides have been added.

The MySQL authentication information specified in the minion config file can be overridden in states using the following arguments: `connection_host`, `connection_port`, `connection_user`, `connection_pass`, `connection_db`, `connection_unix_socket`, `connection_default_file` and `connection_charset`.

This state is not able to grant permissions for the user. See `salt.states.mysql_grants` for further instructions.

```
code
frank:
    mysql_user.present:
        - host: localhost
        - password: bobcat
```
Network ACL

Manage the firewall configuration on the network device managed through NAPALM. The firewall configuration is generated by Capirca.

New in version 2017.7.0.

- **codeauthor**: Mircea Ulinic <mircea@cloudflare.com>
- **maturity**: new
- **depends**: capirca, napalm
- **platform**: unix

Dependencies

Capirca

To install Capirca, execute:

```
pip install capirca
```

NAPALM

To be able to load configuration on network devices, it requires NAPALM library to be installed:

```
pip install napalm
```

Please check Installation for complete details.

```
salt.states.netacl.filter(name, filter_name, filter_options=None, terms=None, prepend=True, pillar_key='acl', pillarenv=None, saltenv=None, merge_pillar=False, only_lower_merge=False, revision_id=None, revision_no=None, revision_date=True, revision_date_format='%Y/%m/%d', test=False, commit=True, debug=False)
```

Generate and load the configuration of a policy filter.

- **filter_name**: The name of the policy filter.
- **filter_options**: Additional filter options. These options are platform-specific. See the complete list of options.
- **terms**: Dictionary of terms for this policy filter. If not specified or empty, will try to load the configuration from the pillar, unless merge_pillar is set as False.
- **prepend**: **True** When merge_pillar is set as True, the final list of terms generated by merging the terms from terms with those defined in the pillar (if any): new terms are prepended at the beginning, while existing ones will preserve the position. To add the new terms at the end of the list, set this argument to False.
- **pillar_key**: **acl** The key in the pillar containing the default attributes values. Default: acl.
- **pillarenv**: Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.
- **saltenv**: Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.
- **merge_pillar**: **False** Merge terms with the corresponding value from the pillar. Default: False.

---

**Note:** By default this state does not merge, to avoid any unexpected behaviours.

The merge logic depends on the prepend argument.

The terms specified through the terms argument have higher priority than the pillar.

- **only_lower_merge**: **False** Specify if it should merge only the terms fields. Otherwise it will try to merge also filters fields. Default: False. This option requires merge_pillar, otherwise it is ignored.
- **revision_id**: Add a comment in the filter config having the description for the changes applied.
**revision_no**  The revision count.

**revision_date**: True  Boolean flag: display the date when the filter configuration was generated. Default: True.

**revision_date_format**: %Y/%m/%d  The date format to be used when generating the perforce data. Default: %Y/%m/%d (<year>/<month>/<day>).

**test**: False  Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.

**commit**: True  Commit? Default: True.

**debug**: False  Debug mode. Will insert a new key under the output dictionary, as loaded_config containing the raw configuration loaded on the device.

**CLI Example:**

```
salt 'edge01.flw01' state.sls router.acl test=True
```

**Output Example:**

```
edge01.flw01:
----------
ID: my-filter
Function: netacl.filter
Result: None
Comment: Testing mode: Configuration discarded.

Summary for edge01.flw01
----------
Succeeded: 1 (unchanged=1, changed=1)
Failed: 0
----------
Total states run: 1
Total run time: 2.437 s
```

**Pillar example:**
State SLS Example:

```yaml
{% set filter_name = 'my-filter' %}
{% set my_filter_cfg = salt.netacl.get_filter_pillar(filter_name, pillar_key='firewall') %}

my_first_filter_state:
  netacl.filter:
    - filter_name: {{ filter_name }}
    - options: {{ my_filter_cfg['options'] | json }}
    - terms: {{ my_filter_cfg['terms'] | json }}
    - revision_date: false
    - revision_no: 5
    - debug: true

Or:

my_first_filter_state:
  netacl.filter:
    - filter_name: my-filter
    - merge_pillar: true
    - pillar_key: firewall
    - revision_date: false
    - revision_no: 5
    - debug: true
```

In the example above, as `inet6` has been specified in the `filter_options`, the configuration chunk referring to `my-term` has been ignored as it referred to IPv4 only (from `source_address` field).

**Note:** The first method allows the user to eventually apply complex manipulation and / or retrieve the data from external services before passing the data to the state. The second one is more straightforward, for less complex cases when loading the data directly from the pillar is sufficient.

**Note:** When passing retrieved pillar data into the state file, it is strongly recommended to use the json serializer explicitly (" | json"), instead of relying on the default Python serializer.
salt.states.netacl.managed(name, filters=None, prepend=True, pillar_key='acl', pillarenv=None, saltenv=None, merge_pillar=False, only_lower_merge=False, revision_id=None, revision_no=None, revision_date=True, revision_date_format='%Y/%m/%d', test=False, commit=True, debug=False)

Manage the whole firewall configuration.

**filters** Dictionary of filters for this policy. If not specified or empty, will try to load the configuration from the pillar, unless `merge_pillar` is set as `False`.

**prepend**: `True` When `merge_pillar` is set as `True`, the final list of filters generated by merging the filters from `filters` with those defined in the pillar (if any): new filters are prepended at the beginning, while existing ones will preserve the position. To add the new filters at the end of the list, set this argument to `False`.

**pillar_key**: `acl` The key in the pillar containing the default attributes values. Default: `acl`.

**pillarenv** Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv** Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

**merge_pillar**: `False` Merge the filters will the corresponding values from the pillar. Default: `False`.

---

**Note**: By default this state does not merge, to avoid any unexpected behaviours.

The merge logic depends on the `prepend` argument.

The filters specified through the `filters` argument have higher priority than the pillar.

**only_lower_merge**: `False` Specify if it should merge only the filters and terms fields. Otherwise it will try to merge everything at the policy level. Default: `False`. This option requires `merge_pillar`, otherwise it is ignored.

**test**: `False` Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

**revision_id** Add a comment in the policy config having the description for the changes applied.

**revision_no** The revision count.

**revision_date**: `True` Boolean flag: display the date when the policy configuration was generated. Default: `True`.

**revision_date_format**: `%Y/%m/%d` The date format to be used when generating the perforce data. Default: `%Y/%m/%d (%<year>-%<month>-%<day>).` 

**commit**: `True` Commit? Default: `True`.

**debug**: `False` Debug mode. Will insert a new key under the output dictionary, as `loaded_config containing the raw configuration loaded on the device.`

---

**CLI Example:**

```
salt 'edge01.bjm01' state.sls router.acl test=True
```

**Output Example:**

Summary for edge01.bjm01
-------------
Succeeded: 1 (unchanged=1, changed=1)
Failed: 0
-------------
Total states run: 1
Total run time: 5.569 s

The policy configuration has been loaded from the pillar, having the following structure:
firewall:
- my-filter:
  terms:
  - my-term:
    source_port: [1234, 1235]
    protocol:
      - tcp
      - udp
    source_address: 1.2.3.4
    action: reject
  - my-other-term:
    source_port: [5678, 5680]
    protocol: tcp
    action: accept
- block-icmp:
  terms:
  - first-term:
    protocol:
      - icmp
    action: reject

Example SLS file:

```yaml
{% set fw_filters = pillar.get('firewall', {}) %}
netacl_example:
  netacl.managed:
    - filters: {{ fw_filters | json }}
    - revision_no: 2
    - debug: true
```

Or:

```yaml
netacl_example:
  netacl.managed:
    - pillar_key: firewall
    - merge_pillar: true
    - revision_no: 2
    - debug: true
```

**Note:** The first method allows the user to eventually apply complex manipulation and / or retrieve the data from external services before passing the data to the state. The second one is more straightforward, for less complex cases when loading the data directly from the pillar is sufficient.

**Note:** When passing retrieved pillar data into the state file, it is strongly recommended to use the json serializer explicitly (" | json"), instead of relying on the default Python serializer.

`salt.states.netacl.term(name, filter_name, term_name, filter_options=None, pillar_key='acl', pillarenv=None, saltenv=None, merge_pillar=False, revision_id=None, revision_no=None, revision_date=True, revision_date_format='%Y/%m/%d', test=False, commit=True, debug=False, source_service=None, destination_service=None, **term_fields)`

Manage the configuration of a specific policy term.

*filter_name* The name of the policy filter.
term_name  The name of the term.

filter_options  Additional filter options. These options are platform-specific. See the complete list of options.

pillar_key: acl  The key in the pillar containing the default attributes values. Default: acl.

pillarenv  Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

saltenv  Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.

merge_pillar: False  Merge the CLI variables with the pillar. Default: False.

The properties specified through the state arguments have higher priority than the pillar.

revision_id  Add a comment in the term config having the description for the changes applied.

revision_no  The revision count.

revision_date: True  Boolean flag: display the date when the term configuration was generated. Default: True.

revision_date_format: %Y/%m/%d  The date format to be used when generating the perforce data. Default: %Y/%m/%d (<year>/<month>/<day>).

test: False  Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.

dbgt: False  Debug mode. Will insert a new key under the output dictionary, as loaded_config containing the raw configuration loaded on the device.

source_service  A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a source_port and protocol.

As this module is available on Unix platforms only, it reads the IANA port assignment from /etc/services.

If the user requires additional shortcuts to be referenced, they can add entries under /etc/services, which can be managed using the file state.

destination_service  A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a destination_port and protocol. Allows the same options as source_service.

term_fields  Term attributes. To see what fields are supported, please consult the list of supported keywords.

Some platforms have few other optional keywords.

Note: The following fields are accepted:

• action
• address
• address_exclude
• comment
• counter
• expiration
• destination_address
• destination_address_exclude
• destination_port
• destination_prefix
• forwarding_class
• forwarding_class_except
• logging
• log_name
• loss_priority
• option
• policer
• port
• precedence
• principals
• protocol
- protocol_except
- qos
- pan_application
- routing_instance
- source_address
- source_address_exclude
- source_port
- source_prefix
- verbatim
- packet_length
- fragment_offset
- hop_limit
- icmp_type
- ether_type
- traffic_class_count
- traffic_type
- translated
- dscp_set
- dscp_match
- dscp_except
- next_ip
- flexible_match_range
- source_prefix_except
- destination_prefix_except
- vpn
- source_tag
- destination_tag
- source_interface
- destination_interface
- flattened
- flattened_addr
- flattened_saddr
- flattened_daddr
- priority

**Note:** The following fields can be also a single value and a list of values:
- action
- address
- address_exclude
- comment
- destination_address
- destination_address_exclude
- destination_port
- destination_prefix
- forwarding_class
- forwarding_class_except
- logging
- option
- port
- precedence
- principals
- protocol
- protocol_except
- pan_application
- source_address
- source_address_exclude
- source_port
- source_prefix
- verbatim
- icmp_type
- ether_type
- traffic_type
- dscp_match
- dscp_except
- flexible_match_range
- source_prefix_except
- destination_prefix_except
- source_tag
- destination_tag
- source_service
- destination_service

Example: destination_address can be either defined as:

```
| destination_address: 172.17.17.1/24 |
```

or as a list of destination IP addresses:

```
<table>
<thead>
<tr>
<th>destination_address:</th>
</tr>
</thead>
<tbody>
<tr>
<td>172.17.17.1/24</td>
</tr>
<tr>
<td>172.17.19.1/24</td>
</tr>
</tbody>
</table>
```

or a list of services to be matched:

```
<table>
<thead>
<tr>
<th>source_service:</th>
</tr>
</thead>
<tbody>
<tr>
<td>ntp</td>
</tr>
<tr>
<td>snmp</td>
</tr>
<tr>
<td>ldap</td>
</tr>
<tr>
<td>bgpd</td>
</tr>
</tbody>
</table>
```

**Note:** The port fields source_port and destination_port can be used as above to select either a single value, either a list of values, but also they can select port ranges. Example:

```
<table>
<thead>
<tr>
<th>source_port:</th>
</tr>
</thead>
<tbody>
<tr>
<td>[1000, 2000]</td>
</tr>
<tr>
<td>[3000, 4000]</td>
</tr>
</tbody>
</table>
```

With the configuration above, the user is able to select the 1000-2000 and 3000-4000 source port ranges.

**CLI Example:**

```
salt 'edge01.bjm01' state.sls router.acl
```

Output Example:
edge01.bjm01:

----------

ID: update_icmp_first_term
Function: netacl.term
Result: None
Comment: Testing mode: Configuration discarded.
Started: 12:49:09.174179
Duration: 5751.882 ms
Changes:

----------

diff:

+ + */
+ + filter block-icmp {
+ +   term first-term {
+ +     from {
+ +       protocol icmp;
+ +     }
+ +     then {
+ +       reject;
+ +     }
+ +   }
+ + }
+ }

Summary for edge01.bjm01
----------
Succeeded: 1 (unchanged=1, changed=1)
Failed: 0
----------
Total states run: 1
Total run time: 5.752 s

Pillar example:

```
firewall:
  - block-icmp:
    terms:
      - first-term:
        protocol:
          - icmp
        action: reject
```

State SLS example:

```
{%- set filter_name = 'block-icmp' -%}
{%- set term_name = 'first-term' -%}
{%- set my_term_cfg = salt.netacl.get_term_pillar(filter_name, term_name) -%}

update_icmp_first_term:
  netacl.term:
    - filter_name: {{ filter_name }}
```

(continues on next page)
- filter_options:
  - not-interface-specific
- term_name: {{ term_name }}
- {{ my_termCfg | json }}

Or directly referencing the pillar keys:

```
update_icmp_first_term:
  netacl.term:
    - filter_name: block-icmp
    - filter_options:
      - not-interface-specific
    - term_name: first-term
    - merge_pillar: true
```

**Note:** The first method allows the user to eventually apply complex manipulation and/or retrieve the data from external services before passing the data to the state. The second one is more straightforward, for less complex cases when loading the data directly from the pillar is sufficient.

**Note:** When passing retrieved pillar data into the state file, it is strongly recommended to use the json serializer explicitly ("| json"), instead of relying on the default Python serializer.

### 21.19.179 salt.states.netconfig

**Network Config**

Manage the configuration on a network device given a specific static config or template.

**codeauthor** Mircea Ulinic <mircea@cloudflare.com> & Jerome Fleury <jf@cloudflare.com>

**maturity** new

**depends** napalm

**platform** unix

**Dependencies**

- NAPALM proxy minion
- Network-related basic features execution module

New in version 2017.7.0.

**salt.states.netconfig.commit_cancelled**(name)

New in version 2019.2.0.

Cancel a commit scheduled to be executed via the commit_in and commit_at arguments from the net.load_template or net.load_config execution functions. The commit ID is displayed when the commit is scheduled via the functions named above.

State SLS Example:
salt.states.netconfig.commit_cancelled

New in version 2019.2.0.

Confirm a commit scheduled to be reverted via the revert_in and revert_at arguments from the net.
load_template or net.load_config execution functions. The commit ID is displayed when the com-
mit confirmed is scheduled via the functions named above.

State SLS Example:

```
'20180726083540640360':
    netconfig.commit_confirmed
```

salt.states.netconfig.commit_confirmed(name)

New in version 2019.2.0.

Confirm a commit scheduled to be reverted via the revert_in and revert_at arguments from the net.
load_template or net.load_config execution functions. The commit ID is displayed when the com-
mit confirmed is scheduled via the functions named above.

State SLS Example:

```
'20180726083540640360':
    netconfig.commit_confirmed
```

salt.states.netconfig.managed(name, template_name=None, template_source=None, tem-
plate_hash=None, template_hash_name=None, saltenv='base', template_engine='jinja', skip_verify=False, context=None, defaults=None, test=False, commit=True, debug=False, replace=False, commit_in=None, commit_at=None, revert_in=None, revert_at=None, **template_vars)

Manages the configuration on network devices.

By default this state will commit the changes on the device. If there are no changes required, it does not
commit and the field already_configured from the output dictionary will be set as True to notify that.

To avoid committing the configuration, set the argument test to True (or via the CLI argument
test=True) and will discard (dry run).

To preserve the changes, set commit to False (either as CLI argument, either as state parameter). However,
this is recommended to be used only in exceptional cases when there are applied few consecutive states and/or
configuration changes. Otherwise the user might forget that the config DB is locked and the candidate config
buffer is not cleared/merged in the running config.

To replace the config, set replace to True. This option is recommended to be used with caution!

**template_name** Identifies path to the template source. The template can be either stored on the local machine,
either remotely. The recommended location is under the file_roots as specified in the master config
file. For example, let's suppose the file_roots is configured as:

```
file_roots:
    base:
    - /etc/salt/states
```

Placing the template under /etc/salt/states/templates/example.jinja, it can be used as salt://templates/example.jinja. Alternatively, for local files, the user can specify the absolute path. If remotely, the source can be retrieved via http, https or ftp.

Examples:
- salt://my_template.jinja
- /absolute/path/to/my_template.jinja
- http://example.com/template.cheetah
- https://example.com/template.mako
- ftp://example.com/template.py

Changed in version 2019.2.0: This argument can now support a list of templates to be rendered. The
resulting configuration text is loaded at once, as a single configuration chunk.

**template_source**: None Inline config template to be rendered and loaded on the device.

**template_hash**: None Hash of the template file. Format: {hash_type: 'md5', 'hsum':<md5sum>}

21.19. state modules 3499
template_hash_name: None  When template_hash refers to a remote file, this specifies the filename to look for in that file.
saltenv: base  Specifies the template environment. This will influence the relative imports inside the templates.
template_engine: jinja  The following templates engines are supported:
  • cheetah
  • genshi
  • jinja
  • mako
  • py
  • wempy
skip_verify: False  If True, hash verification of remote file sources (http://, https://, ftp://) will be skipped, and the source_hash argument will be ignored.

Changed in version 2017.7.1.
test: False  Dry run? If set to True, will apply the config, discard and return the changes. Default: False (will commit the changes on the device).
debug: False  Debug mode. Will insert a new key under the output dictionary, as loaded_config containing the raw result after the template was rendered.

Note:  This argument cannot be used directly on the command line. Instead, it can be passed through the pillar variable when executing either of the state.sls or state.apply (see below for an example).

commit_in: None  Commit the changes in a specific number of minutes / hours. Example of accepted formats: 5 (commit in 5 minutes), 2m (commit in 2 minutes), 1h (commit the changes in 1 hour), 5h30m (commit the changes in 5 hours and 30 minutes).

Note:  This feature works on any platforms, as it does not rely on the native features of the network operating system.

Note:  After the command is executed and the diff is not satisfactory, or for any other reasons you have to discard the commit, you are able to do so using the net.cancel_commit execution function, using the commit ID returned by this function.

Warning:  Using this feature, Salt will load the exact configuration you expect, however the diff may change in time (i.e., if an user applies a manual configuration change, or a different process or command changes the configuration in the meanwhile).

New in version 2019.2.0.
commit_at: None  Commit the changes at a specific time. Example of accepted formats: 1am (will commit the changes at the next 1AM), 13:20 (will commit at 13:20), 1:20am, etc.

Note:  This feature works on any platforms, as it does not rely on the native features of the network operating system.

Note:  After the command is executed and the diff is not satisfactory, or for any other reasons you
have to discard the commit, you are able to do so using the `net.cancel_commit` execution function, using the commit ID returned by this function.

**Warning:** Using this feature, Salt will load the exact configuration you expect, however the diff may change in time (i.e., if an user applies a manual configuration change, or a different process or command changes the configuration in the meanwhile).

New in version 2019.2.0.

`revert_in`: **None** Commit and revert the changes in a specific number of minutes / hours. Example of accepted formats: 5 (revert in 5 minutes), 2m (revert in 2 minutes), 1h (revert the changes in 1 hour), 5h30m (revert the changes in 5 hours and 30 minutes).

**Note:** To confirm the commit, and prevent reverting the changes, you will have to execute the `net.confirm_commit` function, using the commit ID returned by this function.

**Warning:** This works on any platform, regardless if they have or don’t have native capabilities to confirming a commit. However, please be very cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don’t have this capability natively, therefore the revert is done via Salt. That means, your device needs to be reachable at the moment when Salt will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.

Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.

New in version 2019.2.0.

`revert_at`: **None** Commit and revert the changes at a specific time. Example of accepted formats: 1am (will commit and revert the changes at the next 1AM), 13:20 (will commit and revert at 13:20), 1:20am, etc.

**Note:** To confirm the commit, and prevent reverting the changes, you will have to execute the `net.confirm_commit` function, using the commit ID returned by this function.

**Warning:** This works on any platform, regardless if they have or don’t have native capabilities to confirming a commit. However, please be very cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don’t have this capability natively, therefore the revert is done via Salt. That means, your device needs to be reachable at the moment when Salt will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.

Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.
New in version 2019.2.0.

**replace** : False  Load and replace the configuration. Default: False (will apply load merge).

**context** : None  Overrides default context variables passed to the template.

New in version 2019.2.0.

**defaults** : None  Default variables/context passed to the template.

**template_vars**  Dictionary with the arguments/context to be used when the template is rendered. Do not explicitly specify this argument. This represents any other variable that will be sent to the template rendering system. Please see an example below! In both ntp_peers_example_using_pillar and ntp_peers_example, peers is sent as template variable.

**Note:** It is more recommended to use the context argument instead, to avoid any conflicts with other arguments.

SLS Example (e.g.: under salt://router/config.sls):

```yaml
whole_config_example:
  netconfig.managed:
    - template_name: salt://path/to/complete_config.jinja
    - debug: True
    - replace: True

bgp_config_example:
  netconfig.managed:
    - template_name: /absolute/path/to/bgp_neighbors.mako
    - template_engine: mako

prefix_lists_example:
  netconfig.managed:
    - template_name: prefix_lists.cheetah
    - debug: True
    - template_engine: cheetah

ntp_peers_example:
  netconfig.managed:
    - template_name: http://bit.ly/2gKOj20
    - skip_verify: False
    - debug: True
    - peers:
      - 192.168.0.1
      - 192.168.0.1

ntp_peers_example_using_pillar:
  netconfig.managed:
    - template_name: http://bit.ly/2gKOj20
    - peers: {{ pillar.get('ntp.peers', []) }}
```

Multi template example:

```yaml
hostname_and_ntp:
  netconfig.managed:
    - template_name:
    - debug: true
    - context:
      - hostname: {{ opts.id }}
      - servers:
        - 172.17.17.1
        - 172.17.17.2
```

(continues on next page)
Usage examples:

$ sudo salt 'juniper.device' state.sls router.config test=True

$ sudo salt -N all-routers state.sls router.config pillar="{'debug': True}"

router.config depends on the location of the SLS file (see above). Running this command, will be executed all five steps from above. These examples above are not meant to be used in a production environment, their sole purpose is to provide usage examples.

Output example:

$ sudo salt 'juniper.device' state.sls router.config test=True
juniper.device:
----------
ID: ntp_peers_example_using_pillar
Function: netconfig.managed
Result: None
Comment: Testing mode: Configuration discarded.
Started: 12:01:40.744535
Duration: 8755.788 ms
Changes:
----------

    [edit system ntp]
    peer 192.168.0.1 { ... }
    + peer 172.17.17.1;
    + peer 172.17.17.3;

Summary for juniper.device
----------
Succeeded: 1 (unchanged=1, changed=1)
Failed: 0
----------
Total states run: 1
Total run time: 8.756 s

Raw output example (useful when the output is reused in other states/execution modules):

$ sudo salt --out=pprint 'juniper.device' state.sls router.config test=True
diff: [edit system ntp]
    peer 192.168.0.1 { ... }
    + peer 172.17.17.1;
    + peer 172.17.17.3;

(continues on next page)

'result': None,
'start_time': '12:09:09.814455'
}
}
}

salt.states.netconfig.replace_pattern(name, pattern, repl, count=0, flags=8,
bufsize=1, append_if_not_found=False,
prepend_if_not_found=False,
not_found_content=None, search_only=False,
show_changes=True, backslash_literal=False,
source='running', path=None, test=False, replace=True,
deploy=False, commit=True)
```

New in version 2019.2.0.

Replace occurrences of a pattern in the configuration source. If `show_changes` is `True`, then a diff of what changed will be returned, otherwise a `True` will be returned when changes are made, and `False` when no changes are made. This is a pure Python implementation that wraps Python’s `sub()`.

- **pattern** A regular expression, to be matched using Python’s `search()`.
- **repl** The replacement text.
- **count** Maximum number of pattern occurrences to be replaced. If count is a positive integer n, only n occurrences will be replaced, otherwise all occurrences will be replaced.
- **flags** A list of flags defined in the `re` module documentation from the Python standard library. Each list item should be a string that will correlate to the human-friendly flag name. E.g., `['IGNORECASE', 'MULTILINE']`. Optionally, flags may be an int, with a value corresponding to the XOR (`|`) of all the desired flags. Defaults to 8 (which supports 'MULTILINE').
- **bufsize** How much of the configuration to buffer into memory at once. The default value processes one line at a time. The special value `file` may be specified which will read the entire file into memory before processing.
- **append_if_not_found** If set to `True`, and pattern is not found, then the content will be appended to the file.
- **prepend_if_not_found** If set to `True` and pattern is not found, then the content will be prepended to the file.
- **not_found_content** Content to use for append/prepend if not found. If None (default), uses `repl`. Useful when `repl` uses references to group in pattern.
- **search_only** If set to `True`, this no changes will be performed on the file, and this function will simply return `True` if the pattern was matched, and `False` if not.
- **show_changes** If `True`, return a diff of changes made. Otherwise, return `True` if changes were made, and `False` if not.
- **backslash_literal** Interpret backslashes as literal backslashes for the `repl` and not escape characters. This will help when using append/prepend so that the backslashes are not interpreted for the `repl` on the second run of the state.
- **source** The configuration source. Choose from: `running`, `candidate`, or `startup`. Default: `running`.
- **path** Save the temporary configuration to a specific path, then read from there.
- **test** Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.
- **commit** Commit the configuration changes? Default: `True`.
**debug**: `False` Debug mode. Will insert a new key in the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

**replace**: `True` Load and replace the configuration. Default: `True`.
If an equal sign (`=`) appears in an argument to a Salt command it is interpreted as a keyword argument in the format `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

State SLS Example:

```python
def update_policy_name:
    netconfig.replace_pattern:
        - pattern: OLD-POLICY-NAME
        - repl: new-policy-name
        - debug: true
```

`salt.states.netconfig.saved` (name, source='running', user=None, group=None, mode=None, attrs=None, makedirs=False, dir_mode=None, replace=True, backup='', show_changes=True, create=True, tmp_dir='', tmp_ext='', encoding=None, encoding_errors='strict', allow_empty=False, follow_symlinks=True, check_cmd=None, win_owner=None, win_perms=None, win_deny_perms=None, win_inheritance=True, win_perms_reset=False, **kwargs)

New in version 2019.2.0.

Save the configuration to a file on the local file system.

- **name** Absolute path to file where to save the configuration. To push the files to the Master, use `cp.push` Execution function.
- **user** The user to own the file, this defaults to the user salt is running as on the minion.
- **group** The group ownership set for the file, this defaults to the group salt is running as on the minion. On Windows, this is ignored.
- **mode** The permissions to set on this file, e.g. `644`, `0775`, or `4664`. The default mode for new files and directories corresponds to the umask of the salt process. The mode of existing files and directories will only be changed if `mode` is specified.

**Note**: This option is **not** supported on Windows.

- **attrs** The attributes to have on this file, e.g. `a`, `i`. The attributes can be any or a combination of the following characters: `aAcCdDeijPsStTu`.

**Note**: This option is **not** supported on Windows.

- **makedirs**: `False` If set to `True`, then the parent directories will be created to facilitate the creation of the named file. If `False`, and the parent directory of the destination file doesn’t exist, the state will fail.
- **dir_mode** If directories are to be created, passing this option specifies the permissions for those directories. If this is not set, directories will be assigned permissions by adding the execute bit to the mode of the files.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it’s not enforced.

- **replace**: `True` If set to `False` and the file already exists, the file will not be modified even if changes would otherwise be made. Permissions and ownership will still be enforced, however.
- **backup** Overrides the default backup mode for this specific file. See `backup_mode documentation` for more details.
show_changes: True Output a unified diff of the old file and the new file. If False return a boolean if any changes were made.

create: True If set to False, then the file will only be managed if the file already exists on the system.

encoding If specified, then the specified encoding will be used. Otherwise, the file will be encoded using the system locale (usually UTF-8). See https://docs.python.org/3/library/codecs.html#standard-encodings for the list of available encodings.

encoding_errors: 'strict' Error encoding scheme. Default is 'strict'. See https://docs.python.org/2/library/codecs.html#codec-base-classes for the list of available schemes.

allow_empty: True If set to False, then the state will fail if the contents specified by contents_pillar or contents_grains are empty.

follow_symlinks: True If the desired path is a symlink follow it and make changes to the file to which the symlink points.

check_cmd The specified command will be run with an appended argument of a temporary file containing the new managed contents. If the command exits with a zero status the new managed contents will be written to the managed destination. If the command exits with a nonzero exit code, the state will fail and no changes will be made to the file.

tmp_dir Directory for temp file created by check_cmd. Useful for checkers dependent on config file location (e.g. daemons restricted to their own config directories by an apparmor profile).

tmp_ext Suffix for temp file created by check_cmd. Useful for checkers dependent on config file extension (e.g. the init-checkconf upstart config checker).

win_owner: None The owner of the directory. If this is not passed, user will be used. If user is not passed, the account under which Salt is running will be used.

win_perms: None A dictionary containing permissions to grant and their propagation. For example: {'Administrators': {'perms': 'full_control'}} Can be a single basic perm or a list of advanced perms. perms must be specified. applies_to does not apply to file objects.

win_deny_perms: None A dictionary containing permissions to deny and their propagation. For example: {'Administrators': {'perms': 'full_control'}} Can be a single basic perm or a list of advanced perms. perms must be specified. applies_to does not apply to file objects.

win_inheritance: True True to inherit permissions from the parent directory, False not to inherit permission.

win_perms_reset: False If True the existing DACL will be cleared and replaced with the settings defined in this function. If False, new entries will be appended to the existing DACL. Default is False.

State SLS Example:

```
/var/backups/{{ opts.id }}/{{ salt.status.time('%s') }}.cfg:
    netconfig.saved:
        - source: running
        - makedirs: true
```

The state SLS above would create a backup config grouping the files by the Minion ID, in chronological files. For example, if the state is executed at on the 3rd of August 2018, at 5:15PM, on the Minion core1.lon01, the configuration would saved in the file: /var/backups/core01.lon01/1533316558.cfg

21.19.180 salt.states.netntp

Network NTP

Manage the configuration of NTP peers and servers on the network devices through the NAPALM proxy.

codeauthor Mircea Ulinic <mircea@cloudflare.com> & Jerome Fleury <jf@cloudflare.com>
maturity new
depends napalm
platform unix
Dependencies

- Requires netaddr to be installed: `pip install netaddr` to check if IP Addresses are correctly specified
- Requires dnspython to be installed: `pip install dnspython` to resolve the nameserver entities (in case the user does not configure the peers/servers using their IP addresses)
- NAPALM proxy minion
- NTP operational and configuration management module

`salt.states.netntp.managed(name, peers=None, servers=None)`

Manages the configuration of NTP peers and servers on the device, as specified in the state SLS file. NTP entities not specified in these lists will be removed whilst entities not configured on the device will be set.

SLS Example:

```yaml
netntp_example:
  netntp.managed:
    - peers:
      - 192.168.0.1
      - 172.17.17.1
    - servers:
      - 24.124.0.251
      - 138.236.128.36
```

Output example:

```yaml
{'edge01.nrt04': {
  'netntp_|-netntp_example_|-netntp_example_|-managed': {
    'comment': 'NTP servers already configured as needed.',
    'name': 'netntp_example',
    'start_time': '12:45:24.056659',
    'duration': 2938.857,
    'changes': {
      'peers': {
        'removed': [
          '192.168.0.2',
          '192.168.0.3'
        ],
        'added': [
          '192.168.0.1',
          '172.17.17.1'
        ]
      }
    },
    'result': None
  }
}}
```

21.19.181 `salt.states.netsnmp`

Network SNMP

Manage the SNMP configuration on network devices.
Dependencies

- napalm snmp management module (salt.modules.napalm_snmp)

salt.states.netsnmp.managed(name, config=None, defaults=None)

Configures the SNMP on the device as specified in the SLS file.

SLS Example:

```python
snmp_example:
  netsnmp.managed:
    - config:
      location: Honolulu, HI, US
    - defaults:
      contact: noc@cloudflare.com
```

Output example (for the SLS above, e.g. called snmp.sls under /router/):

```
$ sudo salt edge01.hnl01 state.sls router.snmp test=True
edge01.hnl01:
    ----------
    ID: snmp_example
    Function: netsnmp.managed
    Result: None
    Comment: Testing mode: configuration was not changed!
    Started: 13:29:06.872363
    Duration: 920.466 ms
    Changes:  
        added:  
        chassis_id: None
        contact: noc@cloudflare.com
        location: Honolulu, HI, US

Summary for edge01.hnl01
    ----------
    Succeeded: 1 (unchanged=1, changed=1)
    Failed: 0
    ----------
    Total states run: 1
    Total run time: 920.466 ms
```

21.19.182 salt.states.netusers
Network Users

Manage the users configuration on network devices via the NAPALM proxy.

codeauthor Mircea Ulinic <mircea@cloudflare.com>
maturity new
depends napalm
platform unix

Dependencies

- NAPALM proxy minion
- Users configuration management module

New in version 2016.11.0.

salt.states.netusers.managed(name, users=None, defaults=None)

Manages the configuration of the users on the device, as specified in the state SLS file. Users not defined in that file will be removed whilst users not configured on the device, will be added.

SLS Example:

```yaml
netusers_example:
  netusers.managed:
    - users:
      admin:
        - level: 15
        password: $1$knmhgPPv$g8745biu4rb.Zf.ITE/U1
        sshkeys: []
      restricted:
        - level: 1
        password: $1$j34j5k4b$4d5SVjTiz1l.Zf.ITE/K7
      martin:
        - level: 15
        password: '
        sshkeys:
          - ssh-dss AAAAB3NzaC1kc3MAAACBAK9dP3KariMlM/...jFtIt0thEDKPjFJxW9bAAAAB3NzaC1y2EAAADQQABAAAAAQDcgxG6HZF/
```

(continues on next page)
CLI Example:

```
salt 'edge01.kix01' state.sls router.users
```

Output example (raw python - can be reused in other modules):

```python
{
    'netusers_|-netusers_example_|-netusers_example_|-managed': {
        'comment': 'Configuration updated!',
        'name': 'netusers_example',
        'start_time': '10:57:08.678811',
        '__id__': 'netusers_example',
        'duration': 1620.982,
        '__run_num__': 0,
        'changes': {
            'updated': {
                'admin': {
                    'level': 15
                },
                'restricted': {
                    'level': 1
                },
                'martin': {
                    'sshkeys': [
                        'ssh-dss AAAAB3NzaC1kc3MAAABABK9dP3KariMLM/
                    ]
                },
            },
            'added': {
                'jonathan': {
                    'password': '',
                    'sshkeys': [
                        'ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAABAQOeEm7z5yy0
                    ]
                },
            },
        },
    }
}
```
CLI Output:

edge01.kix01:

```json
Bx9dW26zc40+hi6754trxcfgvhvjo98765drt/
  LYEg0KSQPWy3EK1g31gacbxN7Ab006xeHh7rv7HtXF6zH3WId

  }, 'level': 15
  }, 'removed': {
    } 
  }, 'result': True
```

```json
edge01.kix01:

```
21.19.183 salt.states.network

Configuration of network interfaces

The network module is used to create and manage network settings, interfaces can be set as either managed or ignored. By default all interfaces are ignored unless specified.

Note: RedHat-based systems (RHEL, CentOS, Scientific, etc.) have been supported since version 2014.1.0. Debian-based systems (Debian, Ubuntu, etc.) have been supported since version 2017.7.0. The following options are not supported: ipaddr_start, and ipaddr_end. Other platforms are not yet supported.

Note: On Debian-based systems, networking configuration can be specified in `/etc/network/interfaces` or via included files such as (by default) `/etc/network/interfaces.d/*`. This can be problematic for configuration management. It is recommended to use either `file.managed` or `network.managed`.

If using `network.managed`, it can be useful to ensure `interfaces.d/` is empty. This can be done using:

```
/etc/network/interfaces.d:

file.directory:
  * clean: True
```
system:
  network.system:
    - enabled: True
    - hostname: server1.example.com
    - gateway: 192.168.0.1
    - gatewaydev: eth0
    - nozeroconf: True
    - nisdomain: example.com
    - require_reboot: True

eth0:
  network.managed:
    - enabled: True
    - type: eth
    - proto: static
    - ipaddr: 10.1.0.7
    - netmask: 255.255.255.0
    - gateway: 10.1.0.1
    - enable_ipv6: true
    - ipv6proto: static
    - ipv6ipaddrs:
      - 2001:db8:dead:beef::3/64
      - 2001:db8:dead:beef::7/64
    - ipv6gateway: 2001:db8:dead:beef::1
    - ipv6netmask: 64
    - dns:
      - 8.8.8.8
      - 8.8.4.4

eth0-range0:
  network.managed:
    - type: eth
    - ipaddr_start: 192.168.1.1
    - ipaddr_end: 192.168.1.10
    - clonenum_start: 10
    - mtu: 9000

bond0-range0:
  network.managed:
    - type: eth
    - ipaddr_start: 192.168.1.1
    - ipaddr_end: 192.168.1.10
    - clonenum_start: 10
    - mtu: 9000

eth1.0-range0:
  network.managed:
    - type: eth
    - ipaddr_start: 192.168.1.1
    - ipaddr_end: 192.168.1.10
    - clonenum_start: 10

- **type**: eth
- **proto**: loopback
- **onboot**: yes
- **userctl**: no
- **ipv6_autoconf**: no
- **enable_ipv6**: true
```

.. note::
   Apply changes to hostname immediately.

.. versionadded:: 2015.5.0

**system**

```yaml
network.system:
- **hostname**: server2.example.com
- **apply_hostname**: True
- **retain_settings**: True
```

.. note::
Use `retain_settings` to retain current network settings that are not otherwise specified in the state. Particularly useful if only setting the hostname. Default behavior is to delete unspecified network settings.

.. versionadded:: 2016.11.0

Note: When managing bridged interfaces on a Debian or Ubuntu based system, the ports argument is required. Red Hat systems will ignore the argument.

salt.states.network.managed(name, type, enabled=True, **kwargs)

Ensure that the named interface is configured properly.

- name: The name of the interface to manage.
- type: Type of interface and configuration.
- enabled: Designates the state of this interface.
- kwargs: The IP parameters for this interface.

salt.states.network.routes(name, **kwargs)

Manage network interface static routes.

- name: Interface name to apply the route to.
- kwargs: Named routes

salt.states.network.system(name, **kwargs)

Ensure that global network settings are configured properly.

- name: Custom name to represent this configuration change.
- kwargs: The global parameters for the system.

21.19.184 salt.states.net_napalm_yang

NAPALM YANG state

Manage the configuration of network devices according to the YANG models (OpenConfig/IETF).

New in version 2017.7.0.

Dependencies

- napalm-yang
- pyangbing > 0.5.11

To be able to load configuration on network devices, it requires NAPALM library to be installed: `pip install napalm`. Please check Installation for complete details.

salt.states.net_napalm_yang.configured(name, data, **kwargs)

Configure the network device, given the input data structured according to the YANG models.

Note: The main difference between this function and managed is that the later generates and loads the configuration only when there are differences between the existing configuration on the device and the expected configuration. Depending on the platform and hardware capabilities, one could be more optimal than...
the other. Additionally, the output of the managed is different, in such a way that the pchange field in the output contains structured data, rather than text.

data YANG structured data.
models A list of models to be used when generating the config.
profile: None Use certain profiles to generate the config. If not specified, will use the platform default profile(s).
test: False Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.
debug: False Debug mode. Will insert a new key under the output dictionary, as loaded_config containing the raw configuration loaded on the device.
replace: False Should replace the config with the new generate one?

State SLS example:

```
{% set expected_config = pillar.get('openconfig_interfaces_cfg') %}
napalm_yang.configured:
  - data: {{ expected_config | json }}
  - models:
    - models.openconfig_interfaces
  - debug: true
```

Pillar example:

```
openconfig_interfaces_cfg:
  _kwargs:
    filter: true
  interfaces:
    interface:
      Et1:
        config:
          mtu: 9000
      Et2:
        config:
          description: "description example"
```

salt.states.net_napalm_yang.managed(name, data, **kwargs)
Manage the device configuration given the input data structured according to the YANG models.
data YANG structured data.
models A list of models to be used when generating the config.
profile: None Use certain profiles to generate the config. If not specified, will use the platform default profile(s).
compliance_report: False Return the compliance report in the comment.

New in version 2017.7.3.
test: False Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.
debug: False Debug mode. Will insert a new key under the output dictionary, as loaded_config containing the raw configuration loaded on the device.
replace: False Should replace the config with the new generate one?
State SLS example:
Pillar example:

```python
openconfig_interfaces_cfg:
  _kwargs:
    filter: true
  interfaces:
    interface:
      Et1:
        config:
          mtu: 9000
      Et2:
        config:
          description: "description example"
```

21.19.185 salt.states.neutron_network

Management of OpenStack Neutron Networks

New in version 2018.3.0.

```yaml
depends: shade
configuration see salt.modules.neutronng for setup instructions
```

Example States

```yaml
create network:
  neutron_network.present:
    - name: network1

delete network:
  neutron_network.absent:
    - name: network1

create network with optional params:
  neutron_network.present:
    - name: network1
    - vlan: 200
    - shared: False
    - external: False
    - project: project1
```

```yaml
salt.states.neutron_network.absent(name, auth=None, **kwargs)
Ensure a network does not exists
name Name of the network
```

```yaml
salt.states.neutron_network.present(name, auth=None, **kwargs)
Ensure a network exists and is up-to-date
name Name of the network
```
provider  A dict of network provider options.
shared  Set the network as shared.
external  Whether this network is externally accessible.
admin_state_up  Set the network administrative state to up.
vlan  Vlan ID. Alias for provider
      •  physical_network: provider
      •  network_type: vlan
      •  segmentation_id: (vlan id)

21.19.186  salt.states.neutron_secgroup

Management of OpenStack Neutron Security Groups

New in version 2018.3.0.

depends  shade
configuration  see salt.modules.neutronng for setup instructions

Example States

```python
create security group;
    neutron_secgroup.present:
        - name: security_group1
        - description: "Very Secure Security Group"

delete security group:
    neutron_secgroup.absent:
        - name_or_id: security_group1
        - project_name: Project1

create security group with optional params:
    neutron_secgroup.present:
        - name: security_group1
        - description: "Very Secure Security Group"
        - project_id: 1dcac318a83b4610b7a7f7ba01465548

create security group with optional params:
    neutron_secgroup.present:
        - name: security_group1
        - description: "Very Secure Security Group"
        - project_name: Project1
```

salt.states.neutron_secgroup.absent(name, auth=None, **kwargs)
Ensure a security group does not exist
name  Name of the security group

salt.states.neutron_secgroup.present(name, auth=None, **kwargs)
Ensure a security group exists.
You can supply either project_name or project_id.
Creating a default security group will not show up as a change; it gets created through the lookup process.
name  Name of the security group
description  Description of the security group
project_name  Name of Project
project_id  ID of Project
21.19.187  salt.states.neutron_secgroup_rule

Management of OpenStack Neutron Security Group Rules

New in version 2018.3.0.

depends shade
configuration see salt.modules.neutronng for setup instructions

Example States

```
create security group rule:
neutron_secgroup_rule.present:
- name: security_group1
- project_name: Project1
- protocol: icmp

delete security group:
neutron_secgroup_rule.absent:
- name_or_id: security_group1

create security group with optional params:
neutron_secgroup_rule.present:
- name: security_group1
- description: "Very Secure Security Group"
- project_id: 1dcac318a83b4610b7a7f7ba01465548
```

salt.states.neutron_secgroup_rule.absent(name, auth=None, **kwargs)
Ensure a security group rule does not exist
name name or id of the security group rule to delete
rule_id uuid of the rule to delete
project_id id of project to delete rule from

salt.states.neutron_secgroup_rule.present(name, auth=None, **kwargs)
Ensure a security group rule exists
defaults: port_range_min=None, port_range_max=None, protocol=None, remote_ip_prefix=None, remote_group_id=None, direction='ingress', ethertype='IPv4', project_id=None
name Name of the security group to associate with this rule
project_name Name of the project associated with the security group
protocol The protocol that is matched by the security group rule. Valid values are None, tcp, udp, and icmp.

21.19.188  salt.states.neutron_subnet

Management of OpenStack Neutron Subnets

New in version 2018.3.0.

depends shade
configuration see salt.modules.neutronng for setup instructions

Example States

```
create subnet:
neutron_subnet.present:
- name: subnet1
```
- network_name_or_id: network1
- cidr: 192.168.199.0/24

delete subnet:
neutron_subnet.absent:
- name: subnet2

create subnet with optional params:
neutron_subnet.present:
- name: subnet1
- network_name_or_id: network1
- enable_dhcp: True
- cidr: 192.168.199.0/24
- allocation_pools:
  - start: 192.168.199.5
  - end: 192.168.199.250
- host_routes:
  - destination: 192.168.0.0/24
  - nexthop: 192.168.0.1
  - gateway_ip: 192.168.199.1
- dns_nameservers:
  - 8.8.8.8
  - 8.8.8.7

create ipv6 subnet:
neutron_subnet.present:
- name: v6subnet1
- network_name_or_id: network1
- ip_version: 6

salt.states.neutron_subnet.absent(name, auth=None)
Ensure a subnet does not exists
name Name of the subnet

salt.states.neutron_subnet.present(name, auth=None, **kwargs)
Ensure a subnet exists and is up-to-date
name Name of the subnet
network_name_or_id The unique name or ID of the attached network. If a non-unique name is supplied, an exception is raised.
allocation_pools A list of dictionaries of the start and end addresses for the allocation pools
gateway_ip The gateway IP address.
dns_nameservers A list of DNS name servers for the subnet.
host_routes A list of host route dictionaries for the subnet.
ipv6_ra_mode IPv6 Router Advertisement mode. Valid values are: 'dhcpv6-stateful', 'dhcpv6-stateless', or 'slaac'.
ipv6_address_mode IPv6 address mode. Valid values are: 'dhcpv6-stateful', 'dhcpv6-stateless', or 'slaac'.

21.19.189 salt.states.nfs_export

Management of NFS exports

New in version 2018.3.0.
To ensure an NFS export exists:
add_simple_export:
  nfs_export.present:
    - name: '/srv/nfs'
    - hosts: '10.0.2.0/24'
    - options:
      - 'rw'

This creates the following in /etc/exports:

```
/srv/nfs 10.0.2.0/24(rw)
```

For more complex exports with multiple groups of hosts, use 'clients':

add_complex_export:
  nfs_export.present:
    - name: '/srv/nfs'
    - clients:
      # First export, same as simple one above
      - hosts: '10.0.2.0/24'
        options:
          - 'rw'
      # Second export
      - hosts: '*.example.com'
        options:
          - 'ro'
          - 'subtree_check'

This creates the following in /etc/exports:

```
/srv/nfs 10.0.2.0/24(rw) 192.168.0.0/24,172.19.0.0/16(ro,subtree_check)
```

Any export of the given path will be modified to match the one specified.

To ensure an NFS export is absent:

delete_export:
  nfs_export.absent:
    - name: '/srv/nfs'

salt.states.nfs_export.absent(name, exports='/etc/exports')
  Ensure that the named path is not exported
  name  The export path to remove

salt.states.nfs_export.present(name, clients=None, hosts=None, options=None, exports='/etc/exports')
  Ensure that the named export is present with the given options
  name  The export path to configure
  clients A list of hosts and the options applied to them. This option may not be used in combination with the
          'hosts' or 'options' shortcuts.

- clients:
  # First export
  - hosts: '10.0.2.0/24'
    options:
      - 'rw'
  # Second export
  - hosts: '*.example.com'

(continues on next page)
hosts  A string matching a number of hosts, for example:

```yaml
hosts: '10.0.2.123'
hosts: '10.0.2.0/24'
hosts: 'minion1.example.com'
hosts: '*.*.example.com'
hosts: '*'
```

options  A list of NFS options, for example:

```yaml
options:
  - 'rw'
  - 'subtree_check'
```

### 21.19.190 salt.states.nftables

Management of nftables

This is an nftables-specific module designed to manage Linux firewalls. It is expected that this state module, and other system-specific firewall states, may at some point be deprecated in favor of a more generic firewall state.

```yaml
httpd:
  nftables.append:
    - table: filter
    - chain: input
    - jump: accept
    - match: state
    - connstate: new
    - dport: 80
    - proto: tcp
    - sport: 1025:65535
    - save: True
httpd:
  nftables.append:
    - table: filter
    - family: ipv6
    - chain: INPUT
    - jump: ACCEPT
    - match: state
    - connstate: NEW
    - dport: 80
    - proto: tcp
    - sport: 1025:65535
    - save: True
```

(continues on next page)
httpd:
  nftables.insert:
  - position: 1
  - table: filter
  - chain: INPUT
  - jump: ACCEPT
  - match: state
  - connstate: NEW
  - dport: 80
  - proto: tcp
  - sport: 1025:65535
  - save: True

httpd:
  nftables.insert:
  - position: 1
  - table: filter
  - family: ipv6
  - chain: INPUT
  - jump: ACCEPT
  - match: state
  - connstate: NEW
  - dport: 80
  - proto: tcp
  - sport: 1025:65535
  - save: True

httpd:
  nftables.delete:
  - table: filter
  - chain: INPUT
  - jump: ACCEPT
  - match: state
  - connstate: NEW
  - dport: 80
  - proto: tcp
  - sport: 1025:65535
  - save: True

httpd:
  nftables.delete:
  - position: 1
  - table: filter
  - chain: INPUT
  - jump: ACCEPT
  - match: state
  - connstate: NEW
  - dport: 80
  - proto: tcp
  - sport: 1025:65535
  - save: True

httpd:
  nftables.delete:
  - table: filter
  - family: ipv6
- `chain`: INPUT
- `jump`: ACCEPT
- `match`: state
- `connstate`: NEW
- `dport`: 80
- `proto`: tcp
- `sport`: 1025:65535
- `save`: True

**output:**

```
  nftables.chain_present:
  - family: ip
    table: filter
```

**output:**

```
  nftables.chain_absent:
  - family: ip
    table: filter
```

```python
salt.states.nftables.append(name, family='ipv4', **kwargs)
```
New in version 0.17.0.

Append a rule to a chain

- **name**: A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.
- **family**: Network family, ipv4 or ipv6.
- **All other arguments are passed in with the same name as the long option that would normally be used for nftables, with one exception: –state is specified as connstate instead of state (not to be confused with ctstate).**

```python
salt.states.nftables.chain_absent(name, table='filter', family='ipv4')
```
New in version 2014.7.0.

Verify the chain is absent.

- **family**: Networking family, either ipv4 or ipv6

```python
salt.states.nftables.chain_present(name, table='filter', table_type=None, hook=None, priority=None, family='ipv4')
```
New in version 2014.7.0.

Verify the chain is exist.

- **name**: A user-defined chain name.
- **table**: The table to own the chain.
- **family**: Networking family, either ipv4 or ipv6

```python
salt.states.nftables.delete(name, family='ipv4', **kwargs)
```
New in version 2014.7.0.

Delete a rule to a chain

- **name**: A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.
- **family**: Networking family, either ipv4 or ipv6
- **All other arguments are passed in with the same name as the long option that would normally be used for nftables, with one exception: –state is specified as connstate instead of state (not to be confused with ctstate).**

```python
salt.states.nftables.flush(name, family='ipv4', **kwargs)
```
New in version 2014.7.0.

Flush current nftables state

- **family**: Networking family, either ipv4 or ipv6
salt.states.nftables.insert(name, family='ipv4', **kwargs)

New in version 2014.7.0.

Insert a rule into a chain

name A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

family Networking family, either ipv4 or ipv6

All other arguments are passed in with the same name as the long option that would normally be used for nftables, with one exception: –state is specified as connstate instead of state (not to be confused with ctstate).

21.19.191 salt.states.npm

Installation of NPM Packages

These states manage the installed packages for node.js using the Node Package Manager (npm). Note that npm must be installed for these states to be available, so npm states should include a requisite to a pkg.installed state for the package which provides npm (simply npm in most cases). Example:

```yaml
npm:
  pkg.installed

yaml:
  npm.installed:
    - require:
    - pkg: npm
```

salt.states.npm.bootstrap(name, user=None, silent=True)

Bootstraps a node.js application.

Will execute 'npm install –json' on the specified directory.

user The user to run NPM with

New in version 0.17.0.

salt.states.npm.cache_cleaned(name=None, user=None, force=False)

Ensure that the given package is not cached.

If no package is specified, this ensures the entire cache is cleared.

name The name of the package to remove from the cache, or None for all packages

user The user to run NPM with

force Force cleaning of cache. Required for npm@5 and greater

New in version 2016.11.6.

salt.states.npm.installed(name, pkgs=None, dir=None, user=None, force_reinstall=False, registry=None, env=None)

Verify that the given package is installed and is at the correct version (if specified).

```yaml
coffee-script:
  npm.installed:
    - user: someuser
coffee-script@1.0.1:
  npm.installed: []
```

name The package to install

Changed in version 2014.7.2: This parameter is no longer lowercased by salt so that case-sensitive NPM package names will work.
**pkgs**  A list of packages to install with a single npm invocation; specifying this argument will ignore the name argument

New in version 2014.7.0.

**dir**  The target directory in which to install the package, or None for global installation

**user**  The user to run NPM with

New in version 0.17.0.

**registry**  The NPM registry from which to install the package

New in version 2014.7.0.

**env**  A list of environment variables to be set prior to execution. The format is the same as the `cmd.run` state function.

New in version 2014.7.0.

**force_reinstall**  Install the package even if it is already installed

salt.states.npm.removed(name, dir=None, user=None)

Verify that the given package is not installed.

**dir**  The target directory in which to install the package, or None for global installation

**user**  The user to run NPM with

New in version 0.17.0.

---

**21.19.192 salt.states.ntp**

**Management of NTP servers**

New in version 2014.1.0.

This state is used to manage NTP servers. Currently only Windows is supported.

```yaml
win_ntp:
    ntp.managed:
        - servers:
            - pool.ntp.org
            - us.pool.ntp.org
```

salt.states.ntp.managed(name, servers=None)

Manage NTP servers

**servers**  A list of NTP servers

---

**21.19.193 salt.states.nxos module**

State module for Cisco NX OS Switches Proxy minions

For documentation on setting up the nxos proxy minion look in the documentation for `salt.proxy.nxos`.

salt.states.nxos.config_absent(name)

Ensure a specific configuration line does not exist in the running config

**name**  config line to remove

Examples:

```yaml
add snmp group:
    nxos.config_absent:
        - names:
```

(continues on next page)
- snmp-server community randoSNMPstringHERE group network-operator
- snmp-server community AnotherRandomSNMPstring group network-admin

Note: For certain cases extra lines could be removed based on dependencies. In this example, included after
the example for config_present, the ACLs would be removed because they depend on the existence of the
group.

salt.states.nxos.config_present(name)
Ensure a specific configuration line exists in the running config
name config line to set
Examples:

add snmp group:
  nxos.config_present:
    - names:
      - snmp-server community randoSNMPstringHERE group network-operator
      - snmp-server community AnotherRandomSNMPstring group network-admin

add snmp acl:
  nxos.config_present:
    - names:
      - snmp-server community randoSNMPstringHERE use-acl snmp-acl-ro
      - snmp-server community AnotherRandomSNMPstring use-acl snmp-acl-rw

salt.states.nxos.replace(name, repl, full_match=False)
Replace all instances of a string or full line in the running config
name String to replace
repl The replacement text
full_match Whether name will match the full line or only a subset of the line. Defaults to False. When False,
  .* is added around name for matching in the show run config.
Examples:

replace snmp string:
  nxos.replace:
    - name: randoSNMPstringHERE
    - repl: NEWrandoSNMPstringHERE

replace full snmp string:
  nxos.replace:
    - name: ^snmp-server community randoSNMPstringHERE group network-operator$
    - repl: snmp-server community NEWrandoSNMPstringHERE group network-operator
    - full_match: True

Note: The first example will replace the SNMP string on both the group and the ACL, so you will not lose
the ACL setting. Because the second is an exact match of the line, when the group is removed, the ACL is
removed, but not readded, because it was not matched.

salt.states.nxos.user_absent(name)
Ensure a user is not present
name username to remove if it exists
Examples:
delete:
  nxos.user_absent:
    - name: daniel

salt.states.nxos.user_present(name, password=None, roles=None, encrypted=False, crypt_salt=None, algorithm='sha256')
Ensure a user is present with the specified groups
name Name of user
password Encrypted or Plain Text password for user
roles List of roles the user should be assigned. Any roles not in this list will be removed
encrypted Whether the password is encrypted already or not. Defaults to False
crypt_salt Salt to use when encrypting the password. Default is None (salt is randomly generated for un-hashed passwords)
algorithm Algorithm to use for hashing password. Defaults to sha256. Accepts md5, blowfish, sha256, sha512
Examples:
create:
  nxos.user_present:
    - name: daniel
    - roles:
      - vdc-admin
set_password:
  nxos.user_present:
    - name: daniel
    - password: admin
    - roles:
      - network-admin
update:
  nxos.user_present:
    - name: daniel
    - password: AiN9jaoP
    - roles:
      - network-admin
      - vdc-admin

21.19.194 salt.states.openstack_config
Manage OpenStack configuration file settings.
maintainer Jeffrey C. Ollie <jeff@ocjtech.us>
maturity new
depends
platform linux
salt.states.openstack_config.absent(name, filename, section, parameter=None)
Ensure a value is not set in an OpenStack configuration file.
filename The full path to the configuration file
section The section in which the parameter will be set
parameter (optional) The parameter to change. If the parameter is not supplied, the name will be used as the parameter.
salt.states.openstack_config.present(name, filename, section, value, parameter=None)
   Ensure a value is set in an OpenStack configuration file.
   filename The full path to the configuration file
   section The section in which the parameter will be set
   parameter (optional) The parameter to change. If the parameter is not supplied, the name will be used as the parameter.
   value The value to set

21.19.195 salt.states.openvswitch_bridge module

Management of Open vSwitch bridges.
salt.states.openvswitch_bridge.absent(name)
   Ensures that the named bridge does not exist, eventually deletes it.
   Parameters name – The name of the bridge.
salt.states.openvswitch_bridge.present(name)
   Ensures that the named bridge exists, eventually creates it.
   Parameters name – The name of the bridge.

21.19.196 salt.states.openvswitch_port module

Management of Open vSwitch ports.
salt.states.openvswitch_port.absent(name, bridge=None)
   Ensures that the named port exists on bridge, eventually deletes it. If bridge is not set, port is removed from whatever bridge contains it.
   Parameters
   • name – The name of the port.
   • bridge – The name of the bridge.
salt.states.openvswitch_port.present(name, bridge, tunnel_type=None, id=None, remote=None, dst_port=None, internal=False)
   Ensures that the named port exists on bridge, eventually creates it.
   Parameters
   • name – The name of the port.
   • bridge – The name of the bridge.
   • tunnel_type – Optional type of interface to create, currently supports: vlan, vxlan and gre.
   • id – Optional tunnel’s key.
   • remote – Remote endpoint’s IP address.
   • dst_port – Port to use when creating tunnelpoint in the switch.
   • internal – Create an internal port if one does not exist

21.19.197 salt.states.opsgenie

Create/Close an alert in OpsGenie

New in version 2018.3.0.
This state is useful for creating or closing alerts in OpsGenie during state runs.
used_space:
  disk.status:
    - name: /
    - maximum: 79%
    - minimum: 28%

opsgenie_create_action_sender:
opsgenie.create_alert:
  - api_key: XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX
  - reason: 'Disk capacity is out of designated range.'
  - name: disk.status
  - onfail:
    - disk: used_space

opsgenie_close_action_sender:
opsgenie.close_alert:
  - api_key: XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX
  - name: disk.status
  - require:
    - disk: used_space

salt.states.opsgenie.close_alert(name=None, api_key=None, reason='Conditions are met', action_type='Close')

Close an alert in OpsGenie. It’s a wrapper function for create_alert. Example usage with Salt’s requisites and other global state arguments could be found above.

Required Parameters:
name It will be used as alert’s alias. If you want to use the close functionality you must provide name field for both states like in above case.

Optional Parameters:
api_key It’s the API Key you’ve copied while adding integration in OpsGenie.
reason It will be used as alert’s default message in OpsGenie.
action_type OpsGenie supports the default values Create/Close for action_type. You can customize this field with OpsGenie’s custom actions for other purposes like adding notes or acknowledging alerts.

salt.states.opsgenie.create_alert(name=None, api_key=None, reason=None, action_type='Create')

Create an alert in OpsGenie. Example usage with Salt’s requisites and other global state arguments could be found above.

Required Parameters:
api_key It’s the API Key you’ve copied while adding integration in OpsGenie.
reason It will be used as alert’s default message in OpsGenie.

Optional Parameters:
name It will be used as alert’s alias. If you want to use the close functionality you must provide name field for both states like in above case.
action_type OpsGenie supports the default values Create/Close for action_type. You can customize this field with OpsGenie’s custom actions for other purposes like adding notes or acknowledging alerts.

21.19.198 salt.states.pagerduty

Create an Event in PagerDuty

New in version 2014.1.0.

This state is useful for creating events on the PagerDuty service during state runs.
server-warning-message:
pagerduty.create_event:
  - name: 'This is a server warning message'
  - details: 'This is a much more detailed message'
  - service_key: 9abcd123456789efabcde362783cdbaf
  - profile: my-pagerduty-account

salt.states.pagerduty.create_event(name, details, service_key, profile)
Create an event on the PagerDuty service

server-warning-message:
pagerduty.create_event:
  - name: 'This is a server warning message'
  - details: 'This is a much more detailed message'
  - service_key: 9abcd123456789efabcde362783cdbaf
  - profile: my-pagerduty-account

The following parameters are required:
name This is a short description of the event.
details This can be a more detailed description of the event.
service_key This key can be found by using pagerduty.list_services.
profile This refers to the configuration profile to use to connect to the PagerDuty service.

21.19.199 salt.states.pagerduty_escalation_policy
Manage PagerDuty escalation policies.
Schedules and users can be referenced by pagerduty ID, or by name, or by email address.
For example:

ensure test escalation policy:
pagerduty_escalation_policy.present:
  - name: bruce test escalation policy
  - escalation_rules:
    - targets:
      - type: schedule
        id: 'bruce test schedule level1'
      - type: user
        id: 'Bruce Sherrod'
        escalation_delay_in_minutes: 15
    - targets:
      - type: schedule
        id: 'bruce test schedule level2'
        escalation_delay_in_minutes: 15
    - targets:
      - type: user
        id: 'Bruce TestUser1'
      - type: user
        id: 'Bruce TestUser2'
      - type: user
        id: 'Bruce TestUser3'
      - type: user
        id: 'bruce+test4@lyft.com'
        escalation_delay_in_minutes: 15
salt.states.pagerduty_escalation_policy.absent(
    profile='pagerduty',
    subdomain=None,
    api_key=None,
    **kwargs)

Ensure that a PagerDuty escalation policy does not exist. Accepts all the arguments that pager-
duty_escalation_policy.present accepts; but ignores all arguments except the name.

Name can be the escalation policy id or the escalation policy name.

salt.states.pagerduty_escalation_policy.present(
    profile='pagerduty',
    subdomain=None,
    api_key=None,
    **kwargs)

Ensure that a pagerduty escalation policy exists. Will create or update as needed.

This method accepts as args everything defined in https://developer.pagerduty.com/documentation/rest/
escalation_policies/create. In addition, user and schedule id’s will be translated from name (or email address)
into PagerDuty unique ids. For example:

```
pagerduty_escalation_policy.present:
  • name: bruce test escalation policy
  • escalation_rules:
    – targets:
      * type: schedule id: 'bruce test schedule level1'
      * type: user id: 'Bruce Sherrod'

In this example, 'Bruce Sherrod' will be looked up and replaced with the PagerDuty id (usually a 7 digit all-caps
string, e.g. PX6GQL7)
```

21.19.200 salt.states.pagerduty_schedule

Manage PagerDuty schedules.

Example:

```
ensure test schedule:
  pagerduty_schedule.present:
    - name: 'bruce test schedule level1'
    - schedule:
        name: 'bruce test schedule level1'
        time_zone: 'Pacific Time (US & Canada)'
        schedule_layers:
          - name: 'Schedule Layer 1'
            start: '2015-01-01T00:00:00'
            users:
              - user:
                'id': 'Bruce TestUser1'
              - user:
                'id': 'Bruce TestUser2'
              - user:
                'id': 'bruce+test3@lyft.com'
              - user:
                'id': 'bruce+test4@lyft.com'
            member_order: 1
            rotation_virtual_start: '2015-01-01T00:00:00'
            rotation_turn_length_seconds: 604800
```
salt.states.pagerduty_schedule.absent(profile='pagerduty', subdomain=None, api_key=None, **kwargs)

Ensure that a pagerduty schedule does not exist. Name can be pagerduty schedule id or pagerduty schedule name.

salt.states.pagerduty_schedule.present(profile='pagerduty', subdomain=None, api_key=None, **kwargs)

Ensure that a pagerduty schedule exists. This method accepts as args everything defined in https://developer.pagerduty.com/documentation/rest/schedules/create. This means that most arguments are in a dict called "schedule."

User id’s can be pagerduty id, or name, or email address.

21.19.201 salt.states.pagerduty_service

Manage PagerDuty services

Escalation policies can be referenced by pagerduty ID or by name.

For example:

```python
ensure test service
    pagerduty_service.present:
    - name: 'my service'
    - escalation_policy_id: 'my escalation policy'
    - type: nagios
```

salt.states.pagerduty_service.absent(profile='pagerduty', subdomain=None, api_key=None, **kwargs)

Ensure a pagerduty service does not exist. Name can be the service name or pagerduty service id.

salt.states.pagerduty_service.present(profile='pagerduty', subdomain=None, api_key=None, **kwargs)

Ensure pagerduty service exists. This method accepts as arguments everything defined in https://developer.pagerduty.com/documentation/rest/services/create

Note that many arguments are mutually exclusive, depending on the "type" argument.

Examples:

```python
# create a PagerDuty email service at test-email@DOMAIN.pagerduty.com
ensure generic email service exists:
    pagerduty_service.present:
    - name: my email service
    - service:
        description: "email service controlled by salt"
        escalation_policy_id: "my escalation policy"
        type: "generic_email"
        service_key: "test-email"
```

```python
# create a pagerduty service using cloudwatch integration
ensure my cloudwatch service exists:
    pagerduty_service.present:
    - name: my cloudwatch service
    - service:
        escalation_policy_id: "my escalation policy"
        type: aws_cloudwatch
        description: "my cloudwatch service controlled by salt"
```
21.19.202 salt.states.pagerduty_user

Manage PagerDuty users.

Example

```python
ensure bruce test user 1:
    pagerduty.user_present:
        - name: 'Bruce TestUser1'
        - email: bruce+test1@lyft.com
        - requester_id: P1GV5NT

salt.states.pagerduty_user.absent(profile='pagerduty', subdomain=None, api_key=None, **kwargs)
    Ensure pagerduty user does not exist. Name can be pagerduty id, email address, or user name.

salt.states.pagerduty_user.present(profile='pagerduty', subdomain=None, api_key=None, **kwargs)
```

21.19.203 salt.states.panos

A state module to manage Palo Alto network devices.

```none
codeauthor Spencer Ervin <spencer_ervin@hotmail.com>
maturity new
depends none
platform unix
```

About

This state module was designed to handle connections to a Palo Alto based firewall. This module relies on the Palo Alto proxy module to interface with the devices.

This state module is designed to give extreme flexibility in the control over XPATH values on the PANOS device. It exposes the core XML API commands and allows state modules to chain complex XPATH commands.

Below is an example of how to construct a security rule and move to the top of the policy. This will take a config lock to prevent execution during the operation, then remove the lock. After the XPATH has been deployed, it will commit to the device.

```python
panos/take_lock:
    panos.add_config_lock

panos/service_tcp_22:
    panos.set_config:
        - xpath: /config/devices/entry[@name='localhost.localdomain']/vsys/
          entry[@name='vsys1']/service
            - value: <entry name='tcp-22'><protocol><tcp><port>22</port></tcp></protocol>
              </entry>
```

(continues on next page)
Version Specific Configurations

Palo Alto devices running different versions will have different supported features and different command structures. In order to account for this, the proxy module can be leveraged to check if the panos device is at a specific revision level.

The proxy['panos.is_required_version'] method will check if a panos device is currently running a version equal or greater than the passed version. For example, proxy['panos.is_required_version']('7.0.0') would match both 7.1.0 and 8.0.0.

{% if proxy['panos.is_required_version']('8.0.0') %}
panos/deviceconfig/system/motd-and-banner:
    panos.set_config:
        - xpath: /config/devices/entry[@name='localhost.localdomain']/deviceconfig/system/motd-and-banner
        - value: |
            <banner-header>BANNER TEXT</banner-header>
            <banner-header-color>color2</banner-header-color>
            <banner-header-text-color>color18</banner-header-text-color>
            <banner-header-footer-match>yes</banner-header-footer-match>
        - commit: False
{% endif %}

See also:

Palo Alto Proxy Module

salt.states.panos.add_config_lock(name)
Prevent other users from changing configuration until the lock is released.

name: The name of the module function to execute.

SLS Example:

```python
cpanos/takelock:
  ppanos.add_config_lock
```

salt.states.panos.**address_exists**(name, addressname=None, vsys=1, ipnetmask=None, iprange=None, fqdn=None, description=None, commit=False)

Ensures that an address object exists in the configured state. If it does not exist or is not configured with the specified attributes, it will be adjusted to match the specified values.

This module will only process a single address type (ip-netmask, ip-range, or fqdn). It will process the specified value if the following order: ip-netmask, ip-range, fqdn. For proper execution, only specify a single address type.

name: The name of the module function to execute.

addressname(str): The name of the address object. The name is case-sensitive and can have up to 31 characters, which can be letters, numbers, spaces, hyphens, and underscores. The name must be unique on a firewall and, on Panorama, unique within its device group and any ancestor or descendant device groups.

vsys(str): The string representation of the VSYS ID. Defaults to VSYS 1.

ipnetmask(str): The IPv4 or IPv6 address or IP address range using the format ip_address/mask or ip_address where the mask is the number of significant binary digits used for the network portion of the address. Ideally, for IPv6, you specify only the network portion, not the host portion.

iprange(str): A range of addresses using the format ip_address–ip_address where both addresses can be IPv4 or both can be IPv6.

fqdn(str): A fully qualified domain name format. The FQDN initially resolves at commit time. Entries are subsequently refreshed when the firewall performs a check every 30 minutes; all changes in the IP address for the entries are picked up at the refresh cycle.

description(str): A description for the policy (up to 255 characters).

commit(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```python
panos/address/h-10.10.10.10:
  panos.address_exists:
    - addressname: h-10.10.10.10
    - vsys: 1
    - ipnetmask: 10.10.10.10
    - commit: False

panos/address/10.0.0.1-10.0.0.50:
  panos.address_exists:
    - addressname: r-10.0.0.1-10.0.0.50
    - vsys: 1
    - iprange: 10.0.0.1-10.0.0.50
    - commit: False

panos/address/foo.bar.com:
  panos.address_exists:
    - addressname: foo.bar.com
    - vsys: 1
```

(continues on next page)
salt.states.panos.address_group_exists(name, groupname=None, vsys=1, members=None, description=None, commit=False)

Ensures that an address group object exists in the configured state. If it does not exist or is not configured with the specified attributes, it will be adjusted to match the specified values.

This module will enforce group membership. If a group exists and contains members this state does not include, those members will be removed and replaced with the specified members in the state.

name: The name of the module function to execute.

groupname(str): The name of the address group object. The name is case-sensitive and can have up to 31 characters, which can be letters, numbers, spaces, hyphens, and underscores. The name must be unique on a firewall and, on Panorama, unique within its device group and any ancestor or descendant device groups.

vsys(str): The string representation of the VSYS ID. Defaults to VSYS 1.

members(str, list): The members of the address group. These must be valid address objects or address groups on the system that already exist prior to the execution of this state.

description(str): A description for the policy (up to 255 characters).

commit(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```yaml
panos/address-group/my-group:
  panos.address_group_exists:
    - groupname: my-group
    - vsys: 1
    - members:
      - my-address-object
      - my-other-address-group
    - description: A group that needs to exist
    - commit: False
```

salt.states.panos.clone_config(name, xpath=None, newname=None, commit=False)

Clone a specific XPATH and set it to a new name.

name: The name of the module function to execute.

xpath(str): The XPATH of the configuration API tree to clone.

newname(str): The new name of the XPATH clone.

commit(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```yaml
panos/clonerule:
  panos.clone_config:
    - xpath: /config/devices/entry/vsys/entry[@name='vsys1']/rulebase/security/rules&from=/config/devices/entry/vsys/entry[@name='vsys1']/rulebase/security/rules/entry[@name='rule1']
    - value: rule2
    - commit: True
```
salt.states.panos.commit_config(name)
    Commits the candidate configuration to the running configuration.
    name: The name of the module function to execute.
    SLS Example:
    ```
    panos/commit:
        - panos.commit_config
    ```

salt.states.panos.delete_config(name, xpath=None, commit=False)
    Deletes a Palo Alto XPATH to a specific value.
    name: The name of the module function to execute.
    xpath(str): The XPATH of the configuration API tree to control.
    commit(bool): If true the firewall will commit the changes, if false do not commit changes.
    SLS Example:
    ```
    panos/deletegroup:
        - panos.delete_config:
            - xpath: /config/devices/entry/vsys/entry[@name='vsys1']/address-group/
            - entry[@name='test']
            - commit: True
    ```

salt.states.panos.download_software(name, version=None, synch=False, check=False)
    Ensures that a software version is downloaded.
    name: The name of the module function to execute.
    version(str): The software version to check. If this version is not already downloaded, it will attempt to download the file from Palo Alto.
    synch(bool): If true, after downloading the file it will be synched to its peer.
    check(bool): If true, the PANOS device will first attempt to pull the most recent software inventory list from Palo Alto.
    SLS Example:
    ```
    panos/version8.0.0:
        - panos.download_software:
            - version: 8.0.0
            - synch: False
            - check: True
    ```

salt.states.panos.edit_config(name, xpath=None, value=None, commit=False)
    Edits a Palo Alto XPATH to a specific value. This will always overwrite the existing value, even if it is not changed.
    You can replace an existing object hierarchy at a specified location in the configuration with a new value.
    Use the xpath parameter to specify the location of the object, including the node to be replaced.
    This is the recommended state to enforce configurations on a xpath.
    name: The name of the module function to execute.
    xpath(str): The XPATH of the configuration API tree to control.
    value(str): The XML value to edit. This must be a child to the XPATH.
commit(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```python
panos/addressgroup:
    panos.edit_config:
        - xpath: /config/devices/entry/vsys/entry[@name='vsys1']/address-group/
          entry[@name='test']
        - value: <static><entry name='test'><member>abc</member><member>xyz</member></entry></static>
        - commit: True
```

salt.states.panos.move_config(name, xpath=None, where=None, dst=None, commit=False)

Moves a XPATH value to a new location.

Use the xpath parameter to specify the location of the object to be moved, the where parameter to specify type of move, and dst parameter to specify the destination path.

name: The name of the module function to execute.

xpath(str): The XPATH of the configuration API tree to move.

where(str): The type of move to execute. Valid options are after, before, top, bottom. The after and before options will require the dst option to specify the destination of the action. The top action will move the XPATH to the top of its structure. The botoom action will move the XPATH to the bottom of its structure.

dst(str): Optional. Specifies the destination to utilize for a move action. This is ignored for the top or bottom action.

commit(bool): If true the firewall will commit the changes, if false do not commit changes. If the operation is not successful, it will not commit.

SLS Example:

```python
panos/moveruletop:
    panos.move_config:
        - xpath: /config/devices/entry/vsys/entry[@name='vsys1']/rulebase/security/rules/entry[@name='rule1']
        - where: top
        - commit: True

panos/moveruleafter:
    panos.move_config:
        - xpath: /config/devices/entry/vsys/entry[@name='vsys1']/rulebase/security/rules/entry[@name='rule1']
        - where: after
        - dst: rule2
        - commit: True
```

salt.states.panos.remove_config_lock(name)

Release config lock previously held.

name: The name of the module function to execute.

SLS Example:

```python
panos/takelock:
    panos.remove_config_lock
```

salt.states.panos.rename_config(name, xpath=None, newname=None, commit=False)

Rename a Palo Alto XPATH to a specific value. This will always rename the value even if a change is not needed.
name: The name of the module function to execute.

xpath(str): The XPATH of the configuration API tree to control.

newname(str): The new name of the XPATH value.

commit(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```python
panos/renamegroup:
  panos.rename_config:
    - xpath: /config/devices/entry/vsys/entry[@name='vsys1']/address/
      entry[@name='old_address']
    - value: new_address
    - commit: True
```

salt.states.panos.security_rule_exists(name, rulename=None, vsys='1', action=None, disabled=None, sourcezone=None, destinationzone=None, source=None, destination=None, application=None, service=None, description=None, logsetting=None, logstart=None, logend=None, negatesource=None, negatedestination=None, profilegroup=None, datafilter=None, fileblock=None, spyware=None, urlfilter=None, virus=None, vulnerability=None, wildfire=None, move=None, movetarget=None, commit=False)

Ensures that a security rule exists on the device. Also, ensure that all configurations are set appropriately.

This method will create the rule if it does not exist. If the rule does exist, it will ensure that the configurations are set appropriately.

If the rule does not exist and is created, any value that is not provided will be provided as the default. The action, to, from, source, destination, application, and service fields are mandatory and must be provided.

This will enforce the exact match of the rule. For example, if the rule is currently configured with the log-end option, but this option is not specified in the state method, it will be removed and reset to the system default.

It is strongly recommended to specify all options to ensure proper operation.

When defining the profile group settings, the device can only support either a profile group or individual settings. If both are specified, the profile group will be preferred and the individual settings are ignored. If neither are specified, the value will be set to system default of none.

name: The name of the module function to execute.

rulename(str): The name of the security rule. The name is case-sensitive and can have up to 31 characters, which can be letters, numbers, spaces, hyphens, and underscores. The name must be unique on a firewall and, on Panorama, unique within its device group and any ancestor or descendant device groups.

vsys(str): The string representation of the VSYS ID. Defaults to VSYS 1.

action(str): The action that the security rule will enforce. Valid options are: allow, deny, drop, reset-client, reset-server, reset-both.

disabled(bool): Controls if the rule is disabled. Set 'True' to disable and 'False' to enable.

sourcezone(str, list): The source zone(s). The value 'any' will match all zones.

destinationzone(str, list): The destination zone(s). The value 'any' will match all zones.

source(str, list): The source address(es). The value 'any' will match all addresses.

destination(str, list): The destination address(es). The value 'any' will match all addresses.
application(str, list): The application(s) matched. The value 'any' will match all applications.

service(str, list): The service(s) matched. The value 'any' will match all services. The value 'application-default' will match based upon the application defined ports.

description(str): A description for the policy (up to 255 characters).

logsetting(str): The name of a valid log forwarding profile.

logstart(bool): Generates a traffic log entry for the start of a session (disabled by default).

logend(bool): Generates a traffic log entry for the end of a session (enabled by default).

negatesource(bool): Match all but the specified source addresses.

negatedestination(bool): Match all but the specified destination addresses.

profilegroup(str): A valid profile group name.

datafilter(str): A valid data filter profile name. Ignored with the profilegroup option set.

fileblock(str): A valid file blocking profile name. Ignored with the profilegroup option set.

spyware(str): A valid spyware profile name. Ignored with the profilegroup option set.

urlfilter(str): A valid URL filtering profile name. Ignored with the profilegroup option set.

virus(str): A valid virus profile name. Ignored with the profilegroup option set.

vulnerability(str): A valid vulnerability profile name. Ignored with the profilegroup option set.

wildfire(str): A valid vulnerability profile name. Ignored with the profilegroup option set.

move(str): An optional argument that ensure the rule is moved to a specific location. Valid options are 'top', 'bottom', 'before', or 'after'. The 'before' and 'after' options require the use of the 'movetarget' argument to define the location of the move request.

movetarget(str): An optional argument that defines the target of the move operation if the move argument is set to 'before' or 'after'.

commit(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```yaml
panos/rulebase/security/rule01:
  panos.security_rule_exists:
    - rulename: rule01
    - vsys: 1
    - action: allow
    - disabled: False
    - sourcezone: untrust
    - destinationzone: trust
    - source:
      - 10.10.10.0/24
      - 1.1.1.1
    - destination:
      - 2.2.2.2-2.2.2.4
    - application:
      - any
    - service:
      - tcp-25
    - description: My test security rule
    - logsetting: logprofile
    - logstart: False
```

(continues on next page)
- logend: True
-negatesource: False
-negatedestination: False
-profilegroup: myprofilegroup
-move: top
-commit: False

panos/rulebase/security/rule01:
  panos.security_rule_exists:
    - rulename: rule01
    - vsys: 1
    - action: allow
    - disabled: False
    - sourcezone: untrust
    - destinationzone: trust
    - source:
        - 10.10.10.0/24
        - 1.1.1.1
    - destination:
        - 2.2.2.2–2.2.2.4
    - application:
        - any
    - service:
        - tcp-25
    - description: My test security rule
    - logsetting: logprofile
    - logstart: False
    - logend: False
    - datafilter: foobar
    - fileblock: foobar
    - spyware: foobar
    - urlfilter: foobar
    - virus: foobar
    - vulnerability: foobar
    - wildfire: foobar
    - move: after
    - movetarget: rule02
    - commit: False

salt.states.panos.service_exists(name, servicename=None, vsys=1, protocol=None, port=None,
  description=None, commit=False)

Ensures that a service object exists in the configured state. If it does not exist or is not configured with
the specified attributes, it will be adjusted to match the specified values.

name: The name of the module function to execute.

servicename(str): The name of the security object. The name is case-sensitive and can have up to 31 characters,
which an be letters, numbers, spaces, hyphens, and underscores. The name must be unique on a firewall and,
on Panorama, unique within its device group and any ancestor or descendant device groups.

vsys(str): The string representation of the VSYS ID. Defaults to VSYS 1.

protocol(str): The protocol that is used by the service object. The only valid options are tcp and udp.

port(str): The port number that is used by the service object. This can be specified as a single integer or a valid
range of ports.

description(str): A description for the policy (up to 255 characters).
commit(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```
panos/service/tcp-80:
    panos.service_exists:
        - servicename: tcp-80
        - vsys: 1
        - protocol: tcp
        - port: 80
        - description: Hypertext Transfer Protocol
        - commit: False

panos/service/udp-500-550:
    panos.service_exists:
        - servicename: udp-500-550
        - vsys: 3
        - protocol: udp
        - port: 500-550
        - commit: False
```

```python
salt.states.panos.service_group_exists(name, groupname=None, vsys=1, members=None, description=None, commit=False)
```

Ensures that a service group object exists in the configured state. If it does not exist or is not configured with the specified attributes, it will be adjusted to match the specified values.

This module will enforce group membership. If a group exists and contains members this state does not include, those members will be removed and replaced with the specified members in the state.

name: The name of the module function to execute.

groupname(str): The name of the service group object. The name is case-sensitive and can have up to 31 characters, which can be letters, numbers, spaces, hyphens, and underscores. The name must be unique on a firewall and, on Panorama, unique within its device group and any ancestor or descendant device groups.

vsys(str): The string representation of the VSYS ID. Defaults to VSYS 1.

members(str, list): The members of the service group. These must be valid service objects or service groups on the system that already exist prior to the execution of this state.

description(str): A description for the policy (up to 255 characters).

commit(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```
panos/service-group/my-group:
    panos.service_group_exists:
        - groupname: my-group
        - vsys: 1
        - members:
            - tcp-80
            - custom-port-group
        - description: A group that needs to exist
        - commit: False
```

```python
salt.states.panos.set_config(name, xpath=None, value=None, commit=False)
```

Sets a Palo Alto XPATH to a specific value. This will always overwrite the existing value, even if it is not changed.

You can add or create a new object at a specified location in the configuration hierarchy. Use the xpath parameter to specify the location of the object in the configuration.
name: The name of the module function to execute.
xpath(str): The XPATH of the configuration API tree to control.
value(str): The XML value to set. This must be a child to the XPATH.
commit(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```
panos/hostname:
  panos.set_config:
    - xpath: /config/devices/entry[@name='localhost.localdomain']/deviceconfig/
    - value: <hostname>foobar</hostname>
    - commit: True
```

21.19.204 salt.states.pcs module

Management of Pacemaker/Corosync clusters with PCS

A state module to manage Pacemaker/Corosync clusters with the Pacemaker/Corosync configuration system (PCS)
New in version 2016.110.

```
depends pcs
```

Requirements: PCS is installed, pcs service is started and the password for the hacluster user is set and known.

Remark on the cibname variable used in the examples: The use of the cibname variable is optional. Use it only if you want to deploy your changes into a cibfile first and then push it. This makes only sense if you want to deploy multiple changes (which require each other) at once to the cluster.

At first the cibfile must be created:

```
mysql_pcs__cib_present_cib_for_galera:
  pcs.cib_present:
    - cibname: cib_for_galera
    - scope: None
    - extra_args: None
```

Then the cibfile can be modified by creating resources (creating only 1 resource for demonstration, see also 7.):

```
mysql_pcs__resource_present_galera:
  pcs.resource_present:
    - resource_id: galera
    - resource_type: "ocf:heartbeat:galera"
    - resource_options:
      - 'wsrep_cluster_address=gcomm://node1.example.org,node2.example.org,
        node3.example.org'
      - '--master'
    - cibname: cib_for_galera
```

After modifying the cibfile, it can be pushed to the live CIB in the cluster:
Create a cluster from scratch:

1. Authorize nodes to each other:

   ```
   pcs_auth__auth:
     pcs.auth:
       - nodes:
         - node1.example.com
         - node2.example.com
       - pcsuser: hacluster
       - pcspasswd: hoonetorg
       - extra_args: []
   ```

2. Do the initial cluster setup:

   ```
   pcs_setup__setup:
     pcs.cluster_setup:
       - nodes:
         - node1.example.com
         - node2.example.com
       - pcsclusternname: pcscluster
       - extra_args:
         - '--start'
         - '--enable'
   ```

3. Optional: Set cluster properties:

   ```
   pcs_properties__prop_has_value_no-quorum-policy:
     pcs.prop_has_value:
       - prop: no-quorum-policy
       - value: ignore
       - cibname: cib_for_cluster_settings
   ```

4. Optional: Set resource defaults:

   ```
   pcs_properties__resource_defaults_to_resource-stickiness:
     pcs.resource_defaults_to:
       - default: resource-stickiness
       - value: 100
       - cibname: cib_for_cluster_settings
   ```

5. Optional: Set resource op defaults:

   ```
   pcs_properties__resource_op_defaults_to_monitor-interval:
     pcs.resource_op_defaults_to:
       - op_default: monitor-interval
       - value: 60s
       - cibname: cib_for_cluster_settings
   ```

6. Configure Fencing (!is often not optional on production ready cluster!):

   ```
   ```
7. Add resources to your cluster:

```python
mysql_pcs__resource_present_galera:
    pcs.resource_present:
        - resource_id: galera
        - resource_type: "ocf:heartbeat:galera"
        - resource_options:
            - 'wsrep_cluster_address=gcomm://node1.example.org,node2.example.org,'
            - '--master'
    cibname: cib_for_galera
```

8. Optional: Add constraints (locations, colocations, orders):

```python
haproxy_pcs__constraint_present_colocation-vip_galera-haproxy-clone-INFINITY:
    pcs.constraint_present:
        - constraint_id: colocation-vip_galera-haproxy-clone-INFINITY
        - constraint_type: colocation
        - constraint_options:
            - 'add'
            - 'vip_galera'
            - 'with'
            - 'haproxy-clone'
    cibname: cib_for_haproxy
```

New in version 2016.3.0.

salt.states.pcs.auth(name, nodes, pcsuser=‘hacluster’, pcspasswd=‘hacluster’, extra_args=None)

Ensure all nodes are authorized to the cluster

- **name**: Irrelevant, not used (recommended: pcs_auth__auth)
- **nodes**: a list of nodes which should be authorized to the cluster
- **pcsuser**: user for communication with pcs (default: hacluster)
- **pcspasswd**: password for pcsuser (default: hacluster)
- **extra_args**: list of extra args for the ’pcs cluster auth’ command

Example:

```python
pcs_auth__auth:
    pcs.auth:
        - nodes:
            - node1.example.com
            - node2.example.com
        - pcsuser: hacluster
        - pcspasswd: hoonetorg
```

(continues on next page)
salt.states.pcs.cib_present(name, cibname, scope=None, extra_args=None)
Ensure that a CIB-file with the content of the current live CIB is created

Should be run on one cluster node only (there may be races)
name Irrelevant, not used (recommended: {{formulaname}}__cib_present_{{cibname}})
cibname name/path of the file containing the CIB
scope specific section of the CIB (default):
extra_args additional options for creating the CIB-file
Example:

```
mysql_pcs__cib_present_cib_for_galera:
  pcs.cib_present:
    - cibname: cib_for_galera
    - scope: None
    - extra_args: None
```

salt.states.pcs.cib_pushed(name, cibname, scope=None, extra_args=None)
Ensure that a CIB-file is pushed if it is changed since the creation of it with pcs.cib_present

Should be run on one cluster node only (there may be races)
name Irrelevant, not used (recommended: {{formulaname}}__cib_pushed_{{cibname}})
cibname name/path of the file containing the CIB
scope specific section of the CIB
extra_args additional options for creating the CIB-file
Example:

```
mysql_pcs__cib_pushed_cib_for_galera:
  pcs.cib_pushed:
    - cibname: cib_for_galera
    - scope: None
    - extra_args: None
```

salt.states.pcs.cluster_node_present(name, node, extra_args=None)
Add a node to the Pacemaker cluster via PCS Should be run on one cluster node only (there may be races)
Can only be run on a already setup/added node
name Irrelevant, not used (recommended: pcs_setup__node_add_{{node}})
node node that should be added
extra_args list of extra args for the 'pcs cluster node add’ command
Example:

```
pcs_setup__node_add_node1.example.com:
  pcs.cluster_node_present:
    - node: node1.example.com
    - extra_args:
      - '--start'
      - '--enable'
```

salt.states.pcs.cluster_setup(name, nodes, pcsclusternname='pcscluster', extra_args=None)
Setup Pacemaker cluster on nodes. Should be run on one cluster node only (there may be races)
nname Irrelevant, not used (recommended: pcs_setup__setup)
nodes a list of nodes which should be set up
pcsclusternname Name of the Pacemaker cluster
extra_args list of extra args for the 'pcs cluster setup' command
Example:
```python
pcs_cluster_setup:
- nodes:
  - node1.example.com
  - node2.example.com
- pcsclustername: pcscluster
- extra_args:
  - '--start'
  - '--enable'
```

```python
salt.states.pcs.constraint_present(name, constraint_id, constraint_type, constraint_options=None, cibname=None)
```

Ensure that a constraint is created

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync

- **name**: Irrelevant, not used (recommended: {{formulaname}}__constraint_present_{{constraint_id}})
- **constraint_id**: name for the constraint (try first to create manually to find out the autocreated name)
- **constraint_type**: constraint type (location, colocation, order)
- **constraint_options**: options for creating the constraint
- **cibname**: use a cached CIB-file named like cibname instead of the live CIB

Example:

```bash
haproxy_pcs__constraint_present_colocation-vip_galera-haproxy-clone-INFINITY:
pcs.constraint_present:
- constraint_id: colocation-vip_galera-haproxy-clone-INFINITY
- constraint_type: colocation
- constraint_options:
  - 'add'
  - 'vip_galera'
  - 'with'
  - 'haproxy-clone'
- cibname: cib_for_haproxy
```

```python
salt.states.pcs.prop_has_value(name, prop, value, extra_args=None, cibname=None)
```

Ensure that a property in the cluster is set to a given value

Should be run on one cluster node only (there may be races)

- **name**: Irrelevant, not used (recommended: pcs_properties__prop_has_value_{{prop}})
- **prop**: name of the property
- **value**: value of the property
- **extra_args**: additional options for the pcs property command
- **cibname**: use a cached CIB-file named like cibname instead of the live CIB

Example:

```bash
pcs_properties__prop_has_value_no-quorum-policy:
pcs.prop_has_value:
- prop: no-quorum-policy
- value: ignore
- cibname: cib_for_cluster_settings
```

```python
salt.states.pcs.resource_defaults_to(name, default, value, extra_args=None, cibname=None)
```

Ensure a resource default in the cluster is set to a given value

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync

- **name**: Irrelevant, not used (recommended: pcs_properties__resource_defaults_to_{{default}})
default  name of the default resource property
value   value of the default resource property
extra_args   additional options for the pcs command
cibname   use a cached CIB-file named like cibname instead of the live CIB

Example:

```
pcs_properties__resource_defaults_to_resource-stickiness:
    pcs.resource_defaults_to:
        - default: resource-stickiness
        - value: 100
        - cibname: cib_for_cluster_settings
```

salt.states.pcs.resource_op_defaults_to(name, op_default, value, extra_args=None, cibname=None)
Ensure a resource operation default in the cluster is set to a given value
Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync
name Irrelevant, not used (recommended: pcs_properties__resource_op_defaults_to_{{op_default}})
op_default name of the operation default resource property
value value of the operation default resource property
extra_args additional options for the pcs command
cibname use a cached CIB-file named like cibname instead of the live CIB

Example:

```
pcs_properties__resource_op_defaults_to_monitor-interval:
    pcs.resource_op_defaults_to:
        - op_default: monitor-interval
        - value: 60s
        - cibname: cib_for_cluster_settings
```

salt.states.pcs.resource_present(name, resource_id, resource_type, resource_options=None, cibname=None)
Ensure that a resource is created
Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync
name Irrelevant, not used (recommended: {{formulaname}}__resource_present_{{resource_id}})
resource_id name for the resource
resource_type resource type (f.e. ocf:heartbeat:IPaddr2 or VirtualIP)
resource_options additional options for creating the resource
cibname use a cached CIB-file named like cibname instead of the live CIB

Example:

```
mysql_pcs__resource_present_galera:
    pcs.resource_present:
        - resource_id: galera
        - resource_type: "ocf:heartbeat:galera"
        - resource_options:
            - 'wsrep_cluster_address=gcomm://node1.example.org,node2.example.org,
             node3.example.org'
            - '--master'
        - cibname: cib_for_galera
```

salt.states.pcs.stonith_present(name, stonith_id, stonith_device_type,
    stonith_device_options=None, cibname=None)
Ensure that a fencing resource is created
Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync

name Irrelevant, not used (recommended: pcs_stonith__created_{[stonith_id]})

stonith_id name for the stonith resource

stonith_device_type name of the stonith agent fence_eps, fence_xvm f.e.

stonith_device_options additional options for creating the stonith resource

cibname use a cached CIB-file named like cibname instead of the live CIB

Example:

```
pcs_stonith__created_eps_fence:
    pcs.stonith_present:
        - stonith_id: eps_fence
        - stonith_device_type: fence_eps
        - stonith_device_options:
            - 'pcmk_host_map=node1.example.org:01;node2.example.org:02'
            - 'ipaddr=myepsdevice.example.org'
            - 'power_wait=5'
            - 'verbose=1'
            - 'debug=/var/log/pcsd/eps_fence.log'
            - 'login=hidden'
            - 'passwd=hoonetorg'
        - cibname: cib_for_stonith
```

21.19.205 salt.states.pecl

Installation of PHP Extensions Using pecl

These states manage the installed pecl extensions. Note that php-pear must be installed for these states to be available, so pecl states should include a requisite to a pkg.installed state for the package which provides pecl (php-pear in most cases). Example:

```
php-pear:
    pkg.installed

mongo:
    pecl.installed:
        require:
            - pkg: php-pear
```

```
salt.states.pecl.installed(name, version=None, defaults=False, force=False, preferred_state='stable')
```

New in version 0.17.0.

Make sure that a pecl extension is installed.

name The pecl extension name to install

version The pecl extension version to install. This option may be ignored to install the latest stable version.

defaults Use default answers for extensions such as pecl_http which ask questions before installation. Without this option, the pecl.installed state will hang indefinitely when trying to install these extensions.

force Whether to force the installed version or not

preferred_state The pecl extension state to install

```
salt.states.pecl.removed(name)
```

Make sure that a pecl extension is not installed.

name The pecl extension name to uninstall
21.19.206  salt.states.pdbedit

Manage accounts in Samba’s passdb using pdbedit

maintainer  Jorge Schrauwen <sjorge@blackdot.be>
maturity  new
depends  pdbedit
platform  posix

New in version 2017.7.0.

```
wash:
pdbedit.absent

kaylee:
pdbedit.managed:
  - password: A70C708517B5DD0EDB67714FE25336EB
  - password_hashed: True
  - drive: 'X://'
  - homedir: '\\serenity\mechanic\profile'
```

salt.states.pdbedit.absent(name)
Ensure user account is absent
name  [string] username

salt.states.pdbedit.managed(name, **kwargs)
Manage user account
login  [string] login name
password  [string] password
password_hashed  [boolean] set if password is a nt hash instead of plain text
domain  [string] users domain
profile  [string] profile path
script  [string] logon script
drive  [string] home drive
homedir  [string] home directory
fullname  [string] full name
account_desc  [string] account description
machine_sid  [string] specify the machines new primary group SID or rid
user_sid  [string] specify the users new primary group SID or rid
account_control  [string] specify user account control properties

Note: Only the following can be set: - N: No password required - D: Account disabled - H: Home directory required - L: Automatic Locking - X: Password does not expire

reset_login_hours  [boolean] reset the users allowed logon hours
reset_bad_password_count  [boolean] reset the stored bad login counter

salt.states.pdbedit.present(name, **kwargs)
Alias for pdbedit.managed

21.19.207  salt.states.pip_state
Installation of Python Packages Using pip

These states manage system installed python packages. Note that pip must be installed for these states to be available, so pip states should include a requisite to a pkg.installed state for the package which provides pip (python-pip in most cases). Example:

```yaml
python-pip:
  pkg.installed

virtualenvwrapper:
  pip.installed:
    - require:
      - pkg: python-pip
```

```python
salt.states.pip_state.installed(name, pkgs=None, pip_bin=None, requirements=None, bin_env=None, use_wheel=False, no_use_wheel=False, log=None, proxy=None, timeout=None, editable=None, find_links=None, index_url=None, extra_index_url=None, no_index=False, mirrors=None, build=None, target=None, download=None, download_cache=None, source=None, upgrade=False, force_reinstall=False, ignore_installed=False, exists_action=None, no_deps=False, no_install=False, no_download=False, install_options=None, global_options=None, user=None, cwd=None, pre_releases=False, cert=None, allow_all_external=False, allow_external=None, allow_unverified=False, process_dependency_links=False, env_vars=None, use_vt=False, trusted_host=None, no_cache_dir=False, cache_dir=None, no_binary=False, **kwargs)
```

Make sure the package is installed

**name** The name of the python package to install. You can also specify version numbers here using the standard operators ==, >=, <=. If **requirements** is given, this parameter will be ignored.

Example:

```yaml
django:
  pip.installed:
    - name: django >= 1.6, <= 1.7
      - require:
        - pkg: python-pip
```

This will install the latest Django version greater than 1.6 but less than 1.7.

**requirements** Path to a pip requirements file. If the path begins with salt:// the file will be transferred from the master file server.

**user** The user under which to run pip

**use_wheel** [False] Prefer wheel archives (requires pip>=1.4)

**no_use_wheel** [False] Force to not use wheel archives (requires pip>=1.4)

**no_binary** Force to not use binary packages (requires pip >= 7.0.0) Accepts either :all: to disable all binary packages, :none: to empty the set, or a list of one or more packages

Example:

```yaml
django:
  pip.installed:
    - no_binary: ':all:'
```

(continues on next page)
**flask:**

**pip.installed:**
- no_binary:
  - itsdangerous
  - click

**log**  Log file where a complete (maximum verbosity) record will be kept

**proxy**  Specify a proxy in the form user:passwd@proxy.server:port. Note that the user:password@ is optional and required only if you are behind an authenticated proxy. If you provide user@proxy.server:port then you will be prompted for a password.

**timeout**  Set the socket timeout (default 15 seconds)

**editable**  install something editable (i.e. git+https://github.com/worldcompany/djangoembed.git#egg=djangoembed)

**find_links**  URL to look for packages at

**index_url**  Base URL of Python Package Index

**extra_index_url**  Extra URLs of package indexes to use in addition to index_url

**no_index**  Ignore package index

**mirrors**  Specific mirror URL(s) to query (automatically adds –use-mirrors)

**build**  Unpack packages into build dir

**target**  Install packages into target dir

**download**  Download packages into download instead of installing them

**download_cache**  Cache downloaded packages in download_cache dir

**source**  Check out editable packages into source dir

**upgrade**  Upgrade all packages to the newest available version

**force_reinstall**  When upgrading, reinstall all packages even if they are already up-to-date.

**ignore_installed**  Ignore the installed packages (reinstalling instead)

**exists_action**  Default action when a path already exists: (s)witch, (i)gnore, (w)ipe, (b)ackup

**no_deps**  Ignore package dependencies

**no_install**  Download and unpack all packages, but don’t actually install them

**no_cache_dir**  Disable the cache.

**cwd**  Current working directory to run pip from

**pre_releases**  Include pre-releases in the available versions

**cert**  Provide a path to an alternate CA bundle

**allow_all_external**  Allow the installation of all externally hosted files

**allow_external**  Allow the installation of externally hosted files (comma separated list)

**allow_unverified**  Allow the installation of insecure and unverifiable files (comma separated list)

**process_dependency_links**  Enable the processing of dependency links

**bin_env**  [None] Absolute path to a virtual environment directory or absolute path to a pip executable. The example below assumes a virtual environment has been created at /foo/.virtualenvs/bar.

**env_vars**  Add or modify environment variables. Useful for tweaking build steps, such as specifying INCLUDE or LIBRARY paths in Makefiles, build scripts or compiler calls. This must be in the form of a dictionary or a mapping.

**Example:**

**django:**

**pip.installed:**
- name: django_app
  - env_vars:
    CUSTOM_PATH: /opt/django_app
    VERBOSE: True

**use_vt**  Use VT terminal emulation (see output while installing)

**trusted_host**  Mark this host as trusted, even though it does not have valid or any HTTPS.

**Example:**
**django:**
**pip.installed:**
- **name**: django >= 1.6, <= 1.7
- **bin_env**: /foo/.virtualenvs/bar
- **require**:
  - **pkg**: python-pip

Or

Example:

**django:**
**pip.installed:**
- **name**: django >= 1.6, <= 1.7
- **bin_env**: /foo/.virtualenvs/bar/bin/pip
- **require**:
  - **pkg**: python-pip

**Attention**
The following arguments are deprecated, do not use.

- **pip_bin** [None] Deprecated, use **bin_env**

Changed in version 0.17.0: **use_wheel** option added.

**install_options**
Extra arguments to be supplied to the setup.py install command. If you are using an option with a directory path, be sure to use absolute path.

Example:

**django:**
**pip.installed:**
- **name**: django
- **install_options**:
  - --prefix=/blah
- **require**:
  - **pkg**: python-pip

**global_options** Extra global options to be supplied to the setup.py call before the install command.

New in version 2014.1.3.

**Attention**

As of Salt 0.17.0 the pip state needs an importable pip module. This usually means having the system’s pip package installed or running Salt from an active virtualenv.

The reason for this requirement is because pip already does a pretty good job parsing its own requirements. It makes no sense for Salt to do pip requirements parsing and validation before passing them to the pip library. It’s functionality duplication and it’s more error prone.

**Attention**
Please set `reload_modules: True` to have the salt minion import this module after installation.

Example:

```python
pyopenssl:
  pip.installed:
    - name: pyOpenSSL
    - reload_modules: True
    - exists_action: i
```

```python
salt.states.pip_state.removed(name, requirements=None, bin_env=None, log=None, proxy=None, timeout=None, user=None, cwd=None, use_vt=False)
```

Make sure that a package is not installed.

- **name** The name of the package to uninstall
- **user** The user under which to run pip
- **bin_env** [None] the pip executable or virtualenv to use
- **use_vt** Use VT terminal emulation (see output while installing)

```python
salt.states.pip_state.uptodate(name, bin_env=None, user=None, cwd=None, use_vt=False)
```

New in version 2015.5.0.

Verify that the system is completely up to date.

- **name** The name has no functional value and is only used as a tracking reference
- **user** The user under which to run pip
- **bin_env** the pip executable or virtualenv to use
- **use_vt** Use VT terminal emulation (see output while installing)

## 21.19.208 salt.states.pkg

Installation of packages using OS package managers such as yum or apt-get

**Note:** On minions running systemd>=205, as of version 2015.8.12, 2016.3.3, and 2016.11.0, `systemd-run(1)` is now used to isolate commands which modify installed packages from the salt-minion daemon’s control group. This is done to keep systemd from killing the package manager commands spawned by Salt, when Salt updates itself (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a config option called `systemd.use_scope`, with a value of `False` (no quotes).

Salt can manage software packages via the pkg state module, packages can be set up to be installed, latest, removed and purged. Package management declarations are typically rather simple:

```python
vim:
  pkg.installed
```

A more involved example involves pulling from a custom repository.

```python
base:
  pkgrepo.managed:
    - humanname: Logstash PPA
    - name: ppa:wolfnet/logstash
    - dist: precise
    - file: /etc/apt/sources.list.d/logstash.list
    - keyid: 28B04E4A
    - keyserver: keyserver.ubuntu.com
```

(continues on next page)
Multiple packages can also be installed with the use of the pkgs state module:

**dotdeb.repo:**
```
pkgrepo.managed:
  - humanname: Dotdeb
  - name: deb http://packages.dotdeb.org wheezy-php55 all
  - dist: wheezy-php55
  - file: /etc/apt/sources.list.d/dotdeb.list
  - keyid: 89DF5277
  - keyserver: keys.gnupg.net
  - refresh_db: true
```

**php.packages:**
```
pkg.installed:
  - fromrepo: wheezy-php55
  - pkgs:
    - php5-fpm
    - php5-cli
    - php5-curl
```

---

**Warning:** Package names are currently case-sensitive. If the minion is using a package manager which is not case-sensitive (such as `pkgng`), then this state will fail if the proper case is not used. This will be addressed in a future release of Salt.

---

**salt.states.pkg.downloaded**
```
(name, version=None, pkgs=None, fromrepo=None, ignore_epoch=None, **kwargs)
```
New in version 2017.7.0.

Ensure that the package is downloaded, and that it is the correct version (if specified).

Currently supported for the following pkg providers: `yumpkg` and `zypper`

Parameters
- **name** *(str)* – The name of the package to be downloaded. This parameter is ignored if either "pkgs" is used. Additionally, please note that this option can only be used to download packages from a software repository.
- **version** *(str)* – Download a specific version of a package.

---

**Important:** As of version 2015.8.7, for distros which use yum/dnf, packages which have a version with a nonzero epoch (that is, versions which start with a number followed by a colon) must have the epoch included when specifying the version number. For example:

```
vim-enhanced:
pkg.downloaded:
  - version: 2:7.4.160-1.el7
```

An **ignore_epoch** argument has been added to which causes the epoch to be disregarded when the state checks to see if the desired version was installed.
You can install a specific version when using the `pkgs` argument by including the version after the package:

```yaml
common_packages:
  pkg.downloaded:
    - pkgs:
      - unzip
      - dos2unix
    - salt-minion: 2015.8.5-1.el6
```

- `resolve_capabilities (bool)` – Turn on resolving capabilities. This allow one to name "provides" or alias names for packages.

 CLI Example:

```bash
zsh:
  pkg.downloaded:
    - version: 5.0.5-4.63
    - fromrepo: "myrepository"
```

`salt.states.pkg.group_installed (name, skip=None, include=None, **kwargs)`

New in version 2015.8.0.

Changed in version 2016.11.0: Added support in `pacman`

Ensure that an entire package group is installed. This state is currently only supported for the `yum` and `pacman` package managers.

- `skip` Packages that would normally be installed by the package group ("default" packages), which should not be installed.

```yaml
Load Balancer:
  pkg.group_installed:
    - skip:
      - piranha
```

- `include` Packages which are included in a group, which would not normally be installed by a `yum groupinstall` ("optional" packages). Note that this will not enforce group membership; if you include packages which are not members of the specified groups, they will still be installed.

```yaml
Load Balancer:
  pkg.group_installed:
    - include:
      - haproxy
```

Changed in version 2016.3.0: This option can no longer be passed as a comma-separated list, it must now be passed as a list (as shown in the above example).

**Note:** Because this is essentially a wrapper around `pkg.install`, any argument which can be passed to `pkg.install` may also be included here, and it will be passed on to the call to `pkg.install`.

`salt.states.pkg.installed (name, version=None, refresh=None, fromrepo=None, skip_verify=False, skip_suggestions=False, pkgs=None, sources=None, allow_updates=False, pkg_verify=False, normalize=True, ignore_epoch=False, reinstall=False, update_holds=False, **kwargs)`

Ensure that the package is installed, and that it is the correct version (if specified).

**Parameters**
- **name** *(str)* – The name of the package to be installed. This parameter is ignored if either "pkgs" or "sources" is used. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the "sources" option detailed below.

- **version** *(str)* – Install a specific version of a package. This option is ignored if "sources" is used. Currently, this option is supported for the following pkg providers: *apt, ebuild, pacman, pkgin, win pkg, yum pkg*, and *zypper*. The version number includes the release designation where applicable, to allow Salt to target a specific release of a given version. When in doubt, using the pkg.latest_version function for an uninstalled package will tell you the version available.

    ```
    # salt myminion pkg.latest_version vim-enhanced
    myminion:
        2:7.4.160-1.el7
    ```

**Important:** As of version 2015.8.7, for distros which use yum/dnf, packages which have a version with a nonzero epoch (that is, versions which start with a number followed by a colon like in the pkg.latest_version output above) must have the epoch included when specifying the version number. For example:

    ```
    vim-enhanced:
    pkg.installed:
        - version: 2:7.4.160-1.el7
    ```

In version 2015.8.9, an ignore_epoch argument has been added to pkg.installed, pkg.removed, and pkg.purged states, which causes the epoch to be disregarded when the state checks to see if the desired version was installed.

Also, while this function is not yet implemented for all pkg frontends, pkg.list_repo_pkgs will show all versions available in the various repositories for a given package, irrespective of whether or not it is installed.

    ```
    # salt myminion pkg.list_repo_pkgs bash
    myminion:
        -------
        bash:
            - 4.2.46-21.el7_3
            - 4.2.46-20.el7_2
    ```

This function was first added for pkg.list_repo_pkgs in 2014.1.0, and was expanded to Debian/Ubuntu and Arch Linux-based distros in the 2017.7.0 release.

The version strings returned by either of these functions can be used as version specifiers in pkg states.

You can install a specific version when using the pkgs argument by including the version after the package:

    ```
    common_packages:
    pkg.installed:
        - pkgs:
            - unzip
            - dos2unix
            - salt-minion: 2015.8.5-1.el6
    ```
If the version given is the string `latest`, the latest available package version will be installed à la `pkg.latest`.

### WILDCARD VERSIONS

As of the 2017.7.0 release, this state now supports wildcards in package versions for SUSE SLES/Leap/Tumbleweed, Debian/Ubuntu, RHEL/CentOS, Arch Linux, and their derivatives. Using wildcards can be useful for packages where the release name is built into the version in some way, such as for RHEL/CentOS which typically has version numbers like `1.2.34-5.el7`. An example of the usage for this would be:

```yaml
mypkg:
  pkg.installed:
    - version: '1.2.34*' 
```

Keep in mind that using wildcard versions will result in a slower state run since Salt must gather the available versions of the specified packages and figure out which of them match the specified wildcard expression.

- **refresh** (`bool`) – This parameter controls whether or not the package repo database is updated prior to installing the requested package(s).

  If `True`, the package database will be refreshed (`apt-get update` or equivalent, depending on platform) before installing.

  If `False`, the package database will not be refreshed before installing.

  If unset, then Salt treats package database refreshes differently depending on whether or not a `pkg` state has been executed already during the current Salt run. Once a refresh has been performed in a `pkg` state, for the remainder of that Salt run no other refreshes will be performed for `pkg` states which do not explicitly set `refresh` to `True`. This prevents needless additional refreshes from slowing down the Salt run.

- **cache_valid_time** (`str`) – New in version 2016.11.0.

  This parameter sets the value in seconds after which the cache is marked as invalid, and a cache update is necessary. This overwrites the `refresh` parameter’s default behavior.

  Example:

  ```yaml
  httpd:
    pkg.installed:
      - fromrepo: mycustomrepo
      - skip_verify: True
      - skip_suggestions: True
      - version: 2.0.6~ubuntu3
      - refresh: True
      - cache_valid_time: 300
      - allow_updates: True
      - hold: False
  
  In this case, a refresh will not take place for 5 minutes since the last `apt-get update` was executed on the system.

  **Note:** This parameter is available only on Debian based distributions and has no effect on the rest.

- **fromrepo** (`str`) – Specify a repository from which to install
Note: Distros which use APT (Debian, Ubuntu, etc.) do not have a concept of repositories, in the same way as YUM-based distros do. When a source is added, it is assigned to a given release. Consider the following source configuration:

```
deb http://ppa.launchpad.net/saltstack/salt/ubuntu precise main
```

The packages provided by this source would be made available via the `precise` release, therefore `fromrepo` would need to be set to `precise` for Salt to install the package from this source.

Having multiple sources in the same release may result in the default install candidate being newer than what is desired. If this is the case, the desired version must be specified using the `version` parameter.

If the `pkgs` parameter is being used to install multiple packages in the same state, then instead of using `version`, use the method of version specification described in the Multiple Package Installation Options section below.

Running the shell command `apt-cache policy pkgname` on a minion can help elucidate the APT configuration and aid in properly configuring states:

```
root@saltmaster:~# salt ubuntu01 cmd.run 'apt-cache policyffmpeg'
ubuntu01:
  ffmpeg:
    Installed: (none)
    Candidate: 7:0.10.11-1-precise1
    Version table:
      7:0.10.11-1-precise1 0
        http://ppa.launchpad.net/jon-severinsson/
        ffmpeg/ubuntu/ precise/main amd64 Packages
      4:0.8.10-0ubuntu0.12.04.1 0
        http://us.archive.ubuntu.com/ubuntu/ precise-
        updates/main amd64 Packages
      500 http://security.ubuntu.com/ubuntu/ precise-
        security/main amd64 Packages
      4:0.8.1-0ubuntu1 0
        http://us.archive.ubuntu.com/ubuntu/ precise/
        main amd64 Packages
```

The release is located directly after the source’s URL. The actual release name is the part before the slash, so to install version 4:0.8.10-0ubuntu0.12.04.1 either `precise-updates` or `precise-security` could be used for the `fromrepo` value.

- `skip_verify (bool)` – Skip the GPG verification check for the package to be installed

New in version 2014.1.1.
- `resolve_capabilities (bool)` – Turn on resolving capabilities. This allow one to name “provides” or alias names for packages.

New in version 2018.3.0.
- `allow_updates (bool)` – Allow the package to be updated outside Salt’s control (e.g. auto updates on Windows). This means a package on the Minion can have
a newer version than the latest available in the repository without enforcing a re-
installation of the package.

New in version 2014.7.0.

Example:

```
httpd:
  pkg.installed:
    - fromrepo: mycustomrepo
    - skip_verify: True
    - skip_suggestions: True
    - version: 2.0.6-ubuntu3
    - refresh: True
    - allow_updates: True
    - hold: False
```

- `pkg_verify` *(bool)* – New in version 2014.7.0.

For requested packages that are already installed and would not be targeted for up-
grade or downgrade, use pkg.verify to determine if any of the files installed by the
package have been altered. If files have been altered, the reinstall option of pkg.install
is used to force a reinstall. Types to ignore can be passed to pkg.verify. Additionally,
verify_options can be used to modify further the behavior of pkg.verify. See
examples below. Currently, this option is supported for the following pkg providers:
`yumpkg`.

Examples:

```
httpd:
  pkg.installed:
    - version: 2.2.15-30.el6.centos
    - pkg_verify: True

mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar: 1.2.3-4
      - baz
    - pkg_verify:
      - ignore_types:
        - config
        - doc

mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar: 1.2.3-4
      - baz
    - pkg_verify:
      - ignore_types:
        - config
        - doc
      - verify_options:
        - nodelps
        - nofiledigest
```

- `ignore_types` *(list)* – List of types to ignore when verifying the package
New in version 2014.7.0.

- **verify_options** *(list)* – List of additional options to pass when verifying the package. These options will be added to the **rpm -V** command, prepended with **--** (for example, when **nodeps** is passed in this option, **rpm -V** will be run with **--nodeps**).

New in version 2016.11.0.

- **normalize** *(bool)* – Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2014.7.0.

Example:

```
gpfs.gplbin-2.6.32-279.31.1.el6.x86_64
pkg.installed:
  - normalize: False
```

- **ignore_epoch** *(bool)* – When a package version contains an non-zero epoch (e.g. 1:3.14.159–2.el7, and a specific version of a package is desired, set this option to **True** to ignore the epoch when comparing versions. This allows for the following SLS to be used:

```
# Actual vim-enhanced version: 2:7.4.160-1.el7
vim-enhanced:
  pkg.installed:
    - version: 7.4.160-1.el7
    - ignore_epoch: True
```

Without this option set to **True** in the above example, the package would be installed, but the state would report as failed because the actual installed version would be 2:7.4.160–1.el7. Alternatively, this option can be left as **False** and the full version string (with epoch) can be specified in the SLS file:

```
vim-enhanced:
  pkg.installed:
    - version: 2:7.4.160-1.el7
```

New in version 2015.8.9.

---

**MULTIPLE PACKAGE INSTALLATION OPTIONS**: (not supported in pkgng)

**Parameters**

- **pkgs** *(list)* – A list of packages to install from a software repository. All packages listed under **pkgs** will be installed via a single command.

```
mpkpks:
  pkg.installed:
    - pkgs:
      - foo
      - bar
```
- baz
- hold: True

**NOTE:** For `apt`, `ebuild`, `pacman`, `winrepo`, `yumpkg`, and `zypper`, version numbers can be specified in the `pkgs` argument. For example:

```yaml
mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar: 1.2.3-4
      - baz
```

Additionally, `ebuild`, `pacman`, `zypper`, `yum/dnf`, and `apt` support the `<`, `<=`, `>=`, and `>` operators for more control over what versions will be installed. For example:

```yaml
mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar: '>=1.2.3-4'
      - baz
```

**NOTE:** When using comparison operators, the expression must be enclosed in quotes to avoid a YAML render error.

With `ebuild` it is also possible to specify a use flag list and/or if the given packages should be in package.accept_keywords file and/or the overlay from which you want the package to be installed. For example:

```yaml
mypkgs:
  pkg.installed:
    - pkgs:
      - foo:
        - bar: '~=1.2:slot::overlay[use,-otheruse]'
      - baz
```

- **sources** *(list)* – A list of packages to install, along with the source URI or local path from which to install each package. In the example below, `foo`, `bar`, `baz`, etc. refer to the name of the package, as it would appear in the output of the `{version | pkg.list_pkgs}` salt CLI commands.

```yaml
mypkgs:
  pkg.installed:
    - sources:
      - foo: salt://rpms/foo.rpm
      - bar: http://somesite.org/bar.rpm
      - baz: ftp://someothersite.org/baz.rpm
      - qux: /minion/path/to/qux.rpm
```

**PLATFORM-SPECIFIC ARGUMENTS**

These are specific to each OS. If it does not apply to the execution module for your OS, it is ignored.

**Parameters**

- **hold** *(bool)* – Force the package to be held at the current installed version. Currently works with YUM/DNF & APT based systems.
New in version 2014.7.0.

- **update_holds (bool)** - If True, and this function would update the package version, any packages which are being held will be temporarily unheld so that they can be updated. Otherwise, if this function attempts to update a held package, the held package(s) will be skipped and the state will fail. By default, this parameter is set to False.

Currently works with YUM/DNF & APT based systems.

New in version 2016.11.0.

- **names (list)** - A list of packages to install from a software repository. Each package will be installed individually by the package manager.

  **Warning:** Unlike pkgs, the names parameter cannot specify a version. In addition, it makes a separate call to the package management frontend to install each package, whereas pkgs makes just a single call. It is therefore recommended to use pkgs instead of names to install multiple packages, both for the additional features and the performance improvement that it brings.

- **install_recommends (bool)** - Whether to install the packages marked as recommended. Default is True. Currently only works with APT-based systems.

New in version 2015.5.0.

```yaml
httpd:
  pkg.installed:
    - install_recommends: False
```

- **only_upgrade (bool)** - Only upgrade the packages, if they are already installed. Default is False. Currently only works with APT-based systems.

New in version 2015.5.0.

```yaml
httpd:
  pkg.installed:
    - only_upgrade: True
```

**Note:** If this parameter is set to True and the package is not already installed, the state will fail.

- **report_reboot_exit_codes (bool)** - If the installer exits with a recognized exit code indicating that a reboot is required, the module function

  ```python
  win_system.set_reboot_required_witnessed
  ```

will be called, preserving the knowledge of this event for the remainder of the current boot session. For the time being, 3010 is the only recognized exit code, but this is subject to future refinement. The value of this param defaults to True. This parameter has no effect on non-Windows systems.

New in version 2016.11.0.

```yaml
ms vcpp installed:
  pkg.installed:
    - name: ms-vcpp
    - version: 10.0.40219
    - report_reboot_exit_codes: False
```

**Returns** A dictionary containing the state of the software installation
Rtype dict

Note: The pkg.installed state supports the usage of reload_modules. This functionality allows you to force Salt to reload all modules. In many cases, Salt is clever enough to transparently reload the modules. For example, if you install a package, Salt reloads modules because some other module or state might require the package which was installed. However, there are some edge cases where this may not be the case, which is what reload_modules is meant to resolve.

You should only use reload_modules if your pkg.installed does some sort of installation where if you do not reload the modules future items in your state which rely on the software being installed will fail. Please see the Reloading Modules documentation for more information.

salt.states.pkg.latest (name, refresh=None, fromrepo=None, skip_verify=False, pkgs=None, watch_flags=True, **kwargs)

Ensure that the named package is installed and the latest available package. If the package can be updated, this state function will update the package. Generally it is better for the installed function to be used, as latest will update the package whenever a new package is available.

name The name of the package to maintain at the latest available version. This parameter is ignored if "pkgs" is used.
fromrepo Specify a repository from which to install
skip_verify Skip the GPG verification check for the package to be installed
refresh This parameter controls whether or not the package repo database is updated prior to checking for the latest available version of the requested packages.

If True, the package database will be refreshed (apt-get update or equivalent, depending on platform) before checking for the latest available version of the requested packages.

If False, the package database will not be refreshed before checking.

If unset, then Salt treats package database refreshes differently depending on whether or not a pkg state has been executed already during the current Salt run. Once a refresh has been performed in a pkg state, for the remainder of that Salt run no other refreshes will be performed for pkg states which do not explicitly set refresh to True. This prevents needless additional refreshes from slowing down the Salt run.

param str cache_valid_time New in version 2016.11.0.

This parameter sets the value in seconds after which the cache is marked as invalid, and a cache update is necessary. This overwrites the refresh parameter’s default behavior.

Example:

```
httpd:
  pkg.latest:
    - refresh: True
    - cache_valid_time: 300
```

In this case, a refresh will not take place for 5 minutes since the last apt-get update was executed on the system.

Note: This parameter is available only on Debian based distributions and has no effect on the rest.

param bool resolve_capabilities Turn on resolving capabilities. This allow one to name "provides" or alias names for packages.
New in version 2018.3.0.

Multiple Package Installation Options:
(Not yet supported for: FreeBSD, OpenBSD, MacOS, and Solaris pkgutil)

**pkgs**  A list of packages to maintain at the latest available version.

```yaml
mypkgs:
  pkg.latest:
    - pkgs:
      - foo
      - bar
      - baz
```

**install_recommends**  Whether to install the packages marked as recommended. Default is True. Currently only works with APT-based systems.

New in version 2015.5.0.

```yaml
httpd:
  pkg.latest:
    - install_recommends: False
```

**only_upgrade**  Only upgrade the packages, if they are already installed. Default is False. Currently only works with APT-based systems.

New in version 2015.5.0.

```yaml
httpd:
  pkg.latest:
    - only_upgrade: True
```

**Note:** If this parameter is set to True and the package is not already installed, the state will fail.

**report_reboot_exit_codes**  If the installer exits with a recognized exit code indicating that a reboot is required, the module function `win_system.set_reboot_required_witnessed` will be called, preserving the knowledge of this event for the remainder of the current boot session. For the time being, 3010 is the only recognized exit code, but this is subject to future refinement. The value of this param defaults to True. This parameter has no effect on non-Windows systems.

New in version 2016.11.0.

```yaml
ms vcpp installed:
  pkg.latest:
    - name: ms-vcpp
    - report_reboot_exit_codes: False
```

**salt.states.pkg.mod_aggregate**(*low, chunks, running*)

The mod_aggregate function which looks up all packages in the available low chunks and merges them into a single pkgs ref in the present low data

**salt.states.pkg.mod_watch**(*name, **kwargs*)

Install/reinstall a package based on a watch requisite

**Note:** This state exists to support special handling of the watch requisite. It should not be called directly.
Parameters for this function should be set by the state being triggered.

```
salt.states.pkg.patch_downloaded(name, advisory_ids=None, **kwargs)
```

New in version 2017.7.0.

Ensure that packages related to certain advisory ids are downloaded.

Currently supported for the following pkg providers: **yumpkg** and **zypper**

CLI Example:
```
preparing-to-fix-issues:
pkg.patch_downloaded:
  - advisory_ids:
    - SUSE-SLE-SERVER-12-SP2-2017-185
    - SUSE-SLE-SERVER-12-SP2-2017-150
    - SUSE-SLE-SERVER-12-SP2-2017-120
```

```
salt.states.pkg.patch_installed(name, advisory_ids=None, downloadonly=None, **kwargs)
```

New in version 2017.7.0.

Ensure that packages related to certain advisory ids are installed.

Currently supported for the following pkg providers: **yumpkg** and **zypper**

CLI Example:
```
issue-foo-fixed:
pkg.patch_installed:
  - advisory_ids:
    - SUSE-SLE-SERVER-12-SP2-2017-185
    - SUSE-SLE-SERVER-12-SP2-2017-150
    - SUSE-SLE-SERVER-12-SP2-2017-120
```

```
salt.states.pkg.purged(name, version=None, pkgs=None, normalize=True, ignore_epoch=False, **kwargs)
```

Verify that a package is not installed, calling `pkg.purge` if necessary to purge the package. All configuration files are also removed.

- **name** The name of the package to be purged.
- **version** The version of the package that should be removed. Don’t do anything if the package is installed with an unmatching version.

**Important:** As of version 2015.8.7, for distros which use yum/dnf, packages which have a version with a nonzero epoch (that is, versions which start with a number followed by a colon like in the example above) must have the epoch included when specifying the version number. For example:

```
vim-enhanced:
pkg.purged:
  - version: 2:7.4.160-1.el7
```

In version 2015.8.9, an **ignore_epoch** argument has been added to `pkg.installed`, `pkg.removed`, and `pkg.purged` states, which causes the epoch to be disregarded when the state checks to see if the desired version was installed. If **ignore_epoch** was not set to **True**, and instead of `2:7.4.160-1.el7` a version of `7.4.160-1.el7` were used, this state would report success since the actual installed version includes the epoch, and the specified version would not match.

- **normalize** [True] Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful.
for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2015.8.0.

**ignore_epoch** [False] When a package version contains a non-zero epoch (e.g. `1:3.14.159-2.el7`, and a specific version of a package is desired, set this option to `True` to ignore the epoch when comparing versions. This allows for the following SLS to be used:

```yaml
# Actual vim-enhanced version: 2:7.4.160-1.el7
vim-enhanced:
  pkg.purged:
    - version: 7.4.160-1.el7
    - ignore_epoch: True
```

Without this option set to `True` in the above example, the state would falsely report success since the actual installed version is `2:7.4.160-1.el7`. Alternatively, this option can be left as `False` and the full version string (with epoch) can be specified in the SLS file:

```yaml
vim-enhanced:
  pkg.purged:
    - version: 2:7.4.160-1.el7
```

New in version 2015.8.9.

**Multiple Package Options:**

- **pkgs** A list of packages to purge. Must be passed as a python list. The `name` parameter will be ignored if this option is passed. It accepts version numbers as well.

New in version 0.16.0.

```python
salt.states.pkg.removed(name, version=None, pkgs=None, normalize=True, ignore_epoch=False, **kwargs)
```

Verify that a package is not installed, calling `pkg.remove` if necessary to remove the package.

- **name** The name of the package to be removed. Don’t do anything if the package is installed with an unmatching version.

**Important:** As of version 2015.8.7, for distros which use yum/dnf, packages which have a version with a nonzero epoch (that is, versions which start with a number followed by a colon like in the example above) must have the epoch included when specifying the version number. For example:

```yaml
vim-enhanced:
  pkg.removed:
    - version: 2:7.4.160-1.el7
```

In version 2015.8.9, an **ignore_epoch** argument has been added to `pkg.installed`, `pkg.removed`, and `pkg.purged` states, which causes the epoch to be disregarded when the state checks to see if the desired version was installed. If **ignore_epoch** was not set to `True`, and instead of `2:7.4.160-1.el7` a version of `7.4.160-1.el7` were used, this state would report success since the actual installed version includes the epoch, and the specified version would not match.

- **normalize** [True] Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2015.8.0.

- **ignore_epoch** [False] When a package version contains an non-zero epoch (e.g. `1:3.14.159-2.el7`, and a specific version of a package is desired, set this option to `True` to ignore the epoch when comparing versions.
versions. This allows for the following SLS to be used:

```yaml
# Actual vim-enhanced version: 2:7.4.160-1.el7
vim-enhanced:
  pkg.removed:
    - version: 7.4.160-1.el7
    - ignore_epoch: True
```

Without this option set to `True` in the above example, the state would falsely report success since the actual installed version is `2:7.4.160-1.el7`. Alternatively, this option can be left as `False` and the full version string (with epoch) can be specified in the SLS file:

```yaml
vim-enhanced:
  pkg.removed:
    - version: 2:7.4.160-1.el7
```

New in version 2015.8.9.

Multiple Package Options:

- `pkgs` A list of packages to remove. Must be passed as a python list. The `name` parameter will be ignored if this option is passed. It accepts version numbers as well.

New in version 0.16.0.

```python
salt.states.pkg.uptodate(name, refresh=False, pkgs=None, **kwargs)
```

New in version 2014.7.0.

Changed in version 2018.3.0: Added support for the `pkgin` provider.

Verify that the system is completely up to date.

- `name` The name has no functional value and is only used as a tracking reference
- `refresh` refresh the package database before checking for new upgrades
- `pkgs` list of packages to upgrade

**Parameters**

- `cache_valid_time (str)` - This parameter sets the value in seconds after which cache marked as invalid, and cache update is necessary. This overwrite `refresh` parameter default behavior.

  In this case `cache_valid_time` is set, refresh will not take place for amount in seconds since last `apt-get update` executed on the system.

  **Note:** This parameter available only on Debian based distributions, and have no effect on the rest.

- `resolve_capabilities (bool)` - Turn on resolving capabilities. This allow one to name "provides" or alias names for packages.

  New in version 2018.3.0.

- `kwargs` Any keyword arguments to pass through to `pkg.upgrade`.

  New in version 2015.5.0.

21.19.209 salt.states.pkgbuild

The `pkgbuild` state is the front of Salt package building backend. It automatically builds DEB and RPM packages from specified sources.

New in version 2015.8.0.
salt_2015.5.2:
pkgbuild.built:
  - runas: thatch
  - results:
    - salt-2015.5.2-2.el7.centos.noarch.rpm
    - salt-api-2015.5.2-2.el7.centos.noarch.rpm
    - salt-cloud-2015.5.2-2.el7.centos.noarch.rpm
    - salt-master-2015.5.2-2.el7.centos.noarch.rpm
    - salt-minion-2015.5.2-2.el7.centos.noarch.rpm
    - salt-ssh-2015.5.2-2.el7.centos.noarch.rpm
    - salt-syndic-2015.5.2-2.el7.centos.noarch.rpm
  - dest_dir: /tmp/pkg
  - spec: salt://pkg/salt/spec/salt.spec
  - template: jinja
  - deps:
    - salt://pkg/salt/sources/required_dependency.rpm
  - tgt: epel-7-x86_64
  - sources:
    - salt://pkg/salt/sources/logrotate.salt
    - salt://pkg/salt/sources/README.fedora
    - salt://pkg/salt/sources/salt-2015.5.2.tar.gz
    - salt://pkg/salt/sources/salt-2015.5.2-tests.patch
    - salt://pkg/salt/sources/salt-api
    - salt://pkg/salt/sources/salt-api.service
    - salt://pkg/salt/sources/salt-master
    - salt://pkg/salt/sources/salt-master.service
    - salt://pkg/salt/sources/salt-minion
    - salt://pkg/salt/sources/salt-minion.service
    - salt://pkg/salt/sources/saltpkg.sls
    - salt://pkg/salt/sources/salt-syndic
    - salt://pkg/salt/sources/salt-syndic.service
    - salt://pkg/salt/sources/SaltTesting-2015.5.8.tar.gz

/tmp/pkg:
pkgbuild.repo

salt.states.pkgbuild.built(name, runas, dest_dir, spec, sources, tgt, template=None, deps=None, env=None, results=None, force=False, saltenv='base', log_dir='/var/log/salt/pkgbuild')

Ensure that the named package is built and exists in the named directory
name The name to track the build, the name value is otherwise unused
runas The user to run the build process as
dest_dir The directory on the minion to place the built package(s)
spec The location of the spec file (used for rpms)
sources The list of package sources
tgt The target platform to run the build on
template Run the spec file through a templating engine

Changed in version 2015.8.2: This argument is now optional, allowing for no templating engine to be used if none is desired.
deps Packages required to ensure that the named package is built can be hosted on either the salt master server or on an HTTP or FTP server. Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials
env A dictionary of environment variables to be set prior to execution. Example:

- env:
  
  DEB_BUILD_OPTIONS: 'nocheck'
Warning: The above illustrates a common PyYAML pitfall, that yes, no, on, off, true, and false are all loaded as boolean True and False values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found here.

results The names of the expected rpms that will be built
force [False] If True, packages will be built even if they already exist in the dest_dir. This is useful when building a package for continuous or nightly package builds.

New in version 2015.8.2.
saltenv The saltenv to use for files downloaded from the salt fileserver
log_dir [/var/log/salt/rpmbuild] Root directory for log files created from the build. Logs will be organized by package name, version, OS release, and CPU architecture under this directory.

New in version 2015.8.2.
salt.states.pkgbuild.repo(name, keyid=None, env=None, use_passphrase=False, gnupghome='/etc/salt/gpgkeys', runas='builder', timeout=15.0)
Make a package repository and optionally sign it and packages present

The name is directory to turn into a repo. This state is best used with onchanges linked to your package building states.

name The directory to find packages that will be in the repository
keyid Changed in version 2016.3.0.

Optional Key ID to use in signing packages and repository. Utilizes Public and Private keys associated with keyid which have been loaded into the minion’s Pillar data.

For example, contents from a Pillar data file with named Public and Private keys as follows:

gpg_pkg_priv_key: |
------BEGIN PGP PRIVATE KEY BLOCK------
Version: GnuPG v1

\lQO+BFeiFQBCADAPCtwx7I5RL32escCMZsPzaEKWe7bIX1em4KCKkBoX47Ig54b

inNNq9w9c=
=s1C
------END PGP PUBLIC KEY BLOCK------
gpg_pkg_pub_keyname: gpg_pkg_key.pub

env

Changed in version 2016.3.0.

A dictionary of environment variables to be utilized in creating the repository. Example:

```yaml
- env:
  OPTIONS: 'ask-passphrase'
```

**Warning:** The above illustrates a common PyYAML pitfall, that `yes`, `no`, `on`, `off`, `true`, and `false` are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Use of OPTIONS on some platforms, for example: `ask-passphrase`, will require `gpg-agent` or similar to cache passphrases.

**Note:** This parameter is not used for making `yum` repositories.

use_passphrase [False] New in version 2016.3.0.

Use a passphrase with the signing key presented in keyid. Passphrase is received from Pillar data which could be passed on the command line with pillar parameter. For example:

```yaml
pillar='{"gpg_passphrase": "my_passphrase"}"
```

gnupghome [/etc/salt/gpgkeys] New in version 2016.3.0.

Location where GPG related files are stored, used with `keyid`

runas [builder] New in version 2016.3.0.

User to create the repository as, and optionally sign packages.

**Note:** Ensure the user has correct permissions to any files and directories which are to be utilized.

timeout [15.0] New in version 2016.3.4.

Timeout in seconds to wait for the prompt for inputting the passphrase.

### 21.19.210 salt.states.pkgng

 Manage package remote repo using FreeBSD pkgng

Salt can manage the URL pkgng pulls packages from. ATM the state and module are small so use cases are typically rather simple:

```yaml
pkgng_clients:
  pkgng.update_packaging_site:
    - name: "http://192.168.0.2"
```

```python
salt.states.pkgng.update_packaging_site(name)
```
21.19.211 salt.states.pkgrepo

Management of APT/DNF/YUM/Zypper package repos

States for managing software package repositories on Linux distros. Supported package managers are APT, DNF, YUM and Zypper. Here is some example SLS:

```yaml
base:
  pkgrepo.managed:
    - humanname: CentOS-$releasever - Base
    - mirrorlist: http://mirrorlist.centos.org/?release=$releasever&arch=$basearch&
    - repos=os
      - comments: http://mirror.centos.org/centos/$releasever/os/$basearch/
    - gpgcheck: 1
    - gpgkey: file:///etc/pki/rpm-gpg/RPM-GPG-KEY-CentOS-6

base:
  pkgrepo.managed:
    - humanname: Logstash PPA
    - name: deb http://ppa.launchpad.net/wolfnet/logstash/ubuntu precise main
    - dist: precise
    - file: /etc/apt/sources.list.d/logstash.list
    - keyid: 28B04E4A
    - keyserver: keyserver.ubuntu.com
    - require_in:
      - pkg: logstash

pkg.latest:
  - name: logstash
  - refresh: True

base:
  pkgrepo.managed:
    - humanname: deb-multimedia
    - name: deb http://www.deb-multimedia.org stable main
    - file: /etc/apt/sources.list.d/deb-multimedia.list
    - key_url: salt://deb-multimedia/files/marillat.pub

base:
  pkgrepo.managed:
    - humanname: Google Chrome
    - name: deb http://dl.google.com/linux/chrome/deb/ stable main
    - dist: stable
    - file: /etc/apt/sources.list.d/chrome-browser.list
    - require_in:
      - pkg: google-chrome-stable
    - gpgcheck: 1
    - key_url: https://dl-ssl.google.com/linux/linux_signing_key.pub

base:
  pkgrepo.managed:
    - ppa: wolfnet/logstash
  pkg.latest:
    - name: logstash
    - refresh: True
```
Note: On Ubuntu systems, the `python-software-properties` package should be installed for better support of PPA repositories. To check if this package is installed, run `dpkg -l python-software-properties`.

Also, some Ubuntu releases have a bug in their `python-software-properties` package, a missing dependency on pycurl, so `python-pycurl` will need to be manually installed if it is not present once `python-software-properties` is installed.

On Ubuntu & Debian systems, the `python-apt` package is required to be installed. To check if this package is installed, run `dpkg -l python-apt`. `python-apt` will need to be manually installed if it is not present.

```
salt.states.pkgrepo.absent(name, **kwargs)
```

This function deletes the specified repo on the system, if it exists. It is essentially a wrapper around `pkg.del_repo`.

- **name**: The name of the package repo, as it would be referred to when running the regular package manager commands.

**UBUNTU-SPECIFIC OPTIONS**

- **ppa**: On Ubuntu, you can take advantage of Personal Package Archives on Launchpad simply by specifying the user and archive name.

```
logstash-ppa:
  pkgrepo.absent:
    - ppa: wolfnet/logstash
```

- **ppa_auth**: For Ubuntu PPAs there can be private PPAs that require authentication to access. For these PPAs the username/password can be specified. This is required for matching if the name format uses the `ppa:` specifier and is private (requires username/password to access, which is encoded in the URI).

```
logstash-ppa:
  pkgrepo.absent:
    - ppa: wolfnet/logstash
    - ppa_auth: username:password
```

- **keyid**: If passed, then the GPG key corresponding to the passed KeyID will also be removed.

```
keyid_ppa: [False] If set to True, the GPG key’s ID will be looked up from ppa.launchpad.net and removed, and the keyid argument will be ignored.
```

Note: This option will be disregarded unless the `ppa` argument is present.

```
salt.states.pkgrepo.managed(name, ppa=None, **kwargs)
```

This state manages software package repositories. Currently, `yum`, `apt`, and `zypper` repositories are supported.

**YUM/DNF/ZYPPER-BASED SYSTEMS**

Note: One of `baseurl` or `mirrorlist` below is required. Additionally, note that this state is not presently capable of managing more than one repo in a single repo file, so each instance of this state will manage a single repo file containing the configuration for a single repo.

- **name**: This value will be used in two ways: Firstly, it will be the repo ID, as seen in the entry in square brackets (e.g. `[foo]`) for a given repo. Secondly, it will be the name of the file as stored in `/etc/yum.repos.d` (e.g. `/etc/yum.repos.d/foo.conf`).

- **enabled**: [True] Whether or not the repo is enabled. Can be specified as True/False or 1/0.

- **disabled**: [False] Included to reduce confusion due to APT’s use of the `disabled` argument. If this is passed for a YUM/DNF/Zypper-based distro, then the reverse will be passed as `enabled`. For example passing
disabled=True will assume enabled=False.
humanname This is used as the "name" value in the repo file in /etc/yum.repos.d/ (or /etc/zypp/repos.d for SUSE distros).
baseurl The URL to a yum repository
mirrorlist A URL which points to a file containing a collection of baseurls
comments Sometimes you want to supply additional information, but not as enabled configuration. Anything supplied for this list will be saved in the repo configuration with a comment marker (#) in front.
gpgautoimport Only valid for Zypper package manager. If set to True, automatically trust and import public GPG key for the repository. The key should be specified with gpgkey parameter. See details below.

Additional configuration values seen in YUM/DNF/Zypper repo files, such as gpgkey or gpgcheck, will be used directly as key-value pairs. For example:

```
foo:
  pkgrepo.managed:
    - humanname: Personal repo for foo
    - baseurl: https://mydomain.tld/repo/foo/$releasever/$basearch
    - gpgkey: file:///etc/pki/rpm-gpg/foo-signing-key
    - gpgcheck: 1
```

### APT-BASED SYSTEMS

**ppa** On Ubuntu, you can take advantage of Personal Package Archives on Launchpad simply by specifying the user and archive name. The keyid will be queried from launchpad and everything else is set automatically. You can override any of the below settings by simply setting them as you would normally. For example:

```
logstash-ppa:
  pkgrepo.managed:
    - ppa: wolfnet/logstash
```

**ppa_auth** For Ubuntu PPAs there can be private PPAs that require authentication to access. For these PPAs the username/password can be passed as an HTTP Basic style username/password combination.

```
logstash-ppa:
  pkgrepo.managed:
    - ppa: wolfnet/logstash
    - ppa_auth: username:password
```

**name** On apt-based systems this must be the complete entry as it would be seen in the sources.list file. This can have a limited subset of components (i.e. 'main') which can be added/modified with the comps option.

```
precise-repo:
  pkgrepo.managed:
    - name: deb http://us.archive.ubuntu.com/ubuntu precise main
```

Note: The above example is intended as a more readable way of configuring the SLS, it is equivalent to the following:

```
'deb http://us.archive.ubuntu.com/ubuntu precise main':
  pkgrepo.managed
```

disabled [False] Toggles whether or not the repo is used for resolving dependencies and/or installing packages.
enabled [True] Included to reduce confusion due to YUM/DNF/Zypper's use of the enabled argument. If this is passed for an APT-based distro, then the reverse will be passed as disabled. For example, passing enabled=False will assume disabled=False.
architectures  On apt-based systems, architectures can restrict the available architectures that the repository provides (e.g. only amd64). architectures should be a comma-separated list.
comps  On apt-based systems, comps dictate the types of packages to be installed from the repository (e.g. main, nonfree, ...). For purposes of this, comps should be a comma-separated list.
file  The filename for the .list that the repository is configured in. It is important to include the full-path AND make sure it is in a directory that APT will look in when handling packages.
dist  This dictates the release of the distro the packages should be built for. (e.g. unstable). This option is rarely needed.
keyid  The KeyID or a list of KeyIDs of the GPG key to install. This option also requires the keyserver option to be set.
keyserver  This is the name of the keys server to retrieve gpg keys from. The keyid option must also be set for this option to work.
key_url  URL to retrieve a GPG key from. Allows the usage of http://, https:// as well as salt://.

Note: Use either keyid/keyserver or key_url, but not both.

key_text  The string representation of the GPG key to install.

New in version 2018.3.0.

Note: Use either keyid/keyserver, key_url, or key_text but not more than one method.

consolidate  [False] If set to True, this will consolidate all sources definitions to the sources.list file, cleanup the now unused files, consolidate components (e.g. main) for the same URI, type, and architecture to a single line, and finally remove comments from the sources.list file. The consolidate will run every time the state is processed. The option only needs to be set on one repo managed by salt to take effect.
clean_file  [False] If set to True, empty the file before config repo

Note: Use with care. This can be dangerous if multiple sources are configured in the same file.

refresh  [True] If set to False this will skip refreshing the apt package database on debian based systems.
refresh_db  [True] Deprecated since version 2018.3.0: Use refresh instead.
require_in  Set this to a list of pkg.installed or pkg.latest to trigger the running of apt-get update prior to attempting to install these packages. Setting a require in the pkg state will not work for this.

21.19.212  salt.states.portage_config

Management of Portage package configuration on Gentoo

A state module to manage Portage configuration on Gentoo

```python
salt:
  portage_config.flags:
    - use:
      - openssl
```

salt.states.portage_config.flags(name, use=None, accept_keywords=None, env=None, license=None, properties=None, unmask=False, mask=False)

Enforce the given flags on the given package or DEPEND atom.
Warning: In most cases, the affected package(s) need to be rebuilt in order to apply the changes.

name  The name of the package or its DEPEND atom
use   A list of USE flags
accept_keywords A list of keywords to accept. ~ARCH means current host arch, and will be translated into a line without keywords
env   A list of environment files
license A list of accepted licenses
properties A list of additional properties
unmask A boolean to unmask the package
mask  A boolean to mask the package

21.19.213 salt.states.ports

Manage software from FreeBSD ports
New in version 2014.1.0.

Note: It may be helpful to use a higher timeout when running a `ports.installed` state, since compiling the port may exceed Salt's timeout.

count -t 1200 '*' state.highstate

salt.states.ports.installed(name, options=None)
Verify that the desired port is installed, and that it was compiled with the desired options.

- options Make sure that the desired non-default options are set

Warning: Any build options not passed here assume the default values for the port, and are not just differences from the existing cached options from a previous `make config`.

Example usage:

```
security/nmap:
ports.installed:
- options:
  - IPV6: off
```

21.19.214 salt.states.postgres_cluster module

Management of PostgreSQL clusters

The postgres_cluster state module is used to manage PostgreSQL clusters. Clusters can be set as either absent or present

```
create cluster 9.3 main:
postgres_cluster.present:
  - name: 'main'
  - version: '9.3'
```
salt.states.postgres_cluster.absent(version, name)

Ensure that the named cluster is absent

version Version of the postgresql server of the cluster to remove
name The name of the cluster to remove

New in version 2015.XX.

salt.states.postgres_cluster.present(version, name, port=None, encoding=None, locale=None, datadir=None)

Ensure that the named cluster is present with the specified properties. For more information about all of these options see man pg_createcluster(1)

version Version of the postgresql cluster
name The name of the cluster
port Cluster port
encoding The character encoding scheme to be used in this database
locale Locale with which to create cluster
datadir Where the cluster is stored

New in version 2015.XX.

21.19.215 salt.states.postgres_database

Management of PostgreSQL databases

The postgres_database module is used to create and manage Postgres databases. Databases can be set as either absent or present

```python
frank:
  postgres_database.present
```

salt.states.postgres_database.absent(name, user=None, maintenance_db=None, 
db_password=None, db_host=None, db_port=None, 
db_user=None)

Ensure that the named database is absent

name The name of the database to remove
db_user database username if different from config or default
db_password user password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default
user System user all operations should be performed on behalf of

New in version 0.17.0.

salt.states.postgres_database.present(name, tablespace=None, encoding=None, 
lc_collate=None, lc_ctype=None, owner=None, 
user=None, maintenance_db=None, db_password=None, 
db_host=None, db_port=None, db_user=None)

Ensure that the named database is present with the specified properties. For more information about all of these options see man createdb(1)

name The name of the database to manage
tablespace Default tablespace for the database
encoding The character encoding scheme to be used in this database
lc_collate The LC_COLLATE setting to be used in this database
lc_ctype The LC_CTYPE setting to be used in this database
owner The username of the database owner
**owner_recurse**  Recurse owner change to all relations in the database
**template**  The template database from which to build this database
**user**  System user all operations should be performed on behalf of
**db_user**  Database username if different from config or default
**db_password**  User password if any password for a specified user
**db_host**  Database host if different from config or default
**db_port**  Database port if different from config or default

New in version 0.17.0.

### 21.19.216 **salt.states.postgres_extension**

**Management of PostgreSQL extensions**

A module used to install and manage PostgreSQL extensions.

```python
adminpack:
    postgres_extension.present
```

New in version 2014.7.0.

**salt.states.postgres_extension.absent**(name, if_exists=None, restrict=None, cascade=None, user=None, maintenance_db=None, db_user=None, db_password=None, db_host=None, db_port=None)

Ensure that the named extension is absent.

- **name**  Extension name of the extension to remove
- **if_exists**  Add if exist slug
- **restrict**  Add restrict slug
- **cascade**  Drop on cascade
- **user**  System user all operations should be performed on behalf of
- **maintenance_db**  Database to act on
- **db_user**  Database username if different from config or default
- **db_password**  User password if any password for a specified user
- **db_host**  Database host if different from config or default
- **db_port**  Database port if different from config or default

**salt.states.postgres_extension.present**(name, if_not_exists=None, schema=None, ext_version=None, from_version=None, user=None, maintenance_db=None, db_user=None, db_password=None, db_host=None, db_port=None)

Ensure that the named extension is present.

---

**Note:** Before you can use the state to load an extension into a database, the extension’s supporting files must be already installed.

For more information about all of these options see CREATE EXTENSION SQL command reference in the PostgreSQL documentation.

- **name**  The name of the extension to be installed
- **if_not_exists**  Add an IF NOT EXISTS parameter to the DDL statement
- **schema**  Schema to install the extension into
- **ext_version**  Version to install
- **from_version**  Old extension version if already installed
- **user**  System user all operations should be performed on behalf of
- **maintenance_db**  Database to act on
**db_user**  Database username if different from config or default
**db_password**  User password if any password for a specified user
**db_host**  Database host if different from config or default
**db_port**  Database port if different from config or default

### 21.19.217 salt.states.postgres_group

**Management of PostgreSQL groups (roles)**

The `postgres_group` module is used to create and manage Postgres groups.

```python
frank:
    postgres_group.present
```

salt.states.postgres_group.absent(name, user=None, maintenance_db=None, db_password=None, db_host=None, db_port=None, db_user=None)

Ensure that the named group is absent
- **name**  The groupname of the group to remove
- **user**  System user all operations should be performed on behalf of

New in version 0.17.0.
- **db_user**  database username if different from config or default
- **db_password**  user password if any password for a specified user
- **db_host**  Database host if different from config or default
- **db_port**  Database port if different from config or default

salt.states.postgres_group.present(name, createdb=None, createdbroles=None, encrypted=None, superuser=None, inherit=None, replication=None, password=None, refresh_password=None, groups=None, user=None, maintenance_db=None, db_password=None, db_host=None, db_port=None, db_user=None)

Ensure that the named group is present with the specified privileges Please note that the user/group notion in postgresql is just abstract, we have roles, where users can be seen as roles with the LOGIN privilege and groups the others.
- **name**  The name of the group to manage
- **createdb**  Is the group allowed to create databases?
- **createdbroles**  Is the group allowed to create other roles/users
- **encrypted**  Should the password be encrypted in the system catalog?
- **login**  Should the group have login perm
- **inherit**  Should the group inherit permissions
- **superuser**  Should the new group be a "superuser"
- **replication**  Should the new group be allowed to initiate streaming replication
- **password**  The group's password It can be either a plain string or a md5 postgresql hashed password:

```python
'md5(MD5OF{{password}{role}})'
```

If encrypted is `None` or `True`, the password will be automatically encrypted to the previous format if it is not already done.

- **refresh_password**  Password refresh flag
  - Boolean attribute to specify whether to password comparison check should be performed.
  - If refresh_password is `True`, the password will be automatically updated without extra password change check.
This behaviour makes it possible to execute in environments without superuser access available, e.g. Amazon RDS for PostgreSQL.

groups A string of comma separated groups the group should be in
user System user all operations should be performed on behalf of

db_user database username if different from config or default
db_password user password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

21.19.218 salt.states.postgres_initdb

Initialization of PostgreSQL data directory

The postgres_initdb module is used to initialize the postgresql data directory.

New in version 2016.3.0.

```
pgsql-data-dir:
  postgres_initdb.present:
    - name: /var/lib/pgsql/data
    - auth: password
    - user: postgres
    - password: strong_password
    - encoding: UTF8
    - locale: C
    - runas: postgres
```

```
salt.states.postgres_initdb.present(name, user=None, password=None, auth='password', encoding='UTF8', locale=None, runas=None, waldir=None, checksums=False)
```

Initialize the PostgreSQL data directory
name The name of the directory to initialize
user The database superuser name
password The password to set for the postgres user
auth The default authentication method for local connections
encoding The default encoding for new databases
locale The default locale for new databases
waldir The transaction log (WAL) directory (default is to keep WAL inside the data directory)

New in version 2019.2.0.

checksums If True, the cluster will be created with data page checksums.

Note: Data page checksums are supported since PostgreSQL 9.3.

New in version 2019.2.0.

runas The system user the operation should be performed on behalf of

21.19.219 salt.states.postgres_language
Management of PostgreSQL languages

The `postgres_language` module is used to create and manage Postgres languages. Languages can be set as either absent or present.

New in version 2016.3.0.

```python
plpgsql:
    postgres_language.present:
        - maintenance_db: testdb

plpgsql:
    postgres_language.absent:
        - maintenance_db: testdb
```

```python
salt.states.postgres_language.absent(name, maintenance_db, user=None, db_password=None, db_host=None, db_port=None, db_user=None)

Ensure that a named language is absent in the specified database.

- name: The name of the language to remove
- maintenance_db: The name of the database in which the language is to be installed
- user: System user all operations should be performed on behalf of
- db_user: database username if different from config or default
- db_password: user password if any password for a specified user
- db_host: Database host if different from config or default
- db_port: Database port if different from config or default

salt.states.postgres_language.present(name, maintenance_db, user=None, db_password=None, db_host=None, db_port=None, db_user=None)

Ensure that a named language is present in the specified database.

- name: The name of the language to install
- maintenance_db: The name of the database in which the language is to be installed
- user: System user all operations should be performed on behalf of
- db_user: database username if different from config or default
- db_password: user password if any password for a specified user
- db_host: Database host if different from config or default
- db_port: Database port if different from config or default
```

21.19.220  `salt.states.postgres_privileges`

Management of PostgreSQL Privileges

The `postgres_privileges` module is used to manage Postgres privileges. Privileges can be set as either absent or present.

Privileges can be set on the following database object types:

- database
- schema
- tablespace
- table
- sequence
- language
• group

Setting the grant option is supported as well.

New in version 2016.3.0.

baruwa:
postgres_privileges.present:
  - object_name: awl
  - object_type: table
  - privileges:
    - SELECT
    - INSERT
    - DELETE
  - grant_option: False
  - prepend: public
  - maintenance_db: testdb

andrew:
postgres_privileges.present:
  - object_name: admins
  - object_type: group
  - grant_option: False
  - maintenance_db: testdb

baruwa:
postgres_privileges.absent:
  - object_name: awl
  - object_type: table
  - privileges:
    - SELECT
    - INSERT
    - DELETE
  - prepend: public
  - maintenance_db: testdb

andrew:
postgres_privileges.absent:
  - object_name: admins
  - object_type: group
  - maintenance_db: testdb

salt.states.postgres_privileges.absent(name, object_name, object_type, privileges=None, prepend='public', maintenance_db=None, user=None, db_password=None, db_host=None, db_port=None, db_user=None)

Revoke the requested privilege(s) on the specified object(s)

name Name of the role whose privileges should be revoked

object_name Name of the object on which the revoke is to be performed

object_type The object type, which can be one of the following:
  • table
  • sequence
  • schema
  • tablespace
  • language
  • database
  • group
function

View permissions should specify `object_type: table`.

privileges Comma separated list of privileges to revoke, from the list below:

- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

Note: privileges should not be set when revoking group membership.

prepend Table and Sequence object types live under a schema so this should be provided if the object is not under the default `public` schema.

maintenance_db The name of the database in which the language is to be installed

user System user all operations should be performed on behalf of

db_user database username if different from config or default

db_password user password if any password for a specified user

db_host Database host if different from config or default

db_port Database port if different from config or default

`salt.states.postgres_privileges.present(name, object_name, object_type, privileges=None, grant_option=None, prepend='public', maintenance_db=None, user=None, db_password=None, db_host=None, db_port=None, db_user=None)`

Grant the requested privilege(s) on the specified object to a role

name Name of the role to which privileges should be granted

object_name Name of the object on which the grant is to be performed. 'ALL' may be used for objects of type 'table' or 'sequence'.

object_type The object type, which can be one of the following:
- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

View permissions should specify `object_type: table`.

privileges List of privileges to grant, from the list below:
- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
EXECUTE
REFERENCES
DELETE
ALL

- privileges should not be set when granting group membership
- grant_option If grant_option is set to True, the recipient of the privilege can in turn grant it to others
- prepend Table and Sequence object types live under a schema so this should be provided if the object is not
  under the default public schema
- maintenance_db The name of the database in which the language is to be installed
- user System user all operations should be performed on behalf of
- db_user database username if different from config or default
- db_password user password if any password for a specified user
- db_host Database host if different from config or default
- db_port Database port if different from config or default

21.19.221 salt.states.postgres_schema

Management of PostgreSQL schemas

The postgres_schemas module is used to create and manage Postgres schemas.

```python
public:
    postgres_schema.present 'dbname' 'name'
```

salt.states.postgres_schema.absent(
    dbname, name, user=None, db_user=None,
    db_password=None, db_host=None, db_port=None)

- Ensure that the named schema is absent.
- dbname The database’s name will work on
- name The name of the schema to remove
- user system user all operations should be performed on behalf of
- db_user database username if different from config or default
- db_password user password if any password for a specified user
- db_host Database host if different from config or default
- db_port Database port if different from config or default

salt.states.postgres_schema.present(
    dbname, name, owner=None, user=None, db_user=None,
    db_password=None, db_host=None, db_port=None)

- Ensure that the named schema is present in the database.
- dbname The database’s name will work on
- name The name of the schema to manage
- user system user all operations should be performed on behalf of
- db_user database username if different from config or default
- db_password user password if any password for a specified user
- db_host Database host if different from config or default
- db_port Database port if different from config or default

21.19.222 salt.states.postgres_tablespace

Management of PostgreSQL tablespace

A module used to create and manage PostgreSQL tablespaces.

Chapter 21. Salt Module Reference
ssd-tablespace:
  postgres_tablespace.present:
    - name: indexes
    - directory: /mnt/ssd-data

New in version 2015.8.0.

salt.states.postgres_tablespace.absent(name, user=None, maintenance_db=None, db_user=None, db_password=None, db_host=None, db_port=None)

Ensure that the named tablespace is absent.
name  The name of the tablespace to remove
user  System user all operations should be performed on behalf of
maintenance_db  Database to act on
db_user  Database username if different from config or default
db_password  User password if any password for a specified user
db_host  Database host if different from config or default
db_port  Database port if different from config or default

salt.states.postgres_tablespace.present(name, directory, options=None, owner=None, user=None, maintenance_db=None, db_password=None, db_host=None, db_port=None, db_user=None)

Ensure that the named tablespace is present with the specified properties. For more information about all of these options run man 7 create_tablespace.
name  The name of the tablespace to create/manage.
directory  The directory where the tablespace will be located, must already exist
options  A dictionary of options to specify for the tablespace. Currently, the only tablespace options supported are seq_page_cost and random_page_cost. Default values are shown in the example below:

```
my_space:
  postgres_tablespace.present:
    - directory: /srv/my_tablespace
    - options:
      seq_page_cost: 1.0
      random_page_cost: 4.0
```
owner  The database user that will be the owner of the tablespace. Defaults to the user executing the command (i.e. the user option)
user  System user all operations should be performed on behalf of
maintenance_db  Database to act on
db_user  Database username if different from config or default
db_password  User password if any password for a specified user
db_host  Database host if different from config or default
db_port  Database port if different from config or default

21.19.223  salt.states.postgres_user

Management of PostgreSQL users (roles)

The postgres_users module is used to create and manage Postgres users.

```
frank:
  postgres_user.present
```
salt.states.postgres_user.absent(name, user=None, maintenance_db=None, db_password=None, db_host=None, db_port=None, db_user=None)

Ensure that the named user is absent

name  The username of the user to remove
user  System user all operations should be performed on behalf of

New in version 0.17.0.

db_user  database username if different from config or default
db_password  user password if any password for a specified user
db_host  Database host if different from config or default
db_port  Database port if different from config or default

salt.states.postgres_user.present(name, createdb=None, createroles=None, encrypted=None, superuser=None, replication=None, inherit=None, login=None, password=None, default_password=None, refresh_password=None, valid_until=None, groups=None, user=None, maintenance_db=None, db_password=None, db_host=None, db_port=None, db_user=None)

Ensure that the named user is present with the specified privileges Please note that the user/group notion in postgresql is just abstract, we have roles, where users can be seen as roles with the LOGIN privilege and groups the others.

name  The name of the system user to manage.
createdb  Is the user allowed to create databases?
createroles  Is the user allowed to create other users?
encrypted  Should the password be encrypted in the system catalog?
login  Should the group have login perm
inherit  Should the group inherit permissions
superuser  Should the new user be a "superuser"
replication  Should the new user be allowed to initiate streaming replication
password  The system user’s password. It can be either a plain string or a md5 postgresql hashed password:

```
'dm5(MD5OF({password}{{role}})'
```

If encrypted is None or True, the password will be automatically encrypted to the previous format if it is not already done.

default_password  The password used only when creating the user, unless password is set.

New in version 2016.3.0.

refresh_password  Password refresh flag

Boolean attribute to specify whether to password comparison check should be performed.

If refresh_password is True, the password will be automatically updated without extra password change check.

This behaviour makes it possible to execute in environments without superuser access available, e.g. Amazon RDS for PostgreSQL.

valid_until  A date and time after which the role’s password is no longer valid.

groups  A string of comma separated groups the user should be in
user  System user all operations should be performed on behalf of

New in version 0.17.0.

db_user  Postgres database username, if different from config or default.
db_password  Postgres user’s password, if any password, for a specified db_user.
db_host  Postgres database host, if different from config or default.
db_port  Postgres database port, if different from config or default.
21.19.224 salt.states.powerpath

Powerpath configuration support

Allows configuration of EMC Powerpath. Currently only addition/deletion of licenses is supported.

```yaml
key:
  powerpath.license_present: []
```

salt.states.powerpath.license_absent(name)
Ensures that the specified PowerPath license key is absent on the host.
name The license key to ensure is absent

salt.states.powerpath.license_present(name)
Ensures that the specified PowerPath license key is present on the host.
name The license key to ensure is present

21.19.225 salt.states.probes

Network Probes

Configure RPM (JunOS)/SLA (Cisco) probes on the device via NAPALM proxy.

codeauthor Mircea Ulinic <mircea@cloudflare.com> & Jerome Fleury <jf@cloudflare.com>
maturity new
depends napalm
platform unix

Dependencies

- napalm probes management module

salt.states.probes.managed(name, probes, defaults=None)
Ensure the networks device is configured as specified in the state SLS file. Probes not specified will be removed, while probes not configured as expected will trigger config updates.

Parameters

- **probes** – Defines the probes as expected to be configured on the device. In order to ease the configuration and avoid repeating the same parameters for each probe, the next parameter (defaults) can be used, providing common characteristics.

- **defaults** – Specifies common parameters for the probes.

SLS Example:

```yaml
rpmprobes:
  probes.managed:
    - probes:
      probe_name1:
        probe1_test1:
          source: 192.168.0.2
          target: 192.168.0.1
        probe1_test2:
          target: 172.17.17.1
      probe1_test3:
```

(continues on next page)
target: 8.8.8.8
  probe_type: http-ping
  probe_name2:
    probe2_test1:
      test_interval: 100

  defaults:
    target: 10.10.10.10
    probe_count: 15
    test_interval: 3
    probe_type: icmp-ping

In the probes configuration, the only mandatory attribute is target (specified either in probes configuration, either in the defaults dictionary). All the other parameters will use the operating system defaults, if not provided:

- source - Specifies the source IP Address to be used during the tests. If not specified will use the IP Address of the logical interface loopback0.
- target - Destination IP Address.
- probe_count - Total number of probes per test (1..15). System defaults: 1 on both JunOS & Cisco.
- probe_interval - Delay between tests (0..86400 seconds). System defaults: 3 on JunOS, 5 on Cisco.
- probe_type - Probe request type. Available options:
  - icmp-ping
  - tcp-ping
  - udp-ping

Using the example configuration above, after running the state, on the device will be configured 4 probes, with the following properties:

- **probes configuration**
  - probe_name1:
    - probe1_test1:
      - source: 192.168.0.2
      - target: 192.168.0.1
      - probe_count: 15
      - test_interval: 3
      - probe_type: icmp-ping
  - probe1_test2:
    - target: 172.17.17.1
    - probe_count: 15
    - test_interval: 3
    - probe_type: icmp-ping
  - probe1_test3:
    - target: 8.8.8.8
    - probe_count: 15
    - test_interval: 3
    - probe_type: http-ping

- **defaults configuration**
  - probe_name2:
    - probe2_test1:
      - target: 10.10.10.10
      - probe_count: 15
      - test_interval: 3
      - probe_type: icmp-ping
Process Management

Ensure a process matching a given pattern is absent.

```yaml
httpd-absent:
    process.absent:
      - name: apache2
```

`salt.states.process.absent(name, user=None, signal=None)`

Ensures that the named command is not running.

- **name**: The pattern to match.
- **user**: The user to which the process belongs
- **signal**: Signal to send to the process(es).

### 21.19.227 salt.states.proxy module

Allows you to manage proxy settings on minions

Setup proxy settings on minions

```yaml
192.168.1.4:
    proxy.managed:
      - port: 3128
      - bypass_domains:
          - localhost
          - 127.0.0.1
```

`salt.states.proxy.managed(name, port, services=None, user=None, password=None, bypass_domains=None, network_service='Ethernet')`

Manages proxy settings for this minion

- **name**: The proxy server to use
- **port**: The port used by the proxy server
- **services**: A list of the services that should use the given proxy settings, valid services include http, https and ftp. If no service is given all of the valid services will be used.
- **user**: The username to use for the proxy server if required
- **password**: The password to use for the proxy server if required
- **bypass_domains**: An array of the domains that should bypass the proxy
- **network_service**: The network service to apply the changes to, this only necessary on macOS

### 21.19.228 salt.states.pushover

Send a message to PushOver

This state is useful for sending messages to PushOver during state runs.

New in version 2015.5.0.

```yaml
pushover-message:
    pushover.post_message:
      - user: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
      - token: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
      - title: Salt Returner
      - device: phone
      - priority: -1
```

(continues on next page)
The api key can be specified in the master or minion configuration like below: .. code-block:: yaml

```
pusher: token: peWcBiMOS9HzG15peWcBiMOS9HzG15
```

```
salt.states.pushover.post_message(name, user=None, device=None, message=None, title=None, priority=None, expire=None, retry=None, sound=None, api_version=1, token=None)
```

Send a message to a PushOver channel.

```
pusher-post_message:
  - user: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
  - token: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
  - title: Salt Returner
  - device: phone
  - priority: -1
  - expire: 3600
  - retry: 5
```

The following parameters are required:

- **name** The unique name for this event.
- **user** The user or group of users to send the message to. Must be ID of user, not name or email address.
- **message** The message that is to be sent to the PushOver channel.

The following parameters are optional:

- **title** The title to use for the message.
- **device** The device for the user to send the message to.
- **priority** The priority for the message.
- **expire** The message should expire after specified amount of seconds.
- **retry** The message should be resent this many times.
- **token** The token for PushOver to use for authentication, if not specified in the configuration options of master or minion.

## 21.19.229 salt.states.pyenv

### Managing python installations with pyenv

This module is used to install and manage python installations with pyenv. Different versions of python can be installed, and uninstalled. pyenv will be installed automatically the first time it is needed and can be updated later. This module will not automatically install packages which pyenv will need to compile the versions of python.

If pyenv is run as the root user then it will be installed to /usr/local/pyenv, otherwise it will be installed to the users ~/.pyenv directory. To make pyenv available in the shell you may need to add the pyenv/shims and pyenv/bin directories to the users PATH. If you are installing as root and want other users to be able to access pyenv then you will need to add pyenv_ROOT to their environment.

This is how a state configuration could look like:

```
pyenv-deps:
  pkg.installed:
    - pkgs:
      - make
```

(continues on next page)
- build-essential
- libssl-dev
- zlib1g-dev
- libbz2-dev
- libreadline-dev
- libsqlite3-dev
- wget
- curl
- llvm

**python-2.6:**
- **pyenv.absent:**
  - **require:**
    - **pkg:** pyenv-deps

**python-2.7.6:**
- **pyenv.installed:**
  - **default:** True
  - **require:**
    - **pkg:** pyenv-deps

---

**Note:** Git needs to be installed and available via PATH if pyenv is to be installed automatically by the module.

salt.states.pyenv.absent(name, user=None)

Verify that the specified python is not installed with pyenv. pyenv is installed if necessary.
- **name** The version of python to uninstall
- **user** None The user to run pyenv as.

New in version 0.17.0.
New in version 0.16.0.

salt.states.pyenv.install_pyenv(name, user=None)

Install pyenv if not installed. Allows you to require pyenv be installed prior to installing the plugins. Useful if you want to install pyenv plugins via the git or file modules and need them installed before installing any rubies.

Use the pyenv.root configuration option to set the path for pyenv if you want a system wide install that is not in a user home dir.
- **user** None The user to run pyenv as.

salt.states.pyenv.installed(name, default=False, user=None)

Verify that the specified python is installed with pyenv. pyenv is installed if necessary.
- **name** The version of python to install
- **default** [False] Whether to make this python the default
- **user** None The user to run pyenv as.

New in version 0.17.0.
New in version 0.16.0.

---

**21.19.230 salt.states.pyrax_queues**

Manage Rackspace Queues

New in version 2015.5.0.
Create and destroy Rackspace queues. Be aware that this interacts with Rackspace’s services, and so may incur charges.

This module uses `pyrax`, which can be installed via package, or `pip`. This module is greatly inspired by boto_* modules from SaltStack code source.

```python
myqueue:
    pyrax_queues.present:
        - provider: my-pyrax

myqueue:
    pyrax_queues.absent:
        - provider: my-pyrax
```

```python
salt.states.pyrax_queues.absent(name, provider)

Ensure the named Rackspace queue is deleted.

- `name`: Name of the Rackspace queue.
- `provider`: Salt Cloud provider
```

```python
salt.states.pyrax_queues.present(name, provider)

Ensure the Rackspace queue exists.

- `name`: Name of the Rackspace queue.
- `provider`: Salt Cloud Provider
```

### 21.19.231 salt.states.quota

**Management of POSIX Quotas**

The quota can be managed for the system:

```
/: 
    quota.mode:
        mode: off
        quotatype: user
```

```python
salt.states.quota.mode(name, mode, quotatype)

Set the quota for the system

- `name`: The filesystem to set the quota mode on
- `mode`: Whether the quota system is on or off
- `quotatype`: Must be `user` or `group`
```

### 21.19.232 salt.states.rabbitmq_cluster

**Manage RabbitMQ Clusters**

Example:

```python
rabbit@rabbit.example.com:
    rabbitmq_cluster.join:
        - user: rabbit
        - host: rabbit.example.com
```

```python
salt.states.rabbitmq_cluster.join(name, host, user='rabbit', ram_node=None, runas='root')

This function is an alias of `joined`.

Ensure the current node joined to a cluster with node `user@host`
name  Irrelevant, not used (recommended: `user@host`)
user  The user of node to join to (default: `rabbit`)
host  The host of node to join to
ram_node  Join node as a RAM node
runas  The user to run the rabbitmq command as

salt.states.rabbitmq_cluster.joined(name, host, user='rabbit', ram_node=None, runas='root')
Ensure the current node joined to a cluster with node `user@host`
name  Irrelevant, not used (recommended: `user@host`)
user  The user of node to join to (default: `rabbit`)
host  The host of node to join to
ram_node  Join node as a RAM node
runas  The user to run the rabbitmq command as

21.19.233  salt.states.rabbitmq_plugin

Manage RabbitMQ Plugins

New in version 2014.1.0.

Example:

```yaml
some_plugin:
  rabbitmq_plugin.enabled: []
```

salt.states.rabbitmq_plugin.disabled(name, runas=None)
Ensure the RabbitMQ plugin is disabled.
name  The name of the plugin
runas  The user to run the rabbitmq-plugin command as

salt.states.rabbitmq_plugin.enabled(name, runas=None)
Ensure the RabbitMQ plugin is enabled.
name  The name of the plugin
runas  The user to run the rabbitmq-plugin command as

21.19.234  salt.states.rabbitmq_policy

Manage RabbitMQ Policies

maintainer  Benn Eichhorn  <benn@getlocalmeasure.com>
maturity  new
platform  all

Example:

```yaml
rabbit_policy:
  rabbitmq_policy.present:
    - name: HA
    - pattern: '.*'
    - definition: '{"ha-mode": "all"}'
```

salt.states.rabbitmq_policy.absent(name, vhost='/', runas=None)
Ensure the named policy is absent

**name** The name of the policy to remove

**runas** Name of the user to run the command as

```
salt.states.rabbitmq_policy.present(name, pattern, definition, priority=0, vhost='/', runas=None, apply_to=None)
```

Ensure the RabbitMQ policy exists.

**name** Policy name

**pattern** A regex of queues to apply the policy to

**definition** A json dict describing the policy

**priority** Priority (defaults to 0)

**vhost** Virtual host to apply to (defaults to '/')

**runas** Name of the user to run the command as

**apply_to** Apply policy to 'queues', 'exchanges' or 'all' (default to 'all')

---

## 21.19.235 salt.states.rabbitmq_user

Manage RabbitMQ Users

Example:

```
rabbit_user:
    rabbitmq_user.present:
      - password: password
      - force: True
      - tags:
        - monitoring
        - user
      - perms:
        - '/':
          - '*'
          - '.x'
          - '.x'
        - runas: rabbitmq
```

```
salt.states.rabbitmq_user.absent(name, runas=None)
```

Ensure the named user is absent

**name** The name of the user to remove

**runas** User to run the command

```
salt.states.rabbitmq_user.present(name, password=None, force=False, tags=None, perms=(), runas=None)
```

Ensure the RabbitMQ user exists.

**name** User name

**password** User’s password, if one needs to be set

**force** If user exists, forcibly change the password

**tags** Optional list of tags for the user

**perms** A list of dicts with vhost keys and 3-tuple values

**runas** Name of the user to run the command

---

## 21.19.236 salt.states.rabbitmq_vhost
Manage RabbitMQ Virtual Hosts

Example:

```yaml
virtual_host:
  rabbitmq_vhost.present:
    - user: rabbit_user
    - conf: .*
    - write: .*
    - read: .*
```

`salt.states.rabbitmq_vhost.absent(name)`
Ensure the RabbitMQ Virtual Host is absent
- **name** Name of the Virtual Host to remove
- **runas** User to run the command

Deprecated since version 2015.8.0.

`salt.states.rabbitmq_vhost.present(name)`
Ensure the RabbitMQ VHost exists.
- **name** VHost name
- **user** Initial user permission to set on the VHost, if present
  Deprecated since version 2015.8.0.
- **owner** Initial owner permission to set on the VHost, if present
  Deprecated since version 2015.8.0.
- **conf** Initial conf string to apply to the VHost and user. Defaults to .*
  Deprecated since version 2015.8.0.
- **write** Initial write permissions to apply to the VHost and user. Defaults to .*
  Deprecated since version 2015.8.0.
- **read** Initial read permissions to apply to the VHost and user. Defaults to .*
  Deprecated since version 2015.8.0.
- **runas** Name of the user to run the command
  Deprecated since version 2015.8.0.

21.19.237 `salt.states.rbac_solaris`

Management of Solaris RBAC
- **maintainer** Jorge Schrauwen <sjorge@blackdot.be>
- **maturity** new
- **depends** rbac_solaris,solaris_user
- **platform** solaris,illumos

New in version 2016.11.0.

```yaml
sjorge:
  rbac.managed:
    - roles:
      - netcfg
    - profiles:
      - System Power
```

(continues on next page)
salt.states.rbac_solaris.managed(name, roles=None, profiles=None, authorizations=None)

Manage RBAC properties for user

name  [string] username
roles  [list] list of roles for user
profiles  [list] list of profiles for user
authorizations  [list] list of authorizations for user

Warning: All existing roles, profiles and authorizations will be replaced! An empty list will remove everything.
Set the property to None to not manage it.

21.19.238  salt.states.rbenv

Managing Ruby installations with rbenv

This module is used to install and manage ruby installations with rbenv and the ruby-build plugin. Different versions of ruby can be installed, and uninstalled. Rbenv will be installed automatically the first time it is needed and can be updated later. This module will not automatically install packages which rbenv will need to compile the versions of ruby. If your version of ruby fails to install, refer to the ruby-build documentation to verify you are not missing any dependencies: https://github.com/sstephenson/ruby-build/wiki

If rbenv is run as the root user then it will be installed to /usr/local/rbenv, otherwise it will be installed to the users ~/.rbenv directory. To make rbenv available in the shell you may need to add the rbenv/shims and rbenv/bin directories to the users PATH. If you are installing as root and want other users to be able to access rbenv then you will need to add RBENV_ROOT to their environment.

The following state configuration demonstrates how to install Ruby 1.9.x and 2.x using rbenv on Ubuntu/Debian:

rbenv-deps:
  pkg.installed:
    - names:
      - bash
      - git
      - openssl
      - libssl-dev
      - make
      - curl
      - autoconf
      - bison
      - build-essential
      - libffi-dev
      - libyaml-dev
      - libreadline6-dev
      - zlib1g-dev
      - libncurses5-dev

ruby-1.9.3-p429:
  rbenv.absent:
    - require:
- **pkg**: rbenv-deps

**ruby-2.0.0-p598**:
- **rbenv.installed**:
  - **default**: True
  - **require**:
    - **pkg**: rbenv-deps

### salt.states.rbenv.absent(name, user=None)
Verify that the specified ruby is not installed with rbenv. Rbenv is installed if necessary.
- **name**: The version of ruby to uninstall
- **user**: None The user to run rbenv as.

New in version 0.17.0.
New in version 0.16.0.

### salt.states.rbenv.install_rbenv(name, user=None)
Install rbenv if not installed. Allows you to require rbenv be installed prior to installing the plugins. Useful if you want to install rbenv plugins via the git or file modules and need them installed before installing any rubies.

Use the rbenv.root configuration option to set the path for rbenv if you want a system wide install that is not in a user home dir.
- **user**: None The user to run rbenv as.

### salt.states.rbenv.installed(name, default=False, user=None)
Verify that the specified ruby is installed with rbenv. Rbenv is installed if necessary.
- **name**: The version of ruby to install
- **default**: [False] Whether to make this ruby the default.
- **user**: None The user to run rbenv as.

New in version 0.17.0.
New in version 0.16.0.

### 21.19.239 salt.states.rdp
Manage RDP Service on Windows servers

#### salt.states.rdp.disabled(name)
Disable the RDP service

#### salt.states.rdp.enabled(name)
Enable the RDP service and make sure access to the RDP port is allowed in the firewall configuration

### 21.19.240 salt.states.redismod
Management of Redis server

New in version 2014.7.0.

- **depends**
  - redis Python module

- **configuration** See salt.modules.redis for setup instructions.
key_in_redis:
  redis.string:
    - value: string data

The redis server information specified in the minion config file can be overridden in states using the following arguments: host, post, db, password.

key_in_redis:
  redis.string:
    - value: string data
    - host: localhost
    - port: 6379
    - db: 0
    - password: somuchkittycat

salt.states.redismod.absent(name, keys=None, **connection_args)
Ensure key absent from redis
  name   Key to ensure absent from redis
  keys   list of keys to ensure absent, name will be ignored if this is used

salt.states.redismod.slaveof(name, sentinel_host=None, sentinel_port=None, sentinel_password=None, **connection_args)
Set this redis instance as a slave.
  name   Master to make this a slave of
  sentinel_host   Ip of the sentinel to check for the master
  sentinel_port   Port of the sentinel to check for the master
salt.states.redismod.string(name, value, expire=None, expireat=None, **connection_args)
Ensure that the key exists in redis with the value specified
  name   Redis key to manage
  value   Data to persist in key
  expire   Sets time to live for key in seconds
  expireat   Sets expiration time for key via UNIX timestamp, overrides expire

21.19.241 salt.states.reg

Manage the Windows registry

Many python developers think of registry keys as if they were python keys in a dictionary which is not the case. The windows registry is broken down into the following components:

Hives

This is the top level of the registry. They all begin with HKEY.
  - HKEY_CLASSES_ROOT (HKCR)
  - HKEY_CURRENT_USER (HKCU)
  - HKEY_LOCAL_MACHINE (HKLM)
  - HKEY_USER (HKU)
  - HKEY_CURRENT_CONFIG
Keys

Hives contain keys. These are basically the folders beneath the hives. They can contain any number of subkeys.

When passing the hivekey values they must be quoted correctly depending on the backslashes being used (\ vs \\). The way backslashes are handled in the state file is different from the way they are handled when working on the CLI. The following are valid methods of passing the hivekey:

**Using single backslashes**: HKLM\SOFTWARE\Python 'HKLM\SOFTWARE\Python'

**Using double backslashes**: "HKLM\SOFTWARE\Python"

Values or Entries

Values or Entries are the name/data pairs beneath the keys and subkeys. All keys have a default name/data pair. The name is (Default) with a displayed value of (value not set). The actual value is Null.

Example

The following example is taken from the windows startup portion of the registry:

```
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Run]
"RTHDVCPL"=""C:\\Program Files\\Realtek\\Audio\\HDA\\RtkNGUI64.exe" -s"
"NvBackend"=""C:\\Program Files (x86)\\NVIDIA Corporation\\Update Core\\NvBackend.exe"
"BTMTrayAgent"="rundll32.exe "C:\\Program Files (x86)\\Intel\\Bluetooth\\btmshellex.dll",TrayApp"
```

In this example these are the values for each:

**Hive**: HKEY_LOCAL_MACHINE

**Key and subkeys**: SOFTWARE\Microsoft\Windows\CurrentVersion\Run

**Value**:

- There are 3 value names: RTHDVCPL, NvBackend, and BTMTrayAgent
- Each value name has a corresponding value

```python
salt.states.reg.absent(name, vname=None, use_32bit_registry=False)
```

Ensure a registry value is removed. To remove a key use key_absent.

**Parameters**

- **name** *(str)* – A string value representing the full path of the key to include the HIVE, Key, and all Subkeys. For example:
  
  HKEY_LOCAL_MACHINE\SOFTWARE\Salt
  
  Valid hive values include:
  - HKEY_CURRENT_USER or HKCU
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_USERS or HKU

- **vname** *(str)* – The name of the value you’d like to create beneath the Key. If this parameter is not passed it will assume you want to set the (Default) value

- **use_32bit_registry** *(bool)* – Use the 32bit portion of the registry. Applies only to 64bit windows. 32bit Windows will ignore this parameter. Default is False.

**Returns**

A dictionary showing the results of the registry operation.

**Return type** *dict*
CLI Example:

```
'HKEY_CURRENT_USER\SOFTWARE\Salt':
  reg.absent
    - vname: version
```

In the above example the value named `version` will be removed from the SOFTWARE\Salt key in the HKEY_CURRENT_USER hive. If `vname` was not passed, the (Default) value would be deleted.

```python
salt.states.reg.key_absent(name, use_32bit_registry=False)
```

New in version 2015.5.4.

Ensure a registry key is removed. This will remove the key, subkeys, and all value entries.

**Parameters**

- `name (str)` – A string representing the full path to the key to be removed to include the hive and the keypath. The hive can be any of the following:
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USERS or HKU
- `use_32bit_registry (bool)` – Use the 32bit portion of the registry. Applies only to 64bit windows. 32bit Windows will ignore this parameter. Default is False.

**Returns**
A dictionary showing the results of the registry operation.

**Return type**
dict

CLI Example:

The following example will delete the SOFTWARE\DeleteMe key in the HKEY_LOCAL_MACHINE hive including all its subkeys and value pairs.

```python
remove_key_demo:
  reg.key_absent:
    - name: HKEY_CURRENT_USER\SOFTWARE\DeleteMe
```

In the above example the path is interpreted as follows:
- HKEY_CURRENT_USER is the hive
- SOFTWARE\DeleteMe is the key

```python
salt.states.reg.present(name, vname=None, vdata=None, vtype='REG_SZ', use_32bit_registry=False, win_owner=None, win_perms=None, win_deny_perms=None, win_inheritance=True, win_perms_reset=False)
```

Ensure a registry key or value is present.

**Parameters**

- `name (str)` – A string value representing the full path of the key to include the HIVE, Key, and all Subkeys. For example:
  - HKEY_LOCAL_MACHINE\SOFTWARE\Salt

Valid hive values include:
- HKEY_CURRENT_USER or HKCU
- HKEY_LOCAL_MACHINE or HKLM
- HKEY_USERS or HKU
- `vname (str)` – The name of the value you’d like to create beneath the Key. If this parameter is not passed it will assume you want to set the (Default) value
- `vdata (str, int, list, bytes)` – The value you’d like to set. If a value name (`vname`) is passed, this will be the data for that value name. If not, this will be the (Default) value for the key.

The type of data this parameter expects is determined by the value type specified in `vtype`. The correspondence is as follows:
- REG_BINARY: Binary data (str in Py2, bytes in Py3)
- REG_DWORD: int
- REG_EXPAND_SZ: str
- REG_MULTI_SZ: list of str
- REG_QWORD: int
- REG_SZ: str

Note: When setting REG_BINARY, string data will be converted to binary automatically. To pass binary data, use the built-in yaml tag `!!binary` to denote the actual binary characters. For example, the following lines will both set the same data in the registry:

- vdata: Salty Test
- vdata: !!binary U2FsdHkgVGVzdA==

For more information about the `!!binary` tag see here

Note: The type for the (Default) value is always REG_SZ and cannot be changed. This parameter is optional. If not passed, the Key will be created with no associated item/value pairs.

• **vtype** *(str)* – The value type for the data you wish to store in the registry. Valid values are:
  - REG_BINARY
  - REG_DWORD
  - REG_EXPAND_SZ
  - REG_MULTI_SZ
  - REG_QWORD
  - REG_SZ (Default)

• **use_32bit_registry** *(bool)* – Use the 32bit portion of the registry. Applies only to 64bit windows. 32bit Windows will ignore this parameter. Default is False.

• **win_owner** *(str)* – The owner of the registry key. If this is not passed, the account under which Salt is running will be used.

Note: Owner is set for the key that contains the value/data pair. You cannot set ownership on value/data pairs themselves.

New in version 2019.2.0.

• **win_perms** *(dict)* – A dictionary containing permissions to grant and their propagation. If not passed the ’Grant’ permissions will not be modified.

Note: Permissions are set for the key that contains the value/data pair. You cannot set permissions on value/data pairs themselves.

For each user specify the account name, with a sub dict for the permissions to grant and the ’Applies to’ setting. For example: {'Administrators': {'perms': 'full_control', 'applies_to': 'this_key_subkeys'}}. perms must be specified.

Registry permissions are specified using the `perms` key. You can specify a single basic permission or a list of advanced perms. The following are valid perms:

**Basic (passed as a string):**

- full_control
- read
- write

Advanced (passed as a list):
- delete
- query_value
- set_value
- create_subkey
- enum_subkeys
- notify
- create_link
- read_control
- write_dac
- write_owner

The 'Applies to' setting is optional. It is specified using the applies_to key. If not specified this_key_subkeys is used. Valid options are:

<table>
<thead>
<tr>
<th>Applies to settings:</th>
</tr>
</thead>
<tbody>
<tr>
<td>this_key_only</td>
</tr>
<tr>
<td>this_key_subkeys</td>
</tr>
<tr>
<td>subkeys_only</td>
</tr>
</tbody>
</table>

New in version 2019.2.0.

- **win_denial_perms** (*dict*) - A dictionary containing permissions to deny and their propagation. If not passed the Deny permissions will not be modified.

  Note: Permissions are set for the key that contains the value/data pair. You cannot set permissions on value/data pairs themselves.

  Valid options are the same as those specified in win_perms

  Note: 'Deny' permissions always take precedence over 'grant' permissions.

New in version 2019.2.0.

- **win_inheritance** (*bool*) - True to inherit permissions from the parent key. False to disable inheritance. Default is True.

  Note: Inheritance is set for the key that contains the value/data pair. You cannot set inheritance on value/data pairs themselves.

New in version 2019.2.0.

- **win_perms_reset** (*bool*) - If True the existing DACL will be cleared and replaced with the settings defined in this function. If False, new entries will be appended to the existing DACL. Default is False

  Note: Perms are reset for the key that contains the value/data pair. You cannot set permissions on value/data pairs themselves.

New in version 2019.2.0.

**Returns** A dictionary showing the results of the registry operation.

**Return type** *dict*

Example:
The following example will set the (Default) value for the SOFTWARE\Salt key in the HKEY_CURRENT_USER hive to 2016.3.1:

```
HKEY_CURRENT_USER\SOFTWARE\Salt:
    reg.present:
      - vdata: 2016.3.1
```

Example:

The following example will set the value for the version entry under the SOFTWARE\Salt key in the HKEY_CURRENT_USER hive to 2016.3.1. The value will be reflected in Wow6432Node:

```
HKEY_CURRENT_USER\SOFTWARE\Salt:
    reg.present:
      - vname: version
      - vdata: 2016.3.1
```

In the above example the path is interpreted as follows:
- HKEY_CURRENT_USER is the hive
- SOFTWARE\Salt is the key
- vname is the value name ('version') that will be created under the key
- vdata is the data that will be assigned to 'version'

Example:

Binary data can be set in two ways. The following two examples will set a binary value of Salty Test

```
no_conversion:
    reg.present:
      - name: HKLM\SOFTWARE\SaltTesting
      - vname: test_reg_binary_state
      - vdata: Salty Test
      - vtype: REG_BINARY
conversion:
    reg.present:
      - name: HKLM\SOFTWARE\SaltTesting
      - vname: test_reg_binary_state_with_tag
      - vdata: !!binary U2FsdHkgVGVzdA==
      - vtype: REG_BINARY
```

Example:

To set a REG_MULTI_SZ value:

```
reg_multi_sz:
    reg.present:
      - name: HKLM\SOFTWARE\Salt
      - vname: reg_multi_sz
      - vdata:
        - list item 1
        - list item 2
```

Example:

To ensure a key is present and has permissions:

```
set_key_permissions:
    reg.present:
      - name: HKLM\SOFTWARE\Salt
```

(continues on next page)
- **vname**: version
- **vdata**: 2016.3.1
- **win_owner**: Administrators
- **win_perms**:
  - **jsnuffy**:
    - **perms**: full_control
  - **sjones**:
    - **perms**:
      - read_control
      - enum_subkeys
      - query_value
    - **applies_to**:
      - this_key_only
- **win_deny_perms**:
  - **bsimpson**:
    - **perms**: full_control
    - **applies_to**: this_key_subkeys
- **win_inheritance**: True
- **win_perms_reset**: True

### 21.19.242 salt.states.rsync

State to synchronize files and directories with rsync.

New in version 2016.3.0.

```bash
/opt/user-backups:
rsync.synchronized:
  - **source**: /home
  - **force**: True

salt.states.rsync.synchronized(name, source, delete=False, force=False, update=False, passwordfile=None, exclude=None, excludefrom=None, prepare=False, dryrun=False, additional_opts=None)
```

Guarantees that the source directory is always copied to the target.

- **name**  Name of the target directory.
- **source**  Source directory.
- **prepare**  Create destination directory if it does not exists.
- **delete**  Delete extraneous files from the destination dirs (True or False)
- **force**  Force deletion of dirs even if not empty
- **update**  Skip files that are newer on the receiver (True or False)
- **passwordfile**  Read daemon-access password from the file (path)
- **exclude**  Exclude files, that matches pattern.
- **excludefrom**  Read exclude patterns from the file (path)
- **dryrun**  Perform a trial run with no changes made. Is the same as doing test=True

New in version 2016.3.1.

- **additional_opts**  Pass additional options to rsync, should be included as a list.

New in version 2018.3.0.

### 21.19.243 salt.states.rvm
Managing Ruby installations and gemsets with Ruby Version Manager (RVM)

This module is used to install and manage Ruby installations and gemsets with RVM, the Ruby Version Manager. Different versions of Ruby can be installed and gemsets created. RVM itself will be installed automatically if it’s not present. This module will not automatically install packages that RVM depends on or ones that are needed to build Ruby. If you want to run RVM as an unprivileged user (recommended) you will have to create this user yourself. This is how a state configuration could look like:

```yaml
rvm:
  group.present: []
user.present:
  - gid: rvm
  - home: /home/rvm
  - require:
    - group: rvm

rvm-deps:
pkg.installed:
  - pkgs:
    - bash
    - coreutils
    - gzip
    - bzip2
    - gawk
    - sed
    - curl
    - git-core
    - subversion

mri-deps:
pkg.installed:
  - pkgs:
    - build-essential
    - openssl
    - libreadline6
    - libreadline6-dev
    - curl
    - git-core
    - zlib1g
    - zlib1g-dev
    - libssl-dev
    - libyaml-dev
    - libsqlite3-0
    - libsqlite3-dev
    - sqlite3
    - libxml2-dev
    - libxslt1-dev
    - autoconf
    - libc6-dev
    - libncurses5-dev
    - automake
    - libtool
    - bison
    - subversion
    - ruby

jruby-deps:
```

(continues on next page)
pkg.installed:
  - pkgs:
    - curl
    - g++
    - openjdk-6-jre-headless

ruby-1.9.2:
  rvm.installed:
    - default: True
    - user: rvm
    - require:
      - pkg: rvm-deps
      - pkg: mri-deps
      - user: rvm

jruby:
  rvm.installed:
    - user: rvm
    - require:
      - pkg: rvm-deps
      - pkg: jruby-deps
      - user: rvm

jgemset:
  rvm.gemset_present:
    - ruby: jruby
    - user: rvm
    - require:
      - rvm: jruby

mygemset:
  rvm.gemset_present:
    - ruby: ruby-1.9.2
    - user: rvm
    - require:
      - rvm: ruby-1.9.2

salt.states.rvm.gemset_present(name, ruby='default', user=None)
    Verify that the gemset is present.
    name  The name of the gemset.
    ruby: default  The ruby version this gemset belongs to.
    user: None  The user to run rvm as.

    New in version 0.17.0.

salt.states.rvm.installed(name, default=False, user=None, opts=None, env=None)
    Verify that the specified ruby is installed with RVM. RVM is installed when necessary.
    name  The version of ruby to install
    default [False] Whether to make this ruby the default.
    user: None  The user to run rvm as.
    env: None  A list of environment variables to set (ie, RUBY_CONFIGURE_OPTS)
    opts: None  A list of option flags to pass to RVM (ie -C, -patch)

    New in version 0.17.0.
21.19.244 salt.states.salt_proxy module

Salt proxy state
New in version 2015.8.2.
State to deploy and run salt-proxy processes on a minion.
Set up pillar data for your proxies per the documentation.
Run the state as below

.. code-block:: yaml
   salt-proxy-configure:
       salt_proxy.configure_proxy:
           proxynmae: p8000
           start: True

This state will configure the salt proxy settings within /etc/salt/proxy (if /etc/salt/proxy doesn’t exists) and start the salt-proxy process (default true), if it isn’t already running.

salt.states.salt_proxy.configure_proxy(name, proxynmae='p8000', start=True)

Create the salt proxy file and start the proxy process if required

Parameters
- name – The name of this state
- proxynmae – Name to be used for this proxy (should match entries in pillar)
- start – Boolean indicating if the process should be started

Example:

.. code-block:: yaml
   salt-proxy-configure:
       salt_proxy.configure_proxy:
           proxynmae: p8000
           start: True

21.19.245 salt.states.saltmod

Control the Salt command interface

This state is intended for use from the Salt Master. It provides access to sending commands down to minions as well as access to executing master-side modules. These state functions wrap Salt’s Python API.

Support for masterless minions was added to the salt.state function, so they can run orchestration sls files. This is particularly useful when the rendering of a state is dependent on the execution of another state. Orchestration will render and execute each orchestration block independently, while honoring requisites to ensure the states are applied in the correct order.

See also:

More Orchestrate documentation
- Full Orchestrate Tutorial
- The Orchestrate runner
salt.states.saltmod.function(name, tgt, ssh=False, tgt_type='glob', ret='', ret_config=None, ret_kwargs=None, expect_minions=False, fail_minions=None, fail_function=None, arg=None, kwarg=None, timeout=None, batch=None, subset=None, **kwargs)

Execute a single module function on a remote minion via salt or salt-ssh

name The name of the function to run, aka cmd.run or pkg.install
tgt The target specification, aka '*' for all minions
tgt_type The target type, defaults to glob
arg The list of arguments to pass into the function
kwarg The dict (not a list) of keyword arguments to pass into the function
ret Optionally set a single or a list of returners to use
ret_config Use an alternative returner configuration
ret_kwargs Override individual returner configuration items
expect_minions An optional boolean for failing if some minions do not respond
fail_minions An optional list of targeted minions where failure is an option
fail_function An optional string that points to a salt module that returns True or False based on the returned data dict for individual minions
ssh Set to True to use the ssh client instead of the standard salt client
batch Execute the command in batches. E.g.: 10%.
subset Number of minions from the targeted set to randomly use

New in version 2017.7.0.

salt.states.saltmod.parallel_runners(name, runners, **kwargs)

Executes multiple runner modules on the master in parallel.

New in version 2017.x.0: (Nitrogen)

A separate thread is spawned for each runner. This state is intended to be used with the orchestrate runner in place of the saltmod.runner state when different tasks should be run in parallel. In general, Salt states are not safe when used concurrently, so ensure that they are used in a safe way (e.g. by only targeting separate minions in parallel tasks).

ame: name identifying this state. The name is provided as part of the output, but not used for anything else.
runners: list of runners that should be run in parallel. Each element of the list has to be a dictionary. This dictionary’s name entry stores the name of the runner function that shall be invoked. The optional kwarg entry stores a dictionary of named arguments that are passed to the runner function.

```yaml
parallel-state:
  salt.parallel_runners:
    - runners:
      my_runner_1:
        - name: state.orchestrate
        - kwarg:
          mods: orchestrate_state_1
      my_runner_2:
        - name: state.orchestrate
        - kwarg:
          mods: orchestrate_state_2
```

salt.states.saltmod.runner(name, **kwargs)

Execute a runner module on the master

New in version 2014.7.0.

name The name of the function to run
kwarg Any keyword arguments to pass to the runner function
run-manage-up:
  salt.runner:
    - name: manage.up

salt.states.saltmod.state(name, tgt, ssh=False, tgt_type='glob', ret='', ret_config=None,
ret_kwargs=None, highstate=None, sls=None, top=None, saltenv=None,
test=None, pillar=None, pillarenv=None, expect_minions=True,
fail_minions=None, allow_fail=0, concurrent=False, timeout=None,
batch=None, queue=False, subset=None, orchestration_jid=None,
**kwargs)

Invoke a state run on a given target

name An arbitrary name used to track the state execution
tgt The target specification for the state run.

  Masterless support: When running on a masterless minion, the tgt is ignored and will always be the
local minion.
tgt_type The target type to resolve, defaults to glob
ret Optionally set a single or a list of returners to use
ret_config Use an alternative returner configuration
ret_kwargs Override individual returner configuration items
highstate Defaults to None, if set to True the target systems will ignore any sls references specified in the sls
option and call state.highstate on the targeted minions
top Should be the name of a top file. If set state.top is called with this top file instead of state.sls.
sls A group of sls files to execute. This can be defined as a single string containing a single sls file, or a list of
sls files
test Pass test=true or test=false through to the state function. This can be used to override a test
mode set in the minion’s config file. If left as the default of None and the 'test' mode is supplied on the
command line, that value is passed instead.
pillar Pass the pillar kwarg through to the state function
pillarenv The pillar environment to grab pillars from

  New in version 2017.7.0.
saltenv The default salt environment to pull sls files from
ssh Set to True to use the ssh client instead of the standard salt client
roster In the event of using salt-ssh, a roster system can be set
expect_minions An optional boolean for failing if some minions do not respond
fail_minions An optional list of targeted minions where failure is an option
allow_fail Pass in the number of minions to allow for failure before setting the result of the execution to False
concurrent Allow multiple state runs to occur at once.

  WARNING: This flag is potentially dangerous. It is designed for use when multiple state runs can safely
be run at the same Do not use this flag for performance optimization.
queue Pass queue=true through to the state function
batch Execute the command in batches. E.g.: 10%.

  New in version 2016.3.0.
subset Number of minions from the targeted set to randomly use

  New in version 2017.7.0.
Examples:

Run a list of sls files via state.sls on target minions:

webservers:
  salt.state:
    - tgt: 'web*'
Run a full `state.highstate` on target minions.

```yaml
sls:
  - apache
  - django
  - core
  - saltenv: prod

salt.saltmod.wait_for_event(name, id_list, event_id='id', timeout=300, node='master')
    Watch Salt’s event bus and block until a condition is met

    New in version 2014.7.0.

    name An event tag to watch for; supports Reactor-style globbing.
    id_list A list of event identifiers to watch for – usually the minion ID. Each time an event tag is matched
    the event data is inspected for `event_id`, if found it is removed from `id_list`. When `id_list` is
    empty this function returns success.
    event_id [id] The name of a key in the event data. Default is `id` for the minion ID, another common value is
    name for use with orchestrating salt-cloud events.
    timeout [300] The maximum time in seconds to wait before failing.

    The following example blocks until all the listed minions complete a restart and reconnect to the Salt master:

    ```
    reboot_all_minions:
      salt.function:
        - name: system.reboot
          tgt: '*'
    wait_for_reboots:
      salt.wait_for_event:
        - name: salt/minion/*/start
        - id_list:
          - jerry
          - stuart
          - dave
          - phil
          - kevin
          - mike
        - require:
          - salt: reboot_all_minions
    ```

salt.saltmod.wheel(name, **kwargs)
    Execute a wheel module on the master

    New in version 2014.7.0.

    name The name of the function to run
    kwargs Any keyword arguments to pass to the wheel function

    ```
    accept_minion_key:
      salt.wheel:
        - name: key.accept
        - match: frank
    ```
21.19.246 salt.states.schedule

Management of the Salt scheduler

```yaml
job3:
schedule.present:
  - function: test.ping
  - seconds: 3600
  - splay: 10

This will schedule the command: test.ping every 3600 seconds (every hour) splaying the time between 0 and 10 seconds

job2:
schedule.present:
  - function: test.ping
  - seconds: 15
  - splay:
    start: 10
    end: 20

This will schedule the command: test.ping every 15 seconds splaying the time between 10 and 20 seconds

job1:
schedule.present:
  - function: state.sls
  - job_args:
    - httpd
  - job_kwargs:
    test: True
  - when:
    - Monday 5:00pm
    - Tuesday 3:00pm
    - Wednesday 5:00pm
    - Thursday 3:00pm
    - Friday 5:00pm

This will schedule the command: state.sls httpd test=True at 5pm on Monday, Wednesday and Friday, and 3pm on Tuesday and Thursday. Requires that python-dateutil is installed on the minion.

job1:
schedule.present:
  - function: state.sls
  - job_args:
    - httpd
  - job_kwargs:
    test: True
  - cron: */5 * * * *

Scheduled jobs can also be specified using the format used by cron. This will schedule the command: state.sls httpd test=True to run every 5 minutes. Requires that python-croniter is installed on the minion.
```

(continues on next page)
- function: state.sls
  - job_args:
    - httpd
  - job_kwargs:
    - test: True
  - when:
    - Monday 5:00pm
    - Tuesday 3:00pm
    - Wednesday 5:00pm
    - Thursday 3:00pm
    - Friday 5:00pm
  - returner: xmpp
  - return_config: xmpp_state_run
  - return_kwargs:
    - recipient: user@domain.com

This will schedule the command: state.sls httpd test=True at 5pm on Monday, Wednesday and Friday, and 3pm on Tuesday and Thursday. Using the xmpp returner to return the results of the scheduled job, with the alternative configuration options found in the xmpp_state_run section.

job1:

  schedule.present:
  - function: state.sls
  - job_args:
  - job_kwargs:
    - test: True
  - hours: 1
  - skip_during_range:
    - start: 2pm
    - end: 3pm
  - run_after_skip_range: True

This will schedule the command: state.sls httpd test=True at 5pm on Monday, Wednesday and Friday, and 3pm on Tuesday and Thursday. Requires that python-dateutil is installed on the minion.

salt.states.schedule.absent(name, **kwargs)
Ensure a job is absent from the schedule

  name The unique name that is given to the scheduled job.
  persist Whether the job should persist between minion restarts, defaults to True.

salt.states.schedule.disabled(name, **kwargs)
Ensure a job is disabled in the schedule

  name The unique name that is given to the scheduled job.
  persist Whether the job should persist between minion restarts, defaults to True.

salt.states.schedule.enabled(name, **kwargs)
Ensure a job is enabled in the schedule

  name The unique name that is given to the scheduled job.
  persist Whether the job should persist between minion restarts, defaults to True.

salt.states.schedule.present(name, **kwargs)
Ensure a job is present in the schedule

  name The unique name that is given to the scheduled job.
  seconds The scheduled job will be executed after the specified number of seconds have passed.
minutes  The scheduled job will be executed after the specified number of minutes have passed.
hours  The scheduled job will be executed after the specified number of hours have passed.
days  The scheduled job will be executed after the specified number of days have passed.
when  This will schedule the job at the specified time(s). The when parameter must be a single value or a
dictionary with the date string(s) using the dateutil format. Requires python-dateutil.
cron  This will schedule the job at the specified time(s) using the crontab format. Requires python-croniter.
run_on_start  Whether the job will run when Salt minion start. Value should be a boolean.
function  The function that should be executed by the scheduled job.
job_args  The arguments that will be used by the scheduled job.
job_kwargs  The keyword arguments that will be used by the scheduled job.
maxrunning  Ensure that there are no more than N copies of a particular job running.
jid_include  Include the job into the job cache.
splay  The amount of time in seconds to splay a scheduled job. Can be specified as a single value in seconds
or as a dictionary range with 'start' and 'end' values.
range  This will schedule the command within the range specified. The range parameter must be a dictionary
with the date strings using the dateutil format. Requires python-dateutil.
once  This will schedule a job to run once on the specified date.
once_fmt  The default date format is ISO 8601 but can be overridden by also specifying the once_fmt option.
enabled  Whether the job should be enabled or disabled. Value should be a boolean.
return_job  Whether to return information to the Salt master upon job completion.
metadata  Using the metadata parameter special values can be associated with a scheduled job. These values
are not used in the execution of the job, but can be used to search for specific jobs later if combined with
the return_job parameter. The metadata parameter must be specified as a dictionary, otherwise it will be
ignored.
returner  The returner to use to return the results of the scheduled job.
return_config  The alternative configuration to use for returner configuration options.
return_kwargs  Any individual returner configuration items to override. Should be passed as a dictionary.
persist  Whether the job should persist between minion restarts, defaults to True.
skip_during_range  This will ensure that the scheduled command does not run within the range specified.
The range parameter must be a dictionary with the date strings using the dateutil format. Requires
python-dateutil.
run_after_skip_range  Whether the job should run immediately after the skip_during_range time period ends.

21.19.247  salt.states.selinux

Management of SELinux rules

If SELinux is available for the running system, the mode can be managed and booleans can be set.

```
enforcing:
  selinux.mode

samba_create_home_dirs:
  selinux.boolean:
    - value: True
    - persist: True

nginx:
  selinux.module:
    - enabled: False
```

Note: Use of these states require that the `selinux` execution module is available.
salt.states.selinux.boolean(name, value, persist=False)
Set up an SELinux boolean
name  The name of the boolean to set
value  The value to set on the boolean
persist  Defaults to False, set persist to true to make the boolean apply on a reboot

salt.states.selinux.fcontext_policy_absent(name, filetype='a', sel_type=None, sel_user=None, sel_level=None)
New in version 2017.7.0.
Makes sure an SELinux file context policy for a given filespec (name), filetype and SELinux context type is absent.
name  filespec of the file or directory. Regex syntax is allowed.
filetype  The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also man semanage-fcontext.
           Defaults to 'a' (all files).
sel_type  The SELinux context type. There are many.
sel_user  The SELinux user.
sel_level  The SELinux MLS range.

salt.states.selinux.fcontext_policy_applied(name, recursive=False)
New in version 2017.7.0.
Checks and makes sure the SELinux policies for a given filespec are applied.

salt.states.selinux.fcontext_policy_present(name, sel_type, filetype='a', sel_user=None, sel_level=None)
New in version 2017.7.0.
Makes sure a SELinux policy for a given filespec (name), filetype and SELinux context type is present.
name  filespec of the file or directory. Regex syntax is allowed.
sel_type  SELinux context type. There are many.
filetype  The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also man semanage-fcontext.
           Defaults to 'a' (all files).
sel_user  The SELinux user.
sel_level  The SELinux MLS range.

salt.states.selinux.mode(name)
Verifies the mode SELinux is running in, can be set to enforcing, permissive, or disabled

Note:  A change to or from disabled mode requires a system reboot. You will need to perform this yourself.

name  The mode to run SELinux in, permissive, enforcing, or disabled.

salt.states.selinux.module(name, module_state='Enabled', version='any', **opts)
Enable/Disable and optionally force a specific version for an SELinux module
name  The name of the module to control
module_state  Should the module be enabled or disabled?
version  Defaults to no preference, set to a specified value if required. Currently can only alert if the version is incorrect.
install  Setting to True installs module
source  Points to module source file, used only when install is True
remove  Setting to True removes module
New in version 2016.3.0.

salt.states.selinux.module_install(name)
Installs custom SELinux module from given file
name  Path to file with module to install
New in version 2016.11.6.
salt.states.selinux.module_remove(name)

Removes SELinux module

**name** The name of the module to remove

New in version 2016.11.6.

salt.states.selinux.port_policy_absent(name, sel_type=None, protocol=None, port=None)

New in version 2019.2.0.

Makes sure an SELinux port policy for a given port, protocol and SELinux context type is absent.

**name** The protocol and port spec. Can be formatted as (tcp|udp)/(port|port-range).

**sel_type** The SELinux Type. Optional; can be used in determining if policy is present, ignored by semanage port --delete.

**protocol** The protocol for the port, tcp or udp. Required if name is not formatted.

**port** The port or port range. Required if name is not formatted.

salt.states.selinux.port_policy_present(name, sel_type, protocol=None, port=None, sel_range=None)

New in version 2019.2.0.

Makes sure an SELinux port policy for a given port, protocol and SELinux context type is present.

**name** The protocol and port spec. Can be formatted as (tcp|udp)/(port|port-range).

**sel_type** The SELinux Type.

**protocol** The protocol for the port, tcp or udp. Required if name is not formatted.

**port** The port or port range. Required if name is not formatted.

**sel_range** The SELinux MLS/MCS Security Range.

### 21.19.248 salt.states.serverdensity_device

**Monitor Server with Server Density**

New in version 2014.7.0.

**Server Density** Is a hosted monitoring service.

**Warning:** This state module is beta. It might be changed later to include more or less automation.

**Note:** This state module requires a pillar for authentication with Server Density To install a v1 agent:

```
serverdensity:
  api_token: "b97da80a41c4f61b0f05975ee51eb1aa"
  account_url: "https://your-account.serverdensity.io"
```

To install a v2 agent:

```
serverdensity:
  api_token: "b97da80a41c4f61b0f05975ee51eb1aa"
  account_name: "your-account"
```

**Note:** Although Server Density allows duplicate device names in its database, this module will raise an exception if you try monitoring devices with the same name.

Example:
server_name: serverdensity_device.monitored

salt.states.serverdensity_device.monitored(name, group=None, salt_name=True, 
salt_params=True, agent_version=1, **params)

Device is monitored with Server Density.
name  Device name in Server Density.
salt_name  If True (default), takes the name from the id grain. If False, the provided name is used.
group  Group name under with device will appear in Server Density dashboard. Default - None.
agent_version  The agent version you want to use. Valid values are 1 or 2. Default - 1.
salt_params  If True (default), needed config parameters will be sourced from grains and from status.
params  Add parameters that you want to appear in the Server Density dashboard. Will overwrite the 
salt_params parameters. For more info, see the API docs.

Usage example:

'server_name':
    serverdensity_device.monitored

'server_name':
    serverdensity_device.monitored:
    - group: web-servers

'my_special_server':
    serverdensity_device.monitored:
    - salt_name: False
    - group: web-servers
    - cpuCores: 2
    - os: {'"code": "linux", "name": "Linux"'}

21.19.249 salt.states.service

Starting or restarting of services and daemons

Services are defined as system daemons and are typically launched using system init or rc scripts. This service state
uses whichever service module is loaded on the minion with the virtualname of service. Services can be defined
as either running or dead.

If you need to know if your init system is supported, see the list of supported service modules for your desired
init system (systemd, sysvinit, launchctl, etc.).

Note that Salt's service execution module, and therefore this service state, uses OS grains to ascertain which service
module should be loaded and used to execute service functions. As existing distributions change init systems or new
distributions are created, OS detection can sometimes be incomplete. If your service states are running into trouble
with init system detection, please see the Overriding Virtual Module Providers section of Salt's module documentation
to work around possible errors.

Note: The current status of a service is determined by the return code of the init/rc script status command. A status
return code of 0 it is considered running. Any other return code is considered dead.
httpd:
  service.running: []

The service can also be set to start at runtime via the enable option:

openvpn:
  service.running:
    - enable: True

By default if a service is triggered to refresh due to a watch statement the service is restarted. If the desired behavior is to reload the service, then set the reload value to True:

redis:
  service.running:
    - enable: True
    - reload: True
    - watch:
      - pkg: redis

Note: More details regarding watch can be found in the Requisites documentation.

salt.states.service.dead(name, enable=None, sig=None, init_delay=None, **kwargs)
Ensure that the named service is dead by stopping the service if it is running
name The name of the init or rc script used to manage the service
enable Set the service to be enabled at boot time, True sets the service to be enabled, False sets the named service to be disabled. The default is None, which does not enable or disable anything.
sig The string to search for when looking for the service process with ps
init_delay Add a sleep command (in seconds) before the check to make sure service is killed.
no_block [False] For systemd minions only. Stops the service using --no-block.

New in version 2017.7.0.

salt.states.service.disabled(name, **kwargs)
Ensure that the service is disabled on boot, only use this state if you don’t want to manage the running process, remember that if you want to disable a service to use the enable: False option for the running or dead function.
name The name of the init or rc script used to manage the service

salt.states.service.enabled(name, **kwargs)
Ensure that the service is enabled on boot, only use this state if you don’t want to manage the running process, remember that if you want to enable a running service to use the enable: True option for the running or dead function.
name The name of the init or rc script used to manage the service

salt.states.service.masked(name, runtime=False)
New in version 2017.7.0.

Note: This state is only available on minions which use systemd.

Ensures that the named service is masked (i.e. prevented from being started).
name Name of the service to mask
runtime [False] By default, this state will manage an indefinite mask for the named service. Set this argument to True to runtime mask the service.
Note: It is possible for a service to have both indefinite and runtime masks set for it. Therefore, this state will manage a runtime or indefinite mask independently of each other. This means that if the service is already indefinitely masked, running this state with runtime set to True will not remove the indefinite mask before setting a runtime mask. In these cases, if it is desirable to ensure that the service is runtime masked and not indefinitely masked, pair this state with a service.unmasked state, like so:

```yaml
mask_runtime_foo:
  service.masked:
    - name: foo
      runtime: True

unmask_indefinite_foo:
  service.unmasked:
    - name: foo
      runtime: False
```

salt.states.service.mod_watch(name, sfun=None, sig=None, reload=False, full_restart=False, init_delay=None, force=False, **kwargs)

The service watcher, called to invoke the watch command. When called, it will restart or reload the named service.

Note: This state exists to support special handling of the watch requisite. It should not be called directly.

Parameters for this function should be set by the watching service. (i.e. service.running)

name The name of the init or rc script used to manage the service
sfun The original function which triggered the mod_watch call (service.running, for example).
sig The string to search for when looking for the service process with ps
reload When set, reload the service instead of restarting it. (i.e. service nginx reload)
full_restart Perform a full stop/start of a service by passing --full-restart. This option is ignored if reload is set and is supported by only a few service modules.
force Use service.force_reload instead of reload (needs reload to be set to True)
init_delay Add a sleep command (in seconds) before the service is restarted/reloaded

salt.states.service.running(name, enable=None, sig=None, init_delay=None, no_block=False, unmask=False, unmask_runtime=False, **kwargs)

Ensure that the service is running

name The name of the init or rc script used to manage the service
enable Set the service to be enabled at boot time, True sets the service to be enabled, False sets the named service to be disabled. The default is None, which does not enable or disable anything.
sig The string to search for when looking for the service process with ps
init_delay Some services may not be truly available for a short period after their startup script indicates to the system that they are. Provide an 'init_delay' to specify that this state should wait an additional given number of seconds after a service has started before returning. Useful for requisite states wherein a dependent state might assume a service has started but is not yet fully initialized.
no_block [False] For systemd minions only. Starts the service using --no-block.

New in version 2017.7.0.

unmask [False] For systemd minions only. Set to True to remove an indefinite mask before attempting to start the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before making any changes. This behavior is no longer the default.
unmask_runtime [False] For systemd minions only. Set to True to remove a runtime mask before attempting to start the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before making any changes. This behavior is no longer the default.

Note: watch can be used with service.running to restart a service when another state changes ( example: a file.managed state that creates the service’s config file ). More details regarding watch can be found in the Requisites documentation.

salt.states.service.unmasked(name, runtime=False)

New in version 2017.7.0.

Note: This state is only available on minions which use systemd.

Ensures that the named service is unmasked
name Name of the service to unmask
runtime [False] By default, this state will manage an indefinite mask for the named service. Set this argument to True to ensure that the service is runtime masked.

Note: It is possible for a service to have both indefinite and runtime masks set for it. Therefore, this state will manage a runtime or indefinite mask independently of each other. This means that if the service is indefinitely masked, running this state with runtime set to True will not remove the indefinite mask.

21.19.250 salt.states.slack

Send a message to Slack

This state is useful for sending messages to Slack during state runs.

New in version 2015.5.0.

```
slack-message:
  slack.post_message:
    - channel: '#general'
    - from_name: SuperAdmin
    - message: 'This state was executed successfully.'
    - api_key: peWcBiMOS9HrzG15peWcBiMOS9HrzG15
```

The api key can be specified in the master or minion configuration like below:

```
slack:
  api_key: peWcBiMOS9HrzG15peWcBiMOS9HrzG15
```

salt.states.slack.post_message(name, **kwargs)

Send a message to a Slack channel.

```
slack-message:
  slack.post_message:
    - channel: '#general'
    - from_name: SuperAdmin
```

(continues on next page)
The following parameters are required:

**api_key parameters:**
- **name** The unique name for this event.
- **channel** The channel to send the message to. Can either be the ID or the name.
- **from_name** The name of that is to be shown in the "from" field.
- **message** The message that is to be sent to the Slack channel.

The following parameters are optional:
- **api_key** The api key for Slack to use for authentication, if not specified in the configuration options of master or minion.
- **icon** URL to an image to use as the icon for this message

**webhook parameters:**
- **name** The unique name for this event.
- **message** The message that is to be sent to the Slack channel.
- **color** The color of border of left side
- **short** An optional flag indicating whether the value is short enough to be displayed side-by-side with other values.
- **identifier** The identifier of WebHook.
- **channel** The channel to use instead of the WebHook default.
- **username** Username to use instead of WebHook default.
- **icon_emoji** Icon to use instead of WebHook default.

### 21.19.251 salt.states.smartos

Management of SmartOS Standalone Compute Nodes

- **maintainer** Jorge Schrauwen <sjorge@blackdot.be>
- **maturity** new
- **depends** vmadm, imgadm
- **platform** smartos

New in version 2016.3.0.

```yaml
vmtest.example.org:
  smartos.vm_present:
    - config:
      - reprovision: true
    - vmconfig:
      - image_uuid: c02a2044-c1bd-11e4-bd8c-dfc1db8b0182
        brand: joyent
        alias: vmtest
        quota: 5
        max_physical_memory: 512
      tags:
        label: 'test vm'
        owner: 'sjorge'
    nics:
      "82:1b:8e:49:e9:12":
        nic_tag: trunk
        mtu: 1500
```

(continues on next page)
ips:
  - 172.16.1.123/16
  - 192.168.2.123/24

  vlan_id: 10
  "82:1b:8e:49:e9:13":
  nic_tag: trunk
  mtu: 1500
  ips:
    - dhcp
  vlan_id: 30

  "/bigdata":
    source: "/bulk/data"
    type: lofs
    options:
      - ro
      - nodevices

kvmtest.example.org:
  smartos.vm_present:
    - vmconfig:
        brand: kvm
        alias: kvmtest
        cpu_type: host
        ram: 512
        vnc_port: 9
        tags:
          label: 'test kvm'
          owner: 'sjorge'
        disks:
          disk0
            size: 2048
            model: virtio
            compression: lz4
            boot: true
        nics: 
          "82:1b:8e:49:e9:15":
            nic_tag: trunk
            mtu: 1500
            ips:
              - dhcp
            vlan_id: 30

docker.example.org:
  smartos.vm_present:
    - config:
        auto_import: true
        reprovision: true
    - vmconfig:
        image_uuid: emby/embysolver:latest
        brand: 'lx'
        alias: mydockervm
        quota: 5
        max_physical_memory: 1024
        tags:
          label: 'my emby docker'
owner: 'sjorge'
resolvers:
  - 172.16.1.1
nics:
  "82:1b:8e:49:e9:18":
    nic_tag: trunk
    mtu: 1500
    ips:
      - 172.16.1.118/24
    vlan_id: 10
filesystems:
  "/config:
    source: "/vmdata/emby_config"
    type: lofs
    options:
      - nodev devices

cleanup_images:
  smartos.image_vacuum

Note: Keep in mind that when removing properties from vmconfig they will not get removed from the vm's current configuration, except for nics, disk, tags, ... they get removed via add_*, set_*, update_*, and remove_* . Properties must be manually reset to their default value. The same behavior as when using 'vmadm update'.

salt.states.smartos.config_absent(name)
Ensure configuration property is absent in /usbkey/config
name [string] name of property

salt.states.smartos.config_present(name, value)
Ensure configuration property is set to value in /usbkey/config
name [string] name of property
value [string] value of property

salt.states.smartos.image_absent(name)
Ensure image is absent on the computenode
name [string] uuid of image

Note: computenode.image_absent will only remove the image if it is not used by a vm.

salt.states.smartos.image_present(name)
Ensure image is present on the computenode
name [string] uuid of image

salt.states.smartos.image_vacuum(name)
Delete images not in use or installed via image_present

Warning: Only image_present states that are included via the top file will be detected.

salt.states.smartos.source_absent(name)
Ensure an image source is absent on the computenode
name [string] source url
salt.states.smartos.**source_present**(name, source_type='imgapi')
Ensure an image source is present on the computer node
name [string] source url
source_type [string] source type (imgapi or docker)

salt.states.smartos.**vm_absent**(name, archive=False)
Ensure vm is absent on the computer node
name [string] hostname of vm
archive [boolean] toggle archiving of vm on removal

**Note:** State ID is used as hostname. Hostnames must be unique.

salt.states.smartos.**vm_present**(name, vmconfig, config=None)
Ensure vm is present on the computer node
name [string] hostname of vm
vmconfig [dict] options to set for the vm
config [dict] fine grain control over vm_present

**Note:**
The following configuration properties can be toggled in the config parameter.
- kvm_reboot (true) - reboots of kvm zones if needed for a config update
- auto_import (false) - automatic importing of missing images
- auto_lx_vars (true) - copy kernel_version and docker:* variables from image
- reprovision (false) - reprovision on image_uuid changes
- enforce_tags (true) - false = add tags only, true = add, update, and remove tags
- enforce_routes (true) - false = add tags only, true = add, update, and remove routes
- enforce_internal_metadata (true) - false = add metadata only, true = add, update, and remove metadata
- enforce_customer_metadata (true) - false = add metadata only, true = add, update, and remove metadata

**Note:** State ID is used as hostname. Hostnames must be unique.

**Note:** If hostname is provided in vmconfig this will take president over the State ID. This allows multiple states to be applied to the same vm.

**Note:**
The following instances should have a unique ID.
- nic : mac
- filesystem: target
- disk : path or diskN for zvols
e.g. disk0 will be the first disk added, disk1 the 2nd,...

Changed in version 2019.2.0: Added support for docker image uuids, added auto_lx_vars configuration, documented some missing configuration options.

salt.states.smartos.**vm_running**(name)
Ensure vm is in the running state on the computer node
name [string] hostname of vm
Note: State ID is used as hostname. Hostnames must be unique.

salt.states.smartos.vm_stopped(name)

Ensure vm is in the stopped state on the compute node

name [string] hostname of vm

Note: State ID is used as hostname. Hostnames must be unique.

21.19.252 salt.states.smtp

Sending Messages via SMTP

New in version 2014.7.0.

This state is useful for firing messages during state runs, using the SMTP protocol

```python
server-warning-message:
smtp.send_msg:
   - name: 'This is a server warning message'
   - profile: my-smtp-account
   - recipient: admins@example.com
```

salt.states.smtp.send_msg(name, recipient, subject, sender=None, profile=None, use_ssl='True', attachments=None)

Send a message via SMTP

```python
server-warning-message:
smtp.send_msg:
   - name: 'This is a server warning message'
   - profile: my-smtp-account
   - subject: 'Message from Salt'
   - recipient: admin@example.com
   - sender: admin@example.com
   - use_ssl: True
   - attachments:
     - /var/log/syslog
     - /var/log/messages
```

name The message to send via SMTP

21.19.253 salt.states.snapper module

Managing implicit state and baselines using snapshots

New in version 2016.11.0.

Salt can manage state against explicitly defined state, for example if your minion state is defined by:

```bash
/etc/config_file:
file.managed:
   - source: salt://configs/myconfig
```
If someone modifies this file, the next application of the highstate will allow the admin to correct this deviation and the file will be corrected.

Now, what happens if somebody creates a file `/etc/new_config_file` and deletes `/etc/important_config_file`? Unless you have a explicit rule, this change will go unnoticed.

The snapper state module allows you to manage state implicitly, in addition to explicit rules, in order to define a baseline and iterate with explicit rules as they show that they work in production.

The workflow is: once you have a working and audited system, you would create your baseline snapshot (eg. with `salt tgt snapper.create_snapshot`) and define in your state this baseline using the identifier of the snapshot (in this case: 20):

```yaml
my_baseline:
  snapper.baseline_snapshot:
    - number: 20
    - include_diff: False
    - ignore:
      - /var/log
      - /var/cache
```

Baseline snapshots can be also referenced by tag. Most recent baseline snapshot is used in case of multiple snapshots with the same tag:

```yaml
my_baseline_external_storage:
  snapper.baseline_snapshot:
    • tag: my_custom_baseline_tag
    • config: external
    • ignore: - /mnt/tmp_files/
```

If you have this state, and you haven’t done changes to the system since the snapshot, and you add a user, the state will show you the changes (including full diffs) to `/etc/passwd`, `/etc/shadow`, etc if you call it with `test=True` and will undo all changes if you call it without.

This allows you to add more explicit state knowing that you are starting from a very well defined state, and that you can audit any change that is not part of your explicit configuration.

So after you made this your state, you decided to introduce a change in your configuration:

```yaml
my_baseline:
  snapper.baseline_snapshot:
    - number: 20
    - ignore:
      - /var/log
      - /var/cache
hosts_entry:
  file.blockreplace:
    - name: /etc/hosts
    - content: 'First line of content'
    - append_if_not_found: True
```

The change in `/etc/hosts` will be done after any other change that deviates from the specified snapshot are reverted. This could be for example, modifications to the `/etc/passwd` file or changes in the `/etc/hosts` that could render your the `hosts_entry` rule void or dangerous.

Once you take a new snapshot and you update the baseline snapshot number to include the change in `/etc/hosts` the `hosts_entry` rule will basically do nothing. You are free to leave it there for documentation, to ensure that
the change is made in case the snapshot is wrong, but if you remove anything that comes after the snapper.
baseline_snapshot as it will have no effect; by the moment the state is evaluated, the baseline state was already
applied and include this change.

**Warning:** Make sure you specify the baseline state before other rules, otherwise the baseline state will revert
all changes if they are not present in the snapshot.

**Warning:** Do not specify more than one baseline rule as only the last one will affect the result.

codeauthor Duncan Mac-Vicar P. <dmacvicar@suse.de>
codeauthor Pablo Suárez Hernández <psuarezhernandez@suse.de>
maturity new
platform Linux

```python
salt.states.snapper.baseline_snapshot(name, number=None, tag=None, include_diff=True, 
config='root', ignore=None)
```

Enforces that no file is modified comparing against a previously defined snapshot identified by number.

- **number** Number of selected baseline snapshot.
- **tag** Tag of the selected baseline snapshot. Most recent baseline baseline snapshot is used in case of multiple
snapshots with the same tag. *(tag and number cannot be used at the same time)*
- **include_diff** Include a diff in the response (Default: True)
- **config** Snapper config name (Default: root)
- **ignore** List of files to ignore. (Default: None)

---

### 21.19.254 salt.states.solrcloud module

States for solrcloud alias and collection configuration

New in version 2017.7.0.

```python
salt.states.solrcloud.alias(name, collections, **kwargs)
```

Create alias and enforce collection list.

Use the solrcloud module to get alias members and set them.

You can pass additional arguments that will be forwarded to http.query

- **name** The collection name
- **collections** list of collections to include in the alias

```python
salt.states.solrcloud.collection(name, options=None, **kwargs)
```

Create collection and enforce options.

Use the solrcloud module to get collection parameters.

You can pass additional arguments that will be forwarded to http.query

- **name** The collection name
- **options** [{} options to ensure

---

### 21.19.255 salt.states.splunk

Splunk User State Module
New in version 2016.3.0..

This state is used to ensure presence of users in splunk.

```python
ensure example test user 1:
    splunk.present:
        - name: 'Example TestUser1'
        - email: example@domain.com
```

```
salt.states.splunk.absent(email, profile='splunk', **kwargs)

Ensure a splunk user is absent
```

```python
ensure example test user 1:
    splunk.absent:
        - email: 'example@domain.com'
        - name: 'exampleuser'
```

The following parameters are required:
- **email** This is the email of the user in splunk
- **name** This is the splunk username used to identify the user.

```
salt.states.splunk.present(email, profile='splunk', **kwargs)

Ensure a user is present
```

```python
ensure example test user 1:
    splunk.user_present:
        - realname: 'Example TestUser1'
        - name: 'exampleuser'
        - email: 'example@domain.com'
        - roles: ['user']
```

The following parameters are required:
- **email** This is the email of the user in splunk

**21.19.256 salt.states.splunk_search**

Splunk Search State Module

New in version 2015.5.0.

This state is used to ensure presence of splunk searches.

```python
server-warning-message:
    splunk_search.present:
        - name: This is the splunk search name
        - search: index=main sourcetype=
```

```
salt.states.splunk_search.absent(name, profile='splunk')

Ensure a search is absent
```

```
API Error Search:
    splunk_search.absent
```

The following parameters are required:
- **name** This is the name of the search in splunk

```
salt.states.splunk_search.present(name, profile='splunk', **kwargs)

Ensure a search is present
```
The following parameters are required:

name  This is the name of the search in splunk

### 21.19.257 salt.states.sqlite3

Management of SQLite3 databases

New in version 2016.3.0.

**depends**

- SQLite3 Python Module

**configuration** See `salt.modules.sqlite3` for setup instructions

The sqlite3 module is used to create and manage sqlite3 databases and execute queries

Here is an example of creating a table using sql statements:

```yaml
users:
  sqlite3.table_present:
    - db: /var/www/data/app.sqlite
    - schema: CREATE TABLE `users` (`username` TEXT COLLATE NOCASE UNIQUE NOT NULL, `password` BLOB NOT NULL, `salt` BLOB NOT NULL, `last_login` INT)
```

Here is an example of creating a table using yaml/jinja instead of sql:

```yaml
users:
  sqlite3.table_present:
    - db: /var/www/app.sqlite
    - schema:
        - email TEXT COLLATE NOCASE UNIQUE NOT NULL
        - firstname TEXT NOT NULL
        - lastname TEXT NOT NULL
        - company TEXT NOT NULL
        - password BLOB NOT NULL
        - salt BLOB NOT NULL
```

Here is an example of making sure a table is absent:

```yaml
bad_servers:
  sqlite3.table_absent:
    - db: /var/www/data/users.sqlite
```

Sometimes you would to have specific data in tables to be used by other services Here is an example of making sure rows with specific data exist:

```yaml
user_john_doe_xyz:
  sqlite3.row_present:
    - db: /var/www/app.sqlite
    - table: users
    - where_sql: email='john.doe@companyxyz.com'
```

(continues on next page)
Here is an example of removing a row from a table:

```
user_john_doe_abc:
  sqlite3.row_absent:
    - db: /var/www/app.sqlite
    - table: users
    - where_sql: email="john.doe@companyabc.com"
    - require:
      - sqlite3: users
```

Note that there is no explicit state to perform random queries, however, this can be approximated with sqlite3’s module functions and module.run:

```
zone-delete:
  module.run:
    - name: sqlite3.modify
    - db: {{ db }}
    - sql: "DELETE FROM records WHERE id > {{ count[0] }} AND domain_id = {{ domain_--id }}"
    - watch:
      - sqlite3: zone-insert-12
```

---

salt.states.sqlite3.row_absent(name, db, table, where_sql, where_args=None)

Makes sure the specified row is absent in db. If multiple rows match where_sql, then the state will fail.

- **name**: Only used as the unique ID
- **db**: The database file name
- **table**: The table name to check
- **where_sql**: The sql to select the row to check
- **where_args**: The list parameters to substitute in where_sql

salt.states.sqlite3.row_present(name, db, table, data, where_sql, where_args=None, update=False)

Checks to make sure the given row exists. If row exists and update is True then row will be updated with data. Otherwise it will leave existing row unmodified and check it against data. If the existing data doesn’t match data_check the state will fail. If the row doesn’t exist then it will insert data into the table. If more than one row matches, then the state will fail.

- **name**: Only used as the unique ID
- **db**: The database file name
- **table**: The table name to check the data
- **data**: The dictionary of key/value pairs to check against if row exists, insert into the table if it doesn’t
- **where_sql**: The sql to select the row to check
- **where_args**: The list parameters to substitute in where_sql
- **update**: True will replace the existing row with data When False and the row exists and data does not equal the row data then the state will fail

salt.states.sqlite3.table_absent(name, db)

---

21.19. state modules
Make sure the specified table does not exist

**salt.states.sqlite3.table_present(name, db, schema, force=False)**

Make sure the specified table exists with the specified schema

**name** The name of the table  
**db** The name of the database file  
**schema** The dictionary containing the schema information  
**force** If the name of the table exists and force is set to False, the state will fail. If force is set to True, the existing table will be replaced with the new table

### 21.19.258 salt.states.ssh_auth

**Control of entries in SSH authorized_key files**

The information stored in a user’s SSH authorized key file can be easily controlled via the ssh_auth state. Defaults can be set by the enc, options, and comment keys. These defaults can be overridden by including them in the name.

Since the YAML specification limits the length of simple keys to 1024 characters, and since SSH keys are often longer than that, you may have to use a YAML ‘explicit key’, as demonstrated in the second example below.

```
AAAAB3NzaC1kc3MAAACBAL0sQ9fJ5bYTEyY==:
    ssh_auth.present:
      - user: root
      - enc: ssh-dss

? AAAAB3NzaC1kc3MAAACBAL0sQ9fJ5bYTEyY==...

  ssh_auth.present:
    - user: root
    - enc: ssh-dss

thatch:
  ssh_auth.present:
    - user: root
    - source: salt://ssh_keys/thatch.id_rsa.pub
    - config: '%h/.ssh/authorized_keys'

sshkeys:
  ssh_auth.present:
    - user: root
    - enc: ssh-rsa
    - options:
      - option1="value1"
      - option2="value2 flag2"
    - comment: myuser
    - names:
      - AAAAB3NzaC1kc3MAAACBAL0sQ9fJ5bYTEyY==
      - ssh-dss AAAAB3NzaC1kc3MAAACBAL0sQ9fJ5bYTEyY== user@domain
      - option3="value3" ssh-dss AAAAB3NzaC1kc3MAAACBAL0sQ9fJ5bYTEyY== other@testdomain
      - AAAAB3NzaC1kcQ9fJFF435bYTEyY== newcomment

salt.states.ssh_auth.absent(name, user, enc='ssh-rsa', comment='', source='', options=None, config='ssh/authorized_keys', fingerprint_hash_type=None)

Verifies that the specified SSH key is absent

**name** The SSH key to manage
user The user who owns the SSH authorized keys file to modify
enc Defines what type of key is being used; can be ed25519, ecdsa, ssh-rsa or ssh-dss
comment The comment to be placed with the SSH public key
options The options passed to the key, pass a list object
source The source file for the key(s). Can contain any number of public keys, in standard "authorized_keys" format. If this is set, comment, enc and options will be ignored.

New in version 2015.8.0.
config The location of the authorized keys file relative to the user’s home directory, defaults to ".ssh/authorized_keys". Token expansion %u and %h for username and home path supported.
fingerprint_hash_type The public key fingerprint hash type that the public key fingerprint was originally hashed with. This defaults to md5 if not specified.

New in version 2016.11.7.

Note: The default value of the fingerprint_hash_type will change to sha256 in Salt 2017.7.0.

salt.states.ssh_auth.present(name, user, enc='ssh-rsa', comment='', source='', options=None, config='.ssh/authorized_keys', fingerprint_hash_type=None, **kwargs)
Verifies that the specified SSH key is present for the specified user
name The SSH key to manage
user The user who owns the SSH authorized keys file to modify
enc Defines what type of key is being used; can be ed25519, ecdsa, ssh-rsa or ssh-dss
comment The comment to be placed with the SSH public key
source The source file for the key(s). Can contain any number of public keys, in standard "authorized_keys" format. If this is set, comment and enc will be ignored.

Note: The source file must contain keys in the format <enc> <key> <comment>. If you have generated a keypair using PuTTYgen, then you will need to do the following to retrieve an OpenSSH-compatible public key.
1. In PuTTYgen, click Load, and select the private key file (not the public key), and click Open.
2. Copy the public key from the box labeled Public key for pasting into OpenSSH authorized_keys file.
3. Paste it into a new file.

options The options passed to the key, pass a list object
config The location of the authorized keys file relative to the user’s home directory, defaults to ".ssh/authorized_keys". Token expansion %u and %h for username and home path supported.
fingerprint_hash_type The public key fingerprint hash type that the public key fingerprint was originally hashed with. This defaults to md5 if not specified.

New in version 2016.11.7.

Note: The default value of the fingerprint_hash_type will change to sha256 in Salt 2017.7.0.

21.19.259 salt.states.ssh_known_hosts
Control of SSH known_hosts entries
Manage the information stored in the known_hosts files.
github.com:
  ssh_known_hosts:
  - present
  - user: root
  - fingerprint_hash_type: md5

example.com:
  ssh_known_hosts:
  - absent
  - user: root

salt.states.ssh_known_hosts.absent(name, user=None, config=None)
Verifies that the specified host is not known by the given user
name The host name Note that only single host names are supported. If foo.example.com and bar.example.com are the same machine and you need to exclude both, you will need one Salt state for each.
user The user who owns the ssh authorized keys file to modify
config The location of the authorized keys file relative to the user’s home directory, defaults to ".ssh/known_hosts". If no user is specified, defaults to "/etc/ssh/ssh_known_hosts". If present, must be an absolute path when a user is not specified.

salt.states.ssh_known_hosts.present(name, user=None, fingerprint=None, key=None, port=None, enc=None, config=None, hash_known_hosts=True, timeout=5, fingerprint_hash_type=None)
Verifies that the specified host is known by the specified user
On many systems, specifically those running with openssh 4 or older, the enc option must be set, only openssh 5 and above can detect the key type.
name The name of the remote host (e.g. "github.com") Note that only a single hostname is supported, if foo.example.com and bar.example.com have the same host you will need two separate Salt States to represent them.
user The user who owns the ssh authorized keys file to modify
fingerprint The fingerprint of the key which must be present in the known_hosts file (optional if key specified)
key The public key which must be present in the known_hosts file (optional if fingerprint specified)
port optional parameter, port which will be used to when requesting the public key from the remote host, defaults to port 22.
enc Defines what type of key is being used, can be ed25519, ecdsa ssh-rsa or ssh-dss
cfg The location of the authorized keys file relative to the user’s home directory, defaults to ".ssh/known_hosts". If no user is specified, defaults to "/etc/ssh/ssh_known_hosts". If present, must be an absolute path when a user is not specified.
hash_known_hosts [True] Hash all hostnames and addresses in the known hosts file.
timeout [int] Set the timeout for connection attempts. If timeout seconds have elapsed since a connection was initiated to a host or since the last time anything was read from that host, then the connection is closed and the host in question considered unavailable. Default is 5 seconds.
New in version 2016.3.0.
fingerprint_hash_type The public key fingerprint hash type that the public key fingerprint was originally hashed with. This defaults to sha256 if not specified.
New in version 2016.11.4.
Changed in version 2017.7.0:: default changed from md5 to sha256

21.19.260 salt.states.stateconf
Stateconf System

The stateconf system is intended for use only with the stateconf renderer. This State module presents the set function. This function does not execute any functionality, but is used to interact with the stateconf renderer.

```python
salt.states.stateconf.context(name, **kwargs)
    No-op state to support state config via the stateconf renderer.
```

```python
salt.states.stateconf.set(name, **kwargs)
    No-op state to support state config via the stateconf renderer.
```

21.19.261 salt.states.status

Minion status monitoring

Maps to the status execution module.

```python
salt.states.status.loadavg(name, maximum=None, minimum=None)
    Return the current load average for the specified minion. Available values for name are 1-min, 5-min and 15-min. minimum and maximum values should be passed in as strings.
```

```python
salt.states.status.process(name)
    Return whether the specified signature is found in the process tree. This differs slightly from the services states, in that it may refer to a process that is not managed via the init system.
```

21.19.262 salt.states.statuspage

StatusPage

Manage the StatusPage configuration.

In the minion configuration file, the following block is required:

```yaml
statuspage:
    api_key: <API_KEY>
    page_id: <PAGE_ID>
```

New in version 2017.7.0.

```python
salt.states.statuspage.create(name, endpoint='incidents', api_url=None, page_id=None, api_key=None, api_version=None, **kwargs)
    Insert a new entry under a specific endpoint.
```

```
- endpoint: incidents
- name: my component
- group_id: 993vgplshj12
```
salt.states.statuspage.delete(name, endpoint='incidents', id=None, api_url=None, page_id=None, api_key=None, api_version=None)

Remove an entry from an endpoint.

- **endpoint**: `incidents` Request a specific endpoint.
- **page_id**: Page ID. Can also be specified in the config file.
- **api_key**: API key. Can also be specified in the config file.
- **api_version**: 1 API version. Can also be specified in the config file.
- **api_url**: Custom API URL in case the user has a StatusPage service running in a custom environment.

SLS Example:

```yaml
delete-my-component:
  statuspage.delete:
    - endpoint: components
      id: ftgks51sfs2d
```

salt.states.statuspage.managed(name, config, api_url=None, page_id=None, api_key=None, api_version=None, pace=1, allow_empty=False)

Manage the StatusPage configuration.

- **config**: Dictionary with the expected configuration of the StatusPage. The main level keys of this dictionary represent the endpoint name. If a certain endpoint does not exist in this structure, it will be ignored / not configured.
- **page_id**: Page ID. Can also be specified in the config file.
- **api_key**: API key. Can also be specified in the config file.
- **api_version**: 1 API version. Can also be specified in the config file.
- **api_url**: Custom API URL in case the user has a StatusPage service running in a custom environment.
- **pace**: 1 Max requests per second allowed by the API.
- **allow_empty**: False Allow empty config.

SLS example:

```yaml
my-statuspage-config:
  statuspage.managed:
    - config:
        components:
          - name: component1
            group_id: uy4g37rf
          - name: component2
            group_id: 3n4uyu4gf
        incidents:
          - name: incident1
            status: resolved
            impact: major
            backfilled: false
          - name: incident2
            status: investigating
            impact: minor
```

salt.states.statuspage.update(name, endpoint='incidents', id=None, api_url=None, page_id=None, api_key=None, api_version=None, **kwargs)

Update attribute(s) of a specific endpoint.

- **id**: The unique ID of the endpoint entry.
- **endpoint**: `incidents` Endpoint name.
- **page_id**: Page ID. Can also be specified in the config file.
- **api_key**: API key. Can also be specified in the config file.
- **api_version**: 1 API version. Can also be specified in the config file.
- **api_url**: Custom API URL in case the user has a StatusPage service running in a custom environment.

SLS Example:
update-my-incident:
statuspage.update:
  - id: dz959yz2nd4l
  - status: resolved

21.19.263 salt.states.supervisord

Interaction with the Supervisor daemon

wsgi_server:
supervisord.running:
  - require:
    - pkg: supervisor
  - watch:
    - file: /etc/nginx/sites-enabled/wsgi_server.conf

salt.states.supervisord.dead(name, user=None, conf_file=None, bin_env=None, **kwargs)

Ensure the named service is dead (not running).

- name: Service name as defined in the supervisor configuration file
- user: Name of the user to run the supervisorctl command

Salt 0.17.0.

- conf_file: path to supervisorctl config file
- bin_env: path to supervisorctl bin or path to virtualenv with supervisor installed

salt.states.supervisord.mod_watch(name, restart=True, update=False, user=None, conf_file=None, bin_env=None, **kwargs)

The supervisord watcher, called to invoke the watch command. Always restart on watch.

Note: This state exists to support special handling of the watch requisite. It should not be called directly.

Parameters for this function should be set by the state being triggered.
	salt.states.supervisord.running(name, restart=False, update=False, user=None, conf_file=None, bin_env=None, **kwargs)

Ensure the named service is running.

- name: Service name as defined in the supervisor configuration file
- restart: Whether to force a restart
- update: Whether to update the supervisor configuration.
- user: Name of the user to run the supervisorctl command

Salt 0.17.0.

- conf_file: path to supervisorctl config file
- bin_env: path to supervisorctl bin or path to virtualenv with supervisor installed

21.19.264 salt.states.svn

Manage SVN repositories

Manage repository checkouts via the svn vcs system. Note that subversion must be installed for these states to be available, so svn states should include a requisite to a pkg.installed state for the package which provides subversion (subversion in most cases). Example:
Salt Documentation, Release 2019.2.0

**subversion:**
- pkg.installed

http://unladen-swallow.googlecode.com/svn/trunk/:
  - svn.latest: 

salt.states.svn.dirty(name, target=None, username=None, password=None, ignore_unversioned=False)

Determine if the working directory has been changed.

salt.states.svn.export(name, target=None, rev=None, user=None, username=None, password=None, force=False, overwrite=False, externals=True, trust=False, trust_failures=None)

Export a file or directory from an SVN repository

name Address and path to the file or directory to be exported.
target Name of the target directory where the checkout will put the working directory
rev [None] The name revision number to checkout. Enable "force" if the directory already exists.
user [None] Name of the user performing repository management operations
username [None] The user to access the name repository with. The svn default is the current user
password Connect to the Subversion server with this password

force [False] Continue if conflicts are encountered
overwrite [False] Overwrite existing target
externals [True] Change to False to not checkout or update externals
trust [False] Automatically trust the remote server. SVN’s –trust-server-cert
trust_failures [None] Comma-separated list of certificate trust failures, that shall be ignored. This can be used if trust=True is not sufficient. The specified string is passed to SVN’s –trust-server-cert-failures option as-is.

New in version 2019.2.0.

salt.states.svn.latest(name, target=None, rev=None, user=None, username=None, password=None, force=False, externals=True, trust=False, trust_failures=None)

Checkout or update the working directory to the latest revision from the remote repository.

name Address of the name repository as passed to "svn checkout"
target Name of the target directory where the checkout will put the working directory
rev [None] The name revision number to checkout. Enable "force" if the directory already exists.
user [None] Name of the user performing repository management operations
username [None] The user to access the name repository with. The svn default is the current user
password Connect to the Subversion server with this password

force [False] Continue if conflicts are encountered
externals [True] Change to False to not checkout or update externals
trust [False] Automatically trust the remote server. SVN’s –trust-server-cert
trust_failures [None] Comma-separated list of certificate trust failures, that shall be ignored. This can be used if trust=True is not sufficient. The specified string is passed to SVN’s –trust-server-cert-failures option as-is.

New in version 2019.2.0.

21.19.265 salt.states.sysctl
Configuration of the kernel using sysctl

Control the kernel sysctl system.

```
vm.swappiness:
   sysctl.present:
     - value: 20
```

`salt.states.sysctl.present(name, value, config=None)`

Ensure that the named sysctl value is set in memory and persisted to the named configuration file. The default sysctl configuration file is /etc/sysctl.conf

- **name**: The name of the sysctl value to edit
- **value**: The sysctl value to apply
- **config**: The location of the sysctl configuration file. If not specified, the proper location will be detected based on platform.

21.19.266 salt.states.syslog_ng

State module for syslog_ng

- **maintainer**: Tibor Benke <btibi@sch.bme.hu>
- **maturity**: new
- **depends**: cmd, ps, syslog_ng
- **platform**: all

Users can generate syslog-ng configuration files from YAML format or use plain ones and reload, start, or stop their syslog-ng by using this module.

Details

The service module is not available on all system, so this module includes `syslog_ng.reloaded`, `syslog_ng.stopped`, and `syslog_ng.started` functions. If the service module is available on the computers, users should use that.

Users can generate syslog-ng configuration with `syslog_ng.config` function. For more information see `syslog-ng state usage`.

Syslog-ng configuration file format

The syntax of a configuration snippet in syslog-ng.conf:

```
object_type object_id {<options>};
```

These constructions are also called statements. There are options inside of them:

```
option(parameter1, parameter2); option2(parameter1, parameter2);
```

salt.states.syslog_ng.config(name, config, write=True)

Builds syslog-ng configuration.

name: the id of the Salt document
config: the parsed YAML code
write: if True, it writes the config into the
configuration file, otherwise just returns it

salt.states.syslog_ng.reloaded(name)

Reloads syslog-ng.

salt.states.syslog_ng.started(name=None, user=None, group=None, chroot=None, caps=None, no_caps=False, pidfile=None, enable_core=False, fd_limit=None, verbose=False, debug=False, trace=False, yydebug=False, persist_file=None, control=None, worker_threads=None, *args, **kwargs)

Ensures, that syslog-ng is started via the given parameters.

Users shouldn't use this function, if the service module is available on their system.

salt.states.syslog_ng.stopped(name=None)

Kills syslog-ng.

21.19.267 salt.states.sysrc

State to work with sysrc

salt.states.sysrc.absent(name, **kwargs)

Ensure a sysrc variable is absent.

name: The variable name to set
file (optional) The rc file to add the variable to.

jail (option) the name or JID of the jail to set the value in.

salt.states.sysrc.managed(name, value, **kwargs)

Ensure a sysrc variable is set to a specific value.

name: The variable name to set
value: Value to set the variable to

file (optional) The rc file to add the variable to.

jail (option) the name or JID of the jail to set the value in.

Example:

```
syslogd:
sysrc.managed:
  - name: syslogd_flags
  - value: "-ss"
```

21.19.268 salt.states.telemetry_alert

Manage Telemetry alert configurations

New in version 2016.3.0.

Create, Update and destroy Mongo Telemetry alert configurations.

This module uses requests, which can be installed via package, or pip.

This module accepts explicit credential (telemetry api key) or can also read api key credentials from a pillar. Example:
ensure telemetry alert X is defined on deployment Y:

```python
telemetry_alert.present:
   - deployment_id: "rs-XXXXXX"
   - metric_name: "testMetric"
   - alert_config:
     max: 1
     filter: SERVER_ROLE_MONGOD_PRIMARY
     escalate_to: "example@pagerduty.com"
   - name: "**MANAGED BY ORCA DO NOT EDIT BY HAND** manages alarm on testMetric"
```

salt.states.telemetry_alert.absent(name, deployment_id, metric_name, api_key=None, profile='telemetry')

Ensure the telemetry alert config is deleted

- **name**: An optional description of the alarms (not currently supported by telemetry API)
- **deployment_id**: Specifies the ID of the root deployment resource (replica set cluster or sharded cluster) to which this alert definition is attached
- **metric_name**: Specifies the unique ID of the metric to whose values these thresholds will be applied
- **api_key**: Telemetry api key for the user
- **profile**: A dict with telemetry config data. If present, will be used instead of api_key.

salt.states.telemetry_alert.present(name, deployment_id, metric_name, alert_config, api_key=None, profile='telemetry')

Ensure the telemetry alert exists.

- **name**: An optional description of the alarm (not currently supported by telemetry API)
- **deployment_id**: Specifies the ID of the root deployment resource (replica set cluster or sharded cluster) to which this alert definition is attached
- **metric_name**: Specifies the unique ID of the metric to whose values these thresholds will be applied
- **alert_config**: A list of dictionaries where each dict contains the following fields:
  - **filter**: By default the alert will apply to the deployment and all its constituent resources. If the alert only applies to a subset of those resources, a filter may be specified to narrow this scope.
  - **min**: the smallest "ok" value the metric may take on; if missing or null, no minimum is enforced.
  - **max**: the largest "ok" value the metric may take on; if missing or null, no maximum is enforced.
  - **notify_all**: Used to indicate if you want to alert both onCallEngineer and apiNotifications
- **api_key**: Telemetry api key for the user
- **profile**: A dict of telemetry config information. If present, will be used instead of api_key.

21.19.269 salt.states.test

Test States

Provide test case states that enable easy testing of things to do with state calls, e.g. running, calling, logging, output filtering etc.

```python
always-passes-with-any-kwarg:
    test.nop:
      - name: foo
      - something: else
      - foo: bar

always-passes:
    test.succeed_without_changes:
      - name: foo

always-fails:
```

(continues on next page)
test.fail_without_changes:
  - name: foo

always-changes-and-succeeds:
  test.succeed_with_changes:
    - name: foo

always-changes-and-fails:
  test.fail_with_changes:
    - name: foo

my-custom-combo:
  test.configurable_test_state:
    - name: foo
      changes: True
      result: False
      comment: bar.baz

is-pillar-foo-present-and-bar-is-int:
  test.check_pillar:
    - present:
      - foo
    - integer:
      - bar

salt.states.test.check_pillar(name, present=None, boolean=None, integer=None, string=None, listing=None, dictionary=None, verbose=False)

  Checks the presence and, optionally, the type of given keys in Pillar. Supported kwargs for types are: boolean (bool) - integer (int) - string (str) - listing (list) - dictionary (dict)

  Checking for None type pillars is not implemented yet.

is-pillar-foo-present-and-bar-is-int:
  test.check_pillar:
    - present:
      - foo
    - integer:
      - bar

salt.states.test.configurable_test_state(name, changes=True, result=True, comment="")

  A configurable test state which determines its output based on the inputs.

  New in version 2014.7.0.
  name: A unique string.
  changes: Do we return anything in the changes field? Accepts True, False, and 'Random' Default is True
  result: Do we return successfully or not? Accepts True, False, and 'Random' Default is True If test is True and changes is True, this will be None. If test is True and and changes is False, this will be True.
  comment: String to fill the comment field with. Default is "

salt.states.test.fail_with_changes(name, **kwargs)

  Returns failure and changes is not empty.

  New in version 2014.7.0.
  name: A unique string.

salt.states.test.fail_without_changes(name, **kwargs)

  Returns failure.
New in version 2014.7.0.

**name**: A unique string.

**salt.states.test.mod_watch**(name, sfun=None, **kwargs)

Call this function via a watch statement

New in version 2014.7.0.

Any parameters in the state return dictionary can be customized by adding the keywords `result`, `comment`, and `changes`.

```
this_state_will_return_changes:
    test.succeed_with_changes

test.succeed_without_changes

this_state_will_NOT_return_changes:
    test.succeed_without_changes

this_state_is_watching_another_state:
    test.succeed_without_changes:
        - comment: 'This is a custom comment'
        - watch:
            - test: this_state_will_return_changes
            - test: this_state_will_NOT_return_changes

test.succeed_without_changes:
    - test: this_state_will_NOT_return_changes

this_state_is_also_watching_another_state:
    test.succeed_without_changes:
        - watch:
            - test: this_state_will_NOT_return_changes
```

**salt.states.test.nop**(name, **kwargs)

A no-op state that does nothing. Useful in conjunction with the `use` requisite, or in templates which could otherwise be empty due to jinja rendering

**salt.states.test.show_notification**(name, text=None, **kwargs)

Simple notification using text argument.

New in version 2015.8.0.

**name**: A unique string.

**text**: Text to return in the comment.

**salt.states.test.succeed_with_changes**(name, **kwargs)

Returns successful and changes is not empty

New in version 2014.7.0.

**name**: A unique string.

**salt.states.test.succeed_without_changes**(name, **kwargs)

Returns successful.

New in version 2014.7.0.

**name**: A unique string.

---

21.19.270 salt.states.testinfra module

21.19.271 salt.states.timezone
Management of timezones

The timezone can be managed for the system:

```yaml
America/Denver:
  timezone.system
```

The system and the hardware clock are not necessarily set to the same time. By default, the hardware clock is set to localtime, meaning it is set to the same time as the system clock. If utc is set to True, then the hardware clock will be set to UTC, and the system clock will be an offset of that.

```yaml
America/Denver:
  timezone.system:
    - utc: True
```

The Ubuntu community documentation contains an explanation of this setting, as it applies to systems that dual-boot with Windows. This is explained in greater detail here.

```python
class salt.states.timezone.system:
  name: The name of the timezone to use (e.g.: America/Denver)
  utc: Whether or not to set the hardware clock to UTC (default is True)
```

21.19.272 salt.states.tls

Enforce state for SSL/TLS

```python
class salt.states.tls.valid_certificate:
  name: The name of the webapp
  weeks: The number of weeks for validation
  days: The number of days for validation
  hours: The number of hours for validation
  minutes: The number of minutes for validation
  seconds: The number of seconds for validation
```

21.19.273 salt.states.tomcat

Manage Apache Tomcat web applications

**Note:** This state requires the Tomcat Manager webapp to be installed and running.

The following grains/pillars must be set for communication with Tomcat Manager to work:

```yaml
tomcat-manager:
  user: 'tomcat-manager'
  passwd: 'Passw0rd'
```

Configuring Tomcat Manager

To manage webapps via the Tomcat Manager, you’ll need to configure a valid user in the file conf/tomcat-users.xml.
Listing 1: conf/tomcat-users.xml

```xml
<?xml version='1.0' encoding='utf-8'?>
<tomcat-users>
  <role rolename="manager-script"/>
  <user username="tomcat-manager" password="Passw0rd" roles="manager-script"/>
</tomcat-users>
```

Notes

- Using multiple versions (aka. parallel deployments) on the same context path is not supported.
- If you use only this module for deployments you might want to restrict access to the manager so it's only accessible via localhost. For more info: [http://tomcat.apache.org/tomcat-7.0-doc/manager-howto.html#Configuring_Manager_Application_Access](http://tomcat.apache.org/tomcat-7.0-doc/manager-howto.html#Configuring_Manager_Application_Access)

- Last tested on:
  - **Tomcat Version**: Apache Tomcat/7.0.54
  - **JVM Vendor**: Oracle Corporation
  - **JVM Version**: 1.8.0_101-b13
  - **OS Architecture**: amd64
  - **OS Name**: Linux
  - **OS Version**: 3.10.0-327.22.2.el7.x86_64

```python
salt.states.tomcat.mod_watch(name, url='http://localhost:8080/manager', timeout=180)
```

The tomcat watcher, called to invoke the watch command. When called, it will reload the webapp in question

**Note:** This state exists to support special handling of the watch *requisite*. It should not be called directly. Parameters for this function should be set by the state being triggered.

```python
salt.states.tomcat.undeployed(name, url='http://localhost:8080/manager', timeout=180)
```

Enforce that the WAR will be undeployed from the server

**name** The context path to undeploy.

**url** [http://localhost:8080/manager] The URL of the server with the Tomcat Manager webapp.

**timeout** [180] Timeout for HTTP request to the Tomcat Manager.

Example:

```python
jenkins:
  tomcat.undeployed:
    - name: /ran
    - require:
      - service: application-service
```

```python
salt.states.tomcat.wait(name, url='http://localhost:8080/manager', timeout=180)
```

Wait for the Tomcat Manager to load.

Notice that if tomcat is not running we won’t wait for it start and the state will fail. This state can be required in the tomcat.war_deployed state to make sure tomcat is running and that the manager is running as well and ready for deployment.

21.19. state modules 3647

timeout [180] Timeout for HTTP request to the Tomcat Manager.

Example:

```
tomcat-service:
  service.running:
    - name: tomcat
    - enable: True

wait-for-tomcatmanager:
  tomcat.wait:
    - timeout: 300
    - require:
      - service: tomcat-service

jenkins:
  tomcat.war_deployed:
    - name: /ran
    - war: salt://jenkins-1.2.4.war
    - require:
      - tomcat: wait-for-tomcatmanager

salt.states.tomcat.war_deployed(name, war, force=False, url='http://localhost:8080/manager',
  timeout=180, temp_war_location=None, version=True)
```

Enforce that the WAR will be deployed and started in the context path, while making use of WAR versions in the filename.

Note: For more info about Tomcats file paths and context naming, please see [http://tomcat.apache.org/tomcat-7.0-doc/config/context.html#Naming](http://tomcat.apache.org/tomcat-7.0-doc/config/context.html#Naming)

name The context path to deploy (incl. forward slash) the WAR to.

war Absolute path to WAR file (should be accessible by the user running Tomcat) or a path supported by the salt.modules.cp.get_url function.

force [False] Force deployment even if the version strings are the same. Disabled by default.

timeout [180] Timeout for HTTP requests to the Tomcat Manager.

temp_war_location [None] Use another location to temporarily copy the WAR file to. By default the system’s temp directory is used.

version [''] Specify the WAR version. If this argument is provided, it overrides the version encoded in the WAR file name, if one is present.

Use False or blank value to prevent guessing the version and keeping it blank.

New in version 2016.11.0.

Example:

```
jenkins:
  tomcat.war_deployed:
    - name: /salt-powered-enkins
    - war: salt://jenkins-1.2.4.war
    - require:
      - service: application-service
```
Note: Be aware that in the above example the WAR jenkins-1.2.4.war will be deployed to the context path salt-powered-jenkins##1.2.4. To avoid this either specify a version yourself, or set version to False.

21.19.274 salt.states.trafficserver

Control Apache Traffic Server

New in version 2015.8.0.

salt.states.trafficserver.bounce_cluster(name)

```python
bounce_ats_cluster:
  trafficserver.bounce_cluster
```

salt.states.trafficserver.bounce_local(name, drain=False)

This option modifies the behavior of traffic_line -b and traffic_line -L such that traffic_server is not shut down until the number of active client connections drops to the number given by the proxy.config.restart.active_client_threshold configuration variable.

```python
bounce_ats_local:
  trafficserver.bounce_local

bounce_ats_local:
  trafficserver.bounce_local
  - drain: True
```

salt.states.trafficserver.clear_cluster(name)
Clears accumulated statistics on all nodes in the cluster.

```python
clear_ats_cluster:
  trafficserver.clear_cluster
```

salt.states.trafficserver.clear_node(name)
Clears accumulated statistics on the local node.

```python
clear_ats_node:
  trafficserver.clear_node
```

salt.states.trafficserver.config(name, value)
Set Traffic Server configuration variable values.

```python
proxy.config.proxy_name:
  trafficserver.config:
    - value: cdn.site.domain.tld

OR

traffic_server_setting:
```

(continues on next page)
trafficserver.config:
- name: proxy.config.proxy_name
- value: cdn.site.domain.tld

salt.states.trafficserver.offline(name, path)
Mark a cache storage device as offline. The storage is identified by a path which must match exactly a path specified in storage.config. This removes the storage from the cache and redirects requests that would have used this storage to other storage. This has exactly the same effect as a disk failure for that storage. This does not persist across restarts of the traffic_server process.

offline_ats_path:
trafficserver.offline:
- path: /path/to/cache

salt.states.trafficserver.refresh(name)
Initiate a Traffic Server configuration file reread. Use this command to update the running configuration after any configuration file modification.

The timestamp of the last reconfiguration event (in seconds since epoch) is published in the proxy.node.config.reconfigure_time metric.

refresh_ats:
trafficserver.refresh

salt.states.trafficserver.restart_cluster(name)
Restart the traffic_manager process and the traffic_server process on all the nodes in a cluster.

restart_ats_cluster:
trafficserver.restart_cluster

salt.states.trafficserver.restart_local(name, drain=False)
Restart the traffic_manager and traffic_server processes on the local node.

This option modifies the behavior of traffic_line -b and traffic_line -L such that traffic_server is not shut down until the number of active client connections drops to the number given by the proxy.config.restart.active_client_threshold configuration variable.

restart_ats_local:
trafficserver.restart_local

restart_ats_local_drain:
trafficserver.restart_local
- drain: True

salt.states.trafficserver.shutdown(name)
Shut down Traffic Server on the local node.

shutdown_ats:
trafficserver.shutdown

salt.states.trafficserver.startup(name)
Start Traffic Server on the local node.

startup_ats:
trafficserver.startup
salt.states.trafficserver.zero_cluster(name)
  Reset performance statistics to zero across the cluster.

  zero_ats_cluster:
    trafficserver.zero_cluster

salt.states.trafficserver.zero_node(name)
  Reset performance statistics to zero on the local node.

  zero_ats_node:
    trafficserver.zero_node

21.19.275  salt.states.tuned

Interface to Red Hat tuned-adm module

  maintainer  Syed Ali <alicsyed@gmail.com>
  maturity    new
  depends     cmd.run
  platform    Linux

salt.states.tuned.off(name=None)
  Turns 'tuned' off. Example tuned.sls file for turning tuned off:
    tuned: tuned.off: []
    To see a valid list of states call execution module: tuned.list

salt.states.tuned.profile(name)
  This state module allows you to modify system tuned parameters

    Example tuned.sls file to set profile to virtual-guest
    tuned:
      • profile
      • name: virtual-guest
    name  tuned profile name to set the system to
    To see a valid list of states call execution module: tuned.list

21.19.276  salt.states.uptime

Monitor Web Server with Uptime

Uptime is an open source remote monitoring application using Node.js, MongoDB, and Twitter Bootstrap.

  Warning:  This state module is beta. It might be changed later to include more or less automation.

  Note: This state module requires a pillar to specify the location of your uptime install

    uptime:
      application_url: "http://uptime-url.example.org"
Example:

```python
url:
  uptime.monitored
url/sitemap.xml:
  uptime.monitored:
    - polling: 600 # every hour
```

```python
class salt.states.uptime.monitored(name, **params):
    """(function) Monitors an URL.
    Checks if URL is already monitored, and if not, adds it.
    ""
```

```python
21.19.277 salt.states.user
```

Management of user accounts

The user module is used to create and manage user settings, users can be set as either absent or present.

```python
fred:
  user.present:
    - fullname: Fred Jones
    - shell: /bin/zsh
    - home: /home/fred
    - uid: 4000
    - gid: 4000
    - groups:
      - wheel
      - storage
      - games

testuser:
  user.absent
```

```python
class salt.states.user.absent(name, purge=False, force=False):
    """(function) Ensures that the named user is absent.
    ""
```

```python
21.19.277 salt.states.user
```

Management of user accounts

The user module is used to create and manage user settings, users can be set as either absent or present.

```python
fred:
  user.present:
    - fullname: Fred Jones
    - shell: /bin/zsh
    - home: /home/fred
    - uid: 4000
    - gid: 4000
    - groups:
      - wheel
      - storage
      - games

testuser:
  user.absent
```

```python
class salt.states.user.absent(name, purge=False, force=False):
    """(function) Ensures that the named user is absent.
    ""
```

```python
21.19.277 salt.states.user
```

Management of user accounts

The user module is used to create and manage user settings, users can be set as either absent or present.

```python
fred:
  user.present:
    - fullname: Fred Jones
    - shell: /bin/zsh
    - home: /home/fred
    - uid: 4000
    - gid: 4000
    - groups:
      - wheel
      - storage
      - games

testuser:
  user.absent
```

```python
class salt.states.user.absent(name, purge=False, force=False):
    """(function) Ensures that the named user is absent.
    ""
```

```python
21.19.277 salt.states.user
```

Management of user accounts

The user module is used to create and manage user settings, users can be set as either absent or present.

```python
fred:
  user.present:
    - fullname: Fred Jones
    - shell: /bin/zsh
    - home: /home/fred
    - uid: 4000
    - gid: 4000
    - groups:
      - wheel
      - storage
      - games

testuser:
  user.absent
```

```python
class salt.states.user.absent(name, purge=False, force=False):
    """(function) Ensures that the named user is absent.
    ""
```

```python
21.19.277 salt.states.user
```

Management of user accounts

The user module is used to create and manage user settings, users can be set as either absent or present.

```python
fred:
  user.present:
    - fullname: Fred Jones
    - shell: /bin/zsh
    - home: /home/fred
    - uid: 4000
    - gid: 4000
    - groups:
      - wheel
      - storage
      - games

testuser:
  user.absent
```

```python
class salt.states.user.absent(name, purge=False, force=False):
    """(function) Ensures that the named user is absent.
    ""
```

```python
21.19.277 salt.states.user
```

Management of user accounts

The user module is used to create and manage user settings, users can be set as either absent or present.

```python
fred:
  user.present:
    - fullname: Fred Jones
    - shell: /bin/zsh
    - home: /home/fred
    - uid: 4000
    - gid: 4000
    - groups:
      - wheel
      - storage
      - games

testuser:
  user.absent
```

```python
class salt.states.user.absent(name, purge=False, force=False):
    """(function) Ensures that the named user is absent.
    ""
```
**gid_from_name** [False] If True, the default group id will be set to the id of the group with the same name as the user. If the group does not exist the state will fail.

**allow_uid_change** [False] Set to True to allow the state to update the uid.

  New in version 2018.3.1.

**allow_gid_change** [False] Set to True to allow the state to update the gid.

  New in version 2018.3.1.

**groups** A list of groups to assign the user to, pass a list object. If a group specified here does not exist on the minion, the state will fail. If set to the empty list, the user will be removed from all groups except the default group. If unset, salt will assume current groups are still wanted (see issue #28706).

**optional_groups** A list of groups to assign the user to, pass a list object. If a group specified here does not exist on the minion, the state will silently ignore it.

  NOTE: If the same group is specified in both "groups" and "optional_groups", then it will be assumed to be required and not optional.

**remove_groups** Remove groups that the user is a member of that weren’t specified in the state, Default is True.

**home** The custom login directory of user. Uses default value of underlying system if not set. Notice that this directory does not have to exist. This also the location of the home directory to create if createhome is set to True.

**createhome** [True] If set to False, the home directory will not be created if it doesn’t already exist.

```
Warning: Not supported on Windows or Mac OS.

Additionally, parent directories will not be created. The parent directory for home must already exist.
```

**nologinit** [False] If set to True, it will not add the user to lastlog and faillog databases.

```
Note: Not supported on Windows or Mac OS.
```

**password** A password hash to set for the user. This field is only supported on Linux, FreeBSD, NetBSD, OpenBSD, and Solaris. If the empty_password argument is set to True then password is ignored. For Windows this is the plain text password. For Linux, the hash can be generated with `openssl passwd -1`.

  Changed in version 0.16.0: BSD support added.

**hash_password** Set to True to hash the clear text password. Default is False.

**enforce_password** Set to False to keep the password from being changed if it has already been set and the password hash differs from what is specified in the "password" field. This option will be ignored if "password" is not specified, Default is True.

**empty_password** Set to True to enable password-less login for user, Default is False.

**shell** The login shell, defaults to the system default shell

**unique** Require a unique UID, Default is True.

**system** Choose UID in the range of FIRST_SYSTEM_UID and LAST_SYSTEM_UID, Default is False.

**loginclass** The login class, defaults to empty (BSD only)

User comment field (GECOS) support (currently Linux, BSD, and MacOS only):

The below values should be specified as strings to avoid ambiguities when the values are loaded. (Especially the phone and room number fields which are likely to contain numeric data)

**fullname** The user’s full name

**roomnumber** The user’s room number (not supported in MacOS)

**workphone** The user’s work phone number (not supported in MacOS)

**homephone** The user’s home phone number (not supported in MacOS)

**other** The user’s other attribute (not supported in MacOS) If GECOS field contains more than 4 commas, this field will have the rest of ’em
Changed in version 2014.7.0: Shadow attribute support added.

Shadow attributes support (currently Linux only):

The below values should be specified as integers.

date  Date of last change of password, represented in days since epoch (January 1, 1970).

mindays  The minimum number of days between password changes.

maxdays  The maximum number of days between password changes.

inactdays  The number of days after a password expires before an account is locked.

warndays  Number of days prior to maxdays to warn users.

expire  Date that account expires, represented in days since epoch (January 1, 1970).

The below parameters apply to windows only:

win_homedrive (Windows Only)  The drive letter to use for the home directory. If not specified the home directory will be a unc path. Otherwise the home directory will be mapped to the specified drive. Must be a letter followed by a colon. Because of the colon, the value must be surrounded by single quotes. ie: -win_homedrive: 'U:

Changed in version 2015.8.0.

win_profile (Windows Only)  The custom profile directory of the user. Uses default value of underlying system if not set.

Changed in version 2015.8.0.

win_logonscript (Windows Only)  The full path to the logon script to run when the user logs in.

Changed in version 2015.8.0.

win_description (Windows Only)  A brief description of the purpose of the users account.

Changed in version 2015.8.0.

21.19.278  salt.states.vagrant

Manage Vagrant VMs

Manange execution of Vagrant virtual machines on Salt minions.

Vagrant is a tool for building and managing virtual machine environments. It can use various providers, such as VirtualBox, Docker, or VMware, to run its VMs. Vagrant provides some of the functionality of a light-weight hypervisor. The combination of Salt modules, Vagrant running on the host, and a virtual machine provider, gives hypervisor-like functionality for developers who use Vagrant to quickly define their virtual environments.

New in version 2018.3.0.

The configuration of each virtual machine is defined in a file named Vagrantfile which must exist on the VM host machine. The essential parameters which must be defined to start a Vagrant VM are the directory where the Vagrantfile is located (argument cwd:), and the username which will own the Vagrant box created for the VM (argument vagrant_runas:).

A single Vagrantfile may define one or more virtual machines. Use the machine argument to chose among them. The default (blank) value will select the primary (or only) machine in the Vagrantfile.

[NOTE:] Each virtual machine host must have the following:

- a working salt-minion
- a Salt sdb database configured for vagrant_sdb_data.
- Vagrant installed and the vagrant command working
- a suitable VM provider
# EXAMPLE:
file /etc/salt/minion.d/vagrant_sdb.conf on the host computer
-- this sdb database is required by the Vagrant module --

<table>
<thead>
<tr>
<th>vagrant_sdb_data:</th>
<th># The sdb database must have this name.</th>
</tr>
</thead>
<tbody>
<tr>
<td>driver:</td>
<td>sqlite3</td>
</tr>
<tr>
<td>database:</td>
<td>/var/cache/salt/vagrant.sqlite</td>
</tr>
<tr>
<td>table:</td>
<td>sdb</td>
</tr>
<tr>
<td>create_table:</td>
<td>True</td>
</tr>
</tbody>
</table>

```
salt.states.vagrant.destroyed(name)

  Stops a VM (or VMs) and removes all references to it (them). (Runs vagrant destroy.)
  
  Subsequent re-use of the same machine will require another operation of vagrant.running or a call to the vagrant.init execution module.
  
  Parameters name – May be a Salt_id node or a POSIX-style wildcard string.
```

```
node_name:
  vagrant.destroyed
```

```
salt.states.vagrant.initialized(name, **kwargs)

  Defines a new VM with specified arguments, but does not start it.

  Parameters name – The Salt_id node name you wish your VM to have.
  
  Each machine must be initialized individually using this function or the "vagrant.running" function, or the vagrant.init execution module call.
  
  This command will not change the state of a running or paused machine.
  
  Possible keyword arguments:
  - cwd: The directory (path) containing the Vagrantfile
  - machine: ("" the name of the machine (in the Vagrantfile) if not default
  - vagrant_runas: ("root") the username who owns the vagrantbox file
  - vagrant_provider: the provider to run the VM (usually 'virtualbox')
  - vm: ({} a dictionary containing these or other keyword arguments
```

```
node_name1:
  vagrant.initialized
  - cwd: /projects/my_project
  - vagrant_runas: my_username
  - machine: machine1

node_name2:
  vagrant.initialized
  - cwd: /projects/my_project
  - vagrant_runas: my_username
  - machine: machine2

start_nodes:
  vagrant.start:
    - name: node_name?
```

```
salt.states.vagrant.paused(name)

  Stores the state of a VM (or VMs) for fast restart. (Runs vagrant suspend.)

  Parameters name – May be a Salt_id node or a POSIX-style wildcard string.
```

```
node_name:
  vagrant.paused
```
salt.states.vagrant.powered_off(name)
Stops a VM (or VMs) by power off. (Runs `vagrant halt`.)

This method is provided for compatibility with other VM-control state modules. For Vagrant, the action is identical with `stopped`.

Parameters name – May be a Salt_id node or a POSIX-style wildcard string.

```yaml
node_name:
vagrant.unpowered
```

salt.states.vagrant.rebooted(name)
Reboots a running, paused, or stopped VM (or VMs). (Runs `vagrant reload`.)

The will re-run the provisioning

Parameters name – May be a Salt_id node or a POSIX-style wildcard string.

```yaml
node_name:
vagrant.reloaded
```

salt.states.vagrant.running(name, **kwargs)
Defines and starts a new VM with specified arguments, or restart a VM (or group of VMs). (Runs `vagrant up`.)

Parameters name – the Salt_id node name you wish your VM to have.
If name contains a "?" or "*" then it will re-start a group of VMs which have been paused or stopped.

Each machine must be initially started individually using this function or the vagrant.init execution module call.

[NOTE:] Keyword arguments are silently ignored when re-starting an existing VM.

Possible keyword arguments:
- **cwd**: The directory (path) containing the Vagrantfile
- **machine**: (") the name of the machine (in the Vagrantfile) if not default
- **vagrant.runas**: ('root') the username who owns the vagrantbox file
- **vagrant_provider**: the provider to run the VM (usually 'virtualbox')
- **vm**: ([]) a dictionary containing these or other keyword arguments

```yaml
node_name:
vagrant.running
```

```yaml
node_name:
vagrant.running:
  - **cwd**: /projects/my_project
  - **vagrant.runas**: my_username
  - **machine**: machine1
```

salt.states.vagrant.stopped(name)
Stops a VM (or VMs) by shutting it (them) down nicely. (Runs `vagrant halt`)

Parameters name – May be a Salt_id node, or a POSIX-style wildcard string.

```yaml
node_name:
vagrant.stopped
```

21.19.279 salt.states.vault module

States for managing Hashicorp Vault. Currently handles policies. Configuration instructions are documented in the execution module docs.
Salt Documentation, Release 2019.2.0

maintainer SaltStack
maturity new
platform all
New in version 2017.7.0.
salt.states.vault.policy_present(name, rules)
   Ensure a Vault policy with the given name and rules is present.
   name The name of the policy
   rules Rules formatted as in-line HCL

demo-policy:
   vault.policy_present:
       - name: foo/bar
       - rules:
           path "secret/top-secret/*" {
               policy = "deny"
           }
           path "secret/not-very-secret/*" {
               policy = "write"
           }

21.19.280 salt.states.vbox_guest

VirtualBox Guest Additions installer state
salt.states.vbox_guest.additions_installed(name, reboot=False, upgrade_os=False)
   Ensure that the VirtualBox Guest Additions are installed. Uses the CD, connected by VirtualBox.
   name The name has no functional value and is only used as a tracking reference.
   reboot [False] Restart OS to complete installation.
   upgrade_os [False] Upgrade OS (to ensure the latests version of kernel and developer tools installed).
salt.states.vbox_guest.additions_removed(name, force=False)
   Ensure that the VirtualBox Guest Additions are removed. Uses the CD, connected by VirtualBox.
   name The name has no functional value and is only used as a tracking reference.
   force Force VirtualBox Guest Additions removing.
salt.states.vbox_guest.grant_access_to_shared_folders_to(name, users=None)
   Grant access to auto-mounted shared folders to the users.
   User is specified by it’s name. To grant access for several users use argument users.
   name Name of the user to grant access to auto-mounted shared folders to.
   users List of names of users to grant access to auto-mounted shared folders to. If specified, name will not be taken into account.

21.19.281 salt.states.victorops

Create an Event in VictorOps
New in version 2015.8.0.
This state is useful for creating events on the VictorOps service during state runs.

21.19. state modules
webserver-warning-message:
  victorops.create_event:
    - message_type: 'CRITICAL'
    - entity_id: 'webserver/diskspace'
    - state_message: 'Webserver disk space is low.'

```
salt.states.victorops.create_event(name, message_type, routing_key='everyone', **kwargs)
```
Create an event on the VictorOps service

database-server-warning-message:
  victorops.create_event:
    - message_type: 'WARNING'
    - entity_id: 'db_server/load'
    - state_message: 'Database Server load is high.'

    - entity_is_host: True
    - entity_display_name: 'dbdserver.example.com'

The following parameters are required:

- **name**: This is a short description of the event.
- **message_type**: One of the following values: INFO, WARNING, ACKNOWLEDGEMENT, CRITICAL, RECOVERY.

The following parameters are optional:

- **routing_key**: The key for where messages should be routed. By default, sent to 'everyone' route.
- **entity_id**: The name of alerting entity. If not provided, a random name will be assigned.
- **timestamp**: Timestamp of the alert in seconds since epoch. Defaults to the time the alert is received at VictorOps.
- **timestamp_fmt**: The date format for the timestamp parameter. Defaults to '%Y-%m-%dT%H:%M:%S'.
- **state_start_time**: The time this entity entered its current state (seconds since epoch). Defaults to the time alert is received.
- **state_start_time_fmt**: The date format for the timestamp parameter. Defaults to '%Y-%m-%dT%H:%M:%S'.
- **state_message**: Any additional status information from the alert item.
- **entity_is_host**: Used within VictorOps to select the appropriate display format for the incident.
- **entity_display_name**: Used within VictorOps to display a human-readable name for the entity.
- **ack_message**: A user entered comment for the acknowledgment.
- **ack_author**: The user that acknowledged the incident.

**21.19.282 salt.states.virt module**

Manage virt

For the key certificate this state uses the external pillar in the master to call for the generation and signing of certificates for systems running libvirt:

```
libvirt_keys:
  virt.keys
```
salt.states.virt.keys(name, basepath='/etc/pki', **kwargs)
Manage libvirt keys.

- **name** The name variable used to track the execution
- **basepath** Defaults to /etc/pki, this is the root location used for libvirt keys on the hypervisor

The following parameters are optional:

- **country** The country that the certificate should use. Defaults to US.
  
  New in version 2018.3.0.

- **state** The state that the certificate should use. Defaults to Utah.
  
  New in version 2018.3.0.

- **locality** The locality that the certificate should use. Defaults to Salt Lake City.
  
  New in version 2018.3.0.

- **organization** The organization that the certificate should use. Defaults to Salted.
  
  New in version 2018.3.0.

- **expiration_days** The number of days that the certificate should be valid for. Defaults to 365 days (1 year)
  
  New in version 2018.3.0.

salt.states.virt.network_running(name, bridge, forward, vport=None, tag=None, autostart=True, connection=None, username=None, password=None)

Defines and starts a new network with specified arguments.

Parameters

- **connection** – libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.

- **username** – username to connect with, overriding defaults
  
  New in version 2019.2.0.

- **password** – password to connect with, overriding defaults
  
  New in version 2019.2.0.

salt.states.virt.pool_running(name, ptype=None, target=None, permissions=None, source=None, transient=False, autostart=True, connection=None, username=None, password=None)

Defines and starts a new pool with specified arguments.

New in version 2019.2.0.

Parameters

- **ptype** – libvirt pool type
- **target** – full path to the target device or folder. (Default: None)
- **permissions** – target permissions. See Permissions definition for more details on this structure.
- **source** – dictionary containing keys matching the source_* parameters in function salt.modules.virt.pool_define().
- **transient** – when set to True, the pool will be automatically undefined after being stopped. (Default: False)
Salt Documentation, Release 2019.2.0

- **autostart** – Whether to start the pool when booting the host. (Default: True)
- **start** – When True, define and start the pool, otherwise the pool will be left stopped.
- **connection** – libvirt connection URL, overriding defaults
- **username** – username to connect with, overriding defaults
- **password** – password to connect with, overriding defaults

```python
pool_name:
  virt.pool_define

pool_name:
  virt.pool_define:
    - ptype: netfs
    - target: /mnt/cifs
    - permissions:
      - mode: 0770
      - owner: 1000
      - group: 100
    - source:
      - dir: samba_share
      - hosts:
        - one.example.com
        - two.example.com
      - format: cifs
    - autostart: True
```

**salt.states.virt.powered_off**(*name*, **connection**=None, **username**=None, **password**=None)

Stops a VM by power off.

New in version 2016.3.0.

Parameters

- **connection** – libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- **username** – username to connect with, overriding defaults
  
  New in version 2019.2.0.
- **password** – password to connect with, overriding defaults
  
  New in version 2019.2.0.

```python
domain_name:
  virt.stopped
```

**salt.states.virt.rebooted**(*name*, **connection**=None, **username**=None, **password**=None)

Reboots VMs

New in version 2016.3.0.

Parameters

- **name** – 
- **connection** – libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- **username** – username to connect with, overriding defaults
  
  New in version 2019.2.0.
- **password** – password to connect with, overriding defaults
  
  New in version 2019.2.0.
salt.states.virt.reverted(name, snapshot=None, cleanup=False)

Deprecated since version 2016.3.0.

Reverts to the particular snapshot.

New in version 2016.3.0.

```
domain_name:
    virt.reverted:
        - cleanup: True

domain_name_1:
    virt.reverted:
        - snapshot: snapshot_name
        - cleanup: False
```

salt.states.virt.running(name, cpu=None, mem=None, image=None, vm_type=None, disk_profile=None, disks=None, nic_profile=None, interfaces=None, graphics=None, seed=True, install=True, pub_key=None, priv_key=None, update=False, connection=None, username=None, password=None, os_type=None, arch=None)

Starts an existing guest, or defines and starts a new VM with specified arguments.

New in version 2016.3.0.

Parameters

- **name** – name of the virtual machine to run
- **cpu** – number of CPUs for the virtual machine to create
- **mem** – amount of memory in MiB for the new virtual machine
- **image** – disk image to use for the first disk of the new VM

Deprecated since version 2019.2.0.

- **vm_type** – force virtual machine type for the new VM. The default value is taken from the host capabilities. This could be useful for example to use 'qemu' type instead of the 'kvm' one.

New in version 2019.2.0.

- **disk_profile** – Name of the disk profile to use for the new virtual machine

New in version 2019.2.0.

- **disks** – List of disk to create for the new virtual machine. See Disks Definitions for more details on the items on this list.

New in version 2019.2.0.

- **nic_profile** – Name of the network interfaces profile to use for the new virtual machine

New in version 2019.2.0.

- **interfaces** – List of network interfaces to create for the new virtual machine. See Network Interfaces Definitions for more details on the items on this list.

New in version 2019.2.0.

- **graphics** – Graphics device to create for the new virtual machine. See Graphics Definition for more details on this dictionary

New in version 2019.2.0.

- **saltenv** – Fileserver environment (Default: 'base'). See cp module for more details

New in version 2019.2.0.

- **seed** –
**True** to seed the disk image. Only used when the **image** parameter is provided. (Default: True)
New in version 2019.2.0.

- **install** – install salt minion if absent (Default: True)
  New in version 2019.2.0.

- **pub_key** – public key to seed with (Default: None)
  New in version 2019.2.0.

- **priv_key** – public key to seed with (Default: None)
  New in version 2019.2.0.

- **seed_cmd** – Salt command to execute to seed the image. (Default: 'seed.apply')
  New in version 2019.2.0.

- **update** – set to True to update a defined module. (Default: False)
  New in version 2019.2.0.

- **connection** – libvirt connection URI, overriding defaults
  New in version 2019.2.0.

- **username** – username to connect with, overriding defaults
  New in version 2019.2.0.

- **password** – password to connect with, overriding defaults
  New in version 2019.2.0.

- **os_type** – type of virtualization as found in the //os/type element of the libvirt definition. The default value is taken from the host capabilities, with a preference for hvm. Only used when creating a new virtual machine.
  New in version Neon.

- **arch** – architecture of the virtual machine. The default value is taken from the host capabilities, but x86_64 is preferred over i686. Only used when creating a new virtual machine.
  New in version Neon.

### Example States

Make sure an already-defined virtual machine called **domain_name** is running:

```
**domain_name:**
  **virt.running**
```

Do the same, but define the virtual machine if needed:

```
**domain_name:**
  **virt.running:**
  - **cpu**: 2
  - **mem**: 2048
  - **disk_profile**: prod
  - **disks**:
    - **name**: system
    - **size**: 8192
    - **overlay_image**: True
  **pool**: default
  **image**: /path/to/image.qcow2
```

(continues on next page)
Salt Documentation, Release 2019.2.0

Variations of the state:

```yaml
- name: data
  size: 16834
- nic_profile: prod
- interfaces:
  - name: eth0
    mac: 01:23:45:67:89:AB
  - name: eth1
    type: network
    source: admin
- graphics:
  - type: spice
    listen:
      - type: address
        address: 192.168.0.125
```

**salt.states.virt.saved***(name, suffix=None)***

Deprecated since version 2016.3.0: Use **snapshot()** instead.

Takes a snapshot of a particular VM or by a UNIX-style wildcard.

New in version 2016.3.0.

```yaml
domain_name:
  virt.saved:
    - suffix: periodic
domain*:
  virt.saved:
    - suffix: periodic
```

**salt.states.virt.snapshot***(name, suffix=None, connection=None, username=None, password=None)***

Takes a snapshot of a particular VM or by a UNIX-style wildcard.

New in version 2016.3.0.

Parameters

- **connection** – libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** – username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** – password to connect with, overriding defaults
  New in version 2019.2.0.

```yaml
domain_name:
  virt.snapshot:
    - suffix: periodic
domain*:
  virt.snapshot:
    - suffix: periodic
```

**salt.states.virt.stopped***(name, connection=None, username=None, password=None)***

Stops a VM by shutting it down nicely.

New in version 2016.3.0.

Parameters
• **connection** – libvirt connection URI, overriding defaults
  New in version 2019.2.0.
• **username** – username to connect with, overriding defaults
  New in version 2019.2.0.
• **password** – password to connect with, overriding defaults
  New in version 2019.2.0.

```python
domain_name:
  virt.stopped
```

domain_name:
 virt.stopped

salt.states.virt.unpowered(name)
Deprecated since version 2016.3.0: Use powered_off() instead.

Stops a VM by power off.
New in version 2016.3.0.

```python
domain_name:
  virt.stopped
```

### 21.19.283 salt.states.virtualenv

Setup of Python virtualenv sandboxes.
New in version 0.17.0.

```python
salt.states.virtualenv_mod.managed(name, venv_bin=None, requirements=None, system_site_packages=False, distribute=False, use_wheel=False, clear=False, python=None, extra_search_dir=None, never_download=None, prompt=None, user=None, cwd=None, index_url=None, extra_index_url=None, pre_releases=False, no_deps=False, pip_download=None, pip_download_cache=None, pip_exists_action=None, pip_ignore_installed=False, proxy=None, use_vt=False, env_vars=None, no_use_wheel=False, pip_upgrade=False, pip_pkgs=None, pip_no_cache_dir=None, pip_cache_dir=None, process_dependency_links=False, no_binary=None, **kwargs)
```

Create a virtualenv and optionally manage it with pip

**name**  Path to the virtualenv.

**venv_bin:** virtualenv  The name (and optionally path) of the virtualenv command. This can also be set globally in the minion config file as `virtualenv.venv_bin`.

**requirements:** None  Path to a pip requirements file. If the path begins with `salt://` the file will be transferred from the master file server.

**use_wheel:** False  Prefer wheel archives (requires pip >= 1.4).

**python**  [None]  Python executable used to build the virtualenv

**user:** None  The user under which to run virtualenv and pip.

**cwd:** None  Path to the working directory where `pip install` is executed.

**no_deps:** False  Pass --no-deps to `pip install`.

**pip_exists_action:** None  Default action of pip when a path already exists: (s)witch, (i)gnore, (w)ipe, (b)ackup.

**proxy:** None  Proxy address which is passed to `pip install`.

**env_vars:** None  Set environment variables that some builds will depend on. For example, a Python C-module may have a Makefile that needs INCLUDE_PATH set to pick up a header file while compiling.

**no_use_wheel:** False  Force to not use wheel archives (requires pip>=1.4)
no_binary  Force to not use binary packages (requires pip >= 7.0.0) Accepts either :all: to disable all binary packages, :none: to empty the set, or a list of one or more packages

pip_upgrade: False Pass –upgrade to pip install.

pip_pkgs: None As an alternative to requirements, pass a list of pip packages that should be installed.

process_dependency_links: False Run pip install with the –process_dependency_links flag.

New in version 2017.7.0.
Also accepts any kwargs that the virtualenv module will. However, some kwargs, such as the pip option, require – distribute: True.

```
/var/www/myvirtualenv.com:
virtualenv.managed:
  - system_site_packages: False
  - requirements: salt://REQUIREMENTS.txt
  - env_vars:
    PATH_VAR: '/usr/local/bin/
```

21.19.284 salt.states.webutil

Support for htpasswd module. Requires the apache2-utils package for Debian-based distros.
New in version 2014.7.0.

```
username:
  webutil.user_exists:
    - password: secr3t
    - htpasswd_file: /etc/nginx/htpasswd
    - options: d
    - force: true
```

salt.states.webutil.user_absent(name, htpasswd_file=None, runas=None)
Make sure the user is not in the specified htpasswd file
name User name
htpasswd_file Path to the htpasswd file
runas The system user to run htpasswd command with

salt.states.webutil.user_exists(name, password=None, htpasswd_file=None, options=",", force=False, runas=None, update=False)
Make sure the user is inside the specified htpasswd file
name User name
password User password
htpasswd_file Path to the htpasswd file
options See salt.modules.htpasswd.useradd
force Touch the file even if user already created
runas The system user to run htpasswd command with
update Update an existing user’s password if it’s different from what’s in the htpasswd file (unlike force, which updates regardless)

21.19.285 salt.states.win_certutil module

Installing of certificates to the Windows Certificate Manager

Install certificates to the Windows Certificate Manager
salt://certs/cert.cer:

```python
    certutil.add_store:
        - store: TrustedPublisher
```

salt.states.win_certutil.add_store(name, store, saltenv='base')

Store a certificate to the given store

- **name**: The certificate to store, this can use local paths or salt:// paths
- **store**: The store to add the certificate to
- **saltenv**: The salt environment to use, this is ignored if a local path is specified

salt.states.win_certutil.del_store(name, store, saltenv='base')

Remove a certificate from the given store

- **name**: The certificate to remove, this can use local paths or salt:// paths
- **store**: The store to remove the certificate from
- **saltenv**: The salt environment to use, this is ignored if a local path is specified

### 21.19.286 salt.states.win_dacl

Windows Object Access Control Lists

Ensure an ACL is present

- **parameters**: name - the path of the object
  - **objectType**: Registry/File/Directory
  - **user**: user account or SID for the ace
  - **permission**: permission for the ace (see module win_acl for available permissions for each objectType)
  - **acetype**: Allow/Deny
  - **propagation**: how the ACL should apply to child objects (see module win_acl for available propagation types)

```python
addAcl:
    win_dacl.present:
        - name: HKEY_LOCAL_MACHINE\SOFTWARE\mykey
        - objectType: Registry
        - user: FakeUser
        - permission: FullControl
        - acetype: ALLOW
        - propagation: KEY&SUBKEYS
```

Ensure an ACL does not exist

- **parameters**: name - the path of the object
  - **objectType**: Registry/File/Directory
  - **user**: user account or SID for the ace
  - **permission**: permission for the ace (see module win_acl for available permissions for each objectType)
  - **acetype**: Allow/Deny
  - **propagation**: how the ACL should apply to child objects (see module win_acl for available propagation types)

```python
removeAcl:
    win_dacl.absent:
        - name: HKEY_LOCAL_MACHINE\SOFTWARE\mykey
        - objectType: Registry
        - user: FakeUser
        - permission: FullControl
        - acetype: ALLOW
        - propagation: KEY&SUBKEYS
```

Ensure an object is inheriting permissions

- **parameters**: name - the path of the object
  - **clear_existing_acl**: True/False
  - **objectType**: Registry/File/Directory
  - **user**: user account or SID for the ace
  - **permission**: permission for the ace (see module win_acl for available permissions for each objectType)
  - **acetype**: Allow/Deny
  - **propagation**: how the ACL should apply to child objects (see module win_acl for available propagation types)
eInherit:

```
win_dacl.enableinheritance:
  - name: HKEY_LOCAL_MACHINE\SOFTWARE\mykey
  - objectType: Registry
  - clear_existing_acl: True
```

Ensure an object is not inheriting permissions

parameters: name - the path of the object
objectType - Registry/File/Directory
copy_inherited_acl - True/False - if inheritance is enabled, should the inherited permissions be copied to the ACL when inheritance is disabled

dInherit:

```
win_dacl.disableinheritance:
  - name: HKEY_LOCAL_MACHINE\SOFTWARE\mykey
  - objectType: Registry
  - copy_inherited_acl: False
```

salt.states.win_dacl.absent(name, objectType, user, permission, acetype, propagation)

Ensure an ACL does not exist

tsalt.states.win_dacl.disinherit(name, objectType, copy_inherited_acl=True)

Ensure an object is not inheriting ACLs from its parent

tsalt.states.win_dacl.inherit(name, objectType, clear_existing_acl=False)

Ensure an object is inheriting ACLs from its parent

tsalt.states.win_dacl.present(name, objectType, user, permission, acetype, propagation)

Ensure an ACE is present

21.19.287 salt.states.win_dism module

Installing of Windows features using DISM

Install windows features/capabilities with DISM

```
Language.Basic~~~en-US~0.0.1.0:
  dism.capability_installed

NetFx3:
  dism.feature_installed
```

salt.states.win_dism.capability_installed(name, source=None, limit_access=False, image=None, restart=False)

Install a DISM capability

Parameters

- **name (str)** – The capability to install
- **source (str)** – The optional source of the capability
- **limit_access (bool)** – Prevent DISM from contacting Windows Update for online images
- **image (Optional[str])** – The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
- **restart (Optional[bool])** – Reboot the machine if required by the install
Example

Run dism.available_capabilities to get a list of available capabilities. This will help you get the proper name to use.

```
install_dotnet35:
    dism.capability_installed:
        - name: NetFX3
```

salt.states.win_dism.capability_removed(name, image=None, restart=False)

Uninstall a DISM capability

Parameters

- name (str) – The capability to uninstall
- image (Optional[str]) – The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
- restart (Optional[bool]) – Reboot the machine if required by the install

Example

Run dism.installed_capabilities to get a list of installed capabilities. This will help you get the proper name to use.

```
remove_dotnet35:
    dism.capability_removed:
        - name: NetFX3
```

salt.states.win_dism.feature_installed(name, package=None, source=None, limit_access=False, enable_parent=False, image=None, restart=False)

Install a DISM feature

Parameters

- name (str) – The feature in which to install
- package (Optional[str]) – The parent package for the feature. You do not have to specify the package if it is the Windows Foundation Package. Otherwise, use package to specify the parent package of the feature
- source (str) – The optional source of the feature
- limit_access (bool) – Prevent DISM from contacting Windows Update for online images
- enable_parent (Optional[bool]) – True will enable all parent features of the specified feature
- image (Optional[str]) – The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
- restart (Optional[bool]) – Reboot the machine if required by the install

Example

Run dism.available_features to get a list of available features. This will help you get the proper name to use.

```
install_telnet_client:
    dism.feature_installed:
        - name: TelnetClient
```
salt.states.win_dism.feature_removed(name, remove_payload=False, image=None, restart=False)

Disables a feature.
Parameters
- name (str) – The feature to disable
- remove_payload (Optional[bool]) – Remove the feature’s payload. Must supply source when enabling in the future.
- image (Optional[str]) – The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
- restart (Optional[bool]) – Reboot the machine if required by the install

Example
Run dism.installed_features to get a list of installed features. This will help you get the proper name to use.

```yaml
remove_telnet_client:
  dism.feature_removed:
    - name: TelnetClient
    - remove_payload: True
```

salt.states.win_dism.package_installed(name, ignore_check=False, prevent_pending=False, image=None, restart=False)

Install a package.
Parameters
- name (str) – The package to install. Can be a .cab file, a .msu file, or a folder
- ignore_check (Optional[bool]) – Skip installation of the package if the applicability checks fail
- prevent_pending (Optional[bool]) – Skip the installation of the package if there are pending online actions
- image (Optional[str]) – The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
- restart (Optional[bool]) – Reboot the machine if required by the install

Example

```yaml
install_KB123123123:
  dism.package_installed:
    - name: C:\Packages\KB123123123.cab
```

salt.states.win_dism.package_removed(name, image=None, restart=False)

Uninstall a package.
Parameters
- name (str) – The full path to the package. Can be either a .cab file or a folder. Should point to the original source of the package, not to where the file is installed. This can also be the name of a package as listed in dism.installed_packages
- image (Optional[str]) – The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
- restart (Optional[bool]) – Reboot the machine if required by the install
Example

```python
# Example using source
remove_KB1231231:
  dism.package_installed:
    - name: C:\Packages\KB1231231.cab

# Example using name from `dism.installed_packages`
remove_KB1231231:
  dism.package_installed:
    - name: Package_for_KB1231231~31bf3856ad364e35~amd64~~10.0.1.3
```

21.19.288 salt.states.win_dns_client

Module for configuring DNS Client on Windows systems

```python
salt.states.win_dns_client.dns_dhcp(name, interface='Local Area Connection')
```

Configure the DNS server list from DHCP Server

```python
salt.states.win_dns_client.dns_exists(name, servers=None, interface='Local Area Connection', replace=False)
```

Configure the DNS server list in the specified interface

Example:

```python
cfg_dns_servers:
  win_dns_client.dns_exists:
    - replace: True  #remove any servers not in the "servers" list, default is False
    - servers:
      - 8.8.8.8
      - 8.8.8.9
```

```python
cfg_primary_suffix:
  win_dns_client.primary_suffix:
    - suffix: sub.domain.tld
    - updates: True
```

21.19.289 salt.states.win_firewall

State for configuring Windows Firewall

```python
salt.states.win_firewall.add_rule(name, localport, protocol='tcp', action='allow', dir='in', remoteip='any')
```

Add a new inbound or outbound rule to the firewall policy

Parameters

- **name** (*str*) – The name of the rule. Must be unique and cannot be "all". Required.
• **localport** (*int*) – The port the rule applies to. Must be a number between 0 and 65535. Can be a range. Can specify multiple ports separated by commas. Required.

• **protocol** (*Optional*[str]*) – The protocol. Can be any of the following:
  - A number between 0 and 255
  - icmpv4
  - icmpv6
  - tcp
  - udp
  - any

• **action** (*Optional*[str]*) – The action the rule performs. Can be any of the following:
  - allow
  - block
  - bypass

• **dir** (*Optional*[str]*) – The direction. Can be in or out.

• **remoteip** (*Optional*[str]*) – The remote IP. Can be any of the following:
  - any
  - localsubnet
  - dns
  - dhcp
  - wins
  - defaultgateway
  - Any valid IPv4 address (192.168.0.12)
  - Any valid subnet (192.168.1.0/24)
  - Any valid range of IP addresses (192.168.0.1-192.168.0.12)
  - A list of valid IP addresses
Can be combinations of the above separated by commas.

New in version 2016.11.6.

Example:

```python
open_smb_port:
  win_firewall.add_rule:
    - name: SMB (445)
    - localport: 445
    - protocol: tcp
    - action: allow
```

salt.states.win_firewall.disabled(name='allprofiles')

Disable all the firewall profiles (Windows only)

Parameters **profile** (*Optional*[str]*) – The name of the profile to disable. Default is allprofiles. Valid options are:

- allprofiles
- domainprofile
- privateprofile
- publicprofile

Example:

```python
# To disable the domain profile
disable_domain:
  win_firewall.disabled:
    - name: domainprofile

# To disable all profiles
```

(continues on next page)
enable_all:
    win_firewall.disabled:
    - name: allprofiles

salt.states.win_firewall.enabled(name='allprofiles')

Enable all the firewall profiles (Windows only)

Parameters
- profile (Optional[str]) – The name of the profile to enable. Default is allprofiles. Valid options are:
  - allprofiles
  - domainprofile
  - privateprofile
  - publicprofile

Example:

# To enable the domain profile
enable_domain:
    win_firewall.enabled:
    - name: domainprofile

# To enable all profiles
enable_all:
    win_firewall.enabled:
    - name: allprofiles

21.19.290 salt.states.win_iis module

Microsoft IIS site management

This module provides the ability to add/remove websites and application pools from Microsoft IIS.

New in version 2016.3.0.

salt.states.win_iis.container_setting(name, container, settings=None)

Set the value of the setting for an IIS container.

Parameters
- name (str) – The name of the IIS container.
- container (str) – The type of IIS container. The container types are: AppPools, Sites, SslBindings
- settings (str) – A dictionary of the setting names and their values. Example of usage for the AppPools container:

```
site0-apppool-setting:
    win_iis.container_setting:
    - name: site0
    - container: AppPools
    - settings:
        managedPipelineMode: Integrated
        processModel.maxProcesses: 1
        processModel.userName: TestUser
        processModel.password: TestPassword
        processModel.identityType: SpecificUser
```

Example of usage for the Sites container:
**site0-site-setting:**

- **win_iis.container_setting:**
  - **name:** site0
  - **container:** Sites
  - **settings:**
    - logFile.logFormat: W3C
    - logFile.period: Daily
    - limits.maxUrlSegments: 32

**salt.states.win_iis.create_app**(name, site, sourcepath, apppool=None)
Create an IIS application.

**Parameters**
- **name** *(str)* – The IIS application.
- **site** *(str)* – The IIS site name.
- **sourcepath** *(str)* – The physical path.
- **apppool** *(str)* – The name of the IIS application pool.

**Example of usage with only the required arguments:**

```python
site0-v1-app:
  win_iis.create_app:
    - name: v1
    - site: site0
    - sourcepath: C:\inetpub\site0\v1
```

**Example of usage specifying all available arguments:**

```python
site0-v1-app:
  win_iis.create_app:
    - name: v1
    - site: site0
    - sourcepath: C:\inetpub\site0\v1
    - apppool: site0
```

**salt.states.win_iis.create_apppool**(name)
Create an IIS application pool.

**Parameters**
- **name** *(str)* – The name of the IIS application pool.

**Usage:**

```python
site0-apppool:
  win_iis.create_apppool:
    - name: site0
```

**salt.states.win_iis.create_binding**(name, site, hostheader=", ipaddress=‘*’, port=80, protocol='http', sslflags=0)
Create an IIS binding.

**Parameters**
- **site** *(str)* – The IIS site name.
- **hostheader** *(str)* – The host header of the binding.
- **ipaddress** *(str)* – The IP address of the binding.
- **port** *(str)* – The TCP port of the binding.
- **protocol** *(str)* – The application protocol of the binding.
- **sslflags** *(str)* – The flags representing certificate type and storage of the binding.

**Example of usage with only the required arguments:**

```python
site0-https-binding:
  win_iis.create_binding:
```

(continues on next page)
Example of usage specifying all available arguments:

```shell
site0-https-binding:
  win_iis.create_binding:
    - site: site0
      hostheader: site0.local
      ipaddress: '*'
      port: 443
      protocol: https
      sslflags: 0
```

salt.states.win_iis.create_cert_binding(name, site, hostheader=", ipaddress=", port=443, sslflags=0)

Assign a certificate to an IIS binding.

Parameters

- **name** *(str)* – The thumbprint of the certificate.
- **site** *(str)* – The IIS site name.
- **hostheader** *(str)* – The host header of the binding.
- **ipaddress** *(str)* – The IP address of the binding.
- **port** *(str)* – The TCP port of the binding.
- **sslflags** *(str)* – Flags representing certificate type and certificate storage of the binding.

Example of usage with only the required arguments:

```shell
site0-cert-binding:
  win_iis.create_cert_binding:
    - name: 9988776655443322111000AAABBBCCCDDDEEEFFF
      site: site0
```

Example of usage specifying all available arguments:

```shell
site0-cert-binding:
  win_iis.create_cert_binding:
    - name: 9988776655443322111000AAABBBCCCDDDEEEFFF
      site: site0
      hostheader: site0.local
      ipaddress: 192.168.1.199
      port: 443
      sslflags: 1
```

New in version 2016.11.0.

salt.states.win_iis.create_vdir(name, site, sourcepath, app="/"

Create an IIS virtual directory.

Parameters

- **name** *(str)* – The virtual directory name.
- **site** *(str)* – The IIS site name.
- **sourcepath** *(str)* – The physical path.
- **app** *(str)* – The IIS application.

Example of usage with only the required arguments:

```shell
site0-foo-vdir:
  win_iis.create_vdir:
```

(continues on next page)
Example of usage specifying all available arguments:

```yaml
site0-foo-vdir:
  win_iis.create_vdir:
    - name: foo
      site: site0
      sourcepath: C:\inetpub\vdirs\foo
```

salt.states.win_iis.deployed(name, sourcepath, apppool=", hostheader=", ipaddress='\', port=80, protocol='http')

Ensure the website has been deployed.

Parameters
- **name** *(str)* – The IIS site name.
- **sourcepath** *(str)* – The physical path of the IIS site.
- **apppool** *(str)* – The name of the IIS application pool.
- **hostheader** *(str)* – The host header of the binding.
- **ipaddress** *(str)* – The IP address of the binding.
- **port** *(str)* – The TCP port of the binding.
- **protocol** *(str)* – The application protocol of the binding.

Example of usage with only the required arguments. This will default to using the default application pool assigned by IIS:

```yaml
site0-deployed:
  win_iis.deployed:
    - name: site0
      sourcepath: C:\inetpub\site0
```

Example of usage specifying all available arguments:

```yaml
site0-deployed:
  win_iis.deployed:
    - name: site0
      sourcepath: C:\inetpub\site0
      apppool: site0
      hostheader: site0.local
      ipaddress: '*'
      port: 443
      protocol: https
```

salt.states.win_iis.remove_app(name, site)

Remove an IIS application.

Parameters
- **name** *(str)* – The application name.
- **site** *(str)* – The IIS site name.

Usage:

```yaml
site0-v1-app-remove:
  win_iis.remove_app:
    - name: v1
      site: site0
```
salt.states.win_iis.remove_apppool(name)
Remove an IIS application pool.

Parameters
name (str) – The name of the IIS application pool.

Usage:

```bash
defaultapppool-remove:
    win_iis.remove_apppool:
        - name: DefaultAppPool
```

salt.states.win_iis.remove_binding(name, site, hostheader='', ipaddress='*', port=80)
Remove an IIS binding.

Parameters
- site (str) – The IIS site name.
- hostheader (str) – The host header of the binding.
- ipaddress (str) – The IP address of the binding.
- port (str) – The TCP port of the binding.

Example of usage with only the required arguments:

```
site0-https-binding-remove:
    win_iis.remove_binding:
        - site: site0
```

Example of usage specifying all available arguments:

```
site0-https-binding-remove:
    win_iis.remove_binding:
        - site: site0
        - hostheader: site0.local
        - ipaddress: '*'
        - port: 443
```

salt.states.win_iis.remove_cert_binding(name, site, hostheader='', ipaddress='*', port=443)
Remove a certificate from an IIS binding.

Parameters
- name (str) – The thumbprint of the certificate.
- site (str) – The IIS site name.
- hostheader (str) – The host header of the binding.
- ipaddress (str) – The IP address of the binding.
- port (str) – The TCP port of the binding.

Example of usage with only the required arguments:

```
site0-cert-binding-remove:
    win_iis.remove_cert_binding:
        - name: 9988776655443322111000AAABBBCCCDDDEEEFFFF
        - site: site0
```

Example of usage specifying all available arguments:

```
site0-cert-binding-remove:
    win_iis.remove_cert_binding:
        - name: 9988776655443322111000AAABBBCCCDDDEEEFFFF
        - site: site0
        - hostheader: site0.local
        - ipaddress: 192.168.1.199
        - port: 443
```

New in version 2016.11.0.
salt.states.win_iis.remove_site(name)
Delete a website from IIS.

Parameters **name** (**str**) – The IIS site name.

Usage:

```
defaultwebsite-remove:
    win_iis.remove_site:
        - name: Default Web Site
```

salt.states.win_iis.remove_vdir(name, site, app='/')
Remove an IIS virtual directory.

Parameters

- **name** (**str**) – The virtual directory name.
- **site** (**str**) – The IIS site name.
- **app** (**str**) – The IIS application.

Example of usage with only the required arguments:

```
site0-foo-vdir-remove:
    win_iis.remove_vdir:
        - name: foo
        - site: site0
```

Example of usage specifying all available arguments:

```
site0-foo-vdir-remove:
    win_iis.remove_vdir:
        - name: foo
        - site: site0
        - app: v1
```

salt.states.win_iis.set_app(name, site, settings=None)
New in version 2017.7.0.
Set the value of the setting for an IIS web application.

**Note**: This function only configures existing app. Params are case sensitive.

Parameters

- **name** (**str**) – The IIS application.
- **site** (**str**) – The IIS site name.
- **settings** (**str**) – A dictionary of the setting names and their values.

Available settings:

- **physicalPath** - The physical path of the webapp
- **applicationPool** - The application pool for the webapp
- **userName** "connectAs" user
- **password** "connectAs" password for user

**Return type** bool

Example of usage:

```
site0-webapp-setting:
    win_iis.set_app:
        - name: app0
        - site: Default Web Site
```

(continues on next page)
settings:
- **userName**: domain\user
- **password**: pass
- **physicalPath**: c:\inetpub\wwwroot
- **applicationPool**: appPool0

### 21.19.291 salt.states.win_lgpo module

Manage Windows Local Group Policy

New in version 2016.11.0.

This state allows configuring local Windows Group Policy.

The state can be used to ensure the setting of a single policy or multiple policies in one pass.

Single policies must specify the policy name, the setting, and the policy class (Machine/User/Both).

Example single policy configuration

```yaml
Ensure Account Lockout Duration:
lgpo.set:
  - **name**: Account lockout duration
  - **setting**: 90
  - **policy_class**: Machine
```

```yaml
Account lockout duration:
lgpo.set:
  - **setting**: 120
  - **policy_class**: Machine
```

Multiple policy configuration

```yaml
Company Local Group Policy:
lgpo.set:
  - **computer_policy**:
    Deny logon locally: Guest
    Account lockout duration: 120
    Account lockout threshold: 10
    Reset account lockout counter after: 1440
    Enforce password history: 24
    Maximum password age: 60
    Minimum password age: 1
    Minimum password length: 14
    Password must meet complexity requirements: Enabled
    Store passwords using reversible encryption: Disabled
    Configure Automatic Updates:
      Configure automatic updating: 4 - Auto download and schedule the
    - installs
      Scheduled install day: 7 - Every Saturday
      Scheduled install time: 17:00
      Specify intranet Microsoft update service location:
        Set the intranet update service for detecting updates: http://mywsus
        Set the intranet statistics server: http://mywsus
    - **user_policy**:
      Do not process the legacy run list: Enabled
```

```yaml
- **userName**: domain\user
- **password**: pass
- **physicalPath**: c:\inetpub\wwwroot
- **applicationPool**: appPool0
```
server_policy:
  lgpo.set:
    - computer_policy:
      Maximum password age: 60
      Minimum password age: 1
      Minimum password length: 14
      Account lockout duration: 1440
      Account lockout threshold: 10
      Reset account lockout counter after: 1440
      Manage auditing and security log:
        - "BUILTIN\Administrators"
      Replace a process level token:
        - "NT AUTHORITY\NETWORK SERVICE"
        - "NT AUTHORITY\LOCAL SERVICE"
      "Accounts: Guest account status": Disabled
      "Accounts: Rename guest account": Not_4_U
      "Audit: Audit the use of Backup and Restore privilege": Enabled
      "Interactive logon: Do not display last user name": Enabled
      "Network\DNS Client\Dynamic update": Disabled
      "System\Logon\Do not display the Getting Started welcome screen at logon": Enabled
      "Windows Components\Remote Desktop Services\Remote Desktop Session Host\Connections\Select RDP transport protocols": "Select Transport Type": "Use both UDP and TCP"
      "Windows Components\Windows Update\Allow Automatic Updates immediate installation": Enabled
      "Windows Components\Windows Update\Allow non-administrators to receive update notifications": Disabled
      "Windows Components\Windows Update\Always automatically restart at the scheduled time": "The restart timer will give users this much time to save their work" (minutes): 15
      "Windows Components\Windows Update\Automatic Updates detection frequency": "Check for updates at the following interval (hours)": 1
      "Windows Components\Windows Update\Configure Automatic Updates": "Configure automatic updating": 4 - Auto download and schedule the install, "Install during automatic maintenance": False, "Scheduled install day": 7 - Every Saturday, "Scheduled install time": "17:00"
      "Windows Components\Windows Update\Delay Restart for scheduled installations": "Wait the following period before proceeding with a scheduled restart" (minutes): 1
      "Windows Components\Windows Update\No auto-restart with logged on users for scheduled automatic updates installations": Disabled
      "Windows Components\Windows Update\Re-prompt for restart with scheduled installations": "Wait the following period before prompting again with a scheduled restart" (minutes): 30
      "Windows Components\Windows Update\Reschedule Automatic Updates scheduled installations": Disabled
      "Windows Components\Windows Update\Specify intranet Microsoft update service location": "Set the intranet update service for detecting updates": http://mywsus
      "Set the intranet statistics server": http://mywsus
      cumulative_rights_assignments: True
salt.states.win_lgpo.set_(name, setting=None, policy_class=None, computer_policy=None, user_policy=None, cumulative_rights_assignments=True, adml_language='en-US')

Ensure the specified policy is set
name the name of a single policy to configure
setting the configuration setting for the single named policy if this argument is used the computer_policy/user_policy arguments will be ignored
policy_class the policy class of the single named policy to configure this can "machine", "user", or "both"
computer_policy a dict of policynam: value pairs of a set of computer policies to configure if this argument is used, the name/setting/policy_class arguments will be ignored
user_policy a dict of policynam: value pairs of a set of user policies to configure if this argument is used, the name/setting/policy_class arguments will be ignored
cumulative_rights_assignments determine if any user right assignment policies specified will be cumulative or explicit
adml_language the adml language to use for AMDX policy data/display conversions

21.19.292 salt.states.win_license module

Installation and activation of windows licenses

Install and activate windows licenses

XXXXX-XXXXX-XXXXX-XXXXX-XXXXX:
license.activate

salt.states.win_license.activate(name)
Install and activate the given product key
name The 5x5 product key given to you by Microsoft

21.19.293 salt.states.win_network

Configuration of network interfaces on Windows hosts

New in version 2014.1.0.

This module provides the network state(s) on Windows hosts. DNS servers, IP addresses and default gateways can currently be managed.

Below is an example of the configuration for an interface that uses DHCP for both DNS servers and IP addresses:

Local Area Connection #2:
network.managed:
  - dns_proto: dhcp
  - ip_proto: dhcp

Note: Both the dns_proto and ip_proto arguments are required.

Static DNS and IP addresses can be configured like so:

Local Area Connection #2:
network.managed:
  - dns_proto: static

(continues on next page)
- **dns_servers:**
  - 8.8.8.8
  - 8.8.4.4
- **ip_proto:** static
- **ip_addrs:**
  - 10.2.3.4/24

**Note:** IP addresses are specified using the format `<ip-address>/<subnet-length>`. Salt provides a convenience function called `ip.get_subnet_length` to calculate the subnet length from a netmask.

Optionally, if you are setting a static IP address, you can also specify the default gateway using the `gateway` parameter:

```plaintext
Local Area Connection #2:
  network.managed:
    - dns_proto: static
    - dns_servers:
      - 8.8.8.8
      - 8.8.4.4
    - ip_proto: static
    - ip_addrs:
      - 10.2.3.4/24
    - gateway: 10.2.3.1
```

salt.states.win_network.managed(name, dns_proto=None, dns_servers=None, ip_proto=None, ip_addrs=None, gateway=None, enabled=True, **kwargs)

Ensure that the named interface is configured properly.

**Parameters**

- **name** *(str)* – The name of the interface to manage
- **dns_proto** *(str)* – None Set to `static` and use the `dns_servers` parameter to provide a list of DNS nameservers. set to `dhcp` to use DHCP to get the DNS servers.
- **dns_servers** *(list)* – None A list of static DNS servers. To clear the list of DNS servers pass an empty list (`[]`). None will make no changes.
- **ip_proto** *(str)* – None Set to `static` and use the `ip_addrs` and (optionally) `gateway` parameters to provide a list of static IP addresses and the default gateway. Set to `dhcp` to use DHCP.
- **ip_addrs** *(list)* – None A list of static IP addresses with netmask flag, ie: 192.168.0.11/24
- **gateway** *(str)* – None The gateway to set for the interface
- **enabled** *(bool)* – True Set to `False` to ensure that this interface is disabled.

**Returns** A dictionary of old and new settings

**Example:**

```plaintext
Ethernet1:
  network.managed:
    - dns_proto: static
    - dns_servers:
      - 8.8.8.8
      - 8.8.4.4
    - ip_proto: static
    - ip_addrs:
      - 192.168.0.100/24
```
Clear DNS entries example:

```
Ethernet1:
    network.managed:
    - dns_proto: static
    - dns_servers: []
    - ip_proto: dhcp
```

### 21.19.294 salt.states.win_path

Manage the Windows System PATH

#### `salt.states.win_path.absent(name)`

Remove the directory from the SYSTEM path

Example:

```
'C:\sysinternals':
    win_path.absent
```

#### `salt.states.win_path.exists(name, index=None)`

Add the directory to the system PATH at index location

**index** Position where the directory should be placed in the PATH. This is 0-indexed, so 0 means to prepend at the very start of the PATH.

**Note:** If the index is not specified, and the directory needs to be added to the PATH, then the directory will be appended to the PATH, and this state will not enforce its location within the PATH.

Examples:

```
'C:\python27':
    win_path.exists

'C:\sysinternals':
    win_path.exists:
    - index: 0

'C:\mystuff':
    win_path.exists:
    - index: -1
```

### 21.19.295 salt.states.win_pki module

Microsoft certificate management via the Pki PowerShell module.

**platform** Windows

New in version 2016.11.0.

#### `salt.states.win_pki.import_cert(name, cert_format='cer', context='LocalMachine', store='My', exportable=True, password='', saltenv='base')`

Import the certificate file into the given certificate store.

**Parameters**

- `name (str)` – The path of the certificate file to import.
• **cert_format** *(str)* – The certificate format. Specify 'cer' for X.509, or 'pfx' for PKCS #12.
• **context** *(str)* – The name of the certificate store location context.
• **store** *(str)* – The name of the certificate store.
• **exportable** *(bool)* – Mark the certificate as exportable. Only applicable to pfx format.
• **password** *(str)* – The password of the certificate. Only applicable to pfx format.
• **saltenv** *(str)* – The environment the file resides in.

Example of usage with only the required arguments:

```
site0-cert-imported:
  win_pki.import_cert:
    - name: salt://win/webserver/certs/site0.cer
```

Example of usage specifying all available arguments:

```
site0-cert-imported:
  win_pki.import_cert:
    - name: salt://win/webserver/certs/site0.pfx
    - cert_format: pfx
    - context: LocalMachine
    - store: My
    - exportable: True
    - password: TestPassword
    - saltenv: base
```

salt.states.win_pki.remove_cert *(name, thumbprint, context='LocalMachine', store='My')*
Remove the certificate from the given certificate store.

Parameters

• **thumbprint** *(str)* – The thumbprint value of the target certificate.
• **context** *(str)* – The name of the certificate store location context.
• **store** *(str)* – The name of the certificate store.

Example of usage with only the required arguments:

```
site0-cert-removed:
  win_pki.remove_cert:
    - thumbprint: 9988776655443322111000AAABBBCCCDDDEEEFFF
```

Example of usage specifying all available arguments:

```
site0-cert-removed:
  win_pki.remove_cert:
    - thumbprint: 9988776655443322111000AAABBBCCCDDDEEEFFF
    - context: LocalMachine
    - store: My
```

21.19.296  salt.states.win_powercfg

This module allows you to control the power settings of a windows minion via powercfg.

New in version 2015.8.0.

```
# Set timeout to 30 minutes on battery power
monitor:
  powercfg.set_timeout:
```

(continues on next page)
salt.states.win_powercfg.set_timeout(name, value, power='ac', scheme=None)

Set the sleep timeouts of specific items such as disk, monitor, etc.

Parameters

- **name** (str) – The setting to change, can be one of the following:
  - monitor
  - disk
  - standby
  - hibernate
- **value** (int) – The amount of time in minutes before the item will timeout
- **power** (str) – Set the value for AC or DC power. Default is ac. Valid options are:
  - ac (AC Power)
  - dc (Battery)
- **scheme** (str) – The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:
  - SCHEME_BALANCED - Balanced
  - SCHEME_MAX - Power saver
  - SCHEME_MIN - High performance

CLI Example:

```
# Set monitor timeout to 30 minutes on Battery
monitor:
    powercfg.set_timeout:
    - value: 30
    - power: dc

# Set disk timeout to 10 minutes on AC Power
disk:
    powercfg.set_timeout:
    - value: 10
    - power: ac
```

21.19.297 salt.states.win_servermanager

Manage Windows features via the ServerManager powershell module. Can install and remove roles/features.

- maintainer Shane Lee <slee@saltstack.com>
- platform Windows Server 2008R2 or greater
- depends win_servermanager.install
- depends win_servermanager.remove

salt.states.win_servermanager.installed(name, features=None, recurse=False, restart=False, source=None, exclude=None, **kwargs)

Install the windows feature. To install a single feature, use the name parameter. To install multiple features, use the features parameter.

**Note:** Some features require reboot after un/installation. If so, until the server is restarted other features can not be installed!
Parameters

- **name** *(str)* – Short name of the feature (the right column in `win_servermanager.list_available`). This can be a single feature or a string of features in a comma delimited list (no spaces)

Note: A list is not allowed in the name parameter of any state. Use the **features** parameter if you want to pass the features as a list

- **features** *(Optional[list])* – A list of features to install. If this is passed it will be used instead of the **name** parameter.

New in version 2018.3.0.

- **recurse** *(Optional[bool])* – Install all sub-features as well. If the feature is installed but one of its sub-features are not installed set this will install additional sub-features

- **source** *(Optional[str])* – Path to the source files if missing from the target system. None means that the system will use windows update services to find the required files. Default is None

- **restart** *(Optional[bool])* – Restarts the computer when installation is complete, if required by the role/feature installed. Default is False

- **exclude** *(Optional[str])* – The name of the feature to exclude when installing the named feature. This can be a single feature, a string of features in a comma-delimited list (no spaces), or a list of features.

**Warning:** As there is no exclude option for the `Add-WindowsFeature` or `Install-WindowsFeature` PowerShell commands the features named in `exclude` will be installed with other sub-features and will then be removed. If the feature named in “exclude” is not a sub-feature of one of the installed items it will still be removed.

Example

Do not use the role or feature names mentioned in the PKGMGR documentation. To get a list of available roles and features run the following command:

```bash
salt <minion_name> win_servermanager.list_available
```

Use the name in the right column of the results.

```
# Installs the IIS Web Server Role (Web-Server)
IIS-WebServerRole:
  win_servermanager.installed:
    - recurse: True
      - name: Web-Server

# Install multiple features, exclude the Web-Service
install_multiple_features:
  win_servermanager.installed:
    - recurse: True
      - features:
          - RemoteAccess
          - XPS-Viewer
          - SNMP-Service
```

(continues on next page)
- **exclude:**
  - Web-Server

salt.states.win_servermanager.removed(name, features=None, remove_payload=False, restart=False)

Remove the windows feature To remove a single feature, use the `name` parameter. To remove multiple features, use the `features` parameter.

**Parameters**

- **name** *(str)* – Short name of the feature (the right column in `win_servermanager.list_available`). This can be a single feature or a string of features in a comma-delimited list (no spaces)

  **Note:** A list is not allowed in the `name` parameter of any state. Use the `features` parameter if you want to pass the features as a list

- **features** *(Optional[list]*) – A list of features to remove. If this is passed it will be used instead of the `name` parameter.

  New in version 2018.3.0.

- **remove_payload** *(Optional[bool]*) – True will cause the feature to be removed from the side-by-side store. To install the feature in the future you will need to specify the `source`

- **restart** *(Optional[bool]*) – Restarts the computer when uninstall is complete if required by the role/feature uninstall. Default is False

  **Note:** Some features require a reboot after uninstall. If so the feature will not be completely uninstalled until the server is restarted.

**Example**

Do not use the role or feature names mentioned in the PKGMGR documentation. To get a list of available roles and features run the following command:

```
salt <minion_name> win_servermanager.list_available
```

Use the name in the right column of the results.

```
# Uninstall the IIS Web Server Rol (Web-Server)
IIS-WebserverRole:
  win_servermanager.removed:
    - name: Web-Server

# Uninstall multiple features, reboot if required
uninstall_multiple_features:
  win_servermanager.removed:
    - features:
      - RemoteAccess
      - XPX-Viewer
      - SNMP-Service
    - restart: True
```
**21.19.298 salt.states.win_smtp_server module**

Module for managing IIS SMTP server configuration on Windows servers.

salt.states.win_smtp_server.active_log_format(name, log_format, server='SmtpSvc/1')

Manage the active log format for the SMTP server.

Parameters

- **log_format** (str) – The log format name.
- **server** (str) – The SMTP server name.

Example of usage:

```yaml
smtp-log-format:
  win_smtp_server.active_log_format:
    - log_format: Microsoft IIS Log File Format
```

salt.states.win_smtp_server.connection_ip_list(name, addresses=None, grant_by_default=False, server='SmtpSvc/1')

Manage IP list for SMTP connections.

Parameters

- **addresses** (str) – A dictionary of IP + subnet pairs.
- **grant_by_default** (bool) – Whether the addresses should be a blacklist or whitelist.
- **server** (str) – The SMTP server name.

Example of usage for creating a whitelist:

```yaml
smtp-connection-whitelist:
  win_smtp_server.connection_ip_list:
    - addresses: 127.0.0.1: 255.255.255.255
      172.16.1.98: 255.255.255.255
      172.16.1.99: 255.255.255.255
    - grant_by_default: False
```

Example of usage for creating a blacklist:

```yaml
smtp-connection-blacklist:
  win_smtp_server.connection_ip_list:
    - addresses: 172.16.1.100: 255.255.255.255
      172.16.1.101: 255.255.255.255
    - grant_by_default: True
```

Example of usage for allowing any source to connect:

```yaml
smtp-connection-blacklist:
  win_smtp_server.connection_ip_list:
    - addresses: {}
    - grant_by_default: True
```

salt.states.win_smtp_server.relay_ip_list(name, addresses=None, server='SmtpSvc/1')

Manage IP list for SMTP relay connections.

Due to the unusual way that Windows stores the relay IPs, it is advisable to retrieve the existing list you wish to set from a pre-configured server.

For example, setting '127.0.0.1' as an allowed relay IP through the GUI would generate an actual relay IP list similar to the following:
Note: Setting the list to None corresponds to the restrictive 'Only the list below' GUI parameter with an empty access list configured, and setting an empty list/tuple corresponds to the more permissive 'All except the list below' GUI parameter.

Parameters

- **addresses** *(str)* – A list of the relay IPs. The order of the list is important.
- **server** *(str)* – The SMTP server name.

Example of usage:

```yaml
smtp-relay-list:
  win_smtp_server.relay_ip_list:
    - addresses:
        - 24.0.0.128
        - 32.0.0.128
        - 60.0.0.128
        - 1.0.0.0
        - 76.0.0.0
        - 0.0.0.0
        - 0.0.0.0
        - 1.0.0.0
        - 1.0.0.0
        - 2.0.0.0
        - 2.0.0.0
        - 4.0.0.0
        - 0.0.0.0
        - 76.0.0.128
        - 0.0.0.0
        - 0.0.0.0
        - 0.0.0.0
        - 0.0.0.0
        - 255.255.255.255
        - 127.0.0.1
```

Example of usage for disabling relaying:

```yaml
smtp-relay-list:
  win_smtp_server.relay_ip_list:
    - addresses: None
```

Example of usage for allowing relaying from any source:

```yaml
smtp-relay-list:
  win_smtp_server.relay_ip_list:
    - addresses: []
```

salt.states.win_smtp_server.server_setting(name, settings=None, server='SmtpSvc/1')

Ensure the value is set for the specified setting.
Note: The setting names are case-sensitive.

Parameters
• settings (str) – A dictionary of the setting names and their values.
• server (str) – The SMTP server name.

Example of usage:

```yaml
smtp-settings:
  win_smtp_server.server_setting:
    - settings:
      LogType: 1
      LogFilePeriod: 1
      MaxMessageSize: 16777216
      MaxRecipients: 10000
      MaxSessionSize: 16777216
```

### 21.19.299 salt.states.win_snmp module

Module for managing SNMP service settings on Windows servers.

**salt.states.win_snmp.agent_settings**(name, contact, location, services=\None)

Manage the SNMP sysContact, sysLocation, and sysServices settings.

Parameters
• contact (str) – The SNMP contact.
• location (str) – The SNMP location.
• services (str) – A list of selected services.

Example of usage:

```yaml
snmp-agent-settings:
  win_snmp.agent_settings:
    - contact: Test Contact
    - location: Test Location
    - services:
      - Physical
      - Internet
```

**salt.states.win_snmp.auth_traps_enabled**(name, status=True)

Manage the sending of authentication traps.

Parameters status (bool) – The enabled status.

Example of usage:

```yaml
snmp-auth-traps:
  win_snmp.auth_traps_enabled:
    - status: True
```

**salt.states.win_snmp.community_names**(name, communities=\None)

Manage the SNMP accepted community names and their permissions.

Parameters communities (str) – A dictionary of SNMP communities and permissions.

Example of usage:

```yaml
snmp-community-names:
  win_snmp.community_names:
    - communities:
```
21.19.300 salt.states.win_system

Management of Windows system information

New in version 2014.1.0.

This state is used to manage system information such as the computer name and description.

salt.states.win_system.computer_desc(name)

Manage the computer’s description field
name The desired computer description

salt.states.win_system.computer_name(name)

Manage the computer’s name
name The desired computer name

salt.states.win_system.hostname(name)

New in version 2016.3.0.

Manage the hostname of the computer
name The hostname to set

salt.states.win_system.join_domain(name, username=None, password=None, account_ou=None, account_exists=False, restart=False)

Checks if a computer is joined to the Domain. If the computer is not in the Domain, it will be joined.

Example:

join_to_domain:
    system.join_domain:
      - name: mydomain.local.com
      - username: myaccount@mydomain.local.com
      - password: mysecretpassword
      - restart: True

ERIK-WORKSTATION:
    system.computer_name: []
This is Erik's computer, don't touch!:
    system.computer_desc: []

salt.states.win_system.
    computer_desc
    name

Manage the computer's description field
name The desired computer description

salt.states.win_system.
    computer_name
    name

Manage the computer’s name
name The desired computer name

salt.states.win_system.
    hostname

New in version 2016.3.0.

Manage the hostname of the computer
name The hostname to set

salt.states.win_system.
    join_domain

Checks if a computer is joined to the Domain. If the computer is not in the Domain, it will be joined.

Parameters

- name (str) – The name of the Domain.
- username (str) – Username of an account which is authorized to join computers to the specified domain. Need to be either fully qualified like user@domain.tld or simply user.
- password (str) – Password of the account to add the computer to the Domain.
- account_ou (str) – The DN of the OU below which the account for this computer should be created when joining the domain, e.g. ou=computers,ou=departm_432,dc=my-company,dc=com.
- account_exists (bool) – Needs to be set to True to allow re-using an existing computer account.
- restart (bool) – Needs to be set to True to restart the computer after a successful join.

Example:

join_to_domain:
    system.join_domain:
      - name: mydomain.local.com
      - username: myaccount@mydomain.local.com
      - password: mysecretpassword
      - restart: True
salt.states.win_system.reboot(name, message=None, timeout=5, force_close=True, in_seconds=False, only_on_pending_reboot=True)

Reboot the computer

Parameters

- **message (str)** – An optional message to display to users. It will also be used as a comment in the event log entry. The default value is None.
- **timeout (int)** – The number of minutes or seconds before a reboot will occur. Whether this number represents minutes or seconds depends on the value of **in_seconds**. The default value is 5.
- **in_seconds (bool)** – If this is True, the value of **timeout** will be treated as a number of seconds. If this is False, the value of **timeout** will be treated as a number of minutes. The default value is False.
- **force_close (bool)** – If this is True, running applications will be forced to close without warning. If this is False, running applications will not get the opportunity to prompt users about unsaved data. The default value is True.
- **only_on_pending_reboot (bool)** – If this is True, the reboot will only occur if the system reports a pending reboot. If this is False, the reboot will always occur. The default value is True.

salt.states.win_system.shutdown(name, message=None, timeout=5, force_close=True, reboot=False, in_seconds=False, only_on_pending_reboot=False)

Shutdown the computer

Parameters

- **message (str)** – An optional message to display to users. It will also be used as a comment in the event log entry. The default value is None.
- **timeout (int)** – The number of minutes or seconds before a shutdown will occur. Whether this number represents minutes or seconds depends on the value of **in_seconds**. The default value is 5.
- **in_seconds (bool)** – If this is True, the value of **timeout** will be treated as a number of seconds. If this is False, the value of **timeout** will be treated as a number of minutes. The default value is False.
- **force_close (bool)** – If this is True, running applications will be forced to close without warning. If this is False, running applications will not get the opportunity to prompt users about unsaved data. The default value is True.
- **reboot (bool)** – If this is True, the computer will restart immediately after shutting down. If False the system flushes all caches to disk and safely powers down the system. The default value is False.
- **only_on_pending_reboot (bool)** – If this is True, the shutdown will only occur if the system reports a pending reboot. If this is False, the shutdown will always occur.
The default value is False.

21.19.301 salt.states.win_wua module

Installation of Windows Updates using the Windows Update Agent

New in version 2017.7.0.

Salt can manage Windows updates via the "wua" state module. Updates can be installed and removed. Update management declarations are as follows:

For installation:

```python
# Install a single update using the KB
KB3194343:
    wua.installed

# Install a single update using the name parameter
install_update:
    wua.installed:
        - name: KB3194343

# Install multiple updates using the updates parameter and a combination of
# KB number and GUID
install_updates:
    wua.installed:
        - updates:
            - KB3194343
            - bb1dbb26-3fb6-45fd-bb05-e3c8e379195c
```

For removal:

```python
# Remove a single update using the KB
KB3194343:
    wua.removed

# Remove a single update using the name parameter
remove_update:
    wua.removed:
        - name: KB3194343

# Remove multiple updates using the updates parameter and a combination of
# KB number and GUID
remove_updates:
    wua.removed:
        - updates:
            - KB3194343
            - bb1dbb26-3fb6-45fd-bb05-e3c8e379195c
```

salt.states.win_wua.installed(name, updates=None)

Ensure Microsoft Updates are installed. Updates will be downloaded if needed.

Parameters

- **name** *(str)* – The identifier of a single update to install.
- **updates** *(list)* – A list of identifiers for updates to be installed. Overrides name.

| Default is None. |

Note: Identifiers can be the GUID, the KB number, or any part of the Title of the Microsoft update. GUIDs
and KBs are the preferred method to ensure you’re installing the correct update.

**Warning:** Using a partial KB number or a partial Title could result in more than one update being installed.

Returns A dictionary containing the results of the update
Return type dict

CLI Example:

```python
# using a GUID
install_update:
  wua.installed:
    - name: 28cf1b09-2b1a-458c-9bd1-971d1b26b211

# using a KB
install_update:
  wua.installed:
    - name: KB3194343

# using the full Title
install_update:
  wua.installed:
    - name: Security Update for Adobe Flash Player for Windows 10 Version 1607\(for x64-based Systems\) (KB3194343)

# Install multiple updates
install_updates:
  wua.installed:
    - updates: KB3194343
    - 28cf1b09-2b1a-458c-9bd1-971d1b26b211
```

```
salt.states.win_wua.removed(name, updates=None)
Ensure Microsoft Updates are uninstalled.
Parameters
  • name (str) – The identifier of a single update to uninstall.
  • updates (list) – A list of identifiers for updates to be removed. Overrides name.
    Default is None.

Note: Identifiers can be the GUID, the KB number, or any part of the Title of the Microsoft update. GUIDs and KBs are the preferred method to ensure you’re uninstalling the correct update.

**Warning:** Using a partial KB number or a partial Title could result in more than one update being removed.

Returns A dictionary containing the results of the removal
Return type dict

CLI Example:

```python
# using a GUID
uninstall_update:
  wua.removed:
    - name: 28cf1b09-2b1a-458c-9bd1-971d1b26b211
```

(continues on next page)
# using a KB

```python
uninstall_update:
  wua.removed:
    - name: KB3194343
```

# using the full Title

```python
uninstall_update:
  wua.removed:
    - name: Security Update for Adobe Flash Player for Windows 10 Version 1607
      (for x64-based Systems) (KB3194343)
```

# Install multiple updates

```python
uninstall_updates:
  wua.removed:
    - updates:
      - KB3194343
      - 28cf1b09-2b1a-458c-9bd1-971d1b26b211
```

salt.states.win_wua.uptodate(name, software=True, drivers=False, skip_hidden=False, skip_mandatory=False, skip_reboot=True, categories=None, severities=None)

Ensure Microsoft Updates that match the passed criteria are installed. Updates will be downloaded if needed.

This state allows you to update a system without specifying a specific update to apply. All matching updates will be installed.

**Parameters**

- **name (str)** – The name has no functional value and is only used as a tracking reference
- **software (bool)** – Include software updates in the results (default is True)
- **drivers (bool)** – Include driver updates in the results (default is False)
- **skip_hidden (bool)** – Skip updates that have been hidden. Default is False.
- **skip_mandatory (bool)** – Skip mandatory updates. Default is False.
- **skip_reboot (bool)** – Skip updates that require a reboot. Default is True.
- **categories (list)** – Specify the categories to list. Must be passed as a list. All categories returned by default.

Categories include the following:

- Critical Updates
- Definition Updates
- Drivers (make sure you set drivers=True)
- Feature Packs
- Security Updates
- Update Rollups
- Updates
- Update Rollups
- Windows 7
- Windows 8.1
- Windows 8.1 drivers
- Windows 8.1 and later drivers
- Windows Defender

- **severities (list)** – Specify the severities to include. Must be passed as a list. All severities returned by default.

Severities include the following:

- Critical
Returns A dictionary containing the results of the update
Return type dict

CLI Example:

```bash
# Update the system using the state defaults
update_system:
    wua.uptodate

# Update the drivers
update_drivers:
    wua.uptodate:
        - software: False
        - drivers: True
        - skip_reboot: False

# Apply all critical updates
update_critical:
    wua.uptodate:
        - severities:
            - Critical
```

21.19.302 salt.states.winrepo

Manage Windows Package Repository

salt.states.winrepo.genrepo(name, force=False, allow_empty=False)

Refresh the winrepo.p file of the repository (salt-run winrepo.genrepo)

If `force` is True no checks will be made and the repository will be generated if `allow_empty` is True then the state will not return an error if there are 0 packages,

**Note:** This state only loads on minions that have the roles: salt-master grain set.

Example:

```
winrepo:
    winrepo.genrepo
```

21.19.303 salt.states.x509

Manage X509 Certificates

New in version 2015.8.0.

depends M2Crypto

This module can enable managing a complete PKI infrastructure including creating private keys, CA's, certificates and CRLs. It includes the ability to generate a private key on a server, and have the corresponding public key sent to a remote CA to create a CA signed certificate. This can be done in a secure manner, where private keys are always generated locally and never moved across the network.

Here is a simple example scenario. In this example `ca` is the ca server, and `www` is a web server that needs a certificate signed by `ca`.

For remote signing, peers must be permitted to remotely call the `sign_remote_certificate` function.

21.19. state modules
/etc/salt/master.d/peer.conf

```
peer:
  .*:
    - x509.sign_remote_certificate
```

/srv/salt/top.sls

```
base:
  '*':
    - cert
  'ca':
    - ca
  'www':
    - www
```

This state creates the CA key, certificate and signing policy. It also publishes the certificate to the mine where it can be easily retrieved by other minions.

/srv/salt/ca.sls

```
salt-minion:
  service.running:
    - enable: True
    - listen:
      - file: /etc/salt/minion.d/signing_policies.conf

/etc/salt/minion.d/signing_policies.conf:
  file.managed:
    - source: salt://signing_policies.conf

/etc/pki:
  file.directory

/etc/pki/issued_certs:
  file.directory

/etc/pki/ca.crt:
  x509.certificate_managed:
    - signing_private_key: /etc/pki/ca.key
    - CN: ca.example.com
    - C: US
    - ST: Utah
    - L: Salt Lake City
    - basicConstraints: "critical CA:true"
    - keyUsage: "critical cRLSign, keyCertSign"
    - subjectKeyIdentifier: hash
    - authorityKeyIdentifier: keyid,issuer:always
    - days_valid: 3650
    - days_remaining: 0
    - backup: True
    - managed_private_key:
      - name: /etc/pki/ca.key
      - bits: 4096
      - backup: True
    - require:
      - file: /etc/pki
```

(continues on next page)
The signing policy defines properties that override any property requested or included in a CRL. It also can define a restricted list of minions which are allowed to remotely invoke this signing policy.

```
-srv/salt/signing_policies.conf

x509_signing_policies:
  www:
    - minions: 'www'
    - signing_private_key: /etc/pki/ca.key
    - signing_cert: /etc/pki/ca.crt
    - C: US
    - ST: Utah
    - L: Salt Lake City
    - basicConstraints: "critical CA:false"
    - keyUsage: "critical keyEncipherment"
    - subjectKeyIdentifier: hash
    - authorityKeyIdentifier: keyid,issuer:always
    - days_valid: 90
    - copypath: /etc/pki/issued_certs/
```

This state will instruct all minions to trust certificates signed by our new CA. Using jinja to strip newlines from the text avoids dealing with newlines in the rendered yaml, and the `sign_remote_certificate` state will handle properly formatting the text before writing the output.

```
-srv/salt/cert.sls

/usr/local/share/ca-certificates:
  file.directory

/usr/local/share/ca-certificates/intca.crt:
  x509.pem_managed:
    - text: {{ salt['mine.get']('ca', 'x509.get_pem_entries')['ca']['/etc/pki/ca.crt'] | replace('
', '') }}
```

This state creates a private key then requests a certificate signed by ca according to the www policy.

```
-srv/salt/www.sls

/etc/pki/www.crt:
  x509.certificate_managed:
    - ca_server: ca
    - signing_policy: www
    - public_key: /etc/pki/www.key
    - CN: www.example.com
    - days_remaining: 30
    - backup: True
    - managed_private_key:
      name: /etc/pki/www.key
      bits: 4096
      backup: True
```

21.19. state modules
salt.states.x509.certificate_managed(name, days_remaining=90, manages_private_key=None, append_certs=None, **kwargs)

Manage a Certificate
name Path to the certificate
days_remaining [90] The minimum number of days remaining when the certificate should be recreated. A value of 0 disables automatic renewal.
managed_private_key Manages the private key corresponding to the certificate. All of the arguments supported by x509.private_key_managed are supported. If name is not specified or is the same as the name of the certificate, the private key and certificate will be written together in the same file.
append_certs: A list of certificates to be appended to the managed file.
kwargs: Any arguments supported by x509.create_certificate or file.managed are supported.
Examples:

/etc/pki/ca.crt:
x509.certificate_managed:
  - signing_private_key: /etc/pki/ca.key
  - CN: ca.example.com
  - C: US
  - ST: Utah
  - L: Salt Lake City
  - basicConstraints: "critical CA:true"
  - keyUsage: "critical cRLSign, keyCertSign"
  - subjectKeyIdentifier: hash
  - authorityKeyIdentifier: keyid,issuer:always
  - days_valid: 3650
  - days_remaining: 0
  - backup: True

/etc/ssl/www.crt:
x509.certificate_managed:
  - ca_server: pki
  - signing_policy: www
  - public_key: /etc/ssl/www.key
  - CN: www.example.com
  - days_valid: 90
  - days_remaining: 30
  - backup: True

salt.states.x509.crl_managed(name, signing_private_key, signing_private_key_passphrase=None, signing_cert=None, revoked=None, days_valid=100, digest="", days_remaining=30, include_expired=False, **kwargs)

Manage a Certificate Revocation List
name Path to the certificate
signing_private_key The private key that will be used to sign this crl. This is usually your CA’s private key.
signing_private_key_passphrase Passphrase to decrypt the private key.
signing_cert The certificate of the authority that will be used to sign this crl. This is usually your CA’s certificate.
revoked A list of certificates to revoke. Must include either a serial number or a the certificate itself. Can optionally include the revocation date and notAfter date from the certificate. See example below for details.
days_valid [100] The number of days the certificate should be valid for.
digest The digest to use for signing the CRL. This has no effect on versions of pyOpenSSL less than 0.14.
days_remaining [30] The crl should be automatically recreated if there are less than days_remaining days until the crl expires. Set to 0 to disable automatic renewal.
include_expired [False] If True, include expired certificates in the CRL.
**kwargs**  Any arguments supported by `file.managed` are supported.

Example:

```
/etc/pki/ca.crl:
  x509.crl_managed:
    - signing_private_key: /etc/pki/myca.key
    - signing_cert: /etc/pki/myca.crt
    - revoked:
      - compromised_web_key:
        - certificate: /etc/pki/certs/badweb.crt
        - revocation_date: 2015-03-01 00:00:00
        - reason: keyCompromise
      - terminated_vpn_user:
        - serial_number: D6:D2:DC:D8:4D:5C:C0:F4
        - not_after: 2016-01-01 00:00:00
        - revocation_date: 2015-02-25 00:00:00
        - reason: cessationOfOperation
```

salt.states.x509.csr_managed(name, **kwargs)

Manage a Certificate Signing Request

**name**: Path to the CSR

**properties**: The properties to be added to the certificate request, including items like subject, extensions and public key. See above for valid properties.

**kwargs**: Any arguments supported by `file.managed` are supported.

Example:

```
/etc/pki/mycert.csr:
  x509.csr_managed:
    - private_key: /etc/pki/mycert.key
    - CN: www.example.com
    - C: US
    - ST: Utah
    - L: Salt Lake City
    - keyUsage: 'critical dataEncipherment'
```

salt.states.x509.pem_managed(name, text, backup=False, **kwargs)

Manage the contents of a PEM file directly with the content in text, ensuring correct formatting.

**name**: The path to the file to manage

**text**: The PEM formatted text to write.

**kwargs**: Any arguments supported by `file.managed` are supported.

salt.states.x509.private_key_managed(name, bits=2048, passphrase=None, cipher='aes_128_cbc', new=False, overwrite=False, verbose=True, **kwargs)

Manage a private key’s existence.

**name**: Path to the private key

**bits**: Key length in bits. Default 2048.

**passphrase**: Passphrase for encrypting the private key.

**cipher**: Cipher for encrypting the private key.

**new**: Always create a new key. Defaults to False. Combining new with `prereq`, or when used as part of a `managed_private_key` can allow key rotation whenever a new certificate is generated.

**overwrite**: Overwrite an existing private key if the provided passphrase cannot decrypt it.

**verbose**: Provide visual feedback on stdout, dots while key is generated. Default is True.

New in version 2016.11.0.

**kwargs**: Any kwargs supported by file.managed are supported.

Example:
The jinja templating in this example ensures a private key is generated if the file doesn’t exist and that a new private key is generated whenever the certificate that uses it is to be renewed.

```yaml
/etc/pki/www.key:
x509.private_key_managed:
  - bits: 4096
  - new: True
{% if salt['file.file_exists']('/etc/pki/www.key') %}
  - prereq:
    - x509: /etc/pki/www.crt
{% endif %}
```

### 21.19.304 salt.states.xmpp

**Sending Messages over XMPP**

New in version 2014.1.0.

This state is useful for firing messages during state runs, using the XMPP protocol.

```yaml
server-warning-message:
  xmpp.send_msg:
    - name: 'This is a server warning message'
    - profile: my-xmpp-account
    - recipient: admins@xmpp.example.com/salt
```

`salt.states.xmpp.send_msg(name, recipient, profile)`

Send a message to an XMPP user

```yaml
server-warning-message:
  xmpp.send_msg:
    - name: 'This is a server warning message'
    - profile: my-xmpp-account
    - recipient: admins@xmpp.example.com/salt
```

**name** The message to send to the XMPP user

`salt.states.xmpp.send_msg_multi(name, profile, recipients=None, rooms=None)`

Send a message to an list of recipients or rooms

```yaml
server-warning-message:
  xmpp.send_msg:
    - name: 'This is a server warning message'
    - profile: my-xmpp-account
    - recipients:
    - admins@xmpp.example.com/salt
    - qa@conference.xmpp.example.com
```

**name** The message to send to the XMPP user

### 21.19.305 salt.states.zabbix_action

New in version 2017.7.

Management of Zabbix Action object over Zabbix API.
salt.states.zabbix_action.absent(name, **kwargs)
    Makes the Zabbix Action to be absent (either does not exist or delete it).
    Parameters
    • name – Zabbix Action name
    • _connection_user – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
    • _connection_password – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
    • _connection_url – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

    zabbix-action-absent:
    zabbix_action.absent:
    - name: Action name

salt.states.zabbix_action.present(name, params, **kwargs)
    Creates Zabbix Action object or if differs update it according defined parameters
    Parameters
    • name – Zabbix Action name
    • params – Definition of the Zabbix Action
    • _connection_user – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
    • _connection_password – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
    • _connection_url – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

    If there is a need to get a value from current zabbix online (e.g. id of a hostgroup you want to put a discovered system into), put a dictionary with two keys "query_object" and "query_name" instead of the value. In this example we want to get object id of hostgroup named "Virtual machines" and "Databases".

    zabbix-action-present:
    zabbix_action.present:
    - name: VMs
    - params:
        eventsource: 2
        status: 0
        filter:
            evaltype: 2
            conditions:
                - conditiontype: 24
                  operator: 2
                  value: 'virtual'
                - conditiontype: 24
                  operator: 2
                  value: 'kvm'
            operations:
                - operationtype: 2
                - operationtype: 4
          groupid:
            query_object: hostgroup
            query_name: Virtual machines
            - groupid:
              query_object: hostgroup
              query_name: Databases
21.19.306 salt.states.zabbix_host module

Management of Zabbix hosts.

codeauthor Jiri Kotlin <jiri.kotlin@ultimum.io>

salt.states.zabbix_host.absent(name, **kwargs)
Ensures that the host does not exists, eventually deletes host.

New in version 2016.3.0.

Param name: technical name of the host

Parameters

• _connection_user – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
• _connection_password – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
• _connection_url – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

```
TestHostWithInterfaces:
zabbix_host.absent
```

salt.states.zabbix_host.assign_templates(host, templates, **kwargs)
Ensures that templates are assigned to the host.

New in version 2017.7.0.

Parameters

• host – technical name of the host
• _connection_user – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
• _connection_password – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
• _connection_url – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

```
add_zabbix_templates_to_host:
zabbix_host.assign_templates:
  - host: TestHost
  - templates:
    - "Template OS Linux"
    - "Template App MySQL"
```

salt.states.zabbix_host.present(host, groups, interfaces, **kwargs)
Ensures that the host exists, eventually creates new host. NOTE: please use argument visible_name instead of name to not mess with name from salt sls. This function accepts all standard host properties: keyword argument names differ depending on your zabbix version, see: https://www.zabbix.com/documentation/2.4/manual/api/reference/host/object#host

New in version 2016.3.0.

Parameters

• host – technical name of the host
• groups – groupids of host groups to add the host to
• interfaces – interfaces to be created for the host
• proxy_host – Optional proxy name or proxyid to monitor host
• inventory – Optional list of inventory names and values
• _connection_user – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
• **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
• **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)
• **visible_name** – Optional - string with visible name of the host, use ’visible_name’ instead of ’name’ parameter to not mess with value supplied from Salt sls file.

```yaml
create_test_host:
  zabbix_host.present:
    - host: TestHostWithInterfaces
    - proxy_host: 12345
    - groups:
        - 5
        - 6
        - 7
    - interfaces:
        - test1.example.com:
            - ip: '192.168.1.8'
            - type: 'Agent'
            - port: 92
        - testing2_create:
            - ip: '192.168.1.9'
            - dns: 'test2.example.com'
            - type: 'agent'
            - main: false
        - testovaci1_ipmi:
            - ip: '192.168.100.111'
            - type: 'ipmi'
    - inventory:
        - alias: some alias
        - asset_tag: jlm3937
```

### 21.19.307 salt.states.zabbix_hostgroup module

Management of Zabbix host groups.

**codeauthor** Jiri Kotlin <jiri.kotlin@ultimum.io>

salt.states.zabbix_hostgroup.absent(name, **kwargs)

Ensures that the host group does not exist, eventually delete host group.

New in version 2016.3.0.

**Parameters**

- **name** – name of the host group
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

```yaml
delete_testing_host_group:
  zabbix_hostgroup.absent:
    - name: 'My hostgroup name'
```

salt.states.zabbix_hostgroup.present(name, **kwargs)

Ensures that the host group exists, eventually creates new host group.
New in version 2016.3.0.

Parameters
- name – name of the host group
- _connection_user – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- _connection_password – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- _connection_url – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

```yaml
create_testing_host_group:
  zabbix_hostgroup.present:
    - name: 'My hostgroup name'
```

21.19.308 salt.states.zabbix_mediatype module

Management of Zabbix mediatypes.

codeauthor Raymond Kuiper <qix@the-wired.net>

salt.states.zabbix_mediatype.absent(name, **kwargs)
Ensures that the mediatype does not exist, eventually deletes the mediatype.

Parameters
- name – name of the mediatype
- _connection_user – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- _connection_password – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- _connection_url – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

```yaml
delete_mediatype:
  zabbix_mediatype.absent:
    - name: 'Email'
```

salt.states.zabbix_mediatype.present(name, mediatype, **kwargs)
Creates new mediatype. NOTE: This function accepts all standard mediatype properties: keyword argument names differ depending on your zabbix version, see: https://www.zabbix.com/documentation/3.0/manual/api/reference/host/object#host_inventory

Parameters
- name – name of the mediatype
- _connection_user – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- _connection_password – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- _connection_url – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

```yaml
make_new_mediatype:
  zabbix_mediatype.present:
    - name: 'Email'
    - mediatype: 0
    - smtp_server: smtp.example.com
    - smtp_hello: zabbix@example.com
    - smtp_email: zabbix@example.com
```
### 21.19.309 salt.states.zabbix_template

New in version 2017.7.

Management of Zabbix Template object over Zabbix API.

**codeauthor** Jakub Sliva <jakub.sliva@ultimum.io>

#### salt.states.zabbix_template.absent(name, **kwargs)

Makes the Zabbix Template to be absent (either does not exist or delete it).

**Parameters**

- **name** – Zabbix Template name
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

```yaml
zabbix-template-absent:
  zabbix_template.absent:
    - name: Ceph OSD
```

#### salt.states.zabbix_template.is_present(name, **kwargs)

Check if Zabbix Template already exists.

**Parameters**

- **name** – Zabbix Template name
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

```yaml
does_zabbix-template-exist:
  zabbix_template.is_present:
    - name: Template OS Linux
```

#### salt.states.zabbix_template.present(name, params, static_host_list=True, **kwargs)

Creates Zabbix Template object or if differs update it according defined parameters. See Zabbix API documentation.

Zabbix API version: >3.0

**Parameters**

- **name** – Zabbix Template name
- **params** – Additional parameters according to Zabbix API documentation
- **static_host_list** – If hosts assigned to the template are controlled only by this state or can be also assigned externally
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

**Note:** If there is a need to get a value from current zabbix online (e.g. ids of host groups you want the template to be associated with), put a dictionary with two keys "query_object" and "query_name" instead of the value.
In this example we want to create template named "Testing Template", assign it to hostgroup Templates, link it to two ceph nodes and create a macro.

**Note:** IMPORTANT NOTE: Objects (except for template name) are identified by name (or by other key in some exceptional cases) so changing name of object means deleting old one and creating new one with new ID ‼!

**Note:**

NOT SUPPORTED FEATURES:

- linked templates
- trigger dependencies
- groups and group prototypes for host prototypes

SLS Example:

```yaml
zabbix-template-present:
  zabbix_template.present:
    - name: Testing Template
      # Do not touch existing assigned hosts
      # True will detach all other hosts than defined here
      static_host_list: False
    params:
      description: Template for Ceph nodes
      groups:
        # groups must already exist
        # template must be at least in one hostgroup
        - groupid:
            query_object: hostgroup
            query_name: Templates
      macros:
        - macro: "${CEPH_CLUSTER_NAME}"
          value: ceph
      hosts:
        # hosts must already exist
        - hostid:
            query_object: host
            query_name: ceph-osd-01
        - hostid:
            query_object: host
            query_name: ceph-osd-02
      applications:
        - name: Ceph OSD
      items:
        - name: Ceph OSD avg fill item
          key_: ceph.osd_avg_fill
          type: 2
          value_type: 0
          delay: 60
          units: '%%'
  ```
(continues on next page)
description: 'Average fill of OSD'

applications:

      query_name: Ceph OSD avg fill graph

21.19.310 salt.states.zabbix_user module

Management of Zabbix users.
codeauthor Jiri Kotlin <jiri.kotlin@ultimum.io>

salt.states.zabbix_user.absent(name, **kwargs)
Ensures that the user does not exist, eventually delete user.
New in version 2016.3.0.
Parameters
• name – user alias
• _connection_user – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
• _connection_password – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
• _connection_url – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

George:
zabbix_user.absent

salt.states.zabbix_user.admin_password_present(name, password=None, **kwargs)
Initial change of Zabbix Admin password to password taken from one of the sources (only the most prioritized one):
1. ‘password’ parameter
2. '_connection_password' parameter
3. pillar ‘zabbix.password’ setting
1) Tries to log in as Admin with password found in state password parameter or _connection_password or pillar or default zabbix password in this precise order, if any of them is present.
2) If one of above passwords matches, it tries to change the password to the most prioritized one.
3) If not able to connect with any password then it fails.
Parameters
• name – Just a name of state
• password – Optional - desired password for Admin to be set
• _connection_user – Optional - Ignored in this state (always assumed 'Admin')
• _connection_password – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
• _connection_url – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

# password taken from pillar or _connection_password
zabbix-admin-password:  
zabbix_user.admin_password_present

# directly set password
zabbix-admin-password:  
zabbix_user.admin_password_present:  
  - password: SECRET_PASS

salt.states.zabbix_user.present(alias, passwd, usgrgps, medias=None, password_reset=False, **kwargs)
Ensures that the user exists, eventually creates new user. NOTE: use argument firstname instead of name to not mess values with name from salt sls.
New in version 2016.3.0.
Parameters
• alias – user alias
• passwd – user’s password
• usgrgps – user groups to add the user to
• **medias** – Optional - user’s medias to create
• **password_reset** – whether or not to reset password at update
• **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
• **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
• **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)
• **firstname** – string with firstname of the user, use 'firstname' instead of 'name' parameter to not mess with value supplied from Salt sls file.

```yaml
make_user:
  zabbix_user.present:
    - alias: George
    - passwd: donottellanyonE@456x
    - password_reset: True
    - usgrps:
      - 13
      - 7
    - medias:
      - me@example.com:
        - mediatype: mail
        - period: '1-7,00:00-24:00'
        - severity: NIWAHD
      - make_jabber:
        - active: true
        - mediatype: jabber
        - period: '1-5,08:00-19:00'
        - sendto: jabbera@example.com
      - text_me_morning_disabled:
        - active: false
        - mediatype: sms
        - period: '1-5,09:30-10:00'
        - severity: D
        - sendto: '+42032132588568'
```

### 21.19.311 salt.states.zabbix_usergroup module

Management of Zabbix user groups.

**codeauthor** Jiri Kotlin <jiri.kotlin@ultimum.io>

salt.states.zabbix_usergroup.absent(name, **kwargs)

Ensures that the user group does not exist, eventually delete user group.

New in version 2016.3.0.

**Parameters**

- **name** – name of the user group
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)
salt.states.zabbix_usergroup.present(name, **kwargs)

Creates new user group. NOTE: This function accepts all standard user group properties: keyword argument names differ depending on your zabbix version, see: https://www.zabbix.com/documentation/2.0/manual/appendix/api/usergroup/definitions#user_group

New in version 2016.3.0.

Parameters

- **name** – name of the user group
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

```python
make_new_thai_monks_usergroup:
  zabbix_usergroup.present:
    - name: 'Thai monks'
    - gui_access: 1
    - debug_mode: 0
    - users_status: 0
```

21.19.312 salt.states.zabbix_valuemap

New in version 2017.7.

Management of Zabbix Valuemap object over Zabbix API.

 codeauthor Jakub Sliva <jakub.sliva@ultimum.io>

salt.states.zabbix_valuemap.absent(name, **kwargs)

Makes the Zabbix Value map to be absent (either does not exist or delete it).

Parameters

- **name** – Zabbix Value map name
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

```python
zabbix-valuemap-absent:
  zabbix_valuemap.absent:
    - name: Value map name
```

salt.states.zabbix_valuemap.present(name, params, **kwargs)

Creates Zabbix Value map object or if differs update it according defined parameters

Parameters

- **name** – Zabbix Value map name
- **params** – Definition of the Zabbix Value map
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
• \_connection\_password – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
• \_connection\_url – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

```
zabbix-valuemap-present:
zabbix_valuemap.present:
  - name: Number mapping
  - params:
    mappings:
      - value: 1
        newvalue: one
      - value: 2
        newvalue: two
```

21.19.313 salt.states.zcbuildout

Management of zc.buildout

This module is inspired from minitage’s buildout maker (https://github.com/minitage/minitage/blob/master/src/minitage/core/makers/buildout.py)

New in version 2016.3.0.

**Note:** This state module is beta; the API is subject to change and no promise as to performance or functionality is yet present

Available Functions

• built

```
installed1
buildout.installed:
  - name: /path/to/buildout

installed2
buildout.installed:
  - name: /path/to/buildout
  - parts:
    - a
    - b
  - python: /path/to/pythonpath/bin/python
  - unless: /bin/test_something_installed
  - onlyif: /bin/test_else_installed
```

salt.states.zcbuildout.installed(name, config='buildout.cfg', quiet=False, parts=None, user=None, env=(), buildout_ver=None, test_release=False, distribute=None, new_st=None, offline=False, newest=False, python="/usr/bin/python3", debug=False, verbose=False, unless=None, onlyif=None, use_vt=False, loglevel='debug', **kwargs)

Install buildout in a specific directory
It is a thin wrapper to modules.buildout.buildout

name directory to execute in

quiet
do not output console & logs

config buildout config to use (default: buildout.cfg)

parts specific buildout parts to run

user user used to run buildout as

New in version 2014.1.4.

env environment variables to set when running

buildout_ver force a specific buildout version (1 | 2)

test_release buildout accept test release

new_st Forcing use of setuptools >= 0.7

distribute use distribute over setuptools if possible

offline does buildout run offline

python python to use

deploy run buildout with -D deploy flag

onlyif Only execute cmd if statement on the host return 0

unless Do not execute cmd if statement on the host return 0

newest run buildout in newest mode

verbose run buildout in verbose mode (-vvvvv)

use_vt Use the new salt VT to stream output [experimental]

loglevel loglevel for buildout commands

21.19.314 salt.states.zenoss

State to manage monitoring in Zenoss.

New in version 2016.3.0.

This state module depends on the 'zenoss' Salt execution module.

Allows for setting a state of minions in Zenoss using the Zenoss API. Currently Zenoss 4.x and 5.x are supported.

enable_monitoring:

zenoss.monitored:
  - name: web01.example.com
  - device_class: /Servers/Linux
  - collector: localhost
  - prod_state: 1000

salt.states.zenoss.monitored(name, device_class=None, collector='localhost', prod_state=None)

Ensure a device is monitored. The 'name' given will be used for Zenoss device name and should be resolvable.

enable_monitoring:

zenoss.monitored:
  - name: web01.example.com
  - device_class: /Servers/Linux
  - collector: localhost
  - prod_state: 1000

21.19.315 salt.states.zk_concurrency
Control concurrency of steps within state execution using zookeeper

**depends** kazoo

**configuration** See `salt.modules.zookeeper` for setup instructions.

This module allows you to "wrap" a state's execution with concurrency control. This is useful to protect against all hosts executing highstate simultaneously if your services don't all HUP restart. The common way of protecting against this is to run in batch mode, but that doesn't protect from another person running the same batch command (and thereby having 2x the number of nodes deploying at once).

This module will block while acquiring a slot, meaning that however the command gets called it will coordinate with zookeeper to ensure that no more than max_concurrency steps are executing with a single path.

```yaml
acquire_lock:
    zk_concurrency.lock:
        - name: /trafficeserver
        - zk_hosts: 'zookeeper:2181'
        - max_concurrency: 4
        - prereq:
            - service: trafficserver

trafficserver:
    service.running:
        - watch:
            - file: /etc/trafficserver/records.config

/etc/trafficserver/records.config:
    file.managed:
        - source: salt://records.config

release_lock:
    zk_concurrency.unlock:
        - name: /trafficserver
        - require:
            - service: trafficserver
```

This example would allow the file state to change, but would limit the concurrency of the trafficserver service restart to 4.

```python
salt.states.zk_concurrency.lock(name, zk_hosts=None, identifier=None, max_concurrency=1, timeout=None, ephemeral_lease=False, profile=None, scheme=None, username=None, password=None, default_acl=None)
```

Block state execution until you are able to get the lock (or hit the timeout)

```python
salt.states.zk_concurrency.min_party(name, zk_hosts, min_nodes, blocking=False, profile=None, scheme=None, username=None, password=None, default_acl=None)
```

Ensure that there are min_nodes in the party at name, optionally blocking if not available.

```python
salt.states.zk_concurrency.unlock(name, zk_hosts=None, identifier=None, max_concurrency=1, ephemeral_lease=False, profile=None, scheme=None, username=None, password=None, default_acl=None)
```

Remove lease from semaphore.

**21.19.316 salt.states.zfs**

States for managing zfs datasets
maintainer Jorge Schrauwen <sjorge@blackdot.be>
maturity new
depends salt.utils.zfs, salt.modules.zfs
platform smartos, illumos, solaris, freebsd, linux

New in version 2016.3.0.
Changed in version 2018.3.1: Big refactor to remove duplicate code, better type conversions and improved consistancy in output.

```
test/shares/yuki:
zfs.filesystem_present:
  - create_parent: true
  - properties:
    quota: 16G

test/iscsi/haruhi:
zfs.volume_present:
  - create_parent: true
  - volume_size: 16M
  - sparse: true
  - properties:
    readonly: on

test/shares/yuki@frozen:
zfs.snapshot_present

moka_origin:
zfs.hold_present:
  - snapshot: test/shares/yuki@frozen

test/shares/moka:
zfs.filesystem_present:
  - cloned_from: test/shares/yuki@frozen

test/shares/moka@tsukune:
zfs.snapshot_absent
```

salt.states.zfs.bookmark_absent(name, force=False, recursive=False)
ensure bookmark is absent on the system
name [string] name of snapshot
force [boolean] try harder to destroy the dataset (zfs destroy -f)
recursive [boolean] also destroy all the child datasets (zfs destroy -r)

salt.states.zfs.bookmark_present(name, snapshot)
ensure bookmark exists
name [string] name of bookmark
snapshot [string] name of snapshot

salt.states.zfs.filesystem_absent(name, force=False, recursive=False)
ensure filesystem is absent on the system
name [string] name of filesystem
force [boolean] try harder to destroy the dataset (zfs destroy -f)
recursive [boolean] also destroy all the child datasets (zfs destroy -r)
**Warning:** If a volume with `name` exists, this state will succeed without destroying the volume specified by `name`. This module is dataset type sensitive.

```python
salt.states.zfs.filesystem_present(name, create_parent=False, properties=None, cloned_from=None)
```

- **name** [string]: name of filesystem
- **create_parent** [boolean]: creates all the non-existing parent datasets. any property specified on the command line using the `-o` option is ignored.
- **cloned_from** [string]: name of snapshot to clone
- **properties** [dict]: additional zfs properties (`-o`)

**Note:** `cloned_from` is only use if the filesystem does not exist yet, when `cloned_from` is set after the filesystem exists it will be ignored.

**Note:** Properties do not get cloned, if you specify the properties in the state file they will be applied on a subsequent run.

```python
salt.states.zfs.hold_absent(name, snapshot, recursive=False)
```

- **name** [string]: name of hold
- **snapshot** [string]: name of snapshot
- **recursive** [boolean]: recursively releases a hold with the given tag on the snapshots of all descendent file systems.

```python
salt.states.zfs.hold_present(name, snapshot, recursive=False)
```

- **name** [string]: name of holdt
- **snapshot** [string]: name of snapshot
- **recursive** [boolean]: recursively add hold with the given tag on the snapshots of all descendent file systems.

```python
salt.states.zfs.promoted(name)
```

- **name** [string]: name of fileset or volume

**Warning:** only one dataset can be the origin, if you promote a clone the original will now point to the promoted dataset.

```python
salt.states.zfs.scheduled_snapshot(name, prefix, recursive=True, schedule=None)
```

- **name** [string]: name of filesystem or volume
- **prefix** [string]: prefix for the snapshots e.g. 'test' will result in snapshots being named 'test-yyyyymmdd_hhmm'
- **recursive** [boolean]: create snapshots for all children also
- **schedule** [dict]: dict holding the schedule, the following keys are available (minute, hour, day, month, and year) by default all are set to 0 the value indicated the number of snapshots of that type to keep around.

**Warning:** snapshots will only be created and pruned every time the state runs. a schedule must be setup to automatically run the state. this means that if you run the state daily the hourly snapshot will only be made once per day!
Changed in version 2018.3.0: switched to localtime from gmtime so times now take into account timezones.

```python
salt.states.zfs.snapshot_absent(name, force=False, recursive=False)

ensure snapshot is absent on the system

name  [string] name of snapshot
force  [boolean] try harder to destroy the dataset (zfs destroy -f)
recursive  [boolean] also destroy all the child datasets (zfs destroy -r)
```

```python
salt.states.zfs.snapshot_present(name, recursive=False, properties=None)

ensure snapshot exists and has properties set

name  [string] name of snapshot
recursive  [boolean] recursively create snapshots of all descendent datasets
properties  [dict] additional zfs properties (-o)
```

```python
salt.states.zfs.volume_absent(name, force=False, recursive=False)

ensure volume is absent on the system

name  [string] name of volume
force  [boolean] try harder to destroy the dataset (zfs destroy -f)
recursive  [boolean] also destroy all the child datasets (zfs destroy -r)
```

**Warning:** If a filesystem with `name` exists, this state will succeed without destroying the filesystem specified by `name`. This module is dataset type sensitive.

```python
salt.states.zfs.volume_present(name, volume_size, sparse=False, create_parent=False, properties=None, cloned_from=None)

ensure volume exists and has properties set

name  [string] name of volume
volume_size  [string] size of volume
sparse  [boolean] create sparse volume
create_parent  [boolean] creates all the non-existing parent datasets. any property specified on the command line using the -o option is ignored.
cloned_from  [string] name of snapshot to clone
properties  [dict] additional zfs properties (-o)
```

**Note:** `cloned_from` is only use if the volume does not exist yet, when `cloned_from` is set after the volume exists it will be ignored.

**Note:** Properties do not get cloned, if you specify the properties in the state file they will be applied on a subsequent run.

`volume_size` is considered a property, so the volume’s size will be corrected when the properties get updated if it differs from the original volume.

The sparse parameter is ignored when using `cloned_from`.

### 21.19.317 salt.states.zone

Management of Solaris Zones

**maintainer** Jorge Schrauwen <sjorge@blackdot.be>

**maturity** new

**depends** salt.modules.zonadm, salt.modules.zonecfg
platform: solaris

New in version 2017.7.0.

Below are some examples of how to use this state. Let's start with creating a zone and installing it.

```yaml
omipkg1_configuration:
  zone.present:
    - name: omipkg1
    - brand: ipkg
    - zonepath: /zones/omipkg1
    - properties:
      - autoboot: true
      - ip-type: exclusive
      - cpu-shares: 50
      - resources:
        - attr:
          - name: owner
          - value: Jorge Schrauwen
          - type: string
          - attr:
            - name: description
            - value: OmniOS ipkg zone for testing
            - type: string
        - capped-memory:
          - physical: 64M

omipkg1_installation:
  zone.installed:
    - name: omipkg1
    - require:
      - zone: omipkg1_configuration

omipkg1_running:
  zone.booted:
    - name: omipkg1
    - require:
      - zone: omipkg1_installation
```

A zone without network access is not very useful. We could update the zone.present state in the example above to add a network interface or we could use a separate state for this.

```yaml
omipkg1_network:
  zone.resource_present:
    - name: omipkg1
    - resource_type: net
    - resource_selector_property: mac-addr
    - resource_selector_value: "02:08:20:a2:a3:10"
    - physical: znic1
    - require:
      - zone: omipkg1_configuration
```

Since this is a single tenant system having the owner attribute is pointless. Let's remove that attribute.

Note: The following state run the omipkg1_configuration state will add it again! If the entire configuration is managed it would be better to add resource_prune and optionally the resource_selector_property properties to the resource.
Let's bump the zone's CPU shares a bit.

Note: The following state run the omipkg1_configuration state will set it to 50 again. Update the entire zone configuration is managed you should update it there instead.

Or we can remove the limit altogether!

Note: The following state run the omipkg1_configuration state will set it to 50 again. Update the entire zone configuration is managed you should set the property to None (nothing after the :) instead.

salt.states.zone.absent(name, uninstall=False)
Ensure a zone is absent
name [string] name of the zone
uninstall [boolean] when true, uninstall instead of detaching the zone first.

salt.states.zone.attached(name, force=False)
Ensure zone is attached
name [string] name of the zone
force [boolean] force attach the zone

salt.states.zone.booted(name, single=False)
Ensure zone is booted
name [string] name of the zone
single [boolean] boot in single usermode

salt.states.zone.detached(name)
Ensure zone is detached
name [string] name of the zone

salt.states.zone.export(name, path, replace=False)
Export a zones configuration
name [string] name of the zone
path [string] path of file to export too.
replace [boolean] replace the file if it exists
salt.states.zone.halted

  Ensure zone is halted
  name [string] name of the zone
graceful [boolean] use shutdown instead of halt if true

salt.states.zone.import_

  Import a zones configuration
  name [string] name of the zone
  path [string] path of the configuration file to import
  mode [string] either import, install, or attach
  nodataset [boolean] do not create a ZFS file system
  brand_opts [boolean] brand specific options to pass

Note: The mode argument can be set to import, install, or attach. import: will only import the configuration install: will import and then try to install the zone attach: will import and then try to attach of the zone

omipkg1:
  zone.import:
    - path: /foo/bar/baz

salt.states.zone.installed

  Ensure zone is installed
  name [string] name of the zone
  nodataset [boolean] do not create a ZFS file system
  brand_opts [boolean] brand specific options to pass

salt.states.zone.present

  Ensure a zone with certain properties and resources
  name [string] name of the zone
  brand [string] brand of the zone
  zonepath [string] path of the zone
  properties [list of key-value pairs] dict of properties
  resources [list of key-value pairs] dict of resources

Note: If the zone does not exist it will not be installed. You can use the `zone.installed` state for this.

Note:
Default resource selectors:

- fs: dir
- net: mac-addr
- device: match
- rctl: name
- attr: name
- dataset: name
- admin: user

Warning: Properties and resource will not be removed when they are absent from the state!
For properties, simple set them to `None`.
For resources, add the `resource_prune` property and set it to `True`. Also specify the `resource_selector_property` if the default is not the one you want.

salt.states.zone.property_absent(name, property)
Ensure property is absent
name [string] name of the zone
property [string] name of property

Note: This does a zonecfg clear call. So the property may be reset to a default value! Does has the side effect of always having to be called.

salt.states.zone.property_present(name, property, value)
Ensure property has a certain value
name [string] name of the zone
property [string] name of property
value [string] value of property

salt.states.zone.resource_absent(name, resource_type, resource_selector_property, resource_selector_value)
Ensure resource is absent
name [string] name of the zone
resource_type [string] type of resource
resource_selector_property [string] unique resource identifier
resource_selector_value [string] value for resource selection

Warning: Both resource_selector_property and resource_selector_value must be provided, some properties like `name` are already reserved by salt in there states.

Note: You can set both resource_selector_property and resource_selector_value to None for resources that do not require them.

salt.states.zone.resource_present(name, resource_type, resource_selector_property, resource_selector_value, **kwargs)
Ensure resource exists with provided properties
name [string] name of the zone
resource_type [string] type of resource
resource_selector_property [string] unique resource identifier
resource_selector_value [string] value for resource selection
kwargs [string|int|... resource properties

Warning: Both resource_selector_property and resource_selector_value must be provided, some properties like name are already reserved by salt in states.

Note: You can set both resource_selector_property and resource_selector_value to None for resources that do not require them.

salt.states.zone.uninstalled(name)
Ensure zone is uninstalled
name  [string] name of the zone

21.19.318  salt.states.zookeeper

   depends  kazoo

   configuration  See salt.modules.zookeeper for setup instructions.

ACLS

For more information about acls, please checkout the kazoo documentation.

http://kazoo.readthedocs.io/en/latest/api/security.html#kazoo.security.make_digest_acl

The following options can be included in the acl dictionary:

   param username  Username to use for the ACL.
   param password  A plain-text password to hash.
   param write  Write permission.
      type write  bool
   param create  Create permission.
      type create  bool
   param delete  Delete permission.
      type delete  bool
   param admin  Admin permission.
      type admin  bool
   param all  All permissions.
      type all  bool

salt.states.zookeeper.absent(name, version=-1, recursive=False, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)

Make sure znode is absent
name  path to znode
version  Specify the version which should be deleted Default: -1 (always match)
recursive  Boolean to indicate if children should be recursively deleted Default: False
profile  Configured Zookeeper profile to authenticate with (Default: None)
hosts  Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')
scheme  Scheme to authenticate with (Default: 'digest')
username  Username to authenticate (Default: None)
password  Password to authenticate (Default: None)
default_acl  Default acls to assign if a node is created in this connection (Default: None)

default_acls:
  zookeeper.absent:
     - name: /test
     - recursive: True

salt.states.zookeeper.acls(name, acls, version=-1, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)

Update acls on a znode
name  path to znode
acls  list of acl dictionaries to set on znode
version  Specify the version which should be deleted Default: -1 (always match)
profile  Configured Zookeeper profile to authenticate with (Default: None)
hosts  Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')
scheme  Scheme to authenticate with (Default: 'digest')
username  Username to authenticate (Default: None)
password  Password to authenticate (Default: None)
default_acl  Default acls to assign if a node is created in this connection (Default: None)

```python
update acls:
  zookeeper.acls:
    - name: /test/name
    - acls:
      - username: daniel
        password: test
        all: True
      - username: gtmanfred
        password: test
        all: True

salt.states.zookeeper.present(name, value, acls=None, ephemeral=False, sequence=False,
makepath=False, version=-1, profile=None, hosts=None,
scheme=None, username=None, password=None, default_acl=None)
```

Make sure znode is present in the correct state with the correct acls

name  path to znode
value  value znode should be set to
acls  list of acl dictionaries to set on znode (make sure the ones salt is connected with are included) Default: None
ephemeral  Boolean to indicate if ephemeral znode should be created Default: False
sequence  Boolean to indicate if znode path is suffixed with a unique index Default: False
makepath  Boolean to indicate if the parent paths should be created Default: False
version  For updating, specify the version which should be updated Default: -1 (always match)
profile  Configured Zookeeper profile to authenticate with (Default: None)
hosts  Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')
scheme  Scheme to authenticate with (Default: 'digest')
username  Username to authenticate (Default: None)
password  Password to authenticate (Default: None)
default_acl  Default acls to assign if a node is created in this connection (Default: None)

```python
add znode:
  zookeeper.present:
    - name: /test/name
    - value: gtmanfred
    - makepath: True

update znode:
  zookeeper.present:
    - name: /test/name
    - value: daniel
    - acls:
      - username: daniel
        password: test
        read: true
      - username: gtmanfred
```

(continues on next page)
| password: test |
| read: true |
| write: true |
| create: true |
| delete: true |
| admin: true |
| - makepath: True |

21.19.319 salt.states.zpool

States for managing zpools

maintainer Jorge Schrauwen <sjorge@blackdot.be>
maturity new
depends salt.utils.zfs, salt.modules.zpool
platform smartos, illumos, solaris, freebsd, linux

New in version 2016.3.0.

Changed in version 2018.3.1: Big refactor to remove duplicate code, better type conversions and improved consistancy in output.

| oldpool: |
| zpool.absent: |
| - export: true |

| newpool: |
| zpool.present: |
| - config: |
|   - import: false |
|   - force: true |
| - properties: |
|   - comment: salty storage pool |
| - layout: |
|   - mirror: |
|     - /dev/disk0 |
|     - /dev/disk1 |
| - mirror: |
|     - /dev/disk2 |
|     - /dev/disk3 |

| partitionpool: |
| zpool.present: |
| - config: |
|   - import: false |
|   - force: true |
| - properties: |
|   - comment: disk partition salty storage pool |
|   - ashift: 12 |
|   - feature@lz4_compress: enabled |
| - filesystem_properties: |
|   - compression: lz4 |
|   - atime: on |
|   - relatime: on |
- **layout**:  
  - /dev/disk/by-uuid/3e43ce94-77af-4f52-a91b-6cddbb0b0f41b

**simplepool:**

**zpool.present:**

- **config:**
  - import: false  
  - force: true

- **properties:**
  - comment: another salty storage pool

- **layout:**
  - /dev/disk0
  - /dev/disk1

**Warning:** The layout will never be updated, it will only be used at time of creation. It's a whole lot of work to figure out if a devices needs to be detached, removed, etc. This is best done by the sysadmin on a case per case basis.

Filesystem properties are also not updated, this should be managed by the zfs state module.

salt.states.zpool.absent(name, export=False, force=False)

ensure storage pool is absent on the system

- **name** [string] name of storage pool
- **export** [boolean] export instead of destroy the zpool if present
- **force** [boolean] force destroy or export

salt.states.zpool.present(name, properties=None, filesystem_properties=None, layout=None, config=None)

ensure storage pool is present on the system

- **name** [string] name of storage pool
- **properties** [dict] optional set of properties to set for the storage pool
- **filesystem_properties** [dict] optional set of filesystem properties to set for the storage pool (creation only)
- **layout** [dict] disk layout to use if the pool does not exist (creation only)
- **config** [dict] fine grain control over this state

**Note:**

The following configuration properties can be toggled in the config parameter.

- import (true) - try to import the pool before creating it if absent
- import_dirs (None) - specify additional locations to scan for devices on import (comma-separated)
- device_dir (None, SunOS=/dev/dsk, Linux=/dev) - specify device directory to prepend for none absolute device paths
- force (false) - try to force the import or creation

**Note:** It is no longer needed to give a unique name to each top-level vdev, the old layout format is still supported but no longer recommended.

- **mirror:**
  - /tmp/vdisk3
  - /tmp/vdisk2
- **mirror:**
  - /tmp/vdisk0
  - /tmp/vdisk1
The above yaml will always result in the following zpool create:

```
zpool create mypool mirror /tmp/vdisk3 /tmp/vdisk2 mirror /tmp/vdisk0 /tmp/vdisk1
```

**Warning:** The legacy format is also still supported but not recommended, because ID’s inside the layout dict must be unique they need to have a suffix.

<table>
<thead>
<tr>
<th>mirror-0:</th>
<th>mirror-1:</th>
</tr>
</thead>
<tbody>
<tr>
<td>/tmp/vdisk3</td>
<td>/tmp/vdisk0</td>
</tr>
<tr>
<td>/tmp/vdisk2</td>
<td>/tmp/vdisk1</td>
</tr>
</tbody>
</table>

**Warning:** Pay attention to the order of your dict!

```
- mirror:
- /tmp/vdisk0
- /tmp/vdisk1
- /tmp/vdisk2
```

The above will result in the following zpool create:

```
zpool create mypool mirror /tmp/vdisk0 /tmp/vdisk1 /tmp/vdisk2
```

Creating a 3-way mirror! While you probably expect it to be mirror root vdev with 2 devices + a root vdev of 1 device!

### 21.20 thorium modules

21.20.1 salt.thorium.calc module

Used to manage the thorium register. The thorium register is where compound values are stored and computed, such as averages etc.

New in version 2016.11.0.

depends statistics PyPi module

salt.thorium.calc.add(name, num, minimum=0, maximum=0, ref=None)

Adds together the num most recent values. Requires a list.

USAGE:

```python
foo:
calc.add:
   - name: myregentry
   - num: 5
```

salt.thorium.calc.calc(name, num, oper, minimum=0, maximum=0, ref=None)

Perform a calculation on the num most recent values. Requires a list. Valid values for oper are:

- add: Add last num values together
- mul: Multiple last num values together
- mean: Calculate mean of last num values
- median: Calculate median of last num values
- median_low: Calculate low median of last num values
- median_high: Calculate high median of last num values
- median_grouped: Calculate grouped median of last num values
- mode: Calculate mode of last num values

USAGE:

```python
foo:
calc.calc:
   - name: myregentry
   - num: 5
   - oper: mean
```

salt.thorium.calc.mean(name, num, minimum=0, maximum=0, ref=None)

Calculates the mean of the num most recent values. Requires a list.

USAGE:

```python
foo:
calc.mean:
   - name: myregentry
   - num: 5
```

salt.thorium.calc.median(name, num, minimum=0, maximum=0, ref=None)

Calculates the median of the num most recent values. Requires a list.

USAGE:

```python
foo:
calc.median:
   - name: myregentry
   - num: 5
```

salt.thorium.calc.median_grouped(name, num, minimum=0, maximum=0, ref=None)

Calculates the grouped mean of the num most recent values. Requires a list.
salt.thorium.calc.median_high(name, num, minimum=0, maximum=0, ref=None)
Calculates the high mean of the num most recent values. Requires a list.

Usage:

```python
foo:
    calc.median_high:
        - name: myregentry
        - num: 5
```

salt.thorium.calc.median_low(name, num, minimum=0, maximum=0, ref=None)
Calculates the low mean of the num most recent values. Requires a list.

Usage:

```python
foo:
    calc.median_low:
        - name: myregentry
        - num: 5
```

salt.thorium.calc.mode(name, num, minimum=0, maximum=0, ref=None)
Calculates the mode of the num most recent values. Requires a list.

Usage:

```python
foo:
    calc.mode:
        - name: myregentry
        - num: 5
```

salt.thorium.calc.mul(name, num, minimum=0, maximum=0, ref=None)
Multiplies together the num most recent values. Requires a list.

Usage:

```python
foo:
    calc.mul:
        - name: myregentry
        - num: 5
```

21.20.2 salt.thorium.check module

The check Thorium state is used to create gateways to commands, the checks make it easy to make states that watch registers for changes and then just succeed or fail based on the state of the register, this creates the pattern of having a command execution get gated by a check state via a requisite.

salt.thorium.check.contains(name, value, count_lt=None, count_lte=None, count_eq=None, count_gte=None, count_gt=None, count_ne=None)

Only succeed if the value in the given register location contains the given value.

Usage:
salt.thorium.check.eq(name, value)
Only succeed if the value in the given register location is equal to the given value

**USAGE:**

```
foo:
  check.eq:
    - value: 42
```

salt.thorium.check.event(name)
Checks for a specific event match and returns result True if the match happens

**USAGE:**

```
salt/foo/*/bar:
  check.event

run_remote_ex:
  local.cmd:
    - tgt: 'x'
    - func: test.ping
    - require:
      - check: salt/foo/*/bar
```

salt.thorium.check.gt(name, value)
Only succeed if the value in the given register location is greater than the given value

**USAGE:**

```
foo:
  check.gt:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: 'x'
    - func: test.ping
    - require:
      - check: foo
```
salt.thorium.check.gte(name, value)
Only succeed if the value in the given register location is greater or equal than the given value

USAGE:

```yaml
foo:
  check.gte:
    - value: 42
run_remote_ex:
  local.cmd:
    - tgt: *
    - func: test.ping
    - require:
      - check: foo
```

salt.thorium.check.len_eq(name, value)
Only succeed if the length of the given register location is equal to the given value.

USAGE:

```yaml
foo:
  check.len_eq:
    - value: 42
run_remote_ex:
  local.cmd:
    - tgt: *
    - func: test.ping
    - require:
      - check: foo
```

salt.thorium.check.len_gt(name, value)
Only succeed if length of the given register location is greater than the given value.

USAGE:

```yaml
foo:
  check.len_gt:
    - value: 42
run_remote_ex:
  local.cmd:
    - tgt: *
    - func: test.ping
    - require:
      - check: foo
```

salt.thorium.check.len_gte(name, value)
Only succeed if the length of the given register location is greater or equal than the given value.

USAGE:

```yaml
foo:
  check.len_gte:
    - value: 42
run_remote_ex:
  local.cmd:
    - tgt: *
    - func: test.ping
    - require:
      - check: foo
```

(continues on next page)
salt.thorium.check.len_lt(name, value)
  Only succeed if the length of the given register location is less than the given value.
  USAGE:

  ```
  foo:
    check.len_lt:
      - value: 42
  run_remote_ex:
    local.cmd:
      - tgt: '*'
      - func: test.ping
      - require:
        - check: foo
  ```

salt.thorium.check.len_lte(name, value)
  Only succeed if the length of the given register location is less than or equal the given value.
  USAGE:

  ```
  foo:
    check.len_lte:
      - value: 42
  run_remote_ex:
    local.cmd:
      - tgt: '*'
      - func: test.ping
      - require:
        - check: foo
  ```

salt.thorium.check.len_ne(name, value)
  Only succeed if the length of the given register location is not equal to the given value.
  USAGE:

  ```
  foo:
    check.len_ne:
      - value: 42
  run_remote_ex:
    local.cmd:
      - tgt: '*'
      - func: test.ping
      - require:
        - check: foo
  ```

salt.thorium.check.lt(name, value)
  Only succeed if the value in the given register location is less than the given value.
  USAGE:
foo:
  check.lt:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo

salt.thorium.check.lte(name, value)
Only succeed if the value in the given register location is less than or equal the given value

USAGE:

foo:
  check.lte:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo

salt.thorium.check.ne(name, value)
Only succeed if the value in the given register location is not equal to the given value

USAGE:

foo:
  check.ne:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo

21.20.3 salt.thorium.file module

Writes matches to disk to verify activity, helpful when testing

Normally this is used by giving the name of the file (without a path) that the data will be saved to. If for instance you use foo as the name:

Then the file will be saved to:

You may also provide an absolute path for the file to be saved to:

/tmp/foo.save:
  file.save
Files will be saved in JSON format. However, JSON does not support `set()`'s. If you are saving a register entry that contains a `set()`, then it will fail to save to JSON format. However, you may pass data through a filter which makes it JSON compliant:

```yaml
foo:
  file.save:
    filter: True
```

Be warned that if you do this, then the file will be saved, but not in a format that can be re-imported into Python.

```
salt.thorium.file.save(name, filter=False)
```

Save the register to `<salt cachedir>/thorium/saves/<name>`, or to an absolute path.

If an absolute path is specified, then the directory will be created non-recursively if it doesn’t exist.

**Usage:**

```yaml
foo:
  file.save
/tmp/foo:
  file.save
```

### 21.20.4 salt.thorium.key module

The key Thorium State is used to apply changes to the accepted/rejected/pending keys

New in version 2016.11.0.

```
salt.thorium.key.timeout(name, delete=0, reject=0)
```

If any minion’s status is older than the timeout value then apply the given action to the timed out key. This example will remove keys to minions that have not checked in for 300 seconds (5 minutes)

**Usage:**

```yaml
statreg:
  status.reg

clean_keys:
  key.timeout:
    - require:
      - status: statreg
    - delete: 300
```

### 21.20.5 salt.thorium.local module

Run remote execution commands via the local client

```
salt.thorium.local.cmd(name, tgt, func, arg=(), tgt_type='glob', ret=None, kwarg=None, **kwargs)
```

Execute a remote execution command

**Usage:**

```yaml
run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
```

(continues on next page)
21.20.6 salt.thorium.reg module

Used to manage the thorium register. The thorium register is where compound values are stored and computed, such as averages etc.

salt.thorium.reg.clear(name)
Clear the namespace from the register

**Usage:**

```python
clearns:
reg.clear:
    - name: myregister
```

salt.thorium.reg.delete(name)
Delete the namespace from the register

**Usage:**

```python
deletens:
reg.delete:
    - name: myregister
```

salt.thorium.reg.list_(name, add, match, stamp=False, prune=0)
Add the specified values to the named list

If `stamp` is True, then the timestamp from the event will also be added if `prune` is set to an integer higher than 0, then only the last `prune` values will be kept in the list.

**Usage:**

```python
foo:
reg.list:
    - add: bar
    - match: my/custom/event
    - stamp: True
```

salt.thorium.reg.mean(name, add, match)
Accept a numeric value from the matched events and store a running average of the values in the given register. If the specified value is not numeric it will be skipped

**Usage:**

```python
```
foo:
  reg.mean:
    - add: data_field
    - match: my/custom/event

salt.thorium.reg.set_(name, add, match)
Add a value to the named set

USAGE:

foo:
  reg.set:
    - add: bar
    - match: my/custom/event

21.20.7 salt.thorium.runner module

React by calling asynchronous runners

salt.thorium.runner.cmd(name, func=None, arg=(), **kwargs)
Execute a runner asynchronous:

USAGE:

run_cloud:
  runner.cmd:
    - func: cloud.create
    - arg:
      - my-ec2-config
      - myinstance
run_cloud:
  runner.cmd:
    - func: cloud.create
    - kwargs:
      provider: my-ec2-config
      instances: myinstance

21.20.8 salt.thorium.status module

This thorium state is used to track the status beacon events and keep track of the active status of minions
New in version 2016.11.0.

salt.thorium.status.reg(name)
Activate this register to turn on a minion status tracking register, this register keeps the current status beacon data and the time that each beacon was last checked in.

21.20.9 salt.thorium.timer module

Allow for flow based timers. These timers allow for a sleep to exist across multiple runs of the flow

salt.thorium.timer.hold(name, seconds)
Wait for a given period of time, then fire a result of True, requiring this state allows for an action to be blocked for evaluation based on time
USAGE:

```python
hold_on_a_moment:
    timer.hold:
        - seconds: 30
```

21.20.10 salt.thorium.wheel module

React by calling asynchronous runners

```python
salt.thorium.wheel.cmd(name, fun=None, arg=(), **kwargs)
```

Execute a runner asynchronous:

```python
run_cloud:
    wheel.cmd:
        - fun: key.delete
        - match: minion_id
```

21.21 master tops modules

</tbody>
</table>

21.21.1 salt.tops.cobbler

Cobbler Tops

Cobbler Tops is a master tops subsystem used to look up mapping information from Cobbler via its API. The same cobbler* parameters are used for both the Cobbler tops and Cobbler pillar modules.

```yaml
master_tops:
    cobbler: {}
    cobbler.url: https://example.com/cobbler_api #default is http://localhost/cobbler_api
    cobbler.user: username # default is no username
    cobbler.password: password # default is no password
```

Module Documentation

```python
salt.tops.cobbler.top(**kwargs)
```

Look up top data in Cobbler for a minion.

21.21.2 salt.tops.ext_nodes
External Nodes Classifier

The External Nodes Classifier is a master tops subsystem that retrieves mapping information from major configuration management systems. One of the most common external nodes classifiers system is provided by Cobbler and is called cobbler-ext-nodes.

The cobbler-ext-nodes command can be used with this configuration:

```
master_tops:
    ext_nodes: cobbler-ext-nodes
```

It is noteworthy that the Salt system does not directly ingest the data sent from the cobbler-ext-nodes command, but converts the data into information that is used by a Salt top file.

Any command can replace the call to 'cobbler-ext-nodes' above, but currently the data must be formatted in the same way that the standard 'cobbler-ext-nodes' does.

See (admittedly degenerate and probably not complete) example:

```
classes:
    - basepackages
    - database
```

The above essentially is the same as a top.sls containing the following:

```
base:
    '*':
        - basepackages
        - database
```

salt.tops.ext_nodes.top(**kwargs)

Run the command configured

21.21.3 salt.tops.mongo

Read tops data from a mongodb collection

This module will load tops data from a mongo collection. It uses the node's id for lookups.

Salt Master Mongo Configuration

The module shares the same base mongo connection variables as salt.returners.mongo_return. These variables go in your master config file.

- **mongo.db** - The mongo database to connect to. Defaults to 'salt'.
- **mongo.host** - The mongo host to connect to. Supports replica sets by specifying all hosts in the set, comma-delimited. Defaults to 'salt'.
- **mongo.port** - The port that the mongo database is running on. Defaults to 27017.
- **mongo.user** - The username for connecting to mongo. Only required if you are using mongo authentication. Defaults to ''. 
- **mongo.password** - The password for connecting to mongo. Only required if you are using mongo authentication. Defaults to ''. 

### Configuring the Mongo Tops Subsystem

```
master_tops:
  mongo:
    collection: tops
    id_field: _id
    re_replace: ''
    re_pattern: \.example\.com
    states_field: states
    environment_field: environment
```

### Module Documentation

**salt.tops.mongo.top(**kwargs)**

Connect to a mongo database and read per-node tops data.

**Parameters**

- **collection** (*) - The mongodb collection to read data from. Defaults to 'tops'.
- **id_field** (*) - The field in the collection that represents an individual minion id. Defaults to '_id'.
- **re_pattern** (*) - If your naming convention in the collection is shorter than the minion id, you can use this to trim the name. `re_pattern` will be used to match the name, and `re_replace` will be used to replace it. Backrefs are supported as they are in the Python standard library. If `None`, no mangling of the name will be performed - the collection will be searched with the entire minion id. Defaults to `None`.
- **re_replace** (*) - Use as the replacement value in node ids matched with `re_pattern`. Defaults to ''. Feel free to use backreferences here.
- **states_field** (*) - The name of the field providing a list of states.
- **environment_field** (*) - The name of the field providing the environment. Defaults to `environment`.

#### 21.21.4 **salt.tops.reclass_adapter**

Read tops data from a reclass database

This `master_tops` plugin provides access to the `reclass` database, such that state information (top data) are retrieved from `reclass`.

You can find more information about `reclass` at [http://reclass.pantsfullofunix.net](http://reclass.pantsfullofunix.net).

To use the plugin, add it to the `master_tops` list in the Salt master config and tell `reclass` by way of a few options how and where to find the inventory:

```
master_tops:
  reclass:
    storage_type: yaml_fs
    inventory_base_uri: /srv/salt
```

This would cause `reclass` to read the inventory from YAML files in `/srv/salt/nodes` and `/srv/salt/classes`.

---

**21.21. master tops modules** 3737
If you are also using `reclass` as `ext_pillar` plugin, and you want to avoid having to specify the same information for both, use YAML anchors (take note of the differing data types for `ext_pillar` and `master_tops`):

```yaml
reclass: &reclass
  storage_type: yaml_fs
  inventory_base_uri: /srv/salt
  reclass_source_path: ~/code/reclass

ext_pillar:
  - reclass: *reclass

master_tops:
  reclass: *reclass
```

If you want to run reclass from source, rather than installing it, you can either let the master know via the `PYTHONPATH` environment variable, or by setting the configuration option, like in the example above.

```python
salt.tops.reclass_adapter.top(**kwargs)
Query reclass for the top data (states of the minions).
```

### 21.21.5 `salt.tops.saltclass`

**Saltclass Configuration**

```yaml
master_tops:
  saltclass:
    path: /srv/saltclass
```

**Description**

This module clones the behaviour of reclass ([http://reclass.pantsfullofunix.net/](http://reclass.pantsfullofunix.net/)), without the need of an external app, and add several features to improve flexibility. Saltclass lets you define your nodes from simple yaml files (.yml) through hierarchical class inheritance with the possibility to override pillars down the tree.

**Features**

- Define your nodes through hierarchical class inheritance
- Reuse your reclass datas with minimal modifications
  - applications => states
  - parameters => pillars
- Use Jinja templating in your yaml definitions
- Access to the following Salt objects in Jinja
  - `__opts__`
  - `__salt__`
  - `__grains__`
  - `__pillars__`
  - `minion_id`
- Chose how to merge or override your lists using ^ character (see examples)
- Expand variables $[] with possibility to escape them if needed $[] (see examples)
- Ignores missing node/class and will simply return empty without breaking the pillar module completely - will be logged

An example subset of datas is available here: [http://git.mauras.ch/salt/saltclass/src/master/examples](http://git.mauras.ch/salt/saltclass/src/master/examples)

<table>
<thead>
<tr>
<th>Terms usable in yaml files</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>classes</td>
<td>A list of classes that will be processed in order</td>
</tr>
<tr>
<td>states</td>
<td>A list of states that will be returned by master_tops function</td>
</tr>
<tr>
<td>pillars</td>
<td>A yaml dictionary that will be returned by the ext_pillar function</td>
</tr>
<tr>
<td>environment</td>
<td>Node saltenv that will be used by master_tops</td>
</tr>
</tbody>
</table>

A class consists of:
- zero or more parent classes
- zero or more states
- any number of pillars

A child class can override pillars from a parent class. A node definition is a class in itself with an added environment parameter for saltenv definition.

**Class names**

Class names mimic salt way of defining states and pillar files. This means that default.users class name will correspond to one of these:

- `<saltclass_path>/classes/default/users.yml`
- `<saltclass_path>/classes/default/users/init.yml`

**Saltclass file hierachy**

A saltclass tree would look like this:

```
<saltclass_path>
  └── classes
      ├── app
      │   └── server.yml
      │   └── ssh
      │       └── server.yml
      └── default
          ├── init.yml
          ├── motd.yml
          └── users.yml
      └── roles
          └── app.yml
              └── nginx
                  └── init.yml
                  └── server.yml
          └── subsidiaries

```

(continues on next page)
Saltclass Examples

<saltclass_path>/nodes/lausanne/qls.node1.yml

environment: base

classes:
{% for class in ['default'] %}
  - {{ class }}
{% endfor %}
- subsidiaries.{{ __grains__['id'].split('.')[0] }}

<saltclass_path>/classes/default/init.yml

classes:
  - default.users
  - default.motd

states:
  - openssh

pillars:
  default:
    network:
      dns:
        srv1: 192.168.0.1
        srv2: 192.168.0.2
        domain: example.com
      ntp:
        srv1: 192.168.10.10
        srv2: 192.168.10.20

<saltclass_path>/classes/subsidiaries/gnv.yml

pillars:
  default:
    network:
      sub: Geneva
Variable expansions

Escaped variables are rendered as is: ${test}

Missing variables are rendered as is: ${net:dns:srv2}

List override

Not using `^` as the first entry will simply merge the lists

Note: Known limitation

Currently you can’t have both a variable and an escaped variable in the same string as the escaped one will not be correctly rendered - `${xx}` will stay as is instead of being rendered as `${xx}`
**21.21.6 salt.tops.varstack_top**

Use **Varstack** to provide tops data

This **master_top** plugin provides access to the **varstack** hierarchical yaml files, so you can use **varstack** as a full **external node classifier** and store state information (top data) in it.

**Configuring Varstack**

To use varstack as a master top external node classifier, install varstack as documented. Then, add to your master’s configuration:

```yaml
master_tops:
  varstack: /path/to/the/config/file/varstack.yaml
```

Varstack will then use `/path/to/the/config/file/varstack.yaml` (usually `/etc/varstack.yaml`) to determine which configuration data to return as adapter information. From there you can take a look at the `README` of varstack to learn how this file is evaluated. The ENC part will just return the ‘states’ dictionary for the node.

Ie, if my.fqdn.yaml file contains:

```yaml
---
states:
  - sudo
  - openssh
  - apache
  - salt.minion
```

these will be returned as `{‘base’: [‘sudo’, ‘openssh’, ‘apache’, ‘salt.minion’]}` and managed by salt as if given from a top.sls file.

**21.22 wheel modules**

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>config</strong></td>
<td>Manage the master configuration file</td>
</tr>
<tr>
<td><strong>error</strong></td>
<td>Error generator to enable integration testing of salt wheel error handling</td>
</tr>
<tr>
<td><strong>file_roots</strong></td>
<td>Read in files from the file_root and save files to the file root</td>
</tr>
<tr>
<td><strong>key</strong></td>
<td>Wheel system wrapper for the Salt key system to be used in interactions with the Salt Master programmatically.</td>
</tr>
<tr>
<td><strong>minions</strong></td>
<td>Wheel system wrapper for connected minions</td>
</tr>
<tr>
<td><strong>pillar_roots</strong></td>
<td>The <code>pillar_roots</code> wheel module is used to manage files under the pillar roots directories on the master server.</td>
</tr>
</tbody>
</table>
21.22.1 salt.wheel.config

Manage the master configuration file

salt.wheel.config.apply(key, value)
Set a single key

Note: This will strip comments from your config file

salt.wheel.config.update_config(file_name, yaml_contents)
Update master config with yaml_contents.

Writes yaml_contents to a file named file_name.conf under the folder specified by default_include. This folder is named master.d by default. Please look at include-configuration for more information.

Example low data:

```python
data = {
    'username': 'salt',
    'password': 'salt',
    'fun': 'config.update_config',
    'file_name': 'gui',
    'yaml_contents': {'id': 1},
    'client': 'wheel',
    'eauth': 'pam',
}
```

salt.wheel.config.values()
Return the raw values of the config file

21.22.2 salt.wheel.error

Error generator to enable integration testing of salt wheel error handling

salt.wheel.error.error(name=None, message=“”)
If name is None Then return empty dict

Otherwise raise an exception with __name__ from name, message from message

CLI Example:

```
salt-wheel error
salt-wheel error.error name="Exception" message="This is an error."
```

21.22.3 salt.wheel.file_roots

Read in files from the file_root and save files to the file root

salt.wheel.file_roots.find(path, saltenv='base')
Return a dict of the files located with the given path and environment

salt.wheel.file_roots.list_env(saltenv='base')
Return all of the file paths found in an environment

salt.wheel.file_roots.list_roots()
Return all of the files names in all available environments
Salt Documentation, Release 2019.2.0

salt.wheel.file_roots.read(path, saltenv='base')
Read the contents of a text file, if the file is binary then

salt.wheel.file_roots.write(data, path, saltenv='base', index=0)
Write the named file, by default the first file found is written, but the index of the file can be specified to write to a lower priority file root

21.22.4 salt.wheel.key

Wheel system wrapper for the Salt key system to be used in interactions with the Salt Master programmatically.

The key module for the wheel system is meant to provide an internal interface for other Salt systems to interact with the Salt Master. The following usage examples assume that a WheelClient is available:

```python
import salt.config
import salt.wheel
opts = salt.config.master_config('/etc/salt/master')
wheel = salt.wheel.WheelClient(opts)
```

Note that importing and using the WheelClient must be performed on the same machine as the Salt Master and as the same user that runs the Salt Master, unless external_auth is configured and the user is authorized to execute wheel functions.

The function documentation starts with the wheel reference from the code sample above and use the WheelClient functions to show how they can be called from a Python interpreter.

The wheel key functions can also be called via a salt command at the CLI using the saltutil execution module.

salt.wheel.key.accept(match, include_rejected=False, include_denied=False)
Accept keys based on a glob match. Returns a dictionary.

match The glob match of keys to accept.
include_rejected To include rejected keys in the match along with pending keys, set this to True. Defaults to False.
include_denied To include denied keys in the match along with pending keys, set this to True. Defaults to False.

```python
>>> wheel.cmd('key.accept', ['minion1'])
{'minions': ['minion1']}
```

salt.wheel.key.accept_dict(match, include_rejected=False, include_denied=False)
Accept keys based on a dict of keys. Returns a dictionary.

match The dictionary of keys to accept.
include_rejected To include rejected keys in the match along with pending keys, set this to True. Defaults to False.
include_denied To include denied keys in the match along with pending keys, set this to True. Defaults to False.

New in version 2016.3.4.

Example to move a list of keys from the minions_pre (pending) directory to the minions (accepted) directory:

```python
>>> wheel.cmd('key.accept_dict',
            {
                'minions': ['minion1'],
                'minions_pre': [
```
salt.wheel.key.delete(match)
Delete keys based on a glob match. Returns a dictionary.
match The glob match of keys to delete.

```python
>>> wheel.cmd_async({'fun': 'key.delete', 'match': 'minion1'})
{'jid': '20160826201244808521', 'tag': 'salt/wheel/20160826201244808521'}
```

salt.wheel.key.delete_dict(match)
Delete keys based on a dict of keys. Returns a dictionary.
match The dictionary of keys to delete.

```python
>>> wheel.cmd_async({'fun': 'key.delete_dict', 'match': {'minions': ['jerry', 'stuart', 'bob'],}}

{'jid': '20160826201244808521', 'tag': 'salt/wheel/20160826201244808521'}
```

salt.wheel.key.finger(match, hash_type=None)
Return the matching key fingerprints. Returns a dictionary.
match The key for with to retrieve the fingerprint.
hash_type The hash algorithm used to calculate the fingerprint

```python
>>> wheel.cmd('key.finger', ['minion1'])
```

salt.wheel.key.finger_master(hash_type=None)
Return the fingerprint of the master’s public key
hash_type The hash algorithm used to calculate the fingerprint

```python
>>> wheel.cmd('key.finger_master')
```

salt.wheel.key.gen(id_=None, keysize=2048)
Generate a key pair. No keys are stored on the master. A key pair is returned as a dict containing pub and priv keys. Returns a dictionary containing the the pub and priv keys with their generated values.
id_ Set a name to generate a key pair for use with salt. If not specified, a random name will be specified.
keysize The size of the key pair to generate. The size must be 2048, which is the default, or greater. If set to a value less than 2048, the key size will be rounded up to 2048.

```python
>>> wheel.cmd('key.gen')
{'pub': '-----BEGIN PUBLIC KEY-----
MIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBC
...BBPfamX9gGPQtPn9e8HwcZjXQnmg80rcULi0WHw09SDWL0nW+ueTwugE0pPt\nQiIDAQAB

      ----END PUBLIC KEY-----'}
```
salt.wheel.key.gen_accept(id_, keysize=2048, force=False)
Generate a key pair then accept the public key. This function returns the key pair in a dict, only the public key is preserved on the master. Returns a dictionary.
id_ The name of the minion for which to generate a key pair.
keysize The size of the key pair to generate. The size must be 2048, which is the default, or greater. If set to a value less than 2048, the key size will be rounded up to 2048.
force If a public key has already been accepted for the given minion on the master, then the gen_accept function will return an empty dictionary and not create a new key. This is the default behavior. If force is set to True, then the minion’s previously accepted key will be overwritten.

```python
>>> wheel.cmd('key.gen_accept', ['foo'])
{'pub': '-----BEGIN PUBLIC KEY-----
MIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBC
...BBPfamX9gGPQTPN9e8HwczJXQnmg8OrCul10WHw09SDWL0jnW+ueTWugEqPt\niQIDAQAB\n
-----END PUBLIC KEY-----',
'priv': '-----BEGIN RSA PRIVATE KEY-----
MIIEpAIBAAKCAQEA42Kf+w9XeZWgguzv
...QH3/W74X1+WTBlx4R2KGLYBiH+bCCFEQ/Zvcu4Xp4bIOPtRKozEQ==\n
-----END RSA PRIVATE KEY-----'}
```

We can now see that the `foo` minion’s key has been accepted by the master:

```python
>>> wheel.cmd('key.list', ['accepted'])
{'minions': ['foo', 'minion1', 'minion2', 'minion3']}
```

salt.wheel.key.gen_keys(keydir=None, keyname=None, keysize=None, user=None)
Generate minion RSA public keypair

salt.wheel.key.gen_signature(priv, pub, signature_path, auto_create=False, keysize=None)
Generate master public-key-signature

salt.wheel.key.key_str(match)
Return information about the key. Returns a dictionary.
match The key to return information about.

```python
>>> wheel.cmd('key.key_str', ['minion1'])
{'minions': {'minion1': '-----BEGIN PUBLIC KEY-----\nMIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBC
...TWugEqPt\niQIDAQAB\n
-----END PUBLIC KEY-----'}}
```

salt.wheel.key.list_(match)
List all the keys under a named status. Returns a dictionary.
match The type of keys to list. The pre, un, and unaccepted options will list unaccepted/unsigned keys. acc or accepted will list accepted/signed keys. rej or rejected will list rejected keys. Finally, all will list all keys.

```python
>>> wheel.cmd('key.list_', ['accepted'])
{'minions': ['minion1', 'minion2', 'minion3']}
```

salt.wheel.key.list_all()
List all the keys. Returns a dictionary containing lists of the minions in each salt-key category, including
minions, minions_rejected, minions_denied, etc. Returns a dictionary.

>>> wheel.cmd('key.list_all')
{'local': ['master.pem', 'master.pub'], 'minions_rejected': [],
 'minions_denied': [], 'minions_pre': [],
 'minions': ['minion1', 'minion2', 'minion3']}

salt.wheel.key.name_match(match)
List all the keys based on a glob match

dict(wheel.key.reject(match, include_accepted=False, include_denied=False))
Reject keys based on a glob match. Returns a dictionary.

match The glob match of keys to reject.

include_accepted To include accepted keys in the match along with pending keys, set this to True. Defaults to False.

include_denied To include denied keys in the match along with pending keys, set this to True. Defaults to False.

>>> wheel.cmd_async({'fun': 'key.reject', 'match': 'minion1'})
{'jid': '2016082620124480521', 'tag': 'salt/wheel/2016082620124480521'}

salt.wheel.key.reject_dict(match, include_accepted=False, include_denied=False)
Reject keys based on a dict of keys. Returns a dictionary.

match The dictionary of keys to reject.

include_accepted To include accepted keys in the match along with pending keys, set this to True. Defaults to False.

include_denied To include denied keys in the match along with pending keys, set this to True. Defaults to False.

New in version 2016.3.4.

>>> wheel.cmd_async({'fun': 'key.reject_dict',
                   'match': {
                     'minions': [
                         'jerry',
                         'stuart',
                         'bob',
                     ],
                   }},
                   {'jid': '2016082620124480521', 'tag': 'salt/wheel/2016082620124480521'}

21.22.5 salt.wheel.minions

Wheel system wrapper for connected minions

salt.wheel.minions.connected()
List all connected minions on a salt-master

21.22.6 salt.wheel.pillar_roots

The pillar_roots wheel module is used to manage files under the pillar roots directories on the master server.

salt.wheel.pillar_roots.find(path, saltenv='base')
Return a dict of the files located with the given path and environment
salt.wheel.pillar_roots.list_env(saltenv='base')
    Return all of the file paths found in an environment

salt.wheel.pillar_roots.list_roots()
    Return all of the files names in all available environments

salt.wheel.pillar_roots.read(path, saltenv='base')
    Read the contents of a text file, if the file is binary then

salt.wheel.pillar_roots.write(data, path, saltenv='base', index=0)
    Write the named file, by default the first file found is written, but the index of the file can be specified to write
to a lower priority file root
22.1 Python client API

Salt provides several entry points for interfacing with Python applications. These entry points are often referred to as `Client()` APIs. Each client accesses different parts of Salt, either from the master or from a minion. Each client is detailed below.

See also:

There are many ways to access Salt programmatically.

Salt can be used from CLI scripts as well as via a REST interface.

See Salt’s `outputter system` to retrieve structured data from Salt as JSON, or as shell-friendly text, or many other formats.

See the `state.event` runner to utilize Salt’s event bus from shell scripts.

Salt’s `netapi module` provides access to Salt externally via a REST interface. Review the `netapi module` documentation for more information.

22.1.1 Salt’s `opts` dictionary

Some clients require access to Salt’s `opts` dictionary. (The dictionary representation of the `master` or `minion` config files.)

A common pattern for fetching the `opts` dictionary is to defer to environment variables if they exist or otherwise fetch the config from the default location.

```python
salt.config.client_config(path, env_var='SALT_CLIENT_CONFIG', defaults=None)
```

Load Master configuration data

Usage:

```python
import salt.config
master_opts = salt.config.client_config('/etc/salt/master')
```

Returns a dictionary of the Salt Master configuration file with necessary options needed to communicate with a locally-running Salt Master daemon. This function searches for client specific configurations and adds them to the data from the master configuration.

This is useful for master-side operations like `LocalClient`. 
salt.config.minion_config(path, env_var='SALT_MINION_CONFIG', defaults=None, cache_minion_id=False, ignore_config_errors=True, minion_id=None, role='minion')

Reads in the minion configuration file and sets up special options.
This is useful for Minion-side operations, such as the Caller class, and manually running the loader interface.

```python
import salt.config
minion_opts = salt.config.minion_config('/etc/salt/minion')
```

### 22.1.2 Salt’s Loader Interface

Modules in the Salt ecosystem are loaded into memory using a custom loader system. This allows modules to have conditional requirements (OS, OS version, installed libraries, etc) and allows Salt to inject special variables (__salt__, __opts__, etc).

Most modules can be manually loaded. This is often useful in third-party Python apps or when writing tests. However, some modules require and expect a full, running Salt system underneath. Notably, modules that facilitate master-to-minion communication such as the mine, publish, and peer execution modules. The error `KeyError: 'master_uri'` is a likely indicator for this situation. In those instances, use the Caller class to execute those modules instead.

Each module type has a corresponding loader function.

salt.loader.minion_mods(opts, context=None, utils=None, whitelist=None, initial_load=False, loaded_base_name=None, notify=False, static_modules=None, proxy=None)

Load execution modules.

Returns a dictionary of execution modules appropriate for the current system by evaluating the __virtual__() function in each module.

**Parameters**

- `opts (dict)` - The Salt options dictionary
- `context (dict)` - A Salt context that should be made present inside generated modules in __context__
- `utils (dict)` - Utility functions which should be made available to Salt modules in __utils__. See utils_dirs in salt.config for additional information about configuration.
- `whitelist (list)` - A list of modules which should be whitelisted.
- `initial_load (bool)` - Deprecated flag! Unused.
- `loaded_base_name (str)` - A string marker for the loaded base name.
- `notify (bool)` - Flag indicating that an event should be fired upon completion of module loading.

```python
import salt.config
import salt.loader
__opts__ = salt.config.minion_config('/etc/salt/minion')
__grains__ = salt.loader.grains(__opts__)
__opts__['grains'] = __grains__
__utils__ = salt.loader.utils(__opts__)
__salt__ = salt.loader.minion_mods(__opts__, __utils__)
__salt__['test.ping']()

salt.loader.raw_mod(opts, name, functions, mod='modules')

Returns a single module loaded raw and bypassing the __virtual__ function.
```
salt.config

import salt.config
import salt.loader

__opts__ = salt.config.minion_config('/etc/salt/minion')
testmod = salt.loader.raw_mod(__opts__, 'test', None)
testmod['test.ping']()

salt.loader.states

Returns the state modules

Parameters

- **opts** (*dict*) – The Salt options dictionary
- **functions** (*dict*) – A dictionary of minion modules, with module names as keys and funcs as values.

salt.loader.grains

Return the functions for the dynamic grains and the values for the static grains.

Since grains are computed early in the startup process, grains functions do not have __salt__ or __proxy__ available. At proxy-minion startup, this function is called with the proxymodule LazyLoader object so grains functions can communicate with their controlled device.

salt.loader.grain_funcs

Returns the grain functions

22.1.3 Salt’s Client Interfaces

LocalClient

class salt.client.LocalClient(c_path='/etc/salt/master', mopts=None, skip_perm_errors=False, io_loop=None, keep_loop=False, auto_reconnect=False)

The interface used by the salt CLI tool on the Salt Master

LocalClient is used to send a command to Salt minions to execute execution modules and return the results to the Salt Master.

Importing and using LocalClient must be done on the same machine as the Salt Master and it must be done using the same user that the Salt Master is running as. (Unless external_auth is configured and
authentication credentials are included in the execution).

**Note:** The LocalClient uses a Tornado IOLoop, this can create issues when using the LocalClient inside an existing IOLoop. If creating the LocalClient in partnership with another IOLoop either create the IOLoop before creating the LocalClient, or when creating the IOLoop use ioloop.current() which will return the ioloop created by LocalClient.

```python
import salt.client
local = salt.client.LocalClient()
local.cmd('*', 'test.fib', [10])
```

The `cmd` method will execute and wait for the timeout period for all minions to reply, then it will return all minion data at once.

```python
def cmd(tgt, fun, arg=(), timeout=None, tgt_type='glob', ret='', jid='', full_return=False, kwarg=None, **kwargs):
    """Synchronously execute a command on targeted minions"

    The cmd method will execute and wait for the timeout period for all minions to reply, then it will return all minion data at once.

    >>> import salt.client
    >>> local = salt.client.LocalClient()
    >>> local.cmd('*', 'cmd.run', ['whoami'])
    {'jerry': 'root'}

    With extra keyword arguments for the command function to be run:

    local.cmd('*', 'test.arg', ['arg1', 'arg2'], kwarg={'foo': 'bar'})

    Compound commands can be used for multiple executions in a single publish. Function names and function arguments are provided in separate lists but the index values must correlate and an empty list must be used if no arguments are required.

    >>> local.cmd('*', [  
    # 'grains.items',  
    'sys.doc',  
    'cmd.run',  
    ],  
    [  
        [],  
        [],  
        ['uptime'],  
    ])

    Parameters
    • **tgt**(string or list) – Which minions to target for the execution. Default is shell glob. Modified by the tgt_type option.
    • **fun**(string or list of strings) – The module and function to call on the specified minions of the form module.function. For example test.ping or grains.items.

    **Compound commands** Multiple functions may be called in a single publish by passing a list of commands. This can dramatically lower overhead and speed up the application communicating with Salt.

    This requires that the arg param is a list of lists. The fun list and the arg list must correlate by index meaning a function that does not take
arguments must still have a corresponding empty list at the expected index.

- `arg(list or list-of-lists)` - A list of arguments to pass to the remote function. If the function takes no arguments `arg` may be omitted except when executing a compound command.

- `timeout` - Seconds to wait after the last minion returns but before all minions return.

- `tgt_type` - The type of `tgt`. Allowed values:
  - `glob` - Bash glob completion - Default
  - `pcre` - Perl style regular expression
  - `list` - Python list of hosts
  - `grain` - Match based on a grain comparison
  - `grain_pcre` - Grain comparison with a regex
  - `pillar` - Pillar data comparison
  - `pillar_pcre` - Pillar data comparison with a regex
  - `nodegroup` - Match on nodegroup
  - `range` - Use a Range server for matching
  - `compound` - Pass a compound match string
  - `ipcidr` - Match based on Subnet (CIDR notation) or IPv4 address.

  Changed in version 2017.7.0: Renamed from `expr_form` to `tgt_type`

- `ret` - The returner to use. The value passed can be single returner, or a comma delimited list of returners to call in order on the minions

- `kwarg` - A dictionary with keyword arguments for the function.

- `full_return` - Output the job return only (default) or the full return including exit code and other job metadata.

- `kwargs` - Optional keyword arguments. Authentication credentials may be passed when using `external_auth`.

For example:

```python
local.cmd('*', 'test.ping', username='saltdev', password='saltdev', eauth='pam').
```

Or:

```python
local.cmd('*', 'test.ping', token='5871821ea51754fdcea8153c1c745433')
```

Returns A dictionary with the result of the execution, keyed by minion ID. A compound command will return a sub-dictionary keyed by function name.

```python
cmd_async(tgt, fun, arg=(), tgt_type='glob', ret=''', jid=''', kwarg=None, **kwargs)
```

Asynchronously send a command to connected minions

The function signature is the same as `cmd()` with the following exceptions.

Returns A job ID or 0 on failure.

```python
>>> local.cmd_async('*', 'test.sleep', [300])
20131219215921857715'
```

```python
cmd_batch(tgt, fun, arg=(), tgt_type='glob', ret=''', jid=''', kwarg=None, batch='10%', **kwargs)
```

Iteratively execute a command on subsets of minions at a time

The function signature is the same as `cmd()` with the following exceptions.

Parameters batch - The batch identifier of systems to execute on

Returns A generator of minion returns

```python
>>> returns = local.cmd_batch('*', 'state.highstate', batch='10%')

for ret in returns:
    print(ret)
    {'jerry': {...}}
    {'dave': {...}}
    {'stewart': {...}}
```
**cmd_iter** *(tgt, fun, arg=(), timeout=None, tgt_type='glob', ret='', kwarg=None, **kwargs)*

Yields the individual minion returns as they come in.

The function signature is the same as **cmd()** with the following exceptions.

Normally **cmd_iter()** does not yield results for minions that are not connected. If you want it to return results for disconnected minions set **expect_minions**=`True` in **kwargs**.

**Returns** A generator yielding the individual minion returns.

```python
>>> ret = local.cmd_iter('*','test.ping')
>>> for i in ret:
...     print(i)
{'jerry': {'ret': True}}
{'dave': {'ret': True}}
{'stewart': {'ret': True}}
```

**cmd_iter_no_block** *(tgt, fun, arg=(), timeout=None, tgt_type='glob', ret='', kwarg=None, show_jid=False, verbose=False, **kwargs)*

Yields the individual minion returns as they come in, or **None** when no returns are available.

The function signature is the same as **cmd()** with the following exceptions.

**Returns** A generator yielding the individual minion returns, or None when no returns are available. This allows for actions to be injected in between minion returns.

```python
>>> ret = local.cmd_iter_no_block('*','test.ping')
>>> for i in ret:
...     print(i)
None
{'jerry': {'ret': True}}
{'dave': {'ret': True}}
None
{'stewart': {'ret': True}}
```

**cmd_subset** *(tgt, fun, arg=(), tgt_type='glob', ret='', kwarg=None, sub=3, cli=False, progress=False, full_return=False, **kwargs)*

Execute a command on a random subset of the targeted systems.

The function signature is the same as **cmd()** with the following exceptions.

**Parameters**

- **sub** – The number of systems to execute on
- **cli** – When this is set to True, a generator is returned, otherwise a dictionary of the minion returns is returned

```python
>>> SLC.cmd_subset('*','test.ping', sub=1)
{'jerry': True}
```

**get_cli_returns** *(jid, minions, timeout=None, tgt='*', tgt_type='glob', verbose=False, show_jid=False, **kwargs)*

Starts a watcher looking at the return data for a specified JID.

**Returns** all of the information for the JID.

**get_event_iter_returns** *(jid, minions, timeout=None)*

Gather the return data from the event system, break hard when timeout is reached.

**run_job** *(tgt, fun, arg=(), tgt_type='glob', ret='', timeout=None, jid='', kwarg=None, listen=False, **kwargs)*

Asynchronously send a command to connected minions.

Prep the job directory and publish a command to any targeted minions.
Returns A dictionary of (validated) `pub_data` or an empty dictionary on failure. The `pub_data` contains the job ID and a list of all minions that are expected to return data.

```python
>>> local.run_job('*', 'test.sleep', [300])
{'jid': '20131219215650131543', 'minions': ['jerry']}
```

Salt Caller

class salt.client.Caller(c_path='etc/salt/minion', mopts=None)

Caller is the same interface used by the `salt-call` command-line tool on the Salt Minion.

Changed in version 2015.8.0: Added the `cmd` method for consistency with the other Salt clients. The existing `function` and `sminion.functions` interfaces still exist but have been removed from the docs.

Importing and using `Caller` must be done on the same machine as a Salt Minion and it must be done using the same user that the Salt Minion is running as.

Usage:

```python
import salt.client
caller = salt.client.Caller()
caller.cmd('test.ping')
```

Note, a running master or minion daemon is not required to use this class. Running `salt-call --local` simply sets `file_client` to `'local'`. The same can be achieved at the Python level by including that setting in a minion config file.

New in version 2014.7.0: Pass the minion config as the `mopts` dictionary.

```python
import salt.client
import salt.config
__opts__ = salt.config.minion_config('/etc/salt/minion')
__opts__['file_client'] = 'local'
caller = salt.client.Caller(mopts=__opts__)
```

```python
caller.cmd('test.arg', 'Foo', 'Bar', baz='Baz')
caller.cmd('event.send', 'myco/myevent/something',
            data={'foo': 'Foo'}, with_env=['GIT_COMMITTER'], with_grains=True)
```

Salt Proxy Caller

class salt.client.ProxyCaller(c_path='etc/salt/proxy', mopts=None)

ProxyCaller is the same interface used by the `salt-call` with the `--proxyid <proxyid>` command-line tool on the Salt Proxy Minion.

Importing and using `ProxyCaller` must be done on the same machine as a Salt Minion and it must be done using the same user that the Salt Minion is running as.
Usage:

```python
import salt.client
caller = salt.client.Caller()
caller.cmd('test.ping')
```

Note, a running master or minion daemon is not required to use this class. Running `salt-call --local` simply sets `file_client` to 'local'. The same can be achieved at the Python level by including that setting in a minion config file.

```python
import salt.client
import salt.config
__opts__ = salt.config.proxy_config('/etc/salt/proxy', minion_id='quirky_edison')
__opts__['file_client'] = 'local'
caller = salt.client.ProxyCaller(mopts=__opts__)
```

---

Note: To use this for calling proxies, the `is_proxy` functions requires that `--proxyid` be an argument on the commandline for the script this is used in, or that the string `proxy` is in the name of the script.

```python
cmd(fun, *args, **kwargs)
Call an execution module with the given arguments and keyword arguments

caller.cmd('test.arg', 'Foo', 'Bar', baz='Baz')
caller.cmd('event.send', 'myco/myevent/something',
           data={'foo': 'Foo'}, with_env=['GIT_COMMIT'], with_grains=True)
```

---

**RunnerClient**

```python
class salt.runner.RunnerClient(opts)
The interface used by the `salt-run` CLI tool on the Salt Master

It executes runner modules which run on the Salt Master.

Importing and using RunnerClient must be done on the same machine as the Salt Master and it must be done using the same user that the Salt Master is running as.

Salt's `external_auth` can be used to authenticate calls. The eauth user must be authorized to execute runner modules: (@runner). Only the `master_call()` below supports eauth.

asynchronous(fun, low, user='UNKNOWN', pub=None)
Execute the function in a multiprocess and return the event tag to use to watch for the return

```python
cmd(fun, arg=None, pub_data=None, kwarg=None, print_event=True, full_return=False)
Execute a function
```

cmd_async(low)
Execute a runner function asynchronously; eauth is respected

This function requires that `external_auth` is configured and the user is authorized to execute runner functions: (@runner).

```python
runner.eauth_async({
    'fun': 'jobs.list_jobs',
    'username': 'saltdev',
    'password': 'saltdev',
})
```

(continues on next page)
cmd_sync \((low, timeout=None, full_return=False)\)
Execute a runner function synchronously; eauth is respected

This function requires that external_auth is configured and the user is authorized to execute runner functions: (@runner).

```python
cmd_sync(
    'jobs.list_jobs',
    'saltdev',
    'saltdev',
    'pam',
    None,
    False
)
```

WheelClient

class salt.wheel.WheelClient(\(opts=\text{None})\)
An interface to Salt’s wheel modules

Wheel modules interact with various parts of the Salt Master.

Importing and using WheelClient must be done on the same machine as the Salt Master and it must be done using the same user that the Salt Master is running as. Unless external_auth is configured and the user is authorized to execute wheel functions: (@wheel).

Usage:

```python
import salt.config
import salt.wheel
opts = salt.config.master_config('/etc/salt/master')
wheel = salt.wheel.WheelClient(opts)
```

async\(\) (fun, low, user='\text{UNKNOWN}', pub=None)
Execute the function in a multiprocess and return the event tag to use to watch for the return

```python
wheel.cmd(
    'key.finger',
    ['jerry'])
```

cmd_async \((\text{low})\)
Execute a function asynchronously; eauth is respected

This function requires that external_auth is configured and the user is authorized

```python
wheel.cmd_async(
    'key.finger',
    'jerry',
    'auto',
    'saltdev',
    'saltdev',
    None,
    False
)
{'jid': '20131219224744416681', 'tag': 'salt/wheel/20131219224744416681'}
```
**cmd_sync**(`low`, `timeout=None`, `full_return=False`)
Execute a wheel function synchronously; eauth is respected

This function requires that `external_auth` is configured and the user is authorized to execute runner functions: (@wheel).

```python
>>> wheel.cmd_sync({
    'fun': 'key.finger',
    'match': 'jerry',
    'eauth': 'auto',
    'username': 'saltdev',
    'password': 'saltdev',
})
```

**CloudClient**

class `salt.cloud.CloudClient`(`path=None`, `opts=None`, `config_dir=None`, `pillars=None`)
The client class to wrap cloud interactions

**action**(`fun=None`, `cloudmap=None`, `names=None`, `provider=None`, `instance=None`, `kwargs=None`)
Execute a single action via the cloud plugin backend

Examples:

```python
client.action(fun='show_instance', names=['myinstance'])
client.action(fun='show_image', provider='my-ec2-config',
    kwargs={'image': 'ami-10314d79'})
```  

**create**(`provider`, `names`, `**kwargs`)
Create the named VMs, without using a profile

Example:

```python
client.create(provider='my-ec2-config', names=['myinstance'],
    image='ami-1624987f', size='t1.micro', ssh_username='ec2-user',
    securitygroup='default', delvol_on_destroy=True)
```  

**destroy**(`names`)
Destroy the named VMs

**extra_action**(`names`, `provider`, `action`, `**kwargs`)
Perform actions with block storage devices

Example:

```python
client.extra_action(names=['myblock'], action='volume_create',
    provider='my-nova', kwargs={'voltype': 'SSD', 'size': 1000})
client.extra_action(names=['salt-net'], action='network_create',
    provider='my-nova', kwargs={'cidr': '192.168.100.0/24'})
```  

**full_query**(`query_type='list_nodes_full'`)
Query all instance information

**list_images**(`provider=None`)
List all available images in configured cloud systems
**list_locations** *(provider=None)*

List all available locations in configured cloud systems

**list_sizes** *(provider=None)*

List all available sizes in configured cloud systems

**low** *(fun, low)*

Pass the cloud function and low data structure to run

**map_run** *(path=None, **kwargs)*

To execute a map

**min_query** *(query_type='list_nodes_min')*

Query select instance information

**profile** *(profile, names, vm_overrides=None, **kwargs)*

Pass in a profile to create, names is a list of vm names to allocate

vm_overrides is a special dict that will be per node options overrides

Example:

```python
>>> client = salt.cloud.CloudClient(path='/etc/salt/cloud')
>>> client.profile('do_512.git', names=['minion01',])
{'minion01': {'backups_active': 'False',
             'created_at': '2014-09-04T18:10:15Z',
             'droplet': {'event_id': 31000502,
                         'id': 2530006,
                         'image_id': 5140006,
                         'name': 'minion01',
                         'size_id': 66},
             'id': '2530006',
             'image_id': '5140006',
             'ip_address': '107.XXX.XXX.XXX',
             'locked': 'True',
             'name': 'minion01',
             'private_ip_address': None,
             'region_id': '4',
             'size_id': '66',
             'status': 'new'}}
```

**query** *(query_type='list_nodes')*

Query basic instance information

**select_query** *(query_type='list_nodes_select')*

Query select instance information

**SSHClient**

**class** *salt.client.ssh.client.SSHClient(c_path='/etc/salt/master', mopts=None, disable_custom_roster=False)*

Create a client object for executing routines via the salt-ssh backend

New in version 2015.5.0.

**cmd** *(tgt, fun, arg=(), timeout=None, tgt_type='glob', kwarg=None, **kwargs)*

Execute a single command via the salt-ssh subsystem and return all routines at once

New in version 2015.5.0.

**cmd_iter** *(tgt, fun, arg=(), timeout=None, tgt_type='glob', ret=True, kwarg=None, **kwargs)*

Execute a single command via the salt-ssh subsystem and return a generator
22.2 netapi modules

22.2.1 Introduction to netapi modules

netapi modules provide API-centric access to Salt. Usually externally-facing services such as REST or WebSockets, XMPP, XMLRPC, etc.

In general netapi modules bind to a port and start a service. They are purposefully open-ended. A single module can be configured to run as well as multiple modules simultaneously.

netapi modules are enabled by adding configuration to your Salt Master config file and then starting the salt-api daemon. Check the docs for each module to see external requirements and configuration settings.

Communication with Salt and Salt satellite projects is done using Salt’s own Python API. A list of available client interfaces is below.

salt-api

Prior to Salt’s 2014.7.0 release, netapi modules lived in the separate sister projected salt-api. That project has been merged into the main Salt project.

See also:
The full list of netapi modules

22.2.2 Client interfaces

Salt’s client interfaces expose executing functions by crafting a dictionary of values that are mapped to function arguments. This allows calling functions simply by creating a data structure. (And this is exactly how much of Salt’s own internals work!)

class salt.netapi.NetapiClient

Provide a uniform method of accessing the various client interfaces in Salt in the form of low-data data structures. For example:

```python
>>> client = NetapiClient(__opts__)
>>> lowstate = {
    'client': 'local', 'tgt': '*', 'fun': 'test.ping', 'arg': ''
}
>>> client.run(lowstate)

local(*args, **kwargs)
Run execution modules synchronously

See salt.client.LocalClient.cmd() for all available parameters.

Sends a command from the master to the targeted minions. This is the same interface that Salt’s own CLI uses. Note the arg and kwarg parameters are sent down to the minion(s) and the given function, fun, is called with those parameters.

Returns Returns the result from the execution module

local_async(*args, **kwargs)
Run execution modules asynchronously

Wraps salt.client.LocalClient.run_job().

Returns job ID
**local_subset**(*args, **kwargs*)

Run execution modules against subsets of minions

New in version 2016.3.0.

Wraps `salt.client.LocalClient.cmd_subset()`

**runner**(*fun, timeout=None, full_return=False, **kwargs*)

Run runner modules `<all-salt.runners>` synchronously

Wraps `salt.runner.RunnerClient.cmd_sync()`.

Note that runner functions must be called using keyword arguments. Positional arguments are not supported.

Returns: Returns the result from the runner module

**runner_async**(*fun, **kwargs*)

Run runner modules `<all-salt.runners>` asynchronously

Wraps `salt.runner.RunnerClient.cmd_async()`.

Note that runner functions must be called using keyword arguments. Positional arguments are not supported.

Returns: Returns event data and a job ID for the executed function.

**ssh**(*args, **kwargs*)

Run salt-ssh commands synchronously

Wraps `salt.client.ssh.client.SSHClient.cmd_sync()`.

Returns: Returns the result from the salt-ssh command

**wheel**(*fun, **kwargs*)

Run wheel modules synchronously

Wraps `salt.wheel.WheelClient.master_call()`.

Note that wheel functions must be called using keyword arguments. Positional arguments are not supported.

Returns: Returns the result from the wheel module

**wheel_async**(*fun, **kwargs*)

Run wheel modules asynchronously

Wraps `salt.wheel.WheelClient.master_call()`.

Note that wheel functions must be called using keyword arguments. Positional arguments are not supported.

Returns: Returns the result from the wheel module

---

**Writing netapi modules**

Netapi modules, put simply, bind a port and start a service. They are purposefully open-ended and can be used to present a variety of external interfaces to Salt, and even present multiple interfaces at once.

See also:

* The full list of netapi modules

---

**Configuration**

All netapi configuration is done in the Salt master config and takes a form similar to the following:
**rest_cherrypy**:

- **port**: 8000
- **debug**: True
- **ssl_crt**: /etc/pki/tls/certs/localhost.crt
- **ssl_key**: /etc/pki/tls/certs/localhost.key

The __virtual__ function

Like all module types in Salt, netapi modules go through Salt’s loader interface to determine if they should be loaded into memory and then executed.

The __virtual__ function in the module makes this determination and should return False or a string that will serve as the name of the module. If the module raises an `ImportError` or any other errors, it will not be loaded.

The start function

The `start()` function will be called for each netapi module that is loaded. This function should contain the server loop that actually starts the service. This is started in a multiprocess.

Multiple instances

New in version 2016.11.0.

*rest_cherrypy* and *rest_tornado* support running multiple instances by copying and renaming entire directory of those. To start the copied multiple netapi modules, add configuration blocks for the copied netapi modules in the Salt Master config. The name of each added configuration block must match with the name of each directory of the copied netapi module.

Inline documentation

As with the rest of Salt, it is a best-practice to include liberal inline documentation in the form of a module docstring and docstrings on any classes, methods, and functions in your netapi module.

Loader “magic” methods

The loader makes the __opts__ data structure available to any function in a netapi module.
If you are used to configuration management tools that require you to plan down to the last detail before you install anything, you are probably wondering why this section doesn’t appear before the installation instructions. With Salt, you can switch to a high availability architecture at any time, and add additional components to scale your deployment as you go.

Since a single Salt master can manage thousands of systems, we usually recommend that you start by deploying a single Salt master, and then modifying your deployment as needed for redundancy, geographical distribution, and scale.

### 23.1 High Availability Features in Salt

Salt supports several features for high availability and fault tolerance. Brief documentation for these features is listed alongside their configuration parameters in *Configuration file examples*.

#### 23.1.1 Multimaster

Salt minions can connect to multiple masters at one time by configuring the `master` configuration parameter as a YAML list of all the available masters. By default, all masters are "hot", meaning that any master can direct commands to the Salt infrastructure.

In a multimaster configuration, each master must have the same cryptographic keys, and minion keys must be accepted on all masters separately. The contents of file_roots and pillar_roots need to be kept in sync with processes external to Salt as well.

A tutorial on setting up multimaster with "hot" masters is here:

*Multimaster Tutorial*

#### 23.1.2 Multimaster with Failover

Changing the `master_type` parameter from `str` to `failover` will cause minions to connect to the first responding master in the list of masters. Every `master_alive_interval` seconds the minions will check to make sure the current master is still responding. If the master does not respond, the minion will attempt to connect to the next master in the list. If the minion runs out of masters, the list will be recycled in case dead masters have been restored. Note that `master_alive_interval` must be present in the minion configuration, or else the recurring job to check master status will not get scheduled.

Failover can be combined with PKI-style encrypted keys, but PKI is NOT REQUIRED to use failover.

Multimaster with PKI and Failover is discussed in *this tutorial*.
master_type: failover can be combined with master_shuffle: True to spread minion connections across all masters (one master per minion, not each minion connecting to all masters). Adding Salt Syndics into the mix makes it possible to create a load-balanced Salt infrastructure. If a master fails, minions will notice and select another master from the available list.

23.1.3 Syndic

Salt’s Syndic feature is a way to create differing infrastructure topologies. It is not strictly an HA feature, but can be treated as such.

With the syndic, a Salt infrastructure can be partitioned in such a way that certain masters control certain segments of the infrastructure, and "Master of Masters" nodes can control multiple segments underneath them.

Syndics are covered in depth in *Salt Syndic*.

23.1.4 Syndic with Multimaster

New in version 2015.5.0.

Syndic with Multimaster lets you connect a syndic to multiple masters to provide an additional layer of redundancy in a syndic configuration.

Syndics are covered in depth in *Salt Syndic*.

23.2 Salt Syndic

The most basic or typical Salt topology consists of a single Master node controlling a group of Minion nodes. An intermediate node type, called Syndic, when used offers greater structural flexibility and scalability in the construction of Salt topologies than topologies constructed only out of Master and Minion node types.

A Syndic node can be thought of as a special passthrough Minion node. A Syndic node consists of a s`alt-syndic` daemon and a s`alt-master` daemon running on the same system. The s`alt-master` daemon running on the Syndic node controls a group of lower level Minion nodes and the s`alt-syndic` daemon connects higher level Master node, sometimes called a Master of Masters.

The s`alt-syndic` daemon relays publications and events between the Master node and the local s`alt-master` daemon. This gives the Master node control over the Minion nodes attached to the s`alt-master` daemon running on the Syndic node.

23.2.1 Configuring the Syndic

To setup a Salt Syndic you need to tell the Syndic node and its Master node about each other. If your Master node is located at 10.10.0.1, then your configurations would be:

On the Syndic node:

```bash
# /etc/salt/master
syndic_master: 10.10.0.1  # may be either an IP address or a hostname
```

```bash
# /etc/salt/minion

# id is shared by the salt-syndic daemon and a possible salt-minion daemon
```

(continues on next page)
# on the Syndic node

**id**: my_syndic

On the Master node:

```
# /etc/salt/master
order_masters: True
```

The `syndic_master` option tells the Syndic node where to find the Master node in the same way that the `master` option tells a Minion node where to find a Master node.

The `id` option is used by the `salt-syndic` daemon to identify with the Master node and if unset will default to the hostname or IP address of the Syndic just as with a Minion.

The `order_masters` option configures the Master node to send extra information with its publications that is needed by Syndic nodes connected directly to it.

---

**Note**: Each Syndic must provide its own `file_roots` directory. Files will not be automatically transferred from the Master node.

### 23.2.2 Configuring the Syndic with Multimaster

New in version 2015.5.0.

Syndic with Multimaster lets you connect a syndic to multiple masters to provide an additional layer of redundancy in a syndic configuration.

Higher level masters should first be configured in a multimaster configuration. See [Multimaster Tutorial](#).

On the syndic, the `syndic_master` option is populated with a list of the higher level masters.

Since each syndic is connected to each master, jobs sent from any master are forwarded to minions that are connected to each syndic. If the `master_id` value is set in the master config on the higher level masters, job results are returned to the master that originated the request in a best effort fashion. Events/jobs without a `master_id` are returned to any available master.

### 23.2.3 Running the Syndic

The `salt-syndic` daemon is a separate process that needs to be started in addition to the `salt-master` daemon running on the Syndic node. Starting the `salt-syndic` daemon is the same as starting the other Salt daemons.

The Master node in many ways sees the Syndic as an ordinary Minion node. In particular, the Master will need to accept the Syndic’s Minion key as it would for any other Minion.

On the Syndic node:

```
# salt-syndic
or
# service salt-syndic start
```

On the Master node:

```
# salt-key -a my_syndic
```
The Master node will now be able to control the Minion nodes connected to the Syndic. Only the Syndic key will be listed in the Master node’s key registry but this also means that key activity between the Syndic’s Minions and the Syndic does not encumber the Master node. In this way, the Syndic’s key on the Master node can be thought of as a placeholder for the keys of all the Minion and Syndic nodes beneath it, giving the Master node a clear, high level structural view on the Salt cluster.

On the Master node:

```bash
# salt-key -L
Accepted Keys:
my_syndic
Denied Keys:
Unaccepted Keys:
Rejected Keys:

# salt '*' test.version
minion_1: 2018.3.4
minion_2: 2018.3.4
minion_4: 2018.3.4
minion_3: 2018.3.4
```

### 23.2.4 Topology

A Master node (a node which is itself not a Syndic to another higher level Master node) must run a `salt-master` daemon and optionally a `salt-minion` daemon.

A Syndic node must run `salt-syndic` and `salt-master` daemons and optionally a `salt-minion` daemon.

A Minion node must run a `salt-minion` daemon.

When a `salt-master` daemon issues a command, it will be received by the Syndic and Minion nodes directly connected to it. A Minion node will process the command in the way it ordinarily would. On a Syndic node, the `salt-syndic` daemon will relay the command to the `salt-master` daemon running on the Syndic node, which then propagates the command to the Minions and Syndics connected to it.

When events and job return data are generated by `salt-minion` daemons, they are aggregated by the `salt-master` daemon they are connected to, which `salt-master` daemon then relays the data back through its `salt-syndic` daemon until the data reaches the Master or Syndic node that issued the command.

### 23.2.5 Syndic wait

`syndic_wait` is a master configuration file setting that specifies the number of seconds the Salt client should wait for additional syndics to check in with their lists of expected minions before giving up. This value defaults to 5 seconds.

The `syndic_wait` setting is necessary because the higher-level master does not have a way of knowing which minions are below the syndics. The higher-level master has its own list of expected minions and the masters below them have their own lists as well, so the Salt client does not how long to wait for all returns. The `syndic_wait` option allows time for all minions to return to the Salt client.
Note: To reduce the amount of time the CLI waits for Minions to respond, install a Minion on the Syndic or tune the value of the syndic_wait configuration.

While it is possible to run a Syndic without a Minion installed on the same system, it is recommended, for a faster CLI response time, to do so. Without a Minion installed on the Syndic node, the timeout value of syndic_wait increases significantly - about three-fold. With a Minion installed on the Syndic, the CLI timeout resides at the value defined in syndic_wait.

Note: If you have a very large infrastructure or many layers of Syndics, you may find that the CLI doesn’t wait long enough for the Syndics to return their events. If you think this is the case, you can set the syndic_wait value in the Master configs on the Master or Syndic nodes from which commands are executed. The default value is 5, and should work for the majority of deployments.

In order for a Master or Syndic node to return information from Minions that are below their Syndics, the CLI requires a short wait time in order to allow the Syndics to gather responses from their Minions. This value is defined in the syndic_wait config option and has a default of five seconds.

23.2.6 Syndic config options

These are the options that can be used to configure a Syndic node. Note that other than id, Syndic config options are placed in the Master config on the Syndic node.

- **id**: Syndic id (shared by the salt-syndic daemon with a potential salt-minion daemon on the same system)
- **syndic_master**: Master node IP address or hostname
- **syndic_master_port**: Master node ret_port
- **syndic_log_file**: path to the logfile (absolute or not)
- **syndic_pidfile**: path to the pidfile (absolute or not)
- **syndic_wait**: time in seconds to wait on returns from this syndic

23.2.7 Minion Data Cache

Beginning with Salt 2016.11.0, the Pluggable Minion Data Cache was introduced. The minion data cache contains the Salt Mine data, minion grains, and minion pillar information cached on the Salt Master. By default, Salt uses the localfs cache module, but other external data stores can be used instead.

Using a pluggable minion cache modules allows for the data stored on a Salt Master about Salt Minions to be replicated on other Salt Masters the Minion is connected to. Please see the Minion Data Cache documentation for more information and configuration examples.
New in version 2016.11.0.

The Minion data cache contains the Salt Mine data, minion grains and minion pillar information cached on the Salt Master. By default, Salt uses the `localfs` cache module to save the data in a `msgpack` file on the Salt Master.

### 24.1 Pluggable Data Cache

While the default Minion data cache is the `localfs` cache, other external data stores can also be used to store this data such as the `consul` module. To configure a Salt Master to use a different data store, the `cache` setting needs to be established:

```
[cache]
    consul
```

The pluggable data cache streamlines using various Salt topologies such as a Multi-Master or Salt Syndics configuration by allowing the data stored on the Salt Master about a Salt Minion to be available to other Salt Syndics or Salt Masters that a Salt Minion is connected to.

Additional minion data cache modules can be easily created by modeling the custom data store after one of the existing cache modules.

See [cache modules](https:// Saltstack.com/docs/salt/cache_modules) for a current list.

### 24.2 Configuring the Minion Data Cache

The default `localfs` Minion data cache module doesn’t require any configuration. External data cache modules with external data stores such as Consul require a configuration setting in the master config.

Here’s an example config for Consul:

```
[consul]
    host: 127.0.0.1
    port: 8500
    token: None
    scheme: http
    consistency: default
    dc: dc1
    verify: True

[cache]
    consul
```
New in version 2018.3.0.

Note: This functionality is under development and could be changed in the future releases.

Many times it is useful to store the results of a command during the course of an execution. Salt Slots are designed to allow you to store this information and use it later during the highstate or other job execution.

Slots extend the state syntax and allows you to do things right before the state function is executed. So you can make a decision in the last moment right before a state is executed.

### 25.1 Execution functions

Note: Using execution modules return data as a state values is a first step of Slots development. Other functionality is under development.

Slots allow you to use the return from a remote-execution function as an argument value in states. Slot syntax looks close to the simple python function call.

```
__slot__:salt:<module>.<function>(<args>, ..., <kwargs...>, ...)
```

Also there are some specifics in the syntax coming from the execution functions nature and a desire to simplify the user experience. First one is that you don’t need to quote the strings passed to the slots functions. The second one is that all arguments handled as strings.

Here is a simple example:

```
copy-some-file:
  file.copy:
    - name: __slot__:salt:test.echo(text=/tmp/some_file)
    - source: __slot__:salt:test.echo(/etc/hosts)
```

This will execute the `test.echo` execution functions right before calling the state. The functions in the example will return `/tmp/some_file` and `/etc/hosts` strings that will be used as a target and source arguments in the state function `file.copy`.
This section contains details on the Windows Package Manager, and specific information you need to use Salt on Windows.

### 26.1 Windows Software Repository

**Note:** In 2015.8.0 and later, the Windows Software Repository cache is compiled on the Salt Minion, which enables pillar, grains and other things to be available during compilation time. To support this new functionality, a next-generation (ng) package repository was created. See the *Changes in Version 2015.8.0* for details.

The SaltStack Windows Software Repository provides a package manager and software repository similar to what is provided by yum and apt on Linux. This repository enables the installation of software using the installers on remote Windows systems.

In many senses, the operation is similar to that of the other package managers salt is aware of:

- the `pkg.installed` and similar states work on Windows.
- the `pkg.install` and similar module functions work on Windows.

High level differences to yum and apt are:

- The repository metadata (SLS files) is hosted through either salt or git.
- Packages can be downloaded from within the salt repository, a git repository or from http(s) or ftp urls.
- No dependencies are managed. Dependencies between packages needs to be managed manually.

**Requirements:**

- GitPython 0.3 or later, or pygit2 0.20.3 with libgit 0.20.0 or later installed on your Salt master. The Windows package definitions are downloaded and updated using Git.

#### 26.1.1 Configuration

**Populate the Repository**

The SLS files used to install Windows packages are not distributed by default with Salt. Run the following command to initialize the repository on your Salt master:

```
salt-run winrepo.update_git_repos
```
Sync Repo to Windows Minions

Run `pkg.refresh_db` on each of your Windows minions to synchronize the package repository.

```
salt -G 'os:windows' pkg.refresh_db
```

**Note:** Use `pkg.refresh_db` from 2016.11 when developing new Windows package definitions to check for errors in the definitions against one or more Windows minions.

### 26.1.2 Install Windows Software

After completing the configuration steps, you are ready to manage software on your Windows minions.

#### Show Installed Packages

```
salt -G 'os:windows' pkg.list_pkgs
```

#### Install a Package

You can query the available version of a package using the Salt `pkg` module.

```
salt winminion pkg.list_available firefox
```

```
winminion:
  - 15.0.1
  - 16.0.2
  - 17.0.1
```

As you can see, there are three versions of Firefox available for installation. You can refer a software package by its `name` or its `full_name` surround by single quotes.

```
salt winminion pkg.install 'firefox'
```

The above line will install the latest version of Firefox.

```
salt winminion pkg.install 'firefox' version=16.0.2
```

The above line will install version 16.0.2 of Firefox.

If a different version of the package is already installed it will be replaced with the version in the winrepo (only if the package itself supports live updating).

You can also specify the full name:

```
salt winminion pkg.install 'Mozilla Firefox 17.0.1 (x86 en-US)'
```

### 26.1.3 Uninstall Windows Software

Uninstall software using the `pkg` module:
salt winminion pkg.remove firefox
salt winminion pkg.purge firefox

Note: pkg.purge just executes pkg.remove on Windows. At some point in the future pkg.purge may direct the installer to remove all configs and settings for software packages that support that option.

### 26.1.4 Repository Location

Salt maintains a repository of SLS files to install a large number of Windows packages:

- **2015.8.0 and later minions**: https://github.com/saltstack/salt-winrepo-ng
- **Earlier releases**: https://github.com/saltstack/salt-winrepo

By default, these repositories are mirrored to /srv/salt/win/repo-ng and /srv/salt/win/repo.

This location can be changed in the master config file by setting the `winrepo_dir_ng` and `winrepo_dir` options.

### 26.1.5 Maintaining Windows Repo Definitions in Git Repositories

Windows software package definitions can be hosted in one or more Git repositories. The default repositories are hosted on GitHub by SaltStack. These include software definition files for various open source software projects. These software definition files are `.sls` files. There are two default repositories: `salt-winrepo` and `salt-winrepo-ng`. `salt-winrepo` contains software definition files for older minions (older than 2015.8.0). `salt-winrepo-ng` is for newer minions (2015.8.0 and newer).

Each software definition file contains all the information salt needs to install that software on a minion including the HTTP or FTP locations of the installer files, required command-line switches for silent install, etc. Anyone is welcome to send a pull request to this repo to add new package definitions. The repos can be browsed here: `salt-winrepo` `salt-winrepo-ng`

Note: The newer software definition files are run through the salt’s parser which allows for the use of jinja.

Configure which git repositories the master can search for package definitions by modifying or extending the `winrepo_remotes` and `winrepo_remotes_ng` options.

**Important**: `winrepo_remotes` was called `win_gitrepos` in Salt versions earlier than 2015.8.0

Package definitions are pulled down from the online git repository by running the `winrepo.update_git_repos` runner. This command is run on the master:

```
salt-run winrepo.update_git_repos
```

This will pull down the software definition files for older minions (salt-winrepo) and new minions (salt-winrepo-ng). They are stored in the file_roots under `win/repo/salt-winrepo` and `win/repo-ng/salt-winrepo-ng` respectively.

**Important**: If you have customized software definition files that aren’t maintained in a repository, those should be stored under `win/repo` for older minions and `win/repo-ng` for newer minions. The reason for this is that the
The contents of `win/repo/salt-winrepo` and `win/repo-ng/salt-winrepo-ng` are wiped out every time you run a `winrepo.update_git_repos`.

Additionally, when you run `winrepo.genrepo` and `pkg.refresh_db` the entire contents under `win/repo` and `win/repo-ng`, to include all subdirectories, are used to create the meta database file.

The next step (if you have older minions) is to create the meta database file for the repo (`winrepo.p`). This is done by running the `winrepo.genrepo` runner. This is also run on the master:

```
salt-run winrepo.genrepo
```

**Note:** If you have only 2015.8.0 and newer minions, you no longer need to run `salt-run winrepo.genrepo` on the master.

Finally, you need to refresh the minion database by running the `pkg.refresh_db` command. This is run on the master as well:

```
salt '*' pkg.refresh_db
```

On older minions (older than 2015.8.0) this will copy the `winrepo.p` file down to the minion. On newer minions (2015.8.0 and newer) this will copy all the software definition files (.sls) down to the minion and then create the meta database file (`winrepo.p`) locally. The reason this is done locally is because the Jinja needs to be parsed using the minion’s grains.

**Important:** Every time you modify the software definition files on the master, either by running `salt-run winrepo.update_git_repos`, modifying existing files, or by creating your own, you need to refresh the database on your minions. For older minions, that means running `salt-run winrepo.genrepo` and then `salt '*' pkg.refresh_db`. For newer minions (2015.8.0 and newer) it is just `salt '*' pkg.refresh_db`.

**Note:** If the `winrepo.genrepo` or the `pkg.refresh_db` fails, it is likely a problem with the Jinja in one of the software definition files. This will cause the operations to stop. You’ll need to fix the syntax in order for the meta database file to be created successfully.

To disable one of the repos, set it to an empty list `[]` in the master config. For example, to disable `winrepo_remotes` set the following in the master config file:

```
winrepo_remotes: []
```

### 26.1.6 Creating a Package Definition SLS File

The package definition file is a yaml file that contains all the information needed to install a piece of software using Salt. It defines information about the package to include version, full name, flags required for the installer and uninstaller, whether or not to use the Windows task scheduler to install the package, where to find the installation package, etc.

Take a look at this example for Firefox:
firefox:
  '17.0.1':
    installer: 'salt://win/repo/firefox/English/Firefox Setup 17.0.1.exe'
    full_name: Mozilla Firefox 17.0.1 (x86 en-US)
    locale: en_US
    reboot: False
    install_flags: '-ms'
    uninstaller: '%ProgramFiles(x86)%/Mozilla Firefox/uninstall/helper.exe'
    uninstall_flags: '/S'

'16.0.2':
    installer: 'salt://win/repo/firefox/English/Firefox Setup 16.0.2.exe'
    full_name: Mozilla Firefox 16.0.2 (x86 en-US)
    locale: en_US
    reboot: False
    install_flags: '-ms'
    uninstaller: '%ProgramFiles(x86)%/Mozilla Firefox/uninstall/helper.exe'
    uninstall_flags: '/S'

'15.0.1':
    installer: 'salt://win/repo/firefox/English/Firefox Setup 15.0.1.exe'
    full_name: Mozilla Firefox 15.0.1 (x86 en-US)
    locale: en_US
    reboot: False
    install_flags: '-ms'
    uninstaller: '%ProgramFiles(x86)%/Mozilla Firefox/uninstall/helper.exe'
    uninstall_flags: '/S'

Each software definition file begins with a package name for the software. As in the example above *firefox*. The next line is indented two spaces and contains the version to be defined. As in the example above, a software definition file can define multiple versions for the same piece of software. The lines following the version are indented two more spaces and contain all the information needed to install that package.

**Warning:** The package name and the `full_name` must be unique to all other packages in the software repository.

The version line is the version for the package to be installed. It is used when you need to install a specific version of a piece of software.

**Warning:** The version must be enclosed in quotes, otherwise the yaml parser will remove trailing zeros.

**Note:** There are unique situations where previous versions are unavailable. Take Google Chrome for example. There is only one url provided for a standalone installation of Google Chrome.

(https://dl.google.com/edgedl/chrome/install/GoogleChromeStandaloneEnterprise.msi)

When a new version is released, the url just points to the new version. To handle situations such as these, set the version to `latest`. Salt will install the version of Chrome at the URL and report that version. Here’s an example:

chrome:
  latest:  
    full_name: 'Google Chrome'
    installer: 'https://dl.google.com/edgedl/chrome/install/GoogleChromeStandaloneEnterprise.msi'
**install_flags**: '/qn /norestart'

**uninstaller**: 'https://dl.google.com/edgedl/chrome/install/
--GoogleChromeStandaloneEnterprise.msi'

**uninstall_flags**: '/qn /norestart'

**msiexec**: True

**locale**: en_US

**reboot**: False

Available parameters are as follows:

**param str full_name**  The Full Name for the software as shown in "Programs and Features" in the control panel. You can also get this information by installing the package manually and then running `pkg.list_pkgs`. Here's an example of the output from `pkg.list_pkgs`:

```bash
salt 'test-2008' pkg.list_pkgs
```

test-2008

```
7-Zip 9.20 (x64 edition):
  9.20.00.0
Microsoft .NET Framework 4 Client Profile:
  4.0.30319,4.0.30319
Microsoft .NET Framework 4 Extended:
  4.0.30319,4.0.30319
Microsoft Visual C++ 2008 Redistributable - x64 9.0.21022:
  9.0.21022
Mozilla Firefox 17.0.1 (x86 en-US):
  17.0.1
Mozilla Maintenance Service:
  17.0.1
NSClient++ (x64):
  0.3.8.76
Notepad++:
  6.4.2
Salt Minion 0.16.0:
  0.16.0
```

Notice the Full Name for Firefox: Mozilla Firefox 17.0.0 (x86 en-US). That's exactly what's in the full_name parameter in the software definition file.

If any of the software installed on the machine matches one of the software definition files in the repository, the full_name will be automatically renamed to the package name. The example below shows the `pkg.list_pkgs` for a machine that already has Mozilla Firefox 17.0.1 installed.

```bash
test-2008:
  7zip:
    9.20.00.0
Microsoft .NET Framework 4 Client Profile:
  4.0.30319,4.0.30319
Microsoft .NET Framework 4 Extended:
  4.0.30319,4.0.30319
Microsoft Visual C++ 2008 Redistributable - x64 9.0.21022:
  9.0.21022
Mozilla Maintenance Service:
  17.0.1
NSClient++ (x64):
  0.3.8.76
Notepad++:
  6.4.2
```
Salt Minion 0.16.0:
  0.16.0
firefox:
  17.0.1
nsclient:
  0.3.9.328

**Important:** The version number and full_name need to match the output from `pkg.list_pkgs` so that the status can be verified when running a highstate.

**Note:** It is still possible to successfully install packages using `pkg.install`, even if the full_name or the version number don’t match. However, this can make troubleshooting issues difficult, so be careful.

**Tip:** To force salt to display the full name when there’s already an existing package definition file on the system, you can pass a bogus `saltenv` parameter to the command like so: `pkg.list_pkgs saltenv=NotARealEnv`

**param str installer** The path to the .exe or .msi to use to install the package. This can be a path or a URL. If it is a URL or a salt path (salt://), the package will be cached locally and then executed. If it is a path to a file on disk or a file share, it will be executed directly.

**Note:** If storing software in the same location as the winrepo it is best practice to place each installer in its own directory rather than the root of winrepo. Then you can place your package definition file in the same directory. It is best practice to name the file `init.sls`. This will be picked up by `pkg.refresh_db` and processed properly.

**param str install_flags** Any flags that need to be passed to the installer to make it perform a silent install. These can often be found by adding /? or /h when running the installer from the command-line. A great resource for finding these silent install flags can be found on the WPKG project’s wiki:

**Warning:** Salt will not return if the installer is waiting for user input so it is imperative that the software package being installed has the ability to install silently.

**param str uninstaller** The path to the program used to uninstall this software. This can be the path to the same exe or msi used to install the software. It can also be a GUID. You can find this value in the registry under the following keys:

- Software\Microsoft\Windows\CurrentVersion\Uninstall
- Software\Wow6432None\Microsoft\Windows\CurrentVersion\Uninstall

**param str uninstall_flags** Any flags that need to be passed to the uninstaller to make it perform a silent uninstall. These can often be found by adding /? or /h when running the uninstaller from the command-line. A great resource for finding these silent install flags can be found on the WPKG project’s wiki:
Warning: Salt will not return if the uninstaller is waiting for user input so it is imperative that the software package being uninstalled has the ability to uninstall silently.

Here are some examples of installer and uninstaller settings:

### 7zip:

| 9.20.00.0 |  
| --- | --- |
| installer: salt://win/repo/7zip/7z920-x64.msi | full_name: 7-Zip 9.20 (x64 edition) |
| reboot: False | install_flags: '/qn /norestart' |
| msiexec: True | uninstaller: '{23170F69-40C1-2702-0920-000001000000}' |
| uninstall_flags: '/qn /norestart' |

Alternatively the uninstaller can also simply repeat the URL of an msi file:

### 7zip:

| 9.20.00.0 |  
| --- | --- |
| installer: salt://win/repo/7zip/7z920-x64.msi | full_name: 7-Zip 9.20 (x64 edition) |
| reboot: False | install_flags: '/qn /norestart' |
| msiexec: True | uninstaller: salt://win/repo/7zip/7z920-x64.msi |
| uninstall_flags: '/qn /norestart' |

**param msiexec** This tells salt to use msiexec /i to install the package and msiexec /x to uninstall. This is for .msi installations. Possible options are: True, False or the path to msiexec.exe on your system

### 7zip:

| 9.20.00.0 |  
| --- | --- |
| installer: salt://win/repo/7zip/7z920-x64.msi | full_name: 7-Zip 9.20 (x64 edition) |
| reboot: False | install_flags: '/qn /norestart' |
| msiexec: 'C:\Windows\System32\msiexec.exe' | uninstaller: salt://win/repo/7zip/7z920-x64.msi |
| uninstall_flags: '/qn /norestart' |

**param bool allusers** This parameter is specific to .msi installations. It tells msiexec to install the software for all users. The default is True.

**param bool cache_dir** If True and the installer URL begins with salt://, the entire directory where the installer resides will be recursively cached. This is useful for installers that depend on other files in the same directory for installation.

Warning: Be aware that all files and directories in the same location as the installer file will be copied down to the minion. If you place your installer file in the root of winrepo (/srv/salt/win/repo-ng) and cache_dir: True the entire contents of winrepo will be cached to the minion. Therefore, it is best practice to place your installer files in a subdirectory if they are to be stored in winrepo.

**param str cache_file** When the installer URL begins with salt://, this indicates a single file to copy
down for use with the installer. It is copied to the same location as the installer. Use this over cache_dir if there are many files in the directory and you only need a specific file and don’t want to cache additional files that may reside in the installer directory.

Here’s an example for a software package that has dependent files:

```yaml
sqlexpress:
  '12.0.2000.8':
    installer: 'salt://win/repo/sqlexpress/setup.exe'
    full_name: Microsoft SQL Server 2014 Setup (English)
    reboot: False
    install_flags: '/ACTION=install /IACCEPTSQLSERVERLICENSETERMS /Q'
    cache_dir: True
```

**param bool use_scheduler** If True, Windows will use the task scheduler to run the installation. This is useful for running the Salt installation itself as the installation process kills any currently running instances of Salt.

**param str source_hash** This tells Salt to compare a hash sum of the installer to the provided hash sum before execution. The value can be formatted as `<hash_algorithm>=<hash_sum>`, or it can be a URI to a file containing the hash sum.

For a list of supported algorithms, see the `hashlib` documentation.

Here’s an example of source_hash usage:

```yaml
messageanalyzer:
  '4.8.7551.0':
    full_name: 'Microsoft Message Analyzer'
    installer: 'salt://win/repo/messageanalyzer/MessageAnalyzer64.msi'
    install_flags: '/quiet /norestart'
    uninstaller: '{1CC02C23-8FCD-487E-860C-311EC0A0C933}'
    uninstall_flags: '/quiet /norestart'
    msiexec: True
    source_hash: 'sha1=62875ff451f13b10a8ff988f2943e76a4735d3d4'
```

**param bool reboot** Not implemented

**param str local** Not implemented

Examples can be found at https://github.com/saltstack/salt-winrepo-ng

### 26.1.7 Managing Windows Software on a Standalone Windows Minion

The Windows Package Repository functions similar in a standalone environment, with a few differences in the configuration.

To replace the winrepo runner that is used on the Salt master, an execution module exists to provide the same functionality to standalone minions. The functions are named the same as the ones in the runner, and are used in the same way; the only difference is that `salt-call` is used instead of `salt-run`:

```bash
salt-call winrepo.update_git_repos
salt-call winrepo.genrepo
salt-call pkg.refresh_db
```

After executing the previous commands the repository on the standalone system is ready to use.
Custom Location for Repository SLS Files

If `file_roots` has not been modified in the minion configuration, then no additional configuration needs to be added to the minion configuration. The `winrepo.genrepo` function from the `winrepo` execution module will by default look for the filename specified by `winrepo_cachefile` within `C:salt\srv\salt\win\repo`.

If the `file_roots` parameter has been modified, then `winrepo_dir` must be modified to fall within that path, at the proper relative path. For example, if the base environment in `file_roots` points to `D:\foo`, and `winrepo_source_dir` is `salt://win/repo`, then `winrepo_dir` must be set to `D:\foo\win\repo` to ensure that `winrepo.genrepo` puts the cache file into right location.

26.1.8 Configuration options for Minions 2015.8.0 and later

The `winrepo_source_dir` config parameter (default: `salt://win/repo-ng/`) controls where `pkg.refresh_db` fetches the software package definitions. `pkg.refresh_db` generates meta database file called `winrepo_cachefile` on the minion.

26.1.9 Cache configuration options for Minions 2016.11.0 and later

Software package definitions are automatically refresh if stale after `winrepo_cache_expire_max`. Running a highstate normal forces the refresh of the package definition and generation of meta database, unless the meta database is younger than `winrepo_cache_expire_max`. Refreshing the package definition can take some time, these options were introduced to allow more control of when it occurs.

It’s important use `pkg.refresh_db` to check for errors and ensure the latest package definition is on any minion your testing new definitions on.

26.1.10 Configuration options for Minions before 2015.8.0

If connected to a master, the minion will by default look for the winrepo cache file (the file generated by the `winrepo.genrepo runner`) at `salt://win/repo/winrepo.p`. If the cachefile is in a different path on the salt fileserver, then `win_repo_cachefile` will need to be updated to reflect the proper location.

26.1.11 Changes in Version 2015.8.0

Git repository management for the Windows Software Repository has changed in version 2015.8.0, and several master/minion config parameters have been renamed to make their naming more consistent with each other.

For a list of the `winrepo` config options, see [here](#) for master config options, and [here](#) for configuration options for masterless Windows minions.

On the master, the `winrepo.update_git_repos` runner has been updated to use either `pygit2` or `GitPython` to checkout the git repositories containing repo data. If `pygit2` or `GitPython` is installed, existing winrepo `git` checkouts should be removed after upgrading to 2015.8.0, to allow them to be checked out again by running `winrepo.update_git_repos`.

If neither `GitPython` nor `pygit2` are installed, then Salt will fall back to the pre-existing behavior for `winrepo.update_git_repos`, and a warning will be logged in the master log.

Note: Standalone Windows minions do not support the new `GitPython/pygit2` functionality, and will instead use the `git.latest` state to keep repositories up-to-date. More information on how to use the Windows Software Repo on a standalone minion can be found [here](#).
Config Parameters Renamed

Many of the legacy winrepo configuration parameters have changed in version 2015.8.0 to make the naming more consistent. The old parameter names will still work, but a warning will be logged indicating that the old name is deprecated.

Below are the parameters which have changed for version 2015.8.0:

Master Config

<table>
<thead>
<tr>
<th>Old Name</th>
<th>New Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>win_repo</td>
<td>winrepo_dir</td>
</tr>
<tr>
<td>win_repo_mastercachefile</td>
<td>winrepo_cachefile</td>
</tr>
<tr>
<td>win_gitrepos</td>
<td>winrepo_remotes</td>
</tr>
</tbody>
</table>

Note: winrepo_cachefile is no longer used by 2015.8.0 and later minions, and the winrepo_dir setting is replaced by winrepo_dir_ng for 2015.8.0 and later minions.

Minion Config

<table>
<thead>
<tr>
<th>Old Name</th>
<th>New Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>win_repo</td>
<td>winrepo_dir</td>
</tr>
<tr>
<td>win_repo_cachefile</td>
<td>winrepo_cachefile</td>
</tr>
<tr>
<td>win_gitrepos</td>
<td>winrepo_remotes</td>
</tr>
</tbody>
</table>

See here for detailed information on all master config options for the Windows Repo.

Minion Config

See here for detailed information on all minion config options for the Windows Repo.

pygit2/GitPython Support for Maintaining Git Repos

The winrepo.update_git_repos runner (and the corresponding remote execution function for standalone minions) now makes use of the same underlying code used by the Git Fileserver Backend and Git External Pillar to maintain and update its local clones of git repositories. If a compatible version of either pygit2 (0.20.3 and later) or GitPython (0.3.0 or later) is installed, then Salt will use it instead of the old method (which invokes the git.latest state).

Note: If compatible versions of both pygit2 and GitPython are installed, then Salt will prefer pygit2, to override this behavior use the winrepo_provider configuration parameter:

```yaml
winrepo_provider: gitpython
```

The winrepo execution module (discussed above in the Managing Windows Software on a Standalone Windows Minion section) does not yet officially support the new pygit2/GitPython functionality, but if either pygit2 or GitPython is installed into Salt’s bundled Python then it should work. However, it should be considered experimental at this time.
To minimize potential issues, it is a good idea to remove any winrepo git repositories that were checked out by the old (pre-2015.8.0) winrepo code when upgrading the master to 2015.8.0 or later, and run `winrepo.update_git_repos` to clone them anew after the master is started.

Additional added features include the ability to access authenticated git repositories \(\text{(NOTE: pygit2 only)}\), and to set per-remote config settings. An example of this would be the following:

```
winrepo_remotes:
  - https://github.com/saltstack/salt-winrepo.git
  - git@github.com:myuser/myrepo.git:
    - pubkey: /path/to/key.pub
    - privkey: /path/to/key
    - passphrase: myaw3s0m3pa$$phr4$3
  - https://github.com/myuser/privaterrepo.git:
    - user: mygithubuser
    - password: CorrectHorseBatteryStaple
```

**Note:** Per-remote configuration settings work in the same fashion as they do in gitfs, with global parameters being overridden by their per-remote counterparts (for instance, setting `winrepo_passphrase` would set a global passphrase for winrepo that would apply to all SSH-based remotes, unless overridden by a `passphrase` per-remote parameter).

See [here](#) for more more in-depth explanation of how per-remote configuration works in gitfs, the same principles apply to winrepo.

There are a couple other changes in how Salt manages git repos using pygit2/GitPython. First of all, a `clean` argument has been added to the `winrepo.update_git_repos` runner, which (if set to `True`) will tell the runner to dispose of directories under the `winrepo_dir` which are not explicitly configured. This prevents the need to manually remove these directories when a repo is removed from the config file. To clean these old directories, just pass `clean=True`, like so:

```
salt-run winrepo.update_git_repos clean=True
```

However, if a mix of git and non-git Windows Repo definition files are being used, then this should **not** be used, as it will remove the directories containing non-git definitions.

The other major change is that collisions between repo names are now detected, and the `winrepo.update_git_repos` runner will not proceed if any are detected. Consider the following configuration:

```
winrepo_remotes:
  - https://foo.com/bar/baz.git
  - https://mydomain.tld/baz.git
  - https://github.com/foobar/baz
```

The `winrepo.update_git_repos` runner will refuse to update repos here, as all three of these repos would be checked out to the same directory. To work around this, a per-remote parameter called `name` can be used to resolve these conflicts:

```
winrepo_remotes:
  - https://foo.com/bar/baz.git
  - https://mydomain.tld/baz.git:
    - name: baz_junior
  - https://github.com/foobar/baz:
    - name: baz_the_third
```
26.1.12 Troubleshooting

Incorrect name/version

If the package seems to install properly, but salt reports a failure then it is likely you have a version or full_name mismatch.

Check the exact full_name and version used by the package. Use `pkg.list_pkgs` to check that the names and version exactly match what is installed.

Changes to sls files not being picked up

Ensure you have (re)generated the repository cache file (for older minions) and then updated the repository cache on the relevant minions:

```
salt-run winrepo.genrepo
salt winminion pkg.refresh_db
```

Packages management under Windows 2003

On Windows server 2003, you need to install optional Windows component "wmi Windows installer provider" to have full list of installed packages. If you don’t have this, salt-minion can’t report some installed software.

How Success and Failure are Reported

The install state/module function of the Windows package manager works roughly as follows:

1. Execute `pkg.list_pkgs` and store the result
2. Check if any action needs to be taken. (i.e. compare required package and version against `pkg.list_pkgs` results)
3. If so, run the installer command.
4. Execute `pkg.list_pkgs` and compare to the result stored from before installation.
5. Success/Failure/Changes will be reported based on the differences between the original and final `pkg.list_pkgs` results.

If there are any problems in using the package manager it is likely due to the data in your sls files not matching the difference between the pre and post `pkg.list_pkgs` results.

26.2 Windows-specific Behaviour

Salt is capable of managing Windows systems, however due to various differences between the operating systems, there are some things you need to keep in mind.

This document will contain any quirks that apply across Salt or generally across multiple module functions. Any Windows-specific behavior for particular module functions will be documented in the module function documentation. Therefore this document should be read in conjunction with the module function documentation.
26.2.1 Group parameter for files

Salt was originally written for managing Unix-based systems, and therefore the file module functions were designed around that security model. Rather than trying to shoehorn that model on to Windows, Salt ignores these parameters and makes non-applicable module functions unavailable instead.

One of the commonly ignored parameters is the group parameter for managing files. Under Windows, while files do have a 'primary group' property, this is rarely used. It generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Because of this, any file module functions that typically require a group, do not under Windows. Attempts to directly use file module functions that operate on the group (e.g. file.chgrp) will return a pseudo-value and cause a log message to appear. No group parameters will be acted on.

If you do want to access and change the 'primary group' property and understand the implications, use the file.get_pgid or file.get_pgroup functions or the pgroup parameter on the file.chown module function.

26.2.2 Dealing with case-insensitive but case-preserving names

Windows is case-insensitive, but however preserves the case of names and it is this preserved form that is returned from system functions. This causes some issues with Salt because it assumes case-sensitive names. These issues generally occur in the state functions and can cause bizarre looking errors.

To avoid such issues, always pretend Windows is case-sensitive and use the right case for names, e.g. specify user=Administrator instead of user=administrator.

Follow issue #11801 for any changes to this behavior.

26.2.3 Dealing with various username forms

Salt does not understand the various forms that Windows usernames can come in, e.g. username, mydomain\username, username@mydomain.tld can all refer to the same user. In fact, Salt generally only considers the raw username value, i.e. the username without the domain or host information.

Using these alternative forms will likely confuse Salt and cause odd errors to happen. Use only the raw username value in the correct case to avoid problems.

Follow issue #11801 for any changes to this behavior.

26.2.4 Specifying the None group

Each Windows system has built-in _None_ group. This is the default 'primary group' for files for users not on a domain environment.

Unfortunately, the word _None_ has special meaning in Python - it is a special value indicating 'nothing', similar to null or nil in other languages.

To specify the None group, it must be specified in quotes, e.g. ../salt '*' file.chgrp C:\path\to\file "'None'".

26.2.5 Symbolic link loops

Under Windows, if any symbolic link loops are detected or if there are too many levels of symlinks (defaults to 64), an error is always raised.
For some functions, this behavior is different to the behavior on Unix platforms. In general, avoid symlink loops on either platform.
CHAPTER TWENTYSEVEN

DEVELOPING SALT

27.1 Overview

In its most typical use, Salt is a software application in which clients, called "minions" can be commanded and controlled from a central command server called a "master".

Commands are normally issued to the minions (via the master) by calling a client script simply called, 'salt'.

Salt features a pluggable transport system to issue commands from a master to minions. The default transport is ZeroMQ.

27.2 Salt Client

27.2.1 Overview

The salt client is run on the same machine as the Salt Master and communicates with the salt-master to issue commands and to receive the results and display them to the user.

The primary abstraction for the salt client is called 'LocalClient'.

When LocalClient wants to publish a command to minions, it connects to the master by issuing a request to the master's ReqServer (TCP: 4506)

The LocalClient system listens to responses for its requests by listening to the master event bus publisher (master_event_pub.ipc).

27.3 Salt Master

27.3.1 Overview

The salt-master daemon runs on the designated Salt master and performs functions such as authenticating minions, sending, and receiving requests from connected minions and sending and receiving requests and replies to the 'salt' CLI.

27.3.2 Moving Pieces

When a Salt master starts up, a number of processes are started, all of which are called 'salt-master' in a process-list but have various role categories.
Among those categories are:

- Publisher
- EventPublisher
- MWorker

### 27.3.3 Publisher

The Publisher process is responsible for sending commands over the designated transport to connected minions. The Publisher is bound to the following:

- TCP: port 4505
- IPC: publish_pull.ipc

Each salt minion establishes a connection to the master Publisher.

### 27.3.4 EventPublisher

The EventPublisher publishes master events out to any event listeners. It is bound to the following:

- IPC: master_event_pull.ipc
- IPC: master_event_pub.ipc

### 27.3.5 MWorker

Worker processes manage the back-end operations for the Salt Master.

The number of workers is equivalent to the number of 'worker_threads' specified in the master configuration and is always at least one.

Workers are bound to the following:

- IPC: workers.ipc

### 27.3.6 ReqServer

The Salt request server takes requests and distributes them to available MWorker processes for processing. It also receives replies back from minions.

The ReqServer is bound to the following:

- TCP: 4506
- IPC: workers.ipc

Each salt minion establishes a connection to the master ReqServer.

### 27.3.7 Job Flow

The Salt master works by always publishing commands to all connected minions and the minions decide if the command is meant for them by checking themselves against the command target.

The typical lifecycle of a salt job from the perspective of the master might be as follows:
1) A command is issued on the CLI. For example, 'salt my_minion test.version'.

2) The 'salt' command uses LocalClient to generate a request to the salt master by connecting to the ReqServer on TCP:4506 and issuing the job.

3) The salt-master ReqServer sees the request and passes it to an available MWorker over workers.ipc.

4) A worker picks up the request and handles it. First, it checks to ensure that the requested user has permissions to issue the command. Then, it sends the publish command to all connected minions. For the curious, this happens in ClearFuncs.publish().

5) The worker announces on the master event bus that it is about to publish a job to connected minions. This happens by placing the event on the master event bus (master_event_pull.ipc) where the EventPublisher picks it up and distributes it to all connected event listeners on master_event_pub.ipc.

6) The message to the minions is encrypted and sent to the Publisher via IPC on publish_pull.ipc.

7) Connected minions have a TCP session established with the Publisher on TCP port 4505 where they await commands. When the Publisher receives the job over publish_pull, it sends the jobs across the wire to the minions for processing.

8) After the minions receive the request, they decrypt it and perform any requested work, if they determine that they are targeted to do so.

9) When the minion is ready to respond, it publishes the result of its job back to the master by sending the encrypted result back to the master on TCP 4506 where it is again picked up by the ReqServer and forwarded to an available MWorker for processing. (Again, this happens by passing this message across workers.ipc to an available worker.)

10) When the MWorker receives the job it decrypts it and fires an event onto the master event bus (master_event_pull.ipc). (Again for the curious, this happens in AESFuncs._return().)

11) The EventPublisher sees this event and re-publishes it on the bus to all connected listeners of the master event bus (on master_event_pub.ipc). This is where the LocalClient has been waiting, listening to the event bus for minion replies. It gathers the job and stores the result.

12) When all targeted minions have replied or the timeout has been exceeded, the salt client displays the results of the job to the user on the CLI.

### 27.4 Salt Minion

#### 27.4.1 Overview

The salt-minion is a single process that sits on machines to be managed by Salt. It can either operate as a stand-alone daemon which accepts commands locally via 'salt-call' or it can connect back to a master and receive commands remotely.

When starting up, salt minions connect back to a master defined in the minion config file. They connect to two ports on the master:

- **TCP: 4505** This is the connection to the master Publisher. It is on this port that the minion receives jobs from the master.

- **TCP: 4506** This is the connection to the master ReqServer. It is on this port that the minion sends job results back to the master.
27.4.2 Event System

Similar to the master, a salt-minion has its own event system that operates over IPC by default. The minion event system operates on a push/pull system with IPC files at minion_event_<unique_id>_pub.ipc and minion_event_<unique_id>_pull.ipc.

The astute reader might ask why have an event bus at all with a single-process daemon. The answer is that the salt-minion may fork other processes as required to do the work without blocking the main salt-minion process and this necessitates a mechanism by which those processes can communicate with each other. Secondarily, this provides a bus by which any user with sufficient permissions can read or write to the bus as a common interface with the salt minion.

27.4.3 Minion Job Flow

When a salt minion starts up, it attempts to connect to the Publisher and the ReqServer on the salt master. It then attempts to authenticate and once the minion has successfully authenticated, it simply listens for jobs.

Jobs normally come either come from the `salt-call` script run by a local user on the salt minion or they can come directly from a master.

The job flow on a minion, coming from the master via a `salt` command is as follows:

1) A master publishes a job that is received by a minion as outlined by the master’s job flow above. 2) The minion is polling its receive socket that’s connected to the master Publisher (TCP 4505 on master). When it detects an incoming message, it picks it up from the socket and decrypts it. 3) A new minion process or thread is created and provided with the contents of the decrypted message. The _thread_return() method is provided with the contents of the received message. 4) The new minion thread is created. The _thread_return() function starts up and actually calls out to the requested function contained in the job. 5) The requested function runs and returns a result. [Still in thread.] 6) The result of the function that’s run is encrypted and returned to the master’s ReqServer (TCP 4506 on master). [Still in thread.] 7) Thread exits. Because the main thread was only blocked for the time that it took to initialize the worker thread, many other requests could have been received and processed during this time.

27.5 A Note on ClearFuncs vs. AESFuncs

A common source of confusion is determining when messages are passed in the clear and when they are passed using encryption. There are two rules governing this behaviour:

1) ClearFuncs is used for intra-master communication and during the initial authentication handshake between a minion and master during the key exchange. 2) AESFuncs is used everywhere else.

27.6 Contributing

There is a great need for contributions to Salt and patches are welcome! The goal here is to make contributions clear, make sure there is a trail for where the code has come from, and most importantly, to give credit where credit is due!

There are a number of ways to contribute to Salt development.

For details on how to contribute documentation improvements please review [Writing Salt Documentation](#).
27.6.1 Salt Coding Style

SaltStack has its own coding style guide that informs contributors on various coding approaches. Please review the *Salt Coding Style* documentation for information about Salt’s particular coding patterns.

Within the *Salt Coding Style* documentation, there is a section about running Salt’s `.testing.pylintrc` file. SaltStack recommends running the `.testing.pylintrc` file on any files you are changing with your code contribution before submitting a pull request to Salt’s repository. Please see the *Linting* documentation for more information.

---

**Note:** There are two pylintrc files in the *salt* directory. One is the `.pylintrc` file and the other is the `.testing.pylintrc` file. The tests that run in Jenkins against GitHub Pull Requests use `.testing.pylintrc`. The `.testing.pylintrc` file is a little less strict than the `.pylintrc` and is used to make it easier for contributors to submit changes. The `.pylintrc` file can be used for linting, but the `.testing.pylintrc` is the source of truth when submitting pull requests.

---

27.6.2 Sending a GitHub pull request

Sending pull requests on GitHub is the preferred method for receiving contributions. The workflow advice below mirrors GitHub’s own guide and is well worth reading.

1. Fork `saltstack/salt` on GitHub.
2. Make a local clone of your fork.
   ```bash
git clone git@github.com:my-account/salt.git
cd salt
```
3. Add `saltstack/salt` as a git remote.
   ```bash
git remote add upstream https://github.com/saltstack/salt.git
```
4. Create a new branch in your clone.
   ```bash
Note: A branch should have one purpose. For example, "Fix bug X," or "Add feature Y". Multiple unrelated fixes and/or features should be isolated into separate branches.
```
   If you’re working on a bug or documentation fix, create your branch from the oldest supported main release branch that contains the bug or requires the documentation update. See *Which Salt Branch?*.
   ```bash
git fetch upstream
git checkout -b fix-broken-thing upstream/2016.11
```
   If you’re working on a feature, create your branch from the develop branch.
   ```bash
git fetch upstream
git checkout -b add-cool-feature upstream/develop
```
5. Edit and commit changes to your branch.
   ```bash
vim path/to/file1 path/to/file2
git diff
```
   ```bash
git add path/to/file1 path/to/file2
git commit
```
Write a short, descriptive commit title and a longer commit message if necessary.

**Note:** If your change fixes a bug or implements a feature already filed in the issue tracker, be sure to reference the issue number in the commit message body.

```plaintext
Fix broken things in file1 and file2
Fixes #31337

# Please enter the commit message for your changes. Lines starting
# with '#' will be ignored, and an empty message aborts the commit.
# On branch fix-broken-thing
# Changes to be committed:
#   modified:  path/to/file1
#   modified:  path/to/file2

If you get stuck, there are many introductory Git resources on [http://help.github.com](http://help.github.com).

6. Push your locally-committed changes to your GitHub fork.

   ```plaintext
git push -u origin fix-broken-thing
   
or
   git push -u origin add-cool-feature
   ```

   **Note:** You may want to rebase before pushing to work out any potential conflicts:

   ```plaintext
git fetch upstream
git rebase upstream/2016.11 fix-broken-thing
git push -u origin fix-broken-thing
   
or
   git fetch upstream
git rebase upstream/develop add-cool-feature
git push -u origin add-cool-feature
   ```

   If you do rebase, and the push is rejected with a (non-fast-forward) comment, then run `git status`. You will likely see a message about the branches diverging:

   ```plaintext
On branch fix-broken-thing
Your branch and 'origin/fix-broken-thing' have diverged,
and have 1 and 2 different commits each, respectively.
  (use "git pull" to merge the remote branch into yours)
nothing to commit, working tree clean
   ```

   Do **NOT** perform a `git pull` or `git merge` here. Instead, add `-force-with-leak` to the end of the `git push` command to get the changes pushed to your fork. Pulling or merging, while they will resolve the non-fast-forward issue, will likely add extra commits to the pull request which were not part of your changes.

7. Find the branch on your GitHub salt fork.

   ```plaintext
https://github.com/my-account/salt/branches/fix-broken-thing
   ```
8. Open a new pull request.
   Click on Pull Request on the right near the top of the page,
   https://github.com/my-account/salt/pull/new/fix-broken-thing
   1. If your branch is a fix for a release branch, choose that as the base branch (e.g. 2016.11),
      https://github.com/my-account/salt/compare/saltstack:2016.11...fix-broken-thing
      If your branch is a feature, choose develop as the base branch,
      https://github.com/my-account/salt/compare/saltstack:develop...add-cool-feature
   2. Review that the proposed changes are what you expect.
   3. Write a descriptive comment. Include links to related issues (e.g. ‘Fixes #31337.’) in the comment field.
   4. Click Create pull request.

9. Salt project members will review your pull request and automated tests will run on it.
   If you recognize any test failures as being related to your proposed changes or if a reviewer asks for modifications:
   1. Make the new changes in your local clone on the same local branch.
   2. Push the branch to GitHub again using the same commands as before.
   3. New and updated commits will be added to the pull request automatically.
   4. Feel free to add a comment to the discussion.

Note: Jenkins
Pull request against saltstack/salt are automatically tested on a variety of operating systems and configurations. On average these tests take 30 minutes. Depending on your GitHub notification settings you may also receive an email message about the test results.
Test progress and results can be found at http://jenkins.saltstack.com/.

27.6.3 Salt’s Branch Topology

There are three different kinds of branches in use: develop, main release branches, and dot release branches.

- All feature work should go into the develop branch.
- Bug fixes and documentation changes should go into the oldest supported main release branch affected by the bug or documentation change (you can use the blame button in github to figure out when the bug was introduced). Supported releases are the last 2 releases. For example, if the latest release is 2018.3, the last two release are 2018.3 and 2017.7. Main release branches are named after a year and month, such as 2016.11 and 2017.7.
- Hot fixes, as determined by SaltStack’s release team, should be submitted against dot release branches. Dot release branches are named after a year, month, and version. Examples include 2016.11.8 and 2017.7.2.

Note: GitHub will open pull requests against Salt’s main branch, develop, by default. Be sure to check which branch is selected when creating the pull request.
The Develop Branch

The develop branch is unstable and bleeding-edge. Pull requests containing feature additions or non-bug-fix changes should be made against the develop branch.

Note: If you have a bug fix or documentation change and have already forked your working branch from develop and do not know how to rebase your commits against another branch, then submit it to develop anyway. SaltStack’s development team will be happy to back-port it to the correct branch.

Please make sure you let the maintainers know that the pull request needs to be back-ported.

Main Release Branches

The current release branch is the most recent stable release. Pull requests containing bug fixes or documentation changes should be made against the oldest supported main release branch that is affected.

The branch name will be a date-based name such as 2016.11.

Bug fixes are made on this branch so that dot release branches can be cut from the main release branch without introducing surprises and new features. This approach maximizes stability.

Dot Release Branches

Prior to tagging an official release, a branch will be created when the SaltStack release team is ready to tag. The dot release branch is created from a main release branch. The dot release branch will be the same name as the tag minus the v. For example, the 2017.7.1 dot release branch was created from the 2017.7 main release branch. The v2017.7.1 release was tagged at the HEAD of the 2017.7.1 branch.

This branching strategy will allow for more stability when there is a need for a re-tag during the testing phase of the release process and further increases stability.

Once the dot release branch is created, the fixes required for a given release, as determined by the SaltStack release team, will be added to this branch. All commits in this branch will be merged forward into the main release branch as well.

Merge Forward Process

The Salt repository follows a "Merge Forward" policy. The merge-forward behavior means that changes submitted to older main release branches will automatically be "merged-forward" into the newer branches.

For example, a pull request is merged into 2017.7. Then, the entire 2017.7 branch is merged-forward into the 2018.3 branch, and the 2018.3 branch is merged-forward into the develop branch.

This process makes it easy for contributors to make only one pull-request against an older branch, but allows the change to propagate to all main release branches.

The merge-forward work-flow applies to all main release branches and the operation runs continuously.

Merge-Forwards for Dot Release Branches

The merge-forward policy applies to dot release branches as well, but has a slightly different behavior. If a change is submitted to a dot release branch, the dot release branch will be merged into its parent main release branch.
For example, a pull request is merged into the 2017.7.2 release branch. Then, the entire 2017.7.2 branch is merged-forward into the 2017.7 branch. From there, the merge forward process continues as normal.

The only way in which dot release branches differ from main release branches in regard to merge-forwards, is that once a dot release branch is created from the main release branch, the dot release branch does not receive merge forwards.

**Note:** The merge forward process for dot release branches is one-way: dot release branch → main release branch.

### Closing GitHub issues from commits

This "merge-forward" strategy requires that the magic keywords to close a GitHub issue appear in the commit message text directly. Only including the text in a pull request will not close the issue.

GitHub will close the referenced issue once the commit containing the magic text is merged into the default branch (develop). Any magic text input only into the pull request description will not be seen at the Git-level when those commits are merged-forward. In other words, only the commits are merged-forward and not the pull request text.

### Backporting Pull Requests

If a bug is fixed on develop and the bug is also present on a currently-supported release branch, it will need to be back-ported to an applicable branch.

**Note:** Most Salt contributors can skip these instructions

These instructions do not need to be read in order to contribute to the Salt project! The SaltStack team will back-port fixes on behalf of contributors in order to keep the contribution process easy.

These instructions are intended for frequent Salt contributors, advanced Git users, SaltStack employees, or independent souls who wish to back-port changes themselves.

It is often easiest to fix a bug on the oldest supported release branch and then merge that branch forward into develop (as described earlier in this document). When that is not possible the fix must be back-ported, or copied, into any other affected branches.

These steps assume a pull request #1234 has been merged into develop. And upstream is the name of the remote pointing to the main Salt repo.

1. Identify the oldest supported release branch that is affected by the bug.

2. Create a new branch for the back-port by reusing the same branch from the original pull request.

   Name the branch bp-<NNNN> and use the number of the original pull request.

   ```
   git fetch upstream refs/pull/1234/head:bp-1234
   git checkout bp-1234
   ```

3. Find the parent commit of the original pull request.

   The parent commit of the original pull request must be known in order to rebase onto a release branch. The easiest way to find this is on GitHub.

   Open the original pull request on GitHub and find the first commit in the list of commits. Select and copy the SHA for that commit. The parent of that commit can be specified by appending ~1 to the end.

4. Rebase the new branch on top of the release branch.
• `<release-branch>` is the branch identified in step #1.
• `<orig-base>` is the SHA identified in step #3 – don’t forget to add `~1` to the end!

```
git rebase --onto <release-branch> <orig-base> bp-1234
```

Note, release branches prior to `2016.11` will not be able to make use of rebase and must use cherry-picking instead.

5. Push the back-port branch to GitHub and open a new pull request.

Opening a pull request for the back-port allows for the test suite and normal code-review process.

```
git push -u origin bp-1234
```

### 27.6.4 Keeping Salt Forks in Sync

Salt advances quickly. It is therefore critical to pull upstream changes from upstream into your fork on a regular basis. Nothing is worse than putting hard work into a pull request only to see bunches of merge conflicts because it has diverged too far from upstream.

See also:

GitHub Fork a Repo Guide

The following assumes `origin` is the name of your fork and `upstream` is the name of the main `saltstack/salt` repository.

1. View existing remotes.

```
git remote -v
```

2. Add the `upstream` remote.

```
# For ssh github
git remote add upstream git@github.com:saltstack/salt.git

# For https github
git remote add upstream https://github.com/saltstack/salt.git
```

3. Pull upstream changes into your clone.

```
git fetch upstream
```

4. Update your copy of the `develop` branch.

```
git checkout develop
git merge --ff-only upstream/develop
```

If Git complains that a fast-forward merge is not possible, you have local commits.

• Run `git pull --rebase origin develop` to rebase your changes on top of the upstream changes.

• Or, run `git branch <branch-name>` to create a new branch with your commits. You will then need to reset your `develop` branch before updating it with the changes from upstream.

If Git complains that local files will be overwritten, you have changes to files in your working directory. Run `git status` to see the files in question.
5. Update your fork.

```bash
git push origin develop
```

6. Repeat the previous two steps for any other branches you work with, such as the current release branch.

### 27.6.5 Posting patches to the mailing list

Patches will also be accepted by email. Format patches using `git format-patch` and send them to the `salt-users` mailing list. The contributor will then get credit for the patch, and the Salt community will have an archive of the patch and a place for discussion.

### 27.6.6 Issue and Pull Request Labeling System

SaltStack uses several labeling schemes to help facilitate code contributions and bug resolution. See the [Labels and Milestones](#) documentation for more information.

### 27.6.7 Mentionbot

SaltStack runs a mention-bot which notifies contributors who might be able to help review incoming pull-requests based on their past contribution to files which are being changed.

If you do not wish to receive these notifications, please add your GitHub handle to the blacklist line in the `.mention-bot` file located in the root of the Salt repository.

### 27.6.8 GPG Verification

SaltStack has enabled [GPG Probot](#) to enforce GPG signatures for all commits included in a Pull Request.

In order for the GPG verification status check to pass, every contributor in the pull request must:

- Set up a GPG key on local machine
- Sign all commits in the pull request with key
- Link key with GitHub account

This applies to all commits in the pull request.

GitHub hosts a number of [help articles](#) for creating a GPG key, using the GPG key with `git` locally, and linking the GPG key to your GitHub account. Once these steps are completed, the commit signing verification will look like the example in GitHub’s [GPG Signature Verification feature announcement](#).

### 27.6.9 Bootstrap Script Changes

Salt’s Bootstrap Script, known as `bootstrap-salt.sh` in the Salt repo, has its own repository, contributing guidelines, and release cadence.

All changes to the Bootstrap Script should be made to `salt-bootstrap repo`. Any pull requests made to the `bootstrap-salt.sh` file in the Salt repository will be automatically overwritten upon the next stable release of the Bootstrap Script.

For more information on the release process or how to contribute to the Bootstrap Script, see the Bootstrap Script’s [Contributing Guidelines](#).
27.7 Deprecating Code

Salt should remain backwards compatible, though sometimes, this backwards compatibility needs to be broken because a specific feature and/or solution is no longer necessary or required. At first one might think, let me change this code, it seems that it’s not used anywhere else so it should be safe to remove. Then, once there’s a new release, users complain about functionality which was removed and they where using it, etc. This should, at all costs, be avoided, and, in these cases, that specific code should be deprecated.

In order to give users enough time to migrate from the old code behavior to the new behavior, the deprecation time frame should be carefully determined based on the significance and complexity of the changes required by the user.

Salt feature releases are based on the Periodic Table. Any new features going into the develop branch will be named after the next element in the Periodic Table. For example, Beryllium was the feature release name of the develop branch before the 2015.8 branch was tagged. At that point in time, any new features going into the develop branch after 2015.8 was branched were part of the Boron feature release.

A deprecation warning should be in place for at least two major releases before the deprecated code and its accompanying deprecation warning are removed. More time should be given for more complex changes. For example, if the current release under development is Sodium, the deprecated code and associated warnings should remain in place and warn for at least Aluminum.

To help in this deprecation task, salt provides salt.utils.versions.warn_until. The idea behind this helper function is to show the deprecation warning to the user until salt reaches the provided version. Once that provided version is equaled salt.utils.versions.warn_until will raise a RuntimeError making salt stop its execution. This stoppage is unpleasant and will remind the developer that the deprecation limit has been reached and that the code can then be safely removed.

Consider the following example:

```python
def some_function(bar=False, foo=None):
    if foo is not None:
        salt.utils.versions.warn_until('Aluminum',
            'The \"foo\" argument has been deprecated and its 
            functionality removed, as such, its usage is no longer '
            'required.'
        )
```

Development begins on the Aluminum release when the Magnesium branch is forked from the develop branch. Once this occurs, all uses of the warn_until function targeting Aluminum, along with the code they are warning about should be removed from the code.

27.8 Installing Salt for development

Clone the repository using:

```
git clone https://github.com/saltstack/salt
```

**Note:** tags

Just cloning the repository is enough to work with Salt and make contributions. However, fetching additional tags from git is required to have Salt report the correct version for itself. To do this, first add the git repository as an upstream source:
git remote add upstream https://github.com/saltstack/salt

Fetching tags is done with the git 'fetch' utility:

```
git fetch --tags upstream
```

Create a new virtualenv:

```
virtualenv /path/to/your/virtualenv
```

Avoid making your virtualenv path too long.

On Arch Linux, where Python 3 is the default installation of Python, use the virtualenv2 command instead of virtualenv.

On Gentoo you must use --system-site-packages to enable pkg and portage_config functionality.

**Note:** Using system Python modules in the virtualenv

To use already-installed python modules in virtualenv (instead of having pip download and compile new ones), run `virtualenv --system-site-packages` Using this method eliminates the requirement to install the salt dependencies again, although it does assume that the listed modules are all installed in the system PYTHONPATH at the time of virtualenv creation.

**Note:** Python development package

Be sure to install python devel package in order to install required Python modules. In Debian/Ubuntu run `sudo apt-get install -y python-dev`. In RedHat based system install python-devel.

Activate the virtualenv:

```
source /path/to/your/virtualenv/bin/activate
```

Install Salt (and dependencies) into the virtualenv:

```
pip install pyzmq PyYAML pycrypto msgpack-python jinja2 psutil futures tornado
pip install -e ./salt  # the path to the salt git clone from above
```

**Note:** Installing psutil

Python header files are required to build this module, otherwise the pip install will fail. If your distribution separates binaries and headers into separate packages, make sure that you have the headers installed. In most Linux distributions which split the headers into their own package, this can be done by installing the python-dev or python-devel package. For other platforms, the package will likely be similarly named.

**Note:** Installing dependencies on macOS.

You can install needed dependencies on macOS using homebrew or macports. See macOS Installation.

27.8. Installing Salt for development
Warning: Installing on RedHat-based Distros

If installing from pip (or from source using `setup.py install`), be advised that the `yum-utils` package is needed for Salt to manage packages on RedHat-based systems.

27.8.1 Running a self-contained development version

During development it is easiest to be able to run the Salt master and minion that are installed in the virtualenv you created above, and also to have all the configuration, log, and cache files contained in the virtualenv as well.

The `/path/to/your/virtualenv` referenced multiple times below is also available in the variable `$VIRTUAL_ENV` once the virtual environment is activated.

Copy the master and minion config files into your virtualenv:

```
mkdir -p /path/to/your/virtualenv/etc/salt/pki/{master,minion}
cp ./salt/conf/master ./salt/conf/minion /path/to/your/virtualenv/etc/salt/
```

Edit the master config file:

1. Uncomment and change the `user: root` value to your own user.
2. Uncomment and change the `root_dir: /` value to point to `/path/to/your/virtualenv`.
3. Uncomment and change the `pki_dir: /etc/salt/pki/master` value to point to `/path/to/your/virtualenv/etc/salt/pki/master`.
4. If you are running version 0.11.1 or older, uncomment, and change the `pidfile: /var/run/salt-master.pid` value to point to `/path/to/your/virtualenv/salt-master.pid`.
5. If you are also running a non-development version of Salt you will have to change the `publish_port` and `ret_port` values as well.

Edit the minion config file:

1. Repeat the edits you made in the master config for the `user` and `root_dir` values as well as any port changes.
2. Uncomment and change the `pki_dir: /etc/salt/pki/minion` value to point to `/path/to/your/virtualenv/etc/salt/pki/minion`.
3. If you are running version 0.11.1 or older, uncomment, and change the `pidfile: /var/run/salt-minion.pid` value to point to `/path/to/your/virtualenv/salt-minion.pid`.
4. Uncomment and change the `master: salt` value to point at `localhost`.
5. Uncomment and change the `id:` value to something descriptive like "saltdev". This isn’t strictly necessary but it will serve as a reminder of which Salt installation you are working with.
6. If you changed the `ret_port` value in the master config because you are also running a non-development version of Salt, then you will have to change the `master_port` value in the minion config to match.

Note: Using `salt-call` with a Standalone Minion

If you plan to run `salt-call` with this self-contained development environment in a masterless setup, you should invoke `salt-call` with `-c /path/to/your/virtualenv/etc/salt` so that salt can find the minion config file. Without the `-c` option, Salt finds its config files in `/etc/salt`.

Start the master and minion, accept the minion’s key, and verify your local Salt installation is working:
cd /path/to/your/virtualenv
salt-master -c ./etc/salt -d
salt-minion -c ./etc/salt -d
salt-key -c ./etc/salt -L
salt-key -c ./etc/salt -A
salt -c ./etc/salt '*'
test.version

Running the master and minion in debug mode can be helpful when developing. To do this, add -l debug to the calls to salt-master and salt-minion. If you would like to log to the console instead of to the log file, remove the -d.

Note: Too long socket path?

Once the minion starts, you may see an error like the following:

```
zmq.core.error.ZMQError: ipc path "/path/to/your/virtualenv/
  var/run/salt/minion/minion_event_7824dcbcfd7a8f6755939af78b96249f_pub.ipc"
is longer than 107 characters (sizeof(sockaddr_un.sun_path)).
```

This means that the path to the socket the minion is using is too long. This is a system limitation, so the only workaround is to reduce the length of this path. This can be done in a couple different ways:

1. Create your virtualenv in a path that is short enough.
2. Edit the sock_dir minion config variable and reduce its length. Remember that this path is relative to the value you set in root_dir.

NOTE: The socket path is limited to 107 characters on Solaris and Linux, and 103 characters on BSD-based systems.

Note: File descriptor limits

Ensure that the system open file limit is raised to at least 2047:

```
# check your current limit
ulimit -n

# raise the limit. persists only until reboot
# use 'limit descriptors 2047' for c-shell
ulimit -n 2047
```

To set file descriptors on macOS, refer to the macOS Installation instructions.

Changing Default Paths

Instead of updating your configuration files to point to the new root directory and having to pass the new configuration directory path to all of Salt’s CLI tools, you can explicitly tweak the default system paths that Salt expects:

```
GENERATE_SALT_SYSPATHS=1 pip install --global-option="--salt-root-dir=/path/to/your/
  _virtualenv/" \\
  -e .:/salt # the path to the salt git clone from above
```

You can now call all of Salt’s CLI tools without explicitly passing the configuration directory.
Additional Options

If you want to distribute your virtualenv, you probably don’t want to include Salt’s clone .git/ directory, and, without it, Salt won’t report the accurate version. You can tell setup.py to generate the hardcoded version information which is distributable:

```
GENERATE_SALT_SYSPATHS=1 WRITE_SALT_VERSION=1 pip install --global-option='--salt-root-dir=/path/to/your/virtualenv/' \
-e ./salt  # the path to the salt git clone from above
```

Instead of passing those two environmental variables, you can just pass a single one which will trigger the other two:

```
MIMIC_SALT_INSTALL=1 pip install --global-option='--salt-root-dir=/path/to/your/virtualenv/' \
-e ./salt  # the path to the salt git clone from above
```

This last one will grant you an editable salt installation with hardcoded system paths and version information.

27.8.2 Installing Salt from the Python Package Index

If you are installing using easy_install, you will need to define a USE_SETUPTOOLS environment variable, otherwise dependencies will not be installed:

```
USE_SETUPTOOLS=1 easy_install salt
```

27.8.3 Editing and previewing the documentation

You need sphinx-build command to build the docs. In Debian/Ubuntu this is provided in the python-sphinx package. Sphinx can also be installed to a virtualenv using pip:

```
pip install Sphinx==1.3.1
```

Change to salt documentation directory, then:

```
cd doc; make html
```

- This will build the HTML docs. Run make without any arguments to see the available make targets, which include html, man, and text.
- The docs then are built within the docs/_build/ folder. To update the docs after making changes, run make again.
- The docs use reStructuredText for markup. See a live demo at http://rst.ninjs.org/.
- The help information on each module or state is culled from the python code that runs for that piece. Find them in salt/modules/ or salt/states/.
- To build the docs on Arch Linux, the python2-sphinx package is required. Additionally, it is necessary to tell make where to find the proper sphinx-build binary, like so:

```
make SPHINXBUILD=sphinx-build2 html
```

- To build the docs on RHEL/CentOS 6, the python-sphinx10 package must be installed from EPEL, and the following make command must be used:
Once you've updated the documentation, you can run the following command to launch a simple Python HTTP server to see your changes:

```bash
make SPHINXBUILD=sphinx-build html
```

Running unit and integration tests

Run the test suite with following command:

```bash
./setup.py test
```

See [here](#) for more information regarding the test suite.

Issue and Pull Request Labeling System

SaltStack uses several labeling schemes to help facilitate code contributions and bug resolution. See the [Labels and Milestones](#) documentation for more information.

GitHub Labels and Milestones

SaltStack uses several label categories, as well as milestones, to triage incoming issues and pull requests in the GitHub issue tracker. Labels are used to sort issues by type, priority, severity, status, functional area, functional group, and targeted release and pull requests by status, functional area, functional group, type of change, and test status. Milestones are used to indicate whether an issue is fully triaged or is scheduled to be fixed by SaltStack in an upcoming sprint.

Milestones

All issues are assigned to a milestone, whereas pull requests are almost never assigned to a milestone as the mean lifetime of pull requests is short enough that there is no need to track them temporally.

SaltStack uses milestones to indicate which issues are blocked on submitter or upstream actions, are approved, or are scheduled to be fixed or implemented in an upcoming sprint. If an issue is not attached to a sprint milestone, you are welcome to work on it at your own desire and convenience. If it is attached to a sprint milestone and you have already begun working on it or have a solution in mind or have other ideas related to the issue, you are encouraged to coordinate with the assignee via the GitHub issue tracker to create the best possible solution or implementation.

- **Approved** - The issue has been validated and has all necessary information.
- **Blocked** - The issue is waiting on actions by parties outside of SaltStack, such as receiving more information from the submitter or resolution of an upstream issue. This milestone is usually applied in conjunction with the labels Info Needed, Question, Expected Behavior, Won't Fix For Now, or Upstream Bug.

Labels

Labels are used to sort and describe issues and pull requests. Some labels are usually reserved for one or the other, though most labels may be applied to both.
New issues will receive at least one label and a milestone, and new pull requests will receive at least one label. Except for the functional area and functional group label categories, issues will generally receive only up to one label per category.

Type

Issues are categorized into one of several types. Type labels are almost never used for pull requests. GitHub treats pull requests like issues in many ways, so a pull request could be considered an issue with an implicit Pull Request type label applied.

- **Feature** - The issue is a request for new functionality including changes, enhancements, refactors, etc.
- **Bug** - The issue documents broken, incorrect, or confusing behavior. This label is always accompanied by a severity label.
- **Duplicate** - The issue is a duplicate of another feature request or bug report.
- **Upstream Bug** - The issue is a result of an upstream issue.
- **Question** - The issue is more of a question than a request for new features or a report of broken features, but can sometimes lead to further discussion or changes of confusing or incongruous behavior or documentation.
- **Expected Behavior** - The issue is a bug report of intended functionality.

Priority

An issue’s priority is relative to its functional area. If a bug report, for example, about gitfs indicates that all users of gitfs will encounter this bug, then a P1 label will be applied, even though users who are not using gitfs will not encounter the bug. If a feature is requested by many users, it may be given a high priority.

- **P1** - The issue will be seen by all users.
- **P2** - The issue will be seen by most users.
- **P3** - The issue will be seen by about half of users.
- **P4** - The issue will not be seen by most users. Usually the issue is a very specific use case or corner case.

Severity

Severity labels are almost always only applied to issues labeled Bug.

- **Blocker** - The issue is blocking an impending release.
- **Critical** - The issue causes data loss, crashes or hangs salt processes, makes the system unresponsive, etc.
- **High Severity** - The issue reports incorrect functionality, bad functionality, a confusing user experience, etc.
- **Medium Severity** - The issue reports cosmetic items, formatting, spelling, colors, etc.

Functional Area

Many major components of Salt have corresponding GitHub labels. These labels are applied to all issues and pull requests as is reasonably appropriate. They are useful in organizing issues and pull requests according to the source code relevant to issues or the source code changed by pull requests.

- **Execution Module**
• File Servers
• Grains
• Multi-Master
• Packaging Related to packaging of Salt, not Salt's support for package management.
• Pillar
• RAET
• Returners
• Runners
• SPM
• Salt-API
• Salt-Cloud
• Salt-SSH
• Salt-Syndic
• State Module
• Tests
• Transport
• Windows
• ZMQ

Functional Group

These labels sort issues and pull requests according to the internal SaltStack engineering teams.

- **Core** - The issue or pull request relates to code that is central or existential to Salt itself.
- **Platform** - The issue or pull request relates to support and integration with various platforms like traditional operating systems as well as containers, platform-based utilities like filesystems, command schedulers, etc., and system-based applications like web servers, databases, etc.
- **RIoT** - The issue or pull request relates to support and integration with various abstract systems like cloud providers, hypervisors, API-based services, etc.
- **Console** - The issue or pull request relates to the SaltStack enterprise console.
- **Documentation** - The issue or pull request relates to documentation.

Status

Status labels are used to define and track the state of issues and pull requests. Not all potential statuses correspond to a label, but some statuses are common enough that labels have been created for them. If an issue has not been moved beyond the **Blocked** milestone, it is very likely that it will only have a status label.

- **Bugfix - back-port** The pull request needs to be back-ported to an older release branch. This is done by recreating the pull request against that branch. Once the back-port is completed, this label is replaced with a **Bugfix - [Done] back-ported** label. Normally, new features should go into the develop and bug fixes into the oldest supported release branch, see [here](#).
- **Bugfix - [Done] back-ported** - The pull request has been back-ported to an older branch.
• **Cannot Reproduce** - The issue is a bug and has been reviewed by a SaltStack engineer, but it cannot be replicated with the provided information and context. Those involved with the bug will need to work through additional ideas until the bug can be isolated and verified.

• **Confirmed** - The issue is a bug and has been confirmed by a SaltStack engineer, who often documents a minimal working example that reproduces the bug.

• **Fixed Pending Verification** - The issue is a bug and has been fixed by one or more pull requests, which should link to the issue. Closure of the issue is contingent upon confirmation of resolution from the submitter. If the submitter reports a negative confirmation, this label is removed. If no response is given after a few weeks, then the issue will be assumed fixed and closed.

• **Info Needed** - The issue needs more information before it can be verified and resolved. For a feature request this may include a description of the use cases. Almost all bug reports need to include at least the versions of salt and its dependencies, the system type and version, commands used, debug logs, error messages, and relevant configs.

• **Pending Changes** - The pull request needs additional changes before it can be merged.

• **Pending Discussion** - The issue or pull request needs more discussion before it can be closed or merged. The status of the issue or pull request is not clear or apparent enough for definite action to be taken, or additional input from SaltStack, the submitter, or another party has been requested.

    If the issue is not a pull request, once the discussion has arrived at a cogent conclusion, this label will be removed and the issue will be accepted. If it is a pull request, the results of the discussion may require additional changes and thus, a Pending Changes label.

• **Won't Fix for Now** - The issue is legitimate, but it is not something the SaltStack team is currently able or willing to fix or implement. Issues having this label may be revisited in the future.

**Type of Change**

Every pull request should receive a change label. These labels measure the quantity of change as well as the significance of the change. The amount of change and the importance of the code area changed are considered, but often the depth of secondary code review required and the potential repercussions of the change may also advise the label choice.

Core code areas include: state compiler, crypto engine, master and minion and syndic daemons, transport, pillar rendering, loader, transport layer, event system, salt.utils, client, cli, logging, netapi, runner engine, templating engine, top file compilation, file client, file server, mine, salt-ssh, test runner, etc.

Non-core code usually constitutes the specific set of plugins for each of the several plugin layers of Salt: execution modules, states, runners, returners, clouds, etc.

• **Minor Change**
  - Less than 64 lines changed, or
  - Less than 8 core lines changed

• **Medium Change**
  - Less than 256 lines changed, or
  - Less than 64 core lines changed

• **Master Change**
  - More than 256 lines changed, or
  - More than 64 core lines changed
• **Expert Change**
  - Needs specialized, in-depth review

**Test Status**

These labels relate to the status of the automated tests that run on pull requests. If the tests on a pull request fail and are not overridden by one of these labels, the pull request submitter needs to update the code and/or tests so that the tests pass and the pull request can be merged.

- **Lint** - The pull request has passed all tests except for the code lint checker.
- **Tests Passed** - The pull request has passed all tests even though some test results are negative. Sometimes the automated testing infrastructure will encounter internal errors unrelated to the code change in the pull request that cause test runs to fail. These errors can be caused by cloud host and network issues and also Jenkins issues like erroneously accumulating workspace artifacts, resource exhaustion, and bugs that arise from long running Jenkins processes.

**Other**

These labels indicate miscellaneous issue types or statuses that are common or important enough to be tracked and sorted with labels.

- **Awesome** - The pull request implements an especially well crafted solution, or a very difficult but necessary change.
- **Help Wanted** - The issue appears to have a simple solution. Issues having this label should be a good starting place for new contributors to Salt.
- **Needs Testcase** - The issue or pull request relates to a feature that needs test coverage. The pull request containing the tests should reference the issue or pull request having this label, whereupon the label should be removed.
- **Regression** - The issue is a bug that breaks functionality known to work in previous releases.
- **Story** - The issue is used by a SaltStack engineer to track progress on multiple related issues in a single place.
- **Stretch** - The issue is an optional goal for the current sprint but may not be delivered.
- **ZD** - The issue is related to a Zendesk customer support ticket.
- **<Release>** - The issue is scheduled to be implemented by `<Release>`. See here for a discussion of Salt’s release codenames.

### 27.10 Logging Internals

TODO

### 27.11 Package Providers

This page contains guidelines for writing package providers.
27.11.1 Package Functions

One of the most important features of Salt is package management. There is no shortage of package managers, so in the interest of providing a consistent experience in pkg states, there are certain functions that should be present in a package provider. Note that these are subject to change as new features are added or existing features are enhanced.

**list_pkgs**

This function should declare an empty dict, and then add packages to it by calling `pkg_resource.add_pkg`, like so:

```python
__salt__['pkg_resource.add_pkg'](ret, name, version)
```

The last thing that should be done before returning is to execute `pkg_resource.sort_pkglist`. This function does not presently do anything to the return dict, but will be used in future versions of Salt.

```python
__salt__['pkg_resource.sort_pkglist'](ret)
```

`list_pkgs` returns a dictionary of installed packages, with the keys being the package names and the values being the version installed. Example return data:

```python
{'foo': '1.2.3-4', 'bar': '5.6.7-8'}
```

**latest_version**

Accepts an arbitrary number of arguments. Each argument is a package name. The return value for a package will be an empty string if the package is not found or if the package is up-to-date. The only case in which a non-empty string is returned is if the package is available for new installation (i.e. not already installed) or if there is an upgrade available.

If only one argument was passed, this function return a string, otherwise a dict of name/version pairs is returned.

This function must also accept **kwargs, in order to receive the `fromrepo` and `repo` keyword arguments from pkg states. Where supported, these arguments should be used to find the install/upgrade candidate in the specified repository. The `fromrepo` kwarg takes precedence over `repo`, so if both of those kwargs are present, the repository specified in `fromrepo` should be used. However, if `repo` is used instead of `fromrepo`, it should still work, to preserve backwards compatibility with older versions of Salt.

**version**

Like `latest_version`, accepts an arbitrary number of arguments and returns a string if a single package name was passed, or a dict of name/value pairs if more than one was passed. The only difference is that the return values are the currently-installed versions of whatever packages are passed. If the package is not installed, an empty string is returned for that package.

**upgrade_available**

Deprecated and destined to be removed. For now, should just do the following:

```python
return __salt__['pkg.latest_version'](name) != ''
```
install

The following arguments are required and should default to `None`:

1. `name` (for single-package pkg states)
2. `pkgs` (for multiple-package pkg states)
3. `sources` (for binary package file installation)

The first thing that this function should do is call `pkg_resource.parse_targets` (see below). This function will convert the SLS input into a more easily parsed data structure. `pkg_resource.parse_targets` may need to be modified to support your new package provider, as it does things like parsing package metadata which cannot be done for every package management system.

```python
pkg_params, pkg_type = __salt__['pkg_resource.parse_targets'](name, pkgs, sources)
```

Two values will be returned to the `install` function. The first of them will be a dictionary. The keys of this dictionary will be package names, though the values will differ depending on what kind of installation is being done:

- If `name` was provided (and `pkgs` was not), then there will be a single key in the dictionary, and its value will be `None`. Once the data has been returned, if the `version` keyword argument was provided, then it should replace the `None` value in the dictionary.
- If `pkgs` was provided, then `name` is ignored, and the dictionary will contain one entry for each package in the `pkgs` list. The values in the dictionary will be `None` if a version was not specified for the package, and the desired version if specified. See the Multiple Package Installation Options section of the `pkg.installed` state for more info.
- If `sources` was provided, then `name` is ignored, and the dictionary values will be the path/URI for the package.

The second return value will be a string with two possible values: `repository` or `file`. The `install` function can use this value (if necessary) to build the proper command to install the targeted package(s).

Both before and after the installing the target(s), you should run `list_pkgs` to obtain a list of the installed packages. You should then return the output of `salt.utils.data.compare_dicts()`:

```python
return salt.utils.data.compare_dicts(old, new)
```

remove

Removes the passed package and return a list of the packages removed.

### 27.11.2 Package Repo Functions

There are some functions provided by `pkg` which are specific to package repositories, and not to packages themselves. When writing modules for new package managers, these functions should be made available as stated below, in order to provide compatibility with the `pkgrepo` state.

All repo functions should accept a `basedir` option, which defines which directory repository configuration should be found in. The default for this is dictated by the repo manager that is being used, and rarely needs to be changed.

```python
basedir = '/etc/yum.repos.d'
__salt__['pkg.list_repos'](basedir)
```
list_repos

Lists the repositories that are currently configured on this system.

```
__salt__['pkg.list_repos']()
```

Returns a dictionary, in the following format:

```
{ 'reponame': 'config_key_1': 'config value 1',
  'config_key_2': 'config value 2',
  'config_key_3': ['list item 1 (when appropriate)',
                  'list item 2 (when appropriate)']}
```

get_repo

Displays all local configuration for a specific repository.

```
__salt__['pkg.get_repo'](repo='myrepo')
```

The information is formatted in much the same way as list_repos, but is specific to only one repo.

```
{ 'config_key_1': 'config value 1',
  'config_key_2': 'config value 2',
  'config_key_3': ['list item 1 (when appropriate)',
                  'list item 2 (when appropriate)']}
```

del_repo

Removes the local configuration for a specific repository. Requires a repo argument, which must match the locally configured name. This function returns a string, which informs the user as to whether or not the operation was a success.

```
__salt__['pkg.del_repo'](repo='myrepo')
```

mod_repo

Modify the local configuration for one or more option for a configured repo. This is also the way to create new repository configuration on the local system; if a repo is specified which does not yet exist, it will be created.

The options specified for this function are specific to the system; please refer to the documentation for your specific repo manager for specifics.

```
__salt__['pkg.mod_repo'](repo='myrepo', url='http://myurl.com/repo')
```

27.11.3 Low-Package Functions

In general, the standard package functions as describes above will meet your needs. These functions use the system’s native repo manager (for instance, yum or the apt tools). In most cases, the repo manager is actually separate from the package manager. For instance, yum is usually a front-end for rpm, and apt is usually a front-end for dpkg. When possible, the package functions that use those package managers directly should do so through the low package functions.
It is normal and sane for `pkg` to make calls to `lowpkgs`, but `lowpkg` must never make calls to `pkg`. This is affects functions which are required by both `pkg` and `lowpkg`, but the technique in `pkg` is more performant than what is available to `lowpkg`. When this is the case, the `lowpkg` function that requires that technique must still use the `lowpkg` version.

**list_pkgs**

Returns a dict of packages installed, including the package name and version. Can accept a list of packages; if none are specified, then all installed packages will be listed.

```python
installed = __salt__['lowpkg.list_pkgs']('foo', 'bar')
```

Example output:

```python
{'foo': '1.2.3-4',
 'bar': '5.6.7-8'}
```

**verify**

Many (but not all) package management systems provide a way to verify that the files installed by the package manager have or have not changed. This function accepts a list of packages; if none are specified, all packages will be included.

```python
installed = __salt__['lowpkg.verify']('httpd')
```

Example output:

```python
{'/etc/httpd/conf/httpd.conf': {'mismatch': ['size', 'md5sum', 'mtime'],
 'type': 'config'}}
```

**file_list**

Lists all of the files installed by all packages specified. If not packages are specified, then all files for all known packages are returned.

```python
installed = __salt__['lowpkg.file_list']('httpd', 'apache')
```

This function does not return which files belong to which packages; all files are returned as one giant list (hence the `file_list` function name. However, This information is still returned inside of a dict, so that it can provide any errors to the user in a sane manner.

```python
{'errors': ['package apache is not installed'],
 'files': ['/etc/httpd',
 '/etc/httpd/conf',
 '/etc/httpd/conf.d',
 '...SNIP...']}
```

**file_dict**

Lists all of the files installed by all packages specified. If not packages are specified, then all files for all known packages are returned.
installed = __salt__['lowpkg.file_dict']('httpd', 'apache', 'kernel')

Unlike file_list, this function will break down which files belong to which packages. It will also return errors in the same manner as file_list.

```python
{
    'errors': ['package apache is not installed'],
    'packages': {'httpd': ['/etc/httpd',
                         '/etc/httpd/conf',
                         '...SNIP...'],
                'kernel': ['/boot/.vmlinuz-2.6.32-279.el6.x86_64.hmac',
                           '/boot/System.map-2.6.32-279.el6.x86_64',
                           '...SNIP...']}
```

### 27.12 Pull Requests

Salt is a large software project with many developers working together. We encourage all Salt users to contribute new features, bug fixes and documentation fixes. For those who haven’t contributed to a large software project before we encourage you to consider the following questions when preparing a pull request.

This isn’t an exhaustive list and these aren’t necessarily hard and fast rules, but these are things we consider when reviewing a pull request.

- Does this change work on all platforms? In cases where it does not, is an appropriate and easy-to-understand reason presented to the user? Is it documented as-such? Have we thought about all the possible ways this code might be used and accounted as best we can for them?
- Will this code work on versions of all Python we support? Will it work on future versions?
- Are Python reserved keywords used? Are variables named in a way that will make it easy for the next person to understand what’s going on?
- Does this code present a security risk in any way? What is the worst possible thing that an attacker could do with this code? If dangerous cases are possible, is it appropriate to document them? If so, has this been done? Would this change pass muster with a professional security audit? Is it obvious to a person using this code what the risks are?
- Is it readable? Does it conform to our style guide? Is the code documented such that the next person who comes along will be able to read and understand it? Most especially, are edge-cases documented to avoid regressions? Will it be immediately evident to the next person who comes along why this change was made?
- If appropriate, has the person who wrote the code which is being modified been notified and included in the process?
- What are the performance implications of this change? Is there a more efficient way to structure the logic and if so, does making the change balance itself against readability in a sensible way? Do the performance characteristics of the code change based on the way it is being invoked (i.e., through an API or various command-line tools.) Will it be easy to profile this change if it might be a problem?
- Are caveats considered and documented in the change?
- Will the code scale? More critically, will it scale in both directions? Salt runs in data-centers and on Raspberry Pi installations in the Sahara. It needs to work on big servers and tiny devices.
- Is appropriate documentation written both in public-facing docs and in-line? How will the user know how to use this? What will they do if it doesn’t work as expected? Is this something a new user will understand? Can a user know all they need to about this functionality by reading the public docs?
• Is this a change in behavior? If so, is it in the appropriate branch? Are deprecation warnings necessary? Have those changes been fully documented? Have we fully thought through what implications a change in behavior might have?

• How has the code been tested? If appropriate are there automated tests which cover this? Is it likely to regress? If so, how has the potential of that regression been mitigated? What is the plan for ensuring that this code works going forward?

• If it’s asynchronous code, what is the potential for a race condition?

• Is this code an original work? If it’s borrowed from another project or found online are the appropriate licensing/attribution considerations handled?

• Is the reason for the change fully explained in the PR? If not for review, this is necessary so that somebody in the future can go back and figure out why it was necessary.

• Is the intended behavior of the change clear? How will that behavior be known to future contributors and to users?

• Does this code handle errors in a reasonable way? Have we gone back through the stack as much as possible to make sure that an error cannot be raised that we do not account for? Are errors tested for as well as proper functionality?

• If the code relies on external libraries, do we properly handle old versions of them? Do we require a specific version and if so is this version check implemented? Is the library available on the same platforms that module in question claims to support? If the code was written and tested against a particular library, have we documented that fact?

• Can this code freeze/hang/crash a running daemon? Can it stall a state run? Are there infinite loops? Are appropriate timeouts implemented?

• Is the function interface well documented? If argument types can not be inferred by introspection, are they documented?

• Are resources such as file-handles cleaned-up after they are used?

• Is it possible that a reference-cycle exists between objects that will leak memory?

• Has the code been linted and does it pass all tests?

• Does the change fully address the problem or is it limited to a small surface area? By this, I mean that it should be clear that the submitter has looked for other cases in the function or module where the given case might also be addressed. If additional changes are necessary are they documented in the code as a FIXME or the PR and in Github as an issue to be tracked?

• Will the code throw errors/warnings/stacktraces to the console during normal operation?

• Has all the debugging been removed?

• Does the code log any sensitive data? Does it show sensitive data in process lists? Does it store sensitive data to disk and if so, does it do so in a secure manner? Are there potential race conditions in between writing the data to disk and setting the appropriate permissions?

• Is it clear from the solution that the problem is well-understood? How can somebody who has never seen the problem feel confident that this proposed change is the best one?

• What’s hard-coded that might not need to be? Are we making sensible decisions for the user and allowing them to tune and change things where appropriate?

• Are utility functions used where appropriate? Does this change re-implement something we already have code for?
- Is the right thing being fixed? There are cases where it’s appropriate to fix a test and cases where it’s appropriate to fix the code that’s under test. Which is best for the user? Is this change a shortcut or a solution that will be solid in the months and years to come?

- How will this code react to changes elsewhere in the code base? What is it coupled to and have we fully thought through how best to present a coherent interface to consumers of a given function or method?

- Does this PR try to fix too many bugs/problems at once?

- Should this be split into multiple PRs to make them easier to test and reason about?

## 27.13 Reporting Bugs

Salt uses GitHub to track open issues and feature requests.

To file a bug, please navigate to the new issue page for the Salt project.

In an issue report, please include the following information:

- The output of `salt --versions-report` from the relevant machines. This can also be gathered remotely by using `salt <my_tgt> test.versions_report`.
- A description of the problem including steps taken to cause the issue to occur and the expected behaviour.
- Any steps taken to attempt to remediate the problem.
- Any configuration options set in a configuration file that may be relevant.
- A reproduceable test case. This may be as simple as an SLS file that illustrates a problem or it may be a link to a repository that contains a number of SLS files that can be used together to re-produce a problem. If the problem is transitory, any information that can be used to try and reproduce the problem is helpful.
- [Optional] The output of each salt component (master/minion/CLI) running with the `-l debug` flag set.

**Note:** Please be certain to scrub any logs or SLS files for sensitive data!

## 27.14 Salt Topology

Salt is based on a powerful, asynchronous, network topology using ZeroMQ. Many ZeroMQ systems are in place to enable communication. The central idea is to have the fastest communication possible.

### 27.14.1 Servers

The Salt Master runs 2 network services. First is the ZeroMQ PUB system. This service by default runs on port 4505 and can be configured via the `publish_port` option in the master configuration.

Second is the ZeroMQ REP system. This is a separate interface used for all bi-directional communication with minions. By default this system binds to port 4506 and can be configured via the `ret_port` option in the master.
27.14.2 PUB/SUB

The commands sent out via the salt client are broadcast out to the minions via ZeroMQ PUB/SUB. This is done by allowing the minions to maintain a connection back to the Salt Master and then all connections are informed to download the command data at once. The command data is kept extremely small (usually less than 1K) so it is not a burden on the network.

27.14.3 Return

The PUB/SUB system is a one way communication, so once a publish is sent out the PUB interface on the master has no further communication with the minion. The minion, after running the command, then sends the command’s return data back to the master via the `ret_port`.

27.15 Translating Documentation

If you wish to help translate the Salt documentation to your language, please head over to the [Transifex](https://www.transifex.com) website and **signup** for an account.

Once registered, head over to the Salt Translation Project, and either click on **Request Language** if you can’t find yours, or, select the language for which you wish to contribute and click **Join Team**.

Transifex provides some useful reading resources on their support domain, namely, some useful articles directed to translators.

### 27.15.1 Building A Localized Version of the Documentation

While you’re working on your translation on Transifex, you might want to have a look at how it’s rendering.

**Install The Transifex Client**

To interact with the Transifex web service you will need to install the `transifex-client`:

```
pip install transifex-client
```

**Configure The Transifex Client**

Once installed, you will need to set it up on your computer. We created a script to help you with that:

```
scripts/setup-transifex-config
```

**Download Remote Translations**

There’s a little script which simplifies the download process of the translations(which isn’t that complicated in the first place). So, let’s assume you’re translating `pt_PT`, Portuguese(Portugal). To download the translations, execute from the `doc/` directory of your Salt checkout:

```
make download-translations SPHINXLANG=pt_PT
```

To download `pt_PT`, Portuguese(Portugal), and `nl`, Dutch, you can use the helper script directly:
Build Localized Documentation

After the download process finishes, which might take a while, the next step is to build a localized version of the documentation. Following the `pt_PT` example above:

```
make html SPHINXLANG=pt_PT
```

View Localized Documentation

Open your browser, point it to the local documentation path and check the localized output you’ve just build.

27.16 Developing Salt Tutorial

This tutorial assumes you have:

- a web browser
- a GitHub account (<my_account>)
- a command line (CLI)
- git
- a text editor

27.16.1 Fork

In your browser, navigate to the `saltstack/salt` GitHub repository. Click on Fork (https://github.com/saltstack/salt/#fork-destination-box).

Note: If you have more than one GitHub presence, for example if you are a member of a team, GitHub will ask you into which area to clone Salt. If you don’t know where, then select your personal GitHub account.

27.16.2 Clone

In your CLI, navigate to the directory into which you want clone the Salt codebase and submit the following command:

```
$ git clone https://github.com/<my_account>/salt.git
```

where `<my_account>` is the name of your GitHub account. After the clone has completed, add SaltStack as a second remote and fetch any changes from upstream.

```
$ cd salt
$ git remote add upstream https://github.com/saltstack/salt.git
$ git fetch upstream
```
For this tutorial, we will be working off from the develop branch, which is the default branch for the SaltStack GitHub project. This branch needs to track upstream/develop so that we will get all upstream changes when they happen.

```bash
$ git checkout develop
$ git branch --set-upstream-to upstream/develop
```

### 27.16.3 Fetch

Fetch any upstream changes on the develop branch and sync them to your local copy of the branch with a single command:

```bash
$ git pull --rebase
```

**Note:** For an explanation on `pull` vs `pull --rebase` and other excellent points, see this article by Mislav Marohnić.

### 27.16.4 Branch

Now we are ready to get to work. Consult the sprint beginner bug list and select an execution module whose `__virtual__` function needs to be updated. I'll select the `alternatives` module.

Create a new branch off from develop. Be sure to name it something short and descriptive.

```bash
$ git checkout -b virt_ret
```

### 27.16.5 Edit

Edit the file you have selected, and verify that the changes are correct.

```bash
$ vim salt/modules/alternatives.py
$ git diff
```

```diff
diff --git a/salt/modules/alternatives.py b/salt/modules/alternatives.py
index 1653e5f..30c0a59 100644
--- a/salt/modules/alternatives.py
+++ b/salt/modules/alternatives.py
@@ -30,7 +30,7 @@ def __virtual__():
     if os.path.isdir('/etc/alternatives'):
         return True
-    return False
+    return (False, 'Cannot load alternatives module: /etc/alternatives dir not found')

 def _get_cmd():
```
27.16.6 Commit

Stage and commit the changes. Write a descriptive commit summary, but try to keep it less than 50 characters. Review your commit.

```
$ git add salt/modules/alternatives.py
$ git commit -m 'modules.alternatives: __virtual__ return err msg'
$ git show
```

Note: If you need more room to describe the changes in your commit, run `git commit` (without the `-m` message option) and you will be presented with an editor. The first line is the commit summary and should still be 50 characters or less. The following paragraphs you create are free form and will be preserved as part of the commit.

27.16.7 Push

Push your branch to your GitHub account. You will likely need to enter your GitHub username and password.

```
$ git push origin virt_ret
```

Note: If authentication over https does not work, you can alternatively setup ssh keys. Once you have done this, you may need add the keys to your git repository configuration

```
$ git config ssh.key ~/.ssh/<key_name>
```

where `<key_name>` is the file name of the private key you created.

27.16.8 Merge

In your browser, navigate to the new pull request page on the saltstack/salt GitHub repository and click on compare across forks. Select `<my_account>` from the list of head forks and the branch you are wanting to merge into develop (virt_ret in this case).

When you have finished reviewing the changes, click Create pull request.

If your pull request contains only a single commit, the title and comment will be taken from that commit’s summary and message, otherwise the branch name is used for the title. Edit these fields as necessary and click Create pull request.

Note: Although these instructions seem to be the official pull request procedure on github’s website, here are two alternative methods that are simpler.

- If you navigate to your clone of salt, `https://github.com/<my_account>/salt`, depending on how old your branch is or how recently you pushed updates on it, you may be presented with a button to create a pull request with your branch.
- I find it easiest to edit the following URL:
  `https://github.com/saltstack/salt/compare/develop...<my_account>:virt_ret`
27.16.9 Resources

GitHub offers many great tutorials on various aspects of the git- and GitHub-centric development workflow:
https://help.github.com/

There are many topics covered by the Salt Developer documentation:
https://docs.saltstack.com/en/latest/topics/development/index.html

The contributing documentation presents more details on specific contributing topics:
https://docs.saltstack.com/en/latest/topics/development/contributing.html

27.17 Modular Systems

When first working with Salt, it is not always clear where all of the modular components are and what they do. Salt comes loaded with more modular systems than many users are aware of, making Salt very easy to extend in many places.

The most commonly used modular systems are execution modules and states. But the modular systems extend well beyond the more easily exposed components and are often added to Salt to make the complete system more flexible.

27.17.1 Developing New Modules

Interactive Debugging

Sometimes debugging with `print()` and extra logs sprinkled everywhere is not the best strategy.

IPython is a helpful debug tool that has an interactive python environment which can be embedded in python programs.

First the system will require IPython to be installed.

```
# Debian
apt-get install ipython

# Arch Linux
pacman -Syu ipython2

# RHEL/CentOS (via EPEL)
yum install python-ipython
```

Now, in the troubling python module, add the following line at a location where the debugger should be started:

```
test = 'test123'
import IPython; IPython.embed_kernel()
```

After running a Salt command that hits that line, the following will show up in the log file:

```
[CRITICAL] To connect another client to this kernel, use:
[IPKernelApp] --existing kernel-31271.json
```

Now on the system that invoked `embed_kernel`, run the following command from a shell:

```
# NOTE: use ipython2 instead of ipython for Arch Linux
ipython console --existing
```
This provides a console that has access to all the vars and functions, and even supports tab-completion.

```
print(test)
test123
```

To exit IPython and continue running Salt, press Ctrl-d to logout.

**Special Module Contents**

These are things that may be defined by the module to influence various things.

- `__virtual__`
- `__virtual_aliases__`
- `__virtualname__`
- `__init__`

Called before `__virtual__()`

- `__proxyenabled__`

Grains and proxy modules

- `__proxyenabled__` as a list containing the names of the proxy types that the module supports.

- `__load__`
- `__func_alias__`
- `__outputter__`

**Dunder Dictionaries**

Salt provides several special “dunder” dictionaries as a convenience for Salt development. These include `__opts__`, `__context__`, `__salt__`, and others. This document will describe each dictionary and detail where they exist and what information and/or functionality they provide.

The following dunder dictionaries are always defined, but may be empty

- `__context__`
- `__grains__`
- `__pillar__`
- `__opts__`
__opts__

Defined in: All modules

The __opts__ dictionary contains all of the options passed in the configuration file for the master or minion.

Note: In many places in salt, instead of pulling raw data from the __opts__ dict, configuration data should be pulled from the salt get functions such as config.get, aka __salt__['config.get']('foo:bar'). The get functions also allow for dict traversal via the : delimiter. Consider using get functions whenever using __opts__ or __pillar__ and __grains__ (when using grains for configuration data)

The configuration file data made available in the __opts__ dictionary is the configuration data relative to the running daemon. If the modules are loaded and executed by the master, then the master configuration data is available, if the modules are executed by the minion, then the minion configuration is available. Any additional information passed into the respective configuration files is made available

__salt__

Defined in: Auth, Beacons, Engines, Execution, Executors, Outputters, Pillars, Proxies, Renderers, Returners, Runners, SDB, SSH Wrappers, State, Thorium

__salt__ contains the execution module functions. This allows for all functions to be called as they have been set up by the salt loader.

```python
__salt__['cmd.run']('fdisk -l')
__salt__['network.ip_addrs']()
```

Note: When used in runners or outputters, __salt__ references other runner/outputter modules, and not execution modules.

__grains__

Filled in for: Execution, Pillar, Renderer, Returner, SSH Wrapper, State.

The __grains__ dictionary contains the grains data generated by the minion that is currently being worked with. In execution modules, state modules and returners this is the grains of the minion running the calls, when generating the external pillar the __grains__ is the grains data from the minion that the pillar is being generated for.

While __grains__ is defined for every module, it's only filled in for some.

__pillar__

Filled in for: Execution, Returner, SSH Wrapper, State

The __pillar__ dictionary contains the pillar for the respective minion.

While __pillar__ is defined for every module, it's only filled in for some.
__context__

During a state run the __context__ dictionary persists across all states that are run and then is destroyed when the state ends.

When running an execution module __context__ persists across all module executions until the modules are refreshed; such as when saltutil.sync_all or state.apply are executed.

A great place to see how to use __context__ is in the cp.py module in salt/modules/cp.py. The fileclient authenticates with the master when it is instantiated and then is used to copy files to the minion. Rather than create a new fileclient for each file that is to be copied down, one instance of the fileclient is instantiated in the __context__ dictionary and is reused for each file. Here is an example from salt/modules/cp.py:

```python
if not 'cp.fileclient' in __context__:
    __context__['cp.fileclient'] = salt.fileclient.get_file_client(__opts__)
```

Note: Because __context__ may or may not have been destroyed, always be sure to check for the existence of the key in __context__ and generate the key before using it.

__utils__

Defined in: Cloud, Engine, Execution, File Server, Pillar, Proxy, Runner, SDB.

__proxy__

Defined in: Beacon, Engine, Execution, Executor, Proxy, Renderer, Returner, State, Util

__runners__

Defined in: Engine, Roster, Thorium

__ret__

Defined in: Proxy, Search

__thorium__

Defined in: Thorium

__states__

Defined in: Renderers, State

__serializers__

Defined in: State
Additional Globals

Defined for: Runners, Execution Modules, Wheels

- **__jid__**: The job ID
- **__user__**: The user
- **__tag__**: The jid tag
- **__jid_event__**: A `salt.utils.event.NamespacedEvent`.

NamespacedEvent defines a single method `fire_event`, that takes data and tag. The Runner docs has examples.

### 27.17.2 Configuration Options

A number of configuration options can affect the load process. This is a quick list of them:

- `autoload_dynamic_modules (Minion)`
- `cython_enable (Minion, Master)`
- `disable_modules (Minion)`
- `disable_returners (Minion)`
- `enable_zip_modules (Minion)`
- `extension_modules (Master)`
- `extmod_whitelist (Minion, Master)`
- `extmod_blacklist (Minion, Master)`
- `whitelist_modules (Minion)`
- `grains_dirs (Minion)`
- `module_dirs (Minion, Master)`
- `outputter_dirs (Minion, Master)`
- `providers (Minion)`
- `render_dirs (Minion)`
- `returner_dirs (Minion)`
- `runner_dirs (Master)`
- `states_dirs (Minion)`
- `utils_dirs (Minion)`
27.17.3 Loading Modules

Modules come primarily from several sources:

- The Salt package itself
- The Salt File Server
- The extmods directory
- Secondary packages installed

Using one source to override another is not supported.

The Salt Package

Salt itself ships with a large number of modules. These are part of the Salt package itself and don’t require the user to do anything to use them. (Although a number of them have additional dependencies and/or configuration.)

The Salt File Server

The user may add modules by simply placing them in special directories in their fileserver.

The name of the directory inside of the file server is the directory name prepended by underscore, such as:

- _grains
- _modules
- _states

Modules must be synced before they can be used. This can happen a few ways, discussed below.

Sync Via States

The minion configuration contains an option autoload_dynamic_modules which defaults to True. This option makes the state system refresh all dynamic modules when states are run. To disable this behavior set autoload_dynamic_modules to False in the minion config.

When dynamic modules are autoloaded via states, only the modules defined in the same saltenvs as the states currently being run.

Sync Via the saltutil Module

The saltutil module has a number of functions that can be used to sync all or specific dynamic modules. The saltutil.sync_*execution functions and runner functions can be used to sync modules to minions and the master, respectively.

The extmods Directory

Any files placed in the directory set by extension_modules settings (minion, master, default /var/cache/salt/*/extmods) can also be loaded as modules. Note that these directories are also used by the saltutil.sync_* functions (mentioned above) and files may be overwritten.
Secondary Packages

Third-party packages may also add modules to Salt if they are installed in the same system and Python environment as the Salt Minion or Master.

This is done via setuptools entry points:

```python
setup(
    # ...
    entry_points={
        'salt.loader': [
            'module_dirs=spirofs.loader:module',
        ],
    },
    # ...
)
```

Note that these are not synced from the Salt Master to the Minions. They must be installed independently on each Minion.

### 27.17.4 Module Types

The specific names used by each loading method above are as follows. See sections below for a short summary of each of these systems.

<table>
<thead>
<tr>
<th>Module Type</th>
<th>Salt Package Name</th>
<th>FS/Directory Name</th>
<th>Entry Point</th>
</tr>
</thead>
<tbody>
<tr>
<td>Auth</td>
<td>salt.auth(index)</td>

</table>

Continued on next page
Auth

The auth module system allows for external authentication routines to be easily added into Salt. The `auth` function needs to be implemented to satisfy the requirements of an auth module. Use the `pam` module as an example.

See External Authentication System for more about authentication in Salt.

Beacon

- Writing Beacons

Beacons are polled by the Salt event loop to monitor non-salt processes. See Beacons for more information about the beacon system.

Cache

The minion cache is used by the master to store various information about minions. See Minion Data Cache for more information.

Cloud

Cloud modules are backend implementations used by Salt Cloud.

Engine

Engines are open-ended services managed by the Salt daemon (both master and minion). They may interact with event loop, call other modules, or a variety of non-salt tasks. See Salt Engines for complete details.

Execution

Execution modules make up the core of the functionality used by Salt to interact with client systems. The execution modules create the core system management library used by all Salt systems, including states, which interact with minion systems.

1 These modules cannot be loaded from the Salt File Server.
Execution modules are completely open ended in their execution. They can be used to do anything required on a minion, from installing packages to detecting information about the system. The only restraint in execution modules is that the defined functions always return a JSON serializable object.

**Executor**

Executors control how execution modules get called. The default is to just call them, but this can be customized.

**File Server**

The file server module system is used to create file server backends used by the Salt Master. These modules need to implement the functions used in the fileserver subsystem. Use the `gitfs` module as an example. See [File Server Backends](#) for more information.

**Grains**

- **Writing Grains**

  Grain modules define extra routines to populate grains data. All defined public functions will be executed and MUST return a Python dict object. The dict keys will be added to the grains made available to the minion.

  See [Grains](#) for more.

**Log Handler**

Log handlers allows the logs from salt (master or minion) to be sent to log aggregation systems.

**Net API**

Net API modules are the actual server implementation used by Salt API.

**Output**

The output modules supply the outputter system with routines to display data in the terminal. These modules are very simple and only require the `output` function to execute. The default system outputter is the `nested` module.

**Pillar**

**External Pillars**

Salt provides a mechanism for generating pillar data by calling external pillar interfaces. This document will describe an outline of an `ext_pillar` module.

**Location**

Salt expects to find your `ext_pillar` module in the same location where it looks for other python modules. If the `extension_modules` option in your Salt master configuration is set, Salt will look for a `pillar` directory under there and load all the modules it finds. Otherwise, it will look in your Python site-packages `salt/pillar` directory.
Configuration

The external pillars that are called when a minion refreshes its pillars is controlled by the `ext_pillar` option in the Salt master configuration. You can pass a single argument, a list of arguments or a dictionary of arguments to your pillar:

```yaml
ext_pillar:
  - example_a: some argument
  - example_b:
    - argumentA
    - argumentB
  - example_c:
    keyA: valueA
    keyB: valueB
```

The Module

Imports and Logging

Import modules your external pillar module needs. You should first include generic modules that come with stock Python:

```python
import logging
```

And then start logging. This is an idiomatic way of setting up logging in Salt:

```python
log = logging.getLogger(__name__)
```

Finally, load modules that are specific to what you are doing. You should catch import errors and set a flag that the `__virtual__` function can use later.

```python
try:
    import weird_thing
    EXAMPLE_A_LOADED = True
except ImportError:
    EXAMPLE_A_LOADED = False
```

Options

If you define an `__opts__` dictionary, it will be merged into the `__opts__` dictionary handed to the `ext_pillar` function later. This is a good place to put default configuration items. The convention is to name things `modulename.option`.

```python
__opts__ = { 'example_a.someconfig': 137 }
```

Initialization

If you define an `__init__` function, it will be called with the following signature:

```python
def __init__( __opts__ ):
    # Do init work here
```
Note: The \_\_init\_\_ function is ran every time a particular minion causes the external pillar to be called, so don’t put heavy initialization code here. The \_\_init\_\_ functionality is a side-effect of the Salt loader, so it may not be as useful in pillars as it is in other Salt items.

\_\_virtual\_

If you define a \_\_virtual\_ function, you can control whether or not this module is visible. If it returns False then Salt ignores this module. If it returns a string, then that string will be how Salt identifies this external pillar in its ext\_pillar configuration. If you’re not renaming the module, simply return True in the \_\_virtual\_ function, which is the same as if this function did not exist, then, the name Salt’s ext\_pillar will use to identify this module is its conventional name in Python.

This is useful to write modules that can be installed on all Salt masters, but will only be visible if a particular piece of software your module requires is installed.

```python
# This external pillar will be known as 'example_a'
def __virtual__():
    if EXAMPLE_A_LOADED:
        return True
    return False

# This external pillar will be known as 'something_else'
__virtualname__ = 'something_else'
def __virtual__():
    if EXAMPLE_A_LOADED:
        return __virtualname__
    return False
```

ext\_pillar

This is where the real work of an external pillar is done. If this module is active and has a function called ext\_pillar, whenever a minion updates its pillar this function is called.

How it is called depends on how it is configured in the Salt master configuration. The first argument is always the current pillar dictionary, this contains pillar items that have already been added, starting with the data from pillar\_roots, and then from any already-ran external pillars.

Using our example above:

```python
ext_pillar( id, pillar, 'some argument' )  # example_a
ext_pillar( id, pillar, 'argumentA', 'argumentB' )  # example_b
ext_pillar( id, pillar, keyA='valueA', keyB='valueB' )  # example_c
```

In the example\_a case, pillar will contain the items from the pillar\_roots, in example\_b pillar will contain that plus the items added by example\_a, and in example\_c pillar will contain that plus the items added by example\_b. In all three cases, id will contain the ID of the minion making the pillar request.

This function should return a dictionary, the contents of which are merged in with all of the other pillars and returned to the minion. Note: this function is called once for each minion that fetches its pillar data.

```python
def ext_pillar( minion_id, pillar, \*args, \*\*kwargs):
    my_pillar = {'external_pillar': {}}
```

(continues on next page)
my_pillar['external_pillar'] = get_external_pillar_dictionary()
return my_pillar

You can call pillar with the dictionary’s top name to retrieve its data. From above example, 'external_pillar' is the top dictionary name. Therefore:
salt-call '* pillar.get external_pillar

You shouldn’t just add items to pillar and return that, since that will cause Salt to merge data that already exists. Rather, just return the items you are adding or changing. You could, however, use pillar in your module to make some decision based on pillar data that already exists.

This function has access to some useful globals:

__opts__ A dictionary of mostly Salt configuration options. If you had an __opts__ dictionary defined in your module, those values will be included.

__salt__ A dictionary of Salt module functions, useful so you don’t have to duplicate functions that already exist. E.g. __salt__['cmd.run']( 'ls -l' ) Note, runs on the master

__grains__ A dictionary of the grains of the minion making this pillar call.

Example configuration

As an example, if you wanted to add external pillar via the cmd_json external pillar, add something like this to your master config:

| ext_pillar: |
| - cmd_json: 'echo \"arg\": \"value\"'}

Reminder

Just as with traditional pillars, external pillars must be refreshed in order for minions to see any fresh data:
salt '*' saltutil.refresh_pillar

Used to define optional external pillar systems. The pillar generated via the filesystem pillar is passed into external pillars. This is commonly used as a bridge to database data for pillar, but is also the backend to the libvirt state used to generate and sign libvirt certificates on the fly.

Proxy

Proxy Minions are a way to manage devices that cannot run a full minion directly.

Renderers

Renderers are the system used to render sls files into salt highdata for the state compiler. They can be as simple as the py renderer and as complex as stateconf and pydsl.
Returners

Returners are used to send data from minions to external sources, commonly databases. A full returner will implement all routines to be supported as an external job cache. Use the `redis` returner as an example.

Roster

The `Roster system` is used by Salt SSH to enumerate devices.

Runners

Runners are purely master-side execution sequences.

SDB

- *Writing SDB Modules*

SDB is a way to store data that's not associated with a minion. See *Storing Data in Other Databases*.

Serializer

Primarily used with `file.serialize`.

State

State modules are used to define the state interfaces used by Salt States. These modules are restrictive in that they must follow a number of rules to function properly.

**Note:** State modules define the available routines in sls files. If calling an execution module directly is desired, take a look at the `module` state.

SPM pkgdb

- *SPM Development Guide: Package Database*

pkgdb modules provides storage backends to the package database.

SPM pkgfiles

- *SPM Development Guide: Package Database*

pkgfiles modules handle the actual installation.

SSH Wrapper

Replacement execution modules for *Salt SSH*. 

---

27.17. Modular Systems
Thorium

Modules for use in the Thorium event reactor.

Tokens

Token stores for External Authentication. See the salt.tokens docstring for details.

Tops

Tops modules are used to convert external data sources into top file data for the state system.

Util

Just utility modules to use with other modules via __utils__ (see Dunder Dictionaries).

Wheel

The wheel system is used to manage master side management routines. These routines are primarily intended for the API to enable master configuration.

27.18 Salt Extend

salt-extend is a templating tool for extending SaltStack. If you’re looking to add a module to SaltStack, then the salt-extend utility can guide you through the process.

You can use Salt Extend to quickly create templated modules for adding new behaviours to some of the module subsystems within Salt.

Salt Extend takes a template directory and merges it into a SaltStack source code directory.

27.18.1 Command line usage

See salt-extend

27.18.2 Choosing a template

The following templates are available:

module

Creates a new execution module within salt/modules/{{module_name}}.py

module_unit

Creates a new execution module unit test suite within tests/unit/modules/test_{{module_name}}.py
state

Creates a new state module within salt/states/{{module_name}}.py

state_unit

Creates a new state module unit test suite within tests/unit/states/test_{{module_name}}.py

27.18.3 Adding templates

1. Create a directory under <src>/templates
2. Create a file template.yml containing properties for
   - description - a description of the template
   - questions - a collection of additional questions to ask the user, the name of the item will be used as the key in the context dictionary within the jinja template.
     - question - The question to ask the user, as a string
     - default - (optional) the default value, can contain Jinja2 template syntax and has access to the default context properties

Example template.yml

```yaml
description: "Execution module"
questions:
  depending_libraries:
    question: "What libraries does this module depend upon?"
  virtual_name:
    question: "What module virtual name to use?"
    default: "{{module_name}}"
```

3. Create the files within <src>/templates/<your template> to match the target

Note: File names can contain Jinja 2 template syntax, e.g. "{{module_name}}.py"

Example file in the template directory

```python
print(\'Hello {{module_name}}\')
__virtual__ = '{{__virtual_name__}}'
```

Default context properties

The default context provides the following properties
- description - A description of the template
- short_description - A short description of the module as entered by the user
- version - The version name of the next release
27.18.4 API

salt.utils.extend module

SaltStack Extend

A templating tool for extending SaltStack.

Takes a template directory and merges it into a SaltStack source code directory. This tool uses Jinja2 for templating.

This tool is accessed using `salt-extend`

```python
codeauthor Anthony Shaw <anthonyshaw@apache.org>
```

```python
salt.utils.extend.apply_template(template_dir, output_dir, context)
```

Apply the template from the template directory to the output using the supplied context dict.

- **Parameters**
  - `src` (str) – The source path
  - `dst` (str) – The destination path
  - `context` (dict) – The dictionary to inject into the Jinja template as context

```python
salt.utils.extend.run( extension=None, name=None, description=None, salt_dir=None, merge=False, temp_dir=None)
```

A template factory for extending the salt ecosystem

- **Parameters**
  - `extension` (str) – The extension type, e.g. 'module', 'state', if omitted, user will be prompted
  - `name` (str) – Python-friendly name for the module, if omitted, user will be prompted
  - `description` (str) – A description of the extension, if omitted, user will be prompted
  - `salt_dir` (str) – The targeted Salt source directory
  - `merge` (bool) – Merge with salt directory, `False` to keep separate, `True` to merge trees.
  - `temp_dir` (str) – The directory for generated code, if omitted, system temp will be used

27.19 Salt’s Test Suite

Salt comes with a powerful integration and unit test suite allowing for the fully automated run of integration and/or unit tests from a single interface.

To learn the basics of how Salt’s test suite works, be sure to check out the [Salt’s Test Suite: An Introduction](#) tutorial.

27.19.1 Test Directory Structure

Salt’s test suite is located in the `tests` directory in the root of Salt’s codebase. The test suite is divided into two main groups:
• *Integration Tests*

• *Unit Tests*

Within each of these groups, the directory structure roughly mirrors the structure of Salt’s own codebase. Notice that there are directories for states, modules, runners, output, and more in each testing group.

The files that are housed in the modules directory of either the unit or the integration testing factions contain respective integration or unit test files for Salt execution modules.

**Note:** Salt’s test framework provides for the option to only run tests which correspond to a given file (or set of files), via the `--from-filenames` argument to `runtests.py`:

```python
python /path/to/runtests.py --from-filenames=salt/modules/foo.py
```

Therefore, where possible, test files should be named to match the source files they are testing. For example, when writing tests for `salt/modules/foo.py`, unit tests should go into `tests/unit/modules/test_foo.py`, and integration tests should go into `tests/integration/modules/test_foo.py`.

However, integration tests are organized differently from unit tests, and this may not always be plausible. In these cases, to ensure that the proper tests are run for these files, they must be mapped in `tests/filename_map.yml`.

The filename map is used to supplement the test framework’s filename matching logic. This allows one to ensure that states corresponding to an execution module are also tested when `--from-filenames` includes that execution module. It can also be used for those cases where the path to a test file doesn’t correspond directly to the file which is being tested (e.g. the shell,spm, and ssh integration tests, among others). Both glob expressions and regular expressions are permitted in the filename map.

**Important:** Test modules which don’t map directly to the source file they are testing (using the naming convention described above), must be added to the ignore tuple in `tests/unit/test_module_names.py`, in the `test_module_name_source_match` function. This unit test ensures that we maintain the naming convention for test files.

### Integration Tests

The Integration section of Salt’s test suite start up a number of Salt daemons to test functionality in a live environment. These daemons include two Salt Masters, one Syndic, and two Minions. This allows the Syndic interface to be tested and Master/Minion communication to be verified. All of the integration tests are executed as live Salt commands sent through the started daemons.

Integration tests are particularly good at testing modules, states, and shell commands, among other segments of Salt’s ecosystem. By utilizing the integration test daemons, integration tests are easy to write. They are also SaltStack’s generally preferred method of adding new tests.

The discussion in the *Integration vs. Unit* section of the *testing tutorial* is beneficial in learning why you might want to write integration tests vs. unit tests. Both testing arenas add value to Salt’s test suite and you should consider adding both types of tests if possible and appropriate when contributing to Salt.

• *Integration Test Documentation*

### Unit Tests

Unit tests do not spin up any Salt daemons, but instead find their value in testing singular implementations of individual functions. Instead of testing against specific interactions, unit tests should be used to test a function’s...
logic as well as any return or raises statements. Unit tests also rely heavily on mocking external resources.

The discussion in the Integration vs. Unit section of the testing tutorial is useful in determining when you should consider writing unit tests instead of, or in addition to, integration tests when contributing to Salt.

- Unit Test Documentation

## 27.19.2 Running The Tests

There are requirements, in addition to Salt’s requirements, which need to be installed in order to run the test suite. Install one of the lines below, depending on the relevant Python version:

```
$ pip install -r requirements/dev_python27.txt
$ pip install -r requirements/dev_python34.txt
```

To be able to run integration tests which utilizes ZeroMQ transport, you also need to install additional requirements for it. Make sure you have installed the C/C++ compiler and development libraries and header files needed for your Python version.

This is an example for RedHat-based operating systems:

```
$ yum install gcc gcc-c++ python-devel
$ pip install -r requirements/zeromq.txt
```

On Debian, Ubuntu or their derivatives run the following commands:

```
$ apt-get install build-essential python-dev
$ pip install -r requirements/zeromq.txt
```

This will install the latest pycrypto and pyzmq (with bundled libzmq) Python modules required for running integration tests suite.

Once all requirements are installed, use `runtests.py` script to run all of the tests included in Salt’s test suite:

```
$ python tests/runtests.py
```

For more information about options you can pass the test runner, see the `--help` option:

```
$ python tests/runtests.py --help
```

An alternative way of invoking the test suite is available in `setup.py`:

```
$ ./setup.py test
```

### Running Test Subsections

Instead of running the entire test suite all at once, which can take a long time, there are several ways to run only specific groups of tests or individual tests:

- Run unit tests only: `python tests/runtests.py --unit-tests`
- Run unit and integration tests for states: `python tests/runtests.py --state`
- Run integration tests for an individual module: `python tests/runtests.py -n integration.modules.virt`
- Run unit tests for an individual module: `python tests/runtests.py -n unit.modules.virt_test`
• Run an individual test by using the class and test name (this example is for the test_default_kvm_profile test in the integration.module.virt): python tests/runtests.py -n integration.module.virt.VirtTest.test_default_kvm_profile

For more specific examples of how to run various test subsections or individual tests, please see the Test Selection Options documentation or the Running Specific Tests section of the Salt’s Test Suite: An Introduction tutorial.

Running Unit Tests Without Integration Test Daemons

Since the unit tests do not require a master or minion to execute, it is often useful to be able to run unit tests individually, or as a whole group, without having to start up the integration testing daemons. Starting up the master, minion, and syndic daemons takes a lot of time before the tests can even start running and is unnecessary to run unit tests. To run unit tests without invoking the integration test daemons, simply run the runtests.py script with --unit argument:

```bash
python tests/runtests.py --unit
```

All of the other options to run individual tests, entire classes of tests, or entire test modules still apply.

Running Destructive Integration Tests

Salt is used to change the settings and behavior of systems. In order to effectively test Salt’s functionality, some integration tests are written to make actual changes to the underlying system. These tests are referred to as “destructive tests”. Some examples of destructive tests are changes may be testing the addition of a user or installing packages. By default, destructive tests are disabled and will be skipped.

Generally, destructive tests should clean up after themselves by attempting to restore the system to its original state. For instance, if a new user is created during a test, the user should be deleted after the related test(s) have completed. However, no guarantees are made that test clean-up will complete successfully. Therefore, running destructive tests should be done with caution.

**Note:** Running destructive tests will change the underlying system. Use caution when running destructive tests.

To run tests marked as destructive, set the --run-destructive flag:

```bash
python tests/runtests.py --run-destructive
```

Running Cloud Provider Tests

Salt’s testing suite also includes integration tests to assess the successful creation and deletion of cloud instances using Salt-Cloud for providers supported by Salt-Cloud.

The cloud provider tests are off by default and run on sample configuration files provided in tests/integration/files/conf/cloud.providers.d/. In order to run the cloud provider tests, valid credentials, which differ per provider, must be supplied. Each credential item that must be supplied is indicated by an empty string value and should be edited by the user before running the tests. For example, DigitalOcean requires a client key and an api key to operate. Therefore, the default cloud provider configuration file for DigitalOcean looks like this:

```yaml
digitalocean-config:
  driver: digitalocean
  client_key: ''
```

(continues on next page)
As indicated by the empty string values, the client_key and the api_key must be provided:

```yaml
api_key: ')
location: New York 1
```

The test suite can be run by setting the `--cloud-provider-tests` flag:

```
./tests/runtests.py --cloud-provider-tests
```

### Running The Tests In A Docker Container

The test suite can be executed under a docker container using the `--docked` option flag. The docker container must be properly configured on the system invoking the tests and the container must have access to the internet.

Here's a simple usage example:

```
python tests/runtests.py --docked=ubuntu-12.04 -v
```

The current list of test suite images is on Salt's docker repository.

Custom docker containers can be provided by submitting a pull request against Salt's docker Salt test containers repository.

### 27.19.3 Automated Test Runs

SaltStack maintains a Jenkins server to allow for the execution of tests across supported platforms. The tests executed from Salt's Jenkins server create fresh virtual machines for each test run, then execute destructive tests on the new, clean virtual machine.

SaltStack's Jenkins server continuously runs the entire test suite, including destructive tests, on an array of various supported operating systems throughout the day. Each actively supported branch of Salt's repository runs the tests located in the respective branch's code. Each set of branch tests also includes a pylint run. These branch tests help ensure the viability of Salt code at any given point in time as pull requests are merged into branches throughout the day.
In addition to branch tests, SaltStack’s Jenkins server also runs tests on pull requests. These pull request tests include a smaller set of virtual machines that run on the branch tests. The pull request tests, like the branch tests, include a pylint test as well.

When a pull request is submitted to Salt’s repository on GitHub, the suite of pull request tests are started by Jenkins. These tests are used to gauge the pull request’s viability to merge into Salt’s codebase. If these initial tests pass, the pull request can then merged into the Salt branch by one of Salt’s core developers, pending their discretion. If the initial tests fail, core developers may request changes to the pull request. If the failure is unrelated to the changes in question, core developers may merge the pull request despite the initial failure.

As soon as the pull request is merged, the changes will be added to the next branch test run on Jenkins.

For a full list of currently running test environments, go to http://jenkins.saltstack.com.

**Using Salt-Cloud on Jenkins**

For testing Salt on Jenkins, SaltStack uses Salt-Cloud to spin up virtual machines. The script using Salt-Cloud to accomplish this is open source and can be found here: https://github.com/saltstack/salt/blob/develop/tests/jenkins.py

### 27.19.4 Writing Tests

The salt testing infrastructure is divided into two classes of tests, integration tests and unit tests. These terms may be defined differently in other contexts, but for Salt they are defined this way:

- **Unit Test**: Tests which validate isolated code blocks and do not require external interfaces such as salt-call or any of the salt daemons.
- **Integration Test**: Tests which validate externally accessible features.

Salt testing uses unittest2 from the python standard library and MagicMock.

- **Writing integration tests**
- **Writing unit tests**

**Naming Conventions**

Any function in either integration test files or unit test files that is doing the actual testing, such as functions containing assertions, must start with `test_`:

```python
def test_user_present(self):
```

When functions in test files are not prepended with `test_`, the function acts as a normal, helper function and is not run as a test by the test suite.

**Submitting New Tests**

Which branch of the Salt codebase should new tests be written against? The location of where new tests should be submitted depends largely on the reason you’re writing the tests.
Tests for New Features

If you are adding new functionality to Salt, please write the tests for this new feature in the same pull request as the new feature. New features should always be submitted to the develop branch.

If you have already submitted the new feature, but did not write tests in the original pull request that has already been merged, please feel free to submit a new pull request containing tests. If the feature was recently added to Salt’s develop branch, then the tests should be added there as well. However, if the feature was added to develop some time ago and is already present in one or more release branches, please refer to the Tests for Entire Files or Functions section below for more details about where to submit tests for functions or files that do not already have tests.

Tests to Accompany a Bugfix

If you are writing tests for code that fixes a bug in Salt, please write the test in the same pull request as the bugfix. If you’re unsure of where to submit your bugfix and accompanying test, please review the Which Salt Branch? documentation in Salt’s Contributing guide.

Tests for Entire Files or Functions

Sometimes entire files in Salt are completely untested. If you are writing tests for a file that doesn’t have any tests written for it, write your test against the earliest supported release branch that contains the file or function you’re testing.

Once your tests are submitted in a pull request and is merged into the branch in question, the tests you wrote will be merged-forward by SaltStack core engineers and the new tests will propagate to the newer release branches. That way the tests you wrote will apply to all current and relevant release branches, and not just the develop branch, for example. This methodology will help protect against regressions on older files in Salt’s codebase.

There may be times when the tests you write against an older branch fail in the merge-forward process because functionality has changed in newer release branches. In these cases, a Salt core developer may reach out to you for advice on the tests in question if the path forward is unclear.

*Note:* If tests are written against a file in an older release branch and then merged forward, there may be new functionality in the file that is present in the new release branch that is untested. It would be wise to see if new functionality could use additional testing once the test file has propagated to newer release branches.

Test Helpers

Several Salt-specific helpers are available. A full list is available by inspecting functions exported in tests.support.helpers.

@expensiveTest – Designates a test which typically requires a relatively costly external resource, like a cloud virtual machine. This decorator is not normally used by developers outside of the Salt core team.

@destructiveTest – Marks a test as potentially destructive. It will not be run by the test runner unless the -run-destructive test is expressly passed.

@requires_network – Requires a network connection for the test to operate successfully. If a network connection is not detected, the test will not run.

@requires_salt_modules – Requires all the modules in a list of modules in order for the test to be executed. Otherwise, the test is skipped.
@requires_system_grains – Loads and passes the grains on the system as an keyword argument to the test function with the name grains.

@skip_if_binaries_missing(['list', 'of', 'binaries']) – If called from inside a test, the test will be skipped if the binaries are not all present on the system.

@skip_if_not_root – If the test is not executed as root, it will be skipped.

@with_system_user – Creates and optionally destroys a system user within a test case. See implementation details in tests.support.helpers for details.

@with_system_group – Creates and optionally destroys a system group within a test case. See implementation details in tests.support.helpers for details.

@with_system_user_and_group – Creates and optionally destroys a system user and group within a test case. See implementation details in tests.support.helpers for details.

27.20 Integration Tests

The Salt integration tests come with a number of classes and methods which allow for components to be easily tested. These classes are generally inherited from and provide specific methods for hooking into the running integration test environment created by the integration tests.

It is noteworthy that since integration tests validate against a running environment that they are generally the preferred means to write tests.

The integration system is all located under tests/integration in the Salt source tree. Each directory within tests/integration corresponds to a directory in Salt’s tree structure. For example, the integration tests for the test.py Salt module that is located in salt/modules should also be named test.py and reside in tests/integration/modules.

27.20.1 Preparing to Write Integration Tests

This guide assumes that your Salt development environment is already configured and that you have a basic understanding of contributing to the Salt codebase. If you’re unfamiliar with either of these topics, please refer to the Installing Salt for Development and the Contributing pages, respectively.

This documentation also assumes that you have an understanding of how to run Salt’s test suite, including running the test subsections, and running a single integration test file, class, or individual test.

27.20.2 Best Practices

Integration tests should be written to the following specifications.

What to Test?

Since integration tests are used to validate against a running Salt environment, integration tests should be written with the Salt components, and their various interactions, in mind.

- Isolate testing functionality. Don’t rely on the pass or failure of other, separate tests.
- Individual tests should test against a single behavior.
• Since it occasionally takes some effort to "set up" an individual test, it may be necessary to call several functions within a single test. However, be sure that once the work has been done to set up a test, make sure you are clear about the functionality that is being tested.

Naming Conventions

Test names and docstrings should indicate what functionality is being tested. Test functions are named test_<fcn>_<test-name> where <fcn> is the function being tested and <test-name> describes the behavior being tested.

In order for integration tests to get picked up during a run of the test suite, each individual test must be prepended with the test_ naming syntax, as described above.

If a function does not start with test_, then the function acts as a "normal" function and is not considered a testing function. It will not be included in the test run or testing output.

The setUp and tearDown Functions

There are two special functions that can be utilized in the integration side of Salt’s test suite: setUp and tearDown. While these functions are not required in all test files, there are many examples in Salt’s integration test suite illustrating the broad usefulness of each function.

The setUp function is used to set up any repetitive or useful tasks that the tests in a test class need before running. For example, any of the mac_* integration tests should only run on macOS machines. The setUp function can be used to test for the presence of the Darwin kernel. If the Darwin kernel is not present, then the test should be skipped.

```python
def setUp(self):
    '''
    Sets up test requirements
    '''
    os_grain = self.run_function('grains.item', ['kernel'])
    if os_grain['kernel'] not in 'Darwin':
        self.skipTest('Test not applicable to "{kernel}" kernel'.format(**os_grain))
```

The setUp function can be used for many things. The above code snippet is only one example. Another example might be to ensure that a particular setting is present before running tests that would require the setting.

The tearDown function is used to clean up after any tests. This function is useful for restoring any settings that might have been changed during the test run.

Note: The setUp and tearDown functions run before and after each test in the test class that the setUp and tearDown functions are defined.

Be sure to read the Destructive vs Non-Destructive Tests section when using any kind of destructive functions that might alter the system running the test suite in either the setUp or tearDown function definitions.
Testing Order

The test functions within a test class do not run in the order they were defined, but instead run in lexicographical order.

Note that if any setUp or tearDown functions are defined in the class, those functions will run before (for setUp) or after (for tearDown) each test case.

27.20.3 Integration Classes

The integration classes are located in tests/integration/__init__.py and can be extended therein. There are four classes available to extend:

- ModuleCase
- ShellCase
- SSHCase
- SyndicCase

ModuleCase

Used to define executions run via the master to minions and to call single modules and states. The available testing functions are:

run_function

Run a single salt function and condition the return down to match the behavior of the raw function call. This will run the command and only return the results from a single minion to verify.

run_state

Run the state.single command and return the state return structure.

minion_run

Run a single salt function on the 'minion' target and condition the return down to match the behavior of the raw function call.

ShellCase

Shell out to the scripts which ship with Salt. The testing functions are:

run_cp

Execute salt-cp. Pass in the argument string as it would be passed on the command line.
run_call

Execute salt-call, pass in the argument string as it would be passed on the command line.

run_cloud

Execute the salt-cloud command. Pass in the argument string as it would be passed on the command line.

run_key

Execute the salt-key command. Pass in the argument string as it would be passed on the command line.

run_run

Execute the salt-run command. Pass in the argument string as it would be passed on the command line.

run_run_plus

Execute the runner function the and return the return data and output in a dict

run_salt

Execute the salt command. Pass in the argument string as it would be passed on the command line.

run_script

Execute a salt script with the given argument string.

run_ssh

Execute the salt-ssh. Pass in the argument string as it would be passed on the command line.

SSHCase

Used to execute remote commands via salt-ssh. The available methods are as follows:

run_function

Run a single salt function via salt-ssh and condition the return down to match the behavior of the raw function call. This will run the command and only return the results from a single minion to verify.

SyndicCase

Used to execute remote commands via a syndic and is only used to verify the capabilities of the Salt Syndic. The available methods are as follows:
run_function

Run a single salt function and condition the return down to match the behavior of the raw function call. This will run the command and only return the results from a single minion to verify.

27.20.4 Examples

The following sections define simple integration tests present in Salt’s integration test suite for each type of testing class.

Module Example via ModuleCase Class

Import the integration module, this module is already added to the python path by the test execution. Inherit from the integration.ModuleCase class.

Now the workhorse method run_function can be used to test a module:

```python
import os
import tests.integration as integration

class TestModuleTest(integration.ModuleCase):
    '''
    Validate the test module
    '''
    def test_ping(self):
        '''
        test.ping
        '''
        self.assertTrue(self.run_function('test.ping'))

    def test_echo(self):
        '''
        test.echo
        '''
        self.assertEqual(self.run_function('test.echo', ['text']), 'text')
```

The fist example illustrates the testing master issuing a test.ping call to a testing minion. The test asserts that the minion returned with a True value to the master from the test.ping call.

The second example similarly verifies that the minion executed the test.echo command with the text argument. The assertEqual call maintains that the minion ran the function and returned the data as expected to the master.

Shell Example via ShellCase

Validating the shell commands can be done via shell tests:

```python
import sys
import shutil
import tempfile
import tests.integration as integration

class KeyTest(integration.ShellCase):
```

(continues on next page)
Test salt-key script

```python
_call_binary_ = 'salt-key'

def test_list(self):
    '''
    test salt-key -L
    '''
    data = self.run_key('-L')
    expect = [
        'Unaccepted Keys:',
        'Accepted Keys:',
        'minion',
        'sub_minion',
        'Rejected:', '', ']
    self.assertEqual(data, expect)
```

This example verifies that the `salt-key` command executes and returns as expected by making use of the `run_key` method.

### SSH Example via SSHCase

Testing salt-ssh functionality can be done using the SSHCase test class:

```python
import tests.integration as integration

class SSHGrainsTest(integration.SSHCase):
    '''
    Test salt-ssh grains functionality
    Depend on proper environment set by integration.SSHCase class
    '''

    def test_grains_id(self):
        '''
        Test salt-ssh grains id work for localhost.
        '''
        cmd = self.run_function('grains.get', ['id'])
        self.assertEqual(cmd, 'localhost')
```

### Testing Event System via SaltMinionEventAssertsMixin

The fundamentally asynchronous nature of Salt makes testing the event system a challenge. The `SaltMinionEventAssertsMixin` provides a facility for testing that events were received on a minion event bus.

```python
import tests.integration as integration
import salt.utils.event

class TestEvent(integration.SaltEventAssertsMixin):
    '''
    Example test of firing an event and receiving it
    '''
```

(continues on next page)
def test_event(self):
e = salt.utils.event.get_event('minion', sock_dir=self.minion_opts['sock_dir']
-'), opts=self.minion_opts)
e.fire_event({'a': 'b'}, '/test_event')
self.assertMinionEventReceived({'a': 'b'})

 Syndic Example via SyndicCase

Testing Salt’s Syndic can be done via the SyndicCase test class:

```python
import tests.integration as integration
class TestSyndic(integration.SyndicCase):
    '''
    Validate the syndic interface by testing the test module
    '''
    def test_ping(self):
        '''
test.ping
        '''
        test.ping
        self.assertTrue(self.run_function('test.ping'))
```

This example verifies that a test.ping command is issued from the testing master, is passed through to the testing syndic, down to the minion, and back up again by using the run_function located with in the SyndicCase test class.

27.20.5 Integration Test Files

Since using Salt largely involves configuring states, editing files, and changing system data, the integration test suite contains a directory named files to aid in testing functions that require files. Various Salt integration tests use these example files to test against instead of altering system files and data.

Each directory within tests/integration/files contain files that accomplish different tasks, based on the needs of the integration tests using those files. For example, tests/integration/files/ssh is used to boot-strap the test runner for salt-ssh testing, while tests/integration/files/pillar contains files storing data needed to test various pillar functions.

The tests/integration/files directory also includes an integration state tree. The integration state tree can be found at tests/integration/files/file/base.

The following example demonstrates how integration files can be used with ModuleCase to test states:

```python
# Import python libs
from __future__ import absolute_import
import os
import shutil
# Import Salt Testing libs
from tests.support.case import ModuleCase
from tests.support.paths import FILES, TMP
from tests.support.mixins import SaltReturnAssertsMixin
```
# Import salt libs
import salt.utils.files

HFILE = os.path.join(TMP, 'hosts')

class HostTest(ModuleCase, SaltReturnAssertsMixin):
    '''Validate the host state'''
    def setUp(self):
        shutil.copyfile(os.path.join(FILES, 'hosts'), HFILE)
        super(HostTest, self).setUp()

    def tearDown(self):
        if os.path.exists(HFILE):
            os.remove(HFILE)
        super(HostTest, self).tearDown()

    def test_present(self):
        '''host.present'''
        name = 'spam.bacon'
        ip = '10.10.10.10'
        ret = self.run_state('host.present', name=name, ip=ip)
        self.assertSaltTrueReturn(ret)
        with salt.utils.files.fopen(HFILE) as fp_:
            output = fp_.read()
        self.assertIn('{{0}}	{{1}}'.format(ip, name), output)

To access the integration files, a variable named FILES points to the tests/integration/files directory. This is where the referenced host.present sls file resides.

In addition to the static files in the integration state tree, the location TMP can also be used to store temporary files that the test system will clean up when the execution finishes.

### 27.20.6 Destructive vs Non-Destructive Tests

Since Salt is used to change the settings and behavior of systems, one testing approach is to run tests that make actual changes to the underlying system. This is where the concept of destructive integration tests comes into play. Tests can be written to alter the system they are running on. This capability is what fills in the gap needed to properly test aspects of system management like package installation.

Any test that changes the underlying system in any way, such as creating or deleting users, installing packages, or changing permissions should include the @destructive decorator to signal system changes and should be written with care. System changes executed within a destructive test should also be restored once the related tests have completed. For example, if a new user is created to test a module, the same user should be removed after the test is completed to maintain system integrity.

To write a destructive test, import, and use the destructiveTest decorator for the test method:
import tests.integration as integration
from tests.support.helpers import destructiveTest, skip_if_not_root

class DestructiveExampleModuleTest(integration.ModuleCase):
    '''
    Demonstrate a destructive test
    '''

    @destructiveTest
    @skip_if_not_root
    def test_user_not_present(self):
        '''
        This is a DESTRUCTIVE TEST it creates a new user on the minion.
        And then destroys that user.
        '''
        ret = self.run_state('user.present', name='salt_test')
        self.assertSaltTrueReturn(ret)
        ret = self.run_state('user.absent', name='salt_test')
        self.assertSaltTrueReturn(ret)

27.20.7 Cloud Provider Tests

Cloud provider integration tests are used to assess Salt-Cloud's ability to create and destroy cloud instances for various supported cloud providers. Cloud provider tests inherit from the ShellCase Integration Class.

Any new cloud provider test files should be added to the tests/integration/cloud/providers/ directory. Each cloud provider test file also requires a sample cloud profile and cloud provider configuration file in the integration test file directory located at tests/integration/files/conf/cloud.*.d/.

The following is an example of the default profile configuration file for Digital Ocean, located at: tests/integration/files/conf/cloud.profiles.d/digitalocean.conf:

```
digitalocean-test:
    provider: digitalocean-config
    image: Ubuntu 14.04 x64
    size: 512MB
```

Each cloud provider requires different configuration credentials. Therefore, sensitive information such as API keys or passwords should be omitted from the cloud provider configuration file and replaced with an empty string. The necessary credentials can be provided by the user by editing the provider configuration file before running the tests.

The following is an example of the default provider configuration file for Digital Ocean, located at: tests/integration/files/conf/cloud.providers.d/digitalocean.conf:

```
digitalocean-config:
    driver: digitalocean
    client_key: ''
    api_key: ''
    location: New York 1
```

In addition to providing the necessary cloud profile and provider files in the integration test suite file structure, appropriate checks for if the configuration files exist and contain valid information are also required in the test class's setUp function:
class LinodeTest(ShellCase):
    '''
    Integration tests for the Linode cloud provider in Salt-Cloud
    '''

def setUp(self):
    '''
    Sets up the test requirements
    '''
    super(LinodeTest, self).setUp()

    # check if appropriate cloud provider and profile files are present
    profile_str = 'linode-config:
    provider = 'linode'
    providers = self.run_cloud('--list-providers')
    if profile_str not in providers:
        self.skipTest('Configuration file for {0} was not found. Check {0}.conf files in tests/integration/files/conf/cloud.*.d/ to run these tests.'
                       .format(provider))

    # check if apikey and password are present
    path = os.path.join(FILES,
                        'conf',
                        'cloud.providers.d',
                        provider + '.conf')
    config = cloud_providers_config(path)
    api = config['linode-config'][provider]['apikey']
    password = config['linode-config'][provider]['password']
    if api == '' or password == '':
        self.skipTest('An api key and password must be provided to run these tests. Check'
                       'tests/integration/files/conf/cloud.providers.d/{0}.conf'.format(  
                       provider))

Repeatedly creating and destroying instances on cloud providers can be costly. Therefore, cloud provider tests are off by default and do not run automatically. To run the cloud provider tests, the --cloud-provider-tests flag must be provided:

./tests/runtests.py --cloud-provider-tests

Since cloud provider tests do not run automatically, all provider tests must be preceded with the @expensiveTest decorator. The expensive test decorator is necessary because it signals to the test suite that the --cloud-provider-tests flag is required to run the cloud provider tests.

To write a cloud provider test, import, and use the expensiveTest decorator for the test function:

from tests.support.helpers import expensiveTest

@expensiveTest
def test_instance(self):
    '''
    (continues on next page)
```python
Test creating an instance on Linode
'''
name = 'linode-testing'

# create the instance
instance = self.run_cloud('-p linode-test {0}'.format(name))
str = '{}'.format(name)

# check if instance with salt installed returned as expected
try:
    self.assertIn(str, instance)
except AssertionError:
    self.run_cloud('-d {0} --assume-yes'.format(name))
    raise

# delete the instance
delete = self.run_cloud('-d {0} --assume-yes'.format(name))
str = '{0} True'.format(name)
try:
    self.assertIn(str, delete)
except AssertionError:
    raise
```

### 27.20.8 Adding New Directories

If the corresponding Salt directory does not exist within `tests/integration`, the new directory must be created along with the appropriate test file to maintain Salt’s testing directory structure.

In order for Salt’s test suite to recognize tests within the newly created directory, options to run the new integration tests must be added to `tests/runtests.py`. Examples of the necessary options that must be added can be found here: [https://github.com/saltstack/salt/blob/develop/tests/runtests.py](https://github.com/saltstack/salt/blob/develop/tests/runtests.py). The functions that need to be edited are `setup_additional_options`, `validate_options`, and `run_integration_tests`.

### 27.21 Writing Unit Tests

#### 27.21.1 Introduction

Like many software projects, Salt has two broad-based testing approaches – integration testing and unit testing. While integration testing focuses on the interaction between components in a sandboxed environment, unit testing focuses on the singular implementation of individual functions.

Unit tests should be used specifically to test a function’s logic. Unit tests rely on mocking external resources.

While unit tests are good for ensuring consistent results, they are most useful when they do not require more than a few mocks. Effort should be made to mock as many external resources as possible. This effort is encouraged, but not required. Sometimes the isolation provided by completely mocking the external dependencies is not worth the effort of mocking those dependencies.

In these cases, requiring an external library to be installed on the system before running the test file is a useful way to strike this balance. For example, the unit tests for the MySQL execution module require the presence of the MySQL python bindings on the system running the test file before proceeding to run the tests.
Overly detailed mocking can also result in decreased test readability and brittleness as the tests are more likely to fail when the code or its dependencies legitimately change. In these cases, it is better to add dependencies to the test runner dependency state.

27.21.2 Preparing to Write a Unit Test

This guide assumes that your Salt development environment is already configured and that you have a basic understanding of contributing to the Salt codebase. If you’re unfamiliar with either of these topics, please refer to the Installing Salt for Development and the Contributing pages, respectively.

This documentation also assumes that you have an understanding of how to run Salt’s test suite, including running the unit test subsection, running the unit tests without testing daemons to speed up development wait times, and running a unit test file, class, or individual test.

27.21.3 Best Practices

Unit tests should be written to the following specifications.

What to Test?

Since unit testing focuses on the singular implementation of individual functions, unit tests should be used specifically to test a function’s logic. The following guidelines should be followed when writing unit tests for Salt’s test suite:

- Each raise and return statement needs to be independently tested.
- Isolate testing functionality. Don’t rely on the pass or failure of other, separate tests.
- Test functions should contain only one assertion.
- Many Salt execution modules are merely wrappers for distribution-specific functionality. If there isn’t any logic present in a simple execution module, consider writing an integration test instead of heavily mocking a call to an external dependency.

Mocking Test Data

A reasonable effort needs to be made to mock external resources used in the code being tested, such as APIs, function calls, external data either globally available or passed in through function arguments, file data, etc.

- Test functions should contain only one assertion and all necessary mock code and data for that assertion.
- External resources should be mocked in order to "block all of the exits". If a test function fails because something in an external library wasn’t mocked properly (or at all), this test is not addressing all of the "exits" a function may experience. We want the Salt code and logic to be tested, specifically.
- Consider the fragility and longevity of a test. If the test is so tightly coupled to the code being tested, this makes a test unnecessarily fragile.
- Make sure you are not mocking the function to be tested so vigorously that the test return merely tests the mocked output. The test should always be testing a function’s logic.
Mocking Loader Modules

Salt loader modules use a series of globally available dunder variables, __salt__, __opts__, __pillar__, etc. To facilitate testing these modules a mixin class was created, LoaderModuleMockMixin which can be found in tests/support/mixins.py. The reason for the existence of this class is because historically and because it was easier, one would add these dunder variables directly on the imported module. This however, introduces unexpected behavior when running the full test suite since those attributes would not be removed once we were done testing the module and would therefore leak to other modules being tested with unpredictable results. This is the kind of work that should be deferred to mock, and that’s exactly what this mixin class does.

As an example, if one needs to specify some options which should be available to the module being tested one should do:

```python
import salt.modules.somemodule as somemodule
class SomeModuleTest(TestCase, LoaderModuleMockMixin):
    def setup_loader_modules(self):
        return {
            somemodule: {
                '__opts__': {'test': True}
            }
        }
```

Consider this more extensive example from tests/unit/modules/test_libcloud_dns.py:

```python
# Import Python Libs
from __future__ import absolute_import
# Import Salt Testing Libs
from tests.support.mixins import LoaderModuleMockMixin
from tests.support.unit import TestCase, skipIf
from tests.support.mock import patch, MagicMock, NO_MOCK, NO_MOCK_REASON
import salt.modules.libcloud_dns as libcloud_dns

class MockDNSDriver(object):
    def __init__(self):
        pass

def get_mock_driver():
    return MockDNSDriver()

@skipIf(NO_MOCK, NO_MOCK_REASON)
@patch('salt.modules.libcloud_dns._get_driver',
       MagicMock(return_value=MockDNSDriver()))
class LibcloudDnsModuleTestCase(TestCase, LoaderModuleMockMixin):
    def setup_loader_modules(self):
        module_globals = {
(continues on next page)
What happens in the above example is we mock a call to `__salt__['config.option']` to return the configuration needed for the execution of the tests. Additionally, if the `libcloud` library is not available, since that’s not actually part of what’s being tested, we mocked that import by patching `sys.modules` when tests are running.

Mocking Filehandles

Note: This documentation applies to the 2018.3 release cycle and newer. The extended functionality for `mock_open` described below does not exist in the 2017.7 and older release branches.

Opening files in Salt is done using `salt.utils.files.fopen()`. When testing code that reads from files, the `mock_open` helper can be used to mock filehandles. Note that is not the same `mock_open` as `unittest.mock.mock_open()` from the Python standard library, but rather a separate implementation which has additional functionality.

```python
from tests.support.unit import TestCase, skipIf
from tests.support.mock import (patch, mock_open, NO_MOCK, NO_MOCK_REASON,)

import salt.modules.mymod as mymod

@skipIf(NO_MOCK, NO_MOCK_REASON)
class MyAwesomeTestCase(TestCase):
    def test_something(self):
        fopen_mock = mock_open(read_data='foo\nbar\nbaz\n')
        with patch('salt.utils.files.fopen', fopen_mock):
            result = mymod.myfunc()
            assert result is True
```

This will force any filehandle opened to mimic a filehandle which, when read, produces the specified contents.

**Important: String Types**

When running tests on Python 2, `mock_open` will convert any `unicode` types to `str` types to more closely reproduce Python 2 behavior (file reads are always `str` types in Python 2, irrespective of mode).
However, when configuring your `read_data`, make sure that you are using bytestrings (e.g. `b'foo\nbbar\nbaz\nn'`) when the code you are testing is opening a file for binary reading, otherwise the tests will fail on Python 3. The mocked filehandles produced by `mock_open` will raise a `TypeError` if you attempt to read a bytestring when opening for non-binary reading, and similarly will not let you read a string when opening a file for binary reading. They will also not permit bytestrings to be "written" if the mocked filehandle was opened for non-binary writing, and vice-versa when opened for non-binary writing. These enhancements force test writers to write more accurate tests.

More Complex Scenarios

Multiple File Paths

What happens when the code being tested reads from more than one file? For those cases, you can pass `read_data` as a dictionary:

```python
import textwrap

from tests.support.unit import TestCase, skipIf
from tests.support.mock import patch

import salt.modules.mymod as mymod

@skipIf(NO_MOCK, NO_MOCK_REASON)
class MyAwesomeTestCase(TestCase):
    def test_something(self):
        contents = {
            '/etc/foo.conf': textwrap.dedent('''
foo
bar
baz'''),
            '/etc/b*.conf': textwrap.dedent('''
one
two
three'''),
        }
        fopen_mock = mock_open(read_data=contents)
        with patch('salt.utils.files.fopen', fopen_mock):
            result = mymod.myfunc()
            assert result is True
```

This would make `salt.utils.files.fopen()` produce filehandles with different contents depending on which file was being opened by the code being tested. `/etc/foo.conf` and any file matching the pattern `/etc/b*.conf` would work, while opening any other path would result in a `FileNotFoundError` being raised (in Python 2, an `IOError`).

Since file patterns are supported, it is possible to use a pattern of `'*'` to define a fallback if no other patterns match the filename being opened. The below two `mock_open` calls would produce identical results:
mock_open(read_data='foo
')
mock_open(read_data={'*': 'foo
'})

Note: Take care when specifying the read_data as a dictionary, in cases where the patterns overlap (e.g. when both /etc/b*.conf and /etc/bar.conf are in the read_data). Dictionary iteration order will determine which pattern is attempted first, second, etc., with the exception of * which is used when no other pattern matches. If your test case calls for specifying overlapping patterns, and you are not running Python 3.6 or newer, then an OrderedDict can be used to ensure matching is handled in the desired way:

```
collections = OrderedDict()
collections['/etc/bar.conf'] = 'foo
bar
baz'
collections['/etc/b*.conf'] = IOError(errno.EACCES, 'Permission denied')
collections['*'] = 'This is a fallback for files not beginning with "/etc/b"

fopen_mock = mock_open(read_data=collections)
```

Raising Exceptions

Instead of a string, an exception can also be used as the read_data:

```
import errno

from tests.support.unit import TestCase, skipIf
from tests.support.mock import (patch, mock_open, NO_MOCK, NO_MOCK_REASON,)

import salt.modules.mymod as mymod

@skipIf(NO_MOCK, NO_MOCK_REASON)
class MyAwesomeTestCase(TestCase):
    def test_something(self):
        exc = IOError(errno.EACCES, 'Permission denied')
        fopen_mock = mock_open(read_data=exc)
        with patch('salt.utils.files.fopen', fopen_mock):
            mymod.myfunc()
```

The above example would raise the specified exception when any file is opened. The expectation would be that mymod.myfunc() would gracefully handle the IOError, so a failure to do that would result in it being raised and causing the test to fail.

Multiple File Contents

For cases in which a file is being read more than once, and it is necessary to test a function’s behavior based on what the file looks like the second (or third, etc.) time it is read, just specify the the contents for that file as a list. Each time the file is opened, mock_open will cycle through the list and produce a mocked filehandle with the specified contents. For example:
import errno
import textwrap

from tests.support.unit import TestCase, skipIf
from tests.support.mock import (patch,
    mock_open,
    NO_MOCK,
    NO_MOCK_REASON,
)

import salt.modules.mymod as mymod

@skipIf(NO_MOCK, NO_MOCK_REASON)
class MyAwesomeTestCase(TestCase):
    def test_something(self):
        contents = {
            '/etc/foo.conf': [
                textwrap.dedent('''
foo
bar
'''),
                textwrap.dedent('''
foo
bar
baz
'''),
            ],
            '/etc/b*.conf': [
                IOError(errno.ENOENT, 'No such file or directory'),
                textwrap.dedent('''
one
two
three
'''),
            ],
        }
        fopen_mock = mock_open(read_data=contents)
        with patch('salt.utils.files.fopen', fopen_mock):
            result = mymod.myfunc()
            assert result is True

Using this example, the first time /etc/foo.conf is opened, it will simulate a file with the first string in the list as its contents, while the second time it is opened, the simulated file’s contents will be the second string in the list.

If no more items remain in the list, then attempting to open the file will raise a RuntimeError. In the example above, if /etc/foo.conf were to be opened a third time, a RuntimeError would be raised.

Note that exceptions can also be mixed in with strings when using this technique. In the above example, if /etc/bar.conf were to be opened twice, the first time would simulate the file not existing, while the second time would simulate a file with string defined in the second element of the list.

Note: Notice that the second path in the contents dictionary above (/etc/b*.conf) contains an asterisk. The items in the list are cycled through for each match of a given pattern (not separately for each individual file path), so this means that only two files matching that pattern could be opened before the next one would raise a...
RuntimeError.

Accessing the Mocked Filehandles in a Test

Note: The code for the MockOpen, MockCall, and MockFH classes (referenced below) can be found in tests/support/mock.py. There are extensive unit tests for them located in tests/unit/test_mock.py.

The above examples simply show how to mock `salt.utils.files.fopen()` to simulate files with the contents you desire, but you can also access the mocked filehandles (and more), and use them to craft assertions in your tests. To do so, just add an `as` clause to the end of the `patch` statement:

```python
fopen_mock = mock_open(read_data='foo
bar
baz
')
with patch('salt.utils.files.fopen', fopen_mock) as m_open:
    # do testing here
    ...
```

When doing this, `m_open` will be a `MockOpen` instance. It will contain several useful attributes:

- **read_data** - A dictionary containing the `read_data` passed when `mock_open` was invoked. In the event that multiple file paths are not used, then this will be a dictionary mapping `*` to the `read_data` passed to `mock_open`.

- **call_count** - An integer representing how many times `salt.utils.files.fopen()` was called to open a file.

- **calls** - A list of `MockCall` objects. A `MockCall` object is a simple class which stores the arguments passed to it, making the positional arguments available via its `args` attribute, and the keyword arguments available via its `kwargs` attribute.

```python
from tests.support.unit import TestCase, skipIf
from tests.support.mock import (patch, mock_open, MockCall, NO_MOCK, NO_MOCK_REASON)

import salt.modules.mymod as mymod

@skipIf(NO_MOCK, NO_MOCK_REASON)
class MyAwesomeTestCase(TestCase):
    def test_something(self):
        with patch('salt.utils.files.fopen', mock_open(read_data=b'foo\n')) as m_open:
            mymod.myfunc()
            assert m_open.call_count == 2
            assert all(call.args[0] == '/etc/foo.conf' for call in m_open.calls)
            # Assert that the first open was for binary read, and the
```
# second was for binary write.
assert m_open.calls == [
    MockCall('/etc/foo.conf', 'rb'),
    MockCall('/etc/foo.conf', 'wb'),
]

Note that MockCall is imported from tests.support.mock in the above example. Also, the second assert above is redundant since it is covered in the final assert, but both are included simply as an example.

- **filehandles** - A dictionary mapping the unique file paths opened, to lists of MockFH objects. Each open creates a unique MockFH object. Each MockFH object itself has a number of useful attributes:
  - **filename** - The path to the file which was opened using salt.utils.files.fopen()
  - **call** - A MockCall object representing the arguments passed to salt.utils.files.fopen(). Note that this MockCall is also available in the parent MockOpen instance's calls list.
  - The following methods are mocked using unittest.mock.Mock objects, and Mock's built-in asserts (as well as the call data) can be used as you would with any other Mock object:
    * .read()
    * .readlines()
    * .readline()
    * .close()
    * .write()
    * .writelines()
    * .seek()
  - The read functions (.read(), .readlines(), .readline()) all work as expected, as does iterating through the file line by line (i.e. for line in fh:).
  - The .tell() method is also implemented in such a way that it updates after each time the mocked filehandle is read, and will report the correct position. The one caveat here is that .seek() doesn't actually work (it's simply mocked), and will not change the position. Additionally, neither .write() or .writelines() will modify the mocked filehandle's contents.
  - The attributes .write_calls and .writelines_calls (no parenthesis) are available as shorthands and correspond to lists containing the contents passed for all calls to .write() and .writelines(), respectively.

Examples

```python
with patch('salt.utils.files.fopen', mock_open(read_data=contents)) as m_open:
    # Run the code you are unit testing
    mymod.myfunc()
    # Check that only the expected file was opened, and that it was opened # only once.
    assert m_open.call_count == 1
    assert list(m_open.filehandles) == ['/etc/foo.conf']
    # "opens" will be a list of all the mocked filehandles opened
    opens = m_open.filehandles['/etc/foo.conf']
    # Check that we wrote the expected lines ("expected" here is assumed to # be a list of strings)
    assert opens[0].write_calls == expected
```
with patch('salt.utils.files.fopen', mock_open(read_data=contents)) as m_open:
    # Run the code you are unit testing
    mymod.myfunc()
    # Check that .readlines() was called (remember, it's a Mock)
    m_open.filehandles['/etc/foo.conf'][0].readlines.assert_called()

with patch('salt.utils.files.fopen', mock_open(read_data=contents)) as m_open:
    # Run the code you are unit testing
    mymod.myfunc()
    # Check that we read the file and also wrote to it
    m_open.filehandles['/etc/foo.conf'][0].read.assert_called_once()
    m_open.filehandles['/etc/foo.conf'][1].writelines.assert_called_once()

Naming Conventions

Test names and docstrings should indicate what functionality is being tested. Test functions are named test_<fcn>_<test-name> where <fcn> is the function being tested and <test-name> describes the raise or return being tested.

Unit tests for salt/.../<module>.py are contained in a file called tests/unit/.../test_<module>.py, e.g. the tests for salt/modules/fib.py are in tests/unit/modules/test_fib.py.

In order for unit tests to get picked up during a run of the unit test suite, each unit test file must be prefixed with test_ and each individual test must be prepended with the test_ naming syntax, as described above.

If a function does not start with test_, then the function acts as a "normal" function and is not considered a testing function. It will not be included in the test run or testing output. The same principle applies to unit test files that do not have the test_* .py naming syntax. This test file naming convention is how the test runner recognizes that a test file contains unit tests.

Imports

Most commonly, the following imports are necessary to create a unit test:

from tests.support.unit import TestCase, skipIf

If you need mock support to your tests, please also import:

from tests.support.mock import NO_MOCK, NO_MOCK_REASON, MagicMock, patch, call

27.21.4 Evaluating Truth

A longer discussion on the types of assertions one can make can be found by reading Python’s documentation on unit testing.

27.21.5 Tests Using Mock Objects

In many cases, the purpose of a Salt module is to interact with some external system, whether it be to control a database, manipulate files on a filesystem or something else. In these varied cases, it’s necessary to design a unit test which can test the function whilst replacing functions which might actually call out to external systems. One might think of this as "blocking the exits" for code under tests and redirecting the calls to external systems with our own code which produces known results during the duration of the test.
To achieve this behavior, Salt makes heavy use of the MagicMock package.

To understand how one might integrate Mock into writing a unit test for Salt, let’s imagine a scenario in which we’re testing an execution module that’s designed to operate on a database. Furthermore, let’s imagine two separate methods, here presented in pseudo-code in an imaginary execution module called ‘db.py’.

```python
def create_user(username):
    qry = 'CREATE USER {0}'.format(username)
    execute_query(qry)

def execute_query(qry):
    # Connect to a database and actually do the query...
```

Here, let’s imagine that we want to create a unit test for the `create_user` function. In doing so, we want to avoid any calls out to an external system and so while we are running our unit tests, we want to replace the actual interaction with a database with a function that can capture the parameters sent to it and return pre-defined values. Therefore, our task is clear – to write a unit test which tests the functionality of `create_user` while also replacing ‘execute_query’ with a mocked function.

To begin, we set up the skeleton of our class much like we did before, but with additional imports for MagicMock:

```python
# Import Salt Testing libs
from tests.support.unit import TestCase

# Import Salt execution module to test
from salt.modules import db

# Import Mock libraries
from tests.support.mock import NO_MOCK, NO_MOCK_REASON, MagicMock, patch, call

# Create test case class and inherit from Salt's customized TestCase
# Skip this test case if we don't have access to mock!
@skipIf(NO_MOCK, NO_MOCK_REASON)
class DbTestCase(TestCase):
    def test_create_user(self):
        # First, we replace 'execute_query' with our own mock function
        with patch.object(db, 'execute_query', MagicMock()) as db_exq:

            # Now that the exits are blocked, we can run the function under test.
            db.create_user('testuser')

            # We could now query our mock object to see which calls were made
            # to it.
            ## print db_exq.mock_calls

            # Construct a call object that simulates the way we expected
            # execute_query to have been called.
            expected_call = call('CREATE USER testuser')

            # Compare the expected call with the list of actual calls. The
            # test will succeed or fail depending on the output of this
            # assertion.
            db_exq.assert_has_calls(expected_call)
```
27.21.6 Modifying __salt__ In Place

At times, it becomes necessary to make modifications to a module’s view of functions in its own __salt__ dictionary. Luckily, this process is quite easy.

Below is an example that uses MagicMock’s patch functionality to insert a function into __salt__ that’s actually a MagicMock instance.

```python
def show_patch(self):
    with patch.dict(my_module.__salt__,
        {'function.to_replace': MagicMock()}):
        # From this scope, carry on with testing, with a modified __salt__!
```

27.21.7 A Simple Example

Let’s assume that we’re testing a very basic function in an imaginary Salt execution module. Given a module called fib.py that has a function called calculate(num_of_results), which given a num_of_results, produces a list of sequential Fibonacci numbers of that length.

A unit test to test this function might be commonly placed in a file called tests/unit/modules/test_fib.py. The convention is to place unit tests for Salt execution modules in test/unit/modules/ and to name the tests module prefixed with test_*.py.

Tests are grouped around test cases, which are logically grouped sets of tests against a piece of functionality in the tested software. Test cases are created as Python classes in the unit test module. To return to our example, here’s how we might write the skeleton for testing fib.py:

```python
# Import Salt Testing libs
from tests.support.unit import TestCase

# Import Salt execution module to test
import salt.modules.fib as fib

# Create test case class and inherit from Salt's customized TestCase
class FibTestCase(TestCase):
    '''
    This class contains a set of functions that test salt.modules.fib.
    '''
    def test_fib(self):
        '''
        To create a unit test, we should prefix the name with `test_` so
        that it's recognized by the test runner.
        '''
        fib_five = (0, 1, 1, 2, 3)
        self.assertEqual(fib.calculate(5), fib_five)
```

At this point, the test can now be run, either individually or as a part of a full run of the test runner. To ease development, a single test can be executed:

```
tests/runtests.py -v -n unit.modules.test_fib
```

This will report the status of the test: success, failure, or error. The -v flag increases output verbosity.

```
tests/runtests.py -n unit.modules.test_fib -v
```

To review the results of a particular run, take a note of the log location given in the output for each test:
Logging tests on /var/folders/nl/d809xbq577l3qrbj3ymtpbq80000gn/T/salt-runtests.log

27.21.8 A More Complete Example

Consider the following function from salt/modules/linux_sysctl.py.

```python
def get(name):
    '''
    Return a single sysctl parameter for this minion

    CLI Example:
    .. code-block:: bash
        salt '*' sysctl.get net.ipv4.ip_forward
    '''
    cmd = 'sysctl -n {0}'.format(name)
    out = __salt__['cmd.run'](cmd)
    return out
```

This function is very simple, comprising only four source lines of code and having only one return statement, so we know only one test is needed. There are also two inputs to the function, the `name` function argument and the call to `__salt__['cmd.run']()`, both of which need to be appropriately mocked.

Mocking a function parameter is straightforward, whereas mocking a function call will require, in this case, the use of MagicMock. For added isolation, we will also redefine the `__salt__` dictionary such that it only contains `'cmd.run'`.

```python
# Import Salt Libs
import salt.modules.linux_sysctl as linux_sysctl

# Import Salt Testing Libs
from tests.support.mixins import LoaderModuleMockMixin
from tests.support.unit import skipIf, TestCase
from tests.support.mock import (Mock, patch, NO_MOCK, NO_MOCK_REASON)

@skipIf(NO_MOCK, NO_MOCK_REASON)
class LinuxSysctlTestCase(TestCase, LoaderModuleMockMixin):
    '''
    TestCase for salt.modules.linux_sysctl module
    '''

    def test_get(self):
        '''
        Tests the return of get function
        '''
        mock_cmd = Mock(return_value=1)
        with patch.dict(linux_sysctl.__salt__, {'cmd.run': mock_cmd}):
            self.assertEqual(linux_sysctl.get('net.ipv4.ip_forward'), 1)
```
Since `get()` has only one raise or return statement and that statement is a success condition, the test function is simply named `test_get()`. As described, the single function call parameter, `name` is mocked with `net.ipv4.ip_forward` and `__salt__['cmd.run']` is replaced by a MagicMock function object. We are only interested in the return value of `__salt__['cmd.run']`, which MagicMock allows us by specifying via `return_value=1`. Finally, the test itself tests for equality between the return value of `get()` and the expected return of `1`. This assertion is expected to succeed because `get()` will determine its return value from `__salt__['cmd.run']`, which we have mocked to return `1`.

27.21.9 A Complex Example

Now consider the `assign()` function from the same salt/modules/linux_sysctl.py source file.

```python
def assign(name, value):
    
    Assign a single sysctl parameter for this minion

    CLI Example:

    .. code-block:: bash

        salt '*' sysctl.assign net.ipv4.ip_forward 1

    value = str(value)
    sysctl_file = '/proc/sys/' + name.replace('.', '/')
    if not os.path.exists(sysctl_file):
        raise CommandExecutionError('sysctl {0} does not exist'.format(name))

    ret = {}
    cmd = 'sysctl -w {0}={1}'.format(name, value)
    data = __salt__['cmd.run_all'](cmd)
    out = data['stdout']
    err = data['stderr']

    regex = re.compile(r'^{0}=.*{1}$'.format(re.escape(name), re.escape(value)))

    if not regex.match(out) or 'Invalid argument' in str(err):
        if data['retcode'] != 0 and err:
            error = err
        else:
            error = out
        raise CommandExecutionError('sysctl -w failed: {0}'.format(error))

    new_name, new_value = out.split('=', 1)
    ret[new_name] = new_value

    return ret
```

This function contains two raise statements and one return statement, so we know that we will need (at least) three tests. It has two function arguments and many references to non-built-in functions. In the tests below you will see that MagicMock's `patch()` method may be used as a context manager or as a decorator. When patching the salt dunders however, please use the context manager approach.

There are three test functions, one for each raise and return statement in the source function. Each function is self-contained and contains all and only the mocks and data needed to test the raise or return statement it is concerned with.
# Import Salt Libs
import salt.modules.linux_sysctl as linux_sysctl
from salt.exceptions import CommandExecutionError

# Import Salt Testing Libs
from tests.support.mixins import LoaderModuleMockMixin
from tests.support.unit import skipIf, TestCase
from tests.support.mock import (MagicMock, patch, NO_MOCK, NO_MOCK_REASON)

@skipIf(NO_MOCK, NO_MOCK_REASON)
class LinuxSysctlTestCase(TestCase, LoaderModuleMockMixin):
    '''
    TestCase for salt.modules.linux_sysctl module
    '''
    @patch('os.path.exists', MagicMock(return_value=False))
    def test_assign_proc_sys_failed(self):
        '''
        Tests if /proc/sys/<kernel-subsystem> exists or not
        '''
        cmd = {'pid': 1337, 'retcode': 0, 'stderr': '', 'stdout': 'net.ipv4.ip_forward = 1'}
        mock_cmd = MagicMock(return_value=cmd)
        with patch.dict(linux_sysctl.__salt__, {'cmd.run_all': mock_cmd}):
            self.assertRaises(CommandExecutionError, linux_sysctl.assign, 'net.ipv4.ip_forward', 1)

    @patch('os.path.exists', MagicMock(return_value=True))
    def test_assign_cmd_failed(self):
        '''
        Tests if the assignment was successful or not
        '''
        cmd = {'pid': 1337, 'retcode': 0, 'stderr': 'sysctl: setting key "net.ipv4.ip_forward": Invalid argument', 'stdout': 'net.ipv4.ip_forward = backward'}
        mock_cmd = MagicMock(return_value=cmd)
        with patch.dict(linux_sysctl.__salt__, {'cmd.run_all': mock_cmd}):
            self.assertRaises(CommandExecutionError, linux_sysctl.assign, 'net.ipv4.ip_forward', 1)

    @patch('os.path.exists', MagicMock(return_value=True))
    def test_assign_success(self):
        '''
        Tests the return of successful assign function
        '''
        cmd = {'pid': 1337, 'retcode': 0, 'stderr': '', 'stdout': 'net.ipv4.ip_forward = 1'}
        ret = {'net.ipv4.ip_forward': '1'}
        mock_cmd = MagicMock(return_value=cmd)
        with patch.dict(linux_sysctl.__salt__, {'cmd.run_all': mock_cmd}):
            self.assertEqual(ret, linux_sysctl.assign('net.ipv4.ip_forward', 1)
27.22 raet

# RAET # Reliable Asynchronous Event Transport Protocol

See also:
RAET Overview

27.22.1 Protocol

Layering:
OSI Layers

Link is hidden from Raet Network is IP host address and Udp Port Transport is Raet transactions, service kind, tail error checking. Could include header signing as part of transport reliable delivery serialization of header Session is session id key exchange for signing. Grouping is Road (like 852 channel) Presentation is Encrypt Decrypt body Serialize Deserialize Body Application is body data dictionary

Header signing spans both the Transport and Session layers.

27.22.2 Header

JSON Header (Tradeoff some processing speed for extensibility, ease of use, readability)

Body initially JSON but support for "packed" binary body

27.22.3 Packet

Header ASCII Safe JSON Header termination: Empty line given by double pair of carriage return linefeed /r/n/r/n 10 13 10 13 ADAD 1010 1101 1010 1101

In json carriage return and newline characters cannot appear in a json encoded string unless they are escaped with backslash, so the 4 byte combination is illegal in valid json that does not have multi-byte unicode characters.

These means the header must be ascii safe so no multibyte utf-8 strings allowed in header.

Following Header Terminator is variable length signature block. This is binary and the length is provided in the header.

Following the signature block is the packet body or data. This may either be JSON or packed binary. The format is given in the json header
Finally is an optional tail block for error checking or encryption details

### 27.22.4 Header Fields

In UDP header

- \(sh\) = source host
- \(sp\) = source port
- \(dh\) = destination host
- \(dp\) = destination port

In RAET Header

- \(hk\) = header kind
- \(hl\) = header length
- \(vn\) = version number
- \(sd\) = Source Device ID
- \(dd\) = Destination Device ID
- \(cf\) = Corresponder Flag
- \(mf\) = Multicast Flag
- \(si\) = Session ID
- \(ti\) = Transaction ID
- \(sk\) = Service Kind
- \(pk\) = Packet Kind
- \(bf\) = Burst Flag
- \(oi\) = Order Index
- \(dt\) = DateTime Stamp
- \(sn\) = Segment Number
- \(sc\) = Segment Count
- \(pf\) = Pending Segment Flag
- \(af\) = All Flag
- \(nk\) = Auth header kind
- \(nl\) = Auth header length
- \(bk\) = body kind
- \(bl\) = body length
- \(tk\) = tail kind
- \(tl\) = tail length

**fg = flags packed (Flags)** Default ’00’ hex string 2 byte Hex string with bits (0, 0, af, pf, 0, bf, mf, cf) Zeros are TBD flags

### 27.22.5 Session Bootstrap

Minion sends packet with SID of Zero with public key of minions Public Private Key pair Master acks packet with SID of Zero to let minion know it received the request

Some time later Master sends packet with SID of zero that accepts the Minion

Minion

### 27.22.6 Session

Session is important for security. Want one session opened and then multiple transactions within session.

Session ID SID \(sid\)

GUID hash to guarantee uniqueness since no guarantee of nonvolatile storage or require file storage to keep last session ID used.

### 27.22.7 Service Types or Modular Services

Four Service Types

- A) One or more maybe (unacknowledged repeat) maybe means no guarantee
B) Exactly one at most (ack with retries) (duplicate detection idempotent) at most means fixed number of retries has finite probability of failing B1) finite retries B2) infinite retries with exponential back-off up to a maximum delay

C) Exactly one of sequence at most (sequence numbered) Receiver requests retry of missing packet with same B1 or B2 retry type

D) End to End (Application layer Request Response) This is two B sub transactions

Initially unicast messaging Eventually support for Multicast

The use case for C) is to fragment large packets as once a UDP packet exceeds the frame size its reliability goes way down So its more reliable to fragment large packets.

Better approach might be to have more modularity. Services Levels

1) Maybe one or more
   A) Fire and forget no transaction either side
   B) Repeat, no ack, no dupdet repeat counter send side, no transaction on receive side
   C) Repeat, no Ack, dupdet repeat counter send side, dup detection transaction receive side

2) More or Less Once
   A) retry finite, ack no dupdet retry timer send side, finite number of retires ack receive side no dupdet

3) At most Once
   A) retry finite, ack, dupdet retry timer send side, finite number of retires ack receive side dupdet

4) Exactly once
   A) ack retry retry timer send side, ack and duplicate detection receive side Infinite retries with exponential backoff

5) Sequential sequence number
   A) reorder escrow
   B) Segmented packets

6) request response to application layer

Service Features

1) repeats
2) ack retry transaction id
3) sequence number duplicate detection out of order detection sequencing
4) rep-req

Always include transaction id since multiple transactions on same port So get duplicate detection for free if keep transaction alive but if use

A) Maybe one or more B1) At Least One B2) Exactly One C) One of sequence D) End to End
A) Sender creates transaction id for number of repeats but receiver does not keep transaction alive
B1) Sender creates transaction id keeps it for retries. Receiver keeps it to send ack then kills so retry could be duplicate not detected
B2) Sender creates transaction id keeps for retries Receiver keeps tid for acks on any retires so no duplicates.
C) Sender creates TID and Sequence Number. Receiver checks for out of order sequence and can request retry.
D) Application layer sends response. So question is do we keep transaction open or have response be new transaction. No because then we need a rep-req ID so might as well use the same transaction id. Just keep alive until get response. Little advantage to B1 vs B2 not having duplicates.

So 4 service types

A) Maybe one or more (unacknowledged repeat)

B) Exactly One (At most one) (ack with retry) (duplicate detection idempotent)

C) One of Sequence (sequence numbered)

D) End to End

Also multicast or unicast

Modular Transaction Table

**Sender Side:** Transaction ID plus transaction source sender or receiver generated transaction id Repeat Counter Retry Timer Retry Counter (finite retries) Redo Timer (infinite redos with exponential backoff) Sequence number without acks (look for resend requests) Sequence with ack (wait for ack before sending next in sequence) Segmentation

**Receiver Side:** Nothing just accept packet Acknowledge (can delete transaction after acknowledge) No duplicate detection Transaction timeout (keep transaction until timeout) Duplicate detection save transaction id duplicate detection timeout Request resend of missing packet in sequence Sequence reordering with escrow timeout wait escrow before requesting resend Unsegmentation (request resends of missing segment)

### 27.23 SaltStack Git Policy

The SaltStack team follows a git policy to maintain stability and consistency with the repository.

The git policy has been developed to encourage contributions and make contributing to Salt as easy as possible. Code contributors to SaltStack projects DO NOT NEED TO READ THIS DOCUMENT, because all contributions come into SaltStack via a single gateway to make it as easy as possible for contributors to give us code.

The primary rule of git management in SaltStack is to make life easy on contributors and developers to send in code. Simplicity is always a goal!

#### 27.23.1 New Code Entry

All new SaltStack code should be submitted against either the `develop` branch or a point release branch, depending on the nature of the submission. Please see the *Which Salt Branch?* section of Salt’s *Contributing* documentation or the Release Branching section below for more information.

#### 27.23.2 Release Branching

SaltStack maintains two types of releases, Feature Releases and Point Releases (also commonly referred to as Bugfix Releases). A feature release is managed by incrementing the first or second release point number, so 2015.5.5 -> 2015.8.0 signifies a feature release and 2015.8.0 -> 2015.8.1 signifies a point release.
Feature Release Branching

Each feature release is maintained in a dedicated git branch derived from the last applicable release commit on develop. All file changes relevant to the feature release will be completed in the develop branch prior to the creation of the feature release branch. The feature release branch will be named after the relevant numbers to the feature release, which constitute the first two numbers. This means that the release branch for the 2015.8.0 series is named 2015.8.

A feature release branch is created with the following command:

```
# git checkout -b 2015.8  # From the develop branch
# git push origin 2015.8
```

Point Releases

Each point release is derived from its parent release branch. Constructing point releases is a critical aspect of Salt development and is managed by members of the core development team. Point releases comprise bug and security fixes. Bug fixes can be made against a point release branch in one of two ways: the bug fix can be submitted directly against the point release branch, or an attempt can be made to back-port the fix to the point release branch.

Bug fixes should be made against the earliest supported release branch on which the bug is present. The Salt development team regularly merges older point release branches forward into newer point release branches. That way, the bug fixes that are submitted to older release branches can cascade up through all related release branches.

For more information, please see the Which Salt Branch? section of Salt’s Contributing documentation.

Generally point releases are made every 2 months or if there is a security fix they can be made sooner.

The point release is designated by branching (ex 2019.2.1) and then tagging (v2019.2.1) from that newly created release branch when its determined the release is stable. From the tag point a new source tarball is generated and published to PyPI, and a release announcement is made.

27.24 Salt Conventions

27.24.1 Writing Salt Documentation

Salt’s documentation is built using the Sphinx documentation system. It can be built in a large variety of output formats including HTML, PDF, ePUB, and manpage.

All the documentation is contained in the main Salt repository. Speaking broadly, most of the narrative documentation is contained within the https://github.com/saltstack/salt/blob/develop/doc subdirectory and most of the reference and API documentation is written inline with Salt’s Python code and extracted using a Sphinx extension.

Style

The Salt project recommends the IEEE style guide as a general reference for writing guidelines. Those guidelines are not strictly enforced but rather serve as an excellent resource for technical writing questions. The NCBI style guide is another very approachable resource.

Point-of-view

Use third-person perspective and avoid “I”, “we”, “you” forms of address. Identify the addressee specifically e.g., "users should", "the compiler does", etc.
Active voice

Use active voice and present-tense. Avoid filler words.

Title capitalization

Document titles and section titles within a page should follow normal sentence capitalization rules. Words that are capitalized as part of a regular sentence should be capitalized in a title and otherwise left as lowercase. Punctuation can be omitted unless it aids the intent of the title (e.g., exclamation points or question marks).

For example:

---
This is a main heading

Paragraph.

This is an exciting sub-heading!

Paragraph.
---

Serial Commas

According to Wikipedia: In English punctuation, a serial comma or series comma (also called Oxford comma and Harvard comma) is a comma placed immediately before the coordinating conjunction (usually "and", "or", or "nor") in a series of three or more terms. For example, a list of three countries might be punctuated either as "France, Italy, and Spain" (with the serial comma), or as "France, Italy and Spain" (without the serial comma).

When writing a list that includes three or more items, the serial comma should always be used.

Documenting modules

Documentation for Salt’s various module types is inline in the code. During the documentation build process it is extracted and formatted into the final HTML, PDF, etc format.

Inline documentation

Python has special multi-line strings called docstrings as the first element in a function or class. These strings allow documentation to live alongside the code and can contain special formatting. For example:

```python
def my_function(value):
    """
    Upper-case the given value
    Usage:
    .. code-block:: python
        val = 'a string'
        new_val = myfunction(val)
        print(new_val) # 'A STRING'
```

(continues on next page)
Specify a release for additions or changes

New functions or changes to existing functions should include a marker that denotes what Salt release will be affected. For example:

```python
def my_function(value):
    '''
    Upper-case the given value
    .. versionadded:: 2014.7.0
    <...snip...>
    '''
    return value.upper()
```

For changes to a function:

```python
def my_function(value, strip=False):
    '''
    Upper-case the given value
    .. versionchanged:: 2016.3.0
    Added a flag to also strip whitespace from the string.
    <...snip...>
    '''
    if strip:
        return value.upper().strip()
    return value.upper()
```

Adding module documentation to the index

Each module type has an index listing all modules of that type. For example: `execution modules`, `state modules`, `renderer modules`. New modules must be added to the index manually.

1. Edit the file for the module type: `execution modules`, `state modules`, `renderer modules`, etc.
2. Add the new module to the alphabetized list.
3. `Build the documentation` which will generate an `.rst` file for the new module in the same directory as the `index.rst`.
4. Commit the changes to `index.rst` and the new `.rst` file and send a pull request.

Cross-references

The Sphinx documentation system contains a wide variety of cross-referencing capabilities.
Glossary entries

Link to glossary entries using the term role. A cross-reference should be added the first time a Salt-specific term is used in a document.

A common way to encapsulate master-side functionality is by writing a custom :term:`Runner Function`. Custom Runner Functions are easy to write.

Index entries

Sphinx automatically generates many kinds of index entries, but it is occasionally useful to manually add items to the index.

One method is to use the index directive above the document or section that should appear in the index.

Sphinx automatically generates many kinds of index entries, but it is occasionally useful to manually add items to the index.

One method is to use the index directive above the document or section that should appear in the index.

Another method is to use the index role inline with the text that should appear in the index. The index entry is created and the target text is left otherwise intact.

Documents and sections

Each document should contain a unique top-level label of the form:

Unique labels can be linked using the ref role. This allows cross-references to survive document renames or movement.

For more information see :ref:`my-page`.

Note, the :doc: role should not be used to link documents together.

Modules

Cross-references to Salt modules can be added using Sphinx’s Python domain roles. For example, to create a link to the test.ping function:

Salt modules can be referenced as well:
The :py:mod:`test module <salt.modules.test>` contains many useful functions for inspecting an active Salt connection.

The same syntax works for all modules types:

One of the workhorse state module functions in Salt is the :py:func:`file.managed <salt.states.file.managed>` function.

**Settings**

Individual settings in the Salt Master or Salt Minion configuration files are cross-referenced using two custom roles, :conf_master: and :conf_minion:.

The :conf_minion:`minion ID <id>` setting is a unique identifier for a single minion.

**Documentation Changes and Fixes**

Documentation changes and fixes should be made against the earliest supported release branch that the update applies to. The practice of updating a release branch instead of making all documentation changes against Salt’s main, default branch, :dev:`develop`, is necessary in order for the docs to be as up-to-date as possible when the docs are built.

The workflow mentioned above is also in line with the recommendations outlined in Salt’s :contrib:`Contributing` page. You can read more about how to choose where to submit documentation fixes by reading the Salt’s Branch Topology section.

For an explanation of how to submit changes against various branches, see the `Sending a GitHub pull request` section. Specifically, see the section describing how to **Create a new branch** and the steps that follow.

**Building the documentation**

1. Install Sphinx using a system package manager or pip. The package name is often of the form python-sphinx. There are no other dependencies.

2. Build the documentation using the provided Makefile or :bat file on Windows.

   ```
   cd /path/to/salt/doc
   make html
   ```

3. The generated documentation will be written to the doc/_build/<format> directory.

4. A useful method of viewing the HTML documentation locally is to start Python’s built-in HTTP server:

   **Python 3:**

   ```
   cd /path/to/salt/doc/_build/html
   python3 -m http.server
   ```

   **Python 2:**

   ```
   cd /path/to/salt/doc/_build/html
   python -m SimpleHTTPServer
   ```

   Then pull up the documentation in a web browser at http://localhost:8000/.
### 27.24.2 Salt Formulas

Formulas are pre-written Salt States. They are as open-ended as Salt States themselves and can be used for tasks such as installing a package, configuring, and starting a service, setting up users or permissions, and many other common tasks.

All official Salt Formulas are found as separate Git repositories in the "saltstack-formulas" organization on GitHub: https://github.com/saltstack-formulas

As a simple example, to install the popular Apache web server (using the normal defaults for the underlying distro) simply include the `apache-formula` from a top file:

```yaml
base:
  'web*':
    - apache
```

### Installation

Each Salt Formula is an individual Git repository designed as a drop-in addition to an existing Salt State tree. Formulas can be installed in the following ways.

#### Adding a Formula as a GitFS remote

One design goal of Salt's GitFS fileserver backend was to facilitate reusable States. GitFS is a quick and natural way to use Formulas.

1. **Install any necessary dependencies and configure GitFS.**
2. Add one or more Formula repository URLs as remotes in the `gitfs_remotes` list in the Salt Master configuration file:

   ```yaml
gitfs_remotes:
    - https://github.com/saltstack-formulas/apache-formula
    - https://github.com/saltstack-formulas/memcached-formula
   ```

   We strongly recommend forking a formula repository into your own GitHub account to avoid unexpected changes to your infrastructure.

   Many Salt Formulas are highly active repositories so pull new changes with care. Plus any additions you make to your fork can be easily sent back upstream with a quick pull request!
3. Restart the Salt master.

Beginning with the 2018.3.0 release, using formulas with GitFS is now much more convenient for deployments which use many different fileserver environments (i.e. saltenvs). Using the `all_saltenvs` parameter, files from a single git branch/tag will appear in all environments. See [here](#) for more information on this feature.

#### Adding a Formula directory manually

Formulas are simply directories that can be copied onto the local file system by using Git to clone the repository or by downloading and expanding a tarball or zip file of the repository. The directory structure is designed to work with `file_roots` in the Salt master configuration.

1. Clone or download the repository into a directory:
mkdir -p /srv/formulas
cd /srv/formulas
git clone https://github.com/saltstack-formulas/apache-formula.git

# or

mkdir -p /srv/formulas
cd /srv/formulas
wget https://github.com/saltstack-formulas/apache-formula/archive/master.tar.gz
tar xf apache-formula-master.tar.gz

2. Add the new directory to `file_roots`:

```yaml
file_roots:
  base:
    - /srv/salt
    - /srv/formulas/apache-formula
```

3. Restart the Salt Master.

Usage

Each Formula is intended to be immediately usable with sane defaults without any additional configuration. Many formulas are also configurable by including data in Pillar; see the `pillar.example` file in each Formula repository for available options.

Including a Formula in an existing State tree

Formula may be included in an existing `sls` file. This is often useful when a state you are writing needs to `require` or `extend` a state defined in the formula.

Here is an example of a state that uses the `epel-formula` in a `require` declaration which directs Salt to not install the `python26` package until after the EPEL repository has also been installed:

```yaml
include:
  - epel

python26:
  pkg.installed:
    - require:
      - pkg: epel
```

Including a Formula from a Top File

Some Formula perform completely standalone installations that are not referenced from other state files. It is usually cleanest to include these Formula directly from a Top File.

For example the easiest way to set up an OpenStack deployment on a single machine is to include the `openstack-standalone-formula` directly from a `top.sls` file:

```yaml
base:
  'myopenstackmaster':
    - openstack
```
Quickly deploying OpenStack across several dedicated machines could also be done directly from a Top File and may look something like this:

```
base:
  'controller':
    - openstack.horizon
    - openstack.keystone
  'hyper-*':
    - openstack.nova
    - openstack.glance
  'storage-*':
    - openstack.swift
```

**Configuring Formula using Pillar**

Salt Formulas are designed to work out of the box with no additional configuration. However, many Formula support additional configuration and customization through *Pillar*. Examples of available options can be found in a file named `pillar.example` in the root directory of each Formula repository.

**Using Formula with your own states**

Remember that Formula are regular Salt States and can be used with all Salt’s normal state mechanisms. Formula can be required from other States with `require` declarations, they can be modified using `extend`, they can made to watch other states with `The _in versions of requisites`.

The following example uses the stock `apache-formula` alongside a custom state to create a vhost on a Debian/Ubuntu system and to reload the Apache service whenever the vhost is changed.

```
# Include the stock, upstream apache formula.
include:
  - apache

# Use the watch_in requisite to cause the apache service state to reload # apache whenever the my-example-com-vhost state changes.
my-example-com-vhost:
  file:
    - managed
    - name: /etc/apache2/sites-available/my-example-com
      watch_in:
        - service: apache
```

Don’t be shy to read through the source for each Formula!

**Reporting problems & making additions**

Each Formula is a separate repository on GitHub. If you encounter a bug with a Formula please file an issue in the respective repository! Send fixes and additions as a pull request. Add tips and tricks to the repository wiki.

**Writing Formulas**

Each Formula is a separate repository in the `saltstack-formulas` organization on GitHub.
Get involved creating new Formulas

The best way to create new Formula repositories for now is to create a repository in your own account on GitHub and notify a SaltStack employee when it is ready. We will add you to the Contributors team on the saltstack-formulas organization and help you transfer the repository over. Ping a SaltStack employee on IRC (#salt on Freenode), join the #formulas channel on the salt-slack or send an email to the salt-users mailing list.

There are a lot of repositories in that organization! Team members can manage which repositories they are subscribed to on GitHub’s watching page: https://github.com/watching.

Members of the Contributors team are welcome to participate in reviewing pull requests across the Organization. Some repositories will have regular contributors and some repositories will not. As you get involved in a repository be sure to communicate with any other contributors there on pull requests that are large or have breaking changes.

In general it is best to have another Contributor review and merge any pull requests that you open. Feel free to at-mention other regular contributors to a repository and request a review. However, there are a lot of formula repositories so if a repository does not yet have regular contributors or if your pull request has stayed open for more than a couple days feel free to “selfie-merge” your own pull request.

Style

Maintainability, readability, and reusability are all marks of a good Salt sls file. This section contains several suggestions and examples.

```bash
# Deploy the stable master branch unless version overridden by passing
# Pillar at the CLI or via the Reactor.

deploy_myapp:
  git.latest:
    - name: git@github.com/myco/myapp.git
    - version: {{ salt.pillar.get('myapp:version', 'master') }}
```

Use a descriptive State ID

The ID of a state is used as a unique identifier that may be referenced via other states in requisites. It must be unique across the whole state tree (it is a key in a dictionary, after all).

In addition a state ID should be descriptive and serve as a high-level hint of what it will do, or manage, or change. For example, deploy_webapp, or apache, or reload_firewall.

Use module.function notation

So-called ”short-declaration” notation is preferred for referencing state modules and state functions. It provides a consistent pattern of module.function shared between Salt States, the Reactor, Salt Mine, the Scheduler, as well as with the CLI.

```bash
# Do
apache:
  pkg.installed:
    - name: httpd

# Don't
apache:
```
Salt’s state compiler will transform "short-decs" into the longer format when compiling the human-friendly highstate structure into the machine-friendly lowstate structure.

Specify the name parameter

Use a unique and permanent identifier for the state ID and reserve name for data with variability. The name declaration is a required parameter for all state functions. The state ID will implicitly be used as name if it is not explicitly set in the state.

In many state functions the name parameter is used for data that varies such as OS-specific package names, OS-specific file system paths, repository addresses, etc. Any time the ID of a state changes all references to that ID must also be changed. Use a permanent ID when writing a state the first time to future-proof that state and allow for easier refactors down the road.

Comment state files

YAML allows comments at varying indentation levels. It is a good practice to comment state files. Use vertical whitespace to visually separate different concepts or actions.

```
# Start with a high-level description of the current sls file.
# Explain the scope of what it will do or manage.

# Comment individual states as necessary.
update_a_config_file:
  # Provide details on why an unusual choice was made. For example:
  # This template is fetched from a third-party and does not fit our
  # company norm of using Jinja. This must be processed using Mako.
  file.managed:
    - name: /path/to/file.cfg
    - source: salt://path/to/file.cfg.template
    - template: mako

  # Provide a description or explanation that did not fit within the state
  # ID. For example:
  #
  # Update the application's last-deployed timestamp.
  # This is a workaround until Bob configures Jenkins to automate RPM
  # builds of the app.
  cmd.run:
    # FIXME: Joe needs this to run on Windows by next quarter. Switch these
    # from shell commands to Salt's file.managed and file.replace state
    # modules.
    - name: |
      touch /path/to/file_last_updated
      sed -e 's/foo/bar/g' /path/to/file_environment
    - onchanges:
      - file: a_config_file
```

Be careful to use Jinja comments for commenting Jinja code and YAML comments for commenting YAML code.

27.24. Salt Conventions
Easy on the Jinja!

Jinja templating provides vast flexibility and power when building Salt sls files. It can also create an unmaintainable tangle of logic and data. Speaking broadly, Jinja is best used when kept apart from the states (as much as is possible). Below are guidelines and examples of how Jinja can be used effectively.

**Know the evaluation and execution order**

High-level knowledge of how Salt states are compiled and run is useful when writing states. The default renderer setting in Salt is Jinja piped to YAML. Each is a separate step. Each step is not aware of the previous or following step. Jinja is not YAML aware, YAML is not Jinja aware; they cannot share variables or interact.

- Whatever the Jinja step produces must be valid YAML.
- Whatever the YAML step produces must be a valid highstate data structure. (This is also true of the final step for any of the alternate renderers in Salt.)
- Highstate can be thought of as a human-friendly data structure; easy to write and easy to read.
- Salt’s state compiler validates the highstate and compiles it to low state.
- Low state can be thought of as a machine-friendly data structure. It is a list of dictionaries that each map directly to a function call.
- Salt’s state system finally starts and executes on each "chunk" in the low state. Remember that requisites are evaluated at runtime.
- The return for each function call is added to the "running" dictionary which is the final output at the end of the state run.

The full evaluation and execution order:

```
Jinja -> YAML -> Highstate -> low state -> execution
```

**Avoid changing the underlying system with Jinja**

Avoid calling commands from Jinja that change the underlying system. Commands run via Jinja do not respect Salt’s dry-run mode (test=True)! This is usually in conflict with the idempotent nature of Salt states unless the command being run is also idempotent.
Inspect the local system

A common use for Jinja in Salt states is to gather information about the underlying system. The grains dictionary available in the Jinja context is a great example of common data points that Salt itself has already gathered. Less common values are often found by running commands. For example:

```jinja
{% set is_selinux_enabled = salt.cmd.run('sestatus') == '1' %}
```

This is usually best done with a variable assignment in order to separate the data from the state that will make use of the data.

Gather external data

One of the most common uses for Jinja is to pull external data into the state file. External data can come from anywhere like API calls or database queries, but it most commonly comes from flat files on the file system or Pillar data from the Salt Master. For example:

```jinja
{% set some_data = salt.pillar.get('some_data', {'sane default': True}) %}
[# or #]
{% import_yaml 'path/to/file.yaml' as some_data %}
[# or #]
{% import_json 'path/to/file.json' as some_data %}
[# or #]
{% import_text 'path/to/ssh_key.pub' as ssh_pub_key %}
[# or #]
{% from 'path/to/other_file.jinja' import some_data with context %}
```

This is usually best done with a variable assignment in order to separate the data from the state that will make use of the data.

Light conditionals and looping

Jinja is extremely powerful for programatically generating Salt states. It is also easy to overuse. As a rule of thumb, if it is hard to read it will be hard to maintain!

Separate Jinja control-flow statements from the states as much as is possible to create readable states. Limit Jinja within states to simple variable lookups.

Below is a simple example of a readable loop:

```jinja
{% for user in salt.pillar.get('list_of_users', []) %}
[# Ensure unique state IDs when looping. #]
{{ user.name }}-{{ loop.index }}:
  user.present:
    - name: {{ user.name }}
```

(continues on next page)
Avoid putting a Jinja conditionals within Salt states where possible. Readability suffers and the correct YAML indentation is difficult to see in the surrounding visual noise. Parametrization (discussed below) and variables are both useful techniques to avoid this. For example:

```yaml
# ---- Bad example ---- #
apache:
  pkg.installed:
    - name: httpd
    - name: apache2
# ---- Better example ---- #
apache:
  pkg.installed:
    - name: {{ name }}
# ---- Good example ---- #
apache:
  pkg.installed:
    - name: {{ name }}
```

Dictionaries are useful to effectively "namespace" a collection of variables. This is useful with parametrization (discussed below). Dictionaries are also easily combined and merged. And they can be directly serialized into YAML which is often easier than trying to create valid YAML through templating. For example:

```yaml
# ---- Bad example ---- #
haproxy_conf:
  file.managed:
    - name: /etc/haproxy/haproxy.cfg
    - template: jinja
      % if 'external_loadbalancer' in grains.roles %
      - source: salt://haproxy/external_haproxy.cfg
      % elif 'internal_loadbalancer' in grains.roles %
      - source: salt://haproxy/internal_haproxy.cfg
      % endif %
# ---- Better example ---- #
```

(continues on next page)
There is still room for improvement in the above example. For example, extracting into an external file or replacing the if-elif conditional with a function call to filter the correct data more succinctly. However, the state itself is simple and legible, the data is separate and also simple and legible. And those suggested improvements can be made at some future date without altering the state at all!

Avoid heavy logic and programming

Jinja is not Python. It was made by Python programmers and shares many semantics and some syntax but it does not allow for arbitrary Python function calls or Python imports. Jinja is a fast and efficient templating language but the syntax can be verbose and visually noisy.

Once Jinja use within an sls file becomes slightly complicated – long chains of if-elif-elif-else statements, nested conditionals, complicated dictionary merges, wanting to use sets – instead consider using a different Salt renderer, such as the Python renderer. As a rule of thumb, if it is hard to read it will be hard to maintain – switch to a format that is easier to read.
Using alternate renderers is very simple to do using Salt's “she-bang” syntax at the top of the file. The Python renderer must simply return the correct highstate data structure. The following example is a state tree of two sls files, one simple and one complicated.

/srv/salt/top.sls:

```yaml
base:
  '*':
    - common_configuration
    - roles_configuration
```

/srv/salt/common_configuration.sls:

```yaml
common_users:
  user.present:
    - names:
      - larry
      - curly
      - moe
```

/srv/salt/roles_configuration:

```python
#!/py

def run():
    list_of_roles = set()
    
    # This example has the minion id in the form 'web-03-dev'.
    # Easily access the grains dictionary:
    try:
        app, instance_number, environment = __grains__['id'].split('-')
        instance_number = int(instance_number)
    except ValueError:
        app, instance_number, environment = ['Unknown', 0, 'dev']
    list_of_roles.add(app)
    
    if app == 'web' and environment == 'dev':
        list_of_roles.add('primary')
        list_of_roles.add('secondary')
    elif app == 'web' and environment == 'staging':
        if instance_number == 0:
            list_of_roles.add('primary')
        else:
            list_of_roles.add('secondary')
    
    # Easily cross-call Salt execution modules:
    if __salt__['myutils.query_valid_ec2_instance']():
        list_of_roles.add('is_ec2_instance')
    
    return {
        'set_roles_grains': {
            'grains.present': [
                {'name': 'roles'},
                {'value': list(list_of_roles)},
            ],
        },
    }
```
Jinja Macros

In Salt sls files Jinja macros are useful for one thing and one thing only: creating mini templates that can be reused and rendered on demand. Do not fall into the trap of thinking of macros as functions; Jinja is not Python (see above).

Macros are useful for creating reusable, parameterized states. For example:

```jinja
{% macro user_state(state_id, user_name, shell='/bin/bash', groups=[]) %}
  user.present:
    - name: {{ user_name }}
    - shell: {{ shell }}
    - groups: {{ groups | json() }}
{% endmacro %}

{# for user_info in salt.pillar.get('my_users', []) #}
{{ user_state('user_number_' ~ loop.index, **user_info) }}
{% endfor %}
```

Macros are also useful for creating one-off "serializers" that can accept a data structure and write that out as a domain-specific configuration file. For example, the following macro could be used to write a php.ini config file:

```jinja
/srv/salt/php.sls:

php_ini:
  file.managed:
    - name: /etc/php.ini
    - source: salt://php.ini.tmpl
    - template: jinja
    - context:
      php_ini_settings: {{ salt.pillar.get('php_ini', {}) | json() }}
```

```
/srv/pillar/php.sls:

php_ini:
  PHP:
    engine: 'On'
    short_open_tag: 'Off'
    error_reporting: 'E_ALL & ~E_DEPRECATED & ~E_STRICT'
```

```
/srv/salt/php.ini.tmpl:

{% macro php_ini_serializer(data) %}
{% for section_name, name_val_pairs in data.items() %}
  [[[ section_name ]]]
  {% for name, val in name_val_pairs.items() -%}
    {{ name }} = "{{ val }}"
  {% endfor %}
{% endfor %}
{% endmacro %}

; File managed by Salt at <{{ source }}>.
; Your changes will be overwritten.

{{ php_ini_serializer(php_ini_settings) }}
```
Abstracting static defaults into a lookup table

Separate data that a state uses from the state itself to increase the flexibility and reusability of a state.

An obvious and common example of this is platform-specific package names and file system paths. Another example is sane defaults for an application, or common settings within a company or organization. Organizing such data as a dictionary (aka hash map, lookup table, associative array) often provides a lightweight namespace and allows for quick and easy lookups. In addition, using a dictionary allows for easily merging and overriding static values within a lookup table with dynamic values fetched from Pillar.

A strong convention in Salt Formulas is to place platform-specific data, such as package names and file system paths, into a file named `map.jinja` that is placed alongside the state files.

The following is an example from the MySQL Formula. The `grains.filter_by` function performs a lookup on that table using the `os_family` grain (by default).

The result is that the `mysql` variable is assigned to a subset of the lookup table for the current platform. This allows states to reference, for example, the name of a package without worrying about the underlying OS. The syntax for referencing a value is a normal dictionary lookup in Jinja, such as `{{ mysql['service'] }}` or the shorthand `{{ mysql.service }}`.

```jinja
{% set mysql = salt['grains.filter_by']({
    'Debian': {
        'server': 'mysql-server',
        'client': 'mysql-client',
        'service': 'mysql',
        'config': '/etc/mysql/my.cnf',
        'python': 'python-mysqldb',
    },
    'RedHat': {
        'server': 'mysql-server',
        'client': 'mysql',
        'service': 'mysqld',
        'config': '/etc/my.cnf',
        'python': 'MySQL-python',
    },
    'Gentoo': {
        'server': 'dev-db/mysql',
        'client': 'dev-db/mysql',
        'service': 'mysql',
        'config': '/etc/mysql/my.cnf',
        'python': 'dev-python/mysql-python',
    },
}, merge=salt['pillar.get']('mysql:lookup')) %}
```

Values defined in the map file can be fetched for the current platform in any state file using the following syntax:

```jinja
{% from "mysql/map.jinja" import mysql with context %}

mysql-server:
  pkg.installed:
    - name: {{ mysql.server }}
  service.running:
    - name: {{ mysql.service }}
```

3888 Chapter 27. Developing Salt
Organizing Pillar data

It is considered a best practice to make formulas expect all formula-related parameters to be placed under second-level lookup key, within a main namespace designated for holding data for particular service/software/etc, managed by the formula:

```
mysql:
  lookup:
    version: 5.7.11
```

Collecting common values

Common values can be collected into a base dictionary. This minimizes repetition of identical values in each of the lookup_dict sub-dictionaries. Now only the values that are different from the base must be specified by the alternates:

```
map.jinja:

{% set mysql = salt['grains.filter_by']({
    'default': {
        'server': 'mysql-server',
        'client': 'mysql-client',
        'service': 'mysql',
        'config': '/etc/mysql/my.cnf',
        'python': 'python-mysqldb',
    },
    'Debian': {},
    'RedHat': {
        'client': 'mysql',
        'service': 'mysqld',
        'config': '/etc/my.cnf',
        'python': 'MySQL-python',
    },
    'Gentoo': {
        'server': 'dev-db/mysql',
        'client': 'dev-db/mysql',
        'python': 'dev-python/mysql-python',
    },
}, merge=salt['pillar.get']('mysql:lookup'), base='default') %}
```

Overriding values in the lookup table

Allow static values within lookup tables to be overridden. This is a simple pattern which once again increases flexibility and reusability for state files.

The merge argument in filter_by specifies the location of a dictionary in Pillar that can be used to override values returned from the lookup table. If the value exists in Pillar it will take precedence.

This is useful when software or configuration files is installed to non-standard locations or on unsupported platforms. For example, the following Pillar would replace the config value from the call above.
note: Protecting Expansion of Content with Special Characters

When templating keep in mind that YAML does have special characters for quoting, flows, and other special structure and content. When a Jinja substitution may have special characters that will be incorrectly parsed by YAML care must be taken. It is a good policy to use the `yaml_encode` or the `yaml_dquote` Jinja filters:

```jinja
{% set foo = 7.7 %}
{% set bar = none %}
{% set baz = true %}
{% set zap = 'The word of the day is "salty".' %}
{% set zip = "The quick brown fox . . ." %}

foo: {{ foo|yaml_encode }}
bar: {{ bar|yaml_encode }}
baz: {{ baz|yaml_encode }}
zap: {{ zap|yaml_encode }}
zip: {{ zip|yaml_dquote }}
```

The above will be rendered as below:

```yaml
foo: 7.7
bar: null
baz: true
zap: "The word of the day is "salty"."
zip: "The quick brown fox . . ."
```

The `filter_by` function performs a simple dictionary lookup but also allows for fetching data from Pillar and overriding data stored in the lookup table. That same workflow can be easily performed without using `filter_by`; other dictionaries besides data from Pillar can also be used.

```jinja
{% set lookup_table = {...} %}
{% do lookup_table.update(salt.pillar.get('my:custom:data')) %}
```

When to use lookup tables

The `map.jinja` file is only a convention within Salt Formulas. This greater pattern is useful for a wide variety of data in a wide variety of workflows. This pattern is not limited to pulling data from a single file or data source. This pattern is useful in States, Pillar and the Reactor, for example.

Working with a data structure instead of, say, a config file allows the data to be cobbled together from multiple sources (local files, remote Pillar, database queries, etc), combined, overridden, and searched.

Below are a few examples of what lookup tables may be useful for and how they may be used and represented.

**Platform-specific information**

An obvious pattern and one used heavily in Salt Formulas is extracting platform-specific information such as package names and file system paths in a file named `map.jinja`. The pattern is explained in detail above.
Sane defaults

Application settings can be a good fit for this pattern. Store default settings along with the states themselves and keep overrides and sensitive settings in Pillar. Combine both into a single dictionary and then write the application config or settings file.

The example below stores most of the Apache Tomcat server.xml file alongside the Tomcat states and then allows values to be updated or augmented via Pillar. (This example uses the BadgerFish format for transforming JSON to XML.)

```
/srv/salt/tomcat/defaults.yaml:

Server:
  '@port': '8005'
  '@shutdown': SHUTDOWN

GlobalNamingResources:
  Resource:
    '@auth': Container
    '@description': User database that can be updated and saved
    '@factory': org.apache.catalina.users.MemoryUserDatabaseFactory
    '@name': UserDatabase
    '@pathname': conf/tomcat-users.xml
    '@type': org.apache.catalina.UserDatabase

# <...snip...>
```

```
/srv/pillar/tomcat.sls:

appX:
  server_xml_overrides:
    Server:
      Service:
        '@name': Catalina
    Connector:
      '@port': '8009'
      '@protocol': AJP/1.3
      '@redirectPort': '8443'

# <...snip...>
```

```
/srv/salt/tomcat/server_xml.sls:

{% import_yaml 'tomcat/defaults.yaml' as server_xml_defaults %}
{% set server_xml_final_values = salt.pillar.get(
  'appX:server_xml_overrides',
  default=server_xml_defaults,
  merge=True
)%}

appX_server_xml:
  file.serialize:
    - name: /etc/tomcat/server.xml
    - dataset: {{ server_xml_final_values | json() }}
    - formatter: xml_badgerfish

```

The file.serialize state can provide a shorthand for creating some files from data structures. There are also many examples within Salt Formulas of creating one-off "serializers" (often as Jinja macros) that reformat a data structure to a specific config file format. For example, look at the Nginx vhosts states or the php.ini file template.
Environment specific information

A single state can be reused when it is parameterized as described in the section below, by separating the data the state will use from the state that performs the work. This can be the difference between deploying Application X and Application Y, or the difference between production and development. For example:

```
/srv/salt/app/deploy.sls:

{% import_yaml 'app/defaults.yaml' as app_defaults %}

{% set app = app_defaults.get(salt.grains.get('role')) %}

{% do app_defaults.update(salt.pillar.get('myapp', {})) %}

deploy_application:
  git.latest:
    - name: {{ app.repo_url }}
    - version: {{ app.version }}
    - target: {{ app.deploy_dir }}

myco/myapp/deployed:
  event.send:
    - data:
      - version: {{ app.version }}
      - onchanges:
        - git: deploy_application
```

```
/srv/salt/app/defaults.yaml:

appX:
  repo_url: git@github.com/myco/appX.git
  target: /var/www/appX
  version: master

appY:
  repo_url: git@github.com/myco/appY.git
  target: /var/www/appY
  version: v1.2.3.4
```

Single-purpose SLS files

Each sls file in a Formula should strive to do a single thing. This increases the reusability of this file by keeping unrelated tasks from getting coupled together.

As an example, the base Apache formula should only install the Apache httpd server and start the httpd service. This is the basic, expected behavior when installing Apache. It should not perform additional changes such as set the Apache configuration file or create vhosts.

If a formula is single-purpose as in the example above, other formulas, and also other states can include and use that formula with Requisites and Other Global State Arguments without also including undesirable or unintended side-effects.
The following is a best-practice example for a reusable Apache formula. (This skips platform-specific options for brevity. See the full `apache-formula` for more.)

```yaml
# apache/init.sls
apache:
  pkg.installed:
    [...]  
  service.running:
    [...]  

# apache/mod_wsgi.sls
include:
  - apache  
mod_wsgi:
  pkg.installed:
    [...]  
    - require:
      - pkg: apache  

# apache/conf.sls
include:
  - apache  
apache_conf:
  file.managed:
    [...]  
    - watch_in:
      - service: apache  
```

To illustrate a bad example, say the above Apache formula installed Apache and also created a default vhost. The mod_wsgi state would not be able to include the Apache formula to create that dependency tree without also installing the unneeded default vhost.

*Formulas should be reusable.* Avoid coupling unrelated actions together.

**Parameterization**

*Parameterization is a key feature of Salt Formulas* and also for Salt States. Parameterization allows a single Formula to be reused across many operating systems; to be reused across production, development, or staging environments; and to be reused by many people all with varying goals.

Writing states, specifying ordering and dependencies is the part that takes the longest to write and to test. Filling those states out with data such as users or package names or file locations is the easy part. How many users, what those users are named, or where the files live are all implementation details that should be parameterized. This separation between a state and the data that populates a state creates a reusable formula.

In the example below the data that populates the state can come from anywhere – it can be hard-coded at the top of the state, it can come from an external file, it can come from Pillar, it can come from an execution function call, or it can come from a database query. The state itself doesn’t change regardless of where the data comes from. Production data will vary from development data will vary from data from one company to another, however the state itself stays the same.

```yaml
{% set user_list = [
  {'name': 'larry', 'shell': 'bash'},
  {'name': 'curly', 'shell': 'bash'},
]  
```
Configuration

Formulas should strive to use the defaults of the underlying platform, followed by defaults from the upstream project, followed by sane defaults for the formula itself.

As an example, a formula to install Apache should not change the default Apache configuration file installed by the OS package. However, the Apache formula should include a state to change or override the default configuration file.

Pillar overrides

Pillar lookups must use the safe `get()` and must provide a default value. Create local variables using the Jinja `set` construct to increase readability and to avoid potentially hundreds or thousands of function calls across a large state tree.

Any default values used in the Formula must also be documented in the `pillar.example` file in the root of the repository. Comments should be used liberally to explain the intent of each configuration value. In addition, users should be able copy-and-paste the contents of this file into their own Pillar to make any desired changes.
Scripting

Remember that both State files and Pillar files can easily call out to Salt execution modules and have access to all the system grains as well.

```{% if '/storage' in salt['mount.active']() %}
/usr/local/etc/myfile.conf:
  file:
    - symlink
    - target: /storage/myfile.conf
{% endif %}
```

Jinja macros to encapsulate logic or conditionals are discouraged in favor of writing custom execution modules in Python.

Repository structure

A basic Formula repository should have the following layout:

```
foo-formula
|-- foo/
  |-- map.jinja
  |-- init.sls
  `-- bar.sls
|-- CHANGELOG.rst
|-- LICENSE
|-- pillar.example
|-- README.rst
`-- VERSION
```

See also:

template-formula

The template-formula repository has a pre-built layout that serves as the basic structure for a new formula repository. Just copy the files from there and edit them.

**README.rst**

The README should detail each available .sls file by explaining what it does, whether it has any dependencies on other formulas, whether it has a target platform, and any other installation or usage instructions or tips.

A sample skeleton for the README.rst file:

```text
===
foo
===

Install and configure the FOO service.

**NOTE**

See the full `Salt Formulas installation and usage instructions`<https://docs.saltstack.com/en/latest/topics/development/conventions/formulas.html>`_.
```
**Available states**

```
.. contents::
    :local:

```

```
``foo``
-------

Install the ``foo`` package and enable the service.

```
``foo.bar``
--------

Install the ``bar`` package.

**CHANGELOG.rst**

The CHANGELOG.rst file should detail the individual versions, their release date and a set of bullet points for each version highlighting the overall changes in a given version of the formula.

A sample skeleton for the CHANGELOG.rst file:

CHANGELOG.rst:

```python

foo formula
===========

0.0.2 (2013-01-01)
- Re-organized formula file layout
- Fixed filename used for upstart logger template
- Allow for pillar message to have default if none specified
```

**Versioning**

Formula are versioned according to Semantic Versioning, [http://semver.org/](http://semver.org/).

Note: Given a version number MAJOR.MINOR.PATCH, increment the:

1. **MAJOR** version when you make incompatible API changes,
2. **MINOR** version when you add functionality in a backwards-compatible manner, and
3. **PATCH** version when you make backwards-compatible bug fixes.

Additional labels for pre-release and build metadata are available as extensions to the MAJOR.MINOR.PATCH format.

Formula versions are tracked using Git tags as well as the VERSION file in the formula repository. The VERSION file should contain the currently released version of the particular formula.
Testing Formulas

A smoke-test for invalid Jinja, invalid YAML, or an invalid Salt state structure can be performed by with the `state.show_sls` function:

```
salt '* state.show_sls apache
```

Salt Formulas can then be tested by running each `.sls` file via `state.apply` and checking the output for the success or failure of each state in the Formula. This should be done for each supported platform.

27.24.3 SaltStack Packaging Guide

Since Salt provides a powerful toolkit for system management and automation, the package can be split into a number of sub-tools. While packaging Salt as a single package containing all components is perfectly acceptable, the split packages should follow this convention.

Patching Salt For Distributions

The occasion may arise where Salt source and default configurations may need to be patched. It is preferable if Salt is only patched to include platform specific additions or to fix release time bugs. It is preferable that configuration settings and operations remain in the default state, as changes here lowers the user experience for users moving across distributions.

In the event where a packager finds a need to change the default configuration it is advised to add the files to the master.d or minion.d directories.

Source Files

Release packages should always be built from the source tarball distributed via pypi. Release packages should NEVER use a git checkout as the source for distribution.

Single Package

Shipping Salt as a single package, where the minion, master, and all tools are together is perfectly acceptable and practiced by distributions such as FreeBSD.

Split Package

Salt Should always be split in a standard way, with standard dependencies, this lowers cross distribution confusion about what components are going to be shipped with specific packages. These packages can be defined from the Salt Source as of Salt 2014.1.0:

Salt Common

The `salt-common` or `salt` package should contain the files provided by the salt python package, or all files distributed from the `salt/` directory in the source distribution packages. The documentation contained under the `doc/` directory can be a part of this package but splitting out a doc package is preferred. Since salt-call is the entry point to utilize the libs and is useful for all salt packages it is included in the salt-common package.
Name

• salt OR salt-common

Files

• salt/*
• man/salt.7
• scripts/salt-call
• tests/*
• man/salt-call.1

Depends

• Python 2.6-2.7
• PyYAML
• Jinja2

Salt Master

The salt-master package contains the applicable scripts, related man pages and init information for the given platform.

Name

• salt-master

Files

• scripts/salt-master
• scripts/salt
• scripts/salt-run
• scripts/salt-key
• scripts/salt-cp
• pkg/<master init data>
• man/salt.1
• man/salt-master.1
• man/salt-run.1
• man/salt-key.1
• man/salt-cp.1
• conf/master
Depends

- Salt Common
- ZeroMQ >= 3.2
- PyZMQ >= 2.10
- PyCrypto
- M2Crypto
- Python MessagePack (Messagepack C lib, or msgpack-pure)

Salt Syndic

The Salt Syndic package can be rolled completely into the Salt Master package. Platforms which start services as part of the package deployment need to maintain a separate salt-syndic package (primarily Debian based platforms). The Syndic may optionally not depend on the anything more than the Salt Master since the master will bring in all needed dependencies, but fall back to the platform specific packaging guidelines.

Name

- salt-syndic

Files

- scripts/salt-syndic
- pkg/<syndic init data>
- man/salt-syndic.1

Depends

- Salt Common
- Salt Master
- ZeroMQ >= 3.2
- PyZMQ >= 2.10
- PyCrypto
- M2Crypto
- Python MessagePack (Messagepack C lib, or msgpack-pure)

Salt Minion

The Minion is a standalone package and should not be split beyond the salt-minion and salt-common packages.
Name

• salt-minion

Files

• scripts/salt-minion
• pkg/<minion init data>
• man/salt-minion.1
• conf/minion

Depends

• Salt Common
• ZeroMQ >= 3.2
• PyZMQ >= 2.10
• PyCrypto
• M2Crypto
• Python MessagePack (Messagepack C lib, or msgpack-pure)

Salt SSH

Since Salt SSH does not require the same dependencies as the minion and master, it should be split out.

Name

• salt-ssh

Files

• scripts/salt-ssh
• man/salt-ssh.1
• conf/cloud*

Depends

• Salt Common
• Python MessagePack (Messagepack C lib, or msgpack-pure)
Salt Cloud

As of Salt 2014.1.0 Salt Cloud is included in the same repo as Salt. This can be split out into a separate package or it can be included in the salt-master package.

Name

• salt-cloud

Files

• scripts/salt-cloud
• man/salt-cloud.1

Depends

• Salt Common
• apache libcloud >= 0.14.0

Salt Doc

The documentation package is very distribution optional. A completely split package will split out the documentation, but some platform conventions do not prefer this. If the documentation is not split out, it should be included with the Salt Common package.

Name

• salt-doc

Files

• doc/*

Optional Depends

• Salt Common
• Python Sphinx
• Make

27.24.4 Salt Release Process

The goal for Salt projects is to cut a new feature release every six months. This document outlines the process for these releases, and the subsequent bug fix releases which follow.
Feature Release Process

When a new release is ready to be cut, the person responsible for cutting the release will follow the following steps (written using the 2019.2.0 release as an example):

1. Create first public draft of release notes with major features.
2. Remove any deprecations for the upcoming release.
3. Notify salt-users and salt-announce google groups when the feature freeze branch creation will occur so they can try to get their work merged.
4. Create QA test plan. Review features planned for the release and determine if there is sufficient test coverage.
5. Ensure all required features are merged.
6. Complete one last merge forward from the previous branch.
7. Create feature release branch with the name of the release. (ex. fluorine)
8. Create issue to start the process of deprecating for the next feature release.
9. Create jenkins jobs to test the new feature release branch.
10. Inform salt-users and salt-announce google groups feature branch and freeze is complete.
11. Add new feature branch to salt-jenkins repo and the kitchen yaml file.
12. Fix tests failing in jenkins test runs.
13. Finalize QA test plan and add all required tests.
14. Run through a manual test run based off of the head of the feature branch.
15. Convert the feature release branch to the version number. For example (v2019.2) This is based off of the year and month that is planned to release.
16. Migrate both the jenkins test jobs and salt-jenkins repo to the new branch number.
17. Notify salt-users and salt-announce google groups of the new version branch number and migrate any PRs to the new branch.
18. Delete old feature release branch name (ex. fluorine)
19. Update all name references to version number in the docs. For example all fluorine references in the docs needs to be moved to v2019.2.0
20. Create RC release branch. (ex. 2019.2.0.rc)
21. Create new jenkins test jobs with new RC release branch
22. Notify salt-users and salt-announce google groups of the new RC branch.
23. Fix tests failing in jenkins test runs.
24. Review the release notes with major features.
25. Generate the new man pages for the release.
26. Create internal RC tag for testing.
27. Build latest windows, mac, ubuntu, debian and redhat packages.
28. Run manual and package tests against new RC packages.
29. Update release candidate docs with the new version. (ex. 2019.2.0rc1)
30. Push the internal tag live to salt’s repo.
31. Publish release archive to pipi based off tag.
32. Push the RC packages live.
33. Announce new RC to salt-users and salt-announce google groups.
34. Triage incoming issues based on the new RC release.
35. Fix RC issues once they are categorized as a release blocker.
36. Depending on the issues found during the RC process make a decesion on whether to release based off the RC or go through another RC process, repeating the steps starting at ensuring the tests are not failing.
37. If a RC is categorized as stable, build all required packages.
38. Test all release packages.
40. Update installation instructions with new release number at repo.saltstack.com.
41. Update and build docs to include new version (2019.2) as the latest.
42. Pre-announce on salt-users google group that we are about to update our repo.
43. Publish release (v2019.2.0) archive to pipi based off tag.
44. Publish all packages live to repo.
45. Publish the docs.
46. Create release at github
47. Update win-repo-ng with new salt versions.
48. Announce release is live to irc, salt-users, salt-announce and release slack community channel.

**Maintenance and Bugfix Releases**

Once a feature release branch has been cut from develop, the branch moves into a "feature freeze" state. The new release branch enters the merge-forward chain and only bugfixes should be applied against the new branch. Once major bugs have been fixed, a bugfix release can be cut:

1. Ensure all required bug fixes are merged.
2. Inform salt-users and salt-announce we are going to branch for the release.
3. Complete one last merge forward from the previous branch.
4. Create release branch with the version of the release. (ex. 2019.2.1)
5. Create jenkins jobs that test the new release branch.
6. Fix tests failing in jenkins test runs.
7. Run through a manual test run based off of the head of the branch.
8. Generate the new man pages for the release.
9. Create internal tag for testing.(ex v2019.2.1)
10. Build all release packages.
11. Run manual and package tests against new packages.
13. Update and build docs to include new version. (ex. 2019.2.1)
14. Pre-announce on salt-users google groups that we are about to update our repo.
15. Push the internal tag live to salt’s repo.
16. Publish release archive to pypi based off tag.
17. Push the packages live.
18. Publish release (v2019.2.1) archive to pypi based off tag.
19. Publish all packages live to repo.
20. Publish the docs.
21. Create release at github
22. Update win-repo-ng with new salt versions.
23. Announce release is live to irc, salt-users, salt-announce and release slack channel.

For more information about the difference between the develop branch and bugfix release branches, please refer to the Which Salt Branch? section of Salt’s Contributing documentation.

27.24.5 Salt Coding Style

Salt is developed with a certain coding style, while the style is dominantly PEP 8 it is not completely PEP 8. It is also noteworthy that a few development techniques are also employed which should be adhered to. In the end, the code is made to be “Salty”.

Most importantly though, we will accept code that violates the coding style and KINDLY ask the contributor to fix it, or go ahead and fix the code on behalf of the contributor. Coding style is NEVER grounds to reject code contributions, and is never grounds to talk down to another member of the community (There are no grounds to treat others without respect, especially people working to improve Salt)!!

Linting

Most Salt style conventions are codified in Salt’s .testing.pylintrc file. Salt’s pylint file has two dependencies: pylint and saltpylint. You can install these dependencies with pip:

```
pip install pylint
pip install saltpylint
```

The .testing.pylintrc file is found in the root of the Salt project and can be passed as an argument to the pylint program as follows:

```
pylint --rcfile=/path/to/salt/.testing.pylintrc salt/dir/to/lint
```

Note: There are two pylint files in the salt directory. One is the .pylintrc file and the other is the .testing.pylintrc file. The tests that run in Jenkins against GitHub Pull Requests use .testing.pylintrc. The testing.pylintrc file is a little less strict than the .pylintrc and is used to make it easier for contributors to submit changes. The .pylintrc file can be used for linting, but the testing.pylintrc is the source of truth when submitting pull requests.
Variables

Variables should be a minimum of three characters and should provide an easy-to-understand name of the object being represented.

When keys and values are iterated over, descriptive names should be used to represent the temporary variables.

Multi-word variables should be separated by an underscore.

Variables which are two-letter words should have an underscore appended to them to pad them to three characters.

Strings

Salt follows a few rules when formatting strings:

Single Quotes

In Salt, all strings use single quotes unless there is a good reason not to. This means that docstrings use single quotes, standard strings use single quotes etc.:

```python
def foo():
    
    A function that does things
    
    name = 'A name'
    return name
```

Formatting Strings

All strings which require formatting should use the .format string method:

```python
data = 'some text'
moe = '{0} and then some'.format(data)
```

Make sure to use indices or identifiers in the format brackets, since empty brackets are not supported by python 2.6. Please do NOT use printf formatting.

Docstring Conventions

Docstrings should always add a newline, docutils takes care of the new line and it makes the code cleaner and more vertical:

GOOD:

```python
def bar():

    Here lies a docstring with a newline after the quotes and is the salty way to handle it! Vertical code is the way to go!
    
    return
```

BAD:
When adding a new function or state, where possible try to use a `versionadded` directive to denote when the function or state was added.

```python
def new_func(msg=' '):
    '''
    .. versionadded:: 0.16.0
    Prints what was passed to the function.
    
    msg : None
    The string to be printed.
    
    print msg
    
    .. versionchanged:: 0.17.1
    signature : None
    An optional signature.
    
    .. versionadded 0.17.0
    
    print 'Greetings! {0}\n\n{1}'.format(msg, signature)
```

If you are uncertain what version should be used, either consult a core developer in IRC or bring this up when opening your pull request and a core developer will add the proper version once your pull request has been merged. Bugfixes will be available in a bugfix release (i.e. 0.17.1, the first bugfix release for 0.17.0), while new features are held for feature releases, and this will affect what version number should be used in the `versionadded` directive.

Similar to the above, when an existing function or state is modified (for example, when an argument is added), then under the explanation of that new argument a `versionadded` directive should be used to note the version in which the new argument was added. If an argument’s function changes significantly, the `versionchanged` directive can be used to clarify this:

```python
def new_func(msg=' ', signature=' '):
    '''
    .. versionadded:: 0.16.0
    Prints what was passed to the function.
    
    msg : None
    The string to be printed. Will be prepended with 'Greetings! '
    
    .. versionchanged:: 0.17.1
    
    signature : None
    An optional signature.
    
    .. versionadded 0.17.0
    
    print 'Greetings! {0}\n\n{1}'.format(msg, signature)
```

**Dictionaries**

Dictionaries should be initialized using `{}` instead of `dict()`.

See [here](#) for an in-depth discussion of this topic.

**Imports**

Salt code prefers importing modules and not explicit functions. This is both a style and functional preference. The functional preference originates around the fact that the module import system used by pluggable modules will
include callable objects (functions) that exist in the direct module namespace. This is not only messy, but may unintentionally expose code python libs to the Salt interface and pose a security problem.

To say this more directly with an example, this is **GOOD**:

```python
import os
def minion_path():
    path = os.path.join(self.opts['cachedir'], 'minions')
    return path
```

This on the other hand is **DISCOURAGED**:

```python
from os.path import join
def minion_path():
    path = join(self.opts['cachedir'], 'minions')
    return path
```

The time when this is changed is for importing exceptions, generally directly importing exceptions is preferred:

This is a good way to import exceptions:

```python
from salt.exceptions import CommandExecutionError
```

### Absolute Imports

Although **absolute imports** seems like an awesome idea, please do not use it. Extra care would be necessary all over salt’s code in order for absolute imports to work as supposed. Believe it, it has been tried before and, as a tried example, by renaming `salt.modules.sysmod` to `salt.modules.sys`, all other salt modules which needed to import `sys` would have to also import `absolute_import`, which should be avoided.

**Note**: An exception to this rule is the `absolute_import` from `__future__` at the top of each file within the Salt project. This import is necessary for Py3 compatibility. This particular import looks like this:

```python
from __future__ import absolute_import
```

This import is required for all new Salt files and is a good idea to add to any custom states or modules. However, the practice of avoiding absolute imports still applies to all other cases as to avoid a name conflict.

### Vertical is Better

When writing Salt code, vertical code is generally preferred. This is not a hard rule but more of a guideline. As PEP 8 specifies, Salt code should not exceed 79 characters on a line, but it is preferred to separate code out into more newlines in some cases for better readability:

```python
import os
os.chmod(os.path.join(self.opts['sock_dir'], 'minion_event_pub.ipc'), 448)
```
Where there are more line breaks, this is also apparent when constructing a function with many arguments, something very common in state functions for instance:

```python
def managed(name,
             source=None,
             source_hash='',
             user=None,
             group=None,
             mode=None,
             template=None,
             makedirs=False,
             context=None,
             replace=True,
             defaults=None,
             saltenv=None,
             backup=''
             **kwargs):
```

**Note:** Making function and class definitions vertical is only required if the arguments are longer than 80 characters. Otherwise, the formatting is optional and both are acceptable.

**Line Length**

For function definitions and function calls, Salt adheres to the PEP-8 specification of at most 80 characters per line. Non function definitions or function calls, please adopt a soft limit of 120 characters per line. If breaking the line reduces the code readability, don’t break it. Still, try to avoid passing that 120 characters limit and remember, vertical is better... unless it isn’t

**Indenting**

Some confusion exists in the python world about indenting things like function calls, the above examples use 8 spaces when indenting comma-delimited constructs.

The confusion arises because the pep8 program INCORRECTLY flags this as wrong, where PEP 8, the document, cites only using 4 spaces here as wrong, as it doesn’t differentiate from a new indent level.

Right:

```python
def managed(name,
             source=None,
             source_hash='',
             user=None)
```

WRONG:

```python
def managed(name,
             source=None,
             source_hash='',
             user=None)
```

Lining up the indent is also correct:
```python
def managed(name, 
            source=None, 
            source_hash='', 
            user=None)
```

This also applies to function calls and other hanging indents.

pep8 and Flake8 (and, by extension, the vim plugin Syntastic) will complain about the double indent for hanging indents. This is a known conflict between pep8 (the script) and the actual PEP 8 standard. It is recommended that this particular warning be ignored with the following lines in ~/.config/flake8:

```ini
[flake8]
ignore = E226,E241,E242,E126
```

Make sure your Flake8/pep8 are up to date. The first three errors are ignored by default and are present here to keep the behavior the same. This will also work for pep8 without the Flake8 wrapper – just replace all instances of ‘flake8’ with ‘pep8’, including the filename.

**Code Churn**

Many pull requests have been submitted that only churn code in the name of PEP 8. Code churn is a leading source of bugs and is strongly discouraged. While style fixes are encouraged they should be isolated to a single file per commit, and the changes should be legitimate, if there are any questions about whether a style change is legitimate please reference this document and the official PEP 8 ([http://legacy.python.org/dev/peps/pep-0008/](http://legacy.python.org/dev/peps/pep-0008/)) document before changing code. Many claims that a change is PEP 8 have been invalid, please double check before committing fixes.

### 27.25 Salt code and internals

Reference documentation on Salt’s internal code.

#### 27.25.1 Contents

- salt.aggregation
- salt.utils.aggregation

This library makes it possible to introspect dataset and aggregate nodes when it is instructed.

**Note:** The following examples with be expressed in YAML for convenience's sake:

- !aggr-scalar will refer to Scalar python function
- !aggr-map will refer to Map python object
- !aggr-seq will refer for Sequence python object

**How to instructs merging**

This yaml document has duplicate keys:
but tagged values instruct Salt that overlapping values they can be merged together:

```
foo: !aggr-seq [first, second]
bar: !aggr-map {first: foo, second: bar}
baz: !aggr-seq [42]
```

**Default merge strategy is keep untouched**

For example, this yaml document still has duplicate keys, but does not instruct aggregation:

```
foo: first
foo: second
bar: {first: foo}
bar: {second: bar}
baz: 42
```

So the late found values prevail:

```
foo: second
bar: {second: bar}
baz: 42
```

**Limitations**

Aggregation is permitted between tagged objects that share the same type. If not, the default merge strategy prevails.

For example, these examples:

```
foo: {first: value}
foo: !aggr-map {second: value}
bar: !aggr-map {first: value}
bar: 42
baz: !aggr-seq [42]
baz: [fail]
qux: 42
qux: !aggr-scalar fail
```

are interpreted like this:

```
foo: !aggr-map{second: value}
bar: 42
baz: [fail]
qux: !aggr-seq [fail]
```
Introspection

TODO: write this part

```python
def aggregate(obj_a, obj_b, level=False, map_class=salt.utils.aggregation.Map, sequence_class=salt.utils.aggregation.Sequence):
    Merge obj_b into obj_a.
```

```python
>>> aggregate('first', 'second', True) == ['first', 'second']
True
```

```python
class salt.utils.aggregation.Aggregate
    Aggregation base.

class salt.utils.aggregation.Map
    Map aggregation.

class salt.utils.aggregation.Scalar(obj)
    Shortcut for Sequence creation
```

```python
>>> Scalar('foo') == Sequence(['foo'])
True
```

```python
class salt.utils.aggregation.Sequence
    Sequence aggregation.
```

Exceptions

Salt-specific exceptions should be thrown as often as possible so the various interfaces to Salt (CLI, API, etc) can handle those errors appropriately and display error messages appropriately.

```python
salt.exceptions
    This module is a central location for all salt exceptions
```

```python
salt.exceptions
    This module is a central location for all salt exceptions
```

```python
exception salt.exceptions.ArgumentValueError(message=", info=None)
    Used when an invalid argument was passed to a command execution

exception salt.exceptions.AuthenticationError(message=")
    If sha256 signature fails during decryption

exception salt.exceptions.AuthorizationError(message=")
    Thrown when runner or wheel execution fails due to permissions

exception salt.exceptions.CheckError(message=", info=None)
    Used when a check fails

exception salt.exceptions.CommandExecutionError(message=", info=None)
    Used when a module runs a command which returns an error and wants to show the user the output gracefully instead of dying

exception salt.exceptions.CommandNotFoundError(message=")
    Used in modules or grains when a required binary is not available
```
exception salt.exceptions.EauthAuthenticationError(message="")
   Thrown when eauth authentication fails

exception salt.exceptions.FileLockError(message, time_start=None, *args, **kwargs)
   Used when an error occurs obtaining a file lock

exception salt.exceptions.FileserverConfigError(message="")
   Used when invalid fileserver settings are detected

exception salt.exceptions.GitLockError(errno, message, *args, **kwargs)
   Raised when an uncaught error occurs in the midst of obtaining an update/checkout lock in salt.utils.gitfs.
   NOTE: While this uses the errno param similar to an OSError, this exception class is not a subclass of OSError.
   This is done intentionally, so that this exception class can be caught in a try/except without being caught as
   an OSError.

exception salt.exceptions.GitRemoteError(message="")
   Used by GitFS to denote a problem with the existence of the "origin" remote or part of its configuration

exception salt.exceptions.InvalidConfigError(message="", info=None)
   Used when the config is invalid

exception salt.exceptions.InvalidEntityError(message="", info=None)
   Used when an entity fails validation

exception salt.exceptions.LoaderError(message="")
   Problems loading the right renderer

exception salt.exceptions.MasterExit
   Rise when the master exits

exception salt.exceptions.MinionError(message="")
   Minion problems reading uris such as salt:// or http://

exception salt.exceptions.MissingSmb(message="")
   Raised when no smb library is found.

exception salt.exceptions.NotImplemented(message="")
   Used when a module runs a command which returns an error and wants to show the user the output gracefully
   instead of dying

exception salt.exceptions.PkgParseError(message="")
   Used when of the pkg modules cannot correctly parse the output from the CLI tool (pacman, yum, apt, aptitude,
   etc)

exception salt.exceptions.PublishError(message="")
   Problems encountered when trying to publish a command

exception salt.exceptions.SaltCacheError(message="")
   Thrown when a problem was encountered trying to read or write from the salt cache

exception salt.exceptions.SaltClientError(message="")
   Problem reading the master root key

exception salt.exceptions.SaltClientTimeout(message, jid=None, *args, **kwargs)
   Thrown when a job sent through one of the Client interfaces times out
   Takes the jid as a parameter

exception salt.exceptions.SaltCloudConfigError(message="")
   Raised when a configuration setting is not found and should exist.

exception salt.exceptions.SaltCloudException(message="")
   Generic Salt Cloud Exception
exception `salt.exceptions.SaltCloudExecutionFailure(message=”)`  
Raised when too much failures have occurred while querying/waiting for data.

exception `salt.exceptions.SaltCloudExecutionTimeout(message=”)`  
Raised when too much time has passed while querying/waiting for data.

exception `salt.exceptions.SaltCloudNotFoundException(message=”)`  
Raised when some cloud provider function cannot find what’s being searched.

exception `salt.exceptions.SaltCloudPasswordError(message=”)`  
Raise when virtual terminal password input failed

exception `salt.exceptions.SaltCloudSystemExit(message, exit_code=1)`  
This exception is raised when the execution should be stopped.

exception `salt.exceptions.SaltConfigurationError(message=”)`  
Configuration error

exception `salt.exceptions.SaltDaemonNotRunning(message=”)`  
Throw when a running master/minion/syndic is not running but is needed to perform the requested operation (e.g., eauth).

exception `salt.exceptions.SaltException(message=”)`  
Base exception class; all Salt-specific exceptions should subclass this

pack()  
Pack this exception into a serializable dictionary that is safe for transport via msgpack

exception `salt.exceptions.SaltInvocationError(message=”)`  
Used when the wrong number of arguments are sent to modules or invalid arguments are specified on the command line

exception `salt.exceptions.SaltMasterError(message=”)`  
Problem reading the master root key

exception `salt.exceptions.SaltMasterUnresolvableError(message=”)`  
Problem resolving the name of the Salt master

exception `salt.exceptions.SaltNoMinionsFound(message=”)`  
An attempt to retrieve a list of minions failed

exception `salt.exceptions.SaltRenderError(message, line_num=None, buf=”<======================”, marker=’--------------‘, trace=None)`  
Used when a render needs to raise an explicit error. If a line number and buffer string are passed, get_context will be invoked to get the location of the error.

exception `salt.exceptions.SaltReqTimeoutError(message=”)`  
Thrown when a salt master request call fails to return within the timeout

exception `salt.exceptions.SaltRunnerError(message=”)`  
Problem in runner

exception `salt.exceptions.SaltSyndicMasterError(message=”)`  
Problem while proxying a request in the syndication master

exception `salt.exceptions.SaltSystemExit(code=0, msg=None)`  
This exception is raised when an unsolvable problem is found. There’s nothing else to do, salt should just exit.

exception `salt.exceptions.SaltWheelError(message=”)`  
Problem in wheel

exception `salt.exceptions.TemplateError(message=”)`  
Used when a custom error is triggered in a template
**exception** salt.exceptions.TimedProcTimeoutError(*message=*"")
Thrown when a timed subprocess does not terminate within the timeout, or if the specified timeout is not an int or a float

**exception** salt.exceptions.TimeoutError(*message=*"")
Thrown when an operation cannot be completed within a given time limit.

**exception** salt.exceptions.TokenAuthenticationError(*message=*"")
Thrown when token authentication fails

**exception** salt.exceptions.VMwareApiError(*message=", info=None*)
Used when representing a generic VMware API error

**exception** salt.exceptions.VMwareConnectionError(*message=", info=None*)
Used when the client fails to connect to a either a VMware vCenter server or to a ESXi host

**exception** salt.exceptions.VMwareFileNotFoundException(*message=", info=None*)
Used when representing a generic VMware error if a file not found

**exception** salt.exceptions.VMwareMultipleObjectsError(*message=", info=None*)
Used when multiple objects were retrieved (and one was expected)

**exception** salt.exceptions.VMwareNotFoundError(*message=", info=None*)
Used when a VMware object was not found

**exception** salt.exceptions.VMwareObjectExistsError(*message=", info=None*)
Used when a VMware object already exists

**exception** salt.exceptions.VMwareObjectNotFoundError(*message=", info=None*)
Used when a VMware object was not found

**exception** salt.exceptions.VMwareObjectRetrievalError(*message=", info=None*)
Used when a VMware object cannot be retrieved

**exception** salt.exceptions.VMwarePowerOnError(*message=", info=None*)
Used when error occurred during power on

**exception** salt.exceptions.VMwareRuntimeError(*message=", info=None*)
Used when a runtime error is encountered when communicating with the vCenter

**exception** salt.exceptions.VMwareSaltError(*message=", info=None*)
Used when a VMware object cannot be retrieved

**exception** salt.exceptions.VMwareSystemError(*message=", info=None*)
Used when representing a generic VMware system error

**exception** salt.exceptions.VMwareVmCreationError(*message=", info=None*)
Used when a configuration parameter is incorrect

**exception** salt.exceptions.VMwareVmRegisterError(*message=", info=None*)
Used when a configuration parameter is incorrect

salt.exceptions.get_error_message(*error*)
Get human readable message from Python Exception

---

### The Salt Fileserver and Client

### Introduction

Salt has a modular fileserver, and multiple client classes which are used to interact with it. This page serves as a developer’s reference, to help explain how the fileserver and clients both work.
Fileserver

The fileserver is not a daemon, so the fileserver and client are not a true server and client in the traditional sense. Instead, the fileserver is simply a class (``salt.fileserver.Fileserver``), located in `salt/fileserver/__init__.py`. This class has access to the configured fileserver backends via a loader instance, referenced as `self.servers`. When a request comes in from the fileclient, it will ultimately result in a `Fileserver` class function being run.

The functions in this class will run corresponding functions in the configured fileserver backends to perform the requested action. So, in summary:

1. A fileclient class makes a request...
2. which triggers the fileserver to run a function...
3. which runs a named function in each of the configured backends.

Not all of the functions will always execute on every configured backend. For instance, the `find_file` function in the fileserver will stop when it finds a match, so if it finds a match for the desired path in the first configured backend, it won’t proceed and try to find the file in the next backend in the list.

Additionally, not all backends implement all functions in the `salt.fileserver.Fileserver` class. For instance, there is a function called `update`, which exists to update remote fileservers such as the `git`, `hg`, and `svn` backends. This action has no use however in the `roots` backend, so it is simply not implemented there, and thus the `roots` backend will be skipped if the `update` function is run on the fileserver.

Backends for the fileserver are located in `salt/fileserver/` (the files not named `__init__.py`).

Fileclient

There are three fileclient classes:

**salt.fileclient.RemoteClient**

This client is used when `file_client` is set to `remote`. This is how minions request files from the master.

Functions in this client will craft a payload and send it to the master via the transport channel. This is the same way that the minion asks the minion to do other things, such as updating and requesting data from the mine. The payload will be a dictionary with a key called `cmd`, and other values as needed.

Payloads sent via the transport channel are processed by an MWorker instance on the master, and the MWorker’s `_handle_aes()` function will execute the command. The command will be a function attribute of the `salt.master.AESFuncs` class. The AESFuncs class’ `_setup_fileserver()` function instantiates a `salt.fileserver.Fileserver` instance and maps its member functions to AESFuncs attributes. This is what makes the fileserver functions available remotely. The result of the function is returned back through the transport channel to the minion.

Transporting files is done in chunks, the size of which is decided by the `file_buffer_size` config option. If you look at the `serve_file()` function in any of the fileserver backends, you can see how the `loc` value in the payload determines the offset so that an intermediate chunk of the file can be served. The RemoteClient’s `get_file()` function will loop until the end of the file is reached, retrieving one chunk at a time.

**salt.fileclient.FSClient**

This client is used when `file_client` is set to `local`. This is how masterless minions request files.
This class inherits from the RemoteClient, but instead of using a transport channel (zmq, tcp, etc.), it uses a "fake" transport channel (salt.fileserver.FSChan), which implements its own send() function. Thus, when a function that the FSClient inherits from the RemoteClient runs self.channel.send(), it's actually calling salt.fileserver.FSChan.send(), which calls corresponding functions in the salt.fileserver.Fileserver() class. The result is that local file requests use the same code as remote file requests, they just bypass sending them through an actual transport channel and instead call them on the FSChan’s Fileserver instance.

salt.fileclient.LocalClient

This client is now used exclusively by Pillar. This used to be used when file_client was set to local, but the FSChan class was written to allow minions with file_client: local to access the full set of backends. This class will probably be renamed at some point as it is often confused with salt.client.LocalClient.

The cp Module

Most of the user-facing interaction with the fileclient happens via the cp module. The functions in this module instantiate a fileclient instance (if one is not already saved to the __context__ dunder) and run fileclient functions.

Updating the Fileserver

The master daemon spawns a process dedicated to routine maintenance tasks upon startup. This process runs an instance of salt.master.Maintenance, which loops forever, running a series of functions and then sleeping for a length of time determined by the loop_interval config option. One of the maintenance tasks is to update the fileserver, and it essentially runs salt.fileserver.Fileserver.update(), which as we know from above will run all configured backends’ update() functions, if present. This is now remote fileservers like git, hg, and svn stay up-to-date.

For the local file_client (FSClient), since it does not interact with the master, upon spawning of its FSChan it will update the fileserver.

Salt opts dictionary

It is very common in the Salt codebase to see opts referred to in a number of contexts.

For example, it can be seen as __opts__ in certain cases, or simply as opts as an argument to a function in others.

Simply put, this data structure is a dictionary of Salt’s runtime configuration information that’s passed around in order for functions to know how Salt is configured.

When writing Python code to use specific parts of Salt, it may become necessary to initialize a copy of opts from scratch in order to have it available for a given function.

To do so, use the utility functions available in salt.config.

As an example, here is how one might generate and print an options dictionary for a minion instance:

```python
import salt.config
opts = salt.config.minion_config('/etc/salt/minion')
print(opts)
```

To generate and display opts for a master, the process is similar:
Unicode in Salt

Though Unicode handling in large projects can often be complex, Salt adheres to several basic rules to help developers handle Unicode correctly.

(For a basic introduction to this problem, see Ned Batchelder's excellent introduction to the topic <http://nedbatchelder.com/text/unipain/unipain.html>.

Salt’s basic workflow for Unicode handling is as follows:

1) Salt should convert whatever data is passed on CLI/API to Unicode. Internally, everything that Salt does should be Unicode unless it is printing to the screen or writing to storage.

2) Modules and various Salt pluggable systems use incoming data assuming Unicode.
   2.1) For Salt modules that query an API; the module should convert the data received from the API into Unicode.
   2.2) For Salt modules that shell out to get output; the module should convert data received into Unicode. (This does not apply if using the cmd execution module, which should handle this for you.
   2.3) For Salt modules which print directly to the console (not via an outputter) or which write directly to disk, a string should be encoded when appropriate. To handle this conversion, the global variable __salt_system_encoding__ is available, which declares the locale of the system that Salt is running on.

3) When a function in a Salt module returns a string, it should return a unicode type in Python 2.

4) When Salt delivers the data to an outputter or a returner, it is the job of the outputter or returner to encode the Unicode before displaying it on the console or writing it to storage.

27.26 Salt Community Projects

This page contains links to Salt-related projects created by community members. If you come across a useful project please add it to the list!

27.26.1 Hubblestack

Hubble is a modular, open-source security compliance framework built on top of SaltStack. The project provides on-demand profile-based auditing, real-time security event notifications, automated remediation, alerting and reporting.

http://hubblestack.io/

27.26.2 alkali

alkali is a collections of SaltStack states and pillar data that provide just the basics for provisioning Linux instances that may be built upon. alkali is a starter kit of sorts, to help new users to SaltStack get up-and-running quickly with the most commonly used, core packages.

https://github.com/zulily/alkali
27.26.3 buoyant

buoyant leverages docker to provide an alternative to VM-centric SaltStack development environments. buoyant containers may be spun up nearly instantly, once an initial docker image has been built.

https://github.com/zulily/buoyant

27.26.4 Salt Sandbox

Salt Sandbox is a multi-VM Vagrant-based Salt development environment used for creating and testing new Salt state modules outside of your production environment. It’s also a great way to learn firsthand about Salt and its remote execution capabilities.

https://github.com/elasticdog/salt-sandbox

27.26.5 Salt Vagrant Demo

A Salt Demo using Vagrant.

https://github.com/UtahDave/salt-vagrant-demo
See the version numbers page for more information about the version numbering scheme.

### 28.1 Latest Branch Release

Release Candidate

### 28.2 Previous Releases

#### 28.2.1 Salt 2019.2.0 Release Notes - Codename Fluorine

**Python 2.7 Deprecation**

In light of Python 2.7 reaching its End of Life (EOL) on Jan 1st 2020, Python 2 will be deprecated from SaltStack no earlier than the Sodium release, that is either the Sodium release or a later release. This decision is pending further community discussion.

**Non-Backward-Compatible Change to YAML Renderer**

In earlier releases, this was considered valid usage in Python 2, assuming that data was a list or dictionary containing keys/values which are *unicode* types:

```
/etc/foo.conf:
  file.managed:
    - source: salt://foo.conf.jinja
    - template: jinja
    - context:
      data: {{ data }}
```

One common use case for this is when using one of Salt's *custom Jinja filters* which return lists or dictionaries, such as the *ipv4* filter.

In Python 2, Jinja will render the *unicode* string types within the list/dictionary with the "u" prefix (e.g. `{u'foo': u'bar'}`). While not valid YAML, earlier releases would successfully load these values.

As of this release, the above SLS would result in an error message. To allow for a data structure to be dumped directly into your SLS file, use the *tojson Jinja filter*:
/etc/foo.conf:
    file.managed:
      - source: salt://foo.conf.jinja
      - template: jinja
      - context:
          data: {{ data|tojson }}

Another example where the new filter needs to be used is the following state example:

grafana_packages:
  pkg.installed:
    - names: {{ server.pkgs }}

This will fail when pkgs is a list or dictionary. You will need to update the state:

grafana_packages:
  pkg.installed:
    - names: {{ server.pkgs|tojson }}

This test case has also been tested with the yaml and json filters successfully.

---

Note: This filter was added in Jinja 2.9. However, fear not! The 2018.3.3 release added a tojson filter which will be used if this filter is not already present, making it available on platforms like RHEL 7 and Ubuntu 14.04 which provide older versions of Jinja.

---

Important: The json_encode_dict and json_encode_list filters do not actually dump the results to JSON. Since tojson accomplishes what those filters were designed to do, they are now deprecated and will be removed in the Neon release. The tojson filter should be used in all cases where json_encode_dict and json_encode_list would have been used.

---

Ansible Playbook State and Execution Modules

Along with the including the ansible modules in the Oxygen release, running playbooks has been added in 2019.2.0 with the playbooks function. This also includes an ansible playbooks state module which can be used on a targeted host to run ansible playbooks, or used in an orchestration state runner.

install nginx:
  ansible.playbooks:
    - name: install.yml
    - git_repo: git://github.com/gtmanfred/playbook.git
    - git_kwargs:
        rev: master

The playbooks modules also includes the ability to specify a git repo to clone and use, or a specific directory can to used when running the playbook.

Network Automation

Beginning with this release, Salt provides much broader support for a variety of network operating systems, and features for configuration manipulation or operational command execution.
NetBox

Added in the previous release, 2018.3.0, the capabilities of the netbox Execution Module have been extended, with a much longer list of available features:

- `netbox.create_circuit`
- `netbox.create_circuit_provider`
- `netbox.create_circuit_termination`
- `netbox.create_circuit_type`
- `netbox.create_device`
- `netbox.create_device_role`
- `netbox.create_device_type`
- `netbox.create_interface`
- `netbox.create_interface_connection`
- `netbox.create_inventory_item`
- `netbox.create_ipaddress`
- `netbox.create_manufacturer`
- `netbox.create_platform`
- `netbox.create_site`
- `netbox.delete_interface`
- `netbox.delete_inventory_item`
- `netbox.delete_ipaddress`
- `netbox.get_circuit_provider`
- `netbox.get_interfaces`
- `netbox.get_ipaddresses`
- `netbox.make_interface_child`
- `netbox.make_interface_lag`
- `netbox.openconfig_interfaces`
- `netbox.openconfig_lacp`
- `netbox.update_device`
- `netbox.update_interface`

Besides this Execution Module, Salt users can load data directly from NetBox into the device Pillar, via the `netbox` External Pillar module.

Netmiko

Netmiko, the multi-vendor library to simplify Paramiko SSH connections to network devices, is now officially integrated into Salt. The network community can use it via the `netmiko` Proxy Module or directly from any Salt Minions, passing the connection credentials - see the documentation for the `netmiko` Execution Module.
Arista

Arista switches can now be managed running under the `pyeapi` Proxy Module, and execute RPC requests via the `pyeapi` Execution Module.

Cisco Nexus

While support for SSH-based operations has been added in the release codename Carbon (2016.11), the new `nxos_api` Proxy Module and `nxos_api` allow management of Cisco Nexus switches via the NX-API.

It is important to note that these modules don’t have third party dependencies, therefore they can be used straight away from any Salt Minion. This also means that the user may be able to install the regular Salt Minion on the Nexus switch directly and manage the network devices like a regular server.

General-purpose Modules

The new `ciscoconfparse` Execution Module can be used for basic configuration parsing, audit or validation for a variety of network platforms having Cisco IOS style configuration (one space indentation), as well as brace-delimited configuration style.

The `iosconfig` can be used for various configuration manipulation for Cisco IOS style configuration, such as: `configuration cleanup`, `tree representation of the config`, etc.

NAPALM

Commit At and Commit Confirmed

Beginning with this release, NAPALM users are able to execute scheduled commits (broadly known as "commit at") and "commit confirmed" (revert the configuration change unless the user confirms by running another command). These features are available via the `commit_in`, `commit_at`, `revert_in`, or `revert_at` arguments for the `net.load_config` and `net.load_template` execution functions, or `netconfig.managed`.

The counterpart execution functions `net.confirm_commit`, or `net.cancel_commit`, as well as the State functions `netconfig.commit_cancelled`, or `netconfig.commit_confirmed` can be used to confirm or cancel a commit.

Please note that the commit confirmed and commit cancelled functionalities are available for any platform whether the network devices supports the features natively or not. However, be cautious and make sure you read and understand the caveats before using them in production.

Multiple Templates Rendered Simultaneously

The `template_name` argument of the `net.load_template` Execution and `netconfig.managed` State function now supports a list of templates. This is particularly useful when a very large Jinja template is split into multiple smaller and easier to read templates that can eventually be reused in other States. For example, the following syntax is not correct to manage the configuration of NTP and BGP simultaneously, using two different templates and changing the device configuration through one single commit:

```
manage_bgp_and_ntp:
  netconfig.managed:
    - template_name:
```

(continues on next page)
Connection Re-establishment on Demand

Beginning with this release, any NAPALM command executed when running under a NAPALM Proxy Minion supports the `force_reconnect` magic argument.

Proxy Minions generally establish a connection with the remote network device at the time of the Minion startup and that connection is going to be used forever.

If one would need to execute a command on the device but is connecting using different parameters (due to various causes, e.g., unable to authenticate the user specified in the Pillar as the authentication system - say TACACS+ is not available, or the DNS resolver is currently down and would like to temporarily use the IP address instead, etc.), it implies updating the Pillar data and restarting the Proxy Minion process restart. In particular cases like that, you can pass the `force_reconnect=True` keyword argument, together with the alternative connection details, to enforce the command to be executed over a separate connection.

For example, if the usual command is `salt '*' net.arp`, you can use the following to connect using a different username instead:

```
salt '*' net.arp username=my-alt-usr force_reconnect=True
```

The same goes with any of the other configuration arguments required for the NAPALM connection - see `NAPALM proxy documentation`.

Configuration Replace Features

To replace various configuration chunks, you can use the new `net.replace_pattern` execution function, or the `netconfig.replace_pattern` State function. For example, if you want to update your configuration and rename a BGP policy referenced in many places, you can do so by running:

```
salt '*' net.replace_pattern OLD-POLICY-CONFIG new-policy-config
```

Similarly, you can also replace entire configuration blocks using the `net.blockreplace` function.

Configuration Save Features

The `net.save_config` function can be used to save the configuration of the managed device into a file. For the State subsystem, the `netconfig.saved` function has been added which provides a complete list of facilities when managing the target file where the configuration of the network device can be saved.

For example, backup the running configuration of each device under its own directory tree:

```
/var/backups/{{ opts.id }}/running.cfg:
    - source: running
    - makedirs: true
```
All the new network automation modules mentioned above are directly exposed to the NAPALM users, without requiring any architectural changes, just eventually install some requirements:

**Junos**

The features from the existing `junos` Execution Module are available via the following functions:

- `napalm.junos_cli`: Execute a CLI command and return the output as text or Python dictionary.
- `napalm.junos_rpc`: Execute an RPC request on the remote Junos device, and return the result as a Python dictionary, easy to digest and manipulate.
- `napalm.junos_install_os`: Install the given image on the device.
- `napalm.junos_facts`: The complete list of Junos facts collected by the `junos-eznc` underlying library.

**Netmiko**

The features from the newly added `netmiko` Execution Module are available as:

- `napalm.netmiko_commands`: Execute one or more commands to be execute on the remote device, via Netmiko, and return the output as a text.
- `napalm.netmiko_config`: Load a list of configuration command on the remote device, via Netmiko. The commands can equally be loaded from a local or remote path, and passed through Salt’s template rendering pipeline (by default using Jinja as the template rendering engine).

**Arista pyeapi**

For various operations and various extension modules, the following features have been added to gate functionality from the `pyeapi` module:

- `napalm.pyeapi_run_commands`: Execute a list of commands on the Arista switch, via the `pyeapi` library.
- `napalm.pyeapi_config`: Configure the Arista switch with the specified commands, via the `pyeapi` Python library. Similarly to `napalm.netmiko_config`, you can use both local and remote files, with or without templating.
Cisco NX-API

In the exact same way as above, the user has absolute control by using the following primitives to manage Cisco Nexus switches via the NX-API:

- `napalm.nxos_api_show`: Execute one or more show (non-configuration) commands, and return the output as plain text or Python dictionary.
- `napalm.nxos_api_rpc`: Execute arbitrary RPC requests via the Nexus API.
- `napalm.nxos_api_config`: Configures the Nexus switch with the specified commands, via the NX-API. The commands can be loaded from the command line, or a local or remote file, eventually rendered using the templating engine of choice (default: jinja).

Usage examples:

```bash
salt '*' napalm.nxos_api_show 'show bgp sessions' 'show processes' raw_text=False
```

Ciscoconfparse

The following list of function may be handy when manipulating Cisco IOS or Junos style configurations:

- `napalm.config_filter_lines`: Return a list of detailed matches, for the configuration blocks (parent-child relationship) whose parent and children respect the regular expressions provided.
- `napalm.config_find_lines`: Return the configuration lines that match the regular expression provided.
- `napalm.config_lines_w_child`: Return the configuration lines that match a regular expression, having child lines matching the child regular expression.
- `napalm.config_lines_wo_child`: Return the configuration lines that match a regular expression, that don’t have child lines matching the child regular expression.

Note: These functions require the `ciscoconfparse` Python library to be installed.

Usage example (find interfaces that are administratively shut down):

```bash
salt '*' napalm.config_lines_w_child 'interface' 'shutdown'
```

IOSConfig

For Cisco IOS style configuration, the following features have been added to the `napalm` Execution Module:

- `napalm.config_tree`: Transform Cisco IOS style configuration to structured Python dictionary, using the configuration of the interrogated network device.
- `napalm.config_merge_tree`: Return the merge tree of the configuration of the managed network device with a different configuration to be merged with (without actually loading any changes on the device).
Salt Documentation, Release 2019.2.0

- **napalm.config_merge_text**: Return the merge result (as text) of the configuration of the managed network device with a different configuration to be merged with.

- **napalm.config_merge_diff**: Return the merge diff after merging the configuration of the managed network device with a different configuration (without actually loading any changes on the device).

**SCP**

Reusing the already available connection credentials provided for NAPALM, the following features are now available:

- **napalm.scp_put**: Transfer files and directories to remote network device.

- **napalm.scp_get**: Transfer files and directories from remote network device to the localhost of the Minion.

**PeeringDB**

The **peeringdb** Execution Module is useful to gather information about other networks you can potentially peer with, and automatically establish BGP sessions, e.g., given just a specific AS number, the rest of the data (i.e., IP addresses, locations where the remote network is available, etc.) is retrieved from PeeringDB, and the session configuration is automated with minimal to no effort (typing the IP addresses manually can be both tedious and error prone).

**New Docker Proxy Minion**

Docker containers can now be treated as actual minions without installing salt in the container, using the new **docker proxy minion**.

This proxy minion uses the **docker executor** to pass commands to the docker container using **docker.call**. Any state module calls are passed through the corresponding function from the **docker module**.

```
proxy:
  proxytype: docker
  name: keen_proskuriakova
```

**Terraform Salt-SSH Roster**

You can now dynamically generate a Salt-SSH roster from the terraform resources defined with **terraform-provider-salt**.

This allows you to combine both terraform and Salt-SSH to provision and configure your hosts. See the **terraform roster** for an example on how to setup and use.

**Grains Dictionary Passed into Custom Grains**

Starting in this release, if a custom grains function accepts a variable named **grains**, the Grains dictionary of the already compiled grains will be passed in. Because of the non-deterministic order that grains are rendered in, the only grains that can be relied upon to be passed in are **core.py** grains, since those are compiled first.
More Precise virtual Grain

This release improves the accuracy of the virtual grain when running Salt in a nested virtualization environment (e.g. systemd-nspawn container inside a VM) and having virt-what installed.

Until now, the virtual grain was determined by matching against all output lines of virt-what instead of individual items which could lead to not quite precise results (e.g. reporting HyperV inside a systemd-nspawn container running within a Hyper-V-based VM).

Configurable Module Environment

Salt modules (states, execution modules, returners, etc.) now can have custom environment variables applied when running shell commands. This can be configured by setting a system-environment key either in Grains or Pillar. The syntax is as follows:

```
system-environment:
  <type>:
    <module>:
      # Namespace for all functions in the module
      _: <key>: <value>
      
      # Namespace only for particular function in the module
      <function>:
        <key>: <value>
```

- `<type>` would be the type of module (i.e. states, modules, etc.).
- `<module>` would be the module's name.

**Note:** The module name can be either the virtual name (e.g. pkg), or the physical name (e.g. yumpkg).

- `<function>` would be the function name within that module. To apply environment variables to *all* functions in a given module, use an underscore (i.e. `_`) as the function name. For example, to set the same environment variable for all package management functions, the following could be used:

```
system-environment:
  modules:
    pkg:
      _:
        SOMETHING: for_all
```

To set an environment variable in pkg.install only:

```
system-environment:
  modules:
    pkg:
      install:
        LC_ALL: en_GB.UTF-8
```

To set the same variable but only for SUSE minions (which use zypper for package management):

```
system-environment:
  modules:
    zypper:
```

(continues on next page)
install:
  LC_ALL: en_GB.UTF-8

Note: This is not supported throughout Salt; the module must explicitly support this feature (though this may change in the future). As of this release, the only modules which support this are the following pkg virtual modules:

- aptpkg
- yumpkg
- zypper

"Virtual Package" Support Dropped for APT

In APT, some packages have an associated list of packages which they provide. This allows one to do things like run `apt-get install foo` when the real package name is `foo1.0`, and get the right package installed.

Salt has traditionally designated as "virtual packages" those which are provided by an installed package, but for which there is no real package by that name installed. Given the above example, if one were to run a `pkg.installed` state for a package named `foo`, then `pkg.list_pkgs` would show a package version of simply `1` for package `foo`, denoting that it is a virtual package.

However, while this makes certain aspects of package management convenient, there are issues with this approach that make relying on "virtual packages" problematic. For instance, Ubuntu has four different mutually-conflicting packages for `nginx`:

- nginx-core
- nginx-full
- nginx-light
- nginx-extras

All four of these provide `nginx`. Yet there is an `nginx` package as well, which has no actual content and merely has dependencies on any one of the above four packages. If one used `nginx` in a `pkg.installed` state, and none of the above four packages were installed, then the `nginx` metapackage would be installed, which would pull in `nginx-core_`. Later, if `nginx` were used in a `pkg.removed` state, the `nginx` metapackage would be removed, leaving `nginx-core` installed. The result would be that, since `nginx-core` provides `nginx`, Salt would now see `nginx` as an installed virtual package, and the `pkg.removed` state would fail. Moreover, `nginx would not actually have been removed`, since `nginx-core` would remain installed.

Starting with this release, Salt will no longer support using "virtual package" names in pkg states, and package names will need to be specified using the proper package name. The `pkg.list_repo_pkgs` function can be used to find matching package names in the repositories, given a package name (or glob):

```
# salt myminion pkg.list_repo_pkgs 'nginx*'  myminion:
   -------------
   nginx:
   - 1.10.3-0ubuntu0.16.04.2
   - 1.9.15-0ubuntu1
   nginx-common:
   - 1.10.3-0ubuntu0.16.04.2
   - 1.9.15-0ubuntu1
   nginx-core:
```

(continues on next page)
Alternatively, the newly-added `pkg.show` function can be used to get more detailed information about a given package and help determine what package name is correct:

```
# salt myminion pkg.show 'nginx*' filter=description,provides
myminion:
    -----------
nginx:
    ---------
1.10.3-0ubuntu0.16.04.2:
    -----------

### Minion Startup Events

When a minion starts up it sends a notification on the event bus with a tag that looks like this: `salt/minion/<minion_id>/start`. For historical reasons the minion also sends a similar event with an event tag like this: `minion_start`. This duplication can cause a lot of clutter on the event bus when there are many minions. Set `enable_legacy_startup_events: False` in the minion config to ensure only the `salt/minion/<minion_id>/start` events are sent.
The new `enable_legacy_startup_events` minion config option defaults to True, but will be set to default to False beginning with the Sodium release of Salt.

The Salt Syndic currently sends an old style `syndic_start` event as well. The syndic respects `enable_legacy_startup_events` as well.

**Failhard changes**

It is now possible to override a global failhard setting with a state-level failhard setting. This is most useful in case where global failhard is set to True and you want the execution not to stop for a specific state that could fail, by setting the state level failhard to False. This also allows for the use of `onfail*`-requisites, which would previously be ignored when a global failhard was set to True. This is a deviation from previous behavior, where the global failhard setting always resulted in an immediate stop whenever any state failed (regardless of whether the failing state had a failhard setting of its own, or whether any `onfail*`-requisites were used).

**Pass Through Options to `file.serialize` State**

This allows for more granular control over the way in which the dataset is serialized. See the documentation for the new `serializer_opts` and `deserializer_opts` options in the `file.serialize` state for more information.

**`file.patch` State Rewritten**

The `file.patch` state has been rewritten with several new features:

- Patch sources can now be remote files instead of only `salt://` URLs
- Multi-file patches are now supported
- Patch files can be templated

In addition, it is no longer necessary to specify what the hash of the patched file should be.

**New no_proxy Minion Configuration**

Pass a list of hosts using the `no_proxy` minion config option to bypass an HTTP proxy.

Note: This key does nothing unless `proxy_host` is configured and it does not support any kind of wildcards.

```plaintext
no_proxy: [ '127.0.0.1', 'foo.tld' ]
```

**Changes to `slack` Engine**

The output returned to Slack from functions run using this engine is now formatted using that function’s proper outputer. Earlier releases would format the output in YAML for all functions except for when states were run.
Enhancements to wtmp Beacon

A new key, `action`, has been added to the events fired by this beacon, which will contain either the string `login` or `logout`. This will simplify reactors which use this beacon’s data, as it will no longer be necessary to check the integer value of the `type` key to know whether the event is a login or logout.

Additionally, in the event that your platform has a non-standard `utmp.h`, you can now configure which type numbers indicate a login and logout.

See the `wtmp beacon documentation` for more information.

Deprecations

API Deprecations

Support for `LocalClient`’s `expr_form` argument has been removed. Please use `tgt_type` instead. This change was made due to numerous reports of confusion among community members, since the targeting method is published to minions as `tgt_type`, and appears as `tgt_type` in the job cache as well.

Those who are using the `LocalClient` (either directly, or implicitly via a `netapi module`) need to update their code to use `tgt_type`.

```python
>>> import salt.client
>>> local = salt.client.LocalClient()
>>> local.cmd('x', 'cmd.run', ['whoami'], tgt_type='glob')
{'jerry': 'root'}
```

Minion Configuration Deprecations

The `master_shuffle` configuration option is deprecated as of the 2019.2.0 release. Please use the `random_master` option instead.

Module Deprecations

- The `napalm_network` module has been changed as follows:
  - Support for the `template_path` has been removed from `net.load_template` function. This is because support for NAPALM native templates has been dropped.
- The `pip` module has been changed as follows:
  - Support for the `no_chown` option has been removed from `pip.install` function.
- The `trafficserver` module has been changed as follows:
  - The `trafficserver.match_var` function was removed. Please use `trafficserver.match_metric` instead.
  - The `trafficserver.read_var` function was removed. Please use `trafficserver.read_config` instead.
  - The `trafficserver.set_var` function was removed. Please use `trafficserver.set_config` instead.
- The `win_update` module has been removed. It has been replaced by `win_wua`.
- The `win_wua` module has been changed as follows:
- The `win_wua.download_update` and `win_wua.download_updates` functions have been removed. Please use `win_wua.download` instead.

- The `win_wua.install_update` and `win_wua.install_updates` functions have been removed. Please use `win_wua.install` instead.

- The `win_wua.list_update` function has been removed. Please use functions have been removed. Please use `win_wua.get` instead.

- The `win_wua.list_updates` function has been removed. Please use functions have been removed. Please use `win_wua.list` instead.

**Pillar Deprecations**

- The `vault` external pillar has been changed as follows:
  - Support for the `profile` argument was removed. Any options passed up until and following the first `path=` are discarded.

**Roster Deprecations**

- The `cache` roster has been changed as follows:
  - Support for `roster_order` as a list or tuple has been removed. As of the 2019.2.0 release, `roster_order` must be a dictionary.
  - The `roster_order` option now includes IPv6 in addition to IPv4 for the `private`, `public`, `global` or `local` settings. The syntax for these settings has changed to `ipv4-*` or `ipv6-*`, respectively.

**State Deprecations**

- The `docker` state module has been removed
  - In 2017.7.0, the states from this module were split into four separate state modules:
    - `docker_container`
    - `docker_image`
    - `docker_volume`
    - `docker_network`
  - The `docker` module remained, for backward-compatibility, but it has now been removed. Please update SLS files to use the new state names:
    - `docker.running` => `docker_container.running`
    - `docker.stopped` => `docker_container.stopped`
    - `docker.absent` => `docker_container.absent`
    - `docker.network_present` => `docker_network.present`
    - `docker.network_absent` => `docker_network.absent`
    - `docker.image_present` => `docker_image.present`
    - `docker.image_absent` => `docker_image.absent`
    - `docker.volume_present` => `docker_volume.present`
- `docker.volume_absent` => `docker_volume.absent`

- The `docker_network` state module has been changed as follows:
  - The `driver` option has been removed from `docker_network.absent`. It had no functionality, as the state simply deletes the specified network name if it exists.

- The deprecated `ref` option has been removed from the `git.detached` state. Please use `rev` instead.

- The `k8s` state module has been removed in favor of the `kubernetes` state module. Please update SLS files as follows:
  - In place of `k8s.label_present`, use `kubernetes.node_label_present`
  - In place of `k8s.label_absent`, use `kubernetes.node_label_absent`
  - In place of `k8s.label_folder_absent`, use `kubernetes.node_label_folder_absent`

- Support for the `template_path` option in the `netconfig.managed <salt.states.netconfig.managed>()` state has been removed. This is because support for NAPALM native templates has been dropped.

- Support for the `no_chown` option in the `pip.installed` state has been removed.

- The `trafficserver.set_var` state has been removed. Please use `trafficserver.config` instead.

- Support for the `no_chown` option in the `py:func'virtualenv.managed <salt.states.virtualenv.managed>()` function has been removed.

- The `win_update` state module has been removed. It has been replaced by `win_wua`.

- Support for virtual packages has been removed from the `py:mod:pkg state <salt.states.pkg>`.

**Utils Deprecations**

The `cloud` utils module had the following changes:

- Support for the `cache_nodes_ip` function in `salt utils` module has been removed. The function was incomplete and non-functional.

The `vault` utils module had the following changes:

- Support for specifying Vault connection data within a 'profile' has been removed. Please see the `vault execution module` documentation for details on the new configuration schema.

**Dependency Deprecations**

Salt-Cloud has been updated to use the `pypsexec` Python library instead of the `winexe` executable. Both `winexe` and `pypsexec` run remote commands against Windows OSes. Since `winexe` is not packaged for every system, it has been deprecated in favor of `pypsexec`.

Salt-Cloud has deprecated the use of `impacket` in favor of `smbprotocol`. This change was made because `impacket` is not compatible with Python 3.

**SaltSSH major updates**

SaltSSH now works across different major Python versions. Python 2.7 - Python 3.x are now supported transparently. Requirement is, however, that the SaltMaster should have installed Salt, including all related dependencies for Python 2 and Python 3. Everything needs to be importable from the respective Python environment.
SaltSSSH can bundle up an arbitrary version of Salt. If there would be an old box for example, running an outdated and unsupported Python 2.6, it is still possible from a SaltMaster with Python 3.5 or newer to access it. This feature requires an additional configuration in /etc/salt/master as follows:

```yaml
ssh_ext_alternatives:
  2016.3:
    py-version: [2, 6]  # Constraint to specific interpreter version
    path: /opt/2016.3/salt  # Main Salt installation
    dependencies:
      jinja2: /opt/jinja2
      yaml: /opt/yaml
      tornado: /opt/tornado
      msgpack: /opt/msgpack
      certifi: /opt/certifi
      singledispatch: /opt/singledispatch.py
      singledispatch_helpers: /opt/singledispatch_helpers.py
      markupsafe: /opt/markupsafe
      backports_abc: /opt/backports_abc.py
```

It is also possible to use several alternative versions of Salt. You can for instance generate a minimal tarball using runners and include that. But this is only possible, when such specific Salt version is also available on the Master machine, although does not need to be directly installed together with the older Python interpreter.

SaltSSSH now support private key’s passphrase. You can configure it by:

- `–priv-passwd` for salt-ssh cli
- `salt_priv_passwd` for salt master configure file
- `priv_passwd` for salt roster file

**State Module Changes**

**salt State Module (used in orchestration)**

The `test` option now defaults to None. A value of True or False set here is passed to the state being run and can be used to override a test: True option set in the minion’s config file. In previous releases the minion’s config option would take precedence and it would be impossible to run an orchestration on a minion with test mode set to True in the config file.

If a minion is not in permanent test mode due to the config file and the ‘test’ argument here is left as None then a value of `test=True` on the command-line is passed correctly to the minion to run an orchestration in test mode. At present it is not possible to pass `test=False` on the command-line to override a minion in permanent test mode and so the `test: False` option must still be set in the orchestration file.

**event.send State**

The `event.send` state does not know the results of the sent event, so returns changed every state run. It can now be set to return changed or unchanged.

**influxdb_user.present Influxdb User Module State**

The `password` parameter has been changed to `passwd` to remove the name collusion with the influxdb client configuration (`client_kwargs`) allowing management of users when authentication is enabled on the influxdb instance.
Old behavior:

```
influxdb_user.present:
  - name: exampleuser
  - password: exampleuserpassword
  - user: admin
  - password: adminpassword
```

New behavior:

```
influxdb_user.present:
  - name: exampleuser
  - passwd: exampleuserpassword
  - user: admin
  - password: adminpassword
```

**winrepo_cache_expire_min** Windows Package Definitions Caching

The `winrepo_cache_expire_min` has been changed from 0 to 1800 (30 minutes) For example if you run highstate the package definitions are normally updated, however now if the package definitions are younger than `winrepo_cache_expire_min` (30 minutes) the package definitions will not be refreshed, reducing the amount of time taken to run a 2nd highstate. To get the old behaviour change the value back to 0 in the minion configuration file. This also effects the behaviour of other functions which default to refresh. The `pkg.refresh_db` will always refresh the package definitions.

**LDAP External Authentication**

**freeipa groupattribute** support

Previously, if Salt was using external authentication against a freeipa LDAP system it could only search for users via the `accountattributename` field. This release add an additional search using the `groupattribute` field as well. The original `accountattributename` search is done first then the `groupattribute` allowing for backward compatibility with previous Salt releases.

**Jinja Include Relative Paths**

When a jinja include template name begins with `. /` or `../` then the import will be relative to the importing file.

Prior practices required the following construct:

```
{% from tpldir ~ '/foo' import bar %}
```

A more "natural" construct is now supported:

```
{% from './foo' import bar %}
```

Comparatively when importing from a parent directory - prior practice:

```
{% from tpldir ~ '/../foo' import bar %}
```

New style for including from a parent directory:

```
{% from './foo' import bar %}
```
salt-api

salt-api Windows support

Previously, salt-api was not supported on the Microsoft Windows platforms. Now it is! salt-api provides a RESTful interface to a running Salt system. It allows for viewing minions, runners, and jobs as well as running execution modules and runners of a running Salt system through a REST API that returns JSON. See Salt-API documentation.

.. _Salt-API:

Logging Changes

Include Job ID (JID) in Minion and Master Logs

The Job ID (JID) can now be optionally included in both the minion and master logs by including jid in either the log_fmt_console or log_fmt_logfile configuration option:

```
log_fmt_console: "[%(levelname)-8s] %(jid)s %(message)s"
```

The will cause the JID to be included in any log entries that are related to a particular Salt job. The JID will be included using the default format, [JID: %jid], but can be overridden with the log_fmt_jid configuration item.

```
log_fmt_jid: "[JID: %jid]"
```

Security

Windows runas changes

A password is no longer required with runas under normal circumstances. The password option is only needed if the minion process is run under a restricted (non-administrator) account. In the aforementioned case, a password is only required when using the runas argument to run command as a different user.

New Modules

Execution Modules

- salt.modules.ciscoconfparse_mod
- salt.modules.jira

• `salt.modules.pyeapi`

**Pillar Modules**

• `netbox`

**Proxy Modules**

• `salt.proxy.netmiko`
  • `salt.proxy.nxos_api`
  • `salt.proxy.pyeapi`

### 28.2.2 In Progress: Salt 2019.2.1 Release Notes

Version 2019.2.1 is an unreleased bugfix release for 2019.2.0. This release is still in progress and has not been released yet.

**Change to YAML Renderer**

```
/etc/foo.conf:
  file.managed:
    - source: salt://foo.conf.jinja
    - template: jinja
    - context:
      data: {{ data}}
```

In 2019.2.0, the above SLS will result in an error message following changes to the YAML renderer that now require the new Jinja filter `tojson`.

```
/etc/foo.conf:
  file.managed:
    - source: salt://foo.conf.jinja
    - template: jinja
    - context:
      data: {{ data|tojson }}
```

In 2019.2.1, we introduce a new configuration option for both the Salt master and Salt minion configurations to be able to support the older YAML renderer. Using the option `use_yamlloader_old` will allow the YAML renderer to function as before.

### 28.2.3 Salt 2018.3.0 Release Notes - Codename Oxygen

**Warning:** If you are using Jinja to dump lists or dictionaries in your SLS files, this will now cause errors in Python 2 since Jinja does not produce YAML-compatible output when strings in the data structures contain unicode types. The dictionary must be passed through a Jinja filter to produce YAML-compatible strings.

The below is an example of invalid SLS:
Unicode/Python 3 Compatibility Improvements

This release fixes a number of nagging issues with Unicode strings in Salt under Python 2 (ex. 'ascii' codec can't decode byte 0xd0). For best results, use a UTF-8 locale (such as by setting the `LANG` environment variable to one which supports UTF-8. For example en_US.UTF-8, de_DE.UTF-8, ru_RU.UTF-8, C.UTF-8).

Additionally, a number of Python 3 compatibility fixes have been made, many of them having to do with file I/O and str/bytes mismatches.

We continue to work toward improving both Unicode and Python 3 compatibility and welcome any feedback.

Lots of Docker Improvements

Much Improved Support for Docker Networking

The `docker_network.present` state has undergone a full rewrite, which includes the following improvements:

Full API Support for Network Management

The improvements made to input handling in the `docker_container.running` state for 2017.7.0 have now been expanded to `docker_network.present`. This brings with it full support for all tunable configuration arguments.

Custom Subnets

Custom subnets can now be configured. Both IPv4 and mixed IPv4/IPv6 networks are supported. See here for more information.

Network Configuration in `docker_container.running` States

A long-requested feature has finally been added! It is now possible to configure static IPv4/IPv6 addresses, as well as links and labels. See here for more information.
Note: While the `containers` argument to `docker_network.present` will continue to be supported, it will no longer be the recommended way of ensuring that a container is attached to a network.

**Improved Handling of Images from Custom Registries**

Rather than attempting to parse the tag from the passed image name, Salt will now resolve that tag down to an image ID and use that ID instead.

**Important:** Due to this change, there are some backward-incompatible changes to image management. See below for a full list of these changes.

**Backward-incompatible Changes to Docker Image Management**

Passing image names to the following functions must now be done using separate `repository` and `tag` arguments:

- `docker.build`
- `docker.commit`
- `docker.import`
- `docker.load`
- `docker.tag`
- `docker.sls_build`

Additionally, the `tag` argument must now be explicitly passed to the `docker_image.present` state, unless the image is being pulled from a docker registry.

**State and Execution Module Support for `docker run` Functionality**

The `docker_container.running` state is good for containers which run services, but it is not as useful for cases in which the container only needs to run once. The `start` argument to `docker_container.running` can be set to `False` to prevent the container from being started again on a subsequent run, but for many use cases this is not sufficient. Therefore, the `docker.run_container` remote-execution function was added. When used on the Salt CLI, it will return information about the container, such as its name, ID, exit code, and any output it produces.

State support has also been added via the `docker_container.run` state. This state is modeled after the `cmd.run` state, and includes arguments like `onlyif`, `unless`, and `creates` to control whether or not the container is run.

**Full API Support for `docker.logs`**

This function now supports all of the functions that its Docker API counterpart does, allowing you to do things like include timestamps, and also suppress stdout/stderr, etc. in the return.
**Start Argument Added to `docker.create` Function**

This removes the need to run `docker.start` separately when creating containers on the Salt CLI.

```
salt myminion docker.create image=foo/bar:baz command=/path/to/command start=True
```

**Use SaltSSH Minions like regular Master-Minions**

The Master process can now also call SSH minions as if they were connected to the master using ZeroMQ. By setting `enable_ssh_minions: True` in the master config file, the master will create a Salt SSH client process which connects to the minion and returns the output for the `salt` CLI to use like a regular minion. This can be used anywhere the LocalClient is used.

**Exceptions Raised for Authentication/Authorization Errors**

When sending `publish` commands via `master.py` and `masterapi.py` and an authorization or authentication problem is encountered, Salt will now raise the appropriate exceptions instead of returning an empty string: `''`. The reasoning behind this change is to make it easier to debug various scenarios surrounding authentication and authorization issues more effectively.

**Comparison Operators in Package Installation**

Salt now supports using comparison operators (e.g. `>=1.2.3`) when installing packages on minions which use `yum/dnf or opt`. This is supported both in the `pkg.installed` state and in the `pkg.install` remote execution function.

**Master Tops Changes**

When both `Master Tops` and a `Top File` produce SLS matches for a given minion, the matches were being merged in an unpredictable manner which did not preserve ordering. This has been changed. The top file matches now execute in the expected order, followed by any master tops matches that are not matched via a top file.

To make master tops matches execute first, followed by top file matches, set the new `master_tops_first` minion config option to `True`.

**Several Jinja Filters Renamed**

The following Jinja filters (originally added in 2017.7.0) have been renamed due to the fact that they were inaccurately named when initially added. The original names will be supported until the Neon release of Salt.

- `rand_str` renamed to `random_hash`
- `jinja_decode_dict` renamed to `jinja_encode_dict`
- `jinja_decode_list` renamed to `jinja_encode_list`
Return Codes for Runner/Wheel Functions

When using orchestration, runner and wheel functions used to report a True result if the function ran to completion without raising an exception. It is now possible to set a return code in the __context__ dictionary, allowing runner and wheel functions to report that they failed. Here’s some example pseudocode:

```python
def myrunner():
    ...
    do stuff
    ...
    if some_error_condition:
        __context__['retcode'] = 1
    return result
```

Variable Update Intervals for Fileserver Backends

Prior to this release, fileservers would be updated as part of a dedicated “maintenance” process, in which various routine maintenance tasks were performed. This tied the update interval to the loop_interval config option, and also forced all fileservers to update at the same interval.

2018.3.0 adds the following configuration options for the various fileserver backends:

- roots_update_interval
- azurefs_update_interval
- gifs_update_interval
- hgfs_update_interval
- minionfs_update_interval
- s3fs_update_interval
- svnfs_update_interval

These allow for update intervals to be set for each individual backend. The default value for each of these is 60 seconds.

In addition, for GitFS it is also possible to apply intervals to individual remotes. See here for examples.

Note: git_pillar does not yet support variable update intervals, this is targeted for the next feature release (2019.2.0).

LDAP via External Authentication Changes

In this release of Salt, if LDAP Bind Credentials are supplied, then these credentials will be used for all LDAP access except the first authentication when a job is submitted. The first authentication will use the user’s credentials as passed on the CLI. This behavior is to accommodate certain two-factor authentication schemes where the authentication token can only be used once.

In previous releases the bind credentials would only be used to determine the LDAP user’s existence and group membership. The user’s LDAP credentials were used from then on.
Stormpath External Authentication Removed

Per Stormpath’s announcement, their API will be shutting down on 8/17/2017 at noon PST so the Stormpath external authentication module has been removed.

https://stormpath.com/oktaplusstormpath

New (Proxy) Minion Configuration Options

To be able to connect the Minion to the Master using a certain source IP address or port, the following options have been added:

- source_interface_name
- source_address
- source_ret_port
- source_publish_port

environment config option renamed to saltenv

The environment config option predates referring to a salt fileserver environment as a saltenv. To pin a minion to a single environment for running states, one would use environment, but overriding that environment would be done with the saltenv argument. For consistency, environment is now simply referred to as saltenv. There are no plans to deprecate or remove environment, if used it will log a warning and its value will be used as saltenv.

lock_saltnv config option added

If set to True, this option will prevent a minion from allowing the saltenv argument to override the value set in saltenv when running states.

Failed Minions for State/Function Orchestration Jobs Added to Changes Dictionary

For orchestration jobs which run states (or run remote execution functions and also use a fail function to indicate success or failure), minions which have False results were previously included as a formatted string in the comment field of the return for that orchestration job. This made the failed returns difficult to parse programatically. The failed returns in these cases are now included in the changes dictionary, making for much easier parsing.

Grains

- fc_wwn - Show all fibre channel world wide port names for a host, must be enabled with fibre_channel_grains
- iscsi_iqn - Show the iSCSI IQN name for a host
- swap_total - Show the configured swap_total for Linux, *BSD X and Solaris/SunOS
- virtual:
  - identifies reports KVM and VMM hypervisors when running an OpenBSD guest
  - for detecting Solaris Logical Domains (LDOMs) running on T-Series SPARC hardware. The virtual_subtype grain is populated as a list of domain roles.
Salt Minion Auto-discovery

Using auto-discovery, the Salt Minion now no longer needs to be configured against a specific DNS name or IP address of a Master.

For this feature Salt Master now requires port 4520 for UDP broadcast packets to be opened and the Salt Minion be able to send UDP packets to the same port.

Configuration

By default, automatic discovery is disabled.

**Warning:** Due to the current limitations that will be changing in a future release, before you turn on auto-discovery, make sure your network is secured and trusted.

Auto-discovery is configured on Master and Minion. Both of them are configured via the `discovery` option as follows:

**Master configuration**

To use the default configuration, which accepts any minion, simply set `discovery` to True:

```
discovery: true
```

A sub-option called `mapping` allows auto-discovery to help find the proper Master. The mapping contains an arbitrary set of key/value pairs, which the Minion configuration can target. By default, no mappings are set.

Example:

```
discovery:
discovery:
discovery:
discovery:
```

```
mapping:
mapping:
mapping:
mapping:
```

```
description: SES 5.0
description: SES 5.0
description: SES 5.0
description: SES 5.0
```

```
noderos: 1
node: 1
node: 1
```

It is also possible to change the port used from the default of 4520, by setting a `port` option under the Master’s `discovery` configuration:

```
discovery:
discovery:
discovery:
discovery:
```

```
port: 4567
```

**Note:** When using a port number other than the default, the Minion’s `discovery` configuration must also have a port specified, otherwise the Minion will still attempt to contact the Master on port 4520.

**Minion configuration**

In addition to the `mapping` and `port` options, the following additional options are available to Minions:

- **attempts** - This option specifies how many broadcast requests should be sent to the network, waiting for any Master response. Each attempt takes a couple of seconds, so raising this value may result in a slower Minion startup. Note that, on a properly-configured network, autodiscovery should succeed on the first attempt. By default, this value is set to 3.

- **match** - This option can be set to either `all` or `any`, and it determines how the values configured in `mapping` are matched. If set to `all`, then all of the key/value pairs in the Minion’s `mapping` must match a given Master. If set to `any` (the default), then any match to a key/value mapping will constitute a match.
• pause - The interval in seconds between attempts (default: 5).
• fibre_channel_grains - Enables the fc_wn grain. (Default: False)
• iscsi_grains - Enables the iscsi_iqn grain. (Default: False)

Connection to a type instead of DNS

By now each Minion was connecting to a Master by DNS or IP address. From now on it is possible also to connect to a _type_ of a Master. For example, in a network there are three different Masters, each corresponds for a particular niche or environment or specific role etc. The Minion is supposed to connect only to one of those Masters that is described appropriately.

To achieve such an effect, each /etc/salt/master configuration should have a discovery option, which should have a mapping element with arbitrary key/value pairs. The same configuration should be on the Minion, so then when mapping matches, Minion recognises Master as its connection target.

Example for Master configuration (/etc/salt/master):

discovery:
mapping:
  description: SES 5.0
  node: 1

The example above describes a system that is running a particular product, where description is an arbitrary key and SES 5.0 is just a string. In order to match exactly this Master, the following configuration at Minion should be present:

discovery:
  match: all  # Can be "all" or "any"
mapping:
  description: SES 5.0
  node: 1

Notice match criteria is set to all. This would mean that from all found Masters select only that, which description is set to SES 5.0 _and_ node is set to 1. All other Masters will be ignored.

Limitations

This feature has a couple of _temporary_ limitations that are subject to change in the future:

• Only one Master on the network is supported. Currently the Minion cannot select which Master out of few the same to choose. This will change to choosing the Master that is least loaded.
• Minions will accept _any_ master that matches connection criteria without any particular security applied (priv/pub key check, signature, fingerprint etc). That implies that administrator is expected to know his network and make sure it is clean.

New Modules

• salt.modules.purefa

New NaCl Renderer

A new renderer has been added for encrypted data.
New support for Cisco UCS Chassis

The salt proxy minion now allows for control of Cisco USC chassis. See the cimc modules for details.

New support for Cassandra v3

The cassandra_cql module now supports Cassandra v3 which has changed its internal schema to define keyspaces and columns.

New salt-ssh roster

A new roster has been added that allows users to pull in a list of hosts for salt-ssh targeting from a ~/.ssh configuration. For full details, please see the sshconfig roster.

New GitFS Features

Two new features which affect how GitFS maps branches/tags to fileserv fileerver environment (i.e. saltenvs) have been added:

1. It is now possible to completely turn off Salt’s default mapping logic (aside from the mapping of the base saltenv). This can be triggered using the new gitfs_disable_saltenv_mapping config option.

   **Note:** When this is disabled, only the base saltenv and any configured using per-saltenv configuration parameters will be available.

2. The types of refs which Salt will use as saltenvs can now be controlled. In previous releases, branches and tags were both mapped as environments, and individual commit SHAs could be specified as saltenvs in states (and when caching files using cp.cache_file). Using the new gitfs_ref_types config option, the types of refs which are used as saltenvs can be restricted. This makes it possible to ignore all tags and use branches only, and also to keep SHAs from being made available as saltenvs.

Additional output modes

The state_output parameter now supports full_id, changes_id and terse_id. Just like mixed_id, these use the state ID as name in the highstate output. For more information on these output modes, see the docs for the Highstate Outputter.

Windows

Python Version

Python 2 Windows API was designed when Windows did not support Unicode. Windows now supports Unicode however to keep backwards compatibility Python 2 Windows API has not been changed. Python 3 Windows API supports Unicode. Salt Python 3 installer is the recommend choice for users who need characters other than Non-ASCII (7bit) characters.
pkg Execution module changes

Significant changes have been made to the `win_pkg` execution module. Users should test this release against their existing package sls definition files. These changes are also in 2016.11.9 & 2017.7.3.

- `pkg.list_available` no longer defaults to refreshing the winrepo meta database.
- `pkg.install` without a version parameter no longer upgrades software if the software is already installed. Use `pkg.install version=latest` or in a state use `pkg.latest` to get the old behavior.
- `pkg.list_pkgs` now returns multiple versions if software installed more than once.
- `pkg.list_pkgs` now returns 'Not Found' when the version is not found instead of '(value not set)' which matches the contents of the sls definitions.
- `pkg.remove()` will wait up to 3 seconds (normally about a second) to detect changes in the registry after removing software, improving reporting of version changes.
- `pkg.remove()` can remove latest software, if latest is defined in sls definition.
- Documentation was update for the execution module to match the style in new versions, some corrections as well.
- All install/remove commands are prefix with cmd.exe shell and cmdmod is called with a command line string instead of a list. Some sls files in saltstack/salt-winrepo-ng expected the commands to be prefixed with cmd.exe (i.e. the use of &).
- Some execution module functions results, now behaviour more like their Unix/Linux versions.

Installer

Changes to config handling

Behavior with existing configuration has changed. With previous windows installers the existing config was used and the master and minion id could be modified via the installer. It was problematic in that it didn’t account for configuration that may be defined in the `minion.d` directory. This change gives you the option via a drop-down list to use one of the following:

- Default Config: Use the config that comes with the installer
- Existing Config: Use the current config without changes
- Custom Config: Select a custom config using the file picker

The existing config option will only be available if the installer detects an existing config. If there is an existing config, and you choose Default or Custom, the existing config will be deleted, including the `minion.d` directory, and replaced by your selection.

The Default Config and Custom Config options will allow you to modify the Master and the Minion ID. Existing Config will leave the existing configuration unchanged.

These settings can be defined on the command line using the following switches:

- `/default-config`
- `/custom-config=C:\Path\To\Custom\Config\minion`

If neither option is passed and there is an existing config, the default is to use the existing config. If there is no existing config (new install) the default config will be used.
Multi-master configuration

The installer now has the ability to apply a multi-master configuration either from the GUI or the command line. The master field in the GUI can accept either a single master or a comma-separated list of masters. The command-line switch (/master=) can accept the same.

Command-line help

The Windows installer will now display command-line help when a help switch (/?) is passed.

New utils module salt.utils.pkg.win

A new utils module has been added, which gathers information about windows installed software. This is currently not used by any salt execution module or state at this time. Users are encouraged to run this and report any issues. Running the command with the detail option will be useful for anyone developing windows package definitions. With salt installed in the default location the following command will print the help message.

```
chcp 65001
c:\salt\bin\python.exe c:\salt\bin\lib\site-packages\salt\utils\pkg\win.py
c:\salt\bin\python.exe c:\salt\bin\lib\site-packages\salt\utils\pkg\win.py detail --system
```

Salt Cloud Features

OpenStack Revamp

The OpenStack Driver has been rewritten mostly from scratch. Salt is now using the shade driver <https://docs.openstack.org/shade/latest/>.

With this, the nova driver is being deprecated.

openstack driver

There have also been several new modules and states added for managing OpenStack setups using shade as well.

keystone keystone role grant keystone group keystone role keystone service keystone user keystone domain keystone project keystone endpoint glance glance_image neutron neutron subnet neutron secgroup neutron secgroup rule neutron network

Pre-Flight Commands

Support has been added for specified "preflight commands" to run on a VM before the deploy script is run. These must be defined as a list in a cloud configuration file. For example:

```
my-cloud-profile:
  provider: linode-config
  image: Ubuntu 16.04 LTS
  size: Linode 2048
  preflight_cmds:
    - whoami
    - echo 'hello world!'
```
These commands will run in sequence before the bootstrap script is executed.

New salt-cloud Grains

When salt-cloud creates a new minion, it will now add grain information to the minion configuration file, identifying the resources originally used to create it.

The generated grain information will appear similar to:

```
grains:
salt-cloud:
  driver: ec2
  provider: my_ec2:ec2
  profile: ec2-web
```

The generation of salt-cloud grains can be suppressed by the option `enable_cloud_grains: 'False'` in the cloud configuration file.

Upgraded Saltify Driver

The salt-cloud Saltify driver is used to provision machines which are not controlled by a dedicated cloud supervisor (such as typical hardware machines) by pushing a salt-bootstrap command to them and accepting them on the salt master. Creation of a node has been its only function and no other salt-cloud commands were implemented.

With this upgrade, it can use the salt-api to provide advanced control, such as rebooting a machine, querying it along with conventional cloud minions, and, ultimately, disconnecting it from its master.

After disconnection from ("destroying" on) one master, a machine can be re-purposed by connecting to ("creating" on) a subsequent master.

New Vagrant Driver

The salt-cloud Vagrant driver brings virtual machines running in a limited environment, such as a programmer’s workstation, under salt-cloud control. This can be useful for experimentation, instruction, or testing salt configurations.

Using salt-api on the master, and a salt-minion running on the host computer, the Vagrant driver can create (vagrant up), restart (vagrant reload), and destroy (vagrant destroy) VMs, as controlled by salt-cloud profiles which designate a Vagrantfile on the host machine.

The master can be a very limited machine, such as a Raspberry Pi, or a small VagrantBox VM.

Python PyWinRM Module

Versions of pywinrm>=0.2.1 are finally able to disable validation of self signed certificates. Here for more information.

DigitalOcean

The DigitalOcean driver has been renamed to conform to the company name. The new driver name is digitalocean. The old name digital_ocean and a short one do will still be supported through virtual aliases, this is mostly cosmetic.
Azure Cloud

The azure sdk used for the azurearm cloud driver now depends on azure-cli>=2.0.12

New `saltclass` pillar/master_tops modules

This module clones the behaviour of reclass (http://reclass.pantsfullofunix.net/), without the need of an external app, and add several features to improve flexibility. Saltclass lets you define your nodes from simple yaml files (.yml) through hierarchical class inheritance with the possibility to override pillars down the tree.

Features

- Define your nodes through hierarchical class inheritance
- Reuse your reclass data with minimal modifications
  - applications => states
  - parameters => pillars
- Use Jinja templating in your yaml definitions
- Access to the following Salt objects in Jinja
  - __opts__
  - __salt__
  - __grains__
  - __pillars__
  - minion_id
- Chose how to merge or override your lists using `^` character (see examples)
- Expand variables `$()` with possibility to escape them if needed `$$` (see examples)
- Ignores missing node/class and will simply return empty without breaking the pillar module completely - will be logged

An example subset of data is available here: http://git.mauras.ch/salt/saltclass/src/master/examples

<table>
<thead>
<tr>
<th>Terms usable in yaml files</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>classes</td>
<td>A list of classes that will be processed in order</td>
</tr>
<tr>
<td>states</td>
<td>A list of states that will be returned by master_tops function</td>
</tr>
<tr>
<td>pillars</td>
<td>A yaml dictionary that will be returned by the ext_pillar function</td>
</tr>
<tr>
<td>environment</td>
<td>Node saltenv that will be used by master_tops</td>
</tr>
</tbody>
</table>

A class consists of:

- zero or more parent classes
- zero or more states
- any number of pillars

A child class can override pillars from a parent class. A node definition is a class in itself with an added environment parameter for saltenv definition.

Class Names
Class names mimic salt way of defining states and pillar files. This means that `default.users` class name will correspond to one of these:

- `<saltclass_path>/classes/default/users.yml`
- `<saltclass_path>/classes/default/users/init.yml`

**Saltclass Tree**

A saltclass tree would look like this:

```
<saltclass_path>
  ├── classes
  │   ├── app
  │   │   └── ssh
  │   │       └── server.yml
  │   ├── default
  │   │   ├── init.yml
  │   │   ├── motd.yml
  │   │   └── users.yml
  │   └── roles
  │       ├── app.yml
  │       └── nginx
  │           └── server.yml
  │   └── subsidiaries
  │       └── gnv.yml
  │           └── qls.yml
  │               └── zrh.yml
  └── nodes
      └── geneva
          └── gnv.node1.yml
      └── lausanne
          ├── qls.node1.yml
          └── qls.node2.yml
      └── node127.yml
      └── zurich
          └── zrh.node1.yml
          └── zrh.node2.yml
          └── zrh.node3.yml
```

**Examples**

```
<saltclass_path>/nodes/lausanne/qls.node1.yml

environment: base

classes:
{% for class in ['default'] %}
  - {{ class }}
{% endfor %}
  - subsidiaries.{{ __grains__['id'].split('.')[0] }}
```

```
<saltclass_path>/classes/default/init.yml
```
classes:
- default.users
- default.motd

states:
- openssh

pillars:
default:
network:
dns:
srv1: 192.168.0.1
srv2: 192.168.0.2
domain: example.com
ntp:
srv1: 192.168.10.10
srv2: 192.168.10.20

classes

<saltclass_path>/classes/subsidiaries/gnv.yml

pillars:
default:
network:
sub: Geneva
dns:
srv1: 10.20.0.1
srv2: 10.20.0.2
srv3: 192.168.1.1
domain: gnv.example.com

users:
adm1:
uid: 1210
gid: 1210
gecos: 'Super user adm1'
homedir: /srv/app/adm1
adm3:
uid: 1203
gid: 1203
gecos: 'Super user adm

Variable expansions:

Escaped variables are rendered as is - ${test}

Missing variables are rendered as is - ${net:dns:srv2}

pkg:
- prod
- p1
- p2
- p3

(continues on next page)
List override:
Not using `^` as the first entry will simply merge the lists

```
pillars:
  app:
    pkg:
      ^
      - ^
      - app-frontend
```

Known limitation
Currently you can’t have both a variable and an escaped variable in the same string as the escaped one will not be correctly rendered - `'$[xx]'` will stay as is instead of being rendered as `'$\{xx\}'`

Lists of comments in state returns
State functions can now return a list of strings for the `comment` field, as opposed to only a single string. This is meant to ease writing states with multiple or multi-part comments.

Beacon configuration changes
In order to remain consistent and to align with other Salt components such as states, support for configuring beacons using dictionary based configuration has been deprecated in favor of list based configuration. All beacons have a validation function which will check the configuration for the correct format and only load if the validation passes.

**avahi_announce**

Old behavior:

```
beacons:
  avahi_announce:
    run_once: True
    servicetype: _demo._tcp
    port: 1234
    txt:
      ProdName: grains.productname
      SerialNo: grains.serialnumber
      Comments: 'this is a test'
```

New behavior:

```
beacons:
  avahi_announce:
    - run_once: True
    - servicetype: _demo._tcp
    - port: 1234
    - txt:
      ProdName: grains.productname
      SerialNo: grains.serialnumber
      Comments: 'this is a test'
```
**bonjour_announce**

Old behavior:

```yaml
beacons:
  bonjour_announce:
    run_once: True
    servicetype: _demo._tcp
    port: 1234
    txt:
      ProdName: grains.productname
      SerialNo: grains.serialnumber
      Comments: 'this is a test'
```

New behavior:

```yaml
beacons:
  bonjour_announce:
    - run_once: True
    - servicetype: _demo._tcp
    - port: 1234
    - txt:
        ProdName: grains.productname
        SerialNo: grains.serialnumber
        Comments: 'this is a test'
```

**btmmp**

Old behavior:

```yaml
beacons:
  btmp: {}
```

New behavior:

```yaml
beacons:
  btmp: []
```

**glxinfo**

Old behavior:

```yaml
beacons:
  glxinfo:
    user: frank
    screen_event: True
```

New behavior:

```yaml
beacons:
  glxinfo:
    - user: frank
    - screen_event: True
```
haproxy

Old behavior:

```yaml
beacons:
  haproxy:
    - www-backend:
      threshold: 45
      servers:
        - web1
        - web2
      interval: 120
```

New behavior:

```yaml
beacons:
  haproxy:
    - backends:
      www-backend:
        threshold: 45
        servers:
          - web1
          - web2
        interval: 120
```

inotify

Old behavior:

```yaml
beacons:
  inotify:
    /path/to/file/or/dir:
      mask:
        - open
        - create
        - close_write
      recurse: True
      auto_add: True
      exclude:
        - /path/to/file/or/dir/exclude1
        - /path/to/file/or/dir/exclude2
        - /path/to/file/or/dir/regex[a-m]*$:
          regex: True
          coalesce: True
```

New behavior:

```yaml
beacons:
  inotify:
    - files:
      /path/to/file/or/dir:
        mask:
          - open
          - create
          - close_write
```

(continues on next page)
recurse: True
auto_add: True
exclude:
  - /path/to/file/or/dir/exclude1
  - /path/to/file/or/dir/exclude2
  - /path/to/file/or/dir/regex[a-m]*$:
    regex: True
    coalesce: True

journald

Old behavior:

beacons:
  journald:
    sshd:
      SYSLOG_IDENTIFIER: sshd
      PRIORITY: 6

New behavior:

beacons:
  journald:
    services:
      sshd:
        SYSLOG_IDENTIFIER: sshd
        PRIORITY: 6

load

Old behavior:

beacons:
  load:
    1m:
      - 0.0
      - 2.0
    5m:
      - 0.0
      - 1.5
    15m:
      - 0.1
      - 1.0
    emitatstartup: True
    onchangeonly: False

New behavior:

beacons:
  load:
    averages:
      1m:
        - 0.0
```
- 2.0
5m:
- 0.0
- 1.5
15m:
- 0.1
- 1.0
- emitatstartup: True
- onchangeonly: False

log

Old behavior:
```
```yaml
beacons:
  log:
    file: <path>
    <tag>:
      regex: <pattern>
```

New behavior:
```
beacons:
  log:
    - file: <path>
    - tags:
      <tag>:
        regex: <pattern>
```

network_info

Old behavior:
```
beacons:
  network_info:
    - eth0:
      type: equal
      bytes_sent: 100000
      bytes_recv: 100000
      packets_sent: 100000
      packets_recv: 100000
      errin: 100
      errout: 100
      dropin: 100
      dropout: 100
```

New behavior:
```
beacons:
  network_info:
    - interfaces:
      eth0:
        type: equal
```
bytes_sent: 100000
bytes_recv: 100000
packets_sent: 100000
packets_recv: 100000
erin: 100
erout: 100
dropin: 100
dropout: 100

network_settings

Old behavior:

```yaml
beacons:
  network_settings:
    eth0:
      ipaddr:
      promiscuity:
        onvalue: 1
    eth1:
      linkmode:
```

New behavior:

```yaml
beacons:
  network_settings:
    interfaces:
      - eth0:
        ipaddr:
        promiscuity:
          onvalue: 1
      - eth1:
        linkmode:
```

proxy_example

Old behavior:

```yaml
beacons:
  proxy_example:
    endpoint: beacon
```

New behavior:

```yaml
beacons:
  proxy_example:
    - endpoint: beacon
```

ps

Old behavior:
**beacons:**

```yaml
ps:
    - salt-master: running
    - mysql: stopped
```

New behavior:

```yaml
beacons:
    ps:
        - processes:
            salt-master: running
            mysql: stopped
```

**salt_proxy**

Old behavior:

```yaml
beacons:
    salt_proxy:
        - p8000: {}
        - p8001: {}
```

New behavior:

```yaml
beacons:
    salt_proxy:
        - proxies:
            p8000: {}
            p8001: {}
```

**sensehat**

Old behavior:

```yaml
beacons:
    sensehat:
        humidity: 70%
        temperature: [20, 40]
        temperature_from_pressure: 40
        pressure: 1500
```

New behavior:

```yaml
beacons:
    sensehat:
        sensors:
            humidity: 70%
            temperature: [20, 40]
            temperature_from_pressure: 40
            pressure: 1500
```
service

Old behavior:

```yaml
beacons:
  service:
    salt-master:
    mysql:
```

New behavior:

```yaml
beacons:
  service:
    - services:
      nginx:
        onchangeonly: True
        delay: 30
        uncleanshutdown: /run/nginx.pid
```

sh

Old behavior:

```yaml
beacons:
  sh: {}
```

New behavior:

```yaml
beacons:
  sh: []
```

status

Old behavior:

```yaml
beacons:
  status: {}
```

New behavior:

```yaml
beacons:
  status: []
```

telegram_bot_msg

Old behavior:

```yaml
beacons:
  telegram_bot_msg:
    token: "<bot access token>"
    accept_from:
      - "<valid username>"
    interval: 10
```
New behavior:

```yaml
beacons:
  telegram_bot_msg:
    - token: "<bot access token>"
    - accept_from:
      - "<valid username>"
    - interval: 10
```

**twilio_txt_msg**

Old behavior:

```yaml
beacons:
  twilio_txt_msg:
    account_sid: "<account sid>"
    auth_token: "<auth token>"
    twilio_number: "+15555555555"
    interval: 10
```

New behavior:

```yaml
beacons:
  twilio_txt_msg:
    account_sid: "<account sid>"
    auth_token: "<auth token>"
    twilio_number: "+15555555555"
    interval: 10
```

**wtmp**

Old behavior:

```yaml
beacons:
  wtmp: {}
```

New behavior:

```yaml
beacons:
  wtmp: []
```

New requisites available in state compiler

**require_any**

The use of `require_any` demands that one of the required states executes before the dependent state. The state containing the `require_any` requisite is defined as the dependent state. The states specified in the `require_any` statement are defined as the required states. If at least one of the required state’s execution succeeds, the dependent state will then execute. If all of the executions by the required states fail, the dependent state will not execute.
**watch_any**

The state containing the `watch_any` requisite is defined as the watching state. The states specified in the `watch_any` statement are defined as the watched states. When the watched states execute, they will return a dictionary containing a key named "changes".

If the "result" of any of the watched states is `True`, the watching state will execute normally, and if all of them are `False`, the watching state will never run. This part of `watch` mirrors the functionality of the `require` requisite.

If the "result" of any of the watched states is `True and` the "changes" key contains a populated dictionary (changes occurred in the watched state), then the `watch` requisite can add additional behavior. This additional behavior is defined by the `mod_watch` function within the watching state module. If the `mod_watch` function exists in the watching state module, it will be called in addition to the normal watching state. The return data from the `mod_watch` function is what will be returned to the master in this case; the return data from the main watching function is discarded.

If the "changes" key contains an empty dictionary, the `watch` requisite acts exactly like the `require` requisite (the watching state will execute if "result" is `True`, and fail if "result" is `False` in the watched state).

**onchanges_any**

The `onchanges_any` requisite makes a state only apply one of the required states generates changes, and if one of the watched state's "result" is `True`. This can be a useful way to execute a post hook after changing aspects of a system.

**onfail_any**

The `onfail_any` requisite allows for reactions to happen strictly as a response to the failure of at least one other state. This can be used in a number of ways, such as executing a second attempt to set up a service or begin to execute a separate thread of states because of a failure.

The `onfail_any` requisite is applied in the same way as `require_any` and `watch_any`.

**Basic Slots support in state compiler**

Slots extend the state syntax and allows you to do things right before the state function is executed. So you can make a decision in the last moment right before a state is executed.

Slot syntax looks close to the simple python function call. Here is a simple example:

```python
copy-some-file:
  file.copy:
    - name: __slot__:salt:test.echo(text=/tmp/some_file)
    - source: __slot__:salt:test.echo(/etc/hosts)
```

Read more here.

**Cryptographic layer changes**

M2Crypto is coming back. We are making the crypto backend modular but in this release M2Crypto is enabled if it’s importable by Python. If not Cryptodome or PyCrypto is used as it was in the previous releases. M2Crypto is used in the same way as PyCrypto so there would be no compatibility issues, different nodes could use different backends.
NaCL Module and Runner changes

In addition to argument changes in both the NaCL module and runner for future removal in the Neon release, the default "box_type" has changed from secretbox to sealedbox. SecretBox is data encrypted using private key sk and Sealedbox is encrypted using public key pk.

utils functions reorganized into separate modules

The Salt utility functions from salt.utils (typically used by those developing extension modules for Salt) have been moved into different modules, grouped logically based on their functionality. The old function names will continue to work until the Neon release of Salt (due around Q1 2019).

The renamed functions are:

- salt.utils.appendproctitle: use salt.utils.process.appendproctitle instead.
- salt.utils.daemonize: use salt.utils.process.daemonize instead.
- salt.utils.daemonize_if: use salt.utils.process.daemonize_if instead.
- salt.utils.reinit_crypto: use salt.utils.crypt.reinit_crypto instead.
- salt.utils.to_bytes: use salt.utils.stringutils.to_bytes instead.
- salt.utils.to_str: use salt.utils.stringutils.to_str instead.
- salt.utils.to_unicode: use salt.utils.stringutils.to_unicode instead.
- salt.utils.dequote: use salt.utils.stringutils.dequote instead.
- salt.utils.is_hex: use salt.utils.stringutils.is_hex instead.
- salt.utils.is_bin_str: use salt.utils.stringutils.is_bin_str instead.
- salt.utils.rand_string: use salt.utils.stringutils.random instead.
- salt.utils.contains_whitespace: use salt.utils.stringutils.contains_whitespace instead.
- salt.utils.build_whitespace_split_regex: use salt.utils.stringutils.build_whitespace_split_regex instead.
- salt.utils.expr_match: use salt.utils.stringutils.expr_match instead.
- salt.utils.check_whitelist_blacklist: use salt.utils.stringutils.check_whitelist_blacklist instead.
- salt.utils.check_include_exclude: use salt.utils.stringutils.check_include_exclude instead.
- salt.utils.print_cli: use salt.utils.stringutils.print_cli instead.
- salt.utils.clean_kwargs: use salt.utils.args.clean_kwargs instead.
- salt.utils.invalid_kwargs: use salt.utils.args.invalid_kwargs instead.
- salt.utils.shlex_split: use salt.utils.args.shlex_split instead.
- `salt.utils.split_input`: use `salt.utils.args.split_input` instead.
- `salt.utils.test_mode`: use `salt.utils.args.test_mode` instead.
- `salt.utils.format_call`: use `salt.utils.args.format_call` instead.
- `salt.utils.which`: use `salt.utils.path.which` instead.
- `salt.utils.which_bin`: use `salt.utils.path.which_bin` instead.
- `salt.utils.path_join`: use `salt.utils.path.join` instead.
- `salt.utils.check_or_die`: use `salt.utils.path.check_or_die` instead.
- `salt.utils.sanitize_win_path_string`: use `salt.utils.path.sanitize_win_path` instead.
- `salt.utils.rand_str`: use `salt.utils.hashutils.random_hash` instead.
- `salt.utils.get_hash`: use `salt.utils.hashutils.get_hash` instead.
- `salt.utils.is_windows`: use `salt.utils.platform.is_windows` instead.
- `salt.utils.is_proxy`: use `salt.utils.platform.is_proxy` instead.
- `salt.utils.is_linux`: use `salt.utils.platform.is_linux` instead.
- `salt.utils.is_darwin`: use `salt.utils.platform.is_darwin` instead.
- `salt.utils.is_sunos`: use `salt.utils.platform.is_sunos` instead.
- `salt.utils.is_smartos`: use `salt.utils.platform.is_smartos` instead.
- `salt.utils.is_smartos_globalzone`: use `salt.utils.platform.is_smartos_globalzone` instead.
- `salt.utils.is_smartos_zone`: use `salt.utils.platform.is_smartos_zone` instead.
- `salt.utils.is_freebsd`: use `salt.utils.platform.is_freebsd` instead.
- `salt.utils.is_netbsd`: use `salt.utils.platform.is_netbsd` instead.
- `salt.utils.is_openbsd`: use `salt.utils.platform.is_openbsd` instead.
- `salt.utils.is_aix`: use `salt.utils.platform.is_aix` instead.
- `salt.utils.safe_rm`: use `salt.utils.files.safe_rm` instead.
- `salt.utils.is_empty`: use `salt.utils.files.is_empty` instead.
- `salt.utils.fopen`: use `salt.utils.files.fopen` instead.
- `salt.utils.flopen`: use `salt.utils.files.fopen` instead.
- `salt.utils.fpopen`: use `salt.utils.files.fpopen` instead.
- `salt.utils.rm_rf`: use `salt.utils.files.rm_rf` instead.
- `salt.utils.mkstemp`: use `salt.utils.files.mkstemp` instead.
- `salt.utils.istextfile`: use `salt.utils.files.is_text_file` instead.
- `salt.utils.is_bin_file`: use `salt.utils.files.is_binary` instead.
- `salt.utils.list_files`: use `salt.utils.files.list_files` instead.
- `salt.utils.safe_walk`: use `salt.utils.files.safe_walk` instead.
- `salt.utils.st_mode_to_octal`: use `salt.utils.files.st_mode_to_octal` instead.
- `salt.utils.normalize_mode`: use `salt.utils.files.normalize_mode` instead.
- `salt.utils.human_size_to_bytes`: use `salt.utils.files.human_size_to_bytes` instead.
- `salt.utils.backup_minion`: use `salt.utils.files.backup_minion` instead.
- `salt.utils.str_version_to_evr`: use `salt.utils.pkg.rpm.version_to_evr` instead.
- `salt.utils.parse_docstring`: use `salt.utils.doc.parse_docstring` instead.
- `salt.utils.compare_versions`: use `salt.utils.versions.compare` instead.
- `salt.utils.version_cmp`: use `salt.utils.versions.version_cmp` instead.
- `salt.utils.warn_until`: use `salt.utils.versions.warn_until` instead.
- `salt.utils.kwars_warn_until`: use `salt.utils.versions.kwars_warn_until` instead.
- `salt.utils.get_color_theme`: use `salt.utils.color.get_color_theme` instead.
- `salt.utils.get_colors`: use `salt.utils.color.get_colors` instead.
- `salt.utils.gen_state_tag`: use `salt.utils.state.gen_tag` instead.
- `salt.utils.search_onfail_requisites`: use `salt.utils.state.search_onfail_requisites` instead.
- `salt.utils.check_state_result`: use `salt.utils.state.check_result` instead.
- `salt.utils.get_user`: use `salt.utils.user.get_user` instead.
- `salt.utils.get_uid`: use `salt.utils.user.get_uid` instead.
- `salt.utils.get_specific_user`: use `salt.utils.user.get_specific_user` instead.
- `salt.utils.chugid`: use `salt.utils.user.chugid` instead.
- `salt.utils.chugid_and_umask`: use `salt.utils.user.chugid_and_umask` instead.
- `salt.utils.get_default_group`: use `salt.utils.user.get_default_group` instead.
- `salt.utils.get_group_list`: use `salt.utils.user.get_group_list` instead.
- `salt.utils.get_group_list`: use `salt.utils.user.get_group_list` instead.
- `salt.utils.get_gid_list`: use `salt.utils.user.get_gid_list` instead.
- `salt.utils.get_gid`: use `salt.utils.user.get_gid` instead.
- `salt.utils.enable_ctrl_logoff_handler`: use `salt.utils.win_functions.enable_ctrl_logoff_handler` instead.
- `salt.utils.traverse_dict`: use `salt.utils.data.traverse_dict` instead.
- `salt.utils.traverse_dict_and_list`: use `salt.utils.data.traverse_dict_and_list` instead.
- `salt.utils.filter_by`: use `salt.utils.data.filter_by` instead.
- `salt.utils.subdict_match`: use `salt.utils.data.subdict_match` instead.
- `salt.utils.substr_in_list`: use `salt.utils.data.substr_in_list` instead.
- `salt.utils.is_dictlist`: use `salt.utils.data.is_dictlist`.
- `salt.utils.repack_dictlist`: use `salt.utils.data.repack_dictlist` instead.
- `salt.utils.compare_dicts`: use `salt.utils.data.compare_dicts` instead.
• `salt.utils.compare_lists`: use `salt.utils.data.compare_lists` instead.
• `salt.utils.decode_dict`: use `salt.utils.data.encode_dict` instead.
• `salt.utils.decode_list`: use `salt.utils.data.encode_list` instead.
• `salt.utils.exactly_n`: use `salt.utils.data.exactly_n` instead.
• `salt.utils.exactly_one`: use `salt.utils.data.exactly_one` instead.
• `salt.utils.is_list`: use `salt.utils.data.is_list` instead.
• `salt.utils.is_iter`: use `salt.utils.data.is_iter` instead.
• `salt.utils.isorted`: use `salt.utils.data.sorted_ignorecase` instead.
• `salt.utils.is_true`: use `salt.utils.data.is_true` instead.
• `salt.utils.mysql_to_dict`: use `salt.utils.data.mysql_to_dict` instead.
• `salt.utils.simple_types_filter`: use `salt.utils.data.simple_types_filter` instead.
• `salt.utils.ip_bracket`: use `salt.utils.zeromq.ip_bracket` instead.
• `salt.utils.gen_mac`: use `salt.utils.network.gen_mac` instead.
• `salt.utils.mac_str_to_bytes`: use `salt.utils.network.mac_str_to_bytes` instead.
• `salt.utils.refresh_dns`: use `salt.utils.network.refresh_dns` instead.
• `salt.utils.dns_check`: use `salt.utils.network.dns_check` instead.
• `salt.utils.get_context`: use `salt.utils.stringutils.get_context` instead.
• `salt.utils.get_master_key`: use `salt.utils.master.get_master_key` instead.
• `salt.utils.get_values_of_matching_keys`: use `salt.utils.master.get_values_of_matching_keys` instead.
• `salt.utils.date_cast`: use `salt.utils.dateutils.date_cast` instead.
• `salt.utils.date_format`: use `salt.utils.dateutils.strftime` instead.
• `salt.utils.total_seconds`: use `salt.utils.dateutils.total_seconds` instead.
• `salt.utils.find_json`: use `salt.utils.json.find_json` instead.
• `salt.utils.import_json`: use `salt.utils.json.import_json` instead.
• `salt.utils.namespaced_function`: use `salt.utils.functools.namespaced_function` instead.
• `salt.utils.alias_function`: use `salt.utils.functools.alias_function` instead.
• `salt.utils.profile_func`: use `salt.utils.profile.profile_func` instead.
• `salt.utils.activate_profile`: use `salt.utils.profile.activate_profile` instead.
• `salt.utils.output_profile`: use `salt.utils.profile.output_profile` instead.

Deprecations

Configuration Option Deprecations

• The `requests_lib` configuration option has been removed. Please use `backend` instead.
Profitbricks Cloud Updated Dependency

The minimum version of the profitbrick python package for the profitbricks cloud driver has changed from 3.0.0 to 3.1.0.

Execution Module Deprecations

- The blockdev execution module has been removed. Its functions were merged with the disk module.
- The lxc execution module has been changed as follows:
  - The dnservers option to lxc.cloud_init_interface no longer defaults to 4.4.4.4 and 8.8.8.8.
  - The dns_via_dhcp option to lxc.cloud_init_interface now defaults to True instead of False.
- The win_psget module has been changed as follows:
  - The psget.psversion function was removed. Please use cmd.shell_info instead.
- The win_service module (which provides the service module on Windows platforms) has been changed as follows:
  - The config function was removed. Please use service.modify instead.
  - The following arguments to the service.create function have been renamed:
    * binpath has been renamed to bin_path
    * depend has been renamed to dependencies
    * DisplayName has been renamed to display_name
    * error has been renamed to error_control
    * group has been renamed to load_order_group
    * obj has been renamed to account_name
    * password has been renamed to account_password
    * start has been renamed to start_type
    * type has been renamed to service_type
- The nacl module has been changed as follows:
  - The following arguments have been renamed in the nacl.keygen, nacl.enc, and nacl.dec:
    * key_file has been renamed to sk_file
    * key has been renamed to sk

Runner Deprecations

- The manage runner has been changed as follows:
  - root_user argument was removed from the manage.bootstrap function. Please use salt-ssh roster entries for the host instead.
- The nacl runner has been changed as follows:
  - The following arguments have been renamed in the nacl.keygen, nacl.enc, and nacl.dec:
* key_file has been renamed to sk_file
* key has been renamed to sk

State Deprecations

- In the archive state, the `tar_options` and `zip_options` options were removed. Please use `options` instead.
- The `cmd` state had the following changes:
  - The `user` and `group` options were removed from the following functions (please use `runas` instead):
    * `cmd.run`
    * `cmd.script`
    * `cmd.wait`
    * `cmd.wait_script`
- In the `file` states, the `show_diff` option was removed in all states where it was previously supported. Please use `show_changes` instead.

Grain Deprecations

- For `smartos`, some grains have been deprecated. These grains will be removed in Neon:
  - The `hypervisor_uuid` grain has been replaced with `mdata:sdc:server_uuid`
  - The `datacenter` grain has been replaced with `mdata:sdc:datacenter_name`

Pillar Deprecations

The legacy configuration for `git_pillar` has been removed. Please use the new configuration for `git_pillar` which was added in 2015.8.0, which is documented [here](#).

Utils Deprecations

- In `salt.utils.cloud`, the `fire_event` function now requires a `sock_dir` argument. It was previously optional.

Other Miscellaneous Deprecations

- In `version.py`, the `rc_info` function was removed. Please use `pre_info` instead.
- Warnings for moving away from the `env` option were removed. `saltenv` should be used instead. The removal of these warnings does not have a behavior change. Only the warning text was removed.
Minion Blackout

During a blackout, minions will not execute any remote execution commands, except for `saltutil.refresh_pillar`. Previously, support was added so that blackouts are enabled using a special pillar key, `minion_blackout` set to `True` and an optional pillar key `minion_blackout_whitelist` to specify additional functions that are permitted during blackout. This release adds support for using this feature in the grains as well, by using special grains keys `minion_blackout` and `minion_blackout_whitelist`.

Sentry Log Handler

Configuring sentry raven python client via `project, servers, public_key` and `secret_key` is deprecated and won’t work with sentry clients > 3.0. Instead, the `dsn` config param must be used.

RAET transport

We haven’t been doing development on RAET for quite some time and decided that 2018.3.0 is the time to announce the deprecation. RAET support will be removed in Neon. Please consider to move to `zeromq` or `tcp` transport instead of `raet`.

28.2.4 Salt 2018.3.1 Release Notes

Version 2018.3.1 is a bugfix release for 2018.3.0.

Statistics

- Total Merges: 525
- Total Issue References: 74
- Total PR References: 255
- Contributors: 55 (Ch3LL, DmitryKuzmenko, Giandom, Kimol, L4rS6, LukeCarrier, OrlandoArcapix, TamCore, The-Loeki, UtahDave, aesposito91, bbinet, bdrung, boltronics, bosatsu, clan, corywright, damon-atkins, din-camihai, dmurphy18, dABic, douglasreynolds, dwoz, edgan, ejparker12, esell, ezh, femnad, folti, gareth-greenaway, gmanfred, isbm, jasperla, johnj, mateiw, mcalmer, mirceaulinic, morganwillcock, opdude, pcn, pruiz, psagers, psyer, rallytime, robinro, s0undt3ch, samodid, shengis, skjaro, tankywoo, terminalmage, twang-boy, vutny, yannj-fr, zmedico)

Warning: If you are using Jinja to dump lists or dictionaries in your SLS files, this will now cause errors in Python 2 since Jinja does not produce YAML-compatible output when strings in the data structures contain unicode types. The dictionary must be passed through a Jinja filter to produce YAML-compatible strings.

The below is an example of invalid SLS:

```
/etc/foo.conf:
file.managed:
  - source: salt://foo.conf
  - template: jinja
  - defaults: {{ mydict }}
```

To make it valid, use either one of Salt’s own `json` or `yaml` filters:
### Tornado 5.0 Support for Python 2 Only

Tornado 5.0 moves to using asyncio for all python3 versions. Because of this and changes in asyncio between python 3.4 and 3.5 to only be able to use one ioloop, which requires some rearchitecting, support for tornado 5.0 and python3 versions of salt has been delayed to a later release.

For now, to use tornado 5.0, the python 2 version of salt must be used.

### Changes to Slack Engine pillars

When using `groups_pillar_name` for the slack engine, the engine should be used as part of a salt-minion process running on the master. This will allow the minion to have pillars assigned to it, and will still allow the engine to create a LocalClient connection to the master ipc sockets to control environments.

### Changes to Automatically Updating the Roster File

In 2018.3.0 salt-ssh was configured to automatically update the flat roster file if a minion was not found for salt-ssh. This was decided to be undesireable as a default. The `--skip-roster` flag has been removed and replaced with `--update-roster`, which will enable salt-ssh to add minions to the flat roster file. This behavior can also be enabled by setting `ssh_update_roster: True` in the master config file.

### Changes to file.blockreplace State

The `append_newline` argument was added to this state. Additionally, to improve idempotence, if the string represented by `marker_end` is found in the middle of the line, the content preceding the marker will be removed when the block is replaced. This allows one to remove `append_newline: False` from the SLS and have the block properly replaced if the end of the content block is immediately followed by the `marker_end` (i.e. no newline before the marker).

**Note:** This will require changes to your SLS if your `marker_end` does not include the very beginning of the content you want to keep.

See the `file.blockreplace` state documentation for further information.

### Changelog for v2018.3.0..v2018.3.1

*Generated at: 2018-06-06 17:43:01 UTC*

- ISSUE #47955: (frogunder) 2018.3.1 Creating Windows machine in Amazon using salt-cloud fails. (refs: #47989)
- PR #47998: (rallytime) Back-port #47989 to 2018.3.1 @ 2018-06-06 17:08:04 UTC
  - PR #47989: (dwoz) Properly decode password from aws using m2crypto (refs: #47998)
- 605463ca0d Merge pull request #47998 from rallytime/bp-47989
- 1b7e9ac2d3 Lint fixes
- 0545152ddd Properly decode password from aws using m2crypto

- **PR #47965:** (Ch3LL) Add PR 47924 from 2018.3 branch @ 2018-06-06 13:54:09 UTC
  - dbc798ac68 Merge pull request #47965 from Ch3LL/gitpy_mac_3.1
  - bf608abd44 Catch all exceptions in git import for salt.utils.gitfs

- **PR #47973:** (terminalmage) salt.modules.testinframod: fix TypeError invoking types.FunctionType @ 2018-06-06 13:53:46 UTC
  - 864d640633 Merge pull request #47973 from terminalmage/fix-testinfra
  - 4518c89484 Lint: Remove unused six import
  - c6816b2149 salt.modules.testinframod: fix TypeError invoking types.FunctionType

- **ISSUE #47236:** (MorphBonehunter) x509.private_key_managed broken after upgrade to 2018.3.0 (refs: #47957)

- **PR #47967:** (rallytime) Back-port #47957 to 2018.3.1 @ 2018-06-06 13:53:28 UTC
  - PR #47957: (garethgreenaway) [2018.8] Ensure x509 passphrase is a string (refs: #47967)
  - 5ddcfff420 Merge pull request #47967 from rallytime/bp-47957
  - 9a55579af1 removing unnecessary change
  - 329b2e5956 Ensuring that when a passphrase is passed in, it is returned as a string from the passphrase callback.

- **PR #47902:** (Ch3LL) Remove In Progress for 2018.3.1 Release Notes @ 2018-05-30 18:26:49 UTC
  - 9c964fdbce Merge pull request #47902 from Ch3LL/rn_in_progress
  - f560a151cd Remove In Progress for 2018.3.1 Release Notes

- **PR #47897:** (Ch3LL) Add changelog to 2018.3.1 release notes @ 2018-05-30 15:04:42 UTC
  - ea7b4fdce0 Merge pull request #47897 from Ch3LL/rn_2018
  - e27ee273a7 Add == line to changelog line for release notes
  - 61e56d275d Add changelog to 2018.3.1 release notes

- **ISSUE #47784:** (jpsv) win_lgpo.py line 5368; AttributeError: 'OrderedDict' object has no attribute 'lower' (refs: #47848)

- **PR #47848:** (twangboy) Fix some major issues with the LGPO module @ 2018-05-30 13:37:32 UTC
  - f15e636d5e Merge pull request #47848 from twangboy/fix_47784
  - 98fac8dc8 Remove log.debug statement in __virtual__
  - f037fa4064 Fix some major issues with the LGPO module

- **PR #47881:** (gtmanfred) quote python_version in requirements.txt @ 2018-05-29 21:12:05 UTC
  - 92b8c4e08e Merge pull request #47881 from gtmanfred/2018.3.1
  - 3d874b5529 quote python_version in requirements.txt

- **PR #47874:** (gtmanfred) Tornado 5.0 is only supported on python 2 for now @ 2018-05-29 19:45:44 UTC
  - 705bf8172d Merge pull request #47874 from gtmanfred/2018.3.1
  - 13f920415a add tornado5 note to 2018.3.1
- aeacd2b749 allow tornado 5.0 to be installed only for python2

- **PR #47820**: (Ch3LL) Remove output_loglevel in mac_system module @ 2018-05-25 13:10:36 UTC
  - 09e8c5f0cd Merge pull request #47820 from Ch3LL/mac_system
  - 362414e53b Remove output_loglevel in mac_system module

- **PR #47798**: (rallytime) Back-port #47776 to 2018.3.1 @ 2018-05-23 15:10:43 UTC
  - PR #4776: (garethgreenaway) [2018.3] Fixes to failing _before_connect tests (refs: #47798)
  - 7e314c26c8 Merge pull request #47798 from rallytime/bp-47776
  - ae881547d2 Fixing unit.test_minion.MinionTestCase.test_beacons_before_connect and unit.test_minion.MinionTestCase.test_scheduler_before_connect.

- **PR #47782**: (rallytime) Back-port #47775 to 2018.3.1 @ 2018-05-22 20:56:37 UTC
  - PR #47775: (gtmanfred) catch UnsupportedOperation with AssertionError (refs: #47782)
  - 9c61da0b0c Merge pull request #47782 from rallytime/bp-47775
  - bab9c966c5 catch UnsupportedOperation with AssertionError

- **PR #47770**: (rallytime) Back-port #47769 to 2018.3.1 @ 2018-05-22 17:27:20 UTC
  - PR #47769: (gtmanfred) skip test that breaks test suite (refs: #47770)
  - 4adf10b20b Merge pull request #47770 from rallytime/bp-47769
  - 3c9b95c7bc skip test that breaks test suite

- **PR #47724**: (terminalmage) 2 master_tops/ext_nodes fixes @ 2018-05-21 15:59:04 UTC
  - bbe8e62a98 Merge pull request #47724 from terminalmage/master_tops_fixes
  - 48b8c5acd1 Merge branch '2018.3.1' into master_tops_fixes
  - 89b3070d4c Change deprecation warning to debug logging
  - ceb6e1087 Fix spurious "Malformed request" error

- **ISSUE #47484**: (whytwolf) Windows: pkg.latest state not updating packages. (refs: #47702)

- **PR #47739**: (rallytime) Back-port #47702 to 2018.3.1 @ 2018-05-21 15:37:03 UTC
  - PR #47702: (damon-atkins) State pkg.latest called win pkg.install with list of pkgs and the required versions (refs: #47739)
  - 97df6e7434 Merge pull request #47739 from rallytime/bp-47702
  - f79da64bb0 Update is.windows path to use platform
  - f04b19b5b6 Ensure targeted_pkgs always contains value for non-windows.
  - 14659f9cad Adjusted based on feedback.
  - 9b18f7cd5f Whitespace lint issues
  - 2a2b28e66 Merge pull request #47730 from rallytime/bp-47700

- **PR #47730**: (rallytime) Back-port #47700 to 2018.3.1 @ 2018-05-21 15:36:16 UTC
  - PR #47700: (yannj-fr) fix roots modification time check (refs: #47730)
  - cbe0ba73e Merge pull request #47730 from rallytime/bp-47700
9bc35b88ea fix roots modification time check

- **PR #47727**: (Ch3LL) Fix salt.utils.versions.warn_until spelling @ 2018-05-21 13:41:00 UTC
  - 3614dd83a Merge pull request #47727 from Ch3LL/spelling
  - 47a8de5b73 Fix salt.utils.versions.warn_until spelling

- **PR #47736**: (Ch3LL) mac_utils test: patch __salt__['cmd.run*'] @ 2018-05-21 13:38:59 UTC
  - bb45daafe Merge pull request #47736 from Ch3LL/fix_util_mac_test
  - ee90c779a8 mac_utils test: patch __salt__['cmd.run*']

- **PR #47641**: (gtmanfred) fix _create_stream and tornado 5.0 @ 2018-05-18 14:25:36 UTC
  - 4393088bc Merge pull request #47641 from gtmanfred/2018.3.1
  - 037f92959 fix pylint
  - 75d42d8963 Fix last test for tornado
  - a04652287 allow using tornado 5.0
  - 05e651038 fix _create_stream and tornado 5.0

- **ISSUE #47532**: (edgan) roster auto-add feature in salt-ssh-2018.3.0 (refs: #47541)

- **PR #47541**: (gtmanfred) switch skip-roster to update-roster @ 2018-05-18 13:29:50 UTC
  - 9fb2beda1 Merge pull request #47541 from gtmanfred/2018.3
  - 8c5c7029c2 switch skip-roster to update-roster

- **PR #47719**: (rallytime) Back-port #47692 to 2018.3.1 @ 2018-05-18 13:22:02 UTC
  - PR #47692: (dwoz) Default windows to m1.small for ec2-classic (refs: #47719)
  - a9631fb55 Merge pull request #47719 from rallytime/bp-47692
  - 1d9f247fb7 Default windows to m1.small for ec2-classic

- **PR #47706**: (Ch3LL) Add cmd._run_all_quiet to mac_utils and __utils__ in mac_service @ 2018-05-18 01:11:46 UTC
  - c910893ab Merge pull request #47706 from Ch3LL/mac_service_util
  - 3611af699f remove added space
  - 9921caaa13 fix pylint
  - 317e41d3c0 use cmd._run_quiet and cmd._run_all_quiet instead of importing minion_mods in __salt__
  - a78652519a Add __salt__ to mac_utils and __utils__ in mac_service

- **PR #47664**: (rallytime) Back-port #47645 to 2018.3.1 @ 2018-05-15 18:25:27 UTC
  - PR #47645: (Ch3LL) query the pip path for test test_issue_2087_missing_pip (refs: #47664)
  - fb3bf1f3 Merge pull request #47664 from rallytime/bp-47645
  - 0a732d8666 query the pip path for test test_issue_2087_missing_pip

- **PR #47647**: (rallytime) Back-port #47601 and #47643 to 2018.3.1 @ 2018-05-15 14:07:54 UTC
  - PR #47643: (dwoz) Remove unwanted file (refs: #47647)
  - PR #47601: (dwoz) Skip tests when we can not use runas (refs: #47647)
  - 9039ee104 Merge pull request #47647 from rallytime/bp-47601-and-47643-2018.3.1
- 7214fe17c8 Fix typo
- 506dceed17 Remove unwanted file
- b6a21dfda3 use ignore-undefined-variable
- 2429f9fe8a Ignore pylint WindowsError
- 2d63682fea Better doc string
- ec2adff699 Skip tests when we can not use runas

- PR #47596: (rallytime) Back-port #47568 to 2018.3.1 @ 2018-05-10 22:09:09 UTC
  - PR #47568: (terminalmage) salt.serializers.yaml/yamlex: remove invalid multi_constructor (refs: #47596)
  - 17b5265d95 Merge pull request #47596 from rallytime/bp-47568
  - ec5dc8b9f Add exception logging on serialize/deserialize exceptions
  - 9659b19819 salt.serializers.yaml/yamlex: remove invalid multi_constructor

- PR #47595: (rallytime) Back-port #47569 to 2018.3.1 @ 2018-05-10 22:08:53 UTC
  - PR #47569: (Ch3LL) Update salt.utils.path mock in virtual core test (refs: #47595)
  - 718252c1ef Update salt.utils.path mock in virtual core test

- PR #47599: (rallytime) Back-port #47570 to 2018.3.1 @ 2018-05-10 22:06:44 UTC
  - PR #47570: (gtmanfred) Update dependency to msgpack (refs: #47599)
  - 9334c03da9 Update dependency to msgpack

- PR #47550: (pcn) Fixes a bad deletion I did that only surfaced in 2018.3 @ 2018-05-09 13:36:33 UTC
  - d58a56877c Fixes a bad deletion I did that only surfaced in 2018.3

- ISSUE #47553: (douglasjreynolds) Unicode version error in lxc (refs: #47554)

- PR #47554: (douglasjreynolds) Converted unicode str version to a LooseVersion; matching line 2080. @ 2018-05-09 13:34:13 UTC
  - f9083f77e Merge pull request #47554 from douglasjreynolds/lxc_unicode_fix
  - e6bce581c6 Converted unicode str version to _LooseVersion to match line 2080.

- PR #47518: (Ch3LL) Fix 47364: ensure we are not caching zfs.is_supported @ 2018-05-09 13:29:07 UTC
  - fe4e79f1de Merge pull request #47518 from Ch3LL/zfs_support
  - d19fe963e remove unnecessary patch in zfs.is_supported test
  - 58c4f29f96 Fix 47364: ensure we are not caching zfs.is_supported

- PR #47159: (terminalmage) Fix for whitelist/blacklist checking for non-list iterables @ 2018-05-08 20:43:51 UTC
- 332e9f13a6 Merge pull request #47159 from terminalmage/whitelist_blacklist-iter-fix
- ca936de372 Treat empty whitelist/blacklist as no whitelist/blacklist
- bcccaf2621 Raise a TypeError when invalid input passed to check_whitelist_blacklist
- 2ae510ff2b Fix comment in test
- 17398efcf7 Fix for whitelist/blacklist checking for non-list iterables

- **PR #47514**: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-05-08 18:36:54 UTC
  - 21809ddc02 Merge pull request #47514 from rallytime/merge-2018.3
  - e2616b605f Update the pip tests to use the parsing syntax generated in PR #47196
  - b13b59791f Remove double instance of adding --format=json in pip module
  - 2ad60c7e81 Lint: remove duplicate function in helpers.py
  - 75480158b3 Lint: cur_version should just be pip_version
  - 5565d5e9b1 Update old utils paths with new utils paths
  - 786076ac03 Merge branch '2017.7' into '2018.3'
    * 611ca1fc03 Merge pull request #47476 from gtmanfred/2017.7
      - 1f91a85587 specify cache dir for pip install
      - 99e150e09c check for kitchen-vagrant gem before loading windows tests
    * 7c3f2c56da Merge pull request #47412 from twangboy/fix_47125
      - c9bab0b83e Merge branch '2017.7' into fix_47125
      - 2600e404d5 Fix overly long line
      - 5c8db05769 Fix issue where the cwd was being removed
    * 4846e957c4 Merge pull request #47467 from twangboy/cleanup_settings
      - 9d498293b1 Remove unused settings, update NSIS
    * da9871d36b Merge pull request #47196 from twangboy/fix_47024
      - 14ee5537b9 Add @with_tmpdir helper
      - 6c3b5fa6fa Fix typo
      - f031710af2 Merge branch '2017.7' into fix_47024
      - 7c46d9d0d4 Fix integration.modules.test_pip
      - 22ac81df63 Fix integration.modules.test_pip
      - 57d98224d4 Merge pull request #9 from terminalmage/twangboy/fix_47024
      - 37a13d8004 Update pip unit tests to reflect changes
      - 7f86779be0 Lint fix
      - c48d8f4f61 DRY and other fixes in pip module
      - b1117896a0 Change from global variable to __context__
      - 3e6e524eca Fix some tests
      - c94f0f20e4 Fix lint error
      - fd47b21530 Fix merge conflict
* e8c4524bae Merge pull request #47455 from Ch3LL/unreleased_rn
  - b6d0cc2ab7 Add In Progress Warning for 2017.7.6 Release Notes
* 2c7a4b6179 Merge pull request #47459 from gtmanfred/2017.7
  - d228e72477 update ubuntu-rolling to 18.04
* 64a64e0ed7 Merge pull request #47462 from terminalmage/docs
  - 6d7803ece0 Fix docs build on Sphinx 1.7+
* 6cd0d31c03 Merge pull request #47438 from lomeroe/double_admx_test
  - 4902f1e2ba check if a policy has either an enabled value or enabled list entry or a disabled value or disabled list entry when determining the state of the policy
* ed69821d19 Merge pull request #47433 from s0undt3ch/2017.7
  - 5abadf25d6 Add missing requirements files not commited in #47106

• ISSUE #47443: (skylarberg) Input validation does not raise SaltInvocationError in win_dsc.py (refs: #47505)
• PR #47516: (rallytime) Back-port #47505 to 2018.3 @ 2018-05-08 13:32:33 UTC
  - PR #47505: (dwoz) Raise proper invocation errors (refs: #47516)
  - 9559a7679 Merge pull request #47516 from rallytime/bp-47505
  - 7c60e4071e Raise proper invocation errors
• ISSUE #47502: (psagers) service.enable (and .disable) destroys /etc/rc.conf on FreeBSD (refs: #47503)
• PR #47515: (rallytime) Back-port #47503 to 2018.3 @ 2018-05-08 13:32:03 UTC
  - PR #47503: (psagers) Fix #47502: Remove an extraneous (accidentally introduced?) call to rstrip() (refs: #47515)
  - bf79acfb8 Merge pull request #47515 from rallytime/bp-47503
  - 821db88a0 Fix #47502: Remove an extraneous (accidentally introduced?) call to rstrip.
• ISSUE #47511: (joesusecom) sshconfig salt-ssh roster is missing in the documentation (refs: #47531)
• PR #47531: (gtmanfred) add ssh config doc for rosters @ 2018-05-07 22:26:30 UTC
  - 779b3ed056 Merge pull request #47531 from gtmanfred/2018.3
  - 92ded7162c add ssh config doc for rosters
• PR #47520: (rallytime) Cleanup weird spaces @ 2018-05-07 19:50:58 UTC
  - 95b2f9db30 Merge pull request #47520 from rallytime/cleanup-spaces
  - e9cb080a00 Cleanup weird spaces
• PR #47495: (dwoz) Fix crufty nssm.exe reference @ 2018-05-07 19:12:49 UTC
  - 05fc52f124 Merge pull request #47495 from dwoz/uninstall_wart
  - caa36c9064 Merge branch '2018.3' into uninstall_wart
• ISSUE #47322: (masau) lxc clone not working (refs: #47494)
• PR #47494: (ejparker12) Fixed lxc.clone unhandled exception in salt/modules/lxc.py @ 2018-05-07 19:03:58 UTC
  - 3cc7d3ae7c Merge pull request #47494 from ejparker12/fix-lxc-clone
  - e0e2c9782d Fixed lxc.clone unhandled exception in salt/modules/lxc.py
• ISSUE #47496: (mateiw) salt-ssh --extra-filerefs doesn’t include any files if no refs in state files (refs: #47497)
• PR #47497: (mateiw) Fix salt-ssh –extra-filerefs to include files even if no refs in states to apply @ 2018-05-07 19:02:50 UTC
  - adde83f639 Merge pull request #47497 from mateiw/2018.3-fix-salt-ssh-extras-refissue-47496
  - d67239ae7 –extra-filerefs include files even if no refs in states to apply
• ISSUE #47404: (shengis) Localized version of yum breaks pkg.install (refs: #47441)
• PR #47441: (shengis) Fix _run to reset LANGUAGE env variable @ 2018-05-07 18:29:25 UTC
  - 34b1b1ee53 Merge pull request #47441 from shengis/fix-run-env-reset
  - 62fc16b721 Merge branch '2018.3' into fix-run-env-reset
  - 3b02b0bdc1 Merge branch '2018.3' into fix-run-env-reset
  - ee2ab38c8c Fix _run to reset LANGUAGE env variable
• ISSUE #47479: (whytewolf) win_task.info on py3 throwing error, but works in py2 (refs: #47507)
• PR #47507: (gtmanfred) fix win_task for py3 @ 2018-05-07 17:41:21 UTC
  - 17cfdf4f7c Merge pull request #47507 from gtmanfred/2018.3
  - 19db39f402 fix win_task for py3
• PR #47472: (terminalmage) salt.utils.hashutils: Fix UnicodeEncodeError in several funcs @ 2018-05-07 13:31:07 UTC
  - a4c2df8f2b Merge pull request #47472 from terminalmage/hashutils
  - 7266c9984d salt.utils.hashutils: Fix UnicodeEncodeError in several funcs
• PR #47485: (gtmanfred) add openstack modules to doc index.rst @ 2018-05-07 13:11:42 UTC
  - 8b0a370189 Merge pull request #47485 from gtmanfred/2018.3
  - c86163d79f add openstack modules to doc index.rst
  * 3557fc5fa6 Fix crufty nssm.exe reference
• PR #47482: (gtmanfred) add all autodoc for new salt openstack modules @ 2018-05-04 21:03:38 UTC
  - 8df37f734a Merge pull request #47482 from gtmanfred/2018.3
  - f65d5cb73 add all autodoc for new salt openstack modules
• PR #47447: (dwoz) Fix failing test due to windows console encoding @ 2018-05-04 16:41:29 UTC
  - db20ca15c5d Merge pull request #47447 from dwoz/strv
  - 8e01773833 Use the same non decodable bytes for all tests
  - 983881a2a1 Add bytes that will not decode using cp1252
• PR #47466: (dwoz) bytes file that decodes the same utf-8 and cp1252 @ 2018-05-04 15:54:24 UTC
  - 8c5b30b541 Merge pull request #47466 from dwoz/randbytes
  - fd9bc06aab bytes file that decodes the same utf-8 and cp1252
• ISSUE #46660: (mruepp) top file merging same does produce conflicting ids with gitfs (refs: #47354, #46751)
• PR #47465: (rallytime) Back-port #47354 to 2018.3 @ 2018-05-04 13:06:04 UTC
  - PR #47354: (folti) fix forward port of #46751 (refs: #47465)
  - PR #46751: (folti) top file merging strategy 'same' works again (refs: #47354)
  - 3658604c43 Merge pull request #47465 from rallytime/bp-47354
– 3df6fa7990 fix forward port of #46751

• **PR #47435: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-05-04 13:05:32 UTC**
  – fa293f8fac Merge pull request #47435 from rallytime/merge-2018.3
  – be0731da5f Add skipIfs back in for rest_tornado tests
  – fd98ee3dc1 Lint: Add missing blank line
  – 561718b20b Update old is_windows utils path to new utils path
  – a94c4df8a0d Merge branch '2017.7' into '2018.3'
    • 7ae3497b0c Merge pull request #47429 from gtmanfred/2017.7
      • 8ae32033cc server_list_min should use state, not status
    • 2f5fc4ecc5 Merge pull request #47399 from isbm/isbm-zeromq17-deprecationwarning-2017.7.2-v2
      • a36e49fd27 fix pylint
      • 98b5629b36 Fix imports
      • d94c0f0152 Remove unnecessary variable
      • 8e377b5653 Lintfix: E0203 and attribute access
      • 2aab70b1b8 Install ZMQ handler if >15 version
      • 296ec589f4b Use ZMQ switch utility in the integration tests
      • ab5fa34d7c Use ZMQ_VERSION_INFO constant everywhere
      • 43b5558b82 Add trace logging on ZMQ sockets communication
      • 164204a9fe Remove duplicate code for ZMQ monitor handling
      • 834b1e4ff0 Remove obsolete ZMQIOLoop direct instance
      • 1c90cbdb3c Remove an empty line
      • ef2e0adc66 Add logging on ZMQ socket exception
      • 38ceed371d Lintfix: ident

      • e2a353c0b0 Remove unnecessary ZMQ extra-check for cache utils
      • c8f2cc271d Remove unnecessary ZMQ extra-check for master utils
      • 3940667bb9 Remove old ZMQ import handling
Salt Documentation, Release 2019.2.0

- f34a53e029 Use ZMQ utility for version check
- cbb26dcbb8 Use ZMQ installer for master
- 453e83210a Add ZMQ version build
- af9601e21d Use ZMQ importer utility in async
- d50b2b2023 Incorporate tornado-5 fixes
- 1fd9a0655 Add ZMQ backward-compatibility tornado installer for older versions
- ad4b0415c Add one place for handling various ZMQ versions and IOLoop classes

- b14e974b5f Merge pull request #47343 from Ch3LL/win_srv_test
  - 2173b6f549 ensure we are enabling/disabling before test
  - d5b006751 Add additionatl service module integration tests and enable for windows

- b0f3fb577f Merge pull request #47375 from terminalmage/issue47310
  - fa2bea52bb Remove extra blank line to appease linter
  - f8ab2be81c Add debug logging if we fail to detect virtual packages
  - 67c4fc56ac Warn on use of virtual packages in pkg.installed state

- 56235032f4 Merge pull request #47415 from kstreee/fix-local-client-tgt-bug
  - b8d37e0a1e To add a test case for the syndic environment, copies the test case which was written by @mattp- that was already merged into develop branch, related pr is #46692.
  - 4627bad1fd Realizes 'tgt' field into actual minions using ckminions to subscribe results of the minions before publishing a payload.

- d65ceae03 Merge pull request #47286 from baniobloom/vpc_peering_connection_name_fix
  - a968965087 Merge branch '2017.7' into vpc_peering_connection_name_fix

- 8a5d4437bb Merge pull request #47270 from meaksh/2017.7-fix-retcode-on-schedule-utils
  - d299cf3385 Merge branch '2017.7' into 2017.7-fix-retcode-on-schedule-utils
  - b6da600fff Initialize __context__ retcode for functions handled via schedule util module

- 5b51075384 Merge pull request #47371 from rallytime/fix-47264
  - a43485b49c Fix "of pass" typo in grains.delval docs: change to "or pass"

- a86e53be66 Merge pull request #47389 from dwoz/moregittestfix
  - 67745c1362 Older GitPython versions will not have close

- a5367ea6f63 Merge pull request #47388 from dwoz/test_pip_fix
  - eb26321e8b Fix missing import

- 9b59b991c2 Merge pull request #47380 from gtmanfred/2017.7
  - 93d1445ec1 add io_loop handling to runtests engine

- 37822c0cbb Merge pull request #47384 from dwoz/test_pip_fix
  - a379a9da1fb Fix py2 version of pip test

- eefd96732e Merge pull request #47382 from dwoz/gitfs_tests
  - 1570708fac Close the repo and fix multiple tests

- 57c75ff660 Merge pull request #47369 from terminalmage/ldap_piller
085883ae2d Return an empty dict if no search_order in ldap ext_pillar config file

bcc66d9bf Merge pull request #47363 from DSRCorporation/bugs/replace_exc_info_with_exception

3f7b93a23c Tornado5.0: Future.exc_info is dropped

bcef34f7e1 Merge pull request #47334 from terminalmage/ldap_pillar

0175a8687c pillar_ldap: Fix cryptic errors when config file fails to load

65c3ba7ff1 Remove useless documentation

5d67cb27de Remove unnecessary commented line

8de3d41adb fixed vpc_peering_connection_name option

PR #47464: (dwoz) Skip tests not applicable to windows @ 2018-05-04 13:04:38 UTC

51d21af4d4 Merge pull request #47464 from dwoz/skip_syslog_tests

c9393b7fbf Skip tests not applicable to windows

PR #47456: (dwoz) Sysname returns text type @ 2018-05-04 02:57:50 UTC

3219430dce Merge pull request #47456 from dwoz/sysname

559e0e1961f Sysname returns text type

PR #47458: (Ch3LL) Add In Progress Warning for 2018.3.1 Release Notes @ 2018-05-03 20:40:46 UTC

f39185147a Merge pull request #47458 from Ch3LL/unreleased_rn_2018

6a261e5e3a Add In Progress Warning for 2018.3.1 Release Notes

PR #47448: (dwoz) Fix missing import in test suite @ 2018-05-03 14:30:23 UTC

9bdce994 Merge pull request #47448 from dwoz/transport_import

7e04eb82e1 Fix missing import in test suite

ISSUE #47260: (mew1033) disable_saltenv_mapping not working as expected (refs: #47410)

PR #47410: (terminalmage) gitfs: Fix identification of base env when saltenv mapping is disabled @ 2018-05-03 14:12:27 UTC

157a32a7f7 Merge pull request #47410 from terminalmage/issue47260

3ab332ad0e Update tests to reflect bugfix

7b8127f336 gitfs: Fix identification of base env when saltenv mapping is disabled

PR #47413: (dmurphy18) Repobuild improvements for Ubuntu 18.04 lack of gpg2 and better error checking @ 2018-05-02 16:21:31 UTC

091e4cf9a6 Merge pull request #47413 from saltstack/reobuild_improv

c064032110 Removed extra spaces for pylint

20c50b3331 Minor cleanup due to review comments

c143b599e9 Update for Ubuntu 18.04 lack of gpg2 and enhanced error checking

PR #47216: (twangboy) Reg docs @ 2018-05-02 13:33:27 UTC

5e5774fd37 Merge pull request #47216 from twangboy/reg_docs

0beb58b16 Fix lint, add bytes

bad441f8dc Fix some lint’
- af5139c2ff Add additional examples
- 24df6ec1b7 Additional docs formatting
- ff46b27a60 Update reg docs, fix formatting issues

- **PR #47417**: (gtmanfred) revert instantiating a Caller Client in the engine @ 2018-05-01 18:58:06 UTC
  - 63baf4e4f8 Merge pull request #47417 from gtmanfred/slack
  - 5c8ea7f506 Update slack.py
  - ee8a5eeb10 revert instantiating a Caller Client in the engine

- **ISSUE #45790**: (bdarnell) Test with Tornado 5.0b1 (refs: #46066, #47106, #47433)

- **PR #47368**: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-05-01 18:56:20 UTC
  - **PR #47106**: (DmitryKuzmenko) Tornado50 compatibility fixes (refs: #47374, #47368, #47433)
  - **PR #46002**: (isbm) Pyzmq 17.0.0 proper handling (refs: #47374, #47368)
  - 0bdffaa5ffe Merge pull request #47368 from rallytime/merge-2018.3
  - 4680e5959b Update test assertion comment for pip pkgs
  - d9d24de49e Lint: Add missing import
  - c7b73d132e Merge branch '2017.7' into '2018.3'
    - 31db8ca7ad Merge pull request #47347 from dwoz/test_mysql_fix_again
      - add78fb618 Fix linter warnings
      - 264a3cc7553 Fix linter nits
      - 799c601184 Proper fix for mysql tests
  - fefc0cc53ca Update old utils paths to use new utils paths
  - 13e8124031 Merge branch '2017.7' into '2018.3'
    - e573236848 Merge pull request #47359 from gtmanfred/2017.7
      - 6214ed8133 add mention of the formulas channel to the formulas docs
    - 629503b2a8 Merge pull request #47317 from dwoz/threadshutdown
      - 6db2a0e4d3 Log exceptions at exception level
      - d4ae787595 Do not join a thread that is stopped
  - aacd5cfe3 Merge pull request #47304 from cachedout/test_cli_timeout_arg
    - 85025a83c Pass timeout to salt CLI for tests
  - 55534f6b59 Merge pull request #47311 from Ch3LL/firewall_windows
    - 4e16c18c16 Add firewall module windows tests to whitelist
    - 4b2f4e6c6 Add windows firewall execution modules integration tests
  - 1667375a80 Merge pull request #47348 from dwoz/no_symlinks
    - 94a70e847a Ignore gits tests when symlinks not enabled
  - dac04261b5 Merge pull request #47342 from dwoz/test_mysql_fix
    - 749645c5a8 Fix mysql test cases
  - 34e78ef564 Merge pull request #47341 from dwoz/inet_pton_fix
- 8545f48d4 Fix python 3 support for inet_pton function
- e4779f3246 Merge pull request #47339 from dwoz/ssh_key_test_fix
  - e37a93a1ca Remove redundant close call
  - b2ae5889b7 Close the temporary file handle
  - 9f7f83a975 Use salt.utils.fopen for line ending consistancy
- b221860151 Merge pull request #47335 from dwoz/pip_test_fix
  - dcb6a22c00 Remove un-needed string-escape
- 1c527bfd3a Merge pull request #47331 from dwoz/py3_wingroup_fix
  - cc154ef857 Do not encode usernames
- 708078b152 Merge pull request #47329 from cachedout/frank_credit
  - 33c064ac4 Credit Frank Spierings
- a545e55543 Merge pull request #47281 from Ch3LL/system_test
  - c9181a75a6 Add destructivetest decorator on tests
  - 0d0c8987fc Add win_system integration module tests
- b64d930df0 Merge pull request #47283 from Ch3LL/ntp_test
  - ced7f86546 Add windows ntp integration module tests
- 910aff910f Merge pull request #47314 from Ch3LL/net_mac_test
  - 67beb1451c Skip netstat test on macosx as its not supported
- 0549ef7c16 Merge pull request #47307 from rallytime/bp-47257
  - 6c5b2f92bc Role is not a list but a dictionary
- d6ff4689f6 Merge pull request #47312 from rallytime/update-bootstrap-release
  - 765cc06a2 Update bootstrap script to latest release: 2018.04.25
- e0765f5719 Merge pull request #47279 from dwoz/py3_build_fix
  - 21dc1bab91 Pep-8 line endings
  - 717abeda77 Fix common wart
  - 400cdd64c Close might get called more than once
  - dbe67f943 Stop socket before queue on delete
  - 9587f5c69e Silence pylint import-error for six.moves
  - 4b0c7d3b34 Fix typo
  - 05ad7c2b1 Use six.moves for queue import
  - fe340778fa Gracefully shutdown worker threads
- 44f1bf29f4 Merge pull request #47113 from jfindlay/iptables_state
  - 8bd08012ee modules,states.iptables support proto for policy ext
- b7a6206330 Merge pull request #47302 from Ch3LL/dead_code
  - daa68b4877 Add virtual grains test for core grains
  - a59dd2785d Remove dead code in core grains file for virt-what

28.2. Previous Releases
3984  Chapter 28. Release Notes

- e29362acfc Merge pull request #47303 from baniobloom/bug_fix_doc
  - b97c9df5f3 added clarity on how to figure out what is the oldest supported main release branch
- 0d9d55e013 Merge pull request #47106 from DSRCorporation/bugs/tornado50
  - 39e40b1d8d Merge branch '2017.7' into bugs/tornado50
  - 6706b3a2d1 Run off of a temporary config
  - d6873800d5 Allow running pytest>=3.5.0
  - 2da393740 Tornado 5.0 compatibility fixes
- e290e4746 Merge pull request #47271 from gtmanfred/amazon
  - 8a53908908 Do not load rh_service module when booted with systemd
  - e4d1d5b11 Revert "support amazon linux 2 for service module"
- 59b96ed1e9 Merge pull request #47246 from cloudflare/fix-44847-2017.7
  - ad80028104 This way, we can pass flags such as debug into the state, but also test.
- 4e21f0719 Merge pull request #47220 from benediktwerner/fix-pip-2017.7
  - 0197c3e973 Fix pip test
  - 34bf66c09f Fix pip.installed with pip>=10.0.0
- 92e606251f Merge pull request #47272 from rallytime/req-windows-codeowners
  - 9445af0185 Add windows tests and reg module/state to CODEOWNERS file for team-windows
- 9dca5c0221 Merge pull request #47252 from rallytime/codeowners-fixes
  - 204ba92bf Fix the matching patterns in the CODEOWNERS file to use fnmatch patterns
- 3de1bb49c8 Merge pull request #47177 from fpicot/fix_47173_pkg_normalize
  - 149f84f34 fix normalize parameter in pkg.installed
- 10e30515dc Merge pull request #47251 from Ch3LL/pub_fix_rn
  - fa4c2e6575 Update Docs to remove unnecessary + sign
- bb7850a431 Merge pull request #47249 from Ch3LL/pub_fix_rn
  - 24de24b7e Add CVE number to 2016.3.6 Release
- 5693ebe0b2 Merge pull request #47227 from pruiz/pruiz/zfs-dataset-present-slow-2017.7
  - fded61f198 Fix issue #47225: avoid zfs.filesystem_present slowdown when dataset has lots of snapshots
- 9825065048 Merge pull request #47167 from smitty42/vbox-skdfix
  - 5de53139cd Merge branch '2017.7' into vbox-skdfix
- 976f031170 Merge pull request #47213 from dwoz/py3win
  - ad9c7f63f0 Fix coverate on py3 windows builds
  - 91252bac95 Adding updates for python3 compatibility and new virtualbox SDK version support.
- cebcd6d069 Merge pull request #47197 from dwoz/testfix
25803c9176 Move process target to top level module namespace
  * d4269c2b70 Merge pull request #47193 from Ch3LL/network_test
    * bbf9987c19 Add network module integration tests
  * c777248a78 Merge pull request #47189 from Ch3LL/autoruns
    * 6a88bedb7a Add autoruns to windows whitelist
    * e9e4d4af70 Add autoruns.list integration test for Windows

**PR #47403:** (rallytime) Back-port #47356 to 2018.3 @ 2018-05-01 15:19:06 UTC
  - **PR #47356:** (robinro) Fix syscall translate (refs: #47403)
  - 4e6870305c Merge pull request #47403 from rallytime/bp-47356
  - 9b682bc48e Fix syscall translate

**PR #47407:** (terminalmage) Reduce severity of missing X_update_interval key @ 2018-05-01 15:18:46 UTC
  - 7e0cdd6145 Merge pull request #47407 from terminalmage/update-interval-log
  - abc592bfff Reduce severity of missing X_update_interval key

**ISSUE #47042:** (valentin2105) [ERROR] Unable to manage file: 'utf8' codec can’t decode byte (refs: #47061)

**PR #47405:** (terminalmage) Fix file.get_diff regression in 2018.3 branch @ 2018-05-01 15:16:46 UTC
  - **PR #47061:** (terminalmage) Fix diffing binary files in file.get_diff (refs: #47405)
  - 1377942bcc Merge pull request #47405 from terminalmage/binary-diff
  - 89ddb08026 Use a lambda instead of defining a one-line function
  - b79ff04fda Remove no-longer-used enumerate
  - e03b865359 Add unit test for file.get_diff
  - 5bd9c9e9bd5 Fix UnboundLocalError in file.get_diff

**ISSUE #47325:** (robertodocampo) docker_container.running creates containers using the image ID as the image name (refs: #47367)

**PR #47367:** (terminalmage) Start docker containers with image name instead of ID @ 2018-04-30 18:46:13 UTC
  - c267e6083e Merge pull request #47367 from terminalmage/issue47325
  - 798134aa2a Add regression test for creating images with image name instead of ID
  - 4ed47e839e Start docker containers with image name instead of ID

**ISSUE #47006:** (cedwards) marathon & fx2 grain modules cause master and minion failure (refs: #47401)

**PR #47401:** (gtmanfred) fix proxy virtual checks for marathon and fx2 @ 2018-04-30 18:44:46 UTC
  - 3bb00cb55 Merge pull request #47401 from gtmanfred/proxy
  - 99f9231759 fix proxy virtual checks for marathon and fx2

**PR #47397:** (rallytime) Add 2018.3.1 Release Notes @ 2018-04-30 14:44:38 UTC
  - c1460f36ce Merge pull request #47397 from rallytime/2018.3.1-release-notes
  - 3b40cdad2a Add 2018.3.1 Release Notes

**ISSUE #45790:** (bdarnell) Test with Tornado 5.0b1 (refs: #46066, #47106, #47433)

**PR #47374:** (DmitryKuzmenko) tornado50 merge forward for 2018.3 @ 2018-04-29 16:20:12 UTC
- PR #47106: (DmitryKuzmenko) Tornado50 compatibility fixes (refs: #47374, #47368, #47433)
- PR #46002: (isbm) Pyzmq 17.0.0 proper handling (refs: #47374, #47368)
- 3400f829c4 Merge pull request #47374 from DSRCorporation/bugs/tornado50-2018.3
- 40099c54f4 fix pylint
- 47b6d409d1 add io_loop handling to runtests engine
- fd0f4f7d7d use salt.utils.zeromq
- 4ae335c559a Run off of a temporary config
- 7938b4906e Allow running pytest>=3.5.0
- 34058c181e Tornado 5.0 compatibility fixes

• ISSUE #47124: (mchugh19) Vault module problem in 2018.3.0 (refs: #47379)

• PR #47379: (dwoz) Properly encode messages when creating/validating signatures with m2crypto @ 2018-04-28 08:38:23 UTC
  - 2afe4bee95 Merge pull request #47379 from dwoz/m2crypto_regression
  - 0682d4306d Always sign and verify bytes
  - 7810ebaba9 Add sign regression tests
  - f444133ac1c Adding regression test for 47124

• PR #47277: (morganwillcock) Fix minion crash on NetBSD @ 2018-04-27 15:02:21 UTC
  - 7390b72808 Merge pull request #47277 from morganwillcock/netbsdswap
  - 0bcba079a Merge branch ’2018.3’ into netbsdswap
  - 30478e8e9c Use swapctl for NetBSD

• PR #47320: (twangboy) Change from NSSM to SSM @ 2018-04-27 14:37:50 UTC
  - 2b7c7ef704 Merge pull request #47320 from twangboy/win_ssm
  - 5549d83aae Use ssm instead of nssm

• PR #47308: (rallytime) Back-port #47287 to 2018.3 @ 2018-04-27 13:50:49 UTC
  - PR #47287: (esell) convert unicode ssh pass to str for azure (refs: #47308)
  - b6df5facce Merge pull request #47308 from rallytime/bp-47287
  - 5f392a23fe convert unicode ssh pass to str for azure

• ISSUE #47324: (rlschilperoort) archive.extracted keep and/or keep_source not working (refs: #47332)

• PR #47332: (garethgreenaway) [2018.3] Removing duplicate code from state/archive.py @ 2018-04-27 13:12:51 UTC
  - efa3a8b800 Merge pull request #47332 from garethgreenaway/47324_archive_extracted_keep_keep_source
  - cc10bfe6b6 Removing redundant code which is preventing keep & keep_source from being set.

• PR #47326: (The-Loeki) Some Redis fixes @ 2018-04-26 17:12:47 UTC
  - 245d62ca16 Merge pull request #47326 from The-Loeki/redis-cache-sockets
  - d86be5bddd redis_return: add unix_socket_path to docs
  - ee9533765 redis_cache: document UNIX socket access
  - 5337558a5a redis_return: Let redis handle pool creation, add UNIX socket support
- c90f83b0f9 redis_return: cluster_mode default to False in __virtual__ to prevent KeyError stacktraces
- 71e3286829 redis_return: Fix code blocks in docs
- e6605f1c78 redis_cache fix code box in docs
- 40e67747ee redis_cache: add socket to options

- **PR #47319**: (dwoz) Skip unix group tests on windows. @ 2018-04-26 15:59:35 UTC
  - 27a438f0ff Merge pull request #47319 from dwoz/skip_tests
  - d9442d043e Skip tests not applicable to windows

- **PR #47293**: (dwoz) The grp module is not available on windows @ 2018-04-25 20:22:34 UTC
  - 057f668788 Merge pull request #47293 from dwoz/win_build_fix
  - 0386216005 Fix sneaky indentation
  - 082b8d0b3d Use salt.utils.platform
  - cc2538e08f The grp modules is not available on windows

- **ISSUE #46862**: (kivoli) Setting locale.system fails in 2018.3 (refs: #47280, #46869)

- **PR #47280**: (gtmanfred) make sure not to send invalid information @ 2018-04-25 17:46:45 UTC
  - fff4f8c1a5 Merge pull request #47280 from gtmanfred/localectl
  - 7c212ceb2d fix pylint
  - 6754787e8e update localemod tests
  - 9075070573 make sure not to send invalid information

- **ISSUE #46977**: (gtmanfred) [2018.3.0] Backwards compatability breaking change in 2018.3.0 (refs: #47038)

- **PR #47038**: (garethgreenaway) [2018.3] fix to fileclient.py @ 2018-04-25 14:57:04 UTC
  - 205701dcbe Merge pull request #47038 from garethgreenaway/46977_fixing_fileclient_forward_compatibility
  - ba01d2133a Updating version.py to include Magnesium.
  - 10e823dd79 The _ext_nodes master function has been renamed to _master_tops. To ensure compatibility when using older Salt masters we continue to pass the function as _ext_nodes until the Magnesium release.

- **ISSUE #47059**: (OrlandoArcapix) Some states incorrectly return None instead of an empty dict when there are no changes (refs: #47060)

- **ISSUE #46985**: (OrlandoArcapix) grafana4_user.present and grafana4_org.present states not working in 2018.3.0 (refs: #47048)

- **PR #47060**: (OrlandoArcapix) Return an empty dict for 'changes' instead of 'None' @ 2018-04-25 14:55:24 UTC
  - **PR #47048**: (OrlandoArcapix) Issue46985 fix grafana4 state (refs: #47060)
  - 89daf4fdc7 Merge pull request #47060 from OrlandoArcapix/Issue47059-return_dict_from_state
  - 5378e4fd07 Update grafana_datasource test to check for empty dict being returned on no changes, rather than None
  - f11542653 Return an empty dict for 'changes' instead of 'None'

- **ISSUE #47089**: (syphernl) UnicodeDecodeError: 'ascii' codec can’t decode byte 0xc3 in position 404: ordinal not in range(128) (refs: #47155)

- **PR #47153**: (terminalmage) salt.modules.ssh: properly encode/decode I/O @ 2018-04-25 14:53:51 UTC
ISSUE #47199: (tkaehn) Targeting by list (-L) broken for minions behind syndic? (refs: #47275)

PR #47275: (terminalmage) Fix false failure events sent when using syndic @ 2018-04-25 13:56:47 UTC

- b5d64f1a70 Merge pull request #47275 from terminalmage/issue47199
- 8012ada12f Fix false failure events sent when using syndic

ISSUE #47267: (skjaro) Problem with beacon diskusage on windows platform in 2018.3 (refs: #47284)

PR #47284: (skjaro) Fix beacon diskusage documentation for the new behavior mentioned in issue #47267 @ 2018-04-25 13:52:30 UTC

- 6215a995d8 Merge pull request #47284 from skjaro/beacon_diskusage_doc_fix
- fcc042aa5f Fix beacon documentation for the new behavior mentioned in issue #47267

PR #47291: (bosatsu) Fix proxy minion beacon doc @ 2018-04-25 13:42:36 UTC

- 3ef4fe6ed2 Merge pull request #47291 from bosatsu/fix-proxy-minion-beacon-doc
- 019804a4c3 Fix topics/releases/2018.3.0.rst to include correct example of proxy_example beacon yaml configuration.
- 9682e26ec5 Fix topics/proxyminion/beacon.rst to include correct example of salt_proxy beacon yaml configuration.

ISSUE #47239: (bosatsu) Unable to load salt_proxy beacon on minion in 2018.3.0 (refs: #47255)

PR #47255: (garethgreenaway) [2018.3] Fixes to salt_proxy beacon and beacon tests @ 2018-04-25 13:41:51 UTC

- ea2d88b865 Merge pull request #47255 from garethgreenaway/47239_fixes_to_salt_proxy_beacon
- a2a8d78cb0 Fixing status beacon tests.
- c87d6c8235 Ensure the salt_proxy is returning the correct tuple when the configuration is valid. Update various beacon unit tests to ensure they are testing the results of the validate function for a True result.

PR #47292: (dwoz) Fix decorator wart @ 2018-04-25 04:25:23 UTC

- PR #47290: (dwoz) Run cache_master test in tmp dir (refs: #47292)
- 19fe8258f Merge pull request #47290 from dwoz/cp_fix_again
- 7d045eb235 Fix decorator wart

PR #47285: (dwoz) Fix reg grains test @ 2018-04-25 00:16:56 UTC

- da532a1ac Merge pull request #47285 from dwoz/core_test_fix
- 884f4c1829 Fix extra space
- 8a9027c0c9 Fix reg grains test

PR #47290: (dwoz) Run cache_master test in tmp dir (refs: #47292) @ 2018-04-24 23:37:21 UTC

- f591c6f643 Merge pull request #47290 from dwoz/test_cp_fix
- 5ff51affb0 Run cache_master test in tmp dir

ISSUE #47092: (syphernl) [2018.3.0] pkg.installed breaks with virtual packages (refs: #47250)

ISSUE #38838: (Zorlin) Failing to remove nginx (refs: #44455)

PR #47250: (terminalmage) Fix virtual package detection @ 2018-04-24 19:22:24 UTC
- PR #44455: (samodid) Fix for #38838 (refs: #47250)
- 6d323aa8f0 Merge pull request #47250 from terminalmage/issue47092
- b8630a70be Fix virtual package detection

- **ISSUE #47225**: (pruiz) zfs.filesystem_present takes forever on a dataset with lots (10k+) of snapshots (refs: #47228, #47227, #47226)
- **PR #47228**: (pruiz) Fix issue #47225: avoid zfs.filesystem_present slowdown when dataset has lots of snapshots (2018.3 branch) @ 2018-04-24 13:35:21 UTC
  - PR #47226: (pruiz) Fix issue #47225: avoid zfs.filesystem_present slowdown when dataset has lots of snapshots (refs: #47228, #47227)
  - 428e915d6a Merge pull request #47228 from pruiz/pruiz/zfs-dataset-present-slow-2018.3
  - cfbf136ab2 Fix issue #47225: avoid zfs.filesystem_present slowdown when dataset has lots of snapshots

- **ISSUE #46943**: (Auha) Slack.Engine could not start (refs: #47262, #47109)
- **PR #47262**: (garethgreenaway) [2018.3] Fixes to targeting in Slack engine @ 2018-04-24 13:18:36 UTC
  - 0b836106b9 Merge pull request #47262 from garethgreenaway/slack_engine_target_fix
  - bcd6f641e8 Removing target and tgt_type from the cmdline that is passed along to Salt, the target is used elsewhere and including it in the cmdline causes problem when it is passed along. Adding an additional test to ensure we are getting the right target.

- **ISSUE #47047**: (Giandom) Pillars aren’t evaluated when alias is passed in Slack Engine (refs: #47142)
- **PR #47142**: (garethgreenaway) [2018.3] pillar and output formatting fixes to Slack engine @ 2018-04-23 19:55:07 UTC
  - 2ed4b38b02 Merge pull request #47142 from garethgreenaway/47047_passing_pillar_to_slack_aliases
  - 6f183e1d80 Initial commit for unit/engines/test_slack_engine
  - a2840fc230 Only include the rest of the cmdline if the cmd is an alias.
  - e846df7409 Fixing a bug when passing pillar values to aliases for the Slack engine. Cleaned up the formatting of the results, color codes don’t translate well into Slack output. For any state runs, eg. highstate. apply, sls, we run the output through the highstate formatter. For anything else run it though the yaml outputer. Running it through highstate causes errors when the output does match what the highstate output is expecting.

- **PR #47245**: (terminalmage) Ensure we pass hexid as bytes when zmq_filtering enabled @ 2018-04-23 16:54:57 UTC
  - 42a0e655dc Merge pull request #47245 from terminalmage/zeromq-bytes
  - a7acc0548 Ensure we pass hexid as bytes when zmq_filtering enabled

- **PR #47242**: (aesposito91) PY3 fix for zeromq setsockopt @ 2018-04-23 16:38:09 UTC
  - 735251d1460 Merge pull request #47242 from aesposito91/2018.3
  - b2253516ed Update napalm_syslog.py

- **ISSUE #47117**: (prashanthtuttu) Napalm / Capirca Issue (refs: #47241)
- **PR #47241**: (mirceaulinic) Fix the imports into the netacl execution and state modules @ 2018-04-23 14:56:32 UTC
  - b78295aee9 Merge pull request #47241 from cloudflare/fix-47117
  - 26c5583264 #47117: fix the napalm imports in the netacl state module
• PR #47219: (garethgreenaway) [2018.3] Fixing a backward compatibility issue with vault module & runner @ 2018-04-23 14:10:19 UTC
  - 88557ea991 Merge pull request #47219 from garethgreenaway/vault_backward_compatibility
  - 1758081ffe When using the vault module on a 2018.3 minion against a 2017.7 master, the 2018.3 minion is expecting a verify element in the results from the Salt runner on the master. The runner in 2017.7 did not include a verify element, which results in an error. This change accounts for this by using the default in 2018.3 which is not to verify if not configured.

• PR #47186: (dmurphy18) backport of issue 46933, updated ZFS handling to Salt 2018.3.x @ 2018-04-23 14:07:06 UTC
  - 370feadb2 Merge pull request #47186 from dmurphy18/zfs_backport_46933
  - 283359d315 Corrected typo in comma-seprated and 2018.3.0 --> 2018.3.1
  - b7f8d5a22f Replace use of Fluorine with 2018.3.0 for comma-separated warnings
  - 3f0ab2ed6 ZFS backport of 46933 to 2018.3.1

• PR #47217: (twangboy) Remove installation of pywin32 from setup.py @ 2018-04-23 13:32:54 UTC
  - bf3a67d11b Merge pull request #47217 from twangboy/fix_setup
  - eb3d45bb08 Remove installation of pywin32 from setup.py

• PR #47195: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-04-20 19:25:30 UTC
  - 8e21703f13 Merge pull request #47195 from rallytime/merge-2018.3
  - f90fd8c663 Test fix: file strings must be unicode in master config
  - b6e4948df1 Lint: use full path for event utils function
  - 120c5446b7 Update old utils paths to new utils paths
  - 4718d31e53 Merge branch '2017.7' into '2018.3'
    - 65f344e371 Merge pull request #47184 from Ch3LL/status_test
      - 25a84428b8 Add status module integration modules tests for Windows
    - 965600ad6c Merge pull request #47163 from rallytime/jenkins-autodoc
      - 0039395017 Update jenkins module autodocs to use jenkinsmod name instead
    - 0a43dde5fc Merge pull request #47185 from twangboy/add_tests
      - 345da0423 Add additional integration tests to whitelist
    - 1a600bb9a4 Merge pull request #47172 from dwoz/cover_without_admin
      - cadd759727 Use warnings to warn user
      - 144c68e214 Allow non admin name based runs on windows
    - d599d230c Merge pull request #47110 from kstreee/fix-misusing-of-timeout
      - 062aee06ed Fixes misusing of the timeout option.
    - 87ca2b4003 Merge pull request #40961 from terminalmage/issue40948
      - 6ba66cc41 Fix incorrect logic in exception check
      - fed5041c5f Make error more specific to aid in troubleshooting
      - 8c67ab53b4 Fix path in log message

  - 2ee8006d3a Merge pull request #47165 from terminalmage/issue47081
  - 9e29acb477 Make sure a str type is passed to os.walk
- **PR #47070:** (terminalmage) Use decorators for temp files/dirs in test suite @ 2018-04-19 14:01:48 UTC
  - 6257862bbb Merge pull request #47070 from terminalmage/with_tempdir
- 048728d2b7 Remove unused imports
- 879c557264 Use decorators for temp files/dirs in test suite

**PR #47155**: (mcalmer) Fix patchinstall for yumpkg @ 2018-04-18 19:24:17 UTC
- b46365614b Merge pull request #47155 from mcalmer/fix-patchinstall
- 382a5ba457 fix invalid string compare
- 8c19368938 provide kwargs to pkg_resource.parse_targets required to detect advisory type

**ISSUE #47042**: (valentin2105) [ERROR] Unable to manage file: 'utf8' codec can't decode byte (refs: #47061)

**PR #47061**: (terminalmage) Fix diffing binary files in file.get_diff (refs: #47050) @ 2018-04-18 18:52:10 UTC
- 13ae1a2413 Merge pull request #47061 from terminalmage/issue47042
- 87f62cefa3 Rewrite flaky utf8 state to make it easier to troubleshoot
- df6e535f05 Fix diffing binary files in file.get_diff

**PR #47058**: (terminalmage) Fix calls to file.lsattr when lsattr is not installed @ 2018-04-18 16:30:12 UTC
- cb0ef13c99 Merge pull request #47058 from terminalmage/lsattr
- eeb067e910 Fix calls to file.lsattr when lsattr is not installed

**ISSUE #46929**: (noelmcloughlin) 2018.3 regression file.managed.context parsing (refs: #47104)

**PR #47104**: (terminalmage) yamlloader: Properly handle colons in inline dicts @ 2018-04-18 16:22:47 UTC
- b96ce23b3f Merge pull request #47104 from terminalmage/issue46929
- 33bf6643cd Add additional test for plain scalars
- 508659b682 yamlloader: Properly handle colons in inline dicts

**ISSUE #46887**: (julientravelaer) ldap.managed broken with 2018.3.0 (refs: #47029)

**ISSUE #46859**: (cheribral) pillar_ldap causing TypeError exceptions in python-ldap with unicode objects (refs: #47029)

**PR #47076**: (terminalmage) pillar_ldap: Load config options as str types @ 2018-04-18 16:16:22 UTC
- PR #47029: (terminalmage) ldapmod.py/ldap3.py: Force modlist for search/modify/etc. to be str types (refs: #47076)
- c12697b173 Merge pull request #47076 from terminalmage/issue46859
- c06c859caf pillar_ldap: Load config options as str types

**PR #47107**: (twangboy) Fix issues with reg state, add tests @ 2018-04-18 15:53:02 UTC
- 50bd885ec7 Merge pull request #47107 from twangboy/fix_46932
- ae8ab2ab1a Fix tests for py3, enable tearDown
- 3cf4ac1475 Add integration tests for reg state
- cc259b146f Cast vdata to appropriate type in reg state

**ISSUE #46909**: (epelc) Binary contents_pillar with file.managed raises UnicodeDecodeError (refs: #47041)

**PR #47041**: (terminalmage) Force null bytes to be str types @ 2018-04-18 14:08:25 UTC
- d6c59696bc Merge pull request #47041 from terminalmage/issue46909
- e4182715be Special check specifically for bytes types
- ee90dd5d95 Merge branch '2018.3’ into issue46909
- 0e99343a7f Use the same way of defining contents in both file.managed states
- 5741d287b5 Move back to using null byte check for contents
- 8e214c9fa9 file.managed: Add test to ensure binary contents work
- 7b7de94610 Use salt.utils.stringutils.is_binary to check if contents are binary
- e3c96da81 PY3: Ensure binary contents work with file.managed
- 5d98a8bedd Make salt.utils.stringutils.to_binary work for bytestrings
- 102400369 Force null bytes to be str types

- PR #47007: (twangboy) Fix some issues with the win_servermanager module @ 2018-04-17 20:57:04 UTC
  - 9a9fe524f8 Merge pull request #47007 from twangboy/fix_46968
  - 432db7c6ed Lint: Remove unused import
  - 103418e7f8 Remove erroneous pop statement
  - 56582f293a Remove redundant try/except block from state'
  - 6ad242779 Remove unnecessary try/except blocks
  - 92e9e5a110 Put some error checking in the shell command

- ISSUE #46943: (Auha) Slack.Engine could not start (refs: #47262, #47109)

- PR #47109: (garethgreenaway) [2018.3] fixes to Slack engine @ 2018-04-17 13:56:27 UTC
  - a52137ee36 Merge pull request #47109 from garethgreenaway/46943_slack_engine_fixes
  - 02baa76595 Fixing a bug that occurred when a comment was added to a message sent to Slack by Salt. Also making slack_engine:groups_pillar optional.

- PR #47045: (tankywoo) Fix ba7d00f5 for gentoo pkg.installed method @ 2018-04-17 13:55:45 UTC
  - 6c16a34ec4 Merge pull request #47045 from tankywoo/fixed-gentoo-pkg-installed
  - 551f4e10cf Fix ba7d00f5 for gentoo pkg.installed

- PR #47053: (clan) handle jinja error in <module> level @ 2018-04-16 22:47:54 UTC
  - 86c7cef56 Merge pull request #47053 from clan/jinja-error
  - a847466946 handle jinja error in <module> level

- PR #47062: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-04-16 19:58:32 UTC
  - 7bfa608e9f Merge pull request #47062 from rallytime/merge-2018.3
  - 59ff880e72 lint fix
  - 1dd88c584b Update old utils files to new new utils files path
  - 28a79ebba4 Merge branch '2017.7' into '2018.3'
    * 1700a10ebe Merge pull request #46326 from kstreee/fixed-client-local
      0f358a9c9e Fixes a timing bug of saltnado’s client local.
    * c3c00316c5 Merge pull request #46913 from lomeroe/2017_7-fix46877
      369a0645ed move exception for clarity
      32ce5fbd9a Use configparser serializer object to read psscript.ini and script.ini startup/shutdown script files.
    * 9e37cfc9d6 Merge pull request #47025 from terminalimage/fixed-server_id-windows
· cb0cf89ed3 Fix server_id grain in PY3 on Windows
· 2e193cfb45 Merge pull request #47027 from rallytime/bp-44508
· 8c72f362f4 Add priority field to support the latest capirca.
· 112f92baab Add priority field to support the latest capirca.
· 385fe2bc1e Merge pull request #47020 from rallytime/bp-46970
· 9373d6e52b Update test_pkgrepo.py
· 13cf9eb5b1 Removing debugging.
· a61a8593e5 Removing suse from pkgrepo comments tests. the pkgrepo functions in SUSE pkg module do not support comments.

• PR #47066: (terminalmage) Fix regression in handling of environment/saltenv @ 2018-04-16 19:57:12 UTC
  - fa27e64a33 Merge pull request #47066 from terminalmage/issue46979
  - 5c4c0468ad Fix regression in handling of environment/saltenv

• PR #47051: (rallytime) Simplify LooseVersion check in __virtual__ check in mac_assistive module @ 2018-04-13 19:43:33 UTC
  - 8761b81a69 Merge pull request #47051 from rallytime/fx-lint
  - d52b3689d9 Simplify LooseVersion check in __virtual__ check in mac_assistive module

• PR #47057: (corywright) Fix copy/paste typo in minionfs tutorial @ 2018-04-13 19:43:01 UTC
  - bbb8018b55 Merge pull request #47057 from corywright/fx-minionfs-whitelist-docs
  - 9b7ee97d12 Fix copy/paste typo in minionfs tutorial

• ISSUE #46931: (anlutro) file.managed diff is switched when using template in salt-ssh 2018.3 (refs: #47046)

• PR #47046: (clan) switch order of file to be diffed @ 2018-04-13 13:40:13 UTC
  - d5afa4a2c5 Merge pull request #47046 from clan/file_diff
  - bb58605c54 switch order of file to be diffed

• ISSUE #46985: (OrlandoArcapix) grafana4_user.present and grafana4_org.present states not working in 2018.3.0 (refs: #47048)

• PR #47048: (OrlandoArcapix) Issue46985 fix grafana4 state (refs: #47060) @ 2018-04-13 13:34:29 UTC
  - ec9251ed3 Merge pull request #47048 from OrlandoArcapix/Issue46985-fix-grafana4-state
  - 259d747414 Remove accidentally added copy of a file
  - 6c8c3da74d Return an empty dict instead of 'None' from grafana4 states

• PR #47017: (opdude) Don’t encode a unicode string @ 2018-04-13 13:31:33 UTC
  - d8c4c221cf Merge pull request #47017 from Unity-Technologies/hotfix/pip_windows
  - 838670f626 Don’t encode a unicode string

• ISSUE #46917: (boltronics) mysql_grants.present broken with database: somedatabase.* (refs: #46919)

• PR #47019: (rallytime) Back-port #46919 to 2018.3 @ 2018-04-12 19:43:01 UTC
  - PR #46919: (boltronics) Replace failing is and is not tests with == and != (refs: #47019)
  - 5b7544eaa0 Merge pull request #47019 from rallytime/bp-46919
  - 6837d6c138 Replace failing is and is not tests with == and !=
• ISSUE #46887: (julientravelaer) ldap.managed broken with 2018.3.0 (refs: #47029)
• ISSUE #46859: (cheribral) pillar_ldap causing TypeError exceptions in python-ldap with unicode objects (refs: #47029)
• PR #47029: (terminalmage) ldapmod.py/ldap3.py: Force modlist for search/modify/etc. to be str types (refs: #47076) @ 2018-04-12 19:41:29 UTC
  - ac2d54d78a Merge pull request #47029 from terminalmage/issue46859
  - ab6314247b ldapmod.py/ldap3.py: Force modlist for search/modify/etc. to be str types
  - 7691dee4ed Add to_str option to decode funcs
• ISSUE #46868: (tjyang) 2017.7.4 to 2018.3.0 upgrade issue: Salt request timed out. The master is not responding (refs: #46930)
• PR #46930: (dwoz) Clean up bad public key headers @ 2018-04-12 18:57:37 UTC
  - e6e07720fa Merge pull request #46930 from dwoz/crptodomekeyfix
  - f2e484ed54 Merge branch '2018.3' into crptodomekeyfix
  - e1995a92ee Fix verify signature test
  - 0ba32118d9 Add test for bad public key without m2crypto
  - a44c356233 Clean up bad public key headers
• ISSUE #46951: (Giandom) Slack engine error using aliases: TypeError unhashable type (refs: #47008)
• PR #47008: (garethgreenaway) [2018.3] Fixing aliases in slack engine @ 2018-04-12 15:24:40 UTC
  - 0e43becc12 Merge pull request #47008 from garethgreenaway/46951_fixing_slack_engine_aliases
  - dc2a72d44f Fixing aliases in slack engine
• ISSUE #46947: (Giandom) Slack engine groups error (refs: #47009)
• PR #47009: (garethgreenaway) [2018.3] fixes to slack engine documentation @ 2018-04-12 15:20:54 UTC
  - c33de7c82d Merge pull request #47009 from garethgreenaway/46947_slack_documentation_update_catch_non_dicts
  - f0fadbb4ce Fixing indention for slack documention. Updating try..except to ensure we catch when groups aren’t dicts.
• PR #47023: (rallytime) Back-port #46997 to 2018.3 @ 2018-04-12 15:05:24 UTC
  - PR #46997: (LukeCarrier) Fix respository (=> repository) typo in sls_build (refs: #47023)
  - PR #4638: (terminalmage) Many improvements to docker network and container states (refs: #46997)
  - 68d17c71f1 Merge pull request #47023 from rallytime/bp-46997
  - c2c60f4ff4 Fix respository (=> repository) typo in sls_build
• PR #47026: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-04-12 14:39:41 UTC
  - 9cf3c6406a Merge pull request #47026 from rallytime/merge-2018.3
  - ba70df9d62 Use msgpack utils for loads call, import msgpack for UnpackValueError
  - 34a478df5 Update old fopen path with new utils files path
  - 590c7fc13f Merge branch '2017.7' into '2018.3'
    - 8f994e7cf9 Merge pull request #46539 from jfoboss/patch-1
      - 6890122e41 Merge pull request #1 from twangboy/pull_46539
- 19c3fadbe5 Fix unit test for win_ntp
  - 826a8d3099 Fixing #46504
- 74d70e95a5 Merge pull request #46999 from gtmanfred/2017.7
  - 791a8f6ce switch pip test package
- 8adaf7f526 Merge pull request #46023 from bloomberg/parallel-orch
  - 0ac0b3ca29 Merge branch '2017.7' into parallel-orch
- 39d65a39cf Merge pull request #46613 from myinitialsarepm/fix_puppet.fact_and_puppet.facts
  - 44ecd13abc Update tests to use cmd.run_all
  - 7d7d40f541 Merge branch '2017.7' into fix_puppet.fact_and_puppet.facts
  - 0ce1520bd0 Merge branch '2017.7' into fix_puppet.fact_and_puppet.facts
  - 69e1f6f681 Fix puppet факт and puppet.facts to use stdout.
  - 3d5e96f00b address lint issues raised by @isbm
  - a9866c7a03 fix parallel mode py3 compatibility
  - 6d7730864a removing prereq from test orch
  - 6c8a25778f add integration test to runners/test_state to exercise parallel
  - 2ce8f16b93 cherry-pick cdata KeyError prevention from #39832
  - 26a96e8933 record start/stop duration for parallel processes separately
  - e484bf2b revisit previous join() behavior in check_requisites
  - f00a359cdf join() parallel process instead of a recursive sleep
  - 6e7007a4dc add parallel support for orchestrations

- **PR #47021:** (garethgreenaway) [2018.3] Fixing integration.modules.test_state_jinja_filters.StateModuleJinjaFiltersTest.test_path_which @ 2018-04-12 13:12:39 UTC
  - d3be82896 Merge pull request #47021 from garethgreenaway/920_state_module_jinja_filters_test_test_path_which
  - 2ccf2c5fe0 Fixing test.path_which to check that the filter is available rather than results.

- **PR #47022:** (corywright) Add auth.file module to auth documentation page @ 2018-04-11 21:11:10 UTC
  - 66e8445b82 Merge pull request #47022 from corywright/add-auth-file-module-to-docs
  - bd0918fc40 Add auth.file module to auth documentation page

- **PR #45774:** (twangboy) Fix __virtual__ issue in mac_system.py @ 2018-04-11 14:26:13 UTC
  - 12cfdec93 Merge pull request #45774 from twangboy/mac_add_service_util
  - 5796696617 Fix tests for Py3
  - 7b40218790 Fix lint, remove sentence from docstring
  - 7981800f0c Add _available_services function for testing
  - 6080633613 Add assert_called_with
  - 1bf70b2033 Add more tests for available_services
  - b429fc3e74 Add tests for mac_utils
  - b5f67130cc Used *args and **kwargs
- ed061617a2 Fix unicode literal issue in mac_assistive
- 82e17e5fc8 Fix args/kwarg
- 455146500a Move some functions into mac_utils
- 125586264b Add utilsmac_service.py

- **ISSUE #46953**: (cskowronnek) salt-cloud azurearm [ERROR ] There was a profile error: Parameter 'subscription_id' must be str. (refs: #47012)

- **PR #47012**: (terminalmage) Azure: ensure subscription_id is a str type @ 2018-04-11 13:57:08 UTC
  - 79347f108a Merge pull request #47012 from terminalmage/issue46953
  - 5192622a32 Azure: ensure subscription_id is a str type

- **PR #46526**: (Ch3LL) Add tests for new source_* minion options @ 2018-04-10 19:56:45 UTC
  - 6503bf88da Merge pull request #46526 from Ch3LL/ip_conf
  - c01180f47 Patch ZMQ versions for master_uri test
  - da38f332a5 Change comment and salt.utils.network import
  - e972cbdf1a Add for new source_* minion options

- **PR #46993**: (L4rS6) Fix: tuple instead of string @ 2018-04-10 17:07:59 UTC
  - 03907d5f8e Merge pull request #46993 from L4rS6/fix-broken-keystone-auth/2018.3
  - e33ba1b365 Fix: tuple instead of string

- **PR #46990**: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-04-10 17:07:33 UTC
  - ffaee265a0 Merge pull request #46990 from rallytime/merge-2018.3
  - ccc5bad2df Merge branch '2017.7' into merge-2018.3
    * ba5421d988 Merge pull request #46991 from gtmanfred/windows
      * 985881dc5 use saltstack salt-jenkins
  - 2f1cf3e511 Merge branch '2017.7' into '2018.3'
    * 00c4067585 Merge pull request #46975 from gtmanfred/windows
      * 1f69c0d788 make sure windows outputs xml junit files
      * 4a2e1bb83 support new versions of winrm-fs
      * b9efec8526 remove libnacl on windows
      * 2edd5ef9e fix path
      * b03e272e44 windows work
    * 3cf2353e41 Merge pull request #46945 from vutny/doc-faq-fix-jinja
      * bfd54e61d [DOC] Fix Jinja block in FAQ page
    * fc2f728665 Merge pull request #46925 from terminalmage/fix-file.patch-docstring
      * 97695657f0 Remove reference to directory support in file.patch state
    * ee6c518e1 Merge pull request #46900 from rallytime/bp-46801
      * 6a41e8b457 rename jenkins to jenkinsmod
    * 71839b0303 Merge pull request #46899 from rallytime/bp-45116
- b92f908da4 fix adding parameters to http.query from sdb yaml

- **PR #46339**: (DmitryKuzmenko) SSH State test failures @ 2018-04-10 17:06:51 UTC
  - a34b92ae82 Merge pull request #46339 from DSRCorporation/bugs/ssh_state_test_failures
  - bd98c49dc7 Merge branch '2018.3' into bugs/ssh_state_test_failures
  - 6fcd458a7f Increase timeout for run_run in ShellCase
  - 8e60ccdfb Give background task more chance to start.
  - e0b6878fac One more useful assert for better test results.
  - 92a6c43c73 More logging and assertion fixes. Extended ssh ops timeout.
  - 6ebdd17ac4 Advanced logging in the failing SSH State tests.

- **PR #46989**: (Ch3LL) Fix redis cache log debug line @ 2018-04-10 16:35:12 UTC
  - 9924100c44 Merge pull request #46989 from Ch3LL/redis_log

- **ISSUE #46834**: (oeufete) strftime filter not found in 2018.3.0 (refs: #46848)

- **ISSUE #46668**: (anlutro) Jinja2 filter strftime stopped working in salt-ssh 2018.3 (refs: #46848, #46744)

- **PR #46848**: (garethgreenaway) [2018.8] salt-ssh jinja filters tests @ 2018-04-10 16:19:51 UTC
  - c6431936cb Merge pull request #46848 from garethgreenaway/testing_jinja_filters_available_via_salt_ssh
  - 5fcd3eff8 Merge branch '2018.3' into testing_jinja_filters_available_via_salt_ssh
  - 0adfee9b11 Updating a couple tests. Fixing check_whitelist_blacklist to work with PY3 when non-iterables are passed. Adding warning about lst_avg results being wrong and future updates in Neon.
  - f3f42146ca Removing expected from strftime and hashsum tests since the results are always different and we are only concerned about the filter being available.
  - 860234c045 Fixing lint.
  - 0891c6b580 fixing docstring
  - c8945e4b2e cleaning up some imports.
  - 0599759e5b cleaning up some test doc strings.
  - dceda5eb88 Moving all jinja filter tests into support/jinja_filters.py. Updating integration/ssh/test_jinja_filters.py to use those tests. Adding integration/modules/test_state_jinja_filters.py to also use the common jinja filter tests.
  - 07d7e3ca01 Adding a new integration test and corresponding state files to test availability of jinja filters when using salt-ssh.

- **ISSUE #46880**: (liquidgecka) rabbitmq_policy broken in 2018.3.0 (refs: #46973)

- **PR #46973**: (rallytime) New "apply_to" kwarg in rabbitmq module should be added at the end @ 2018-04-10 14:42:32 UTC
  - **PR #41233**: (dnABic) added parameter apply_to for rabbitmq policy (refs: #46973)
  - fbcb7584c Merge pull request #46973 from rallytime/fix-46880
  - 8ce2f982c New "apply_to" kwarg in rabbitmq module should be added at the end

- **ISSUE #46934**: (d601) GPG encrypted binary data in pillars breaks in 2018.3.0 (refs: #46966)
• **PR #46966:** (terminalmage) Fix traceback when attempting to decode binary data to unicode @ 2018-04-10 14:08:35 UTC
  - 58f59c8ff Merge pull request #46966 from terminalmage/issue46934
  - df43f8dbf8 salt.payload.Serial: fix traceback when unpacking binary blob
  - 40a4935ec9 gpg renderer: fix traceback when decrypted ciphertext contains binary data
  - 17a88f6a7i Include exc_info in pillar render errors to aid in troubleshooting

• **ISSUE #46881:** (SynPrime) Cron.file - source file not found (refs: #46944)

• **PR #46944:** (garethgreenaway) [2018.3] cron.file with salt source URL @ 2018-04-10 13:34:03 UTC
  - e33e792e2a Merge pull request #46944 from garethgreenaway/46881_Cron_file_source_file_not_found
  - 438a9e03c Adding kwargs to calls into file module functions
  - 14d12b1d6b Remove unused imports. Gating tests so they do not run on Windows
  - 623d96f21a Adding dummy cron file for integration/states/test_cron
  - c8e01871d6 Adding an integration test to test cron.file.
  - ddc55df9b Fixing bug that made cron.file unable to use a file via a Salt URL.

• **PR #46937:** (gtmanfred) enable_ssh_minions does not work with subset yet @ 2018-04-07 02:54:56 UTC
  - 08e8782f76 Merge pull request #46937 from gtmanfred/2018.3
  - 3b7e590ec enable_ssh_minions does not work with subset yet

• **PR #46936:** (gtmanfred) don’t copy __pycache__ or .pyc files for kitchen @ 2018-04-06 19:15:46 UTC
  - ac4e7cd73fa Merge pull request #46936 from gtmanfred/2018.3
  - 91474878fa don’t copy __pycache__ or .pyc files for kitchen

• **ISSUE #46659:** (stamak) [salt-cloud] [new oxygen openstack driver ] no public_ips and floating_ips in salt-cloud output (refs: #46912)

• **PR #46912:** (gtmanfred) pull latest vm data after building for openstack shade driver @ 2018-04-06 13:46:42 UTC
  - 8105fd9715 Merge pull request #46912 from gtmanfred/openstack
  - 56f38fd8ad pull latest vm data after building for openstack shade driver

• **PR #46908:** (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-04-05 21:27:03 UTC
  - 735ea12960 Merge pull request #46908 from rallytime/merge-2018.3
  - 1020966512 Remove redundant section in log setup
  - 177c686b52 Update old utils paths to new utils paths
  - 0a297e7319 Merge branch ’2017.7’ into ’2018.3’
    - d0f5b43753 Merge pull request #44926 from frogunder/whitelisted_acl
      - 18e460fc30 Merge branch ’2017.7’ into whitelisted_acl
      - 1ad4d7d988 fix assert errors
      - e6a530616df update test
      - 19a2244ce7 whitelist_acl_test
    - 7d822f9cec Merge pull request #46464 from gtmanfred/orchestration
- 637cd6b7b fix pylint
- 0151013ddbb document cli option for cmd_subset
- 4a3ed6607d add test for subset in orchestration
- 3112359dd6 fix salt subset in orchestrator
- 805ed1c964 Merge pull request #46879 from dwoz/cloudtestfix
  - dc54fc53c3 Fix multiple typos causing tests to fail
- f70f6de282 Merge pull request #46647 from twangboy/win_fix_test_grains
  - c179388b0e Fix the tear down function in integration.modules.test_grains.GrainsAppendTestCase
- 91c078ce12 Merge pull request #46756 from nages13/bugfix-grain-virtual_subtype
  - 781f5030a4 Merge branch 'bugfix-grain-virtual_subtype' of https://github.com/nages13/salt into bugfix-grain-virtual_subtype
  - cd1ac4b7f9 Merge branch '2017.7' into bugfix-grain-virtual_subtype
  - 0ace76c0e7 Merge branch '2017.7' into bugfix-grain-virtual_subtype
  - 9eb6f5c0d0 Merge branch '2017.7' into bugfix-grain-virtual_subtype
  - 73d6d9d365 Merge branch '2017.7' into bugfix-grain-virtual_subtype
  - a4a17eba6a Merge branch '2017.7' into bugfix-grain-virtual_subtype
  - b5034dadb Merge branch '2017.7' into bugfix-grain-virtual_subtype
  - 8d12770951 Merge branch '2017.7' into bugfix-grain-virtual_subtype
  - 7e704c0e81 Moved down container check code below hypervisors to validate containers type running in virtual.environment. Fixes #46754 & #43405
  - 710f74c4a6 fix grains['virtual_subtype'] to show Docker on xen kernels
- 058bbed221 Merge pull request #46799 from garethgreenaway/46762_prereq_shenanigans_tests
  - 13875e78cf Fixing documentation string for test.
  - 3d288c44d4 Fixing test documentation
  - 6cfc02e6fa Adding tests for #46788
- d9770bf3f8 Merge pull request #46867 from terminalmage/unicode-logging-normalization
  - 7652688e83 Backport string arg normalization to 2017.7 branch
- 9eb98b1f6e Merge pull request #46770 from twangboy/fix_46433
  - 89af0a6222 Merge branch '2017.7' into fix_46433
  - 67b4697578 Remove unused import (ling)
  - 9302fa5ab0 Clean up code comments
  - b383b9330 Change the order of SID Lookup
- 9c776cffe7 Merge pull request #46839 from gtmanfred/tupletarget
  - 3b7208ece27 match tuple for targets as well
- 7db251dc11 Merge pull request #46845 from rallytime/bp-46817
  - 36a0f6d8ca address filehandle/event leak in async run_job invocations
* e3d17ab7bc Merge pull request #46847 from dwoz/missing-strdup
  - 55845f4846 strdup from libc is not available on windows
* f2dd7f9fc4 Merge pull request #46776 from gtmanfred/2017.7
  - edc1059ee0 fix shrinking list in for loop bug

- **PR #46853**: (terminalmage) Add back date_format filter @ 2018-04-05 20:33:50 UTC
  - 9a47afc33b Merge pull request #46853 from terminalmage/date_format_filter
  - 266d13a665 Add back date_format filter

- **PR #46882**: (jasperla) Backport #46280 #46849 #46852 to 2018.3 @ 2018-04-05 14:29:12 UTC
  - **PR #46852**: (jasperla) fix creating a nic tag on a link with double 0 in the MAC (refs: #46882)
  - **PR #46849**: (jasperla) Unbreak creating etherstubs on SmartOS (refs: #46882)
  - **PR #46280**: (jasperla) Remove unneeded checks for binaries in SmartOS modules (refs: #46882)
    - a064a3e695 Merge pull request #46882 from jasperla/smartos/backports
    - 47a66975ff fix creating a nic tag on a link with double 0 in the MAC
    - a3cb0e576e Unbreak creating etherstubs on SmartOS
    - c703254990 Remove unneeded checks for binaries in SmartOS modules

- **PR #46873**: (terminalmage) Attempt UTF-8 first when decoding/encoding @ 2018-04-05 14:16:28 UTC
  - 4e5e291c99 Merge pull request #46873 from terminalmage/utf8-first
  - cf28eb74aa Don’t log command when output_loglevel == 'quiet'
  - 5f9eece28db Remove hacky workarounds to get encode/decode tests to pass on Windows
  - 76e5d81bb4 Remove hacky workaround to get Windows to decode deserialized data properly
  - 0b5729e58a Remove hacky workaround to get git state/exec module to work properly on Windows
  - 22af48518f Attempt UTF-8 first when decoding/encoding

- **ISSUE #43499**: (tyeapple) zmq setsockopt need to adapt python3 (refs: #46874)

- **PR #46878**: (terminalmage) Backport #46874 to 2018.3 @ 2018-04-05 13:26:04 UTC
  - **PR #46874**: (johnj) Use bytestrings for PY3 compatibility when running setsockopt for zmq.SUBSCRIBE (refs: #46878)
  - 1518762465 Merge pull request #46878 from terminalmage/bp-46874
  - d9511d04d4 #43499, zmq setsockopt need to adapt python3

- **ISSUE #46862**: (kivoli) Setting locale.system fails in 2018.3 (refs: #47280, #46869)

- **PR #46869**: (gtmanfred) Always return dictionary for _localectl_status @ 2018-04-05 13:25:14 UTC
  - 67894e3ee9 Merge pull request #46869 from gtmanfred/2018.3
  - 1496e985f7 fix pylint
  - 75425dfd20 fix tests for locatemod
  - 2d7c7b5e33 Always return dictionary for _localectl_status

- **PR #46870**: (mirceaulinic) Correct the documentation for two new proxy modules @ 2018-04-04 21:48:41 UTC
  - 58c8ff18e2 Merge pull request #46870 from cloudflare/proxy-doc
- f4b6184476 Correct and add the cimc proxy module to autodoc
- a99bc202b9 Correct & add Panos to autodoc

- **PR #46729**: (terminalmage) Performance improvement/error catching in expr_match @ 2018-04-04 20:25:57 UTC
  - d7e4b9d755 Merge pull request #46729 from terminalmage/expr_match
  - 70cfafe299 Add test case
  - 250039b11f Restore original variable name
  - ae0f112a49 Log an exception when non-string val/expr passed to expr_match
  - dac42a672b Performance improvement/error catching in expr_match

- **PR #46872**: (terminalmage) Backport #46863 to 2018.3 @ 2018-04-04 19:04:40 UTC
  - PR #46863: (TamCore) fixed top function which was broken since commit 002aa88a97e (refs: #46872)
  - e0b383af8b5 Merge pull request #46872 from terminalmage/bp-46863
  - be284e5b99 Add skipIf when older mock present
  - db8f6aee56 Add unit tests for ext_nodes master_tops module
  - ee437f7cbe5 fixed top function which was broken since commit 002aa88a97e

- **PR #46850**: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-04-04 18:07:44 UTC
  - 5c76d98d1a Merge pull request #46850 from rallytime/merge-2018.3
  - a0fcd5e053 Fix test_cp failure: forgot to add tgt to test when @with_tempfile is present
  - d0202cab72 Resolve bad merge: there should only be one test_get_file_from_env_in_url test
  - e28f71b418 Lint: use full salt utils path
  - 4ad50bbeece6 Update old utils paths to new paths
  - 893196d3e6 Merge branch '2017.7' into '2018.3'
    - 1941426218 Merge pull request #46838 from gtmanfred/npm
      - bb61dd291 use http registry for npm
    - e544254e7b Merge pull request #46823 from rallytime/fix-42312
      - dafa820f93 Improve __virtual__ checks in sensehat module
    - 37f6d2de35 Merge pull request #46641 from skizunov/develop3
      - c624aa4827 Make LazyLoader thread safe
    - 989508b100 Merge pull request #46837 from rallytime/merge-2017.7
      - 8522cd6634 Merge branch '2016.11' into '2017.7'
      - 3e844ed1df Merge pull request #46739 from rallytime/2016.11_update_version_doc
      - 4d9fc5ccf0 Update release versions for the 2016.11 branch
    - 307e7f35f9 Merge pull request #46740 from rallytime/2017.7_update_version_doc
      - 7edf98d224 Update 2018.3.0 information and move branch from "latest" to "previous"
      - 5336e866ac Update release versions for the 2017.7 branch
    - ebf5dd276f Merge pull request #46783 from twangboy/fix_46680

  - 8d93156604 Fix unit.returners.test_local_cache for Windows
- 0c2dce0416 Merge pull request #46469 from terminalmage/issue46595
  - e82a1aa1ec Make server_id consistent on Python 3
- 4e7466a21c Merge pull request #46588 from UtahDave/no_crash_winshell
  - b7842a1777 Update error message.
  - 95dfdb91ca Don’t stacktrace when salt-ssh w/o saltwinshell
- 33a3cfc7c Merge pull request #46631 from rallytime/update-pillar-unit-tests
  - 0f728186aa Fix pillar unit test failures: file_roots and pillar_roots environments should be lists
- d329e7af78 Merge pull request #46640 from terminalmage/file.copy-docs
  - 480c5f8faa Clarify the docs for the file.copy state
- ff40590c06 Merge pull request #46642 from vutny/doc-cloud-index
  - 51e6aa54a1 [DOC] Unify cloud modules index header
- 83ed40c06a Merge pull request #46619 from rallytime/merge-2017.7
  - hcbddf5d07 Merge branch '2017.7.5' into '2017.7'
- 19bb725698 Merge pull request #4612 from Ch3LL/7.5_rn
- 6076bfa2ee Add changelog to 2017.7.5 release
- 31c78aef11 Merge pull request #46572 from dmurphy18/update_xxbuild
- c87511570d Merge branch '2017.7.5' into update_xxbuild
- cdd768fa4d Merge pull request #46577 from gtmanfred/2017.7.5
- 78cbf7b5cd Fix npm issue
- c76f7eb028 enable debug logging on the minionlog
- e6682c660c Merge pull request #46551 from terminalmage/salt-jenkins-885
- 703b5e7e65 Change versionadded to show that 2018.3.0 will not have this function
- 010d260d06 Rewrite failing Suse pkg integration test
- f3f5dec239 zypper.py: fix version argument being ignored
- 214f2d6ad3 Add pkg.list_repo_pkgs to zypper.py
- 0a541613f2 Additon of -sa flag to allow for revision numbers other than -0 or -1
- bd62699cbb Merge pull request #46563 from gtmanfred/2017.7.5
- 8d5ab72983 virtualenv version too old for python3.6
- 2916708124 Merge pull request #46561 from gtmanfred/2017.7.5
- 2c39ac6dfb disable verbose
- ee3bffe5e32 Merge pull request #46537 from rallytime/bp-46529
- 289c7a228f retry if there is a segfault
- 1271536a89 Merge pull request #46519 from rallytime/man-pages-2017.7.5
- 782a5584f5 Update man pages for 2017.7.5
- df12135439 Merge pull request #46584 from twangboy/lgpo-46568
- 661017104b Detect disabled reg_multi_sz elements properly
- 2fd3aae487c Merge pull request #46624 from twangboy/win_fix_installer
- fa00b0e46 Fix some installer script inconsistencies
- f038e3c452 Merge pull request #46571 from garethgreenaway/46552_onfail_and_require
  - 152c43c843 Accounting for a case when multiple onfails are used along with requires. Previously if you have multiple states using 'onfail' and two of those states using a 'require' against the first one state, the last two will run even if the 'onfail' isn't met because the 'require' is met because the first state returns true even though it didn't execute. This change adds an additional hidden variable that is used when checking requisities to determine if the state actually ran.
- 2677330e19 Merge pull request #46520 from gtmanfred/2017.7
  - caefedc095 make sure utils is empty for pickling for windows
  - 2883548e66 pass utils to the scheduler for reloading in modules
- 7bc3c2e588 Merge pull request #46531 from terminalmage/issue44299
  - b70c3389da Fix case where no comments specified
  - ce391c53f4 Add regression test for #44299
- c3e36a6c94 Fix regression in yumpkg._parse_repo_file()
- f0c79e3da3 Slight modification to salt.utils.pkg.rpm.combine_comments()
  - b80edb5d26 Merge pull request #46567 from dwoz/runtest-n-wart
  - 3b6901e19d Honor named tests when running integration suites
  - 1ddc22e767 Merge pull request #46580 from twangboy/win_update_docs_dism
    - d52b99d7a3 Clarify some issues with msu files in win_dism.py
  - 0a68c22332 Merge pull request #46541 from gtmanfred/metadata
    - 19bd1d9db5 handle user-data for metadata grains
- **ISSUE #46668**: (anlutro) Jinja2 filter strftime stopped working in salt-ssh 2018.3 (refs: #46848, #46744)
- **PR #46744**: (garethgreenaway) [2018.3] Ensure salt.utils.dateutils is available for templates via salt-ssh @ 2018-03-28 21:09:46 UTC
  - ef68df7f3a Merge pull request #46744 from garethgreenaway/46668_jinja2_filter_strftime_unavailable
  - 0b30955c00 Including salt.utils.dateutils so various jinja_filters are available when using salt-ssh.
- **ISSUE #46334**: (sjorge) [2018.3.0rc1] Stacktrace on call to nacl.dec (refs: #46426)
- **PR #46720**: (rallytime) Bump deprecation notices in nacl module & runner to Neon @ 2018-03-27 21:15:46 UTC
  - PR #46426: (garethgreenaway) [2018.3.0rc1] fixes to nacl module & runner (refs: #46639, #46720)
  - 65bb37e7fd Merge pull request #46720 from rallytime/bump-nacl-deprecation
  - 5102c0310e Bump deprecation notices in nacl module & runner to Neon
- **PR #46733**: (rallytime) [2018.3] Merge forward from 2018.3.0rc1 to 2018.3 @ 2018-03-27 18:46:43 UTC
  - c83d9e66fe Merge pull request #46733 from rallytime/merge-2018.3
  - 00d4eb26f3 Merge branch '2018.3.0rc1' into '2018.3'
- **PR #46565**: (twangboy) Create reg salt util (2018.3) @ 2018-03-26 22:03:33 UTC
  - 0faced1d54 Merge pull request #46565 from twangboy/win_fix_cmd_powershell_2018.3
  - 5ee64e9b0e Fix lint (spelling error)
  - 0de54ed953 Additional tests
  - fc9ecd75e2 Skip unit.state.test_reg unless on Windows
  - aa98bdf250 Fix some lint
  - e0d201a96f Make sure the docs are correct for the tests
  - f15f92318d Add tests for salt.utils.win_reg
  - f7112b19a2 Submit #46527 agains 2018.3
- **ISSUE #46334**: (sjorge) [2018.3.0rc1] Stacktrace on call to nacl.dec (refs: #46426)
- **PR #46639**: (terminalmage) Use the correct path for nacl certificates in Windows @ 2018-03-26 19:20:10 UTC
  - PR #46426: (garethgreenaway) [2018.3.0rc1] fixes to nacl module & runner (refs: #46639, #46720)
  - dd52368f9a Merge pull request #46639 from terminalmage/nacl-default-path
  - 2f7660fe35 Use the correct path for nacl certificates in Windows
- **PR #46416**: (dincamihai) Fix cp.push empty file @ 2018-03-26 17:52:47 UTC
- 2efef52a3e Merge pull request #46416 from dincamihai/fix-cp.push-empty-file
- 536ba0fa1e Fix cp.push empty file

- **PR #46643**: (mcalmer) fix docker return @ 2018-03-26 15:52:31 UTC
  - 84579e7652 Merge pull request #46643 from mcalmer/fix-docker-return
  - 3ceb63f607 fix checking test results
  - af64632bf3 add unit test for failed login
  - 0fc7989236 make it possible to use login, pull and push from module.run and detect errors

- **PR #46650**: (Ch3LL) Mirror libnacl imports in test from the nacl module @ 2018-03-26 14:48:40 UTC
  - c67afbeb36 Merge pull request #46650 from Ch3LL/nacl_test
  - 9ef8f8c4f1 Mirror libnacl imports in test from the nacl runner
  - f11d58a8e9 Mirror libnacl imports in test from the nacl module

- **PR #46645**: (terminalmage) Add Unicode / Python 3 update to 2018.3.0 release notes @ 2018-03-26 14:43:53 UTC
  - 85d9a26d52 Merge pull request #46645 from terminalmage/release-notes
  - 986c7bcd00 Rewrite unicode/py3 section
  - 064bc83276 Add Unicode / Python 3 update to 2018.3.0 release notes

- **ISSUE #46150**: (whytewolf) With chocolately.version some packages don’t work with check_remote=True (refs: #46661)
- **PR #46661**: (Kimol) Chocolatey - Lowered name of local and remote packages before comparing versions. @ 2018-03-26 14:35:39 UTC
  - 308c9ddf3c Merge pull request #46661 from Kimol/2018.3-fix_chocolatey_check_remote_packages
  - 52581e7918 Removed trailing whitespace
  - 123a8e9747c Chocolatey - Added lowering local packages for unifing both local and remote names to lowercase for comparison.
  - 4be1a991c2 Lowered name of available packages before comparing with local packages

- **PR #46569**: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 (refs: #46631) @ 2018-03-21 20:57:04 UTC
  - 2e1f7c37f7 Merge pull request #46569 from rallytime/merge-2018.3
  - 46ba72fb1c Fix pillar unit test failures: file_roots and pillar_roots environments should be lists
  - fe2d46dd0c Better merge conflict resolution for setup.py windows changes
  - 8886b61576 Update old utils paths to new paths
  - 8d1e1e7f9d Merge branch '2017.7' into '2018.3'
    - 048b2ba3f6 Merge pull request #46547 from garethgreenaway/46427_service_module_cumulus
      - edd0b11447 Merge branch '2017.7' into 46427_service_module_cumulus
      - 8a3c16080e Disable the service module on Cumulus since it is using systemd.
  - 9f8e3260b9a Merge pull request #46548 from Ch3LL/profit_test
    - db96c4e72e check for foo,bar username,password set in profitbrick config
  - 79f2a76609 Merge pull request #46549 from Ch3LL/dimension_test
    - 98388c464c Fix dimensionsdata test random_name call
- 083846fe0e Merge pull request #46529 from gtmanfred/kitchen
  - 50d6e2c7be retry if there is a segfault
- 5cc11129f1 Merge pull request #46511 from rallytime/bp-45769
  - a8ffceda53 Surpress boto WARNING during decode, reference: https://github.com/boto/boto/issues/2965
- 0e90c8ac6f Merge pull request #46493 from terminalmage/issue46207
  - f06f68f10 salt-call: don’t re-use initial pillar if CLI overrides passed
- b11a8fc8e0 Merge pull request #46450 from gtmanfred/salt_runner
  - 7974ff7264 load grains for salt.cmd runner
- 22d753364b Merge pull request #46337 from gtmanfred/2017.7
  - d69c36359 add tests for names and listen/listen_in
  - 3f8e0db572 let listen_in work with names
  - 7161f4d4df fix listen to be able to handle names
- b7191b8782 Merge pull request #46413 from meaksh/2017.7-explore-result-in-depth
  - 885751634e Add new unit test to check state.apply within module.run
  - 9f19ad5264 Rename and fix recursive method
  - 1476ace558 Fix Python3 and pylint issue
  - 726ca3044d Explore ‘module.run’ response to catch the ‘result’ in depth
- 02a79a2014 Merge pull request #46496 from gtmanfred/kitchen
  - da002f78d0 include virtualenv path for py3 windows
  - fe2efe03ea remove duplicate setup
- 5c4c182d75 Merge pull request #46330 from bdrung/fixed_kubernetes_test_create_deployments
  - 5008c3ec44 Fix ValueError for template in AppsV1beta1DeploymentSpec
- c7e05d3ff4 Merge pull request #46482 from rongshengfang/fixed-keyerror-in-instance_present
  - ed8c83e89a Fix KeyErrro in salt(states/boto_ec2.py when an EIP is being associated to an existing instance with the instance_present state.
- 573d51afec Merge pull request #46463 from terminalmage/mock-2.0
  - b958b4699c Update requirements files to depend on mock>=2.0.0
- a154d35fc7 Merge pull request #46422 from rallytime/bp-46300
  - 829ddfde88 Change stringutils path to old utils path for 2017.7
  - 91db2e0782 Python 3 support
- 2afaca17a1 Merge pull request #46320 from mcalmer/warn-kubernetes
  - c493ced415 add warning about future config option change
- c7f95581e3 Merge pull request #46449 from bdrung/make-doc-theme-configurable
  - 4a5da2d144 Make documentation theme configurable
- 10ce0e9ec20 Merge pull request #46162 from rallytime/team-suse-zypper-owner
  - 13a295a3b7 Add pkg and snapper to team-suse
35c7b7b0d3 Add btrfs, xfs, yumpkg, and kubernetes file to team-suse
485d777ac0 Add team-suse to CODEOWNERS file for zypper files

* cac096b311 Merge pull request #46434 from gtmanfred/highstate_return
  - d18f1a55a7 fix pylint
  - 9e2c3f7991 split return key value correctly

* 7dd71101ce Merge pull request #46455 from whytwolf/Issue_44452_unicode_cloud
  - 5fe474b1a8 .format remove fix for #44452

* 4e8d9026d3 Merge pull request #46428 from twangboy/win_fix_reqs
  - e7ab97cc17 Remove six as a hard dep for Salt
  - cc67e5c2ef Set six to 1.11.0

* e834d9a63b Merge pull request #46454 from gtmanfred/kitchen
  - b8ab8434a5 fix windows for kitchen

* 2886dca88f Merge pull request #46452 from gtmanfred/spm_cache_dir
  - 169cf7a4e2 make spm cache_dir instead of all cachedirs

* a188984cd9 Merge pull request #46446 from bdrung/fix-typos
  - 7e6e80be87 heat: Fix spelling mistake of environment
  - a3c54b50f6 Fix various spelling mistakes

* e35fc5263c Merge pull request #46309 from bdrung/dynamic-pillarenv
  - 58ab451fd1 Support dynamic pillar_root environment

* 35fe9827fe Merge pull request #46430 from terminalmage/issue44032
  - f9f187e915 Improve reliability/idempotence of file.blockreplace state

* 2bad0a21c0 Merge pull request #46429 from twangboy/win_fix_snmp
  - 8995a9b8de Fix problem with __virtual__ in win_snmp

* 93a572f229 Merge pull request #46100 from jfindlay/resolv_scope
  - d5561bedaf tests.unit.grains.core add scoped IPv6 nameserver
  - 4e2e62d508 salt.utils.dns parse scope param for ipv6 servers

* 5acc1d5e54 Merge pull request #46420 from bdrung/2017.7
  - e48c13d9e0 Fix SSH client exception if SSH is not found

* ca6a76e317 Merge pull request #46379 from angeloudy/2017.7
  - 3acb59c74c Merge branch '2017.7' into 2017.7
  - d971e0c08b Fix indent
  - 269514683f Update http.py
  - 908c040ac3 Update http.py
  - 51ba3c135b Update http.py
  - 14aba24111 fix bytes-object required error in python 3

* 73f9233557 Merge pull request #46404 from gtmanfred/kitchen
• c56baa95a8 clone .git for the version tests
• 3620611b5b fix unhold package for debian
• 5219f7d2ba fix minion log path
  * ca28cfd4e4 Merge pull request #46310 from twangboy/win_update_installer_build
  * bcf8b19566 Update the installer build
  * decccbeca3 Merge pull request #46316 from twangboy/win_fix_dsc
    • 2042d33d59 Fix issues with the DSC module
• PR #46620: (rallytime) [2018.3] Merge 2018.3.0rc1 into 2018.3 @ 2018-03-20 22:45:00 UTC
  – 8cdd56b9dc Merge pull request #46620 from rallytime/merge-2018.3.0rc1-into-2018.3
  – b03cda3cea Merge branch ’2018.3.0rc1’ into ’2018.3’
• PR #46606: (Ch3LL) add autodoc topics for infoblox state modules @ 2018-03-19 21:35:46 UTC
  – 2d2fe22ae2 Merge pull request #46606 from Ch3LL/infoblox_docs
  – 6eab6a7dc4 add autodoc topics for infoblox state modules
• PR #46540: (s0undt3ch) Some missing isinstance checks. @ 2018-03-15 16:17:19 UTC
  – 1191d5b379 Merge pull request #46540 from s0undt3ch/2018.3
  – fa1d68774 Some missing isinstance checks. Committed again through a PR.
• PR #46513: (rallytime) [2018.3] Merge forward from 2018.3.0rc1 to 2018.3 @ 2018-03-15 15:58:59 UTC
  – 5429438e4b Merge pull request #46513 from rallytime/merge-2018.3
  – aa760334a1 Merge branch ’2018.3.0rc1’ into ’2018.3’
• ISSUE #43208: (mitar) Prevent user.present to change uid and gid of existing user (refs: #46502)
• PR #46502: (terminalmage) user.present: don’t change uid/gid unless explicitly told to @ 2018-03-13 14:25:20 UTC
  – 3e073c7e8a Merge pull request #46502 from terminalmage/issue43208
  – 4106840deb user.present: don’t change uid/gid unless explicitly told to
• PR #46398: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-03-12 20:25:19 UTC
  – 7cdb00ca9c Merge pull request #46398 from rallytime/merge-2018.3
  – d22e5ba442 Merge fix: return back wb+ mode in crypt.gen_keys.
  – c7ddaf8ce Lint: Use log variable, not logger.
  – ca1860cd91 Use new get_umask function in mask calls in virt.py
  – 19ec7b6d1e Update old utils paths with new utils paths
  – d83727fd9 Merge branch ’2017.7’ into ’2018.3’
  * 95586678c3 Merge pull request #46394 from Ch3LL/mac_doc
    • 158add6661 change oxdownload to oxdownload-{python_version}
    • 21aa848c89 Add mac py2 and py3 packages to mac installation docs
  * 07b5d09a1c Merge pull request #46338 from rallytime/fix-44831
    • 90771da999 Remove cmd.wait deprecation reference in docs
* 3849e7a085 Merge pull request #46333 from danlsgiga/issue-42438
  - 3b13f37b44 Revert changes in the code and change docs instead
  - 38114a65d8 Fixes color parameter mismatch and handles 204 responses correctly
* a8f2f1b063 Merge pull request #46322 from terminalmage/issue44935
  - 85ac6a9893 yamlify_arg: don’t treat leading dashes as lists
* da5c282cb2 Merge pull request #46327 from samilaine/fix-vmware-cloud-fqdn
  - 4b8db326f Modify the way a FQDN is handled in the vmware cloud provider.
* 78c45d3786 Merge pull request #46318 from terminalmage/issue44935
  - 5889b36646 Skip type-checking for several gitfs/git_pillar/winrepo params
* bb0d6fc263 Merge pull request #46312 from gtmanfred/2017.7
  - 749ae580ed add module_dirs to salt ssh thin tarball

  - b14bf6295 Update PillarStack stack.py to latest upstream version
- **PR #46227**: (Ch3LL) Mock file_client call in smtp return test @ 2018-02-28 22:12:22 UTC
  - 738265ac70 Merge pull request #46227 from Ch3LL/smtp_file_client
  - 280cd9a2b6 Mock file_client call in smtp return test
- **PR #46232**: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-02-28 19:16:37 UTC
  - 123625213e Merge pull request #46232 from rallytime/merge-2018.3
  - 04f24c1794 Lint: fix from a bad merge
  - aad61c77bd Update old utils paths to new paths
  - 7243baf2c0 Merge branch '2017.7' into '2018.3'
    - 633e1208e4 Merge pull request #46221 from terminalmage/salt-jenkins-854
      - 0eb012659c Fix hanging tests in integration suite
    - 7917277345 Merge pull request #46214 from vutny/formulas-readme-formatting
      - d702846961 [DOC] Replace note rST block for GitHub
Chapter 28. Release Notes

- a2e099b744 Merge pull request #46203 from Ch3LL/7.5_release
  - 6ddf3246ce Add 2017.7.5 Release Notes File
- 973b227818 Merge pull request #46201 from rallytime/merge-2017.7
  - 9ac2101baa Merge branch '2016.11' into '2017.7'
  - a4c5417d23 Merge pull request #46132 from rallytime/2016.11_update_version_doc
  - d2196b6df3 Update release versions for the 2016.11 branch
- 89cf2e5061 Merge pull request #46139 from bdrung/os-grains
  - 0b445f2a37 tests: Add unit tests for _parse_os_release()
  - f6069b77ed Fix osfinger grain on Debian
  - 8d8e55a761 tests: Add os_grains test cases for Debian
  - ff02ab9937 tests: Add Ubuntu 17.10 (artful) os_grains test case
  - 77d5356aba Fix incorrect oscodename grain on Ubuntu
  - 7e62d9f6d2 tests: Support reading os-release files from disk
  - a92ec0db1b Make _parse_os_release() always callable
  - eee1fe5b38 tests: Dissolve _run_ubuntu_os_grains_tests
  - 1d6ef731fe tests: Deduplicate _run_os_grains_tests()
- c8c71e75ca Merge pull request #46133 from rallytime/2017.7_update_version_doc
  - 0ed338e643 Update release versions for the 2017.7 branch
- 390d592aa6 Merge pull request #46185 from terminalmage/issue46124
  - 3b58dd0da0 gitfs: Fix detection of base env when its ref is also mapped to a different env
- 705caa8cca Merge pull request #46148 from rallytime/merge-2017.7
  - 25deeb7a6 Merge branch '2017.7.3' into '2017.7'
  - b5b083fd26 Merge pull request #46074 from Ch3LL/update-7.4
  - 8d0eeeb059 Update 2017.7.4 Release Notes with new fixes
  - 32f3d00e44 Merge pull request #46066 from rallytime/pin-tornado
  - 6dc1a3b9dc Pin tornado version in requirements file
  - 85761ee650 Merge pull request #46036 from terminalmage/issue43769
  - e2140d9a84 Mock the ssh.key_is_encrypted utils func
  - 169924b3fe Move ssh.key_is_encrypted to a utils module temporarily
  - 54f4d78f7a Only keep ssh.py in the Windows installer
  - 5f04531e1b Keep ssh state and execution modules in the installer
  - f2b69f703d git.latest: Fix regression with identity file usage
- 10a47dc8c4 Merge pull request #46137 from damon-atkins/2017.7_fix_ec2_pillar2
  - 99e76a7d3 update ec2 pillar arguments with better names
- d74cb14557 Merge pull request #46145 from terminalmage/issue46004
  - 467ff841cd pillarenv argument should default to None and not the value from opts
• ISSUE #42932: (bobrik) cmd.run with bg: true doesn’t fail properly (refs: #46172, #45932)

• PR #46172: (The-Loeki) cmdmod: reimplementation of #45932 for Oxygen @ 2018-02-28 19:14:26 UTC
  - PR #45932: (The-Loeki) Fix cmd run_all bg error (refs: #46172)
  - PR #39980: (vutny) [2016.3] Allow to use bg kwarg for cmd.run state function (refs: #46172, #45932)
  - 20d869c228 Merge pull request #46172 from The-Loeki/fix_cmd_run_all_bg_oxygen
  - 3ecf5018d0 Merge branch '2018.3' into fix_cmd_run_all_bg_oxygen
  - b5315e817b Merge branch '2018.3' into fix_cmd_run_all_bg_oxygen
  - beabf406b cmdmod: reimplementaion of #45932 for Oxygen

• PR #46238: (terminalmage) Don’t allow salt.utils.files.fopen() to open stdin/stdout/stderr @ 2018-02-28 19:08:23 UTC
  - 687575b582 Merge pull request #46238 from terminalmage/fds-in-fopen
  - fe1527a3c4 Don’t allow salt.utils.files.fopen() to open stdin/stdout/stderr

• PR #46219: (twangboy) Fix unit.modules.test_network for Windows @ 2018-02-28 15:45:02 UTC
  - 3da5dcb313 Merge pull request #46219 from twangboy/win_fix_inet_pton
  - 46f1d2cc09 Use six.text_type instead of six.u

• PR #46228: (twangboy) Fix unit.modules.test_pip for Windows @ 2018-02-28 15:37:49 UTC
  - 44343f8063 Merge pull request #46228 from twangboy/win_fix_test_pip
  - 415821eee9 Fix encoding issue

• PR #46198: (rallytime) [2018.3] Merge forward from 2018.3.0rc1 to 2018.3 @ 2018-02-27 15:17:51 UTC
  - ade8950b8e Merge pull request #46198 from rallytime/merge-2018.3
  - 1b4dc71930 Lint fix
  - 776f2ea5d7 Merge branch '2018.3.0rc1' into '2018.3'

• ISSUE #45849: (Epiclemonaid) XenServer Provisioning errors out on this line. removing it succeeds. (refs: #46168)

• PR #46168: (gtmanfred) driver and provider should be specified @ 2018-02-26 16:17:13 UTC
  - 06d2df3ac Merge pull request #46168 from gtmanfred/2018.3
  - ac99bd26db driver and provider should be specified

• PR #46161: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-02-26 15:29:39 UTC
  - 605e5eff73 Merge pull request #46161 from rallytime/merge-2018.3
  - 69ac94baca Update utils paths
  - cffbf52c10 Lint fix: remove extra line
- 79bed0cf1 Merge branch '2017.7' into '2018.3'
  - 0398ce0482 Merge pull request #46135 from rallytime/bp-46088
    - 57a60f62a3 fix kernel subpackages install bug
  - 1fcbbd1e02 Merge pull request #46136 from rallytime/bp-46115
    - 0a481d707f update digitalocean salt-cloud driver
  - 11e5e8eb86 Merge pull request #45911 from twangboy/win_fix_lgpo_unicode
    - bcde5cc625 Update log statement
    - e9fa53d3b7 Change the Invalid Data Message
    - c818d4b791 Convert reg values to unicode for debug
  - 524a6a72a0 Merge pull request #46123 from gtmanfred/2017.7
    - 8d36730ef7 If no pubkey is passed in openmode fail
  - e48fa58012 Merge pull request #46131 from vutny/doc-formula-formatting
    - d8b051e444 [DOC] Fix code-blocks for reStructuredText
  - 6cea44ee95 Merge pull request #46118 from rallytime/bp-44603
    - 2a2c23c66b Fix acme state to correctly return on test
  - 16c382b55b Merge pull request #46121 from rallytime/merge-2017.7
    - 4c2f504a85 Merge branch '2016.11' into '2017.7'
    - e197a0fbcc5 Merge pull request #46076 from rallytime/bp-46066
    - b94d73c53e Pin tornado version in requirements file
    - c72c1bdef5 Merge pull request #46093 from wedge-jarrad/contributing-doc-typo
    - 5a0fe104f7 Fix contributing doc typo
    - 3cb383e876 Merge pull request #45992 from bgridley/fix-routes-present-state
    - 679787699c Add vpc_peering_connection_id to describe_route_tables route_keys
    - 8a60635da0 Merge pull request #46000 from terminalmage/issue45910
    - 8cf13325ee salt.states.reg.present: Prevent traceback when reg data is binary
    - 1f44e285dc Merge pull request #46011 from terminalmage/fix-solaris-runs
    - 8ae03a28b Move Solaris USER workaround up a bit
    - 13cd52690 cmdmod.py: runs workaround for platforms that don’t set a USER env var
    - 30bf8f7be0 Merge pull request #45467 from twangboy/win_exclude_hidden
    - ea41215646 Make the regex pattern less greedy
    - 6d223c6fa7 Add tip about passing bogus saltenv
    - 1282ae3a93 Skip hidden first
    - 437a457911 Skip hidden dirs in genrepo
    - 87dc554dc3 Add final updates to docs
    - 3646d5c897 Fix some docs formatting, add some warnings
    - 35c81fa5a Log the source_dir when caching the files
91c3da8dfd Improve docs for pkg.refresh_db
4803d92707 Add some documentation
08b82e0875 Fix lint error, use raw
2f712691cf Exclude hidden directories in pkg.refresh_db

- b92346645b Merge pull request #46107 from amendlik/yumpkg-assumeyes
  - 8d9a432fb2 Add --assumeyes to yum/dnf commands in yumpkg.refresh_db

- 14fe423e0c Merge pull request #46094 from kstreee/fix-memory-leak
  - 48080a1bae Fixes memory leak, saltclients should be cleaned after used.
  - aba00805f4 Adds set_close_callback function to removes stream instance after closed from a set streams.

- 320c2037e1 Merge pull request #46097 from vutny/fix-https-link
  - 2062fd0e5c [DOC] Put https link to the formulas doc page

- 0eb137fb4e Merge pull request #46103 from bdrunug/2017.7
  - dd3f936557 Fix skipping Kubernetes tests if client is not installed

- c3a938e994 Merge pull request #46070 from Ch3LL/fix-doc-dns
  - 2a5d855d97 add required arg to dns_check jinja doc example

- 01042e9d77 Merge pull request #46067 from rallytime/bp-45994
  - a07bb48726 Correct formatting for lint
  - e8678f633d Fix Comment being None not " and inject quotes into the TXT ChangeRecords

- 5e0e2a30e2 Merge pull request #45932 from The-Loeki/fix_cmd_run_all_bg
  - f83da27ca5 Merge branch '2017.7' into fix_cmd_run_all_bg
  - 771758fbca Merge branch '2017.7' into fix_cmd_run_all_bg
  - c54fc7a2d cmd: move separate DRY logging blocks into _run, prevent logging on bg=True, don’t use_vt on bg
  - ebb1f81a9b cmd run: when running in bg, force ignore_retcode=True

- 45ace39961 Merge pull request #46062 from vutny/pg-user-state-fix-typo
  - a5be4e95e Fix typo in postgres_user.present state function

- edcb64de76 Merge pull request #45763 from twangboy/win_fix_path_rehash
  - b9a2be7b29 Fix hyperlinks
  - 29912adc15 Move the test_rehash test to test_win_functions
  - adc594c183 Remove duplicate link
  - e84628c1eb Add some comments to the code
  - d50d5f582f Add additional info to docs for broadcast_setting_change
  - 3a54e09cd9 Rename setting to message
  - a3f9e99bc0 Change to a generic function to broadcast change
  - 79299361c3 Create refresh_environment salt util
  - 967b83940c Fix rehash function

28.2. Previous Releases 4021
• PR #46160: (rallytime) Mark 2 tests as flaky @ 2018-02-23 19:10:06 UTC
  - 05b771bf67 Merge pull request #46160 from rallytime/flaky-tests
  - 49e49ae51b Mark 2 tests as flaky
• PR #46006: (dincamihai) Remove obsolete unicode handling in pkg.info_installed @ 2018-02-22 19:22:36 UTC
  - 9b2bc1982c Merge pull request #46006 from dincamihai/oxygen.rc1
  - 99079fc442 Remove obsolete unicode handling in pkg.info_installed
• PR #46078: (rallytime) [oxygen] Merge forward from oxygen.rc1 to oxygen @ 2018-02-20 21:49:04 UTC
  - 2d0f81fd1b Merge pull request #46078 from rallytime/merge-oxygen
• ISSUE #45938: (edgan) zookeeper.present state doesn’t deal with an existing znode with no ACL specified (refs: #46043)
• PR #46071: (rallytime) Back-port #46043 to oxygen @ 2018-02-16 19:56:36 UTC
  - PR #46043: (edgan) Allow zookeeper znode creation to not require an ACL (refs: #46071)
  - 5a31422432 Merge pull request #46056 from Ch3LL/ver_mac
  - e44f5133c5 Fix mac_assistive module not loading
• PR #46041: (rallytime) [oxygen] Merge forward from 2017.7 to oxygen @ 2018-02-16 14:55:51 UTC
  - cdca28f5da Merge pull request #46041 from rallytime/merge-oxygen
  - e060a74fd8 Merge branch '2017.7' into 'oxygen'
  * 07e5735471 Merge pull request #46016 from rallytime/bp-45826
    - 1916e5c4a4 Fix selinux.fcontext_policy_present for Centos 6
  * a1f4092811 Merge pull request #46015 from rallytime/bp-45785
    - ef6ff1492 Resolve linting errors
    - 8047066c46 Remove unused import
    - 8f7c45935a Add tests for salt.modules.selinux.fcontext_get_policy
    - baf8b4e66 Ensure parsed fields are stripped
- a830a6e819 m/selinux.fcontext_get_policy allow long file specs
  - 96097c037e Merge pull request #46012 from rallytime/bp-45462
    - 9f76836a6c emit port cli version, variants as separate args
  - 1279924f5f Merge pull request #45991 from terminalmage/fix-duplicate-extra-opts
    - 916766f651 yumpkg: Fix a couple issues with _get_extra_opts
  - 8b9adc258e Merge pull request #46017 from rallytime/merge-2017.7
    - a06645ce71 Merge branch '2017.7.3' into '2017.7'
    - 6d534c6e7e Merge pull request #46009 from Ch3LL/ren_7.4
    - ac0ba4b344 Add 2017.7.4 Release Notes with PRs
    - ca76a0b328 Merge pull request #45981 from gtmanfred/2017.7.3
    - 0d448457dc apparently local is not set by default
    - 2a92f4bc16 use local config for vault when masterless
    - 6530649dbc Merge pull request #45953 from rallytime/bp-45928-2017.7.3
    - 85363189d1 Fixing vault when used with pillar over salt-ssh
    - fb378ceb0 Merge pull request #45934 from rallytime/bp-45902
    - bb38e83455 Add regression test for issue 45893
    - cdd46b759 Remove duplicated section in docstring and fix example
    - 4b6351da6 Check the effective saltenv for cached archive
    - 0d7451c71 Merge pull request #45935 from rallytime/bp-45742
    - 6a0b5f7a35 Removed the chained copy
    - ad1150fad4 list.copy() is not compatible with python 2.7
  - d20f89414 Merge pull request #45988 from rallytime/bp-45797
    - 953a40d79 follow sym links
  - b18087ce0 Merge pull request #45711 from bdrung/fixed-unicode-tests
    - b6181b56d Fix Unicode tests when run with LC_ALL=POSIX
  - 5271fb1d40 Merge pull request #45878 from damon-atkins/2017.7_fix_ec2_pillar
    - 0e74025714 Merge branch '2017.7' into 2017.7_fix_ec2_pillar
    - b4d0b3891 py3 fix
    - 75d9e20d8a Add ignoring 'terminated', 'stopped' instances, to improve changes of a single match
    - 0093472a37 added tag_key_list and tag_key_sep to create ec2_tags_list
    - afb3968aa7 ec2_pillar could not find instance-id, resolved. add support to use any tag to compare minion id against.
  - cf367d0d04 Merge pull request #45942 from terminalmage/issue45679-2017.7
    - 89c7d72a0d Don’t try to sort ports when translating docker input
    - 9cd47b39dd Fix incorrect translation of docker port_bindings -> ports
  - dae41de7a8 Merge pull request #45959 from rallytime/state-doc-update
• 6f781cb95d A couple of grammar updates for the state compiler docs
• 007214f7bf Merge pull request #45908 from DimensionDataResearch/fix/issue/45884
  1a75786b5a Fix linter warnings.
  82ec0b589c Revert to using salt.utils.cloud.is_public_ip.
  9b6b01873b Fix violations reported by flake8.
  a2bc155c73 Use __utils__['cloud:'] instead of salt.cloud.utils.
  98907a32cb Ensure 'auth' parameter is correctly passed to dimensiondata driver.
  de2b03e2c Fix copy/paste bug in dimensiondata provider integration test.
  6b1b6be427 Add integration tests for dimensiondata cloud provider.
  f6ea9ed7d Ensure that event data provided by the dimensiondata driver is serialisable.
• efcbfa868c Merge pull request #45985 from garethgreenaway/2017_7_fixing_mac_tests_again
  7b8dc14333 Fixing format in the call to write.
• bf03abd07c Merge pull request #45958 from garethgreenaway/backport-fixing_mactests_queue_full
  25dfaae91 Backporting #45935
• bab365d6c6 Merge pull request #45949 from rallytime/merge-2017.7
  f51687e903 Merge branch '2016.11' into '2017.7'
  7779e9a7ba Merge pull request #45940 from d murphy18/fix_aix_cmdmod
  dd2788419b Fix use of 'su' for AIX to use '-'
• 7fd00ec752 Merge pull request #45928 from garethgreenaway/fixing_vault_pillar_for_salt_ssh
  259e60e5d4 Fixing vault when used with pillar over salt-ssh
• 9d14ad9ccf Merge pull request #45925 from terminalmage/fi x-spelling
  7a143fe454 Fix spelling error in docstring
• PR #45972: (mcalmer) move log_file option to changeable defaults @ 2018-02-15 18:57:24 UTC
  057e895faf Merge pull request #45972 from mcalmer/allow-salt-ssh-define-log_file
  f89a20bf3e move log_file option to changeable defaults
• PR #46007: (rallytime) [oxygen] Merge forward from oxygen.rc1 to oxygen @ 2018-02-13 18:50:09 UTC
  d4377d4678 Merge pull request #46007 from rallytime/merge-oxygen
  d6c2d0693a Merge branch 'oxygen.rc1' into 'oxygen'
• PR #45944: (mirceaulinic) Add NetBox module autodoc @ 2018-02-13 00:01:48 UTC
  069f790b3c Merge pull request #45944 from cloudflare/netbox-autodoc
  ed69b987cf Add NetBox module autodoc
• PR #45984: (garethgreenaway) [oxygen] Missing format in the call to write. @ 2018-02-12 19:06:04 UTC
  2a6285d313 Merge pull request #45984 from garethgreenaway/fixing_mac_tests_again
  ae7791d30b Missing format in the call to write.
• PR #45922: (rallytime) [oxygen] Merge forward from 2017.7 to oxygen @ 2018-02-09 20:24:26 UTC
- 88f481a3df Merge pull request #45922 from rallytime/merge-oxygen
- 9c49c8d47c Remove extra patch
- b96f4cf8ad Remove duplicate import in cmdmod.py
- 34edf4a71 Replace old utils paths with new paths
- d80547e0b8 Merge branch '2017.7' into 'oxygen'
- 0ce93cd69 Merge pull request #45920 from rallytime/merge-2017.7
  * e4e4f4218 Merge branch '2016.11' into '2017.7'
  * 27ff82f996 Merge pull request #45864 from rallytime/release-note-fix
    * 104a24f244 Remove extraneous ] in release notes for 2016.11.9
  * 5fa010de2b Merge pull request #45787 from rallytime/2016.11.9_docs
    * a38d4d4fa [2016.11] Bump latest and previous versions
- 643a85278 Merge pull request #45814 from gtmanfred/2017.7
  * d8ec9aa97 fix cookies dict size changing in http.query
- 3a3f87c16d Merge pull request #45877 from rallytime/new-release-notes
  * f93e88ba81 Add release notes file for 2017.7.4 release
- 1c3e0670 Merge pull request #45904 from rallytime/bp-41017
  * 80c56cdeca Fixed typo in pkg state documentation
- 317d35bd15 Merge pull request #45907 from terminalmage/fix-grains-backport
  * 6cf7e50cc4 Fix backport of grains fix
- dade5f0cab Merge pull request #45906 from rallytime/bp-45548
  * 1be7a7386c Update x509.py
- 82c473af1 Merge pull request #45902 from terminalmage/issue45893
  * 9d200ef2c6 Add regression test for issue 45893
  * 1468f1d0ff Remove duplicated section in docstring and fix example
  * 6cc5cd9b8a Check the effective saltenv for cached archive
- fdedec3cb Merge pull request #45862 from rallytime/bp-45830
  * 1024856f9a Wrapping the put_nowait in a try...except and catching the exception when the multi-processing queue is full. This situation is happening when running the full testing suite on MacOS where the queue limit is 32767 vs on Linux where the queue limit is unlimited.
- 43a45b42c3 Merge pull request #45779 from The-Loeki/patch-3
  * 8575ae3d52 Merge branch '2017.7' into patch-3

28.2.5 Salt 2018.3.2 Release Notes

Version 2018.3.2 is a bugfix release for 2018.3.0.

The 2018.3.2 release contains only a small number of fixes, which are detailed below.

This release fixes two critical issues.

The first is Issue #48038, which is a critical bug that occurs in a multi-syndic setup where the same job is run multiple times on a minion.

The second issue is #48130. This bug appears in certain setups where the Master reports a Minion time-out, even though the job is still running on the Minion.

Both of these issues have been fixed with this release.

Statistics

• Total Merges: 7
• Total Issue References: 2
• Total PR References: 10
• Contributors: 4 (cro, garethgreenaway, gtmanfred, rallytime)

Warning: If you are using Jinja to dump lists or dictionaries in your SLS files, this will now cause errors in Python 2 since Jinja does not produce YAML-compatible output when strings in the data structures contain unicode types. The dictionary must be passed through a Jinja filter to produce YAML-compatible strings.

The below is an example of invalid SLS:

```
/etc/foo.conf:
  file.managed:
    - source: salt://foo.conf
    - template: jinja
    - defaults: {{ mydict }}
```

To make it valid, use either one of Salt’s own json or yaml filters:
/etc/foo.conf:
  file.managed:
    - source: salt://foo.conf
    - template: jinja
    - defaults: {{ mydict | json }}

Changelog for v2018.3.1..v2018.3.2

Generated at: 2018-06-17 19:17:16 UTC

- ISSUE #48130: (rmarchei) Minion timeouts with 2018.3.1 (refs: #48158)

  - ecf564433 always listen when gathering job info
- PR #48138: (rallytime) Update man pages for 2018.3.2 @ 2018-06-14 21:22:34 UTC
  - f154545aff Merge pull request #48138 from rallytime/man-pages-2018.3.2
  - 8c340134f5 Update man pages for 2018.3.2
- PR #48137: (gtmanfred) [2018.3.2] bootstrap kitchen branch tests with 2017.7.6 @ 2018-06-14 21:20:28 UTC
  - b49271b76d Merge pull request #48137 from gtmanfred/2018.3.2
  - 6128519e8b bootstrap kitchen branch tests with 2017.7.6
- PR #48129: (rallytime) Add release notes for 2018.3.2 @ 2018-06-14 15:48:36 UTC
  - 21aaf1cb4 Merge pull request #48129 from rallytime/release-notes-2018.3.2
  - 0b13be0111 Add release notes for 2018.3.2
- PR #48100: (rallytime) Back-port #48014 to 2018.3.2 @ 2018-06-14 12:54:52 UTC
  - PR #48014: (cro) Find job pause (refs: #48100)
  - 36b99ae80a Merge pull request #48010 from rallytime/bp-48014
  - 77feccc5c4 Lint: Add blank line
  - 159b052962 One more case where returner doesn’t respond
  - 91b45b4cc4 Catch two cases when a returner is not able to be contacted—these would throw a stacktrace.
- PR #48099: (rallytime) Back-port #47915 to 2018.3.2 @ 2018-06-14 12:54:23 UTC
  - PR #47915: (garethgreenaway) [2018.3] state runner pause resume kill (refs: #48099)
  - 40e1bdfdec9 Merge pull request #48099 from rallytime/bp-47915
  - 355b580058 fixing typo in alias_function call.
  - 4b0f8f946f6a Some fixes to the set_pause and rm_pause function in the state runner, renaming to in line
    with the functions in the state module. Including aliases to previous names for back-ward compatibility. Including a soft_kill function to kill running orchestration states. A new test to test soft_kill
    functionality.
- ISSUE #48038: (austinpapp) jobs are not dedup’ing minion side (refs: #48075)
- PR #48097: (rallytime) Back-port #48075 to 2018.3.2 @ 2018-06-14 12:52:44 UTC
PR #48075: (garethgreenaway) [2017.7] Ensure that the shared list of jids is passed (refs: #48097)

- 074a97dcfa Merge pull request #48097 from rallytime/bp-48075
- e4c719b55f Ensure that the shared list of jids is passed when creating the Minion. Fixes an issue when minions are pointed at multiple syndics.

28.2.6 Salt 2018.3.3 Release Notes

Version 2018.3.3 is a security and bugfix release for 2018.3.0.

Statistics

- Total Merges: 548
- Total Issue References: 69
- Total PR References: 341
- Contributors: 55 (Ch3LL, FedericoCeratto, KaiSforza, L4rS6, Lutseslav, The-Loeki, Vaeltern, admid, aesposito91, asenci, astorath, azelelzi, babs, bceuz, bbinet, brejoc, cro, daa, dmurphy18, dwebb, eliasp, ezh, garethgreenaway, gtmanfred, ishm, jeduardo, kt97679, kuetrzi, linopt, lomere, lusche, mateiw, maxarnold, maxim-sermin, meaksh, mmulqueen, morganwillcock, mtorromeo, nullify005, paulcollinsiii, pritambaral, rallytime, rares-pop, rmarchei, rosscdh, sizgyaev, sjorge, t0fik, terminalmage, travispaull, twangboy, vinian, weswhet, zethimon)

Warning: If you are using Jinja to dump lists or dictionaries in your SLS files, this will now cause errors in Python 2 since Jinja does not produce YAML-compatible output when strings in the data structures contain unicode types. The dictionary must be passed through a Jinja filter to produce YAML-compatible strings.

The below is an example of invalid SLS:

```
/etc/foo.conf:
  file.mangaged:
    - source: salt://foo.conf
    - template: jinja
    - defaults: {{ mydict }}
```

To make it valid, use either one of Salt’s own `json` or `yaml` filters. Another option would be to use Jinja’s `tojson` filter.

```
/etc/foo.conf:
  file.mangaged:
    - source: salt://foo.conf
    - template: jinja
    - defaults: {{ mydict | tojson }}
```

Security Fix

CVE-2018-15751 Remote command execution and incorrect access control when using salt-api.

CVE-2018-15750 Directory traversal vulnerability when using salt-api. Allows an attacker to determine what files exist on a server when querying /run or /events.

Credit and thanks for discovery and responsible disclosure: nullbr4in, xcuter, koredge, loupos, blackcon, Naver Business Platform

28.2. Previous Releases
Changes to win_timezone

Improves timezone detection by using the pytz module.
timezone.get_offset and timezone.get_zonecode now work properly.
Adds timezone.list to list supported timezones in either Windows or Unix format.

New Jinja Filter

The tojson filter (from Jinja 2.9 and later) has been ported to Salt, and will be used when this filter is not available.
This allows older LTS releases such as CentOS 7 and Ubuntu 14.04 to use this filter.
You can use this filter any time you wish to dump a list or dictionary into an SLS file, to ensure that the result is able
to be loaded by the YAML renderer. For example:

```yaml
foo:
  bar.baz:
    - some_arg: {{ mydict | tojson }}
```

MacOSX escape characters with runas

You are now required to escape quotes when using the runas argument with the cmd module on macosx.
Example:

```bash
cmd.run 'echo "h="baz""' runas=macuser
```

  - a80e64569 Merge pull request #49368 from rallytime/bp-49322
  - 2388539d0 Encode shell commands explicitly.

- **PR #49363**: (rallytime) Back-port #49245 to 2018.3.3 @ 2018-08-28 17:14:18 UTC
  - **PR #49245**: (dwoz) Skip grep unit tests on windows (refs: #49363)
  - 0f0e3e8786 Merge pull request #49363 from rallytime/bp-49245
  - cc6050d0 Fix is_windows call - use the right path
  - 5488f0ea38 Skip grep unit tests on windows
• PR #49361: (rallytime) Back-port #49244 to 2018.3.3 @ 2018-08-28 17:12:58 UTC
  - PR #49244: (dwoz) Test fixes: unit.fileserver.test_gitfs (refs: #49361)
  - dbcd2fc726 Merge pull request #49361 from rallytime/bp-49244
  - e09093a2d5 Simplify by using to_unicode helper
  - 4723c6092 Older GitPython version do not have a close method
  - d5fcb7a16 Fix up fileserver.test_gitfs tests on windows
  - 4b68f6347 Remove unicode filenames on windows python 2

• PR #49362: (rallytime) Back-port #49240 to 2018.3.3 @ 2018-08-28 17:00:25 UTC
  - PR #49240: (dwoz) file state test fixes (refs: #49362, #49441)
  - b4a1e1d365 Merge pull request #49362 from rallytime/bp-49240
  - 16ca5b9694 Work around listdir encoding issues on py2 windows
  - 764a79e8db file state test fixes

• PR #49365: (rallytime) Back-port #49270 to 2018.3.3 @ 2018-08-28 16:56:23 UTC
  - PR #49270: (dwoz) Add async helper to test_sock_path_len (refs: #49365)
  - 9ca9a775ff Merge pull request #49365 from rallytime/bp-49270
  - 1b3f57a8b8 Add async helper to test_sock_path_len

• PR #49364: (rallytime) Back-port #49243 to 2018.3.3 @ 2018-08-28 16:55:55 UTC
  - PR #49243: (dwoz) Revert newline translation change (refs: #49364)
  - bbf57da16 Merge pull request #49364 from rallytime/bp-49243
  - 5db77c629a Revert newline translation change

• PR #49347: (Ch3LL) [2018.3.3] Backport #49345 @ 2018-08-28 01:54:00 UTC
  - PR #49345: (gtmanfred) upgrade including linux kernels (refs: #49347)
  - 74b78835b3 Merge pull request #49347 from Ch3LL/bp_49345_2018.3.3
  - 7bf5ba83c8 upgrade including linux kernels

• PR #49323: (Ch3LL) Skip nonexistent branch test for git versions <1.7.10 @ 2018-08-25 19:52:48 UTC
  - be6691d91b Merge pull request #49323 from Ch3LL/skip_git
  - ee3d32f7ae Skip nonexistent branch for git versions <1.7.10

• ISSUE #32737: (Lothiraldan) No support for compound matcher in external auth configuration (refs: #49236)

• PR #49313: (rallytime) Back-port #49236 to 2018.3.3 @ 2018-08-24 20:59:16 UTC
  - PR #49236: (terminalmage) Allow compound matching in auth config expressions (refs: #49313)
  - 64d38b6c46 Merge pull request #49313 from rallytime/bp-49236
  - 1a5ef996e3 Add 'minion_data_cache: True' to mocked opts for minions unit tests
  - 549f5d5a86 Allow compound matching in auth config expressions

• ISSUE saltstack/salt-jenkins#1075: (Ch3LL) [2018.3.3] arch python3 tests do not finish (refs: #49303, #49451)

• PR #49311: (rallytime) Back-port #49303 to 2018.3.3 @ 2018-08-24 17:48:23 UTC
  - PR #49303: (gtmanfred) use os._exit instead of sys.exit when daemonizing (refs: #49311)
- 7a89a4c8aa Merge pull request #49311 from rallytime/bp-49303
- 3fe1387751 use os._exit instead of sys.exit when daemonizing

- **PR #49294**: (Ch3LL) Move run_function call from __init__ to setup @ 2018-08-24 12:41:35 UTC
  - 7bb356f11e Merge pull request #49294 from Ch3LL/fed_28_tests
  - 0a5d44a3db Move run_function call from __init__ to setup

- **PR #49302**: (twangboy) Fix installer 2018.3.3 @ 2018-08-24 12:41:14 UTC
  - a6079332f Merge pull request #49302 from twangboy/fix_installer_2018.3.3
  - 68fd37575e Fix erroneous NSSM reference
  - 103f2c289e Remove delete vcredist line
  - 007a16638e Bring installer updates from 2017.7.8 to 2018.3.3

- **PR #49241**: (terminalmage) Don’t silently catch SystemExit @ 2018-08-22 12:57:58 UTC
  - bc0b4ac513 Merge pull request #49241 from terminalmage/salt-jenkins-1078
  - 08d144f2c7 Don’t silently catch SystemExit
  - c0f8b818f7 Don’t use a bare except!

- **PR #49239**: (Ch3LL) Use yaml’s safe_dump in windows ec2 tests @ 2018-08-22 08:48:13 UTC
  - 0bb9c6f0a Merge pull request #49239 from Ch3LL/win_yaml_test
  - f5b4db24b4 import salt.utils.yaml
  - 67290eaf7 Use yaml’s safe_dump in windows ec2 tests

- **PR #49182**: (terminalmage) Fix hanging syndic test @ 2018-08-18 12:10:32 UTC
  - 134f125b96 Merge pull request #49182 from terminalmage/salt-jenkins-1078
  - a2d2cd317b Fix hanging syndic test

- **PR #49172**: (Ch3LL) [2018.3.3] cherry pick #49118 @ 2018-08-17 20:54:05 UTC
  - **PR #49118**: (dwoz) Multiple fixes for integration.states.test_file (refs: #49172)
  - **PR #49088**: (dwoz) Multiple file state test fixes (refs: #49118)
  - **PR #49087**: (dwoz) Filter out scheme’s that are not valid (refs: #49118)
  - b3a247bb2 Merge pull request #49172 from Ch3LL/bp-49118
  - ce5e17bd9b update is_windows salt.utils to correct path
  - 3fe112409 Multiple fixes for integration.states.test_file

- **PR #49173**: (Ch3LL) [2018.3.3] cherry pick #49167 @ 2018-08-17 20:30:27 UTC
  - **PR #49167**: (dwoz) Fix remaining file state integration tests (py3) (refs: #49173, #49442)
  - 85fc8db87 Merge pull request #49173 from Ch3LL/bp-49167
  - a1a298a13c Simplify dict keys lookup
  - 3d26affa10 Fix remaining file state integration tests (py3)

- **PR #49171**: (Ch3LL) [2018.3.3] cherry pick #49103 @ 2018-08-17 20:23:32 UTC
  - **PR #49103**: (dwoz) Install the launcher so we can execute py files (refs: #49171)
  - ee54ea5f73 Merge pull request #49171 from Ch3LL/bp-49103
- 05a2b91fb2 Install the launcher so we can execute py files

- **PR #49132**: (Ch3LL) [2018.3.3] backport PR #49062 @ 2018-08-17 14:51:50 UTC
  
  - PR #49062: (weswhet) fix memoize on available macOS services (refs: #49132)
  
  - 58034c9dc3 Merge pull request #49132 from Ch3LL/bp-49062
  
  - 990fdb6a52 decorator link fix, updating context names, as well as updating macutils tests for latest changes
  
  - 3ab5d282be fixing an issue with memoize on macOS services, switching to using __context__ instead

- **PR #49142**: (Ch3LL) Remove -Z script_arg for cloud tests @ 2018-08-16 16:12:59 UTC
  
  - 01f8f83cf0 Merge pull request #49142 from Ch3LL/rm_z_arg
  
  - a1ef68a8a6 Remove -Z script_arg for cloud tests

- **PR #49137**: (Ch3LL) [2018.3.3] Update bootstrap script to latest release (2018.08.15) @ 2018-08-15 19:49:22 UTC
  
  - a0382884b Merge pull request #49137 from Ch3LL/bootstrap_2018.3.3
  
  - eb9a612096 [2018.3.3] Update bootstrap script to latest release (2018.08.15)

- **PR #49110**: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-08-14 17:11:25 UTC
  
  - b412bb534 Merge pull request #49110 from rallytime/merge-2018.3
  
  - 4649f60209 Update old utils paths with new paths
  
  - 49c2a784bb Merge branch ’2017.7’ into ’2018.3’
    - d46e23f4c2 Merge pull request #49109 from rallytime/merge-2017.7
      - 3c5527f300 Merge branch ’2017.7.8’ into ’2017.7’
      - 01cf2c71ff Merge pull request #49051 from rallytime/bp-49046
      - fc0817cb35 The osfullname grain differs when using Python2 vs Python3, swapping this out for the "OS" grain which is consistent.
    - 8954dd269f Merge pull request #49090 from dwoz/file_line_fix
      - 0dca634e3c Search for (but do not include) CRLF line ending
    - b99edc3dce Merge pull request #49088 from dwoz/file_hash_diffs
      - 054af88197 Multiple file state test fixes
    - 27a977b6c4 Merge pull request #49087 from dwoz/url_file_test_fixes
      - 632b65f975 Filter out scheme’s that are not valid
    - db5fb3232a Merge pull request #49086 from rallytime/new-doc-img
      - 90954203cb Update the DOCBANNER image for saltconf
    - af6ec1dce2 Merge pull request #49045 from twangboy/fix_43164
      - 589456d08f Fix lint errors
      - e79243566d Add rallytime’s suggestions
      - d1ae6b3d6d Fix docs for the registry module and state
    - a840fe1a1a Merge pull request #49083 from rallytime/bootstrap-2017.7
      - 358e14dca[2017.7] Update bootstrap script to latest release
    - 9db6cd5654 Merge pull request #49059 from twangboy/fix_37984
- 7ed45b5b00 Remove import
- 7fb1ed469 Fix docs to clarify uptime output on Windows

  * f9db72f00c Merge pull request #49061 from saltstack/revert-48982-new_logo_2017.7
  * 98a8da728b Revert "New logo 2017.7 (WIP)"

  * bbcd1869ec Merge pull request #48982 from newwebash/new_logo_2017.7
    * 5c1c311f77 Update Salt Conf ad
    * 72dc63c426 Merge branch '2017.7' of https://github.com/saltstack/salt into new_logo_2017.7
    * 9f4e78a7b9 Revert "Update saltconf ad"
    * 3ab8c9882 Update saltconf ad

- ISSUE #48665: (dgengtek) salt-api auth ldap generates a valid token when using bindpw and an invalid request (refs: #48901)

- PR #48901: (garethgreenaway) [2018.3] fix to auth/ldap.py @ 2018-08-14 16:10:19 UTC
  - e78fc0e0eb Merge pull request #48901 from garethgreenaway/48665_auth_ldap_valid_token_failed_auth
  - d4e4f2e803 Fixing a typo in a comment.
  - 2eb167e422 Fixing issue when a valid token is generated even when invalid user credentials are passed. This change verifies that the binddn credentials are valid, then verifies that the username & password (if not None) are also valid.

- ISSUE #49081: (frogunder) Fluorine - I see error/traceback when running minion in debug mode (refs: #49085)

- PR #49099: (rallytime) Back-port #49085 to 2018.3 @ 2018-08-14 12:42:51 UTC
  - PR #49085: (gtmanfred) fix async call to process manager (refs: #49099)
  - 484c1e0123 Merge pull request #49099 from rallytime/bp-49085
  - 024d9cb843 fix async call to process manager

- ISSUE #49018: (Ch3LL) add MasterPillarUtil tests (refs: #49034)

- PR #49071: (rallytime) Back-port #49034 to 2018.3 @ 2018-08-13 20:15:31 UTC
  - PR #49034: (garethgreenaway) [fluorine] Adding tests for MasterPillarUtil (refs: #49071)
  - bc033da677 Merge pull request #49071 from rallytime/bp-49034
  - 8108a4d31a Adding some tests for the grains, pillar and mine functions in the cache runner. These will also ensure that the relevant functions in salt.utils.master.MasterPillarUtil are functioning properly.

- PR #49077: (rallytime) Back-port #49075 to 2018.3 @ 2018-08-13 20:00:00 UTC
  - PR #49075: (gtmanfred) fix last async issue (refs: #49077)
  - 90c2f026b3 Merge pull request #49077 from rallytime/bp-49075
  - 5e07b8306f fix last async issue

- PR #49096: (rallytime) Update the DOCBANNER image for saltconf @ 2018-08-13 19:59:39 UTC
  - 6942ef1102 Merge pull request #49096 from rallytime/new-doc-img-2018.3
  - 75080705ce Update the DOCBANNER image for saltconf

- PR #49055: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-08-13 19:20:11 UTC
  - 0e1ed7b923 Merge pull request #49055 from rallytime/merge-2018.3
- 83a15c623 Add optimization_order config to mocked opts
- ea6883e55 Update old utils paths to new utils paths
- 20103f8a8 Merge branch '2017.7' into '2018.3'
  - 0d2a49537 Merge pull request #49050 from rallytime/merge-2017.7
    - ed6fb8b739 Merge branch '2017.7.8' into '2017.7'
    - 189e28691f Merge pull request #49044 from Ch3LL/vultr_test
    - 0de4d4e5d1 increase timeout on vultr cloud integration test
    - c606a32cf2 Merge pull request #49042 from rallytime/flaky-jinja-test
    - a43d9b4a6 Mark a jinja template test as flaky
    - 6415b6f73b Merge pull request #49041 from Ch3LL/ec2_fix
    - cf7f2459b8 [2017.7.8] backport PR #48212
    - 1db036406b Merge pull request #49030 from rallytime/update-client-tests
    - f08e6c6ae Update netapi client tests
  - 70be9ac9b1 Merge pull request #49046 from garethgreen-away/1022_fixing_test_failing_py3_Debian_test
    - fa23399b91 The osfullname grain differs when using Python2 vs Python3, swapping this out for the "OS" grain which is consistent.
  - 69c9b0aeb1 Merge pull request #49036 from cspeidel/doc-fix-netyang
    - f7ac085eb5 minor doc fix in netyang.py
  - c5f3f6b2b Merge pull request #48997 from AVenstra/patch-1
    - 0e535f2c8c Unpacking dict with the six iterator
    - 5e82685b89 Python 3 related fix in highstate_return.py
  - c606a3cf531 Merge pull request #49021 from rallytime/merge-2017.7
    - ca82b3d57a Merge branch '2017.7.8' into merge-2017.7
    - f73ba21bc7 Merge pull request #49024 from rallytime/fix-deb-test
    - a9c16d9137 Fix test error in test_compiler jinja check
    - c606a3cf531 Merge branch '2017.7.8' into '2017.7'
    - 6b6d8c615 Merge pull request #49020 from rallytime/fix-grains-test
    - f72a3ac6be Make grains integration test more robust
    - 92d6c25c7f Merge pull request #49002 from rallytime/skip-jinja-deep-error-test
    - 23b66ef8bb Skip test_jinja_deep_error on Debian 8
    - 41d9f11eb3 Merge pull request #48999 from rallytime/fix-boto-test
    - d0136b1be5 Update expected return value in boto test
  - 2ddba6391a Merge pull request #49010 from Ch3LL/univention
    - c09b2e9afe Add univention OS to debian os_family mapping
  - 41bd3684e2 Merge pull request #48636 from terminalmage/loader-fixes
    - 0441cd56ef Add optimization_order to mocking
- 2256fad320 Process pycache files after .py files
- a78663a301 Lint
- 0728b5f8b6 Add note about Python 3.5+ only support for optimization_order
- 764969e0e8 Add a test to confirm that .py files are still loaded correctly
- 0f60beb6b6 Fix bad copypasta
- bcd142ea2 Add configuration docs for optimization_order config option
- 8af2d580f3 Only compile the suffix_order/map once per LazyLoader instance
- 4b95e5f313 Don’t put __pycache__ dir in the file list
- e7c10196da Quiet the byte compiling for PY2
- 9338370477 Add unit tests for loader optimization levels
- c3622933c1 PY3: Support different optimization levels
- 6fc8da5bab Add optimization_order config option with default value
- dfe423a1e0 Remove commented-out log message

- **PR #49084**: (rallytime) [2018.3] Update bootstrap script to latest release @ 2018-08-13 18:14:42 UTC
  - db7ec46875 Merge pull request #49084 from rallytime/bootstrap-2018.3
  - 28dc8ce954 [2017.7] Update bootstrap script to latest release

- **PR #49052**: (ismb) Python 3.7 support (backport 2018.3) @ 2018-08-13 13:06:51 UTC
  - b0d5ache0d Merge pull request #49052 from isbm/ismb-python37-support-2018.3
  - 4386a9ca1f Merge branch ’2018.3’ into isbm-python37-support-2018.3
  - bc85a5fa98 Fix configuration setting
  - 47078a300f Remove async keyword, moving it into the kwargs.
  - 31dcc4fdff fix unicode literals
  - 990936992c Keep runner API unchanged
  - 46bae0b6f6 Fix nag-message
  - 5c887ac2ae Support original API
  - 2c22e794d4 Use kwargs instead of directly named parameters
  - 7d095491d9 Update docstring
  - 98078c87bb Add 'async' backward compatibility
  - e8608aa9be Revert api call: it is about "functionname_async" suffix.
  - 0543578336 Deprecate 'async' parameter in Mandrill API
  - 1107e0dec Lintfix: PEP8 requires two empty lines
  - 2a18e335af Fix function signatures in Cassandra module
  - 603f94e2a3 Cleanup docstrings at module level
  - b971b83a09 Fix log error/info/warning and exception messages
  - 6e77aff69a Fix local opts from CLI
  - 493e48dd85 Remove internal variables/properties with the reserved words
- be07f64bc4 Change internal function signatures to avoid reserved word
- 7d095e0b26 Rename async function to asynchronous
- 35aeeb8a4 Fix docstrings
- 7a597f19b5 Fix comments
- 69920366ae Fix CLI config
- 173f3d7a8 Fix docstring typo
- b7da571624 Fix imports
- 7ec3954bef Rename module to full wording

**ISSUE #48557**: (whytewolf) file.line in python3 on windows 2012 r2 is adding extra CR line endings. (refs: #49026)

**PR #49026**: (dwoz) Fix file.line line endings @ 2018-08-13 13:05:43 UTC

- 338ecb70ef Merge pull request #49026 from dwoz/issue_48557
- a4d22fda2f Merge remote-tracking branch 'origin/issue_48557' into issue_48557
  * 702e76fc9 Merge branch '2018.3' into issue_48557
- 6cf93e8fc4 Skip newline in binary mode
- 2cf80c1595 Fix linter errors
- baf291b4c8 Fix file.line line endings

**PR #49038**: (gtmanfred) disable enable_ssh_minions to see if it is slowing down 2018.3 tests @ 2018-08-10 18:07:59 UTC

- 602fed7806 Merge pull request #49038 from gtmanfred/slowtest
- 6bc44c91c4 remove localhost from tests
- 7b168a5aac disable enable_ssh_minions to see if it is slowing down 2018.3 tests

**ISSUE #48996**: (jils2013) file.get_diff not work on version:2018.3.2 (refs: #49033)

**PR #49033**: (terminalmage) Fix file.get_diff for remote files @ 2018-08-09 21:06:53 UTC

- 4eeb75f028 Merge pull request #49033 from terminalmage/issue48996
- 163aec71c8 Lint
- d6e5038022 Fix file.get_diff for remote files

**ISSUE #48856**: (travispaul) Salt fails to start on NetBSD 8 (refs: #48926)

**PR #48926**: (travispaul) Handle ifconfig output differently for NetBSD >= 8.0 @ 2018-08-09 20:07:44 UTC

- b24c96a292 Merge pull request #48926 from travispaul/fix-netbsd-8-new-ifconfig
- d9b6d8269 Add unit test for NetBSD 8 ifconfig changes
- 80f8a667d1 Handle ifconfig output differently for NetBSD >= 8.0

**PR #48803**: (dmurphy18) Support for execution modules and states mount on AIX @ 2018-08-09 17:51:55 UTC

- 7d6b9eda95 Merge pull request #48803 from dmurphy18/aix_filesystems
- 92818f816b Fixes for testing
- 77dd7a1743 Adjust unit tests
- eaed033cde Updated for review comments and adjusted locking when writing files
– 5bf9e6085b Update due to review comments
– 9fb5641dc7 Mount unit tests for modules and states for AIX
– b28f27432 Save off work after laptop issue
– e5c2741fe7 module and states mount support for AIX
– b701e16ad0 Further updates to support for mount on AIX
– 210076276f Initial support for handling /etc/filesystems on AIX

• ISSUE #48946: (icy) Salt-key unable to delete the certificate Test=True (refs: #48929)
• PR #48929: (terminalmage) 2 salt-key fixes @ 2018-08-09 17:50:07 UTC
  - 2a38905a8a Merge pull request #48929 from terminalmage/issue48496
  - 7ac10f9eac 2 salt-key fixes
• ISSUE #47481: (whytewolf) Oxygen: task.add_trigger with start_date stating strftime needs a string not int. (refs: #49022)
• PR #49022: (dwoz) Document time format idiosyncrasies @ 2018-08-09 17:47:12 UTC
  - bb9d23fbf1 Merge pull request #49022 from dwoz/47481_docs
  - 313a3d93d6 Document time format idiosyncrasies
• PR #48932: (twangboy) Fix pkg.install when pkg already installed @ 2018-08-09 17:45:51 UTC
  - 9b6a9ff4f1 Merge pull request #48932 from twangboy/fix_win_repo
  - 075ea29d29 remove .lower(), fix debug messages
  - d7c2f476ac Remove current: version for latest as well
  - 522ac26459 Fix typo in code comment
  - 47b2898a85 return empty dict on no changes
  - 6532706d2f Make the tests run on Linux
  - cfe55a391a Add tests for pkg.install output
  - 8ec058f498 Clarify code comment
  - 8af2cfd54a Fix issues where current is not returned
• PR #49011: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-08-09 17:34:18 UTC
  - d7b7a92ef6 Merge pull request #49011 from rallytime/merge-2018.3
  - 02670969d0 Apply fix to ssh init file that was there before merge
  - 7e1f7915e4 Revert "Allow for not being prompted to supply a password to deploy keys to a minion with salt-ssh"
  - 00416d54d1 Revert "add key-deploy test"
  - c26fa0d6c4 Mark orchestration test as expensive
  - fce6d8d6f Update old utils paths to use new paths
  - 3e6445a9d6 Merge branch '2017.7' into '2018.3'
    * b49eea6e9 Merge pull request #49003 from rallytime/boto-test-2017.7
      - 1a23bb233f Update expected return value in boto test
    * 51eed1fd8b Merge pull request #48988 from rallytime/merge-2017.7
- df8699e2e7 Merge branch '2017.7.8' into '2017.7'
- a1e54634dc Merge pull request #48976 from rallytime/tornado
- 0bd838ab6c Skip unreliable tornado tests
- 22713be9c1 Merge pull request #48979 from rallytime/bp-48959
- 03aa0e49b0 Merge pull request #48970 from Ch3LL/back_48962
- 3ce1b8a3c9 Update the elif block to only be true for versions below Debian 9.
- e6cea5e3c7 Merge pull request #48968 from rallytime/man-pages
- 64fe3be41a Update man pages for 2017.7.8 release
- 10fd4661ff Merge pull request #48978 from gtmanfred/2017.7
  - 6108363f82 clean up gemfile
- 5b2423e527 Merge pull request #48959 from rallytime/flaky-tests
  - aa9f86d728 Mark one grains test as flaky & convert to pytest notation
  - e7e5abcf48 Mark 2 matcher tests as flaky
- 79994ecab4 Merge pull request #48962 from garethgreen-away/1022_test_service_disable_debian_part_deux
  - 9e71551b36 Update the elif block to only be true for versions below Debian 9.
- 1a1bda00cb Merge pull request #48960 from dwoz/block_replace_tests
  - 94ac2b4fc7 Multiple block replace test fixes
- 93b862f350 Merge pull request #48957 from whytewolf/beacons_log_doc_change
  - a77fd16869 Update salt.beacons.log to reflect that re module is used for matching.
- 0245cbb07 Merge pull request #48955 from terminalmage/service-systemd
  - 23f87bd536 Don’t load service.py if minion is running a non-sysvinit init system
- 848d583438 Merge pull request #48950 from KaiSforza/kitchenfix-2017.7
  - 5242cb143a Added a quote to kitchen Jenkinsfiles
- 928d688d65 Merge pull request #48943 from rallytime/flaky-tests
  - 668da57ab9 Mark some shell and runner integration tests as flaky
- cd42510d3a Merge pull request #48940 from rallytime/bp-48852
  - fa4ef92e79 Record all the artifacts from the build
- 43649a68be Merge pull request #48935 from garethgreen-away/1045_test/pkg_015_installed_held_centos
  - 0bb10107b6 Merge branch '2017.7' into 1045_test/pkg_015_installed_held_centos
  - 24d5e6a22f Fixing the test_pkg_015_installed_held test to be able to successfully run on CentOS
- 2421e2a570 Merge pull request #47100 from gtmanfred/ssh
  - 5b443af7ae add key-deploy test
  - a131c9bee Allow for not being prompted to supply a password to deploy keys to a minion with salt-ssh
• d541bd6446 Merge pull request #48891 from damon-atkins/2017.7_win_pkg.list_pkgs_not_found
  - a4af1dbfb1 Fix win_pkg issues introduced Jan 2018. If DisplayVersion does not exist it should return version as "Not Found"
• 5f6a56f5dc Merge pull request #48896 from rallytime/bp-48730
  - 57aa204c9d Merge branch '2017.7' into bp-48730
  - 4995922584 Forgot variable in signature
  - 0503bc18b6 Fix batch install using pkgng
• 0c64ba865 Merge pull request #48933 from garethgreenaway/1022_debian_8_failing_service-test
  - 280d1d2ad2 Fixing failing test, integration.modules.test_service.ServiceModuleTest.test_service_disable_doesnt_exist on Debian 8 and higher.
• 0c3d2c6a09 Merge pull request #48922 from rallytime/cache-doc-error
  - 8ca89d7e8 Update backticks on job_cache docs
• 8d1fc4f8e5 Merge pull request #48866 from Ch3LL/cmd_win_tests
  - 905da13653 Merge branch '2017.7' into cmd_win_tests
• 57d58e7541 Merge pull request #48920 from rallytime/bp-48904-2017.7
  - a55f92954a No rehashing in parallel
  - 3be11e06fe Add docs for new escape kwarg
  - 391bb8a411 use a specific path for just the cmd._run call
  - 62c66ba489 make sure we lower the check on shell
  - 9312a993a5 Add cmd module integration tests for windows and fix space in path issue

• ISSUE #48123: (c-wicklein) file.directory with recurse fails when it encounters a broken symbolic link (refs: #48985)

• PR #48985: (garethgreenaway) [2018.3] Fix to salt/modules/file.py @ 2018-08-09 15:03:09 UTC
  - 3325bd4c0 Merge pull request #48985 from garethgreenaway/48123_file_directory_recurse_fails_broken_symlink
  - 10c4eca206 Merge branch '2018.3' into 48123_file_directory_recurse_fails_broken_symlink
  - a404ce030f Fixing the issue when using the file.directory state with recurse if the directory contains a broken symbolic link. This fix adds an additional conditional, is_link, before running lsattr since lsattr does not work on symlinks and causes issues when that symlink is broken.

• ISSUE #47695: (AmbicaY) Continuous error in the proxy minion logs (refs: #49019)

• PR #49019: (garethgreenaway) [2018.3] Fix to scheduler when global enabled key is present @ 2018-08-09 13:06:26 UTC
  - d353c02a8c Merge pull request #49019 from garethgreenaway/47695_fixing_scheduler_bug_when_enabled_is_present
  - af7b8fd4f Lint.
  - 8935c08141 Fixing a bug that occurs if the "enabled" key is present in the scheduler items dictionary. Adding a test to ensure scheduler runs as expected when that key is present.

• PR #49023: (The-Loeki) Salt SSH appends IdentityFile=agent-forwarding @ 2018-08-09 12:55:59 UTC
  - a56bc7fbb9 Merge pull request #49023 from The-Loeki/patch-1
  - 8b53571c70 Salt SSH appends IdentityFile=agent-forwarding
• **PR #48981**: (Ch3LL) Add warning to mac runas docs about escaping characters @ 2018-08-08 19:43:43 UTC
  - 4590494b50 Merge pull request #48981 from Ch3LL/mac_runas_quote
  - 8269b55b84 remove unnecessary spaces in cmdmod.py docs
  - 757daf7d7e add runas macosx warning in 2018.3.3 release notes
  - 4e9e985b14 Add warning to mac runas docs about escaping characters

• **PR #49004**: (rallytime) Port #48999 to 2018.3 @ 2018-08-08 15:32:46 UTC
  - PR #48999: (rallytime) Update expected return value in boto test (refs: #49004, #49003)
  - b87bf905c2 Merge pull request #49004 from rallytime/boto-test-2018.3
  - 9f0b9a1073 Update expected return value in boto test

• **PR #48987**: (twangboy) Fix issue with win_iis.create_cert_binding @ 2018-08-08 13:29:06 UTC
  - 630f61e625 Merge pull request #48987 from twangboy/fixed_48786
  - 86d0836f90 Fix issue with iterating over None

• **ISSUE #48777**: (jonasgit) file.recurse fails on file contents encoding not utf-8 (refs: #48934)

• **PR #48934**: (terminalmage) Properly handle latin-1 encoding in file diffs @ 2018-08-07 21:02:24 UTC
  - ab1a713bc3 Merge pull request #48934 from terminalmage/issue48777
  - 52c64e4d51 Fix to_unicode test
  - e2d19f40b6 Only try latin-1 from get_diff instead of by default
  - d39fa889f3 Add stringutils.get_diff to mocks
  - 5b191c9120 Fix incorrect use of __salt__ when __utils__ is needed
  - 53ba10ad5f Skip pylint false-positives
  - f14f4dae22 Add unit test for latin-1 fallback, multi-encoding
  - 906644a80f PY3 scoping fix
  - 726dd4331f Add integration test for latin-1 file diffs
  - 2dd1f31d23 Use BASE_FILES instead of redundant STATE_DIR
  - 612fbb5fe8 Use new get_diff helper in file module
  - c632265802 Make to_unicode/to_str/to_bytes helpers attempt latin-1
  - 2a0c49b01 Add get_diff to salt.utils.stringutils

• **ISSUE #47766**: (zerthimon) salt-cloud: openstack driver: crash on instance creation (refs: #48956)

• **PR #48956**: (gtmanfred) if booted from volume, use string from image @ 2018-08-07 16:39:45 UTC
  - bad995462c Merge pull request #48956 from gtmanfred/openstack
  - 4cb1636c4b if booted from volume, use string from image

• **ISSUE #48306**: (davidscholberg) Documentation update for custom returners used for master job cache (refs: #48319)

• **PR #48319**: (gtmanfred) don’t break older returners right now @ 2018-08-06 13:19:43 UTC
  - 71f587edd7 Merge pull request #48319 from gtmanfred/jid
  - 084e7f0ef4 Merge branch '2018.3' into jid
- 60661b4cd0 document minions required on save_load
- a8c243071d document passing in minions
- d49381e0b6 don’t break save_load backwards compat
- cfcacf953a don’t break older returners right now

• PR #48941: (rallytime) Back-port #48912 to 2018.3 @ 2018-08-06 13:09:38 UTC
  - PR #48912: (maxim-sermin) make jboss7.py compatible with 2018.3.0 and later (refs: #48941)
  - 1623e53ef4 Merge pull request #48941 from rallytime/bp-48912
  - 3f55b2f89e make jboss7.py compatible with 2018.3.0 and later

• PR #48897: (rallytime) Back-port #48863 to 2018.3 @ 2018-08-05 19:15:51 UTC
  - PR #48863: (admd) Decode file contents for python2 as well (refs: #48897)
  - 070af9d925 Merge pull request #48897 from rallytime/bp-48863
  - 0ee1940232 Merge branch ’2018.3’ into bp-48863
  - 3f55b2f89e make jboss7.py compatible with 2018.3.0 and later

• PR #48928: (Ch3LL) fix test_runas integration test for macosx @ 2018-08-05 14:24:13 UTC
  - abd7f1312d Merge pull request #48928 from Ch3LL/mac_runas
  - 3d6455dbcd remove unnecessary comment in setup
  - 8e30db0217 move destructivetest to testname
  - 708dec8740 add destructivetest to setup and teardown for runas test
  - c0730ff968 fix test_runas integration test for macosx

• PR #48899: (Ch3LL) remove base_top_file file in teardown and add sleep @ 2018-08-05 14:23:42 UTC
  - dbd300ff70 Merge pull request #48899 from Ch3LL/unit_state
  - 0272cadff8 Merge branch ’2018.3’ into unit_state
  - 5896c7e36 remove base_top_file file in teardown and add sleep

• PR #48898: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-08-05 14:23:19 UTC
  - ffa1fccc68 Merge pull request #48898 from rallytime/merge-2018.3
  - 1f093ef4a Merge branch ’2018.3’ into merge-2018.3
  - b3a5aa49d7 Merge branch ’2017.7’ into ’2018.3’
    - e79cc83b51 Merge pull request #48876 from Vaelatern/make-network-learning-optional
      - a49050b5e5 Make IP_LEARNING optional
    - f8bfab4f9f Merge pull request #48890 from Ch3LL/cmd_test
      - acda4ed9ab add sleep in test_cmd integration test
    - 5272f6fbed Merge pull request #48885 from rallytime/flaky-tests-shadow
      - da871a2d57 Mark shadow module integration test as flaky
    - bf0895656e Merge pull request #48884 from rallytime/flaky-tests-matchers
      - 3d6e91a5f7 Merge branch ’2017.7’ into flaky-tests-matchers
    - a567666938 Merge pull request #48868 from terminalmage/fix-loader-race
- 5f1169b9a2 Fix race when SIGTERM/SIGINT received while lazyloading a module
  - 0ca0b6f2f2 Merge pull request #48883 from terminalmage/salt-jenkins-1023
  - c61f75cb50 Fix failing git worktree tests
  - 3660df13c Separate compound matcher tests into individual tests
  - a84f5155a1 Merge pull request #48869 from Ch3LL/mac_shell_tests
  - 3734b1ec89 Catch socket.error exception in testprogram
  - 7f56b8bf44 Merge pull request #48867 from rallytime/skip-tornado-test
  - 7320aa9104 Skip unreliable tornado test.

- **PR #48893**: (Ch3LL) handle when ca_certs is None in utils.http @ 2018-08-03 20:30:48 UTC
  - 848e26ed0b Merge pull request #48893 from Ch3LL/http_tests
  - 16d2517ff Merge branch '2018.3' into http_tests
  - 5674dddb2a handle when ca_certs is None in utils.http

- **PR #48903**: (Vaelatern) Wrap ElementTree.tostring to make strs, not bytes @ 2018-08-03 19:12:34 UTC
  - **PR #48877**: (Vaelatern) Wrap ElementTree.tostring to make strs, not bytes (refs: #48903)
  - f1adf56017 Merge pull request #48903 from Vaelatern/improve-salt-cloud-python3-virt
  - c45447fe0b Wrap ElementTree.tostring to make strs, not bytes

- **PR #48900**: (Ch3LL) skip getpwnam check on mac in unit test_cmdmod @ 2018-08-03 16:38:51 UTC
  - d23471262d Merge pull request #48900 from Ch3LL/cmd_unit
  - b82dd70be skip getpwnam check on mac in unit test_cmdmod

- **PR #48921**: (rallytime) Back-port #48904 to 2018.3 @ 2018-08-03 15:17:15 UTC
  - **PR #48904**: (KaiSforza) No rehashing in parallel (refs: #48921, #48920)
  - d622a49b58 Merge pull request #48921 from rallytime/bp-48904
  - b504625f61 No rehashing in parallel

- **PR #48877**: (Vaelatern) Wrap ElementTree.tostring to make strs, not bytes (refs: #48903) @ 2018-08-02 19:28:56 UTC
  - 1e150923aa Merge pull request #48877 from Vaelatern/improve-salt-cloud-libvirt-python3-libvirt
  - fb7885315c Wrap ElementTree.tostring to make strs, not bytes

- **PR #48824**: (rallytime) Bump deprecation in win_servermanager state to Neon @ 2018-08-02 18:01:34 UTC
  - 1fb7d9431b Merge pull request #48824 from rallytime/win_servermanager_deprecations
  - 6ef5412528 Bump deprecation in win_servermanager state to Neon

- **ISSUE #37512**: (ChristianBeer) What’s the precedence if multiple master configurations are specified? (refs: #48888)

- **PR #48888**: (terminalmage) Explicitly document the configuration override priority @ 2018-08-02 16:57:18 UTC
  - ec8e07e8ce Merge pull request #48888 from terminalmage/issue37512
  - 7dce7cde14 Explicitly document the configuration override priority

- **PR #48871**: (dwoz) Remove unicode key pairs from environ after test @ 2018-08-01 22:33:41 UTC
  - d4bb3a0963 Merge pull request #48871 from dwoz/test_cleanup
- f2e15e7f1d Do not re-define tearDown
- 4f8a191a69 Remove unicode key pairs from environ after test

- **PR #48843**: (isbm) Prevent u’something’ to appear in help info. @ 2018-08-01 20:38:58 UTC
  - bec79e83a3 Merge pull request #48843 from isbm/isbm-log-level-names-fix-2
  - a636b6180d Merge branch ’2018.3’ into isbm-log-level-names-fix-2
  - 783c96ac72 Prevent u’something’ to appear in help info.

- **PR #48855**: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-08-01 17:44:59 UTC
  - a8376b537a Merge pull request #48855 from rallytime/merge-2018.3
  - 44998c208e Lint: Fix undefined logger variable
  - 92c9317a25 Update old utils paths to use new paths
  - 15f6ba7143 Merge branch ’2017.7’ into ’2018.3’
    - 05f2d5d63 Merge pull request #48853 from rallytime/bp-48850
      - 3c33ee5544 Skip tests in integration.shell.test_master
    - 8a1285239a Merge pull request #48426 from garethgreen-away/46689_fixing_pkg_held_when_package_is_installed
      - 9b0f5dd212 Fixing indentation, removing some unnecessary conditionals.
      - 72796ab455 One last cleanup.
      - 11cb86e6eb General cleanup in pkg state, reducing duplicate code. Fixing the requires_salt_modules decorator, sys.doc was returning too much information for the event to handle. This change specifically calls sys.doc with the module name.
      - 16f66a6e35 Make sure pkg.hold and pkg.unhold are available before running the test.
      - 998651102d Fixing a situation when a package is already installed via salt or manually and a state attempts to set that package to be held. Previously the holding/unholding logic was only being run against packages that were being installed. This change moves the holding logic outside and runs it against all desired packages. Adding a new test to test holding logic.
    - c8e69431ff Merge pull request #47734 from OrlandoArcapix/Issue47689-pip-state-performance
      - 662bd17f80 Merge branch ’2017.7’ into Issue47689-pip-state-performance
      - 66936bf4f1 Changed string comparison in pip test to match new confirmation string - ref PR #47734.
      - bb5939d6ef Merge branch ’2017.7’ into Issue47689-pip-state-performance
      - d6a49ae41c Merge branch ’2017.7’ into Issue47689-pip-state-performance
      - 779b5fa785 Merge branch ’2017.7’ into Issue47689-pip-state-performance
      - f3653349ab Removed whitespaces at end of added comments lines
      - db11f2ff4b Merge branch ’2017.7’ into Issue47689-pip-state-performance
      - eac0178de2 Ref: #47689 - document additional kwarg passed to pip._check_if_installed function
Salt Documentation, Release 2019.2.0

- od19803106 Merge branch '2017.7' into Issue47689-pip-state-performance
- d367bf2f3 #47689 fix lint errors
- 4f88686c8c5 #47698 improve run-speed of pip package state checks by only loading the current package list once when checking multiple packages
- 83a5b3cc47 Merge pull request #48844 from AVeenstra/fix-python3-incompatibility
  - f2388779a62 Merge branch '2017.7' into fix-python3-incompatibility
  - 6b1805af6c6 Fixed Python 3 incompatibility in methods in nilrt_ip and debian_ip.
- 136ff6735a Merge pull request #48662 from slaws/fix-retention-schedule-48637
  - 3e8f5f5b3d pylint fix
  - 5539e6739e Excluding relative dirs in state.file.retention_schedule
- 1fc04f281b Merge pull request #48840 from gtmanfred/docs
  - 8d2d268c4a fix links in pkg doc.
- 0a19f845ea Merge pull request #48834 from gtmanfred/slsutil
  - 9f44d2bef read output of stringio if it is readable
- 2e00939a6e Merge pull request #48788 from Ch3LL/timezone_windows
  - de95a6a215 add unused import to timezone test file
  - 2e424859e add unused import to import
  - 0840fc3117 disable pylint import error
  - 2e00939a6e Merge pull request #48830 from garethgreenaway/48659_file_grep_glob_fix
  - 0791c0a03c FileGrepTestCase tests back to 2018.3
  - 2e015c5e7e Fixing a bug that prevents specifying wildcards for filenames.
- PR #48814: (isbm) dmidecode race conditions check @ 2018-07-31 20:48:29 UTC
  - 9fda70b3d0 Merge pull request #48814 from isbm/isbm-2018.3-smbios-bugfix
  - 5f1141dc05 Merge branch ‘2018.3’ into isbm-2018.3-smbios-bugfix

    * ce4e22224e Merge pull request #48720 from Ch3LL/mac_file_path
      - 01d25fae19 Fix test_managed_source_hash_indifferent_case on macosx to correct tmp path
    * 4b9f037d43 Merge pull request #48719 from Ch3LL/service_mac_state
- f44a2fc349 Enable service if disabled before running state service tests
- b2431eb10 Merge pull request #48715 from rallytime/flaky-tests
- 7323ce567 [2017.7] Mark some tornado tests as flaky
- 801ea3b8d Merge pull request #48672 from frogunder/45012
- 0747f2e58a add service enabled test

- ISSUE #48676: (djneades) salt-ssh should not target wrong minion from roster file as a result of reverse-DNS lookups (refs: #48771)
- PR #48771: (gtmanfred) only do reverse dns lookup on ips for salt-ssh @ 2018-07-26 15:41:40 UTC
  - 5ea43817ab Merge pull request #48771 from gtmanfred/2018.3
  - 535fb88e7 only do reverse dns lookup on ips for salt-ssh
- PR #48752: (garethgreenaway) [2018.3] Fix when state file is integers @ 2018-07-25 15:03:02 UTC
  - f2ef2d3ef6 Merge pull request #48752 from garethgreenaway/fix_state_file_all_integers
  - 790801c67e Fixing a case where the state module would fail if the state file being passed was all integers. Added a new tests for this edge case.
- ISSUE #46896: (Poil) Proxy + file.managed => Comment: Failed to cache xxx invalid arguments to setopt (refs: #48754)
- PR #48754: (lomeroe) send proxy/ca_cert parameters as strings (not unicode) to tornado httpclient @ 2018-07-25 14:55:42 UTC
  - 030c921914 Merge pull request #48754 from lomeroe/fix-tornado-proxy
  - d33056704b pass proxy_user, proxy_password, proxy_host, and ca_certs through salt.utils.stringutils.to_str()
- PR #48769: (Ch3LL) Update Saltstack Logo banner on docs.saltstack.com @ 2018-07-25 14:47:19 UTC
  - 1ee4b136b Merge pull request #48769 from Ch3LL/update_doc_2018.3
  - 0cb4bac798 Update Saltstack Logo banner on docs.saltstack.com
- PR #48760: (dwoz) Multiple windows test fixes @ 2018-07-25 11:55:27 UTC
  - 19afa3b023 Merge pull request #48760 from dwoz/test_file_fixes
  - a89019e956 Multiple windows test fixes
- PR #48753: (dwoz) Finally fix prepend for real @ 2018-07-25 00:07:15 UTC
  - e6dace3959 Merge pull request #48753 from dwoz/fix.prepend
  - 0d1e8ab3f8 Merge branch '2018.3' into fix.prepend
- PR #48756: (dwoz) os.uname is not available on py2 windows @ 2018-07-24 23:38:32 UTC
  - 8ae6f9960 Merge pull request #48756 from dwoz/core_grains_fix
  - b7a37ecf11 os.uname is not available on py2 windows
- ISSUE #48536: (whytwolf) diskusage beacon does not recognize tmpfs disks in linux. (refs: #48718)
- PR #48718: (garethgreenaway) [2018.3] beacon diskusage fixes @ 2018-07-24 17:45:26 UTC
  - 062f7ccc1f Merge pull request #48718 from garethgreenaway/48536_beacon_diskusage_fixes
  - 38a65e8fb3 Fixing test_diskusage_nomatch and test_diskusage_match_regex
– 6ecc166ff Updating psutil.disk_partitions to pull in all mounts not just the physical ones. Check to see if the mount point from the configuration ends with a $ (regular expression end of line) if not we add one in to ensure that a simple / does not end up matching all mount points. Updating tests accordingly.

- PR #48711: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-07-24 17:38:58 UTC
  – e873621009 Merge pull request #48711 from rallytime/merge-2018.3
  – ea5c063237 Update old utils paths to use new paths
  – e740d3b208 Merge branch '2017.7' into '2018.3'
  - 689c231d2b Merge pull request #48691 from Ch3LL/win_repo_pkg_test
    - 4b7d6d80c5 Remove unnecessary jinja in curl.sls file
    - 2bedadfa5d Add windows pkg module integration tests
  - 83e4bba916 Merge pull request #48635 from nbraud/acme
    - 3673bae9de modules/acme: explicitly ignore the perms return value
    - 1800a231e8 Fixup some schema expectations
    - 8c718cb417 acme: Make the private key mode configurable
    - 917dea6761 modules/acme: Use file.check_perms ret-morphing powers
    - d2241eb2d module/acme: Do not exit early when the certificate already exists
    - 98af0db826 modules/acme: Set the private key filemode to 0640
  - 85991680c8 Merge pull request #48345 from twangboy/fix_48169
    - ead19725b6 Merge branch '2017.7' into fix_48169
    - 653fbc383 Fix some docs errata
    - 8898e5ff11 Add warn_until Fluorine
    - 707906ac15 Fix unit.state.test_powercfg
    - 32c5014eb6 Fix unit tests
    - 0d9c56e540 Add some more logging
    - b20453de9f Use minutes to set
    - 7dc7eb11c2 Fix documentation to denote seconds when setting
  - 96447ce541 Merge pull request #48656 from Ch3LL/windows_ip_mod
    - 90c3f568b1 Add windows ip module integration tests
  - 0c5f93dc8 Merge pull request #48638 from twangboy/fix_vcredist
    - e30d17099d Use goto instead of if statement
    - e1042fa084 Remove vcredist for Py3
  - 1ebd96d909 Merge pull request #48664 from Ch3LL/srv_disable_mac
    - f1fbfad387 move the disable call up in try block
    - f60d21bda4 reverse assertion order for service disable test
    - 3727d1b3b9 switch try/except to match 2018.3
    - fb953c2369 [2017.7] Fix service.disabled test for macosx
  - 3da3cf2f3f Merge pull request #48625 from Ch3LL/ssh_state
· f590eb2b02 Update state.py
  · 9790ee3d0d Follow up to PR #48555

* 33812f78f1 Merge pull request #48673 from Ch3LL/mac_port
  · 87dd85a220 Use different pub and ret ports for testprogram integration tests

  · cb654bb2f2 Add timeout to all s3 queries
* 1b663888f8 Merge pull request #48588 from garethgreenaway/48415_event_send_multi_master
  · fab25af1a9 Adding some quick documentation about why we are setting ret=True following the channel.send.
  · bf28f4b1b88 If the channel send is successful and does not raise an exception, we set ret to True, in case a previous exception from a previous channel send to another master has sent it to False.

28.2. Previous Releases
When using Salt multi-master, if we encounter a salt master that has not accepted the minion key yet we should not exit right away, rather continue on and try the next salt master available in the list.

- 8d1551c5fb When using Salt multi-master, if we encounter a salt master that has not accepted the minion key yet we should not exit right away, rather continue on and try the next salt master available in the list.
- 24ffda49ba Merge pull request #48610 from gtmanfred/2017.7
- 779d1a3dcb only run pylint on files that change
- 5391dd0a8d Merge pull request #48584 from Ch3LL/mac_user_grp
- 585ee9db90 Fix grp import for mac in test_user integration test
- 61572b6780 Merge pull request #48555 from Ch3LL/ssh_id
- f69932f506 fix pylint
- 70e36764ee Add more tests for salt-shh state.sls_id
- dab80e805c Fix state.sls_id to run on ssh minion and not master
- aa6dcf39e8 Merge pull request #48583 from Ch3LL/mac_flaky_tests
- 4ba2299a87 import flaky decorator on mac tests
- 811220b41e Add flaky decorator to mac_system and mac_timezone tests
- 6973152057 Merge pull request #48534 from xetix/fix-zypper-latest_version
- 9985f0b4c1 Lint: remove extra blank line
- 5fbead8a36 Merge branch '2017.7' into fix-zypper-latest_version
- 56a4c49271 Merge branch 'fix-zypper-latest_version' of https://github.com/xetix/salt into fix-zypper-latest_version
- 44e87f5af0 Adding testcase for this fix.
- b354c6863c Fix behaviour of function latest_version in zypper module when multiple packages are passed to function. Function now properly return dict with empty string as version if latest packages is already installed, and multiple packages are passed to function
- db35d0c1e1 Adding testcase for this fix.
- d2513757ed Fix behaviour of function latest_version in zypper module when multiple packages are passed to function. Function now properly return dict with empty string as version if latest packages is already installed, and multiple packages are passed to function
- 10124034cb Merge pull request #48582 from dwoz/test_prepend_fix
- f37571e0bd Merge branch '2017.7' into test_prepend_fix
- 13f67335f3 Merge pull request #48564 from dwoz/test_prepend_fix
- 136ddff5f4 Finally fix prepend for real
- 66b25e6bf0 Fix failing prepend test
- b8ce27729f Merge pull request #48558 from dwoz/test_file_fix
- c858bf477f Remove which mock to get the test passing
- a15c65202d Merge pull request #48552 from KaiSforza/jenkins-junit-2017
- 72b1830974 Set up junit in jenkins
- f73108076e Merge pull request #48550 from gtmanfred/2017.7
- d5c603d9b6 add posargs to tox pylint
- 113b0426f8 Merge pull request #48535 from asnell/asnell-patch-2
  - d328f6e43d Update manage_file helptext
- **PR #48744**: (rallytime) [2018.3] Update DOCBANNER with new SaltConf18 image @ 2018-07-24 17:15:40 UTC
  - 6c7f1c549d Merge pull request #48744 from rallytime/saltconf-ad-2018.3
  - dbc1f8b772 Update DOCBANNER with new SaltConf18 image
- **PR #48726**: (dwoz) Skip test when syslog not available @ 2018-07-24 16:12:44 UTC
  - 04ab17a4d6 Merge pull request #48726 from dwoz/syslogtest
  - 00f04cfd59 Skip test when syslog not available
- **PR #48727**: (dwoz) Windows compatible cp test @ 2018-07-24 14:41:34 UTC
  - af837424aa Merge pull request #48727 from dwoz/file_cp_test_fix
  - 6e7824266b Windows compatible cp test
- **ISSUE #40004**: (te-af-github) svn changes report (refs: #47510)
- **ISSUE #21025**: (RobertFach) svn.export reports invalid change data (2014.7.x) (refs: #47510)
- **PR #48710**: (rallytime) Back-port #47510 to 2018.3 @ 2018-07-23 21:11:18 UTC
  - **PR #47510**: (daa) Fix svn export invalid changes data (refs: #48710)
  - 04125b077d Merge pull request #48710 from rallytime/bp-47510
  - ebcd3b16b fixed test for svn.export
  - e79f4aa5cc put name under "new" key in changes dictionary to be in line with svn.latest
  - 163f99089c made svn.export changes data dictionary, fixes #21025, #40004
    - 3a941055c1 Use `salt.utils.platform.is_windows`
    - 33e48f7ad7 Finally fix prepend for real
- **PR #48699**: (terminalmage) Add missing release notes mention of file.blockreplace changes @ 2018-07-23 13:34:32 UTC
  - e1dd10be70 Merge pull request #48699 from terminalmage/issue48695
  - 7ad832c901 Add missing release notes mention of file.blockreplace changes
- **PR #48700**: (dwoz) Call sync_modules to fix Windows test case @ 2018-07-22 22:23:48 UTC
  - ab44a05fe4 Merge pull request #48700 from dwoz/ext_mod_test
  - 3d3f66bf8e Call sync_all to fix Windows test case
- **PR #48653**: (terminalmage) docker_containers.running: Fix regression in test mode @ 2018-07-20 19:15:47 UTC
  - 64494205f2 Merge pull request #48653 from terminalmage/docker-unboundlocal
  - b0440871a0 Merge branch '2018.3' into docker-unboundlocal
  - 9515dd17ff docker_containers.running: Fix regression in test mode
- **ISSUE #47059**: (OrlandoArcapix) Some states incorrectly return None instead of an empty dict when there are no changes (refs: #48685)
- **ISSUE #46985**: (OrlandoArcapix) grafana4_user.present and grafana4_org.present states not working in 2018.3.0 (refs: #48685)
- **PR #48685**: (bbinet) Use empty dict for 'changes' instead of None @ 2018-07-20 17:12:43 UTC
- PR #48671: (bbinet) Few fixes to the grafana module and states (refs: #48685)
  - 266c6f250e Merge pull request #48685 from bbinet/none-changes
  - 842eb3da24 Use empty dict for 'changes' instead of None
- PR #48670: (bbinet) Add the "traverse" jinja filter @ 2018-07-20 16:36:21 UTC
  - 5a6f7a085c Merge pull request #48670 from bbinet/traverse
  - 32b6d22cf2 Fix RST syntax issue in doc
  - 37a41226d5 Add the "traverse" jinja filter
- PR #48594: (pritambaral) Backport 48418 @ 2018-07-20 14:57:19 UTC
  - PR #48418: (pritambaral) Fix multi-sls salt.state orchestration in masterless systems (refs: #48594)
  - ff11763fd3 Merge pull request #48594 from pritambaral/bp-48418
  - adcee28b84 Fix multi-sls salt.state orchestration in masterless systems
- ISSUE #48184: (mmulqueen) Invalid DMI prevents salt-minion from running (refs: #48440)

  - 9d7eabcd24 Merge pull request #48671 from bbinet/grafana-fixes
  - 3c5083f550 Add support for dry run (test=True) of grafana states
  - 7e7ae8ace7 influxdb: fix conflicts in function arg names with client_args
  - 73a2a2b774a Ignore readOnly option when diffing
  - 81f0cc8a3f Add missing profile argument to grafana4.get_user_data
- PR #48650: (gtmanfred) [2018.3] handle pyzmq for python3.4 @ 2018-07-18 17:34:37 UTC
  - e828167114 Merge pull request #48650 from gtmanfred/pylint-2018.3
  - 3c1882077e handle pyzmq for python3.4
- PR #48648: (gtmanfred) [2018.3] disable checks on pylint @ 2018-07-18 16:21:37 UTC
  - a6f8acfa4dc Merge pull request #48648 from gtmanfred/pylint-2018.3
  - 7c34c2965e disable checks on pylint
- PR #48634: (dwoz) Sync modules for state tests @ 2018-07-17 20:33:06 UTC
- 01c9e59a97 Merge pull request #48634 from dwoz/state-module-test-fix
- 9dfd2ae392 Sync modules for state tests

- **PR #48585**: (astorath) replaced meta tag @ 2018-07-16 14:11:02 UTC
- fsb7bc757c Merge pull request #48585 from astorath/fix-vault-meta
- 42f3d5f67 replaced meta tag

- **PR #48579**: (Ch3LL) Fix python2 syslog returner expecting string bytes not unicode @ 2018-07-13 19:50:16 UTC
- d816537a29 Merge pull request #48579 from Ch3LL/fix_syslog
- d8288a0ff add unicode type for syslog test for tag
- 17e69382d5 Fix python2 syslog returner expecting string bytes not unicode

- **ISSUE #48542**: (calvinhp) Missing state git.cloned is listed in the docs as new for 2018.3.2 (refs: #48547)
- **PR #48547**: (gtmanfred) fix git.cloned doc versionadded @ 2018-07-13 18:46:25 UTC
- 3549ce408d Merge pull request #48547 from gtmanfred/git.cloned
- b596a945ea Merge branch '2018.3' into git.cloned
- e41f4922a0 fix git.cloned doc versionadded

- **ISSUE #48110**: (whytwolf) file.line on windows not treating unix line endings correctly. (refs: #48503)

- **PR #48503**: (rallytime) Back-port #46291 to 2018.3 @ 2018-07-13 17:14:47 UTC
- **PR #48380**: (twangboy) Detect and preserve line endings (refs: #48503)
- **PR #46291**: (t0fik) Line mixed line ends (refs: #48503)
- **PR #45498**: (t0fik) Added support for mixed line ending in file (refs: #46291)
- ee257af91 Merge pull request #48503 from rallytime/bp-46291
- 8bc71688ea Remove /sr.* pattern from test
- 5e2e2a63fa Update file unit tests to handle "writelines" change
- 5d38aa8b33 Update file.line to use writelines instead of joining
- d0b6e82ecb Add `name` as the passed in filepath for test_line_insert_ensure_before_first_line test
- d8920cb61f Update test_line_insert_ensure_before_first_line to use new mock_open methodologies
- 475f075d8e Handle list of lines instead of strings in file.line func
- b9dd53b04 Added comments
- f3517a1852 List comprehension replaced
- adfa3aed0d Empty match on delete or replace not causing IndexError exception
- 5169b1f7fd Comprehensions converting to unicode replaced by salt.utils.data.decode_list
- d3e8679e05 Removed regex compilation
- f29815b49b Fixed file permissions
- d2af81e9c7 Make integration green. Added test for mode ensure insert before first line
- 9b7d671a5 file.line function refactored
- 3af551ebe1 /sr.* pattern should raise exception
- 935a9b9d56 test_line_insert_end fixed
- 7d6e3ad2e2 Make tests green
- 75a7e368a6 Setting end of line
- 489e381100 Added _set_line_eol and _get_eol functions
- aacb8c0e2 line function refactored to work on list
- de688166f9 _regex_to_static refactored to work on lists
- 464eef6fe1 _get_line_indent renamed to _set_line_indent

- **ISSUE #48507:** (emersonveenstra) mysql_grants.present escape option incorrectly reports failure (refs: #48561)
- **PR #48561:** (garethgreenaway) [2018.3] fixes to grants in mysql module @ 2018-07-13 14:24:58 UTC
  - 2d923f2943 Merge pull request #48561 from garethgreenaway/48507_mysql_grants_incorrect_failure
  - 14c59da72c Following a successful grant application in the MySQL module, the new grant and the desired grant are mismatched because the new grant from Mysql included hashmarks. This change adds the replace which is included for other items such as database name and username.
- **PR #48529:** (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-07-12 17:59:35 UTC
  - 5b5a930449 Merge pull request #48529 from rallytime/merge-2018.3
  - f9b8c4b257 Use () when using with_tempfile decorator in tests
  - d3190ca0c0 Update old utils paths to new utils paths
  - 29b05fdd1 Merge branch '2017.7' into '2018.3'
    - 0c0c05c2bc Merge pull request #48527 from saltstack/revert-48525-2017.7
      - 18d06c1a93 Revert "add kazoo for testing zookeeper."
    - 05bad3e71c Merge pull request #48526 from twangboy/rollback_certifi-win32
      - 361b3edc2f Rollback python-certifi-win32
    - db066e0e4 Merge pull request #48521 from Martin819/2017.7
      - d5d01f6698 Fix for GlusterFS 4.0 and above
    - ed0bd2bbec Merge pull request #48525 from gtmanfred/2017.7
      - d7a6bf2b2 add kazoo for testing zookeeper.
    - ad5a959ab9 Merge pull request #48388 from garethgreenaway/48277_2017_7_file_roots_wrong
      - 6f11da35a7 Fixing a few things in the new test.
      - cf747b14ec Fixing lint issue
      - 16d36c79c8 When pillar items are compiled a new render is instantiated but the file_roots is the pillar_roots. This change forces the __opts__["file_roots"] to be set to what is set in actual_file_roots for all renderers once compile_pillar has finished. Adding a test when this situation is run via a orchestration runner.
    - 38df812257 Merge pull request #48512 from gtmanfred/npm
      - 9ba0f6b3a0 pin pm and grunt packages for npm tests
    - 04ba31147f Merge pull request #48513 from rallytime/merge-2017.7
      - a466a4880f Merge branch '2017.7.7' into '2017.7'
      - cf2d1ed22c Merge pull request #48172 from rallytime/2017.7.7-release-notes
      - a0ad794132 Update release notes for 2017.7.7
- 8af4452134 Merge pull request #48157 from gtmanfred/2017.7.7
- d8209e8a40 always listen when gathering job info

- 084de927fe Merge pull request #48098 from rallytime/bp-48075-2017.7.7
- e4e62e8b3a Ensure that the shared list of jids is passed when creating the Minion. Fixes an issue when minions are pointed at multiple syndics.
- f0352ea95a Merge pull request #48514 from gtmanfred/2017.7
- 739bf92599 upgrade dependencies for pytest tests
- 5372b60137 Merge pull request #48491 from grokrecursion/group-fix-v2
  - 1556b37221 fixed pylint errors
  - f6d9177dab fixed indentation for pep8
  - b9556bf923 v2 try of gid converted to integer
- 16d3daab3c Merge pull request #48375 from Ch3LL/file_copy
  - d16a790775 Add mode to _makedirs call in file.copy
  - 2cbcb4fd26 Add user and group to makedirs cmd in file.copy
- d38951b1b3 Merge pull request #48490 from KaiSforza/cifixes
  - 9fe7199af5 Mark failed if anything is found
  - 6749a6bf19 Stop archiving the docs

**PR #48553**: (KaiSforza) Set up junit in jenkins @ 2018-07-12 16:24:01 UTC
  - a95b8ef8da Merge pull request #48553 from KaiSforza/jenkins-junit-2018
  - 412ffcc956 Set up junit in jenkins

**PR #48551**: (gtmanfred) add posargs to tox pylint @ 2018-07-12 14:35:25 UTC
  - c4ae0d2740 Merge pull request #48551 from gtmanfred/2018.3
  - a6a286af28 add posargs to tox pylint

**PR #48533**: (terminalmage) Fix UnicodeDecodeError in sh beacon @ 2018-07-12 13:38:43 UTC
  - 260da0d545 Merge pull request #48533 from terminalmage/sh-beacon
  - 7ac5ac06c9 Fix UnicodeDecodeError in sh beacon

**ISSUE #48519**: (Lutseslav) Mysql module alter_db quotation missing (refs: #48520)

**PR #48520**: (Lutseslav) Add quotes to schema name in ALTER DATABASE. @ 2018-07-11 19:15:08 UTC
  - 8761ac2589 Merge pull request #48520 from Lutseslav/fix-alter-databases-with-special-symbols
- d088b00ff2 Merge branch '2018.3' into fix-alter-databases-with-special-symbols
- 59629e9757 Merge branch '2018.3' into fix-alter-databases-with-special-symbols
- da8336712e Add quotes to schema name in ALTER DATABASE.

- **PR #48528**: (gtmanfred) add 2018.3 requirements for tox/pytest tests @ 2018-07-11 18:13:40 UTC
  - ad4f7e6af0 Merge pull request #48528 from gtmanfred/2018.3
  - 221559358a add 2018.3 requirements for tox/pytest tests

- **ISSUE #48336**: (JuanManuelVizcainoAbad) file.directory (refs: #48399, #48398)

- **PR #48508**: (rallytime) [2018.3] Fix 2 bugs found in the file.check_perms function @ 2018-07-11 15:03:32 UTC
  - PR #48399: (garethgreenaway) [2017.7] fixes to module/file.py (refs: #48508)
  - PR #48398: (garethgreenaway) [2018.3] fixes to module/file.py (refs: #48508)
  - 70e5fcb8a5 Merge pull request #48508 from rallytime/fix-file-bug
  - 0747eb5476 Move comment string join and test/changes check to bottom of file.check_perms
  - aef1d7be21 Fix up bad merge - remove extra section of "mode" changes

- **ISSUE #48277**: (dvenckus) init.sls with included states fails with more than one, 'Template was specified incorrectly: False' (refs: #48388, #48389)

- **ISSUE #46986**: (github-abcde) opts file_roots gets overwritten with pillar_roots in orchestration run (refs: #48388, #48389)

- **PR #48389**: (garethgreenaway) [2018.3] reset file_roots for renderers after compile_pillar @ 2018-07-11 13:13:33 UTC
  - 5a0b274bf1 Merge pull request #48389 from garethgreenaway/48277_2018_3_file_roots_wrong
  - 4b492fa633 Removing unused start_time variable from test_orchestration_with_pillar_dot_items test.
  - 30c5855d20 Fixing a few things in the new test.
  - 36b7253418 Fixing lint issue
  - ab6abfad31 When pillar items are compiled a new render is instantiated but the file_roots is the pillar_roots. This change forces the _opts__['file_roots'] to be set to what is set in actual_file_roots for all renderers once compile_pillar has finished. Adding a test when this situation is run via a orchestration runner.

- **ISSUE #48342**: (jeffclay) UnicodeDecodeError when using cache mysql (refs: #48495)

- **PR #48495**: (garethgreenaway) [2018.3] Fix to mysql cache module @ 2018-07-10 12:54:10 UTC
  - f9fd1a889a Merge pull request #48495 from garethgreenaway/48342_mysql_cache_unicode
  - 0029f19033 Ensure the query_string is a bytestring, otherwise an attempt will be made to convert the msgpack data to unicode which will result in a UnicodeDecodeError error.

- **PR #48487**: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-07-09 18:38:00 UTC
  - fc3eeef6b3 Merge pull request #48487 from rallytime/merge-2018.3
  - 54341d1a8d Update old utils paths to use new utils paths
  - 68aabf0cf Merge branch '2017.7' into '2018.3'
  - 22cd4206c4 Merge pull request #48472 from gtmanfred/2017.7
    - c7a3a7dadb update jenkins tests to use tox for lint
• 44aaac1d33 use tox to run pylint
  – 27ea8f35ea Merge pull request #48476 from twangboy/fix_dependencies
    • b0087d425c Add license info
    • 935f9b560c Fix dependencies
  – acf42864a Merge pull request #48399 from garethgreenaway/48336_2017_7_ensure_chmod_setuid_with_chown
    • 8efd3320f Normalize the mode before we compare it.
    • f89f0ecb8 Setting the mode with setuid or setgid bits in addition to setting the owner and group will force the setuid & setgid bits to reset. This change ensures that we set the mode after setting the owner & group.
  – 6166ff6b78 Merge pull request #48471 from gtmanfred/2017.7
    • 392ab4e5f Add some configurations to tox
  – 6234d9b15d Merge pull request #48433 from discogestalt/fixed-redis.hmset
    • 65817ac74d Use clean_kwargs method instead
    • f7fa7f576c Found another issue with redismod.hmset
    • 5624865f86 Fix issue with redismod.hmset method
  – aace0fe2c Merge pull request #48428 from terminalmage/fixed-jobs.lookup_jid
    • 6509aa9089 Fix outptter detection in jobs.lookup_jid runner
  – a7e52f0de2 Merge pull request #48429 from rallytime/bp-46824
    • 8b4486248e Added ignore_retcode to mock unit tests
    • f8beab71dc Regression to ignore retcodes on crontab calls
  – 4576ef20bc Merge pull request #48432 from dwoz/file-prepend-again
    • 349a2b2799 Prepend test needs file.touch method

• PR #48481: (terminalmage) Improve the slack engine docs @ 2018-07-09 13:41:15 UTC
  – 4d4d2eacce Merge pull request #48481 from terminalmage/slack-engine
  – 56ea8a1eb93 Improve the slack engine docs
  – dde9c0640d Add information on creating bot users
  – 513ce6af975 Fix inaccurate docs

• PR #48348: (dwoz) Fix multiple git module tests @ 2018-07-06 20:35:58 UTC
  – 491b5b077c Merge pull request #48348 from dwoz/test_git
  – 5ca5e060b3 Merge branch '2018.3' into test_git

• PR #48454: (terminalmage) Improve error message when ext_pillar is incorrectly formatted @ 2018-07-06 18:03:44 UTC
  – dd6a6a97c5 Merge pull request #48454 from terminalmage/issue48107
  – 269dab77f6 Improve error message when ext_pillar is incorrectly formatted

• ISSUE #48336: (Juan Manuel Vizcaino Abad) file.directory (refs: #48399, #48398)

• PR #48398: (garethgreenaway) [2018.3] Fixes to module/file.py (refs: #48508) @ 2018-07-06 18:02:43 UTC
  – a9dc758e73 Merge pull request #48398 from garethgreenaway/48336_ensure_chmodd_setuid_with_chown
- 2454652914 Normalize the mode before we compare it.
- 08ad5665de Fixing test to ensure it works under py3
- 2b25d8c95b Setting the mode with setuid or setgid bits in addition to setting the owner and group will force the setuid & setgid bits to reset. This change ensures that we set the mode after setting the owner & group.

**PR #48431:** (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-07-05 17:23:00 UTC
- 2baa7f189f Merge pull request #48431 from rallytime/merge-2018.3
- 3e59dda0b1 Merge branch ‘2017.7’ into ‘2018.3’
  - 422441505d Merge pull request #48422 from rallytime/fix-48230
    - a6abf85621 Allow file.managed to work with uppercase source_hash in test=true mode
    - 4c691ac57a Add regression test for Issue #48230
  - 83e387c951 Merge pull request #48410 from dwoz/service_dead_test_fix
    - 5c0923448d Fix service dead test on windows
  - d3ba345da5 Merge pull request #48413 from twangboy/fix_47811
    - c5aad04140 handle unc paths
  - 827ef2aac4 Merge pull request #48416 from dwoz/service_integration_fix
    - c43f150dcd Fix service integration test (py3)
  - 10fe7d2b9b Merge pull request #48385 from Ch3LL/1update_version_doc_2017.7
    - 3cf335b0b9 Update release versions for the 2017.7 branch
  - f8a9a037e6 Merge pull request #48405 from Ch3LL/rm_inprog_2017.7
    - 03ed5167fa [2017.7] Remove In Progress Warning on 2017.7.7
  - 8ac867c168 Merge pull request #48409 from dwoz/test prepend_fix
    - 9c7085b70f Fix file state prepend test
  - 10e93bff7f Merge pull request #48396 from dwoz/symlink_test_fix
    - d3456d31e6 Fix file symlink state test for windows

**PR #48310:** (mtorromeo) Backport ini_manage fixes to 2018.3 @ 2018-07-05 16:27:19 UTC
- 432cbb5ee Merge pull request #48310 from mtorromeo/ini-manage-backports
- 88f80fd77 Fixed pylint useless-super-delegation warning.
- e20f4cad4 Uniformed reports between ini.options_absent and ini.options_present
- 2c3aa0b6c9 pylint cosmetics.
- 0cd1d18f Fixes dry run false positive when option value is a number.
- 7014bbccbb Fixes dry run in ini_manage + Fixes related bug - when working with options which are not in section. + Fixes related tests + Fixes pylint warnings

**ISSUE #48402:** (elsmorian) Running SaltStack master with no init system repeatedly logs "could not determine init system " (refs: #48441)

**PR #48441:** (terminalmage) Switch init system log message to debug @ 2018-07-05 14:43:25 UTC
- 84fd3d2784 Merge pull request #48441 from terminalmage/issue48402
- d758995763 Switch init system log message to debug

**PR #48386**: (Ch3LL) Update release versions for the 2018.3 branch @ 2018-07-03 13:37:32 UTC
- 871e9e3b98 Merge pull request #48386 from Ch3LL/update_version_doc_2018.3
- 84a1994110 Update release versions for the 2018.3 branch

**PR #48404**: (Ch3LL) [2018.3] Remove In Progress Warning on 2017.7.7 @ 2018-07-03 13:33:18 UTC
- ddb83ad4ce Merge pull request #48404 from Ch3LL/rm_inprog_2018.3
- e2f882a74 [2018.3] Remove In Progress Warning on 2017.7.7

**PR #48339**: (terminalmage) Backport tojson filter from #48309 to 2018.3 @ 2018-07-02 17:52:53 UTC
- PR #48309: (terminalmage) Drop support for Python 2 unicode string literals in YAML renderer (refs: #48339)
- 5b38019ca0 Merge pull request #48339 from terminalmage/backport-tojson-filter
- 4433bec891 Add release notes for tojson jinja filter
- ac6998801 Tweak docs to reflect backported filter
- c636b18c0 Add unit test for tojson filter
- e34e39f0e2 Document filter deprecation
- b9a4f288b2 Deprecate json_encode_dict and json_encode_list jinja filters
- 3896e3468c Use upstream tojson filter, if present
- 1499c6abcf Implement tojson jinja filter for those using Jinja < 2.9

**ISSUE #48274**: (ipmb) s3.get signature failure with + in the object name (refs: #48328)

**PR #48328**: (garethgreenaway) [2018.3] Fixes to utils/s3.py @ 2018-07-02 13:22:31 UTC
- 222c1d65db Merge pull request #48328 from garethgreenaway/48274_s3_get_signature_fail
- 22caf8334 fixing lint issue
- 13148203e Need to pass the URL path through quote to ensure any special characters are being quoted properly. if we include local_file for a PUT, read the file into data before passing it along to requests.requests.

**PR #48358**: (Ch3LL) Fix corrupt public key with m2crypto python3 @ 2018-07-02 13:10:32 UTC
- d3e65b9f4c Merge pull request #48358 from Ch3LL/m2crypto_fix
- 8fdd34d430 m2crypto open file in rb mode for pub key
- a964db4663 Fix corrupt public key with m2crypto python3

**ISSUE #48367**: (asenci) salt.proxy.fx2: dictionary changed size during iteration (refs: #48368)

**ISSUE #46765**: (roskens) pkg.mod_repo fails with a python error when removing a dictionary key (refs: #46776)

**PR #48384**: (rallytime) Back-port #48368 to 2018.3 @ 2018-07-01 04:19:10 UTC
- PR #48368: (asenci) Fix issue #48367 using the same approach as PR #46776 (refs: #48384)
- PR #46776: (gtmanfred) fix shrinking list in for loop bug (refs: #48368)
- 2fd66d6bdc Merge pull request #48384 from rallytime/bp-48368
- 430c462f34 Fix issue #48367 using the same approach as PR #46776

**PR #48394**: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-07-01 04:13:03 UTC
– 3b53e2d206 Merge pull request #48394 from rallytime/merge-2018.3
– 047f5b5f39 Update old utils paths to new utils paths
– c4fd2a0930 Merge branch '2017.7' into '2018.3'
– 7e25f26837 Merge pull request #48362 from twangboy/fix_48276
  - 77629f640a Fix module unit tests
  - b5ca560b73 Fix lint error
  - 210e280ecf Use explicit parameter names
  - 776db98a5c Handle missing registry entries
– 80222b6b7c Merge pull request #48383 from rallytime/bp-48379
  - 9fc7815594 Clean up the workspaces at the end for every job
– aa68a774a Merge pull request #48382 from rallytime/bp-48346
  - 6a70ba222e Use the right ssh key to destroy kitchen
– 9519f640e7 Merge pull request #48381 from rallytime/bp-48330
  - 6857bedcc2 Add warnings plugin to replace violations
– 14db0aa35d Merge pull request #48363 from dubb-b/2017.7
  - 6857bedcc2 Add warnings plugin to replace violations
– 5b29cd326f Merge pull request #48352 from Ch3LL/wheel_doc
  - 89ada68165 Add missing key to accept_dict function in wheel docs
– 02cf19ee3b Merge pull request #48329 from rallytime/codeowners-roster-files
  - 5e56615e00 Trigger review requests for team-ssh for roster files
– 53cf1794be Merge pull request #48349 from ralex/fix-manjaro-service-behaviour
  - 6cafe547e Disable the service module on Manjaro since it is using systemd
– 89dfcf3a4e Merge pull request #48324 from Ch3LL/update_version_doc_2017.7
  - 47845ba810 Update release versions for the 2017.7 branch
– ece4c30aac Merge pull request #48331 from rallytime/bp-48215
  - 9d6ba3e247 Set jobs to pending when they come in
  - 727d2b4ffe Use proper creds with githubNotify
  - d355861c5c Test using different credentials
– ab05e00d8c Merge pull request #48332 from rallytime/bp-48321
  - d72af6ab4e Jenkins needs the / to get the directory
– 21ed5b97ce Merge pull request #48295 from rallytime/bp-48193
  - 352fe3f6d6 Separate set_result() to a new line apart from Future() call
  - c0180ff33d Properly configure syndic in test case
  - d0a98534a9 Properly wait on returns in saltnado
– 9aa4687ab9 Merge pull request #48117 from twangboy/fix_48026
  - dd37f8fbc2 Disable services that are set to manual
- caf630487c Merge pull request #48207 from rallytime/bp-48189
  - e9d09e0375 Use old is_windows utils path on 2017.7
  - b9656c9b3 If pip binary is passed to bin_env, use that pip binary
- 06a927b2aa Merge pull request #48293 from rallytime/bp-47453
  - e96ab778e dont reset system locale when running rabbitmqctl commands

- **ISSUE #45939:** (andygabby) user.present with hash_password: True detects change on every state.apply/highstate (refs: #47147)

- **PR #47147:** (eliasp) states.user.present: Make usage of hash_password idempotent @ 2018-06-30 13:29:27 UTC
  - 9b364e25cf Merge pull request #47147 from eliasp/2018.3-issue-45939-shadow-hash-salt
  - dd3be1d76e Add warning log message when using MD5 for hashing shadow passwords
- 5451ab67a states.user.present: Make usage of hash_password idempotent

- **PR #48297:** (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-06-30 12:57:35 UTC
  - 89857ea8b9 Merge pull request #48297 from rallytime/merge-2018.3
  - 9498618418 Use saltenv opts instead of environment
  - 1c8bd35f28 Update old utils paths to use new utils paths
  - c7bb8a50b0 Merge branch '2017.7' into '2018.3'
    - 95ef06e00 Merge pull request #48219 from zer0def/lxc-bootstrap-fixes
      - c77058560b Merge branch '2017.7' into lxc-bootstrap-fixes
      - d63cf3f072 Fixes another case of legacy configuration key usage warning getting in the way of changing container’s state.
    - 3327181507 Merge pull request #48234 from dwoz/thin_dir
      - 70c63451b Fix py2 thin dir issues
  - 83d7d286c4 Merge pull request #48080 from lusche/2017.7
    - 917dc985fc #47984 remove the line completly
    - ba12ee947b Merge branch '2017.7' of https://github.com/saltstack/salt into 2017.7
    - dfb13d5051 Bugfix #47984 messed up cert serial
  - bccb4dcd46 Merge pull request #48232 from gtmanfred/cloud
    - d108112e1a do not expand kwargs for cloud.action
  - 056f43f663 Merge pull request #48238 from mirceaulinic/fix-sdb-cache
    - 51e5bfaf1d SDB cache module: AttributeError: 'Cache' object has no attribute 'set'
  - 731ec0a11a Merge pull request #48037 from terminalmage/fix-custom-types-sync-docs
    - 052ae834c4b Update versionchanged
    - 8b1bd0eda2 Update test to reflect changed argument name
    - 5e75936198 Change 2018.3.2 to 2018.3.3
    - 5c3ad603fc Rename sync -> sync_mods per review suggestion
    - e4d67c5fd8 Update docs to include references to new "sync" argument
    - cb8e6f9fb8 Remove redundant mocking
Salt Documentation, Release 2019.2.0

- bc3ad795e9 Add test for sync argument to state.sls
- f81ccd1fdd Add sync option to state.apply/state.sls
- 8289b07e24 Fix documentation on when custom types are synced
  - 0bae927048 Merge pull request #48249 from rallytime/2017.7.7-release-notes-update
  - 36032c8ee7 Update release notes for 2017.7.7
  - 8e06471817 Merge pull request #48242 from asnell/asnell-patch-1
- f66bf60073 Add sample list data via command line pillar
- PR #48364: (dubb-b) Changing debug to info for logging @ 2018-06-28 20:48:24 UTC
  - c5746deb5f Merge pull request #48364 from dubb-b/2018.3
  - d8260b6628 Changing debug to info for logging
- PR #48354: (rallytime) [2018.3] Merge forward from 2018.3.2 to 2018.3 @ 2018-06-28 20:26:31 UTC
  - 0202493760 Merge pull request #48354 from rallytime/merge-2018.3.2-to-2018.3
  - cc7e7c7c4 Merge branch '2018.3.2' into '2018.3'
- PR #48347: (dwoz) Fixes fileserver maintenance process on Windows @ 2018-06-28 13:17:42 UTC
  - b6fbb7f6c8 Merge pull request #48347 from dwoz/sigfix
- PR #47975: (terminalmage) Add a new git.cloned state @ 2018-06-27 20:53:42 UTC
  - 67303d7901 Merge pull request #47975 from terminalmage/issue47937
  - 34b24b7af7fa Merge branch '2018.3' into issue47937
- PR #48323: (Ch3LL) Update release versions for the 2018.3 branch @ 2018-06-27 13:44:58 UTC
  - 5b8d55428e Merge pull request #48323 from Ch3LL/update_version_doc_2018.3
  - 45484a5a6e Update release versions for the 2018.3 branch
- PR #48326: (Ch3LL) Remove In Progress Warning for 2018.3.2 Release @ 2018-06-27 13:43:16 UTC
  - 7cf403931 Merge pull request #48326 from Ch3LL/rn_remove_in_prog
  - dfe1ad5ed Remove In Progress Warning for 2018.3.2 Release
- PR #48301: (terminalmage) Fix typos in new mock_open docs @ 2018-06-25 19:08:14 UTC
  - 60ffad5126 Merge pull request #48301 from terminalmage/docs
  - 6c33345f05 Fix typos in new mock_open docs
- PR #48292: (rallytime) Back-port #48288 to 2018.3 @ 2018-06-25 19:07:11 UTC
  - PR #48288: (rmarchei) fix lsattr.get in file.check_perms (refs: #48292)
  - 4760f87153 Merge pull request #48292 from rallytime/bp-48288
  - d660573bb fix lsattr.get in file.check_perms
- PR #48296: (rallytime) Back-port #48258 to 2018.3 @ 2018-06-25 19:04:41 UTC
- **PR #48258**: (nullify005) preserve tuples for ldap modification operations (refs: #48296)
- 27207fc510 Merge pull request #48296 from rallytime/bp-48258
- 8b7f36f264 preserve tuples for ldap modification operations

**ISSUE #48204**: (zerthimon) State mysql_user.present Exception with mysql 8.0.11 (refs: #48275, #48228)

**PR #48275**: (garethgreenaway) [2018.3] Follow up fix to MySQL user for password management @ 2018-06-25 13:23:35 UTC
- d5265da945 Merge pull request #48275 from garethgreenaway/mysql_fix_followup
- bb024b9115 Removing unnecessary code.
- 8b542e1745 With MySQL versions 8.0.11 and beyond, since the PASSWORD function has been removed we need to hash the password string before comparing when checking if the user exists.

**PR #48286**: (terminalmage) Don’t load the grains again when printing them via salt-call -g @ 2018-06-25 13:19:18 UTC
- 1f306525a7 Merge pull request #48286 from terminalmage/caller-print_grains
- caa62c051f Don’t load the grains again when printing them via salt-call -g

**PR #48279**: (terminalmage) Add documentation/further enhancements to rewritten mock_open @ 2018-06-25 13:12:30 UTC
- 27a0e95174 Merge pull request #48279 from terminalmage/mock_open-docs
- 65c575ea9c Fix spelling error
- 830a624ce8 Ignore IOError when tearing down filehandles not opened for reading
- 3b6356f4b0 Raise TypeError when trying to read from filehandles not opened for reading
- 09aaee0c82b Add more examples and information on strict string types
- 8e069d105d Add some mock_open docs
- a13d1fe1a0 Update mock_open usage to reflect read_data type enforcement
- 374a8ce31f Add more mock_open tests
- 0f06adb008 Improve code-reuse in mock_open tests
- 0e8c83bac6 2 MockFH enhancements:

**ISSUE #48141**: (zerthimon) salt-api request causes exception (refs: #48236)

**PR #48236**: (garethgreenaway) [2018.3] Fix to cmd_batch @ 2018-06-25 12:58:49 UTC
- 6ee856631b Merge pull request #48236 from garethgreenaway/48141_salt_api_local_batch
- aea4f7ae14 Fixing test_local_batch
- ce3e1af2c Removing sort.
- 83acef3b20 Fixing test_local_batch
- ff14b99752 Fixing a typo in the comment.
- 85ce2f6e0 Adding note about why salt.utils.versions is being re-imported. Adding a test for local_batch.
- 808805fd3d Fixing cmd_batch to work correctly when called via salt-api.

**ISSUE #48204**: (zerthimon) State mysql_user.present Exception with mysql 8.0.11 (refs: #48275, #48228)

**PR #48228**: (garethgreenaway) [2018.3] Fixes to mysql module @ 2018-06-22 15:44:00 UTC
- 09b036c26e Merge pull request #48228 from garethgreenaway/48204_mysql_user_password_exception
- 1b2ffce1fd Updating the mysql module to not use the PASSWORD when MySQL is version 8.0.11 or higher, where the PASSWORD function has been removed.

**PR #48252: (rallytime) [2018.3]** Merge forward from 2017.7 to 2018.3 @ 2018-06-22 15:13:42 UTC

- 67cb5563ef Merge pull request #48252 from rallytime/merge-2018.3
- 84ec655c24 Merge pull request '2017.7' into '2018.3'
  - a172f9de84 Merge pull request #48226 from terminalmage/fix-alias-docstring
    - fb237272f5 Don’t display "None” in SaltInvocationError when Salt installed using -OO
    - 90c90f5d5c Fix docstring construction in alias_function when Salt installed using -OO
  - c6a0207cae Merge pull request #48227 from Ch3LL/fix_win_tests
    - 236773e3e9 Skip new sha256 files on repo.saltstack.com/windows
  - 6929423528 Merge pull request #48131 from bowmanjd-lms/fix-apk-python3
    - 5f5d2835299 Merge branch '2017.7' into fix-apk-python3
    - 0229fcb50 Fix py3-incompatible dict.keys()[x] call in apk.py
  - 868c17377f Merge pull request #48185 from DSRCorporation/bugs/47901_future_done_exception
    - 5f63316311 Merge branch '2017.7' into bugs/47901_future_done_exception
    - 9fd5bf4cb Don’t call .exception() on future unless it’s done.
  - 80a3e37c2e Merge pull request #48192 from twangboy/fix_pip_version_2017.7
    - 59ae2cc5fc Use –disable-pip-version-check for build_env_.#.ps1
  - 12e2b8882a Merge pull request #48201 from zer0def/lxc-bootstrap-fixes
    - 6f6d3d40d4 Take lxcpath into account when bootstrapping new containers. Version comparison fixes.
  - e079fcb836d Merge pull request #48190 from terminalmage/fix-vfstab-test
    - 8d70d14362 Fix mount.vfstab unit test
  - c8b9ce9c8e Merge pull request #48115 from KaiSforza/pr-lint-2017
    - 494727ab39 Add docs, kitchen tests
    - 537023bb20 Move .jenkins to .ci for future
    - dedc313ce4 Make it parallel so we don’t fail right away
    - cd13426726 Add a .jenkins file to run pylint
  - fc752b721 Merge pull request #48174 from terminalmage/docker-update-mine
    - 9af09e0127 Mock config get due to changes in _refresh_mine_cache
    - c5802ad465 Fix the version number in versionadded
    - d403ae58d7 Add unit test for docker.update_mine
    - 44c275698a Actually it’s more than just add/remove that updates the mine
    - 0cb6996b07 Add release notes mention of docker.update_mine config option
    - de05097b20 Add docs for new config option
    - 04c55a9178 Add note in mine.get_docker docstring about new config item
· 4e456255c0 Allow mine update to be disabled using new config option

· ISSUE #48029: (vinian) syndic failed to auth when restart salt-master on syndic master (refs: #48034)

· PR #48034: (vinian) restart salt-syndic when salt-master restart @ 2018-06-21 20:12:37 UTC
  · 9f0bd90c5b Merge pull request #48034 from vinian/restart-salt-syndic-when-salt-master-restart
  · f7652d8c8b restart salt-syndic when salt-master restart

· PR #48250: (rallytime) Update release notes for 2018.3.2 @ 2018-06-21 18:30:21 UTC
  · ab2ba942ad Merge pull request #48250 from rallytime/2018.3.2-release-notes-update
  · 19c104b6cd Update release notes for 2018.3.2

· PR #48166: (terminalmage) Add trace logging and optimize file handling in grains.core.os_data @ 2018-06-21 18:02:33 UTC
  · 51928ff050 Merge pull request #48166 from terminalmage/salt-jenkins-1000
  · b73df0ab00 Change call_args to call.args to reflect changes to MockFH
  · 0c2cc07704 remove unused import
  · b8c0a55cf3 Add test for tell()
  · 1cb89f9e4e Implement tell() for filehandle iteration
  · efb8f9d42 Add tests for read_data being a list, and containing unicode or bytestrings
  · 38df912fa6 Operate on a copy of the read_data
  · 71eeae1240 Update mount module unit tests to reflect changes in mock_open
  · 16c414e120 Update nfs3 module tests to reflect changes in mock_open
  · b7ebab56c6 Update grub_legacy module tests to reflect changes in mock_open
  · cc002b8fd7 Update new network unit test to reflect changes in mock_open
  · a8f11594f1 Update new core grains tests to reflect changes in mock_open
  · 84e18d956 Update crypt unit tests to reflect changes in mock_open
  · 67c036dc2d Add MockCall to tests.support.mock to track calls
  · 2556a1e13d Remove unused import
  · fd9d700157 Add additional docs to MockOpen class
  · 6acb4c833ec Update newly added test to reflect renaming of handles attribute
  · 77e5288d42 Update fibre_channel grains tests to reflect changes in mock_open
  · ed40371a06 Update timezone module tests to reflect changes in mock_open
  · fc0aa9934f Track call_count in MockOpen
  · 2598d2453a Update snapper module tests to reflect changes in mock_open
  · 51b3faa7b4 Add support for passing multiple strings for a given match in read_data
  · 55487c175c Fix mock_open call to use new multifile syntax
  · 7f516ef73a Update puppet module tests to reflect changes in mock_open
  · 33a97c4ec8 Update btmp beacon tests to reflect changes in mock_open
  · bc027cfa94 Update wtmp beacon tests to reflect changes in mock_open
- f5823252bb Track call args/kwargs in MockFH
- 335591ca90 Mock the seek function in MockFH
- 7eb4b1a1c Update cp.push test to reflect changes to mock_open
- 2be19ca89 Report correct location when reading using explicit size and EOF reached
- 5ec95ba5ca On second thought, actually implement tell()
- 19022eb96 Add tell mock to MockFH
- 4b5a393445 Update junos tests to reflect changes to mock_open
- 278a222b09 Update dnsutil tests to reflect changes to mock_open
- 4e67955572 Replace the rest of mock_open with a class
- 75307a47c5 Update linux_sysctl tests to reflect changes to mock_open
- 05c68fd5d9 Use explicit config file and fix remaining mac_sysctl tests
- 836fde9a30 Allow Python 2 to accept an exception as read_data
- 543385fd02 Add writelines_calls property
- 42fa84256 Make read funcs mocks so their calls can be tracked
- 67503c58f Update mac_sysctl tests to reflect new mock_open behavior
- 3d2c4d395 Update file module tests to reflect new mock_open behavior
- b9200db3e Add a dict containing the handles to the mock_open return object
- 852ba4b982 Add mocked close() function to MockFH
- 6b46bc608 Remove unused import
- 20f60a769b Add blank lines to appease linter
- 48d7cfa6d3 Add multifile tests for mock_open
- 1861e9h944 mock_open: rewrite multi-file support
- 5e6b539770 Use function for empty string
- cb2620ad2b Update core grains tests to reflect EAFP changes
- 5d09b178d7 Separate mocked file contents per filename, not glob
- 875102f538 Modify mock_open to support multiple file paths
- 96ace74df Move lsb_release parsing into its own function
- 6a0828beed Add unit tests for mock_open
- 8ba6cadac7 More mock_open bugfixes
- 329dea218e Add a bunch of logging for linux os_data core grains
- 2c64b270df Add timestamp to the minion’s log_fmt_console

**PR #48216:** (Ch3LL) Fix UnicodeDecodeError when reading file to determine virtual grain (refs: #48440) @ 2018-06-20 16:53:41 UTC

- 6072d1ef9c Merge pull request #48216 from Ch3LL/grains_unicode
- c4334f3f1c Fix UnicodeDecodeError when reading file to determine virtual grain

**PR #48212:** (Ch3LL) Fix python3 ec2 salt-cloud TypeError when installing salt (refs: #49041) @ 2018-06-20 16:00:21 UTC
- 77a75ebdcf Merge pull request #48212 from Ch3LL/py3_ec2
- b0d75f459a Fix python3 ec2 salt-cloud TypeError when installing salt

**ISSUE #47984**: (jeduardo) x509 module/state writing wrong certificate serial number to CRL (refs: #47986, #48080)

**PR #48209**: (rallytime) Back-port #47986 to 2018.3 @ 2018-06-20 13:44:17 UTC

- PR #48080: (lusche) Bugfix #47984 messed up cert serial (refs: #48209)
- PR #47986: (jeduardo) Fix serial number writing into CRL files with the x509 module (refs: #48209)
- de614d31f5 Merge pull request #48209 from rallytime/bp-47986
- f4b3bd5d2c Changed salt.utils.fopen to salt.utils.files.fopen
- 868672909 Fixed typos, removed repeated unit tests, and applied code fixes suggested by linter.
- 382df48a72 Removed useless new line
- 5aa99d14c4 Added unit tests for CRL creation and certificate revocation with CRL
- cc12844922 Fixed a problem where the OpenSSL bindings refuse to consume unicode strings.
- 399cf08860 Stopped converting the certificate hexadecimal serial number to an integer in order to avoid breaking CRLs.

**PR #48210**: (rallytime) [2018.3] Merge forward from 2018.3.1 to 2018.3 @ 2018-06-20 13:43:19 UTC

- 1f88df6e89 Merge pull request #48210 from rallytime/merge-2018.3
- dae65da256 Merge branch '2018.3.1' into '2018.3'

**PR #48186**: (rallytime) Add autodoc module for saltcheck.py @ 2018-06-19 19:03:55 UTC

- 5b4897f050 Merge pull request #48186 from rallytime/saltcheck-docs
- 314fc2d889 Clean up some doc references
- da7603d879 Add autodoc module for saltcheck.py

**PR #48191**: (twangboy) Use the --disable-pip-version-check option @ 2018-06-19 18:13:44 UTC

- 7274a33c80 Merge pull request #48191 from twangboy/fix_pip_check
- 5c00fcee6f Use the --disable-pip-version-check option

**ISSUE #48122**: (pasmon) Salt minion 2017.7.6 disregards "bin_env" in pip state (refs: #48189)

**PR #48189**: (gtmanfred) If pip binary is passed to bin_env, use that pip binary (refs: #48207) @ 2018-06-19 18:08:13 UTC

- 96f79b0674 Merge pull request #48189 from gtmanfred/pip
- 96c59f39d3 If pip binary is passed to bin_env, use that pip binary

**PR #48165**: (terminalmage) Fix regression with top_file_merging_strategy=same @ 2018-06-19 18:03:07 UTC

- 71e385501b Merge pull request #48165 from terminalmage/issue48144
- 92ac2a2d6a Remove unused imports
- 15a44d5dd4 Remove redundant top file merging tests
- 121009bd3 Add more top file merging tests
- 0ed686cb3f Add unit test for show_top with "same" merging strategy
- 35e5492fb7 Revert 7058f10 / 3d6fa7
• ISSUE #46806: (ezh) Lack of debug messages on authentication fail. (refs: #46807, #48179)
• PR #48179: (ezh) 2018.3 auth @ 2018-06-19 14:16:40 UTC
  - PR #46807: (ezh) Reduce initial authentication setup complexity (refs: #48179)
  - 2a8e1c6539 Merge pull request #48179 from ezh/2018.3-auth
  - 9ed2d2ec55 Fix integration.shell.test_key and integration.shell.test_runner
  - 26a6f79730 Fix integration tests test_list_acc_wrong_eauth, test_salt_run_with_wrong_eauth
  - b84c4321c4 Add more verbose debug messages for auth subsystem
• PR #48188: (gtmanfred) allow virtual aliases to be used for the driver name @ 2018-06-18 21:49:16 UTC
  - 0231008cf8 Merge pull request #48188 from gtmanfred/2018.3
  - 45249d3e10 allow virtual aliases to be used for the driver name
• PR #48116: (KaiSforza) Add jenkinsfiles to define tests in 2018 @ 2018-06-18 21:27:10 UTC
  - 0f95238dca Merge pull request #48116 from KaiSforza/pr-lint-2018
  - f158bed5bd Add docs, kitchen tests
  - 904a70c187 Move .jenkins to .ci for future
  - 365fa0e51f Make it parallel so we don’t fail right away
  - e594979745 Add a .jenkins file to run pylint
• ISSUE #48146: (rmarchei) mysql_query.run: exception on 2018.3 (refs: #48164)
• PR #48164: (garethgreenaway) [2018.3] Fixes to mysql state @ 2018-06-18 13:10:20 UTC
  - 60c9490bdc Merge pull request #48164 from garethgreenaway/48146_mysql_output_to_file
  - a040643a82 Accounting for certain situations when the query result is not a string, but actually a dictionary.
• ISSUE #48113: (gaetanquentin) state file.line has error and erase file content completely, while with mode test=true it is ok (refs: #48156)
• PR #48156: (garethgreenaway) [2018.3] Unicode fixes for file.line @ 2018-06-17 19:34:08 UTC
  - 85eb9d3f2 Merge pull request #48156 from garethgreenaway/48113_ensure_writing_strings_with_file_dot_line
  - 5a9ef0d1ae Unless we’re using py2 and Windows, ensure we’re writing out a string when using file.line.
• PR #48161: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-06-17 19:33:29 UTC
  - 33400e72db Merge pull request #48161 from rallytime/merge-2018.3
  - 073fa1b02 Update utils path for which function to new path
  - 398cc78224 Merge branch `2017.7` into `2018.3`
  - df2a156338 Merge pull request #48061 from garethgreenaway/port_47049_2017_7
    * 7c472fed51 Fixing failing test_set_hwclock_aix test.
    * ccb0acc958 Porting #47049 to 2017.7.
  - 5ee3cf2ddd Merge pull request #48143 from Ch3LL/fix_long_job
    * 48b5d2e9d3 Add timeout argument to run_salt for ShellCase
  - e1e566d1f8 Merge pull request #48135 from rallytime/release-notes-2017.7
    * 7a97f157b3 Add missing v for tag reference
- 2f2b69ed37 Add "in progress" notation to 2017.7.7 release notes
- 06a1151a63 Add release notes file for 2017.7.7
- 885b2862ce Move 2017.7.7 release notes to 2017.7.8
  - ac9dabbfaa Merge pull request #48105 from rallytime/merge-2017.7
  - cdb45874de Merge branch '2017.7.6' into '2017.7'
    - 16916d6bd2 Merge pull request #47880 from gtmanfred/2017.7.6
    - 987ae6358b quote python_version in requirements.txt
    - 27670168ea Merge pull request #47875 from rallytime/release-notes-dot-six
    - 58dee4c829 Remove sentence about the release being in progress
    - b3dcb7330e Remove "in progress" too
    - 99e1df7823 Update 2017.7.6 release notes: remove "unreleased" text
    - 1f0bada07c Merge pull request #47873 from gtmanfred/2017.7.6
    - a1c1b5bdfc allow tornado 5.0 to be installed only for python2
  - 2da56a9d9 Merge pull request #48101 from rallytime/update-doc-refs-2017.7
    - 7ba6f3f36 Update 2017.7.7 reference to 2017.7.8
  - 4a03d46e7 Merge pull request #48091 from terminalmage/fix-file_roots-monkeypatching
    - 6fe711ad76 Reverse monkeypatching after test_symlink_list finishes
  - 053b019a8f Merge pull request #48088 from rallytime/update_version_doc_2017.7
    - 1b8d1c936b Remove "in progress" info for 2017.7.6 release notes
    - 9a0f4d190a Update release versions for the 2017.7 branch
  - d6d25ee18 Merge pull request #48075 from garethgreenaway/48038_jobs_are_not_deduping_minion_side
    - c537b3275b Ensure that the shared list of jids is passed when creating the Minion. Fixes an issue when minions are pointed at multiple syndics.
  - aa33cc0b0c Merge pull request #48071 from terminalmage/gitfs-docs
    - 24545204b3 Fix inaccurate gitfs_saltenv example in GitFS Walkthrough
  - f84ceacb88 Merge pull request #48053 from rallytime/bp-48040
    - 265b22b194 states/github.py fix for incorrect positional argument
  - f37daac6d Merge pull request #48024 from gtmanfred/2017.7
    - 56b074ab27 allow specifying a different state to run on converge
    - cc9c4b4d5a add pytest coverage and xml junits

- ISSUE #48145: (max-arnold) Failed to load ext_pillar saltclass: can only assign an iterable (refs: #48155)
- PR #48155: (max-arnold) Do not fail on empty saltclass classes (fix for #48145) @ 2018-06-15 20:21:28 UTC
  - 9aa9a83b10 Merge pull request #48155 from max-arnold/2018.3
  - 63ab02c648 Do not fail on empty saltclass classes declaration #48145
  - 3d4fbcbe3aa Add test for issue #48145
- PR #48104: (twangboy) Fix unit.modules.test_win_status @ 2018-06-15 17:05:34 UTC

28.2. Previous Releases

4073
- 152c09cc0c Merge pull request #48104 from twangboy/fix_test_win_status
- 1ec3f436ee Fix test_error_logged_if_process_get_owner_fails

**PR #48147:** (brejoc) Fix for sorting of multi-version packages @ 2018-06-15 17:03:18 UTC
- 8cf03110dd Merge pull request #48147 from brejoc/2018.3-multi-version-fix
- 90ed25447d Switching to salt.utils.versions like linter suggested
- ed09574073 Fix for sorting of multi-version packages (bsc#1097174 and bsc#1097413)

**PR #47956:** (dmurphy18) Improved support for mount on AIX @ 2018-06-15 13:40:01 UTC
- 2edc5f5442 Merge pull request #47956 from dmurphy18/aix_mount_support
- f2a3e321db Improved support for mount on AIX

**ISSUE #48012:** (Timandes) Found UnicodeDecodeError when trying to start Salt Master (refs: #48081)

**PR #48081:** (terminalmage) Fix UnicodeDecodeError when parsing hosts file with non-ascii @ 2018-06-15 12:41:13 UTC
- c05c176782 Merge pull request #48081 from terminalmage/issue48012
- 8d2fb0bf25 Fix cp.push test
- e230a7223f Fix definition of test data for wtmp/btmp beacon tests
- 82874a8c10 Import six like we do everywhere else
- 54f9a2ab54 Remove unused import
- 767cc7e87f fix tabs
- db19636f56 Get rid of additional newline append
- 7427e192ba Fix more crappy mocking
- 4eaa5789ce Fix crappy mocking
- 248467edac Add regression test for _generate_minion_id()
- 5e62d6d45f Fix UnicodeDecodeError when parsing hosts file with non-ascii
- e6a4744f85 Use errno instead of hard-coding error 2
- ff63f36932 Fixes / enhancements for mock_open

**PR #48133:** (rallytime) Updates the 2018.3.2 and 2018.3.3 release notes files @ 2018-06-14 21:21:15 UTC
- **PR #48129:** (rallytime) Add release notes for 2018.3.2 (refs: #48133)
- 5d92e2763a Merge pull request #48133 from rallytime/release-notes-2018.3
- afe1e91972 Add "in progress" notation to 2018.3.2 release notes
- 3e4272ac09 Add release notes for 2018.3.2
- 88c584cb0d Move 2018.3.2 release notes to 2018.3.3

**PR #48103:** (terminalmage) Fix for gitfs base env being pinned to commit ID @ 2018-06-14 16:29:24 UTC
- 0e3f846836 Merge pull request #48103 from terminalmage/gitfs-base-pinned-to-commit
- 31ab2fe8de Fix for gitfs base env being pinned to commit ID

**PR #48077:** (twangboy) Fix issue with salt.utils.parsers on Windows @ 2018-06-14 16:22:57 UTC
- 4b6f1c777f Merge pull request #48077 from twangboy/fix_parsers
- 0f7d7691a2 Call logger in each case
- 0e99dd741c Fix logic for non-root
- 2d2534a688 Fix parsers for Windows, fix tests

- **PR #48096**: (twangboy) Fix `unit.utils.test_which` on Windows @ 2018-06-14 13:15:14 UTC
  - 80332b32a7 Merge pull request #48096 from twangboy/fix_test_which
  - d26f656f13 Use os.sep for paths

- **PR #48102**: (rallytime) [2018.3] Update 2018.3.2 references to 2018.3.3 @ 2018-06-14 13:14:26 UTC
  - 66b2200913 Merge pull request #48102 from rallytime/update-doc-refs-2018.3
  - 1c9bce3d8 Update 2018.3.2 references to 2018.3.3

- **PR #48109**: (rallytime) Back-port #47851 to 2018.3 @ 2018-06-14 13:09:04 UTC
  - **PR #47851**: (rares-pop) Fixup! add master.py:FileserverUpdate **kwargs (refs: #48109)
  - 2902ee0b14 Merge pull request #48109 from rallytime/bp-47851
  - e9dc30b5e Fixup! add master.py:FileserverUpdate **kwargs

- **ISSUE #47925**: (JonGriggs) GitFS looking for files in the master branch only (refs: #47943)

- **PR #47943**: (terminalmage) Make sure we set the effective environment when lock_saltenv is True @ 2018-06-13 20:02:00 UTC
  - 2529292568 Merge pull request #47943 from terminalmage/issue47925
  - 5c341a2b10 Merge branch '2018.3' into issue47925

- **PR #48089**: (rallytime) Update release versions for the 2018.3 branch @ 2018-06-13 14:03:44 UTC
  - 9ed040ed4 Merge pull request #48089 from rallytime/update_version_doc_2018.3
  - fad6a0991e Remove "in progress" info for 2018.3.1 release notes
  - a3b3b0a0e1 Remove "in progress" info for 2017.7.6 release notes
  - 9eb1b1925 Update release versions for the 2018.3 branch

- **PR #48054**: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-06-13 12:58:46 UTC
  - b10b7355a0 Merge pull request #48054 from rallytime/merge-2018.3
  - 508d70f0a Update old utils paths to use new paths
  - 3d2ea16c3a Merge branch '2017.7' into '2018.3'
    - ffe3d766ec Merge pull request #48044 from twangboy/wua_add_fail_code
      - d41d0c25eb Add faile code for WinHTTP send/receive error
    - 871a910f67 Merge pull request #48009 from dwoz/winswarmfix
      - 5027b7bb84 minionswarm runs on windows
    - 0dcaead36d Merge pull request #47968 from gtmanfred/2017.7
      - ae1b6d28bb pass LANG and HOME into tox commands
      - 8d15b93d00 remove tox virtualenvs from doc tests
      - e1872e2036 simplify tox.ini
      - 81bd01f5af add tests.txt for running tests with tox requirements
556a2067fc fix masterapi test to use testing directory for configs
5a41f484ef add EXPENSIVE_TESTS
055cd5a6ba set DESTRUCTIVE_TESTS environment variable for pytest
  * 42dd6b83eb Merge pull request #47978 from twangboy/fix_test_pkg
  * 8bb36b3a4b Add try/finally, fix typo in 7zip def file
  * a67b21ef3d Merge pull request #47959 from twangboy/fix_test_service
    * 0cd47aa81e Remove unused import
    * d4b42540e3 Fix failing test when service doesn’t exist
  * b81d482067 Merge pull request #47983 from garethgreenaway/backport_47843_2017_7
    * 7b7fb1f5d5 Adding missing test sls file.
    * 54e51bc627 Backporting #47843 to 2017.7, updating test for 2017.7.
  * d56dad22c Merge pull request #47533 from twangboy/fix_47178
    * 24717cbc21 Change version added to 2017.7.7
    * 0592f1bac2 Fix issues with functions that user makedirs on Windows
  * 5c56b8c755 Merge pull request #47827 from twangboy/fix_47791
    * fbbd91f09e Add more descriptive debug message
    * 365f81651b Fix deprecated exception handling
    * 8dd6710b93 Use local instead of network
    * 980d99d74b Fix issue when archive is on mapped drive

  • PR #48060: (gtmanfred) mark test as expensive @ 2018-06-13 12:58:21 UTC
    * c83818e4f9 Merge pull request #48060 from gtmanfred/2018.3
    * 914935c4d4 Merge branch ‘2018.3’ into 2018.3

  • PR #48057: (terminalmage) Fix link without target in 2018.3.0 release notes @ 2018-06-11 18:50:17 UTC
    * a4eb41623d Merge pull request #48057 from terminalmage/docs-2018.3
    * 20f71ff6f6 Fix link without target in 2018.3.0 release notes
    * d8e035e5e5 mark test as expensive

  • PR #48042: (terminalmage) Switch to trace level logging for further test failure troubleshooting @ 2018-06-11 14:03:48 UTC
    * 0f9a3122df Merge pull request #48042 from terminalmage/salt-jenkins-1000
    * b33a0b5eaa Switch to trace level logging for further test failure troubleshooting

  • PR #48041: (terminalmage) salt.utils.hashutils: Only decode to utf-8 on Windows @ 2018-06-11 13:31:41 UTC
    * 6c5389189a Merge pull request #48041 from terminalmage/hashutils-fix-windows
    * 58c7cd3d7 salt.utils.hashutils: Only decode to utf-8 on Windows

  • PR #48014: (cro) Find job pause @ 2018-06-08 13:48:45 UTC
    * dcae209951 Merge pull request #48014 from cro/find_job_pause
    * 440aa67c4f Lint: Add blank line
• PR #47915: (garethgreenaway) [2018.3] state runner pause resume kill @ 2018-06-07 16:08:30 UTC
  - ea85f882bc Merge pull request #47915 from garethgreenaway/state_runner_pause_resume_kill
  - 2ecbe9c034 fixing typo in alias_function call.
  - 4377e0cc08 Some fixes to the set_pause and rm_pause function in the state runner, renaming to in line with the functions in the state module. Including aliases to previous names for back-ward compatibility. Including a soft_kill function to kill running orchestration states. A new test to test soft_kill functionality.

• PR #48002: (rallytime) Back-port #47923 to 2018.3 @ 2018-06-07 15:25:39 UTC
  - PR #47923: (isbn) Prevent crash if files in file.recurse (refs: #48002)
  - 5c11fcde60 Merge pull request #48002 from rallytime/bp-47923
  - 9465e5f1e9 Use to_unicode from stringutils avoid deprecation warning
  - 73d33cbfc3 Prevent crash if files in file.recurse

• PR #48003: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-06-07 15:25:19 UTC
  - 3d0a087c71 Merge pull request #48003 from rallytime/merge-2018.3
  - a6533a9332 Merge branch '2017.7' into '2018.3'
    * 998a1c13d5 Merge pull request #47966 from mbunkus/fix-postfix-prefix-free-key-names-assumption
      - 0ae402d1b5 Fix postfix.set_main’s assumption of prefix-free key names
    * df50ce7b1b Merge pull request #47824 from twangboy/fix_setup.py
      - 4538b3abb3 Remove 'len-as-condition' disablement
      - d4efcc3c8b Skip lint errors
      - 1b3977f8d4 Remove m2crypto download for Windows
    * 3e91a31134 Merge pull request #47922 from damon-atkins/2017.7_win_pkg_keys_fix
      - 7129203b1b Merge branch '2017.7' into 2017.7_win_pkg_keys_fix
    * 8008fa2f6 Merge pull request #47933 from terminalmage/add-pillar.get-docs
      - 4eb022675 Clarify pillar.get docs
    * ab565bfaa3 Merge pull request #47944 from terminalmage/fix-git.detached-docs
      - 1d082b4389 Replace use of deprecated argument name in git.detached docstring
      - 6253793eb6 Merge branch '2017.7' into 2017.7_win_pkg_keys_fix
      - 4ce0fe6546 win_pkg under py3 keys returns a view instead of a list, wrap keys in list()

• PR #48022: (morganwillcock) win_wua state: fix function name in examples @ 2018-06-07 15:03:52 UTC
  - 0a05212f60 Merge pull request #48022 from morganwillcock/patch-1
  - 443f4d6f21 win_wua state: fix function name in examples

• ISSUE #47546: (ender8282) archive.extracted fails when archive includes files with non-ascii names with 2018.3.0 (refs: #48015, #47572)

• PR #48015: (garethgreenaway) [2018.3] more unicode nonsense in archive module @ 2018-06-07 14:44:55 UTC
- 406eb161e Merge pull request #48015 from garethgreenaway/47546_more_unicode_nonsense
- f457f9cb84 Adding a test to ensure archive.list returns the right results when a tar file contains a file with unicode in its name.
- 9af49bc595 Ensure member names are decoded before adding to various lists.

- **ISSUE #47955**: (frogunder) 2018.3.1 Creating Windows machine in Amazon using salt-cloud fails. (refs: #47989)
- **PR #47989**: (dwoz) Properly decode password from aws using m2crypto @ 2018-06-06 20:44:28 UTC
  - 1ce7d6c38a Merge pull request #47989 from dwoz/awscloud
  - 23ab2727be Fix linter errors
  - 6c8daa2b85 Properly decode password from aws using m2crypto
- **PR #47976**: (terminalmage) Capture and log output of processes that timed out and were killed @ 2018-06-06 19:17:08 UTC
  - 76068c83f5 Merge pull request #47976 from terminalmage/salt-jenkins-1000
  - 41e5a75027 Add catch_timeout to run_script
  - 551ada8e4d Capture and log output of processes that timed out and were killed
- **PR #47990**: (terminalmage) Docs fixes in 2018.3 release branch @ 2018-06-06 17:15:17 UTC
  - f12a52736e Merge pull request #47990 from terminalmage/2018.3-docs
  - f89d2ccd30 Clean up Sphinx warnings
  - 5fc93686f Add clarifying comment so that we don’t break this
  - 94849780ac fix docs build error due to IndexError
- **PR #47982**: (twangboy) Fix unit.modules.test_win_dns_client tests @ 2018-06-06 15:02:10 UTC
  - 9d56af3cad Merge pull request #47982 from twangboy/fix_test_win_dns_client
  - 2dcd6f688c Force string to ModuleType
- **PR #47985**: (twangboy) Fix unit.states.test_reg test failure @ 2018-06-06 14:56:03 UTC
  - 1be472345b Merge pull request #47985 from twangboy/fix_test_reg
  - 4ce551811f Remove the unnecessary to_unicode stuff
  - 863d639fa Mock reg.cast_vdata
- **ISSUE #47236**: (MorphBonehunter) x509.private_key_managed broken after upgrade to 2018.3.0 (refs: #47957)
- **PR #47957**: (garethgreenaway) [2018.8] Ensure x509 passphrase is a string @ 2018-06-05 13:27:33 UTC
  - 84100570f7 Merge pull request #47957 from garethgreenaway/47236 Ensure_passphrase_is_a_string
  - 99bad3ca6 removing unnecessary change
  - e2df8473d Ensuring that when a passphrase is passed in, it is returned as a string from the passphrase callback.
    - 9b0fa6a24d Make sure we set the effective environment when lock_saltenv is True
      - 8da6ce45dc Finish the docstring for git.cloned state
      - 4a8260a5e5 Add tests for git.cloned state
      - 31179da05 Add git.cloned state
• **PR #47926**: (dmurphy18) Backport of PR 47808 to 2018.3, improved grains support for AIX @ 2018-06-04 19:31:24 UTC
  - **PR #47808**: (dmurphy18) Updated AIX support for grains reported (refs: #47926)
  - c355da9e0d Merge pull request #47926 from dmurphy18/backport_pr47808
  - ac15d2093a Backport of PR 47808 to 2018.3, improved grains support for AIX

• **PR #47927**: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-06-04 18:55:12 UTC
  - a464e2ab11 Merge pull request #47927 from rallytime/merge-2018.3
  - 5baab66f4b Lint: Whitespace fix
  - 7e1d278d19 Update old utils paths to use new utils paths
  - 3273bdab7 Merge branch '2017.7' into '2018.3'
  * a2b588299b Merge pull request #47860 from terminalmage/state-writing-docs
    - 8cb33d3dec Quiet the linter
    - af51e16f23 Use more elegant RST syntax
    - 91cd571e0 Update mocking to reflect changes in service module
    - b9ace5a859 Fix crappy mocking
    - bc9e3acef3 Lint fixes
    - d37f7e4f04 Add 2017.7.6 release notes
    - 9dddeefab Improve documentation on syncing states
    - f465fa3ca7 Add best practices docs for writing states
    - 93ee5ee2b0 Fix all Sphinx warnings
    - 64b9b4d0b8 Clarify that name would override the id declaration
  * d2f3377b5b Merge pull request #47877 from dwoz/sleep_audit
    - ebc7cde9cb Revert job chunk wait time change
  * 735e92093e Merge pull request #47917 from dwoz/winsuite
    - 118601b6d6 Fix windows tests suite breakage
  * 63efb76d51 Merge pull request #47822 from Ch3LL/win_user_test
    - 3a691d405f add user_home path for both windows and linux
    - 788abf771e Add user state integration tests to windows
  * b9da4f1221 Merge pull request #47876 from doesitblend/add-file-read-windows
    - 3f7e7ec327 Add file.read function to Windows module
  * cbe2ecfae8 Merge pull request #47882 from frogunder/45013
    - 38d114a2d2 add whoami test

• **PR #47931**: (rallytime) Back-port #47913 to 2018.3 @ 2018-06-04 14:39:16 UTC
  - **PR #47913**: (rares-pop) Fixup! beacons/avahi_announce.py finding grains (refs: #47931)
  - 4db1f8c063 Merge pull request #47931 from rallytime/bp-47913
  - c51e732f4d Fixup! beacons/avahi_announce.py finding grains

28.2. Previous Releases
• PR #47930: (rallytime) Back-port #47725 to 2018.3 @ 2018-06-04 14:38:58 UTC
  – PR #47725: (bbczeuz) network_settings beacon: Update example to follow new cfg convention (refs: #47930)
  – d05a6c70d3 Merge pull request #47930 from rallytime/bp-47725
  – 5c666409f3 Spelling fix
  – cfe0a5bb42 network_settings: Fix doc using new list/dict syntax

• PR #47557: (L4rS6) fix broken rabbitmq list policies in rabbitmq version 3.7 @ 2018-06-04 13:25:07 UTC
  – 484d83014b Merge pull request #47557 from L4rS6/fix-broken-rabbitmq-list-policies
  – 6d7ef27557 Merge branch '2018.3' into fix-broken-rabbitmq-list-policies
  – e043ea2833 refactored list_policies code and added more tests
  – eea81fe8b7 fix broken rabbitmq list policies in rabbitmq version 3.7

• PR #47949: (terminalmage) Continued troubleshooting on salt-jenkins 1000 @ 2018-06-04 13:17:14 UTC
  – 866a2fb5e Merge pull request #47949 from terminalmage/salt-jenkins-1000
  – 9c369c6aa8 Remove temp logging from test
  – a0fd35ba7b Add result logging to run_script, make returns DRY

• PR #47941: (terminalmage) Update test logging for salt-jenkins @ 2018-06-03 02:40:56 UTC
  – 0b85d1273f Merge pull request #47941 from terminalmage/salt-jenkins-1000
  – fb66368a9 Update test logging for salt-jenkins 1000

• PR #47924: (Ch3LL) Catch all exceptions in git import for salt.utils.gitfs @ 2018-06-01 21:06:58 UTC
  – 58b5f2b4dd Merge pull request #47924 from Ch3LL/mac_gitpy
  – 75c51ad69b Catch all exceptions in git import for salt.utils.gitfs

• ISSUE #47269: (isdig) Reopen Windows Minion That Has IAM Role Cannot Access to S3 (refs: #47879)

• PR #47879: (dwoz) Fix ami role usage warts #47269 @ 2018-06-01 14:11:55 UTC
  – b88ec5258d Merge pull request #47879 from dwoz/ami_role_fix
  – 3884c2cf5f Fix ami role usage warts #47269

• PR #47788: (twangboy) Use pytz to calculate timezones @ 2018-05-31 18:33:20 UTC
  – b0956982b Merge pull request #47788 from twangboy/fix_47759
  – 0d229c6182 Merge branch '2018.3' into fix_47559
  – 9e612ec9e7 Fix markup in release notes
  – 60499d18f0 Skip test if pytz not present
  – 72cc361c7b Move pytz to 3rd party import, add to __virtual__
  – b8a6488688 Update __virtual__ function
  – 9923176b68 Use __utils__, fix unit tests
  – 73e033f555 Return offset in the same format as Unix
  – 5656183c5e Add timezone.list, add 2018.3.2 release notes
  – 986f0c9b2a Use pytz to calculate timezones
• PR #47899: (terminalmage) salt-jenkins issue 1000 @ 2018-05-31 18:24:49 UTC
  - ae73cb3947 Merge pull request #47899 from terminalmage/salt-jenkins-1000
  - 25af0c932f7 WIP salt-jenkins issue 1000
• PR #47753: (Ch3LL) Add stderr launchctl helper class and fix service mac tests @ 2018-05-31 18:16:57 UTC
  - 8f78e3ae6 Merge pull request #47753 from Ch3LL/service_mac
  - 185c9e9ae2 only stop service if its running
  - e15e674955 Add stderr launchctl helper class and fix service mac tests
• PR #47908: (meaksh) Align SUSE salt-master.service 'LimitNOFILES' limit with upstream Salt @ 2018-05-31 18:13:27 UTC
  - 828bf39695 Merge pull request #47908 from meaksh/2018.3-align-suse-salt-master-service
  - efe308013a Align SUSE salt-master.service 'LimitNOFILES' limit with upstream Salt
• PR #47868: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-05-30 21:20:38 UTC
  - b4bac9b41b Merge pull request #47868 from rallytime/merge-2018.3
  - e5d386e91c Update solaris core grains test
  - 267f09c1a0 Lint: Remove unused import
  - 120ee16b70 Replace old utils paths with new utils paths
  - dc32b67c03 Merge branch '2017.7' into '2018.3'
    * 4b28e510f1 Merge pull request #47853 from dwoz/py3-cloud-test
      - c2f8ae7c5 Fix for py3 ec2 cloud tests
    * 215efa6b73 Merge pull request #47847 from garethgreen-away/47833-reactor_runner_documentation
      - 03676712de Adding some addition documentation to the reactor runner indicating that the reactor system must be active prior to using it.
    * 0bf651b470 Merge pull request #47846 from Ch3LL/p_refresh_test
      - 019edad8e4 Fix flaky refresh pillar integration test
    * 799fde979d Merge pull request #47552 from twangboy/fix_46981
      - 081308a4a44 Add release notes for 2017.7.7
      - 008af0ac6b Fix unit tests
      - 87097eeb6 Add comments about how get is returning data
      - f1f1bfc5c1 Show GPO settings, raise error if trying to set gpo managed settings
    * ffc2ebc373 Merge pull request #47691 from lomeroe/solaris_product_grains
      - 6889bec6b Merge branch '2017.7' into solaris_product_grains
      - 49053bc106 lint fix
      - 6f185c9179 another lint fix
      - dbffba6876 fix tons of errors in my tests
      - 8e9355d34c Lint fix
- `b29ec75da7` Update regexes in core grains for detecting the 'product' grain on Solaris Sparc systems. Additionally, copy the 'product' grain to 'productname' to be consistent with other OSes.

- `96b7c0cc76` Merge pull request #47778 from Ch3LL/win_state_pkg
  - `e1786de6b0` Merge branch '2017.7' into win_state_pkg
  - `f8c467d3e6` Fix text editor error
  - `872e162137` Add test_pkg integration state tests to windows

- `6f934c2259` Merge pull request #47823 from Ch3LL/win_dns_test
  - `7848114d6a` Add win_dns module integration tests for windows

- `e63e04602d` Merge pull request #4738 from rallytime/bp-47810
  - `bd2b62fa66` better debug message
  - `83565c55df` Address PR feedback
  - `50bce3a2f3` make decode_linode_plan_label a private function
  - `2ba4fc4cea` fix raising when a 'GB' format invalid plan is supplied
  - `3af50d5a2` slight cleanup
  - `319fb3406` match quotation mark types properly
  - `95e020222` more consistent use of parens in logged warning
  - `f52926ca87` log a warning when the user supplied a label we could decode but was not in the proper format
  - `121303d827` reduce complexity of get_plan_id by moving decoding of the user-supplied label to its own function
  - `cf534c7314` Fix Linode plan selection

- `9e66e60617` Merge pull request #47805 from twangboy/add_sign.bat
  - `66d8b0331a` Add sign.bat script for signing packages

- `93420950d3` Merge pull request #47500 from dwoz/winuser
  - `0ca5224cbf` Merge branch '2017.7' into winuser
  - `e5948902af` Use salt utils method for this_user
  - `a056a293f1` Centralize test username lookup
  - `6a6ab69722` Get the current username on windows

- `552526f309` Merge pull request #47802 from rallytime/bp-40892
  - `bb357da084` add minion function to reload beacon #35960

- `c9ccf53b9` Merge pull request #47816 from Ch3LL/disable_windows
  - `2509d36888` Add windows to service disable ERROR check in tests

- `2cb66346cb` Merge pull request #47773 from frogunder/45011
  - `7e9b0b33a3` add win_servermanager.list_available test

- `e65dece202` Merge pull request #47807 from dwoz/winrmtests
  - `1f1cc1357a` Increase instance size for cloud tests
- be8dcd21f1 Try an even bigger timeout

- **PR #47900**: (rallytime) [2018.3] Merge forward from 2018.3.1 to 2018.3 @ 2018-05-30 18:09:41 UTC
  - 21550dhd2d Merge pull request #47900 from rallytime/merge-2018.3.1-to-2018.3
  - 2801eeb26 Merge branch '2018.3.1' into '2018.3'

- **ISSUE #30367**: (paulfanelli) salt-run orchestration via state.sls always successful; it is ignoring state return value (refs: #47843)

- **PR #47843**: (garethgreenaway) [2018.3] orchestration results False when function is False (refs: #47983) @ 2018-05-30 17:21:54 UTC
  - a0bf565741 Merge pull request #47843 from garethgreenaway/30367_orch_return_false_when_function_fails
  - 09242697b8 Merge branch '2018.3' into 30367_orch_return_false_when_function_fails

- **PR #47866**: (rallytime) Back-port #47814 to 2018.3 @ 2018-05-29 19:55:24 UTC
  - **PR #47814**: (travispaul) Bugfixes and unit tests for pkgin module (refs: #47866)
    - da676a538 Merge pull request #47866 from rallytime/bp-47814
    - d50c0ab96b Lint test_pkgin.py
    - 4d4c6a31 pkgin latest_version bugfix
    - 4ae0313797 Bugfixes and unit tests for pkgin module

- **PR #47865**: (rallytime) Back-port #47600 to 2018.3 @ 2018-05-29 19:54:44 UTC
  - **PR #47600**: (travispaul) Prevent crash on NetBSD and OpenBSD when no swap is configured. (refs: #47865)
    - d9e7e22b51 Merge pull request #47865 from rallytime/bp-47600
    - f9f464fa51 Prevent crash on NetBSD and OpenBSD when no swap is configured.

- **PR #47221**: (azelezi) Fix boto_ec2 unused parameter "network_interfaces" @ 2018-05-29 14:41:35 UTC
  - 61561a8279 Merge pull request #47221 from azelezi/fix-boto_ec2-network_interfaces
  - 03e0023eb Fix unused network_interfaces parameter
  - 1ec61ddf8 Fix unused network_interfaces parameter
  - 3e074be9c3 Fixing lint
  - 02609b6661 Adding state files for new test.
  - 377e34c689 Updating function in saltmod to ensure that the result is a failure if the function being run returns as False.

- **PR #47850**: (rallytime) Fix autodoc for new swarm module @ 2018-05-26 01:53:16 UTC
  - 61561a8279 Merge pull request #47850 from rallytime/swarm-autodoc
  - 467c8fa45c Fix autodoc for new swarm module

- **PR #47800**: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-05-26 01:17:40 UTC
  - 30b31c5db5 Merge pull request #47800 from rallytime/merge-2018.3
  - 9e3e3e9e8c Typo: test_type -> text_type
  - 8877489836 Fix bad merge caught by test in zpool state
  - c328450be2 Update old utils paths to new paths
- 4abfd26e86 Merge branch ’2017.7’ into ’2018.3’
  - 46618d2ce7 Merge pull request #47765 from meaksh/2017.7-fix-zypper-error-reading-repo
    - 4475ba19b8 Prevent zypper from parsing repo configuration from not .repo files
  - 0e87599ee3 Merge pull request #47781 from rallytime/update-linode-sizes
    - a90c1b760e Update cloud test profile and docs to use new Linode size labels
  - 3ddc56cb9b Merge pull request #47748 from rallytime/merge-2017.7
    - b75f5ae38e Merge branch ’2017.7.6’ into ’2017.7’
    - edf94c915e Merge pull request #47775 from gtmanfred/2017.7.6
    - 548f65d056 catch UnsupportedOperation with AssertionError
    - 17596f3025 Merge branch ’2017.7.6’ into ’2017.7’
    - 8c38edc75f Merge pull request #47769 from gtmanfred/2017.7.6
    - 3dfc0fa82 skip test that breaks test suite
    - e458faa031 Merge branch ’2017.7.6’ into ’2017.7’
    - 0d5b473ce2 Merge pull request #47747 from Ch3LL/rn_2017.7.6
    - d4aa83b92d Add changelog to 2017.7.6 release notes
    - 8a5b34f7d9 Merge pull request #47702 from damon-atkins/2017.7.6_fix_pkg.latest_state
    - adcc094e08 Merge branch ’2017.7.6’ into 2017.7.6_fix_pkg.latest_state
    - d610c192d9 Merge pull request #47700 from yannj-fr/2017.7.6
    - 961c1e61e fix roots modification time check
    - 2a73e905df Merge branch ’2017.7.6’ into 2017.7.6
    - 266749420f Merge pull request #47632 from gtmanfred/2017.7.6
    - 2c50c0d2f5 fix pylint
    - 4a29057b16 Fix last test for tornado
    - 550ef2e272 allow using tornado 5.0
    - 62e468448b handle new _create_stream in tornado 5.0
    - 2643c356af Merge pull request #47720 from rallytime/hp-47692-2017.7.6
    - 6e5cb36839 Default windows to m1.small for ec2-classic
    - 20d97b5244 fix roots modification time check
    - aef37d11c fix roots modification time check
    - d51662e053 Ensure targeted_pkgs always contains value for non-windows.
    - 83b4224cf8 Adjusted based on feed back.
    - 12f983ce9f Whitespace lint issues
    - 075d3d5c49 pkg.install execution module on windows ensures the software package is installed when no version is specified, it does not upgrade the software to the latest. This is per the design. pkg.latest must provide the versions to install to pkg.install
  - 0ddc864f90 Merge pull request #47779 from dwoz/winrmtests
    - d5eafe9d53 Use common timeout variable
- 7e948eb540 Increase ec2 cloud timeouts to 1000
- 17c4c8443c Merge pull request #47430 from baniobloom/vpc_association_not_found
  - 0f1d007f91 added catch for VPCAssociationNotFound
- 9c5dde1449 Merge pull request #47525 from baniobloom/duplicate_sec_group_rule
  - dcc35df489 if we are trying to add the same rule then we are already in the desired state, return true
- 536ce2fa42 Merge pull request #47772 from gtmanfred/2017.7
  - 67756a50fd lock down dependencies for kitchen-salt
- 12b330f049 Merge pull request #47749 from terminalmage/issue47717
  - cd484bef69 Fix "dnf list upgrades" parsing
- 5cd18b9e70 Merge pull request #47525 from terminalmage/issue47717
  - 57dd89e6c3 Default to ec2 classic compatible images
  - f89668920a Be explicit about winrm setting
- f45a96b1d Merge pull request #47668 from Ch3LL/win_pkg_test
  - a8981024de Add pkg.latest_version windows test
- 7b12444df8 Merge pull request #47750 from dwoz/cloudtest
  - 63b722ba21 Allow ssh_interface to default to public_ips
- 27fb42210 Merge pull request #47737 from dwoz/win_timeout
  - e88833a07d Cloud test fixup
- 1a93f060f8 Merge pull request #47729 from UtahDave/fix_get_info_doc
  - 443a2d72a2 fix cli example to match function name
- 00a13761c7 Merge pull request #47682 from terminalmage/issue47182
  - d0243e8f23 Suppress spurious lint failure
  - 3b44f11fc Add regression test for excludes issue
  - 28a7d2b81c Skip __exclude__ in find_sls_ids
- 518f7bccc6 Merge pull request #47708 from darkpixel/47696-do-not-enumerate-none
  - 54e9bf9ec9 Merge branch '2017.7' into 47696-do-not-enumerate-none
- cad062ea7 Merge pull request #47681 from rallytime/merge-2017.7
  - 6c06cb3ae3 Merge branch '2017.7.6' into '2017.7'
- fd2d45d9c2 Merge pull request #47683 from Ch3LL/mac_user_test
  - 5a1b25bb9c7 Remove unnecessary setUp in states.test_user test for mac
- f323799c42 Merge pull request #47692 from dwoz/win_instance_type
  - 20b607654 Default windows to m1.small for ec2-classic
- 990ece5cd5 Merge pull request #47665 from gtmanfred/cloud
  - fd8a02decb use dictupdate to update the providers dictionary and merge lists
- a2ed8cb7f Merge pull request #47151 from zer0def/configparser-defaultsect
• a8f2ad977e Merge branch '2017.7' into configparser-defaultsect
• cca2a806c9 Made interaction with [DEFAULT] section in ConfigParser as sane as upstream permits.
  • e6fb8342ef Merge pull request #47673 from terminalmage/bp-45808
  • 45429ad62 Fix errors when attempting to cache files with long names or URLs
  • b0446aab07 Merge pull request #47670 from gtmanfred/2017.7
    • dfd5a8715f add a pytest.ini and update a dependency for kitchen
  • 0d06da944 Merge pull request #47626 from gtmanfred/2017.7
    • 418364a533 make dev_python27.txt have the same message as dev_python34.txt
    • d53b44d10f remove lock file
    • 493ed7f93d use the toml dict format
    • e0f7cc1447 add proxy tests decorator to pytest conftest
    • 0a621dd0ec add Pipfile for managing dependencies in salt
    • f78b81db94 simplify dev and base.txt to single files
  • a07a8906a0 Merge pull request #47578 from Ch3LL/mac_service_disabled
    • 6032a015f55 change disable check for upstart service on ubuntu14
    • 33b44fbc5b Change service assertion check for systemd platforms
    • 14896f9743 change codeauthor and class name
    • 502c5bdff5 Ensure mac_service.disabled is correctly querying services

95d4488f01 Merge branch '2017.7.6' into 47696-do-not-enumerate-none
16c2153385 Merge pull request #47667 from Ch3LL/mac_user_enable
ba40d3d1a1 Update test_mac_user_enable_auto_login to test both py2 and py3
a4921e86c9 Merge pull request #47645 from Ch3LL/py3_rm_pip
225d90adec query the pip path for test test_issue_2087_missing_pip
e441733ac1 Merge pull request #47646 from rallytime/bp-47601-and-47643
9e1d1a5ef8 Fix typo
4e94609136 Remove unwanted file
0109249c78 use ignore-undefined-variable
37caeb7f4 Ignore pylint WindowsError
c1135d90c7 Better doc string
e53d6b9ed9 Skip tests when we can not use runas
041e4c6d8db Wrap properties loop with a check for None. Closes GH-47696

• PR #47581: (twangboy) Add get_encoding salt util @ 2018-05-25 20:40:07 UTC
  – da9eaa1825 Merge pull request #47581 from twangboy/fix_47274
  – ff6600f25e Merge branch '2018.3' into fix_47274
- 6eff2f847b Add suggested changes
- e27e9fd1e7 Fix tests on Py3
- f398cbddda Use os.linesep.join instead of textwrap.dedent
- 771392e299 Fix unit tests, add newline=" to io.open
- c0f735dde3 Remove comment
- 6d877bb48b Add comment
- 9f369d3f22 Remove to_encoding, create get_encoding
- 68be0f9ed2 Add is_encoding salt util

- **ISSUE #47694**: (thuhak) utils/boto and utils/boto3 load error (refs: #47726)

- **PR #47726**: (gtmanfred) rename boto to botomod @ 2018-05-25 20:37:37 UTC
  - b860d95b2c Merge pull request #47726 from gtmanfred/2018.3
  - 43997a466e fix tests
  - 59180e09a8 switch all salt.utils.boto* calls to __utils__ calls
  - 7e30f459c9 rename boto to botomod

- **ISSUE #47701**: (babs) elasticsearch.index_template_present state with check_definition: True fails. (refs: #47703)

- **PR #47803**: (rallytime) Back-port #47703 to 2018.3 @ 2018-05-23 20:12:30 UTC
  - PR #47703: (babs) Fix elasticsearch.index_template_present with check_definition (refs: #47803)
  - 2a270162d0 Merge pull request #47803 from rallytime/bp-47703
  - 8fce0c562d Fix elasticsearch with check_definition

- **PR #47804**: (rallytime) Back-port #47761 to 2018.3 @ 2018-05-23 20:11:55 UTC
  - PR #47761: (zerthimon) Fix userdata in openstack instances (refs: #47804)
  - 780043e6fd Merge pull request #47804 from rallytime/bp-47761
  - b7bc306333 Fix userdata in openstack instances

- **PR #47776**: (garethgreenaway) [2018.3] Fixes to failing _before_connect tests @ 2018-05-23 15:10:35 UTC
  - 1efe891ec4 Merge pull request #47776 from garethgreenaway/970_two_minion_unit_tests_failing
  - a5011b49af Merge branch '2018.3' into 970_two_minion_unit_tests_failing

- **PR #47783**: (rallytime) [2018.3] Merge forward from 2018.3.1 to 2018.3 @ 2018-05-23 14:51:56 UTC
  - 446ca67883 Merge pull request #47783 from rallytime/merge-2018.3
  - 1adb8ea2af Merge branch '2018.3.1' into '2018.3'

- **PR #47149**: (meaksh) [2018.3] Strip trailing commas on Linux user’s GECOS fields @ 2018-05-22 21:18:49 UTC
  - f86a6a85d8 Merge pull request #47149 from meaksh/2018.3-remove-trailing-commas-on-linux-user-gecos-fields
  - 60ec33230d Merge branch '2018.3' into 2018.3-remove-trailing-commas-on-linux-user-gecos-fields

- **ISSUE #46938**: (racooper) Beacons documentation update for 2018.3 (refs: #47740)
• **PR #47740**: (garethgreenaway) [2018.3] Updating Beacon topic to include list based configuration for Beacons @ 2018-05-21 13:58:01 UTC
  - 19f4137b63 Merge pull request #47740 from garethgreenaway/46938 Beacons_documentation
  - 5d23ef4dd8 Updating Beacon topic to include list based configuration for Beacons

• **PR #47710**: (terminalmage) salt.loader: add error logging when whitelist lookup fails @ 2018-05-18 16:56:18 UTC
  - 22807ac756 Merge pull request #47710 from terminalmage/fix-loader-whitelist
  - 6192391b7b Add additional missing modules to whitelist
  - 7192c38f66 Change key -> function to make log message more clear
  - 91f9d38fd Fix loader whitelists in unit tests
  - d4f2662e5b Add error logging when whitelist lookup fails

• **PR #47680**: (rallytime) [2018.3] Merge forward from 2018.3.1 to 2018.3 @ 2018-05-17 21:30:27 UTC
  - b91c0f5647 Merge pull request #47680 from rallytime/merge-2018.3
  - 9b1773a763 Merge branch '2018.3.1' into '2018.3'

• **PR #47545**: (dmurphy18) Fix non-root build and signing for rpm packages @ 2018-05-17 21:20:10 UTC
  - dbf12f9be2 Merge pull request #47545 from dmurphy18/fix_nonroot_build
  - 220f887fa6 Fixed review comment, changed file.chown to file.makedirs_perms
  - b15a1652b5 Changed version added from 2018.3.1 to 2018.3.2, to reflect when change should be accepted
  - 90eb03e375 Additional error checking and minor cleanup
  - 40d77e03d2 Correct building rpms with non-root user

• **ISSUE #47546**: (ender8282) archive.extracted fails when archive includes files with non-ascii names with 2018.3.0 (refs: #48015, #47572)

• **PR #47572**: (garethgreenaway) [2018.3] archive module, filenames with Unicode characters @ 2018-05-17 20:41:11 UTC
  - 69056e5b67 Merge pull request #47572 from garethgreenaway/47546 Archive_non_ascii_filenames
  - 5e97b8b44a Updating with requested changes.
  - cc1aa75a2f only convert to bytes when using Python2
  - 0fe32f4066 Updating integration/modules/test_archive to include filenames with unicode characters.
  - 5a9cadd125 Accounting for when files in an archive contain non-ascii characters

• **PR #47661**: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-05-16 15:53:36 UTC
  - cb04d9c37e Merge pull request #47661 from rallytime/merge-2018.3

**PR #47640: (rallytime) [2018.3] Merge forward from 2018.3.1 to 2018.3 @ 2018-05-14 17:59:06 UTC**
- cc33da88f3 Merge pull request #47640 from rallytime/merge-2018.3
- 2827c56399 Merge branch '2018.3.1' into '2018.3'
  * f1680f1d9b Do make comparisons in a single line
  * 7dea45c12 Add unit test for new method 'user.chother'
  * 694882632c Add 'other' attribute to GECOS fields to avoid inconsistencies with chfn
  * 6c089c9de1 Fix unsupported chars checking on GECOS fields
  * d5c9ca0fbc Add unit tests for GECOS fields
  * ed940c4f58 Strip trailing commas on Linux user GECOS fields

**PR #47589: (Ch3LL) Remove duplicate file id in watch_any doc example @ 2018-05-10 22:06:00 UTC**
- 4ec63dd041 Merge pull request #47589 from Ch3LL/watch_any_doc
- 8cb97a48f5 Add additional state to watch_any doc example
- f723a3bbf Remove duplicate file id in watch_any doc example

**PR #47564: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-05-10 19:13:36 UTC**
- 9836a7e62b Merge pull request #47564 from rallytime/merge-2018.3
- 295e302f8c Merge branch '2017.7' into '2018.3'
- 291d3d3bd8 Merge pull request #47540 from terminalmage/cmdmod-home-fix
  * e4b277f82e Fix corner case where runas user’s HOME env value is incorrect
- 49af577b3e Merge pull request #47547 from terminalmage/gitfs-tutorial
  * 806ff298a Add masterless mode docs to gitfs tutorial
- 476ba053d1 Merge pull request #47538 from terminalmage/pip-docs
  * 98e88f6ba4 Fix/clarify some of the pip module documentation
- 7cc8d9430a Merge pull request #47524 from dwoz/whitelistlines
  * 2605ff8712 Gracefully handle blank lines in whitelist.txt
- f1a5b13072 Merge pull request #47527 from dwoz/test_file_name
  * 4aa7ca571 Update doc string
  * b3289e5a1c Fix test file name
- e4c63dd041 Merge pull request #47408 from Ch3LL/skip_diskusage
  * 068da8ad7d Merge branch '2017.7' into skip_diskusage
  * 1a7ff4e0d return error if diskusage not available
  * 10bd63a976 Skip status.diskusage integration tests on macos
- 2f50f7bc8 Merge pull request #47480 from baniobloom/ConflictingDomainExists
  * d2ed7d6fa added handling for the aws error ConflictingDomainExists
- 7f53be6e92 Merge pull request #47444 from terminalmage/render_state-spurious-error
28.2.7 Salt 2018.3.4 Release Notes

Version 2018.3.4 is a bugfix release for 2018.3.0.
State Changes

- The `host.present` state can now remove the specified hostname from IPs not specified in the state. This can be done by setting the newly-added `clean` argument to `True`.

  - 06854cf Merge pull request #51147 from Ch3LL/merge-2018.3
  - d39d8b7 Merge branch '2018.3' into merge-2018.3

- ISSUE #51160: (amendlik) Minion crashes with long hostname under Python 3 (refs: #51173, #51161)
- PR #51161: (amendlik) Ignore exceptions when generating the minion ID (refs: #51173) @ 2019-01-14 22:47:54 UTC
  - b79c09e Merge pull request #51161 from amendlik/long-hostname
- 6fcc4ad Merge branch '2018.3' into long-hostname

- ISSUE #51067: (rkrieger) KeyError u'manufacturer' causes salt-minion crash on start with OpenBSD arm64 system (refs: #51159)

- ISSUE #3: (thatchb45) libvirt module (refs: #51159)

- PR #51159: (rkrieger) Prevent crash by testing for 'manufacturer' in osdata on OpenBSD @ 2019-01-14 18:08:22 UTC
  - 1424734 Merge pull request #51159 from rkrieger/fix-issue-51067
  - 1440ccf Prevent crash by testing for 'manufacturer' in osdata on OpenBSD
  - 1a4e307 Ignore exceptions when generating the minion ID

- PR #51146: (terminalmage) Fix invalid assignment in vsphere module @ 2019-01-12 21:44:33 UTC
  - 5e37326 Merge pull request #51146 from terminalmage/fix-vsphere-tuple-issue
  - 5d60022 Fix invalid assignment in vsphere module

- PR #51154: (twangboy) Add support for Advanced Audit policies @ 2019-01-12 21:43:27 UTC
  - fad8621 Merge pull request #51154 from twangboy/auditpol
  - 9064376 Add support for Advanced Audit policies

- PR #51151: (Ch3LL) Backport #51061 to 2018.3 @ 2019-01-12 03:18:44 UTC
  - PR #51061: (garethgreenaway) [fluorine] fix to salt.utils.vt.Terminal (refs: #51151)
  - f7a100c Merge pull request #51151 from Ch3LL/bp_51061
  - ffda27 When writing output to stdout we want to ensure that the data is a string not bytes. Under py2 the salt.utils.data.encode function results in a string but under py3 the result is a bytestring. Swapping out salt.utils.data.encode for salt.utils.stringutils.to_str.

- PR #51150: (Ch3LL) Back-port #49508 to 2018.3 @ 2019-01-12 03:18:19 UTC
  - PR #49508: (bergmannf) Fix X509 remote signing on python3 (refs: #51150)
  - 3a50a57 Merge pull request #51150 from Ch3LL/bp-49508
  - 7ae53ad Do not silently ignore errors.
  - 651c551 Use to_str salt.utils when writing to a file.

- ISSUE #50433: (zerthimon) Wildcard grant fails in mysql_grants.present in mysql 8.x (refs: #51152)

- PR #51152: (garethgreenaway) [2018.3] Fixes to mysql module to handle ALL PRIVILEGES grant @ 2019-01-12 03:17:15 UTC
  - 8bb589d Merge pull request #51152 from garethgreenaway/50433_handle_grants_better
  - f7caad4 Fixing lint
  - e8c80f Adding some tests to ensure "ALL PRIVILEGES" is handled correctly in 8.0 and 5.6
  - b4bf69f Add additional grants. Adding logic to handle when ALL or ALL PRIVILEGES is passed for the grant, including some logic to handle the fact that the grants are split when show grants is run for a particular user.
    - 74edfd9 Fix pylint
    - 81a3d47 Merge branch '2017.7' into '2018.3'
**ISSUE #50849**: (SuperShoot) MySQL version needs to be decoded (refs: #51133)

**PR #51133**: (SuperShoot) Fixes mysql server version comparison. @ 2019-01-10 16:45:38 UTC
- da1ebb Merge pull request #51133 from SuperShoot/issue-#50849
- ec14e13 Fixes mysql server version comparison.

**PR #50878**: (max-arnold) Fix profile outputter docs @ 2019-01-08 18:32:40 UTC
- d4321d Merge pull request #50878 from max-arnold/output-docs
- d4321d Merge pull request #50878 from max-arnold/output-docs
- d7403da Fix profile outputter docs

**PR #51076**: (OrangeDog) Typos in index_template_present documentation @ 2019-01-08 18:25:20 UTC
- ee8750a Merge pull request #51076 from OrangeDog/patch-1
- 56e8e4f Revert add -> check
- 4d7ebe7 Typos in index_template_present documentation

**PR #51081**: (garethgreenaway) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2019-01-07 20:34:16 UTC
- da8abf4 Merge pull request #51081 from garethgreenaway/merge-2018.3
- 027804a Merge branch ’2018.3’ into merge-2018.3

**ISSUE #50966**: (klafkoff) 2018.3.3 missing a patch to salt/modules/nxos.py (refs: #51080)

**PR #51080**: (garethgreenaway) [2018.3] Fix to nxos module @ 2019-01-07 18:07:25 UTC
- 335088b Merge pull request #51080 from garethgreenaway/50966_nxos_ensure_kwars_list
- 20a66bf Merge branch ’2018.3’ into 50966_nxos_ensure_kwars_list
- 629de25 Ensure kwars is a list before we attempt to loop through. Similar fix to https://github.com/rallytime/salt/commit/430c462f34eb4eedf2384e06fbee8dc19b8026f6 in the proxy module.
  * a20791b Merge branch ’2018.3’ into merge-2018.3

**PR #51079**: (terminalmage) Fix shadow.set_date/shadow.set_expire on F28 @ 2019-01-07 16:28:36 UTC
- c47b646 Merge pull request #51079 from terminalmage/salt-jenkins-1238
- ccc5c15 Fix shadow.set_date/shadow.set_expire on F28

**ISSUE #47043**: (xBytez) lsattr slowing down archive.extracted (refs: #51044)

**PR #51044**: (terminalmage) archive.extracted: Don’t run lsattr when enforcing user/group ownership @ 2019-01-03 19:26:03 UTC
- aeeb047 Merge pull request #51044 from terminalmage/issue47043
- 787b79a archive.extracted: Don’t run lsattr when enforcing user/group ownership

**ISSUE #50964**: (gtmanfred) Add a long description to setup.py for the new pypi.org (refs: #51031)

**PR #51034**: (garethgreenaway) Back-port PR #51031 to 2018.3 @ 2019-01-03 15:42:22 UTC
- PR #51031: (waynew) Set long_description (refs: #51034)
- 04fdae5 Merge pull request #51034 from garethgreenaway/bp-51031
- cd310c2 Set long_description

- **ISSUE #50634:** (marek-obuchowicz) Debian pkg.managed gpg/tty issue (refs: #50972)

- **PR #50972:** (pirogoeth) Use gpg's `--batch` in apt-key adv during repo key add @ 2019-01-03 02:34:13 UTC
  - 4685e0e Merge pull request #50972 from pirogoeth/sjohn/2018.3-apt-key-batch
  - cd3d755 Merge branch '2018.3' into sjohn/2018.3-apt-key-batch

- **PR #51028:** (whytetwol) AIX lsattr fix for file module. @ 2019-01-03 01:52:33 UTC
  - 44bc862 Merge pull request #51028 from whytetwol/aix_lsattr_fix
  - 1b733c6 Set lsattr functions to return None if `salt.utils.platform.is_aix` returns true.
  - 7410008 Merge branch '2018.3' into sjohn/2018.3-apt-key-batch

- **PR #51018:** (garethgreenaway) [fluorine] Merge forward from 2017.7 to 2018.3 @ 2019-01-01 23:11:02 UTC
  - b4774a8 Merge pull request #51018 from garethgreenaway/merge-2018.3
    - 773bf31 Use gpg's `--batch` in apt-key adv during repo key add
      - 9386aab Merge branch '2017.7' into merge-2018.3
      - 998feca Merge pull request #51030 from terminalmage/issue38502
        - 6dbd81f Add unit test to ensure we don’t diff bare repos
    - 12f7583 Merge branch '2017.7' into merge-2018.3

      - 43c9e7 Add documentation to master config docs for `job_cache_store_endtime`
      - 887cd07 Add some salt-api options to the master config docs
      - 0d49746 Fix some formatting in master config docs
    - 409594b Merge pull request #50991 from twangboy/requests_2017.7
      - 32b9d2a Update requests for osx
        - 413dc72 Merge branch '2017.7' of https://github.com/saltstack/salt into requests_2017.7
    - e053074 Merge pull request #50983 from garethgreenaway/bp-50885
      - 09a86e6 fix a del in cloud vmware that crash when the key isn’t there
      - 4196690 Update requests to 2.21.0
        - 23f78b0 Upgrade requests to 2.20.1

- **PR #50990:** (twangboy) Requests 2018.3 @ 2018-12-31 20:19:01 UTC
  - c53723a Merge pull request #50990 from twangboy/requests_2018.3
    - e8b923a Update requests for osx
      - 413dc72 Merge branch '2017.7' of https://github.com/saltstack/salt into requests_2017.7
  - e053074 Merge pull request #50983 from garethgreenaway/bp-50885
    - 09a86e6 fix a del in cloud vmware that crash when the key isn’t there
      - 4196690 Update requests to 2.21.0
        - 23f78b0 Upgrade requests to 2.20.1

- **PR #51004:** (twangboy) Add tests for the win_wusa state and module @ 2018-12-31 20:03:30 UTC
  - cec1d08 Merge pull request #51004 from twangboy/win_wusa
- 0e92528 Merge branch '2018.3' into win_wusa
- c0d2495 Fix lint, add test docs
- 1750270 Add state tests for win_wusa
- 6285b64 Update win_wusa and add tests

- **PR #51014**: (madrisan) ssh module: missing space in error message @ 2018-12-31 19:59:19 UTC
  - 3e0515b Merge pull request #51014 from madrisan/patch-1
  - ab980fb ssh module: missing space in error message

- **PR #50883**: (terminalmage) Backport #49622 to 2018.3 branch @ 2018-12-31 19:58:11 UTC
  - **PR #49622**: (angeloudy) fix command line options (refs: #50883)
  - 5826db4 Merge pull request #50883 from terminalmage/bp-49622
  - c93dbfa Update archive.py
  - 925a9c9 Update archive.py
  - ed26e3f fix command line options

- **PR #50945**: (garethgreenaway) [2018.3] Merge forward from 2017.7 to 2018.8 @ 2018-12-30 00:05:47 UTC
  - fd9711b Merge pull request #50945 from garethgreenaway/merge-2017.7
  - 43b3fa4 Merge branch '2018.3' into merge-2017.7

- **ISSUE #50854**: (Ch3LL) [fluorine] windows stops when cannot connect to master (refs: #50855)

- **PR #51006**: (dwoz) Let minions try to connect to master indefinitely @ 2018-12-28 21:10:39 UTC
  - **PR #50855**: (dwoz) Let minions try to connect to master indefinitely (refs: #51006)
  - b8615e1 Merge pull request #51006 from dwoz/backport_50855
  - 5563631 Let minions try to connect to master indefinitely

- **ISSUE #50989**: (mpx8701) SLS error (An exception occurred in this state: Traceback) (refs: #51005)

- **PR #51005**: (garethgreenaway) [2018.3] Fixes to junos state module @ 2018-12-28 20:51:31 UTC
  - cefed69 Merge pull request #51005 from garethgreenaway/50989_fixing_junos_state_arguments
  - d4ac180 Fixing the arguments accepted by cli function in the junos state module which are passed along to the cli function in junos module, so they align.
  - 3cfc8ce Merge branch '2018.3' into merge-2017.7

- **PR #50982**: (twangboy) Fix issue with LGPO when returning empty dict (2018.3) @ 2018-12-26 19:58:12 UTC
  - daa591b Merge pull request #50982 from twangboy/fix_lgpo_2018.3
  - d942934 Get rid of requests import (CaseInsensitiveDict)
    - 6170fa5 Merge branch '2018.3' into merge-2017.7

- **ISSUE #46886**: (bbh-kmd) Unable to get salt-minion to call salt-call with alternate configuration (refs: #50959)

- **PR #50984**: (garethgreenaway) Back-port PR #50959 to 2018.3 @ 2018-12-26 19:29:54 UTC
  - **PR #50959**: (bbh-kmd) #46886: Use correct path to config_dir when running salt from alternate placement. (refs: #50984)
  - 110bc66 Merge pull request #50984 from garethgreenaway/bp-50959
  - 20fa5c9 Update sudo.py
• **PR #50958**: (bdrung) Fix twilio version checking @ 2018-12-25 10:46:15 UTC
  - 8fc89a0 Merge pull request #50958 from bdrung/fix-twilio
  - df8d7b9 Fix twilio version checking
    * d89e9b5 Merge branch '2018.3' into merge-2017.7
• **ISSUE #50947**: (cachedout) Log full of IPv6 warnings (refs: #50962)
• **PR #50962**: (terminalmage) Remove redundant overrides for ip_address/ip_interface @ 2018-12-21 22:04:34 UTC
  - bb87822 Merge pull request #50962 from terminalmage/ipv6-warnings
  - 773b983 Merge branch '2018.3' into ipv6-warnings
  - 68b1254 Remove redundant overrides for ip_address/ip_interface
    * 1ea01e7 Updating validate_tgt to ensure tests pass.
    * cdc7825 yet another lint fix.
    * f44a87e One last lint fix.
    * 65b363b Fixing various lint errors.
    * 6a65bf9 Merge branch '2017.7' into merge-2017.7
    * 747dd69 Merge pull request #50876 from terminalmage/issue50153
      * 676a12b Fix compound matching in eauth
    * 07fa64 Merge pull request #50909 from damon-atkins/jenkins_pylint
      * da1faced change params.CHANGE_BRANCH to env.CHANGE_BRANCH
    * e7f0ab6 Merge pull request #50873 from Ch3LL/bp-50740
      * 5fd9ed9 Merge branch '2017.7' into bp-50740
    * 2f77b2d Merge pull request #50869 from garethgreenaway/50848_mysql_exception_test
      * 376daf Merge branch '2017.7' into 50848_mysql_exception_test
        * af3e145 Cleanup.
        * b85c15bf Adding a test to ensure exception handling is correct.
        * 4242e6d Merge branch '2017.7' into bp-50740
    * a5caab7 Merge pull request #50872 from Ch3LL/bp-50864
      * fc9e64b fix typo in file.managed documentation
      * df73f86 Catch UnicodeDecodeErrors in id verification
• **PR #50937**: (Ch3LL) Fix external_pillars documentation @ 2018-12-20 19:15:20 UTC
  - 49f2a35 Merge pull request #50937 from Ch3LL/pillar_doc
  - 1ff0189 Fix external_pillars documentation
• **ISSUE #50919**: (dpkirchner) state.apply test documentation unclear (refs: #50940)
• **PR #50940**: (terminalmage) Fix confusing state module documentation @ 2018-12-20 18:29:26 UTC
  - 4213527 Merge pull request #50940 from terminalmage/issue50919
  - 3318927 Fix confusing state module documentation
• PR #50929: (twangboy) Fix `unit.utils.test_lgpo_netsh` on Windows for Py3 (2018.3) @ 2018-12-20 17:50:37 UTC
  - 421e4f4 Merge pull request #50929 from twangboy/fix_test_lgpo_netsh_2018.3
  - 01f9beb Fix failing lgpo netsh tests

• PR #50917: (dwoz) Cherry pick test fixes from fluorine @ 2018-12-19 17:56:19 UTC
  - b08b7e1 Merge pull request #50917 from dwoz/test_fixes
  - 16d10fb Fix linter warnings
  - b22f827 Increase and standardize ShellCase timeouts
  - a5c8c18 Do not pass unicode in environment

• PR #50913: (bdrung) Fix documentation build @ 2018-12-19 16:03:55 UTC
  - 59df6b4 Merge pull request #50913 from bdrung/fix-doc-build
  - ecb452 doc: Introduce MOCK_MODULES_MAPPING
  - cf64824 doc: Move mock_decorator_with_params up
  - 08ef669 doc: Address pylint issues in conf.py
  - 67a3e37 doc: Mark preamble variable as raw string
  - b1e6080 doc: Fix reference to salt executors
  - e48b324 doc: Replace xa0 (non-breaking space) by spaces
  - b973e7a doc: Fix iterating over the Mock object in Python 3
  - bb29948 doc: Do not mock non-existing __mro_entries__ attribute
  - e6cf3c4 Do not mock json when building the documentation
  - 4acaf45 Fix sphynx error about tornado.version_info

• ISSUE #50892: (cruscio) archive.extracted source_hash is case sensitive (refs: #50906)

• PR #50906: (garethgreenaway) [2018.3] Ensure source_hash returned from get_source_sum is lowercase. @ 2018-12-19 04:22:23 UTC
  - f4e6b88 Merge pull request #50906 from garethgreenaway/50892archive_extracted_source_hash_case_sensitive
  - bcf8f06 fixing lint
  - 543ec7b Ensure source_hash returned from get_source_sum is lowercase.

• PR #50867: (Ch3LL) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-12-14 21:32:23 UTC
  - b95b4ff Merge pull request #50867 from Ch3LL/merge-2018.3
  - 512293f Remove dunder_dictionaries.rst. Was added to modules/developing.rst
  - 89b4e09 Merge branch `2017.7` into `2018.3`
  - 858cfac Merge pull request #50863 from 5uper5hoot/fix-issue-50848
    * c90d201 Unpack exception args in python3 compatible way.
  - e28b2ba Merge pull request #50752 from kstreee/fixed-memory-leak
    * 98cc63a Fixes a memory leak un-cleared stream connections.
  - 45f7602 Merge pull request #50837 from Ch3LL/pyren_doc
    * a873019 Clarify py render docs when data context is available
- fdff675 Merge pull request #50844 from twangboy/fix_grains
  * 473f4d7 Fix some unrelated lint
  * fd1a072 Fix grains for future windows releases
- 32dfaba Merge pull request #50816 from dubb-b/2017.7
  * dc7ff48 Pinning bootstrap to the tagged version of salt.
- b1e5f3f Merge pull request #50709 from mattLLVW/service_unmask
  * b199255 Merge branch ’2017.7’ into service_unmask
  * 38add1 salt style guideline
  * 823c4ad Implement unmask in states.services
  * 91a6bf5 Functional unmask, must add tests
- e4e9563 Merge pull request #50633 from astronouth7303/loader-docs
  * 03e3168 whitelist_modules is linked via enable_whitelist_modules for some reason? idk
  * 5ca1f8e Typos
  * 7cb1a87 Add a quick index of loader-related settings
  * 318ca48 Make a note to not import modules
  * 6294658 Merge remote-tracking branch ’origin/2017.7’ into loader-docs
  * 678958e Editing
  * 9d59629 Merge branch ’2017.7’ into loader-docs
  * 374d0e9 Finish the last sections
  * 98da110 Migrate Dynamic Module Distribution to Modular Systems.
  * 1bd349d Add more links and write some system summaries
  * bd3796a Update TOC
  * 3a9abf1b Merge dunders into developing, expand to cover all dunders.
  * d06739a Add short writeups for a bunch of systems.
  * 705e7e4 Add a bunch of cross linking
  * 40f9b16 Add missing module type sections
  * 172d8c2 Refactor headings
  * 53154a0 Oops, missed that
  * 0dcd341 Possible horrific use of toctrees? maybe
  * bed3509 Refactor, add a TOC
  * f647c1d Fill in some missing modules
  * 9d4b596 Merge branch ’2017.7’ into loader-docs
  * 26468df Add missing blank line
  * 205f8e9 Some more revising
  * d4a8f7e Remove some code from some links
  * 65e4199 I feel like it should be up there
Salt Documentation, Release 2019.2.0

- d44f5ce Rephrase footnote
- 125e46e Add section on how modules get loaded, including giant table of names
- 5bfc6c6 Update reference to modules/index
- 4b096c1 Move all the module-development documentation into a single folder
  - d6cb9b2 Merge pull request #50750 from bewing/pepa12
    - 9931a41 Fix last key detection in pepa key_value_to_tree
  - cb85d5d Merge pull request #50733 from marmarek/patch-3
    - 1011421 Report salt-call exit code from ssh_py_shim.py
  - b086ff3 Merge pull request #50756 from GwiYeong/local-client-fix
    - c488092 fix local client missing minion return

- ISSUE #50850: (akrus) key_cache: sched prints error messages in logs (refs: #50859)
- PR #50859: (garethgreenaway) [2018.3] Fixes for key_cache and python3 @ 2018-12-13 23:57:07 UTC
  - 216fa14 Merge pull request #50859 from garethgreenaway/50850_python_key_cache_file_binary
  - ebc9a01 When reading and writing the key cache file, when using Python3, ensuring the file is read &
    written in binary mode.
- PR #50828: (twangboy) Fix issues with lgpo state and util @ 2018-12-13 16:37:33 UTC
  - 6b45aad Merge pull request #50828 from twangboy/fix_lgpo
  - 05b8b95 Merge branch '2018.3' into fix_lgpo
- PR #50843: (bdrung) Fix RemoveCapacityFromDiskgroupTestCase require pyvmomi @ 2018-12-12 20:36:32 UTC
  - 6e0a59d Merge pull request #50843 from bdrung/fix-tests
  - 0d00ae4 Fix RemoveCapacityFromDiskgroupTestCase require pyvmomi
- ISSUE #50829: (ghost) process.absent UnicodeDecodeError (refs: #50839)
- PR #50839: (terminalmage) Fix UnicodeDecodeError in ps module @ 2018-12-12 19:59:12 UTC
  - 14d7d1d Merge pull request #50839 from terminalmage/issue50829
  - 3a3d9b7 Ensure that unicode types returned from compatibility funcns
  - 1a00abc Add unit test for _get_proc_cmdline
  - 9ea2ed Remove extraneous comments
- ISSUE saltstack/salt#49393: (Poil) file.directory recurse not always changing perms (refs: #50653)
- PR #50653: (lexvella) Check file_mode in file.directory and _check_directory @ 2018-12-12 16:30:52 UTC
  - 264a042 Merge pull request #50653 from lexvella/2018.3
  - 4e9386 Merge branch '2018.3' into 2018.3
  - 4e9386 Merge branch '2018.3' into 2018.3
  - 79f6b42 Check file_mode in file.directory and _check_directory
    - 1233e2b Fix some lint
    - 56c6e55 Fix issues with lgpo state and util
- ISSUE #45026: (angeloudy) bytes error in mysql module (refs: #50823)
• **PR #50823**: (terminalmage) salt.modules.mysql: Decode fetch results before making string comparisons @ 2018-12-11 21:04:41 UTC
  - a8ad17a Merge pull request #50823 from terminalmage/issue45026
  - ec8e116 Decode fetch results before making string comparisons
• **PR #50817**: (dubb-b) Adding git 'v' to the bootstrap options @ 2018-12-11 17:28:10 UTC
  - e31e731 Merge pull request #50817 from dubb-b/2018.3
  - 48fc01f Adding git 'v' to the bootstrap options
• **PR #50780**: (twangboy) Add netsh mechanism in the LGPO module @ 2018-12-10 22:09:20 UTC
  - 9b6b39c Merge pull request #50780 from twangboy/lgpo_netsh
  - 5eea728 Fix some lint
  - f077783 Add some tests
  - 2dde12a Fix one more lint item
  - c55b7b4 Fix some lint
  - 1247598 Add more policies
  - b2b9795 Fix overly long lines
  - f18d1aa Add additional policies that use netsh
  - cb50648 Add versionadded tags
  - 00cbf26 Add the netsh mechanism to the lgpo module
• **PR #50783**: (sathieu) gitfs/git_pillar: Fix UnicodeDecodeError while cleaning stale refs @ 2018-12-10 20:34:53 UTC
  - 0351296 Merge pull request #50783 from sathieu/gitfs_stalerefs_unicode
  - ef160a6 gitfs/git_pillar: Fix UnicodeDecodeError while cleaning stale refs
• **ISSUE #45867**: (Nick2253) Icinga2 Module uses incorrect paths (refs: #50615)
• **PR #50765**: (ClaudiuPID) Fix icinga2 cert path @ 2018-12-10 18:10:24 UTC
  - **PR #50615**: (ClaudiuPID) Fixes icinga2 certs path for newer versions 2.8+ (refs: #50765)
  - deadf9c Merge pull request #50615 from ClaudiuPID/fix-icinga2-cert-path
  - ce1842e Merge branch '2018.3' into fix-icinga2-cert-path
  - 31878d5 Pylint fixes
  - 47bba1 Migrated to cmd.run_all and tested on working srv
  - a1ddec Fixes icinga2 certs path for newer versions 2.8+
• **PR #50692**: (terminalmage) Update a couple test modules to use with_tempdir/with_tempfile decorators @ 2018-12-10 17:24:02 UTC
  - 9f8289b Merge pull request #50692 from terminalmage/update-tests
  - 36a4a1a Merge branch '2018.3' into update-tests
  - be14517 Make x509 tests use tempfiles instead of hard-coding them
  - a394cd7 Update file integration tests to use decorator for tempdirs
• ISSUE #32245: (tkwilliams) git_pillar should permit automatic mapping of environment to branch a-la gitfs (refs: #50768)

• PR #50768: (sathieu) git_pillar: Add support for all_saltenvs parameter @ 2018-12-10 16:39:37 UTC
  – 3a71567 Merge pull request #50768 from sathieu/git_pillar_all_saltenvs
  – e971412 git_pillar: Add support for all_saltenvs parameter

• ISSUE #48801: (dstoliker) salt.states.user.present - mindays, warndays, and inactdays won’t return to salt’s default values (refs: #50796)

• PR #50796: (dwoz) Fix #48801 min, max, inact, and warn changes @ 2018-12-10 16:30:14 UTC
  – 12a8447 Merge pull request #50796 from dwoz/issue48801
  – 6b95223 fix linter errors
  – 87a04df Fix #48801 min, max, inact, and warn changes

• ISSUE #46388: (dynek) IPv4 & v6 network configuration on Debian (refs: #49355)

• ISSUE #40262: (pjediny) Salt enforces configuration from /etc/network/interfaces.d/* to /etc/network/interface (refs: #49355)

• ISSUE #38672: (valentin2105) IPv6 Network states is incomplete (refs: #49355)

• PR #50804: (Ch3LL) Back-port #49355 to 2018.3 @ 2018-12-10 16:21:31 UTC
  – PR #49355: (MTecknology) Improve management of interfaces in debian-based distributions (refs: #50804)
  – PR #46980: (MTecknology) Fix broken rendering debian_eth.jinja. (refs: #49355)
  – b266e8b Merge pull request #50804 from Ch3LL/bp-49355
  – d34eade Use a temp file instead of /etc/network/interfaces for unit tests.
  – 622c354 Support reading multiple addresses from interface files.
  – 15c34fe Support unicode in space-delimited list; fixes unit tests in py2.
  – 0b59561 Added documentation about debian.interfaces.d/*. (Fixes: #40262)
  – 1b096fb Removed python lint.
  – 6e41225 Finished adding support for multiple IP addresses.
  – 4c7df5f Cleaned up documentation/examples in states.network:
  – 601f43f Added support for -ipaddrs and -ipv6ipaddrs to modules.debian_ip().
  – 638f899 Added support for loopback devices to modules.debian_ip(). (Fixes: #38672)
  – cf61c8d Added a bunch of unit tests for modules.debian_ip.build_interface().
  – b905cf6 Added support for dns_{nameservers,search} being a list or string.

• PR #50767: (dwoz) Make sure ldap passwords are honored @ 2018-12-05 22:59:17 UTC
  – dc9414c Merge pull request #50767 from dwoz/ldap_no_pass
  – 67a59f1 Fix linter errors
  – be3945a Remove crufty import
  – 91f50a4 Add more ldap auth tests for ZD-2993
  – 055a8d5 Make sure ldap passwords are honored
• ISSUE #50364: (sathieu) git_pillar mountpoint ignores the root parameter (refs: #50626)
• PR #50626: (sathieu) git_pillar: Allow root and mountpoint parameters together @ 2018-12-05 17:46:59 UTC
  – 60aad5 Merge pull request #50626 from sathieu/git_pillar_mountpoint_and_root
  – 5423c27 git_pillar: Allow root and mountpoint parameters together
• PR #50745: (bbinet) Fix grafana dashboard updating when nothing has changed @ 2018-12-04 19:26:32 UTC
  – c02387e Merge pull request #50745 from bbinet/fix-grafana-dashboard-update
  – 7019d47 Fix grafana dashboard updating when nothing has changed
• PR #50737: (garethgreenaway) [develop] Merge forward from 2017.7 to 2018.8 @ 2018-12-04 16:02:13 UTC
  – ae81498 Merge pull request #50737 from garethgreenaway/merge-2017.7
  – fde8db5 Merge branch '2017.7' into merge-2017.7
  – 246c055 Merge pull request #50718 from dwoz/run_run_timeout
    • ecd8486 Honor run_run timeout for shell tests
  – 979b3aa Merge pull request #50702 from damon-atkins/jenkins_pylint
    • 5936066 ensure archiveArtifacts are always collected. Use CHANGE_BRANCH to detect merge-forward
  – 22acaaa Merge pull request #50632 from astronouth7303/loader-exception-handler
    • 07f2815 Merge branch '2017.7' into loader-exception-handler
  – d9e7be1 Merge pull request #50670 from damon-atkins/jenkins_pylint
    • b6d1605 ci/lint corrected filenames and test condition on full lint Also fix CODEOWNER team name
      • 194801a Merge branch 'loader-exception-handler' of github.com:astronouth7303/salt into loader-exception-handler
      • da8eb0d Merge branch '2017.7' into loader-exception-handler
      • 8697744 Use single quotes per style guide
      • 07868f1 Improve logging output
      • fb05bd5 Eat an exception from an entry point instead of letting it kill the system.
• PR #50685: (Ch3LL) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-11-30 18:46:07 UTC
  – edaa9fe Merge pull request #50685 from Ch3LL/merge_2018.3
  – d46aff0 Merge branch 2017.7 into 2018.3
    • 6dc3af0 Merge pull request #50672 from garethgreenaway/49691_file_replace_search_only_return_false
      • 7e7df06 lint
      • 6b73c76 When using file.replace, with the search_only option, if the pattern does not exist
        in the file then we should return False.
    • 1236b51 Merge pull request #50659 from garethgreenaway/49954_gem_installed_less_than_greater_than_support
      • 0ec8b5c When using the gem installed state, when passing a version that includes greater
        than or less than symbols, ensure that the installed versions meets that requirement.
    • 6317f3a Merge pull request #50583 from damon-atkins/jenkins_pylint
- 2d1f51c Fix lint only changes, full lint on merge forwards - lint only changes previous diff picked up out of data files, when the branch was out of date. - full limit on merge forward to pick up changes in the lint checks between versions. - update CODEOWNERS for .ci/*

- 15bf09a Merge pull request #50605 from Oloremo/fix-supervisord-dead-state-idempotency
  - ba3f281 Merge branch '2017.7' into fix-supervisord-dead-state-idempotency
  - cf9ab84 Merge branch '2017.7' into fix-supervisord-dead-state-idempotency
  - af386a2 Fixed the supervisord.dead state idempotency

- ISSUE #50016: (abednarik) State augeas.change do not update config file (refs: #50690)

- PR #50690: (garethgreenaway) [2018.3] fixes to augeas_cfg module @ 2018-11-30 18:44:42 UTC
  - 7cb2405 Merge pull request #50690 from garethgreenaway/50016_ensure_path_is_str
  - cec7cb4 Older versions of python-augeas need the path passed to aug.match to be a string.

- ISSUE #49392: (Poil) hosts not replacing existing entry (refs: #50657)

- PR #50657: (terminalmage) Rewrite host.present state to allow for removal of entries not matching IP @ 2018-11-29 17:58:40 UTC
  - a5c7639 Merge pull request #50657 from terminalmage/issue49392
  - 2ddb587 Add release notes for new "clean" option
  - e946f9 Rename "remove" argument to "clean"
  - 7fd3bce Add remove parameter to host.present state
  - 2671a30 Add unit tests for host.present state
  - 30f1b85 Remove non-matching IPs from hosts file
  - ec297a0 Performance improvements in hosts module
  - d1c2038 Add generic ip address validation function
  - 9f54720 Add ignore ability to process_read_exception

- ISSUE #48759: (Mylgel) acme.cert: Fail to update certificate after adding aliases / missing --expand (refs: #50683)

- PR #50683: (garethgreenaway) [2018.3] Fixes to acme module when adding aliases to existing certificate @ 2018-11-29 17:46:54 UTC
  - b604785 Merge pull request #50683 from garethgreenaway/48759_adding_aliases_include_expand
  - 3940a0f When adding aliases to an existing Certbot certificate, if we see a message about expanding in the stderr returned from cmd.run_all we should rerun the cmd with --expand included.

- ISSUE #50406: (glkappe) salt-ssh can’t use Mongo returner (refs: #50664)

- PR #50664: (garethgreenaway) [2018.3] Fix to logic for configuring returners @ 2018-11-28 05:24:30 UTC
  - 15f9ae4 Merge pull request #50664 from garethgreenaway/50406_salt_ssh_returner_configuration
  - 3525411 When pulling values out of the available configuration for returners we should always default to using keys for those returners, eg. mongo.user for the username. Otherwise in certain situations, eg. when using salt-ssh we will end up with the wrong value for the user.

- PR #50652: (twangboy) Fix unit.utils.test_mac_utils on Windows @ 2018-11-27 20:45:41 UTC
  - abcf03 Merge pull request #50652 from twangboy/fix_test_mac_utils
  - c4cb729 Fix path issues with the tests
• **PR #50640**: (garethgreenaway) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-11-26 22:33:22 UTC
  - 61a824f Merge pull request #50640 from garethgreenaway/merge-2017
  - 49c98f Merge branch '2018.3’ into merge-2017

• **ISSUE #50403**: (prometheanfire) tornado 5.1.1 is not co-installable with salt on python2.7 (refs: #50639)

• **PR #50639**: (dwoz) Handle pipenv like version restrictions @ 2018-11-26 19:42:11 UTC
  - 20a2de3 Merge pull request #50639 from dwoz/pipfix
  - 9c66f53 Handle pipenv like version restrictions
    - fed78b lint
    - 45a1aa3 Merge branch '2017.7’ into merge-2017
    - b2cf134 Merge pull request #50463 from dwoz/zmqpubserv
      - a289e3c Merge branch '2017.7’ into zmqpubserv
    - 6679242 Merge pull request #50590 from garethgreenaway/bp-50333
      - 1f5a4b pkg.installed currently fails when sources is used along with hold: True. This was due to a change in #48426 that swapped out sending the pkgs variable for the desired variable instead. This caused problems with pkg.hold because desired and sources are always populated, and pkg.hold can only include one or the other. This change just includes desired in the call to pkg.hold since desired has the same value for sources.
      - 39e811b Add issue url to tests
      - c4d7a43 Add debug log when connecting
      - 4f81432 Set subscribe via sockopt for better compatibility
      - 6882209 More reliable pub server publishing

• **ISSUE #49957**: (whytwolf) salt-master scheduled items ignore maxrunning. (refs: #50130)

• **PR #50130**: (garethgreenaway) [2018.3] Fixes to schedule maxrunning on master @ 2018-11-26 18:35:35 UTC
  - 5b7ab35 Merge pull request #50130 from garethgreenaway/49957_master_schedule_ignoring_maxrunning
  - 2f6dac9 Updating test_maxrunning_master to Mock get_running_jobs.
  - abda0a4 Reverting changes to doc/conf.py.
  - 6d072fc Some additional cleanup.
  - 4bd0406 Adding integration.scheduler.test_maxrunning to ignore list.
  - 45e160d Adding integration.scheduler.test_maxrunning to filename_map.yml
  - 2201a46 Fixing lint
  - 6c0ee32 removing unused cache_jobs function from utils/master.py
  - c2ed1d4 Adding some logging when the cache files are unable to be removed.
  - 44940d6 Ensure minion tests using minion options.
  - 722be43 Fixing lint
  - 65b4421 Adding some master specific functions to utils/masters.py to determine if a Salt process is running. Updating utils/schedule.py to use the appropriate running function either from utils/master.py or utils/minion.py depending on where the scheduled job is running. Adding tests to test maxrunning in scheduled jobs for both the minion and master.
• ISSUE #50542: (doug-stratoscale) mysql.user_exists doesn’t work with Mysql 8.0.13 (refs: #50551)
• PR #50551: (garethgreenaway) [2018.3] Fixes to verify_login in mysql module @ 2018-11-26 17:44:25 UTC
  - 26759c2 Merge pull request #50551 from garethgreenaway/50542_mysql_ensure_verify_login_uses_connection_host
  - 96742aed4 Merge branch '2018.3' into 50542_mysql_ensure_verify_login_uses_connection_host
  - eb510a6 Merge branch '2018.3' into 50542_mysql_ensure_verify_login_uses_connection_host
  - 6d2309d Merge branch '2018.3' into 50542_mysql_ensure_verify_login_uses_connection_host
  - db89b27 Merge branch '2018.3' into 50542_mysql_ensure_verify_login_uses_connection_host
  - 0284323 Ensure that verify_login is using the host from the connection_args and not the host associated with the user. Adding a test to ensure user_exists when the passed host is the MySQL wildcard %.
• PR #50619: (s0undt3ch) Don’t squash tracebacks and Unicode fixes @ 2018-11-26 17:04:31 UTC
  - 14c4fd5 Merge pull request #50619 from s0undt3ch/2018.3
  - a4771d2 UNICODE!
  - 72205a5 DO! NOT! SQUASH! TRACEBACKS!
• ISSUE #50562: (soostdijck) scheduled highstate ignores blackout (refs: #50586)
• PR #50586: (garethgreenaway) [2018.3] minion_blackout for scheduled jobs @ 2018-11-23 11:15:38 UTC
  - 59809a1 Merge pull request #50586 from garethgreenaway/50562_minion_blackout_scheduler
  - 48673b7 Adding some defaults for minion_blackout code when pillar & grains are not available in opts. Removing some debugging code.
  - 9f422b2 Moving the minion_blackout code to the start of the try...except. Adding a test to ensure we get a log.exception when minion_blackout is True.
  - 2bf8fa5 Adding support for minion_blackout for jobs that are run from the Salt scheduler.
• PR #50576: (garethgreenaway) Back-port PR #50549 to 2018.3 @ 2018-11-21 14:39:55 UTC
  - PR #50549: (cachedout) Add security credits to release notes (refs: #50576)
  - 5c28179 Merge pull request #50576 from garethgreenaway/bp-50549
  - 807068d Typo fix
  - 2ef8307 Typo fix
  - 7c8957a Typo fix
  - c1ca603 Merge branch '2018.3' into bp-50549
  - b163380 Add security credits to release notes
• PR #50599: (terminalmage) Merge Sphinx fixes from 2017.7 to 2018.3 @ 2018-11-21 13:31:18 UTC
  - c9531d8 Merge pull request #50599 from terminalmage/merge-2018.3
  - ba82b07 Merge remote-tracking branch 'upstream/2017.7' into merge-2018.3
  - 1b8a8ac Merge pull request #50592 from terminalmage/docs-2017.7
    * db15776 Remove overline from section title
    * 8127dd5 Disable unused shorturls plugin
• ISSUE #50254: (jmcook1) file.line adding line every time (refs: #50366)
• **PR #50366**: (t0fik) 2018.3 fix issue50254 @ 2018-11-20 20:31:30 UTC
  - a9b9fa2 Fixed pylint warnings
  - 342786b Issue #50254 fixed
  - 1ab59e7 Added integration tests
  - 110f74f Added unit tests reproducing issue

• **ISSUE #50558**: (angelously) 'test=True' does not work with artifactory.download (refs: #50580)

• **ISSUE #50155**: (mikemartino) artifactory.downloaded state is not respecting test=True (refs: #50580)

• **PR #50580**: (garethgreenaway) [2018.3] Adding test=True to artifactory.download. @ 2018-11-20 16:37:14 UTC
  - 735c9f4 Merge pull request #50580 from garethgreenaway/50155_artificatory_download_state_test_true
  - 7dd57d0 Lint.
  - 3661ee0 Adding test=True to artifactory.download.

• **ISSUE #46292**: (asymetrix) win_wua should have possibility to specify source file (refs: #50397)

• **PR #50577**: (garethgreenaway) Back-port PR #50397 to 2018.3 @ 2018-11-19 21:28:42 UTC
  - **PR #50397**: (tlemarchand) Add Win WUSA management, to install Windows Update files (.msu). (refs: #50577)
  - 015834d Merge pull request #50577 from garethgreenaway/bp-50397
  - dd2d872 Documentation
  - af6d21f Import unicode_literals from future and add versionadded tag
  - 09dc09d Disable powershell modules list Add list_kbs function
  - 05852d0 pchanges to changes named parameters
  - 16525e4 Add Win WUSA management, to install Windows Update files (.msu).

• **PR #50570**: (garethgreenaway) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-11-19 20:04:05 UTC
  - 12e0d80 Merge pull request #50570 from garethgreenaway/merge-2018.3
  - 4c85119 merge-forward 2017.7 to 2018.3
  - 02238a7 Merge pull request #50520 from dwoz/issue_50459
    - 1aa2e34 Simplifie and portable homedir lookup
    - f14f747 Fix windows home dir lookup
    - d3620c3 Always set .gitconfig dir to user’s home
  - edd9738 Merge pull request #50532 from dubb-b/2017.7
    - 809e52d Adding tag to ec2 cloud tests
  - b0446f5 Merge pull request #50500 from terminalmage/2017.7-docs
    - 870a364 Set docs jenkins job to treat warnings as errors
    - e03bdcd Update docs references for states with func_alias
    - 8a2c08f Disable custom sphinx automodule

• **ISSUE #50266**: (4815162342lost) grains.virtual show incorrect info (refs: #50519)

  - 6ba83c Merge pull request #50519 from garethgreenaway/50266_core_virtual_grain_fixes
  - dcae2f0 Merge branch '2018.3' into 50266_core_virtual_grain_fixes

- **PR #50427:** (sathieu) Backports git_pillar tests improvements to 2018.3 @ 2018-11-16 16:37:29 UTC
  - **PR #50425:** (sathieu) git_pillar: Add tests for mountpoint parameter (refs: #50427)
  - **PR #50407:** (sathieu) git_pillar: Add tests for root parameter (refs: #50427)
  - **PR #50378:** (sathieu) Don’t fail on git_pillar tests when destructive tests are not enable (refs: #50427)
  - 84edd62 Merge pull request #50427 from sathieu/bp-git_pillar_tests
  - 12ea1cc git_pillar: Add tests for mountpoint parameter
  - fce467e git_pillar: Add tests for root parameter
  - ba150a5 Don’t fail on git_pillar tests when destructive tests are not enable

- **PR #50530:** (terminalmage) Enable proxy/ssh daemons when filename mapping causes those tests to be run @ 2018-11-15 23:03:06 UTC
  - 4651481 Merge pull request #50530 from terminalmage/salt-jenkins-1209
  - fbee11d Enable proxy/ssh daemons when filename mapping causes those tests to be run
  - 4f30611 lint
  - 4f9eb95 Fixing a typo in the _virtual function, should be checking for existing grains in odata not grains. Updating the detection to look for /sys/bus/xen/drivers/xenconsole instead of specifically looking for any files under /sys/bus/xen/drivers. Some systems that are not running as Xen PV hosts include files under that location, particular Oracle Linux.

- **ISSUE #50224:** (mruepp) Augeas changes state with setm not working (refs: #50526)

- **PR #50526:** (terminalmage) Work around augeas' lack of unicode support @ 2018-11-15 17:33:26 UTC
  - 6c07ba4 Merge pull request #50526 from terminalmage/issue50224
  - ee246ed Work around augeas' lack of unicode support

- **PR #50503:** (terminalmage) Set jenkins docs job to treat any warnings as errors (2018.3 branch) @ 2018-11-14 19:30:24 UTC
  - d83da51d Merge pull request #50503 from terminalmage/2018.3-docs
  - a4fc108 Fix docs configuration for renamed logstash engine
  - 5b06464 Set docs jenkins job to treat warnings as errors
  - 9b6c669 Update docs references for states with func_alias
  - 62b5d40 Disable custom sphinx automodule

- **ISSUE #48343:** (bornwitbugs) CPU Beacon TypeError (refs: #50514)

- **PR #50514:** (bornwitbugs) Load beacon fix @ 2018-11-14 19:20:33 UTC
  - fa2f4a5 Merge pull request #50514 from bornwitbugs/load_beacon_fix
  - e9c6d6e Merge branch '2018.3' of github.com:saltstack/salt into load_beacon_fix

- **PR #50509:** (Ch3LL) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-11-14 17:52:06 UTC
  - a50377b Merge pull request #50509 from Ch3LL/merge-2018.3
  - 178dab3 Merge branch 2017.7 into 2018.3
- c00fd43 Merge pull request #50493 from rallytime/bp-50362
  * 60559cf Remove flaky test
  * a696a8f Fix test_matcher on Windows
- 3cac1d0 Merge pull request #50494 from terminalmage/2017.7-docs
  * d561b26 Late import to fix docs build errors
- 0829944 Merge pull request #50479 from Ch3LL/digital_ocean_location
  * 917781d Lint: Add blank line
  * 3583519 Update digital ocean location for cloud tests
- accf681 Merge pull request #50480 from terminalmage/docs
  * c34690e Don’t import obsolete Directive class from Sphinx
- 2e9b3d2 Merge pull request #50478 from rallytime/update-bootstrap-docs
  * 66b078c Update the bootstrap script documentation to point to bootstrap repo
- PR #50502: (twangboy) Add definition for RestrictRemoteSAM @ 2018-11-14 14:30:38 UTC
  - 55b4914 Merge pull request #50502 from twangboy/lgpo_2018.3
  - fe92a3a Add definition for RestrictRemoteSAM
- ISSUE #48734: (oddfellow) salt-run.jobs.list_jobs has Target: unknown-target (refs: #50328)
- ISSUE #43453: (kunal-bajpai) Runner job load is never saved to job cache (refs: #43454)
- PR #50328: (rallytime) Fix issue with salt-run.jobs.list_jobs where Target: unknown-target @ 2018-11-13 19:49:58 UTC
  - PR #43454: (kunal-bajpai) Fix save_load which is never called for returner jobs (refs: #50328)
  - c1dde7e Merge pull request #50328 from rallytime/fixed-48734
  - 2c51cf9 Make target test job more specific to reduce test flakiness
  - caace3f Rewrite job cache target test to be more robust
  - b29fcfa New test must be py3 compatible...oops. :)
  - c684e29 Fix issue #48734
  - 6859e0e Add regression test for issue #48734
- PR #50499: (dwoz) Fix 2018.3 build @ 2018-11-13 18:46:54 UTC
  - 351faeb Merge pull request #50499 from dwoz/build_fix
  - 5754b4a Fix 2018.3 build
- PR #50496: (terminalmage) Fix 2018.3 docs build warnings @ 2018-11-13 17:21:09 UTC
  - 6f4b23f Merge pull request #50496 from terminalmage/2018.3-docs
  - cb25641 Fix header underline length to avoid another sphinx warning
  - 9272f7b Fix more sphinx build errors
  - 18a8104 Late import to fix docs build errors
  - d457132 Fix sphinx build warnings in 2018.3 branch
- ISSUE #50227: (sheagcraig) mac_utils _available_services will fail with malformed launchd plists present (refs: #50228)
- **PR #50492**: (rallytime) Back-port #50228 and #50443 to 2018.3 @ 2018-11-13 16:59:15 UTC
  - **PR #50443**: (weswhet) fix when checking for service Label on macOS (refs: #50492)
  - **PR #50228**: (sheagcraig) Fix 50227 malformed plists (refs: #50492, #50443)
  - 6b272c1 Merge pull request #50492 from rallytime/bp-50228-and-50443
  - 7879a2d Fix logging format
  - f578392 Lint Fix: add mock_open import
  - e5b999b add try/except when checking for service Label
  - 3c36b8d Fix linting errors.
  - fab57de Write tests to handle invalid launchd plist XML.
  - bb429b0 Condense service result assertions, add a binary plist test.
  - a809fe5 Factor out another helper function, implement broken symlink test.
  - 216f7ef Update testing for mac_utils services.
  - 89d8267 Fix trailing-slash bug in User LaunchAgent appending.
  - 0e23b6e Handle bad plists by ignoring them, with py2 and py3 specific approaches
  - fa44149 Avoid AttributeError when checking for exception types.
  - fd5eb33 Add secondary exception handler for malformed plists.
  - ae6f49b Make test correctly generate a double exception.

- **PR #50486**: (twangboy) Back port lgpo from Fluorine @ 2018-11-13 09:40:17 UTC
  - da980d9 Merge pull request #50486 from twangboy/lgpo_2018.3
  - bbbc07b Back port lgpo from Fluorine

- **ISSUE #50218**: (ata-sql) git.latest with unless command fails after upgrade to 2018.3.3 (refs: #50456)

- **PR #50456**: (terminalmage) Two bugfixes @ 2018-11-13 06:06:52 UTC
  - 7dd3438 Merge pull request #50456 from terminalmage/issue50218
  - 6143408 Add unit test for TimedProc regression
  - e234ab4 Add support for list of commands in git states’ onlyif/unless
  - cbf05c8 TimedProc: Don’t assume args is a string
  - 87de250 Exit gracefully when mod_run_check raises exception

- **PR #50455**: (dubb-b) Adding the released version as the bootstrap minion. @ 2018-11-12 22:52:53 UTC
  - 8514e6c Merge pull request #50455 from dubb-b/2018.3
  - fb61482 adding git
  - 181b8a4 removing stable
  - fc93ad6 Adding the released version as the bootstrap minion.

- **PR #50483**: (rallytime) Back-port #50272 to 2018.3 @ 2018-11-12 22:45:05 UTC
  - **PR #50272**: (jyurdal) Fix out of order docker Env comparison (refs: #50483)
  - cb3351 Merge pull request #50483 from rallytime/bp-50272
  - 0f02da7 Remove unnecessary u prefix from string literals
– fc26ae8 Add unit test for comparing containers with the same env vars
– c7fcb4b extra blank line after function definition (pylint)
– 1de9ce3 Compare sorted docker environment

• PR #50481: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-11-12 22:44:15 UTC
  – 360ae6a Merge pull request #50481 from rallytime/merge-2018.3
  – 1517bb3 Update old utils paths to use new paths
  – d8e7c47 Merge branch ’2017.7’ into ’2018.3’
  – e5f97cd Merge pull request #50467 from dwoz/test_kitchen_up
    • 8c5e93e Use patched version of test-kitchen until next release
  – b16ff9c Merge pull request #50469 from dwoz/minion_timeout_test
    • 57f702d Fix linter warning
    • 686153a Fix up integration.minion.test_timeout
  – 45b438e Merge pull request #50470 from dwoz/set_time_flaky
    • 794ba17 Reset date and time after changing
  – c85561e Merge pull request #50442 from rallytime/replace-docbanner
    • 193325d Update docbanner hyperlink
  – 7200568 Merge pull request #50439 from rallytime/bootstrap-contributing-docs
    • d2158aa Add bootstrap section to contributing docs
  – cca7a36 Merge pull request #50441 from rallytime/replace-docbanner
    • 2af92bd Update SaltConf doc banner
  – 1e72d20 Merge pull request #50414 from flassman/backmerge-for-typeerror-windows-python3
    • 20ff15 use exc.winerror not exc[0] to avoid python3 TypeError
  – 93095cb Merge pull request #50415 from flassman/pass-cwd-to-runas_system
    • 0113137 cwd needs to be passed from runas() to runas_system()

• ISSUE #50461: (absolutejam) elementaryOS ‘pkg’ __virtual__ returned false (refs: #50468)

• PR #50468: (garethgreenaway) [2018.3] Adding elementary override to grains/core.py @ 2018-11-12 16:41:57 UTC
  – 3aaad17 Merge pull request #50468 from garethgreenaway/50461_fix_elementary_os_family_grain
  – 77e8d0c On later versions of elementary, the os_family is being populated as elementary. In order for the aptpkg module to function, we need to override is to be Debian.

• ISSUE #50311: (marek-obuchowicz) pkg.installed state fails even though it succeeded (refs: #50590, #50333)

• ISSUE #46689: (mxork) pkg.installed: hold: True not applied to a package which is already installed. (refs: #48426)

• PR #50333: (garethgreenaway) [2018.3] Fix to pkg.installed for sources and hold: True (refs: #50590) @ 2018-11-08 18:02:33 UTC
  – PR #48426: (garethgreenaway) [2017.7] fixes to states/pkg.py (refs: #50333)
  – d9179fb Merge pull request #50333 from garethgreenaway/50311_pkg_installed_fails_sources_hold
- 7bc9b3d Merge branch '2018.3' into 50311_pkg_installed_fails_sources_hold
- 6e96728 pkg.installed currently fails when sources is used along with hold: True. This was due to a change in #48426 that swapped out sending the pkgs variable for the desired variable instead. This caused problems with pkg.hold because desired and sources are always populated, and pkg.hold can only include one or the other. This change just includes desired in the call to pkg.hold since desired has the same value for sources.

- **PR #50434**: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-11-08 17:40:39 UTC
  - 193c80a Merge pull request #50434 from rallytime/merge-2018.3
  - 83dbb2 Merge branch '2017.7' into '2018.3'
    - ef4509e Merge pull request #50370 from dwoz/pubd_msg_logs
      - 58ced12 log jid to payload size
      - 3c537b5 Log message flow to publish daemon

- **PR #50417**: (meaksh) Get the right target when using "__env__" on git ext_pillar to avoid merging problems @ 2018-11-08 17:07:03 UTC
  - 73ce80f Merge pull request #50417 from meaksh/2018.3-fix-git_pillar-__env__-solving-for-merging
  - 71af32d Remove unicode references
  - b7a5e5 Test git_ext_pillar across multiple repos using __env__
  - 59894e2 Resolve target branch when using __env__

- **ISSUE #50292**: (dstoliker) sysctl in test=True mode results in [ERROR ] Could not open sysctl file (refs: #50423)

- **ISSUE #50420**: (meaksh) Get the right target when using "__env__" on git ext_pillar to avoid merging problems @ 2018-11-08 17:07:03 UTC
  - 73ce80f Merge pull request #50417 from meaksh/2018.3-fix-git_pillar-__env__-solving-for-merging
  - 71af32d Remove unicode references
  - b7a5e5 Test git_ext_pillar across multiple repos using __env__
  - 59894e2 Resolve target branch when using __env__

- **ISSUE #50423**: (garethgreenaway) [2018.3] Fixes to sysctl modules and state @ 2018-11-08 14:13:00 UTC
  - e9464c9 Merge pull request #50423 from garethgreenaway/50292_no_error_log_test_true
  - 95a7f12 Adding file check and empty list return to freebsd_sysctl.py
  - 469c090 Adding a check to see if the config file exists, if not then return an empty list so we get the would be changes. Adding a test for this functionality.

- **ISSUE #50420**: (weswhet) mac_system virtual function fails to load on 2018.3.3 (refs: #50421)

- **PR #50421**: (weswhet) fixing an issue on mac_system where the virtual function wouldn't load @ 2018-11-07 21:57:44 UTC
  - fccf875 Merge pull request #50421 from weswhet/fix-mac_system-loader
  - 042445d fixing an issue on mac_system where the virtual function wouldnt load

- **PR #50409**: (casselt) Fix test mode for mount state if device_name_regex is used. @ 2018-11-07 16:04:45 UTC
  - d2fc910 Merge pull request #50409 from casselt/mount-device_name_regex-test-mode-fix
  - 56d5a32 Fix test mode for mount state if device_name_regex is used.

- **PR #50383**: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-11-06 15:51:53 UTC
  - c2fda9d Merge pull request #50383 from rallytime/merge-2018.3
  - e993692 Merge branch '2017.7' into '2018.3'
    - cd7e95f Merge pull request #50128 from mgomersbach/fix-py3-reload-compat
      - e453e82 Satisfy pylint, use naming instead of W or E classification
      - d20581c Merge branch 'fix-py3-reload-compat' of github.com:mgomersbach/salt into fix-py3-reload-compat
• 48c6a4f Merge branch '2017.7' into fix-py3-reload-compat
• 5cd9741 Satisfy pylint
• a2838db Satisfy pylint checks
• 05c598c Fix import error by utilizing six and strict version spec
• 95174e6 Merge branch '2017.7' into fix-py3-reload-compat
• ab8b5b4 Update workaround to root of file
• 37ab1f8 Update workaround to root of file
• 253ab11 Workaround for py2 builtin, =<3.3 imp and >=3.4 libimport quirks, solves #50127
• aa6b149 Merge pull request #50354 from rallytime/version_num_docs
  • 0621f7d Add a few more feature release codenames to the version_numbers doc
• 6472100 Merge pull request #50359 from dwoz/clitest
  • 18b5d43 Increase cli batch test timeout for increased reliability
• 99c8f35 Merge pull request #50345 from dwoz/pub_d_logging
  • fd58523 Fix linter warnings
  • 5e1db3c Fix ZMQ PubServer daemon logging works on winndows
  • 8899832 Configure logging for ZMQ PubServer daemon
• 44f7af4 Merge pull request #50350 from dubb-b/2017.7
  • 346a831 Updating the AMI’s and sizes for the test run.
• b947a18 Merge pull request #50274 from rallytime/bp-41472
  • 0a1e607 When the minion key is denied by the master then exit status 77 (permission denied)
• 4725acd Merge pull request #50195 from damon-atkins/jenkins_pylint
  • eb13407 capture some extra info
• ab8e845 Merge pull request #50329 from twangboy/fix_cloud_winrm
  • cf5fb04 Check WinRM port before initiating connection
• e535b38 Merge pull request #50252 from dwoz/backport_fs_fix
  • 59ac284 Do not allow age to be a negative number

• ISSUE #49523: (MTecknology) [salt-cloud] Non-ascii chars cause an exception in salt-cloud (refs: #50146, #50236)
  • PR saltstack/salt#50174: (rallytime) Back-port #50146 to 2018.3 (refs: #50231)
• PR #50236: (rallytime) Fix salt-cloud UnicodeEncodeError when writing to stdout @ 2018-11-05 22:04:18 UTC
  • PR #50235: (rallytime) Don’t encode the return values in utils/vt.py (refs: #50236)
  • PR #50231: (rallytime) Revert "Back-port #50146 to 2018.3" (refs: #50236)
  • PR #50230: (rallytime) Add various ssh tests to the filemap for salt/utils/vt.py changes (refs: #50291, #50235)
  • PR #50174: (rallytime) Back-port #50146 to 2018.3 (refs: #50236)
  • PR #50146: (MTecknology) Improve handling of non-ascii characters in terminal output. (Fixes: #49523) (refs: #50235, #saltstack/salt#50174_, #50174, #50231, #50236)
• ISSUE #50062: (whytwolf) max_event_size does not always trim large events. (refs: #50382)

• PR #50382: (garethgreenaway) [2018.3] Fix to utils/dicttrim.py to honor max_event_size with nested dictionaries @ 2018-11-05 20:04:06 UTC
  - ed4fa87 Merge pull request #50382 from garethgreenaway/50062_max_event_size_does_not_always_trim_large_events
  - 039f3d1 Increase limit for trimming.
  - 7f77bfe Adding test for utils/dicttrim.py
  - 9b55ac7 Adding _trim_dict_in_dict to utils/dicttrim.py to be called from trim_dict when data contains a nested dictionary. This will ensure that values will still be trimmed correctly.

• PR #50387: (rallytime) Back-port #50339 to 2018.3 @ 2018-11-05 20:03:15 UTC
  - PR #50339: (bartlaarhoven) The driver requires dependency, not the other way around. (refs: #50387)
  - 493d653 Merge pull request #50387 from rallytime/bp-50339
  - a3f264d Lint: Add extra blank line
  - bd18412 The driver requires dependency, not the other way around.

• ISSUE #41342: (githubcdr) beacons.state does not save as list (refs: #50347)

• PR #50347: (garethgreenaway) [2018.3] Fixes to beacon state module @ 2018-11-05 14:19:41 UTC
  - 3022b7d Merge pull request #50347 from garethgreenaway/41342_beacon_state_module_fixes
  - 8885d1f Merge branch '2018.3' into 41342_beacon_state_module_fixes
  - c2354a9 Fixing beacon state test. Adding a reset function to beacon module to clear out beacon configuration. Useful for tests runs to ensure bits are left over between runs.
  - 2390f47 Adding SaltReturnAssertsMixin back in
  - 677d090 Remove zookeeper reference.
  - f3dee43 Updating the beacon state module to ensure that the format of the beacon data that is being sent along to the beacon execution module is in the right format.

• ISSUE #41583: (seanjnkns) mount.swap for swap file test=True results wrong (refs: #50358)

• PR #50358: (garethgreenaway) [2018.3] Fixes to function mount.swap in mount state @ 2018-11-05 14:16:50 UTC
  - 929525a Merge pull request #50358 from garethgreenaway/41583_mount_swap_test_true_wrong_results
  - b8ded8b Updating the swap function in the mount.swap function also check the device name when checking the fstab data. Updating tests to reflect new behavior.
    - d07c84d reordering ret dictionary in load test to ascending order
    - f704128 fixing type in load beacon module and adding option validators to config check function along with mock default values in test, fixes #48343
    - 4114a4f fixing type in load beacon module and adding option validators to config check function along with mock default values in test

• ISSUE #49225: (onnodb) [win_lgpo] lgpo_set always reports failure; Registry.pol corruption (refs: #50006)

• ISSUE #48782: (mike2523) [win_lgpo] Causes corrupt Registry.pol file (refs: #50006)

• PR #50006: (lomeroe) Correct more issues in lgpo @ 2018-11-02 16:32:29 UTC
Salt Documentation, Release 2019.2.0

28.2. Previous Releases

- 3fba392 Merge pull request #50006 from lomeroe/issue48782_2018.3
- dc58252 update to use a single line if statement when dealing with prepended text
- 0e011ad add runTest method to class for PY2
- 377ec09 add a test for #47784
- 0a14505 change backslashes in comment string to fix lint error
- 02181d3 add fix/test for #50079
- 05f2951 more lint fixes
- 94b3335 lint fixes in test
- 2a79626 update test to actually work
- 42840ec add missing comma in function call
- c283f50 Log a warning message instead of an exception when a SID cannot be converted to a username (for user rights assignments)
- 271bd70 capture and print exception information
- bc94b8e update method for creating size field of **delvals items for py3 compatibility
- d9fe28a fix clobbering of admx_search_results which was keeping some policies from being properly detected

- PR #50340: (garethgreenaway) [2018.3] Backporting #48087 to 2018.3 @ 2018-11-01 18:15:37 UTC
  - PR #48087: (mat813) Fix patching sysctl.conf on FreeBSD. (refs: #50340)
  - d9fe28a fix clobbering of admx_search_results which was keeping some policies from being properly detected

- PR #50275: (rallytime) Back-port #49752 to 2018.3 @ 2018-11-01 16:50:17 UTC
  - PR #49752: (jodok) add support for clonenum parameter (refs: #50275)
  - e463d99 Merge branch '2018.3' into bp-49752
  - 1e10c6e add support for clonenum parameter

- ISSUE #47425: (raddessi) states/netyang.managed ignores models when passed as a kwarg (refs: #50301)

- PR #50316: (rallytime) Back-port #50301 to 2018.3 @ 2018-11-01 16:32:04 UTC
  - PR #50301: (tonybaloney) Fixes issues raised in #47425 for states.netyang (refs: #50316)
  - 529687a update test assertions
  - ba526ad remove unused import
  - 220e57f create 2 simple unit tests for the netyang state module and fix issue in #47425
  - 69c02fc Fix some lint and some typos

- PR #50290: (twangboy) Fix test_state for Windows @ 2018-10-31 19:28:34 UTC
  - af1075b Merge pull request #50290 from twangboy/fix_test_state
  - 51e333a Merge pull request #50316 from rallytime/bp50301
- d184013 Fix typo
- 92b5ea0 Create salt util that copies file security info

**ISSUE #50050**: (terminalmage) Backport runtests.py’s –from-filenames functionality to 2018.3 branch (refs: #50308, #50291)

**PR #50291**: (rallytime) Back-port #50230 to 2018.3 @ 2018-10-31 19:22:25 UTC
- PR #50230: (rallytime) Add various ssh tests to the filemap for salt/utils/vt.py changes (refs: #50291, #50235)
- 045d81c Merge pull request #50291 from rallytime/bp-50230
- 1aae681 Merge branch '2018.3' into bp-50230
- 1ef712a Add various ssh tests to the filemap for salt/utils/vt.py changes

**PR #50315**: (rallytime) [2018.3] Merge forward from 2018.3.3 to 2018.3 @ 2018-10-31 14:16:34 UTC
- 00437aa Merge pull request #50315 from rallytime/merge-2018.3
- 422465e Merge branch '2018.3.3' into '2018.3'
- 4d9e2a0 Merge pull request #50088 from vulnbe/fix-incorrect-id-handling-2018-3-3
- 619f2f2 Fix incorrect id handling in file state

**PR #50309**: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-10-30 16:07:25 UTC
- 84ee7a3 Merge pull request #50309 from rallytime/merge-2018.3
- 381a59d Merge branch '2017.7' into '2018.3'
- 11fa33e Merge pull request #50295 from dubb-b/remove-cloud-change
  - 80982ad Removing an un needed change and maybe fixing the lint error
  - e00c507 Merge pull request #50287 from whytewolf/boto_vpc
    - 5a39644 minor correction to boto_vpc.route_table_present example, subnet_names was on wrong indent level
  - 37ae06c Merge pull request #50280 from gtmanfred/2017.7
  - 5808074 fix InstallRequirement.from_line for pip 18.1

**ISSUE #50050**: (terminalmage) Backport runtests.py’s –from-filenames functionality to 2018.3 branch (refs: #50308, #50291)

**PR #50308**: (rallytime) Fix matcher grain file @ 2018-10-30 15:27:47 UTC
- PR #50182: (terminalmage) Backport runtests.py modifications from develop to 2018.3 (refs: #50308)
- b805bab Merge pull request #50308 from rallytime/test-fixes
- f238522 Fix matcher grain file

**PR #50270**: (terrible-broom) apt: speedup installing packages with ’>=’ or ’<=’ and reduced memory... @ 2018-10-30 13:24:36 UTC
- 57f6edc Merge pull request #50270 from terrible-broom/feature/apt-cache-show-instead-of-dump
- 6cd1b05a Lint: add extra blank line
- a4df706 fix review notes
- d059edd apt: speedup installing packages with ’>=’ or ’<=’ and reduced memory consumption

**PR #50293**: (gtmanfred) update jenkins version for 2018.3 @ 2018-10-29 23:39:34 UTC
- 6a65402 Merge pull request #50293 from saltstack/jenkins
- fe6fbc4 update jenkins version for 2018.3
- PR saltstack/salt-jenkins#1182: (gtmanfred) clean up salt.utils for using 2018.3.3 (refs: #50289)

- PR #50289: (gtmanfred) ignore empty line in localectl status output @ 2018-10-29 21:39:07 UTC
- 935f181 Merge pull request #50289 from gtmanfred/2018.3
- fb43061 fix test
- 5eb0e37 add extra space to localemod test
- e8dc8ba if line in output of localectl is empty, ignore it

- PR #50276: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-10-29 19:05:15 UTC
- 10ba8b4 Merge pull request #50276 from rallytime/merge-2018.3
- f05abb0 Merge branch '2017.7' into '2018.3'
- 6ae8a33 Merge pull request #50281 from dubb-b/add_subnet
  - 4fdef7c Lint: Add extra blank line
  - cebfd8a Fixing lint error
  - 0da6301 Merge branch '2017.7' of https://github.com/saltstack/salt into add_subnet
  - 2df6115 Adding subnetID so it knows the right VPC to build the node in.
- a0cfbdc Merge branch '2017.7' into '2018.3'
- b94a43b Merge pull request #50184 from ethanculler/fix-minion-return-exception-with-return
  - 283d41c Merge branch '2017.7' into fix-minion-return-exception-with-return
  - a4e54d7 Added handling for minion return exceptions containing the word "return"
- 6b009b4 Merge pull request #50258 from dubb-b/fix_cloud_ec2
  - 6a1e9f0 Adding securitygroupname as the config instead of securitygroup
- 3e1aac9 Merge pull request #50251 from gtmanfred/2017.7
  - 061e599 bump salt version to 2017.7.8
- fe9bc81 Merge pull request #50233 from Ch3LL/bp-50232
  - f83460d change order of search engine ids
  - b3f217 Update search engine IDs for releases

- PR #50282: (twangboy) Fix unit.beacons.test_diskusage on Windows @ 2018-10-29 18:37:13 UTC
- 0f1dc08 Merge pull request #50282 from twangboy/fixed_tests
- fd369dd Mock is_windows = False

- PR #50182: (terminalmage) Backport runtests.py modifications from develop to 2018.3 (refs: #50308) @ 2018-10-29 16:25:07 UTC
- f7c2f04 Merge pull request #50182 from terminalmage/issue50050
- 113d76e Revert "Move jinja templating tests alongside salt/utils/jinja.py’s tests"
- 3057ca4 Lint fix: add extra blank line in core.py
- 8968f9d Revert "Rename test_map_conf test file to respect naming convention"
- 85a9395 Remove saltclass pillar unit test for list expansion
- 3d95673 Use get_config_dir() instead of self.config_dir
- e8b3a62 Add init file back in for unit/client pkg
- d527dd2 Rename states/test_libvirt.py into states/test_virt.py
- ab4a670 Remove pgjsonb returner unit tests
- 68ab3ee Remove "test_custom" from grains section of filename_map
- 6814698 Remove test_error from scheduler tests
- c55def0 Add init file back in for integration/cloud/clouds pkg
- f485b4a enable testing only filemaps
- dfa05b9 Remove test files for beacons that don’t exist in 2018.3
- 85612cf runtests.py: Fix IndexError in –from-filenames
- 25097f9 Make sure from-filenames intersect with names-file
- ed864ce runtests.py: Accept modified file list from a text file
- 059754c Add some doc tests to the filemap that should run on every PR
- b1ee2e5 Set a default value for the filename map path
- 5ea1024 Add documentation explaining naming convention for test files
- 8f790c0 Fix conflicting dict key in filename map
- f2e5512 Evan Moar Lint
- 65fe9a Moar Lint
- 39c2455 Lint
- dd20f12 Make sure we always run the module names test
- 2ac939e Add test to check test module names and make sure they match the naming convention
- 785d298 Add integration.netapi.rest_tornado.test_app to filename map
- 662ca0d Rename files to match naming convention
- 186d333 Add back changes lost in cherry-pick
- a236531 Add back test accidentally deleted when cherry-picking
- eaa4da3 Rename providers to clouds to respect naming convention
- 85b96de Rename some files to avoid them being identified as test modules
- bf6015 Rename/consolidate salt.utils unit tests to conform to naming convention
- 84749dd Consolidate and move salt-ssh unit tests to proper location
- 71825a5 Consolidate and move loader tests to test/unit/test_loader.py
- 8326a09 Rename test_map_conf test file to respect naming convention
- 6d9c2eb Move jinja templating tests alongside salt/utils/jinja.py’s tests
- 1ef43a3 Add additional paths to the filename map
- 75e6731 Use the new helper to get the test mods
- c3dc8ec Add function to get all of the test modules
- c5593bc Rename custom_grains.py so it’s not identified as a test module
- 330c211 Consolidate saltclass pillar unit tests into single module
- a642619 Rename test pgjsonb returner test file to match naming convention
- 6433c48 Don’t import old module name
- a97e032 Move helper outside of for loop
- 3f1b6fd Add more unit test mapping
- ac3406d Fill out the filename map a bit
- 07d6f2a Enhancements to –from-filenames, –filename-map options
- b851a41 Don’t run unit or integration tests unnecessarily
- 569276b Add an initial filename_map
- 44199b1 Add –from-filenames and –filename-map options to parser

- **PR #50267:** (m03) Fix missing aptly config paths @ 2018-10-29 13:27:23 UTC
  - 1e8b092 Merge pull request #50267 from m03/fix-aptly-config-paths-20183
  - 319bb31 Fix missing aptly config paths

- **PR #50232:** (Ch3LL) Update search engine IDs for releases (refs: #50233) @ 2018-10-25 20:15:08 UTC
  - ab6022 Merge pull request #50232 from Ch3LL/search_latest
  - 3452d9b change order of search engine ids
  - c9546df Update search engine IDs for releases

- **ISSUE #49523:** (MTecknology) [salt-cloud] Non-ascii chars cause an exception in salt-cloud (refs: #50146, #50236)
  - **PR saltstack/salt#50174:** (rallytime) Back-port #50146 to 2018.3 (refs: #50231)

- **PR #50231:** (rallytime) Revert "Back-port #50146 to 2018.3" (refs: #50236) @ 2018-10-25 20:12:15 UTC
  - **PR #50146:** (MTecknology) Improve handling of non-ascii characters in terminal output. (Fixes: #49523) (refs: #50235, #saltstack/salt#50174, #50174, #50231, #50236)
  - 1c8cd9f Merge pull request #50231 from saltstack/revert-50174-bp-50146
  - c76ac1b Revert "Back-port #50146 to 2018.3"

- **ISSUE #50132:** (ManicoW) XCP-ng packages and services management (refs: #50140)

- **PR #50172:** (rallytime) Back-port #50140 to 2018.3 @ 2018-10-25 14:00:32 UTC
  - **PR #50140:** (ManicoW) Adding XCP-ng support (refs: #50172)
  - 8dd4f43 Merge pull request #50172 from rallytime/bp-50140
  - 02e0ea0 lint fix
  - 819c46c fix lint errors and code factorization
  - 8aa3598 Fix lint error
  - 9092e4c Adding support for XCP-ng
  - c516bc5 Adding XCP-ng to os family map

- **PR #50063:** (twangboy) Use long when setting REG_QWORD @ 2018-10-25 13:45:03 UTC
  - 9ad43f2 Merge pull request #50063 from twangboy.fix_50039

28.2. Previous Releases
- 5fd8a7d Disable lint error
- 8488dd6 Add tests
- 464bb6 Use long when setting REG_QWORD

- **ISSUE #49965**: (nkrishnakishor) Beacon: Usage in windows (refs: #50188)
- **PR #50188**: (garethgreenaway) [2018.3] fixes to diskusage beacon @ 2018-10-25 13:41:19 UTC
  - 01b083e Merge pull request #50188 from garethgreenaway/49965_beacon_diskusage_windows
  - f65fa57 Fixing a bug in the diskusage beacon that prevented it from working on Windows. Adding a couple tests to test functionality on Windows.

- **PR #50214**: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-10-25 13:38:40 UTC
  - 9ea51c0 Merge pull request #50214 from rallytime/merge-2018.3
  - 8971145c Merge branch '2018.3' into '2018.3'
    - 017d394 Merge pull request #50202 from Ch3LL/2017.7.8
      - d520f9a Add tests with filename in token data
      - d45f6c7 Add empty token salt-api integration tests
      - 652db6 Ensure that tokens are hex to avoid hanging/errors in cherrypy
    - f28a4fa Merge pull request #50211 from channias/fix-spm-modules-install
      - 9b203d5 Fix broken install of additionnal modules in SPM packages
    - 6b4e07b Merge pull request #50212 from dwoz/test_no_fail
      - 7f613ac Do not fail if process already ended
    - 85e22d2 Merge pull request #50207 from Ch3LL/2update_version_doc_2017.7
      - 198d25c Add 2017.7.8 previous release
      - d4e26ac Update release versions for the 2017.7 branch
    - d035695 Merge pull request #50205 from Ch3LL/rn_2017.7.8
      - 71ee68b [2017.7.8] remove in progress and add security details
    - ce341f2 Merge pull request #50180 from max-arnold/2017.7
      - 881a521 Revert curly braces example for nested dictionaries
    - 622bb51 Merge pull request #50026 from damon-atkins/jenkins_pylint
      - aec888 Merge branch '2017.7' into jenkins_pylint
      - 5fd8a7d use awk to create the other files, so git does not need to search again
      - 6b96a24 Adjust jenkins linting process, only run stage if required, use git diff to find files, instead of find, report on status, changed and deleted files, lint only changed files.
    - aa66d1b Merge pull request #50158 from vutny/doc/2017.7/fix-http-tutorial
      - fe2d70d [DOC] Fix JSON payload example in HTTP tutorial
    - **ISSUE #50162**: (rbthomp) Scheduled job runs in endless loop when using when: and splay: together. (refs: #50216)
• **PR #50216**: (garethgreenaway) [2018.3] Fixes to scheduler, list of whens plus splay @ 2018-10-25 13:31:26 UTC
  - 51b3fa4 Merge pull request #50216 from garethgreenaway/50162_when_plus_splay_endless_loop
  - 685509f Fixing an issue when a combination of the when parameter as a list plus using the splay parameter would cause the schedule to continuously run jobs in an endless loop, regardless of if their scheduled time had been reached. Also fixing a related issue where scheduled jobs that rely on _next_fire_time were not being run as the corrected splayed time but rather running at the original scheduled time. Adding new tests.

• **PR #50190**: (dwoz) Fix test_managed_file_with_grains_data on Windows @ 2018-10-24 22:43:35 UTC
  - 43303fb Merge pull request #50190 from dwoz/grains_template_test
  - b77db48 Fix test_managed_file_with_grains_data on Windows

• **PR #50187**: (garethgreenaway) [2018.3] Adding fixes to scheduler tests to 2018.3 @ 2018-10-24 19:45:32 UTC

  - PR #49871: (garethgreenaway) [fluorine] Updating scheduler tests for OS X (refs: #50187)
  - 462314b Merge pull request #50187 from garethgreenaway/port_49871_to_2018_3
  - 25e7cb6 Merge branch ’2018.3’ into port_49871_to_2018_3
  - d232db Update test_eval.py
  - d8d8559 Fixing lint
  - 76e6232 Removing unnecessary debugging lines
  - d2d622 Back porting #49871 to 2018.3. Adding some additional changes to ensure they are passing on OS X.

• **PR #50201**: (Ch3LL) [2018.3] Ensure that tokens are hex to avoid hanging/errors in cherrypy @ 2018-10-24 19:44:23 UTC
  - 8ad9a1b Merge pull request #50201 from Ch3LL/_2018.3.3

• **PR #50208**: (Ch3LL) Update release versions for the 2018.3 branch @ 2018-10-24 15:52:19 UTC
  - 88673ad Merge pull request #50208 from Ch3LL/2update_version_doc_2018.3
  - cdbf493 Add 2017.7.8 previous release
  - 6f775e7 Add 2018.3.8 release
  - 6f775e7 Update release versions for the 2018.3 branch

• **PR #50206**: (Ch3LL) [2018.3.3] remove in progress and add security details @ 2018-10-24 15:50:50 UTC
  - db8ef1e Merge pull request #50206 from Ch3LL/rn_2018.3.3
  - 896ca1 Add 2016.11.10 release notes to 2018.3 branch
  - 1e34158 [2018.3.3] remove in progress and add security details

• **PR #50200**: (rallytime) Back-port #50181 to 2018.3 @ 2018-10-24 15:49:59 UTC
  - PR #50181: (cro) Testinfra has a python packaging issue that is making version 1.17.0 fail to install some places (refs: #50200)
  - 3d3db70 Merge pull request #50200 from rallytime/bp-50181
  - f3e5399 Ignore testinfra 1.17.0

• **ISSUE #49523**: (MTecknology) [salt-cloud] Non-ascii chars cause an exception in salt-cloud (refs: #50146, #50236)

• **PR #50174**: (rallytime) Back-port #50146 to 2018.3 (refs: #50236) @ 2018-10-23 18:16:45 UTC
- PR #50146: (MTecknology) Improve handling of non-ascii characters in terminal output. (Fixes: #49523) (refs: #50235, #saltstack/salt’#50174’ advertisers, #50174, #50231, #50236)
  - 5f904dd Merge pull request #50174 from rallytime/bp-50146
  - 601a5b8 Improve handling of non-ascii characters in terminal output. (Fixes: #49523)

- ISSUE #50142: (m03) stringutils.to_none AttributeError: 'module' object has no attribute 'tex_type' (refs: #50143)
- PR #50173: (rallytime) Back-port #50143 to 2018.3 @ 2018-10-23 17:13:55 UTC
  - PR #50143: (m03) Fix #50142, stringutils.to_none (refs: #50173)
  - PR #45429: (terminalmage) [PY3] Add unicode_literals to salt.utils modules (R-S) (refs: #50143)
  - 1cd0339 Merge pull request #50173 from rallytime/bp-50143
  - f5d6080 Add test_to_none
    - c0ce36b Fix #50142, stringutils.to_none

- PR #50171: (terminalmage) Fix invalid RST link in docker_network docs @ 2018-10-23 13:40:36 UTC
  - 9331f1e Merge pull request #50171 from terminalmage/docs
  - 7ea1d6c Fix invalid RST link in docker_network docs

- PR #50161: (rmarcinik) Add a missing result for task.info @ 2018-10-23 13:31:43 UTC
  - 16eece3 Merge pull request #50161 from rmarcinik/patch-1
  - 9848f06 Add a missing result for task.info

- PR #50136: (terminalmage) Add some debug logging before and after states gather pillar data @ 2018-10-22 14:40:38 UTC
  - 28bc5e3 Merge pull request #50136 from terminalmage/debug-logging
  - 8592a0b Add some debug logging before and after states gather pillar data

- ISSUE #50129: (kmatsoukas) Call to network.get_route fails when interface name contains a dash (refs: #50147)

- PR #50147: (garethgreenaway) [2018.3] Fix to modules/network.py @ 2018-10-22 14:31:03 UTC
  - 599c7ff Merge pull request #50147 from garethgreenaway/50129_network.get_route_fails_dash_in_name
  - 8fa87e3 Update test_network.py
  - 3117969 Fixing scenario where the interface for the default route has a dash in it, regular expression used in get_route currently doesn’t not account for this.. Adding some additional tests for network.get_route.

- PR #50156: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-10-22 14:24:39 UTC
  - 5c7a7d9 Merge pull request #50156 from rallytime/merge-2018.3
  - 87e20fd Merge branch ’2017.7’ into ’2018.3’
  - 1a90c4f Merge pull request #50144 from dwoz/winrm_fs_release
    * 0951d85 Use newest winrm-fs release
  - e096560 Merge pull request #50113 from rallytime/bp-49989
    * 27c7ac9 Increase centos7-py2 kitchen pr timeout to 8 hours

- PR #50148: (MTecknology) Proxmox fixups @ 2018-10-22 11:55:10 UTC
  - ce375f4 Merge pull request #50148 from MTecknology/proxmox-fixups
Race condition still exists at one second timeout.
3a62f74 Add support for setting root ssh pubkey to proxmox containers.

• PR #50085: (dwoz) Fix test_win_pkg yet again @ 2018-10-19 18:16:16 UTC
  0ece06e Merge pull request #50085 from dwoz/win_pkg_redux
  f22630e Merge branch '2018.3' into win_pkg_redux
  0b033a6 Do not allow age to be a negative number
  a24d888 Debug file list cache
  9f5722a The test is not a flush problem
  071f8a0 Add cache file name to list cache log
  128c2e5 Flush and sync file contents
  7d361d8 Add debug log when file list is returned from cache

• PR #49980: (twangboy) Add support for AddPrinterDrivers @ 2018-10-19 13:19:41 UTC
  0669247 Merge pull request #49980 from twangboy/lgpo_add_printer_drivers
  76c9301 Add support for AddPrinterDrivers

• PR #50114: (rallytime) Back-port #50061 to 2018.3 @ 2018-10-19 11:46:03 UTC
  PR #50061: (rongzeng54) pkg.install bugfix (refs: #50114)
  de23c85 Merge pull request #50114 from rallytime/bp-50061
  1f09104 Add unit test for pkg.install with epoch
  a2536c6 pkg.install bugfix

• ISSUE #50074: (bigpick) Arista EOS Salt Minion - Debug Log Flooded with Repeated Message (refs: #50115)

• PR #50115: (garethgreenaway) [2018.3] Apply scheduler fixes and tests from #49104 to 2018.3 @ 2018-10-19 11:45:31 UTC
  PR #49104: (garethgreenaway) [fluorine] Fixes to scheduler for jobs with seconds, minutes, etc. (refs: #50115)
  9188bec Merge pull request #50115 from garethgreenaway/apply_49104_to_2018_3
  adb1e79 Apply scheduler fixes and tests from #49104 to 2018.3

• PR #50119: (terminalmage) Squelch spurious errors logged in unit tests @ 2018-10-19 11:42:31 UTC
  e892042 Merge pull request #50119 from terminalmage/boto-tests
  91812ff Squelch spurious errors logged in unit tests

• PR #50120: (terminalmage) Fix bad merge conflict resolution @ 2018-10-19 11:38:35 UTC
  35449b4 Merge pull request #50120 from terminalmage/salt-jenkins-1137
  1d0d816 Fix bad merge conflict resolution

• PR #50013: (giandom) Passed kwargs to db_exists in db_remove method @ 2018-10-18 11:28:30 UTC
  5123488 Merge pull request #50013 from giandom/2018.3
  9e91d3f Merge branch '2018.3' into 2018.3
  06bb245 Merge branch '2018.3' into 2018.3
  04a99e0 Passed kwargs to db_remove

28.2. Previous Releases 4129
• **PR #50092:** (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-10-17 19:57:07 UTC
  
  - aa94f60 Merge pull request #50092 from rallytime/merge-2018.3
  - 8609064 Update old utils paths to use new paths
  - a984ad8 Merge branch '2017.7' into '2018.3'
    
    - 7ec3840 Merge pull request #49794 from twangboy/fix_groupadd_test
      
      - 3d3b67d Gate for Windows
      - decfa52 Check value of result instead of entire dict
    
    - e562838 Merge pull request #50028 from basseed/fix-windows-virtual-grain
      
      - 8129ac6 removed whitespaces
      - 82fa866 Fix #50015, Windows grain defaults to physical as unix grain
  
  • **ISSUE #50073:** (jorotenev) boto_cloudfront update distribution fails (refs: #50082)
  
  • **PR #50082:** (garethgreenaway) [2018.3] Fixing a typo in the boto_cloudfront @ 2018-10-17 19:35:00 UTC
  
  - d1f2c5d Merge pull request #50082 from garethgreenaway/50073_fixing_typo_boto_cloudfront
  - b5b90a1 Fixing a typo in the boto_cloudfront.
  
  • **PR #50090:** (garethgreenaway) [2018.3] Fix to utils/vault.py @ 2018-10-17 13:57:30 UTC
  
  - 05bd2a0 Merge pull request #50090 from garethgreenaway/fix_vault_sdb_runner_test
  - 444a4e5 Merge branch '2018.3' into fix_vault_sdb_runner_test
  
  • **ISSUE #49275:** (dgengtek) execution module cp.cache_file fails with error 'invalid arguments to setopt' (refs: #50080)
  
  • **PR #50080:** (terminalmage) Ensure all string kwargs passed to Tornado’s httpclient are str types @ 2018-10-16 21:01:41 UTC
  
  - 7092879 Merge pull request #50080 from terminalmage/issue49275
  - 4a6c327 Ensure all string kwargs passed to Tornado’s httpclient are str types
  
  • **ISSUE #44979:** (hunkeelin) Firewalld state cause horrid performance during saltrun. (refs: #49811)
  
  • **PR #49811:** (nhavens) Optimize firewalld state @ 2018-10-16 11:26:46 UTC
  
  - 45b6da3 Merge pull request #49811 from nhavens/optimize-firewalld-state
  - 7d6e628 Merge branch '2018.3' into optimize-firewalld-state
  - a718b0c Merge branch '2018.3' into optimize-firewalld-state
  - f7299b9 Merge branch '2018.3' into optimize-firewalld-state
  - f289618 Merge branch '2018.3' into optimize-firewalld-state
  - 41af513 Merge branch '2018.3' into optimize-firewalld-state
  - 7cebab4 Merge branch '2018.3' into optimize-firewalld-state
  - c38bb7d Merge branch '2018.3' into optimize-firewalld-state
  - abed058 Merge branch '2018.3' into optimize-firewalld-state
  - 0ec1f82 Merge branch '2018.3' into optimize-firewalld-state
  - db6b23b Merge branch '2018.3' into optimize-firewalld-state
  - 4ca7e12 Merge branch '2018.3' into optimize-firewalld-state
- 4f7c914 fix invalid icmp type handling in firewalld state
- 2d2e2eb resolve lint error in firewalld state
- 081424d resolve indentation issues in updates to firewalld state
- c92c4fe optimize firewalld.present rich rule handling
- 25d1daf optimize firewalld.present source handling
- 5f62c14 optimize firewalld.present interface handling
- 69f2c6c optimize firewalld.present service handling
- 71ec8e7 optimize firewalld.present port forward handling
- f18e09e optimize firewalld.present open port handling
- 35193dc clean up firewalld.present masquerade code (DRY)
- 8c88784 optimize firewalld.present icmp block handling

• PR #50055: (rallytime) Back-port #50024 to 2018.3 @ 2018-10-16 09:14:06 UTC
  - PR #50024: (rwaweber) docs: Correct napalm topic spelling mistake and smooth out sentence (refs: #50055)
  - b94e0a0 Merge pull request #50055 from rallytime/bp-50024
  - 1ea72a0 docs: Correct spelling mistake and smooth out sentence

• PR #50056: (rallytime) Back-port #50029 to 2018.3 @ 2018-10-16 09:12:59 UTC
  - PR #50029: (thebluesnevrdie) Expose docs for Ansible modules (refs: #50056)
  - 14f3fac Merge pull request #50056 from rallytime/bp-50029
  - 2e46a78 Expose docs for Ansible modules

• PR #50064: (rallytime) Back-port #50022 to 2018.3 @ 2018-10-16 09:07:10 UTC
  - PR #50022: (bluesliverx) Make test check_pillar more lenient (refs: #50064)
  - eedeaeb Expose docs for Ansible modules
  - 6ef5ce4 Due to a previous PR the test_sdb_runner in sdb.test_vault was failing because of a exception that was being swallowed in the test run function. The cause was that when vault related functions were being run, if they were being run on the master then they were being forced to run through the _get_token_and_url_from_master() function, which is pull the id element out of the grains dictionary. When the call was taking place from a runner, the exception was popping up since there is no id when called from a runner. This fix checks to see if the id exists in the dictionary

28.2. Previous Releases
first, if it is there then _get_token_and_url_from_master() is called, otherwise _use_local_config
is called.

- **PR #49987:** (terminalmage) Make Pillar no longer munge file_roots @ 2018-10-15 21:58:08 UTC
  - 4c4bb5a Merge pull request #49987 from terminalmage/pillar_roots
  - f59506d Update tests to reflect behavior changes
  - 58f5fde Make Pillar no longer munge file_roots

- **PR #50065:** (rallytime) Back-port #50044 to 2018.3 @ 2018-10-15 21:32:37 UTC
  - **PR #50044:** (mchugh19) add saltclass info from release notes to docs (refs: #50065)
  - 1e377ac Merge pull request #50065 from rallytime/bp-50044
  - 1eaaab7 Doc title formatting must match doc name length
  - 6ac26b6 add saltclass docs from release notes

- **PR #50038:** (s0undt3ch) Don’t squash the traceback @ 2018-10-15 20:36:55 UTC
  - 8a6b435 Merge pull request #50038 from s0undt3ch/2018.3
  - 852257a Don’t squash the traceback

- **PR #50054:** (rallytime) Back-port #50004 to 2018.3 @ 2018-10-15 20:36:03 UTC
  - **PR #50004:** (kiemlicz) https://github.com/saltstack/salt/issues/49883 (refs: #50054)
  - dbfd7ee Merge pull request #50054 from rallytime/bp-50004
  - 88e3202 https://github.com/saltstack/salt/issues/49883

- **PR #50057:** (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-10-15 20:35:46 UTC
  - a9e9974 Merge pull request #50057 from rallytime/merge-2018.3
  - 1b5b018 Merge branch `2017.7` into `2018.3`
    - 9eb17ea Merge pull request #50047 from rallytime/bp-49605
      - e3a0f7b Add gce fix to 2017.7.9 release notes
      - e6d86fc document GCE instance credentials configuration
      - c3a0d1b allow empty service_account_private_key in GCE driver
    - 6cdd390 Merge pull request #50017 from gtmanfred/iptables
      - e552e4f Use parse_known_args when checking iptables rules
    - a6a66b9 Merge pull request #50012 from dwoz/norm_log
      - f96b29d Use normal log formatting and add jid
    - 15f86b2 Merge pull request #50001 from kyentei/doc-fix-gpg
      - 3d6ee3e Fix gpg state Documentation
    - 7a235d7 Merge pull request #50000 from kyentei/doc-fix-lvm
      - c2f3d87 Fix LVM state documentation
    - 4ed094 Merge pull request #49999 from kyentei/doc-fix-proxy
      - a180ed7 Fix proxy documentation
    - 58d2302 Merge pull request #49998 from kyentei/doc-fix-process
- edd4f40 Fix documentation on process.py
  - 411635b Merge pull request #49997 from kyentei/doc-fix-mysql
  - 01059cc Fix documentation for mysql process list

- PR #50060: (rallytime) [2018.3] Fix some pylint issues that have popped up recently @ 2018-10-15 20:35:22 UTC
  - f1bcb1f Merge pull request #50060 from rallytime/fix-lint
  - a8f4f39 Merge branch '2018.3' into fix-lint

- ISSUE #49927: (thetaurean) File Tree external pillar fails to render templates in python 3 (refs: #49943)

- PR #50052: (rallytime) Back-port #49943 to 2018.3 @ 2018-10-15 20:06:20 UTC
  - PR #49943: (thetaurean) Coerce string when calling compile_template_str (refs: #50052)
  - b26b21c Merge pull request #50052 from rallytime/bp-49943
  - d336dec Handle non-ASCII chars during template data decode
  - 435afbf Adjusted import to expose stringutils namespace
  - 9586e30 Coerce string when calling compile_template_str
  - e73f13d [2018.3] Fix some pylint issues that have popped up recently

- PR #49809: (Ch3LL) Add additional asserts to help investigate test_win_pkg failure @ 2018-10-13 18:00:09 UTC
  - fe7669 Merge pull request #49809 from Ch3LL/win_pkg_flaky
  - f795b60 Merge pull request #7 from dwoz/win_pkg_flaky
    - beaab2a Fix win_pkg test
  - 75809b4 Merge pull request #6 from dwoz/win_pkg_flaky
    - e5ea3f1 Try running fsync to avoid fs caching race condition
  - fd5e842 Merge pull request #5 from dwoz/win_pkg_flaky
    - c386826 Log results of cache_dir for now
  - 2cd4058 Merge pull request #4 from dwoz/win_pkg_flaky
    - 1005b91 Debug win_pkg
  - 9dce5cc Fix the assertion message order
  - 18e9a28 Add additional asserts to help investigate test_win_pkg failure

- PR #49983: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-10-11 13:27:34 UTC
  - 8949873 Merge pull request #49983 from rallytime/merge-2018.3
  - f8e73e8 Merge branch '2017.7' into '2018.3'
    - a8a3811 Merge pull request #49972 from rallytime/release-notes-2017.7.9
      - 6c00003 Add 2017.7.9 release notes file
    - 8de58d6 Merge pull request #49974 from rallytime/bp-49940
      - a70358a Update mod_watch() description for all states.
      - b73d064 Another attempt to clean up service.mod_watch description.
      - 165b799 Clean up documentation/language in service state. (Fixes #40819)
    - d68e5d3 Merge pull request #49978 from whytewolf/inotify_doc_change
b4d9523 using an exclude list that does not list every operating system leaves open the possibility that it would work on those not listed

* 89cbbb6 Merge pull request #49934 from rallytime/fix-49925
  * 216fd64 Remove event_publisher_pub_hwm and salt_event_publisher_pub_hwm from documentation

- **PR #49979:** (cachedout) Update license date and include NOTICE @ 2018-10-11 12:57:21 UTC
  - c7d2482 Merge pull request #49979 from cachedout/license_update
  - b4f148e Break out support and contributing docs into separate files
  - 1dd0e34 Update license date and include NOTICE

- **PR #49973:** (rallytime) Add 2018.3.4 release notes file @ 2018-10-10 17:46:04 UTC
  - ef61fc6 Merge pull request #49973 from rallytime/release-notes-2018.3.4
  - 32e7d90 Add 2018.3.4 release notes file

- **PR #49975:** (rallytime) Back-port #49958 to 2018.3 @ 2018-10-10 17:44:56 UTC
  - PR #49958: (garethgreenaway) [fluorine] Fixes to mac_system.py (refs: #49975)
  - 7d8f10c Merge pull request #49975 from rallytime/bp-49958
  - a229a50 Swap the call for mac_utils.available_services to use __utils__ so mac_utils.available_services has access to __context__

- **PR #49946:** (ismb) osversion/osversion_info/osmajorrelease grains fixes @ 2018-10-10 14:01:05 UTC
  - c912d3a Merge pull request #49946 from isbm/ismb-osversion_info-fixes
  - a17ba35 Fix proper part name in the string-bound CPE
  - 9d49607 Expand unit test to verify part name
  - a6b7d01 Remove linebreak
  - 5376886 Keep CPE_NAME only for opensuse series
  - 8af3904 Add part parsing
  - e202b41 Prevent possible crash if CPE_NAME is wrongly written in the distro
  - 712083d Add unit test for broken CPE_NAME
  - 1306dd8 Add unit test for v2.3 of CPE format
  - 04b61d3 Add unit test for WFN format of CPE_NAME
  - 035690f Override VERSION_ID from os-release, if CPE_NAME is given
  - 08e235b Remove unnecessary linebreak
  - 853e163 Add CPE_NAME parsing

- **ISSUE #48204:** (zerthimon) State mysql_user.present Exception with mysql 8.0.11 (refs: #49918)

- **PR #49918:** (garethgreenaway) [2018.3] Fixes to MySQL module @ 2018-10-10 14:00:11 UTC
  - 18fb5df Merge pull request #49918 from garethgreenaway/48204_mysql_user_password_exception_part_deux
  - 92c0680 Merge branch '2018.3' into 48204_mysql_user_password_exception_part_deux
  - 71e53a3 Cleanup of debugging.
  - dd96c13 Fixing lint.
  - ac7da89 Tweaking a couple tests to account for new scenarios with later versions.
- 4320c43 Removing __mysql_hash_password, no longer needed.
- 0475ac9f Removing unnecessary empty line.
- 9265195 Updating the mysql update to handle changes in version 8.0.11 where PASSWORD was removed. Updating unit tests.

- **PR #49961**: (dmurphy18) Fix aix grains test for prtcconf present @ 2018-10-10 13:38:02 UTC
  - 1c2e5b5 Merge pull request #49961 from dmurphy18/fix_aix_grains
  - f38d543 Correct test for AIX grains prtcconf

- **ISSUE #49205**: (ereslib) Compound targeting includes unexpected targets in the result (refs: #49897, #49907)

- **PR #49907**: (brejoc) 2018.3 fix for list compound targeting @ 2018-10-10 13:33:40 UTC
  - **PR #49897**: (brejoc) 2017.7 fix for list compound targeting (refs: #49907)
  - b427306 Merge pull request #49907 from brejoc/2018.3-fix-for-list-compound-targeting
  - f03cad9 Merge branch '2018.3' into 2018.3-fix-for-list-compound-targeting
  - 649bd4c Adds check for engine before adding the additional engine argument
  - 7d0b20c Minor fix for def test_batch_run_grains_targeting
  - 0d64716 Ignore missing minions only when excluding them with 'not'
  - 6a53ed No longer passes missing in list compound engine

- **ISSUE #48599**: (angeloudy) module ldap3 "TypeError: ('expected a byte string in the list"
  (refs: #48666)

- **PR #49947**: (rallytime) Back-port #48666 to 2018.3 @ 2018-10-09 17:48:20 UTC
  - **PR #48666**: (angeloudy) values need to be bytes when writing back to ldap (refs: #49947)
  - 14c723 Merge pull request #49947 from rallytime/bp-48666
  - 5166917 Update ldap3.py
  - 05e55bd values need to be bytes when writing to ldap
  - 0d749e6 values need to be bytes when writing back to ldap

- **PR #49948**: (rallytime) Skip pillar refresh test @ 2018-10-09 15:20:52 UTC
  - dbf994e Merge pull request #49948 from rallytime/skip-flaky-test
  - df11c39 Skip pillar refresh test

- **PR #49938**: (s0undt3ch) Handle missing pkg_resources package @ 2018-10-09 13:41:09 UTC
  - 614d172 Merge pull request #49938 from s0undt3ch/2018.3
  - b1c2928 Handle missing pkg_resources package

- **PR #49942**: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-10-09 13:38:04 UTC
  - bce12c3 Merge pull request #49942 from rallytime/merge-2018.3
  - 91534ee Merge branch '2017.7' into '2018.3'
    - 327796e Merge pull request #49911 from dubb-b/slack-pr
      - 57e630c Adding failure messages for PR.
    - cf1df79 Merge pull request #49900 from dwoz/presence_wart
7bd34f6 Connect before processing presence

8c4707d Merge pull request #49899 from twangboy/fix_49892

a66765f Remove arrInstalled artifact

- **PR #49930**: (isbm) Get os_family for RPM distros from the RPM macros @ 2018-10-09 13:31:52 UTC
  - a30c053 Merge pull request #49930 from isbm/isbm-osarch-bugfix
  - f8a75f1 Fix imports
  - 70d3de0 Strip and stringify the return for the osarch
  - a248371 Get os_family for RPM distros from the RPM macros.

- **PR #49868**: (dwoz) windows shell tests @ 2018-10-08 17:32:20 UTC
  - 99c5dba Merge pull request #49868 from dwoz/shelltests
  - 9997f45 Merge branch '2018.3' into shelltests

- **PR #49875**: (dwoz) Add spm tests to Windows suite @ 2018-10-05 18:13:07 UTC
  - eee82d3 Merge pull request #49875 from dwoz/win_spm_tests
  - e76a751 Use os.path.split for more consistancy
  - bc54d15 Fix wart in spm on windows
  - df5e271 Add spm tests for windows

- **PR #49872**: (twangboy) Fix issues with windows file permissions when using reset=True @ 2018-10-05 13:52:07 UTC
  - c0e2404 Merge pull request #49872 from twangboy/fix_49861
  - 01bd847 Gate the win_function a little better
  - bcd366 Skip on non-windows systems
  - 02f6335 Fix some lint
  - 8ecbe0e Add tests for check_perms
  - d6e7512 Fix issues with file permissions

- **ISSUE #49582**: (UtahDave) lgpo doesn’t seem to allow for unsetting a gpo setting (refs: #49902)

- **ISSUE #48661**: (mike2523) win_lgpo: User Rights Assignment policies (refs: #49902)

- **PR #49902**: (lomeroe) lgpo better comments on user right assignments @ 2018-10-05 13:41:16 UTC
  - d3a909f Merge pull request #49902 from lomeroe/issue48661_2018.3
  - 760d8f4 Merge branch '2018.3' into issue48661_2018.3
